Chapter 1

RTI Data Distribution Service

Real-Time Innovations, Inc.

RTI Data Distribution Service is a data-centric communications middleware that allows developers to build high-performance distributed communications in a heterogeneous computer environment.

The Application Programming Interface (API) of RTI Data Distribution Service 4 is based on the OMG's Data Distribution Service (DDS) specification. The most recent publication of this specification can be found in the Catalog of OMG Specifications under "Middleware Specifications".

1.1 Feedback and Support for this Release.

For more information, visit our knowledge base, accessible from http://www.rti.com/support, to see sample code, general information on RTI Data Distribution Service, performance information, troubleshooting tips, and technical details.

By its very nature, the knowledge base is continuously evolving and improving. We hope that you will find it helpful. If there are questions that you would like to see addressed or comments you would like to share, please send e-mail to support@rti.com. We can only guarantee a response for customers with a current maintenance contract or subscription. To purchase a maintenance contract or subscription, contact your local RTI representative (see http://www.rti.com/company/contact.html), send an email request to sales@rti.com, or call +1 (408) 990-7400.

Please do not hesitate to contact RTI with questions or comments about this release. We welcome any input on how to improve RTI Data Distribution Service to suit your needs.

1.2 Available Documentation.

The documentation of this release is provided in two forms: the HTML API reference and PDF documents. If you are new to RTI Data Distribution Service 4, the **Documentation Roadmap** (p. 948) will provide direction on how to learn about this product.

1.2.1 The PDF documents are:

- What's New. An overview of the new features in this release.
- Release Notes. System requirements, compatibility, what's fixed in this release, and known issues.
- ^ Getting Started Guide. Download and installation instructions. It also lays out the core value and concepts behind the product and takes you step-by-step through the creation of a simple example application. Developers should read this document first.
- ^ Getting Started Guide, Database Addendum. Additional installation and setup information for database usage.
- ^ Getting Started Guide, Embedded Systems Addendum. Additional installation and setup information for embedded systems.
- * User's Manual. Introduction to RTI Data Distribution Service, product tour and conceptual presentation of the functionality of RTI Data Distribution Service.
- ^ Platform Notes. Specific details, such as compilation setting and libraries, related to building and using RTI Data Distribution Service on the various supported platforms.
- ^ C API Reference Manual. PDF version of the online HTML documentation for the C API.
- ^ C++ API Reference Manual. PDF version of the online HTML documentation for the C++ API.

- ^ Java API Reference Manual. PDF version of the online HTML documentation for the Java API.
- ^ .NET API Reference Manual. PDF version of the online HTML documentation for the .NET API.

1.2.2 The HTML API reference contains:

- $\hat{\ }$ DDS API Reference (p. 952) The DDS API reference.
- **RTI Data Distribution Service API Reference** (p. 965) RTI Data Distribution Service API's independent of the DDS standard.
- **Programming How-To's** (p. 966) Describes and shows the common tasks done using the API.
- Programming Tools (p. 968) RTI Data Distribution Service helper tools.

The HTML API documentation can be accessed through the tree view in the left frame of the web browser window. The bulk of the documentation is found under the entry labeled "Modules".

Chapter 3

Data Structure Index

3.1 Data Structures

Here are the data structures with brief descriptions:

DDS_AllocationSettings_t (Resource allocation settings)	1033
$\mathbf{DDS_AsynchronousPublisherQosPolicy} \ (\mathbf{Configures} \ \ \mathbf{the} \ \ \mathbf{mecha-}$	
nism that sends user data in an external middleware thread	
)	1035
DDS_BatchQosPolicy (Used to configure batching of multiple sam-	
ples into a single network packet in order to increase through-	
put for small samples)	1040
$DDS_BooleanSeq$ (Instantiates FooSeq (p. 1497) $< DDS_Boolean$	
(1 -) ·)	1044
	1045
DDS_BuiltinTopicReaderResourceLimits_t (Built-in topic	
reader's resource limits)	1046
DDS_ChannelSettings_t (Type used to configure the properties of	
a channel)	1049
DDS_ChannelSettingsSeq (Declares IDL sequence< DDS	
ChannelSettings_t $(p. 1049) >)$	1051
DDS_CharSeq (Instantiates FooSeq (p. 1497) < DDS_Char	
$(p.107) >) \dots $	1052
DDS_ConditionSeq (Instantiates FooSeq (p. 1497) < DDS	
Condition $(p. 252) >)$	1053
DDS_ContentFilter ($<>$ (p. 950) Interface to be used	
by a custom filter of a $\mathbf{DDS_ContentFilteredTopic}$ (p. $426)$)	1054
DDS_ContentFilterProperty_t ($<< eXtension>>$ (p. 950) Type	
used to provide all the required information to enable content	
filtering)	1057

DDS_DatabaseQosPolicy (Various threads and resource limits set-	
tings used by RTI Data Distribution Service to control its	
internal database)	1059
DDS_DataReaderCacheStatus ($<< eXtension>>$ (p. 950) The	
status of the reader's cache)	1064
DDS_DataReaderListener (<< interface>> (p. 950) DDS	
Listener (p. 1246) for reader status)	1065
DDS_DataReaderProtocolQosPolicy (Along with DDS	
WireProtocolQosPolicy (p. 1483) and DDS	
DataWriterProtocolQosPolicy (p. 1106), this QoS	
policy configures the DDS on-the-network protocol (RTPS)	1069
DDS_DataReaderProtocolStatus ($<<$ eXtension>> (p. 950)	
The status of a reader's internal protocol related metrics, like	
the number of samples received, filtered, rejected; and status	
of wire protocol traffic)	1073
DDS_DataReaderQos (QoS policies supported by a DDS	
DataReader (p. 783) entity)	1083
DDS_DataReaderResourceLimitsQosPolicy (Various settings	
that configure how a DDS_DataReader (p. 783) allocates	
and uses physical memory for internal resources)	1089
DDS_DataReaderSeq (Declares IDL sequence < DDS	
DataReader (p. 783) $>$)	1100
DDS_DataWriterCacheStatus ($<< eXtension>>$ (p. 950) The	
status of the writer's cache)	1101
DDS_DataWriterListener (<< interface>> (p. 950) DDS	1101
Listener (p. 1246) for writer status)	1102
DDS_DataWriterProtocolQosPolicy (Protocol that applies only	1102
to DDS_DataWriter (p. 673) instances)	1106
DDS_DataWriterProtocolStatus (< <extension>> (p. 950)</extension>	1100
The status of a writer's internal protocol related metrics, like	
the number of samples pushed, pulled, filtered; and status of	
wire protocol traffic)	1111
DDS_DataWriterQos (QoS policies supported by a DDS	
DataWriter (p. 673) entity)	1123
DDS_DataWriterResourceLimitsQosPolicy (Various settings	1120
that configure how a DDS_DataWriter (p. 673) allocates	
and uses physical memory for internal resources)	1130
DDS_DeadlineQosPolicy (Expresses the maximum duration (dead-	1100
line) within which an instance is expected to be updated)	1135
DDS_DestinationOrderQosPolicy (Controls how the middleware	1100
will deal with data sent by multiple DDS_DataWriter	
(p. 673) entities for the same instance of data (i.e., same	
DDS_Topic (p. 425) and key))	1138
DDS_DiscoveryConfigQosPolicy (Settings for discovery configura-	1100
tion)	1141

DDS_DiscoveryQosPolicy (Configures the mechanism used by the	
middleware to automatically discover and connect with new	
remote applications)	1149
DDS_DomainParticipantFactoryQos (QoS policies supported by	
	1153
DDS_DomainParticipantListener (<< interface>> (p. 950) Lis-	
tener for participant status)	1155
DDS_DomainParticipantQos (QoS policies supported by a DDS	
DomainParticipant (p. 339) entity)	1157
DDS_DomainParticipantResourceLimitsQosPolicy (Various	
settings that configure how a DDS_DomainParticipant	
(p. 339) allocates and uses physical memory for internal	
resources, including the maximum sizes of various properties)	1162
$DDS_DoubleSeq$ (Instantiates FooSeq (p. 1497) $< DDS_Double$	
(2 / /	1180
DDS_DurabilityQosPolicy (This QoS policy specifies whether or	
not RTI Data Distribution Service will store and deliver pre-	
viously published data samples to new DDS_DataReader	
$(p.783)$ entities that join the network later $) \dots \dots \dots$	1181
DDS_DurabilityServiceQosPolicy (Various settings to con-	
figure the external RTI Persistence Service used by	
RTI Data Distribution Service for DataWriters with a	
DDS_DurabilityQosPolicy (p. 1181) setting of DDS	
PERSISTENT_DURABILITY_QOS (p. 154) or DDS	1105
• (2 / / /	1185
DDS_Duration_t (Type for duration representation)	1188
DDS_DynamicData (A sample of any complex data type, which can	1100
1 ,	1189
DDS_DynamicDataInfo (A descriptor for a DDS_DynamicData	1107
(1 / 0 /	1197
DDS_DynamicDataMemberInfo (A descriptor for a single member	1100
(, , , , , , , , , , , , , , , , , , ,	1198
DDS_DynamicDataProperty_t (A collection of attributes used to	1001
	1201
DDS_DynamicDataSeq (An ordered collection of DDS	1000
DynamicData (p. 1189) elements)	
DDS_DynamicDataTypeProperty_t (A collection of attributes	
used to configure DDS_DynamicDataTypeSupport (p. 539) objects)	1204
DDS_DynamicDataTypeSerializationProperty_t (Properties	1204
that govern how data of a certain type will be serialized on	
	1205
DDS_EntityFactoryQosPolicy (A QoS policy for all DDS_Entity	1200
(p. 242) types that can act as factories for one or more other	
DDS_Entity (p. 242) types)	1207
= = =	0.

DDS_EntityNameQosPolicy (Assigns a name to a DDS	
DomainParticipant (p. 339). This name will be visible dur-	
ing the discovery process and in RTI tools to help you visualize	
and debug your system)	1209
DDS_EnumMember (A description of a member of an enumeration)	1211
DDS_EnumMemberSeq (Defines a sequence of enumerator mem-	
bers)	1212
DDS_EventQosPolicy (Settings for event)	1213
DDS_ExclusiveAreaQosPolicy (Configures multi-thread concur-	
rency and deadlock prevention capabilities)	1216
DDS_FloatSeq (Instantiates FooSeq (p. 1497) < DDS_Float	
(p.108) >)	1219
DDS_FlowControllerProperty_t (Determines the flow control	1210
characteristics of the DDS_FlowController (p. 726))	1220
DDS_FlowControllerTokenBucketProperty_t (DDS	1220
FlowController (p. 726) uses the popular token bucket	
approach for open loop network flow control. The flow	
control characteristics are determined by the token bucket	
properties)	1222
DDS_GroupDataQosPolicy (Attaches a buffer of opaque data that	1222
is distributed by means of Built-in Topics (p. 410) during	
discovery)	1226
DDS_GUID_t (Type for GUID (Global Unique Identifier) represen-	1220
tation)	1999
,	1228
DDS_HistoryQosPolicy (Specifies the behavior of RTI Data Distri-	
bution Service in the case where the value of a sample changes	
(one or more times) before it can be successfully communi-	1000
cated to one or more existing subscribers)	1229
DDS_InconsistentTopicStatus (DDS_INCONSISTENT	1000
TOPIC_STATUS (p. 128))	1233
DDS_InstanceHandleSeq (Instantiates FooSeq (p. 1497) <	4005
DDS_InstanceHandle_t $(p. 452) >)$	1235
DDS_KeyedOctets (Built-in type consisting of a variable-length ar-	
ray of opaque bytes and a string that is the key)	1236
DDS_KeyedOctetsSeq (Instantiates FooSeq (p. 1497) < DDS	
$\mathbf{KeyedOctets} \; (\mathrm{p.1236}) >) \; \ldots \; \ldots \; \ldots \; \ldots \; \ldots \; \ldots$	1237
$ DDS_KeyedOctetsTypeSupport $	
·	1238
	1239
$DDS_KeyedStringSeq$ (Instantiates FooSeq (p. 1497) $< DDS\$	
$\mathbf{KeyedString} \; (p. 1239) >) \; \ldots \;$	1240
$ \textbf{DDS_KeyedStringTypeSupport} (<< \textit{interface}>> (\text{p. 950}) $	
Keyed string type support)	1241
DDS_LatencyBudgetQosPolicy (Provides a hint as to the maxi-	
mum acceptable delay from the time the data is written to	
the time it is received by the subscribing applications)	1242

DDS_LifespanQosPolicy (Specifies how long the data written by the	
(1)	1244
DDS_Listener (<< interface>> (p. 950) Abstract base class for all	
Listener interfaces)	1246
DDS_LivelinessChangedStatus (DDS_LIVELINESS	4050
CHANGED_STATUS (p. 131))	1250
DDS_LivelinessLostStatus (DDS_LIVELINESS_LOST	1050
\1 / /	1252
DDS_LivelinessQosPolicy (Specifies and configures the mechanism	
that allows DDS_DataReader (p. 783) entities to detect when DDS_DataWriter (p. 673) entities become discon-	
nected or "dead.")	1954
DDS_Locator_t ($<<$ <i>eXtension</i> $>>$ (p. 950) Type used to represent	1204
the addressing information needed to send a message to an	
RTPS Endpoint using one of the supported transports)	1258
DDS_LocatorFilter_t (Specifies the configuration of an individual	1200
channel within a MultiChannel DataWriter)	1260
DDS_LocatorFilterQosPolicy (The QoS policy used to report the	
configuration of a MultiChannel DataWriter as part of DDS	
PublicationBuiltinTopicData (p. 1313))	1262
DDS_LocatorFilterSeq (Declares IDL sequence< DDS	
$\mathbf{LocatorFilter_t} \ (\mathbf{p}. \frac{1260}{1260}) >) \dots \dots \dots \dots$	1264
$\mathbf{DDS_LocatorSeq} \hspace{0.2cm} (\mathbf{Declares} \hspace{0.2cm} \mathbf{IDL} \hspace{0.2cm} \mathbf{sequence} \hspace{0.2cm} < \hspace{0.2cm} \mathbf{DDS_Locator_t}$	
$(p. 1258) >) \dots \dots \dots \dots \dots \dots \dots \dots \dots \dots$	1265
$\mathbf{DDS_LongDoubleSeq} \hspace{0.2cm} (\mathbf{Instantiates} \hspace{0.2cm} \mathbf{FooSeq} \hspace{0.2cm} (\mathbf{p.1497}) \hspace{0.2cm} < \hspace{0.2cm} \mathbf{DDS\}$	
	1266
$\mathbf{DDS_LongLongSeq} (\mathbf{Instantiates} FooSeq (\mathbf{p}. 1497) < \mathbf{DDS\}$	
$\mathbf{LongLong}\ (\mathrm{p.108}) >) \dots \dots \dots \dots \dots \dots$	1267
DDS_LongSeq (Instantiates FooSeq (p. 1497) < DDS_Long	
	1268
DDS_MultiChannelQosPolicy (Configures the ability of a	
DataWriter to send data on different multicast groups (addresses) based on the value of the data	1960
dresses) based on the value of the data)	1209
DDS_Octets (Built-in type consisting of a variable-length array of opaque bytes)	1272
DDS_OctetSeq (Instantiates FooSeq (p. 1497) < DDS_Octet	14/4
	1273
DDS_OctetsSeq (Instantiates FooSeq (p. 1497) < DDS_Octets	1210
(p. 1272) >)	1274
DDS_OctetsTypeSupport (<< interface>> (p. 950) DDS	
Octets (p. 1272) type support)	1275
DDS_OfferedDeadlineMissedStatus (DDS_OFFERED	
· ·	1276
DDS_OfferedIncompatibleQosStatus (DDS_OFFERED	
INCOMPATIBLE_QOS_STATUS (p. 129))	1278

DDS_OwnershipQosPolicy (Specifies whether it is allowed for mul-	
tiple DDS_DataWriter (p. 673) (s) to write the same in-	
stance of the data and if so, how these modifications should	ഹ
,	280
DDS_OwnershipStrengthQosPolicy (Specifies the value of the strength used to arbitrate among multiple DDS_DataWriter (p. 673) objects that attempt to modify the same instance of	
	287
DDS_ParticipantBuiltinTopicData (Entry created when a Do-	
mainParticipant object is discovered)	289
DDS_ParticipantBuiltinTopicDataSeq (Instantiates FooSeq	
$(\mathrm{p.} 1497) < \mathbf{DDS_ParticipantBuiltinTopicData}(\mathrm{p.} 1289)$	റെറ
>)	292
DDS_ParticipantBuiltinTopicDataTypeSupport (Instantiates TypeSupport < DDS_ParticipantBuiltinTopicData	
$(p. 1289) >) \dots $	293
DDS_PartitionQosPolicy (Set of strings that introduces a logical partition among the topics visible by a DDS_Publisher	
$(p. 632)$ and a DDS_Subscriber $(p. 743)$ $)$	294
DDS_PresentationQosPolicy (Specifies how the samples represent-	
ing changes to data instances are presented to a subscribing	
application)	297
DDS_ProductVersion_t ($<< eXtension>> (p. 950)$ Type used to	
represent the current version of RTI Data Distribution Service)1:	302
DDS_ProfileQosPolicy (Configures the way that XML documents	
containing QoS profiles are loaded by RTI Data Distribution	
,	304
DDS_Property_t (Properties are name/value pairs objects) 13	307
DDS_PropertyQosPolicy (Stores name/value(string) pairs that can	
be used to configure certain parameters of RTI Data Distribu-	
tion Service that are not exposed through formal QoS policies.	
Can also be used to store and propagate application-specific	
name/value pairs that can be retrieved by user code during	000
• /	308
DDS_PropertySeq (Declares IDL sequence < DDS_Property_t (p. 1307) >)	211
	911
DDS_ProtocolVersion_t ($<< eXtension>> (p. 950)$ Type used to represent the version of the RTPS protocol)	219
DDS_PublicationBuiltinTopicData (Entry created when a DDS	012
DataWriter (p. 673) is discovered in association with its Pub-	
· ,	313
DDS_PublicationBuiltinTopicDataSeq (Instantiates FooSeq	010
(p. 1497) < DDS_PublicationBuiltinTopicData (p. 1313)	
>)	321

DDS_PublicationBuiltinTopicDataTypeSupport (Instantiates	
TypeSupport < DDS_PublicationBuiltinTopicData	
$(p. 1313) >) \dots \dots \dots \dots \dots \dots \dots \dots \dots$	1322
$DDS_Publication Matched Status \qquad (DDS_PUBLICATION\$	
MATCHED_STATUS (p. 131))	1323
DDS_PublisherListener (<< interface>> (p. 950) DDS	
Listener (p. 1246) for DDS_Publisher (p. 632) status	
)	1326
DDS_PublisherQos (QoS policies supported by a DDS_Publisher	
(p. 632) entity)	1328
DDS_PublisherSeq (Declares IDL sequence < DDS_Publisher	
$(p.632) >) \dots $	1330
DDS_PublishModeQosPolicy (Specifies how RTI Data Distribu-	
tion Service sends application data on the network. This QoS	
policy can be used to tell RTI Data Distribution Service to	
use its own thread to send data, instead of the user thread).	1331
DDS_QosPolicyCount (Type to hold a counter for a DDS	1001
QosPolicyId_t (p. 146))	1334
DDS_QosPolicyCountSeq (Declares IDL sequence < DDS	1001
	1335
DDS_ReaderDataLifecycleQosPolicy (Controls how a	1999
DataReader manages the lifecycle of the data that it	
The state of the s	1226
has received)	1990
Data Distribution Service to receive and process data from	1220
transports (for example, UDP sockets))	1999
DDS_ReliabilityQosPolicy (Indicates the level of reliability of-	1949
fered/requested by RTI Data Distribution Service)	1342
DDS_ReliableReaderActivityChangedStatus	
(<< eXtension>> (p. 950) Describes the activity (i.e.	
are acknowledgements forthcoming) of reliable readers	1940
matched to a reliable writer)	1346
$ ext{DDS_ReliableWriterCacheChangedStatus} (<< eXtension>>$	
(p. 950) A summary of the state of a data writer's cache of	1040
unacknowledged samples written)	1348
$ DDS_ReliableWriterCacheEventCount \qquad (<< eXtension>>$	
(p. 950) The number of times the number of unacknowl-	
edged samples in the cache of a reliable writer hit a certain	
well-defined threshold)	1351
DDS_RequestedDeadlineMissedStatus (DDS	
REQUESTED_DEADLINE_MISSED_STATUS	
(p. 129))	1352
$DDS_RequestedIncompatibleQosStatus \\ (DDS\$	
REQUESTED_INCOMPATIBLE_QOS_STATUS	
(p. 129))	1354

DDS_ResourceLimitsQosPolicy (Controls the amount of physical	
memory allocated for DDS entities, if dynamic allocations are	
allowed, and how they occur. Also controls memory usage	
among different instance values for keyed topics $)$	1356
$\mathbf{DDS_RtpsReliableReaderProtocol_t} (\mathbf{Qos} \mathbf{related} \mathbf{to} \mathbf{reliable}$	
reader protocol defined in RTPS)	1361
$\mathbf{DDS_RtpsReliableWriterProtocol_t} \ (\mathrm{QoS} \ \mathrm{related} \ \mathrm{to} \ \mathrm{the} \ \mathrm{reliable}$	
writer protocol defined in RTPS)	1364
DDS_RtpsWellKnownPorts_t (RTPS well-known port mapping	
configuration) \dots	1378
DDS_SampleInfo (Information that accompanies each sample that	
is read or taken)	1384
DDS_SampleInfoSeq (Declares IDL sequence < DDS	
SampleInfo (p. 1384) >)	1393
DDS_SampleLostStatus (DDS_SAMPLE_LOST_STATUS	
$\left(\mathrm{p.}130\right)\right)\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots\ldots$	1394
$DDS_Sample Rejected Status (DDS_SAMPLE_REJECTED\$	
$\mathbf{STATUS} \; (\mathrm{p.} 130) \;) \dots \dots$	1395
DDS_SequenceNumber_t (Type for sequence number representa-	
tion) \dots	1397
DDS_ShortSeq (Instantiates FooSeq (p. 1497) < DDS_Short	
$(p. 107) >) \dots $	1398
$\mathbf{DDS_StringSeq}$ (Instantiates FooSeq (p. 1497) < char* > with	
value type semantics)	1399
DDS_StringTypeSupport (< <interface>> (p. 950) String type</interface>	
support)	1401
DDS_StructMember (A description of a member of a struct)	1402
DDS_StructMemberSeq (Defines a sequence of struct members) .	1404
$ DDS_SubscriberListener (<< interface>> (p. 950) DDS\ $	
Listener (p. 1246) for status about a subscriber)	1405
DDS_SubscriberQos (QoS policies supported by a DDS	
Subscriber (p. 743) entity) $\dots \dots \dots \dots \dots$	1407
$\mathbf{DDS_SubscriberSeq} \ (\mathrm{Declares} \ \mathrm{IDL} \ \mathtt{sequence} < \mathbf{DDS_Subscriber}$	
$(p.743) >) \dots \dots \dots \dots \dots \dots \dots \dots$	1409
DDS_SubscriptionBuiltinTopicData (Entry created when a	
DDS_DataReader (p. 783) is discovered in association with	
its Subscriber)	1410
$\mathbf{DDS_SubscriptionBuiltinTopicDataSeq} (\mathbf{Instantiates} FooSeq$	
(p. 1497) < DDS_SubscriptionBuiltinTopicData	
$(p. 1410) >) \dots $	1418
DDS_SubscriptionBuiltinTopicDataTypeSupport (Instantiates	
TypeSupport < DDS_SubscriptionBuiltinTopicData	1 /1 ^
$(p. 1410) >) \dots $	1419
DDS_SubscriptionMatchedStatus (DDS_SUBSCRIPTION	1.00
MATCHED_STATUS (p. 132))	1420

DDS_SystemResourceLimitsQosPolicy (Configures DDS	
DomainParticipant (p. 339)-independent resources used by	
RTI Data Distribution Service. Mainly used to change the	
maximum number of DDS_DomainParticipant (p. 339)	
entities that can be created within a single process (address	
space))	23
DDS_ThreadSettings_t (The properties of a thread of execution) . 142	25
DDS_Time_t (Type for <i>time</i> representation)	28
DDS_TimeBasedFilterQosPolicy (Filter that allows a DDS	
DataReader (p. 783) to specify that it is interested only in	
(potentially) a subset of the values of the data) 142	29
DDS_TopicBuiltinTopicData (Entry created when a Topic object	
discovered)	33
DDS_TopicBuiltinTopicDataSeq (Instantiates FooSeq (p. 1497)	
$< DDS_{-}TopicBuiltinTopicData (p. 1433) >) \dots 143$	37
DDS_TopicBuiltinTopicDataTypeSupport (Instantiates	
${\tt TypeSupport} < \mathbf{DDS_TopicBuiltinTopicData} \; (\mathrm{p.} 1433) >) \; 143$	38
DDS_TopicDataQosPolicy (Attaches a buffer of opaque data that	
is distributed by means of Built-in Topics (p. 410) during	
discovery)	39
$ DDS_TopicListener \ (<< interface>> \ (p. 950) \ DDS_Listener $	
$(p. 1246)$ for $\mathbf{DDS_Topic}$ $(p. 425)$ entities $) \dots \dots 144$	11
DDS_TopicQos (QoS policies supported by a DDS_Topic (p. 425)	
entity)	13
DDS_TransportBuiltinQosPolicy (Specifies which built-in trans-	
ports are used)	17
DDS_TransportMulticastQosPolicy (Specifies the multicast ad-	
dress on which a DDS_DataReader (p. 783) wants to receive	
its data. It can also specify a port number as well as a subset	
of the available (at the DDS_DomainParticipant (p. 339)	
level) transports with which to receive the multicast data) . 144	19
DDS_TransportMulticastSettings_t (Type representing a list of	
multicast locators)	1(
DDS_TransportMulticastSettingsSeq (Declares IDL sequence<	- 0
DDS_TransportMulticastSettings_t (p. 1451) >) 145)3
DDS_TransportPriorityQosPolicy (This QoS policy allows the ap-	
plication to take advantage of transports that are capable of	٠,
sending messages with different priorities))4
DDS_TransportSelectionQosPolicy (Specifies the physical trans-	
ports a DDS_DataWriter (p. 673) or DDS_DataReader	۰,
(p. 783) may use to send or receive data)	96
DDS_TransportUnicastQosPolicy (Specifies a subset of transports	
and a port number that can be used by an Entity to receive	- 0
data))8
DDS_TransportUnicastSettings_t (Type representing a list of uni-	20
cast locators)	υU

DDS_TransportUnicastSettingsSeq (Declares IDL sequence<	4.400
DDS_TransportUnicastSettings_t (p. 1460) $>$)	1462
DDS_TypeCode (The definition of a particular data type, which you	
can use to inspect the name, members, and other properties of types generated with rtiddsgen (p. 969) or to modify types	
you define yourself at runtime)	1463
DDS_TypeCodeFactory (A singleton factory for creating, copying,	1400
and deleting data type definitions dynamically)	1464
DDS_TypeSupportQosPolicy (Allows you to attach application-	
specific values to a DataWriter or DataReader that are passed	
to the serialization or deserialization routine of the associated	
data type)	1466
$\mathbf{DDS_UnionMember}$ (A description of a member of a union)	1468

internal buffers) $\dots \dots $

Chapter 4

Module Documentation

4.1 Participant Built-in Topics

Builtin topic for accessing information about the DomainParticipants discovered by RTI Data Distribution Service.

Data Structures

 $\hat{\ }$ struct DDS_ParticipantBuiltinTopicData

Entry created when a DomainParticipant object is discovered.

^ struct DDS_ParticipantBuiltinTopicDataSeq

```
Instantiates FooSeq (p. 1497) < DDS\_ParticipantBuiltinTopicData (p. 1289) > .
```

 ${\bf \hat{\ }} struct\ {\bf DDS_ParticipantBuiltinTopicDataTypeSupport}$

```
 \begin{array}{lll} {\it Instantiates} & {\tt TypeSupport} & < & {\it DDS\_ParticipantBuiltinTopicData} \\ {\rm (p.~1289)} > . & \\ \end{array}
```

Typedefs

* typedef struct DDS_ParticipantBuiltinTopicDataDataReader DDS_ParticipantBuiltinTopicDataDataReader

```
Instantiates \ {\tt DataReader} < {\it DDS\_ParticipantBuiltinTopicData} \ ({\tt p.}\ {\it 1289}) > .
```

Variables

 $\hat{\ } \ \ {\rm const\ char}*{\bf DDS_PARTICIPANT_TOPIC_NAME}$

Participant topic name.

4.1.1 Detailed Description

Builtin topic for accessing information about the DomainParticipants discovered by RTI Data Distribution Service.

4.1.2 Typedef Documentation

$\begin{array}{ccc} 4.1.2.1 & typedef \ struct \ DDS_- \\ & ParticipantBuiltinTopicDataDataReader \\ & DDS_ParticipantBuiltinTopicDataDataReader \\ \end{array}$

 ${\bf Instantiates~DataReader} < {\bf DDS_ParticipantBuiltinTopicData~(p.~1289)} > .$

DDS_DataReader (p. 783) of topic DDS_PARTICIPANT_TOPIC_-NAME (p. 22) used for accessing DDS_ParticipantBuiltinTopicData (p. 1289) of the remote DDS_DomainParticipant (p. 339).

Instantiates:

```
<< generic>> (p. 950) FooDataReader (p. 1495)
```

See also:

```
DDS_ParticipantBuiltinTopicData (p. 1289)
DDS_PARTICIPANT_TOPIC_NAME (p. 22)
```

4.1.3 Variable Documentation

4.1.3.1 const char* DDS_PARTICIPANT_TOPIC_NAME

Participant topic name.

Topic name of DDS_ParticipantBuiltinTopicDataDataReader (p. 22)

See also:

```
DDS_ParticipantBuiltinTopicData (p. 1289)
DDS_ParticipantBuiltinTopicDataDataReader (p. 22)
```

4.2 Topic Built-in Topics

Builtin topic for accessing information about the Topics discovered by RTI Data Distribution Service.

Data Structures

^ struct DDS_TopicBuiltinTopicData

Entry created when a Topic object discovered.

^ struct DDS_TopicBuiltinTopicDataSeq

```
Instantiates \ {\tt FooSeq} \ \ (p.\ {\tt 1497}) \ < \ DDS\_TopicBuiltinTopicData \ \ (p.\ {\tt 1433}) \ > \ .
```

 ${\bf \hat{\ }} struct \ {\bf DDS_TopicBuiltinTopicDataTypeSupport}$

```
Instantiates TypeSupport < DDS_{-}TopicBuiltinTopicData  (p. 1433) > .
```

Typedefs

^ typedef struct DDS_TopicBuiltinTopicDataDataReader DDS_-TopicBuiltinTopicDataDataReader

```
Instantiates \ \mathtt{DataReader} < DDS\_TopicBuiltinTopicData \ (p. 1433) > .
```

Variables

^ const char * DDS_TOPIC_TOPIC_NAME

Topic topic name.

4.2.1 Detailed Description

Builtin topic for accessing information about the Topics discovered by RTI Data Distribution Service.

4.2.2 Typedef Documentation

4.2.2.1 typedef struct DDS_TopicBuiltinTopicDataDataReader DDS_TopicBuiltinTopicDataDataReader

 $Instantiates DataReader < DDS_TopicBuiltinTopicData (p. 1433) > .$

DDS_DataReader (p. 783) of topic DDS_TOPIC_TOPIC_NAME (p. 24) used for accessing DDS_TopicBuiltinTopicData (p. 1433) of the remote DDS_Topic (p. 425).

Note: The DDS_TopicBuiltinTopicData (p.1433) built-in topic is meant to convey information about discovered Topics. This Topics samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (DDS_PublicationBuiltinTopicData (p.1313) and DDS_SubscriptionBuiltinTopicData (p.1410)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

Instantiates:

```
<< generic >> (p. 950) FooDataReader (p. 1495)
```

See also:

```
DDS_TopicBuiltinTopicData (p. 1433)
DDS_TOPIC_TOPIC_NAME (p. 24)
```

4.2.3 Variable Documentation

4.2.3.1 const char* DDS_TOPIC_TOPIC_NAME

Topic topic name.

Topic name of DDS_TopicBuiltinTopicDataDataReader (p. 23)

See also:

```
DDS_TopicBuiltinTopicData (p. 1433)
DDS_TopicBuiltinTopicDataDataReader (p. 23)
```

4.3 Publication Built-in Topics

Builtin topic for accessing information about the Publications discovered by RTI Data Distribution Service.

Data Structures

^ struct DDS_PublicationBuiltinTopicData

Entry created when a DDS_DataWriter (p. 673) is discovered in association with its Publisher.

 $\hat{\ }$ struct DDS_PublicationBuiltinTopicDataSeq

```
Instantiates FooSeq (p. 1497) < DDS_PublicationBuiltinTopicData (p. 1313) > .
```

 ${\bf \hat{\ }} struct\ {\bf DDS_PublicationBuiltinTopicDataTypeSupport}$

```
\begin{array}{lll} {\it Instantiates} & {\it TypeSupport} & < & {\it DDS\_PublicationBuiltinTopicData} \\ {\rm (p.\,1313)} > . & & \\ \end{array}
```

Typedefs

^ typedef struct DDS_PublicationBuiltinTopicDataDataReader DDS_PublicationBuiltinTopicDataDataReader

```
Instantiates \ {\tt DataReader} < {\it DDS\_PublicationBuiltinTopicData} \ ({\tt p.}\ 1313) > .
```

Variables

^ const char * DDS_PUBLICATION_TOPIC_NAME

Publication topic name.

4.3.1 Detailed Description

Builtin topic for accessing information about the Publications discovered by RTI Data Distribution Service.

4.3.2 Typedef Documentation

4.3.2.1 typedef struct DDS_PublicationBuiltinTopicDataDataReader DDS_PublicationBuiltinTopicDataDataReader

 $Instantiates \ {\tt DataReader} < {\tt DDS_PublicationBuiltinTopicData} \ ({\tt p.\,1313}) > \\$

DDS_DataReader (p. 783) of topic DDS_PUBLICATION_TOPIC_-NAME (p. 26) used for accessing DDS_PublicationBuiltinTopicData (p. 1313) of the remote DDS_DataWriter (p. 673) and the associated DDS_Publisher (p. 632).

Instantiates:

```
<< generic>> (p. 950) FooDataReader (p. 1495)
```

See also:

```
DDS_PublicationBuiltinTopicData (p. 1313)
DDS_PUBLICATION_TOPIC_NAME (p. 26)
```

4.3.3 Variable Documentation

4.3.3.1 const char* DDS_PUBLICATION_TOPIC_NAME

Publication topic name.

Topic name of DDS_PublicationBuiltinTopicDataDataReader (p. 26)

See also:

```
DDS_PublicationBuiltinTopicData (p. 1313)
DDS_PublicationBuiltinTopicDataDataReader (p. 26)
```

4.4 Subscription Built-in Topics

Builtin topic for accessing information about the Subscriptions discovered by RTI Data Distribution Service.

Data Structures

^ struct DDS_SubscriptionBuiltinTopicData

Entry created when a DDS_DataReader (p. 783) is discovered in association with its Subscriber.

^ struct DDS_SubscriptionBuiltinTopicDataSeq

```
Instantiates FooSeq (p. 1497) < DDS\_SubscriptionBuiltinTopicData (p. 1410) > .
```

 $\hat{\ }$ struct DDS_SubscriptionBuiltinTopicDataTypeSupport

```
Instantiates TypeSupport < DDS\_SubscriptionBuiltinTopicData (p. <math>1410) > .
```

Typedefs

^ typedef struct DDS_SubscriptionBuiltinTopicDataDataReader DDS_SubscriptionBuiltinTopicDataDataReader

```
\begin{array}{lll} {\it Instantiates} & {\tt DataReader} & < & {\it DDS\_SubscriptionBuiltinTopicData} \\ {\rm (p.~1410)} > . & & \\ \end{array}
```

Variables

^ const char * DDS_SUBSCRIPTION_TOPIC_NAME

 $Subscription\ topic\ name.$

4.4.1 Detailed Description

Builtin topic for accessing information about the Subscriptions discovered by RTI Data Distribution Service.

4.4.2 Typedef Documentation

$\begin{array}{ccc} 4.4.2.1 & typedef \ struct \ DDS_-\\ & SubscriptionBuiltinTopicDataDataReader\\ & DDS_SubscriptionBuiltinTopicDataDataReader \end{array}$

 $\label{eq:loss_problem} Instantiates \ \mbox{\tt DataReader} < \mbox{\tt DDS_SubscriptionBuiltinTopicData} \ (\mbox{\tt p. 1410}) > .$

DDS_DataReader (p. 783) of topic DDS_SUBSCRIPTION_TOPIC_-NAME (p. 28) used for accessing DDS_SubscriptionBuiltinTopicData (p. 1410) of the remote DDS_DataReader (p. 783) and the associated DDS_Subscriber (p. 743).

Instantiates:

```
<< generic>> (p. 950) FooDataReader (p. 1495)
```

See also:

```
DDS_SubscriptionBuiltinTopicData (p. 1410)
DDS_SUBSCRIPTION_TOPIC_NAME (p. 28)
```

4.4.3 Variable Documentation

4.4.3.1 const char* DDS_SUBSCRIPTION_TOPIC_NAME

Subscription topic name.

Topic name of DDS_SubscriptionBuiltinTopicDataDataReader (p. 28)

See also:

```
DDS_SubscriptionBuiltinTopicData (p. 1410)
DDS_SubscriptionBuiltinTopicDataDataReader (p. 28)
```

4.5 String Built-in Type

Built-in type consisting of a single character string.

Data Structures

* struct DDS_StringTypeSupport <<interface>> (p. 950) String type support.

Typedefs

- typedef struct DDS_StringDataReader DDS_StringDataReader
 <<iinterface>> (p. 950) Instantiates DataReader < char* >.

Functions

Allows an application to communicate to RTI Data Distribution Service the existence of the char* data type.

Allows an application to unregister the char* data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

- const char * DDS_StringTypeSupport_get_type_name ()
 - $Get\ the\ default\ name\ for\ the\ char*\ type.$
- void **DDS_StringTypeSupport_print_data** (const char *a_data) <<**eXtension**>> (p. 950) Print value of data type to standard out.
- ^ DDS_StringDataWriter * DDS_StringDataWriter_narrow (DDS_DataWriter *writer)

Narrow the given DDS_DataWriter (p. 673) pointer to a DDS_-StringDataWriter (p. 31) pointer. ^ DDS_DataWriter * DDS_StringDataWriter_as_datawriter (DDS_StringDataWriter *writer)

Widen the given DDS_StringDataWriter (p. 31) pointer to a DDS_-DataWriter (p. 673) pointer.

^ DDS_ReturnCode_t DDS_StringDataWriter_write (DDS_-StringDataWriter *self, const char *instance_data, const DDS_-InstanceHandle_t *handle)

Modifies the value of a string data instance.

^ DDS_ReturnCode_t DDS_StringDataWriter_write_w_timestamp (DDS_StringDataWriter *self, const char *instance_data, const DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

Performs the same function as DDS_StringDataWriter_write (p. 35) except that it also provides the value for the source_timestamp.

^ DDS_StringDataReader * DDS_StringDataReader_narrow (DDS_DataReader *reader)

Narrow the given DDS_DataReader (p. 783) pointer to a DDS_-StringDataReader (p. 32) pointer.

^ DDS_DataReader * DDS_StringDataReader_as_datareader (DDS_StringDataReader *reader)

Widen the given DDS_StringDataReader (p. 32) pointer to a DDS_DataReader (p. 783) pointer.

^ DDS_ReturnCode_t DDS_StringDataReader_read (DDS_StringDataReader *self, struct DDS_StringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_StringDataReader_take (DDS_StringDataReader *self, struct DDS_StringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_StringDataReader_read_w_condition (DDS_StringDataReader *self, struct DDS_StringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Accesses via DDS_StringDataReader_read (p. 36) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

^ DDS_ReturnCode_t DDS_StringDataReader_take_w_condition (DDS_StringDataReader *self, struct DDS_StringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Analogous to DDS_StringDataReader_read_w_condition (p. 36) except it accesses samples via the DDS_StringDataReader_take (p. 36) operation.

^ DDS_ReturnCode_t DDS_StringDataReader_read_next_sample (DDS_StringDataReader *self, char *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS-DataReader (p. 783).

DDS_ReturnCode_t DDS_StringDataReader_take_next_sample (DDS_StringDataReader *self, char *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} -DataReader (p. 783).

` DDS_ReturnCode_t DDS_StringDataReader_return_loan (DDS_StringDataReader *self, struct DDS_StringSeq *received_data, struct DDS_SampleInfoSeq *info_seq)

Indicates to the DDS_DataReader (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the DDS_DataReader (p. 783).

4.5.1 Detailed Description

Built-in type consisting of a single character string.

4.5.2 Typedef Documentation

4.5.2.1 typedef struct DDS_StringDataWriter DDS_StringDataWriter

<<interface>> (p. 950) Instantiates DataWriter < char* >.

See also:

```
FooDataWriter (p. 1496)
DDS_DataWriter (p. 673)
String Support (p. 285)
```

4.5.2.2 typedef struct DDS_StringDataReader DDS_StringDataReader

```
<<interface>> (p. 950) Instantiates DataReader < char* >.
```

See also:

```
FooDataReader (p. 1495)
DDS_DataReader (p. 783)
String Support (p. 285)
```

4.5.3 Function Documentation

4.5.3.1 DDS_ReturnCode_t DDS_StringTypeSupport_register_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of the char* data type.

By default, The char* built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDS_-StringTypeSupport_get_type_name** (p. 34). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This function can also be used to register the same **DDS_StringTypeSupport** (p. 1401) with a **DDS_DomainParticipant** (p. 339) using different values for the type_name.

If register_type is called multiple times with the same DDS_-DomainParticipant (p. 339) and type_name, the second (and subsequent) registrations are ignored by the operation.

Parameters:

```
participant << in>> (p. 951) the DDS_DomainParticipant (p. 339) to register the data type char* with. Cannot be NULL.
```

 $type_name << in>> (p. 951)$ the type name under with the data type char* is registered with the participant; this type name is

used when creating a new **DDS_Topic** (p. 425). (See **DDS_DomainParticipant_create_topic** (p. 374).) The name may not be NULL or longer than 255 characters.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_OUT_-OF_RESOURCES (p. 121).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also:

DDS_DomainParticipant_create_topic (p. 374)

4.5.3.2 DDS_ReturnCode_t DDS_StringTypeSupport_unregister_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to unregister the char* data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

Precondition:

The char* type with type_name is registered with the participant and all DDS_Topic (p. 425) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any DDS_Topic (p. 425) is associated with the type, the operation will fail with DDS_RETCODE_ERROR (p. 121).

Postcondition:

All information about the type is removed from RTI Data Distribution Service. No further communication using this type is possible.

Parameters:

```
participant << in>> (p. 951) the DDS_DomainParticipant (p. 339) to unregister the data type char* from. Cannot be NULL.
```

type_name <<iin>>> (p. 951) the type name under with the data type char* is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-BAD_PARAMETER (p. 121) or DDS_RETCODE_ERROR (p. 121)
```

MT Safety:

SAFE.

See also:

DDS_StringTypeSupport_register_type (p. 32)

4.5.3.3 const char* DDS_StringTypeSupport_get_type_name ()

Get the default name for the char* type.

Can be used for calling **DDS_StringTypeSupport_register_type** (p. 32) or creating **DDS_Topic** (p. 425).

Returns:

default name for the char* type.

See also:

```
DDS_StringTypeSupport_register_type (p. 32)
DDS_DomainParticipant_create_topic (p. 374)
```

4.5.3.4 void DDS_StringTypeSupport_print_data (const char * a_data)

<< eXtension>> (p. 950) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters:

```
a\_data << in>> (p. 951) String to be printed.
```

$\begin{array}{ll} \textbf{4.5.3.5} & \textbf{DDS_StringDataWriter} * \textbf{DDS_StringDataWriter_narrow} \\ & (\textbf{DDS_DataWriter} * \textit{writer}) \end{array}$

Narrow the given **DDS_DataWriter** (p. 673) pointer to a **DDS_StringDataWriter** (p. 31) pointer.

See also:

FooDataWriter_narrow (p. 677)

4.5.3.6 DDS_DataWriter* DDS_StringDataWriter_as_datawriter (DDS_StringDataWriter * writer)

Widen the given DDS_StringDataWriter (p. 31) pointer to a DDS_DataWriter (p. 673) pointer.

See also:

FooDataWriter_as_datawriter (p. 678)

4.5.3.7 DDS_ReturnCode_t DDS_StringDataWriter_write (DDS_StringDataWriter * self, const char * instance_data, const DDS_InstanceHandle_t * handle)

Modifies the value of a string data instance.

See also:

FooDataWriter_write (p. 684)

4.5.3.8 DDS_ReturnCode_t DDS_StringDataWriter_write_w_timestamp (DDS_StringDataWriter * self, const char *
instance_data, const DDS_InstanceHandle_t * handle,
const struct DDS_Time_t * source_timestamp)

Performs the same function as **DDS_StringDataWriter_write** (p. 35) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_write_w_timestamp (p. 686)

 $\begin{array}{ll} \textbf{4.5.3.9} & \textbf{DDS_StringDataReader*} \ \textbf{DDS_StringDataReader_narrow} \\ & (\textbf{DDS_DataReader*} \ \textit{reader}) \end{array}$

Narrow the given **DDS_DataReader** (p. 783) pointer to a **DDS_StringDataReader** (p. 32) pointer.

See also:

FooDataReader_narrow (p. 787)

4.5.3.10 DDS_DataReader* DDS_StringDataReader_as_datareader (DDS_StringDataReader * reader)

Widen the given DDS_StringDataReader (p. 32) pointer to a DDS_DataReader (p. 783) pointer.

See also:

FooDataReader_as_datareader (p. 788)

4.5.3.11 DDS_ReturnCode_t DDS_StringDataReader_read (DDS_StringDataReader * self, struct DDS_StringSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read (p. 788)

4.5.3.12 DDS_ReturnCode_t DDS_StringDataReader_take (DDS_StringDataReader * self, struct DDS_StringSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take (p. 789)

4.5.3.13 DDS_ReturnCode_t DDS_StringDataReader_read_w_condition (DDS_StringDataReader * self,
struct DDS_StringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
DDS_ReadCondition * condition)

Accesses via DDS_StringDataReader_read (p. 36) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_read_w_condition (p. 796)

4.5.3.14 DDS_ReturnCode_t DDS_StringDataReader_take_w_condition (DDS_StringDataReader * self,
struct DDS_StringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
DDS_ReadCondition * condition)

Analogous to DDS_StringDataReader_read_w_condition (p. 36) except it accesses samples via the DDS_StringDataReader_take (p. 36) operation.

See also:

FooDataReader_take_w_condition (p. 797)

4.5.3.15 DDS_ReturnCode_t DDS_StringDataReader_read_next_sample (DDS_StringDataReader * self, char *
received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the DDS_-DataReader (p. 783).

See also:

FooDataReader_read_next_sample (p. 798)

4.5.3.16 DDS_ReturnCode_t DDS_StringDataReader_take_next_sample (DDS_StringDataReader * self, char *
received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the DDS_- DataReader (p. 783).

See also:

FooDataReader_take_next_sample (p. 799)

 $\begin{array}{lll} \textbf{4.5.3.17} & \textbf{DDS_ReturnCode_t DDS_StringDataReader_return_loan} \\ & (\textbf{DDS_StringDataReader} * \textit{self}, \; \text{struct DDS_StringSeq} * \\ & \textit{received_data}, \; \text{struct DDS_SampleInfoSeq} * \textit{info_seq}) \end{array}$

Indicates to the **DDS_DataReader** (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 783).

See also:

 $FooDataReader_return_loan (p. 811)$

4.6 KeyedString Built-in Type

Built-in type consisting of a string payload and a second string that is the key.

Data Structures

^ struct DDS_KeyedString

Keyed string built-in type.

 $\hat{\ }$ struct $\mathbf{DDS_KeyedStringSeq}$

```
Instantiates FooSeq (p. 1497) < DDS\_KeyedString (p. 1239) > .
```

^ struct DDS_KeyedStringTypeSupport

```
<<i nterface>> (p. 950) Keyed string type support.
```

Typedefs

```
<<interface>> (p. 950) Instantiates DataWriter < DDS_KeyedString (p. 1239) >.
```

^ typedef struct DDS_KeyedStringDataReader DDS_-KeyedStringDataReader

```
<<interface>> (p. 950) Instantiates DataReader < DDS_KeyedString (p. 1239) >.
```

Functions

^ DDS_KeyedString * DDS_KeyedString_new ()

Constructor.

^ DDS_KeyedString * DDS_KeyedString_new_w_size (int key_size, int size)

Constructor that specifies the allocated sizes.

^ void DDS_KeyedString_delete (DDS_KeyedString *self)

Destructor.

^ DDS_ReturnCode_t DDS_KeyedSringTypeSupport_register_type (DDS_DomainParticipant *participant, const char *type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of the DDS_KeyedString (p. 1239) data type.

^ DDS_ReturnCode_t DDS_KeyedSringTypeSupport_unregister_type (DDS_DomainParticipant *participant, const char *type_name)

Allows an application to unregister the **DDS_KeyedString** (p. 1239) data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

- ^ const char * DDS_KeyedSringTypeSupport_get_type_name ()
 Get the default name for the DDS_KeyedString (p. 1239) type.
- ^ void DDS_KeyedStringTypeSupport_print_data (const DDS_-KeyedString *a_data)

<<eXtension>> (p. 950) Print value of data type to standard out.

^ DDS_KeyedStringDataWriter * DDS_KeyedStringDataWriter_narrow (DDS_DataWriter *writer)

Narrow the given DDS_DataWriter (p. 673) pointer to a DDS_-KeyedStringDataWriter (p. 47) pointer.

 $\begin{tabular}{ll} \bf DDS_DataWriter * DDS_KeyedStringDataWriter * writer) \\ \bf (DDS_KeyedStringDataWriter * writer) \\ \end{tabular}$

Widen the given $DDS_KeyedStringDataWriter$ (p. 47) pointer to a $DDS_DataWriter$ (p. 673) pointer.

^ DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance (DDS_KeyedStringDataWriter *self, const DDS_KeyedString *instance_data)

Informs RTI Data Distribution Service that the application will be modifying a particular instance.

^ DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key (DDS_KeyedStringDataWriter *self, const char *key)

<<e**Xtension**>> (p. 950) Informs RTI Data Distribution Service that the application will be modifying a particular instance.

^ DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_timestamp (DDS_KeyedStringDataWriter *self, const

DDS_KeyedString *instance_data, const struct **DDS_Time_t** *source_timestamp)

Performs the same functions as $DDS_KeyedStringDataWriter_register_instance$ (p. 51) except that the application provides the value for the source_timestamp.

^ DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_-instance_w_key_w_timestamp (DDS_KeyedStringDataWriter *self, const char *key, const struct DDS_Time_t *source_timestamp)

<<extension>> (p. 950) Performs the same functions as DDS_-KeyedStringDataWriter_register_instance_w_key (p. 51) except that the application provides the value for the source_timestamp.

DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance (DDS_KeyedStringDataWriter *self, const DDS_KeyedString *instance_data, const DDS_InstanceHandle_t
*handle)

Reverses the action of DDS_KeyedStringDataWriter_register_instance (p. 51).

DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key (DDS_KeyedStringDataWriter *self, const char
*key, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p.950) Reverses the action of DDS_-KeyedStringDataWriter_register_instance_w_key (p. 51).

DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_timestamp (DDS_KeyedStringDataWriter *self, const
DDS_KeyedString *instance_data, const DDS_InstanceHandle_t
*handle, const struct DDS_Time_t *source_timestamp)

Performs the same function as $DDS_KeyedStringDataWriter_unregister_instance$ (p. 52) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_-instance_w_key_w_timestamp (DDS_KeyedStringDataWriter *self, const char *key, const DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

<<extension>> (p.950) Performs the same function as DDS_-KeyedStringDataWriter_unregister_instance_w_key (p.53) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_write (DDS_KeyedStringDataWriter *self, const DDS_KeyedString *instance_data, const DDS_InstanceHandle_t *handle)

Modifies the value of a DDS_KeyedString (p. 1239) data instance.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key (DDS_KeyedStringDataWriter *self, const char *key, const char *str, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Modifies the value of a DDS_KeyedString (p. 1239) data instance.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_timestamp (DDS_KeyedStringDataWriter *self, const DDS_KeyedString *instance_data, const DDS_InstanceHandle_t *handle,
const struct DDS_Time_t *source_timestamp)

Performs the same function as DDS_KeyedStringDataWriter_write (p. 54) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_timestamp (DDS_KeyedStringDataWriter *self, const char *key, const char *str, const DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

<<eXtension>> (p. 950) Performs the same function as DDS_-KeyedStringDataWriter_write_string_w_key (p. 54) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose (DDS_KeyedStringDataWriter *self, const DDS_KeyedString *instance_data, const DDS_InstanceHandle_t *instance_handle)

Requests the middleware to delete the data.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_-key (DDS_KeyedStringDataWriter *self, const char *key, const DDS_InstanceHandle_t *instance_handle)

<<eXtension>> (p. 950) Requests the middleware to delete the data.

DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_timestamp (DDS_KeyedStringDataWriter *self, const DDS_KeyedString *instance_data, const DDS_InstanceHandle_t *instance_handle, const struct DDS_Time_t *source_timestamp)

Performs the same functions as DDS_KeyedStringDataWriter_dispose (p. 55) except that the application provides the value for the source_timestamp that is made available to DDS_DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key_w_timestamp (DDS_KeyedStringDataWriter *self, const char

*key, const **DDS_InstanceHandle_t** *instance_handle, const struct **DDS_Time_t** *source_timestamp)

<<extension>> (p. 950) Performs the same functions as DDS_-KeyedStringDataWriter_dispose_w_key (p. 55) except that the application provides the value for the source_timestamp that is made available to DDS_DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_-value (DDS_KeyedStringDataWriter *self, DDS_KeyedString *key_holder, const DDS_InstanceHandle_t *handle)

Retrieve the instance key that corresponds to an instance handle.

^ DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_-value_w_key (DDS_KeyedStringDataWriter *self, char *key, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Retrieve the instance key that corresponds to an instance handle.

^ DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_-instance (DDS_KeyedStringDataWriter *self, const DDS_-KeyedString *key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

^ DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_-instance_w_key (DDS_KeyedStringDataWriter *self, const char *key)

<<eXtension>> (p. 950) Retrieve the instance handle that corresponds to an instance key.

^ DDS_KeyedStringDataReader * DDS_KeyedStringDataReader_narrow (DDS_DataReader *reader)

Narrow the given DDS_DataReader (p. 783) pointer to a DDS_-KeyedStringDataReader (p. 47) pointer.

^ DDS_DataReader * DDS_KeyedStringDataReader_as_datareader (DDS_KeyedStringDataReader *reader)

Widen the given DDS_KeyedStringDataReader (p. 47) pointer to a DDS_DataReader (p. 783) pointer.

DDS_ReturnCode_t DDS_KeyedStringDataReader_read (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedStringDataReader_take (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_read_w_-condition (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Accesses via DDS_KeyedStringDataReader_read (p. 58) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_take_w_-condition (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Analogous to DDS_KeyedStringDataReader_read_w_condition (p. 58) except it accesses samples via the DDS_KeyedStringDataReader_take (p. 58) operation.

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_sample (DDS_KeyedStringDataReader *self, DDS_KeyedString *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_-DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_sample (DDS_KeyedStringDataReader *self, DDS_KeyedString *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_- -DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedStringDataReader_read_instance (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedStringDataReader_take_-instance (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_-instance (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_-instance (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_-instance_w_condition (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_ReadCondition *condition)

Accesses via DDS_KeyedStringDataReader_read_next_instance (p. 60) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_-instance_w_condition (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_ReadCondition *condition)

Accesses via DDS_KeyedStringDataReader_take_next_instance (p. 61) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_return_loan (DDS_KeyedStringDataReader *self, struct DDS_KeyedStringSeq *received_data, struct DDS_SampleInfoSeq *info_seq)

Indicates to the DDS_DataReader (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_-value (DDS_KeyedStringDataReader *self, DDS_KeyedString *key_holder, const DDS_InstanceHandle_t *handle)

Retrieve the instance key that corresponds to an instance handle.

^ DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_-value_w_key (DDS_KeyedStringDataReader *self, char *key, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Retrieve the instance key that corresponds to an instance handle.

^ DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance (DDS_KeyedStringDataReader **self, const DDS_KeyedString **key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

^ DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_-instance_w_key (DDS_KeyedStringDataReader *self, const char *key)

<<eXtension>> (p. 950) Retrieve the instance handle that corresponds to an instance key.

Variables

^ char * DDS_KeyedString::key

Instance key associated with the specified value.

^ char * DDS_KeyedString::value

String value.

4.6.1 Detailed Description

Built-in type consisting of a string payload and a second string that is the key.

4.6.2 Typedef Documentation

4.6.2.1 typedef struct DDS_KeyedStringDataWriter DDS_KeyedStringDataWriter

```
<<iinterface>> (p. 950) Instantiates DataWriter < DDS_KeyedString (p. 1239) >.
```

See also:

```
FooDataWriter (p. 1496)
DDS_DataWriter (p. 673)
```

4.6.2.2 typedef struct DDS_KeyedStringDataReader DDS_KeyedStringDataReader

```
<<iinterface>> (p. 950) Instantiates DataReader < DDS_KeyedString (p. 1239) >.
```

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string in a destination data sample is NULL, the middleware will allocate a new string for you of sufficient length to hold the received string. The new string will be allocated with **DDS_String_alloc** (p. 287); the sample's destructor will delete it.

A non- NULL string is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

See also:

```
FooDataReader (p. 1495)
DDS_DataReader (p. 783)
```

4.6.3 Function Documentation

4.6.3.1 DDS_KeyedString* DDS_KeyedString_new ()

Constructor.

The default constructor initializes the newly created object with NULL key and value.

Returns:

A new **DDS_KeyedString** (p. 1239) or NULL if failure.

4.6.3.2 DDS_KeyedString* DDS_KeyedString_new_w_size (int key_size, int size)

Constructor that specifies the allocated sizes.

The allocated strings are initialized to empty ("").

Parameters:

key_size <<in>> (p. 951) Size of the allocated key string (with NULL-terminated character). Cannot be smaller than zero.

size << in>> (p. 951) Size of the allocated value string (with NULL-terminated character). Cannot be smaller than zero.

Returns:

A new **DDS_KeyedString** (p. 1239) or NULL if failure.

4.6.3.3 void DDS_KeyedString_delete (DDS_KeyedString * self)

Destructor.

4.6.3.4 DDS_ReturnCode_t DDS_KeyedSringTypeSupport_register_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of the **DDS_KeyedString** (p. 1239) data type.

By default, The **DDS_KeyedString** (p. 1239) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by DDS_KeyedStringTypeSupport_get_type_name. Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This function can also be used to register the same DDS_KeyedStringTypeSupport (p. 1241) with a DDS_DomainParticipant (p. 339) using different values for the type_name.

If register_type is called multiple times with the same DDS_-DomainParticipant (p. 339) and type_name, the second (and subsequent) registrations are ignored by the operation.

Parameters:

 $participant \ll (in) > (p. 951)$ the DDS_DomainParticipant (p. 339)

to register the data type $\mathbf{DDS_KeyedString}$ (p. 1239) with. Cannot be NULL.

type_name <<in>> (p. 951) the type name under with the data type DDS_KeyedString (p. 1239) is registered with the participant; this type name is used when creating a new DDS_Topic (p. 425). (See DDS_DomainParticipant_create_topic (p. 374).) The name may not be NULL or longer than 255 characters.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_OUT_-OF_RESOURCES (p. 121).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also:

DDS_DomainParticipant_create_topic (p. 374)

4.6.3.5 DDS_ReturnCode_t DDS_KeyedSringTypeSupport_unregister_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to unregister the **DDS_KeyedString** (p. 1239) data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

Precondition:

The DDS_KeyedString (p. 1239) type with type_name is registered with the participant and all DDS_Topic (p. 425) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any DDS_Topic (p. 425) is associated with the type, the operation will fail with DDS_RETCODE_ERROR (p. 121).

Postcondition:

All information about the type is removed from RTI Data Distribution Service. No further communication using this type is possible.

Parameters:

participant <<in>> (p. 951) the DDS_DomainParticipant (p. 339) to unregister the data type DDS_KeyedString (p. 1239) from. Cannot be NULL.

type_name <<in>>> (p. 951) the type name under with the data type DDS_KeyedString (p. 1239) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_BAD_PARAMETER (p. 121) or DDS_RETCODE_ERROR (p. 121)

MT Safety:

SAFE.

See also:

DDS_KeyedStringTypeSupport_register_type

4.6.3.6 const char* DDS_KeyedSringTypeSupport_get_type_name ()

Get the default name for the DDS_KeyedString (p. 1239) type.

Can be used for calling DDS_KeyedStringTypeSupport_register_type or creating DDS_Topic (p. 425).

Returns:

default name for the DDS_KeyedString (p. 1239) type.

See also:

```
DDS_KeyedStringTypeSupport_register_type
DDS_DomainParticipant_create_topic (p. 374)
```

4.6.3.7 void DDS_KeyedStringTypeSupport_print_data (const DDS_KeyedString * a_data)

<< eXtension>> (p. 950) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters:

```
a_{-}data << in>> (p. 951) DDS_KeyedString (p. 1239) to be printed.
```

4.6.3.8 DDS_KeyedStringDataWriter* DDS_-KeyedStringDataWriter_narrow (DDS_DataWriter * writer)

Narrow the given **DDS_DataWriter** (p. 673) pointer to a **DDS_KeyedStringDataWriter** (p. 47) pointer.

See also:

FooDataWriter_narrow (p. 677)

4.6.3.9 DDS_DataWriter* DDS_KeyedStringDataWriter_as_datawriter (DDS_KeyedStringDataWriter * writer)

Widen the given DDS_KeyedStringDataWriter (p. 47) pointer to a DDS_-DataWriter (p. 673) pointer.

See also:

FooDataWriter_as_datawriter (p. 678)

4.6.3.10 DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance (DDS_KeyedStringDataWriter * self,
const DDS_KeyedString * instance_data)

Informs RTI Data Distribution Service that the application will be modifying a particular instance.

See also:

FooDataWriter_register_instance (p. 678)

4.6.3.11 DDS_InstanceHandle_t DDS_KeyedStringDataWriter_- register_instance_w_key (DDS_KeyedStringDataWriter * self, const char * key)

<< eXtension>> (p. 950) Informs RTI Data Distribution Service that the application will be modifying a particular instance.

See also:

FooDataWriter_register_instance (p. 678)

4.6.3.12 DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_timestamp (DDS_KeyedStringDataWriter * self, const DDS_KeyedString
* instance_data, const struct DDS_Time_t *
source_timestamp)

Performs the same functions as DDS_KeyedStringDataWriter_register_instance (p. 51) except that the application provides the value for the source_timestamp.

See also:

FooDataWriter_register_instance_w_timestamp (p. 680)

4.6.3.13 DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key_w_timestamp
(DDS_KeyedStringDataWriter * self, const char * key,
const struct DDS_Time_t * source_timestamp)

<<*eXtension*>> (p. 950) Performs the same functions as **DDS_KeyedStringDataWriter_register_instance_w_key** (p. 51) except that the application provides the value for the source_timestamp.

See also:

FooDataWriter_register_instance_w_timestamp (p. 680)

4.6.3.14 DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance (DDS_KeyedStringDataWriter *
self, const DDS_KeyedString * instance_data, const
DDS_InstanceHandle_t * handle)

Reverses the action of DDS_KeyedStringDataWriter_register_instance (p. 51).

See also:

FooDataWriter_unregister_instance (p. 681)

4.6.3.15 DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key (DDS_KeyedStringDataWriter *
self, const char * key, const DDS_InstanceHandle_t *
handle)

<<eXtension>> (p. 950) Reverses the action of DDS_-KeyedStringDataWriter_register_instance_w_key (p. 51).

See also:

FooDataWriter_unregister_instance (p. 681)

4.6.3.16 DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_timestamp
(DDS_KeyedStringDataWriter * self, const
DDS_KeyedString * instance_data, const
DDS_InstanceHandle_t * handle, const struct DDS_Time_t
* source_timestamp)

Performs the same function as DDS_KeyedStringDataWriter_unregister_instance (p. 52) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_unregister_instance_w_timestamp (p. 683)

4.6.3.17 DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key_w_timestamp
(DDS_KeyedStringDataWriter * self, const char * key,
const DDS_InstanceHandle_t * handle, const struct
DDS_Time_t * source_timestamp)

<<extension>> (p. 950) Performs the same function as DDS_-KeyedStringDataWriter_unregister_instance_w_key (p. 53) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_unregister_instance_w_timestamp (p. 683)

4.6.3.18 DDS_ReturnCode_t DDS_KeyedStringDataWriter_write (DDS_KeyedStringDataWriter * self, const DDS_KeyedString * instance_data, const DDS_InstanceHandle_t * handle)

Modifies the value of a **DDS_KeyedString** (p. 1239) data instance.

See also:

FooDataWriter_write (p. 684)

4.6.3.19 DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key (DDS_KeyedStringDataWriter * self, const char * key, const char * str, const DDS_InstanceHandle_t * handle)

<<eXtension>> (p. 950) Modifies the value of a DDS_KeyedString (p. 1239) data instance.

See also:

FooDataWriter_write (p. 684)

4.6.3.20 DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_timestamp (DDS_KeyedStringDataWriter *
self, const DDS_KeyedString * instance_data, const
DDS_InstanceHandle_t * handle, const struct DDS_Time_t
* source_timestamp)

Performs the same function as **DDS_KeyedStringDataWriter_write** (p. 54) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_write_w_timestamp (p. 686)

4.6.3.21 DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_timestamp (DDS_KeyedStringDataWriter
* self, const char * key, const char * str, const
DDS_InstanceHandle_t * handle, const struct DDS_Time_t
* source_timestamp)

<<e Xtension>> (p. 950) Performs the same function as DDS_-KeyedStringDataWriter_write_string_w_key (p. 54) except that it also provides the value for the source_timestamp. See also:

FooDataWriter_write_w_timestamp (p. 686)

4.6.3.22 DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose (DDS_KeyedStringDataWriter * self, const DDS_KeyedString * instance_data, const DDS_InstanceHandle_t * instance_handle)

Requests the middleware to delete the data.

See also:

FooDataWriter_dispose (p. 688)

4.6.3.23 DDS_ReturnCode_t DDS_KeyedStringDataWriter_-dispose_w_key (DDS_KeyedStringDataWriter * self, const char * key, const DDS_InstanceHandle_t * instance_handle)

<< eXtension>> (p. 950) Requests the middleware to delete the data.

See also:

FooDataWriter_dispose (p. 688)

4.6.3.24 DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_timestamp (DDS_KeyedStringDataWriter *
self, const DDS_KeyedString * instance_data, const
DDS_InstanceHandle_t * instance_handle, const struct
DDS_Time_t * source_timestamp)

Performs the same functions as DDS_KeyedStringDataWriter_dispose (p. 55) except that the application provides the value for the source_timestamp that is made available to DDS_DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

See also:

FooDataWriter_dispose_w_timestamp (p. 690)

4.6.3.25 DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key_w_timestamp (DDS_KeyedStringDataWriter * self, const char * key, const
DDS_InstanceHandle_t * instance_handle, const struct
DDS_Time_t * source_timestamp)

<<extension>> (p. 950) Performs the same functions as DDS_-KeyedStringDataWriter_dispose_w_key (p. 55) except that the application provides the value for the source_timestamp that is made available to DDS_-DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

See also:

FooDataWriter_dispose_w_timestamp (p. 690)

4.6.3.26 DDS_ReturnCode_t DDS_KeyedStringDataWriter_-get_key_value (DDS_KeyedStringDataWriter * self, DDS_KeyedString * key_holder, const DDS_InstanceHandle_t * handle)

Retrieve the instance key that corresponds to an instance handle.

See also:

FooDataWriter_get_key_value (p. 691)

 $\begin{array}{lll} 4.6.3.27 & DDS_ReturnCode_t \ DDS_KeyedStringDataWriter_get_key_value_w_key \ (DDS_KeyedStringDataWriter * \textit{self}, \\ & char * \textit{key}, \ const \ DDS_InstanceHandle_t * \textit{handle}) \end{array}$

 $<<\!eXtension>>$ (p. 950) Retrieve the instance key that corresponds to an instance handle.

See also:

 $FooDataWriter_get_key_value (p. 691)$

4.6.3.28 DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance (DDS_KeyedStringDataWriter * self, const DDS_KeyedString * key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

See also:

FooDataWriter_lookup_instance (p. 692)

4.6.3.29 DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance_w_key (DDS_KeyedStringDataWriter * self, const char * key)

<<eXtension>> (p. 950) Retrieve the instance handle that corresponds to an instance key.

See also:

FooDataWriter_lookup_instance (p. 692)

Narrow the given **DDS_DataReader** (p. 783) pointer to a **DDS_KeyedStringDataReader** (p. 47) pointer.

See also:

FooDataReader_narrow (p. 787)

4.6.3.31 DDS_DataReader* DDS_KeyedStringDataReader_as_datareader (DDS_KeyedStringDataReader * reader)

Widen the given DDS_KeyedStringDataReader (p. 47) pointer to a DDS_-DataReader (p. 783) pointer.

See also:

FooDataReader_as_datareader (p. 788)

4.6.3.32 DDS_ReturnCode_t DDS_KeyedStringDataReader_read (DDS_KeyedStringDataReader * self, struct DDS_KeyedStringSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read (p. 788)

4.6.3.33 DDS_ReturnCode_t DDS_KeyedStringDataReader_take (DDS_KeyedStringDataReader * self, struct DDS_KeyedStringSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take (p. 789)

4.6.3.34 DDS_ReturnCode_t DDS_KeyedStringDataReader_read_w_condition (DDS_KeyedStringDataReader * self,
struct DDS_KeyedStringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
DDS_ReadCondition * condition)

Accesses via DDS_KeyedStringDataReader_read (p. 58) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_read_w_condition (p. 796)

4.6.3.35 DDS_ReturnCode_t DDS_KeyedStringDataReader_take_w_condition (DDS_KeyedStringDataReader * self,
struct DDS_KeyedStringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
DDS_ReadCondition * condition)

Analogous to DDS_KeyedStringDataReader_read_w_condition (p. 58) except it accesses samples via the DDS_KeyedStringDataReader_take (p. 58) operation.

See also:

FooDataReader_take_w_condition (p. 797)

 $\begin{array}{lll} \textbf{4.6.3.36} & \textbf{DDS_ReturnCode_t DDS_KeyedStringDataReader_-} \\ & \textbf{read_next_sample (DDS_KeyedStringDataReader} * \textit{self}, \\ & \textbf{DDS_KeyedString} * \textit{received_data}, \text{ struct DDS_SampleInfo} \\ & * \textit{sample_info}) \end{array}$

Copies the next not-previously-accessed data value from the \mathbf{DDS}_{-} -**DataReader** (p. 783).

See also:

FooDataReader_read_next_sample (p. 798)

4.6.3.37 DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_sample (DDS_KeyedStringDataReader * self,
DDS_KeyedString * received_data, struct DDS_SampleInfo
* sample_info)

Copies the next not-previously-accessed data value from the DDS_-DataReader (p. 783).

See also:

FooDataReader_take_next_sample (p. 799)

4.6.3.38 DDS_ReturnCode_t DDS_KeyedStringDataReader_read_instance (DDS_KeyedStringDataReader * self,
struct DDS_KeyedStringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
const DDS_InstanceHandle_t * a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask
view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read_instance (p. 800)

4.6.3.39 DDS_ReturnCode_t DDS_KeyedStringDataReader_take_instance (DDS_KeyedStringDataReader * self,
struct DDS_KeyedStringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
const DDS_InstanceHandle_t * a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask
view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take_instance (p. 802)

4.6.3.40 DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance (DDS_KeyedStringDataReader * self, struct DDS_KeyedStringSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read_next_instance (p. 804)

4.6.3.41 DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance (DDS_KeyedStringDataReader *
self, struct DDS_KeyedStringSeq * received_data,
struct DDS_SampleInfoSeq * info_seq, DDS_Long
max_samples, const DDS_InstanceHandle_t
* previous_handle, DDS_SampleStateMask
sample_states, DDS_ViewStateMask view_states,
DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take_next_instance (p. 806)

4.6.3.42 DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance_w_condition (DDS_KeyedStringDataReader
* self, struct DDS_KeyedStringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
const DDS_InstanceHandle_t * previous_handle,
DDS_ReadCondition * condition)

Accesses via DDS_KeyedStringDataReader_read_next_instance (p. 60) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_read_next_instance_w_condition (p. 808)

4.6.3.43 DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance_w_condition (DDS_KeyedStringDataReader
* self, struct DDS_KeyedStringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
const DDS_InstanceHandle_t * previous_handle,
DDS_ReadCondition * condition)

Accesses via DDS_KeyedStringDataReader_take_next_instance (p. 61) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_take_next_instance_w_condition (p. 809)

4.6.3.44 DDS_ReturnCode_t DDS_KeyedStringDataReader_return_loan (DDS_KeyedStringDataReader * self,
struct DDS_KeyedStringSeq * received_data, struct
DDS_SampleInfoSeq * info_seq)

Indicates to the **DDS_DataReader** (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 783).

See also:

FooDataReader_return_loan (p. 811)

4.6.3.45 DDS_ReturnCode_t DDS_KeyedStringDataReader_-get_key_value (DDS_KeyedStringDataReader * self, DDS_KeyedString * key_holder, const DDS_InstanceHandle_t * handle)

Retrieve the instance key that corresponds to an instance handle.

See also:

FooDataReader_get_key_value (p. 812)

4.6.3.46 DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value_w_key (DDS_KeyedStringDataReader * self, char * key, const DDS_InstanceHandle_t * handle)

 $<<\!eXtension>>$ (p. 950) Retrieve the instance key that corresponds to an instance handle.

See also:

FooDataReader_get_key_value (p. 812)

4.6.3.47 DDS_InstanceHandle_t DDS_KeyedStringDataReader_-lookup_instance (DDS_KeyedStringDataReader * self, const DDS_KeyedString * key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

See also:

FooDataReader_lookup_instance (p. 813)

4.6.3.48 DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance_w_key (DDS_KeyedStringDataReader * self, const char * key)

<<eXtension>> (p. 950) Retrieve the instance handle that corresponds to an instance key.

See also:

FooDataReader_lookup_instance (p. 813)

4.6.4 Variable Documentation

4.6.4.1 char* DDS_KeyedString::key [inherited]

Instance key associated with the specified value.

4.6.4.2 char* DDS_KeyedString::value [inherited]

String value.

4.7 Octets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes.

Data Structures

 $\hat{\ }$ struct **DDS_Octets**

Built-in type consisting of a variable-length array of opaque bytes.

* struct DDS_OctetsSeq

```
Instantiates FooSeq (p. 1497) < DDS_{-}Octets (p. 1272) > .
```

^ struct DDS_OctetsTypeSupport

```
<<interface>> (p. 950) DDS_Octets (p. 1272) type support.
```

Typedefs

- ^ typedef struct DDS_OctetsDataWriter DDS_OctetsDataWriter
 <<iinterface>> (p. 950) Instantiates DataWriter < DDS_Octets
 - <<interface>> (p. 950) Instantiates DataWriter < DDS_Octets (p. 1272) >.
- ^ typedef struct DDS_OctetsDataReader DDS_OctetsDataReader

```
<<interface>> (p. 950) Instantiates DataReader < DDS_Octets (p. 1272) >.
```

Functions

- ^ DDS_Octets * DDS_Octets_new ()
 - Constructor.
- ^ DDS_Octets * DDS_Octets_new_w_size (int size)

Constructor that specifies the size of the allocated octets array.

^ void DDS_Octets_delete (DDS_Octets *self)

Destructor.

DDS_ReturnCode_t DDS_OctetsTypeSupport_register_type (DDS_DomainParticipant *participant, const char *type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of the DDS_Octets (p. 1272) data type.

DDS_ReturnCode_t DDS_OctetsTypeSupport_unregister_type
(DDS_DomainParticipant *participant, const char *type_name)

Allows an application to unregister the DDS_Octets (p. 1272) data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

 $\hat{}$ const char * DDS_OctetsTypeSupport_get_type_name ()

Get the default name for the DDS_Octets (p. 1272) type.

^ void DDS_OctetsTypeSupport_print_data (const DDS_Octets *a_data)

<<eXtension>> (p. 950) Print value of data type to standard out.

^ DDS_OctetsDataWriter * DDS_OctetsDataWriter_narrow (DDS_DataWriter *writer)

Narrow the given DDS_DataWriter (p. 673) pointer to a DDS_-OctetsDataWriter (p. 68) pointer.

^ DDS_DataWriter * DDS_OctetsDataWriter_as_datawriter (DDS_OctetsDataWriter *writer)

Widen the given DDS_OctetsDataWriter (p. 68) pointer to a DDS_DataWriter (p. 673) pointer.

DDS_ReturnCode_t DDS_OctetsDataWriter_write (DDS_OctetsDataWriter *self, const DDS_Octets *instance_data, const DDS_InstanceHandle_t *handle)

Modifies the value of a DDS_Octets (p. 1272) data instance.

DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets (DDS_OctetsDataWriter *self, const unsigned char *octets, int length, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Modifies the value of a DDS_Octets (p. 1272) data instance.

<<eXtension>> (p. 950) Modifies the value of a DDS_Octets (p. 1272) data instance.

DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_timestamp (DDS_OctetsDataWriter *self, const DDS_Octets *instance_data, const DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

Performs the same function as DDS_OctetsDataWriter_write (p. 72) except that it also provides the value for the source_timestamp.

<<extension>> (p. 950) Performs the same function as DDS_-OctetsDataWriter_write_octets (p. 72) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_timestamp (DDS_OctetsDataWriter *self, const struct DDS_OctetSeq *octets, const DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

<<extension>> (p. 950) Performs the same function as DDS_-OctetsDataWriter_write_octets_seq (p. 73) except that it also provides the value for the source_timestamp.

^ DDS_OctetsDataReader * DDS_OctetsDataReader_narrow (DDS_DataReader *reader)

Narrow the given DDS_DataReader (p. 783) pointer to a DDS_OctetsDataReader (p. 68) pointer.

 $\begin{array}{lll} {\bf \hat{DDS_DataReader}} & {\bf *DDS_OctetsDataReader_as_datareader} \\ & ({\bf DDS_OctetsDataReader} * {\bf *reader}) \end{array}$

Widen the given DDS_OctetsDataReader (p. 68) pointer to a DDS_DataReader (p. 783) pointer.

^ DDS_ReturnCode_t DDS_OctetsDataReader_read (DDS_OctetsDataReader *self, struct DDS_OctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_OctetsDataReader_take (DDS_OctetsDataReader *self, struct DDS_OctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_OctetsDataReader_read_w_condition (DDS_OctetsDataReader *self, struct DDS_OctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Accesses via DDS_OctetsDataReader_read (p. 75) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

DDS_ReturnCode_t DDS_OctetsDataReader_take_w_condition (DDS_OctetsDataReader *self, struct DDS_OctetsSeq *received_-data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Analogous to DDS_OctetsDataReader_read_w_condition (p. 76) except it accesses samples via the DDS_OctetsDataReader_take (p. 76) operation.

^ DDS_ReturnCode_t DDS_OctetsDataReader_read_next_sample (DDS_OctetsDataReader *self, DDS_Octets *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} -DataReader (p. 783).

^ DDS_ReturnCode_t DDS_OctetsDataReader_take_next_sample (DDS_OctetsDataReader *self, DDS_Octets *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} -DataReader (p. 783).

Indicates to the $DDS_DataReader$ (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the $DDS_DataReader$ (p. 783).

Variables

^ int DDS_Octets::length

Number of octets to serialize.

^ unsigned char * DDS_Octets::value

DDS_Octets (p. 1272) array value.

4.7.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

4.7.2 Typedef Documentation

4.7.2.1 typedef struct DDS_OctetsDataWriter DDS_OctetsDataWriter

```
<<iinterface>> (p. 950) Instantiates DataWriter < DDS_Octets (p. 1272) >.
```

See also:

```
FooDataWriter (p. 1496)
DDS_DataWriter (p. 673)
```

4.7.2.2 typedef struct DDS_OctetsDataReader DDS_OctetsDataReader

```
<<\!\!interface>> (p. 950) Instantiates DataReader < DDS_Octets (p. 1272) >.
```

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and the byte array in a destination data sample is NULL, the middleware will allocate a new array for you of sufficient length to hold the received data. The new array will be allocated with **DDS_OctetBuffer_alloc** (p. 268); the sample's destructor will delete it.

A non- NULL array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

See also:

```
FooDataReader (p. 1495)
DDS_DataReader (p. 783)
```

4.7.3 Function Documentation

4.7.3.1 DDS_Octets* DDS_Octets_new ()

Constructor.

The default constructor initializes the newly created object with NULL value, and zero length.

Returns:

A new **DDS_Octets** (p. 1272) or NULL if failure.

4.7.3.2 DDS_Octets* DDS_Octets_new_w_size (int size)

Constructor that specifies the size of the allocated octets array.

After this function is called, length is set to zero.

Parameters:

size <<iin>> (p. 951) Size of the allocated octets array. Cannot be smaller than zero.

Returns:

A new **DDS_Octets** (p. 1272) or NULL if failure.

4.7.3.3 void DDS_Octets_delete (DDS_Octets * self)

Destructor.

4.7.3.4 DDS_ReturnCode_t DDS_OctetsTypeSupport_register_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of the **DDS_Octets** (p. 1272) data type.

By default, The **DDS_Octets** (p. 1272) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDS_OctetsTypeSupport_get_type_name** (p. 71). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This function can also be used to register the same **DDS_OctetsTypeSupport** (p. 1275) with a **DDS_DomainParticipant** (p. 339) using different values for the type_name.

If register_type is called multiple times with the same DDS_-DomainParticipant (p. 339) and type_name, the second (and subsequent) registrations are ignored by the operation.

Parameters:

participant <<in>> (p. 951) the DDS_DomainParticipant (p. 339) to register the data type DDS_Octets (p. 1272) with. Cannot be NULL.

type_name <<in>> (p. 951) the type name under with the data type DDS_Octets (p. 1272) is registered with the participant; this type name is used when creating a new DDS_Topic (p. 425). (See DDS_DomainParticipant_create_topic (p. 374).) The name may not be NULL or longer than 255 characters.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_OUT_-OF_RESOURCES (p. 121).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also:

DDS_DomainParticipant_create_topic (p. 374)

4.7.3.5 DDS_ReturnCode_t DDS_OctetsTypeSupport_unregister_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to unregister the **DDS_Octets** (p. 1272) data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

Precondition:

The DDS_Octets (p. 1272) type with type_name is registered with the participant and all DDS_Topic (p. 425) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any DDS_Topic (p. 425) is associated with the type, the operation will fail with DDS_RETCODE_ERROR (p. 121).

Postcondition:

All information about the type is removed from RTI Data Distribution Service. No further communication using this type is possible.

Parameters:

```
participant << in>> (p. 951) the DDS_DomainParticipant (p. 339) to unregister the data type DDS_Octets (p. 1272) from. Cannot be NULL.
```

type_name <<in>>> (p. 951) the type name under with the data type DDS_Octets (p. 1272) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_BAD_PARAMETER (p. 121) or DDS_RETCODE_ERROR (p. 121)
```

MT Safety:

SAFE.

See also:

DDS_OctetsTypeSupport_register_type (p. 69)

4.7.3.6 const char* DDS_OctetsTypeSupport_get_type_name ()

Get the default name for the **DDS_Octets** (p. 1272) type.

Can be used for calling **DDS_OctetsTypeSupport_register_type** (p. 69) or creating **DDS_Topic** (p. 425).

Returns:

```
default name for the DDS_Octets (p. 1272) type.
```

See also:

```
DDS_OctetsTypeSupport_register_type (p. 69)
DDS_DomainParticipant_create_topic (p. 374)
```

4.7.3.7 void DDS_OctetsTypeSupport_print_data (const DDS_Octets * a_data)

<< eXtension>> (p. 950) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters:

```
a\_data << in>> (p. 951) DDS_Octets (p. 1272) to be printed.
```

4.7.3.8 DDS_OctetsDataWriter* DDS_OctetsDataWriter_narrow (DDS_DataWriter * writer)

Narrow the given $DDS_DataWriter$ (p. 673) pointer to a $DDS_OctetsDataWriter$ (p. 68) pointer.

See also:

FooDataWriter_narrow (p. 677)

4.7.3.9 DDS_DataWriter* DDS_OctetsDataWriter_as_datawriter (DDS_OctetsDataWriter * writer)

Widen the given DDS_OctetsDataWriter (p. 68) pointer to a DDS_DataWriter (p. 673) pointer.

See also:

FooDataWriter_as_datawriter (p. 678)

4.7.3.10 DDS_ReturnCode_t DDS_OctetsDataWriter_write (DDS_OctetsDataWriter * self, const DDS_Octets * $instance_data$, const DDS_InstanceHandle_t * handle)

Modifies the value of a **DDS_Octets** (p. 1272) data instance.

See also:

FooDataWriter_write (p. 684)

4.7.3.11 DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets (DDS_OctetsDataWriter * self, const unsigned char * octets, int length, const DDS_InstanceHandle_t * handle)

 $<<\!eXtension>>$ (p. 950) Modifies the value of a DDS_Octets (p. 1272) data instance.

Parameters:

 $self \ll in \gg (p. 951)$ Cannot be NULL.

octets << in>> (p. 951) Array of octets to be published. length << in>> (p. 951) Number of octets to be published. handle << in>> (p. 951) The special value DDS_HANDLE_NIL (p. 460) should be used always.

See also:

FooDataWriter_write (p. 684)

4.7.3.12 DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq (DDS_OctetsDataWriter * self, const struct
DDS_OctetSeq * octets, const DDS_InstanceHandle_t *
handle)

<<eXtension>> (p. 950) Modifies the value of a DDS_Octets (p. 1272) data instance.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. octets << in>> (p. 951) Sequence of octets to be published. handle << in>> (p. 951) The special value DDS_HANDLE_NIL (p. 460) should be used always.
```

See also:

FooDataWriter_write (p. 684)

4.7.3.13 DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_timestamp (DDS_OctetsDataWriter * self, const DDS_Octets * instance_data, const DDS_InstanceHandle_t * handle, const struct DDS_Time_t * source_timestamp)

Performs the same function as **DDS_OctetsDataWriter_write** (p. 72) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_write_w_timestamp (p. 686)

4.7.3.14 DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_w_timestamp (DDS_OctetsDataWriter * self,
const unsigned char * octets, int length, const
DDS_InstanceHandle_t * handle, const struct DDS_Time_t
* source_timestamp)

<<eXtension>> (p. 950) Performs the same function as DDS_OctetsDataWriter_write_octets (p. 72) except that it also provides the value for the source_timestamp.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. octets << in>> (p. 951) Array of octets to be published. length << in>> (p. 951) Number of octets to be published. handle << in>> (p. 951) The special value DDS_HANDLE_NIL (p. 460) should be used always. source\_timestamp << in>> (p. 951) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter\_write\_w\_timestamp (p. 686). Cannot be NULL.
```

See also:

FooDataWriter_write_w_timestamp (p. 686)

4.7.3.15 DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_timestamp (DDS_OctetsDataWriter *
self, const struct DDS_OctetSeq * octets, const
DDS_InstanceHandle_t * handle, const struct DDS_Time_t
* source_timestamp)

<<extension>> (p. 950) Performs the same function as DDS_-OctetsDataWriter_write_octets_seq (p. 73) except that it also provides the value for the source_timestamp.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. octets << in>> (p. 951) Sequence of octets to be published. handle << in>> (p. 951) The special value DDS_HANDLE_NIL (p. 460) should be used always.
```

source_timestamp <<iin>>> (p. 951) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter_write_w_timestamp (p. 686). Cannot be NULL.

See also:

FooDataWriter_write_w_timestamp (p. 686)

4.7.3.16 DDS_OctetsDataReader* DDS_OctetsDataReader_narrow (DDS_DataReader * reader)

Narrow the given **DDS_DataReader** (p. 783) pointer to a **DDS_OctetsDataReader** (p. 68) pointer.

See also:

FooDataReader_narrow (p. 787)

 $\begin{array}{lll} \textbf{4.7.3.17} & \textbf{DDS_DataReader} * \textbf{DDS_OctetsDataReader}_\textbf{as_datareader} \\ & (\textbf{DDS_OctetsDataReader} * \textit{reader}) \end{array}$

Widen the given DDS_OctetsDataReader (p. 68) pointer to a DDS_DataReader (p. 783) pointer.

See also:

FooDataReader_as_datareader (p. 788)

4.7.3.18 DDS_ReturnCode_t DDS_OctetsDataReader_read (DDS_OctetsDataReader * self, struct DDS_OctetsSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read (p. 788)

4.7.3.19 DDS_ReturnCode_t DDS_OctetsDataReader_take (DDS_OctetsDataReader * self, struct DDS_OctetsSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take (p. 789)

4.7.3.20 DDS_ReturnCode_t DDS_OctetsDataReader_read_w_condition (DDS_OctetsDataReader * self,
struct DDS_OctetsSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
DDS_ReadCondition * condition)

Accesses via DDS_OctetsDataReader_read (p. 75) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_read_w_condition (p. 796)

4.7.3.21 DDS_ReturnCode_t DDS_OctetsDataReader_take_w_condition (DDS_OctetsDataReader * self,
struct DDS_OctetsSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
DDS_ReadCondition * condition)

Analogous to DDS_OctetsDataReader_read_w_condition (p. 76) except it accesses samples via the DDS_OctetsDataReader_take (p. 76) operation.

See also:

FooDataReader_take_w_condition (p. 797)

4.7.3.22 DDS_ReturnCode_t DDS_OctetsDataReader_read_next_sample (DDS_OctetsDataReader * self, DDS_Octets * received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} DataReader (p. 783).

See also:

FooDataReader_read_next_sample (p. 798)

4.7.3.23 DDS_ReturnCode_t DDS_OctetsDataReader_take_next_sample (DDS_OctetsDataReader * self, DDS_Octets * received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the DDS_-DataReader (p. 783).

See also:

FooDataReader_take_next_sample (p. 799)

4.7.3.24 DDS_ReturnCode_t DDS_OctetsDataReader_return_loan (DDS_OctetsDataReader * self, struct DDS_OctetsSeq * $received_data$, struct DDS_SampleInfoSeq * $info_seq$)

Indicates to the **DDS_DataReader** (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 783).

See also:

FooDataReader_return_loan (p. 811)

- 4.7.4 Variable Documentation
- 4.7.4.1 int DDS_Octets::length [inherited]

Number of octets to serialize.

4.7.4.2 unsigned char* DDS_Octets::value [inherited]

DDS_Octets (p. 1272) array value.

4.8 KeyedOctets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

Data Structures

 $\hat{\ }$ struct DDS_KeyedOctets

 $\label{lem:bulk-length} \textit{Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.}$

^ struct DDS_KeyedOctetsSeq

```
Instantiates FooSeq (p. 1497) < DDS_{-}KeyedOctets (p. 1236) >.
```

 $\hat{\ }$ struct DDS_KeyedOctetsTypeSupport

```
<<interface>> (p. 950) DDS_KeyedOctets (p. 1236) type support.
```

Typedefs

^ typedef struct DDS_KeyedOctetsDataWriter DDS_-KeyedOctetsDataWriter

```
<<interface>> (p. 950) Instantiates DataWriter < DDS_KeyedOctets (p. 1236) >.
```

 $\begin{array}{lll} \textbf{typedef} & \textbf{struct} & \textbf{DDS_KeyedOctetsDataReader} & \textbf{DDS_-} \\ \textbf{KeyedOctetsDataReader} & \end{array}$

```
<<interface>> (p. 950) Instantiates DataReader < DDS_KeyedOctets (p. 1236) >.
```

Functions

 $\verb|^ DDS_KeyedOctets| * DDS_KeyedOctets_new| ()$

Constructor.

DDS_KeyedOctets * DDS_KeyedOctets_new_w_size (int key_size, int size)

 $Constructor\ that\ specifies\ the\ allocated\ sizes.$

^ void **DDS_KeyedOctets_delete** (**DDS_KeyedOctets** *self)

Destructor.

^ DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_register_type (DDS_DomainParticipant *participant, const char *type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of the DDS_KeyedOctets (p. 1236) data type.

DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_unregister_type (DDS_DomainParticipant *participant, const char *type_name)

Allows an application to unregister the **DDS_KeyedOctets** (p. 1236) data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

 $\begin{tabular}{ll} \^{\ } & const \ char * \bf DDS_KeyedOctetsTypeSupport_get_type_name \ () \\ \hline \end{tabular}$

Get the default name for the DDS_KeyedOctets (p. 1236) type.

^ void DDS_KeyedOctetsTypeSupport_print_data (const DDS_-KeyedOctets *a_data)

<<eXtension>> (p. 950) Print value of data type to standard out.

DDS_KeyedOctetsDataWriter * DDS_KeyedOctetsDataWriter_narrow (DDS_DataWriter *writer)

Narrow the given DDS_DataWriter (p. 673) pointer to a DDS_KeyedOctetsDataWriter (p. 86) pointer.

^ DDS_DataWriter * DDS_KeyedOctetsDataWriter_as_datawriter (DDS_KeyedOctetsDataWriter *writer)

Widen the given DDS_KeyedOctetsDataWriter (p. 86) pointer to a DDS_DataWriter (p. 673) pointer.

DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance (DDS_KeyedOctetsDataWriter *self, const DDS_KeyedOctets *instance_data)

Informs RTI Data Distribution Service that the application will be modifying a particular instance.

^ DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_-instance_w_key (DDS_KeyedOctetsDataWriter *self, const char *key)

<<eXtension>> (p. 950) Informs RTI Data Distribution Service that the application will be modifying a particular instance.

^ DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_timestamp (DDS_KeyedOctetsDataWriter *self, const DDS_KeyedOctets *instance_data, const struct DDS_Time_t *source_timestamp)

Performs the same functions as $DDS_KeyedOctetsDataWriter_register_instance$ (p. 91) except that the application provides the value for the source_timestamp.

^ DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_key_w_timestamp (DDS_KeyedOctetsDataWriter *self, const char *key, const struct DDS_Time_t *source_timestamp)

<<exXtension>> (p.950) Performs the same functions as DDS_-KeyedOctetsDataWriter_register_instance_w_key (p.91) except that the application provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance (DDS_KeyedOctetsDataWriter *self, const DDS_KeyedOctets *instance_data, const DDS_InstanceHandle_t *handle)

Reverses the action of DDS_KeyedOctetsDataWriter_register_instance (p. 91).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key (DDS_KeyedOctetsDataWriter *self, const char *key, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Reverses the action of DDS_-KeyedOctetsDataWriter_register_instance_w_key (p. 91).

DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_ instance_w_timestamp (DDS_KeyedOctetsDataWriter *self, const DDS_KeyedOctets *instance_data, const DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

Performs the same function as $DDS_KeyedOctetsDataWriter_unregister_instance$ (p. 92) except that it also provides the value for the source_timestamp.

DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key_w_timestamp (DDS_KeyedOctetsDataWriter *self, const char *key, const DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

<<eXtension>> (p.950) Performs the same function as DDS_-KeyedOctetsDataWriter_unregister_instance_w_key (p.92) except that it also provides the value for the source_timestamp. ^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write (DDS_KeyedOctetsDataWriter *self, const DDS_KeyedOctets *instance_data, const DDS_InstanceHandle_t *handle)

Modifies the value of a DDS_KeyedOctets (p. 1236) data instance.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_-octets_w_key (DDS_KeyedOctetsDataWriter *self, const char *key, const unsigned char *octets, int length, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Modifies the value of a DDS_KeyedOctets (p. 1236) data instance.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key (DDS_KeyedOctetsDataWriter *self, const
char *key, const struct DDS_OctetSeq *octets, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Modifies the value of a DDS_KeyedOctets (p. 1236) data instance.

Performs the same function as DDS_KeyedOctetsDataWriter_write (p. 93) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_timestamp (DDS_KeyedOctetsDataWriter
*self, const char *key, const unsigned char *octets, int length, const
DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

Performs the same function as DDS_KeyedOctetsDataWriter_write_-octets_w_key (p. 94) except that it also provides the value for the source_timestamp.

DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_timestamp (DDS_KeyedOctetsDataWriter
*self, const char *key, const struct DDS_OctetSeq *octets, const
DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

Performs the same function as DDS_KeyedOctetsDataWriter_write_-octets_seq_w_key (p. 94) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose (DDS_KeyedOctetsDataWriter *self, const DDS_KeyedOctets *instance_data, const DDS_InstanceHandle_t *instance_handle)

Requests the middleware to delete the data.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_key (DDS_KeyedOctetsDataWriter *self, const char *key, const DDS_InstanceHandle_t *instance_handle)

<<eXtension>> (p. 950) Requests the middleware to delete the data.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_-timestamp (DDS_KeyedOctetsDataWriter *self, const DDS_KeyedOctets *instance_data, const DDS_InstanceHandle_t *instance_handle, const struct DDS_Time_t *source_timestamp)

Performs the same functions as DDS_KeyedOctetsDataWriter_dispose (p. 96) except that the application provides the value for the source_timestamp that is made available to DDS_DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_-key_w_timestamp (DDS_KeyedOctetsDataWriter *self, const char *key, const DDS_InstanceHandle_t *instance_handle, const struct DDS_Time_t *source_timestamp)

<<extension>> (p.950) Performs the same functions as DDS_-KeyedOctetsDataWriter_dispose_w_key (p.97) except that the application provides the value for the source_timestamp that is made available to DDS_DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_get_key_-value (DDS_KeyedOctetsDataWriter *self, DDS_KeyedOctets *key_holder, const DDS_InstanceHandle_t *handle)

Retrieve the instance key that corresponds to an instance handle.

<<e $\mathbf{Xtension}>>$ (p. 950) Retrieve the instance key that corresponds to an instance handle.

^ DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_-instance (DDS_KeyedOctetsDataWriter *self, const DDS_-KeyedOctets *key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

^ DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_-instance_w_key (DDS_KeyedOctetsDataWriter *self, const char *key)

<<eXtension>> (p. 950) Retrieve the instance handle that corresponds to an instance key.

^ DDS_KeyedOctetsDataReader * DDS_-KeyedOctetsDataReader_narrow (DDS_DataReader *reader)

Narrow the given DDS_DataReader (p. 783) pointer to a DDS_KeyedOctetsDataReader (p. 87) pointer.

` DDS_DataReader * DDS_KeyedOctetsDataReader_as_-datareader (DDS_KeyedOctetsDataReader *reader)

Widen the given DDS_KeyedOctetsDataReader (p. 87) pointer to a DDS_DataReader (p. 783) pointer.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_w_-condition (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Accesses via DDS_KeyedOctetsDataReader_read (p. 99) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_w_-condition (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_ReadCondition *condition)

Analogous to DDS_KeyedOctetsDataReader_read_w_condition (p. 100) except it accesses samples via the DDS_KeyedOctetsDataReader_take (p. 99) operation.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_sample (DDS_KeyedOctetsDataReader *self, DDS_KeyedOctets *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} -DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_sample (DDS_KeyedOctetsDataReader *self, DDS_KeyedOctets *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} -DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_-instance (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq

*info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_-instance_w_condition (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_ReadCondition *condition)

Accesses via DDS_KeyedOctetsDataReader_read_next_instance (p. 102) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_-instance_w_condition (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_ReadCondition *condition)

Accesses via DDS_KeyedOctetsDataReader_take_next_instance (p. 102) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_return_loan (DDS_KeyedOctetsDataReader *self, struct DDS_KeyedOctetsSeq *received_data, struct DDS_SampleInfoSeq
*info_seq)

Indicates to the DDS_DataReader (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_-value (DDS_KeyedOctetsDataReader *self, DDS_KeyedOctets *key_holder, const DDS_InstanceHandle_t *handle)

Retrieve the instance key that corresponds to an instance handle.

^ DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_-value_w_key (DDS_KeyedOctetsDataReader *self, char *key, const DDS_InstanceHandle_t *handle)

<<eXtension>> (p. 950) Retrieve the instance key that corresponds to an instance handle.

^ DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance (DDS_KeyedOctetsDataReader *self, const DDS_KeyedOctets *key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

^ DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_-instance_w_key (DDS_KeyedOctetsDataReader *self, const char *key)

<<eXtension>> (p.950) Retrieve the instance handle that corresponds to an instance key.

Variables

^ char * DDS_KeyedOctets::key

Instance key associated with the specified value.

^ int DDS_KeyedOctets::length

Number of octets to serialize.

unsigned char * DDS_KeyedOctets::value

DDS_Octets (p. 1272) array value.

4.8.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

4.8.2 Typedef Documentation

${\bf 4.8.2.1} \quad {\bf typedef \ struct \ DDS_KeyedOctetsDataWriter} \\ {\bf DDS_KeyedOctetsDataWriter}$

```
<<iinterface>> (p. 950) Instantiates DataWriter < DDS_KeyedOctets (p. 1236) >.
```

See also:

```
FooDataWriter (p. 1496)
DDS_DataWriter (p. 673)
```

4.8.2.2 typedef struct DDS_KeyedOctetsDataReader DDS_KeyedOctetsDataReader

```
<<iinterface>> (p. 950) Instantiates DataReader < DDS_KeyedOctets (p. 1236) >.
```

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string or byte array in a destination data sample is NULL, the middleware will allocate a new string or array for you of sufficient length to hold the received data. New strings will be allocated with **DDS_String_alloc** (p. 287); new arrays will be allocated with **DDS_-OctetBuffer_alloc** (p. 268). The sample's destructor will delete them.

A non- NULL string or array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

FooDataReader (p. 1495)
DDS_DataReader (p. 783)
```

4.8.3 Function Documentation

4.8.3.1 DDS_KeyedOctets* DDS_KeyedOctets_new ()

Constructor.

The default constructor initializes the newly created object with NULL key, NULL value, and zero length.

Returns:

A new **DDS_KeyedOctets** (p. 1236) or NULL if failure.

4.8.3.2 DDS_KeyedOctets* DDS_KeyedOctets_new_w_size (int key_size, int size)

Constructor that specifies the allocated sizes.

After this function is called, key is initialized with the empty string and length is set to zero.

Parameters:

 $key_size << in>> (p. 951)$ Size of the allocated key (with NULL-terminated character). Cannot be smaller than zero.

size << in>> (p. 951) Size of the allocated octets array. Cannot be smaller than zero.

Returns:

A new **DDS_KeyedOctets** (p. 1236) or NULL if failure.

4.8.3.3 void DDS_KeyedOctets_delete (DDS_KeyedOctets * self)

Destructor.

4.8.3.4 DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_register_type (DDS_DomainParticipant * participant, const
char * type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of the **DDS_KeyedOctets** (p. 1236) data type.

By default, The **DDS_KeyedOctets** (p. 1236) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDS_KeyedOctetsTypeSupport_get_type_name** (p. 90). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This function can also be used to register the same DDS_-KeyedOctetsTypeSupport (p. 1238) with a DDS_DomainParticipant (p. 339) using different values for the type_name.

If register_type is called multiple times with the same DDS_-DomainParticipant (p. 339) and type_name, the second (and subsequent) registrations are ignored by the operation.

Parameters:

participant <<in>> (p. 951) the DDS_DomainParticipant (p. 339) to register the data type DDS_Octets (p. 1272) with. Cannot be NULL.

type_name <<in>>> (p. 951) the type name under with the data type DDS_KeyedOctets (p. 1236) is registered with the participant; this type name is used when creating a new DDS_Topic (p. 425). (See DDS_DomainParticipant_create_topic (p. 374).) The name may not be NULL or longer than 255 characters.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-

PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_OUT_-OF_RESOURCES (p. 121).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also:

DDS_DomainParticipant_create_topic (p. 374)

4.8.3.5 DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_unregister_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to unregister the **DDS_KeyedOctets** (p. 1236) data type from RTI Data Distribution Service. After calling unregister_type, no further communication using this type is possible.

Precondition:

The DDS_KeyedOctets (p. 1236) type with type_name is registered with the participant and all DDS_Topic (p. 425) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any DDS_Topic (p. 425) is associated with the type, the operation will fail with DDS_RETCODE_ERROR (p. 121).

Postcondition:

All information about the type is removed from RTI Data Distribution Service. No further communication using this type is possible.

Parameters:

participant <<in>> (p. 951) the DDS_DomainParticipant (p. 339) to unregister the data type DDS_KeyedOctets (p. 1236) from. Cannot be NULL.

type_name <<in>> (p. 951) the type name under with the data type DDS_KeyedOctets (p. 1236) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-BAD_PARAMETER (p. 121) or DDS_RETCODE_ERROR (p. 121)

MT Safety:

SAFE.

See also:

DDS_KeyedOctetsTypeSupport_register_type (p. 88)

 $\begin{array}{ll} \textbf{4.8.3.6} & const\ char*\ DDS_KeyedOctetsTypeSupport_get_type_name \\ () \end{array}$

Get the default name for the DDS_KeyedOctets (p. 1236) type.

Can be used for calling $DDS_KeyedOctetsTypeSupport_register_type$ (p. 88) or creating DDS_Topic (p. 425).

Returns:

default name for the DDS_KeyedOctets (p. 1236) type.

See also:

DDS_KeyedOctetsTypeSupport_register_type (p. 88) DDS_DomainParticipant_create_topic (p. 374)

4.8.3.7 void DDS_KeyedOctetsTypeSupport_print_data (const DDS_KeyedOctets * a_data)

<< eXtension>> (p. 950) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters:

 $a_data << in>> (p. 951)$ DDS_KeyedOctets (p. 1236) to be printed.

4.8.3.8 DDS_KeyedOctetsDataWriter* DDS_-KeyedOctetsDataWriter_narrow (DDS_DataWriter * writer)

Narrow the given **DDS_DataWriter** (p. 673) pointer to a **DDS_KeyedOctetsDataWriter** (p. 86) pointer.

See also:

FooDataWriter_narrow (p. 677)

4.8.3.9 DDS_DataWriter* DDS_KeyedOctetsDataWriter_-as_datawriter (DDS_KeyedOctetsDataWriter * writer)

Widen the given DDS_KeyedOctetsDataWriter (p. 86) pointer to a DDS_-DataWriter (p. 673) pointer.

See also:

FooDataWriter_as_datawriter (p. 678)

4.8.3.10 DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance (DDS_KeyedOctetsDataWriter * self, const DDS_KeyedOctets * instance_data)

Informs RTI Data Distribution Service that the application will be modifying a particular instance.

See also:

FooDataWriter_register_instance (p. 678)

4.8.3.11 DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_- register_instance_w_key (DDS_KeyedOctetsDataWriter * self, const char * key)

<< eXtension>> (p. 950) Informs RTI Data Distribution Service that the application will be modifying a particular instance.

See also:

FooDataWriter_register_instance (p. 678)

4.8.3.12 DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_timestamp (DDS_KeyedOctetsDataWriter * self, const DDS_KeyedOctets
* instance_data, const struct DDS_Time_t *
source_timestamp)

Performs the same functions as DDS_KeyedOctetsDataWriter_register_instance (p. 91) except that the application provides the value for the source_timestamp.

See also:

FooDataWriter_register_instance_w_timestamp (p. 680)

4.8.3.13 DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_key_w_timestamp
(DDS_KeyedOctetsDataWriter * self, const char * key,
const struct DDS_Time_t * source_timestamp)

<<eXtension>> (p. 950) Performs the same functions as DDS_-KeyedOctetsDataWriter_register_instance_w_key (p. 91) except that the application provides the value for the source_timestamp.

See also:

FooDataWriter_register_instance_w_timestamp (p. 680)

4.8.3.14 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance (DDS_KeyedOctetsDataWriter *
self, const DDS_KeyedOctets * instance_data, const
DDS_InstanceHandle_t * handle)

Reverses the action of DDS_KeyedOctetsDataWriter_register_instance (p. 91).

See also:

FooDataWriter_unregister_instance (p. 681)

4.8.3.15 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key (DDS_KeyedOctetsDataWriter
* self, const char * key, const DDS_InstanceHandle_t *
handle)

<<eXtension>> (p. 950) Reverses the action of DDS_-KeyedOctetsDataWriter_register_instance_w_key (p. 91).

See also:

FooDataWriter_unregister_instance (p. 681)

4.8.3.16 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_timestamp
(DDS_KeyedOctetsDataWriter * self, const
DDS_KeyedOctets * instance_data, const
DDS_InstanceHandle_t * handle, const struct DDS_Time_t
* source_timestamp)

Performs the same function as DDS_KeyedOctetsDataWriter_unregister_instance (p. 92) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_unregister_instance_w_timestamp (p. 683)

4.8.3.17 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key_w_timestamp
(DDS_KeyedOctetsDataWriter * self, const char * key,
const DDS_InstanceHandle_t * handle, const struct
DDS_Time_t * source_timestamp)

<<extension>> (p. 950) Performs the same function as DDS_-KeyedOctetsDataWriter_unregister_instance_w_key (p. 92) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_unregister_instance_w_timestamp (p. 683)

 $\begin{array}{lll} 4.8.3.18 & DDS_ReturnCode_t \ DDS_KeyedOctetsDataWriter_write \\ & (DDS_KeyedOctetsDataWriter * \textit{self}, \ \text{const} \\ & DDS_KeyedOctets * \textit{instance_data}, \ \text{const} \\ & DDS_InstanceHandle_t * \textit{handle}) \end{array}$

Modifies the value of a DDS_KeyedOctets (p. 1236) data instance.

See also:

FooDataWriter_write (p. 684)

4.8.3.19 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_-octets_w_key (DDS_KeyedOctetsDataWriter * self, const char * key, const unsigned char * octets, int length, const DDS_InstanceHandle_t * handle)

<< eXtension>> (p. 950) Modifies the value of a DDS_KeyedOctets (p. 1236) data instance.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
key <<iin>> (p. 951) Instance key.
octets <<in>> (p. 951) Array of octets to be published.
length <<in>> (p. 951) Number of octets to be published.
handle <<in>> (p. 951) Either the handle returned by a previous call
to DDS_KeyedOctetsDataWriter_register_instance (p. 91), or
else the special value DDS_HANDLE_NIL (p. 460). See Foo-
DataWriter_write (p. 684).
```

See also:

FooDataWriter_write (p. 684)

4.8.3.20 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key (DDS_KeyedOctetsDataWriter * self,
const char * key, const struct DDS_OctetSeq * octets,
const DDS_InstanceHandle_t * handle)

<<eXtension>> (p. 950) Modifies the value of a DDS_KeyedOctets (p. 1236) data instance.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
key <<iin>> (p. 951) Instance key.
octets <<in>> (p. 951) Sequence of octets to be published.
handle <<in>> (p. 951) Either the handle returned by a previous call to DDS_KeyedOctetsDataWriter_register_instance (p. 91), or else the special value DDS_HANDLE_NIL (p. 460). See Foo-DataWriter_write (p. 684).
```

See also:

FooDataWriter_write (p. 684)

4.8.3.21 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_w_timestamp (DDS_KeyedOctetsDataWriter * self, const DDS_KeyedOctets * instance_data, const DDS_InstanceHandle_t * handle, const struct DDS_Time_t * source_timestamp)

Performs the same function as **DDS_KeyedOctetsDataWriter_write** (p. 93) except that it also provides the value for the source_timestamp.

See also:

FooDataWriter_write_w_timestamp (p. 686)

self << in>> (p. 951) Cannot be NULL.

4.8.3.22 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_timestamp (DDS_KeyedOctetsDataWriter
* self, const char * key, const unsigned char * octets, int
length, const DDS_InstanceHandle_t * handle, const
struct DDS_Time_t * source_timestamp)

Performs the same function as DDS_KeyedOctetsDataWriter_write_octets_w_key (p. 94) except that it also provides the value for the source_timestamp.

Parameters:

```
key <<in>> (p. 951) Instance key.
octets <<in>> (p. 951) Array of octets to be published.
length <<in>> (p. 951) Number of octets to be published.
handle <<in>> (p. 951) Either the handle returned by a previous call to DDS_KeyedOctetsDataWriter_register_instance (p. 91), or else the special value DDS_HANDLE_NIL (p. 460). See Foo-DataWriter_write (p. 684).
```

source_timestamp <<iin>>> (p. 951) The timestamp value must be
greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter_write_w_timestamp (p. 686). Cannot be NULL.

See also:

FooDataWriter_write (p. 684)

4.8.3.23 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_timestamp
(DDS_KeyedOctetsDataWriter * self, const char *
key, const struct DDS_OctetSeq * octets, const
DDS_InstanceHandle_t * handle, const struct DDS_Time_t
* source_timestamp)

Performs the same function as DDS_KeyedOctetsDataWriter_write_octets_seq_w_key (p. 94) except that it also provides the value for the source_timestamp.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 key << in>> (p. 951) Instance key. 
 octets << in>> (p. 951) Sequence of octets to be published.
```

handle <<in>> (p. 951) Either the handle returned by a previous call to DDS_KeyedOctetsDataWriter_register_instance (p. 91), or else the special value DDS_HANDLE_NIL (p. 460). See Foo-DataWriter_write (p. 684).

source_timestamp <<iin>>> (p. 951) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter_write_w_timestamp (p. 686). Cannot be NULL.

See also:

FooDataWriter_write (p. 684)

4.8.3.24 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose (DDS_KeyedOctetsDataWriter * self, const DDS_KeyedOctets * instance_data, const DDS_InstanceHandle_t * instance_handle)

Requests the middleware to delete the data.

See also:

FooDataWriter_dispose (p. 688)

4.8.3.25 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_-dispose_w_key (DDS_KeyedOctetsDataWriter * self, const char * key, const DDS_InstanceHandle_t * instance_handle)

<< eXtension>> (p. 950) Requests the middleware to delete the data.

See also:

FooDataWriter_dispose (p. 688)

4.8.3.26 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_timestamp (DDS_KeyedOctetsDataWriter *
self, const DDS_KeyedOctets * instance_data, const
DDS_InstanceHandle_t * instance_handle, const struct
DDS_Time_t * source_timestamp)

Performs the same functions as **DDS_KeyedOctetsDataWriter_dispose** (p. 96) except that the application provides the value for the source_timestamp that is made available to **DDS_DataReader** (p. 783) objects by means of the source_timestamp attribute inside the **DDS_SampleInfo** (p. 1384).

See also:

FooDataWriter_dispose_w_timestamp (p. 690)

4.8.3.27 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_key_w_timestamp (DDS_KeyedOctetsDataWriter * self, const char * key, const
DDS_InstanceHandle_t * instance_handle, const struct
DDS_Time_t * source_timestamp)

<<extension>> (p. 950) Performs the same functions as DDS_-KeyedOctetsDataWriter_dispose_w_key (p. 97) except that the application provides the value for the source_timestamp that is made available to DDS_-DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

See also:

FooDataWriter_dispose_w_timestamp (p. 690)

4.8.3.28 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_-get_key_value (DDS_KeyedOctetsDataWriter * self, DDS_KeyedOctets * key_holder, const DDS_InstanceHandle_t * handle)

Retrieve the instance key that corresponds to an instance handle.

See also:

FooDataWriter_get_key_value (p. 691)

4.8.3.29 DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_get_key_value_w_key (DDS_KeyedOctetsDataWriter * self, char * key, const DDS_InstanceHandle_t * handle)

 $<<\!eXtension>>$ (p. 950) Retrieve the instance key that corresponds to an instance handle.

See also:

FooDataWriter_get_key_value (p. 691)

4.8.3.30 DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_-lookup_instance (DDS_KeyedOctetsDataWriter * self, const DDS_KeyedOctets * key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

See also:

FooDataWriter_lookup_instance (p. 692)

4.8.3.31 DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_instance_w_key (DDS_KeyedOctetsDataWriter * self, const char * key)

<<eXtension>> (p. 950) Retrieve the instance handle that corresponds to an instance key.

See also:

FooDataWriter_lookup_instance (p. 692)

 $\begin{array}{lll} 4.8.3.32 & DDS_KeyedOctetsDataReader* & DDS_- \\ & KeyedOctetsDataReader_narrow & (DDS_DataReader* \\ & reader) \end{array}$

Narrow the given **DDS_DataReader** (p. 783) pointer to a **DDS_KeyedOctetsDataReader** (p. 87) pointer.

See also:

FooDataReader_narrow (p. 787)

4.8.3.33 DDS_DataReader* DDS_KeyedOctetsDataReader_as_datareader (DDS_KeyedOctetsDataReader * reader)

Widen the given DDS_KeyedOctetsDataReader (p. 87) pointer to a DDS_-DataReader (p. 783) pointer.

See also:

FooDataReader_as_datareader (p. 788)

4.8.3.34 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read (DDS_KeyedOctetsDataReader * self, struct DDS_KeyedOctetsSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read (p. 788)

4.8.3.35 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take (DDS_KeyedOctetsDataReader * self, struct DDS_KeyedOctetsSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_mask, DDS_ViewStateMask view_mask, DDS_InstanceStateMask instance_mask)

Access a collection of data-samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take (p. 789)

4.8.3.36 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_w_condition (DDS_KeyedOctetsDataReader * self,
struct DDS_KeyedOctetsSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
DDS_ReadCondition * condition)

Accesses via DDS_KeyedOctetsDataReader_read (p. 99) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_read_w_condition (p. 796)

 $\begin{array}{lll} 4.8.3.37 & DDS_ReturnCode_t \ DDS_KeyedOctetsDataReader_-\\ & take_w_condition \ (DDS_KeyedOctetsDataReader * \textit{self},\\ & struct \ DDS_KeyedOctetsSeq * \textit{received_data}, \ struct\\ & DDS_SampleInfoSeq * \textit{info_seq}, \ DDS_Long \ \textit{max_samples},\\ & DDS_ReadCondition * \textit{condition}) \end{array}$

Analogous to DDS_KeyedOctetsDataReader_read_w_condition (p. 100) except it accesses samples via the DDS_KeyedOctetsDataReader_take (p. 99) operation.

See also:

FooDataReader_take_w_condition (p. 797)

4.8.3.38 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_sample (DDS_KeyedOctetsDataReader * self, DDS_KeyedOctets * received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the **DDS_- DataReader** (p. 783).

See also:

FooDataReader_read_next_sample (p. 798)

4.8.3.39 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_sample (DDS_KeyedOctetsDataReader * self, DDS_KeyedOctets * received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the DDS_-DataReader (p. 783).

See also:

FooDataReader_take_next_sample (p. 799)

4.8.3.40 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance (DDS_KeyedOctetsDataReader * self,
struct DDS_KeyedOctetsSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
const DDS_InstanceHandle_t * a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask
view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read_instance (p. 800)

4.8.3.41 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance (DDS_KeyedOctetsDataReader * self,
struct DDS_KeyedOctetsSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
const DDS_InstanceHandle_t * a_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask
view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take_instance (p. 802)

4.8.3.42 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance (DDS_KeyedOctetsDataReader * self, struct DDS_KeyedOctetsSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_read_next_instance (p. 804)

4.8.3.43 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_-take_next_instance (DDS_KeyedOctetsDataReader * self, struct DDS_KeyedOctetsSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

See also:

FooDataReader_take_next_instance (p. 806)

4.8.3.44 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance_w_condition (DDS_KeyedOctetsDataReader
* self, struct DDS_KeyedOctetsSeq * received_data, struct
DDS_SampleInfoSeq * info_seq, DDS_Long max_samples,
const DDS_InstanceHandle_t * previous_handle,
DDS_ReadCondition * condition)

Accesses via DDS_KeyedOctetsDataReader_read_next_instance (p. 102) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_read_next_instance_w_condition (p. 808)

4.8.3.45 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_instance_w_condition (DDS_KeyedOctetsDataReader * self, struct DDS_KeyedOctetsSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_ReadCondition * condition)

Accesses via DDS_KeyedOctetsDataReader_take_next_instance (p. 102) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

See also:

FooDataReader_take_next_instance_w_condition (p. 809)

4.8.3.46 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_return_loan (DDS_KeyedOctetsDataReader * self,
struct DDS_KeyedOctetsSeq * received_data, struct
DDS_SampleInfoSeq * info_seq)

Indicates to the **DDS_DataReader** (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 783).

See also:

FooDataReader_return_loan (p. 811)

4.8.3.47 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_-get_key_value (DDS_KeyedOctetsDataReader * self, DDS_KeyedOctets * key_holder, const DDS_InstanceHandle_t * handle)

Retrieve the instance key that corresponds to an instance handle.

See also:

FooDataReader_get_key_value (p. 812)

4.8.3.48 DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_value_w_key (DDS_KeyedOctetsDataReader * self, char * key, const DDS_InstanceHandle_t * handle)

<<eXtension>> (p. 950) Retrieve the instance key that corresponds to an instance handle.

See also:

 $FooDataReader_get_key_value (p. 812)$

4.8.3.49 DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_-lookup_instance (DDS_KeyedOctetsDataReader * self, const DDS_KeyedOctets * key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

See also:

FooDataReader_lookup_instance (p. 813)

4.8.3.50 DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance_w_key (DDS_KeyedOctetsDataReader * self, const char * key)

<<eXtension>> (p. 950) Retrieve the instance handle that corresponds to an instance key.

See also:

FooDataReader_lookup_instance (p. 813)

- 4.8.4 Variable Documentation
- 4.8.4.1 char* DDS_KeyedOctets::key [inherited]

Instance key associated with the specified value.

4.8.4.2 int DDS_KeyedOctets::length [inherited]

Number of octets to serialize.

4.8.4.3 unsigned char* DDS_KeyedOctets::value [inherited]

DDS_Octets (p. 1272) array value.

4.9 DDS-Specific Primitive Types

Basic DDS value types for use in user data types.

Defines

* #define DDS_BOOLEAN_TRUE

Defines "true" value of DDS_Boolean (p. 109) data type.

 $\hat{}$ #define **DDS_BOOLEAN_FALSE**

Defines "false" value of DDS_Boolean (p. 109) data type.

Typedefs

^ typedef RTICdrChar **DDS_Char**

Defines a character data type, equivalent to IDL/CDR char.

 $\hat{}$ typedef RTICdrWchar **DDS_Wchar**

Defines a wide character data type, equivalent to IDL/CDR wchar.

^ typedef RTICdrOctet **DDS_Octet**

Defines an opaque byte data type, equivalent to IDL/CDR octet.

* typedef RTICdrShort **DDS_Short**

Defines a short integer data type, equivalent to IDL/CDR short.

^ typedef RTICdrUnsignedShort DDS_UnsignedShort

Defines an unsigned short integer data type, equivalent to IDL/CDR unsigned short.

^ typedef RTICdrLong **DDS_Long**

Defines a long integer data type, equivalent to IDL/CDR long.

^ typedef RTICdrUnsignedLong DDS_UnsignedLong

 $Defines\ an\ unsigned\ long\ integer\ data\ type,\ equivalent\ to\ IDL/CDR\ {\tt unsigned\ long}.$

* typedef RTICdrLongLong DDS_LongLong

Defines an extra-long integer data type, equivalent to IDL/CDR long long.

^ typedef RTICdrUnsignedLongLong DDS_UnsignedLongLong

Defines an unsigned extra-long data type, equivalent to IDL/CDR unsigned long long.

^ typedef RTICdrFloat **DDS_Float**

Defines a single-precision floating-point data type, equivalent to IDL/CDR float.

typedef RTICdrDouble **DDS_Double**

 $\label{lem:defines} \textit{Defines a double-precision floating-point data type, equivalent to IDL/CDR $\mbox{double}.$}$

typedef RTICdrLongDouble **DDS_LongDouble**

Defines an extra-precision floating-point data type, equivalent to $\mathit{IDL/CDR}$ long double.

^ typedef RTICdrBoolean DDS_Boolean

Defines a Boolean data type, equivalent to IDL/CDR boolean.

* typedef RTICdrEnum **DDS_Enum**

Defines an enumerated data type.

4.9.1 Detailed Description

Basic DDS value types for use in user data types.

As part of the finalization of the DDS standard, a number of DDS-specific primitive types will be introduced. By using these types, you will ensure that your data is serialized consistently across platforms even if the C/C++ built-in types have different sizes on those platforms.

In this version of RTI Data Distribution Service, the DDS primitive types are defined using the OMG's Common Data Representation (CDR) standard. In a future version of RTI Data Distribution Service, you will be given the choice of whether to use these CDR-based types or C/C++ built-in types through a flag provided to the rtiddsgen tool.

4.9.2 Define Documentation

4.9.2.1 #define DDS_BOOLEAN_TRUE

Defines "true" value of **DDS_Boolean** (p. 109) data type.

Examples:

HelloWorld_publisher.c.

4.9.2.2 #define DDS_BOOLEAN_FALSE

Defines "false" value of **DDS_Boolean** (p. 109) data type.

Examples:

HelloWorld.c.

4.9.3 Typedef Documentation

4.9.3.1 typedef RTICdrChar DDS_Char

Defines a character data type, equivalent to IDL/CDR char.

An 8-bit quantity that encodes a single byte charater from any byte-oriented code set.

4.9.3.2 typedef RTICdrWchar DDS_Wchar

Defines a wide character data type, equivalent to IDL/CDR wchar.

An 16-bit quantity that encodes a wide character from any character set.

4.9.3.3 typedef RTICdrOctet DDS_Octet

Defines an opaque byte data type, equivalent to IDL/CDR octet.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

4.9.3.4 typedef RTICdrShort DDS_Short

Defines a short integer data type, equivalent to IDL/CDR short.

A 16-bit signed short integer value.

${\bf 4.9.3.5} \quad type def \ RTIC dr Unsigned Short \ DDS_Unsigned Short$

Defines an unsigned short integer data type, equivalent to IDL/CDR unsigned short.

A 16-bit unsigned short integer value.

4.9.3.6 typedef RTICdrLong DDS_Long

Defines a long integer data type, equivalent to IDL/CDR long.

A 32-bit signed long integer value.

4.9.3.7 typedef RTICdrUnsignedLong DDS_UnsignedLong

Defines an unsigned long integer data type, equivalent to IDL/CDR unsigned long.

A 32-bit unsigned long integer value.

4.9.3.8 typedef RTICdrLongLong DDS_LongLong

Defines an extra-long integer data type, equivalent to IDL/CDR long long.

A 64-bit signed long long integer value.

4.9.3.9 typedef RTICdrUnsignedLongLong DDS_UnsignedLongLong

Defines an unsigned extra-long data type, equivalent to IDL/CDR unsigned long long.

An 64-bit unsigned long long integer value.

${\bf 4.9.3.10 \quad typedef \ RTICdrFloat \ DDS_Float}$

Defines a single-precision floating-point data type, equivalent to $\mathrm{IDL}/\mathrm{CDR}$ float.

A 32-bit floating-point value.

4.9.3.11 typedef RTICdrDouble DDS_Double

Defines a double-precision floating-point data type, equivalent to IDL/CDR double.

A 64-bit floating-point value.

4.9.3.12 typedef RTICdrLongDouble DDS_LongDouble

Defines an extra-precision floating-point data type, equivalent to IDL/CDR long double.

A 128-bit floating-point value.

Since some architectures do not support long double, RTI has defined character arrays that match the expected size of this type. On systems that do have native long double, you have to define RTI_CDR_SIZEOF_LONG_DOUBLE as 16 to map them to native types.

4.9.3.13 typedef RTICdrBoolean DDS_Boolean

Defines a Boolean data type, equivalent to IDL/CDR boolean.

An 8-bit Boolean value that is used to denote a data item that can only take one of the values **DDS_BOOLEAN_TRUE** (p. 106) (1) or **DDS_BOOLEAN_FALSE** (p. 107) (0).

4.9.3.14 typedef RTICdrEnum DDS_Enum

Defines an enumerated data type.

Encoded as unsigned long value. By default, the first enum identifier has the numeric value zero (0). Successive enum identifiers take ascending numeric values, in order of declaration from left to right.

4.10 Time Support

Time and duration types and defines.

Data Structures

 $\hat{}$ struct $\mathbf{DDS_Time_t}$

Type for time representation.

^ struct DDS_Duration_t

Type for duration representation.

Defines

* #define DDS_TIME_ZERO

The default instant in time: zero seconds and zero nanoseconds.

Functions

 $\hat{\ } \ \, \mathbf{DDS_Boolean} \quad \mathbf{DDS_Time_is_zero} \quad (\mathrm{const} \quad \mathrm{struct} \quad \mathbf{DDS_Time_t} \\ *\mathrm{time})$

 $Check\ if\ time\ is\ zero.$

- ^ DDS_Boolean DDS_Time_is_invalid (const struct DDS_Time_t *time)
- ^ DDS_Boolean DDS_Duration_is_infinite (const struct DDS_-Duration_t *duration)
- ^ DDS_Boolean DDS_Duration_is_zero (const struct DDS_-Duration_t *duration)

Variables

^ const DDS_Long DDS_TIME_INVALID_SEC

A sentinel indicating an invalid second of time.

^ const DDS_UnsignedLong DDS_TIME_INVALID_NSEC

A sentinel indicating an invalid nano-second of time.

* struct DDS_Time_t DDS_TIME_INVALID

A sentinel indicating an invalid time.

^ const DDS_Long DDS_DURATION_INFINITE_SEC

An infinite second period of time.

An infinite nano-second period of time.

^ struct DDS_Duration_t DDS_DURATION_INFINITE

An infinite period of time.

^ const DDS_Long DDS_DURATION_ZERO_SEC

A zero-length second period of time.

^ const DDS_UnsignedLong DDS_DURATION_ZERO_NSEC

A zero-length nano-second period of time.

^ struct DDS_Duration_t DDS_DURATION_ZERO

A zero-length period of time.

4.10.1 Detailed Description

Time and duration types and defines.

4.10.2 Define Documentation

4.10.2.1 #define DDS_TIME_ZERO

The default instant in time: zero seconds and zero nanoseconds.

4.10.3 Function Documentation

4.10.3.1 DDS_Boolean DDS_Time_is_zero (const struct DDS_Time_t * time)

Check if time is zero.

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the given time is equal to DDS_-TIME_ZERO (p. 111) or DDS_BOOLEAN_FALSE (p. 107) otherwise.

4.10.3.2 DDS_Boolean DDS_Time_is_invalid (const struct DDS_Time_t * time)

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the given time is not valid (i.e. is negative)

4.10.3.3 DDS_Boolean DDS_Duration_is_infinite (const struct DDS_Duration_t * duration)

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the given duration is of infinite length.

4.10.3.4 DDS_Boolean DDS_Duration_is_zero (const struct DDS_Duration_t * duration)

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the given duration is of zero length.

4.10.4 Variable Documentation

4.10.4.1 const DDS_Long DDS_TIME_INVALID_SEC

A sentinel indicating an invalid second of time.

4.10.4.2 const DDS_UnsignedLong DDS_TIME_INVALID_NSEC

A sentinel indicating an invalid nano-second of time.

4.10.4.3 struct DDS_Time_t DDS_TIME_INVALID

A sentinel indicating an invalid time.

4.10.4.4 const DDS_Long DDS_DURATION_INFINITE_SEC

An infinite second period of time.

$\begin{array}{lll} \textbf{4.10.4.5} & \textbf{const DDS_UnsignedLong DDS_DURATION_INFINITE_-} \\ \textbf{NSEC} \end{array}$

An infinite nano-second period of time.

4.10.4.6 struct DDS_Duration_t DDS_DURATION_INFINITE

An infinite period of time.

4.10.4.7 const DDS_Long DDS_DURATION_ZERO_SEC

A zero-length second period of time.

4.10.4.8 const DDS_UnsignedLong DDS_DURATION_ZERO_NSEC

A zero-length nano-second period of time.

4.10.4.9 struct DDS_Duration_t DDS_DURATION_ZERO

A zero-length period of time.

4.11 GUID Support

<< eXtension>> (p. 950) GUID type and defines.

Data Structures

 $^{\circ}$ struct **DDS_GUID_t**

Type for GUID (Global Unique Identifier) representation.

Functions

DDS_Boolean DDS_GUID_equals (const struct DDS_GUID_t *self, const struct DDS_GUID_t *other)

Compares this GUID with another GUID for equality.

^ void DDS_GUID_copy (struct DDS_GUID_t *self, const struct DDS_GUID_t *other)

Copies another GUID into this GUID.

Variables

^ struct DDS_GUID_t DDS_GUID_AUTO

 $Indicates\ that\ RTI\ Data\ Distribution\ Service\ should\ choose\ an\ appropriate\ virtual\ GUID.$

^ struct DDS_GUID_t DDS_GUID_UNKNOWN

Unknown GUID.

4.11.1 Detailed Description

<< eXtension>> (p. 950) GUID type and defines.

4.11.2 Function Documentation

4.11.2.1 DDS_Boolean DDS_GUID_equals (const struct DDS_GUID_t * self, const struct DDS_GUID_t * other)

Compares this GUID with another GUID for equality.

Parameters:

```
self << in>> (p. 951) This GUID. Cannot be NULL. other << in>> (p. 951) The other GUID to be compared with this GUID. Cannot be NULL.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the two GUIDs have equal values, or **DDS_BOOLEAN_FALSE** (p. 107) otherwise.

4.11.2.2 void DDS_GUID_copy (struct DDS_GUID_t * self, const struct DDS_GUID_t * other)

Copies another GUID into this GUID.

Parameters:

```
self << in>> (p. 951) This GUID. Cannot be NULL. other << in>> (p. 951) The other GUID to be copied.
```

4.11.3 Variable Documentation

4.11.3.1 struct DDS_GUID_t DDS_GUID_AUTO

Indicates that RTI Data Distribution Service should choose an appropriate virtual GUID.

If DDS_{-} this special value isassigned to DataWriterProtocolQosPolicy::virtual_guid (p. 1107)or DDS_{-} DataReaderProtocolQosPolicy::virtual_guid (p. 1070),Distribution Service will assign the virtual GUID automatically based on the RTPS or physical GUID.

4.11.3.2 struct DDS_GUID_t DDS_GUID_UNKNOWN

Unknown GUID.

4.12 Sequence Number Support

<< eXtension>> (p. 950) Sequence number type and defines.

Data Structures

 $\hat{}$ struct DDS_SequenceNumber_t

Type for sequence number representation.

Functions

int DDS_SequenceNumber_compare (const struct DDS_-SequenceNumber_t *sn1, const struct DDS_SequenceNumber_t *sn2)

Compares two sequence numbers.

Variables

^ struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_UNKNOWN

Unknown sequence number.

^ struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_-ZERO

Zero value for the sequence number.

^ struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_-MAX

Highest, most positive value for the sequence number.

4.12.1 Detailed Description

<< eXtension>> (p. 950) Sequence number type and defines.

4.12.2 Function Documentation

4.12.2.1 int DDS_SequenceNumber_compare (const struct DDS_SequenceNumber_t *sn1, const struct DDS_SequenceNumber_t *sn2)

Compares two sequence numbers.

Parameters:

```
sn1 << in>> (p. 951) Sequence number to compare. Cannot be NULL. sn2 << in>> (p. 951) Sequence number to compare. Cannot be NULL.
```

Returns:

If the two sequence numbers are equal, the function returns 0. If sn1 is greater than sn2 the function returns a positive number; otherwise, it returns a negative number.

4.12.3 Variable Documentation

$\begin{array}{ll} \textbf{4.12.3.1} & \textbf{struct DDS_SequenceNumber_t DDS_SEQUENCE_-} \\ & \textbf{NUMBER_UNKNOWN} \end{array}$

Unknown sequence number.

4.12.3.2 struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_ZERO

Zero value for the sequence number.

4.12.3.3 struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_MAX

Highest, most positive value for the sequence number.

4.13 Exception Codes

<< eXtension>> (p. 950) Exception codes.

Enumerations

enum DDS_ExceptionCode_t {
 DDS_NO_EXCEPTION_CODE,
 DDS_USER_EXCEPTION_CODE,
 DDS_SYSTEM_EXCEPTION_CODE,
 DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE,
 DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE,
 DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE,
 DDS_BADKIND_USER_EXCEPTION_CODE,
 DDS_BOUNDS_USER_EXCEPTION_CODE,
 DDS_IMMUTABLE_TYPECODE_SYSTEM_EXCEPTION_CODE
 CODE = 8.

 $\label{eq:double-doub$

Error codes used by the DDS_TypeCode (p. 1463) class.

4.13.1 Detailed Description

<< eXtension>> (p. 950) Exception codes.

These exceptions are used for error handling by the **Type Code Support** (p. 461) API.

4.13.2 Enumeration Type Documentation

4.13.2.1 enum DDS_ExceptionCode_t

Error codes used by the DDS_TypeCode (p. 1463) class.

Exceptions are modeled via a special parameter passed to the operations.

Enumerator:

DDS_NO_EXCEPTION_CODE No failure occurred.

- DDS_USER_EXCEPTION_CODE User exception.
 - This class is based on a similar class in CORBA.
- $DDS_SYSTEM_EXCEPTION_CODE$ System exception.
 - This class is based on a similar class in CORBA.
- DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE Exception thrown when a parameter passed to a call is considered illegal.
- **DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE** Exception thrown when there is not enough memory for a dynamic memory allocation.
- $DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE$

Exception thrown when a malformed type code is found (for example, a type code with an invalid TCKind value).

- **DDS_BADKIND_USER_EXCEPTION_CODE** The exception BadKind is thrown when an inappropriate operation is invoked on a TypeCode object.
- **DDS_BOUNDS_USER_EXCEPTION_CODE** A user exception thrown when a parameter is not within the legal bounds.
- DDS_IMMUTABLE_TYPECODE_SYSTEM_EXCEPTION_CODE
 An attempt was made to modify a DDS_TypeCode (p. 1463) that
 was received from a remote object.

The built-in publication and subscription readers provide access to information about the remote **DDS_DataWriter** (p. 673) and **DDS_DataReader** (p. 783) entities in the distributed system. Among other things, the data from these built-in readers contains the **DDS_TypeCode** (p. 1463) for these entities. Modifying this received **DDS_TypeCode** (p. 1463) is not permitted.

DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE The specified DDS_TypeCode (p. 1463) member name is invalid.

This failure can occur, for example, when querying a field by name when no such name is defined in the type.

See also:

DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE (p. 119)

DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE The specified DDS_TypeCode (p. 1463) member ID is invalid.

This failure can occur, for example, when querying a field by ID when no such ID is defined in the type.

See also:

DDS_BAD_MEMBER_NAME_USER_EXCEPTION_-CODE (p. 119)

4.14 Return Codes

Types of return codes.

Enumerations

```
^ enum DDS_ReturnCode_t {
    DDS_RETCODE_OK,
    DDS_RETCODE_ERROR,
    DDS_RETCODE_UNSUPPORTED,
    DDS_RETCODE_BAD_PARAMETER,
    DDS_RETCODE_PRECONDITION_NOT_MET,
    DDS_RETCODE_OUT_OF_RESOURCES,
    DDS_RETCODE_IMMUTABLE_POLICY,
    DDS_RETCODE_INCONSISTENT_POLICY,
    DDS_RETCODE_ALREADY_DELETED,
    DDS_RETCODE_TIMEOUT,
    DDS_RETCODE_INCONSISTENT_POLICY,
    DDS_RETCODE_ILLEGAL_OPERATION }
    Type for return codes.
```

Types of return codes.

4.14.1

4.14.2 Standard Return Codes

Detailed Description

Any operation with return type DDS_ReturnCode_t (p. 121) may return DDS_RETCODE_OK (p. 121) DDS_RETCODE_ERROR (p. 121) or DDS_RETCODE_ILLEGAL_OPERATION (p. 122). Any operation that takes one or more input parameters may additionally return DDS_RETCODE_BAD_PARAMETER (p. 121). Any operation on an object created from any of the factories may additionally return DDS_RETCODE_ALREADY_DELETED (p. 122). Any operation that is stated as optional may additionally return DDS_RETCODE_UNSUPPORTED (p. 121).

Thus, the standard return codes are:

- ^ DDS_RETCODE_ERROR (p. 121)
- ^ DDS_RETCODE_ILLEGAL_OPERATION (p. 122)
- ^ DDS_RETCODE_ALREADY_DELETED (p. 122)
- ^ DDS_RETCODE_BAD_PARAMETER (p. 121)
- ^ DDS_RETCODE_UNSUPPORTED (p. 121)

Operations that may return any of the additional return codes will state so explicitly.

4.14.3 Enumeration Type Documentation

4.14.3.1 enum DDS_ReturnCode_t

Type for return codes.

Errors are modeled as operation return codes of this type.

Enumerator:

- DDS_RETCODE_OK Successful return.
- $DDS_RETCODE_ERROR$ Generic, unspecified error.
- DDS_RETCODE_UNSUPPORTED Unsupported operation. Can only returned by operations that are unsupported.
- DDS_RETCODE_BAD_PARAMETER Illegal parameter value.

The value of the parameter that is passed in has llegal value. Things that falls into this category includes NULL parameters and parameter values that are out of range.

 $DDS_RETCODE_PRECONDITION_NOT_MET$ A pre-condition for the operation was not met.

The system is not in the expected state when the function is called, or the parameter itself is not in the expected state when the function is called.

- $DDS_RETCODE_OUT_OF_RESOURCES$ RTI Data Distribution Service ran out of the resources needed to complete the operation.
- DDS_RETCODE_NOT_ENABLED Operation invoked on a DDS_Entity (p. 242) that is not yet enabled.
- DDS_RETCODE_IMMUTABLE_POLICY Application attempted to modify an immutable QoS policy.

- DDS_RETCODE_INCONSISTENT_POLICY Application specified a set of QoS policies that are not consistent with each other.
- **DDS_RETCODE_ALREADY_DELETED** The object target of this operation has already been deleted.
- $DDS_{-}RETCODE_{-}TIMEOUT$ The operation timed out.
- **DDS_RETCODE_NO_DATA** Indicates a transient situation where the operation did not return any data but there is no inherent error.
- **DDS_RETCODE_ILLEGAL_OPERATION** The operation was called under improper circumstances.

An operation was invoked on an inappropriate object or at an inappropriate time. This return code is similar to **DDS_RETCODE_-PRECONDITION_NOT_MET** (p. 121), except that there is no precondition that could be changed to make the operation succeed.

4.15 Status Kinds 123

4.15 Status Kinds

Kinds of communication status.

Defines

 $\hat{\ }$ #define $\mathbf{DDS_STATUS_MASK_NONE}$

No bits are set.

 $\hat{\ }$ #define $\mathbf{DDS_STATUS_MASK_ALL}$

All bits are set.

Typedefs

^ typedef DDS_UnsignedLong DDS_StatusMask

A bit-mask (list) of concrete status types, i.e. DDS_StatusKind (p. 128)[].

Enumerations

^ enum **DDS_StatusKind** {

DDS_INCONSISTENT_TOPIC_STATUS,

DDS_OFFERED_DEADLINE_MISSED_STATUS,

DDS_REQUESTED_DEADLINE_MISSED_STATUS,

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS,

DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS,

 $\mathbf{DDS_SAMPLE_LOST_STATUS},$

DDS_SAMPLE_REJECTED_STATUS,

DDS_DATA_ON_READERS_STATUS,

DDS_DATA_AVAILABLE_STATUS,

DDS_LIVELINESS_LOST_STATUS,

DDS_LIVELINESS_CHANGED_STATUS,

DDS_PUBLICATION_MATCHED_STATUS,

DDS_SUBSCRIPTION_MATCHED_STATUS,

DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS,

DDS_RELIABLE_READER_ACTIVITY_CHANGED_STATUS,

DDS_DATA_WRITER_CACHE_STATUS,

DDS_DATA_WRITER_PROTOCOL_STATUS,
DDS_DATA_READER_CACHE_STATUS,
DDS_DATA_READER_PROTOCOL_STATUS }

Type for status kinds.

4.15.1 Detailed Description

Kinds of communication status.

```
Entity:
```

```
DDS_Entity (p. 242)
```

QoS:

```
QoS Policies (p. 137)
```

Listener:

```
DDS_Listener (p. 1246)
```

Each concrete **DDS_Entity** (p. 242) is associated with a set of Status objects whose value represents the communication status of that entity. Each status value can be accessed with a corresponding function on the **DDS_Entity** (p. 242).

When these status values change, the corresponding DDS_StatusCondition (p. 253) objects are activated and the proper DDS_Listener (p. 1246) objects are invoked to asynchronously inform the application.

An application is notified of communication status by means of the $DDS_Listener$ (p. 1246) or the $DDS_WaitSet$ (p. 253) / $DDS_Condition$ (p. 252) mechanism. The two mechanisms may be combined in the application (e.g., using $DDS_WaitSet$ (p. 253) (s) / $DDS_Condition$ (p. 252) (s) to access the data and $DDS_Listener$ (p. 1246) (s) to be warned asynchronously of erroneous communication statuses).

It is likely that the application will choose one or the other mechanism for each particular communication status (not both). However, if both mechanisms are enabled, then the **DDS_Listener** (p. 1246) mechanism is used first and then the **DDS_WaitSet** (p. 253) objects are signalled.

The statuses may be classified into:

^ read communication statuses: i.e., those that are related to arrival of data, namely DDS_DATA_ON_READERS_STATUS (p. 130) and DDS_DATA_AVAILABLE_STATUS (p. 130).

plain communication statuses: i.e., all the others.

Read communication statuses are treated slightly differently than the others because they don't change independently. In other words, at least two changes will appear at the same time (DDS_DATA_ON_READERS_STATUS (p. 130) and DDS_DATA_AVAILABLE_STATUS (p. 130)) and even several of the last kind may be part of the set. This 'grouping' has to be communicated to the application.

For each plain communication status, there is a corresponding structure to hold the status value. These values contain the information related to the change of status, as well as information related to the statuses themselves (e.g., contains cumulative counts).

4.15.2 Changes in Status

Associated with each one of an **DDS_Entity** (p. 242)'s communication status is a logical StatusChangedFlag. This flag indicates whether that particular communication status has changed since the last time the status was read by the application. The way the status changes is slightly different for the Plain Communication Status and the Read Communication status.

4.15.2.1 Changes in plain communication status

For the plain communication status, the StatusChangedFlag flag is initially set to FALSE. It becomes TRUE whenever the plain communication status changes and it is reset to DDS_BOOLEAN_FALSE (p. 107) each time the application accesses the plain communication status via the proper get_<plain communication status>() operation on the DDS_Entity (p. 242).

The communication status is also reset to FALSE whenever the associated listener operation is called as the listener implicitly accesses the status which is passed as a parameter to the operation. The fact that the status is reset prior to calling the listener means that if the application calls the get_<plain communication status> from inside the listener it will see the status already reset.

An exception to this rule is when the associated listener is the 'nil' listener. The 'nil' listener is treated as a NOOP and the act of calling the 'nil' listener does not reset the communication status.

For example, the value of the StatusChangedFlag associated with the DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 129) will become TRUE each time new deadline occurs (which increases the DDS_RequestedDeadlineMissedStatus::total_count (p. 1352) field). The value changes to FALSE when the application accesses the status via the corresponding DDS_DataReader_get_requested_deadline_missed_status

(p. 833) method on the proper Entity

4.15.2.2 Changes in read communication status

For the read communication status, the StatusChangedFlag flag is initially set to FALSE. The StatusChangedFlag becomes TRUE when either a data-sample arrives or else the DDS_ViewStateKind (p. 850), DDS_SampleStateKind (p. 848), or DDS_InstanceStateKind (p. 853) of any existing sample changes for any reason other than a call to FooDataReader_read (p. 788), FooDataReader_take (p. 789) or their variants. Specifically any of the following events will cause the StatusChangedFlag to become TRUE:

- ^ The arrival of new data.
- ^ A change in the **DDS_InstanceStateKind** (p. 853) of a contained instance. This can be caused by either:
 - The arrival of the notification that an instance has been disposed by:
 - * the DDS_DataWriter (p. 673) that owns it if OWNERSHIP (p. 159) QoS kind= DDS_EXCLUSIVE_OWNERSHIP_QOS (p. 160)
 - * or by any DDS_DataWriter (p. 673) if OWNERSHIP (p. 159) QoS kind= DDS_SHARED_OWNERSHIP_QOS (p. 160)
 - The loss of liveliness of the **DDS_DataWriter** (p. 673) of an instance for which there is no other **DDS_DataWriter** (p. 673).
 - The arrival of the notification that an instance has been unregistered by the only DDS_DataWriter (p. 673) that is known to be writing the instance.

Depending on the kind of StatusChangedFlag, the flag transitions to FALSE again as follows:

- The DDS_DATA_AVAILABLE_STATUS (p. 130) StatusChangedFlag becomes FALSE when either the corresponding listener operation (on_data_available) is called or the read or take operation (or their variants) is called on the associated DDS_DataReader (p. 783).
- The DDS_DATA_ON_READERS_STATUS (p. 130) StatusChangedFlag becomes FALSE when any of the following events occurs:
 - The corresponding listener operation (on_data_on_readers) is called.

4.15 Status Kinds 127

- The on_data_available listener operation is called on any **DDS_**-**DataReader** (p. 783) belonging to the **DDS_Subscriber** (p. 743).
- The read or take operation (or their variants) is called on any DDS_-DataReader (p. 783) belonging to the DDS_Subscriber (p. 743).

```

4.15.3 Define Documentation

4.15.3.1 #define DDS_STATUS_MASK_NONE

No bits are set.

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

4.15.3.2 #define DDS_STATUS_MASK_ALL

All bits are set.

Examples:

HelloWorld_subscriber.c.

4.15.4 Typedef Documentation

4.15.4.1 typedef DDS_UnsignedLong DDS_StatusMask

A bit-mask (list) of concrete status types, i.e. DDS_StatusKind (p. 128)[].

The bit-mask is an efficient and compact representation of a fixed-length list of $\mathbf{DDS_StatusKind}$ (p. 128) values.

Bits in the mask correspond to different statuses. You can choose which changes in status will trigger a callback by setting the corresponding status bits in this bit-mask and installing callbacks for each of those statuses.

The bits that are true indicate that the listener will be called back for changes in the corresponding status.

For example:

4.15.5 Enumeration Type Documentation

4.15.5.1 enum DDS_StatusKind

Type for *status* kinds.

Each concrete **DDS_Entity** (p. 242) is associated with a set of *Status objects whose values represent the communication status of that **DDS_Entity** (p. 242).

The communication statuses whose changes can be communicated to the application depend on the **DDS_Entity** (p. 242).

Each status value can be accessed with a corresponding function on the **DDS_-Entity** (p. 242). The changes on these status values cause activation of the corresponding

DDS_StatusCondition (p. 253) objects and trigger invocation of

the proper $\mathbf{DDS_Listener}$ (p. 1246) objects to asynchronously inform the application.

See also:

```
\mathbf{DDS\_Entity} (p. 242), \mathbf{DDS\_StatusCondition} (p. 253), \mathbf{DDS\_Listener} (p. 1246)
```

Enumerator:

```
DDS\_INCONSISTENT\_TOPIC\_STATUS Another topic exists with the same name but different characteristics.
```

Entity:

```
DDS_Topic (p. 425)
```

Status:

DDS_InconsistentTopicStatus (p. 1233)

Listener:

DDS_TopicListener (p. 1441)

4.15 Status Kinds 129

```
DDS_OFFERED_DEADLINE_MISSED_STATUS The
                                                        deadline
    that the DDS_DataWriter (p. 673) has committed through its
    DDS_DeadlineQosPolicy (p. 1135) was not respected for a specific
    instance.

DDS_PUBLICATION_MATCHED_STATUS The
                                                        DDS_{-}
    DataWriter (p. 673) has found DDS_DataReader (p. 783)
    that matches the DDS_Topic (p. 425) and has compatible QoS.
    Entity:
       DDS_DataWriter (p. 673)
    Status:
       DDS_PublicationMatchedStatus (p. 1323)
   Listener:
       DDS_DataWriterListener (p. 1102)
```

```
DDS_SUBSCRIPTION_MATCHED_STATUS The DDS_DataReader (p. 783) has found DDS_DataWriter (p. 673) that matches the DDS_Topic (p. 425) and has compatible QoS.
```

Entity:

DDS_DataReader (p. 783)

Status:

DDS_SubscriptionMatchedStatus (p. 1420)

Listener:

DDS_DataReaderListener (p. 1065)

$DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS$

<< eXtension>> (p. 950) The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point.

This status is considered changed at the following times: the cache is empty (i.e. contains no unacknowledge samples), full (i.e. the sample count has reached the value specified in DDS_ResourceLimitsQosPolicy::max_samples (p. 1358)), or the number of samples has reached a high (see DDS_RtpsReliableWriterProtocol_t::high_watermark (p. 1367)) or low (see DDS_RtpsReliableWriterProtocol_t::low_watermark (p. 1366)) watermark.

Entity:

DDS_DataWriter (p. 673)

Status:

DDS_ReliableWriterCacheChangedStatus (p. 1348)

Listener:

DDS_DataWriterListener (p. 1102)

$DDS_RELIABLE_READER_ACTIVITY_CHANGED_STATUS$

<< eXtension>> (p. 950) One or more reliable readers has become active or inactive.

A reliable reader is considered active by a reliable writer with which it is matched if that reader acknowledges the samples it has been sent in a timely fashion. For the definition of "timely" in this case, see DDS_RtpsReliableWriterProtocol_t (p. 1364) and DDS_ReliableReaderActivityChangedStatus (p. 1346).

See also:

DDS_RtpsReliableWriterProtocol_t (p. 1364)
DDS_ReliableReaderActivityChangedStatus (p. 1346)

4.15 Status Kinds

- $DDS_DATA_WRITER_CACHE_STATUS << eXtension>> (p. 950)$ The status of the writer's cache.
- DDS_DATA_WRITER_PROTOCOL_STATUS << eXtension>> (p. 950) The status of a writer's internal protocol related metrics. The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.
- $DDS_DATA_READER_CACHE_STATUS << eXtension>> (p. 950)$ The status of the reader's cache.
- DDS_DATA_READER_PROTOCOL_STATUS << eXtension>> (p. 950) The status of a reader's internal protocol related metrics. The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

4.16 Thread Settings

The properties of a thread of execution.

Data Structures

^ struct DDS_ThreadSettings_t

The properties of a thread of execution.

Defines

*#define DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT

The mask of default thread options.

Typedefs

* typedef DDS_UnsignedLong DDS_ThreadSettingsKindMask
A mask of which each bit is taken from DDS_ThreadSettingsKind (p. 135).

Enumerations

^ enum DDS_ThreadSettingsKind {
 DDS_THREAD_SETTINGS_FLOATING_POINT,
 DDS_THREAD_SETTINGS_STDIO,
 DDS_THREAD_SETTINGS_REALTIME_PRIORITY,
 DDS_THREAD_SETTINGS_PRIORITY_ENFORCE }

 $A\ collection\ of\ flags\ used\ to\ configure\ threads\ of\ execution.$

`enum DDS_ThreadSettingsCpuRotationKind {
 DDS_THREAD_SETTINGS_CPU_NO_ROTATION,
 DDS_THREAD_SETTINGS_CPU_RR_ROTATION }

Determines how DDS_ThreadSettings_t::cpu_list (p. 1426) affects processor affinity for thread-related QoS policies that apply to multiple threads.

4.16.1 Detailed Description

The properties of a thread of execution.

4.16.2 Define Documentation

$\begin{array}{ccc} 4.16.2.1 & \# define \ DDS_THREAD_SETTINGS_KIND_MASK_-\\ DEFAULT & \end{array}$

The mask of default thread options.

4.16.3 Typedef Documentation

4.16.3.1 typedef DDS_UnsignedLong DDS_-ThreadSettingsKindMask

A mask of which each bit is taken from DDS_ThreadSettingsKind (p. 135).

See also:

DDS_ThreadSettings_t (p. 1425)

4.16.4 Enumeration Type Documentation

4.16.4.1 enum DDS_ThreadSettingsKind

A collection of flags used to configure threads of execution.

Not all of these options may be relevant for all operating systems.

See also:

DDS_ThreadSettingsKindMask (p. 135)

Enumerator:

- **DDS_THREAD_SETTINGS_FLOATING_POINT** Code executed within the thread may perform floating point operations.
- **DDS_THREAD_SETTINGS_STDIO** Code executed within the thread may access standard I/O.
- DDS_THREAD_SETTINGS_REALTIME_PRIORITY The thread will be schedule on a real-time basis.
- **DDS_THREAD_SETTINGS_PRIORITY_ENFORCE** Strictly enforce this thread's priority.

4.16.4.2 enum DDS_ThreadSettingsCpuRotationKind

Determines how **DDS_ThreadSettings_t::cpu_list** (p. 1426) affects processor affinity for thread-related QoS policies that apply to multiple threads.

4.16.5 Controlling CPU Core Affinity for RTI Threads

Most thread-related QoS settings apply to a single thread (such as for the DDS_EventQosPolicy (p. 1213), DDS_DatabaseQosPolicy (p. 1059), and DDS_AsynchronousPublisherQosPolicy (p. 1035)). However, the thread settings in the DDS_ReceiverPoolQosPolicy (p. 1339) control every receive thread created. In this case, there are several schemes to map M threads to N processors; the rotation kind controls which scheme is used.

If DDS_ThreadSettings_t::cpu_list (p. 1426) is empty, the rotation is irrelevant since no affinity adjustment will occur. Suppose instead that DDS_ThreadSettings_t::cpu_list (p. 1426) = {0, 1} and that the middleware creates three receive threads: {A, B, C}. If DDS_ThreadSettings_t::cpu_rotation (p. 1426) is DDS_THREAD_SETTINGS_CPU_NO_ROTATION (p. 136), threads A, B and C will have the same processor affinities (0-1), and the OS will control thread scheduling within this bound. It is common to denote CPU affinities as a bitmask, where set bits represent allowed processors to run on. This mask is printed in hex, so a CPU core affinity of 0-1 can be represented by the mask 0x3.

If DDS_ThreadSettings_t::cpu_rotation (p. 1426) is DDS_THREAD_SETTINGS_CPU_RR_ROTATION (p. 136), each thread will be assigned in round-robin fashion to one of the processors in DDS_ThreadSettings_t::cpu_list (p. 1426); perhaps thread A to 0, B to 1, and C to 0. Note that the order in which internal middleware threads spawn is unspecified.

Not all of these options may be relevant for all operating systems.

Enumerator:

- DDS_THREAD_SETTINGS_CPU_NO_ROTATION Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.
- DDS_THREAD_SETTINGS_CPU_RR_ROTATION Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

4.17 QoS Policies

Quality of Service (QoS) policies.

Modules

^ USER_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

^ TOPIC_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

^ GROUP_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

^ DURABILITY

This QoS policy specifies whether or not RTI Data Distribution Service will store and deliver previously published data samples to new **DDS**_-**DataReader** (p. 783) entities that join the network later.

^ PRESENTATION

Specifies how the samples representing changes to data instances are presented to a subscribing application.

^ DEADLINE

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

^ LATENCY_BUDGET

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

^ OWNERSHIP

Specifies whether it is allowed for multiple DDS_DataWriter (p. 673) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

^ OWNERSHIP_STRENGTH

Specifies the value of the strength used to arbitrate among multiple DDS_-DataWriter (p. 673) objects that attempt to modify the same instance of a data type (identified by DDS_Topic (p. 425) + key).

^ LIVELINESS

Specifies and configures the mechanism that allows DDS_DataReader (p. 783) entities to detect when DDS_DataWriter (p. 673) entities become disconnected or "dead.".

^ TIME_BASED_FILTER

Filter that allows a DDS_DataReader (p. 783) to specify that it is interested only in (potentially) a subset of the values of the data.

^ PARTITION

Set of strings that introduces a logical partition among the topics visible by a DDS_Publisher (p. 632) and a DDS_Subscriber (p. 743).

^ RELIABILITY

 $Indicates\ the\ level\ of\ reliability\ offered/requested\ by\ RTI\ Data\ Distribution\ Service.$

^ DESTINATION_ORDER

Controls the criteria used to determine the logical order among changes made by DDS_Publisher (p. 632) entities to the same instance of data (i.e., matching DDS_Topic (p. 425) and key).

^ HISTORY

Specifies the behavior of RTI Data Distribution Service in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

^ DURABILITY_SERVICE

Various settings to configure the external RTI Persistence Service used by RTI Data Distribution Service for DataWriters with a DDS_DurabilityQosPolicy (p. 1181) setting of DDS_PERSISTENT_DURABILITY_QOS (p. 154) or DDS_TRANSIENT_DURABILITY_QOS (p. 154).

^ RESOURCE_LIMITS

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

^ TRANSPORT_PRIORITY

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

` LIFESPAN

Specifies how long the data written by the DDS_DataWriter (p. 673) is considered valid.

^ WRITER_DATA_LIFECYCLE

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

^ READER_DATA_LIFECYCLE

Controls how a DataReader manages the lifecycle of the data that it has received.

^ ENTITY_FACTORY

A QoS policy for all **DDS_Entity** (p. 242) types that can act as factories for one or more other **DDS_Entity** (p. 242) types.

^ Extended Qos Support

<<eXtension>> (p. 950) Types and defines used in extended QoS policies.

^ TRANSPORT_SELECTION

 $<<\!\!\!\!$ eXtension>> (p. 950) Specifies the physical transports a $DDS_DataWriter$ (p. 673) or $DDS_DataReader$ (p. 783) may use to send or receive data.

^ TRANSPORT_UNICAST

<<eXtension>> (p. 950) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

^ TRANSPORT_MULTICAST

<<extension>> (p. 950) Specifies the multicast address on which a DDS_DataReader (p. 783) wants to receive its data. It can also specify a port number as well as a subset of the available (at the DDS_DomainParticipant (p. 339) level) transports with which to receive the multicast data.

^ DISCOVERY

<<extension>> (p. 950) Specifies the attributes required to discover participants in the domain.

^ TRANSPORT_BUILTIN

<<eXtension>> (p. 950) Specifies which built-in transports are used.

^ WIRE_PROTOCOL

<<eXtension>> (p. 950) Specifies the wire protocol related attributes for the DDS_DomainParticipant (p. 339).

^ DATA_READER_RESOURCE_LIMITS

<<eXtension>> (p. 950) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

^ DATA_WRITER_RESOURCE_LIMITS

<<extension>> (p. 950) Various settings that configure how a DDS_-DataWriter (p. 673) allocates and uses physical memory for internal resources.

^ DATA_READER_PROTOCOL

<<eXtension>> (p. 950) Specifies the DataReader-specific protocol QoS.

^ DATA_WRITER_PROTOCOL

<<extension>> (p. 950) Along with DDS_WireProtocolQosPolicy (p. 1483) and DDS_DataReaderProtocolQosPolicy (p. 1069), this QoS policy configures the DDS on-the-network protocol (RTPS).

^ SYSTEM_RESOURCE_LIMITS

<<eXtension>> (p. 950) Configures DomainParticipant-independent resources used by RTI Data Distribution Service.

^ DOMAIN_PARTICIPANT_RESOURCE_LIMITS

<<eXtension>> (p.950) Various settings that configure how a DDS_-DomainParticipant (p. 339) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

^ EVENT

<<eXtension>> (p. 950) Configures the internal thread in a DomainParticipant that handles timed events.

^ DATABASE

<<**eXtension**>> (p. 950) Various threads and resource limits settings used by RTI Data Distribution Service to control its internal database.

^ RECEIVER_POOL

<<extension>> (p. 950) Configures threads used by RTI Data Distribution Service to receive and process data from transports (for example, UDP sockets).

^ PUBLISH_MODE

<<extension>> (p. 950) Specifies how RTI Data Distribution Service sends application data on the network. This QoS policy can be used to tell RTI Data Distribution Service to use its own thread to send data, instead of the user thread.

^ DISCOVERY_CONFIG

<<e**xtension**>> (p. 950) Specifies the discovery configuration QoS.

^ TYPESUPPORT

<<extension>> (p. 950) Allows you to attach application-specific values to a DataWriter or DataReader that are passed to the serialization or deserialization routine of the associated data type.

^ ASYNCHRONOUS_PUBLISHER

<<eXtension>> (p. 950) Specifies the asynchronous publishing settings of the DDS_Publisher (p. 632) instances.

^ EXCLUSIVE_AREA

<<eXtension>> (p. 950) Configures multi-thread concurrency and dead-lock prevention capabilities.

^ BATCH

<<eXtension>> (p. 950) Batch QoS policy used to enable batching in DDS_DataWriter (p. 673) instances.

^ LOCATORFILTER

<<eXtension>> (p. 950) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of DDS_-PublicationBuiltinTopicData (p. 1313).

^ MULTICHANNEL

<<eXtension>> (p.950) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

^ PROPERTY

<<extension>> (p. 950) Stores name/value (string) pairs that can be used to configure certain parameters of RTI Data Distribution Service that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

ENTITY_NAME

<<extension>> (p. 950) Assigns a name to a DDS_DomainParticipant (p. 339). This name will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

^ PROFILE

<<eXtension>> (p. 950) Configures the way that XML documents containing QoS profiles are loaded by RTI Data Distribution Service.

Data Structures

^ struct DDS_QosPolicyCount

Type to hold a counter for a DDS_QosPolicyId_t (p. 146).

^ struct DDS_QosPolicyCountSeq

Declares IDL sequence $< DDS_{-}QosPolicyCount$ (p. 1334) >.

Type to identify QosPolicies.

4.17.1 Detailed Description

Quality of Service (QoS) policies.

Data Distribution Service (DDS) relies on the use of QoS. A QoS is a set of characteristics that controls some aspect of the behavior of DDS. A QoS is comprised of individual QoS policies (objects conceptually deriving from an abstract QosPolicy class).

The QosPolicy provides the basic mechanism for an application to specify quality of service parameters. It has an attribute name that is used to uniquely identify each QosPolicy.

QosPolicy implementation is comprised of a name, an ID, and a type. The type of a QosPolicy value may be atomic, such as an integer or float, or compound (a structure). Compound types are used whenever multiple parameters must be set coherently to define a consistent value for a QosPolicy.

QoS (i.e., a list of QosPolicy objects) may be associated with all DDS_-Entity (p. 242) objects in the system such as DDS_Topic (p. 425), DDS_DataWriter (p. 673), DDS_DataReader (p. 783), DDS_Publisher (p. 632), DDS_Subscriber (p. 743), and DDS_DomainParticipant (p. 339).

4.17.2 Specifying QoS on entities

QosPolicies can be set programmatically when an **DDS_Entity** (p. 242) is created, or modified with the **DDS_Entity** (p. 242)'s **set_qos** (abstract) (p. 243) function.

QosPolicies can also be configured from XML resources (files, strings). With this approach, you can change the QoS without recompiling the application. For more information, see Configuring QoS Profiles with XML (p. 896).

To customize a **DDS_Entity** (p. 242)'s QoS before creating the entity, the correct pattern is:

- First, initialize a QoS object with the appropriate INITIALIZER constant.
- ^ Call the relevant get_<entity>_default_qos() method.
- ^ Modify the QoS values as desired.
- ^ Finally, create the entity.

Each QosPolicy is treated independently from the others. This approach has the advantage of being very extensible. However, there may be cases where several policies are in conflict. Consistency checking is performed each time the policies are modified via the **set_qos** (abstract) (p. 243) operation, or when the **DDS_Entity** (p. 242) is created.

When a policy is changed after being set to a given value, it is not required that the new value be applied instantaneously; RTI Data Distribution Service is allowed to apply it after a transition phase. In addition, some QosPolicy have immutable semantics, meaning that they can only be specified either at DDS_Entity (p. 242) creation time or else prior to calling the DDS_Entity_enable (p. 245) operation on the entity.

Each **DDS_Entity** (p. 242) can be configured with a list of QosPolicy objects. However, not all QosPolicies are supported by each **DDS_Entity** (p. 242). For instance, a **DDS_DomainParticipant** (p. 339) supports a different set of QosPolicies than a **DDS_Topic** (p. 425) or a **DDS_Publisher** (p. 632).

4.17.3 QoS compatibility

In several cases, for communications to occur properly (or efficiently), a QosPolicy on the publisher side must be compatible with a corresponding policy on the subscriber side. For example, if a **DDS_Subscriber** (p. 743) requests to receive data reliably while the corresponding **DDS_Publisher** (p. 632) defines a best-effort policy, communication will not happen as requested.

To address this issue and maintain the desirable decoupling of publication and subscription as much as possible, the QosPolicy specification follows the subscriber-requested, publisher-offered pattern.

In this pattern, the subscriber side can specify a "requested" value for a particular QosPolicy. The publisher side specifes an "offered" value for that QosPolicy. RTI Data Distribution Service will then determine whether the value requested by the subscriber side is compatible with what is offered by the publisher side. If the two policies are compatible, then communication will be established. If the two policies are not compatible, RTI Data Distribution Service will not establish communications between the two DDS_-Entity (p. 242) objects and will record this fact by means of the DDS_-OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129) on the publisher end and DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129) on the subscriber end. The application can detect this fact by means of a DDS_Listener (p. 1246) or a DDS_Condition (p. 252).

The following **properties** are defined on a QosPolicy.

RxO (p. 145) property

The QosPolicy objects that need to be set in a compatible manner between the **publisher** and **subscriber** end are indicated by the setting of the **RxO** (p. 145) property:

- RxO (p. 145) = YES indicates that the policy can be set both at the publishing and subscribing ends and the values must be set in a compatible manner. In this case the compatible values are explicitly defined.
- RxO (p. 145) = NO indicates that the policy can be set both at the publishing and subscribing ends but the two settings are independent.
 That is, all combinations of values are compatible.
- **RxO** (p. 145) = **N/A** indicates that the policy can only be specified at either the publishing or the subscribing end, but not at both ends.

So compatibility does not apply.

Changeable (p. 146) property

Determines whether a QosPolicy can be changed.

 ${\bf NO}$ (p. 146) – policy can only be specified at ${\bf DDS_Entity}$ (p. 242) creation time.

UNTIL ENABLE (p. 146) – policy can only be changed before the DDS_Entity (p. 242) is enabled.

YES (p. 146) – policy can be changed at any time.

4.17.4 Enumeration Type Documentation

4.17.4.1 enum DDS_QosPolicyId_t

Type to identify QosPolicies.

Enumerator:

- DDS_INVALID_QOS_POLICY_ID Identifier for an invalid QoS policy.
- DDS_USERDATA_QOS_POLICY_ID Identifier for DDS_-UserDataQosPolicy (p. 1474).

4.18 USER_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Data Structures

^ struct DDS_UserDataQosPolicy

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Variables

^ const char *const **DDS_USERDATA_QOS_POLICY_NAME**Stringified human-readable name for **DDS_UserDataQosPolicy** (p. 1474).

4.18.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

4.18.2 Variable Documentation

4.18.2.1 const char* const DDS_USERDATA_QOS_POLICY_NAME

Stringified human-readable name for DDS_UserDataQosPolicy (p. 1474).

4.19 TOPIC_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Data Structures

^ struct DDS_TopicDataQosPolicy

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Variables

^ const char *const DDS_TOPICDATA_QOS_POLICY_NAME

Stringified human-readable name for DDS_TopicDataQosPolicy
(p. 1439).

4.19.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

4.19.2 Variable Documentation

4.19.2.1 const char* const DDS_TOPICDATA_QOS_POLICY_NAME

Stringified human-readable name for DDS_TopicDataQosPolicy (p. 1439).

4.20 GROUP_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Data Structures

^ struct DDS_GroupDataQosPolicy

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Variables

^ const char *const DDS_GROUPDATA_QOS_POLICY_NAME

Stringified human-readable name for DDS_GroupDataQosPolicy
(p. 1226).

4.20.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

4.20.2 Variable Documentation

 $\begin{array}{ll} \textbf{4.20.2.1} & \textbf{const char}* \textbf{ const DDS_GROUPDATA_QOS_POLICY_-} \\ \textbf{NAME} \end{array}$

Stringified human-readable name for DDS_GroupDataQosPolicy (p. 1226).

4.21 DURABILITY

This QoS policy specifies whether or not RTI Data Distribution Service will store and deliver previously published data samples to new **DDS_DataReader** (p. 783) entities that join the network later.

Data Structures

^ struct DDS_DurabilityQosPolicy

This QoS policy specifies whether or not RTI Data Distribution Service will store and deliver previously published data samples to new **DDS_-DataReader** (p. 783) entities that join the network later.

Enumerations

num DDS_DurabilityQosPolicyKind {
 DDS_VOLATILE_DURABILITY_QOS,
 DDS_TRANSIENT_LOCAL_DURABILITY_QOS,
 DDS_TRANSIENT_DURABILITY_QOS,
 DDS_PERSISTENT_DURABILITY_QOS }

Kinds of durability.

Variables

^ const char *const DDS_DURABILITY_QOS_POLICY_NAME

Stringified human-readable name for DDS_DurabilityQosPolicy (p. 1181).

4.21.1 Detailed Description

This QoS policy specifies whether or not RTI Data Distribution Service will store and deliver previously published data samples to new **DDS_DataReader** (p. 783) entities that join the network later.

4.21.2 Enumeration Type Documentation

4.21.2.1 enum DDS_DurabilityQosPolicyKind

Kinds of durability.

QoS:

DDS_DurabilityQosPolicy (p. 1181)

Enumerator:

DDS_VOLATILE_DURABILITY_QOS [default] RTI Data Distribution Service does not need to keep any samples of data instances on behalf of any DDS_DataReader (p. 783) that is unknown by the DDS_DataWriter (p. 673) at the time the instance is written.

In other words, RTI Data Distribution Service will only attempt to provide the data to existing subscribers.

DDS_TRANSIENT_LOCAL_DURABILITY_QOS
RTI Data Distribution Service will attempt to keep some samples so that they can be delivered to any potential late-joining DDS_DataReader (p. 783).
Which particular samples are kept depends on other QoS such as DDS_HistoryQosPolicy (p. 1229) and DDS_ResourceLimitsQosPolicy (p. 1356).
RTI Data Distribution Service is only required to keep the data in memory of the DDS_DataWriter (p. 673) that wrote the data.

Data is not required to survive the **DDS_DataWriter** (p. 673).

For this setting to be effective, you must also set the DDS_ReliabilityQosPolicy::kind (p. 1344) to DDS_RELIABLE_RELIABILITY_QOS (p. 167).

DDS_TRANSIENT_DURABILITY_QOS RTI Data Distribution Service will attempt to keep some samples so that they can be delivered to any potential late-joining DDS_DataReader (p. 783).

Which particular samples are kept depends on other QoS such as $\mathbf{DDS_HistoryQosPolicy}$ (p. 1229) and $\mathbf{DDS_ResourceLimitsQosPolicy}$ (p. 1356). RTI Data Distribution Service is only required to keep the data in memory and not in permanent storage.

Data is not tied to the lifecycle of the **DDS_DataWriter** (p. 673). Data will survive the **DDS_DataWriter** (p. 673).

DDS_PERSISTENT_DURABILITY_QOS Data is kept on permanent storage, so that they can outlive a system session.

4.21.3 Variable Documentation

4.21.3.1 const char* const DDS_DURABILITY_QOS_POLICY_NAME

Stringified human-readable name for DDS_DurabilityQosPolicy (p. 1181).

4.22 PRESENTATION

Specifies how the samples representing changes to data instances are presented to a subscribing application.

Data Structures

^ struct DDS_PresentationQosPolicy

Specifies how the samples representing changes to data instances are presented to a subscribing application.

Enumerations

^ enum DDS_PresentationQosPolicyAccessScopeKind {
 DDS_INSTANCE_PRESENTATION_QOS,
 DDS_TOPIC_PRESENTATION_QOS,
 DDS_GROUP_PRESENTATION_QOS }

Kinds of presentation "access scope".

Variables

^ const char *const **DDS_PRESENTATION_QOS_POLICY_- NAME**

Stringified human-readable name for $DDS_PresentationQosPolicy$ (p. 1297).

4.22.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

4.22.2 Enumeration Type Documentation

4.22.2.1 enum DDS_PresentationQosPolicyAccessScopeKind

Kinds of presentation "access scope".

Access scope determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

QoS:

DDS_PresentationQosPolicy (p. 1297)

Enumerator:

DDS_INSTANCE_PRESENTATION_QOS [default] Scope spans only a single instance.

Indicates that changes to one instance need not be coherent nor ordered with respect to changes to any other instance. In other words, order and coherent changes apply to each instance separately.

- DDS_GROUP_PRESENTATION_QOS [Not supported (optional)] Scope spans to all instances belonging to DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)) entities within the same DDS_Publisher (p. 632) (or DDS_Subscriber (p. 743)).

4.22.3 Variable Documentation

4.22.3.1 const char* const DDS_PRESENTATION_QOS_POLICY_NAME

Stringified human-readable name for DDS_PresentationQosPolicy (p. 1297).

4.23 DEADLINE 157

4.23 DEADLINE

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Data Structures

^ struct DDS_DeadlineQosPolicy

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Variables

^ const char *const DDS_DEADLINE_QOS_POLICY_NAME

Stringified human-readable name for DDS_DeadlineQosPolicy (p. 1135).

4.23.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

4.23.2 Variable Documentation

4.23.2.1 const char* const DDS_DEADLINE_QOS_POLICY_NAME

Stringified human-readable name for $\mathbf{DDS_DeadlineQosPolicy}$ (p. 1135).

4.24 LATENCY_BUDGET

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Data Structures

 $\hat{\ }$ struct DDS_LatencyBudgetQosPolicy

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Variables

^ const char *const DDS_LATENCYBUDGET_QOS_POLICY_-NAME

Stringified human-readable name for $DDS_LatencyBudgetQosPolicy$ (p. 1242).

4.24.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

4.24.2 Variable Documentation

$\begin{array}{ll} \textbf{4.24.2.1} & \textbf{const char* const DDS_LATENCYBUDGET_QOS_-} \\ \textbf{POLICY_NAME} \end{array}$

Stringified human-readable name for **DDS_LatencyBudgetQosPolicy** (p. 1242).

4.25 OWNERSHIP

Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 673) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Data Structures

^ struct DDS_OwnershipQosPolicy

Specifies whether it is allowed for multiple DDS_DataWriter (p. 673) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Enumerations

^ enum DDS_OwnershipQosPolicyKind {
 DDS_SHARED_OWNERSHIP_QOS,
 DDS_EXCLUSIVE_OWNERSHIP_QOS }

Kinds of ownership.

Variables

^ const char *const DDS_OWNERSHIP_QOS_POLICY_NAME
 Stringified human-readable name for DDS_OwnershipQosPolicy
 (p. 1280).

4.25.1 Detailed Description

Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 673) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

4.25.2 Enumeration Type Documentation

4.25.2.1 enum DDS_OwnershipQosPolicyKind

Kinds of ownership.

QoS:

DDS_OwnershipQosPolicy (p. 1280)

Enumerator:

DDS_SHARED_OWNERSHIP_QOS [default] Indicates shared ownership for each instance.

Multiple writers are allowed to update the same instance and all the updates are made available to the readers. In other words there is no concept of an owner for the instances.

This is the **default** behavior if the **OWNERSHIP** (p. 159) policy is not specified or supported.

DDS_EXCLUSIVE_OWNERSHIP_QOS Indicates each instance can only be owned by one DDS_DataWriter (p. 673), but the owner of an instance can change dynamically.

The selection of the owner is controlled by the setting of the OWN-ERSHIP_STRENGTH (p. 161) policy. The owner is always set to be the highest-strength DDS_DataWriter (p. 673) object among the ones currently active (as determined by the LIVELINESS (p. 162)).

4.25.3 Variable Documentation

4.25.3.1 const char* const DDS_OWNERSHIP_QOS_POLICY_NAME

Stringified human-readable name for DDS_OwnershipQosPolicy (p. 1280).

4.26 OWNERSHIP_STRENGTH

Specifies the value of the strength used to arbitrate among multiple **DDS_-DataWriter** (p. 673) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 425) + key).

Data Structures

^ struct DDS_OwnershipStrengthQosPolicy

Specifies the value of the strength used to arbitrate among multiple DDS-DataWriter (p. 673) objects that attempt to modify the same instance of a data type (identified by DDS-Topic (p. 425) + key).

Variables

^ const char *const DDS_OWNERSHIPSTRENGTH_QOS_-POLICY_NAME

Stringified human-readable name for DDS_OwnershipStrengthQosPolicy (p. 1287).

4.26.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **DDS_-DataWriter** (p. 673) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 425) + key).

4.26.2 Variable Documentation

4.26.2.1 const char* const DDS_OWNERSHIPSTRENGTH_QOS_-POLICY_NAME

Stringified human-readable name for $DDS_DownershipStrengthQosPolicy$ (p. 1287).

4.27 LIVELINESS

Specifies and configures the mechanism that allows **DDS_DataReader** (p. 783) entities to detect when **DDS_DataWriter** (p. 673) entities become disconnected or "dead.".

Data Structures

* struct DDS_LivelinessQosPolicy

Specifies and configures the mechanism that allows DDS_DataReader (p. 783) entities to detect when DDS_DataWriter (p. 673) entities become disconnected or "dead.".

Enumerations

^ enum DDS_LivelinessQosPolicyKind {
 DDS_AUTOMATIC_LIVELINESS_QOS,
 DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS,
 DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS }

Kinds of liveliness.

Variables

^ const char *const **DDS_LIVELINESS_QOS_POLICY_NAME**Stringified human-readable name for **DDS_LivelinessQosPolicy** (p. 1254).

4.27.1 Detailed Description

Specifies and configures the mechanism that allows **DDS_DataReader** (p. 783) entities to detect when **DDS_DataWriter** (p. 673) entities become disconnected or "dead.".

4.27.2 Enumeration Type Documentation

4.27.2.1 enum DDS_LivelinessQosPolicyKind

Kinds of liveliness.

QoS:

DDS_LivelinessQosPolicy (p. 1254)

Enumerator:

DDS_AUTOMATIC_LIVELINESS_QOS [default] The infrastructure will automatically signal liveliness for the DDS_DataWriter (p. 673) (s) at least as often as required by the lease_duration.

A DDS_DataWriter (p. 673) with this setting does not need to take any specific action in order to be considered 'alive.' The DDS_DataWriter (p. 673) is only 'not alive' when the participant to which it belongs terminates (gracefully or not), or when there is a network problem that prevents the current participant from contacting that remote participant.

$DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS$

RTI Data Distribution Service will assume that as long as at least one DDS_DataWriter (p. 673) belonging to the DDS_DomainParticipant (p. 339) (or the DDS_DomainParticipant (p. 339) itself) has asserted its liveliness, then the other Entities belonging to that same DDS_DomainParticipant (p. 339) are also alive.

The user application takes responsibility to signal liveliness to RTI Data Distribution Service either by calling DDS_DomainParticipant_assert_liveliness (p. 395), or by calling DDS_DataWriter_assert_liveliness (p. 709), or FooDataWriter_write (p. 684) on any DDS_DataWriter (p. 673) belonging to the DDS_DomainParticipant (p. 339).

DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS RTI Data Distribution Service will only assume liveliness of the DDS_DataWriter (p. 673) if the application has asserted liveliness of that DDS_DataWriter (p. 673) itself.

The user application takes responsibility to signal liveliness to RTI Data Distribution Service using the **DDS_DataWriter_assert_liveliness** (p. 709) function, or by writing some data.

4.27.3 Variable Documentation

4.27.3.1 const char* const DDS_LIVELINESS_QOS_POLICY_-NAME

Stringified human-readable name for DDS_LivelinessQosPolicy (p. 1254).

4.28 TIME_BASED_FILTER

Filter that allows a **DDS_DataReader** (p. 783) to specify that it is interested only in (potentially) a subset of the values of the data.

Data Structures

 $\hat{\ }$ struct DDS_TimeBasedFilterQosPolicy

Filter that allows a DDS_DataReader (p. 783) to specify that it is interested only in (potentially) a subset of the values of the data.

Variables

^ const_char *const_DDS_TIMEBASEDFILTER_QOS_POLICY_-NAME

Stringified human-readable name for $DDS_TimeBasedFilterQosPolicy$ (p. 1429).

4.28.1 Detailed Description

Filter that allows a **DDS_DataReader** (p. 783) to specify that it is interested only in (potentially) a subset of the values of the data.

4.28.2 Variable Documentation

$\begin{array}{ll} \textbf{4.28.2.1} & \textbf{const char} * \textbf{const DDS_TIMEBASEDFILTER_QOS_-} \\ \textbf{POLICY_NAME} \end{array}$

Stringified human-readable name for **DDS_TimeBasedFilterQosPolicy** (p. 1429).

4.29 PARTITION

Set of strings that introduces a logical partition among the topics visible by a **DDS_Publisher** (p. 632) and a **DDS_Subscriber** (p. 743).

Data Structures

^ struct DDS_PartitionQosPolicy

Set of strings that introduces a logical partition among the topics visible by a DDS_Publisher (p. 632) and a DDS_Subscriber (p. 743).

165

Variables

^ const char *const DDS_PARTITION_QOS_POLICY_NAME

Stringified human-readable name for DDS_PartitionQosPolicy (p. 1294).

4.29.1 Detailed Description

Set of strings that introduces a logical partition among the topics visible by a **DDS_Publisher** (p. 632) and a **DDS_Subscriber** (p. 743).

4.29.2 Variable Documentation

4.29.2.1 const char* const DDS_PARTITION_QOS_POLICY_NAME

Stringified human-readable name for DDS_PartitionQosPolicy (p. 1294).

4.30 RELIABILITY

Indicates the level of reliability offered/requested by RTI Data Distribution Service.

Data Structures

^ struct DDS_ReliabilityQosPolicy

 $Indicates\ the\ level\ of\ reliability\ offered/requested\ by\ RTI\ Data\ Distribution\ Service.$

Enumerations

^ enum DDS_ReliabilityQosPolicyKind {
 DDS_BEST_EFFORT_RELIABILITY_QOS,
 DDS_RELIABLE_RELIABILITY_QOS }

Kinds of reliability.

Variables

^ const char *const DDS_RELIABILITY_QOS_POLICY_NAME

Stringified human-readable name for DDS_ReliabilityQosPolicy (p. 1342).

4.30.1 Detailed Description

Indicates the level of reliability offered/requested by RTI Data Distribution Service.

4.30.2 Enumeration Type Documentation

4.30.2.1 enum DDS_ReliabilityQosPolicyKind

Kinds of reliability.

QoS:

 $\mathbf{DDS_ReliabilityQosPolicy}\ (\mathrm{p.}\ 1342)$

Enumerator:

 $DDS_BEST_EFFORT_RELIABILITY_QOS$ Indicates that it is acceptable to not retry propagation of any samples.

Presumably new values for the samples are generated often enough that it is not necessary to re-send or acknowledge any samples.

[default] for DDS_DataReader (p. 783) and DDS_Topic (p. 425)

DDS_RELIABLE_RELIABILITY_QOS Specifies RTI Data Distribution Service will attempt to deliver all samples in its history. Missed samples may be retried.

In steady-state (no modifications communicated via the DDS_DataWriter (p. 673)) RTI Data Distribution Service guarantees that all samples in the DDS_DataWriter (p. 673) history will eventually be delivered to all the DDS_DataReader (p. 783) objects (subject to timeouts that indicate loss of communication with a particular DDS_Subscriber (p. 743)).

Outside steady state the **HISTORY** (p. 170) and **RESOURCE_-LIMITS** (p. 174) policies will determine how samples become part of the history and whether samples can be discarded from it.

[default] for DDS_DataWriter (p. 673)

4.30.3 Variable Documentation

4.30.3.1 const char* const DDS_RELIABILITY_QOS_POLICY_NAME

Stringified human-readable name for DDS_ReliabilityQosPolicy (p. 1342).

4.31 DESTINATION_ORDER

Controls the criteria used to determine the logical order among changes made by **DDS_Publisher** (p. 632) entities to the same instance of data (i.e., matching **DDS_Topic** (p. 425) and key).

Data Structures

^ struct DDS_DestinationOrderQosPolicy

Controls how the middleware will deal with data sent by multiple DDS_DataWriter (p. 673) entities for the same instance of data (i.e., same DDS_Topic (p. 425) and key).

Enumerations

^ enum DDS_DestinationOrderQosPolicyKind {
 DDS_BY_RECEPTION_TIMESTAMP_ DESTINATIONORDER_QOS,

 DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_ QOS }

Kinds of destination order.

Variables

^ const char *const DDS_DESTINATIONORDER_QOS_POLICY_-NAME

Stringified human-readable name for DDS_DestinationOrderQosPolicy (p. 1138).

4.31.1 Detailed Description

Controls the criteria used to determine the logical order among changes made by **DDS_Publisher** (p. 632) entities to the same instance of data (i.e., matching **DDS_Topic** (p. 425) and key).

4.31.2 Enumeration Type Documentation

4.31.2.1 enum DDS_DestinationOrderQosPolicyKind

Kinds of destination order.

QoS:

DDS_DestinationOrderQosPolicy (p. 1138)

Enumerator:

$DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS$

[default] Indicates that data is ordered based on the reception time at each DDS_Subscriber (p. 743).

Since each subscriber may receive the data at different times there is no guaranteed that the changes will be seen in the same order. Consequently, it is possible for each subscriber to end up with a different final value for the data.

$DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS$

Indicates that data is ordered based on a time-stamp placed at the source (by RTI Data Distribution Service or by the application).

In any case this guarantees a consistent final value for the data in all subscribers.

See also:

Special Instructions if Using Timestamp APIs and BY_SOURCE_TIMESTAMP Destination Ordering: (p. 644)

4.31.3 Variable Documentation

4.31.3.1 const char* const DDS_DESTINATIONORDER_QOS_-POLICY_NAME

Stringified human-readable name for **DDS_DestinationOrderQosPolicy** (p. 1138).

4.32 HISTORY

Specifies the behavior of RTI Data Distribution Service in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Data Structures

^ struct DDS_HistoryQosPolicy

Specifies the behavior of RTI Data Distribution Service in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Enumerations

```
num DDS_HistoryQosPolicyKind {
   DDS_KEEP_LAST_HISTORY_QOS,
   DDS_KEEP_ALL_HISTORY_QOS }
   Kinds of history.

enum DDS_RefilterQosPolicyKind {
   DDS_NONE_REFILTER_QOS,
   DDS_ALL_REFILTER_QOS,
   DDS_ON_DEMAND_REFILTER_QOS }
   <<eXtension>> (p. 950) Kinds of Refiltering
```

Variables

const char *const DDS_HISTORY_QOS_POLICY_NAME

Stringified human-readable name for DDS_HistoryQosPolicy (p. 1229).

4.32.1 Detailed Description

Specifies the behavior of RTI Data Distribution Service in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

4.32 HISTORY 171

4.32.2 Enumeration Type Documentation

4.32.2.1 enum DDS_HistoryQosPolicyKind

Kinds of history.

QoS:

DDS_HistoryQosPolicy (p. 1229)

Enumerator:

 $DDS_KEEP_LAST_HISTORY_QOS$ [default] Keep the last depth samples.

On the publishing side, RTI Data Distribution Service will only attempt to keep the most recent depth samples of each instance of data (identified by its key) managed by the DDS_DataWriter (p. 673).

On the subscribing side, the **DDS_DataReader** (p. 783) will only attempt to keep the most recent depth samples received for each instance (identified by its key) until the application takes them via the **DDS_DataReader** (p. 783) 's take() operation.

DDS_KEEP_ALL_HISTORY_QOS Keep all the samples.

On the publishing side, RTI Data Distribution Service will attempt to keep all samples (representing each value written) of each instance of data (identified by its key) managed by the **DDS_DataWriter** (p. 673) until they can be delivered to all subscribers.

On the subscribing side, RTI Data Distribution Service will attempt to keep all samples of each instance of data (identified by its key) managed by the **DDS_DataReader** (p. 783). These samples are kept until the application takes them from RTI Data Distribution Service via the **take()** operation.

4.32.2.2 enum DDS_RefilterQosPolicyKind

```
<< eXtension>> (p. 950) Kinds of Refiltering
```

QoS:

DDS_HistoryQosPolicy (p. 1229)

Enumerator:

DDS_NONE_REFILTER_QOS [default] Do not filter existing samples for a new reader

On the publishing side, when a new reader matches a writer, the writer can be configured to filter previously written samples stored in the writer queue for the new reader. This option configures the writer to not filter any existing samples for the reader and the reader will do the filtering.

 $DDS_ALL_REFILTER_QOS$ Filter all existing samples for a new reader.

On the publishing side, when a new reader matches a writer, the writer can be configured to filter previously written samples stored in the writer queue. This option configures the writer to filter all existing samples for the reader when a new reader is matched to the writer.

DDS_ON_DEMAND_REFILTER_QOS Filter existing samples only when they are requested by the reader.

On the publishing side, when a new reader matches a writer, the writer can be configured to filter previously written samples stored in the writer queue. This option configures the writer to filter only existing samples that are requested by the reader.

4.32.3 Variable Documentation

4.32.3.1 const char* const DDS_HISTORY_QOS_POLICY_NAME

Stringified human-readable name for DDS_HistoryQosPolicy (p. 1229).

4.33 DURABILITY_SERVICE

Various settings to configure the external *RTI Persistence Service* used by RTI Data Distribution Service for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1181) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 154) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 154).

Data Structures

 ${\bf \hat{~}} struct \ {\bf DDS_DurabilityServiceQosPolicy}$

Various settings to configure the external RTI Persistence Service used by RTI Data Distribution Service for DataWriters with a DDS_- DurabilityQosPolicy (p. 1181) setting of DDS_- PERSISTENT_-DURABILITY_QOS (p. 154) or DDS_- TRANSIENT_-DURABILITY_QOS (p. 154).

Variables

^ const char *const DDS_DURABILITYSERVICE_QOS_POLICY_-NAME

Stringified human-readable name for DDS_DurabilityServiceQosPolicy (p. 1185).

4.33.1 Detailed Description

Various settings to configure the external *RTI Persistence Service* used by RTI Data Distribution Service for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1181) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 154) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 154).

4.33.2 Variable Documentation

4.33.2.1 const char* const DDS_DURABILITYSERVICE_QOS_-POLICY_NAME

Stringified human-readable name for **DDS_DurabilityServiceQosPolicy** (p. 1185).

4.34 RESOURCE_LIMITS

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Data Structures

^ struct DDS_ResourceLimitsQosPolicy

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Variables

^ const char *const **DDS_RESOURCELIMITS_QOS_POLICY_- NAME**

Stringified human-readable name for DDS_ResourceLimitsQosPolicy (p. 1356).

` const DDS_Long DDS_LENGTH_UNLIMITED

A special value indicating an unlimited quantity.

4.34.1 Detailed Description

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

4.34.2 Variable Documentation

4.34.2.1 const char* const DDS_RESOURCELIMITS_QOS_-POLICY_NAME

Stringified human-readable name for **DDS_ResourceLimitsQosPolicy** (p. 1356).

4.34.2.2 const DDS_Long DDS_LENGTH_UNLIMITED

A special value indicating an unlimited quantity.

Examples:

 $HelloWorld_subscriber.c.$

4.35 TRANSPORT_PRIORITY

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

Data Structures

 ${\bf \hat{\ }} \ \, {\rm struct} \ \, {\bf DDS_TransportPriorityQosPolicy}$

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

Variables

^ const char *const DDS_TRANSPORTPRIORITY_QOS_-POLICY_NAME

Stringified human-readable name for DDS_TransportPriorityQosPolicy (p. 1454).

4.35.1 Detailed Description

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

4.35.2 Variable Documentation

$\begin{array}{ll} \textbf{4.35.2.1} & \textbf{const char} * \textbf{const DDS_TRANSPORTPRIORITY_QOS_-POLICY_NAME} \end{array}$

Stringified human-readable name for **DDS_TransportPriorityQosPolicy** (p. 1454).

4.36 LIFESPAN 177

4.36 LIFESPAN

Specifies how long the data written by the **DDS_DataWriter** (p. 673) is considered valid.

Data Structures

^ struct DDS_LifespanQosPolicy

Specifies how long the data written by the DDS_DataWriter (p. 673) is considered valid.

Variables

^ const char *const DDS_LIFESPAN_QOS_POLICY_NAME

Stringified human-readable name for DDS_LifespanQosPolicy (p. 1244).

4.36.1 Detailed Description

Specifies how long the data written by the ${\bf DDS_DataWriter}$ (p. 673) is considered valid.

4.36.2 Variable Documentation

${\bf 4.36.2.1} \quad const\ char*\ const\ DDS_LIFESPAN_QOS_POLICY_NAME$

Stringified human-readable name for DDS_LifespanQosPolicy (p. 1244).

4.37 WRITER_DATA_LIFECYCLE

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

Data Structures

 $\hat{\ }$ struct DDS_WriterDataLifecycleQosPolicy

Controls how a $DDS_DataWriter$ (p. 673) handles the lifecycle of the instances (keys) that it is registered to manage.

Variables

^ const char *const DDS_WRITERDATALIFECYCLE_QOS_-POLICY_NAME

Stringified human-readable name for DDS_- -WriterDataLifecycleQosPolicy (p. 1491).

4.37.1 Detailed Description

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

4.37.2 Variable Documentation

$\begin{array}{ll} \textbf{4.37.2.1} & \textbf{const char* const DDS_WRITERDATALIFECYCLE_-} \\ \textbf{QOS_POLICY_NAME} \end{array}$

Stringified human-readable name for DDS_WriterDataLifecycleQosPolicy (p. 1491).

4.38 READER_DATA_LIFECYCLE

Controls how a DataReader manages the lifecycle of the data that it has received.

Data Structures

 $\hat{\ }$ struct DDS_ReaderDataLifecycleQosPolicy

Controls how a DataReader manages the lifecycle of the data that it has received.

Variables

^ const char *const DDS_READERDATALIFECYCLE_QOS_-POLICY_NAME

Stringified human-readable name for DDS-Reader Data Life cycle Qos Policy (p. 1336).

4.38.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

4.38.2 Variable Documentation

4.38.2.1 const char* const DDS_READERDATALIFECYCLE_-QOS_POLICY_NAME

Stringified human-readable name for **DDS_ReaderDataLifecycleQosPolicy** (p. 1336).

4.39 ENTITY_FACTORY

A QoS policy for all **DDS_Entity** (p. 242) types that can act as factories for one or more other **DDS_Entity** (p. 242) types.

Data Structures

* struct DDS_EntityFactoryQosPolicy

A QoS policy for all **DDS_Entity** (p. 242) types that can act as factories for one or more other **DDS_Entity** (p. 242) types.

Variables

^ const char *const DDS_ENTITYFACTORY_QOS_POLICY_-NAME

Stringified human-readable name for DDS_EntityFactoryQosPolicy (p. 1207).

4.39.1 Detailed Description

A QoS policy for all **DDS_Entity** (p. 242) types that can act as factories for one or more other **DDS_Entity** (p. 242) types.

4.39.2 Variable Documentation

$\begin{array}{ll} \textbf{4.39.2.1} & \textbf{const char} * \textbf{const DDS_ENTITYFACTORY_QOS_-POLICY_NAME} \end{array}$

Stringified human-readable name for **DDS_EntityFactoryQosPolicy** (p. 1207).

4.40 Extended Qos Support

<< eXtension>> (p. 950) Types and defines used in extended QoS policies.

Modules

^ Thread Settings

 $The\ properties\ of\ a\ thread\ of\ execution.$

Data Structures

 $\hat{\ }$ struct DDS_RtpsReliableReaderProtocol_t

Qos related to reliable reader protocol defined in RTPS.

 ${\bf \hat{\ }} struct \ {\bf DDS_RtpsReliableWriterProtocol_t}$

QoS related to the reliable writer protocol defined in RTPS.

4.40.1 Detailed Description

<< eXtension>> (p. 950) Types and defines used in extended QoS policies.

4.41 Unicast Settings

Unicast communication settings.

Data Structures

 ${\bf \hat{~}} struct~{\bf DDS_TransportUnicastSettings_t}$

Type representing a list of unicast locators.

 ${\bf \hat{~}} struct~{\bf DDS_TransportUnicastSettingsSeq}$

Declares IDL sequence < DDS_TransportUnicastSettings_t (p. 1460) >.

4.41.1 Detailed Description

Unicast communication settings.

4.42 Multicast Settings

Multicast communication settings.

Data Structures

 $\hat{\ }$ struct DDS_TransportMulticastSettings_t

Type representing a list of multicast locators.

 ${\bf \hat{\ }} struct\ {\bf DDS_TransportMulticastSettingsSeq}$

 $\begin{array}{ll} \textit{Declares IDL sequence} < \textit{DDS_TransportMulticastSettings_t} \ \ (\text{p. 1451}) \\ > \end{array}$

4.42.1 Detailed Description

Multicast communication settings.

4.43 TRANSPORT_SELECTION

<<e Xtension>> (p. 950) Specifies the physical transports a DDS_-DataWriter (p. 673) or DDS_DataReader (p. 783) may use to send or receive data

Data Structures

^ struct DDS_TransportSelectionQosPolicy

Specifies the physical transports a DDS_DataWriter (p. 673) or DDS_DataReader (p. 783) may use to send or receive data.

Variables

 $\begin{tabular}{lll} \^{\bf const} & {\bf char} & *{\bf const} & {\bf DDS_TRANSPORTSELECTION_QOS_-POLICY_NAME} \\ \end{tabular}$

Stringified human-readable name for DDS_TransportSelectionQosPolicy (p. 1456).

4.43.1 Detailed Description

<<eXtension>> (p. 950) Specifies the physical transports a DDS_DataWriter (p. 673) or DDS_DataReader (p. 783) may use to send or receive data.

4.43.2 Variable Documentation

4.43.2.1 const char* const DDS_TRANSPORTSELECTION_QOS_-POLICY_NAME

Stringified human-readable name for DDS-TransportSelectionQosPolicy (p. 1456).

4.44 TRANSPORT_UNICAST

<<eXtension>> (p. 950) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Modules

^ Unicast Settings

Unicast communication settings.

Data Structures

^ struct DDS_TransportUnicastQosPolicy

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Variables

 $\hat{\ }$ const char *const DDS_TRANSPORTUNICAST_QOS_POLICY_NAME

Stringified human-readable name for $DDS_{-}TransportUnicastQosPolicy$ (p. 1458).

4.44.1 Detailed Description

<<eXtension>> (p. 950) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

4.44.2 Variable Documentation

4.44.2.1 const char* const DDS_TRANSPORTUNICAST_QOS_-POLICY_NAME

Stringified human-readable name for DDS_TransportUnicastQosPolicy (p. 1458).

4.45 TRANSPORT_MULTICAST

<<e xtension>> (p. 950) Specifies the multicast address on which a DDS_-DataReader (p. 783) wants to receive its data. It can also specify a port number as well as a subset of the available (at the DDS_DomainParticipant (p. 339) level) transports with which to receive the multicast data.

Modules

Multicast Settings

Multicast communication settings.

Data Structures

^ struct DDS_TransportMulticastQosPolicy

Specifies the multicast address on which a DDS_DataReader (p. 783) wants to receive its data. It can also specify a port number as well as a subset of the available (at the DDS_DomainParticipant (p. 339) level) transports with which to receive the multicast data.

Variables

^ const char *const DDS_TRANSPORTMULTICAST_QOS_-POLICY_NAME

Stringified human-readable name for DDS_TransportMulticastQosPolicy (p. 1449).

4.45.1 Detailed Description

<<e Xtension>> (p. 950) Specifies the multicast address on which a DDS_DataReader (p. 783) wants to receive its data. It can also specify a port number as well as a subset of the available (at the DDS_DomainParticipant (p. 339) level) transports with which to receive the multicast data.

4.45.2 Variable Documentation

$\begin{array}{ll} \textbf{4.45.2.1} & \textbf{const char}* \textbf{ const DDS_TRANSPORTMULTICAST_-} \\ \textbf{QOS_POLICY_NAME} \end{array}$

Stringified human-readable name for $\mathbf{DDS_TransportMulticastQosPolicy}$ (p. 1449).

4.46 DISCOVERY

<<eXtension>> (p. 950) Specifies the attributes required to discover participants in the domain.

Modules

^ NDDS_DISCOVERY_PEERS

Environment variable or a file that specifies the default values of $DDS_DiscoveryQosPolicy::initial_peers$ (p. 1150) and $DDS_DiscoveryQosPolicy::multicast_receive_addresses$ (p. 1151) contained in the $DDS_DomainParticipantQos::discovery$ (p. 1160) qos policy.

Data Structures

^ struct DDS_DiscoveryQosPolicy

Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Variables

` const char *const **DDS_DISCOVERY_QOS_POLICY_NAME**Stringified human-readable name for **DDS_DiscoveryQosPolicy** (p. 1149).

4.46.1 Detailed Description

<<eXtension>> (p. 950) Specifies the attributes required to discover participants in the domain.

4.46.2 Variable Documentation

4.46.2.1 const char* const DDS_DISCOVERY_QOS_POLICY_NAME

Stringified human-readable name for DDS_DiscoveryQosPolicy (p. 1149).

4.47 NDDS DISCOVERY PEERS

Environment variable or a file that specifies the default values of DDS_DiscoveryQosPolicy::initial_peers (p. 1150) and DDS_DiscoveryQosPolicy::multicast_receive_addresses (p. 1151) contained in the DDS_DomainParticipantQos::discovery (p. 1160) qos policy.

The default value of the DDS_DomainParticipantQos (p. 1157) is obtained by calling DDS_DomainParticipantFactory_get_default_participant_-qos() (p. 308).

NDDS_DISCOVERY_PEERS specifies the default value of the $DDS_DiscoveryQosPolicy::initial_peers$ (p.1150)and DDS_{-} DiscoveryQosPolicy::multicast_receive_addresses (p. 1151) fields, when the default participant QoS policies have not been explictly set by the user DDS_DomainParticipantFactory_set_default_participant_gos() (p. 306) has never been called or was called using DDS_PARTICIPANT_-**QOS_DEFAULT** (p. 325)).

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1151) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1151), starting at element 0. They will be stored in the order in which they appear in NDDS_DISCOVERY_PEERS.

Note: IPv4 multicast addresses must have a prefix. Therefore, when using the UDPv6 transport: if there are any IPv4 multicast addresses in the peers list, make sure they have "udpv4://" in front of them (such as udpv4://239.255.0.1).

Note: Currently, RTI Data Distribution Service will only listen for discovery traffic on the first multicast address (element 0) in DDS_DiscoveryQosPolicy::multicast_receive_addresses (p. 1151).

NDDS_DISCOVERY_PEERS provides a mechanism to dynamically switch the discovery configuration of an RTI Data Distribution Service application without recompilation. The application programmer is free to not use the default values; instead use values supplied by other means.

NDDS_DISCOVERY_PEERS can be specified either in an environment variable as comma (',') separated "peer descriptors" (see **Peer Descriptor Format** (p. 190)) or in a file. These formats are described below.

4.47.1 Peer Descriptor Format

A peer descriptor string specifies a range of participants at a given locator. Peer descriptor strings are used in the DDS_DiscoveryQosPolicy::initial_peers (p. 1150) field and the DDS_DomainParticipant_add_peer() (p. 401) operation.

The anatomy of a peer descriptor is illustrated below using a special "StarFabric" transport example.

A peer descriptor consists of:

optional Maximum Participant ID. Specifies the maximum participant ID that is contacted by the RTI Data Distribution Service discovery mechanism at the given locator. If omitted, a default value of 4 is implied.

^ Locator. See Locator Format (p. 190).

These are separated by the '@' character. The separator may be omitted if a participant ID limit is not explictly specified.

Note that the "participant ID limit" only applies to unicast locators, and is ignored for multicast locators (and therefore should be omitted for multicast peer descriptors).

4.47.1.1 Locator Format

A **locator** string specifies a transport and an address in string format. Locators are used to form peer descriptors. A locator is equivalent to a peer descriptor with the default maximum participant ID.

A locator consists of:

optional **Transport name** (alias or class). This identifies the set of transport plugins (**Transport Aliases** (p. 862)) that may be used to parse the address portion of the locator. Note that a transport class name is an implicit alias that used to refer to all the transport plugin instances of that class.

optional Address. See Address Format (p. 191).

These are separated by the "//:" string. The separator is specified if and only if a transport name is specified.

If a transport name is specified, the address may be omitted; in that case all the unicast addresses (across all transport plugin instances) associated with the transport class are implied. Thus, a locator string may specify several addresses.

If an address is specified, the transport name and the separator string may be omitted; in that case all the available transport plugins (for the **DDS_Entity** (p. 242)) may be used to parse the address string.

4.47.1.2 Address Format

An address string specifies a transport independent network address that qualifies an transport dependent address string. Addresses are used to form locators. Addresses are also used in DDS_DiscoveryQosPolicy::multicast_receive_addresses (p. 1151), and DDS_TransportMulticastSettings_t::receive_address (p. 1452) fields. An address is equivalent to a locator in which the transport name and separator are omitted.

An address consists of:

optional **Network Address**. An address in IPv4 or IPv6 string notation. If omitted, the network address of the transport is implied (**Transport Network Address** (p. 865)).

optional **Transport Address**. A string that is passed to the transport for processing. The transport maps this string into **NDDS_Transport_Property_- t::address_bit_count** (p. 1507) bits. If omitted the network address is used as the fully qualified address.

These are separated by the '#' character. If a separator is specified, it must be followed by a non-empty string which is passed to the transport plugin.

The bits resulting from the transport address string are prepended with the network address. The least significant NDDS_Transport_Property_t::address_bit_count (p. 1507) bits of the network address are ignored (Transport Network Address (p. 865)).

If the separator is omitted and the string is not a valid IPv4 or IPv6 address, it is treated as a transport address with an implicit network address (of the transport plugin).

4.47.2 NDDS_DISCOVERY_PEERS Environment Variable Format

NDDS_DISCOVERY_PEERS can be specified via an environment variable of the same name, consisting of a sequence of peer descriptors separated by the comma (',') character.

Examples

Multicast (maximum participant ID is irrelevant)

239.255.0.1

Default maximum participant ID on localhost

^ localhost

Default maximum participant ID on host 192.168.1.1 (IPv4)

192.168.1.1

Default maximum participant ID on host FAA0::0 (IPv6)

^ FAA0::1

Default maximum participant ID on host FAA0::0#localhost (could be a UDPv4 transport plugin registered at network address of FAA0::0) (IPv6)

FAA0::0#localhost

Default maximum participant ID on host himalaya accessed using the "udpv4" transport plugin(s) (IPv4)

^ udpv4://himalaya

Default maximum participant ID on localhost using the "udpv4" transport plugin(s) registered at network address FAA0::0

^ udpv4://FAA0::0#localhost

Default maximum participant ID on all unicast addresses accessed via the "udpv4" (UDPv4) transport plugin(s)

^ udpv4://

Default maximum participant ID on host 0/0/R (StarFabric)

- 0/0/R
- * #0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s)

• starfabric://0/0/R

 $\hat{}$ starfabric://#0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "star-fabric" (StarFabric) transport plugin(s) registered at network address FAA0::0

 $\hat{}$ starfabric://FBB0::0#0/0/R

Default maximum participant ID on all unicast addresses accessed via the "star-fabric" (StarFabric) transport plugin(s)

^ starfabric://

Default maximum participant ID on all unicast addresses accessed via the "shmem" (shared memory) transport plugin(s)

• shmem://

Default maximum participant ID on all unicast addresses accessed via the "shmem" (shared memory) transport plugin(s) registered at network address FCC0::0

• shmem://FCC0::0

Default maximum participant ID on hosts himalaya and gangotri

^ himalaya,gangotri

Maximum participant ID of 1 on hosts himalaya and gangotri

1@himalaya,1@gangotri

Combinations of above

- ^{239.255.0.1,localhost,192.168.1.1,0/0/R}
- $^{\bullet}$ FAA0::1,FAA0::0#localhost,FBB0::0#0/0/R
- ^ udpv4://himalaya,udpv4://FAA0::0#localhost,#0/0/R
- $\hat{}$ starfabric://0/0/R,starfabric://FBB0::0#0/0/R,shmem://
- $\widehat{}$ starfabric://,shmem://FCC0::0,1@himalaya,1@gangotri

4.47.3 NDDS_DISCOVERY_PEERS File Format

NDDS_DISCOVERY_PEERS can be specified via a file of the same name in the program's current working directory. A NDDS_DISCOVERY_PEERS file would contain a sequence of peer descriptors separated by whitespace or the comma (',') character. The file may also contain comments starting with a semicolon (';') character till the end of the line.

Example:

```
;; NDDS_DISCOVERY_PEERS - Default Discovery Configuration File
;;
;;
;; NOTE:
    1. This file must be in the current working directory, i.e.
        in the folder from which the application is launched.
;;
;;
     2. This file takes precedence over the environment variable NDDS_DISCOVERY_PEERS
;;
;;
;; Multicast
239.255.0.1
                             ; The default RTI Data Distribution Service discovery multicast address
;; Unicast
localhost, 192.168.1.1
                             ; A comma can be used a separator
FAAO::1 FAAO::0#localhost
                             ; Whitespace can be used as a separator
                             ; Maximum participant ID of 1 on 'himalaya'
1@himalava
1@gangotri
;; UDPv4
                             ; 'himalaya' via 'udpv4' transport plugin(s)
udpv4://himalaya
udpv4://FAA0::0#localhost
                             ; 'localhost' via 'updv4' transport
                             ; plugin registered at network address FAAO::0
;; Shared Memory
                             ; All 'shmem' transport plugin(s)
shmem://
builtin.shmem://
                             ; The builtin 'shmem' transport plugin
shmem://FCCO::0
                             ; Shared memory transport plugin registered
                                              at network address FCC0::0
;; StarFabric
0/0/R
                             ; StarFabric node 0/0/R
starfabric://0/0/R
                             ; 0/0/R accessed via 'starfabric'
                                           transport plugin(s)
starfabric://FBB0::0#0/0/R
                             ; StarFabric transport plugin registered
                                           at network address FBB0::0
starfabric://
                             ; All 'starfabric' transport plugin(s)
```

4.47.4 NDDS_DISCOVERY_PEERS Precedence

If the current working directory from which the RTI Data Distribution Service application is launched contains a file called NDDS_DISCOVERY_PEERS, and an environment variable named NDDS_DISCOVERY_PEERS is also defined, the file takes precedence; the environment variable is ignored.

4.47.5 NDDS_DISCOVERY_PEERS Default Value

If NDDS_DISCOVERY_PEERS is not specified (either as a file in the current working directory, or as an environment variable), it implicitly defaults to the following.

