9.149 DDS_QosPrintAll_t Struct Reference

Special type which is used to select the to_string overloads when printing Qos objects.

9.149.1 Detailed Description

Special type which is used to select the to_string overloads when printing Qos objects.

This sentinel value is used to select the to_string overload which prints the entirety of a Qos object (e.g., **DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 146)). The only valid value for this type is the sentinel value **DDS_QOS_PRINT_ALL** (p. 164).

For example:

```
DataReaderQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, DDS_QOS_PRINT_ALL);
```

9.150 DDS_QosPrintFormat Struct Reference

A collection of attributes used to configure how a QoS appears when printed.

Public Attributes

- **DDS_Boolean is_standalone**
Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).
- **DDS_Boolean print_private**
Configures how private QoS policies should be printed.
- **DDS_UnsignedLong indent**
Configures how much additional indent should be added to the string representation of a QoS.

9.150.1 Detailed Description

A collection of attributes used to configure how a QoS appears when printed.

To ensure that new objects of this type are initialized to a known value, assign them with the static initializer **DDS_↵
QosPrintFormat_INITIALIZER** (p. 359).

9.150.2 Member Data Documentation

9.150.2.1 is_standalone

DDS_Boolean DDS_QosPrintFormat::is_standalone

Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).

The default value for this property (false) results in QoS being printed starting from the <ENTITY_qos> tag (where the <ENTITY_qos> tag is, e.g., <domain_participant_qos>, or, <datareader_qos>. This result cannot be directly parsed as valid XML (as it lacks <dds>, <qos_library>, and <qos_profile> tags). If is_standalone is set to true, these additional tags are printed, resulting in valid, parseable XML.

For example, with is_standalone set to false, a Qos may appear as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

Setting is_standalone to true would result in the same Qos being printed as:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <qos_library name="QosLibrary">
    <qos_profile name="QosProfile">
      <datareader_qos>
        <durability>
          <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
        </durability>
      </datareader_qos>
    </qos_profile>
  </qos_library>
</dds>
```

[default] false

9.150.2.2 print_private

DDS_Boolean DDS_QosPrintFormat::print_private

Configures how private QoS policies should be printed.

There are some QoS policies which are not intended for external use. By default, these QoS policies are only printed if they are different to the default value for that policy. When true, private policies are treated like any other policy, and printed if they are different to the supplied base QoS. These private policies cannot be parsed from XML, and are always printed as XML comments.

[default] false

9.150.2.3 indent

DDS_UnsignedLong DDS_QosPrintFormat::indent

Configures how much additional indent should be added to the string representation of a QoS.

Configures how much additional indent is applied when converting a QoS to a string. This value acts as a total offset on the string, increasing the indent which is applied to all elements by the same amount. With indent set to 0, a string representation of a QoS may appear as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

Setting the indent property to 1, the same QoS would be printed as:

```
  <datareader_qos>
    <durability>
      <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
    </durability>
  </datareader_qos>
```

I.e., the entire structure is indented.

[default] 0

9.151 DDS_QueryConditionParams Struct Reference

<< **extension** >> (p. 236) Input parameters for **DDSDataReader::create_querycondition_w_params** (p. 1278)

Public Attributes

DDS_InstanceStateMask `DDS_ReadConditionParams::instance_states`

Instance state.

Instance state of the data samples that are of interest.

9.152.2.4 stream_kinds

`DDS_StreamKindMask DDS_ReadConditionParams::stream_kinds`

Stream kind.

Stream kind of the data samples that are of interest.

9.153 DDS_ReaderDataLifecycleQosPolicy Struct Reference

Controls how a DataReader manages the lifecycle of the data that it has received.

Public Attributes

- struct **DDS_Duration_t autopurge_nowriter_samples_delay**
*Minimum duration for which the **DDSDDataReader** (p. 1272) will maintain information regarding an instance once its *instance_state* becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).*
- struct **DDS_Duration_t autopurge_disposed_samples_delay**
*Minimum duration for which the **DDSDDataReader** (p. 1272) will maintain samples for an instance once its *instance_state* becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161).*
- struct **DDS_Duration_t autopurge_disposed_instances_delay**
*<<extension>> (p. 236) Minimum duration for which the **DDSDDataReader** (p. 1272) will maintain information about a received instance once its *instance_state* becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) and there are no samples for the instance in the DataReader queue.*
- struct **DDS_Duration_t autopurge_nowriter_instances_delay**
*<<extension>> (p. 236) Minimum duration for which the **DDSDDataReader** (p. 1272) will maintain information about a received instance once its *instance_state* becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) and there are no samples for the instance in the DataReader queue.*

9.153.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

When a DataReader receives data, it is stored in a receive queue for the DataReader. The user application may either take the data from the queue or leave it there.

This QoS policy controls whether or not RTI Connext will automatically remove data from the receive queue (so that user applications cannot access it afterwards) when it detects that there are no more DataWriters alive for that data. It specifies how long a **DDSDDataReader** (p. 1272) must retain information regarding instances that have the *instance_state* **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).

Note: This policy is not concerned with keeping reliable reader state or discovery information.

The **DDSDDataReader** (p. 1272) internally maintains the samples that have not been "taken" by the application, subject to the constraints imposed by other QoS policies such as **DDS_HistoryQosPolicy** (p. 906) and **DDS_ResourceLimitsQosPolicy** (p. 1038).

The **DDSDataReader** (p. 1272) also maintains information regarding the identity, `view_state` and `instance_state` of data instances even after all samples have been taken. This is needed to properly compute the states when future samples arrive.

Under normal circumstances the **DDSDataReader** (p. 1272) can only reclaim all resources for instances for which there are no writers and for which all samples have been 'taken'. The last sample the **DDSDataReader** (p. 1272) will have taken for that instance will have an `instance_state` of either **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) or **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) depending on whether or not the last writer that had ownership of the instance disposed it.

In the absence of **READER_DATA_LIFECYCLE** (p. 432), this behavior could cause problems if the application forgets to take those samples. "Untaken" samples will prevent the **DDSDataReader** (p. 1272) from reclaiming the resources and they would remain in the **DDSDataReader** (p. 1272) indefinitely.

A DataReader can also reclaim all resources for instances that have an instance state of **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) and for which all DDS samples have been 'taken'. DataReaders will only reclaim resources in this situation when the `autopurge_disposed_instances_delay` has been set to zero.

For keyed Topics, the consideration of removing data samples from the receive queue is done on a per instance (key) basis. Thus when RTI Connext detects that there are no longer DataWriters alive for a certain key value of a Topic (an instance of the Topic), it can be configured to remove all data samples for that instance (key).

Entity:

DDSDataReader (p. 1272)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **YES** (p. ??)

9.153.2 Member Data Documentation

9.153.2.1 `autopurge_nowriter_samples_delay`

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_samples_delay
```

Minimum duration for which the **DDSDataReader** (p. 1272) will maintain information regarding an instance once its `instance_state` becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).

At some point after this time elapses, the **DDSDataReader** (p. 1272) will purge all internal information regarding the instance, any "untaken" samples will also be dropped.

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.153.2.2 autopurge_disposed_samples_delay

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_samples_delay
```

Minimum duration for which the **DDSDDataReader** (p. 1272) will maintain samples for an instance once its `instance_state` becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161).

After this time elapses, the **DDSDDataReader** (p. 1272) will purge all samples for the instance even if they have not been read by the application. This purge is done lazily when space is needed for other samples or instances.

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.153.2.3 autopurge_disposed_instances_delay

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_instances_delay
```

<<**extension**>> (p. 236) Minimum duration for which the **DDSDDataReader** (p. 1272) will maintain information about a received instance once its `instance_state` becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) and there are no samples for the instance in the DataReader queue.

After this time elapses, when the last sample for the disposed instance is taken, the **DDSDDataReader** (p. 1272) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set `keep_minimum_state_for_instances` to **FALSE** in **DDS_DataReaderResourceLimitsQosPolicy** (p. 648).

The only currently supported values are **DDS_DURATION_ZERO** (p. 326) and **DDS_DURATION_INFINITE** (p. 325). A value of **DDS_DURATION_ZERO** (p. 326) will purge an instance's state immediately after the instance state transitions to **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161), as long as all samples, including the dispose sample, associated with that instance have been 'taken'.

[default] **DDS_DURATION_INFINITE** (p. 325)

9.153.2.4 autopurge_nowriter_instances_delay

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_instances_delay
```

<<**extension**>> (p. 236) Minimum duration for which the **DDSDDataReader** (p. 1272) will maintain information about a received instance once its `instance_state` becomes **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) and there are no samples for the instance in the DataReader queue.

An instance will transition to the **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) `instance_state` when all known writers for the instance have either lost liveliness or have unregistered themselves from the instance. After this time elapses, when the last sample for the instance without writers is taken, the **DDSDDataReader** (p. 1272) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set `keep_minimum_state_for_instances` to **FALSE** in **DDS_DataReaderResourceLimitsQosPolicy** (p. 648).

The only currently supported values are **DDS_DURATION_ZERO** (p. 326) and **DDS_DURATION_INFINITE** (p. 325). A value of **DDS_DURATION_ZERO** (p. 326) will purge an instance's state immediately after the instance state transitions to **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161), as long as all samples, including the `no_writers` sample, associated with that instance have been 'taken'.

[default] **DDS_DURATION_ZERO** (p. 326)

9.154 DDS_ReceiverPoolQosPolicy Struct Reference

Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

Public Attributes

- struct **DDS_ThreadSettings_t** **thread**
Receiver pool thread(s).
- **DDS_Long** **buffer_size**
The receive buffer size in bytes.
- **DDS_Long** **buffer_alignment**
The receive buffer alignment.

9.154.1 Detailed Description

Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

This QoS policy is an extension to the DDS standard.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

See also

Controlling CPU Core Affinity for RTI Threads (p. 351)

9.154.2 Usage

This QoS policy sets the thread properties such as priority level and stack size for the threads used by the middleware to receive and process data from transports.

RTI uses a separate receive thread per port per transport plug-in. To force RTI Connex to use a separate thread to process the data for a **DDSDataReader** (p. 1272), set a unique port for the **DDS_TransportUnicastQosPolicy** (p. 1143) or **DDS_TransportMulticastQosPolicy** (p. 1136) for the **DDSDataReader** (p. 1272).

This QoS policy also sets the size of the buffer used to store packets received from a transport. This buffer size will limit the largest single packet of data that a **DDSDomainParticipant** (p. 1335) will accept from a transport. Users will often set this size to the largest packet that any of the transports used by their application will deliver. For many applications, the value 65,536 (64 K) is a good choice; this value is the largest packet that can be sent/received via UDP.

9.154.3 Member Data Documentation

9.154.3.1 thread

```
struct DDS_ThreadSettings_t DDS_ReceiverPoolQosPolicy::thread
```

Receiver pool thread(s).

There is at least one receive thread, possibly more.

[default] priority above normal.

The actual value depends on your architecture:

For Windows: 2

For Linux: OS default priority

For a complete list of platform specific values, please refer to `Platform Notes`.

[default] The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to `Platform Notes`.

[default] mask `DDS_THREAD_SETTINGS_FLOATING_POINT` (p. 351) | `DDS_THREAD_SETTINGS_STUDIO` (p. 351)

9.154.3.2 buffer_size

```
DDS_Long DDS_ReceiverPoolQosPolicy::buffer_size
```

The receive buffer size in bytes.

The receive buffer is used by the receive thread to store the raw data that arrives over the transports in non-zero-copy transports.

Zero-copy transports do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in buffers allocated by the transports themselves. Only the shared memory built-in transport (SHMEM) supports zero-copy.

`buffer_size` must always be at least as large as the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1761) across *all* of the transports being used that are not doing zero-copy.

By default (`DDS_LENGTH_AUTO` (p. 433)): the size is equal to the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1761) across *all* of the non-zero-copy transports.

You may want the value to be greater than the default if you try to limit the largest data packet that can be sent through the transport(s) in one application, but you still want to receive data from other applications that have not made the same change.

For example, to avoid IP fragmentation, you may want to set `NDDS_Transport_Property_t::message_size_max` (p. 1761) for IP-based transports to a small value, such as 1400 bytes. However, you may not be able to apply this change to all the applications at the same time. To receive data from these other applications the `buffer_size` should be equal to the original `NDDS_Transport_Property_t::message_size_max` (p. 1761).

[default] `DDS_LENGTH_AUTO` (p. 433)

[range] [1, 1 GB] or `DDS_LENGTH_AUTO` (p. 433)

9.154.3.3 buffer_alignment

DDS_Long DDS_ReceiverPoolQosPolicy::buffer_alignment

The receive buffer alignment.

Most users will not need to change this alignment.

[default] 16

[range] [1,1024] Value must be a power of 2.

9.155 DDS_ReliabilityQosPolicy Struct Reference

Indicates the level of reliability offered/requested by RTI Connex.

Public Attributes

- **DDS_ReliabilityQosPolicyKind kind**
Kind of reliability.
- struct **DDS_Duration_t max_blocking_time**
The maximum time a writer may block on a write() call.
- **DDS_ReliabilityQosPolicyAcknowledgmentModeKind acknowledgment_kind**
<<extension>> (p. 236) *Kind of reliable acknowledgment*
- **DDS_InstanceStateConsistencyKind instance_state_consistency_kind**
<<extension>> (p. 236) *Whether instance state consistency is enabled*

9.155.1 Detailed Description

Indicates the level of reliability offered/requested by RTI Connex.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343)

Properties:

RxO (p. ??) = YES

Changeable (p. ??) = **UNTIL ENABLE** (p. ??) (the instance_state_consistency_kind is **Changeable** (p. ??) = NO (p. ??))

9.155.2 Usage

This policy indicates the level of reliability requested by a **DDSDataReader** (p. 1272) or offered by a **DDSDataWriter** (p. 1305).

The reliability of a connection between a **DataWriter** and **DataReader** is entirely user configurable. It can be done on a per **DataWriter/DataReader** connection. A connection may be configured to be "best effort" which means that RTI Connext will not use any resources to monitor or guarantee that the data sent by a **DataWriter** is received by a **DataReader**.

For some use cases, such as the periodic update of sensor values to a GUI displaying the value to a person, **DDS_↵_BEST_EFFORT_RELIABILITY_QOS** (p. 435) delivery is often good enough. It is certainly the fastest, most efficient, and least resource-intensive (CPU and network bandwidth) method of getting the newest/latest value for a topic from **DataWriters** to **DataReaders**. But there is no guarantee that the data sent will be received. It may be lost due to a variety of factors, including data loss by the physical transport such as wireless RF or even Ethernet.

However, there are data streams (topics) in which you want an absolute guarantee that all data sent by a **DataWriter** is received reliably by **DataReaders**. This means that RTI Connext must check whether or not data was received, and repair any data that was rejected by resending a copy of the data as many times as it takes for the **DataReader** to receive the data. RTI Connext uses a reliability protocol configured and tuned by these QoS policies: **DDS_History_↵QosPolicy** (p. 906), **DDS_DataWriterProtocolQosPolicy** (p. 667), **DDS_DataReaderProtocolQosPolicy** (p. 624), and **DDS_ResourceLimitsQosPolicy** (p. 1038).

The Reliability QoS policy is simply a switch to turn on the reliability protocol for a **DataWriter/DataReader** connection. The level of reliability provided by RTI Connext is determined by the configuration of the aforementioned QoS policies.

You can configure RTI Connext to deliver *all* data in the order they were sent (also known as absolute or strict reliability). Or, as a tradeoff for less memory, CPU, and network usage, you can choose a reduced level of reliability where only the last *N* values are guaranteed to be delivered reliably to **DataReaders** (where *N* is user-configurable). In the reduced level of reliability, there are no guarantees that the data sent before the last *N* are received. Only the last *N* data packets are monitored and repaired if necessary.

These levels are ordered, **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435) < **DDS_RELIABLE_RELIABILITY_↵QOS** (p. 435). A **DDSDataWriter** (p. 1305) offering one level is implicitly offering all levels below.

Note: To send *large* data reliably, you will also need to set **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431). *Large* in this context means that the data cannot be sent as a single packet by the transport (for example, data larger than 63K when using UDP/IP).

The setting of this policy has a dependency on the setting of the **RESOURCE_LIMITS** (p. 437) policy. In case the reliability kind is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) the write operation on the **DDSDataWriter** (p. 1305) may block if the modification would cause data to be lost or else cause one of the limits in specified in the **RESOURCE_↵LIMITS** (p. 437) to be exceeded. Under these circumstances, the **RELIABILITY** (p. 433) `max_blocking_time` configures the maximum duration the write operation may block.

If the **DDS_ReliabilityQosPolicy::kind** (p. 1029) is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435), data samples originating from a single **DDSDataWriter** (p. 1305) cannot be made available to the **DDSDataReader** (p. 1272) if there are previous data samples that have not been received yet due to a communication error. In other words, RTI Connext will repair the error and resend data samples as needed in order to reconstruct a correct snapshot of the **DDSDataWriter** (p. 1305) history before it is accessible by the **DDSDataReader** (p. 1272).

If the **DDS_ReliabilityQosPolicy::kind** (p. 1029) is set to **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435), the service will not re-transmit missing data samples. However, for data samples originating from any one **DataWriter** the service will ensure they are stored in the **DDSDataReader** (p. 1272) history in the same order they originated in the **DDSDataWriter** (p. 1305). In other words, the **DDSDataReader** (p. 1272) may miss some data samples, but it will never see the value of a data object change from a newer value to an older value.

See also

DDS_HistoryQosPolicy (p. 906)

DDS_ResourceLimitsQosPolicy (p. 1038)

9.155.3 Compatibility

The value offered is considered compatible with the value requested if and only if:

- the inequality *offered kind* \geq *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS_ReliabilityQosPolicy::kind** (p. 1029) are considered ordered such that **DDS_BEST_EFFORT** \leftarrow **_RELIABILITY_QOS** (p. 435) $<$ **DDS_RELIABLE_RELIABILITY_QOS** (p. 435).
- The offered acknowledgment_kind = **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 435) and requested acknowledgment_kind = **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 435) OR offered acknowledgment_kind \neq **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 435).
- the inequality *offered instance_state_consistency_kind* \geq *requested instance_state* \leftarrow *_consistency_kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS** \leftarrow **ReliabilityQosPolicy::instance_state_consistency_kind** (p. 1030) are considered ordered such that **DDS** \leftarrow **_NO_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 436) $<$ **DDS_RECOVER_INSTANCE_STATE** \leftarrow **CONSISTENCY** (p. 436).

9.155.4 Member Data Documentation

9.155.4.1 kind

DDS_ReliabilityQosPolicyKind DDS_ReliabilityQosPolicy::kind

Kind of reliability.

[default] **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435) for **DDSDataReader** (p. 1272) and **DDSTopic** (p. 1601), **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) for **DDSDataWriter** (p. 1305)

9.155.4.2 max_blocking_time

struct **DDS_Duration_t** DDS_ReliabilityQosPolicy::max_blocking_time

The maximum time a writer may block on a write() call.

This setting applies only to the case where **DDS_ReliabilityQosPolicy::kind** (p. 1029) = **DDS_RELIABLE** \leftarrow **RELIABILITY_QOS** (p. 435). **FooDataWriter::write** (p. 1666) is allowed to block if the **DDSDataWriter** (p. 1305) does not have space to store the value written. Only applies to **DDSDataWriter** (p. 1305).

[default] 100 milliseconds

[range] [0,1 year] or **DDS_DURATION_INFINITE** (p. 325)

See also

DDS_ResourceLimitsQosPolicy (p. 1038)

9.155.4.3 acknowledgment_kind

DDS_ReliabilityQosPolicyAcknowledgmentModeKind DDS_ReliabilityQosPolicy::acknowledgment_kind

<<**extension**>> (p. 236) Kind of reliable acknowledgment

This setting applies only to the case where **DDS_ReliabilityQosPolicy::kind** (p. 1029) = **DDS_RELIABLE_↵**
RELIABILITY_QOS (p. 435).

Sets the kind acknowledgments supported by a **DDSDataWriter** (p. 1305) and sent by **DDSDataReader** (p. 1272).

[default] **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 435)

9.155.4.4 instance_state_consistency_kind

DDS_InstanceStateConsistencyKind DDS_ReliabilityQosPolicy::instance_state_consistency_kind

<<**extension**>> (p. 236) Whether instance state consistency is enabled

A DataReader that determines that the DataWriter is no longer alive will transition instances to NOT_ALIVE_NO_↵
WRITERS if there are no other DataWriters updating that instance. If the DataReader rediscovers the DataWriter, the
DataReader does not automatically transition instances back to the state they were in prior to the disconnection until it
gets updates (i.e., samples) for them.

If InstanceStateConsistencyKind is set to RECOVER_INSTANCE_STATE_CONSISTENCY, then when
the DataReader rediscovers a DataWriter, the DataReader will query the DataWriter for the state of its instances, and
restore the instances to their correct state.

[default] **DDS_NO_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 436) for **DDSDataReader** (p. 1272), **DDS_↵**
RECOVER_INSTANCE_STATE_CONSISTENCY (p. 436) for **DDSDataWriter** (p. 1305)

9.156 DDS_ReliableReaderActivityChangedStatus Struct Reference

<<**extension**>> (p. 236) Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched
to a reliable writer.

Public Attributes

- **DDS_Long active_count**
The current number of reliable readers currently matched with this reliable writer.
- **DDS_Long inactive_count**
*The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledge-
ments in a timely fashion.*
- **DDS_Long active_count_change**
The most recent change in the number of active remote reliable readers.
- **DDS_Long inactive_count_change**
The most recent change in the number of inactive remote reliable readers.
- **DDS_InstanceHandle_t last_instance_handle**
The instance handle of the last reliable remote reader to be determined inactive.

9.156.1 Detailed Description

<<**extension**>> (p. 236) Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer.

Entity:

DDSDataWriter (p. 1305)

Listener:

DDSDataWriterListener (p. 1328)

This status is the reciprocal status to the **DDS_LivelinessChangedStatus** (p. 919) on the reader. It is different than the **DDS_LivelinessLostStatus** (p. 921) on the writer in that the latter informs the writer about its own liveliness; this status informs the writer about the "liveliness" (activity) of its matched readers.

All counts in this status will remain at zero for best effort writers.

9.156.2 Member Data Documentation

9.156.2.1 active_count

DDS_Long DDS_ReliableReaderActivityChangedStatus::active_count

The current number of reliable readers currently matched with this reliable writer.

9.156.2.2 inactive_count

DDS_Long DDS_ReliableReaderActivityChangedStatus::inactive_count

The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.

A reader is considered to be inactive after is has been sent heartbeats **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1052) times, each heartbeat having been separated from the previous by the current heartbeat period.

9.156.2.3 active_count_change

`DDS_Long DDS_ReliableReaderActivityChangedStatus::active_count_change`

The most recent change in the number of active remote reliable readers.

9.156.2.4 inactive_count_change

`DDS_Long DDS_ReliableReaderActivityChangedStatus::inactive_count_change`

The most recent change in the number of inactive remote reliable readers.

9.156.2.5 last_instance_handle

`DDS_InstanceHandle_t DDS_ReliableReaderActivityChangedStatus::last_instance_handle`

The instance handle of the last reliable remote reader to be determined inactive.

9.157 DDS_ReliableWriterCacheChangedStatus Struct Reference

<<*extension*>> (p. 236) A summary of the state of a data writer's cache of unacknowledged samples written.

Public Attributes

- struct **DDS_ReliableWriterCacheEventCount empty_reliable_writer_cache**
The number of times the reliable writer's cache of unacknowledged samples has become empty.
- struct **DDS_ReliableWriterCacheEventCount full_reliable_writer_cache**
The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.
- struct **DDS_ReliableWriterCacheEventCount low_watermark_reliable_writer_cache**
The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.
- struct **DDS_ReliableWriterCacheEventCount high_watermark_reliable_writer_cache**
The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.
- **DDS_Long unacknowledged_sample_count**
The current number of unacknowledged samples in the writer's cache.
- **DDS_Long unacknowledged_sample_count_peak**
The highest value that unacknowledged_sample_count has reached until now.
- **DDS_LongLong replaced_unacknowledged_sample_count**
The number of unacknowledged samples that have been replaced in the writer's cache.

9.157.1 Detailed Description

<<**extension**>> (p. 236) A summary of the state of a data writer's cache of unacknowledged samples written.

Entity:

DDSDataWriter (p. 1305)

Listener:

DDSDataWriterListener (p. 1328)

A written sample is unacknowledged (and therefore accounted for in this status) if the writer is reliable and one or more readers matched with the writer has not yet sent an acknowledgement to the writer declaring that it has received the sample.

If the low watermark is zero and the unacknowledged sample count decreases to zero, both the low watermark and cache empty events are considered to have taken place. A single callback will be dispatched (assuming the user has requested one) that contains both status changes. The same logic applies when the high watermark is set equal to the maximum number of samples and the cache becomes full.

9.157.2 Member Data Documentation

9.157.2.1 empty_reliable_writer_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::empty_reliable_↔
writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has become empty.

9.157.2.2 full_reliable_writer_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::full_reliable_↔
writer_cache
```

The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.

Applies to writer's cache when the send window is enabled (when both **DDS_RtpsReliableWriterProtocol_t::min_↔_send_window_size** (p. 1058) and **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1059) are not **DDS_LENGTH_UNLIMITED** (p. 437)).

Otherwise, applies when the number of unacknowledged samples has reached the send window limit.

9.157.2.3 low_watermark_reliable_writer_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::low_watermark_↔  
reliable_writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

A low watermark event will only be considered to have taken place when the number of unacknowledged samples in the writer's cache *decreases* to this value. A sample count that increases to this value will not result in a callback or in a change to the total count of low watermark events.

When the writer's send window is enabled, the low watermark is scaled down, if necessary, to fit within the current send window.

9.157.2.4 high_watermark_reliable_writer_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::high_watermark_↔  
reliable_writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

A high watermark event will only be considered to have taken place when the number of unacknowledged sampled *increases* to this value. A sample count that was above this value and then decreases back to it will not trigger an event.

When the writer's send window is enabled, the high watermark is scaled down, if necessary, to fit within the current send window.

9.157.2.5 unacknowledged_sample_count

```
DDS_Long DDS_ReliableWriterCacheChangedStatus::unacknowledged_sample_count
```

The current number of unacknowledged samples in the writer's cache.

A sample is considered unacknowledged if the writer has failed to receive an acknowledgement from one or more reliable readers matched to it.

9.157.2.6 unacknowledged_sample_count_peak

```
DDS_Long DDS_ReliableWriterCacheChangedStatus::unacknowledged_sample_count_peak
```

The highest value that `unacknowledged_sample_count` has reached until now.

9.157.2.7 replaced_unacknowledged_sample_count

DDS_LongLong DDS_ReliableWriterCacheChangedStatus::replaced_unacknowledged_sample_count

The number of unacknowledged samples that have been replaced in the writer's cache.

Total number of unacknowledged samples that have been replaced by a DataWriter after applying **DDS_KEEP_LAST**↔**_HISTORY_QOS** (p. 406) policy.

9.158 DDS_ReliableWriterCacheEventCount Struct Reference

<<**extension**>> (p. 236) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

Public Attributes

- **DDS_Long total_count**
The total number of times the event has occurred.
- **DDS_Long total_count_change**
The incremental number of times the event has occurred since the listener was last invoked or the status read.

9.158.1 Detailed Description

<<**extension**>> (p. 236) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

The threshold interpretation depends on the usage of this data type in **DDS_ReliableWriterCacheChangedStatus** (p. 1032).

9.158.2.2 total_count_change

`DDS_Long DDS_ReliableWriterCacheEventCount::total_count_change`

The incremental number of times the event has occurred since the listener was last invoked or the status read.

9.159 DDS_RequestedDeadlineMissedStatus Struct Reference

DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 343)

Public Attributes

- **DDS_Long total_count**
*Total cumulative count of the deadlines detected for any instance read by the **DDSDDataReader** (p. 1272).*
- **DDS_Long total_count_change**
The incremental number of deadlines detected since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_instance_handle**
*Handle to the last instance in the **DDSDDataReader** (p. 1272) for which a deadline was detected.*

9.159.1 Detailed Description

DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 343)

9.159.2 Member Data Documentation

9.159.2.1 total_count

`DDS_Long DDS_RequestedDeadlineMissedStatus::total_count`

Total cumulative count of the deadlines detected for any instance read by the **DDSDDataReader** (p. 1272).

9.159.2.2 total_count_change

`DDS_Long DDS_RequestedDeadlineMissedStatus::total_count_change`

The incremental number of deadlines detected since the last time the listener was called or the status was read.

9.159.2.3 last_instance_handle

`DDS_InstanceHandle_t DDS_RequestedDeadlineMissedStatus::last_instance_handle`

Handle to the last instance in the **DDSDataReader** (p. 1272) for which a deadline was detected.

9.160 DDS_RequestedIncompatibleQosStatus Struct Reference

DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 343)

Public Attributes

- **DDS_Long total_count**

*Total cumulative count of how many times the concerned **DDSDataReader** (p. 1272) discovered a **DDSDataWriter** (p. 1305) for the same **DDSTopic** (p. 1601) with an offered QoS that is incompatible with that requested by the **DDSDataReader** (p. 1272).*

- **DDS_Long total_count_change**

The change in `total_count` since the last time the listener was called or the status was read.

- **DDS_QosPolicyId_t last_policy_id**

*The **DDS_QosPolicyId_t** (p. 359) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*

- struct **DDS_QosPolicyCountSeq policies**

*A list containing, for each policy, the total number of times that the concerned **DDSDataReader** (p. 1272) discovered a **DDSDataWriter** (p. 1305) for the same **DDSTopic** (p. 1601) with an offered QoS that is incompatible with that requested by the **DDSDataReader** (p. 1272).*

9.160.2.4 policies

struct DDS_QosPolicyCountSeq DDS_RequestedIncompatibleQosStatus::policies

A list containing, for each policy, the total number of times that the concerned **DDSDataReader** (p. 1272) discovered a **DDSDataWriter** (p. 1305) for the same **DDSTopic** (p. 1601) with an offered QoS that is incompatible with that requested by the **DDSDataReader** (p. 1272).

9.161 DDS_ResourceLimitsQosPolicy Struct Reference

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Public Attributes

- **DDS_Long max_samples**

*Represents the maximum samples the middleware can store for any one **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)).*

- **DDS_Long max_instances**

*Represents the maximum number of instances a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) can manage.*

- **DDS_Long max_samples_per_instance**

*Represents the maximum number of samples of any one instance a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) can manage.*

- **DDS_Long initial_samples**

*<<extension>> (p. 236) Represents the initial samples the middleware will store for any one **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)).*

- **DDS_Long initial_instances**

*<<extension>> (p. 236) Represents the initial number of instances a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) will manage.*

- **DDS_Long instance_hash_buckets**

<<extension>> (p. 236) Number of hash buckets for instances.

9.161.1 Detailed Description

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_SAMPLE_REJECTED_STATUS (p. 344), **DDS_SampleRejectedStatus** (p. 1080)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = UNTIL ENABLE (p. ??)

9.161.2 Usage

This policy controls the resources that RTI Connext can use to meet the requirements imposed by the application and other QoS settings.

For the reliability protocol (and **DDS_DurabilityQosPolicy** (p. 761)), this QoS policy determines the actual maximum queue size when the **DDS_HistoryQosPolicy** (p. 906) is set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 406).

In general, this QoS policy is used to limit the amount of system memory that RTI Connext can allocate. For embedded real-time systems and safety-critical systems, pre-determination of maximum memory usage is often required. In addition, dynamic memory allocation could introduce non-deterministic latencies in time-critical paths.

This QoS policy can be set such that an entity does not dynamically allocate any more memory after its initialization phase.

If **DDSDataWriter** (p. 1305) objects are communicating samples faster than they are ultimately taken by the **DDSDataReader** (p. 1272) objects, the middleware will eventually hit against some of the QoS-imposed resource limits. Note that this may occur when just a single **DDSDataReader** (p. 1272) cannot keep up with its corresponding **DDSDataWriter** (p. 1305). The behavior in this case depends on the setting for the **RELIABILITY** (p. 433). If reliability is **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435), then RTI Connext is allowed to drop samples. If the reliability is **DDS_RELIABLE_RELIABILITY_QOS** (p. 435), RTI Connext will block the **DDSDataWriter** (p. 1305) or discard the sample at the **DDSDataReader** (p. 1272) in order not to lose existing samples.

The constant **DDS_LENGTH_UNLIMITED** (p. 437) may be used to indicate the absence of a particular limit. For example setting **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041) to **DDS_LENGTH_UNLIMITED** (p. 437) will cause RTI Connext not to enforce this particular limit.

