# Release Notes

## 1 Supported Platforms

This release of *RTI® Secure WAN Transport* is supported on the platforms in [Table 1.1](#).

Table 1.1 **Supported Platforms**

Operating System	CPU	Compiler	RTI Architecture Abbreviation
Android™	All Android platforms in the <i>RTI Connex® DDS Core Libraries Platform Notes</i> for the same version number. Note: RTI WAN Server is not supported.		
iOS®	All iOS platforms in the <i>RTI Connex DDS Core Libraries Platform Notes</i> for the same version number. Note: RTI WAN Server is not supported.		
Linux®	All Linux platforms in the <i>RTI Connex DDS Core Libraries Platform Notes</i> for the same version number, except not supported on SUSE 11. Among custom target platforms, only RedHawk™ Linux 6.5 is supported.		
OS X®	All OS X platforms in the <i>RTI Connex DDS Core Libraries Platform Notes</i> for the same version number.		
QNX®	All QNX Neutrino® 6.5 and higher platforms in the <i>RTI Connex DDS Core Libraries Platform Notes</i> for the same version number.		
Solaris™	Solaris 2.10	UltraSPARC®	gcc3.4.2 sparcSol2.10gcc3.4.2
Windows®	All Windows platforms in the <i>RTI Connex DDS Core Libraries Platform Notes</i> for the same version number.		

## 2 Compatibility with Current Software

*RTI Secure WAN Transport* is an optional product for use with *RTI Connex® DDS* with the same version number.

This release uses OpenSSL 1.0.2n.

## 3 Backward Compatibility

- ❑ In *Connex DDS 5.1.0*, the default value for **message\_size\_max** for this transport changed. *Secure WAN Transport* also uses this value. Consequently, *Secure WAN Transport 5.1.0* and higher is not off-the-shelf compatible with applications running older versions of this transport. See the *RTI Core Libraries Release Notes* for instructions on how to resolve the compatibility issue with older *Connex DDS* and *RTI Data Distribution Service* applications.
- ❑ If you were using OpenSSL 1.0.1: Because *Connex DDS 5.2.3* and higher uses OpenSSL 1.0.2, the number of bits of any Diffie-Hellman (DH) parameters must now be at least 1024 (see <https://www.openssl.org/blog/blog/2015/05/20/logjam-freak-upcoming-changes/>). Therefore, if you are using the property **tls.cipher.dh\_param\_files** and there is a DH parameter file that has fewer than 1024 bits, you must regenerate the file with at least 1024 bits.

## 4 What's New in 5.3.1

### 4.1 New Platforms

This release adds support for the following platforms. These platforms have been added since 5.3.0.

Operating System	CPU	Compiler	RTI Architecture Abbreviation
OS X 10.13	x64	clang 9.0	x64Darwin17clang9.0
QNX Neutrino 7.0	Arm® 8	qcc 7.0.0 with LLVM default libraries	armv8QNX7.0.0qcc_cxx5.4.0
		qcc 7.0.0 with GNU C++ libraries	armv8QNX7.0.0qcc_gpp5.4.0
	x64	qcc 7.0.0 with LLVM default libraries	x64QNX7.0.0qcc_cxx5.4.0
		qcc 7.0.0 with GNU C++ libraries	x64QNX7.0.0qcc_gpp5.4.0
RedHawk Linux 6.5 (Available through custom support)	i86	gcc 4.9.2	i86RedHawk6.5gcc4.9.2
	x64	gcc 4.9.2	x64RedHawk6.5gcc4.9.2
Ubuntu® 16.04 LTS	ARMv8 (AArch64)	gcc 5.4.0	armv8Linux4.4gcc5.4.0
Wind River® Linux 7	x64	gcc 4.9.1	x64WRLinux7gcc4.9.1
Windows 10	x86	Visual Studio 2017 Update 2	i86Win32VS2017
Windows Server 2008 R2 Windows Server 2016	x64	Visual Studio 2017 Update 2	x64Win64VS2017

See the *RTI Connex DDS Core Libraries Platform Notes* for details.

## 5 Previous Release

### 5.1 What's New in 5.3.0

This section highlights new platforms and improvements in 5.3.0. These enhancements have been made since 5.2.3.

### 5.1.1 New Platforms

This release adds support for platforms on the following operating systems:

- OS X 10.12
- Red Hat Enterprise Linux 6.8
- Ubuntu 16.04 LTS
- Windows Server 2016

See the *RTI Core Libraries Platform Notes* for details.