```
;; Multicast (only on platforms which allow UDPv4 multicast out of the box)
;; This allows any RTI Data Distribution Service applications anywhere on the local network to
;; discover each other over UDPv4.
builtin.udpv4://239.255.0.1 ; RTI Data Distribution Service's default discovery multicast address
;; Unicast - UDPv4 (on all platforms)
;;
;; This allows two RTI Data Distribution Service applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over UDP/IPv4.
builtin.udpv4://127.0.0.1
;; Unicast - Shared Memory (only on platforms that support shared memory)
;;
;; This allows two RTI Data Distribution Service applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over shared memory.
builtin.shmem://
```

4.47.6 Builtin Transport Class Names

The class names for the builtin transport plugins are:

```
^ shmem - ::Shared Memory Transport (p. 1005)
^ udpv4 - ::UDPv4 Transport (p. 1013)
^ udpv6 - ::UDPv6 Transport (p. 1023)
```

These may be used as the transport names in the **Locator Format** (p. 190).

4.47.7 NDDS_DISCOVERY_PEERS and Local Host Communication

Suppose you want to communicate with other RTI Data Distribution Service applications on the same host and you are setting NDDS_DISCOVERY_PEERS explicitly (generally in order to use unicast discovery with applications on other hosts)

If the local host platform does not support the shared memory transport, then you can include the name of the local host in the NDDS_DISCOVERY_PEERS list.

If the local host platform supports the shared memory transport, then you can do one of the following:

^ Include "shmem://" in the NDDS_DISCOVERY_PEERS list. This will cause shared memory to be used for discovery and data traffic for applications on the same host.

or:

^ Include the name of the local host in the NDDS_DISCOVERY_-PEERS list, and disable the shared memory transport in the DDS_TransportBuiltinQosPolicy (p. 1447) of the DDS_-DomainParticipant (p. 339). This will cause UDP loopback to be used for discovery and data traffic for applications on the same host.

(To check if your platform supports shared memory, see the Platform Notes document.)

4.48 TRANSPORT_BUILTIN

<< eXtension>> (p. 950) Specifies which built-in transports are used.

Data Structures

^ struct DDS_TransportBuiltinQosPolicy

Specifies which built-in transports are used.

Defines

^ #define DDS_TRANSPORTBUILTIN_MASK_NONE

None of the built-in transports will be registered automatically when the DDS_DomainParticipant (p. 339) is enabled. The user must explicitly register transports using NDDS_Transport_Support_register_transport (p. 871).

^ #define DDS_TRANSPORTBUILTIN_MASK_DEFAULT

The default value of DDS_TransportBuiltinQosPolicy::mask (p. 1447).

^ #define DDS_TRANSPORTBUILTIN_MASK_ALL

All the available built-in transports are registered automatically when the DDS_DomainParticipant (p. 339) is enabled.

Typedefs

^ typedef DDS_Long DDS_TransportBuiltinKindMask

A mask of DDS_TransportBuiltinKind (p. 199) bits.

Enumerations

^ enum DDS_TransportBuiltinKind {
 DDS_TRANSPORTBUILTIN_UDPv4,
 DDS_TRANSPORTBUILTIN_SHMEM ,
 DDS_TRANSPORTBUILTIN_UDPv6 }

Built-in transport kind.

Variables

^ const_char *const_DDS_TRANSPORTBUILTIN_QOS_POLICY_-NAME

Stringified human-readable name for DDS_TransportBuiltinQosPolicy (p. 1447).

^ const char *const DDS_TRANSPORTBUILTIN_SHMEM_-ALIAS

Alias name for the shared memory built-in transport.

- ^ const char *const DDS_TRANSPORTBUILTIN_UDPv4_ALIAS
 Alias name for the UDPv4 built-in transport.
- ^ const char *const DDS_TRANSPORTBUILTIN_UDPv6_ALIAS
 Alias name for the UDPv6 built-in transport.

4.48.1 Detailed Description

- DDS_TRANSPORTBUILTIN_SHMEM Built-in shared memory transport, ::Shared Memory Transport (p. 1005).
- DDS_TRANSPORTBUILTIN_UDPv6 Built-in UDPv6 transport, ::UDPv6 Transport (p. 1023).

4.48.5 Variable Documentation

4.48.5.1 const char* const DDS_TRANSPORTBUILTIN_QOS_-POLICY_NAME

Stringified human-readable name for DDS_TransportBuiltinQosPolicy (p. 1447).

4.48.5.2 const char* const DDS_TRANSPORTBUILTIN_-SHMEM_ALIAS

Alias name for the shared memory built-in transport.

4.48.5.3 const char* const DDS_TRANSPORTBUILTIN_UDPv4_-ALIAS

Alias name for the UDPv4 built-in transport.

$\begin{array}{ll} 4.48.5.4 & const \ char* \ const \ DDS_TRANSPORTBUILTIN_UDPv6_-\\ & ALIAS \end{array}$

Alias name for the UDPv6 built-in transport.

4.49 WIRE_PROTOCOL

<<e xtension>> (p. 950) Specifies the wire protocol related attributes for the DDS_DomainParticipant (p. 339).

Data Structures

^ struct DDS_RtpsWellKnownPorts_t

 $RTPS\ well-known\ port\ mapping\ configuration.$

 $\hat{\ }$ struct DDS_WireProtocolQosPolicy

Specifies the wire-protocol-related attributes for the DDS_- -DomainParticipant (p. 339).

Defines

- *#define DDS_RTPS_RESERVED_PORT_MASK_DEFAULT

 The default value of DDS_WireProtocolQosPolicy::rtps_reserved_port_mask (p. 1489).
- * #define DDS_RTPS_RESERVED_PORT_MASK_NONE
 No bits are set.
- *#define DDS_RTPS_RESERVED_PORT_MASK_ALL
 All bits are set.

Typedefs

^ typedef DDS_Long DDS_RtpsReservedPortKindMask
A mask of DDS_RtpsReservedPortKind (p. 204) bits.

Enumerations

num DDS_RtpsReservedPortKind {
 DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST = 0x0001
 << 0,
 DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST =
 0x0001 << 1,</pre>

DDS_RTPS_RESERVED_PORT_USER_UNICAST = 0x0001 << 2.

DDS_RTPS_RESERVED_PORT_USER_MULTICAST = 0x0001 << 3 }

RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.

^ enum DDS_WireProtocolQosPolicyAutoKind {
 DDS_RTPS_AUTO_ID_FROM_IP,
 DDS_RTPS_AUTO_ID_FROM_MAC }

Kind of auto mechanism used to calculate the GUID prefix.

Variables

^ struct DDS_RtpsWellKnownPorts_t DDS_RTI_BACKWARDS_-COMPATIBLE_RTPS_WELL_KNOWN_PORTS

Assign to use well-known port mappings which are compatible with previous versions of the RTI Data Distribution Service middleware.

^ struct DDS_RtpsWellKnownPorts_t DDS_INTEROPERABLE_-RTPS_WELL_KNOWN_PORTS

Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

Stringified human-readable name for DDS_WireProtocolQosPolicy (p. 1483).

4.49.1 Detailed Description

<<e xtension>> (p. 950) Specifies the wire protocol related attributes for the DDS_DomainParticipant (p. 339).

4.49.2 Define Documentation

$\begin{array}{ccc} 4.49.2.1 & \# define\ DDS_RTPS_RESERVED_PORT_MASK_-\\ & DEFAULT \end{array}$

Value:

((DDS_RtpsReservedPortKindMask) DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST \
| DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST | DDS_RTPS_RESERVED_PORT_USER_UNICAST)

The default value of DDS_WireProtocolQosPolicy::rtps_reserved_port_mask (p. 1489).

Most of the ports that may be needed by DDS will be reserved by the transport when the participant is enabled. With this value set, failure to allocate a port that is computed based on the DDS_RtpsWellKnownPorts_t (p. 1378) will be detected at this time and the enable operation will fail.

This setting will avoid reserving the **usertraffic** multicast port, which is not actually used unless there are DataReaders that enable multicast but fail to specify a port.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also:

DDS_RtpsReservedPortKindMask (p. 204)

4.49.2.2 #define DDS_RTPS_RESERVED_PORT_MASK_NONE

No bits are set.

None of the ports that are needed by DDS will be allocated until they are specifically required. With this value set, automatic participant Id selection will be based on selecting a port for discovery (metatraffic) unicast traffic on a single transport.

See also:

DDS_RtpsReservedPortKindMask (p. 204)

$4.49.2.3 \quad \# define \ DDS_RTPS_RESERVED_PORT_MASK_ALL$

All bits are set.

All of the ports that may be needed by DDS will be reserved when the participant is enabled. With this value set, failure to allocate a port that is computed based on the DDS_RtpsWellKnownPorts_t (p. 1378) will be detected at this time, and the enable operation will fail.

Note that this will also reserve the **usertraffic** multicast port which is not actually used unless there are DataReaders that enable multicast but fail to

specify a port. To avoid unnecesary resource usage for these ports, use RTPS_RESERVED_PORT_MASK_DEFAULT.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also:

DDS_RtpsReservedPortKindMask (p. 204)

4.49.3 Typedef Documentation

4.49.3.1 typedef DDS_Long DDS_RtpsReservedPortKindMask

A mask of $DDS_RtpsReservedPortKind$ (p. 204) bits.

QoS:

DDS_WireProtocolQosPolicy (p. 1483)

4.49.4 Enumeration Type Documentation

4.49.4.1 enum DDS_RtpsReservedPortKind

RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.

See also:

DDS_WireProtocolQosPolicy::rtps_reserved_port_mask (p. 1489)

Enumerator:

- DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST Select the metatraffic unicast port.
- DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST Select the metatraffic multicast port.
- DDS_RTPS_RESERVED_PORT_USER_UNICAST Select the usertraffic unicast port.
- $DDS_RTPS_RESERVED_PORT_USER_MULTICAST$ Select the usertraffic multicast port.

4.49.4.2 enum DDS_WireProtocolQosPolicyAutoKind

Kind of auto mechanism used to calculate the GUID prefix.

See also:

DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 1490)

Enumerator:

 $DDS_RTPS_AUTO_ID_FROM_IP$ Select the IPv4 based algorithm. $DDS_RTPS_AUTO_ID_FROM_MAC$ Select the MAC based algorithm.

Note to Solaris Users: To use DDS_RTPS_AUTO_ID_FROM_MAC, you must run the RTI Data Distribution Service application while logged in as root.

4.49.5 Variable Documentation

4.49.5.1 struct DDS_RtpsWellKnownPorts_t DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS

Assign to use well-known port mappings which are compatible with previous versions of the RTI Data Distribution Service middleware.

Assign DDS_WireProtocolQosPolicy::rtps_well_known_ports (p. 1489) to this value to remain compatible with previous versions of the RTI Data Distribution Service middleware that used fixed port mappings.

The following are the rtps_well_known_ports values for DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS (p. 205):

```
port_base = 7400
domain_id_gain = 10
participant_id_gain = 1000
builtin_multicast_port_offset = 2
builtin_unicast_port_offset = 0
user_multicast_port_offset = 1
user_unicast_port_offset = 3
```

These settings are *not* compliant with OMG's DDS Interoperability Wire Protocol. To comply with the specification, please use **DDS_INTEROPERABLE_-RTPS_WELL_KNOWN_PORTS** (p. 206).

See also:

DDS_WireProtocolQosPolicy::rtps_well_known_ports (p. 1489) DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS (p. 206)

4.49.5.2 struct DDS_RtpsWellKnownPorts_t DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS

Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

Assign DDS_WireProtocolQosPolicy::rtps_well_known_ports (p. 1489) to this value to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

The following are the rtps_well_known_ports values for DDS_-INTEROPERABLE_RTPS_WELL_KNOWN_PORTS (p. 206):

```
\label{eq:port_base} \begin{array}{l} \texttt{port\_base} = 7400 \\ \\ \texttt{domain\_id\_gain} = 250 \\ \\ \texttt{participant\_id\_gain} = 2 \\ \\ \texttt{builtin\_multicast\_port\_offset} = 0 \\ \\ \texttt{builtin\_unicast\_port\_offset} = 10 \\ \\ \texttt{user\_multicast\_port\_offset} = 1 \\ \\ \texttt{user\_unicast\_port\_offset} = 11 \\ \end{array}
```

Assuming a maximum port number of 65535 (UDPv4), the above settings enable the use of about 230 domains with up to 120 Participants per node per domain.

These settings are *not* backwards compatible with previous versions of the RTI Data Distribution Service middleware that used fixed port mappings. For backwards compability, please use **DDS_RTI_BACKWARDS_-COMPATIBLE_RTPS_WELL_KNOWN_PORTS** (p. 205).

Stringified human-readable name for DDS_-DataWriterResourceLimitsQosPolicy (p. 1130).

4.51.1 Detailed Description

<<e xtension>> (p. 950) Various settings that configure how a DDS_-DataWriter (p. 673) allocates and uses physical memory for internal resources.

4.51.2 Enumeration Type Documentation

Sets the kinds of instances that can be replaced when instance resource limits are reached.

When DDS_ResourceLimitsQosPolicy::max_instances (p. 1359) is reached, a DDS_DataWriter (p. 673) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kind specified by DDS_DataWriterResourceLimitsQosPolicy::instance_replacement (p. 1133).

Only instances whose states match the specified kinds are eligible to be replaced. In addition, an instance must have had all of its samples fully acknowledged for it to be considered replaceable.

For all kinds, a **DDS_DataWriter** (p. 673) will replace the oldest instance satisfying that kind. For example, when the kind is **DDS_UNREGISTERED_-INSTANCE_REPLACEMENT** (p. 212), a **DDS_DataWriter** (p. 673) will remove the oldest fully acknowledged unregistered instance, if such an instance exists.

If no replaceable instance exists, the invoked function will either return with an appropriate out-of-resources return code, or in the case of a write, it may first block to wait for an instance to be acknowledged. Otherwise, the **DDS_DataWriter** (p. 673) will replace the old instance with the new instance, and invoke, if available, the **DDS_DataWriterListener_-InstanceReplacedCallback** (p. 677) to notify the user about an instance being replaced.

A **DDS_DataWriter** (p. 673) checks for replaceable instances in the following order, stopping once a replaceable instance is found:

If DDS_DataWriterResourceLimitsQosPolicy::replace_empty_instances (p. 1133) is DDS_BOOLEAN_TRUE (p. 106), a DDS_-**DataWriter** (p. 673) first tries replacing instances that have no samples. These empty instances can be unregistered, disposed, or alive. DDS_DataWriter (p. 673) tries replacing unregistered instances. an unregistered instance indicates that the DDS_DataWriter (p. 673) is done modifying it, unregistered instances are replaced before instances of any other state (alive, disposed). This is the same as the **DDS**₋-UNREGISTERED_INSTANCE_REPLACEMENT (p. 212) kind. Then, a DDS_DataWriter (p. 673) tries replacing what is specified by DDS_-DataWriterResourceLimitsQosPolicy::instance_replacement (p. 1133). With unregistered instances already checked, this leaves alive and disposed instances. When both alive and disposed instances may be replaced, the kind specifies whether the particular order matters (e.g. DISPOSED_THEN_ALIVE, ALIVE_THEN_DISPOSED) or not (ALIVE_OR_DISPOSED).

QoS:

DDS_DataWriterResourceLimitsQosPolicy (p. 1130)

Enumerator:

DDS_UNREGISTERED_INSTANCE_REPLACEMENT Allows a DDS_DataWriter (p. 673) to reclaim unregistered acknowledged instances.

By default all instance replacement kinds first attempt to reclaim an unregistered acknowledged instance. Used in DDS_-DataWriterResourceLimitsQosPolicy::instance_replacement (p. 1133) [default]

DDS_ALIVE_INSTANCE_REPLACEMENT Allows a DDS_-DataWriter (p. 673) to reclaim alive acknowledged instances.

When an unregistered acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 673) to reclaim an alive acknowledged instance, where an alive instance is a registered, non-disposed instance. The least recently registered or written alive instance will be reclaimed.

DDS_DISPOSED_INSTANCE_REPLACEMENT Allows a DDS_DataWriter (p. 673) to reclaim disposed acknowledged instances.

When an unregistered acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 673) to reclaim a disposed acknowledged instance. The least recently disposed instance will be reclaimed.

$DDS_ALIVE_THEN_DISPOSED_INSTANCE_REPLACEMENT$

Allows a **DDS_DataWriter** (p. 673) first to reclaim an alive acknowledged instance, and then if necessary a disposed acknowledged instance.

When an unregistered acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 673) first try reclaiming an alive acknowledged instance. If no instance is reclaimable, then it trys reclaiming a disposed acknowledged instance. The least recently used (i.e. registered, written, or disposed) instance will be reclaimed.

$DDS_DISPOSED_THEN_ALIVE_INSTANCE_REPLACEMENT$

Allows a **DDS_DataWriter** (p. 673) first to reclaim a disposed acknowledged instance, and then if necessary an alive acknowledged instance.

When an unregistered acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 673) first try reclaiming a disposed acknowledged instance. If no instance is reclaimable,

then it trys reclaiming an alive acknowledged instance. The least recently used (i.e. disposed, registered, or written) instance will be reclaimed.

$DDS_ALIVE_OR_DISPOSED_INSTANCE_REPLACEMENT$

Allows a **DDS_DataWriter** (p. 673) to reclaim a either an alive acknowledged instance or a disposed acknowledged instance.

When an unregistered acknowledged instance is not available to reclaim, this kind allows a **DDS_DataWriter** (p. 673) to reclaim either an alive acknowledged instance or a disposed acknowledged instance. If both instance kinds are available to reclaim, the **DDS_DataWriter** (p. 673) will reclaim the least recently used (i.e. disposed, registered, or written) instance.

4.51.3 Variable Documentation

4.51.3.1 const char* const DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME

Stringified human-readable name for DDS_- -DataWriterResourceLimitsQosPolicy (p. 1130).

4.52 DATA_READER_PROTOCOL

<< eXtension>> (p. 950) Specifies the DataReader-specific protocol QoS.

Data Structures

^ struct DDS_DataReaderProtocolQosPolicy

Along with DDS_WireProtocolQosPolicy (p. 1483) and DDS_DataWriterProtocolQosPolicy (p. 1106), this QoS policy configures the DDS on-the-network protocol (RTPS).

Variables

^ const char *const DDS_DATAREADERPROTOCOL_QOS_-POLICY_NAME

Stringified human-readable name for DDS_- -DataReaderProtocolQosPolicy (p. 1069).

4.52.1 Detailed Description

<< eXtension>> (p. 950) Specifies the DataReader-specific protocol QoS.

4.52.2 Variable Documentation

4.52.2.1 const char* const DDS_DATAREADERPROTOCOL_-QOS_POLICY_NAME

Stringified human-readable name for DDS_DataReaderProtocolQosPolicy (p. 1069).

4.53 DATA_WRITER_PROTOCOL

<<extension>> (p. 950) Along with DDS_WireProtocolQosPolicy (p. 1483) and DDS_DataReaderProtocolQosPolicy (p. 1069), this QoS policy configures the DDS on-the-network protocol (RTPS).

Data Structures

^ struct DDS_DataWriterProtocolQosPolicy

Protocol that applies only to DDS_DataWriter (p. 673) instances.

Variables

^ const char *const DDS_DATAWRITERPROTOCOL_QOS_-POLICY_NAME

Stringified human-readable name for DDS_- -DataWriterProtocolQosPolicy (p. 1106).

4.53.1 Detailed Description

<<e xtension>> (p. 950) Along with DDS_WireProtocolQosPolicy (p. 1483) and DDS_DataReaderProtocolQosPolicy (p. 1069), this QoS policy configures the DDS on-the-network protocol (RTPS).

4.53.2 Variable Documentation

$\begin{array}{ll} \textbf{4.53.2.1} & \textbf{const char}* \ \textbf{const DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME} \end{array}$

Stringified human-readable name for **DDS_DataWriterProtocolQosPolicy** (p. 1106).

4.54 SYSTEM_RESOURCE_LIMITS

<< eXtension>> (p. 950) Configures DomainParticipant-independent resources used by RTI Data Distribution Service.

Data Structures

^ struct DDS_SystemResourceLimitsQosPolicy

Configures DDS_DomainParticipant (p. 339)-independent resources used by RTI Data Distribution Service. Mainly used to change the maximum number of DDS_DomainParticipant (p. 339) entities that can be created within a single process (address space).

Variables

^ const char *const DDS_SYSTEMRESOURCELIMITS_QOS_-POLICY_NAME

4.54.1 Detailed Description

<<eXtension>> (p. 950) Configures DomainParticipant-independent resources used by RTI Data Distribution Service.

4.54.2 Variable Documentation

4.54.2.1 const char* const DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME

Stringified human-readable name for DDS_{-} -SystemResourceLimitsQosPolicy (p. 1423).

4.55 DOMAIN_PARTICIPANT_RESOURCE_-LIMITS

<<e xtension>> (p. 950) Various settings that configure how a DDS_DomainParticipant (p. 339) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Data Structures

^ struct DDS_AllocationSettings_t

Resource allocation settings.

 $\hat{\ }$ struct DDS_DomainParticipantResourceLimitsQosPolicy

Various settings that configure how a DDS_DomainParticipant (p. 339) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Variables

 ${\rm const\;char\;*const\;DDS_DOMAINPARTICIPANTRESOURCELIMITS_-QOS_POLICY_NAME}$

Stringified human-readable name for DDS_- -DomainParticipantResourceLimitsQosPolicy (p. 1162).

4.55.1 Detailed Description

<< eXtension>> (p. 950) Various settings that configure how a DDS_DomainParticipant (p. 339) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

4.55.2 Variable Documentation

4.55.2.1 const char* const DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME

Stringified human-readable name for DDS_-DomainParticipantResourceLimitsQosPolicy (p. 1162).

4.56 EVENT

<<eXtension>> (p. 950) Configures the internal thread in a DomainParticipant that handles timed events.

Data Structures

* struct DDS_EventQosPolicy

 $Settings\ for\ event.$

Variables

^ const char *const DDS_EVENT_QOS_POLICY_NAME

Stringified human-readable name for DDS_EventQosPolicy (p. 1213).

4.56.1 Detailed Description

<<eXtension>> (p. 950) Configures the internal thread in a DomainParticipant that handles timed events.

4.56.2 Variable Documentation

4.56.2.1 const char* const DDS_EVENT_QOS_POLICY_NAME

Stringified human-readable name for DDS_EventQosPolicy (p. 1213).

4.57 DATABASE 219

4.57 DATABASE

<< eXtension>> (p. 950) Various threads and resource limits settings used by RTI Data Distribution Service to control its internal database.

Data Structures

^ struct DDS_DatabaseQosPolicy

Various threads and resource limits settings used by RTI Data Distribution Service to control its internal database.

Variables

^ const char *const DDS_DATABASE_QOS_POLICY_NAME

Stringified human-readable name for DDS_DatabaseQosPolicy (p. 1059).

4.57.1 Detailed Description

<<eXtension>> (p. 950) Various threads and resource limits settings used by RTI Data Distribution Service to control its internal database.

4.57.2 Variable Documentation

$4.57.2.1 \quad const \; char* \; const \; DDS_DATABASE_QOS_POLICY_NAME$

Stringified human-readable name for DDS_DatabaseQosPolicy (p. 1059).

4.58 RECEIVER_POOL

<< eXtension>> (p. 950) Configures threads used by RTI Data Distribution Service to receive and process data from transports (for example, UDP sockets).

Data Structures

^ struct DDS_ReceiverPoolQosPolicy

Configures threads used by RTI Data Distribution Service to receive and process data from transports (for example, UDP sockets).

Variables

^ const char *const DDS_RECEIVERPOOL_QOS_POLICY_-NAME

Stringified human-readable name for $DDS_ReceiverPoolQosPolicy$ (p. 1339).

4.58.1 Detailed Description

<< eXtension>> (p. 950) Configures threads used by RTI Data Distribution Service to receive and process data from transports (for example, UDP sockets).

4.58.2 Variable Documentation

4.58.2.1 const char* const DDS_RECEIVERPOOL_QOS_-POLICY_NAME

Stringified human-readable name for **DDS_ReceiverPoolQosPolicy** (p. 1339).

4.59 PUBLISH_MODE

<<e xtension>> (p. 950) Specifies how RTI Data Distribution Service sends application data on the network. This QoS policy can be used to tell RTI Data Distribution Service to use its own thread to send data, instead of the user thread.

Data Structures

^ struct DDS_PublishModeQosPolicy

Specifies how RTI Data Distribution Service sends application data on the network. This QoS policy can be used to tell RTI Data Distribution Service to use its own thread to send data, instead of the user thread.

Enumerations

^ enum DDS_PublishModeQosPolicyKind {
 DDS_SYNCHRONOUS_PUBLISH_MODE_QOS,
 DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS }

Kinds of publishing mode.

Variables

^ const char *const DDS_PUBLISHMODE_QOS_POLICY_NAME

Stringified human-readable name for DDS_PublishModeQosPolicy
(p. 1331).

4.59.1 Detailed Description

<<e xtension>> (p. 950) Specifies how RTI Data Distribution Service sends application data on the network. This QoS policy can be used to tell RTI Data Distribution Service to use its own thread to send data, instead of the user thread.

4.59.2 Enumeration Type Documentation

4.59.2.1 enum DDS_PublishModeQosPolicyKind

Kinds of publishing mode.

QoS:

DDS_PublishModeQosPolicy (p. 1331)

Enumerator:

 $DDS_SYNCHRONOUS_PUBLISH_MODE_QOS$ Indicates to send data synchronously.

If DDS_DataWriterProtocolQosPolicy::push_on_write (p. 1108) is DDS_BOOLEAN_TRUE (p. 106), data is sent immediately in the context of FooDataWriter_write (p. 684).

As data is sent immediately in the context of the user thread, no flow control is applied.

See also:

 $\begin{aligned} \mathbf{DDS_DataWriterProtocolQosPolicy::push_on_write} \\ & (\mathbf{p}.\ 1108) \end{aligned}$

[default] for DDS_DataWriter (p. 673)

DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS Indicates to send data asynchronously.

Configures the **DDS_DataWriter** (p. 673) to delegate the task of data transmission to a separate publishing thread. The **FooDataWriter_write** (p. 684) call does not send the data, but instead schedules the data to be sent later by its associated **DDS_Publisher** (p. 632).

Each **DDS_Publisher** (p. 632) uses its dedicated publishing thread (**DDS_PublisherQos::asynchronous_publisher** (p. 1329)) to send data for all its asynchronous DataWriters. For each asynchronous DataWriter, the associated **DDS_FlowController** (p. 726) determines when the publishing thread is allowed to send the data.

DDS_DataWriter_wait_for_asynchronous_publishing (p. 714) and DDS_Publisher_wait_for_asynchronous_publishing (p. 655) enable you to determine when the data has actually been sent.

Note: DDS_DataWriterProtocolQosPolicy::push_on_write (p. 1108) must be TRUE for Asynchronous DataWriters. Otherwise, samples will never be sent.

See also:

```
DDS_FlowController (p. 726)
DDS_HistoryQosPolicy (p. 1229)
DDS_DataWriter_wait_for_asynchronous_publishing (p. 714)
DDS_Publisher_wait_for_asynchronous_publishing (p. 655)
NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508)
```

4.59.3 Variable Documentation

$\begin{array}{ll} \textbf{4.59.3.1} & \textbf{const char}* \textbf{ const DDS_PUBLISHMODE_QOS_POLICY_-} \\ \textbf{NAME} \end{array}$

Stringified human-readable name for $DDS_PublishModeQosPolicy$ (p. 1331).

4.60 DISCOVERY_CONFIG

<< eXtension>> (p. 950) Specifies the discovery configuration QoS.

Data Structures

 ${\bf \hat{\ }} struct\ {\bf DDS_BuiltinTopicReaderResourceLimits_t}$

Built-in topic reader's resource limits.

^ struct DDS_DiscoveryConfigQosPolicy

Settings for discovery configuration.

Defines

^ #define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_-MASK_ALL

All bits are set.

^ #define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_-MASK_NONE

No bits are set.

^ #define DDS_DISCOVERYCONFIG_-BUILTIN_PLUGIN_MASK_DEFAULT (DDS_-DiscoveryConfigBuiltinPluginKindMask)DDS_-DISCOVERYCONFIG_BUILTIN_SDP

The default value of DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins (p. 1148).

Typedefs

^ typedef DDS_Long DDS_DiscoveryConfigBuiltinPluginKindMask

A bit-mask (list) of built-in discovery plugins.

Enumerations

^ enum DDS_DiscoveryConfigBuiltinPluginKind { , DDS_DISCOVERYCONFIG_BUILTIN_SDP }

Built-in discovery plugins that can be used.

^ enum DDS_RemoteParticipantPurgeKind {

 $\begin{array}{ll} \textbf{DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_-PURGE,} \end{array}$

DDS_NO_REMOTE_PARTICIPANT_PURGE }

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

Variables

^ const_char *const_DDS_DISCOVERYCONFIG_QOS_POLICY_-NAME

Stringified human-readable name for DDS_DiscoveryConfigQosPolicy (p. 1141).

4.60.1 Detailed Description

<< eXtension>> (p. 950) Specifies the discovery configuration QoS.

4.60.2 Define Documentation

$\begin{array}{ccc} 4.60.2.1 & \# define \ DDS_DISCOVERYCONFIG_BUILTIN_-\\ PLUGIN_MASK_ALL \end{array}$

All bits are set.

See also:

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 226)

$\begin{array}{ccc} 4.60.2.2 & \# define \ DDS_DISCOVERYCONFIG_BUILTIN_- \\ PLUGIN_MASK_NONE & \end{array}$

No bits are set.

See also:

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 226)

4.60.2.3 #define DDS_DISCOVERYCONFIG_-BUILTIN_PLUGIN_MASK_DEFAULT (DDS_-DiscoveryConfigBuiltinPluginKindMask)DDS_-DISCOVERYCONFIG_BUILTIN_SDP

The default value of DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins (p. 1148).

See also:

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 226)

4.60.3 Typedef Documentation

4.60.3.1 typedef DDS_Long DDS_-DiscoveryConfigBuiltinPluginKindMask

A bit-mask (list) of built-in discovery plugins.

The bit-mask is an efficient and compact representation of a fixed-length list of DDS_DiscoveryConfigBuiltinPluginKind (p. 226) values.

QoS:

DDS_DiscoveryConfigQosPolicy (p. 1141)

4.60.4 Enumeration Type Documentation

4.60.4.1 enum DDS_DiscoveryConfigBuiltinPluginKind

Built-in discovery plugins that can be used.

See also:

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 226)

Enumerator:

 $DDS_DISCOVERYCONFIG_BUILTIN_SDP \quad [\mathbf{default}] \ \mathrm{Simple} \ \mathrm{discovery} \ \mathrm{plugin}.$

4.60.4.2 enum DDS_RemoteParticipantPurgeKind

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

When discovery communication with a remote participant has been lost, the local participant must make a decision about whether to continue attempting to communicate with that participant and its contained entities. This "kind" is used to select the desired behavior.

This "kind" does not pertain to the situation in which a remote participant has been gracefully deleted and notification of that deletion have been successfully received by its peers. In that case, the local participant will immediately stop attempting to communicate with those entities and will remove the associated remote entity records from its internal database.

See also:

 $\begin{aligned} \mathbf{DDS_DiscoveryConfigQosPolicy::} \mathbf{remote_participant_purge_kind} \\ (\mathrm{p.}\ 1144) \end{aligned}$

Enumerator:

$DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE$

[default] Maintain knowledge of the remote participant for as long as it maintains its liveliness contract.

A participant will continue attempting communication with its peers, even if discovery communication with them is lost, as long as the remote participants maintain their liveliness. If both discovery communication and participant liveliness are lost, however, the local participant will remove all records of the remote participant and its contained endpoints, and no further data communication with them will occur until and unless they are rediscovered.

The liveliness contract a participant promises to its peers—its "liveliness lease duration"— is specified in its DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration (p. 1143) QoS field. It maintains that contract by writing data to those other participants with a writer that has a DDS_LivelinessQosPolicyKind (p. 162) of DDS_AUTOMATIC_LIVELINESS_QOS (p. 163) or DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS (p. 163) and by asserting itself (at the DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period (p. 1143)) over the Simple Discovery Protocol.

DDS_NO_REMOTE_PARTICIPANT_PURGE Never "forget" a remote participant with which discovery communication has been lost. If a participant with this behavior loses discovery communication with a remote participant, it will nevertheless remember that remote participant and its endpoints and continue attempting to communicate with them indefinitely.

This value has consequences for a participant's resource usage. If discovery communication with a remote participant is lost, but the same participant is later rediscovered, any relevant records that remain in the database will be reused. However, if it is not rediscovered, the records will continue to take up space in the database for as long as the local participant remains in existence.

4.60.5 Variable Documentation

4.60.5.1 const char* const DDS_DISCOVERYCONFIG_QOS_-POLICY_NAME

Stringified human-readable name for DDS_DiscoveryConfigQosPolicy (p. 1141).

4.61 TYPESUPPORT

<<e xtension>> (p. 950) Allows you to attach application-specific values to a DataWriter or DataReader that are passed to the serialization or deserialization routine of the associated data type.

Data Structures

^ struct DDS_TypeSupportQosPolicy

Allows you to attach application-specific values to a DataWriter or DataReader that are passed to the serialization or describilization routine of the associated data type.

Variables

^ const char *const DDS_TYPESUPPORT_QOS_POLICY_NAME

Stringified human-readable name for DDS_TypeSupportQosPolicy
(p. 1466).

4.61.1 Detailed Description

<<eXtension>> (p. 950) Allows you to attach application-specific values to a DataWriter or DataReader that are passed to the serialization or deserialization routine of the associated data type.

4.61.2 Variable Documentation

$\begin{array}{ll} \textbf{4.61.2.1} & \textbf{const char* const DDS_TYPESUPPORT_QOS_POLICY_-} \\ \textbf{NAME} \end{array}$

Stringified human-readable name for **DDS_TypeSupportQosPolicy** (p. 1466).

4.62 ASYNCHRONOUS_PUBLISHER

<<eXtension>> (p. 950) Specifies the asynchronous publishing settings of the DDS_Publisher (p. 632) instances.

Data Structures

 $\hat{\ }$ struct DDS_AsynchronousPublisherQosPolicy

 $Configures\ the\ mechanism\ that\ sends\ user\ data\ in\ an\ external\ middleware\ thread.$

Variables

^ const_char *const_DDS_ASYNCHRONOUSPUBLISHER_QOS_-POLICY_NAME

Stringified human-readable name for DDS_- -Asynchronous Publisher Qos Policy (p. 1035).

4.62.1 Detailed Description

<<eXtension>> (p. 950) Specifies the asynchronous publishing settings of the DDS_Publisher (p. 632) instances.

4.62.2 Variable Documentation

 $\begin{array}{ll} 4.62.2.1 & const\ char*\ const\ DDS_ASYNCHRONOUSPUBLISHER_-\\ QOS_POLICY_NAME \end{array}$

Stringified human-readable name for DDS_-AsynchronousPublisherQosPolicy (p. 1035).

4.63 EXCLUSIVE_AREA

<<eXtension>> (p. 950) Configures multi-thread concurrency and deadlock prevention capabilities.

Data Structures

 ${\bf \hat{\ }} \ \, {\rm struct} \ \, {\bf DDS_ExclusiveAreaQosPolicy}$

Configures multi-thread concurrency and deadlock prevention capabilities.

Variables

Stringified human-readable name for DDS_ExclusiveAreaQosPolicy (p. 1216).

4.63.1 Detailed Description

<<eXtension>> (p. 950) Configures multi-thread concurrency and deadlock prevention capabilities.

4.63.2 Variable Documentation

$\begin{array}{ll} \textbf{4.63.2.1} & \textbf{const char} * \textbf{const DDS_EXCLUSIVEAREA_QOS_-} \\ \textbf{POLICY_NAME} \end{array}$

Stringified human-readable name for **DDS_ExclusiveAreaQosPolicy** (p. 1216).

4.64 BATCH

<<eXtension>> (p. 950) Batch QoS policy used to enable batching in DDS_-DataWriter (p. 673) instances.

Data Structures

^ struct DDS_BatchQosPolicy

 $Used\ to\ configure\ batching\ of\ multiple\ samples\ into\ a\ single\ network\ packet$ in order to increase throughput for small samples.

Variables

const char *const DDS_BATCH_QOS_POLICY_NAME

Stringified human-readable name for DDS_BatchQosPolicy (p. 1040).

4.64.1 Detailed Description

<<eXtension>> (p. 950) Batch QoS policy used to enable batching in DDS_-DataWriter (p. 673) instances.

4.64.2 Variable Documentation

4.64.2.1 const char* const DDS_BATCH_QOS_POLICY_NAME

Stringified human-readable name for DDS_BatchQosPolicy (p. 1040).

4.65 LOCATORFILTER

<<e Xtension>> (p. 950) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of DDS_PublicationBuiltinTopicData (p. 1313).

Data Structures

^ struct DDS_LocatorFilter_t

Specifies the configuration of an individual channel within a MultiChannel DataWriter

* struct DDS_LocatorFilterSeq

 $Declares\ IDL\ sequence < DDS_LocatorFilter_t\ (p.\ 1260) > .$

* struct DDS_LocatorFilterQosPolicy

The QoS policy used to report the configuration of a MultiChannel DataWriter as part of DDS_PublicationBuiltinTopicData (p. 1313).

Variables

^ const char *const DDS_LOCATORFILTER_QOS_POLICY_-NAME

Stringified human-readable name for DDS_LocatorFilterQosPolicy (p. 1262).

4.65.1 Detailed Description

<<e**eXtension**>> (p. 950) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 1313).

4.65.2 Variable Documentation

4.65.2.1 const char* const DDS_LOCATORFILTER_QOS_-POLICY_NAME

Stringified human-readable name for **DDS_LocatorFilterQosPolicy** (p. 1262).

4.66 MULTICHANNEL

<<eXtension>> (p. 950) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Data Structures

* struct DDS_ChannelSettings_t

Type used to configure the properties of a channel.

* struct DDS_ChannelSettingsSeq

Declares IDL sequence $< DDS_-ChannelSettings_t$ (p. 1049) >.

* struct DDS_MultiChannelQosPolicy

Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Variables

^ const char *const **DDS_MULTICHANNEL_QOS_POLICY_- NAME**

Stringified human-readable name for $DDS_MultiChannelQosPolicy$ (p. 1269).

4.66.1 Detailed Description

 $<<\!eXtension>>$ (p. 950) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

4.66.2 Variable Documentation

4.66.2.1 const char* const DDS_MULTICHANNEL_QOS_-POLICY_NAME

Stringified human-readable name for **DDS_MultiChannelQosPolicy** (p. 1269).

4.67 PROPERTY

<<extension>> (p. 950) Stores name/value (string) pairs that can be used to configure certain parameters of RTI Data Distribution Service that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Data Structures

 $\hat{}$ struct **DDS_Property_t**

Properties are name/value pairs objects.

* struct DDS_PropertySeq

 $Declares\ IDL\ \mathtt{sequence}\ <\ DDS_Property_t\ (\mathtt{p.}\ 1307)>.$

^ struct DDS_PropertyQosPolicy

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Data Distribution Service that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Functions

^ DDS_Long DDS_PropertyQosPolicyHelper_get_number_of_properties (struct DDS_PropertyQosPolicy *policy)

Gets the number of properties in the input policy.

DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_property (struct DDS_PropertyQosPolicy *policy, const char *name, const char *value, DDS_Boolean propagate)

Asserts the property identified by name in the input policy.

^ DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_property (struct DDS_PropertyQosPolicy *policy, const char *name, const char *value, DDS_Boolean propagate)

Adds a new property to the input policy.

struct DDS_Property_t * DDS_PropertyQosPolicyHelper_lookup_property (struct DDS_PropertyQosPolicy *policy, const
char *name)

Searches for a property in the input policy given its name.

DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_remove_property (struct DDS_PropertyQosPolicy *policy, const char
*name)

Removes a property from the input policy.

Retrieves a list of properties whose names match the input prefix.

Variables

^ const char *const DDS_PROPERTY_QOS_POLICY_NAME

Stringified human-readable name for DDS_PropertyQosPolicy (p. 1308).

4.67.1 Detailed Description

<<e xtension>> (p. 950) Stores name/value (string) pairs that can be used to configure certain parameters of RTI Data Distribution Service that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

See DDS_PropertyQosPolicy (p. 1308)

4.67.2 Function Documentation

4.67.2.1 DDS_Long DDS_PropertyQosPolicyHelper_get_number_of_properties (struct DDS_PropertyQosPolicy * policy)

Gets the number of properties in the input policy.

Precondition:

policy cannot be NULL.

Parameters:

policy <<in>> (p. 951) Input policy.

Returns:

Number of properties.

4.67.2.2 DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_property (struct DDS_PropertyQosPolicy * policy, const char * name, const char * value, DDS_Boolean propagate)

Asserts the property identified by name in the input policy.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

Precondition:

policy, name and value cannot be NULL.

Parameters:

```
    policy <<iin>> (p. 951) Input policy.
    name <<iin>> (p. 951) Property name.
    value <<iin>> (p. 951) Property value.
    propagate <<iin>> (p. 951) Indicates if the property will be propagated on discovery.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121).

4.67.2.3 DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_property (struct DDS_PropertyQosPolicy * policy, const char * name, const char * value, DDS_Boolean propagate)

Adds a new property to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Data Distribution Service.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

Precondition:

policy, name and value cannot be NULL. The property is not in the policy.

Parameters:

```
policy <<in>> (p. 951) Input policy.
name <<in>> (p. 951) Property name.
value <<in>> (p. 951) Property value.
propagate <<in>> (p. 951) Indicates if the property will be propagated on discovery.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_-RETCODE_OUT_OF_RESOURCES (p. 121) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121)

4.67.2.4 struct DDS_Property_t* DDS_PropertyQosPolicyHelper_lookup_property (struct DDS_PropertyQosPolicy * policy, const char * name) [read]

Searches for a property in the input policy given its name.

Precondition:

policy, name and value cannot be NULL.

Parameters:

```
policy << in>> (p. 951) Input policy. name << in>> (p. 951) Property name.
```

Returns:

On success, the function returns the first property with the given name. Otherwise, the function returns NULL.

4.67.2.5 DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_remove_property (struct DDS_PropertyQosPolicy * policy,
const char * name)

Removes a property from the input policy.

If the property does not exist, the function fails with **DDS_RETCODE_- PRECONDITION_NOT_MET** (p. 121).

Precondition:

policy and name cannot be NULL. The property is in the policy.

Parameters:

```
policy <<in>> (p. 951) Input policy.
name <<in>> (p. 951) Property name.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

4.67.2.6 DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_get_properties (struct DDS_PropertyQosPolicy * policy, struct DDS_PropertySeq * properties, const char * name_prefix)

Retrieves a list of properties whose names match the input prefix.

If the properties sequence doesn't own its buffer, and its maximum is less than the total number of properties matching the input prefix, it will be filled up to its maximum and fail with an error of DDS_RETCODE_OUT_OF_-RESOURCES (p. 121).

Precondition:

policy, properties and name_prefix cannot be NULL.

Parameters:

```
policy <<in>>> (p. 951) Input policy.
properties <<inout>> (p. 951) A DDS_PropertySeq (p. 1311) object
where the set or list of properties will be returned.
name_prefix Name prefix.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_OUT_OF_RESOURCES (p. 121).

4.67.3 Variable Documentation

4.67.3.1 const char* const DDS_PROPERTY_QOS_POLICY_NAME

Stringified human-readable name for DDS_PropertyQosPolicy (p. 1308).

4.68 Entity Support

DDS_Entity (p. 242), DDS_Listener (p. 1246) and related items.

Data Structures

^ struct DDS_Listener

<<iinterface>> (p. 950) Abstract base class for all Listener interfaces.

Defines

 $\hat{\ }$ #define DDS_Listener_INITIALIZER

Initialize the DDS_Listener::listener_data (p. 1249) pointer to NULL.

Typedefs

* typedef struct DDS_EntityImpl **DDS_Entity**

<<iinterface>> (p. 950) Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.

* typedef struct DDS_DomainEntityImpl DDS_DomainEntity

<<iinterface>> (p.950) Abstract base class for all DDS entities except for the DDS_DomainParticipant (p. 339).

Functions

Entity *self)

^ DDS_ReturnCode_t DDS_Entity_enable (DDS_Entity *self)

Enables the DDS_Entity (p. 242).

^ DDS_StatusCondition * DDS_Entity_get_statuscondition (DDS_-

Allows access to the DDS_StatusCondition (p. 253) associated with the DDS_Entity (p. 242).

` DDS_StatusMask DDS_Entity_get_status_changes (DDS_Entity *self)

Retrieves the list of communication statuses in the DDS_Entity (p. 242) that are triggered.

^ DDS_InstanceHandle_t DDS_Entity_get_instance_handle (DDS_-Entity *self)

Allows access to the $DDS_InstanceHandle_t$ (p. 452) associated with the DDS_Entity (p. 242).

Allows access to the $DDS_InstanceHandle_t$ (p. 452) associated with the DDS_Entity (p. 242).

4.68.1 Detailed Description

DDS_Entity (p. 242), DDS_Listener (p. 1246) and related items.

DDS_Entity (p. 242) subtypes are created and destroyed by factory objects. With the exception of DDS_DomainParticipant (p. 339), whose factory is DDS_DomainParticipantFactory (p. 302), all DDS_Entity (p. 242) factory objects are themselves DDS_Entity (p. 242) subtypes as well.

Important: all **DDS_Entity** (p. 242) delete operations are inherently thread-unsafe. The user must take extreme care that a given **DDS_Entity** (p. 242) is not destroyed in one thread while being used concurrently (including being deleted concurrently) in another thread. An operation's effect in the presence of the concurrent deletion of the operation's target **DDS_Entity** (p. 242) is undefined.

4.68.2 Define Documentation

4.68.2.1 #define DDS_Listener_INITIALIZER

Initialize the DDS_Listener::listener_data (p. 1249) pointer to NULL.

4.68.3 Typedef Documentation

4.68.3.1 typedef struct DDS_EntityImpl DDS_Entity

<<interface>> (p. 950) Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.

All operations except for set_qos(), get_qos(), set_listener(), get_listener() and enable(), may return the value **DDS_RETCODE_NOT_ENABLED** (p. 121).

QoS:

```
QoS Policies (p. 137)
```

Status:

Status Kinds (p. 123)

Listener:

DDS_Listener (p. 1246)

4.68.4 Abstract operations

Each derived entity provides the following operations specific to its role in RTI Data Distribution Service.

4.68.4.1 set_qos (abstract)

This operation sets the QoS policies of the **DDS_Entity** (p. 242).

This operation must be provided by each of the derived **DDS_Entity** (p. 242) classes (**DDS_DomainParticipant** (p. 339), **DDS_Topic** (p. 425), **DDS_Publisher** (p. 632), **DDS_DataWriter** (p. 673), **DDS_Subscriber** (p. 743), and **DDS_DataReader** (p. 783)) so that the policies that are meaningful to each **DDS_Entity** (p. 242) can be set.

Precondition:

Certain policies are immutable (see QoS Policies (p. 137)): they can only be set at DDS_Entity (p. 242) creation time or before the entity is enabled. If set_qos() is invoked after the DDS_Entity (p. 242) is enabled and it attempts to change the value of an immutable policy, the operation will fail and return DDS_RETCODE_IMMUTABLE_POLICY (p. 121).

Certain values of QoS policies can be incompatible with the settings of the other policies. The set_qos() operation will also fail if it specifies a set of values that, once combined with the existing values, would result in an inconsistent set of policies. In this case, the operation will fail and return DDS_RETCODE_INCONSISTENT_POLICY (p. 122).

If the application supplies a non-default value for a QoS policy that is not supported by the implementation of the service, the set_qos operation will fail and return **DDS_RETCODE_UNSUPPORTED** (p. 121).

Postcondition:

The existing set of policies is only changed if the set_qos() operation succeeds. This is indicated by a return code of DDS_RETCODE_OK (p. 121). In all other cases, none of the policies are modified.

Each derived DDS_Entity (p. 242) class (DDS_DomainParticipant (p. 339), DDS_Topic (p. 425), DDS_Publisher (p. 632), DDS_DataWriter (p. 673), DDS_Subscriber (p. 743), DDS_DataReader (p. 783)) has a corresponding special value of the QoS (DDS_PARTICIPANT_QOS_DEFAULT (p. 325), DDS_PUBLISHER_QOS_DEFAULT (p. 406), DDS_SUBSCRIBER_QOS_DEFAULT (p. 407), DDS_TOPIC_QOS_DEFAULT (p. 406), DDS_DATAWRITER_QOS_DEFAULT (p. 656), DDS_DATAREADER_QOS_DEFAULT (p. 765)). This special value may be used as a parameter to the set_qos operation to indicate that the QoS of the DDS_Entity (p. 242) should be changed to match the current default QoS set in the DDS_Entity (p. 242)'s factory. The operation set_qos cannot modify the immutable QoS, so a successful return of the operation indicates that the mutable QoS for the Entity has been modified to match the current default for the DDS_Entity (p. 242)'s factory.

The set of policies specified in the qos parameter are applied on top of the existing QoS, replacing the values of any policies previously set.

Possible error codes returned in addition to **Standard Return Codes** (p. 120): **DDS_RETCODE_IMMUTABLE_POLICY** (p. 121), or **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122).

4.68.4.2 get_qos (abstract)

This operation allows access to the existing set of QoS policies for the DDS_Entity (p. 242). This operation must be provided by each of the derived DDS_Entity (p. 242) classes (DDS_DomainParticipant (p. 339), DDS_Topic (p. 425), DDS_Publisher (p. 632), DDS_DataWriter (p. 673), DDS_Subscriber (p. 743), and DDS_DataReader (p. 783)), so that the policies that are meaningful to each DDS_Entity (p. 242) can be retrieved.

Possible error codes are **Standard Return Codes** (p. 120).

4.68.4.3 set_listener (abstract)

This operation installs a **DDS_Listener** (p. 1246) on the **DDS_Entity** (p. 242). The listener will only be invoked on the changes of communication status indicated by the specified mask.

This operation must be provided by each of the derived DDS_Entity (p. 242) classes (DDS_DomainParticipant (p. 339), DDS_Topic (p. 425), DDS_Publisher (p. 632), DDS_DataWriter (p. 673), DDS_Subscriber (p. 743), and DDS_DataReader (p. 783)), so that the listener is of the concrete type suitable to the particular DDS_Entity (p. 242).

It is permitted to use NULL as the value of the listener. The NULL listener behaves as if the mask is DDS_STATUS_MASK_NONE (p. 127).

Postcondition:

Only one listener can be attached to each **DDS_Entity** (p. 242). If a listener was already set, the operation **set_listener()** will replace it with the new one. Consequently, if the value NULL is passed for the listener parameter to the set_listener operation, any existing listener will be removed.

4.68.4.4 get_listener (abstract)

This operation allows access to the existing **DDS_Listener** (p. 1246) attached to the **DDS_Entity** (p. 242).

This operation must be provided by each of the derived DDS_Entity (p. 242) classes (DDS_DomainParticipant (p. 339), DDS_Topic (p. 425), DDS_Publisher (p. 632), DDS_DataWriter (p. 673), DDS_Subscriber (p. 743), and DDS_DataReader (p. 783)) so that the listener is of the concrete type suitable to the particular DDS_Entity (p. 242).

If no listener is installed on the **DDS_Entity** (p. 242), this operation will return NULL.

4.68.4.5 typedef struct DDS_DomainEntityImpl DDS_DomainEntity

<< interface>> (p. 950) Abstract base class for all DDS entities except for the DDS_DomainParticipant (p. 339).

Its sole purpose is to *conceptually* express that **DDS_DomainParticipant** (p. 339) is a special kind of **DDS_Entity** (p. 242) that acts as a container of all other **DDS_Entity** (p. 242) but itself cannot contain other **DDS_DomainParticipant** (p. 339).

4.68.5 Function Documentation

4.68.5.1 DDS_ReturnCode_t DDS_Entity_enable (DDS_Entity * self)

Enables the **DDS_Entity** (p. 242).

This operation enables the Entity. Entity objects can be created either enabled or disabled. This is controlled by the value of the ENTITY_FACTORY (p. 180) QoS policy on the corresponding factory for the DDS_Entity (p. 242).

By default, **ENTITY_FACTORY** (p. 180) is set so that it is not necessary to explicitly call **DDS_Entity_enable** (p. 245) on newly created entities.

The DDS_Entity_enable (p. 245) operation is idempotent. Calling enable on

an already enabled Entity returns OK and has no effect.

If a **DDS_Entity** (p. 242) has not yet been enabled, the following kinds of operations may be invoked on it:

- ^ set or get the QoS policies (including default QoS policies) and listener
- ^ DDS_Entity_get_status condition (p. 247)
- 'factory' operations
- **DDS_Entity_get_status_changes** (p. 247) and other get status operations (although the status of a disabled entity never changes)
- ^ 'lookup' operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **DDS_RETCODE_NOT_-ENABLED** (p. 121).

It is legal to delete an **DDS_Entity** (p. 242) that has not been enabled by calling the proper operation on its factory.

Entities created from a factory that is disabled are created disabled, regardless of the setting of the **DDS_EntityFactoryQosPolicy** (p. 1207).

Calling enable on an Entity whose factory is not enabled will fail and return DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

If DDS_EntityFactoryQosPolicy::autoenable_created_entities (p. 1208) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory.

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a trigger_value == FALSE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), Standard Return Codes (p. 120) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

4.68.5.2 DDS_StatusCondition* DDS_Entity_get_statuscondition (DDS_Entity * self)

Allows access to the **DDS_StatusCondition** (p. 253) associated with the **DDS_Entity** (p. 242).

The returned condition can then be added to a **DDS_WaitSet** (p. 253) so that the application can wait for specific status changes that affect the **DDS_Entity** (p. 242).

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

Returns:

the status condition associated with this entity.

4.68.5.3 DDS_StatusMask DDS_Entity_get_status_changes (DDS_Entity * self)

Retrieves the list of communication statuses in the **DDS_Entity** (p. 242) that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the get_*_status() function.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the get_status_changes operation will be empty.

The list of statuses returned by the get_status_changes operation refers to the status that are triggered on the Entity itself and does not include statuses that apply to contained entities.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

list of communication statuses in the $\mathbf{DDS_Entity}~(\mathrm{p.\,}\underline{242})$ that are triggered.

See also:

Status Kinds (p. 123)

4.68.5.4 DDS_InstanceHandle_t DDS_Entity_get_instance_handle (DDS_Entity * self)

Allows access to the **DDS_InstanceHandle_t** (p. 452) associated with the **DDS_Entity** (p. 242).

This operation returns the **DDS_InstanceHandle_t** (p. 452) that represents the **DDS_Entity** (p. 242).

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

Returns:

the instance handle associated with this entity.

4.68.5.5 DDS_EntityKind_t DDS_Entity_get_entity_kind (DDS_Entity * self)

Allows access to the DDS_InstanceHandle_t (p. 452) associated with the DDS_Entity (p. 242).

This operation returns the **DDS_InstanceHandle_t** (p. 452) that represents the **DDS_Entity** (p. 242).

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

Returns:

the instance handle associated with this entity.

4.69 Conditions and WaitSets

DDS_Condition (p. 252) and DDS_WaitSet (p. 253) and related items.

Data Structures

^ struct DDS_ConditionSeq

```
Instantiates FooSeq (p. 1497) < DDS_{-}Condition (p. 252) >.
```

^ struct DDS_WaitSetProperty_t

<<extension>> (p. 950) Specifies the DDS_WaitSet (p. 253) behavior for multiple trigger events.

Defines

^ #define DDS_WaitSetProperty_t_INITIALIZER

```
<<eXtension>> (p. 950) Initializer for new property instances.
```

Typedefs

^ typedef struct DDS_ConditionImpl **DDS_Condition**

```
<<iinterface>> (p. 950) Root class for all the conditions that may be attached to a DDS_WaitSet (p. 253).
```

 $\hat{}$ typedef struct DDS_GuardConditionImpl **DDS_GuardCondition**

```
<<\!\! interface>> (p.950) A specific DDS\_Condition (p.252) whose trigger_value is completely under the control of the application.
```

^ typedef struct DDS_StatusConditionImpl **DDS_StatusCondition**

```
<<iinterface>> (p. 950) A specific DDS_Condition (p. 252) that is associated with each DDS_Entity (p. 242).
```

^ typedef struct DDS_WaitSetImpl **DDS_WaitSet**

```
<<iinterface>> (p. 950) Allows an application to wait until one or more of the attached DDS_Condition (p. 252) objects has a trigger_value of DDS_BOOLEAN_TRUE (p. 106) or else until the timeout expires.
```

Functions

^ DDS_Boolean DDS_Condition_get_trigger_value (DDS_-Condition *self) (DDS_-

Retrieve the trigger_value.

^ DDS_Condition * DDS_GuardCondition_as_condition (DDS_GuardCondition) *guardCondition)

Access a DDS_GuardCondition (p. 252)'s supertype instance.

^ DDS_GuardCondition * DDS_GuardCondition_new ()

No argument constructor.

Destructor.

^ DDS_ReturnCode_t DDS_GuardCondition_set_trigger_value (DDS_GuardCondition *self, DDS_Boolean value)

Set the guard condition trigger value.

^ DDS_Condition * DDS_StatusCondition_as_condition (DDS_-StatusCondition *statusCondition)

Access a DDS_StatusCondition (p. 253)'s supertype instance.

Get the list of statuses enabled on an DDS_Entity (p. 242).

^ DDS_ReturnCode_t DDS_StatusCondition_set_enabled_statuses (DDS_StatusCondition *self, DDS_StatusMask mask)

This operation defines the list of communication statuses that determine the trigger_value of the $DDS_StatusCondition$ (p. 253).

^ DDS_Entity * DDS_StatusCondition_get_entity (DDS_-StatusCondition *self)

Get the DDS_Entity (p. 242) associated with the $DDS_StatusCondition$ (p. 253).

^ DDS_WaitSet * DDS_WaitSet_new ()

 $Default\ no-argument\ constructor.$

^ DDS_WaitSet * DDS_WaitSet_new_ex (const struct DDS_-WaitSetProperty_t *prop) <<extension>> (p. 950) Constructor for a DDS_WaitSet (p. 253) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first

^ DDS_ReturnCode_t DDS_WaitSet_delete (DDS_WaitSet *self)

Destructor.

DDS_ReturnCode_t DDS_WaitSet_set_property (DDS_WaitSet
 *self, const struct DDS_WaitSetProperty_t *prop)

<<extension>> (p. 950) Sets the DDS_WaitSetProperty_t (p. 1480), to configure the associated DDS_WaitSet (p. 253) to return after one or more trigger events have occurred.

^ DDS_ReturnCode_t DDS_WaitSet_get_property (DDS_WaitSet *self, struct DDS_WaitSetProperty_t *prop)

<<eXtension>> (p. 950) Retrieves the DDS_WaitSetProperty_t (p. 1480) configuration of the associated DDS_WaitSet (p. 253).

^ DDS_ReturnCode_t DDS_WaitSet_wait (DDS_WaitSet *self,
 struct DDS_ConditionSeq *active_conditions, const struct DDS_ Duration_t *timeout)

Allows an application thread to wait for the occurrence of certain conditions.

Attaches a DDS_Condition (p. 252) to the DDS_WaitSet (p. 253).

Detaches a DDS_Condition (p. 252) from the DDS_WaitSet (p. 253).

^ DDS_ReturnCode_t DDS_WaitSet_get_conditions (DDS_WaitSet *self, struct DDS_ConditionSeq *attached_conditions)

Retrieves the list of attached DDS_Condition (p. 252) (s).

4.69.1 Detailed Description

DDS_Condition (p. 252) and DDS_WaitSet (p. 253) and related items.

4.69.2 Define Documentation

4.69.2.1 #define DDS_WaitSetProperty_t_INITIALIZER

Value:

```
{ \
   1, { 0x7fffffffL, 0x7fffffffUL } \
}
```

<< eXtension>> (p. 950) Initializer for new property instances.

Default property specifies max_event_count = 1 and max_event_delay = DDS_-DURATION_INFINITE

4.69.3 Typedef Documentation

4.69.3.1 typedef struct DDS_ConditionImpl DDS_Condition

<< interface>> (p. 950) Root class for all the conditions that may be attached to a DDS_WaitSet (p. 253).

This basic class is specialised in three classes:

DDS_GuardCondition (p. 252), DDS_StatusCondition (p. 253), and DDS_ReadCondition (p. 842).

A DDS_Condition (p. 252) has a trigger_value that can be DDS_BOOLEAN_TRUE (p. 106) or DDS_BOOLEAN_FALSE (p. 107) and is set automatically by RTI Data Distribution Service.

See also:

```
DDS_WaitSet (p. 253)
```

4.69.3.2 typedef struct DDS_GuardConditionImpl DDS_GuardCondition

<< interface>> (p. 950) A specific DDS_Condition (p. 252) whose trigger_value is completely under the control of the application.

The DDS_GuardCondition (p. 252) provides a way for an application to manually wake up a DDS_WaitSet (p. 253). This is accomplished by attaching the DDS_GuardCondition (p. 252) to the DDS_WaitSet (p. 253) and then setting the trigger_value by means of the DDS_GuardCondition_set_trigger_value (p. 257) operation.

See also:

```
DDS_-WaitSet (p. 253)
```

4.69.3.3 typedef struct DDS_StatusConditionImpl DDS_StatusCondition

<< interface>> (p. 950) A specific DDS_Condition (p. 252) that is associated with each DDS_Entity (p. 242).

The trigger_value of the DDS_StatusCondition (p. 253) depends on the communication status of that entity (e.g., arrival of data, loss of information, etc.), 'filtered' by the set of enabled_statuses on the DDS_StatusCondition (p. 253).

See also:

```
Status Kinds (p. 123)
DDS_WaitSet (p. 253), DDS_Condition (p. 252)
DDS_Listener (p. 1246)
```

4.69.3.4 typedef struct DDS_WaitSetImpl DDS_WaitSet

<< interface>> (p. 950) Allows an application to wait until one or more of the attached DDS_Condition (p. 252) objects has a trigger_value of DDS_BOOLEAN_TRUE (p. 106) or else until the timeout expires.

4.69.4 Usage

DDS_Condition (p. 252) (s) (in conjunction with wait-sets) provide an alternative mechanism to allow the middleware to communicate communication status changes (including arrival of data) to the application.

This mechanism is wait-based. Its general use pattern is as follows:

- ^ The application indicates which relevant information it wants to get by creating DDS_Condition (p. 252) objects (DDS_StatusCondition (p. 253), DDS_ReadCondition (p. 842) or DDS_QueryCondition (p. 845)) and attaching them to a DDS_WaitSet (p. 253).
- ^ It then waits on that DDS_WaitSet (p. 253) until the trigger_value of one or several DDS_Condition (p. 252) objects become DDS_BOOLEAN_TRUE (p. 106).

- It then uses the result of the wait (i.e., active_conditions, the list of DDS_Condition (p. 252) objects with trigger_value == DDS_BOOLEAN_TRUE (p. 106)) to actually get the information:
 - by calling DDS_Entity_get_status_changes (p. 247) and then get_<communication_status>() on the relevant DDS_Entity (p. 242), if the condition is a DDS_StatusCondition (p. 253) and the status changes, refer to plain communication status;
 - by calling DDS_Entity_get_status_changes (p. 247) and then DDS_Subscriber_get_datareaders (p. 756) on the relevant DDS_Subscriber (p. 743) (and then FooDataReader_read() (p. 788) or FooDataReader_take (p. 789) on the returned DDS_DataReader (p. 783) objects), if the condition is a DDS_StatusCondition (p. 253) and the status changes refers to DDS_DATA_ON_READERS_STATUS (p. 130);
 - by calling DDS_Entity_get_status_changes (p. 247) and then FooDataReader_read() (p. 788) or FooDataReader_take (p. 789) on the relevant DDS_DataReader (p. 783), if the condition is a DDS_StatusCondition (p. 253) and the status changes refers to DDS_DATA_AVAILABLE_STATUS (p. 130);
 - by calling directly FooDataReader_read_w_condition (p. 796) or FooDataReader_take_w_condition (p. 797) on a DDS_DataReader (p. 783) with the DDS_Condition (p. 252) as a parameter if it is a DDS_ReadCondition (p. 842) or a DDS_QueryCondition (p. 845).

Usually the first step is done in an initialization phase, while the others are put in the application main loop.

As there is no extra information passed from the middleware to the application when a wait returns (only the list of triggered **DDS_Condition** (p. 252) objects), **DDS_Condition** (p. 252) objects are meant to embed all that is needed to react properly when enabled. In particular, **DDS_Entity** (p. 242)-related conditions are related to exactly one **DDS_Entity** (p. 242) and cannot be shared.

The blocking behavior of the **DDS_WaitSet** (p. 253) is illustrated below.

The result of a DDS_WaitSet_wait (p. 261) operation depends on the state of the DDS_WaitSet (p. 253), which in turn depends on whether at least one attached DDS_Condition (p. 252) has a trigger_value of DDS_BOOLEAN_TRUE (p. 106). If the wait operation is called on DDS_WaitSet (p. 253) with state BLOCKED, it will block the calling thread. If wait is called on a DDS_WaitSet (p. 253) with state UNBLOCKED, it will return immediately. In addition, when the DDS_WaitSet (p. 253) transitions from BLOCKED to UNBLOCKED it wakes up any threads that had called wait on it.

A key aspect of the **DDS_Condition** (p. 252)/**DDS_WaitSet** (p. 253) mechanism is the setting of the trigger_value of each **DDS_Condition** (p. 252).

4.69.5 Trigger State of a ::DDS_StatusCondition

The trigger_value of a DDS_StatusCondition (p. 253) is the boolean OR of the ChangedStatusFlag of all the communication statuses (see Status Kinds (p. 123)) to which it is sensitive. That is, trigger_value == DDS_BOOLEAN_FALSE (p. 107) only if all the values of the ChangedStatusFlags are DDS_BOOLEAN_FALSE (p. 107).

The sensitivity of the DDS_StatusCondition (p. 253) to a particular communication status is controlled by the list of enabled_statuses set on the condition by means of the DDS_StatusCondition_set_enabled_statuses (p. 258) operation.

4.69.6 Trigger State of a ::DDS_ReadCondition

Similar to the DDS_StatusCondition (p. 253), a DDS_ReadCondition (p. 842) also has a trigger_value that determines whether the attached DDS_WaitSet (p. 253) is BLOCKED or UNBLOCKED. However, unlike the DDS_StatusCondition (p. 253), the trigger_value of the DDS_ReadCondition (p. 842) is tied to the presence of at least a sample managed by RTI Data Distribution Service with DDS_SampleStateKind (p. 848) and DDS_ViewStateKind (p. 850) matching those of the DDS_ReadCondition (p. 842). Furthermore, for the DDS_QueryCondition (p. 845) to have a trigger_value == DDS_BOOLEAN_TRUE (p. 106), the data associated with the sample must be such that the query_expression evaluates to DDS_BOOLEAN_TRUE (p. 106).

The fact that the trigger_value of a DDS_ReadCondition (p. 842) depends on the presence of samples on the associated DDS_DataReader (p. 783) implies that a single take operation can potentially change the trigger_value of several DDS_ReadCondition (p. 842) or DDS_QueryCondition (p. 845) conditions. For example, if all samples are taken, any DDS_ReadCondition (p. 842) and DDS_QueryCondition (p. 845) conditions associated with the DDS_DataReader (p. 783) that had their trigger_value==TRUE before will see the trigger_value change to FALSE. Note that this does not guarantee that DDS_WaitSet (p. 253) objects that were separately attached to those conditions will not be woken up. Once we have trigger_value==TRUE on a condition, it may wake up the attached DDS_WaitSet (p. 253), the condition transitioning to trigger_value==FALSE does not necessarily 'unwakeup' the WaitSet as 'unwakening' may not be possible in general.

The consequence is that an application blocked on a DDS_WaitSet (p. 253) may return from the wait with a list of conditions, some of which are not no

longer 'active'. This is unavoidable if multiple threads are concurrently waiting on separate **DDS_WaitSet** (p. 253) objects and taking data associated with the same **DDS_DataReader** (p. 783) entity.

To elaborate further, consider the following example: A DDS_ReadCondition (p. 842) that has a sample_state_mask = {DDS_NOT_READ_SAMPLE_STATE (p. 849)} will have trigger_value of DDS_BOOLEAN_TRUE (p. 106) whenever a new sample arrives and will transition to DDS_BOOLEAN_FALSE (p. 107) as soon as all the newly-arrived samples are either read (so their sample state changes to READ) or taken (so they are no longer managed by RTI Data Distribution Service). However if the same DDS_ReadCondition (p. 842) had a sample_state_mask = { DDS_READ_SAMPLE_STATE (p. 849) }, then the trigger_value would only become DDS_BOOLEAN_FALSE (p. 107) once all the newly-arrived samples are taken (it is not sufficient to read them as that would only change the sample state to READ), which overlaps the mask on the DDS_ReadCondition (p. 842).

4.69.7 Trigger State of a ::DDS_GuardCondition

The trigger_value of a DDS_GuardCondition (p.252) is completely controlled by the application via the operation DDS_GuardCondition_set_trigger_value (p.257).

DDS_Listener (p. 1246)
```

4.69.8 Function Documentation

4.69.8.1 DDS_Boolean DDS_Condition_get_trigger_value (DDS_Condition * self)

Retrieve the trigger_value.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

the trigger value.

4.69.8.2 DDS_Condition* DDS_GuardCondition_as_condition (DDS_GuardCondition * guardCondition)

Access a DDS_GuardCondition (p. 252)'s supertype instance.

Parameters:

```
guardCondition << in>> (p. 951) Cannot be NULL.
```

4.69.8.3 DDS_GuardCondition* DDS_GuardCondition_new ()

No argument constructor.

Construct a new guard condition on the heap.

Returns:

A new condition with trigger value **DDS_BOOLEAN_FALSE** (p. 107), or NULL if a condition could not be allocated.

4.69.8.4 DDS_ReturnCode_t DDS_GuardCondition_delete (DDS_GuardCondition * self)

Destructor.

Releases the resources associated with this object.

Deleting a NULL condition is safe and has no effect.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

4.69.8.5 DDS_ReturnCode_t DDS_GuardCondition_set_trigger_value (DDS_GuardCondition * self, DDS_Boolean value)

Set the guard condition trigger value.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL. value \ll in \gg (p. 951) the new trigger value.
```

4.69.8.6 DDS_Condition* DDS_StatusCondition_as_condition (DDS_StatusCondition * statusCondition)

Access a DDS_StatusCondition (p. 253)'s supertype instance.

Parameters:

```
statusCondition << in>> (p. 951) Cannot be NULL.
```

4.69.8.7 DDS_StatusMask DDS_StatusCondition_get_enabled_statuses (DDS_StatusCondition * self)

Get the list of statuses enabled on an **DDS_Entity** (p. 242).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

list of enabled statuses.

4.69.8.8 DDS_ReturnCode_t DDS_StatusCondition_set_enabled_statuses (DDS_StatusCondition * self, DDS_StatusMask mask)

This operation defines the list of communication statuses that determine the trigger_value of the DDS_StatusCondition (p. 253).

This operation may change the trigger_value of the DDS_StatusCondition (p. 253).

DDS_WaitSet (p. 253) objects' behavior depends on the changes of the trigger_value of their attached conditions. Therefore, any DDS_WaitSet (p. 253) to which the DDS_StatusCondition (p. 253) is attached is potentially affected by this operation.

If this function is not invoked, the default list of enabled statuses includes all the statuses.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.

mask << in>> (p. 951) the list of enables statuses (see Status Kinds (p. 123))
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.69.8.9 DDS_Entity* DDS_StatusCondition_get_entity (DDS_StatusCondition * self)

Get the DDS_Entity (p. 242) associated with the DDS_StatusCondition (p. 253).

There is exactly one **DDS_Entity** (p. 242) assocated with each **DDS_StatusCondition** (p. 253).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

DDS_Entity (p. 242) associated with the **DDS_StatusCondition** (p. 253).

4.69.8.10 DDS_WaitSet* DDS_WaitSet_new ()

Default no-argument constructor.

Construct a new **DDS_WaitSet** (p. 253).

Returns:

A new **DDS_WaitSet** (p. 253) or NULL if one could not be allocated.

4.69.8.11 DDS_WaitSet* DDS_WaitSet_new_ex (const struct DDS_WaitSetProperty_t * prop)

<< eXtension>> (p. 950) Constructor for a DDS_WaitSet (p. 253) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first

Constructs a new **DDS_WaitSet** (p. 253).

Returns:

A new **DDS_WaitSet** (p. 253) or NULL if one could not be allocated.

4.69.8.12 DDS_ReturnCode_t DDS_WaitSet_delete (DDS_WaitSet * self)

Destructor.

Releases the resources associated with this DDS_WaitSet (p. 253).

Freeing a null pointer is safe and does nothing.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

4.69.8.13 DDS_ReturnCode_t DDS_WaitSet_set_property (DDS_WaitSet * self, const struct DDS_WaitSetProperty_t * prop)

<<eXtension>> (p. 950) Sets the DDS_WaitSetProperty_t (p. 1480), to configure the associated DDS_WaitSet (p. 253) to return after one or more trigger events have occurred.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. prop << in>> (p. 951)
```

Returns:

One of the Standard Return Codes (p. 120)

4.69.8.14 DDS_ReturnCode_t DDS_WaitSet_get_property (DDS_WaitSet * self, struct DDS_WaitSetProperty_t * prop)

<<eXtension>> (p. 950) Retrieves the DDS_WaitSetProperty_t (p. 1480) configuration of the associated DDS_WaitSet (p. 253).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. prop << out>> (p. 951)
```

Returns:

One of the Standard Return Codes (p. 120)

4.69.8.15 DDS_ReturnCode_t DDS_WaitSet_wait (DDS_WaitSet * self, struct DDS_ConditionSeq * active_conditions, const struct DDS_Duration_t * timeout)

Allows an application thread to wait for the occurrence of certain conditions.

If none of the conditions attached to the **DDS_WaitSet** (p. 253) have a trigger_value of **DDS_BOOLEAN_TRUE** (p. 106), the wait operation will block suspending the calling thread.

The result of the wait operation is the list of all the attached conditions that have a trigger_value of **DDS_BOOLEAN_TRUE** (p. 106) (i.e., the conditions that unblocked the wait).

The wait operation takes a timeout argument that specifies the maximum duration for the wait. If this duration is exceeded and none of the attached DDS_Condition (p. 252) objects is DDS_BOOLEAN_TRUE (p. 106), wait will return with the return code DDS_RETCODE_TIMEOUT (p. 122). In this case, the resulting list of conditions will be empty.

DDS_RETCODE_TIMEOUT (p. 122) will not be returned when the timeout duration is exceeded if attached DDS_Condition (p. 252) objects are DDS_BOOLEAN_TRUE (p. 106), or in the case of a DDS_WaitSet (p. 253) waiting for more than one trigger event, if one or more trigger events have occurred.

It is not allowable for for more than one application thread to be waiting on the same DDS_WaitSet (p. 253). If the wait operation is invoked on a DDS_WaitSet (p. 253) that already has a thread blocking on it, the operation will return immediately with the value DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Parameters:

```
active_conditions <<inout>> (p. 951) a valid non-NULL DDS_-
ConditionSeq (p. 1053) object. Note that RTI Data Distribution
Service will not allocate a new object if active_conditions is NULL;
the function will return DDS_RETCODE_PRECONDITION_-
NOT_MET (p. 121).
```

```
self << in>> (p. 951) Cannot be NULL. timeout << in>> (p. 951) a wait timeout
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_-TIMEOUT (p. 122).

4.69.8.16 DDS_ReturnCode_t DDS_WaitSet_attach_condition (DDS_WaitSet * self, DDS_Condition * cond)

Attaches a DDS_Condition (p. 252) to the DDS_WaitSet (p. 253).

It is possible to attach a DDS_Condition (p. 252) on a DDS_WaitSet (p. 253) that is currently being waited upon (via the wait operation). In this case, if the DDS_Condition (p. 252) has a trigger_value of DDS_BOOLEAN_TRUE (p. 106), then attaching the condition will unblock the DDS_WaitSet (p. 253).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. cond << in>> (p. 951) Contition to be attached.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121).

4.69.8.17 DDS_ReturnCode_t DDS_WaitSet_detach_condition (DDS_WaitSet * self, DDS_Condition * cond)

Detaches a DDS_Condition (p. 252) from the DDS_WaitSet (p. 253).

If the DDS_Condition (p. 252) was not attached to the DDS_WaitSet (p. 253) the operation will return DDS_RETCODE_BAD_PARAMETER (p. 121).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. cond << in>> (p. 951) Condition to be detached.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

4.69.8.18 DDS_ReturnCode_t DDS_WaitSet_get_conditions (DDS_WaitSet * self, struct DDS_ConditionSeq * attached_conditions)

Retrieves the list of attached **DDS_Condition** (p. 252) (s).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 attached\_conditions << inout>> (p. 951) a DDS_ConditionSeq 
 (p. 1053) object where the list of attached conditions will be returned
```

Returns:

One of the **Standard Return Codes** (p. 120), or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121).

4.70 ENTITY_NAME

<<*eXtension>>* (p. 950) Assigns a name to a **DDS_DomainParticipant** (p. 339). This name will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Data Structures

^ struct DDS_EntityNameQosPolicy

Assigns a name to a DDS_DomainParticipant (p. 339). This name will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Variables

^ const char *const **DDS_ENTITYNAME_QOS_POLICY_NAME**Stringified human-readable name for **DDS_EntityNameQosPolicy**(p. 1209).

4.70.1 Detailed Description

<< eXtension>> (p. 950) Assigns a name to a DDS_DomainParticipant (p. 339). This name will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

4.70.2 Variable Documentation

4.70.2.1 const char* const DDS_ENTITYNAME_QOS_POLICY_NAME

Stringified human-readable name for DDS_EntityNameQosPolicy (p. 1209).

4.71 PROFILE 265

4.71 PROFILE

<<eXtension>> (p. 950) Configures the way that XML documents containing QoS profiles are loaded by RTI Data Distribution Service.

Data Structures

^ struct DDS_ProfileQosPolicy

Configures the way that XML documents containing QoS profiles are loaded by RTI Data Distribution Service.

Variables

^ const char *const DDS_PROFILE_QOS_POLICY_NAME

Stringified human-readable name for DDS_ProfileQosPolicy (p. 1304).

4.71.1 Detailed Description

<<eXtension>> (p. 950) Configures the way that XML documents containing QoS profiles are loaded by RTI Data Distribution Service.

4.71.2 Variable Documentation

4.71.2.1 const char* const DDS_PROFILE_QOS_POLICY_NAME

Stringified human-readable name for $\mathbf{DDS_ProfileQosPolicy}$ (p. 1304).

4.72 Octet Buffer Support

<< eXtension>> (p. 950) Octet buffer creation, cloning, and deletion.

Functions

- unsigned char * DDS_OctetBuffer_alloc (unsigned int size)

 Create a new empty OctetBuffer that can hold up to size octets.
- ^ unsigned char * DDS_OctetBuffer_dup (const unsigned char *buffer, unsigned int size)

Clone an OctetBuffer.

^ void **DDS_OctetBuffer_free** (unsigned char *buffer)

Delete an OctetBuffer.

4.72.1 Detailed Description

<< eXtension>> (p. 950) Octet buffer creation, cloning, and deletion.

The functions in this class ensure consistent cross-platform implementations for OctetBuffer creation (DDS_OctetBuffer_alloc() (p. 268)), deletion (DDS_OctetBuffer_free() (p. 268)), and cloning (DDS_OctetBuffer_dup() (p. 268)) that preserve the mutable value type semantics. These are to be viewed as functions that define an OctetBuffer class whose data is represented by a 'unsigned char*'.

4.72.2 Conventions

The following conventions govern the memory management of OctetBuffers in RTI Data Distribution Service.

- ^ The DDS implementation ensures that when value types containing Octet-Buffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the OctetBuffer class functions.
 - Value types containing OctetBuffers have ownership of the contained OctetBuffer. Thus, when a value type is deleted, the contained octet buffer field is also deleted.
- ^ The user must ensure that when value types containing OctetBuffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the OctetBuffer class functions.

The representation of an OctetBuffer in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a OctetBuffer. RTI Data Distribution Service must therefore make some assumptions when a user requests that a OctetBuffer be copied into. The following rules apply when RTI Data Distribution Service is copying into an OctetBuffer.

- ^ If the 'unsigned char*' is NULL, RTI Data Distribution Service will allocate a new OctetBuffer on behalf of the user. To avoid leaking memory, you must ensure that the OctetBuffer will be freed (see **Usage** (p. 267) below) in C. For C++, the destructor of the valuetype containing the OctetBuffer will free it automatically..
- ^ If the 'unsigned char*' is not NULL, RTI Data Distribution Service will assume that you are managing the OctetBuffer's memory yourself and have allocated enough memory to store the OctetBuffer to be copied. RTI Data Distribution Service will copy into your memory; to avoid memory corruption, be sure to allocate enough of it. Also, do not pass structures containing junk pointers into RTI Data Distribution Service; you are likely to crash.

4.72.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating OctetBuffers.

```
Always use

DDS_OctetBuffer_alloc() to create,

DDS_OctetBuffer_dup() to clone,

DDS_OctetBuffer_free() to delete

a 'unsigned char*' that is passed back and forth between

user code and the DDS C/C++ APIs.
```

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of **DDS_OctetBuffer_alloc()** (p. 268), with matching occurrences of **DDS_OctetBuffer_free()** (p. 268) in the code.
- ^ Finalize value types containing OctetBuffer. In C++ the destructor accomplishes this automatically. in C, explicit "destructor" functions are provided.

4.72.4 Function Documentation

4.72.4.1 unsigned char* DDS_OctetBuffer_alloc (unsigned int size)

Create a new empty OctetBuffer that can hold up to size octets.

An OctetBuffer created by this function must be deleted using **DDS_-OctetBuffer_free()** (p. 268).

This function will allocate enough memory to hold an OctetBuffer of size octets.

Parameters:

```
size << in>> (p. 951) Size of the buffer.
```

Returns:

A newly created non-NULL OctetBuffer upon success or NULL upon failure.

4.72.4.2 unsigned char* DDS_OctetBuffer_dup (const unsigned char * buffer, unsigned int size)

Clone an OctetBuffer.

An OctetBuffer created by this function must be deleted using DDS_-OctetBuffer_free() (p. 268)

Parameters:

```
buffer <<in>> (p. 951) The OctetBuffer to duplicate.
size <<in>> (p. 951) Size of the OctetBuffer to duplicate.
```

Returns:

If $\mathtt{src} == \mathtt{NULL}$ or size <0, this function always returns NULL. Otherwise, upon success it returns a newly created OctetBuffer whose value is \mathtt{src} ; upon failure it returns NULL.

4.72.4.3 void DDS_OctetBuffer_free (unsigned char * buffer)

Delete an OctetBuffer.

Precondition:

buffer must be either NULL, or must have been created using DDS_-OctetBuffer_alloc() (p. 268), DDS_OctetBuffer_dup() (p. 268)

Parameters:

buffer << in>> (p. 951) The buffer to delete.

4.73 Sequence Support

The **FooSeq** (p. 1497) interface allows you to work with variable-length collections of homogeneous data.

Modules

^ Built-in Sequences

Defines sequences of primitive data type.

Data Structures

* struct FooSeq

<<interface>> (p. 950) <<generic>> (p. 950) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as Foo (p. 1494).

Defines

^ #define DDS_SEQUENCE_INITIALIZER

An initializer for new sequence instances.

Functions

 ${\bf \hat{~~}DDS_Boolean~FooSeq_initialize~(struct~FooSeq~*self)}$

Initialize sequence instances.

^ DDS_Long FooSeq_get_maximum (const struct FooSeq *self)

Get the current maximum number of elements that can be stored in this sequence.

^ DDS_Boolean FooSeq_set_maximum (struct FooSeq *self, DDS_-Long new_max)

Resize this sequence to a new desired maximum.

^ DDS_Long FooSeq_get_length (const struct FooSeq *self)

Get the logical length of this sequence.

DDS_Boolean FooSeq_set_length (struct FooSeq *self, DDS_Long new_length)

Change the length of this sequence.

^ DDS_Boolean FooSeq_ensure_length (struct FooSeq *self, DDS_Long length, DDS_Long max)

Set the sequence to the desired length, and resize the sequence if necessary.

^ Foo FooSeq_get (const struct FooSeq *self, DDS_Long i)

Get the i-th element for a const sequence.

Foo * FooSeq_get_reference (const struct FooSeq *self, DDS_Long
i)

Get the pointer to the i-th element of this sequence.

^ DDS_Boolean FooSeq_copy_no_alloc (struct FooSeq *self, const struct FooSeq *src_seq)

Copy elements from another sequence, only if the destination sequence has enough capacity.

^ FooSeq * FooSeq_copy (struct FooSeq *self, const struct FooSeq *src_seq)

 $Copy\ elements\ from\ another\ sequence,\ resizing\ the\ sequence\ if\ necessary.$

DDS_Boolean FooSeq_from_array (struct FooSeq *self, const Foo array[], DDS_Long length)

Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.

DDS_Boolean FooSeq_to_array (struct FooSeq *self, Foo array[],
DDS_Long length)

Copy elements to an array of elements. The original contents of the array (if any) are replaced.

^ DDS_Boolean FooSeq_loan_contiguous (struct FooSeq *self, Foo *buffer, DDS_Long new_length, DDS_Long new_max)

Loan a contiguous buffer to this sequence.

^ DDS_Boolean FooSeq_loan_discontiguous (struct FooSeq *self, Foo **buffer, DDS_Long new_length, DDS_Long new_max)

Loan a discontiguous buffer to this sequence.

^ DDS_Boolean FooSeq_unloan (struct FooSeq *self)

Return the loaned buffer in the sequence and set the maximum to 0.

 $\mathbf{\hat{f}}$ Foo * FooSeq_get_contiguous_buffer (const struct FooSeq *self)

Return the contiguous buffer of the sequence.

^ Foo ** FooSeq_get_discontiguous_buffer (const struct FooSeq *self)

Return the discontiguous buffer of the sequence.

^ DDS_Boolean FooSeq_has_ownership (const struct FooSeq *self)

Return the value of the owned flag.

^ DDS_Boolean FooSeq_finalize (struct FooSeq *self)

Deallocate this sequence's buffer.

4.73.1 Detailed Description

The **FooSeq** (p. 1497) interface allows you to work with variable-length collections of homogeneous data.

This interface is instantiated for each concrete element type in order to provide compile-time type safety to applications. The **Built-in Sequences** (p. 857) are pre-defined instantiations for the primitive data types.

When you use the **rtiddsgen** (p. 969) code generation tool, it will automatically generate concrete sequence instantiations for each of your own custom types.

4.73.2 Define Documentation

4.73.2.1 #define DDS_SEQUENCE_INITIALIZER

An initializer for new sequence instances.

This constant will initialize a new sequence to a valid empty state. C language users should assign it to uninitialized sequence instances before using them, at the time they are declared, or use **FooSeq_initialize** (p. 273) as an alternative function to initialize new sequences.

Examples:

HelloWorld_subscriber.c.

4.73.3 Function Documentation

4.73.3.1 DDS_Boolean FooSeq_initialize (struct FooSeq * self)

Initialize sequence instances.

Use this function to initialize new sequences to a valid emptu state. C users should initialize sequences before using them.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

See also:

DDS_SEQUENCE_INITIALIZER (p. 272)

4.73.3.2 DDS_Long FooSeq_get_maximum (const struct FooSeq * self)

Get the current maximum number of elements that can be stored in this sequence.

The maximum of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements

The maximum is a non-negative number. It is initialized when the sequence is first created.

maximum can only be changed with the FooSeq_set_maximum (p. 273) operation.

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

Returns:

the current maximum of the sequence.

See also:

FooSeq_get_length (p. 274)

4.73.3.3 DDS_Boolean FooSeq_set_maximum (struct FooSeq * self, DDS_Long new_max)

Resize this sequence to a new desired maximum.

This operation does nothing if the new desired maximum matches the current maximum.

If this sequence owns its buffer and the new maximum is not equal to the old maximum, then the existing buffer will be freed and re-allocated.

Precondition:

```
owned == DDS\_BOOLEAN\_TRUE (p. 106)
```

Postcondition:

```
owned == DDS_BOOLEAN_TRUE (p. 106) length == MINIMUM(original length, new_max)
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL. new\_max Must be >= 0.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) on success, DDS_BOOLEAN_FALSE (p. 107) if the preconditions are not met. In that case the sequence is not modified.

4.73.3.4 DDS_Long FooSeq_get_length (const struct FooSeq * self)

Get the logical length of this sequence.

Get the length that was last set, or zero if the length has never been set.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

the length of the sequence

4.73.3.5 DDS_Boolean FooSeq_set_length (struct FooSeq * self, DDS_Long new_length)

Change the length of this sequence.

This function does not allocate/deallocate memory.

The new length must not exceed the maximum of this sequence as returned by the FooSeq_get_maximum (p. 273) operation. (Note that, if necessary, the maximum of this sequence can be increased manually by using the FooSeq_set_maximum (p. 273) operation.)

The elements of the sequence are not modified by this operation. If the new length is larger than the original length, the new elements will be uninitialized; if the length is decreased, the old elements that are beyond the new length will physically remain in the sequence but will not be accessible.

Postcondition:

```
length = new\_length.
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL. new\_length the new desired length. This value must be non-negative and cannot exceed maximum of the sequence. In other words 0 <= new\_length <= maximum
```

Returns:

```
DDS_BOOLEAN_TRUE (p. 106) on sucess or DDS_BOOLEAN_-FALSE (p. 107) on failure
```

4.73.3.6 DDS_Boolean FooSeq_ensure_length (struct FooSeq * self, DDS_Long length, DDS_Long max)

Set the sequence to the desired length, and resize the sequence if necessary.

If the current maximum is greater than the desired length, then sequence is not resized.

Otherwise if this sequence owns its buffer, the sequence is resized to the new maximum by freeing and re-allocating the buffer. However, if the sequence does not own its buffer, this operation will fail.

This function allows user to avoid unnecessary buffer re-allocation.

Precondition:

```
\begin{array}{ll} \texttt{length} <= \texttt{max} \\ \texttt{owned} == \mathbf{DDS\_BOOLEAN\_TRUE} \ (\texttt{p.106}) \ \texttt{if} \ \texttt{sequence} \ \texttt{needs} \ \texttt{to} \ \texttt{be} \\ \texttt{resized} \end{array}
```

Postcondition:

```
length == length
maximum == max if resized
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 length << in>> (p. 951) The new length that should be set. Must be >= 0. 
 max << in>> (p. 951) If sequence need to be resized, this is the maximum that should be set. max >= length
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) on success, DDS_BOOLEAN_FALSE (p. 107) if the preconditions are not met. In that case the sequence is not modified.

4.73.3.7 Foo FooSeq_get (const struct FooSeq * self, DDS_Long i)

Get the i-th element for a const sequence.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. i index of element to access, must be >= 0 and less than FooSeq_get_length (p. 274)
```

Returns:

the i-th element

4.73.3.8 Foo* FooSeq_get_reference (const struct FooSeq * self, DDS_Long i)

Get the pointer to the i-th element of this sequence.

This operation can used to modify the elements of the sequence in place.

```
struct DDS_LongSeq my_seq = DDS_SEQUENCE_INITIALIZER;
DDS_Long* first_element = NULL;
DDS_LongSeq_ensure_length(1, 1);
first_element = DDS_LongSeq_get_reference(&my_seq, 0);
*first_element = 5;
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL. i index of element to access, must be >= 0 and less than FooSeq_get_length (p. 274)
```

Returns:

a pointer to the i-th element

4.73.3.9 DDS_Boolean FooSeq_copy_no_alloc (struct FooSeq * self, const struct FooSeq * src_seq)

Copy elements from another sequence, only if the destination sequence has enough capacity.

Fill the elements in this sequence by copying the corresponding elements in src_seq. The original contents in this sequence are replaced via the element assignment operation (Foo_copy() function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Precondition:

```
this::maximum >= src_seq::length
this::owned == DDS_BOOLEAN_TRUE (p. 106)
```

Postcondition:

```
this::length == src\_seq::length this[i] == src\_seq[i] for 0 <= i < target\_seq::length this::owned == DDS_BOOLEAN_TRUE (p. 106)
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL. src\_seq << in>> (p. 951) the sequence from which to copy
```

Returns:

```
DDS_BOOLEAN_TRUE (p. 106) if the sequence was successfully copied; DDS_BOOLEAN_FALSE (p. 107) otherwise.
```

Note:

If the pre-conditions are not met, the operator will print a message to stdout and leave this sequence unchanged.

See also:

```
FooSeq_copy (p. 278)
```

4.73.3.10 FooSeq* FooSeq_copy (struct FooSeq * self, const struct FooSeq * src_seq)

Copy elements from another sequence, resizing the sequence if necessary.

This function invokes FooSeq_copy_no_alloc (p. 277) after ensuring that the sequence has enough capacity to hold the elements to be copied.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. src\_seq << in>> (p. 951) the sequence from which to copy
```

Returns:

```
self, this sequence
```

See also:

```
FooSeq_copy_no_alloc (p. 277)
```

4.73.3.11 DDS_Boolean FooSeq_from_array (struct FooSeq * self, const Foo array[], DDS_Long length)

Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.

Fill the elements in this sequence by copying the corresponding elements in array. The original contents in this sequence are replaced via the element assignment operation (Foo_copy() function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Precondition:

```
this::owned == DDS\_BOOLEAN\_TRUE (p. 106)
```

Postcondition:

```
\begin{array}{l} this::length == \texttt{length} \\ this[i] == array[i] \ for \ 0 <= i < \texttt{length} \\ this::owned == \textbf{DDS\_BOOLEAN\_TRUE} \ (p. \ 106) \end{array}
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL. array << in>> (p. 951) The array of elements to be copy elements from length << in>> (p. 951) The length of the array.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the array was successfully copied; DDS_BOOLEAN_FALSE (p. 107) otherwise.

Note:

If the pre-conditions are not met, the function will print a message to stdout and leave this sequence unchanged.

4.73.3.12 DDS_Boolean FooSeq_to_array (struct FooSeq * self, Foo array[], DDS_Long length)

Copy elements to an array of elements. The original contents of the array (if any) are replaced.

Copy the elements of this sequence to the corresponding elements in the array. The original contents of the array are replaced via the element assignment operation (Foo_copy() function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 array << in>> (p. 951) The array of elements to be filled with elements from this sequence 
 length << in>> (p. 951) The number of elements to be copied.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the elements of the sequence were successfully copied; DDS_BOOLEAN_FALSE (p. 107) otherwise.

4.73.3.13 DDS_Boolean FooSeq_loan_contiguous (struct FooSeq * self, Foo * buffer, DDS_Long new_length , DDS_Long new_max)

Loan a contiguous buffer to this sequence.

This operation changes the owned flag of the sequence to DDS_BOOLEAN_-FALSE (p. 107) and also sets the underlying buffer used by the sequence. See the user's manual for more information about sequences and memory ownership.

Use this function if you want to manage the memory used by the sequence yourself. You must provide an array of elements and integers indicating how many elements are allocated in that array (i.e. the maximum) and how many elements are valid (i.e. the length). The sequence will subsequently use the memory you provide and will not permit it to be freed by a call to **FooSeq**-set_maximum (p. 273).

Once you have loaned a buffer to a sequence, make sure that you don't free it before calling **FooSeq_unloan** (p. 281): the next time you access the sequence, you will be accessing freed memory!

You can use this function to wrap stack memory with a sequence interface, thereby avoiding dynamic memory allocation. Create a **FooSeq** (p. 1497) and an array of type **Foo** (p. 1494) and then loan the array to the sequence:

```
struct ::Foo fooArray[10];
struct ::FooSeq fooSeq = ::DDS_SEQUENCE_INITIALIZER;
::FooSeq_loan_contiguous(&fooSeq, fooArray, 0, 10);
```

By default, a sequence you create owns its memory unless you explicitly loan memory of your own to it. In a very few cases, RTI Data Distribution Service will return a sequence to you that has a loan; those cases are documented as such. For example, if you call **FooDataReader_read** (p. 788) or **FooDataReader_take** (p. 789) and pass in sequences with no loan and no memory allocated, RTI Data Distribution Service will loan memory to your sequences which must be unloaned with **FooDataReader_return_loan** (p. 811). See the documentation of those functions for more information.

Precondition:

```
FooSeq_get_maximum (p. 273) == 0; i.e. the sequence has no memory allocated to it.
```

```
FooSeq_has_ownership (p. 283) == DDS_BOOLEAN_TRUE (p. 106); i.e. the sequence does not already have an outstanding loan
```

Postcondition:

```
The sequence will store its elements in the buffer provided.
```

```
\label{eq:fooseq_has_ownership} \begin{array}{lll} \textbf{FooSeq\_has\_ownership} & (p.\ 283) & == & \textbf{DDS\_BOOLEAN\_FALSE} \\ (p.\ 107) & & \end{array}
```

```
FooSeq_get_length (p. 274) == new_length
FooSeq_get_maximum (p. 273) == new_max
```

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

buffer The new buffer that the sequence will use. Must point to enough memory to hold new_max elements of type **Foo** (p. 1494). It may be NULL if new_max == 0.

 new_length The desired new length for the sequence. It must be the case that that $0 \le new_length \le new_max$.

new_max The allocated number of elements that could fit in the loaned buffer

Returns:

DDS_BOOLEAN_TRUE (p. 106) if buffer is successfully loaned to this sequence or DDS_BOOLEAN_FALSE (p. 107) otherwise. Failure only occurs due to failing to meet the pre-conditions. Upon failure the sequence remains unmodified.

See also:

FooSeq_unloan (p. 281), FooSeq_loan_discontiguous (p. 281)

4.73.3.14 DDS_Boolean FooSeq_loan_discontiguous (struct FooSeq * self, Foo ** buffer, DDS_Long new_length, DDS_Long new_max)

Loan a discontiguous buffer to this sequence.

This function is exactly like **FooSeq_loan_contiguous** (p. 279) except that the buffer loaned is an array of **Foo** (p. 1494) pointers, not an array of **Foo** (p. 1494).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

buffer The new buffer that the sequence will use. Must point to enough memory to hold new_max elements of type Foo*. It may be NULL if $new_max == 0$.

 new_length The desired new length for the sequence. It must be the case that that $0 \le new_length \le new_max$.

 new_max The allocated number of elements that could fit in the loaned buffer.

See also:

FooSeq_unloan (p. 281), FooSeq_loan_contiguous (p. 279)

4.73.3.15 DDS_Boolean FooSeq_unloan (struct FooSeq * self)

Return the loaned buffer in the sequence and set the maximum to 0.

This function affects only the state of this sequence; it does not change the contents of the buffer in any way.

Only the user who originally loaned a buffer should return that loan, as the user may have dependencies on that memory known only to them. Unloaning someone else's buffer may cause unspecified problems. For example, suppose a sequence is loaning memory from a custom memory pool. A user of the sequence likely has no way to release the memory back into the pool, so unloaning the sequence buffer would result in a resource leak. If the user were to then re-loan a different buffer, the original creator of the sequence would have no way to discover, when freeing the sequence, that the loan no longer referred to its own memory and would thus not free the user's memory properly, exacerbating the situation and leading to undefined behavior.

Precondition:

```
owned == DDS\_BOOLEAN\_FALSE (p. 107)
```

Postcondition:

```
owned == DDS_BOOLEAN_TRUE (p. 106) maximum == 0
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the preconditions were met. Otherwise DDS_BOOLEAN_FALSE (p. 107). The function only fails if the pre-conditions are not met, in which case it leaves the sequence unmodified.

See also:

```
FooSeq_loan_contiguous (p. 279), FooSeq_loan_discontiguous (p. 281), FooSeq_set_maximum (p. 273)
```

4.73.3.16 Foo* FooSeq_get_contiguous_buffer (const struct FooSeq * self)

Return the contiguous buffer of the sequence.

Get the underlying buffer where contiguous elements of the sequence are stored. The size of the buffer matches the maximum of the sequence, but only the elements up to the **FooSeq_get_length** (p. 274) of the sequence are valid.

This function provides almost no encapsulation of the sequence's underlying implementation. Certain operations, such as **FooSeq_set_maximum** (p. 273), may render the buffer invalid. In light of these caveats, this operation should be used with care.

Parameters:

$$self \ll in >> (p. 951)$$
 Cannot be NULL.

Returns:

buffer that stores contiguous elements in sequence.

4.73.3.17 Foo** FooSeq_get_discontiguous_buffer (const struct FooSeq * self)

Return the discontiguous buffer of the sequence.

This operation returns the underlying buffer where discontiguous elements of the sequence are stored. The size of the buffer matches the maximum of this sequence, but only the elements up to the **FooSeq_get_length** (p. 274) of the sequence are valid.

The same caveats apply to this function as to FooSeq_get_contiguous_bufferI.

The sequence will dereference pointers in the discontiguous buffer to provide access to its elements by value in C and by reference in C++. If you access the discontiguous buffer directly by means of this function, do not store any NULL values into it, as accessing those values will result in a segmentation fault.

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

Returns:

buffer that stores discontiguous elements in sequence.

4.73.3.18 DDS_Boolean FooSeq_has_ownership (const struct FooSeq * self)

Return the value of the owned flag.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) if sequence owns the underlying buffer, or DDS_BOOLEAN_FALSE (p. 107) if it has an outstanding loan.

4.73.3.19 DDS_Boolean FooSeq_finalize (struct FooSeq * self)

Deallocate this sequence's buffer.

Note that this function deletes this sequence's buffer, not this sequence itself. To avoid memory leaks, it should be called even on sequences declared on the stack. And after it has been called on a sequence located in dynamic memory, it is still necessary to call free().

Precondition:

(owned == **DDS_BOOLEAN_TRUE** (p. 106)). If this precondition is not met, no memory will be freed and an error will be logged.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Postcondition:

maximum == 0 and the underlying buffer is freed.

FooSeq_get_maximum (p. 273), FooSeq_unloan (p. 281)

4.74 String Support

<< eXtension>> (p. 950) String creation, cloning, assignment, and deletion.

Functions

^ char * **DDS_String_alloc** (size_t length)

Create a new empty string that can hold up to length characters.

^ char * **DDS_String_dup** (const char *str)

Clone a string. Creates a new string that duplicates the value of string.

^ void **DDS_String_free** (char *str)

Delete a string.

^ DDS_Wchar * DDS_Wstring_alloc (DDS_UnsignedLong length)

Create a new empty string that can hold up to length wide characters.

^ DDS_UnsignedLong DDS_Wstring_length (const DDS_Wchar *str)

Get the number of wide characters in the given string.

^ DDS_Wchar * DDS_Wstring_copy (DDS_Wchar *dst, const DDS_-Wchar *src)

Copy the source string over the destination string reallocating the space if it's necessary.

^ DDS_Wchar * DDS_Wstring_copy_and_widen (DDS_Wchar *dst, const char *src)

Copy the source string over the destination string, widening each character.

 ${\bf ^{\hat{}}\ DDS_Wchar*DDS_Wstring_dup\ (const\ DDS_Wchar\ *str)}$

Clone a string of wide characters. Creates a new string that duplicates the value of string.

^ DDS_Wchar * DDS_Wstring_dup_and_widen (const char *str)

Clone a string of characters as a string of wide characters.

^ void **DDS_Wstring_free** (**DDS_Wchar** *str)

Delete a string.

4.74.1 Detailed Description

<< eXtension>> (p. 950) String creation, cloning, assignment, and deletion.

The functions in this class ensure consistent cross-platform implementations for string creation (DDS_String_alloc() (p. 287)), deletion (DDS_String_free() (p. 288)), and cloning (DDS_String_dup() (p. 288)) that preserve the mutable value type semantics. These are to be viewed as functions that define a string class whose data is represented by a 'char*'.

4.74.2 Conventions

The following conventions govern the memory management of strings in RTI Data Distribution Service.

- ^ The DDS implementation ensures that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the string class functions.
 - Value types containing strings have ownership of the contained string.
 Thus, when a value type is deleted, the contained string field is also deleted.
 - DDS_StringSeq (p. 1399) is a value type that contains strings;
 it owns the memory for the contained strings. When a DDS_-StringSeq (p. 1399) is assigned or deleted, the contained strings are also assigned or deleted respectively.
- ^ The user must ensure that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the String class functions.

The representation of a string in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a string. RTI Data Distribution Service must therefore make some assumptions when a user requests that a string be copied into. The following rules apply when RTI Data Distribution Service is copying into a string or string sequence:

- fig. If the 'char*' is NULL, RTI Data Distribution Service will log a warning and allocate a new string on behalf of the user. To avoid leaking memory, you must ensure that the string will be freed (see Usage (p. 287) below).
- ^ If the 'char*' is not NULL, RTI Data Distribution Service will assume that you are managing the string's memory yourself and have allocated enough memory to store the string to be copied. RTI Data Distribution Service will copy into your memory; to avoid memory corruption, be sure to allocate enough of it. Also, do not pass structures containing junk pointers into RTI Data Distribution Service; you are likely to crash.

4.74.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating strings.

```
Always use

DDS_String_alloc() to create,

DDS_String_dup() to clone,

DDS_String_free() to delete

a string 'char*' that is passed back and forth between

user code and the DDS C/C++ APIs.
```

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of **DDS_String_alloc()** (p. 287), **DDS_String_dup()** (p. 288), with matching occurrences of **DDS_String_free()** (p. 288) in the code.
- ^ Finalize value types containing strings. In C++ the destructor accomplishes this automatically. in C, explicit "destructor" functions are provided; these functions are typically called "finalize."

See also:

```
DDS_StringSeq (p. 1399)
```

4.74.4 Function Documentation

4.74.4.1 char* DDS_String_alloc (size_t length)

Create a new empty string that can hold up to length characters.

A string created by this function must be deleted using **DDS_String_free()** (p. 288).

This function will allocate enough memory to hold a string of length characters, plus one additional byte to hold the NULL terminating character.

Parameters:

```
length << in>> (p. 951) Capacity of the string.
```

Returns:

A newly created non-NULL string upon success or NULL upon failure.

Examples:

HelloWorld.c.

4.74.4.2 char* DDS_String_dup (const char * str)

Clone a string. Creates a new string that duplicates the value of string.

A string created by this function must be deleted using **DDS_String_free()** (p. 288)

Parameters:

```
str \ll in >> (p. 951) The string to duplicate.
```

Returns:

If string == NULL, this function always returns NULL. Otherwise, upon success it returns a newly created string whose value is string; upon failure it returns NULL.

4.74.4.3 void DDS_String_free (char * str)

Delete a string.

Precondition:

```
string must be either NULL, or must have been created using DDS_-String_alloc() (p. 287), DDS_String_dup() (p. 288)
```

Parameters:

```
str << in>> (p. 951) The string to delete.
```

Examples:

HelloWorld.c.

4.74.4.4 DDS_Wchar* DDS_Wstring_alloc (DDS_UnsignedLong length)

Create a new empty string that can hold up to length wide characters.

A string created by this function must be deleted using **DDS_Wstring_free()** (p. 290)

This function will allocate enough memory to hold a string of length characters, plus one additional wide character to hold the NULL terminator.

Parameters:

```
length << in>> (p. 951) Capacity of the string.
```

Returns:

A newly created non-NULL string upon success or NULL upon failure.

4.74.4.5 DDS_UnsignedLong DDS_Wstring_length (const DDS_Wchar * str)

Get the number of wide characters in the given string.

The result does not count the terminating zero character.

Parameters:

```
str << in>> (p. 951) A non-NULL string.
```

Returns:

The number of wide characters in the string.

4.74.4.6 DDS_Wchar* DDS_Wstring_copy (DDS_Wchar * dst, const DDS_Wchar * src)

Copy the source string over the destination string reallocating the space if it's necessary.

Parameters:

dst

src

Returns:

dst

4.74.4.7 DDS_Wchar* DDS_Wstring_copy_and_widen (DDS_Wchar * dst, const char * src)

Copy the source string over the destination string, widening each character.

Parameters:

 $dst \ll in > (p. 951)$ A non-NULL string to be overwritten by src.

src << in>> (p. 951) A non-NULL string to be copied over dst

Returns:

dst

4.74.4.8 DDS_Wchar* DDS_Wstring_dup (const DDS_Wchar * str)

Clone a string of wide characters. Creates a new string that duplicates the value of string.

A string created by this function must be deleted using **DDS_Wstring_free()** (p. 290).

Parameters:

```
str \ll in >> (p. 951) The string to duplicate.
```

Returns:

If string == NULL, this function always returns NULL. Otherwise, upon success it returns a newly created string whose value is string; upon failure it returns NULL.

4.74.4.9 DDS_Wchar* DDS_Wstring_dup_and_widen (const char * str)

Clone a string of characters as a string of wide characters.

A string created by this function must be deleted using **DDS_Wstring_free()** (p. 290)

Parameters:

```
str \ll in >> (p. 951) The string to duplicate.
```

Returns:

If string == NULL, this function always returns NULL. Otherwise, upon success it returns a newly created string whose value is string; upon failure it returns NULL.

4.74.4.10 void DDS_Wstring_free (DDS_Wchar * str)

Delete a string.

Precondition:

```
string must either NULL, or must have been created using DDS_-
Wstring_alloc() (p. 288), DDS_Wstring_dup() (p. 290), or DDS_-
Wstring_replace()
```

Parameters:

str << in>> (p. 951) The string to delete.

4.75 Clock Selection

APIs related to clock selection. RTI Data Distribution Service uses clocks to measure time and generate timestamps.

The middleware uses two clocks, an internal clock and an external clock. The internal clock is used to measure time and handles all timing in the middleware. The external clock is used solely to generate timestamps, such as the source timestamp and the reception timestamp, in addition to providing the time given by **DDS_DomainParticipant_get_current_time** (p. 397).

4.75.1 Available Clocks

Two clock implementations are generally available, the monotonic clock and the realtime clock.

The monotonic clock provides times that are monotonic from a clock that is not adjustable. This clock is useful to use in order to not be subject to changes in the system or realtime clock, which may be adjusted by the user or via time synchronization protocols. However, this time generally starts from an arbitrary point in time, such as system startup. Note that this clock is not available for all architectures. Please see the Platform Notes for the architectures on which it is supported. For the purposes of clock selection, this clock can be referenced by the name "monotonic".

The realtime clock provides the realtime of the system. This clock may generally be monotonic but may not be guaranteed to be so. It is adjustable and may be subject to small and large changes in time. The time obtained from this clock is generally a meaningful time in that it is the amount of time from a known epoch. For the purposes of clock selection, this clock can be referenced by the names "realtime" or "system".

4.75.2 Clock Selection Strategy

By default, both the internal and external clocks use the realtime clock. If you want your application to be robust to changes in the system time, you may use the monotonic clock as the internal clock, and leave the system clock as the external clock. Note, however, that this may slightly diminish performance in that both the send and receive paths may need to obtain times from both clocks. Since the monotonic clock is not available on all architectures, you may want to specify "monotonic, realtime" for the internal_clock (see the table below). By doing so, the middleware will attempt to use the monotonic clock if available, and will fall back to the realtime clock if the monotonic clock is not available.

If you want your application to be robust to changes in the system time, you are not relying on source timestamps, and you want to avoid obtaining times

from both clocks, you may use the monotonic clock for both the internal and external clocks.

4.75.3 Configuring Clock Selection

To configure the clock selection, use the **PROPERTY** (p. 235) QoS policy associated with the **DDS_DomainParticipant** (p. 339).

See also:

DDS_PropertyQosPolicy (p. 1308)

The following table lists the supported clock selection properties.

Property	Description
dds.clock.external_clock	Comma-delimited list of clocks to
	use for the external clock, in the
	order of preference. Valid clock
	names are "realtime", "system",
	and "monotonic".
	Default: "realtime"
dds.clock.internal_clock	Comma-delimited list of clocks to
	use for the internal clock, in the
	order of preference. Valid clock
	names are "realtime", "system",
	and "monotonic".
	Default: "realtime"

Table 4.1: Clock Selection Properties

4.76 Domain Module

Contains the **DDS_DomainParticipant** (p. 339) class that acts as an entrypoint of RTI Data Distribution Service and acts as a factory for many of the classes. The **DDS_DomainParticipant** (p. 339) also acts as a container for the other objects that make up RTI Data Distribution Service.

Modules

^ DomainParticipantFactory

DDS_DomainParticipantFactory (p. 302) entity and associated elements

^ DomainParticipants

DDS_DomainParticipant (p. 339) entity and associated elements

^ Built-in Topics

Built-in objects created by RTI Data Distribution Service but accessible to the application.

Defines

*#define DDS_TheParticipantFactory DDS_DomainParticipantFactory_get_instance()

Can be used as an alias for the singleton factory returned by the operation DDS_DomainParticipantFactory_get_instance() (p. 304).

Typedefs

`typedef DDS_DOMAINID_TYPE_NATIVE **DDS_DomainId_t**

An integer that indicates in which domain a DDS_DomainParticipant (p. 339) communicates.

4.76.1 Detailed Description

Contains the **DDS_DomainParticipant** (p. 339) class that acts as an entrypoint of RTI Data Distribution Service and acts as a factory for many of the classes. The **DDS_DomainParticipant** (p. 339) also acts as a container for the other objects that make up RTI Data Distribution Service.

4.76.2 Define Documentation

4.76.2.1 #define DDS_TheParticipantFactory DDS_DomainParticipantFactory_get_instance()

Can be used as an alias for the singleton factory returned by the operation DDS_DomainParticipantFactory_get_instance() (p. 304).

See also:

DDS_DomainParticipantFactory_get_instance (p. 304)

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

4.76.3 Typedef Documentation

4.76.3.1 typedef DDS_DOMAINID_TYPE_NATIVE DDS_DomainId_t

An integer that indicates in which domain a DDS_DomainParticipant (p. 339) communicates.

Participants with the same **DDS_DomainId_t** (p. 295) are said to be in the same domain, and can thus communicate with one another.

The lower limit for a domain ID is 0. The upper limit for a domain ID is determined by the guidelines stated in **DDS_RtpsWellKnownPorts_t** (p. 1378) (specifically **DDS_RtpsWellKnownPorts_t::domain_id_gain** (p. 1380))

4.77 DomainParticipantFactory

DDS_DomainParticipantFactory (p. 302) entity and associated elements

Data Structures

 $\hat{\ }$ struct DDS_DomainParticipantFactoryQos

QoS policies supported by a DDS_DomainParticipantFactory (p. 302).

Defines

*#define DDS_DomainParticipantFactoryQos_INITIALIZER
Initializer for new QoS instances.

Typedefs

^ typedef struct DDS_DomainParticipantFactoryImpl **DDS_- DomainParticipantFactory**

<<singleton>> (p. 950) <<interface>> (p. 950) Allows creation and destruction of DDS_DomainParticipant (p. 339) objects.

Functions

Initializer for new QoS instances.

DDS_ReturnCode_t DDS_DomainParticipantFactoryQos_copy (struct DDS_DomainParticipantFactoryQos *self, const struct DDS_DomainParticipantFactoryQos *source)

Copy the contents of the given QoS into this QoS.

Free any dynamic memory allocated by the policies in this DDS_{-} -DomainParticipantFactoryQos (p. 1153).

` DDS_DomainParticipantFactory * DDS_DomainParticipantFactory_get_instance ()

Gets the singleton instance of this class.

DDS_ReturnCode_t DDS_DomainParticipantFactory_finalize_instance ()

<<eXtension>> (p. 950) Destroys the singleton instance of this class.

^ DDS_ReturnCode_t DDS_DomainParticipantFactory_set_default_participant_qos (DDS_DomainParticipantFactory *self, const struct DDS_DomainParticipantQos *qos)

Sets the default $DDS_DomainParticipantQos$ (p. 1157) values for this domain participant factory.

<<exXtension>> (p. 950) Sets the default DDS_DomainParticipantQos (p. 1157) values for this domain participant factory based on the input XML QoS profile.

Initializes the DDS_DomainParticipantQos (p. 1157) instance with default values.

^ DDS_DomainParticipant * DDS_DomainParticipantFactory_-create_participant (DDS_DomainParticipantFactory *self, DDS_DomainId_t domainId, const struct DDS_DomainParticipantQos *qos, const struct DDS_DomainParticipantListener *listener, DDS_StatusMask mask)

Creates a new DDS_DomainParticipant (p. 339) object.

DDS_DomainParticipant * DDS_DomainParticipantFactory_create_participant_with_profile (DDS_DomainParticipantFactory *self, DDS_DomainId_t domainId, const char *library_name, const char *profile_name, const struct DDS_DomainParticipantListener *listener, DDS_StatusMask mask)

<<eXtension>> (p. 950) Creates a new DDS_DomainParticipant (p. 339) object using the DDS_DomainParticipantQos (p. 1157) associated with the input XML QoS profile.

DDS_ReturnCode_t DDS_DomainParticipantFactory_delete_-participant (DDS_DomainParticipantFactory *self, DDS_DomainParticipant *a_participant)

Deletes an existing DDS_DomainParticipant (p. 339).

^ DDS_DomainParticipant * DDS_DomainParticipantFactory_-lookup_participant (DDS_DomainParticipantFactory *self, DDS_DomainId_t domainId)

Locates an existing DDS_DomainParticipant (p. 339).

 $\begin{array}{lll} {\bf \hat{DDS_ReturnCode_t}} & {\bf DDS_DomainParticipantFactory_get_-qos} & ({\bf DDS_DomainParticipantFactory} & *self, & struct & {\bf DDS_-DomainParticipantFactoryQos} & *qos) \end{array}$

Gets the value for participant factory QoS.

Sets the value for a participant factory QoS.

```
<<eXtension>> (p. 950) Loads the XML QoS profiles.
```

```
<<eXtension>> (p. 950) Reloads the XML QoS profiles.
```

```
<<eXtension>> (p. 950) Unloads the XML QoS profiles.
```

^ DDS_ReturnCode_t DDS_DomainParticipantFactory_set_-default_library (DDS_DomainParticipantFactory *self, const char *library_name)

<<eXtension>> (p. 950) Sets the default XML library for a DDS_-DomainParticipantFactory (p. 302).

<<eXtension>> (p.950) Sets the default XML profile for a DDS_-DomainParticipantFactory (p. 302).

^ const_char * DDS_DomainParticipantFactory_get_default_library (DDS_DomainParticipantFactory *self)

- <<extension>> (p. 950) Gets the default XML library associated with a DDS_DomainParticipantFactory (p. 302).
- ^ const char * DDS_DomainParticipantFactory_get_default_profile
 (DDS_DomainParticipantFactory *self)
 - <<extension>> (p. 950) Gets the default XML profile associated with a DDS_DomainParticipantFactory (p. 302).
- ^ const char * DDS_DomainParticipantFactory_get_default_profile_library (DDS_DomainParticipantFactory *self)
 - <<eXtension>> (p. 950) Gets the library where the default XML profile is contained for a DDS_DomainParticipantFactory (p. 302).
- DDS_DomainParticipantFactory_get_participant_qos_from_profile (DDS_DomainParticipantFactory *self, struct DDS_DomainParticipantQos *qos, const char *library_name, const char *profile_name)
 - <<eXtension>> (p. 950) Gets the DDS_DomainParticipantQos (p. 1157) values associated with the input XML QoS profile.
- - <<eXtension>> (p. 950) Gets the DDS_PublisherQos (p. 1328) values associated with the input XML QoS profile.
- DDS_DomainParticipantFactory_get_subscriber_qos_from_profile (DDS_DomainParticipantFactory *self, struct DDS_SubscriberQos *qos, const char *library_name, const char *profile_name)
 - <<eXtension>> (p. 950) Gets the DDS_SubscriberQos (p. 1407) values associated with the input XML QoS profile.
- ^ DDS_ReturnCode_t DDS_DomainParticipantFactory_get_-datareader_qos_from_profile (DDS_DomainParticipantFactory *self, struct DDS_DataReaderQos *qos, const char *library_name, const char *profile_name)
 - <<eXtension>> (p. 950) Gets the DDS_DataReaderQos (p. 1083) values associated with the input XML QoS profile.
- DDS_DomainParticipantFactory_-get_datareader_qos_from_profile_w_topic_name (DDS_DomainParticipantFactory *self, struct DDS_DataReaderQos *qos, const char *library_name, const char *profile_name, const char *topic_name)

- <<eXtension>> (p. 950) Gets the DDS_DataReaderQos (p. 1083) values associated with the input XML QoS profile while applying topic filters to the input topic name.
- DDS_ReturnCode_t DDS_DomainParticipantFactory_get_-datawriter_qos_from_profile (DDS_DomainParticipantFactory *self, struct DDS_DataWriterQos *qos, const char *library_name, const char *profile_name)
 - <<eXtension>> (p. 950) Gets the DDS_DataWriterQos (p. 1123) values associated with the input XML QoS profile.
- DDS_DomainParticipantFactory_get_datawriter_qos_from_profile_w_topic_name (DDS_DomainParticipantFactory *self, struct DDS_DataWriterQos *qos, const char *library_name, const char *profile_name, const char *topic_name)
- DDS_ReturnCode_t DDS_DomainParticipantFactory_get_topic_-qos_from_profile (DDS_DomainParticipantFactory *self, struct DDS_TopicQos *qos, const char *library_name, const char *profile_name)
 - <<eXtension>> (p. 950) Gets the DDS_TopicQos (p. 1443) values associated with the input XML QoS profile.
- DDS_DomainParticipantFactory_get_topic_qos_from_profile_w_topic_name (DDS_DomainParticipantFactory *self, struct DDS_TopicQos *qos, const
 char *library_name, const char *profile_name, const char *topic_name)
 - <<eXtension>> (p. 950) Gets the $DDS_-TopicQos$ (p. 1443) values associated with the input XML QoS profile while applying topic filters to the input topic name.
- ^ DDS_ReturnCode_t DDS_DomainParticipantFactory_get_qos_profile_libraries (DDS_DomainParticipantFactory *self, struct DDS_StringSeq *library_names)
 - <<eXtension>> (p. 950) Gets the names of all XML QoS profile libraries associated with the DDS_DomainParticipantFactory (p. 302)
- ^ DDS_ReturnCode_t DDS_DomainParticipantFactory_get_qos_profiles (DDS_DomainParticipantFactory *self, struct DDS_-StringSeq *profile_names, const char *library_name)
 - <<eXtension>> (p.950) Gets the names of all XML QoS profiles associated with the input XML QoS profile library.

Variables

` struct DDS_DomainParticipantQos DDS_PARTICIPANT_QOS_-DEFAULT

Special value for creating a DomainParticipant with default QoS.

4.77.1 Detailed Description

DDS_DomainParticipantFactory (p. 302) entity and associated elements

4.77.2 Define Documentation

$\begin{array}{ccc} 4.77.2.1 & \# define \ DDS_DomainParticipantFactoryQos_-\\ INITIALIZER \end{array}$

Initializer for new QoS instances.

New DDS_DomainParticipantFactoryQos (p. 1153) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a new QoS structure is to initialize it on the stack at the time of its creation:

```
\verb|struct DDS_DomainParticipantFactoryQos myQos = DDS_DomainParticipantFactoryQos_INITIALIZER; \\
```

Note that the above assignment is not a substitute for calling DDS_DomainParticipantFactory_get_qos (p. 313); that function should be called subsequently to setting the QoS. DDS_DomainParticipantFactoryQos_finalize (p. 304) should be called to free the contained QoS policies that use dynamic memory:

```
struct DDS_DomainParticipantFactoryQos myQos = DDS_DomainParticipantFactoryQos_INITIALIZER;
DDS_DomainParticipantFactory_get_qos(myFactory, &myQos);
DDS_DomainParticipantFactory_set_qos(myFactory, &myQos);
DDS_DomainParticipantFactoryQos_finalize(myFactory, &myQos);
```

See also:

```
DDS_DomainParticipantFactory_get_qos (p. 313)
DDS_DomainParticipantFactoryQos_finalize (p. 304)
```

4.77.3 Typedef Documentation

4.77.3.1 typedef struct DDS_DomainParticipantFactoryImpl DDS_DomainParticipantFactory

<< singleton>> (p. 950) << interface>> (p. 950) Allows creation and destruction of DDS_DomainParticipant (p. 339) objects.

The sole purpose of this class is to allow the creation and destruction of **DDS_-DomainParticipant** (p. 339) objects. This class itself is a << singleton>> (p. 950), and accessed via the get_instance() function, and destroyed with finalize_instance() function.

A single application can participate in multiple domains by instantiating multiple **DDS_DomainParticipant** (p. 339) objects.

An application may even instantiate multiple participants in the same domain. Participants in the same domain exchange data in the same way regardless of whether they are in the same application or different applications or on the same node or different nodes; their location is transparent.

There are two important caveats:

- When there are multiple participants on the same node (in the same application or different applications) in the same domain, the application(s) must make sure that the participants do not try to bind to the same port numbers. You must disambiguate between the participants by setting a participant index for each participant. (The participant index is a field in the **DDS_DiscoveryQosPolicy** (p. 1149).) The port numbers used by a participant are calculated based on both the participant index and the domain ID, so if all participants on the same node have different participant indexes, they can coexist in the same domain.
- You cannot mix entities from different participants. For example, you cannot delete a topic on a different participant than you created it from, and you cannot ask a subscriber to create a reader for a topic created from a participant different than the subscriber's own participant. (Note that it is permissable for an application built on top of RTI Data Distribution Service to know about entities from different participants. For example, an application could keep references to a reader from one domain and a writer from another and then bridge the domains by writing the data received in the reader callback.)

DDS_DomainParticipant (p. 339)

4.77.4 Function Documentation

4.77.4.1 DDS_ReturnCode_t DDS_DomainParticipantFactoryQos_initialize (struct DDS_DomainParticipantFactoryQos * self)

Initializer for new QoS instances.

New **DDS_DomainParticipantFactoryQos** (p. 1153) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This function does not allocate memory.

Calling this function is not a substitute for calling DDS_-DomainParticipantFactory_get_qos (p. 313); that function should be called subsequently to setting the QoS of an existing factory. DDS_-DomainParticipantFactoryQos_finalize (p. 304) should be called to free the contained QoS policies that use dynamic memory:

```
DDS_DomainParticipantFactoryQos *myQos = malloc(sizeof(struct DDS_DomainParticipantFactoryQos));
DDS_DomainParticipantQos_initialize(myQos);
DDS_DomainParticipantFactory_get_qos(myFactory, myQos);
DDS_DomainParticipantFactory_set_qos(myFactory, myQos);
DDS_DomainParticipantFactoryQos_finalize(myQos);
free(myQos);
```

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DomainParticipantFactory_get_qos (p. 313)
DDS_DomainParticipantFactoryQos_finalize (p. 304)
```

4.77.4.2 DDS_ReturnCode_t DDS_DomainParticipantFactoryQos_copy (struct DDS_DomainParticipantFactoryQos * self, const struct DDS_DomainParticipantFactoryQos * source)

Copy the contents of the given QoS into this QoS.

DDS_DomainParticipantFactoryQos (p. 1153) instances can use dynamic memory because of the sequences contained in some QoS policies. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). QoS to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DomainParticipantFactoryQos_INITIALIZER (p. 301)
DDS_DomainParticipantFactoryQos_initialize (p. 303)
DDS_DomainParticipantFactoryQos_finalize (p. 304)
```

4.77.4.3 DDS_ReturnCode_t DDS_DomainParticipantFactoryQos_finalize (struct DDS_DomainParticipantFactoryQos * self)

Free any dynamic memory allocated by the policies in this DDS_-DomainParticipantFactoryQos (p. 1153).

Some QoS policies may use dynamic memory (regardless of whether the QoS itself is in dynamic memory). This function frees that memory but otherwise leaves this QoS unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

This function does not leave this object in an invalid state. It is permissable to clear a QoS and then subsequently allocate new dynamic memory in one or more of its QoS policies.

Note that if this QoS instance is stored in heap memory, calling this function will not call free() on it; the user is responsible for explicitly freeing any heap-based QoS instance after calling this function.

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
DDS_DomainParticipantFactoryQos_INITIALIZER (p. 301)
DDS_DomainParticipantFactoryQos_initialize (p. 303)
```

4.77.4.4 DDS_DomainParticipantFactory* DDS_DomainParticipantFactory_get_instance ()

Gets the singleton instance of this class.

Returns:

The **DDS_DomainParticipantFactory** (p. 302) instance.

MT Safety:

On non-Linux systems: UNSAFE for multiple threads to simultaneously make the FIRST call to either DDS_DomainParticipantFactory_get_instance() (p. 304) or DDS_DomainParticipantFactory_finalize_instance() (p. 305). Subsequent calls are thread safe. (On Linux systems, these calls are thread safe.)

DDS_TheParticipantFactory (p. 295) can be used as an alias for the singleton factory returned by this operation.

Returns:

The singleton DDS_DomainParticipantFactory (p. 302) instance.

See also:

DDS_TheParticipantFactory (p. 295)

4.77.4.5 DDS_ReturnCode_t DDS_DomainParticipantFactory_finalize_instance ()

<< eXtension>> (p. 950) Destroys the singleton instance of this class.

Only necessary to explicitly reclaim resources used by the participant factory singleton. Note that on many OSs, these resources are automatically reclaimed by the OS when the program terminates. However, some memory-check tools still flag these as unreclaimed. So this function provides a way to clean up memory used by the participant factory.

Precondition:

All participants created from the factory have been deleted.

Postcondition:

All resources belonging to the factory have been reclaimed. Another call to DDS_DomainParticipantFactory_get_instance (p. 304) will return a new lifecycle of the singleton.

MT Safety:

On non-Linux systems: UNSAFE for multiple threads to simultaneously make the FIRST call to either **DDS_DomainParticipantFactory_get_-**

instance() (p. 304) or DDS_DomainParticipantFactory_finalize_instance() (p. 305). Subsequent calls are thread safe. (On Linux systems, these calls are thread safe.)

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121)

4.77.4.6 DDS_ReturnCode_t DDS_DomainParticipantFactory_set_-default_participant_qos (DDS_DomainParticipantFactory * self, const struct DDS_DomainParticipantQos * qos)

Sets the default **DDS_DomainParticipantQos** (p. 1157) values for this domain participant factory.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a domain participant factory while another thread may be simultaneously calling **DDS_-DomainParticipantFactory_set_default_participant_gos** (p. 306)

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

qos <<inout>> (p. 951) Qos to be filled up. The special value DDS_-PARTICIPANT_QOS_DEFAULT (p. 325) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if DDS_DomainParticipantFactory_set_default_participant_qos (p. 306) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_PARTICIPANT_QOS_DEFAULT (p. 325)
DDS_DomainParticipantFactory_create_participant (p. 309)
```

4.77.4.7 DDS_ReturnCode_t DDS_DomainParticipantFactory_set_default_participant_qos_with_profile
(DDS_DomainParticipantFactory * self, const char * library_name, const char * profile_name)

<<extension>> (p. 950) Sets the default DDS_DomainParticipantQos (p. 1157) values for this domain participant factory based on the input XML QoS profile.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

This default value will be used for newly created **DDS_DomainParticipant** (p. 339) if **DDS_PARTICIPANT_QOS_DEFAULT** (p. 325) is specified as the qos parameter when **DDS_DomainParticipantFactory_create_participant** (p. 309) is called.

Precondition:

The DDS_DomainParticipantQos (p. 1157) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a domain participant factory while another thread may be simultaneously calling **DDS_DomainParticipantFactory_set_default_participant_qos** (p. 306)

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_-default_library (p. 316)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipantFactory_set_default_profile (p. 316)).

If the input profile cannot be found the function fails with $DDS_RETCODE_ERROR$ (p. 121).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

```
\begin{array}{l} \textbf{DDS\_PARTICIPANT\_QOS\_DEFAULT} \ (p. \ 325) \\ \textbf{DDS\_DomainParticipantFactory\_create\_participant\_with\_profile} \\ (p. \ 310) \end{array}
```

4.77.4.8 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_default_participant_qos (DDS_DomainParticipantFactory * self, struct DDS_DomainParticipantQos * qos)

Initializes the **DDS_DomainParticipantQos** (p. 1157) instance with default values.

The retrieved qos will match the set of values specified on the last successful call to DDS_DomainParticipantFactory_set_default_participant_qos (p. 306), or DDS_DomainParticipantFactory_set_default_participant_qos_with_profile (p. 307), or else, if the call was never made, the default values listed in DDS_DomainParticipantQos (p. 1157).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << out>> (p. 951) the domain participant's QoS Cannot be NULL.
```

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a domain participant factory while another thread may be simultaneously calling **DDS_DomainParticipantFactory_set_default_participant_qos** (p. 306)

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
DDS_PARTICIPANT_QOS_DEFAULT (p. 325)
DDS_DomainParticipantFactory_create_participant (p. 309)
```

4.77.4.9 DDS_DomainParticipant* DDS_DomainParticipantFactory_create_participant (DDS_DomainParticipantFactory * self, DDS_DomainId_t domainId, const struct DDS_DomainParticipantQos * qos, const struct DDS_DomainParticipantListener * listener, DDS_StatusMask mask)

Creates a new DDS_DomainParticipant (p. 339) object.

Precondition:

The specified QoS policies must be consistent or the operation will fail and no **DDS_DomainParticipant** (p. 339) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **DDS_-WireProtocolQosPolicy** (p. 1483)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

Precondition:

If listener is specified, none of the listener callback functions can be NULL.

MT Safety:

UNSAFE. (1) If **DDS_PARTICIPANT_QOS_DEFAULT** (p. 325) is used for qos, it is not safe to create the participant while another thread may simultaneously be calling **DDS_DomainParticipantFactory_set_default_participant_qos** (p. 306). (2) It is not safe to create one participant while another thread may simultaneously be looking up or deleting the same participant.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

domainId <<in>> (p. 951) ID of the domain that the application intends to join. [range] [>=0], and does not violate guidelines stated in DDS_RtpsWellKnownPorts_t (p. 1378).

qos <<iin>> (p. 951) the DomainParticipant's QoS. The special value DDS_PARTICIPANT_QOS_DEFAULT (p. 325) can be used to indicate that the DDS_DomainParticipant (p. 339) should be created with the default DDS_DomainParticipantQos (p. 1157) set in the DDS_DomainParticipantFactory (p. 302). Cannot be NULL.

listener <<in>> (p. 951) the domain participant's listener. mask <<in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

domain participant or NULL on failure

See also:

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_DomainParticipantQos (p. 1157) for rules on consistency among QoS

DDS_PARTICIPANT_QOS_DEFAULT (p. 325)

NDDS_DISCOVERY_PEERS (p. 189)

DDS_DomainParticipantFactory_create_participant_with_-profile() (p. 310)

 $\begin{aligned} \mathbf{DDS_DomainParticipantFactory_get_default_participant_qos()} \\ & (\mathrm{p.\,308}) \end{aligned}$

DDS_DomainParticipant_set_listener() (p. 404)

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

4.77.4.10 DDS_DomainParticipant* DDS_DomainParticipantFactory_create_participant_with_profile (DDS_DomainParticipantFactory * self, DDS_DomainId_t domainId, const char * library_name, const char * profile_name, const struct_DDS_DomainParticipantListener * listener*

struct DDS_DomainParticipantListener * listener, DDS_StatusMask mask)

<<extension>> (p. 950) Creates a new DDS_DomainParticipant (p. 339) object using the DDS_DomainParticipantQos (p. 1157) associated with the input XML QoS profile.

Precondition:

The DDS_DomainParticipantQos (p. 1157) in the input profile must be consistent, or the operation will fail and no DDS_DomainParticipant (p. 339) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **DDS_-WireProtocolQosPolicy** (p. 1483)). This in turn will ensure each participant

uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

Precondition:

if listener is specified, none of the listener callback functions can be NULL.

MT Safety:

UNSAFE. (1) If **DDS_PARTICIPANT_QOS_DEFAULT** (p. 325) is used for qos, it is not safe to create the participant while another thread may simultaneously be calling **DDS_DomainParticipantFactory_set_default_participant_qos** (p. 306). (2) It is not safe to create one participant while another thread may simultaneously be looking up or deleting the same participant.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

domainId <<in>> (p. 951) ID of the domain that the application intends to join. [range] [>=0], and does not violate guidelines stated in DDS_RtpsWellKnownPorts_t (p. 1378).

library_name <<in>>> (p. 951) Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipantFactory_set_default_profile (p. 316)).

listener << in>> (p. 951) the Domain Participant's listener.

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

domain participant or NULL on failure

See also:

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_DomainParticipantQos (p. 1157) for rules on consistency among QoS

```
DDS_PARTICIPANT_QOS_DEFAULT (p. 325)

DDS_DomainParticipantFactory_create_participant() (p. 309)
DDS_DomainParticipantFactory_get_default_participant_qos()
(p. 308)
DDS_DomainParticipant_set_listener() (p. 404)
```

4.77.4.11 DDS_ReturnCode_t DDS_DomainParticipantFactory_delete_participant (DDS_DomainParticipantFactory * self, DDS_DomainParticipant * a_participant)

Deletes an existing **DDS_DomainParticipant** (p. 339).

Precondition:

All domain entities belonging to the participant must have already been deleted. Otherwise it fails with the error **DDS_RETCODE_-PRECONDITION_NOT_MET** (p. 121).

Postcondition:

Listener installed on the **DDS_DomainParticipant** (p. 339) will not be called after this function returns successfully.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
a_participant <<in>> (p. 951) DDS_DomainParticipant (p. 339) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

$\begin{array}{lll} 4.77.4.12 & DDS_DomainParticipant* & DDS_-\\ & DomainParticipantFactory_lookup_participant\\ & (DDS_DomainParticipantFactory * \textit{self},\\ & DDS_DomainId_t & \textit{domainId}) \end{array}$

Locates an existing DDS_DomainParticipant (p. 339).

If no such **DDS_DomainParticipant** (p. 339) exists, the operation will return NULL value.

If multiple **DDS_DomainParticipant** (p. 339) entities belonging to that domainId exist, then the operation will return one of them. It is not specified which one.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. domainId << in>> (p. 951) ID of the domain participant to lookup.
```

Returns:

domain participant if it exists, or NULL

4.77.4.13 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_qos (DDS_DomainParticipantFactory * self, struct
DDS_DomainParticipantFactoryQos * qos)

Gets the value for participant factory QoS.

MT Safety:

UNSAFE. It is not safe to get the participant factory QoS while another thread may simultaneously be calling DDS-DomainParticipantFactory_get_qos (p. 313) or DDS-DomainParticipantFactory_set_qos (p. 313).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) QoS to be filled up. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.77.4.14 DDS_ReturnCode_t DDS_DomainParticipantFactory_set_qos (DDS_DomainParticipantFactory * self, const
struct DDS_DomainParticipantFactoryQos * qos)

Sets the value for a participant factory QoS.

The DDS_DomainParticipantFactoryQos::entity_factory (p. 1153) can be changed. The other policies are immutable.

Note that despite having QoS, the **DDS_DomainParticipantFactory** (p. 302) is not an **DDS_Entity** (p. 242).

MT Safety:

UNSAFE. It is not safe to set the participant factory QoS while another thread may simultaneously be calling DDS_DomainParticipantFactory_set_qos (p. 313) or DDS_DomainParticipantFactory_get_qos (p. 313).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) Set of policies to be applied to DDS_-DomainParticipantFactory (p. 302). Policies must be consistent. Immutable policies can only be changed before calling any other RTI Data Distribution Service functions except for DDS_-DomainParticipantFactory_get_qos (p. 313) Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 122) if policies are inconsistent

See also:

DDS_DomainParticipantFactoryQos (p. 1153) for rules on consistency among QoS

4.77.4.15 DDS_ReturnCode_t DDS_DomainParticipantFactory_load_profiles (DDS_DomainParticipantFactory * self)

<< eXtension>> (p. 950) Loads the XML QoS profiles.

The XML QoS profiles are loaded implicitly after the first DDS_DomainParticipant (p. 339) is created or explicitly, after a call to this function.

This has the same effect as DDS_DomainParticipantFactory_reload_profiles() (p. 315).

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_ProfileQosPolicy (p. 1304)

4.77.4.16 DDS_ReturnCode_t DDS_DomainParticipantFactory_reload_profiles (DDS_DomainParticipantFactory * self)

<< eXtension>> (p. 950) Reloads the XML QoS profiles.

The XML QoS profiles are loaded implicitly after the first DDS_DomainParticipant (p. 339) is created or explicitly, after a call to this function.

This has the same effect as DDS_DomainParticipantFactory_load_profiles() (p. 314).

Parameters:

$$self \ll in \gg (p. 951)$$
 Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_ProfileQosPolicy (p. 1304)

4.77.4.17 DDS_ReturnCode_t DDS_DomainParticipantFactory_unload_profiles (DDS_DomainParticipantFactory * self)

<< eXtension>> (p. 950) Unloads the XML QoS profiles.

The resources associated with the XML QoS profiles are freed. Any reference to the profiles after calling this function will fail with an error.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_ProfileQosPolicy (p. 1304)

4.77.4.18 DDS_ReturnCode_t DDS_DomainParticipantFactory_set_default_library (DDS_DomainParticipantFactory * self, const char * library_name)

<< eXtension>> (p. 950) Sets the default XML library for a DDS_-DomainParticipantFactory (p. 302).

Any API requiring a library_name as a parameter can use null to refer to the default library.

See also:

DDS_DomainParticipantFactory_set_default_profile (p. 316) for more information.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $library_name << in>> (p. 951)$ Library name. If library_name is null any previous default is unset.

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DomainParticipantFactory_get_default_library (p. 317)

4.77.4.19 DDS_ReturnCode_t DDS_DomainParticipantFactory_set_default_profile (DDS_DomainParticipantFactory * self, const char * library_name, const char * profile_name)

<<e xtension>> (p. 950) Sets the default XML profile for a DDS_-DomainParticipantFactory (p. 302).

This function specifies the profile that will be used as the default the next time a default DomainParticipantFactory profile is needed during a call to a DomainParticipantFactory function. When calling a DDS_DomainParticipantFactory (p. 302) function that requires a profile_name parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

This function does not set the default QoS for newly created DomainParticipants; for this functionality, use **DDS_DomainParticipantFactory_set_default_participant_qos_with_profile** (p. 307) (you may pass in NULL after having called set_default_profile()).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. library\_name << in>> (p. 951) The library name containing the profile. profile\_name << in>> (p. 951) The profile name. If profile\_name is null any previous default is unset.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DomainParticipantFactory_get_default_profile (p. 317)
DDS_DomainParticipantFactory_get_default_profile_library (p. 318)
```

4.77.4.20 const char* DDS_DomainParticipantFactory_get_default_library (DDS_DomainParticipantFactory * self)

<< eXtension>> (p. 950) Gets the default XML library associated with a DDS_DomainParticipantFactory (p. 302).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The default library or null if the default library was not set.

See also:

DDS_DomainParticipantFactory_set_default_library (p. 316)

4.77.4.21 const char* DDS_DomainParticipantFactory_get_default_profile (DDS_DomainParticipantFactory * self)

<<eeXtension>> (p. 950) Gets the default XML profile associated with a DDS_DomainParticipantFactory (p. 302).

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

The default profile or null if the default profile was not set.

See also:

DDS_DomainParticipantFactory_set_default_profile (p. 316)

4.77.4.22 const char* DDS_DomainParticipantFactory_get_default_profile_library (DDS_DomainParticipantFactory * self)

<< eXtension>> (p. 950) Gets the library where the default XML profile is contained for a DDS_DomainParticipantFactory (p. 302).

The default profile library is automatically set when DDS_DomainParticipantFactory_set_default_profile (p. 316) is called.

This library can be different than the DDS_DomainParticipantFactory (p. 302) default library (see DDS_DomainParticipantFactory_get_-default_library (p. 317)).

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

The default profile library or null if the default profile was not set.

See also:

DDS_DomainParticipantFactory_set_default_profile (p. 316)

4.77.4.23 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_participant_qos_from_profile
(DDS_DomainParticipantFactory * self, struct
DDS_DomainParticipantQos * qos, const char *
library_name, const char * profile_name)

<<eXtension>> (p. 950) Gets the DDS_DomainParticipantQos (p. 1157) values associated with the input XML QoS profile.

default_library (p. 316)).

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
qos <<out>> (p. 951) Qos to be filled up. Cannot be NULL.
library_name <<iin>> (p. 951) Library name containing the XML QoS
profile. If library_name is null RTI Data Distribution Service will
use the default library (see DDS_DomainParticipantFactory_set_-
```

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipantFactory_set_default_profile (p. 316)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the **Standard Return Codes** (p. 120)

4.77.4.24 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_publisher_qos_from_profile (DDS_DomainParticipantFactory * self, struct DDS_PublisherQos * qos, const char * $library_name$, const char * $profile_name$)

<<eXtension>> (p. 950) Gets the DDS_PublisherQos (p. 1328) values associated with the input XML QoS profile.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 qos << out>> (p. 951) Qos to be filled up. Cannot be NULL. 
 library\_name << in>> (p. 951) Library name containing the XML QoS profile. If library\_name is null RTI Data Distribution Service will
```

profile. If library_name is null RTI Data Distribution Service will use the default library (see **DDS_DomainParticipantFactory_set_default_library** (p. 316)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipantFactory_set_default_profile (p. 316)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120)

4.77.4.25 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_subscriber_qos_from_profile
(DDS_DomainParticipantFactory * self, struct
DDS_SubscriberQos * qos, const char * library_name,
const char * profile_name)

<<eXtension>> (p. 950) Gets the DDS_SubscriberQos (p. 1407) values associated with the input XML QoS profile.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << out>> (p. 951) Qos to be filled up. Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120)

4.77.4.26 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_datareader_qos_from_profile
(DDS_DomainParticipantFactory * self, struct
DDS_DataReaderQos * qos, const char * library_name,
const char * profile_name)

 $<<\!eXtension>>$ (p. 950) Gets the DDS_DataReaderQos (p. 1083) values associated with the input XML QoS profile.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
qos << out>> (p. 951) Qos to be filled up. Cannot be NULL.
```

library_name <<iin>> (p. 951) Library name containing the XML QoS
 profile. If library_name is null RTI Data Distribution Service will
 use the default library (see DDS_DomainParticipantFactory_set_ default_library (p. 316)).

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipantFactory_set_default_profile (p. 316)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the **Standard Return Codes** (p. 120)

4.77.4.27 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_datareader_qos_from_profile_w_topic_name
(DDS_DomainParticipantFactory * self, struct
DDS_DataReaderQos * qos, const char * library_name,
const char * profile_name, const char * topic_name)

<<e xtension>> (p. 950) Gets the DDS_DataReaderQos (p. 1083) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
qos << out>> (p. 951) Qos to be filled up. Cannot be NULL.
```

library_name <<in>>> (p. 951) Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipantFactory_set_default_profile (p. 316)).

topic_name <<in>>> (p. 951) Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Data Distribution Service will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the function fails with $\mathbf{DDS_RETCODE_ERROR}$ (p. 121).

Returns:

One of the Standard Return Codes (p. 120)

4.77.4.28 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_datawriter_qos_from_profile
(DDS_DomainParticipantFactory * self, struct
DDS_DataWriterQos * qos, const char * library_name,
const char * profile_name)

<<eXtension>> (p. 950) Gets the DDS_DataWriterQos (p. 1123) values associated with the input XML QoS profile.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
qos <<out>> (p. 951) Qos to be filled up. Cannot be NULL.
library_name <<in>> (p. 951) Library name containing the XML QoS
profile. If library_name is null RTI Data Distribution Service will
use the default library (see DDS_DomainParticipantFactory_set_-
default_library (p. 316)).
```

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipantFactory_set_default_profile (p. 316)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the **Standard Return Codes** (p. 120)

4.77.4.29 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_datawriter_qos_from_profile_w_topic_name
(DDS_DomainParticipantFactory * self, struct
DDS_DataWriterQos * qos, const char * library_name,
const char * profile_name, const char * topic_name)

<<eXtension>> (p. 950) Gets the DDS_DataWriterQos (p. 1123) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
qos <<out>> (p. 951) Qos to be filled up. Cannot be NULL.
library_name <<in>> (p. 951) Library name containing the XML QoS
profile. If library_name is null RTI Data Distribution Service will
use the default library (see DDS_DomainParticipantFactory_set_-
default_library (p. 316)).
```

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name is null RTI Data Distribution Service will use the default profile (see DDS_DomainParticipantFactory_set_default_profile (p. 316)).

topic_name <<in>>> (p. 951) Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Data Distribution Service will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120)

4.77.4.30 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_topic_qos_from_profile (DDS_DomainParticipantFactory * self, struct DDS_TopicQos
* qos, const char * library_name, const char *
profile_name)

<<eXtension>> (p. 950) Gets the DDS_TopicQos (p. 1443) values associated with the input XML QoS profile.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << out>> (p. 951) Qos to be filled up. Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipantFactory_set_default_profile (p. 316)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120)

4.77.4.31 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_topic_qos_from_profile_w_topic_name
(DDS_DomainParticipantFactory * self, struct
DDS_TopicQos * qos, const char * library_name, const
char * profile_name, const char * topic_name)

<<eXtension>> (p. 950) Gets the DDS_TopicQos (p. 1443) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << out>> (p. 951) Qos to be filled up. Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipantFactory_set_default_profile (p. 316)).

topic_name <<in>>> (p. 951) Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Data Distribution Service will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the function fails with $\mathbf{DDS_RETCODE_ERROR}$ (p. 121).

Returns:

One of the Standard Return Codes (p. 120)

4.77.4.32 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_qos_profile_libraries (DDS_DomainParticipantFactory * self, struct DDS_StringSeq * library_names)

<<eeXtension>> (p. 950) Gets the names of all XML QoS profile libraries associated with the DDS_DomainParticipantFactory (p. 302)

Parameters:

```
self <<\!\!in\!\!>> (p. 951) \text{ Cannot be NULL.} library\_names <<\!\!out\!\!>> (p. 951) \text{ DDS\_StringSeq } (p. 1399) \text{ to be filled} with names of XML QoS profile libraries. Cannot be NULL.
```

4.77.4.33 DDS_ReturnCode_t DDS_DomainParticipantFactory_get_qos_profiles (DDS_DomainParticipantFactory * self,
struct DDS_StringSeq * profile_names, const char *
library_name)

<<eXtension>> (p. 950) Gets the names of all XML QoS profiles associated with the input XML QoS profile library.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $profile_names << out>> (p. 951)$ DDS_StringSeq (p. 1399) to be filled with names of XML QoS profiles. Cannot be NULL.

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

4.77.5 Variable Documentation

4.77.5.1 struct DDS_DomainParticipantQos DDS_PARTICIPANT_QOS_DEFAULT

Special value for creating a DomainParticipant with default QoS.

When used in DDS_DomainParticipantFactory_create_participant (p. 309), this special value is used to indicate that the DDS_DomainParticipant (p. 339) should be created with the default DDS_DomainParticipant (p. 339) QoS by means of the operation DDS_DomainParticipantFactory_get_default_participant_qos() (p. 308) and using the resulting QoS to create the DDS_DomainParticipant (p. 339).

When used in DDS_DomainParticipantFactory_set_default_participant_qos (p. 306), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the DDS_DomainParticipantFactory_set_default_participant_qos (p. 306) operation had never been called.

When used in DDS_DomainParticipant_set_qos (p. 402), this special value is used to indicate that the QoS of the DDS_DomainParticipant (p. 339) should be changed to match the current default QoS set in the DDS_DomainParticipantFactory (p. 302) that the DDS_DomainParticipant (p. 339) belongs to.

RTI Data Distribution Service treats this special value as a constant.

Note: You cannot use this value to get the default QoS values from the domain

participant factory; for this purpose, use $\mathbf{DDS_DomainParticipantFactory_get_default_participant_qos}$ (p. 308).

4.78 DomainParticipants

DDS_DomainParticipant (p. 339) entity and associated elements

Data Structures

- * struct DDS_DomainParticipantListener <<interface>> (p.950) Listener for participant status.
- $\hat{}$ struct $\mathbf{DDS_DomainParticipantQos}$

QoS policies supported by a DDS_DomainParticipant (p. 339) entity.

Defines

- *#define DDS_DomainParticipantListener_INITIALIZER

 Initializer for new DDS_DomainParticipantListener (p. 1155).
- *#define DDS_DomainParticipantQos_INITIALIZER
 Initializer for new QoS instances.

Typedefs

^ typedef struct DDS_DomainParticipantImpl **DDS_- DomainParticipant**

<<interface>> (p.950) Container for all DDS_DomainEntity (p.245) objects.

Functions

Initializer for new QoS instances.

^ DDS_ReturnCode_t DDS_DomainParticipantQos_copy (struct DDS_DomainParticipantQos *self, const struct DDS_DomainParticipantQos *source)

Copy the contents of the given QoS into this QoS.

^ DDS_ReturnCode_t DDS_DomainParticipantQos_finalize (struct DDS_DomainParticipantQos *self)

Free any dynamic memory allocated by the policies in this DDS-DomainParticipantQos (p. 1157).

^ DDS_Entity * DDS_DomainParticipant_as_entity (DDS_-DomainParticipant *domain)

Access a DDS_DomainParticipant (p. 339)'s supertype instance.

Copies the default DDS_TopicQos (p. 1443) values for this domain participant into the given DDS_TopicQos (p. 1443) instance.

^ DDS_ReturnCode_t DDS_DomainParticipant_set_default_topic_qos (DDS_DomainParticipant *self, const struct DDS_TopicQos *qos)

Set the default DDS_TopicQos (p. 1443) values for this domain participant.

<<eXtension>> (p. 950) Set the default DDS_TopicQos (p. 1443) values for this domain participant based on the input XML QoS profile.

Copy the default $DDS_PublisherQos$ (p. 1328) values into the provided $DDS_PublisherQos$ (p. 1328) instance.

Set the default $DDS_PublisherQos$ (p. 1328) values for this DomainParticipant.

DDS_ReturnCode_t DDS_DomainParticipant_set_default_-publisher_qos_with_profile (DDS_DomainParticipant *self, const char *library_name, const char *profile_name)

<<eXtension>> (p. 950) Set the default DDS_PublisherQos (p. 1328) values for this DomainParticipant based on the input XML QoS profile.

 $<<\!\!\!\!$ eXtension>> (p. $\!\!\!\!$ 950) Copy the default $DDS_DataWriterQos$ (p. $\!\!\!$ 1123) values into the provided $DDS_DataWriterQos$ (p. $\!\!\!$ 1123) instance.

<<e**Xtension**>> (p. 950) Set the default DataWriterQos values for this DomainParticipant.

<<extension>> (p. 950) Set the default DDS_DataWriterQos (p. 1123) values for this domain participant based on the input XML QoS profile.

Copy the default DDS_SubscriberQos (p. 1407) values into the provided DDS_SubscriberQos (p. 1407) instance.

Set the default $DDS_SubscriberQos$ (p. 1407) values for this Domain{articipant.

^ DDS_ReturnCode_t DDS_DomainParticipant_set_default_subscriber_qos_with_profile (DDS_DomainParticipant *self, const char *library_name, const char *profile_name)

<<extension>> (p. 950) Set the default DDS_SubscriberQos (p. 1407) values for this DomainParticipant based on the input XML QoS profile.

^ DDS_ReturnCode_t DDS_DomainParticipant_set_default_-datareader_qos (DDS_DomainParticipant *self, const struct DDS_DataReaderQos *qos)

<<eXtension>> (p. 950) Set the default DDS_DataReaderQos (p. 1083) values for this domain participant.

DDS_ReturnCode_t DDS_DomainParticipant_set_default_-datareader_qos_with_profile (DDS_DomainParticipant *self, const char *library_name, const char *profile_name)

<<eXtension>> (p. 950) Set the default DDS_DataReaderQos (p. 1083) values for this DomainParticipant based on the input XML QoS profile.

<<eXtension>> (p.950) Copies the default DDS-FlowControllerProperty_t (p.1220) values for this domain participant into the given DDS-FlowControllerProperty_t (p. 1220) instance.

<<eXtension>> (p. 950) Set the default DDS_-FlowControllerProperty_t (p. 1220) values for this domain participant.

^ const char * DDS_DomainParticipant_get_default_library (DDS_-DomainParticipant *self)

<<eXtension>> (p. 950) Gets the default XML library associated with a DDS_DomainParticipant (p. 339).

^ const_char * DDS_DomainParticipant_get_default_profile (DDS_-DomainParticipant *self)

<<eXtension>> (p. 950) Gets the default XML profile associated with a DDS_DomainParticipant (p. 339).

` const_char * DDS_DomainParticipant_get_default_profile_library (DDS_DomainParticipant *self)

<<eXtension>> (p. 950) Gets the library where the default XML QoS profile is contained for a DDS_DomainParticipant (p. 339).

^ DDS_ReturnCode_t DDS_DomainParticipant_set_default_library (DDS_DomainParticipant *self, const char *library_name)

<<eXtension>> (p. 950) Sets the default XML library for a DDS_- -DomainParticipant (p. 339).

^ DDS_ReturnCode_t DDS_DomainParticipant_set_default_profile (DDS_DomainParticipant *self, const char *library_name, const char *profile_name)

<<eXtension>> (p. 950) Sets the default XML profile for a DDS_-DomainParticipant (p. 339).

^ DDS_Publisher * DDS_DomainParticipant_create_publisher (DDS_DomainParticipant *self, const struct DDS_PublisherQos *qos, const struct DDS_PublisherListener *listener, DDS_StatusMask mask)

Creates a DDS_Publisher (p. 632) with the desired QoS policies and attaches to it the specified DDS_PublisherListener (p. 1326).

^ DDS_Publisher * DDS_DomainParticipant_create_publisher_with_profile (DDS_DomainParticipant *self, const char *library_name, const char *profile_name, const struct DDS_PublisherListener *listener, DDS_StatusMask mask)

<<extension>> (p. 950) Creates a new DDS_Publisher (p. 632) object using the DDS_PublisherQos (p. 1328) associated with the input XML QoS profile.

Deletes an existing DDS_Publisher (p. 632).

DDS_Subscriber * DDS_DomainParticipant_create_subscriber (DDS_DomainParticipant *self, const struct DDS_SubscriberQos *qos, const struct DDS_SubscriberListener *listener, DDS_StatusMask mask)

Creates a DDS_Subscriber (p. 743) with the desired QoS policies and attaches to it the specified DDS_SubscriberListener (p. 1405).

^ DDS_Subscriber * DDS_DomainParticipant_create_subscriber_with_profile (DDS_DomainParticipant *self, const char *library_name, const char *profile_name, const struct DDS_SubscriberListener *listener, DDS_StatusMask mask)

<<extension>> (p. 950) Creates a new DDS_Subscriber (p. 743) object using the DDS_PublisherQos (p. 1328) associated with the input XML QoS profile.

DDS_ReturnCode_t DDS_DomainParticipant_delete_subscriber (DDS_DomainParticipant *self, DDS_Subscriber *s)

Deletes an existing DDS_Subscriber (p. 743).

- ^ DDS_DataWriter * DDS_DomainParticipant_create_datawriter (DDS_DomainParticipant *self, DDS_Topic *topic, const struct DDS_DataWriterQos *qos, const struct DDS_DataWriterListener *listener, DDS_StatusMask mask)
 - <<eXtension>> (p. 950) Creates a DDS_DataWriter (p. 673) that will be attached and belong to the implicit DDS_Publisher (p. 632).
- DDS_DataWriter * DDS_DomainParticipant_create_datawriter_with_profile (DDS_DomainParticipant *self, DDS_Topic *topic, const char *library_name, const char *profile_name, const struct DDS_DataWriterListener *listener, DDS_StatusMask mask)
 - <<extension>> (p. 950) Creates a DDS_DataWriter (p. 673) using a XML QoS profile that will be attached and belong to the implicit DDS_Publisher (p. 632).
- ^ DDS_ReturnCode_t DDS_DomainParticipant_delete_datawriter (DDS_DomainParticipant *self, DDS_DataWriter *a_datawriter)
 - <<eXtension>> (p. 950) Deletes a DDS_DataWriter (p. 673) that belongs to the implicit DDS_Publisher (p. 632).
- ^ DDS_DataReader * DDS_DomainParticipant_create_datareader (DDS_DomainParticipant *self, DDS_TopicDescription *topic, const struct DDS_DataReaderQos *qos, const struct DDS_DataReaderListener *listener, DDS_StatusMask mask)
 - <<eXtension>> (p. 950) Creates a DDS_DataReader (p. 783) that will be attached and belong to the implicit DDS_Subscriber (p. 743).
- ^ DDS_DataReader * DDS_DomainParticipant_create_datareader_with_profile (DDS_DomainParticipant *self, DDS_TopicDescription *topic, const char *library_name, const char *profile_name, const struct DDS_DataReaderListener *listener, DDS_StatusMask mask)
 - <<eXtension>> (p. 950) Creates a DDS_DataReader (p. 783) using a XML QoS profile that will be attached and belong to the implicit DDS_-Subscriber (p. 743).
- ^ DDS_ReturnCode_t DDS_DomainParticipant_delete_datareader (DDS_DomainParticipant *self, DDS_DataReader *a_datareader)
 - <<eXtension>> (p. 950) Deletes a DDS_DataReader (p. 783) that belongs to the implicit DDS_Subscriber (p. 743).
- ^ DDS_Topic * DDS_DomainParticipant_create_topic (DDS_DomainParticipant *self, const char *topic_name, const char *type_name, const struct DDS_TopicQos *qos, const struct DDS_TopicListener *listener, DDS_StatusMask mask)

Creates a DDS_Topic (p. 425) with the desired QoS policies and attaches to it the specified DDS_TopicListener (p. 1441).

DDS_Topic * DDS_DomainParticipant_create_topic_with_profile (DDS_DomainParticipant *self, const char *topic_name, const char *type_name, const char *library_name, const char *profile_name, const struct DDS_TopicListener *listener, DDS_StatusMask mask)

<<extension>> (p. 950) Creates a new DDS_Topic (p. 425) object using the DDS_PublisherQos (p. 1328) associated with the input XML QoS profile.

Deletes a DDS_Topic (p. 425).

DDS_ContentFilteredTopic * DDS_DomainParticipant_create_-contentfilteredtopic (DDS_DomainParticipant *self, const char *name, DDS_Topic *related_topic, const char *filter_expression, const struct DDS_StringSeq *expression_parameters)

Creates a DDS_ContentFilteredTopic (p. 426), that can be used to do content-based subscriptions.

DDS_ContentFilteredTopic * DDS_DomainParticipant_create_contentfilteredtopic_with_filter (DDS_DomainParticipant *self, const char *name, const DDS_Topic *related_topic, const char *filter_expression, const struct DDS_StringSeq *expression_parameters, const char *filter_name)

<<eXtension>> (p. 950) Creates a DDS_ContentFilteredTopic (p. 426) using the specified filter to do content-based subscriptions.

 $\begin{array}{lll} \textbf{DDS_ReturnCode_t} & \textbf{DDS_DomainParticipant_delete_-contentfilteredtopic} & \textbf{(DDS_DomainParticipant} & *self, & \textbf{DDS_-ContentFilteredTopic} & *a_contentfilteredtopic) \end{array}$

Deletes a DDS_ContentFilteredTopic (p. 426).

<<eXtension>> (p. 950) Register a content filter which can be used to create a DDS_ContentFilteredTopic (p. 426).

^ void * DDS_DomainParticipant_lookup_contentfilter (DDS_DomainParticipant *self, const char *filter_name)

<<extension>> (p. 950) Lookup a content filter previously registered with DDS_DomainParticipant_register_contentfilter (p. 380).

<<eXtension>> (p. 950) Unregister a content filter previously registered with DDS_DomainParticipant_register_contentfilter (p. 380).

^ DDS_MultiTopic * DDS_DomainParticipant_create_multitopic (DDS_DomainParticipant *self, const char *name, const char *type_name, const char *subscription_expression, const struct DDS_StringSeq *expression_parameters)

[Not supported (optional)] Creates a MultiTopic that can be used to subscribe to multiple topics and combine/filter the received data into a resulting type.

^ DDS_ReturnCode_t DDS_DomainParticipant_delete_multitopic (DDS_DomainParticipant *self, DDS_MultiTopic *a_multitopic)

/Not supported (optional)/ Deletes a DDS_MultiTopic (p. 430).

^ DDS_FlowController * DDS_DomainParticipant_create_flowcontroller (DDS_DomainParticipant *self, const char *name, const struct DDS_FlowControllerProperty_t *prop)

<<eXtension>> (p. 950) Creates a DDS_FlowController (p. 726) with the desired property.

 $\begin{array}{lll} \textbf{DDS_ReturnCode_t} & \textbf{DDS_DomainParticipant_delete_-} \\ \textbf{flowController} & (\textbf{DDS_DomainParticipant} & *self, & \textbf{DDS_-} \\ \textbf{FlowController} & *fc) \end{array}$

<<eXtension>> (p. 950) Deletes an existing DDS_FlowController (p. 726).

DDS_Topic * DDS_DomainParticipant_find_topic (DDS_DomainParticipant *self, const char *topic_name, const struct DDS_Duration_t *timeout)

Finds an existing (or ready to exist) DDS_Topic (p. 425), based on its name.

DDS_TopicDescription * DDS_DomainParticipant_lookup_topicdescription (DDS_DomainParticipant *self, const char *topic_name)

Looks up an existing, locally created **DDS_TopicDescription** (p. 425), based on its name.

DDS_FlowController * DDS_DomainParticipant_lookup_flowcontroller (DDS_DomainParticipant *self, const char *name)

<<eXtension>> (p. 950) Looks up an existing locally-created DDS_-FlowController (p. 726), based on its name.

^ DDS_Subscriber * DDS_DomainParticipant_get_builtin_subscriber (DDS_DomainParticipant *self)

Accesses the built-in DDS_Subscriber (p. 743).

^ DDS_Publisher * DDS_DomainParticipant_get_implicit_publisher (DDS_DomainParticipant *self)

<<eXtension>> (p. 950) Returns the implicit DDS_Publisher (p. 632). If an implicit Publisher does not already exist, this creates one.

^ DDS_Subscriber * DDS_DomainParticipant_get_implicit_subscriber (DDS_DomainParticipant *self)

<<eXtension>> (p. 950) Returns the implicit DDS_Subscriber (p. 743). If an implicit Subscriber does not already exist, this creates one.

^ DDS_ReturnCode_t DDS_DomainParticipant_ignore_participant (DDS_DomainParticipant *self, const DDS_InstanceHandle_t *handle)

Instructs RTI Data Distribution Service to locally ignore a remote DDS_-DomainParticipant (p. 339).

Instructs RTI Data Distribution Service to locally ignore a **DDS_Topic** (p. 425).

Instructs RTI Data Distribution Service to locally ignore a publication.

Instructs RTI Data Distribution Service to locally ignore a subscription.

Get the unique domain identifier.

DDS_ReturnCode_t DDS_DomainParticipant_delete_contained_entities (DDS_DomainParticipant *self)

Delete all the entities that were created by means of the "create" operations on the DDS_DomainParticipant (p. 339).

Manually asserts the liveliness of this DDS_DomainParticipant (p. 339).

<<eXtension>> (p. 950) Allows the application to access all the publishers the participant has.

<<eXtension>> (p. 950) Allows the application to access all the subscribers the participant has.

Returns the current value of the time.

^ DDS_Boolean DDS_DomainParticipant_contains_entity (DDS_DomainParticipant *self, const DDS_InstanceHandle_t *a_handle)

Completes successfully with DDS_BOOLEAN_TRUE (p. 106) if the referenced DDS_Entity (p. 242) is contained by the DDS_DomainParticipant (p. 339).

^ DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_participants (DDS_DomainParticipant *self, struct DDS_-InstanceHandleSeq *participant_handles)

Returns list of discovered $DDS_DomainParticipant$ (p. 339) s.

^ DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_participant_data (DDS_DomainParticipant *self, struct DDS_-ParticipantBuiltinTopicData *participant_data, const DDS_-InstanceHandle_t *participant_handle)

Returns $DDS_ParticipantBuiltinTopicData$ (p. 1289) for the specified $DDS_DomainParticipant$ (p. 339).

^ DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_topics (DDS_DomainParticipant *self, struct DDS_-InstanceHandleSeq *topic_handles) Returns list of discovered DDS_Topic (p. 425) objects.

DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_topic_data (DDS_DomainParticipant *self, struct DDS_TopicBuiltinTopicData *topic_data, const DDS_InstanceHandle_t *topic_handle)

Returns DDS_TopicBuiltinTopicData (p. 1433) for the specified DDS_Topic (p. 425).

DDS_ReturnCode_t DDS_DomainParticipant_add_peer (DDS_DomainParticipant *self, const char *peer_desc_string)

<<**eXtension**>> (p. 950) Attempt to contact one or more additional peer participants.

^ DDS_ReturnCode_t DDS_DomainParticipant_set_qos (DDS_DomainParticipant vself, const struct DDS_DomainParticipantQos vqos)

Change the QoS of this domain participant.

<<extension>> (p. 950) Change the QoS of this domain participant using the input XML QoS profile.

Get the participant QoS.

Sets the participant listener.

 $\begin{tabular}{lll} \bf Struct & \bf DDS_DomainParticipantListener & \bf DDS_DomainParticipant_Stener & (DDS_DomainParticipant + self) \end{tabular}$

Get the participant listener.

<<eXtension>> (p. 950) Get the participant listener.

Variables

- ^ struct DDS_TopicQos DDS_TOPIC_QOS_DEFAULT
 - Special value for creating a DDS_Topic (p. 425) with default QoS.
- `struct DDS_PublisherQos DDS_PUBLISHER_QOS_DEFAULT

Special value for creating a DDS_Publisher (p. 632) with default QoS.

struct DDS_SubscriberQos DDS_SUBSCRIBER_QOS_-DEFAULT

Special value for creating a DDS_Subscriber (p. 743) with default QoS.

^ struct DDS_FlowControllerProperty_t DDS_FLOW_-CONTROLLER_PROPERTY_DEFAULT

<<eXtension>> (p. 950) Special value for creating a DDS_-FlowController (p. 726) with default property.

- ^ const char *const DDS_SQLFILTER_NAME
 - <<eXtension>> (p. 950) The name of the built-in SQL filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.
- ^ const char *const DDS_STRINGMATCHFILTER_NAME

<<extension>> (p. 950) The name of the built-in StringMatch filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.

4.78.1 Detailed Description

DDS_DomainParticipant (p. 339) entity and associated elements

4.78.2 Define Documentation

4.78.2.1 #define DDS_DomainParticipantListener_INITIALIZER

Initializer for new DDS_DomainParticipantListener (p. 1155).

No memory is allocated. New **DDS_DomainParticipantListener** (p. 1155) instances stored in the stack should be initialized with this value before they are passed to any functions.

struct DDS_DomainParticipantListener listener = DDS_DomainParticipantListener_INITIALIZER;
/* initialize listener functions */
listener.as_subscriberlistener.as_datareaderlistener.on_data_available =;
DDS_DomainParticipant_set_listener(myParticipant, &listener, mask);

See also:

```
DDS_DomainParticipant_set_listener (p. 404)
DDS_DomainParticipantListener (p. 1155)
```

4.78.2.2 #define DDS_DomainParticipantQos_INITIALIZER

Initializer for new QoS instances.

New **DDS_DomainParticipantQos** (p. 1157) instances stored on the stack should be initialized with this value before they are passed to any functions. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a new QoS structure is to initialize it on the stack at the time of its creation:

```
struct DDS_DomainParticipantQos myQos = DDS_DomainParticipantQos_INITIALIZER;
```

Note that the above assignment $_{
m not}$ a substitute for callising DDS_DomainParticipant_get_qos (p.404) DDS_{-} DomainParticipantFactory_get_default_participant_qos (p. 308); one of those functions should be called subsequently to setting the QoS of any new or existing entity. DDS_DomainParticipantQos_finalize (p. 342) should be called to free the contained QoS policies that use dynamic memory:

```
struct DDS_DomainParticipantQos myQos = DDS_DomainParticipantQos_INITIALIZER;
DDS_DomainParticipantFactory_get_default_participant_qos(myFactory, &myQos);
DDS_DomainParticipant_set_qos(myParticipant, &myQos);
DDS_DomainParticipantQos_finalize(&myQos);
```

See also:

```
DDS_DomainParticipantFactory_get_default_participant_qos (p. 308)
DDS_DomainParticipantQos_finalize (p. 342)
```

4.78.3 Typedef Documentation

4.78.3.1 typedef struct DDS_DomainParticipantImpl DDS_DomainParticipant

 $<<\!\!interface\!\!>> (p.\,950)$ Container for all DDS_DomainEntity (p. 245) objects.

The DomainParticipant object plays several roles:

- It acts as a container for all other DDS_Entity (p. 242) objects.
- It acts as factory for the DDS_Publisher (p. 632), DDS_Subscriber (p. 743), DDS_Topic (p. 425) and DDS_MultiTopic (p. 430) DDS_Entity (p. 242) objects.
- It represents the participation of the application on a communication plane that isolates applications running on the same set of physical computers from each other. A domain establishes a virtual network linking all applications that share the same domainId and isolating them from applications running on different domains. In this way, several independent distributed applications can coexist in the same physical network without interfering, or even being aware of each other.
- It provides administration services in the domain, offering operations that allow the application to ignore locally any information about a given participant (ignore_participant()), publication (ignore_publication()), subscription (ignore_subscription()) or topic (ignore_topic()).

The following operations may be called even if the **DDS_DomainParticipant** (p. 339) is not enabled. (Operations NOT in this list will fail with the value **DDS_RETCODE_NOT_ENABLED** (p. 121) if called on a disabled Domain-Participant).

- Operations defined at the base-class level: set_qos(), set_qos_with_profile(), get_qos(), set_listener(), get_listener(), enable();
- Factory operations: create_flowcontroller(), create_topic(), create_topic_with_profile(), create_publisher(), create_publisher_with_profile(), create_subscriber(), create_subscriber_with_profile(), delete_flowcontroller(), delete_topic(), delete_publisher(), delete_subscriber(), flowcontroller_property(), get_default_flowcontroller_property(), default_topic_gos(), set_default_topic_qos_with_profile(), get_default_set_default_publisher_qos(), topic_qos(), set_default_publisher_qos_with_profile(), get_default_publisher_qos(), set_default_subscriber_qos(), set_default_subscriber_qos_with_profile(), get_default_subscriber_qos(), delete_contained_entities(), set_default_datareader_qos(), set_default_datareader_qos_with_profile(), get_default_datareader_qos(), set_default_datawriter_qos(), set_default_datawriter_qos_with_profile(), get_default_datawriter_qos(), set_default_library(), set_default_profile();
- Operations for looking up topics: lookup_topicdescription();
- Operations that access status: get_statuscondition(), get_status_changes().

QoS:

DDS_DomainParticipantQos (p. 1157)

Status:

```
Status Kinds (p. 123)
```

Listener:

```
DDS_DomainParticipantListener (p. 1155)
```

See also:

Operations Allowed in Listener Callbacks (p. 1248)

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

4.78.4 Function Documentation

4.78.4.1 DDS_ReturnCode_t DDS_DomainParticipantQos_initialize (struct DDS_DomainParticipantQos * self)

Initializer for new QoS instances.

New DDS_DomainParticipantQos (p. 1157) instances on heap should be initialized with this function before they are passed to any functions. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This function does not allocate memory.

Calling this function is not a substitute for calling DDS_DomainParticipant_get_qos (p. 404) or DDS_DomainParticipantFactory_get_default_participant_qos (p. 308); one of those functions should be called subsequently to setting the QoS of any new or existing entity. DDS_DomainParticipantQos_finalize (p. 342) should be called to free the contained QoS policies that use dynamic memory:

```
DDS_DomainParticipantQos *myQos = malloc(sizeof(struct DDS_DomainParticipantQos));
DDS_DomainParticipantQos_initialize(myQos);
DDS_DomainParticipantFactory_get_default_participant_qos(myFactory, myQos);
DDS_DomainParticipant_set_qos(myParticipant, myQos);
DDS_DomainParticipantQos_finalize(myQos);
free(myQos);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
\begin{tabular}{l} DDS\_DomainParticipantFactory\_get\_default\_participant\_qos \\ (p. 308) \end{tabular}
```

DDS_DomainParticipantQos_finalize (p. 342)

4.78.4.2 DDS_ReturnCode_t DDS_DomainParticipantQos_copy (struct DDS_DomainParticipantQos * self, const struct DDS_DomainParticipantQos * source)

Copy the contents of the given QoS into this QoS.

DDS_DomainParticipantQos (p. 1157) instances can use dynamic memory because of the sequences contained in some QoS policies. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). QoS to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
\begin{array}{l} \mathbf{DDS\_DomainParticipantQos\_INITIALIZER} \ (\mathrm{p.\,339}) \\ \mathbf{DDS\_DomainParticipantQos\_initialize} \ (\mathrm{p.\,341}) \\ \mathbf{DDS\_DomainParticipantQos\_finalize} \ (\mathrm{p.\,342}) \end{array}
```

4.78.4.3 DDS_ReturnCode_t DDS_DomainParticipantQos_finalize (struct DDS_DomainParticipantQos * self)

Free any dynamic memory allocated by the policies in this DDS_-DomainParticipantQos (p. 1157).

Some QoS policies may use dynamic memory (regardless of whether the QoS itself is in dynamic memory). This function frees that memory but otherwise leaves this QoS unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

This function does not leave this object in an invalid state. It is permissable to finalize a QoS and then subsequently allocate new dynamic memory in one or more of its QoS policies.

Note that if this QoS instance is stored in heap memory, calling this function will not call free() on it; the user is responsible for explicitly freeing any heap-based QoS instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DomainParticipantQos_INITIALIZER (p. 339)
DDS_DomainParticipantQos_initialize (p. 341)
```

4.78.4.4 DDS_Entity* DDS_DomainParticipant_as_entity (DDS_DomainParticipant * domain)

Access a DDS_DomainParticipant (p. 339)'s supertype instance.

Parameters:

```
domain << in>> (p. 951) Cannot be NULL.
```

Returns:

 $\mathbf{DDS_DomainParticipant}$ (p. 339)'s supertype $\mathbf{DDS_Entity}$ (p. 242) instance

4.78.4.5 DDS_ReturnCode_t DDS_DomainParticipant_get_- default_topic_qos (DDS_DomainParticipant * self, struct DDS_TopicQos * qos)

Copies the default **DDS_TopicQos** (p. 1443) values for this domain participant into the given **DDS_TopicQos** (p. 1443) instance.

The retrieved qos will match the set of values specified on the last successful call to DDS_DomainParticipant_set_default_topic_qos (p. 344), or else, if the call was never made, the default values listed in DDS_TopicQos (p. 1443).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default Topic QoS from a Domain-Participant while another thread may be simultaneously calling **DDS_-DomainParticipant_set_default_topic_qos** (p. 344)

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << in>> (p. 951) Default gos to be retrieved. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_TOPIC_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_topic (p. 374)
```

4.78.4.6 DDS_ReturnCode_t DDS_DomainParticipant_set_default_topic_qos (DDS_DomainParticipant * self, const struct DDS_TopicQos * qos)

Set the default **DDS_TopicQos** (p. 1443) values for this domain participant.

This default value will be used for newly created **DDS_Topic** (p. 425) if **DDS_TOPIC_QOS_DEFAULT** (p. 406) is specified as the qos parameter when **DDS_DomainParticipant_create_topic** (p. 374) is called.

Precondition:

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_topic_qos (p. 344), DDS_DomainParticipant_get_default_topic_qos (p. 343) or calling DDS_DomainParticipant_create_topic (p. 374) with DDS_TOPIC_QOS_DEFAULT (p. 406) as the qos parameter.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) Default qos to be set. The special value DDS_TOPIC_QOS_DEFAULT (p. 406) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if DDS_DomainParticipant_set_default_topic_qos (p. 344) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

```
DDS_TOPIC_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_topic (p. 374)
```

4.78.4.7 DDS_ReturnCode_t DDS_DomainParticipant_set_default_topic_qos_with_profile (DDS_DomainParticipant * self, const char * library_name, const char * profile_name)

<<**eXtension**>> (p. 950) Set the default **DDS_TopicQos** (p. 1443) values for this domain participant based on the input XML QoS profile.

This default value will be used for newly created **DDS_Topic** (p. 425) if **DDS_TOPIC_QOS_DEFAULT** (p. 406) is specified as the **qos** parameter when **DDS_DomainParticipant_create_topic** (p. 374) is called.

Precondition:

The DDS_TopicQos (p. 1443) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_topic_qos (p. 344), DDS_DomainParticipant_get_default_topic_qos (p. 343) or calling DDS_DomainParticipant_create_topic (p. 374) with DDS_TOPIC_QOS_DEFAULT (p. 406) as the qos parameter.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

library_name <<iin>> (p. 951) Library name containing the XML QoS
 profile. If library_name is null RTI Data Distribution Service will use
 the default library (see DDS_DomainParticipant_set_default_ library (p. 359)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipant_set_default_profile (p. 360)).

If the input profile cannot be found the function fails with $\mathbf{DDS_RETCODE_ERROR}$ (p. 121).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

```
DDS_TOPIC_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_topic_with_profile (p. 376)
```

4.78.4.8 DDS_ReturnCode_t DDS_DomainParticipant_get_default_publisher_qos (DDS_DomainParticipant * self, struct DDS_PublisherQos * qos)

Copy the default **DDS_PublisherQos** (p. 1328) values into the provided **DDS_PublisherQos** (p. 1328) instance.

The retrieved qos will match the set of values specified on the last successful call to DDS_DomainParticipant_set_default_publisher_qos (p. 347), or DDS_DomainParticipant_set_default_publisher_qos_with_profile (p. 348), or else, if the call was never made, the default values listed in DDS_PublisherQos (p. 1328).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

If DDS_PUBLISHER_QOS_DEFAULT (p. 406) is specified as the qos parameter when DDS_DomainParticipant_create_topic (p. 374) is called, the default value of the QoS set in the factory, equivalent to the value obtained by calling DDS_DomainParticipant_get_default_publisher_qos (p. 346), will be used to create the DDS_Publisher (p. 632).

MT Safety:

UNSAFE. It is not safe to retrieve the default publisher QoS from a Domain-Participant while another thread may be simultaneously calling **DDS_-DomainParticipant_set_default_publisher_qos** (p. 347)

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) Qos to be filled up. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_PUBLISHER_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_publisher (p. 361)
```

4.78.4.9 DDS_ReturnCode_t DDS_DomainParticipant_set_default_-publisher_qos (DDS_DomainParticipant * self, const struct DDS_PublisherQos * qos)

Set the default $\mathbf{DDS_PublisherQos}$ (p. 1328) values for this DomainParticipant.

This set of default values will be used for a newly created **DDS_Publisher** (p. 632) if **DDS_PUBLISHER_QOS_DEFAULT** (p. 406) is specified as the qos parameter when **DDS_DomainParticipant_create_publisher** (p. 361) is called.

Precondition:

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default publisher QoS for a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_publisher_qos (p. 347), DDS_DomainParticipant_get_default_publisher_qos (p. 346) or calling DDS_DomainParticipant_create_publisher (p. 361) with DDS_PUBLISHER_QOS_DEFAULT (p. 406) as the qos parameter.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
qos <<iin>> (p. 951) Default qos to be set. The special value DDS_-
PUBLISHER_QOS_DEFAULT (p. 406) may be passed as qos to
indicate that the default QoS should be reset back to the initial values
the factory would used if DDS_DomainParticipant_set_default_-
publisher_qos (p. 347) had never been called. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

```
DDS_PUBLISHER_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_publisher (p. 361)
```

4.78.4.10 DDS_ReturnCode_t DDS_DomainParticipant_set_default_publisher_qos_with_profile
(DDS_DomainParticipant * self, const char *
library_name, const char * profile_name)

<<eXtension>> (p. 950) Set the default DDS_PublisherQos (p. 1328) values for this DomainParticipant based on the input XML QoS profile.

This set of default values will be used for a newly created **DDS_Publisher** (p. 632) if **DDS_PUBLISHER_QOS_DEFAULT** (p. 406) is specified as the **qos** parameter when **DDS_DomainParticipant_create_publisher** (p. 361) is called.

Precondition:

The DDS_PublisherQos (p. 1328) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default publisher QoS for a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_publisher_qos (p. 347), DDS_DomainParticipant_get_default_publisher_qos (p. 346) or calling DDS_DomainParticipant_create_publisher (p. 361) with DDS_PUBLISHER_QOS_DEFAULT (p. 406) as the qos parameter.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<iin>> (p. 951) Library name containing the XML QoS
 profile. If library_name is null RTI Data Distribution Service will use
 the default library (see DDS_DomainParticipant_set_default_ library (p. 359)).

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipant_set_default_profile (p. 360)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

```
DDS_PUBLISHER_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_publisher_with_profile (p. 362)
```

4.78.4.11 DDS_ReturnCode_t DDS_DomainParticipant_get_default_datawriter_qos (DDS_DomainParticipant * self, struct DDS_DataWriterQos * qos)

<<eXtension>> (p. 950) Copy the default DDS_DataWriterQos (p. 1123) values into the provided DDS_DataWriterQos (p. 1123) instance.

The retrieved qos will match the set of values specified on the last successful call to DDS_DomainParticipant_set_default_datawriter_qos (p. 350), or DDS_DomainParticipant_set_default_datawriter_qos_with_profile (p. 350), or else, if the call was never made, the default values listed in DDS_DataWriterQos (p. 1123).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataWriter QoS from a DomainPartipant while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_datawriter_qos** (p. 350).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) Qos to be filled up. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.78.4.12 DDS_ReturnCode_t DDS_DomainParticipant_set_default_datawriter_qos (DDS_DomainParticipant * self, const struct DDS_DataWriterQos * qos)

 $<<\!eXtension>>$ (p. 950) Set the default DataWriterQos values for this Domain Participant.

This set of default values will be inherited for a newly created **DDS_Publisher** (p. 632).

Precondition:

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a Domain-Participant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_datawriter_qos (p. 350) or DDS_DomainParticipant_get_default_datawriter_qos (p. 349).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) Default qos to be set. The special value DDS_-DATAWRITER_QOS_DEFAULT (p. 656) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if DDS_DomainParticipant_set_default_datawriter_qos (p. 350) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

4.78.4.13 DDS_ReturnCode_t DDS_DomainParticipant_set_default_datawriter_qos_with_profile
(DDS_DomainParticipant * self, const char *
library_name, const char * profile_name)

<<eXtension>> (p. 950) Set the default DDS_DataWriterQos (p. 1123) values for this domain participant based on the input XML QoS profile.

This set of default values will be inherited for a newly created **DDS_Publisher** (p. 632).

Precondition:

The DDS_DataWriterQos (p. 1123) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a Domain-Participant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_datawriter_qos (p. 350) or DDS_DomainParticipant_get_default_datawriter_qos (p. 349)

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<iin> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipant_set_default_profile (p. 360)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

4.78.4.14 DDS_ReturnCode_t DDS_DomainParticipant_get_- default_subscriber_qos (DDS_DomainParticipant * self, struct DDS_SubscriberQos * qos)

Copy the default **DDS_SubscriberQos** (p. 1407) values into the provided **DDS_SubscriberQos** (p. 1407) instance.

The retrieved qos will match the set of values specified on the last successful call to DDS_DomainParticipant_set_default_subscriber_qos (p. 352), or DDS_DomainParticipant_set_default_subscriber_qos_with_profile (p. 353), or else, if the call was never made, the default values listed in DDS_SubscriberQos (p. 1407).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

If DDS_SUBSCRIBER_QOS_DEFAULT (p. 407) is specified as the qos parameter when DDS_DomainParticipant_create_subscriber (p. 364) is called, the default value of the QoS set in the factory, equivalent to the value obtained by calling DDS_DomainParticipant_get_default_subscriber_qos (p. 351), will be used to create the DDS_Subscriber (p. 743).

MT Safety:

UNSAFE. It is not safe to retrieve the default Subscriber QoS from a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_subscriber_qos (p. 352).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
qos << inout>> (p. 951) Qos to be filled up. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_SUBSCRIBER_QOS_DEFAULT (p. 407)
DDS_DomainParticipant_create_subscriber (p. 364)
```

4.78.4.15 DDS_ReturnCode_t DDS_DomainParticipant_set_default_subscriber_qos (DDS_DomainParticipant * self, const struct DDS_SubscriberQos * qos)

Set the default $\mathbf{DDS_SubscriberQos}$ (p. 1407) values for this Domain{articipant.

This set of default values will be used for a newly created **DDS_Subscriber** (p. 743) if **DDS_SUBSCRIBER_QOS_DEFAULT** (p. 407) is specified as the qos parameter when **DDS_DomainParticipant_create_subscriber** (p. 364) is called.

Precondition:

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default Subscriber QoS for a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_subscriber_qos (p. 352),

DDS_DomainParticipant_get_default_subscriber_qos (p. 351) or calling DDS_DomainParticipant_create_subscriber (p. 364) with DDS_SUBSCRIBER_QOS_DEFAULT (p. 407) as the gos parameter.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) Default qos to be set. The special value DDS_-SUBSCRIBER_QOS_DEFAULT (p. 407) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if DDS_DomainParticipant_set_default_subscriber_qos (p. 352) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

4.78.4.16 DDS_ReturnCode_t DDS_DomainParticipant_set_default_subscriber_qos_with_profile
(DDS_DomainParticipant * self, const char *
library_name, const char * profile_name)

<< eXtension>> (p. 950) Set the default DDS_SubscriberQos (p. 1407) values for this DomainParticipant based on the input XML QoS profile.

This set of default values will be used for a newly created **DDS_Subscriber** (p. 743) if **DDS_SUBSCRIBER_QOS_DEFAULT** (p. 407) is specified as the qos parameter when **DDS_DomainParticipant_create_subscriber** (p. 364) is called.

Precondition:

The DDS_SubscriberQos (p. 1407) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default Subscriber QoS for a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_subscriber_qos (p. 352), DDS_DomainParticipant_get_default_subscriber_qos (p. 351) or calling DDS_DomainParticipant_create_subscriber (p. 364) with DDS_SUBSCRIBER_QOS_DEFAULT (p. 407) as the qos parameter.

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>> (p. 951) Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipant_set_default_profile (p. 360)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_**-**ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

```
DDS_SUBSCRIBER_QOS_DEFAULT (p. 407)
DDS_DomainParticipant_create_subscriber_with_profile (p. 365)
```

4.78.4.17 DDS_ReturnCode_t DDS_DomainParticipant_get_default_datareader_qos (DDS_DomainParticipant * self, struct DDS_DataReaderQos * qos)

<<eXtension>> (p. 950) Copy the default DDS_DataReaderQos (p. 1083) values into the provided DDS_DataReaderQos (p. 1083) instance.

The retrieved qos will match the set of values specified on the last successful call to DDS_DomainParticipant_set_default_datareader_qos (p. 355), or DDS_DomainParticipant_set_default_datareader_qos_with_profile (p. 356), or else, if the call was never made, the default values listed in DDS_DataReaderQos (p. 1083).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataReader QoS from a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_datareader_qos (p. 355).

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) Qos to be filled up. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

4.78.4.18 DDS_ReturnCode_t DDS_DomainParticipant_set_- default_datareader_qos (DDS_DomainParticipant * self, const struct DDS_DataReaderQos * qos)

<<eXtension>> (p. 950) Set the default DDS_DataReaderQos (p. 1083) values for this domain participant.

This set of default values will be inherited for a newly created $\mathbf{DDS_Subscriber}$ (p. 743).

Precondition:

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a Domain-Participant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_datareader_qos (p. 355) or DDS_DomainParticipant_get_default_datareader_qos (p. 354).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) Default qos to be set. The special value DDS_-DATAREADER_QOS_DEFAULT (p. 765) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if DDS_DomainParticipant_set_-default_datareader_qos (p. 355) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

4.78.4.19 DDS_ReturnCode_t DDS_DomainParticipant_set_default_datareader_qos_with_profile
(DDS_DomainParticipant * self, const char *
library_name, const char * profile_name)

<<eeXtension>> (p. 950) Set the default DDS_DataReaderQos (p. 1083) values for this DomainParticipant based on the input XML QoS profile.

This set of default values will be inherited for a newly created **DDS_Subscriber** (p. 743).

Precondition:

The DDS_DataReaderQos (p. 1083) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a Domain-Participant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_datareader_qos (p. 355) or DDS_DomainParticipant_get_default_datareader_qos (p. 354).

Parameters:

 $self \ll in >> (p. 951)$ Cannot be NULL.

library_name <<iin>> (p. 951) Library name containing the XML QoS
 profile. If library_name is null RTI Data Distribution Service will use
 the default library (see DDS_DomainParticipant_set_default_ library (p. 359)).

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipant_set_default_profile (p. 360)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

 $\begin{array}{lll} 4.78.4.20 & DDS_ReturnCode_t & DDS_DomainParticipant_get_-\\ & default_flowcontroller_property & (DDS_DomainParticipant\\ & * self, & struct & DDS_FlowControllerProperty_t * prop) \end{array}$

<< eXtension>> (p. 950) Copies the default DDS_-

FlowControllerProperty_t (p. 1220) values for this domain participant into the given DDS_FlowControllerProperty_t (p. 1220) instance.

The retrieved property will match the set of values specified on the last successful call to DDS_DomainParticipant_set_default_flowcontroller_property (p. 357), or else, if the call was never made, the default values listed in DDS_FlowControllerProperty_t (p. 1220).

MT Safety:

UNSAFE. It is not safe to retrieve the default flow controller properties from a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_flowcontroller_property (p. 357)

Parameters:

```
self << in>> (p. 951) Cannot be NULL. prop << in>> (p. 951) Default property to be retrieved. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
\begin{array}{l} \textbf{DDS\_FLOW\_CONTROLLER\_PROPERTY\_DEFAULT} \ (p.\,408) \\ \textbf{DDS\_DomainParticipant\_create\_flowcontroller} \ (p.\,384) \end{array}
```

4.78.4.21 DDS_ReturnCode_t DDS_DomainParticipant_set_default_flowcontroller_property (DDS_DomainParticipant * self, const struct DDS_FlowControllerProperty_t * prop)

<<e Xtension>> (p. 950) Set the default DDS_FlowControllerProperty_t (p. 1220) values for this domain participant.

This default value will be used for newly created **DDS_FlowController** (p. 726) if **DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 408) is specified as the property parameter when **DDS_-DomainParticipant_create_flowcontroller** (p. 384) is called.

Precondition:

The specified property values must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_-POLICY** (p. 122)

The special

MT Safety:

UNSAFE. It is not safe to set the default flow controller properties for a DomainParticipant while another thread may be simultaneously calling DDS_DomainParticipant_set_default_flowcontroller_property (p. 357) , DDS_DomainParticipant_get_default_flowcontroller_property (p. 356) or calling DDS_DomainParticipant_create_flowcontroller (p. 384) with DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 408) as the gos parameter.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. prop << in>> (p. 951) Default property to be set. value DDS_FLOW_CONTROLLER_PROPERT
```

value DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 408) may be passed as property to indicate that the default property should be reset to the default values the factory would use if DDS_DomainParticipant_set_default_flowcontroller_property (p. 357) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

 $\begin{array}{l} \textbf{DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT} \ (p.\,408) \\ \textbf{DDS_DomainParticipant_create_flowcontroller} \ (p.\,384) \end{array}$

4.78.4.22 const char* DDS_DomainParticipant_get_default_library (DDS_DomainParticipant * self)

<<eXtension>> (p. 950) Gets the default XML library associated with a DDS_DomainParticipant (p. 339).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The default library or null if the default library was not set.

See also:

DDS_DomainParticipant_set_default_library (p. 359)

4.78.4.23 const char* DDS_DomainParticipant_get_default_profile (DDS_DomainParticipant * self)

<<e xtension>> (p. 950) Gets the default XML profile associated with a DDS_DomainParticipant (p. 339).

Parameters:

$$self \ll in >> (p. 951)$$
 Cannot be NULL.

Returns:

The default profile or null if the default profile was not set.

See also:

DDS_DomainParticipant_set_default_profile (p. 360)

4.78.4.24 const char* DDS_DomainParticipant_get_- default_profile_library (DDS_DomainParticipant * self)

<<e xtension>> (p. 950) Gets the library where the default XML QoS profile is contained for a DDS_DomainParticipant (p. 339).

The default profile library is automatically set when **DDS_- DomainParticipant_set_default_profile** (p. 360) is called.

This library can be different than the **DDS_DomainParticipant** (p. 339) default library (see **DDS_DomainParticipant_get_default_library** (p. 358)).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

The default profile library or null if the default profile was not set.

See also:

DDS_DomainParticipant_set_default_profile (p. 360)

4.78.4.25 DDS_ReturnCode_t DDS_DomainParticipant_set_- default_library (DDS_DomainParticipant * self, const char * $library_name$)

<< eXtension>> (p. 950) Sets the default XML library for a DDS_-DomainParticipant (p. 339).

This function specifies the library that will be used as the default the next time a default library is needed during a call to one of this DomainParticipants operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the DDS_DomainParticipant (p. 339) inherits the default from the DDS_DomainParticipantFactory (p. 302) (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $library_name << in>> (p. 951)$ Library name. If library_name is null any previous default is unset.

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DomainParticipant_get_default_library (p. 358)

4.78.4.26 DDS_ReturnCode_t DDS_DomainParticipant_set_default_profile (DDS_DomainParticipant * self, const char * library_name, const char * profile_name)

<< eXtension>> (p. 950) Sets the default XML profile for a DDS_-DomainParticipant (p. 339).

This function specifies the profile that will be used as the default the next time a default DomainParticipant profile is needed during a call to one of this DomainParticipants operations. When calling a **DDS_DomainParticipant** (p. 339) function that requires a **profile_name** parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the DDS_DomainParticipant (p. 339) inherits the default from the DDS_DomainParticipantFactory (p. 302) (see DDS_DomainParticipantFactory_set_default_profile (p. 316)).

This function does not set the default QoS for entities created by the **DDS_-DomainParticipant** (p. 339); for this functionality, use the functions set_default_<entity>_qos_with_profile (you may pass in NULL after having called set_default_profile()).

This function does not set the default QoS for newly created DomainParticipants; for this functionality, use **DDS_DomainParticipantFactory_set_default_participant_qos_with_profile** (p. 307).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 library\_name << in>> (p. 951) The library name containing the profile. 
 profile\_name << in>> (p. 951) The profile name. If profile_name is null any previous default is unset.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DomainParticipant_get_default_profile (p. 359)
DDS_DomainParticipant_get_default_profile_library (p. 359)
```

4.78.4.27 DDS_Publisher* DDS_DomainParticipant_create_publisher (DDS_DomainParticipant * self, const struct DDS_PublisherQos * qos, const struct DDS_PublisherListener * listener, DDS_StatusMask mask)

Creates a **DDS_Publisher** (p. 632) with the desired QoS policies and attaches to it the specified **DDS_PublisherListener** (p. 1326).

Precondition:

The specified QoS policies must be consistent, or the operation will fail and no **DDS_Publisher** (p. 632) will be created.

if listener is specified, none of the listener callback functions can be NULL.

MT Safety:

UNSAFE. If **DDS_PUBLISHER_QOS_DEFAULT** (p. 406) is used for qos, it is not safe to create the publisher while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_publisher_qos** (p. 347).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) QoS to be used for creating the new DDS_Publisher (p. 632). The special value DDS_PUBLISHER_QOS_DEFAULT (p. 406) can be used to indicate that the DDS_Publisher (p. 632) should be created with the default DDS_PublisherQos (p. 1328) set in the DDS_DomainParticipant (p. 339). Cannot be NULL.

listener <<*in*>> (p. 951). Listener to be attached to the newly created DDS_Publisher (p. 632).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

newly created publisher object or NULL on failure.

See also:

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_PublisherQos (p. 1328) for rules on consistency among QoS

DDS_PUBLISHER_QOS_DEFAULT (p. 406)

DDS_DomainParticipant_create_publisher_with_profile (p. 362)

DDS_DomainParticipant_get_default_publisher_qos (p. 346)

DDS_Publisher_set_listener (p. 653)

Examples:

HelloWorld_publisher.c.

4.78.4.28 DDS_Publisher* DDS_DomainParticipant_create_publisher_with_profile (DDS_DomainParticipant * self,
const char * library_name, const char * profile_name,
const struct DDS_PublisherListener * listener,
DDS_StatusMask mask)

<<eXtension>> (p. 950) Creates a new DDS_Publisher (p. 632) object using the DDS_PublisherQos (p. 1328) associated with the input XML QoS profile.

Precondition:

The DDS_PublisherQos (p. 1328) in the input profile must be consistent, or the operation will fail and no DDS_Publisher (p. 632) will be created. if listener is specified, none of the listener callback functions can be NULL.

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipant_set_default_profile (p. 360)).

listener <<in>> (p. 951). Listener to be attached to the newly created DDS_Publisher (p. 632).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

newly created publisher object or NULL on failure.