If these resource limits are not set sufficiently, under certain circumstances the **DDSDataWriter** (p. 1305) may block on a write() call even though the **DDS_HistoryQosPolicy** (p. 906) is **DDS_KEEP_LAST_HISTORY_QOS** (p. 406). To guarantee the writer does not block for **DDS_KEEP_LAST_HISTORY_QOS** (p. 406), make sure the resource limits are set such that:

```
max_samples >= max_instances * max_samples_per_instance
```

See also

DDS_ReliabilityQosPolicy (p. 1027)

DDS_HistoryQosPolicy (p. 906)

9.161.3 Consistency

The setting of **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) must be consistent with **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041). For these two values to be consistent, it must be true that **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) \geq **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041). As described above, this limit will not be enforced if **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041) is set to **DDS_LENGTH_UNLIMITED** (p. 437).

The setting of **RESOURCE_LIMITS** (p. 437) **max_samples_per_instance** must be consistent with the **HISTORY** (p. 404) **depth**. For these two QoS to be consistent, it must be true that $depth \leq max_samples_per_instance$.

See also

DDS_HistoryQosPolicy (p. 906)

9.161.4 Member Data Documentation

9.161.4.1 max_samples

DDS_Long DDS_ResourceLimitsQosPolicy::max_samples

Represents the maximum samples the middleware can store for any one **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)).

Specifies the maximum number of data samples a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) can manage across all the instances associated with it.

For unkeyed types, this value has to be equal to max_samples_per_instance if max_samples_per_instance is not equal to **DDS_LENGTH_UNLIMITED** (p. 437).

When batching is enabled, the maximum number of data samples a **DDSDataWriter** (p. 1305) can manage will also be limited by **DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 694).

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 437), \geq initial_samples, \geq max_samples_per_instance, \geq **DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_remote_writer** (p. 651) or \geq **DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples** (p. 1053)

For **DDS_DataWriterQos** (p. 683) max_samples \geq **DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples** (p. 1053) in **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671) if batching is disabled.

9.161.4.2 max_instances

DDS_Long DDS_ResourceLimitsQosPolicy::max_instances

Represents the maximum number of instances a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) can manage.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437), \geq initial_instances

9.161.4.3 max_samples_per_instance

DDS_Long DDS_ResourceLimitsQosPolicy::max_samples_per_instance

Represents the maximum number of samples of any one instance a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) can manage.

While an unkeyed type is logically considered as a single instance, for unkeyed types this value has to be equal to max_samples or **DDS_LENGTH_UNLIMITED** (p. 437).

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 437), \leq max_samples or **DDS_LENGTH_UNLIMITED** (p. 437), \geq **DDS_HistoryQosPolicy::depth** (p. 908)

9.161.4.4 initial_samples

DDS_Long DDS_ResourceLimitsQosPolicy::initial_samples

<<**extension**>> (p. 236) Represents the initial samples the middleware will store for any one **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)).

Specifies the initial number of data samples a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) will manage across all the instances associated with it.

[default] 32

[range] [1,100 million], <= max_samples

9.161.4.5 initial_instances

DDS_Long DDS_ResourceLimitsQosPolicy::initial_instances

<<**extension**>> (p. 236) Represents the initial number of instances a **DDSDataWriter** (p. 1305) (or **DDSDataReader** (p. 1272)) will manage.

[default] 32

[range] [1,1 million], <= max_instances

9.161.4.6 instance_hash_buckets

DDS_Long DDS_ResourceLimitsQosPolicy::instance_hash_buckets

<<**extension**>> (p. 236) Number of hash buckets for instances.

The instance hash table facilitates instance lookup. A higher number of buckets decreases instance lookup time but increases the memory usage.

[default] 1 **[range]** [1,1 million]

9.162 DDS_RTPS_EntityId_t Struct Reference

From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.

9.162.1 Detailed Description

From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

9.163 DDS_RTPS_GUID_t Struct Reference

From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.

9.163.1 Detailed Description

From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

9.164 DDS_RtpsReliableReaderProtocol_t Struct Reference

Qos related to reliable reader protocol defined in RTPS.

Public Attributes

- struct **DDS_Duration_t min_heartbeat_response_delay**
The minimum delay to respond to a heartbeat.
- struct **DDS_Duration_t max_heartbeat_response_delay**
The maximum delay to respond to a heartbeat.
- struct **DDS_Duration_t heartbeat_suppression_duration**
The duration a reader ignores consecutively received heartbeats.
- struct **DDS_Duration_t nack_period**
The period at which to send NACKs.
- **DDS_Long receive_window_size**
The number of received out-of-order samples a reader can keep at a time.
- struct **DDS_Duration_t round_trip_time**
The duration from sending a NACK to receiving a repair of a sample.
- struct **DDS_Duration_t app_ack_period**
The period at which application-level acknowledgment messages are sent.
- struct **DDS_Duration_t min_app_ack_response_keep_duration**
Minimum duration for which application-level acknowledgment response data is kept.
- **DDS_Long samples_per_app_ack**
The minimum number of samples acknowledged by one application-level acknowledgment message.

9.164.1 Detailed Description

Qos related to reliable reader protocol defined in RTPS.

It is used to config reliable reader according to RTPS protocol.

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

QoS:

DDS_DataReaderProtocolQosPolicy (p. 624) **DDS_DiscoveryConfigQosPolicy** (p. 706)

9.164.2 Member Data Documentation

9.164.2.1 min_heartbeat_response_delay

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::min_heartbeat_response_delay
```

The minimum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0, 1 year], <= max_heartbeat_response_delay

9.164.2.2 max_heartbeat_response_delay

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::max_heartbeat_response_delay
```

The maximum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of maximum delay.

[default] The default value depends on the container policy:

- For **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 627): 0.5 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_reader** (p. 712): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_reader** (p. 712): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_reader** (p. 715): 0 seconds

[range] [0, 1 year], >= min_heartbeat_response_delay

9.164.2.3 heartbeat_suppression_duration

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::heartbeat_suppression_duration
```

The duration a reader ignores consecutively received heartbeats.

When a reliable reader receives consecutive heartbeats within a short duration that will trigger redundant NACKs, the reader may ignore the latter heartbeat(s). This sets the duration during which additionally received heartbeats are suppressed.

[default] 0.0625 seconds

[range] [0, 1 year],

9.164.2.4 nack_period

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::nack_period
```

The period at which to send NACKs.

A reliable reader will send periodic NACKs at this rate when it first matches with a reliable writer. The reader will stop sending NACKs when it has received all available historical data from the writer.

[default] 5 seconds

[range] [1 nanosec, 1 year]

9.164.2.5 receive_window_size

```
DDS_Long DDS_RtpsReliableReaderProtocol_t::receive_window_size
```

The number of received out-of-order samples a reader can keep at a time.

A reliable reader stores the out-of-order samples it receives until it can present them to the application in-order. The receive window is the maximum number of out-of-order samples that a reliable reader keeps at a given time. When the receive window is full, subsequently received out-of-order samples are dropped.

[default] 256

[range] [≥ 1]

9.164.2.6 round_trip_time

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::round_trip_time
```

The duration from sending a NACK to receiving a repair of a sample.

This round-trip time is an estimate of the time starting from when the reader sends a NACK for a specific sample to when it receives that sample. For each sample, the reader will not send a subsequent NACK for it until the round-trip time has passed, thus preventing inefficient redundant requests.

[default] 0 seconds

[range] [0 nanosec, 1 year]

9.164.2.7 app_ack_period

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::app_ack_period
```

The period at which application-level acknowledgment messages are sent.

A **DDSDataReader** (p. 1272) sends application-level acknowledgment messages to a **DDSDataWriter** (p. 1305) at this periodic rate, and will continue sending until it receives a message from the **DDSDataWriter** (p. 1305) that it has received and processed the acknowledgment and an AppAckConfirmation has been received by the **DDSDataReader** (p. 1272). Note: application-level acknowledgment messages can also be sent non-periodically, as determined by **DDS_RtpsReliableReaderProtocol_t::samples_per_app_ack** (p. 1046).

[default] 5 seconds

[range] [1 nanosec, 1 year]

9.164.2.8 min_app_ack_response_keep_duration

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::min_app_ack_response_keep_duration
```

Minimum duration for which application-level acknowledgment response data is kept.

The user-specified response data of an explicit application-level acknowledgment (called by **DDSDataReader::acknowledge_sample** (p. 1280) or **DDSDataReader::acknowledge_all** (p. 1281)) is cached by the **DDSDataReader** (p. 1272) for the purpose of reliably resending the data with the acknowledgment message. After this duration has passed from the time of the first acknowledgment, the response data is dropped from the cache and will not be resent with future acknowledgments for the corresponding sample(s).

[default] 0 sec

[range] [0 sec, 1 year]

9.164.2.9 samples_per_app_ack

DDS_Long DDS_RtpsReliableReaderProtocol_t::samples_per_app_ack

The minimum number of samples acknowledged by one application-level acknowledgment message.

This setting applies only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) = **DDS_APPLICATION_←
_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436) or **DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 435)

A **DDSDataReader** (p. 1272) will immediately send an application-level acknowledgment message when it has at least this many samples that have been acknowledged. It will not send an acknowledgment message until it has at least this many samples pending acknowledgment.

For example, calling **DDSDataReader::acknowledge_sample** (p. 1280) this many times consecutively will trigger the sending of an acknowledgment message. Calling **DDSDataReader::acknowledge_all** (p. 1281) may trigger the sending of an acknowledgment message, if at least this many samples are being acknowledged at once.

This is independent of the **DDS_RtpsReliableReaderProtocol_t::app_ack_period** (p. 1046), where a **DDSData←
Reader** (p. 1272) will send acknowledgement messages at the periodic rate regardless.

When this is set to **DDS_LENGTH_UNLIMITED** (p. 437), then acknowledgement messages are sent only periodically, at the rate set by **DDS_RtpsReliableReaderProtocol_t::app_ack_period** (p. 1046).

[default] 1

[range] [1, 1000000], or **DDS_LENGTH_UNLIMITED** (p. 437)

9.165 DDS_RtpsReliableWriterProtocol_t Struct Reference

QoS related to the reliable writer protocol defined in RTPS.

Public Attributes

- **DDS_Long low_watermark**

*When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 348) is considered to have changed.*

- **DDS_Long high_watermark**

*When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 348) is considered to have changed.*

- struct **DDS_Duration_t heartbeat_period**

The period at which to send heartbeats.

- struct **DDS_Duration_t fast_heartbeat_period**

An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

- struct **DDS_Duration_t late_joiner_heartbeat_period**

An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

- struct **DDS_Duration_t virtual_heartbeat_period**

The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

- **DDS_Long samples_per_virtual_heartbeat**

The number of samples that a reliable writer has to publish before sending a virtual heartbeat.

- **DDS_Long max_heartbeat_retries**

The maximum number of periodic heartbeat retries before marking a remote reader as inactive.

- **DDS_Boolean inactivate_nonprogressing_readers**

Whether to treat remote readers as inactive when their NACKs do not progress.

- **DDS_Long heartbeats_per_max_samples**

The number of piggyback heartbeats sent per max send window.

- struct **DDS_Duration_t min_nack_response_delay**

The minimum delay to respond to a NACK.

- struct **DDS_Duration_t max_nack_response_delay**

The maximum delay to respond to a nack.

- struct **DDS_Duration_t nack_suppression_duration**

The duration for ignoring consecutive NACKs that may trigger redundant repairs.

- **DDS_Long max_bytes_per_nack_response**

The maximum total message size when resending rejected samples.

- struct **DDS_Duration_t disable_positive_acks_min_sample_keep_duration**

The minimum duration a sample is queued for ACK-disabled readers.

- struct **DDS_Duration_t disable_positive_acks_max_sample_keep_duration**

The maximum duration a sample is queued for ACK-disabled readers.

- **DDS_Boolean disable_positive_acks_enable_adaptive_sample_keep_duration**

Enables dynamic adjustment of sample keep duration in response to congestion.

- **DDS_Long disable_positive_acks_decrease_sample_keep_duration_factor**

Controls rate of contraction of dynamic sample keep duration.

- **DDS_Long disable_positive_acks_increase_sample_keep_duration_factor**

Controls rate of growth of dynamic sample keep duration.

- **DDS_Long min_send_window_size**

Minimum size of send window of unacknowledged samples.

- **DDS_Long max_send_window_size**

Maximum size of send window of unacknowledged samples.

- struct **DDS_Duration_t send_window_update_period**

Period in which send window may be dynamically changed.

- **DDS_Long send_window_increase_factor**

Increases send window size by this percentage when reacting dynamically to network conditions.

- **DDS_Long send_window_decrease_factor**

Decreases send window size by this percentage when reacting dynamically to network conditions.

- **DDS_Boolean enable_multicast_periodic_heartbeat**

Whether periodic heartbeat messages are sent over multicast.

- **DDS_Long multicast_resend_threshold**

The minimum number of requesting readers needed to trigger a multicast resend.

- **DDS_Boolean disable_repair_piggyback_heartbeat**

Prevents piggyback heartbeats from being sent with repair samples.

9.165.1 Detailed Description

QoS related to the reliable writer protocol defined in RTPS.

It is used to configure a reliable writer according to RTPS protocol.

The reliability protocol settings are applied to batches instead of individual data samples when batching is enabled.

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

QoS:

DDS_DataWriterProtocolQosPolicy (p. 667) **DDS_DiscoveryConfigQosPolicy** (p. 706)

9.165.2 Member Data Documentation

9.165.2.1 low_watermark

DDS_Long DDS_RtpsReliableWriterProtocol_t::low_watermark

When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 348) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be greater than or equal to zero and strictly less than high_watermark.

The high and low watermarks are used for switching between the regular and fast heartbeat rates (**DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1050) and **DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period** (p. 1050), respectively). When the number of unacknowledged samples in the queue of a reliable **DDSDataWriter** (p. 1305) meets or exceeds high_watermark, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 348) is changed, and the DataWriter will start heartbeating at **DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period** (p. 1050). When the number of samples meets or falls below low_watermark, **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 348) is changed, and the heartbeat rate will return to the "normal" rate (**DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1050)).

[default] 0

[range] [0, 100 million], < high_watermark

9.165.2.2 high_watermark

DDS_Long DDS_RtpsReliableWriterProtocol_t::high_watermark

When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS** (p. 348) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be strictly greater than low_watermark and less than or equal to a maximum that depends on the container QoS policy:

In **DDS_DomainParticipantQos::discovery_config** (p. 739):

For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713)

high_watermark ≤ **DDS_AllocationSettings_t::max_count** (p. 583) in **DDS_DomainParticipantResourceLimitsQosPolicy::local_writer_allocation** (p. 744)

For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714)

high_watermark ≤ **DDS_AllocationSettings_t::max_count** (p. 583) in **DDS_DomainParticipantResourceLimitsQosPolicy::local_reader_allocation** (p. 744)

In **DDS_DataWriterQos::protocol** (p. 689):

For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671),

high_watermark ≤ **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) if batching is disabled. Otherwise, high_watermark ≤ **DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 694) high_watermark ≤ **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1059)

[default] 1

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 437), > low_watermark ≤ *maximum* which depends on the container policy

9.165.2.3 heartbeat_period

struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::heartbeat_period

The period at which to send heartbeats.

A reliable writer will send periodic heartbeats at this rate.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): 1.0 seconds

[range] [1 nanosec, 1 year], ≥ **DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period** (p. 1050), ≥ **DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period** (p. 1051)

9.165.2.4 fast_heartbeat_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period
```

An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

This heartbeat period will be used when the number of unacknowledged samples in the cache of a reliable writer meets or exceeds the writer's high watermark and has not subsequently dropped to the low watermark. The normal period will be used at all other times.

This period must not be slower (i.e. must be of the same or shorter duration) than the normal heartbeat period.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): 1.0 seconds

[range] [1 nanosec,1 year], <= **DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1050)

9.165.2.5 late_joiner_heartbeat_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period
```

An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

This heartbeat period will be used when a reliable reader joins after a reliable writer with non-volatile durability has begun publishing samples. Once the reliable reader has received all cached samples, it will be serviced at the same rate as other reliable readers.

This period must not be slower (i.e., must be of the same or shorter duration) than the normal heartbeat period.

A reliable writer will use whichever heartbeat period is faster, the current heartbeat period being used for other reliable readers or the **DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period** (p. 1051), to service the late joining reader. This means that if the **DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period** (p. 1050) is currently being used and is faster than the **late_joiner_heartbeat_period**, then the **fast_heartbeat_period** will continue to be used for the late joiner as well.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): 3.0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): 1.0 seconds

[range] [1 nanosec, 1 year], \leq **DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1050)

9.165.2.6 virtual_heartbeat_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::virtual_heartbeat_period
```

The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

A reliable writer will send periodic virtual heartbeats at this rate.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): **DDS_DURATION_AUTO** (p. 326). If **DDS_PresentationQosPolicy::access_scope** (p. 987) is set to **DDS_GROUP_PRESENTATION_QOS** (p. 418) on the DataWriter, this value is set to **DDS_RtpsReliableWriterProtocol_t::heartbeat_period** (p. 1050). Otherwise, the value is set to **DDS_DURATION_INFINITE** (p. 325).
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): **DDS_DURATION_INFINITE** (p. 325)
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): **DDS_DURATION_INFINITE** (p. 325)
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): **DDS_DURATION_INFINITE** (p. 325)

[range] > 1 nanosec, **DDS_DURATION_INFINITE** (p. 325), or **DDS_DURATION_AUTO** (p. 326)

9.165.2.7 samples_per_virtual_heartbeat

```
DDS_Long DDS_RtpsReliableWriterProtocol_t::samples_per_virtual_heartbeat
```

The number of samples that a reliable writer has to publish before sending a virtual heartbeat.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1000000], **DDS_LENGTH_UNLIMITED** (p. 437)

9.165.2.8 max_heartbeat_retries

DDS_Long DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries

The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.

When a remote reader has not acked all the samples the reliable writer has in its queue, and max_heartbeat_retries number of periodic heartbeats has been sent without receiving any ack/nack back, the remote reader will be marked as inactive (not alive) and be ignored until it resumes sending ack/nack.

Note that piggyback heartbeats do NOT count towards this value.

[default] 10

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437)

9.165.2.9 inactivate_nonprogressing_readers

DDS_Boolean DDS_RtpsReliableWriterProtocol_t::inactivate_nonprogressing_readers

Whether to treat remote readers as inactive when their NACKs do not progress.

Nominally, a remote reader is marked inactive when a successive number of periodic heartbeats equal or greater than **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1052) have been sent without receiving any ack/nacks back.

By setting this **DDS_BOOLEAN_TRUE** (p. 316), it changes the conditions of inactivating a remote reader: a reader will be considered inactive when it either does not send any ack/nacks or keeps sending non-progressing nacks for **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1052) number of heartbeat periods, where a non-progressing nack is one whose oldest sample requested has not advanced from the oldest sample requested of the previous nack.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.165.2.10 heartbeats_per_max_samples

DDS_Long DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples

The number of piggyback heartbeats sent per max send window.

When a DataWriter is configured with a fixed send window size (**DDS_RtpsReliableWriterProtocol_t::min_send_window_size** (p. 1058) is equal to effective max_send_window_size), a piggyback heartbeat is sent every [(effective max send window size/heartbeats_per_max_samples)] number of samples written.

Otherwise, the number of piggyback heartbeats sent is scaled according to the current size of the send window. For example, consider a **DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples** (p. 1053) of 50. If the current send window size is 100, a piggyback heartbeat will be sent every 2 samples. If the send window size grows to 150, a piggyback heartbeat will be sent every 3 samples, and so on. Additionally, when the send window size grows, a piggyback heartbeat is sent with the next sample. (If it weren't, the sending of that heartbeat could be delayed, since the heartbeat rate scales with the increasing window size.)

The effective max send window is calculated as follows:

Without batching:

`min (DDS_ResourceLimitsQosPolicy::max_samples (p. 1041), DDS_RtpsReliableWriterProtocol_t::max_send_↵
_window_size (p. 1059))`

With batching:

`min (DDS_DataWriterResourceLimitsQosPolicy::max_batches (p. 694), DDS_RtpsReliableWriterProtocol_t↵
::max_send_window_size (p. 1059))`

If `heartbeats_per_max_samples` is set to zero, no piggyback heartbeats will be sent.

If current send window size is `DDS_LENGTH_UNLIMITED` (p. 437), 100 million is assumed as the effective max send window.

[default] The default value depends on the container policy:

- For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 671): 8
- For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 713): 8
- For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 714): 8
- For `DDS_DiscoveryConfigQosPolicy::participant_message_writer` (p. 716): 1

[range] [0, 100 million]

- For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 713):
`heartbeats_per_max_samples` ≤ `DDS_AllocationSettings_t::max_count` (p. 583) in `DDS_Domain↵
ParticipantResourceLimitsQosPolicy::local_writer_allocation` (p. 744)
- For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 714):
`heartbeats_per_max_samples` ≤ `DDS_AllocationSettings_t::max_count` (p. 583) in `DDS_Domain↵
ParticipantResourceLimitsQosPolicy::local_reader_allocation` (p. 744)
- For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 671):

`heartbeats_per_max_samples` ≤ `DDS_ResourceLimitsQosPolicy::max_samples` (p. 1041) if batching is disabled.
Otherwise:

`heartbeats_per_max_samples` ≤ `DDS_DataWriterResourceLimitsQosPolicy::max_batches` (p. 694)

`heartbeats_per_max_samples` ≤ `DDS_RtpsReliableWriterProtocol_t::max_send_window_size` (p. 1059)

9.165.2.11 min_nack_response_delay

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::min_nack_response_delay
```

The minimum delay to respond to a NACK.

When a reliable writer receives a NACK from a remote reader, the writer can choose to delay a while before it sends repair samples or a heartbeat. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0,1 day], <= max_nack_response_delay

9.165.2.12 max_nack_response_delay

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::max_nack_response_delay
```

The maximum delay to respond to a nack.

This set the value of maximum delay between receiving a NACK and sending repair samples or a heartbeat.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): 0.2 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): 0 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): 0 seconds

[range] [0,1 day], >= min_nack_response_delay

9.165.2.13 nack_suppression_duration

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::nack_suppression_duration
```

The duration for ignoring consecutive NACKs that may trigger redundant repairs.

A reliable writer may receive consecutive NACKs within a short duration from a remote reader that will trigger the sending of redundant repair messages.

This specifies the duration during which consecutive NACKs are ignored to prevent redundant repairs from being sent.

[default] 0 seconds

[range] [0,1 day],

9.165.2.14 max_bytes_per_nack_response

DDS_Long DDS_RtpsReliableWriterProtocol_t::max_bytes_per_nack_response

The maximum total message size when resending rejected samples.

As part of the reliable communication protocol, data writers send heartbeat (HB) messages to their data readers. Each HB message contains the sequence number of the most recent sample sent by the data writer.

In response, a data reader sends an acknowledgement (ACK) message, indicating what sequence numbers it did not receive, if any. If the data reader is missing some samples, the data writer will send them again.

max_bytes_per_nack_response determines the maximum size of the message sent by the data writer in response to an ACK. This message may contain multiple samples. The data writer will always send at least one message, even if the size of that message exceeds the max_bytes_per_nack_response value.

If max_bytes_per_nack_response is larger than the maximum message size supported by the underlying transport, RTI Connex will send multiple messages. If the total size of all samples that need to be resent is larger than max_bytes_per_nack_response, the remaining samples will be resent the next time an ACK arrives.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): 131072 bytes
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): 131072 bytes
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): 131072 bytes
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): 9216 bytes

[range] [0, 1 GB]

9.165.2.15 disable_positive_acks_min_sample_keep_duration

struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration

The minimum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (**DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 669) = **DDS_BOOLEAN_TRUE** (p. 316)) or a data reader (**DDS_DataReaderProtocolQosPolicy::disable_positive_acks** (p. 626) = **DDS_BOOLEAN_TRUE** (p. 316)), a sample is available from the data writer's queue for at least this duration, after which the sample may be considered to be acknowledged.

[default] 1 millisecond

[range] [0,1 year], <= **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_max_sample_keep_duration** (p. 1056)

9.165.2.16 disable_positive_acks_max_sample_keep_duration

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_max_sample_keep_↵
duration
```

The maximum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (**DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 669) = **DDS_BOOLEAN_TRUE** (p. 316)) or a data reader (**DDS_DataReaderProtocolQosPolicy::disable_↵**
positive_acks (p. 626) = **DDS_BOOLEAN_TRUE** (p. 316)), a sample is available from the data writer's queue for at most this duration, after which the sample is considered to be acknowledged.

[default] 1 second

[range] [0,1 year], >= **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration** (p. 1056)

9.165.2.17 disable_positive_acks_enable_adaptive_sample_keep_duration

```
DDS_Boolean DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_↵
duration
```

Enables dynamic adjustment of sample keep duration in response to congestion.

For dynamic networks where a static minimum sample keep duration may not provide sufficient performance or reliability, setting **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1057) = **DDS_BOOLEAN_TRUE** (p. 316), enables the sample keep duration to be dynamically adjusted to adapt to network conditions. The keep duration changes according to the detected level of congestion, which is determined to be proportional to the rate of NACKs received. An adaptive algorithm automatically controls the keep duration to optimize throughput and reliability.

To relieve high congestion, the keep duration is increased to effectively decrease the send rate; this lengthening of the keep duration is controlled by **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_increase_sample_↵**
_keep_duration_factor (p. 1058). Alternatively, when congestion is low, the keep duration is decreased to effectively increase send rate; this shortening of the keep duration is controlled by **DDS_RtpsReliableWriterProtocol_t::disable_↵**
_positive_acks_decrease_sample_keep_duration_factor (p. 1057).

The lower and upper bounds of the dynamic sample keep duration are set by **DDS_RtpsReliableWriterProtocol_↵**
_t::disable_positive_acks_min_sample_keep_duration (p. 1056) and **DDS_RtpsReliableWriterProtocol_t_↵**
::disable_positive_acks_max_sample_keep_duration (p. 1056), respectively.

When **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1057) = **DDS_BOOLEAN_FALSE** (p. 316), the sample keep duration is set to **DDS_RtpsReliableWriterProtocol_↵**
_t::disable_positive_acks_min_sample_keep_duration (p. 1056) .

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.165.2.18 disable_positive_acks_decrease_sample_keep_duration_factor

DDS_Long DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_decrease_sample_keep_duration_factor ↔

Controls rate of contraction of dynamic sample keep duration.

Used when **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1057) = **DDS_BOOLEAN_TRUE** (p. 316).

When the adaptive algorithm determines that the keep duration should be decreased, this factor (a percentage) is multiplied with the current keep duration to get the new shorter keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 95% would result in a new keep duration of 19 milliseconds.

[default] 95

[range] <= 100

9.165.2.19 disable_positive_acks_increase_sample_keep_duration_factor

DDS_Long DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_increase_sample_keep_duration_factor ↔

Controls rate of growth of dynamic sample keep duration.

Used when **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration** (p. 1057) = **DDS_BOOLEAN_TRUE** (p. 316).

When the adaptive algorithm determines that the keep duration should be increased, this factor (a percentage) is multiplied with the current keep duration to get the new longer keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 150% would result in a new keep duration of 30 milliseconds.

[default] 150

[range] >= 100

9.165.2.20 min_send_window_size

DDS_Long DDS_RtpsReliableWriterProtocol_t::min_send_window_size

Minimum size of send window of unacknowledged samples.

A **DDSDDataWriter** (p. 1305) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (this field) and a maximum size (**max_send_window_size**). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When a variable sized send window is used (i.e., when **min_send_window_size** and **max_send_window_size** are not set to the same value) the send window is initialized to **min_send_window_size**.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] > 0, <= **max_send_window_size**, or **DDS_LENGTH_UNLIMITED** (p. 437)

See also

DDS_RtpsReliableWriterProtocol_t::max_send_window_size (p. 1059)

DDS_RtpsReliableWriterProtocol_t::low_watermark (p. 1049)

DDS_RtpsReliableWriterProtocol_t::high_watermark (p. 1049)

DDS_ReliableWriterCacheChangedStatus::full_reliable_writer_cache (p. 1033)

9.165.2.21 max_send_window_size

DDS_Long DDS_RtpsReliableWriterProtocol_t::max_send_window_size

Maximum size of send window of unacknowledged samples.

A **DDSDataWriter** (p. 1305) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (**min_send_window_size**) and a maximum size (this field). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When a variable sized send window is used (i.e., when **min_send_window_size** and **max_send_window_size** are not set to the same value) the send window is initialized to **min_send_window_size**.

When both **min_send_window_size** and **max_send_window_size** are **DDS_LENGTH_UNLIMITED** (p. 437), then either **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) (for non-batching) or **DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 694) (for batching) serves as the effective **max_send_window_size**. When **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) (for non-batching) or **DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 694) (for batching) is less than **max_send_window_size**, then it serves as the effective **max_send_window_size**. If it is also less than **min_send_window_size**, then effectively both min and max send window sizes are equal to **max_samples** or **max_batches**.

In addition, the low and high watermarks are scaled down linearly to stay within the current send window size, and the full reliable queue status is set when the send window is full.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] > 0 , $\geq \text{min_send_window_size}$, or **DDS_LENGTH_UNLIMITED** (p. 437)

See also

DDS_RtpsReliableWriterProtocol_t::min_send_window_size (p. 1058)

DDS_RtpsReliableWriterProtocol_t::low_watermark (p. 1049)

DDS_RtpsReliableWriterProtocol_t::high_watermark (p. 1049)

DDS_ReliableWriterCacheChangedStatus::full_reliable_writer_cache (p. 1033)

9.165.2.22 send_window_update_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::send_window_update_period
```

Period in which send window may be dynamically changed.

The **DDSDataWriter** (p. 1305)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

The change in send window size happens at this update period, whereupon the send window is either increased or decreased in size according to the increase or decrease factors, respectively.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): 3 seconds
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): 3 seconds
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): 3 seconds
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): 1 second

[range] > [0,1 year]

See also

DDS_RtpsReliableWriterProtocol_t::send_window_increase_factor (p. 1060), **DDS_RtpsReliableWriterProtocol_t::send_window_decrease_factor** (p. 1060)

9.165.2.23 send_window_increase_factor

```
DDS_Long DDS_RtpsReliableWriterProtocol_t::send_window_increase_factor
```

Increases send window size by this percentage when reacting dynamically to network conditions.

The **DDSDataWriter** (p. 1305)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

After an update period during which no negative acknowledgements were received, the send window will be increased by this factor. The factor is treated as a percentage, where a factor of 150 would increase the send window by 150%. The increased send window size will not exceed the `max_send_window_size`.

[default] 105

[range] > 100

See also

DDS_RtpsReliableWriterProtocol_t::send_window_update_period (p. 1059), **DDS_RtpsReliableWriterProtocol_t::send_window_decrease_factor** (p. 1060)

9.165.2.24 send_window_decrease_factor

DDS_Long DDS_RtpsReliableWriterProtocol_t::send_window_decrease_factor

Decreases send window size by this percentage when reacting dynamically to network conditions.

The **DDSDataWriter** (p. 1305)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When increased network congestion causes a negative acknowledgement to be received by a writer, the send window will be decreased by this factor to throttle the effective send rate. The factor is treated as a percentage, where a factor of 80 would decrease the send window to 80% of its previous size. The decreased send window size will not be less than the min_send_window_size.

[default] The default value depends on the container policy:

- For **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671): 70
- For **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713): 50
- For **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714): 50
- For **DDS_DiscoveryConfigQosPolicy::participant_message_writer** (p. 716): 50

[range] [0, 100]

DDS_RtpsReliableWriterProtocol_t::send_window_update_period (p. 1059), **DDS_RtpsReliableWriterProtocol_t::send_window_increase_factor** (p. 1060)

9.165.2.25 enable_multicast_periodic_heartbeat

DDS_Boolean DDS_RtpsReliableWriterProtocol_t::enable_multicast_periodic_heartbeat

Whether periodic heartbeat messages are sent over multicast.

When enabled, if a reader has a multicast destination, then the writer will send its periodic HEARTBEAT messages to that destination. Otherwise, if not enabled or the reader does not have a multicast destination, the writer will send its periodic HEARTBEATs over unicast.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.165.2.26 multicast_resend_threshold

DDS_Long DDS_RtpsReliableWriterProtocol_t::multicast_resend_threshold

The minimum number of requesting readers needed to trigger a multicast resend.

Given readers with multicast destinations, when a reader NACKs for samples to be resent, the writer can either resend them over unicast or multicast. In order for the writer to resend over multicast, this threshold is the minimum number of readers of the same multicast group that the writer must receive NACKs from within a single response-delay. This allows the writer to coalesce near-simultaneous unicast resends into a multicast resend. Note that a threshold of 1 means that all resends will be sent over multicast, if available.

[default] 2

[range] [\geq 1]

9.165.2.27 disable_repair_piggyback_heartbeat

DDS_Boolean DDS_RtpsReliableWriterProtocol_t::disable_repair_piggyback_heartbeat

Prevents piggyback heartbeats from being sent with repair samples.

When samples are repaired, the **DDSDataWriter** (p.1305) resends **DDS_RtpsReliableWriterProtocol_t::max_bytes_per_nack_response** (p.1055) bytes and a piggyback heartbeat with each message. You can configure the **DDSDataWriter** (p.1305) to not send the piggyback heartbeat and instead rely on the **DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period** (p.1051) to control the throughput used to repair samples. This field is mutable only for **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p.671). **[default]** **DDS_BOOLEAN_FALSE** (p.316)

9.166 DDS_RtpsWellKnownPorts_t Struct Reference

RTPS well-known port mapping configuration.

Public Attributes

- **DDS_Long port_base**
The base port offset.
- **DDS_Long domain_id_gain**
Tunable domain gain parameter.
- **DDS_Long participant_id_gain**
Tunable participant gain parameter.
- **DDS_Long builtin_multicast_port_offset**
*Additional offset for **metatraffic** multicast port.*
- **DDS_Long builtin_unicast_port_offset**
*Additional offset for **metatraffic** unicast port.*
- **DDS_Long user_multicast_port_offset**
*Additional offset for **usertraffic** multicast port.*
- **DDS_Long user_unicast_port_offset**
*Additional offset for **usertraffic** unicast port.*

9.166.1 Detailed Description

RTPS well-known port mapping configuration.

RTI Connex uses the RTPS wire protocol. The discovery protocols defined by RTPS rely on well-known ports to initiate discovery. These well-known ports define the multicast and unicast ports on which a Participant will listen for discovery **metatraffic** from other Participants. The discovery metatraffic contains all the information required to establish the presence of remote DDS entities in the network.

The well-known ports are defined by RTPS in terms of port mapping expressions with several tunable parameters, which allow you to customize what network ports are used by RTI Connex. These parameters are exposed in **DDS_RtpsWellKnownPorts_t** (p. 1062). In order for all Participants in a system to correctly discover each other, it is important that they all use the same port mapping expressions.

The actual port mapping expressions, as defined by the RTPS specification, can be found below. In addition to the parameters listed in **DDS_RtpsWellKnownPorts_t** (p. 1062), the port numbers depend on:

- `domain_id`, as specified in **DDSDomainParticipantFactory::create_participant** (p. 1425)
- `participant_id`, as specified using **DDS_WireProtocolQosPolicy::participant_id** (p. 1231)

The `domain_id` parameter ensures no port conflicts exist between Participants belonging to different domains. This also means that discovery metatraffic in one domain is not visible to Participants in a different domain. The `participant_id` parameter ensures that unique unicast port numbers are assigned to Participants belonging to the same domain on a given host.

The `metatraffic_unicast_port` is used to exchange discovery metatraffic using unicast.

