RTI Secure WAN Transport

Release Notes

Version 5.2.0
Release Notes

1 Supported Platforms

This release of RTI® Secure WAN Transport is supported on the architectures listed in Table 1.1.

Table 1.1 Supported Platforms

<table>
<thead>

</table>

2 Compatibility

RTI Secure WAN Transport is an optional product for use with RTI Connext™ DDS with the same version number.

This release uses OpenSSL 1.0.1L.

3 What’s New in 5.2.0

- New platforms (see Table 1.1):
  - CentOS 6.0, 6.2, 6.3, 6.4
  - Red Hat Enterprise Linux 6.0 - 6.5, 7.0
  - Raspbian “Wheezy” 7.0
  - Mac OS X 10.8 and 10.10
  - Ubuntu 14
  - Additional Windows platforms (see RTI Connext DDS Core Libraries What’s New)

- Windows platforms using Visual Studio 2005 are no longer supported.
- This release uses OpenSSL 1.0.1L.
- RTI’s OpenSSL bundles include multiple builds in different directories. The release and debug builds are now in separate directories. For this reason, the path to the libraries will change with respect to earlier bundles.
- Starting with the OpenSSL 1.0.1h, RTI provides the OpenSSL static libraries with a "z" suffix. No suffix is used for dynamic libraries. This means that the name of the dynamic libraries is the same as in previous bundles, but the name of static libraries now has a 'z' suffix.

4 What’s Fixed in 5.2.0

4.1 Error When Enabling DomainParticipant

A DomainParticipant could not be enabled if it was configured to use Secure WAN Transport. When this issue occurred, the following message was displayed:
This problem has been resolved.

[RTI Issue ID COREPLG-315]

4.2 Errors Deserializing Messages when Using Secure WAN Transport

An issue in Secure WAN Transport may have caused deserialization errors upon receipt of STUN messages from a remote plugin. This problem has been resolved.

[RTI Issue ID COREPLG-327]

4.3 Unexpected Memory Growth when Sending and Receiving STUN Messages

An issue in Secure WAN Transport may have caused unexpected memory growth when sending and receiving STUN messages. Note that this was not a memory leak, since all the memory was returned upon WAN Transport plugin destruction. This problem has been resolved.

[RTI Issue ID COREPLG-328]

4.4 Unexpected Memory Growth when Accepting Connection from Remote Plugin

An issue in Secure WAN Transport may have caused unexpected memory growth upon accepting a new connection from a remote plugin. Note that this was not a memory leak, since all the memory was returned upon WAN Transport plugin destruction. This problem has been resolved.

[RTI Issue ID COREPLG-329]

4.5 Communication may not have Resumed after Killing and Restarting Secure WAN Participant

When using Secure WAN Transport over DTLS, ungracefully shutting down and restarting a participant may have resulted in unrecoverable communication failure. This issue has been resolved. The recovery time can be configured via a new WAN transport property: `dtls_connection_liveliness_interval`.

[RTI Issue ID COREPLG-347]

5 Compatibility

In Connext DDS 5.1.0, the default value for `message_size_max` for this transport changed. Secure WAN Transport also uses this value. Consequently, Secure WAN Transport 5.1.0 and higher is not off-the-shelf compatible with applications running older versions of this transport. See the RTI Connext DDS Core Libraries Release Notes for instructions on how to resolve the compatibility issue with older Connext DDS and RTI Data Distribution Service applications.
6 Known Issues

- When communicating over some networks, the Secure WAN Transport plug-ins may fail to send data larger than the MTU (maximum transmission unit) size available for the network. This is especially likely over wide-area networks. This scenario is also a suggested configuration of the DTLS protocol, according to the DTLS specification, which is IETF RFC 4347.

If problems occur while sending large packets, set the maximum_message_size transport property to the MTU of your network minus 28 bytes for the DTLS header and set up your application according to the Large Data Use Cases “How To” provided in the online (HTML) documentation. For example, for an MTU size of 1500 bytes (for standard Ethernet), set maximum_message_size to 1500 - 28 = 1472.

One instance of this problem for which there is no workaround is the case where the discovery packets are larger than your network’s MTU. This could occur if user data, propagated properties, or type-codes are configured.

- An application using the WAN transport may appear to hang for several minutes if the WAN server is shut down and not restarted before the application tries to contact it, or if the application is unable to communicate with the WAN server.

Two scenarios under which the application tries to contact the STUN server are during shut down and while establishing a connection with the initial peers.

This issue is due to a sequence of synchronous STUN transactions with the STUN server. If you need to run WAN transport without a STUN server, here are some recommendations:

  - Decrease the blocking time by decreasing the number of STUN retransmissions. To do so, change the property, stun_number_of_retransmissions. For example, a change from the default of 7 retries to 5 retries will result in a total period of 3.1 seconds per synchronous operation. Note however, that this may impact the ability to reliably set up connections to peers over a WAN.

  - Decrease the blocking time by using a participant ID limit of zero when configuring the initial peer descriptors.

For example, when the peer descriptor wan://::1:10.10.1.150 is specified, DDS will try to contact five participants with the same WAN ID in different ports. Usually there is only one participant using the same WAN ID. Although the other four participants will never be reachable, the application still tries to establish communication with them by contacting the STUN server.

You can reduce the number of participants to which the application will try to contact to one by using a participant ID limit of zero in the peer descriptor. For example, 0@wan://::1:10.10.1.150.

For information on peer descriptors, see the Discovery chapter in the RTI Connext DDS Core Libraries User’s Manual.