See also:

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_PublisherQos (p. 1328) for rules on consistency among QoS

DDS_DomainParticipant_create_publisher (p. 361)

DDS_DomainParticipant_get_default_publisher_qos (p. 346)

DDS_Publisher_set_listener (p. 653)

4.78.4.29 DDS_ReturnCode_t DDS_DomainParticipant_delete_publisher (DDS_DomainParticipant * self, DDS_Publisher * p)

Deletes an existing **DDS_Publisher** (p. 632).

Precondition:

The DDS_Publisher (p. 632) must not have any attached DDS_DataWriter (p. 673) objects. If there are existing DDS_DataWriter (p. 673) objects, it will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

DDS_Publisher (p. 632) must have been created by this DDS_-

DDS_Publisher (p. 632) must have been created by this DDS_-DomainParticipant (p. 339), or else it will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

Postcondition:

Listener installed on the **DDS_Publisher** (p. 632) will not be called after this function completes successfully.

```
self << in>> (p. 951) Cannot be NULL.

p << in>> (p. 951) DDS_Publisher (p. 632) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

4.78.4.30 DDS_Subscriber* DDS_DomainParticipant_create_subscriber (DDS_DomainParticipant * self, const struct DDS_SubscriberQos * qos, const struct DDS_SubscriberListener * listener, DDS_StatusMask mask)

Creates a **DDS_Subscriber** (p. 743) with the desired QoS policies and attaches to it the specified **DDS_SubscriberListener** (p. 1405).

Precondition:

The specified QoS policies must be consistent, or the operation will fail and no **DDS_Subscriber** (p. 743) will be created.

if listener is specified, none of the listener callback functions can be NULL.

MT Safety:

UNSAFE. If **DDS_SUBSCRIBER_QOS_DEFAULT** (p. 407) is used for **qos**, it is not safe to create the subscriber while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_subscriber_qos** (p. 352).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) QoS to be used for creating the new DDS_Subscriber (p. 743). The special value DDS_SUBSCRIBER_QOS_DEFAULT (p. 407) can be used to indicate that the DDS_Subscriber (p. 743) should be created with the default DDS_SubscriberQos (p. 1407) set in the DDS_DomainParticipant (p. 339). Cannot be NULL.

listener <<*in>>* (p. *951*). Listener to be attached to the newly created DDS_Subscriber (p. 743).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

newly created subscriber object or NULL on failure.

See also:

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_SubscriberQos (p. 1407) for rules on consistency among QoS

DDS_SUBSCRIBER_QOS_DEFAULT (p. 407)

DDS_DomainParticipant_create_subscriber_with_profile (p. 365)

DDS_DomainParticipant_get_default_subscriber_qos (p. 351)

DDS_Subscriber_set_listener (p. 764)

Examples:

HelloWorld_subscriber.c.

4.78.4.31 DDS_Subscriber* DDS_DomainParticipant_create_subscriber_with_profile (DDS_DomainParticipant * self,
const char * library_name, const char * profile_name,
const struct DDS_SubscriberListener * listener,
DDS_StatusMask mask)

<<extension>> (p. 950) Creates a new DDS_Subscriber (p. 743) object using the DDS_PublisherQos (p. 1328) associated with the input XML QoS profile.

Precondition:

The **DDS_SubscriberQos** (p. 1407) in the input profile must be consistent, or the operation will fail and no **DDS_Subscriber** (p. 743) will be created.

if listener is specified, none of the listener callback functions can be NULL.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951) Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name is null RTI Data Distribution Service will use the default profile (see DDS_DomainParticipant_set_default_profile (p. 360)).

listener <<*in*>> (p. 951). Listener to be attached to the newly created DDS_Subscriber (p. 743).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

newly created subscriber object or NULL on failure.

See also:

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_SubscriberQos (p. 1407) for rules on consistency among QoS

DDS_DomainParticipant_create_subscriber (p. 364)

DDS_DomainParticipant_get_default_subscriber_qos (p. 351)

DDS_Subscriber_set_listener (p. 764)

4.78.4.32 DDS_ReturnCode_t DDS_DomainParticipant_delete_subscriber (DDS_DomainParticipant * self, DDS_Subscriber * s)

Deletes an existing **DDS_Subscriber** (p. 743).

Precondition:

The DDS_Subscriber (p. 743) must not have any attached DDS_DataReader (p. 783) objects. If there are existing DDS_DataReader (p. 783) objects, it will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121)

The DDS_Subscriber (p. 743) must have been created by this DDS_DomainParticipant (p. 339), or else it will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Postcondition:

A Listener installed on the **DDS_Subscriber** (p. 743) will not be called after this function completes successfully.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. s << in>> (p. 951) DDS_Subscriber (p. 743) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

4.78.4.33 DDS_DataWriter* DDS_DomainParticipant_create_-datawriter (DDS_DomainParticipant * self, DDS_Topic * topic, const struct DDS_DataWriterQos * qos, const struct DDS_DataWriterListener * listener, DDS_StatusMask mask)

<< eXtension>> (p. 950) Creates a DDS_DataWriter (p. 673) that will be attached and belong to the implicit DDS_Publisher (p. 632).

Precondition:

The given **DDS**_**Topic** (p. 425) must have been created from the same DomainParticipant as the implicit Publisher. If it was created from a different DomainParticipant, this function will fail.

The DDS_DataWriter (p. 673) created using this function will be associated with the implicit Publisher. This Publisher is automatically created (if it does not exist) using DDS_PUBLISHER_QOS_DEFAULT (p. 406) when the following functions are called: DDS_DomainParticipant_create_datawriter (p. 367), DDS_DomainParticipant_create_datawriter_with_profile (p. 368), or DDS_DomainParticipant_get_implicit_publisher (p. 388).

MT Safety:

UNSAFE. If **DDS_DATAWRITER_QOS_DEFAULT** (p. 656) is used for the **qos** parameter, it is not safe to create the DataWriter while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_datawriter_qos** (p. 350).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

topic <<iin>> (p. 951) The DDS_Topic (p. 425) that the DDS_DataWriter (p. 673) will be associated with. Cannot be NULL.

qos <<iin>> (p. 951) QoS to be used for creating the new DDS_DataWriter (p. 673). The special value DDS_DATAWRITER_QOS_DEFAULT (p. 656) can be used to indicate that the DDS_DataWriter (p. 673) should be created with the default DDS_DataWriterQos (p. 1123) set in the implicit DDS_Publisher (p. 632). The special value DDS_DATAWRITER_QOS_USE_TOPIC_QOS (p. 656) can be used to indicate that the DDS_DataWriter (p. 673) should be created with the combination of the default DDS_DataWriterQos (p. 1123) set on the DDS_Publisher (p. 632) and the DDS_TopicQos (p. 1443) of the DDS_Topic (p. 425). Cannot be NULL.

listener << in>> (p. 951) The listener of the **DDS_DataWriter** (p. 673).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A DDS_DataWriter (p. 673) of a derived class specific to the data type associated with the DDS_Topic (p. 425) or NULL if an error occurred.

See also:

FooDataWriter (p. 1496)

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_DataWriterQos (p. 1123) for rules on consistency among QoS

DDS_DATAWRITER_QOS_USE_TOPIC_QOS (p. 656)

DDS_DomainParticipant_create_datawriter_with_profile (p. 368)

DDS_DomainParticipant_get_default_datawriter_qos (p. 349)

DDS_DomainParticipant_get_implicit_publisher (p. 388)

DDS_Topic_set_qos (p. 438)

DDS_DataWriter_set_listener (p. 721)

4.78.4.34 DDS_DataWriter* DDS_DomainParticipant_create_datawriter_with_profile (DDS_DomainParticipant * self,
DDS_Topic * topic, const char * library_name, const char
* profile_name, const struct DDS_DataWriterListener *
listener, DDS_StatusMask mask)

<<e**x**tension>> (p. 950) Creates a **DDS_DataWriter** (p. 673) using a XML QoS profile that will be attached and belong to the implicit **DDS_Publisher** (p. 632).

Precondition:

The given **DDS_Topic** (p. 425) must have been created from the same DomainParticipant as the implicit Publisher. If it was created from a different DomainParticipant, this function will return NULL.

The DDS_DataWriter (p. 673) created using this function will be associated with the implicit Publisher. This Publisher is automatically created (if it does not exist) using DDS_PUBLISHER_QOS_DEFAULT (p. 406) when the following functions are called: DDS_DomainParticipant_create_datawriter (p. 367), DDS_DomainParticipant_create_datawriter_with_profile (p. 368), or DDS_DomainParticipant_get_implicit_publisher (p. 388)

```
self << in>> (p. 951) Cannot be NULL.
```

topic <<in>>> (p. 951) The DDS_Topic (p. 425) that the DDS_DataWriter (p. 673) will be associated with. Cannot be NULL.

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipant_set_default_profile (p. 360)).

listener <<*in*>> (p. 951) The listener of the **DDS_DataWriter** (p. 673).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A **DDS_DataWriter** (p. 673) of a derived class specific to the data type associated with the **DDS_Topic** (p. 425) or NULL if an error occurred.

See also:

FooDataWriter (p. 1496)

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_DataWriterQos (p. 1123) for rules on consistency among QoS

DDS_DomainParticipant_create_datawriter (p. 367)

DDS_DomainParticipant_get_default_datawriter_qos (p. 349)

DDS_DomainParticipant_get_implicit_publisher (p. 388)

DDS_Topic_set_qos (p. 438)

DDS_DataWriter_set_listener (p. 721)

4.78.4.35 DDS_ReturnCode_t DDS_DomainParticipant_delete_datawriter (DDS_DomainParticipant * self, DDS_DataWriter * a_datawriter)

<<e Xtension>> (p. 950) Deletes a DDS_DataWriter (p. 673) that belongs to the implicit DDS_Publisher (p. 632).

The deletion of the **DDS_DataWriter** (p. 673) will automatically unregister all instances. Depending on the settings of the **WRITER_DATA_LIFECYCLE** (p. 178) QosPolicy, the deletion of the **DDS_DataWriter** (p. 673) may also dispose all instances.

4.78.5 Special Instructions if Using Timestamp APIs and BY_SOURCE_TIMESTAMP Destination Ordering:

If the DataWriters **DDS_DestinationOrderQosPolicy::kind** (p. 1140) is **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 169), calls to delete_datawriter() may fail if your application has previously used the with timestamp APIs (write_w_timestamp(), register_instance_w_timestamp(), unregister_instance_w_timestamp(), or dispose_w_timestamp()) with a timestamp larger (later) than the time at which delete_datawriter() is called. To prevent delete_datawriter() from failing in this situation, either:

- ^ Change the WRITER_DATA_LIFECYCLE (p. 178) QosPolicy so that RTI Data Distribution Service will not autodispose unregistered instances (set DDS_WriterDataLifecycleQosPolicy::autodispose_unregistered_instances (p. 1492) to DDS_BOOLEAN_FALSE (p. 107).) or
- ^ Explicitly call unregister_instance_w_timestamp() for all instances modified with the *_w_timestamp() APIs before calling delete_datawriter().

Precondition:

If the DDS_DataWriter (p. 673) does not belong to the implicit DDS_Publisher (p. 632), the operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Postcondition:

Listener installed on the **DDS_DataWriter** (p. 673) will not be called after this function completes successfully.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. 
 a\_datawriter <<in>> (p. 951) The DDS_DataWriter (p. 673) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

See also:

DDS_DomainParticipant_get_implicit_publisher (p. 388)

4.78.5.1 DDS_DataReader* DDS_DomainParticipant_create_datareader (DDS_DomainParticipant *
self, DDS_TopicDescription * topic, const
struct DDS_DataReaderQos * qos, const struct
DDS_DataReaderListener * listener, DDS_StatusMask
mask)

<< eXtension>> (p. 950) Creates a DDS_DataReader (p. 783) that will be attached and belong to the implicit DDS_Subscriber (p. 743).

Precondition:

The given **DDS_TopicDescription** (p. 425) must have been created from the same DomainParticipant as the implicit Subscriber. If it was created from a different DomainParticipant, this function will return NULL.

The DDS_DataReader (p. 783) created using this function will be associated with the implicit Subscriber. This Subscriber is automatically created (if it does not exist) using DDS_SUBSCRIBER_QOS_DEFAULT (p. 407) when the following functions are called: DDS_DomainParticipant_create_datareader (p. 371), DDS_DomainParticipant_create_datareader_with_profile (p. 372), or DDS_DomainParticipant_get_implicit_subscriber (p. 389).

MT Safety:

UNSAFE. If **DDS_DATAREADER_QOS_DEFAULT** (p. 765) is used for the **qos** parameter, it is not safe to create the datareader while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_datareader_qos** (p. 355).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

topic <<in>> (p. 951) The DDS_TopicDescription (p. 425) that the DDS_DataReader (p. 783) will be associated with. Cannot be NULL.

qos <<in>>> (p. 951) The qos of the DDS_DataReader (p. 783). The special value DDS_DATAREADER_QOS_DEFAULT (p. 765) can be used to indicate that the DDS_DataReader (p. 783) should be created with the default DDS_DataReaderQos (p. 1083) set in the implicit DDS_Subscriber (p. 743). If DDS_TopicDescription (p. 425) is of type DDS_Topic (p. 425) or DDS_ContentFilteredTopic (p. 426), the special value DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 766) can be used to indicate that the DDS_DataReader (p. 783) should be created with

the combination of the default DDS_DataReaderQos (p. 1083) set on the implicit DDS_Subscriber (p. 743) and the DDS_TopicQos (p. 1443) (in the case of a DDS_ContentFilteredTopic (p. 426), the DDS_TopicQos (p. 1443) of the related DDS_Topic (p. 425)). if DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 766) is used, topic cannot be a DDS_MultiTopic (p. 430). Cannot be NULL.

listener << in>> (p. 951) The listener of the DDS_DataReader (p. 783).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A DDS_DataReader (p. 783) of a derived class specific to the data-type associated with the DDS_Topic (p. 425) or NULL if an error occurred.

See also:

FooDataReader (p. 1495)

4.78.5.2 DDS_DataReader* DDS_DomainParticipant_create_datareader_with_profile (DDS_DomainParticipant *
self, DDS_TopicDescription * topic, const char *
library_name, const char * profile_name, const struct
DDS_DataReaderListener * listener, DDS_StatusMask
mask)

<<e xtension>> (p. 950) Creates a DDS_DataReader (p. 783) using a XML QoS profile that will be attached and belong to the implicit DDS_-Subscriber (p. 743).

Precondition:

The given **DDS_TopicDescription** (p. 425) must have been created from the same DomainParticipant as the implicit subscriber. If it was created from a different DomainParticipant, this function will return NULL.

The DDS_DataReader (p. 783) created using this function will be associated with the implicit Subscriber. This Subscriber is automatically created (if it does not exist) using DDS_SUBSCRIBER_QOS_DEFAULT (p. 407) when the following functions are called: DDS_DomainParticipant_create_datareader (p. 371), DDS_DomainParticipant_create_datareader_with_profile (p. 372), or DDS_DomainParticipant_get_implicit_subscriber (p. 389)

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

topic <<in>> (p. 951) The DDS_TopicDescription (p. 425) that the DDS_DataReader (p. 783) will be associated with. Cannot be NULL.

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipant_set_default_profile (p. 360)).

listener << in>> (p. 951) The listener of the DDS_DataReader (p. 783).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A **DDS_DataReader** (p. 783) of a derived class specific to the data-type associated with the **DDS_Topic** (p. 425) or NULL if an error occurred.

See also:

```
FooDataReader (p. 1495)

DDS_DomainParticipant_get_default_datareader_qos (p. 354)

DDS_DomainParticipant_get_implicit_subscriber (p. 389)

DDS_Topic_set_qos (p. 438)

DDS_DataReader_set_listener (p. 838)

4.78.5.3 DDS_ReturnCode_t DDS_DomainParticipant_delete_datareader (DDS_DomainParticipant * self, DDS_DataReader * $a_datareader$)

<< eXtension>> (p. 950) Deletes a DDS_DataReader (p. 783) that belongs to the implicit DDS_Subscriber (p. 743).

Precondition:

If the DDS_DataReader (p. 783) does not belong to the implicit DDS_Subscriber (p. 743), or if ther are any existing DDS_ReadCondition (p. 842) or DDS_QueryCondition (p. 845) objects that are attached to the DDS_DataReader (p. 783), or if there are outstanding loans on samples (as a result of a call to read(), take(), or one of the variants thereof), the operation fails with the error DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Postcondition:

Listener installed on the **DDS_DataReader** (p. 783) will not be called after this function completes successfully.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. 
 a\_datareader <<in>> (p. 951) The DDS_DataReader (p. 783) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

See also:

 $\mathbf{DDS_DomainParticipant_get_implicit_subscriber} \ (\mathrm{p.}\ 389)$

4.78.5.4 DDS_Topic* DDS_DomainParticipant_create_topic (DDS_DomainParticipant * self, const char * $topic_name$, const char * $type_name$, const struct DDS_TopicQos * qos, const struct DDS_TopicListener * listener, DDS_StatusMask mask)

Creates a **DDS_Topic** (p. 425) with the desired QoS policies and attaches to it the specified **DDS_TopicListener** (p. 1441).

Precondition:

The application is not allowed to create two **DDS_Topic** (p. 425) objects with the same **topic_name** attached to the same **DDS_DomainParticipant** (p. 339). If the application attempts this, this function will fail and return a NULL topic.

The specified QoS policies must be consistent, or the operation will fail and no **DDS_Topic** (p. 425) will be created.

Prior to creating a **DDS_Topic** (p. 425), the type must have been registered with RTI Data Distribution Service. This is done using the **FooTypeSupport_register_type** (p. 457) operation on a derived class of the **DDS_TypeSupport** (p. 452) interface.

MT Safety:

UNSAFE. It is not safe to create a topic while another thread is trying to lookup that topic description with **DDS_DomainParticipant_lookup_topicdescription** (p. 386).

MT Safety:

UNSAFE. If **DDS_TOPIC_QOS_DEFAULT** (p. 406) is used for qos, it is not safe to create the topic while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_topic_qos** (p. 344).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $topic_name << in>> (p. 951)$ Name for the new topic, must not exceed 255 characters. Cannot be NULL.

 $type_name << in>> (p. 951)$ The type to which the new **DDS_Topic** (p. 425) will be bound. Cannot be NULL.

qos <<in>> (p. 951) QoS to be used for creating the new DDS_Topic (p. 425). The special value DDS_TOPIC_QOS_DEFAULT (p. 406) can be used to indicate that the DDS_Topic (p. 425) should be created with the default DDS_TopicQos (p. 1443) set in the DDS_DomainParticipant (p. 339). Cannot be NULL.

listener <<in>> (p. 951). Listener to be attached to the newly created **DDS_Topic** (p. 425).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

newly created topic, or NULL on failure

See also:

```
Specifying QoS on entities (p. 144) for information on setting QoS before entity creation
```

```
DDS_TopicQos (p. 1443) for rules on consistency among QoS

DDS_DomainParticipant_create_topic_with_profile (p. 376)

DDS_DomainParticipant_get_default_topic_gos (p. 343)

DDS_Topic_set_listener (p. 440)

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

4.78.5.5 DDS_Topic* DDS_DomainParticipant_create_topic_with_profile (DDS_DomainParticipant * self, const char
* topic_name, const char * type_name, const char *
library_name, const char * profile_name, const struct
DDS_TopicListener * listener, DDS_StatusMask mask)

<<e Xtension>> (p. 950) Creates a new DDS_Topic (p. 425) object using the DDS_PublisherQos (p. 1328) associated with the input XML QoS profile.

Precondition:

The application is not allowed to create two DDS_TopicDescription (p. 425) objects with the same topic_name attached to the same DDS_DomainParticipant (p. 339). If the application attempts this, this function will fail and return a NULL topic.

The **DDS_TopicQos** (p. 1443) in the input profile must be consistent, or the operation will fail and no **DDS_Topic** (p. 425) will be created.

Prior to creating a **DDS_Topic** (p. 425), the type must have been registered with RTI Data Distribution Service. This is done using the **FooTypeSupport_register_type** (p. 457) operation on a derived class of the **DDS_TypeSupport** (p. 452) interface.

MT Safety:

UNSAFE. It is not safe to create a topic while another thread is trying to lookup that topic description with **DDS_DomainParticipant_lookup_topicdescription** (p. 386).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

topic_name <<in>>> (p. 951) Name for the new topic, must not exceed 255 characters. Cannot be NULL.

 $type_name << in>> (p. 951)$ The type to which the new **DDS_Topic** (p. 425) will be bound. Cannot be NULL.

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipant_set_default_profile (p. 360)).

listener <<in>> (p. 951). Listener to be attached to the newly created DDS_Topic (p. 425).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

newly created topic, or NULL on failure

See also:

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_TopicQos (p. 1443) for rules on consistency among QoS

DDS_DomainParticipant_create_topic (p. 374)

DDS_DomainParticipant_get_default_topic_qos (p. 343)

DDS_Topic_set_listener (p. 440)

4.78.5.6 DDS_ReturnCode_t DDS_DomainParticipant_delete_topic (DDS_DomainParticipant * self, DDS_Topic * topic)

Deletes a **DDS_Topic** (p. 425).

Precondition:

If the DDS_Topic (p. 425) does not belong to the application's DDS_DomainParticipant (p. 339), this operation fails with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Make sure no objects are using the topic. More specifically, there must be no existing DDS_DataReader (p. 783), DDS_DataWriter (p. 673), DDS_ContentFilteredTopic (p. 426), or DDS_MultiTopic (p. 430) objects belonging to the same DDS_DomainParticipant (p. 339) that are using the DDS_Topic (p. 425). If delete_topic is called on a DDS_Topic (p. 425) with any of these existing objects attached to it, it will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Postcondition:

Listener installed on the \mathbf{DDS} - \mathbf{Topic} (p. 425) will not be called after this function completes successfully.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. topic << in>> (p. 951) DDS_Topic (p. 425) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121)

4.78.5.7 DDS_ContentFilteredTopic* DDS_DomainParticipant_create_contentfilteredtopic (DDS_DomainParticipant *
self, const char * name, DDS_Topic * related_topic, const
char * filter_expression, const struct DDS_StringSeq *
expression_parameters)

Creates a $\mathbf{DDS_ContentFilteredTopic}$ (p. 426), that can be used to do content-based subscriptions.

The DDS_ContentFilteredTopic (p. 426) only relates to samples published under that DDS_Topic (p. 425), filtered according to their content. The filtering is done by means of evaluating a logical expression that involves the values of some of the data-fields in the sample. The logical expression derived from the filter_expression and expression_parameters arguments.

Queries and Filters Syntax (p.957) describes the syntax of filter_-expression and expression_parameters.

Precondition:

The application is not allowed to create two **DDS_ContentFilteredTopic** (p. 426) objects with the same topic_name attached to the same **DDS_DomainParticipant** (p. 339). If the application attempts this, this function will fail and returns NULL.

If related_topic does not belong to this **DDS_DomainParticipant** (p. 339), this operation returns NULL.

This function will create a content filter using the builtin SQL filter which implements a superset of the DDS specification. This filter **requires** that all IDL types have been compiled with typecodes. If this precondition is not met, this operation returns NULL. Do not use rtiddsgen's -notypecode option if you want to use the builtin SQL filter.

```
self << in>> (p. 951) Cannot be NULL.
```

name << in>> (p. 951) Name for the new content filtered topic, must not exceed 255 characters. Cannot be NULL.

 $related_topic << in>> (p. 951)$ DDS_Topic (p. 425) to be filtered. Cannot be NULL.

 $filter_expression << in>> (p. 951)$ Cannot be NULL

expression_parameters <<in>>> (p. 951) Cannot be NULL.An empty sequence must be used if the filter expression does not contain any parameters. Length of sequence cannot be greater than 100.

Returns:

newly created **DDS_ContentFilteredTopic** (p. 426), or NULL on failure

4.78.5.8 DDS_ContentFilteredTopic* DDS_DomainParticipant_create_contentfilteredtopic_with_filter
(DDS_DomainParticipant * self, const char * name, const
DDS_Topic * related_topic, const char * filter_expression,
const struct DDS_StringSeq * expression_parameters,
const char * filter_name)

<< eXtension>> (p. 950) Creates a DDS_ContentFilteredTopic (p. 426) using the specified filter to do content-based subscriptions.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

name <<in>>> (p. 951) Name for the new content filtered topic. Cannot exceed 255 characters. Cannot be NULL.

 $related_topic << in>> (p. 951)$ DDS_Topic (p. 425) to be filtered. Cannot be NULL.

 $filter_expression << in>> (p. 951)$ Cannot be NULL.

expression_parameters <<in>> (p. 951) Cannot be NULL.. An empty sequence must be used if the filter expression does not contain any parameters. Length of the sequence cannot be greater than 100.

filter_name <<in>> (p. 951) Name of content filter to use. Must previously have been registered with DDS_-DomainParticipant_register_contentfilter (p. 380) on the same DDS_DomainParticipant (p. 339). Cannot be NULL.

Builtin filter names are DDS_SQLFILTER_NAME (p. 408) and DDS_-STRINGMATCHFILTER_NAME (p. 409)

Returns:

newly created **DDS_ContentFilteredTopic** (p. 426), or NULL on failure

4.78.5.9 DDS_ReturnCode_t DDS_DomainParticipant_delete_contentfilteredtopic (DDS_DomainParticipant * self, DDS_ContentFilteredTopic * $a_contentfilteredtopic$)

Deletes a DDS_ContentFilteredTopic (p. 426).

Precondition:

The deletion of a DDS_ContentFilteredTopic (p. 426) is not allowed if there are any existing DDS_DataReader (p. 783) objects that are using the DDS_ContentFilteredTopic (p. 426). If the operation is called on a DDS_ContentFilteredTopic (p. 426) with existing DDS_DataReader (p. 783) objects attached to it, it will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

The DDS_ContentFilteredTopic (p. 426) must be created by this DDS_DomainParticipant (p. 339), or else this operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. a\_content filtered topic <math><< in>> (p. 951)
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121)

4.78.5.10 DDS_ReturnCode_t DDS_DomainParticipant_register_contentfilter (DDS_DomainParticipant * self, const char * filter_name, const struct DDS_ContentFilter * contentfilter)

<<eXtension>> (p. 950) Register a content filter which can be used to create a DDS_ContentFilteredTopic (p. 426).

DDS specifies an SQL like content filter for use by content filtered topics. If this filter does not meet the filtering requirements a custom filter can be registered.

Each filter_name can only be used to registered a content filter once with a DDS_DomainParticipant (p. 339).

```
self \ll in >> (p. 951) Cannot be NULL.
```

filter_name <<in>> (p. 951) Name of the filter. The name must be unique within the DDS_DomainParticipant (p. 339) and must not exceed 255 characters. Cannot be NULL.

content filter << in>> (p. 951) Content filter to be registered. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DomainParticipant_unregister_contentfilter (p. 381)

4.78.5.11 void* DDS_DomainParticipant_lookup_contentfilter (DDS_DomainParticipant * self, const char * filter_name)

<<e xtension>> (p. 950) Lookup a content filter previously registered with DDS_DomainParticipant_register_contentfilter (p. 380).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. filter\_name << in>> (p. 951) Name of the filter. Cannot be NULL.
```

Returns:

NULL if the given filter_name has not been previously registered to the DDS_DomainParticipant (p. 339) with DDS_DomainParticipant_register_contentfilter (p. 380). Otherwise, return the filter_data that has been previously registered with the given filter_name.

See also:

DDS_DomainParticipant_register_contentfilter (p. 380)

4.78.5.12 DDS_ReturnCode_t DDS_DomainParticipant_unregister_contentfilter (DDS_DomainParticipant * self, const char * $filter_name$)

<< eXtension>> (p. 950) Unregister a content filter previously registered with DDS_DomainParticipant_register_contentfilter (p. 380).

A filter_name can be unregistered only if it has been previously registered to the DDS_DomainParticipant (p. 339) with DDS_DomainParticipant_register_contentfilter (p. 380).

The unregistration of filter is not allowed if there are any existing DDS_ContentFilteredTopic (p. 426) objects that are using the filter. If the operation is called on a filter with existing DDS_ContentFilteredTopic (p. 426) objects attached to it, this operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

If there are still existing discovered **DDS_DataReader** (p. 783) s with the same filter_name and the filter's compile method of the filter have previously been called on the discovered **DDS_DataReader** (p. 783) s, finalize method of the filter will be called on those discovered **DDS_DataReader** (p. 783) s before the content filter is unregistered. This means filtering will now be performed on the application that is creating the **DDS_DataReader** (p. 783).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. filter\_name << in>> (p. 951) Name of the filter. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121)

See also:

DDS_DomainParticipant_register_contentfilter (p. 380)

4.78.5.13 DDS_MultiTopic* DDS_DomainParticipant_create_multitopic (DDS_DomainParticipant * self, const
char * name, const char * type_name, const char *
subscription_expression, const struct DDS_StringSeq *
expression_parameters)

[Not supported (optional)] Creates a MultiTopic that can be used to subscribe to multiple topics and combine/filter the received data into a resulting type.

The resulting type is specified by the type_name argument. The list of topics and the logic used to combine, filter, and rearrange the information from each DDS_Topic (p. 425) are specified using the subscription_expression and expression_parameters arguments.

Queries and Filters Syntax (p. 957) describes the syntax of subscription—expression and expression_parameters.

Precondition:

The application is not allowed to create two DDS_TopicDescription (p. 425) objects with the same name attached to the same DDS_DomainParticipant (p. 339). If the application attempts this, this function will fail and return NULL.

Prior to creating a **DDS_MultiTopic** (p. 430), the type must have been registered with RTI Data Distribution Service. This is done using the **FooTypeSupport_register_type** (p. 457) operation on a derived class of the **DDS_TypeSupport** (p. 452) interface. Otherwise, this function will return NULL.

Parameters:

Returns:

NULL

4.78.5.14 DDS_ReturnCode_t DDS_DomainParticipant_delete_multitopic (DDS_DomainParticipant * self, DDS_MultiTopic * $a_{-}multitopic$)

[Not supported (optional)] Deletes a DDS_MultiTopic (p. 430).

Precondition:

The deletion of a DDS_MultiTopic (p. 430) is not allowed if there are any existing DDS_DataReader (p. 783) objects that are using the DDS_MultiTopic (p. 430). If the delete_multitopic operation is called on a DDS_MultiTopic (p. 430) with existing DDS_DataReader (p. 783) objects attached to it, it will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

The DDS_MultiTopic (p. 430) must be created by this DDS_DomainParticipant (p. 339), or else this operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $a_{-}multitopic << in>> (p. 951)$

Returns:

DDS_RETCODE_UNSUPPORTED (p. 121)

4.78.5.15 DDS_FlowController* DDS_DomainParticipant_create_flowcontroller (DDS_DomainParticipant * self, const char
* name, const struct DDS_FlowControllerProperty_t *
prop)

<<eXtension>> (p. 950) Creates a DDS_FlowController (p. 726) with the desired property.

The created DDS_FlowController (p. 726) is associated with a DDS_DataWriter (p. 673) via DDS_PublishModeQosPolicy::flow_controller_name (p. 1333). A single DDS_FlowController (p. 726) may service multiple DDS_DataWriter (p. 673) instances, even if they belong to a different DDS_Publisher (p. 632). The property determines how the DDS_FlowController (p. 726) shapes the network traffic.

Precondition:

The specified property must be consistent, or the operation will fail and no DDS_FlowController (p. 726) will be created.

MT Safety:

UNSAFE. If DDS_FLOW_CONTROLLER_PROPERTY_-DEFAULT (p. 408) is used for property, it is not safe to create the flow controller while another thread may be simultaneously calling DDS_DomainParticipant_set_default_flowcontroller_property (p. 357) or trying to lookup that flow controller with DDS_DomainParticipant_lookup_flowcontroller (p. 387).

Parameters:

self << in>> (p. 951) Cannot be NULL.

name <<iin>> (p. 951) name of the DDS_FlowController (p. 726) to create. A DDS_DataWriter (p. 673) is associated with a DDS_FlowController (p. 726) by name. Limited to 255 characters.

prop <<in>> (p. 951) property to be used for creating the new DDS_FlowController (p. 726). The special value DDS_FLOW_-CONTROLLER_PROPERTY_DEFAULT (p. 408) can be used to indicate that the DDS_FlowController (p. 726) should be created with the default DDS_FlowControllerProperty_t (p. 1220) set in the DDS_DomainParticipant (p. 339). Cannot be NULL.

Returns:

Newly created flow controller object or NULL on failure.

See also:

DDS_FlowControllerProperty_t (p. 1220) for rules on consistency among property

DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 408) DDS_DomainParticipant_get_default_flowcontroller_property (p. 356)

4.78.5.16 DDS_ReturnCode_t DDS_DomainParticipant_delete_flowcontroller (DDS_DomainParticipant * self, DDS_FlowController * fc)

<< eXtension>> (p. 950) Deletes an existing **DDS_FlowController** (p. 726).

Precondition:

The DDS_FlowController (p. 726) must not have any attached DDS_-DataWriter (p. 673) objects. If there are any attached DDS_-DataWriter (p. 673) objects, it will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

The DDS_FlowController (p. 726) must have been created by this DDS_DomainParticipant (p. 339), or else it will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Postcondition:

The **DDS_FlowController** (p. 726) is deleted if this function completes successfully.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. fc << in>> (p. 951) The DDS_FlowController (p. 726) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121). 4.78.5.17 DDS_Topic* DDS_DomainParticipant_find_topic (DDS_DomainParticipant * self, const char * topic_name, const struct DDS_Duration_t * timeout)

Finds an existing (or ready to exist) **DDS_Topic** (p. 425), based on its name.

This call can be used to block for a specified duration to wait for the **DDS**_-**Topic** (p. 425) to be created.

If the requested **DDS_Topic** (p. 425) already exists, it is returned. Otherwise, find_topic() waits until another thread creates it or else returns when the specified timeout occurs.

find_topic() is useful when multiple threads are concurrently creating and looking up topics. In that case, one thread can call find_topic() and, if another thread has not yet created the topic being looked up, it can wait for some period of time for it to do so. In almost all other cases, it is more straightforward to call **DDS_DomainParticipant_lookup_topicdescription** (p. 386).

The DDS_DomainParticipant (p. 339) must already be enabled.

Note: Each DDS_Topic (p. 425) obtained by DDS_DomainParticipant_find_topic (p. 386) must also be deleted by means of DDS_DomainParticipant_delete_topic (p. 377). If DDS_Topic (p. 425) is obtained multiple times by means of DDS_DomainParticipant_find_topic (p. 386) or DDS_DomainParticipant_create_topic (p. 374), it must also be deleted that same number of times using DDS_DomainParticipant_delete_topic (p. 377).

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
topic_name <<iin>> (p. 951) Name of the DDS_Topic (p. 425) to search for. Cannot be NULL.
timeout <<iin>> (p. 951) The time to wait if the DDS_Topic (p. 425) does not exist already. Cannot be NULL.
```

Returns:

the topic, if it exists, or NULL

4.78.5.18 DDS_TopicDescription* DDS_DomainParticipant_lookup_topicdescription (DDS_DomainParticipant * self, const char * topic_name)

Looks up an existing, locally created **DDS_TopicDescription** (p. 425), based on its name.

DDS_Topic Description (p. 425) is the base class for DDS_Topic (p. 425), DDS_MultiTopic (p. 430) and DDS_ContentFilteredTopic (p. 426). So you can narrow the DDS_TopicDescription (p. 425) returned from this operation to a DDS_Topic (p. 425) or DDS_ContentFilteredTopic (p. 426) as appropriate.

Unlike **DDS_DomainParticipant_find_topic** (p. 386), which logically returns a new **DDS_Topic** (p. 425) object that must be independently deleted, *this* operation returns a reference to the original local object.

The **DDS_DomainParticipant** (p. 339) does not have to be enabled when you call lookup_topicdescription().

The returned topic may be either enabled or disabled.

MT Safety:

UNSAFE. It is not safe to lookup a topic description while another thread is creating that topic.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. topic\_name << in>> (p. 951) Name of DDS_TopicDescription (p. 425) to search for. This string must be no more than 255 characters; it cannot be NULL.
```

Returns:

The topic description, if it has already been created locally, otherwise it returns NULL.

4.78.5.19 DDS_FlowController* DDS_DomainParticipant_lookup_flowcontroller (DDS_DomainParticipant * self, const char * name)

<< eXtension>> (p. 950) Looks up an existing locally-created DDS_-FlowController (p. 726), based on its name.

Looks up a previously created **DDS_FlowController** (p. 726), including the built-in ones. Once a **DDS_FlowController** (p. 726) has been deleted, subsequent lookups will fail.

MT Safety:

UNSAFE. It is not safe to lookup a flow controller description while another thread is creating that flow controller.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. name << in>> (p. 951) Name of DDS_FlowController (p. 726) to search for. Limited to 255 characters. Cannot be NULL.
```

Returns:

The flow controller if it has already been created locally, or NULL otherwise.

4.78.5.20 DDS_Subscriber* DDS_DomainParticipant_get_builtin_subscriber (DDS_DomainParticipant * self)

Accesses the built-in DDS_Subscriber (p. 743).

Each **DDS_DomainParticipant** (p. 339) contains several built-in **DDS_Topic** (p. 425) objects as well as corresponding **DDS_DataReader** (p. 783) objects to access them. All of these **DDS_DataReader** (p. 783) objects belong to a single built-in **DDS_Subscriber** (p. 743).

The built-in Topics are used to communicate information about other DDS_DomainParticipant (p. 339), DDS_Topic (p. 425), DDS_DataReader (p. 783), and DDS_DataWriter (p. 673) objects.

The built-in subscriber is created when this operation is called for the first time. The built-in subscriber is deleted automatically when the **DDS_-DomainParticipant** (p. 339) is deleted.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The built-in **DDS_Subscriber** (p. 743) singleton.

See also:

```
DDS_SubscriptionBuiltinTopicData (p. 1410)
DDS_PublicationBuiltinTopicData (p. 1313)
DDS_ParticipantBuiltinTopicData (p. 1289)
DDS_TopicBuiltinTopicData (p. 1433)
```

4.78.5.21 DDS_Publisher* DDS_DomainParticipant_get_implicit_publisher (DDS_DomainParticipant * self)

<< eXtension>> (p. 950) Returns the implicit DDS_Publisher (p. 632). If

an implicit Publisher does not already exist, this creates one.

There can only be one implicit Publisher per DomainParticipant.

The implicit Publisher is created with **DDS_PUBLISHER_QOS_DEFAULT** (p. 406) and no Listener.

This implicit Publisher will be deleted automatically when the following functions are called: **DDS_DomainParticipant_delete_contained_entities** (p. 394), or **DDS_DomainParticipant_delete_publisher** (p. 363) with the implicit publisher as a parameter. Additionally, when a DomainParticipant is deleted, if there are no attached DataWriters that belong to the implicit Publisher, the implicit Publisher will be implicitly deleted.

MT Safety:

UNSAFE. It is not safe to create an implicit Publisher while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_publisher_qos** (p. 347).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The implicit publisher

See also:

```
DDS_PUBLISHER_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_publisher (p. 361)
```

4.78.5.22 DDS_Subscriber* DDS_DomainParticipant_get_implicit_subscriber (DDS_DomainParticipant * self)

<<eXtension>> (p. 950) Returns the implicit DDS_Subscriber (p. 743). If an implicit Subscriber does not already exist, this creates one.

There can only be one implicit Subscriber per DomainParticipant.

The implicit Subscriber is created with DDS_SUBSCRIBER_QOS_-DEFAULT (p. 407) and no Listener.

This implicit Subscriber will be deleted automatically when the following functions are called: **DDS_DomainParticipant_delete_contained_entities** (p. 394), or **DDS_DomainParticipant_delete_subscriber** (p. 366) with the subscriber as a parameter. Additionally, when a DomainParticipant is deleted,

if there are no attached DataReaders that belong to the implicit Subscriber, the implicit Subscriber will be implicitly deleted.

MT Safety:

UNSAFE. it is not safe to create the implicit subscriber while another thread may be simultaneously calling **DDS_DomainParticipant_set_default_subscriber_qos** (p. 352).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

The implicit subscriber

See also:

```
DDS_PUBLISHER_QOS_DEFAULT (p. 406)
DDS_DomainParticipant_create_subscriber (p. 364)
```

4.78.5.23 DDS_ReturnCode_t DDS_DomainParticipant_ignore_participant (DDS_DomainParticipant * self, const DDS_InstanceHandle_t * handle)

Instructs RTI Data Distribution Service to locally ignore a remote **DDS**_**DomainParticipant** (p. 339).

From the time of this call onwards, RTI Data Distribution Service will locally behave as if the remote participant did not exist. This means it will ignore any topic, publication, or subscription that originates on that **DDS_-DomainParticipant** (p. 339).

There is no way to reverse this operation.

This operation can be used in conjunction with the discovery of remote participants offered by means of the **DDS_ParticipantBuiltinTopicData** (p. 1289) to provide access control.

Application data can be associated with a **DDS_DomainParticipant** (p. 339) by means of the **USER_DATA** (p. 150) policy. This application data is propagated as a field in the built-in topic and can be used by an application to implement its own access control policy.

The DDS_DomainParticipant (p. 339) to ignore is identified by the handle argument. This handle is the one that appears in the DDS_SampleInfo (p. 1384) retrieved when reading the data-samples available for the built-in

DDS_DataReader (p. 783) to the DDS_DomainParticipant (p. 339) topic. The built-in DDS_DataReader (p. 783) is read with the same Foo-DataReader_read (p. 788) and FooDataReader_take (p. 789) operations used for any DDS_DataReader (p. 783).

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
handle <<in>> (p. 951) DDS_InstanceHandle_t (p. 452) of the
DDS_DomainParticipant (p. 339) to be ignored. Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-OUT_OF_RESOURCES (p. 121), DDS_RETCODE_NOT_-ENABLED (p. 121)
```

See also:

```
DDS_ParticipantBuiltinTopicData (p. 1289)
DDS_PARTICIPANT_TOPIC_NAME (p. 22)
DDS_DomainParticipant_get_builtin_subscriber (p. 388)
```

4.78.5.24 DDS_ReturnCode_t DDS_DomainParticipant_- ignore_topic (DDS_DomainParticipant * self, const DDS_InstanceHandle_t * handle)

Instructs RTI Data Distribution Service to locally ignore a **DDS_Topic** (p. 425).

This means it will locally ignore any publication, or subscription to the **DDS**_**Topic** (p. 425).

There is no way to reverse this operation.

This operation can be used to save local resources when the application knows that it will never publish or subscribe to data under certain topics.

The DDS_Topic (p. 425) to ignore is identified by the handle argument. This is the handle of a DDS_Topic (p. 425) that appears in the DDS_SampleInfo (p. 1384) retrieved when reading data samples from the built-in DDS_DataReader (p. 783) for the DDS_Topic (p. 425).

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. 
 handle <<in>> (p. 951) Handle of the DDS_Topic (p. 425) to be ignored. Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-OUT_OF_RESOURCES (p. 121) or DDS_RETCODE_NOT_-ENABLED (p. 121)
```

See also:

```
DDS_TopicBuiltinTopicData (p. 1433)
DDS_TOPIC_TOPIC_NAME (p. 24)
DDS_DomainParticipant_get_builtin_subscriber (p. 388)
```

4.78.5.25 DDS_ReturnCode_t DDS_DomainParticipant_ignore_publication (DDS_DomainParticipant * self, const DDS_InstanceHandle_t * handle)

Instructs RTI Data Distribution Service to locally ignore a publication.

A publication is defined by the association of a topic name, user data, and partition set on the DDS_Publisher (p. 632) (see DDS_PublicationBuiltinTopicData (p. 1313)). After this call, any data written by that publication's DDS_DataWriter (p. 673) will be ignored.

This operation can be used to ignore local and remote DataWriters.

The publication (DataWriter) to ignore is identified by the handle argument.

- ^ To ignore a remote DataWriter, the handle can be obtained from the DDS_SampleInfo (p. 1384) retrieved when reading data samples from the built-in DDS_DataReader (p. 783) for the publication topic.
- ^ To ignore a *local* DataWriter, the handle can be obtained by calling DDS_Entity_get_instance_handle (p. 248) for the local DataWriter.

There is no way to reverse this operation.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 handle << in>> (p. 951) Handle of the DDS_DataWriter (p. 673) to be ignored. Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-OUT_OF_RESOURCES (p. 121) or DDS_RETCODE_NOT_-ENABLED (p. 121)
```

See also:

```
DDS_PublicationBuiltinTopicData (p. 1313)
DDS_PUBLICATION_TOPIC_NAME (p. 26)
DDS_DomainParticipant_get_builtin_subscriber (p. 388)
```

4.78.5.26 DDS_ReturnCode_t DDS_DomainParticipant_ignore_subscription (DDS_DomainParticipant * self, const DDS_InstanceHandle_t * handle)

Instructs RTI Data Distribution Service to locally ignore a subscription.

A subscription is defined by the association of a topic name, user data, and partition set on the DDS_Subscriber (p. 743) (see DDS_SubscriptionBuiltinTopicData (p. 1410)). After this call, any data received related to that subscription's DDS_DataReader (p. 783) will be ignored.

This operation can be used to ignore local and remote DataReaders.

The subscription to ignore is identified by the handle argument.

- ^ To ignore a remote DataReader, the handle can be obtained from the DDS_SampleInfo (p. 1384) retrieved when reading data samples from the built-in DDS_DataReader (p. 783) for the subscription topic.
- ^ To ignore a *local* DataReader, the handle can be obtained by calling DDS_Entity_get_instance_handle (p. 248) for the local DataReader.

There is no way to reverse this operation.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.

handle <<in>> (p. 951) Handle of the DDS_DataReader (p. 783) to be ignored. Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_OUT_OF_RESOURCES (p. 121) or DDS_RETCODE_NOT_ENABLED (p. 121)
```

See also:

```
DDS_SubscriptionBuiltinTopicData (p. 1410)
DDS_SUBSCRIPTION_TOPIC_NAME (p. 28)
DDS_DomainParticipant_get_builtin_subscriber (p. 388)
```

4.78.5.27 DDS_DomainId_t DDS_DomainParticipant_get_domain_id (DDS_DomainParticipant * self)

Get the unique domain identifier.

This operation retrieves the domain_id used to create the DDS_DomainParticipant (p. 339). The domain_id identifies the DDS domain to which the DDS_DomainParticipant (p. 339) belongs. Each DDS domain represents a separate data 'communication plane' isolated from other domains.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

the unique domainId that was used to create the domain

See also:

$$\label{eq:decomposition} \begin{split} DDS_DomainParticipantFactory_create_participant \ (p. 309) \\ DDS_DomainParticipantFactory_create_participant_with_profile \\ (p. 310) \end{split}$$

4.78.5.28 DDS_ReturnCode_t DDS_DomainParticipant_- delete_contained_entities (DDS_DomainParticipant * self)

Delete all the entities that were created by means of the "create" operations on the **DDS_DomainParticipant** (p. 339).

This operation deletes all contained **DDS_Publisher** (p. 632) (including an implicit Publisher, if one exists), **DDS_Subscriber** (p. 743) (including implicit subscriber), **DDS_Topic** (p. 425), **DDS_ContentFilteredTopic** (p. 426), and **DDS_MultiTopic** (p. 430) objects.

Prior to deleting each contained entity, this operation will recursively call the corresponding delete_contained_entities operation on each contained entity (if applicable). This pattern is applied recursively. In this manner the operation delete_contained_entities() on the DDS_DomainParticipant (p. 339) will end up deleting all the entities recursively contained in the DDS_DomainParticipant (p. 339), that is also the DDS_DataWriter (p. 673), DDS_DataReader (p. 783), as well as the DDS_QueryCondition (p. 845) and DDS_ReadCondition (p. 842) objects belonging to the contained DDS_DataReader (p. 783).

The operation will fail with DDS_RETCODE_PRECONDITION_NOT_-MET (p. 121) if any of the contained entities is in a state where it cannot be deleted.

If delete_contained_entities() completes successfully, the application may delete the **DDS_DomainParticipant** (p. 339) knowing that it has no contained entities.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

4.78.5.29 DDS_ReturnCode_t DDS_DomainParticipant_assert_liveliness (DDS_DomainParticipant * self)

Manually asserts the liveliness of this DDS_DomainParticipant (p. 339).

This is used in combination with the **DDS_LivelinessQosPolicy** (p. 1254) to indicate to RTI Data Distribution Service that the entity remains active.

You need to use this operation if the DDS_DomainParticipant (p. 339) conatins DDS_DataWriter (p. 673) entities with the DDS_LivelinessQosPolicy::kind (p. 1257) set to DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS (p. 163) and it only affects the liveliness of those DDS_DataWriter (p. 673) entities. Otherwise, it has no effect.

Note: writing data via the FooDataWriter_write (p. 684) or FooDataWriter_write_w_timestamp (p. 686) operation asserts liveliness on the DDS_DataWriter (p. 673) itself and its DDS_DomainParticipant (p. 339). Consequently the use of assert_liveliness() is only needed if the application is not writing data regularly.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-NOT_ENABLED (p. 121)

See also:

DDS_LivelinessQosPolicy (p. 1254)

4.78.5.30 DDS_ReturnCode_t DDS_DomainParticipant_get_publishers (DDS_DomainParticipant * self, struct DDS_PublisherSeq * publishers)

<<eXtension>> (p. 950) Allows the application to access all the publishers the participant has.

If the sequence doesn't own its buffer, and its maximum is less than the total number of publishers, it will be filled up to its maximum, and fail with **DDS_-RETCODE_OUT_OF_RESOURCES** (p. 121).

MT Safety:

Safe.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 publishers << inout>> (p. 951) a PublisherSeq object where the set or list of publishers will be returned
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

4.78.5.31 DDS_ReturnCode_t DDS_DomainParticipant_get_subscribers (DDS_DomainParticipant * self, struct DDS_SubscriberSeq * subscribers)

<<eXtension>> (p. 950) Allows the application to access all the subscribers the participant has.

If the sequence doesn't own its buffer, and its maximum is less than the total number of subscribers, it will be filled up to its maximum, and fail with **DDS_-RETCODE_OUT_OF_RESOURCES** (p. 121).

MT Safety:

Safe.

Parameters:

 $self \ll in >> (p. 951)$ Cannot be NULL.

subscribers <<inout>> (p. 951) a SubscriberSeq object where the set or list of subscribers will be returned

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

4.78.5.32 DDS_ReturnCode_t DDS_DomainParticipant_get_current_time (DDS_DomainParticipant * self, struct DDS_Time_t * current_time)

Returns the current value of the time.

The current value of the time that RTI Data Distribution Service uses to time-stamp **DDS_DataWriter** (p. 673) and to set the reception-timestamp for the data updates that it receives.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. current\_time << inout>> (p. 951) Current time to be filled up. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

4.78.5.33 DDS_Boolean DDS_DomainParticipant_contains_entity (DDS_DomainParticipant * self, const DDS_InstanceHandle_t * a_handle)

Completes successfully with **DDS_BOOLEAN_TRUE** (p. 106) if the referenced **DDS_Entity** (p. 242) is contained by the **DDS_DomainParticipant** (p. 339).

This operation checks whether or not the given a_handle represents an DDS_Entity (p. 242) that was created from the DDS_DomainParticipant (p. 339). The containment applies recursively. That is, it applies both to entities (DDS_TopicDescription (p. 425), DDS_Publisher (p. 632), or DDS_Subscriber (p. 743)) created directly using the DDS_DomainParticipant (p. 339) as well as entities created using a contained DDS_Publisher (p. 632), or DDS_Subscriber (p. 743) as the factory, and so forth.

The instance handle for an **DDS_Entity** (p. 242) may be obtained from built-in topic data, from various statuses, or from the operation **DDS_Entity_get_-instance_handle** (p. 248).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 a\_handle << in>> (p. 951) DDS_InstanceHandle_t (p. 452) of the DDS_Entity (p. 242) to be checked.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) if DDS_Entity (p. 242) is contained by the DDS_DomainParticipant (p. 339), or DDS_BOOLEAN_FALSE (p. 107) otherwise.

4.78.5.34 DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_participants (DDS_DomainParticipant * self, struct DDS_InstanceHandleSeq * participant_handles)

Returns list of discovered **DDS_DomainParticipant** (p. 339) s.

This operation retrieves the list of **DDS_DomainParticipant** (p. 339) s that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **DDS_DomainParticipant_ignore_participant** (p. 390) operation.

Parameters:

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_NOT_ENABLED (p. 121)

4.78.5.35 DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_participant_data (DDS_DomainParticipant
* self, struct DDS_ParticipantBuiltinTopicData
* participant_data, const DDS_InstanceHandle_t *
participant_handle)

Returns $DDS_ParticipantBuiltinTopicData$ (p. 1289) for the specified $DDS_DomainParticipant$ (p. 339).

This operation retrieves information on a **DDS_DomainParticipant** (p. 339) that has been discovered on the network. The participant must be in the same

domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **DDS_DomainParticipant_ignore_- participant** (p. 390) operation.

The participant_handle must correspond to such a DomainParticipant. Otherwise, the operation will fail with PRECONDITION_NOT_MET.

Use the operation DDS_DomainParticipant_get_discovered_participants (p. 398) to find the DDS_DomainParticipant (p. 339) s that are currently discovered.

Note: This operation does not retrieve the DDS_{-} ParticipantBuiltinTopicData::property (p. 1290). This informa-DDS_DataReaderListener::on_data_available through available() (p. 1067) (if a reader listener is installed on the DDS_-ParticipantBuiltinTopicDataDataReader (p. 22)).

Parameters:

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_NOT_-ENABLED (p. 121)

See also:

```
DDS_ParticipantBuiltinTopicData (p. 1289)
DDS_DomainParticipant_get_discovered_participants (p. 398)
```

4.78.5.36 DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_topics (DDS_DomainParticipant * self, struct DDS_InstanceHandleSeq * topic_handles)

Returns list of discovered **DDS_Topic** (p. 425) objects.

This operation retrieves the list of **DDS_Topic** (p. 425) s that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **DDS_DomainParticipant_ignore_topic** (p. 391) operation.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 topic\_handles << inout>> (p. 951) DDS_InstanceHandleSeq (p. 1235) to be filled with handles of the discovered DDS_Topic (p. 425) objects
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-NOT_ENABLED (p. 121)

4.78.5.37 DDS_ReturnCode_t DDS_DomainParticipant_get_discovered_topic_data (DDS_DomainParticipant * self, struct DDS_TopicBuiltinTopicData * topic_data, const DDS_InstanceHandle_t * topic_handle)

Returns **DDS_TopicBuiltinTopicData** (p. 1433) for the specified **DDS_Topic** (p. 425).

This operation retrieves information on a **DDS_Topic** (p. 425) that has been discovered on the network. The topic must have been created by a participant in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **DDS_DomainParticipant_-ignore_topic** (p. 391) operation.

The topic_handle must correspond to such a topic. Otherwise, the operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

This call is not supported for remote topics. If a remote topic_handle is used, the operation will fail with DDS_RETCODE_UNSUPPORTED (p. 121).

Use the operation **DDS_DomainParticipant_get_discovered_topics** (p. 399) to find the topics that are currently discovered.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. \\ topic\_data <<inout>> (p. 951) DDS\_TopicBuiltinTopicData \\ (p. 1433) to be filled with the specified DDS\_Topic (p. 425)'s data. \\ topic\_handle <<in>> (p. 951) DDS\_InstanceHandle\_t (p. 452) of DDS\_Topic (p. 425).
```

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_NOT_-ENABLED (p. 121)

See also:

```
DDS_TopicBuiltinTopicData (p. 1433)
DDS_DomainParticipant_get_discovered_topics (p. 399)
```

4.78.5.38 DDS_ReturnCode_t DDS_DomainParticipant_add_peer (DDS_DomainParticipant * self, const char * peer_desc_string)

<<eXtension>> (p. 950) Attempt to contact one or more additional peer participants.

Add the given peer description to the list of peers with which this DDS_-DomainParticipant (p. 339) will try to communicate.

This function may be called at any time after this DDS_DomainParticipant (p. 339) has been created, before or after it has been enabled. If it is called after DDS_Entity_enable (p. 245), an attempt will be made to contact the new peer(s) immediately. If it is called before, the peer description will simply be added to the list that was populated by DDS_DiscoveryQosPolicy::initial_peers (p. 1150); the first attempted contact will take place after this DDS_DomainParticipant (p. 339) is enabled.

Adding a peer description with this function does not guarantee that any peer(s) discovered as a result will exactly correspond to those described:

- ^ This **DDS_DomainParticipant** (p. 339) will attempt to discover peer participants at the given locations but may not succeed if no such participants are available. Such a situation will not result in an error result from this function, which will not wait for contact attempt(s) to be made.
- If remote participants such as are described by the given peer description are discovered, the distributed application is configured with asymmetric peer lists, and DDS_DiscoveryQosPolicy::accept_unknown_peers (p. 1152) is set to DDS_BOOLEAN_TRUE (p. 106), this DDS_DomainParticipant (p. 339) may actually discover more peers than are described in the given peer description.

To be informed of the exact remote participants that are discovered, regardless of which peers this **DDS_DomainParticipant** (p. 339) attempts to discover, use the built-in participant topic: **DDS_PARTICIPANT_TOPIC_NAME** (p. 22).

Note that there is no "remove peer" operation. To cease communications with a peer **DDS_DomainParticipant** (p. 339) that has been discovered, use **DDS_DomainParticipant_ignore_participant** (p. 390).

Adding a peer description with this function has no effect on the DDS_DiscoveryQosPolicy::initial_peers (p. 1150) that may be subsequently retrieved with DDS_DomainParticipant_get_qos() (p. 404) (because DDS_DiscoveryQosPolicy (p. 1149) is immutable).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. peer\_desc\_string << in>> (p. 951) New peer descriptor to be added. The format is specified in Peer Descriptor Format (p. 190). Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
Peer Descriptor Format (p. 190)

DDS_DiscoveryQosPolicy::initial_peers (p. 1150)

DDS_PARTICIPANT_TOPIC_NAME (p. 22)

DDS_DomainParticipant_get_builtin_subscriber (p. 388)
```

4.78.5.39 DDS_ReturnCode_t DDS_DomainParticipant_set_qos (DDS_DomainParticipant * self, const struct DDS_DomainParticipantQos * qos)

Change the QoS of this domain participant.

The DDS_DomainParticipantQos::user_data (p. 1159) and DDS_DomainParticipantQos::entity_factory (p. 1159) can be changed. The other policies are immutable.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) Set of policies to be applied to DDS_DomainParticipant (p. 339). Policies must be consistent. Immutable policies cannot be changed after DDS_DomainParticipant (p. 339) is enabled. The special value DDS_PARTICIPANT_QOS_DEFAULT (p. 325) can be used to indicate that the QoS of the DDS_DomainParticipant (p. 339) should be changed to match the current default DDS_DomainParticipantQos (p. 1157) set in the DDS_DomainParticipantFactory (p. 302). Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 122) if policies are inconsistent

See also:

```
DDS_DomainParticipantQos (p. 1157) for rules on consistency among QoS set_qos (abstract) (p. 243)
```

4.78.5.40 DDS_ReturnCode_t DDS_DomainParticipant_set_qos_with_profile (DDS_DomainParticipant * self, const char * library_name, const char * profile_name)

<<eXtension>> (p. 950) Change the QoS of this domain participant using the input XML QoS profile.

The DDS_DomainParticipantQos::user_data (p. 1159) and DDS_DomainParticipantQos::entity_factory (p. 1159) can be changed. The other policies are immutable.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipantFactory_set_default_library (p. 316)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_DomainParticipantFactory_set_default_profile (p. 316)).

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 122) if policies are inconsistent

See also:

DDS_DomainParticipantQos (p. 1157) for rules on consistency among QoS

4.78.5.41 DDS_ReturnCode_t DDS_DomainParticipant_get_qos (DDS_DomainParticipant * self, struct DDS_DomainParticipantQos * qos)

Get the participant QoS.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) QoS to be filled up. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
get_qos (abstract) (p. 244)
```

4.78.5.42 DDS_ReturnCode_t DDS_DomainParticipant_set_listener (DDS_DomainParticipant * self, const struct DDS_DomainParticipantListener * l, DDS_StatusMask mask)

Sets the participant listener.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. l << in>> (p. 951) Listener to be installed on entity.
```

mask <<in>> (p. 951) Changes of communication status to be invoked on the listener. The callback function on the listener cannot be NULL if the corresponding status is turned on in the mask.

MT Safety:

Unsafe. This function is not synchronized with the listener callbacks, so it is possible to set a new listener on a participant when the old listener is in a callback.

Once a participant has been enabled, it is therefore important that the listener not be changed unless some application-specific means are available of

ensuring that the old listener cannot be concurrently in use. If this contract is violated, it is possible for the **DDS_Listener::listener_data** (p. 1249) field to have been changed without the callback function pointers having been changed (or vica versa); callback functions may therefore be passed an incorrect **DDS_-Listener::listener_data** (p. 1249) value.

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
set_listener (abstract) (p. 244)
```

4.78.5.43 struct DDS_DomainParticipantListener DDS_DomainParticipant_get_listener (DDS_DomainParticipant * self) [read]

Get the participant listener.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

Existing listener attached to the **DDS_DomainParticipant** (p. 339).

See also:

```
DDS_DomainParticipant_get_listenerX (p. 405) get_listener (abstract) (p. 245)
```

4.78.5.44 DDS_ReturnCode_t DDS_DomainParticipant_get_listenerX (DDS_DomainParticipant * self, struct DDS_DomainParticipantListener * listener)

<< eXtension>> (p. 950) Get the participant listener.

An alternative form of **DDS_DomainParticipant_get_listener** (p. 405) that fills in an existing listener structure rather than returning one on the stack.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $\it listener << \it inout>> (p. 951)$ Listener structure to be filled up. Cannnot be NULL.

See also:

```
DDS_DomainParticipant_get_listener (p. 405) get_listener (abstract) (p. 245)
```

4.78.6 Variable Documentation

4.78.6.1 struct DDS_TopicQos DDS_TOPIC_QOS_DEFAULT

Special value for creating a **DDS_Topic** (p. 425) with default QoS.

When used in **DDS_DomainParticipant_create_topic** (p. 374), this special value is used to indicate that the **DDS_Topic** (p. 425) should be created with the default **DDS_Topic** (p. 425) QoS by means of the operation get_default_topic_qos and using the resulting QoS to create the **DDS_Topic** (p. 425).

When used in **DDS_DomainParticipant_set_default_topic_qos** (p. 344), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDS_DomainParticipant_set_default_topic_qos** (p. 344) operation had never been called.

When used in **DDS_Topic_set_qos** (p. 438), this special value is used to indicate that the QoS of the **DDS_Topic** (p. 425) should be changed to match the current default QoS set in the **DDS_DomainParticipant** (p. 339) that the **DDS_Topic** (p. 425) belongs to.

See also:

```
DDS_DomainParticipant_create_topic (p. 374)
DDS_DomainParticipant_set_default_topic_qos (p. 344)
DDS_Topic_set_qos (p. 438)
```

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

Special value for creating a **DDS_Publisher** (p. 632) with default QoS.

When used in **DDS_DomainParticipant_create_publisher** (p. 361), this special value is used to indicate that the **DDS_Publisher** (p. 632) should be

created with the default **DDS_Publisher** (p. 632) QoS by means of the operation get_default_publisher_qos and using the resulting QoS to create the **DDS_Publisher** (p. 632).

When used in **DDS_DomainParticipant_set_default_publisher_qos** (p. 347), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDS_DomainParticipant_set_default_publisher_qos** (p. 347) operation had never been called.

When used in **DDS_Publisher_set_qos** (p. 650), this special value is used to indicate that the QoS of the **DDS_Publisher** (p. 632) should be changed to match the current default QoS set in the **DDS_DomainParticipant** (p. 339) that the **DDS_Publisher** (p. 632) belongs to.

See also:

```
DDS_DomainParticipant_create_publisher (p. 361)
DDS_DomainParticipant_set_default_publisher_qos (p. 347)
DDS_Publisher_set_qos (p. 650)
```

Examples:

 $HelloWorld_publisher.c.$

4.78.6.3 struct DDS_SubscriberQos DDS_SUBSCRIBER_QOS_-DEFAULT

Special value for creating a DDS_Subscriber (p. 743) with default QoS.

When used in **DDS_DomainParticipant_create_subscriber** (p. 364), this special value is used to indicate that the **DDS_Subscriber** (p. 743) should be created with the default **DDS_Subscriber** (p. 743) QoS by means of the operation get_default_subscriber_qos and using the resulting QoS to create the **DDS_Subscriber** (p. 743).

When used in **DDS_DomainParticipant_set_default_subscriber_qos** (p. 352), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDS_DomainParticipant_set_default_subscriber_qos** (p. 352) operation had never been called.

When used in **DDS_Subscriber_set_qos** (p. 759), this special value is used to indicate that the QoS of the **DDS_Subscriber** (p. 743) should be changed to match the current default QoS set in the **DDS_DomainParticipant** (p. 339) that the **DDS_Subscriber** (p. 743) belongs to.

Examples:

HelloWorld_subscriber.c.

4.78.6.4 struct DDS_FlowControllerProperty_t DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT

<< eXtension>> (p. 950) Special value for creating a DDS_FlowController (p. 726) with default property.

When used in DDS_DomainParticipant_create_flowcontroller (p. 384), this special value is used to indicate that the DDS_FlowController (p. 726) should be created with the default DDS_FlowController (p. 726) property by means of the operation get_default_flowcontroller_property and using the resulting QoS to create the DDS_FlowControllerProperty_t (p. 1220).

When used in DDS_DomainParticipant_set_default_flowcontroller_property (p. 357), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the DDS_DomainParticipant_set_default_flowcontroller_property (p. 357) operation had never been called.

When used in DDS_FlowController_set_property (p. 729), this special value is used to indicate that the property of the DDS_FlowController (p. 726) should be changed to match the current default property set in the DDS_DomainParticipant (p. 339) that the DDS_FlowController (p. 726) belongs to.

DDS_DomainParticipant_set_default_flowcontroller_property (p. 357)
DDS_FlowController_set_property (p. 729)
```

4.78.6.5 const char* const DDS_SQLFILTER_NAME

<<eXtension>> (p. 950) The name of the built-in SQL filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.

See also:

Queries and Filters Syntax (p. 957)

${\bf 4.78.6.6} \quad {\bf const~char*~const~DDS_STRINGMATCHFILTER_NAME}$

 $<<\!eXtension>>$ (p. 950) The name of the built-in StringMatch filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.

The StringMatch Filter is a subset of the SQL filter; it only supports the MATCH relational operator on a single string field.

See also:

Queries and Filters Syntax (p. 957)

4.79 Built-in Topics

Built-in objects created by RTI Data Distribution Service but accessible to the application.

Modules

^ Participant Built-in Topics

 $Built in \ topic \ for \ accessing \ information \ about \ the \ Domain Participants \ discovered \ by \ RTI \ Data \ Distribution \ Service.$

^ Topic Built-in Topics

Builtin topic for accessing information about the Topics discovered by RTI Data Distribution Service.

^ Publication Built-in Topics

 $Builtin\ topic\ for\ accessing\ information\ about\ the\ Publications\ discovered\ by\ RTI\ Data\ Distribution\ Service.$

^ Subscription Built-in Topics

Builtin topic for accessing information about the Subscriptions discovered by RTI Data Distribution Service.

Data Structures

^ struct DDS_Locator_t

<<e**Xtension**>> (p. 950) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

^ struct DDS_LocatorSeq

 $Declares\ IDL\ sequence < DDS_Locator_t\ (p.\ 1258) > .$

^ struct DDS_ProtocolVersion_t

<<e**Xtension**>> (p. 950) Type used to represent the version of the RTPS protocol.

^ struct DDS_VendorId_t

<<e**Xtension**>> (p. 950) Type used to represent the vendor of the service implementing the RTPS protocol.

`struct DDS_ProductVersion_t

<<extension>> (p. 950) Type used to represent the current version of RTI Data Distribution Service.

^ struct DDS_BuiltinTopicKey_t

The key type of the built-in topic types.

^ struct DDS_ContentFilterProperty_t

<<extension>> (p. 950) Type used to provide all the required information to enable content filtering.

Defines

* #define DDS_LOCATOR_ADDRESS_LENGTH_MAX 16

Declares length of address field in locator.

^ #define DDS_PROTOCOLVERSION_1_0 { 1, 0 }

The protocol version 1.0.

^ #define DDS_PROTOCOLVERSION_1_1 { 1, 1 }

The protocol version 1.1.

^ #define DDS_PROTOCOLVERSION_1_2 { 1, 2 }

The protocol version 1.2.

* #define DDS_PROTOCOLVERSION_2_0 { 2, 0 }

The protocol version 2.0.

 $^{\circ}$ #define DDS_PROTOCOLVERSION_2_1 { 2, 1 }

The protocol version 2.1.

^ #define **DDS_PROTOCOLVERSION** { 2, 1 }

The most recent protocol version. Currently 1.2.

^ #define DDS_VENDOR_ID_LENGTH_MAX 2

Length of vendor id.

* #define DDS_PRODUCTVERSION_UNKNOWN { 0, 0, '0', 0 }

The value used when the product version is unknown.

Variables

- ^ struct DDS_Locator_t DDS_LOCATOR_INVALID
 - An invalid locator.
- ^ const DDS_Long DDS_LOCATOR_KIND_INVALID

Locator of this kind is invalid.

- ^ const DDS_UnsignedLong DDS_LOCATOR_PORT_INVALID

 An invalid port.
- ^ const **DDS_Octet DDS_LOCATOR_ADDRESS_INVALID** [DDS_-LOCATOR_ADDRESS_LENGTH_MAX]

An invalid address.

- ^ const DDS_Long DDS_LOCATOR_KIND_UDPv4
 - A locator for a UDPv4 address.
- ^ const DDS_Long DDS_LOCATOR_KIND_SHMEM

A locator for an address acessed via shared memory.

const DDS_Long DDS_LOCATOR_KIND_UDPv6

A locator for a UDPv6 address.

` const DDS_Long DDS_LOCATOR_KIND_RESERVED

Locator of this kind is reserved.

4.79.1 Detailed Description

Built-in objects created by RTI Data Distribution Service but accessible to the application.

RTI Data Distribution Service must discover and keep track of the remote entities, such as new participants in the domain. This information may also be important to the application, which may want to react to this discovery, or else access it on demand.

A set of built-in topics and corresponding **DDS_DataReader** (p. 783) objects are introduced to be used by the application to access these discovery information.

The information can be accessed as if it was normal application data. This allows the application to know when there are any changes in those values by means of the **DDS_Listener** (p. 1246) or the **DDS_Condition** (p. 252) mechanisms.

The built-in data-readers all belong to a built-in DDS_Subscriber (p. 743), which can be retrieved by using the function DDS_DomainParticipant_get_builtin_subscriber (p. 388). The built-in DDS_DataReader (p. 783) objects can be retrieved by using the operation DDS_Subscriber_lookup_datareader (p. 754), with the topic name as a parameter.

Built-in entities have default listener settings as well. The built-in **DDS_-Subscriber** (p. 743) and all of its built-in topics have 'nil' listeners with all statuses appearing in their listener masks (acting as a NO-OP listener that does not reset communication status). The built-in DataReaders have null listeners with no statuses in their masks.

The information that is accessible about the remote entities by means of the built-in topics includes all the QoS policies that apply to the corresponding remote Entity. This QoS policies appear as normal 'data' fields inside the data read by means of the built-in Topic. Additional information is provided to identify the Entity and facilitate the application logic.

The built-in **DDS_DataReader** (p. 783) will not provide data pertaining to entities created from the same **DDS_DomainParticipant** (p. 339) under the assumption that such entities are already known to the application that created them.

Refer to DDS_ParticipantBuiltinTopicData (p. 1289), DDS_TopicBuiltinTopicData (p. 1433), DDS_SubscriptionBuiltinTopicData (p. 1410) and DDS_PublicationBuiltinTopicData (p. 1313) for a description of all the built-in topics and their contents.

The QoS of the built-in **DDS_Subscriber** (p. 743) and **DDS_DataReader** (p. 783) objects is given by the following table:

4.79.2 Define Documentation

4.79.2.1 #define DDS_LOCATOR_ADDRESS_LENGTH_MAX 16

Declares length of address field in locator.

4.79.2.2 #define DDS_PROTOCOLVERSION_1_0 { 1, 0 }

The protocol version 1.0.

4.79.2.3 #define DDS_PROTOCOLVERSION_1_1 { 1, 1 }

The protocol version 1.1.

4.79.2.4 #define DDS_PROTOCOLVERSION_1_2 { 1, 2 }

The protocol version 1.2.

4.79.2.5 #define DDS_PROTOCOLVERSION_2_0 { 2, 0 }

The protocol version 2.0.

4.79.2.6 #define DDS_PROTOCOLVERSION_2_1 $\{ 2, 1 \}$

The protocol version 2.1.

4.79.2.7 #define DDS_PROTOCOLVERSION { 2, 1 }

The most recent protocol version. Currently 1.2.

4.79.2.8 #define DDS_VENDOR_ID_LENGTH_MAX 2

Length of vendor id.

4.79.2.9 #define DDS_PRODUCTVERSION_UNKNOWN { 0, 0, '0', 0 }

The value used when the product version is unknown.

4.79.3 Variable Documentation

4.79.3.1 struct DDS_Locator_t DDS_LOCATOR_INVALID

An invalid locator.

4.79.3.2 const DDS_Long DDS_LOCATOR_KIND_INVALID

Locator of this kind is invalid.

An invalid port.

4.79.3.4 const DDS_Octet DDS_LOCATOR_ADDRESS_INVALID[DDS_LOCATOR_ADDRESS_LENGTH_MAX]

An invalid address.

$4.79.3.5 \quad const\ DDS_Long\ DDS_LOCATOR_KIND_UDPv4$

A locator for a UDPv4 address.

4.79.3.6 const DDS_Long DDS_LOCATOR_KIND_SHMEM

A locator for an address acessed via shared memory.

4.79.3.7 const DDS_Long DDS_LOCATOR_KIND_UDPv6

A locator for a UDPv6 address.

4.79.3.8 const DDS_Long DDS_LOCATOR_KIND_RESERVED

Locator of this kind is reserved.

4.80 Topic Module

Contains the DDS_Topic (p. 425), DDS_ContentFilteredTopic (p. 426), and DDS_MultiTopic (p. 430) classes, the DDS_TopicListener (p. 1441) interface, and more generally, all that is needed by an application to define DDS_Topic (p. 425) objects and attach QoS policies to them.

Modules

^ DDS-Specific Primitive Types

Basic DDS value types for use in user data types.

^ Topics

DDS_Topic (p. 425) entity and associated elements

^ User Data Type Support

Defines generic classes and macros to support user data types.

^ Type Code Support

<<eXtension>> (p. 950) A DDS_TypeCode (p. 1463) is a mechanism for representing a type at runtime. RTI Data Distribution Service can use type codes to send type definitions on the network. You will need to understand this API in order to use the **Dynamic Data** (p. 519) capability or to inspect the type information you receive from remote readers and writers.

^ Built-in Types

<<eXtension>> (p. 950) RTI Data Distribution Service provides a set of very simple data types for you to use with the topics in your application.

^ Dynamic Data

<<extension>> (p. 950) The Dynamic Data API provides a way to interact with arbitrarily complex data types at runtime without the need for code generation.

4.80.1 Detailed Description

Contains the DDS_Topic (p. 425), DDS_ContentFilteredTopic (p. 426), and DDS_MultiTopic (p. 430) classes, the DDS_TopicListener (p. 1441) interface, and more generally, all that is needed by an application to define DDS_Topic (p. 425) objects and attach QoS policies to them.

4.81 Topics

DDS_Topic (p. 425) entity and associated elements

Data Structures

- * struct DDS_InconsistentTopicStatus

 *DDS_INCONSISTENT_TOPIC_STATUS (p. 128)
- * struct DDS_TopicQos

QoS policies supported by a **DDS_Topic** (p. 425) entity.

```
struct DDS_TopicListener

<<interface>> (p. 950) DDS_Listener (p. 1246) for DDS_Topic
(p. 425) entities.
```

^ struct DDS_ContentFilter

```
<<interface>> (p. 950) Interface to be used by a custom filter of a DDS_--ContentFilteredTopic (p. 426)
```

Defines

^ #define DDS_InconsistentTopicStatus_INITIALIZER

Initializer for new status instances.

* #define DDS_TopicQos_INITIALIZER

Initializer for new QoS instances.

 $\hat{\ }$ #define $\mathbf{DDS_TopicListener_INITIALIZER}$

Initializer for new DDS_TopicListener (p. 1441).

*#define DDS_ContentFilter_INITIALIZER

Initializer for new DDS_ContentFilter (p. 1054).

Typedefs

* typedef struct DDS_TopicDescriptionImpl DDS_TopicDescription <<iinterface>> (p. 950) Base class for DDS_Topic (p. 425), DDS_-ContentFilteredTopic (p. 426), and DDS_MultiTopic (p. 430).

- ^ typedef struct DDS_TopicWrapperI **DDS_Topic**
 - <<iinterface>> (p. 950) The most basic description of the data to be published and subscribed.
- ^ typedef void(* DDS_TopicListener_InconsistentTopicCallback
)(void *listener_data, DDS_Topic *topic, const struct DDS_InconsistentTopicStatus *status)

Prototype of DDS_TopicListener::on_inconsistent_topic (p. 1442).

<<iinterface>> (p. 950) Specialization of DDS_TopicDescription (p. 425) that allows for content-based subscriptions.

Prototype of DDS_ContentFilter::compile (p. 1055).

^ typedef DDS_Boolean(* DDS_ContentFilterEvaluateFunction
)(void *filter_data, void *compile_data, const void *sample)

Prototype of DDS_ContentFilter::evaluate (p. 1055).

^ typedef void(* DDS_ContentFilterFinalizeFunction)(void *filter_data, void *compile_data)

Prototype of DDS_ContentFilter::finalize (p. 1056).

^ typedef struct DDS_MultiTopicImpl **DDS_MultiTopic**

[Not supported (optional)] <<iinterface>> (p. 950) A specialization of DDS_TopicDescription (p. 425) that allows subscriptions that combine/filter/rearrange data coming from several topics.

Functions

Initializer for new status instances.

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_TopicQos_initialize (struct DDS_-TopicQos *self)

Initializer for new QoS instances.

^ DDS_ReturnCode_t DDS_TopicQos_copy (struct DDS_TopicQos *self, const struct DDS_TopicQos *source)

Copy the contents of the given QoS into this QoS.

^ DDS_ReturnCode_t DDS_TopicQos_finalize (struct DDS_-TopicQos *self)

Free any dynamic memory allocated by the policies in this DDS_TopicQos (p. 1443).

^ const char * DDS_TopicDescription_get_type_name (DDS_TopicDescription *self)

 $Get\ the\ associated\ {\tt type_name}.$

^ const char * DDS_TopicDescription_get_name (DDS_-TopicDescription *self)

Get the name used to create this DDS_TopicDescription (p. 425).

^ DDS_DomainParticipant * DDS_TopicDescription_get_participant (DDS_TopicDescription *self)

Get the DDS_DomainParticipant (p. 339) to which the DDS_TopicDescription (p. 425) belongs.

^ DDS_Entity * DDS_Topic_as_entity (DDS_Topic *topic)

Access a DDS_Topic (p. 425)'s DDS_Entity (p. 242) supertype instance.

^ DDS_TopicDescription * DDS_Topic_as_topicdescription (DDS_-Topic *topic)

Access a DDS_Topic (p. 425)'s $DDS_TopicDescription$ (p. 425) supertype instance.

DDS_Topic * DDS_Topic_narrow (DDS_TopicDescription *self)

Narrow the given DDS_TopicDescription (p. 425) pointer to a DDS_Topic (p. 425) pointer.

^ DDS_Topic * DDS_Topic_narrow_from_entity (DDS_Entity *self)

Narrow the given DDS_Entity (p. 242) pointer to a DDS_Topic (p. 425) pointer.

^ DDS_ReturnCode_t DDS_Topic_get_inconsistent_topic_status (DDS_Topic *self, struct DDS_InconsistentTopicStatus *status)

Allows the application to retrieve the DDS_INCONSISTENT_TOPIC_-STATUS (p. 128) status of a DDS_Topic (p. 425).

^ DDS_ReturnCode_t DDS_Topic_set_qos (DDS_Topic *self, const struct DDS_TopicQos *qos)

Set the topic QoS.

^ DDS_ReturnCode_t DDS_Topic_set_qos_with_profile (DDS_Topic *self, const char *library_name, const char *profile_name)

 $<<\!\!eXtension>>$ (p. 950) Change the QoS of this topic using the input XML QoS profile.

DDS_ReturnCode_t DDS_Topic_get_qos (DDS_Topic *self, struct DDS_TopicQos *qos)

Get the topic QoS.

^ DDS_ReturnCode_t DDS_Topic_set_listener (DDS_Topic *self, const struct DDS_TopicListener *l, DDS_StatusMask mask)

Set the topic listener.

 $\begin{array}{ll} {\color{red} \mathbf{\hat{P}}} & \mathbf{Struct} & \mathbf{DDS_Topic_Listener} & \mathbf{DDS_Topic_get_listener} & \mathbf{(DDS_Topic} \\ & *\mathbf{self}) \end{array}$

Get the topic listener.

DDS_ReturnCode_t DDS_Topic_get_listenerX (DDS_Topic *self, struct DDS_TopicListener *listener)

<<eXtension>> (p. 950) Get the topic listener.

^ DDS_TopicDescription * DDS_ContentFilteredTopic_as_topicdescription * (DDS_ContentFilteredTopic *contentFilteredTopic)

Access a DDS_ContentFilteredTopic (p. 426)'s supertype instance.

^ DDS_ContentFilteredTopic * DDS_ContentFilteredTopic_narrow (DDS_TopicDescription *self)

Narrow the given DDS_TopicDescription (p. 425) pointer to a DDS_ContentFilteredTopic (p. 426) pointer.

^ const_char * DDS_ContentFilteredTopic_get_filter_expression (DDS_ContentFilteredTopic *self)

 $Get\ the\ {\tt filter_expression}.$

 $Get\ the\ {\tt expression_parameters}.$

^ DDS_ReturnCode_t DDS_ContentFilteredTopic_set_expression_parameters (DDS_ContentFilteredTopic *self, const struct DDS_-StringSeq *parameters)

 $Set\ the\ {\tt expression_parameters}.$

<<e**Xtension**>> (p. 950) Appends a string term to the specified parameter string.

^ DDS_ReturnCode_t DDS_ContentFilteredTopic_remove_from_expression_parameter (DDS_ContentFilteredTopic *self, const DDS_Long index, const char *val)

<<e**xtension**>> (p. 950) Removes a string term from the specified parameter string.

^ DDS_Topic * DDS_ContentFilteredTopic_get_related_topic (DDS_ContentFilteredTopic *self)

 $Get\ the\ {\tt related_topic}.$

^ DDS_TopicDescription * DDS_MultiTopic_as_topicdescription (DDS_MultiTopic *multiTopic)

Access a DDS_MultiTopic (p. 430)'s supertype instance.

^ DDS_MultiTopic * DDS_MultiTopic_narrow (DDS_-TopicDescription *self)

Narrow the given DDS_TopicDescription (p. 425) pointer to a DDS_MultiTopic (p. 430) pointer.

^ const char * DDS_MultiTopic_get_subscription_expression (DDS_MultiTopic *self)

Get the expression for this DDS_MultiTopic (p. 430).

DDS_ReturnCode_t DDS_MultiTopic_get_expression_-parameters (DDS_MultiTopic *self, struct DDS_StringSeq *parameters)

Get the expression parameters.

DDS_ReturnCode_t DDS_MultiTopic_set_expression_parameters
(DDS_MultiTopic *self, const struct DDS_StringSeq *parameters)

 $Set\ the\ {\tt expression_parameters}.$

4.81.1 Detailed Description

DDS_Topic (p. 425) entity and associated elements

4.81.2 Define Documentation

4.81.2.1 #define DDS_InconsistentTopicStatus_INITIALIZER

Initializer for new status instances.

New **DDS_InconsistentTopicStatus** (p. 1233) instances that are stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_InconsistentTopicStatus_finalize** (p. 433) should be called to free the contained fields that use dynamic memory:

```
struct DDS_InconsistentTopicStatus myStatus = DDS_InconsistentTopicStatus_INITIALIZER;
DDS_Topic_get_inconsistent_topic(myTopic, &myStatus);
DDS_InconsistentTopicStatus_finalize(&myStatus);
```

See also:

DDS_InconsistentTopicStatus_initialize (p. 432)

DDS_Topic_get_inconsistent_topic_status (p. 438)

DDS_InconsistentTopicStatus_finalize (p. 433)

4.81.2.2 #define DDS_TopicQos_INITIALIZER

Initializer for new QoS instances.

New **DDS_TopicQos** (p. 1443) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures

that those contained QoS policies that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a new QoS structure is to initialize it on the stack at the time of its creation:

```
struct DDS_TopicQos myQos = DDS_TopicQos_INITIALIZER;
```

Note that the above assignment is not a substitute for calling DDS_DomainParticipant_get_default_topic_qos (p. 343) or DDS_Topic_get_qos (p. 440); one of those should be called subsequently to setting the QoS of a new or existing entity. DDS_TopicQos_finalize (p. 435) should be called to free the contained QoS policies that use dynamic memory:

```
struct DDS_TopicQos myQos = DDS_TopicQos_INITIALIZER;
DDS_DomainParticipant_get_default_topic_qos(myParticipant, &myQos);
DDS_Topic_set_qos(myTopic, &myQos);
DDS_TopicQos_finalize(&myQos);
```

See also:

```
DDS_DomainParticipant_get_default_topic_qos (p. 343)
DDS_TopicQos_finalize (p. 435)
```

4.81.2.3 #define DDS_TopicListener_INITIALIZER

Initializer for new **DDS_TopicListener** (p. 1441).

All the new **DDS_TopicListener** (p. 1441) instances allocated in the stack should be initialized to this value. No memory is allocated.

```
struct DDS_TopicListener listener = DDS_TopicListener_INITIALIZER;
/* initialize listener functions */
listener.on_inconsistent_topic = ....;
DDS_Topic_set_listener(myTopic, &listener, mask);
```

See also:

```
DDS_Topic_set_listener (p. 440)
DDS_TopicListener (p. 1441)
```

4.81.2.4 #define DDS_ContentFilter_INITIALIZER

Initializer for new **DDS_ContentFilter** (p. 1054).

All the new **DDS_ContentFilter** (p. 1054) instances allocated in the stack should be initialized to this value. No memory is allocated.

See also:

```
\label{eq:decomposition} \begin{split} \mathbf{DDS\_ContentFilter} & \text{ (p. } \underline{1054}) \\ \mathbf{DDS\_DomainParticipant\_create\_contentfilteredtopic\_with\_filter} \\ & \text{ (p. } \underline{379}) \end{split}
```

4.81.3 Typedef Documentation

4.81.3.1 typedef struct DDS_TopicDescriptionImpl DDS_TopicDescription

<<iinterface>> (p. 950) Base class for DDS_Topic (p. 425), DDS_ContentFilteredTopic (p. 426), and DDS_MultiTopic (p. 430).

DDS_TopicDescription (p. 425) represents the fact that both publications and subscriptions are tied to a single data-type. Its attribute type_name defines a unique resulting type for the publication or the subscription and therefore creates an implicit association with a DDS_TypeSupport (p. 452).

DDS_TopicDescription (p. 425) has also a name that allows it to be retrieved locally.

See also:

```
DDS_TypeSupport (p. 452), FooTypeSupport (p. 1499)
```

4.81.3.2 typedef struct DDS_TopicWrapperI DDS_Topic

<< interface>> (p. 950) The most basic description of the data to be published and subscribed.

QoS:

```
DDS_TopicQos (p. 1443)
```

Status:

```
 \begin{array}{lll} \textbf{DDS\_INCONSISTENT\_TOPIC\_STATUS} & (p.~128), & \textbf{DDS\_InconsistentTopicStatus} & (p.~1233) \end{array}
```

Listener:

```
DDS_TopicListener (p. 1441)
```

A DDS_Topic (p. 425) is identified by its name, which must be unique in the whole domain. In addition (by virtue of extending DDS_TopicDescription

(p. 425)) it fully specifies the type of the data that can be communicated when publishing or subscribing to the **DDS_Topic** (p. 425).

DDS_Topic (p. 425) is the only **DDS_TopicDescription** (p. 425) that can be used for publications and therefore associated with a **DDS_DataWriter** (p. 673).

The following operations may be called even if the **DDS_Topic** (p. 425) is not enabled. Other operations will fail with the value **DDS_RETCODE_NOT_-ENABLED** (p. 121) if called on a disabled **DDS_Topic** (p. 425):

- All the base-class operations set_qos(), set_qos_with_profile(), get_qos(), set_listener(), get_listener() enable(), get_statuscondition() and get_status_changes()
- ^ get_inconsistent_topic_status()

See also:

Operations Allowed in Listener Callbacks (p. 1248)

4.81.3.3 typedef void(* DDS_TopicListener_InconsistentTopicCallback)(void *listener_data, DDS_Topic *topic, const struct DDS_InconsistentTopicStatus *status)

Prototype of **DDS_TopicListener::on_inconsistent_topic** (p. 1442).

Parameters:

 $listener_data <<\!out>>$ (p. 951) Data associated with the listener when the listener is set

 $topic <<\!\!out\!\!>> (p.\,951)$ Locally created DDS_Topic (p. 425) that triggers the listener callback

status <<out>> (p. 951) Current inconsistent status of the locally created DDS_Topic (p. 425)

4.81.3.4 typedef struct DDS_ContentFilteredTopicWrapperI DDS_ContentFilteredTopic

 $<<\!\!interface\!\!>> (p.\,950)$ Specialization of DDS_TopicDescription (p. 425) that allows for content-based subscriptions.

It describes a more sophisticated subscription that indicates a **DDS_-DataReader** (p. 783) does not want to necessarily see all values of each instance published under the **DDS_Topic** (p. 425). Rather, it wants to see only

the values whose contents satisfy certain criteria. This class therefore can be used to request content-based subscriptions.

The selection of the content is done using the filter_expression with parameters expression_parameters.

- ^ The filter_expression attribute is a string that specifies the criteria to select the data samples of interest. It is similar to the WHERE part of an SQL clause.
- ^ The expression_parameters attribute is a sequence of strings that give values to the 'parameters' (i.e. "%n" tokens) in the filter_expression. The number of supplied parameters must fit with the requested values in the filter_expression (i.e. the number of n tokens).

Queries and Filters Syntax (p.957) describes the syntax of filter_expression and expression_parameters.

Note on Content-Based Filtering and Sparse Value Types

If you are a user of the **Dynamic Data** (p. 519) API, you may define *sparse value types*; that is, types for which every data sample need not include a value for every field defined in the type. (See **DDS_TK_SPARSE** (p. 477) and **DDS_TypeCodeFactory_create_sparse_tc** (p. 509).) In order for a filter expression on a field to be well defined, that field must be present in the data sample. That means that you will only be able to perform a content-based filter on fields that are marked as **DDS_TYPECODE_KEY_MEMBER** (p. 474) or **DDS_TYPECODE_NONKEY_REQUIRED_MEMBER** (p. 475).

4.81.3.5 typedef DDS_ReturnCode_t(* DDS_ContentFilterCompileFunction)(void *filter_data, void **new_compile_data, const char *expression, const struct DDS_StringSeq *parameters, const struct DDS_TypeCode *type_code, const char *type_class_name, void *old_compile_data)

Prototype of **DDS_ContentFilter::compile** (p. 1055).

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

This function is called when an instance of the locally registered content filter is created or when the expression parameter for the locally registered content filter instance is changed.

An instance of the locally registered content filter is created every time a local **DDS_ContentFilteredTopic** (p. 426) with the matching filter name is cre-

ated, or when a **DDS_DataReader** (p. 783) with a matching filter name is discovered.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters:

- filter_data <<in>> (p. 951) The opaque pointer the content filter was registered with in DDS_DomainParticipant_register_contentfilter (p. 380). Can be NULL. When a custom filter is registered, it is registered with a filter_data. This filter_data is user defined, e.g., it could be a reference to a program context. This is useful if the content filter functions are registered with different filter names. E.g, each filter name could have its own context and the DDS_ContentFilter::compile (p. 1055) function can access this context.
- new_compile_data <<out>> (p. 951) User specified opaque pointer
 of this instance of the content filter. This value is then
 passed to the DDS_ContentFilter::evaluate (p. 1055) and DDS_ContentFilter::finalize (p. 1056) functions for this instance of the
 content filter. Can be set to NULL.
- expression <<in>> (p. 951) An ASCIIZ string with the filter expression. The memory used by this string is owned by RTI Data Distribution Service and must not be freed. If you want to manipulate this string, you must first make a copy of it.
- parameters <<in>> (p. 951) A string sequence with the expression parameters the DDS_ContentFilteredTopic (p. 426) was created with. The string sequence is equal (but not identical) to the string sequence passed to DDS_DomainParticipant_create_contentfilteredtopic (p. 378). Note that the sequence passed to the compile function is owned by RTI Data Distribution Service and must not be referenced outside the compile function.
- type_code <<in>> (p. 951) A pointer to the type code for the related DDS_Topic (p. 425) of the DDS_ContentFilteredTopic (p. 426). A type_code is a description of a type in terms of which types it contains (such as long, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
- $type_class_name << in>> (p. 951)$ Fully qualified class name of the related DDS_Topic (p. 425).
- $old_compile_data << in>> (p. 951)$ The previous new_compile_data value from a previous call to this instance of a content filter. If the

compile function is called more than once for an instance of a DDS_-ContentFilteredTopic (p. 426), e.g., if the expression parameters are changed, then the new_compile_data value returned by the previous invocation is passed in the old_compile_data parameter (which can be NULL). If this is a new instance of the filter, NULL is passed. This parameter is useful for freeing or reusing resources previously allocated for this

Returns:

One of the Standard Return Codes (p. 120)

4.81.3.6 typedef DDS_Boolean(* DDS_-ContentFilterEvaluateFunction)(void *filter_data, void *compile_data, const void *sample)

Prototype of **DDS_ContentFilter::evaluate** (p. 1055).

Evaluate whether the sample is passing the filter or not according to the sample content.

This function is called when a sample for a locally created **DDS_DataReader** (p. 783) associated with the filter is received, or when a sample for a discovered **DDS_DataReader** (p. 783) associated with the filter needs to be sent.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters:

```
filter\_data << in>> (p. 951) The opaque pointer the content filter was registered with in DDS_DomainParticipant_register_contentfilter (p. 380). Can be NULL.
```

compile_data <<in>> (p. 951) The last return value of the DDS_ContentFilter::compile (p. 1055) function for this instance of the
content filter. Can be NULL.

sample <<iin>> (p. 951) Pointer to a deserialized sample to be filtered

Returns:

The function must return 0 if the sample should be filtered out, non zero otherwise

4.81.3.7 typedef void(* DDS_ContentFilterFinalizeFunction)(void *filter_data, void *compile_data)

Prototype of **DDS_ContentFilter::finalize** (p. 1056).

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up

This function is called when an instance of the locally registered content filter is deleted.

An instance of the locally registered content filter is deleted every time a local **DDS_ContentFilteredTopic** (p. 426) with the matching filter name is deleted, or when a **DDS_DataReader** (p. 783) with a matching filter name is removed due to discovery.

This function is also called on all instances of the discovered **DDS_DataReader** (p. 783) with a matching filter name if the filter is unregistered with **DDS_DomainParticipant_unregister_contentfilter** (p. 381)

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters:

filter_data <<in>> (p. 951) The opaque pointer the content filter was registered with in DDS_DomainParticipant_register_contentfilter (p. 380). Can be NULL.

compile_data <<in>> (p. 951) The last return value of the DDS_ContentFilter::compile (p. 1055) function for this instance of the
content filter. Can be NULL.

4.81.3.8 typedef struct DDS_MultiTopicImpl DDS_MultiTopic

[Not supported (optional)] << interface>> (p. 950) A specialization of DDS_TopicDescription (p. 425) that allows subscriptions that combine/filter/rearrange data coming from several topics.

DDS_MultiTopic (p. 430) allows a more sophisticated subscription that can select and combine data received from multiple topics into a single resulting type (specified by the inherited type_name). The data will then be filtered (selection) and possibly re-arranged (aggregation/projection) according to a subscription_expression with parameters expression_parameters.

^ The subscription_expression is a string that identifies the selection and re-arrangement of data from the associated topics. It is similar to an

SQL statement where the SELECT part provides the fields to be kept, the FROM part provides the names of the topics that are searched for those fields, and the WHERE clause gives the content filter. The Topics combined may have different types but they are restricted in that the type of the fields used for the NATURAL JOIN operation must be the same.

- The expression_parameters attribute is a sequence of strings that give values to the 'parameters' (i.e. "%n" tokens) in the subscription_-expression. The number of supplied parameters must fit with the requested values in the subscription_expression (i.e. the number of n tokens).
- ^ DDS_DataReader (p. 783) entities associated with a DDS_MultiTopic (p. 430) are alerted of data modifications by the usual DDS_Listener (p. 1246) or DDS_WaitSet (p. 253) / DDS_Condition (p. 252) mechanisms whenever modifications occur to the data associated with any of the topics relevant to the DDS_MultiTopic (p. 430).

Note that the source for data may not be restricted to a single topic.

DDS_DataReader (p. 783) entities associated with a DDS_MultiTopic (p. 430) may access instances that are "constructed" at the DDS_DataReader (p. 783) side from the instances written by multiple DDS_DataWriter (p. 673) entities. The DDS_MultiTopic (p. 430) access instance will begin to exist as soon as all the constituting DDS_Topic (p. 425) instances are in existence. The view_state and instance_state is computed from the corresponding states of the constituting instances:

- The view_state of the DDS_MultiTopic (p. 430) instance is DDS_NEW_-VIEW_STATE (p. 851) if at least one of the constituting instances has view_state = DDS_NEW_VIEW_STATE (p. 851). Otherwise, it will be DDS_NOT_NEW_VIEW_STATE (p. 851).
- The instance_state of the DDS_MultiTopic (p. 430) instance is DDS_ALIVE_INSTANCE_STATE (p. 854) if the instance_state of all the constituting DDS_Topic (p. 425) instances is DDS_ALIVE_INSTANCE_STATE (p. 854). It is DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE (p. 854) if at least one of the constituting DDS_Topic (p. 425) instances is DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE (p. 854). Otherwise, it is DDS_NOT_ALIVE_NOT_ALIVE_NOT_ALIVE_STATE (p. 854).

Queries and Filters Syntax (p. 957) describes the syntax of subscription_expression and expression_parameters.

4.81.4 Function Documentation

4.81.4.1 DDS_ReturnCode_t DDS_InconsistentTopicStatus_initialize (struct DDS_InconsistentTopicStatus * self)

Initializer for new status instances.

New **DDS_InconsistentTopicStatus** (p. 1233) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_InconsistentTopicStatus_finalize (p. 433) should be called to free the contained fields that use dynamic memory:

```
DDS_InconsistentTopicStatus *myStatus = malloc(sizeof(struct DDS_InconsistentTopicStatus));
DDS_InconsistentTopicStatus_initialize(myStatus);
DDS_Topic_get_inconsistent_topic_status(myTopic, myStatus);
DDS_InconsistentTopicStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_InconsistentTopicStatus_INITIALIZER (p. 423)
DDS_Topic_get_inconsistent_topic_status (p. 438)
DDS_InconsistentTopicStatus_finalize (p. 433)
```

4.81.4.2 DDS_ReturnCode_t DDS_InconsistentTopicStatus_copy (struct DDS_InconsistentTopicStatus * self, const struct DDS_InconsistentTopicStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

```
source \langle\langle in\rangle\rangle (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_InconsistentTopicStatus_INITIALIZER (p. 423)
DDS_InconsistentTopicStatus_initialize (p. 432)
DDS_InconsistentTopicStatus_finalize (p. 433)
```

4.81.4.3 DDS_ReturnCode_t DDS_InconsistentTopicStatus_finalize (struct DDS_InconsistentTopicStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_InconsistentTopicStatus_INITIALIZER (p. 423)
DDS_InconsistentTopicStatus_initialize (p. 432)
```

4.81.4.4 DDS_ReturnCode_t DDS_TopicQos_initialize (struct DDS_TopicQos * self)

Initializer for new QoS instances.

New **DDS_TopicQos** (p. 1443) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those

contained QoS policies that use dynamic memory are properly initialized. This function does not allocate memory.

Calling this function is not a substitute for calling DDS_Topic_get_qos (p. 440) or DDS_DomainParticipant_get_default_topic_qos (p. 343); one of those should be called subsequently to setting the QoS of any new or existing entity. DDS_TopicQos_finalize (p. 435) should be called to free the contained QoS policies that use dynamic memory:

```
DDS_TopicQos *myQos = malloc(sizeof(struct DDS_TopicQos));
DDS_TopicQos_initialize(myQos);
DDS_DomainParticipantFactory_get_default_topic_qos(myFactory, myQos);
DDS_Topic_set_qos(myTopic, myQos);
DDS_TopicQos_finalize(myQos);
free(myQos);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
\begin{array}{l} \mathbf{DDS\_TopicQos\_INITIALIZER} \ (\mathrm{p.\,423}) \\ \mathbf{DDS\_DomainParticipant\_get\_default\_topic\_qos} \ (\mathrm{p.\,343}) \\ \mathbf{DDS\_TopicQos\_finalize} \ (\mathrm{p.\,435}) \end{array}
```

4.81.4.5 DDS_ReturnCode_t DDS_TopicQos_copy (struct DDS_TopicQos * self, const struct DDS_TopicQos * source)

Copy the contents of the given QoS into this QoS.

DDS_TopicQos (p. 1443) instances can use dynamic memory because of the sequences contained in some QoS policies. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). QoS to be copied from.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_TopicQos_INITIALIZER (p. 423)
DDS_TopicQos_initialize (p. 433)
DDS_TopicQos_finalize (p. 435)
```

4.81.4.6 DDS_ReturnCode_t DDS_TopicQos_finalize (struct DDS_TopicQos * self)

Free any dynamic memory allocated by the policies in this **DDS_TopicQos** (p. 1443).

Some QoS policies may use dynamic memory (regardless of whether the QoS itself is in dynamic memory). This function frees that memory but otherwise leaves this QoS unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

This function does not leave this object in an invalid state. It is permissable to clear a QoS and then subsequently allocate new dynamic memory in one or more of its QoS policies.

Note that if this QoS instance is stored in heap memory, calling this function will not call free() on it; the user is responsible for explicitly freeing any heap-based QoS instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
\begin{array}{l} \mathbf{DDS\_TopicQos\_INITIALIZER} \ (\mathrm{p.}\ 423) \\ \mathbf{DDS\_TopicQos\_initialize} \ (\mathrm{p.}\ 433) \end{array}
```

4.81.4.7 const char* DDS_TopicDescription_get_type_name (DDS_TopicDescription * self)

Get the associated type_name.

The type name defines a locally unique type for the publication or the subscription.

The type_name corresponds to a unique string used to register a type via the FooTypeSupport_register_type (p. 457) function.

Thus, the type_name implies an association with a corresponding DDS_TypeSupport (p. 452) and this DDS_TopicDescription (p. 425).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

the type name. The returned type name is valid until the **DDS**_-**TopicDescription** (p. 425) is deleted.

Postcondition:

The result is non-NULL.

See also:

```
DDS_TypeSupport (p. 452), FooTypeSupport (p. 1499)
```

4.81.4.8 const char* DDS_TopicDescription_get_name (DDS_TopicDescription * self)

Get the name used to create this DDS_TopicDescription (p. 425) .

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

the name used to create this **DDS_TopicDescription** (p. 425). The returned topic name is valid until the **DDS_TopicDescription** (p. 425) is deleted.

Postcondition:

The result is non-NULL.

4.81.4.9 DDS_DomainParticipant* DDS_TopicDescription_get_participant (DDS_TopicDescription * self)

Get the $DDS_DomainParticipant$ (p. 339) to which the $DDS_TopicDescription$ (p. 425) belongs.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The **DDS_DomainParticipant** (p. 339) to which the **DDS_-TopicDescription** (p. 425) belongs.

Postcondition:

The result is non-NULL.

4.81.4.10 DDS_Entity* DDS_Topic_as_entity (DDS_Topic * topic)

Access a DDS_Topic (p. 425)'s DDS_Entity (p. 242) supertype instance.

Returns:

DDS_Topic (p. 425)'s supertype DDS_Entity (p. 242) instance

4.81.4.11 DDS_TopicDescription* DDS_Topic_as_topicdescription (DDS_Topic * topic)

Access a $\mathbf{DDS_Topic}$ (p. 425)'s $\mathbf{DDS_TopicDescription}$ (p. 425) supertype instance.

Returns:

 $\mathbf{DDS_Topic}$ (p. 425)'s supertype $\mathbf{DDS_TopicDescription}$ (p. 425) instance

Examples:

HelloWorld_subscriber.c.

4.81.4.12 DDS_Topic* DDS_Topic_narrow (DDS_TopicDescription * self)

Narrow the given **DDS_TopicDescription** (p. 425) pointer to a **DDS_Topic** (p. 425) pointer.

Returns:

DDS_Topic (p. 425) if this DDS_TopicDescription (p. 425) is a DDS_Topic (p. 425). Otherwise, return NULL.

4.81.4.13 DDS_Topic* DDS_Topic_narrow_from_entity (DDS_Entity * self)

Narrow the given **DDS_Entity** (p. 242) pointer to a **DDS_Topic** (p. 425) pointer.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

DDS_Topic (p. 425) if this DDS_Entity (p. 242) is a DDS_Topic (p. 425). Otherwise, return NULL.

4.81.4.14 DDS_ReturnCode_t DDS_Topic_get_inconsistent_topic_status (DDS_Topic * self, struct DDS_InconsistentTopicStatus * status)

Allows the application to retrieve the **DDS_INCONSISTENT_TOPIC_-STATUS** (p. 128) status of a **DDS_Topic** (p. 425).

Retrieve the current **DDS_InconsistentTopicStatus** (p. 1233)

Parameters:

```
self << in>> (p. 951) Cannot be NULL. status << inout>> (p. 951) Status to be retrieved. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_InconsistentTopicStatus (p. 1233)

4.81.4.15 DDS_ReturnCode_t DDS_Topic_set_qos (DDS_Topic * self, const struct DDS_TopicQos * qos)

Set the topic QoS.

The DDS_TopicQos::topic_data (p. 1444) and DDS_TopicQos::deadline (p. 1445), DDS_TopicQos::latency_budget (p. 1445), DDS_TopicQos::lifespan (p. 1446) can be changed. The other policies are immutable.

Parameters:

```
qos << in>> (p. 951) Set of policies to be applied to DDS_Topic (p. 425).
```

Policies must be consistent. Immutable policies cannot be changed after DDS_Topic (p. 425) is enabled. The special value DDS_TOPIC_QOS_DEFAULT (p. 406) can be used to indicate that the QoS of the DDS_Topic (p. 425) should be changed to match the current default DDS_TopicQos (p. 1443) set in the DDS_DomainParticipant (p. 339). Cannot be NULL.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 122) if policies are inconsistent

See also:

```
DDS_TopicQos (p. 1443) for rules on consistency among QoS set_qos (abstract) (p. 243)
Operations Allowed in Listener Callbacks (p. 1248)
```

```
4.81.4.16 DDS_ReturnCode_t DDS_Topic_set_qos_with_profile (DDS_Topic * self, const char * library_name, const char * profile_name)
```

 $<<\!eXtension>>$ (p. 950) Change the QoS of this topic using the input XML QoS profile.

The DDS_TopicQos::topic_data (p. 1444) and DDS_TopicQos::deadline (p. 1445), DDS_TopicQos::latency_budget (p. 1445), DDS_TopicQos::lifespan (p. 1446) can be changed. The other policies are immutable.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_DomainParticipant_set_default_library (p. 359)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_DomainParticipant_set_default_profile (p. 360)).

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_IMMUTABLE_POLICY (p. 121) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 122) if policies are inconsistent

See also:

DDS_TopicQos (p. 1443) for rules on consistency among QoS Operations Allowed in Listener Callbacks (p. 1248)

4.81.4.17 DDS_ReturnCode_t DDS_Topic_get_qos (DDS_Topic * self, struct DDS_TopicQos * qos)

Get the topic QoS.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.

qos << inout>> (p. 951) QoS to be filled up. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
get_qos (abstract) (p. 244)
```

4.81.4.18 DDS_ReturnCode_t DDS_Topic_set_listener (DDS_Topic * self, const struct DDS_TopicListener * l, DDS_StatusMask mask)

Set the topic listener.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

```
l << in>> (p. 951) Listener to be installed on entity.

mask << in>> (p. 951) Changes of communication status to be invoked
```

on the listener. The callback function on the listener cannot be NULL if the corresponding status is turned on in the mask.

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
set_listener (abstract) (p. 244)
```

4.81.4.19 struct DDS_TopicListener DDS_Topic_get_listener (DDS_Topic * self) [read]

Get the topic listener.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

Existing listener attached to the **DDS_Topic** (p. 425).

See also:

```
DDS_Topic_get_listenerX (p. 441) get_listener (abstract) (p. 245)
```

4.81.4.20 DDS_ReturnCode_t DDS_Topic_get_listenerX (DDS_Topic * self, struct DDS_TopicListener * listener)

```
<< eXtension>> (p. 950) Get the topic listener.
```

An alternative form of get_listener that fills in an existing listener structure rather than returning one on the stack.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 listener << inout>> (p. 951) Listener structure to be filled up. Cannot be NULL.
```

See also:

```
DDS_Topic_get_listener (p. 441) get_listener (abstract) (p. 245)
```

4.81.4.21 DDS_TopicDescription* DDS_ContentFilteredTopic_-as_topicdescription (DDS_ContentFilteredTopic * contentFilteredTopic)

Access a DDS_ContentFilteredTopic (p. 426)'s supertype instance.

Parameters:

contentFilteredTopic << in>> (p. 951) Cannot be NULL.

Returns:

DDS_ContentFilteredTopic (p. 426)'s supertype DDS_-TopicDescription (p. 425) instance

4.81.4.22 DDS_ContentFilteredTopic* DDS_ContentFilteredTopic_narrow (DDS_TopicDescription * self)

Narrow the given **DDS_TopicDescription** (p. 425) pointer to a **DDS_ContentFilteredTopic** (p. 426) pointer.

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

Returns:

DDS_ContentFilteredTopic (p. 426) if this DDS_TopicDescription (p. 425) is a DDS_ContentFilteredTopic (p. 426). Otherwise, return NULL.

4.81.4.23 const char* DDS_ContentFilteredTopic_get_- filter_expression (DDS_ContentFilteredTopic * self)

Get the filter_expression.

Return the filter_expression associated with the DDS_-ContentFilteredTopic (p. 426).

Parameters:

self << in>> (p. 951) Cannot be NULL.

Returns:

the filter_expression.

 $\begin{array}{lll} 4.81.4.24 & DDS_ReturnCode_t & DDS_ContentFilteredTopic_get_-\\ & expression_parameters & (DDS_ContentFilteredTopic * \textit{self},\\ & struct & DDS_StringSeq * \textit{parameters}) \end{array}$

Get the expression_parameters.

Return the expression_parameters associated with the DDS_ContentFilteredTopic (p. 426). expression_parameters is either specified on the last successful call to DDS_ContentFilteredTopic_set_expression_parameters (p. 443) or, if that function is never called, the parameters specified when the DDS_ContentFilteredTopic (p. 426) was created.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

parameters <<inout>> (p. 951) the filter expression parameters. Cannot be NULL. The memory for the strings in this sequence is managed according to the conventions described in Conventions (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DomainParticipant_create_contentfilteredtopic (p. 378)
DDS_ContentFilteredTopic_set_expression_parameters (p. 443)

4.81.4.25 DDS_ReturnCode_t DDS_ContentFilteredTopic_set_expression_parameters (DDS_ContentFilteredTopic * self, const struct DDS_StringSeq * parameters)

Set the $expression_parameters$.

Change the expression_parameters associated with the DDS-ContentFilteredTopic (p. 426).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 parameters << in>> (p. 951) the filter expression parameters Cannot be NULL.. Length of sequence cannot be greater than 100.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.81.4.26 DDS_ReturnCode_t DDS_ContentFilteredTopic_append_to_expression_parameter (DDS_ContentFilteredTopic * self, const DDS_Long index, const char * val)

<<eXtension>> (p. 950) Appends a string term to the specified parameter string.

Appends the input string to the end of the specified parameter string, separated by a comma. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks.

This function can be used in expression parameters associated with MATCH operators in order to add a pattern to the match pattern list. For example, if the filter expression parameter value is:

'IBM'

Then append_to_expression_parameter(0, "MSFT") would generate the new value:

'IBM,MSFT'

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

index <<iin>> (p. 951) The index of the parameter string to be modified. The first index is index 0. When using the DDS_STRINGMATCHFILTER_NAME (p. 409) filter, index must be 0

val << in>> (p. 951) The string term to be appended to the parameter string.

Returns:

One of the **Standard Return Codes** (p. 120)

4.81.4.27 DDS_ReturnCode_t DDS_ContentFilteredTopic_remove_from_expression_parameter (DDS_ContentFilteredTopic * self, const DDS_Long index, const char * val)

<<eXtension>> (p. 950) Removes a string term from the specified parameter string.

Removes the input string from the specified parameter string. To be found and removed, the input string must exist as a complete term, bounded by comma separators or the strong boundary. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks. If the removed term was the last entry in the string, the result will be a string of empty quotation marks.

This function can be used in expression parameters associated with MATCH operators in order to remove a pattern from the match pattern list. For example, if the filter expression paremeter value is:

'IBM,MSFT'

Then $remove_from_expression_parameter(0, "IBM")$ would generate the expression:

'MSFT'

Parameters:

```
    self <<in>> (p. 951) Cannot be NULL.
    index <<in>> (p. 951) The index of the parameter string to be modified. The first index is index 0. When using the DDS_STRINGMATCHFILTER_NAME (p. 409) filter, index must be 0.
    val <<in>> (p. 951) The string term to be removed from the parameter string.
```

Returns:

One of the Standard Return Codes (p. 120)

4.81.4.28 DDS_Topic* DDS_ContentFilteredTopic_get_related_topic (DDS_ContentFilteredTopic * self)

Get the related_topic.

Return the $DDS_{-}Topic$ (p. 425) specified when the DDS_{-} ContentFilteredTopic (p. 426) was created.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

```
The DDS_Topic (p. 425) assocated with the DDS_-ContentFilteredTopic (p. 426).
```

4.81.4.29 DDS_TopicDescription* DDS_MultiTopic_-as_topicdescription (DDS_MultiTopic * multiTopic)

Access a **DDS_MultiTopic** (p. 430)'s supertype instance.

Parameters:

```
multiTopic << in>> (p. 951) Cannot be NULL.
```

Returns:

 $\mathbf{DDS_MultiTopic}$ (p. 430)'s supertype $\mathbf{DDS_TopicDescription}$ (p. 425) instance

4.81.4.30 DDS_MultiTopic* DDS_MultiTopic_narrow (DDS_TopicDescription * self)

Narrow the given **DDS_TopicDescription** (p. 425) pointer to a **DDS_MultiTopic** (p. 430) pointer.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

DDS_MultiTopic (p. 430) if this DDS_TopicDescription (p. 425) is a DDS_MultiTopic (p. 430). Otherwise, return NULL.

4.81.4.31 const char* DDS_MultiTopic_get_subscription_expression (DDS_MultiTopic * self)

Get the expression for this **DDS_MultiTopic** (p. 430).

The expressions syntax is described in the DDS specification. It is specified when the **DDS_MultiTopic** (p. 430) is created.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

subscription_expression of the DDS_MultiTopic (p. 430).

4.81.4.32 DDS_ReturnCode_t DDS_MultiTopic_get_expression_parameters (DDS_MultiTopic * self, struct DDS_StringSeq * parameters)

Get the expression parameters.

The expressions syntax is described in the DDS specification.

The parameters is either specified on the last successful call to DDS_MultiTopic_set_expression_parameters (p. 447), or if DDS_MultiTopic_set_expression_parameters (p. 447) was never called, the parameters specified when the DDS_MultiTopic (p. 430) was created.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

parameters <<inout>> (p. 951) Fill in this sequence with the expression parameters. Cannot be NULL. The memory for the strings in this sequence is managed according to the conventions described in Conventions (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

Returns:

One of the Standard Return Codes (p. 120)

4.81.4.33 DDS_ReturnCode_t DDS_MultiTopic_set_expression_parameters (DDS_MultiTopic * self, const struct DDS_StringSeq * parameters)

Set the expression_parameters.

Changes the expression_parameters associated with the DDS_MultiTopic (p. 430).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.

parameters << in>> (p. 951) the filter expression parameters
```

Returns:

One of the Standard Return Codes (p. 120).

4.82 User Data Type Support

Defines generic classes and macros to support user data types.

Data Structures

* struct Foo

A representative user-defined data type.

* struct FooTypeSupport

<<interface>> (p. 950) <<generic>> (p. 950) User data type specific interface.

`struct DDS_InstanceHandleSeq

Instantiates FooSeq (p. 1497) $< DDS_InstanceHandle_t$ (p. 452) > .

Defines

* #define DDS_TYPESUPPORT_C(TTypeSupport, TData)

Declares the interface required to support a user data type.

*# #define DDS_DATAWRITER_C(TDataWriter, TData)

Declares the interface required to support a user data type specific data writer.

*# #define DDS_DATAREADER_C(TDataReader, TDataSeq, TData)

 $\label{lem:decomposition} Declares \ the \ interface \ required \ to \ support \ a \ user \ data \ type-specific \ data \ reader.$

Typedefs

^ typedef DDS_HANDLE_TYPE_NATIVE **DDS_InstanceHandle_t**

Type definition for an instance handle.

* typedef struct DDS_TypeSupportImpl DDS_TypeSupport

<<iinterface>> (p. 950) An abstract marker interface that has to be specialized for each concrete user data type that will be used by the application.

Functions

```
• Foo * FooTypeSupport_create_data ()
<<eXtension>> (p. 950) Create a data type and initialize it.
```

^ Foo * FooTypeSupport_create_data_ex (DDS_Boolean allocate-Pointers)

```
<<eXtension>> (p. 950) Create a data type and initialize it.
```

^ DDS_ReturnCode_t FooTypeSupport_copy_data (Foo *dst_data, const Foo *src_data)

```
<<eXtension>> (p. 950) Copy data type.
```

^ DDS_ReturnCode_t FooTypeSupport_delete_data (Foo *a_data)

```
<<eXtension>> (p. 950) Destroy a user data type instance.
```

^ DDS_ReturnCode_t FooTypeSupport_delete_data_ex (Foo *a_-data, DDS_Boolean deletePointers)

```
<<eXtension>> (p. 950) Destroy a user data type instance.
```

^ DDS_ReturnCode_t FooTypeSupport_initialize_data (Foo *a_-data)

```
<<eXtension>> (p. 950) Initialize data type.
```

^ DDS_ReturnCode_t FooTypeSupport_initialize_data_ex (Foo *a_-data, DDS_Boolean allocatePointers)

```
<<eXtension>> (p. 950) Initialize data type.
```

 $\begin{tabular}{llll} $\textbf{DDS_ReturnCode_t} & \textbf{FooTypeSupport_finalize_data} & (\textbf{Foo} & *a_-data) \end{tabular}$

```
<<eXtension>> (p. 950) Finalize data type.
```

^ DDS_ReturnCode_t FooTypeSupport_finalize_data_ex (Foo *a_-data, DDS_Boolean deletePointers)

```
<<eXtension>> (p. 950) Finalize data type.
```

^ const char * FooTypeSupport_get_type_name ()

Get the default name for this type.

^ DDS_ReturnCode_t FooTypeSupport_register_type (DDS_-DomainParticipant *participant, const char *type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of a data type.

^ DDS_ReturnCode_t FooTypeSupport_unregister_type (DDS_-DomainParticipant *participant, const char *type_name)

Allows an application to unregister a data type from RTI Data Distribution Service. After calling unregister_type, no further communication using that type is possible.

^ void FooTypeSupport_print_data (Foo *a_data)

<<eXtension>> (p. 950) Print value of data type to standard out.

^ DDS_Boolean DDS_InstanceHandle_equals (const DDS_InstanceHandle_t *other)

Compares this instance handle with another handle for equality.

^ DDS_Boolean DDS_InstanceHandle_is_nil (const DDS_-InstanceHandle_t *self)

Compare this handle to DDS_HANDLE_NIL (p. 460).

Variables

^ const DDS_InstanceHandle_t DDS_HANDLE_NIL

The NIL instance handle.

4.82.1 Detailed Description

Defines generic classes and macros to support user data types.

DDS specifies strongly typed interfaces to read and write user data. For each data class defined by the application, there is a number of specialised classes that are required to facilitate the type-safe interaction of the application with RTI Data Distribution Service.

RTI Data Distribution Service provides an automatic means to generate all these type-specific classes with the **rtiddsgen** (p. 969) utility. The complete set of automatic classes created for a hypothetical user data type named Foo (p. 1494) are shown below.

The macros defined here declare the strongly typed APIs needed to support an arbitrary user defined data of type Foo (p. 1494).

See also:

rtiddsgen (p. 969)

4.82.2 Define Documentation

$\begin{array}{ccc} 4.82.2.1 & \# define \ DDS_TYPESUPPORT_C(TTypeSupport, \\ & TData) \end{array}$

Declares the interface required to support a user data type.

Defines:

```
FooTypeSupport (p. 1499) TypeSupport of type Foo (p. 1494), i.e. FooTypeSupport (p. 1499)
```

Examples:

HelloWorldSupport.c.

4.82.2.2 #define DDS_DATAWRITER_C(TDataWriter, TData)

Declares the interface required to support a user data type specific data writer.

Uses:

```
FooTypeSupport (p. 1499) user data type, Foo (p. 1494)
```

Defines:

```
FooDataWriter (p. 1496) DDS_DataWriter (p. 673) of type Foo (p. 1494), i.e. FooDataWriter (p. 1496)
```

Examples:

HelloWorldSupport.c.

4.82.2.3 #define DDS_DATAREADER_C(TDataReader, TDataSeq, TData)

Declares the interface required to support a user data type-specific data reader.

Uses:

```
FooTypeSupport (p. 1499) user data type, Foo (p. 1494) FooSeq (p. 1497) sequence of user data type, sequence<::Foo>
```

Defines:

```
FooDataReader (p. 1495) DDS_DataReader (p. 783) of type Foo (p. 1494), i.e. FooDataReader (p. 1495)
```

See also:

```
FooSeq (p. 1497)
```

Examples:

HelloWorldSupport.c.

4.82.3 Typedef Documentation

4.82.3.1 typedef DDS_HANDLE_TYPE_NATIVE DDS_InstanceHandle_t

Type definition for an instance handle.

Handle to identity different instances of the same **DDS_Topic** (p. 425) of a certain type.

See also:

```
FooDataWriter_register_instance (p. 678)
DDS_SampleInfo::instance_handle (p. 1389)
```

Examples:

 $HelloWorld_publisher.c.$

4.82.3.2 typedef struct DDS_TypeSupportImpl DDS_TypeSupport

<<interface>> (p. 950) An abstract marker interface that has to be specialized for each concrete user data type that will be used by the application.

The implementation provides an automatic means to generate a type-specific class, **FooTypeSupport** (p. 1499), from a description of the type in IDL.

A DDS_TypeSupport (p. 452) must be registered using the FooTypeSupport_register_type (p. 457) operation on this type-specific class before it can be used to create DDS_Topic (p. 425) objects.

See also:

```
FooTypeSupport (p. 1499)
rtiddsgen (p. 969)
```

4.82.4 Function Documentation

4.82.4.1 Foo* FooTypeSupport_create_data ()

<< eXtension>> (p. 950) Create a data type and initialize it.

The *generated* implementation of the operation knows how to instantiate a data type and initialize it properly.

All memory for the type is deeply allocated.

Returns:

newly created data type

See also:

FooTypeSupport_delete_data (p. 454)

4.82.4.2 Foo* FooTypeSupport_create_data_ex (DDS_Boolean allocatePointers)

<< eXtension>> (p. 950) Create a data type and initialize it.

The *generated* implementation of the operation knows how to instantiate a data type and initialize it properly.

When allocatePointers is DDS_BOOLEAN_TRUE (p. 106), all the references (pointers) in the type are recursively allocated.

Parameters:

allocatePointers << in>> (p. 951) Whether or not to recursively allocate pointers.

Returns:

newly created data type

See also:

FooTypeSupport_delete_data_ex (p. 454)

4.82.4.3 DDS_ReturnCode_t FooTypeSupport_copy_data (Foo * dst_data, const Foo * src_data)

<< eXtension>> (p. 950) Copy data type.

The *generated* implementation of the operation knows how to copy value of a data type.

Parameters:

```
dst\_data << inout>> (p. 951) Data type to copy value to. Cannot be NULL.
```

 $src_data << in>> (p. 951)$ Data type to copy value from. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120)

4.82.4.4 DDS_ReturnCode_t FooTypeSupport_delete_data (Foo * a_data)

<< eXtension>> (p. 950) Destroy a user data type instance.

The *generated* implementation of the operation knows how to destroy a data type and return all resources.

Parameters:

```
a\_data << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

FooTypeSupport_create_data (p. 453)

4.82.4.5 DDS_ReturnCode_t FooTypeSupport_delete_data_ex (Foo * a_data , DDS_Boolean deletePointers)

<< eXtension>> (p. 950) Destroy a user data type instance.

The *generated* implementation of the operation knows how to destroy a data type and return all resources.

When deletePointers is DDS_BOOLEAN_TRUE (p. 106), all the references (pointers) are destroyed as well.

Parameters:

 $a_{-}data \ll in >> (p. 951)$ Cannot be NULL.

deletePointers << in>> (p. 951) Whether or not to destroy pointers.

Returns:

One of the Standard Return Codes (p. 120)

See also:

FooTypeSupport_create_data_ex (p. 453)

$ext{4.82.4.6} \quad ext{DDS_ReturnCode_t FooTypeSupport_initialize_data (Foo} * a_data)$

<< eXtension>> (p. 950) Initialize data type.

The *generated* implementation of the operation knows how to initialize a data type. This function is typically called to initialize a data type that is allocated on the stack.

Parameters:

```
a\_data << inout>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

FooTypeSupport_finalize_data (p. 456)

4.82.4.7 DDS_ReturnCode_t FooTypeSupport_initialize_data_ex (Foo * a_data , DDS_Boolean allocatePointers)

<< eXtension>> (p. 950) Initialize data type.

The *generated* implementation of the operation knows how to initialize a data type. This function is typically called to initialize a data type that is allocated on the stack.

When allocatePointers is DDS_BOOLEAN_TRUE (p. 106), all the references (pointers) in the type are recursively allocated.

Parameters:

 $a_{-}data << inout>> (p. 951)$ Cannot be NULL.

allocatePointers << in>> (p. 951) Whether or not to recursively allocate pointers.

Returns:

One of the Standard Return Codes (p. 120)

See also:

FooTypeSupport_finalize_data_ex (p. 456)

4.82.4.8 DDS_ReturnCode_t FooTypeSupport_finalize_data (Foo * a_data)

<< eXtension>> (p. 950) Finalize data type.

The *generated* implementation of the operation knows how to finalize a data type. This function is typically called to finalize a data type that has previously been initialized.

Parameters:

```
a\_data << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

FooTypeSupport_initialize_data (p. 455)

4.82.4.9 DDS_ReturnCode_t FooTypeSupport_finalize_data_ex (Foo * a_data, DDS_Boolean deletePointers)

```
<< eXtension>> (p. 950) Finalize data type.
```

The *generated* implementation of the operation knows how to finalize a data type. This function is typically called to finalize a data type that has previously been initialized.

When deletePointers is DDS_BOOLEAN_TRUE (p. 106), the memory required by the references (pointers) associated to the type is freed.

Parameters:

 $a_{-}data << in>> (p. 951)$ Cannot be NULL.

deletePointers << in>> (p. 951) Whether or not to free memory allocated by the pointers.

Returns:

One of the Standard Return Codes (p. 120)

See also:

FooTypeSupport_initialize_data_ex (p. 455)

4.82.4.10 const char* FooTypeSupport_get_type_name ()

Get the default name for this type.

Can be used for calling $FooTypeSupport_register_type$ (p. 457) or creating DDS_Topic (p. 425)

Returns:

default name for this type

See also:

```
FooTypeSupport_register_type (p. 457)
DDS_DomainParticipant_create_topic (p. 374)
```

4.82.4.11 DDS_ReturnCode_t FooTypeSupport_register_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to communicate to RTI Data Distribution Service the existence of a data type.

The generated implementation of the operation embeds all the knowledge that has to be communicated to the middleware in order to make it able to manage the contents of data of that type. This includes in particular the key definition that will allow RTI Data Distribution Service to distinguish different instances of the same type.

The same DDS_TypeSupport (p. 452) can be registered multiple times with a DDS_DomainParticipant (p. 339) using the same or different values for the type_name. If register_type is called multiple times on the same DDS_TypeSupport (p. 452) with the same DDS_DomainParticipant (p. 339) and type_name, the second (and subsequent) registrations are ignored by the operation fails with DDS_RETCODE_OK (p. 121).

Precondition:

Cannot use the same type_name to register two different DDS_-TypeSupport (p. 452) with the same DDS_DomainParticipant (p. 339), or else the operation will fail and DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) will be returned.

Parameters:

```
participant <<in>> (p. 951) the DDS_DomainParticipant (p. 339) to register the data type Foo (p. 1494) with. Cannot be NULL.
```

type_name <<in>>> (p. 951) the type name under with the data type Foo (p. 1494) is registered with the participant; this type name is used when creating a new DDS_Topic (p. 425). (See DDS_DomainParticipant_create_topic (p. 374).) The name may not be NULL or longer than 255 characters.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_OUT_-OF_RESOURCES (p. 121).

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also:

DDS_DomainParticipant_create_topic (p. 374)

4.82.4.12 DDS_ReturnCode_t FooTypeSupport_unregister_type (DDS_DomainParticipant * participant, const char * type_name)

Allows an application to unregister a data type from RTI Data Distribution Service. After calling unregister_type, no further communication using that type is possible.

The generated implementation of the operation removes all the information about a type from RTI Data Distribution Service. No further communication using that type is possible.

Precondition:

A type with type_name is registered with the participant and all **DDS**_-**Topic** (p. 425) objects referencing the type have been destroyed. If the

type is not registered with the participant, or if any **DDS_Topic** (p. 425) is associated with the type, the operation will fail with **DDS_RETCODE_-ERROR** (p. 121).

Postcondition:

All information about the type is removed from RTI Data Distribution Service. No further communication using this type is possible.

Parameters:

```
participant <<in>> (p. 951) the DDS_DomainParticipant (p. 339) to unregister the data type Foo (p. 1494) from. Cannot be NULL.
```

type_name <<iin>>> (p. 951) the type name under with the data type Foo (p. 1494) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-BAD_PARAMETER (p. 121) or DDS_RETCODE_ERROR (p. 121)

MT Safety:

SAFE.

See also:

FooTypeSupport_register_type (p. 457)

4.82.4.13 void FooTypeSupport_print_data (Foo * a_data)

<< eXtension>> (p. 950) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters:

```
a\_data << in>> (p. 951) Data type to be printed.
```

4.82.4.14 DDS_Boolean DDS_InstanceHandle_equals (const DDS_InstanceHandle_t * self, const DDS_InstanceHandle_t * other)

Compares this instance handle with another handle for equality.

Parameters:

```
self << in>> (p. 951) This handle. Cannot be NULL. other << in>> (p. 951) The other handle to be compared with this handle. Cannot be NULL.
```

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the two handles have equal values, or DDS_BOOLEAN_FALSE (p. 107) otherwise.

See also:

DDS_InstanceHandle_is_nil (p. 460)

4.82.4.15 DDS_Boolean DDS_InstanceHandle_is_nil (const DDS_InstanceHandle_t * self)

Compare this handle to DDS_HANDLE_NIL (p. 460).

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the given instance handle is equal to DDS_HANDLE_NIL (p. 460) or DDS_BOOLEAN_FALSE (p. 107) otherwise.

See also:

DDS_InstanceHandle_equals (p. 459)

4.82.5 Variable Documentation

$4.82.5.1 \quad const \ DDS_Instance Handle_t \ DDS_HANDLE_NIL$

The NIL instance handle.

Special **DDS_InstanceHandle_t** (p. 452) value

See also:

DDS_InstanceHandle_is_nil (p. 460)

Examples:

HelloWorld_publisher.c.

4.83 Type Code Support

<<e xtension>> (p. 950) A DDS_TypeCode (p. 1463) is a mechanism for representing a type at runtime. RTI Data Distribution Service can use type codes to send type definitions on the network. You will need to understand this API in order to use the Dynamic Data (p. 519) capability or to inspect the type information you receive from remote readers and writers.

Data Structures

^ struct DDS_TypeCode

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with **rtiddsgen** (p. 969) or to modify types you define yourself at runtime.

* struct DDS_StructMember

A description of a member of a struct.

* struct DDS_StructMemberSeq

Defines a sequence of struct members.

^ struct DDS_UnionMember

A description of a member of a union.

* struct DDS_UnionMemberSeq

Defines a sequence of union members.

* struct DDS_EnumMember

A description of a member of an enumeration.

^ struct DDS_EnumMemberSeq

Defines a sequence of enumerator members.

$\hat{}$ struct DDS_ValueMember

A description of a member of a value type.

^ struct DDS_ValueMemberSeq

Defines a sequence of value members.

^ struct DDS_TypeCodeFactory

A singleton factory for creating, copying, and deleting data type definitions dynamically.

Defines

^ #define DDS_TYPECODE_MEMBER_ID_INVALID

A sentinel indicating an invalid DDS_TypeCode (p. 1463) member ID.

*#define DDS_TYPECODE_INDEX_INVALID

A sentinel indicating an invalid DDS_TypeCode (p. 1463) member index.

* #define DDS_TYPECODE_NOT_BITFIELD

Indicates that a member of a type is not a bitfield.

* #define DDS_VM_NONE

Constant used to indicate that a value type has no modifiers.

* #define DDS_VM_CUSTOM

Constant used to indicate that a value type has the custom modifier.

* #define DDS_VM_ABSTRACT

Constant used to indicate that a value type has the abstract modifier.

* #define DDS_VM_TRUNCATABLE

Constant used to indicate that a value type has the truncatable modifier.

* #define DDS_PRIVATE_MEMBER

Constant used to indicate that a value type member is private.

* #define DDS_PUBLIC_MEMBER

Constant used to indicate that a value type member is public.

*#define DDS_TYPECODE_NONKEY_MEMBER

A flag indicating that a type member is optional and not part of the key.

* #define DDS_TYPECODE_KEY_MEMBER

A flag indicating that a type member is part of the key for that type, and therefore required.

^ #define DDS_TYPECODE_NONKEY_REQUIRED_MEMBER

A flag indicating that a type member is not part of the key but is nevertheless required.

Typedefs

^ typedef short DDS_ValueModifier

Modifier type for a value type.

^ typedef short DDS_Visibility

Type to indicate the visibility of a value type member.

Enumerations

```
• enum DDS_TCKind {
 DDS_TK_NULL,
 \mathbf{DDS\_TK\_SHORT},
 DDS_TK_LONG,
 DDS_TK_USHORT,
 DDS_TK_ULONG,
 DDS_TK_FLOAT,
 DDS_TK_DOUBLE,
 DDS_TK_BOOLEAN,
 DDS_TK_CHAR,
 DDS_TK_OCTET,
 DDS_TK_STRUCT,
 DDS_TK_UNION,
 DDS_TK_ENUM,
 DDS_TK_STRING,
 DDS_TK_SEQUENCE,
 DDS_TK_ARRAY,
 DDS_TK_ALIAS,
 DDS_TK_LONGLONG,
 DDS_TK_ULONGLONG,
 DDS_TK_LONGDOUBLE,
 DDS_TK_WCHAR,
 DDS_TK_WSTRING.
 DDS_TK_VALUE,
 DDS_TK_SPARSE }
   Enumeration type for DDS_TypeCode (p. 1463) kinds.
```

Functions

^ DDS_TCKind DDS_TypeCode_kind (const DDS_TypeCode *self, DDS_ExceptionCode_t *ex)

Gets the DDS_TCKind (p. 476) value of a type code.

^ DDS_Boolean DDS_TypeCode_equal (const DDS_TypeCode *self, const DDS_TypeCode *tc, DDS_ExceptionCode_t *ex)

Compares two DDS_TypeCode (p. 1463) objects for equality.

Retrieves the simple name identifying this DDS_TypeCode (p. 1463) object within its enclosing scope.

^ DDS_UnsignedLong DDS_TypeCode_member_count (const DDS_TypeCode *self, DDS_ExceptionCode_t *ex) (

Returns the number of members of the type code.

Returns the name of a type code member identified by the given index.

^ DDS_UnsignedLong DDS_TypeCode_find_member_by_name (const DDS_TypeCode *self, const char *name, DDS_ExceptionCode_t *ex)

Get the index of the member of the given name.

Retrieves the DDS_TypeCode (p. 1463) object describing the type of the member identified by the given index.

^ DDS_UnsignedLong DDS_TypeCode_member_label_count (const DDS_TypeCode *self, DDS_UnsignedLong index, DDS_ExceptionCode_t *ex)

Returns the number of labels associated to the index-th union member.

^ DDS_Long DDS_TypeCode_member_label (const DDS_TypeCode *self, DDS_UnsignedLong member_index, DDS_UnsignedLong label_index, DDS_ExceptionCode_t *ex)

Return the label_index-th label associated to the member_index-th member.

^ DDS_Long DDS_TypeCode_member_ordinal (const DDS_-TypeCode *self, DDS_UnsignedLong index, DDS_-ExceptionCode_t *ex)

Returns the ordinal that corresponds to the index-th enum value.

Function that tells if a member is a key or not.

^ DDS_Boolean DDS_TypeCode_is_member_required (const DDS_TypeCode *self, DDS_UnsignedLong index, DDS_-ExceptionCode_t *ex)

Indicates whether a given member of a type is required to be present in every sample of that type.

^ DDS_Boolean DDS_TypeCode_is_member_pointer (const DDS_TypeCode *self, DDS_UnsignedLong index, DDS_ExceptionCode_t *ex)

Function that tells if a member is a pointer or not.

Function that tells if a member is a bitfield or not.

^ DDS_Short DDS_TypeCode_member_bitfield_bits (const DDS_TypeCode *self, DDS_UnsignedLong index, DDS_ExceptionCode_t *ex) (const DDS_UnsignedLong index, DDS_-typeCode_t *ex)

Returns the number of bits of a bitfield member.

 $\begin{array}{lll} {\bf \hat{DDS_Visibility}} & {\bf DDS_TypeCode_member_visibility} & {\rm (const} \\ {\bf DDS_TypeCode} & *{\rm self}, & {\bf DDS_UnsignedLong} & {\rm index}, & {\bf DDS_ExceptionCode_t} & *{\rm ex}) \\ \end{array}$

Returns the constant that indicates the visibility of the index-th member.

` DDS_TypeCode * DDS_TypeCode_discriminator_type (const DDS_TypeCode *self, DDS_ExceptionCode_t *ex)

Returns the discriminator type code.

^ DDS_UnsignedLong DDS_TypeCode_length (const DDS_-TypeCode *self, DDS_ExceptionCode_t *ex)

Returns the number of elements in the type described by this type code.

^ DDS_UnsignedLong DDS_TypeCode_array_dimension_count (const DDS_TypeCode *self, DDS_ExceptionCode_t *ex)

This function returns the number of dimensions of an array type code.

^ DDS_UnsignedLong DDS_TypeCode_array_dimension (const DDS_TypeCode *self, DDS_UnsignedLong index, DDS_ExceptionCode_t *ex)

This function returns the index-th dimension of an array type code.

^ DDS_UnsignedLong DDS_TypeCode_element_count (const DDS_TypeCode *self, DDS_ExceptionCode_t *ex) (

The number of elements in an array.

^ DDS_TypeCode * DDS_TypeCode_content_type (const DDS_ TypeCode *self, DDS_ExceptionCode_t *ex)

Returns the DDS_TypeCode (p. 1463) object representing the type for the members of the object described by this DDS_TypeCode (p. 1463) object.

^ DDS_Boolean DDS_TypeCode_is_alias_pointer (const DDS_-TypeCode *self, DDS_ExceptionCode_t *ex)

Function that tells if an alias is a pointer or not.

^ DDS_Long DDS_TypeCode_default_index (const DDS_TypeCode *self, DDS_ExceptionCode_t *ex)

Returns the index of the default member, or -1 if there is no default member.

^ DDS_TypeCode * DDS_TypeCode_concrete_base_type (const DDS_TypeCode *self, DDS_ExceptionCode_t *ex)

Returns the **DDS_TypeCode** (p. 1463) that describes the concrete base type of the value type that this **DDS_TypeCode** (p. 1463) object describes.

^ DDS_ValueModifier DDS_TypeCode_type_modifier (const DDS_-TypeCode *self, DDS_ExceptionCode_t *ex)

Returns a constant indicating the modifier of the value type that this DDS_-TypeCode (p. 1463) object describes.

^ DDS_UnsignedLong DDS_TypeCode_find_member_by_id (const DDS_TypeCode *self, DDS_Long id, DDS_ExceptionCode_t *ex)

Get the index of the member of the given ID.

^ DDS_Long DDS_TypeCode_member_id (const DDS_TypeCode *self, DDS_UnsignedLong index, DDS_ExceptionCode_t *ex)

Returns the ID of a sparse type code member identified by the given index.

^ DDS_UnsignedLong DDS_TypeCode_add_member_to_enum (DDS_TypeCode *self, const char *name, DDS_Long ordinal, DDS_ExceptionCode_t *ex)

Add a new enumerated constant to this enum DDS_TypeCode (p. 1463).

^ DDS_UnsignedLong DDS_TypeCode_add_member (DDS_-TypeCode *self, const char *name, DDS_Long id, const DDS_-TypeCode *tc, DDS_Octet member_flags, DDS_ExceptionCode_t *ex)

Add a new member to this DDS_TypeCode (p. 1463).

^ DDS_UnsignedLong DDS_TypeCode_add_member_ex (DDS_-TypeCode *self, const char *name, DDS_Long id, const DDS_-TypeCode *tc, DDS_Octet member_flags, DDS_Visibility visibility, DDS_Boolean is_pointer, DDS_Short bits, DDS_ExceptionCode_t *ex)

Add a new member to this DDS_TypeCode (p. 1463).

Prints a DDS_TypeCode (p. 1463) in a pseudo-IDL notation.

^ DDS_TypeCodeFactory * DDS_TypeCodeFactory_get_instance ()

Gets the singleton instance of this class.

^ DDS_TypeCode * DDS_TypeCodeFactory_clone_tc (DDS_-TypeCodeFactory *self, const DDS_TypeCode *tc, DDS_-ExceptionCode_t *ex)

Creates and returns a copy of the input DDS_TypeCode (p. 1463).

^ void DDS_TypeCodeFactory_delete_tc (DDS_TypeCodeFactory *self, DDS_TypeCode *tc, DDS_ExceptionCode_t *ex)

Deletes the input DDS_TypeCode (p. 1463).

^ const DDS_TypeCode * DDS_TypeCodeFactory_get_primitive_tc (DDS_TypeCodeFactory *self, DDS_TCKind tc_kind)

Get the DDS_TypeCode (p. 1463) for a primitive type (integers, floating point values, etc.) identified by the given DDS_TCKind (p. 476).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_struct_tc (DDS_TypeCodeFactory *self, const char *name, const struct DDS_StructMemberSeq *members, DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_STRUCT (p. 476) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_value_tc (DDS_TypeCodeFactory *self, const char *name, DDS_ValueModifier type_modifier, const DDS_TypeCode *concrete_base, const struct DDS_ValueMemberSeq *members, DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_VALUE (p. 477) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_union_tc (DDS_TypeCodeFactory *self, const char *name, const DDS_TypeCode *discriminator_type, DDS_Long default_index, const struct DDS_UnionMemberSeq *members, DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_UNION (p. 476) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_enum_tc (DDS_TypeCodeFactory *self, const char *name, const struct DDS_EnumMemberSeq *members, DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_ENUM (p. 476) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_alias_tc (DDS_TypeCodeFactory *self, const char *name, const DDS_TypeCode *original_type, DDS_Boolean is_pointer, DDS_ExceptionCode_t *ex)

Constructs a DDS_-TK_-ALIAS (p. 477) (typedef) $DDS_-TypeCode$ (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_string_tc (DDS_TypeCodeFactory *self, DDS_UnsignedLong bound, DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_STRING (p. 476) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_wstring_tc (DDS_TypeCodeFactory *self, DDS_UnsignedLong bound, DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_WSTRING (p. 477) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_sequence_tc (DDS_TypeCodeFactory *self, DDS_UnsignedLong bound, const DDS_TypeCode *element_type, DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_SEQUENCE (p. 477) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_array_tc (DDS_TypeCodeFactory *self, const struct DDS_UnsignedLongSeq

*dimensions, const $\mathbf{DDS_TypeCode}$ *element_type, $\mathbf{DDS_ExceptionCode_t}$ *ex)

Constructs a DDS_TK_ARRAY (p. 477) DDS_TypeCode (p. 1463).

^ DDS_TypeCode * DDS_TypeCodeFactory_create_sparse_tc (DDS_TypeCodeFactory *self, const char *name, DDS_ValueModifier type_modifier, const DDS_TypeCode *concrete_base,
DDS_ExceptionCode_t *ex)

Constructs a DDS_TK_SPARSE (p. 477) DDS_TypeCode (p. 1463).

Variables

 ${\bf ^{\hat{}}\ DDS_TypeCode\ DDS_g_tc_null}$

Basic NULL type.

 ${\bf \hat{}} \ \ DDS_TypeCode\ DDS_g_tc_short$

Basic 16-bit signed integer type.

 $^{\circ}$ DDS_TypeCode DDS_g_tc_long

Basic 32-bit signed integer type.

 ${\bf \hat{}} \ \ DDS_TypeCode\ DDS_g_tc_ushort$

Basic unsigned 16-bit integer type.

^ DDS_TypeCode DDS_g_tc_ulong

Basic unsigned 32-bit integer type.

 ${\bf \hat{}} \ \ DDS_TypeCode\ DDS_g_tc_float$

Basic 32-bit floating point type.

^ DDS_TypeCode DDS_g_tc_double

Basic 64-bit floating point type.

^ DDS_TypeCode DDS_g_tc_boolean

Basic Boolean type.

^ DDS_TypeCode DDS_g_tc_char

 $Basic\ single-byte\ character\ type.$

^ DDS_TypeCode DDS_g_tc_octet

Basic octet/byte type.

^ DDS_TypeCode DDS_g_tc_longlong

Basic 64-bit integer type.

^ DDS_TypeCode DDS_g_tc_ulonglong

Basic unsigned 64-bit integer type.

^ DDS_TypeCode DDS_g_tc_longdouble

Basic 128-bit floating point type.

^ DDS_TypeCode DDS_g_tc_wchar

Basic four-byte character type.

4.83.1 Detailed Description

<<extension>> (p. 950) A DDS_TypeCode (p. 1463) is a mechanism for representing a type at runtime. RTI Data Distribution Service can use type codes to send type definitions on the network. You will need to understand this API in order to use the Dynamic Data (p. 519) capability or to inspect the type information you receive from remote readers and writers.

Type codes are values that are used to describe arbitrarily complex types at runtime. Type code values are manipulated via the **DDS_TypeCode** (p. 1463) class, which has an analogue in CORBA.

A DDS_TypeCode (p. 1463) value consists of a type code *kind* (represented by the DDS_TCKind (p. 476) enumeration) and a list of *members* (that is, fields). These members are recursive: each one has its own DDS_TypeCode (p. 1463), and in the case of complex types (structures, arrays, and so on), these contained type codes contain their own members.

There are a number of uses for type codes. The type code mechanism can be used to unambiguously match type representations. The **DDS_TypeCode_equal** (p. 478) function is a more reliable test than comparing the string type names, requiring equivalent definitions of the types.

4.83.2 Accessing a Local ::DDS_TypeCode

When generating types with **rtiddsgen** (p. 969), type codes are enabled by default. (The *-notypecode* option can be used to disable generation of **DDS_-TypeCode** (p. 1463) information.) For these types, a **DDS_TypeCode** (p. 1463) may be accessed by calling the Foo_get_typecode function for a type "Foo", which returns a **DDS_TypeCode** (p. 1463) pointer.

This API also includes support for dynamic creation of DDS_TypeCode (p. 1463) values, typically for use with the Dynamic Data (p. 519) API. You can create a DDS_TypeCode (p. 1463) using the DDS_TypeCodeFactory (p. 1464) class. You will construct the DDS_TypeCode (p. 1463) recursively, from the outside in: start with the type codes for primitive types, then compose them into complex types like arrays, structures, and so on. You will find the following methods helpful:

- ^ DDS_TypeCodeFactory_get_primitive_tc (p. 503), which provides the DDS_TypeCode (p. 1463) instances corresponding to the primitive types (e.g. DDS_TK_LONG (p. 476), DDS_TK_SHORT (p. 476), and so on).
- ^ DDS_TypeCodeFactory_create_string_tc (p. 507) and DDS_-TypeCodeFactory_create_wstring_tc (p. 507) create a DDS_-TypeCode (p. 1463) representing a text string with a certain *bound* (i.e. maximum length).
- ^ DDS_TypeCodeFactory_create_array_tc (p. 509) and DDS_-TypeCodeFactory_create_sequence_tc (p. 508) create a DDS_-TypeCode (p. 1463) for a collection based on the DDS_TypeCode (p. 1463) for its elements.
- TypeCodeFactory_create_struct_tc (p. 503), DDS_-TypeCodeFactory_create_value_tc (p. 504), and DDS_-TypeCodeFactory_create_sparse_tc (p. 509) create a DDS_-TypeCode (p. 1463) for a structured type.

4.83.3 Accessing a Remote ::DDS_TypeCode

In addition to being used locally, RTI Data Distribution Service can transmit **DDS_TypeCode** (p. 1463) on the network between participants. This information can be used to access information about types used remotely at runtime, for example to be able to publish or subscribe to topics of arbitrarily types (see **Dynamic Data** (p. 519)). This functionality is useful for a generic system monitoring tool like **rtiddsspy**.

Remote DDS_TypeCode (p. 1463) information is shared during discovery over the publication and subscription built-in topics and can be accessed using the built-in readers for these topics; see Built-in Topics (p. 410). Discovered DDS_TypeCode (p. 1463) values are not cached by RTI Data Distribution Service upon receipt and are therefore not available from the built-in topic data returned by DDS_DataWriter_get_matched_subscription_data (p. 711) or DDS_DataReader_get_matched_publication_data (p. 831).

The space available locally to describilize a discovered remote DDS_TypeCode (p. 1463) is specified by the DDS_DomainParticipant (p. 339)'s

DDS_DomainParticipantResourceLimitsQosPolicy::type_code_max_serialized_length (p. 1177) QoS parameter. To support especially complex type codes, it may be necessary for you to increase the value of this parameter.

DDS_SubscriptionBuiltinTopicData (p. 1410)
DDS_PublicationBuiltinTopicData (p. 1313)
```

4.83.4 Define Documentation

4.83.4.1 #define DDS_TYPECODE_MEMBER_ID_INVALID

A sentinel indicating an invalid **DDS_TypeCode** (p. 1463) member ID.

4.83.4.2 #define DDS_TYPECODE_INDEX_INVALID

A sentinel indicating an invalid **DDS_TypeCode** (p. 1463) member index.

4.83.4.3 #define DDS_TYPECODE_NOT_BITFIELD

Indicates that a member of a type is not a bitfield.

4.83.4.4 #define DDS_VM_NONE

Constant used to indicate that a value type has no modifiers.

See also:

```
DDS_ValueModifier (p. 475)
```

Examples:

HelloWorld.c.

4.83.4.5 #define DDS_VM_CUSTOM

Constant used to indicate that a value type has the custom modifier.

This modifier is used to specify whether the value type uses custom marshaling.

```
DDS_ValueModifier (p. 475)
```

4.83.4.6 #define DDS_VM_ABSTRACT

Constant used to indicate that a value type has the abstract modifier.

An abstract value type may not be instantiated.

See also:

```
DDS_ValueModifier (p. 475)
```

4.83.4.7 #define DDS_VM_TRUNCATABLE

Constant used to indicate that a value type has the truncatable modifier.

A value with a state that derives from another value with a state can be declared as truncatable. A truncatable type means the object can be truncated to the base type.

See also:

```
DDS_ValueModifier (p. 475)
```

4.83.4.8 #define DDS_PRIVATE_MEMBER

Constant used to indicate that a value type member is private.

See also:

```
DDS_Visibility (p. 476)
DDS_PUBLIC_MEMBER (p. 473)
```

Examples:

HelloWorld.c.

4.83.4.9 #define DDS_PUBLIC_MEMBER

Constant used to indicate that a value type member is public.

```
DDS_Visibility (p. 476)
DDS_PRIVATE_MEMBER (p. 473)
```

4.83.4.10 #define DDS_TYPECODE_NONKEY_MEMBER

A flag indicating that a type member is optional and not part of the key.

Only sparse value types (i.e. types of DDS_TCKind (p. 476) DDS_TK_SPARSE (p. 477)) support this flag. Non-key members of other type kinds should use the flag DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 475).

If a type is used with the **Dynamic Data** (p. 519) facility, a **DDS_-DynamicData** (p. 1189) sample of the type will only contain a value for a **DDS_TYPECODE_NONKEY_MEMBER** (p. 474) field if one has been explicitly set (see, for example, **DDS_DynamicData_set_long** (p. 587)). The middleware will *not* assume any default value.

See also:

```
DDS_TYPECODE_KEY_MEMBER (p. 474)
DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 475)
DDS_TYPECODE_KEY_MEMBER (p. 474)
DDS_TypeCode_add_member (p. 498)
DDS_TypeCode_add_member_ex (p. 500)
DDS_TypeCode_is_member_key (p. 485)
DDS_TypeCode_is_member_required (p. 485)
DDS_StructMember::is_key (p. 1403)
DDS_ValueMember::is_key (p. 1477)
```

4.83.4.11 #define DDS_TYPECODE_KEY_MEMBER

A flag indicating that a type member is part of the key for that type, and therefore required.

If a type is used with the **Dynamic Data** (p. 519) facility, all **DDS_DynamicData** (p. 1189) samples of the type will contain a value for all **DDS_TYPECODE_KEY_MEMBER** (p. 474) fields, even if the type is a sparse value type (i.e. of kind **DDS_TK_SPARSE** (p. 477)). If you do not set a value of the member explicitly (see, for example, **DDS_DynamicData_set_long** (p. 587)), the middleware will assume a default "zero" value: numeric values will be set to zero; strings and sequences will be of zero length.

```
DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 475)
DDS_TYPECODE_NONKEY_MEMBER (p. 474)
DDS_TypeCode_add_member (p. 498)
DDS_TypeCode_add_member_ex (p. 500)
DDS_TypeCode_is_member_key (p. 485)
DDS_TypeCode_is_member_required (p. 485)
DDS_StructMember::is_key (p. 1403)
DDS_ValueMember::is_key (p. 1477)
```

$\begin{array}{ccc} 4.83.4.12 & \# define \ DDS_TYPECODE_NONKEY_REQUIRED_-\\ & MEMBER \end{array}$

A flag indicating that a type member is not part of the key but is nevertheless required.

This is the most common kind of member.

If a type is used with the **Dynamic Data** (p. 519) facility, all **DDS_-DynamicData** (p. 1189) samples of the type will contain a value for all **DDS_-TYPECODE_NONKEY_REQUIRED_MEMBER** (p. 475) fields, even if the type is a sparse value type (i.e. of kind **DDS_TK_SPARSE** (p. 477)). If you do not set a value of the member explicitly (see, for example, **DDS_-DynamicData_set_long** (p. 587)), the middleware will assume a default "zero" value: numeric values will be set to zero; strings and sequences will be of zero length.

See also:

```
DDS_TYPECODE_KEY_MEMBER (p. 474)
DDS_TYPECODE_NONKEY_MEMBER (p. 474)
DDS_TYPECODE_KEY_MEMBER (p. 474)
DDS_TypeCode_add_member (p. 498)
DDS_TypeCode_add_member_ex (p. 500)
DDS_TypeCode_is_member_key (p. 485)
DDS_TypeCode_is_member_required (p. 485)
DDS_StructMember::is_key (p. 1403)
DDS_ValueMember::is_key (p. 1477)
```

4.83.5 Typedef Documentation

4.83.5.1 typedef short DDS_ValueModifier

Modifier type for a value type.

```
DDS_VM_NONE (p. 472)
DDS_VM_CUSTOM (p. 472)
DDS_VM_ABSTRACT (p. 473)
DDS_VM_TRUNCATABLE (p. 473)
```

4.83.5.2 typedef short DDS_Visibility

Type to indicate the visibility of a value type member.

See also:

```
DDS_PRIVATE_MEMBER (p. 473)
DDS_PUBLIC_MEMBER (p. 473)
```

4.83.6 Enumeration Type Documentation

4.83.6.1 enum DDS_TCKind

Enumeration type for **DDS_TypeCode** (p. 1463) kinds.

Type code kinds are modeled as values of this type.

Enumerator:

DDS_TK_NULL Indicates that a type code does not describe anything.

```
DDS_{-}TK_{-}SHORT short type.
```

 $DDS_{-}TK_{-}LONG$ long type.

 $DDS_{-}TK_{-}USHORT$ unsigned short type.

 $DDS_{-}TK_{-}ULONG$ unsigned long type.

 $DDS_{-}TK_{-}FLOAT$ float type.

 $DDS_{-}TK_{-}DOUBLE$ double type.

 $DDS_{-}TK_{-}BOOLEAN$ boolean type.

 $DDS_{-}TK_{-}CHAR$ char type.

 $DDS_{-}TK_{-}OCTET$ octet type.

 $DDS_{-}TK_{-}STRUCT$ struct type.

 $DDS_{-}TK_{-}UNION$ union type.

 $DDS_{-}TK_{-}ENUM$ enumerated type.

 $DDS_{-}TK_{-}STRING$ string type.

 $DDS_{-}TK_{-}SEQUENCE$ sequence type.

 $DDS_{-}TK_{-}ARRAY$ array type.

DDS_TK_ALIAS alias (typedef) type.

DDS_TK_LONGLONG long long type.

 $DDS_{-}TK_{-}ULONGLONG$ unsigned long long type.

 $DDS_{-}TK_{-}LONGDOUBLE$ long double type.

 $DDS_{-}TK_{-}WCHAR$ wide char type.

 $DDS_{-}TK_{-}WSTRING$ wide string type.

 $DDS_{-}TK_{-}VALUE$ value type.

 $DDS_{-}TK_{-}SPARSE$ A sparse value type.

A sparse value type is one in which all of the fields are not necessarily sent on the network as a part of every sample.

Fields of a sparse value type fall into one of three categories:

- ^ Key fields (see DDS_TYPECODE_KEY_MEMBER (p. 474))
- Non-key, but required members (see DDS_TYPECODE_-NONKEY_REQUIRED_MEMBER (p. 475))
- Non-key, optional members (see **DDS_TYPECODE_-**NONKEY_MEMBER (p. 474))

Fields of the first two kinds must appear in every sample. These are also the only kinds of fields on which you can perform content filtering (see **DDS_ContentFilteredTopic** (p. 426)), because filter evaluation on a non-existent field is not well defined.

4.83.7 Function Documentation

4.83.7.1 DDS_TCKind DDS_TypeCode_kind (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Gets the **DDS_TCKind** (p. 476) value of a type code.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

ex << out>> (p. 951) Parameter for error indications. The values that it can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Retrieves the kind of this **DDS_TypeCode** (p. 1463) object. The kind of a type code determines which **DDS_TypeCode** (p. 1463) functions may legally be invoked on it.

MT Safety:

SAFE.

Returns:

The type code kind.

Compares two DDS_TypeCode (p. 1463) objects for equality.

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

tc << in>> (p. 951) Type code that will be compared with this DDS_-TypeCode (p. 1463).

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the type codes are equal. Otherwise, DDS_BOOLEAN_FALSE (p. 107).

4.83.7.3 const char* DDS_TypeCode_name (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Retrieves the simple name identifying this **DDS_TypeCode** (p. 1463) object within its enclosing scope.

Precondition:

```
self kind is DDS_TK_STRUCT (p. 476), DDS_TK_UNION (p. 476), DDS_TK_ENUM (p. 476), DDS_TK_VALUE (p. 477), DDS_TK_-SPARSE (p. 477) or DDS_TK_ALIAS (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

Name of the type code if no errors.

4.83.7.4 DDS_UnsignedLong DDS_TypeCode_member_count (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Returns the number of members of the type code.

The function member_count can be invoked on structure, union, and enumeration **DDS_TypeCode** (p. 1463) objects.

Precondition:

```
self kind is DDS_TK_STRUCT (p. 476), DDS_TK_UNION (p. 476), DDS_TK_ENUM (p. 476), DDS_TK_VALUE (p. 477) or DDS_TK_SPARSE (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

The number of members constituting the type described by this **DDS**_**TypeCode** (p. 1463) object if no errors.

4.83.7.5 const char* DDS_TypeCode_member_name (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Returns the name of a type code member identified by the given index.

The function member_name can be invoked on structure, union, and enumeration **DDS_TypeCode** (p. 1463) objects.

Precondition:

```
self kind is DDS_TK_STRUCT (p. 476), DDS_TK_UNION (p. 476), DDS_TK_ENUM (p. 476), DDS_TK_VALUE (p. 477) or DDS_TK_SPARSE (p. 477).
```

The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

index << in>> (p. 951) Member index in the interval [0,(member count-1)].

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)

- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Name of the member if no errors.

4.83.7.6 DDS_UnsignedLong DDS_TypeCode_find_member_by_name (const DDS_TypeCode * self, const char * name, DDS_ExceptionCode_t * ex)

Get the index of the member of the given name.

MT Safety:

SAFE.

4.83.7.7 DDS_TypeCode* DDS_TypeCode_member_type (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Retrieves the **DDS_TypeCode** (p. 1463) object describing the type of the member identified by the given index.

The function member_type can be invoked on structure and union type codes.

Precondition:

```
self kind is DDS_TK_STRUCT (p. 476), DDS_TK_UNION (p. 476), DDS_TK_VALUE (p. 477) or DDS_TK_SPARSE (p. 477). The index param must be in the interval [0,(member count-1)].
```

MT Safety:

SAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
index <<in>> (p. 951) Member index in the interval [0,(member count-
1)].
ex <<out>> (p. 951) Parameter for error indications. The values that
can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

The **DDS_TypeCode** (p. 1463) object describing the member at the given index if no errors.

4.83.7.8 DDS_UnsignedLong DDS_TypeCode_member_label_count (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Returns the number of labels associated to the index-th union member.

The function can be invoked on union **DDS_TypeCode** (p. 1463) objects.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_UNION (p. 476). The index param must be in the interval [0,(member count-1)].
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $index <<\!\!in\!\!>> ($ p. 951) Member index in the interval [0,(member count-1)].

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Number of labels if no errors.

4.83.7.9 DDS_Long DDS_TypeCode_member_label (const DDS_TypeCode * self, DDS_UnsignedLong $member_index$, DDS_UnsignedLong $label_index$, DDS_ExceptionCode_t * ex)

Return the label_index-th label associated to the member_index-th member.

This function has been modified for RTI Data Distribution Service from the CORBA Type code Specification.

Example:

```
case 1: Label index 0
case 2: Label index 1
short short_member;
```

The function can be invoked on union DDS_TypeCode (p. 1463) objects.

Precondition:

```
self kind is DDS_TK_UNION (p. 476). The member_index param must be in the interval [0,(member count-1)]. The label_index param must be in the interval [0,(member labels count-1)].
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 

member\_index << in>> (p. 951) Member index. 

label\_index << in>> (p. 951) Label index. 

ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)

- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

The evaluated value of the label if no errors.

4.83.7.10 DDS_Long DDS_TypeCode_member_ordinal (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Returns the ordinal that corresponds to the index-th enum value.

The function can be invoked on enum DDS_TypeCode (p. 1463) objects.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_ENUM (p. 476). Member index in the interval [0,(member count-1)].
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. index << in>> (p. 951) Member index in the interval [0,(member count-1)].
```

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Returns:

Ordinal that corresponds to the index-th enumerator if no errors.

4.83.7.11 DDS_Boolean DDS_TypeCode_is_member_key (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Function that tells if a member is a key or not.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_STRUCT (p. 476), DDS_TK_VALUE (p. 477) or DDS_TK_SPARSE (p. 477).
```

The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

index << in>> (p. 951) Member index in the interval [0,(member count-1)].

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the member is a key. Otherwise, DDS_BOOLEAN_FALSE (p. 107).

4.83.7.12 DDS_Boolean DDS_TypeCode_is_member_required (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Indicates whether a given member of a type is required to be present in every sample of that type.

Which fields are required depends on the **DDS_TCKind** (p. 476) of the type. For example, in a type of kind **DDS_TK_SPARSE** (p. 477), key fields are required. In **DDS_TK_STRUCT** (p. 476) and **DDS_TK_VALUE** (p. 477) types, all fields are required.

MT Safety:

SAFE.

4.83.7.13 DDS_Boolean DDS_TypeCode_is_member_pointer (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Function that tells if a member is a pointer or not.

The function is_member_pointer can be invoked on union and structs type objects

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_STRUCT (p. 476), DDS_TK_UNION (p. 476) or DDS_TK_VALUE (p. 477).
```

The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

index << in>> (p. 951) Index of the member for which type information is begin requested.

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

DDS_BOOLEAN_TRUE (p. 106) if the member is a pointer. Otherwise, DDS_BOOLEAN_FALSE (p. 107).

4.83.7.14 DDS_Boolean DDS_TypeCode_is_member_bitfield (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Function that tells if a member is a bitfield or not.

The function can be invoked on struct type objects.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

self kind is **DDS_TK_STRUCT** (p. 476) or **DDS_TK_VALUE** (p. 477). The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. index << in>> (p. 951) Member index in the interval [0,(member count-1)].
```

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the member is a bitfield. Otherwise, DDS_BOOLEAN_FALSE (p. 107).

4.83.7.15 DDS_Short DDS_TypeCode_member_bitfield_bits (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Returns the number of bits of a bitfield member.

The function can be invoked on struct type objects.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_STRUCT (p. 476) or DDS_TK_VALUE (p. 477). The index param must be in the interval [0,(member count-1)].
```

MT Safety:

SAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
```

index << in>> (p. 951) Member index in the interval [0,(member count-1)].

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Returns:

The number of bits of the bitfield or DDS_TYPECODE_NOT_-BITFIELD (p. 472) if the member is not a bitfield.

4.83.7.16 DDS_Visibility DDS_TypeCode_member_visibility (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Returns the constant that indicates the visibility of the index-th member.

Precondition:

self kind is **DDS_TK_VALUE** (p. 477). The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

index << in>> (p. 951) Member index in the interval [0,(member count-1)].

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Returns:

One of the following constants: **DDS_PRIVATE_MEMBER** (p. 473) or **DDS_PUBLIC_MEMBER** (p. 473).

4.83.7.17 DDS_TypeCode* DDS_TypeCode_discriminator_type (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Returns the discriminator type code.

The function discriminator_type can be invoked only on union **DDS_- TypeCode** (p. 1463) objects.

Precondition:

```
self kind is DDS_TK_UNION (p. 476).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

DDS_TypeCode (p. 1463) object describing the discriminator of the union type if no errors.

4.83.7.18 DDS_UnsignedLong DDS_TypeCode_length (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Returns the number of elements in the type described by this type code. Length is:

- ^ The maximum length of the string for string type codes.
- ^ The maximum length of the sequence for sequence type codes.
- ^ The first dimension of the array for array type codes.

Precondition:

```
self kind is DDS_TK_ARRAY (p. 477), DDS_TK_SEQUENCE (p. 477), DDS_TK_STRING (p. 476) or DDS_TK_WSTRING (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

^ DDS_NO_EXCEPTION_CODE (p. 118)

- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

The bound for strings and sequences, or the number of elements for arrays if no errors.

4.83.7.19 DDS_UnsignedLong DDS_TypeCode_array_dimension_count (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

This function returns the number of dimensions of an array type code.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_ARRAY (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

Number of dimensions if no errors.

4.83.7.20 DDS_UnsignedLong DDS_TypeCode_array_dimension (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

This function returns the index-th dimension of an array type code.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_ARRAY (p. 477). Dimension index in the interval [0,(dimensions count-1)].
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

index << in>> (p. 951) Dimension index in the interval [0,(dimensions count-1)].

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Returns:

Requested dimension if no errors.

4.83.7.21 DDS_UnsignedLong DDS_TypeCode_element_count (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

The number of elements in an array.

This operation isn't relevant for other kinds of types.

MT Safety:

SAFE.

4.83.7.22 DDS_TypeCode* DDS_TypeCode_content_type (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Returns the **DDS_TypeCode** (p. 1463) object representing the type for the members of the object described by this **DDS_TypeCode** (p. 1463) object.

For sequences and arrays, it returns the element type. For aliases, it returns the original type.

Precondition:

```
self kind is DDS_TK_ARRAY (p. 477), DDS_TK_SEQUENCE (p. 477) or DDS_TK_ALIAS (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

A DDS_TypeCode (p. 1463) object representing the element type for sequences and arrays, and the original type for aliases.

4.83.7.23 DDS_Boolean DDS_TypeCode_is_alias_pointer (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Function that tells if an alias is a pointer or not.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_ALIAS (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

DDS_BOOLEAN_TRUE (p. 106) if an alias is a pointer to the aliased type. Otherwise, **DDS_BOOLEAN_FALSE** (p. 107).

4.83.7.24 DDS_Long DDS_TypeCode_default_index (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Returns the index of the default member, or -1 if there is no default member.

The function default_index can be invoked only on union **DDS_TypeCode** (p. 1463) objects.

Precondition:

```
self kind is DDS_TK_UNION (p. 476)
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. ex << out>> (p. 951) Parameter for error indications. The values that
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)

- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

The index of the default member, or -1 if there is no default member.

4.83.7.25 DDS_TypeCode* DDS_TypeCode_concrete_base_type (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Returns the DDS_TypeCode (p. 1463) that describes the concrete base type of the value type that this DDS_TypeCode (p. 1463) object describes.

Precondition:

```
self kind is DDS_TK_VALUE (p. 477) or DDS_TK_SPARSE (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

DDS_TypeCode (p. 1463) that describes the concrete base type or NULL if there is no a concrete base type.

4.83.7.26 DDS_ValueModifier DDS_TypeCode_type_modifier (const DDS_TypeCode * self, DDS_ExceptionCode_t * ex)

Returns a constant indicating the modifier of the value type that this **DDS**_-**TypeCode** (p. 1463) object describes.

Precondition:

```
self kind is DDS_TK_VALUE (p. 477).
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE $(p. \frac{118}{})$
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)

Returns:

One of the following type modifiers: DDS_VM_NONE (p. 472), DDS_VM_ABSTRACT (p. 473), DDS_VM_CUSTOM (p. 472) or DDS_VM_TRUNCATABLE (p. 473).

4.83.7.27 DDS_UnsignedLong DDS_TypeCode_find_member_by_id (const DDS_TypeCode * self, DDS_Long id, DDS_ExceptionCode_t * ex)

Get the index of the member of the given ID.

MT Safety:

SAFE.

4.83.7.28 DDS_Long DDS_TypeCode_member_id (const DDS_TypeCode * self, DDS_UnsignedLong index, DDS_ExceptionCode_t * ex)

Returns the ID of a sparse type code member identified by the given index.

The function can be invoked on sparse DDS_TypeCode (p. 1463) objects.

This function is an RTI Data Distribution Service extension to the CORBA Type Code Specification.

Precondition:

```
self kind is DDS_TK_SPARSE (p. 477). Member index in the interval [0,(member count-1)].
```

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 index << in>> (p. 951) Member index in the interval [0,(member count-1)]. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)
- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BOUNDS_USER_EXCEPTION_CODE (p. 119)

Returns:

ID of the member if no errors.

4.83.7.29 DDS_UnsignedLong DDS_TypeCode_add_member_to-enum (DDS_TypeCode * self, const char * name, DDS_Long ordinal, DDS_ExceptionCode_t * ex)

Add a new enumerated constant to this enum **DDS_TypeCode** (p. 1463).

This method is applicable to **DDS_TypeCode** (p. 1463) objects representing enumerations (**DDS_TK_ENUM** (p. 476)). To add a field to a structured type, see **DDS_TypeCode_add_member_to_enum** (p. 497).

Modifying a $DDS_TypeCode$ (p. 1463) – such as by adding a member – is important if you are using the $Dynamic\ Data\ (p. 519)$ APIs.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

- name << in>> (p. 951) The name of the new member. This string must be unique within this type and must not be NULL.
- ordinal <<in>> (p. 951) The relative order of the new member in this enum or a custom integer value. The value must be unique within the type.
- ex << out>> (p. 951) If this method fails, this argument will contain information about the failure. Possible values include:
 - ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
 - ^ DDS_BAD_MEMBER_NAME_USER_EXCEPTION_-CODE (p. 119)
 - ^ DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE (p. 119)

Returns:

The zero-based index of the new member relative to any other members that previously existed.

See also:

```
DDS_TypeCode_add_member (p. 498)
DDS_TypeCode_add_member_ex (p. 500)
DDS_TypeCodeFactory (p. 1464)
```

4.83.7.30 DDS_UnsignedLong DDS_TypeCode_add_member (DDS_TypeCode * self, const char * name, DDS_Long id, const DDS_TypeCode * tc, DDS_Octet member_flags, DDS_ExceptionCode_t * ex)

Add a new member to this DDS_TypeCode (p. 1463).

This method is applicable to DDS_TypeCode (p. 1463) objects representing structures (DDS_TK_STRUCT (p. 476)), value types (DDS_TK_VALUE (p. 477)), sparse value types (DDS_TK_SPARSE (p. 477)), and unions (DDS_TK_UNION (p. 476)). To add a constant to an enumeration, see DDS_TypeCode_add_member_to_enum (p. 497).

Modifying a $\mathbf{DDS_TypeCode}$ (p. 1463) – such as by adding a member – is important if you are using the $\mathbf{Dynamic}$ \mathbf{Data} (p. 519) APIs.

Here's a simple code example that adds two fields to a data type, one an integer and another a sequence of integers.

```
// Integer:
DDS_TypeCode_add_member(
    myTypeCode,
```

```
"myFieldName",
    // If the type is sparse, specify an ID. Otherwise, use this sentinel:
    DDS_TYPECODE_MEMBER_ID_INVALID,
    {\tt DDS\_TypeCodeFactory\_get\_primitive\_tc(DDS\_TheTypeCodeFactory,\ DDS\_TK\_LONG)}\,,
    // New field is not a key:
    DDS_TYPECODE_NONKEY_REQUIRED_MEMBER);
// Sequence of 10 or fewer integers:
DDS_TypeCode_add_member(
    myTypeCode,
    "myFieldName",
    // If the type is sparse, specify an ID. Otherwise, use this sentinel:
    DDS_TYPECODE_MEMBER_ID_INVALID,
    {\tt DDS\_TypeCodeFactory\_create\_sequence\_tc(}
        DDS_TheTypeCodeFactory,
        DDS_TypeCodeFactory_get_primitive_tc(DDS_TheTypeCodeFactory, DDS_TK_LONG)),
    // New field is not a key:
    DDS_TYPECODE_NONKEY_REQUIRED_MEMBER);
```

MT Safety:

UNSAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. 
 name <<in>> (p. 951) The name of the new member.
```

- id <<in>>> (p. 951) The ID of the new member. This should only be specified for members of kind DDS_TK_SPARSE (p. 477) and DDS_TK_UNION (p. 476); otherwise, it should be DDS_TYPECODE_MEMBER_ID_INVALID (p. 472).
- tc <<in>>> (p. 951) The type of the new member. You can get or create this DDS_TypeCode (p. 1463) with the DDS_TypeCodeFactory (p. 1464).
- $member_flags << in>> (p. 951)$ Indicates whether the member is part of the key and whether it is required.
- ex << out>> (p. 951) If this method fails, this argument will contain information about the failure. Possible values include:
 - ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
 - ^ DDS_BAD_MEMBER_NAME_USER_EXCEPTION_-CODE (p. 119)
 - ^ DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE (p. 119)

Returns:

The zero-based index of the new member relative to any other members that previously existed.

See also:

```
DDS_TypeCode_add_member_ex (p. 500)
DDS_TypeCode_add_member_to_enum (p. 497)
DDS_TypeCodeFactory (p. 1464)
DDS_TYPECODE_NONKEY_MEMBER (p. 474)
DDS_TYPECODE_KEY_MEMBER (p. 474)
DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 475)
```

4.83.7.31 DDS_UnsignedLong DDS_TypeCode_add_member_ex (DDS_TypeCode * self, const char * name, DDS_Long id, const DDS_TypeCode * tc, DDS_Octet member_flags, DDS_Visibility visibility, DDS_Boolean is_pointer, DDS_Short bits, DDS_ExceptionCode_t * ex)

Add a new member to this **DDS_TypeCode** (p. 1463).

Modifying a **DDS_TypeCode** (p. 1463) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 519) APIs.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. \frac{951}{2}) Cannot be NULL.
```

name << in>> (p. 951) The name of the new member.

id <<in>>> (p. 951) The ID of the new member. This should only be specified for members of kind DDS_TK_SPARSE (p. 477) and DDS_TK_UNION (p. 476); otherwise, it should be DDS_TYPECODE_MEMBER_ID_INVALID (p. 472).

tc << in>> (p. 951) The type of the new member. You can get or create this DDS_TypeCode (p. 1463) with the DDS_TypeCodeFactory (p. 1464).

 $member_flags << in>> (p. 951)$ Indicates whether the member is part of the key and whether it is required.

visibility <<iin>> (p. 951) Whether the new member is public or private. Non-public members are only relevant for types of kind DDS_TK_-VALUE (p. 477) and DDS_TK_SPARSE (p. 477).

is_pointer <<in>>> (p. 951) Whether the data member, in its deserialized form, should be stored by pointer as opposed to by value.

bits <<in>> (p. 951) The number of bits, if this new member is a bit field, or DDS_TYPECODE_NOT_BITFIELD (p. 472).

ex << out>> (p. 951) If this method fails, this argument will contain information about the failure. Possible values include:

- ^ DDS_BADKIND_USER_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_MEMBER_NAME_USER_EXCEPTION_-CODE (p. 119)
- ^ DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE (p. 119)

Returns:

The zero-based index of the new member relative to any other members that previously existed.

See also:

```
DDS_TypeCode_add_member (p. 498)
DDS_TypeCodeFactory (p. 1464)
DDS_TYPECODE_NONKEY_MEMBER (p. 474)
DDS_TYPECODE_KEY_MEMBER (p. 474)
DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 475)
```

4.83.7.32 void DDS_TypeCode_print_IDL (const DDS_TypeCode * self, DDS_UnsignedLong indent, DDS_ExceptionCode_t * ex)

Prints a DDS_TypeCode (p. 1463) in a pseudo-IDL notation.

MT Safety:

SAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. indent << in>> (p. 951) Indent. ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

4.83.7.33 DDS_TypeCodeFactory* DDS_TypeCodeFactory_get_-instance ()

Gets the singleton instance of this class.

Returns:

The DDS_TypeCodeFactory (p. 1464) instance if no errors. Otherwise, NULL.

4.83.7.34 DDS_TypeCode* DDS_TypeCodeFactory_clone_tc (DDS_TypeCodeFactory * self, const DDS_TypeCode * tc, DDS_ExceptionCode_t * ex)

Creates and returns a copy of the input DDS_TypeCode (p. 1463).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 tc << in>> (p. 951) Type code that will be copied. Cannot be NULL. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A clone of tc.

$\begin{array}{lll} 4.83.7.35 & \text{void DDS_TypeCodeFactory_delete_tc} \\ & & \text{(DDS_TypeCodeFactory} * \textit{self}, \text{ DDS_TypeCode} * \textit{tc}, \\ & & \text{DDS_ExceptionCode_t} * \textit{ex}) \end{array}$

Deletes the input **DDS_TypeCode** (p. 1463).

All the type codes created through the DDS_TypeCodeFactory (p. 1464) must be deleted using this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. tc << inout>> (p. 951) Type code that will be deleted. Cannot be NULL. ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- 4.83.7.36 const DDS_TypeCode* DDS_TypeCodeFactory_get_primitive_tc (DDS_TypeCodeFactory * self, DDS_TCKind tc_kind)

Get the **DDS_TypeCode** (p. 1463) for a primitive type (integers, floating point values, etc.) identified by the given **DDS_TCKind** (p. 476).

This method is equivalent to, and replaces, the DDS_g_tc_* constants.

See also:

```
DDS_g_tc_long (p. 511)

DDS_g_tc_float (p. 511)
DDS_g_tc_float (p. 512)
DDS_g_tc_longdouble (p. 512)
DDS_g_tc_loctet (p. 512)
DDS_g_tc_boolean (p. 512)
DDS_g_tc_char (p. 512)
DDS_g_tc_char (p. 513)
```

4.83.7.37 DDS_TypeCode* DDS_TypeCodeFactory_create_struct_tc (DDS_TypeCodeFactory * self, const char * name, const struct DDS_StructMemberSeq * members, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_STRUCT (p. 476) DDS_TypeCode (p. 1463).

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. 
 name <<in>> (p. 951) Name of the struct type. Cannot be NULL.
```

- members <<iin>> (p. 951) Initial members of the structure. This list may be empty (that is, FooSeq_get_length (p. 274) may return zero). If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.)
- ex << out>> (p. 951) Parameter for error indications. The values that can take are:
 - ^ DDS_NO_EXCEPTION_CODE (p. 118)
 - ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
 - DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
 - ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A newly-created DDS_TypeCode (p. 1463) object describing a struct.

4.83.7.38 DDS_TypeCode* DDS_TypeCodeFactory_create_value_tc (DDS_TypeCodeFactory * self, const char * name, DDS_ValueModifier type_modifier, const DDS_TypeCode * concrete_base, const struct DDS_ValueMemberSeq * members, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_VALUE (p. 477) DDS_TypeCode (p. 1463).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

name << in>> (p. 951) Name of the value type. Cannot be NULL.

- type_modifier <<iin>> (p. 951) One of the value type modifier constants: DDS_VM_NONE (p. 472), DDS_VM_CUSTOM (p. 472), DDS_VM_ABSTRACT (p. 473) or DDS_VM_-TRUNCATABLE (p. 473).
- $concrete_base << in>> (p. 951)$ DDS_TypeCode (p. 1463) object describing the concrete valuetype base. It may be NULL if the valuetype does not have a concrete base.
- members <<in>> (p. 951) Initial members of the value type. This list may be empty. If the list is not empty, the elements must describe valid value type members. (For example, the names must be unique within the type.)
- ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing a value.

4.83.7.39 DDS_TypeCode* DDS_TypeCodeFactory_create_union_tc (DDS_TypeCodeFactory * self, const char * name, const DDS_TypeCode * discriminator_type, DDS_Long default_index, const struct DDS_UnionMemberSeq * members, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_UNION (p. 476) DDS_TypeCode (p. 1463).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

name << in>> (p. 951) Name of the union type. Cannot be NULL.

 $discriminator_type << in>> (p. 951)$ Discriminator Type Code. Cannot be NULL.

 $default_index << in>> (p. 951)$ Index of the default member, or -1 if there is no default member.

members <<in>>> (p. 951) Initial members of the union. This list may be empty. If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.)

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing a union.

4.83.7.40 DDS_TypeCode* DDS_TypeCodeFactory_create_enum_tc (DDS_TypeCodeFactory * self, const char * name, const struct DDS_EnumMemberSeq * members, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_ENUM (p. 476) DDS_TypeCode (p. 1463).

Parameters:

(p. 497).

```
self << in>> (p. 951) Cannot be NULL. 

name << in>> (p. 951) Name of the enum type. Cannot be NULL. 

members << in>> (p. 951) Initial members of the enumeration. All members must have non-NULL names, and both names and ordinal values must be unique within the type. Note that it is also possible to add members later with {\bf DDS\_TypeCode\_add\_member\_to\_enum}
```

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing an enumeration.

4.83.7.41 DDS_TypeCode* DDS_TypeCodeFactory_create_alias_tc (DDS_TypeCodeFactory * self, const char * name, const DDS_TypeCode * original_type, DDS_Boolean is_pointer, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_ALIAS (p. 477) (typedef) DDS_TypeCode (p. 1463).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 name << in>> (p. 951) Name of the alias. Cannot be NULL. 
 original\_type << in>> (p. 951) Aliased type code. Cannot be NULL. 
 is\_pointer << in>> (p. 951) Indicates if the alias is a pointer to the aliased type code.
```

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing an alias.

4.83.7.42 DDS_TypeCode* DDS_TypeCodeFactory_create_string_tc (DDS_TypeCodeFactory * self, DDS_UnsignedLong bound, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_STRING (p. 476) DDS_TypeCode (p. 1463).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 bound << in>> (p. 951) Maximum length of the string. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing a string.

4.83.7.43 DDS_TypeCode* DDS_TypeCodeFactory_create_wstring_tc (DDS_TypeCodeFactory * self,
DDS_UnsignedLong bound, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_WSTRING (p. 477) DDS_TypeCode (p. 1463).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 bound << in>> (p. 951) Maximum length of the wide string. 
 ex << out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing a wide string.

4.83.7.44 DDS_TypeCode* DDS_TypeCodeFactory_create_sequence_tc (DDS_TypeCodeFactory * self,
DDS_UnsignedLong bound, const DDS_TypeCode *
element_type, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_SEQUENCE (p. 477) DDS_TypeCode (p. 1463).

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
bound <<in>> (p. 951) The bound for the sequence (> 0).
element_type <<in>> (p. 951) DDS_TypeCode (p. 1463) object describing the sequence elements.
ex <<out>> (p. 951) Parameter for error indications. The values that can take are:
```

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing a sequence.

4.83.7.45 DDS_TypeCode* DDS_TypeCodeFactory_create_array_tc (DDS_TypeCodeFactory * self, const struct DDS_UnsignedLongSeq * dimensions, const DDS_TypeCode * $element_type$, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_ARRAY (p. 477) DDS_TypeCode (p. 1463).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

dimensions << in>> (p. 951) Dimensions of the array. Each dimension has to be greater than 0.

 $element_type << in>> (p. 951)$ DDS_TypeCode (p. 1463) describing the array elements. Cannot be NULL.

ex << out>> (p. 951) Parameter for error indications. The values that can take are:

- ^ DDS_NO_EXCEPTION_CODE (p. 118)
- ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
- ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing a sequence.

4.83.7.46 DDS_TypeCode* DDS_TypeCodeFactory_create_sparse_tc (DDS_TypeCodeFactory * self, const char * name, DDS_ValueModifier type_modifier, const DDS_TypeCode * concrete_base, DDS_ExceptionCode_t * ex)

Constructs a DDS_TK_SPARSE (p. 477) DDS_TypeCode (p. 1463).

A sparse value type is similar to other value types but with one major difference: not all members need to be present in every sample.

It is not possible to generate code for sparse value types; they must be created at runtime using these APIs. You will interact with samples of sparse types using the **Dynamic Data** (p. 519) APIs.

Parameters:

 $self \ll in >> (p. 951)$ Cannot be NULL.

name << in>> (p. 951) Name of the value type. Cannot be NULL.

type_modifier <<iin>> (p. 951) One of the value type modifier constants: DDS_VM_NONE (p. 472), DDS_VM_CUSTOM (p. 472), DDS_VM_ABSTRACT (p. 473) or DDS_VM_-TRUNCATABLE (p. 473).

- $concrete_base << in>> (p. 951)$ DDS_TypeCode (p. 1463) object describing the concrete valuetype base. It may be NULL if the valuetype does not have a concrete base.
- ex << out>> (p. 951) Parameter for error indications. The values that can take are:
 - ^ DDS_NO_EXCEPTION_CODE (p. 118)
 - ^ DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 119)
 - ^ DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 119)
 - ^ DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_-CODE (p. 119)

Returns:

A newly-created **DDS_TypeCode** (p. 1463) object describing a value.

4.83.8 Variable Documentation

4.83.8.1 DDS_TypeCode DDS_g_tc_null

Basic NULL type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

DDS_TypeCodeFactory_get_primitive_tc (p. 503)

4.83.8.2 DDS_TypeCode DDS_g_tc_short

Basic 16-bit signed integer type.

For new code, $\mathbf{DDS_TypeCodeFactory_get_primitive_tc}$ (p. 503) is preferred to using this global variable.

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_Short (p. 107)
```

4.83.8.3 DDS_TypeCode DDS_g_tc_long

Basic 32-bit signed integer type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_Long (p. 108)
```

4.83.8.4 DDS_TypeCode DDS_g_tc_ushort

Basic unsigned 16-bit integer type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_UnsignedShort (p. 107)
```

4.83.8.5 DDS_TypeCode DDS_g_tc_ulong

Basic unsigned 32-bit integer type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_UnsignedLong (p. 108)
```

${\bf 4.83.8.6 \quad DDS_TypeCode\ DDS_g_tc_float}$

Basic 32-bit floating point type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

```
\begin{array}{l} \mathbf{DDS\_TypeCodeFactory\_get\_primitive\_tc} \ (\mathrm{p.}\ 503) \\ \mathbf{DDS\_Float} \ (\mathrm{p.}\ 108) \end{array}
```

$4.83.8.7 \quad DDS_TypeCode\ DDS_g_tc_double$

Basic 64-bit floating point type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
\begin{array}{l} \mathbf{DDS\_TypeCodeFactory\_get\_primitive\_tc} \ (\mathrm{p.}\ 503) \\ \mathbf{DDS\_Double} \ (\mathrm{p.}\ 108) \end{array}
```

4.83.8.8 DDS_TypeCode DDS_g_tc_boolean

Basic Boolean type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_Boolean (p. 109)
```

4.83.8.9 DDS_TypeCode DDS_g_tc_char

Basic single-byte character type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_Char (p. 107)
```

$4.83.8.10 \quad DDS_TypeCode\ DDS_g_tc_octet$

Basic octet/byte type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

```
\begin{array}{l} \mathbf{DDS\_TypeCodeFactory\_get\_primitive\_tc} \ (\mathrm{p.}\ 503) \\ \mathbf{DDS\_Octet} \ (\mathrm{p.}\ 107) \end{array}
```

4.83.8.11 DDS_TypeCode DDS_g_tc_longlong

Basic 64-bit integer type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_LongLong (p. 108)
```

4.83.8.12 DDS_TypeCode DDS_g_tc_ulonglong

Basic unsigned 64-bit integer type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_UnsignedLongLong (p. 108)
```

4.83.8.13 DDS_TypeCode DDS_g_tc_longdouble

Basic 128-bit floating point type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

See also:

```
DDS_TypeCodeFactory_get_primitive_tc (p. 503)
DDS_LongDouble (p. 108)
```

${\bf 4.83.8.14}\quad {\bf DDS_TypeCode\ DDS_g_tc_wchar}$

Basic four-byte character type.

For new code, **DDS_TypeCodeFactory_get_primitive_tc** (p. 503) is preferred to using this global variable.

```
\begin{array}{l} \mathbf{DDS\_TypeCodeFactory\_get\_primitive\_tc} \ (\mathrm{p.}\ 503) \\ \mathbf{DDS\_Wchar} \ (\mathrm{p.}\ 107) \end{array}
```

4.84 Built-in Types

<<eXtension>> (p. 950) RTI Data Distribution Service provides a set of very simple data types for you to use with the topics in your application.

Modules

String Built-in Type

Built-in type consisting of a single character string.

^ KeyedString Built-in Type

Built-in type consisting of a string payload and a second string that is the key.

^ Octets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes.

^ KeyedOctets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

4.84.1 Detailed Description

 $<<\!eXtension>>$ (p. 950) RTI Data Distribution Service provides a set of very simple data types for you to use with the topics in your application.

The middleware provides four built-in types:

- ^ String: A payload consisting of a single string of characters. This type has no key.
- ^ DDS_KeyedString (p. 1239): A payload consisting of a single string of characters and a second string, the key, that identifies the instance to which the sample belongs.
- **DDS_Octets** (p. 1272): A payload consisting of an opaque variable-length array of bytes. This type has no key.
- **DDS_KeyedOctets** (p. 1236): A payload consisting of an opaque variable-length array of bytes and a string, the key, that identifies the instance to which the sample belongs.

The String and **DDS_KeyedString** (p. 1239) types are appropriate for simple text-based applications. The **DDS_Octets** (p. 1272) and **DDS_KeyedOctets** (p. 1236) types are appropriate for applications that perform their own custom data serialization, such as legacy applications still in the process of migrating to RTI Data Distribution Service. In most cases, string-based or structured data is preferable to opaque data, because the latter cannot be easily visualized in tools or used with content-based filters (see **DDS_ContentFilteredTopic** (p. 426)).

The built-in types are very simple in order to get you up and running as quickly as possible. If you need a structured data type you can define your own type with exactly the fields you need in one of two ways:

- At compile time, by generating code from an IDL or XML file using the **rtiddsgen** (p. 969) utility
- ^ At runtime, by using the **Dynamic Data** (p. 519) API

4.84.2 Managing Memory for Builtin Types

When a sample is written, the DataWriter serializes it and stores the result in a buffer obtained from a pool of preallocated buffers. In the same way, when a sample is received, the DataReader describilizes it and stores the result in a sample coming from a pool of preallocated samples.

For builtin types, the maximum size of the buffers/samples and depends on the nature of the application using the builtin type.

You can configure the maximum size of the builtin types on a per-DataWriter and per-DataReader basis using the **DDS_PropertyQosPolicy** (p. 1308) in DataWriters, DataReaders or Participants.

The following table lists the supported builtin type properties to configure memory allocation. When the properties are defined in the DomainParticipant, they are applicable to all DataWriters and DataReaders belonging to the DomainParticipant unless they are overwritten in the DataWriters and DataReaders.

The previous properties must be set consistently with respect to the corresponding *.max_size properties that set the maximum size of the builtin types in the typecode.

4.84.3 Typecodes for Builtin Types

The typecodes associated with the builtin types are generated from the following IDL type definitions:

```
module DDS {
    struct String {
        string value;
    };

    struct KeyedString {
        string key;
        string value;
    };

    struct Octets {
        sequence<octet> value;
    };

    struct KeyedOctets {
        string key;
        sequence<octet> value;
    };
};
```

The maximum size of the strings and sequences that will be included in the type code definitions can be configured on a per-DomainParticipant-basis by using the properties in following table.

For more information about the built-in types, including how to control memory usage and maximum lengths, please see chapter 3, *Data Types and Data Samples*, in the RTI Data Distribution Service User's Manual.

Property	Description
dds.builtin_type.string.alloc_size	Maximum size of the strings
addistanting personning tender 25220	published by the
	DDS_StringDataWriter (p. 31) or
	received the
	DDS_StringDataReader (p. 32)
	(includes the NULL-terminated
	character).
	Default:
	dds.builtin_type.string.max_size if
	defined. Otherwise, 1024.
dds.builtin_type.keyed_string.alloc	Maximum size of the keys used by
key_size	the
	${ m DDS_KeyedStringDataWriter}$
	(p. 47) or
	DDS_KeyedStringDataReader
	(p. 47) (includes the
	NULL-terminated character).
	Default: dds.builtin_type.keyed
	string.max_key_size if defined.
	Otherwise, 1024.
dds.builtin_type.keyed_string.alloc	Maximum size of the strings
size	published by the
	DDS_KeyedStringDataWriter
	(p. 47) or received by the
	DDS_KeyedStringDataReader
	(p. 47) (includes the
	NULL-terminated character).
	Default: dds.builtin_type.keyed
	string.max_size if defined.
	Otherwise, 1024.
dds.builtin_type.octets.alloc_size	Maximum size of the octet
	sequences published the
	DDS_OctetsDataWriter (p. 68)
	or received by the
	DDS_OctetsDataReader (p. 68).
	Default:
	dds.builtin_type.octets.max_size if
	defined. Otherwise, 2048.
dds.builtin_type.keyed_octets.alloc	Maximum size of the key published
key_size	by the
	DDS_KeyedOctetsDataWriter
	(p. 86) or received by the
	DDS_KeyedOctetsDataReader
	(p. 87) (includes the
	NULL-terminated character).
	Default: dds.builtin_type.keyed
Generated on Wed Jun 9 20:07:25 2010 for Doxygen	
	Otherwise, 1024.
dds.builtin_type.keyed_octets.alloc	Maximum size of the octets
size	sequences published by a
	DDS_KeyedOctetsDataWriter
	(p. 86) or received by a
	DDS_KeyedOctetsDataReader
	(p. 87).
	Default: dds.builtin type.keved -

Property	Description
dds.builtin_type.string.max_size	Maximum size of the strings published by the StringDataWriters and received by the StringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_string.maxkey_size	Maximum size of the keys used by the KeyedStringDataWriters and KeyedStringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_string.maxsize	Maximum size of the strings published by the KeyedStringDataWriters and received by the KeyedStringDataReaders belonging to a DomainParticipant using the builtin type (includes the NULL-terminated character). Default: 1024
dds.builtin_type.octets.max_size	Maximum size of the octet sequences published by the OctetsDataWriters and received by the OctetsDataReader belonging to a DomainParticipant. Default: 2048
dds.builtin_type.keyed_octets.maxkey_size	Maximum size of the keys used by the KeyedOctetsStringDataWriters and KeyedOctetsStringDataReaders belonging to a DomainParticipant (includes the NULL-terminated character). Default: 1024.
dds.builtin_type.keyed_octets.max size	Maximum size of the octet sequences published by the KeyedOctetsDataWriters and received by the KeyedOctetsDataReaders belonging to a DomainParticipant. Default: 2048

4.85 Dynamic Data

<<eXtension>> (p. 950) The Dynamic Data API provides a way to interact with arbitrarily complex data types at runtime without the need for code generation.

Data Structures

^ struct DDS_DynamicDataProperty_t

A collection of attributes used to configure DDS_DynamicData (p. 1189) objects.

^ struct DDS_DynamicDataInfo

A descriptor for a DDS_DynamicData (p. 1189) object.

^ struct DDS_DynamicDataMemberInfo

A descriptor for a single member (i.e. field) of dynamically defined data type.

^ struct DDS_DynamicData

A sample of any complex data type, which can be inspected and manipulated reflectively.

* struct DDS_DynamicDataSeq

An ordered collection of DDS_DynamicData (p. 1189) elements.

 $\hat{}$ struct DDS_DynamicDataTypeSerializationProperty_t

Properties that govern how data of a certain type will be serialized on the network.

^ struct DDS_DynamicDataTypeProperty_t

A collection of attributes used to configure DDS_-DynamicDataTypeSupport (p. 539) objects.

Defines

 ${\bf ^{\hat{}}}\ \# {\rm define}\ {\bf DDS_DynamicDataProperty_t_INITIALIZER}$

 $Static\ initializer\ for\ \textbf{DDS_DynamicDataProperty_t}\ (p.\ 1201)\ objects.$

^ #define DDS_DYNAMIC_DATA_MEMBER_ID_-UNSPECIFIED

A sentinel value that indicates that no member ID is needed in order to perform some operation.

 $^{`}$ #define DDS_DynamicDataTypeProperty_t_INITIALIZER

Static initializer for $DDS_DynamicDataTypeProperty_t$ (p. 1204) objects.

Typedefs

^ typedef DDS_Long DDS_DynamicDataMemberId

An integer that uniquely identifies some member of a data type within that type.

^ typedef struct DDS_DynamicDataWriter DDS_DynamicDataWriter

Writes (publishes) objects of type DDS_DynamicData (p. 1189).

^ typedef struct DDS_DynamicDataReader DDS_DynamicDataReader

Reads (subscribes to) objects of type DDS_DynamicData (p. 1189).

 $\begin{array}{lll} \textbf{typedef} & \textbf{struct} & \textbf{DDS_DynamicDataTypeSupport} & \textbf{DDS_-} \\ \textbf{DynamicDataTypeSupport} & \end{array}$

A factory for registering a dynamically defined type and creating DDS_-DynamicData (p. 1189) objects.

Functions

^ DDS_Boolean DDS_DynamicData_initialize (DDS_DynamicData *self, const DDS_TypeCode *type, const struct DDS_DynamicDataProperty_t *property)

Initialize a DDS_DynamicData (p. 1189) object to a valid empty state.

^ DDS_DynamicData * DDS_DynamicData_new (const DDS_ TypeCode *type, const struct DDS_DynamicDataProperty_t *property)

The constructor for new DDS_DynamicData (p. 1189) objects.

^ void DDS_DynamicData_finalize (DDS_DynamicData *self)

Clean up the internal state of this object to get it ready for deallocation, but don't deallocate the pointer.

`void DDS_DynamicData_delete (DDS_DynamicData *self)

Finalize and deallocate this DDS_DynamicData (p. 1189) sample.

^ DDS_ReturnCode_t DDS_DynamicData_copy (DDS_-DynamicData *self, const DDS_DynamicData *src)

Deeply copy from the given object to this object.

^ DDS_Boolean DDS_DynamicData_equal (const DDS_DynamicData *self, const DDS_DynamicData *other)

Indicate whether the contents of another DDS_DynamicData (p. 1189) sample are the same as those of this one.

Clear the contents of all data members of this object, including key members.

^ DDS_ReturnCode_t DDS_DynamicData_clear_nonkey_members (DDS_DynamicData *self)

Clear the contents of all data members of this object, not including key members.

Clear the contents of a single data member of this object.

^ DDS_ReturnCode_t DDS_DynamicData_print (const DDS_-DynamicData *self, FILE *fp, int indent)

Output a textual representation of this object and its contents to the given file.

^ void DDS_DynamicData_get_info (const DDS_DynamicData *self, struct DDS_DynamicDataInfo *info_out)

Fill in the given descriptor with information about this DDS_DynamicData (p. 1189).

^ DDS_ReturnCode_t DDS_DynamicData_bind_type (DDS_-DynamicData *self, const DDS_TypeCode *type)

If this DDS_DynamicData (p. 1189) object is not yet associated with a data type, set that type now to the given DDS_TypeCode (p. 1463).

Dissociate this DDS_DynamicData (p. 1189) object from any particular data type.

^ DDS_ReturnCode_t DDS_DynamicData_bind_complex_member (DDS_DynamicData *self, DDS_DynamicData *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Use another DDS_DynamicData (p. 1189) object to provide access to a complex field of this DDS_DynamicData (p. 1189) object.

^ DDS_ReturnCode_t DDS_DynamicData_unbind_complex_member (DDS_DynamicData *self, DDS_DynamicData *value)

Tear down the association created by a DDS_DynamicData_bind_complex_member (p. 546) operation, committing any changes to the outer object since then.

^ const DDS_TypeCode * DDS_DynamicData_get_type (const DDS_DynamicData *self)

Get the data type, of which this **DDS_DynamicData** (p. 1189) represents an instance.

^ DDS_TCKind DDS_DynamicData_get_type_kind (const DDS_DynamicData *self)

Get the kind of this object's data type.

Get the number of members in this sample.

^ DDS_Boolean DDS_DynamicData_member_exists (const DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id)

 $Indicates\ whether\ a\ member\ of\ a\ particular\ name/ID\ exists\ in\ this\ data\ sample.$

^ DDS_Boolean DDS_DynamicData_member_exists_in_type (const DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id)

Indicates whether a member of a particular name/ID exists in this data sample's type.

^ DDS_ReturnCode_t DDS_DynamicData_get_member_info (const DDS_DynamicData *self, struct DDS_DynamicDataMemberInfo *info, const char *member_name, DDS_DynamicDataMemberId member_id)

Fill in the given descriptor with information about the identified member of this DDS_DynamicData (p. 1189) sample.

^ DDS_ReturnCode_t DDS_DynamicData_get_member_info_by_index (const DDS_DynamicData *self, struct DDS_-DynamicDataMemberInfo *info, DDS_UnsignedLong index)

Fill in the given descriptor with information about the identified member of this DDS_DynamicData (p. 1189) sample.

^ DDS_ReturnCode_t DDS_DynamicData_get_member_type (const DDS_DynamicData *self, const DDS_TypeCode **type_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the type of the given member of this sample.

^ DDS_ReturnCode_t DDS_DynamicData_is_member_key (const DDS_DynamicData *self, DDS_Boolean *is_key_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Indicates whether a given member forms part of the key of this sample's data type.

^ DDS_ReturnCode_t DDS_DynamicData_get_long (const DDS_DynamicData *self, DDS_Long *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_Long (p. 108) or another type implicitly convertible to it.

DDS_ReturnCode_t DDS_DynamicData_get_short (const DDS_-DynamicData *self, DDS_Short *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_Short (p. 107) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_ulong (const DDS_-DynamicData *self, DDS_UnsignedLong *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_UnsignedLong (p. 108) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_ushort (const DDS_-DynamicData *self, DDS_UnsignedShort *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_UnsignedShort (p. 107) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_float (const DDS_-DynamicData *self, DDS_Float *value_out, const char *member_name, DDS_DynamicDataMemberId member_id) Get the value of the given field, which is of type DDS_Float (p. 108) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_double (const DDS_-DynamicData *self, DDS_Double *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_Double (p. 108) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_boolean (const DDS_DynamicData *self, DDS_Boolean *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_Boolean (p. 109).

^ DDS_ReturnCode_t DDS_DynamicData_get_char (const DDS_DynamicData *self, DDS_Char *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_Char (p. 107) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_octet (const DDS_-DynamicData *self, DDS_Octet *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_Octet (p. 107) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_longlong (const DDS_DynamicData *self, DDS_LongLong *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_LongLong (p. 108) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_ulonglong (const DDS_DynamicData *self, DDS_UnsignedLongLong *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_UnsignedLongLong (p. 108) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_longdouble (const DDS_DynamicData *self, DDS_LongDouble *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_LongDouble (p. 108) or another type implicitly convertible to it.

DDS_ReturnCode_t DDS_DynamicData_get_wchar (const DDS_DynamicData *self, DDS_Wchar *value_out, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type DDS_Wchar (p. 107) or another type implicitly convertible to it.

^ DDS_ReturnCode_t DDS_DynamicData_get_string (const DDS_-DynamicData *self, char **value, DDS_UnsignedLong *size, const char *member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type char*.

^ DDS_ReturnCode_t DDS_DynamicData_get_wstring (const DDS_DynamicData *self, DDS_Wchar **value, DDS_-UnsignedLong *size, const char *member_name, DDS_-DynamicDataMemberId member_id) (const DDS_-

Get the value of the given field, which is of type DDS_Wchar (p. 107)*.

DDS_ReturnCode_t DDS_DynamicData_get_complex_member
(const DDS_DynamicData *self, DDS_DynamicData *value_out,
const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the value of the given field, which is of some composed type.