```
metatraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + b
```

The `metatraffic_multicast_port` is used to exchange discovery metatraffic using multicast. The corresponding multicast group addresses are specified via **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 727) on a **DDSDomainParticipant** (p. 1335) entity.

```
metatraffic_multicast_port = port_base + (domain_id_gain * domain_id) + builtin_multicast_port_offset
```

RTPS also defines the *default* multicast and unicast ports on which DataReaders and DataWriters receive **usertraffic**. These default ports can be overridden using the **DDS_DataReaderQos::multicast** (p. 645), **DDS_DataReaderQos::unicast** (p. 645), or by the **DDS_DataWriterQos::unicast** (p. 690) QoS policies.

The `usertraffic_unicast_port` is used to exchange user data using unicast.

```
usertraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + u
```

The `usertraffic_multicast_port` is used to exchange user data using multicast. The corresponding multicast group addresses can be configured using **DDS_TransportMulticastQosPolicy** (p. 1136).

```
usertraffic_multicast_port = port_base + (domain_id_gain * domain_id) + user_multicast_port_offset
```

By default, the port mapping parameters are configured to compliant with OMG's DDS Interoperability Wire Protocol (see also **DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS** (p. 461)).

The OMG's DDS Interoperability Wire Protocol compliant port mapping parameters are *not* backwards compatible with previous versions of the RTI Connex middleware.

When modifying the port mapping parameters, care must be taken to avoid port aliasing. This would result in undefined discovery behavior. The chosen parameter values will also determine the maximum possible number of domains in the system and the maximum number of participants per domain. Additionally, any resulting mapped port number must be within the range imposed by the underlying transport. For example, for UDPv4, this range typically equals [1024 - 65535].

Note: On Windows, you should avoid using ports 49152 through 65535 for inbound traffic. RTI Connex's ephemeral ports (see "Ports Used for Communication" in the *User's Manual*) may be within that range (see [https://msdn.microsoft.com/en-us/library/windows/desktop/ms737550\(v=vs.85\).aspx](https://msdn.microsoft.com/en-us/library/windows/desktop/ms737550(v=vs.85).aspx)). With the default `RtpsWellKnownPorts` settings, port 49152 corresponds to domain ID 167, so using domain IDs 168 through 232 on Windows introduces the risk of a port collision and failure to create the Domain Participant when using multicast discovery. You may see this error:

RTIOsapiSocket_bindWithIP:OS bind() failure, error 0X271D: An attempt was made to access a socket in a way forbidden by its access permissions.

QoS:

DDS_WireProtocolQosPolicy (p. 1228)

9.166.2 Member Data Documentation

9.166.2.1 port_base

DDS_Long `DDS_RtpsWellKnownPorts_t::port_base`

The base port offset.

All mapped well-known ports are offset by this value.

[default] 7400

[range] [≥ 1], but resulting ports must be within the range imposed by the underlying transport.

9.166.2.2 domain_id_gain

DDS_Long DDS_RtpsWellKnownPorts_t::domain_id_gain

Tunable domain gain parameter.

Multiplier of the domain_id. Together with participant_id_gain, it determines the highest domain_id and participant_id allowed on this network.

In general, there are two ways to setup domain_id_gain and participant_id_gain parameters.

If domain_id_gain > participant_id_gain, it results in a port mapping layout where all **DDSDomainParticipant** (p. 1335) instances within a single domain occupy a consecutive range of domain_id_gain ports. Precisely, all ports occupied by the domain fall within:

$$(\text{port_base} + (\text{domain_id_gain} * \text{domain_id}))$$

and:

$$(\text{port_base} + (\text{domain_id_gain} * (\text{domain_id} + 1)) - 1)$$

Under such a case, the highest domain_id is limited only by the underlying transport's maximum port. The highest participant_id, however, must satisfy:

$$\text{max_participant_id} < (\text{domain_id_gain} / \text{participant_id_gain})$$

On the contrary, if domain_id_gain ≤ participant_id_gain, it results in a port mapping layout where a given domain's **DDSDomainParticipant** (p. 1335) instances occupy ports spanned across the entire valid port range allowed by the underlying transport. For instance, it results in the following potential mapping:

Mapped Port	Domain Id	Participant ID
higher port number	Domain Id = 1	Participant ID = 2
	Domain Id = 0	Participant ID = 2
	Domain Id = 1	Participant ID = 1
	Domain Id = 0	Participant ID = 1
	Domain Id = 1	Participant ID = 0
lower port number	Domain Id = 0	Participant ID = 0

Under this case, the highest participant_id is limited only by the underlying transport's maximum port. The highest domain_id, however, must satisfy:

$$\text{max_domain_id} < (\text{participant_id_gain} / \text{domain_id_gain})$$

Additionally, domain_id_gain also determines the range of the port-specific offsets.

$$\text{domain_id_gain} > \text{abs}(\text{builtin_multicast_port_offset} - \text{user_multicast_port_offset})$$

$$\text{domain_id_gain} > \text{abs}(\text{builtin_unicast_port_offset} - \text{user_unicast_port_offset})$$

Violating this may result in port aliasing and undefined discovery behavior.

[default] 250

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

9.166.2.3 participant_id_gain

DDS_Long DDS_RtpsWellKnownPorts_t::participant_id_gain

Tunable participant gain parameter.

Multiplier of the `participant_id`. See **DDS_RtpsWellKnownPorts_t::domain_id_gain** (p. 1064) for its implications on the highest `domain_id` and `participant_id` allowed on this network.

Additionally, `participant_id_gain` also determines the range of `builtin_unicast_port_offset` and `user_unicast_port_offset`.

`participant_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)`

[default] 2

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

9.166.2.4 builtin_multicast_port_offset

DDS_Long DDS_RtpsWellKnownPorts_t::builtin_multicast_port_offset

Additional offset for **metatraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 0

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

9.166.2.5 builtin_unicast_port_offset

DDS_Long DDS_RtpsWellKnownPorts_t::builtin_unicast_port_offset

Additional offset for **metatraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 10

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

9.166.2.6 user_multicast_port_offset

`DDS_Long DDS_RtpsWellKnownPorts_t::user_multicast_port_offset`

Additional offset for **usertraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 1

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

9.166.2.7 user_unicast_port_offset

`DDS_Long DDS_RtpsWellKnownPorts_t::user_unicast_port_offset`

Additional offset for **usertraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 11

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

9.167 DDS_SampleIdentity_t Struct Reference

Type definition for a Sample Identity.

Public Attributes

- struct **DDS_GUID_t** **writer_guid**
16-byte identifier identifying the virtual GUID.
- struct **DDS_SequenceNumber_t** **sequence_number**
monotonically increasing 64-bit integer that identifies the sample in the data source.

9.167.1 Detailed Description

Type definition for a Sample Identity.

A SampleIdentity defines a pair (Virtual Writer GUID, Sequence Number) that uniquely identifies a sample within a DDS domain and a Topic.

9.168 DDS_SampleInfo Struct Reference

Information that accompanies each sample that is `read` or `taken`.

Public Attributes

- **DDS_SampleStateKind sample_state**
The sample state of the sample.
- **DDS_ViewStateKind view_state**
The view state of the instance.
- **DDS_InstanceStateKind instance_state**
The instance state of the instance.
- struct **DDS_Time_t source_timestamp**
The timestamp when the sample was written by a DataWriter.
- **DDS_InstanceHandle_t instance_handle**
Identifies locally the corresponding instance.
- **DDS_InstanceHandle_t publication_handle**
Identifies locally the DataWriter that modified the instance.
- **DDS_Long disposed_generation_count**
The disposed generation count of the instance at the time of sample reception.
- **DDS_Long no_writers_generation_count**
The no writers generation count of the instance at the time of sample reception.
- **DDS_Long sample_rank**
The sample rank of the sample.
- **DDS_Long generation_rank**
The generation rank of the sample.
- **DDS_Long absolute_generation_rank**
The absolute generation rank of the sample.
- **DDS_Boolean valid_data**
Indicates whether the DataSample contains data or else it is only used to communicate a change in the instance's state of the instance.
- struct **DDS_Time_t reception_timestamp**
<<extension>> (p. 236) The timestamp when the sample was committed by a DataReader.
- struct **DDS_SequenceNumber_t publication_sequence_number**
<<extension>> (p. 236) The publication sequence number.
- struct **DDS_SequenceNumber_t reception_sequence_number**
<<extension>> (p. 236) The reception sequence number when sample was committed by a DataReader
- struct **DDS_GUID_t original_publication_virtual_guid**
<<extension>> (p. 236) The original publication virtual GUID.
- struct **DDS_SequenceNumber_t original_publication_virtual_sequence_number**
<<extension>> (p. 236) The original publication virtual sequence number.
- struct **DDS_GUID_t related_original_publication_virtual_guid**
<<extension>> (p. 236) The original publication virtual GUID of a related sample.
- struct **DDS_SequenceNumber_t related_original_publication_virtual_sequence_number**
<<extension>> (p. 236) The original publication virtual sequence number of a related sample.
- **DDS_SampleFlag flag**

- `<<extension>>` (p. 236) *Flags associated with the sample.*
- struct **DDS_GUID_t source_guid**
 - `<<extension>>` (p. 236) *The application logical data source associated with the sample.*
- struct **DDS_GUID_t related_source_guid**
 - `<<extension>>` (p. 236) *The application logical data source that is related to the sample.*
- struct **DDS_GUID_t related_subscription_guid**
 - `<<extension>>` (p. 236) *The related_reader_guid associated with the sample.*
- struct **DDS_GUID_t topic_query_guid**
 - `<<extension>>` (p. 236) *The GUID of the **DDSTopicQuery** (p. 1611) that is related to the sample.*
- struct **DDS_CoherentSetInfo_t * coherent_set_info**
 - `<<extension>>` (p. 236) *The information about the coherent set that this sample is a part of.*

9.168.1 Detailed Description

Information that accompanies each sample that is `read` or `taken`.

9.168.2 Interpretation of the SampleInfo

The **DDS_SampleInfo** (p. 1068) contains information pertaining to the associated `Data` instance sample including:

- the `sample_state` of the `Data` value (i.e., if it has already been read or not)
- the `view_state` of the related instance (i.e., if the instance is new or not)
- the `instance_state` of the related instance (i.e., if the instance is alive or not)
- **DDS_SampleInfo::valid_data** (p. 1074) flag. This flag indicates whether there is data associated with the sample. Some samples do not contain data indicating only a change on the `instance_state` of the corresponding instance.
- The values of `disposed_generation_count` and `no_writers_generation_count` for the related instance at the time the sample was received. These counters indicate the number of times the instance had become ALIVE (with `instance_state= DDS_ALIVE_INSTANCE_STATE` (p. 161)) at the time the sample was received.
- The `sample_rank` and `generation_rank` of the sample within the returned sequence. These ranks provide a preview of the samples that follow within the sequence returned by the `read` or `take` operations.
- The `absolute_generation_rank` of the sample within the **DDSDDataReader** (p. 1272). This rank provides a preview of what is available within the **DDSDDataReader** (p. 1272).
- The `source_timestamp` of the sample. This is the timestamp provided by the **DDSDDataWriter** (p. 1305) at the time the sample was produced.

9.168.3 Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count

For each instance, RTI Connexx internally maintains two counts, the **DDS_SampleInfo::disposed_generation_count** (p. 1073) and **DDS_SampleInfo::no_writers_generation_count** (p. 1073), relative to each DataReader:

- The **DDS_SampleInfo::disposed_generation_count** (p. 1073) and **DDS_SampleInfo::no_writers_generation_count** (p. 1073) are initialized to zero when the **DDSDataReader** (p. 1272) first detects the presence of a never-seen-before instance.
- The **DDS_SampleInfo::disposed_generation_count** (p. 1073) is incremented each time the instance_state of the corresponding instance changes from **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) to **DDS_ALIVE_INSTANCE_STATE** (p. 161).
- The **DDS_SampleInfo::no_writers_generation_count** (p. 1073) is incremented each time the instance_state of the corresponding instance changes from **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) to **DDS_ALIVE_INSTANCE_STATE** (p. 161).
- These 'generation counts' are reset to zero when the instance resource is reclaimed.

The **DDS_SampleInfo::disposed_generation_count** (p. 1073) and **DDS_SampleInfo::no_writers_generation_count** (p. 1073) available in the **DDS_SampleInfo** (p. 1068) capture a snapshot of the corresponding counters at the time the sample was received.

9.168.4 Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank

The **DDS_SampleInfo::sample_rank** (p. 1073) and **DDS_SampleInfo::generation_rank** (p. 1074) available in the **DDS_SampleInfo** (p. 1068) are computed based solely on the actual samples in the ordered collection returned by read or take.

- The **DDS_SampleInfo::sample_rank** (p. 1073) indicates the number of samples of the same instance that follow the current one in the collection.
- The **DDS_SampleInfo::generation_rank** (p. 1074) available in the **DDS_SampleInfo** (p. 1068) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that appears in the returned Collection (MRSIC). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the reception of MRSIC.
- These 'generation ranks' are reset to zero when the instance resource is reclaimed.

The **DDS_SampleInfo::generation_rank** (p. 1074) is computed using the formula:

```
generation_rank = (MRSIC.disposed_generation_count
                  + MRSIC.no_writers_generation_count)
                  - (S.disposed_generation_count
                  + S.no_writers_generation_count)
```

The **DDS_SampleInfo::absolute_generation_rank** (p. 1074) available in the **DDS_SampleInfo** (p. 1068) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that the middleware has received (MRS). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the time when the read or take was called.

```
absolute_generation_rank = (MRS.disposed_generation_count
                           + MRS.no_writers_generation_count)
                           - (S.disposed_generation_count
                           + S.no_writers_generation_count)
```

9.168.5 Interpretation of the SampleInfo counters and ranks

These counters and ranks allow the application to distinguish samples belonging to different "generations" of the instance. Note that it is possible for an instance to transition from not-alive to alive (and back) several times before the application accesses the data by means of read or take. In this case, the returned collection may contain samples that cross generations (i.e. some samples were received before the instance became not-alive, other after the instance re-appeared again). Using the information in the **DDS_SampleInfo** (p. 1068), the application can anticipate what other information regarding the same instance appears in the returned collection, as well as in the infrastructure and thus make appropriate decisions.

For example, an application desiring to only consider the most current sample for each instance would only look at samples with `sample_rank == 0`. Similarly, an application desiring to only consider samples that correspond to the latest generation in the collection will only look at samples with `generation_rank == 0`. An application desiring only samples pertaining to the latest generation available will ignore samples for which `absolute_generation_rank != 0`. Other application-defined criteria may also be used.

DDS_SampleStateKind (p. 156), **DDS_InstanceStateKind** (p. 160), **DDS_ViewStateKind** (p. 158), **DDS_SampleInfo::valid_data** (p. 1074)

"Statechart of the \p instance_state and \p view_state of a single instance"

9.168.6 Member Data Documentation

9.168.6.1 sample_state

DDS_SampleStateKind DDS_SampleInfo::sample_state

The sample state of the sample.

Indicates whether or not the corresponding data sample has already been read.

See also

DDS_SampleStateKind (p. 156)

9.168.6.2 view_state

```
DDS_ViewStateKind DDS_SampleInfo::view_state
```

The view state of the instance.

Indicates whether the **DDSDataReader** (p. 1272) has already seen samples for the most-current generation of the related instance.

See also

DDS_ViewStateKind (p. 158)

9.168.6.3 instance_state

```
DDS_InstanceStateKind DDS_SampleInfo::instance_state
```

The instance state of the instance.

Indicates whether the instance is currently in existence or, if it has been disposed, the reason why it was disposed.

See also

DDS_InstanceStateKind (p. 160)

9.168.6.4 source_timestamp

```
struct DDS_Time_t DDS_SampleInfo::source_timestamp
```

The timestamp when the sample was written by a DataWriter.

9.168.6.5 instance_handle

```
DDS_InstanceId_t DDS_SampleInfo::instance_handle
```

Identifies locally the corresponding instance.

The handle is equal to **DDS_HANDLE_NIL** (p. 76) for unkeyed topics.

9.168.6.6 publication_handle

`DDS_InstanceHandle_t DDS_SampleInfo::publication_handle`

Identifies locally the DataWriter that modified the instance.

The `publication_handle` is the same `DDS_InstanceHandle_t` (p.74) that is returned by the operation `DDSDataReader::get_matched_publications` (p.1283) and can also be used as a parameter to the operation `DDSDataReader::get_matched_publication_data` (p.1284).

9.168.6.7 disposed_generation_count

`DDS_Long DDS_SampleInfo::disposed_generation_count`

The disposed generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from `DDS_NOT_ALIVE`↔`_DISPOSED_INSTANCE_STATE` (p.161) to `DDS_ALIVE_INSTANCE_STATE` (p.161). The counter is reset when the instance resource is reclaimed (removed from the DataReader cache).

See also

Interpretation of the SampleInfo `disposed_generation_count` and `no_writers_generation_count` (p. ??) Interpretation of the SampleInfo counters and ranks (p.1071)

9.168.6.8 no_writers_generation_count

`DDS_Long DDS_SampleInfo::no_writers_generation_count`

The no writers generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from `DDS_NOT_ALIVE`↔`_NO_WRITERS_INSTANCE_STATE` (p.161) to `DDS_ALIVE_INSTANCE_STATE` (p.161). The counter is reset when the instance resource is reclaimed (removed from the DataReader cache).

See also

Interpretation of the SampleInfo `disposed_generation_count` and `no_writers_generation_count` (p. ??) Interpretation of the SampleInfo counters and ranks (p.1071)

9.168.6.9 sample_rank

DDS_Long DDS_SampleInfo::sample_rank

The sample rank of the sample.

Indicates the number of samples related to the same instance that follow in the collection returned by `read` or `take`.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. ??) Interpretation of the SampleInfo counters and ranks (p. 1071)

9.168.6.10 generation_rank

DDS_Long DDS_SampleInfo::generation_rank

The generation rank of the sample.

Indicates the generation difference (number of times the instance was NOT_ALIVE and become alive again) between the time the sample was received and the time the most recent sample in the collection related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. ??) Interpretation of the SampleInfo counters and ranks (p. 1071)

9.168.6.11 absolute_generation_rank

DDS_Long DDS_SampleInfo::absolute_generation_rank

The absolute generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample (which may not be in the returned collection) related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. ??) Interpretation of the SampleInfo counters and ranks (p. 1071)

9.168.6.12 valid_data

```
DDS_Boolean DDS_SampleInfo::valid_data
```

Indicates whether the `DataSample` contains data or else it is only used to communicate a change in the `instance_state` of the instance.

Normally each `DataSample` contains both a **DDS_SampleInfo** (p. 1068) and some Data. However there are situations where a `DataSample` contains only the **DDS_SampleInfo** (p. 1068) and does not have any associated data. This occurs when the RTI Connexnt notifies the application of a change of state for an instance that was caused by some internal mechanism (such as a timeout) for which there is no associated data. An example of this situation is when the RTI Connexnt detects that an instance has no writers and changes the corresponding `instance_state` to **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).

The application can distinguish whether a particular `DataSample` has data by examining the value of the **DDS_SampleInfo::valid_data** (p. 1074). If this flag is set to **DDS_BOOLEAN_TRUE** (p. 316), then the `DataSample` contains valid Data. If the flag is set to **DDS_BOOLEAN_FALSE** (p. 316), the `DataSample` contains no Data.

To ensure correctness and portability, the `valid_data` flag must be examined by the application prior to accessing the Data associated with the `DataSample` and if the flag is set to **DDS_BOOLEAN_FALSE** (p. 316), the application should not access the Data associated with the `DataSample`, that is, the application should access only the **DDS_SampleInfo** (p. 1068).

9.168.6.13 reception_timestamp

```
struct DDS_Time_t DDS_SampleInfo::reception_timestamp
```

<<*extension*>> (p. 236) The timestamp when the sample was committed by a `DataReader`.

9.168.6.14 publication_sequence_number

9.168.6.17 original_publication_virtual_sequence_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::original_publication_virtual_sequence_number
```

<<**extension**>> (p. 236) The original publication virtual sequence number.

If the **DDS_PresentationQosPolicy::access_scope** (p.987) of the **DDSPublisher** (p.1534) is **DDS_GROUP_↵PRESENTATION_QOS** (p.418), this field contains the **DDSPublisher** (p.1534) virtual sequence number that uniquely identifies a sample within the DataWriter group.

See also

connext::Sample::identity() (p. 1891)

9.168.6.18 related_original_publication_virtual_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_original_publication_virtual_guid
```

<<**extension**>> (p. 236) The original publication virtual GUID of a related sample.

See also

connext::Sample::related_identity() (p. 1891)

9.168.6.19 related_original_publication_virtual_sequence_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::related_original_publication_virtual_sequence_number
```

<<**extension**>> (p. 236) The original publication virtual sequence number of a related sample.

See also

connext::Sample::related_identity() (p. 1891)

9.168.6.20 flag

```
DDS_SampleFlag DDS_SampleInfo::flag
```

<<**extension**>> (p. 236) Flags associated with the sample.

The flags can be set by using the field **DDS_WriteParams_t::flag** (p. 1238) when writing a sample using the method **FooDataWriter::write_w_params** (p. 1671).

9.168.6.21 source_guid

```
struct DDS_GUID_t DDS_SampleInfo::source_guid
```

<<**extension**>> (p. 236) The application logical data source associated with the sample.

The **source_guid** can be set by using the field **DDS_WriteParams_t::source_guid** (p. 1238) when writing a sample using the method **FooDataWriter::write_w_params** (p. 1671).

9.168.6.22 related_source_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_source_guid
```

<<**extension**>> (p. 236) The application logical data source that is related to the sample.

The **related_source_guid** can be set by using the field **DDS_WriteParams_t::related_source_guid** (p. 1239) when writing a sample using the method **FooDataWriter::write_w_params** (p. 1671).

9.168.6.23 related_subscription_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_subscription_guid
```

<<**extension**>> (p. 236) The **related_reader_guid** associated with the sample.

The **related_reader_guid** can be set by using the field **DDS_WriteParams_t::related_reader_guid** (p. 1239) when writing a sample using the method **FooDataWriter::write_w_params** (p. 1671).

9.168.6.24 topic_query_guid

```
struct DDS_GUID_t DDS_SampleInfo::topic_query_guid
```

<<**extension**>> (p. 236) The GUID of the **DDSTopicQuery** (p. 1611) that is related to the sample.

This GUID indicates whether a sample is part of the response to a **DDSTopicQuery** (p. 1611) or a regular ("live") sample:

- If the sample was written for the TopicQuery stream, this field contains the GUID of the target TopicQuery.
- If the sample was written for the live stream, this field will be set to **DDS_GUID_UNKNOWN** (p. 330).

9.168.6.25 coherent_set_info

```
struct DDS_CoherentSetInfo_t* DDS_SampleInfo::coherent_set_info
```

<<**extension**>> (p. 236) The information about the coherent set that this sample is a part of.

This field is set for all samples that are part of a coherent set. Coherent sets are initiated using the operation **DDSPublisher::begin_coherent_changes** (p. 1548) and finalized using the operation **DDSPublisher::end_↔coherent_changes** (p. 1549).

See also

DDSPublisher::begin_coherent_changes (p. 1548) for additional information on coherent sets.

9.170 DDS_SampleLostStatus Struct Reference

DDS_SAMPLE_LOST_STATUS (p. 344)

Public Attributes

- **DDS_Long total_count**
*Total cumulative count of all samples lost across all instances of data published under the **DDSTopic** (p. 1601).*
- **DDS_Long total_count_change**
The incremental number of samples lost since the last time the listener was called or the status was read.
- **DDS_SampleLostStatusKind last_reason**
<<extension>> (p. 236) Reason why the last sample was lost.

9.170.1 Detailed Description

DDS_SAMPLE_LOST_STATUS (p. 344)

9.170.2 Member Data Documentation

9.170.2.1 total_count

DDS_Long DDS_SampleLostStatus::total_count

Total cumulative count of all samples lost across all instances of data published under the **DDSTopic** (p. 1601).

9.170.2.2 total_count_change

DDS_Long DDS_SampleLostStatus::total_count_change

The incremental number of samples lost since the last time the listener was called or the status was read.

9.170.2.3 last_reason

DDS_SampleLostStatusKind DDS_SampleLostStatus::last_reason

<<**extension**>> (p. 236) Reason why the last sample was lost.

See also

DDS_SampleLostStatusKind (p. 136)

9.171 DDS_SampleRejectedStatus Struct Reference

DDS_SAMPLE_REJECTED_STATUS (p. 344)

Public Attributes

- **DDS_Long total_count**
*Total cumulative count of samples rejected by the **DDSDataReader** (p. 1272).*
- **DDS_Long total_count_change**
The incremental number of samples rejected since the last time the listener was called or the status was read.
- **DDS_SampleRejectedStatusKind last_reason**
Reason for rejecting the last sample rejected.
- **DDS_InstanceHandle_t last_instance_handle**
Handle to the instance being updated by the last sample that was rejected.

9.171.1 Detailed Description

DDS_SAMPLE_REJECTED_STATUS (p. 344)

9.171.2 Member Data Documentation

9.171.2.1 total_count

DDS_Long DDS_SampleRejectedStatus::total_count

Total cumulative count of samples rejected by the **DDSDataReader** (p. 1272).

9.171.2.2 total_count_change

DDS_Long DDS_SampleRejectedStatus::total_count_change

The incremental number of samples rejected since the last time the listener was called or the status was read.

9.171.2.3 last_reason

`DDS_SampleRejectedStatusKind DDS_SampleRejectedStatus::last_reason`

Reason for rejecting the last sample rejected.

See also

`DDS_SampleRejectedStatusKind` (p. 140)

9.171.2.4 last_instance_handle

`DDS_InstanceHandle_t DDS_SampleRejectedStatus::last_instance_handle`

Handle to the instance being updated by the last sample that was rejected.

If the sample was rejected because of `DDS_REJECTED_BY_DECODE_FAILURE` (p. 142) and the `DDSDataWriter` (p. 1305) set `DDS_DataWriterProtocolQosPolicy::disable_inline_keyhash` (p. 669) to `DDS_BOOLEAN_TRUE` (p. 316), then the `last_instance_handle` may not be correct if the sample was encrypted.

9.172 DDS_SequenceNumber_t Struct Reference

Type for *sequence* number representation.

Public Attributes

- `DDS_Long high`
The most significant part of the sequence number.
- `DDS_UnsignedLong low`
The least significant part of the sequence number.

9.172.1 Detailed Description

Type for *sequence* number representation.

Represents a 64-bit sequence number.

9.172.2 Member Data Documentation

9.172.2.1 high

DDS_Long DDS_SequenceNumber_t::high

The most significant part of the sequence number.

9.172.2.2 low

DDS_UnsignedLong DDS_SequenceNumber_t::low

The least significant part of the sequence number.

9.173 DDS_ServiceQosPolicy Struct Reference

Service associated with a DDS entity.

Public Attributes

- **DDS_ServiceQosPolicyKind** kind
The kind of service.

9.173.1 Detailed Description

Service associated with a DDS entity.

This QoS policy is intended to be used by RTI infrastructure services.

User applications should not modify its value.

Entity:

DDSDomainParticipant (p. 1335), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

9.173.2 Member Data Documentation

9.173.2.1 kind

`DDS_ServiceQosPolicyKind DDS_ServiceQosPolicy::kind`

The kind of service.

[default] `DDS_NO_SERVICE_QOS` (p. 439)

9.174 DDS_ServiceRequest Struct Reference

A request coming from one of the built-in services.

Public Attributes

- `DDS_Long service_id`
The id of the service that the request was sent on.
- struct `DDS_GUID_t instance_id`
Each ServiceRequest is keyed on the instance_id.
- struct `DDS_OctetSeq request_body`
Service-specific information.

9.174.1 Detailed Description

A request coming from one of the built-in services.

Data associated with the built-in topic `DDS_SERVICE_REQUEST_TOPIC_NAME` (p. 302). It contains service-specific information.

See also

`DDS_SERVICE_REQUEST_TOPIC_NAME` (p. 302)

`DDSParticipantBuiltinTopicDataDataReader` (p. 1532)

9.174.2 Member Data Documentation

9.174.2.1 service_id

```
DDS_Long DDS_ServiceRequest::service_id
```

The id of the service that the request was sent on.

There can be multiple services that use the built-in ServiceRequest topic. The service_id identifies which service a specific request was sent from.

See also

DDS_UNKNOWN_SERVICE_REQUEST_ID (p. 301)

DDS_TOPIC_QUERY_SERVICE_REQUEST_ID (p. 301)

9.174.2.2 instance_id

```
struct DDS_GUID_t DDS_ServiceRequest::instance_id
```

Each ServiceRequest is keyed on the instance_id.

The instance_id provides a way for users to differentiate between different requests coming from the same service.

9.174.2.3 request_body

```
struct DDS_OctetSeq DDS_ServiceRequest::request_body
```

Service-specific information.

Each service uses the request_body field to send information specific to that service in the form of an opaque sequence of bytes. Each service provides a helper function that will deserialize the information from the request body.

See also

DDSTopicQueryHelper::topic_query_data_from_service_request (p. 1612)

9.175 DDS_ServiceRequestAcceptedStatus Struct Reference

DDS_SERVICE_REQUEST_ACCEPTED_STATUS (p. 347)

Public Attributes

- **DDS_Long total_count**
*The total cumulative number of ServiceRequests that have been accepted by a **DDSDataWriter** (p. 1305).*
- **DDS_Long total_count_change**
The incremental changes in total_count since the last time the listener was called or the status was read.
- **DDS_Long current_count**
*The current number of ServiceRequests that have been accepted by this **DDSDataWriter** (p. 1305).*
- **DDS_Long current_count_change**
The change in current_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_request_handle**
*A handle to the last **DDS_ServiceRequest** (p. 1083) that caused the **DDSDataWriter** (p. 1305)'s status to change.*
- **DDS_Long service_id**
ID of the service to which the accepted Request belongs.