### 5.1.2 Platforms on Legacy Operating Systems

The following legacy operating systems have reached end-of-life from their corresponding vendors. Please contact RTI support or your account manager if you require version 5.3 to run on these platforms:

- Red Hat Enterprise Linux 5.0
- Wind River Linux 4

### 5.1.3 Removed Platforms

Platforms on the following operating systems are no longer supported:

- OS X 10.8
- Windows 2003, Windows Vista, Windows XP

### 5.1.4 OpenSSL

This release uses OpenSSL 1.02g.

## 5.2 What's Fixed in 5.3.0

This section describes bugs fixed in 5.3.0. These fixes have been made since 5.2.0.

### 5.2.1 DTLS Communication Failed when Using More than One Network Interface

Participants using the DTLS transport did not communicate if one of the machines used more than one network interface. That machine reported errors such as:

```
NDDS_Transport_DTLS_Connection_process_receive:OpenSSL error:
[04091068]:[INT_RSA_VERIFY]:[bad signature]
```

This problem has been resolved.

[RTI Issue ID COREPLG-385]

### 5.2.2 Segmentation Fault when Creating DTLS DomainParticipants in Multiple Threads on QNX and Solaris Systems

On QNX and Solaris systems, the creation of DTLS-enabled DomainParticipants was not thread-safe and may have led to a segmentation fault in the function `RTIOSapiSemaphore_take()`. This problem has been resolved for all RTI Secure WAN Transport architectures.

[RTI Issue ID COREPLG-264]

## 6 Known Issues

- ❑ When communicating over some networks, the Secure WAN Transport plug-ins may fail to send data larger than the MTU (maximum transmission unit) size available for the network. This is especially likely over wide-area networks. This scenario is also a suggested configuration of the DTLS protocol, according to the DTLS specification, which is IETF RFC 4347.

If problems occur while sending large packets, set the `maximum_message_size` transport property to the MTU of your network *minus 28 bytes for the DTLS header* and set up your application according to the Large Data Use Cases “How To” provided in the online (HTML) documentation. For example, for an MTU size of 1500 bytes (for standard Ethernet), set **`maximum_message_size`** to  $1500 - 28 = 1472$ .

One instance of this problem for which there is no workaround is the case where the discovery packets are larger than your network’s MTU. This could occur if user data, propagated properties, or type-codes are configured.

- ❑ An application using the WAN transport may appear to hang for several minutes if the WAN server is shut down and not restarted before the application tries to contact it, or if the application is unable to communicate with the WAN server.

Two scenarios under which the application tries to contact the STUN server are during shut down and while establishing a connection with the initial peers.

This issue is due to a sequence of synchronous STUN transactions with the STUN server. If you need to run WAN transport without a STUN server, here are some recommendations:

- Decrease the blocking time by decreasing the number of STUN retransmissions. To do so, change the property, **`stun_number_of_retransmissions`**. For example, a change from the default of 7 retries to 5 retries will result in a total period of 3.1 seconds per synchronous operation. Note however, that this may impact the ability to reliably set up connections to peers over a WAN.
- Decrease the blocking time by using a participant ID limit of zero when configuring the initial peer descriptors.

For example, when the peer descriptor **`wan://:1:10.10.1.150`** is specified, DDS will try to contact five participants with the same WAN ID in different ports. Usually there is only one participant using the same WAN ID. Although the other four participants will never be reachable, the application still tries to establish communication with them by contacting the STUN server.

You can reduce the number of participants to which the application will try to contact to one by using a participant ID limit of zero in the peer descriptor. For example, **`0@wan://:1:10.10.1.150`**.

For information on peer descriptors, see the *Discovery* chapter in the *RTI Core Libraries User’s Manual*.

## 7 Third-Party Licenses

This product includes software developed by the OpenSSL Project for use in the OpenSSL Toolkit (<http://www.openssl.org/>).

Copyright (c) 1998-2011 The OpenSSL Project. All rights reserved.

The OpenSSL toolkit stays under a dual license, i.e. both the conditions of the OpenSSL License and the original SSLeay license apply to the toolkit. See below for the actual license texts. Actually both licenses are BSD-style Open Source licenses. In case of any license issues related to OpenSSL please contact [openssl-core@openssl.org](mailto:openssl-core@openssl.org).