^ DDS_ReturnCode_t DDS_DynamicData_get_long_array (const DDS_DynamicData *self, DDS_Long *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_short_array (const DDS_DynamicData *self, DDS_Short *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_ushort_array (const DDS_DynamicData *self, DDS_UnsignedShort *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_float_array (const DDS_DynamicData *self, DDS_Float *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_boolean_array (const DDS_DynamicData *self, DDS_Boolean *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_char_array (const DDS_DynamicData *self, DDS_Char *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_octet_array (const DDS_DynamicData *self, DDS_Octet *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_ulonglong_array (const DDS_DynamicData *self, DDS_UnsignedLongLong *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_longdouble_array (const DDS_DynamicData *self, DDS_LongDouble *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_wchar_array (const DDS_DynamicData *self, DDS_Wchar *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_get_long_seq (const DDS_DynamicData *self, struct DDS_LongSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_short_seq (const DDS_DynamicData *self, struct DDS_ShortSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_ulong_seq (const DDS_DynamicData *self, struct DDS_UnsignedLongSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_ushort_seq (const DDS_DynamicData *self, struct DDS_UnsignedShortSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_double_seq (const DDS_DynamicData *self, struct DDS_DoubleSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_boolean_seq (const DDS_DynamicData *self, struct DDS_BooleanSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_char_seq (const DDS_DynamicData *self, struct DDS_CharSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_octet_seq (const DDS_DynamicData *self, struct DDS_OctetSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_longlong_seq (const DDS_DynamicData *self, struct DDS_LongLongSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_ulonglong_seq (const DDS_DynamicData *self, struct DDS_UnsignedLongLongSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_longdouble_seq (const DDS_DynamicData *self, struct DDS_LongDoubleSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_get_wchar_seq (const DDS_DynamicData *self, struct DDS_WcharSeq *seq, const char *member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_set_long (DDS_-DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, DDS_Long value) (DDS_-

Set the value of the given field, which is of type DDS_Long (p. 108).

^ DDS_ReturnCode_t DDS_DynamicData_set_short (DDS_-DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, DDS_Short value) Set the value of the given field, which is of type DDS_Short (p. 107).

- ^ DDS_ReturnCode_t DDS_DynamicData_set_ulong (DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong value)

 Set the value of the given field, which is of type DDS_UnsignedLong (p. 108).
- ^ DDS_ReturnCode_t DDS_DynamicData_set_ushort (DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedShort value)

 Set the value of the given field, which is of type DDS_UnsignedShort (p. 107).
- ^ DDS_ReturnCode_t DDS_DynamicData_set_float DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, DDS_Float value) DDS_-
 - Set the value of the given field, which is of type DDS_Float (p. 108).
- ^ DDS_ReturnCode_t DDS_DynamicData_set_double (DDS_-DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, DDS_Double value) (DDS_-

Set the value of the given field, which is of type DDS_Double (p. 108).

^ DDS_ReturnCode_t DDS_DynamicData_set_boolean (DDS_-DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, DDS_Boolean value)

Set the value of the given field, which is of type DDS_Boolean (p. 109).

Set the value of the given field, which is of type DDS_Char (p. 107).

Set the value of the given field, which is of type DDS_Octet (p. 107).

Set the value of the given field, which is of type DDS_LongLong (p. 108).

Set the value of the given field, which is of type DDS_UnsignedLongLong (p. 108).

Set the value of the given field, which is of type DDS_LongDouble (p. 108).

^ DDS_ReturnCode_t DDS_DynamicData_set_wchar DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, DDS_Wchar value) DDS_-

Set the value of the given field, which is of type DDS_Wchar (p. 107).

^ DDS_ReturnCode_t DDS_DynamicData_set_string DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, const char *value) DDS_-

Set the value of the given field of type char*.

^ DDS_ReturnCode_t DDS_DynamicData_set_wstring (DDS_-DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, const DDS_Wchar *value)

Set the value of the given field of type DDS_Wchar (p. 107)*.

^ DDS_ReturnCode_t DDS_DynamicData_set_complex_member (DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id, const DDS_DynamicData *value)

Copy the state of the given $DDS_DynamicData$ (p. 1189) object into a member of this object.

Set the contents of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_set_boolean_array (DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Boolean *array)

Set the contents of the given array member.

Set the contents of the given array member.

DDS_DynamicData_set_octet_array (DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Octet *array)

Set the contents of the given array member.

Set the contents of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_set_ulonglong_array (DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_UnsignedLongLong *array)

Set the contents of the given array member.

Set the contents of the given array member.

Set the contents of the given array member.

^ DDS_ReturnCode_t DDS_DynamicData_set_long_seq (DDS_DynamicData *self, const char *member_name, DDS_DynamicDataMemberId member_id, const struct DDS_LongSeq *value)

Set the contents of the given sequence member.

^ DDS_ReturnCode_t DDS_DynamicData_set_char_seq (DDS_-DynamicData *self, const char *member_name, DDS_-DynamicDataMemberId member_id, const struct DDS_CharSeq *value)

Set the contents of the given sequence member.

Set the contents of the given sequence member.

Set the contents of the given sequence member.

DDS_DynamicDataMemberId member_id, const struct DDS_-UnsignedLongSeq *value)

Set the contents of the given sequence member.

Set the contents of the given sequence member.

Set the contents of the given sequence member.

^ struct DDS_DynamicDataTypeSupport * DDS_-DynamicDataTypeSupport_new (DDS_TypeCode *type, const struct DDS_DynamicDataTypeProperty_t *props)

Construct a new DDS_DynamicDataTypeSupport (p. 539) object.

^ void **DDS_DynamicDataTypeSupport_delete** (struct **DDS_- DynamicDataTypeSupport** *self)

Delete a DDS_DynamicDataTypeSupport (p. 539) object.

DDS_ReturnCode_t DDS_DynamicDataTypeSupport_register_type (struct DDS_DynamicDataTypeSupport *self, DDS_DomainParticipant *participant, const char *type_name)

Associate the DDS_TypeCode (p. 1463) with the given DDS_DomainParticipant (p. 339) under the given logical name.

Remove the definition of this type from the $DDS_DomainParticipant$ (p. 339).

^ const char * DDS_DynamicDataTypeSupport_get_type_name (const struct DDS_DynamicDataTypeSupport *self)

Get the default name of this type.

^ struct DDS_TypeCode * DDS_DynamicDataTypeSupport_get_data_type (const struct DDS_DynamicDataTypeSupport *self)

Get the DDS_TypeCode (p. 1463) wrapped by this DDS_-DynamicDataTypeSupport (p. 539).

^ DDS_DynamicData * DDS_DynamicDataTypeSupport_create_data (struct DDS_DynamicDataTypeSupport *self)

Create a new DDS_DynamicData (p. 1189) sample initialized with the DDS_TypeCode (p. 1463) and properties of this DDS_DynamicDataTypeSupport (p. 539).

Finalize and deallocate the DDS_DynamicData (p. 1189) sample.

^ void DDS_DynamicDataTypeSupport_print_data (const struct DDS_DynamicDataTypeSupport *self, const DDS_DynamicData *a_data)

Print a string representation of the given sample to the given file.

^ DDS_ReturnCode_t DDS_DynamicDataTypeSupport_copy_data (const_struct_DDS_DynamicDataTypeSupport_*self, DDS_DynamicData *dest, const_DDS_DynamicData *source)

Deeply copy the given data samples.

^ DDS_ReturnCode_t DDS_DynamicDataTypeSupport_initialize_data (const struct DDS_DynamicDataTypeSupport *self, DDS_-DynamicData *a_data)

Initialize a DDS_DynamicData (p. 1189) object to a valid empty state.

^ DDS_ReturnCode_t DDS_DynamicDataTypeSupport_finalize_data (const struct DDS_DynamicDataTypeSupport *self, DDS_-DynamicData *a_data)

Clean up the internal state of this object to get it ready for deallocation, but don't deallocate the pointer.

Variables

^ struct DDS_DynamicDataProperty_t DDS_DYNAMIC_DATA_-PROPERTY_DEFAULT

Sentinel constant indicating default values for DDS_- - $DynamicDataProperty_-t$ (p. 1201).

struct DDS_DynamicDataTypeProperty_t DDS_DYNAMIC_-DATA_TYPE_PROPERTY_DEFAULT

Sentinel constant indicating default values for DDS_{-} - $DynamicDataTypeProperty_{-}t$ (p. 1204).

4.85.1 Detailed Description

<<eXtension>> (p. 950) The Dynamic Data API provides a way to interact with arbitrarily complex data types at runtime without the need for code generation.

This API allows you to define new data types, modify existing data types, and interact reflectively with samples. To use it, you will take the following steps:

1. Obtain a DDS_TypeCode (p. 1463) (see Type Code Support (p. 461)) that defines the type definition you want to use.

A DDS_TypeCode (p. 1463) includes a type's kind (DDS_TCKind (p. 476)), name, and members (that is, fields). You can create your own DDS_TypeCode (p. 1463) using the DDS_TypeCodeFactory (p. 1464) class – see, for example, the DDS_TypeCodeFactory_create_struct_tc (p. 503) method. Alternatively, you can use a remote DDS_TypeCode (p. 1463) that you discovered on the network (see Built-in Topics (p. 410)) or one generated by rtiddsgen (p. 969).

2. Wrap the DDS_TypeCode (p. 1463) in a DDS_-DynamicDataTypeSupport (p. 539) object.

See the constructor **DDS_DynamicDataTypeSupport_new** (p. 619). This object lets you connect the type definition to a **DDS_DomainParticipant** (p. 339) and manage data samples (of type **DDS_DynamicData** (p. 1189)).

3. Register the DDS_DynamicDataTypeSupport (p. 539) with one or more domain participants.

See **DDS_DynamicDataTypeSupport_register_type** (p. 620). This action associates the data type with a logical name that you can use to create topics. (Starting with this step, working with a dynamically defined data type is almost exactly the same as working with a generated one.)

4. Create a DDS_Topic (p. 425) from the DDS_DomainParticipant (p. 339).

Use the name under which you registered your data type – see **DDS_DomainParticipant_create_topic** (p. 374). This **DDS_Topic** (p. 425) is what you will use to produce and consume data.

5. Create a DDS_DynamicDataWriter (p. 538) and/or DDS_DynamicDataReader (p. 538).

These objects will produce and/or consume data (of type DDS_DynamicData (p.1189)) on the DDS_Topic (p.425). You can create these objects directly from the DDS_DomainParticipant (p.339) – see DDS_DomainParticipant_create_datawriter (p.367) and DDS_DomainParticipant_create_datareader (p.371) – or by first creating intermediate DDS_Publisher (p.632) and DDS_Subscriber (p.743) objects – see DDS_DomainParticipant_create_publisher (p.361) and DDS_DomainParticipant_create_subscriber (p.364).

- 6. Write and/or read the data of interest.
- 7. Tear down the objects described above.

You should delete them in the reverse order in which you created them. Note that unregistering your data type with the **DDS_DomainParticipant** (p. 339) is optional; all types are automatically unregistered when the **DDS_DomainParticipant** (p. 339) itself is deleted.

4.85.2 Define Documentation

4.85.2.1 #define DDS_DynamicDataProperty_t_INITIALIZER

Static initializer for DDS_DynamicDataProperty_t (p. 1201) objects.

Use this initializer to ensure that new properties objects don't have uninitialized contents.

struct DDS_DynamicDataProperty_t props = DDS_DynamicDataProperty_t_INITIALIZER;

See also:

DDS_DynamicDataProperty_t (p. 1201)

4.85.2.2 #define DDS_DYNAMIC_DATA_MEMBER_ID_-UNSPECIFIED

A sentinel value that indicates that no member ID is needed in order to perform some operation.

Most commonly, this constant will be used in "get" operations to indicate that a lookup should be performed based on a name, not on an ID.

See also:

DDS_DynamicDataMemberId (p. 538)

4.85.2.3 #define DDS_DynamicDataTypeProperty_t_-INITIALIZER

Static initializer for DDS_DynamicDataTypeProperty_t (p. 1204) objects.

Use this initializer to ensure that new properties objects don't have uninitialized contents.

```
struct DDS_DynamicDataTypeProperty_t props =
    DDS_DynamicDataTypeProperty_t_INITIALIZER;
```

See also:

DDS_DynamicDataTypeProperty_t (p. 1204)

4.85.3 Typedef Documentation

4.85.3.1 typedef DDS_Long DDS_DynamicDataMemberId

An integer that uniquely identifies some member of a data type within that type.

The range of a member ID is the range of an unsigned short integer, except for the value 0, which is reserved.

See also:

```
DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537)
```

4.85.3.2 typedef struct DDS_DynamicDataWriter DDS_DynamicDataWriter

```
Writes (publishes) objects of type DDS_DynamicData (p. 1189).
```

```
Instantiates DDS_DataWriter (p. 673) < DDS_DynamicData (p. 1189) > .
```

See also:

```
DDS_DataWriter (p. 673)
FooDataWriter (p. 1496)
DDS_DynamicData (p. 1189)
```

4.85.3.3 typedef struct DDS_DynamicDataReader DDS_DynamicDataReader

Reads (subscribes to) objects of type DDS_DynamicData (p. 1189).

 $Instantiates \ \mathtt{DDS_DataReader} \ \ (\mathtt{p.\,783}) < \mathbf{DDS_DynamicData} \ (\mathtt{p.\,1189}) > .$

See also:

```
DDS_DataReader (p. 783)
FooDataReader (p. 1495)
DDS_DynamicData (p. 1189)
```

4.85.3.4 typedef struct DDS_DynamicDataTypeSupport DDS_DynamicDataTypeSupport

A factory for registering a dynamically defined type and creating **DDS**₋-**DynamicData** (p. 1189) objects.

A DDS_DynamicDataTypeSupport (p. 539) has three roles:

- It associates a DDS_TypeCode (p. 1463) with policies for managing objects of that type. See the constructor, DDS_-DynamicDataTypeSupport_new (p. 619).
- 2. It registers its type under logical names with a DDS_DomainParticipant (p. 339). See DDS_-DynamicDataTypeSupport_register_type (p. 620).
- 3. It creates **DDS_DynamicData** (p. 1189) samples pre-initialized with the type and properties of the type support itself. See **DDS_DynamicDataTypeSupport_create_data** (p. 622).

4.85.4 Function Documentation

4.85.4.1 DDS_Boolean DDS_DynamicData_initialize (DDS_DynamicData * self, const DDS_TypeCode * type, const struct DDS_DynamicDataProperty_t * property)

Initialize a DDS_DynamicData (p. 1189) object to a valid empty state.

Use the constructor, **DDS_DynamicData_new** (p. 540), to allocate a new **DDS_DynamicData** (p. 1189) object on the heap. Use this method to initialize a **DDS_DynamicData** (p. 1189) object that is stored deeply, either within another object or on the stack.

When you're finished with the object, dispose of it with **DDS_DynamicData_-**finalize (p. 541).

```
struct DDS_DynamicData sample;
DDS_Boolean succeeded = DDS_DynamicData_initialize(
```

```
&sample, myType, myProperties);
/* Handle failure... */
/* Do something... */
DDS_DynamicData_finalize(&sample);

MT Safety:
    UNSAFE.

See also:
    DDS_DynamicData_finalize (p. 541)
    DDS_DynamicData_new (p. 540)
```

4.85.4.2 DDS_DynamicData* DDS_DynamicData_new (const DDS_TypeCode * type, const struct DDS_DynamicDataProperty_t * property)

The constructor for new DDS_DynamicData (p. 1189) objects.

This method returns a fully initialized object. It is *not* necessary to subsequently call **DDS_DynamicData_initialize** (p. 539).

If initialization fails, this method returns NULL.

The type parameter may be NULL. In that case, this **DDS_DynamicData** (p. 1189) must be *bound* with **DDS_DynamicData_bind_type** (p. 545) or **DDS_DynamicData_bind_complex_member** (p. 546) before it can be used.

If the **DDS_TypeCode** (p. 1463) is not NULL, the newly constructed **DDS_DynamicData** (p. 1189) object will retain a reference to it. It is *not* safe to delete the **DDS_TypeCode** (p. 1463) until all samples that use it have themselves been deleted.

In most cases, it is not necessary to call this constructor explicitly. Instead, use **DDS_DynamicDataTypeSupport_create_data** (p. 622), and the **DDS_TypeCode** (p. 1463) and properties will be specified for you. Using the factory method also ensures that the memory management contract documented above is followed correctly, because the **DDS_DynamicDataTypeSupport** (p. 539) object maintains the **DDS_TypeCode** (p. 1463) used by the samples it creates.

However you create a **DDS_DynamicData** (p. 1189) object, you must delete it when you are finished with it. If you choose to use this constructor, delete the object with the destructor: **DDS_DynamicData_delete** (p. 541).

```
struct DDS_DynamicData* sample = DDS_DynamicData_new(
          myType, myProperties);
/* Failure indicated by NULL return result. */
/* Do something... */
DDS_DynamicData_delete(sample);
```

Parameters:

```
type << in>> (p. 951) The type of which the new object will represent an object.
```

property <<in>> (p. 951) Properties that configure the behavior of the new object. Most users can simply use DDS_DYNAMIC_DATA_-PROPERTY_DEFAULT (p. 624).

See also:

```
DDS_DynamicData_initialize (p. 539)
DDS_DynamicData_delete (p. 541)
DDS_DynamicDataTypeSupport_create_data (p. 622)
```

4.85.4.3 void DDS_DynamicData_finalize (DDS_DynamicData * self)

Clean up the internal state of this object to get it ready for deallocation, but don't deallocate the pointer.

Use DDS_DynamicData_delete (p. 541) to clean up a DDS_DynamicData (p. 1189) object on the heap. Use this method to clean up a DDS_DynamicData (p. 1189) object that is stored deeply, either within another object or on the stack.

MT Safety:

UNSAFE.

See also:

```
DDS_DynamicData_delete (p. 541)
DDS_DynamicData_initialize (p. 539)
```

4.85.4.4 void DDS_DynamicData_delete (DDS_DynamicData * self)

Finalize and deallocate this **DDS_DynamicData** (p. 1189) sample.

This method fully finalizes the object. It is *not* necessary to previously call **DDS_DynamicData_finalize** (p. 541).

MT Safety:

UNSAFE.

See also:

```
DDS_DynamicData_finalize (p. 541)
DDS_DynamicData_new (p. 540)
```

4.85.4.5 DDS_ReturnCode_t DDS_DynamicData_copy (DDS_DynamicData * self, const DDS_DynamicData * src)

Deeply copy from the given object to this object.

MT Safety:

UNSAFE.

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

4.85.4.6 DDS_Boolean DDS_DynamicData_equal (const DDS_DynamicData * self, const DDS_DynamicData * other)

Indicate whether the contents of another **DDS_DynamicData** (p. 1189) sample are the same as those of this one.

This operation compares the data and type of existing members. The types of non-instantiated members may differ in sparse types.

MT Safety:

UNSAFE.

See also:

```
DDS_TK_SPARSE (p. 477)
```

4.85.4.7 DDS_ReturnCode_t DDS_DynamicData_clear_all_members (DDS_DynamicData * self)

Clear the contents of all data members of this object, including key members.

MT Safety:

UNSAFE.

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_clear_nonkey_members (p. 543)
DDS_DynamicData_clear_member (p. 543)
```

4.85.4.8 DDS_ReturnCode_t DDS_DynamicData_clear_nonkey_members (DDS_DynamicData * self)

Clear the contents of all data members of this object, not including key members. This method is only applicable to sparse value types.

MT Safety:

UNSAFE.

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_TK_SPARSE (p. 477)
DDS_DynamicData_clear_all_members (p. 542)
DDS_DynamicData_clear_member (p. 543)
```

4.85.4.9 DDS_ReturnCode_t DDS_DynamicData_clear_member (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id)

Clear the contents of a single data member of this object.

This method is only applicable to sparse value types.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

```
member\_name << in>> (p. 951) The name of the member or NULL to look up the member by its ID.
```

```
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_TK_SPARSE (p. 477)
DDS_DynamicData_clear_all_members (p. 542)
DDS_DynamicData_clear_nonkey_members (p. 543)
```

Delete a field

4.85.4.10 DDS_ReturnCode_t DDS_DynamicData_print (const DDS_DynamicData * self, FILE * fp, int indent)

Output a textual representation of this object and its contents to the given file.

This method is equivalent to DDS_DynamicDataTypeSupport_print_data (p. 623).

Warning: This operation may not display any data for members at the end of a data structure that have not been explicitly set before the data sample is serialized. This will not be a problem on a received data sample, which should always correctly display all members.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. fp << in>> (p. 951) The file to which the object should be printed. indent << in>> (p. 951) The output of this method will be pretty-printed. This argument indicates the amount of initial indentation of the output.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicDataTypeSupport_print_data (p. 623)

4.85.4.11 void DDS_DynamicData_get_info (const DDS_DynamicData * self, struct DDS_DynamicDataInfo * info_out)

Fill in the given descriptor with information about this **DDS_DynamicData** (p. 1189).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. info\_out << out>> (p. 951) The descriptor object whose contents will be overwritten by this operation.
```

4.85.4.12 DDS_ReturnCode_t DDS_DynamicData_bind_type (DDS_DynamicData * self, const DDS_TypeCode * type)

If this **DDS_DynamicData** (p. 1189) object is not yet associated with a data type, set that type now to the given **DDS_TypeCode** (p. 1463).

This advanced operation allows you to reuse a single **DDS_DynamicData** (p. 1189) object with multiple data types.

```
struct DDS_DynamicData* myData = DDS_DynamicData_new(NULL, myProperties);
DDS_TypeCode* myType = ...;
DDS_DynamicData_bind_type(myData, myType);
/* Do something... */
DDS_DynamicData_unbind_type(myData);
DDS_DynamicData_delete(myData);
```

Note that the **DDS_DynamicData** (p. 1189) object will retain a reference to the **DDS_TypeCode** (p. 1463) object you provide. It is *not* safe to delete the **DDS_TypeCode** (p. 1463) until after it is unbound.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. type << in>> (p. 951) The type to associate with this DDS_-DynamicData (p. 1189) object.
```

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
DDS_DynamicData_unbind_type (p. 546)
```

4.85.4.13 DDS_ReturnCode_t DDS_DynamicData_unbind_type (DDS_DynamicData * self)

Dissociate this **DDS_DynamicData** (p. 1189) object from any particular data type.

This step is necessary before the object can be associated with a new data type.

This operation clears all members as a side effect.

MT Safety:

UNSAFE.

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
DDS_DynamicData_bind_type (p. 545)
DDS_DynamicData_clear_all_members (p. 542)
```

4.85.4.14 DDS_ReturnCode_t DDS_DynamicData_bind_complex_member (DDS_DynamicData * self, DDS_DynamicData * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Use another **DDS_DynamicData** (p. 1189) object to provide access to a complex field of this **DDS_DynamicData** (p. 1189) object.

For example, consider the following data types:

```
struct MyFieldType {
    float theFloat;
};

struct MyOuterType {
    MyFieldType complexMember;
};
```

Suppose you have an instance of MyOuterType, and you would like to examine the contents of its member complexMember. To do this, you must bind another DDS_DynamicData (p. 1189) object to that member. This operation will bind the type code of the member to the provided DDS_DynamicData (p. 1189) object and perform additional initialization.

The following example demonstrates the usage pattern. Note that error handling has been omitted for brevity.

```
struct DDS_DynamicData* outer = ...;
float theFloatValue = 0;
struct DDS_DynamicData* toBeBound = DDS_DynamicData_new(NULL, myProperties);
DDS_DynamicData_bind_complex_member(
    outer,
    toBeBound,
    "complexMember",
    DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
DDS_DynamicData_get_float(
    toBeBound,
    &theFloat,
    "theFloat"
    DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

This operation is only permitted when the object toBeBound (named as in the example above) is not currently associated with any type, including already being bound to another member. You can see in the example that this object is created directly with the constructer and is not provided with a DDS_-TypeCode (p. 1463).

Only a single member of a given **DDS_DynamicData** (p. 1189) object may be bound at one time – however, members of members may be recursively bound to any depth. Furthermore, while the outer object has a bound member, it may only be modified through that bound member. That is, after calling this member, all "set" operations on the outer object will be disabled until **DDS_DynamicData_unbind_complex_member** (p. 548) has been called. Furthermore, any bound member must be unbound before a sample can be written or deleted.

This method is logically related to DDS_DynamicData_get_complex_member (p. 566) in that both allow you to examine the state of nested objects. They are different in an important way: this method provides a view into an outer object, such that any change made to the inner object will be reflected in the outer. But the DDS_DynamicData_get_complex_member (p. 566) operation copies the state of the nested object; changes to it will not be reflected in the source object.

Note that you can bind to a member of a sequence at an index that is past the current length of that sequence. In that case, this method behaves like a "set" method: it automatically lengthens the sequence (filling in default elements) to allow the bind to take place. See **Getters and Setters** (p. 1191).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. value\_out << out>> (p. 951) The object that you wish to bind to the
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_unbind_complex_member (p. 548)
DDS_DynamicData_get_complex_member (p. 566)
```

4.85.4.15 DDS_ReturnCode_t DDS_DynamicData_unbind_complex_member (DDS_DynamicData * self, DDS_DynamicData * value)

Tear down the association created by a DDS_DynamicData_bind_complex_member (p. 546) operation, committing any changes to the outer object since then.

Some changes to the outer object will not be observable until after you have performed this operation.

If you have called **DDS_DynamicData_bind_complex_member** (p. 546) on a data sample, you must unbind before writing or deleting the sample.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. value << in>> (p. 951) The same object you passed to DDS_-DynamicData\_bind\_complex\_member (p. 546). This argument is used for error checking purposes.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_bind_complex_member (p. 546)

4.85.4.16 const DDS_TypeCode* DDS_DynamicData_get_type (const DDS_DynamicData * self)

Get the data type, of which this **DDS_DynamicData** (p. 1189) represents an instance.

MT Safety:

UNSAFE.

4.85.4.17 DDS_TCKind DDS_DynamicData_get_type_kind (const DDS_DynamicData * self)

Get the kind of this object's data type.

This is a convenience method. It's equivalent to calling DDS_DynamicData_get_type (p. 549) followed by DDS_TypeCode_kind (p. 477).

MT Safety:

UNSAFE.

4.85.4.18 DDS_UnsignedLong DDS_DynamicData_get_member_count (const DDS_DynamicData * self)

Get the number of members in this sample.

For objects of type kind $\mathbf{DDS_TK_ARRAY}$ (p. 477) or $\mathbf{DDS_TK_SEQUENCE}$ (p. 477), this method returns the number of elements in the collection.

For objects of type kind **DDS_TK_STRUCT** (p. 476) or **DDS_TK_VALUE** (p. 477), it returns the number of fields in the sample, which will always be the same as the number of fields in the type.

For objects of type kind **DDS_TK_SPARSE** (p. 477), it returns the number of fields in the sample, which may be less than or equal to the number of fields in the type.

MT Safety:

UNSAFE.

See also:

DDS_DynamicData_get_member_info_by_index (p. 552)

4.85.4.19 DDS_Boolean DDS_DynamicData_member_exists (const DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id)

Indicates whether a member of a particular name/ID exists in this data sample. Only one of the name and/or ID need by specified.

For objects of type kinds other than **DDS_TK_SPARSE** (p. 477), the result of this method will always be the same as that of **DDS_DynamicData_member_exists_in_type** (p. 551).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

See also:

```
DDS_DynamicData_member_exists_in_type (p. 551)
DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537)
```

4.85.4.20 DDS_Boolean DDS_DynamicData_member_exists_in_type (const DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id)

Indicates whether a member of a particular name/ID exists in this data sample's type.

Only one of the name and/or ID need by specified.

For objects of type kinds other than **DDS_TK_SPARSE** (p. 477), the result of this method will always be the same as that of **DDS_DynamicData_member_exists** (p. 550).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

See also:

```
DDS_DynamicData_member_exists (p. 550)
DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537)
```

4.85.4.21 DDS_ReturnCode_t DDS_DynamicData_get_member_info (const DDS_DynamicData * self, struct DDS_DynamicDataMemberInfo * info, const char * member_name, DDS_DynamicDataMemberId member_id)

Fill in the given descriptor with information about the identified member of this **DDS_DynamicData** (p. 1189) sample.

This operation is valid for objects of DDS_TCKind (p. 476) DDS_TK_-ARRAY (p. 477), DDS_TK_SEQUENCE (p. 477), DDS_TK_STRUCT (p. 476), DDS_TK_VALUE (p. 477), and DDS_TK_SPARSE (p. 477).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

info << out>> (p. 951) The descriptor object whose contents will be overwritten by this operations.

member_name <<in>>> (p. 951) The name of the member for which to get the info or NULL to look up the member by its ID. Only one of the name and the ID may be unspecified.

member_id <<in>> (p. 951) The ID of the member for which to get the info, or DDS_DYNAMIC_DATA_MEMBER_ID_-UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicData_get_member_info_by_index (p. 552)
DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537)

4.85.4.22 DDS_ReturnCode_t DDS_DynamicData_get_member_info_by_index (const DDS_DynamicData * self, struct DDS_DynamicDataMemberInfo * info, DDS_UnsignedLong index)

Fill in the given descriptor with information about the identified member of this **DDS_DynamicData** (p. 1189) sample.

This operation is valid for objects of DDS_TCKind (p. 476) DDS_TK_-ARRAY (p. 477), DDS_TK_SEQUENCE (p. 477), DDS_TK_STRUCT (p. 476), DDS_TK_VALUE (p. 477), and DDS_TK_SPARSE (p. 477).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

info << out>> (p. 951) The descriptor object whose contents will be overwritten by this operations.

index << in>> (p. 951) The zero-based of the member for which to get the info.

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_get_member_info (p. 551)
DDS_DynamicData_get_member_count (p. 549)
DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537)
```

4.85.4.23 DDS_ReturnCode_t DDS_DynamicData_get_member_type (const DDS_DynamicData * self, const
DDS_TypeCode ** type_out, const char * member_name,
DDS_DynamicDataMemberId member_id)

Get the type of the given member of this sample.

The member can be looked up either by name or by ID.

This operation is valid for objects of DDS_TCKind (p. 476) DDS_TK_-ARRAY (p. 477), DDS_TK_SEQUENCE (p. 477), DDS_TK_STRUCT (p. 476), DDS_TK_VALUE (p. 477), and DDS_TK_SPARSE (p. 477). For type kinds DDS_TK_ARRAY (p. 477) and DDS_TK_SEQUENCE (p. 477), the index into the collection is taken to be one less than the ID, if specified. If this index is valid, this operation will return the content type of this collection.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $type_out << out>> (p. 951)$ If this method returned success, this argument refers to the found member's type. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_get_member_info (p. 551)
DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537)
```

4.85.4.24 DDS_ReturnCode_t DDS_DynamicData_is_member_key (const DDS_DynamicData * self, DDS_Boolean * is_key_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Indicates whether a given member forms part of the key of this sample's data type.

This operation is only valid for samples of types of kind DDS_TK_STRUCT (p. 476), DDS_TK_VALUE (p. 477), or DDS_TK_SPARSE (p. 477).

Note to users of sparse types: A key member may only have a single representation and is required to exist in every sample.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

is_key_out <<out>> (p. 951) If this method returned success, this argument indicates whether the indicated member is part of the key. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

 $\begin{array}{lll} 4.85.4.25 & DDS_ReturnCode_t \ DDS_DynamicData_get_long \ (const \ DDS_DynamicData * self, \ DDS_Long * value_out, \ const \ char * member_name, \ DDS_DynamicDataMemberId \\ member_id) \end{array}$

Get the value of the given field, which is of type **DDS_Long** (p. 108) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

value_out <<out>< (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DynamicData_set_long (p. 587)

4.85.4.26 DDS_ReturnCode_t DDS_DynamicData_get_short (const DDS_DynamicData * self, DDS_Short * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_Short** (p. 107) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

value_out <<out>>> (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicData_set_short (p. 588)

4.85.4.27 DDS_ReturnCode_t DDS_DynamicData_get_ulong (const DDS_DynamicData * self, DDS_UnsignedLong * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_UnsignedLong** (p. 108) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

value_out <<out>> (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicData_set_ulong (p. 589)

4.85.4.28 DDS_ReturnCode_t DDS_DynamicData_get_ushort (const DDS_DynamicData * self, DDS_UnsignedShort * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_UnsignedShort** (p. 107) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

value_out <<out>>> (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicData_set_ushort (p. 589)

4.85.4.29 DDS_ReturnCode_t DDS_DynamicData_get_float (const DDS_DynamicData * self, DDS_Float * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_Float** (p. 108) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

value_out <<out>> (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DynamicData_set_float (p. 590)

4.85.4.30 DDS_ReturnCode_t DDS_DynamicData_get_double (const DDS_DynamicData * self, DDS_Double * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_Double** (p. 108) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self <<\!\!in\!\!>> (p. 951) Cannot be NULL.
```

 $value_out << out>>$ (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DynamicData_set_double (p. 591)

4.85.4.31 DDS_ReturnCode_t DDS_DynamicData_get_boolean (const DDS_DynamicData * self, DDS_Boolean * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_Boolean** (p. 109). The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

value_out <<out>< (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.</pre>

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicData_set_boolean (p. 591)

4.85.4.32 DDS_ReturnCode_t DDS_DynamicData_get_char (const DDS_DynamicData * self, DDS_Char * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_Char** (p. 107) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

value_out <<out>< (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.</pre>

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DynamicData_set_char (p. 592)

4.85.4.33 DDS_ReturnCode_t DDS_DynamicData_get_octet (const DDS_DynamicData * self, DDS_Octet * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type $\mathbf{DDS_Octet}$ (p. 107) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

value_out <<out>< (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.</pre>

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicData_set_octet (p. 593)

4.85.4.34 DDS_ReturnCode_t DDS_DynamicData_get_longlong (const DDS_DynamicData * self, DDS_LongLong * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_LongLong** (p. 108) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

value_out <<out>> (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_DynamicData_set_longlong (p. 593)

4.85.4.35 DDS_ReturnCode_t DDS_DynamicData_get_ulonglong (const DDS_DynamicData * self,
DDS_UnsignedLongLong * value_out, const char
* member_name, DDS_DynamicDataMemberId
member_id)

Get the value of the given field, which is of type **DDS_UnsignedLongLong** (p. 108) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $value_out << out>>$ (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DynamicData_set_ulonglong (p. 594)

4.85.4.36 DDS_ReturnCode_t DDS_DynamicData_get_longdouble (const DDS_DynamicData * self, DDS_LongDouble * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_LongDouble** (p. 108) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

value_out <<out>>> (p. 951) If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DynamicData_set_longdouble (p. 595)

4.85.4.37 DDS_ReturnCode_t DDS_DynamicData_get_wchar (const DDS_DynamicData * self, DDS_Wchar * value_out, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type **DDS_Wchar** (p. 107) or another type implicitly convertible to it.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $value_out << out>> (p. 951)$ If this method returned success, this argument will contain the value of the indicated member. It cannot be NULL.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DynamicData_set_wchar (p. 595)

4.85.4.38 DDS_ReturnCode_t DDS_DynamicData_get_string (const DDS_DynamicData * self, char ** value, DDS_UnsignedLong * size, const char * member_name, DDS_DynamicDataMemberId member_id)

Get the value of the given field, which is of type char*.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

value <<out>< (p. 951)</p>
The string into which the middleware should copy the string member. The allocated size of this string is indicated by size argument. If the size is sufficient to hold the contents of the member, they will be copied into this string. If value is a pointer to NULL, the middleware will allocate a new string for you of sufficient length; it will be your responsibility to free that string. If the size is insufficient but greater than zero, the middleware will not free your string; instead, this operation will fail and size will contain the minimum required size.

size <<inout>> (p. 951) As an input argument, the allocated size of the string. As an output argument, the actual size of the contents.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_String_alloc (p. 287)
DDS_String_free (p. 288)
DDS_DynamicData_set_string (p. 596)
```

 $\begin{array}{lll} 4.85.4.39 & DDS_ReturnCode_t \ DDS_DynamicData_get_wstring \\ & (const \ DDS_DynamicData * \textit{self}, \ \ DDS_Wchar ** \textit{value}, \\ & DDS_UnsignedLong * \textit{size}, \ \ const \ char * \textit{member_name}, \\ & DDS_DynamicDataMemberId \ \textit{member_id}) \end{array}$

Get the value of the given field, which is of type **DDS_Wchar** (p. 107)*.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

value <<out>< (p. 951)</p>
The string into which the middleware should copy the string member. The allocated size of this string is indicated by size argument. If the size is sufficient to hold the contents of the member, they will be copied into this string. If value is a pointer to NULL, the middleware will allocate a new string for you of sufficient length; it will be your responsibility to free that string. If the size is insufficient but greater than zero, the middleware will not free your string; instead, this operation will fail and size will contain the minimum required size.

size <<iinout>> (p. 951) As an input argument, the allocated size of the string. As an output argument, the actual size of the contents.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_String_alloc (p. 287)

```
DDS_String_free (p. 288)
DDS_DynamicData_set_wstring (p. 597)
```

4.85.4.40 DDS_ReturnCode_t DDS_DynamicData_get_complex_member (const DDS_DynamicData *
self, DDS_DynamicData * value_out, const char
* member_name, DDS_DynamicDataMemberId
member_id)

Get a copy of the value of the given field, which is of some composed type.

The member may be of type kind DDS_TK_ARRAY (p. 477), DDS_TK_-SEQUENCE (p. 477), DDS_TK_STRUCT (p. 476), DDS_TK_VALUE (p. 477), DDS_TK_UNION (p. 476), or DDS_TK_SPARSE (p. 477). It may be specified by name or by ID.

This method is logically related to **DDS_DynamicData_bind_complex_member** (p. 546) in that both allow you to examine the state of nested objects. They are different in an important way: this method provides a *copy* of the data; changes to it will not be reflected in the source object.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

value_out <<out>< (p. 951)</p>
The DDS_DynamicData (p. 1189) sample whose contents will be overwritten by this operation. This object must not be a bound member of another DDS_DynamicData (p. 1189) sample.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_set_complex_member (p. 597) DDS_DynamicData_bind_complex_member (p. 546) 4.85.4.41 DDS_ReturnCode_t DDS_DynamicData_get_long_array (const DDS_DynamicData * self, DDS_Long * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_LongSeq** (p. 1268).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

array <<out>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_set_long_array (p. 599)
DDS_DynamicData_get_long_seq (p. 578)
```

4.85.4.42 DDS_ReturnCode_t DDS_DynamicData_get_short_array (const DDS_DynamicData * self, DDS_Short * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_ShortSeq** (p. 1398).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

array << out>> (p. 951) An already-allocated array, into which the elements will be copied.

length << inout>> (p. 951) As an input, the allocated length of array. As an output, the number of elements that were copied.

 $member_name <<\!\!in>\!\!>$ (p. 951) The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_set_short_array (p. 600)
DDS_DynamicData_get_short_seq (p. 578)
```

4.85.4.43 DDS_ReturnCode_t DDS_DynamicData_get_ulong_array (const DDS_DynamicData * self, DDS_UnsignedLong * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS**_-**UnsignedLongSeq** (p. 1472).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

array << out>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_set_ulong_array (p. 601)
DDS_DynamicData_get_ulong_seq (p. 579)
```

4.85.4.44 DDS_ReturnCode_t DDS_DynamicData_get_ushort_array (const DDS_DynamicData * self, DDS_UnsignedShort * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from DDS_-UnsignedShortSeq (p. 1473).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

array <<out>>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_set_ushort_array (p. 601)
DDS_DynamicData_get_ushort_seq (p. 580)
```

 $\begin{array}{lll} 4.85.4.45 & DDS_ReturnCode_t \ DDS_DynamicData_get_float_array \\ & (const \ DDS_DynamicData * \textit{self}, \ DDS_Float * \textit{array}, \\ & DDS_UnsignedLong * \textit{length}, \ const \ char * \textit{member_name}, \\ & DDS_DynamicDataMemberId \ \textit{member_id}) \end{array}$

Get a copy of the given array member.

This method will perform an automatic conversion from $\mathbf{DDS_FloatSeq}$ (p. 1219).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

array << out>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_set_float_array (p. 602)
DDS_DynamicData_get_float_seq (p. 581)
```

4.85.4.46 DDS_ReturnCode_t DDS_DynamicData_get_double_array (const DDS_DynamicData * self, DDS_Double * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_DoubleSeq** (p. 1180).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

array << out >> (p. 951) An already-allocated array, into which the elements will be copied.

length << inout>> (p. 951) As an input, the allocated length of array. As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_set_double_array (p. 603)
DDS_DynamicData_get_double_seq (p. 581)
```

4.85.4.47 DDS_ReturnCode_t DDS_DynamicData_get_boolean_array (const DDS_DynamicData * self, DDS_Boolean
* array, DDS_UnsignedLong * length, const char
* member_name, DDS_DynamicDataMemberId
member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_BooleanSeq** (p. 1044).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

array << out>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_set_boolean_array (p. 604)
DDS_DynamicData_get_boolean_seq (p. 582)
```

4.85.4.48 DDS_ReturnCode_t DDS_DynamicData_get_char_array (const DDS_DynamicData * self, DDS_Char * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_CharSeq** (p. 1052).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

array <<out>>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_set_char_array (p. 605)
DDS_DynamicData_get_char_seq (p. 583)
```

4.85.4.49 DDS_ReturnCode_t DDS_DynamicData_get_octet_array (const DDS_DynamicData * self, DDS_Octet * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_OctetSeq** (p. 1273).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

array << out>> (p. 951) An already-allocated array, into which the elements will be copied.

length << inout>> (p. 951) As an input, the allocated length of array. As an output, the number of elements that were copied.

 $member_name <<\!\!in>\!\!>$ (p. 951) The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_set_octet_array (p. 605)
DDS_DynamicData_get_octet_seq (p. 584)
```

4.85.4.50 DDS_ReturnCode_t DDS_DynamicData_get_longlong_array (const DDS_DynamicData * self, DDS_LongLong * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_LongLongSeq** (p. 1267).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

array << out>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_set_longlong_array (p. 606)
DDS_DynamicData_get_longlong_seq (p. 584)
```

4.85.4.51 DDS_ReturnCode_t DDS_DynamicData_get_ulonglong_array (const DDS_DynamicData

* self, DDS_UnsignedLongLong * array,
DDS_UnsignedLong * length, const char * member_name,
DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from DDS_-UnsignedLongLongSeq (p. 1471).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

array <<out>>> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_set_ulonglong_array (p. 607)
DDS_DynamicData_get_ulonglong_seq (p. 585)
```

4.85.4.52 DDS_ReturnCode_t DDS_DynamicData_get_longdouble_array (const DDS_DynamicData * self, DDS_LongDouble
 * array, DDS_UnsignedLong * length, const char
 * member_name, DDS_DynamicDataMemberId
 member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS**_-**LongDoubleSeq** (p. 1266).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

array << out >> (p. 951) An already-allocated array, into which the elements will be copied.

length <<iinout>> (p. 951) As an input, the allocated length of array.
As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DynamicData_set_longdouble_array (p. 608)
DDS_DynamicData_get_longdouble_seq (p. 586)
```

4.85.4.53 DDS_ReturnCode_t DDS_DynamicData_get_wchar_array (const DDS_DynamicData * self, DDS_Wchar * array, DDS_UnsignedLong * length, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_WcharSeq** (p. 1482).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

array << out >> (p. 951) An already-allocated array, into which the elements will be copied.

length << inout>> (p. 951) As an input, the allocated length of array. As an output, the number of elements that were copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DynamicData_set_wchar_array (p. 609)
DDS_DynamicData_get_wchar_seq (p. 587)
```

4.85.4.54 DDS_ReturnCode_t DDS_DynamicData_get_long_seq (const DDS_DynamicData * self, struct DDS_LongSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of $\mathbf{DDS_Long}$ (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

seq << out>> (p. 951) A sequence, into which the elements will be copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

See also:

```
DDS_DynamicData_set_long_seq (p. 610)
DDS_DynamicData_get_long_array (p. 567)
```

4.85.4.55 DDS_ReturnCode_t DDS_DynamicData_get_short_seq (const DDS_DynamicData * self, struct DDS_ShortSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_-Short (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
seq <<out>> (p. 951) A sequence, into which the elements will be copied.
member_name <<iin>> (p. 951) The name of the member or NULL to look up the member by its ID.
member_id <<iin>> (p. 951) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_set_short_seq (p. 610)
DDS_DynamicData_get_short_array (p. 567)
```

4.85.4.56 DDS_ReturnCode_t DDS_DynamicData_get_ulong_seq (const DDS_DynamicData * self, struct DDS_UnsignedLongSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_-UnsignedLong (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $seq << out >> (\text{p. }951) \text{ A sequence, into which the elements will be copied.} \\ member_name << in >> (\text{p. }951) \text{ The name of the member or NULL to look up the member by its ID.}$

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_set_ulong_seq (p. 611) DDS_DynamicData_get_ulong_array (p. 568)

4.85.4.57 DDS_ReturnCode_t DDS_DynamicData_get_ushort_seq (const DDS_DynamicData * self, struct DDS_UnsignedShortSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_-UnsignedShort (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $seq \ll out \gg (p. 951)$ A sequence, into which the elements will be copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_set_ushort_seq (p. 612)
DDS_DynamicData_get_ushort_array (p. 569)
```

4.85.4.58 DDS_ReturnCode_t DDS_DynamicData_get_float_seq (const DDS_DynamicData * self, struct DDS_FloatSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of **DDS_Float** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. seq << out>> (p. 951) A sequence, into which the elements will be copied. member\_name << in>> (p. 951) The name of the member or NULL to look up the member by its ID. member\_id << in>> (p. 951) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
```

look up by name. See Member Names and IDs (p. 1189).

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

See also:

```
DDS_DynamicData_set_float_seq (p. 613)
DDS_DynamicData_get_float_array (p. 570)
```

4.85.4.59 DDS_ReturnCode_t DDS_DynamicData_get_double_seq (const DDS_DynamicData * self, struct DDS_DoubleSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_{-} Double (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
seq <<out>> (p. 951) A sequence, into which the elements will be copied.
member_name <<in>> (p. 951) The name of the member or NULL to look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).
```

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

See also:

```
DDS_DynamicData_set_double_seq (p. 613)
DDS_DynamicData_get_double_array (p. 571)
```

4.85.4.60 DDS_ReturnCode_t DDS_DynamicData_get_boolean_seq (const DDS_DynamicData * self, struct DDS_BooleanSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of **DDS**_**Boolean** (p. 109).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

seq << out>> (p. 951) A sequence, into which the elements will be copied. $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_set_boolean_seq (p. 614) DDS_DynamicData_get_boolean_array (p. 572)

4.85.4.61 DDS_ReturnCode_t DDS_DynamicData_get_char_seq (const DDS_DynamicData * self, struct DDS_CharSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of **DDS_Char** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

seq << out>> (p. 951) A sequence, into which the elements will be copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_set_char_seq (p. 615)
DDS_DynamicData_get_char_array (p. 573)
```

4.85.4.62 DDS_ReturnCode_t DDS_DynamicData_get_octet_seq (const DDS_DynamicData * self, struct DDS_OctetSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_-Octet (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

seq << out>> (p. 951) A sequence, into which the elements will be copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

See also:

```
DDS_DynamicData_set_octet_seq (p. 616)
DDS_DynamicData_get_octet_array (p. 573)
```

4.85.4.63 DDS_ReturnCode_t DDS_DynamicData_get_longlong_seq (const DDS_DynamicData * self, struct DDS_LongLongSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_-LongLong (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
seq <<out>> (p. 951) A sequence, into which the elements will be copied.
member_name <<iin>> (p. 951) The name of the member or NULL to look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
\begin{array}{l} \mathbf{DDS\_DynamicData\_set\_longlong\_seq} \ (\mathrm{p.} \ \underline{\mathbf{616}}) \\ \mathbf{DDS\_DynamicData\_get\_longlong\_array} \ (\mathrm{p.} \ \underline{\mathbf{574}}) \end{array}
```

4.85.4.64 DDS_ReturnCode_t DDS_DynamicData_get_ulonglong_seq (const DDS_DynamicData * self, struct DDS_UnsignedLongLongSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_-UnsignedLong (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $seq <<\!out>> (p. \frac{951}{}) \text{ A sequence, into which the elements will be copied.} \\ member_name <<\!in>> (p. \frac{951}{}) \text{ The name of the member or NULL to look up the member by its ID.}$

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_set_ulonglong_seq (p. 617) DDS_DynamicData_get_ulonglong_array (p. 575)

4.85.4.65 DDS_ReturnCode_t DDS_DynamicData_get_longdouble_seq (const DDS_DynamicData * self, struct DDS_LongDoubleSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of **DDS_-LongDouble** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

seq <<out>> (p. 951) A sequence, into which the elements will be copied.

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_set_longdouble_seq (p. 618)
DDS_DynamicData_get_longdouble_array (p. 576)
```

4.85.4.66 DDS_ReturnCode_t DDS_DynamicData_get_wchar_seq (const DDS_DynamicData * self, struct DDS_WcharSeq * seq, const char * member_name, DDS_DynamicDataMemberId member_id)

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of DDS_{-} -Wchar (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
seq <<out>> (p. 951) A sequence, into which the elements will be copied.
member_name <<in>> (p. 951) The name of the member or NULL to
look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
```

look up by name. See Member Names and IDs (p. 1189).

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_set_wchar_seq (p. 619)
DDS_DynamicData_get_wchar_array (p. 577)
```

4.85.4.67 DDS_ReturnCode_t DDS_DynamicData_set_long (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_Long value)

Set the value of the given field, which is of type **DDS_Long** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_get_long (p. 554)

4.85.4.68 DDS_ReturnCode_t DDS_DynamicData_set_short (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_Short value)

Set the value of the given field, which is of type **DDS_Short** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_short (p. 555)

4.85.4.69 DDS_ReturnCode_t DDS_DynamicData_set_ulong (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong value)

Set the value of the given field, which is of type **DDS_UnsignedLong** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_- OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_ulong (p. 556)

4.85.4.70 DDS_ReturnCode_t DDS_DynamicData_set_ushort (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedShort value)

Set the value of the given field, which is of type **DDS_UnsignedShort** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_get_ushort (p. 557)

4.85.4.71 DDS_ReturnCode_t DDS_DynamicData_set_float (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_Float value)

Set the value of the given field, which is of type **DDS_Float** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_float (p. 557)

 $\begin{array}{lll} 4.85.4.72 & DDS_ReturnCode_t & DDS_DynamicData_set_double \\ & (DDS_DynamicData * \textit{self}, & const & char * \textit{member_name}, \\ & & DDS_DynamicDataMemberId & \textit{member_id}, & DDS_Double \\ & & \textit{value}) \end{array}$

Set the value of the given field, which is of type **DDS_Double** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

member_name <<in>> (p. 951) The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_- OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_double (p. 558)

 $\begin{array}{lll} 4.85.4.73 & DDS_ReturnCode_t \ DDS_DynamicData_set_boolean \\ & (DDS_DynamicData * \textit{self}, \ const \ char * \textit{member_name}, \\ & DDS_DynamicDataMemberId \ \textit{member_id}, \ DDS_Boolean} \\ & \textit{value}) \end{array}$

Set the value of the given field, which is of type **DDS_Boolean** (p. 109).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_get_boolean (p. 559)

4.85.4.74 DDS_ReturnCode_t DDS_DynamicData_set_char (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_Char value)

Set the value of the given field, which is of type **DDS_Char** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_char (p. 559)

4.85.4.75 DDS_ReturnCode_t DDS_DynamicData_set_octet (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_Octet value)

Set the value of the given field, which is of type **DDS_Octet** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

member_name <<in>> (p. 951) The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_- OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_octet (p. 560)

4.85.4.76 DDS_ReturnCode_t DDS_DynamicData_set_longlong (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_LongLong value)

Set the value of the given field, which is of type **DDS_LongLong** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_get_longlong (p. 561)

 $\begin{array}{lll} 4.85.4.77 & DDS_ReturnCode_t \ DDS_DynamicData_set_ulonglong \\ & (DDS_DynamicData * \textit{self}, \ const \ char * \textit{member_name}, \\ & DDS_DynamicDataMemberId \ \textit{member_id}, \\ & DDS_UnsignedLongLong \ \textit{value}) \end{array}$

Set the value of the given field, which is of type **DDS_UnsignedLongLong** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_ulonglong (p. 562)

4.85.4.78 DDS_ReturnCode_t DDS_DynamicData_set_longdouble (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_LongDouble value)

Set the value of the given field, which is of type **DDS_LongDouble** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_get_longdouble (p. 562)

4.85.4.79 DDS_ReturnCode_t DDS_DynamicData_set_wchar (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_Wchar value)

Set the value of the given field, which is of type **DDS_Wchar** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

DDS_DynamicData_get_char (p. 559)

4.85.4.80 DDS_ReturnCode_t DDS_DynamicData_set_string (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const char * value)

Set the value of the given field of type char*.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_string (p. 564)

4.85.4.81 DDS_ReturnCode_t DDS_DynamicData_set_wstring (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const DDS_Wchar * value)

Set the value of the given field of type **DDS_Wchar** (p. 107)*.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << in>> (p. 951) The value to which to set the member.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_- OUT_OF_RESOURCES** (p. 121)

See also:

DDS_DynamicData_get_wstring (p. 565)

4.85.4.82 DDS_ReturnCode_t DDS_DynamicData_set_complex_member (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const DDS_DynamicData * value)

Copy the state of the given **DDS_DynamicData** (p. 1189) object into a member of this object.

The member may be of type kind DDS_TK_ARRAY (p. 477), DDS_TK_-SEQUENCE (p. 477), DDS_TK_STRUCT (p. 476), DDS_TK_VALUE (p. 477), DDS_TK_UNION (p. 476), or DDS_TK_SPARSE (p. 477). It may be specified by name or by ID.

Example: Copying Data

This method can be used with DDS_DynamicData_bind_complex_member (p. 546) to copy from one DDS_DynamicData (p. 1189) object to another efficiently. Suppose the following data structure:

```
struct Bar {
      short theShort;
};

struct Foo {
    Bar theBar;
};
```

Support we have two instances of Foo (p. 1494): foo_dst and foo_src. We want to replace the contents of foo_dst.theBar with the contents of foo_src.theBar. Error handling has been omitted for the sake of brevity.

```
struct DDS_DynamicData* foo_dst = ...;
struct DDS_DynamicData* foo_src = ...;
struct DDS_DynamicData* bar = DDS_DynamicData_new(NULL, myProperties);
 /* Point to the source of the copy: */
DDS_DynamicData_bind_complex_member(
     foo_src,
     "theBar"
     DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED,
     bar);
 /* Just one copy: */
DDS_DynamicData_set_complex_member(
     foo_dst,
     "theBar",
     DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED,
     bar);
 /* Tear down: */
DDS_DynamicData_unbind_complex_member(foo_src, bar);
free(bar);
```

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

```
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).
```

value <<iin>>> (p. 951) The source DDS_DynamicData (p. 1189) object whose contents will be copied.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_complex_member (p. 566)
DDS_DynamicData_bind_complex_member (p. 546)
```

4.85.4.83 DDS_ReturnCode_t DDS_DynamicData_set_long_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Long * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS_LongSeq** (p. 1268).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

```
length <<in>> (p. 951) The length of array. array <<in>> (p. 951) The elements to copy.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_long_array (p. 567)
DDS_DynamicData_set_long_seq (p. 610)
```

4.85.4.84 DDS_ReturnCode_t DDS_DynamicData_set_short_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Short * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS_ShortSeq** (p. 1398).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

```
length <<in>>> (p. 951) The length of array.
```

```
array << in>> (p. 951) The elements to copy.
```

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

```
DDS_DynamicData_get_short_array (p. 567)
DDS_DynamicData_set_short_seq (p. 610)
```

4.85.4.85 DDS_ReturnCode_t DDS_DynamicData_set_ulong_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_UnsignedLong * array)

Set the contents of the given array member.

This method will perform an automatic conversion to DDS_-UnsignedLongSeq (p. 1472).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

```
length <<in>> (p. 951) The length of array. array <<in>> (p. 951) The elements to copy.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_ulong_array (p. 568)
DDS_DynamicData_set_ulong_seq (p. 611)
```

4.85.4.86 DDS_ReturnCode_t DDS_DynamicData_set_ushort_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_UnsignedShort * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS**_-**UnsignedShortSeq** (p. 1473).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
member_name <<in>> (p. 951) The name of the member or NULL to
look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).
length <<in>> (p. 951) The length of array.
```

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

See also:

```
DDS_DynamicData_get_ushort_array (p. 569)
DDS_DynamicData_set_ushort_seq (p. 612)
```

array << in>> (p. 951) The elements to copy.

4.85.4.87 DDS_ReturnCode_t DDS_DynamicData_set_float_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Float * array)

Set the contents of the given array member.

This method will perform an automatic conversion to DDS_FloatSeq (p. 1219).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
member_name <<in>> (p. 951) The name of the member or NULL to
look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).
length <<in>> (p. 951) The length of array.
array <<in>> (p. 951) The elements to copy.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_float_array (p. 570)
DDS_DynamicData_set_float_seq (p. 613)
```

4.85.4.88 DDS_ReturnCode_t DDS_DynamicData_set_double_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Double * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS_DoubleSeq** (p. 1180).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
member_name <<in>> (p. 951) The name of the member or NULL to look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).
```

```
length << in>> (p. 951) The length of array. array << in>> (p. 951) The elements to copy.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_double_array (p. 571)
DDS_DynamicData_set_double_seq (p. 613)
```

4.85.4.89 DDS_ReturnCode_t DDS_DynamicData_set_boolean_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Boolean * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS_BooleanSeq** (p. 1044).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 member\_name << in>> (p. 951) The name of the member or NULL to look up the member by its ID.
```

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

```
length <<in>> (p. 951) The length of array. array <<in>> (p. 951) The elements to copy.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_boolean_array (p. 572)
DDS_DynamicData_set_boolean_seq (p. 614)
```

4.85.4.90 DDS_ReturnCode_t DDS_DynamicData_set_char_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Char * array)

Set the contents of the given array member.

This method will perform an automatic conversion to DDS_CharSeq (p. 1052).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
member_name <<in>> (p. 951) The name of the member or NULL to
look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).
length <<in>> (p. 951) The length of array.
array <<in>> (p. 951) The elements to copy.
```

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

See also:

```
DDS_DynamicData_get_char_array (p. 573)
DDS_DynamicData_set_char_seq (p. 615)
```

4.85.4.91 DDS_ReturnCode_t DDS_DynamicData_set_octet_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Octet * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS_OctetSeq** (p. 1273).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
member_name <<in>> (p. 951) The name of the member or NULL to look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).
length <<in>> (p. 951) The length of array.
array <<in>> (p. 951) The elements to copy.
```

Returns:

```
One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)
```

See also:

```
DDS_DynamicData_get_octet_array (p. 573)
DDS_DynamicData_set_octet_seq (p. 616)
```

4.85.4.92 DDS_ReturnCode_t DDS_DynamicData_set_longlong_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_LongLong * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS_LongLongSeq** (p. 1267).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
member_name <<in>> (p. 951) The name of the member or NULL to
look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).
length <<in>> (p. 951) The length of array.
array <<in>> (p. 951) The elements to copy.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_longlong_array (p. 574)
DDS_DynamicData_set_longlong_seq (p. 616)
```

4.85.4.93 DDS_ReturnCode_t DDS_DynamicData_set_ulonglong_array (DDS_DynamicData * self, const
char * member_name, DDS_DynamicDataMemberId
member_id, DDS_UnsignedLong length, const
DDS_UnsignedLongLong * array)

Set the contents of the given array member.

This method will perform an automatic conversion to $\mathbf{DDS}_{\text{--}}$ $\mathbf{UnsignedLongLongSeq}~(p.~1471).$

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
member_name <<iin>> (p. 951) The name of the member or NULL to look up the member by its ID.
member_id <<iin>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).
```

```
length << in>> (p. 951) The length of array. array << in>> (p. 951) The elements to copy.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_ulonglong_array (p. 575)
DDS_DynamicData_set_ulonglong_seq (p. 617)
```

4.85.4.94 DDS_ReturnCode_t DDS_DynamicData_set_longdouble_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_LongDouble * array)

Set the contents of the given array member.

This method will perform an automatic conversion to **DDS_LongDoubleSeq** (p. 1266).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
member_name <<in>> (p. 951) The name of the member or NULL to
look up the member by its ID.
member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).
length <<in>> (p. 951) The length of array.
array <<in>> (p. 951) The elements to copy.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_longdouble_array (p. 576)
DDS_DynamicData_set_longdouble_seq (p. 618)
```

4.85.4.95 DDS_ReturnCode_t DDS_DynamicData_set_wchar_array (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong length, const DDS_Wchar * array)

Set the contents of the given array member.

This method will perform an automatic conversion to DDS_WcharSeq (p. 1482).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters:

```
self <<in>>> (p. 951) Cannot be NULL.

member_name <<in>> (p. 951) The name of the member or NULL to
look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-
DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to
look up by name. See Member Names and IDs (p. 1189).

length <<in>> (p. 951) The length of array.

array <<in>> (p. 951) The elements to copy.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

```
DDS_DynamicData_get_wchar_array (p. 577)
DDS_DynamicData_set_wchar_seq (p. 619)
```

4.85.4.96 DDS_ReturnCode_t DDS_DynamicData_set_long_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_LongSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Long** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_long_seq (p. 578)
DDS_DynamicData_set_long_array (p. 599)
```

4.85.4.97 DDS_ReturnCode_t DDS_DynamicData_set_short_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_ShortSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Short** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_short_seq (p. 578)
DDS_DynamicData_set_short_array (p. 600)
```

4.85.4.98 DDS_ReturnCode_t DDS_DynamicData_set_ulong_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_UnsignedLongSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of DDS_-UnsignedLong (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

member_name <<iin>> (p. 951) The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_ulong_seq (p. 579)
DDS_DynamicData_set_ulong_array (p. 601)
```

4.85.4.99 DDS_ReturnCode_t DDS_DynamicData_set_ushort_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_UnsignedShortSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of DDS_-UnsignedShort (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

 $\it value << out>>$ (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

```
\begin{array}{l} DDS\_DynamicData\_get\_ushort\_seq~(p.\,580) \\ DDS\_DynamicData\_set\_ushort\_array~(p.\,601) \end{array}
```

4.85.4.100 DDS_ReturnCode_t DDS_DynamicData_set_float_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_FloatSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Float** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_float_seq (p. 581)
DDS_DynamicData_set_float_array (p. 602)
```

4.85.4.101 DDS_ReturnCode_t DDS_DynamicData_set_double_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_DoubleSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Double** (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_double_seq (p. 581)
DDS_DynamicData_set_double_array (p. 603)
```

4.85.4.102 DDS_ReturnCode_t DDS_DynamicData_set_boolean_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_BooleanSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of DDS_-Boolean (p. 109).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

 ${\it value} << {\it out}>> {\it (p.\,951)}$ A sequence, from which the elements will be copied.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_boolean_seq (p. 582)
DDS_DynamicData_set_boolean_array (p. 604)
```

4.85.4.103 DDS_ReturnCode_t DDS_DynamicData_set_char_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_CharSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Char** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

```
DDS_DynamicData_get_char_seq (p. 583)
DDS_DynamicData_set_char_array (p. 605)
```

4.85.4.104 DDS_ReturnCode_t DDS_DynamicData_set_octet_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_OctetSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Octet** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

See also:

```
DDS_DynamicData_get_octet_seq (p. 584)
DDS_DynamicData_set_octet_array (p. 605)
```

4.85.4.105 DDS_ReturnCode_t DDS_DynamicData_set_longlong_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_LongLongSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of DDS_-LongLong (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_longlong_seq (p. 584)
DDS_DynamicData_set_longlong_array (p. 606)
```

4.85.4.106 DDS_ReturnCode_t DDS_DynamicData_set_ulonglong_seq (DDS_DynamicData * self, const char
 * member_name, DDS_DynamicDataMemberId
 member_id, const struct DDS_UnsignedLongLongSeq *
 value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of DDS_-UnsignedLong (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_ulonglong_seq (p. 585)
DDS_DynamicData_set_ulonglong_array (p. 607)
```

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of DDS_-LongDouble (p. 108).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

 $\it value << out>>$ (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121)

```
\begin{array}{l} \mathbf{DDS\_DynamicData\_get\_longdouble\_seq} \ (\mathrm{p.}\ 586) \\ \mathbf{DDS\_DynamicData\_set\_longdouble\_array} \ (\mathrm{p.}\ 608) \end{array}
```

4.85.4.108 DDS_ReturnCode_t DDS_DynamicData_set_wchar_seq (DDS_DynamicData * self, const char * member_name, DDS_DynamicDataMemberId member_id, const struct DDS_WcharSeq * value)

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Wchar** (p. 107).

MT Safety:

UNSAFE.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $member_name << in>> (p. 951)$ The name of the member or NULL to look up the member by its ID.

member_id <<in>> (p. 951) The ID of the member or DDS_-DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 537) to look up by name. See Member Names and IDs (p. 1189).

value << out>> (p. 951) A sequence, from which the elements will be copied.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-OUT_OF_RESOURCES** (p. 121)

See also:

```
DDS_DynamicData_get_wchar_seq (p. 587)
DDS_DynamicData_set_wchar_array (p. 609)
```

4.85.4.109 struct DDS_DynamicDataTypeSupport*

DDS_DynamicDataTypeSupport_new (DDS_TypeCode * type, const struct DDS_DynamicDataTypeProperty_t

* props) [read]

Construct a new DDS_DynamicDataTypeSupport (p. 539) object.

This step is usually followed by type registration.

The DDS_TypeCode (p. 1463) object that is passed to this constructor is cloned and stored internally; no pointer is retained to the object passed in. It is therefore safe to delete the DDS_TypeCode (p. 1463) after this method returns.

Parameters:

type The DDS_TypeCode (p. 1463) that describes the members of this type. The new object will contain a *copy* of this DDS_TypeCode (p. 1463); you may delete the argument after this constructor returns.

props Policies that describe how to manage the memory and other properties of the data samples created by this factory. In most cases, the default values will be appropriate; see **DDS_DYNAMIC_DATA_- TYPE_PROPERTY_DEFAULT** (p. 624).

See also:

```
DDS_DynamicDataTypeSupport_register_type (p. 620)
DDS_DynamicDataTypeSupport_delete (p. 620)
```

$\begin{array}{lll} 4.85.4.110 & void \ DDS_DynamicDataTypeSupport_delete \ (struct \ DDS_DynamicDataTypeSupport * \textit{self}) \end{array}$

Delete a DDS_DynamicDataTypeSupport (p. 539) object.

A DDS_DynamicDataTypeSupport (p. 539) cannot be deleted while it is still in use. For each DDS_DomainParticipant (p. 339) with which the DDS_DynamicDataTypeSupport (p. 539) is registered, either the type must be unregistered or the participant must be deleted.

See also:

```
DDS_DynamicDataTypeSupport_unregister_type (p. 621)
DDS_DynamicDataTypeSupport_new (p. 619)
```

4.85.4.111 DDS_ReturnCode_t DDS_DynamicDataTypeSupport_register_type (struct DDS_DynamicDataTypeSupport *
self, DDS_DomainParticipant * participant, const char
* type_name)

Associate the DDS_TypeCode (p. 1463) with the given DDS_DomainParticipant (p. 339) under the given logical name.

Once a type has been registered, it can be referenced by name when creating a topic. Statically and dynamically defined types behave the same way in this respect.

```
FooTypeSupport_register_type (p. 457)
DDS_DomainParticipant_create_topic (p. 374)
DDS_DynamicDataTypeSupport_unregister_type (p. 621)
```

4.85.4.112 DDS_ReturnCode_t DDS_DynamicDataTypeSupport_unregister_type (struct DDS_DynamicDataTypeSupport * self, DDS_DomainParticipant * participant, const char * type_name)

Remove the definition of this type from the **DDS_DomainParticipant** (p. 339).

This operation is optional; all types are automatically unregistered when a **DDS_DomainParticipant** (p. 339) is deleted. Most application will not need to manually unregister types.

A type cannot be unregistered while it is still in use; that is, while any **DDS**₋**Topic** (p. 425) is still referring to it.

See also:

```
FooTypeSupport_unregister_type (p. 458)
DDS_DynamicDataTypeSupport_register_type (p. 620)
```

4.85.4.113 const char* DDS_DynamicDataTypeSupport_get_type_name (const struct DDS_DynamicDataTypeSupport * self)

Get the default name of this type.

The DDS_TypeCode (p.1463) that is wrapped by this DDS_DynamicDataTypeSupport (p.539) includes a name; this operation returns that name.

This operation is useful when registering a type, because in most cases it is not necessary for the physical and logical names of the type to be different.

```
DDS_DynamicDataTypeSupport_register_type(
   myTypeSupport,
   myParticipant,
   DDS_DynamicDataTypeSupport_get_type_name(myTypeSupport));
```

See also:

 $FooTypeSupport_get_type_name (p. 457)$

Get the DDS_TypeCode (p. 1463) wrapped by this DDS_-DynamicDataTypeSupport (p. 539).

4.85.4.115 DDS_DynamicData* DDS_DynamicDataTypeSupport_-create_data (struct DDS_DynamicDataTypeSupport * self)

Create a new **DDS_DynamicData** (p. 1189) sample initialized with the **DDS_TypeCode** (p. 1463) and properties of this **DDS_DynamicDataTypeSupport** (p. 539).

This method returns a fully initialized object. It is *not* necessary to subsequently call **DDS_DynamicDataTypeSupport_initialize_data** (p. 623).

If initialization fails, this method returns NULL.

You must delete your **DDS_DynamicData** (p. 1189) object when you are finished with it.

```
struct DDS_DynamicData* sample = DDS_DynamicDataTypeSupport_create_data(
    myTypeSupport);
/* Failure indicated by NULL return result. */
/* Do something... */
DDS_DynamicDataTypeSupport_delete_data(myTypeSupport, sample);
```

See also:

```
DDS_DynamicDataTypeSupport_initialize_data (p. 623)
DDS_DynamicDataTypeSupport_delete_data (p. 622)
FooTypeSupport_create_data (p. 453)
DDS_DynamicData_new (p. 540)
DDS_DynamicDataTypeProperty_t::data (p. 1204)
```

4.85.4.116 DDS_ReturnCode_t DDS_DynamicDataTypeSupport_delete_data (struct DDS_DynamicDataTypeSupport * self, DDS_DynamicData * a_data)

Finalize and deallocate the **DDS_DynamicData** (p. 1189) sample.

This method fully finalizes the object. It is *not* necessary to previously call **DDS_DynamicDataTypeSupport_finalize_data** (p. 624).

```
\label{local_decomposition} \begin{split} &\mathbf{DDS\_DynamicDataTypeSupport\_finalize\_data} \ (\mathrm{p.}\ 624) \\ &\mathbf{FooTypeSupport\_delete\_data} \ (\mathrm{p.}\ 454) \\ &\mathbf{DDS\_DynamicDataTypeSupport\_create\_data} \ (\mathrm{p.}\ 622) \end{split}
```

4.85.4.117 void DDS_DynamicDataTypeSupport_print_data (const struct DDS_DynamicDataTypeSupport * self, const DDS_DynamicData * a_data)

Print a string representation of the given sample to the given file.

This method is equivalent to DDS_DynamicData_print (p. 544).

See also:

```
DDS_DynamicData_print (p. 544)
```

4.85.4.118 DDS_ReturnCode_t DDS_DynamicDataTypeSupport_copy_data (const struct DDS_DynamicDataTypeSupport
* self, DDS_DynamicData * dest, const
DDS_DynamicData * source)

Deeply copy the given data samples.

4.85.4.119 DDS_ReturnCode_t DDS_DynamicDataTypeSupport_initialize_data (const struct DDS_-DynamicDataTypeSupport * self, DDS_DynamicData * a_data)

Initialize a DDS_DynamicData (p. 1189) object to a valid empty state.

Use DDS_DynamicDataTypeSupport_create_data (p. 622) to allocate a new DDS_DynamicData (p. 1189) object on the heap. Use this method to initialize a DDS_DynamicData (p. 1189) object that is stored deeply, either within another object or on the stack.

When you're finished with the object, dispose of it with DDS_-DynamicDataTypeSupport_finalize_data (p. 624).

```
FooTypeSupport_initialize_data (p. 455)
DDS_DynamicDataTypeSupport_finalize_data (p. 624)
DDS_DynamicDataTypeSupport_create_data (p. 622)
```

4.85.4.120 DDS_ReturnCode_t DDS_DynamicDataTypeSupport_-finalize_data (const struct DDS_- DynamicDataTypeSupport * self, DDS_DynamicData * a_data)

Clean up the internal state of this object to get it ready for deallocation, but don't deallocate the pointer.

Use DDS_DynamicDataTypeSupport_delete_data (p.622) to clean up a DDS_DynamicData (p.1189) object on the heap. Use this method to clean up a DDS_DynamicData (p.1189) object that is stored deeply, either within another object or on the stack.

See also:

```
FooTypeSupport_finalize_data (p. 456)

DDS_DynamicDataTypeSupport_delete_data (p. 622)

DDS_DynamicDataTypeSupport_initialize_data (p. 623)
```

4.85.5 Variable Documentation

4.85.5.1 struct DDS_DynamicDataProperty_t DDS_DYNAMIC_DATA_PROPERTY_DEFAULT

Sentinel constant indicating default values for DDS_- -DynamicDataProperty_t (p. 1201).

Pass this object instead of your own **DDS_DynamicDataProperty_t** (p. 1201) object to use the default property values:

```
struct DDS_DynamicData* sample = DDS_DynamicData_new(
    myTypeCode,
    &DDS_DYNAMIC_DATA_PROPERTY_DEFAULT);
```

See also:

```
DDS_DynamicDataProperty_t (p. 1201)
```

4.85.5.2 struct DDS_DynamicDataTypeProperty_t DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT

Sentinel constant indicating default values for DDS_- -DynamicDataTypeProperty_t (p. 1204).

Pass this object instead of your own **DDS_DynamicDataTypeProperty_t** (p. 1204) object to use the default property values:

```
struct DDS_DynamicDataTypeSupport* support = DDS_DynamicDataTypeSupport_new(
    myTypeCode,
&DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT);
```

Initializer for new DDS_PublisherListener (p. 1326).

Typedefs

^ typedef struct DDS_PublisherImpl **DDS_Publisher**

<<iinterface>> (p. 950) A publisher is the object responsible for the actual dissemination of publications.

Functions

^ DDS_ReturnCode_t DDS_PublisherQos_initialize (struct DDS_PublisherQos *self)

 $Initializer\ for\ new\ QoS\ instances.$

^ DDS_ReturnCode_t DDS_PublisherQos_copy (struct DDS_-PublisherQos *self, const struct DDS_PublisherQos *source) Copy the contents of the given QoS into this QoS.

^ DDS_ReturnCode_t DDS_PublisherQos_finalize (struct DDS_-PublisherQos *self)

Free any dynamic memory allocated by the policies in this DDS_-PublisherQos (p. 1328).

^ DDS_Entity * DDS_Publisher_as_entity (DDS_Publisher *publisher)

Access a DDS_Publisher (p. 632)'s supertype instance.

^ DDS_ReturnCode_t DDS_Publisher_get_default_datawriter_qos (DDS_Publisher *self, struct DDS_DataWriterQos *qos)

Copies the default DDS_DataWriterQos (p. 1123) values into the provided DDS_DataWriterQos (p. 1123) instance.

^ DDS_ReturnCode_t DDS_Publisher_set_default_datawriter_qos (DDS_Publisher *self, const struct DDS_DataWriterQos *qos)

Sets the default DDS_DataWriterQos (p. 1123) values for this publisher.

^ DDS_ReturnCode_t DDS_Publisher_set_default_datawriter_qos_with_profile (DDS_Publisher *self, const char *library_name, const char *profile_name)

<<eXtension>> (p. 950) Set the default DDS_DataWriterQos (p. 1123) values for this publisher based on the input XML QoS profile.

^ DDS_ReturnCode_t DDS_Publisher_set_default_profile (DDS_-Publisher *self, const char *library_name, const char *profile_name)

<<eXtension>> (p. 950) Sets the default XML profile for a DDS_- -Publisher (p. 632).

^ DDS_ReturnCode_t DDS_Publisher_set_default_library (DDS_-Publisher *self, const char *library_name)

<<eXtension>> (p. 950) Sets the default XML library for a DDS_- -Publisher (p. 632).

^ DDS_DataWriter * DDS_Publisher_create_datawriter (DDS_-Publisher *self, DDS_Topic *topic, const struct DDS_-DataWriterQos *qos, const struct DDS_DataWriterListener *listener, DDS_StatusMask mask)

Creates a DDS_DataWriter (p. 673) that will be attached and belong to the DDS_Publisher (p. 632).

4.87 Publishers 629

^ DDS_DataWriter * DDS_Publisher_create_datawriter_with_profile (DDS_Publisher *self, DDS_Topic *topic, const char *library_name, const char *profile_name, const struct DDS_DataWriterListener *listener, DDS_StatusMask mask)

<<eXtension>> (p. 950) Creates a DDS_DataWriter (p. 673) object using the DDS_DataWriterQos (p. 1123) associated with the input XML QoS profile.

^ DDS_ReturnCode_t DDS_Publisher_delete_datawriter (DDS_-Publisher *self, DDS_DataWriter *a_datawriter)

Deletes a DDS_DataWriter (p. 673) that belongs to the DDS_Publisher (p. 632).

^ DDS_DataWriter * DDS_Publisher_lookup_datawriter (DDS_-Publisher *self, const char *topic_name)

Retrieves the DDS_DataWriter (p. 673) for a specific DDS_Topic (p. 425).

Indicates to RTI Data Distribution Service that the application is about to make multiple modifications using **DDS_DataWriter** (p. 673) objects belonging to the **DDS_Publisher** (p. 632).

^ DDS_ReturnCode_t DDS_Publisher_resume_publications (DDS_-Publisher *self)

Indicates to RTI Data Distribution Service that the application has completed the multiple changes initiated by the previous **DDS_Publisher_suspend_publications** (p. 645).

Indicates that the application will begin a coherent set of modifications using DDS_DataWriter (p. 673) objects attached to the DDS_Publisher (p. 632).

Terminates the coherent set initiated by the matching call to DDS-Publisher_begin_coherent_changes (p. 647).

^ DDS_DomainParticipant * DDS_Publisher_get_participant (DDS_Publisher *self)

Returns the $DDS_DomainParticipant$ (p. 339) to which the $DDS_Political Publisher$ (p. 632) belongs.

Deletes all the entities that were created by means of the "create" operation on the **DDS_Publisher** (p. 632).

^ DDS_ReturnCode_t DDS_Publisher_copy_from_topic_qos (DDS_-Publisher *self, struct DDS_DataWriterQos *a_datawriter_qos, const struct DDS_TopicQos *a_topic_qos)

Copies the policies in the DDS_TopicQos (p. 1443) to the corresponding policies in the DDS_DataWriterQos (p. 1123).

^ DDS_ReturnCode_t DDS_Publisher_set_qos (DDS_Publisher *self, const struct DDS_PublisherQos *qos)

Sets the publisher QoS.

^ DDS_ReturnCode_t DDS_Publisher_set_qos_with_profile (DDS_-Publisher *self, const char *library_name, const char *profile_name)

<<eXtension>> (p.950) Change the QoS of this publisher using the input XML QoS profile.

^ DDS_ReturnCode_t DDS_Publisher_get_qos (DDS_Publisher *self, struct DDS_PublisherQos *qos)

Gets the publisher QoS.

 $\hat{}$ const char * DDS_Publisher_get_default_library (DDS_Publisher *self)

<<eXtension>> (p. 950) Gets the default XML library associated with a DDS_Publisher (p. 632).

 $\begin{array}{l} {\color{red} {\bf ^{c}}} \ {\color{blue} {\bf const}} \ {\color{blue} {\bf char}} \ * \ {\color{blue} {\bf DDS_Publisher_get_default_profile}} \ ({\color{blue} {\bf DDS_Publisher}} \ * {\color{blue} {\bf self}}) \end{array}$

<<eXtension>> (p. 950) Gets the default XML profile associated with a DDS_Publisher (p. 632).

^ const_char * DDS_Publisher_get_default_profile_library (DDS_-Publisher *self)

<<**eXtension**>> (p. 950) Gets the library where the default XML QoS profile is contained for a **DDS_Publisher** (p. 632).

^ DDS_ReturnCode_t DDS_Publisher_set_listener (DDS_Publisher *self, const struct DDS_PublisherListener *l, DDS_StatusMask mask)

Sets the publisher listener.

4.87 Publishers 631

struct DDS_PublisherListener
(DDS_Publisher *self)
DDS_Publisher_get_listener

Get the publisher listener.

^ DDS_ReturnCode_t DDS_Publisher_get_listenerX (DDS_-Publisher *self, struct DDS_PublisherListener *listener)

<<eXtension>> (p. 950) Get the publisher listener.

DDS_ReturnCode_t DDS_Publisher_wait_for_acknowledgments
(DDS_Publisher *self, const struct DDS_Duration_t *max_wait)

Blocks the calling thread until all data written by reliable DDS_DataWriter (p. 673) entities is acknowledged, or until timeout expires.

^ DDS_ReturnCode_t DDS_Publisher_wait_for_asynchronous_publishing (DDS_Publisher *self, const struct DDS_Duration_t *max_wait)

<<e**Xtension**>> (p. 950) Blocks the calling thread until asynchronous sending is complete.

Variables

Special value for creating DDS_DataWriter (p. 673) with default QoS.

`struct DDS_DataWriterQos DDS_DATAWRITER_QOS_USE_-TOPIC_QOS

Special value for creating DDS_DataWriter (p. 673) with a combination of the default DDS_DataWriterQos (p. 1123) and the DDS_TopicQos (p. 1443).

4.87.1 Detailed Description

DDS_Publisher (p. 632) entity and associated elements

4.87.2 Define Documentation

4.87.2.1 #define DDS_PublisherQos_INITIALIZER

Initializer for new QoS instances.

New **DDS_PublisherQos** (p. 1328) instance stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a new QoS structure is to initialize it on the stack at the time of its creation:

```
struct DDS_PublisherQos myQos = DDS_PublisherQos_INITIALIZER;
```

Note that the above assignment is not a substitute for calling DDS_-DomainParticipant_get_default_publisher_qos (p. 346) or DDS_-Publisher_get_qos (p. 651); one of those should be called subsequently to setting the QoS of a new or existing entity:

```
struct DDS_PublisherQos myQos = DDS_PublisherQos_INITIALIZER;
DDS_DomainParticipant_get_default_publisher_qos(myParticipant, &myQos);
DDS_Publisher_set_qos(myPub, &myQos);
DDS_PublisherQos_finalize(&myQos);
```

See also:

```
DDS_DomainParticipant_get_default_publisher_qos (p. 346)
DDS_PublisherQos_finalize (p. 635)
```

4.87.2.2 #define DDS_PublisherListener_INITIALIZER

Initializer for new DDS_PublisherListener (p. 1326).

All the new **DDS_PublisherListener** (p. 1326) instances allocated in the stack should be initialized to this value. No memory is allocated.

```
struct DDS_PublisherListener listener = DDS_PublisherListener_INITIALIZER;
/* initialize listener functions */
listener.as_datawriterlistener.on_offered_deadline_missed = ....;
DDS_Publisher_set_listener(myPublisher, &listener, mask);
```

See also:

```
DDS_Publisher_set_listener (p. 653)
DDS_PublisherListener (p. 1326)
Operations Allowed in Listener Callbacks (p. 1248)
```

4.87.3 Typedef Documentation

4.87.3.1 typedef struct DDS_PublisherImpl DDS_Publisher

<<interface>> (p. 950) A publisher is the object responsible for the actual dissemination of publications.

4.87 Publishers 633

QoS:

DDS_PublisherQos (p. 1328)

Listener:

DDS_PublisherListener (p. 1326)

A publisher acts on the behalf of one or several **DDS_DataWriter** (p. 673) objects that belong to it. When it is informed of a change to the data associated with one of its **DDS_DataWriter** (p. 673) objects, it decides when it is appropriate to actually send the data-update message. In making this decision, it considers any extra information that goes with the data (timestamp, writer, etc.) as well as the QoS of the **DDS_Publisher** (p. 632) and the **DDS_DataWriter** (p. 673).

The following operations may be called even if the **DDS_Publisher** (p. 632) is not enabled. Other operations will fail with the value **DDS_RETCODE_-NOT_ENABLED** (p. 121) if called on a disabled **DDS_Publisher** (p. 632):

- The base-class operations DDS_Publisher_set_qos (p. 650), DDS_Publisher_set_qos_with_profile (p. 650), DDS_Publisher_get_qos (p. 651), DDS_Publisher_set_listener (p. 653), DDS_Publisher_get_listener (p. 653), DDS_Entity_enable (p. 245), DDS_Entity_get_status_changes (p. 247)
- DDS_Publisher_create_datawriter (p.640),DDS_Publisher_create_datawriter_with_profile (p. 642), DDS_Publisher_delete_datawriter (p. 643),DDS_Publisher_delete_contained_entities DDS_Publisher_set_default_datawriter_gos $DDS_Publisher_set_default_datawriter_qos_with_profile$ (p.637),DDS_Publisher_get_default_datawriter_gos (p.636), DDS_{-} Publisher_wait_for_acknowledgments (p. 654), DDS_Publisher_set_default_library (p. 639), DDS_Publisher_set_default_profile (p.639),

See also:

Operations Allowed in Listener Callbacks (p. 1248)

Examples:

HelloWorld_publisher.c.

4.87.4 Function Documentation

4.87.4.1 DDS_ReturnCode_t DDS_PublisherQos_initialize (struct DDS_PublisherQos * self)

Initializer for new QoS instances.

New DDS_PublisherQos (p. 1328) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This function does not allocate memory.

Calling this function is not a substitute for calling **DDS_Publisher_get_qos** (p. 651) or **DDS_DomainParticipant_get_default_publisher_qos** (p. 346); one of those should be called subsequently to setting the QoS of any new or existing entity. **DDS_PublisherQos_finalize** (p. 635) should be called to free the contained QoS policies that use dynamic memory:

```
DDS_PublisherQos *myQos = malloc(sizeof(struct DDS_PublisherQos));
DDS_PublisherQos_initialize(myQos);
DDS_Publisher_get_default_datawriter_qos(myFactory, myQos);
DDS_Publisher_set_qos(myPublisher, myQos);
DDS_PublisherQos_finalize(myQos);
free(myQos);
```

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
DDS_DomainParticipant_get_default_publisher_qos (p. 346)
DDS_PublisherQos_finalize (p. 635)
```

4.87.4.2 DDS_ReturnCode_t DDS_PublisherQos_copy (struct DDS_PublisherQos * self, const struct DDS_PublisherQos * source)

Copy the contents of the given QoS into this QoS.

DDS_PublisherQos (p. 1328) instances can use dynamic memory because of the sequences contained in some QoS policies. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. source <<in>> (p. 951) The DDS_PublisherQos (p. 1328) to copy from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_PublisherQos_INITIALIZER (p. 631)
DDS_PublisherQos_initialize (p. 634)
DDS_PublisherQos_finalize (p. 635)
```

4.87.4.3 DDS_ReturnCode_t DDS_PublisherQos_finalize (struct DDS_PublisherQos * self)

Free any dynamic memory allocated by the policies in this **DDS_PublisherQos** (p. 1328).

Some QoS policies may use dynamic memory (regardless of whether the QoS itself is in dynamic memory). This function frees that memory but otherwise leaves this QoS unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

This function does not leave this object in an invalid state. It is permissable to clear a QoS and then subsequently allocate new dynamic memory in one or more of its QoS policies.

Note that if this QoS instance is stored in heap memory, calling this function will not call free() on it; the user is responsible for explicitly freeing any heap-based QoS instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_PublisherQos_INITIALIZER (p. 631)
DDS_PublisherQos_initialize (p. 634)
```

4.87.4.4 DDS_Entity* DDS_Publisher_as_entity (DDS_Publisher * publisher)

Access a **DDS_Publisher** (p. 632)'s supertype instance.

Parameters:

```
publisher << in>> (p. 951) Cannot be NULL.
```

Returns:

The DDS_Entity (p. 242) that is supertype instance of the publisher.

4.87.4.5 DDS_ReturnCode_t DDS_Publisher_get_default_datawriter_qos (DDS_Publisher * self, struct DDS_DataWriterQos * qos)

Copies the default **DDS_DataWriterQos** (p. 1123) values into the provided **DDS_DataWriterQos** (p. 1123) instance.

The retreived qos will match the set of values specified on the last successful call to DDS_Publisher_set_default_datawriter_qos (p. 637) or DDS_Publisher_set_default_datawriter_qos_with_profile (p. 637), or else, if the call was never made, the default values from is owning DDS_DomainParticipant (p. 339).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a **DDS_-Publisher** (p. 632) while another thread may be simultaneously calling **DDS_Publisher_set_default_datawriter_qos** (p. 637).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) DDS_DataWriterQos (p. 1123) to be filledup. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DATAWRITER_QOS_DEFAULT (p. 656)
DDS_Publisher_create_datawriter (p. 640)
```

4.87.4.6 DDS_ReturnCode_t DDS_Publisher_set_default_datawriter_qos (DDS_Publisher * self, const struct DDS_DataWriterQos * qos)

Sets the default **DDS_DataWriterQos** (p. 1123) values for this publisher.

This call causes the default values inherited from the owning **DDS**_**DomainParticipant** (p. 339) to be overridden.

This default value will be used for newly created **DDS_DataWriter** (p. 673) if **DDS_DATAWRITER_QOS_DEFAULT** (p. 656) is specified as the qos parameter when **DDS_Publisher_create_datawriter** (p. 640) is called.

Precondition:

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a DDS_Publisher (p. 632) while another thread may be simultaneously calling DDS_Publisher_set_default_datawriter_qos (p. 637), DDS_Publisher_get_default_datawriter_qos (p. 636) or calling DDS_Publisher_create_datawriter (p. 640) with DDS_DATAWRITER_QOS_DEFAULT (p. 656) as the qos parameter.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) Default qos to be set. The special value DDS_-DATAREADER_QOS_DEFAULT (p. 765) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if DDS_Publisher_set_default_datawriter_qos (p. 637) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

4.87.4.7 DDS_ReturnCode_t DDS_Publisher_set_default_- datawriter_qos_with_profile (DDS_Publisher * self, const char * $library_name$, const char * $profile_name$)

<<eXtension>> (p. 950) Set the default DDS_DataWriterQos (p. 1123) values for this publisher based on the input XML QoS profile.

This default value will be used for newly created **DDS_DataWriter** (p. 673) if **DDS_DATAWRITER_QOS_DEFAULT** (p. 656) is specified as the qos parameter when **DDS_Publisher_create_datawriter** (p. 640) is called.

Precondition:

The DDS_DataWriterQos (p. 1123) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a DDS_Publisher (p. 632) while another thread may be simultaneously calling DDS_Publisher_set_default_datawriter_qos (p. 637), DDS_Publisher_get_default_datawriter_qos (p. 636) or calling DDS_Publisher_create_datawriter (p. 640) with DDS_DATAWRITER_QOS_DEFAULT (p. 656) as the qos parameter.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<iin>> (p. 951) Library name containing the XML QoS
 profile. If library_name is null RTI Data Distribution Service will
 use the default library (see DDS_Publisher_set_default_library
 (p. 639)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_Publisher_set_default_profile (p. 639)).

If the input profile cannot be found, the function fails with **DDS_RETCODE_-ERROR** (p. 121).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

```
DDS_DATAWRITER_QOS_DEFAULT (p. 656)
DDS_Publisher_create_datawriter_with_profile (p. 642)
```

4.87.4.8 DDS_ReturnCode_t DDS_Publisher_set_default_profile (DDS_Publisher * self, const char * library_name, const char * profile_name)

<<eXtension>> (p. 950) Sets the default XML profile for a **DDS_Publisher** (p. 632).

This function specifies the profile that will be used as the default the next time a default Publisher profile is needed during a call to one of this Publishers operations. When calling a **DDS_Publisher** (p. 632) function that requires a **profile_name** parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **DDS_Publisher** (p. 632) inherits the default from the **DDS_DomainParticipant** (p. 339) (see **DDS_DomainParticipant_set_default_profile** (p. 360)).

This function does not set the default QoS for **DDS_DataWriter** (p. 673) objects created by the **DDS_Publisher** (p. 632); for this functionality, use **DDS_Publisher_set_default_datawriter_qos_with_profile** (p. 637) (you may pass in NULL after having called set_default_profile()).

This function does not set the default QoS for newly created Publishers; for this functionality, use **DDS_DomainParticipant_set_default_publisher_qos_with_profile** (p. 348).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 library\_name << in>> (p. 951) The library name containing the profile. 
 profile\_name << in>> (p. 951) The profile name. If profile_name is null any previous default is unset.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_Publisher_get_default_profile (p. 652)
DDS_Publisher_get_default_profile_library (p. 652)
```

4.87.4.9 DDS_ReturnCode_t DDS_Publisher_set_default_library (DDS_Publisher * self, const char * $library_name$)

<<eXtension>> (p. 950) Sets the default XML library for a **DDS_Publisher** (p. 632).

This function specifies the library that will be used as the default the next time a default library is needed during a call to one of this Publisher's operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the **DDS_Publisher** (p. 632) inherits the default from the **DDS_DomainParticipant** (p. 339) (see **DDS_DomainParticipant_set_default_library** (p. 359)).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $library_name << in>> (p. 951)$ Library name. If library_name is null any previous default is unset.

Returns:

One of the Standard Return Codes (p. 120)

See also:

 $DDS_Publisher_get_default_library$ (p. 652)

4.87.4.10 DDS_DataWriter* DDS_Publisher_create_datawriter (DDS_Publisher * self, DDS_Topic * topic, const struct DDS_DataWriterQos * qos, const struct DDS_DataWriterListener * listener, DDS_StatusMask mask)

Creates a **DDS_DataWriter** (p. 673) that will be attached and belong to the **DDS_Publisher** (p. 632).

For each application-defined type, Foo (p. 1494), there is an implied, autogenerated class FooDataWriter (p. 1496) that extends DDS_DataWriter (p. 673) and contains the operations to write data of type Foo (p. 1494).

Note that a common application pattern to construct the QoS for the DDS_-DataWriter (p. 673) is to:

- ^ Retrieve the QoS policies on the associated **DDS_Topic** (p. 425) by means of the **DDS_Topic_get_qos** (p. 440) operation.
- Retrieve the default **DDS_DataWriter** (p. 673) qos by means of the **DDS_Publisher_get_default_datawriter_qos** (p. 636) operation.
- ^ Combine those two QoS policies (for example, using **DDS_Publisher_- copy_from_topic_qos** (p. 649)) and selectively modify policies as desired.

When a **DDS_DataWriter** (p. 673) is created, only those transports already registered are available to the **DDS_DataWriter** (p. 673). See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

Precondition:

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DDS_DataWriter** (p. 673) will be created. The given **DDS_Topic** (p. 425) must have been created from the same participant as this publisher. If it was created from a different participant, this function will fail.

MT Safety:

UNSAFE. If **DDS_DATAWRITER_QOS_DEFAULT** (p. 656) is used for the **qos** parameter, it is not safe to create the datawriter while another thread may be simultaneously calling **DDS_Publisher_set_default_datawriter_qos** (p. 637).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

topic <<iin>> (p. 951) The DDS_Topic (p. 425) that the DDS_-DataWriter (p. 673) will be associated with. Cannot be NULL.

qos <<iin>> (p. 951) QoS to be used for creating the new DDS_DataWriter (p. 673). The special value DDS_DATAWRITER_QOS_DEFAULT (p. 656) can be used to indicate that the DDS_DataWriter (p. 673) should be created with the default DDS_DataWriterQos (p. 1123) set in the DDS_Publisher (p. 632). The special value DDS_DATAWRITER_QOS_USE_TOPIC_QOS (p. 656) can be used to indicate that the DDS_DataWriter (p. 673) should be created with the combination of the default DDS_DataWriterQos (p. 1123) set on the DDS_Publisher (p. 632) and the DDS_TopicQos (p. 1443) of the DDS_Topic (p. 425). Cannot be NULL.

listener << in>> (p. 951) The listener of the DDS_DataWriter (p. 673).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A DDS_DataWriter (p. 673) of a derived class specific to the data type associated with the DDS_Topic (p. 425) or NULL if an error occurred.

See also:

```
FooDataWriter (p. 1496)
Specifying QoS on entities (p. 144) for information on setting QoS before entity creation
DDS_DataWriterQos (p. 1123) for rules on consistency among QoS
DDS_DATAWRITER_QOS_DEFAULT (p. 656)
DDS_DATAWRITER_QOS_USE_TOPIC_QOS (p. 656)
DDS_Publisher_create_datawriter_with_profile (p. 642)
DDS_Publisher_get_default_datawriter_qos (p. 636)
DDS_Topic_set_qos (p. 438)
DDS_Publisher_copy_from_topic_qos (p. 649)
DDS_DataWriter_set_listener (p. 721)
```

Examples:

HelloWorld_publisher.c.

4.87.4.11 DDS_DataWriter* DDS_Publisher_create_datawriter_with_profile (DDS_Publisher * self, DDS_Topic * topic, const char * library_name, const char * profile_name, const struct DDS_DataWriterListener * listener, DDS_StatusMask mask)

<<eeXtension>> (p. 950) Creates a DDS_DataWriter (p. 673) object using the DDS_DataWriterQos (p. 1123) associated with the input XML QoS profile.

The **DDS_DataWriter** (p. 673) will be attached and belong to the **DDS_-Publisher** (p. 632).

For each application-defined type, Foo (p. 1494), there is an implied, autogenerated class FooDataWriter (p. 1496) that extends DDS_DataWriter (p. 673) and contains the operations to write data of type Foo (p. 1494).

When a **DDS_DataWriter** (p. 673) is created, only those transports already registered are available to the **DDS_DataWriter** (p. 673). See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

Precondition:

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DDS_DataWriter** (p. 673) will be created. The given **DDS_Topic** (p. 425) must have been created from the same participant as this publisher. If it was created from a different participant, this function will return NULL.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

topic <<iin>> (p. 951) The DDS_Topic (p. 425) that the DDS_-DataWriter (p. 673) will be associated with. Cannot be NULL.

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_Publisher_set_default_library (p. 639)).

profile_name <<iin> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
 DDS_Publisher_set_default_profile (p. 639)).

listener << in>> (p. 951) The listener of the **DDS_DataWriter** (p. 673).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A **DDS_DataWriter** (p. 673) of a derived class specific to the data type associated with the **DDS_Topic** (p. 425) or NULL if an error occurred.

See also:

FooDataWriter (p. 1496)

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_DataWriterQos (p. 1123) for rules on consistency among QoS

DDS_Publisher_create_datawriter (p. 640)

DDS_Publisher_get_default_datawriter_gos (p. 636)

DDS_Topic_set_qos (p. 438)

DDS_Publisher_copy_from_topic_qos (p. 649)

DDS_DataWriter_set_listener (p. 721)

4.87.4.12 DDS_ReturnCode_t DDS_Publisher_delete_datawriter (DDS_Publisher * self, DDS_DataWriter * a_datawriter)

Deletes a **DDS_DataWriter** (p. 673) that belongs to the **DDS_Publisher** (p. 632).

The deletion of the **DDS_DataWriter** (p. 673) will automatically unregister all instances. Depending on the settings of the **WRITER_DATA_LIFECYCLE** (p. 178) QosPolicy, the deletion of the **DDS_DataWriter** (p. 673) may also dispose all instances.

4.87.5 Special Instructions if Using Timestamp APIs and BY_SOURCE_TIMESTAMP Destination Ordering:

If the DataWriters **DDS_DestinationOrderQosPolicy::kind** (p. 1140) is **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 169), calls to delete_datawriter() may fail if your application has previously used the with timestamp APIs (write_w_timestamp(), register_instance_w_timestamp(), unregister_instance_w_timestamp(), or dispose_w_timestamp()) with a timestamp larger (later) than the time at which delete_datawriter() is called. To prevent delete_datawriter() from failing in this situation, either:

- ^ Change the WRITER_DATA_LIFECYCLE (p. 178) QosPolicy so that RTI Data Distribution Service will not autodispose unregistered instances (set DDS_WriterDataLifecycleQosPolicy::autodispose_unregistered_instances (p. 1492) to DDS_BOOLEAN_FALSE (p. 107).) or
- * Explicitly call unregister_instance_w_timestamp() for all instances modified with the *_w_timestamp() APIs before calling delete_datawriter().

Precondition:

If the DDS_DataWriter (p. 673) does not belong to the DDS_Publisher (p. 632), the operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Postcondition:

Listener installed on the **DDS_DataWriter** (p. 673) will not be called after this function completes successfully.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. 
 a\_datawriter <<in>> (p. 951) The DDS_DataWriter (p. 673) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

4.87.5.1 DDS_DataWriter* DDS_Publisher_lookup_datawriter (DDS_Publisher * self, const char * topic_name)

Retrieves the **DDS_DataWriter** (p. 673) for a specific **DDS_Topic** (p. 425).

This returned **DDS_DataWriter** (p. 673) is either enabled or disabled.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
topic_name <<iin>> (p. 951) Name of the DDS_Topic (p. 425) associated with the DDS_DataWriter (p. 673) that is to be looked up.
Cannot be NULL.
```

Returns:

A DDS_DataWriter (p. 673) that belongs to the DDS_Publisher (p. 632) attached to the DDS_Topic (p. 425) with topic_name. If no such DDS_DataWriter (p. 673) exists, this operation returns NULL.

If more than one **DDS_DataWriter** (p. 673) is attached to the **DDS_Publisher** (p. 632) with the same topic_name, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **DDS_DataWriter** (p. 673) in one thread while another thread is simultaneously creating or destroying that **DDS_DataWriter** (p. 673).

4.87.5.2 DDS_ReturnCode_t DDS_Publisher_suspend_publications (DDS_Publisher * self)

Indicates to RTI Data Distribution Service that the application is about to make multiple modifications using **DDS_DataWriter** (p. 673) objects belonging to the **DDS_Publisher** (p. 632).

It is a **hint** to RTI Data Distribution Service so it can optimize its performance by e.g., holding the dissemination of the modifications and then batching them.

The use of this operation must be matched by a corresponding call to **DDS_-Publisher_resume_publications** (p. 646) indicating that the set of modifications has completed.

If the DDS_Publisher (p. 632) is deleted before DDS_Publisher_resume_publications (p. 646) is called, any suspended updates yet to be published will be discarded.

RTI Data Distribution Service is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using asynchronous publishing. Combined with DDS_FlowController (p. 726), DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222) DDS_DataWriter (p. 673) instances allow the user even finer control of traffic shaping and sample coalescing.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-NOT_ENABLED (p. 121).

See also:

```
DDS_FlowController (p. 726)
DDS_FlowController_trigger_flow (p. 730)
DDS_ON_DEMAND_FLOW_CONTROLLER_NAME (p. 733)
DDS_PublishModeQosPolicy (p. 1331)
```

4.87.5.3 DDS_ReturnCode_t DDS_Publisher_resume_publications (DDS_Publisher * self)

Indicates to RTI Data Distribution Service that the application has completed the multiple changes initiated by the previous **DDS_Publisher_suspend_publications** (p. 645).

This is a **hint** to RTI Data Distribution Service that can be used for example, to batch all the modifications made since the **DDS_Publisher_suspend_publications** (p. 645).

RTI Data Distribution Service is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using asynchronous publishing. Combined with DDS_FlowController (p. 726), DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222) DDS_DataWriter (p. 673) instances allow the user even finer control of traffic shaping and sample coalescing.

Precondition:

A call to DDS_Publisher_resume_publications (p. 646) must match a previous call to DDS_Publisher_suspend_publications (p. 645). Otherwise the operation will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

```
DDS_FlowController (p. 726)
DDS_FlowController_trigger_flow (p. 730)
DDS_ON_DEMAND_FLOW_CONTROLLER_NAME (p. 733)
DDS_PublishModeQosPolicy (p. 1331)
```

```
4.87.5.4 DDS_ReturnCode_t DDS_Publisher_-
begin_coherent_changes (DDS_Publisher * self)
```

Indicates that the application will begin a coherent set of modifications using DDS_DataWriter (p. 673) objects attached to the DDS_Publisher (p. 632).

A 'coherent set' is a set of modifications that must be propagated in such a way that they are interpreted at the receiver's side as a consistent set of modifications; that is, the receiver will only be able to access the data after all the modifications in the set are available at the receiver end.

A connectivity change may occur in the middle of a set of coherent changes; for example, the set of partitions used by the **DDS_Publisher** (p. 632) or one of its **DDS_Subscriber** (p. 743) s may change, a late-joining **DDS_DataReader** (p. 783) may appear on the network, or a communication failure may occur. In the event that such a change prevents an entity from receiving the entire set of coherent changes, that entity must behave as if it had received none of the set.

These calls can be nested. In that case, the coherent set terminates only with the last call to **DDS_Publisher_end_coherent_changes** (p. 648).

The support for coherent changes enables a publishing application to change the value of several data-instances that could belong to the same or different topics and have those changes be seen *atomically* by the readers. This is useful in cases where the values are inter-related (for example, if there are two data-instances representing the altitude and velocity vector of the same aircraft and both are changed, it may be useful to communicate those values in a way the reader can see both together; otherwise, it may e.g., erroneously interpret that the aircraft is on a collision course).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_NOT_ENABLED (p. 121).

4.87.5.5 DDS_ReturnCode_t DDS_Publisher_end_coherent_changes (DDS_Publisher * self)

Terminates the coherent set initiated by the matching call to **DDS_Publisher_begin_coherent_changes** (p. 647).

Precondition:

If there is no matching call to DDS_Publisher_begin_coherent_changes (p. 647) the operation will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_NOT_-ENABLED (p. 121).

$\begin{array}{ll} \textbf{4.87.5.6} & \textbf{DDS_DomainParticipant} * \ \textbf{DDS_Publisher_get_participant} \\ & (\textbf{DDS_Publisher} * \textit{self}) \end{array}$

Returns the **DDS_DomainParticipant** (p. 339) to which the **DDS_Publisher** (p. 632) belongs.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

the **DDS_DomainParticipant** (p. 339) to which the **DDS_Publisher** (p. 632) belongs.

4.87.5.7 DDS_ReturnCode_t DDS_Publisher_delete_contained_entities (DDS_Publisher * self)

Deletes all the entities that were created by means of the "create" operation on the **DDS_Publisher** (p. 632).

Deletes all contained **DDS_DataWriter** (p. 673) objects. Once **DDS_Publisher_delete_contained_entities** (p. 648) completes successfully, the application may delete the **DDS_Publisher** (p. 632), knowing that it has no contained **DDS_DataWriter** (p. 673) objects.

The operation will fail with DDS_RETCODE_PRECONDITION_NOT_-MET (p. 121) if any of the contained entities is in a state where it cannot be deleted.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-PRECONDITION_NOT_MET** (p. 121).

4.87.5.8 DDS_ReturnCode_t DDS_Publisher_copy_from_topic_qos (DDS_Publisher * self, struct DDS_DataWriterQos * $a_datawriter_qos$, const struct DDS_TopicQos * a_topic_qos)

Copies the policies in the **DDS_TopicQos** (p. 1443) to the corresponding policies in the **DDS_DataWriterQos** (p. 1123).

Copies the policies in the **DDS_TopicQos** (p. 1443) to the corresponding policies in the **DDS_DataWriterQos** (p. 1123) (replacing values in the **DDS_DataWriterQos** (p. 1123), if present).

This is a "convenience" operation most useful in combination with the operations DDS_Publisher_get_default_datawriter_qos (p. 636) and DDS_Topic_get_qos (p. 440). The operation DDS_Publisher_copy_from_topic_qos (p. 649) can be used to merge the DDS_DataWriter (p. 673) default QoS policies with the corresponding ones on the DDS_Topic (p. 425). The resulting QoS can then be used to create a new DDS_DataWriter (p. 673), or set its QoS.

This operation does not check the resulting **DDS_DataWriterQos** (p. 1123) for consistency. This is because the 'merged' **DDS_DataWriterQos** (p. 1123) may not be the final one, as the application can still modify some policies prior to applying the policies to the **DDS_DataWriter** (p. 673).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 a\_datawriter\_qos << inout>> (p. 951) DDS_DataWriterQos 
 (p. 1123) to be filled-up. Cannot be NULL.
```

a_topic_qos <<*in>>* (p. *951*) **DDS_TopicQos** (p. 1443) to be merged with **DDS_DataWriterQos** (p. 1123). Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120)

4.87.5.9 DDS_ReturnCode_t DDS_Publisher_set_qos (DDS_Publisher * self, const struct DDS_PublisherQos * qos)

Sets the publisher QoS.

This operation modifies the QoS of the DDS_Publisher (p. 632).

The DDS_PublisherQos::group_data (p. 1329), DDS_-PublisherQos::partition (p. 1329) and DDS_PublisherQos::entity_factory (p. 1329) can be changed. The other policies are immutable.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
qos <<in>> (p. 951) DDS_PublisherQos (p. 1328) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDS_Publisher (p. 632) is enabled. The special value DDS_PUBLISHER_QOS_DEFAULT (p. 406) can be used to indicate that the QoS of the DDS_Publisher (p. 632) should be changed to match the current default DDS_PublisherQos (p. 1328) set in the
```

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122).
```

See also:

```
DDS_PublisherQos (p. 1328) for rules on consistency among QoS set_qos (abstract) (p. 243)
Operations Allowed in Listener Callbacks (p. 1248)
```

DDS_DomainParticipant (p. 339). Cannot be NULL.

4.87.5.10 DDS_ReturnCode_t DDS_Publisher_set_qos_with_profile (DDS_Publisher * self, const char * $library_name$, const char * $profile_name$)

<< eXtension>> (p. 950) Change the QoS of this publisher using the input

XML QoS profile.

This operation modifies the QoS of the DDS_Publisher (p. 632).

The DDS_PublisherQos::group_data (p. 1329), DDS_-PublisherQos::partition (p. 1329) and DDS_PublisherQos::entity_factory (p. 1329) can be changed. The other policies are immutable.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951) Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_Publisher_set_default_library (p. 639)).

profile_name <<in>> (p. 951) XML QoS Profile name. If profile_name is null RTI Data Distribution Service will use the default profile (see DDS_Publisher_set_default_profile (p. 639)).

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122).
```

See also:

```
DDS_PublisherQos (p. 1328) for rules on consistency among QoS Operations Allowed in Listener Callbacks (p. 1248)
```

4.87.5.11 DDS_ReturnCode_t DDS_Publisher_get_qos (DDS_Publisher * self, struct DDS_PublisherQos * qos)

Gets the publisher QoS.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.

qos <<in>> (p. 951) DDS_PublisherQos (p. 1328) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
get_qos (abstract) (p. 244)
```

4.87.5.12 const char* DDS_Publisher_get_default_library (DDS_Publisher * self)

<< eXtension>> (p. 950) Gets the default XML library associated with a DDS_Publisher (p. 632).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

The default library or null if the default library was not set.

See also:

DDS_Publisher_set_default_library (p. 639)

4.87.5.13 const char* DDS_Publisher_get_default_profile (DDS_Publisher * self)

<< eXtension>> (p. 950) Gets the default XML profile associated with a DDS_Publisher (p. 632).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The default profile or null if the default profile was not set.

See also:

 $DDS_Publisher_set_default_profile (p. 639)$

4.87.5.14 const char* DDS_Publisher_get_default_profile_library (DDS_Publisher * self)

<<eXtension>> (p. 950) Gets the library where the default XML QoS profile is contained for a **DDS_Publisher** (p. 632).

The default profile library is automatically set when **DDS_Publisher_set_default_profile** (p. 639) is called.

This library can be different than the **DDS_Publisher** (p. 632) default library (see **DDS_Publisher_get_default_library** (p. 652)).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The default profile library or null if the default profile was not set.

See also:

```
DDS_Publisher_set_default_profile (p. 639)
```

4.87.5.15 DDS_ReturnCode_t DDS_Publisher_set_listener (DDS_Publisher * self, const struct DDS_PublisherListener * l, DDS_StatusMask mask)

Sets the publisher listener.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. l << in>> (p. 951) DDS_PublisherListener (p. 1326) to set to. mask << in>> (p. 951) DDS_StatusMask (p. 127) associated with the DDS_PublisherListener (p. 1326). The callback function on the listener cannot be NULL if the corresponding status is turned on in the mask.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
set_listener (abstract) (p. 244)
```

$\begin{array}{ll} \textbf{4.87.5.16} & \textbf{struct DDS_PublisherListener DDS_Publisher_get_listener} \\ & \textbf{(DDS_Publisher} * \textit{self} \textbf{)} & \textbf{[read]} \end{array}$

Get the publisher listener.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

DDS_PublisherListener (p. 1326) of the DDS_Publisher (p. 632).

See also:

```
DDS_Publisher_get_listenerX (p. 654) get_listener (abstract) (p. 245)
```

4.87.5.17 DDS_ReturnCode_t DDS_Publisher_get_listenerX (DDS_Publisher * self, struct DDS_PublisherListener * listener)

```
<< eXtension>> (p. 950) Get the publisher listener.
```

An alternative form of get_listener that fills in an existing listener structure rather than returning one on the stack.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 listener << inout>> (p. 951) DDS_PublisherListener (p. 1326) structure to be filled up. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_Publisher_get_listener (p. 653)
get_listener (abstract) (p. 245)
```

4.87.5.18 DDS_ReturnCode_t DDS_Publisher_wait_for_-acknowledgments (DDS_Publisher * self, const struct DDS_Duration_t * max_wait)

Blocks the calling thread until all data written by reliable **DDS_DataWriter** (p. 673) entities is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable **DDS_DataWriter** (p. 673) entities is acknowledged by all matched reliable **DDS_DataReader** (p. 783) entities, or else the duration specified by the

max_wait parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged by all reliable matched data readers; a return value of TIMEOUT indicates that max_wait elapsed before all the data was acknowledged.

If none of the **DDS_DataWriter** (p. 673) instances have **DDS_ReliabilityQosPolicy** (p. 1342) kind set to RELIABLE, the operation will complete successfully.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. max\_wait << in>> (p. 951) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 1188) .
```

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_NOT_ENABLED (p. 121), DDS_RETCODE_TIMEOUT (p. 122)
```

4.87.5.19 DDS_ReturnCode_t DDS_Publisher_wait_for_asynchronous_publishing (DDS_Publisher * self, const struct DDS_Duration_t * max_wait)

<<eXtension>> (p. 950) Blocks the calling thread until asynchronous sending is complete.

This operation blocks the calling thread (up to max_wait) until all data written by the asynchronous DDS_DataWriter (p. 673) entities is sent and acknowledged (if reliable) by all matched DDS_DataReader (p. 783) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; if it times out, this indicates that max_wait elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort DDS_DataReader (p. 783) is complete in addition to what DDS_Publisher_wait_for_acknowledgments (p. 654) provides.

If none of the DDS_DataWriter (p. 673) instances have DDS_PublishModeQosPolicy::kind (p. 1333) set to DDS_-ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222), the operation will complete immediately, with DDS_RETCODE_OK (p. 121).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. max\_wait << in>> (p. 951) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 1188).
```

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-NOT_ENABLED (p. 121), DDS_RETCODE_TIMEOUT (p. 122)

4.87.6 Variable Documentation

Special value for creating **DDS_DataWriter** (p. 673) with default QoS.

When used in DDS_Publisher_create_datawriter (p. 640), this special value is used to indicate that the DDS_DataWriter (p. 673) should be created with the default DDS_DataWriter (p. 673) QoS by means of the operation get_default_datawriter_qos and using the resulting QoS to create the DDS_DataWriter (p. 673).

When used in **DDS_Publisher_set_default_datawriter_qos** (p. 637), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDS_Publisher_set_default_datawriter_qos** (p. 637) operation had never been called.

When used in **DDS_DataWriter_set_qos** (p. 719), this special value is used to indicate that the QoS of the **DDS_DataWriter** (p. 673) should be changed to match the current defualt QoS set in the **DDS_Publisher** (p. 632) that the **DDS_DataWriter** (p. 673) belongs to.

See also:

```
DDS_Publisher_create_datawriter (p. 640)
DDS_Publisher_set_default_datawriter_qos (p. 637)
DDS_DataWriter_set_qos (p. 719)
```

Examples:

HelloWorld_publisher.c.

4.87.6.2 struct DDS_DataWriterQos DDS_DATAWRITER_QOS_-USE_TOPIC_QOS

Special value for creating **DDS_DataWriter** (p. 673) with a combination of the default **DDS_DataWriterQos** (p. 1123) and the **DDS_TopicQos** (p. 1443).

The use of this value is equivalent to the application obtaining the default **DDS_DataWriterQos** (p. 1123) and the **DDS_TopicQos** (p. 1443) (by means of the operation **DDS_Topic_get_qos** (p. 440)) and then combining these

two QoS using the operation **DDS_Publisher_copy_from_topic_qos** (p. 649) whereby any policy that is set on the **DDS_TopicQos** (p. 1443) "overrides" the corresponding policy on the default QoS. The resulting QoS is then applied to the creation of the **DDS_DataWriter** (p. 673).

This value should only be used in $DDS_Publisher_create_datawriter$ (p. 640).

Initializer for new DDS_DataWriterListener (p. 1102).

Typedefs

^ typedef struct DDS_DataWriterImpl **DDS_DataWriter**

<<iinterface>> (p. 950) Allows an application to set the value of the data to be published under a given DDS_Topic (p. 425).

Prototype of a DDS_DataWriterListener (p. 1102) on_offered_deadline_missed function.

^ typedef void(* DDS_DataWriterListener_LivelinessLostCallback
)(void *listener_data, DDS_DataWriter *writer, const struct DDS_LivelinessLostStatus *status)

Prototype of a DDS_DataWriterListener (p. 1102) on_liveliness_lost function.

f typedef void(* DDS_DataWriterListener_OfferedIncompatibleQosCallback)(void *listener_data, DDS_DataWriter *writer, const struct DDS_OfferedIncompatibleQosStatus *status)

Prototype of a DDS_DataWriterListener (p. 1102) on_offered_incompatible_gos function.

Prototype of a $DDS_DataWriterListener$ (p. 1102) on_publication_matched function.

<<e**Xtension**>> (p. 950) A change has occurred in the writer's cache of unacknowledged samples.

<<e $\mathbf{Xtension}>>$ (p. 950) A matched reliable reader has become active or become inactive.

<<e**Xtension**>> (p. 950) An instance previously registered with the writer has been replaced

Functions

^ FooDataWriter * FooDataWriter_narrow (DDS_DataWriter *writer)

Narrow the given **DDS_DataWriter** (p. 673) pointer to a **FooDataWriter** (p. 1496) pointer.

^ DDS_DataWriter * FooDataWriter_as_datawriter (Foo-DataWriter *writer)

Widen the given FooDataWriter (p. 1496) pointer to a DDS_DataWriter (p. 673) pointer.

^ DDS_InstanceHandle_t FooDataWriter_register_instance (Foo-DataWriter *self, const Foo *instance_data)

 $In forms\ RTI\ Data\ Distribution\ Service\ that\ the\ application\ will\ be\ modifying\ a\ particular\ instance.$

^ DDS_InstanceHandle_t FooDataWriter_register_instance_w_timestamp (FooDataWriter *self, const Foo *instance_data, const
struct DDS_Time_t *source_timestamp)

Performs the same functions as register_instance except that the application provides the value for the ${\tt source_timestamp}$.

Reverses the action of FooDataWriter_register_instance (p. 678).

DDS_ReturnCode_t FooDataWriter_unregister_instance_w_timestamp (FooDataWriter *self, const Foo *instance_data, const
DDS_InstanceHandle_t *handle, const struct DDS_Time_t *source_timestamp)

Performs the same function as **FooDataWriter_unregister_instance** (p. <u>681</u>) except that it also provides the value for the source_timestamp.

DDS_ReturnCode_t FooDataWriter_write (FooDataWriter *self, const Foo *instance_data, const DDS_InstanceHandle_t *handle)

Modifies the value of a data instance.

Performs the same function as **FooDataWriter_write** (p. 684) except that it also provides the value for the source_timestamp.

^ DDS_ReturnCode_t FooDataWriter_dispose (FooDataWriter *self, const Foo *instance_data, const DDS_InstanceHandle_t *instance_handle)

Requests the middleware to delete the data.

Performs the same functions as dispose except that the application provides the value for the source_timestamp that is made available to DDS_DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384).

Retrieve the instance key that corresponds to an instance handle.

^ DDS_InstanceHandle_t FooDataWriter_lookup_instance (Foo-DataWriter *self, const Foo *key_holder)

 $Retrieve\ the\ instance\ {\tt handle}\ that\ corresponds\ to\ an\ instance\ {\tt key_holder}.$

Initializer for new status instances.

 $\begin{array}{lll} {\bf \hat{DDS_ReturnCode_t}} & {\bf DDS_OfferedDeadlineMissedStatus_copy} \\ {\rm (struct} & {\bf DDS_OfferedDeadlineMissedStatus} & *self, & const & struct \\ {\bf DDS_OfferedDeadlineMissedStatus} & *source) \end{array}$

Copy the contents of the given status into this status.

^ DDS_ReturnCode_t DDS_OfferedDeadlineMissedStatus_finalize (struct DDS_OfferedDeadlineMissedStatus *self)

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_LivelinessLostStatus_initialize (struct DDS_LivelinessLostStatus *self)

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_LivelinessLostStatus_copy (struct DDS_LivelinessLostStatus *self, const struct DDS_-LivelinessLostStatus *source)

Copy the contents of the given status into this status.

^ DDS_ReturnCode_t DDS_LivelinessLostStatus_finalize (struct DDS_LivelinessLostStatus *self)

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_OfferedIncompatibleQosStatus_-initialize (struct DDS_OfferedIncompatibleQosStatus *self)

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_OfferedIncompatibleQosStatus_copy (struct DDS_OfferedIncompatibleQosStatus *self, const struct DDS_OfferedIncompatibleQosStatus *source)

Copy the contents of the given status into this status.

^ DDS_ReturnCode_t DDS_OfferedIncompatibleQosStatus_finalize (struct DDS_OfferedIncompatibleQosStatus *self)

Free any dynamic memory allocated by status instances.

 $\begin{tabular}{ll} \bf DDS_ReturnCode_t & DDS_PublicationMatchedStatus_initialize \\ (struct \begin{tabular}{ll} \bf DDS_PublicationMatchedStatus *self) \end{tabular}$

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_PublicationMatchedStatus_copy (struct DDS_PublicationMatchedStatus *self, const struct DDS_PublicationMatchedStatus *source)

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_ReliableWriterCacheChangedStatus_-initialize (struct DDS_ReliableWriterCacheChangedStatus *self)

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_ReliableWriterCacheChangedStatus_-copy (struct DDS_ReliableWriterCacheChangedStatus *self, const struct DDS_ReliableWriterCacheChangedStatus *source)

Copy the contents of the given status into this status.

^ DDS_ReturnCode_t DDS_ReliableWriterCacheChangedStatus_finalize (struct DDS_ReliableWriterCacheChangedStatus *self)

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_ReliableReaderActivityChangedStatus_-initialize (struct DDS_ReliableReaderActivityChangedStatus *self)

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_ReliableReaderActivityChangedStatus_copy (struct DDS_ReliableReaderActivityChangedStatus *self, const struct DDS_ReliableReaderActivityChangedStatus *source)

Copy the contents of the given status into this status.

^ DDS_ReturnCode_t DDS_ReliableReaderActivityChangedStatus_finalize (struct DDS_ReliableReaderActivityChangedStatus *self)

Free any dynamic memory allocated by status instances.

Initializer for new status instances.

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

DDS_ReturnCode_t DDS_DataWriterProtocolStatus_initialize
 (struct DDS_DataWriterProtocolStatus *self)

665

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_DataWriterProtocolStatus_copy (struct DDS_DataWriterProtocolStatus *self, const struct DDS_DataWriterProtocolStatus *source)

Copy the contents of the given status into this status.

` DDS_ReturnCode_t DDS_DataWriterProtocolStatus_finalize (struct DDS_DataWriterProtocolStatus *self)

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_DataWriterQos_initialize (struct DDS_DataWriterQos *self)

Initializer for new QoS instances.

^ DDS_ReturnCode_t DDS_DataWriterQos_copy (struct DDS_DataWriterQos *source)

Copy the contents of the given QoS into this QoS.

^ DDS_ReturnCode_t DDS_DataWriterQos_finalize (struct DDS_DataWriterQos *self)

Free any dynamic memory allocated by the policies in this DDS_-DataWriterQos (p. 1123).

^ DDS_Entity * DDS_DataWriter_as_entity (DDS_DataWriter *dataWriter)

Access a DDS_DataWriter (p. 673)'s supertype instance.

^ DDS_ReturnCode_t DDS_DataWriter_assert_liveliness (DDS_-DataWriter *self)

This operation manually asserts the liveliness of this DDS_DataWriter (p. 673).

<<eXtension>> (p. 950) Retrieve the list of locators for subscriptions currently "associated" with this DDS_DataWriter (p. 673).

DDS_ReturnCode_t DDS_DataWriter_get_matched_subscriptions (DDS_DataWriter *self, struct DDS_InstanceHandleSeq *subscription_handles)

Retrieve the list of subscriptions currently "associated" with this DDS_-DataWriter (p. 673).

This operation retrieves the information on a subscription that is currently "associated" with the DDS_DataWriter (p. 673).

^ DDS_Topic * DDS_DataWriter_get_topic (DDS_DataWriter *self)

This operation returns the DDS_Topic (p. 425) associated with the DDS_DataWriter (p. 673).

 $\begin{array}{lll} {\bf \hat{D}DS_Publisher} & * & {\bf DDS_DataWriter_get_publisher} & ({\bf DDS_DataWriter_get_publisher} & \\ {\bf DataWriter} & *self) \end{array}$

This operation returns the DDS_Publisher (p. 632) to which the DDS_-DataWriter (p. 673) belongs.

Blocks the calling thread until all data written by reliable DDS_DataWriter (p. 673) entity is acknowledged, or until timeout expires.

DDS_ReturnCode_t DDS_DataWriter_wait_for_asynchronous_publishing (DDS_DataWriter *self, const struct DDS_Duration_t
*max_wait)

<<eXtension>> (p. 950) Blocks the calling thread until asynchronous sending is complete.

Accesses the $DDS_LIVELINESS_LOST_STATUS$ (p. 131) communication status.

^ DDS_ReturnCode_t DDS_DataWriter_get_offered_deadline_missed_status (DDS_DataWriter *self, struct DDS_-OfferedDeadlineMissedStatus *status)

Accesses the DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 129) communication status.

Accesses the DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129) communication status.

Accesses the $DDS_PUBLICATION_MATCHED_STATUS$ (p. 131) communication status.

 $\begin{array}{lll} {\bf \hat{DDS_ReturnCode_t}} & {\bf DDS_DataWriter_get_reliable_writer_cache_changed_status} & ({\bf DDS_DataWriter} & *self, & struct & {\bf DDS_ReliableWriterCacheChangedStatus} & *status) \end{array}$

<<eXtension>> (p. 950) Get the reliable cache status for this writer.

<<extension>> (p. 950) Get the reliable reader activity changed status for this writer.

<<eXtension>> (p. 950) Get the datawriter cache status for this writer.

<<eXtension>> (p. 950) Get the datawriter protocol status for this writer.

DDS_ReturnCode_t DDS_DataWriter_get_matched_subscription_datawriter_protocol_status (DDS_DataWriter *self, struct DDS_DataWriterProtocolStatus *status, const DDS_InstanceHandle_t *subscription_handle)

<<extension>> (p. 950) Get the datawriter protocol status for this writer, per matched subscription identified by the subscription_handle.

<<eXtension>> (p. 950) Get the datawriter protocol status for this writer, per matched subscription identified by the locator.

^ DDS_ReturnCode_t DDS_DataWriter_set_qos (DDS_DataWriter *self, const struct DDS_DataWriterQos *qos)

Sets the writer QoS.

^ DDS_ReturnCode_t DDS_DataWriter_set_qos_with_profile (DDS_DataWriter *self, const char *library_name, const char *profile_name)

<<eXtension>> (p. 950) Change the QoS of this writer using the input XML QoS profile.

^ DDS_ReturnCode_t DDS_DataWriter_get_qos (DDS_DataWriter *self, struct DDS_DataWriterQos *qos)

Gets the writer QoS.

^ DDS_ReturnCode_t DDS_DataWriter_set_listener (DDS_DataWriter *self, const struct DDS_DataWriterListener *l, DDS_StatusMask mask)

Sets the writer listener.

^ struct DDS_DataWriterListener DDS_DataWriter_get_listener
(DDS_DataWriter *self)

Get the writer listener.

<<eXtension>> (p. 950) Get the writer listener.

^ DDS_ReturnCode_t DDS_DataWriter_flush (DDS_DataWriter *self)

<<extension>> (p. 950) Flushes the batch in progress in the context of the calling thread.

4.88.1 Detailed Description

DDS_DataWriter (p. 673) entity and associated elements

4.88.2 Define Documentation

$\begin{array}{ccc} 4.88.2.1 & \# define \ DDS_OfferedDeadlineMissedStatus_-\\ & INITIALIZER \end{array}$

Initializer for new status instances.

New DDS_OfferedDeadlineMissedStatus (p. 1276) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_OfferedDeadlineMissedStatus_finalize** (p. 694) should be called to free the contained fields that use dynamic memory:

```
struct DDS_OfferedDeadlineMissedStatus myStatus = DDS_OfferedDeadlineMissedStatus_INITIALIZER;
DDS_DataWriter_get_offered_deadline_missed_status(myDataWriter, &myStatus);
DDS_OfferedDeadlineMissedStatus_finalize(&myStatus);
```

See also:

```
DDS_OfferedDeadlineMissedStatus_initialize (p. 692)
DDS_DataWriter_get_offered_deadline_missed_status (p. 715)
DDS_OfferedDeadlineMissedStatus_finalize (p. 694)
```

4.88.2.2 #define DDS_LivelinessLostStatus_INITIALIZER

Initializer for new status instances.

New **DDS_LivelinessLostStatus** (p. 1252) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_LivelinessLostStatus_finalize** (p. 695) should be called to free the contained fields that use dynamic memory:

```
struct DDS_LivelinessLostStatus myStatus = DDS_LivelinessLostStatus_INITIALIZER;
DDS_DataWriter_get_liveliness_lost_status(myDataWriter, &myStatus);
DDS_LivelinessLostStatus_finalize(&myStatus);
```

See also:

```
DDS_LivelinessLostStatus_initialize (p. 694)
DDS_DataWriter_get_liveliness_lost_status (p. 714)
DDS_LivelinessLostStatus_finalize (p. 695)
```

${\it 4.88.2.3 \quad \# define \ DDS_OfferedIncompatibleQosStatus_-} \\ INITIALIZER$

Initializer for new status instances.

New DDS_OfferedIncompatibleQosStatus (p. 1278) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_OfferedIncompatibleQosStatus_finalize** (p. 697) should be called to free the contained fields that use dynamic memory:

```
struct DDS_OfferedIncompatibleQosStatus myStatus = DDS_OfferedIncompatibleQosStatus_INITIALIZER;
DDS_DataWriter_get_offered_incompatible_qos_status(myDataWriter, &myStatus);
DDS_OfferedIncompatibleQosStatus_finalize(&myStatus);
```

See also:

```
DDS_DataWriter_get_offered_incompatible_qos_status (p. 715)
DDS_OfferedIncompatibleQosStatus_finalize (p. 697)
```

$4.88.2.4 \quad \# define \ DDS_PublicationMatchedStatus_INITIALIZER$

Initializer for new status instances.

New **DDS_PublicationMatchedStatus** (p. 1323) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_PublicationMatchedStatus_finalize** (p. 699) should be called to free the contained fields that use dynamic memory:

```
struct DDS_PublicationMatchedStatus myStatus = DDS_PublicationMatchedStatus_INITIALIZER;
DDS_DataWriter_get_publication_matched_status(myDataWriter, &myStatus);
DDS_PublicationMatchedStatus_finalize(&myStatus);
```

See also:

```
\begin{array}{l} \textbf{DDS\_DataWriter\_get\_publication\_matched\_status} \ (p.\ 715) \\ \textbf{DDS\_PublicationMatchedStatus\_finalize} \ (p.\ 699) \end{array}
```

$\begin{array}{ll} \textbf{4.88.2.5} & \texttt{\#define DDS_ReliableWriterCacheChangedStatus_INITIALIZER} \\ \end{array}$

Initializer for new status instances.

New DDS_ReliableWriterCacheChangedStatus (p. 1348) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_ReliableWriterCacheChangedStatus_finalize** (p. 701) should be called to free the contained fields that use dynamic memory:

```
struct DDS_ReliableWriterCacheChangedStatus myStatus = DDS_ReliableWriterCacheChangedStatus_INITIALIZER;
DDS_DataWriter_get_reliable_writer_cache_changed_status(myDataWriter, &myStatus);
DDS_ReliableWriterCacheChangedStatus_finalize(&myStatus);
```

See also:

```
\begin{tabular}{ll} DDS\_DataWriter\_get\_reliable\_writer\_cache\_changed\_status \\ (p. 716) \end{tabular}
```

DDS_ReliableWriterCacheChangedStatus_finalize (p. 701)

${\it 4.88.2.6 \quad \# define \ DDS_Reliable Reader Activity Changed Status_INITIALIZER}$

Initializer for new status instances.

New DDS_ReliableReaderActivityChangedStatus (p. 1346) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_ReliableReaderActivityChangedStatus_finalize** (p. 703) should be called to free the contained fields that use dynamic memory:

```
struct DDS_ReliableReaderActivityChangedStatus myStatus = DDS_ReliableReaderActivityChangedStatus_INITIALIZER;
DDS_DataWriter_get_reliable_reader_activity_changed_status(myDataWriter, &myStatus);
DDS_ReliableReaderActivityChangedStatus_finalize(&myStatus);
```

See also:

```
 \begin{array}{l} \mathbf{DDS\_DataWriter\_get\_reliable\_reader\_activity\_changed\_status} \\ \text{(p. } 716) \end{array}
```

DDS_ReliableReaderActivityChangedStatus_finalize (p. 703)

4.88.2.7 #define DDS_DataWriterCacheStatus_INITIALIZER

Initializer for new status instances.

New DDS_DataWriterCacheStatus (p. 1101) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_DataWriterCacheStatus_finalize** (p. 704) should be called to free the contained fields that use dynamic memory:

```
struct DDS_DataWriterCacheStatus myStatus = DDS_DataWriterCacheStatus_INITIALIZER;
DDS_DataWriter_get_datawriter_cache_status(myDataWriter, &myStatus);
DDS_DataWriterCacheStatus_finalize(&myStatus);
```

See also:

```
DDS_DataWriter_get_datawriter_cache_status (p. 717)
DDS_DataWriterCacheStatus_finalize (p. 704)
```

4.88.2.8 #define DDS_DataWriterProtocolStatus_INITIALIZER

Initializer for new status instances.

New **DDS_DataWriterProtocolStatus** (p. 1111) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_DataWriterProtocolStatus_finalize** (p. 706) should be called to free the contained fields that use dynamic memory:

```
struct DDS_DataWriterProtocolStatus myStatus = DDS_DataWriterProtocolStatus_INITIALIZER;
DDS_DataWriter_get_datawriter_protocol_status(myDataWriter, &myStatus);
DDS_DataWriterProtocolStatus_finalize(&myStatus);
```

See also:

```
DDS_DataWriter_get_datawriter_protocol_status (p. 717)
DDS_DataWriterProtocolStatus_finalize (p. 706)
```

4.88.2.9 #define DDS_DataWriterQos_INITIALIZER

Initializer for new QoS instances.

New DDS_DataWriterQos (p. 1123) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a new QoS structure is to initialize it on the stack at the time of its creation:

```
struct DDS_DataWriterQos myQos = DDS_DataWriterQos_INITIALIZER;
```

Note that the above assignment is not a substitute for calling **DDS_Publisher_get_default_datawriter_qos** (p. 636) or **DDS_DataWriter_get_qos** (p. 720); one of those should be called subsequently to setting the QoS of a new or existing entity. **DDS_DataWriterQos_finalize** (p. 708) should be called to free the contained QoS policies that use dynamic memory:

```
struct DDS_DataWriterQos myQos = DDS_DataWriterQos_INITIALIZER;
DDS_Publisher_get_default_datawriter_qos(myPub, &myQos);
DDS_DataWriter_set_qos(myDataWriter, &myQos);
DDS_DataWriterQos_finalize(&myQos);
```

See also:

```
DDS_Publisher_get_default_datawriter_qos (p. 636)
DDS_DataWriterQos_finalize (p. 708)
```

4.88.2.10 #define DDS_DataWriterListener_INITIALIZER

Initializer for new DDS_DataWriterListener (p. 1102).

All the new **DDS_DataWriterListener** (p. 1102) instances allocated in the stack should be initialized to this value. No memory is allocated.

```
struct DDS_DataWriterListener listener = DDS_DataWriterListener_INITIALIZER;
/* initialize listener functions */
listener.on_offered_deadline_missed = ....;
DDS_DataWriter_set_listener(myDataWriter, &listener, mask);
```

See also:

```
DDS_DataWriter_set_listener (p. 721)
DDS_DataWriterListener (p. 1102)
```

4.88.3 Typedef Documentation

4.88.3.1 typedef struct DDS_DataWriterImpl DDS_DataWriter

<< interface>> (p. 950) Allows an application to set the value of the data to be published under a given DDS_Topic (p. 425).

QoS:

DDS_DataWriterQos (p. 1123)

Status:

```
DDS_LIVELINESS_LOST_STATUS
                                     (p. 131),
                                                   DDS_{-}
LivelinessLostStatus (p. 1252);
DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 129), DDS_-
OfferedDeadlineMissedStatus (p. 1276);
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS
                                                  (p. 129),
DDS_OfferedIncompatibleQosStatus (p. 1278);
DDS_PUBLICATION_MATCHED_STATUS
                                         (p. 131),
                                                   DDS_-
PublicationMatchedStatus (p. 1323);
DDS\_RELIABLE\_READER\_ACTIVITY\_CHANGED\_STATUS
(p. 132), DDS_ReliableReaderActivityChangedStatus (p. 1346);
DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS
(p. 132), DDS_ReliableWriterCacheChangedStatus<BR>
```

Listener:

DDS_DataWriterListener (p. 1102)

A DDS_DataWriter (p. 673) is attached to exactly one DDS_Publisher (p. 632), that acts as a factory for it.

A DDS_DataWriter (p. 673) is bound to exactly one DDS_Topic (p. 425) and therefore to exactly one data type. The DDS_Topic (p. 425) must exist prior to the DDS_DataWriter (p. 673)'s creation.

DDS_DataWriter (p. 673) is an abstract class. It must be specialized for each particular application data-type (see **USER_DATA** (p. 150)). The additional methods or functions that must be defined in the auto-generated class for a hypothetical application type Foo (p. 1494) are specified in the example type **DDS_DataWriter** (p. 673).

The following operations may be called even if the DDS_DataWriter (p. 673) is not enabled. Other operations will fail with DDS_RETCODE_NOT_-ENABLED (p. 121) if called on a disabled DDS_DataWriter (p. 673):

- The base-class operations DDS_DataWriter_set_qos (p. 719), DDS_DataWriter_get_qos (p. 720), DDS_DataWriter_set_listener (p. 721), DDS_DataWriter_get_listener (p. 721), DDS_Entity_enable (p. 245), DDS_Entity_get_statuscondition (p. 247) and DDS_Entity_get_status_changes (p. 247)
- ^ DDS_DataWriter_get_liveliness_lost_status (p. 714) DDS_-DataWriter_get_offered_deadline_missed_status (p. 715) DDS_-DataWriter_get_offered_incompatible_qos_status (p. 715) DDS_-

675

 $\begin{tabular}{llll} DataWriter_get_publication_matched_status & (p.\,715) & DDS_DataWriter_get_reliable_writer_cache_changed_status & (p.\,716) \\ DDS_DataWriter_get_reliable_reader_activity_changed_status & (p.\,716) \\ \end{tabular}$

Several **DDS_DataWriter** (p. 673) may operate in different threads. If they share the same **DDS_Publisher** (p. 632), the middleware guarantees that its operations are thread-safe.

```
FooDataWriter (p. 1496)
Operations Allowed in Listener Callbacks (p. 1248)
```

Examples:

HelloWorld_publisher.c.

4.88.3.2 typedef void(* DDS_DataWriterListener_OfferedDeadlineMissedCallback)(void *listener_data,
DDS_DataWriter *writer, const struct
DDS_OfferedDeadlineMissedStatus *status)

Prototype of a **DDS_DataWriterListener** (p. 1102) on_offered_deadline_missed function.

4.88.3.3 typedef void(* DDS_DataWriterListener_-LivelinessLostCallback)(void *listener_data, DDS_DataWriter *writer, const struct DDS_LivelinessLostStatus *status)

Prototype of a ${\bf DDS_DataWriterListener}$ (p. 1102) on_liveliness_lost function.

Parameters:

```
listener\_data << out>> (p. 951) Data associated with the listener when the listener is set
```

writer << out>> (p. 951) Locally created DDS_DataWriter (p. 673) that triggers the listener callback

status <<out>>> (p. 951) Current liveliness lost status of the locally created DDS_DataWriter (p. 673)

4.88.3.4 typedef void(* DDS_DataWriterListener_OfferedIncompatibleQosCallback)(void *listener_data,
DDS_DataWriter *writer, const struct
DDS_OfferedIncompatibleQosStatus *status)

Prototype of a **DDS_DataWriterListener** (p. 1102) on_offered_incompatible_-qos function.

Parameters:

 $listener_data << out>> (p. 951)$ Data associated with the listener when the listener is set

writer <<out>> (p. 951) Locally created DDS_DataWriter (p. 673) that triggers the listener callback

status << out>> (p. 951) Current offered incompatible qos status of the locally created DDS_DataWriter (p. 673)

4.88.3.5 typedef void(* DDS_DataWriterListener_-PublicationMatchedCallback)(void *listener_data, DDS_DataWriter *writer, const struct DDS_PublicationMatchedStatus *status)

Prototype of a **DDS_DataWriterListener** (p. 1102) on_publication_matched function.

4.88.3.6 typedef void(* DDS_DataWriterListener_-ReliableWriterCacheChangedCallback)(void *listener_data, DDS_DataWriter *writer, const struct DDS_ReliableWriterCacheChangedStatus *status)

 $<<\!\!eXtension>>$ (p. 950) A change has occurred in the writer's cache of unacknowledged samples.

Parameters:

 $listener_data << out>> (p. 951)$ Data associated with the listener when the listener is set

writer <<out>> (p. 951) Locally created DDS_DataWriter (p. 673) that triggers the listener callback

status << out>> (p. 951) Current reliable writer cache changed status of the locally created DDS_DataWriter (p. 673)

4.88 Data Writers 677

4.88.3.7 typedef void(* DDS_DataWriterListener_-ReliableReaderActivityChangedCallback)(void *listener_data, DDS_DataWriter *writer, const struct DDS_ReliableReaderActivityChangedStatus *status)

<< eXtension>> (p. 950) A matched reliable reader has become active or become inactive.

Parameters:

 $listener_data << out>> (p. 951)$ Data associated with the listener when the listener is set

writer << out>> (p. 951) Locally created DDS_DataWriter (p. 673) that triggers the listener callback

status <<out>

 (p. 951) Current reliable reader activity changed status of the locally created DDS_DataWriter (p. 673)

4.88.3.8 typedef void(* DDS_DataWriterListener_InstanceReplacedCallback)(void *listener_data,
DDS_DataWriter *writer, const DDS_InstanceHandle_t
*handle)

<<eXtension>> (p. 950) An instance previously registered with the writer has been replaced

Parameters:

 $listener_data << out>> (p. 951)$ Data associated with the listener when the listener is set

writer << out>> (p. 951) Locally created DDS_DataWriter (p. 673) that triggers the listener callback

handle << out>> (p. 951) Handle of the replaced instance

4.88.4 Function Documentation

4.88.4.1 FooDataWriter* FooDataWriter_narrow (DDS_DataWriter * writer)

Narrow the given **DDS_DataWriter** (p. 673) pointer to a **FooDataWriter** (p. 1496) pointer.

Check if the given writer is of type FooDataWriter (p. 1496).

Parameters:

```
\label{eq:writer} writer <<in>> (p. 951) Cannot be NULL. \\ writer <<in>> (p. 951) Base-class DDS_DataWriter (p. 673) to be converted to the auto-generated class FooDataWriter (p. 1496) that extends DDS_DataWriter (p. 673).
```

Returns:

FooDataWriter (p. 1496) if writer is of type **Foo** (p. 1494). Return NULL otherwise.

4.88.4.2 DDS_DataWriter* FooDataWriter_as_datawriter (FooDataWriter * writer)

Widen the given FooDataWriter (p. 1496) pointer to a DDS_DataWriter (p. 673) pointer.

Parameters:

```
writer << in>> (p. 951) Cannot be NULL. writer << in>> (p. 951) auto-generated FooDataWriter (p. 1496) to be converted to the Base-class DDS_DataWriter (p. 673).
```

Returns:

```
DDS_DataWriter (p. 673).
```

4.88.4.3 DDS_InstanceHandle_t FooDataWriter_register_instance (FooDataWriter * self, const Foo * instance_data)

Informs RTI Data Distribution Service that the application will be modifying a particular instance.

This operation is only useful for keyed data types. Using it for non-keyed types causes no effect and returns **DDS_HANDLE_NIL** (p. 460). The operation takes as a parameter an instance (of which only the key value is examined) and returns a handle that can be used in successive write() or dispose() operations.

The operation gives RTI Data Distribution Service an opportunity to preconfigure itself to improve performance.

The use of this operation by an application is optional even for keyed types. If an instance has not been pre-registered, the application can use the special value **DDS_HANDLE_NIL** (p. 460) as the **DDS_InstanceHandle_t** (p. 452)

paramater to the write or dispose operation and RTI Data Distribution Service will auto-register the instance.

For best performance, the operation should be invoked prior to calling any operation that modifies the instance, such as FooDataWriter_write (p. 684), FooDataWriter_write_w_timestamp (p. 686), FooDataWriter_dispose (p. 688) and FooDataWriter_dispose_w_timestamp (p. 690) and the handle used in conjunction with the data for those calls.

When this operation is used, RTI Data Distribution Service will automatically supply the value of the source_timestamp that is used.

This operation may fail and return **DDS_HANDLE_NIL** (p. 460) if **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1359) limit has been exceeded.

The operation is **idempotent**. If it is called for an already registered instance, it just returns the already allocated handle. This may be used to lookup and retrieve the handle allocated to a given instance.

This operation can only be called after **DDS_DataWriter** (p. 673) has been enabled. Otherwise, **DDS_HANDLE_NIL** (p. 460) will be returned.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

instance_data <<in>>> (p. 951) The instance that should be registered.
Of this instance, only the fields that represent the key are examined by the function. Cannot be NULL..

Returns:

For keyed data type, a handle that can be used in the calls that take a DDS_InstanceHandle_t (p. 452), such as write, dispose, unregister_instance, or return DDS_HANDLE_NIL (p. 460) on failure. If the instance_data is of a data type that has no keys, this function always return DDS_HANDLE_NIL (p. 460).

See also:

FooDataWriter_unregister_instance (p. 681), FooDataWriter_get_key_value (p. 691), RELATIONSHIP BETWEEN REGISTRATION, LIVELINESS and OWNERSHIP (p. 1282)

4.88.4.4 DDS_InstanceHandle_t FooDataWriter_register_instance_w_timestamp (FooDataWriter * self, const
Foo * instance_data, const struct DDS_Time_t *
source_timestamp)

Performs the same functions as register_instance except that the application provides the value for the source_timestamp.

The provided source_timestamp potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_-ORDER** (p. 168) QoS policy for details.

This operation may fail and return DDS_HANDLE_NIL (p. 460) if DDS_-ResourceLimitsQosPolicy::max_instances (p. 1359) limit has been exceeded

This operation can only be called after **DDS_DataWriter** (p. 673) has been enabled. Otherwise, **DDS_HANDLE_NIL** (p. 460) will be returned.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

instance_data <<in>> (p. 951) The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function. Cannot be NULL.

source_timestamp <<iin> (p. 951) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a register, unregister, dispose, or write, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. Cannot be NULL.

Returns:

For keyed data type, return a handle that can be used in the calls that take a **DDS_InstanceHandle_t** (p. 452), such as write, dispose, unregister_instance, or return **DDS_HANDLE_NIL** (p. 460) on failure. If the instance_data is of a data type that has no keys, this function always return **DDS_HANDLE_NIL** (p. 460).

See also:

FooDataWriter_unregister_instance (p. 681), FooDataWriter_get_-key_value (p. 691)

4.88.4.5 DDS_ReturnCode_t FooDataWriter_unregister_instance (FooDataWriter * self, const Foo * instance_data, const DDS_InstanceHandle_t * handle)

Reverses the action of FooDataWriter_register_instance (p. 678).

This operation is useful only for keyed data types. Using it for non-keyed types causes no effect and reports no error. The operation takes as a parameter an instance (of which only the key value is examined) and a handle.

This operation should only be called on an instance that is currently registered. This includes instances that have been auto-registered by calling operations such as write or dispose as described in **FooDataWriter_register_instance** (p. 678). Otherwise, this operation may fail with **DDS_RETCODE_BAD_-PARAMETER** (p. 121).

This only need be called just once per instance, regardless of how many times register_instance was called for that instance.

When this operation is used, RTI Data Distribution Service will automatically supply the value of the source_timestamp that is used.

This operation informs RTI Data Distribution Service that the **DDS_-DataWriter** (p. 673) is no longer going to provide any information about the instance. This operation also indicates that RTI Data Distribution Service can locally remove all information regarding that instance. The application should not attempt to use the handle previously allocated to that instance after calling **FooDataWriter_unregister_instance()** (p. 681).

The special value **DDS_HANDLE_NIL** (p. 460) can be used for the parameter handle. This indicates that the identity of the instance should be automatically deduced from the instance_data (by means of the key).

If handle is any value other than **DDS_HANDLE_NIL** (p. 460), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 121).

RTI Data Distribution Service will not detect the error when the handle is any value other than DDS_HANDLE_NIL (p. 460), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the instance_data (by means of the key). RTI Data Distribution Service will treat as if the unregister_instance() operation is for the instance as indicated by the handle.

If after a FooDataWriter_unregister_instance (p. 681), the application wants to modify (FooDataWriter_write (p. 684) or FooDataWriter_dispose (p. 688)) an instance, it has to register it again, or else use the special handle value DDS_HANDLE_NIL (p. 460).

This operation does not indicate that the instance is deleted (that is the pur-

pose of FooDataWriter_dispose (p. 688)). The operation FooDataWriter_unregister_instance (p. 681) just indicates that the DDS_DataWriter (p. 673) no longer has anything to say about the instance. DDS_DataReader (p. 783) entities that are reading the instance may receive a sample with DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE (p. 854) for the instance, unless there are other DDS_DataWriter (p. 673) objects writing that same instance.

This operation can affect the ownership of the data instance (see **OWNER-SHIP** (p. 159)). If the **DDS_DataWriter** (p. 673) was the exclusive owner of the instance, then calling unregister_instance() will relinquish that ownership.

If DDS_ReliabilityQosPolicy::kind (p. 1344) is set to DDS_RELIABLE_-RELIABILITY_QOS (p. 167) and the unregistration would overflow the resource limits of this writer or of a reader, this operation may block for up to DDS_ReliabilityQosPolicy::max_blocking_time (p. 1345); if this writer is still unable to unregister after that period, this function will fail with DDS_-RETCODE_TIMEOUT (p. 122).

Parameters:

instance_data <<in>> (p. 951) The instance that should be unregistered. If Foo (p. 1494) has a key and instance_handle is DDS_HANDLE_NIL (p. 460), only the fields that represent the key are examined by the function. Otherwise, instance_data is not used. If instance_data is used, it must represent an instance that has been registered. Otherwise, this function may fail with DDS_RETCODE_BAD_PARAMETER (p. 121). If Foo (p. 1494) has a key, instance_data can be NULL only if handle is not DDS_HANDLE_NIL (p. 460). Otherwise, this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121).

handle <<in>> (p. 951) represents the instance to be unregistered. If Foo (p. 1494) has a key and handle is DDS_HANDLE_NIL (p. 460), handle is not used and instance is deduced from instance_data. If Foo (p. 1494) has no key, handle is not used. If handle is used, it must represent an instance that has been registered. Otherwise, this function may fail with DDS_RETCODE_BAD_PARAMETER (p. 121). This function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if handle is NULL. If Foo (p. 1494) has a key, handle cannot be DDS_HANDLE_NIL (p. 460) if instance_data is NULL. Otherwise, this function will report the error DDS_RETCODE_BAD_PARAMETER (p. 121).

 $self \ll in >> (p. 951)$ Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-TIMEOUT (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121)

See also:

FooDataWriter_register_instance (p. 678)
FooDataWriter_unregister_instance_w_timestamp (p. 683)
FooDataWriter_get_key_value (p. 691)
RELATIONSHIP BETWEEN REGISTRATION, LIVELINESS and OWNERSHIP (p. 1282)

4.88.4.6 DDS_ReturnCode_t FooDataWriter_unregister_instance_w_timestamp (FooDataWriter * self, const Foo * instance_data, const DDS_InstanceHandle_t * handle, const struct DDS_Time_t * source_timestamp)

Performs the same function as **FooDataWriter_unregister_instance** (p. 681) except that it also provides the value for the **source_timestamp**.

The provided source_timestamp potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_-ORDER** (p. 168) QoS policy for details.

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the FooDataWriter_unregister_instance (p. 681) operation.

This operation may block and may time out (DDS_RETCODE_TIMEOUT (p. 122)) under the same circumtances described for the unregister_instance operation.

Parameters:

 $self \ll in >> (p. 951)$ Cannot be NULL.

instance_data <<iin>>> (p. 951) The instance that should be unregistered. If Foo (p. 1494) has a key and instance_handle is DDS_HANDLE_NIL (p. 460), only the fields that represent the key are examined by the function. Otherwise, instance_data is not used. If instance_data is used, it must represent an instance that has been registered. Otherwise, this function may fail with DDS_RETCODE_BAD_PARAMETER (p. 121). If Foo (p. 1494) has a key, instance_data can be NULL only if handle is not DDS_HANDLE_NIL (p. 460). Otherwise, this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121).

handle <<in>> (p. 951) represents the instance to be unregistered.
If Foo (p. 1494) has a key and handle is DDS_HANDLE_NIL (p. 460), handle is not used and instance is deduced from instance_data. If Foo (p. 1494) has no key, handle is not used. If handle is used, it must represent an instance that has been registered. Otherwise, this function may fail with DDS_RETCODE_-

BAD_PARAMETER (p. 121). This function will fail with DDS_-RETCODE_BAD_PARAMETER (p. 121) if handle is NULL. If Foo (p. 1494) has a key, handle cannot be DDS_HANDLE_NIL (p. 460) if instance_data is NULL. Otherwise, this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121).

source_timestamp <<iin>> (p. 951) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a register, unregister, dispose, or write, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. Cannot be NULL.

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-TIMEOUT (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).
```

See also:

```
FooDataWriter_register_instance (p. 678)

FooDataWriter_get_key_value (p. 691)
```

4.88.4.7 DDS_ReturnCode_t FooDataWriter_write (FooDataWriter * self, const Foo * instance_data, const DDS_InstanceHandle_t * handle)

Modifies the value of a data instance.

When this operation is used, RTI Data Distribution Service will automatically supply the value of the source_timestamp that is made available to DDS_DataReader (p. 783) objects by means of the source_timestamp attribute inside the DDS_SampleInfo (p. 1384). (Refer to DDS_SampleInfo (p. 1384) and DESTINATION_ORDER (p. 168) QoS policy for details).

As a side effect, this operation asserts liveliness on the $DDS_DataWriter$ (p. 673) itself, the $DDS_Publisher$ (p. 632) and the $DDS_DomainParticipant$ (p. 339).

Note that the special value DDS_HANDLE_NIL (p. 460) can be used for the parameter handle. This indicates the identity of the instance should be automatically deduced from the instance_data (by means of the key).

If handle is any value other than DDS_HANDLE_NIL (p. 460), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with DDS_RETCODE_BAD_PARAMETER (p. 121).

RTI Data Distribution Service will not detect the error when the handle is any value other than DDS_HANDLE_NIL (p. 460), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the instance_data (by means of the key). RTI Data Distribution Service will treat as if the write() operation is for the instance as indicated by the handle.

This operation may block if the **RELIABILITY** (p. 166) kind is set to **DDS_-RELIABILITY_QOS** (p. 167) and the modification would cause data to be lost or else cause one of the limits specified in the **RE-SOURCE_LIMITS** (p. 174) to be exceeded.

Specifically, this operation may block in the following situations (note that the list may not be exhaustive), even if its **DDS_HistoryQosPolicyKind** (p. 171) is **DDS_KEEP_LAST_HISTORY_QOS** (p. 171):

- If (DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) < DDS_ResourceLimitsQosPolicy::max_instances (p. 1359) * DDS_-HistoryQosPolicy::depth (p. 1231)), then in the situation where the max_samples resource limit is exhausted, RTI Data Distribution Service is allowed to discard samples of some other instance, as long as at least one sample remains for such an instance. If it is still not possible to make space available to store the modification, the writer is allowed to block.
- If (DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) < DDS_ResourceLimitsQosPolicy::max_instances (p. 1359)), then the DataWriter may block regardless of the DDS_HistoryQosPolicy::depth (p. 1231).

This operation may also block when using DDS_BEST_EFFORT_-RELIABILITY_QOS (p. 167) and DDS_ASYNCHRONOUS_-PUBLISH_MODE_QOS (p. 222). In this case, the DDS_DataWriter (p. 673) will queue samples until they are sent by the asynchronous publishing thread. The number of samples that can be stored is determined by the DDS_HistoryQosPolicy (p. 1229). If the asynchronous thread does not send samples fast enough (e.g., when using a slow DDS_FlowController (p. 726)), the queue may fill up. In that case, subsequent write calls will block.

If this operation *does* block for any of the above reasons, the **RELIABIL-ITY** (p. 166) max_blocking_time configures the maximum time the write operation may block (waiting for space to become available). If max_blocking_time elapses before the **DDS_DataWriter** (p. 673) is able to store the modification without exceeding the limits, the operation will time out (**DDS_RETCODE_-TIMEOUT** (p. 122)).

If there are no instance resources left, this operation may fail with DDS_-RETCODE_OUT_OF_RESOURCES (p. 121). Calling FooDataWriter_unregister_instance (p. 681) may help freeing up some resources.

This operation will fail with DDS_RETCODE_PRECONDITION_NOT_-

MET (p. 121) if the timestamp is less than the timestamp used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. instance\_data << in>> (p. 951) The data to write.
```

This function will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 121) if instance_data is NULL.

Parameters:

handle <<in>> (p. 951) Either the handle returned by a previous call to FooDataWriter_register_instance (p. 678), or else the special value DDS_HANDLE_NIL (p. 460). If Foo (p. 1494) has a key and handle is not DDS_HANDLE_NIL (p. 460), handle must represent a registered instance of type Foo (p. 1494). Otherwise, this function may fail with DDS_RETCODE_BAD_PARAMETER (p. 121). This function will fail with DDS_RETCODE_BAD_PARAMETER PARAMETER (p. 121) if handle is NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_TIMEOUT (p. 122), DDS_RETCODE_PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_OUT_OF_RESOURCES (p. 121), or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

```
DDS_DataReader (p. 783)
FooDataWriter_write_w_timestamp (p. 686)
DESTINATION_ORDER (p. 168)
```

4.88.4.8 DDS_ReturnCode_t FooDataWriter_write_w_timestamp (FooDataWriter * self, const Foo * instance_data, const DDS_InstanceHandle_t * handle, const struct DDS_Time_t * source_timestamp)

Performs the same function as **FooDataWriter_write** (p. 684) except that it also provides the value for the source_timestamp.

Explicitly provides the timestamp that will be available to the DDS_-DataReader (p. 783) objects by means of the source_timestamp attribute

inside the DDS_SampleInfo (p. 1384). (Refer to DDS_SampleInfo (p. 1384) and DESTINATION_ORDER (p. 168) QoS policy for details)

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the FooDataWriter_write (p. 684) operation.

This operation may block and time out (DDS_RETCODE_TIMEOUT (p. 122)) under the same circumtances described for FooDataWriter_write (p. 684).

If there are no instance resources left, this operation may fail with DDS_-RETCODE_OUT_OF_RESOURCES (p. 121). Calling FooDataWriter_-unregister_instance (p. 681) may help free up some resources.

This operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 121) under the same circumstances described for the write operation.

Parameters:

self << in>> (p. 951) Cannot be NULL.

instance_data <<iin>> (p. 951) The data to write. This function
will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if
instance_data is NULL.

handle <<in>> (p. 951) Either the handle returned by a previous call to FooDataWriter_register_instance (p. 678), or else the special value DDS_HANDLE_NIL (p. 460). If Foo (p. 1494) has a key and handle is not DDS_HANDLE_NIL (p. 460), handle must represent a registered instance of type Foo (p. 1494). Otherwise, this function may fail with DDS_RETCODE_BAD_PARAMETER (p. 121). This function will fail with DDS_RETCODE_BAD_PARAMETER PARAMETER (p. 121) if handle is NULL.

 $source_timestamp << in>>$ (p. 951) When DDS_BY_using SOURCE_TIMESTAMP_DESTINATIONORDER_QOS (p. 169) the timestamp value must be greater than or equal to the timestamp value used in the last writer operation (register, unregister, dispose, or write, with either the automatically supplied timestamp or the application-provided timestamp) However, if it is less than the timestamp of the previous operation but the difference is less than DDS_DestinationOrderQosPolicy::source_timestamp_tolerance (p. 1140), the timestamp of the previous operation will be used as the source timestamp of this sample. Otherwise, if the difference is greater than DDS_DestinationOrderQosPolicy::source_timestamp_tolerance (p. 1140), the function will return DDS_-RETCODE_BAD_PARAMETER (p. 121).

Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_TIMEOUT (p. 122), DDS_RETCODE_OUT_OF_RESOURCES (p. 121), or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

```
FooDataWriter_write (p. 684)
DDS_DataReader (p. 783)
DESTINATION_ORDER (p. 168)
```

4.88.4.9 DDS_ReturnCode_t FooDataWriter_dispose (FooDataWriter * self, const Foo * instance_data, const DDS_InstanceHandle_t * instance_handle)

Requests the middleware to delete the data.

This operation is useful only for keyed data types. Using it for non-keyed types has no effect and reports no error.

The actual deletion is postponed until there is no more use for that data in the whole system.

Applications are made aware of the deletion by means of operations on the DDS_DataReader (p. 783) objects that already knew that instance. DDS_DataReader (p. 783) objects that didn't know the instance will never see it.

This operation does not modify the value of the instance. The instance_data parameter is passed just for the purposes of identifying the instance.

When this operation is used, RTI Data Distribution Service will automatically supply the value of the source_timestamp that is made available to **DDS_DataReader** (p. 783) objects by means of the source_timestamp attribute inside the **DDS_SampleInfo** (p. 1384).

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the **FooDataWriter_unregister_instance** (p. 681) operation.

The special value **DDS_HANDLE_NIL** (p. 460) can be used for the parameter <code>instance_handle</code>. This indicates the identity of the instance should be automatically deduced from the <code>instance_data</code> (by means of the <code>key</code>).

If handle is any value other than DDS_HANDLE_NIL (p. 460), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with DDS_RETCODE_BAD_PARAMETER (p. 121).

RTI Data Distribution Service will not detect the error when the handle is any value other than DDS_HANDLE_NIL (p. 460), corresponds to an instance

that has been registered, but does not correspond to the instance deduced from the instance_data (by means of the key). RTI Data Distribution Service will treat as if the dispose() operation is for the instance as indicated by the handle.

This operation may block and time out (DDS_RETCODE_TIMEOUT (p. 122)) under the same circumtances described for FooDataWriter_write() (p. 684).

If there are no instance resources left, this operation may fail with DDS_-RETCODE_OUT_OF_RESOURCES (p. 121). Calling FooDataWriter_-unregister_instance (p. 681) may help freeing up some resources.

Parameters:

 $self \ll in \gg (p. 951)$ Cannot be NULL.

instance_data <<iin>> (p. 951) The data to dispose. If Foo (p. 1494)
has a key and instance_handle is DDS_HANDLE_NIL (p. 460),
only the fields that represent the key are examined by the function. Otherwise, instance_data is not used. If Foo (p. 1494) has
a key, instance_data can be NULL only if instance_handle is not
DDS_HANDLE_NIL (p. 460). Otherwise, this function will fail with
DDS_RETCODE_BAD_PARAMETER (p. 121).

instance_handle <<iin>> (p. 951) Either the handle returned by a
 previous call to FooDataWriter_register_instance (p. 678), or
 else the special value DDS_HANDLE_NIL (p. 460). If Foo
 (p. 1494) has a key and instance_handle is DDS_HANDLE_NIL
 (p. 460), instance_handle is not used and instance is deduced from
 instance_data. If Foo (p. 1494) has no key, instance_handle is
 not used. If handle is used, it must represent a registered instance
 of type Foo (p. 1494). Otherwise, this function fail with DDS_RETCODE_BAD_PARAMETER (p. 121). This function will fail
 with DDS_RETCODE_BAD_PARAMETER (p. 121) if handle is
 NULL. If Foo (p. 1494) has a key, instance_handle cannot be DDS_HANDLE_NIL (p. 460) if instance_data is NULL. Otherwise, this
 function will fail with DDS_RETCODE_BAD_PARAMETER
 (p. 121).

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_TIMEOUT (p. 122), DDS_RETCODE_OUT_OF_RESOURCES (p. 121) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

 $\label{eq:continuous_pose_w_timestamp} \begin{array}{l} FooDataWriter_dispose_w_timestamp \ (p. \, 690) \\ RELATIONSHIP \ BETWEEN \ REGISTRATION, \ LIVELINESS \\ and \ OWNERSHIP \ (p. \, 1282) \\ \end{array}$

4.88.4.10 DDS_ReturnCode_t FooDataWriter_dispose_w_timestamp (FooDataWriter * self, const Foo * instance_data, const DDS_InstanceHandle_t * instance_handle, const struct DDS_Time_t * source_timestamp)

Performs the same functions as dispose except that the application provides the value for the source_timestamp that is made available to **DDS_DataReader** (p. 783) objects by means of the source_timestamp attribute inside the **DDS_SampleInfo** (p. 1384).

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the FooDataWriter_dispose (p. 688) operation.

This operation may block and time out (DDS_RETCODE_TIMEOUT (p. 122)) under the same circumtances described for FooDataWriter_write (p. 684).

If there are no instance resources left, this operation may fail with DDS_-RETCODE_OUT_OF_RESOURCES (p. 121). Calling FooDataWriter_unregister_instance (p. 681) may help freeing up some resources.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

instance_data <<in>> (p. 951) The data to dispose. If Foo (p. 1494) has a key and instance_handle is DDS_HANDLE_NIL (p. 460), only the fields that represent the key are examined by the function. Otherwise, instance_data is not used. If Foo (p. 1494) has a key, instance_data can be NULL only if instance_handle is not DDS_HANDLE_NIL (p. 460). Otherwise, this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121).

instance_handle <<iin>> (p. 951) Either the handle returned by a
previous call to FooDataWriter_register_instance (p. 678), or
else the special value DDS_HANDLE_NIL (p. 460). If Foo
(p. 1494) has a key and instance_handle is DDS_HANDLE_NIL
(p. 460), instance_handle is not used and instance is deduced from
instance_data. If Foo (p. 1494) has no key, instance_handle is not
used. If handle is used, it must represent a registered instance of
type Foo (p. 1494). Otherwise, this function may fail with DDS_RETCODE_BAD_PARAMETER (p. 121) This function will fail
with DDS_RETCODE_BAD_PARAMETER (p. 121) if handle is
NULL. If Foo (p. 1494) has a key, instance_handle cannot be DDS_HANDLE_NIL (p. 460) if instance_data is NULL. Otherwise, this
function will fail with DDS_RETCODE_BAD_PARAMETER
(p. 121).

 $source_timestamp << in>> (p. 951)$ The timestamp value must be

greater than or equal to the timestamp value used in the last writer operation (used in a register, unregister, dispose, or write, with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. This timestamp will be available to the **DDS_DataReader** (p. 783) objects by means of the source_timestamp attribute inside the **DDS_SampleInfo** (p. 1384). Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_TIMEOUT (p. 122), DDS_RETCODE_OUT_OF_RESOURCES (p. 121) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

FooDataWriter_dispose (p. 688)

4.88.4.11 DDS_ReturnCode_t FooDataWriter_get_key_value (FooDataWriter * self, Foo * key_holder, const DDS_InstanceHandle_t * handle)

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the key inside the key_holder instance. If Foo (p. 1494) has no key, this function has no effect and exit with no error.

For keyed data types, this operation may fail with **DDS_RETCODE_BAD_-PARAMETER** (p. 121) if the handle does not correspond to an existing data-object known to the **DDS_DataWriter** (p. 673).

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

key_holder <<iinout>> (p. 951) a user data type specific key holder,
whose key fields are filled by this operation. If Foo (p. 1494) has
no key, this function has no effect. This function will fail with
DDS_RETCODE_BAD_PARAMETER (p. 121) if key_holder is
NULL.

handle <<in>> (p. 951) the instance whose key is to be retrieved. If Foo (p. 1494) has a key, handle must represent a registered instance of type Foo (p. 1494). Otherwise, this function will fail with DDS_-RETCODE_BAD_PARAMETER (p. 121). If Foo (p. 1494) has a

key and handle is DDS_HANDLE_NIL (p. 460), this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121). This function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if handle is NULL.

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-NOT_ENABLED** (p. 121).

See also:

FooDataReader_get_key_value (p. 812)

4.88.4.12 DDS_InstanceHandle_t FooDataWriter_lookup_instance (FooDataWriter * self, const Foo * key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. This operation does not register the instance in question. If the instance has not been previously registered, or if for any other reason RTI Data Distribution Service is unable to provide an instance handle, RTI Data Distribution Service will return the special value HANDLE_NIL.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. key\_holder << in>> (p. 951) a user data type specific key holder.
```

Returns:

the instance handle associated with this instance. If **Foo** (p. 1494) has no key, this function has no effect and returns **DDS_HANDLE_NIL** (p. 460)

$\begin{array}{lll} 4.88.4.13 & DDS_ReturnCode_t \ DDS_OfferedDeadlineMissedStatus_initialize \ (struct \ DDS_OfferedDeadlineMissedStatus * \\ & self) \end{array}$

Initializer for new status instances.

New DDS_OfferedDeadlineMissedStatus (p. 1276) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_OfferedDeadlineMissedStatus_finalize (p. 694) should be called to free the contained fields that use dynamic memory:

```
DDS_OfferedDeadlineMissedStatus *myStatus = malloc(sizeof(struct DDS_OfferedDeadlineMissedStatus));
DDS_OfferedDeadlineMissedStatus_initialize(myStatus);
DDS_DataWriter_get_offered_deadline_missed_status(myDataWriter, myStatus);
DDS_OfferedDeadlineMissedStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DataWriter_get_offered_deadline_missed_status (p. 715)
DDS_OfferedDeadlineMissedStatus_finalize (p. 694)
```

$\begin{array}{lll} 4.88.4.14 & DDS_ReturnCode_t \ DDS_OfferedDeadlineMissedStatus_copy \ (struct \ DDS_OfferedDeadlineMissedStatus * \textit{self}, \\ & const \ struct \ DDS_OfferedDeadlineMissedStatus * \textit{source}) \end{array}$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_OfferedDeadlineMissedStatus_INITIALIZER (p. 669)

```
DDS_OfferedDeadlineMissedStatus_initialize (p. 692)
DDS_OfferedDeadlineMissedStatus_finalize (p. 694)
```

4.88.4.15 DDS_ReturnCode_t DDS_OfferedDeadlineMissedStatus_finalize (struct DDS_OfferedDeadlineMissedStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_OfferedDeadlineMissedStatus_INITIALIZER (p. 669) DDS_OfferedDeadlineMissedStatus_initialize (p. 692)
```

4.88.4.16 DDS_ReturnCode_t DDS_LivelinessLostStatus_initialize (struct DDS_LivelinessLostStatus * self)

Initializer for new status instances.

New **DDS_LivelinessLostStatus** (p. 1252) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_LivelinessLostStatus_finalize (p. 695) should be called to free the contained fields that use dynamic memory:

```
DDS_LivelinessLostStatus *myStatus = malloc(sizeof(struct DDS_LivelinessLostStatus));
DDS_LivelinessLostStatus_initialize(myStatus);
DDS_DataWriter_get_liveliness_lost_status(myDataWriter, myStatus);
DDS_LivelinessLostStatus_finalize(myStatus);
free(myStatus);
```

4.88 Data Writers 695

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriter_get_liveliness_lost_status (p. 714)
DDS_LivelinessLostStatus_finalize (p. 695)
```

4.88.4.17 DDS_ReturnCode_t DDS_LivelinessLostStatus_copy (struct DDS_LivelinessLostStatus * self, const struct DDS_LivelinessLostStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self \ll in > (p. 951) Cannot be NULL. source \ll in > (p. 951). Status to be copied from.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_LivelinessLostStatus_INITIALIZER (p. 669)
DDS_LivelinessLostStatus_initialize (p. 694)
DDS_LivelinessLostStatus_finalize (p. 695)
```

4.88.4.18 DDS_ReturnCode_t DDS_LivelinessLostStatus_finalize (struct DDS_LivelinessLostStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_LivelinessLostStatus_INITIALIZER (p. 669)
DDS_LivelinessLostStatus_initialize (p. 694)
```

$\begin{array}{ccc} 4.88.4.19 & DDS_ReturnCode_t & DDS_- \\ & OfferedIncompatibleQosStatus_initialize \\ & (struct & DDS_OfferedIncompatibleQosStatus * \textit{self}) \end{array}$

Initializer for new status instances.

New **DDS_OfferedIncompatibleQosStatus** (p. 1278) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_OfferedIncompatibleQosStatus_finalize (p. 697) should be called to free the contained fields that use dynamic memory:

```
DDS_OfferedIncompatibleQosStatus *myStatus = malloc(sizeof(struct DDS_OfferedIncompatibleQosStatus));
DDS_OfferedIncompatibleQosStatus_initialize(myStatus);
DDS_DataWriter_get_offered_incompatible_qos_status(myDataWriter, myStatus);
DDS_OfferedIncompatibleQosStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
\label{local_possible_qos_status} \begin{split} DDS\_DataWriter\_get\_offered\_incompatible\_qos\_status \ (p.\ 715) \\ DDS\_OfferedIncompatibleQosStatus\_finalize \ (p.\ 697) \end{split}
```

4.88 Data Writers 697

4.88.4.20 DDS_ReturnCode_t DDS_-

 $\label{lem:compatibleQosStatus_copy} \\ (struct\ DDS_OfferedIncompatibleQosStatus*\ self,\ conststruct\ DDS_OfferedIncompatibleQosStatus*\ source) \\$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_OfferedIncompatibleQosStatus_INITIALIZER (p. 670)
DDS_OfferedIncompatibleQosStatus_initialize (p. 696)
DDS_OfferedIncompatibleQosStatus_finalize (p. 697)
```

4.88.4.21 DDS_ReturnCode_t DDS_OfferedIncompatibleQosStatus_finalize (struct DDS_OfferedIncompatibleQosStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
\begin{aligned} &\mathbf{DDS\_OfferedIncompatibleQosStatus\_INITIALIZER} \ (\mathrm{p.}\ 670) \\ &\mathbf{DDS\_OfferedIncompatibleQosStatus\_initialize} \ (\mathrm{p.}\ 696) \end{aligned}
```

4.88.4.22 DDS_ReturnCode_t DDS_PublicationMatchedStatus_initialize (struct DDS_PublicationMatchedStatus * self)

Initializer for new status instances.

New **DDS_PublicationMatchedStatus** (p. 1323) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_PublicationMatchedStatus_finalize (p. 699) should be called to free the contained fields that use dynamic memory:

```
DDS_PublicationMatchedStatus *myStatus = malloc(sizeof(struct DDS_PublicationMatchedStatus));
DDS_PublicationMatchedStatus_initialize(myStatus);
DDS_DataWriter_get_publication_matched_status(myDataWriter, myStatus);
DDS_PublicationMatchedStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriter_get_publication_matched_status (p. 715)
DDS_PublicationMatchedStatus_finalize (p. 699)
```

$\begin{array}{lll} 4.88.4.23 & DDS_ReturnCode_t \ DDS_PublicationMatchedStatus_copy \ (struct \ DDS_PublicationMatchedStatus * \textit{self}, \\ & const \ struct \ DDS_PublicationMatchedStatus * \textit{source}) \end{array}$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_PublicationMatchedStatus_INITIALIZER (p. 670)
DDS_PublicationMatchedStatus_initialize (p. 698)
DDS_PublicationMatchedStatus_finalize (p. 699)
```

4.88.4.24 DDS_ReturnCode_t DDS_PublicationMatchedStatus_finalize (struct DDS_PublicationMatchedStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_PublicationMatchedStatus_INITIALIZER (p. 670)
DDS_PublicationMatchedStatus_initialize (p. 698)
```

4.88.4.25 DDS_ReturnCode_t DDS_-ReliableWriterCacheChangedStatus_initialize (struct DDS_ReliableWriterCacheChangedStatus * self)

Initializer for new status instances.

New DDS_ReliableWriterCacheChangedStatus (p. 1348) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_ReliableWriterCacheChangedStatus_finalize (p. 701) should be called to free the contained fields that use dynamic memory:

```
DDS_ReliableWriterCacheChangedStatus *myStatus = malloc(sizeof(struct DDS_ReliableWriterCacheChangedStatus
DDS_ReliableWriterCacheChangedStatus_initialize(myStatus);
DDS_DataWriter_get_reliable_writer_cache_changed_status(myDataWriter, myStatus);
DDS_ReliableWriterCacheChangedStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriter_get_reliable_writer_cache_changed_status (p. 716)
DDS_ReliableWriterCacheChangedStatus_finalize (p. 701)
```

4.88.4.26 DDS_ReturnCode_t DDS_ReliableWriterCacheChangedStatus_copy (struct DDS_ReliableWriterCacheChangedStatus * self, const struct DDS_ReliableWriterCacheChangedStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

4.88 Data Writers 701

See also:

4.88.4.27 DDS_ReturnCode_t DDS_-ReliableWriterCacheChangedStatus_finalize (struct DDS_ReliableWriterCacheChangedStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

$$\label{lem:decomposition} \begin{split} \mathbf{DDS_ReliableWriterCacheChangedStatus_INITIALIZER} \ (\mathrm{p.\,671}) \\ \mathbf{DDS_ReliableWriterCacheChangedStatus_initialize} \ (\mathrm{p.\,699}) \end{split}$$

4.88.4.28 DDS_ReturnCode_t DDS_ReliableReaderActivityChangedStatus_initialize (struct DDS_ReliableReaderActivityChangedStatus * self)

Initializer for new status instances.

New DDS_ReliableReaderActivityChangedStatus (p. 1346) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_ReliableReaderActivityChangedStatus_finalize (p. 703) should be called to free the contained fields that use dynamic memory:

DDS_ReliableReaderActivityChangedStatus *myStatus = malloc(sizeof(struct DDS_ReliableReaderActivityChangedStatus_initialize(myStatus);
DDS_ReliableReaderActivityChangedStatus_initialize(myStatus);
DDS_DataWriter_get_reliable_reader_activity_changed_status(myDataWriter, myStatus);
DDS_ReliableReaderActivityChangedStatus_finalize(myStatus);
free(myStatus);

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

 $\begin{tabular}{l} DDS_DataWriter_get_reliable_reader_activity_changed_status \\ (p. \begin{tabular}{l} 716 \end{tabular}) \end{tabular}$

DDS_ReliableReaderActivityChangedStatus_finalize (p. 703)

4.88.4.29 DDS_ReturnCode_t DDS_-

 $Reliable Reader Activity Changed Status_copy \ (struct DDS_Reliable Reader Activity Changed Status * \textit{self}, const struct DDS_Reliable Reader Activity Changed Status * \textit{source})$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

 $\begin{tabular}{ll} DDS_Reliable Reader Activity Changed Status_INITIALIZER \\ (p. 671) \end{tabular}$

DDS_ReliableReaderActivityChangedStatus_initialize (p. 701) DDS_ReliableReaderActivityChangedStatus_finalize (p. 703) 4.88 Data Writers 703

4.88.4.30 DDS_ReturnCode_t DDS_-ReliableReaderActivityChangedStatus_finalize (struct DDS_ReliableReaderActivityChangedStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_ReliableReaderActivityChangedStatus_INITIALIZER (p. 671)
DDS_ReliableReaderActivityChangedStatus_initialize (p. 701)
```

4.88.4.31 DDS_ReturnCode_t DDS_DataWriterCacheStatus_initialize (struct DDS_DataWriterCacheStatus * self)

Initializer for new status instances.

New DDS_DataWriterCacheStatus (p. 1101) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_DataWriterCacheStatus_finalize (p. 704) should be called to free the contained fields that use dynamic memory:

```
DDS_DataWriterCacheStatus *myStatus = malloc(sizeof(struct DDS_DataWriterCacheStatus));
DDS_DataWriterCacheStatus_initialize(myStatus);
DDS_DataWriter_get_datawriter_cache_status(myDataWriter, myStatus);
DDS_DataWriterCacheStatus_finalize(myStatus);
free(myStatus);
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriter_get_datawriter_cache_status (p. 717)
DDS_DataWriterCacheStatus_finalize (p. 704)
```

4.88.4.32 DDS_ReturnCode_t DDS_DataWriterCacheStatus_copy (struct DDS_DataWriterCacheStatus * self, const struct DDS_DataWriterCacheStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriterCacheStatus_INITIALIZER (p. 672)
DDS_DataWriterCacheStatus_initialize (p. 703)
DDS_DataWriterCacheStatus_finalize (p. 704)
```

$\begin{array}{ll} 4.88.4.33 & DDS_ReturnCode_t \ DDS_DataWriterCacheStatus_finalize \\ & (struct \ DDS_DataWriterCacheStatus * \textit{self}) \end{array}$

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriterCacheStatus_INITIALIZER (p. 672)
DDS_DataWriterCacheStatus_initialize (p. 703)
```

$\begin{array}{lll} 4.88.4.34 & DDS_ReturnCode_t \ DDS_DataWriterProtocolStatus_initialize \ (struct \ DDS_DataWriterProtocolStatus * \\ & self) \end{array}$

Initializer for new status instances.

New DDS_DataWriterProtocolStatus (p. 1111) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_DataWriterProtocolStatus_finalize (p. 706) should be called to free the contained fields that use dynamic memory:

```
DDS_DataWriterProtocolStatus *myStatus = malloc(sizeof(struct DDS_DataWriterProtocolStatus));
DDS_DataWriterProtocolStatus_initialize(myStatus);
DDS_DataWriter_get_datawriter_protocol_status(myDataWriter, myStatus);
DDS_DataWriterProtocolStatus_finalize(myStatus);
free(myStatus);
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriter_get_datawriter_protocol_status (p. 717)
DDS_DataWriterProtocolStatus_finalize (p. 706)
```

4.88.4.35 DDS_ReturnCode_t DDS_DataWriterProtocolStatus_copy (struct DDS_DataWriterProtocolStatus * self, const struct DDS_DataWriterProtocolStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DataWriterProtocolStatus_INITIALIZER (p. 672)
DDS_DataWriterProtocolStatus_initialize (p. 705)
DDS_DataWriterProtocolStatus_finalize (p. 706)
```

4.88.4.36 DDS_ReturnCode_t DDS_DataWriterProtocolStatus_finalize (struct DDS_DataWriterProtocolStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
DDS_DataWriterProtocolStatus_INITIALIZER (p. 672)
DDS_DataWriterProtocolStatus_initialize (p. 705)
```

4.88 Data Writers 707

4.88.4.37 DDS_ReturnCode_t DDS_DataWriterQos_initialize (struct DDS_DataWriterQos * self)

Initializer for new QoS instances.

New DDS_DataWriterQos (p. 1123) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This function does not allocate memory.

Calling this function is not a substitute for calling DDS_DataWriter_get_qos (p. 720) or DDS_Publisher_get_default_datawriter_qos (p. 636); one of those should be called subsequently to setting the QoS of any new or existing entity. DDS_DataWriterQos_finalize (p. 708) should be called to free the contained QoS policies that use dynamic memory:

```
DDS_DataWriterQos *myQos = malloc(sizeof(struct DDS_DataWriterQos));
DDS_DataWriterQos_initialize(myQos);
DDS_Publisher_get_default_datawriter_qos(myFactory, myQos);
DDS_DataWriter_set_qos(myDataWriter, myQos);
DDS_DataWriterQos_finalize(myQos);
free(myQos);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_Publisher_get_default_datawriter_qos (p. 636)
DDS_DataWriterQos_finalize (p. 708)
```

4.88.4.38 DDS_ReturnCode_t DDS_DataWriterQos_copy (struct DDS_DataWriterQos * self, const struct DDS_DataWriterQos * source)

Copy the contents of the given QoS into this QoS.

DDS_DataWriterQos (p. 1123) instances can use dynamic memory because of the sequences contained in some QoS policies. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

```
source <<\!in>> (p. 951) The DDS_DataWriterQos (p. 1123) to copy from
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriterQos_INITIALIZER (p. 672)
DDS_DataWriterQos_initialize (p. 707)
DDS_DataWriterQos_finalize (p. 708)
```

4.88.4.39 DDS_ReturnCode_t DDS_DataWriterQos_finalize (struct DDS_DataWriterQos * self)

Free any dynamic memory allocated by the policies in this **DDS**_-**DataWriterQos** (p. 1123).

Some QoS policies may use dynamic memory (regardless of whether the QoS itself is in dynamic memory). This function frees that memory but otherwise leaves this QoS unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

This function does not leave this object in an invalid state. It is permissable to clear a QoS and then subsequently allocate new dynamic memory in one or more of its QoS policies.

Note that if this QoS instance is stored in heap memory, calling this function will not call free() on it; the user is responsible for explicitly freeing any heap-based QoS instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriterQos_INITIALIZER (p. 672)
DDS_DataWriterQos_initialize (p. 707)
```

4.88 Data Writers 709

4.88.4.40 DDS_Entity* DDS_DataWriter_as_entity (DDS_DataWriter * dataWriter)

Access a **DDS_DataWriter** (p. 673)'s supertype instance.

Parameters:

```
dataWriter << in>> (p. 951) Cannot be NULL.
```

Returns:

The **DDS_Entity** (p. 242) that is supertype instance of the datawriter.

4.88.4.41 DDS_ReturnCode_t DDS_DataWriter_assert_liveliness (DDS_DataWriter * self)

This operation manually asserts the liveliness of this **DDS_DataWriter** (p. 673).

This is used in combination with the **LIVELINESS** (p. 162) policy to indicate to RTI Data Distribution Service that the **DDS_DataWriter** (p. 673) remains active.

You only need to use this operation if the LIVELINESS (p. 162) setting is either DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS (p. 163) or DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS (p. 163). Otherwise, it has no effect.

Note: writing data via the FooDataWriter_write (p. 684) or FooDataWriter_write_w_timestamp (p. 686) operation asserts liveliness on the DDS_DataWriter (p. 673) itself, and its DDS_DomainParticipant (p. 339). Consequently the use of assert_liveliness() is only needed if the application is not writing data regularly.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_NOT_ENABLED (p. 121)

See also:

DDS_LivelinessQosPolicy (p. 1254)

4.88.4.42 DDS_ReturnCode_t DDS_DataWriter_get_matched_subscription_locators (DDS_DataWriter * self, struct DDS_LocatorSeq * locators)

<< eXtension>> (p. 950) Retrieve the list of locators for subscriptions currently "associated" with this DDS_DataWriter (p. 673).

Matched subscription locators include locators for all those subscriptions in the same domain that have a matching DDS_Topic (p. 425), compatible QoS and common partition that the DDS_DomainParticipant (p. 339) has not indicated should be "ignored" by means of the DDS_DomainParticipant_-ignore_subscription (p. 393) operation.

The locators returned in the locators list are the ones that are used by the DDS implementation to communicate with the corresponding matched **DDS_-DataReader** (p. 783) entities.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. locators << inout>> (p. 951). Handles of all the matched subscription locators.
```

The sequence will be grown if the sequence has ownership and the system has the corresponding resources. Use a sequence without ownership to avoid dynamic memory allocation. If the sequence is too small to store all the matches and the system can not resize the sequence, this function will fail with **DDS_-RETCODE_OUT_OF_RESOURCES** (p. 121). Cannot be NULL..

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121) if the sequence is too small and the system can not resize it, or DDS_RETCODE_NOT_ENABLED (p. 121)

4.88.4.43 DDS_ReturnCode_t DDS_DataWriter_get_matched_subscriptions (DDS_DataWriter * self, struct DDS_InstanceHandleSeq * subscription_handles)

Retrieve the list of subscriptions currently "associated" with this **DDS**_**-DataWriter** (p. 673).

Matched subscriptions include all those in the same domain that have a matching DDS_Topic (p. 425), compatible QoS and common partition that the DDS_DomainParticipant (p. 339) has not indicated should be "ignored" by means of the DDS_DomainParticipant_ignore_subscription (p. 393) operation.

The handles returned in the subscription_handles list are the ones that are used by the DDS implementation to locally identify the corresponding matched DDS_DataReader (p. 783) entities. These handles match the ones that appear in the DDS_SampleInfo::instance_handle (p. 1389) field of the DDS_SampleInfo (p. 1384) when reading the DDS_SUBSCRIPTION_TOPIC_NAME (p. 28) builtin topic.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. subscription\_handles << inout>> (p. 951). Handles of all the matched subscriptions.
```

The sequence will be grown if the sequence has ownership and the system has the corresponding resources. Use a sequence without ownership to avoid dynamic memory allocation. If the sequence is too small to store all the matches and the system can not resize the sequence, this function will fail with **DDS_-RETCODE_OUT_OF_RESOURCES** (p. 121).

The maximum number of matches possible is configured with **DDS_-DomainParticipantResourceLimitsQosPolicy** (p. 1162). You can use a zero-maximum sequence without ownership to quickly check whether there are any matches without allocating any memory. Cannot be NULL..

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121) if the sequence is too small and the system can not resize it, or DDS_RETCODE_NOT_ENABLED (p. 121)

4.88.4.44 DDS_ReturnCode_t DDS_DataWriter_get_matched_subscription_data (DDS_DataWriter * self, struct DDS_SubscriptionBuiltinTopicData * subscription_data, const DDS_InstanceHandle_t * subscription_handle)

This operation retrieves the information on a subscription that is currently "associated" with the DDS_DataWriter (p. 673).

The subscription_handle must correspond to a subscription currently associated with the DDS_DataWriter (p. 673). Otherwise, the operation will fail and fail with DDS_RETCODE_BAD_PARAMETER (p. 121). Use DDS_DataWriter_get_matched_subscriptions (p. 710) to find the subscriptions that are currently matched with the DDS_DataWriter (p. 673).

Note: This operation does not retrieve the following information in **DDS_-SubscriptionBuiltinTopicData** (p. 1410):

- ^ DDS_SubscriptionBuiltinTopicData::type_code (p. 1415)
- ^ DDS_SubscriptionBuiltinTopicData::property (p. 1415)
- ^ DDS_SubscriptionBuiltinTopicData::content_filter_property (p. 1416)

The above information is available through DDS_DataReaderListener::on_data_available() (p. 1067) (if a reader listener is installed on the DDS_SubscriptionBuiltinTopicDataDataReader (p. 28)).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

subscription_data << inout>> (p. 951). The information to be filled in on the associated subscription. Cannot be NULL.

subscription_handle <<in>>> (p. 951). Handle to a specific subscription associated with the DDS_DataReader (p. 783). Cannot be NULL.. Must correspond to a subscription currently associated with the DDS_DataWriter (p. 673).

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_NOT_ENABLED (p. 121)

4.88.4.45 DDS_Topic* DDS_DataWriter_get_topic (DDS_DataWriter * self)

This operation returns the DDS_Topic (p. 425) associated with the DDS_DataWriter (p. 673).

This is the same **DDS_Topic** (p. 425) that was used to create the **DDS_DataWriter** (p. 673).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

DDS_Topic (p. 425) that was used to create the **DDS_DataWriter** (p. 673).

4.88 Data Writers 713

4.88.4.46 DDS_Publisher* DDS_DataWriter_get_publisher (DDS_DataWriter * self)

This operation returns the DDS_Publisher (p. 632) to which the DDS_DataWriter (p. 673) belongs.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

 $\mathbf{DDS_Publisher}$ (p. 632) to which the $\mathbf{DDS_DataWriter}$ (p. 673) belongs.

4.88.4.47 DDS_ReturnCode_t DDS_DataWriter_wait_for_acknowledgments (DDS_DataWriter * self, const struct DDS_Duration_t * max_wait)

Blocks the calling thread until all data written by reliable **DDS_DataWriter** (p. 673) entity is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable DDS_DataWriter (p. 673) entity is acknowledged by all matched reliable DDS_DataReader (p. 783) entities, or else the duration specified by the max_wait parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged by all reliable matched data readers; a time out indicates that max_wait elapsed before all the data was acknowledged.

If the **DDS_DataWriter** (p. 673) does not have **DDS_ReliabilityQosPolicy** (p. 1342) kind set to RELIABLE the operation will complete immediately with RETCODE_OK.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 max\_wait << in>> (p. 951) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 1188) .
```

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_NOT_ENABLED (p. 121), DDS_RETCODE_TIMEOUT (p. 122)

4.88.4.48 DDS_ReturnCode_t DDS_DataWriter_wait_for_asynchronous_publishing (DDS_DataWriter * self, const struct DDS_Duration_t * max_wait)

 $<<\!eXtension>>$ (p. 950) Blocks the calling thread until asynchronous sending is complete.

This operation blocks the calling thread (up to max_wait) until all data written by the asynchronous DDS_DataWriter (p. 673) is sent and acknowledged (if reliable) by all matched DDS_DataReader (p. 783) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; a time out indicates that max_wait elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **DDS_DataReader** (p. 783) is complete in addition to what **DDS_DataWriter_wait_for_acknowledgments** (p. 713) provides.

If the DDS_DataWriter (p. 673) does not have DDS_PublishModeQosPolicy (p. 1331) kind set to DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222) the operation will complete immediately with DDS_RETCODE_OK (p. 121).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. max\_wait << in>> (p. 951) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 1188) .
```

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-NOT_ENABLED (p. 121), DDS_RETCODE_TIMEOUT (p. 122)

4.88.4.49 DDS_ReturnCode_t DDS_DataWriter_get_liveliness_-lost_status (DDS_DataWriter * self, struct DDS_LivelinessLostStatus * status)

Accesses the **DDS_LIVELINESS_LOST_STATUS** (p. 131) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_LivelinessLostStatus (p. 1252) to be filled in. Cannot be NULL.
```

4.88 Data Writers 715

Returns:

One of the **Standard Return Codes** (p. 120)

4.88.4.50 DDS_ReturnCode_t DDS_DataWriter_get_offered_deadline_missed_status (DDS_DataWriter * self, struct DDS_OfferedDeadlineMissedStatus * status)

Accesses the **DDS_OFFERED_DEADLINE_MISSED_STATUS** (p. 129) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. status << inout>> (p. 951) DDS_OfferedDeadlineMissedStatus (p. 1276) to be filled in. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

 $\begin{array}{lll} 4.88.4.51 & DDS_ReturnCode_t & DDS_DataWriter_get_offered_incompatible_qos_status & (DDS_DataWriter * self, struct & DDS_OfferedIncompatibleQosStatus * status) \end{array}$

Accesses the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 129) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. status << inout>> (p. 951) DDS_OfferedIncompatibleQosStatus (p. 1278) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

4.88.4.52 DDS_ReturnCode_t DDS_DataWriter_get_publication_matched_status (DDS_DataWriter * self, struct DDS_PublicationMatchedStatus * status)

Accesses the **DDS_PUBLICATION_MATCHED_STATUS** (p. 131) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_PublicationMatchedStatus 
 (p. 1323) to be filled in. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.88.4.53 DDS_ReturnCode_t DDS_DataWriter_get_reliable_writer_cache_changed_status (DDS_DataWriter * self, struct DDS_ReliableWriterCacheChangedStatus * status)

<< eXtension>> (p. 950) Get the reliable cache status for this writer.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_ReliableWriterCacheChangedStatus 
 (p. 1348) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

4.88.4.54 DDS_ReturnCode_t DDS_DataWriter_get_reliable_reader_activity_changed_status (DDS_DataWriter * self,
struct DDS_ReliableReaderActivityChangedStatus *
status)

<<eXtension>> (p. 950) Get the reliable reader activity changed status for this writer.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. status << inout>> (p. 951) DDS_ReliableReaderActivityChangedStatus (p. 1346) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

4.88 Data Writers 717

4.88.4.55 DDS_ReturnCode_t DDS_DataWriter_get_datawriter_cache_status (DDS_DataWriter * self, struct DDS_DataWriterCacheStatus * status)

 $\langle\langle eXtension\rangle\rangle$ (p. 950) Get the datawriter cache status for this writer.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. status <<inout>> (p. 951) DDS_DataWriterCacheStatus (p. 1101) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-NOT_ENABLED (p. 121).

4.88.4.56 DDS_ReturnCode_t DDS_DataWriter_get_datawriter_protocol_status (DDS_DataWriter * self, struct DDS_DataWriterProtocolStatus * status)

<< eXtension>> (p. 950) Get the datawriter protocol status for this writer.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_DataWriterProtocolStatus 
 (p. 1111) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-NOT_ENABLED (p. 121).

4.88.4.57 DDS_ReturnCode_t DDS_DataWriter_get_matched_subscription_datawriter_protocol_status
(DDS_DataWriter * self, struct DDS_DataWriterProtocolStatus * status, const
DDS_InstanceHandle_t * subscription_handle)

<<eXtension>> (p. 950) Get the data writer protocol status for this writer, per matched subscription identified by the subscription_handle.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

status <<inout>> (p. 951) DDS_DataWriterProtocolStatus (p. 1111) to be filled in. Cannot be NULL.

subscription_handle <<in>>> (p. 951) Handle to a specific subscription associated with the DDS_DataReader (p. 783). Cannot be NULL.Must correspond to a subscription currently associated with the DDS_DataWriter (p. 673).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-NOT_ENABLED (p. 121).

4.88.4.58 DDS_ReturnCode_t DDS_DataWriter_get_matched_subscription_datawriter_protocol_status_by_locator (DDS_DataWriter * self, struct DDS_DataWriterProtocolStatus * status, const struct DDS_Locator_t * locator)

<<eXtension>> (p. 950) Get the datawriter protocol status for this writer, per matched subscription identified by the locator.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

status <<inout>> (p. 951) DDS_DataWriterProtocolStatus (p. 1111) to be filled in Cannot be NULL.

locator <<iin>> (p. 951) Locator to a specific locator associated with the
 DDS_DataReader (p. 783). Cannot be NULL.Must correspond to
 a locator of one or more subscriptions currently associated with the
 DDS_DataWriter (p. 673).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_NOT_ENABLED (p. 121).

4.88 Data Writers 719

4.88.4.59 DDS_ReturnCode_t DDS_DataWriter_set_qos (DDS_DataWriter * self, const struct DDS_DataWriterQos * qos)

Sets the writer QoS.

This operation modifies the QoS of the DDS_DataWriter (p. 673).

The DDS_DataWriterQos::user_data (p. 1127), DDS_DataWriterQos::deadline (p. 1126), DDS_DataWriterQos::latency_budget (p. 1126), DDS_DataWriterQos::ownership_strength (p. 1127), DDS_DataWriterQos::transport_priority (p. 1126), DDS_DataWriterQos::lifespan (p. 1127) and DDS_DataWriterQos::writer_data_lifecycle (p. 1127) can be changed. The other policies are immutable.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) The DDS_DataWriterQos (p. 1123) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDS_DataWriter (p. 673) is enabled. The special value DDS_DATAWRITER_QOS_DEFAULT (p. 656) can be used to indicate that the QoS of the DDS_DataWriter (p. 673) should be changed to match the current default DDS_DataWriterQos (p. 1123) set in the DDS_Publisher (p. 632). Cannot be NULL.

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121) or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)
```

See also:

```
DDS_DataWriterQos (p. 1123) for rules on consistency among QoS set_qos (abstract) (p. 243)
Operations Allowed in Listener Callbacks (p. 1248)
```

4.88.4.60 DDS_ReturnCode_t DDS_DataWriter_set_qos_with_profile (DDS_DataWriter * self, const char * library_name, const char * profile_name)

 $<<\!eXtension>>$ (p. 950) Change the QoS of this writer using the input XML QoS profile.

This operation modifies the QoS of the DDS_DataWriter (p. 673).

The DDS_DataWriterQos::user_data (p. 1127), DDS_DataWriterQos::deadline (p. 1126), DDS_DataWriterQos::latency_budget (p. 1126), DDS_DataWriterQos::ownership_strength (p. 1127), DDS_DataWriterQos::transport_priority (p. 1126), DDS_DataWriterQos::writer_data_lifecycle (p. 1127) can be changed. The other policies are immutable.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<iin>>> (p. 951) Library name containing the XML QoS
 profile. If library_name is null RTI Data Distribution Service will
 use the default library (see DDS_Publisher_set_default_library
 (p. 639)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_Publisher_set_default_profile (p. 639)).