9.175.1 Detailed Description

DDS_SERVICE_REQUEST_ACCEPTED_STATUS (p. 347)

Currently, the only service that causes the ServiceRequestAcceptedStatus to be triggered is the **DDSTopicQuery** (p. 1611) service. A **DDS_ServiceRequest** (p. 1083) is accepted when a **DDSDataWriter** (p. 1305) matches with a **DDSDataReader** (p. 1272) that has created a **DDSTopicQuery** (p. 1611).

This status is also changed (and the listener, if any, called) when a ServiceRequest has been cancelled, or deleted. This will happen when a **DDSDataReader** (p. 1272) deletes a TopicQuery using **DDSDataReader::delete_topic_query** (p. 1294).

9.175.2 Member Data Documentation

9.175.2.1 total_count

```
DDS_Long DDS_ServiceRequestAcceptedStatus::total_count
```

The total cumulative number of ServiceRequests that have been accepted by a **DDSDataWriter** (p. 1305).

This number increases whenever a new request is accepted. It does not change when a request is cancelled.

9.175.2.2 total_count_change

```
DDS_Long DDS_ServiceRequestAcceptedStatus::total_count_change
```

The incremental changes in total_count since the last time the listener was called or the status was read.

9.175.2.3 `current_count`

`DDS_Long DDS_ServiceRequestAcceptedStatus::current_count`

The current number of ServiceRequests that have been accepted by this **DDSDataWriter** (p. 1305).

This number increases when a new request is accepted and decreases when an existing request is cancelled.

9.175.2.4 `current_count_change`

`DDS_Long DDS_ServiceRequestAcceptedStatus::current_count_change`

The change in `current_count` since the last time the listener was called or the status was read.

9.175.2.5 `last_request_handle`

`DDS_InstanceHandle_t DDS_ServiceRequestAcceptedStatus::last_request_handle`

A handle to the last **DDS_ServiceRequest** (p. 1083) that caused the **DDSDataWriter** (p. 1305)'s status to change.

9.175.2.6 `service_id`

`DDS_Long DDS_ServiceRequestAcceptedStatus::service_id`

ID of the service to which the accepted Request belongs.

DDS_Short (p. 317)

FooSeq (p. 1680)

9.178 DDS_StringSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < char* > with value type semantics.

9.178.1 Detailed Description

Instantiates **FooSeq** (p. 1680) < char* > with value type semantics.

StringSeq is a sequence that contains strings.

Even though the element type is a `char*`, i.e. a pointer, the sequence semantically behaves as a sequence of `char*` *value* types. When a **DDS_StringSeq** (p. 1087) is copied or deleted, the contained strings are also respectively copied or deleted.

Important: Users of this type must understand its memory management contract.

- Ownership of this sequence's buffer implies ownership of the pointers stored in that buffer; a loan of the buffer implies lack of ownership of the pointers. In other words, for a type **FooSeq** (p. 1680) where **Foo** (p. 1632) is a pointer, ownership of **Foo** (p. 1632) implies ownership of ***Foo** (p. 1632). In other words, deleting a string sequence that owns its memory implies the deletion of all strings in that sequence. See **FooSeq::loan_contiguous** (p. 1690) for more information about sequence memory ownership.
- The second important rule is that non-NULL strings are *assumed to be of sufficient size* to store the necessary characters. This is a dangerous rule, but it cannot be avoided because a string doesn't store the amount of memory it has. The only other alternative is to always free and re-allocate memory. Not only would this latter policy be very expensive, but it would essentially render any loaned **DDS_StringSeq** (p. 1087) immutable, since to modify any string in it would require freeing and re-allocating that string, which would violate the first principle discussed above.

It is also worth noting that the element type of a string sequence is `char*`, not `const char*`. It is therefore incorrect and dangerous, for example, to insert a string literal into a string sequence without first copying it into mutable memory.

In order to guarantee correct behavior, it is recommended that the contained elements always be manipulated using the string support API's described in **String Support** (p. 545).

9.179 DDS_StructMember Struct Reference

A description of a member of a struct.

Public Attributes

- **char * name**
The name of the struct member.
- **const DDS_TypeCode * type**
The type of the struct member.
- **DDS_Boolean is_pointer**
Indicates whether the struct member is a pointer or not.
- **DDS_Short bits**
Number of bits of a bitfield member.
- **DDS_Boolean is_key**
Indicates if the struct member is a key member or not.
- **DDS_Long id**
The member ID.
- **DDS_Boolean is_optional**
Indicates if the struct member is optional or required.

9.179.1 Detailed Description

A description of a member of a struct.

See also

DDS_StructMemberSeq (p. 1090)

DDS_TypeCodeFactory::create_struct_tc (p. 1198)

9.179.2 Member Data Documentation

9.179.2.1 name

```
char* DDS_StructMember::name
```

The name of the struct member.

Cannot be NULL.

9.179.2.2 type

```
const DDS_TypeCode* DDS_StructMember::type
```

The type of the struct member.

Cannot be NULL.

9.179.2.3 is_pointer

```
DDS_Boolean DDS_StructMember::is_pointer
```

Indicates whether the struct member is a pointer or not.

9.179.2.4 bits

```
DDS_Short DDS_StructMember::bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **DDS_TYPECODE_NOT_BITFIELD** (p. 81).

9.179.2.5 is_key

```
DDS_Boolean DDS_StructMember::is_key
```

Indicates if the struct member is a key member or not.

9.179.2.6 id

`DDS_Long DDS_StructMember::id`

The member ID.

Use `DDS_TYPECODE_MEMBER_ID_INVALID` (p. 81) to have the member ID automatically assigned.

9.179.2.7 is_optional

`DDS_Boolean DDS_StructMember::is_optional`

Indicates if the struct member is optional or required.

9.180 DDS_StructMemberSeq Struct Reference

Defines a sequence of struct members.

9.180.1 Detailed Description

Defines a sequence of struct members.

See also

`DDS_StructMember` (p. 1088)

`FooSeq` (p. 1680)

9.181 DDS_SubscriberQos Struct Reference

QoS policies supported by a `DDSSubscriber` (p. 1576) entity.

Public Member Functions

- bool **operator==** (const **DDS_SubscriberQos** &r) const
Compares two SubscriberQos objects for equality.
- bool **operator!=** (const **DDS_SubscriberQos** &r) const
Compares two SubscriberQos objects for inequality.
- **DDS_ReturnCode_t print** () const
*Prints this **DDS_SubscriberQos** (p. 1090) to stdout.*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_SubscriberQos** &base) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_SubscriberQos** &base, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*

Public Attributes

- struct **DDS_PresentationQosPolicy presentation**
*Presentation policy, **PRESENTATION** (p. 417).*
- struct **DDS_PartitionQosPolicy partition**
*Partition policy, **PARTITION** (p. 416).*
- struct **DDS_GroupDataQosPolicy group_data**
*Group data policy, **GROUP_DATA** (p. 406).*
- struct **DDS_EntityFactoryQosPolicy entity_factory**
*Entity factory policy, **ENTITY_FACTORY** (p. 401).*
- struct **DDS_ExclusiveAreaQosPolicy exclusive_area**
<<extension>> (p. 236) Exclusive area for the subscriber and all entities that are created by the subscriber.
- struct **DDS_EntityNameQosPolicy subscriber_name**
*<<extension>> (p. 236) EntityName policy, **ENTITY_NAME** (p. 402).*

9.181.1 Detailed Description

QoS policies supported by a **DDSSubscriber** (p. 1576) entity.

You must set certain members in a consistent manner:

length of **DDS_GroupDataQosPolicy::value** (p. 905) \leq **DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_data_max_length** (p. 752)

length of **DDS_PartitionQosPolicy::name** (p. 978) \leq **DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions** (p. 753)

combined number of characters (including terminating 0) in **DDS_PartitionQosPolicy::name** (p. 978) \leq **DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_characters** (p. 753)

If any of the above are not true, **DDSSubscriber::set_qos** (p. 1593) and **DDSSubscriber::set_qos_with_profile** (p. 1594) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

9.181.2 Member Function Documentation

9.181.2.1 operator==()

```
bool DDS_SubscriberQos::operator== (
    const DDS_SubscriberQos & r ) const [inline]
```

Compares two SubscriberQos objects for equality.

See also

DDS_SubscriberQos_equals (p. 127)

References **DDS_SubscriberQos_equals()**.

9.181.2.2 operator!=()

```
bool DDS_SubscriberQos::operator!= (
    const DDS_SubscriberQos & r ) const [inline]
```

Compares two SubscriberQos objects for inequality.

See also

DDS_SubscriberQos_equals (p. 127)

References **DDS_SubscriberQos_equals()**.

9.181.3 Member Data Documentation

9.181.3.1 presentation

```
struct DDS_PresentationQosPolicy DDS_SubscriberQos::presentation
```

Presentation policy, **PRESENTATION** (p. 417).

9.181.3.2 partition

```
struct DDS_PartitionQosPolicy DDS_SubscriberQos::partition
```

Partition policy, **PARTITION** (p. 416).

9.181.3.3 group_data

```
struct DDS_GroupDataQosPolicy DDS_SubscriberQos::group_data
```

Group data policy, **GROUP_DATA** (p. 406).

9.181.3.4 entity_factory

```
struct DDS_EntityFactoryQosPolicy DDS_SubscriberQos::entity_factory
```

Entity factory policy, **ENTITY_FACTORY** (p. 401).

9.181.3.5 exclusive_area

```
struct DDS_ExclusiveAreaQosPolicy DDS_SubscriberQos::exclusive_area
```

<<**extension**>> (p. 236) Exclusive area for the subscriber and all entities that are created by the subscriber.

9.181.3.6 subscriber_name

```
struct DDS_EntityNameQosPolicy DDS_SubscriberQos::subscriber_name
```

<<*extension*>> (p. 236) EntityName policy, **ENTITY_NAME** (p. 402).

9.182 DDS_SubscriptionBuiltinTopicData Struct Reference

Entry created when a **DDSDDataReader** (p. 1272) is discovered in association with its Subscriber.

Public Attributes

- **DDS_BuiltinTopicKey_t key**
DCPS key to distinguish entries.
- **DDS_BuiltinTopicKey_t participant_key**
DCPS key of the participant to which the DataReader belongs.
- char * **topic_name**
*Name of the related **DDSTopic** (p. 1601).*
- char * **type_name**
*Name of the type attached to the **DDSTopic** (p. 1601).*
- struct **DDS_DurabilityQosPolicy durability**
Policy of the corresponding DataReader.
- struct **DDS_DeadlineQosPolicy deadline**
Policy of the corresponding DataReader.
- struct **DDS_LatencyBudgetQosPolicy latency_budget**
Policy of the corresponding DataReader.
- struct **DDS_LivelinessQosPolicy liveliness**
Policy of the corresponding DataReader.
- struct **DDS_ReliabilityQosPolicy reliability**
Policy of the corresponding DataReader.
- struct **DDS_OwnershipQosPolicy ownership**
Policy of the corresponding DataReader.
- struct **DDS_DestinationOrderQosPolicy destination_order**
Policy of the corresponding DataReader.
- struct **DDS_UserDataQosPolicy user_data**
Policy of the corresponding DataReader.
- struct **DDS_TimeBasedFilterQosPolicy time_based_filter**
Policy of the corresponding DataReader.
- struct **DDS_PresentationQosPolicy presentation**
Policy of the Subscriber to which the DataReader belongs.
- struct **DDS_PartitionQosPolicy partition**
Policy of the Subscriber to which the DataReader belongs.
- struct **DDS_TopicDataQosPolicy topic_data**
Policy of the related Topic.
- struct **DDS_GroupDataQosPolicy group_data**

- Policy of the Subscriber to which the DataReader belongs.*
- struct **DDS_TypeConsistencyEnforcementQosPolicy** **type_consistency**
Policy of the corresponding DataReader.
- struct **DDS_DataRepresentationQosPolicy** **representation**
Data representation policy of the corresponding DataReader.
- **DDS_DataTagQosPolicy** **data_tags**
Tags of the corresponding DataReader.
- struct **DDS_TypeCode** * **type_code**
<<extension>> (p. 236) Type code information of the corresponding Topic
- **DDS_BuiltinTopicKey_t** **subscriber_key**
<<extension>> (p. 236) DCPS key of the subscriber to which the DataReader belongs.
- struct **DDS_PropertyQosPolicy** **property**
<<extension>> (p. 236) Properties of the corresponding DataReader.
- struct **DDS_LocatorSeq** **unicast_locators**
<<extension>> (p. 236) Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.
- struct **DDS_LocatorSeq** **multicast_locators**
<<extension>> (p. 236) Custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.
- struct **DDS_ContentFilterProperty_t** **content_filter_property**
<<extension>> (p. 236) This field provides all the required information to enable content filtering on the Writer side.
- struct **DDS_GUID_t** **virtual_guid**
<<extension>> (p. 236) Virtual GUID associated to the DataReader.
- struct **DDS_ServiceQosPolicy** **service**
<<extension>> (p. 236) Policy of the corresponding DataReader.
- **DDS_ProtocolVersion_t** **rtps_protocol_version**
<<extension>> (p. 236) Version number of the RTPS wire protocol used.
- struct **DDS_VendorId_t** **rtps_vendor_id**
<<extension>> (p. 236) ID of vendor implementing the RTPS wire protocol.
- struct **DDS_ProductVersion_t** **product_version**
<<extension>> (p. 236) This is a vendor specific parameter. It gives the current version of RTI Connext
- **DDS_Boolean** **disable_positive_acks**
<<extension>> (p. 236) This is a vendor specific parameter. Determines whether the corresponding DataReader sends positive acknowledgments for reliability.
- struct **DDS_EntityNameQosPolicy** **subscription_name**
<<extension>> (p. 236) The subscription name and role name.
- struct **DDS_EndpointTrustProtectionInfo** **trust_protection_info**
<<extension>> (p. 236) Trust plugins protection information associated with the discovered DataReader.
- struct **DDS_EndpointTrustAlgorithmInfo** **trust_algorithm_info**
<<extension>> (p. 236) Trust Plugins algorithms associated with the discovered DataReader.

9.182.1 Detailed Description

Entry created when a **DDSDataReader** (p. 1272) is discovered in association with its Subscriber.

Data associated with the built-in topic **DDS_SUBSCRIPTION_TOPIC_NAME** (p. 299). It contains QoS policies and additional information that apply to the remote **DDSDataReader** (p. 1272) the related **DDSSubscriber** (p. 1576).

See also

DDS_SUBSCRIPTION_TOPIC_NAME (p. 299)

DDSSubscriptionBuiltinTopicDataDataReader (p. 1598)

9.182.2 Member Data Documentation

9.182.2.1 key

`DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::key`

DCPS key to distinguish entries.

9.182.2.2 participant_key

`DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::participant_key`

DCPS key of the participant to which the DataReader belongs.

9.182.2.3 topic_name

`char* DDS_SubscriptionBuiltinTopicData::topic_name`

Name of the related **DDSTopic** (p. 1601).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 546).

See also

String Conventions (p. 546)

9.182.2.4 type_name

`char* DDS_SubscriptionBuiltinTopicData::type_name`

Name of the type attached to the **DDSTopic** (p. 1601).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 546).

See also

String Conventions (p. 546)

9.182.2.5 durability

```
struct DDS_DurabilityQosPolicy DDS_SubscriptionBuiltinTopicData::durability
```

Policy of the corresponding DataReader.

9.182.2.6 deadline

```
struct DDS_DeadlineQosPolicy DDS_SubscriptionBuiltinTopicData::deadline
```

Policy of the corresponding DataReader.

9.182.2.7 latency_budget

```
struct DDS_LatencyBudgetQosPolicy DDS_SubscriptionBuiltinTopicData::latency_budget
```

Policy of the corresponding DataReader.

9.182.2.8 liveliness

```
struct DDS_LivelinessQosPolicy DDS_SubscriptionBuiltinTopicData::liveliness
```

Policy of the corresponding DataReader.

9.182.2.9 reliability

```
struct DDS_ReliabilityQosPolicy DDS_SubscriptionBuiltinTopicData::reliability
```

Policy of the corresponding DataReader.

9.182.2.10 ownership

```
struct DDS_OwnershipQosPolicy DDS_SubscriptionBuiltinTopicData::ownership
```

Policy of the corresponding DataReader.

9.182.2.11 destination_order

```
struct DDS_DestinationOrderQosPolicy DDS_SubscriptionBuiltinTopicData::destination_order
```

Policy of the corresponding DataReader.

Warning

Only the field **DDS_DestinationOrderQosPolicy::kind** (p. 705) is propagated during discovery. The other fields always contain their default values.

9.182.2.12 user_data

```
struct DDS_UserDataQosPolicy DDS_SubscriptionBuiltinTopicData::user_data
```

Policy of the corresponding DataReader.

9.182.2.13 time_based_filter

```
struct DDS_TimeBasedFilterQosPolicy DDS_SubscriptionBuiltinTopicData::time_based_filter
```

Policy of the corresponding DataReader.

9.182.2.14 presentation

```
struct DDS_PresentationQosPolicy DDS_SubscriptionBuiltinTopicData::presentation
```

Policy of the Subscriber to which the DataReader belongs.

9.182.2.15 partition

```
struct DDS_PartitionQosPolicy DDS_SubscriptionBuiltinTopicData::partition
```

Policy of the Subscriber to which the DataReader belongs.

9.182.2.16 topic_data

```
struct DDS_TopicDataQosPolicy DDS_SubscriptionBuiltinTopicData::topic_data
```

Policy of the related Topic.

9.182.2.17 group_data

```
struct DDS_GroupDataQosPolicy DDS_SubscriptionBuiltinTopicData::group_data
```

Policy of the Subscriber to which the DataReader belongs.

9.182.2.18 type_consistency

```
struct DDS_TypeConsistencyEnforcementQosPolicy DDS_SubscriptionBuiltinTopicData::type_consistency
```

Policy of the corresponding DataReader.

9.182.2.19 representation

```
struct DDS_DataRepresentationQosPolicy DDS_SubscriptionBuiltinTopicData::representation
```

Data representation policy of the corresponding DataReader.

9.182.2.20 data_tags

```
DDS_DataTagQosPolicy DDS_SubscriptionBuiltinTopicData::data_tags
```

Tags of the corresponding DataReader.

9.182.2.21 type_code

```
struct DDS_TypeCode* DDS_SubscriptionBuiltinTopicData::type_code
```

<<*extension*>> (p. 236) Type code information of the corresponding Topic

9.182.2.22 subscriber_key

```
DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::subscriber_key
```

<<*extension*>> (p. 236) DCPS key of the subscriber to which the DataReader belongs.

9.182.2.23 property

```
struct DDS_PropertyQosPolicy DDS_SubscriptionBuiltinTopicData::property
```

<<*extension*>> (p. 236) Properties of the corresponding DataReader.

9.182.2.24 unicast_locators

```
struct DDS_LocatorSeq DDS_SubscriptionBuiltinTopicData::unicast_locators
```

<<*extension*>> (p. 236) Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

9.182.2.25 multicast_locators

```
struct DDS_LocatorSeq DDS_SubscriptionBuiltinTopicData::multicast_locators
```

<<*extension*>> (p. 236) Custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.

9.182.2.26 content_filter_property

```
struct DDS_ContentFilterProperty_t DDS_SubscriptionBuiltinTopicData::content_filter_property
```

<<*extension*>> (p. 236) This field provides all the required information to enable content filtering on the Writer side.

9.182.2.27 virtual_guid

```
struct DDS_GUID_t DDS_SubscriptionBuiltinTopicData::virtual_guid
```

<<**extension**>> (p. 236) Virtual GUID associated to the DataReader.

See also

DDS_GUID_t (p. 905)

9.182.2.28 service

```
struct DDS_ServiceQosPolicy DDS_SubscriptionBuiltinTopicData::service
```

<<**extension**>> (p. 236) Policy of the corresponding DataReader.

9.182.2.29 rtps_protocol_version

```
DDS_ProtocolVersion_t DDS_SubscriptionBuiltinTopicData::rtps_protocol_version
```

<<**extension**>> (p. 236) Version number of the RTPS wire protocol used.

9.182.2.30 rtps_vendor_id

```
struct DDS_VendorId_t DDS_SubscriptionBuiltinTopicData::rtps_vendor_id
```

<<**extension**>> (p. 236) ID of vendor implementing the RTPS wire protocol.

9.182.2.31 product_version

```
struct DDS_ProductVersion_t DDS_SubscriptionBuiltinTopicData::product_version
```

<<**extension**>> (p. 236) This is a vendor specific parameter. It gives the current version of RTI Connext

9.182.2.32 disable_positive_acks

`DDS_Boolean DDS_SubscriptionBuiltinTopicData::disable_positive_acks`

<<**extension**>> (p. 236) This is a vendor specific parameter. Determines whether the corresponding DataReader sends positive acknowledgments for reliability.

9.182.2.33 subscription_name

`struct DDS_EntityNameQosPolicy DDS_SubscriptionBuiltinTopicData::subscription_name`

<<**extension**>> (p. 236) The subscription name and role name.

This member contains the name and the role name of the discovered subscription.

9.182.2.34 trust_protection_info

`struct DDS_EndpointTrustProtectionInfo DDS_SubscriptionBuiltinTopicData::trust_protection_info`

<<**extension**>> (p. 236) Trust plugins protection information associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

9.182.2.35 trust_algorithm_info

`struct DDS_EndpointTrustAlgorithmInfo DDS_SubscriptionBuiltinTopicData::trust_algorithm_info`

<<**extension**>> (p. 236) Trust Plugins algorithms associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

9.183 DDS_SubscriptionBuiltinTopicDataSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_SubscriptionBuiltinTopicData** (p. 1094) > .

9.183.1 Detailed Description

Instantiates **FooSeq** (p. 1680) < **DDS_SubscriptionBuiltinTopicData** (p. 1094) > .

Instantiates:

DDS_SubscriptionBuiltinTopicData (p. 1094)

9.184 DDS_SubscriptionMatchedStatus Struct Reference

DDS_SUBSCRIPTION_MATCHED_STATUS (p. 346)

Public Attributes

- **DDS_Long total_count**
*The total cumulative number of times that this **DDSDataReader** (p. 1272) discovered a "match" with a **DDSDataWriter** (p. 1305).*
- **DDS_Long total_count_change**
The changes in total_count since the last time the listener was called or the status was read.
- **DDS_Long current_count**
*The current number of DataWriters with which the **DDSDataReader** (p. 1272) is matched.*
- **DDS_Long current_count_peak**
<<extension>> (p. 236) Greatest number of DataWriters that matched this DataReader simultaneously.
- **DDS_Long current_count_change**
The change in current_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_publication_handle**
*This InstanceHandle can be used to look up which remote **DDSDataWriter** (p. 1305) was the last to cause this DataReader's status to change, using **DDSDataReader::get_matched_publication_data** (p. 1284).*

9.184.1 Detailed Description

DDS_SUBSCRIPTION_MATCHED_STATUS (p. 346)

A "match" happens when the **DDSDDataReader** (p. 1272) finds a **DDSDDataWriter** (p. 1305) with the same **DDSTopic** (p. 1601), same or compatible data type, and an offered QoS that is compatible with that requested by the **DDSDDataReader** (p. 1272). (For information on compatible data types, see the [Extensible Types Guide](#).)

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDSDDataReader** (p. 1272) will become "unmatched" from a remote **DDSDDataWriter** (p. 1305) when that **DDSDDataWriter** (p. 1305) goes away for any of the following reasons:

- The **DDSDomainParticipant** (p. 1335) containing the matched **DDSDDataWriter** (p. 1305) has lost liveliness.
- This DataReader or the matched DataWriter has changed QoS such that the entities are now incompatible.
- The matched DataWriter has been deleted.

This status may reflect changes from multiple match or unmatched events, and the **DDS_SubscriptionMatchedStatus::current_count_change** (p. 1105) can be used to determine the number of changes since the listener was called back or the status was checked.

Note: A DataWriter's loss of liveliness (which is determined by **DDS_LivelinessQosPolicyKind** (p. 409)) does not trigger an unmatched event. So a DataWriter may still match even though its liveliness is lost.

9.184.2 Member Data Documentation

9.184.2.1 total_count

DDS_Long **DDS_SubscriptionMatchedStatus::total_count**

The total cumulative number of times that this **DDSDDataReader** (p. 1272) discovered a "match" with a **DDSDDataWriter** (p. 1305).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **DDS_SubscriptionMatchedStatus** (p. 1103).

9.184.2.2 total_count_change

DDS_Long **DDS_SubscriptionMatchedStatus::total_count_change**

The changes in **total_count** since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times the DataReader ever matched with a DataWriter).

9.184.2.3 current_count

```
DDS_Long DDS_SubscriptionMatchedStatus::current_count
```

The current number of DataWriters with which the **DDSDataReader** (p. 1272) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **DDS_SubscriptionMatchedStatus** (p. 1103).

9.184.2.4 current_count_peak

```
DDS_Long DDS_SubscriptionMatchedStatus::current_count_peak
```

<<*extension*>> (p. 236) Greatest number of DataWriters that matched this DataReader simultaneously.

That is, there was no moment in time when more than this many DataWriters matched this DataReader. (As a result, total_count can be higher than current_count_peak.)

9.184.2.5 current_count_change

```
DDS_Long DDS_SubscriptionMatchedStatus::current_count_change
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataWriters have become unmatched for one or more of the reasons described in **DDS_SubscriptionMatchedStatus** (p. 1103).

9.184.2.6 last_publication_handle

```
DDS_InstanceHandle_t DDS_SubscriptionMatchedStatus::last_publication_handle
```

This InstanceHandle can be used to look up which remote **DDSDataWriter** (p. 1305) was the last to cause this DataReader's status to change, using **DDSDataReader::get_matched_publication_data** (p. 1284).

If the DataWriter no longer matches this DataReader due to any of the reasons in **DDS_SubscriptionMatchedStatus** (p. 1103) except incompatible QoS, then the DataWriter has been purged from this DataReader's DomainParticipant discovery database. (See the "Discovery Overview" section of the *User's Manual*.) In that case, the **DDSDataReader::get_matched_publication_data** (p. 1284) method will not be able to return information about the DataWriter. The only way to get information about the lost DataWriter is if you cached the information previously.

9.185 DDS_SystemResourceLimitsQosPolicy Struct Reference

<<*extension*>> (p. 236) Configures **DDSDomainParticipant** (p. 1335)-independent resources used by RTI Connext. Mainly used to change the maximum number of **DDSDomainParticipant** (p. 1335) entities that can be created within a single process (address space).

Public Attributes

- **DDS_Long max_objects_per_thread**

*The maximum number of objects that can be stored per thread for a **DDSDomainParticipantFactory** (p. 1409).*

- **DDS_Long initial_objects_per_thread**

*The number of objects per thread for a **DDSDomainParticipantFactory** (p. 1409) for which infrastructure will initially be allocated.*

9.185.1 Detailed Description

<<**extension**>> (p. 236) Configures **DDSDomainParticipant** (p. 1335)-independent resources used by RTI Connex. Mainly used to change the maximum number of **DDSDomainParticipant** (p. 1335) entities that can be created within a single process (address space).

Entity:

DDSDomainParticipantFactory (p. 1409)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.185.2 Usage

Within a single process (or address space for some supported real-time operating systems), applications may create and use multiple **DDSDomainParticipant** (p. 1335) entities. This QoS policy sets a parameter that places an effective upper bound on the maximum number of **DDSDomainParticipant** (p. 1335) entities that can be created in a single process/address space. These values cannot be changed after a DomainParticipant has been created and they cannot be set in a QoS XML file.

9.185.3 Member Data Documentation

9.185.3.1 max_objects_per_thread

DDS_Long `DDS_SystemResourceLimitsQosPolicy::max_objects_per_thread`

The maximum number of objects that can be stored per thread for a **DDSDomainParticipantFactory** (p. 1409).

This value is the upper bound on the number of objects that can be stored per thread. When a **DDSDomainParticipantFactory** (p. 1409) is created, infrastructure will be created to manage the number of objects specified by `initial_objects_per_thread`. As more objects are required by the application, the infrastructure will be automatically grown to accommodate up to `max_objects_per_thread` objects. Leave this property set to the default value to allow the infrastructure to grow as needed. If you wish to strictly control memory allocation, set `max_objects_per_thread` to a smaller value, but note that this runs the risk of a runtime error and reduced application functionality if your limit is reached.

[default] 261120

[range] [1, 261120]

9.185.3.2 initial_objects_per_thread

DDS_Long DDS_SystemResourceLimitsQosPolicy::initial_objects_per_thread

The number of objects per thread for a **DDSDomainParticipantFactory** (p. 1409) for which infrastructure will initially be allocated.

The infrastructure for managing thread-specific objects will initially be sized according to this value. The infrastructure will grow automatically, up to a maximum of `max_objects_per_thread`, as required by the application at runtime. If you are certain that more than the default value of `initial_objects_per_thread` will be required for your application and you wish to reduce the number of memory allocations performed while your application reaches steady state, you may set this value to a larger number. To improve the efficiency of memory allocation, RTI Connext may initially size the infrastructure to a larger value than the value of `initial_objects_per_thread`. The infrastructure will never be sized less than `initial_objects_per_thread` or greater than `max_objects_per_thread`. When the infrastructure for managing thread-specific objects is created or increased, a log message stating "Allowed number of thread specific objects is now " will be produced at the local log level.

[default] 1024

[range] [1, 261120]; must be less than or equal to `max_objects_per_thread`

9.186 DDS_Tag Struct Reference

Tags are name/value pair objects.

Public Attributes

- char * **name**
Tag name.
- char * **value**
Tag value.

9.186.1 Detailed Description

Tags are name/value pair objects.

9.186.2 Member Data Documentation

9.186.2.1 name

char* DDS_Tag::name

Tag name.

It must be a NULL-terminated string.

9.186.2.2 value

`char* DDS_Tag::value`

Tag value.

It must be a NULL-terminated string.

9.187 DDS_TagSeq Struct Reference

Declares IDL sequence `< DDS_Tag` (p. 1107) `>`

9.187.1 Detailed Description

Declares IDL sequence `< DDS_Tag` (p. 1107) `>`

9.188 DDS_ThreadSettings_t Struct Reference

The properties of a thread of execution.

Public Attributes

- **DDS_ThreadSettingsKindMask mask**
Describes the type of thread.
- **DDS_Long priority**
Thread priority.
- **DDS_Long stack_size**
The thread stack-size.
- struct **DDS_LongSeq cpu_list**
The list of processors on which the thread(s) may run.
- **DDS_ThreadSettingsCpuRotationKind cpu_rotation**
Determines how processor affinity is applied to multiple threads.

9.188.1 Detailed Description

The properties of a thread of execution.

QoS:

DDS_EventQosPolicy (p. 893) **DDS_DatabaseQosPolicy** (p. 613) **DDS_ReceiverPoolQosPolicy** (p. 1025)
DDS_AsynchronousPublisherQosPolicy (p. 584)

9.188.2 Member Data Documentation

9.188.2.1 mask

`DDS_ThreadSettingsKindMask DDS_ThreadSettings_t::mask`

Describes the type of thread.

The meaning of each bit of the mask are defined by **DDS_ThreadSettingsKind** (p. 351).

[default] 0, use default options of the OS

9.188.2.2 priority

`DDS_Long DDS_ThreadSettings_t::priority`

Thread priority.

[range] Platform-dependent - Consult `Platform Notes` for additional details.

9.188.2.3 stack_size

`DDS_Long DDS_ThreadSettings_t::stack_size`

The thread stack-size.

[range] Platform-dependent. Consult `Platform Notes` for additional details.

9.188.2.4 cpu_list

`struct DDS_LongSeq DDS_ThreadSettings_t::cpu_list`

The list of processors on which the thread(s) may run.

A sequence of integers that represent the set of processors on which the thread(s) controlled by this QoS may run. An empty sequence (the default) means the middleware will make no CPU affinity adjustments.

Note: This feature is currently only supported on a subset of architectures (see the `Platform Notes`). The API may change as more architectures are added in future releases.

This value is only relevant to the **DDS_ReceiverPoolQosPolicy** (p. 1025). It is ignored within other QoS policies that include **DDS_ThreadSettings_t** (p. 1108).