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121) or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

See also:

DDS_DataWriterQos (p. 1123) for rules on consistency among QoS Operations Allowed in Listener Callbacks (p. 1248)

$\begin{array}{lll} \textbf{4.88.4.61} & \textbf{DDS_ReturnCode_t DDS_DataWriter_get_qos} \\ & (\textbf{DDS_DataWriter} * \textit{self}, \; \; \textbf{struct DDS_DataWriterQos} * \\ & \textit{qos}) \end{array}$

Gets the writer QoS.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) The DDS_DataWriterQos (p. 1123) to be filled up. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.88 Data Writers

See also:

```
get_qos (abstract) (p. 244)
```

4.88.4.62 DDS_ReturnCode_t DDS_DataWriter_set_listener (DDS_DataWriter * self, const struct DDS_DataWriterListener * l, DDS_StatusMask mask)

Sets the writer listener.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. l << in>> (p. 951) DDS_DataWriterListener (p. 1102) to set to mask << in>> (p. 951) DDS_StatusMask (p. 127) associated with the DDS_DataWriterListener (p. 1102). The callback function on the listener cannot be NULL if the corresponding status is turned on in the mask.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
set_listener (abstract) (p. 244)
```

4.88.4.63 struct DDS_DataWriterListener DDS_DataWriter_get_listener (DDS_DataWriter * self)
[read]

Get the writer listener.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

```
DDS_DataWriterListener (p. 1102) of the DDS_DataWriter (p. 673).
```

See also:

```
DDS_DataWriter_get_listenerX (p. 722) get_listener (abstract) (p. 245)
```

4.88.4.64 DDS_ReturnCode_t DDS_DataWriter_get_listenerX (DDS_DataWriter * self, struct DDS_DataWriterListener * listener)

<< eXtension>> (p. 950) Get the writer listener.

An alternative form of get_listener that fills in an existing listener structure rather than returning one on the stack.

Parameters:

```
 \begin{array}{lll} \textit{self} <<\!\!in\!\!>> (\text{p. 951}) \text{ Cannot be NULL.} \\ \textit{listener} <<\!\!inout\!\!>> (\text{p. 951}) \text{ DDS\_DataWriterListener} & \text{(p. 1102)} \\ & \text{structure to be filled up. Cannot be NULL.} \\ \end{array}
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataWriter_get_listener (p. 721) get_listener (abstract) (p. 245)
```

4.88.4.65 DDS_ReturnCode_t DDS_DataWriter_flush (DDS_DataWriter * self)

<<eXtension>> (p. 950) Flushes the batch in progress in the context of the calling thread.

After being flushed, the batch is available to be sent on the network.

If the DDS_DataWriter (p. 673) does not have DDS_-PublishModeQosPolicy (p. 1331) kind set to DDS_ASYNCHRONOUS_-PUBLISH_MODE_QOS (p. 222), the batch will be sent on the network immediately (in the context of the calling thread).

If the DDS_DataWriter (p. 673) does have DDS_PublishModeQosPolicy (p. 1331) kind set to DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222), the batch will be sent in the context of the asynchronous publishing thread.

This operation may block in the same conditions than **FooDataWriter_write** (p. 684).

If this operation does block, the RELIABILITY max_blocking_time configures the maximum time the write operation may block (waiting for space to become available). If max_blocking_time elapses before the DDS_DataWriter is able to

store the modification without exceeding the limits, the operation will fail with DDS_RETCODE_TIMEOUT.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_TIMEOUT (p. 122), DDS_RETCODE_OUT_OF_RESOURCES (p. 121) or DDS_RETCODE_NOT_ENABLED (p. 121).

4.89 Flow Controllers

 $<<\!eXtension>>$ (p. 950) DDS_FlowController (p. 726) and associated elements

Data Structures

^ struct DDS_FlowControllerTokenBucketProperty_t

DDS_FlowController (p. 726) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

^ struct DDS_FlowControllerProperty_t

Determines the flow control characteristics of the $DDS_FlowController$ (p. 726).

Defines

* #define DDS_FlowControllerProperty_t_INITIALIZER

Initializer for new property instances.

Typedefs

^ typedef struct DDS_FlowControllerImpl **DDS_FlowController**

<<interface>> (p. 950) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous DDS_DataWriter (p. 673) instances are allowed to write data.

Enumerations

` enum DDS_FlowControllerSchedulingPolicy {
 DDS_RR_FLOW_CONTROLLER_SCHED_POLICY,
 DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY }

Kinds of flow controller scheduling policy.

Functions

^ const char * DDS_FlowController_get_name (DDS_FlowController *self)

Returns the name of the DDS_FlowController (p. 726).

^ DDS_DomainParticipant * DDS_FlowController_get_participant (DDS_FlowController *self)

Returns the DDS_DomainParticipant (p. 339) to which the DDS_FlowController (p. 726) belongs.

^ DDS_ReturnCode_t DDS_FlowController_set_property (DDS_FlowController *self, const struct DDS_FlowControllerProperty_t *prop)

Sets the DDS_FlowController (p. 726) property.

^ DDS_ReturnCode_t DDS_FlowController_get_property (DDS_FlowController *self, struct DDS_FlowControllerProperty_t *prop)

Gets the DDS_FlowController (p. 726) property.

^ DDS_ReturnCode_t DDS_FlowController_trigger_flow (DDS_-FlowController *self)

Provides an external trigger to the DDS_FlowController (p. 726).

Variables

 $\ \hat{\ } \ \operatorname{char} * \mathbf{DDS_DEFAULT_FLOW_CONTROLLER_NAME}$

[default] Special value of DDS_PublishModeQosPolicy::flow_-controller_name (p. 1333) that refers to the built-in default flow controller.

Special value of $DDS_PublishModeQosPolicy::flow_controller_name$ (p. 1333) that refers to the built-in fixed-rate flow controller.

 $\hat{}$ char * DDS_ON_DEMAND_FLOW_CONTROLLER_NAME

Special value of DDS_PublishModeQosPolicy::flow_controller_name (p. 1333) that refers to the built-in on-demand flow controller.

4.89.1 Detailed Description

 $<<\!eXtension>>$ (p. 950) DDS_FlowController (p. 726) and associated elements

DDS_FlowController (p. 726) provides the network traffic shaping capability to asynchronous DDS_DataWriter (p. 673) instances. For use cases and advantages of publishing asnychronously, please refer to DDS_PublishModeQosPolicy (p. 1331) of DDS_DataWriterQos (p. 1123).

See also:

```
DDS_PublishModeQosPolicy (p. 1331)
DDS_DataWriterQos::publish_mode (p. 1128)
DDS_AsynchronousPublisherQosPolicy (p. 1035)
```

4.89.2 Define Documentation

4.89.2.1 #define DDS_FlowControllerProperty_t_INITIALIZER

Initializer for new property instances.

New DDS_FlowControllerProperty_t (p. 1220) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that the contained property values are properly initialized. This does not allocate memory.

The simplest way to create a new property structure is to initialize it on the stack at the time of its creation:

```
struct DDS_FlowControllerProperty_t myProperty = DDS_FlowControllerProperty_t_INITIALIZER;
```

Note that the above assignment is not a substitute for calling DDS_DomainParticipant_get_default_flowcontroller_property (p. 356).

See also:

```
\begin{tabular}{ll} DDS\_DomainParticipant\_get\_default\_flowcontroller\_property\\ (p.\ 356) \end{tabular}
```

4.89.3 Typedef Documentation

4.89.3.1 typedef struct DDS_FlowControllerImpl DDS_FlowController

<<iinterface>> (p. 950) A flow controller is the object responsible for shap-

ing the network traffic by determining when attached asynchronous DDS_-DataWriter (p. 673) instances are allowed to write data.

QoS:

DDS_FlowControllerProperty_t (p. 1220)

4.89.4 Enumeration Type Documentation

4.89.4.1 enum DDS_FlowControllerSchedulingPolicy

Kinds of flow controller scheduling policy.

Samples written by an asynchronous **DDS_DataWriter** (p. 673) are not sent in the context of the **FooDataWriter_write** (p. 684) call. Instead, the middleware puts the samples in a queue for future processing. The **DDS_FlowController** (p. 726) associated with each asynchronous DataWriter instance determines when the samples are actually sent.

Each DDS_FlowController (p. 726) maintains a separate FIFO queue for each unique destination (remote application). Samples written by asynchronous DDS_DataWriter (p. 673) instances associated with the flow controller, are placed in the queues that correspond to the intended destinations of the sample.

When tokens become available, a flow controller must decide which queue(s) to grant tokens first. This is determined by the flow controller's scheduling policy. Once a queue has been granted tokens, it is serviced by the asynchronous publishing thread. The queued up samples will be coalesced and sent to the corresponding destination. The number of samples sent depends on the data size and the number of tokens granted.

QoS:

DDS_FlowControllerProperty_t (p. 1220)

Enumerator:

DDS_RR_FLOW_CONTROLLER_SCHED_POLICY Indicates to flow control in a round-robin fashion.

Whenever tokens become available, the flow controller distributes the tokens uniformly across all of its (non-empty) destination queues. No destinations are prioritized. Instead, all destinations are treated equally and are serviced in a round-robin fashion.

$\label{eq:decomposition} DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY \hspace{0.2cm} \text{Indicates}$ to flow control in an earliest-deadline-first fashion.

A sample's deadline is determined by the time it was written plus the latency budget of the DataWriter at the time of the write call (as

specified in the **DDS_LatencyBudgetQosPolicy** (p. 1242)). The relative priority of a flow controller's destination queue is determined by the earliest deadline across all samples it contains.

When tokens become available, the **DDS_FlowController** (p. 726) distributes tokens to the destination queues in order of their priority. In other words, the queue containing the sample with the earliest deadline is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal deadline value, the corresponding destination queues are serviced in a round-robin fashion.

Hence, under the default DDS_-LatencyBudgetQosPolicy::duration (p. 1243) setting, an EDF_-FLOW_CONTROLLER_SCHED_POLICY DDS_FlowController (p. 726) preserves the order in which the user calls FooDataWriter_write (p. 684) across the DataWriters associated with the flow controller.

Since the DDS_LatencyBudgetQosPolicy (p. 1242) is mutable, a sample written second may contain an earlier deadline than the sample written first if the DDS_LatencyBudgetQosPolicy::duration (p. 1243) value is sufficiently decreased in between writing the two samples. In that case, if the first sample is not yet written (still in queue waiting for its turn), it inherits the priority corresponding to the (earlier) deadline from the second sample.

In other words, the priority of a destination queue is always determined by the earliest deadline among all samples contained in the queue. This priority inheritance approach is required in order to both honor the updated **DDS_LatencyBudgetQosPolicy::duration** (p. 1243) and adhere to the **DDS_DataWriter** (p. 673) in-order data delivery guarantee.

[default] for DDS_DataWriter (p. 673)

4.89.5 Function Documentation

4.89.5.1 const char* DDS_FlowController_get_name (DDS_FlowController * self)

Returns the name of the **DDS_FlowController** (p. 726).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

The name of the **DDS_FlowController** (p. 726).

4.89.5.2 DDS_DomainParticipant* DDS_FlowController_get_participant (DDS_FlowController * self)

Returns the **DDS_DomainParticipant** (p. 339) to which the **DDS_FlowController** (p. 726) belongs.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

The **DDS_DomainParticipant** (p. 339) to which the **DDS_- FlowController** (p. 726) belongs.

4.89.5.3 DDS_ReturnCode_t DDS_FlowController_set_property (DDS_FlowController * self, const struct DDS_FlowControllerProperty_t * prop)

Sets the **DDS_FlowController** (p. 726) property.

This operation modifies the property of the DDS_FlowController (p. 726).

Once a DDS_FlowController (p. 726) has been instantiated, only the DDS_FlowControllerProperty_t::token_bucket (p. 1221) can be changed. The DDS_FlowControllerProperty_t::scheduling_policy (p. 1221) is immutable.

A new DDS_FlowControllerTokenBucketProperty_t::period (p. 1224) only takes effect at the next scheduled token distribution time (as determined by its previous value).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

prop <<in>> (p. 951) The new DDS_FlowControllerProperty_t (p. 1220). Property must be consistent. Immutable fields cannot be changed after DDS_FlowController (p. 726) has been created. The special value DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 408) can be used to indicate that the property of the DDS_FlowController (p. 726) should be changed to match the current default DDS_FlowControllerProperty_t (p. 1220) set in the DDS_DomainParticipant (p. 339). Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-

```
IMMUTABLE_POLICY (p. 121), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122).
```

See also:

DDS_FlowControllerProperty_t (p. 1220) for rules on consistency among property values.

4.89.5.4 DDS_ReturnCode_t DDS_FlowController_get_property (DDS_FlowController * self, struct DDS_FlowControllerProperty_t * prop)

Gets the **DDS_FlowController** (p. 726) property.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 prop << in>> (p. 951) DDS_FlowController (p. 726) to be filled in. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.89.5.5 DDS_ReturnCode_t DDS_FlowController_trigger_flow (DDS_FlowController * self)

Provides an external trigger to the **DDS_FlowController** (p. 726).

Typically, a **DDS_FlowController** (p. 726) uses an internal trigger to periodically replenish its tokens. The period by which this trigger is called is determined by the **DDS_FlowControllerTokenBucketProperty_t::period** (p. 1224) property setting.

This additional, function provides external trigger the an toDDS_FlowController (p. 726). This trigger adds DDS_{-} $FlowControllerTokenBucketProperty_t::tokens_added_per_period$ (p. 1223) tokens each time it is called (subject to the other property settings of the **DDS_FlowController** (p. 726)).

 $\mathbf{DDS_FlowController}$ An on-demand (p.726)be crecan with a **DDS_DURATION_INFINITE** (p. 113)as DDS_{-} FlowControllerTokenBucketProperty_t::period (p. 1224), in which case the only trigger source is external (i.e. the DDS_FlowController (p. 726) is solely triggered by the user on demand).

DDS_FlowController_trigger_flow (p. 730) can be called on both strict ondemand DDS_FlowController (p. 726) and hybrid DDS_FlowController (p. 726) (internally and externally triggered).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.89.6 Variable Documentation

4.89.6.1 char* DDS_DEFAULT_FLOW_CONTROLLER_NAME

[default] Special value of DDS_PublishModeQosPolicy::flow_controller_name (p. 1333) that refers to the built-in default flow controller.

RTI Data Distribution Service provides several built-in **DDS_FlowController** (p. 726) for use with an asynchronous **DDS_DataWriter** (p. 673). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

By default, flow control is disabled. That is, the built-in **DDS_DEFAULT_-FLOW_CONTROLLER_NAME** (p. 731) flow controller does not apply any flow control. Instead, it allows data to be sent asynchronously as soon as it is written by the **DDS_DataWriter** (p. 673).

Essentially, this is equivalent to a user-created **DDS_FlowController** (p. 726) with the following **DDS_FlowControllerProperty_t** (p. 1220) settings:

- DDS_FlowControllerProperty_t::scheduling_policy $(p. 1221) = DDS_-EDF_FLOW_CONTROLLER_SCHED_POLICY (p. 727)$
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) max_tokens = DDS_LENGTH_UNLIMITED (p. 174)
- DDS_FlowControllerProperty_t::token_bucket (p.1221) tokens_-added_per_period = DDS_LENGTH_UNLIMITED (p.174)
- ${\bf DDS_FlowControllerProperty_t::}$ token_bucket (p. 1221) tokens_-leaked_per_period = 0
- $\mathbf{DDS_FlowControllerProperty_t::} \mathbf{token_bucket} \ (p. \ \underline{1221}) \ \mathtt{period} = 1 \ \mathrm{second}$
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) bytes_per_token = DDS_LENGTH_UNLIMITED (p. 174)

See also:

```
DDS_Publisher_create_datawriter (p. 640)
DDS_DomainParticipant_lookup_flowcontroller (p. 387)
DDS_FlowController_set_property (p. 729)
DDS_PublishModeQosPolicy (p. 1331)
DDS_AsynchronousPublisherQosPolicy (p. 1035)
```

4.89.6.2 char* DDS_FIXED_RATE_FLOW_CONTROLLER_NAME

Special value of DDS_PublishModeQosPolicy::flow_controller_name (p. 1333) that refers to the built-in fixed-rate flow controller.

RTI Data Distribution Service provides several builtin **DDS_FlowController** (p. 726) for use with an asynchronous **DDS_DataWriter** (p. 673). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in **DDS_FIXED_RATE_FLOW_CONTROLLER_NAME** (p. 732) flow controller shapes the network traffic by allowing data to be sent only once every second. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

Essentially, this is equivalent to a user-created **DDS_FlowController** (p. 726) with the following **DDS_FlowControllerProperty_t** (p. 1220) settings:

- DDS_FlowControllerProperty_t::scheduling_policy (p. 1221) = DDS_-EDF_FLOW_CONTROLLER_SCHED_POLICY (p. 727)
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) max_tokens = DDS_LENGTH_UNLIMITED (p. 174)
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) tokens_added_per_period = DDS_LENGTH_UNLIMITED (p. 174)
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) tokens_-leaked_per_period = DDS_LENGTH_UNLIMITED (p. 174)
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) period = 1 second
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) bytes_per_token = DDS_LENGTH_UNLIMITED (p. 174)

See also:

```
DDS_Publisher_create_datawriter (p. 640)
DDS_DomainParticipant_lookup_flowcontroller (p. 387)
DDS_FlowController_set_property (p. 729)
DDS_PublishModeQosPolicy (p. 1331)
DDS_AsynchronousPublisherQosPolicy (p. 1035)
```

4.89.6.3 char* DDS_ON_DEMAND_FLOW_CONTROLLER_- NAME

Special value of **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1333) that refers to the built-in on-demand flow controller.

RTI Data Distribution Service provides several builtin **DDS_FlowController** (p. 726) for use with an asynchronous **DDS_DataWriter** (p. 673). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in DDS_ON_DEMAND_FLOW_CONTROLLER_NAME (p. 733) allows data to be sent only when the user calls DDS_FlowController_trigger_flow (p. 730). With each trigger, all accumulated data since the previous trigger is sent (across all DDS_Publisher (p. 632) or DDS_DataWriter (p. 673) instances). In other words, the network traffic shape is fully controlled by the user. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

This external trigger source is ideal for users who want to implement some form of closed-loop flow control or who want to only put data on the wire every so many samples (e.g. with the number of samples based on NDDS_Transport_-Property_t::gather_send_buffer_count_max (p. 1508)).

Essentially, this is equivalent to a user-created **DDS_FlowController** (p. 726) with the following **DDS_FlowControllerProperty_t** (p. 1220) settings:

- DDS_FlowControllerProperty_t::scheduling_policy (p. 1221) = DDS_-EDF_FLOW_CONTROLLER_SCHED_POLICY (p. 727)
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) max_tokens = DDS_LENGTH_UNLIMITED (p. 174)
- DDS_FlowControllerProperty_t::token_bucket (p.1221) tokens_-added_per_period = DDS_LENGTH_UNLIMITED (p.174)
- $DDS_FlowControllerProperty_t::token_bucket \quad (p. 1221) \quad tokens_leaked_per_period = DDS_LENGTH_UNLIMITED \ (p. 174)$
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) period = DDS_DURATION_INFINITE (p. 113)
- DDS_FlowControllerProperty_t::token_bucket (p. 1221) bytes_per_token = DDS_LENGTH_UNLIMITED (p. 174)

4.90 Subscription Module

Contains the DDS_Subscriber (p. 743), DDS_DataReader (p. 783), DDS_ReadCondition (p. 842), and DDS_QueryCondition (p. 845) classes, as well as the DDS_SubscriberListener (p. 1405) and DDS_DataReaderListener (p. 1065) interfaces, and more generally, all that is needed on the subscription side.

Modules

^ Subscribers

DDS_Subscriber (p. 743) entity and associated elements

` DataReaders

DDS_DataReader (p. 783) entity and associated elements

^ Data Samples

DDS_SampleInfo (p. 1384), DDS_SampleStateKind (p. 848), DDS_ViewStateKind (p. 850), DDS_InstanceStateKind (p. 853) and associated elements

4.90.1 Detailed Description

Contains the DDS_Subscriber (p. 743), DDS_DataReader (p. 783), DDS_ReadCondition (p. 842), and DDS_QueryCondition (p. 845) classes, as well as the DDS_SubscriberListener (p. 1405) and DDS_DataReaderListener (p. 1065) interfaces, and more generally, all that is needed on the subscription side.

4.90.2 Access to data samples

Data is made available to the application by the following operations on DDS_DataReader (p. 783) objects: FooDataReader_read (p. 788), FooDataReader_read_w_condition (p. 796), FooDataReader_take (p. 789), FooDataReader_take_w_condition (p. 797), and the other variants of read() and take().

The general semantics of the read() operation is that the application only gets access to the corresponding data (i.e. a precise instance value); the data remains the responsibility of RTI Data Distribution Service and can be read again.

The semantics of the take() operations is that the application takes full responsibility for the data; that data will no longer be available locally to RTI Data

Distribution Service. Consequently, it is possible to access the same information multiple times only if all previous accesses were read() operations, not take().

Each of these operations returns a collection of Data values and associated DDS_SampleInfo (p. 1384) objects. Each data value represents an atom of data information (i.e., a value for one instance). This collection may contain samples related to the same or different instances (identified by the key). Multiple samples can refer to the same instance if the settings of the HISTORY (p. 170) QoS allow for it.

To return the memory back to the middleware, every read() or take() that retrieves a sequence of samples must be followed with a call to FooDataReader_return_loan (p. 811).

See also:

Interpretation of the SampleInfo (p. 1385)

4.90.2.1 Data access patterns

The application accesses data by means of the operations read or take on the DDS_DataReader (p. 783). These operations return an ordered collection of DataSamples consisting of a DDS_SampleInfo (p. 1384) part and a Data part.

The way RTI Data Distribution Service builds the collection depends on QoS policies set on the **DDS_DataReader** (p. 783) and **DDS_Subscriber** (p. 743), as well as the source_timestamp of the samples, and the parameters passed to the read() / take() operations, namely:

- the desired sample states (any combination of DDS_SampleStateKind (p. 848))
- the desired view states (any combination of DDS_ViewStateKind (p. 850))
- ^ the desired instance states (any combination of **DDS_- InstanceStateKind** (p. 853))

The read() and take() operations are non-blocking and just deliver what is currently available that matches the specified states.

The read_w_condition() and take_w_condition() operations take a DDS_ReadCondition (p. 842) object as a parameter instead of sample, view or instance states. The behaviour is that the samples returned will only be those for which the condition is DDS_BOOLEAN_TRUE (p. 106). These operations, in conjunction with DDS_ReadCondition (p. 842) objects and a DDS_WaitSet (p. 253), allow performing waiting reads.

Once the data samples are available to the data readers, they can be read or taken by the application. The basic rule is that the application may do this in any order it wishes. This approach is very flexible and allows the application ultimate control.

To access data coherently, or in order, the **PRESENTATION** (p. 155) QoS must be set properly.

4.91 Subscribers

DDS_Subscriber (p. 743) entity and associated elements

Data Structures

* struct DDS_SubscriberSeq

```
Declares\ IDL\ \mathtt{sequence}\ <\ DDS\_Subscriber\ (\mathrm{p.}\ 743)>.
```

* struct DDS_SubscriberQos

```
QoS policies supported by a DDS_Subscriber (p. 743) entity.
```

* struct DDS_SubscriberListener

```
<<iinterface>> (p. 950) DDS_Listener (p. 1246) for status about a subscriber.
```

Defines

^ #define DDS_SubscriberQos_INITIALIZER

Initializer for new QoS instances.

*# #define DDS_SubscriberListener_INITIALIZER

```
<<eXtension>> (p. 950) Initializer for new DDS_SubscriberListener (p. 1405).
```

Typedefs

^ typedef struct DDS_SubscriberImpl **DDS_Subscriber**

```
<<iinterface>> (p. 950) A subscriber is the object responsible for actually receiving data from a subscription.
```

^ typedef void(* DDS_SubscriberListener_DataOnReadersCallback
)(void *listener_data, DDS_Subscriber *sub)

Prototype of a $DDS_SubscriberListener$ (p. 1405) data_on_readers function.

4.91 Subscribers 739

Functions

^ DDS_ReturnCode_t DDS_SubscriberQos_initialize (struct DDS_SubscriberQos *self)

Initializer for new QoS instances.

` DDS_ReturnCode_t DDS_SubscriberQos_copy (struct DDS_SubscriberQos *source)

Copy the contents of the given QoS into this QoS.

^ DDS_ReturnCode_t DDS_SubscriberQos_finalize (struct DDS_-SubscriberQos *self)

Free any dynamic memory allocated by the policies in this DDS_-SubscriberQos (p. 1407).

`DDS_Entity * DDS_Subscriber_as_entity (DDS_Subscriber *subscriber)

Access a DDS_Subscriber (p. 743)'s supertype instance.

^ DDS_ReturnCode_t DDS_Subscriber_get_default_datareader_qos (DDS_Subscriber *self, struct DDS_DataReaderQos *qos)

Copies the default DDS_DataReaderQos (p. 1083) values into the provided DDS_DataReaderQos (p. 1083) instance.

^ DDS_ReturnCode_t DDS_Subscriber_set_default_datareader_qos (DDS_Subscriber *self, const struct DDS_DataReaderQos *qos)

Sets the default DDS_DataReaderQos (p. 1083) values for this subscriber.

^ DDS_DataReader * DDS_Subscriber_create_datareader (DDS_Subscriber *self, DDS_TopicDescription *topic, const struct DDS_DataReaderQos *qos, const struct DDS_DataReaderListener *listener, DDS_StatusMask mask)

Creates a DDS_DataReader (p. 783) that will be attached and belong to the DDS_Subscriber (p. 743).

^ DDS_DataReader * DDS_Subscriber_create_datareader_with_profile (DDS_Subscriber *self, DDS_TopicDescription *topic, const char *library_name, const char *profile_name, const struct DDS_DataReaderListener *listener, DDS_StatusMask mask)

<<eXtension>> (p. 950) Creates a DDS_DataReader (p. 783) object using the DDS_DataReaderQos (p. 1083) associated with the input XML QoS profile.

^ DDS_ReturnCode_t DDS_Subscriber_delete_datareader (DDS_-Subscriber *self, DDS_DataReader *a_datareader) Deletes a DDS_DataReader (p. 783) that belongs to the DDS_Subscriber (p. 743).

^ DDS_ReturnCode_t DDS_Subscriber_delete_contained_entities (DDS_Subscriber *self)

Deletes all the entities that were created by means of the "create" operation on the DDS_Subscriber (p. 743).

^ DDS_DataReader * DDS_Subscriber_lookup_datareader (DDS_-Subscriber *self, const char *topic_name)

Retrieves an existing DDS_DataReader (p. 783).

[Not supported (optional)] Indicates that the application is about to access the data samples in any of the DDS_DataReader (p. 783) objects attached to the DDS_Subscriber (p. 743).

^ DDS_ReturnCode_t DDS_Subscriber_end_access (DDS_-Subscriber *self)

[Not supported (optional)] Indicates that the application has finished accessing the data samples in DDS_DataReader (p. 783) objects managed by the DDS_Subscriber (p. 743).

^ DDS_ReturnCode_t DDS_Subscriber_get_datareaders (DDS_Subscriber *self, struct DDS_DataReaderSeq *readers, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Allows the application to access the DDS_DataReader (p. 783) objects that contain samples with the specified sample_states, view_states and instance_states.

^ DDS_ReturnCode_t DDS_Subscriber_notify_datareaders (DDS_-Subscriber *self)

Invokes the operation DDS_DataReaderListener::on_data_available() (p. 1067) on the DDS_DataReaderListener (p. 1065) objects attached to contained DDS_DataReader (p. 783) entities with DDS_DATA_-AVAILABLE_STATUS (p. 130) that is considered changed as described in Changes in read communication status (p. 126).

^ DDS_DomainParticipant * DDS_Subscriber_get_participant (DDS_Subscriber *self)

Returns the DDS_DomainParticipant (p. 339) to which the DDS_-Subscriber (p. 743) belongs.

4.91 Subscribers 741

DDS_ReturnCode_t DDS_Subscriber_copy_from_topic_qos (DDS_Subscriber *self, struct DDS_DataReaderQos *datareader_qos, const struct DDS_TopicQos *topic_qos)

Copies the policies in the DDS_TopicQos (p. 1443) to the corresponding policies in the DDS_DataReaderQos (p. 1083).

^ DDS_ReturnCode_t DDS_Subscriber_set_qos (DDS_Subscriber *self, const struct DDS_SubscriberQos *qos)

Sets the subscriber QoS.

<<eXtension>> (p. 950) Change the QoS of this subscriber using the input XML QoS profile.

^ DDS_ReturnCode_t DDS_Subscriber_get_qos (DDS_Subscriber *self, struct DDS_SubscriberQos *qos)

Gets the subscriber QoS.

^ DDS_ReturnCode_t DDS_Subscriber_set_default_profile (DDS_-Subscriber *self, const char *library_name, const char *profile_name)

<<eXtension>> (p. 950) Sets the default XML profile for a DDS_-Subscriber (p. 743).

 $\begin{tabular}{ll} \sim const char * DDS_Subscriber_get_default_profile (DDS_Subscriber *self) \end{tabular}$

<<extension>> (p. 950) Gets the default XML profile associated with a DDS_Subscriber (p. 743).

^ const_char * DDS_Subscriber_get_default_profile_library (DDS_-Subscriber *self)

<<eXtension>> (p. 950) Gets the library where the default XML QoS profile is contained for a DDS_Subscriber (p. 743).

^ DDS_ReturnCode_t DDS_Subscriber_set_default_library (DDS_-Subscriber *self, const char *library_name)

<<eXtension>> (p. 950) Sets the default XML library for a DDS_-Subscriber (p. 743).

 $\begin{tabular}{ll} \bf const. char * DDS_Subscriber_get_default_library (DDS_Subscriber *self) \end{tabular}$

<<extension>> (p. 950) Gets the default XML library associated with a DDS_Subscriber (p. 743).

^ DDS_ReturnCode_t DDS_Subscriber_set_listener (DDS_-Subscriber *self, const struct DDS_SubscriberListener *l, DDS_-StatusMask mask)

Sets the subscriber listener.

^ struct DDS_SubscriberListener DDS_Subscriber_get_listener (DDS_Subscriber *self)

Get the subscriber listener.

^ DDS_ReturnCode_t DDS_Subscriber_get_listenerX (DDS_Subscriber *self, struct DDS_SubscriberListener *listener)

<<eXtension>> (p. 950) Get the subscriber listener.

Variables

^ struct DDS_DataReaderQos DDS_DATAREADER_QOS_-DEFAULT

Special value for creating data reader with default QoS.

^ struct DDS_DataReaderQos DDS_DATAREADER_QOS_USE_-TOPIC_QOS

Special value for creating DDS_DataReader (p. 783) with a combination of the default DDS_DataReaderQos (p. 1083) and the DDS_TopicQos (p. 1443).

4.91.1 Detailed Description

DDS_Subscriber (p. 743) entity and associated elements

4.91.2 Define Documentation

4.91.2.1 #define DDS_SubscriberQos_INITIALIZER

Initializer for new QoS instances.

New DDS_SubscriberQos (p. 1407) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a new QoS structure is to initialize it on the stack at the time of its creation:

```
struct DDS_SubscriberQos myQos = DDS_SubscriberQos_INITIALIZER;
```

Note that the above assignment is not a substitute for calling DDS_DomainParticipant_get_default_subscriber_qos (p. 351) or DDS_Subscriber_get_qos (p. 761); one of those should be called subsequently to setting the QoS of a new or existing entity. DDS_SubscriberQos_finalize (p. 746) should be called to free the contained QoS policies that use dynamic memory:

```
struct DDS_SubscriberQos myQos = DDS_SubscriberQos_INITIALIZER;
DDS_DomainParticipant_get_default_Subscriber_qos(myParticipant, &myQos);
DDS_Subscriber_set_qos(mySubscriber, &myQos);
DDS_SubscriberQos_finalize(&myQos);
```

See also:

```
DDS_SubscriberQos_initialize (p. 745)
DDS_DomainParticipant_get_default_subscriber_qos (p. 351)
DDS_SubscriberQos_finalize (p. 746)
```

4.91.2.2 #define DDS_SubscriberListener_INITIALIZER

```
<< eXtension>> (p. 950) Initializer for new DDS_SubscriberListener (p. 1405).
```

All the new instances allocated in the stack should be initialized to this value. No memory is allocated.

4.91.3 Typedef Documentation

4.91.3.1 typedef struct DDS_SubscriberImpl DDS_Subscriber

<<*interface>>* (p. 950) A subscriber is the object responsible for actually receiving data from a subscription.

QoS:

```
DDS_SubscriberQos (p. 1407)
```

Status:

```
DDS_DATA_ON_READERS_STATUS (p. 130)
```

Listener:

DDS_SubscriberListener (p. 1405)

A subscriber acts on the behalf of one or several **DDS_DataReader** (p. 783) objects that are related to it. When it receives data (from the other parts of the system), it builds the list of concerned **DDS_DataReader** (p. 783) objects and then indicates to the application that data is available through its listener or by enabling related conditions.

The application can access the list of concerned **DDS_DataReader** (p. 783) objects through the operation get_datareaders() and then access the data available through operations on the **DDS_DataReader** (p. 783).

The following operations may be called even if the DDS_Subscriber (p. 743) is not enabled. Other operations will the value DDS_RETCODE_NOT_-ENABLED (p. 121) if called on a disabled DDS_Subscriber (p. 743):

- The base-class operations DDS_Subscriber_set_qos (p. 759), DDS_Subscriber_set_qos_with_profile (p. 760), DDS_Subscriber_get_qos (p. 761), DDS_Subscriber_set_listener (p. 764), DDS_Subscriber_get_listener (p. 764), DDS_Entity_enable (p. 245), DDS_Entity_get_status_changes (p. 247)
- DDS_Subscriber_create_datareader (p. 749), DDS_Subscriber_-DDS_Subscriber_create_datareader_with_profile (p.751),delete_datareader (p. 752), DDS_Subscriber_delete_contained_entities (p.753), $DDS_Subscriber_set_default_datareader_gos$ (p.748),DDS_Subscriber_set_default_datareader_qos_with_profile, DDS_Subscriber_get_default_datareader_qos (p.747),Subscriber_set_default_library (p. 763),DDS_Subscriber_set_default_profile (p. 761)

All operations except for the base-class operations set_qos(), set_qos_with_profile(), get_qos(), set_listener(), get_listener(), enable() and create_datareader() may fail with **DDS_RETCODE_NOT_ENABLED** (p. 121).

See also:

Operations Allowed in Listener Callbacks (p. 1248)

Examples:

HelloWorld_subscriber.c.

4.91.3.2 typedef void(* DDS_SubscriberListener_-DataOnReadersCallback)(void *listener_data, DDS_Subscriber *sub)

Prototype of a **DDS_SubscriberListener** (p. 1405) data_on_readers function.

4.91.4 Function Documentation

4.91.4.1 DDS_ReturnCode_t DDS_SubscriberQos_initialize (struct DDS_SubscriberQos * self)

Initializer for new QoS instances.

New **DDS_SubscriberQos** (p. 1407) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This function does not allocate memory.

Calling this function is not a substitute for calling DDS_Subscriber_get_qos (p. 761) or DDS_DomainParticipant_get_default_subscriber_qos (p. 351); one of those should be called subsequently to setting the QoS of any new or existing entity. DDS_SubscriberQos_finalize (p. 746) should be called to free the contained QoS policies that use dynamic memory:

```
DDS_SubscriberQos *myQos = malloc(sizeof(struct DDS_SubscriberQos));
DDS_SubscriberQos_initialize(myQos);
DDS_DomainParticipantFactory_get_default_subscriber_qos(myFactory, myQos);
DDS_Subscriber_set_qos(mySubscriber, myQos);
DDS_SubscriberQos_finalize(myQos);
free(myQos);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
\begin{array}{l} \mathbf{DDS\_SubscriberQos\_INITIALIZER}~(p.\,742)\\ \mathbf{DDS\_DomainParticipant\_get\_default\_subscriber\_qos}~(p.\,351)\\ \mathbf{DDS\_SubscriberQos\_finalize}~(p.\,746) \end{array}
```

4.91.4.2 DDS_ReturnCode_t DDS_SubscriberQos_copy (struct DDS_SubscriberQos * self, const struct DDS_SubscriberQos * source)

Copy the contents of the given QoS into this QoS.

DDS_SubscriberQos (p. 1407) instances can use dynamic memory because of the sequences contained in some QoS policies. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 source << in>> (p. 951) The DDS_PublisherQos (p. 1328) to copy from.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.91.4.3 DDS_ReturnCode_t DDS_SubscriberQos_finalize (struct DDS_SubscriberQos * self)

Free any dynamic memory allocated by the policies in this **DDS**_-**SubscriberQos** (p. 1407).

Some QoS policies may use dynamic memory (regardless of whether the QoS itself is in dynamic memory). This function frees that memory but otherwise leaves this QoS unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

This function does not leave this object in an invalid state. It is permissable to clear a QoS and then subsequently allocate new dynamic memory in one or more of its QoS policies.

Note that if this QoS instance is stored in heap memory, calling this function will not call free() on it; the user is responsible for explicitly freeing any heap-based QoS instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

4.91.4.4 DDS_Entity* DDS_Subscriber_as_entity (DDS_Subscriber * subscriber)

Access a DDS_Subscriber (p. 743)'s supertype instance.

Parameters:

```
subscriber << in>> (p. 951) Cannot be NULL.
```

Returns:

The **DDS_Entity** (p. 242) that is supertype instance of the subscriber.

4.91.4.5 DDS_ReturnCode_t DDS_Subscriber_get_default_datareader_qos (DDS_Subscriber * self, struct DDS_DataReaderQos * qos)

Copies the default **DDS_DataReaderQos** (p. 1083) values into the provided **DDS_DataReaderQos** (p. 1083) instance.

The retrieved qos will match the set of values specified on the last successful call to DDS_Subscriber_set_default_datareader_qos (p. 748), or DDS_Subscriber_set_default_datareader_qos_with_profile, or else, if the call was never made, the default values from is owning DDS_DomainParticipant (p. 339).

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a subscriber while another thread may be simultaneously calling **DDS_Subscriber_set_default_datareader_qos** (p. 748)

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.

qos <<inout>> (p. 951) DDS_DataReaderQos (p. 1083) to be filled-

up. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
DDS_DATAREADER_QOS_DEFAULT (p. 765)
DDS_Subscriber_create_datareader (p. 749)
```

4.91.4.6 DDS_ReturnCode_t DDS_Subscriber_set_default_datareader_qos (DDS_Subscriber * self, const struct DDS_DataReaderQos * qos)

Sets the default DDS_DataReaderQos (p. 1083) values for this subscriber.

This call causes the default values inherited from the owning DDS_-DomainParticipant (p. 339) to be overridden.

This default value will be used for newly created **DDS_DataReader** (p. 783) if **DDS_DATAREADER_QOS_DEFAULT** (p. 765) is specified as the qos parameter when **DDS_Subscriber_create_datareader** (p. 749) is called.

Precondition:

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 122)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a subscriber while another thread may be simultaneously calling DDS_Subscriber_set_default_datareader_qos (p. 748), DDS_Subscriber_get_default_datareader_qos (p. 747) or calling DDS_Subscriber_create_datareader (p. 749) with DDS_DATAREADER_QOS_DEFAULT (p. 765) as the qos parameter.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

qos <<iin>> (p. 951) The default DDS_DataReaderQos (p. 1083) to be set to. The special value DDS_DATAREADER_QOS_DEFAULT (p. 765) may be passed as qos to indicate that the default QoS should be reset back to the initial values the factory would used if DDS_Subscriber_set_default_datareader_qos (p. 748) had never been called. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), or or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122)

4.91.4.7 DDS_DataReader* DDS_Subscriber_create_datareader (DDS_Subscriber * self, DDS_TopicDescription * topic, const struct DDS_DataReaderQos * qos, const struct DDS_DataReaderListener * listener, DDS_StatusMask mask)

Creates a **DDS_DataReader** (p. 783) that will be attached and belong to the **DDS_Subscriber** (p. 743).

For each application-defined type Foo (p. 1494), there is an implied, autogenerated class FooDataReader (p. 1495) (an incarnation of FooDataReader (p. 1495)) that extends **DDS_DataReader** (p. 783) and contains the operations to read data of type Foo (p. 1494).

Note that a common application pattern to construct the QoS for the \mathbf{DDS} -DataReader (p. 783) is to:

- [^] Retrieve the QoS policies on the associated **DDS_Topic** (p. 425) by means of the **DDS_Topic_get_qos** (p. 440) operation.
- Retrieve the default **DDS_DataReader** (p. 783) qos by means of the **DDS_Subscriber_get_default_datareader_qos** (p. 747) operation.
- ^ Combine those two QoS policies (for example, using **DDS_Subscriber_- copy_from_topic_qos** (p. 758)) and selectively modify policies as desired
- ^ Use the resulting QoS policies to construct the **DDS_DataReader** (p. 783).

When a **DDS_DataReader** (p. 783) is created, only those transports already registered are available to the **DDS_DataReader** (p. 783). See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If **DDS_DATAREADER_QOS_DEFAULT** (p. 765) is used for the **qos** parameter, it is not safe to create the datareader while another thread may be simultaneously calling **DDS_Subscriber_set_default_datareader_qos** (p. 748).

Precondition:

If subscriber is enabled, the topic must be enabled. If it is not, this operation will fail and no **DDS_DataReader** (p. 783) will be created.

The given **DDS_TopicDescription** (p. 425) must have been created from the same participant as this subscriber. If it was created from a different participant, this function will return NULL.

If qos is DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 766), topic cannot be DDS_MultiTopic (p. 430), or else this function will return NULL.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

topic <<in>> (p. 951) The DDS_TopicDescription (p. 425) that the DDS_DataReader (p. 783) will be associated with. Cannot be NULL.

qos <<in>> (p. 951) The qos of the DDS_DataReader (p. 783). The special value DDS_DATAREADER_QOS_DEFAULT (p. 765) can be used to indicate that the DDS_DataReader (p. 783) should be created with the default DDS_DataReaderQos (p. 1083) set in the DDS_Subscriber (p. 743). If DDS_TopicDescription (p. 425) is of type DDS_Topic (p. 425) or DDS_ContentFilteredTopic (p. 426), the special value DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 766) can be used to indicate that the DDS_DataReader (p. 783) should be created with the combination of the default DDS_DataReaderQos (p. 1083) set on the DDS_Subscriber (p. 743) and the DDS_TopicQos (p. 1443) (in the case of a DDS_ContentFilteredTopic (p. 426), the DDS_TopicQos (p. 1443) of the related DDS_Topic (p. 426)). if DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 766) is used, topic cannot be a DDS_MultiTopic (p. 430). Cannot be NULL.

listener << in>> (p. 951) The listener of the DDS_DataReader (p. 783).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A **DDS_DataReader** (p. 783) of a derived class specific to the data-type associated with the **DDS_Topic** (p. 425) or NULL if an error occurred.

See also:

```
FooDataReader (p. 1495)
```

Specifying QoS on entities (p. 144) for information on setting QoS before entity creation

DDS_DataReaderQos (p. 1083) for rules on consistency among QoS

DDS_Subscriber_create_datareader_with_profile (p. 751)

DDS_Subscriber_get_default_datareader_qos (p. 747)

 $DDS_Topic_set_qos$ (p. 438)

DDS_Subscriber_copy_from_topic_qos (p. 758)

DDS_DataReader_set_listener (p. 838)

Examples:

 $HelloWorld_subscriber.c.$

4.91.4.8 DDS_DataReader* DDS_Subscriber_create_- datareader_with_profile (DDS_Subscriber * self, DDS_TopicDescription * topic, const char * $library_name$, const char * $profile_name$, const struct DDS_DataReaderListener * listener, DDS_StatusMask mask)

<< eXtension>> (p. 950) Creates a DDS_DataReader (p. 783) object using the DDS_DataReaderQos (p. 1083) associated with the input XML QoS profile.

The DDS_DataReader (p. 783) will be attached and belong to the DDS_Subscriber (p. 743).

For each application-defined type Foo (p. 1494), there is an implied, autogenerated class FooDataReader (p. 1495) (an incarnation of FooDataReader (p. 1495)) that extends **DDS_DataReader** (p. 783) and contains the operations to read data of type Foo (p. 1494).

When a **DDS_DataReader** (p. 783) is created, only those transports already registered are available to the **DDS_DataReader** (p. 783). See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

Precondition:

If subscriber is enabled, the topic must be enabled. If it is not, this operation will fail and no **DDS_DataReader** (p. 783) will be created.

The given **DDS_TopicDescription** (p. 425) must have been created from the same participant as this subscriber. If it was created from a different participant, this function will return NULL.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

topic <<in>>> (p. 951) The DDS_TopicDescription (p. 425) that the DDS_DataReader (p. 783) will be associated with. Cannot be NULL.

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_Subscriber_set_default_library (p. 763)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_Subscriber_set_default_profile (p. 761)).

listener << in>> (p. 951) The listener of the DDS_DataReader (p. 783).

mask << in>> (p. 951). Changes of communication status to be invoked on the listener.

Returns:

A DDS_DataReader (p. 783) of a derived class specific to the data-type associated with the DDS_Topic (p. 425) or NULL if an error occurred.

See also:

FooDataReader (p. 1495)

DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 766)

DDS_Subscriber_create_datareader (p. 749)

DDS_Subscriber_get_default_datareader_qos (p. 747)

 $DDS_Topic_set_qos$ (p. 438)

DDS_Subscriber_copy_from_topic_qos (p. 758)

DDS_DataReader_set_listener (p. 838)

4.91.4.9 DDS_ReturnCode_t DDS_Subscriber_delete_datareader (DDS_Subscriber * self, DDS_DataReader * a_datareader)

Deletes a **DDS_DataReader** (p. 783) that belongs to the **DDS_Subscriber** (p. 743).

Precondition:

If the DDS_DataReader (p. 783) does not belong to the DDS_Subscriber (p. 743), or if ther are any existing DDS_ReadCondition (p. 842) or DDS_QueryCondition (p. 845) objects that are attached to the DDS_DataReader (p. 783), or if there are outstanding loans on samples (as a result of a call to read(), take(), or one of the variants thereof), the operation fails with the error DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Postcondition:

Listener installed on the **DDS_DataReader** (p. 783) will not be called after this function completes successfully.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL. 
a_datareader <<in>> (p. 951) The DDS_DataReader (p. 783) to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

```
4.91.4.10 DDS_ReturnCode_t DDS_Subscriber_-
delete_contained_entities (DDS_Subscriber * self)
```

Deletes all the entities that were created by means of the "create" operation on the **DDS_Subscriber** (p. 743).

Deletes all contained **DDS_DataReader** (p. 783) objects. This pattern is applied recursively. In this manner, the operation **DDS_Subscriber_delete_contained_entities** (p. 753) on the **DDS_Subscriber** (p. 743) will end up deleting all the entities recursively contained in the **DDS_Subscriber** (p. 743), that is also the **DDS_QueryCondition** (p. 845) and **DDS_ReadCondition** (p. 842) objects belonging to the contained **DDS_DataReader** (p. 783).

The operation will fail with DDS_RETCODE_PRECONDITION_NOT_-MET (p. 121) if any of the contained entities is in a state where it cannot be deleted. This will occur, for example, if a contained DDS_DataReader (p. 783) cannot be deleted because the application has called a FooDataReader_read (p. 788) or FooDataReader_take (p. 789) operation and has not called the corresponding FooDataReader_return_loan (p. 811) operation to return the loaned samples.

Once **DDS_Subscriber_delete_contained_entities** (p. 753) completes successfully, the application may delete the **DDS_Subscriber** (p. 743), knowing that it has no contained **DDS_DataReader** (p. 783) objects.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) 4.91.4.11 DDS_DataReader* DDS_Subscriber_lookup_datareader (DDS_Subscriber * self, const char * topic_name)

Retrieves an existing DDS_DataReader (p. 783).

Use this operation on the built-in **DDS_Subscriber** (p. 743) (**Built-in Topics** (p. 410)) to access the built-in **DDS_DataReader** (p. 783) entities for the built-in topics.

The built-in **DDS_DataReader** (p. 783) is created when this operation is called on a built-in topic for the first time. The built-in **DDS_DataReader** (p. 783) is deleted automatically when the **DDS_DomainParticipant** (p. 339) is deleted.

To ensure that builtin **DDS_DataReader** (p. 783) entities receive all the discovery traffic, it is suggested that you lookup the builtin **DDS_DataReader** (p. 783) before the **DDS_DomainParticipant** (p. 339) is enabled. Looking up builtin **DDS_DataReader** (p. 783) may implicitly register builtin transports due to creation of **DDS_DataReader** (p. 783) (see **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- ^ Create a disabled **DDS_DomainParticipant** (p. 339).
- ^ (optional) Modify builtin transport properties
- ^ Call DDS_DomainParticipant_get_builtin_subscriber() (p. 388).
- ^ Call lookup_datareader().

to. Cannot be NULL.

^ Call enable() on the DomainParticipant.

Parameters:

Returns:

A DDS_DataReader (p. 783) that belongs to the DDS_Subscriber (p. 743) attached to the DDS_TopicDescription (p. 425) with topic_name. If no such DDS_DataReader (p. 783) exists, this operation returns NULL.

The returned **DDS_DataReader** (p. 783) may be enabled or disabled.

If more than one **DDS_DataReader** (p. 783) is attached to the **DDS_Subscriber** (p. 743), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **DDS_DataReader** (p. 783) in one thread while another thread is simultaneously creating or destroying that **DDS_DataReader** (p. 783).

4.91.4.12 DDS_ReturnCode_t DDS_Subscriber_begin_access (DDS_Subscriber * self)

[Not supported (optional)] Indicates that the application is about to access the data samples in any of the DDS_DataReader (p. 783) objects attached to the DDS_Subscriber (p. 743).

The application is **required** to use this operation only if the **PRE-SENTATION** (p. 155) policy of the **DDS_Subscriber** (p. 743) to which a **DDS_DataReader** (p. 783) belongs has the **DDS_PresentationQosPolicy::access_scope** (p. 1300) set to **DDS_GROUP_PRESENTATION_QOS** (p. 156).

In the aforementioned case, the operation begin_access() must be called prior to calling any of the sample-accessing operations, namely: get_datareaders() on the DDS_Subscriber (p. 743) and FooDataReader_read (p. 788), FooDataReader_take (p. 789), FooDataReader_read_w_condition (p. 796), FooDataReader_take_w_condition (p. 797) on any DDS_DataReader (p. 783). Otherwise the sample-accessing operations will fail with the error DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Once the application has finished accessing the data samples it must call end-access().

The application is not required to call begin_access() / end_access() if the PRESENTATION (p. 155) policy has the DDS_PresentationQosPolicy::access_scope (p. 1300) set to something other than DDS_GROUP_PRESENTATION_QOS (p. 156).

Calling begin_access() / end_access() in this case is not considered an error and has no effect.

Calls to begin_access() / end_access() may be nested and must be balanced.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

DDS_RETCODE_UNSUPPORTED (p. 121)

4.91.4.13 DDS_ReturnCode_t DDS_Subscriber_end_access (DDS_Subscriber * self)

[Not supported (optional)] Indicates that the application has finished accessing the data samples in DDS_DataReader (p. 783) objects managed by the DDS_Subscriber (p. 743).

This operation must be used to close a corresponding begin_access().

After calling end_access() the application should no longer access any of the Data or DDS_SampleInfo (p. 1384) elements returned from the sample-accessing operations. This call must close a previous call to begin_access(), otherwise the operation will fail with the error DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

DDS_RETCODE_UNSUPPORTED (p. 121)

4.91.4.14 DDS_ReturnCode_t DDS_Subscriber_get_datareaders (DDS_Subscriber * self, struct DDS_DataReaderSeq * readers, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Allows the application to access the **DDS_DataReader** (p. 783) objects that contain samples with the specified sample_states, view_states and instance_states.

If the PRESENTATION (p. 155) policy of the DDS_Subscriber (p. 743) to which the DDS_DataReader (p. 783) belongs has the DDS_PresentationQosPolicy::access_scope (p. 1300) set to DDS_GROUP_PRESENTATION_QOS (p. 156), this operation should only be invoked inside a begin_access() / end_access() block. Otherwise, it will fail with the error DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

Depending on the setting of the **PRESENTATION** (p. 155) policy, the returned collection of **DDS_DataReader** (p. 783) objects may be a 'set' containing each **DDS_DataReader** (p. 783) at most once in no specified order, or a 'list' containing each **DDS_DataReader** (p. 783) one or more times in a specific order.

INSTANCE_PRESENTATION_QOS or idref_-PresentationQosPolicyAccessScopeKind_TOPIC_PRESENTATION_-QOS, the returned collection is a 'set.'

If DDS_PresentationQosPolicy::access_scope (p. 1300) is DDS_GROUP_PRESENTATION_QOS (p. 156) and DDS_PresentationQosPolicy::ordered_access (p. 1301) is set to DDS_BOOLEAN_TRUE (p. 106), then the returned collection is a 'list'.

This difference is due to the fact that, in the second situation it is required to access samples belonging to different **DDS_DataReader** (p. 783) objects in a particular order. In this case, the application should process each **DDS_DataReader** (p. 783) in the same order it appears in the list and **read()** or take() exactly one sample from each **DDS_DataReader** (p. 783). The patterns that an application should use to access data is fully described in **Access to data samples** (p. 735)

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

readers <<inout>> (p. 951) a DDS_DataReaderSeq (p. 1100) object where the set or list of readers will be returned. Cannot be NULL.

sample_states <<iin>>> (p. 951) the returned data reader must contain
samples that have one of these sample_states.

view_states <<iin>> (p. 951) the returned data reader must contain
samples that have one of these view_states.

instance_states <<in>>> (p. 951) the returned data reader must contain samples that have one of these instance_states.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

Access to data samples (p. 735) PRESENTATION (p. 155)

$\begin{array}{ll} \textbf{4.91.4.15} & \textbf{DDS_ReturnCode_t DDS_Subscriber_notify_datareaders} \\ & \textbf{(DDS_Subscriber} * \textit{self}) \end{array}$

Invokes the operation DDS_DataReaderListener::on_data_available() (p. 1067) on the DDS_DataReaderListener (p. 1065) objects attached

to contained DDS_DataReader (p. 783) entities with DDS_DATA_-AVAILABLE_STATUS (p. 130) that is considered changed as described in Changes in read communication status (p. 126).

This operation is typically invoked from the DDS_SubscriberListener::on_data_on_readers (p. 1406) operation in the DDS_SubscriberListener (p. 1405). That way the DDS_SubscriberListener (p. 1405) can delegate to the DDS_DataReaderListener (p. 1065) objects the handling of the data.

The operation will notify the data readers that have a sample_state of DDS_NOT_READ_SAMPLE_STATE (p. 849), view_state of DDS_ANY_SAMPLE_STATE (p. 849) and instance_state of DDS_ANY_INSTANCE_STATE (p. 854).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120), or **DDS_RETCODE_-NOT_ENABLED** (p. 121).

4.91.4.16 DDS_DomainParticipant* DDS_Subscriber_get_participant (DDS_Subscriber * self)

Returns the **DDS_DomainParticipant** (p. 339) to which the **DDS_-Subscriber** (p. 743) belongs.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

the DDS_DomainParticipant (p. 339) to which the DDS_Subscriber (p. 743) belongs.

 $\begin{array}{llll} 4.91.4.17 & DDS_ReturnCode_t \ DDS_Subscriber_copy_from_topic_qos \\ & (DDS_Subscriber * \textit{self}, \ struct \ DDS_DataReaderQos * \\ & \textit{datareader_qos}, \ const \ struct \ DDS_TopicQos * \textit{topic_qos}) \end{array}$

Copies the policies in the **DDS_TopicQos** (p. 1443) to the corresponding policies in the **DDS_DataReaderQos** (p. 1083).

Copies the policies in the **DDS_TopicQos** (p. 1443) to the corresponding policies in the **DDS_DataReaderQos** (p. 1083) (replacing values in the **DDS_DataReaderQos** (p. 1083), if present).

This is a "convenience" operation most useful in combination with the operations DDS_Subscriber_get_default_datareader_qos (p. 747) and DDS_Topic_get_qos (p. 440). The operation DDS_Subscriber_copy_from_topic_qos (p. 758) can be used to merge the DDS_DataReader (p. 783) default QoS policies with the corresponding ones on the DDS_Topic (p. 425). The resulting QoS can then be used to create a new DDS_DataReader (p. 783), or set its QoS.

This operation does not check the resulting **DDS_DataReaderQos** (p. 1083) for consistency. This is because the 'merged' **DDS_DataReaderQos** (p. 1083) may not be the final one, as the application can still modify some policies prior to applying the policies to the **DDS_DataReader** (p. 783).

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 datareader\_qos << inout>> (p. 951) DDS_DataReaderQos (p. 1083) to be filled-up. Cannot be NULL. 
 topic\_qos << in>> (p. 951) DDS_TopicQos (p. 1443) to be merged with DDS_DataReaderQos (p. 1083). Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

```
4.91.4.18 DDS_ReturnCode_t DDS_Subscriber_set_qos (DDS_Subscriber * self, const struct DDS_SubscriberQos * qos)
```

Sets the subscriber QoS.

This operation modifies the QoS of the DDS_Subscriber (p. 743).

The DDS_SubscriberQos::group_data (p. 1408), DDS_SubscriberQos::partition (p. 1408) and DDS_SubscriberQos::entity_factory (p. 1408) can be changed. The other policies are immutable.

Parameters:

```
self <<iin>> (p. 951) Cannot be NULL.
qos <<iin>> (p. 951) DDS_SubscriberQos (p. 1407) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDS_Subscriber (p. 743) is enabled. The special value DDS_SUBSCRIBER_QOS_DEFAULT (p. 407) can be used to indicate
```

that the QoS of the **DDS_Subscriber** (p. 743) should be changed to match the current default **DDS_SubscriberQos** (p. 1407) set in the **DDS_DomainParticipant** (p. 339). Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122).

See also:

DDS_SubscriberQos (p. 1407) for rules on consistency among QoS set_qos (abstract) (p. 243)
Operations Allowed in Listener Callbacks (p. 1248)

4.91.4.19 DDS_ReturnCode_t DDS_Subscriber_set_qos_with_profile (DDS_Subscriber * self, const char * $library_name$, const char * $profile_name$)

 $<<\!eXtension>>$ (p. 950) Change the QoS of this subscriber using the input XML QoS profile.

This operation modifies the QoS of the **DDS_Subscriber** (p. 743).

The DDS_SubscriberQos::group_data (p. 1408), DDS_SubscriberQos::partition (p. 1408) and DDS_SubscriberQos::entity_factory (p. 1408) can be changed. The other policies are immutable.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>> (p. 951) Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_Subscriber_set_default_library (p. 763)).

profile_name <<iin>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_Subscriber_set_default_profile (p. 761)).

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122).

See also:

DDS_SubscriberQos (p. 1407) for rules on consistency among QoS Operations Allowed in Listener Callbacks (p. 1248)

4.91.4.20 DDS_ReturnCode_t DDS_Subscriber_get_qos (DDS_Subscriber * self, struct DDS_SubscriberQos * qos)

Gets the subscriber QoS.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << in>> (p. 951) DDS_SubscriberQos (p. 1407) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
get_qos (abstract) (p. 244)
```

4.91.4.21 DDS_ReturnCode_t DDS_Subscriber_set_default_profile (DDS_Subscriber * self, const char * $library_name$, const char * $profile_name$)

<< eXtension>> (p. 950) Sets the default XML profile for a DDS_-Subscriber (p. 743).

This function specifies the profile that will be used as the default the next time a default Subscriber profile is needed during a call to one of this Subscribers operations. When calling a **DDS_Subscriber** (p. 743) function that requires a **profile_name** parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **DDS_Subscriber** (p. 743) inherits the default from the **DDS_DomainParticipant** (p. 339) (see **DDS_DomainParticipant_set_default_profile** (p. 360)).

This function does not set the default QoS for DDS_DataReader (p. 783) objects created by this DDS_Subscriber (p. 743); for this functionality,

use DDS_Subscriber_set_default_datareader_qos_with_profile (you may pass in NULL after having called set_default_profile()).

This function does not set the default QoS for newly created Subscribers; for this functionality, use **DDS_DomainParticipant_set_default_subscriber_qos_with_profile** (p. 353).

Parameters:

```
self <<in>>> (p. 951) Cannot be NULL.
library_name <<in>> (p. 951) The library name containing the profile.
profile_name <<in>>> (p. 951) The profile name. If profile_name is null any previous default is unset.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_Subscriber_get_default_profile (p. 762)
DDS_Subscriber_get_default_profile_library (p. 762)
```

4.91.4.22 const char* DDS_Subscriber_get_default_profile (DDS_Subscriber * self)

<< eXtension>> (p. 950) Gets the default XML profile associated with a DDS_Subscriber (p. 743).

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

Returns:

The default profile or null if the default profile was not set.

See also:

```
DDS_Subscriber_set_default_profile (p. 761)
```

4.91.4.23 const char* DDS_Subscriber_get_default_profile_library (DDS_Subscriber * self)

<<eXtension>> (p. 950) Gets the library where the default XML QoS profile is contained for a **DDS_Subscriber** (p. 743).

The default profile library is automatically set when **DDS_Subscriber_set_default_profile** (p. 761) is called.

This library can be different than the **DDS_Subscriber** (p. 743) default library (see **DDS_Subscriber_get_default_library** (p. 764)).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The default profile library or null if the default profile was not set.

See also:

```
DDS_Subscriber_set_default_profile (p. 761)
```

4.91.4.24 DDS_ReturnCode_t DDS_Subscriber_set_default_library (DDS_Subscriber * self, const char * library_name)

<< eXtension>> (p. 950) Sets the default XML library for a DDS_-Subscriber (p. 743).

This function specifies the library that will be used as the default the next time a default library is needed during a call to one of this Subscriber's operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the DDS_Subscriber (p. 743) inherits the default from the DDS_DomainParticipant (p. 339) (see DDS_DomainParticipant_set_default_library (p. 359)).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

 $library_name << in>> (p. 951)$ Library name. If library_name is null any previous default is unset.

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

DDS_Subscriber_get_default_library (p. 764)

4.91.4.25 const char* DDS_Subscriber_get_default_library (DDS_Subscriber * self)

<< eXtension>> (p. 950) Gets the default XML library associated with a DDS_Subscriber (p. 743).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

The default library or null if the default library was not set.

See also:

DDS_Subscriber_set_default_library (p. 763)

4.91.4.26 DDS_ReturnCode_t DDS_Subscriber_set_listener (DDS_Subscriber * self, const struct DDS_SubscriberListener * l, DDS_StatusMask mask)

Sets the subscriber listener.

Parameters:

```
self <<in>> (p. 951) Cannot be NULL.
l <<in>> (p. 951) DDS_SubscriberListener (p. 1405) to set to.
mask <<in>> (p. 951) DDS_StatusMask (p. 127) associated with the
DDS_SubscriberListener (p. 1405). The callback function on the
listener cannot be NULL if the corresponding status is turned on in
the mask.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
set_listener (abstract) (p. 244)
```

4.91.4.27 struct DDS_SubscriberListener DDS_- Subscriber_get_listener (DDS_Subscriber * self) [read]

Get the subscriber listener.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

```
DDS_SubscriberListener (p. 1405) of the DDS_Subscriber (p. 743).
```

See also:

```
DDS_Subscriber_get_listenerX (p. 765) get_listener (abstract) (p. 245)
```

4.91.4.28 DDS_ReturnCode_t DDS_Subscriber_get_listenerX (DDS_Subscriber * self, struct DDS_SubscriberListener * listener)

```
<< eXtension>> (p. 950) Get the subscriber listener.
```

An alternative form of get_listener that fills in an existing listener structure rather than returning one on the stack.

Parameters:

```
\begin{split} self <<&in>> (\text{p. 951}) \text{ Cannot be NULL.} \\ listener <<&inout>> (\text{p. 951}) \text{ } \mathbf{DDS\_SubscriberListener} \quad \text{(p. 1405)} \\ \text{structure to be filled up. Cannot be NULL.} \end{split}
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_Subscriber_get_listener (p. 764) get_listener (abstract) (p. 245)
```

4.91.5 Variable Documentation

Special value for creating data reader with default QoS.

When used in **DDS_Subscriber_create_datareader** (p. 749), this special value is used to indicate that the **DDS_DataReader** (p. 783) should be created with the default **DDS_DataReader** (p. 783) QoS by means of the operation

get_default_datareader_qos and using the resulting QoS to create the **DDS_-DataReader** (p. 783).

When used in DDS_Subscriber_set_default_datareader_qos (p. 748), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the DDS_Subscriber_set_default_datareader_qos (p. 748) operation had never been called.

When used in **DDS_DataReader_set_qos** (p. 836), this special value is used to indicate that the QoS of the **DDS_DataReader** (p. 783) should be changed to match the current defualt QoS set in the **DDS_Subscriber** (p. 743) that the **DDS_DataReader** (p. 783) belongs to.

See also:

```
DDS_Subscriber_create_datareader (p. 749)
DDS_Subscriber_set_default_datareader_qos (p. 748)
DDS_DataReader_set_qos (p. 836)
```

Examples:

 $HelloWorld_subscriber.c.$

4.91.5.2 struct DDS_DataReaderQos DDS_DATAREADER_QOS_-USE_TOPIC_QOS

Special value for creating **DDS_DataReader** (p. 783) with a combination of the default **DDS_DataReaderQos** (p. 1083) and the **DDS_TopicQos** (p. 1443).

The use of this value is equivalent to the application obtaining the default DDS_DataReaderQos (p. 1083) and the DDS_TopicQos (p. 1443) (by means of the operation DDS_Topic_get_qos (p. 440)) and then combining these two QoS using the operation DDS_Subscriber_copy_from_topic_qos (p. 758) whereby any policy that is set on the DDS_TopicQos (p. 1443) "overrides" the corresponding policy on the default QoS. The resulting QoS is then applied to the creation of the DDS_DataReader (p. 783).

This value should only be used in **DDS_Subscriber_create_datareader** (p. 749).

4.92 DataReaders 769

#define DDS_DataReaderListener_INITIALIZER

Initializer for new DDS_DataReaderListener (p. 1065).

Typedefs

 $\hat{\ }$ typedef struct DDS_DataReader Impl
 $\mathbf{DDS}_{-}\mathbf{DataReader}$

<<iinterface>> (p. 950) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached DDS_Subscriber (p. 743).

Prototype of a DDS_DataReaderListener (p. 1065) requested_deadline_missed function.

typedef void(* DDS_DataReaderListener_LivelinessChangedCallback)(void *listener_data, DDS_DataReader
 *reader, const struct DDS_LivelinessChangedStatus *status)

Prototype of a $DDS_DataReaderListener$ (p. 1065) liveliness_changed function.

Prototype of a $DDS_DataReaderListener$ (p. 1065) requested_incompatible_QoS function.

typedef void(* DDS_DataReaderListener_SampleRejectedCallback)(void *listener_data, DDS_DataReader
 *reader, const struct DDS_SampleRejectedStatus *status)

Prototype of a $DDS_DataReaderListener$ (p. 1065) sample_rejected function.

^ typedef void(* DDS_DataReaderListener_DataAvailableCallback)(void *listener_data, DDS_DataReader *reader)

Prototype of a DDS_DataReaderListener (p. 1065) data_available function.

Prototype of a $DDS_DataReaderListener$ (p. 1065) subscription_match function.

^ typedef void(* DDS_DataReaderListener_SampleLostCallback)(void *listener_data, DDS_DataReader *reader, const struct DDS_-SampleLostStatus *status)

Prototype of a $DDS_DataReaderListener$ (p. 1065) subscription_lost function.

Enumerations

 $\hat{}$ enum $\mathbf{DDS_SampleRejectedStatusKind}$ {

DDS_NOT_REJECTED,

DDS_REJECTED_BY_INSTANCES_LIMIT,

DDS_REJECTED_BY_SAMPLES_LIMIT,

DDS_REJECTED_BY_SAMPLES_PER_INSTANCE_LIMIT,

DDS_REJECTED_BY_REMOTE_WRITERS_LIMIT,

DDS_REJECTED_BY_REMOTE_WRITERS_PER_-INSTANCE_LIMIT,

DDS_REJECTED_BY_SAMPLES_PER_REMOTE_WRITER_-LIMIT }

Kinds of reasons for rejecting a sample.

Functions

 $\begin{tabular}{lll} \bf FooDataReader & FooDataReader_narrow & (DDS_DataReader \\ *reader) \end{tabular}$

Narrow the given DDS_DataReader (p. 783) pointer to a FooDataReader (p. 1495) pointer.

^ DDS_DataReader * FooDataReader_as_datareader (Foo-DataReader *reader)

Widen the given FooDataReader (p. 1495) pointer to a DDS_DataReader (p. 783) pointer.

DDS_ReturnCode_t FooDataReader_read (FooDataReader *self, struct FooSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

771

^ DDS_ReturnCode_t FooDataReader_take (FooDataReader *self, struct FooSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data-samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t FooDataReader_read_w_condition (Foo-DataReader *self, struct FooSeq *received_data, struct DDS_-SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_-ReadCondition *condition)

Accesses via FooDataReader_read (p. 788) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

^ DDS_ReturnCode_t FooDataReader_take_w_condition (Foo-DataReader *self, FooSeq *received_data, struct DDS_-SampleInfoSeq *info_seq, DDS_Long max_samples, DDS_-ReadCondition *condition)

Analogous to FooDataReader_read_w_condition (p. 796) except it accesses samples via the FooDataReader_take (p. 789) operation.

` DDS_ReturnCode_t FooDataReader_read_next_sample (FooDataReader *self, struct Foo *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS-DataReader (p. 783).

^ DDS_ReturnCode_t FooDataReader_take_next_sample (FooDataReader *self, struct Foo *received_data, struct DDS_SampleInfo *sample_info)

Copies the next not-previously-accessed data value from the DDS_-DataReader (p. 783).

DDS_ReturnCode_t FooDataReader_read_instance (FooDataReader_*self, struct FooSeq *received_data, struct DDS_-SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_-InstanceHandle_t *a_handle, DDS_SampleStateMask sample_states,

DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t FooDataReader_read_next_instance (FooDataReader *self, struct FooSeq *received_data, struct DDS_-SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_-InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t FooDataReader_take_next_instance (FooDataReader *self, struct FooSeq *received_data, struct DDS_-SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_-InstanceHandle_t *previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_-InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

Accesses via FooDataReader_read_next_instance (p. 804) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

^ DDS_ReturnCode_t FooDataReader_take_next_instance_w_condition (FooDataReader *self, struct FooSeq *received_data, struct DDS_SampleInfoSeq *info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t *previous_handle, DDS_ReadCondition *condition)

Accesses via FooDataReader_take_next_instance (p. 806) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

4.92 DataReaders 773

Indicates to the DDS_DataReader (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the DDS_DataReader (p. 783).

Retrieve the instance key that corresponds to an instance handle.

^ DDS_InstanceHandle_t FooDataReader_lookup_instance (FooDataReader *self, const Foo *key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_RequestedDeadlineMissedStatus_copy (struct DDS_RequestedDeadlineMissedStatus *self, const struct DDS_RequestedDeadlineMissedStatus *source)

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_LivelinessChangedStatus_copy (struct DDS_LivelinessChangedStatus *self, const struct DDS_-LivelinessChangedStatus *source)

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

Initializer for new status instances.

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_SampleLostStatus_initialize (struct DDS_SampleLostStatus *self)

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_SampleLostStatus_copy (struct DDS_SampleLostStatus *self, const struct DDS_SampleLostStatus *source)

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_SampleRejectedStatus_initialize (struct DDS_SampleRejectedStatus *self)

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_SampleRejectedStatus_copy (struct DDS_SampleRejectedStatus *self, const struct DDS_SampleRejectedStatus *source)

Copy the contents of the given status into this status.

^ DDS_ReturnCode_t DDS_SampleRejectedStatus_finalize (struct DDS_SampleRejectedStatus *self)

Free any dynamic memory allocated by status instances.

^ DDS_ReturnCode_t DDS_SubscriptionMatchedStatus_initialize (struct DDS_SubscriptionMatchedStatus *self)

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_SubscriptionMatchedStatus_copy (struct DDS_SubscriptionMatchedStatus *self, const struct DDS_SubscriptionMatchedStatus *source)

4.92 DataReaders 775

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

Initializer for new status instances.

^ DDS_ReturnCode_t DDS_DataReaderCacheStatus_copy (struct DDS_DataReaderCacheStatus *self, const struct DDS_DataReaderCacheStatus *source)

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

` DDS_ReturnCode_t DDS_DataReaderProtocolStatus_initialize (struct DDS_DataReaderProtocolStatus *self)

Initializer for new status instances.

Copy the contents of the given status into this status.

Free any dynamic memory allocated by status instances.

Initializer for new QoS instances.

^ DDS_ReturnCode_t DDS_DataReaderQos_copy (struct DDS_DataReaderQos *self, const struct DDS_DataReaderQos *source)

Copy the contents of the given QoS into this QoS.

^ DDS_ReturnCode_t DDS_DataReaderQos_finalize (struct DDS_-DataReaderQos *self)

Free any dynamic memory allocated by the policies in this DDS_{-} -DataReaderQos (p. 1083).

^ DDS_Entity * DDS_DataReader_as_entity (DDS_DataReader *dataReader)

Accesses the DDS_DataReader (p. 783)'s supertype instance.

DDS_ReadCondition * DDS_DataReader_create_readcondition
(DDS_DataReader *self, DDS_SampleStateMask sample_states,
DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Creates a DDS_ReadCondition (p. 842).

^ DDS_QueryCondition * DDS_DataReader_create_querycondition (DDS_DataReader *self, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states, const char *query_expression, const struct DDS_StringSeq *query_parameters)

Creates a DDS_QueryCondition (p. 845).

Deletes a DDS_ReadCondition (p. 842) or DDS_QueryCondition (p. 845) attached to the DDS_DataReader (p. 783).

^ DDS_ReturnCode_t DDS_DataReader_delete_contained_entities (DDS_DataReader *self)

Deletes all the entities that were created by means of the "create" operations on the DDS_DataReader (p. 783).

Waits until all "historical" data is received for $DDS_DataReader$ (p. 783) entities that have a non-VOLATILE PERSISTENCE Qos kind.

Retrieve the list of publications currently "associated" with this DDS_-DataReader (p. 783).

This operation retrieves the information on a publication that is currently "associated" with the DDS_DataReader (p. 783).

4.92 DataReaders 777

^ DDS_TopicDescription * DDS_DataReader_get_topicdescription (DDS_DataReader *self)

Returns the DDS_TopicDescription (p. 425) associated with the DDS_DataReader (p. 783).

^ DDS_Subscriber * DDS_DataReader_get_subscriber (DDS_-DataReader *self)

Returns the DDS_Subscriber (p. 743) to which the DDS_DataReader (p. 783) belongs.

Accesses the $DDS_SAMPLE_REJECTED_STATUS$ (p. 130) communication status.

Accesses the DDS_LIVELINESS_CHANGED_STATUS (p. 131) communication status.

Accesses the DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 129) communication status.

DDS_ReturnCode_t DDS_DataReader_get_requested_-incompatible_qos_status (DDS_DataReader *self, struct DDS_RequestedIncompatibleQosStatus *status)

Accesses the DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129) communication status.

^ DDS_ReturnCode_t DDS_DataReader_get_subscription_matched_status (DDS_DataReader *self, struct DDS_-SubscriptionMatchedStatus *status)

Accesses the DDS_SUBSCRIPTION_MATCHED_STATUS (p. 132) communication status.

^ DDS_ReturnCode_t DDS_DataReader_get_sample_lost_status (DDS_DataReader *self, struct DDS_SampleLostStatus *status)

Accesses the $DDS_SAMPLE_LOST_STATUS$ (p. 130) communication status.

<<eXtension>> (p. 950) Get the datareader cache status for this reader.

<<eXtension>> (p. 950) Get the datareader protocol status for this reader.

^ DDS_ReturnCode_t DDS_DataReader_get_matched_publication_datareader_protocol_status (DDS_DataReader *self, struct DDS_DataReaderProtocolStatus *status, const DDS_InstanceHandle_t *publication_handle)

<<eXtension>> (p. 950) Get the datareader protocol status for this reader, per matched publication identified by the publication_handle.

^ DDS_ReturnCode_t DDS_DataReader_set_qos (DDS_DataReader *self, const struct DDS_DataReaderQos *qos)

Sets the reader QoS.

<<**eXtension**>> (p. 950) Change the QoS of this reader using the input XML QoS profile.

^ DDS_ReturnCode_t DDS_DataReader_get_qos (DDS_DataReader *self, struct DDS_DataReaderQos *qos)

Gets the reader QoS.

^ DDS_ReturnCode_t DDS_DataReader_set_listener (DDS_DataReader *self, const struct DDS_DataReaderListener *l, DDS_StatusMask mask)

Sets the reader listener.

struct DDS_DataReaderListener DDS_DataReader_get_listener
(DDS_DataReader *self)

Get the reader listener.

^ DDS_ReturnCode_t DDS_DataReader_get_listenerX (DDS_DataReader_struct DDS_DataReaderListener *listener)

<<eXtension>> (p. 950) Get the reader listener.

4.92.1 Detailed Description

DDS_DataReader (p. 783) entity and associated elements

4.92.2 Define Documentation

$\begin{array}{ll} \textbf{4.92.2.1} & \texttt{\#define\ DDS_RequestedDeadlineMissedStatus_-} \\ \textbf{INITIALIZER} \end{array}$

Initializer for new status instances.

New DDS_RequestedDeadlineMissedStatus (p. 1352) instances that are stored on the stack should be initialized with this value before they are passed to any methods. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_InconsistentTopicStatus_finalize** (p. 433) should be called to free the contained fields that use dynamic memory:

```
struct DDS_RequestedDeadlineMissedStatus myStatus = DDS_RequestedDeadlineMissedStatus_INITIALIZER;
...
DDS_RequestedDeadlineMissedStatus_finalize(&myStatus);
```

See also:

```
DDS_RequestedDeadlineMissedStatus_initialize (p. 814)
DDS_RequestedDeadlineMissedStatus_finalize (p. 815)
```

4.92.2.2 #define DDS_LivelinessChangedStatus_INITIALIZER

Initializer for new status instances.

New DDS_LivelinessChangedStatus (p. 1250) instances that are stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_LivelinessChangedStatus_finalize** (p. 816) should be called to free the contained fields that use dynamic memory:

```
struct DDS_LivelinessChangedStatus myStatus = DDS_LivelinessChangedStatus_INITIALIZER;
...
DDS_LivelinessChangedStatuss_finalize(&myStatus);
```

See also:

```
DDS_LivelinessChangedStatus_initialize (p. 815)
DDS_LivelinessChangedStatus_finalize (p. 816)
```

$\begin{array}{ccc} 4.92.2.3 & \# define \ DDS_R equested Incompatible Qos Status_-\\ INITIALIZER \end{array}$

Initializer for new status instances.

New DDS_RequestedIncompatibleQosStatus (p. 1354) instances that are stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_RequestedIncompatibleQosStatus_finalize** (p. 817) should be called to free the contained fields that use dynamic memory:

```
struct DDS_RequestedIncompatibleQosStatus myStatus = DDS_RequestedIncompatibleQosStatus_INITIALIZER;
...
DDS_RequestedIncompatibleQosStatus_finalize(&myStatus);
```

See also:

```
DDS_RequestedIncompatibleQosStatus_initialize (p. 816)
DDS_RequestedIncompatibleQosStatus_finalize (p. 817)
```

4.92.2.4 #define DDS_SampleLostStatus_INITIALIZER

Initializer for new status instances.

New DDS_SampleLostStatus (p. 1394) instances that are stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_SampleLostStatus_finalize** (p. 818) should be called to free the contained fields that use dynamic memory:

```
struct DDS_SampleLostStatus myStatus = DDS_SampleLostStatus_INITIALIZER;
...
DDS_SampleLostStatus_finalize(&myStatus);
```

See also:

```
DDS_SampleLostStatus_initialize (p. 818)
DDS_SampleLostStatus_finalize (p. 818)
```

${\bf 4.92.2.5 \quad \# define\ DDS_S ample Rejected Status_INITIALIZER}$

Initializer for new status instances.

New DDS_SampleRejectedStatus (p. 1395) instances that are stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_SampleRejectedStatus_finalize** (p. 820) should be called to free the contained fields that use dynamic memory:

```
struct DDS_SampleRejectedStatus myStatus = DDS_SampleRejectedStatus_INITIALIZER;
...
DDS_SampleRejectedStatus_finalize(&myStatus);
```

See also:

```
DDS_SampleRejectedStatus_initialize (p. 819)
DDS_SampleRejectedStatus_finalize (p. 820)
```

4.92.2.6 #define DDS_SubscriptionMatchedStatus_INITIALIZER

Initializer for new status instances.

New DDS_SubscriptionMatchedStatus (p. 1420) instances that are stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_SubscriptionMatchedStatus_finalize** (p. 821) should be called to free the contained fields that use dynamic memory:

```
struct DDS_SubscriptionMatchedStatus myStatus = DDS_SubscriptionMatchedStatus_INITIALIZER;
...
DDS_SubscriptionMatchedStatus_finalize(&myStatus);
```

See also:

```
DDS_SubscriptionMatchedStatus_initialize (p. 820)
DDS_SubscriptionMatchedStatus_finalize (p. 821)
```

4.92.2.7 #define DDS_DataReaderCacheStatus_INITIALIZER

Initializer for new status instances.

New DDS_DataReaderCacheStatus (p. 1064) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_DataReaderCacheStatus_finalize** (p. 823) should be called to free the contained fields that use dynamic memory:

```
struct DDS_DataReaderCacheStatus myStatus = DDS_DataReaderCacheStatus_INITIALIZER;
DDS_DataReader_get_datareader_cache_status(myDataReader, &myStatus);
DDS_DataReaderCacheStatus_finalize(&myStatus);
```

See also:

```
DDS_DataReader_get_datareader_cache_status (p. 835)
DDS_DataReaderCacheStatus_finalize (p. 823)
```

4.92.2.8 #define DDS_DataReaderProtocolStatus_INITIALIZER

Initializer for new status instances.

New DDS_DataReaderProtocolStatus (p. 1073) instances stored on the stack should be initialized with this value before they are passed to any function. This step ensures that those fields that use dynamic memory are properly initialized. This does not allocate memory.

The simplest way to create a status structure is to initialize it on the stack at the time of its creation. **DDS_DataReaderProtocolStatus_finalize** (p. 824) should be called to free the contained fields that use dynamic memory:

```
struct DDS_DataReaderProtocolStatus myStatus = DDS_DataReaderProtocolStatus_INITIALIZER;
DDS_DataReader_get_datareader_protocol_status(myDataReader, &myStatus);
DDS_DataReaderProtocolStatus_finalize(&myStatus);
```

See also:

```
DDS_DataReader_get_datareader_protocol_status (p. 835)
DDS_DataReaderProtocolStatus_finalize (p. 824)
```

4.92.2.9 #define DDS_DataReaderQos_INITIALIZER

Initializer for new QoS instances.

New DDS_DataReaderQos (p. 1083) instances that are stored in the stack should be initialized with this value before they are passed to any function.

This step ensures that those contained QoS policies that use dynamic memory are properly initialized.

The simplest way to create a new QoS structure is to initialize it on the stack at the time of its creation:

```
struct DDS_DataReaderQos myQos = DDS_DataReaderQos_INITIALIZER;
```

Note that the above assignment is not a substitute for calling DDS_-Subscriber_get_default_datareader_qos (p. 747) or DDS_DataReader_get_qos (p. 838); one of those should be called subsequently to setting the QoS of a new or existing entity:

```
struct DDS_DataReaderQos myQos = DDS_DataReaderQos_INITIALIZER;
DDS_Subscriber_get_default_datareader_qos(mySub, &myQos);
DDS_DataReader_get_qos(myReader, &myQos);
```

See also:

```
DDS_DataReaderQos_initialize (p. 825)
DDS_Subscriber_get_default_datareader_qos (p. 747)
DDS_DataReaderQos_finalize (p. 826)
```

4.92.2.10 #define DDS_DataReaderListener_INITIALIZER

Initializer for new DDS_DataReaderListener (p. 1065).

All the new instances allocated in the stack should be initialized to this value. No memory is allocated.

Examples:

 $HelloWorld_subscriber.c.$

4.92.3 Typedef Documentation

4.92.3.1 typedef struct DDS_DataReaderImpl DDS_DataReader

<<ii>interface>> (p. 950) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached DDS_Subscriber (p. 743).

QoS:

```
DDS_DataReaderQos (p. 1083)
```

Status:

```
DDS_DATA_AVAILABLE_STATUS (p. 130);
DDS_LIVELINESS_CHANGED_STATUS
                                                  DDS_{-}
                                        (p. 131),
LivelinessChangedStatus (p. 1250);
DDS_REQUESTED_DEADLINE_MISSED_STATUS
                                                  (p. 129),
DDS_RequestedDeadlineMissedStatus (p. 1352);
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS
                                                  (p. 129),
DDS_RequestedIncompatibleQosStatus (p. 1354);
DDS_SAMPLE_LOST_STATUS (p. 130), DDS_SampleLostStatus
(p. 1394);
DDS_SAMPLE_REJECTED_STATUS
                                      (p. 130),
                                                  DDS_{-}
SampleRejectedStatus (p. 1395);
DDS_SUBSCRIPTION_MATCHED_STATUS
                                                   DDS_-
SubscriptionMatchedStatus<BR>
```

Listener:

DDS_DataReaderListener (p. 1065)

A DDS_DataReader (p. 783) refers to exactly one DDS_TopicDescription (p. 425) (either a DDS_Topic (p. 425), a DDS_ContentFilteredTopic (p. 426) or a DDS_MultiTopic (p. 430)) that identifies the data to be read.

The subscription has a unique resulting type. The data-reader may give access to several instances of the resulting type, which can be distinguished from each other by their key.

DDS_DataReader (p. 783) is an abstract class. It must be specialised for each particular application data-type (see **USER_DATA** (p. 150)). The additional methods or functions that must be defined in the auto-generated class for a hypothetical application type Foo (p. 1494) are specified in the generic type **FooDataReader** (p. 1495).

The following operations may be called even if the DDS_DataReader (p. 783) is not enabled. Other operations will fail with the value DDS_RETCODE_NOT_ENABLED (p. 121) if called on a disabled DDS_DataReader (p. 783):

- ^ The base-class operations DDS_DataReader_set_qos (p. 836), DDS_DataReader_set_listener (p. 838), DDS_DataReader_set_listener (p. 838), DDS_DataReader_get_listener (p. 839), DDS_Entity_enable (p. 245), DDS_Entity_get_statuscondition (p. 247) and DDS_Entity_get_status_changes (p. 247)
- ^ DDS_DataReader_get_liveliness_changed_status (p. 833) DDS_-DataReader_get_requested_deadline_missed_status (p. 833) DDS_DataReader_get_requested_incompatible_qos_status (p. 834) DDS_DataReader_get_sample_lost_status (p. 835)

DDS_DataReader_get_sample_rejected_status (p. 833) DDS_DataReader_get_subscription_matched_status (p. 834)

All sample-accessing operations, namely: FooDataReader_read (p. 788), FooDataReader_take (p. 789), FooDataReader_read_w_condition (p. 796), and FooDataReader_take_w_condition (p. 797) may fail with the error DDS_RETCODE_PRECONDITION_NOT_MET (p. 121) as described in DDS_Subscriber_begin_access (p. 755).

See also:

Operations Allowed in Listener Callbacks (p. 1248)

Examples:

HelloWorld_subscriber.c.

4.92.3.2 typedef void(* DDS_DataReaderListener_-RequestedDeadlineMissedCallback)(void *listener_data, DDS_DataReader *reader, const struct DDS_RequestedDeadlineMissedStatus *status)

Prototype of a **DDS_DataReaderListener** (p. 1065) requested_deadline_missed function.

4.92.3.3 typedef void(* DDS_DataReaderListener_-LivelinessChangedCallback)(void *listener_data, DDS_DataReader *reader, const struct DDS_LivelinessChangedStatus *status)

Prototype of a ${\bf DDS_DataReaderListener}$ (p. 1065) liveliness_changed function.

4.92.3.4 typedef void(* DDS_DataReaderListener_RequestedIncompatibleQosCallback)(void
*listener_data, DDS_DataReader *reader, const struct
DDS_RequestedIncompatibleQosStatus *status)

Prototype of a **DDS_DataReaderListener** (p. 1065) requested_incompatible_QoS function.

4.92.3.5 typedef void(* DDS_DataReaderListener_-SampleRejectedCallback)(void *listener_data, DDS_DataReader *reader, const struct DDS_SampleRejectedStatus *status)

Prototype of a DDS_DataReaderListener (p. 1065) sample_rejected function.

4.92.3.6 typedef void(* DDS_DataReaderListener_-DataAvailableCallback)(void *listener_data, DDS_DataReader *reader)

Prototype of a DDS_DataReaderListener (p. 1065) data_available function.

4.92.3.7 typedef void(* DDS_DataReaderListener_-SubscriptionMatchedCallback)(void *listener_data, DDS_DataReader *reader, const struct DDS_SubscriptionMatchedStatus *status)

Prototype of a $\mathbf{DDS_DataReaderListener}$ (p. 1065) subscription_match function.

4.92.3.8 typedef void(* DDS_DataReaderListener_-SampleLostCallback)(void *listener_data, DDS_DataReader *reader, const struct DDS_SampleLostStatus *status)

Prototype of a **DDS_DataReaderListener** (p. 1065) subscription_lost function.

4.92.4 Enumeration Type Documentation

4.92.4.1 enum DDS_SampleRejectedStatusKind

Kinds of reasons for rejecting a sample.

Enumerator:

DDS_NOT_REJECTED Samples are never rejected.

See also:

ResourceLimitsQosPolicy

DDS_REJECTED_BY_INSTANCES_LIMIT A resource limit on the number of instances was reached.

See also:

ResourceLimitsQosPolicy

DDS_REJECTED_BY_SAMPLES_LIMIT A resource limit on the number of samples was reached.

See also:

ResourceLimitsQosPolicy

DDS_REJECTED_BY_SAMPLES_PER_INSTANCE_LIMIT A

resource limit on the number of samples per instance was reached.

See also:

ResourceLimitsQosPolicy

DDS_REJECTED_BY_REMOTE_WRITERS_LIMIT A resource

limit on the number of remote writers from which a DDS_-DataReader (p. 783) may read was reached.

This constant is an extension to the DDS standard.

See also:

DDS_DataReaderResourceLimitsQosPolicy (p. 1089)

$DDS_REJECTED_BY_REMOTE_WRITERS_PER_INSTANCE_LIMIT$

A resource limit on the number of remote writers for a single instance from which a **DDS_DataReader** (p. 783) may read was reached.

This constant is an extension to the DDS standard.

See also:

DDS_DataReaderResourceLimitsQosPolicy (p. 1089)

$DDS_REJECTED_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT$

A resource limit on the number of samples from a given remote writer that a **DDS_DataReader** (p. 783) may store was reached.

This constant is an extension to the DDS standard.

See also:

DDS_DataReaderResourceLimitsQosPolicy (p. 1089)

4.92.5 Function Documentation

4.92.5.1 FooDataReader* FooDataReader_narrow (DDS_DataReader * reader)

Narrow the given **DDS_DataReader** (p. 783) pointer to a **FooDataReader** (p. 1495) pointer.

Parameters:

reader << in>> (p. 951) Cannot be NULL.

4.92.5.2 DDS_DataReader* FooDataReader_as_datareader (FooDataReader * reader)

Widen the given **FooDataReader** (p. 1495) pointer to a **DDS_DataReader** (p. 783) pointer.

Parameters:

```
reader << in>> (p. 951) Cannot be NULL.
```

4.92.5.3 DDS_ReturnCode_t FooDataReader_read (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

This operation offers the same functionality and API as FooDataReader_take (p. 789) except that the samples returned remain in the DDS_DataReader (p. 783) such that they can be retrieved again by means of a read or take operation.

Please refer to the documentation of FooDataReader_take() (p. 789) for details on the number of samples returned within the received_data and info_seq as well as the order in which the samples appear in these sequences.

The act of reading a sample changes its sample_state to DDS_READ_-SAMPLE_STATE (p. 849). If the sample belongs to the most recent generation of the instance, it will also set the view_state of the instance to be DDS_NOT_NEW_VIEW_STATE (p. 851). It will not affect the instance_state of the instance.

Important: If the samples "returned" by this function are loaned from RTI Data Distribution Service (see FooDataReader_take (p. 789) for more information on memory loaning), it is important that their contents not be changed. Because the memory in which the data is stored belongs to the middleware, any modifications made to the data will be seen the next time the same samples are read or taken; the samples will no longer reflect the state that was received from the network.

Parameters:

Must be a valid non-NULL **FooSeq** (p. 1497). The function will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 121) if it is NULL.

- info_seq <<inout>> (p. 951) A DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).
- $sample_states << in>> (p. 951)$ Data samples matching one of these sample_states are returned.
- view_states <<in>>> (p. 951) Data samples matching one of these
 view_state are returned.
- instance_states <<iin>> (p. 951) Data samples matching ones of these
 instance_state are returned.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

FooDataReader_read_w_condition (p. 796), FooDataReader_take (p. 789), FooDataReader_take_w_condition (p. 797)
DDS_LENGTH_UNLIMITED (p. 174)

4.92.5.4 DDS_ReturnCode_t FooDataReader_take (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data-samples from the DDS_DataReader (p. 783).

The operation will return the list of samples received by the **DDS_DataReader** (p. 783) since the last **FooDataReader_take** (p. 789) operation that match the specified **DDS_SampleStateMask** (p. 848), **DDS_ViewStateMask** (p. 850) and **DDS_InstanceStateMask** (p. 853).

This operation may fail with DDS_RETCODE_ERROR (p. 121) if DDS_DataReaderResourceLimitsQosPolicy::max_outstanding_reads (p. 1094) limit has been exceeded.

The actual number of samples returned depends on the information that has been received by the middleware as well as the DDS_-HistoryQosPolicy (p. 1229), DDS_ResourceLimitsQosPolicy (p. 1356), DDS_DataReaderResourceLimitsQosPolicy (p. 1089) and the characteristics of the data-type that is associated with the DDS_DataReader (p. 783):

- In the case where the DDS_HistoryQosPolicy::kind (p. 1231) is DDS_KEEP_LAST_HISTORY_QOS (p. 171), the call will return at most DDS_HistoryQosPolicy::depth (p. 1231) samples per instance.
- The maximum number of samples returned is limited by DDS_-ResourceLimitsQosPolicy::max_samples (p. 1358), and by DDS_-DataReaderResourceLimitsQosPolicy::max_samples_per_read (p. 1094).
- For multiple the instances, number of samples reis additionally limited by the product $(DDS_{-}$ ResourceLimitsQosPolicy::max_samples_per_instance (p. 1359) * DDS_ResourceLimitsQosPolicy::max_instances (p. 1359))
- If DDS_DataReaderResourceLimitsQosPolicy::max_infos (p. 1092) is limited, the number of samples returned may also be limited if insufficient DDS_SampleInfo (p. 1384) resources are available.

If the read or take succeeds and the number of samples returned has been limited (by means of a maximum limit, as listed above, or insufficient **DDS_-SampleInfo** (p. 1384) resources), the call will complete successfully and provide those samples the reader is able to return. The user may need to make additional calls, or return outstanding loaned buffers in the case of insuffificient resources, in order to access remaining samples.

Note that in the case where the **DDS_Topic** (p. 425) associated with the **DDS_DataReader** (p. 783) is bound to a data-type that has no key definition, then there will be at most one instance in the **DDS_DataReader** (p. 783). So the per-sample limits will apply.

The act of *taking* a sample removes it from RTI Data Distribution Service so it cannot be read or taken again. If the sample belongs to the most recent generation of the instance, it will also set the view_state of the sample's instance to DDS_NOT_NEW_VIEW_STATE (p. 851). It will not affect the instance_state of the sample's instance.

After FooDataReader_take (p. 789) completes, received_data and info_seq will be of the same length and contain the received data.

If the sequences are empty (maximum size equals 0) when the **Foo-DataReader_take** (p. 789) is called, the samples returned in the received_data and the corresponding info_seq are 'loaned' to the application from buffers provided by the **DDS_DataReader** (p. 783). The application can use them as desired and has guaranteed exclusive access to them.

Once the application completes its use of the samples it must 'return the loan' to the **DDS_DataReader** (p. 783) by calling the **FooDataReader_return_loan** (p. 811) operation.

Important: When you loan data from the middleware, you must not keep any pointers to any part of the data samples or the DDS_SampleInfo (p. 1384) objects after the call to FooDataReader_return_loan (p. 811). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While you must call **FooDataReader_return_loan** (p. 811) at some point, you do not have to do so before the next **FooDataReader_take** (p. 789) call. However, failure to return the loan will eventually deplete the **DDS_DataReader** (p. 783) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **DDS_DataReader** (p. 783) is specified by the **DDS_ResourceLimitsQosPolicy** (p. 1356) and the **DDS_DataReaderResourceLimitsQosPolicy** (p. 1089).

If the sequences are not empty (maximum size not equal to 0 and length not equal to 0) when **FooDataReader_take** (p. 789) is called, samples are copied to received_data and info_seq. The application will not need to call **FooDataReader_return_loan** (p. 811).

The order of the samples returned to the caller depends on the DDS_-PresentationQosPolicy (p. 1297).

- ^ If DDS_PresentationQosPolicy::access_scope (p. 1300) is DDS_-INSTANCE_PRESENTATION_QOS (p. 156), the returned collection is a list where samples belonging to the same data instance are consecutive.
- If DDS_PresentationQosPolicy::access_scope (p. 1300) is DDS_TOPIC_PRESENTATION_QOS (p. 156) and DDS_-PresentationQosPolicy::ordered_access (p. 1301) is set to DDS_-BOOLEAN_FALSE (p. 107), then returned collection is a list where samples belonging to the same data instance are consecutive.
- If DDS_PresentationQosPolicy::access_scope (p. 1300) is DDS_TOPIC_PRESENTATION_QOS (p. 156) and DDS_PresentationQosPolicy::ordered_access (p. 1301) is set to DDS_BOOLEAN_TRUE (p. 106), then the returned collection is a list were

the relative order of samples is preserved also accross different instances. Note that samples belonging to the same instance may or may not be consecutive. This is because to preserve order it may be necessary to mix samples from different instances.

- If DDS_PresentationQosPolicy::access_scope (p. 1300) is DDS_GROUP_PRESENTATION_QOS (p. 156) and DDS_PresentationQosPolicy::ordered_access (p. 1301) is set to DDS_BOOLEAN_FALSE (p. 107), then returned collection is a list where samples belonging to the same data instance are consecutive. [Not supported (optional)]
- If DDS_PresentationQosPolicy::access_scope (p. 1300) is DDS_GROUP_PRESENTATION_QOS (p. 156) and DDS_PresentationQosPolicy::ordered_access (p. 1301) is set to DDS_BOOLEAN_TRUE (p. 106), then the returned collection contains at most one sample. The difference in this case is due to the fact that is required that the application is able to read samples belonging to different DDS_DataReader (p. 783) objects in a specific order. [Not supported (optional)]

In any case, the relative order between the samples of one instance is consistent with the **DESTINATION_ORDER** (p. 168) policy:

- If DDS_DestinationOrderQosPolicy::kind (p.1140) is DDS_BY_-RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS (p. 169), samples belonging to the same instances will appear in the relative order in which there were received (FIFO, earlier samples ahead of the later samples).
- If DDS_DestinationOrderQosPolicy::kind (p.1140) is DDS_BY_-SOURCE_TIMESTAMP_DESTINATIONORDER_QOS (p.169), samples belonging to the same instances will appear in the relative order implied by the source_timestamp (FIFO, smaller values of source_timestamp ahead of the larger values).

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function will fail with DDS_RETCODE_NO_DATA (p. 122).

In addition to the collection of samples, the read and take operations also use a collection of **DDS_SampleInfo** (p. 1384) structures.

4.92.6 SEQUENCES USAGE IN TAKE AND READ

The initial (input) properties of the received_data and info_seq collections will determine the precise behavior of the read or take operation. For the pur-

poses of this description, the collections are modeled as having these properties:

hether the collection container owns the memory of the elements within (owns, see FooSeq_has_ownership (p. 283))

793

- the current-length (len, see FooSeq_get_length (p. 274))
- the maximum length (max_len, see FooSeq_get_maximum (p. 273))

The initial values of the owns, len and max_len properties for the received_data and info_seq collections govern the behavior of the read and take operations as specified by the following rules:

- The values of owns, len and max_len properties for the two collections must be identical. Otherwise read/take will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).
- On successful output, the values of owns, len and max_len will be the same for both collections.
- 3. If the initial max_len==0, then the received_data and info_seq collections will be filled with elements that are loaned by the DDS_-DataReader (p. 783). On output, owns will be FALSE, len will be set to the number of values returned, and max_len will be set to a value verifying max_len >= len. The use of this variant allows for zero-copy access to the data and the application will need to return the loan to the DDS_-DataWriter (p. 673) using FooDataReader_return_loan (p. 811).
- 4. If the initial max_len>0 and owns==FALSE, then the read or take operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121). This avoids the potential hard-to-detect memory leaks caused by an application forgetting to return the loan.
- 5. If initial max_len>0 and owns==TRUE, then the read or take operation will copy the received_data values and DDS_SampleInfo (p. 1384) values into the elements already inside the collections. On output, owns will be TRUE, len will be set to the number of values copied and max_len will remain unchanged. The use of this variant forces a copy but the application can control where the copy is placed and the application will not need to return the loan. The number of samples copied depends on the relative values of max_len and max_samples:
 - ^ If max_samples == LENGTH_UNLIMITED, then at most max_len values will be copied. The use of this variant lets the application limit the number of samples returned to what the sequence can accommodate.

- If max_samples <= max_len, then at most max_samples values will be copied. The use of this variant lets the application limit the number of samples returned to fewer that what the sequence can accommodate.
- If max_samples > max_len, then the read or take operation will fail with DDS_RETCODE_PRECONDITION_NOT_-MET (p. 121). This avoids the potential confusion where the application expects to be able to access up to max_samples, but that number can never be returned, even if they are available in the DDS_DataReader (p. 783), because the output sequence cannot accommodate them.

As described above, upon completion, the received_data and info_seq collections may contain elements loaned from the DDS_DataReader (p. 783). If this is the case, the application will need to use FooDataReader_return_loan (p. 811) to return the loan once it is no longer using the received_data in the collection. When FooDataReader_return_loan (p. 811) completes, the collection will have owns=FALSE and max_len=0. The application can determine whether it is necessary to return the loan or not based on how the state of the collections when the read/take operation was called or by accessing the owns property. However, in many cases it may be simpler to always call FooDataReader_return_loan (p. 811), as this operation is harmless (i.e., it leaves all elements unchanged) if the collection does not have a loan.

To avoid potential memory leaks, the implementation of the **Foo** (p. 1494) and **DDS_SampleInfo** (p. 1384) collections should disallow changing the length of a collection for which owns==FALSE. Furthermore, deleting a collection for which owns==FALSE should be considered an error.

On output, the collection of **Foo** (p. 1494) values and the collection of **DDS_SampleInfo** (p. 1384) structures are of the same length and are in a one-to-one correspondence. Each **DDS_SampleInfo** (p. 1384) provides information, such as the source_timestamp, the sample_state, view_state, and instance_state, etc., about the corresponding sample.

Some elements in the returned collection may not have valid data. If the instance_state in the DDS_SampleInfo (p. 1384) is DDS_NOT_ALIVE_-DISPOSED_INSTANCE_STATE (p. 854) or DDS_NOT_ALIVE_NO_-WRITERS_INSTANCE_STATE (p. 854), then the last sample for that instance in the collection (that is, the one whose DDS_SampleInfo (p. 1384) has sample_rank==0) does not contain valid data.

Samples that contain no data do not count towards the limits imposed by the **DDS_ResourceLimitsQosPolicy** (p. 1356). The act of reading/taking a sample sets its sample_state to **DDS_READ_SAMPLE_STATE** (p. 849).

If the sample belongs to the most recent generation of the instance, it will also set the view_state of the instance to **DDS_NOT_NEW_VIEW_STATE** (p. 851). It will not affect the instance_state of the instance.

This operation must be provided on the specialized class that is generated for the particular application data-type that is being read (Foo (p. 1494)). If the DDS_DataReader (p. 783) has no samples that meet the constraints, the operations fails with DDS_RETCODE_NO_DATA (p. 122).

For an example on how take can be used, please refer to the **receive example** (p. 920).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

info_seq <<inout>> (p. 951) A DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described above.

sample_states <<iin>>> (p. 951) Data samples matching one of these
sample_states are returned.

view_states <<in>>> (p. 951) Data samples matching one of these
view_state are returned.

 $instance_states << in>> (p. 951)$ Data samples matching one of these instance_state are returned.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

\label{lem:condition} FooDataReader\_read\ (p.\,788) \\ FooDataReader\_read\_w\_condition\ (p.\,796),\ FooDataReader\_take\_w\_condition\ (p.\,797) \\ DDS\_LENGTH\_UNLIMITED\ (p.\,174) \\ \\
```

4.92.6.1 DDS_ReturnCode_t FooDataReader_read_w_condition (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_ReadCondition * condition)

Accesses via FooDataReader_read (p. 788) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

This operation is especially useful in combination with **DDS_QueryCondition** (p. 845) to filter data samples based on the content.

The specified **DDS_ReadCondition** (p. 842) must be attached to the **DDS_DataReader** (p. 783); otherwise the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 121).

In case the DDS_ReadCondition (p. 842) is a plain DDS_ReadCondition (p. 842) and not the specialized DDS_QueryCondition (p. 845), the operation is equivalent to calling FooDataReader_read (p. 788) and passing as sample_states, view_states and instance_states the value of the corresponding attributes in the read_condition. Using this operation, the application can avoid repeating the same parameters specified when creating the DDS_ReadCondition (p. 842).

The samples are accessed with the same semantics as **FooDataReader_read** (p. 788).

If the **DDS_DataReader** (p. 783) has no samples that meet the constraints, the operation will fail with **DDS_RETCODE_NO_DATA** (p. 122).

Parameters:

 $self \ll in >> (p. 951)$ Cannot be NULL.

info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).

condition << in>> (p. 951) the DDS_ReadCondition (p. 842) to select samples of interest. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

```

4.92.6.2 DDS_ReturnCode_t FooDataReader_take_w_condition (FooDataReader * self, FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, DDS_ReadCondition * condition)

Analogous to FooDataReader_read_w_condition (p. 796) except it accesses samples via the FooDataReader_take (p. 789) operation.

This operation is analogous to **FooDataReader_read_w_condition** (p. 796) except that it accesses samples via the **FooDataReader_take** (p. 789) operation.

The specified DDS_ReadCondition (p. 842) must be attached to the DDS_DataReader (p. 783); otherwise the operation will fail with DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

The samples are accessed with the same semantics as **FooDataReader_take** (p. 789).

This operation is especially useful in combination with **DDS_QueryCondition** (p. 845) to filter data samples based on the content.

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function will fail with DDS_RETCODE_NO_DATA (p. 122).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-

NULL **DDS_SampleInfoSeq** (p. 1393). The function will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 121) if it is NULL.

max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).

condition << in>> (p. 951) the DDS_ReadCondition (p. 842) to select samples of interest. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

DDS_LENGTH_UNLIMITED (p. 174)

4.92.6.3 DDS_ReturnCode_t FooDataReader_read_next_sample (FooDataReader * self, struct Foo * received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} -DataReader (p. 783).

This operation copies the next not-previously-accessed data value from the DDS_DataReader (p. 783). This operation also copies the corresponding DDS_SampleInfo (p. 1384). The implied order among the samples stored in the DDS_DataReader (p. 783) is the same as for the FooDataReader_read (p. 788) operation.

The **FooDataReader_read_next_sample** (p. 798) operation is semantically equivalent to the **FooDataReader_read** (p. 788) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The FooDataReader_read_next_sample (p. 798) operation provides a simplified API to 'read' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **DDS_DataReader** (p. 783), the operation will fail with **DDS_RETCODE_NO_DATA** (p. 122) and nothing is copied.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

received_data <<inout>> (p. 951) user data type-specific Foo (p. 1494) object where the next received data sample will be returned. The received_data must have been fully allocated. Otherwise, this operation may fail. Must be a valid non-NULL Foo (p. 1494). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

sample_info <<inout>> (p. 951) a DDS_SampleInfo (p. 1384) object where the next received sample info will be returned. Must be a valid non-NULL DDS_SampleInfo (p. 1384). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

FooDataReader_read (p. 788)

4.92.6.4 DDS_ReturnCode_t FooDataReader_take_next_sample (FooDataReader * self, struct Foo * received_data, struct DDS_SampleInfo * sample_info)

Copies the next not-previously-accessed data value from the DDS_{-} -DataReader (p. 783).

This operation copies the next not-previously-accessed data value from the **DDS_DataReader** (p. 783) and 'removes' it from the **DDS_DataReader** (p. 783) so that it is no longer accessible. This operation also copies the corresponding **DDS_SampleInfo** (p. 1384). This operation is analogous to the **Foo-DataReader_read_next_sample** (p. 798) except for the fact that the sample is removed from the **DDS_DataReader** (p. 783).

The FooDataReader_take_next_sample (p. 799) operation is semantically equivalent to the FooDataReader_take (p. 789) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The FooDataReader_read_next_sample (p. 798) operation provides a simplified API to 'take' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **DDS_DataReader** (p. 783), the operation will fail with **DDS_RETCODE_NO_DATA** (p. 122) and nothing is copied.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

received_data <<inout>> (p. 951) user data type-specific Foo (p. 1494)
 object where the next received data sample will be returned. The re ceived_data must have been fully allocated. Otherwise, this operation
 may fail. Must be a valid non-NULL Foo (p. 1494). The function will
 fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is
 NULL.

sample_info <<inout>> (p. 951) a DDS_SampleInfo (p. 1384) object where the next received sample info will be returned. Must be a valid non-NULL DDS_SampleInfo (p. 1384). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

FooDataReader_take (p. 789)

4.92.6.5 DDS_ReturnCode_t FooDataReader_read_instance (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * a_handle, DDS_SampleStateMask sample_states, DDS_-ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

This operation accesses a collection of data values from the **DDS_DataReader** (p. 783). The behavior is identical to **FooDataReader_read** (p. 788), except that all samples returned belong to the single specified instance whose handle is a_handle.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **DDS_SampleInfo** (p. 1384) verifies **DDS_SampleInfo::instance_handle** (p. 1389) == a_handle.

The FooDataReader_read_instance (p. 800) operation is semantically equivalent to the FooDataReader_read (p. 788) operation, except in building the

collection, the **DDS_DataReader** (p. 783) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The behavior of the FooDataReader_read_instance (p. 800) operation follows the same rules as the FooDataReader_read (p. 788) operation regarding the pre-conditions and post-conditions for the received_data and sample_info. Similar to the FooDataReader_read (p. 788), the FooDataReader_read_instance (p. 800) operation may 'loan' elements to the output collections, which must then be returned by means of FooDataReader_return_loan (p. 811).

Similar to the **FooDataReader_read** (p. 788), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function will fail with DDS_RETCODE_NO_DATA (p. 122).

This operation may fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if the DDS_InstanceHandle_t (p. 452) a_handle does not correspond to an existing data-object known to the DDS_DataReader (p. 783).

Parameters:

- $self \ll in >> (p. 951)$ Cannot be NULL.
- info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).
- a_handle <<in>> (p. 951)
 The specified instance to return samples for.
 Must be a valid non-NULL DDS_InstanceHandle_t (p. 452). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if the handle does not correspond to an existing data-object known to the DDS_DataReader (p. 783).
- sample_states <<iin>> (p. 951) data samples matching ones of these
 sample_states are returned

 $view_states << in>> (p. 951)$ data samples matching ones of these view_state are returned

instance_states <<iin>> (p. 951) data samples matching ones of these
instance_state are returned

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

```
FooDataReader_read (p. 788)
DDS_LENGTH_UNLIMITED (p. 174)
```

4.92.6.6 DDS_ReturnCode_t FooDataReader_take_instance (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * a_handle, DDS_SampleStateMask sample_states, DDS_-ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the **DDS_DataReader** (p. 783).

This operation accesses a collection of data values from the **DDS_DataReader** (p. 783). The behavior is identical to **FooDataReader_take** (p. 789), except for that all samples returned belong to the single specified instance whose handle is a_handle.

The semantics are the same for the **FooDataReader_take** (p. 789) operation, except in building the collection, the **DDS_DataReader** (p. 783) will check that the sample belongs to the specified instance, and otherwise it will not place the sample in the returned collection.

The behavior of the FooDataReader_take_instance (p. 802) operation follows the same rules as the FooDataReader_read (p. 788) operation regarding the pre-conditions and post-conditions for the received_data and sample_info. Similar to the FooDataReader_read (p. 788), the FooDataReader_take_instance (p. 802) operation may 'loan' elements to the output collections, which must then be returned by means of FooDataReader_return_loan (p. 811).

Similar to the **FooDataReader_read** (p. 788), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function fails with DDS_RETCODE_NO_DATA (p. 122).

This operation may fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if the DDS_InstanceHandle_t (p. 452) a_handle does not correspond to an existing data-object known to the DDS_DataReader (p. 783).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

- received_data <<inout>> (p. 951) user data type-specific FooSeq (p. 1497) object where the received data samples will be returned. Must be a valid non-NULL FooSeq (p. 1497). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).
- a_handle <<in>>> (p. 951) The specified instance to return samples for. Must be a valid non-NULL DDS_InstanceHandle_t (p. 452). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL. The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if the handle does not correspond to an existing data-object known to the DDS_DataReader (p. 783).
- sample_states <<iin>> (p. 951) data samples matching ones of these
 sample_states are returned
- view_states <<in>>> (p. 951) data samples matching ones of these
 view_state are returned
- $instance_states << in>> (p. 951)$ data samples matching ones of these instance_state are returned

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

```
FooDataReader_take (p. 789)
DDS_LENGTH_UNLIMITED (p. 174)
```

4.92.6.7 DDS_ReturnCode_t FooDataReader_read_next_instance (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

This operation accesses a collection of data values from the **DDS_DataReader** (p. 783) where all the samples belong to a single instance. The behavior is similar to **FooDataReader_read_instance** (p. 800), except that the actual instance is not directly specified. Rather, the samples will all belong to the 'next' instance with **instance_handle** 'greater' than the specified 'previous_handle' that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the **DDS_-DataReader** (p. 783). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of FooDataReader_read_next_instance (p. 804) is 'as if' the DDS_DataReader (p. 783) invoked FooDataReader_read_instance (p. 800), passing the smallest instance_handle among all the ones that: (a) are greater than previous_handle, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value **DDS_HANDLE_NIL** (p. 460) is guaranteed to be 'less than' any valid instance_handle. So the use of the parameter value previous_handle == **DDS_HANDLE_NIL** (p. 460) will return the samples for the instance which has the smallest instance_handle among all the instances that contain available samples.

The operation FooDataReader_read_next_instance (p.804) is intended to be used in an application-driven iteration, where the application starts by passing previous_handle == DDS_HANDLE_NIL (p.460), examines the samples returned, and then uses the instance_handle returned in the DDS_SampleInfo (p. 1384) as the value of the previous_handle argument to the next call to FooDataReader_read_next_instance (p. 804). The iteration continues until FooDataReader_read_next_instance (p. 804) fails with the value DDS_RETCODE_NO_DATA (p. 122).

Note that it is possible to call the FooDataReader_read_next_instance

(p. 804) operation with a previous handle that does not correspond to an instance currently managed by the DDS_DataReader (p. 783). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the DDS_DataReader (p. 783). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a DDS_NOT_ALIVE_NO_WRITERS_-INSTANCE_STATE (p. 854) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance.

The behavior of the **FooDataReader_read_next_instance** (p. 804) operation follows the same rules as the **FooDataReader_read** (p. 788) operation regarding the pre-conditions and post-conditions for the received_data and sample_info. Similar to the **FooDataReader_read** (p. 788), the **FooDataReader_read_instance** (p. 800) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader_return_loan** (p. 811).

Similar to the **FooDataReader_read** (p. 788), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function will fail with DDS_RETCODE_NO_DATA (p. 122).

Parameters:

- self << in>> (p. 951) Cannot be NULL.
- info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).
- previous_handle <<iin>> (p. 951) The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL DDS_InstanceHandle_t (p. 452). The function will fail with DDS_RETCODE_BAD_-PARAMETER (p. 121) if it is NULL.

 $sample_states << in>> (p. 951)$ data samples matching ones of these sample_states are returned

 $view_states << in>> (p. 951)$ data samples matching ones of these view_state are returned

instance_states <<iin>>> (p. 951) data samples matching ones of these
instance_state are returned

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

4.92.6.8 DDS_ReturnCode_t FooDataReader_take_next_instance (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask instance_states)

Access a collection of data samples from the DDS_DataReader (p. 783).

This operation accesses a collection of data values from the **DDS_DataReader** (p. 783) and 'removes' them from the **DDS_DataReader** (p. 783).

This operation has the same behavior as FooDataReader_read_next_instance (p. 804), except that the samples are 'taken' from the DDS_DataReader (p. 783) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Similar to the operation FooDataReader_read_next_instance (p. 804), it is possible to call FooDataReader_take_next_instance (p. 806) with a previous_handle that does not correspond to an instance currently managed by the DDS_DataReader (p. 783).

The behavior of the FooDataReader_take_next_instance (p. 806) operation follows the same rules as the FooDataReader_read (p. 788) operation regarding the pre-conditions and post-conditions for the received_data and sample_info. Similar to the FooDataReader_read (p. 788), the FooDataReader_take_next_instance (p. 806) operation may 'loan' elements to the output collections, which must then be returned by means of FooDataReader_return_loan (p. 811).

Similar to the **FooDataReader_read** (p. 788), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function will fail with DDS_RETCODE_NO_DATA (p. 122).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

- info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- max_samples <<in>>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).
- previous_handle <<iin>> (p. 951) The 'next smallest' instance with
 a value greater than this value that has available samples will be
 returned. Must be a valid non-NULL DDS_InstanceHandle_t (p. 452). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- $sample_states << in>> (p. 951)$ data samples matching ones of these sample_states are returned
- $view_states << in>> (p. 951)$ data samples matching ones of these view_state are returned
- $instance_states << in>> (p. 951)$ data samples matching ones of these instance_state are returned

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

```
FooDataReader_take (p. 789)
DDS_LENGTH_UNLIMITED (p. 174)
```

4.92.6.9 DDS_ReturnCode_t FooDataReader_read_next_instance_w_condition (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_ReadCondition * condition)

Accesses via FooDataReader_read_next_instance (p. 804) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

This operation access a collection of data values from the **DDS_DataReader** (p. 783). The behavior is identical to **FooDataReader_read_next_instance** (p. 804), except that all samples returned satisfy the specified condition. In other words, on success, all returned samples belong to the same instance, and the instance is the instance with 'smallest' instance_handle among the ones that verify: (a) instance_handle >= previous_handle, and (b) have samples for which the specified **DDS_ReadCondition** (p. 842) evaluates to TRUE.

Similar to the operation FooDataReader_read_next_instance (p. 804), it is possible to call FooDataReader_read_next_instance_w_condition (p. 808) with a previous_handle that does not correspond to an instance currently managed by the DDS_DataReader (p. 783).

The behavior of the FooDataReader_read_next_instance_w_condition (p. 808) operation follows the same rules as the FooDataReader_read (p. 788) operation regarding the pre-conditions and post-conditions for the received_data and sample_info. Similar to the FooDataReader_read (p. 788), the FooDataReader_read_next_instance_w_condition (p. 808) operation may 'loan' elements to the output collections, which must then be returned by means of FooDataReader_return_loan (p. 811).

Similar to the FooDataReader_read (p. 788), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function will fail with DDS_RETCODE_NO_DATA (p. 122).

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).

previous_handle <<iin>> (p. 951) The 'next smallest' instance with
a value greater than this value that has available samples will be
returned. Must be a valid non-NULL DDS_InstanceHandle_t (p. 452). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

condition << in>> (p. 951) the DDS_ReadCondition (p. 842) to select samples of interest. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) DDS_RETCODE_NO_-DATA (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

FooDataReader_read_next_instance (p. 804) DDS_LENGTH_UNLIMITED (p. 174)

4.92.6.10 DDS_ReturnCode_t FooDataReader_take_next_instance_w_condition (FooDataReader * self, struct FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq, DDS_Long max_samples, const DDS_InstanceHandle_t * previous_handle, DDS_ReadCondition * condition)

Accesses via FooDataReader_take_next_instance (p. 806) the samples that match the criteria specified in the DDS_ReadCondition (p. 842).

This operation access a collection of data values from the **DDS_DataReader** (p. 783) and 'removes' them from the **DDS_DataReader** (p. 783).

The operation has the same behavior as **FooDataReader_read_next_-instance_w_condition** (p. 808), except that the samples are 'taken' from the **DDS_DataReader** (p. 783) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Similar to the operation FooDataReader_read_next_instance (p. 804), it is possible to call FooDataReader_take_next_instance_w_condition (p. 809) with a previous_handle that does not correspond to an instance currently managed by the DDS_DataReader (p. 783).

The behavior of the FooDataReader_take_next_instance_w_condition (p. 809) operation follows the same rules as the FooDataReader_read (p. 788) operation regarding the pre-conditions and post-conditions for the received_data and sample_info. Similar to the FooDataReader_read (p. 788), the FooDataReader_take_next_instance_w_condition (p. 809) operation may 'loan' elements to the output collections, which must then be returned by means of FooDataReader_return_loan (p. 811).

Similar to the **FooDataReader_read** (p. 788), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the DDS_DataReader (p. 783) has no samples that meet the constraints, the function will fail with DDS_RETCODE_NO_DATA (p. 122).

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

- info_seq <<inout>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info will be returned. Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- max_samples <<in>> (p. 951) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 174) is provided, as many samples will be returned as are available, up to the limits described in the documentation for Foo-DataReader_take() (p. 789).
- previous_handle <<in>> (p. 951) The 'next smallest' instance with a value greater than this value that has available samples will be returned. Must be a valid non-NULL DDS_InstanceHandle_t (p. 452). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.
- condition << in>> (p. 951) the DDS_ReadCondition (p. 842) to select samples of interest. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121), or DDS_RETCODE_NO_-DATA (p. 122), DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

FooDataReader_take_next_instance (p. 806) DDS_LENGTH_UNLIMITED (p. 174)

4.92.6.11 DDS_ReturnCode_t FooDataReader_return_loan (FooDataReader * self, FooSeq * received_data, struct DDS_SampleInfoSeq * info_seq)

Indicates to the **DDS_DataReader** (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 783).

This operation indicates to the **DDS_DataReader** (p. 783) that the application is done accessing the collection of received_data and info_seq obtained by some earlier invocation of read or take on the **DDS_DataReader** (p. 783).

The received_data and info_seq must belong to a single related "pair"; that is, they should correspond to a pair returned from a single call to read or take. The received_data and info_seq must also have been obtained from the same DDS_DataReader (p. 783) to which they are returned. If either of these conditions is not met, the operation will fail with DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

The operation FooDataReader_return_loan (p. 811) allows implementations of the read and take operations to "loan" buffers from the DDS_DataReader (p. 783) to the application and in this manner provide "zerocopy" access to the data. During the loan, the DDS_DataReader (p. 783) will guarantee that the data and sample-information are not modified.

It is not necessary for an application to return the loans immediately after the read or take calls. However, as these buffers correspond to internal resources inside the **DDS_DataReader** (p. 783), the application should not retain them indefinitely.

The use of FooDataReader_return_loan (p.811) is only necessary if the read or take calls "loaned" buffers to the application. This only occurs if the received_data and info_Seq collections had max_len=0 at the time read or take was called.

The application may also examine the "owns" property of the collection to determine where there is an outstanding loan. However, calling **FooDataReader_return_loan** (p. 811) on a collection that does not have a loan is safe and has no side effects.

If the collections had a loan, upon completion of **FooDataReader_return_-loan** (p. 811), the collections will have max_len=0.

Similar to read, this operation must be provided on the specialized class that is

generated for the particular application data-type that is being taken.

Parameters:

received_data <<in>> (p. 951) user data type-specific FooSeq (p. 1497) object where the received data samples was obtained from earlier invocation of read or take on the DDS_DataReader (p. 783). Must be a valid non-NULL FooSeq (p. 1497). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

self << in>> (p. 951) Cannot be NULL.

info_seq <<in>> (p. 951) a DDS_SampleInfoSeq (p. 1393) object where the received sample info was obtained from earlier invocation of read or take on the DDS_DataReader (p. 783). Must be a valid non-NULL DDS_SampleInfoSeq (p. 1393). The function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if it is NULL.

Returns:

One of the Standard Return Codes (p. 120), DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121) or DDS_RETCODE_NOT_-ENABLED (p. 121).

4.92.6.12 DDS_ReturnCode_t FooDataReader_get_key_value (FooDataReader * self, Foo * key_holder, const DDS_InstanceHandle_t * handle)

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the key inside the key_holder instance.

For keyed data types, this operation may fail with **DDS_RETCODE_BAD_-PARAMETER** (p. 121) if the handle does not correspond to an existing data-object known to the **DDS_DataReader** (p. 783).

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

key_holder <<inout>> (p. 951) a user data type specific key holder, whose key fields are filled by this operation. If Foo (p. 1494) has no key, this function has no effect. This function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if key_holder is NULL.

handle <<in>> (p. 951) the instance whose key is to be retrieved. If Foo (p. 1494) has a key, handle must represent an existing instance of type Foo (p. 1494) known to the DDS_DataReader (p. 783). Otherwise, this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121). If Foo (p. 1494) has a key and handle is DDS_HANDLE_NIL (p. 460), this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121). If Foo (p. 1494) has a key and handle represents an instance of another type or an instance of type Foo (p. 1494) that has been unregistered, this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121). If Foo (p. 1494) has no key, this function has no effect. This function will fail with DDS_RETCODE_BAD_PARAMETER (p. 121) if handle is NULL.

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_NOT_ENABLED (p. 121).

See also:

FooDataWriter_get_key_value (p. 691)

4.92.6.13 DDS_InstanceHandle_t FooDataReader_lookup_instance (FooDataReader * self, const Foo * key_holder)

Retrieve the instance handle that corresponds to an instance key_holder.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. This operation does not register the instance in question. If the instance has not been previously registered, or if for any other reason the Service is unable to provide an instance handle, the Service will return the special value HANDLE_NIL.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. key\_holder << in>> (p. 951) a user data type specific key holder.
```

Returns:

the instance handle associated with this instance. If Foo (p. 1494) has no key, this function has no effect and returns DDS_HANDLE_NIL (p. 460)

$\begin{array}{ccc} 4.92.6.14 & DDS_ReturnCode_t & DDS_- \\ & RequestedDeadlineMissedStatus_initialize \\ & (struct & DDS_RequestedDeadlineMissedStatus * \textit{self}) \end{array}$

Initializer for new status instances.

New DDS_RequestedDeadlineMissedStatus (p. 1352) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_RequestedDeadlineMissedStatus_finalize (p. 815) should be called to free the contained fields that use dynamic memory:

```
DDS_RequestedDeadlineMissedStatus *myStatus = malloc(sizeof(struct DDS_RequestedDeadlineMissedStatus));
DDS_RequestedDeadlineMissedStatus_initialize(myStatus);
...
DDS_RequestedDeadlineMissedStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

See also:

```
DDS_RequestedDeadlineMissedStatus_INITIALIZER (p. 779)
DDS_RequestedDeadlineMissedStatus_finalize (p. 815)
```

4.92.6.15 DDS_ReturnCode_t DDS_-

 $Requested Deadline Missed Status_copy \\ (struct DDS_Requested Deadline Missed Status**self*, \\ const struct DDS_Requested Deadline Missed Status**source)$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

$\begin{array}{ccc} 4.92.6.16 & DDS_ReturnCode_t & DDS_- \\ & RequestedDeadlineMissedStatus_finalize \\ & (struct & DDS_RequestedDeadlineMissedStatus * \textit{self}) \end{array}$

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

4.92.6.17 DDS_ReturnCode_t DDS_LivelinessChangedStatus_initialize (struct DDS_LivelinessChangedStatus * self)

Initializer for new status instances.

New **DDS_LivelinessChangedStatus** (p. 1250) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_LivelinessChangedStatus_finalize (p. 816) should be called to free the contained fields that use dynamic memory:

```
DDS_LivelinessChangedStatus *myStatus = malloc(sizeof(struct DDS_LivelinessChangedStatus));
DDS_LivelinessChangedStatus_initialize(myStatus);
...
DDS_LivelinessChangedStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

See also:

```
DDS_LivelinessChangedStatus_INITIALIZER (p. 779)
DDS_LivelinessChangedStatus_finalize (p. 816)
```

$\begin{array}{lll} 4.92.6.18 & DDS_ReturnCode_t \ DDS_LivelinessChangedStatus_copy \\ & (struct \ DDS_LivelinessChangedStatus * \textit{self}, \ const \ struct \ DDS_LivelinessChangedStatus * \textit{source}) \end{array}$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

4.92.6.19 DDS_ReturnCode_t DDS_LivelinessChangedStatus_finalize (struct DDS_LivelinessChangedStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

$\begin{array}{ccc} 4.92.6.20 & DDS_ReturnCode_t & DDS_-\\ & RequestedIncompatibleQosStatus_initialize\\ & (struct & DDS_RequestedIncompatibleQosStatus * \textit{self}) \end{array}$

Initializer for new status instances.

New DDS_RequestedIncompatibleQosStatus (p. 1354) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_RequestedIncompatibleQosStatus_finalize (p. 817) should be called to free the contained fields that use dynamic memory:

```
DDS_RequestedIncompatibleQosStatus *myStatus = malloc(sizeof(struct DDS_RequestedIncompatibleQosStatus));
DDS_RequestedIncompatibleQosStatus_initialize(myStatus);
...
DDS_RequestedIncompatibleQosStatus_finalize(myStatus);
free(myStatus);
```

See also:

```
DDS_RequestedIncompatibleQosStatus_INITIALIZER (p. 780)
DDS_RequestedIncompatibleQosStatus_finalize (p. 817)
```

4.92.6.21 DDS_ReturnCode_t DDS_-

 $Requested Incompatible QosStatus_copy\\ (struct DDS_Requested Incompatible QosStatus*self,\\ const struct DDS_Requested Incompatible QosStatus*source)$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self \ll in > (p. 951) Cannot be NULL. source \ll in > (p. 951). Status to be copied from.
```

4.92.6.22 DDS_ReturnCode_t DDS_-RequestedIncompatibleQosStatus_finalize

 $(\text{struct DDS_RequestedIncompatibleQosStatus} * \textit{self})$

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

```
self \ll in >> (p. 951) Cannot be NULL.
```

4.92.6.23 DDS_ReturnCode_t DDS_SampleLostStatus_initialize (struct DDS_SampleLostStatus * self)

Initializer for new status instances.

New DDS_SampleLostStatus (p. 1394) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_RequestedIncompatibleQosStatus_finalize (p. 817) should be called to free the contained fields that use dynamic memory:

```
DDS_SampleLostStatus *myStatus = malloc(sizeof(struct DDS_SampleLostStatus));
DDS_SampleLostStatus_initialize(myStatus);
...
DDS_SampleLostStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

See also:

```
DDS_SampleLostStatus_INITIALIZER (p. 780)
DDS_SampleLostStatus_finalize (p. 818)
```

4.92.6.24 DDS_ReturnCode_t DDS_SampleLostStatus_copy (struct DDS_SampleLostStatus * self, const struct DDS_SampleLostStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

4.92.6.25 DDS_ReturnCode_t DDS_SampleLostStatus_finalize (struct DDS_SampleLostStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

4.92.6.26 DDS_ReturnCode_t DDS_SampleRejectedStatus_initialize (struct DDS_SampleRejectedStatus * self)

Initializer for new status instances.

New DDS_SampleRejectedStatus (p. 1395) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_RequestedIncompatibleQosStatus_finalize (p. 817) should be called to free the contained fields that use dynamic memory:

```
DDS_SampleRejectedStatus *myStatus = malloc(sizeof(struct DDS_SampleRejectedStatus));
DDS_SampleRejectedStatus_initialize(myStatus);
...
DDS_SampleRejectedStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

See also:

```
DDS_SampleRejectedStatus_INITIALIZER (p. 781)
DDS_SampleRejectedStatus_finalize (p. 820)
```

4.92.6.27 DDS_ReturnCode_t DDS_SampleRejectedStatus_copy (struct DDS_SampleRejectedStatus * self, const struct DDS_SampleRejectedStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

4.92.6.28 DDS_ReturnCode_t DDS_SampleRejectedStatus_finalize (struct DDS_SampleRejectedStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in \gg (p. 951) Cannot be NULL.
```

$\begin{array}{lll} 4.92.6.29 & DDS_ReturnCode_t \ DDS_SubscriptionMatchedStatus_initialize \ (struct \ DDS_SubscriptionMatchedStatus * \\ & self) \end{array}$

Initializer for new status instances.

New **DDS_SubscriptionMatchedStatus** (p. 1420) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_RequestedIncompatibleQosStatus_finalize (p. 817) should be called to free the contained fields that use dynamic memory:

```
DDS_SubscriptionMatchedStatus *myStatus = malloc(sizeof(struct DDS_SubscriptionMatchedStatus));
DDS_SubscriptionMatchedStatus_initialize(myStatus);
...
DDS_SubscriptionMatchedStatus_finalize(myStatus);
free(myStatus);
```

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

See also:

```
DDS_SubscriptionMatchedStatus_INITIALIZER (p. 781)
DDS_SubscriptionMatchedStatus_finalize (p. 821)
```

 $\begin{array}{lll} 4.92.6.30 & DDS_ReturnCode_t \ DDS_SubscriptionMatchedStatus_-\\ & copy \ (struct \ DDS_SubscriptionMatchedStatus * \textit{self},\\ & const \ struct \ DDS_SubscriptionMatchedStatus * \textit{source}) \end{array}$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

4.92.6.31 DDS_ReturnCode_t DDS_SubscriptionMatchedStatus_finalize (struct DDS_SubscriptionMatchedStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

```
self << in>> (p. 951) Cannot be NULL.
```

4.92.6.32 DDS_ReturnCode_t DDS_DataReaderCacheStatus_initialize (struct DDS_DataReaderCacheStatus * self)

Initializer for new status instances.

New **DDS_DataReaderCacheStatus** (p. 1064) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_DataReaderCacheStatus_finalize (p. 823) should be called to free the contained fields that use dynamic memory:

```
DDS_DataReaderCacheStatus *myStatus = malloc(sizeof(struct DDS_DataReaderCacheStatus));
DDS_DataReaderCacheStatus_initialize(myStatus);
DDS_DataReader_get_datareader_cache_status(myDataReader, myStatus);
DDS_DataReaderCacheStatus_finalize(myStatus);
free(myStatus);
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataReader_get_datareader_cache_status (p. 835)
DDS_DataReaderCacheStatus_finalize (p. 823)
```

$\begin{array}{lll} 4.92.6.33 & DDS_ReturnCode_t \ DDS_DataReaderCacheStatus_copy \\ & (struct \ DDS_DataReaderCacheStatus * \textit{self}, \ const \ struct \ DDS_DataReaderCacheStatus * \textit{source}) \end{array}$

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataReaderCacheStatus_INITIALIZER (p. 781)
DDS_DataReaderCacheStatus_initialize (p. 822)
DDS_DataReaderCacheStatus_finalize (p. 823)
```

4.92.6.34 DDS_ReturnCode_t DDS_DataReaderCacheStatus_finalize (struct DDS_DataReaderCacheStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataReaderCacheStatus_INITIALIZER (p. 781)
DDS_DataReaderCacheStatus_initialize (p. 822)
```

$\begin{array}{lll} 4.92.6.35 & DDS_ReturnCode_t \ DDS_DataReaderProtocolStatus_initialize \ (struct \ DDS_DataReaderProtocolStatus * \\ & self) \end{array}$

Initializer for new status instances.

New DDS_DataReaderProtocolStatus (p.1073) instance on heap should be initialized with this function before they are passed to any function. This step ensures that those contained fields that use dynamic memory are properly initialized. This function does not allocate memory.

DDS_DataReaderProtocolStatus_finalize (p. 824) should be called to free the contained fields that use dynamic memory:

```
DDS_DataReaderProtocolStatus *myStatus = malloc(sizeof(struct DDS_DataReaderProtocolStatus));
DDS_DataReaderProtocolStatus_initialize(myStatus);
DDS_DataReader_get_datareader_protocol_status(myDataReader, myStatus);
DDS_DataReaderProtocolStatus_finalize(myStatus);
free(myStatus);
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataReader_get_datareader_protocol_status (p. 835)
DDS_DataReaderProtocolStatus_finalize (p. 824)
```

4.92.6.36 DDS_ReturnCode_t DDS_DataReaderProtocolStatus_copy (struct DDS_DataReaderProtocolStatus * self, const struct DDS_DataReaderProtocolStatus * source)

Copy the contents of the given status into this status.

Status instances can use dynamic memory because of the sequences contained in some status. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
DDS_DataReaderProtocolStatus_INITIALIZER (p. 782)
DDS_DataReaderProtocolStatus_initialize (p. 823)
DDS_DataReaderProtocolStatus_finalize (p. 824)
```

4.92.6.37 DDS_ReturnCode_t DDS_DataReaderProtocolStatus_finalize (struct DDS_DataReaderProtocolStatus * self)

Free any dynamic memory allocated by status instances.

some status may use dynamic memory (regardless of whether the status itself is in dynamic memory). This function frees that memory but otherwise leaves this status unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

Note that if this status instance is stored in heap memory, calling this function will *not* call free() on it; the user is responsible for explicitly freeing any heap-based status instance after calling this function.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

See also:

```
DDS_DataReaderProtocolStatus_INITIALIZER (p. 782)
DDS_DataReaderProtocolStatus_initialize (p. 823)
```

$\begin{array}{lll} \textbf{4.92.6.38} & \textbf{DDS_ReturnCode_t DDS_DataReaderQos_initialize} \\ & (\textbf{struct DDS_DataReaderQos} * \textit{self}) \end{array}$

Initializer for new QoS instances.

New DDS_DataReaderQos (p. 1083) instances on heap should be initialized with this function before they are passed to any function. This step ensures that those contained QoS policies that use dynamic memory are properly initialized. This function does not allocate memory.

Calling this function is not a substitute for calling DDS_DataReader_get_qos (p. 838) or DDS_DomainParticipant_get_default_datareader_qos (p. 354); one of those should be called subsequently to setting the QoS of any new or existing entity. DDS_DataReaderQos_finalize (p. 826) should be called to free the contained QoS policies that use dynamic memory:

```
DDS_DataReaderQos *myQos = malloc(sizeof(struct DDS_DataReaderQos));
DDS_DataReaderQos_initialize(myQos);
DDS_DomainParticipantFactory_get_default_datareader_qos(myFactory, myQos);
DDS_DataReaderQos_set_qos(myDataReader, myQos);
DDS_DataReaderQos_finalize(myQos);
free(myQos);
```

```
self \ll in >> (p. 951) Cannot be NULL.
```

See also:

```
\begin{array}{l} \mathbf{DDS\_DataReaderQos\_INITIALIZER}~(p.~782) \\ \mathbf{DDS\_DomainParticipant\_get\_default\_datareader\_qos}~(p.~354) \\ \mathbf{DDS\_DataReaderQos\_finalize}~(p.~826) \end{array}
```

4.92.6.39 DDS_ReturnCode_t DDS_DataReaderQos_copy (struct DDS_DataReaderQos * self, const struct DDS_DataReaderQos * source)

Copy the contents of the given QoS into this QoS.

DDS_DataReaderQos (p. 1083) instances can use dynamic memory because of the sequences contained in some QoS policies. A shallow copy by assignment is therefore unsafe. This function performs a deep-copy, allocating memory if necessary.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. source << in>> (p. 951). Status to be copied from.
```

4.92.6.40 DDS_ReturnCode_t DDS_DataReaderQos_finalize (struct DDS_DataReaderQos * self)

Free any dynamic memory allocated by the policies in this **DDS**_-**DataReaderQos** (p. 1083).

Some QoS policies may use dynamic memory (regardless of whether the QoS itself is in dynamic memory). This function frees that memory but otherwise leaves this QoS unchanged. It should be called on all instances before they are freed (or, in the case of stack-based instances, before they go out of scope).

This function does not leave this object in an invalid state. It is permissable to clear a QoS and then subsequently allocate new dynamic memory in one or more of its QoS policies.

Note that if this QoS instance is stored in heap memory, calling this function will not call free() on it; the user is responsible for explicitly freeing any heap-based QoS instance after calling this function.

```
self << in>> (p. 951) Cannot be NULL.
```

4.92.6.41 DDS_Entity* DDS_DataReader_as_entity (DDS_DataReader * dataReader)

Accesses the **DDS_DataReader** (p. 783)'s supertype instance.

Parameters:

dataReader << in>> (p. 951) Cannot be NULL.

4.92.6.42 DDS_ReadCondition* DDS_DataReader_create_readcondition (DDS_DataReader * self,
DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask
instance_states)

Creates a DDS_ReadCondition (p. 842).

The returned **DDS_ReadCondition** (p. 842) will be attached and belong to the **DDS_DataReader** (p. 783).

Parameters:

self << in>> (p. 951) Cannot be NULL.

 $sample_states <<$ in>> (p. 951) sample state of the data samples that are of interest

 $view_states << in>> (p. 951)$ view state of the data samples that are of interest

 $instance_states << in>> (p. 951)$ instance state of the data samples that are of interest

Returns:

return **DDS_ReadCondition** (p. 842) created. Returns NULL in case of failure.

4.92.6.43 DDS_QueryCondition* DDS_DataReader_create_querycondition (DDS_DataReader * self,
DDS_SampleStateMask sample_states, DDS_ViewStateMask view_states, DDS_InstanceStateMask
instance_states, const char * query_expression, const
struct DDS_StringSeq * query_parameters)

Creates a DDS_QueryCondition (p. 845).

The returned **DDS_QueryCondition** (p. 845) will be attached and belong to the **DDS_DataReader** (p. 783).

Queries and Filters Syntax (p.957) describes the syntax of query_expression and query_parameters.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $sample_states << in>> (p. 951)$ sample state of the data samples that are of interest

view_states <<in>>> (p. 951) view state of the data samples that are of interest

 $instance_states << in>> (p. 951)$ instance state of the data samples that are of interest

 $query_expression << in>> (p. 951)$ Expression for the query. Cannot be NULL.

query_parameters <<in>>> (p. 951) Parameters for the query expression. Cannot be NULL.

Returns:

NULL

4.92.6.44 DDS_ReturnCode_t DDS_DataReader_delete_readcondition (DDS_DataReader * self, DDS_ReadCondition * condition)

Deletes a DDS_ReadCondition (p. 842) or DDS_QueryCondition (p. 845) attached to the DDS_DataReader (p. 783).

Since DDS_QueryCondition (p. 845) specializes DDS_ReadCondition (p. 842), it can also be used to delete a DDS_QueryCondition (p. 845).

Precondition:

The DDS_ReadCondition (p. 842) must be attached to the DDS_DataReader (p. 783), or the operation will fail with the error DDS_RETCODE_PRECONDITION_NOT_MET (p. 121).

```
self << in>> (p. 951) Cannot be NULL. condition << in>> (p. 951) Condition to be deleted.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121)

4.92.6.45 DDS_ReturnCode_t DDS_DataReader_delete_contained_entities (DDS_DataReader * self)

Deletes all the entities that were created by means of the "create" operations on the **DDS_DataReader** (p. 783).

Deletes all contained **DDS_ReadCondition** (p. 842) and **DDS_-QueryCondition** (p. 845) objects.

The operation will fail with DDS_RETCODE_PRECONDITION_NOT_-MET (p. 121) if the any of the contained entities is in a state where it cannot be deleted.

Once DDS_DataReader_delete_contained_entities (p. 829) completes successfully, the application may delete the DDS_DataReader (p. 783), knowing that it has no contained DDS_ReadCondition (p. 842) and DDS_QueryCondition (p. 845) objects.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121)

4.92.6.46 DDS_ReturnCode_t DDS_DataReader_wait_for_historical_data (DDS_DataReader * self, const struct DDS_Duration_t * max_wait)

Waits until all "historical" data is received for **DDS_DataReader** (p. 783) entities that have a non-VOLATILE PERSISTENCE Qos kind.

This operation is intended only for DDS_DataReader (p. 783) entities that have a non-VOLATILE PERSISTENCE QoS kind.

As soon as an application enables a non-VOLATILE **DDS_DataReader** (p. 783), it will start receiving both "historical" data, i.e. the data that was written prior to the time the **DDS_DataReader** (p. 783) joined the domain, as well as any new data written by the **DDS_DataWriter** (p. 673) entities.

There are situations where the application logic may require the application to wait until all "historical" data is received. This is the purpose of the **DDS_-DataReader_wait_for_historical_data** (p. 829) operations.

The operation DDS_DataReader_wait_for_historical_data (p. 829) blocks the calling thread until either all "historical" data is received, or else duration specified by the max_wait parameter clapses, whichever happens first. A successful completion indicates that all the "historical" data was "received"; timing out indicates that max_wait elapsed before all the data was received.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. max\_wait << in>> (p. 951) Timeout value. Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-TIMEOUT (p. 122) or DDS_RETCODE_NOT_ENABLED (p. 121).
```

```
4.92.6.47 DDS_ReturnCode_t DDS_DataReader_get_matched_publications (DDS_DataReader * self, struct DDS_InstanceHandleSeq * publication_handles)
```

Retrieve the list of publications currently "associated" with this **DDS**_-**DataReader** (p. 783).

Matching publications are those in the same domain that have a matching DDS_Topic (p. 425), compatible QoS common partition that the DDS_DomainParticipant (p. 339) has not indicated should be "ignored" by means of the DDS_DomainParticipant_ignore_publication (p. 392) operation.

The handles returned in the publication_handles' list are the ones that are used by the DDS implementation to locally identify the corresponding matched **DDS_DataWriter** (p. 673) entities. These handles match the ones that appear in the instance_handle field of the **DDS_SampleInfo** (p. 1384) when reading the **DDS_PUBLICATION_TOPIC_NAME** (p. 26) builtin topic

Parameters:

```
self << in>> (p. 951) Cannot be NULL. publication\_handles inout.
```

The sequence will be grown if the sequence has ownership and the system has the corresponding resources. Use a sequence without ownership to avoid dynamic memory allocation. If the sequence is too small to store all the matches and

the system can not resize the sequence, this function will fail with DDS_-RETCODE_OUT_OF_RESOURCES (p. 121).

The maximum number of matches possible is configured with **DDS_-DomainParticipantResourceLimitsQosPolicy** (p. 1162). You can use a zero-maximum sequence without ownership to quickly check whether there are any matches without allocating any memory. Cannot be NULL..

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-OUT_OF_RESOURCES (p. 121) if the sequence is too small and the system can not resize it, or DDS_RETCODE_NOT_ENABLED (p. 121)

4.92.6.48 DDS_ReturnCode_t DDS_DataReader_get_matched_publication_data (DDS_DataReader * self, struct DDS_PublicationBuiltinTopicData * publication_data, const DDS_InstanceHandle_t * publication_handle)

This operation retrieves the information on a publication that is currently "associated" with the **DDS_DataReader** (p. 783).

Publication with a matching **DDS_Topic** (p. 425), compatible QoS and common partition that the application has not indicated should be "ignored" by means of the **DDS_DomainParticipant_ignore_publication** (p. 392) operation.

The publication_handle must correspond to a publication currently associated with the DDS_DataReader (p. 783). Otherwise, the operation will fail with DDS_RETCODE_BAD_PARAMETER (p. 121). Use the operation DDS_DataReader_get_matched_publications (p. 830) to find the publications that are currently matched with the DDS_DataReader (p. 783).

Note: This operation does not retrieve the following information in **DDS_-PublicationBuiltinTopicData** (p. 1313):

- ^ DDS_PublicationBuiltinTopicData::type_code (p. 1318)
- ^ DDS_PublicationBuiltinTopicData::property (p. 1319)

The above information is available through DDS_DataReaderListener::on_data_available() (p. 1067) (if a reader listener is installed on the DDS_PublicationBuiltinTopicDataDataReader (p. 26)).

```
self \ll in >> (p. 951) Cannot be NULL.
```

publication_data <<inout>> (p. 951). The information to be filled in on the associated publication. Cannot be NULL.

publication_handle <<in>>> (p. 951). Handle to a specific publication
associated with the DDS_DataWriter (p. 673). Cannot be NULL..
Must correspond to a publication currently associated with the DDS_DataReader (p. 783).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_NOT_ENABLED (p. 121)

4.92.6.49 DDS_TopicDescription* DDS_DataReader_-get_topicdescription (DDS_DataReader * self)

Returns the **DDS_TopicDescription** (p. 425) associated with the **DDS_DataReader** (p. 783).

Returns that same **DDS_TopicDescription** (p. 425) that was used to create the **DDS_DataReader** (p. 783).

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

DDS_TopicDescription (p. 425) associated with the DDS_DataReader (p. 783).

4.92.6.50 DDS_Subscriber* DDS_DataReader_get_subscriber (DDS_DataReader * self)

Returns the **DDS_Subscriber** (p. 743) to which the **DDS_DataReader** (p. 783) belongs.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

Returns:

DDS_Subscriber (p. 743) to which the **DDS_DataReader** (p. 783) belongs.

4.92.6.51 DDS_ReturnCode_t DDS_DataReader_get_sample_rejected_status (DDS_DataReader * self, struct DDS_SampleRejectedStatus * status)

Accesses the DDS_SAMPLE_REJECTED_STATUS (p. 130) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. status << inout>> (p. 951) DDS_SampleRejectedStatus (p. 1395) to be filled in. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.92.6.52 DDS_ReturnCode_t DDS_DataReader_get_liveliness_-changed_status (DDS_DataReader * self, struct DDS_LivelinessChangedStatus * status)

Accesses the $\mathbf{DDS_LIVELINESS_CHANGED_STATUS}$ (p. 131) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_LivelinessChangedStatus (p. 1250) to be filled in. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.92.6.53 DDS_ReturnCode_t DDS_DataReader_get_requested_deadline_missed_status (DDS_DataReader * self, struct DDS_RequestedDeadlineMissedStatus * status)

Accesses the **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 129) communication status.

```
self \ll in >> (p. 951) Cannot be NULL.
```

status << inout>> (p. 951) DDS_RequestedDeadlineMissedStatus (p. 1352) to be filled in. Cannot be NULL.

Returns:

One of the Standard Return Codes (p. 120)

4.92.6.54 DDS_ReturnCode_t DDS_DataReader_get_requested_incompatible_qos_status (DDS_DataReader * self, struct DDS_RequestedIncompatibleQosStatus * status)

Accesses the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 129) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_RequestedIncompatibleQosStatus (p. 1354) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

4.92.6.55 DDS_ReturnCode_t DDS_DataReader_get_subscription_matched_status (DDS_DataReader * self, struct DDS_SubscriptionMatchedStatus * status)

Accesses the DDS_SUBSCRIPTION_MATCHED_STATUS (p. 132) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_SubscriptionMatchedStatus (p. 1420) to be filled in. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120)

4.92.6.56 DDS_ReturnCode_t DDS_DataReader_get_sample_lost_status (DDS_DataReader * self, struct DDS_SampleLostStatus * status)

Accesses the $\mathbf{DDS_SAMPLE_LOST_STATUS}$ (p. 130) communication status.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. status << inout>> (p. 951) DDS_SampleLostStatus (p. 1394) to be filled in. Cannot be NULL.
```

Returns:

One of the Standard Return Codes (p. 120)

 $\begin{array}{lll} 4.92.6.57 & DDS_ReturnCode_t \ DDS_DataReader_get_datareader_\\ & cache_status \ (DDS_DataReader * \textit{self}, \ \ struct \\ & DDS_DataReaderCacheStatus * \textit{status}) \end{array}$

<< eXtension>> (p. 950) Get the datareader cache status for this reader.

Parameters:

```
 \begin{array}{l} \textit{self} <<\!\!in\!\!>> (\text{p. 951}) \text{ Cannot be NULL.} \\ \textit{status} <<\!\!inout\!\!>> (\text{p. 951}) \text{ DDS\_DataReaderCacheStatus (p. 1064)} \\ \text{to be filled in. Cannot be NULL.} \end{array}
```

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-NOT_ENABLED (p. 121).

 $\begin{array}{lll} 4.92.6.58 & DDS_ReturnCode_t \ DDS_DataReader_get_datareader_protocol_status \ (DDS_DataReader * \textit{self}, \ struct \\ & DDS_DataReaderProtocolStatus * \textit{status}) \end{array}$

<<eXtension>> (p. 950) Get the datareader protocol status for this reader.

```
self << in>> (p. 951) Cannot be NULL. 
 status << inout>> (p. 951) DDS_DataReaderProtocolStatus (p. 1073) to be filled in. Cannot be NULL.
```

Returns:

One of the **Standard Return Codes** (p. 120) or **DDS_RETCODE_-NOT_ENABLED** (p. 121).

4.92.6.59 DDS_ReturnCode_t DDS_DataReader_get_matched_publication_datareader_protocol_status
(DDS_DataReader * self, struct DDS_DataReaderProtocolStatus * status, const
DDS_InstanceHandle_t * publication_handle)

<<eXtension>> (p. 950) Get the datareader protocol status for this reader, per matched publication identified by the publication_handle.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

status << inout>> (p. 951). The information to be filled in on the associated publication. Cannot be NULL.

publication_handle <<in>>> (p. 951). Handle to a specific publication
associated with the DDS_DataWriter (p. 673). Cannot be NULL..
Must correspond to a publication currently associated with the DDS_DataReader (p. 783).

Returns:

One of the Standard Return Codes (p. 120) or DDS_RETCODE_-NOT_ENABLED (p. 121)

 $\begin{array}{lll} \textbf{4.92.6.60} & \textbf{DDS_ReturnCode_t DDS_DataReader_set_qos} \\ & (\textbf{DDS_DataReader} * \textit{self}, & \textbf{const struct} \\ & \textbf{DDS_DataReaderQos} * \textit{qos}) \end{array}$

Sets the reader QoS.

This operation modifies the QoS of the DDS_DataReader (p. 783).

The DDS_DataReaderQos::user_data (p. 1086), DDS_DataReaderQos::deadline (p. 1085), DDS_DataReaderQos::latency_budget (p. 1085), DDS_DataReaderQos::time_based_filter (p. 1086), DDS_DataReaderQos::reader_data_lifecycle (p. 1086) can be changed. The other policies are immutable.

Parameters:

```
self \ll in >> (p. 951) Cannot be NULL.
```

qos <<in>> (p. 951) The DDS_DataReaderQos (p. 1083) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDS_DataReader (p. 783) is enabled. The special value DDS_DATAREADER_QOS_DEFAULT (p. 765) can be used to indicate that the QoS of the DDS_DataReader (p. 783) should be changed to match the current default DDS_DataReaderQos (p. 1083) set in the DDS_Subscriber (p. 743). Cannot be NULL.

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122).
```

See also:

```
DDS_DataReaderQos (p. 1083) for rules on consistency among QoS set_qos (abstract) (p. 243)
DDS_DataReader_set_qos (p. 836)
Operations Allowed in Listener Callbacks (p. 1248)
```

4.92.6.61 DDS_ReturnCode_t DDS_DataReader_set_qos_with_profile (DDS_DataReader * self, const char * library_name, const char * profile_name)

<< eXtension>> (p. 950) Change the QoS of this reader using the input XML QoS profile.

This operation modifies the QoS of the **DDS_DataReader** (p. 783).

The DDS_DataReaderQos::user_data (p. 1086), DDS_DataReaderQos::latency_budget (p. 1085), DDS_DataReaderQos::latency_budget (p. 1085), DDS_DataReaderQos::time_based_filter (p. 1086), DDS_DataReaderQos::reader_data_lifecycle (p. 1086) can be changed. The other policies are immutable.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

library_name <<in>>> (p. 951)
Library name containing the XML QoS profile. If library_name is null RTI Data Distribution Service will use the default library (see DDS_Subscriber_set_default_library (p. 763)).

profile_name <<in>>> (p. 951) XML QoS Profile name. If profile_name
is null RTI Data Distribution Service will use the default profile (see
DDS_Subscriber_set_default_profile (p. 761)).

Returns:

```
One of the Standard Return Codes (p. 120), DDS_RETCODE_-IMMUTABLE_POLICY (p. 121), or DDS_RETCODE_-INCONSISTENT_POLICY (p. 122).
```

See also:

```
DDS_DataReaderQos (p. 1083) for rules on consistency among QoS DDS_DataReader_set_qos (p. 836) Operations Allowed in Listener Callbacks (p. 1248)
```

```
 \begin{array}{lll} \textbf{4.92.6.62} & \textbf{DDS\_ReturnCode\_t DDS\_DataReader\_get\_qos} \\ & (\textbf{DDS\_DataReader} * \textit{self}, \; \text{struct DDS\_DataReaderQos} * \\ & \textit{qos}) \end{array}
```

Gets the reader QoS.

This function may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. qos << inout>> (p. 951) The DDS_DataReaderQos (p. 1083) to be filled up. Cannot be NULL.
```

Returns:

```
One of the Standard Return Codes (p. 120)
```

See also:

```
get_qos (abstract) (p. 244)
```

4.92.6.63 DDS_ReturnCode_t DDS_DataReader_set_listener (DDS_DataReader * self, const struct DDS_DataReaderListener * l, DDS_StatusMask mask)

Sets the reader listener.

Parameters:

```
self << in>> (p. 951) Cannot be NULL. l << in>> (p. 951) DDS_DataReaderListener (p. 1065) to set to mask << in>> (p. 951) DDS_StatusMask (p. 127) associated with the DDS_DataReaderListener (p. 1065). The callback function on the listener cannot be NULL if the corresponding status is turned on in the mask.
```

Returns:

One of the **Standard Return Codes** (p. 120)

See also:

```
set_listener (abstract) (p. 244)
```

4.92.6.64 struct DDS_DataReaderListener DDS_DataReader_get_listener (DDS_DataReader * self) [read]

Get the reader listener.

Parameters:

```
self << in>> (p. 951) Cannot be NULL.
```

Returns:

```
DDS_DataReaderListener (p. 1065) of the DDS_DataReader (p. 783).
```

See also:

```
\begin{array}{l} \mathbf{DDS\_DataReader\_get\_listenerX} \ (\mathrm{p.\,839}) \\ \mathbf{get\_listener} \ (\mathbf{abstract}) \ (\mathrm{p.\,245}) \end{array}
```

$\begin{array}{lll} \textbf{4.92.6.65} & \textbf{DDS_ReturnCode_t DDS_DataReader_get_listenerX (DDS_DataReader * \textit{self}, & struct \\ & \textbf{DDS_DataReaderListener} * \textit{listener}) \end{array}$

```
<< eXtension>> (p. 950) Get the reader listener.
```

An alternative form of get_listener that fills in an existing listener structure rather than returning one on the stack.

```
self \ll in >> (p. 951) Cannot be NULL.
```

 $\label{eq:listener} \begin{array}{ll} \textit{listener} <<\!\!\textit{inout}>> (p.\,951) \ \ \textbf{DDS_DataReaderListener} \ \ (p.\,1065) \\ \text{structure to be filled up. Cannot be NULL.} \end{array}$

Returns:

One of the Standard Return Codes (p. 120)

See also:

DDS_DataReader_get_listener (p. 839) get_listener (abstract) (p. 245)

4.93 Read Conditions

DDS_ReadCondition (p. 842) and associated elements

Typedefs

^ typedef struct DDS_ReadConditionImpl DDS_ReadCondition

<<iinterface>> (p. 950) Conditions specifically dedicated to read operations and attached to one DDS_DataReader (p. 783).

Functions

Accesses a DDS_ReadCondition (p. 842)'s supertype instance.

^ DDS_SampleStateMask DDS_ReadCondition_get_sample_state_mask (DDS_ReadCondition *self)

Retrieves the set of sample_states for the condition.

^ DDS_ViewStateMask DDS_ReadCondition_get_view_state_mask (DDS_ReadCondition *self)

Retrieves the set of view_states for the condition.

Retrieves the set of instance_states for the condition.

^ DDS_DataReader * DDS_ReadCondition_get_datareader (DDS_ReadCondition *self)

Returns the DDS_DataReader (p. 783) associated with the DDS_ReadCondition (p. 842).

4.93.1 Detailed Description

DDS_ReadCondition (p. 842) and associated elements

4.93.2 Typedef Documentation

4.93.2.1 typedef struct DDS_ReadConditionImpl DDS_ReadCondition

<< interface>> (p. 950) Conditions specifically dedicated to read operations and attached to one DDS_DataReader (p. 783).

DDS_ReadCondition (p. 842) objects allow an application to specify the data samples it is interested in (by specifying the desired sample_states, view_states as well as instance_states in FooDataReader_read (p. 788) and FooDataReader_take (p. 789) variants.

This allows RTI Data Distribution Service to enable the condition only when suitable information is available. They are to be used in conjunction with a WaitSet as normal conditions.

More than one **DDS_ReadCondition** (p. 842) may be attached to the same **DDS_DataReader** (p. 783).

Note: If you are using a ReadCondition simply to detect the presence of new data, consider using a **DDS_StatusCondition** (p. 253) with the DATA_AVAILABLE_STATUS instead, which will perform better in this situation.

4.93.3 Function Documentation

4.93.3.1 DDS_Condition* DDS_ReadCondition_as_condition (DDS_ReadCondition * read_condition)

Accesses a DDS_ReadCondition (p. 842)'s supertype instance.

Parameters:

 $read_condition << in>> (p. 951)$ Cannot be NULL.

4.93.3.2 DDS_SampleStateMask DDS_ReadCondition_get_sample_state_mask (DDS_ReadCondition * self)

Retrieves the set of sample_states for the condition.

Parameters:

 $self \ll in >> (p. 951)$ Cannot be NULL.

4.93.3.3 DDS_ViewStateMask DDS_ReadCondition_get_view_state_mask (DDS_ReadCondition *self)

Retrieves the set of view_states for the condition.

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

4.93.3.4 DDS_InstanceStateMask DDS_ReadCondition_get_instance_state_mask (DDS_ReadCondition * self)

Retrieves the set of instance_states for the condition.

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

 $\begin{array}{ll} \textbf{4.93.3.5} & \textbf{DDS_DataReader} * \textbf{DDS_ReadCondition_get_datareader} \\ & (\textbf{DDS_ReadCondition} * \textit{self}) \end{array}$

Returns the $DDS_DataReader$ (p. 783) associated with the $DDS_ReadCondition$ (p. 842).

There is exactly one **DDS_DataReader** (p. 783) assicated with each **DDS_ReadCondition** (p. 842).

Parameters:

$$self << in>> (p. 951)$$
 Cannot be NULL.

Returns:

DDS_DataReader (p. 783) associated with the DDS_ReadCondition (p. 842).

4.94 Query Conditions

DDS_QueryCondition (p. 845) and associated elements

Typedefs

^ typedef struct DDS_QueryConditionImpl **DDS_QueryCondition**

<<iinterface>> (p.950) These are specialised DDS_ReadCondition (p.842) objects that allow the application to also specify a filter on the locally available data.

Functions

^ DDS_ReadCondition * DDS_QueryCondition_as_readcondition (DDS_QueryCondition *query_condition)

Access a DDS_QueryCondition (p. 845)'s supertype instance.

^ const char * DDS_QueryCondition_get_query_expression (DDS_-QueryCondition *self)

Retrieves the query expression.

Retrieves the query parameters.

^ DDS_ReturnCode_t DDS_QueryCondition_set_query_parameters (DDS_QueryCondition *self, const struct DDS_-StringSeq *query_parameters)

Sets the query parameters.

4.94.1 Detailed Description

DDS_QueryCondition (p. 845) and associated elements

4.94.2 Typedef Documentation

4.94.2.1 typedef struct DDS_QueryConditionImpl DDS_QueryCondition

<< interface>> (p. 950) These are specialised DDS_ReadCondition (p. 842) objects that allow the application to also specify a filter on the locally available data.

Each query condition filter is composed of a **DDS_ReadCondition** (p. 842) state filter and a content filter expressed as a query_expression and query_parameters.

The query (query_expression) is similar to an SQL WHERE clause and can be parameterised by arguments that are dynamically changeable by the set_query_parameters() operation.

Two query conditions that have the same query_expression will require unique query condition content filters if their query_paramters differ. Query conditions that differ only in their state masks will share the same query condition content filter.

Queries and Filters Syntax (p. 957) describes the syntax of query_expression and query_parameters.

4.94.3 Function Documentation

4.94.3.1 DDS_ReadCondition* DDS_QueryCondition_as_readcondition (DDS_QueryCondition * query_condition)

Access a DDS_QueryCondition (p. 845)'s supertype instance.

Parameters:

 $query_condition << in>> (p. 951)$ Cannot be NULL.

4.94.3.2 const char* DDS_QueryCondition_get_query_expression (DDS_QueryCondition * self)

Retrieves the query expression.

Parameters:

self << in>> (p. 951) Cannot be NULL.

4.94.3.3 DDS_ReturnCode_t DDS_QueryCondition_get_query_parameters (DDS_QueryCondition * self, struct DDS_StringSeq * query_parameters)

Retrieves the query parameters.

Parameters:

query_parameters <<inout>> (p. 951) the query parameters are returned here. The memory for the strings in this sequence is managed according to the conventions described in Conventions (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

self << in>> (p. 951) Cannot be NULL.

4.94.3.4 DDS_ReturnCode_t DDS_QueryCondition_set_query_parameters (DDS_QueryCondition * self, const struct
DDS_StringSeq * query_parameters)

Sets the query parameters.

```
self <<\!\!in>> (p. 951) Cannot be NULL. 
 query\_parameters <<\!\!in>> (p. 951) the new query parameters
```

4.95 Data Samples

Modules

^ Sample States

 $DDS_SampleStateKind$ (p. 848) and associated elements

^ View States

DDS_ViewStateKind (p. 850) and associated elements

^ Instance States

DDS_InstanceStateKind (p. 853) and associated elements

Data Structures

^ struct DDS_SampleInfo

Information that accompanies each sample that is read or taken.

^ struct DDS_SampleInfoSeq

 $Declares\ IDL\ sequence < DDS_SampleInfo\ (p.\ 1384) > .$

4.95.1 Detailed Description

4.96 Sample States

DDS_SampleStateKind (p. 848) and associated elements

Typedefs

* typedef DDS_UnsignedLong DDS_SampleStateMask
A bit-mask (list) of sample states, i.e. DDS_SampleStateKind (p. 848).

Enumerations

```
num DDS_SampleStateKind {
  DDS_READ_SAMPLE_STATE = 0x0001 << 0,
  DDS_NOT_READ_SAMPLE_STATE = 0x0001 << 1 }</pre>
```

Indicates whether or not a sample has ever been read.

Variables

^ const DDS_SampleStateMask DDS_ANY_SAMPLE_STATE

Any sample state DDS_READ_SAMPLE_STATE (p. 849) | DDS_NOT_READ_SAMPLE_STATE (p. 849).

4.96.1 Detailed Description

DDS_SampleStateKind (p. 848) and associated elements

4.96.2 Typedef Documentation

4.96.2.1 typedef DDS_UnsignedLong DDS_SampleStateMask

A bit-mask (list) of sample states, i.e. DDS_SampleStateKind (p. 848).

4.96.3 Enumeration Type Documentation

4.96.3.1 enum DDS_SampleStateKind

Indicates whether or not a sample has ever been read.

For each sample received, the middleware internally maintains a sample_state relative to each **DDS_DataReader** (p. 783). The sample state can be either:

- DDS_READ_SAMPLE_STATE (p. 849) indicates that the DDS_DataReader (p. 783) has already accessed that sample by means of a read or take operation.
- DDS_NOT_READ_SAMPLE_STATE (p. 849) indicates that the DDS_DataReader (p. 783) has not accessed that sample before.

The sample state will, in general, be different for each sample in the collection returned by read or take.

Enumerator:

 $DDS_READ_SAMPLE_STATE \quad \text{Sample has been read.}$ $DDS_NOT_READ_SAMPLE_STATE \quad \text{Sample has not been read.}$

4.96.4 Variable Documentation

4.96.4.1 const DDS_SampleStateMask DDS_ANY_SAMPLE_-STATE

Any sample state $DDS_READ_SAMPLE_STATE$ (p. 849) | $DDS_NOT_READ_SAMPLE_STATE$ (p. 849).

Examples:

HelloWorld_subscriber.c.

4.97 View States

DDS_ViewStateKind (p. 850) and associated elements

Typedefs

 ${\bf \hat{DDS_UnsignedLong\ DDS_ViewStateMask}}$

A bit-mask (list) of view states, i.e. DDS_ViewStateKind (p. 850).

Enumerations

```
num DDS_ViewStateKind {
  DDS_NEW_VIEW_STATE = 0x0001 << 0,
  DDS_NOT_NEW_VIEW_STATE = 0x0001 << 1 }</pre>
```

Indicates whether or not an instance is new.

Variables

^ const DDS_ViewStateMask DDS_ANY_VIEW_STATE

Any view state DDS_NEW_VIEW_STATE (p. 851) | DDS_NOT_NEW_VIEW_STATE (p. 851).

4.97.1 Detailed Description

DDS_ViewStateKind (p. 850) and associated elements

4.97.2 Typedef Documentation

4.97.2.1 typedef DDS_UnsignedLong DDS_ViewStateMask

A bit-mask (list) of view states, i.e. DDS_ViewStateKind (p. 850).

4.97.3 Enumeration Type Documentation

4.97.3.1 enum DDS_ViewStateKind

Indicates whether or not an instance is new.

4.97 View States 851

For each instance (identified by the key), the middleware internally maintains a view state relative to each **DDS_DataReader** (p. 783). The view state can be either:

- ^ DDS_NEW_VIEW_STATE (p. 851) indicates that either this is the first time that the DDS_DataReader (p. 783) has ever accessed samples of that instance, or else that the DDS_DataReader (p. 783) has accessed previous samples of the instance, but the instance has since been reborn (i.e. become not-alive and then alive again). These two cases are distinguished by examining the DDS_SampleInfo::disposed_generation_count (p. 1389) and the DDS_SampleInfo::no_writers_generation_count (p. 1389).
- DDS_NOT_NEW_VIEW_STATE (p. 851) indicates that the DDS_DataReader (p. 783) has already accessed samples of the same instance and that the instance has not been reborn since.

The view_state available in the **DDS_SampleInfo** (p. 1384) is a snapshot of the view state of the instance relative to the **DDS_DataReader** (p. 783) used to access the samples at the time the collection was obtained (i.e. at the time read or take was called). The view_state is therefore the same for all samples in the returned collection that refer to the same instance.

Once an instance has been detected as not having any "live" writers and all the samples associated with the instance are "taken" from the **DDS_DataReader** (p. 783), the middleware can reclaim all local resources regarding the instance. Future samples will be treated as "never seen."

Enumerator:

DDS_NEW_VIEW_STATE New instance. This latest generation of the instance has not previously been accessed.

 $DDS_NOT_NEW_VIEW_STATE$ Not a new instance. This latest generation of the instance has previously been accessed.

4.97.4 Variable Documentation

4.97.4.1 const DDS_ViewStateMask DDS_ANY_VIEW_STATE

Any view state **DDS_NEW_VIEW_STATE** (p. 851) | **DDS_NOT_NEW_-VIEW_STATE** (p. 851).

Examples:

HelloWorld_subscriber.c.

4.98 Instance States

DDS_InstanceStateKind (p. 853) and associated elements

Typedefs

^ typedef DDS_UnsignedLong DDS_InstanceStateMask

A bit-mask (list) of instance states, i.e. DDS_InstanceStateKind (p. 853).

Enumerations

^ enum **DDS_InstanceStateKind** {

 $DDS_ALIVE_INSTANCE_STATE = 0x0001 << 0$,

 $\begin{array}{lll} \mathbf{DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE} &= & 0x0001 \\ << 1, \end{array}$

DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE 0x0001 << 2 }

Indicates is the samples are from a live DDS_DataWriter (p. 673) or not.

Variables

 $\hat{\ } \ \ const\ \mathbf{DDS_InstanceStateMask}\ \mathbf{DDS_ANY_INSTANCE_STATE}$

^ const DDS_InstanceStateMask DDS_NOT_ALIVE_INSTANCE_-STATE

Not alive instance state NOT_ALIVE_DISPOSED_INSTANCE_STATE | NOT_ALIVE_NO_WRITERS_INSTANCE_STATE.

4.98.1 Detailed Description

DDS_InstanceStateKind (p. 853) and associated elements

4.98.2 Typedef Documentation

4.98.2.1 typedef DDS_UnsignedLong DDS_InstanceStateMask

A bit-mask (list) of instance states, i.e. **DDS_InstanceStateKind** (p. 853).

4.98.3 Enumeration Type Documentation

4.98.3.1 enum DDS_InstanceStateKind

Indicates is the samples are from a live **DDS_DataWriter** (p. 673) or not.

For each instance, the middleware internally maintains an instance state. The instance state can be:

- ^ DDS_ALIVE_INSTANCE_STATE (p. 854) indicates that (a) samples have been received for the instance, (b) there are live DDS_DataWriter (p. 673) entities writing the instance, and (c) the instance has not been explicitly disposed (or else more samples have been received after it was disposed).
- ^ DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE (p. 854) indicates the instance was explicitly disposed by a DDS_DataWriter (p. 673) by means of the dispose operation.
- DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE (p. 854) indicates the instance has been declared as not-alive by the DDS_DataReader (p. 783) because it detected that there are no live DDS_DataWriter (p. 673) entities writing that instance.

The precise behavior events that cause the instance state to change depends on the setting of the OWNERSHIP QoS:

- If OWNERSHIP (p. 159) is set to DDS_EXCLUSIVE_OWNERSHIP_QOS (p. 160), then the instance state becomes DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE (p. 854) only if the DDS_DataWriter (p. 673) that "owns" the instance explicitly disposes it. The instance state becomes DDS_ALIVE_INSTANCE_STATE (p. 854) again only if the DDS_DataWriter (p. 673) that owns the instance writes it.
- ^ If OWNERSHIP (p. 159) is set to DDS_SHARED_OWNERSHIP_QOS (p. 160), then the instance state becomes DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE (p. 854) if any DDS_DataWriter

(p. 673) explicitly disposes the instance. The instance state becomes DDS_ALIVE_INSTANCE_STATE (p. 854) as soon as any DDS_DataWriter (p. 673) writes the instance again.

The instance state available in the **DDS_SampleInfo** (p. 1384) is a snapshot of the instance state of the instance at the time the collection was obtained (i.e. at the time read or take was called). The instance state is therefore the same for all samples in the returned collection that refer to the same instance.

Enumerator:

DDS_ALIVE_INSTANCE_STATE Instance is currently in existence.
DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE Not alive disposed instance. The instance has been disposed by a DataWriter.

DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE Not alive no writers for instance. None of the DDS_DataWriter (p. 673) objects are currently alive (according to the LIVELINESS (p. 162)) are writing the instance.

4.98.4 Variable Documentation

$\begin{array}{ll} 4.98.4.1 & const\ DDS_InstanceStateMask\ DDS_ANY_INSTANCE_-\\ & STATE \end{array}$

Any instance state ALIVE_INSTANCE_STATE | NOT_ALIVE_DISPOSED_-INSTANCE_STATE | NOT_ALIVE_NO_WRITERS_INSTANCE_STATE.

Examples:

 $HelloWorld_subscriber.c.$

4.98.4.2 const DDS_InstanceStateMask DDS_NOT_ALIVE_-INSTANCE_STATE

Not alive instance state NOT_ALIVE_DISPOSED_INSTANCE_STATE | NOT_-ALIVE_NO_WRITERS_INSTANCE_STATE.

4.99 Infrastructure Module

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

Modules

^ Time Support

Time and duration types and defines.

^ GUID Support

```
<<eXtension>> (p. 950) GUID type and defines.
```

^ Sequence Number Support

```
<<eXtension>> (p. 950) Sequence number type and defines.
```

^ Exception Codes

```
<<eXtension>> (p. 950) Exception codes.
```

^ Return Codes

Types of return codes.

^ Status Kinds

Kinds of communication status.

^ QoS Policies

```
Quality of Service (QoS) policies.
```

[^] Entity Support

```
DDS_Entity (p. 242), DDS_Listener (p. 1246) and related items.
```

^ Conditions and WaitSets

```
DDS\_Condition (p. 252) and DDS\_WaitSet (p. 253) and related items.
```

^ Octet Buffer Support

```
<<eXtension>> (p. 950) Octet buffer creation, cloning, and deletion.
```

^ Sequence Support

The FooSeq (p. 1497) interface allows you to work with variable-length collections of homogeneous data.

^ String Support

<<extension>> (p. 950) String creation, cloning, assignment, and deletion

4.99.1 Detailed Description

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

4.100 Built-in Sequences

Defines sequences of primitive data type.

Data Structures

```
* struct DDS_CharSeq
     Instantiates FooSeq (p. 1497) < DDS_-Char (p. 107) >.
* struct DDS_WcharSeq
     Instantiates FooSeq (p. 1497) < DDS_-Wchar (p. 107) >.
* struct DDS_OctetSeq
     Instantiates FooSeq (p. 1497) < DDS_-Octet (p. 107) >.
* struct DDS_ShortSeq
     Instantiates FooSeq (p. 1497) < DDS\_Short (p. 107) >.
* struct DDS_UnsignedShortSeq
     Instantiates FooSeq (p. 1497) < DDS_{-}UnsignedShort (p. 107) >.
* struct DDS_LongSeq
     Instantiates FooSeq (p. 1497) < DDS\_Long (p. 108) >.
\hat{} struct \mathbf{DDS}_{-}\mathbf{UnsignedLongSeq}
     Instantiates FooSeq (p. 1497) < DDS\_UnsignedLong (p. 108) >.
* struct DDS_LongLongSeq
     Instantiates FooSeq (p. 1497) < DDS\_LongLong (p. 108) >.
* struct DDS_UnsignedLongLongSeq
     Instantiates FooSeq (p. 1497) < DDS_{-}UnsignedLongLong (p. 108) >.
^ struct DDS_FloatSeq
     Instantiates FooSeq (p. 1497) < DDS_{-}Float (p. 108) >.
* struct DDS_DoubleSeq
     Instantiates FooSeq (p. 1497) < DDS_Double (p. 108) >.
^ struct DDS_LongDoubleSeq
     Instantiates FooSeq (p. 1497) < DDS\_LongDouble (p. 108) >.
```

```
    struct DDS_BooleanSeq
        Instantiates FooSeq (p. 1497) < DDS_Boolean (p. 109) >.

    struct DDS_StringSeq
        Instantiates FooSeq (p. 1497) < char* > with value type semantics.

    struct DDS_WstringSeq
        Instantiates FooSeq (p. 1497) < DDS_Wchar (p. 107)* >.
```

4.100.1 Detailed Description

Defines sequences of primitive data type.

4.101 Multi-channel DataWriters

APIs related to Multi-channel DataWriters.

4.101.1 What is a Multi-channel DataWriter?

A Multi-channel **DDS_DataWriter** (p. 673) is a **DDS_DataWriter** (p. 673) that is configured to send data over multiple multicast addresses, according to some filtering criteria applied to the data.

To determine which multicast addresses will be used to send the data, the middleware evaluates a set of filters that are configured for the **DDS_DataWriter** (p. 673). Each filter "guards" a channel (a set of multicast addresses). Each time a multi-channel **DDS_DataWriter** (p. 673) writes data, the filters are applied. If a filter evaluates to true, the data is sent over that filter's associated channel (set of multicast addresses). We refer to this type of filter as a Channel Guard filter.

4.101.2 Configuration on the Writer Side

To configure a multi-channel **DDS_DataWriter** (p. 673), simply define a list of all its channels in the **DDS_MultiChannelQosPolicy** (p. 1269).

The DDS_MultiChannelQosPolicy (p. 1269) is propagated along with discovery traffic. The value of this policy is available in DDS_-PublicationBuiltinTopicData::locator_filter (p. 1320).

4.101.3 Configuration on the Reader Side

No special changes are required in a subscribing application to get data from a multichannel **DDS_DataWriter** (p. 673). If you want the **DDS_DataReader** (p. 783) to subscribe to only a subset of the channels, use a **DDS_ContentFilteredTopic** (p. 426).

For more information on Multi-channel DataWriters, refer to the User's Manual.

4.101.4 Reliability with Multi-Channel DataWriters

4.101.4.1 Reliable Delivery

Reliable delivery is only guaranteed when the DDS_-PresentationQosPolicy::access_scope (p. 1300) is set to DDS_-INSTANCE_PRESENTATION_QOS (p. 156) and the filters in DDS_-MultiChannelQosPolicy (p. 1269) are keyed-only based.

If any of the guard filters are based on non-key fields, RTI Data Distribution Service only guarantees reception of the most recent data from the MultiChannel DataWriter.

4.101.4.2 Reliable Protocol Considerations

Reliability is maintained on a per-channel basis. Each channel has its own reliability channel send queue. The size of that queue is limited by DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) and/or DDS_DataWriterResourceLimitsQosPolicy::max_batches (p. 1132).

The protocol parameters described in DDS_DataWriterProtocolQosPolicy (p. 1106) are applied per channel, with the following exceptions:

DDS_RtpsReliableWriterProtocol_t::low_watermark (p. 1366) and DDS_RtpsReliableWriterProtocol_t::high_watermark (p. 1367): The low watermark and high watermark control the queue levels (in number of samples) that determine when to switch between regular and fast heartbeat rates. With MultiChannel DataWriters, high_watermark and low_watermark refer to the DataWriter's queue (not the reliability channel queue). Therefore, periodic heartbeating cannot be controlled on a per-channel basis.

Important: With MultiChannel DataWriters, low_watermark and high_watermark refer to application samples even if batching is enabled. This behavior differs from the one without MultiChannel DataWriters (where low_watermark and high_watermark refer to batches).

DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples

(p. 1370): This field defines the number of heartbeats per send queue. For MultiChannel DataWriters, the value is applied per channel. However, the send queue size that is used to calculate the a piggyback heartbeat rate is defined per DataWriter (see **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1358))

Important: With MultiChannel DataWriters, heartbeats_per_max_samples refers to samples even if batching is enabled. This behavior differs from the one without MultiChannels DataWriters (where heartbeats_per_max_samples refers to batches).

With batching MultiChannel DataWriters. size the and the ofDataWriter's send queue should be configured using \mathbf{DDS}_{-} ResourceLimitsQosPolicy::max_samples (p. 1358) instead of max_batches DDS_DataWriterResourceLimitsQosPolicy::max_batches (p. 1132) in order to take advantage of heartbeats_per_max_samples.

4.102 Pluggable Transports

APIs related to RTI Data Distribution Service pluggable transports.

Modules

[^] Using Transport Plugins

Configuring transports used by RTI Data Distribution Service.

`Built-in Transport Plugins

Transport plugins delivered with RTI Data Distribution Service.

4.102.1 Detailed Description

APIs related to RTI Data Distribution Service pluggable transports.

4.102.2 Overview

RTI Data Distribution Service has a pluggable transports architecture. The core of RTI Data Distribution Service is transport agnostic; it does not make any assumptions about the actual transports used to send and receive messages. Instead, the RTI Data Distribution Service core uses an abstract "transport API" to interact with the **transport plugins** which implement that API.

A transport plugin implements the abstract transport API and performs the actual work of sending and receiving messages over a physical transport. A collection of **builtin plugins** (see **Built-in Transport Plugins** (p. 878)) is delivered with RTI Data Distribution Service for commonly used transports. New transport plugins can easily be created, thus enabling RTI Data Distribution Service applications to run over transports that may not even be conceived yet. This is a powerful capability and that distinguishes RTI Data Distribution Service from competing middleware approaches.

RTI Data Distribution Service also provides a set of APIs for installing and configuring transport plugins to be used in an application. So that RTI Data Distribution Service applications work out of the box, a subset of the builtin transport plugins is *preconfigured* by default (see **DDS_TransportBuiltinQosPolicy** (p. 1447)). You can "turn-off" some or all of the builtin transport plugins. In addition, you can configure other transport plugins for use by the application.

4.102.3 Transport Aliases

In order to use a transport plugin instance in an RTI Data Distribution Service application, it must be registered with a **DDS_DomainParticipant** (p. 339). When you register a transport, you specify a sequence of "alias" strings to symbolically refer to the transport plugin. The same alias strings can be used to register more than one transport plugin.

You can register multiple transport plugins with a **DDS_DomainParticipant** (p. 339). An **alias** symbolically refers to one or more transport plugins registered with the **DDS_DomainParticipant** (p. 339). Builtin transport plugin instances can be referred to using preconfigured aliases (see **TRANSPORT_-BUILTIN** (p. 197)).

A transport plugin's class name is automatically used as an implicit alias. It can be used to refer to all the transport plugin instances of that class.

You can use aliases to refer to transport plugins, in order to specify:

- the transport plugins to use for **discovery** (see **DDS_-DiscoveryQosPolicy::enabled_transports** (p. 1150)), and for **DDS_-DataWriter** (p. 673) and **DDS_DataReader** (p. 783) entities (see **DDS_-TransportSelectionQosPolicy** (p. 1456)).
- the multicast addresses on which to receive discovery messages (see DDS_-DiscoveryQosPolicy::multicast_receive_addresses (p. 1151)), and the multicast addresses and ports on which to receive user data (see DDS_-DataReaderQos::multicast (p. 1087)).
- the unicast ports used for user data (see DDS_-TransportUnicastQosPolicy (p. 1458)) on both DDS_DataWriter (p. 673) and DDS_DataReader (p. 783) entities.
- the transport plugins used to parse an address string in a locator (Locator Format (p. 190) and NDDS_DISCOVERY_PEERS (p. 189)).

A DDS_DomainParticipant (p. 339) (and contained its entities) start using a transport plugin after the DDS_DomainParticipant (p. 339) is enabled (see DDS_Entity_enable (p. 245)). An entity will use *all* the transport plugins that match the specified transport QoS policy. All transport plugins are treated uniformly, regardless of how they were created or registered; there is no notion of some transports being more "special" that others.

4.102.4 Transport Lifecycle

A transport plugin is owned by whoever created it. Thus, if you create and register a transport plugin with a **DDS_DomainParticipant** (p. 339), you are responsible for deleting it by calling its destructor. Note that builtin transport plugins (**TRANSPORT_BUILTIN** (p. 197)) and transport plugins that are

loaded through the **PROPERTY** (p. 235) QoS policy (see Loading Transport Plugins through Property QoS Policy of Domain Participant (p. 869)) are automatically managed by RTI Data Distribution Service.

A user-created transport plugin must not be deleted while it is still in use by a DDS_DomainParticipant (p. 339). This generally means that a user-created transport plugin instance can only be deleted after the DDS_DomainParticipant (p. 339) with which it was registered is deleted (see DDS_DomainParticipantFactory_delete_participant (p. 312)). Note that a transport plugin cannot be "unregistered" from a DDS_DomainParticipant (p. 339).

A transport plugin instance cannot be registered with more than one **DDS_-DomainParticipant** (p. 339) at a time. This requirement is necessary to guarantee the multi-threaded safety of the transport API.

If the same physical transport resources are to be used with more than one **DDS_DomainParticipant** (p. 339) in the same address space, the transport plugin should be written in such a way so that it can be instantiated multiple times—once for each **DDS_DomainParticipant** (p. 339) in the address space. Note that it is always possible to write the transport plugin so that multiple transport plugin instances share the same underlying resources; however the burden (if any) of guaranteeing multi-threaded safety to access shared resource shifts to the transport plugin developer.

4.102.5 Transport Class Attributes

A transport plugin instance is associated with two kinds of attributes:

- the class attributes that are decided by the plugin writer; these are invariant across all instances of the transport plugin class, and
- the *instance* attributes that can be set on a per instance basis by the transport plugin user.

Every transport plugin must specify the following class attributes.

transport class id (see NDDS_Transport_Property_t::classid (p. 1507))

Identifies a transport plugin implementation class. It denotes a unique "class" to which the transport plugin instance belongs. The class is used to distinguish between different transport plugin implementations. Thus, a transport plugin vendor should ensure that its transport plugin implementation has a unique class.

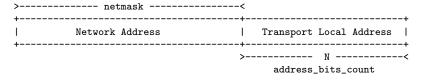

Two transport plugin instances report the same class *iff* they have compatible implementations. Transport plugin instances with mismatching classes are not allowed (by the RTI Data Distribution Service Core) to communicate with one another.

Multiple implementations (possibly from different vendors) for a physical transport mechanism can co-exist in an RTI Data Distribution Service application, provided they use different transport class IDs.

The class ID can also be used to distinguish between different transport protocols over the same physical transport network (e.g., UDP vs. TCP over the IP routing infrastructure).

transport significant address bit count (see NDDS_Transport_Property_t::address_bit_cou RTI Data Distribution Service's addressing is modeled after the IPv6 and uses 128-bit addresses (Address (p. 998)) to route messages.

A transport plugin is expected to map the transport's internal addressing scheme to 128-bit addresses. In general, this mapping is likely to use only N least significant bits (LSB); these are specified by this attribute.

Only these bits are used by the transport plugin.

The remaining bits of an address using the 128-bit address representation will be considered as part of the "network address" (see **Transport Network Address** (p. 865)) and thus ignored by the transport plugin's internal addressing scheme.

For unicast addresses, the transport plugin is expected to ignore the higher (128 - NDDS_Transport_Property_t::address_bit_count (p. 1507)) bits. RTI Data Distribution Service is free to manipulate those bits freely in the addresses passed in/out to the transport plugin APIs.

Theoretically, the significant address bits count, N is related to the size of the underlying transport network as follows:

 $address_bits_count >= ceil(log_2(total_addressable_transport_unicast_interfaces))$

The equality holds when the most compact (theoretical) internal address mapping scheme is used. A practical address mapping scheme may waste some bits.

4.102.6 Transport Instance Attributes

The *per instance* attributes to configure the plugin instance are generally passed in to the plugin constructor. These are defined by the transport plugin writer, and can be used to:

- customize the behavior of an instance of a transport plugin, including the send and the receiver buffer sizes, the maximum message size, various transport level classes of service (CoS), and so on.
- specify the resource values, network interfaces to use, various transport level policies, and so on.

RTI Data Distribution Service requires that every transport plugin instance must specify the NDDS_Transport_Property_t::message_size_max (p. 1508) and NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508).

It is up to the transport plugin developer to make these available for configuration to transport plugin user.

Note that it is important that the instance attributes are "compatible" between the sending side and the receiving side of communicating applications using different instances of a transport plugin class. For example, if one side is configured to send messages larger than can be received by the other side, then communications via the plugin may fail.

4.102.7 Transport Network Address

The address bits not used by the transport plugin for its internal addressing constitute its network address bits.

In order for RTI Data Distribution Service to properly route the messages, each unicast interface in the RTI Data Distribution Service domain must have a unique address. RTI Data Distribution Service allows the user to specify the value of the network address when installing a transport plugin via the NDDS_-Transport_Support_register_transport() (p. 871) API.

The network address for a transport plugin should be chosen such that the resulting fully qualified 128-bit address will be unique in the RTI Data Distribution Service domain. Thus, if two instances of a transport plugin are registered with a **DDS_DomainParticipant** (p. 339), they will be at different network addresses in order for their unicast interfaces to have unique fully qualified 128-bit addresses. It is also possible to create multiple transports with the same network address, as it can be useful for certain use cases; note that this will require special entity configuration for most transports to avoid clashes in resource use (e.g. sockets for UDPv4 transport).

4.102.8 Transport Send Route

By default, a transport plugin is configured to send outgoing messages destined to addresses in the network address range at which the plugin was registered.

RTI Data Distribution Service allows the user to configure the routing of outgo-

ing messages via the NDDS_Transport_Support_add_send_route() (p. 873) API, so that a transport plugin will be used to send messages only to certain ranges of destination addresses. The function can be called multiple times for a transport plugin, with different address ranges.

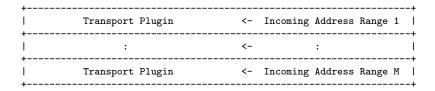

+				+
1	Outgoing Address Range 1	->	Transport Plugin	1
	:	->	:	
	Outgoing Address Range K	->	Transport Plugin	 +

The user can set up a routing table to restrict the use of a transport plugin to send messages to selected addresses ranges.

4.102.9 Transport Receive Route

By default, a transport plugin is configured to receive incoming messages destined to addresses in the network address range at which the plugin was registered.

RTI Data Distribution Service allows the user to configure the routing of incoming messages via the NDDS_Transport_Support_add_receive_route() (p. 874) API, so that a transport plugin will be used to receive messages only on certain ranges of addresses. The function can be called multiple times for a transport plugin, with different address ranges.

The user can set up a routing table to restrict the use of a transport plugin to receive messages from selected ranges. For example, the user may restrict a transport plugin to

- receive messages from a certain multicast address range.
- receive messages only on certain unicast interfaces (when multiple unicast interfaces are available on the transport plugin).

4.103 Using Transport Plugins

Configuring transports used by RTI Data Distribution Service.

Data Structures

^ struct NDDS_Transport_Support

<<iinterface>> (p. 950) The utility class used to configure RTI Data Distribution Service pluggable transports.

Typedefs

^ typedef NDDS_TRANSPORT_HANDLE_TYPE_NATIVE NDDS_Transport_Handle_t

An opaque type representing the handle to a transport plugin registered with a DDS_DomainParticipant (p. 339).

^ typedef NDDS_Transport_Plugin *(* NDDS_Transport_create_plugin
)(NDDS_Transport_Address_t *default_network_address_out, const
struct DDS_PropertyQosPolicy *property_in)

Function prototype for creating plugin through DDS_PropertyQosPolicy (p. 1308).

Functions

^ DDS_Boolean NDDS_Transport_Handle_is_nil (const NDDS_Transport_Handle_t *self)

Is the given transport handle the NIL transport handle?

*NDDS_Transport_Handle_t NDDS_Transport_Support_register_transport (DDS_DomainParticipant *participant_in, NDDS_Transport_Plugin *transport_in, const struct DDS_StringSeq *aliases_in, const NDDS_Transport_Address_t *network_address_in)

Register a transport plugin for use with a DDS_DomainParticipant (p. 339), assigning it a network_address.

^ NDDS_Transport_Handle_t NDDS_Transport_Support_lookup_transport (DDS_DomainParticipant *participant_in, struct DDS_-StringSeq *aliases_out, NDDS_Transport_Address_t *network_address_out, const NDDS_Transport_Plugin *transport_in)

Look up a transport plugin within a DDS_DomainParticipant (p. 339).

^ DDS_ReturnCode_t NDDS_Transport_Support_add_send_route (const NDDS_Transport_Handle_t *transport_handle_in,
const NDDS_Transport_Address_t *address_range_in, DDS_Long
address_range_bit_count_in)

Add a route for outgoing messages.

Add a route for outgoing messages.

Get the properties used to create a builtin transport plugin.

DDS_ReturnCode_t NDDS_Transport_Support_set_builtin_transport_property (DDS_DomainParticipant *participant_in, DDS_TransportBuiltinKind builtin_transport_kind_in, const struct NDDS_Transport_Property_t *builtin_transport_property_in)

Set the properties used to create a builtin transport plugin.

Variables

^ const NDDS_Transport_Handle_t NDDS_TRANSPORT_-HANDLE_NIL

The NIL transport handle.

4.103.1 Detailed Description

Configuring transports used by RTI Data Distribution Service.

There is more than one way to install a transport plugin for use with RTI Data Distribution Service:

If it is a builtin transport plugin, by specifying a bitmask in DDS_-TransportBuiltinQosPolicy (p. 1447) (see Built-in Transport Plugins (p. 878))

- For all other non-builtin transport plugins, by dynamically loading the plugin through PROPERTY (p. 235) QoS policy settings of DDS_DomainParticipant (p. 339) (on UNIX, Solaris and Windows systems only) (see Loading Transport Plugins through Property QoS Policy of Domain Participant (p. 869))
- By explicitly creating a transport plugin and registering the plugin with a DDS_DomainParticipant (p. 339) through NDDS_Transport_-Support_register_transport (p. 871) (for both builtin and non-builtin plugins)

In the first two cases, the lifecycle of the transport plugin is automatically managed by RTI Data Distribution Service. In the last case, user is responsible for deleting the transport plugin after the **DDS_DomainParticipant** (p. 339) is deleted. See **Transport Lifecycle** (p. 862) for details.

4.103.2 Loading Transport Plugins through Property QoS Policy of Domain Participant

On UNIX, Solaris and Windows operating systems, a non-builtin transport plugin written in C/C++ and built as a dynamic-link library (*.dll/*.so) can be loaded by RTI Data Distribution Service through the **PROPERTY** (p. 235) QoS policy settings of the **DDS_DomainParticipant** (p. 339). The dynamic-link library (and all the dependent libraries) need to be in the path during runtime (in **LD_LIBRARY_PATH** environment variable on Linux/Solaris systems, and in **PATH** environment variable for Windows systems).

To allow dynamic loading of the transport plugin, the transport plugin must implement the RTI Data Distribution Service abstract transport API and must provide a function with the signature NDDS_Transport_create_plugin (p. 870) that can be called by RTI Data Distribution Service to create an instance of the transport plugin. The name of the dynamic library that contains the transport plugin implementation, the name of the function and properties that can be used to create the plugin, and the aliases and network address that are used to register the plugin can all be specified through the PROPERTY (p. 235) QoS policy of the DDS_DomainParticipant (p. 339).

The following table lists the property names that are used to load the transport plugins dynamically:

A transport plugin is dynamically created and registered to the **DDS**_**DomainParticipant** (p. 339) by RTI Data Distribution Service when:

^ the DDS_DomainParticipant (p. 339) is enabled,

- ^ the first DataWriter/DataReader is created, or
- you lookup a builtin DataReader (**DDS_Subscriber_lookup_-** datareader (p. 754)),

whichever happens first.

Any changes to the transport plugin related properties in **PROPERTY** (p. 235) QoS policy after the transport plugin has been registered with the **DDS_-DomainParticipant** (p. 339) will have no effect.

See also:

Transport Use Cases (p. 931)

4.103.3 Typedef Documentation

4.103.3.1 typedef NDDS_TRANSPORT_HANDLE_TYPE_-NATIVE NDDS_Transport_Handle_t

An opaque type representing the handle to a transport plugin registered with a **DDS_DomainParticipant** (p. 339).

A transport handle represents the association between a **DDS_- DomainParticipant** (p. 339) and a transport plugin.

4.103.3.2 typedef NDDS_Transport_Plugin*(* NDDS_-Transport_create_plugin)(NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in)

Function prototype for creating plugin through **DDS_PropertyQosPolicy** (p. 1308).

By specifying some predefined property names in **DDS_PropertyQosPolicy** (p. 1308), RTI Data Distribution Service can call a function from a dynamic library to create a transport plugin and register the returned plugin with a **DDS_DomainParticipant** (p. 339).

This is the function prototype of the function as specified in "<TRANSPORT_-PREFIX>.create_function" of **DDS_PropertyQosPolicy** (p. 1308) QoS policy that will be called by RTI Data Distribution Service to create the transport plugin. See **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 869) for details.

Parameters:

network_address_out <<out>> (p. 951) Optional output parameter.

If the network address is not specified in "<TRANSPORT_-PREFIX>.network_address" in **DDS_PropertyQosPolicy** (p. 1308), this is the default network address that is used to register the returned transport plugin using **NDDS_Transport_-Support_register_transport** (p. 871). This parameter will never be null. The default value is a zeroed-out network address.

property_in <<in> (p. 951) property_in contains all the name-value pair properties that matches the format "<TRANSPORT_-PREFIX>. (p. 1308) that can be used to create the transport plugin. Only (p. 1308) that can be used to create the transport plugin. Only (property_name> is passed in - the plugin prefix will be stripped out in the property name. Note: predefined <TRANSPORT_PREFIX> properties "library", "create_function", "aliases" and "network_-address" will not be passed to this function. This parameter will never be null.

Returns:

Upon success, a valid non-NIL transport plugin. NIL upon failure.

4.103.4 Function Documentation

4.103.4.1 DDS_Boolean NDDS_Transport_Handle_is_nil (const NDDS_Transport_Handle_t * self)

Is the given transport handle the NIL transport handle?

Returns:

DDS_BOOLEAN_TRUE (p. 106) if the given transport handle is equal to NDDS_TRANSPORT_HANDLE_NIL (p. 876) or DDS_BOOLEAN_FALSE (p. 107) otherwise.

4.103.4.2 * NDDS_Transport_Handle_t NDDS_Transport_Support_register_transport (DDS_DomainParticipant *
participant_in, NDDS_Transport_Plugin * transport_in,
const struct DDS_StringSeq * aliases_in, const
NDDS_Transport_Address_t * network_address_in)

Register a transport plugin for use with a **DDS_DomainParticipant** (p. 339), assigning it a network_address.

A transport plugin instance can be used by exactly one DDS_-DomainParticipant (p. 339) at a time.

When a DataWriter/DataReader is created, only those transports already registered to the corresponding **DDS_DomainParticipant** (p. 339) are available to the DataWriter/DataReader.

Builtin transports can be automatically registered by RTI Data Distribution Service as a convenience to the user. See **Built-in Transport Plugins** (p. 878) for details on how to control the builtin transports that are automatically registered.

Precondition:

A disabled **DDS_DomainParticipant** (p. 339) and a transport plugin that will be registered exclusively with it.

Parameters:

 $participant_in << in>> (p. 951)$ A non-null, disabled DDS_-DomainParticipant (p. 339).

transport_in <<iin>> (p. 951) A non-null transport plugin that is currently not registered with another DDS_DomainParticipant (p. 339).

aliases_in <<in>>> (p. 951) A non-null sequence of strings used as aliases to symbolically refer to the transport plugins. The transport plugin will be "available for use" by a DDS_Entity (p. 242) in the DDS_DomainParticipant (p. 339) if the transport alias list associated with the DDS_Entity (p. 242) contains one of these transport aliases. An empty alias list represents a wildcard and matches all aliases. Alias names for the builtin transports are defined in TRANSPORT_BUILTIN (p. 197).

network_address_in <<iin>> (p. 951) The network address at which
to register this transport plugin. The least significant transport_in.property.address_bit_count will be truncated. The remaining
bits are the network address of the transport plugin. (see Transport
Class Attributes (p. 863)).

Returns:

Upon success, a valid non-NIL transport handle, representing the association between the **DDS_DomainParticipant** (p. 339) and the transport plugin; a **NDDS_TRANSPORT_HANDLE_NIL** (p. 876) upon failure.

Note that a transport plugin's class name is automatically registered as an implicit alias for the plugin. Thus, a class name can be used to refer to all the transport plugin instance of that class.

See also:

Transport Class Attributes (p. 863)

Transport Network Address (p. 865) Locator Format (p. 190) NDDS_DISCOVERY_PEERS (p. 189)

4.103.4.3 NDDS_Transport_Handle_t NDDS_Transport_Support_lookup_transport (DDS_DomainParticipant *
participant_in, struct DDS_StringSeq * aliases_out,
NDDS_Transport_Address_t * network_address_out,
const NDDS_Transport_Plugin * transport_in)

Look up a transport plugin within a DDS_DomainParticipant (p. 339).

The transport plugin should have already been registered with the DDS_-DomainParticipant (p. 339).

Parameters:

- $participant_in << in>> (p. 951)$ A non-null DDS_-DomainParticipant (p. 339).
- aliases_out <<inout>> (p. 951) A sequence of string where the aliases used to refer to the transport plugin symbolically will be returned. null if not interested.
- network_address_out <<iinout>> (p. 951) The network address at
 which to register the transport plugin will be returned here. null if
 not interested.
- $transport_in \ll in \gg (p. 951)$ A non-null transport plugin that is already registered with the **DDS_DomainParticipant** (p. 339).

Returns:

Upon success, a valid non-NIL transport handle, representating the association between the **DDS_DomainParticipant** (p. 339) and the transport plugin; a **NDDS_TRANSPORT_HANDLE_NIL** (p. 876) upon failure.

See also:

Transport Class Attributes (p. 863) Transport Network Address (p. 865)

4.103.4.4 DDS_ReturnCode_t NDDS_Transport_Support_add_send_route (const NDDS_Transport_Handle_t *
transport_handle_in, const NDDS_Transport_Address_t *
address_range_in, DDS_Long address_range_bit_count_in)

Add a route for outgoing messages.

This function can be used to narrow the range of addresses to which outgoing messages can be sent.

Precondition:

A disabled **DDS_DomainParticipant** (p. 339).

Parameters:

```
transport_handle_in <<iin>>> (p. 951) A valid non-NIL transport han-
dle as a result of a call to NDDS_Transport_Support_register_-
transport() (p. 871).
```

 $address_range_in << in>> (p. 951)$ The outgoing address range for which to use this transport plugin.

 $address_range_bit_count_in << in>> (p. 951)$ The number of most significant bits used to specify the address range.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

See also:

Transport Send Route (p. 865)

4.103.4.5 DDS_ReturnCode_t NDDS_Transport_Support_add_receive_route (const NDDS_Transport_Handle_t *
transport_handle_in, const NDDS_Transport_Address_t *
address_range_in, DDS_Long address_range_bit_count_in)

Add a route for outgoing messages.

This function can be used to narrow the range of addresses to which outgoing messages can be sent.

Precondition:

A disabled **DDS_DomainParticipant** (p. 339).

Parameters:

transport_handle_in <<iin>> (p. 951) A valid non-NIL transport handle as a result of a call to NDDS_Transport_Support_register_transport() (p. 871).

address_range_in << in>> (p. 951) The outgoing address range for which to use this transport plugin.

address_range_bit_count_in <<in>>> (p. 951) The number of most significant bits used to specify the address range.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

See also:

Transport Send Route (p. 865)

4.103.4.6 DDS_ReturnCode_t NDDS_Transport_Support_get_builtin_transport_property (DDS_DomainParticipant * participant_in, DDS_TransportBuiltinKind builtin_transport_kind_in, struct NDDS_Transport_Property_t * builtin_transport_property_inout)

Get the properties used to create a builtin transport plugin.

Retrieves the properties that will be used to create a builtin transport plugin.

Precondition:

The builtin_transport_property_inout parameter must be of the type specified by the builtin_transport_kind_in.

Parameters:

```
participant\_in << in>> (p. 951) A valid non-null DDS_-
DomainParticipant (p. 339)
```

 $builtin_transport_kind_in << in>> (p. 951)$ The builtin transport kind for which to retrieve the properties.

builtin_transport_property_inout << inout>> (p. 951) The storage area where the retrieved property will be output. The specific type required by the builtin_transport_kind_in must be used.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

See also:

NDDS_Transport_Support_set_builtin_transport_property() (p. 876)

4.103.4.7 DDS_ReturnCode_t NDDS_Transport_Support_set_builtin_transport_property
(DDS_DomainParticipant * participant_in,
DDS_TransportBuiltinKind builtin_transport_kind_in,
const struct NDDS_Transport_Property_t *
builtin_transport_property_in)

Set the properties used to create a builtin transport plugin.

Specifies the properties that will be used to create a builtin transport plugin.

If the builtin transport is already registered when this operation is called, these property changes will *not* have any effect. Builtin transport properties should always be set before the transport is registered. See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

Precondition:

A disabled **DDS_DomainParticipant** (p. 339). The builtin_transport_property_inout parameter must be of the type specified by the builtin_transport_kind_in.

Parameters:

participant_in <<in>> (p. 951) A valid non-null DDS_-DomainParticipant (p. 339) that has not been enabled.

 $builtin_transport_kind_in << in>> (p. 951)$ The builtin transport kind for which to specificy the properties.

builtin_transport_property_in <<inout>> (p. 951) The new transport
 property that will be used to the create the builtin transport plugin.
 The specific type required by the builtin_transport_kind_in must
 be used.

Returns:

One of the Standard Return Codes (p. 120), or DDS_RETCODE_-PRECONDITION_NOT_MET (p. 121).

4.104 Built-in Transport Plugins

Transport plugins delivered with RTI Data Distribution Service.

Modules

^ Shared Memory Transport

Built-in transport plug-in for inter-process communications using shared memory (NDDS_TRANSPORT_CLASSID_SHMEM (p. 1009)).

UDPv4 Transport

Built-in transport plug-in using UDP/IPv4 (NDDS_TRANSPORT_-CLASSID_UDPv4 (p. 1016)).

^ UDPv6 Transport

Built-in transport plug-in using UDP/IPv6 (NDDS_TRANSPORT_-CLASSID_UDPv6 (p. 1026)).

4.104.1 Detailed Description

Transport plugins delivered with RTI Data Distribution Service.

The **TRANSPORT_BUILTIN** (p. 197) specifies the collection of transport plugins that can be automatically configured and managed by RTI Data Distribution Service as a convenience to the user.

These transport plugins can simply be turned "on" or "off" by a specifying a bitmask in **DDS_TransportBuiltinQosPolicy** (p. 1447), thus bypassing the steps for setting up a transport plugin. RTI Data Distribution Service preconfigures the transport plugin properties, the network address, and the aliases to "factory defined" values.

If a builtin transport plugin is turned "on" in DDS_-TransportBuiltinQosPolicy (p. 1447), the plugin is implicitly created and registered to the corresponding DDS_DomainParticipant (p. 339) by RTI Data Distribution Service when:

- the DDS_DomainParticipant (p. 339) is enabled,
- the first DataWriter/DataReader is created, or
- you lookup a builtin DataReader (**DDS_Subscriber_lookup_-** datareader (p. 754)),

whichever happens first.

Each builtin transport contains its own set of properties. For example, the ::UDPv4 Transport (p. 1013) allows the application to specify whether or not multicast is supported, the maximum size of the message, and provides a mechanism for the application to filter out network interfaces.

The builtin transport plugin properties can be changed by the function NDDS_Transport_Support_set_builtin_transport_property() (p. 876) or by using the PROPERTY (p. 235) QoS policy associated with the DDS_DomainParticipant (p. 339). Builtin transport plugin properties specified in DDS_PropertyQosPolicy (p. 1308) always overwrite the ones specified through NDDS_Transport_Support_set_builtin_transport_property() (p. 876). Refer to the specific builtin transport for the list of property names that can be specified through PROPERTY (p. 235) QoS policy.

Any changes to the builtin transport properties after the builtin transports have been registered with will have no effect.

See also:

```
NDDS_Transport_Support_set_builtin_transport_property() (p. 876) DDS_PropertyQosPolicy (p. 1308)
```

The built-in transport plugins can also be instantiated and registered by the user, following the steps for **Registering a transport with a participant** (p. 933). This is useful when the application needs different values for the network addresses.

4.105 Configuration Utilities

Utility API's independent of the DDS standard.

Data Structures

^ struct NDDS_Config_LibraryVersion_t

The version of a single library shipped as part of an RTI Data Distribution Service distribution.

^ struct NDDS_Config_Version_t

<<interface>> (p. 950) The version of an RTI Data Distribution Service distribution.

^ struct NDDS_Config_Logger

<<iinterface>> (p. 950) The singleton type used to configure RTI Data Distribution Service logging.

Enumerations

^ enum NDDS_Config_LogVerbosity {

NDDS_CONFIG_LOG_VERBOSITY_SILENT,

NDDS_CONFIG_LOG_VERBOSITY_ERROR,

NDDS_CONFIG_LOG_VERBOSITY_WARNING,

NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL,

NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE,

NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL }

The verbosities at which RTI Data Distribution Service diagnostic information is logged.

^ enum NDDS_Config_LogCategory {

NDDS_CONFIG_LOG_CATEGORY_PLATFORM,

NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION,

NDDS_CONFIG_LOG_CATEGORY_DATABASE,

NDDS_CONFIG_LOG_CATEGORY_ENTITIES,

NDDS_CONFIG_LOG_CATEGORY_API }

Categories of logged messages.

^ enum NDDS_Config_LogPrintFormat { ,

NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT,

NDDS_CONFIG_LOG_PRINT_FORMAT_TIMESTAMPED,

NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE,

NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE_-TIMESTAMPED.

NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG,

NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL,

NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL }

The format used to output RTI Data Distribution Service diagnostic information.

Functions

struct DDS_ProductVersion_t * NDDS_Config_Version_get_product_version (void)

Get the RTI Data Distribution Service product version.

^ struct NDDS_Config_LibraryVersion_t * NDDS_Config_Version_get_api_version (void)

Get the version of the C API library.

^ struct NDDS_Config_LibraryVersion_t * NDDS_Config_Version_get_core_version (void)

Get the version of the core library.

^ const char * NDDS_Config_Version_to_string (void)

Get this version in string form.

^ NDDS_Config_Logger * NDDS_Config_Logger_get_instance (void)

Get the singleton instance of this type.

Get the verbosity at which RTI Data Distribution Service is currently logging diagnostic information.

Get the verbosity at which RTI Data Distribution Service is currently logging diagnostic information in the given category.

^ void NDDS_Config_Logger_set_verbosity (NDDS_Config_Logger *self, NDDS_Config_LogVerbosity verbosity)

Set the verbosity at which RTI Data Distribution Service will log diagnostic information.

^ void NDDS_Config_Logger_set_verbosity_by_category (NDDS_Config_Logger *self, NDDS_Config_LogCategory category, NDDS_Config_LogVerbosity verbosity)

Set the verbosity at which RTI Data Distribution Service will log diagnostic information in the given category.

^ FILE * NDDS_Config_Logger_get_output_file (NDDS_Config_-Logger *self)

Get the file to which the logged output is redirected.

^ DDS_Boolean NDDS_Config_Logger_set_output_file (NDDS_-Config_Logger *self, FILE *out)

Set the file to which the logged output is redirected.

Get the current message format that RTI Data Distribution Service is using to log diagnostic information.

^ DDS_Boolean NDDS_Config_Logger_set_print_format (NDDS_Config_Logger *self, NDDS_Config_LogPrintFormat print_format)

Set the message format that RTI Data Distribution Service will use to log diagnostic information.

4.105.1 Detailed Description

Utility API's independent of the DDS standard.

4.105.2 Enumeration Type Documentation

4.105.2.1 enum NDDS_Config_LogVerbosity

The verbosities at which RTI Data Distribution Service diagnostic information is logged.

Enumerator:

- NDDS_CONFIG_LOG_VERBOSITY_SILENT No further output will be logged.
- NDDS_CONFIG_LOG_VERBOSITY_ERROR Only error messages will be logged.

An error indicates something wrong in the functioning of RTI Data Distribution Service. The most common cause of errors is incorrect configuration.

NDDS_CONFIG_LOG_VERBOSITY_WARNING Both error and warning messages will be logged.

A warning indicates that RTI Data Distribution Service is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.

- NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL Errors, warnings, and verbose information about the lifecycles of local RTI Data Distribution Service objects will be logged.
- NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE
 Errors, warnings, and verbose information about the lifecycles of remote RTI Data Distribution Service objects will be logged.
- NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL Errors, warnings, verbose information about the lifecycles of local and remote RTI Data Distribution Service objects, and periodic information about RTI Data Distribution Service threads will be logged.

4.105.2.2 enum NDDS_Config_LogCategory

Categories of logged messages.

The NDDS_Config_Logger_get_verbosity_by_category (p. 885) and NDDS_Config_Logger_set_verbosity_by_category (p. 886) can be used to specify different verbosities for different categories of messages.

Enumerator:

- NDDS_CONFIG_LOG_CATEGORY_PLATFORM Log messages pertaining to the underlying platform (hardware and OS) on which RTI Data Distribution Service is running are in this category.
- NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION Log messages pertaining to data serialization and deserialization and network traffic are in this category.
- NDDS_CONFIG_LOG_CATEGORY_DATABASE Log messages pertaining to the internal database in which RTI Data Distribution Service objects are stored are in this category.

- **NDDS_CONFIG_LOG_CATEGORY_ENTITIES** Log messages pertaining to local and remote entities and to the discovery process are in this category.
- NDDS_CONFIG_LOG_CATEGORY_API Log messages pertaining to the API layer of RTI Data Distribution Service (such as function argument validation) are in this category.

4.105.2.3 enum NDDS_Config_LogPrintFormat

The format used to output RTI Data Distribution Service diagnostic information.

Enumerator:

- NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT Print message, method name, and activity context (default).
- NDDS_CONFIG_LOG_PRINT_FORMAT_TIMESTAMPED
 Print message, method name, activity context, and timestamp.
- NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE Print message with all available context information (includes thread identifier, activity context).
- NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE_TIMESTAMPED
 Print message with all available context information, and timestamp.
- $NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG$ Print a set of field that may be useful for internal debug.
- $NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL$ Print only message number and method name.
- $NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL$ Print all available fields.

4.105.3 Function Documentation

4.105.3.1 struct DDS_ProductVersion_t* NDDS_-Config_Version_get_product_version (void) [read]

Get the RTI Data Distribution Service product version.

4.105.3.2 struct NDDS_Config_LibraryVersion_t* NDDS_Config_Version_get_api_version (void) [read]

Get the version of the C API library.

Get the version of the core library.

4.105.3.4 const char* NDDS_Config_Version_to_string (void)

Get this version in string form.

Combine all of the constituent library versions into a single string.

The memory in which the string is stored in internal to this NDDS_Config_-Version_t (p. 1503). The caller should not modify it.

4.105.3.5 NDDS_Config_Logger* NDDS_Config_Logger_get_instance (void)

Get the singleton instance of this type.

4.105.3.6 NDDS_Config_LogVerbosity NDDS_Config_Logger_-get_verbosity (const NDDS_Config_Logger * self)

Get the verbosity at which RTI Data Distribution Service is currently logging diagnostic information.

The default verbosity if NDDS_Config_Logger_set_verbosity (p. 886) is never called is DDS_NDDS_CONFIG_LOG_VERBOSITY_ERROR.

If NDDS_Config_Logger_set_verbosity_by_category (p. 886) has been used to set different verbosities for different categories of messages, this function will return the maximum verbosity of all categories.

4.105.3.7 NDDS_Config_LogVerbosity NDDS_Config_Logger_get_verbosity_by_category (const NDDS_Config_Logger * self, NDDS_Config_LogCategory category)

Get the verbosity at which RTI Data Distribution Service is currently logging diagnostic information in the given category.

The default verbosity if NDDS_Config_Logger_set_verbosity (p. 886) and NDDS_Config_Logger_set_verbosity_by_category (p. 886) are never called is DDS_NDDS_CONFIG_LOG_VERBOSITY_ERROR.

4.105.3.8 void NDDS_Config_Logger_set_verbosity (NDDS_Config_LogVerbosity verbosity)

Set the verbosity at which RTI Data Distribution Service will log diagnostic information.

Note: Logging at high verbosities will be detrimental to your application's performance. Your default setting should typically remain at DDS_NDDS_CONFIG_LOG_VERBOSITY_WARNING or below. (The default verbosity if you never set it is DDS_NDDS_CONFIG_LOG_VERBOSITY_ERROR.)

4.105.3.9 void NDDS_Config_Logger_set_verbosity_by_category (NDDS_Config_Logger * self, NDDS_Config_LogCategory category, NDDS_Config_LogVerbosity verbosity)

Set the verbosity at which RTI Data Distribution Service will log diagnostic information in the given category.

4.105.3.10 FILE* NDDS_Config_Logger_get_output_file (NDDS_Config_Logger * self)

Get the file to which the logged output is redirected.

If no output file has been registered through NDDS_Config_Logger_set_-output_file (p. 886), this function will return NULL. In this case, logged output will on most platforms go to standard out as if through printf.

4.105.3.11 DDS_Boolean NDDS_Config_Logger_set_output_file (NDDS_Config_Logger * self, FILE * out)

Set the file to which the logged output is redirected.

The file passed may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

4.105.3.12 NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format (const NDDS_Config_Logger * self)

Get the current message format that RTI Data Distribution Service is using to log diagnostic information.

If NDDS_Config_Logger_set_print_format (p. 887) is never called, the default format is DDS_NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT.

4.105.3.13 DDS_Boolean NDDS_Config_Logger_set_print_format (NDDS_Config_Logger * self, NDDS_Config_LogPrintFormat print_format)

Set the message format that RTI Data Distribution Service will use to \log diagnostic information.

4.106 Unsupported Utilities

Unsupported APIs used by examples in the RTI Data Distribution Service distribution as well as in rtiddsgen-generated examples.

Data Structures

^ struct NDDS_Utility

Unsupported utility APIs.

Functions

^ void NDDS_Utility_sleep (const struct DDS_Duration_t *durationIn)

Block the calling thread for the specified duration.

4.106.1 Detailed Description

Unsupported APIs used by examples in the RTI Data Distribution Service distribution as well as in rtiddsgen-generated examples.

4.106.2 Function Documentation

4.106.2.1 void NDDS_Utility_sleep (const struct DDS_Duration_t * durationIn)

Block the calling thread for the specified duration.

Note that the achievable resolution of sleep is OS-dependent. That is, do not assume that you can sleep for 1 nanosecond just because you can specify a 1-nanosecond sleep duration via the API. The sleep resolution on most operating systems is usually 10 ms or greater.

Parameters:

durationIn << in>> (p. 951) Sleep duration. Cannot be NULL.

MT Safety:

safe

Examples:

 ${\bf HelloWorld_publisher.c}, \ {\bf and} \ {\bf HelloWorld_subscriber.c}.$

4.107 Durability and Persistence

APIs related to RTI Data Distribution Service Durability and Persistence. RTI Data Distribution Service offers the following mechanisms for achieving durability and persistence:

- ^ Durable Writer History (p. 890)
- ^ Durable Reader State (p. 890)
- ^ Data Durability (p. 891)

To use any of these features, you need a relational database, which is not included with RTI Data Distribution Service. Supported databases are listed in the Release Notes.

These three features can be used separately or in combination.

4.107.1 Durable Writer History

This feature allows a **DDS_DataWriter** (p. 673) to locally persist its local history cache so that it can survive shutdowns, crashes and restarts. When an application restarts, each **DDS_DataWriter** (p. 673) that has been configured to have durable writer history automatically loads all the data in its history cache from disk and can carry on sending data as if it had never stopped executing. To the rest of the system, it will appear as if the **DDS_DataWriter** (p. 673) had been temporarily disconnected from the network and then reappeared.

See also:

Configuring Durable Writer History (p. 892)

4.107.2 Durable Reader State

This feature allows a **DDS_DataReader** (p. 783) to locally persists its state and remember the data it has already received. When an application restarts, each **DDS_DataReader** (p. 783) that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the **DDS_DataReader** (p. 783) before the restart will be suppressed so it is not sent over the network.

4.107.3 Data Durability

This feature is a full implementation of the OMG DDS Persistence Profile. The **DURABILITY** (p. 153) QoS lets an application configure a **DDS_DataWriter** (p. 673) such that the information written by the **DDS_DataWriter** (p. 673) survives beyond the lifetime of the **DDS_DataWriter** (p. 673). In this manner, a late-joining **DDS_DataReader** (p. 783) can subscribe and receive the information even after the **DDS_DataWriter** (p. 673) application is no longer executing. To use this feature, you need RTI Persistence Service – an optional product that can be purchased separately.

4.107.4 Durability and Persistence Based on Virtual GUID

Every modification to the global dataspace made by a **DDS_DataWriter** (p. 673) is identified by a pair (virtual GUID, sequence number).

- ^ The virtual GUID (Global Unique Identifier) is a 16-byte character identifier associated with a **DDS_DataWriter** (p. 673) or **DDS_DataReader** (p. 783); it is used to uniquely identify this entity in the global data space.
- The sequence number is a 64-bit identifier that identifies changes published by a specific **DDS_DataWriter** (p. 673).

Several **DDS_DataWriter** (p. 673) entities can be configured with the same virtual GUID. If each of these **DDS_DataWriter** (p. 673) entities publishes a sample with sequence number '0', the sample will only be received once by the **DDS_DataReader** (p. 783) entities subscribing to the content published by the **DDS_DataWriter** (p. 673) entities.

RTI Data Distribution Service also uses the virtual GUID (Global Unique Identifier) to associate a persisted state (state in permanent storage) to the corresponding DDS entity.

For example, the history of a **DDS_DataWriter** (p. 673) will be persisted in a database table with a name generated from the virtual GUID of the **DDS_DataWriter** (p. 673). If the **DDS_DataWriter** (p. 673) is restarted, it must have associated the same virtual GUID to restore its previous history.

Likewise, the state of a DDS_DataReader (p. 783) will be persisted in a database table whose name is generated from the DDS_DataReader (p. 783) virtual GUID

A DDS_DataWriter (p. 673)'s virtual GUID can be configured using DDS_DataWriterProtocolQosPolicy::virtual_guid (p. 1107). Similarly, a DDS_DataReader (p. 783)'s virtual GUID can be configured using DDS_DataReaderProtocolQosPolicy::virtual_guid (p. 1070).

The DDS_PublicationBuiltinTopicData (p. 1313) and DDS_SubscriptionBuiltinTopicData (p. 1410) structures include the virtual GUID associated with the discovered publication or subscription.

Refer to the User's Manual for additional use cases.

See also:

 $\begin{aligned} &\mathbf{DDS_DataWriterProtocolQosPolicy::virtual_guid} \quad (p.\ 1107) \quad \mathbf{DDS_DataReaderProtocolQosPolicy::virtual_guid} \quad (p.\ 1070). \end{aligned}$

4.107.5 Configuring Durable Writer History

To configure a **DDS_DataWriter** (p. 673) to have durable writer history, use the **PROPERTY** (p. 235) QoS policy associated with the **DDS_DataWriter** (p. 673) or the **DDS_DomainParticipant** (p. 339).

Properties defined for the **DDS_DomainParticipant** (p. 339) will be applied to all the **DDS_DataWriter** (p. 673) objects belonging to the **DDS_DomainParticipant** (p. 339), unless the property is overwritten by the **DDS_DataWriter** (p. 673).

See also:

```
DDS_PropertyQosPolicy (p. 1308)
```

The following table lists the supported durable writer history properties.

4.107.6 Configuring Durable Reader State

To configure a **DDS_DataReader** (p. 783) with durable reader state, use the **PROPERTY** (p. 235) QoS policy associated with the **DDS_DataReader** (p. 783) or **DDS_DomainParticipant** (p. 339).

A property defined in the DDS_DomainParticipant (p. 339) will be applicable to all the DDS_DataReader (p. 783) belonging to the DDS_DomainParticipant (p. 339) unless it is overwritten by the DDS_DataReader (p. 783).

See also:

```
DDS_PropertyQosPolicy (p. 1308)
```

The following table lists the supported durable reader state properties.

4.107.7 Configuring Data Durability

For more information on RTI Persistence Service, refer to the User's Manual, or the RTI Persistence Service online documentation.

DURABILITY (p. 153)

Property	Description
dds.data_writer.history.plugin_name	Must be set to "dds.data
	writer.history.odbc_plugin.builtin" to enable durable writer history in the DataWriter. This property is
	required.
dds.data_writer.history.odbc	The ODBC DSN (Data Source
plugin.dsn	Name) associated with the database
	where the writer history must be persisted. This property is required.
dds.data_writer.history.odbc	This property tells RTI Data
plugin.driver	Distribution Service which ODBC
Programmer	driver to load. If the property is not specified, RTI Data Distribution
	Service will try to use the standard
	ODBC driver manager library:
	UnixOdbc (odbc32.dll) on
	UNIX/Linux systems; the Windows
	ODBC driver manager (libodbc.so)
	on Windows systems).
dds.data_writer.history.odbc	Configures the username used to
plugin.username	connect to the database. This
	property is not used if it is unspecified. There is no default
	value.
dds.data_writer.history.odbc	Configures the password used to
plugin.password	connect to the database. This
	property is not used if it is
	unspecified. There is no default
	value.
dds.data_writer.history.odbc	If set to 1, RTI Data Distribution
plugin.shared	Service creates a single connection per DSN that will be shared across
	DataWriters within the same
	Publisher.
	If set to 0 (the default), a
	DDS_DataWriter (p. 673) will
	create its own database connection.
	Default: 0 (false)
dds.data_writer.history.odbc	These properties configure the
plugin.instance_cache_max_size	resource limits associated with the
	ODBC writer history caches. To minimize the number of accesses to
	the database, RTI Data Distribution
	Service uses two caches, one for
	samples and one for instances. The
	initial and maximum sizes of these

	instances that can be stored in the

Description
Name) associated with the database where the DDS DataReader (p. 783) state must be persisted. This property is required. dds.data_reader.state.filter redundant_samples To enable durable reader state, this property must be set to 1. Otherwise, the reader state will not be kept and/or persisted. When the reader state is not maintained, RTI Data Distribution Service does not filter duplicate samples that may be coming from the same virtual writer. By default, this property is set to 1. dds.data_reader.state.odbc.driver dds.data_reader.state.odbc.driver dds.data_reader.state.odbc.driver dds.data_reader.state.odbc.driver dds.data_reader.state.odbc.driver dds.data_reader.state.odbc.driver dds.data_reader.state.odbc.password dds.data_reader.state.odbc.password dds.data_reader.state.odbc.password dds.data_reader.state.restore dds.data_reader.state.restore dds.data_reader.state.restore dds.data_reader.state.restore dds.data_reader.state.restore dds.data_reader.state.restore This property configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value. This property indicates if the persisted DDS_DataReader (p. 783) state must be restored or not once the DDS_DataReader (p. 783) is restarted. If this property is 0, the previous state will be deleted from the database. If it is 1, the DDS_DataReader (p. 783) will restore its previous state will be deleted from the database. If it is 1, the DDS_DataReader (p. 783) will restore its previous state from the database content. Default: 1 dds.data_reader.state.checkpoint
(p. 783) state must be persisted. This property is required. To enable durable reader state, this property must be set to 1. Otherwise, the reader state will not be kept and/or persisted. When the reader state is not maintained, RTI Data Distribution Service does not filter duplicate samples that may be coming from the same virtual writer. By default, this property is set to 1. This property is used to indicate which ODBC driver to load. If the property is not specified, RTI Data Distribution Service will try to use the standard ODBC driver manager library: UnixOdbe (odbc32.dll) on UNIX/Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems). dds.data_reader.state.odbc.username
To enable durable reader state, this property must be set to 1. Otherwise, the reader state will not be kept and/or persisted. When the reader state is not maintained, RTI Data Distribution Service does not filter duplicate samples that may be coming from the same virtual writer. By default, this property is set to 1.
redundant_samples property must be set to 1. Otherwise, the reader state will not be kept and/or persisted. When the reader state is not maintained, RTI Data Distribution Service does not filter duplicate samples that may be coming from the same virtual writer. By default, this property is set to 1. dds.data_reader.state.odbc.driver dds.data_reader.state.odbc.driver This property is used to indicate which ODBC driver to load. If the property is not specified, RTI Data Distribution Service will try to use the standard ODBC driver manager library: UnixOdbc (odbc32.dll) on UNIX/Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems). dds.data reader.state.odbc.username This property configures the username used to connect to the database. This property is not used if it is unspecified. There is no default value. This property configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value. This property indicates if the persisted DDS_DataReader (p. 783) state must be restored or not once the DDS_DataReader (p. 783) is restarted. If this property is 0, the previous state will be deleted from the database. If it is 1, the DDS_DataReader (p. 783) will restore its previous state from the database content. Default: 1 dds.data_reader.state.checkpoint dds.data_reader.state.checkpoint This property controls how often
Otherwise, the reader state will not be kept and/or persisted. is restarted it may receive some
duplicate samples. These samples will be filtered by the middleware

the application

4.108 Configuring QoS Profiles with XML

APIs related to XML QoS Profiles.

4.108.1 Loading QoS Profiles from XML Resources

A 'QoS profile' is a group of QoS settings, specified in XML format. By using QoS profiles, you can change QoS settings without recompiling the application.

The Qos profiles are loaded when the following operations are called:

- ^ DDS_DomainParticipantFactory_create_participant (p. 309)
- $\begin{tabular}{ll} $DDS_DomainParticipantFactory_create_participant_with_profile \\ (p. 310) \end{tabular}$
- ^ DDS_DomainParticipantFactory_set_default_participant_qos_with_profile (p. 307)
- ^ DDS_DomainParticipantFactory_get_default_participant_qos $(p. \frac{308}{})$
- ^ DDS_DomainParticipantFactory_set_default_library (p. 316)
- ^ DDS_DomainParticipantFactory_set_default_profile (p. 316)
- DDS_DomainParticipantFactory_get_participant_qos_from_profile (p. 318)
- ^ DDS_DomainParticipantFactory_get_topic_qos_from_profile (p. 323)
- ^ DDS_DomainParticipantFactory_get_topic_qos_from_profile_w_topic_name $(p. \frac{324}{})$
- ^ DDS_DomainParticipantFactory_get_publisher_qos_from_profile $(p.\, 319)$
- ^ DDS_DomainParticipantFactory_get_subscriber_qos_from_profile (p. 320)
- ^ DDS_DomainParticipantFactory_get_datawriter_qos_from_profile (p. 322)
- DDS_DomainParticipantFactory_get_datawriter_qos_from_profile_w_topic_name (p. 322)
- DDS_DomainParticipantFactory_get_datareader_qos_from_profile (p. 320)

- DDS_DomainParticipantFactory_get_datareader_qos_from_profile_w_topic_name (p. 321)
- ^ DDS_DomainParticipantFactory_get_gos_profile_libraries (p. 324)
- ^ DDS_DomainParticipantFactory_get_qos_profiles (p. 325)
- ^ DDS_DomainParticipantFactory_load_profiles (p. 314)

The QoS profiles are reloaded replacing previously loaded profiles when the following operations are called:

- ^ DDS_DomainParticipantFactory_set_gos (p. 313)
- ^ DDS_DomainParticipantFactory_reload_profiles (p. 315)

The DDS_DomainParticipantFactory_unload_profiles() (p. 315) operation will free the resources associated with the XML QoS profiles.

There are five ways to configure the XML resources (listed by load order):

- The file NDDS_QOS_PROFILES.xml in \$NDDSHOME/resource/gos_profiles_4.5c/xml loaded and is if itexists ProfileQosPolicy::ignore_resource_profile (p. 1306)inDDS -ProfileQosPolicy (p. 1304) is set to DDS_BOOLEAN_FALSE (p. 107) (first to be loaded). An example file, NDDS_QOS_-PROFILES.example.xml, is available for reference.
- ^ The URL groups separated by semicolons referenced by the environment variable NDDS_QOS_PROFILES are loaded if they exist and DDS_ProfileQosPolicy::ignore_environment_profile (p. 1305) in DDS_ProfileQosPolicy (p. 1304) is set to DDS_BOOLEAN_FALSE (p. 107).
- The file USER_QOS_PROFILES.xml in the working directory will be loaded if it exists and DDS_ProfileQosPolicy::ignore_user_profile (p. 1305) in DDS_ProfileQosPolicy (p. 1304) is set to DDS_BOOLEAN_FALSE (p. 107).
- The URL groups referenced by **DDS_ProfileQosPolicy::url_profile** (p. 1305) in **DDS_ProfileQosPolicy** (p. 1304) will be loaded if specified.
- The sequence of XML strings referenced by **DDS_- ProfileQosPolicy::string_profile** (p. 1305) will be loaded if specified (last to be loaded).

The above methods can be combined together.

4.108.2 URL

The location of the XML resources (only files and strings are supported) is specified using a URL (Uniform Resource Locator) format. For example:

File Specification: file:///usr/local/default_dds.xml

String Specification: str://" <dds> <qos_library> . . . lt;/qos_library> </dds>"

If the URL schema name is omitted, RTI Data Distribution Service will assume a file name. For example:

File Specification: /usr/local/default_dds.xml

4.108.2.1 URL groups

To provide redundancy and fault tolerance, you can specify multiple locations for a single XML document via URL groups. The syntax of a URL group is as follows:

```
[URL1 | URL2 | URL2 | . . . | URLn]
```

For example:

[file:///usr/local/default_dds.xml | file:///usr/local/alternative_-default_dds.xml]

Only one of the elements in the group will be loaded by RTI Data Distribution Service, starting from the left.

Brackets are not required for groups with a single URL.

4.108.2.2 NDDS_QOS_PROFILES environment variable

The environment variable NDDS_QOS_PROFILES contains a list of URL groups separated by ';'

The URL groups referenced by the environment variable are loaded if they exist and DDS_ProfileQosPolicy::ignore_environment_profile (p. 1305) is set to DDS_BOOLEAN_FALSE (p. 107)

For more information on XML Configuration, refer to the User's Manual.

4.109 Publication Example

A data publication example.

4.109.1 A typical publication example

Prep

^ Create user data types using rtiddsgen (p. 969)

Set up

```
\hat{} Get the factory (p. 901)
```

```
^ Set up participant (p. 901)
```

```
^ Set up publisher (p. 910)
```

^ Register user data type(s) (p. 904)

```
^ Set up topic(s) (p. 904)
```

^ Set up data writer(s) (p.912)

Adjust the desired quality of service (QoS)

^ Adjust QoS on entities as necessary (p. 924)

Send data

^ Send data (p. 913)

Tear down

```
^ Tear down data writer(s) (p. 914)
```

^ Tear down topic(s) (p. 905)

^ Tear down publisher (p. 910)

[^] Tear down participant (p. 903)

4.110 Subscription Example

A data subscription example.

4.110.1 A typical subscription example

Prep

^ Create user data types using rtiddsgen (p. 969)

Set up

- ^ Get the factory (p. 901)
- [^] Set up participant (p. 901)
- ^ Set up subscriber (p. 915)
- ^ Register user data type(s) (p. 904)
- ^ Set up topic(s) (p. 904)
- ^ Set up data reader(s) (p. 919)
- ^ Set up data reader (p. 920) OR Set up subscriber (p. 916) to receive data

Adjust the desired quality of service (QoS)

^ Adjust QoS on entities as necessary (p. 924)

Receive data

Access received data either via a reader (p. 920) OR via a subscriber (p. 916) (possibly in a ordered or coherent (p. 917) manner)

Tear down

- ^ Tear down data reader(s) (p. 923)
- Tear down topic(s) (p.905)
- ^ Tear down subscriber (p. 918)
- ^ Tear down participant (p. 903)

4.111 Participant Use Cases

Working with domain participants. Working with domain participants.

4.111.1 Turning off auto-enable of newly created participant(s)

- ^ Get the factory (p. 901)
- ^ Change the value of the ENTITY_FACTORY (p. 180) for the DDS_-DomainParticipantFactory (p. 302)

4.111.2 Getting the factory

^ Get the DDS_DomainParticipantFactory instance:

```
DDS_DomainParticipantFactory* factory = NULL;
factory = DDS_DomainParticipantFactory_get_instance();
if (factory == NULL) {
    printf("***Error: failed to get domain participant factory\n");
}
```

4.111.3 Setting up a participant

- ^ Get the factory (p. 901)
- ^ Create DDS_DomainParticipant:

```
struct DDS_DomainParticipantQos participant_qos =
   DDS DomainParticipantQos INITIALIZER:
DDS_DomainParticipant* participant;
struct DDS_DomainParticipantListener participant_listener =
    DDS_DomainParticipantListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* Set the initial peers. These list all the computers the application
  may communicate with along with the maximum number of RTI Data
  Distribution Service participants that can concurrently run on that
   computer. This list only needs to be a superset of the actual list of
  computers and participants that will be running at any time.
const char* NDDS_DISCOVERY_INITIAL_PEERS[] = {
    "host1",
    "10.10.30.192",
    "1@localhost",
    "2@host2".

                                                     DDS_STATUS_MASK_ALL);
 if (participant == NULL) {
    printf("***Error: failed to create domain participant\n");
return participant;
```

4.111.4 Tearing down a participant

- ^ Get the factory (p. 901)
- ^ Delete DDS_DomainParticipant:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipantFactory_delete_participant(
    factory, participant);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete domain participant\n");
}
```

4.112 Topic Use Cases

Working with topics.

4.112.1 Registering a user data type

```
^ Set up participant (p. 901)
```

```
Register user data type of type T under the name "My_Type"
```

```
const char* type_name = "My_Type";
DDS_ReturnCode_t retcode;
retcode = FooTypeSupport_register_type(participant, type_name);
if (retcode != DDS_RETCODE_OK) {
        printf("***Error: failed to register type\n");
}
```

4.112.2 Setting up a topic

- ^ Set up participant (p. 901)
- ^ Ensure user data type is registered (p. 904)
- ^ Create a DDS_Topic under the name "my_topic"

```
const char* topic_name = "my_topic";
const char* type_type = "My_Type"; /* user data type */
struct DDS_TopicQos topic_qos = DDS_TopicQos_INITIALIZER;
DDS_Topic* topic;
struct DDS_TopicListener topic_listener = DDS_TopicListener_INITIALIZER;
/* MyTopicListener_InconsistentTopic function is user defined to match
  DDS_TopicListener_InconsistentTopicCallback */
topic_listener.on_inconsistent_topic = MyTopicListener_InconsistentTopic;
retcode = DDS_DomainParticipant_get_default_topic_qos(participant,
                                            &topic_qos);
if (retcode != DDS_RETCODE_OK) {
   printf("***Error: failed to get default topic qos\n");
topic = DDS_DomainParticipant_create_topic(participant,
                                           topic_name,
                                           type_name,
                                           &topic_qos,
                                           &topic_listener /* or NULL */,
```

```
DDS_STATUS_MASK_ALL);
if (topic == NULL) {
    printf("***Error: failed to create topic\n");
}
```

4.112.3 Tearing down a topic

^ Delete DDS_Topic:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipant_delete_topic(participant, topic);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete topic\n");
}
```

4.113 FlowController Use Cases

Working with flow controllers.

4.113.1 Creating a flow controller

- [^] Set up participant (p. 901)
- ^ Create a flow controller

```
DDS_ReturnCode_t retcode;
DDS_FlowController *controller = NULL;
struct DDS_FlowControllerProperty_t property = DDS_FlowControllerProperty_t_INITIALIZER;

retcode = DDS_DomainParticipant_get_default_flowcontroller_property(
    participant, &property);

if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default flow controller property\n");
}

/* optionally modify flow controller property values */

controller = DDS_DomainParticipant_create_flowcontroller(
    participant, "my flow controller name", &property);

if (controller == NULL) {
    printf("***Error: failed to create flow controller\n");
}
```

4.113.2 Flow controlling a data writer

- ^ Set up participant (p. 901)
- ^ Create flow controller (p. 906)
- ^ Create an asynchronous data writer, **FooDataWriter** (p. 1496), of user data type Foo (p. 1494):

```
MyWriterListener_OfferedIncompatibleQos;
writer_listener.on_liveliness_lost = MyWriterListener_LivelinessLost;
writer_listener.on_publication_matched = MyWriterListener_PublicationMatch;
retcode = DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default datawriter qos\n");
/* Change the writer QoS to publish asnychronously */
writer_qos.publish_mode.kind = DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS;
/* Setup to use the previously created flow controller */
writer_qos.publish_mode.flow_controller_name =
    DDS_String_dup("my flow controller name");
/* Samples queued for asynchronous write are subject to the History Qos policy */
writer_qos.history.kind = DDS_KEEP_ALL_HISTORY_QOS;
writer = DDS_Publisher_create_datawriter(publisher,
                                         &writer_qos,
                                         &writer_listener /* or NULL */,
                                         DDS_STATUS_MASK_ALL);
if (writer == NULL) {
    printf("***Error: failed to create writer\n");
/* Send data asynchronously... */
/* Wait for asynchronous send completes, if desired */
retcode = DDS_DataWriter_wait_for_asynchronous_publishing(writer, &timout);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to wait for asynchronous publishing\n");
```

4.113.3 Using the built-in flow controllers

RTI Data Distribution Service provides several built-in flow controllers.

The DDS_DEFAULT_FLOW_CONTROLLER_NAME (p. 731) built-in flow controller provides the basic asynchronous writer behavior. When calling FooDataWriter_write (p. 684), the call signals the DDS_Publisher (p. 632) asynchronous publishing thread (DDS_PublisherQos::asynchronous_publisher (p. 1329)) to send the actual data. As with any DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222) DDS_DataWriter (p. 673), the FooDataWriter_write (p. 684) call returns immediately afterwards. The data is sent immediately in the context of the DDS_Publisher (p. 632) asynchronous publishing thread.

When using the DDS_FIXED_RATE_FLOW_CONTROLLER_NAME

(p. 732) flow controller, data is also sent in the context of the DDS_-Publisher (p. 632) asynchronous publishing thread, but at a regular fixed interval. The thread accumulates samples from different DDS_DataWriter (p. 673) instances and generates data on the wire only once per DDS_-FlowControllerTokenBucketProperty_t::period (p. 1224).

In contrast, the DDS_ON_DEMAND_FLOW_CONTROLLER_NAME (p. 733) flow controller permits flow only when DDS_FlowController_trigger_flow (p. 730) is called. The data is still sent in the context of the DDS_Publisher (p. 632) asynchronous publishing thread. The thread accumulates samples from different DDS_DataWriter (p. 673) instances (across any DDS_Publisher (p. 632)) and sends all data since the previous trigger.

The properties of the built-in **DDS_FlowController** (p. 726) instances can be adjusted.

- [^] Set up participant (p. 901)
- ^ Lookup built-in flow controller

```
DDS_FlowController *controller = NULL;
controller = DDS_DomainParticipant_lookup_flowcontroller(
    participant, DDS_DEFAULT_FLOW_CONTROLLER_NAME);

/* This should never happen, built-in flow controllers are always created */
if (controller == NULL) {
    printf("***Error: failed to lookup flow controller\n");
}
```

^ Change property of built-in flow controller, if desired

```
DDS_ReturnCode_t retcode;
struct DDS_FlowControllerProperty_t property = DDS_FlowControllerProperty_t_INITIALIZER;

/* Get the property of the flow controller */
retcode = DDS_FlowController_get_property(controller, &property);

if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get flow controller property\n");
}

/* Change the property value as desired */
property.token_bucket.period.sec = 2;
property.token_bucket.period.nanosec = 0;

/* Update the flow controller property */
retcode = DDS_FlowController_set_property(controller, &property);

if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to set flow controller property\n");
```

^ Create a data writer using the correct flow controller name (p. 906)

4.113.4 Shaping the network traffic for a particular transport

- ^ Set up participant (p. 901)
- ^ Create the transports (p. 931)
- ^ Create a separate flow controller for each transport (p. 906)
- ^ Configure **DDS_DataWriter** (p. 673) instances to only use a single transport
- Associate all data writers using the same transport to the corresponding flow controller (p. 906)
- ^ For each transport, the corresponding flow controller limits the network traffic based on the token bucket properties

4.113.5 Coalescing multiple samples in a single network packet

- ^ Set up participant (p. 901)
- ^ Create a flow controller with a desired token bucket period (p. 906)
- ^ Associate the data writer with the flow controller (p. 906)
- ^ Multiple samples written within the specified period will be coalesced into a single network packet (provided that tokens_added_per_period and bytes_per_token permit).

4.114 Publisher Use Cases

Working with publishers.

4.114.1 Setting up a publisher

- ^ Set up participant (p. 901)
- ^ Create a DDS_Publisher

```
struct DDS_PublisherQos publisher_qos = DDS_PublisherQos_INITIALIZER;
DDS_Publisher* publisher;
struct DDS_PublisherListener publisher_listener =
   DDS_PublisherListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* MyPublisherListener_* functions are user defined to match
  DDS_PublisherListener functions */
publisher_listener.as_datawriterlistener.on_offered_deadline_missed =
   MyPublisherListener_OfferedDeadlineMissed;
publisher_listener.as_datawriterlistener.on_offered_incompatible_qos =
   MyPublisherListener_OfferedIncompatibleQos;
publisher_listener.as_datawriterlistener.on_liveliness_lost =
   MyPublisherListener_LivelinessLost;
publisher_listener.as_datawriterlistener.on_publication_matched =
   MyPublisherListener_PublicationMatch;
retcode = DDS_DomainParticipant_get_default_publisher_qos(participant,
                                                &publisher_qos);
if (retcode != DDS_RETCODE_OK) {
   printf("***Error: failed to get default publisher qos\n");
publisher = DDS_DomainParticipant_create_publisher(participant,
                                                   &publisher_qos,
                                                   &publisher_listener /* or NULL */,
                                                   DDS_STATUS_MASK_ALL);
if (publisher == NULL) {
   printf("***Error: failed to create publisher\n");
```

4.114.2 Tearing down a publisher

^ Delete DDS_Publisher:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipant_delete_publisher(participant, publisher);
```

```
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete publisher\n");
}
```

DataWriter Use Cases 4.115

Working with data writers.

4.115.1 Setting up a data writer

```
<sup>^</sup> Set up publisher (p. 910)
^ Set up a topic (p. 904)
^ Create a data writer, FooDataWriter (p. 1496), of user data type Foo
  (p. 1494):
      struct DDS_DataWriterQos writer_qos = DDS_DataWriterQos_INITIALIZER;
      DDS_DataWriter* writer;
      struct DDS_DataWriterListener writer_listener =
          DDS_DataWriterListener_INITIALIZER;
      /* MyWriterListener_* functions are user defined to match
         DDS_DataWriterListener functions */
      writer_listener.on_offered_deadline_missed =
          MyWriterListener_OfferedDeadlineMissed;
      writer_listener.on_offered_incompatible_qos =
          MyWriterListener_OfferedIncompatibleQos;
      writer_listener.on_liveliness_lost = MyWriterListener_LivelinessLost;
      writer_listener.on_publication_match = MyWriterListener_PublicationMatch;
      retcode = DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
      if (retcode != DDS_RETCODE_OK) {
          printf("***Error: failed to get default datawriter qos\n");
      writer = DDS_Publisher_create_datawriter(publisher,
                                               &writer_qos,
                                               &writer_listener /* or NULL */,
                                               DDS_STATUS_MASK_ALL);
      if (writer == NULL) {
          printf("***Error: failed to create writer\n");
       Managing instances
```

4.115.2

```
^ Getting an instance "key" value of user data type Foo (p. 1494)
                               /* user data */
    struct Foo* data = ...;
    retcode = FooDataWriter_get_key_value(writer, data, &instance_handle);
```

```
if (retcode != DDS_RETCODE_OK) {
           /* ... check for cause of failure */
     Registering an instance of type Foo (p. 1494)
       DDS_InstanceHandle_t instance_handle = DDS_HANDLE_NIL;
       instance_handle = FooDataWriter_register_instance(writer, data);
   ^ Unregistering an instance of type Foo (p. 1494)
       retcode = FooDataWriter_unregister_instance(writer, data, &instance_handle);
       if (retcode != DDS_RETCODE_OK) {
           /* ... check for cause of failure */
   ^ Disposing of an instance of type Foo (p. 1494)
       retcode = FooDataWriter_dispose(writer, data, &instance_handle);
       if (retcode != DDS_RETCODE_OK) {
           /* ... check for cause of failure */
            Sending data
4.115.3
   ^ Set up data writer (p. 912)
   ^ Register instance (p. 912)
   ^ Write instance of type Foo (p. 1494)
       struct Foo* data = ...;
                                  /* user data */
       DDS_InstanceHandle_t instance_handle =
           DDS_HANDLE_NIL; /* or a valid registered handle */
       DDS_ReturnCode_t retcode;
       retcode = FooDataWriter_write(writer, data, &instance_handle);
       if (retcode != DDS_RETCODE_OK) {
           /* ... check for cause of failure */
```

4.115.4 Tearing down a data writer

 $\hat{\ }$ Delete DDS_DataWriter:

```
DDS_ReturnCode_t retcode;
retcode = DDS_Publisher_delete_datawriter(publisher, writer);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete writer\n");
}
```

4.116 Subscriber Use Cases

Working with subscribers.

4.116.1 Setting up a subscriber

- ^ Set up participant (p. 901)
- ^ Create a DDS_Subscriber

```
struct DDS_SubscriberQos subscriber_qos = DDS_SubscriberQos_INITIALIZER;
DDS_Subscriber* subscriber;
struct DDS_SubscriberListener subscriber_listener = DDS_SubscriberListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* MySubscriberListener_* functions are user defined to match
   DDS_SubscriberListener functions */
subscriber_listener.on_data_on_readers =
    MySubscriberListener_DataOnReaders;
subscriber_listener.as_datareaderlistener.on_requested_deadline_missed =
    MySubscriberListener_RequestedDeadlineMissed;
subscriber_listener.as_datareaderlistener.on_requested_incompatible_qos =
   MySubscriberListener_RequestedIncompatibleQos;
subscriber_listener.as_datareaderlistener.on_sample_rejected =
   MySubscriberListener_SampleRejected;
subscriber_listener.as_datareaderlistener.on_liveliness_changed =
    MySubscriberListener_LivelinessChanged;
subscriber_listener.as_datareaderlistener.on_data_available =
    MySubscriberListener_DataAvailable;
subscriber_listener.as_datareaderlistener.on_subscription_matched =
    MySubscriberListener_SubscriptionMatch;
subscriber_listener.as_datareaderlistener.on_sample_lost =
    MySubscriberListener_SampleLost;
retcode = DDS_DomainParticipant_get_default_subscriber_qos(participant,
                                                 &subscriber_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default subscriber qos\n");
subscriber = DDS_DomainParticipant_create_subscriber(participant,
                                                      &subscriber_qos,
                                                      &subscriber_listener /*or NULL*/,
                                                      DDS_STATUS_MASK_ALL);
if (subscriber == NULL) {
    printf("***Error: failed to create subscriber\n");
```

4.116.2 Set up subscriber to access received data

- ^ Set up subscriber (p. 915)
- ^ Set up to handle the DDS_DATA_ON_READERS_STATUS status, in one or both of the following two ways.
- Enable DDS_DATA_ON_READERS_STATUS for the DDS_SubscriberListener associated with the subscriber (p. 925)
 - The processing to handle the status change is done in the DDS_-SubscriberListener_on_data_on_readers() method of the attached listener.
 - Typical processing will access the received data (p. 916), either in arbitrary order or in a coherent and ordered manner (p. 917).
- ^ Enable DDS_DATA_ON_READERS_STATUS for the DDS_StatusCondition associated with the subscriber (p. 926)
 - The processing to handle the status change is done when the subscriber's attached status condition is triggered (p. 928) and the DDS_DATA_ON_READERS_STATUS status on the subscriber is changed.
 - Typical processing will access the received data (p. 916), either in an arbitrary order or in a coherent and ordered manner (p. 917).

4.116.3 Access received data via a subscriber

- ^ Ensure subscriber is set up to access received data (p. 916)
- ^ Get the list of readers that have data samples available:

```
if (retcode != DDS_RETCODE_OK) {
         printf("***Error: failed to access received data via subscriber\n");
        return;
}
```

- ^ Upon successfully getting the list of readers with data, process the data readers to either:
 - Read the data in each reader (p. 922), OR
 - Take the data in each reader (p. 921)

If the intent is to access the data **coherently or in order** (p. 917), the list of data readers *must* be processed in the order returned:

`Alternatively, call DDS_Subscriber_notify_datareaders() (p. 757) to invoke the DDS_DataReaderListener (p. 1065) for each of the data readers.

```
DDS_ReturnCode_t retcode;
retcode = DDS_Subscriber_notify_datareaders(subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to notify datareaders\n");
}
```

4.116.4 Access received data coherently and/or in order

To access the received data coherently and/or in an ordered manner, according to the settings of the DDS_PresentationQosPolicy (p. 1297) attached to a DDS_Subscriber:

- ^ Ensure subscriber is set up to access received data (p. 916)
- ^ Indicate that data will be accessed via the subscriber:

```
retcode = DDS_Subscriber_begin_access(subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to begin access\n");
}
```

- ^ Access received data via the subscriber, making sure that the data readers are processed in the order returned. (p. 916)
- ^ Indicate that the data access via the subscriber is done:

```
retcode = DDS_Subscriber_end_access(subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to end access\n");
}
```

4.116.5 Tearing down a subscriber

^ Delete DDS_Subscriber:

```
DDS_ReturnCode_t retcode;
retcode = DDS_DomainParticipant_delete_subscriber(participant, subscriber);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete subscriber\n");
}
```

4.117 DataReader Use Cases

Working with data readers.

4.117.1 Setting up a data reader

```
^ Set up subscriber (p. 915)
```

- ^ Set up a topic (p. 904)
- ^ Create a data reader, **FooDataReader** (p. 1495), of user data type **Foo** (p. 1494):

```
struct DDS_DataReaderQos reader_qos = DDS_DataReaderQos_INITIALIZER;
DDS_DataReader* reader;
struct DDS_DataReaderListener reader_listener =
    DDS_DataReaderListener_INITIALIZER;
DDS_ReturnCode_t retcode;
/* MyReaderListener_* functions are user defined to match
   DDS_ReaderListener functions */
reader_listener.on_requested_deadline_missed =
   MyReaderListener_RequestedDeadlineMissed;
reader_listener.on_requested_incompatible_qos =
    MyReaderListener_RequestedIncompatibleQos;
reader_listener.on_sample_rejected = MyReaderListener_SampleRejected;
reader_listener.on_liveliness_changed =
    MyReaderListener_LivelinessChanged;
reader_listener.on_data_available = MyReaderListener_DataAvailable;
reader_listener.on_subscription_match =
    MyReaderListener_SubscriptionMatch;
reader_listener.on_sample_lost = MyReaderListener_SampleLost;
retcode = DDS_Subscriber_get_default_datareader_qos(
            subscriber, &reader_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default datareader qos\n");
reader = DDS_Subscriber_create_datareader(subscriber,
            DDS_Topic_as_topicdescription(topic),
            &reader_qos,
            &reader_listener /* or NULL */,
            DDS_STATUS_MASK_ALL);
if (reader == NULL) {
    printf("***Error: failed to create reader\n");
```

4.117.2 Managing instances

^ Given a data reader

```
FooDataReader* reader = ...;

Getting an instance "key" value of user data type Foo (p. 1494)

struct Foo* data = ...; /* user data of type Foo */

retcode = FooDataReader_get_key_value(reader, data, &instance_handle);

if (retcode != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

4.117.3 Set up reader to access received data

- ^ Set up data reader (p. 919)
- ^ Set up to handle the DDS_DATA_AVAILABLE_STATUS status, in one or both of the following two ways.
- ^ Enable DDS_DATA_AVAILABLE_STATUS for the DDS_-DataReaderListener associated with the data reader (p. 925)
 - The processing to handle the status change is done in the DDS_-DataReaderListener_on_data_available() method of the attached listener
 - Typical processing will access the received data (p. 920).
- Enable DDS_DATA_AVAILABLE_STATUS for the DDSStatus-Condition associated with the data reader (p. 926)
 - The processing to handle the status change is done when the data reader's attached status condition is triggered (p. 928) and the DDS_DATA_AVAILABLE_STATUS status on the data reader is changed.
 - Typical processing will access the received data (p. 920).

4.117.4 Access received data via a reader

- ^ Ensure reader is set up to access received data (p.920)
- ^ Access the received data, by either:
 - Taking the received data in the reader (p. 921), OR
 - Reading the received data in the reader (p. 922)

4.117.5 Taking data

- ^ Ensure reader is set up to access received data (p. 920)
- ` Take samples of user data type T. The samples are removed from the Service. The caller is responsible for deallocating the buffers.

```
DDS_SampleStateMask
                            sample_state_mask = DDS_ANY_SAMPLE_STATE;
      DDS_ViewStateMask
                            view_state_mask = DDS_ANY_ VIEW_STATE;
      DDS_InstanceStateMask instance_state_mask = DDS_ANY_INSTANCE_STATE;
      struct FooSeq data_seq = FooSeq_INITIALIZER;
      struct DDS_SampleInfoSeq info_seq = DDS_SampleInfoSeq_INITIALIZER;
      DDS_ReturnCode_t retcode;
      retcode = FooDataReader_take(reader, &data_seq, &info_seq,
                                   max_samples,
                                    sample_state_mask,
                                    view_state_mask,
                                    instance_state_mask);
      if (retcode == DDS_RETCODE_NO_DATA) {
          return;
      } else { if (retcode != DDS_RETCODE_OK) {
          printf("***Error: failed to access data from the reader\n");
^ Use the received data
      struct Foo* data = NULL;
      struct DDS_SampleInfo* info = NULL;
      int i:
      for(i = 0; i < FooSeq_get_length(&data_seq); ++i) {</pre>
          info = DDS_SampleInfoSeq_get_reference(&info_seq, i);
          data = FooSeq_get_reference(&data_seq, i);
          /* Note that depending on the info->sample_state
            it is possible that data will be NULL
           */
          /* ... */
```

^ Return the data samples and the information buffers back to the middleware. *IMPORTANT*: Once this call returns, you must not retain any pointers to any part of any sample or sample info object.

```
DDS_ReturnCode_t retcode;
retcode = FooDataReader_return_loan(reader, &data_seq, &info_seq);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to return loan\n");
}
```

4.117.6 Reading data

- Ensure reader is set up to access received data (p. 920)
- Read samples of user data type Foo (p. 1494). The samples are not removed from the Service. It remains responsible for deallocating the buffers.

```
DDS_SampleStateMask
                     sample_state_mask = DDS_ANY_SAMPLE_STATE;
DDS ViewStateMask
                     view_state_mask = DDS_ANY_ VIEW_STATE;
DDS_InstanceStateMask instance_state_mask = DDS_ANY_INSTANCE_STATE;
struct FooSeq data_seq = FooSeq_INITIALIZER;
struct DDS_SampleInfoSeq info_seq = DDS_SampleInfoSeq_INITIALIZER;
DDS_ReturnCode_t retcode;
retcode = FooDataReader_read(reader, &data_seq, &info_seq,
                             max_samples,
                             sample_state_mask,
                             view_state_mask,
                             instance_state_mask);
if (retcode == DDS_RETCODE_NO_DATA) {
    return;
} else if (retcode != DDS_RETCODE_OK) {
   printf("***Error: failed to access data from the reader\n");
```

^ Use the received data

```
struct Foo* data = NULL;
struct DDS_SampleInfo* info = NULL;
int i:
for(i = 0; i < FooSeq_get_length(&data_seq); ++i) {</pre>
    info = DDS_SampleInfoSeq_get_reference(&info_seq, i);
    data = FooSeq_get_reference(&data_seq, i);
    /* Note that depending on the info->sample_state
     it is possible that data will be NULL
     */
    /* ... */
```

Return the data samples and the information buffers back to the middleware

```
retcode = FooDataReader_return_loan(reader, &data_seq, &info_seq);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to return loan\n");
```

4.117.7 Tearing down a data reader

^ Delete DDS_DataReader:

```
DDS_ReturnCode_t retcode;
retcode = DDS_Subscriber_delete_datareader(subscriber, reader);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to delete reader\n");
}
```

4.118 Entity Use Cases

Working with entities.

4.118.1 Enabling an entity

^ To enable an **DDS_Entity** (p. 242)

```
if (DDS_Entity_enable((DDS_Entity*)entity) != DDS_RETCODE_OK) {
    printf("***Error: failed to enable entity\n");
}
```

4.118.2 Checking if a status changed on an entity.

^ Given an **DDS_Entity** (p. 242) and a **DDS_StatusKind** (p. 128) to check for, get the list of statuses that have changed since the last time they were respectively cleared.

```
DDS_StatusMask status_changes_mask;
status_changes_mask = DDS_Entity_get_status_changes(entity);
```

^ Check if status_kind was changed since the last time it was cleared. A plain communication status change is cleared when the status is read using the entity's get_<plain communication status>() method. A read communication status change is cleared when the data is taken from the middleware via a TDataReader_take() call [see Changes in Status (p. 125) for details].

```
if (status_changes_mask & status_kind) {
    return 1; /* ... YES, status_kind changed ... */
} else {
    return 0; /* ... NO, status_kind did NOT change ... */
}
```

4.118.3 Changing the QoS for an entity

The QoS for an entity can be specified at the entity creation time. Once an entity has been created, its QoS can be manipulated as follows.

• Get an entity's QoS settings using get_qos (abstract) (p. 244)

```
if (DDS_DomainParticipant_get_qos(entity, &qos) != DDS_RETCODE_OK) {
    printf("***Error: failed to get qos\n");
}
```

}

^ Change the desired gos policy fields

```
/* Change the desired qos policies */
      /* qos.policy.field = ... */
^ Set the gos using set_gos (abstract) (p. 243).
      switch (DDS_DomainParticipant_set_qos(entity, &qos)) {
          case DDS_RETCODE_OK: { /* success */
          } break;
          case DDS_RETCODE_IMMUTABLE_POLICY: {
              printf("***Error: tried changing a policy that can only be"
                               set at entity creation time\n");
          case DDS_RETCODE_INCONSISTENT_POLICY: {
              printf("***Error: tried changing a policy to a value inconsistent"
                             with other policy settings\n");
          } break;
          default: {
              printf("***Error: some other failure\n");
          }
```

4.118.4 Changing the listener and enabling/disabling statuses associated with it

DDS_DomainParticipantQos_finalize(&qos);

The listener for an entity can be specified at the entity creation time. By default the listener is *enabled* for all the statuses supported by the entity.

Once an entity has been created, its listener and/or the statuses for which it is enabled can be manipulated as follows.

^ User defines entity listener methods

^ Set the entity_listener functions

• Get an entity's listener using **get_listener** (abstract) (p. 245)

```
entity_listener = DDS_Entity_get_listener(entity);
```

^ Enable status_kind for the listener

```
enabled_status_list |= status_kind;
```

^ Disable status_kind for the listener

```
enabled_status_list &= "status_kind;
```

^ Set an entity's listener to entity_listener using set_listener (abstract) (p. 244). Only enable the listener for the statuses specified by the enabled_status_list.

```
if (DDS_Entity_set_listener(entity, &entity_listener, enabled_status_list)
    != DDS_RETCODE_OK) {
    printf("***Error: setting entity listener\n");
}
```

4.118.5 Enabling/Disabling statuses associated with a status condition

Upon entity creation, by default, all the statuses are *enabled* for the DDS_-StatusCondition associated with the entity.

Once an entity has been created, the list of statuses for which the DDS_-StatusCondition is triggered can be manipulated as follows.

• Given an entity, a status_kind, and the associated status_condition:

```
statuscondition = DDS_Entity_get_statuscondition(entity);
```

^ Get the list of statuses enabled for the status_condition

```
enabled_status_list = DDS_StatusCondition_get_enabled_statuses(statuscondition);
```

^ Check if the given status_kind is enabled for the status_condition

```
if (enabled_status_list & status_kind) {
    /*... YES, status_kind is enabled ... */
} else {
    /* ... NO, status_kind is NOT enabled ... */
}
```

• Enable status_kind for the status_condition

4.119 Waitset Use Cases

Using wait-sets and conditions.

4.119.1 Setting up a wait-set

```
^ Create a wait-set
```

```
DDS_WaitSet* waitset = DDS_WaitSet_new();
Attach conditions
   DDS_Condition* cond1 = ...;
   DDS_Condition* cond2 = DDS_StatusCondition_as_condition(
                                 DDS_Entity_get_statuscondition(entity));
   DDS_Condition* cond3 = DDS_ReadCondition_as_condition(
                                 DDS_DataReader_create_readcondition(
                                         reader,
                                                          DDS_NOT_READ_SAMPLE_STATE,
                                         DDS_ANY_VIEW_STATE,
                                         DDS_ANY_INSTANCE_STATE));
   DDS_Condition* cond4 = DDS_GuardCondition_as_condition(
                                 DDS_GuardCondition_new());
  DDS_Condition* cond5 = ...;
   DDS_ReturnCode_t retcode;
   retcode = DDS_WaitSet_attach_condition(waitset, cond1);
   if (retcode != DDS_RETCODE_OK) {
      /* ... error */
   retcode = DDS_WaitSet_attach_condition(waitset, cond2);
   if (retcode != DDS_RETCODE_OK) {
      /* ... error */
  retcode = DDS_WaitSet_attach_condition(waitset, cond3);
   if (retcode != DDS_RETCODE_OK) {
       /* ... error */
  retcode = DDS_WaitSet_attach_condition(waitset, cond4);
   if (retcode != DDS_RETCODE_OK) {
      /* ... error */
   retcode = DDS_WaitSet_attach_condition(waitset, cond5);
   if (retcode != DDS_RETCODE_OK) {
      /* ... error */
```

4.119.2 Waiting for condition(s) to trigger

^ Set up a wait-set (p. 928)

^ Wait for a condition to trigger or timeout, whichever occurs first

```
#define TRUE 1
#define FALSE 0
struct DDS_Duration_t timeout = { 0, 1000000 }; /* 1ms */
struct DDS_ConditionSeq active_conditions = DDS_SEQUENCE_INITIALIZER; /* holder for active conditions */
int is_cond1_triggered = FALSE;
int is_cond2_triggered = FALSE;
int i;
DDS_ReturnCode_t retcode;
retcode = DDS_WaitSet_wait(waitset, &active_conditions, &timeout);
if (retcode != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
} else {
   /* success */
   if (DDS_ConditionSeq_get_length(&active_conditions) == 0) {
      printf("Wait timed out!! None of the conditions was triggered.\n");
   } else {
      /* check if "cond1" or "cond2" are triggered: */
      for(i = 0; i < DDS_ConditionSeq_get_length(&active_conditions); ++i) {</pre>
         if (DDS_ConditionSeq_get(&active_conditions, i) == cond1) {
            printf("Cond1 was triggered!");
            is_cond1_triggered = TRUE;
         if (DDS_ConditionSeq_get(&active_conditions, i) == cond2) {
            printf("Cond2 was triggered!");
            is_cond2_triggered = TRUE;
         if (is_cond1_triggered && is_cond2_triggered) {
            break;
     }
   }
}
if (is_cond1_triggered) {
   /* ... do something because "cond1" was triggered ... */
if (is_cond2_triggered) {
   /* ... do something because "cond2" was triggered ... */
```

4.119.3 Tearing down a wait-set

^ Delete the wait-set

DDS_WaitSet_delete(waitset);
waitset = NULL;

4.120 Transport Use Cases

Working with pluggable transports.

4.120.1 Changing the automatically registered built-in transports

- ^ The DDS_TRANSPORTBUILTIN_MASK_DEFAULT (p. 198) specifies the transport plugins that will be automatically registered with a newly created DDS_DomainParticipant (p. 339) by default.
- ^ This default can be changed by changing the value of the value of TRANSPORT_BUILTIN (p. 197) Qos Policy on the DDS_-DomainParticipant (p. 339)
- ^ To change the **DDS_DomainParticipantQos::transport_builtin** (p. 1159) Qos Policy:

4.120.2 Changing the properties of the automatically registered builtin transports

The behavior of the automatically registered builtin transports can be altered by changing their properties.

- Tell the **DDS_DomainParticipantFactory** (p. 302) to create the participants disabled, as described in **Turning off auto-enable of newly created participant(s)** (p. 901)
- Get the property of the desired builtin transport plugin, say ::UDPv4

 Transport (p. 1013)

^ Change the property fields as desired. Note that the properties should be changed carefully, as inappropriate values may prevent communications. For example, the ::UDPv4 Transport (p. 1013) properties can be changed to support large messages (assuming the underlying operating system's UDPv4 stack supports the large message size). Note: if message_size_max is increased from the default for any of the built-in transports, then the DDS_ReceiverPoolQosPolicy::buffer_size (p. 1341) on the DomainParticipant should also be changed.

• Enable the participant (p. 924) to turn on communications with other participants in the domain using the new properties for the automatically registered builtin transport plugins.

4.120.3 Creating a transport

}

- ^ A transport plugin is created using methods provided by the supplier of the transport plugin.
- For example to create an instance of the ::UDPv4 Transport (p. 1013)

```
NDDS_Transport_Plugin* transport = NULL;
struct NDDS_Transport_UDPv4_Property_t property = NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT;
transport = NDDS_Transport_UDPv4_new(&property);
if (transport == NULL) {
   printf("***Error: creating transport plugin\n");
}
```

4.120.4 Deleting a transport

- A transport plugin can only be deleted only after the DDS_-DomainParticipant (p. 339) with which it is registered is deleted.
- ^ The virtual destructor provided by the abstract transport plugin API can be used to delete a transport plugin.

```
transport->delete_cEA(transport, NULL);
```

4.120.5 Registering a transport with a participant

The basic steps for setting up transport plugins for use in an RTI Data Distribution Service application are described below.

Tell the **DDS_DomainParticipantFactory** (p. 302) to create the participants disabled, as described in **Turning off auto-enable of newly created participant(s)** (p. 901)

Optionally Changing the automatically registered built-in transports (p. 931)

Optionally Changing the properties of the automatically registered builtin transports (p. 931)

- [^] Create a disabled **DDS_DomainParticipant** (p. 339), as described in **Setting up a participant** (p. 901)
- ^ Decide on the **network address** (p. 865) for the transport plugin. The network address should be chosen so that the resulting fully qualified address is globally unique (across all transports used in the domain).

Decide on the aliases (p. 862) for the transport plugin. An alias can refer to one or more transport plugins. The transport class name (see Builtin Transport Class Names (p. 195)) are automatically appended to the user-provided aliases. Alias names are useful in creating logical groupings of transports, e.g. all the transports that are configured to support large messages may be given the alias "large_message".

```
/* Decide aliases, i.e. the names by which this transport plugin will be known */
const char* ALIASES[] = {
    "my",
    "large_message",
};
const DDS_Long ALIASES_LENGTH = sizeof(ALIASES)/sizeof(const char*);

/* Initialize the aliases StringSeq */
struct DDS_StringSeq aliases = DDS_SEQUENCE_INITIALIZER;

if (!DDS_StringSeq_from_array(&aliases, ALIASES, ALIASES_LENGTH)) {
    printf("***Error: creating initializing aliases\n");
}
```

Register the transport plugin with the **DDS_DomainParticipant** (p. 339). Note that a transport plugin should **NOT be registered with more than one DomainParticipant**. It is the responsibility of the application programmer to ensure that this requirement is not violated.

Optionally Adding receive routes for a transport (p. 934)

Optionally Adding send routes for a transport (p. 935)

• Enable the participant (p. 924) to turn on communications with other participants in the domain, using the newly registered transport plugins, and automatically registered builtin transport plugins (if any).

4.120.6 Adding receive routes for a transport

- ^ Receive routes can be added to restrict address ranges on which incoming messages can be received. Any number of receive routes can be added, but these must be done before the participant is enabled.
- ^ To restrict the address range from which incoming messages can be received by the transport plugin:

4.120.7 Adding send routes for a transport

- ^ Send routes can be added to restrict the address ranges to which outgoing messages can be sent by the transport plugin. Any number of send routes can be added, but these must be done before the participant is enabled.
- ^ To restrict address ranges to which outgoing messages can be sent by the transport plugin:

4.121 Filter Use Cases

Working with data filters.

4.121.1 Introduction

RTI Data Distribution Service supports filtering data either during the exchange from **DDS_DataWriter** (p. 673) to **DDS_DataReader** (p. 783), or after the data has been stored at the **DDS_DataReader** (p. 783).

Filtering during the exchange process is performed by a **DDS_ContentFilteredTopic** (p. 426), which is created by the **DDS_DataReader** (p. 783) as a way of specifying a subset of the data samples that it wishes to receive.

Filtering samples that have already been received by the DDS_DataReader (p. 783) is performed by creating a DDS_QueryCondition (p. 845), which can then used to check for matching samples, be alerted when matching samples arrive, or retrieve matching samples through use of the FooDataReader_read_w_condition (p. 796) or FooDataReader_take_w_condition (p. 797) functions. (Conditions may also be used with the APIs FooDataReader_read_next_instance_w_condition (p. 808) and FooDataReader_take_next_instance_w_condition (p. 809).)

Filtering may be performed on any topic, either keyed or un-keyed, except the **Built-in Topics** (p. 410). Filtering may be performed on any field, subset of fields, or combination of fields, subject only to the limitations of the filter syntax, and some restrictions against filtering some *sparse value types* of the **Dynamic Data** (p. 519) API.

RTI Data Distribution Service contains built in support for filtering using SQL syntax, described in the **Queries and Filters Syntax** (p. 957) module.

4.121.1.1 Overview of ContentFilteredTopic

Each DDS_ContentFilteredTopic (p. 426) is created based on an existing DDS_Topic (p. 425). The DDS_Topic (p. 425) specifies the field_names and field_types of the data contained within the topic. The DDS_ContentFilteredTopic (p. 426), by means of its filter_expression and expression_parameters, futher specifies the *values* of the data which the DDS_DataReader (p. 783) wishes to receive.

Custom filters may also be constructed and utilized as described in the **Creating Custom Content Filters** (p. 942) module.

Once the **DDS_ContentFilteredTopic** (p. 426) has been created, a **DDS_DataReader** (p. 783) can be created using the filtered topic. The filter's

characteristics are exchanged between the **DDS_DataReader** (p. 783) and any matching **DDS_DataWriter** (p. 673) during the discovery processs.

If the DDS_DataWriter (p. 673) allows (by DDS_DataWriterResourceLimitsQosPolicy::max_remote_reader_filters (p. 1132)) and the number of filtered DDS_DataReader (p. 783) is less than or equal to 32, and the DDS_DataReader (p. 783) 's DDS_TransportMulticastQosPolicy (p. 1449) is empty, then the DDS_DataWriter (p. 673) will performing filtering and send to the DDS_DataReader (p. 783) only those samples that meet the filtering criteria.

If disallowed by the **DDS_DataWriter** (p. 673), or if more than 32 **DDS_DataReader** (p. 783) require filtering, or the **DDS_DataReader** (p. 783) has set the **DDS_TransportMulticastQosPolicy** (p. 1449), then the **DDS_DataWriter** (p. 673) sends all samples to the **DDS_DataReader** (p. 783), and the **DDS_DataReader** (p. 783) discards any samples that do not meet the filtering criteria.

Although the filter_expression cannot be changed once the DDS_ContentFilteredTopic (p. 426) has been created, the expression_parameters can be modified using DDS_ContentFilteredTopic_set_expression_parameters (p. 443). Any changes made to the filtering criteria by means of DDS_ContentFilteredTopic_set_expression_parameters (p. 443), will be conveyed to any connected DDS_DataWriter (p. 673). New samples will be subject to the modified filtering criteria, but samples that have already been accepted or rejected are unaffected. However, if the DDS_DataReader (p. 783) connects to a DDS_DataWriter (p. 673) that re-sends its data, the re-sent samples will be subjected to the new filtering criteria.

4.121.1.2 Overview of QueryCondition

DDS_QueryCondition (p. 845) combine aspects of the content filtering capabilities of DDS_ContentFilteredTopic (p. 426) with state filtering capabilities of DDS_ReadCondition (p. 842) to create a reconfigurable means of filtering or searching data in the DDS_DataReader (p. 783) queue.

DDS_QueryCondition (p. 845) may be created on a disabled DDS_DataReader (p. 783), or after the DDS_DataReader (p. 783) has been enabled. If the DDS_DataReader (p. 783) is enabled, and has already received and stored samples in its queue, then all data samples in the are filtered against the DDS_QueryCondition (p. 845) filter criteria at the time that the DDS_QueryCondition (p. 845) is created. (Note that an exclusive lock is held on the DDS_DataReader (p. 783) sample queue for the duration of the DDS_QueryCondition (p. 845) creation).

Once created, incoming samples are filtered against all **DDS_QueryCondition** (p. 845) filter criteria at the time of their arrival and storage into the **DDS_DataReader** (p. 783) queue.

The number of DDS_QueryCondition (p. 845) filters that an individual DDS_DataReader (p. 783) may create is set by DDS_DataReaderResourceLimitsQosPolicy::max_query_condition_filters (p. 1099), to an upper maximum of 32.

4.121.2 Filtering with ContentFilteredTopic

```
^ Set up subscriber (p. 915)
^ Set up a topic (p. 904)
^ Create a ContentFilteredTopic, of user data type Foo (p. 1494):
      DDS_ContentFilteredTopic *cft = NULL;
      struct DDS_StringSeq cft_parameters;
      const char* cft_param_list[] = {"1", "100"};
      DDS_StringSeq_initialize(&cft_parameters);
      DDS_StringSeq_set_maximum(&cft_parameters, 2);
      DDS_StringSeq_from_array(&cft_parameters, param_list, 2);
      cft = DDS_DomainParticipant_create_contentfilteredtopic(participant,
                                                              "ContentFilteredTopic",
                                                              Foo_topic,
                                                              "value > %0 AND value < %1",
                                                              &cft_parameters);
      if (cft == NULL) {
          printf("create_contentfilteredtopic error\n");
          subscriber_shutdown(participant);
          return -1;
      }
  Create a FooReader using the ContentFilteredTopic:
      DDS_DataReader* reader;
      FooDataReader* Foo_reader;
      reader = DDS_Subscriber_create_datareader(subscriber,
                                                DDS_ContentFilteredTopic_as_topicdescription(cft),
                                                &reader_qos, /* or DDS_DATAREADER_QOS_DEFAULT */
                                                &reader_listener, /* or NULL */
                                                DDS_STATUS_MASK_ALL);
      if (reader == NULL) {
          printf("create_datareader error\n");
          subscriber_shutdown(participant);
          return -1;
      Foo_reader = FooDataReader_narrow(reader);
      if (Foo_reader == NULL) {
          printf("DataReader narrow error\n");
```

```
subscriber_shutdown(participant);
return -1;
}
```

Once setup, reading samples with a $DDS_ContentFilteredTopic$ (p. 426) is exactly the same as normal reads or takes, as decribed in $DataReader\ Use\ Cases\ (p. 919)$.

^ Changing filter crieria using set_expression_parameters:

4.121.3 Filtering with Query Conditions

```
^ Given a data reader of type Foo (p. 1494)
```

```
DDS_DataReader* reader = ...;
FooDataReader* Foo_reader = FooDataReader_narrow(reader);
```

^ Creating a QueryCondition

```
DDS_QueryCondition *queryCondition = NULL;
struct DDS_StringSeq qc_parameters;
const char *qc_param_list[] = {"1","100"};
DDS_StringSeq_initialize(&qc_parameters);
DDS_StringSeq_set_maximum(&qc_parameters, 2);
DDS_StringSeq_from_array(&qc_parameters, qc_param_list, 2);
queryCondition = DDS_DataReader_create_querycondition(reader,
                                                       DDS_NOT_READ_SAMPLE_STATE,
                                                       DDS_ANY_VIEW_STATE,
                                                      DDS_ALIVE_INSTANCE_STATE,
                                                       "value > %0 AND value < %1",
                                                       &qc_parameters);
if (queryCondition == NULL) {
    printf("create_query_condition error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

Reading matching samples with a DDS_QueryCondition (p. 845)

```
struct FooSeq data_seq = DDS_SEQUENCE_INITIALIZER;
struct DDS_SampleInfoSeq info_seq = DDS_SEQUENCE_INITIALIZER;
retcode = FooDataReader_read_w_condition(Foo_reader,
                                          &data_seq, &info_seq,
                                          DDS_LENGTH_UNLIMITED,
                                          queryCondition);
if (retcode == DDS_RETCODE_NO_DATA) {
    printf("no matching data\n");
} else if (retcode != DDS_RETCODE_OK) {
    printf("read_w_condition error %d\n", retcode);
    subscriber_shutdown(participant);
    return -1;
} else {
    for (i = 0; i < FooSeq_get_length(&data_seq); ++i) {</pre>
        if (DDS_SampleInfoSeq_get_reference(&info_seq, i)->valid_data) {
            /* process your data here */
        }
    retcode = FooDataReader_return_loan(Foo_reader,
                                         &data_seq, &info_seq);
    if (retcode != DDS_RETCODE_OK) {
        printf("return loan error %d\n", retcode);
        subscriber_shutdown(participant);
        return -1:
    }
}
```

- DDS_QueryCondition_set_query_parameters (p. 846) is used similarly to DDS_ContentFilteredTopic_set_expression_parameters (p. 443), and the same coding techniques can be used.
- ^ Any DDS_QueryCondition (p. 845) that have been created must be deleted before the DDS_DataReader (p. 783) can be deleted. This can be done using DDS_DataReader_delete_contained_entities (p. 829) or manually as in:

4.121.4 Filtering Performance

Although RTI Data Distribution Service supports filtering on any field or combination of fields using the SQL syntax of the built-in filter, filters for keyed topics that filter solely on the contents of key fields have the potential for much higher performance. This is because for key field only filters, the **DDS_DataReader** (p. 783) caches the results of the filter (pass or not pass) for each instance. When another sample of the same instance is seen at the **DDS_DataReader** (p. 783), the filter results are retrieved from cache, dispensing with the need to call the filter function.

This optimization applies to all filtering using the built-in SQL filter, performed by the **DDS_DataReader** (p. 783), for either **DDS_ContentFilteredTopic** (p. 426) or **DDS_QueryCondition** (p. 845). This does *not* apply to filtering perfomed for **DDS_ContentFilteredTopic** (p. 426) by the **DDS_DataWriter** (p. 673).

4.122 Creating Custom Content Filters

Working with custom content filters.

4.122.1 Introduction

By default, RTI Data Distribution Service creates content filters with the DDS_SQL_FILTER, which implements a superset of the DDS-specified SQL WHERE clause. However, in many cases this filter may not be what you want. Some examples are:

- ^ The default filter can only filter based on the content of a sample, not on a computation on the content of a sample. You can use a custom filter that is customized for a specific type and can filter based on a computation of the type members.
- You want to use a different filter language then SQL

This HOWTO explains how to write your own custom filter and is divided into the following sections:

- ^ The Custom Content Filter API (p. 942)
- ^ Example Using C format strings (p. 943)

4.122.2 The Custom Content Filter API

A custom content filter is created by calling the DDS_DomainParticipant_register_contentfilter (p. 380) function with a DDS_ContentFilter (p. 1054) that contains a compile, an evaluate function and a finalize function. DDS_ContentFilteredTopic (p. 426) can be created with DDS_DomainParticipant_create_contentfilteredtopic_with_filter (p. 379) to use this filter.

A custom content filter is used by RTI Data Distribution Service at the following times during the life-time of a **DDS_ContentFilteredTopic** (p. 426) (the function called is shown in parenthesis).

- When a DDS_ContentFilteredTopic (p. 426) is created (compile (p. 943))
- When the filter parameters are changed on the DDS_-ContentFilteredTopic (p. 426) (compile (p. 943)) with DDS_-ContentFilteredTopic_set_expression_parameters (p. 443)

- ^ When a sample is filtered (evaluate (p. 943)). This function is called by the RTI Data Distribution Service core with a de-serialized sample
- When a DDS_ContentFilteredTopic (p. 426) is deleted (finalize (p. 943))

4.122.2.1 The compile function

The **compile** (p. 943) function is used to **compile** a filter expression and expression parameters. Please note that the term **compile** is intentionally loosely defined. It is up to the user to decide what this function should do and return.

See DDS_ContentFilter::compile (p. 1055) for details.

4.122.2.2 The evaluate function

The evaluate (p. 944) function is called each time a sample is received to determine if a sample should be filtered out and discarded.

See DDS_ContentFilter::evaluate (p. 1055) for details.

4.122.2.3 The finalize function

The **finalize** (p. 944) function is called when an instance of the custom content filter is no longer needed. When this function is called, it is safe to free all resources used by this particular instance of the custom content filter.

See DDS_ContentFilter::finalize (p. 1056) for details.

4.122.3 Example Using C format strings

Assume that you have a type **Foo** (p. 1494).

You want to write a custom filter function that will drop all samples where the value of Foo.x > x and x is a value determined by an expression parameter. The filter will **only** be used to filter samples of type **Foo** (p. 1494).

4.122.3.1 Writing the Compile Function

The first thing to note is that we can ignore the filter expression, since we already know what the expression is. The second is that x is a parameter that can be changed. By using this information, the compile function is very easy to implement. Simply return the parameter string. This string will then be passed to the evaluate function every time a sample of this type is filtered.

Below is the entire **compile** (p. 943) function.

4.122.3.2 Writing the Evaluate Function

The next step is to implement the **evaluate** function. The evaluate function receives the parameter string with the actual value to test against. Thus the evaluate function must read the actual value from the parameter string before evaluating the expression. Below is the entire **evaluate** (p. 943) function.

4.122.3.3 Writing the Finalize Function

The last function to write is the finalize function. It is safe to free all resources used by this particular instance of the custom content filter that is allocated in **compile**. Below is the entire **finalize** (p. 943) function.

4.122.3.4 Registering the Filter

Before the custom filter can be used, it must be registered with RTI Data Distribution Service:

```
struct DDS_ContentFilter filter = DDS_ContentFilter_INITIALIZER;
filter.compile = howto_write_simple_compile_function;
filter.evaluate = howto_write_simple_evaluate_function;
filter.finalize = howto_write_simple_finalize_function;
filter.filter_data = NULL;

if (DDS_DomainParticipant_register_contentfilter(
    participant, "MyCustomFilter", &filter) != DDS_RETCODE_OK) {
    printf("Failed to register custom filter\n");
}
```

4.122.3.5 Unregistering the Filter

When the filter is no longer needed, it can be unregistered from RTI Data Distribution Service:

```
if (DDS_DomainParticipant_unregister_contentfilter(
   participant, "MyCustomFilter" ) != DDS_RETCODE_OK) {
   printf("Failed to unregister custom filter\n");
}
```

4.123 Large Data Use Cases

Working with large data types.

4.123.1 Introduction

RTI Data Distribution Service supports data types whose size exceeds the maximum message size of the underlying transports. A **DDS_DataWriter** (p. 673) will fragment data samples when required. Fragments are automatically reassembled at the receiving end.

Once all fragments of a sample have been received, the new sample is passed to the DDS_DataReader (p. 783) which can then make it available to the user. Note that the new sample is treated as a regular sample at that point and its availability depends on standard QoS settings such as DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) and DDS_-KEEP_LAST_HISTORY_QOS (p. 171).

The large data feature is fully supported by all DDS API's, so its use is mostly transparent. Some additional considerations apply as explained below.

4.123.2 Writing Large Data

In order to use the large data feature with the DDS_RELIABLE_-RELIABILITY_QOS (p. 167) setting, the DDS_DataWriter (p. 673) must be configured as an asynchronous writer (DDS_ASYNCHRONOUS_-PUBLISH_MODE_QOS (p. 222)) with associated DDS_FlowController (p. 726).

While the use of an asynchronous writer and flow controller is optional when using the DDS_BEST_EFFORT_RELIABILITY_QOS (p. 167) setting, most large data use cases will benefit from the use of a flow controller to prevent flooding the network when fragments are being sent.

- ^ Set up writer (p. 912)
- ^ Add flow control (p. 906)

4.123.3 Receiving Large Data

Large data is supported by default and in most cases, no further changes are required.

The DDS_DataReaderResourceLimitsQosPolicy (p. 1089) allows tuning

the resources available to the ${\bf DDS_DataReader}$ (p. 783) for reassembling fragmented large data.

^ Set up reader (p. 919)

4.124 Documentation Roadmap

This section contains a roadmap for the new user with pointers on what to read first.

If you are new to RTI Data Distribution Service, we recommend starting in the following order:

- ^ See the Getting Started Guide. This document provides download and installation instructions. It also lays out the core value and concepts behind the product and takes you step-by-step through the creation of a simple example application.
- ^ The User's Manual describes the features of the product and how to use them. It is organized around the structure of the DDS APIs and certain common high-level tasks.
- ^ The documentation in the **DDS API Reference** (p. 952) provides an overview of API classes and modules for the DDS data-centric publish-subscribe (DCPS) package from a programmer's perspective. Start by reading the documentation on the main page.
- ^ After reading the high level module documentation, look at the **Publication Example** (p. 899) and **Subscription Example** (p. 900) for step-by-step examples of creating a publication and subscription. These are hyperlinked code snippets to the full API documentation, and provide a good place to begin learning the APIs.
- Next, work through your own application using the example code files generated by **rtiddsgen** (p. 969).
- ^ To integrate similar code into your own application and build system, you will likely need to refer to the Platform Notes.

4.125 Conventions

This section describes the conventions used in the API documentation.

4.125.1 Unsupported Features

[Not supported (optional)] This note means that the optional feature from the DDS specification is not supported in the current release.

4.125.2 API Naming Conventions

4.125.2.1 Structure & Class Names

RTI Data Distribution Service 4 makes a distinction between value types and interface types. Value types are types such as primitives, enumerations, strings, and structures whose identity and equality are determined solely by explicit state. Interface types are those abstract opaque data types that conceptually have an identity apart from their explicit state. Examples include all of the DDS_Entity (p. 242) subtypes, the DDS_Condition (p. 252) subtypes, and DDS_WaitSet (p. 253). Instances of value types are frequently transitory and are declared on the stack. Instances of interface types typically have longer lifecycles, are accessible by pointer only, and may be managed by a factory object.

Value type structures are made more explicit through the use of C's structure tag syntax. For example, a **DDS_Duration_t** (p. 1188) object must be declared as being of type "struct DDS_Duration_t," not simply "DDS_Duration_t." Interface types, by contrast, are always of typedef'ed types; their underlying representations are opaque.

4.125.3 API Documentation Terms

In the API documentation, the term module refers to a logical grouping of documentation and elements in the API.

At this time, typedefs that occur in the API, such as **DDS_ReturnCode_- t** (p. 121) do not show up in the compound list or indices. This is a known limitation in the generated HTML.

4.125.4 Stereotypes

Commonly used stereotypes in the API documentation include the following.

4.125.4.1 Extensions

- $^{\hat{}}$ << eXtension>> (p. 950)
 - An RTI Data Distribution Service product extension to the DDS standard specification.
 - The extension APIs complement the standard APIs specified by the OMG DDS specification. They are provided to improve product usability and enable access to product-specific features such as pluggable transports.

4.125.4.2 Types

- $\hat{\ } << interface>> (p. 950)$
 - Pure interface type with *no state*.
 - Languages such as Java natively support the concept of an interface type, which is a collection of function signatures devoid of any dynamic state.
 - In C++, this is achieved via a class with all *pure virtual* methods and devoid of any instance variables (ie no dynamic state).
 - Interfaces are generally organized into a type hierarchy. Static typecasting along the interface type hierarchy is "safe" for valid objects.
- $\hat{\ } << generic>> (\mathrm{p.} \, rac{950}{})$
 - A generic type is a skeleton class written in terms of generic parameters. Type-specific instantiations of such types are conventionally referred to in this documentation in terms of the hypothetical type "Foo"; for example: FooSeq (p. 1497), FooDataType, FooDataWriter (p. 1496), and FooDataReader (p. 1495).
 - For portability and efficiency, we implement generics using C preprocessor macros, rather than using C++ templates.
 - A generic type interface is declared via a #define macro.
 - Concrete types are generated from the generic type statically at compile time. The implementation of the concrete types is provided via the generic macros which can then be compiled as normal C or C++ code.
- $\hat{\ } << singleton >> ({
 m p.} \, rac{950}{})$
 - Singleton class. There is a single instance of the class.
 - Generally accessed via a get_instance() static function.

4.125.4.3 Method Parameters

- ^ <<*in>> (*p. *951*)
 - An input parameter.
- ^ << out>> $(p. \frac{951}{})$
 - An output parameter.
- ^ << inout>> (p. 951)
 - An input and output parameter.

4.126 DDS API Reference

RTI Data Distribution Service modules following the DDS module definitions.

Modules

^ Domain Module

Contains the **DDS_DomainParticipant** (p. 339) class that acts as an entrypoint of RTI Data Distribution Service and acts as a factory for many of the classes. The **DDS_DomainParticipant** (p. 339) also acts as a container for the other objects that make up RTI Data Distribution Service.

^ Topic Module

Contains the DDS_Topic (p. 425), DDS_ContentFilteredTopic (p. 426), and DDS_MultiTopic (p. 430) classes, the DDS_TopicListener (p. 1441) interface, and more generally, all that is needed by an application to define DDS_Topic (p. 425) objects and attach QoS policies to them.

[^] Publication Module

Contains the DDS_FlowController (p. 726), DDS_Publisher (p. 632), and DDS_DataWriter (p. 673) classes as well as the DDS_PublisherListener (p. 1326) and DDS_DataWriterListener (p. 1102) interfaces, and more generally, all that is needed on the publication side.

[^] Subscription Module

Contains the DDS_Subscriber (p. 743), DDS_DataReader (p. 783), DDS_ReadCondition (p. 842), and DDS_QueryCondition (p. 845) classes, as well as the DDS_SubscriberListener (p. 1405) and DDS_DataReaderListener (p. 1065) interfaces, and more generally, all that is needed on the subscription side.

^ Infrastructure Module

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

^ Queries and Filters Syntax

4.126.1 Detailed Description

RTI Data Distribution Service modules following the DDS module definitions.

4.126.2 Overview

Information flows with the aid of the following constructs: **DDS_Publisher** (p. 632) and **DDS_DataWriter** (p. 673) on the sending side, **DDS_Subscriber** (p. 743) and **DDS_DataReader** (p. 783) on the receiving side.

- A DDS_Publisher (p. 632) is an object responsible for data distribution. It may publish data of different data types. A TDataWriter acts as a typed (i.e. each DDS_DataWriter (p. 673) object is dedicated to one application data type) accessor to a publisher. A DDS_DataWriter (p. 673) is the object the application must use to communicate to a publisher the existence and value of data objects of a given type. When data object values have been communicated to the publisher through the appropriate data-writer, it is the publisher's responsibility to perform the distribution (the publisher will do this according to its own QoS, or the QoS attached to the corresponding data-writer). A publication is defined by the association of a data-writer to a publisher. This association expresses the intent of the application to publish the data described by the data-writer in the context provided by the publisher.
- ^ A DDS_Subscriber (p. 743) is an object responsible for receiving published data and making it available (according to the Subscriber's QoS) to the receiving application. It may receive and dispatch data of different specified types. To access the received data, the application must use a typed TDataReader attached to the subscriber. Thus, a subscription is defined by the association of a data-reader with a subscriber. This association expresses the intent of the application to subscribe to the data described by the data-reader in the context provided by the subscriber.

DDS_Topic (p. 425) objects conceptually fit between publications and subscriptions. Publications must be known in such a way that subscriptions can refer to them unambiguously. A DDS_Topic (p. 425) is meant to fulfill that purpose: it associates a name (unique in the domain i.e. the set of applications that are communicating with each other), a data type, and QoS related to the data itself. In addition to the topic QoS, the QoS of the DDS_DataWriter (p. 673) associated with that Topic and the QoS of the DDS_Publisher (p. 632) associated to the DDS_DataWriter (p. 673) control the behavior on the publisher's side, while the corresponding DDS_Topic (p. 425), DDS_DataReader (p. 783) and DDS_Subscriber (p. 743) QoS control the behavior on the subscriber's side.

When an application wishes to publish data of a given type, it must create a DDS_Publisher (p. 632) (or reuse an already created one) and a DDS_DataWriter (p. 673) with all the characteristics of the desired publication. Similarly, when an application wishes to receive data, it must create a DDS_Subscriber (p. 743) (or reuse an already created one) and a DDS_DataReader (p. 783) to define the subscription.

4.126.3 Conceptual Model

The overall conceptual model is shown below.

Notice that all the main communication objects (the specializations of Entity) follow unified patterns of:

- Supporting QoS (made up of several QosPolicy); QoS provides a generic mechanism for the application to control the behavior of the Service and tailor it to its needs. Each **DDS_Entity** (p. 242) supports its own specialized kind of QoS policies (see **QoS Policies** (p. 137)).
- ^ Accepting a **DDS_Listener** (p. 1246); listeners provide a generic mechanism for the middleware to notify the application of relevant asynchronous events, such as arrival of data corresponding to a subscription, violation of a QoS setting, etc. Each **DDS_Entity** (p. 242) supports its own specialized kind of listener. Listeners are related to changes in status conditions (see **Status Kinds** (p. 123)).
 - Note that only one Listener per entity is allowed (instead of a list of them). The reason for that choice is that this allows a much simpler (and, thus, more efficient) implementation as far as the middleware is concerned. Moreover, if it were required, the application could easily implement a listener that, when triggered, triggers in return attached 'sub-listeners'.
- ^ Accepting a DDS_StatusCondition (p. 253) (and a set of DDS_ReadCondition (p. 842) objects for the DDS_DataReader (p. 783)); conditions (in conjunction with DDS_WaitSet (p. 253) objects) provide support for an alternate communication style between the middleware and the application (i.e., wait-based rather than notification-based).

All DCPS entities are attached to a **DDS_DomainParticipant** (p. 339). A domain participant represents the local membership of the application in a domain. A *domain* is a distributed concept that links all the applications able to communicate with each other. It represents a communication plane: only the publishers and the subscribers attached to the same domain may interact.

DDS_DomainEntity (p. 245) is an intermediate object whose only purpose is to state that a DomainParticipant cannot contain other domain participants.

At the DCPS level, data types represent information that is sent atomically. For performance reasons, only plain data structures are handled by this level.

By default, each data modification is propagated individually, independently, and uncorrelated with other modifications. However, an application may request that several modifications be sent as a whole and interpreted as such at the recipient side. This functionality is offered on a Publisher/Subscriber basis. That is, these relationships can only be specified among **DDS_DataWriter** (p. 673)

objects attached to the same **DDS_Publisher** (p. 632) and retrieved among **DDS_DataReader** (p. 783) objects attached to the same **DDS_Subscriber** (p. 743).

By definition, a **DDS_Topic** (p. 425) corresponds to a single data type. However, several topics may refer to the same data type. Therefore, a **DDS_Topic** (p. 425) identifies data of a single type, ranging from one single instance to a whole collection of instances of that given type. This is shown below for the hypothetical data type Foo (p. 1494).

In case a set of instances is gathered under the same topic, different instances must be distinguishable. This is achieved by means of the values of some data fields that form the **key** to that data set. The *key description* (i.e., the list of data fields whose value forms the key) has to be indicated to the middleware. The rule is simple: different data samples with the same key value represent successive values for the same instance, while different data samples with different key values represent different instances. If no key is provided, the data set associated with the **DDS_Topic** (p. 425) is restricted to a single instance.

Topics need to be known by the middleware and potentially propagated. Topic objects are created using the create operations provided by **DDS_-DomainParticipant** (p. 339).

The interaction style is straightforward on the publisher's side: when the application decides that it wants to make data available for publication, it calls the appropriate operation on the related **DDS_DataWriter** (p. 673) (this, in turn, will trigger its **DDS_Publisher** (p. 632)).

On the subscriber's side however, there are more choices: relevant information may arrive when the application is busy doing something else or when the application is just waiting for that information. Therefore, depending on the way the application is designed, asynchronous notifications or synchronous access may be more appropriate. Both interaction modes are allowed, a **DDS_Listener** (p. 1246) is used to provide a callback for synchronous access and a **DDS_WaitSet** (p. 253) associated with one or several **DDS_Condition** (p. 252) objects provides asynchronous data access.

The same synchronous and asynchronous interaction modes can also be used to access changes that affect the middleware communication status (see **Status Kinds** (p. 123)). For instance, this may occur when the middleware asynchronously detects an inconsistency. In addition, other middleware information that may be relevant to the application (such as the list of the existing topics) is made available by means of **built-in topics** (p. 410) that the application can access as plain application data, using built-in data-readers.

4.126.4 Modules

DCPS consists of five modules:

- ^ Infrastructure module (p. 855) defines the abstract classes and the interfaces that are refined by the other modules. It also provides support for the two interaction styles (notification-based and wait-based) with the middleware.
- ^ Domain module (p. 294) contains the DDS_DomainParticipant (p. 339) class that acts as an entrypoint of the Service and acts as a factory for many of the classes. The DDS_DomainParticipant (p. 339) also acts as a container for the other objects that make up the Service.
- ^ Topic module (p. 417) contains the DDS_Topic (p. 425) class, the DDS_TopicListener (p. 1441) interface, and more generally, all that is needed by the application to define DDS_Topic (p. 425) objects and attach QoS policies to them.
- ^ Publication module (p. 626) contains the DDS_Publisher (p. 632) and DDS_DataWriter (p. 673) classes as well as the DDS_PublisherListener (p. 1326) and DDS_DataWriterListener (p. 1102) interfaces, and more generally, all that is needed on the publication side.
- Subscription module (p. 735) contains the DDS_Subscriber (p. 743), DDS_DataReader (p. 783), DDS_ReadCondition (p. 842), and DDS_QueryCondition (p. 845) classes, as well as the DDS_SubscriberListener (p. 1405) and DDS_DataReaderListener (p. 1065) interfaces, and more generally, all that is needed on the subscription side.

4.127 Queries and Filters Syntax

4.127.1 Syntax for DDS Queries and Filters

A subset of SQL syntax is used in several parts of the specification:

- ^ The filter_expression in the DDS_ContentFilteredTopic (p. 426)
- ^ The query_expression in the DDS_QueryCondition (p. 845)
- ^ The topic_expression in the DDS_MultiTopic (p. 430)

Those expressions may use a subset of SQL, extended with the possibility to use program variables in the SQL expression. The allowed SQL expressions are defined with the BNF-grammar below.

The following notational conventions are made:

- ^ NonTerminals are typeset in italics.
- 'Terminals' are quoted and typeset in a fixed width font. They are written in upper case in most cases in the BNF-grammar below, but should be case insensitive.
- **^ TOKENS** are typeset in bold.
- ^ The notation (element // ',') represents a non-empty comma-separated list of elements.

4.127.2 SQL grammar in BNF

```
FIELDNAME 'AS' IDENTIFIER
                  FIELDNAME IDENTIFIER
Selection ::= TOPICNAME
         | TOPICNAME NaturalJoin JoinItem
JoinItem ::= TOPICNAME
         | TOPICNAME Natural Join Join Item
         '(' TOPICNAME NaturalJoin JoinItem ')'
NaturalJoin ::= 'INNER JOIN'
         'INNER NATURAL JOIN'
            'NATURAL JOIN'
         'NATURAL INNER JOIN'
         Where
         ::= 'WHERE' Condition
Condition ::= Predicate
         | Condition 'AND' Condition
            Condition 'OR' Condition
             'NOT' Condition
             '(' Condition ')'
Predicate ::= ComparisonPredicate
            {\it BetweenPredicate}
         1
{\it Comparison Predicate} \ ::= \ {\it Comparison Term} \ {\it RelOp} \ {\it Comparison Term}
ComparisonTerm
                 ::= FieldIdentifier
                 | Parameter
{\it BetweenPredicate} \qquad ::= \quad {\it FieldIdentifier} \quad {\it 'BETWEEN'} \quad {\it Range}
                | FieldIdentifier 'NOT BETWEEN' Range
FieldIdentifier
                 ::= FIELDNAME
                | IDENTIFIER
RelOp
        ::= '=' | '>' | '>=' | '<' | '<=' | '<>' | 'LIKE' | 'MATCH'
        ::= Parameter 'AND' Parameter
Range
Parameter ::= INTEGERVALUE
          CHARVALUE
            FLOATVALUE
        1
        1
            STRING
        1
           ENUMERATEDVALUE
           BOOLEANVALUE
        1
            PARAMETER
```

Note – INNER JOIN, INNER NATURAL JOIN, NATURAL JOIN, and NAT-URAL INNER JOIN are all aliases, in the sense that they have the same semantics. They are all supported because they all are part of the SQL standard.

4.127.3 Token expression

The syntax and meaning of the tokens used in the SQL grammar is described as follows:

IDENTIFIER - An identifier for a FIELDNAME, and is defined as any series of characters 'a', ..., 'z', 'A', ..., 'Z', '0', ..., '9', '_' but may not start with a digit.

Formal notation:

FIELDNAME - A fieldname is a reference to a field in the data structure. The dot '.' is used to navigate through nested structures. The number of dots that may be used in a FIELDNAME is unlimited. The FIELDNAME can refer to fields at any depth in the data structure. The names of the field are those specified in the IDL definition of the corresponding structure, which may or may not match the fieldnames that appear on the language-specific (e.g., C/C++, Java) mapping of the structure. To reference to the n+1 element in an array or sequence, use the notation '[n]', where n is a natural number (zero included). FIELDNAME must resolve to a primitive IDL type; that is either boolean, octet, (unsigned) short, (unsigned) long, (unsigned) long long, float double, char, wchar, string, wstring, or enum.

Formal notation:

Primitive IDL types referenced by FIELDNAME are treated as different types in *Predicate* according to the following table:

Predicate Data Type	IDL Type
BOOLEANVALUE	boolean
INTEGERVALUE	octet, (unsigned) short, (unsigned)
	long, (unsigned) long long
FLOATVALUE	float, double
CHARVALUE	char, wchar
STRING	string, wstring
ENUMERATEDVALUE	enum

TOPICNAME - A topic name is an identifier for a topic, and is defined as any series of characters 'a', ..., 'z', 'A', ..., 'Z', '0', ..., '9', '_' but may not start with a digit.

Formal notation:

TOPICNAME : IDENTIFIER

^ INTEGERVALUE - Any series of digits, optionally preceded by a plus or minus sign, representing a decimal integer value within the range of the system. A hexadecimal number is preceded by 0x and must be a valid hexadecimal expression.

Formal notation:

```
INTEGERVALUE : (["+","-"])? (["0"-"9"])+ [("L","1")]?
| (["+","-"])? ["0x","0X"](["0"-"9", "A"-"F", "a"-"f"])+ [("L","1")]?
```

^ CHARVALUE - A single character enclosed between single quotes.

Formal notation:

```
CHARVALUE : "'" (~["'"])? "'"
```

FLOATVALUE - Any series of digits, optionally preceded by a plus or minus sign and optionally including a floating point ('.'). A power-of-ten expression may be postfixed, which has the syntax en or En, where n is a number, optionally preceded by a plus or minus sign.

Formal notation:

```
FLOATVALUE : (["+","-"])? (["0"-"9"])* (".")? (["0"-"9"])+ ( \it EXPONENT)? where \it EXPONENT: ["e","E"] (["+","-"])? (["0"-"9"])+
```

STRING - Any series of characters encapsulated in single quotes, except the single quote itself.

Formal notation:

```
STRING : "'" (~["'"])* "'"
```

• ENUMERATEDVALUE - An enumerated value is a reference to a value declared within an enumeration. Enumerated values consist of the name of the enumeration label enclosed in single quotes. The name used for the enumeration label must correspond to the label names specified in the IDL definition of the enumeration.

Formal notation:

```
ENUMERATEDVALUE: "'" ["A" - "Z", "a" - "z"] ["A" - "Z", "a" - "z", ", "0" - "9"] * "'"
```

BOOLEANVALUE - Can either be 'TRUE' or 'FALSE', case insensitive.

Formal notation (case insensitive):

```
BOOLEANVALUE : ["TRUE", "FALSE"]
```

PARAMETER - A parameter is of the form %n, where n represents a natural number (zero included) smaller than 100. It refers to the n+1 th argument in the given context. Argument can only in primitive type value format. It cannot be a FIELDNAME.

Formal notation:

```
PARAMETER : "%" (["0"-"9"])+
```

4.127.4 Type compatability in Predicate

Only certain combination of type comparisons are valid in *Predicate*. The following table marked all the compatible pairs with 'YES':

		INTE-				ENU-
	BOOLE	AKERVAI	LUEOAT-	CHAR-	STRING	MER-
	VALUE		VALUE	VALUE		ATED-
						VALUE
	YES					
BOOLE	AN					
INTE-		YES	YES			
GERVAI	LUE					
		YES	YES			
FLOAT-						
VALUE						
				YES	YES	YES
CHAR-						
VALUE						
				YES		YES
STRING	<u> </u>				YES(*1)	
ENU-		YES				
MER-				YES(*2)	YES(*2)	YES(*3)
ATED-						
VALUE						

- ^ (*1) See SQL Extension: Regular Expression Matching (p. 962)
- ^ (*2) Because the formal notation of the Enumeration values, they are compatible with string and char literals, but they are not compatible with string or char variables, i.e., "MyEnum='EnumValue" would be correct, but "MyEnum=MyString" is not allowed.
- ^ (*3) Only for same type Enums.

4.127.5 SQL Extension: Regular Expression Matching

The relational operator MATCH may only be used with string fields. The right-hand operator is a string *pattern*. A string pattern specifies a template that the left-hand field value must match. The characters $,/?*[]-^!\%$ have special meanings.

MATCH is case-sensitive.

The pattern allows limited "wild card" matching under the following rules:

Character	Meaning
,	"," separates a list of alternate
	patterns. The field string is
	matched if it matches one or more
	of the patterns.
/	"/" in the pattern string matches a
	/ in the field string. This character
	is used to separate a sequence of
	mandatory substrings.
?	"?" in the pattern string matches
	any single non-special characters in
	the field string.
*	"*" in the pattern string matches 0
	or more <i>non-special</i> characters in
	field string.
[charlist]	Matches any one of the characters
	from the list of characters in
	charlist.
[s-e]	Matches any character any
	character from s to e , inclusive.
%	"%" is used to designate filter
	expressions parameters.
$[!charlist] ext{ or } [^{\wedge}charlist]$	Matches any characters not in
	charlist (not supported).
$[!s-e] \text{ or } [^{\wedge}s-e]$	Matches any characters not in the
	interval [s-e] (not supported).
\	Escape character for special
	characters (not supported)

The syntax is similar to the POSIX fnmatch syntax (1003.2-1992 section B.6). The MATCH syntax is also similar to the 'subject' strings of TIBCO Rendezvous.

4.127.6 Examples

Assuming Topic "Location" has as an associated type a structure with fields "flight_id, x, y, z", and Topic "FlightPlan" has as fields "flight_id, source, destination". The following are examples of using these expressions.

Example of a filter_expression (for DDS_ContentFilteredTopic (p. 426)) or a query_expression (for DDS_QueryCondition (p. 845)):

Examples of a filter_expression using MATCH (for DDS_ContentFilteredTopic (p. 426)) operator:

[&]quot;z < 1000 AND x < 23"

```
^ "symbol MATCH 'NASDAQ/GOOG'"
```

Example of a $topic_expression$ (for DDS_MultiTopic (p. 430) [Not supported (optional)]):

"SELECT flight_id, x, y, z AS height FROM 'Location' NATURAL JOIN 'FlightPlan' WHERE height < 1000 AND x <23"

^{^ &}quot;symbol MATCH 'NASDAQ/[A-M]*'"

4.128 RTI Data Distribution Service API Reference

RTI Data Distribution Service product specific API's.

Modules

^ Clock Selection

APIs related to clock selection.

^ Multi-channel DataWriters

APIs related to Multi-channel DataWriters.

^ Pluggable Transports

APIs related to RTI Data Distribution Service pluggable transports.

[^] Configuration Utilities

Utility API's independent of the DDS standard.

[^] Unsupported Utilities

Unsupported APIs used by examples in the RTI Data Distribution Service distribution as well as in rtiddsgen-generated examples.

[^] Durability and Persistence

APIs related to RTI Data Distribution Service Durability and Persistence.

^ Configuring QoS Profiles with XML

APIs related to XML QoS Profiles.

4.128.1 Detailed Description

RTI Data Distribution Service product specific API's.

4.129 Programming How-To's

These "How To"s illustrate how to apply RTI Data Distribution Service APIs to common use cases.

Modules

^ Publication Example

A data publication example.

[^] Subscription Example

A data subscription example.

^ Participant Use Cases

Working with domain partcipants.

^ Topic Use Cases

Working with topics.

^ FlowController Use Cases

Working with flow controllers.

^ Publisher Use Cases

Working with publishers.

^ DataWriter Use Cases

 $Working\ with\ data\ writers.$

^ Subscriber Use Cases

Working with subscribers.

^ DataReader Use Cases

 $Working\ with\ data\ readers.$

^ Entity Use Cases

Working with entities.

Waitset Use Cases

 ${\it Using \ wait-sets \ and \ conditions.}$

^ Transport Use Cases

Working with pluggable transports.

^ Filter Use Cases

Working with data filters.

^ Creating Custom Content Filters

Working with custom content filters.

^ Large Data Use Cases

Working with large data types.

4.129.1 Detailed Description

These "How To"s illustrate how to apply RTI Data Distribution Service APIs to common use cases.

These are a good starting point to familiarize yourself with DDS. You can use these code fragments as "templates" for writing your own code.

4.130 Programming Tools

Modules

^ rtiddsgen

 $\label{eq:conditional} \textit{Generates source code from data types declared in IDL, XML, XSD, or WSDL files.}$

^ rtiddsping

 $Sends\ or\ receives\ simple\ messages\ using\ RTI\ Data\ Distribution\ Service.$

^ rtiddsspy

Debugging tool which receives all RTI Data Distribution Service communication.

4.131 rtiddsgen

Generates source code from data types declared in IDL, XML, XSD, or WSDL files. Generates code necessary to allocate, send, receive, and print user-defined data types.

4.131.1 Usage

```
rtiddsgen [-d <outdir>]
       [-language <C|C++|Java|C++/CLI|C#>]
               [-namespace]
               [-package <packagePrefix>]
               [-example <arch>]
               [-replace]
       [-debug]
               [-corba [client header file] [-orb <CORBA ORB>]]
               [-optimization <level of optimization>]
               [-stringSize <Unbounded strings size>]
               [-sequenceSize <Unbounded sequences size>]
               [-notypecode]
               [-ppDisable]
               [-ppPath processor executable>]
               [-ppOption <option>]
               [-D <name>[=<value>]]
               [-U <name>]
               [-I <directory>]
               [-noCopyable]
               [-use42eAlignment]
               [-enableEscapeChar]
               [-typeSequenceSuffix <Suffix>]
               [-convertToXml |
                -convertToXsd |
   -convertToWsdl |
   -convertToIdl]
               [-convertToCcl]
               [-convertToCcs]
               [-version]
               [-help]
               [-verbosity [1-3]]
               [[-inputId1] <IDLInputFile.id1> |
        [-inputXml] <XMLInputFile.xml> |
[-inputXsd] <XSDInputFile.xsd> |
[-inputWsdl] <WSDLInputFile.wsdl>]
```

-d Specifies where to put the generated files. If omitted, the input file's directory is used.

- **-language** Generates output for only the language specified. The default is C++.
- **-namespace** Specifies the use of C++ namespaces (for C++ only).
- -package Specifies a packagePrefix to use as the root package (for Java only).
- **-example** Generates example programs and makefiles (for UNIX-based systems) or workspace and project files (for Windows systems) based on the input types description file.

The <arch> parameter specifies the architecture for the example makefiles.

For -language C/C++, valid options for <arch> are:

```
i86Linux2.4gcc3.2,
                            i86Linux2.4gcc3.2.2,
                                                          x64Linux2.4gcc3.2.3,
i86Linux2.6gcc3.4.3,
                             x64Linux2.6gcc3.4.5,
                                                          i86Linux2.6gcc4.1.1,
x64Linux2.6gcc4.1.1,
                             i86Linux2.6gcc4.1.2,

```

- **-replace** Overwrites any existing output files. Warning: This removes any changes you may have made to the original files.
- -debug Generates intermediate files for debugging purposes.
- -corba [client header file] [-orb < CORBA ORB>] Specifies that you want to produce CORBA-compliant code.

Use [client header file] and [-orb < CORBA ORB>] for C++ only. The majority of code generated is independent of the ORB. However, for some IDL features, the code generated depends on the ORB. This version of rtiddsgen generates code compatible with ACE-TAO or JacORB. To pick the ACE_TAO version, use the -orb parameter; the default is ACE_TAO1.6.

client header file: the name of the header file for the IDL types generated by the CORBA IDL compiler. This file will be included in the rtiddsgen type header file instead of generating type definitions.

CORBA support requires the RTI CORBA Compatibility Kit, an addon product that provides a different version of rtiddsgen. Please contact support@rti.com for more information.

- **-optimization** Sets the optimization level. (Only applies to C/C++)
 - ^ 0 (default): No optimization.
 - 1: Compiler generates extra code for typedefs but optimizes its use. If the type that is used is a typedef that can be resolved either to a primitive type or to another type defined in the same file, the generated code will invoke the code of the most basic type to which the typedef can be resolved, unless the most basic type is an array or a sequence. This level can be used if the generated code is not expected to be modified.

- [^] 2: Maximum optimization. Functionally the same as level 1, but extra code for typedef is not generated. This level can be used if the typedefs are only referred by types within the same file.
- -typeSequenceSuffix Assigns a suffix to the name of the implicit sequence defined for IDL types. (Only applies to CORBA)

By default, the suffix is 'Seq'. For example, given the type 'Foo' the name of the implicit sequence will be 'FooSeq'.

- -stringSize Sets the size for unbounded strings. Default: 255 bytes.
- -sequenceSize Sets the size for unbounded sequences. Default: 100 elements.
- -notypecode: Disables the generation of type code information.
- -ppDisable: Disables the preprocessor.
- **-ppPath** cpreprocessor executable>: Specifies the preprocessor path. If you only specify the name of an executable (not a complete path to that executable), the executable must be found in your Path.

The default value is "cpp" for non-Windows architectures, "cl.exe" for Windows architectures.

If the default preprocessor is not found in your Path and you use -ppPath to provide its full path and filename, you must also use -ppOption (described below) to set the following preprocessor options:

- If you use a non-default path for cl.exe, you also need to set:
 -ppOption /nologo -ppOption /C -ppOption /E -ppOption /X
- If you use a non-default path for cpp, you also need to set: -ppOption -C
- **-ppOption** <option>: Specifies a preprocessor option. This parameter can be used multiple times to provide the command-line options for the specified preprocessor. See -ppPath (above).
- **-D** <name>[=<value>]: Defines preprocessor macros.
- -U <name>: Cancels any previous definition of name.
- -I <directory>: Adds to the list of directories to be searched for type-definition files (IDL, XML, XSD or WSDL files). Note: A type-definition file in one format cannot include a file in another format.
- **-noCopyable**: Forces rtiddsgen to put copy logic into the corresponding Type-Support class rather than the type itself (for Java code generation only).

This option is not compatible with the use of ndds_standalone_type.jar.

-use42eAlignment: Generates code compliant with RTI Data Distribution Service 4.2e.

973

If your RTI Data Distribution Service applications data type uses a 'double', 'long long', 'unsigned long long', or 'long double' it will not be backwards compatible with RTI Data Distribution Service 4.2e applications, unless you use the -use42eAlignment flag when generating code with rtiddsgen.

- -enableEscapeChar: Enables use of the escape character '_' in IDL identifiers. With CORBA this option is always enabled.
- -convertToXml: Converts the input type-description file to XML format.
- -convertToIdl: Converts the input type-description file to IDL format.
- -convertToXsd: Converts the input type-description file to XSD format.
- -convertToWsdl: Converts the input type-description file to WSDL format.
- -convertToCcl: Converts the input type-description file to CCL format.
- -convertToCcs: Converts the input type-description file to CCS format.
- -version: Prints the version.
- -help: Prints out this rtiddsgen usage help.
- -verbosity: rtiddsgen verbosity.
 - 1: exceptions
 - [^] 2: exceptions and warnings
 - ^ 3 (default): exceptions, warnings and information
- -inputIdl: Indicates that the input file is an IDL file, regardless of the file extension.
- -inputXml: Indicates that the input file is a XML file, regardless of the file extension.
- -inputXsd: Indicates that the input file is a XSD file, regardless of the file extension.
- -inputWsdl: Indicates that the input file is a WSDL file, regardless of the file extension.
- **IDLInputFile.idl:** File containing IDL descriptions of your data types. If -inputIdl is not used, the file must have an .idl extension.
- **XMLInputFile.xml:** File containing XML descriptions of your data types. If -inputXml is not used, the file must have an .xml extension.
- **XSDInputFile.xsd:** File containing XSD descriptions of your data types. If -inputXsd is not used, the file must have an .xsd extension.

XSDInputFile.wsdl: WSDL file containing XSD descriptions of your data types. If -inputWsdl is not used, the file must have an .wsdl extension.

4.131.2 Description

rtiddsgen takes a language-independent specification of the data (in IDL, XML, XSD or WSDL notation) and generates supporting classes and code to distribute instances of the data over RTI Data Distribution Service.

To use rtiddsgen, you first write a description of your data types in IDL, XML, XSD or WSDL format.

4.131.3 C++ Example

The following is an example generating the RTI Data Distribution Service type myDataType:

IDL notation

</xsd:complexType>

</xsd:schema>

```
struct myDataType {
    long value;
};
XML notation
<?xml version="1.0" encoding="UTF-8"?>
<types xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
        xsi:noNamespaceSchemaLocation="rti_dds_topic_types.xsd">
    <struct name="myDataType">
        <member name="value" type="long"/>
    </struct>
</types>
XSD notation
<?xml version="1.0" encoding="UTF-8"?>
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"</pre>
             xmlns:dds="http://www.omg.org/dds"
     xmlns:tns="http://www.omg.org/IDL-Mapped/"
     targetNamespace="http://www.omg.org/IDL-Mapped/">
  <xsd:import namespace="http://www.omg.org/dds" schemaLocation="rti_dds_topic_types_common.xsd"/</pre>
  <xsd:complexType name="myDataType">
    <xsd:sequence>
      <xsd:element name="value" minOccurs="1" maxOccurs="1" type="xsd:int"/>
    </xsd:sequence>
```

4.131 rtiddsgen 975

WSDL notation

```
<?xml version="1.0" encoding="UTF-8"?>
<definitions xmlns="http://schemas.xmlsoap.org/wsdl/" xmlns:dds="http://www.omg.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/wsdl/" xmlns:dds="http://www.omg.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/wsdl/" xmlns:dds="http://www.omg.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/wsdl/" xmlns:dds="http://www.omg.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/wsdl/" xmlns:dds="http://www.omg.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/wsdl/" xmlns:dds="http://www.omg.org/dds" xmlns:xsd="http://schemas.xmlsoap.org/dds" xmlns:xs
```

Assuming the name of the idl file is myFileName.(idl|xml|xsd|wsdl) then all you need to do is type:

rtiddsgen myFileName.(idl|xml|xsd|wsdl)

This generates myFileName.cxx, myFileName.h, myFileNamePlugin.cxx, myFileNamePlugin.h, myFileNameSupport.cxx and myFileNameSupport.h. By default, rtiddsgen will not overwrite these files. You must use the -replace argument to do that.

4.131.4 IDL Language

In the IDL language, data types are described in a fashion almost identical to structures in "C." The complete description of the language can be found at the OMG website.

rtiddsgen does not support the full IDL language.

For detailed information about the IDL support in RTI Data Distribution Service see Chapter 3 of the user manual.

Below are the IDL types that are currently supported:

- ^ char
- wchar
- octet
- short
- unsigned short
- long

- ^ unsigned long
- long long
- unsigned long long
- float
- ^ double
- ^ long double
- **^** boolean
- bounded string
- unbounded string
- bounded wstring
- unbounded wstring
- enum
- ^ typedef
- ^ struct
- ^ valuetypes (limited support)
- ^ union
- sequences
- ^ unbounded sequences
- arrays
- array of sequences
- constant

The following non-IDL types are also supported by rtiddsgen:

- bitfield
- ^ valued enum

Use of Unsupported Types in an IDL File

You may include unsupported data types in the IDL file. rtiddsgen does not consider this an error. This allows you to use types that are defined in non-IDL languages with either hand-written or non-rtiddsgen written plug-ins. For example, the following is allowable:

```
//@copy #include "Bar.h"
//@copy #include "BarHandGeneratedPlugin.h"
struct Foo {
    short height;
    Bar barMember;
};
```

In the above case, Bar is defined externally by the user.

Multiple Types in a Single File

You can specify multiple types in a single idl file. This can simplify management of files in your distributed program.

Use of Directives in an IDL File

The following directives can be used in your IDL file: Note: Do not put a space between the slashes and the @ sign. Note: Directives are case-sensitive (for example: use key, not Key).

- ^ //@key The field declared just before this directive in the enclosing structure is part of the key. Any number of a structure's fields may be declared part of the key.
- ^ //@copy This copies a line of text into the generated code verbatim (for all languages). The text is copied into all of the type-specific files generated by rtiddsgen (except the examples).
- ^ //@copy-c Same as //@copy, but for C++/C-only code.
- ^ //@copy-java Same as //@copy, but for Java-only code.
- ^ //@copy-declaration This is like //@copy, but only copies the text into the file where the type is declared (<type>.h for C++/C, or <type>.java for Java).
- $^{\hat{}}$ //@copy-c-declaration Same as //@copy-declaration, but for C++/C-only code.
- ^ //@copy-java-declaration Same as //@copy-declaration, but for Java-only code.
- ^ //@resolve-name [true|false] This specifies whether or not rtiddsgen should resolve the scope of a type. If this directive is not present or set to true, rtiddsgen resolves the scope. Otherwise rtiddsgen delegates the resolution of a type to the user.
- ^ //@top-level [true|false] This specifies whether or not rtiddsgen should generate type-support code for a particular struct or union. The default is true.

4.131.5 XML Language

The data types can be described using XML.

RTI Data Distribution Service provides DTD and XSD files that describe the XML format.

The DTD definition of the XML elements can be found in ../../resource/dtd/rti_dds_topic_types.dtd" under <NDDSHOME>/resource/dtd.

The XSD definition of the XML elements can be found in ../../resource/dtd/rti_dds_topic_types.dtd" under <NDDSHOME>/resource/xsd.

The XML validation performed by rtiddsgen always uses the DTD definition. If the <!DOCTYPE> tag is not present in the XML file, rtiddsgen will look for the DTD document under <NDDSHOME>/resource/dtd. Otherwise, it will use the location specified in <!DOCTYPE>.

For detailed information about the mapping between IDL and XML see Chapter 3 of the RTI Data Distribution Service User Manual.

4.131.6 XSD Language

The data types can be described using XML schemas (XSD files). The XSD specification is based on the standard IDL to WSDL mapping described in the OMG document CORBA to WSDL/SOAP Interworking Specification

For detailed information about the mapping between IDL and XML see Chapter 3 of the RTI Data Distribution Service User Manual.

4.131.7 WSDL Language

The data types can be described using XML schemas contained in WSDL files. The XSD specification is based on the standard IDL to WSDL mapping described in the OMG document CORBA to WSDL/SOAP Interworking Specification

For detailed information about the mapping between IDL and XML see Chapter 3 of the RTI Data Distribution Service User Manual.

4.131.8 Using Generated Types Without RTI Data Distribution Service (Standalone)

You can use the generated type-specific source and header files without linking the RTI Data Distribution Service libraries or even including the RTI Data Distribution Service header files. That is, the generated files for your data types can be used standalone. The directory <NDDSHOME>/resource/standalone contains the helper files required to work in standalone mode:

 $\hat{}$ include: header and templates files for C/C++.

 $\hat{}$ src: source files for C/C++.

^ class: Java jar file.

Using Standalone Types in C

The generated files that can be used standalone are:

^ <idl file name>.c : Types source file

^ <idl file name>.h : Types header file

You *cannot* use the type plug-in (<idl file>Plugin.c <idl file>Plugin.h) or the type support (<idl file>Support.c <idl file>Support.h) code standalone.

To use the rtiddsgen-generated types in a standalone manner:

- ^ Include the directory <NDDSHOME>/resource/standalone/include in the list of directories to be searched for header files.
- ^ Add the source files ndds_standalone_type.c and <idl file name>.c to your project.
- Include the file <idl file name>.h in the source files that will use the generated types in a standalone way.
- ^ Compile the project using the two following preprocessor definitions:
 - NDDS_STANDALONE_TYPE
 - The definition for your platform: RTI_VXWORKS, RTI_QNX, RTI_WIN32, RTI_INTY, RTI_LYNX or RTI_UNIX

Using Standalone Types in C++

The generated files that can be used standalone are:

- ^ <idl file name>.cxx : Types source file
- ^ <idl file name>.h : Types header file

You cannot use the type plugin (<idl file>Plugin.cxx <idl file>Plugin.h) or the type support (<idl file>Support.cxx <idl file>Support.h) code standalone.

To use the generated types in a standalone manner:

- ^ Include the directory <NDDSHOME>/resource/standalone/include in the list of directories to be searched for header files.
- ^ Add the source files ndds_standalone_type.cxx and <idl file name>.cxx to your project.
- ^ Include the file <idl file name>.h in the source files that will use the generated types in a standalone way.
- ^ Compile the project using the two following preprocessor definitions:
 - NDDS_STANDALONE_TYPE
 - The definition for your platform: RTI_VXWORKS, RTI_QNX, RTI_WIN32, RTI_INTY, RTI_LYNX or RTI_UNIX

Standalone Types in Java

The generated files that can be used standalone are:

- ^ <idl type>.java
- ^ <idl type>Seq.java

You cannot use the type code (<idl file>TypeCode.java), the type support (<idl type>TypeSupport.java), the data reader (<idl file>DataReader.java) or the data writer code (<idl file>DataWriter.java) standalone.

To use the generated types in a standalone manner:

- ^ Include the file ndds_standalone_type.jar in the classpath of your project.
- ^ Compile the project using the standalone types files (<idl type>.java <idl type>Seq.java).

4.132 rtiddsping

Sends or receives simple messages using RTI Data Distribution Service. The rtiddsping utility uses RTI Data Distribution Service to send and receive preconfigured "Ping" messages to other rtiddsping applications which can be running in the same or different computers.

The rtiddsping utility can used to test the network and/or computer configuration and the environment settings that affect the operation of RTI Data Distribution Service.

Usage

```
rtiddsping [-help] [-version]
   [-domainId <domainId>]
                             ... defaults to 0
   [-index <NN>]
                             ... defaults to -1 (auto)
   [-appId <ID>]
                             ... defaults to a middleware-selected value
   [-Verbosity <NN>]
                             ... can be 0..5
                             ... PEER format is NN@TRANSPORT://ADDRESS
   [-peer <PEER>]
   [-discoveryTTL <NN>]
                             ... can be 0..255
[-transport <MASK>]
                         ... defaults to DDS_TRANSPORTBUILTIN_MASK_DEFAULT
[-msgMaxSize <SIZE>]
                         ... defaults to -1 (transport default)
[-shmRcvSize <SIZE>]
                         ... defaults to -1 (transport default)
[-deadline <SS>]
                         ... defaults to -1 (no deadline)
                         ... TYPE can be VOLATILE or TRANSIENT_LOCAL
[-durability <TYPE>]
   [-multicast <ADDRESS>]
                             ... defaults to no multicast
[-numSamples <NN>] ... defaults to infinite
                               ... this is the default
   [-publisher]
[-queueSize <NN>]
                         ... defaults to 1
[-reliable]
                           ... defaults to best-efforts
[-sendPeriod <SS>]
                         ... SS is in seconds, defaults to 1
[-subscriber]
[-timeFilter <SS>]
                         ... defaults to 0 (no filter)
            <SS>]
                         ... SS is in seconds, defaults to infinite
[-timeout
[-topicName <NAME>]
                         ... defaults to PingTopic
[-typeName
            <NAME>]
                         ... defaults to PingType
[-useKeys
            <NN>]
                         ... defaults to PingType
   [-qosFile <file>]
   [-qosProfile <lib::prof>]
 Example: rtiddsping -domainId 3 -publisher -numSamples 100
```

VxWorks Usage

If the stack of the shell is not large enough to run rtiddsping, use "taskSpawn":

taskSpawn <name>,<priority>,<taskspawn options>,<stack size in bytes>,rtiddsping,"[\<options The options use the same syntax as above.

Example taskSpawn "rtiddsping",100,0x8,50000,rtiddsping,"-domainId 3 -publisher -numSamples

Options:

- -help Prints a help message and exits.
- -version Prints the version and exits.
- -Verbosity <NN> Sets the verbosity level. The range is 0 to 5.
- 0 has minimal output and does not echo the fact that data is being sent or received.
- 1 prints the most relevant statuses, including the sending and receiving of data. This is the default.
- 2 prints a summary of the parameters that are in use and echoes more detailed status messages.
- 3-5 Mostly affects the verbosity used by the internal RTI Data Distribution Service modules that implement rtiddsping. The output is not always readable; its main purpose is to provide information that may be useful to RTI's support team.

Example: rtiddsping -Verbosity 2

-domainId <NN>

Sets the domain ID. The valid range is 0 to 100.

Example: rtiddsping -domainId 31

-appId <ID>

Sets the application ID. If unspecified, the system will pick one automatically.

This option is rarely used.

Example: rtiddsping -appId 34556

-index < NN >

Sets the participantIndex. If participantIndex is not -1 (auto), it must be different than the one used by all other applications in the same computer and domainId. If this is not respected, rtiddsping (or the application that starts last) will get an initialization error.

Example: rtiddsping -index 2

-peer <PEER>

Specifies a PEER to be used for discovery. Like any RTI Data Distribution Service application, it defaults to the setting of the environment variable NDDS_DISCOVERY_PEERS or a preconfigured multicast address if the environment is not set.

The format used for PEER is the same one used for NDDS_DISCOVERY_PEERS and is described in detail in NDDS_DISCOVERY_PEERS (p. 189). A brief summary follows:

The general format is: NN@TRANSPORT://ADDRESS where:

- ^ ADDRESS is an address (in name form or using the IP notation xxx.xxx.xxx). ADDRESS may be a multicast address.
- ^ TRANSPORT represents the kind of transport to use and NN is the maximum participantIndex expected at that location. NN can be omitted and it is defaulted to '4'
- [^] Valid settings for TRANSPORT are 'udpv4' and 'shmem'. The default setting if the transport is omitted is 'udpv4'.
- ^ ADDRESS cannot be omitted if the '-peer' option is specified.

The -peer option may be repeated to specify multiple peers.

Example: rtiddsping -peer 10.10.1.192 -peer mars -peer 4@pluto

-discoveryTTL < TTL >

Sets the TTL (time-to-live) used for multicast discovery. If not specified, it defaults to the built-in RTI Data Distribution Service default.

The valid range is 0 to 255. The value '0' limits multicast to the node itself (i.e., can only discover applications running on the same computer). The value '1' limits multicast discovery to computers on the same subnet. Values higher than 1 generally indicate the maximum number of routers that may be traversed (although some routers may be configured differently).

Example: rtiddsping -discoveryTTL 16

-transport <MASK>

A bit-mask that sets the enabled builtin transports. If not specified, the default set of transports is used (UDPv4 + shmem). The bit values are: 1=UDPv4, 2=shmem, 8=UDPv6.

-msgMaxSize <SIZE>

Configure the maximum message size allowed by the installed transports. This is needed if you are using rtiddsping to communicate with an application that has set these transport parameters to larger than default values.

-shmRcvSize <SIZE>

Increase the shared memory receive-buffer size. This is needed if you are using rtiddsping to communicate with an application that has set these transport parameters to larger than default values.

-deadline <SS>

This option only applies if the '-subscriber' option is also specified.

Sets the DEADLINE QoS for the subscriptions made by rtiddsping.

Note that this may cause the subscription QoS to be incompatible with the publisher if the publisher did not specify a sendPeriod greater than the deadline. If the QoS is incompatible, rtiddsping will not receive updates.

Each time a deadline is detected, rtiddsping will print a message indicating the number of deadlines received so far.

Example: rtiddsping -deadline 3.5

-durability <TYPE>

Sets the DURABILITY QoS used for publishing or subscribing. Valid settings are: VOLATILE and TRANSIENT_LOCAL (default). The effect of this setting can only be observed when it is used in in conjunction with reliability and a queueSize larger than 1. If all these conditions are met, a late-joining subscriber will be able to see up to queueSize samples that were previously written by the publisher.

Example: rtiddsping -durability VOLATILE

-multicast <ADDRESS>

This option only applies if the '-subscriber' option is also specified.

Configures ping to receive messages over multicast. The <ADDRESS> parameter indicates the address to use. ADDRESS must be in the valid range for multicast addresses. For IP version 4 the valid range is 224.0.0.1 to 239.255.255.255

Example: rtiddsping -multicast 225.1.1.1

-numSamples <NN>

Sets the number of samples that will be sent by rtiddsping. After those samples are sent, rtiddsping will exit. messages.

Example: rtiddsping -numSamples 10

-publisher

Causes rtiddsping to send ping messages. This is the default.

Example: rtiddsping -publisher

$\textbf{-queueSize} < \hspace{-0.1cm}\text{NN} >$

Specifies the maximal number of samples to hold in the queue. In the case of the publisher, it affects the samples that are available for a late-joining subscriber.

Example: rtiddsping -queueSize 100

-reliable

Configures the RELIABILITY QoS for publishing or subscribing. The default setting (if -reliable is not used) is BEST_EFFORT

Example: rtiddsping -reliable

-sendPeriod <SS>

Sets the period (in seconds) at which rtiddsping sends the messages.

Example: rtiddsping -sendPeriod 0.5

-subscriber

Causes rtiddsping to listen for ping messages. This option cannot be specified if '-publisher' is also specified.

Example: rtiddsping -subscriber

-timeFilter $\langle SS \rangle$

This option only applies if the '-subscriber' option is also specified.

Sets the TIME_BASED_FILTER QoS for the subscriptions made by rtiddsping. This QoS causes RTI Data Distribution Service to filter out messages that are published at a rate faster than what the filter duration permits. For example, if the filter duration is 10 seconds, messages will be printed no faster than once every 10 seconds.

Example: rtiddsping -timeFilter 5.5

-timeout <SS>

This option only applies if the '-subscriber' option is also specified.

Sets a timeout (in seconds) that will cause rtiddsping to exit if no samples are received for a duration that exceeds the timeout.

Example: rtiddsping -timeout 30

-topicName <NAME>

Sets the topic name used by rtiddsping. The default is 'RTIddsPingTopic'. To communicate, both the publisher and subscriber must specify the same topic name.

Example: rtiddsping -topicName Alarm

-typeName <NAME>

Sets the type name used by rtiddsping. The default is 'RTIddsPingType'. To communicate, both publisher and subscriber must specify the same type name.

Example: rtiddsping -typeName AlarmDescription

-useKeys <NN>

This option causes rtiddsping to use a topic whose data contains a key. The value of the NN parameter indicates the number of different data objects (each identified by a different value of the key) that will be published by rtiddsping. The value of NN only affects the publishing behavior. However NN still needs to be specified when the -useKeys option is used with the -subscriber option.

For communication to occur, both the publisher and subscriber must agree on whether the topic that they publish/subscribe contains a key. Consequently, if you specify the -useKeys parameter for the publisher, you must do the same with the subscriber. Otherwise communication will not be stablished.

Example: rtiddsping -useKeys 20

```
-qosFile <file>
```

Allow you to specify additional QoS XML settings using url_profile. For more information on the syntax, see Chapter 15 in the RTI Data Distribution Service User's Manual.

Example: rtiddsping -qosFile /home/user/QoSProfileFile.xml

```
-qosProfile <lib::prof>
```

This option specifies the library name and profile name that the tool should use.

QoS settings

rtiddsping is configured internally using a special set of QoS settings in a profile called InternalPingLibrary::InternalPingProfile. This is the default profile unless a profile called DefaultPingLibrary::DefaultPingProfile is found. You can use the command-line option -qosProfile to tell rtiddsping to use a different lib::profile instead of DefaultPingLibrary::DefaultPingProfile. Like all the other RTI Data Distribution Service applications, rtiddsping loads all the profiles specified using the environment variable NDDS_QOS_PROFILES or the file named USER_QOS_PROFILES found in the current working directory.

The QoS settings used internally are available in the file RTIDDSSPING_QOS_-PROFILES.example.xml.

Description

The usage depends on the operating system from which rtiddsping is executed.

Examples for UNIX, Linux, and Windows Systems

On UNIX, Linux, Windows and other operating systems that have a shell, the syntax matches the one of the regular commands available in the shell. In the examples below, the string 'shell prompt'>' represents the prompt that the shell prints and are not part of the command that must be typed.

```
shell prompt> rtiddsping -domainId 3 -publisher -numSamples 100
shell prompt> rtiddsping -domainId 5 -subscriber -timeout 20
```

```
shell prompt> rtiddsping -help
```

VxWorks examples:

On VxWorks systems, the libraries libnddscore.so, libnddsc.so and libnddscpp.so must first be loaded. The rtiddsping command must be typed to the VxWorks shell (either an rlogin shell, a target-server shell, or the serial line prompt). The arguments are passed embedded into a single string, but otherwise have the same syntax as for Unix/Windows. In the Unix, Linux, Windows and other operating systems that have a shell, the syntax matches the one of the regular commands available in the shell. In the examples below, the string 'vxworks prompt>' represents the prompt that the shell prints and are not part of the command that must be typed.

vxworks prompt> rtiddsping "-domainId 3 -publisher -numSamples 100"

```
vxworks prompt> rtiddsping "-domainId 5 -subscriber -timeout 20"
vxworks prompt> rtiddsping "-help"

or, alternatively (to avoid overflowing the stack):

vxworks prompt> taskSpawn "rtiddsping", 100, 0x8, 50000, rtiddsping, "-domainId 3 -publisher -numSamples 10 vxworks prompt> taskSpawn "rtiddsping", 100, 0x8, 50000, rtiddsping, "-domainId 5 -subscriber -timeout 20"
vxworks prompt> taskSpawn "rtiddsping", 100, 0x8, 50000, rtiddsping, "-help"
```

4.133 rtiddsspy

Debugging tool which receives all RTI Data Distribution Service communication. The rtiddsspy utility allows the user to monitor groups of publications available on any RTI Data Distribution Service domain.

Note: If you have more than one DataWriter for the same Topic, and these DataWriters have different settings for the Ownership QoS, then rtiddsspy will only receive (and thus report on) the samples from the first DataWriter.

To run rtiddsspy, like any RTI Data Distribution Service application, you must have the NDDS_DISCOVERY_PEERS environment variable that defines your RTI Data Distribution Service domain; otherwise you must specify the peers as command line parameters.

Usage

```
rtiddsspy [-help] [-version]
     [-domainId <domainId>]
                                 ... defaults to 0
     [-index <NN>]
                                 ... defaults to -1 (auto)
     [-appId <ID>]
                                ... defaults to a middleware-selected value
     [-Verbosity <NN>]
                                ... can be 0..5
     [-peer <PEER>]
                                ... PEER format is NN@TRANSPORT://ADDRESS
     [-discoveryTTL <NN>]
                                ... can be 0..255
     [-transport <MASK>]
                                ... defaults to DDS_TRANSPORTBUILTIN_MASK_DEFAULT
     [-msgMaxSize <SIZE>]
                                ... defaults to -1 (transport default)
     [-shmRcvSize <SIZE>]
                                ... defaults to -1 (transport default)
     [-tcMaxSize <SIZE>]
                                ... defaults to 4096
     [-hOutput]
     [-deadline
                  <SS>]
                                ... defaults to -1 (no deadline)
     [-history <DEPTH>]
                                 ... defaults to 8192
                                 ... defaults to 0 (no filter)
     [-timeFilter <SS>]
     [-useFirstPublicationQos]
     [-showHandle]
     [-typeRegex <REGEX>]
                                 ... defaults to "*"
                                ... defaults to "*"
     [-topicRegex <REGEX>]
     [-typeWidth <WIDTH>]
                                ... can be 1..255
     [-topicWidth <WIDTH>]
                                ... can be 1..255
     [-truncate]
     [-printSample]
     [-qosFile <file>]
     [-qosProfile <lib::prof>]
```

Example: rtiddsspy -domainId 3 -topicRegex "Alarm*"

VxWorks Usage

```
\mathbf{rtiddsspy} \ \texttt{"[<options>]"}
```

The options use the same syntax as above.

Example rtiddsspy "-domainId 3 -topicRegex Alarm*"

The options use the same syntax as above.

Example taskSpawn "rtiddsspy", 100, 0x8, 50000, rtiddsspy, "-domainId 3 -topicRegex Alarm*"

Options:

- -help Prints a help message and exits.
- -version Prints the version and exits.
- **-Verbosity** <NN> Sets the verbosity level. The range is 0 to 5.
- 0 has minimal output and does not echo the fact that data is being sent or received.
- 1 prints the most relevant statuses, including the sending and receiving of data. This is the default.
- 2 prints a summary of the parameters being used and echoes more detailed status messages.
- 3-5 Mostly affect the verbosity used by the internal RTI Data Distribution Service modules that implement rtiddsspy. The output is not always readable; its main purpose is to provide information that may be useful to RTI's support team.

Example: rtiddsspy -Verbosity 2

-domainId <NN>

Sets the domain ID. The valid range is 0 to 100.

Example: rtiddsspy -domainId 31

-appId <ID>

Sets the application ID. If unspecified, the system will pick one automatically.

This option is rarely used.

Example: rtiddsspy -appId 34556

-index < NN >

Sets the participantIndex. If participantIndex is not -1 (auto), it must be different than the one used by all other applications in the same computer and

domainId. If this is not respected, rtiddsspy (or the application that starts last) will get an initialization error.

Example: rtiddsspy -index 2

-peer <PEER>

Specifies a PEER to be used for discovery. Like any RTI Data Distribution Service application, it defaults to the setting of the environment variable NDDS_DISCOVERY_PEERS or a preconfigured multicast address if the environment is not set.

The format used for PEER is the same used for the NDDS_DISCOVERY_PEERS and is described in detail in **NDDS_DISCOVERY_PEERS** (p. 189). A brief summary follows:

The general format is: NN@TRANSPORT://ADDRESS where:

- ^ ADDRESS is an address (in name form or using the IP notation xxx.xxx.xxx). ADDRESS may be a multicast address.
- ^ TRANSPORT represents the kind of transport to use and NN is the maximum participantIndex expected at that location. NN can be omitted and it is defaulted to '4'
- [^] Valid settings for TRANSPORT are 'udpv4' and 'shmem'. The default setting if the transport is omitted is 'udpv4'
- ^ ADDRESS cannot be omitted if the '-peer' option is specified.

The -peer option may be repeated to specify multiple peers.

Example: rtiddsspy -peer 10.10.1.192 -peer mars -peer 4@pluto

$\textbf{-discoveryTTL} < \!\! \text{TTL} \!\! >$

Sets the TTL (time-to-live) used for multicast discovery. If not specified, it defaults to the built-in RTI Data Distribution Service default.

The valid range is 0 to 255. The value '0' limits multicast to the node itself (i.e. can only discover applications running on the same computer). The value '1' limits multicast discovery to computers on the same subnet. Settings greater than 1 generally indicate the maximum number of routers that may be traversed (although some routers may be configured differently).

Example: rtiddsspy -discoveryTTL 16

-transport <MASK>

SPecifies a bit-mask that sets the enabled builtin transports. If not specified, the default set of transports is used (UDPv4 + shmem). The bit values are: 1=UDPv4, 2=shmem, 8=UDPv6.

-msgMaxSize <SIZE>

Configures the maximum message size allowed by the installed transports. This is needed if you are using rtiddsspy to communicate with an application that has set these transport parameters to larger than default values.

-shmRcvSize <SIZE>

Increases the shared memory receive-buffer size. This is needed if you are using rtiddsspy to communicate with an application that has set these transport parameters to larger than default values.

-tcMaxSize < SIZE >

Configures the maximum size, in bytes, of a received type code.

-hOutput

Prints information on the output format used by rtiddsspy.

This option prints an explanation of the output and then exits.

Example: rtiddsspy -hOutput

-deadline <SS>

Sets the requested DEADLINE QoS for the subscriptions made by rtiddsspy.

Note that this may cause the subscription QoS to be incompatible with the publisher if the publisher did not specify an offered deadline that is greater or equal to the one requested by rtiddsspy. If the QoS is incompatible rtiddsspy will not receive updates from that writer.

Each time a deadline is detected rtiddsspy will print a message that indicates the number of deadlines received so far.

Example: rtiddsspy -deadline 3.5

-timeFilter <SS>

Sets the TIME_BASED_FILTER QoS for the subscriptions made by rtiddsspy. This QoS causes RTI Data Distribution Service to filter-out messages that are published at a rate faster than what the filter duration permits. For example if the filter duration is 10 seconds, messages will be printed no faster than once each 10 seconds.

Example: rtiddsspy -timeFilter 10.0

-history <DEPTH>

Sets the HISTORY depth QoS for the subscriptions made by rtiddsspy.

This may be relevant if the publisher has batching turned on, or if the -useFirstPublicationQos option is used that is causing a reliable or durable subscription to be created.

Example: rtiddsspy -history 1

-useFirstPublicationQos

Sets the RELIABILITY and DURABILITY QoS of the subscription based on the first discovered publication of that topic.

See also -history option.

Example: rtiddsspy -useFirstPublicationQos

-showHandle

Prints additional information about each sample received. The additional information is the 'instance_handle' field in the SampleHeader, which can be used to distinguish among multiple instances of data objects published under the same topic and type names.

Samples displayed that share the topic and type names and also have the same value for the instance_handle represent value updates to the same data object. On the other hand, samples that share the topic and type names but display different values for the instance_handle.

This option causes rtiddsspy to print an explanation of updates to the values of different data objects.

Example: rtiddsspy -showHandle

-typeRegex <REGEX>

Subscribe only to types that match the REGEX regular expression. The syntax of the regular expression is defined by the POSIX regex function.

When typing a regular expression to a command-line shell, some symbols may need to be escaped to avoid interpretation by the shell. In general, it is safest to include the expression in double quotes.

This option may be repeated to specify multiple topic expressions.

Example: rtiddsspy -typeRegex "SensorArray*"

-topicRegex <REGEX>

Subscribe only to topics that match the REGEX regular expression. The syntax of the regular expression is defined by the POSIX regex function.

When typing a regular expression to a command-line shell, some symbols may need to be escaped to avoid interpretation by the shell. In general, it is safest to include the expression in double quotes.

This option may be repeated to specify topic multiple expressions.

Example: rtiddsspy -topicRegex "Alarm*"

-typeWidth <WIDTH>

Sets the maximum width of the Type name column. Names wider than this will wrap around, unless -truncate is specified. Can be 1..255.

-topicWidth <WIDTH>

Sets the maximum width of the Topic name column. Names wider than this will wrap around, unless -truncate is specified. Can be 1..255.

-truncate

Specifies that names exceeding the maximum number of characters should be truncated.

-printSample

Prints the value of the received samples.

```
-qosFile <file>
```

Allows you to specify additional QoS XML settings using url_profile. For more information on the syntax, see Chapter 15 in the RTI Data Distribution Service User's Manual.

Example: rtiddsspy -qosFile /home/user/QoSProfileFile.xml

```
-qosProfile <lib::prof>
```

Specifies the library name and profile name to be used.

QoS settings

rtiddsspy is configured to discover as many entities as possible. To do so, an internal profile is defined, called InternalSpyLibrary::InternalSpyProfile. This is the default profile, unless a profile called DefaultSpyLibrary::DefaultSpyProfile is found. You can use the command-line option -qosProfile to tell rtiddsspy to use a speficied lib::profile instead of DefaultSpyLibrary::DefaultSpyProfile. Like all the other RTI Data Distribution Service applications, rtiddsspy loads all the profiles specified using the environment variable NDDS_QOS_PROFILES or the file named USER_QOS_PROFILES found in the current working directory.

The QoS settings used internally are available in the file RTIDDSSPY_QOS_-PROFILES.example.xml.

Usage Examples

The usage depends on the operating system from which rtiddsspy is executed.

Examples for UNIX, Linux, Windows systems

On UNIX, Linux, Windows and other operating systems that have a shell, the syntax matches the one of the regular commands available in the shell. In the examples below, the string 'shell prompt'>' represents the prompt that the shell prints and are not part of the command that must be typed.

```
shell prompt> rtiddsspy -domainId 3
shell prompt> rtiddsspy -domainId 5 -topicRegex "Alarm*"
shell prompt> rtiddsspy -help
```

Examples for VxWorks Systems

On VxWorks systems, the libraries libnddscore.so, libnddsc.so and libnddscpp.so must first be loaded. The rtiddsspy command must be typed to the VxWorks shell (either an rlogin shell, a target-server shell, or the serial line prompt). The arguments are passed embedded into a single string, but otherwise have the same syntax as for Unix/Windows. In UNIX, Linux, Windows and other operating systems that have a shell, the syntax matches the one of the regular comamnds available in the shell. In the examples below, the string 'vxworks prompt>' represents the prompt that the shell prints and are not part of the command that must be typed.

```
vxworks prompt> rtiddsspy "-domainId 3"
vxworks prompt> rtiddsspy "-domainId 5 5 -topicRegex "Alarm*"
vxworks prompt> rtiddsspy "-help"
```

4.134 Class Id 995

4.134 Class Id

Transport class ID. Specifies the ID of a Transport-Plugin 'class'.

Defines

 $\hat{\ } \# define \ \mathbf{NDDS_TRANSPORT_CLASSID_INVALID} \ (\text{-}1)$

 $Invalid\ Transport\ Class\ ID.$

* #define NDDS_TRANSPORT_CLASSID_DTLS (6)

DTLS Secure Transport-Plugin class ID.

^ #define NDDS_TRANSPORT_CLASSID_WAN (7)

WAN Transport-Plugin class ID.

* #define NDDS_TRANSPORT_CLASSID_TCPV4_LAN (8)

IPv4 TCP/IP Transport-Plugin class ID for LAN case.

* #define NDDS_TRANSPORT_CLASSID_TCPV4_WAN (9)

IPv4 TCP/IP Transport-Plugin class ID for WAN case.

^ #define NDDS_TRANSPORT_CLASSNAME_TCPV4_-WAN "tcpv4_wan"

IPv4 TCP/IP Transport-Plugin class name for WAN case.

- * #define NDDS_TRANSPORT_CLASSID_TLSV4_LAN (10)
 - $\it IPv4\ TCP/IP\ Transport\mbox{-}Plugin\ class\ ID\ for\ LAN\ case\ with\ TLS\ enabled.$
- * #define NDDS_TRANSPORT_CLASSID_TLSV4_WAN (11)

IPv4 TCP/IP Transport-Plugin class ID for WAN case with TLS enabled.

^ #define NDDS_TRANSPORT_CLASSID_PCIE (12)

PCIE Transport-Plugin class ID.

^ #define NDDS_TRANSPORT_CLASSID_RESERVED_-RANGE (1000)

Transport-Plugin class IDs below this are reserved by RTI.

Typedefs

 $\hat{\ }$ typedef RTI_INT32 $\mathbf{NDDS_Transport_ClassId_t}$

Type for storing RTI Data Distribution Service Transport-Plugin class IDs.

4.134.1 Detailed Description

Transport class ID. Specifies the ID of a Transport-Plugin 'class'.

Each implementation of a Transport Plugin must have a unique ID. For example, a UDP/IP Transport-Plugin implemenation must have a different ID than a Shared Memory Transport Plugin.

User-implemented Transport Plugins must have an ID higher than NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (p. 997).

4.134.2 Define Documentation

4.134.2.1 #define NDDS_TRANSPORT_CLASSID_INVALID (-1)

Invalid Transport Class ID.

Transport-Plugins implementations should set their class ID to a value different than this.

4.134.2.2 #define NDDS_TRANSPORT_CLASSID_DTLS (6)

DTLS Secure Transport-Plugin class ID.

4.134.2.3 #define NDDS_TRANSPORT_CLASSID_WAN (7)

WAN Transport-Plugin class ID.

4.134.2.4 #define NDDS_TRANSPORT_CLASSID_TCPV4_-LAN (8)

IPv4 TCP/IP Transport-Plugin class ID for LAN case.

4.134.2.5 #define NDDS_TRANSPORT_CLASSID_TCPV4_-WAN (9)

IPv4 TCP/IP Transport-Plugin class ID for WAN case.

4.134 Class Id 997

4.134.2.6 #define NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN "tcpv4_wan"

IPv4 TCP/IP Transport-Plugin class name for WAN case.

4.134.2.7 #define NDDS_TRANSPORT_CLASSID_TLSV4_-LAN (10)

IPv4 TCP/IP Transport-Plugin class ID for LAN case with TLS enabled.

4.134.2.8 #define NDDS_TRANSPORT_CLASSID_TLSV4_- WAN (11)

IPv4 TCP/IP Transport-Plugin class ID for WAN case with TLS enabled.

4.134.2.9 #define NDDS_TRANSPORT_CLASSID_PCIE (12)

PCIE Transport-Plugin class ID.

4.134.2.10 #define NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (1000)

Transport-Plugin class IDs below this are reserved by RTI.

User-defined Transport-Plugins should use a class ID greater than this number.

4.134.3 Typedef Documentation

$4.134.3.1 \quad typedef \ RTI_INT32 \ NDDS_Transport_ClassId_t$

Type for storing RTI Data Distribution Service Transport-Plugin class IDs.

4.135 Address

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

Data Structures

 $^{\circ}$ struct NDDS_Transport_Address_t

Addresses are stored individually as network-ordered bytes.

Defines

An invalid transport address. Used as an initializer.

*#define NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_-SIZE (40)

The minimum size of the buffer that should be passed to NDDS_Transport_-Address_to_string (p. 1000).

Functions

^ RTI_INT32 NDDS_Transport_Address_to_string (const NDDS_-Transport_Address_t *self, char *buffer_inout, RTI_INT32 buffer_length_in)

Converts a numerical address to a printable string representation.

^ RTLINT32 NDDS_Transport_Address_from_string (NDDS_Transport_Address_t *address_out, const char *address_in)

Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.

^ void NDDS_Transport_Address_print (const NDDS_Transport_-Address_t *address_in, const char *desc_in, RTI_INT32 indent_in)

Prints an address to standard out.

^ RTI_INT32 NDDS_Transport_Address_is_ipv4 (const NDDS_-Transport_Address_t *address_in)

Checks if an address is an IPv4 address.

4.135 Address 999

^ RTI_INT32 NDDS_Transport_Address_is_multicast (const NDDS_-Transport_Address_t *address_in)

Checks if an address is an IPv4 or IPv6 multicast address.

4.135.1 Detailed Description

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

The APIs of RTI Data Distribution Service uses IPv6 address notation for all transports.

Transport-Plugin implementations that are not IP-based are required to map whatever addressing scheme natively used by the physical transport (if any) to an address in IPv6 notation and vice versa.

IPv6 addresses are numerically stored in 16 bytes. An IPv6 address can be presented In string notation in a variety of ways. For example,

```
"00AF:0000:0037:FE01:0000:0000:034B:0089"
"AF:0:37:FE01:0:0:34B:89"
"AF:0:37:FE01::34B:89"
```

are all valid IPv6 presentation of the same address.

IPv4 address in dot notation can be used to specify the last 4 bytes of the address. For example,

```
"0000:0000:0000:0000:0000:192.168.0.1"
"0:0:0:0:0:0:192.168.0.1"
"::192.168.0.1"
```

are all valid IPv6 presentation of the same address.

For a complete description of valid IPv6 address notation, consult the IPv6 Addressing Architecture (RFC 2373).

Addresses are divided into unicast addresses and multicast addresses.

Multicast addresses are defined as

Addresses that start with 0xFF. That is FFxx:xxxx:xxxx:xxxx:xxxx:xxxx.

or an IPv4 multicast address

^ Address in the range [::224.0.0.0, ::239.255.255.255]

Multicast addresses do not refer to any specific destination (network interface). Instead, they usually refer to a group of network interfaces, often called a "multicast group".

Unicast addresses always refer to a specific network interface.

4.135.2 Define Documentation

An invalid transport address. Used as an initializer.

For example: NDDS_Transport_Address_t (p. 1504) address = NDDS_TRANSPORT_ADDRESS_INVALID

4.135.2.2 #define NDDS_TRANSPORT_ADDRESS_STRING_-BUFFER_SIZE (40)

The minimum size of the buffer that should be passed to **NDDS_Transport_-Address_to_string** (p. 1000).

The string size includes space for 8 tuples of 4 characters each plus 7 delimiting colons plus a terminating NULL.

4.135.3 Function Documentation

4.135.3.1 RTI_INT32 NDDS_Transport_Address_to_string (const NDDS_Transport_Address_t * self, char * buffer_inout, RTI_INT32 buffer_length_in)

Converts a numerical address to a printable string representation.

Precondition:

The buffer_inout provided must be at least NDDS_TRANSPORT_-ADDRESS_STRING_BUFFER_SIZE (p. 1000) characters long.

Parameters:

```
self \ll in >> (p. 951) The address to be converted.
```

 $buffer_inout << inout>>$ (p. 951) Storage passed in which to return the string corresponding to the address.

buffer_length_in <<iin>>> (p. 951) The length of the storage buffer. Must be >= NDDS_TRANSPORT_ADDRESS_STRING_-BUFFER_SIZE (p. 1000) 4.135 Address 1001

Returns:

1 upon success; 0 upon failure (not enough space in the provided buffer)

4.135.3.2 RTI_INT32 NDDS_Transport_Address_from_string (NDDS_Transport_Address_t * $address_out$, const char * $address_in$)

Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.

The address string must be in IPv4 dotted notation (X.X.X.X) or IPv6 presentation notation. The string cannot be a hostname since this function does not perform a hostname lookup.

Parameters:

```
address\_out << out>> (p. 951) Numerical value of the address. address\_in << in>> (p. 951) String representation of an address.
```

Returns:

- 1 if address_out contains a valid address
- 0 if it was not able to convert the string into an address.

4.135.3.3 void NDDS_Transport_Address_print (const NDDS_Transport_Address_t * $address_in$, const char * $desc_in$, RTLINT32 $indent_in$)

Prints an address to standard out.

Parameters:

```
address\_in <<in>> (p. 951) Address to be printed. desc\_in <<in>> (p. 951) A prefix to be printed before the address. indent\_in <<in>> (p. 951) Indentation level for the printout.
```

4.135.3.4 RTI_INT32 NDDS_Transport_Address_is_ipv4 (const NDDS_Transport_Address_t $* address_in$)

Checks if an address is an IPv4 address.

Parameters:

```
address_in \ll in \gg (p. 951) Address to be tested.
```

Note:

May be implemented as a macro for efficiency.

Returns:

- 1 if address is an IPv4 address 0 otherwise.
- 4.135.3.5 RTI_INT32 NDDS_Transport_Address_is_multicast (const NDDS_Transport_Address_ $t*address_in$)

Checks if an address is an IPv4 or IPv6 multicast address.

Parameters:

```
address_in << in>> (p. 951) Address to be tested.
```

May be implemented as a macro for efficiency.

Returns:

- 1 if address is a multicast address
- 0 otherwise.

4.136 Attributes 1003

4.136 Attributes

Base "class" of the properties of any Transport Plugin.

Data Structures

 $\hat{\ }$ struct NDDS_Transport_Property_t

Base structure that must be inherited by derived Transport Plugin classes.

Defines

*#define NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_-ALWAYS_LOANED (0x2)

Specified zero-copy behavior of transport.

`#define NDDS_TRANSPORT_PROPERTY_GATHER_SEND_-BUFFER_COUNT_MIN (3)

Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

4.136.1 Detailed Description

Base "class" of the properties of any Transport Plugin.

4.136.2 Define Documentation

4.136.2.1 #define NDDS_TRANSPORT_PROPERTY_BIT_-BUFFER_ALWAYS_LOANED (0x2)

Specified zero-copy behavior of transport.

A Transport Plugin may commit to one of three behaviors for zero copy receives:

- 1. Always does zero copy.
- 2. Sometimes does zero copy, up to the transport discretion.
- 3. Never does zero copy.

This bit should be set only if the Transport Plugin commits to always doing a zero copy receive, or more specifically, always loaning a buffer through its receive_rea() call.

In that case, the NDDS core will not need to allocate storage for a message that it retrieves with the receive_rEA() call.

4.136.2.2 #define NDDS_TRANSPORT_PROPERTY_GATHER_-SEND_BUFFER_COUNT_MIN (3)

Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

For the NDDS_Transport_Property_t (p. 1505) structure to be valid, the value of NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508) must be greater than or equal to this value.

4.137 Shared Memory Transport

Built-in transport plug-in for inter-process communications using shared memory (NDDS_TRANSPORT_CLASSID_SHMEM (p. 1009)).

Data Structures

 ${\bf \hat{\ }} struct \ {\bf NDDS_Transport_Shmem_Property_t}$

Subclass of NDDS_Transport_Property_t (p. 1505) allowing specification of parameters that are specific to the shared-memory transport.

Defines

* #define NDDS_TRANSPORT_CLASSID_SHMEM (2)

Builtin Shared-Memory Transport-Plugin class ID.

*#define NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_-COUNT (0)

Default value of $NDDS_Transport_Property_t::address_bit_count$ (p. 1507).

*#define NDDS_TRANSPORT_SHMEM_PROPERTIES_-BITMAP_DEFAULT (NDDS_TRANSPORT_PROPERTY_BIT_-BUFFER_ALWAYS_LOANED)

Default value of $NDDS_Transport_Property_t::properties_bitmap$ (p. 1507).

* #define NDDS_TRANSPORT_SHMEM_GATHER_SEND_-BUFFER_COUNT_MAX_DEFAULT (1024)

*#define NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_-MAX_DEFAULT (9216)

*#define NDDS_TRANSPORT_SHMEM_RECEIVED_-MESSAGE_COUNT_MAX_DEFAULT (32)

 $Default\ value\ of\ NDDS_Transport_Shmem_Property_t::received_-message_count_max\ (p.\ 1513).$

*#define NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_-SIZE_DEFAULT

Default value of NDDS_Transport_Shmem_Property_t::receive_buffer_-size (p. 1514).

^ #define NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT

Use this to initialize stack variable.

Functions

^ NDDS_Transport_Plugin * NDDS_Transport_Shmem_create (NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in)

Create a new shmem process transport, using PropertyQosPolicy.

^ NDDS_Transport_Plugin * **NDDS_Transport_Shmem_new** (const struct **NDDS_Transport_Shmem_Property_t** *property_in)

Create a new shmem process transport.

4.137.1 Detailed Description

Built-in transport plug-in for inter-process communications using shared memory (NDDS_TRANSPORT_CLASSID_SHMEM (p. 1009)).

This plugin uses System Shared Memory to send messages between processes on the same node.

The transport plugin has exactly one "receive interface"; since the address_bit_count is 0, it can be assigned any address. Thus the interface is located by the "network address" associated with the transport plugin.

4.137.2 Compatibility of Sender and Receiver Transports

Opening a receiver "port" on shared memory corresponds to creating a shared memory segment using a name based on the port number. The transport plugin's properties are embedded in the shared memory segment.

When a sender tries to send to the shared memory port, it verifies that properties of the receiver's shared memory transport are compatible with those specified in its transport plugin. If not, the sender will fail to attach to the port and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_attachShmem:failed to initialize incompatible properties
NDDS_Transport_Shmem_attachShmem:countMax 0 > -19417345 or max size -19416188 > 2147482624
```

In this scenario, the properties of the sender or receiver transport plugin instances should be adjusted, so that they are compatible.

4.137.3 Crashing and Restarting Programs

If a process using shared memory crashes (say because the user typed in ^C), resources associated with its shared memory ports may not be properly cleaned up. Later, if another RTI Data Distribution Service process needs to open the same ports (say, the crashed program is restarted), it will attempt to reuse the shared memory segment left behind by the crashed process.

The reuse is allowed iff the properties of transport plugin are compatible with those embedded in the shared memory segment (i.e., of the original creator). Otherwise, the process will fail to open the ports, and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_create_recvresource_rrEA:failed to initialize shared memory resource Cannot recycle existing shmem: size not compatible for key 0x1234
```

In this scenario, the shared memory segments must be cleaned up using appropriate platform specific commands. For details, please refer to the platform notes.

4.137.4 Shared Resource Keys

The transport uses the **shared memory segment keys**, given by the formula below.

```
0x400000 + port
```

The transport also uses signaling **shared semaphore keys** given by the formula below.

```
0x800000 + port
```

The transport also uses mutex **shared semaphore keys** given by the formula below.

```
0xb00000 + port
```

wher the port is a function of the domain_id and the participant_id, as described in DDS_WireProtocolQosPolicy::participant_id (p. 1487)

See also:

```
DDS_WireProtocolQosPolicy::participant_id (p. 1487)
NDDS_Transport_Support_set_builtin_transport_property()
(p. 876)
```

4.137.5 Creating and Registering Shared Memory Transport Plugin

RTI Data Distribution Service can implicitly create this plugin and register with the **DDS_DomainParticipant** (p. 339) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 1447).

To specify the properties of the builtin shared memory transport that is implicitly registered, you can either:

- ^ call NDDS_Transport_Support_set_builtin_transport_property (p. 876) or
- * specify the pre-defined property names in DDS_PropertyQosPolicy (p. 1308) associated with the DDS_DomainParticipant (p. 339). (see Shared Memory Transport Property Names in Property QoS Policy of Domain Participant (p. 1009)).

Builtin transport plugin properties specified in DDS_PropertyQosPolicy (p. 1308) always overwrite the ones specified through NDDS_Transport_Support_set_builtin_transport_property() (p. 876). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Data Distribution Service. See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

To explicitly create an instance of this plugin, NDDS_Transport_Shmem_new() (p. 1011) should be called. The instance should be registered with RTI Data Distribution Service, see NDDS_Transport_Support_register_transport (p. 871). In some configurations, you may have to disable the builtin shared memory transport plugin instance (DDS_TransportBuiltinQosPolicy (p. 1447), DDS_TRANSPORTBUILTIN_SHMEM (p. 199)), to avoid port conflicts with the newly created plugin instance.

4.137.6 Shared Memory Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the DDS_PropertyQosPolicy (p. 1308) of a DDS_DomainParticipant (p. 339) to configure the builtin shared memory transport plugin.

4.137.7 Define Documentation

4.137.7.1 #define NDDS_TRANSPORT_CLASSID_SHMEM (2)

Builtin Shared-Memory Transport-Plugin class ID.

4.137.7.2 #define NDDS_TRANSPORT_SHMEM_ADDRESS_-BIT_COUNT (0)

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1507).

4.137.7.3 #define NDDS_TRANSPORT_SHMEM_-PROPERTIES_BITMAP_DEFAULT (NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_-ALWAYS_LOANED)

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1507).

4.137.7.4 #define NDDS_TRANSPORT_SHMEM_GATHER_-SEND_BUFFER_COUNT_MAX_DEFAULT (1024)

Default value of NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508).

4.137.7.5 #define NDDS_TRANSPORT_SHMEM_MESSAGE_-SIZE_MAX_DEFAULT (9216)

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1508).

4.137.7.6 #define NDDS_TRANSPORT_SHMEM_RECEIVED_-MESSAGE_COUNT_MAX_DEFAULT (32)

Default value of NDDS_Transport_Shmem_Property_t::received_message_count_max (p. 1513).

4.137.7.7 #define NDDS_TRANSPORT_SHMEM_RECEIVE_-BUFFER_SIZE_DEFAULT

Value:

```
(NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT * \
NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT / 4)
```

Default value of NDDS_Transport_Shmem_Property_t::receive_buffer_size (p. 1514).

4.137.7.8 #define NDDS_TRANSPORT_SHMEM_PROPERTY_-DEFAULT

Use this to initialize stack variable.

4.137.8 Function Documentation

4.137.8.1 NDDS_Transport_Plugin* NDDS_Transport_Shmem_create (NDDS_Transport_Address_t * default_network_address_out, const struct DDS_PropertyQosPolicy * property_in)

Create a new shmem process transport, using PropertyQosPolicy.

An application may create multiple transports, possibly for use in different domains.

Parameters:

 $default_network_address_out << out>> (p. 951)$ Network address to be used when registering the transport.

property_in <<iin>>> (p. 951) Desired behavior of this transport. May
be NULL for default property. The transport plugin can only support
one unicast receive interface; therefore the interface selection lists are
ignored.

Returns:

handle to a Shmem inter-process Transport Plugin on success

NULL on failure.

4.137.8.2 NDDS_Transport_Plugin* NDDS_Transport_Shmem_new (const struct NDDS_Transport_Shmem_Property_t * $property_in$)

Create a new shmem process transport.

An application may create multiple transports, possibly for use in different domains.

Parameters:

property_in <<iin>>> (p. 951) Desired behavior of this transport. May
be NULL for default property. The transport plugin can only support
one unicast receive interface; therefore the interface selection lists are
ignored.

Returns:

handle to a Shmem inter-process Transport Plugin on success NULL on failure.

4.138 UDPv4 Transport

Built-in transport plug-in using UDP/IPv4 (NDDS_TRANSPORT_-CLASSID_UDPv4 (p. 1016)).

Data Structures

^ struct NDDS_Transport_UDPv4_Property_t

Configurable IPv4/UDP Transport-Plugin properties.

Defines

* #define NDDS_TRANSPORT_CLASSID_UDPv4 (1)

Builtin IPv4 UDP/IP Transport-Plugin class ID.

* #define NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_-COUNT (32)

 $Default \quad value \quad of \quad \textbf{NDDS_Transport_Property_t::} address_bit_count \\ \text{(p. } 1507\text{)}.$

*#define NDDS_TRANSPORT_UDPV4_PROPERTIES_-BITMAP_DEFAULT (0)

Default value of NDDS_Transport_Property_t::properties_bitmap (p. 1507).

*#define NDDS_TRANSPORT_UDPV4_GATHER_SEND_-BUFFER_COUNT_MAX_DEFAULT (16)

 $Default\ value\ of\ NDDS_Transport_Property_t::gather_send_buffer_count_max\ (p.\ 1508).$

*#define NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_-SIZE_OS_DEFAULT (-1)

Used to specify that os default be used to specify socket buffer size.

*#define NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_-MAX_DEFAULT (9216)

*#define NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_-DEFAULT (1) Default value of NDDS_Transport_UDPv4_Property_t::multicast_ttl (p. 1520).

- `#define NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER
 - Value for NDDS_Transport_UDPv4_Property_t::send_blocking (p. 1522) to specify non-blocking sockets.
- ^ #define NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

[default] Value for NDDS_Transport_UDPv4_Property_t::send_blocking (p. 1522) to specify blocking sockets.

* #define NDDS_TRANSPORT_UDPV4_BLOCKING_-DEFAULT NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

Default value for NDDS_Transport_UDPv4_Property_t::send_blocking (p. 1522) to specify blocking sockets.

`#define NDDS_TRANSPORT_UDPV4_PROPERTY_-DEFAULT

Use this to initialize a NDDS_Transport_UDPv4_Property_t (p. 1517) structure.

Functions

^ NDDS_Transport_Plugin * NDDS_Transport_UDPv4_create (NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in)

Create an instance of a UDPv4 Transport Pluqin, using PropertyQosPolicy.

^ NDDS_Transport_Plugin * NDDS_Transport_UDPv4_new (const struct NDDS_Transport_UDPv4_Property_t *property_in)

Create an instance of a UDPv4 Transport Plugin.

^ RTI_INT32 NDDS_Transport_UDPv4_string_to_address_cEA (NDDS_Transport_Plugin *self, NDDS_Transport_Address_t *address_out, const char *address_in)

 $Realization \ of \ NDDS_Transport_String_To_Address_Fcn_cEA \ for \ IP \ transports.$

^ RTLINT32 NDDS_Transport_UDPv4_get_receive_interfaces_cEA (NDDS_Transport_Plugin *self, RTLINT32 *found_more_than_provided_for_out, RTLINT32 *interface_reported_count_out, NDDS_Transport_Interface_t interface_array_inout[], RTLINT32 interface_array_size_in)

 $Realization \quad of \quad NDDS_Transport_Get_Receive_Interfaces_Fcn_cEA \quad for \quad IP \\ transports.$

4.138.1 Detailed Description

Built-in transport plug-in using UDP/IPv4 (NDDS_TRANSPORT_-CLASSID_UDPv4 (p. 1016)).

This transport plugin uses UDPv4 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages.

The user can configure an instance of this plugin to only use unicast or only use multicast, see NDDS_Transport_UDPv4_Property_t::unicast_enabled (p. 1519) and NDDS_Transport_UDPv4_Property_t::multicast_enabled (p. 1520).

In addition, the user can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the "white" and "black" lists in the base property's fields (NDDS_Transport_Property_t::allow_interfaces_list (p. 1509), NDDS_Transport_Property_t::deny_interfaces_list (p. 1510), NDDS_Transport_Property_t::allow_multicast_interfaces_list (p. 1510), NDDS_Transport_Property_t::deny_multicast_interfaces_list (p. 1511)).

RTI Data Distribution Service can implicitly create this plugin and register with the **DDS_DomainParticipant** (p. 339) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 1447).

To specify the properties of the builtin UDPv4 transport that is implicitly registered, you can either:

- ^ call NDDS_Transport_Support_set_builtin_transport_property $(\mathrm{p.\,876})~\mathrm{or}$
- * specify the predefined property names in DDS_PropertyQosPolicy (p. 1308) associated with the DDS_DomainParticipant (p. 339). (see UDPv4 Transport Property Names in Property QoS Policy of Domain Participant (p. 1016)).

Builtin transport plugin properties specified in DDS_PropertyQosPolicy (p. 1308) always overwrite the ones specified through NDDS_Transport_Support_set_builtin_transport_property() (p. 876). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Data Distribution Service. Any properties set after

the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

To explicitly create an instance of this plugin, NDDS_Transport_UDPv4_new() (p. 1019) should be called. The instance should be registered with RTI Data Distribution Service, see NDDS_Transport_Support_register_transport (p. 871). In some configurations one may have to disable the builtin UDPv4 transport plugin instance (DDS_TransportBuiltinQosPolicy (p. 1447), DDS_TRANSPORTBUILTIN_UDPv4 (p. 199)), to avoid port conflicts with the newly created plugin instance.

4.138.2 UDPv4 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in DDS_PropertyQosPolicy (p. 1308) of a DDS_DomainParticipant (p. 339) to configure the builtin UDPv4 transport plugin.

See also:

NDDS_Transport_Support_set_builtin_transport_property() (p. 876)

4.138.3 Define Documentation

4.138.3.1 #define NDDS_TRANSPORT_CLASSID_UDPv4 (1)

Builtin IPv4 UDP/IP Transport-Plugin class ID.

4.138.3.2 #define NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_-COUNT (32)

Default value of $NDDS_Transport_Property_t::address_bit_count$ (p. 1507).

4.138.3.3 #define NDDS_TRANSPORT_UDPV4_PROPERTIES_-BITMAP_DEFAULT (0)

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1507).

4.138.3.4 #define NDDS_TRANSPORT_UDPV4_GATHER_-SEND_BUFFER_COUNT_MAX_DEFAULT (16)

Default value of NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508).

This is also the maximum value that can be used when instantiating the udp transport.

16 is sufficient for RTI Data Distribution Service, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

4.138.3.5 #define NDDS_TRANSPORT_UDPV4_SOCKET_-BUFFER_SIZE_OS_DEFAULT (-1)

Used to specify that os default be used to specify socket buffer size.

4.138.3.6 #define NDDS_TRANSPORT_UDPV4_MESSAGE_-SIZE_MAX_DEFAULT (9216)

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1508).

4.138.3.7 #define NDDS_TRANSPORT_UDPV4_MULTICAST_-TTL_DEFAULT (1)

Default value of $NDDS_Transport_UDPv4_Property_t::multicast_ttl$ (p. 1520).

4.138.3.8 #define NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER

Value for NDDS_Transport_UDPv4_Property_t::send_blocking (p. 1522) to specify non-blocking sockets.

4.138.3.9 #define NDDS_TRANSPORT_UDPV4_BLOCKING_-ALWAYS

[default] Value for NDDS_Transport_UDPv4_Property_t::send_-blocking (p. 1522) to specify blocking sockets.

4.138.3.10 #define NDDS_TRANSPORT_UDPV4_BLOCKING_-DEFAULT NDDS_TRANSPORT_UDPV4_-BLOCKING_ALWAYS

Default value for NDDS_Transport_UDPv4_Property_t::send_blocking (p. 1522) to specify blocking sockets.

4.138.3.11 #define NDDS_TRANSPORT_UDPV4_PROPERTY_-DEFAULT

Value:

```
{ NDDS TRANSPORT CLASSID UDPv4. \
  NDDS_TRANSPORT_UDPV4_ADDRESS_BIT_COUNT, \
  NDDS_TRANSPORT_UDPV4_PROPERTIES_BITMAP_DEFAULT, \
  NDDS_TRANSPORT_UDPV4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT, \
  NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT, \
  NULL, 0, /* allow_interfaces_list */ \
  NULL, 0, /* deny_interfaces_list */ \
  NULL, 0, /* allow_multicast_interfaces_list */ \
  NULL, 0, /* deny_multicast_interfaces_list */ \
NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT, \
NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_DEFAULT, \
1, /* use unicast */
NDDS_TRANSPORT_UDPV4_USE_MULTICAST_DEFAULT, /* use multicast */ \
NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT, \
0, /* multicast loopback enabled */
-1, /* (auto-)ignore loopback */ \
0, /* do not ignore non-RUNNING */ \
0, /* no_zero_copy */ \
NDDS_TRANSPORT_UDPV4_BLOCKING_DEFAULT, \
0, 0, 0xff /* no mapping to IP_TOS by default */, \
1 }
```

Use this to initialize a NDDS_Transport_UDPv4_Property_t (p. 1517) structure.

4.138.4 Function Documentation

4.138.4.1 NDDS_Transport_Plugin* NDDS_Transport_-UDPv4_create (NDDS_Transport_Address_t * default_network_address_out, const struct DDS_PropertyQosPolicy * property_in)

Create an instance of a UDPv4 Transport Plugin, using PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Data Distribution Service. This may be to partition the network

interfaces across multiple RTI Data Distribution Service domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton". For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the NDDS_Transport_UDPv4_Property_t::parent (p. 1518):

- ^ NDDS_Transport_Property_t::allow_interfaces_list (p. 1509),
- ^ NDDS_Transport_Property_t::deny_interfaces_list (p. 1510),
- ^ NDDS_Transport_Property_t::allow_multicast_interfaces_list (p. 1510),
- ^ NDDS_Transport_Property_t::deny_multicast_interfaces_list (p. 1511)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters:

```
default_network_address_out << out>> (p. 951) Network address to be used when registering the transport.
```

```
property_in <<in>> (p. 951) Desired behavior of this transport, through the property field in DDS_DomainParticipantQos (p. 1157).
```

Returns:

A UDPv4 Transport Plugin instance on success; or NULL on failure.

4.138.4.2 NDDS_Transport_Plugin* NDDS_Transport_UDPv4_new (const struct NDDS_Transport_UDPv4_Property_t * property_in)

Create an instance of a UDPv4 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Data Distribution Service. This may be to partition the network interfaces across multiple RTI Data Distribution Service domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton". For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the NDDS_Transport_UDPv4_Property_t::parent (p. 1518):

- ^ NDDS_Transport_Property_t::allow_interfaces_list (p. 1509),
- ^ NDDS_Transport_Property_t::deny_interfaces_list (p. 1510),
- ^ NDDS_Transport_Property_t::allow_multicast_interfaces_list (p. 1510),
- ^ NDDS_Transport_Property_t::deny_multicast_interfaces_list (p. 1511)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters:

 $property_in \ll in \gg (p. 951)$ Desired behavior of this transport. May be NULL for default property.

Returns:

A UDPv4 Transport Plugin instance on success; or NULL on failure.

4.138.4.3 RTI_INT32 NDDS_Transport_UDPv4_string_to_-address_cEA (NDDS_Transport_Plugin * self, NDDS_Transport_Address_t * address_out, const char * address_in)

Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports. Converts a host name string to a IPv4 address.

Parameters:

```
self NOT USED. May be NULL.
```

 $address_out << out>>$ (p. 951) The corresponding numerical value in IPv6 format.

 $address_in << in>> (p. 951)$ The name of the IPv4 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also:

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

4.138.4.4 RTI_INT32 NDDS_Transport_UDPv4_get_receive_interfaces_cEA (NDDS_Transport_Plugin * self, RTI_INT32 * found_more_than_provided_for_out, RTI_INT32 * interface_reported_count_out, NDDS_Transport_Interface_t interface_array_inout[], RTI_INT32 interface_array_size_in)

 $Realization\ of\ NDDS_Transport_Get_Receive_Interfaces_Fcn_cEA\ for\ IP\ transports.$

Retrieves a list of available IPv4 network interfaces. The addresses returned from IPv4 plugin will be of the pattern 0.0.0.0.0.0.0.0.0.0.0.x.x.x.x.

See also:

NDDS_Transport_Get_Receive_Interfaces_Fcn_cEA for complete documentation.

 $Realization \quad of \quad NDDS_Transport_Get_Receive_Interfaces_Fcn_cEA \quad for \quad IP \\ transports.$

4.139.1 Detailed Description

Built-in transport plug-in using UDP/IPv6 (NDDS_TRANSPORT_-CLASSID_UDPv6 (p. 1026)).

This transport plugin uses UDPv6 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages.

The user can configure an instance of this plugin to only use unicast or only use multicast, see NDDS_Transport_UDPv6_Property_t::unicast_enabled (p. 1526) and NDDS_Transport_UDPv6_Property_t::multicast_enabled (p. 1527).

In addition, the user can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the "white" and "black" lists in the base property's fields (NDDS_Transport_Property_t::allow_interfaces_list (p. 1509), NDDS_Transport_Property_t::deny_interfaces_list (p. 1510), NDDS_Transport_Property_t::allow_multicast_interfaces_list (p. 1510), NDDS_Transport_Property_t::deny_multicast_interfaces_list (p. 1511)).

RTI Data Distribution Service can implicitly create this plugin and register it with the **DDS_DomainParticipant** (p. 339) if this transport is specified in the **DDS_TransportBuiltinQosPolicy** (p. 1447).

To specify the properties of the builtin UDPv6 transport that is implicitly registered, you can either:

- ^ call NDDS_Transport_Support_set_builtin_transport_property (p. 876) or
- * specify the predefined property names in DDS_PropertyQosPolicy (p. 1308) associated with the DDS_DomainParticipant (p. 339). (see UDPv6 Transport Property Names in Property QoS Policy of Domain Participant (p. 1026)).

Builtin transport plugin properties specified in DDS_PropertyQosPolicy (p. 1308) always overwrite the ones specified through NDDS_Transport_Support_set_builtin_transport_property() (p. 876). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Data Distribution Service. Any properties that are set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 878) for details on when a builtin transport is registered.

To explicitly create an instance of this plugin, NDDS_Transport_UDPv6_new() (p. 1029) should be called. The instance should be registered with

RTI Data Distribution Service, see NDDS_Transport_Support_register_transport (p. 871). In some configurations, you may have to disable the builtin UDPv6 transport plugin instance (DDS_TransportBuiltinQosPolicy (p. 1447), DDS_TRANSPORTBUILTIN_UDPv6 (p. 199)), to avoid port conflicts with the newly created plugin instance.

4.139.2 UDPv6 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in DDS_PropertyQosPolicy (p. 1308) of a DDS_DomainParticipant (p. 339) to configure the builtin UDPv6 transport plugin.

See also:

NDDS_Transport_Support_set_builtin_transport_property() (p. 876)

4.139.3 Define Documentation

4.139.3.1 #define NDDS_TRANSPORT_CLASSID_UDPv6 (5)

Builtin IPv6 UDP/IP Transport-Plugin class ID.

$4.139.3.2 \quad \# define \ \, NDDS_TRANSPORT_UDPV6_ADDRESS_BIT_- \\ COUNT \ \, (128)$

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1507).

4.139.3.3 #define NDDS_TRANSPORT_UDPV6_PROPERTIES_-BITMAP_DEFAULT (0)

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1507).

4.139.3.4 #define NDDS_TRANSPORT_UDPV6_GATHER_-SEND_BUFFER_COUNT_MAX_DEFAULT (16)

Default value of NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508).

This is also the maximum value that can be used when instantiating the udp transport.

16 is sufficient for NDDS, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

4.139.3.5 #define NDDS_TRANSPORT_UDPV6_SOCKET_-BUFFER_SIZE_OS_DEFAULT (-1)

Used to specify that os default be used to specify socket buffer size.

4.139.3.6 #define NDDS_TRANSPORT_UDPV6_MESSAGE_-SIZE_MAX_DEFAULT (9216)

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1508).

4.139.3.7 #define NDDS_TRANSPORT_UDPV6_MULTICAST_-TTL_DEFAULT (1)

Default value of $NDDS_Transport_UDPv6_Property_t::multicast_ttl (p. 1527).$

4.139.3.8 #define NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER

Value for NDDS_Transport_UDPv6_Property_t::send_blocking (p. 1529) to specify non-blocking sockets.

$\begin{array}{ll} \textbf{4.139.3.9} & \# define \ NDDS_TRANSPORT_UDPV6_BLOCKING_-\\ & ALWAYS \end{array}$

[default] Value for NDDS_Transport_UDPv6_Property_t::send_-blocking (p. 1529) to specify blocking sockets.

4.139.3.10 #define NDDS_TRANSPORT_UDPV6_PROPERTY_-DEFAULT

Value:

{ \

```
{ NDDS_TRANSPORT_CLASSID_UDPv6, \
    NDDS TRANSPORT UDPV6 ADDRESS BIT COUNT. \
    NDDS_TRANSPORT_UDPV6_PROPERTIES_BITMAP_DEFAULT, \
    NDDS_TRANSPORT_UDPV6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT, \
    NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT, \
    NULL, 0, /* allow_interfaces_list */
    NULL, 0, /* deny_interfaces_list */ \
    NULL, 0, /* allow_multicast_interfaces_list */ \
    NULL, 0, /* deny_multicast_interfaces_list */ \
}, \
NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT, \
NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_DEFAULT, \
1, /* use unicast */
NDDS_TRANSPORT_UDPV6_USE_MULTICAST_DEFAULT, /* use multicast */ \
NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT, \
0, /* multicast loopback enabled */ \
-1, /* (auto-)ignore loopback */ \
0, /* do not ignore non-RUNNING */ \
0, /* no_zero_copy */ \
NDDS_TRANSPORT_UDPV6_BLOCKING_DEFAULT, \
0, /* enable_v4mapped */ \
0, 0, 0xff /* no mapping to IPV6_TCLASS by default */ }
```

Use this to initialize a NDDS_Transport_UDPv6_Property_t (p. 1524) structure.

4.139.4 Function Documentation

4.139.4.1 NDDS_Transport_Plugin* NDDS_Transport_-UDPv6_create (NDDS_Transport_Address_t * default_network_address_out, const struct DDS_PropertyQosPolicy * property_in)

Create an instance of a UDPv6 Transport Plugin, using PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Data Distribution Service. This may be to partition the network interfaces across multiple RTI Data Distribution Service domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton". For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the NDDS_Transport_UDPv6_Property_t::parent (p. 1525):

- ^ NDDS_Transport_Property_t::allow_interfaces_list (p. 1509),
- ^ NDDS_Transport_Property_t::deny_interfaces_list (p. 1510),

- ^ NDDS_Transport_Property_t::allow_multicast_interfaces_list (p. 1510),
- ^ NDDS_Transport_Property_t::deny_multicast_interfaces_list (p. 1511)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters:

default_network_address_out << out>> (p. 951) Network address to be used when registering the transport.

property_in <<in>> (p. 951) Desired behavior of this transport, through the property field in DDS_DomainParticipantQos (p. 1157).

Returns:

A UDPv6 Transport Plugin instance on success; or NULL on failure.

4.139.4.2 NDDS_Transport_Plugin* NDDS_Transport_UDPv6_new (const struct NDDS_Transport_UDPv6_Property_t * property_in)

Create an instance of a UDPv6 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Data Distribution Service. This may be to partition the network interfaces across multiple RTI Data Distribution Service domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton". For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the NDDS_Transport_UDPv6_Property_t::parent (p. 1525):

^ NDDS_Transport_Property_t::allow_interfaces_list (p. 1509),

- ^ NDDS_Transport_Property_t::deny_interfaces_list (p. 1510),
- ^ NDDS_Transport_Property_t::allow_multicast_interfaces_list (p. 1510),
- ^ NDDS_Transport_Property_t::deny_multicast_interfaces_list (p. 1511)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters:

 $property_in \ll in \gg (p. 951)$ Desired behavior of this transport. May be NULL for default property.

Returns:

A UDPv6 Transport Plugin instance on success; or NULL on failure.

4.139.4.3 RTI_INT32 NDDS_Transport_UDPv6_string_to_-address_cEA (NDDS_Transport_Plugin * self, NDDS_Transport_Address_t * address_out, const char * address_in)

Realization of NDDS_Transport_String_To_Address_Fcn_cEA for IP transports. Converts a host name string to a IPv6 address.

Parameters:

```
self NOT USED. May be NULL.
```

 $address_out << out>> (p. 951)$ The corresponding numerical value in IPv6 format.

address_in <<in>> (p. 951) The name of the IPv6 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also:

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

4.139.4.4 RTI_INT32 NDDS_Transport_UDPv6_get_receive_interfaces_cEA (NDDS_Transport_Plugin * self,
RTI_INT32 * found_more_than_provided_for_out,
RTI_INT32 * interface_reported_count_out,
NDDS_Transport_Interface_t interface_array_inout[],
RTI_INT32 interface_array_size_in)

 $Realization\ of\ NDDS_Transport_Get_Receive_Interfaces_Fcn_cEA\ for\ IP\ transports.$

Retrieves a list of available IPv6 network interfaces. The addresses returned from IPv6 plugin will be full 128-bit addresses.

See also:

NDDS_Transport_Get_Receive_Interfaces_Fcn_cEA for complete documentation.

5.2 DDS_AsynchronousPublisherQosPolicy Struct Reference

Configures the mechanism that sends user data in an external middleware thread.

Data Fields

 $\hat{\ }$ DDS_Boolean disable_asynchronous_write

Disable asynchronous publishing.

^ struct DDS_ThreadSettings_t thread

Settings of the publishing thread.

^ DDS_Boolean disable_asynchronous_batch

Disable asynchronous batch flushing.

^ struct DDS_ThreadSettings_t asynchronous_batch_thread

Settings of the batch flushing thread.

5.2.1 Detailed Description

Configures the mechanism that sends user data in an external middleware thread.

Specifies the asynchronous publishing and asynchronous batch flushing settings of the **DDS_Publisher** (p. 632) instances.

The QoS policy specifies whether asynchronous publishing and asynchronous batch flushing are enabled for the **DDS_DataWriter** (p. 673) entities belonging to this **DDS_Publisher** (p. 632). If so, the publisher will spawn up to two threads, one for asynchronous publishing and one for asynchronous batch flushing.

See also:

```
DDS_BatchQosPolicy (p. 1040).
DDS_PublishModeQosPolicy (p. 1331).
```

Entity:

DDS_Publisher (p. 632)

Properties:

$$\mathbf{RxO} \ (p.145) = N/A$$

Changeable (p. 146) = NO (p. 146)

5.2.2 Usage

You can use this QoS policy to reduce the amount of time your application thread spends sending data.

You can also use it, along with **DDS_PublishModeQosPolicy** (p. 1331) and a **DDS_FlowController** (p. 726), to send large data reliably. "Large" in this context means that the data that cannot be sent as a single packet by a network transport. For example, to send data larger than 63K reliably using UDP/IP, you must configure RTI Data Distribution Service to fragment the data and send it asynchronously.

The asynchronous *publisher* thread is shared by all **DDS_-ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 222) **DDS_-DataWriter** (p. 673) instances that belong to this publisher and handles their data transmission chores.

The asynchronous *batch flushing* thread is shared by all **DDS_DataWriter** (p. 673) instances with batching enabled that belong to this publisher.

This QoS policy also allows you to adjust the settings of the asynchronous publishing and the asynchronous batch flushing threads. To use different threads for two different **DDS_DataWriter** (p. 673) entities, the instances must belong to different **DDS_Publisher** (p. 632) instances.

A DDS_Publisher (p. 632) must have asynchronous publishing enabled for its DDS_DataWriter (p. 673) instances to write asynchronously.

A DDS_Publisher (p. 632) must have asynchronous batch flushing enabled in order to flush the batches of its DDS_DataWriter (p. 673) instances asynchronously. However, no asynchronous batch flushing thread will be started until the first DDS_DataWriter (p. 673) instance with batching enabled is created from this DDS_Publisher (p. 632).

5.2.3 Field Documentation

5.2.3.1 DDS_Boolean DDS_-AsynchronousPublisherQosPolicy::disable_asynchronous_write

Disable asynchronous publishing.

If set to DDS_BOOLEAN_TRUE (p. 106), any DDS_DataWriter (p. 673) created with DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222) will fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122).

[default] DDS_BOOLEAN_FALSE (p. 107)

5.2.3.2 struct DDS_ThreadSettings_t DDS_-AsynchronousPublisherQosPolicy::thread [read]

Settings of the publishing thread.

There is only one asynchronous publishing thread per **DDS_Publisher** (p. 632).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Solaris: OS default priority For Linux: OS default priority

For LynxOS: 13 For Integrity: 80 For VxWorks: 110

For all others: OS default priority.

[default] The actual value depends on your architecture:

For Windows: OS default stack size For Solaris: OS default stack size For Linux: OS default stack size

5.3 DDS_BatchQosPolicy Struct Reference

Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

Data Fields

$\hat{\ }$ DDS_Boolean enable

Specifies whether or not batching is enabled.

^ DDS_Long max_data_bytes

The maximum cumulative length of all serialized samples in a batch.

^ DDS_Long max_samples

The maximum number of samples in a batch.

^ struct DDS_Duration_t max_flush_delay

The maximum flush delay.

^ struct DDS_Duration_t source_timestamp_resolution

Batch source timestamp resolution.

^ DDS_Boolean thread_safe_write

Determines whether or not the write operation is thread safe.

5.3.1 Detailed Description

Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

This QoS policy configures the ability of the middleware to collect multiple user data samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

This QoS policy can be used to dramatically increase effective throughput for small data samples. Usually, throughput for small samples (size < 2048 bytes) is limited by CPU capacity and not by network bandwidth. Batching many smaller samples to be sent in a single large packet will increase network utilization, and thus throughput, in terms of samples per second.

Entity:

DDS_DataWriter (p. 673)

Properties:

```
\mathbf{RxO} (p. 145) = NO
Changeable (p. 146) = UNTIL ENABLE (p. 146)
```

5.3.2 Field Documentation

5.3.2.1 DDS_Boolean DDS_BatchQosPolicy::enable

Specifies whether or not batching is enabled.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.3.2.2 DDS_Long DDS_BatchQosPolicy::max_data_bytes

The maximum cumulative length of all serialized samples in a batch.

A batch is flushed automatically when this maximum is reached.

max_data_bytes does not include the meta data associated with the batch samples. Each sample has at least 8 bytes of meta data containing information such as the timestamp and sequence number. The meta data can be as large as 52 bytes for keyed topics and 20 bytes for unkeyed topics.

Note: Batches must contain whole samples. If a new batch is started and its initial sample causes the serialized size to exceed max_data_bytes, RTI Data Distribution Service will send the sample in a single batch.

```
[default] 1024
```

```
[range] [1,DDS_LENGTH_UNLIMITED (p. 174)]
```

5.3.3 Consistency

The setting of DDS_BatchQosPolicy::max_data_bytes (p. 1041) must be consistent with DDS_BatchQosPolicy::max_samples (p. 1041). For these two values to be consistent, they cannot be both DDS_LENGTH_-UNLIMITED (p. 174).

5.3.3.1 DDS_Long DDS_BatchQosPolicy::max_samples

The maximum number of samples in a batch.

A batch is flushed automatically when this maximum is reached.

```
[default] DDS_LENGTH_UNLIMITED (p. 174)
```

```
[range] [1,DDS_LENGTH_UNLIMITED (p. 174)]
```

5.3.4 Consistency

The setting of DDS_BatchQosPolicy::max_samples (p. 1041) must be consistent with DDS_BatchQosPolicy::max_data_bytes (p. 1041). For these two values to be consistent, they cannot be both DDS_LENGTH_-UNLIMITED (p. 174).

5.3.4.1 struct DDS_Duration_t DDS_BatchQosPolicy::max_flush_-delay [read]

The maximum flush delay.

A batch is flushed automatically after the delay specified by this parameter.

The delay is measured from the time the first sample in the batch is written by the application.

[default] DDS_DURATION_INFINITE (p. 113) [range] [0,DDS_DURATION_INFINITE (p. 113)]

5.3.5 Consistency

The setting of DDS_BatchQosPolicy::max_flush_delay (p. 1042) must be consistent with DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_batch (p. 1038) and DDS_BatchQosPolicy::thread_safe_write (p. 1043). If the delay is different than DDS_DURATION_INFINITE (p. 113), DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_batch (p. 1038) must be set to DDS_BOOLEAN_FALSE (p. 107) and DDS_BatchQosPolicy::thread_safe_write (p. 1043) must be set to DDS_BOOLEAN_TRUE (p. 106).

5.3.5.1 struct DDS_Duration_t DDS_BatchQosPolicy::source_timestamp_resolution [read]

Batch source timestamp resolution.

The value of this field determines how the source timestamp is associated with the samples in a batch.

A sample written with timestamp 't' inherits the source timestamp 't2' associated with the previous sample unless ('t' - 't2') > source_timestamp_resolution.

If source_timestamp_resolution is set to **DDS_DURATION_INFINITE** (p. 113), every sample in the batch will share the source timestamp associated with the first sample.

If source_timestamp_resolution is set to zero, every sample in the batch will contain its own source timestamp corresponding to the moment when the sample was written.

The performance of the batching process is better when source_timestamp_resolution is set to **DDS_DURATION_INFINITE** (p. 113).

 $[\mathbf{default}] \ \mathbf{DDS_DURATION_INFINITE} \ (\mathbf{p.} \ \mathbf{113})$

[range] [0,DDS_DURATION_INFINITE (p. 113)]

5.3.6 Consistency

The setting of DDS_BatchQosPolicy::source_timestamp_resolution (p. 1042) must be consistent with DDS_BatchQosPolicy::thread_safe_write (p. 1043). If DDS_BatchQosPolicy::thread_safe_write (p. 1043) is set to DDS_BOOLEAN_FALSE (p. 107), DDS_BatchQosPolicy::source_timestamp_resolution (p. 1042) must be set to DDS_DURATION_INFINITE (p. 113).

$5.3.6.1 \quad DDS_Boolean\ DDS_BatchQosPolicy:: thread_safe_write$

Determines whether or not the write operation is thread safe.

If this parameter is set to **DDS_BOOLEAN_TRUE** (p. 106), multiple threads can call write on the **DDS_DataWriter** (p. 673) concurrently.

[default] DDS_BOOLEAN_TRUE (p. 106)

5.3.7 Consistency

The setting of DDS_BatchQosPolicy::thread_safe_write (p. 1043) must be consistent with DDS_BatchQosPolicy::source_timestamp_resolution (p. 1042). If DDS_BatchQosPolicy::thread_safe_write (p. 1043) is set to DDS_BOOLEAN_FALSE (p. 107), DDS_BatchQosPolicy::source_timestamp_resolution (p. 1042) must be set to DDS_DURATION_INFINITE (p. 113).

5.4 DDS_BooleanSeq Struct Reference

```
{\rm Instantiates} \ {\tt FooSeq} \ \ ({\rm p.}\ {\tt 1497}) \ < {\bf DDS\_Boolean} \ ({\rm p.}\ {\tt 109}) >.
```

```

5.5 DDS_BuiltinTopicKey_t Struct Reference

The key type of the built-in topic types.

Data Fields

^ DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE value [DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE_LENGTH]

An array of four integers that uniquely represents a remote DDS_Entity (p. 242).

5.5.1 Detailed Description

The key type of the built-in topic types.

Each remote **DDS_Entity** (p. 242) to be discovered is can be uniquely identified by this key. This is the key of all the built-in topic data types.

See also:

DDS_ParticipantBuiltinTopicData (p. 1289) DDS_TopicBuiltinTopicData (p. 1433) DDS_PublicationBuiltinTopicData (p. 1313) DDS_SubscriptionBuiltinTopicData (p. 1410)

5.5.2 Field Documentation

5.5.2.1 DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE DDS_BuiltinTopicKey_t::value[DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE_LENGTH]

An array of four integers that uniquely represents a remote **DDS_Entity** (p. 242).

5.6 DDS_BuiltinTopicReaderResourceLimits_t Struct Reference

Built-in topic reader's resource limits.

Data Fields

^ DDS_Long initial_samples

Initial number of samples.

^ DDS_Long max_samples

Maximum number of samples.

^ DDS_Long initial_infos

Initial number of sample infos.

DDS_Long max_infos

Maximum number of sample infos.

^ DDS_Long initial_outstanding_reads

The initial number of outstanding reads that have not call finish yet on the same built-in topic DDS_DataReader (p. 783).

^ DDS_Long max_outstanding_reads

The maximum number of outstanding reads that have not called finish yet on the same built-in topic DDS_DataReader (p. 783).

^ DDS_Long max_samples_per_read

Maximum number of samples that can be read/taken on a same built-in topic $DDS_DataReader$ (p. 783).

5.6.1 Detailed Description

Built-in topic reader's resource limits.

Defines the resources that can be used for a built-in-topic data reader.

A built-in topic data reader subscribes reliably to built-in topics containing declarations of new entities or updates to existing entities in the domain. Keys are used to differentiate among entities of the same type. RTI Data Distribution Service assigns a unique key to each entity in a domain.

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

QoS:

DDS_DiscoveryConfigQosPolicy (p. 1141)

5.6.2 Field Documentation

5.6.2.1 DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_samples

Initial number of samples.

This should be a value between 1 and initial number of instance of the built-intopic reader, depending on how many instances are sending data concurrently.

[default] 64

[range] [1, 1 million], <= max_samples

$\begin{array}{ccc} 5.6.2.2 & DDS_Long \ DDS_BuiltinTopicReaderResourceLimits_\\ & t::max_samples \end{array}$

Maximum number of samples.

This should be a value between 1 and max number of instance of the built-intopic reader, depending on how many instances are sending data concurrently. Also, it should not be less than initial_samples.

```
[default] DDS_LENGTH_UNLIMITED (p. 174)
```

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_samples

5.6.2.3 DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_infos

Initial number of sample infos.

The initial number of info units that a built-in topic **DDS_DataReader** (p. 783) can have. Info units are used to store **DDS_SampleInfo** (p. 1384).

[default] 64

[range] [1, 1 million] \leq max_infos

5.6.2.4 DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_infos

Maximum number of sample infos.

The maximum number of info units that a built-in topic **DDS_DataReader** (p. 783) can use to store **DDS_SampleInfo** (p. 1384).

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_infos

${\bf 5.6.2.5} \quad {\bf DDS_Long} \ {\bf DDS_BuiltinTopicReaderResourceLimits_t::initial_outstanding_reads}$

The initial number of outstanding reads that have not call finish yet on the same built-in topic **DDS_DataReader** (p. 783).

[default] 2

[range] [1, 65536] or DDS_LENGTH_UNLIMITED (p. 174) <= max_outstanding_reads

${\bf 5.6.2.6} \quad {\bf DDS_Long} \ {\bf DDS_BuiltinTopicReaderResourceLimits_t::} \\ {\bf t::} {\bf max_outstanding_reads}$

The maximum number of outstanding reads that have not called finish yet on the same built-in topic **DDS_DataReader** (p. 783).

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 65536] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_outstanding_reads

5.6.2.7 DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_samples_per_read

Maximum number of samples that can be read/taken on a same built-in topic **DDS_DataReader** (p. 783).

[default] 1024

[range] [1, 65536]

5.7 DDS_ChannelSettings_t Struct Reference

Type used to configure the properties of a channel.

Data Fields

${\bf \hat{\ }} struct\ {\bf DDS_TransportMulticastSettingsSeq\ multicast_settings}$

A sequence of DDS_TransportMulticastSettings_t (p. 1451) used to configure the multicast addresses associated with a channel.

$\hat{}$ char * filter_expression

A logical expression used to determine the data that will be published in the channel.

5.7.1 Detailed Description

Type used to configure the properties of a channel.

QoS:

DDS_MultiChannelQosPolicy (p. 1269)

5.7.2 Field Documentation

5.7.2.1 struct DDS_TransportMulticastSettingsSeq DDS_ChannelSettings_t::multicast_settings [read]

A sequence of **DDS_TransportMulticastSettings_t** (p. 1451) used to configure the multicast addresses associated with a channel.

The sequence cannot be empty.

The maximum number of multicast locators in a channel is limited to four (A locator is defined by a transport alias, a multicast address and a port)

[default] Empty sequence (invalid value)

5.7.2.2 char* DDS_ChannelSettings_t::filter_expression

A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **DDS_-MultiChannelQosPolicy::filter_name** (p. 1271)

Important: This value must be an allocated string with DDS_String_alloc (p. 287) or DDS_String_dup (p. 288). It should not be assigned to a string constant.

The filter expression length (including NULL-terminated character) cannot be greater than $DDS_-DomainParticipantResourceLimitsQosPolicy::channel_filter_-expression_max_length (p. 1178).$

See also:

Queries and Filters Syntax (p. 957)

[default] NULL (invalid value)

5.8 DDS_ChannelSettingsSeq Struct Reference

 ${\rm Declares~IDL~sequence} < {\bf DDS_ChannelSettings_t~(p.\,1049)} >.$

5.8.1 Detailed Description

Declares IDL sequence < DDS_ChannelSettings_t (p. 1049) >.

A sequence of **DDS_ChannelSettings_t** (p. 1049) used to configure the channels' properties. If the length of the sequence is zero, the **DDS_MultiChannelQosPolicy** (p. 1269) has no effect.

Instantiates:

```

5.11 DDS_ContentFilter Struct Reference

<< interface>> (p. 950) Interface to be used by a custom filter of a DDS_-ContentFilteredTopic (p. 426)

Data Fields

$\hat{\ }$ DDS_ContentFilterCompileFunction compile

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

^ DDS_ContentFilterEvaluateFunction evaluate

 $\label{lem:eq:condition} Evaluate\ whether\ the\ sample\ is\ passing\ the\ filter\ or\ not\ according\ to\ the\ sample\ content.$

^ DDS_ContentFilterFinalizeFunction finalize

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

void * filter_data

A place for filter implementors to keep a pointer to data that may be needed by their filter.

5.11.1 Detailed Description

<<iinterface>> (p. 950) Interface to be used by a custom filter of a DDS_-ContentFilteredTopic (p. 426)

Entity:

DDS_ContentFilteredTopic (p. 426)

This is the interface that can be implemented by an application-provided class and then registered with the **DDS_DomainParticipant** (p. 339) such that samples can be filtered for a **DDS_ContentFilteredTopic** (p. 426) with the given filter name.

Note: the API for using a custom content filter is subject to change in a future release.

```
DDS_ContentFilteredTopic (p. 426)
DDS_DomainParticipant_register_contentfilter (p. 380)
```

5.11.2 Field Documentation

5.11.2.1 DDS_ContentFilterCompileFunction DDS_ContentFilter::compile

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

This function is called when an instance of the locally registered content filter is created or when the expression parameter for the locally registered content filter instance is changed.

An instance of the locally registered content filter is created every time a local **DDS_ContentFilteredTopic** (p. 426) with the matching filter name is created, or when a **DDS_DataReader** (p. 783) with a matching filter name is discovered.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters:

 $type_class_name << in>> (p. 951)$ Fully qualified class name of the related **DDS_Topic** (p. 425).

old_compile_data <<in>> (p. 951) The previous new_compile_data value from a previous call to this instance of a content filter. If the compile function is called more than once for an instance of a DDS_ContentFilteredTopic (p. 426), e.g., if the expression parameters are changed, then the new_compile_data value returned by the previous invocation is passed in the old_compile_data parameter (which can be NULL). If this is a new instance of the filter, NULL is passed. This parameter is useful for freeing or reusing resources previously allocated for this

One of the **Standard Return Codes** (p. 120)

5.11.2.2 DDS_ContentFilterEvaluateFunction DDS_ContentFilter::evaluate

Evaluate whether the sample is passing the filter or not according to the sample content.

This function is called when a sample for a locally created **DDS_DataReader** (p. 783) associated with the filter is received, or when a sample for a discovered **DDS_DataReader** (p. 783) associated with the filter needs to be sent.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

5.11.2.3 DDS_ContentFilterFinalizeFunction DDS_ContentFilter::finalize

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

This function is called when an instance of the locally registered content filter is deleted.

An instance of the locally registered content filter is deleted every time a local **DDS_ContentFilteredTopic** (p. 426) with the matching filter name is deleted, or when a **DDS_DataReader** (p. 783) with a matching filter name is removed due to discovery.

This function is also called on all instances of the discovered **DDS_DataReader** (p. 783) with a matching filter name if the filter is unregistered with **DDS_DomainParticipant_unregister_contentfilter** (p. 381)

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

5.11.2.4 void* DDS_ContentFilter::filter_data

A place for filter implementors to keep a pointer to data that may be needed by their filter.

5.12 DDS_ContentFilterProperty_t Struct Reference

<<eXtension>> (p. 950) Type used to provide all the required information to enable content filtering.

Data Fields

^ char * content_filter_topic_name

Name of the Content-filtered Topic associated with the Reader.

^ char * related_topic_name

Name of the Topic related to the Content-filtered Topic.

^ char * filter_class_name

Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).

$\hat{}$ char * filter_expression

The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.

^ struct DDS_StringSeq expression_parameters

Defines the value for each parameter in the filter expression.

5.12.1 Detailed Description

<<eXtension>> (p. 950) Type used to provide all the required information to enable content filtering.

5.12.2 Field Documentation

${\bf 5.12.2.1 \quad char*\ DDS_ContentFilterProperty_t::} content_filter_topic_-\\ name$

Name of the Content-filtered Topic associated with the Reader.

5.12.2.2 char* DDS_ContentFilterProperty_t::related_topic_name

Name of the Topic related to the Content-filtered Topic.

$5.12.2.3 \quad char*\ DDS_ContentFilterProperty_t::filter_class_name$

Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).

$5.12.2.4 \quad char*\ DDS_ContentFilterProperty_t::filter_expression$

The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.

5.12.2.5 struct DDS_StringSeq DDS_ContentFilterProperty_t::expression_parameters [read]

Defines the value for each parameter in the filter expression.

5.13 DDS_DatabaseQosPolicy Struct Reference

Various threads and resource limits settings used by RTI Data Distribution Service to control its internal database.

Data Fields

* struct DDS_ThreadSettings_t thread

Database thread settings.

* struct DDS_Duration_t shutdown_timeout

The maximum wait time during a shutdown.

* struct DDS_Duration_t cleanup_period

The database thread will wake up at this rate to clean up the database.

^ struct DDS_Duration_t shutdown_cleanup_period

The clean-up period used during database shut-down.

^ DDS_Long initial_records

The initial number of total records.

^ DDS_Long max_skiplist_level

The maximum level of the skiplist.

$\hat{\ }$ DDS_Long max_weak_references

The maximum number of weak references.

^ DDS_Long initial_weak_references

The initial number of weak references.

5.13.1 Detailed Description

Various threads and resource limits settings used by RTI Data Distribution Service to control its internal database.

RTI uses an internal in-memory "database" to store information about entities created locally as well as remote entities found during the discovery process. This database uses a background thread to garbage-collect records related to deleted entities. When the **DDS_DomainParticipant** (p. 339) that maintains this database is deleted, it shuts down this thread.

The Database QoS policy is used to configure how RTI Data Distribution Service manages its database, including how often it cleans up, the priority of the database thread, and limits on resources that may be allocated by the database.

You be interested inmodifying the DDS_{-} may DatabaseQosPolicy::shutdown_timeout DDS_{-} (p. 1061)and parameters DatabaseQosPolicy::shutdown_cleanup_period (p. 1061)to decrease the time it takes to delete a DDS_DomainParticipant (p. 339) when your application is shutting down.

The DDS_DomainParticipantResourceLimitsQosPolicy (p. 1162) controls the memory allocation for elements stored in the database.

This QoS policy is an extension to the DDS standard.

Entity:

```
DDS_DomainParticipant (p. 339)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) NO (p. 146)
```

5.13.2 Field Documentation

5.13.2.1 struct DDS_ThreadSettings_t DDS_-DatabaseQosPolicy::thread [read]

Database thread settings.

There is only one database thread: the clean-up thread.

[default] priority low.

The actual value depends on your architecture:

For Windows: -3

For Solaris: OS default priority For Linux: OS default priority

For LynxOS: 10

For INTEGRITY: 60

For VxWorks: 120

For all others: OS default priority.

[default] The actual value depends on your architecture:

For Windows: OS default stack size

For Solaris: OS default stack size For Linux: OS default stack size

For LynxOS: 16*1024

For INTEGRITY: 20*1024 For VxWorks: 16*1024

For all others: OS default stack size.

[default] mask DDS_THREAD_SETTINGS_STDIO (p. 135)

5.13.2.2 struct DDS_Duration_t DDS_-DatabaseQosPolicy::shutdown_timeout [read]

The maximum wait time during a shutdown.

The domain participant will exit after the timeout, even if the database has not been fully cleaned up.

[default] 15 seconds

[range] $[0,DDS_DURATION_INFINITE (p. 113)]$

5.13.2.3 struct DDS_Duration_t DDS_DatabaseQosPolicy::cleanup_period [read]

The database thread will wake up at this rate to clean up the database.

[default] 61 seconds

[range] [0,1 year]

5.13.2.4 struct DDS_Duration_t DDS_DatabaseQosPolicy::shutdown_cleanup_period [read]

The clean-up period used during database shut-down.

[default] 1 second

[range] [0,1 year]

5.13.2.5 DDS_Long DDS_DatabaseQosPolicy::initial_records

The initial number of total records.

[default] 1024 [range] [1,10 million]

5.13.2.6 DDS_Long DDS_DatabaseQosPolicy::max_skiplist_level

The maximum level of the skiplist.

The skiplist is used to keep records in the database. Usually, the search time is $\log 2(N)$, where N is the total number of records in one skiplist. However, once N exceeds 2^n , where n is the maximum skiplist level, the search time will become more and more linear. Therefore, the maximum level should be set such that 2^n is larger than the maximum (N among all skiplists). Usually, the maximum N is the maximum number of remote and local writers or readers.