See also

Controlling CPU Core Affinity for RTI Threads (p. 351)

[default] Empty sequence

9.188.2.5 cpu_rotation

`DDS_ThreadSettingsCpuRotationKind DDS_ThreadSettings_t::cpu_rotation`

Determines how processor affinity is applied to multiple threads.

This value is only relevant to the **DDS_ReceiverPoolQosPolicy** (p. 1025). It is ignored within other QoS policies that include **DDS_ThreadSettings_t** (p. 1108).

9.190 DDS_TimeBasedFilterQosPolicy Struct Reference

Filter that allows a **DDSDataReader** (p. 1272) to specify that it is interested only in (potentially) a subset of the values of the data.

Public Attributes

- struct **DDS_Duration_t** **minimum_separation**
The minimum separation duration between subsequent samples.

9.190.1 Detailed Description

Filter that allows a **DDSDataReader** (p. 1272) to specify that it is interested only in (potentially) a subset of the values of the data.

The filter states that the **DDSDataReader** (p. 1272) does not want to receive more than one value each `minimum_separation`, regardless of how fast the changes occur.

Entity:

DDSDataReader (p. 1272)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **YES** (p. ??)

9.190.2 Usage

You can use this QoS policy to reduce the amount of data received by a **DDSDataReader** (p. 1272). **DDSDataWriter** (p. 1305) entities may send data faster than needed by a **DDSDataReader** (p. 1272). For example, a **DDSDataReader** (p. 1272) of sensor data that is displayed to a human operator in a GUI application does not need to receive data updates faster than a user can reasonably perceive changes in data values. This is often measured in tenths (0.1) of a second up to several seconds. However, a **DDSDataWriter** (p. 1305) of sensor information may have other **DDSDataReader** (p. 1272) entities that are processing the sensor information to control parts of the system and thus need new data updates in measures of hundredths (0.01) or thousandths (0.001) of a second.

With this QoS policy, different **DDSDataReader** (p. 1272) entities can set their own time-based filters, so that data published faster than the period set by a each **DDSDataReader** (p. 1272) will not be delivered to that **DDSDataReader** (p. 1272).

The **TIME_BASED_FILTER** (p. 440) also applies to each instance separately; that is, the constraint is that the **DDSDataReader** (p. 1272) does not want to see more than one sample of each instance per `minimum_separation` period.

This QoS policy allows you to optimize resource usage (CPU and possibly network bandwidth) by only delivering the required amount of data to each **DDSDataReader** (p. 1272), accommodating the fact that, for rapidly-changing data, different subscribers may have different requirements and constraints as to how frequently they need or can handle being notified of the most current values. As such, it can also be used to protect applications that are running on a heterogeneous network where some nodes are capable of generating data much faster than others can consume it.

For best effort data delivery, if the data type is unkeyed and the **DDSDataWriter** (p. 1305) has an infinite **DDS_LivelinessQosPolicy::lease_duration** (p. 925), RTI Connext will only send as many packets to a **DDSDataReader** (p. 1272) as required by the **TIME_BASED_FILTER**, no matter how fast **DDSDataWriter::write** (p. 1666) is called.

For multicast data delivery to multiple DataReaders, the one with the lowest `minimum_separation` determines the DataWriter's send rate. For example, if a **DDSDataWriter** (p. 1305) sends over multicast to two DataReaders, one with `minimum_separation` of 2 seconds and one with `minimum_separation` of 1 second, the DataWriter will send every 1 second.

In configurations where RTI Connext must send all the data published by the **DDSDataWriter** (p. 1305) (for example, when the **DDSDataWriter** (p. 1305) is reliable, when the data type is keyed, or when the **DDSDataWriter** (p. 1305) has a finite **DDS_LivelinessQosPolicy::lease_duration** (p. 925)), only the data that passes the **TIME_BASED_FILTER** will be stored in the receive queue of the **DDSDataReader** (p. 1272). Extra data will be accepted but dropped. Note that filtering is only applied on alive samples (that is, samples that have not been disposed/unregistered).

9.190.3 Consistency

It is inconsistent for a **DDSDataReader** (p. 1272) to have a `minimum_separation` longer than its **DEADLINE** (p. 384) period.

However, it is important to be aware of certain edge cases that can occur when your publication rate, minimum separation, and deadline period align and that can cause missed deadlines that you may not expect. For example, suppose that you nominally publish samples every second but that this rate can vary somewhat over time. You declare a minimum separation of 1 second to filter out rapid updates and set a deadline of two seconds so that you will be aware if the rate falls too low. Even if your update rate never wavers, you can still miss deadlines! Here's why:

Suppose you publish the first sample at time $t=0$ seconds. You then publish your next sample at $t=1$ seconds. Depending on how your operating system schedules the time-based filter execution relative to the publication, this second sample may be filtered. You then publish your third sample at $t=2$ seconds, and depending on how your OS schedules this publication in relation to the deadline check, you could miss the deadline.

This scenario demonstrates a couple of rules of thumb:

- Beware of setting your `minimum_separation` to a value very close to your publication rate: you may filter more data than you intend to.
- Beware of setting your `minimum_separation` to a value that is too close to your deadline period relative to your publication rate. You may miss deadlines.

See **DDS_DeadlineQosPolicy** (p. 701) for more information about the interactions between deadlines and time-based filters.

The setting of a **TIME_BASED_FILTER** (p. 440) – that is, the selection of a `minimum_separation` with a value greater than zero – is consistent with all settings of the **HISTORY** (p. 404) and **RELIABILITY** (p. 433) QoS. The **TIME_BASED_FILTER** (p. 440) specifies the samples that are of interest to the **DDSDataReader** (p. 1272). The **HISTORY** (p. 404) and **RELIABILITY** (p. 433) QoS affect the behavior of the middleware with respect to the samples that have been determined to be of interest to the **DDSDataReader** (p. 1272); that is, they apply *after* the **TIME_BASED_FILTER** (p. 440) has been applied.

In the case where the reliability QoS kind is **DDS_RELIABLE_RELIABILITY_QOS** (p. 435), in steady-state – defined as the situation where the **DDSDataWriter** (p. 1305) does not write new samples for a period "long" compared to the `minimum_separation` – the system should guarantee delivery of the last sample to the **DDSDataReader** (p. 1272).

9.191.1 Detailed Description

Entry created when a Topic object discovered.

Data associated with the built-in topic **DDS_TOPIC_TOPIC_NAME** (p. 296). It contains QoS policies and additional information that apply to the remote **DDSTopic** (p. 1601).

Note: The **DDS_TopicBuiltinTopicData** (p. 1113) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS_PublicationBuiltinTopicData** (p. 997) and **DDS_SubscriptionBuiltinTopicData** (p. 1094)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Public Attributes

- struct **DDS_OctetSeq** value
a sequence of octets

9.193.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Entity:

DDSTopic (p. 1601)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = YES (p. ??)

See also

DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.193.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDSTopic** (p. 1601) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This extra data is not used by RTI Connex.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with **DDSDataReaderListener** (p. 1299), **DDSDataWriterListener** (p. 1328), or operations such as **DDSDomainParticipant::ignore_topic** (p. 1378), this QoS policy can assist an application in defining and enforcing its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connex stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connex with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS_DomainParticipantResourceLimitsQosPolicy::topic_data_max_length** (p. 752).

struct DDS_TopicQuerySelection DDS_TopicQueryData::topic_query_selection
```

The data selection.

9.195.2.2 topic_name

```
char* DDS_TopicQueryData::topic_name
```

The topic name of the **DDSDataReader** (p. 1272).

9.195.2.3 original_related_reader_guid

```
struct DDS_GUID_t DDS_TopicQueryData::original_related_reader_guid
```

Identifies the **DDSDDataReader** (p. 1272) that created the **DDSTopicQuery** (p. 1611).

9.196 DDS_TopicQueryDispatchQosPolicy Struct Reference

Configures the ability of a **DDSDDataWriter** (p. 1305) to publish samples in response to a **DDSTopicQuery** (p. 1611).

Public Attributes

- **DDS_Boolean enable**
Allows this writer to dispatch TopicQueries.
- struct **DDS_Duration_t publication_period**
Sets the periodic interval at which samples are published.
- **DDS_Long samples_per_period**
Sets the maximum number of samples to publish in each publication_period.

9.196.1 Detailed Description

Configures the ability of a **DDSDDataWriter** (p. 1305) to publish samples in response to a **DDSTopicQuery** (p. 1611).

Enables the ability of a **DDSDDataWriter** (p. 1305) to publish historical samples upon reception of a **DDSTopicQuery** (p. 1611) and how often they are published.

Since a TopicQuery selects previously written samples, the DataWriter must have a **DDS_DurabilityQosPolicy::kind** (p. 764) different from **DDS_VOLATILE_DURABILITY_QOS** (p. 399). Also, **DDS_ReliabilityQosPolicy::kind** (p. 1029) must be set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435).

Only samples that fall within the **DDS_DurabilityQosPolicy::writer_depth** (p. 764) for an instance are evaluated against the TopicQuery filter. While the DataWriter is waiting for acknowledgements from one or more DataReaders, there may temporarily be more than **DDS_DurabilityQosPolicy::writer_depth** (p. 764) samples per instance in the DataWriter's queue if the **DDS_HistoryQosPolicy::depth** (p. 908) is set to a higher value than **DDS_DurabilityQosPolicy::writer_depth** (p. 764). Those additional samples past **DDS_DurabilityQosPolicy::writer_depth** (p. 764) are not eligible to be sent in response to the TopicQuery.

A TopicQuery may select multiple samples at once. The writer will publish them periodically, independently from newly written samples. **DDS_TopicQueryDispatchQosPolicy::publication_period** (p. 1127) configures the frequency of that period and **DDS_TopicQueryDispatchQosPolicy::samples_per_period** (p. 1127) configures the maximum number of samples to publish each period.

If the DataWriter blocks during the publication of one of these samples, it will stop and try again the next period. (See **FooDataWriter::write** (p. 1666) for the conditions that may cause the write operation to block.)

All the DataWriters that belong to a single **DDSPublisher** (p. 1534) and enable TopicQueries share the same event thread, but each DataWriter schedules separate events. To configure that thread, see **DDS_AsynchronousPublisherQosPolicy::topic_query_publication_thread** (p. 587).

If the DataWriter is dispatching more than one TopicQuery at the same time, the configuration of this periodic event applies to all of them. For example, if a DataWriter receives two TopicQueries around the same time, the period is 1 second, the number of samples per period is 10, the first TopicQuery selects 5 samples, and the second one selects 8, the DataWriter will immediately attempt to publish all 5 for the first TopicQuery and 5 for the second one. After one second, it will publish the remaining 3 samples.

Entity:

DDSDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

DDSPublisher (p. 1534)

9.196.2 Member Data Documentation

9.196.2.1 enable

```
DDS_Boolean DDS_TopicQueryDispatchQosPolicy::enable
```

Allows this writer to dispatch TopicQueries.

When set to true, this writer can receive and dispatch TopicQueries.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.196.2.2 publication_period

```
struct DDS_Duration_t DDS_TopicQueryDispatchQosPolicy::publication_period
```

Sets the periodic interval at which samples are published.

[default] 1 second

[range] [0,1 year]

9.196.2.3 samples_per_period

```
DDS_Long DDS_TopicQueryDispatchQosPolicy::samples_per_period
```

Sets the maximum number of samples to publish in each publication_period.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 100000000] or **DDS_LENGTH_UNLIMITED** (p. 437)

9.197 DDS_TopicQuerySelection Struct Reference

<<**extension**>> (p. 236) Specifies the data query that defines a **DDSTopicQuery** (p. 1611)

Public Attributes

- char * **filter_class_name**
The name of the filter to use.
- char * **filter_expression**
The filter expression.
- struct **DDS_StringSeq** **filter_parameters**
The query parameters.
- **DDS_TopicQuerySelectionKind** **kind**
Indicates whether the sample selection is limited to cached samples or not.

9.197.1 Detailed Description

<<**extension**>> (p. 236) Specifies the data query that defines a **DDSTopicQuery** (p. 1611)

The query format is similar to the expression and parameters of a **DDSQueryCondition** (p. 1557) or a **DDSContentFilteredTopic** (p. 1267), as described in **DDSDomainParticipant::create_contentfilteredtopic_with_filter** (p. 1370).

There are two special queries:

- **DDS_TOPIC_QUERY_SELECTION_SELECT_ALL** (p. 155)
- **DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER** (p. 155)

See also

Queries and Filters Syntax (p. 178)

9.197.2 Member Data Documentation

9.197.2.1 filter_class_name

```
char* DDS_TopicQuerySelection::filter_class_name
```

The name of the filter to use.

Name of content filter to use. Must be one of the built-in filter names or previously registered with **DDSDomainParticipant::register_contentfilter** (p. 1347) on the same **DDSDomainParticipant** (p. 1335).

Built-in filter names are **DDS_SQLFILTER_NAME** (p. 59) and **DDS_STRINGMATCHFILTER_NAME** (p. 59).

[default] See **DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER** (p. 155)

9.197.2.2 filter_expression

```
char* DDS_TopicQuerySelection::filter_expression
```

The filter expression.

The expression to filter samples in the DataWriters. It follows the format described in **Queries and Filters Syntax** (p. 178).

[default] See **DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER** (p. 155)

See also

Queries and Filters Syntax (p. 178)

9.197.2.3 filter_parameters

```

```

Indicates whether the sample selection is limited to cached samples or not.

[default] **DDS_TOPIC_QUERY_SELECTION_KIND_HISTORY_SNAPSHOT** (p. 155)

9.198 DDS_TransportBuiltinQosPolicy Struct Reference

Specifies which built-in transports are used.

Public Attributes

- **DDS_TransportBuiltinKindMask mask**

*Specifies the built-in transports that are registered automatically when the **DDSDomainParticipant** (p. 1335) is enabled.*

9.198.1 Detailed Description

Specifies which built-in transports are used.

Three different transport plug-ins are built into the core RTI Connex libraries (for most supported target platforms): UDPv4, shared memory, and UDPv6.

This QoS policy allows you to control which of these built-in transport plug-ins are used by a **DDSDomainParticipant** (p. 1335). By default, only the UDPv4 and shared memory plug-ins are enabled (although on some embedded platforms, the shared memory plug-in is not available). In some cases, users will disable the shared memory transport when they do not want applications to use shared memory to communicate when running on the same node.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.198.2 Member Data Documentation

9.198.2.1 mask

DDS_TransportBuiltinKindMask DDS_TransportBuiltinQosPolicy::mask

Specifies the built-in transports that are registered automatically when the **DDSDomainParticipant** (p. 1335) is enabled.

RTI Connex provides several built-in transports. Only those that are specified with this mask are registered automatically when the **DDSDomainParticipant** (p. 1335) is enabled.

[default] **DDS_TRANSPORTBUILTIN_MASK_DEFAULT** (p. 444)

9.199 DDS_TransportInfo_t Struct Reference

Contains the class_id and message_size_max of an installed transport.

Public Attributes

- **NDDS_Transport_ClassId_t class_id**
The class_id identifies the transport associated with the message_size_max.
- **DDS_Long message_size_max**
The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin identified by the class_id.

9.199.1 Detailed Description

Contains the class_id and message_size_max of an installed transport.

9.199.2 Member Data Documentation

9.199.2.1 class_id

NDDS_Transport_ClassId_t DDS_TransportInfo_t::class_id

The class_id identifies the transport associated with the message_size_max.

9.199.2.2 message_size_max

DDS_Long DDS_TransportInfo_t::message_size_max

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin identified by the class_id.

DDS_TransportInfo_t (p. 1130)

9.201 DDS_TransportMulticastMapping_t Struct Reference

Type representing a list of multicast mapping elements.

Public Attributes

- char * **addresses**
*A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive multicast traffic for the entity with a topic that matches the **DDS_TransportMulticastMapping_t::topic_expression** (p. 1132).*
- char * **topic_expression**
A regular expression that will be used to map topic names to corresponding multicast receive addresses.
- struct **DDS_TransportMulticastMappingFunction_t** **mapping_function**
Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.

9.201.1 Detailed Description

Type representing a list of multicast mapping elements.

A multicast mapping element specifies a string containing a list of IP addresses, a topic expression and a mapping function.

QoS:

DDS_TransportMulticastMappingQosPolicy (p. 1134)

9.201.2 Member Data Documentation

9.201.2.1 addresses

```
char* DDS_TransportMulticastMapping_t::addresses
```

A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive *multicast* traffic for the entity with a topic that matches the **DDS_TransportMulticastMapping_t::topic_expression** (p. 1132).

The string must contain IPv4 or IPv6 addresses separated by commas. For example: "239.255.100.1,239.255.100.1,2,239.255.100.3"

You may specify ranges of addresses by enclosing the start address and the end address in square brackets. For example: "[239.255.100.1,239.255.100.3]"

You may combine the two approaches. For example:

```
"239.255.200.1,[239.255.100.1,239.255.100.3], 239.255.200.3"
```

IPv4 addresses must be specified in Dot-decimal notation.

IPv6 addresses must be specified using 8 groups of 16-bit hexadecimal values separated by colons. For example: FF00:0000:0000:0000:0202:B3FF:FE1E:8329

Leading zeroes can be skipped. For example: "FF00:0:0:0:0202:B3FF:FE1E:8329"

You may replace a consecutive number of zeroes with a double colon, but only once within an address. For example: "FF00::0202:B3FF:FE1E:8329"

[default] NULL

9.201.2.2 topic_expression

```
char* DDS_TransportMulticastMapping_t::topic_expression
```

A regular expression that will be used to map topic names to corresponding multicast receive addresses.

A topic name must match the expression before a corresponding address is assigned.

[default] NULL

9.201.2.3 mapping_function

```
struct DDS_TransportMulticastMappingFunction_t DDS_TransportMulticastMapping_t::mapping_function
```

Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.

This function is optional. If not specified, the middleware will use a hash function to perform the mapping.

9.202 DDS_TransportMulticastMappingFunction_t Struct Reference

Type representing an external mapping function.

Public Attributes

- char * **dll**
Specifies a dynamic library that contains a mapping function.
- char * **function_name**
Specifies the name of a mapping function.

9.202.1 Detailed Description

Type representing an external mapping function.

A mapping function is defined by a dynamic library name and a function name.

QoS:

DDS_TransportMulticastMappingQosPolicy (p. 1134)

9.202.2 Member Data Documentation

9.202.2.1 dll

```
char* DDS_TransportMulticastMappingFunction_t::dll
```

Specifies a dynamic library that contains a mapping function.

A relative or absolute path can be specified.

If the name is specified as "foo", the library name on Linux systems will be libfoo.so; on Windows systems it will be foo.dll.

[default] NULL

9.202.2.2 function_name

```
char* DDS_TransportMulticastMappingFunction_t::function_name
```

Specifies the name of a mapping function.

This function must be implemented in the library specified in **DDS_TransportMulticastMappingFunction_t::dll** (p. 1133).

The function must implement the following interface:

```
int function(const char* topic_name, int numberOfAddresses);
```

The function must return an integer that indicates the *index* of the address to use for the given `topic_name`. For example, if the first address in the list should be used, it must return 0; if the second address in the list should be used, it must return 1, etc.

9.203 DDS_TransportMulticastMappingQosPolicy Struct Reference

Specifies a list of `topic_expressions` and multicast addresses that can be used by an Entity with a specific topic name to receive data.

Public Attributes

- struct **DDS_TransportMulticastMappingSeq** **value**
A sequence of multicast communication mappings.

9.203.1 Detailed Description

Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

This QoS policy provides an alternate way to assign multicast receive addresses to DataReaders. It allows you to perform multicast configuration at the **DDSDomainParticipant** (p. 1335) level.

To use multicast communication *without* this QoS policy, you must explicitly assign a multicast receive address on each **DDSDataReader** (p. 1272). This can quickly become difficult to configure as more DataReaders of different topics and multicast addresses are added.

With this QoS policy, you can configure a set of multicast addresses on the **DDSDomainParticipant** (p. 1335); those addresses will then be automatically assigned to the DomainParticipant's DataReaders. A single configuration on the **DDSDomainParticipant** (p. 1335) can thus replace per-DataReader configuration.

On the DomainParticipant, the set of assignable addresses can be configured for specific topics. Addresses are configured on topics because efficient usage of multicast will have all DataWriters and DataReaders of a single topic using the same multicast address.

You can specify a mapping between a topic's name and a multicast address. For example, topic 'A' can be assigned to address 239.255.1.1 and topic 'B' can be assigned to address 239.255.1.2.

You can use filter expressions to configure a subset of topics to use a specific list of addresses. For example, suppose topics "X", "Y" and "Z" need to be sent to any address within the range [239.255.1.1, 239.255.1.255]. You can specify an expression on the topic name (e.g. "[X-Z]") corresponding to that range of addresses. Then the DomainParticipant will select an address for a topic whose name matches the expression.

The middleware will use a hash function to perform the mapping from topic to address. Alternatively, you can specify a pluggable mapping function.

IMPORTANT: All the strings defined in each element of the sequence must be assigned using `RTI_String_dup("foo");`. For example:

```
mcastMappingElement->addresses = DDS_String_dup("[239.255.1.1,239.255.1.255]");
```

NOTE: To use this QoS policy, you must:

- Set **DDS_TransportMulticastQosPolicy::kind** (p. 1137) to **DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS** (p. 448).
- Set the first element in **DDSDataReader** (p. 1272)'s **DDS_TransportMulticastQosPolicy::value** (p. 1137) with an empty address.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.203.2 Member Data Documentation

9.203.2.1 value

```
struct DDS_TransportMulticastMappingSeq DDS_TransportMulticastMappingQosPolicy::value
```

A sequence of multicast communication mappings.

[default] Empty sequence.

9.204 DDS_TransportMulticastMappingSeq Struct Reference

Declares IDL `sequence< DDS_TransportMulticastMapping_t (p. 1132) >`

9.204.1 Detailed Description

Declares IDL `sequence< DDS_TransportMulticastMapping_t (p. 1132) >`

Instantiates:

`<<generic>>` (p. 236) **FooSeq** (p. 1680)

See also

DDS_TransportMulticastMapping_t (p. 1132)

9.205 DDS_TransportMulticastQosPolicy Struct Reference

Specifies the multicast address on which a **DDSDataReader** (p. 1272) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDSDomainParticipant** (p. 1335) level) transports with which to receive the multicast data.

Public Attributes

- struct **DDS_TransportMulticastSettingsSeq** value
A sequence of multicast communications settings.
- **DDS_TransportMulticastQosPolicyKind** kind
A value that specifies a way to determine how to obtain the multicast address.

9.205.1 Detailed Description

Specifies the multicast address on which a **DDSDataReader** (p. 1272) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDSDomainParticipant** (p. 1335) level) transports with which to receive the multicast data.

By default, a **DDSDataWriter** (p. 1305) will send individually addressed packets for each **DDSDataReader** (p. 1272) that subscribes to the topic of the DataWriter – this is known as unicast delivery. Thus, as many copies of the data will be sent over the network as there are DataReaders for the data. The network bandwidth used by a DataWriter will thus increase linearly with the number of DataReaders.

Multicast addressing (on UDP/IP transports) allows multiple DataReaders to receive the *same* network packet. By using multicast, a **DDSDataWriter** (p. 1305) can send a single network packet that is received by all subscribing applications. Thus the network bandwidth usage will be constant, independent of the number of DataReaders.

Coordinating the multicast address specified by DataReaders can help optimize network bandwidth usage in systems where there are multiple DataReaders for the same **DDSTopic** (p. 1601).

Entity:

DDSDataReader (p. 1272)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.205.2 Member Data Documentation

9.205.2.1 value

```
struct DDS_TransportMulticastSettingsSeq DDS_TransportMulticastQosPolicy::value
```

A sequence of multicast communications settings.

An empty sequence means that multicast is not used by the entity.

The RTPS wire protocol currently limits the maximum number of multicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 994) associated with the **DDS_DomainParticipantQos** (p. 735).

[default] Empty sequence.

9.205.2.2 kind

DDS_TransportMulticastQosPolicyKind DDS_TransportMulticastQosPolicy::kind

A value that specifies a way to determine how to obtain the multicast address.

This field can be set to one of the following two values: **DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS** (p. 448) or **DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_QOS** (p. 448).

- If it is set to **DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS** (p. 448), the behavior will depend on the **DDS_TransportMulticastQosPolicy::value** (p. 1137):
 - If **DDS_TransportMulticastQosPolicy::value** (p. 1137) does not have any elements, then multicast will not be used.
 - If **DDS_TransportMulticastQosPolicy::value** (p. 1137) first element has an empty address, then the address will be obtained from **DDS_TransportMulticastMappingQosPolicy** (p. 1134).
 - If none of the elements in **DDS_TransportMulticastQosPolicy::value** (p. 1137) is empty, and at least one element has a valid address, then that address will be used.
- If it is set to **DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_QOS** (p. 448), then multicast will not be used.

[default] **DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS** (p. 448)

9.206 DDS_TransportMulticastSettings_t Struct Reference

Type representing a list of multicast locators.

Public Attributes

- struct **DDS_StringSeq transports**
A sequence of transport aliases that specifies the transports on which to receive multicast traffic for the entity.
- char * **receive_address**
The multicast group address on which the entity can receive data.
- **DDS_Long receive_port**
The multicast port on which the entity can receive data.

9.206.1 Detailed Description

Type representing a list of multicast locators.

A multicast locator specifies a transport class, a multicast address, and a multicast port number on which messages can be received by an entity.

QoS:

DDS_TransportMulticastQosPolicy (p. 1136)

9.206.2 Member Data Documentation

9.206.2.1 transports

```
struct DDS_StringSeq DDS_TransportMulticastSettings_t::transports
```

A sequence of transport aliases that specifies the transports on which to receive *multicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias in this sequence are used to subscribe to the multicast group addresses. Thus, this list of aliases sub-selects from the transport s available to the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 442).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

9.206.2.2 receive_address

```
char* DDS_TransportMulticastSettings_t::receive_address
```

The multicast group address on which the entity can receive data.

Must must be an address in the proper format (see **Address Format** (p. ??)).

[default] NONE/INVALID. Required to specify a multicast group address to join.

[range] A valid IPv4 or IPv6 multicast address.

See also

Address Format (p. ??)

9.206.2.3 receive_port

DDS_Long DDS_TransportMulticastSettings_t::receive_port

The multicast port on which the entity can receive data.

[default] 0, which implies that the actual port number is determined by a formula as a function of the `domain_id` (see **DDS_WireProtocolQosPolicy::participant_id** (p. 1231)).

[range] [0,0xffffffff]

9.207 DDS_TransportMulticastSettingsSeq Struct Reference

Declares IDL `sequence< DDS_TransportMulticastSettings_t` (p. 1138) >

9.207.1 Detailed Description

Declares IDL `sequence< DDS_TransportMulticastSettings_t` (p. 1138) >

Instantiates:

<<*generic*>> (p. 236) **FooSeq** (p. 1680)

See also

DDS_TransportMulticastSettings_t (p. 1138)

9.208 DDS_TransportPriorityQosPolicy Struct Reference

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

Public Attributes

- **DDS_Long** value

This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.

9.208.1 Detailed Description

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

The Transport Priority QoS policy is optional and only supported on certain OSs and transports. It allows you to specify on a per-DataWriter or DataReader basis that the data sent by that endpoint is of a different priority.

The DDS specification does not indicate how a DDS implementation should treat data of different priorities. It is often difficult or impossible for DDS implementations to treat data of higher priority differently than data of lower priority, especially when data is being sent (delivered to a physical transport) directly by the thread that called **FooDataWriter::write** (p. 1666). Also, many physical network transports themselves do not have a end-user controllable level of data packet priority.

Entity:

DDSDataWriter (p. 1305), **DDSDataReader** (p. 1272), **DDSTopic** (p. 1601)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.208.2 Usage

In RTI Connext, for the IP-based transports (UDPv4, UDPv6, Real-Time WAN, and TCP), the value set in the Transport Priority QoS policy can be used to set the differentiated services field (DS field) bits of the IPv4 and IPv6 headers for datagrams sent by a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). It is platform-dependent on how and whether setting the DS field has an effect. Some platforms may require external permissions in order to set the DS field.

The transport priority value is not provided as is to the transports, but transformed according to the following fields: `transport_priority_mask` (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 1776)), `transport_priority_mapping_low` (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p. 1776)), and `transport_priority_mapping_high` (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high** (p. 1776)). If you want the priority value to be exactly equal to the DS value, then the only change you need to make is to set `transport_priority_mask` to `0xff` (and keep the `transport_priority_mapping_low` and `transport_priority_mapping_high` defaults).

It is incorrect to assume that using the Transport Priority QoS policy will have any effect at all on the end-to-end delivery of data from a **DDSDataWriter** (p. 1305) and a **DDSDataReader** (p. 1272). All network elements, including switches and routers, must have the capability and be enabled to actually use the DS field to treat higher priority packets differently. Thus the ability to use the Transport Priority QoS policy must be designed and configured at a *system* level; just turning it on in an application may have no effect at all at a transport level.

For additional details on how to set the DS field in IP-based transports, see the "TRANSPORT_PRIORITY QoSPolicy" section of the `User's Manual`.

9.208.3 Member Data Documentation

9.208.3.1 value

DDS_Long DDS_TransportPriorityQosPolicy::value

This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.

You may choose any value within the range of a 32-bit signed integer; higher values indicate higher priority. However, any further interpretation of this policy is specific to a particular transport and a particular DDS implementation. For example, a particular transport is permitted to treat a range of priority values as equivalent to one another.

[default] 0

9.209 DDS_TransportSelectionQosPolicy Struct Reference

Specifies the physical transports a **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272) may use to send or receive data.

Public Attributes

- struct **DDS_StringSeq enabled_transports**

A sequence of transport aliases that specifies the transport instances available for use by the entity.

9.209.1 Detailed Description

Specifies the physical transports a **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272) may use to send or receive data.

An application may be simultaneously connected to many different physical transports, e.g., Ethernet, Infiniband, shared memory, VME backplane, and wireless. By default, RTI Connext will use up to 16 transports to deliver data from a DataWriter to a DataReader.

This QoS policy can be used to both limit and control which of the application's available transports may be used by a **DDSDDataWriter** (p. 1305) to send data or by a **DDSDDataReader** (p. 1272) to receive data.

Entity:

DDSDDataReader (p. 1272), **DDSDDataWriter** (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.209.2 Member Data Documentation

9.209.2.1 enabled_transports

```
struct DDS_StringSeq DDS_TransportSelectionQosPolicy::enabled_transports
```

A sequence of transport aliases that specifies the transport instances available for use by the entity.

Of the transport instances installed with the **DDSDomainParticipant** (p. 1335), only those with aliases matching an alias in this sequence are available to the entity.

Thus, this list of aliases sub-selects from the transports available to the **DDSDomainParticipant** (p. 1335).

An empty sequence is a special value that specifies all the transports installed with the **DDSDomainParticipant** (p. 1335).

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 442). These alias names are case sensitive and should be written in lowercase.

[default] Empty sequence; i.e. all the transports installed with and available to the **DDSDomainParticipant** (p. 1335).

[range] A sequence of non-null, non-empty strings.

See also

DDS_DomainParticipantQos::transport_builtin (p. 738).

9.210 DDS_TransportUnicastQosPolicy Struct Reference

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Public Attributes

- struct **DDS_TransportUnicastSettingsSeq** value
A sequence of unicast communication settings.

9.210.1 Detailed Description

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Entity:

DDSDomainParticipant (p. 1335), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.210.2 Usage

RTI Connext may send data to a variety of Entities, not just DataReaders. For example, reliable DataWriters may receive ACK/NACK packets from reliable DataReaders.

During discovery, each **DDSEntity** (p. 1446) announces to remote applications a list of (up to 16) unicast addresses to which the remote application should send data (either user data packets or reliable protocol meta-data such as ACK/↔NACKs and heartbeats). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 994) associated with the **DDS_DomainParticipantQos** (p. 735).

By default, the list of addresses is populated automatically with values obtained from the enabled transport plug-ins allowed to be used by the Entity (see **DDS_TransportBuiltinQosPolicy** (p. 1129) and **DDS_TransportSelection↔QosPolicy** (p. 1142)). Also, the associated ports are automatically determined (see **DDS_RtpsWellKnownPorts_t** (p. 1062)).

Use this QoS policy to manually set the receive address list for an Entity. You may optionally set a port to use a non-default receive port as well. Only the first 16 addresses will be used.

RTI Connext will create a receive thread for every unique port number that it encounters (on a per transport basis).

- For a **DDSDomainParticipant** (p. 1335), this QoS policy sets the default list of addresses used by other applications to send user data for local DataReaders.
- For a **DDSDataReader** (p. 1272), if set, then other applications will use the specified list of addresses to send user data (and reliable protocol packets for reliable DataReaders). Otherwise, if not set, the other applications will use the addresses set by the **DDSDomainParticipant** (p. 1335).
- For a reliable **DDSDataWriter** (p. 1305), if set, then other applications will use the specified list of addresses to send reliable protocol packets (ACKS/NACKS) on the behalf of reliable DataReaders. Otherwise, if not set, the other applications will use the addresses set by the **DDSDomainParticipant** (p. 1335).

9.210.3 Member Data Documentation

9.210.3.1 value