[default] 14 [range] [1,31]

5.13.2.7 DDS_Long DDS_DatabaseQosPolicy::max_weak_references

The maximum number of weak references.

A weak reference is an internal data structure that refers to a record within RTI Data Distribution Service' internal database. This field configures the maximum number of such references that RTI Data Distribution Service may create.

The actual number of weak references is permitted to grow from an initial value (indicated by DDS_DatabaseQosPolicy::initial_weak_references (p. 1063)) to this maximum. To prevent RTI Data Distribution Service from allocating any weak references after the system has reached a steady state, set the initial and maximum values equal to one another. To indicate that the number of weak references should continue to grow as needed indefinitely, set this field to DDS_LENGTH_UNLIMITED (p. 174). Be aware that although a single weak reference occupies very little memory, allocating a very large number of them can have a significant impact on your overall memory usage.

Tuning this value precisely is difficult without intimate knowledge of the structure of RTI Data Distribution Service' database; doing so is an advanced feature not required by most applications. The default value has been chosen to be sufficient for reasonably large systems. If you believe you may need to modify this value, please consult with RTI support personnel for assistance.

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 100 million] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_weak_references

See also:

DDS_DatabaseQosPolicy::initial_weak_references (p. 1063)

5.13.2.8 DDS_Long DDS_DatabaseQosPolicy::initial_weak_references

The initial number of weak references.

See DDS_DatabaseQosPolicy::max_weak_references (p. 1062) for more information about what a weak reference is.

If the QoS set contains an initial_weak_references value that is too small to ever grow to **DDS_DatabaseQosPolicy::max_weak_references** (p. 1062) using RTI Data Distribution Service' internal algorithm, this value will be adjusted upwards as necessary. Subsequent accesses of this value will reveal the actual initial value used.

Changing the value of this field is an advanced feature; it is recommended that you consult with RTI support personnel before doing so.

[default] 2049, which is the minimum initial value imposed by REDA when the maximum is unlimited. If a lower value is specified, it will simply be increased to 2049 automatically.

[range] [1, 100 million], <= max_weak_references

DDS_DatabaseQosPolicy::max_weak_references (p. 1062)

5.14 DDS_DataReaderCacheStatus Struct Reference

<< eXtension>> (p. 950) The status of the reader's cache.

Data Fields

${\bf ^{\hat{}}\ DDS_LongLong\ sample_count_peak}$

The highest number of samples in the reader's queue over the lifetime of the reader.

DDS_LongLong sample_count

The number of samples in the reader's queue.

5.14.1 Detailed Description

<< eXtension>> (p. 950) The status of the reader's cache.

Entity:

DDS_DataReader (p. 783)

5.14.2 Field Documentation

${\bf 5.14.2.1} \quad DDS_LongLong\ DDS_DataReaderCacheStatus::sample_count_peak$

The highest number of samples in the reader's queue over the lifetime of the reader.

5.14.2.2 DDS_LongLong DDS_DataReaderCacheStatus::sample_count

The number of samples in the reader's queue.

includes samples that may not yet be available to be read or taken by the user, due to samples being received out of order or $\bf PRESENTATION~(p.\,155)$

5.15 DDS_DataReaderListener Struct Reference

<< interface>> (p. 950) DDS_Listener (p. 1246) for reader status.

Data Fields

^ struct DDS_Listener as_listener

The superclass instance of this DDS_DataReaderListener (p. 1065).

 ${\bf ^{\hat{}}\ DDS_DataReaderListener_RequestedDeadlineMissedCallback\ on_requested_deadline_missed}$

Handles the DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 129) communication status.

^ DDS_DataReaderListener_RequestedIncompatibleQosCallback on_requested_incompatible_qos

Handles the DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129) communication status.

^ DDS_DataReaderListener_SampleRejectedCallback on_sample_rejected

Handles the DDS_SAMPLE_REJECTED_STATUS (p. 130) communication status.

`DDS_DataReaderListener_LivelinessChangedCallback on_-liveliness_changed

Handles the $DDS_LIVELINESS_CHANGED_STATUS$ (p. 131) communication status.

^ DDS_DataReaderListener_DataAvailableCallback on_data_-available

 $Handle\ the\ DDS_DATA_AVAILABLE_STATUS\ (p.\ 130)\ communication\ status.$

 $\begin{tabular}{ll} DDS_DataReaderListener_SubscriptionMatchedCallback & on_subscription_matched \\ \end{tabular}$

Handles the $DDS_SUBSCRIPTION_MATCHED_STATUS$ (p. 132) communication status.

DDS_DataReaderListener_SampleLostCallback on_sample_lost

Handles the $DDS_SAMPLE_LOST_STATUS$ (p. 130) communication status.

5.15.1 Detailed Description

5.15.2 Field Documentation

5.15.2.1 struct DDS_Listener DDS_DataReaderListener::as_listener [read]

The superclass instance of this **DDS_DataReaderListener** (p. 1065).

5.15.2.2 DDS_DataReaderListener_-

 $Requested Dead line Missed Callback \\ DDS_Data Reader Listener::on_requested_dead line_missed$

Handles the **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 129) communication status.

Examples:

HelloWorld_subscriber.c.

 $\begin{array}{ccc} 5.15.2.3 & DDS_DataReaderListener_-\\ & RequestedIncompatibleQosCallback\\ & DDS_DataReaderListener::on_requested_incompatible_qos \end{array}$

Handles the DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129) communication status.

Examples:

 $HelloWorld_subscriber.c.$

5.15.2.4 DDS_DataReaderListener_SampleRejectedCallback DDS_DataReaderListener::on_sample_rejected

Handles the $\mathbf{DDS_SAMPLE_REJECTED_STATUS}$ (p. 130) communication status.

Examples:

HelloWorld_subscriber.c.

 ${\bf 5.15.2.5} \quad DDS_DataReaderListener_LivelinessChangedCallback\\ \quad DDS_DataReaderListener::on_liveliness_changed$

Handles the ${\bf DDS_LIVELINESS_CHANGED_STATUS}$ (p. 131) communication status.

Examples:

HelloWorld_subscriber.c.

5.15.2.6 DDS_DataReaderListener_DataAvailableCallback DDS_DataReaderListener::on_data_available

Handle the $\mathbf{DDS_DATA_AVAILABLE_STATUS}$ (p. 130) communication status.

Examples:

HelloWorld_subscriber.c.

 ${\bf 5.15.2.7} \quad DDS_DataReaderListener_SubscriptionMatchedCallback \\ DDS_DataReaderListener::on_subscription_matched$

Handles the ${\bf DDS_SUBSCRIPTION_MATCHED_STATUS}$ (p. 132) communication status.

Examples:

HelloWorld_subscriber.c.

 ${\bf 5.15.2.8} \quad DDS_DataReaderListener_SampleLostCallback \\ DDS_DataReaderListener::on_sample_lost$

Handles the ${\bf DDS_SAMPLE_LOST_STATUS}$ (p. 130) communication status.

Examples:

HelloWorld_subscriber.c.

5.16 DDS_DataReaderProtocolQosPolicy Struct Reference

Along with DDS_WireProtocolQosPolicy (p. 1483) and DDS_DataWriterProtocolQosPolicy (p. 1106), this QoS policy configures the DDS on-the-network protocol (RTPS).

Data Fields

^ struct DDS_GUID_t virtual_guid

The virtual GUID (Global Unique Identifier).

^ DDS_UnsignedLong rtps_object_id

The RTPS Object ID.

^ DDS_Boolean expects_inline_qos

 $Specifies \ whether \ this \ DataReader \ expects \ in line \ QoS \ with \ every \ sample.$

^ DDS_Boolean disable_positive_acks

Whether the reader sends positive acknowledgements to writers.

^ DDS_Boolean propagate_dispose_of_unregistered_instances

Indicates whether or not an instance can move to the DDS_NOT_ALIVE_-DISPOSED_INSTANCE_STATE (p. 854) state without being in the DDS_ALIVE_INSTANCE_STATE (p. 854) state.

 $\verb|^ struct DDS_RtpsReliableReaderProtocol_t rtps_reliable_reader| \\$

The reliable protocol defined in RTPS.

5.16.1 Detailed Description

Along with DDS_WireProtocolQosPolicy (p. 1483) and DDS_-DataWriterProtocolQosPolicy (p. 1106), this QoS policy configures the DDS on-the-network protocol (RTPS).

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and DDS_DataReaderProtocolQosPolicy (p. 1069) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDS_DataWriter** (p. 673) and **DDS_DataReader** (p. 783) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Data Distribution Service responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **DDS_ReliabilityQosPolicy** (p. 1342) for more information on the per-DataReader/DataWriter reliability configuration. **DDS_HistoryQosPolicy** (p. 1229) and **DDS_ResourceLimitsQosPolicy** (p. 1356) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

```
DDS_DataReader (p. 783)
```

Properties:

```
\mathbf{RxO}\ (\mathrm{p.145}) = \mathrm{N/A} Changeable (\mathrm{p.146}) = \mathbf{NO}\ (\mathrm{p.146})
```

5.16.2 Field Documentation

5.16.2.1 struct DDS_GUID_t DDS_DataReaderProtocolQosPolicy::virtual_guid [read]

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDS_DataReader** (p. 783).

The association between a **DDS_DataReader** (p. 783) and its persisted state is done using the virtual GUID.

```
[default] DDS_GUID_AUTO (p. 115)
```

5.16.2.2 DDS_UnsignedLong DDS_-DataReaderProtocolQosPolicy::rtps_object_id

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data reader according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Data Distribution Service will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data reader.

A rtps_object_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Data Distribution Service. In those cases, the recomendation is not to use automatic object ID assignment.

[default] DDS_RTPS_AUTO_ID (p. ??)

5.16.2.3 DDS_Boolean DDS_DataReaderProtocolQosPolicy::expects_inline_qos

Specifies whether this DataReader expects inline QoS with every sample.

In RTI Data Distribution Service, a **DDS_DataReader** (p. 783) nominally relies on Discovery to propagate QoS on a matched **DDS_DataWriter** (p. 673). Alternatively, a **DDS_DataReader** (p. 783) may get information on a matched **DDS_DataWriter** (p. 673) through QoS sent inline with a sample.

Asserting DDS_DataReaderProtocolQosPolicy::expects_inline_qos (p. 1071) indicates to a matching DDS_DataWriter (p. 673) that this DDS_DataReader (p. 783) expects to receive inline QoS with every sample. The complete set of inline QoS that a DDS_DataWriter (p. 673) may send inline is specified by the Real-Time Publish-Subscribe (RTPS) Wire Interoperability Protocol.

Because RTI Data Distribution Service **DDS_DataWriter** (p. 673) and **DDS_DataReader** (p. 783) cache Discovery information, inline QoS are largely redundant and thus unecessary. Only for other stateless implementations whose **DDS_DataReader** (p. 783) does not cache Discovery information is inline QoS necessary.

Also note that inline QoS are additional wire-payload that consume additional bandwidth and serialization and describilization time.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.16.2.4 DDS_Boolean DDS_-DataReaderProtocolQosPolicy::disable_positive_acks

Whether the reader sends positive acknowledgements to writers.

If set to **DDS_BOOLEAN_TRUE** (p. 106), the reader does not send positive acknowledgments (ACKs) in response to Heartbeat messages. The reader will send negative acknowledgements (NACKs) when a Heartbeat advertises samples that it has not received.

Otherwise, if set to DDS_BOOLEAN_FALSE (p. 107) (the default), the reader will send ACKs to writers that expect ACKs (DDS_-DataWriterProtocolQosPolicy::disable_positive_acks (p. 1108) = DDS_BOOLEAN_FALSE (p. 107)) and it will not send ACKs to writers that disable ACKs (DDS_DataWriterProtocolQosPolicy::disable_positive_acks (p. 1108) = DDS_BOOLEAN_TRUE (p. 106))

[default] DDS_BOOLEAN_FALSE (p. 107)

5.16.2.5 DDS_Boolean DDS_-DataReaderProtocolQosPolicy::propagate_dispose_of_unregistered_instances

Indicates whether or not an instance can move to the DDS_NOT_ALIVE_-DISPOSED_INSTANCE_STATE (p. 854) state without being in the DDS_ALIVE_INSTANCE_STATE (p. 854) state.

This field only applies to keyed readers.

When the field is set to **DDS_BOOLEAN_TRUE** (p. 106), the DataReader will receive dispose notifications even if the instance is not alive.

To guarantee the key availability through the usage of the API Foo-DataReader_get_key_value (p. 812), this option should be used in combination DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose (p. 1109) on the DataWriter that should be set to DDS_BOOLEAN_TRUE (p. 106).

[default] DDS_BOOLEAN_FALSE (p. 107)

5.16.2.6 struct DDS_RtpsReliableReaderProtocol_t DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader [read]

The reliable protocol defined in RTPS.

 $[\mathbf{default}]$ min_heartbeat_response_delay 0 seconds; max_heartbeat_response_delay 0.5 seconds

5.17 DDS_DataReaderProtocolStatus Struct Reference

<<eXtension>> (p. 950) The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

Data Fields

^ DDS_LongLong received_sample_count

The number of user samples from a remote DataWriter received for the first time by a local DataReader.

^ DDS_LongLong received_sample_count_change

The incremental change in the number of user samples from a remote DataWriter received for the first time by a local DataReader since the last time the status was read.

^ DDS_LongLong received_sample_bytes

The number of bytes of user samples from a remote DataWriter received for the first time by a local DataReader.

^ DDS_LongLong received_sample_bytes_change

The incremental change in the number of bytes of user samples from a remote DataWriter received for the first time by a local DataReader since the last time the status was read.

^ DDS_LongLong duplicate_sample_count

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

^ DDS_LongLong duplicate_sample_count_change

The incremental change in the number of samples from a remote DataWriter received, not for the first time, by a local DataReader since the last time the status was read.

^ DDS_LongLong duplicate_sample_bytes

The number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader.

^ DDS_LongLong duplicate_sample_bytes_change

The incremental change in the number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader since the last time the status was read.

^ DDS_LongLong filtered_sample_count

The number of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter.

^ DDS_LongLong filtered_sample_count_change

The incremental change in the number of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter since the last time the status was read.

^ DDS_LongLong filtered_sample_bytes

The number of bytes of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter.

^ DDS_LongLong filtered_sample_bytes_change

The incremental change in the number of bytes of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter since the last time the status was read.

^ DDS_LongLong received_heartbeat_count

The number of Heartbeats from a remote DataWriter received by a local DataReader.

^ DDS_LongLong received_heartbeat_count_change

The incremental change in the number of Heartbeats from a remote DataWriter received by a local DataReader since the last time the status was read.

^ DDS_LongLong received_heartbeat_bytes

The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.

DDS_LongLong received_heartbeat_bytes_change

The incremental change in the number of bytes of Heartbeats from a remote DataWriter received by a local DataReader since the last time the status was read.

DDS_LongLong sent_ack_count

The number of ACKs sent from a local DataReader to a matching remote DataWriter.

^ DDS_LongLong sent_ack_count_change

The incremental change in the number of ACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

^ DDS_LongLong sent_ack_bytes

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

^ DDS_LongLong sent_ack_bytes_change

The incremental change in the number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

^ DDS_LongLong sent_nack_count

 $\label{lem:condition} The \ number \ of \ NACKs \ sent \ from \ a \ local \ DataReader \ to \ a \ matching \ remote \\ DataWriter.$

^ DDS_LongLong sent_nack_count_change

The incremental change in the number of NACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

^ DDS_LongLong sent_nack_bytes

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

^ DDS_LongLong sent_nack_bytes_change

The incremental change in the number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

^ DDS_LongLong received_gap_count

The number of GAPs received from remote DataWriter to this DataReader.

^ DDS_LongLong received_gap_count_change

The incremental change in the number of GAPs received from remote DataWriter to this DataReader since the last time the status was read.

^ DDS_LongLong received_gap_bytes

The number of bytes of GAPs received from remote DataWriter to this DataReader.

^ DDS_LongLong received_gap_bytes_change

The incremental change in the number of bytes of GAPs received from remote DataWriter to this DataReader since the last time the status was read.

^ DDS_LongLong rejected_sample_count

The number of times a sample is rejected due to exceptions in the receive path.

^ DDS_LongLong rejected_sample_count_change

The incremental change in the number of times a sample is rejected due to exceptions in the receive path since the last time the status was read.

^ struct DDS_SequenceNumber_t first_available_sample_sequence_number

Sequence number of the first available sample in a matched Datawriters reliability queue. Applicable only when retrieving matched DataWriter statuses.

^ struct DDS_SequenceNumber_t last_available_sample_sequence_number

Sequence number of the last available sample in a matched Datawriters reliability queue. Applicable only when retrieving matched DataWriter statuses.

struct DDS_SequenceNumber_t last_committed_sample_sequence_number

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue. Applicable only when retrieving matched DataWriter statuses.

^ DDS_Long uncommitted_sample_count

Number of received samples that are not yet available to be read or taken, due to being received out of order. Applicable only when retrieving matched DataWriter statuses.

5.17.1 Detailed Description

<<eXtension>> (p. 950) The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

Entity:

DDS_DataReader (p. 783)

5.17.2 Field Documentation

$\begin{array}{ccc} 5.17.2.1 & DDS_LongLong & DDS_-\\ & DataReaderProtocolStatus::received_sample_count \end{array}$

The number of user samples from a remote DataWriter received for the first time by a local DataReader.

5.17.2.2 DDS_LongLong DDS_-DataReaderProtocolStatus::received_sample_count_change

The incremental change in the number of user samples from a remote DataWriter received for the first time by a local DataReader since the last time the status was read.

5.17.2.3 DDS_LongLong DDS_-DataReaderProtocolStatus::received_sample_bytes

The number of bytes of user samples from a remote DataWriter received for the first time by a local DataReader.

5.17.2.4 DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_bytes_change

The incremental change in the number of bytes of user samples from a remote DataWriter received for the first time by a local DataReader since the last time the status was read.

5.17.2.5 DDS_LongLong DDS_-DataReaderProtocolStatus::duplicate_sample_count

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

5.17.2.6 DDS_LongLong DDS_-DataReaderProtocolStatus::duplicate_sample_count_change

The incremental change in the number of samples from a remote DataWriter received, not for the first time, by a local DataReader since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

5.17.2.7 DDS_LongLong DDS_-DataReaderProtocolStatus::duplicate_sample_bytes

The number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

5.17.2.8 DDS_LongLong DDS_-DataReaderProtocolStatus::duplicate_sample_bytes_change

The incremental change in the number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

${\bf 5.17.2.9} \quad DDS_LongLong \ DDS_DataReader Protocol Status:: filtered_-sample_count$

The number of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter.

$\begin{array}{ccc} 5.17.2.10 & DDS_LongLong & DDS_-\\ & DataReaderProtocolStatus::filtered_sample_count_change \\ \end{array}$

The incremental change in the number of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter since the last time the status was read.

5.17.2.11 DDS_LongLong DDS_-DataReaderProtocolStatus::filtered_sample_bytes

The number of bytes of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter.

5.17.2.12 DDS_LongLong DDS_-DataReaderProtocolStatus::filtered_sample_bytes_change

The incremental change in the number of bytes of user samples filtered by the local DataReader due to Content-Filtered Topics or Time-Based Filter since the last time the status was read.

5.17.2.13 DDS_LongLong DDS_-DataReaderProtocolStatus::received_heartbeat_count

The number of Heartbeats from a remote DataWriter received by a local DataReader.

5.17.2.14 DDS_LongLong DDS_-DataReaderProtocolStatus::received_heartbeat_count_change

The incremental change in the number of Heartbeats from a remote DataWriter received by a local DataReader since the last time the status was read.

5.17.2.15 DDS_LongLong DDS_-DataReaderProtocolStatus::received_heartbeat_bytes

The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.

5.17.2.16 DDS_LongLong DDS_-DataReaderProtocolStatus::received_heartbeat_bytes_change

The incremental change in the number of bytes of Heartbeats from a remote DataWriter received by a local DataReader since the last time the status was read.

The number of ACKs sent from a local DataReader to a matching remote DataWriter.

5.17.2.18 DDS_LongLong DDS_DataReaderProtocolStatus::sent_-ack_count_change

The incremental change in the number of ACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

5.17.2.19 DDS_LongLong DDS_DataReaderProtocolStatus::sent_-ack_bytes

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

${\small 5.17.2.20~DDS_LongLong~DDS_DataReaderProtocolStatus::sent_-ack_bytes_change}$

The incremental change in the number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

$\begin{array}{ccc} 5.17.2.21 & DDS_LongLong \ DDS_DataReaderProtocolStatus::sent_-\\ & nack_count \end{array}$

The number of NACKs sent from a local DataReader to a matching remote DataWriter.

The incremental change in the number of NACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

5.17.2.23 DDS_LongLong DDS_DataReaderProtocolStatus::sent_-nack_bytes

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

5.17.2.24 DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_bytes_change

The incremental change in the number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter since the last time the status was read.

$\begin{array}{ccc} 5.17.2.25 & DDS_LongLong & DDS_-\\ & DataReaderProtocolStatus::received_gap_count \end{array}$

The number of GAPs received from remote DataWriter to this DataReader.

5.17.2.26 DDS_LongLong DDS_-DataReaderProtocolStatus::received_gap_count_change

The incremental change in the number of GAPs received from remote DataWriter to this DataReader since the last time the status was read.

5.17.2.27 DDS_LongLong DDS_-DataReaderProtocolStatus::received_gap_bytes

The number of bytes of GAPs received from remote DataWriter to this DataReader.

5.17.2.28 DDS_LongLong DDS_-DataReaderProtocolStatus::received_gap_bytes_change

The incremental change in the number of bytes of GAPs received from remote DataWriter to this DataReader since the last time the status was read.

5.17.2.29 DDS_LongLong DDS_-DataReaderProtocolStatus::rejected_sample_count

The number of times a sample is rejected due to exceptions in the receive path.

5.17.2.30 DDS_LongLong DDS_-DataReaderProtocolStatus::rejected_sample_count_change

The incremental change in the number of times a sample is rejected due to exceptions in the receive path since the last time the status was read.

Sequence number of the first available sample in a matched Datawriters reliability queue. Applicable only when retrieving matched DataWriter statuses.

5.17.2.32 struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::last_available_sample_sequence_number [read]

Sequence number of the last available sample in a matched Datawriters reliability queue. Applicable only when retrieving matched DataWriter statuses.

5.17.2.33 struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::last_committed_sample_sequence_number [read]

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue. Applicable only when retrieving matched DataWriter statuses.

5.17.2.34 DDS_Long DDS_-DataReaderProtocolStatus::uncommitted_sample_count

Number of received samples that are not yet available to be read or taken, due to being received out of order. Applicable only when retrieving matched DataWriter statuses.

5.18 DDS_DataReaderQos Struct Reference

QoS policies supported by a DDS_DataReader (p. 783) entity.

5.18.1 Detailed Description

QoS policies supported by a DDS_DataReader (p. 783) entity.

You must set certain members in a consistent manner:

 $\label{eq:decomposition} DDS_DataReaderQos::deadline.period >= DDS_DataReaderQos::time_based_filter.minimum_separation$

 $\label{eq:decomposition} DDS_DataReaderQos::resource_limits.max_samples_per_instance \\ <= DDS_$

 $\label{local_decomposition} DDS_DataReaderQos::resource_limits.max_samples \ DDS_DataReaderQos::resource_limits.initial_samples <= DDS_DataReaderQos::resource_limits.max_samples$

DDS_DataReaderQos::resource_limits.initial_instances <= DDS_-DataReaderQos::resource_limits.max_instances

$$\label{local_problem} \begin{split} DDS_DataReaderQos::reader_resource_limits.initial_remote_writers_per_instance &<= DDS_DataReaderQos::reader_resource_limits.max_remote_writers_per_instance \end{split}$$

DDS_DataReaderQos::reader_resource_limits.initial_infos <= DDS_DataReaderQos::reader_resource_limits.max_infos

$$\label{eq:decomposition} \begin{split} DDS_DataReaderQos::reader_resource_limits.max_remote_writers_per_instance \\ <= DDS_DataReaderQos::reader_resource_limits.max_remote_writers \end{split}$$

 $\label{eq:decomposition} DDS_DataReaderQos::reader_resource_limits.max_samples_per_remote_writer <= DDS_DataReaderQos::resource_limits.max_samples$

length of DDS_DataReaderQos::user_data.value <= DDS_-DomainParticipantQos::resource_limits.reader_user_data_max_length

If any of the above are not true, DDS_DataReader_set_qos (p. 836) and DDS_DataReader_set_qos_with_profile (p. 837) will fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122)

5.18.2 Field Documentation

5.18.2.1 struct DDS_DurabilityQosPolicy DDS_DataReaderQos::durability [read]

Durability policy, **DURABILITY** (p. 153).

5.18.2.2 struct DDS_DeadlineQosPolicy DDS_DataReaderQos::deadline [read]

Deadline policy, **DEADLINE** (p. 157).

5.18.2.3 struct DDS_LatencyBudgetQosPolicy DDS_DataReaderQos::latency_budget [read]

Latency budget policy, LATENCY_BUDGET (p. 158).

5.18.2.4 struct DDS_LivelinessQosPolicy DDS_DataReaderQos::liveliness [read]

Liveliness policy, LIVELINESS (p. 162).

5.18.2.5 struct DDS_ReliabilityQosPolicy DDS_DataReaderQos::reliability [read]

Reliability policy, **RELIABILITY** (p. 166).

5.18.2.6 struct DDS_DestinationOrderQosPolicy DDS_DataReaderQos::destination_order [read]

Destination order policy, **DESTINATION_ORDER** (p. 168).

5.18.2.7 struct DDS_HistoryQosPolicy DDS_DataReaderQos::history [read]

History policy, **HISTORY** (p. 170).

5.18.2.8 struct DDS_ResourceLimitsQosPolicy DDS_DataReaderQos::resource_limits [read]

Resource limits policy, **RESOURCE_LIMITS** (p. 174).

5.18.2.9 struct DDS_UserDataQosPolicy DDS_DataReaderQos::user_data [read]

User data policy, USER_DATA (p. 150).

 $\begin{array}{ccc} 5.18.2.10 & struct \ DDS_OwnershipQosPolicy \\ & DDS_DataReaderQos::ownership \ [read] \end{array}$

Ownership policy, **OWNERSHIP** (p. 159).

 $\begin{array}{ccc} 5.18.2.11 & struct \ DDS_TimeBasedFilterQosPolicy \\ & DDS_DataReaderQos::time_based_filter \ \ \ \ \ \ \ \end{array}$

Time-based filter policy, TIME_BASED_FILTER (p. 164).

5.18.2.12 struct DDS_ReaderDataLifecycleQosPolicy DDS_DataReaderQos::reader_data_lifecycle [read]

Reader data lifecycle policy, **READER_DATA_LIFECYCLE** (p. 179).

$\begin{array}{ccc} 5.18.2.13 & struct\ DDS_DataReaderResourceLimitsQosPolicy\\ & DDS_DataReaderQos::reader_resource_limits & [read] \end{array}$

<<e Xtension>> (p. 950) DDS_DataReader (p. 783) resource limits policy, DATA_READER_RESOURCE_LIMITS (p. 208). This policy is an extension to the DDS standard.

5.18.2.14 struct DDS_DataReaderProtocolQosPolicy DDS_DataReaderQos::protocol [read]

<<*eXtension>>* (p. 950) DDS_DataReader (p. 783) protocol policy, DATA_READER_PROTOCOL (p. 214)

<< eXtension>> (p. 950) Transport selection policy, TRANSPORT_-SELECTION (p. 184).

Specifies the transports available for use by the DDS_DataReader (p. 783).

5.18.2.16 struct DDS_TransportUnicastQosPolicy DDS_DataReaderQos::unicast [read]

<< eXtension>> (p. 950) Unicast transport policy, TRANSPORT_-UNICAST (p. 185).

Specifies the unicast transport interfaces and ports on which **messages** can be received.

The unicast interfaces are used to receive messages from **DDS_DataWriter** (p. 673) entities in the domain.

5.18.2.17 struct DDS_TransportMulticastQosPolicy DDS_DataReaderQos::multicast [read]

<< eXtension>> (p. 950) Multicast transport policy, TRANSPORT_-MULTICAST (p. 186).

Specifies the multicast group addresses and ports on which **messages** can be received.

The multicast addresses are used to receive messages from **DDS_DataWriter** (p. 673) entities in the domain.

$\begin{array}{ccc} 5.18.2.18 & struct \ DDS_PropertyQosPolicy \\ & DDS_DataReaderQos::property \ \ [read] \end{array}$

<< eXtension>> (p. 950) Property policy, **PROPERTY** (p. 235).

<<e xtension>> (p. 950) type support data, TYPESUPPORT (p. 229).

Optional value that is passed to a type plugin's on_endpoint_attached and deserialization functions.

5.19 DDS_DataReaderResourceLimitsQosPolicy Struct Reference

Various settings that configure how a **DDS_DataReader** (p. 783) allocates and uses physical memory for internal resources.

Data Fields

^ DDS_Long max_remote_writers

The maximum number of remote writers from which a DDS_DataReader (p. 783) may read, including all instances.

^ DDS_Long max_remote_writers_per_instance

The maximum number of remote writers from which a DDS_DataReader (p. 783) may read a single instance.

^ DDS_Long max_samples_per_remote_writer

The maximum number of out-of-order samples from a given remote DDS_DataWriter (p. 673) that a DDS_DataReader (p. 783) may store when maintaining a reliable connection to the DDS_DataWriter (p. 673).

^ DDS_Long max_infos

The maximum number of info units that a DDS_DataReader (p. 783) can use to store DDS_SampleInfo (p. 1384).

^ DDS_Long initial_remote_writers

The initial number of remote writers from which a DDS_DataReader (p. 783) may read, including all instances.

^ DDS_Long initial_remote_writers_per_instance

The initial number of remote writers from which a DDS_DataReader (p. 783) may read a single instance.

^ DDS_Long initial_infos

The initial number of info units that a DDS_DataReader (p. 783) can have, which are used to store DDS_SampleInfo (p. 1384).

$\hat{\ }$ DDS_Long initial_outstanding_reads

The initial number of outstanding calls to read/take (or one of their variants) on the same DDS_DataReader (p. 783) for which memory has not been returned by calling FooDataReader_return_loan (p. 811).

^ DDS_Long max_outstanding_reads

The maximum number of outstanding read/take calls (or one of their variants) on the same DDS_DataReader (p. 783) for which memory has not been returned by calling FooDataReader_return_loan (p. 811).

$\hat{\ }$ DDS_Long max_samples_per_read

The maximum number of data samples that the application can receive from the middleware in a single call to FooDataReader_read (p. 788) or FooDataReader_take (p. 789). If more data exists in the middleware, the application will need to issue multiple read/take calls.

^ DDS_Boolean disable_fragmentation_support

Determines whether the $DDS_DataReader$ (p. 783) can receive fragmented samples.

DDS_Long max_fragmented_samples

The maximum number of samples for which the DDS_DataReader (p. 783) may store fragments at a given point in time.

^ DDS_Long initial_fragmented_samples

The initial number of samples for which a DDS_DataReader (p. 783) may store fragments.

DDS_Long max_fragmented_samples_per_remote_writer

The maximum number of samples per remote writer for which a DDS_-DataReader (p. 783) may store fragments.

DDS_Long max_fragments_per_sample

Maximum number of fragments for a single sample.

^ DDS_Boolean dynamically_allocate_fragmented_samples

Determines whether the $DDS_DataReader$ (p. 783) pre-allocates storage for storing fragmented samples.

^ DDS_Long max_total_instances

Maximum number of instances for which a DataReader will keep state.

DDS_Long max_remote_virtual_writers_per_instance

The maximum number of virtual remote writers that can be associated with an instance.

^ DDS_Long initial_remote_virtual_writers_per_instance

The initial number of virtual remote writers per instance.

^ DDS_Long max_query_condition_filters

The maximum number of query condition filters a reader is allowed.

5.19.1 Detailed Description

Various settings that configure how a **DDS_DataReader** (p. 783) allocates and uses physical memory for internal resources.

DataReaders must allocate internal structures to handle the maximum number of DataWriters that may connect to it, whether or not a **DDS_DataReader** (p. 783) handles data fragmentation and how many data fragments that it may handle (for data samples larger than the MTU of the underlying network transport), how many simultaneous outstanding loans of internal memory holding data samples can be provided to user code, as well as others.

Most of these internal structures start at an initial size and, by default, will be grown as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDS_DataReader** (p. 783). By setting the initial size to the maximum size, you will prevent RTI Data Distribution Service from dynamically allocating any memory after the creation of the **DDS_DataReader** (p. 783).

This QoS policy is an extension to the DDS standard.

Entity:

```
DDS_DataReader (p. 783)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.19.2 Field Documentation

5.19.2.1 DDS_Long DDS_-

 $DataReaderResourceLimitsQosPolicy:: max_remote_writers$

The maximum number of remote writers from which a DDS_DataReader (p. 783) may read, including all instances.

```
[default] DDS_LENGTH_UNLIMITED (p. 174)
```

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_remote_writers, >= max_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers_per_instance if max_remote_writers_per_instance is not equal to **DDS_LENGTH_-UNLIMITED** (p. 174).

Note: For efficiency, set max_remote_writers >= DDS_-

DataReaderResourceLimitsQosPolicy::max_remote_writers_per_instance (p. 1092).

5.19.2.2 DDS_Long DDS_-

DataReaderResourceLimitsQosPolicy::max_remote_writers_per_instance

The maximum number of remote writers from which a **DDS_DataReader** (p. 783) may read a single instance.

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 1024] or DDS_LENGTH_UNLIMITED (p. 174), <= max_remote_writers or DDS_LENGTH_UNLIMITED (p. 174), >= initial_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers if it is not **DDS_LENGTH_UNLIMITED** (p. 174).

Note: For efficiency, set max_remote_writers_per_instance <= DDS_-DataReaderResourceLimitsQosPolicy::max_remote_writers (p. 1091)

5.19.2.3 DDS_Long DDS_-

DataReaderResourceLimitsQosPolicy::max_samples_per_remote_writer

The maximum number of out-of-order samples from a given remote **DDS_DataWriter** (p. 673) that a **DDS_DataReader** (p. 783) may store when maintaining a reliable connection to the **DDS_DataWriter** (p. 673).

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 100 million] or DDS_LENGTH_UNLIMITED (p. 174), <= DDS_ResourceLimitsQosPolicy::max_samples (p. 1358)

5.19.2.4 DDS_Long DDS_-

DataReaderResourceLimitsQosPolicy::max_infos

The maximum number of info units that a DDS_DataReader (p. 783) can use to store DDS_SampleInfo (p. 1384).

When read/take is called on a data reader, the data reader passes a sequence of data samples and an associated sample info sequence. The sample info sequence contains additional information for each data sample.

max_infos determines the resources allocated for storing sample info. This memory is loaned to the application when passing a sample info sequence.

5.19 DDS_DataReaderResourceLimitsQosPolicy Struct Reference093

Note that sample info is a snapshot, generated when read/take is called. max_infos should not be less than max_samples.

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_infos

5.19.2.5 DDS_Long DDS_-

 $Data Reader Resource Limits Qos Policy :: initial_remote_writers$

The initial number of remote writers from which a **DDS_DataReader** (p. 783) may read, including all instances.

[default] 2

[range] [1, 1 million], <= max_remote_writers

For unkeyed types this value has to be equal to initial_remote_writers_per_instance.

Note: For efficiency, set initial_remote_writers >= DDS_-DataReaderResourceLimitsQosPolicy::initial_remote_writers_per_-instance (p. 1093).

5.19.2.6 DDS_Long DDS_-

 $\label{lem:pataReaderResourceLimitsQosPolicy::initial_remote_writers_per_instance$

The initial number of remote writers from which a **DDS_DataReader** (p. 783) may read a single instance.

[default] 2

 $[\textbf{range}] \ [1{,}1024], <= \max_remote_writers_per_instance$

For unkeyed types this value has to be equal to initial_remote_writers.

Note: For efficiency, set initial_remote_writers_per_instance <= DDS_-DataReaderResourceLimitsQosPolicy::initial_remote_writers (p. 1093).

5.19.2.7 DDS_Long DDS_-

 $Data Reader Resource Limits Qos Policy :: initial_infos$

The initial number of info units that a **DDS_DataReader** (p. 783) can have, which are used to store **DDS_SampleInfo** (p. 1384).

[default] 32

[range] [1,1 million], \leq max_infos

5.19.2.8 DDS_Long DDS_-

DataReaderResourceLimitsQosPolicy::initial_outstanding_reads

The initial number of outstanding calls to read/take (or one of their variants) on the same **DDS_DataReader** (p. 783) for which memory has not been returned by calling **FooDataReader_return_loan** (p. 811).

[default] 2

[range] [1, 65536], <= max_outstanding_reads

5.19.2.9 DDS_Long DDS_-

DataReaderResourceLimitsQosPolicy::max_outstanding_reads

The maximum number of outstanding read/take calls (or one of their variants) on the same **DDS_DataReader** (p. 783) for which memory has not been returned by calling **FooDataReader_return_loan** (p. 811).

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 65536] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_outstanding_reads

5.19.2.10 DDS_Long DDS_-

 ${\bf DataReaderResourceLimitsQosPolicy::} {\bf max_samples_per_read}$

The maximum number of data samples that the application can receive from the middleware in a single call to **FooDataReader_read** (p. 788) or **FooDataReader_take** (p. 789). If more data exists in the middleware, the application will need to issue multiple read/take calls.

When reading data using listeners, the expected number of samples available for delivery in a single take call is typically small: usually just one, in the case of unbatched data, or the number of samples in a single batch, in the case of batched data. (See DDS_BatchQosPolicy (p. 1040) for more information about this feature.) When polling for data or using a DDS_WaitSet (p. 253), however, multiple samples (or batches) could be retrieved at once, depending on the data rate.

A larger value for this parameter makes the API simpler to use at the expense

5.19 DDS_DataReaderResourceLimitsQosPolicy Struct Reference095

of some additional memory consumption.

[default] 1024

[range] [1,65536]

5.19.2.11 DDS_Boolean DDS_-

 $\label{lem:pata} Data Reader Resource Limits Qos Policy:: disable_fragmentation_support$

Determines whether the **DDS_DataReader** (p. 783) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.19.2.12 DDS_Long DDS_-

The maximum number of samples for which the **DDS_DataReader** (p. 783) may store fragments at a given point in time.

At any given time, a **DDS_DataReader** (p. 783) may store fragments for up to max_fragmented_samples samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different **DDS_DataWriter** (p. 673) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **DDS_-ResourceLimitsQosPolicy::max_samples** (p. 1358).

The middleware will drop fragments if the max_fragmented_samples limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support (p. 1095) is DDS_BOOLEAN_FALSE (p. 107).

[default] 1024

[range] [1, 1 million]

5.19.2.13 DDS_Long DDS_-

The initial number of samples for which a DDS_DataReader (p. 783) may store fragments.

Only applies if DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support (p. 1095) is DDS_BOOLEAN_FALSE (p. 107).

[default] 4

[range] [1,1024], \leq max_fragmented_samples

5.19.2.14 DDS_Long DDS_-

The maximum number of samples per remote writer for which a DDS_-DataReader (p. 783) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if $DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support (p. 1095) is <math>DDS_BOOLEAN_FALSE$ (p. 107).

[default] 256

[range] [1, 1 million], <= max_fragmented_samples

5.19.2.15 DDS_Long DDS_-

Maximum number of fragments for a single sample.

Only applies if DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support $(p.\,1095)$ is DDS_BOOLEAN_FALSE $(p.\,107)$.

[default] 512

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174)

5.19.2.16 DDS_Boolean DDS_-

 $\label{lem:patareaderResourceLimitsQosPolicy::dynamically_-allocate_fragmented_samples$

Determines whether the **DDS_DataReader** (p. 783) pre-allocates storage for storing fragmented samples.

By default, the middleware will allocate memory upfront for storing fragments for up to DDS_DataReaderResourceLimitsQosPolicy::initial_fragmented_samples (p. 1096) samples. This memory may grow up to DDS_DataReaderResourceLimitsQosPolicy::max_fragmented_samples (p. 1095) if needed.

If dynamically_allocate_fragmented_samples is set to DDS_BOOLEAN_TRUE (p. 106), the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting may be useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at run-time.

Only applies if DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support (p. 1095) is DDS_BOOLEAN_FALSE (p. 107).

[default] DDS_BOOLEAN_FALSE (p. 107)

5.19.2.17 DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_total_instances

Maximum number of instances for which a DataReader will keep state.

The maximum number of instances actively managed by a DataReader is determined by DDS_ResourceLimitsQosPolicy::max_instances (p. 1359).

These instances have associated DataWriters or samples in the DataReader's queue and are visible to the user through operations such as FooDataReader_take (p. 789), FooDataReader_read (p. 788), and FooDataReader_get_key_value (p. 812).

The features Durable Reader State, MultiChannel DataWriters and RTI Persistence Service require RTI Data Distribution Service to keep some internal state even for instances without DataWriters or samples in the DataReader's queue. The additional state is used to filter duplicate samples that could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

The total maximum number of instances that will be managed by the middle-ware, including instances without associated DataWriters or samples, is determined by max_total_instances.

When a new instance is received, RTI Data Distribution Service will check the resource limit **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1359). If the limit is exceeded, RTI Data Distribution Service will drop the sample and report it as lost and rejected. If the limit is not exceeded, RTI Data Distribution Service will check max_total_instances. If max_total_instances is exceeded, RTI Data Distribution Service will replace an existing instance without DataWriters and samples with the new one. The application could receive duplicate samples for the replaced instance if it becomes alive again.

[default] DDS_AUTO_MAX_TOTAL_INSTANCES (p. 209)

5.19.2.18 DDS_Long DDS_-

DataReaderResourceLimitsQosPolicy::max_remote_virtual_writers_per_instance

The maximum number of virtual remote writers that can be associated with an instance.

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 1024] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_remote_virtual_writers_per_instance

For unkeyed types, this value is ignored.

The features of Durable Reader State and MultiChannel DataWriters, and RTI Persistence Service require RTI Data Distribution Service to keep some internal state per virtual writer and instance that is used to filter duplicate samples. These duplicate samples could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

Once an association between a remote virtual writer and an instance is established, it is permanent - it will not disappear even if the physical writer incarnating the virtual writer is destroyed.

If max_remote_virtual_writers_per_instance is exceeded for an instance, RTI Data Distribution Service will not associate this instance with new virtual writers. Duplicates samples from these virtual writers will not be filtered on the reader.

If you are not using Durable Reader State, MultiChannel DataWriters or RTI Persistence Service in your system, you can set this property to 1 to optimize resources.

$5.19\ DDS_DataReaderResourceLimitsQosPolicy\ Struct\ Reference 099$

5.19.2.19 DDS_Long DDS_-

 $\label{lem:lemote_policy::initial_remote_virtual_writers_per_instance} DataReaderResourceLimitsQosPolicy::initial_remote_virtual_writers_per_instance$

The initial number of virtual remote writers per instance.

[default] 2

 $[\textbf{range}] \ [1, \, 1024], <= \, \text{max_remote_virtual_writers_per_instance}$

For unkeyed types, this value is ignored.

5.19.2.20 DDS_Long DDS_-

 $\label{lem:pataReaderResourceLimitsQosPolicy::max_query_-condition_filters$

The maximum number of query condition filters a reader is allowed.

[default] 4

[range] [0, 32]

This value determines the maximum number of unique query condition content filters that a reader may create.

Each query condition content filter is comprised of both its query_expression and query_parameters. Two query conditions that have the same query_expression will require unique query condition filters if their query_parameters differ. Query conditions that differ only in their state masks will share the same query condition filter.

5.22.2 Field Documentation

5.22.2.1 struct DDS_Listener DDS_DataWriterListener::as_listener [read]

The superclass instance of this DDS_DataWriterListener (p. 1102).

${\bf 5.22.2.2} \quad DDS_DataWriterListener_OfferedDeadlineMissedCallback \\ \quad DDS_DataWriterListener::on_offered_deadline_missed}$

Handles the **DDS_OFFERED_DEADLINE_MISSED_STATUS** (p. 129) status.

This callback is called when the deadline that the **DDS_DataWriter** (p. 673) has committed through its **DEADLINE** (p. 157) qos policy was not respected for a specific instance. This callback is called for each deadline period elapsed during which the **DDS_DataWriter** (p. 673) failed to provide data for an instance.

5.22.2.3 DDS_DataWriterListener_OfferedIncompatibleQosCallback DDS_DataWriterListener::on_offered_incompatible_qos

Handles the DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129) status.

This callback is called when the DDS_DataWriterQos (p. 1123) of the DDS_DataWriter (p. 673) was incompatible with what was requested by a DDS_DataReader (p. 783). This callback is called when a DDS_DataWriter (p. 673) has discovered a DDS_DataReader (p. 783) for the same DDS_Topic (p. 425) and common partition, but with a requested QoS that is incompatible with that offered by the DDS_DataWriter (p. 673).

5.22.2.4 DDS_DataWriterListener_LivelinessLostCallback DDS_DataWriterListener::on_liveliness_lost

Handles the DDS_LIVELINESS_LOST_STATUS (p. 131) status.

This callback is called when the liveliness that the **DDS_DataWriter** (p. 673) has committed through its **LIVELINESS** (p. 162) qos policy was not respected; this **DDS_DataReader** (p. 783) entities will consider the **DDS_DataWriter** (p. 673) as no longer "alive/active". This callback will not be called when an already not alive **DDS_DataWriter** (p. 673) simply renames not alive for another liveliness period.

5.22.2.5 DDS_DataWriterListener_PublicationMatchedCallback DDS_DataWriterListener::on_publication_matched

Handles the DDS_PUBLICATION_MATCHED_STATUS (p. 131) status.

This callback is called when the **DDS_DataWriter** (p. 673) has found a **DDS_DataReader** (p. 783) that matches the **DDS_Topic** (p. 425), has a common partition and compatible QoS, or has ceased to be matched with a **DDS_DataReader** (p. 783) that was previously considered to be matched.

5.22.2.6 DDS_DataWriterListener_ReliableWriterCacheChangedCallback DDS_DataWriterListener::on_reliable_writer_cache_changed

<<eXtension>> (p. 950) A change has occurred in the writer's cache of unacknowledged samples.

5.22.2.7 DDS_DataWriterListener_ReliableReaderActivityChangedCallback DDS_DataWriterListener::on_reliable_reader_activity_changed

 $<<\!eXtension>>$ (p. 950) A matched reliable reader has become active or become inactive.

${\bf 5.22.2.8} \quad DDS_DataWriterListener_InstanceReplacedCallback \\ DDS_DataWriterListener::on_instance_replaced$

Notifies when an instance is replaced in DataWriter queue.

This callback is called when an instance is replaced by the **DDS_DataWriter** (p. 673) due to instance resource limits being reached. This callback returns to the user the handle of the replaced instance, which can be used to get the key of the replaced instance.

5.23 DDS_DataWriterProtocolQosPolicy Struct Reference

Protocol that applies only to **DDS_DataWriter** (p. 673) instances.

Data Fields

^ struct DDS_GUID_t virtual_guid

The virtual GUID (Global Unique Identifier).

 ${\bf ^{\hat{}}\ DDS_UnsignedLong\ rtps_object_id}$

The RTPS Object ID.

^ DDS_Boolean push_on_write

Whether to push sample out when write is called.

^ DDS_Boolean disable_positive_acks

Controls whether or not the writer expects positive acknowledgements from matching readers.

^ DDS_Boolean disable_inline_keyhash

Controls whether or not a keyhash is propagated on the wire with each sample.

^ DDS_Boolean serialize_key_with_dispose

Controls whether or not the serialized key is propagated on the wire with dispose samples.

^ struct DDS_RtpsReliableWriterProtocol_t rtps_reliable_writer

The reliable protocol defined in RTPS.

5.23.1 Detailed Description

Protocol that applies only to **DDS_DataWriter** (p. 673) instances.

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and DDS_DataWriterProtocolQosPolicy (p. 1106) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDS_DataWriter** (p. 673) and **DDS_DataReader** (p. 783) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Data Distribution Service responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See DDS_ReliabilityQosPolicy (p. 1342) for more information on the per-DataReader/DataWriter reliability configuration. DDS_HistoryQosPolicy (p. 1229) and DDS_ResourceLimitsQosPolicy (p. 1356) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

```
DDS_DataWriter (p. 673)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.23.2 Field Documentation

5.23.2.1 struct DDS_GUID_t DDS_-DataWriterProtocolQosPolicy::virtual_guid [read]

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDS_DataWriter** (p. 673).

RTI Data Distribution Service uses the virtual GUID to associate a persisted writer history to a specific DDS_DataWriter (p. 673).

The RTI Data Distribution Service Persistence Service uses the virtual GUID to send samples on behalf of the original **DDS_DataWriter** (p. 673).

```
[default] DDS_GUID_AUTO (p. 115)
```

5.23.2.2 DDS_UnsignedLong DDS_-DataWriterProtocolQosPolicy::rtps_object_id

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data writer according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Data Distribution Service will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data writer.

A rtps_object_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Data Distribution Service. In those cases, the recomendation is not to use automatic object ID assignment.

[default] DDS_RTPS_AUTO_ID (p. ??)

5.23.2.3 DDS_Boolean DDS_DataWriterProtocolQosPolicy::push_on_write

Whether to push sample out when write is called.

If set to **DDS_BOOLEAN_TRUE** (p. 106) (the default), the writer will send a sample every time write is called. Otherwise, the sample is put into the queue waiting for a NACK from remote reader(s) to be sent out.

Note: push_on_write must be TRUE for Asynchronous DataWriters (those with DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS (p. 222)). Otherwise, samples will never be sent.

[default] DDS_BOOLEAN_TRUE (p. 106)

5.23.2.4 DDS_Boolean DDS_-DataWriterProtocolQosPolicy::disable_positive_acks

Controls whether or not the writer expects positive acknowledgements from matching readers.

If set to DDS_BOOLEAN_TRUE (p. 106), the writer does not expect readers to send send positive acknowledgments to the writer. Consequently, instead of keeping a sample queued until all readers have positively acknowledged it, the writer will keep a sample for at least DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration (p. 1372), after which the sample is logically considered as positively acknowledged.

If set to DDS_BOOLEAN_FALSE (p. 107) (the default), the writer expects to receive positive acknowledgements from its acknowledging readers (DDS_DataReaderProtocolQosPolicy::disable_positive_acks (p. 1071) = DDS_BOOLEAN_FALSE (p. 107)) and it applies the keep-duration to its non-acknowledging readers (DDS_DataReaderProtocolQosPolicy::disable_positive_acks (p. 1071) = DDS_BOOLEAN_TRUE (p. 106)).

A writer with both acknowledging and non-acknowledging readers keeps a sample queued until acknowledgements have been received from all acknowledging readers and the keep-duration has elapsed for non-acknowledging readers.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.23.2.5 DDS_Boolean DDS_-DataWriterProtocolQosPolicy::disable_inline_keyhash

Controls whether or not a keyhash is propagated on the wire with each sample.

This field only applies to keyed writers.

With each key, RTI Data Distribution Service associates an internal 16-byte representation, called a keyhash.

When this field is **DDS_BOOLEAN_FALSE** (p. 107), the keyhash is sent on the wire with every data instance.

When this field is **DDS_BOOLEAN_TRUE** (p. 106), the keyhash is not sent on the wire and the readers must compute the value using the received data.

If the *reader* is CPU bound, sending the keyhash on the wire may increase performance, because the reader does not have to get the keyhash from the data.

If the *writer* is CPU bound, sending the keyhash on the wire may decrease performance, because it requires more bandwidth (16 more bytes per sample).

Note: Setting disable_inline_keyhash to **DDS_BOOLEAN_TRUE** (p. 106) is not compatible with using RTI Real-Time Connect or RTI Recorder.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.23.2.6 DDS_Boolean DDS_-DataWriterProtocolQosPolicy::serialize_key_with_dispose

Controls whether or not the serialized key is propagated on the wire with dispose samples.

This field only applies to keyed writers.

We field DDS_BOOLEAN_recommend setting this to TRUE (p. 106)if there are DataReaders where DDS -DataReaderProtocolQosPolicy::propagate_dispose_of_unregistered_instances (p. 1072) is also DDS_BOOLEAN_TRUE (p. 106).

Important: When this field is **DDS_BOOLEAN_TRUE** (p. 106), batching will not be compatible with RTI Data Distribution Service 4.3e, 4.4b, or 4.4c. The **DDS_DataReader** (p. 783) entities will receive incorrect data and/or encounter describing describing and the service of the

[default] DDS_BOOLEAN_FALSE (p. 107)

5.23.2.7 struct DDS_RtpsReliableWriterProtocol_t DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer [read]

5.24 DDS_DataWriterProtocolStatus Struct Reference

<< eXtension>> (p. 950) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

Data Fields

^ DDS_LongLong pushed_sample_count

The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.

^ DDS_LongLong pushed_sample_count_change

The incremental change in the number of user samples pushed on write from a local DataWriter to a matching remote DataReader since the last time the status was read.

^ DDS_LongLong pushed_sample_bytes

The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.

^ DDS_LongLong pushed_sample_bytes_change

The incremental change in the number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader since the last time the status was read.

^ DDS_LongLong filtered_sample_count

The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

^ DDS_LongLong filtered_sample_count_change

The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

^ DDS_LongLong filtered_sample_bytes

The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

^ DDS_LongLong filtered_sample_bytes_change

The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

^ DDS_LongLong sent_heartbeat_count

The number of Heartbeats sent between a local DataWriter and matching remote DataReader.

^ DDS_LongLong sent_heartbeat_count_change

The incremental change in the number of Heartbeats sent between a local DataWriter and matching remote DataReader since the last time the status was read.

^ DDS_LongLong sent_heartbeat_bytes

 $The \ number \ of \ bytes \ of \ Heartbeats \ sent \ between \ a \ local \ DataWriter \ and \ matching \ remote \ DataReader.$

^ DDS_LongLong sent_heartbeat_bytes_change

The incremental change in the number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader since the last time the status was read.

^ DDS_LongLong pulled_sample_count

The number of user samples pulled from local DataWriter by matching DataReaders.

^ DDS_LongLong pulled_sample_count_change

The incremental change in the number of user samples pulled from local DataWriter by matching DataReaders since the last time the status was read.

^ DDS_LongLong pulled_sample_bytes

 $\label{lem:continuous} The \ number \ of \ bytes \ of \ user \ samples \ pulled \ from \ local \ DataWriter \ by \ matching \ DataReaders.$

^ DDS_LongLong pulled_sample_bytes_change

The incremental change in the number of bytes of user samples pulled from local DataWriter by matching DataReaders since the last time the status was read.

^ DDS_LongLong received_ack_count

The number of ACKs from a remote DataReader received by a local DataWriter.

DDS_LongLong received_ack_count_change

The incremental change in the number of ACKs from a remote DataReader received by a local DataWriter since the last time the status was read.

^ DDS_LongLong received_ack_bytes

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

^ DDS_LongLong received_ack_bytes_change

The incremental change in the number of bytes of ACKs from a remote DataReader received by a local DataWriter since the last time the status was read.

^ DDS_LongLong received_nack_count

The number of NACKs from a remote DataReader received by a local DataWriter.

${\bf \hat{~~}DDS_LongLong~received_nack_count_change}$

The incremental change in the number of NACKs from a remote DataReader received by a local DataWriter since the last time the status was read.

^ DDS_LongLong received_nack_bytes

 $\label{eq:continuous} The \ number \ of \ by tes \ of \ NACKs \ from \ a \ remote \ DataReader \ received \ by \ a \ local \ DataWriter.$

^ DDS_LongLong received_nack_bytes_change

The incremental change in the number of bytes of NACKs from a remote DataReader received by a local DataWriter since the last time the status was read.

^ DDS_LongLong sent_gap_count

The number of GAPs sent from local DataWriter to matching remote DataReaders.

${\bf ^{\hat{}}\ DDS_LongLong\ sent_gap_count_change}$

The incremental change in the number of GAPs sent from local DataWriter to matching remote DataReaders since the last time the status was read.

^ DDS_LongLong sent_gap_bytes

 $\label{lem:condition} The \ number \ of \ bytes \ of \ GAPs \ sent \ from \ local \ DataWriter \ to \ matching \ remote \ DataReaders.$

^ DDS_LongLong sent_gap_bytes_change

The incremental change in the number of bytes of GAPs sent from local DataWriter to matching remote DataReaders since the last time the status was read.

^ DDS_LongLong rejected_sample_count

The number of times a sample is rejected due to exceptions in the send path.

DDS_LongLong rejected_sample_count_change

The incremental change in the number of times a sample is rejected due to exceptions in the send path since the last time the status was read.

^ DDS_Long send_window_size

 $Current\ maximum\ number\ of\ outstanding\ samples\ allowed\ in\ the\ DataWriter's\ queue.$

^ struct DDS_SequenceNumber_t first_available_sample_sequence_number

The sequence number of the first available sample currently queued in the local DataWriter.

^ struct DDS_SequenceNumber_t last_available_sample_sequence_number

The sequence number of the last available sample currently queued in the local DataWriter.

struct DDS_SequenceNumber_t first_unacknowledged_sample_sequence_number

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

struct DDS_SequenceNumber_t first_available_sample_virtual_sequence_number

The virtual sequence number of the first available sample currently queued in the local DataWriter.

struct DDS_SequenceNumber_t last_available_sample_virtual_sequence_number

The virtual sequence number of the last available sample currently queued in the local DataWriter.

struct DDS_SequenceNumber_t first_unacknowledged_sample_virtual_sequence_number

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

^ DDS_InstanceHandle_t first_unacknowledged_sample_-subscription_handle

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

struct DDS_SequenceNumber_t first_unelapsed_keep_duration_sample_sequence_number

The sequence number of the first sample whose keep duration has not yet elapsed. Applicable only when DDS-DataWriterProtocolQosPolicy::disable_positive_acks (p. 1108) is set.

5.24.1 Detailed Description

<< eXtension>> (p. 950) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

Entity:

DDS_DataWriter (p. 673)

5.24.2 Field Documentation

${\small 5.24.2.1 \quad DDS_LongLong\ DDS_DataWriterProtocolStatus::pushed_-\\ sample_count}$

The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.

${\bf 5.24.2.2} \quad DDS_LongLong\ DDS_DataWriterProtocolStatus::pushed_sample_count_change$

The incremental change in the number of user samples pushed on write from a local DataWriter to a matching remote DataReader since the last time the status was read.

5.24.2.3 DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes

The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.

5.24.2.4 DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes_change

The incremental change in the number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader since the last time the status was read.

${\bf 5.24.2.5} \quad DDS_LongLong \ DDS_DataWriter Protocol Status:: filtered_sample_count$

The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

5.24.2.6 DDS_LongLong DDS_DataWriterProtocolStatus::filtered_-sample_count_change

The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

5.24.2.7 DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_bytes

The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

${\bf 5.24.2.8} \quad DDS_LongLong \ DDS_DataWriter Protocol Status:: filtered_sample_bytes_change$

5.24.2.9 DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count

The number of Heartbeats sent between a local DataWriter and matching remote DataReader.

5.24.2.10 DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count_change

The incremental change in the number of Heartbeats sent between a local DataWriter and matching remote DataReader since the last time the status was read.

5.24.2.11 DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes

The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.

5.24.2.12 DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes_change

The incremental change in the number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader since the last time the status was read.

${\bf 5.24.2.13} \quad DDS_LongLong \ DDS_DataWriterProtocolStatus::pulled_sample_count}$

The number of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when DDS_{-} DataWriterProtocolQosPolicy::push_on_write (p. 1108) DDS_{-} BOOLEAN_FALSE (p. 107).

5.24.2.14 DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_count_change

The incremental change in the number of user samples pulled from local DataWriter by matching DataReaders since the last time the status was read.

Pulled samples are samples sent for repairs, for late joiners, samples sent by the local DataWriter DDS_{-} when DataWriterProtocolQosPolicy::push_on_write (p. 1108) DDS_{-} BOOLEAN_FALSE (p. 107).

5.24.2.15 DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_bytes

The number of bytes of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, all samples sent by the local DataWriter when DDS_{-} $DataWriterProtocolQosPolicy::push_on_write$ DDS_{-} (p.1108)BOOLEAN_FALSE (p. 107).

${\small 5.24.2.16~DDS_LongLong~DDS_DataWriterProtocolStatus::pulled_sample_bytes_change}$

The incremental change in the number of bytes of user samples pulled from local DataWriter by matching DataReaders since the last time the status was read.

samples are samples sent for repairs, joiners, for late samples sent by the local DataWriter when DDS_{-} $DataWriterProtocolQosPolicy::push_on_write$ DDS_{-} (p. 1108)BOOLEAN_FALSE (p. 107).

5.24.2.17 DDS_LongLong DDS_-DataWriterProtocolStatus::received_ack_count

The number of ACKs from a remote DataReader received by a local DataWriter.

5.24.2.18 DDS_LongLong DDS_-DataWriterProtocolStatus::received_ack_count_change

The incremental change in the number of ACKs from a remote DataReader received by a local DataWriter since the last time the status was read.

5.24.2.19 DDS_LongLong DDS_-DataWriterProtocolStatus::received_ack_bytes

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

The incremental change in the number of bytes of ACKs from a remote DataReader received by a local DataWriter since the last time the status was

read.

5.24.2.21 DDS_LongLong DDS_-DataWriterProtocolStatus::received_nack_count

The number of NACKs from a remote DataReader received by a local DataWriter.

5.24.2.22 DDS_LongLong DDS_-DataWriterProtocolStatus::received_nack_count_change

The incremental change in the number of NACKs from a remote DataReader received by a local DataWriter since the last time the status was read.

5.24.2.23 DDS_LongLong DDS_-DataWriterProtocolStatus::received_nack_bytes

The number of bytes of NACKs from a remote DataReader received by a local DataWriter.

The incremental change in the number of bytes of NACKs from a remote DataReader received by a local DataWriter since the last time the status was read.

$\begin{array}{ccc} 5.24.2.25 & DDS_LongLong\ DDS_DataWriterProtocolStatus::sent_-\\ & gap_count \end{array}$

The number of GAPs sent from local DataWriter to matching remote DataReaders.

5.24.2.26 DDS_LongLong DDS_DataWriterProtocolStatus::sent_-gap_count_change

The incremental change in the number of GAPs sent from local DataWriter to matching remote DataReaders since the last time the status was read.

5.24.2.27 DDS_LongLong DDS_DataWriterProtocolStatus::sent_-gap_bytes

The number of bytes of GAPs sent from local DataWriter to matching remote DataReaders.

The incremental change in the number of bytes of GAPs sent from local DataWriter to matching remote DataReaders since the last time the status was read.

5.24.2.29 DDS_LongLong DDS_-DataWriterProtocolStatus::rejected_sample_count

The number of times a sample is rejected due to exceptions in the send path.

The incremental change in the number of times a sample is rejected due to exceptions in the send path since the last time the status was read.

5.24.2.31 DDS_Long DDS_DataWriterProtocolStatus::send_-window_size

Current maximum number of outstanding samples allowed in the DataWriter's queue.

Spans the range from DDS_RtpsReliableWriterProtocol_t::min_send_window_size (p. 1374) to DDS_RtpsReliableWriterProtocol_t::max_send_window_size (p. 1375).

The sequence number of the first available sample currently queued in the local DataWriter.

5.24.2.33 struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::last_available_sample_sequence_number [read]

The sequence number of the last available sample currently queued in the local DataWriter.

5.24.2.34 struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_sequence_number [read]

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

The virtual sequence number of the first available sample currently queued in the local DataWriter.

The virtual sequence number of the last available sample currently queued in the local DataWriter.

5.24.2.37 struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_virtual_sequence_number [read]

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

$\begin{array}{ccc} 5.24.2.38 & DDS_InstanceHandle_t & DDS_- \\ & DataWriterProtocolStatus::first_unacknowledged_- \\ & sample_subscription_handle \end{array}$

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

$\begin{array}{ll} 5.24.2.39 & struct\ DDS_SequenceNumber_t \\ & DDS_DataWriterProtocolStatus::first_unelapsed_keep_duration_sample_sequence_number \\ & [read] \end{array}$

The first sequence number of $_{
m the}$ sample whose keep ration has not yet elapsed. Applicable only when $\mathrm{DDS}_{ ext{--}}$ DataWriterProtocolQosPolicy::disable_positive_acks (p. 1108) is set.

Sequence number of the first sample kept in the DataWriters queue whose keep_duration (applied when **DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 1108) is set) has not yet elapsed.

5.25 DDS_DataWriterQos Struct Reference

QoS policies supported by a DDS_DataWriter (p. 673) entity.

5.25.1 Detailed Description

QoS policies supported by a DDS_DataWriter (p. 673) entity.

You must set certain members in a consistent manner:

- DDS_DataWriterQos::history.depth <= DDS_DataWriterQos::resource_limits.max_samples_per_instance
- DDS_DataWriterQos::resource_limits.max_samples_per_instance <= DDS_DataWriterQos::resource_limits.max_samples
- DDS_DataWriterQos::resource_limits.initial_samples <= DDS_DataWriterQos::resource_limits.max_samples
- DDS_DataWriterQos::resource_limits.initial_instances <= DDS_DataWriterQos::resource_limits.max_instances
- length of DDS_DataWriterQos::user_data.value <= DDS_DomainParticipantQos::resource_limits (p. 1160) .writer_user_data_max_length

If any of the above are not true, DDS_DataWriter_set_qos (p. 719) and DDS_DataWriter_set_qos_with_profile (p. 719) and DDS_Publisher_set_default_datawriter_qos (p. 637) and DDS_Publisher_set_default_datawriter_qos_with_profile (p. 637) will fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122) and DDS_Publisher_create_datawriter (p. 640) and DDS_Publisher_create_datawriter_with_profile (p. 642) and will return NULL.

Entity:

DDS_DataWriter (p. 673)

<<e xtension>> (p. 950) Transport plugin selection policy, TRANS-PORT_SELECTION (p. 184).

Specifies the transports available for use by the **DDS_DataWriter** (p. 673).

5.25.2.19 struct DDS_TransportUnicastQosPolicy DDS_DataWriterQos::unicast [read]

<< eXtension>> (p. 950) Unicast transport policy, TRANSPORT_-UNICAST (p. 185).

Specifies the unicast transport interfaces and ports on which **messages** can be received.

The unicast interfaces are used to receive messages from **DDS_DataReader** (p. 783) entities in the domain.

5.25.2.20 struct DDS_PublishModeQosPolicy DDS_DataWriterQos::publish_mode [read]

<< eXtension>> (p. 950) Publish mode policy, PUBLISH_MODE (p. 221).

Determines whether the **DDS_DataWriter** (p. 673) publishes data synchronously or asynchronously and how.

5.25.2.21 struct DDS_PropertyQosPolicy DDS_DataWriterQos::property [read]

<< eXtension>> (p. 950) Property policy, **PROPERTY** (p. 235).

5.25.2.22 struct DDS_BatchQosPolicy DDS_DataWriterQos::batch [read]

<< eXtension>> (p. 950) Batch policy, BATCH (p. 232).

$\begin{array}{ccc} 5.25.2.23 & struct \ DDS_MultiChannelQosPolicy \\ & DDS_DataWriterQos::multi_channel \ \ [read] \end{array}$

<< eXtension>> (p. 950) Multi channel policy, MULTICHANNEL (p. 234).

$\begin{array}{ccc} 5.25.2.24 & struct \ DDS_TypeSupportQosPolicy \\ & DDS_DataWriterQos::type_support \ \ [read] \end{array}$

<< eXtension>> (p. 950) Type support data, TYPESUPPORT (p. 229).

Optional value that is passed to a type plugin's on_endpoint_attached and serialization functions.

5.26 DDS_DataWriterResourceLimitsQosPolicy Struct Reference

Various settings that configure how a **DDS_DataWriter** (p. 673) allocates and uses physical memory for internal resources.

Data Fields

^ DDS_Long initial_concurrent_blocking_threads

The initial number of threads that are allowed to concurrently block on write call on the same DDS_DataWriter (p. 673).

DDS_Long max_concurrent_blocking_threads

The maximum number of threads that are allowed to concurrently block on write call on the same DDS_DataWriter (p. 673).

^ DDS_Long max_remote_reader_filters

The maximum number of remote readers for which the writer will perform content-based filtering.

^ DDS_Long initial_batches

Represents the initial number of batches a $DDS_DataWriter$ (p. 673) will manage.

^ DDS_Long max_batches

Represents the maximum number of batches a DDS_DataWriter (p. 673) will manage.

^ DDS_DataWriterResourceLimitsInstanceReplacementKind instance_replacement

Sets the kinds of instances allowed to be replaced when instance resource limits are reached.

^ DDS_Boolean replace_empty_instances

 $Whether \ or \ not \ to \ replace \ empty \ instances \ during \ instance \ replacement.$

^ DDS_Boolean autoregister_instances

Whether or not to automatically register new instances.

5.26.1 Detailed Description

Various settings that configure how a **DDS_DataWriter** (p. 673) allocates and uses physical memory for internal resources.

DataWriters must allocate internal structures to handle the simultaneously blocking of threads trying to call **FooDataWriter_write** (p. 684) on the same **DDS_DataWriter** (p. 673), for the storage used to batch small samples, and for content-based filters specified by DataReaders.

Most of these internal structures start at an initial size and, by default, will be grown as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDS_DataWriter** (p. 673). By setting the initial size to the maximum size, you will prevent RTI Data Distribution Service from dynamically allocating any memory after the creation of the **DDS_DataWriter** (p. 673).

This QoS policy is an extension to the DDS standard.

Entity:

```
DDS_DataWriter (p. 673)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.26.2 Field Documentation

5.26.2.1 DDS_Long DDS_-

The initial number of threads that are allowed to concurrently block on write call on the same **DDS_DataWriter** (p. 673).

This value only applies if DDS_HistoryQosPolicy (p. 1229) has its kind set to DDS_KEEP_ALL_HISTORY_QOS (p. 171) and DDS_ReliabilityQosPolicy::max_blocking_time (p. 1345) is > 0.

```
[default] 1
```

[range] [1, 10000], <= max_concurrent_blocking_threads

5.26.2.2 DDS_Long DDS_-

DataWriterResourceLimitsQosPolicy::max_concurrent_blocking_threads

The maximum number of threads that are allowed to concurrently block on write call on the same **DDS_DataWriter** (p. 673).

This value only applies if DDS_HistoryQosPolicy (p. 1229) has its kind set to DDS_KEEP_ALL_HISTORY_QOS (p. 171) and DDS_ReliabilityQosPolicy::max_blocking_time (p. 1345) is > 0.

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 10000] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_concurrent_blocking_threads

5.26.2.3 DDS_Long DDS_-

DataWriterResourceLimitsQosPolicy::max_remote_reader_filters

The maximum number of remote readers for which the writer will perform content-based filtering.

[default] 32 [range] [0, 32]

5.26.2.4 DDS_Long DDS_-

DataWriterResourceLimitsQosPolicy::initial_batches

Represents the initial number of batches a $\mathbf{DDS_DataWriter}$ (p. 673) will manage.

 $[\mathbf{default}]~8$

[range] [1,100 million]

See also:

DDS_BatchQosPolicy (p. 1040)

5.26.2.5 DDS_Long DDS_-

DataWriterResourceLimitsQosPolicy::max_batches

Represents the maximum number of batches a **DDS_DataWriter** (p. 673) will manage.

[default] DDS_LENGTH_UNLIMITED (p. 174)

When batching is enabled, the maximum number of samples that a DDS_DataWriter (p. 673) can store is limited by this value and DDS_ResourceLimitsQosPolicy::max_samples (p. 1358).

[range] [1,100 million] or DDS_LENGTH_UNLIMITED (p. 174) >= DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples (p. 1370) if batching is enabled

See also:

DDS_BatchQosPolicy (p. 1040)

5.26.2.6 DDS_-

Sets the kinds of instances allowed to be replaced when instance resource limits are reached.

When a DDS_DataWriter (p. 673)'s number of active instances is greater than DDS_ResourceLimitsQosPolicy::max_instances (p. 1359), it will try to make room by replacing an existing instance. This field specifies the kinds of instances allowed to be replaced.

If a replaceable instance is not available, either an out-of-resources exception will be returned, or the writer may block if the instance reclamation was done when writing.

[default] DDS_UNREGISTERED_INSTANCE_REPLACEMENT (p. 212)

See also:

5.26.2.7 DDS_Boolean DDS_-

 $\label{lem:policy::replace_empty_instances} Data Writer Resource Limits Qos Policy:: replace_empty_instances$

Whether or not to replace empty instances during instance replacement.

When a DDS_DataWriter (p. 673) has more active instances than allowed by DDS_ResourceLimitsQosPolicy::max_instances (p. 1359), it tries to make room by replacing an existing instance. This field configures whether

empty instances (i.e. instances with no samples) may be replaced. If set DDS_BOOLEAN_TRUE (p. 106), then a DDS_DataWriter (p. 673) will first try reclaiming empty instances, before trying to replace whatever is specified by DDS_DataWriterResourceLimitsQosPolicy::instance_replacement (p. 1133).

[default] DDS_BOOLEAN_FALSE (p. 107)

See also:

 $\begin{tabular}{ll} DDS_DataWriterResourceLimitsInstanceReplacementKind \\ (p.\ 211) \end{tabular}$

Whether or not to automatically register new instances.

```
[default] DDS_BOOLEAN_TRUE (p. 106)
```

When set to true, it is possible to write with a non-NIL handle of an instance that is not registered: the write operation will succeed and the instance will be registered. Otherwise, that write operation would fail.

See also:

FooDataWriter_write (p. 684)

5.27 DDS_DeadlineQosPolicy Struct Reference

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Data Fields

^ struct DDS_Duration_t period

Duration of the deadline period.

5.27.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

A DDS_DataReader (p. 783) expects a new sample updating the value of each instance at least once every period. That is, period specifies the maximum expected elapsed time between arriving data samples.

A DDS_DataWriter (p. 673) indicates that the application commits to write a new value (using the DDS_DataWriter (p. 673)) for each instance managed by the DDS_DataWriter (p. 673) at least once every period.

This QoS can be used during system integration to ensure that applications have been coded to meet design specifications.

It can also be used during run time to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions to prevent total system failure when data is not received in time. For topics on which data is not expected to be periodic, period should be set to an infinite value.

Entity:

Status:

Properties:

Changeable (p. 146) = YES (p. 146)

5.27.2 Usage

This policy is useful for cases where a **DDS_Topic** (p. 425) is expected to have each instance updated periodically. On the publishing side this setting establishes a contract that the application must meet. On the subscribing side the setting establishes a minimum requirement for the remote publishers that are expected to supply the data values.

When RTI Data Distribution Service 'matches' a **DDS_DataWriter** (p. 673) and a **DDS_DataReader** (p. 783) it checks whether the settings are compatible (i.e., offered deadline <= requested deadline); if they are not, the two entities are informed (via the **DDS_Listener** (p. 1246) or **DDS_Condition** (p. 252) mechanism) of the incompatibility of the QoS settings and communication will not occur.

Assuming that the reader and writer ends have compatible settings, the fulfilment of this contract is monitored by RTI Data Distribution Service and the application is informed of any violations by means of the proper **DDS_Listener** (p. 1246) or **DDS_Condition** (p. 252).

5.27.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality offered period <= requested period holds.

5.27.4 Consistency

The setting of the **DEADLINE** (p. 157) policy must be set consistently with that of the **TIME_BASED_FILTER** (p. 164).

For these two policies to be consistent the settings must be such that deadline $period >= minimum_separation$.

An attempt to set these policies in an inconsistent manner will result in DDS_RETCODE_INCONSISTENT_POLICY (p. 122) in set_qos (abstract) (p. 243), or the DDS_Entity (p. 242) will not be created.

For a DDS_DataReader (p. 783), the DEADLINE (p. 157) policy and DDS_TimeBasedFilterQosPolicy (p. 1429) may interact such that even though the DDS_DataWriter (p. 673) is writing samples fast enough to fulfill its commitment to its own deadline, the DDS_DataReader (p. 783) may see violations of its deadline. This happens because RTI Data Distribution Service will drop any samples received within the DDS_TimeBasedFilterQosPolicy::minimum_separation (p. 1431). To avoid

triggering the **DDS_DataReader** (p. 783)'s deadline, even though the matched **DDS_DataWriter** (p. 673) is meeting its own deadline, set the two QoS parameters so that:

 $reader\ deadline >= reader\ minimum_separation\ +\ writer\ deadline$

See **DDS_TimeBasedFilterQosPolicy** (p. 1429) for more information about the interactions between deadlines and time-based filters.

See also:

DDS_TimeBasedFilterQosPolicy (p. 1429)

5.27.5 Field Documentation

5.27.5.1 struct DDS_Duration_t DDS_DeadlineQosPolicy::period [read]

Duration of the deadline period.

[default] DDS_DURATION_INFINITE (p. 113)

[range] [1 nanosec, 1 year] or DDS_DURATION_INFINITE (p. 113), >= DDS_TimeBasedFilterQosPolicy::minimum_separation (p. 1431)

5.28 DDS_DestinationOrderQosPolicy Struct Reference

Controls how the middleware will deal with data sent by multiple **DDS_-DataWriter** (p. 673) entities for the same instance of data (i.e., same **DDS_-Topic** (p. 425) and key).

Data Fields

 $\hat{DDS}_DestinationOrderQosPolicyKind kind$

Specifies the desired kind of destination order.

^ struct DDS_Duration_t source_timestamp_tolerance

<<eXtension>> (p. 950) Allowed tolerance between source timestamps of consecutive samples.

5.28.1 Detailed Description

Controls how the middleware will deal with data sent by multiple **DDS_-DataWriter** (p. 673) entities for the same instance of data (i.e., same **DDS_-Topic** (p. 425) and key).

Entity:

```
DDS_Topic (p. 425), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Status:

```
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129),
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129)
```

Properties:

```
\mathbf{RxO}\ (\mathrm{p.\,145}) = \mathrm{YES} Changeable (\mathrm{p.\,146}) = \mathbf{UNTIL}\ \mathbf{ENABLE}\ (\mathrm{p.\,146})
```

5.28.2 Usage

When multiple DataWriters send data for the same topic, the order in which data from different DataWriters are received by the applications of different

DataReaders may be different. So different DataReaders may not receive the same "last" value when DataWriters stop sending data.

This QoS policy controls how each subscriber resolves the final value of a data instance that is written by multiple **DDS_DataWriter** (p. 673) entities (which may be associated with different **DDS_Publisher** (p. 632) entities) running on different nodes.

The default setting, DDS_BY_RECEPTION_TIMESTAMP_-DESTINATIONORDER_QOS (p. 169), indicates that (assuming the OWNERSHIP_STRENGTH (p. 161) policy allows it) the latest received value for the instance should be the one whose value is kept. That is, data will be delivered by a DDS_DataReader (p. 783) in the order in which it was received (which may lead to inconsistent final values).

The setting DDS_BY_SOURCE_TIMESTAMP_-DESTINATIONORDER_QOS (p. 169) indicates that (assuming the OWNERSHIP_STRENGTH (p. 161) allows it, within each instance) the source_timestamp of the change shall be used to determine the most recent information. That is, data will be delivered by a DDS_DataReader (p. 783) in the order in which it was sent. If data arrives on the network with a source timestamp that is later than the source timestamp of the last data delivered, the new data will be dropped. This 'by source timestamp' ordering therefore works best when system clocks are relatively synchronized among writing machines.

When using DDS_BY_SOURCE_TIMESTAMP_-DESTINATIONORDER_QOS (p. 169), not all data sent by multiple DDS_DataWriter (p. 673) entities may be delivered to a DDS_DataReader (p. 783) and not all DataReaders will see the same data sent by DataWriters. However, all DataReaders will see the same "final" data when DataWriters "stop" sending data. This is the only setting that, in the case of concurrently publishing DDS_DataWriter (p. 673) entities updating the same instance of a shared-ownership topic, ensures all subscribers will end up with the same final value for the instance.

This QoS can be used to create systems that have the property of "eventual consistency." Thus intermediate states across multiple applications may be inconsistent, but when DataWriters stop sending changes to the same topic, all applications will end up having the same state.

5.28.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality offered kind >= requested kind evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS_DestinationOrderQosPolicy::kind** (p. 1140) are consid-

ered ordered such that DDS_BY_RECEPTION_TIMESTAMP_-DESTINATIONORDER_QOS (p. 169) < DDS_BY_SOURCE_-TIMESTAMP_DESTINATIONORDER_QOS (p. 169)

5.28.4 Field Documentation

5.28.4.1 DDS_DestinationOrderQosPolicyKind DDS_DestinationOrderQosPolicy::kind

Specifies the desired kind of destination order.

[default] DDS_BY_RECEPTION_TIMESTAMP_-DESTINATIONORDER_QOS (p. 169),

5.28.4.2 struct DDS_Duration_t DDS_DestinationOrderQosPolicy::source_timestamp_tolerance [read]

 $<<\!eXtension>>$ (p. 950) Allowed tolerance between source timestamps of consecutive samples.

When a DDS_DataWriter (p. 673) sets DDS_DestinationOrderQosPolicyKind (p. 169) to DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS (p. 169), when when writing a sample, its timestamp must not be less than the timestamp of the previously written sample. However, if it is less than the timestamp of the previously written sample but the difference is less than this tolerance, the sample will use the previously written sample's timestamp as its timestamp. Otherwise, if the difference is greater than this tolerance, the write will fail.

When a DDS_DataReader (p. 783) sets DDS_DestinationOrderQosPolicyKind (p. 169) to DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS (p. 169), the DDS_DataReader (p. 783) will accept a sample only if the difference between its source timestamp and the reception timestamp is no greater than this tolerance. Otherwise, the sample is rejected.

[default] 100 milliseconds for DDS_DataWriter (p.673), 30 seconds for DDS_DataReader (p.783)

5.29 DDS_DiscoveryConfigQosPolicy Struct Reference

Settings for discovery configuration.

Data Fields

 ${\bf \hat{\ }} \ \, {\rm struct} \ \, {\bf DDS_Duration_t} \ \, {\bf participant_liveliness_lease_duration}$

The liveliness lease duration for the participant.

^ struct DDS_Duration_t participant_liveliness_assert_period

The period to assert liveliness for the participant.

^ DDS_RemoteParticipantPurgeKind remote_participant_purge_kind

The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost

^ struct DDS_Duration_t max_liveliness_loss_detection_period

The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.

^ DDS_Long initial_participant_announcements

The number of initial announcements sent when a participant is first enabled or when a remote participant is newly discovered.

struct DDS_Duration_t min_initial_participant_announcement_period

The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

struct DDS_Duration_t max_initial_participant_announcement_period

The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

^ struct DDS_BuiltinTopicReaderResourceLimits_t participant_reader_resource_limits

Resource limits.

RTPS protocol-related configuration settings for a built-in publication writer.

* struct DDS_RtpsReliableWriterProtocol_t subscription_writer

RTPS protocol-related configuration settings for a built-in subscription writer.

^ DDS_DiscoveryConfigBuiltinPluginKindMask builtin_discovery_plugins

The kind mask for built-in discovery plugins.

 ${\bf ^{\hat{}}\ struct\ DDS_RtpsReliableReaderProtocol_t\ participant_message_reader}$

RTPS protocol-related configuration settings for a built-in participant message reader.

^ struct DDS_RtpsReliableWriterProtocol_t participant_message_writer

RTPS protocol-related configuration settings for a built-in participant message writer.

5.29.1 Detailed Description

Settings for discovery configuration.

This QoS policy is an extension to the DDS standard.

This QoS policy controls the amount of delay in discovering entities in the system and the amount of discovery traffic in the network.

The amount of network traffic required by the discovery process can vary widely, based on how your application has chosen to configure the middleware's network addressing (e.g., unicast vs. multicast, multicast TTL, etc.), the size of the system, whether all applications are started at the same time or whether start times are staggered, and other factors. Your application can use this policy to make tradeoffs between discovery completion time and network bandwidth utilization. In addition, you can introduce random back-off periods into the discovery process to decrease the probability of network contention when many applications start simultaneously.

Entity:

```
DDS_DomainParticipant (p. 339)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.29.2 Field Documentation

5.29.2.1 struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration [read]

The liveliness lease duration for the participant.

This is the same as the expiration time of the DomainParticipant as defined in the RTPS protocol.

If the participant has not refreshed its own liveliness to other participants at least once within this period, it may be considered as stale by other participants in the network.

Should be strictly greater than **DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period** (p. 1143).

```
[default] 100 seconds
[range] [1 nanosec,1 year], > participant_liveliness_assert_period
```

5.29.2.2 struct DDS_Duration_t DDS_-DiscoveryConfigQosPolicy::participant_liveliness_assert_period [read]

The period to assert liveliness for the participant.

The period at which the participant will refresh its liveliness to all the peers.

Should be strictly less than $DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration (p. 1143).$

[default] 30 seconds

[range] [1 nanosec,1 year), < participant_liveliness_lease_duration

5.29.2.3 DDS_RemoteParticipantPurgeKind DDS_-DiscoveryConfigQosPolicy::remote_participant_purge_kind

The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.

Most users will not need to change this value from its default, **DDS_-LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE** (p. 227). However, **DDS_NO_REMOTE_PARTICIPANT_PURGE** (p. 227) may be a good choice if the following conditions apply:

- 1. Discovery communication with a remote participant may be lost while data communication remains intact. Such will not typically be the case if discovery takes place over the Simple Discovery Protocol, but may be the case if the RTI Enterprise Discovery Service is used.
- 2. Extensive and prolonged lack of discovery communication between participants is not expected to be common, either because participant loss itself is expected to be rare, or because participants may be lost sporadically but will typically return again.
- 3. Maintaining inter-participant liveliness is problematic, perhaps because a participant has no writers with the appropriate **DDS_- LivelinessQosPolicyKind** (p. 162).

 $[default] \quad DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_-PURGE \ (p.\ 227)$

5.29.2.4 struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::max_liveliness_loss_detection_period [read]

The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.

Notification of the loss of liveliness of a remote entity may come more quickly that this duration, depending on the liveliness contract between the local and remote entities and the capabilities of the discovery mechanism in use. For example, a **DDS_DataReader** (p. 783) will learn of the loss of liveliness of a

matched **DDS_DataWriter** (p. 673) within the reader's offered liveliness lease duration.

Shortening this duration will increase the responsiveness of entities to communication failures. However, it will also increase the CPU usage of the application, as the liveliness of remote entities will be examined more frequently.

```
[default] 60 seconds
[range] [0, 1 year]
```

5.29.2.5 DDS_Long DDS_DiscoveryConfigQosPolicy::initial_participant_announcements

The number of initial announcements sent when a participant is first enabled or when a remote participant is newly discovered.

Also, when a new remote participant appears, the local participant can announce itself to the peers multiple times controlled by this parameter.

```
[default] 5
[range] [0,1 million]
```

5.29.2.6 struct DDS_Duration_t DDS_-DiscoveryConfigQosPolicy::min_initial_participant_announcement_period [read]

The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between this and DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period (p. 1146) is introduced in between initial announcements when a new remote participant is discovered.

The setting of DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period (p. 1145) must be consistent with DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period (p. 1146). For these two values to be consistent, they must verify that:

```
DDS_DiscoveryConfigQosPolicy::min_initial_-
participant_announcement_period (p. 1145) <= DDS_-
DiscoveryConfigQosPolicy::max_initial_participant_announcement_-
period (p. 1146).

[default] 1 second
[range] [1 nanosec,1 year]
```

5.29.2.7 struct DDS_Duration_t DDS_-DiscoveryConfigQosPolicy::max_initial_participant_announcement_period [read]

The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period (p. 1145) and this is introduced in between initial announcements when a new remote participant is discovered.

The setting of DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period (p. 1146) must be consistent with DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period (p. 1145). For these two values to be consistent, they must verify that:

 $\label{eq:def:DDS_DiscoveryConfigQosPolicy::min_initial-participant_announcement_period $(p.\,1145)$ <= DDS_-DiscoveryConfigQosPolicy::max_initial_participant_announcement_period $(p.\,1146)$.}$

[default] 1 second [range] [1 nanosec,1 year]

5.29.2.8 struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::participant_reader_resource_limits [read]

Resource limits.

Resource limit of the built-in topic participant reader. For details, see **DDS_-BuiltinTopicReaderResourceLimits_t** (p. 1046).

5.29.2.9 struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::publication_reader [read]

RTPS protocol-related configuration settings for a built-in publication reader.

For details, refer to the DDS_DataReaderQos (p. 1083)

5.29.2.10 struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::publication_reader_resource_limits [read]

Resource limits.

Resource limit of the built-in topic publication reader. For details, see **DDS_-BuiltinTopicReaderResourceLimits_t** (p. 1046).

 $\begin{array}{ccc} \textbf{5.29.2.11} & \textbf{struct DDS_RtpsReliableReaderProtocol_t} \\ & \textbf{DDS_DiscoveryConfigQosPolicy::subscription_reader} \\ & \lceil \textbf{read} \rceil \end{array}$

RTPS protocol-related configuration settings for a built-in subscription reader.

For details, refer to the DDS_DataReaderQos (p. 1083)

 $\begin{array}{ccc} 5.29.2.12 & struct\ DDS_BuiltinTopicReaderResourceLimits_t \\ & DDS_DiscoveryConfigQosPolicy::subscription_reader_- \\ & resource_limits\ \ \ \ \ \ \ \ \ \ \end{array}$

Resource limits.

Resource limit of the built-in topic subscription reader. For details, see **DDS_-BuiltinTopicReaderResourceLimits_t** (p. 1046).

 $\begin{array}{ccc} 5.29.2.13 & struct \ DDS_RtpsReliableWriterProtocol_t \\ & DDS_DiscoveryConfigQosPolicy::publication_writer \\ & [read] \end{array}$

RTPS protocol-related configuration settings for a built-in publication writer.

For details, refer to the **DDS_DataWriterQos** (p. 1123)

5.29.2.14 struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::subscription_writer [read]

RTPS protocol-related configuration settings for a built-in subscription writer.

For details, refer to the **DDS_DataWriterQos** (p. 1123)

The kind mask for built-in discovery plugins.

There are several built-in discovery plugin. This mask enables the different plugins. Any plugin not enabled will not be created.

[default] DDS_DISCOVERYCONFIG_BUILTIN_SDP (p. 226)

5.29.2.16 struct DDS_RtpsReliableReaderProtocol_t DDS_-DiscoveryConfigQosPolicy::participant_message_reader [read]

RTPS protocol-related configuration settings for a built-in participant message reader.

For details, refer to the DDS_DataReaderQos (p. 1083)

5.29.2.17 struct DDS_RtpsReliableWriterProtocol_t DDS_-DiscoveryConfigQosPolicy::participant_message_writer [read]

RTPS protocol-related configuration settings for a built-in participant message writer.

For details, refer to the DDS_DataWriterQos (p. 1123)

5.30 DDS_DiscoveryQosPolicy Struct Reference

Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Data Fields

^ struct DDS_StringSeq enabled_transports

The transports available for use by the Discovery mechanism.

* struct DDS_StringSeq initial_peers

Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

$\hat{}$ struct DDS_StringSeq multicast_receive_addresses

Specifies the multicast group addresses on which discovery-related metatraffic can be received by the domain participant.

^ DDS_Long metatraffic_transport_priority

The transport priority to use for the Discovery meta-traffic.

^ DDS_Boolean accept_unknown_peers

Whether to accept a new participant that is not in the initial peers list.

5.30.1 Detailed Description

Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Entity:

```
DDS_DomainParticipant (p. 339)
```

Properties:

```
\mathbf{RxO}\ (\mathrm{p.145}) = \mathrm{N/A}
Changeable (\mathrm{p.146}) = \mathbf{NO}\ (\mathrm{p.146})
```

5.30.2 Usage

This QoS policy identifies where on the network this application can *potentially* discover other applications with which to communicate.

The middleware will periodically send network packets to these locations, announcing itself to any remote applications that may be present, and will listen for announcements from those applications.

This QoS policy is an extension to the DDS standard.

See also:

```
NDDS_DISCOVERY_PEERS (p. 189)
DDS_DiscoveryConfigQosPolicy (p. 1141)
```

5.30.3 Field Documentation

5.30.3.1 struct DDS_StringSeq DDS_DiscoveryQosPolicy::enabled_-transports [read]

The transports available for use by the Discovery mechanism.

Only these transports can be used by the discovery mechanism to send meta-traffic via the builtin endpoints (built-in **DDS_DataReader** (p. 783) and **DDS_DataWriter** (p. 673)).

Also determines the unicast addresses on which the Discovery mechanism will listen for meta-traffic. These along with the domain_id and participant_id determine the unicast locators on which the Discovery mechanism can receive meta-data.

The memory for the strings in this sequence is managed according to the conventions described in **Conventions** (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT**_-**BUILTIN** (p. 197).

[default] Empty sequence. All the transports available to the DomainParticipant are available for use by the Discovery mechanism.

[range] Sequence of non-null, non-empty strings.

5.30.3.2 struct DDS_StringSeq DDS_DiscoveryQosPolicy::initial_peers [read]

Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

If there is a remote peer **DDS_DomainParticipant** (p. 339) such as is described this list, it will become aware of this participant and will engage in the

Discovery protocol to exchange meta-data with this participant.

Each element of this list must be a peer descriptor in the proper format (see Peer Descriptor Format (p. 190)).

```
[default] See NDDS_DISCOVERY_PEERS (p. 189)
```

[range] Sequence of arbitrary length.

See also:

```
Peer Descriptor Format (p. 190)
DDS_DomainParticipant_add_peer() (p. 401)
```

5.30.3.3 struct DDS_StringSeq DDS_-DiscoveryQosPolicy::multicast_receive_addresses [read]

Specifies the multicast group addresses on which discovery-related **metatraffic** can be received by the domain participant.

The multicast group addresses on which the Discovery mechanism will listen for meta-traffic.

Each element of this list must be a valid multicast address (IPv4 or IPv6) in the proper format (see **Address Format** (p. 191)).

The domain_id determines the multicast port on which the Discovery mechanism can receive meta-data.

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1151) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 1151), starting at element 0. They will be stored in the order they appear NDDS_DISCOVERY_PEERS.

Note: Currently, RTI Data Distribution Service will only listen for discovery traffic on the first multicast address (element 0) in **DDS_- DiscoveryQosPolicy::multicast_receive_addresses** (p. 1151).

```
[default] See NDDS_DISCOVERY_PEERS (p. 189)
```

[range] Sequence of length [0,1], whose elements are multicast addresses. Currently only the first multicast address (if any) is used. The rest are ignored.

See also:

```
Address Format (p. 191)
```

5.30.3.4 DDS_Long DDS_DiscoveryQosPolicy::metatraffic_transport_priority

The transport priority to use for the Discovery meta-traffic.

The discovery metatraffic will be sent by the built-in **DDS_DataWriter** (p. 673) using this transport priority.

 $[\mathbf{default}] 0$

5.30.3.5 DDS_Boolean DDS_DiscoveryQosPolicy::accept_unknown_peers

Whether to accept a new participant that is not in the initial peers list.

If DDS_BOOLEAN_FALSE (p. 107), the participant will only communicate with those in the initial peers list and those added via DDS_DomainParticipant_add_peer() (p. 401).

If **DDS_BOOLEAN_TRUE** (p. 106), the participant will also communicate with all discovered remote participants.

Note: If accept_unknown_peers is **DDS_BOOLEAN_FALSE** (p. 107) and shared memory is disabled, applications on the same node will *not* communicate if only localhost is specified in the peers list. If shared memory is disabled or shmem:// is not specified in the peers list, to communicate with other applications on the same node through the loopback interface, you must put the actual node address or hostname in **NDDS_DISCOVERY_PEERS** (p. 189).

[default] DDS_BOOLEAN_TRUE (p. 106)

5.31 DDS_DomainParticipantFactoryQos Struct Reference

QoS policies supported by a DDS_DomainParticipantFactory (p. 302).

Data Fields

^ struct DDS_EntityFactoryQosPolicy entity_factory

Entity factory policy, ENTITY_FACTORY (p. 180).

<< interface>> (p. 950) Listener for participant status.

Data Fields

- * struct DDS_TopicListener as_topiclistener

 A superclass instance of this DDS_DomainParticipantListener (p. 1155).
- * struct DDS_PublisherListener as_publisherlistener

 A superclass instance of this DDS_DomainParticipantListener (p. 1155).
- * struct DDS_SubscriberListener as_subscriberlistener

 A superclass instance of this DDS_DomainParticipantListener (p. 1155).

5.32.1 Detailed Description

```
<< interface>> (p. 950) Listener for participant status.
```

Entity:

DDS_DomainParticipant (p. 339)

Status:

Status Kinds (p. 123)

This is the interface that can be implemented by an application-provided class and then registered with the **DDS_DomainParticipant** (p. 339) such that the application can be notified by RTI Data Distribution Service of relevant status changes.

The DDS_DomainParticipantListener (p. 1155) interface extends all other Listener interfaces and has no additional operation beyond the ones defined by the more general listeners.

The purpose of the **DDS_DomainParticipantListener** (p. 1155) is to be the listener of last resort that is notified of all status changes not captured by more specific listeners attached to the **DDS_DomainEntity** (p. 245) objects. When a relevant status change occurs, RTI Data Distribution Service will first attempt to notify the listener attached to the concerned **DDS_DomainEntity** (p. 245) if one is installed. Otherwise, RTI Data Distribution Service will notify the Listener attached to the **DDS_DomainParticipant** (p. 339).

Important: Because a DDS_DomainParticipantListener (p. 1155) may receive callbacks pertaining to many different entities, it is possible for the same listener to receive multiple callbacks simultaneously in different threads. (Such is not the case for listeners of other types.) It is therefore critical that users of this listener provide their own protection for any thread-unsafe activities undertaken in a DDS_DomainParticipantListener (p. 1155) callback.

Note: Due to a thread-safety issue, the destruction of a DomainParticipantListener from an enabled DomainParticipant should be avoided even if the DomainParticipantListener has been removed from the DomainParticipant. (This limitation does not affect the Java API.)

5.34 DDS_DomainParticipantResourceLimitsQosPolicy Struct Reference

Various settings that configure how a **DDS_DomainParticipant** (p. 339) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Data Fields

- * struct DDS_AllocationSettings_t local_writer_allocation
 Allocation settings applied to local DataWriters.
- * struct DDS_AllocationSettings_t local_reader_allocation
 Allocation settings applied to local DataReaders.
- * struct DDS_AllocationSettings_t local_publisher_allocation
 Allocation settings applied to local Publisher.
- * struct DDS_AllocationSettings_t local_subscriber_allocation
 Allocation settings applied to local Subscriber.
- * struct DDS_AllocationSettings_t local_topic_allocation
 Allocation settings applied to local Topic.
- * struct DDS_AllocationSettings_t remote_writer_allocation
 Allocation settings applied to remote DataWriters.
- * struct DDS_AllocationSettings_t remote_reader_allocation Allocation settings applied to remote DataReaders.
- * struct DDS_AllocationSettings_t remote_participant_allocation
 Allocation settings applied to remote DomainParticipants.
- ^ struct DDS_AllocationSettings_t matching_writer_reader_pair_allocation

Allocation settings applied to matching local writer and remote/local reader pairs.

^ struct DDS_AllocationSettings_t matching_reader_writer_pair_allocation

Allocation settings applied to matching local reader and remote/local writer pairs.

* struct DDS_AllocationSettings_t ignored_entity_allocation
Allocation settings applied to ignored entities.

* struct DDS_AllocationSettings_t content_filtered_topic_allocation

Allocation settings applied to content filtered topic.

- * struct DDS_AllocationSettings_t content_filter_allocation
 Allocation settings applied to content filter.
- * struct DDS_AllocationSettings_t read_condition_allocation
 Allocation settings applied to read condition pool.
- * struct DDS_AllocationSettings_t query_condition_allocation
 Allocation settings applied to query condition pool.
- ^ struct DDS_AllocationSettings_t outstanding_asynchronous_sample_allocation

Allocation settings applied to the maximum number of samples (from all DDS_DataWriter (p. 673)) waiting to be asynchronously written.

- * struct DDS_AllocationSettings_t flow_controller_allocation
 Allocation settings applied to flow controllers.
- ^ DDS_Long local_writer_hash_buckets

 Hash_Buckets settings applied to local DataWriters.
- $\hat{\ }$ DDS_Long local_reader_hash_buckets

 $Number\ of\ hash\ buckets\ for\ local\ Data Readers.$

^ DDS_Long local_publisher_hash_buckets Number of hash buckets for local Publisher.

^ DDS_Long local_subscriber_hash_buckets Number of hash buckets for local Subscriber.

^ DDS_Long local_topic_hash_buckets

Number of hash buckets for local Topic.

^ DDS_Long remote_writer_hash_buckets

Number of hash buckets for remote DataWriters.

^ DDS_Long remote_reader_hash_buckets

Number of hash buckets for remote DataReaders.

DDS_Long remote_participant_hash_buckets

Number of hash buckets for remote DomainParticipants.

^ DDS_Long matching_writer_reader_pair_hash_buckets

Number of hash buckets for matching local writer and remote/local reader pairs.

^ DDS_Long matching_reader_writer_pair_hash_buckets

Number of hash buckets for matching local reader and remote/local writer pairs.

^ DDS_Long ignored_entity_hash_buckets

Number of hash buckets for ignored entities.

^ DDS_Long content_filtered_topic_hash_buckets

Number of hash buckets for content filtered topics.

^ DDS_Long content_filter_hash_buckets

 $Number\ of\ hash\ buckets\ for\ content\ filters.$

^ DDS_Long flow_controller_hash_buckets

Number of hash buckets for flow controllers.

^ DDS_Long max_gather_destinations

Maximum number of destinations per RTI Data Distribution Service send.

^ DDS_Long participant_user_data_max_length

Maximum length of user data in DDS_DomainParticipantQos (p. 1157) and DDS_ParticipantBuiltinTopicData (p. 1289).

^ DDS_Long topic_data_max_length

Maximum length of topic data in DDS_TopicQos (p. 1443), DDS_TopicBuiltinTopicData (p. 1433), DDS_PublicationBuiltinTopicData (p. 1313) and DDS_SubscriptionBuiltinTopicData (p. 1410).

^ DDS_Long publisher_group_data_max_length

Maximum length of group data in DDS_PublisherQos (p. 1328) and DDS_PublicationBuiltinTopicData (p. 1313).

DDS_Long subscriber_group_data_max_length

Maximum length of group data in DDS_SubscriberQos (p. 1407) and DDS_SubscriptionBuiltinTopicData (p. 1410).

^ DDS_Long writer_user_data_max_length

Maximum length of user data in DDS_DataWriterQos (p. 1123) and DDS_PublicationBuiltinTopicData (p. 1313).

^ DDS_Long reader_user_data_max_length

Maximum length of user data in DDS_DataReaderQos (p. 1083) and DDS_SubscriptionBuiltinTopicData (p. 1410).

^ DDS_Long max_partitions

Maximum number of partition name strings allowable in a DDS_-PartitionQosPolicy (p. 1294).

^ DDS_Long max_partition_cumulative_characters

Maximum number of combined characters allowable in all partition names in a DDS_PartitionQosPolicy (p. 1294).

^ DDS_Long type_code_max_serialized_length

Maximum size of serialized string for type code.

^ DDS_Long contentfilter_property_max_length

This field is the maximum length of all data related to a Content-filtered topic.

^ DDS_Long channel_seq_max_length

 $\label{lem:maximum number of channels that can be specified in DDS_- MultiChannel QosPolicy (p. 1269) for MultiChannel DataWriters.$

^ DDS_Long channel_filter_expression_max_length

Maximum length of a channel DDS_ChannelSettings_t::filter_expression (p. 1049) in a MultiChannel DataWriter.

^ DDS_Long participant_property_list_max_length

Maximum number of properties associated with the DDS_{-} -DomainParticipant (p. 339).

^ DDS_Long participant_property_string_max_length

Maximum string length of the properties associated with the DDS_- -DomainParticipant (p. 339).

^ DDS_Long writer_property_list_max_length

Maximum number of properties associated with a DDS_DataWriter (p. 673).

^ DDS_Long writer_property_string_max_length

Maximum string length of the properties associated with a DDS_-DataWriter (p. 673).

^ DDS_Long reader_property_list_max_length

Maximum number of properties associated with a DDS_DataReader (p. 783).

^ DDS_Long reader_property_string_max_length

Maximum string length of the properties associated with a DDS_-DataReader (p. 783).

5.34.1 Detailed Description

Various settings that configure how a **DDS_DomainParticipant** (p. 339) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

This QoS policy sets maximum size limits on variable-length parameters used by the participant and its contained Entities. It also controls the initial and maximum sizes of data structures used by the participant to store information about locally-created and remotely-discovered entities (such as DataWriters/DataReaders), as well as parameters used by the internal database to size the hash tables it uses.

By default, a DDS_DomainParticipant (p. 339) is allowed to dynamically allocate memory as needed as users create local Entities such as DDS_DataWriter (p. 673) and DDS_DataReader (p. 783) objects or as the participant discovers new applications. By setting fixed values for the maximum parameters in this QoS policy, you can bound the memory that can be allocated by a DDS_DomainParticipant (p. 339). In addition, by setting the initial values to the maximum values, you can prevent DomainParticipants from allocating memory after the initialization period.

The maximum sizes of different variable-length parameters such as the number of partitions that can be stored in the DDS_PartitionQosPolicy (p. 1294), the maximum length of data store in the DDS_UserDataQosPolicy (p. 1474) and DDS_GroupDataQosPolicy (p. 1226), and many others can be changed from their defaults using this QoS policy. However, it is important that all DomainParticipants that need to communicate with each other use the *same set* of maximum values. Otherwise, when these parameters are propagated from one DDS_DomainParticipant (p. 339) to another, a DDS_DomainParticipant

(p. 339) with a smaller maximum length may reject the parameter, resulting in an error.

An important parameter in this QoS policy that is often changed by users is DDS_DomainParticipantResourceLimitsQosPolicy::type_code_max_serialized_length (p. 1177).

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DomainParticipant (p. 339)

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.34.2.18 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: local-writer_hash_buckets$

Hash_Buckets settings applied to local DataWriters.

[default] 4

[range] [1, 10000]

5.34.2.19 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: local-reader_hash_buckets$

Number of hash buckets for local DataReaders.

[default] 4

[range] [1, 10000]

5.34.2.20 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: local-publisher_hash_buckets$

Number of hash buckets for local Publisher.

[default] 1

[range] [1, 10000]

5.34.2.21 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: local_subscriber_hash_buckets$

Number of hash buckets for local Subscriber.

[default] 1

[range] [1, 10000]

5.34.2.22 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: local_topic_hash_buckets$

Number of hash buckets for local Topic.

[default] 4

[range] [1, 10000]

5.34.2.23 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: remote_writer_hash_buckets$

Number of hash buckets for remote DataWriters.

Remote DataWriters include all DataWriters, both local and remote.

[default] 16

[range] [1, 10000]

5.34.2.24 DDS_Long DDS_-

 $\label{lem:pomainParticipantResourceLimitsQosPolicy::remote-reader_hash_buckets$

Number of hash buckets for remote DataReaders.

Remote DataReaders include all DataReaders, both local and remote.

[default] 16

[range] [1, 10000]

5.34.2.25 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: remote_participant_hash_buckets$

Number of hash buckets for remote DomainParticipants.

Remote Domain Participants include all Domain Participants, both local and remote.

[default] 4

[range] [1, 10000]

5.34.2.26 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: matching_-writer_reader_pair_hash_buckets$

Number of hash buckets for matching local writer and remote/local reader pairs.

[default] 32

[range] [1, 10000]

5.34.2.27 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: matching_reader_writer_pair_hash_buckets$

Number of hash buckets for matching local reader and remote/local writer pairs.

[default] 32

5.34.2.29 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: content_-filtered_topic_hash_buckets$

Number of hash buckets for content filtered topics.

[default] 1

[range] [1, 10000]

5.34.2.30 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: content_-filter_hash_buckets$

Number of hash buckets for content filters.

[default] 1

[range] [1, 10000]

5.34.2.31 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: flow_controller_hash_buckets$

Number of hash buckets for flow controllers.

[default] 1

[range] [1, 10000]

5.34.2.32 DDS_Long DDS_-

Maximum number of destinations per RTI Data Distribution Service send.

When RTI Data Distribution Service sends out a message, it has the capability to send to multiple destinations to be more efficient. The maximum number

of destinations per RTI Data Distribution Service send is specified by max_gather_destinations.

[default] 8

[range] [4, 1 million]

5.34.2.33 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: participant _-user_data_max_length$

Maximum length of user data in DDS_DomainParticipantQos (p. 1157) and DDS_ParticipantBuiltinTopicData (p. 1289).

[default] 256

[range] [0.0x7fffffff]

5.34.2.34 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: topic_data_max_length$

Maximum length of topic data in DDS_TopicQos (p. 1443), DDS_TopicBuiltinTopicData (p. 1433), DDS_PublicationBuiltinTopicData (p. 1313) and DDS_SubscriptionBuiltinTopicData (p. 1410).

[default] 256

[range] [0.0x7fffffff]

5.34.2.35 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: publisher_-group_data_max_length$

Maximum length of group data in **DDS_PublisherQos** (p. 1328) and **DDS_PublicationBuiltinTopicData** (p. 1313).

[default] 256

[range] [0.0x7fffffff]

5.34.2.36 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: subscriber_-group_data_max_length$

Maximum length of group data in DDS_SubscriberQos (p. 1407) and DDS_SubscriptionBuiltinTopicData (p. 1410).

[default] 256

[range] [0.0x7fffffff]

5.34.2.37 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: writer_-user_data_max_length$

Maximum length of user data in DDS_DataWriterQos (p. 1123) and DDS_PublicationBuiltinTopicData (p. 1313).

[default] 256

[range] [0.0x7fffffff]

5.34.2.38 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: reader_-user_data_max_length$

Maximum length of user data in **DDS_DataReaderQos** (p. 1083) and **DDS_SubscriptionBuiltinTopicData** (p. 1410).

[default] 256

[range] [0.0x7fffffff]

5.34.2.39 DDS_Long DDS_-

Maximum number of partition name strings allowable in a DDS_-PartitionQosPolicy (p. 1294).

This value cannot exceed 64.

[default] 64

[range] [0,64]

5.34.2.40 DDS_Long DDS_-

 $\label{lem:participant} Domain Participant Resource Limits Qos Policy :: max-partition_cumulative_characters$

Maximum number of combined characters allowable in all partition names in a DDS_PartitionQosPolicy (p. 1294).

The maximum number of combined characters should account for a terminating NULL ('\0') character for each partition name string.

This value cannot exceed 256.

[default] 256

[range] [0,256]

5.34.2.41 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: type_code_max_serialized_length$

Maximum size of serialized string for type code.

This parameter limits the size of the type code that a DDS_DomainParticipant (p. 339) is able to store and propagate for user data types. Type codes can be used by external applications to understand user data types without having the data type predefined in compiled form. However, since type codes contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in type codes larger than the default maximum of 2048 bytes. So it is common for users to set this parameter to a larger value. However, as with all parameters in this QoS policy defining maximum sizes for variable-length elements, all DomainParticipants in the same domain should use the same value for this parameter.

[default] 2048

[range] [0.0xffff]

5.34.2.42 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy:: content filter_-property_max_length$

This field is the maximum length of all data related to a Content-filtered topic.

This is the sum of the length of the content filter name, the length of the related topic name, the length of the filter expression, the length of the filter parameters, and the length of the filter name. The maximum number of combined characters should account for a terminating NULL ($' \setminus 0'$) character for each string.

[default] 256

[range] [0.0xffff]

5.34.2.43 DDS_Long DDS_-

Maximum number of channels that can be specified in **DDS**_-**MultiChannelQosPolicy** (p. 1269) for MultiChannel DataWriters.

[default] 32

[range] [0.0xffff]

5.34.2.44 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: channel-filter_expression_max_length$

Maximum length of a channel **DDS_ChannelSettings_t::filter_expression** (p. 1049) in a MultiChannel DataWriter.

The length should account for a terminating NULL ('\0') character.

[default] 256

[range] [0.0xffff]

5.34.2.45 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: participant_-property_list_max_length$

Maximum number of properties associated with the DDS_-DomainParticipant (p. 339).

[default] 32

[range] [0.0xffff]

5.34.2.46 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: participant_-property_string_max_length$

Maximum string length of the properties associated with the DDS_{-} -DomainParticipant (p. 339).

The string length is defined as the cumulative length in bytes of all the pair (name, value) associated with the **DDS_DomainParticipant** (p. 339) properties.

[default] 1024

[range] [0.0xffff]

5.34.2.47 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy::writer_-property_list_max_length$

Maximum number of properties associated with a DDS_DataWriter (p. 673).

[range] [0.0xffff]

[default] 32

5.34.2.48 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy::writer_-property_string_max_length$

Maximum string length of the properties associated with a **DDS_DataWriter** (p. 673).

The string length is defined as the cumulative length in bytes of all the pair (name, value) associated with the data writer properties.

[default] 1024

[range] [0.0xffff]

5.34.2.49 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: reader_property_list_max_length$

Maximum number of properties associated with a DDS_DataReader (p. 783).

[default] 32

[range] [0.0xffff]

5.34.2.50 DDS_Long DDS_-

 $Domain Participant Resource Limits Qos Policy :: reader_property_string_max_length$

Maximum string length of the properties associated with a **DDS_DataReader** (p. 783).

The string length is defined as the cumulative length in bytes of all the pair (name, value) associated with a DDS_DataReader (p. 783) properties.

[default] 1024

[range] [0.0xffff]

DURABILITY_SERVICE (p. 173)
```

5.36.2 Usage

It is possible for a **DDS_DataWriter** (p. 673) to start publishing data before all (or any) **DDS_DataReader** (p. 783) entities have joined the network.

Moreover, a **DDS_DataReader** (p. 783) that joins the network after some data has been written could potentially be interested in accessing the most current values of the data, as well as potentially some history.

This policy makes it possible for a late-joining **DDS_DataReader** (p. 783) to obtain previously published samples.

By helping to ensure that DataReaders get all data that was sent by DataWriters, regardless of when it was sent, using this QoS policy can increase system tolerance to failure conditions.

Note that although related, this does not strictly control what data RTI Data Distribution Service will maintain internally. That is, RTI Data Distribution Service may choose to maintain some data for its own purposes (e.g., flow control) and yet not make it available to late-joining readers if the **DURABILITY** (p. 153) policy is set to **DDS_VOLATILE_DURABILITY_QOS** (p. 154).

5.36.2.1 Transient and Persistent Durability

For the purpose of implementing the DURABILITY QoS kind TRANSIENT or PERSISTENT, RTI Data Distribution Service behaves as if for each Topic that has DDS_DurabilityQosPolicy::kind (p. 1184) of DDS_TRANSIENT_DURABILITY_QOS (p. 154) or DDS_PERSISTENT_DURABILITY_QOS (p. 154) there is a corresponding "built-in" DDS_DataReader (p. 783) and DDS_DataWriter (p. 673) configured with the same DURABILITY kind. In other words, it is as if somewhere in the system, independent of the original DDS_DataWriter (p. 673), there is a built-in durable DDS_DataReader (p. 783) subscribing to that Topic and a built-in durable DataWriter republishing it as needed for the new subscribers that join the system. This functionality is provided by the RTI Persistence Service.

The Persistence Service can configure itself based on the QoS of your application's DDS_DataWriter (p. 673) and DDS_DataReader (p. 783) entities. For each transient or persistent DDS_Topic (p. 425), the built-in fictitious Persistence Service DDS_DataReader (p. 783) and DDS_DataWriter (p. 673) have their QoS configured from the QoS of your application's DDS_DataWriter (p. 673) and DDS_DataReader (p. 783) entities that communicate on that DDS_Topic (p. 425).

For a given **DDS_Topic** (p. 425), the usual request/offered semantics apply to the matching between any **DDS_DataWriter** (p. 673) in the domain that writes the **DDS_Topic** (p. 425) and the built-in transient/persistent **DDS_DataReader** (p. 783) for that **DDS_Topic** (p. 425); similarly for the built-

in transient/persistent **DDS_DataWriter** (p. 673) for a **DDS_Topic** (p. 425) and any **DDS_DataReader** (p. 783) for the **DDS_Topic** (p. 425). As a consequence, a **DDS_DataWriter** (p. 673) that has an incompatible QoS will not send its data to the *RTI Persistence Service*, and a **DDS_DataReader** (p. 783) that has an incompatible QoS will not get data from it.

Incompatibilities between local DDS_DataReader (p. 783) and DDS_DataWriter (p. 673) entities and the corresponding fictitious built-in transient/persistent entities cause the DDS_REQUESTED_-INCOMPATIBLE_QOS_STATUS (p. 129) and DDS_OFFERED_-INCOMPATIBLE_QOS_STATUS (p. 129) to change and the corresponding Listener invocations and/or signaling of DDS_Condition (p. 252) objects as they would with your application's own entities.

The value of DDS_DurabilityServiceQosPolicy::service_cleanup_delay (p. 1186) controls when *RTI Persistence Service* is able to remove all information regarding a data instances.

Information on a data instance is maintained until the following conditions are met:

1. The instance has been explicitly disposed (instance_state = NOT_ALIVE_-DISPOSED),

and

2. While in the NOT_ALIVE_DISPOSED state, the system detects that there are no more 'live' **DDS_DataWriter** (p.673) entities writing the instance. That is, all existing writers either unregister the instance (call unregister) or lose their liveliness,

and

3. A time interval longer that **DDS_DurabilityServiceQosPolicy::service_cleanup_delay** (p. 1186) has elapsed since the moment RTI Data Distribution Service detected that the previous two conditions were met.

The utility of DDS_DurabilityServiceQosPolicy::service_cleanup_delay (p. 1186) is apparent in the situation where an application disposes an instance and it crashes before it has a chance to complete additional tasks related to the disposition. Upon restart, the application may ask for initial data to regain its state and the delay introduced by the service_cleanup_delay will allow the restarted application to receive the information on the disposed instance and complete the interrupted tasks.

5.36.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality offered kind >= requested kind evaluates to 'TRUE'.

For the purposes of this inequality, the values of DURABILITY kind are considered ordered such that DDS_VOLATILE_DURABILITY_QOS (p. 154) < DDS_TRANSIENT_LOCAL_DURABILITY_QOS (p. 154) < DDS_TRANSIENT_DURABILITY_QOS (p. 154) < DDS_PERSISTENT_DURABILITY_QOS (p. 154).

5.36.4 Field Documentation

5.36.4.1 DDS_DurabilityQosPolicyKind DDS_-DurabilityQosPolicy::kind

The kind of durability.

[default] DDS_VOLATILE_DURABILITY_QOS (p. 154)

5.36.4.2 DDS_Boolean DDS_DurabilityQosPolicy::direct_communication

<<eeXtension>> (p. 950) Indicates whether or not a TRANSIENT or PER-SISTENT DDS_DataReader (p. 783) should receive samples directly from a TRANSIENT or PERSISTENT DDS_DataWriter (p. 673)

When direct_communication is set to DDS_BOOLEAN_TRUE (p. 106), a TRANSIENT or PERSISTENT DDS_DataReader (p. 783) will receive samples from both the original DDS_DataWriter (p. 673) configured with TRANSIENT or PERSISTENT durability and the DDS_DataWriter (p. 673) created by the persistence service. This peer-to-peer communication pattern provides low latency between end-points.

If the same sample is received from the original **DDS_DataWriter** (p. 673) and the persistence service, the middleware will discard the duplicate.

When direct_communication is set to DDS_BOOLEAN_FALSE (p. 107), a TRANSIENT or PERSISTENT DDS_DataReader (p. 783) will only receive samples from the DDS_DataWriter (p. 673) created by the persistence service. This brokered communication pattern provides a way to guarantee eventual consistency.

[default] DDS_BOOLEAN_TRUE (p. 106)

5.37 DDS_DurabilityServiceQosPolicy Struct Reference

Various settings to configure the external *RTI Persistence Service* used by RTI Data Distribution Service for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1181) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 154) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 154).

Data Fields

^ struct DDS_Duration_t service_cleanup_delay

[Not supported (optional)] Controls when the service is able to remove all information regarding a data instances.

^ DDS_HistoryQosPolicyKind history_kind

The kind of history to apply in recouping durable data.

^ DDS_Long history_depth

Part of history QoS policy to apply when feeding a late joiner.

^ DDS_Long max_samples

Part of resource limits QoS policy to apply when feeding a late joiner.

^ DDS_Long max_instances

Part of resource limits QoS policy to apply when feeding a late joiner.

^ DDS_Long max_samples_per_instance

Part of resource limits QoS policy to apply when feeding a late joiner.

5.37.1 Detailed Description

Various settings to configure the external *RTI Persistence Service* used by RTI Data Distribution Service for DataWriters with a **DDS_DurabilityQosPolicy** (p. 1181) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 154) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 154).

Entity:

DDS_Topic (p. 425), DDS_DataWriter (p. 673)

Properties:

```
\mathbf{RxO}\ (\mathrm{p.145}) = \mathrm{NO}
Changeable (\mathrm{p.146}) = \mathbf{UNTIL}\ \mathbf{ENABLE}\ (\mathrm{p.146})
```

See also:

```
DURABILITY (p. 153)
HISTORY (p. 170)
RESOURCE_LIMITS (p. 174)
```

5.37.2 Usage

When a DataWriter's DDS_DurabilityQosPolicy::kind (p. 1184) is DDS_PERSISTENT_DURABILITY_QOS (p. 154) or DDS_TRANSIENT_DURABILITY_QOS (p. 154), an external service, the RTI Persistence Service, is used to store and possibly forward the data sent by the DDS_DataWriter (p. 673) to DDS_DataReader (p. 783) objects that are created after the data was initially sent.

This QoS policy is used to configure certain parameters of the Persistence Service when it operates on the behalf of the **DDS_DataWriter** (p. 673), such as how much data to store. For example, it configures the **HISTORY** (p. 170) and the **RESOURCE_LIMITS** (p. 174) used by the fictitious DataReader and DataWriter used by the Persistence Service. Note, however, that the Persistence Service itself may be configured to ignore these values and instead use values from its own configuration file.

5.37.3 Field Documentation

5.37.3.1 struct DDS_Duration_t DDS_DurabilityServiceQosPolicy::service_cleanup_delay [read]

[Not supported (optional)] Controls when the service is able to remove all information regarding a data instances.

```
[default] 0
```

5.37.3.2 DDS_HistoryQosPolicyKind DDS_-DurabilityServiceQosPolicy::history_kind

The kind of history to apply in recouping durable data.

[default] DDS_KEEP_LAST_HISTORY_QOS (p. 171)

${\bf 5.37.3.3} \quad {\bf DDS_Long} \ {\bf DDS_DurabilityServiceQosPolicy::history_-depth}$

Part of history QoS policy to apply when feeding a late joiner. [default] 1

5.37.3.4 DDS_Long DDS_DurabilityServiceQosPolicy::max_samples

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] DDS_LENGTH_UNLIMITED (p. 174)

5.37.3.5 DDS_Long DDS_DurabilityServiceQosPolicy::max_instances

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] DDS_LENGTH_UNLIMITED (p. 174)

5.37.3.6 DDS_Long DDS_DurabilityServiceQosPolicy::max_samples_per_instance

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] DDS_LENGTH_UNLIMITED (p. 174)

5.38 DDS_Duration_t Struct Reference

Type for *duration* representation.

Data Fields

 $\hat{\ }$ DDS_Long sec

seconds

 $\hat{\ }$ DDS_Unsigned Long nanosec

nanose conds

5.38.1 Detailed Description

Type for duration representation.

Represents a time interval.

Examples:

HelloWorld_publisher.c, and HelloWorld_subscriber.c.

5.38.2 Field Documentation

${\bf 5.38.2.1}\quad {\bf DDS_Long}\ {\bf DDS_Duration_t::sec}$

seconds

Examples:

 $HelloWorld_subscriber.c.$

${\bf 5.38.2.2} \quad DDS_UnsignedLong\ DDS_Duration_t::nanosec$

nanoseconds

5.39 DDS_DynamicData Struct Reference

A sample of any complex data type, which can be inspected and manipulated reflectively.

5.39.1 Detailed Description

A sample of any complex data type, which can be inspected and manipulated reflectively.

Objects of type **DDS_DynamicData** (p. 1189) represent corresponding objects of the type identified by their **DDS_TypeCode** (p. 1463). Because the definition of these types may not have existed at compile time on the system on which the application is running, you will interact with the data using an API of reflective getters and setters.

For example, if you had access to your data types at compile time, you could do this:

```
theValue = theObject.theField;
```

Instead, you will do something like this:

```
theValue = get(theObject, "theField");
```

DDS_DynamicData (p. 1189) objects can represent any complex data type, including those of type kinds DDS_TK_ARRAY (p. 477), DDS_TK_-SEQUENCE (p. 477), DDS_TK_STRUCT (p. 476), DDS_TK_UNION (p. 476), DDS_TK_VALUE (p. 477), and DDS_TK_SPARSE (p. 477). They cannot represent objects of basic types (e.g. integers and strings). Since those type definitions always exist on every system, you can examine their objects directly.

5.39.2 Member Names and IDs

The members of a data type can be identified in one of two ways: by their name or by their numeric ID. The former is often more transparent to human users; the latter is typically faster.

You define the name and ID of a type member when you add that member to that type. When you define a sparse type, you will typically choose both explicitly. If you define your type in IDL or XML, the name will be the field name that appears in the type definition; the ID will be the one-based index of the field in declaration order. For example, in the following IDL structure, the ID of theLong is 2.

```
struct MyType {
    short theShort;
    long theLong;
};
```

IDs work the same way for **DDS_DynamicData** (p. 1189) objects representing arrays and sequences, since the elements of these collections have no explicit IDs: the ID is one more than the index. (The first element is ID 1, the second is 2, etc.) Array and sequence elements do not have names.

Multi-dimensional arrays are effectively flattened by the **DDS_DynamicData** (p. 1189) API. For example, for an array theArray[4][5], accessing ID 7 is equivalent to index 6, or the second element of the second group of 5.

For unions (**DDS_TK_UNION** (p. 476)), the ID of a member is the discriminator value corresponding to that member.

5.39.3 Available Functionality

The Dynamic Data API is large when measured by the number of methods it contains. But each method falls into one of a very small number of categories. You will find it easier to navigate this documentation if you understand these categories.

5.39.3.1 Lifecycle and Utility Methods

Managing the lifecycle of **DDS_DynamicData** (p. 1189) objects is simple. You have two choices:

- Usually, you will go through a DDS_DynamicDataTypeSupport (p. 539) factory object, which will ensure that the type and property information for the new DDS_DynamicData (p. 1189) object corresponds to a registered type in your system.
- 2. In certain advanced cases, such as when you're navigating a nested structure, you will want to have a DDS_DynamicData (p. 1189) object that is not bound up front to any particular type, or you will want to initialize the object in a custom way. In that case, you can call the constructor directly.

You can also copy DDS_DynamicData (p. 1189) objects:

```
^ DDS_DynamicData_copy (p. 542)
```

You can test them for equality:

DDS	DDS_DynamicData (p. 1189)
DynamicDataTypeSupport	
(p. 539)	
DDS	DDS_DynamicData_new (p. 540)
$DynamicDataTypeSupport_{-}$	
${ m create_data}$	
(p. 622)	
DDS	DDS_DynamicData_initialize
DynamicDataTypeSupport	(p. 539)
initialize_data	
(p. 623)	
DDS_{-} -	DDS_DynamicData_finalize
DynamicDataTypeSupport	(p.541)
finalize_data	
(p. 624)	
DDS	DDS_DynamicData_delete
${\bf Dynamic Data Type Support\}$	(p. 541)
$delete_data$	
(p. 622)	

Table 5.1: Lifecycle

 $^{\hat{}}$ DDS_DynamicData_equal (p. 542)

And you can print their contents:

- ^ DDS_DynamicData_print (p. 544)
- ^ DDS_DynamicDataTypeSupport_print_data (p. 623)

5.39.3.2 Getters and Setters

Most methods get or set the value of some field. These methods are named according to the type of the field they access.

When working with a **DDS_DynamicData** (p. 1189) object representing an array or sequence, calling one of the "get" methods below for an index that is out of bounds will result in **DDS_RETCODE_NO_DATA** (p. 122). Calling "set" for an index that is past the end of a sequence will cause that sequence to automatically lengthen (filling with default contents).

In addition to getting or setting a field, you can "clear" its value; that is, set it to a default zero value.

^ DDS_DynamicData_clear_member (p. 543)

- ^ DDS_DynamicData_clear_all_members (p. 542)
- ^ DDS_DynamicData_clear_nonkey_members (p. 543)

5.39.3.3 Query and Iteration

Not all components of your application will have static knowledge of all of the fields of your type. Sometimes, you will want to query meta-data about the fields that appear in a given data sample.

- ^ DDS_DynamicData_get_type (p. 549)
- ^ DDS_DynamicData_get_type_kind (p. 549)
- ^ DDS_DynamicData_get_member_type (p. 553)
- ^ DDS_DynamicData_get_member_info (p. 551)
- ^ DDS_DynamicData_get_member_count (p. 549)
- ^ DDS_DynamicData_get_member_info_by_index (p. 552)
- ^ DDS_DynamicData_member_exists (p. 550)
- ^ DDS_DynamicData_member_exists_in_type (p. 551)
- ^ DDS_DynamicData_is_member_key (p. 554)

5.39.3.4 Type/Object Association

Sometimes, you may want to change the association between a data object and its type. This is not something you can do with a typical object, but with **DDS_DynamicData** (p. 1189) objects, it is a powerful capability. It allows you to, for example, examine nested structures without copying them by using a "bound" **DDS_DynamicData** (p. 1189) object as a view into an enclosing **DDS_DynamicData** (p. 1189) object.

- ^ DDS_DynamicData_bind_type (p. 545)
- ^ DDS_DynamicData_unbind_type (p. 546)
- ^ DDS_DynamicData_bind_complex_member (p. 546)
- ^ DDS_DynamicData_unbind_complex_member (p. 548)

5.39.3.5 Keys

Keys can be specified in dynamically defined types just as they can in types defined in generated code. However, there are some minor restrictions when sparse value types are involved (see **DDS_TK_SPARSE** (p. 477)).

- ^ If a type has a member that is of a sparse value type, that member cannot be a key for the enclosing type.
- ^ Sparse value types themselves may have at most a single key field. That field may itself be of any type.

5.39.4 Performance

Due to the way in which **DDS_DynamicData** (p. 1189) objects manage their internal state, it is typically more efficient, when setting the field values of a **DDS_DynamicData** (p. 1189) for the first time, to do so in the declared order of those fields.

For example, suppose a type definition like the following:

```
struct MyType {
    float my_float;
    sequence<octet> my_bytes;
    short my_short;
};
```

The richness of the type system makes it difficult to fully characterize the performance differences between all access patterns. Nevertheless, the following are generally true:

- ^ It will be most performant to set the value of my_float, then my_bytes, and finally my_short.
- ^ The order of modification has a greater impact for types of kind **DDS_TK_STRUCT** (p. 476) and **DDS_TK_VALUE** (p. 477) than it does for types of kind **DDS_TK_SPARSE** (p. 477).
- ^ Modifications to variable-sized types (i.e. those containing strings, sequences, unions, or optional members) are more expensive than modifications to fixed-size types.

MT Safety:

UNSAFE. In general, using a single **DDS_DynamicData** (p. 1189) object concurrently from multiple threads is *unsafe*.

Table 5.5: Sequences of Basic Types

5.40 DDS_DynamicDataInfo Struct Reference

A descriptor for a **DDS_DynamicData** (p. 1189) object.

Data Fields

^ DDS_Long member_count

The number of data members in this DDS_DynamicData (p. 1189) sample.

 $\hat{\ }$ DDS_Long stored_size

The number of bytes currently used to store the data of this DDS_-DynamicData (p. 1189) sample.

5.40.1 Detailed Description

A descriptor for a DDS_DynamicData (p. 1189) object.

See also:

DDS_DynamicData_get_info (p. 545)

5.40.2 Field Documentation

5.40.2.1 DDS_Long DDS_DynamicDataInfo::member_count

The number of data members in this DDS_DynamicData (p. 1189) sample.

5.40.2.2 DDS_Long DDS_DynamicDataInfo::stored_size

The number of bytes currently used to store the data of this DDS_-DynamicData (p. 1189) sample.

5.41 DDS_DynamicDataMemberInfo Struct Reference

A descriptor for a single member (i.e. field) of dynamically defined data type.

Data Fields

^ DDS_DynamicDataMemberId member_id

An integer that uniquely identifies the data member within this DDS_-DynamicData (p. 1189) sample's type.

^ const char * member_name

The string name of the data member.

^ DDS_Boolean member_exists

Indicates whether the corresponding member of the data type actually exists in this sample.

^ DDS_TCKind member_kind

The kind of type of this data member (e.g. integer, structure, etc.).

^ DDS_UnsignedLong element_count

The number of elements within this data member.

^ DDS_TCKind element_kind

The kind of type of the elements within this data member.

5.41.1 Detailed Description

A descriptor for a single member (i.e. field) of dynamically defined data type.

See also:

DDS_DynamicData_get_member_info (p. 551)

5.41.2 Field Documentation

$\begin{array}{ccc} 5.41.2.1 & DDS_DynamicDataMemberId & DDS_-\\ & DynamicDataMemberInfo::member_id \end{array}$

An integer that uniquely identifies the data member within this **DDS**_**DynamicData** (p. 1189) sample's type.

For sparse data types, this value will be assigned by the type designer. For types defined in IDL, it will be assigned automatically by the middleware based on the member's declaration order within the type.

See also:

DDS_TCKind (p. 476)

5.41.2.2 const char* DDS_DynamicDataMemberInfo::member_-name

The string name of the data member.

This name will be unique among members of the same type. However, a single named member may have multiple type representations.

See also:

DDS_DynamicDataMemberInfo::representation_count

5.41.2.3 DDS_Boolean DDS_DynamicDataMemberInfo::member_exists

Indicates whether the corresponding member of the data type actually exists in this sample.

For non-sparse data types, this value will always be ${\bf DDS_BOOLEAN_TRUE}$ (p. 106).

See also:

DDS_TCKind (p. 476)

${\bf 5.41.2.4} \quad {\bf DDS_TCKind} \ {\bf DDS_DynamicDataMemberInfo::} member_-kind$

The kind of type of this data member (e.g. integer, structure, etc.).

This is a convenience field; it is equivalent to looking up the member in the **DDS_TypeCode** (p. 1463) and getting the **DDS_TCKind** (p. 476) from there.

$\begin{array}{ccc} 5.41.2.5 & DDS_UnsignedLong & DDS_-\\ & DynamicDataMemberInfo::element_count \end{array}$

The number of elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report zero (0) here.

${\bf 5.41.2.6} \quad {\bf DDS_TCKind} \ {\bf DDS_DynamicDataMemberInfo::element_kind}$

The kind of type of the elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report $\mathbf{DDS_TK_NULL}$ (p. 476) here.

5.42 DDS_DynamicDataProperty_t Struct Reference

A collection of attributes used to configure **DDS_DynamicData** (p. 1189) objects.

Data Fields

^ DDS_Long buffer_initial_size

The initial amount of memory used by this DDS_DynamicData (p. 1189) object, in bytes.

^ DDS_Long buffer_max_size

The maximum amount of memory that this DDS_DynamicData (p. 1189) object may use, in bytes.

5.42.1 Detailed Description

A collection of attributes used to configure $\mathbf{DDS_DynamicData}$ (p. 1189) objects.

To ensure that new objects are initialized to known values, assign them with the static initializer DDS_DynamicDataProperty_t_INITIALIZER (p. 537).

See also:

DDS_DynamicDataProperty_t_INITIALIZER (p. 537)

5.42.2 Field Documentation

5.42.2.1 DDS_Long DDS_DynamicDataProperty_t::buffer_initial_size

The initial amount of memory used by this **DDS_DynamicData** (p. 1189) object, in bytes.

See also:

DDS_DynamicDataProperty_t::buffer_max_size (p. 1202)

$5.42.2.2 \quad DDS_Long\ DDS_DynamicDataProperty_t::buffer_max_size$

The maximum amount of memory that this **DDS_DynamicData** (p. 1189) object may use, in bytes.

It will grow to this size from the initial size as needed.

See also:

DDS_DynamicDataProperty_t::buffer_initial_size (p. 1201)

5.43 DDS_DynamicDataSeq Struct Reference

An ordered collection of DDS_DynamicData (p. 1189) elements.

5.43.1 Detailed Description

```
An ordered collection of DDS_DynamicData (p. 1189) elements.
Instantiates FooSeq (p. 1497) < DDS_DynamicData (p. 1189) > .
```

See also:

```
FooSeq (p. 1497)
DDS_DynamicData (p. 1189)
```

5.44 DDS_DynamicDataTypeProperty_t Struct Reference

A collection of attributes used to configure DDS_-DynamicDataTypeSupport (p. 539) objects.

Data Fields

`struct DDS_DynamicDataProperty_t data

These properties will be provided to every new DDS_DynamicData (p. 1189) sample created from the DDS_DynamicDataTypeSupport (p. 539).

^ struct DDS_DynamicDataTypeSerializationProperty_t serialization

Properties that govern how the data of this type will be serialized on the network.

5.44.1 Detailed Description

A collection of attributes used to configure DDS_-DynamicDataTypeSupport (p. 539) objects.

The properties of a **DDS_DynamicDataTypeSupport** (p. 539) object contain the properties that will be used to instantiate any samples created by that object.

5.44.2 Field Documentation

These properties will be provided to every new **DDS_DynamicData** (p. 1189) sample created from the **DDS_DynamicDataTypeSupport** (p. 539).

5.44.2.2 struct DDS_DynamicDataTypeSerializationProperty_t DDS_DynamicDataTypeProperty_t::serialization [read]

Properties that govern how the data of this type will be serialized on the network.

5.45 DDS_DynamicDataTypeSerializationProperty_t Struct Reference

Properties that govern how data of a certain type will be serialized on the network.

Data Fields

${\bf ^{\hat{}}\ DDS_Boolean\ use_42e_compatible_alignment}$

 $\label{lem:compatible} \textit{Use RTI Data Distribution Service 4.2e-compatible alignment for large primitive types.}$

^ DDS_UnsignedLong max_size_serialized

The maximum number of bytes that objects of a given type could consume when serialized on the network.

5.45.1 Detailed Description

Properties that govern how data of a certain type will be serialized on the network.

5.45.2 Field Documentation

5.45.2.1 DDS_Boolean DDS_-DynamicDataTypeSerializationProperty_t::use_42e_compatible_alignment

Use RTI Data Distribution Service 4.2e-compatible alignment for large primitive types.

In RTI Data Distribution Service 4.2e, the default alignment for large primitive types – **DDS_LongLong** (p. 108), **DDS_UnsignedLongLong** (p. 108), **DDS_Double** (p. 108), and **DDS_LongDouble** (p. 108) – was not RTPS-compliant. This compatibility mode allows applications targeting post-4.2e versions of RTI Data Distribution Service to interoperate with 4.2e-based applications, regardless of the data types they use.

If this flag is not set, all data will be serialized in an RTPS-compliant manner, which for the types listed above, will not be interoperable with RTI Data Distribution Service 4.2e.

5.45.2.2 DDS_UnsignedLong DDS_-DynamicDataTypeSerializationProperty_t::max_size_serialized

The maximum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

The effective value of the maximum serialized size will be the value of this field or the size automatically inferred from the type's **DDS_TypeCode** (p. 1463), whichever is smaller.

5.46 DDS_EntityFactoryQosPolicy Struct Reference

A QoS policy for all **DDS_Entity** (p. 242) types that can act as factories for one or more other **DDS_Entity** (p. 242) types.

Data Fields

^ DDS_Boolean autoenable_created_entities

Specifies whether the entity acting as a factory automatically enables the instances it creates.

5.46.1 Detailed Description

A QoS policy for all **DDS_Entity** (p. 242) types that can act as factories for one or more other **DDS_Entity** (p. 242) types.

Entity:

```
DDS_DomainParticipantFactory (p. 302), DDS_DomainParticipant (p. 339), DDS_Publisher (p. 632), DDS_Subscriber (p. 743)
```

Properties:

```
RxO (p. 145) = NO
Changeable (p. 146) = YES (p. 146)
```

5.46.2 Usage

This policy controls the behavior of the **DDS_Entity** (p. 242) as a factory for other entities. It controls whether or not child entities are created in the enabled state.

RTI Data Distribution Service uses a factory design pattern for creating DDS Entities. That is, a parent entity must be used to create child entities. DomainParticipants create Topics, Publishers and Subscribers. Publishers create DataWriters. Subscribers create DataReaders.

By default, a child object is enabled upon creation (initialized and may be actively used). With this QoS policy, a child object can be created in a disabled state. A disabled entity is only partially initialized and cannot be used until

the entity is enabled. Note: an entity can only be *enabled*; it cannot be *disabled* after it has been enabled.

This QoS policy is useful to synchronize the initialization of DDS Entities. For example, when a **DDS_DataReader** (p. 783) is created in an enabled state, its existence is immediately propagated for discovery and the **DDS_DataReader** (p. 783) object's listener called as soon as data is received. The initialization process for an application may extend beyond the creation of the **DDS_DataReader** (p. 783), and thus, it may not be desireable for the **DDS_DataReader** (p. 783) to start to receive or process any data until the initialization process is complete. So by creating readers in a disabled state, your application can make sure that no data is received until the rest of the application initialization is complete, and at that time, enable the them.

Note: if an entity is disabled, then all of the child entities it creates will be disabled too, regardless of the setting of this QoS policy. However, enabling a disabled entity will enable all of its children if this QoS policy is set to automatically enable children entities.

This policy is mutable. A change in the policy affects only the entities created after the change, not any previously created entities.

5.46.3 Field Documentation

5.46.3.1 DDS_Boolean DDS_EntityFactoryQosPolicy::autoenable_created_entities

Specifies whether the entity acting as a factory automatically enables the instances it creates.

The setting of autoenable_created_entities to DDS_BOOLEAN_TRUE (p. 106) indicates that the factory create_<entity> operation(s) will automatically invoke the DDS_Entity_enable (p. 245) operation each time a new DDS_Entity (p. 242) is created. Therefore, the DDS_Entity (p. 242) returned by create_<entity> will already be enabled. A setting of DDS_BOOLEAN_FALSE (p. 107) indicates that the DDS_Entity (p. 242) will not be automatically enabled. Your application will need to call DDS_Entity_enable (p. 245) itself.

The default setting of autoenable_created_entities = DDS_BOOLEAN_-TRUE (p. 106) means that, by default, it is not necessary to explicitly call DDS_Entity_enable (p. 245) on newly created entities.

[default] DDS_BOOLEAN_TRUE (p. 106)

5.47 DDS_EntityNameQosPolicy Struct Reference

Assigns a name to a **DDS_DomainParticipant** (p. 339). This name will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Data Fields

 $\hat{}$ char * name

The actual name string.

5.47.1 Detailed Description

Assigns a name to a **DDS_DomainParticipant** (p. 339). This name will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Entity:

```
DDS_DomainParticipant (p. 339)
```

Properties:

```
\mathbf{RxO}\ (\mathrm{p.145}) = \mathrm{NO}; Changeable (\mathrm{p.146}) = \mathbf{UNTIL}\ \mathbf{ENABLE}\ (\mathrm{p.146})
```

5.47.2 Usage

The name can only be 255 characters in length.

It must be a NULL-terminated string allocated with **DDS_String_alloc** (p. 287) or **DDS_String_dup** (p. 288).

If you provide a non-NULL pointer when getting the QoS, then it should point to valid memory that can be written to, to avoid ungraceful failures.

5.47.3 Field Documentation

5.47.3.1 char* DDS_EntityNameQosPolicy::name

The actual name string.

 $[\mathbf{default}] \ "[\mathbf{ENTITY}]"$

[range] Null terminated string with length not exceeding 255. Can be NULL.

5.48 DDS EnumMember Struct Reference

A description of a member of an enumeration.

Data Fields

^ char * name

The name of the enumeration member.

^ DDS_Long ordinal

The value associated the the enumeration member.

5.48.1 Detailed Description

A description of a member of an enumeration.

See also:

```
DDS_EnumMemberSeq (p. 1212)
DDS_TypeCodeFactory_create_enum_tc (p. 506)
```

5.48.2 Field Documentation

5.48.2.1 char* DDS_EnumMember::name

The name of the enumeration member.

Cannot be NULL.

5.48.2.2 DDS_Long DDS_EnumMember::ordinal

The value associated the the enumeration member.

5.49 DDS_EnumMemberSeq Struct Reference

Defines a sequence of enumerator members.

5.49.1 Detailed Description

Defines a sequence of enumerator members.

See also:

```
\begin{array}{l} \mathbf{DDS\_EnumMember}\ (\mathrm{p.\,1211}) \\ \mathbf{FooSeq}\ (\mathrm{p.\,1497}) \\ \mathbf{DDS\_TypeCodeFactory\_create\_enum\_tc}\ (\mathrm{p.\,506}) \end{array}
```

5.50 DDS_EventQosPolicy Struct Reference

Settings for event.

Data Fields

^ struct DDS_ThreadSettings_t thread

Event thread QoS.

^ DDS_Long initial_count

The initial number of events.

^ DDS_Long max_count

The maximum number of events.

5.50.1 Detailed Description

Settings for event.

In a DDS_DomainParticipant (p. 339), a thread is dedicated to handle all timed events, including checking for timeouts and deadlines and executing internal and user-defined timeout or exception handling routines/callbacks.

This QoS policy allows you to configure thread properties such as priority level and stack size. You can also configure the maximum number of events that can be posted to the event thread. By default, a **DDS_DomainParticipant** (p. 339) will dynamically allocate memory as needed for events posted to the event thread. However, by setting a maximum value or setting the initial and maximum value to be the same, you can either bound the amount of memory allocated for the event thread or prevent a **DDS_DomainParticipant** (p. 339) from dynamically allocating memory for the event thread after initialization.

This QoS policy is an extension to the DDS standard.

Entity:

```
DDS_DomainParticipant (p. 339)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.50.2 Field Documentation

5.50.2.1 struct DDS_ThreadSettings_t DDS_EventQosPolicy::thread [read]

Event thread QoS.

There is only one event thread.

Priority:

[default] The actual value depends on your architecture:

For Windows: -2

For Solaris: OS default priority For Linux: OS default priority

For LynxOS: 13

For VxWorks: 110

For all others: OS default priority.

Stack Size:

[default] The actual value depends on your architecture:

For Windows: OS default stack size For Solaris: OS default stack size For Linux: OS default stack size

For LynxOS: 4*16*1024

For INTEGRITY: 4*20*1024 For VxWorks: 4*16*1024

For all others: OS default stack size.

Mask:

5.50.2.2 DDS_Long DDS_EventQosPolicy::initial_count

The initial number of events.

[default] 256

[range] [1, 1 million], \leq max_count

$5.50.2.3 \quad DDS_Long\ DDS_EventQosPolicy::max_count$

The maximum number of events.

The maximum number of events. If the limit is reached, no new event can be added.

 $[\mathbf{default}] \ \mathbf{DDS_LENGTH_UNLIMITED} \ (\mathrm{p.} \ \underline{174})$

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_count

5.51 DDS_ExclusiveAreaQosPolicy Struct Reference

Configures multi-thread concurrency and deadlock prevention capabilities.

Data Fields

^ DDS_Boolean use_shared_exclusive_area

Whether the DDS_Entity (p. 242) is protected by its own exclusive area or the shared exclusive area.

5.51.1 Detailed Description

Configures multi-thread concurrency and deadlock prevention capabilities.

An "exclusive area" is an abstraction of a multi-thread-safe region. Each entity is protected by one and only one exclusive area, although a single exclusive area may be shared by multiple entities.

Conceptually, an exclusive area is a mutex or monitor with additional deadlock protection features. If a **DDS_Entity** (p. 242) has "entered" its exclusive area to perform a protected operation, no other **DDS_Entity** (p. 242) sharing the same exclusive area may enter it until the first **DDS_Entity** (p. 242) "exits" the exclusive area.

Entity:

```
DDS_Publisher (p. 632), DDS_Subscriber (p. 743)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

See also:

```
DDS_Listener (p. 1246)
```

5.51.2 Usage

Exclusive Areas (EAs) allow RTI Data Distribution Service to be multi-threaded while preventing deadlock in multi-threaded applications. EAs prevent a **DDS_-DomainParticipant** (p. 339) object's internal threads from deadlocking with

each other when executing internal code as well as when executing the code of user-registered listener callbacks.

Within an EA, all calls to the code protected by the EA are single threaded. Each DDS_DomainParticipant (p. 339), DDS_Publisher (p. 632) and DDS_Subscriber (p. 743) entity represents a separate EA. Thus all DataWriters of the same Publisher and all DataReaders of the same Subscriber share the EA of its parent. Note: this means that operations on the DataWriters of the same Publisher and on the DataReaders of the same Subscriber will be serialized, even when invoked from multiple concurrent application threads.

Within an EA, there are limitations on how code protected by a different EA can be accessed. For example, when received data is being processed by user code in the DataReader Listener, within a Subscriber EA, the user code may call the FooDataWriter_write (p. 684) operation of a DataWriter that is protected by the EA of its Publisher, so you can send data in the function called to process received data. However, you cannot create entities or call functions that are protected by the EA of the DDS_DomainParticipant (p. 339). See Chapter 4 in the RTI Data Distribution Service User's Manual for complete documentation on Exclusive Areas.

With this QoS policy, you can force a **DDS_Publisher** (p. 632) or **DDS_Subscriber** (p. 743) to share the same EA as its **DDS_DomainParticipant** (p. 339). Using this capability, the restriction of not being able to create entities in a DataReader Listener's on_data_available() callback is lifted. However, the tradeoff is that the application has reduced concurrency through the Entities that share an EA.

Note that the restrictions on calling methods in a different EA only exist for user code that is called in registered DDS Listeners by internal DomainParticipant threads. User code may call all RTI Data Distribution Service functions for any DDS Entities from their own threads at any time.

5.51.3 Field Documentation

5.51.3.1 DDS_Boolean DDS_ExclusiveAreaQosPolicy::use_shared_-exclusive_area

Whether the **DDS_Entity** (p. 242) is protected by its own exclusive area or the shared exclusive area.

All writers belonging to the same **DDS_Publisher** (p. 632) are protected by the same exclusive area as the **DDS_Publisher** (p. 632) itself. The same is true of all readers belonging to the same **DDS_Subscriber** (p. 743). Typically, the publishers and subscribers themselves do not share their exclusive areas with each other; each has its own. This configuration maximizes the concurrency of the system because independent readers and writers do not need to take the

same mutexes in order to operate. However, it places some restrictions on the operations that may be invoked from within listener callbacks because of the possibility of a deadlock. See the **DDS_Listener** (p. 1246) documentation for more details.

If this field is set to DDS_BOOLEAN_FALSE (p. 107), the default more concurrent behavior will be used. In the event that this behavior is insufficiently flexible for your application, you may set this value to DDS_BOOLEAN_TRUE (p. 106). In that case, the DDS_Subscriber (p. 743) or DDS_Publisher (p. 632) in question, and all of the readers or writers (as appropriate) created from it, will share a global exclusive area. This global exclusive area is shared by all entities whose value for this QoS field is DDS_BOOLEAN_TRUE (p. 106). By sharing the same exclusive area across a larger number of entities, the concurrency of the system will be decreased; however, some of the callback restrictions will be relaxed.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.52 DDS_FloatSeq Struct Reference

```
{\rm Instantiates} \; {\tt FooSeq} \; \; ({\rm p.}\, {\tt 1497}) < {\bf DDS\_Float} \; ({\rm p.}\, {\tt 108}) >.
```

5.52.1 Detailed Description

```
Instantiates FooSeq (p. 1497) < DDS_Float (p. 108) >.
```

Instantiates:

```
<< generic>> (p. 950) FooSeq (p. 1497)
```

See also:

```
\begin{array}{l} \mathbf{DDS\_Float} \ (\mathrm{p.} \ 108) \\ \mathbf{FooSeq} \ (\mathrm{p.} \ 1497) \end{array}
```

$\begin{array}{ccc} \mathbf{5.53} & \mathbf{DDS_FlowControllerProperty_t} & \mathbf{Struct} \\ & \mathbf{Reference} \end{array}$

Determines the flow control characteristics of the **DDS_FlowController** (p. 726).

Data Fields

- ^ DDS_FlowControllerSchedulingPolicy scheduling_policy Scheduling policy.
- ^ struct DDS_FlowControllerTokenBucketProperty_t token_bucket

Settings for the token bucket.

5.53.1 Detailed Description

Determines the flow control characteristics of the **DDS_FlowController** (p. 726).

The flow control characteristics shape the network traffic by determining how often and in what order associated asynchronous **DDS_DataWriter** (p. 673) instances are serviced and how much data they are allowed to send.

Note that these settings apply directly to the DDS_FlowController (p. 726), and does not depend on the number of DDS_DataWriter (p. 673) instances the DDS_FlowController (p. 726) is servicing. For instance, the specified flow rate does *not* double simply because two DDS_DataWriter (p. 673) instances are waiting to write.

Entity:

DDS_FlowController (p. 726)

Properties:

$$\mathbf{RxO} \ (p. 145) = N/A$$

 used to create an *on-demand* **DDS_FlowController** (p. 726). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

5.53.2 Field Documentation

5.53.2.1 DDS_FlowControllerSchedulingPolicy DDS_FlowControllerProperty_t::scheduling_policy

Scheduling policy.

Determines the scheduling policy for servicing the $DDS_DataWriter$ (p. 673) instances associated with the $DDS_FlowController$ (p. 726).

 $[\textbf{default}] \qquad \qquad \text{idref_FlowControllerSchedulingPolicy_EDF_FLOW_-CONTROLLER_SCHED_POLICY}$

$\begin{array}{ll} \textbf{5.53.2.2} & \textbf{struct DDS_FlowControllerTokenBucketProperty_t} \\ & \textbf{DDS_FlowControllerProperty_t::token_bucket} & \textbf{[read]} \end{array}$

Settings for the token bucket.

5.54 DDS_FlowControllerTokenBucketProperty_t Struct Reference

DDS_FlowController (p. 726) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Data Fields

^ DDS_Long max_tokens

Maximum number of tokens than can accumulate in the token bucket.

DDS_Long tokens_added_per_period

The number of tokens added to the token bucket per specified period.

^ DDS_Long tokens_leaked_per_period

The number of tokens removed from the token bucket per specified period.

^ struct DDS_Duration_t period

Period for adding tokens to and removing tokens from the bucket.

^ DDS_Long bytes_per_token

Maximum number of bytes allowed to send for each token available.

5.54.1 Detailed Description

DDS_FlowController (p. 726) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Asynchronously published samples are queued up and transmitted based on the token bucket flow control scheme. The token bucket contains tokens, each of which represents a number of bytes. Samples can be sent only when there are sufficient tokens in the bucket. As samples are sent, tokens are consumed. The number of tokens consumed is proportional to the size of the data being sent. Tokens are replenished on a periodic basis.

The rate at which tokens become available and other token bucket properties determine the network traffic flow.

Note that if the same sample must be sent to multiple destinations, separate tokens are required for each destination. Only when multiple samples are destined to the same destination will they be co-alesced and sent using the same

5.54 DDS_FlowControllerTokenBucketProperty_t Struct Reference23

token(s). In other words, each token can only contribute to a single network packet.

Entity:

DDS_FlowController (p. 726)

Properties:

$$\mathbf{RxO} \ (\mathbf{p.145}) = \mathbf{N/A}$$

Changeable (p. 146) = YES (p. 146). However, the special value of DDS_DURATION_INFINITE (p. 113) as DDS_-FlowControllerTokenBucketProperty_t::period (p. 1224) is strictly used to create an *on-demand* DDS_FlowController (p. 726). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

5.54.2 Field Documentation

5.54.2.1 DDS_Long DDS_FlowControllerTokenBucketProperty_t::max_tokens

Maximum number of tokens than can accumulate in the token bucket.

The number of tokens in the bucket will never exceed this value. Any excess tokens are discarded. This property value, combined with **DDS_-FlowControllerTokenBucketProperty_t::bytes_per_token** (p. 1225), determines the maximum allowable data burst.

Use **DDS_LENGTH_UNLIMITED** (p. 174) to allow accumulation of an unlimited amount of tokens (and therefore potentially an unlimited burst size).

[default] DDS_LENGTH_UNLIMITED (p. 174)

$\begin{array}{ccc} \textbf{5.54.2.2} & \textbf{DDS_Long} \ \textbf{DDS_FlowControllerTokenBucketProperty_-} \\ & \textbf{t::} tokens_added_per_period \end{array}$

The number of tokens added to the token bucket per specified period.

DDS_FlowController (p. 726) transmits data only when tokens are available. Tokens are periodically replenished. This field determines the number of tokens added to the token bucket with each periodic replenishment.

Available tokens are distributed to associated **DDS_DataWriter** (p. 673) instances based on the **DDS_FlowControllerProperty_t::scheduling_policy** (p. 1221).

Use DDS_LENGTH_UNLIMITED (p. 174) to add the maximum number of tokens allowed by DDS_FlowControllerTokenBucketProperty_t::max_tokens (p. 1223).

[default] DDS_LENGTH_UNLIMITED (p. 174)

5.54.2.3 DDS_Long DDS_FlowControllerTokenBucketProperty_t::tokens_leaked_per_period

The number of tokens removed from the token bucket per specified period.

DDS_FlowController (p. 726) transmits data only when tokens are available. When tokens are replenished and there are sufficient tokens to send all samples in the queue, this property determines whether any or all of the leftover tokens remain in the bucket.

Use **DDS_LENGTH_UNLIMITED** (p. 174) to remove all excess tokens from the token bucket once all samples have been sent. In other words, no token accumulation is allowed. When new samples are written after tokens were purged, the earliest point in time at which they can be sent is at the next periodic replenishment.

[default] 0

5.54.2.4 struct DDS_Duration_t DDS_-FlowControllerTokenBucketProperty_t::period

Period for adding tokens to and removing tokens from the bucket.

DDS_FlowController (p. 726) transmits data only when tokens are available. This field determines the period by which tokens are added or removed from the token bucket.

The special value **DDS_DURATION_INFINITE** (p. 113) can be used to create an *on-demand* **DDS_FlowController** (p. 726), for which tokens are no longer replenished periodically. Instead, tokens must be added explicitly by calling **DDS_FlowController_trigger_flow** (p. 730). This external trigger adds **DDS_FlowControllerTokenBucketProperty_t::tokens_added_per_period** (p. 1223) tokens each time it is called (subject to the other property settings).

[default] 1 second

[range] [0,1 year] or DDS_DURATION_INFINITE (p. 113)

5.54.2.5 DDS_Long DDS_FlowControllerTokenBucketProperty_t::bytes_per_token

Maximum number of bytes allowed to send for each token available.

DDS_FlowController (p. 726) transmits data only when tokens are available. This field determines the number of bytes that can actually be transmitted based on the number of tokens.

Tokens are always consumed in whole by each DDS_DataWriter (p. 673). That is, in cases where DDS_FlowControllerTokenBucketProperty_t::bytes_per_token (p. 1225) is greater than the sample size, multiple samples may be sent to the same destination using a single token (regardless of DDS_FlowControllerProperty_t::scheduling_policy (p. 1221)).

Where fragmentation is required, the fragment size will be DDS_-FlowControllerTokenBucketProperty_t::bytes_per_token (p. 1225) or the minimum largest message size across all transports installed with the DDS_-DataWriter (p. 673), whichever is less.

Use **DDS_LENGTH_UNLIMITED** (p. 174) to indicate that an unlimited number of bytes can be transmitted per token. In other words, a single token allows the recipient **DDS_DataWriter** (p. 673) to transmit all its queued samples to a single destination. A separate token is required to send to each additional destination.

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1024,DDS_LENGTH_UNLIMITED (p. 174)]

5.55 DDS_GroupDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Data Fields

 ${\bf \hat{}}$ struct DDS_OctetSeq value

a sequence of octets

5.55.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Entity:

```
DDS_Publisher (p. 632), DDS_Subscriber (p. 743)
```

Properties:

```
RxO (p. 145) = NO
Changeable (p. 146) = YES (p. 146)
```

See also:

DDS_DomainParticipant_get_builtin_subscriber (p. 388)

5.55.2 Usage

The additional information is attached to a **DDS_Publisher** (p. 632) or **DDS_Subscriber** (p. 743). This extra data is not used by RTI Data Distribution Service itself. When a remote application discovers the **DDS_Publisher** (p. 632) or **DDS_Subscriber** (p. 743), it can access that information and use it for its own purposes.

Use cases for this QoS policy, as well as the **DDS_TopicDataQosPolicy** (p. 1439) and **DDS_UserDataQosPolicy** (p. 1474), are often application-to-application identification, authentication, authorization, and encryption purposes. For example, applications can use Group or User Data to send security certificates to each other for RSA-type security.

In combination with DDS_DataReaderListener (p. 1065), DDS_{-} DataWriterListener (p. 1102)and operations such DDS_{-} as DomainParticipant_ignore_publication DDS_{-} (p.392)and DomainParticipant_ignore_subscription (p. 393), this QoS policy can help an application to define and enforce its own security policies. example, an application can implement matching policies similar to those of the DDS_PartitionQosPolicy (p. 1294), except the decision can be made based on an application-defined policy.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Data Distribution Service stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Data Distribution Service with the maximum size of the data that will be stored in policies of this type. This size is configured with DDS_DomainParticipantResourceLimitsQosPolicy::publisher_-group_data_max_length (p. 1175) and DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_-data_max_length (p. 1175).

5.55.3 Field Documentation

5.55.3.1 struct DDS_OctetSeq DDS_GroupDataQosPolicy::value [read]

a sequence of octets

[default] Empty (zero-sized)

[range] Octet sequence of length [0,max_length]

5.56 DDS_GUID_t Struct Reference

Type for GUID (Global Unique Identifier) representation.

Data Fields

^ DDS_Octet value [16]

A 16 byte array containing the GUID value.

5.56.1 Detailed Description

Type for GUID (Global Unique Identifier) representation. Represents a 128 bit GUID.

5.56.2 Field Documentation

${\bf 5.56.2.1} \quad DDS_Octet\ DDS_GUID_t::value[16]$

A 16 byte array containing the GUID value.

5.57 DDS_HistoryQosPolicy Struct Reference

Specifies the behavior of RTI Data Distribution Service in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Data Fields

^ DDS_HistoryQosPolicyKind kind

Specifies the kind of history to be kept.

^ DDS_Long depth

Specifies the number of samples to be kept, when the kind is DDS_KEEP_-LAST_HISTORY_QOS (p. 171).

^ DDS_RefilterQosPolicyKind refilter

<<eXtension>> (p. 950) Specifies how a writer should handle previously written samples to a new reader.

5.57.1 Detailed Description

Specifies the behavior of RTI Data Distribution Service in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

This QoS policy specifies how much data must to stored by RTI Data Distribution Service for a **DDS_DataWriter** (p. 673) or **DDS_DataReader** (p. 783). It controls whether RTI Data Distribution Service should deliver only the most recent value, attempt to deliver all intermediate values, or do something in between.

On the publishing side, this QoS policy controls the samples that should be maintained by the DDS_DataWriter (p. 673) on behalf of existing DDS_DataReader (p. 783) entities. The behavior with regards to a DDS_DataReader (p. 783) entities discovered after a sample is written is controlled by the DURABILITY (p. 153) policy.

On the subscribing side, this QoS policy controls the samples that should be maintained until the application "takes" them from RTI Data Distribution Service.

Entity:

DDS_Topic (p. 425), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)

Properties:

```
\mathbf{RxO} (p. 145) = NO
Changeable (p. 146) = UNTIL ENABLE (p. 146)
```

See also:

```
DDS_ReliabilityQosPolicy (p. 1342)
DDS_HistoryQosPolicy (p. 1229)
```

5.57.2 Usage

This policy controls the behavior of RTI Data Distribution Service when the value of an instance changes before it is finally communicated to **DDS_-DataReader** (p. 783) entities.

When a DDS_DataWriter (p. 673) sends data, or a DDS_DataReader (p. 783) receives data, the data sent or received is stored in a cache whose contents are controlled by this QoS policy. This QoS policy interacts with DDS_ReliabilityQosPolicy (p. 1342) by controlling whether RTI Data Distribution Service guarantees that *all* of the sent data is received (DDS_KEEP_ALL_HISTORY_QOS (p. 171)) or if only the last N data values sent are guaranteed to be received (DDS_KEEP_ALL_HISTORY_QOS (p. 171))—this is a reduced level of reliability.

The amount of data that is sent to new DataReaders who have configured their **DDS_DurabilityQosPolicy** (p. 1181) to receive previously published data is also controlled by the History QoS policy.

Note that the History QoS policy does not control the *physical* sizes of the send and receive queues. The memory allocation for the queues is controlled by the **DDS_ResourceLimitsQosPolicy** (p. 1356).

If kind is DDS_KEEP_LAST_HISTORY_QOS (p. 171) (the default), then RTI Data Distribution Service will only attempt to keep the latest values of the instance and discard the older ones. In this case, the value of depth regulates the maximum number of values (up to and including the most current one) RTI Data Distribution Service will maintain and deliver. After N values have been sent or received, any new data will overwrite the oldest data in the queue. Thus the queue acts like a circular buffer of length N.

The default (and most common setting) for depth is 1, indicating that only the most recent value should be delivered.

If kind is DDS_KEEP_ALL_HISTORY_QOS (p. 171), then RTI Data Distribution Service will attempt to maintain and deliver all the values of the instance to existing subscribers. The resources that RTI Data Distribution Service can use to keep this history are limited by the settings of the RE-SOURCE_LIMITS (p. 174). If the limit is reached, then the behavior of RTI

Data Distribution Service will depend on the **RELIABILITY** (p. 166). If the Reliability kind is **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 167), then the old values will be discarded. If Reliability kind is RELIABLE, then RTI Data Distribution Service will block the **DDS_DataWriter** (p. 673) until it can deliver the necessary old values to all subscribers.

If refilter is DDS_NONE_REFILTER_QOS (p. 171), then samples written before a DataReader is matched to a DataWriter are not refiltered by the DataWriter.

If refilter is DDS_ALL_REFILTER_QOS (p. 172), then all samples written before a DataReader is matched to a DataWriter are refiltered by the DataWriter when the DataReader is matched.

If refilter is DDS_ON_DEMAND_REFILTER_QOS (p. 172), then a DataWriter will only refilter samples that a DataReader requests.

5.57.3 Consistency

This QoS policy's depth must be consistent with the **RESOURCE_LIMITS** (p. 174) max_samples_per_instance. For these two QoS to be consistent, they must verify that $depth <= max_samples_per_instance$.

See also:

DDS_ResourceLimitsQosPolicy (p. 1356)

5.57.4 Field Documentation

5.57.4.1 DDS_HistoryQosPolicyKind DDS_HistoryQosPolicy::kind

Specifies the kind of history to be kept.

[default] DDS_KEEP_LAST_HISTORY_QOS (p. 171)

5.57.4.2 DDS_Long DDS_HistoryQosPolicy::depth

Specifies the number of samples to be kept, when the kind is DDS_KEEP_LAST_HISTORY_QOS (p. 171).

If a value other than 1 (the default) is specified, it should be consistent with the settings of the **RESOURCE_LIMITS** (p. 174) policy. That is:

 $\label{eq:depth} \begin{array}{ll} \operatorname{depth} & <= & \mathbf{DDS_ResourceLimitsQosPolicy::max_samples_per_instance} \\ & (\mathrm{p.}\,1359) \end{array}$

When the kind is DDS_KEEP_ALL_HISTORY_QOS (p. 171), the depth has no effect. Its implied value is infinity (in practice limited by the settings

of the ${\bf RESOURCE_LIMITS}$ (p. 174) policy).

[default] 1

 $[range] \quad [1{,}100 \quad million], \quad <= \quad \textbf{DDS_ResourceLimitsQosPolicy::max_-samples_per_instance} \ (p. 1359)$

$\begin{array}{ccc} 5.57.4.3 & DDS_RefilterQosPolicyKind & DDS_\\ & HistoryQosPolicy::refilter \end{array}$

<<eXtension>> (p. 950) Specifies how a writer should handle previously written samples to a new reader.

[default] DDS_NONE_REFILTER_QOS (p. 171)

5.58 DDS_InconsistentTopicStatus Struct Reference

DDS_INCONSISTENT_TOPIC_STATUS (p. 128)

Data Fields

^ DDS_Long total_count

Total cumulative count of the Topics discovered whose name matches the DDS_Topic (p. 425) to which this status is attached and whose type is inconsistent with that of that DDS_Topic (p. 425).

^ DDS_Long total_count_change

The incremental number of inconsistent topics discovered since the last time this status was read.

5.58.1 Detailed Description

DDS_INCONSISTENT_TOPIC_STATUS (p. 128)

Entity:

```
DDS_Topic (p. 425)
```

Listener:

```
DDS_TopicListener (p. 1441)
```

A remote **DDS_Topic** (p. 425) will be inconsistent with the locally created **DDS_Topic** (p. 425) if the type name of the two topics are different.

5.58.2 Field Documentation

5.58.2.1 DDS_Long DDS_InconsistentTopicStatus::total_count

Total cumulative count of the Topics discovered whose name matches the **DDS**_Topic (p. 425) to which this status is attached and whose type is inconsistent with that of that **DDS**_Topic (p. 425).

${\bf 5.58.2.2} \quad DDS_Long\ DDS_InconsistentTopicStatus::total_count_-\\ change$

The incremental number of inconsistent topics discovered since the last time this status was read.

5.59 DDS_InstanceHandleSeq Struct Reference

 ${\rm Instantiates} \; {\rm FooSeq} \; \; ({\rm p.}\, 1497) < {\bf DDS_InstanceHandle_t} \; ({\rm p.}\, 452) > .$

5.59.1 Detailed Description

Instantiates FooSeq (p. 1497) < DDS_InstanceHandle_t (p. 452) > .

Instantiates:

```

```

See also:

```
DDS_InstanceHandle_t (p. 452)
FooSeq (p. 1497)
```

5.60 DDS_KeyedOctets Struct Reference

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

Data Fields

 $\hat{}$ char * **key**

Instance key associated with the specified value.

î int length

Number of octets to serialize.

^ unsigned char * value

DDS_Octets (p. 1272) array value.

5.60.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

5.61 DDS_KeyedOctetsSeq Struct Reference

Instantiates FooSeq (p. 1497) < DDS_KeyedOctets (p. 1236) >.

5.61.1 Detailed Description

Instantiates FooSeq (p. 1497) $< DDS_KeyedOctets$ (p. 1236) >.

Instantiates:

```
<< generic>> (p. 950) FooSeq (p. 1497)
```

5.65.1 Detailed Description

<<iinterface>> (p. 950) Keyed string type support.

5.66 DDS_LatencyBudgetQosPolicy Struct Reference

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Data Fields

* struct DDS_Duration_t duration

Duration of the maximum acceptable delay.

5.66.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

This policy is a *hint* to a DDS implementation; it can be used to change how it processes and sends data that has low latency requirements. The DDS specification does not mandate whether or how this policy is used.

Entity:

```
DDS_Topic (p. 425), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Status:

```
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129),
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129)
```

Properties:

```
\mathbf{RxO} (p. 145) = YES
Changeable (p. 146) = YES (p. 146)
```

See also:

```
DDS_PublishModeQosPolicy (p. 1331)
DDS_FlowController (p. 726)
```

5.66.2 Usage

This policy provides a means for the application to indicate to the middleware the urgency of the data communication. By having a non-zero duration, RTI Data Distribution Service can optimize its internal operation.

RTI Data Distribution Service uses it in conjunction with DDS_-ASYNCHRONOUS_PUBLISH_MODE_QOS (p.222) DDS_{-} DDS_EDF_-**DataWriter** (p.673)instances associated with a (p.727)FLOW_CONTROLLER_SCHED_POLICY DDS_{-} FlowController (p. 726) only. Together with the time of write, DDS_-LatencyBudgetQosPolicy::duration (p. 1243) determines the deadline of each individual sample. RTI Data Distribution Service uses this information to prioritize the sending of asynchronously published data; see DDS_AsynchronousPublisherQosPolicy (p. 1035).

5.66.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality offered duration <= requested duration evaluates to 'TRUE'.

5.66.4 Field Documentation

5.66.4.1 struct DDS_Duration_t DDS_-LatencyBudgetQosPolicy::duration [read]

Duration of the maximum acceptable delay.

[default] 0 (meaning minimize the delay)

5.67 DDS_LifespanQosPolicy Struct Reference

Specifies how long the data written by the **DDS_DataWriter** (p. 673) is considered valid.

Data Fields

^ struct DDS_Duration_t duration

Maximum duration for the data's validity.

5.67.1 Detailed Description

Specifies how long the data written by the **DDS_DataWriter** (p. 673) is considered valid.

Each data sample written by the **DDS_DataWriter** (p. 673) has an associated expiration time beyond which the data should not be delivered to any application. Once the sample expires, the data will be removed from the **DDS_DataReader** (p. 783) caches as well as from the transient and persistent information caches.

The expiration time of each sample from the **DDS_DataWriter** (p. 673)'s cache is computed by adding the duration specified by this QoS policy to the sample's source timestamp. The expiration time of each sample from the **DDS_DataReader** (p. 783)'s cache is computed by adding the duration to the reception timestamp.

See also:

```
FooDataWriter_write (p. 684)
FooDataWriter_write_w_timestamp (p. 686)
```

Entity:

```
DDS_Topic (p. 425), DDS_DataWriter (p. 673)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = YES (p. 146)
```

5.67.2 Usage

The Lifespan QoS policy can be used to control how much data is stored by RTI Data Distribution Service. Even if it is configured to store "all" of the data

sent or received for a topic (see **DDS_HistoryQosPolicy** (p. 1229)), the total amount of data it stores may be limited by this QoS policy.

You may also use this QoS policy to ensure that applications do not receive or act on data, commands or messages that are too old and have "expired.

To avoid inconsistencies, multiple writers of the same instance should have the same lifespan.

See also:

```
DDS_SampleInfo::source_timestamp (p. 1389)
DDS_SampleInfo::reception_timestamp (p. 1391)
```

5.67.3 Field Documentation

5.67.3.1 struct DDS_Duration_t DDS_LifespanQosPolicy::duration [read]

Maximum duration for the data's validity.

```
[default] DDS_DURATION_INFINITE (p. 113)
```

[range] [1 nanosec, 1 year] or DDS_DURATION_INFINITE (p. 113)

5.68 DDS Listener Struct Reference

<< interface>> (p. 950) Abstract base class for all Listener interfaces.

Data Fields

 $^{\circ}$ void * listener_data

A place for listener implementors to keep a pointer to data that may be needed by their listener.

5.68.1 Detailed Description

```
<<iinterface>> (p. 950) Abstract base class for all Listener interfaces.
```

Entity:

DDS_Entity (p. 242)

QoS:

QoS Policies (p. 137)

Status:

Status Kinds (p. 123)

All the supported kinds of concrete **DDS_Listener** (p. 1246) interfaces (one per concrete **DDS_Entity** (p. 242) type) derive from this root and add functions whose prototype depends on the concrete Listener.

Listeners provide a way for RTI Data Distribution Service to asynchronously alert the application when there are relevant status changes.

Almost every application will have to implement listener interfaces.

Each dedicated listener presents a list of operations that correspond to the relevant communication status changes to which an application may respond.

The same **DDS_Listener** (p. 1246) instance may be shared among multiple entities if you so desire. Consequently, the provided parameter contains a reference to the concerned **DDS_Entity** (p. 242).

5.68.2 Access to Plain Communication Status

The general mapping between the plain communication statuses (see **Status Kinds** (p. 123)) and the listeners' operations is as follows:

- For each communication status, there is a corresponding operation whose name is on_<communication_status>(), which takes a parameter of type <communication_status> as listed in Status Kinds (p. 123).
- on_<communication_status> is available on the relevant **DDS_Entity** (p. 242) as well as those that embed it, as expressed in the following figure:
- ^ When the application attaches a listener on an entity, it must set a mask. The mask indicates to RTI Data Distribution Service which operations are enabled within the listener (cf. operation **DDS_Entity** (p. 242) set_listener()).
- ^ When a plain communication status changes, RTI Data Distribution Service triggers the most specific relevant listener operation that is enabled. In case the most specific relevant listener operation corresponds to an application-installed 'nil' listener the operation will be considered handled by a NO-OP operation that does not reset the communication status.

This behavior allows the application to set a default behavior (e.g., in the listener associated with the **DDS_DomainParticipant** (p. 339)) and to set dedicated behaviors only where needed.

5.68.3 Access to Read Communication Status

The two statuses related to data arrival are treated slightly differently. Since they constitute the core purpose of the Data Distribution Service, there is no need to provide a default mechanism (as is done for the plain communication statuses above).

The rule is as follows. Each time the read communication status changes:

- ^ First, RTI Data Distribution Service tries to trigger the **DDS_- SubscriberListener::on_data_on_readers** (p. 1406) with a parameter of the related **DDS_Subscriber** (p. 743);
- ^ If this does not succeed (there is no listener or the operation is not enabled), RTI Data Distribution Service tries to trigger DDS_-DataReaderListener::on_data_available (p. 1067) on all the related DDS_DataReaderListener (p. 1065) objects, with a parameter of the related DDS_DataReader (p. 783).

The rationale is that either the application is interested in relations among data arrivals and it must use the first option (and then get the corresponding DDS_DataReader (p. 783) objects by calling DDS_Subscriber_get_datareaders

(p. 756) on the related **DDS_Subscriber** (p. 743) and then get the data by calling **FooDataReader_read** (p. 788) or **FooDataReader_take** (p. 789) on the returned **DDS_DataReader** (p. 783) objects), or it wants to treat each **DDS_DataReader** (p. 783) independently and it may choose the second option (and then get the data by calling **FooDataReader_read** (p. 788) or **FooDataReader_take** (p. 789) on the related **DDS_DataReader** (p. 783)).

Note that if DDS_SubscriberListener::on_data_on_readers (p. 1406) is called, RTI Data Distribution Service will *not* try to call DDS_DataReaderListener::on_data_available (p. 1067). However, an application can force a call to the DDS_DataReader (p. 783) objects that have data by calling DDS_Subscriber_notify_datareaders (p. 757).

5.68.4 Operations Allowed in Listener Callbacks

The operations that are allowed in DDS_Listener (p. 1246) callbacks depend on the DDS_ExclusiveAreaQosPolicy (p. 1216) QoS policy of the DDS_Entity (p. 242) to which the DDS_Listener (p. 1246) is attached – or in the case of a DDS_DataWriter (p. 673) of DDS_DataReader (p. 783) listener, on the DDS_ExclusiveAreaQosPolicy (p. 1216) QoS of the parent DDS_Publisher (p. 632) or DDS_Subscriber (p. 743). For instance, the DDS_ExclusiveAreaQosPolicy (p. 1216) settings of a DDS_Subscriber (p. 743) will determine which operations are allowed within the callbacks of the listeners associated with all the DataReaders created through that DDS_Subscriber (p. 743).

Note: these restrictions do not apply to builtin topic listener callbacks.

Regardless of whether DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area (p. 1217) is set to DDS_BOOLEAN_TRUE (p. 106) or DDS_BOOLEAN_FALSE (p. 107), the following operations are *not* allowed:

- Within any listener callback, deleting the entity to which the DDS_-Listener (p. 1246) is attached
- Within a **DDS_Topic** (p. 425) listener callback, any operations on any subscribers, readers, publishers or writers

An attempt to call a disallowed function from within a callback will result in **DDS_RETCODE_ILLEGAL_OPERATION** (p. 122).

If DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area (p. 1217) is set to DDS_BOOLEAN_FALSE (p. 107), the setting which allows more concurrency among RTI Data Distribution Service threads, the following are *not* allowed:

Within any listener callback, creating any entity

- ^ Within any listener callback, deleting any entity
- ^ Within any listener callback, enabling any entity
- Within any listener callback, setting the QoS of any entities
- Within a DDS_DataReader (p. 783) or DDS_Subscriber (p. 743) listener callback, invoking any operation on any other DDS_Subscriber (p. 743) or on any DDS_DataReader (p. 783) belonging to another DDS_Subscriber (p. 743).
- Within a DDS_DataReader (p. 783) or DDS_Subscriber (p. 743) listener callback, invoking any operation on any DDS_Publisher (p. 632) (or on any DDS_DataWriter (p. 673) belonging to such a DDS_Publisher (p. 632)) that has DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area (p. 1217) set to DDS_BOOLEAN_TRUE (p. 106).
- Within a DDS_DataWriter (p. 673) of DDS_Publisher (p. 632) listener callback, invoking any operation on another Publisher or on a DDS_DataWriter (p. 673) belonging to another DDS_Publisher (p. 632).
- Within a DDS_DataWriter (p. 673) of DDS_Publisher (p. 632) listener callback, invoking any operation on any DDS_Subscriber (p. 743) or DDS_DataReader (p. 783).

An attempt to call a disallowed function from within a callback will result in **DDS_RETCODE_ILLEGAL_OPERATION** (p. 122).

The above limitations can be lifted by setting DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area (p. 1217) to DDS_BOOLEAN_TRUE (p. 106) on the DDS_Publisher (p. 632) or DDS_Subscriber (p. 743) (or on the DDS_Publisher (p. 632)/ DDS_Subscriber (p. 743) of the DDS_DataWriter (p. 673)/DDS_DataReader (p. 783)) to which the listener is attached. However, the application will pay the cost of reduced concurrency between the affected publishers and subscribers.

Data Fields

^ DDS_Long alive_count

The total count of currently alive DDS_DataWriter (p. 673) entities that write the DDS_Topic (p. 425) the DDS_DataReader (p. 783) reads.

DDS_Long not_alive_count

The total count of currently not_alive DDS_DataWriter (p. 673) entities that write the DDS_Topic (p. 425) the DDS_DataReader (p. 783) reads.

^ DDS_Long alive_count_change

The change in the alive_count since the last time the listener was called or the status was read.

^ DDS_Long not_alive_count_change

The change in the not_alive_count since the last time the listener was called or the status was read.

^ DDS_InstanceHandle_t last_publication_handle

An instance handle to the last remote writer to change its liveliness.

5.69.1 Detailed Description

DDS_LIVELINESS_CHANGED_STATUS (p. 131)

Examples:

 $HelloWorld_subscriber.c.$

5.69.2 Field Documentation

$5.69.2.1 \quad DDS_Long\ DDS_Live liness Changed Status :: a live_count$

The total count of currently alive **DDS_DataWriter** (p. 673) entities that write the **DDS_Topic** (p. 425) the **DDS_DataReader** (p. 783) reads.

$5.69.2.2 \quad DDS_Long\ DDS_Live liness Changed Status::not_alive_count$

The total count of currently not_alive **DDS_DataWriter** (p. 673) entities that write the **DDS_Topic** (p. 425) the **DDS_DataReader** (p. 783) reads.

${\bf 5.69.2.3} \quad {\bf DDS_Long} \ {\bf DDS_LivelinessChangedStatus::alive_count_-change}$

The change in the alive_count since the last time the listener was called or the status was read.

${\bf 5.69.2.4} \quad {\bf DDS_Long} \ {\bf DDS_LivelinessChangedStatus::} not_alive_-count_change$

The change in the not_alive_count since the last time the listener was called or the status was read.

5.69.2.5 DDS_InstanceHandle_t DDS_-LivelinessChangedStatus::last_publication_handle

An instance handle to the last remote writer to change its liveliness.

5.70 DDS_LivelinessLostStatus Struct Reference

DDS_LIVELINESS_LOST_STATUS (p. 131)

Data Fields

^ DDS_Long total_count

Total cumulative number of times that a previously-alive DDS_DataWriter (p. 673) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.

DDS_Long total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

5.70.1 Detailed Description

DDS_LIVELINESS_LOST_STATUS (p. 131)

Entity:

DDS_DataWriter (p. 673)

Listener:

DDS_DataWriterListener (p. 1102)

The liveliness that the **DDS_DataWriter** (p. 673) has committed through its **DDS_LivelinessQosPolicy** (p. 1254) was not respected; thus **DDS_DataReader** (p. 783) entities will consider the **DDS_DataWriter** (p. 673) as no longer "alive/active".

5.70.2 Field Documentation

5.70.2.1 DDS_Long DDS_LivelinessLostStatus::total_count

Total cumulative number of times that a previously-alive **DDS_DataWriter** (p. 673) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.

This count does not change when an already not alive **DDS_DataWriter** (p. 673) simply remains not alive for another liveliness period.

$5.70.2.2 \quad DDS_Long\ DDS_LivelinessLostStatus:: total_count_change$

The incremental changees in total_count since the last time the listener was called or the status was read.

5.71 DDS_LivelinessQosPolicy Struct Reference

Specifies and configures the mechanism that allows **DDS_DataReader** (p. 783) entities to detect when **DDS_DataWriter** (p. 673) entities become disconnected or "dead.".

Data Fields

^ DDS_LivelinessQosPolicyKind kind

The kind of liveliness desired.

`struct DDS_Duration_t lease_duration

The duration within which a DDS_Entity (p. 242) must be asserted, or else it is assumed to be not alive.

5.71.1 Detailed Description

Specifies and configures the mechanism that allows **DDS_DataReader** (p. 783) entities to detect when **DDS_DataWriter** (p. 673) entities become disconnected or "dead.".

Liveliness must be asserted at least once every lease_duration otherwise RTI Data Distribution Service will assume the corresponding **DDS_Entity** (p. 242) or is no longer alive.

The liveliness status of a **DDS_Entity** (p. 242) is used to maintain instance ownership in combination with the setting of the **OWNERSHIP** (p. 159) policy. The application is also informed via **DDS_Listener** (p. 1246) when an **DDS_Entity** (p. 242) is no longer alive.

A DDS_DataReader (p. 783) requests that liveliness of writers is maintained by the requested means and loss of liveliness is detected with delay not to exceed the lease_duration.

A **DDS_DataWriter** (p.673) commits to signalling its liveliness using the stated means at intervals not to exceed the **lease_duration**.

Listeners are used to notify a **DDS_DataReader** (p. 783) of loss of liveliness and **DDS_DataWriter** (p. 673) of violations to the liveliness contract. The on_liveliness_lost() callback is only called *once*, after the first time the lease_duration is exceeded (when the **DDS_DataWriter** (p. 673) first loses liveliness).

This QoS policy can be used during system integration to ensure that applications have been coded to meet design specifications. It can also be used during run time to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions in response to disconnected DataWriters.

Entity:

```
DDS_Topic (p. 425), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Status:

Properties:

```
\mathbf{RxO}\ (\mathrm{p.145}) = \mathrm{YES} Changeable (\mathrm{p.146}) = \mathbf{UNTIL}\ \mathbf{ENABLE}\ (\mathrm{p.146})
```

5.71.2 Usage

This policy controls the mechanism and parameters used by RTI Data Distribution Service to ensure that particular entities on the network are still alive. The liveliness can also affect the ownership of a particular instance, as determined by the **OWNERSHIP** (p. 159) policy.

This policy has several settings to support both data types that are updated periodically as well as those that are changed sporadically. It also allows customisation for different application requirements in terms of the kinds of failures that will be detected by the liveliness mechanism.

The DDS_AUTOMATIC_LIVELINESS_QOS (p. 163) liveliness setting is most appropriate for applications that only need to detect failures at the process-level, but not application-logic failures within a process. RTI Data Distribution Service takes responsibility for renewing the leases at the required rates and thus, as long as the local process where a DDS_DomainParticipant (p. 339) is running and the link connecting it to remote participants remains connected, the entities within the DDS_DomainParticipant (p. 339) will be considered alive. This requires the lowest overhead.

The manual settings (DDS_MANUAL_BY_PARTICIPANT_-LIVELINESS_QOS (p. 163), DDS_MANUAL_BY_TOPIC_-LIVELINESS_QOS (p. 163)) require the application on the publishing side to periodically assert the liveliness before the lease expires to indicate the corresponding DDS_Entity (p. 242) is still alive. The action can be explicit by

calling the **DDS_DataWriter_assert_liveliness** (p. 709) operation or implicit by writing some data.

The two possible manual settings control the granularity at which the application must assert liveliness.

- The setting DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS (p. 163) requires only that one DDS_Entity (p. 242) within a participant is asserted to be alive to deduce all other DDS_Entity (p. 242) objects within the same DDS_DomainParticipant (p. 339) are also alive.
- ^ The setting DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS (p. 163) requires that at least one instance within the DDS_DataWriter (p. 673) is asserted.

Changes in LIVELINESS (p. 162) must be detected by the Service with a time-granularity greater or equal to the lease_duration. This ensures that the value of the DDS_LivelinessChangedStatus (p. 1250) is updated at least once during each lease_duration and the related Listeners and DDS_WaitSet (p. 253) s are notified within a lease_duration from the time the LIVELINESS (p. 162) changed.

5.71.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality offered kind >= requested kind evaluates to 'TRUE'. For the purposes of this inequality, the values of DDS_-LivelinessQosPolicyKind (p. 162) kind are considered ordered such that: DDS_AUTOMATIC_LIVELINESS_QOS (p. 163) < DDS_-MANUAL_BY_PARTICIPANT_LIVELINESS_QOS (p. 163) < DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS (p. 163).
- the inequality offered lease_duration <= requested lease_duration evaluates to DDS_BOOLEAN_TRUE (p. 106).

5.72 DDS Locator t Struct Reference

<<eXtension>> (p. 950) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

Data Fields

^ DDS_Long kind

The kind of locator.

^ DDS_UnsignedLong port

 $the\ port\ number$

^ DDS_Octet address [DDS_LOCATOR_ADDRESS_LENGTH_MAX]

A DDS_LOCATOR_ADDRESS_LENGTH_MAX (p. 413) octet field to hold the IP address.

5.72.1 Detailed Description

<<eXtension>> (p. 950) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

5.72.2 Field Documentation

5.72.2.1 DDS_Long DDS_Locator_t::kind

The kind of locator.

If the Locator_t kind is DDS_LOCATOR_KIND_UDPv4 (p. 415), the address contains an IPv4 address. In this case, the leading 12 octets of the DDS_Locator_t::address (p. 1259) must be zero. The last 4 octets of DDS_Locator_t::address (p. 1259) are used to store the IPv4 address.

If the Locator_t kind is **DDS_LOCATOR_KIND_UDPv6** (p. 415), the address contains an IPv6 address. IPv6 addresses typically use a shorthand hexadecimal notation that maps one-to-one to the 16 octets in the **DDS_Locator_-t::address** (p. 1259) field.

${\bf 5.72.2.2} \quad DDS_UnsignedLong\ DDS_Locator_t::port$

the port number

A DDS_LOCATOR_ADDRESS_LENGTH_MAX (p. 413) octet field to hold the IP address.

5.73 DDS_LocatorFilter_t Struct Reference

Specifies the configuration of an individual channel within a MultiChannel DataWriter.

Data Fields

* struct DDS_LocatorSeq locators

Sequence containing from one to four **DDS_Locator_t** (p. 1258), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

$\hat{}$ char * filter_expression

A logical expression used to determine the data that will be published in the channel.

5.73.1 Detailed Description

Specifies the configuration of an individual channel within a MultiChannel DataWriter.

QoS:

DDS_LocatorFilterQosPolicy (p. 1262)

5.73.2 Field Documentation

5.73.2.1 struct DDS_LocatorSeq DDS_LocatorFilter_t::locators [read]

Sequence containing from one to four **DDS_Locator_t** (p. 1258), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

[default] Empty sequence.

5.73.2.2 char* DDS_LocatorFilter_t::filter_expression

A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of DDS_-LocatorFilterQosPolicy::filter_name (p. 1263)

Important: This value must be an allocated string with **DDS_String_alloc** (p. 287) or **DDS_String_dup** (p. 288). It should not be assigned to a string constant.

See also:

Queries and Filters Syntax (p. 957)

[default] NULL (invalid value)

5.74 DDS_LocatorFilterQosPolicy Struct Reference

The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 1313).

Data Fields

^ struct DDS_LocatorFilterSeq locator_filters

A sequence of DDS_LocatorFilter_t (p. 1260). Each DDS_LocatorFilter_t (p. 1260) reports the configuration of a single channel of a MultiChannel DataWriter.

char * filter_name

Name of the filter class used to describe the filter expressions of a Multi-Channel DataWriter.

5.74.1 Detailed Description

The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 1313).

Entity:

DDS_PublicationBuiltinTopicData (p. 1313)

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.74.2 Field Documentation

5.74.2.1 struct DDS_LocatorFilterSeq DDS_-LocatorFilterQosPolicy::locator_filters [read]

A sequence of **DDS_LocatorFilter_t** (p. 1260). Each **DDS_LocatorFilter_t** (p. 1260) reports the configuration of a single channel of a MultiChannel DataWriter.

A sequence length of zero indicates the **DDS_MultiChannelQosPolicy** (p. 1269) is not in use.

[default] Empty sequence.

${\bf 5.74.2.2} \quad char*\ DDS_LocatorFilterQosPolicy::filter_name$

Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported: **DDS_SQLFILTER_NAME** (p. 408) and **DDS_STRINGMATCHFILTER_NAME** (p. 409).

Important: This value must be assigned to either one of the predefined values (DDS_SQLFILTER_NAME (p. 408) or DDS_STRINGMATCHFILTER_NAME (p. 409)), or to an allocated string with DDS_String_alloc (p. 287) or DDS_String_dup (p. 288). It should not be assigned to a string constant.

[default] DDS_STRINGMATCHFILTER_NAME (p. 409)

5.75 DDS_LocatorFilterSeq Struct Reference

Declares IDL sequence < DDS_LocatorFilter_t (p. 1260) >.

5.75.1 Detailed Description

Declares IDL sequence < DDS_LocatorFilter_t (p. 1260) >.

A sequence of DDS_LocatorFilter_t (p.1260) used to report the channels' properties. If the length of the sequence is zero, the DDS_MultiChannelQosPolicy (p.1269) is not in use.

5.80 DDS_MultiChannelQosPolicy Struct Reference

Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Data Fields

* struct DDS_ChannelSettingsSeq channels

A sequence of $DDS_ChannelSettings_t$ (p. 1049) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

$\hat{}$ char * filter_name

Name of the filter class used to describe the filter expressions of a Multi-Channel DataWriter.

5.80.1 Detailed Description

Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

This QoS policy is used to partition the data published by a **DDS_DataWriter** (p. 673) across multiple channels. A *channel* is defined by a filter expression and a sequence of multicast locators.

Entity:

```
DDS_DataWriter (p. 673)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.80.2 Usage

By using this QoS, a **DDS_DataWriter** (p. 673) can be configured to send data to different multicast groups based on the content of the data. Using syntax similar to those used in Content-Based Filters, you can associate different multicast addresses with filter expressions that operate on the values of the

fields within the data. When your applications code calls **FooDataWriter_write** (p. 684), data is sent to any multicast address for which the data passes the filter.

Multi-channel DataWriters can be used to trade off network bandwidth with the unnecessary processing of unwanted data for situations where there are multiple DataReaders that are interested in different subsets of data that come from the same data stream (Topic). For example, in Financial applications, the data stream may be quotes for different stocks at an exchange. Applications usually only want to receive data (quotes) for only a subset of the stocks being traded. In tracking applications, a data stream may carry information on hundreds or thousands of objects being tracked, but again, applications may only be interested in a subset.

The problem is that the most efficient way to deliver data to multiple applications is to use multicast, so that a data value is only sent once on the network for any number of subscribers to the data. However, using multicast, an application will receive *all* of the data sent and not just the data in which it is interested, thus extra CPU time is wasted to throw away unwanted data. With this QoS, you can analyze the data-usage patterns of your applications and optimize network vs. CPU usage by partitioning the data into multiple multicast streams. While network bandwidth is still being conserved by sending data only once using multicast, most applications will only need to listen to a subset of the multicast addresses and receive a reduced amount of unwanted data.

Your system can gain more of the benefits of using multiple multicast groups if your network uses Layer 2 Ethernet switches. Layer 2 switches can be configured to only route multicast packets to those ports that have added membership to specific multicast groups. Using those switches will ensure that only the multicast packets used by applications on a node are routed to the node; all others are filtered-out by the switch.

5.80.3 Field Documentation

5.80.3.1 struct DDS_ChannelSettingsSeq DDS_MultiChannelQosPolicy::channels [read]

A sequence of **DDS_ChannelSettings_t** (p. 1049) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

A sequence length of zero indicates the **DDS_MultiChannelQosPolicy** (p. 1269) is not in use.

The sequence length cannot be greater than DDS_DomainParticipantResourceLimitsQosPolicy::channel_seq_max_length (p. 1178).

[default] Empty sequence.

$5.80.3.2 \quad char*\ DDS_MultiChannelQosPolicy::filter_name$

Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported: **DDS_SQLFILTER_NAME** (p. 408) and **DDS_STRINGMATCHFILTER_NAME** (p. 409).

Important: This value must be assigned to either one of the predefined values (DDS_SQLFILTER_NAME (p. 408) or DDS_STRINGMATCHFILTER_NAME (p. 409)), or to an allocated string with DDS_String_alloc (p. 287) or DDS_String_dup (p. 288). It should not be assigned to a string constant.

[default] DDS_STRINGMATCHFILTER_NAME (p. 409)

5.81 DDS_Octets Struct Reference

Built-in type consisting of a variable-length array of opaque bytes.

Data Fields

 $\hat{}$ int length

Number of octets to serialize.

 $\hat{}$ unsigned char * **value**

DDS_Octets (p. 1272) array value.

5.81.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

5.85 DDS_OfferedDeadlineMissedStatus Struct Reference

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 129)

Data Fields

^ DDS_Long total_count

Total cumulative count of the number of times the DDS_DataWriter (p. 673) failed to write within its offered deadline.

^ DDS_Long total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

^ DDS_InstanceHandle_t last_instance_handle

Handle to the last instance in the DDS_DataWriter (p. 673) for which an offered deadline was missed.

5.85.1 Detailed Description

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 129)

Entity:

DDS_DataWriter (p. 673)

Listener:

DDS_DataWriterListener (p. 1102)

The deadline that the **DDS_DataWriter** (p. 673) has committed through its **DDS_DeadlineQosPolicy** (p. 1135) was not respected for a specific instance.

5.85.2 Field Documentation

$5.85.2.1 \quad DDS_Long\ DDS_OfferedDeadlineMissedStatus:: total_count$

Total cumulative count of the number of times the **DDS_DataWriter** (p. 673) failed to write within its offered deadline.

Missed deadlines accumulate; that is, each deadline period the total_count will be incremented by one.

${\bf 5.85.2.2} \quad {\bf DDS_Long} \ {\bf DDS_OfferedDeadlineMissedStatus::total_count_change}$

The incremental changes in total_count since the last time the listener was called or the status was read.

$\begin{array}{ccc} 5.85.2.3 & DDS_InstanceHandle_t & DDS_- \\ & OfferedDeadlineMissedStatus::last_instance_handle \\ \end{array}$

Handle to the last instance in the **DDS_DataWriter** (p. 673) for which an offered deadline was missed.

5.86 DDS_OfferedIncompatibleQosStatus Struct Reference

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129)

Data Fields

^ DDS_Long total_count

Total cumulative number of times the concerned DDS_DataWriter (p. 673) discovered a DDS_DataReader (p. 783) for the same DDS_Topic (p. 425), common partition with a requested QoS that is incompatible with that offered by the DDS_DataWriter (p. 673).

^ DDS_Long total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

^ DDS_QosPolicyId_t last_policy_id

The DDS_QosPolicyId_t (p. 146) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

* struct DDS_QosPolicyCountSeq policies

A list containing for each policy the total number of times that the concerned DDS_DataWriter (p. 673) discovered a DDS_DataReader (p. 783) for the same DDS_Topic (p. 425) and common partition with a requested QoS that is incompatible with that offered by the DDS_DataWriter (p. 673).

5.86.1 Detailed Description

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129)

Entity:

DDS_DataWriter (p. 673)

Listener:

DDS_DataWriterListener (p. 1102)

The gos policy value was incompatible with what was requested.

5.86.2 Field Documentation

${\bf 5.86.2.1} \quad {\bf DDS_Long} \ {\bf DDS_OfferedIncompatibleQosStatus::total_count}$

Total cumulative number of times the concerned **DDS_DataWriter** (p. 673) discovered a **DDS_DataReader** (p. 783) for the same **DDS_Topic** (p. 425), common partition with a requested QoS that is incompatible with that offered by the **DDS_DataWriter** (p. 673).

${\small 5.86.2.2 \quad DDS_Long \ DDS_Offered Incompatible QosStatus:: total_-count_change}$

The incremental changes in total_count since the last time the listener was called or the status was read.

5.86.2.3 DDS_QosPolicyId_t DDS_-OfferedIncompatibleQosStatus::last_policy_id

The DDS_QosPolicyId_t (p. 146) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

$\begin{array}{ccc} 5.86.2.4 & struct\ DDS_QosPolicyCountSeq\ DDS_\\ & OfferedIncompatibleQosStatus::policies\\ & [read] \end{array}$

A list containing for each policy the total number of times that the concerned **DDS_DataWriter** (p. 673) discovered a **DDS_DataReader** (p. 783) for the same **DDS_Topic** (p. 425) and common partition with a requested QoS that is incompatible with that offered by the **DDS_DataWriter** (p. 673).

5.87 DDS_OwnershipQosPolicy Struct Reference

Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 673) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Data Fields

^ DDS_OwnershipQosPolicyKind kind

The kind of ownership.

5.87.1 Detailed Description

Specifies whether it is allowed for multiple **DDS_DataWriter** (p. 673) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Entity:

```
DDS_Topic (p. 425), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129), DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129)

Properties:

```
\mathbf{RxO} (p. 145) = YES
Changeable (p. 146) = UNTIL ENABLE (p. 146)
```

See also:

OWNERSHIP_STRENGTH (p. 161)

5.87.2 Usage

Along with the **OWNERSHIP_STRENGTH** (p. 161), this QoS policy specifies if **DDS_DataReader** (p. 783) entities can receive updates to the same instance (identified by its key) from multiple **DDS_DataWriter** (p. 673) entities at the same time.

There are two kinds of ownership, selected by the setting of the kind: SHARED and EXCLUSIVE.

5.87.2.1 SHARED ownership

DDS_SHARED_OWNERSHIP_QOS (p. 160) indicates that RTI Data Distribution Service does not enforce unique ownership for each instance. In this case, multiple writers can update the same data type instance. The subscriber to the DDS_Topic (p. 425) will be able to access modifications from all DDS_DataWriter (p. 673) objects, subject to the settings of other QoS that may filter particular samples (e.g. the TIME_BASED_FILTER (p. 164) or HISTORY (p. 170) policy). In any case, there is no "filtering" of modifications made based on the identity of the DDS_DataWriter (p. 673) that causes the modification.

5.87.2.2 EXCLUSIVE ownership

DDS_EXCLUSIVE_OWNERSHIP_QOS (p. 160) indicates that each instance of a data type can only be modified by one DDS_DataWriter (p. 673). In other words, at any point in time, a single DDS_DataWriter (p. 673) owns each instance and is the only one whose modifications will be visible to the DDS_DataReader (p. 783) objects. The owner is determined by selecting the DDS_DataWriter (p. 673) with the highest value of the DDS_OwnershipStrengthQosPolicy::value (p. 1287) that is currently alive, as defined by the LIVELINESS (p. 162) policy, and has not violated its DEAD-LINE (p. 157) contract with regards to the data instance.

Ownership can therefore change as a result of:

- a DDS_DataWriter (p. 673) in the system with a higher value of the strength that modifies the instance,
- ^ a change in the strength value of the **DDS_DataWriter** (p. 673) that owns the instance, and
- a change in the liveliness of the **DDS_DataWriter** (p. 673) that owns the instance.
- `a deadline with regards to the instance that is missed by the **DDS**_-**DataWriter** (p. 673) that owns the instance.

The behavior of the system is as if the determination was made independently by each **DDS_DataReader** (p. 783). Each **DDS_DataReader** (p. 783) may detect the change of ownership at a different time. It is not a requirement that at a particular point in time all the **DDS_DataReader** (p. 783) objects for that **DDS_Topic** (p. 425) have a consistent picture of who owns each instance.

It is also not a requirement that the **DDS_DataWriter** (p. 673) objects are aware of whether they own a particular instance. There is no error or notification given to a **DDS_DataWriter** (p. 673) that modifies an instance it does not currently own.

The requirements are chosen to (a) preserve the decoupling of publishers and subscriber, and (b) allow the policy to be implemented efficiently.

It is possible that multiple DDS_DataWriter (p. 673) objects with the same strength modify the same instance. If this occurs RTI Data Distribution Service will pick one of the DDS_DataWriter (p. 673) objects as the owner. It is not specified how the owner is selected. However, the algorithm used to select the owner guarantees that all DDS_DataReader (p. 783) objects will make the same choice of the particular DDS_DataWriter (p. 673) that is the owner. It also guarantees that the owner remains the same until there is a change in strength, liveliness, the owner misses a deadline on the instance, or a new DDS_DataWriter (p. 673) with higher same strength, or a new DDS_DataWriter (p. 673) with same strength that should be deemed the owner according to the policy of the Service, modifies the instance.

Exclusive ownership is on an instance-by-instance basis. That is, a subscriber can receive values written by a lower strength **DDS_DataWriter** (p. 673) as long as they affect instances whose values have not been set by the higher-strength **DDS_DataWriter** (p. 673).

5.87.3 Compatibility

The value of the **DDS_OwnershipQosPolicyKind** (p. 159) offered must exactly match the one requested or else they are considered incompatible.

5.87.4 RELATIONSHIP BETWEEN REGISTRATION, LIVELINESS and OWNERSHIP

The need for registering/unregistering instances stems from two use cases:

- ^ Ownership resolution on redundant systems
- ^ Detection of loss in topological connectivity

These two use cases also illustrate the semantic differences between the Foo-DataWriter_unregister_instance (p. 681) and FooDataWriter_dispose (p. 688).

5.87.4.1 Ownership Resolution on Redundant Systems

It is expected that users may use DDS to set up redundant systems where multiple **DDS_DataWriter** (p. 673) entities are "capable" of writing the same instance. In this situation, the **DDS_DataWriter** (p. 673) entities are configured such that:

- Either both are writing the instance "constantly"
- ^ Or else they use some mechanism to classify each other as "primary" and "secondary", such that the primary is the only one writing, and the secondary monitors the primary and only writes when it detects that the primary "writer" is no longer writing.

Both cases above use the DDS_EXCLUSIVE_OWNERSHIP_-QOS (p. 160) and arbitrate themselves by means of the DDS_OwnershipStrengthQosPolicy (p. 1287). Regardless of the scheme, the desired behavior from the DDS_DataReader (p. 783) point of view is that DDS_DataReader (p. 783) normally receives data from the primary unless the "primary" writer stops writing, in which case the DDS_DataReader (p. 783) starts to receive data from the secondary DDS_DataWriter (p. 673).

This approach requires some mechanism to detect that a **DDS_DataWriter** (p. 673) (the primary) is no longer "writing" the data as it should. There are several reasons why this may happen and all must be detected (but not necessarily distinguished):

crash The writing process is no longer running (e.g. the whole application has crashed)

connectivity loss Connectivity to the writing application has been lost (e.g. network disconnection)

application fault. The application logic that was writing the data is faulty and has stopped calling **FooDataWriter_write** (p. 684).