```
struct DDS_TransportUnicastSettingsSeq DDS_TransportUnicastQosPolicy::value
```

A sequence of unicast communication settings.

An empty sequence means that applicable defaults specified by elsewhere (e.g. **DDS_DomainParticipantQos**↔
::default_unicast (p. 738)) should be used.

The RTPS wire protocol currently limits the maximum number of unicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 994) associated with the **DDS_DomainParticipantQos** (p. 735).

[default] Empty sequence.

See also

DDS_DomainParticipantQos::default_unicast (p. 738)

9.211 DDS_TransportUnicastSettings_t Struct Reference

Type representing a list of unicast locators.

Public Attributes

- struct **DDS_StringSeq transports**
A sequence of transport aliases that specifies the unicast interfaces on which to receive unicast traffic for the entity.
- **DDS_Long receive_port**
The unicast port on which the entity can receive data.

9.211.1 Detailed Description

Type representing a list of unicast locators.

A unicast locator specifies a transport class, a unicast address, and a unicast port number on which messages can be received by an entity.

QoS:

DDS_TransportUnicastQosPolicy (p. 1143)

9.211.2 Member Data Documentation

9.211.2.1 transports

```
struct DDS_StringSeq DDS_TransportUnicastSettings_t::transports
```

A sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias on this sequence are used to determine the unicast interfaces used by the entity.

Thus, this list of aliases sub-selects from the transports available to the entity.

Each unicast interface on a transport results in a unicast locator for the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 442).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

9.211.2.2 receive_port

```
DDS_Long DDS_TransportUnicastSettings_t::receive_port
```

The unicast port on which the entity can receive data.

Must be an *unused* unicast port on the system.

[default] 0, which implies that the actual port number is determined by a formula as a function of the `domain_id`, and the **DDS_WireProtocolQosPolicy::participant_id** (p. 1231).

[range] [0,0xffffffff]

See also

DDS_WireProtocolQosPolicy::participant_id (p. 1231).

9.212 DDS_TransportUnicastSettingsSeq Struct Reference

Declares IDL `sequence< DDS_TransportUnicastSettings_t` (p. 1145) >

9.212.1 Detailed Description

Declares IDL sequence< **DDS_TransportUnicastSettings_t** (p. 1145) >

Instantiates:

9.213 DDS_TrustAlgorithmRequirements Struct Reference

Type to describe Trust Plugins algorithm requirements for an entity.

9.213.1 Detailed Description

Type to describe Trust Plugins algorithm requirements for an entity.

9.214 DDS_TypeAllocationParams_t Struct Reference

Configures whether or not to allocate pointer and optional members.

Public Member Functions

- struct **DDS_TypeAllocationParams_t** & **set_allocate_pointers** (**DDS_Boolean** allocate)
- struct **DDS_TypeAllocationParams_t** & **set_allocate_optional_members** (**DDS_Boolean** allocate)

Public Attributes

- **DDS_Boolean allocate_pointers**
Whether to allocate pointer members or not.
- **DDS_Boolean allocate_optional_members**
Whether to allocate optional members or not.

9.214.1 Detailed Description

Configures whether or not to allocate pointer and optional members.

By default pointers are allocated and optional members are not.

This structure is also defined in `xcdr.1.0/srcC/typeObject/TypeObjectInfrastructure.h`. If changes are made, please ensure they are made in both locations.

Examples

HelloWorld.cxx, and **HelloWorldPlugin.cxx**.

9.214.2 Member Function Documentation

9.214.2.1 `set_allocate_pointers()`

```
struct DDS_TypeAllocationParams_t & DDS_TypeAllocationParams_t::set_allocate_pointers (
    DDS_Boolean allocate ) [inline]
```

Whether to allocate pointer members or not

9.214.2.2 `set_allocate_optional_members()`

```
struct DDS_TypeAllocationParams_t & DDS_TypeAllocationParams_t::set_allocate_optional_members (
    DDS_Boolean allocate ) [inline]
```

Whether to allocate optional members or not

9.214.3 Member Data Documentation

9.214.3.1 `allocate_pointers`

```
DDS_Boolean DDS_TypeAllocationParams_t::allocate_pointers
```

Whether to allocate pointer members or not.

Examples

HelloWorld.cxx, and **HelloWorldPlugin.cxx**.

9.214.3.2 allocate_optional_members

```
DDS_Boolean DDS_TypeAllocationParams_t::allocate_optional_members
```

Whether to allocate optional members or not.

9.215 DDS_TypeCode Struct Reference

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with rtdsgen (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

Public Member Functions

- **DDS_TCKind kind** (**DDS_ExceptionCode_t** &ex) const
*Gets the **DDS_TCKind** (p. 86) value of a type code.*
- **DDS_ExtensibilityKind extensibility_kind** (**DDS_ExceptionCode_t** &ex) const
*Gets the **DDS_ExtensibilityKind** (p. 86) value of a type code.*
- **DDS_Boolean equal** (const **DDS_TypeCode** *tc, **DDS_ExceptionCode_t** &ex) const
*Compares two **DDS_TypeCode** (p. 1149) objects for equality.*
- const char * **name** (**DDS_ExceptionCode_t** &ex) const
*Retrieves the simple name identifying this **DDS_TypeCode** (p. 1149) object within its enclosing scope.*
- **DDS_UnsignedLong member_count** (**DDS_ExceptionCode_t** &ex) const
Returns the number of members of the type code.
- const char * **member_name** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Returns the name of a type code member identified by the given index.
- **DDS_UnsignedLong find_member_by_name** (const char * name, **DDS_ExceptionCode_t** &ex) const
Get the index of the member of the given name.
- **DDS_TypeCode** * **member_type** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
*Retrieves the **DDS_TypeCode** (p. 1149) object describing the type of the member identified by the given index.*
- **DDS_UnsignedLong member_label_count** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Returns the number of labels associated to the index-th union member.
- **DDS_Long member_label** (**DDS_UnsignedLong** member_index, **DDS_UnsignedLong** label_index, **DDS_ExceptionCode_t** &ex) const
Return the label_index-th label associated to the member_index-th member.
- **DDS_Long member_ordinal** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Returns the ordinal that corresponds to the index-th enum value.
- **DDS_Boolean is_member_key** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Function that tells if a member is a key or not.
- **DDS_Boolean is_member_required** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Indicates whether a given member of a type is required to be present in every sample of that type.
- **DDS_Boolean is_member_pointer** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Function that tells if a member is a pointer or not.
- **DDS_Boolean is_member_bitfield** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const

Function that tells if a member is a bitfield or not.

- **DDS_Short member_bitfield_bits** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Returns the number of bits of a bitfield member.
- **DDS_Visibility member_visibility** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Returns the constant that indicates the visibility of the index-th member.
- **DDS_TypeCode * discriminator_type** (**DDS_ExceptionCode_t** &ex) const
Returns the discriminator type code.
- **DDS_UnsignedLong length** (**DDS_ExceptionCode_t** &ex) const
Returns the number of elements in the type described by this type code.
- **DDS_UnsignedLong array_dimension_count** (**DDS_ExceptionCode_t** &ex) const
This function returns the number of dimensions of an array type code.
- **DDS_UnsignedLong array_dimension** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
This function returns the index-th dimension of an array type code.
- **DDS_UnsignedLong element_count** (**DDS_ExceptionCode_t** &ex) const
The number of elements in an array.
- **DDS_TypeCode * content_type** (**DDS_ExceptionCode_t** &ex) const
*Returns the **DDS_TypeCode** (p. 1149) object representing the type for the members of the object described by this **DDS_TypeCode** (p. 1149) object.*
- **DDS_Boolean is_alias_pointer** (**DDS_ExceptionCode_t** &ex) const
Function that tells if an alias is a pointer or not.
- **DDS_Long default_index** (**DDS_ExceptionCode_t** &ex) const
Returns the index of the default member, or -1 if there is no default member.
- **DDS_TypeCode * concrete_base_type** (**DDS_ExceptionCode_t** &ex) const
*Returns the **DDS_TypeCode** (p. 1149) that describes the concrete base type of the value type that this **DDS_TypeCode** (p. 1149) object describes.*
- **DDS_ValueModifier type_modifier** (**DDS_ExceptionCode_t** &ex) const
*Returns a constant indicating the modifier of the value type that this **DDS_TypeCode** (p. 1149) object describes.*
- **DDS_Long member_id** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex) const
Returns the ID of the TypeCode member identified by the given index.
- **DDS_UnsignedLong find_member_by_id** (**DDS_Long** id, **DDS_ExceptionCode_t** &ex) const
Get the index of the member of the given ID.
- **DDS_UnsignedLong get_type_object_serialized_size** (**DDS_ExceptionCode_t** &ex) const
*Gets the serialized size of the TypeObject created from this **DDS_TypeCode** (p. 1149).*
- **DDS_UnsignedLong get_cdr_serialized_sample_max_size** (**DDS_DataRepresentationId_t** representation_id, **DDS_ExceptionCode_t** &ex) const
[DEPRECATED] Gets the maximum serialized size of samples of this type
- **DDS_UnsignedLong cdr_serialized_sample_max_size** (**DDS_DataRepresentationId_t** representation_id, **DDS_ExceptionCode_t** &ex) const
Gets the maximum serialized size of samples of this type.
- **DDS_UnsignedLong cdr_serialized_sample_min_size** (**DDS_DataRepresentationId_t** representation_id, **DDS_ExceptionCode_t** &ex) const
Gets the minimum serialized size of samples of this type.
- **DDS_UnsignedLong cdr_serialized_sample_key_max_size** (**DDS_DataRepresentationId_t** representation_id, **DDS_ExceptionCode_t** &ex) const
Gets the maximum serialized size of sample keys of this type.
- **DDS_UnsignedLong cdr_serialized_sample_max_size** (**DDS_ExceptionCode_t** &ex) const
Gets the maximum serialized size of samples of this type.
- **DDS_UnsignedLong cdr_serialized_sample_min_size** (**DDS_ExceptionCode_t** &ex) const

Gets the minimum serialized size of samples of this type.

- **DDS_UnsignedLong** **cdr_serialized_sample_key_max_size** (**DDS_ExceptionCode_t** &ex) const

Gets the maximum serialized size of sample keys of this type.

- **DDS_UnsignedLong** **add_member_to_enum** (const char * **name**, **DDS_Long** ordinal, **DDS_ExceptionCode_t** &ex)

*Add a new enumerated constant to this enum **DDS_TypeCode** (p. 1149).*

- **DDS_UnsignedLong** **add_member_to_union** (const char * **name**, **DDS_Long** id, const **DDS_LongSeq** &labels, const **DDS_TypeCode** *tc, **DDS_Boolean** is_pointer, **DDS_ExceptionCode_t** &ex)

*Add a new member to a union **DDS_TypeCode** (p. 1149).*

- **DDS_UnsignedLong** **add_member** (const char * **name**, **DDS_Long** id, const **DDS_TypeCode** *tc, **DDS_Octet** member_flags, **DDS_ExceptionCode_t** &ex)

*Add a new member to this **DDS_TypeCode** (p. 1149).*

- **DDS_UnsignedLong** **add_member_ex** (const char * **name**, **DDS_Long** id, const **DDS_TypeCode** *tc, **DDS_Octet** member_flags, **DDS_Visibility** visibility, **DDS_Boolean** is_pointer, **DDS_Short** bits, **DDS_ExceptionCode_t** &ex)

*Add a new member to this **DDS_TypeCode** (p. 1149).*

- const **DDS_AnnotationParameterValue** * **default_value** (**DDS_ExceptionCode_t** &ex)

*Returns the default annotation for this **DDS_TypeCode** (p. 1149).*

- const **DDS_AnnotationParameterValue** * **min_value** (**DDS_ExceptionCode_t** &ex)

*Returns the min annotation for this **DDS_TypeCode** (p. 1149).*

- const **DDS_AnnotationParameterValue** * **max_value** (**DDS_ExceptionCode_t** &ex)

*Returns the max annotation for this **DDS_TypeCode** (p. 1149).*

- const **DDS_AnnotationParameterValue** * **member_default_value** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex)

*Returns the member default annotation for this **DDS_TypeCode** (p. 1149).*

- const **DDS_AnnotationParameterValue** * **member_min_value** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex)

*Returns the member min annotation for this **DDS_TypeCode** (p. 1149).*

- const **DDS_AnnotationParameterValue** * **member_max_value** (**DDS_UnsignedLong** index, **DDS_ExceptionCode_t** &ex)

*Returns the member max annotation for this **DDS_TypeCode** (p. 1149).*

- void **print_IDL** (**DDS_UnsignedLong** indent, **DDS_ExceptionCode_t** &ex) const

*Prints a **DDS_TypeCode** (p. 1149) in IDL notation.*

- void **print** (const **DDS_TypeCodePrintFormatProperty** &format, **DDS_ExceptionCode_t** &ex) const

*Prints a **DDS_TypeCode** (p. 1149).*

- void **to_string** (char *str, **DDS_UnsignedLong** &str_size, **DDS_ExceptionCode_t** &ex) const

*Get a string representation of this **DDS_TypeCode** (p. 1149) object using the default values for **DDS_TypeCodePrintFormatProperty** (p. 1208).*

- void **to_string** (char *str, **DDS_UnsignedLong** &str_size, const **DDS_TypeCodePrintFormatProperty** &format, **DDS_ExceptionCode_t** &ex) const

*Get a string representation of this **DDS_TypeCode** (p. 1149) object using the format described by **DDS_TypeCodePrintFormatProperty** (p. 1208).*

9.215.1 Detailed Description

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with `rtiddsgen` (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

You create **DDS_TypeCode** (p. 1149) objects using the **DDS_TypeCodeFactory** (p. 1194) singleton. Then you can use the methods on *this* class to inspect and modify the data type definition.

This class is based on a similar class from CORBA.

MT Safety:

SAFE for read-only access, UNSAFE for modification. Modifying a single **DDS_TypeCode** (p. 1149) object concurrently from multiple threads is *unsafe*. Modifying a **DDS_TypeCode** (p. 1149) from a single thread while concurrently reading the state of that **DDS_TypeCode** (p. 1149) from another thread is also *unsafe*. However, reading the state of a **DDS_TypeCode** (p. 1149) concurrently from multiple threads, without any modification, is *safe*.

Examples

HelloWorld.cxx, and **HelloWorldPlugin.cxx**.

9.215.2 Member Function Documentation

9.215.2.1 kind()

```
DDS_TCKind DDS_TypeCode::kind (
    DDS_ExceptionCode_t & ex ) const
```

Gets the **DDS_TCKind** (p. 86) value of a type code.

Parameters

<i>ex</i>	<< out >> (p. 237) Parameter for error indications. The values that it can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)
-----------	---

Retrieves the kind of this **DDS_TypeCode** (p. 1149) object. The kind of a type code determines which **DDS_TypeCode** (p. 1149) methods may legally be invoked on it.

MT Safety:

SAFE.

Returns

The type code kind.

9.215.2.2 extensibility_kind()

```
DDS_ExtensibilityKind DDS_TypeCode::extensibility_kind (
    DDS_ExceptionCode_t & ex ) const
```

Gets the **DDS_ExtensibilityKind** (p. 86) value of a type code.

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that it can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)
-----------	--

Retrieves the extensibility kind of this **DDS_TypeCode** (p. 1149) object.

In some cases, it is desirable for types to evolve without breaking interoperability with deployed components already using those types. For example:

- A new set of applications to be integrated into an existing system may want to introduce additional fields into a structure. These new fields can be safely ignored by already deployed applications, but applications that do understand the new fields can benefit from their presence.
- A new set of applications to be integrated into an existing system may want to increase the maximum size of some sequence or string in a Type. Existing applications can receive data samples from these new applications as long as the actual number of elements (or length of the strings) in the received data sample does not exceed what the receiving applications expects. If a received data sample exceeds the limits expected by the receiving application, then the sample can be safely ignored (filtered out) by the receiver.

In order to support use cases such as these, the type system introduces the concept of extensible and mutable types.

- A type may be final, indicating that the range of its possible data values is strictly defined. In particular, it is not possible to add elements to members of collection or aggregated types while maintaining type assignability.
- A type may be extensible, indicating that two types, where one contains all of the elements/members of the other plus additional elements/members appended to the end, may remain assignable.
- A type may be mutable, indicating that two types may differ from one another in the additional, removal, and/or transposition of elements/members while remaining assignable.

The extensibility of **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86), **DDS_TK_VALUE** (p. 86), and **DDS_TK_ENUM** (p. 86) can be change using the built-in "Extensibility" annotation when the type is declared.

IDL examples:

```
struct MyType {
    long member_1;
} //@Extensibility FINAL_EXTENSIBILITY
struct MyType {
```

```

    long member_1;
} //@Extensibility EXTENSIBLE_EXTENSIBILITY
struct MyType {

    long member_1;

} //@Extensibility MUTABLE_EXTENSIBILITY

```

XML example:

```

<struct name="MyType" extensibility="final">

    <member name="member_1" type="long"/>

</struct>
<struct name="MyType" extensibility="extensible">

    <member name="member_1" type="long"/>

</struct>
<struct name="MyType" extensibility="mutable">

    <member name="member_1" type="long"/>

</struct>

```

XSD example:

```

<xsd:complexType name="MyType">

    <xsd:sequence>

        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>

    </xsd:sequence>

</xsd:complexType>

<!-- @struct true -->

<!-- @extensibility FINAL_EXTENSIBILITY -->
<xsd:complexType name="MyType">

    <xsd:sequence>

        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>

    </xsd:sequence>

</xsd:complexType>

<!-- @struct true -->

<!-- @extensibility EXTENSIBLE_EXTENSIBILITY -->
<xsd:complexType name="MyType">

    <xsd:sequence>

        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>

    </xsd:sequence>

</xsd:complexType>

<!-- @struct true -->

<!-- @extensibility MUTABLE_EXTENSIBILITY -->

```

For TypeCodes built at run-time using the **DDS_TypeCodeFactory** (p. 1194) API, the extensibility can be provided as a parameter of the following APIs:

- **DDS_TypeCodeFactory::create_struct_tc** (p. 1198)
- **DDS_TypeCodeFactory::create_value_tc** (p. 1199)
- **DDS_TypeCodeFactory::create_union_tc** (p. 1201)
- **DDS_TypeCodeFactory::create_enum_tc** (p. 1202)

See also

DDS_ExtensibilityKind (p. 86)

MT Safety:

SAFE.

Returns

The type code extensibility kind.

9.215.2.3 equal()

```
DDS_Boolean DDS_TypeCode::equal (
    const DDS_TypeCode * tc,
    DDS_ExceptionCode_t & ex ) const
```

Compares two **DDS_TypeCode** (p. 1149) objects for equality.

MT Safety:

SAFE.

For equality and assignability purposes, **DDS_TK_STRUCTURE** (p. 86) and **DDS_TK_VALUE** (p. 86) are considered equivalent.

The **DDS_TypeCode** (p. 1149) of structs inheriting from other structs has a **DDS_TK_VALUE** (p. 86) kind.

For example:

```
struct MyStruct: MyBaseStruct {
    long member_1;
};
```

The code generation for the previous type will generate a **DDS_TypeCode** (p. 1149) with **DDS_TK_VALUE** (p. 86) kind.

Parameters

<i>tc</i>	<< <i>in</i> >> (p. 237) Type code that will be compared with this DDS_TypeCode (p. 1149).
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

DDS_BOOLEAN_TRUE (p. 316) if the type codes are equal. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316).

9.215.2.4 name()

```
const char * DDS_TypeCode::name (
    DDS_ExceptionCode_t & ex ) const
```

Retrieves the simple name identifying this **DDS_TypeCode** (p. 1149) object within its enclosing scope.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86), **DDS_TK_ENUM** (p. 86), **DDS_TK_VALUE** (p. 86), or **DDS_TK_ALIAS** (p. 86).

MT Safety:

SAFE.

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
----	--

Returns

Name of the type code if no errors.

9.215.2.5 member_count()

```
DDS_UnsignedLong DDS_TypeCode::member_count (
    DDS_ExceptionCode_t & ex ) const
```

Returns the number of members of the type code.

The method `member_count` can be invoked on structure, union, and enumeration **DDS_TypeCode** (p. 1149) objects.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86), **DDS_TK_ENUM** (p. 86) or **DDS_TK_VALUE** (p. 86).

MT Safety:

SAFE.

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

The number of members constituting the type described by this **DDS_TypeCode** (p. 1149) object if no errors.

9.215.2.6 member_name()

```
const char * DDS_TypeCode::member_name (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Returns the name of a type code member identified by the given index.

The method `member_name` can be invoked on structure, union, and enumeration **DDS_TypeCode** (p. 1149) objects.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86), **DDS_TK_ENUM** (p. 86) or **DDS_TK_VALUE** (p. 86).

The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

Name of the member if no errors.

9.215.2.7 find_member_by_name()

```
DDS_UnsignedLong DDS_TypeCode::find_member_by_name (
    const char * name,
    DDS_ExceptionCode_t & ex ) const
```

Get the index of the member of the given name.

This method is applicable to **DDS_TypeCode** (p. 1149) objects representing structs (**DDS_TK_STRUCT** (p. 86)) and union (**DDS_TK_UNION** (p. 86)) types.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) The member name.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)

Returns

The index of the member of the given name or **DDS_TYPECODE_INDEX_INVALID** (p. 81) if the member is not found.

MT Safety:

SAFE.

9.215.2.8 member_type()

```
DDS_TypeCode * DDS_TypeCode::member_type (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Retrieves the **DDS_TypeCode** (p. 1149) object describing the type of the member identified by the given index.

The method `member_type` can be invoked on structure and union type codes.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86) or **DDS_TK_VALUE** (p. 86).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

The **DDS_TypeCode** (p. 1149) object describing the member at the given index if no errors.

9.215.2.9 member_label_count()

```
DDS_UnsignedLong DDS_TypeCode::member_label_count (
    DDS_UnsignedLong index,
    DDS_StatusCode_t & ex ) const
```

Returns the number of labels associated to the index-th union member.

The method can be invoked on union **DDS_TypeCode** (p. 1149) objects.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_UNION** (p. 86).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

Number of labels if no errors.

9.215.2.10 member_label()

```
DDS_Long DDS_TypeCode::member_label (
    DDS_UnsignedLong member_index,
    DDS_UnsignedLong label_index,
    DDS_StatusCode_t & ex ) const
```

Return the label_index-th label associated to the member_index-th member.

This method has been modified for RTI Connex from the CORBA Type code Specification.

Example:

case 1: Label index 0

case 2: Label index 1

short short_member;

The method can be invoked on union **DDS_TypeCode** (p. 1149) objects.

Precondition

self kind is **DDS_TK_UNION** (p. 86).

The member_index param must be in the interval [0,(member count-1)].

The label_index param must be in the interval [0,(member labels count-1)].

MT Safety:

SAFE.

Parameters

<i>member_index</i>	<< <i>in</i> >> (p. 237) Member index.
<i>label_index</i>	<< <i>in</i> >> (p. 237) Label index.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

The evaluated value of the label if no errors.

9.215.2.11 member_ordinal()

```
DDS_Long DDS_TypeCode::member_ordinal (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Returns the ordinal that corresponds to the index-th enum value.

The method can be invoked on enum **DDS_TypeCode** (p. 1149) objects.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_ENUM** (p. 86).
Member index in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

Ordinal that corresponds to the index-th enumerator if no errors.

9.215.2.12 is_member_key()

```
DDS_Boolean DDS_TypeCode::is_member_key (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Function that tells if a member is a key or not.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86) or **DDS_TK_VALUE** (p. 86).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

DDS_BOOLEAN_TRUE (p. 316) if the member is a key. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316).

9.215.2.13 `is_member_required()`

```
DDS_Boolean DDS_TypeCode::is_member_required (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Indicates whether a given member of a type is required to be present in every sample of that type.

A non-key member is required if it has not been marked as optional. All key members are required.

See also

DDS_TYPECODE_NONKEY_MEMBER (p. 83)

DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 84)

MT Safety:

SAFE.

9.215.2.14 is_member_pointer()

```
DDS_Boolean DDS_TypeCode::is_member_pointer (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Function that tells if a member is a pointer or not.

The method `is_member_pointer` can be invoked on union and structs type objects

This function is an RTI Connex extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86) or **DDS_TK_VALUE** (p. 86).
The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Index of the member for which type information is begin requested.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

DDS_BOOLEAN_TRUE (p. 316) if the member is a pointer. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316).

9.215.2.15 is_member_bitfield()

```
DDS_Boolean DDS_TypeCode::is_member_bitfield (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Function that tells if a member is a bitfield or not.

The method can be invoked on struct type objects.

This function is an RTI Connex extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86) or **DDS_TK_VALUE** (p. 86).
 The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

DDS_BOOLEAN_TRUE (p. 316) if the member is a bitfield. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316).

9.215.2.16 member_bitfield_bits()

```
DDS_Short DDS_TypeCode::member_bitfield_bits (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Returns the number of bits of a bitfield member.

The method can be invoked on struct type objects.

This function is an RTI Connex extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_STRUCT** (p. 86) or **DDS_TK_VALUE** (p. 86).
 The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

The number of bits of the bitfield or **DDS_TYPECODE_NOT_BITFIELD** (p. 81) if the member is not a bitfield.

9.215.2.17 member_visibility()

```
DDS_Visibility DDS_TypeCode::member_visibility (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Returns the constant that indicates the visibility of the index-th member.

Precondition

self kind is **DDS_TK_VALUE** (p. 86) or **DDS_TK_STRUCT** (p. 86). The index param must be in the interval [0,(member count-1)].

MT Safety:

SAFE.

For **DDS_TK_STRUCT** (p. 86), this method always returns **DDS_PUBLIC_MEMBER** (p. 83).

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)
Generated by Doxygen	

Returns

One of the following constants: **DDS_PRIVATE_MEMBER** (p. 82) or **DDS_PUBLIC_MEMBER** (p. 83).

9.215.2.18 discriminator_type()

```
DDS_TypeCode * DDS_TypeCode::discriminator_type (
    DDS_ExceptionCode_t & ex ) const
```

Returns the discriminator type code.

The method `discriminator_type` can be invoked only on union **DDS_TypeCode** (p. 1149) objects.

Precondition

self kind is **DDS_TK_UNION** (p. 86).

MT Safety:

SAFE.

Parameters

<i>ex</i>	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

DDS_TypeCode (p. 1149) object describing the discriminator of the union type if no errors.

9.215.2.19 length()

```
DDS_UnsignedLong DDS_TypeCode::length (
    DDS_ExceptionCode_t & ex ) const
```

Returns the number of elements in the type described by this type code.

Length is:

- The maximum length of the string for string type codes.
- The maximum length of the sequence for sequence type codes.
- The first dimension of the array for array type codes.

Precondition

self kind is **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86), **DDS_TK_STRING** (p. 86) or **DDS_TK_WSTRING** (p. 86).

MT Safety:

SAFE.

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

The bound for strings and sequences, or the number of elements for arrays if no errors.

9.215.2.20 array_dimension_count()

```
DDS_UnsignedLong DDS_TypeCode::array_dimension_count (
    DDS_ExceptionCode_t & ex ) const
```

This function returns the number of dimensions of an array type code.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_ARRAY** (p. 86).

MT Safety:

SAFE.

Parameters

<i>ex</i>	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

Number of dimensions if no errors.

9.215.2.21 array_dimension()

```
DDS_UnsignedLong DDS_TypeCode::array_dimension (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

This function returns the index-th dimension of an array type code.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_ARRAY** (p. 86).
Dimension index in the interval [0,(dimensions count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< in >> (p. 237) Dimension index in the interval [0,(dimensions count-1)].
<i>ex</i>	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

Requested dimension if no errors.

9.215.2.22 element_count()

```
DDS_UnsignedLong DDS_TypeCode::element_count (
    DDS_ExceptionCode_t & ex ) const
```

The number of elements in an array.

This operation isn't relevant for other kinds of types.

MT Safety:

SAFE.

9.215.2.23 content_type()

```
DDS_TypeCode * DDS_TypeCode::content_type (
    DDS_ExceptionCode_t & ex ) const
```

Returns the **DDS_TypeCode** (p. 1149) object representing the type for the members of the object described by this **DDS_TypeCode** (p. 1149) object.

For sequences and arrays, it returns the element type. For aliases, it returns the original type.

Precondition

self kind is **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86) or **DDS_TK_ALIAS** (p. 86).

MT Safety:

SAFE.

Parameters

<i>ex</i>	<p><<<i>out</i>>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

A **DDS_TypeCode** (p. 1149) object representing the element type for sequences and arrays, and the original type for aliases.

9.215.2.24 `is_alias_pointer()`

```
DDS_Boolean DDS_TypeCode::is_alias_pointer (
    DDS_ExceptionCode_t & ex ) const
```

Function that tells if an alias is a pointer or not.

This function is an RTI Connext extension to the CORBA Type Code Specification.

Precondition

self kind is **DDS_TK_ALIAS** (p. 86).

MT Safety:

SAFE.

Parameters

<i>ex</i>	<p><<<i>out</i>>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

DDS_BOOLEAN_TRUE (p. 316) if an alias is a pointer to the aliased type. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316).

9.215.2.25 default_index()

```
DDS_Long DDS_TypeCode::default_index (
    DDS_StatusCode_t & ex ) const
```

Returns the index of the default member, or -1 if there is no default member.

The method `default_index` can be invoked only on union **DDS_TypeCode** (p. 1149) objects.

Precondition

self kind is **DDS_TK_UNION** (p. 86)

MT Safety:

SAFE.

Parameters

<i>ex</i>	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

The index of the default member, or -1 if there is no default member.

9.215.2.26 concrete_base_type()

```
DDS_TypeCode * DDS_TypeCode::concrete_base_type (
    DDS_StatusCode_t & ex ) const
```

Returns the **DDS_TypeCode** (p. 1149) that describes the concrete base type of the value type that this **DDS_TypeCode** (p. 1149) object describes.

Precondition

self kind is **DDS_TK_VALUE** (p. 86) or **DDS_TK_STRUCT** (p. 86).

MT Safety:

SAFE.

For **DDS_TK_STRUCT** (p. 86), this method always returns **DDS_TK_NULL** (p. 86).

The **DDS_TypeCode** (p. 1149) of structs inheriting from other structs has a **DDS_TK_VALUE** (p. 86) kind.

For example:

```
struct MyStruct: MyBaseStruct {
    long member_1;
};
```

The code generation for the previous type will generate a **DDS_TypeCode** (p. 1149) with **DDS_TK_VALUE** (p. 86) kind.

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

DDS_TypeCode (p. 1149) that describes the concrete base type or NULL if there is no a concrete base type.

9.215.2.27 type_modifier()

```
DDS_ValueModifier DDS_TypeCode::type_modifier (
    DDS_ExceptionCode_t & ex ) const
```

Returns a constant indicating the modifier of the value type that this **DDS_TypeCode** (p. 1149) object describes.

Precondition

self kind is **DDS_TK_VALUE** (p. 86) or **DDS_TK_STRUCT** (p. 86).

For **DDS_TK_STRUCT** (p. 86), this method always returns **DDS_VM_NONE** (p. 81).

MT Safety:

SAFE.

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

One of the following type modifiers: **DDS_VM_NONE** (p. 81), **DDS_VM_ABSTRACT** (p. 82), **DDS_VM_CUSTOM** (p. 81) or **DDS_VM_TRUNCATABLE** (p. 82).

9.215.2.28 member_id()

```
DDS_Long DDS_TypeCode::member_id (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex ) const
```

Returns the ID of the TypeCode member identified by the given index.

This function is an RTI Connex extension to the CORBA Type Code Specification.

The method can be invoked on aggregation **DDS_TypeCode** (p. 1149) objects.

All members of aggregated types have an integral member ID that uniquely identifies them within their defining type.

In IDL, you can specify the member ID using the built-in annotation ID. For example:

```
struct MyType {
    long member_1; //@ID 200
} //@Extensibility MUTABLE_EXTENSIBILITY
```

In XML, you can specify the member ID using the attribute 'id':

```
<struct name="MyType" extensibility="mutable" id="200">
    <member name="member_1" type="long"/>
</struct>
```

In XSD, you can specify the member ID using the built-in annotation ID

```
<xsd:complexType name="MyType">
    <xsd:sequence>
        <xsd:element name="member_1" minOccurs="1" maxOccurs="1" type="xsd:int"/>
        <!-- @id 200 -->
    </xsd:sequence>
</xsd:complexType>

<!-- @extensibility MUTABLE_EXTENSIBILITY -->
```

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), **DDS_TK_VALUE** (p. 86), or **DDS_TK_UNION** (p. 86)
 Member index in the interval [0,(member count-1)].

MT Safety:

SAFE.

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) Member index in the interval [0,(member count-1)].
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

ID of the member if no errors.

9.215.2.29 find_member_by_id()

```
DDS_UnsignedLong DDS_TypeCode::find_member_by_id (
    DDS_Long id,
    DDS_ExceptionCode_t & ex ) const
```

Get the index of the member of the given ID.

This method is applicable to **DDS_TypeCode** (p. 1149) objects representing structs (**DDS_TK_STRUCT** (p. 86)) and union (**DDS_TK_UNION** (p. 86)) types.

Parameters

<i>id</i>	<< <i>in</i> >> (p. 237) The member ID.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)

Returns

The index of the member of the given ID or **DDS_TYPECODE_INDEX_INVALID** (p. 81) if the member is not found.

MT Safety:

SAFE.

9.215.2.30 get_type_object_serialized_size()

```
DDS_UnsignedLong DDS_TypeCode::get_type_object_serialized_size (
    DDS_StatusCode_t & ex ) const
```

Gets the serialized size of the TypeObject created from this **DDS_TypeCode** (p. 1149).

Parameters

<i>ex</i>	<p><<out>> (p. 237) Parameter for error indications. The values that it can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_SYSTEM_EXCEPTION_CODE (p. 333)
-----------	---

The default buffer size used for storing a TypeObject is 8192 bytes. For a large TypeObject, this API can be used to determine the size that needs to be set in **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 754)

MT Safety:

SAFE.

Returns

The TypeObject serialized size.

9.215.2.31 get_cdr_serialized_sample_max_size()

```
DDS_UnsignedLong DDS_TypeCode::get_cdr_serialized_sample_max_size (
    DDS_DataRepresentationId_t representation_id,
    DDS_StatusCode_t & ex ) const
```

[DEPRECATED] Gets the maximum serialized size of samples of this type

DEPRECATED: use **DDS_TypeCode::cdr_serialized_sample_max_size** (p. 1178) instead.

Obtains the maximum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>representation↔ _id</i>	The serialized data representation for which we calculate the maximum size.
<i>ex</i>	<< out >> (p. 237) Parameter for error indications.

Returns

The maximum size

9.215.2.32 cdr_serialized_sample_max_size() [1/2]

```
DDS_UnsignedLong DDS_TypeCode::cdr_serialized_sample_max_size (
    DDS_DataRepresentationId_t representation_id,
    DDS_ExceptionCode_t & ex ) const
```

Gets the maximum serialized size of samples of this type.

Obtains the maximum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>representation↔ _id</i>	The serialized data representation for which we calculate the maximum size.
<i>ex</i>	<< out >> (p. 237) Parameter for error indications.

Returns

The maximum size

9.215.2.33 cdr_serialized_sample_min_size() [1/2]

```
DDS_UnsignedLong DDS_TypeCode::cdr_serialized_sample_min_size (
    DDS_DataRepresentationId_t representation_id,
    DDS_ExceptionCode_t & ex ) const
```

Gets the minimum serialized size of samples of this type.

Obtains the minimum possible size in bytes of any serialized data sample of this type.

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>representation↔ _id</i>	The serialized data representation for which we calculate the minimum size.
<i>ex</i>	<< out >> (p. 237) Parameter for error indications.

Returns

The minimum size

9.215.2.34 cdr_serialized_sample_key_max_size() [1/2]

```
DDS_UnsignedLong DDS_TypeCode::cdr_serialized_sample_key_max_size (
    DDS_DataRepresentationId_t representation_id,
    DDS_StatusCode_t & ex ) const
```

Gets the maximum serialized size of sample keys of this type.

Obtains the maximum possible size in bytes of the serialized keys of any data sample of this type

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>representation↔ _id</i>	The serialized data representation for which we calculate the maximum key size.
<i>ex</i>	<< out >> (p. 237) Parameter for error indications.

Returns

The maximum key size

9.215.2.35 cdr_serialized_sample_max_size() [2/2]

```
DDS_UnsignedLong DDS_TypeCode::cdr_serialized_sample_max_size (
    DDS_ExceptionCode_t & ex ) const
```

Gets the maximum serialized size of samples of this type.

Obtains the maximum possible size in bytes of any serialized data sample of this type.

Assumes the **DDS_DataRepresentationId_t** (p. 369) to be DDS_AUTO_DATA_REPRESENTATION

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>ex</i>	<< out >> (p. 237) Parameter for error indications.
-----------	--

Returns

The maximum size

9.215.2.36 cdr_serialized_sample_min_size() [2/2]

```
DDS_UnsignedLong DDS_TypeCode::cdr_serialized_sample_min_size (
    DDS_ExceptionCode_t & ex ) const
```

Gets the minimum serialized size of samples of this type.

Obtains the minimum possible size in bytes of any serialized data sample of this type.

Assumes the **DDS_DataRepresentationId_t** (p. 369) to be DDS_AUTO_DATA_REPRESENTATION

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>ex</i>	<< out >> (p. 237) Parameter for error indications.
-----------	--

Returns

The minimum size

9.215.2.37 cdr_serialized_sample_key_max_size() [2/2]

```
DDS_UnsignedLong DDS_TypeCode::cdr_serialized_sample_key_max_size (
    DDS_ExceptionCode_t & ex ) const
```

Gets the maximum serialized size of sample keys of this type.

Obtains the maximum possible size in bytes of the serialized keys of any data sample of this type

Assumes the **DDS_DataRepresentationId_t** (p. 369) to be **DDS_AUTO_DATA_REPRESENTATION**

Precondition

The type is an aggregation type (struct, union)

Parameters

<i>ex</i>	<< out >> (p. 237) Parameter for error indications.
-----------	--

Returns

The maximum key size

9.215.2.38 add_member_to_enum()

```
DDS_UnsignedLong DDS_TypeCode::add_member_to_enum (
    const char * name,
    DDS_Long ordinal,
    DDS_ExceptionCode_t & ex )
```

Add a new enumerated constant to this enum **DDS_TypeCode** (p. 1149).

This method is applicable to **DDS_TypeCode** (p. 1149) objects representing enumerations (**DDS_TK_ENUM** (p. 86)). To add a field to a structured type, see **DDS_TypeCode::add_member_to_enum** (p. 1181).

Modifying a **DDS_TypeCode** (p. 1149) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 99) APIs.

MT Safety:

UNSAFE.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) The name of the new member. This string must be unique within this type and must not be NULL.
<i>ordinal</i>	<< <i>in</i> >> (p. 237) The relative order of the new member in this enum or a custom integer value. The value must be unique within the type.
<i>ex</i>	<< <i>out</i> >> (p. 237) If this method fails, this argument will contain information about the failure. Possible values include: <ul style="list-style-type: none"> • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE (p. 334) • DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE (p. 334)

Returns

The zero-based index of the new member relative to any other members that previously existed.

See also

DDS_TypeCode::add_member (p. 1183)

DDS_TypeCode::add_member_ex (p. 1185)

DDS_TypeCodeFactory (p. 1194)

9.215.2.39 add_member_to_union()

```

DDS_UnsignedLong DDS_TypeCode::add_member_to_union (
    const char * name,
    DDS_Long id,
    const DDS_LongSeq & labels,
    const DDS_TypeCode * tc,
    DDS_Boolean is_pointer,
    DDS_ExceptionCode_t & ex )

```

Add a new member to a union **DDS_TypeCode** (p. 1149).

This method is applicable to **DDS_TypeCode** (p. 1149) objects representing unions (**DDS_TK_UNION** (p. 86)).

Modifying a **DDS_TypeCode** (p. 1149) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 99) APIs.

MT Safety:

UNSAFE.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) The name of the new member.
<i>id</i>	<< <i>in</i> >> (p. 237) The member ID. For automatic assignment of the member ID specify DDS_TYPECODE_MEMBER_ID_INVALID (p. 81).
<i>labels</i>	<< <i>in</i> >> (p. 237) A sequence of labels or case values associated with the member .
<i>tc</i>	<< <i>in</i> >> (p. 237) The type of the new member. You can get or create this DDS_TypeCode (p. 1149) with the DDS_TypeCodeFactory (p. 1194).
<i>is_pointer</i>	<< <i>in</i> >> (p. 237) Whether the data member, in its deserialized form, should be stored by pointer as opposed to by value.
<i>ex</i>	<< <i>out</i> >> (p. 237) If this method fails, this argument will contain information about the failure.

Possible values include:

- **DDS_BADKIND_USER_EXCEPTION_CODE** (p. 333)
- **DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE** (p. 334)
- **DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE** (p. 334)

Returns

The zero-based index of the new member relative to any other members that previously existed.

See also

DDS_TypeCode::add_member (p. 1183)
DDS_TypeCode::add_member_ex (p. 1185)
DDS_TypeCode::add_member_to_enum (p. 1181)
DDS_TypeCode::add_member_to_union (p. 1182)
DDS_TypeCodeFactory (p. 1194)
DDS_TYPECODE_NONKEY_MEMBER (p. 83)
DDS_TYPECODE_KEY_MEMBER (p. 83)
DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 84)

9.215.2.40 add_member()

```

DDS_UnsignedLong DDS_TypeCode::add_member (
    const char * name,
    DDS_Long id,
    const DDS_TypeCode * tc,
    DDS_Octet member_flags,
    DDS_ExceptionCode_t & ex )

```

Add a new member to this **DDS_TypeCode** (p. 1149).

This method is applicable to **DDS_TypeCode** (p. 1149) objects representing structures (**DDS_TK_STRUCT** (p. 86)), value types (**DDS_TK_VALUE** (p. 86)), and unions (**DDS_TK_UNION** (p. 86)). To add a constant to an enumeration, see **DDS_TypeCode::add_member_to_enum** (p. 1181).

Calling this method clones the type code passed as the `tc` parameter if the type code is not a builtin one. To delete this cloned type code, call **DDS_TypeCodeFactory::delete_tc** (p. 1197).

The ability to modify a **DDS_TypeCode** (p. 1149) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 99) APIs.

Here's a simple code example that adds two fields to a data type, one an integer and another a sequence of integers.

```
// Integer:
myTypeCode->add_member (
    "myFieldName",
    DDS_TYPECODE_MEMBER_ID_INVALID,
    DDS_TheTypeCodeFactory->get_primitive_tc(DDS_TK_LONG),
    // New field is a required non-key member:
    DDS_TYPECODE_NONKEY_REQUIRED_MEMBER);

// Sequence of 10 or fewer integers:
myTypeCode.add_member(
    "myFieldName",
    DDS_TYPECODE_MEMBER_ID_INVALID,
    DDS_TheTypeCodeFactory->create_sequence_tc(
        10,
        DDS_TheTypeCodeFactory->get_primitive_tc(DDS_TK_LONG)),
    // New field is a required non-key member:
    DDS_TYPECODE_NONKEY_REQUIRED_MEMBER);
```

MT Safety:

UNSAFE.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) The name of the new member.
<i>id</i>	<< <i>in</i> >> (p. 237) Member ID or case value. <ul style="list-style-type: none"> For DDS_TK_STRUCT (p. 86), and DDS_TK_VALUE (p. 86), this parameter is used to provide the member ID. For automatic assignment of the member ID specify DDS_TYPECODE_MEMBER_ID_INVALID (p. 81). For DDS_TK_UNION (p. 86), this parameter is used to provide the case value associated with the member. The member ID is assigned automatically. To explicitly assign the member ID, use the API DDS_TypeCode::add_member_to_union (p. 1182).
<i>tc</i>	<< <i>in</i> >> (p. 237) The type of the new member. You can get or create this DDS_TypeCode (p. 1149) with the DDS_TypeCodeFactory (p. 1194).

Parameters

<i>member_flags</i>	<< <i>in</i> >> (p. 237) Indicates whether the member is part of the key and whether it is required.
<i>ex</i>	<< <i>out</i> >> (p. 237) If this method fails, this argument will contain information about the failure. Possible values include: <ul style="list-style-type: none"> • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE (p. 334) • DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE (p. 334)

Returns

The zero-based index of the new member relative to any other members that previously existed.

See also

9.215.2.41 add_member_ex()

```

DDS_UnsignedLong DDS_TypeCode::add_member_ex (
    const char * name,
    DDS_Long id,
    const DDS_TypeCode * tc,
    DDS_Octet member_flags,
    DDS_Visibility visibility,
    DDS_Boolean is_pointer,
    DDS_Short bits,
    DDS_ExceptionCode_t & ex )

```

Add a new member to this **DDS_TypeCode** (p. 1149).

This method is applicable to **DDS_TypeCode** (p. 1149) objects representing structures (**DDS_TK_STRUCT** (p. 86)), value types (**DDS_TK_VALUE** (p. 86)), and unions (**DDS_TK_UNION** (p. 86)). To add a constant to an enumeration, see **DDS_TypeCode::add_member_to_enum** (p. 1181).

Calling this method clones the type code passed in as the *tc* parameter if the type code is not a builtin one. To delete this cloned type code, call **DDS_TypeCodeFactory::delete_tc** (p. 1197).

The ability to modify a **DDS_TypeCode** (p. 1149) – such as by adding a member – is important if you are using the **Dynamic Data** (p. 99) APIs.

MT Safety:

UNSAFE.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) The name of the new member.
<i>id</i>	<< <i>in</i> >> (p. 237) Member ID or case value. <ul style="list-style-type: none"> For DDS_TK_STRUCT (p. 86) and DDS_TK_VALUE (p. 86), this parameter is used to provide the member ID. For DDS_TK_STRUCT (p. 86) and DDS_TK_VALUE (p. 86) only: For automatic assignment of the member ID, specify DDS_TYPECODE_MEMBER_ID_INVALID (p. 81). For DDS_TK_UNION (p. 86), this parameter is used to provide the case value associated with the member. The member ID is assigned automatically. To explicitly assign the member ID, use the API DDS_TypeCode::add_member_to_union (p. 1182).
<i>tc</i>	<< <i>in</i> >> (p. 237) The type of the new member. You can get or create this DDS_TypeCode (p. 1149) with the DDS_TypeCodeFactory (p. 1194).
<i>member_flags</i>	<< <i>in</i> >> (p. 237) Indicates whether the member is part of the key and whether it is required.
<i>visibility</i>	<< <i>in</i> >> (p. 237) Whether the new member is public or private. Non-public members are only relevant for types of kind DDS_TK_VALUE (p. 86). Possible values include: <ul style="list-style-type: none"> DDS_PRIVATE_MEMBER (p. 82) DDS_PUBLIC_MEMBER (p. 83)
<i>is_pointer</i>	<< <i>in</i> >> (p. 237) Whether the data member, in its deserialized form, should be stored by pointer as opposed to by value.
<i>bits</i>	<< <i>in</i> >> (p. 237) The number of bits, if this new member is a bit field, or DDS_TYPECODE_NOT_BITFIELD (p. 81).
<i>ex</i>	<< <i>out</i> >> (p. 237) If this method fails, this argument will contain information about the failure. Possible values include: <ul style="list-style-type: none"> DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE (p. 334) DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE (p. 334)

Returns

The zero-based index of the new member relative to any other members that previously existed.

9.215.2.42 default_value()

```
const DDS_AnnotationParameterValue * DDS_TypeCode::default_value (
    DDS_ExceptionCode_t & ex )
```

Returns the default annotation for this **DDS_TypeCode** (p. 1149).

Precondition

self kind is **DDS_TK_ENUM** (p. 86), or **DDS_TK_ALIAS** (p. 86).

MT Safety:

SAFE

Parameters

<i>ex</i>	<p><<<i>out</i>>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
-----------	--

Returns

the default annotation for this **DDS_TypeCode** (p. 1149)

9.215.2.43 min_value()

```
const DDS_AnnotationParameterValue * DDS_TypeCode::min_value (
    DDS_ExceptionCode_t & ex )
```

Returns the min annotation for this **DDS_TypeCode** (p. 1149).

Precondition

self kind is **DDS_TK_ENUM** (p. 86), or **DDS_TK_ALIAS** (p. 86) of a numerical kind.

MT Safety:

SAFE

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
----	--

Returns

the min annotation for this **DDS_TypeCode** (p. 1149)

9.215.2.44 max_value()

```
const DDS_AnnotationParameterValue * DDS_TypeCode::max_value (
    DDS_ExceptionCode_t & ex )
```

Returns the max annotation for this **DDS_TypeCode** (p. 1149).

Precondition

self kind is **DDS_TK_ENUM** (p. 86), or **DDS_TK_ALIAS** (p. 86) of a numerical kind.

MT Safety:

SAFE

Parameters

ex	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)
----	--

Returns

the max annotation for this **DDS_TypeCode** (p. 1149)

9.215.2.45 member_default_value()

```
const DDS_AnnotationParameterValue * DDS_TypeCode::member_default_value (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex )
```

Returns the member default annotation for this **DDS_TypeCode** (p. 1149).

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), or **DDS_TK_UNION** (p. 86).

MT Safety:

SAFE

Parameters

<i>index</i>	index of the target member
<i>ex</i>	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

the member default annotation for this **DDS_TypeCode** (p. 1149)

9.215.2.46 member_min_value()

```
const DDS_AnnotationParameterValue * DDS_TypeCode::member_min_value (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex )
```

Returns the member min annotation for this **DDS_TypeCode** (p. 1149).

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), or **DDS_TK_UNION** (p. 86).
 member pointed to by index of a numerical kind.

MT Safety:

SAFE

Parameters

<i>index</i>	index of the target member
<i>ex</i>	<p><<out>> (p. 237) Parameter for error indications. The values that can take are:</p> <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BADKIND_USER_EXCEPTION_CODE (p. 333) • DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

the member min annotation for this **DDS_TypeCode** (p. 1149)

9.215.2.47 member_max_value()

```
const DDS_AnnotationParameterValue * DDS_TypeCode::member_max_value (
    DDS_UnsignedLong index,
    DDS_ExceptionCode_t & ex )
```

Returns the member max annotation for this **DDS_TypeCode** (p. 1149).

Precondition

self kind is **DDS_TK_STRUCT** (p. 86), or **DDS_TK_UNION** (p. 86).
 member pointed to by index of a numerical kind.

MT Safety:

SAFE

Parameters

<i>index</i>	index of the target member
<i>ex</i>	<< out >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none">• DDS_NO_EXCEPTION_CODE (p. 333)• DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)• DDS_BADKIND_USER_EXCEPTION_CODE (p. 333)• DDS_BOUNDS_USER_EXCEPTION_CODE (p. 333)

Returns

the member max annotation for this **DDS_TypeCode** (p. 1149)

9.215.2.48 print_IDL()

```
void DDS_TypeCode::print_IDL (
    DDS_UnsignedLong indent,
    DDS_ExceptionCode_t & ex ) const
```

Prints a **DDS_TypeCode** (p. 1149) in IDL notation.

MT Safety:

SAFE.

Parameters

<i>indent</i>	<< in >> (p. 237) Indent.
<i>ex</i>	<< out >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none">• DDS_NO_EXCEPTION_CODE (p. 333)• DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

9.215.2.49 print()

```
void DDS_TypeCode::print (
    const DDS_TypeCodePrintFormatProperty & format,
    DDS_ExceptionCode_t & ex ) const
```

Prints a **DDS_TypeCode** (p. 1149).

MT Safety:

SAFE.

Parameters

<i>format</i>	<< <i>in</i> >> (p. 237) Format.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

9.215.2.50 to_string() [1/2]

```
void DDS_TypeCode::to_string (
    char * str,
    DDS_UnsignedLong & str_size,
    DDS_ExceptionCode_t & ex ) const
```

Get a string representation of this **DDS_TypeCode** (p. 1149) object using the default values for **DDS_TypeCodePrintFormatProperty** (p. 1208).

This function obtains a string representation of a **DDS_TypeCode** (p. 1149) object, it creates this string using the default values of **DDS_TypeCodePrintFormatProperty** (p. 1208).

In order to calculate the required length of the string, the user can call this function with the parameter *str* set to NULL. In this mode, the required length of the string will be stored into the value pointed to by the parameter *str_size*.

If the parameter *str* is not equal to NULL, the string representation of the **DDS_TypeCode** (p. 1149) will be stored into the parameter *str*. In this mode, if the size of the string is insufficient to hold the result, the parameter **ex* will be set to **DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE** (p. 333) and the parameter *str_size* will be updated to hold the required size of the string. All string lengths include the trailing NUL byte.

Parameters

<i>str</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of the DDS_TypeCode (p. 1149). If NULL then this function will store the required length of the buffer into the value pointed to by the <i>str_size</i> parameter.
<i>str_size</i>	<< inout >> (p. 237) Cannot be NULL. The length of the char buffer. If the supplied buffer is NULL or insufficiently long, the value pointed to by this parameter will be updated to contain the required length.
<i>ex</i>	<< out >> (p. 237) Parameter used for error indications.

DDS_TypeCode::print_IDL (p. 1191)

DDS_TypeCode::print (p. 1191)

DDS_TypeCode::to_string (p. 1192)

9.215.2.51 to_string() [2/2]

```
void DDS_TypeCode::to_string (
    char * str,
    DDS_UnsignedLong & str_size,
    const DDS_TypeCodePrintFormatProperty & format,
    DDS_ExceptionCode_t & ex ) const
```

Get a string representation of this **DDS_TypeCode** (p. 1149) object using the format described by **DDS_TypeCodePrintFormatProperty** (p. 1208).

This function behaves in the same way as **DDS_TypeCode::to_string** (p. 1192) but allows the user to specify the format of the string using **DDS_TypeCodePrintFormatProperty** (p. 1208).

Parameters

<i>str</i>	<< out >> (p. 237) The char buffer which will hold the string representation of the DDS_TypeCode (p. 1149).
<i>str_size</i>	<< inout >> (p. 237) Cannot be NULL. The length of the char buffer pointed to by the <i>str</i> parameter. If the <i>str</i> parameter is NULL, or too small, this parameter will be updated to hold the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_TypeCodePrintFormatProperty (p. 1208) used to define the format of the string representation of the DDS_TypeCode (p. 1149).
<i>ex</i>	<< out >> (p. 237) Parameter used for error indications.

*Constructs a **DDS_TK_ENUM** (p. 86) **DDS_TypeCode** (p. 1149).*
- **DDS_TypeCode * create_alias_tc** (const char *name, const **DDS_TypeCode** *original_type, **DDS_Boolean** is_pointer, **DDS_ExceptionCode_t** &ex)
*Constructs a **DDS_TK_ALIAS** (p. 86) (typedef) **DDS_TypeCode** (p. 1149).*
- **DDS_TypeCode * create_string_tc** (**DDS_UnsignedLong** bound, **DDS_ExceptionCode_t** &ex)
*Constructs a **DDS_TK_STRING** (p. 86) **DDS_TypeCode** (p. 1149).*
- **DDS_TypeCode * create_wstring_tc** (**DDS_UnsignedLong** bound, **DDS_ExceptionCode_t** &ex)
*Constructs a **DDS_TK_WSTRING** (p. 86) **DDS_TypeCode** (p. 1149).*
- **DDS_TypeCode * create_sequence_tc** (**DDS_UnsignedLong** bound, const **DDS_TypeCode** *element_type, **DDS_ExceptionCode_t** &ex)

Constructs a **DDS_TK_SEQUENCE** (p. 86) **DDS_TypeCode** (p. 1149).

- **DDS_TypeCode * create_array_tc** (const **DDS_UnsignedLongSeq** &dimensions, const **DDS_TypeCode** *element_type, **DDS_ExceptionCode_t** &ex)

Constructs a **DDS_TK_ARRAY** (p. 86) **DDS_TypeCode** (p. 1149).

- **DDS_TypeCode * create_array_tc** (**DDS_UnsignedLong** length, const **DDS_TypeCode** *element_type, **DDS_ExceptionCode_t** &ex)

Constructs a **DDS_TK_ARRAY** (p. 86) **DDS_TypeCode** (p. 1149) for a single-dimensional array.

Static Public Member Functions

- static **DDS_TypeCodeFactory * get_instance** ()

Gets the singleton instance of this class.

9.216.1 Detailed Description

A singleton factory for creating, copying, and deleting data type definitions dynamically.

You can access the singleton with the **DDS_TypeCodeFactory::get_instance** (p. 1196) method.

If you want to publish and subscribe to data of types that are not known to you at system design time, this class will be your starting point. After creating a data type definition with this class, you will modify that definition using the **DDS_TypeCode** (p. 1149) class and then register it with the **Dynamic Data** (p. 99) API.

The methods of this class fall into several categories:

Getting definitions for primitive types:

Type definitions for primitive types (e.g. integers, floating point values, etc.) are pre-defined; your application only needs to *get* them, not *create* them.

- **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197)

Creating definitions for strings, arrays, and sequences:

Type definitions for strings, arrays, and sequences (i.e. variables-size lists) must be created as you need them, because the type definition includes the maximum length of those containers.

- **DDS_TypeCodeFactory::create_string_tc** (p. 1205)
- **DDS_TypeCodeFactory::create_wstring_tc** (p. 1206)
- **DDS_TypeCodeFactory::create_array_tc** (p. 1207)
- **DDS_TypeCodeFactory::create_array_tc** (p. 1207)
- **DDS_TypeCodeFactory::create_sequence_tc** (p. 1206)

Creating definitions for structured types:

Structured types include structures, value types, and unions.

- **DDS_TypeCodeFactory::create_struct_tc** (p. 1198)

- **DDS_TypeCodeFactory::create_value_tc** (p. 1199)
- **DDS_TypeCodeFactory::create_union_tc** (p. 1201)

Creating definitions for other types:

The type system also supports enumerations and aliases (i.e. `typedefs` in C and C++).

- **DDS_TypeCodeFactory::create_enum_tc** (p. 1202)
- **DDS_TypeCodeFactory::create_alias_tc** (p. 1205)

Deleting type definitions:

When you're finished using a type definition, you should delete it. (*Note* that you only need to delete a **DDS_TypeCode** (p. 1149) that you *created*; if you got the object from **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197), you must *not* delete it.)

- **DDS_TypeCodeFactory::delete_tc** (p. 1197)

Copying type definitions:

You can also create deep copies of type definitions:

- **DDS_TypeCodeFactory::clone_tc** (p. 1196)

9.216.2 Member Function Documentation

9.216.2.1 get_instance()

```
static DDS_TypeCodeFactory * DDS_TypeCodeFactory::get_instance ( ) [static]
```

Gets the singleton instance of this class.

Returns

The **DDS_TypeCodeFactory** (p. 1194) instance if no errors. Otherwise, NULL.

MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this method while another thread may be simultaneously calling **DDSDomainParticipantFactory::get_instance** (p. 1412), **DDSDomainParticipantFactory::finalize_instance** (p. 1412), **DDS_TypeCodeFactory::get_instance** (p. 1196), **NDDUtilityNetworkCapture::enable** (p. 1824), or **NDDUtilityNetworkCapture::disable** (p. 1825).

9.216.2.2 clone_tc()

```
DDS_TypeCode * DDS_TypeCodeFactory::clone_tc (
    const DDS_TypeCode * tc,
    DDS_ExceptionCode_t & ex )
```

Creates and returns a copy of the input **DDS_TypeCode** (p. 1149).

Parameters

<i>tc</i>	<< <i>in</i> >> (p. 237) Type code that will be copied. Cannot be NULL.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A clone of *tc*.

9.216.2.3 delete_tc()

```
void DDS_TypeCodeFactory::delete_tc (
    DDS_TypeCode * tc,
    DDS_ExceptionCode_t & ex )
```

Deletes the input **DDS_TypeCode** (p. 1149).

All the type codes created through the **DDS_TypeCodeFactory** (p. 1194) must be deleted using this method.

Parameters

<i>tc</i>	<< <i>inout</i> >> (p. 237) Type code that will be deleted. Cannot be NULL.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333)

9.216.2.4 get_primitive_tc()

```
const DDS_TypeCode * DDS_TypeCodeFactory::get_primitive_tc (
    DDS_TCKind tc_kind )
```

Get the **DDS_TypeCode** (p. 1149) for a primitive type (integers, floating point values, etc.) identified by the given **DDS_TCKind** (p. 86).

This method is equivalent to, and replaces, the `DDS_g_tc_*` constants.

DDS_g_tc_char (p. 90)
DDS_g_tc_wchar (p. 91)

9.216.2.5 create_struct_tc() [1/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_struct_tc (
    const char * name,
    const DDS_StructMemberSeq & members,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_STRUCTURE** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the struct type. Cannot be NULL.
<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the structure. This list may be empty (that is, FooSeq::length() (p. 1687) may return zero). If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.)
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a struct.

9.216.2.6 create_struct_tc() [2/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_struct_tc (
    const char * name,
    DDS_ExtensibilityKind extensibility_kind,
    const DDS_StructMemberSeq & members,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_STRUCT** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the struct type. Cannot be NULL.
<i>extensibility_kind</i>	<< <i>in</i> >> (p. 237) Type extensibility.
<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the structure. This list may be empty (that is, FooSeq::length() (p. 1687) may return zero). If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.)
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a struct.

9.216.2.7 create_value_tc() [1/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_value_tc (
    const char * name,
    DDS_ValueModifier type_modifier,
    const DDS_TypeCode * concrete_base,
    const DDS_ValueMemberSeq & members,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_VALUE** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the value type. Cannot be NULL.
<i>type_modifier</i>	<< <i>in</i> >> (p. 237) One of the value type modifier constants: DDS_VM_NONE (p. 81), DDS_VM_CUSTOM (p. 81), DDS_VM_ABSTRACT (p. 82) or DDS_VM_TRUNCATABLE (p. 82).
<i>concrete_base</i>	<< <i>in</i> >> (p. 237) DDS_TypeCode (p. 1149) object describing the concrete valuetype base. It may be NULL if the valuetype does not have a concrete base.
<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the value type. This list may be empty. If the list is not empty, the elements must describe valid value type members. (For example, the names must be unique within the type.)
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a value.

9.216.2.8 create_value_tc() [2/2]

```

DDS_TypeCode * DDS_TypeCodeFactory::create_value_tc (
    const char * name,
    DDS_ExtensibilityKind extensibility_kind,
    DDS_ValueModifier type_modifier,
    const DDS_TypeCode * concrete_base,
    const DDS_ValueMemberSeq & members,
    DDS_StatusCode_t & ex )

```

Constructs a **DDS_TK_VALUE** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the value type. Cannot be NULL.
<i>extensibility_kind</i>	<< <i>in</i> >> (p. 237) Type extensibility.
<i>type_modifier</i>	<< <i>in</i> >> (p. 237) One of the value type modifier constants: DDS_VM_NONE (p. 81), DDS_VM_CUSTOM (p. 81), DDS_VM_ABSTRACT (p. 82) or DDS_VM_TRUNCATABLE (p. 82).
<i>concrete_base</i>	<< <i>in</i> >> (p. 237) DDS_TypeCode (p. 1149) object describing the concrete valuetype base. It may be NULL if the valuetype does not have a concrete base.

Parameters

<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the value type. This list may be empty. If the list is not empty, the elements must describe valid value type members. (For example, the names must be unique within the type.)
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a value.

9.216.2.9 create_union_tc() [1/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_union_tc (
    const char * name,
    const DDS_TypeCode * discriminator_type,
    DDS_Long default_index,
    const DDS_UnionMemberSeq & members,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_UNION** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the union type. Cannot be NULL.
<i>discriminator_type</i>	<< <i>in</i> >> (p. 237) Discriminator Type Code. Cannot be NULL.
<i>default_index</i>	<< <i>in</i> >> (p. 237) Index of the default member, or -1 if there is no default member.
<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the union. This list may be empty. If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.)
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a union.

9.216.2.10 create_union_tc() [2/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_union_tc (
    const char * name,
    DDS_ExtensibilityKind extensibility_kind,
    const DDS_TypeCode * discriminator_type,
    DDS_Long default_index,
    const DDS_UnionMemberSeq & members,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_UNION** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the union type. Cannot be NULL.
<i>extensibility_kind</i>	<< <i>in</i> >> (p. 237) Type extensibility.
<i>discriminator_type</i>	<< <i>in</i> >> (p. 237) Discriminator Type Code. Cannot be NULL.
<i>default_index</i>	<< <i>in</i> >> (p. 237) Index of the default member, or -1 if there is no default member.
<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the union. This list may be empty. If the list is not empty, the elements must describe valid struct members. (For example, the names must be unique within the type.)
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a union.

9.216.2.11 create_enum_tc() [1/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_enum_tc (
    const char * name,
```

```
const DDS_EnumMemberSeq & members,  
      DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_ENUM** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the enum type. Cannot be NULL.
<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the enumeration. All members must have non-NULL names, and both names and ordinal values must be unique within the type. Note that it is also possible to add members later with DDS_TypeCode::add_member_to_enum (p. 1181).
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing an enumeration.

9.216.2.12 create_enum_tc() [2/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_enum_tc (
    const char * name,
    DDS_ExtensibilityKind extensibility_kind,
    const DDS_EnumMemberSeq & members,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_ENUM** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the enum type. Cannot be NULL.
<i>extensibility_kind</i>	<< <i>in</i> >> (p. 237) Type extensibility.
<i>members</i>	<< <i>in</i> >> (p. 237) Initial members of the enumeration. All members must have non-NULL names, and both names and ordinal values must be unique within the type. Note that it is also possible to add members later with DDS_TypeCode::add_member_to_enum (p. 1181).
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing an enumeration.

9.216.2.13 create_alias_tc()

```
DDS_TypeCode * DDS_TypeCodeFactory::create_alias_tc (
    const char * name,
    const DDS_TypeCode * original_type,
    DDS_Boolean is_pointer,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_ALIAS** (p. 86) (typedef **DDS_TypeCode** (p. 1149)).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the alias. Cannot be NULL.
<i>original_type</i>	<< <i>in</i> >> (p. 237) Aliased type code. Cannot be NULL.
<i>is_pointer</i>	<< <i>in</i> >> (p. 237) Indicates if the alias is a pointer to the aliased type code.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing an alias.