Arbitrating from a **DDS_DataWriter** (p. 673) to one of a higher strength is simple and the decision can be taken autonomously by the **DDS_DataReader** (p. 783). Switching ownership from a higher strength **DDS_DataWriter** (p. 673) to one of a lower strength **DDS_DataWriter** (p. 673) requires that the **DDS_DataReader** (p. 783) can make a determination that the stronger **DDS_DataWriter** (p. 673) is "no longer writing the instance".

Case where the data is periodically updated This determination is reasonably simple when the data is being written periodically at some rate. The DDS_DataWriter (p. 673) simply states its offered DDS_DeadlineQosPolicy (p. 1135) (maximum interval between updates) and the DDS_DataReader (p. 783) automatically monitors that the DDS_DataWriter (p. 673) indeed updates the instance at least once per DDS_DeadlineQosPolicy::period (p. 1137). If the deadline is missed, the DDS_DataReader (p. 783) considers the DDS_DataWriter (p. 673) "not alive" and automatically gives ownership to the next highest-strength DDS_DataWriter (p. 673) that is alive.

Case where data is not periodically updated The case where the DDS_-**DataWriter** (p. 673) is not writing data periodically is also a very important use-case. Since the instance is not being updated at any fixed period, the "deadline" mechanism cannot be used to determine ownership. The liveliness solves this situation. Ownership is maintained while the **DDS_DataWriter** (p. 673) is "alive" and for the DDS_DataWriter (p. 673) to be alive it must fulfill its DDS_LivelinessQosPolicy (p. 1254) contract. The different means to renew liveliness (automatic, manual) combined by the implied renewal each time data is written handle the three conditions above [crash], [connectivity loss], and [application fault]. Note that to handle [application fault], LIVELINESS must be DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS (p. 163). The DDS_-**DataWriter** (p. 673) can retain ownership by periodically writing data or else calling assert_liveliness if it has no data to write. Alternatively if only protection against [crash] or [connectivity loss] is desired, it is sufficient that some task on the DDS_DataWriter (p. 673) process periodically writes data or calls DDS_DomainParticipant_assert_liveliness (p. 395). However, this scenario requires that the DDS_DataReader (p. 783) knows what instances are being "written" by the **DDS_DataWriter** (p. 673). That is the only way that the DDS_DataReader (p. 783) deduces the ownership of specific instances from the fact that the DDS_DataWriter (p. 673) is still "alive". Hence the need for the DDS_DataWriter (p. 673) to "register" and "unregister" instances. Note that while "registration" can be done lazily the first time the DDS_-DataWriter (p. 673) writes the instance, "unregistration," in general, cannot. Similar reasoning will lead to the fact that unregistration will also require a message to be sent to the DDS_DataReader (p. 783).

5.87.4.2 Detection of Loss in Topological Connectivity

There are applications that are designed in such a way that their correct operation requires some minimal topological connectivity, that is, the writer needs to have a minimum number of readers or alternatively the reader must have a minimum number of writers.

A common scenario is that the application does not start doing its logic until it

knows that some specific writers have the minimum configured readers (e.g the alarm monitor is up).

A more common scenario is that the application logic will wait until some writers appear that can provide some needed source of information (e.g. the raw sensor data that must be processed).

Furthermore, once the application is running it is a requirement that this minimal connectivity (from the source of the data) is monitored and the application informed if it is ever lost. For the case where data is being written periodically, the DDS_DeadlineQosPolicy (p. 1135) and the on_deadline_missed listener provides the notification. The case where data is not periodically updated requires the use of the DDS_LivelinessQosPolicy (p. 1254) in combination with register_instance/unregister_instance to detect whether the "connectivity" has been lost, and the notification is provided by means of DDS_NOT_ALIVE_-NO_WRITERS_INSTANCE_STATE (p. 854).

In terms of the required mechanisms, the scenario is very similar to the case of maintaining ownership. In both cases, the reader needs to know whether a writer is still "managing the current value of an instance" even though it is not continually writing it and this knowledge requires the writer to keep its liveliness plus some means to know which instances the writer is currently "managing" (i.e. the registered instances).

5.87.4.3 Semantic Difference between unregister_instance and dispose

FooDataWriter_dispose (p. 688) is semantically different from FooDataWriter_unregister_instance (p. 681). FooDataWriter_dispose (p. 688) indicates that the data instance no longer exists (e.g. a track that has disappeared, a simulation entity that has been destroyed, a record entry that has been deleted, etc.) whereas FooDataWriter_unregister_instance (p. 681) indicates that the writer is no longer taking responsibility for updating the value of the instance.

Deleting a **DDS_DataWriter** (p. 673) is equivalent to unregistering all the instances it was writing, but is *not* the same as "disposing" all the instances.

For a **DDS_Topic** (p. 425) with **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 160), if the current owner of an instance disposes it, the readers accessing the instance will see the instance_state as being "DISPOSED" and not see the values being written by the weaker writer (even after the stronger one has disposed the instance). This is because the **DDS_DataWriter** (p. 673) that owns the instance is saying that the instance no longer exists (e.g. the master of the database is saying that a record has been deleted) and thus the readers should see it as such.

For a DDS_Topic (p. 425) with DDS_EXCLUSIVE_OWNERSHIP_QOS

(p. 160), if the current owner of an instance *unregisters* it, then it will relinquish ownership of the instance and thus the readers may see the value updated by another writer (which will then become the owner). This is because the owner said that it no longer will be providing values for the instance and thus another writer can take ownership and provide those values.

5.87.5 Field Documentation

5.87.5.1 DDS_OwnershipQosPolicyKind DDS_-OwnershipQosPolicy::kind

The kind of ownership.

[default] DDS_SHARED_OWNERSHIP_QOS (p. 160)

5.88 DDS_OwnershipStrengthQosPolicy Struct Reference

Specifies the value of the strength used to arbitrate among multiple **DDS_-DataWriter** (p. 673) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 425) + key).

Data Fields

^ DDS_Long value

The strength value used to arbitrate among multiple writers.

5.88.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **DDS_-DataWriter** (p. 673) objects that attempt to modify the same instance of a data type (identified by **DDS_Topic** (p. 425) + key).

This policy only applies if the **OWNERSHIP** (p. 159) policy is of kind **DDS_-EXCLUSIVE_OWNERSHIP_QOS** (p. 160).

Entity:

```
DDS_DataWriter (p. 673)
```

Properties:

```
\mathbf{RxO}\ (\mathrm{p.\,145}) = \mathrm{N/A} Changeable (\mathrm{p.\,146}) = \mathbf{YES}\ (\mathrm{p.\,146})
```

The value of the **OWNERSHIP_STRENGTH** (p. 161) is used to determine the ownership of a data instance (identified by the key). The arbitration is performed by the **DDS_DataReader** (p. 783).

5.92 DDS_PartitionQosPolicy Struct Reference

Set of strings that introduces a logical partition among the topics visible by a **DDS_Publisher** (p. 632) and a **DDS_Subscriber** (p. 743).

Data Fields

^ struct DDS_StringSeq name

A list of partition names.

5.92.1 Detailed Description

Set of strings that introduces a logical partition among the topics visible by a DDS_Publisher (p. 632) and a DDS_Subscriber (p. 743).

This QoS policy is used to set string identifiers that are used for matching DataReaders and DataWriters for the same Topic.

A DDS_DataWriter (p. 673) within a DDS_Publisher (p. 632) only communicates with a DDS_DataReader (p. 783) in a DDS_Subscriber (p. 743) if (in addition to matching the DDS_Topic (p. 425) and having compatible QoS) the DDS_Publisher (p. 632) and DDS_Subscriber (p. 743) have a common partition name string.

Entity:

```
DDS_Publisher (p. 632), DDS_Subscriber (p. 743)
```

Properties:

```
\mathbf{RxO} \ (\mathrm{p.145}) = \mathrm{NO}
Changeable (\mathrm{p.146}) = \mathbf{YES} \ (\mathrm{p.146})
```

5.92.2 Usage

This policy allows the introduction of a logical partition concept inside the 'physical' partition induced by a *domain*.

Usually DataReaders and DataWriters are matched only by their topic (so that data are only sent by DataWriters to DataReaders for the same topic). The Partition QoS policy allows you to add one or more strings, "partitions", to a Publisher and/or Subscriber. If partitions are added, then a DataWriter and DataReader for the same topic are only considered matched if their Publishers and Subscribers have partitions in common (intersecting partitions).

Since the set of partitions for a publisher or subscriber can be dynamically changed, the Partition QoS policy is useful to control which DataWriters can send data to which DataReaders and vice versa - even if all of the DataWriters and DataReaders are for the same topic. This facility is useful for creating temporary separation groups among entities that would otherwise be connected to and exchange data each other.

Failure to match partitions is not considered an incompatible QoS and does not trigger any listeners or conditions. A change in this policy *can* potentially modify the "match" of existing DataReader and DataWriter entities. It may establish new "matches" that did not exist before, or break existing matches.

Partition strings are usually directly matched via string comparisons. However, partition strings can also contain wildcard symbols so that partitions can be matched via pattern matching. As long as the partitions or wildcard patterns of a Publisher intersect with the partitions or wildcard patterns of a Subscriber, their DataWriters and DataReaders of the same topic are able to match; otherwise they are not.

These partition name patterns are regular expressions as defined by the POSIX fnmatch API (1003.2-1992 section B.6). Either **DDS_Publisher** (p. 632) or **DDS_Subscriber** (p. 743) may include regular expressions in partition names, but no two names that both contain wildcards will ever be considered to match. This means that although regular expressions may be used both at publisher as well as subscriber side, RTI Data Distribution Service will not try to match two regular expressions (between publishers and subscribers).

Each publisher and subscriber must belong to at least one logical partition. A regular expression is not considered to be a logical partition. If a publisher or subscriber has not specify a logical partition, it is assumed to be in the default partition. The default partition is defined to be an empty string (""). Put another way:

- An empty sequence of strings in this QoS policy is considered equivalent to a sequence containing only a single string, the empty string.
- A string sequence that contains only regular expressions and no literal strings, it is treated as if it had an additional element, the empty string.

Partitions are different from creating $\mathbf{DDS_Entity}$ (p. 242) objects in different domains in several ways.

- ^ First, entities belonging to different domains are completely isolated from each other; there is no traffic, meta-traffic or any other way for an application or RTI Data Distribution Service itself to see entities in a domain it does not belong to.
- Second, a **DDS_Entity** (p. 242) can only belong to one domain whereas a **DDS_Entity** (p. 242) can be in multiple partitions.

^ Finally, as far as RTI Data Distribution Service is concerned, each unique data instance is identified by the tuple (DomainID, DDS_Topic (p. 425), key). Therefore two DDS_Entity (p. 242) objects in different domains cannot refer to the same data instance. On the other hand, the same data instance can be made available (published) or requested (subscribed) on one or more partitions.

5.92.3 Field Documentation

5.92.3.1 struct DDS_StringSeq DDS_PartitionQosPolicy::name [read]

A list of partition names.

Several restrictions apply to the partition names in this sequence. A violation of one of the following rules will result in a DDS_RETCODE_-INCONSISTENT_POLICY (p. 122) when setting a DDS_Publisher (p. 632)'s or DDS_Subscriber (p. 743)'s QoS.

- ^ A partition name string cannot be NULL, nor can it contain the reserved comma character (',').
- The maximum number of partition name strings allowable in a DDS_PartitionQosPolicy (p. 1294) is specified on a domain basis in DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions (p. 1176). The length of this sequence may not be greater than that value.
- The maximum cumulative length of all partition name strings in a DDS_PartitionQosPolicy (p. 1294) is specified on a domain basis in DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_characters (p. 1176).

The memory for the strings in this sequence is managed according to the conventions described in **Conventions** (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

[default] Empty sequence (zero-length sequence). Since no logical partition is specified, RTI Data Distribution Service will assume the entity to be in default partition (empty string partition "").

[range] List of partition name with above restrictions

5.93 DDS_PresentationQosPolicy Struct Reference

Specifies how the samples representing changes to data instances are presented to a subscribing application.

Data Fields

^ DDS_PresentationQosPolicyAccessScopeKind access_scope

Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

$\hat{\ }$ DDS_Boolean coherent_access

Specifies support for coherent access. Controls whether coherent access is supported within the scope access_scope.

^ DDS_Boolean ordered_access

Specifies support for ordered access to the samples received at the subscription end. Controls whether ordered access is supported within the scope access—scope.

5.93.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

This QoS policy controls the extent to which changes to data instances can be made dependent on each other and also the kind of dependencies that can be propagated and maintained by RTI Data Distribution Service. Specifically, this policy affects the application's ability to:

- ^ specify and receive coherent changes to instances
- ^ specify the relative order in which changes are presented

Entity:

```
DDS_Publisher (p. 632), DDS_Subscriber (p. 743)
```

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129).
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129)

Properties:

```
\mathbf{RxO} (p. 145) = YES
Changeable (p. 146) = UNTIL ENABLE (p. 146)
```

5.93.2 Usage

A DDS_DataReader (p. 783) will usually receive data in the order that it was sent by a DDS_DataWriter (p. 673), and the data is presented to the DDS_DataReader (p. 783) as soon as the application receives the next expected value. However, sometimes, you may want a set of data for the same topic to be presented to the DDS_DataReader (p. 783) only after all of the elements of the set have been received. Or you may want the data to be presented in a different order than that in which it was received. Specifically for keyed data, you may want the middleware to present the data in keyed – or instance – order, such that samples pertaining to the same instance are presented together.

The Presentation QoS policy allows you to specify different *scopes* of presentation: within a topic, across instances of a single topic, and even across multiple topics used by different writers of a publisher (although this last option is not currently supported by RTI). It also controls whether or not a set of changes within the scope is delivered at the same time or can be delivered as soon as each element is received.

- ^ coherent_access controls whether RTI Data Distribution Service will preserve the groupings of changes made by a publishing application by means of the operations DDS_Publisher_begin_coherent_changes (p. 647) and DDS_Publisher_end_coherent_changes (p. 648).
- * ordered_access controls whether RTI Data Distribution Service will preserve the order of changes.
- access_scope controls the granularity of the other settings. See below:

If coherent_access is set, then the access_scope controls the maximum extent of coherent changes. The behavior is as follows:

- ^ If access_scope is set to DDS_INSTANCE_PRESENTATION_QOS (p. 156) (the default), the use of DDS_Publisher_begin_coherent_changes (p. 647) and DDS_Publisher_end_coherent_changes (p. 648) has no effect on how the subscriber can access the data, because with the scope limited to each instance, changes to separate instances are considered independent and thus cannot be grouped into a coherent set.
- If access_scope is set to DDS_TOPIC_PRESENTATION_QOS (p. 156), then coherent changes (indicated by their enclosure within

calls to DDS_Publisher_begin_coherent_changes (p. 647) and DDS_Publisher_end_coherent_changes (p. 648)) will be made available as such to each remote DDS_DataReader (p. 783) independently. That is, changes made to instances within each individual DDS_DataWriter (p. 673) will be available as coherent with respect to other changes to instances in that same DDS_DataWriter (p. 673), but will not be grouped with changes made to instances belonging to a different DDS_DataWriter (p. 673).

^ If access_scope is set to DDS_GROUP_PRESENTATION_QOS (p. 156), then coherent changes made to instances through a DDS_DataWriter (p. 673) attached to a common DDS_Publisher (p. 632) are made available as a unit to remote subscribers. (RTI does not currently support this access scope.)

If ordered_access is set, then the access_scope controls the maximum extent for which order will be preserved by RTI Data Distribution Service.

- If access_scope is set to DDS_INSTANCE_PRESENTATION_QOS (p. 156) (the lowest level), then changes to each instance are considered unordered relative to changes to any other instance. That means that changes (creations, deletions, modifications) made to two instances are not necessarily seen in the order they occur. This is the case even if it is the same application thread making the changes using the same DDS_DataWriter (p. 673).
- If access_scope is set to DDS_TOPIC_PRESENTATION_QOS (p. 156), changes (creations, deletions, modifications) made by a single DDS_DataWriter (p. 673) are made available to subscribers in the same order they occur. Changes made to instances though different DDS_DataWriter (p. 673) entities are not necessarily seen in the order they occur. This is the case, even if the changes are made by a single application thread using DDS_DataWriter (p. 673) objects attached to the same DDS_Publisher (p. 632).
- ^ Finally, if access_scope is set to DDS_GROUP_PRESENTATION_QOS (p. 156), changes made to instances via DDS_DataWriter (p. 673) entities attached to the same DDS_Publisher (p. 632) object are made available to subscribers on the same order they occur. (RTI does not currently support this access scope.)

Note that this QoS policy controls the scope at which related changes are made available to the subscriber. This means the subscriber **can** access the changes in a coherent manner and in the proper order; however, it does not necessarily

imply that the **DDS_Subscriber** (p. 743) will indeed access the changes in the correct order. For that to occur, the application at the subscriber end must use the proper logic in reading the **DDS_DataReader** (p. 783) objects.

5.93.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality offered access_scope >= requested access_scope evaluates to 'TRUE'. For the purposes of this inequality, the values of access_scope are considered ordered such that DDS_INSTANCE_PRESENTATION_QOS (p. 156) < DDS_TOPIC_PRESENTATION_QOS (p. 156) < DDS_GROUP_PRESENTATION_QOS (p. 156)
- requested coherent_access is DDS_BOOLEAN_FALSE (p. 107), or else both offered and requested coherent_access are DDS_BOOLEAN_TRUE (p. 106)
- requested ordered_access is DDS_BOOLEAN_FALSE (p. 107), or else both offered and requested ordered_access are DDS_BOOLEAN_-TRUE (p. 106).

5.93.4 Field Documentation

Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

[default] DDS_INSTANCE_PRESENTATION_QOS (p. 156)

5.93.4.2 DDS_Boolean DDS_PresentationQosPolicy::coherent_-access

Specifies support for *coherent* access. Controls whether coherent access is supported within the scope access_scope.

That is, the ability to group a set of changes as a unit on the publishing end such that they are received as a unit at the subscribing end.

[default] DDS_BOOLEAN_FALSE (p. 107)

${\bf 5.93.4.3} \quad DDS_Boolean \ DDS_PresentationQosPolicy:: ordered_access$

Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope access_scope.

That is, the ability of the subscriber to see changes in the same order as they occurred on the publishing end.

 $[\mathbf{default}] \ \mathbf{DDS_BOOLEAN_FALSE} \ (\mathrm{p.} \ 107)$

5.95 DDS_ProfileQosPolicy Struct Reference

Configures the way that XML documents containing QoS profiles are loaded by RTI Data Distribution Service.

Data Fields

^ struct DDS_StringSeq string_profile

Sequence of strings containing a XML document to load.

* struct DDS_StringSeq url_profile

Sequence of URL groups (p. 898) containing a set of XML documents to load.

^ DDS_Boolean ignore_user_profile

 $Ignores\ the\ file\ USER_QOS_PROFILES.xml\ in\ the\ current\ working\ directory.$

DDS_Boolean ignore_environment_profile

Ignores the value of the NDDS_QOS_PROFILES environment variable (p. 898).

DDS_Boolean ignore_resource_profile

5.95.1 Detailed Description

Configures the way that XML documents containing QoS profiles are loaded by RTI Data Distribution Service.

All QoS values for Entities can be configured in QoS profiles defined in XML documents. XML documents can be passed to RTI Data Distribution Service in string form or, more likely, through files found on a file system.

There are also default locations where DomainParticipants will look for files to load QoS profiles. These include the current working directory from where an application is started, a file in the distribution directory for RTI Data Distribution Service, and the locations specified by an environment variable. You may disable any or all of these default locations using the Profile QoS policy.

Entity:

DDS_DomainParticipantFactory (p. 302)

Properties:

```
\mathbf{RxO} (p. 145) = NO
Changeable (p. 146) = Changeable (p. 146)
```

5.95.2 Field Documentation

5.95.2.1 struct DDS_StringSeq DDS_ProfileQosPolicy::string_profile [read]

Sequence of strings containing a XML document to load.

The concatenation of the strings in this sequence must be a valid XML document according to the XML QoS profile schema.

[default] Empty sequence (zero-length).

5.95.2.2 struct DDS_StringSeq DDS_ProfileQosPolicy::url_profile [read]

Sequence of URL groups (p. 898) containing a set of XML documents to load.

Only one of the elements of each group will be loaded by RTI Data Distribution Service, starting from the left.

[default] Empty sequence (zero-length).

5.95.2.3 DDS_Boolean DDS_ProfileQosPolicy::ignore_user_profile

Ignores the file USER_QOS_PROFILES.xml in the current working directory.

When this field is set to **DDS_BOOLEAN_TRUE** (p. 106), the QoS profiles contained in the file USER_QOS_PROFILES.xml in the current working directory will be ignored.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.95.2.4 DDS_Boolean DDS_ProfileQosPolicy::ignore_-environment_profile

Ignores the value of the NDDS_QOS_PROFILES environment variable (p. 898).

When this field is set to **DDS_BOOLEAN_TRUE** (p. 106), the value of the environment variable NDDS_QOS_PROFILES will be ignored.

[default] DDS_BOOLEAN_FALSE (p. 107)

${\bf 5.95.2.5} \quad {\bf DDS_Boolean} \ {\bf DDS_ProfileQosPolicy::ignore_resource_profile}$

 $\label{eq:linear_solution} Ignores \qquad the \qquad file \qquad NDDS_QOS_PROFILES.xml \qquad under $NDDSHOME/resource/qos_profiles_4.4d/xml.$

When this field is set to <code>DDS_BOOLEAN_TRUE</code> (p. 106), the QoS profiles contained in the file NDDS_QOS_PROFILES.xml under \$NDDSHOME/resource/qos_profiles_4.5c/xml will be ignored.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.96 DDS_Property_t Struct Reference

Properties are name/value pairs objects.

Data Fields

 $\hat{}$ char * name

 $Property\ name.$

 $\hat{}$ char * value

Property value.

$\hat{\ }$ DDS_Boolean propagate

Indicates if the property must be propagated on discovery.

5.96.1 Detailed Description

Properties are name/value pairs objects.

5.96.2 Field Documentation

5.96.2.1 char* DDS_Property_t::name

Property name.

It must be a NULL-terminated string allocated with **DDS_String_alloc** (p. 287) or **DDS_String_dup** (p. 288).

5.96.2.2 char* DDS_Property_t::value

Property value.

It must be a NULL-terminated string allocated with **DDS_String_alloc** (p. 287) or **DDS_String_dup** (p. 288).

5.96.2.3 DDS_Boolean DDS_Property_t::propagate

Indicates if the property must be propagated on discovery.

5.97 DDS_PropertyQosPolicy Struct Reference

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Data Distribution Service that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Data Fields

* struct DDS_PropertySeq value

Sequence of properties.

5.97.1 Detailed Description

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Data Distribution Service that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

```
DDS_DomainParticipant (p. 339) DDS_DataReader (p. 783) DDS_DataWriter (p. 673)
```

Properties:

```
RxO (p. 145) = N/A;
Changeable (p. 146) = YES (p. 146)
```

See also:

DDS_DomainParticipant_get_builtin_subscriber (p. 388)

5.97.2 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name,value) pairs with a DDS_DataReader (p. 783), DDS_DataWriter (p. 673), or DDS_DomainParticipant (p. 339). This is similar to the DDS_UserDataQosPolicy (p. 1474), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

This QoS policy may be used to configure:

- Durable Writer History, see Configuring Durable Writer History (p. 892)
- ^ Durable Reader State, see Configuring Durable Reader State (p. 892)
- [^] Builtin Transport Plugins, see UDPv4 Transport Property Names in Property QoS Policy of Domain Participant (p. 1016), UDPv6 Transport Property Names in Property QoS Policy of Domain Participant (p. 1026), and Shared Memory Transport Property Names in Property QoS Policy of Domain Participant (p. 1009)
- Extension Transport Plugins, see Loading Transport Plugins through Property QoS Policy of Domain Participant (p. 869)
- ^ Clock Selection (p. 292)

In addition, you may add your own name/value pairs to the Property QoS policy of an Entity. Via this QoS policy, you can direct RTI Data Distribution Service to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the DDS_UserDataQosPolicy (p. 1474) or DDS_GroupDataQosPolicy (p. 1226)).

5.97.2.1 Reasons for Using the PropertyQosPolicy

- Supports dynamic loading of extension transports (such as RTI Secure WAN Transport)
- ^ Supports multiple instances of the builtin transports
- ^ Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- ^ Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- ^ Allows selection of clock

Some of the RTI Data Distribution Service capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the

Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the DDS_-PropertyQosPolicyHelper class on the **PROPERTY** (p. 235) page.

5.97.3 Field Documentation

${\bf 5.97.3.1} \quad {\bf struct\ DDS_PropertySeq\ DDS_PropertyQosPolicy::value} \\ [{\tt read}]$

5.103 DDS_PublicationMatchedStatus Struct Reference

DDS_PUBLICATION_MATCHED_STATUS (p. 131)

Data Fields

^ DDS_Long total_count

The total cumulative number of times the concerned DDS_DataWriter (p. 673) discovered a "match" with a DDS_DataReader (p. 783).

^ DDS_Long total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

^ DDS_Long current_count

The current number of readers with which the DDS_DataWriter (p. 673) is matched.

^ DDS_Long current_count_peak

<<eXtension>> (p. 950) The highest value that current_count has reached until now.

^ DDS_Long current_count_change

The change in current_count since the last time the listener was called or the status was read.

^ DDS_InstanceHandle_t last_subscription_handle

A handle to the last **DDS_DataReader** (p. 783) that caused the the **DDS_DataWriter** (p. 673)'s status to change.

5.103.1 Detailed Description

DDS_PUBLICATION_MATCHED_STATUS (p. 131)

A "match" happens when the **DDS_DataWriter** (p. 673) finds a **DDS_DataReader** (p. 783) for the same **DDS_Topic** (p. 425) and common partition with a requested QoS that is compatible with that offered by the **DDS_DataWriter** (p. 673).

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDS_DataWriter** (p. 673) will become "unmatched" from

a remote **DDS_DataReader** (p. 783) when that **DDS_DataReader** (p. 783) goes away for any reason.

5.103.2 Field Documentation

5.103.2.1 DDS_Long DDS_PublicationMatchedStatus::total_count

The total cumulative number of times the concerned **DDS_DataWriter** (p. 673) discovered a "match" with a **DDS_DataReader** (p. 783).

This number increases whenever a new match is discovered. It does not change when an existing match goes away.

5.103.2.2 DDS_Long DDS_PublicationMatchedStatus::total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

${\bf 5.103.2.3} \quad {\bf DDS_Long} \ {\bf DDS_PublicationMatchedStatus::current_count}$

The current number of readers with which the **DDS_DataWriter** (p. 673) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away.

${\bf 5.103.2.4} \quad {\bf DDS_Long} \ {\bf DDS_PublicationMatchedStatus::current_-count_peak}$

<<eXtension>> (p. 950) The highest value that current_count has reached until now.

5.103.2.5 DDS_Long DDS_PublicationMatchedStatus::current_-count_change

The change in current_count since the last time the listener was called or the status was read.

A handle to the last **DDS_DataReader** (p. 783) that caused the the **DDS_DataWriter** (p. 673)'s status to change.

<<eXtension>> (p. 950) Asynchronous publishing settings for the DDS_-Publisher (p. 632) and all entities that are created by it.

^ struct DDS_ExclusiveAreaQosPolicy exclusive_area

<<eXtension>> (p. 950) Exclusive area for the DDS_Publisher (p. 632) and all entities that are created by it.

5.105.1 Detailed Description

QoS policies supported by a DDS_Publisher (p. 632) entity.

You must set certain members in a consistent manner:

length of DDS_PublisherQos::group_data.value <= **DDS_- DomainParticipantQos::resource_limits** (p. 1160) .publisher_group_data_max_length

length of DDS_PublisherQos::partition.name <= **DDS_- DomainParticipantQos::resource_limits** (p. 1160) .max_partitions

If any of the above are not true, DDS_Publisher_set_qos (p. 650) and DDS_Publisher_set_qos_with_profile (p. 650) will fail with DDS_RETCODE_INCONSISTENT_POLICY (p. 122) and DDS_DomainParticipant_create_publisher (p. 361) will return NULL.

5.105.2 Field Documentation

5.107 DDS_PublishModeQosPolicy Struct Reference

Specifies how RTI Data Distribution Service sends application data on the network. This QoS policy can be used to tell RTI Data Distribution Service to use its *own* thread to send data, instead of the user thread.

Data Fields

 ${\bf \hat{\ }}DDS_PublishModeQosPolicyKind\ kind}$

Publishing mode.

^ char * flow_controller_name

Name of the associated flow controller.

5.107.1 Detailed Description

Specifies how RTI Data Distribution Service sends application data on the network. This QoS policy can be used to tell RTI Data Distribution Service to use its *own* thread to send data, instead of the user thread.

The publishing mode of a **DDS_DataWriter** (p. 673) determines whether data is written synchronously in the context of the user thread when calling **Foo-DataWriter_write** (p. 684) or asynchronously in the context of a separate thread internal to the middleware.

Each DDS_Publisher (p. 632) spawns a single asynchronous publishing thread (DDS_AsynchronousPublisherQosPolicy::thread (p. 1037)) to serve all its asynchronous DDS_DataWriter (p. 673) instances.

See also:

```
DDS_AsynchronousPublisherQosPolicy (p. 1035)
DDS_HistoryQosPolicy (p. 1229)
DDS_FlowController (p. 726)
```

Entity:

```
DDS_DataWriter (p. 673)
```

Properties:

```
\mathbf{RxO}\ (\mathrm{p.\,145}) = \mathrm{N/A} Changeable (p. 146) = NO (p. 146)
```

5.107.2 Usage

The fastest way for RTI Data Distribution Service to send data is for the user thread to execute the middleware code that actually sends the data itself. However, there are times when user applications may need or want an internal middleware thread to send the data instead. For instance, to send large data reliably, you must use an asynchronous thread.

When data is written asynchronously, a DDS_FlowController (p. 726), identified by flow_controller_name, can be used to shape the network traffic. Shaping a data flow usually means limiting the maximum data rates at which the middleware will send data for a DDS_DataWriter (p. 673). The flow controller will buffer any excess data and only send it when the send rate drops below the maximum rate. The flow controller's properties determine when the asynchronous publishing thread is allowed to send data and how much.

Asynchronous publishing may increase latency, but offers the following advantages:

- The FooDataWriter_write (p. 684) call does not make any network calls and is therefore faster and more deterministic. This becomes important when the user thread is executing time-critical code.
- When data is written in bursts or when sending large data types as multiple fragments, a flow controller can throttle the send rate of the asynchronous publishing thread to avoid flooding the network.
- Asynchronously written samples for the same destination will be coalesced into a single network packet which reduces bandwidth consumption.

The maximum number of samples that will be coalesced depends on NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508) (each sample requires at least 2-4 gather-send buffers). Performance can be improved by increasing NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1508). Note that the maximum value is operating system dependent.

The middleware must queue samples until they can be sent by the asynchronous publishing thread (as determined by the corresponding DDS_FlowController (p. 726)). The number of samples that will be queued is determined by the DDS_HistoryQosPolicy (p. 1229). When using DDS_KEEP_LAST_HISTORY_QOS (p. 171), only the most recent DDS_HistoryQosPolicy::depth (p. 1231) samples are kept in the queue. Once unsent samples are removed from the queue, they are no longer available to the asynchronous publishing thread and will therefore never be sent.

5.107.3 Field Documentation

$\begin{array}{ccc} 5.107.3.1 & DDS_PublishModeQosPolicyKind \\ & DDS_PublishModeQosPolicy::kind \end{array}$

Publishing mode.

[default] DDS_SYNCHRONOUS_PUBLISH_MODE_QOS (p. 222)

5.107.3.2 char* DDS_PublishModeQosPolicy::flow_controller_name

Name of the associated flow controller.

NULL value or zero-length string refers to DDS_DEFAULT_FLOW_-CONTROLLER_NAME (p. 731).

Unless flow_controller_name points to a built-in flow controller, finalizing the DDS_DataWriterQos (p. 1123) will also free the string pointed to by flow_controller_name. Therefore, use DDS_String_dup (p. 288) before passing the string to flow_controller_name, or reset flow_controller_name to NULL before finalizing the QoS.

Please refer to **Conventions** (p. 286) for more information.

5.110 DDS_ReaderDataLifecycleQosPolicy Struct Reference

Controls how a DataReader manages the lifecycle of the data that it has received.

Data Fields

^ struct DDS_Duration_t autopurge_nowriter_samples_delay

Maximum duration for which the DDS_DataReader (p. 783) will maintain information regarding an instance once its instance_state becomes DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE (p. 854).

^ struct DDS_Duration_t autopurge_disposed_samples_delay

Maximum duration for which the DDS_DataReader (p. 783) will maintain samples for an instance once its instance_state becomes DDS_NOT_-ALIVE_DISPOSED_INSTANCE_STATE (p. 854).

5.110.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

When a DataReader receives data, it is stored in a receive queue for the DataReader. The user application may either take the data from the queue or leave it there.

This QoS policy controls whether or not RTI Data Distribution Service will automatically remove data from the receive queue (so that user applications cannot access it afterwards) when it detects that there are no more DataWriters alive for that data. It specifies how long a DDS_DataReader (p. 783) must retain information regarding instances that have the instance_state DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE (p. 854).

Note: This policy is not concerned with keeping reliable reader state or discovery information.

The DDS_DataReader (p. 783) internally maintains the samples that have not been "taken" by the application, subject to the constraints imposed by other QoS policies such as DDS_HistoryQosPolicy (p. 1229) and DDS_ResourceLimitsQosPolicy (p. 1356).

The DDS_DataReader (p. 783) also maintains information regarding the identity, view_state and instance_state of data instances even after all samples have been taken. This is needed to properly compute the states when future samples arrive.

Under normal circumstances the **DDS_DataReader** (p. 783) can only reclaim all resources for instances for which there are no writers and for which all samples have been 'taken'. The last sample the **DDS_DataReader** (p. 783) will have taken for that instance will have an <code>instance_state</code> of either **DDS_NOT_-ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 854) or **DDS_NOT_-ALIVE_DISPOSED_INSTANCE_STATE** (p. 854) depending on whether or not the last writer that had ownership of the instance disposed it.

In the absence of **READER_DATA_LIFECYCLE** (p. 179), this behavior could cause problems if the application forgets to take those samples. "Untaken" samples will prevent the **DDS_DataReader** (p. 783) from reclaiming the resources and they would remain in the **DDS_DataReader** (p. 783) indefinitely.

For keyed Topics, the consideration of removing data samples from the receive queue is done on a per instance (key) basis. Thus when RTI Data Distribution Service detects that there are no longer DataWriters alive for a certain key value of a Topic (an instance of the Topic), it can be configured to remove all data samples for that instance (key).

Entity:

```

```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = YES (p. 146)
```

5.110.2 Field Documentation

5.110.2.1 struct DDS_Duration_t DDS_-ReaderDataLifecycleQosPolicy::autopurge_nowriter_samples_delay [read]

Maximum duration for which the **DDS_DataReader** (p. 783) will maintain information regarding an instance once its instance_state becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 854).

After this time elapses, the **DDS_DataReader** (p. 783) will purge all internal information regarding the instance, any "untaken" samples will also be lost.

```
[default] DDS_DURATION_INFINITE (p. 113)
```

```
[range] [1 nanosec, 1 year] or DDS_DURATION_INFINITE (p. 113)
```

5.110.2.2 struct DDS_Duration_t DDS_-ReaderDataLifecycleQosPolicy::autopurge_disposed_samples_delay [read]

Maximum duration for which the DDS_DataReader (p. 783) will maintain samples for an instance once its instance_state becomes DDS_NOT_-ALIVE_DISPOSED_INSTANCE_STATE (p. 854).

After this time elapses, the $\mathbf{DDS_DataReader}$ (p. 783) will purge all samples for the instance.

[default] DDS_DURATION_INFINITE (p. 113)

[range] [1 nanosec, 1 year] or DDS_DURATION_INFINITE (p. 113)

5.111 DDS_ReceiverPoolQosPolicy Struct Reference

Configures threads used by RTI Data Distribution Service to receive and process data from transports (for example, UDP sockets).

Data Fields

* struct DDS_ThreadSettings_t thread

Receiver pool thread(s).

^ DDS_Long buffer_size

The receive buffer size.

^ DDS_Long buffer_alignment

The receive buffer alignment.

5.111.1 Detailed Description

Configures threads used by RTI Data Distribution Service to receive and process data from transports (for example, UDP sockets).

This QoS policy is an extension to the DDS standard.

Entity:

```
DDS_DomainParticipant (p. 339)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

See also:

Controlling CPU Core Affinity for RTI Threads (p. 136)

5.111.2 Usage

This QoS policy sets the thread properties such as priority level and stack size for the threads used by the middleware to receive and process data from transports. RTI uses a separate receive thread per port per transport plugin. To force RTI Data Distribution Service to use a separate thread to process the data for a DDS_DataReader (p. 783), set a unique port for the DDS_TransportUnicastQosPolicy (p. 1458) or DDS_TransportMulticastQosPolicy (p. 1449) for the DDS_DataReader (p. 783).

This QoS policy also sets the size of the buffer used to store packets received from a transport. This buffer size will limit the largest single packet of data that a **DDS_DomainParticipant** (p. 339) will accept from a transport. Users will often set this size to the largest packet that any of the transports used by their application will deliver. For many applications, the value 65,536 (64 K) is a good choice; this value is the largest packet that can be sent/received via UDP.

5.111.3 Field Documentation

5.111.3.1 struct DDS_ThreadSettings_t DDS_-ReceiverPoolQosPolicy::thread [read]

Receiver pool thread(s).

There is at least one receive thread, possibly more.

[default] priority above normal.

The actual value depends on your architecture:

For Windows: 2

For Solaris: OS default priority For Linux: OS default priority

For LynxOS: 29

For INTEGRITY: 100

For VxWorks: 71

For all others: OS default priority.

[default] The actual value depends on your architecture:

For Windows: OS default stack size For Solaris: OS default stack size For Linux: OS default stack size

For LynxOS: 4*16*1024

For INTEGRITY: 4*20*1024

For VxWorks: 4*16*1024

For all others: OS default stack size.

$5.111.3.2 \quad DDS_Long \ DDS_ReceiverPoolQosPolicy::buffer_size$

The receive buffer size.

The receive buffer is used by the receive thread to store the raw data that arrives over the transport.

In many applications, users will change the configuration of the built-in transport NDDS_Transport_Property_t::message_size_max (p. 1508) to increase the size of the largest data packet that can be sent or received through the transport. Typically, users will change the UDPv4 transport plugin's NDDS_Transport_Property_t::message_size_max (p. 1508) to 65536 (64 K), which is the largest packet that can be sent/received via UDP.

Ihe ReceiverPoolQosPolicy's buffer_size should be set to be the same value as the maximum NDDS_Transport_Property_t::message_size_max (p. 1508) across all of the transports being used.

If you are using the default configuration of the built-in transports, you should not need to change this buffer size.

In addition, if your application *only* uses transports that support zero-copy, then you do not need to modify the value of buffer_size, even if the NDDS_Transport_Property_t::message_size_max (p. 1508) of the transport is changed. Transports that support zero-copy do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in a buffer allocated by the transport itself. The only built-in transport that supports zero-copy is the UDPv4 transport on VxWorks platforms.

[default] 9216

[range] [1, 1 GB]

5.111.3.3 DDS_Long DDS_ReceiverPoolQosPolicy::buffer_alignment

The receive buffer alignment.

Most users will not need to change this alignment.

[default] 16

[range] [1,1024] Value must be a power of 2.

5.112 DDS_ReliabilityQosPolicy Struct Reference

Indicates the level of reliability offered/requested by RTI Data Distribution Service.

Data Fields

^ DDS_ReliabilityQosPolicyKind kind

Kind of reliability.

^ struct DDS_Duration_t max_blocking_time

The maximum time a writer may block on a write() call.

5.112.1 Detailed Description

Indicates the level of reliability offered/requested by RTI Data Distribution Service.

Entity:

```
DDS_Topic (p. 425), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Status:

```
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 129),
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129)
```

Properties:

```
\mathbf{RxO} (p. 145) = YES
Changeable (p. 146) = UNTIL ENABLE (p. 146)
```

5.112.2 Usage

This policy indicates the level of reliability requested by a DDS_DataReader (p. 783) or offered by a DDS_DataWriter (p. 673).

The reliability of a connection between a DataWriter and DataReader is entirely user configurable. It can be done on a per DataWriter/DataReader connection. A connection may be configured to be "best effort" which means that RTI Data

Distribution Service will not use any resources to monitor or guarantee that the data sent by a DataWriter is received by a DataReader.

For some use cases, such as the periodic update of sensor values to a GUI displaying the value to a person, **DDS_BEST_EFFORT_RELIABILITY_-QOS** (p. 167) delivery is often good enough. It is certainly the fastest, most efficient, and least resource-intensive (CPU and network bandwidth) method of getting the newest/latest value for a topic from DataWriters to DataReaders. But there is no guarantee that the data sent will be received. It may be lost due to a variety of factors, including data loss by the physical transport such as wireless RF or even Ethernet.

However, there are data streams (topics) in which you want an absolute guarantee that all data sent by a DataWriter is received reliably by DataReaders. This means that RTI Data Distribution Service must check whether or not data was received, and repair any data that was lost by resending a copy of the data as many times as it takes for the DataReader to receive the data. RTI Data Distribution Service uses a reliability protocol configured and tuned by these QoS policies: DDS_HistoryQosPolicy (p. 1229), DDS_DataWriterProtocolQosPolicy (p. 1106), DDS_DataReaderProtocolQosPolicy (p. 1069), and DDS_ResourceLimitsQosPolicy (p. 1356).

The Reliability QoS policy is simply a switch to turn on the reliability protocol for a DataWriter/DataReader connection. The level of reliability provided by RTI Data Distribution Service is determined by the configuration of the aforementioned QoS policies.

You can configure RTI Data Distribution Service to deliver all data in the order they were sent (also known as absolute or strict reliability). Or, as a tradeoff for less memory, CPU, and network usage, you can choose a reduced level of reliability where only the last N values are guaranteed to be delivered reliably to DataReaders (where N is user-configurable). In the reduced level of reliability, there are no guarantees that the data sent before the last N are received. Only the last N data packets are monitored and repaired if necessary.

These levels are ordered, DDS_BEST_EFFORT_RELIABILITY_QOS (p. 167) < DDS_RELIABLE_RELIABILITY_QOS (p. 167). A DDS_DataWriter (p. 673) offering one level is implicitly offering all levels below.

The setting of this policy has a dependency on the setting of the RE-SOURCE_LIMITS (p.174) policy. In case the reliability kind is set to DDS_RELIABLE_RELIABILITY_QOS (p.167) the write operation on the DDS_DataWriter (p.673) may block if the modification would cause data to be lost or else cause one of the limits in specified in the RESOURCE_LIMITS (p.174) to be exceeded. Under these circumstances, the RELIABILITY (p.166) max_blocking_time configures the maximum duration the write operation may block.

If the DDS_ReliabilityQosPolicy::kind (p. 1344) is set to DDS_RELIABLE_RELIABILITY_QOS (p. 167), data samples originating from a single DDS_DataWriter (p. 673) cannot be made available to the DDS_DataReader (p. 783) if there are previous data samples that have not been received yet due to a communication error. In other words, RTI Data Distribution Service will repair the error and resend data samples as needed in order to reconstruct a correct snapshot of the DDS_DataWriter (p. 673) history before it is accessible by the DDS_DataReader (p. 783).

If the DDS_ReliabilityQosPolicy::kind (p. 1344) is set to DDS_BEST_-EFFORT_RELIABILITY_QOS (p. 167), the service will not re-transmit missing data samples. However, for data samples originating from any one DataWriter the service will ensure they are stored in the DDS_DataReader (p. 783) history in the same order they originated in the DDS_DataWriter (p. 673). In other words, the DDS_DataReader (p. 783) may miss some data samples, but it will never see the value of a data object change from a newer value to an older value.

See also:

```
DDS_HistoryQosPolicy (p. 1229)
DDS_ResourceLimitsQosPolicy (p. 1356)
```

5.112.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality offered kind >= requested kind evaluates to 'TRUE'. For the purposes of this inequality, the values of DDS_ReliabilityQosPolicy::kind (p. 1344) are considered ordered such that DDS_BEST_EFFORT_RELIABILITY_QOS (p. 167) < DDS_RELIABLE_RELIABILITY_QOS (p. 167).

5.112.4 Field Documentation

5.112.4.1 DDS_ReliabilityQosPolicyKind DDS_ReliabilityQosPolicy::kind

Kind of reliability.

[default] DDS_BEST_EFFORT_RELIABILITY_QOS (p. 167) for DDS_DataReader (p. 783) and DDS_Topic (p. 425), DDS_RELIABLE_RELIABILITY_QOS (p. 167) for DDS_DataWriter (p. 673)

5.112.4.2 struct DDS_Duration_t DDS_ReliabilityQosPolicy::max_blocking_time [read]

The maximum time a writer may block on a write() call.

This setting applies only to the case where DDS_ReliabilityQosPolicy::kind (p. 1344) = DDS_RELIABLE_RELIABILITY_QOS (p. 167). Foo-DataWriter_write (p. 684) is allowered to block if the DDS_DataWriter (p. 673) does not have space to store the value written. Only applies to DDS_DataWriter (p. 673).

[default] 100 milliseconds

[range] [0,1 year] or DDS_DURATION_INFINITE (p. 113)

DDS_DataWriter (p. 673)

Listener:

DDS_DataWriterListener (p. 1102)

This status is the reciprocal status to the **DDS_LivelinessChangedStatus** (p. 1250) on the reader. It is different than the **DDS_LivelinessLostStatus** (p. 1252) on the writer in that the latter informs the writer about its own

5.113 DDS_ReliableReaderActivityChangedStatus Struct Referehad7

liveliness; this status informs the writer about the "liveliness" (activity) of its matched readers.

All counts in this status will remain at zero for best effort writers.

5.113.2 Field Documentation

$\begin{array}{ccc} 5.113.2.1 & DDS_Long & DDS_- \\ & Reliable Reader Activity Changed Status:: active_count \end{array}$

The current number of reliable readers currently matched with this reliable writer.

$\begin{array}{ccc} 5.113.2.2 & DDS_Long & DDS_-\\ & Reliable Reader Activity Changed Status:: inactive_count \end{array}$

The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.

A reader is considered to be inactive after is has been sent heartbeats **DDS_-RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1369) times, each heartbeat having been separated from the previous by the current heartbeat period.

$\begin{array}{ccc} 5.113.2.3 & DDS_Long & DDS_- \\ & Reliable Reader Activity Changed Status:: active_count_- \\ & change \end{array}$

The most recent change in the number of active remote reliable readers.

The most recent change in the number of inactive remote reliable readers.

The instance handle of the last reliable remote reader to be determined inactive.

5.114 DDS_ReliableWriterCacheChangedStatus Struct Reference

<<eXtension>> (p. 950) A summary of the state of a data writer's cache of unacknowledged samples written.

Data Fields

^ struct DDS_ReliableWriterCacheEventCount empty_reliable_writer_cache

The number of times the reliable writer's cache of unacknowledged samples has become empty.

^ struct DDS_ReliableWriterCacheEventCount full_reliable_writer_cache

The number of times the reliable writer's cache of unacknowledged samples has become full.

^ struct DDS_ReliableWriterCacheEventCount low_watermark_reliable_writer_cache

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

^ struct DDS_ReliableWriterCacheEventCount high_watermark_reliable_writer_cache

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

^ DDS_Long unacknowledged_sample_count

The current number of unacknowledged samples in the writer's cache.

DDS_Long unacknowledged_sample_count_peak

The highest value that unacknowledged_sample_count has reached until now.

5.114.1 Detailed Description

<<eXtension>> (p. 950) A summary of the state of a data writer's cache of unacknowledged samples written.

Entity:

DDS_DataWriter (p. 673)

5.114 DDS_ReliableWriterCacheChangedStatus Struct Reference349

Listener:

DDS_DataWriterListener (p. 1102)

A written sample is unacknowledged (and therefore accounted for in this status) if the writer is reliable and one or more readers matched with the writer has not yet sent an acknowledgement to the writer declaring that it has received the sample.

If the low watermark is zero and the unacknowledged sample count decreases to zero, both the low watermark and cache empty events are considered to have taken place. A single callback will be dispatched (assuming the user has requested one) that contains both status changes. The same logic applies when the high watermark is set equal to the maximum number of samples and the cache becomes full.

5.114.2 Field Documentation

5.114.2.1 struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::empty_reliable_writer_cache [read]

The number of times the reliable writer's cache of unacknowledged samples has become empty.

5.114.2.2 struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::full_reliable_writer_cache [read]

The number of times the reliable writer's cache of unacknowledged samples has become full.

5.114.2.3 struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::low_watermark_reliable_writer_cache [read]

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

A low watermark event will only be considered to have taken place when the number of unacknowledged samples in the writer's cache *decreases* to this value. A sample count that increases to this value will not result in a callback or in a change to the total count of low watermark events.

$\begin{array}{ccc} 5.114.2.4 & struct\ DDS_ReliableWriterCacheEventCount \\ & DDS_ReliableWriterCacheChangedStatus::high_-\\ & watermark_reliable_writer_cache \ \ \ \ \ \ \ \ \ \end{array}$

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

A high watermark event will only be considered to have taken place when the number of unacknowledged sampled *increases* to this value. A sample count that was above this value and then decreases back to it will not trigger an event.

$\begin{array}{cccc} 5.114.2.5 & DDS_Long & DDS_-\\ & ReliableWriterCacheChangedStatus::unacknowledged_-\\ & sample_count \end{array}$

The current number of unacknowledged samples in the writer's cache.

A sample is considered unacknowledged if the writer has failed to receive an acknowledgement from one or more reliable readers matched to it.

$\begin{array}{cccc} 5.114.2.6 & DDS_Long & DDS_-\\ & ReliableWriterCacheChangedStatus::unacknowledged_-\\ & sample_count_peak \end{array}$

The highest value that unacknowledged_sample_count has reached until now.

DDS_ReliableWriterCacheEventCount 5.115 Struct Reference

<< eXtension>> (p. 950) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined thresh-

Data Fields

^ DDS_Long total_count

The total number of times the event has occurred.

$\hat{\ }$ DDS_Long total_count_change

The incremental number of times the event has occurred since the listener was last invoked or the status read.

5.115.1Detailed Description

<< eXtension>> (p. 950) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

DDS_Long DDS_ReliableWriterCacheEventCount::total_-5.115.2.2count_change

The incremental number of times the event has occurred since the listener was last invoked or the status read.

5.116 DDS_RequestedDeadlineMissedStatus Struct Reference

DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 129)

Data Fields

^ DDS_Long total_count

Total cumulative count of the deadlines detected for any instance read by the DDS_DataReader (p. 783).

^ DDS_Long total_count_change

The incremental number of deadlines detected since the last time the listener was called or the status was read.

^ DDS_InstanceHandle_t last_instance_handle

Handle to the last instance in the DDS_DataReader (p. 783) for which a deadline was detected.

5.116.1 Detailed Description

DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 129)

Examples:

 $HelloWorld_subscriber.c.$

5.116.2 Field Documentation

${\bf 5.116.2.1} \quad {\bf DDS_Long} \ {\bf DDS_RequestedDeadlineMissedStatus::total_count}$

Total cumulative count of the deadlines detected for any instance read by the **DDS_DataReader** (p. 783).

${\bf 5.116.2.2} \quad {\bf DDS_Long} \ {\bf DDS_RequestedDeadlineMissedStatus::total_count_change}$

The incremental number of deadlines detected since the last time the listener was called or the status was read.

Handle to the last instance in the **DDS_DataReader** (p. 783) for which a deadline was detected.

5.117 DDS_RequestedIncompatibleQosStatus Struct Reference

DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 129)

Data Fields

^ DDS_Long total_count

Total cumulative count of how many times the concerned **DDS_DataReader** (p. 783) discovered a **DDS_DataWriter** (p. 673) for the same **DDS_Topic** (p. 425) with an offered QoS that is incompatible with that requested by the **DDS_DataReader** (p. 783).

^ DDS_Long total_count_change

The change in total_count since the last time the listener was called or the status was read.

^ DDS_QosPolicyId_t last_policy_id

The PolicyId_t of one of the policies that was found to be incompatible the last time an incompatibility was detected.

^ struct DDS_QosPolicyCountSeq policies

A list containing, for each policy, the total number of times that the concerned DDS_DataReader (p. 783) discovered a DDS_DataWriter (p. 673) for the same DDS_Topic (p. 425) with an offered QoS that is incompatible with that requested by the DDS_DataReader (p. 783).

5.117.2 Field Documentation

$\begin{array}{ccc} 5.117.2.1 & DDS_Long & DDS_- \\ & & RequestedIncompatibleQosStatus::total_count \end{array}$

Total cumulative count of how many times the concerned **DDS_DataReader** (p. 783) discovered a **DDS_DataWriter** (p. 673) for the same **DDS_Topic** (p. 425) with an offered QoS that is incompatible with that requested by the **DDS_DataReader** (p. 783).

5.117.2.2 DDS_Long DDS_-RequestedIncompatibleQosStatus::total_count_change

The change in total_count since the last time the listener was called or the status was read.

$\begin{array}{cccc} 5.117.2.3 & DDS_QosPolicyId_t & DDS_- \\ & RequestedIncompatibleQosStatus::last_policy_id \end{array}$

The PolicyId_t of one of the policies that was found to be incompatible the last time an incompatibility was detected.

5.117.2.4 struct DDS_QosPolicyCountSeq DDS_-RequestedIncompatibleQosStatus::policies [read]

A list containing, for each policy, the total number of times that the concerned **DDS_DataReader** (p. 783) discovered a **DDS_DataWriter** (p. 673) for the same **DDS_Topic** (p. 425) with an offered QoS that is incompatible with that requested by the **DDS_DataReader** (p. 783).

5.118 DDS_ResourceLimitsQosPolicy Struct Reference

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Data Fields

^ DDS_Long max_samples

Represents the maximum samples the middleware can store for any one $DDS_DataWriter$ (p. 673) (or $DDS_DataReader$ (p. 783)).

^ DDS_Long max_instances

Represents the maximum number of instances a DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)) can manage.

^ DDS_Long max_samples_per_instance

Represents the maximum number of samples of any one instance a DDS_-DataWriter (p. 673) (or DDS_DataReader (p. 783)) can manage.

^ DDS_Long initial_samples

<<extension>> (p. 950) Represents the initial samples the middleware will store for any one DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)).

^ DDS_Long initial_instances

<<eXtension>> (p. 950) Represents the initial number of instances a DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)) will manage.

DDS_Long instance_hash_buckets

<<eXtension>> (p. 950) Number of hash buckets for instances.

5.118.1 Detailed Description

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Entity:

DDS_Topic (p. 425), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)

Status:

```
DDS_SAMPLE_REJECTED_STATUS (p. 130), DDS_-
SampleRejectedStatus (p. 1395)
```

Properties:

```
\mathbf{RxO} (p. 145) = NO
Changeable (p. 146) = UNTIL ENABLE (p. 146)
```

5.118.2 Usage

This policy controls the resources that RTI Data Distribution Service can use to meet the requirements imposed by the application and other QoS settings.

For the reliability protocol (and **DDS_DurabilityQosPolicy** (p. 1181)), this QoS policy determines the actual maximum queue size when the **DDS_HistoryQosPolicy** (p. 1229) is set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 171).

In general, this QoS policy is used to limit the amount of system memory that RTI Data Distribution Service can allocate. For embedded real-time systems and safety-critical systems, pre-determination of maximum memory usage is often required. In addition, dynamic memory allocation could introduce non-deterministic latencies in time-critical paths.

This QoS policy can be set such that an entity does not dynamically allocate any more memory after its initialization phase.

If DDS_DataWriter (p. 673) objects are communicating samples faster than they are ultimately taken by the DDS_DataReader (p. 783) objects, the middleware will eventually hit against some of the QoS-imposed resource limits. Note that this may occur when just a single DDS_DataReader (p. 783) cannot keep up with its corresponding DDS_DataWriter (p. 673). The behavior in this case depends on the setting for the RELIABILITY (p. 166). If reliability is DDS_BEST_EFFORT_RELIABILITY_QOS (p. 167), then RTI Data Distribution Service is allowed to drop samples. If the reliability is DDS_RELIABILITY_QOS (p. 167), RTI Data Distribution Service will block the DDS_DataWriter (p. 673) or discard the sample at the DDS_DataReader (p. 783) in order not to lose existing samples.

The constant DDS_LENGTH_UNLIMITED (p. 174) may be used to indicate the absence of a particular limit. For example setting DDS_ResourceLimitsQosPolicy::max_samples_per_instance (p. 1359) to DDS_LENGTH_UNLIMITED (p. 174) will cause RTI Data Distribution Service not to enforce this particular limit.

If these resource limits are not set sufficiently, under certain circumstances the **DDS_DataWriter** (p. 673) may block on a write() call even though

the DDS_HistoryQosPolicy (p. 1229) is DDS_KEEP_LAST_HISTORY_QOS (p. 171). To guarantee the writer does not block for DDS_KEEP_LAST_HISTORY_QOS (p. 171), make sure the resource limits are set such that:

```
max_samples >= max_instances * max_samples_per_instance
```

See also:

```
DDS_ReliabilityQosPolicy (p. 1342)
DDS_HistoryQosPolicy (p. 1229)
```

5.118.3 Consistency

The setting of DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) must be consistent with DDS_ResourceLimitsQosPolicy::max_samples_per_instance (p. 1359). For these two values to be consistent, it must be true that DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) >= DDS_ResourceLimitsQosPolicy::max_samples_per_instance (p. 1359). As described above, this limit will not be enforced if DDS_ResourceLimitsQosPolicy::max_samples_per_instance (p. 1359) is set to DDS_LENGTH_UNLIMITED (p. 174).

The setting of RESOURCE_LIMITS (p. 174) max_samples_per_instance must be consistent with the HISTORY (p. 170) depth. For these two QoS to be consistent, it must be true that depth <= max_samples_per_instance.

See also:

```
DDS_HistoryQosPolicy (p. 1229)
```

5.118.4 Field Documentation

5.118.4.1 DDS_Long DDS_ResourceLimitsQosPolicy::max_samples

Represents the maximum samples the middleware can store for any one DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)).

Specifies the maximum number of data samples a **DDS_DataWriter** (p. 673) (or **DDS_DataReader** (p. 783)) can manage across all the instances associated with it.

For unkeyed types, this value has to be equal to max_samples_per_instance if max_samples_per_instance is not equal to **DDS_LENGTH_UNLIMITED** (p. 174).

When batching is enabled, the maximum number of data samples a DDS_DataWriter (p. 673) can manage will also be limited by DDS_DataWriterResourceLimitsQosPolicy::max_batches (p. 1132).

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 100 million] or DDS_LENGTH_UNLIMITED (p.174), >= initial_samples, >= max_samples_per_instance, >= DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_remote_writer (p. 1092) or >= DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples (p. 1370)

For **DDS_DataWriterQos** (p. 1123) max_samples >= DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer.heartbeats_per_max_samples if batching is disabled.

5.118.4.2 DDS_Long DDS_ResourceLimitsQosPolicy::max_instances

Represents the maximum number of instances a **DDS_DataWriter** (p. 673) (or **DDS_DataReader** (p. 783)) can manage.

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174), >= initial_instances

5.118.4.3 DDS_Long DDS_ResourceLimitsQosPolicy::max_samples_per_instance

Represents the maximum number of samples of any one instance a DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)) can manage.

For unkeyed types, this value has to be equal to max_samples or DDS_{-} LENGTH_UNLIMITED (p. 174).

[default] DDS_LENGTH_UNLIMITED (p. 174)

[range] [1, 100 million] or DDS_LENGTH_UNLIMITED (p.174), <= max_samples or DDS_LENGTH_UNLIMITED (p.174), >= DDS_HistoryQosPolicy::depth (p.1231)

5.118.4.4 DDS_Long DDS_ResourceLimitsQosPolicy::initial_samples

<<eXtension>> (p. 950) Represents the initial samples the middleware will store for any one DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)).

Specifies the initial number of data samples a DDS_DataWriter (p. 673) (or

 $\mathbf{DDS_DataReader}$ (p. 783)) will manage across all the instances associated with it.

[default] 32

[range] [1,100 million], <= max_samples

${\bf 5.118.4.5} \quad {\bf DDS_Long} \ {\bf DDS_ResourceLimitsQosPolicy::initial_instances}$

<<eXtension>> (p. 950) Represents the initial number of instances a DDS_DataWriter (p. 673) (or DDS_DataReader (p. 783)) will manage.

[default] 32

[range] [1,1 million], <= max_instances

$\begin{array}{ccc} 5.118.4.6 & DDS_Long \ DDS_ResourceLimitsQosPolicy::instance_hash_buckets \end{array}$

<< eXtension>> (p. 950) Number of hash buckets for instances.

The instance hash table facilitates instance lookup. A higher number of buckets decreases instance lookup time but increases the memory usage.

[default] 1 [range] [1,1 million]

5.119 DDS_RtpsReliableReaderProtocol_t Struct Reference

Qos related to reliable reader protocol defined in RTPS.

Data Fields

- * struct DDS_Duration_t min_heartbeat_response_delay

 The minimum delay to respond to a heartbeat.
- * struct DDS_Duration_t max_heartbeat_response_delay

 The maximum delay to respond to a heartbeat.
- * struct DDS_Duration_t heartbeat_suppression_duration

 The duration a reader ignores consecutively received heartbeats.
- * struct DDS_Duration_t nack_period

 The period at which to send NACKs.

5.119.1 Detailed Description

Qos related to reliable reader protocol defined in RTPS.

It is used to config reliable reader according to RTPS protocol.

Properties:

$$\mathbf{RxO}\ (\mathrm{p.\,145}) = \mathrm{N/A}$$
 Changeable $(\mathrm{p.\,146}) = \mathbf{NO}\ (\mathrm{p.\,146})$

QoS:

DDS_DataReaderProtocolQosPolicy (p. 1069) DDS_-DiscoveryConfigQosPolicy (p. 1141)

5.119.2 Field Documentation

5.119.2.1 struct DDS_Duration_t DDS_-RtpsReliableReaderProtocol_t::min_heartbeat_response_delay [read]

The minimum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0, 1 year], <= max_heartbeat_response_delay

5.119.2.2 struct DDS_Duration_t DDS_-RtpsReliableReaderProtocol_t::max_heartbeat_response_delay [read]

The maximum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of maximum delay.

[default] The default value depends on the container policy:

For DDS_DiscoveryConfigQosPolicy (p. 1141): 0 seconds

For DDS_DataReaderProtocolQosPolicy (p. 1069): 0.5 seconds

[range] [0, 1 year], >= min_heartbeat_response_delay

5.119.2.3 struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::heartbeat_suppression_duration [read]

The duration a reader ignores consecutively received heartbeats.

When a reliable reader receives consecutive heartbeats within a short duration that will trigger redundant NACKs, the reader may ignore the latter heartbeat(s). This sets the duration during which additionally received heartbeats are suppressed.

[default] 0.0625 seconds

[range] [0, 1 year],

5.119.2.4 struct DDS_Duration_t DDS_-RtpsReliableReaderProtocol_t::nack_period [read]

The period at which to send NACKs.

A reliable reader will send periodic NACKs at this rate when it first matches with a reliable writer. The reader will stop sending NACKs when it has received all available historical data from the writer.

[default] 5 seconds
[range] [1 nanosec, 1 year]

5.120 DDS_RtpsReliableWriterProtocol_t Struct Reference

QoS related to the reliable writer protocol defined in RTPS.

Data Fields

^ DDS_Long low_watermark

When the number of unacknowledged samples in the cache of a reliable writer falls below this threshold, the DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS (p. 132) is considered to have changed.

^ DDS_Long high_watermark

When the number of unacknowledged samples in the cache of a reliable writer climbs above this threshold, the DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS (p. 132) is considered to have changed.

* struct DDS_Duration_t heartbeat_period

The period at which to send heartbeats.

^ struct DDS_Duration_t fast_heartbeat_period

An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

^ struct DDS_Duration_t late_joiner_heartbeat_period

An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

^ DDS_Long max_heartbeat_retries

The maximum number of periodic heartbeat retries before marking a remote reader as inactive.

^ DDS_Boolean inactivate_nonprogressing_readers

Whether to treat remote readers as inactive when their NACKs do not progress.

^ DDS_Long heartbeats_per_max_samples

The number of heartbeats per send queue.

^ struct DDS_Duration_t min_nack_response_delay

The minimum delay to respond to a NACK.

^ struct DDS_Duration_t max_nack_response_delay

The maximum delay to respond to a nack.

^ struct DDS_Duration_t nack_suppression_duration

The duration for ignoring consecutive NACKs that may trigger redundant repairs.

^ DDS_Long max_bytes_per_nack_response

The maximum total message size when resending dropped samples.

struct DDS_Duration_t disable_positive_acks_min_sample_keep_duration

The minimum duration a sample is queued for ACK-disabled readers.

^ struct DDS_Duration_t disable_positive_acks_max_sample_keep_duration

The maximum duration a sample is queued for ACK-disabled readers.

^ DDS_Boolean disable_positive_acks_enable_adaptive_sample_keep_duration

Enables dynamic adjustment of sample keep duration in response to congestion.

^ DDS_Long disable_positive_acks_decrease_sample_keep_-duration_factor

Controls rate of contraction of dynamic sample keep duration.

^ DDS_Long disable_positive_acks_increase_sample_keep_-duration_factor

Controls rate of growth of dynamic sample keep duration.

^ DDS_Long min_send_window_size

 ${\it Minimum\ size\ of\ send\ window\ of\ unacknowledged\ samples}.$

^ DDS_Long max_send_window_size

 $Maximum\ size\ of\ send\ window\ of\ unacknowledged\ samples.$

struct DDS_Duration_t send_window_update_period

Period in which send window may be dynamically changed.

^ DDS_Long send_window_increase_factor

Increases send window size by this percentage when reacting dynamically to network conditions.

^ DDS_Long send_window_decrease_factor

Decreases send window size by this percentage when reacting dynamically to network conditions.

5.120.1 Detailed Description

QoS related to the reliable writer protocol defined in RTPS.

It is used to configure a reliable writer according to RTPS protocol.

The reliability protocol settings are applied to batches instead of individual data samples when batching is enabled.

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

QoS:

```
DDS_DataWriterProtocolQosPolicy (p. 1106) DDS_-
DiscoveryConfigQosPolicy (p. 1141)
```

5.120.2 Field Documentation

${\bf 5.120.2.1} \quad {\bf DDS_Long} \ {\bf DDS_RtpsReliableWriterProtocol_t::low_watermark}$

When the number of unacknowledged samples in the cache of a reliable writer falls below this threshold, the DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS (p. 132) is considered to have changed.

This value is measured in units of samples except with batching configurations in non MultiChannel DataWriters where it is measured in units of batches.

The value must be greater than or equal to zero and strictly less than high_watermark.

The high and low watermarks are used for switching between the regular and fast heartbeat rates (DDS_RtpsReliableWriterProtocol_t::heartbeat_period (p. 1368) and DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period (p. 1368), respectively). When the number of unacknowledged samples in the queue of a reliable DDS_DataWriter (p. 673) exceeds high_watermark, the DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS (p. 132) is changed, and the

DataWriter will start heartbeating at fast_heartbeat_rate. When the number of samples falls below low_watermark, DDS_RELIABLE_WRITER_-CACHE_CHANGED_STATUS (p. 132) is changed, and the heartbeat rate will return to the "normal" rate (heartbeat_rate).

[default] 0

[range] [0, 100 million], < high_watermark

See also:

Multi-channel DataWriters (p. 859) for additional details on reliability with MultChannel DataWriters.

$\begin{array}{ccc} 5.120.2.2 & DDS_Long \ DDS_RtpsReliableWriterProtocol_t::high_-\\ & watermark \end{array}$

When the number of unacknowledged samples in the cache of a reliable writer climbs above this threshold, the DDS_RELIABLE_WRITER_CACHE_-CHANGED_STATUS (p. 132) is considered to have changed.

This value is measured in units of samples except with batching configurations in non MultiChannel DataWriters where it is measured in units of batches.

The value must be strictly greater than low_watermark and less than or equal to a maximum that depends on the container QoS policy:

In DDS_DomainParticipantQos::discovery_config (p. 1160),

 $For \ \mathbf{DDS_DiscoveryConfigQosPolicy::publication_writer} \ (p. \ \underline{1147})$

 $\label{local_writer_local} high_watermark <= DDS_DomainParticipantQos::resource_limits.local_writer_allocation.max_count$

For DDS_DiscoveryConfigQosPolicy::subscription_writer (p. 1147)

 $\label{local_reader} \label{local_reader} high_watermark <= DDS_DomainParticipantQos::resource_limits.local_reader_allocation.max_count$

In DDS_DataWriterQos::protocol (p. 1127),

 $For \ \mathbf{DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer} \ (\mathrm{p.}\ 1110)$

high_watermark<=DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) if batching is disabled or the DataWriter is a MultiChannel DataWriter. Otherwise,

 $\label{lighwatermark} $$ high_watermark <= DDS_DataWriterResourceLimitsQosPolicy::max_batches \ (p. \frac{1132}{2})$$

[default] 1

[range] [1, 100 million] or DDS_LENGTH_UNLIMITED (p. 174), > low_watermark <= maximum which depends on the container policy

See also:

Multi-channel DataWriters (p. 859) for additional details on reliability with MultChannel DataWriters.

5.120.2.3 struct DDS_Duration_t DDS_-RtpsReliableWriterProtocol_t::heartbeat_period [read]

The period at which to send heartbeats.

A reliable writer will send periodic heartbeats at this rate.

[default] 3 seconds

[range] [1 nanosec,1 year], >= DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period (p. 1368), >= DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period (p. 1368)

5.120.2.4 struct DDS_Duration_t DDS_-RtpsReliableWriterProtocol_t::fast_heartbeat_period [read]

An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

This heartbeat period will be used when the number of unacknowledged samples in the cache of a reliable writer meets or exceeds the writer's high watermark and has not subsequently dropped beneath the low watermark. The normal period will be used at all other times.

This period must not be slower (i.e. must be of the same or shorter duration) than the normal heartbeat period.

[default] 3 seconds

[range] [1 nanosec,1 year], <= DDS_RtpsReliableWriterProtocol_-t::heartbeat_period (p. 1368)

An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

This heartbeat period will be used when a reliable reader joins after a reliable writer with non-volatile durability has begun publishing samples. Once the reliable reader has received all cached samples, it will be serviced at the same rate as other reliable readers.

This period must not be slower (i.e. must be of the same or shorter duration) than the normal heartbeat period.

[default] 3 seconds

[range] [1 nanosec,1 year], <= DDS_RtpsReliableWriterProtocol_-t::heartbeat_period (p. 1368)

5.120.2.6 DDS_Long DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries

The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.

When a remote reader has not acked all the samples the reliable writer has in its queue, and max_heartbeat_retries number of periodic heartbeats has been sent without receiving any ack/nack back, the remote reader will be marked as inactive (not alive) and be ignored until it resumes sending ack/nack.

Note that piggyback heartbeats do NOT count towards this value.

[default] 10

[range] [1, 1 million] or DDS_LENGTH_UNLIMITED (p. 174)

5.120.2.7 DDS_Boolean DDS_RtpsReliableWriterProtocol_t::inactivate_nonprogressing_readers

Whether to treat remote readers as inactive when their NACKs do not progress.

Nominally, a remote reader is marked inactive when a successive number of periodic heartbeats equal or greater than **DDS_RtpsReliableWriterProtocol_-t::max_heartbeat_retries** (p. 1369) have been sent without receiving any ack/nacks back.

By setting this **DDS_BOOLEAN_TRUE** (p. 106), it changes the conditions of inactivating a remote reader: a reader will be considered inactive when it either does not send any ack/nacks or keeps sending non-progressing nacks for **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1369) number of heartbeat periods, where a non-progressing nack is one whose oldest sample requested has not advanced from the oldest sample requested of the previous nack.

[default] DDS_BOOLEAN_FALSE (p. 107)

5.120.2.8 DDS_Long DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples

The number of heartbeats per send queue.

If batching is disabled or the DataWriter is a MultiChannel DataWriter: a piggyback heartbeat will be sent every [DDS_ResourceLimitsQosPolicy::max_samples (p. 1358)/heartbeats_per_max_samples] number of samples.

Otherwise: a piggyback heartbeat will be sent every [DDS_DataWriterResourceLimitsQosPolicy::max_batches (p. 1132)/heartbeats_per_max_samples] number of batches.

If set to zero, no piggyback heartbeat will be sent. If maximum is **DDS_-LENGTH_UNLIMITED** (p. 174), 100 million is assumed as the maximum value in the calculation.

[default] 8

[range] [0, 100 million]

- for DDS_DiscoveryConfigQosPolicy::publication_writer (p. 1147): heartbeats_per_max_samples<= DDS_DomainParticipantQos::resource_limits.local_writer_allocation.max_count

heartbeats_per_max_samples<= DDS_DomainParticipantQos::resource_limits.local_reader_allocation.max_count

^ For DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer (p. 1110):

heartbeats_per_max_samples<= DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) if batching is disabled or the DataWriter is a MultiChannel DataWriter. Otherwise:

heartbeats_per_max_samples \le DDS_DataWriterResourceLimitsQosPolicy::max_batches (p. 1132).

5.120.2.9 struct DDS_Duration_t DDS_-RtpsReliableWriterProtocol_t::min_nack_response_delay [read]

The minimum delay to respond to a NACK.

When a reliable writer receives a NACK from a remote reader, the writer can choose to delay a while before it sends repair samples or a heartbeat. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0,1 day], <= max_nack_response_delay

5.120.2.10 struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::max_nack_response_delay [read]

The maximum delay to respond to a nack.

This set the value of maximum delay between receiving a NACK and sending repair samples or a heartbeat.

[default] The default value depends on the container policy:

For DDS_DiscoveryConfigQosPolicy (p. 1141): 0 seconds

For DDS_DataWriterProtocolQosPolicy (p. 1106): 0.2 seconds

[range] [0,1 day], $>= min_nack_response_delay$

5.120.2.11 struct DDS_Duration_t DDS_-RtpsReliableWriterProtocol_t::nack_suppression_duration [read]

The duration for ignoring consecutive NACKs that may trigger redundant repairs.

A reliable writer may receive consecutive NACKs within a short duration from a remote reader that will trigger the sending of redundant repair messages.

This specifies the duration during which consecutive NACKs are ignored to prevent redundant repairs from being sent.

[default] 0 seconds

[range] [0,1] day],

5.120.2.12 DDS_Long DDS_RtpsReliableWriterProtocol_t::max_-bytes_per_nack_response

The maximum total message size when resending dropped samples.

As part of the reliable communication protocol, data writers send heartbeat (HB) messages to their data readers. Each HB message contains the sequence number of the most recent sample sent by the data writer.

In response, a data reader sends an acknowledgement (ACK) message, indicating what sequence numbers it did not receive, if any. If the data reader is missing some samples, the data writer will send them again.

max_bytes_per_nack_response determines the maximum size of the message sent by the data writer in response to an ACK. This message may contain multiple samples.

If max_bytes_per_nack_response is larger than the maximum message size supported by the underlying transport, RTI Data Distribution Service will send multiple messages. If the total size of all samples that need to be resent is larger than max_bytes_per_nack_response, the remaining samples will be resent the next time an ACK arrives.

[default] 131072 [range] [0, 1 GB]

5.120.2.13 struct DDS_Duration_t DDS_-RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration [read]

The minimum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (DDS_DataWriterProtocolQosPolicy::disable_positive_acks (p. 1108) = DDS_BOOLEAN_TRUE (p. 106)) or a data reader (DDS_DataReaderProtocolQosPolicy::disable_positive_acks (p. 1071) = DDS_BOOLEAN_TRUE (p. 106)), a sample is available from the data writer's queue for at least this duration, after which the sample may be considered to be acknowledged.

[default] 1 millisecond

[range] [0,1 year], <= DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_max_sample_keep_duration (p. 1372)

5.120.2.14 struct DDS_Duration_t DDS_-RtpsReliableWriterProtocol_t::disable_positive_acks_max_sample_keep_duration [read]

The maximum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (DDS_-DataWriterProtocolQosPolicy::disable_positive_acks (p. 1108)

= DDS_BOOLEAN_TRUE (p. 106)) or a data reader (DDS_-DataReaderProtocolQosPolicy::disable_positive_acks (p. 1071) =

DDS_BOOLEAN_TRUE (p. 106)), a sample is available from the data writer's queue for at most this duration, after which the sample is considered to be acknowledged.

[default] 1 second

[range] [0,1 year], >= DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration (p. 1372)

5.120.2.15 DDS_Boolean DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration

Enables dynamic adjustment of sample keep duration in response to congestion.

For dynamic networks where a static minimum sample keep duration may not provide sufficient performance or reliability, setting DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration (p. 1373) = DDS_BOOLEAN_TRUE (p. 106), enables the sample keep duration to be dynamically adjusted to adapt to network conditions. The keep duration changes according to the detected level of congestion, which is determined to be proportional to the rate of NACKs received. An adaptive algorithm automatically controls the keep duration to optimize throughput and reliability.

To relieve high congestion, the keep duration is increased to effectively decrease the send rate; this lengthening of the keep duration is controlled by DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_increase_sample_keep_duration_factor (p. 1374). Alternatively, when congestion is low, the keep duration is decreased to effectively increase send rate; this shortening of the keep duration is controlled by DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_decrease_sample_keep_duration_factor (p. 1374).

The lower and upper bounds of the dynamic sample keep duration are set by DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration (p. 1372) and DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_max_sample_keep_duration (p. 1372), respectively.

When DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration (p. 1373) = DDS_BOOLEAN_FALSE (p. 107), the sample keep duration is set to DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration (p. 1372) .

[default] DDS_BOOLEAN_TRUE (p. 106)

5.120.2.16 DDS_Long DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_decrease_sample_keep_duration_factor

Controls rate of contraction of dynamic sample keep duration.

Used when DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration (p. 1373) = DDS_BOOLEAN_TRUE (p. 106).

When the adaptive algorithm determines that the keep duration should be decreased, this factor (a percentage) is multiplied with the current keep duration to get the new shorter keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 95% would result in a new keep duration of 19 milliseconds.

```
[default] 95
[range] <= 100
```

5.120.2.17 DDS_Long DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_increase_sample_keep_duration_factor

Controls rate of growth of dynamic sample keep duration.

Used when DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration (p. 1373) = DDS_BOOLEAN_TRUE (p. 106).

When the adaptive algorithm determines that the keep duration should be increased, this factor (a percentage) is multiplied with the current keep duration to get the new longer keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 150% would result in a new keep duration of 30 milliseconds.

```
[default] 150
[range] >= 100
```

5.120.2.18 DDS_Long DDS_RtpsReliableWriterProtocol_t::min_send_window_size

Minimum size of send window of unacknowledged samples.

A DDS_DataWriter (p. 673) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (this field) and a maximum size (max_send_window_size). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When both min_send_window_size and max_send_window_size are DDS_LENGTH_UNLIMITED (p. 174), then DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) serves as the effective send window limit. When DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) is less than max_send_window_size, then it serves as the effective max send window; if it is also less than min_send_window_size, then effectively both min and max send window sizes are equal to max samples.

[default] 32

[range] > 0, <= max_send_window_size, or DDS_LENGTH_UNLIMITED (p. 174)

See also:

 $\label{local_t::max_send_window_size} DDS_RtpsReliableWriterProtocol_t::max_send_window_size \\ (p. 1375)$

5.120.2.19 DDS_Long DDS_RtpsReliableWriterProtocol_t::max_send_window_size

Maximum size of send window of unacknowledged samples.

A DDS_DataWriter (p. 673) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (min_send_window_size) and a maximum size (this field). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When both min_send_window_size and max_send_window_size are DDS_LENGTH_UNLIMITED (p. 174), then DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) serves as the effective send window limit. When DDS_ResourceLimitsQosPolicy::max_samples (p. 1358) is less than max_send_window_size, then it serves as the effective max send window; if it is also less than min_send_window_size, then effectively both min and max send window sizes are equal to max samples.

[default] 256

[range] > 0, >= min_send_window_size, or DDS_LENGTH_UNLIMITED (p. 174)

See also:

 $\begin{tabular}{ll} DDS_RtpsReliableWriterProtocol_t::min_send_window_size \\ (p. 1374) \end{tabular}$

5.120.2.20 struct DDS_Duration_t DDS_-RtpsReliableWriterProtocol_t::send_window_update_period [read]

Period in which send window may be dynamically changed.

The **DDS_DataWriter** (p. 673)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

The change in send window size happens at this update period, whereupon the send window is either increased or decreased in size according to the increase or decrease factors, respectively.

```
[default] 3 seconds [range] > [0.1 \text{ year}]
```

See also:

```
DDS_RtpsReliableWriterProtocol_t::send_window_increase_factor (p. 1376), DDS_RtpsReliableWriterProtocol_t::send_window_decrease_factor (p. 1377)
```

5.120.2.21 DDS_Long DDS_RtpsReliableWriterProtocol_t::send_window_increase_factor

Increases send window size by this percentage when reacting dynamically to network conditions.

The DDS_DataWriter (p. 673)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

After an update period during which no negative acknowledgements were received, the send window will be increased by this factor. The factor is treated as a percentage, where a factor of 150 would increase the send window by 150%. The increased send window size will not exceed the max_send_window_size.

```
[default] 105
[range] > 100
```

See also:

$$\label{local_trisk} \begin{split} & \textbf{DDS_RtpsReliableWriterProtocol_t::send_window_update_period} \\ & (p.~1376), & & \textbf{DDS_RtpsReliableWriterProtocol_t::send_window_decrease_factor} \\ & (p.~1377) \end{split}$$

5.120.2.22 DDS_Long DDS_RtpsReliableWriterProtocol_t::send_window_decrease_factor

Decreases send window size by this percentage when reacting dynamically to network conditions.

The **DDS_DataWriter** (p. 673)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When increased network congestion causes a negative acknowledgement to be received by a writer, the send window will be decreased by this factor to throttle the effective send rate. The factor is treated as a percentage, where a factor of 80 would decrease the send window to 80% of its previous size. The decreased send window size will not be less than the min_send_window_size.

[default] 70 [range] [0, 100]

See also:

$$\label{local_period_posterior} \begin{split} DDS_RtpsReliableWriterProtocol_t::send_window_update_period \\ &(p. 1376), \qquad DDS_RtpsReliableWriterProtocol_t::send_window_increase_factor \\ &(p. 1376) \end{split}$$

5.121 DDS_RtpsWellKnownPorts_t Struct Reference

RTPS well-known port mapping configuration.

Data Fields

^ DDS_Long port_base

The base port offset.

^ DDS_Long domain_id_gain

Tunable domain gain parameter.

^ DDS_Long participant_id_gain

Tunable participant gain parameter.

^ DDS_Long builtin_multicast_port_offset

Additional offset for metatraffic multicast port.

^ DDS_Long builtin_unicast_port_offset

Additional offset for metatraffic unicast port.

^ DDS_Long user_multicast_port_offset

Additional offset for usertraffic multicast port.

^ DDS_Long user_unicast_port_offset

Additional offset for usertraffic unicast port.

5.121.1 Detailed Description

RTPS well-known port mapping configuration.

RTI Data Distribution Service uses the RTPS wire protocol. The discovery protocols defined by RTPS rely on well-known ports to initiate discovery. These well-known ports define the multicast and unicast ports on which a Participant will listen for discovery **metatraffic** from other Participants. The discovery metatraffic contains all the information required to establish the presence of remote DDS entities in the network.

The well-known ports are defined by RTPS in terms of port mapping expressions with several tunable parameters, which allow you to customize what network ports are used by RTI Data Distribution Service. These parameters are exposed

in DDS_RtpsWellKnownPorts_t (p. 1378). In order for all Participants in a system to correctly discover each other, it is important that they all use the same port mapping expressions.

The actual port mapping expressions, as defined by the RTPS specification, can be found below. In addition to the parameters listed in **DDS_-RtpsWellKnownPorts_t** (p. 1378), the port numbers depend on:

- domain_id, as specified in DDS_DomainParticipantFactory_create_participant (p. 309)
- participant_id, as specified using DDS_-WireProtocolQosPolicy::participant_id (p. 1487)

The domain_id parameter ensures no port conflicts exist between Participants belonging to different domains. This also means that discovery metatraffic in one domain is not visible to Participants in a different domain. The participant_id parameter ensures that unique unicast port numbers are assigned to Participants belonging to the same domain on a given host.

The metatraffic_unicast_port is used to exchange discovery metatraffic using unicast.

```
metatraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + builtin_
```

The metatraffic_multicast_port is used to exchange discovery metatraffic using multicast. The corresponding multicast group addresses are specified via DDS_DiscoveryQosPolicy::multicast_receive_addresses (p. 1151) on a DDS_DomainParticipant (p. 339) entity.

```
metatraffic_multicast_port = port_base + (domain_id_gain * domain_id) + builtin_multicast_port_offset
```

RTPS also defines the *default* multicast and unicast ports on which DataReaders and DataWriters receive **usertraffic**. These default ports can be overridden using the **DDS_DataReaderQos::multicast** (p. 1087), **DDS_DataReaderQos::unicast** (p. 1087), or by the **DDS_DataWriterQos::unicast** (p. 1128) QoS policies.

The usertraffic_unicast_port is used to exchange user data using unicast.

```
usertraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + user_uni
```

The usertraffic_multicast_port is used to exchange user data using multicast. The corresponding multicast group addresses can be configured using DDS_TransportMulticastQosPolicy (p. 1449).

```
usertraffic_multicast_port = port_base + (domain_id_gain * domain_id) + user_multicast_port_offset
```

By default, the port mapping parameters are configured to compliant with OMG's DDS Interoperability Wire Protocol (see also **DDS_-INTEROPERABLE_RTPS_WELL_KNOWN_PORTS** (p. 206)).

The OMG's DDS Interoperability Wire Protocol compliant port mapping parameters are *not* backwards compatible with previous versions of the RTI Data Distribution Service middleware.

When modifying the port mapping parameters, care must be taken to avoid port aliasing. This would result in undefined discovery behavior. The chosen parameter values will also determine the maximum possible number of domains in the system and the maximum number of participants per domain. Additionally, any resulting mapped port number must be within the range imposed by the underlying transport. For example, for UDPv4, this range typically equals [1024 - 65535].

QoS:

DDS_WireProtocolQosPolicy (p. 1483)

5.121.2 Field Documentation

5.121.2.1 DDS_Long DDS_RtpsWellKnownPorts_t::port_base

The base port offset.

All mapped well-known ports are offset by this value.

[default] 7400

[range] [>= 1], but resulting ports must be within the range imposed by the underlying transport.

5.121.2.2 DDS_Long DDS_RtpsWellKnownPorts_t::domain_id_gain

Tunable domain gain parameter.

Multiplier of the domain_id. Together with participant_id_gain, it determines the highest domain_id and participant_id allowed on this network.

In general, there are two ways to setup domain_id_gain and participant_id_gain parameters.

If domain_id_gain > participant_id_gain, it results in a port mapping layout where all **DDS_DomainParticipant** (p. 339) instances within a single domain occupy a consecutive range of domain_id_gain ports. Precisely, all ports occupied by the domain fall within:

(port_base + (domain_id_gain * domain_id))

and:

```
(port_base + (domain_id_gain * (domain_id + 1)) - 1)
```

Under such a case, the highest domain_id is limited only by the underlying transport's maximum port. The highest participant_id, however, must satisfy:

max_participant_id < (domain_id_gain / participant_id_gain)</pre>

On the contrary, if domain_id_gain <= participant_id_gain, it results in a port mapping layout where a given domain's DDS_DomainParticipant (p. 339) instances occupy ports spanned across the entire valid port range allowed by the underlying transport. For instance, it results in the following potential mapping:

Mapped Port	Domain Id	Participant ID
higher port number	Domain $Id = 1$	Participant $ID = 2$
	Domain $Id = 0$	Participant $ID = 2$
	Domain $Id = 1$	Participant $ID = 1$
	Domain $Id = 0$	Participant $ID = 1$
	Domain $Id = 1$	Participant $ID = 0$
lower port number	Domain $Id = 0$	Participant $ID = 0$

Under this case, the highest participant_id is limited only by the underlying transport's maximum port. The highest domain_id, however, must satisfy:

```
max_domain_id < (participant_id_gain / domain_id_gain)</pre>
```

Additionally, domain_id_gain also determines the range of the port-specific offsets.

```
domain_id_gain > abs(builtin_multicast_port_offset - user_multicast_port_offset)
```

domain_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)

Violating this may result in port aliasing and undefined discovery behavior.

[default] 250

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

${\bf 5.121.2.3} \quad {\bf DDS_Long} \ {\bf DDS_RtpsWellKnownPorts_t::participant_id_gain}$

Tunable participant gain parameter.

Multiplier of the participant_id. See DDS_RtpsWellKnownPorts_t::domain_id_gain (p. 1380) for its implications on the highest domain_id and participant_id allowed on this network.

Additionally, participant_id_gain also determines the range of builtin_unicast_port_offset and user_unicast_port_offset.

participant_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)

[default] 2

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

5.121.2.4 DDS_Long DDS_RtpsWellKnownPorts_t::builtin_multicast_port_offset

Additional offset for **metatraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 0

 $[\mathbf{range}] >= 0]$, but resulting ports must be within the range imposed by the underlying transport.

$\begin{array}{lll} 5.121.2.5 & DDS_Long & DDS_RtpsWellKnownPorts_t::builtin_-unicast_port_offset \end{array}$

Additional offset for **metatraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 10

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

${\small 5.121.2.6 \quad DDS_Long\ DDS_RtpsWellKnownPorts_t::user_multicast_port_offset}$

Additional offset for **usertraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 1

[range] [>= 0], but resulting ports must be within the range imposed by the underlying transport.

${\bf 5.121.2.7} \quad DDS_Long\ DDS_RtpsWellKnownPorts_t::user_unicast_-port_offset$

Additional offset for **usertraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 11

[range] [>=0], but resulting ports must be within the range imposed by the underlying transport.

5.122 DDS_SampleInfo Struct Reference

Information that accompanies each sample that is read or taken.

Data Fields

^ DDS_SampleStateKind sample_state

The sample state of the sample.

^ DDS_ViewStateKind view_state

The view state of the instance.

^ DDS_InstanceStateKind instance_state

The instance state of the instance.

^ struct DDS_Time_t source_timestamp

The timestamp when the sample was written by a DataWriter.

^ DDS_InstanceHandle_t instance_handle

Identifies locally the corresponding instance.

^ DDS_InstanceHandle_t publication_handle

Identifies locally the DataWriter that modified the instance.

^ DDS_Long disposed_generation_count

The disposed generation count of the instance at the time of sample reception.

^ DDS_Long no_writers_generation_count

The no writers generation count of the instance at the time of sample reception.

^ DDS_Long sample_rank

The sample rank of the sample.

^ DDS_Long generation_rank

The generation rank of the sample.

^ DDS_Long absolute_generation_rank

The absolute generation rank of the sample.

^ DDS_Boolean valid_data

Indicates whether the DataSample contains data or else it is only used to communicate a change in the instance_state of the instance.

- ^ struct DDS_Time_t reception_timestamp
 - <<extension>> (p. 950) The timestamp when the sample was committed by a DataReader.
- ^ struct DDS_SequenceNumber_t publication_sequence_number

<<eXtension>> (p. 950) The publication sequence number.

^ struct DDS_SequenceNumber_t reception_sequence_number

<<eXtension>> (p. 950) The reception sequence number when sample was committed by a DataReader

5.122.1 Detailed Description

Information that accompanies each sample that is read or taken.

5.122.2 Interpretation of the SampleInfo

The **DDS_SampleInfo** (p. 1384) contains information pertaining to the associated Data instance sample including:

- ^ the sample_state of the Data value (i.e., if it has already been read or not)
- the view_state of the related instance (i.e., if the instance is new or not)
- ^ the instance_state of the related instance (i.e., if the instance is alive or not)
- ^ the valid_data flag. This flag indicates whether there is data associated with the sample. Some samples do not contain data indicating only a change on the instance_state of the corresponding instance.
- The values of disposed_generation_count and no_writers_generation_count for the related instance at the time the sample was received. These counters indicate the number of times the instance had become ALIVE (with instance_state= DDS_ALIVE_INSTANCE_STATE (p. 854)) at the time the sample was received.
- The sample_rank and generation_rank of the sample within the returned sequence. These ranks provide a preview of the samples that follow within the sequence returned by the read or take operations.

- ^ The absolute_generation_rank of the sample within the DDS_DataReader (p. 783). This rank provides a preview of what is available within the DDS_DataReader (p. 783).
- The source_timestamp of the sample. This is the timestamp provided by the DDS_DataWriter (p. 673) at the time the sample was produced.

5.122.3 Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count

For each instance, RTI Data Distribution Service internally maintains two counts, the **DDS_SampleInfo::disposed_generation_count** (p. 1389) and **DDS_SampleInfo::no_writers_generation_count** (p. 1389), relative to each DataReader:

- ^ The DDS_SampleInfo::disposed_generation_count (p. 1389) and DDS_SampleInfo::no_writers_generation_count (p. 1389) are initialized to zero when the DDS_DataReader (p. 783) first detects the presence of a never-seen-before instance.
- ^ The DDS_SampleInfo::disposed_generation_count (p. 1389) is incremented each time the instance_state of the corresponding instance changes from DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE (p. 854) to DDS_ALIVE_INSTANCE_STATE (p. 854).
- ^ The DDS_SampleInfo::no_writers_generation_count (p. 1389) is incremented each time the instance_state of the corresponding instance changes from DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE (p. 854) to DDS_ALIVE_INSTANCE_STATE (p. 854).
- ^ These 'generation counts' are reset to zero when the instance resource is reclaimed.

The DDS_SampleInfo::disposed_generation_count (p. 1389) and DDS_SampleInfo::no_writers_generation_count (p. 1389) available in the DDS_SampleInfo (p. 1384) capture a snapshot of the corresponding counters at the time the sample was received.

5.122.4 Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank

The DDS_SampleInfo::sample_rank (p. 1390) and DDS_SampleInfo::generation_rank (p. 1390) available in the DDS_SampleInfo

(p. 1384) are computed based solely on the actual samples in the ordered collection returned by read or take.

- ^ The DDS_SampleInfo::sample_rank (p. 1390) indicates the number of samples of the same instance that follow the current one in the collection.
- ^ The DDS_SampleInfo::generation_rank (p. 1390) available in the DDS_SampleInfo (p. 1384) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that appears in the returned Collection (MRSIC). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the reception of MRSIC.
- ^ These 'generation ranks' are reset to zero when the instance resource is reclaimed.

The DDS_SampleInfo::generation_rank (p. 1390) is computed using the formula:

The DDS_SampleInfo::absolute_generation_rank (p. 1390) available in the DDS_SampleInfo (p. 1384) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that the middleware has received (MRS). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the time when the read or take was called.

5.122.5 Interpretation of the SampleInfo counters and ranks

These counters and ranks allow the application to distinguish samples belonging to different "generations" of the instance. Note that it is possible for an instance to transition from not-alive to alive (and back) several times before the application accesses the data by means of read or take. In this case, the returned collection may contain samples that cross generations (i.e. some samples were received before the instance became not-alive, other after the instance

re-appeared again). Using the information in the **DDS_SampleInfo** (p. 1384), the application can anticipate what other information regarding the same instance appears in the returned collection, as well as in the infrastructure and thus make appropriate decisions.

For example, an application desiring to only consider the most current sample for each instance would only look at samples with sample_rank == 0. Similarly, an application desiring to only consider samples that correspond to the latest generation in the collection will only look at samples with generation_rank == 0. An application desiring only samples pertaining to the latest generation available will ignore samples for which absolute_generation_rank != 0. Other application-defined criteria may also be used.

DDS_SampleStateKind (p. 848), DDS_InstanceStateKind (p. 853), DDS_ViewStateKind (p. 850), DDS_SampleInfo::valid_data (p. 1391)
```

5.122.6 Field Documentation

$5.122.6.1 \quad DDS_SampleStateKind\ DDS_SampleInfo::sample_state$

The sample state of the sample.

Indicates whether or not the corresponding data sample has already been read.

See also:

```
DDS_SampleStateKind (p. 848)
```

${\bf 5.122.6.2} \quad DDS_ViewStateKind\ DDS_SampleInfo::view_state$

The view state of the instance.

Indicates whether the **DDS_DataReader** (p. 783) has already seen samples for the most-current generation of the related instance.

See also:

```
DDS_ViewStateKind (p. 850)
```

5.122.6.3 DDS_InstanceStateKind DDS_SampleInfo::instance_state

The instance state of the instance.

Indicates whether the instance is currently in existence or, if it has been disposed, the reason why it was disposed.

See also:

DDS_InstanceStateKind (p. 853)

5.122.6.4 struct DDS_Time_t DDS_SampleInfo::source_timestamp [read]

The timestamp when the sample was written by a DataWriter.

5.122.6.5 DDS_InstanceHandle_t DDS_SampleInfo::instance_handle

Identifies locally the corresponding instance.

5.122.6.6 DDS_InstanceHandle_t DDS_SampleInfo::publication_handle

Identifies locally the DataWriter that modified the instance.

The publication_handle is the same DDS_InstanceHandle_t (p. 452) that is returned by the operation DDS_DataReader_get_matched_publications (p. 830) and can also be used as a parameter to the operation DDS_DataReader_get_matched_publication_data (p. 831).

5.122.6.7 DDS_Long DDS_SampleInfo::disposed_generation_count

The disposed generation count of the instance at the time of sample reception.

Indicates the number of times the instance had become alive after it was disposed explicitly by a **DDS_DataWriter** (p. 673), at the time the sample was received.

See also:

Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count (p. 1386) Interpretation of the SampleInfo counters and ranks (p. 1387)

5.122.6.8 DDS_Long DDS_SampleInfo::no_writers_generation_count

The no writers generation count of the instance at the time of sample reception.

Indicates the number of times the instance had become alive after it was disposed because there were no writers, at the time the sample was received.

See also:

Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count (p. 1386) Interpretation of the SampleInfo counters and ranks (p. 1387)

5.122.6.9 DDS_Long DDS_SampleInfo::sample_rank

The sample rank of the sample.

Indicates the number of samples related to the same instance that follow in the collection returned by read or take.

See also:

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1386) Interpretation of the SampleInfo counters and ranks (p. 1387)

5.122.6.10 DDS_Long DDS_SampleInfo::generation_rank

The generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample in the collection related to the same instance was received.

See also:

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1386) Interpretation of the SampleInfo counters and ranks (p. 1387)

5.122.6.11 DDS_Long DDS_SampleInfo::absolute_generation_rank

The absolute generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample (which may not be in the returned collection) related to the same instance was received.

See also:

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1386) Interpretation of the SampleInfo counters and ranks (p. 1387)

5.122.6.12 DDS_Boolean DDS_SampleInfo::valid_data

Indicates whether the DataSample contains data or else it is only used to communicate a change in the instance_state of the instance.

Normally each DataSample contains both a DDS_SampleInfo (p. 1384) and some Data. However there are situations where a DataSample contains only the DDS_SampleInfo (p. 1384) and does not have any associated data. This occurs when the RTI Data Distribution Service notifies the application of a change of state for an instance that was caused by some internal mechanism (such as a timeout) for which there is no associated data. An example of this situation is when the RTI Data Distribution Service detects that an instance has no writers and changes the corresponding instance_state to DDS_NOT_-ALIVE_NO_WRITERS_INSTANCE_STATE (p. 854).

The application can distinguish whether a particular DataSample has data by examining the value of the valid_data flag. If this flag is set to DDS_BOOLEAN_TRUE (p. 106), then the DataSample contains valid Data. If the flag is set to DDS_BOOLEAN_FALSE (p. 107), the DataSample contains no Data.

To ensure correctness and portability, the valid_data flag must be examined by the application prior to accessing the Data associated with the DataSample and if the flag is set to DDS_BOOLEAN_FALSE (p. 107), the application should not access the Data associated with the DataSample, that is, the application should access only the DDS_SampleInfo (p. 1384).

5.122.6.13 struct DDS_Time_t DDS_SampleInfo::reception_timestamp [read]

<< eXtension>> (p. 950) The timestamp when the sample was committed by a DataReader.

5.122.6.14 struct DDS_SequenceNumber_t DDS_-SampleInfo::publication_sequence_number [read]

<< eXtension>> (p. 950) The publication sequence number.

 $<<\!\!eXtension>>$ (p. 950) The reception sequence number when sample was committed by a DataReader

5.123 DDS_SampleInfoSeq Struct Reference

Declares IDL sequence < **DDS_SampleInfo** (p. 1384) > .

5.124 DDS_SampleLostStatus Struct Reference

DDS_SAMPLE_LOST_STATUS (p. 130)

Data Fields

$\hat{\ }$ DDS_Long total_count

Total cumulative count of all samples lost across all instances of data published under the **DDS_Topic** (p. 425).

DDS_Long total_count_change

The incremental number of samples lost since the last time the listener was called or the status was read.

5.124.1 Detailed Description

DDS_SAMPLE_LOST_STATUS (p. 130)

Examples:

HelloWorld_subscriber.c.

5.124.2 Field Documentation

$5.124.2.1 \quad DDS_Long\ DDS_SampleLostStatus::total_count$

Total cumulative count of all samples lost across all instances of data published under the **DDS_Topic** (p. 425).

$5.124.2.2 \quad DDS_Long\ DDS_SampleLostStatus:: total_count_change$

The incremental number of samples lost since the last time the listener was called or the status was read.

5.125 DDS_SampleRejectedStatus Struct Reference

DDS_SAMPLE_REJECTED_STATUS (p. 130)

Data Fields

^ DDS_Long total_count

Total cumulative count of samples rejected by the DDS_DataReader (p. 783).

^ DDS_Long total_count_change

The incremental number of samples rejected since the last time the listener was called or the status was read.

${\bf ^{\hat{}}\ DDS_SampleRejectedStatusKind\ last_reason}$

Reason for rejecting the last sample rejected.

^ DDS_InstanceHandle_t last_instance_handle

Handle to the instance being updated by the last sample that was rejected.

5.125.1 Detailed Description

DDS_SAMPLE_REJECTED_STATUS (p. 130)

Examples:

HelloWorld_subscriber.c.

5.125.2 Field Documentation

5.125.2.1 DDS_Long DDS_SampleRejectedStatus::total_count

Total cumulative count of samples rejected by the DDS_DataReader (p. 783).

${\bf 5.125.2.2} \quad DDS_Long\ DDS_SampleRejectedStatus::total_count_-change$

The incremental number of samples rejected since the last time the listener was called or the status was read.

$\begin{array}{ccc} 5.125.2.3 & DDS_SampleRejectedStatusKind \\ & DDS_SampleRejectedStatus::last_reason \end{array}$

Reason for rejecting the last sample rejected.

See also:

DDS_SampleRejectedStatusKind (p. 786)

5.125.2.4 DDS_InstanceHandle_t DDS_-SampleRejectedStatus::last_instance_handle

Handle to the instance being updated by the last sample that was rejected.

5.126 DDS_SequenceNumber_t Struct Reference

Type for sequence number representation.

Data Fields

^ DDS_Long high

The most significant part of the sequence number.

^ DDS_UnsignedLong low

The least significant part of the sequence number.

5.126.1 Detailed Description

Type for sequence number representation.

Represents a 64-bit sequence number.

5.126.2 Field Documentation

5.126.2.1 DDS_Long DDS_SequenceNumber_t::high

The most significant part of the sequence number.

5.126.2.2 DDS_UnsignedLong DDS_SequenceNumber_t::low

The least significant part of the sequence number.

5.127 DDS_ShortSeq Struct Reference

```
Instantiates FooSeq (p. 1497) < DDS_Short (p. 107) >.
```

5.127.1 Detailed Description

```
Instantiates FooSeq (p. 1497) < DDS_Short (p. 107) >.
```

5.128 DDS_StringSeq Struct Reference

Instantiates FooSeq (p. 1497) < char* > with value type semantics.

5.128.1 Detailed Description

Instantiates FooSeq (p. 1497) < char* > with value type semantics.

StringSeq is a sequence that contains strings.

Even though the element type is a char*, i.e. a pointer, the sequence semantically behaves as a sequence of char* value types. When a **DDS_StringSeq** (p. 1399) is copied or deleted, the contained strings are also respectively copied or deleted.

Important: Users of this type must understand its memory management contract.

- Ownership of this sequence's buffer implies ownership of the pointers stored in that buffer; a loan of the buffer implies lack of ownership of the pointers. In other words, for a type FooSeq (p. 1497) where Foo (p. 1494) is a pointer, ownership of Foo (p. 1494) implies ownership of *Foo. In other words, deleting a string sequence that owns its memory implies the deletion of all strings in that sequence. See FooSeq_loan_contiguous (p. 279) for more information about sequence memory ownership.
- The second important rule is that non-NULL strings are assumed to be of sufficient size to store the necessary characters. This is a dangerous rule, but it cannot be avoided because a string doesn't store the amount of memory it has. The only other alternative is to always free and re-allocate memory. Not only would this latter policy be very expensive, but it would essentially render any loaned **DDS_StringSeq** (p. 1399) immutable, since to modify any string in it would require freeing and re-allocating that string, which would violate the first principle discussed above.

It is also worth noting that the element type of a string sequence is char*, not const char*. It is therefore incorrect and dangerous, for example, to insert a string literal into a string sequence without first copying it into mutable memory.

In order to guarantee correct behavior, it is recommended that the contained elements always be manipulated using the string support API's described in **String Support** (p. 285).

<<iinterface>> (p. 950) String type support.

5.130 DDS StructMember Struct Reference

A description of a member of a struct.

Data Fields

 $\hat{}$ char * name

The name of the struct member.

 $\hat{}$ const $DDS_TypeCode * type$

The type of the struct member.

^ DDS_Boolean is_pointer

Indicates whether the struct member is a pointer or not.

^ DDS_Short bits

Number of bits of a bitfield member.

^ DDS_Boolean is_key

Indicates if the struct member is a key member or not.

5.130.1 Detailed Description

A description of a member of a struct.

See also:

```
DDS_StructMemberSeq (p. 1404)
DDS_TypeCodeFactory_create_struct_tc (p. 503)
```

5.130.2 Field Documentation

5.130.2.1 char* DDS_StructMember::name

The name of the struct member.

Cannot be NULL.

${\bf 5.130.2.2} \quad {\bf const~DDS_TypeCode*~DDS_StructMember::type}$

The type of the struct member.

Cannot be NULL.

${\bf 5.130.2.3} \quad DDS_Boolean\ DDS_StructMember:: is_pointer$

Indicates whether the struct member is a pointer or not.

5.130.2.4 DDS_Short DDS_StructMember::bits

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **DDS_TYPECODE_NOT_BITFIELD** (p. 472).

${\bf 5.130.2.5}\quad {\bf DDS_Boolean\ DDS_StructMember::} is_key$

Indicates if the struct member is a key member or not.

${\bf 5.131}\quad {\bf DDS_StructMemberSeq~Struct~Reference}$

Defines a sequence of struct members.

5.131.1 Detailed Description

Defines a sequence of struct members.

See also:

```

SubscriptionMatchedStatus (p. 1420)
```

See also:

```
DDS_Listener (p. 1246)
Status Kinds (p. 123)
Operations Allowed in Listener Callbacks (p. 1248)
```

5.132.2 Field Documentation

5.132.2.1 struct DDS_DataReaderListener DDS_- SubscriberListener::as_datareaderlistener $\lceil \text{read} \rceil$

The superclass instance of this **DDS_SubscriberListener** (p. 1405).

 ${\bf 5.132.2.2} \quad DDS_SubscriberListener_DataOnReadersCallback\\ \quad DDS_SubscriberListener::on_data_on_readers$

Handles the ${\bf DDS_DATA_ON_READERS_STATUS}$ (p. 130) communication status.

5.133 DDS_SubscriberQos Struct Reference

QoS policies supported by a DDS_Subscriber (p. 743) entity.

Data Fields

^ struct DDS_PresentationQosPolicy presentation

Presentation policy, PRESENTATION (p. 155).

^ struct DDS_PartitionQosPolicy partition

Partition policy, PARTITION (p. 165).

^ struct DDS_GroupDataQosPolicy group_data

Group data policy, GROUP_DATA (p. 152).

^ struct DDS_EntityFactoryQosPolicy entity_factory

Entity factory policy, ENTITY_FACTORY (p. 180).

^ struct DDS_ExclusiveAreaQosPolicy exclusive_area

<<eXtension>> (p. 950) Exclusive area for the subscriber and all entities that are created by the subscriber.

5.133.1 Detailed Description

QoS policies supported by a DDS_Subscriber (p. 743) entity.

You must set certain members in a consistent manner:

 $\label{length} \mbox{ of } \mbox{ DDS_SubscriberQos::group_data.value } <= \mbox{ DDS_DomainParticipantQos::resource_limits.subscriber_group_data_max_length}$

length of DDS_SubscriberQos::partition.name <= DDS_DomainParticipantQos::resource_limits.max_partitions

combined number of characters (including terminating 0) in DDS_-SubscriberQos::partition.name <= DDS_DomainParticipantQos::resource_limits.max_partition_cumulative_characters

If any of the above are not true, **DDS_Subscriber_set_qos** (p. 759) and **DDS_Subscriber_set_qos_with_profile** (p. 760) will fail with **DDS_RETCODE_-INCONSISTENT_POLICY** (p. 122)

5.133.2 Field Documentation

 $\begin{array}{ccc} \textbf{5.133.2.1} & \textbf{struct DDS_PresentationQosPolicy} \\ & \textbf{DDS_SubscriberQos::presentation} & \textbf{[read]} \end{array}$

Presentation policy, **PRESENTATION** (p. 155).

5.133.2.2 struct DDS_PartitionQosPolicy DDS_SubscriberQos::partition [read]

Partition policy, PARTITION (p. 165).

5.133.2.3 struct DDS_GroupDataQosPolicy DDS_SubscriberQos::group_data [read]

Group data policy, GROUP_DATA (p. 152).

Entity factory policy, **ENTITY_FACTORY** (p. 180).

5.133.2.5 struct DDS_ExclusiveAreaQosPolicy DDS_SubscriberQos::exclusive_area [read]

<<eXtension>> (p. 950) Exclusive area for the subscriber and all entities that are created by the subscriber.

5.134 DDS_SubscriberSeq Struct Reference

5.134.1 Detailed Description

Declares IDL sequence < **DDS_Subscriber** (p. 743) > .

See also:

FooSeq (p. 1497)

5.135 DDS_SubscriptionBuiltinTopicData Struct Reference

Entry created when a **DDS_DataReader** (p. 783) is discovered in association with its Subscriber.

Data Fields

^ DDS_BuiltinTopicKey_t key

DCPS key to distinguish entries.

^ DDS_BuiltinTopicKey_t participant_key

DCPS key of the participant to which the DataReader belongs.

^ char * topic_name

Name of the related **DDS_Topic** (p. 425).

 $\hat{}$ char * **type_name**

Name of the type attached to the DDS_Topic (p. 425).

`struct DDS_DurabilityQosPolicy durability

Policy of the corresponding DataReader.

`struct DDS_DeadlineQosPolicy deadline

Policy of the corresponding DataReader.

* struct DDS_LatencyBudgetQosPolicy latency_budget

Policy of the corresponding DataReader.

* struct DDS_LivelinessQosPolicy liveliness

Policy of the corresponding DataReader.

^ struct DDS_ReliabilityQosPolicy reliability

 $Policy\ of\ the\ corresponding\ Data Reader.$

* struct DDS_OwnershipQosPolicy ownership

Policy of the corresponding DataReader.

^ struct DDS_DestinationOrderQosPolicy destination_order

Policy of the corresponding DataReader.

^ struct DDS_UserDataQosPolicy user_data

Policy of the corresponding DataReader.

^ struct DDS_TimeBasedFilterQosPolicy time_based_filter

Policy of the corresponding DataReader.

$\hat{\ }$ struct DDS_PresentationQosPolicy presentation

Policy of the Subscriber to which the DataReader belongs.

^ struct DDS_PartitionQosPolicy partition

Policy of the Subscriber to which the DataReader belongs.

^ struct DDS_TopicDataQosPolicy topic_data

Policy of the related Topic.

^ struct DDS_GroupDataQosPolicy group_data

Policy of the Subscriber to which the DataReader belongs.

^ struct DDS_TypeCode * type_code

<<eXtension>> (p. 950) Type code information of the corresponding Topic

^ DDS_BuiltinTopicKey_t subscriber_key

<<eXtension>> (p.950) DCPS key of the subscriber to which the DataReader belongs.

^ struct DDS_PropertyQosPolicy property

<<eXtension>> (p. 950) Properties of the corresponding DataReader.

^ struct DDS_LocatorSeq unicast_locators

<<extension>> (p. 950) Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

* struct DDS_LocatorSeq multicast_locators

<<extension>> (p. 950) Custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.

struct DDS_ContentFilterProperty_t content_filter_property

<<extension>> (p. 950) This field provides all the required information to enable content filtering on the Writer side.

$\hat{\ }$ struct DDS_GUID_t virtual_guid

<<eXtension>> (p. 950) Virtual GUID associated to the DataReader.

^ DDS_ProtocolVersion_t rtps_protocol_version

<<eXtension>> (p. 950) Version number of the RTPS wire protocol used.

^ struct DDS_VendorId_t rtps_vendor_id

<<**eXtension**>> (p. 950) ID of vendor implementing the RTPS wire protocol.

`struct DDS_ProductVersion_t product_version

<<e**Xtension**>> (p. 950) This is a vendor specific parameter. It gives the current version for rti-dds.

^ DDS_Boolean disable_positive_acks

<<eXtension>> (p. 950) This is a vendor specific parameter. Determines whether the corresponding DataReader sends positive acknowledgements for reliability.

5.135.1 Detailed Description

Entry created when a **DDS_DataReader** (p. 783) is discovered in association with its Subscriber.

Data associated with the built-in topic **DDS_SUBSCRIPTION_TOPIC_- NAME** (p. 28). It contains QoS policies and additional information that apply to the remote **DDS_DataReader** (p. 783) the related **DDS_Subscriber** (p. 743).

5.138 DDS_SubscriptionMatchedStatus Struct Reference

DDS_SUBSCRIPTION_MATCHED_STATUS (p. 132)

Data Fields

^ DDS_Long total_count

The total cumulative number of times the concerned DDS_DataReader (p. 783) discovered a "match" with a DDS_DataWriter (p. 673).

^ DDS_Long total_count_change

The change in total_count since the last time the listener was called or the status was read.

^ DDS_Long current_count

The current number of writers with which the DDS_DataReader (p. 783) is matched.

^ DDS_Long current_count_peak

<<eXtension>> (p. 950) The highest value that current_count has reached until now.

^ DDS_Long current_count_change

The change in current_count since the last time the listener was called or the status was read.

^ DDS_InstanceHandle_t last_publication_handle

A handle to the last $DDS_DataWriter$ (p. 673) that caused the status to change.

5.138.1 Detailed Description

DDS_SUBSCRIPTION_MATCHED_STATUS (p. 132)

A "match" happens when the **DDS_DataReader** (p. 783) finds a **DDS_DataWriter** (p. 673) for the same **DDS_Topic** (p. 425) with an offered QoS that is compatible with that requested by the **DDS_DataReader** (p. 783).

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDS_DataReader** (p. 783) will become "unmatched" from a remote **DDS_DataWriter** (p. 673) when that **DDS_DataWriter** (p. 673) goes away for any reason.

Examples:

HelloWorld_subscriber.c.

5.138.2 Field Documentation

$5.138.2.1 \quad DDS_Long\ DDS_Subscription Matched Status:: total_count$

The total cumulative number of times the concerned **DDS_DataReader** (p. 783) discovered a "match" with a **DDS_DataWriter** (p. 673).

This number increases whenever a new match is discovered. It does not change when an existing match goes away.

5.138.2.2 DDS_Long DDS_SubscriptionMatchedStatus::total_count_change

The change in total_count since the last time the listener was called or the status was read.

${\bf 5.138.2.3} \quad {\bf DDS_Long} \ {\bf DDS_SubscriptionMatchedStatus::current_-count}$

The current number of writers with which the **DDS_DataReader** (p. 783) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away.

5.138.2.4 DDS_Long DDS_SubscriptionMatchedStatus::current_-count_peak

<< eXtension>> (p. 950) The highest value that current_count has reached until now.

5.138.2.5 DDS_Long DDS_SubscriptionMatchedStatus::current_-count_change

The change in current_count since the last time the listener was called or the status was read.

A handle to the last $\mathbf{DDS_DataWriter}$ (p. 673) that caused the status to change.

DDS_SystemResourceLimitsQosPolicy 5.139Struct Reference

Configures DDS_DomainParticipant (p. 339)-independent resources used by RTI Data Distribution Service. Mainly used to change the maximum number of DDS_DomainParticipant (p. 339) entities that can be created within a single process (address space).

Data Fields

^ DDS_Long max_objects_per_thread

The maximum number of objects that can be stored per thread for a DDS_-DomainParticipantFactory (p. 302).

5.139.1**Detailed Description**

Configures **DDS_DomainParticipant** (p. 339)-independent resources used by RTI Data Distribution Service. Mainly used to change the maximum number of DDS_DomainParticipant (p. 339) entities that can be created within a single process (address space).

This QoS policy is an extension to the DDS standard.

Entity:

DDS_DomainParticipantFactory (p. 302)

Properties:

```
\mathbf{RxO} (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.139.2 Usage

Within a single process (or address space for some supported real-time operating systems), applications may create and use multiple DDS_DomainParticipant (p. 339) entities. This QoS policy sets a parameter that places an effective upper bound on the maximum number of DDS_DomainParticipant (p. 339) entities that can be created in a single process/address space.

5.139.3 Field Documentation

The maximum number of objects that can be stored per thread for a DDS_DomainParticipantFactory (p. 302).

Before increasing this value to allow you to create more participants, carefully consider the application design that requires you to create so many participants. Remember: a **DDS_DomainParticipant** (p. 339) is a heavy-weight object. It spawns several threads and maintains its own discovery database (see **DISCOVERY** (p. 188)). Creating more participants than RTI Data Distribution Service strictly requires – one per domain per process/address space – can adversely affect the performance and resource utilization of your application.

[default] 1024; this value allows you to create about 10 or 11 DDS_-DomainParticipant (p. 339) entities.

[range] [1, 1 billion]

5.140 DDS_ThreadSettings_t Struct Reference

The properties of a thread of execution.

Data Fields

 $\hat{DDS}_ThreadSettingsKindMask\ mask$

Describes the type of thread.

^ DDS_Long priority

Thread priority.

^ DDS_Long stack_size

The thread stack-size.

^ struct DDS_LongSeq cpu_list

The list of processors on which the thread(s) may run.

 $\hat{\ }$ DDS_ThreadSettingsCpuRotationKind cpu_rotation

Determines how processor affinity is applied to multiple threads.

5.140.1 Detailed Description

The properties of a thread of execution.

QoS:

5.140.2 Field Documentation

5.140.2.1 DDS_ThreadSettingsKindMask DDS_ThreadSettings_t::mask

Describes the type of thread.

[default] 0, use default options of the OS

$5.140.2.2 \quad DDS_Long\ DDS_ThreadSettings_t::priority$

Thread priority.

[range] Platform-dependent

5.140.2.3 DDS_Long DDS_ThreadSettings_t::stack_size

The thread stack-size.

[range] Platform-dependent.

5.140.2.4 struct DDS_LongSeq DDS_ThreadSettings_t::cpu_list [read]

The list of processors on which the thread(s) may run.

A sequence of integers that represent the set of processors on which the thread(s) controlled by this QoS may run. An empty sequence (the default) means the middleware will make no CPU affinity adjustments.

Note: This feature is currently only supported on a subset of architectures (see the Platform Notes). The API may change as more architectures are added in future releases.

This value is only relevant to the **DDS_ReceiverPoolQosPolicy** (p. 1339). It is ignored within other QoS policies that include **DDS_ThreadSettings_t** (p. 1425).

See also:

Controlling CPU Core Affinity for RTI Threads (p. 136)

[default] Empty sequence

5.140.2.5 DDS_ThreadSettingsCpuRotationKind DDS_ThreadSettings_t::cpu_rotation

Determines how processor affinity is applied to multiple threads.

This value is only relevant to the **DDS_ReceiverPoolQosPolicy** (p. 1339). It is ignored within other QoS policies that include **DDS_ThreadSettings_t** (p. 1425).

5.141 DDS_Time_t Struct Reference

Type for *time* representation.

Data Fields

 $\hat{\ }$ DDS_Long sec

seconds

 $\hat{\ }$ DDS_Unsigned Long nanosec

nanose conds

5.141.1 Detailed Description

Type for *time* representation.

A DDS_Time_t (p. 1428) represents a moment in time.

5.141.2 Field Documentation

5.141.2.1 DDS_Long DDS_Time_t::sec

seconds

${\bf 5.141.2.2} \quad {\bf DDS_UnsignedLong\ DDS_Time_t::} {\bf nanosec}$

nanoseconds

5.142 DDS_TimeBasedFilterQosPolicy Struct Reference

Filter that allows a **DDS_DataReader** (p. 783) to specify that it is interested only in (potentially) a subset of the values of the data.

Data Fields

^ struct DDS_Duration_t minimum_separation

The minimum separation duration between subequent samples.

5.142.1 Detailed Description

Filter that allows a **DDS_DataReader** (p. 783) to specify that it is interested only in (potentially) a subset of the values of the data.

The filter states that the **DDS_DataReader** (p. 783) does not want to receive more than one value each minimum_separation, regardless of how fast the changes occur.

Entity:

```
DDS_DataReader (p. 783)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = YES (p. 146)
```

5.142.2 Usage

You can use this QoS policy to reduce the amount of data received by a DDS_DataReader (p. 783). DDS_DataWriter (p. 673) entities may send data faster than needed by a DDS_DataReader (p. 783). For example, a DDS_DataReader (p. 783) of sensor data that is displayed to a human operator in a GUI application does not need to receive data updates faster than a user can reasonably perceive changes in data values. This is often measure in tenths (0.1) of a second up to several seconds. However, a DDS_DataWriter (p. 673) of sensor information may have other DDS_DataReader (p. 783) entities that are processing the sensor information to control parts of the system and thus need new data updates in measures of hundredths (0.01) or thousandths (0.001) of a second.

With this QoS policy, different **DDS_DataReader** (p. 783) entities can set their own time-based filters, so that data published faster than the period set by a each **DDS_DataReader** (p. 783) will not be delivered to that **DDS_DataReader** (p. 783).

The **TIME_BASED_FILTER** (p. 164) also applies to each instance separately; that is, the constraint is that the **DDS_DataReader** (p. 783) does not want to see more than one sample of each instance per minimum_separation period.

This QoS policy allows you to optimize resource usage (CPU and possibly network bandwidth) by only delivering the required amount of data to each **DDS_-DataReader** (p. 783), accommodating the fact that, for rapidly-changing data, different subscribers may have different requirements and constraints as to how frequently they need or can handle being notified of the most current values. As such, it can also be used to protect applications that are running on a heterogeneous network where some nodes are capable of generating data much faster than others can consume it.

For best effort, unicast data delivery, if the data type is unkeyed and the DDS_DataWriter (p. 673) has an infinite DDS_LivelinessQosPolicy::lease_duration (p. 1257), RTI Data Distribution Service will only send as many packets to a DDS_DataReader (p. 783) as required by the TIME_BASED_FILTER, no matter how fast FooDataWriter_write (p. 684) is called.

However, in configurations where RTI Data Distribution Service must send all the data published by the **DDS_DataWriter** (p. 673) (for example, when the **DDS_DataWriter** (p. 673) is reliable, when the data type is keyed, or when the **DDS_DataWriter** (p. 673) has a finite **DDS_LivelinessQosPolicy::lease_duration** (p. 1257)), only the data that passes the TIME_BASED_FILTER will be stored in the receive queue of the **DDS_DataReader** (p. 783). Extra data will be accepted but dropped. Note that filtering is only applied on alive samples (that is, samples that have not been disposed/unregistered).

5.142.3 Consistency

It is inconsistent for a DDS_DataReader (p.783) to have a minimum_separation longer than its DEADLINE (p.157) period.

However, it is important to be aware of certain edge cases that can occur when your publication rate, minimum separation, and deadline period align and that can cause missed deadlines that you may not expect. For example, suppose that you nominally publish samples every second but that this rate can vary somewhat over time. You declare a minimum separation of 1 second to filter out rapid updates and set a deadline of two seconds so that you will be aware if the rate falls too low. Even if your update rate never wavers, you can still miss deadlines! Here's why:

Suppose you publish the first sample at time t=0 seconds. You then publish your next sample at t=1 seconds. Depending on how your operating system schedules the time-based filter execution relative to the publication, this second sample may be filtered. You then publish your third sample at t=2 seconds, and depending on how your OS schedules this publication in relation to the deadline check, you could miss the deadline.

This scenario demonstrates a couple of rules of thumb:

- Beware of setting your minimum_separation to a value very close to your publication rate: you may filter more data than you intend to.
- Beware of setting your minimum_separation to a value that is too close to your deadline period relative to your publication rate. You may miss deadlines.

See **DDS_DeadlineQosPolicy** (p. 1135) for more information about the interactions between deadlines and time-based filters.

The setting of a TIME_BASED_FILTER (p. 164) – that is, the selection of a minimum_separation with a value greater than zero – is consistent with all settings of the HISTORY (p. 170) and RELIABILITY (p. 166) QoS. The TIME_BASED_FILTER (p. 164) specifies the samples that are of interest to the DDS_DataReader (p. 783). The HISTORY (p. 170) and RELIABILITY (p. 166) QoS affect the behavior of the middleware with respect to the samples that have been determined to be of interest to the DDS_DataReader (p. 783); that is, they apply after the TIME_BASED_FILTER (p. 164) has been applied.

In the case where the reliability QoS kind is **DDS_RELIABLE_-RELIABILITY_QOS** (p. 167), in steady-state – defined as the situation where the **DDS_DataWriter** (p. 673) does not write new samples for a period "long" compared to the **minimum_separation** – the system should guarantee delivery of the last sample to the **DDS_DataReader** (p. 783).

5.143.1 Detailed Description

Entry created when a Topic object discovered.

Data associated with the built-in topic **DDS_TOPIC_NAME** (p. 24). It contains QoS policies and additional information that apply to the remote **DDS_Topic** (p. 425).

Note: The DDS_TopicBuiltinTopicData (p. 1433) built-in topic is meant to convey information about discovered Topics. This Topics samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (DDS_PublicationBuiltinTopicData (p. 1313) and DDS_SubscriptionBuiltinTopicData (p. 1410)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

DDS_DomainParticipant_get_builtin_subscriber (p. 388)

5.146.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDS_Topic** (p. 425) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This extra data is not used by RTI Data Distribution Service.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with DDS_DataReaderListener (p. 1065), DDS_DataWriterListener (p. 1102), or operations such as DDS_DomainParticipant_ignore_topic (p. 391), this QoS policy can assist an application in defining and enforcing its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Data Distribution Service stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Data Distribution Service with the maximum size of the data that will be stored in policies of this type. This size is configured with DDS_DomainParticipantResourceLimitsQosPolicy::topic_-data_max_length (p. 1175).

5.146.3 Field Documentation

5.146.3.1 struct DDS_OctetSeq DDS_TopicDataQosPolicy::value [read]

a sequence of octets

[default] empty (zero-length)

[range] Octet sequence of length [0,max_length]

5.147 DDS_TopicListener Struct Reference

 $<<\!\!interface>>$ (p. 950) DDS_Listener (p. 1246) for DDS_Topic (p. 425) entities.

Data Fields

^ struct DDS_Listener as_listener

The superclass instance of this DDS_TopicListener (p. 1441).

^ DDS_TopicListener_InconsistentTopicCallback on_inconsistent_topic

 ${\it Handle~the~DDS_INCONSISTENT_TOPIC_STATUS~(p.~128)~status.}$

5.147.1 Detailed Description

```
<<\!\!interface>> (p. 950) DDS_Listener (p. 1246) for DDS_Topic (p. 425) entities.
```

Entity:

```
DDS_Topic (p. 425)
```

Status:

```
\begin{array}{lll} \textbf{DDS\_INCONSISTENT\_TOPIC\_STATUS} & (p.\, 128), & \textbf{DDS\_-} \\ \textbf{InconsistentTopicStatus} & (p.\, 1233) & \end{array}
```

This is the interface that can be implemented by an application-provided class and then registered with the **DDS_Topic** (p. 425) such that the application can be notified by RTI Data Distribution Service of relevant status changes.

See also:

```
Status Kinds (p. 123)

Ownership policy, **OWNERSHIP** (p. 159).

5.149 DDS_TransportBuiltinQosPolicy Struct Reference

Specifies which built-in transports are used.

Data Fields

^ DDS_TransportBuiltinKindMask mask

Specifies the built-in transports that are registered automatically when the DDS_DomainParticipant (p. 339) is enabled.

5.149.1 Detailed Description

Specifies which built-in transports are used.

Three different transport plug-ins are built into the core RTI Data Distribution Service libraries (for most supported target platforms): UDPv4, shared memory, and UDPv6.

This QoS policy allows you to control which of these built-in transport plugins are used by a **DDS_DomainParticipant** (p. 339). By default, only the UDPv4 and shared memory plug-ins are enabled (although on some embedded platforms, the shared memory plug-in is not available). In some cases, users will disable the shared memory transport when they do not want applications to use shared memory to communicate when running on the same node.

Entity:

```
DDS_DomainParticipant (p. 339)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.149.2 Field Documentation

$\begin{array}{ccc} 5.149.2.1 & DDS_TransportBuiltinKindMask \\ & DDS_TransportBuiltinQosPolicy::mask \end{array}$

Specifies the built-in transports that are registered automatically when the **DDS_DomainParticipant** (p. 339) is enabled.

RTI Data Distribution Service provides several built-in transports. Only those that are specified with this mask are registered automatically when the **DDS_-DomainParticipant** (p. 339) is enabled.

 $[default] \ DDS_TRANSPORTBUILTIN_MASK_DEFAULT \ (p. \frac{198}{})$

5.150 DDS_TransportMulticastQosPolicy Struct Reference

Specifies the multicast address on which a **DDS_DataReader** (p. 783) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDS_DomainParticipant** (p. 339) level) transports with which to receive the multicast data.

Data Fields

 $\hat{}$ struct DDS_TransportMulticastSettingsSeq value

A sequence of multicast communications settings.

5.150.1 Detailed Description

Specifies the multicast address on which a **DDS_DataReader** (p. 783) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDS_DomainParticipant** (p. 339) level) transports with which to receive the multicast data.

By default, a **DDS_DataWriter** (p. 673) will send individually addressed packets for each **DDS_DataReader** (p. 783) that subscribes to the topic of the DataWriter this is known as unicast delivery. Thus, as many copies of the data will be sent over the network as there are DataReaders for the data. The network bandwidth used by a DataWriter will thus increase linearly with the number of DataReaders.

Multicast addressing (on UDP/IP transports) allows multiple DataReaders to receive the *same* network packet. By using multicast, a **DDS_DataWriter** (p. 673) can send a single network packet that is received by all subscribing applications. Thus the network bandwidth usage will be constant, independent of the number of DataReaders.

Coordinating the multicast address specified by DataReaders can help optimize network bandwidth usage in systems where there are multiple DataReaders for the same **DDS_Topic** (p. 425).

Entity:

DDS_DataReader (p. 783)

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.150.2 Field Documentation

$\begin{array}{ll} 5.150.2.1 & struct \ DDS_TransportMulticastSettingsSeq \\ & DDS_TransportMulticastQosPolicy::value \ \ [read] \end{array}$

A sequence of multicast communications settings.

An empty sequence means that multicast is not used by the entity.

The RTPS wire protocol currently limits the maximum number of multicast locators to four.

[default] Empty sequence.

5.151 DDS_TransportMulticastSettings_t Struct Reference

Type representing a list of multicast locators.

Data Fields

* struct DDS_StringSeq transports

A sequence of transport aliases that specifies the transports on which to receive multicast traffic for the entity.

$\hat{}$ char * receive_address

The multicast group address on which the entity can receive data.

^ DDS_Long receive_port

The multicast port on which the entity can receive data.

5.151.1 Detailed Description

Type representing a list of multicast locators.

A multicast locator specifies a transport class, a multicast address, and a multicast port number on which messages can be received by an entity.

QoS:

DDS_TransportMulticastQosPolicy (p. 1449)

5.151.2 Field Documentation

5.151.2.1 struct DDS_StringSeq DDS_TransportMulticastSettings_t::transports [read]

A sequence of transport aliases that specifies the transports on which to receive multicast traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias in this sequence are used to subscribe to the multicast group addresses. Thus, this list of aliases sub-selects from the transport s available to the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **Conventions** (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT**₋-**BUILTIN** (p. 197).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

5.151.2.2 char* DDS_TransportMulticastSettings_t::receive_address

The multicast group address on which the entity can receive data.

Must must be an address in the proper format (see Address Format (p. 191)).

[default] NONE/INVALID. Required to specify a multicast group address to join.

[range] A valid IPv4 or IPv6 multicast address.

See also:

Address Format (p. 191)

5.151.2.3 DDS_Long DDS_TransportMulticastSettings_t::receive_port

The multicast port on which the entity can receive data.

[default] 0, which implies that the actual port number is determined by a formula as a function of the domain_id (see DDS_-WireProtocolQosPolicy::participant_id (p. 1487)).

[range] [0,0xffffffff]

$\begin{array}{ccc} 5.152 & DDS_TransportMulticastSettingsSeq \\ & Struct\ Reference \end{array}$

 ${\tt Declares~IDL~sequence} < {\tt DDS_TransportMulticastSettings_t~(p.\,1451)} >.$

5.152.1 Detailed Description

Declares IDL sequence < DDS_TransportMulticastSettings_t (p. 1451) >.

Instantiates:

```
<< generic>> (p. 950) FooSeq (p. 1497)
```

See also:

DDS_TransportMulticastSettings_t (p. 1451)

5.153 DDS_TransportPriorityQosPolicy Struct Reference

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

Data Fields

^ DDS_Long value

This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.

5.153.1 Detailed Description

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

The Transport Priority QoS policy is optional and only supported on certain OSs and transports. It allows you to specify on a per-DDS_DataWriter (p. 673) basis that the data sent by that DDS_DataWriter (p. 673) is of a different priority.

The DDS specification does not indicate how a DDS implementation should treat data of different priorities. It is often difficult or impossible for DDS implementations to treat data of higher priority differently than data of lower priority, especially when data is being sent (delivered to a physical transport) directly by the thread that called **FooDataWriter_write** (p. 684). Also, many physical network transports themselves do not have a end-user controllable level of data packet priority.

Entity:

```
DDS_DataWriter (p. 673), DDS_Topic (p. 425)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = YES (p. 146)
```

5.153.2 Usage

In RTI Data Distribution Service, for the ::**UDPv4 Transport** (p. 1013), the value set in the Transport Priority QoS policy is used in a setsockopt call to

set the TOS (type of service) bits of the IPv4 header for datagrams sent by a **DDS_DataWriter** (p. 673). It is platform-dependent how and whether the setsockopt has an effect. On some platforms, such as Windows and Linux, external permissions must be given to the user application in order to set the TOS bits.

It is incorrect to assume that using the Transport Priority QoS policy will have any effect at all on the end-to-end delivery of data from a **DDS_DataWriter** (p. 673) to a **DDS_DataReader** (p. 783). All network elements, including switches and routers must have the capability and be enabled to actually use the TOS bits to treat higher priority packets differently. Thus the ability to use the Transport Priority QoS policy must be designed and configured at a system level; just turning it on in an application may have no effect at all.

5.153.3 Field Documentation

5.153.3.1 DDS_Long DDS_TransportPriorityQosPolicy::value

This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.

You may choose any value within the range of a 32-bit signed integer; higher values indicate higher priority. However, any further interpretation of this policy is specific to a particular transport and a particular DDS implementation. For example, a particular transport is permitted to treat a range of priority values as equivalent to one another.

[default] 0

5.154 DDS_TransportSelectionQosPolicy Struct Reference

Specifies the physical transports a DDS_DataWriter (p. 673) or DDS_DataReader (p. 783) may use to send or receive data.

Data Fields

`struct DDS_StringSeq enabled_transports

A sequence of transport aliases that specifies the transport instances available for use by the entity.

5.154.1 Detailed Description

Specifies the physical transports a **DDS_DataWriter** (p. 673) or **DDS_DataReader** (p. 783) may use to send or receive data.

An application may be simultaneously connected to many different physical transports, e.g., Ethernet, Infiniband, shared memory, VME backplane, and wireless. By default, RTI Data Distribution Service will use up to 4 transports to deliver data from a DataWriter to a DataReader.

This QoS policy can be used to both limit and control which of the application's available transports may be used by a **DDS_DataWriter** (p. 673) to send data or by a **DDS_DataReader** (p. 783) to receive data.

Entity:

```
DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = NO (p. 146)
```

5.154.2 Field Documentation

$\begin{array}{ccc} 5.154.2.1 & struct \ DDS_StringSeq \ DDS_- \\ & TransportSelectionQosPolicy::enabled_transports \\ & [read] \end{array}$

A sequence of transport aliases that specifies the transport instances available for use by the entity.

Of the transport instances installed with the DDS_DomainParticipant (p. 339), only those with aliases matching an alias in this sequence are available to the entity.

Thus, this list of aliases sub-selects from the transports available to the **DDS**_**DomainParticipant** (p. 339).

An empty sequence is a special value that specifies all the transports installed with the **DDS_DomainParticipant** (p. 339).

The memory for the strings in this sequence is managed according to the conventions described in **Conventions** (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in TRANSPORT_-BUILTIN (p. 197).

[default] Empty sequence; i.e. all the transports installed with and available to the DDS_DomainParticipant (p. 339).

[range] A sequence of non-null, non-empty strings.

See also:

DDS_DomainParticipantQos::transport_builtin (p. 1159).

5.155 DDS_TransportUnicastQosPolicy Struct Reference

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Data Fields

 $\hat{}$ struct $\mathbf{DDS_TransportUnicastSettingsSeq}$ value

A sequence of unicast communication settings.

5.155.1 Detailed Description

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Entity:

```
DDS_DomainParticipant (p. 339), DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Properties:

```
\mathbf{RxO} \ (\mathrm{p.} \ 145) = \mathrm{N/A} Changeable (\mathrm{p.} \ 146) = \mathbf{NO} \ (\mathrm{p.} \ 146)
```

5.155.2 Usage

RTI Data Distribution Service may send data to a variety of Entities, not just DataReaders. For example, reliable DataWriters may receive ACK/NACK packets from reliable DataReaders.

During discovery, each **DDS_Entity** (p. 242) announces to remote applications a list of (up to 4) unicast addresses to which the remote application should send data (either user data packets or reliable protocol meta-data such as ACK/NACKs and heartbeats).

By default, the list of addresses is populated automatically with values obtained from the enabled transport plug-ins allowed to be used by the Entity (see DDS_TransportBuiltinQosPolicy (p. 1447) and DDS_TransportSelectionQosPolicy (p. 1456)). Also, the associated ports are automatically determined (see DDS_RtpsWellKnownPorts_t (p. 1378)).

Use this QoS policy to manually set the receive address list for an Entity. You may optionally set a port to use a non-default receive port as well. Only the first 4 addresses will be used.

RTI Data Distribution Service will create a receive thread for every unique port number that it encounters (on a per transport basis).

- ^ For a **DDS_DomainParticipant** (p. 339), this QoS policy sets the default list of addresses used by other applications to send user data for local DataReaders.
- For a **DDS_DataReader** (p. 783), if set, then other applications will use the specified list of addresses to send user data (and reliable protocol packets for reliable DataReaders). Otherwise, if not set, the other applications will use the addresses set by the **DDS_DomainParticipant** (p. 339).
- For a reliable **DDS_DataWriter** (p. 673), if set, then other applications will use the specified list of addresses to send reliable protocol packets (ACKS/NACKS) on the behalf of reliable DataReaders. Otherwise, if not set, the other applications will use the addresses set by the **DDS_DomainParticipant** (p. 339).

5.155.3 Field Documentation

5.155.3.1 struct DDS_TransportUnicastSettingsSeq DDS_TransportUnicastQosPolicy::value [read]

A sequence of unicast communication settings.

An empty sequence means that applicable defaults specified by elsewhere (e.g. **DDS_DomainParticipantQos::default_unicast** (p. 1159)) should be used.

The RTPS wire protocol currently limits the maximum number of unicast locators to four.

[default] Empty sequence.

See also:

DDS_DomainParticipantQos::default_unicast (p. 1159)

5.156 DDS_TransportUnicastSettings_t Struct Reference

Type representing a list of unicast locators.

Data Fields

* struct DDS_StringSeq transports

A sequence of transport aliases that specifies the unicast interfaces on which to receive unicast traffic for the entity.

^ DDS_Long receive_port

The unicast port on which the entity can receive data.

5.156.1 Detailed Description

Type representing a list of unicast locators.

A unicast locator specifies a transport class, a unicast address, and a unicast port number on which messages can be received by an entity.

QoS:

DDS_TransportUnicastQosPolicy (p. 1458)

5.156.2 Field Documentation

5.156.2.1 struct DDS_StringSeq DDS_TransportUnicastSettings_t::transports [read]

A sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias on this sequence are used to determine the unicast interfaces used by the entity.

Thus, this list of aliases sub-selects from the transports available to the entity.

Each unicast interface on a transport results in a unicast locator for the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **Conventions** (p. 286). In particular, be careful to avoid a situation in which RTI Data Distribution Service allocates a string on your behalf and you then reuse that string in such a way that RTI Data Distribution Service believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in TRANSPORT_-BUILTIN (p. 197).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

5.156.2.2 DDS_Long DDS_TransportUnicastSettings_t::receive_port

The unicast port on which the entity can receive data.

Must be an *unused* unicast port on the system.

[default] 0, which implies that the actual port number is determined by a formula as a function of the domain_id, and the DDS_-WireProtocolQosPolicy::participant_id (p. 1487).

[range] [0.0xfffffff]

See also:

DDS_WireProtocolQosPolicy::participant_id (p. 1487).

5.157 DDS_TransportUnicastSettingsSeq Struct Reference

DDS_TransportUnicastSettings_t (p. 1460)

5.158 DDS_TypeCode Struct Reference

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with **rtiddsgen** (p. 969) or to modify types you define yourself at runtime.

5.158.1 Detailed Description

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with **rtiddsgen** (p. 969) or to modify types you define yourself at runtime.

You create **DDS_TypeCode** (p. 1463) objects using the **DDS_TypeCodeFactory** (p. 1464) singleton. Then you can use the functions on *this* class to inspect and modify the data type definition.

This class is based on a similar class from CORBA.

MT Safety:

SAFE for read-only access, UNSAFE for modification. Modifying a single **DDS_TypeCode** (p. 1463) object concurrently from multiple threads is *unsafe*. Modifying a **DDS_TypeCode** (p. 1463) from a single thread while concurrently reading the state of that **DDS_TypeCode** (p. 1463) from another thread is also *unsafe*. However, reading the state of a **DDS_TypeCode** (p. 1463) concurrently from multiple threads, without any modification, is *safe*.

Examples:

HelloWorld.c.

5.159 DDS_TypeCodeFactory Struct Reference

A singleton factory for creating, copying, and deleting data type definitions dynamically.

5.159.1 Detailed Description

A singleton factory for creating, copying, and deleting data type definitions dynamically.

You can access the singleton with the $DDS_TypeCodeFactory_get_instance$ (p. 502) function.

If you want to publish and subscribe to data of types that are not known to you at system design time, this class will be your starting point. After creating a data type definition with this class, you will modify that definition using the **DDS_TypeCode** (p. 1463) class and then register it with the **Dynamic Data** (p. 519) API.

The functions of this class fall into several categories:

Getting definitions for primitive types:

Type definitions for primitive types (e.g. integers, floating point values, etc.) are pre-defined; your application only needs to *get* them, not *create* them.

^ DDS_TypeCodeFactory_get_primitive_tc (p. 503)

Creating definitions for strings, arrays, and sequences:

Type definitions for strings, arrays, and sequences (i.e. variables-size lists) must be created as you need them, because the type definition includes the maximum length of those containers.

- ^ DDS_TypeCodeFactory_create_string_tc (p. 507)
- ^ DDS_TypeCodeFactory_create_wstring_tc (p. 507)
- ^ DDS_TypeCodeFactory_create_array_tc (p. 509)
- ${\bf ^{\hat{}}\ DDS_TypeCodeFactory_create_sequence_tc\ (p.\,508)}$

Creating definitions for structured types:

Structured types include structures, value types, sparse value types, and unions.

- ^ DDS_TypeCodeFactory_create_struct_tc (p. 503)
- ^ DDS_TypeCodeFactory_create_value_tc (p. 504)

- ${\bf ^{\hat{}}\ DDS_TypeCodeFactory_create_sparse_tc\ (p.\,509)}$
- ^ DDS_TypeCodeFactory_create_union_tc (p. 505)

Creating definitions for other types:

The type system also supports enumerations and aliases (i.e. typedefs in C and C++).

- ^ DDS_TypeCodeFactory_create_enum_tc (p. 506)
- ${\bf ^{\hat{}}\ DDS_TypeCodeFactory_create_alias_tc\ (p.\,506)}$

Deleting type definitions:

When you're finished using a type definition, you should delete it. (*Note* that you only need to delete a **DDS_TypeCode** (p. 1463) that you *created*; if you got the object from **DDS_TypeCodeFactory_get_primitive_tc** (p. 503), you must *not* delete it.)

^ DDS_TypeCodeFactory_delete_tc (p. 502)

Copying type definitions:

You can also create deep copies of type definitions:

^ DDS_TypeCodeFactory_clone_tc (p. 502)

5.160 DDS_TypeSupportQosPolicy Struct Reference

Allows you to attach application-specific values to a DataWriter or DataReader that are passed to the serialization or describilization routine of the associated data type.

Data Fields

^ void * plugin_data

Value to pass into the type plugin's de-/serialization function.

5.160.1 Detailed Description

Allows you to attach application-specific values to a DataWriter or DataReader that are passed to the serialization or describilization routine of the associated data type.

The purpose of this QoS is to allow a user application to pass data to a type plugin's support functions.

Entity:

```
DDS_DataReader (p. 783), DDS_DataWriter (p. 673)
```

Properties:

$$\mathbf{RxO} \ (p. 145) = N/A$$

Changeable (p. 146) = YES (p. 146)

5.160.2 Usage

This QoS policy allows you to associate a pointer to an object with a **DDS_DataWriter** (p. 673) or **DDS_DataReader** (p. 783). This object pointer is passed to the serialization routine of the data type associated with the **DDS_DataWriter** (p. 673) or the descrialization routine of the data type associated with the **DDS_DataReader** (p. 783).

You can modify the rtiddsgen-generated code so that the de/serialization routines act differently depending on the information passed in via the object pointer. (The generated serialization and deserialization code does not use the pointer.)

This functionality can be used to change how data sent by a **DDS_DataWriter** (p. 673) or received by a **DDS_DataReader** (p. 783) is serialized or describing on a per DataWriter and DataReader basis.

It can also be used to dynamically change how serialization (or for a less common case, deserialization) occurs. For example, a data type could represent a table, including the names of the rows and columns. However, since the row/column names of an instance of the table (a Topic) don't change, they only need to be sent once. The information passed in through the TypeSupport QoS policy could be used to signal the serialization routine to send the row/column names the first time a **DDS_DataWriter** (p. 673) calls **FooDataWriter_write** (p. 684), and then never again.

5.160.3 Field Documentation

$5.160.3.1 \quad void*\ DDS_TypeSupportQosPolicy::plugin_data$

Value to pass into the type plugin's de-/serialization function. [default] NULL

5.161 DDS UnionMember Struct Reference

A description of a member of a union.

Data Fields

 $\hat{}$ char * name

The name of the union member.

^ DDS_Boolean is_pointer

Indicates whether the union member is a pointer or not.

* struct DDS_LongSeq labels

The labels of the union member.

^ const DDS_TypeCode * type

The type of the union member.

5.161.1 Detailed Description

A description of a member of a union.

See also:

```
DDS_UnionMemberSeq (p. 1470)
DDS_TypeCodeFactory_create_union_tc (p. 505)
```

5.161.2 Field Documentation

5.161.2.1 char* DDS_UnionMember::name

The name of the union member.

Cannot be NULL.

5.161.2.2 DDS_Boolean DDS_UnionMember::is_pointer

Indicates whether the union member is a pointer or not.

5.161.2.3 struct DDS_LongSeq DDS_UnionMember::labels [read]

The labels of the union member.

Each union member should contain at least one label. If the union discriminator type is not **DDS_Long** (p. 108) the label value should be evaluated to an integer value. For instance, 'a' would be evaluated to 97.

${\bf 5.161.2.4 \quad const\ DDS_TypeCode*\ DDS_UnionMember::type}$

The type of the union member.

Cannot be NULL.

5.162 DDS_UnionMemberSeq Struct Reference

Defines a sequence of union members.

5.162.1 Detailed Description

Defines a sequence of union members.

See also:

5.166 DDS_UserDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Data Fields

```
^ struct DDS_OctetSeq value
a sequence of octets
```

5.166.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 410) during discovery.

Entity:

```
\label{eq:decomposition} \begin{split} \mathbf{DDS\_DomainParticipant} &\ (\mathrm{p.\,339}), \mathbf{DDS\_DataReader} \ (\mathrm{p.\,783}), \mathbf{DDS\_DataReader} \\ \mathbf{DataWriter} \ &\ (\mathrm{p.\,673}) \end{split}
```

Properties:

```
\mathbf{RxO}\ (\mathrm{p.145}) = \mathrm{NO}; Changeable (\mathrm{p.146}) = \mathbf{YES}\ (\mathrm{p.146})
```

See also:

DDS_DomainParticipant_get_builtin_subscriber (p. 388)

5.166.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDS_Entity** (p. 242) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This information is not used by RTI Data Distribution Service.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with operations such as **DDS_DomainParticipant_ignore_participant** (p. 390), **DDS_DomainParticipant_ignore_publication**

(p. 392), DDS_DomainParticipant_ignore_subscription (p. 393), and DDS_DomainParticipant_ignore_topic (p. 391), this QoS policy can assist an application to define and enforce its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Data Distribution Service stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Data Distribution Service with the maximum size of the data that will be stored in policies of this type. This size is configured with DDS_-DomainParticipantResourceLimitsQosPolicy::participant_user_data_max_length (p. 1175), DDS_DomainParticipantResourceLimitsQosPolicy::writer_user_data_max_length (p. 1176), and DDS_-DomainParticipantResourceLimitsQosPolicy::reader_user_data_max_length (p. 1176).

5.166.3 Field Documentation

${\bf 5.166.3.1} \quad {\bf struct\ DDS_OctetSeq\ DDS_UserDataQosPolicy::value} \\ {\tt [read]}$

a sequence of octets

[default] empty (zero-length)

[range] Octet sequence of length [0,max_length]

5.167 DDS_ValueMember Struct Reference

A description of a member of a value type.

Data Fields

 $\hat{}$ char * name

The name of the value member.

 $\hat{}$ const **DDS_TypeCode** * **type**

The type of the value member.

^ DDS_Boolean is_pointer

Indicates whether the value member is a pointer or not.

^ DDS_Short bits

Number of bits of a bitfield member.

^ DDS_Boolean is_key

Indicates if the value member is a key member or not.

$^{\circ}$ DDS_Visibility access

The type of access (public, private) for the value member.

5.167.1 Detailed Description

A description of a member of a value type.

See also:

```
DDS_ValueMemberSeq (p. 1478)

```

5.167.2 Field Documentation

5.167.2.1 char* DDS_ValueMember::name

The name of the value member.

Cannot be NULL.

5.167.2.2 const DDS_TypeCode* DDS_ValueMember::type

The type of the value member.

Cannot be NULL.

5.167.2.3 DDS_Boolean DDS_ValueMember::is_pointer

Indicates whether the value member is a pointer or not.

5.167.2.4 DDS_Short DDS_ValueMember::bits

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bit-field. Otherwise, bits should contain **DDS_TYPECODE_NOT_BITFIELD** (p. 472).

5.167.2.5 DDS_Boolean DDS_ValueMember::is_key

Indicates if the value member is a key member or not.

${\bf 5.167.2.6} \quad DDS_V isibility \ DDS_V alue Member:: access$

The type of access (public, private) for the value member.

It can take the values: $DDS_PRIVATE_MEMBER$ (p. 473) or DDS_PUBLIC_MEMBER (p. 473).

${\bf 5.168}\quad {\bf DDS_Value Member Seq~Struct~Reference}$

Defines a sequence of value members.

5.168.1 Detailed Description

Defines a sequence of value members.

```

5.169 DDS_VendorId_t Struct Reference

<<eXtension>> (p. 950) Type used to represent the vendor of the service implementing the RTPS protocol.

Data Fields

 $\hat{\ } \mathbf{DDS_Octet\ vendorId}\ [\mathrm{DDS_VENDOR_ID_LENGTH_MAX}]$

The vendor Id.

5.169.1 Detailed Description

<<eXtension>> (p. 950) Type used to represent the vendor of the service implementing the RTPS protocol.

5.169.2 Field Documentation

The vendor Id.

$\begin{array}{cccc} \mathbf{5.170} & \mathbf{DDS_WaitSetProperty_t} & \mathbf{Struct} & \mathbf{Refer-} \\ & \mathbf{ence} \end{array}$

<<eXtension>> (p. 950) Specifies the DDS_WaitSet (p. 253) behavior for multiple trigger events.

Data Fields

 $\hat{}$ long max_event_count

Maximum number of trigger events to cause a $DDS_WaitSet$ (p. 253) to awaken.

* struct DDS_Duration_t max_event_delay

Maximum delay from occurrence of first trigger event to cause a DDS_-WaitSet (p. 253) to awaken.

5.170.1 Detailed Description

 $<<\!\!eXtension>>$ (p. 950) Specifies the DDS_WaitSet (p. 253) behavior for multiple trigger events.

In simple use, a **DDS_WaitSet** (p. 253) returns when a single trigger event occurs on one of its attached **DDS_Condition** (p. 252) (s), or when the timeout maximum wait duration specified in the **DDS_WaitSet_wait** (p. 261) call expires.

The DDS_WaitSetProperty_t (p. 1480) allows configuration of a DDS_WaitSet (p. 253) to wait for up to max_event_count trigger events to occur before returning, or to wait for up to max_event_delay time from the occurrence of the first trigger event before returning.

The timeout maximum wait duration specified in the DDS_WaitSet_wait (p. 261) call continues to apply.

Entity:

DDS_WaitSet (p. 253)

Properties:

$$RxO (p. 145) = N/A$$

Changeable (p. 146) = YES (p. 146)

5.170.2 Field Documentation

5.170.2.1 long DDS_WaitSetProperty_t::max_event_count

Maximum number of trigger events to cause a **DDS_WaitSet** (p. 253) to awaken.

The DDS_WaitSet (p. 253) will wait until up to max_event_count trigger events have occurred before returning. The DDS_WaitSet (p. 253) may return earlier if either the timeout duration has expired, or max_event_delay has elapsed since the occurrence of the first trigger event. max_event_count may be used to "collect" multiple trigger events for processing at the same time.

```
[default] 1
[range] >= 1
;
```

5.170.2.2 struct DDS_Duration_t DDS_WaitSetProperty_t::max_event_delay [read]

Maximum delay from occurrence of first trigger event to cause a **DDS_WaitSet** (p. 253) to awaken.

The **DDS_WaitSet** (p. 253) will return no later than max_event_delay after the first trigger event. max_event_delay may be used to establish a maximum latency for events reported by the **DDS_WaitSet** (p. 253).

Note that DDS_RETCODE_TIMEOUT (p. 122) is not returned if max_event_delay is exceeded. DDS_RETCODE_TIMEOUT (p. 122) is returned only if the timeout duration expires before any trigger events occur.

[default] DDS_DURATION_INFINITE (p. 113);

5.171 DDS_WcharSeq Struct Reference

```
Instantiates FooSeq (p. 1497) < DDS_Wchar (p. 107) >.
```

5.171.1 Detailed Description

```
Instantiates FooSeq (p. 1497) < DDS_Wchar (p. 107) >.
```

${\bf Instantiates:}$

```
<< generic>> (p. 950) FooSeq (p. 1497)
```

See also:

 $\begin{array}{l} \mathbf{DDS_Wchar} \ (\mathrm{p.}\ 107) \\ \mathbf{FooSeq} \ (\mathrm{p.}\ 1497) \end{array}$

5.172 DDS_WireProtocolQosPolicy Struct Reference

Specifies the wire-protocol-related attributes for the DDS_-DomainParticipant (p. 339).

Data Fields

^ DDS_Long participant_id

A value used to distinguish between different participants belonging to the same domain on the same host.

^ DDS_UnsignedLong rtps_host_id

The RTPS Host ID of the domain participant.

^ DDS_UnsignedLong rtps_app_id

The RTPS App ID of the domain participant.

^ DDS_UnsignedLong rtps_instance_id

The RTPS Instance ID of the domain participant.

^ struct DDS_RtpsWellKnownPorts_t rtps_well_known_ports

Configures the RTPS well-known port mappings.

 $^{\smallfrown} DDS_RtpsReservedPortKindMask\ rtps_reserved_port_mask$

Specifies which well-known ports to reserve when enabling the participant.

^ DDS_WireProtocolQosPolicyAutoKind rtps_auto_id_kind

 $\it Kind\ of\ auto\ mechanism\ used\ to\ calculate\ the\ \it GUID\ prefix.$

5.172.1 Detailed Description

Specifies the wire-protocol-related attributes for the DDS_-DomainParticipant (p. 339).

Entity:

DDS_DomainParticipant (p. 339)

Properties:

$$RxO (p. 145) = N/A$$

Changeable (p. 146) = NO (p. 146)

5.172.2 Usage

This QoS policy configures some participant-wide properties of the DDS on-thewire protocol, RTPS. (DDS_DataWriterProtocolQosPolicy (p. 1106) and DDS_DataReaderProtocolQosPolicy (p. 1069) configure RTPS and reliability properties on a per DDS_DataWriter (p. 673) or DDS_DataReader (p. 783) basis.)

NOTE: The default Qos policies returned by RTI Data Distribution Service contain the correctly initialized wire protocol attributes. The defaults are not expected to be modified normally, but are available to the advanced user customizing the implementation behavior.

The default values should not be modified without an understanding of the underlying Real-Time Publish Subscribe (RTPS) wire protocol.

In order for the discovery process to work correctly, each **DDS_-DomainParticipant** (p. 339) must have a unique identifier. This QoS policy specifies how that identifier should be generated.

RTPS defines a 96-bit prefix to this identifier; each **DDS_DomainParticipant** (p. 339) must have a unique value of this prefix relative to all other participants in its domain. In order to make it easier to control how this 96-bit value is generated, RTI Data Distribution Service divides it into three integers: a host *ID*, the value of which is based on the identity of the identity of the machine on which the participant is executing, an application *ID*, the value of which is based on the process or task in which the participant is contained, and an instance *ID*, which identifies the participant itself.

This QoS policy provides you with a choiche of algorithms for generating these values automatically. In case none of these algorithms suit your needs, you may also choose to specify some or all of them yourself.

The following three fields:

- ^ DDS_WireProtocolQosPolicy::rtps_host_id (p. 1488)
- ^ DDS_WireProtocolQosPolicy::rtps_app_id (p. 1488)
- ^ DDS_WireProtocolQosPolicy::rtps_instance_id (p. 1489)

will compose the GUID prefix and by default are set to DDS_RTPS_AUTO_-ID (p.??). The meaning of this flag depends on the value assigned to the DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 1490) field.

Depending on the **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 1490) value, there are two different scenarios:

1. In the default and most common scenario, DDS_-WireProtocolQosPolicy::rtps_auto_id_kind (p. 1490) is set to

DDS_RTPS_AUTO_ID_FROM_IP (p. 205). Doing so, each field is interpeted as follows:

- **rtps_host_id:** the 32 bit value of the IPv4 of the first up and running interface of the host machine is assigned
- ^ rtps_app_id: the process (or task) ID is assigned
- rtps_instance_id: A counter is assigned that is incremented per new participant

NOTE: If the IP assigned to the interface is not unique within the network (for instance, if it is not configured), then is it possible that the GUID (specifically, the rtps_host_id portion) may also not be unique.

2. In this situation, RTI Data Distribution Service provides a different value for rtps_auto_id_kind: **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 205). As the name suggests, this alternative mechanism will use the MAC address instead of the IPv4 address. Since the MAC address size is up to 64 bits, the logical mapping of the host information, the application ID, and the instance identifiers has to change.

Note to Solaris Users: To use **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 205), you must run the RTI Data Distribution Service application while logged in as root.

Using **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 205), the default value of each field is interpreted as follows:

- ^ rtps_host_id: the first 32 bits of the MAC address of the first up and running interface of the host machine are assigned
- **rtps_app_id:** the last 32 bits of the MAC address of the first up and running interface of the host machine are assigned
- * rtps_instance_id: this field is split into two different parts. The process (or task) ID is assigned to the first 24 bits. A counter is assigned to the last 8 bits. This counter is incremented per new participant. In both scenarios, you can change the value of each field independently.

If DDS_RTPS_AUTO_ID_FROM_MAC (p. 205) is used, the rtps_instance_id has been logically split into two parts: 24 bits for the process/task ID and 8 bits for the per new participant counter. To give to users the ability to manually set the two parts indepently, a bit field mechanism has been introduced for the rtps_instance_id field when it is used in combination with DDS_RTPS_AUTO_ID_FROM_MAC (p. 205). If one of the two parts is set to 0, only this part will be handled by RTI Data Distribution Service and you will be able to handle the other one manually.

Some examples are provided to better explain the behavior of this QoSPolicy in case you want to change the default behavior with **DDS_RTPS_AUTO_ID_-FROM_MAC** (p. 205).

First, get the participant QoS from the ParticipantFactory:

Second, change the **DDS_WireProtocolQosPolicy** (p. 1483) using one of the options shown below.

Third, create the **DDS_DomainParticipant** (p. 339) as usual using the modified QoS structure instead of the default one.

Option 1: Use **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 205) to explicitly set just the application/task identifier portion of the **rtps_instance_id** field.

Option 2: Handle only the per participant counter and let RTI Data Distribution Service handle the application/task identifier:

Option 3: Handle the entire **rtps_instance_id** field yourself:

NOTE: If you are using DDS_RTPS_AUTO_ID_FROM_MAC (p. 205) as rtps_auto_id_kind and you decide to manually handle the rtps_instance_id field, you must ensure that both parts are non-zero (otherwise RTI Data Distribution Service will take responsibility for them). RTI recommends that you always specify the two parts separately in order to avoid errors.

Option 4: Let RTI Data Distribution Service handle the entire **rtps_instance_-id** field:

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id = DDS_RTPS_AUTO_ID;
```

NOTE: If you are using DDS_RTPS_AUTO_ID_FROM_MAC (p. 205) as rtps_auto_id_kind and you decide to manually handle the rtps_instance_id field, you must ensure that both parts are non-zero (otherwise RTI Data Distribution Service will take responsibility for them). RTI recommends that you always specify the two parts separately in order to clearly show the difference.

5.172.3 Field Documentation

5.172.3.1 DDS_Long DDS_WireProtocolQosPolicy::participant_id

A value used to distinguish between different participants belonging to the same domain on the same host.

Determines the unicast port on which meta-traffic is received. Also defines the *default* unicast port for receiving user-traffic for DataReaders and DataWriters (can be overridden by the **DDS_DataReaderQos::unicast** (p. 1087) or by the **DDS_DataWriterQos::unicast** (p. 1128)).

For more information on port mapping, please refer to DDS_-RtpsWellKnownPorts_t (p. 1378).

Each **DDS_DomainParticipant** (p. 339) in the same domain, running on the same host, must have a unique participant_id. The participants may be in the same address space or in distinct address spaces.

A negative number (-1) means that RTI Data Distribution Service will *auto-matically* resolve the participant ID as follows.

- [^] RTI Data Distribution Service will pick the *smallest* participant ID, based on the unicast ports available on the transports enabled for discovery.
- ^ RTI Data Distribution Service will attempt to resolve an automatic port index either when a DomainPartcipant is enabled, or when a DataReader or a DataWriter is created. Therefore, all the transports enabled for discovery must have been registered by this time. Otherwise, the discovery transports registered after resolving the automatic port index may produce port conflicts when the DomainPartcipant is enabled.

[default] -1 [automatic], i.e. RTI Data Distribution Service will automatically pick the participant_id, as described above.

[range] [>= 0], or -1, and does not violate guidelines stated in DDS_-RtpsWellKnownPorts_t (p. 1378).

```
DDS_Entity_enable() (p. 245)
NDDS_Transport_Support_register_transport() (p. 871)
```

${\bf 5.172.3.2} \quad {\bf DDS_UnsignedLong} \ {\bf DDS_WireProtocolQosPolicy::rtps_host_id}$

The RTPS Host ID of the domain participant.

A machine/operating system specific host ID, that is unique in the domain.

[default] DDS_RTPS_AUTO_ID (p. ??). The default value is interpreted as follows:

If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 1490) is equals to *RTPS_AUTO_ID_FROM_IP* (default value for this field) the value will be interpreted as the IPv4 address of the *first* up and running interface of the host machine.

If DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 1490) is equals to RTPS_AUTO_ID_FROM_MAC the value will be interpreted as the first 32 bit of the MAC address assigned to the first up and running interface of the host machine.

[range] [0,0xffffffff]

5.172.3.3 DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_app_id

The RTPS App ID of the domain participant.

A participant specific ID that, together with the rtps_instance_id, is unique within the scope of the rtps_host_id.

If a participant dies and is restarted, it is recommended that it be given an app ID that is distinct from the previous one, so that other participants in the domain can distinguish between them.

[default] DDS_RTPS_AUTO_ID (p. ??). The default value is interpreted as follows:

If DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 1490) is equals to RTPS_AUTO_ID_FROM_IP (default value for this field) the value will be the process (or task) ID.

If DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 1490) is equals to RTPS_AUTO_ID_FROM_MAC the value will be the last 32 bit of the MAC address assigned to the first up and running interface of the host machine. [range] [0,0xffffffff]

5.172.3.4 DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_instance_id

The RTPS Instance ID of the domain participant.

An instance specific ID of a participant that, together with the rtps_app_id, is unique within the scope of the rtps_host_id.

If a participant dies and is restarted, it is recommended that it be given an instance ID that is distinct from the previous one, so that other participants in the domain can distinguish between them.

[default] DDS_RTPS_AUTO_ID (p. ??). The default value is interpreted as follows:

If **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 1490) is equals to *RTPS_AUTO_ID_FROM_IP* (default value for this field) A counter is assigned that is incremented per new participant.

If DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 1490) is equals to RTPS_AUTO_ID_FROM_MAC the first 24 bits are assigned to the application/task identifier and the last 8 bits are assigned to a counter incremented per new paricipant.

[range] [0,0xffffffff] **NOTE:** if we are using *DDS_RTPS_AUTO_ID_FROM_-MAC* as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you have to ensure that both the two parts are different from zero otherwise the middleware will take responsability for them. We recommend to always specify the two parts separately in order to avoid errors. (examples)

Configures the RTPS well-known port mappings.

Determines the well-known multicast and unicast port mappings for discovery (meta) traffic and user traffic.

[default] DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS (p. 206)

5.172.3.6 DDS_RtpsReservedPortKindMask DDS_WireProtocolQosPolicy::rtps_reserved_port_mask

Specifies which well-known ports to reserve when enabling the participant.

Specifies which of the well-known multicast and unicast ports will be reserved when the domain participant is enabled. Failure to allocate a port that is computed based on the $DDS_RtpsWellKnownPorts_t$ (p. 1378) will be detected at this time, and the enable operation will fail.

 $[default] \ DDS_RTPS_RESERVED_PORT_MASK_DEFAULT \ (p. \ \underline{202})$

$\begin{array}{ccc} 5.172.3.7 & DDS_WireProtocolQosPolicyAutoKind \\ & DDS_WireProtocolQosPolicy::rtps_auto_id_kind \\ \end{array}$

Kind of auto mechanism used to calculate the GUID prefix.

 $[\mathbf{default}] \ \mathrm{RTPS_AUTO_ID_FROM_IP}$

5.173 DDS_WriterDataLifecycleQosPolicy Struct Reference

Controls how a **DDS_DataWriter** (p. 673) handles the lifecycle of the instances (keys) that it is registered to manage.

Data Fields

${\bf ^{\hat{}}\ DDS_Boolean\ autodispose_unregistered_instances}$

Boolean flag that controls the behavior when the **DDS_DataWriter** (p. 673) unregisters an instance by means of the unregister operations.

5.173.1 Detailed Description

Controls how a **DDS_DataWriter** (p. 673) handles the lifecycle of the instances (keys) that it is registered to manage.

Entity:

```
DDS_DataWriter (p. 673)
```

Properties:

```
RxO (p. 145) = N/A
Changeable (p. 146) = YES (p. 146)
```

5.173.2 Usage

This policy determines how the **DDS_DataWriter** (p. 673) acts with regards to the lifecycle of the data instances it manages (data instances that have been either explicitly registered with the **DDS_DataWriter** (p. 673) or implicitly registered by directly writing the data).

Since the deletion of a DataWriter automatically unregisters all data instances it manages, the setting of the autodispose_unregistered_instances flag will only determine whether instances are ultimately disposed when the DDS_DataWriter (p. 673) is deleted either directly by means of the DDS_Publisher_delete_datawriter (p. 643) operation or indirectly as a consequence of calling DDS_Publisher_delete_contained_entities (p. 648) or DDS_DomainParticipant_delete_contained_entities (p. 394) that contains the DataWriter.

You may use **FooDataWriter_unregister_instance** (p. 681) to indicate that the **DDS_DataWriter** (p. 673) no longer wants to send data for a **DDS_Topic** (p. 425).

The behavior controlled by this QoS policy applies on a per instance (key) basis for keyed Topics, so that when a **DDS_DataWriter** (p. 673) unregisters an instance, RTI Data Distribution Service can automatically also dispose that instance. This is the default behavior.

In many cases where the ownership of a Topic is shared (see **DDS_-OwnershipQosPolicy** (p. 1280)), DataWriters may want to relinquish their ownership of a particular instance of the Topic to allow other DataWriters to send updates for the value of that instance regardless of Ownership Strength. In that case, you may only want a DataWriter to unregister an instance without disposing the instance. *Disposing* an instance is a statement that an instance no longer exists. User applications may be coded to trigger on the disposal of instances, thus the ability to unregister without disposing may be useful to properly maintain the semantic of disposal.

5.173.3 Field Documentation

5.173.3.1 DDS_Boolean DDS_-WriterDataLifecycleQosPolicy::autodispose_unregistered_instances

Boolean flag that controls the behavior when the **DDS_DataWriter** (p. 673) unregisters an instance by means of the unregister operations.

^ DDS_BOOLEAN_TRUE (p. 106) (default)

The **DDS_DataWriter** (p. 673) will dispose the instance each time it is unregistered. The behavior is identical to explicitly calling one of the dispose operations on the instance prior to calling the unregister operation.

^ DDS_BOOLEAN_FALSE (p. 107)

The **DDS_DataWriter** (p. 673) will not dispose the instance. The application can still call one of the **dispose** operations prior to unregistering the instance and accomplish the same effect.

[default] DDS_BOOLEAN_TRUE (p. 106)

5.174 DDS_WstringSeq Struct Reference

```
{\rm Instantiates} \ {\tt FooSeq} \ \ ({\rm p.}\ {\tt 1497}) < {\bf DDS\_Wchar} \ ({\rm p.}\ {\tt 107})*>.
```

5.174.1 Detailed Description

```
Instantiates FooSeq (p. 1497) < DDS_Wchar (p. 107)* >.
```

Instantiates:

```

5.175 Foo Struct Reference

A representative user-defined data type.

5.175.1 Detailed Description

A representative user-defined data type.

Foo (p. 1494) represents a user-defined data-type that is intended to be distributed using DDS.

The type Foo (p. 1494) is usually defined using IDL syntax and placed in a ".idl" file that is then processed using rtiddsgen (p. 969). The rtiddsgen (p. 969) utility generates the helper classes FooSeq (p. 1497) as well as the necessary code for DDS to manipulate the type (serialize it so that it can be sent over the network) as well as the implied FooDataReader (p. 1495) and FooDataWriter (p. 1496) types that allow the application to send and receive data of this type.

See also:

FooSeq (p. 1497), FooDataWriter (p. 1496), FooDataReader (p. 1495), FooTypeSupport (p. 1499), rtiddsgen (p. 969)

5.176 FooDataReader Struct Reference

 $<<\!\!interface\!\!>> ($ p. $950)<<\!\!generic\!\!>> ($ p. 950) User data type-specific data reader.

5.176.1 Detailed Description

 $<<\!\!interface\!\!>> ($ p. $950)<<\!\!generic\!\!>> ($ p. 950) User data type-specific data reader.

Defines the user data type specific reader interface generated for each application class.

The concrete user data type reader automatically generated by the implementation is an incarnation of this class.

FooDataReader (p. 1495)
rtiddsgen (p. 969)
```

5.178 FooSeq Struct Reference

<<iinterface>> (p. 950) <<generic>> (p. 950) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as Foo (p. 1494).

5.178.1 Detailed Description

<<iinterface>> (p. 950) << generic>> (p. 950) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as Foo (p. 1494).

For users who define data types in OMG IDL, this type corresponds to the IDL express sequence<Foo (p. 1494)>.

For any user-data type Foo (p. 1494) that an application defines for the purpose of data-distribution with RTI Data Distribution Service, a FooSeq (p. 1497) is generated. We refer to an IDL sequence<Foo (p. 1494)> as FooSeq (p. 1497).

The state of a sequence is described by the properties 'maximum', 'length' and 'owned'.

- The 'maximum' represents the size of the underlying buffer; this is the maximum number of elements it can possibly hold. It is returned by the FooSeq_get_maximum (p. 273) operation.
- The 'length' represents the actual number of elements it currently holds. It is returned by the **FooSeq_get_length** (p. 274) operation.
- ^ The 'owned' flag represents whether the sequence owns the underlying buffer. It is returned by the FooSeq_has_ownership (p. 283) operation. If the sequence does not own the underlying buffer, the underlying buffer is loaned from somewhere else. This flag influences the lifecycle of the sequence and what operations are allowed on it. The general guidelines are provided below and more details are described in detail as pre-conditions and post-conditions of each of the sequence's operations:
 - If owned == DDS_BOOLEAN_TRUE (p. 106), the sequence has ownership on the buffer. It is then responsible for destroying the buffer when the sequence is destroyed.
 - If the owned == DDS_BOOLEAN_FALSE (p. 107), the sequence does not have ownership on the buffer. This implies that the sequence is loaning the buffer. The sequence cannot be destroyed until the loan is returned.

– A sequence with a zero maximum always has owned == $DDS_-BOOLEAN_-TRUE$ (p. 106)

5.180 NDDS_Config_LibraryVersion_t Struct Reference

The version of a single library shipped as part of an RTI Data Distribution Service distribution.

Data Fields

^ DDS_Long major

The major version of a single RTI Data Distribution Service library.

^ DDS_Long minor

The minor version of a single RTI Data Distribution Service library.

^ char release

The release letter of a single RTI Data Distribution Service library.

^ DDS_Long build

The build number of a single RTI Data Distribution Service library.

5.180.1 Detailed Description

The version of a single library shipped as part of an RTI Data Distribution Service distribution.

RTI Data Distribution Service is comprised of a number of separate libraries. Although RTI Data Distribution Service as a whole has a version, the individual libraries each have their own versions as well. It may be necessary to check these individual library versions when seeking technical support.

5.180.2 Field Documentation

5.180.2.1 DDS_Long NDDS_Config_LibraryVersion_t::major

The major version of a single RTI Data Distribution Service library.

5.180.2.2 DDS_Long NDDS_Config_LibraryVersion_t::minor

The minor version of a single RTI Data Distribution Service library.

${\bf 5.180.2.3 \quad char \ NDDS_Config_LibraryVersion_t::} release$

The release letter of a single RTI Data Distribution Service library.

${\bf 5.180.2.4}\quad {\bf DDS_Long}\ {\bf NDDS_Config_LibraryVersion_t::build}$

The build number of a single RTI Data Distribution Service library.

5.181 NDDS_Config_Logger Struct Reference

 $<<\!\!interface\!\!>>$ (p. 950) The singleton type used to configure RTI Data Distribution Service logging.

5.181.1 Detailed Description

<<*interface>>* (p. 950) The singleton type used to configure RTI Data Distribution Service logging.

5.182 NDDS_Config_Version_t Struct Reference

 $<<\!\!interface\!\!>>$ (p. 950) The version of an RTI Data Distribution Service distribution.

5.182.1 Detailed Description

 $<<\!\!interface\!\!>>$ (p. 950) The version of an RTI Data Distribution Service distribution.

The complete version is made up of the versions of the individual libraries that make up the product distribution.

5.183 NDDS_Transport_Address_t Struct Reference

Addresses are stored individually as network-ordered bytes.

Data Fields

^ unsigned char network_ordered_value [NDDS_TRANSPORT_-ADDRESS_LENGTH]

5.183.1 Detailed Description

Addresses are stored individually as network-ordered bytes.

RTI Data Distribution Service addresses are numerically stored in a transport independent manner. RTI Data Distribution Service uses a IPv6-compatible format, which means that the data structure to hold an NDDS_Transport_Address_t (p. 1504) is the same size as a data structure needed to hold an IPv6 address.

In addition, the functions provided to translate a string representation of an RTI Data Distribution Service address to a value assumes that the string presentation follows the IPv6 address presentation as specified in RFC 2373.

An NDDS_Transport_Address_t (p. 1504) always stores the address in network-byte order (which is Big Endian).

5.183.2 Field Documentation

5.183.2.1 unsigned char NDDS_Transport_Address_t::network_ordered_value[NDDS_TRANSPORT_ADDRESS_-LENGTH]

network-byte ordered (i.e., bit 0 is the most significant bit and bit 128 is the least significant bit).

Base structure that must be inherited by derived Transport Plugin classes.

Data Fields

^ NDDS_Transport_ClassId_t classid

The Transport-Plugin Class ID.

^ RTI_INT32 address_bit_count

Number of bits in a 16-byte address that are used by the transport. Should be between 0 and 128.

^ RTLINT32 properties_bitmap

A bitmap that defines various properties of the transport to the RTI Data Distribution Service core.

^ RTI_INT32 gather_send_buffer_count_max

Specifies the maximum number of buffers that RTI Data Distribution Service can pass to the send() function of a transport plugin.

^ RTI_INT32 message_size_max

The maximum size of a message in bytes that can be sent or received by the transport plugin.

^ char ** allow_interfaces_list

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., allow_interfaces_list_length > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

^ RTI_INT32 allow_interfaces_list_length

Number of elements in the allow_interfaces_list.

^ char ** deny_interfaces_list

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., deny_interfaces_list_length > 0), deny the use of these interfaces.

^ RTI_INT32 deny_interfaces_list_length

 $Number\ of\ elements\ in\ the\ {\tt deny_interfaces_list}.$

^ char ** allow_multicast_interfaces_list

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., allow_multicast_interfaces_list_length > 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

^ RTI_INT32 allow_multicast_interfaces_list_length

 $Number\ of\ elements\ in\ the\ {\tt allow_multicast_interfaces_list}.$

^ char ** deny_multicast_interfaces_list

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., deny_multicast_interfaces_list_length > 0), deny the use of those interfaces for multicast.

^ RTLINT32 deny_multicast_interfaces_list_length

Number of elements in deny_multicast_interfaces_list.

5.184.1 Detailed Description

Base structure that must be inherited by derived Transport Plugin classes.

This structure contains properties that must be set before registration of any transport plugin with RTI Data Distribution Service. The RTI Data Distribution Service core will configure itself to use the plugin based on the properties set within this structure.

A transport plugin may extend from this structure to add transport-specific properties.

In the C-language, this can be done by creating a custom plugin property structure whose first member is a NDDS_Transport_Property_t (p. 1505) structure.

For example,

```
struct MyTransport_Plugin_Property_t {
    NDDS_Transport_Property_t base_properties;
    int myIntProperty;
    < etc >;
};
```

WARNING: The transport properties of an instance of a Transport Plugin should be considered immutable after the plugin has been created. That means the values contained in the property structure stored as a part of the transport plugin itself should not be changed. If those values are modified, the results are undefined.

5.184.2 Field Documentation

5.184.2.1 NDDS_Transport_ClassId_t NDDS_Transport_Property_t::classid

The Transport-Plugin Class ID.

Assigned by the implementor of the transport plugin, Class ID's below NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (p. 997) are reserved for RTI (Real-Time Innovations) usage.

User-defined transports should set an ID above this range.

The ID should be globally unique for each Transport-Plugin class. Transport-Plugin implementors should ensure that the class IDs do not conflict with each other amongst different Transport-Plugin classes.

Invariant:

The classid is invariant for the lifecycle of a transport plugin.

5.184.2.2 RTI_INT32 NDDS_Transport_Property_t::address_bit_-count

Number of bits in a 16-byte address that are used by the transport. Should be between 0 and 128.

A transport plugin should define the range of addresses (starting from 0x0) that are meaningful to the plugin. It does this by setting the number of bits of an IPv6 address that will be used to designate an address in the network to which the transport plugin is connected.

For example, for an address range of 0-255, the address_bit_count should be set to 8. For the range of addresses used by IPv4 (4 bytes), it should be set to 32.

See also:

Transport Class Attributes (p. 863)

$\begin{array}{ccc} \mathbf{5.184.2.3} & \mathbf{RTI_INT32} & \mathbf{NDDS_Transport_Property_t::properties_bitmap} \end{array}$

A bitmap that defines various properties of the transport to the RTI Data Distribution Service core.

Currently, the only property supported is whether or not the transport plugin will always loan a buffer when RTI Data Distribution Service tries to receive a message using the plugin. This is in support of a zero-copy interface.

See also:

NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_-LOANED (p. 1003)

5.184.2.4 RTI_INT32 NDDS_Transport_Property_t::gather_send_buffer_count_max

Specifies the maximum number of buffers that RTI Data Distribution Service can pass to the send() function of a transport plugin.

The transport plugin send() API supports a gather-send concept, where the send() call can take several discontiguous buffers, assemble and send them in a single message. This enables RTI Data Distribution Service to send a message from parts obtained from different sources without first having to copy the parts into a single contiguous buffer.

However, most transports that support a gather-send concept have an upper limit on the number of buffers that can be gathered and sent. Setting this value will prevent RTI Data Distribution Service from trying to gather too many buffers into a send call for the transport plugin.

RTI Data Distribution Service requires all transport-plugin implementations to support a gather-send of least a minimum number of buffers. This minimum number is defined to be NDDS_TRANSPORT_PROPERTY_GATHER_-SEND_BUFFER_COUNT_MIN (p. 1004).

If the underlying transport does not support a gather-send concept directly, then the transport plugin itself must copy the separate buffers passed into the <code>send()</code> call into a single buffer for sending or otherwise send each buffer individually. However this is done by the transport plugin, the <code>receive_rea()</code> call of the destination application should assemble, if needed, all of the pieces of the message into a single buffer before the message is passed to the RTI Data Distribution Service layer.

5.184.2.5 RTI_INT32 NDDS_Transport_Property_t::message_size_max

The maximum size of a message in bytes that can be sent or received by the transport plugin.

If the maximum size of a message that can be sent by a transport plugin is user configurable, the transport plugin should provide a default value for this

property. In any case, this value must be set before the transport plugin is registered, so that RTI Data Distribution Service can properly use the plugin. Notes:

- If this value is increased from the default for any of the built-in transports, or if custom transports are used, then the DDS_ReceiverPoolQosPolicy::buffer_size (p. 1341) on the DDS_DomainParticipant (p. 339) should also be changed.
- ^ If two transports have different settings for message_size_max, such that fragmentation is required for one and not the other, the need for fragmentation may not be applied correctly and samples may be lost. To avoid this issue, set message_size_max to the same value in each transport.

5.184.2.6 char** NDDS_Transport_Property_t::allow_interfaces_list

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., allow_interfaces_list_length > 0), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

The "white" list restricts *reception* to a particular set of interfaces for unicast UDP.

Multicast output will be sent and may be received over the interfaces in the list.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.*, 192.168.*, 192.168.*, 192.*

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 339) is deleted.

$\begin{array}{lll} 5.184.2.7 & RTI_INT32 & NDDS_Transport_Property_t::allow_interfaces_list_length \end{array}$

Number of elements in the allow_interfaces_list.

By default, allow_interfaces_list_length = 0, i.e. an empty list.

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

5.184.2.8 char** NDDS_Transport_Property_t::deny_interfaces_list

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., $deny_interfaces_list_length > 0$), deny the use of these interfaces.

This "black" list is applied after the allow_interfaces_list and filters out the interfaces that should not be used.

The resulting list restricts *reception* to a particular set of interfaces for unicast UDP. Multicast output will be sent and may be received over the interfaces in the list.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.*, 192.168.*, 192.*

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 339) is deleted.

5.184.2.9 RTI_INT32 NDDS_Transport_Property_t::deny_-interfaces_list_length

Number of elements in the deny_interfaces_list.

By default, deny_interfaces_list_length = 0 (i.e., an empty list).

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

${\bf 5.184.2.10 \quad char**\ NDDS_Transport_Property_t::allow_multicast_-interfaces_list}$

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., allow_multicast_interfaces_list_length > 0), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

This "white" list sub-selects from the allowed interfaces obtained *after* applying the allow_interfaces_list "white" list *and* the deny_interfaces_list "black" list.

After allow_multicast_interfaces_list, the deny_multicast_interfaces_-list is applied. Multicast output will be sent and may be received over the

interfaces in the resulting list.

If this list is empty, all the allowed interfaces will be potentially used for multicast.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 339) is deleted.

5.184.2.11 RTI_INT32 NDDS_Transport_Property_t::allow_multicast_interfaces_list_length

Number of elements in the allow_multicast_interfaces_list.

By default, allow_multicast_interfaces_list_length = 0 (i.e., an empty list).

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

5.184.2.12 char** NDDS_Transport_Property_t::deny_multicast_-interfaces_list

A list of strings, each identifying a range of interface addresses. If the list is non-empty (i.e., deny_multicast_interfaces_list_length > 0), deny the use of those interfaces for multicast.

This "black" list is applied after allow_multicast_interfaces_list and filters out interfaces that should not be used for multicast.

Multicast output will be sent and may be received over the interfaces in the resulting list.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS_DomainParticipant** (p. 339) is deleted.

$\begin{array}{ll} 5.184.2.13 & RTI_INT32\ NDDS_Transport_Property_t::deny_-\\ & multicast_interfaces_list_length \end{array}$

 $Number\ of\ elements\ in\ {\tt deny_multicast_interfaces_list}.$

By default, deny_multicast_interfaces_list_length = 0 (i.e., an empty list).

This property is not interpreted by the RTI Data Distribution Service core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

5.185 NDDS_Transport_Shmem_Property_t Struct Reference

Subclass of NDDS_Transport_Property_t (p. 1505) allowing specification of parameters that are specific to the shared-memory transport.

Data Fields

^ struct NDDS_Transport_Property_t parent

Generic properties of all transport plugins.

^ RTLINT32 received_message_count_max

Number of messages that can be buffered in the receive queue.

^ RTI_INT32 receive_buffer_size

The total number of bytes that can be buffered in the receive queue.

5.185.1 Detailed Description

Subclass of NDDS_Transport_Property_t (p. 1505) allowing specification of parameters that are specific to the shared-memory transport.

See also:

 $\begin{tabular}{ll} NDDS_Transport_Support_set_builtin_transport_property()\\ (p. 876) \end{tabular}$

5.185.2 Field Documentation

 $\begin{array}{lll} 5.185.2.1 & struct & NDDS_Transport_Property_t \\ & & NDDS_Transport_Shmem_Property_t::parent & \texttt{[read]} \end{array}$

Generic properties of all transport plugins.

5.185.2.2 RTI_INT32 NDDS_Transport_Shmem_Property_t::received_message_count_max

Number of messages that can be buffered in the receive queue.

This is the maximum number of messages that can be buffered in a RecvResource of the Transport-Plugin.

This does not guarantee that the Transport-Plugin will actually be able to buffer received_message_count_max messages of the maximum size set in NDDS_-Transport_Property_t::message_size_max (p. 1508).

The total number of bytes that can be buffered for a RecvResource is actually controlled by receive_buffer_size.

See also:

```
NDDS_Transport_Property_t (p. 1505), NDDS_Transport_RecvResource_t, NDDS_TRANSPORT_SHMEM_RECEIVED_-MESSAGE_COUNT_MAX_DEFAULT (p. 1010)
```

5.185.2.3 RTI_INT32 NDDS_Transport_Shmem_Property_t::receive_buffer_size

The total number of bytes that can be buffered in the receive queue.

This number controls how much memory is allocated by the plugin for the receive queue (on a per RecvResource basis). The actual number of bytes allocated is

where fixedOverhead is some small number of bytes used by the queue data structure. The following rules are noted:

- receive_buffer_size < message_size_max * received_message_count_max, then the transport plugin will not be able to store received_message_count_max messages of size message_size_max.
- receive_buffer_size > message_size_max * received_message_count_max, then there will be memory allocated that cannot be used by the plugin and thus wasted.

To optimize memory usage, the user is allowed to specify a size for the receive queue to be less than that required to hold the maximum number of messages which are all of the maximum size.

In most situations, the average message size may be far less than the maximum message size. So for example, if the maximum message size is 64 K bytes, and the user configures the plugin to buffer at least 10 messages, then 640 K bytes of memory would be needed if all messages were 64 K bytes. Should this be desired, then receive_buffer_size should be set to 640 K bytes.

However, if the average message size is only 10 K bytes, then the user could set the receive_buffer_size to 100 K bytes. This allows the user to optimize the

memory usage of the plugin for the average case and yet allow the plugin to handle the extreme case.

NOTE, the queue will always be able to hold 1 message of message_size_max bytes, no matter what the value of receive_buffer_size is.

Configurable IPv4/UDP Transport-Plugin properties.

Data Fields

^ struct NDDS_Transport_Property_t parent

Generic properties of all transport plugins.

^ RTI_INT32 send_socket_buffer_size

Size in bytes of the send buffer of a socket used for sending.

^ RTI_INT32 recv_socket_buffer_size

Size in bytes of the receive buffer of a socket used for receiving.

^ RTLINT32 unicast_enabled

Allows the transport plugin to use unicast for sending and receiving.

^ RTI_INT32 multicast_enabled

Allows the transport pluqin to use multicast for sending and receiving.

^ RTI_INT32 multicast_ttl

Value for the time-to-live parameter for all multicast sends using this plugin.

^ RTI_INT32 multicast_loopback_disabled

 $Prevents\ the\ transport\ plugin\ from\ putting\ multicast\ packets\ onto\ the\ loopback\ interface.$

^ RTI_INT32 ignore_loopback_interface

Prevents the transport pluqin from using the IP loopback interface.

^ RTLINT32 ignore_nonrunning_interfaces

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

^ RTI_INT32 no_zero_copy

Prevents the transport plugin from doing a zero copy.

^ RTI_INT32 send_blocking

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS

^ RTI_UINT32 transport_priority_mask

Set mask for use of transport priority field.

^ RTI_INT32 transport_priority_mapping_low

Set low value of output range to IPv4 TOS.

^ RTLINT32 transport_priority_mapping_high

Set high value of output range to IPv4 TOS.

5.187.1 Detailed Description

Configurable IPv4/UDP Transport-Plugin properties.

The properties in this structure can be modified by the end user to configure the plugin. However, the properties must be set before the plugin is instantiated.

NDDS_Transport_UDPv4_new (p. 1019)

5.187.2 Field Documentation

5.187.2.1 struct NDDS_Transport_Property_t NDDS_Transport_UDPv4_Property_t::parent [read]

Generic properties of all transport plugins.

5.187.2.2 RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_-socket_buffer_size

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, setsockopt() will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to NDDS_Transport_Property_t::message_size_max (p. 1508). The maximum value is operating system-dependent.

By default, it will be set to be NDDS_TRANSPORT_UDPV4_-MESSAGE_SIZE_MAX_DEFAULT (p. 1017). If users configure this parameter to be NDDS_TRANSPORT_UDPV4_-SOCKET_BUFFER_SIZE_OS_DEFAULT (p. 1017), then setsockopt() (or equivalent) will not be called to size the send buffer of the socket.

See also:

NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_-DEFAULT (p. 1017) NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_-DEFAULT (p. 1017)

5.187.2.3 RTI_INT32 NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, setsockopt() will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to NDDS_Transport_Property_t::message_size_max (p. 1508). The maximum value is operating system-dependent.

By default, it will be set to be NDDS_TRANSPORT_UDPV4_-MESSAGE_SIZE_MAX_DEFAULT (p. 1017).

If it is set to NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_-SIZE_OS_DEFAULT (p. 1017), then setsockopt() (or equivalent) will not be called to size the receive buffer of the socket.

See also:

NDDS_TRANSPORT_UDPV4_MESSAGE_SIZE_MAX_-DEFAULT (p. 1017) NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_-DEFAULT (p. 1017)

5.187.2.4 RTI_INT32 NDDS_Transport_UDPv4_Property_t::unicast_enabled

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instanced.

5.187.2.5 RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_enabled

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instanced.

5.187.2.6 RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_ttl

Value for the time-to-live parameter for all multicast sends using this plugin.

This value is used to set the TTL of multicast packets sent by this transport plugin.

See also:

NDDS_TRANSPORT_UDPV4_MULTICAST_TTL_DEFAULT (p. 1017)

5.187.2.7 RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Data Distribution Service will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

[NOTE: Windows CE systems do not support multicast loopback. This field is ignored for Windows CE targets.]

5.187.2.8 RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- 0: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- 1: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- -1: Automatic. Lets RTI Data Distribution Service decide between the above two choices.

The current "automatic" (-1) RTI Data Distribution Service policy is as follows.

- ^ If a shared memory transport plugin is available for local traffic, the effective value is 1 (i.e., disable UPV4 local traffic).
- ^ Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Data Distribution Service policy based on availability of the shared memory transport.

5.187.2.9 RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface which is not reported as UP will not be used. This property allows the same check to be extended to the IFF_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated", and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- 0: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- 1: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 0 (i.e., do not check RUNNING flag)

5.187.2.10 RTI_INT32 NDDS_Transport_UDPv4_Property_t::no_-zero_copy

Prevents the transport plugin from doing a zero copy.

By default, this plugin will use the zero copy on OSs that offer it. While this is good for performance, it may sometime tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Data Distribution Service will use the zero-copy API if offered by the OS.

5.187.2.11 RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_blocking

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- ^ NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS: Sockets are blocking (default socket options for Operating System).
- ^ NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER: Sockets are modified to make them non-blocking. THIS IS NOT A SUP-PORTED CONFIGURATION AND MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS.

5.187.2.12 RTI_UINT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mask

Set mask for use of transport priority field.

This is used in conjunction with NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low (p. 1523) and NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high (p. 1523) to define the mapping from DDS transport priority (see TRANSPORT_PRIORITY (p. 176)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit

transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x00000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00) in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

 $[\mathbf{default}]$ 0.

5.187.2.13 RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low

Set low value of output range to IPv4 TOS.

This is used in conjunction with NDDS_Transport_UDPv4_Property_t::transport_priority_mask (p. 1522) and NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high (p. 1523) to define the mapping from DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

 $[\mathbf{default}] 0.$

5.187.2.14 RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high

Set high value of output range to IPv4 TOS.

This is used in conjunction with NDDS_Transport_UDPv4_Property_t::transport_priority_mask (p. 1522) and NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low (p. 1523) to define the mapping from DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

5.188 NDDS_Transport_UDPv6_Property_t Struct Reference

Configurable IPv6/UDP Transport-Plugin properties.

Data Fields

^ struct NDDS_Transport_Property_t parent

Set low value of output range to IPv6 TCLASS.

^ RTI_INT32 transport_priority_mapping_high

Set high value of output range to IPv6 TCLASS.

5.188.1 Detailed Description

Configurable IPv6/UDP Transport-Plugin properties.

The properties in this structure can be modified by the end user to configure the plugin. However, the properties must be set before the plugin is instantiated.

See also:

```
\label{local_norm_solution} NDDS\_Transport\_Support\_set\_builtin\_transport\_property() \\ (p. 876)
```

NDDS_Transport_UDPv6_new (p. 1029)

5.188.2 Field Documentation

Generic properties of all transport plugins.

5.188.2.2 RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_-socket_buffer_size

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, setsockopt() will be called to set the SENDBUF to the value of this parameter.

This value must be greater than or equal to NDDS_Transport_Property_t::message_size_max (p. 1508). The maximum value is operating system-dependent.

By default, it will be set to be NDDS_TRANSPORT_UDPV6_-MESSAGE_SIZE_MAX_DEFAULT (p. 1027).

If users configure this parameter to be NDDS_TRANSPORT_UDPV6_-SOCKET_BUFFER_SIZE_OS_DEFAULT (p. 1027), then setsockopt() (or equivalent) will not be called to size the send buffer of the socket.

See also:

NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_-DEFAULT (p. 1027) NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_-DEFAULT (p. 1027)

5.188.2.3 RTI_INT32 NDDS_Transport_UDPv6_Property_t::recv_-socket_buffer_size

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, setsockopt() will be called to set the RECVBUF to the value of this parameter.

This value must be greater than or equal to NDDS_Transport_Property_t::message_size_max (p. 1508). The maximum value is operating system-dependent.

By default, it will be set to be NDDS_TRANSPORT_UDPV6_-MESSAGE_SIZE_MAX_DEFAULT (p. 1027).

If it is set to NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_-SIZE_OS_DEFAULT (p. 1027), then setsockopt() (or equivalent) will not be called to size the receive buffer of the socket.

See also:

NDDS_TRANSPORT_UDPV6_MESSAGE_SIZE_MAX_-DEFAULT (p. 1027) NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_-DEFAULT (p. 1027)

5.188.2.4 RTI_INT32 NDDS_Transport_UDPv6_Property_t::unicast_enabled

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all

the allowed network interfaces that it finds up and running when the plugin is instanced.

5.188.2.5 RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_enabled

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instanced.

5.188.2.6 RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_ttl

Value for the time-to-live parameter for all multicast sends using this plugin.

This is used to set the TTL of multicast packets sent by this transport plugin.

See also:

 $\begin{tabular}{ll} NDDS_TRANSPORT_UDPV6_MULTICAST_TTL_DEFAULT \\ (p. 1027) \end{tabular}$

5.188.2.7 RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Data Distribution Service will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is enabled.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

5.188.2.8 RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- 0: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- ^ 1: Disables local traffic via this plugin. Do not use the IP loopback interface even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient transport (such as shared memory) instead of the IP loopback.
- -1: Automatic. Lets RTI Data Distribution Service decide between the above two choices.

The current "automatic" (-1) RTI Data Distribution Service policy is as follows.

- ^ If a shared memory transport plugin is available for local traffic, the effective value is 1 (i.e., disable UDPv6 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv6 for local traffic also).

[default] -1 Automatic RTI Data Distribution Service policy based on availability of the shared memory transport.

5.188.2.9 RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface which is not reported as UP will not be used. This property allows the same check to be extended to the IFF_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated", and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- 0: Do not check the RUNNING flag when enumerating interfaces, just make sure interface is UP.
- ^ 1: Check flag when enumerating interfaces and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 0 (i.e., do not check RUNNING flag)

5.188.2.10 RTI_INT32 NDDS_Transport_UDPv6_Property_t::no_-zero_copy

Prevents the transport plugin from doing zero copy.

By default, this plugin will use the zero copy on OSs that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. If you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off the use of zero copy.

By default this is set to 0, so RTI Data Distribution Service will use the zero copy API if offered by the OS.

5.188.2.11 RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_blocking

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- ^ NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS: Sockets are blocking (default socket options for Operating System).
- ^ NDDS_TRANSPORT_UDPV6_BLOCKING_NEVER: Sockets are modified to make them non-blocking. THIS IS NOT A SUP-PORTED CONFIGURATION AND MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV6_BLOCKING_ALWAYS.

5.188.2.12 RTI_INT32 NDDS_Transport_UDPv6_Property_t::enable_v4mapped

Specify whether UDPv6 transport will process IPv4 addresses.

Set this to 1 to turn on processing of IPv4 addresses. Note that this may make it incompatible with use of the UDPv4 transport within the same domain participant.

[default] 0.

5.188.2.13 RTI_UINT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mask

Set mask for use of transport priority field.

If transport priority mapping is supported on the platform, this mask is used in conjunction with NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low (p. 1530) and NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high (p. 1530) to define the mapping from DDS transport priority (see TRANSPORT_PRIORITY (p. 176)) to the IPv6 TCLASS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv6 TCLASS field on an outgoing socket. (See the *Platform Notes* to find out if the transport priority is supported on a specific platform.)

For example, the value 0x00000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00) in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv6 TCLASS for send sockets.

 $[\mathbf{default}]$ 0.

5.188.2.14 RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low

Set low value of output range to IPv6 TCLASS.

This is used in conjunction with NDDS_Transport_UDPv6_Property_t::transport_priority_mask (p. 1530) and NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high (p. 1530) to define the mapping from DDS transport priority to the IPv6 TCLASS field. Defines the low value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

 $[\mathbf{default}] 0.$

5.188.2.15 RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high

Set high value of output range to IPv6 TCLASS.

This is used in conjunction with NDDS_Transport_UDPv6_Property_t::transport_priority_mask (p. 1530) and NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low (p. 1530) to define the mapping from DDS transport priority to the IPv6 TCLASS field. Defines the high value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value. [default] 0xff.

5.189 NDDS_Utility Struct Reference

Unsupported utility APIs.

5.189.1 Detailed Description

Unsupported utility APIs.

Unsupported APIs used in example code. The static functions supplied by this module are used by the example code distributed with RTI Data Distribution Service and generated by rtiddsgen. These functions are not supported by RTI.

5.190 TransportAllocationSettings_t Struct Reference

Allocation settings used by various internal buffers.

5.190.1 Detailed Description

Allocation settings used by various internal buffers.

An allocation setting structure defines the rules of memory management used by internal buffers.

An internal buffer can provide blocks of memory of fixed size. They are used in several places of any transport, and this structure defines its starting size, limits, and how to increase its capacity.

It contains three values:

- initial_count: the number of individual elements that are allocated when the buffer is created.
- ^ max_count: the maximum number of elements the buffer can hold. The buffer will grow up to this amount. After this limit is reached, new allocation requests will fail. For unlimited size, use the value NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED
- ^ incremental_count: The amount of elements that are allocated at every increment. You can use the value: NDDS_TRANSPORT_ALLOCATION_-SETTINGS_INCREMENTAL_COUNT_AUTOMATIC to have the buffer double its size at every reallocation request.

Chapter 6

6.2 HelloWorld.idl

6.2.1 IDL Type Description

The data type to be disseminated by RTI Data Distribution Service is described in language independent IDL. The IDL file is input to **rtiddsgen** (p. 969), which produces the following files.

The programming language specific type representation of the type \mathbf{Foo} (p. 1494) = HelloWorld, for use in the application code.

- ^ HelloWorld.h
- ^ HelloWorld.c

User Data Type Support (p. 448) types as required by the DDS specification for use in the application code.

- ^ HelloWorldSupport.h
- ^ HelloWorldSupport.c

Methods required by the RTI Data Distribution Service implementation. These contains the auto-generated methods for serializing and deserializing the type.

- ^ HelloWorldPlugin.h
- ^ HelloWorldPlugin.c

6.2.1.1 HelloWorld.idl

[\$(NDDSHOME)/example/C/helloWorld/HelloWorld.idl]

```
struct HelloWorld {
    string<128> msg;
};
```

6.3 HelloWorld_publisher.c

6.3.1 RTI Data Distribution Service Publication Example

The publication example generated by **rtiddsgen** (p. 969). The example has been modified slightly to update the sample value.

6.3.1.1 HelloWorld_publisher.c

[\$(NDDSHOME)/example/C/helloWorld/HelloWorld_publisher.c]

```
/* HelloWorld_publisher.c
```

A publication of data of type HelloWorld

This file is derived from code automatically generated by the rtiddsgen command:

rtiddsgen -language C -example <arch> HelloWorld.idl

Example publication of type HelloWorld automatically generated by 'rtiddsgen'. To test them follow these steps:

- (1) Compile this file and the example subscription.
- (2) Start the subscription on the same domain used for RTI Data Distribution Service with the command objs/<arch>/HelloWorld_subscriber <domain_id> <sample_count>
- (3) Start the publication on the same domain used for RTI Data Distribution Service with the command objs/<arch>/HelloWorld_publisher <domain_id> <sample_count>
- (4) [Optional] Specify the list of discovery initial peers and multicast receive addresses via an environment variable or a file (in the current working directory) called NDDS_DISCOVERY_PEERS.

You can run any number of publishers and subscribers programs, and can add and remove them dynamically from the domain.

Example:

```
To run the example application on domain <domain_id>:
```

On Unix:

objs/<arch>/HelloWorld_publisher <domain_id>objs/<arch>/HelloWorld_subscriber <domain_id>

On Windows:

objs\<arch>\HelloWorld_publisher <domain_id>

objs\<arch>\HelloWorld_subscriber <domain_id>

```

6.4 HelloWorld subscriber.c

6.4.1 RTI Data Distribution Service Subscription Example

The unmodified subscription example generated by **rtiddsgen** (p. 969).

6.4.1.1 HelloWorld_subscriber.c

[\$(NDDSHOME)/example/C/helloWorld/HelloWorld_subscriber.c]

```
/* HelloWorld_subscriber.c
   A subscription example
   This file is derived from code automatically generated by the rtiddsgen command:
   rtiddsgen -language C -example <arch> HelloWorld.idl
```

Example subscription of type HelloWorld automatically generated by 'rtiddsgen'. To test them, follow these steps:

- (1) Compile this file and the example publication.
- (2) Start the subscription on the same domain used for RTI Data Distribution Service with the command objs/<arch>/HelloWorld_subscriber <domain_id> <sample_count>
- (3) Start the publication on the same domain used for RTI Data Distribution Service with the command objs/<arch>/HelloWorld_publisher <domain_id> <sample_count>
- (4) [Optional] Specify the list of discovery initial peers and multicast receive addresses via an environment variable or a file (in the current working directory) called NDDS_DISCOVERY_PEERS.

You can run any number of publishers and subscribers programs, and can add and remove them dynamically from the domain.

Example:

```
To run the example application on domain <domain_id>:
On UNIX systems:
objs/<arch>/HelloWorld_publisher <domain_id>
objs/<arch>/HelloWorld_subscriber <domain_id>
On Windows systems:
objs/<arch>\HelloWorld_publisher <domain_id>
```

objs\<arch>\HelloWorld_subscriber <domain_id>

6.6 HelloWorldSupport.c

6.6.1 User Data Type Support

Files generated by **rtiddsgen** (p. 969) that implement the type specific APIs required by the DDS specification, as described in the **User Data Type Support** (p. 448), where:

- FooTypeSupport (p. 1499) = HelloWorldTypeSupport
- $^{\circ}$ FooDataWriter (p. 1496) = HelloWorldDataWriter
- $^{\hat{}}$ FooDataReader (p. 1495) = HelloWorldDataReader

6.6.1.1 HelloWorldSupport.h

```
[$(NDDSHOME)/example/C/helloWorld/HelloWorldSupport.h]