9.216.2.14 create_string_tc()

```
DDS_TypeCode * DDS_TypeCodeFactory::create_string_tc (
    DDS_UnsignedLong bound,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_STRING** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>bound</i>	<< <i>in</i> >> (p. 237) Maximum length of the string.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a string.

9.216.2.15 create_wstring_tc()

```
DDS_TypeCode * DDS_TypeCodeFactory::create_wstring_tc (
    DDS_UnsignedLong bound,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_WSTRING** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>bound</i>	<< <i>in</i> >> (p. 237) Maximum length of the wide string.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a wide string.

9.216.2.16 create_sequence_tc()

```
DDS_TypeCode * DDS_TypeCodeFactory::create_sequence_tc (
    DDS_UnsignedLong bound,
    const DDS_TypeCode * element_type,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_SEQUENCE** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>bound</i>	<< <i>in</i> >> (p. 237) The bound for the sequence (> 0).
<i>element_type</i>	<< <i>in</i> >> (p. 237) DDS_TypeCode (p. 1149) object describing the sequence elements.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a sequence.

9.216.2.17 create_array_tc() [1/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_array_tc (
    const DDS_UnsignedLongSeq & dimensions,
    const DDS_TypeCode * element_type,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_ARRAY** (p. 86) **DDS_TypeCode** (p. 1149).

Parameters

<i>dimensions</i>	<< <i>in</i> >> (p. 237) Dimensions of the array. Each dimension has to be greater than 0.
<i>element_type</i>	<< <i>in</i> >> (p. 237) DDS_TypeCode (p. 1149) describing the array elements. Cannot be NULL.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333)
Generated by Doxygen	• DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a sequence.

9.216.2.18 create_array_tc() [2/2]

```
DDS_TypeCode * DDS_TypeCodeFactory::create_array_tc (
    DDS_UnsignedLong length,
    const DDS_TypeCode * element_type,
    DDS_ExceptionCode_t & ex )
```

Constructs a **DDS_TK_ARRAY** (p. 86) **DDS_TypeCode** (p. 1149) for a single-dimensional array.

Parameters

<i>length</i>	<< <i>in</i> >> (p. 237) Length of the single-dimensional array.
<i>element_type</i>	<< <i>in</i> >> (p. 237) DDS_TypeCode (p. 1149) describing the array elements. Cannot be NULL.
<i>ex</i>	<< <i>out</i> >> (p. 237) Parameter for error indications. The values that can take are: <ul style="list-style-type: none"> • DDS_NO_EXCEPTION_CODE (p. 333) • DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE (p. 333) • DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE (p. 333)

Returns

A newly-created **DDS_TypeCode** (p. 1149) object describing a sequence.

9.217 DDS_TypeCodePrintFormatProperty Struct Reference

A collection of attributes used to configure how a TypeCode appears when converted to a string.

Public Attributes

- **DDS_Long indent**
Configures how much indent should be added to the string representation of a **DDS_TypeCode** (p. 1149).
- **DDS_Boolean print_ordinals**
Configures whether or not to print the ordinal value of each enumerator within a **DDS_TypeCode** (p. 1149).
- **DDS_TypeCodePrintFormatKind print_kind**
Configures whether the type should be printed in XML or IDL format.
- **DDS_Boolean print_complete_type**
Configures whether or not to print the complete type.

9.217.1 Detailed Description

A collection of attributes used to configure how a TypeCode appears when converted to a string.

To ensure that new objects are initialized to a known value, assign them with the static initializer **DDS_TypeCode_↵
PrintFormat_INITIALIZER** (p. 84).

9.217.2 Member Data Documentation

9.217.2.1 indent

DDS_Long DDS_TypeCodePrintFormatProperty::indent

Configures how much indent should be added to the string representation of a **DDS_TypeCode** (p. 1149).

Configures how much additional indent is applied when converting a TypeCode to a string. This value acts as a total offset on the string, increasing the indent applied to all elements by the same amount. With an indent of 0, a string representation of a TypeCode may appear as:

```
struct myType {  
    long x;  
};
```

Using an indent of 1, the same TypeCode would be printed as:

```
    struct myType {  
        long x;  
    };
```

I.e., the entire structure is indented.

9.217.2.2 print_ordinals

DDS_Boolean DDS_TypeCodePrintFormatProperty::print_ordinals

Configures whether or not to print the ordinal value of each enumerator within a **DDS_TypeCode** (p. 1149).

When set to true, the ordinal value of each enumerator within an enum will be printed, otherwise only non-default ordinals are printed. Take for example the following enum:

```
enum myEnum {  
    RED,  
    GREEN = 3,  
    BLUE,  
};
```

When print_ordinals is set to false it would be printed as:

```
enum myEnum {  
    RED,  
    GREEN = 3,  
    BLUE,  
};
```

But with print_ordinals set to true it would be printed as:

```
enum myEnum {  
    RED = 0,  
    GREEN = 3,  
    BLUE = 4,  
};
```

9.217.2.3 print_kind

DDS_TypeCodePrintFormatKind DDS_TypeCodePrintFormatProperty::print_kind

Configures whether the type should be printed in XML or IDL format.

When print_kind is DDS_TYPE_CODE_PRINT_KIND_IDL, the type will be printed in IDL format. For example:

```
struct Foo {  
    float32 bar;  
};
```

When print_kind is DDS_TYPE_CODE_PRINT_KIND_XML, the type will be printed in XML format. For example:

```
<struct name="Foo">  
    <member name="bar" type="float32"/>  
</struct>
```

9.217.2.4 print_complete_type

DDS_Boolean DDS_TypeCodePrintFormatProperty::print_complete_type

Configures whether or not to print the complete type.

When print_complete_type is true, the complete type will be printed. When print_complete_type is false, only the top level will be printed.

Take for example the following types:

```
struct Foo {
    float32 member;
};
struct Bar {
    Foo foo;
};
```

When print_complete_type is false, this is printed as:

```
struct Bar {
    Foo foo;
};
```

When print_complete_type is true, this is printed as:

```
struct Foo {
    float32 member;
};
struct Bar {
    Foo foo;
};
```

9.218 DDS_TypeConsistencyEnforcementQosPolicy Struct Reference

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Public Attributes

- **DDS_TypeConsistencyKind kind**
Type consistency kind.
- **DDS_Boolean ignore_sequence_bounds**
Controls whether sequence bounds are taken into consideration for type assignability.
- **DDS_Boolean ignore_string_bounds**
Controls whether string bounds are taken into consideration for type assignability.
- **DDS_Boolean ignore_member_names**
Controls whether member names are taken into consideration for type assignability.
- **DDS_Boolean prevent_type_widening**
Controls whether type widening is allowed.
- **DDS_Boolean force_type_validation**
*Controls whether type information must be available in order to complete matching between a **DDSDataWriter** (p. 1305) and a **DDSDataReader** (p. 1272).*
- **DDS_Boolean ignore_enum_literal_names**
Controls whether enumeration constant names are taken into consideration for type assignability.

9.218.1 Detailed Description

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

This policy defines a type consistency kind, which allows applications to select from among a set of predetermined behaviors. The following consistency kinds are specified: **DDS_DISALLOW_TYPE_COERCION** (p. 452), **DDS_ALLOW_TYPE_COERCION** (p. 452) and **DDS_AUTO_TYPE_COERCION** (p. 452).

The type-consistency-enforcement rules consist of two steps:

Step 1. If both the DataWriter and DataReader specify a TypeObject, it is considered first. If the DataReader allows type coercion, then its type must be assignable from the DataWriter's type, taking into account the values of `prevent_type_widening`, `ignore_sequence_bounds`, `ignore_string_bounds`, `ignore_member_names`, and `ignore_enum_literal_names`. If the DataReader does not allow type coercion, then its type must be equivalent to the type of the DataWriter.

Step 2. If either the DataWriter or the DataReader does not provide a TypeObject definition, then the registered type names are examined. The DataReader's and DataWriter's registered type names must match exactly, as was true in RTI Connext releases prior to 5.0.0.

If either Step 1 or Step 2 fails, the Topics associated with the DataReader and DataWriter are considered to be inconsistent and the **DDS_InconsistentTopicStatus** (p. 908) is updated.

The default enforcement kind is **DDS_AUTO_TYPE_COERCION** (p. 452). This default kind translates to **DDS_ALLOW_TYPE_COERCION** (p. 452) except in the following cases:

- When a **Zero Copy** (p. 70) DataReader is used, the kind is translated to **DDS_DISALLOW_TYPE_COERCION** (p. 452).
- When the middleware is introspecting the built-in topic data declaration of a remote DataReader in order to determine whether it can match with a local DataWriter, if it observes that no `TypeConsistencyEnforcementQosPolicy` value is provided (as would be the case when communicating with a Service implementation not in conformance with this specification), it assumes a kind of **DDS_DISALLOW_TYPE_COERCION** (p. 452).

For additional information on type consistency enforcement refer to the `Extensible Types Guide` and the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

Entity:

DDSDDataReader (p. 1272)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

9.218.2 Member Data Documentation

9.218.2.1 kind

DDS_TypeConsistencyKind DDS_TypeConsistencyEnforcementQosPolicy::kind

Type consistency kind.

[default] **DDS_AUTO_TYPE_COERCION** (p. 452)

9.218.2.2 ignore_sequence_bounds

DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_sequence_bounds

Controls whether sequence bounds are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 316), then sequence bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 sequence type with maximum length L2 would be assignable to a T1 sequence type with maximum length L1, even if L2 is greater than L1. If the option is set to **DDS_BOOLEAN_FALSE** (p. 316), then sequence bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that $L1 \geq L2$.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.218.2.3 ignore_string_bounds

DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_string_bounds

Controls whether string bounds are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 316), then string bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 string type with maximum length L2 would be assignable to a T1 string type with maximum length L1, even if L2 is greater than L1. If the option is set to **DDS_BOOLEAN_FALSE** (p. 316), then string bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that $L1 \geq L2$.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.218.2.4 ignore_member_names

DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_member_names

Controls whether member names are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 316), then member names are not considered as part of the type assignability. If the option is set to **DDS_BOOLEAN_FALSE** (p. 316), then member names are taken into consideration for type assignability, and in order for members with the same ID to be assignable, the members must also have the same name.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.218.2.5 prevent_type_widening

DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::prevent_type_widening

Controls whether type widening is allowed.

If the option is set to **DDS_BOOLEAN_FALSE** (p. 316), then type widening is permitted. If the option is set to **DDS_BOOLEAN_TRUE** (p. 316), then a wider type may not be assignable from a narrower type.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.218.2.6 force_type_validation

DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::force_type_validation

Controls whether type information must be available in order to complete matching between a **DDSDataWriter** (p. 1305) and a **DDSDataReader** (p. 1272).

If the option is set to **DDS_BOOLEAN_TRUE** (p. 316), then type information must be available in order to complete matching between a **DDSDataWriter** (p. 1305) and a **DDSDataReader** (p. 1272). If the option is set to **DDS_BOOLEAN_FALSE** (p. 316), then matching can occur without complete type information as long as the type names match exactly. Note that if the types have the same name but are not assignable, DataReaders may fail to deserialize incoming data samples.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.218.2.7 ignore_enum_literal_names

DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_enum_literal_names

Controls whether enumeration constant names are taken into consideration for type assignability.

If the option is set to **DDS_BOOLEAN_TRUE** (p. 316), then enumeration constants may change their names, but not their values, and still maintain assignability. If the option is set to **DDS_BOOLEAN_FALSE** (p. 316), then in order for enumerations to be assignable, any constant that has the same value in both enumerations must also have the same name.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.219 DDS_TypeDeallocationParams_t Struct Reference

Configures whether to release or not pointer and optional members.

Public Member Functions

- struct **DDS_TypeDeallocationParams_t** & **set_delete_pointers** (**DDS_Boolean** do_delete)
- struct **DDS_TypeDeallocationParams_t** & **set_delete_optional_members** (**DDS_Boolean** do_delete)

Public Attributes

- **DDS_Boolean delete_pointers**
Whether to delete pointer members or not.
- **DDS_Boolean delete_optional_members**
Whether to delete optional members or not.

9.219.1 Detailed Description

Configures whether to release or not pointer and optional members.

By default both pointers optional members are released when they are not null.

This structure is also defined in `xcdr.1.0/srcC/typeObject/TypeObjectInfrastructure.h`. If changes are made, please ensure they are made in both locations.

Examples

HelloWorld.cxx, and **HelloWorldPlugin.cxx**.

9.219.2 Member Function Documentation

9.219.2.1 set_delete_pointers()

```
struct DDS_TypeDeallocationParams_t & DDS_TypeDeallocationParams_t::set_delete_pointers (  
    DDS_Boolean do_delete ) [inline]
```

Whether to delete pointer members or not

9.219.2.2 set_delete_optional_members()

```
struct DDS_TypeDeallocationParams_t & DDS_TypeDeallocationParams_t::set_delete_optional_members (  
    DDS_Boolean do_delete ) [inline]
```

Whether to delete optional members or not

9.219.3 Member Data Documentation

9.219.3.1 delete_pointers

DDS_Boolean DDS_TypeDeallocationParams_t::delete_pointers

Whether to delete pointer members or not.

Examples

HelloWorld.cxx, and **HelloWorldPlugin.cxx**.

9.219.3.2 delete_optional_members

DDS_Boolean DDS_TypeDeallocationParams_t::delete_optional_members

Whether to delete optional members or not.

Examples

HelloWorld.cxx, and **HelloWorldPlugin.cxx**.

9.220 DDS_TypeSupportQosPolicy Struct Reference

Allows you to attach application-specific values to a **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

Public Attributes

- void * **plugin_data**
Value to pass into the type plugin's de-/serialization function.
- **DDS_CdrPaddingKind** **cdr_padding_kind**
Determines whether or not the padding bytes will be set to zero during CDR serialization.

9.220.1 Detailed Description

Allows you to attach application-specific values to a **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

The purpose of this QoS is to allow a user application to pass data to a type plugin's support functions and choose whether or not to set the padding bytes to zero when serializing a sample using CDR encapsulation.

Entity:

DDSDomainParticipant (p. 1335), **DDSDDataReader** (p. 1272), **DDSDDataWriter** (p. 1305)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

9.220.2 Usage

The **DDS_TypeSupportQosPolicy::plugin_data** (p. 1217) allows you to associate a pointer to an object with a **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272). This object pointer is passed to the serialization routine of the data type associated with the **DDSDDataWriter** (p. 1305) or the deserialization routine of the data type associated with the **DDSDDataReader** (p. 1272).

You can modify the rtiddsgen-generated code so that the de/serialization routines act differently depending on the information passed in via the object pointer. (The generated serialization and deserialization code does not use the pointer.)

This functionality can be used to change how data sent by a **DDSDDataWriter** (p. 1305) or received by a **DDSDDataReader** (p. 1272) is serialized or deserialized on a per DataWriter and DataReader basis.

It can also be used to dynamically change how serialization (or for a less common case, deserialization) occurs. For example, a data type could represent a table, including the names of the rows and columns. However, since the row/column names of an instance of the table (a Topic) don't change, they only need to be sent once. The information passed in through the TypeSupport QoS policy could be used to signal the serialization routine to send the row/column names the first time a **DDSDDataWriter** (p. 1305) calls **FooDataWriter::write** (p. 1666), and then never again.

The **DDS_TypeSupportQosPolicy::cdr_padding_kind** (p. 1217) allows you to choose whether or not the padding bytes are set to zero during CDR serialization.

9.220.3 Member Data Documentation

9.220.3.1 plugin_data

```
void* DDS_TypeSupportQosPolicy::plugin_data
```

Value to pass into the type plugin's de-/serialization function.

[default] NULL

9.220.3.2 cdr_padding_kind

```
DDS_CdrPaddingKind DDS_TypeSupportQosPolicy::cdr_padding_kind
```

Determines whether or not the padding bytes will be set to zero during CDR serialization.

In a DomainParticipant, this value configures how the padding bytes are set when serializing data for the Built-In Topic DataWriters and DataReaders. A value of **DDS_AUTO_CDR_PADDING** (p. 455) defaults to **DDS_NOT_SET_CDR_PADDING** (p. 455).

For DataWriters and DataReaders, this value configures how padding bytes are set when serializing data for that entity. A value of **DDS_AUTO_CDR_PADDING** (p. 455) means that the entity will inherit whatever value is set on the DomainParticipant.

[default] **DDS_AUTO_CDR_PADDING** (p. 455)

9.221 DDS_UInt8Seq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_UInt8** (p. 317) >

9.221.1 Detailed Description

Instantiates **FooSeq** (p. 1680) < **DDS_UInt8** (p. 317) >

Instantiates:

9.222 DDS_UnionMember Struct Reference

A description of a member of a union.

Public Attributes

- char * **name**
The name of the union member.
- **DDS_Boolean is_pointer**
Indicates whether the union member is a pointer or not.
- struct **DDS_LongSeq labels**
The labels of the union member.
- const **DDS_TypeCode * type**
The type of the union member.

9.222.1 Detailed Description

A description of a member of a union.

See also

DDS_UnionMemberSeq (p. 1219)

DDS_TypeCodeFactory::create_union_tc (p. 1201)

9.222.2 Member Data Documentation

9.222.2.1 name

```
char* DDS_UnionMember::name
```

The name of the union member.

Cannot be NULL.

9.222.2.2 is_pointer

```
DDS_Boolean DDS_UnionMember::is_pointer
```

Indicates whether the union member is a pointer or not.

9.222.2.3 labels

```
struct DDS_LongSeq DDS_UnionMember::labels
```

The labels of the union member.

Each union member should contain at least one label. If the union discriminator type is not **DDS_Long** (p. 317) the label value should be evaluated to an integer value. For instance, 'a' would be evaluated to 97.

9.222.2.4 type

```
const DDS_TypeCode* DDS_UnionMember::type
```

The type of the union member.

Cannot be NULL.

9.223 DDS_UnionMemberSeq Struct Reference

Defines a sequence of union members.

9.223.1 Detailed Description

Defines a sequence of union members.

9.227 DDS_UserDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Public Attributes

- struct **DDS_OctetSeq** value
a sequence of octets

9.227.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Entity:

DDSDomainParticipant (p. 1335), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = NO;
Changeable (p. ??) = YES (p. ??)

See also

DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.227.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDSEntity** (p. 1446) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This information is not used by RTI Connex.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with operations such as **DDSDomainParticipant::ignore_participant** (p. 1376), **DDSDomainParticipant::ignore_publication** (p. 1379), **DDSDomainParticipant::ignore_subscription** (p. 1379), and **DDSDomainParticipant::ignore_topic** (p. 1378), this QoS policy can assist an application to define and enforce its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connex stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connex with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS_DomainParticipantResourceLimitsQosPolicy::participant_user_data_max_length** (p. 752), **DDS_DomainParticipantResourceLimitsQosPolicy::writer_user_data_max_length** (p. 753), and **DDS_DomainParticipantResourceLimitsQosPolicy::reader_user_data_max_length** (p. 753).

9.227.3 Member Data Documentation

9.227.3.1 value

```
struct DDS_OctetSeq DDS_UserDataQosPolicy::value
```

a sequence of octets

[default] empty (zero-length)

[range] Octet sequence of length [0,max_length]

9.228 DDS_ValueMember Struct Reference

A description of a member of a value type.

Public Attributes

- **char * name**
The name of the value member.
- **const DDS_TypeCode * type**
The type of the value member.
- **DDS_Boolean is_pointer**
Indicates whether the value member is a pointer or not.
- **DDS_Short bits**
Number of bits of a bitfield member.
- **DDS_Boolean is_key**
Indicates if the value member is a key member or not.
- **DDS_Visibility access**
The type of access (public, private) for the value member.
- **DDS_Long id**
The member ID.
- **DDS_Boolean is_optional**
Indicates if the value member is optional or required.

9.228.1 Detailed Description

A description of a member of a value type.

See also

DDS_ValueMemberSeq (p. 1225)

9.228.2 Member Data Documentation

9.228.2.1 name

```
char* DDS_ValueMember::name
```

The name of the value member.

Cannot be NULL.

9.228.2.2 type

```
const DDS_TypeCode* DDS_ValueMember::type
```

The type of the value member.

Cannot be NULL.

9.228.2.3 is_pointer

```
DDS_Boolean DDS_ValueMember::is_pointer
```

Indicates whether the value member is a pointer or not.

9.228.2.4 bits

```
DDS_Short DDS_ValueMember::bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **DDS_TYPECODE_NOT_BITFIELD** (p. 81).

9.228.2.5 is_key

```
DDS_Boolean DDS_ValueMember::is_key
```

Indicates if the value member is a key member or not.

9.228.2.6 access

```
DDS_Visibility DDS_ValueMember::access
```

The type of access (public, private) for the value member.

It can take the values: **DDS_PRIVATE_MEMBER** (p. 82) or **DDS_PUBLIC_MEMBER** (p. 83).

9.228.2.7 id

```
DDS_Long DDS_ValueMember::id
```

The member ID.

Use **DDS_TYPECODE_MEMBER_ID_INVALID** (p. 81) to have the member ID automatically assigned.

9.228.2.8 is_optional

```
DDS_Boolean DDS_ValueMember::is_optional
```

Indicates if the value member is optional or required.

DDS_Octet DDS_VendorId_t::vendorId[**DDS_VENDOR_ID_LENGTH_MAX**]

The vendor Id.

9.231 DDS_WaitSetProperty_t Struct Reference

<<*extension*>> (p. 236) Specifies the **DDSWaitSet** (p. 1613) behavior for multiple trigger events.

Public Attributes

- **DDS_Long max_event_count**
*Maximum number of trigger events to cause a **DDSWaitSet** (p. 1613) to awaken.*
- struct **DDS_Duration_t max_event_delay**
*Maximum delay from occurrence of first trigger event to cause a **DDSWaitSet** (p. 1613) to awaken.*

9.231.1 Detailed Description

<<*extension*>> (p. 236) Specifies the **DDSWaitSet** (p. 1613) behavior for multiple trigger events.

In simple use, a **DDSWaitSet** (p. 1613) returns when a single trigger event occurs on one of its attached **DDSCondition** (p. 1260) (s), or when the `timeout` maximum wait duration specified in the **DDSWaitSet::wait** (p. 1617) call expires.

The **DDS_WaitSetProperty_t** (p. 1226) allows configuration of the waiting behavior of a **DDSWaitSet** (p. 1613). If no conditions are true at the time of the call to wait, then the `max_event_count` parameter may be used to configure the WaitSet to wait for `max_event_count` trigger events to occur before returning, or to wait for up to `max_event_delay` time from the occurrence of the first trigger event before returning.

The `timeout` maximum wait duration specified in the **DDSWaitSet::wait** (p. 1617) call continues to apply.

Entity:

DDSWaitSet (p. 1613)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **YES** (p. ??)

9.231.2 Member Data Documentation

9.231.2.1 max_event_count

`DDS_Long DDS_WaitSetProperty_t::max_event_count`

Maximum number of trigger events to cause a **DDSWaitSet** (p. 1613) to awaken.

The **DDSWaitSet** (p. 1613) will wait until up to `max_event_count` trigger events have occurred before returning. The **DDSWaitSet** (p. 1613) may return earlier if either the `timeout` duration has expired, or `max_event_delay` has elapsed since the occurrence of the first trigger event. `max_event_count` may be used to "collect" multiple trigger events for processing at the same time.

[default] 1

[range] >= 1

;

9.231.2.2 max_event_delay

`struct DDS_Duration_t DDS_WaitSetProperty_t::max_event_delay`

Maximum delay from occurrence of first trigger event to cause a **DDSWaitSet** (p. 1613) to awaken.

The **DDSWaitSet** (p. 1613) will return no later than `max_event_delay` after the first trigger event. `max_event_delay` may be used to establish a maximum latency for events reported by the **DDSWaitSet** (p. 1613).

Note that **DDS_RETCODE_TIMEOUT** (p. 336) is *not* returned if `max_event_delay` is exceeded. **DDS_RETCODE_TIMEOUT** (p. 336) is returned only if the `timeout` duration expires before any trigger events occur.

[default] **DDS_DURATION_INFINITE** (p. 325) ;

9.232 DDS_WcharSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_Wchar** (p. 316) >

See also

DDS_Wchar (p. 316)

FooSeq (p. 1680)

9.233 DDS_WireProtocolQosPolicy Struct Reference

Specifies the wire-protocol-related attributes for the **DDSDomainParticipant** (p. 1335).

Public Attributes

- **DDS_Long participant_id**
A value used to distinguish among different participants belonging to the same domain on the same host.
- **DDS_UnsignedLong rtps_host_id**
The RTPS Host ID of the domain participant.
- **DDS_UnsignedLong rtps_app_id**
The RTPS App ID of the domain participant.
- **DDS_UnsignedLong rtps_instance_id**
*The RTPS Instance ID of the **DDSDomainParticipant** (p. 1335).*
- struct **DDS_RtpsWellKnownPorts_t rtps_well_known_ports**
Configures the RTPS well-known port mappings.
- **DDS_RtpsReservedPortKindMask rtps_reserved_port_mask**
Specifies which well-known ports to reserve when enabling the participant.
- **DDS_WireProtocolQosPolicyAutoKind rtps_auto_id_kind**
Kind of auto mechanism used to calculate the GUID prefix.
- **DDS_Boolean compute_crc**
*Adds RTPS CRC submessage to every message when this field is set to **DDS_BOOLEAN_TRUE** (p. 316).*
- **DDS_Boolean check_crc**
*Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to **DDS_BOOLEAN_TRUE** (p. 316).*

9.233.1 Detailed Description

Specifies the wire-protocol-related attributes for the **DDSDomainParticipant** (p. 1335).

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.233.2 Usage

This QoS policy configures some participant-wide properties of the DDS Real-Time Publish Subscribe (RTPS) on-the-wire protocol. (**DDS_DataWriterProtocolQosPolicy** (p. 667) and **DDS_DataReaderProtocolQosPolicy** (p. 624) configure RTPS and reliability properties on a per **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272) basis.)

NOTE: The default QoS policies returned by RTI Connext contain the correctly initialized wire protocol attributes. The defaults are not normally expected to be modified, but are available to the advanced user customizing the implementation behavior.

The default values should not be modified without an understanding of the underlying Real-Time Publish Subscribe (RTPS) wire protocol.

In order for the discovery process to work correctly, each **DDSDomainParticipant** (p. 1335) must have a unique identifier. This QoS policy specifies how that identifier should be generated.

RTPS defines a 96-bit prefix to this identifier; each **DDSDomainParticipant** (p. 1335) must have a unique value for this prefix relative to all other participants in its domain.

If an application dies unexpectedly and is restarted, the IDs used by the new instance of DomainParticipants should be different than the ones used by the previous instances. A change in these values allows other DomainParticipants to know that they are communicating with a new instance of an application, and not the previous instance.

For legacy reasons, RTI Connext divides the 96-bit prefix into three integers:

- The first integer is called host ID. The original purpose of this integer was to contain the identity of the machine on which the DomainParticipant is executing.
- The second integer is called an application ID. The original purpose of this integer was to contain a value that identifies the process or task in which the DomainParticipant is contained.
- The third integer is called instance ID. The original purpose was to contain a value that uniquely identifies a DomainParticipant within a task or process.

The **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 1233) field can be used to configure the algorithm that RTI Connext uses to populate the 96-bit prefix. Then you can optionally overwrite specific parts of the 96-bit prefix by explicitly configuring the **DDS_WireProtocolQosPolicy::rtps_host_id** (p. 1231) (first integer), **DDS_WireProtocolQosPolicy::rtps_app_id** (p. 1232) (second integer), and **DDS_WireProtocolQosPolicy::rtps_instance_id** (p. 1232) (third integer).

The **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 1233) field supports three different prefix generation algorithms:

1. In the default and most common scenario, **DDS_WireProtocolQosPolicy::rtps_auto_id_kind** (p. 1233) is set to **DDS_RTPS_AUTO_ID_FROM_UUID** (p. 460). As the name suggests, this mechanism uses a unique, randomly generated UUID to fill the **rtps_host_id**, **rtps_app_id**, or **rtps_instance_id** fields. The first two bytes of the **rtps_host_id** are replaced with the RTI vendor ID (0x0101).
2. (Legacy) When **rtps_auto_id_kind** is set to **DDS_RTPS_AUTO_ID_FROM_IP** (p. 460), the 96-bit prefix is generated as follows:

- **rtps_host_id**: The 32-bit value of the IPv4 of the first up and running interface of the host machine is assigned. If the host does not have an IPv4 address, the host-id will be automatically set to 0x7F000001.
- **rtps_app_id**: The process (or task) ID is assigned.
- **rtps_instance_id**: A counter is assigned that is incremented per new participant within a process.

DDS_RTSPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

3. (Legacy) When `rtps_auto_id_kind` is set to **DDS_RTSPS_AUTO_ID_FROM_MAC** (p.460), the 96-bit prefix is generated as follows:

- **rtps_host_id**: The first 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
- **rtps_app_id**: The last 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
- **rtps_instance_id**: This field is split into two different parts. The process (or task) ID is assigned to the first 24 bits. A counter is assigned to the last 8 bits. This counter is incremented per new participant.

DDS_RTSPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

Some examples are provided to clarify the behavior of this QoSPolicy in case you want to change the default behavior with **DDS_RTSPS_AUTO_ID_FROM_MAC** (p.460).

First, get the participant QoS from the DomainParticipantFactory:

```
DDSDomainParticipantFactory *factory = NULL;
factory = DDSTheParticipantFactory->get_instance();
factory->get_default_participant_qos(participant_qos);
```

Second, change the **DDS_WireProtocolQoSPolicy** (p.1228) using one of the options shown below.

Third, create the **DDSDomainParticipant** (p.1335) as usual, using the modified QoS structure instead of the default one.

Option 1: Use **DDS_RTSPS_AUTO_ID_FROM_MAC** (p.460) to explicitly set just the application/task identifier portion of the **rtps_instance_id** field.

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTSPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id      = DDS_RTSPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id       = DDS_RTSPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id  = (/* App ID */ (12 << 8) |
/* Instance ID*/ (DDS_RTSPS_AUTO_ID));
```

Option 2: Handle only the per participant counter and let RTI Connext handle the application/task identifier:

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTSPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id      = DDS_RTSPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id       = DDS_RTSPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id  = (/* App ID */ (DDS_RTSPS_AUTO_ID) |
/* Instance ID*/ (12));
```

Option 3: Handle the entire **rtps_instance_id** field yourself:

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTSPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id      = DDS_RTSPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id       = DDS_RTSPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id  = ( /* App ID */ (12 << 8) |
/* Instance ID */ (9) )
```

NOTE: If you are using **DDS_RTSPS_AUTO_ID_FROM_MAC** (p.460) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connext will take

responsibility for them). RTI recommends that you always specify the two parts separately in order to avoid errors.

Option 4: Let RTI Connexthandle the entire **rtps_instance_id** field:

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id      = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id       = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id  = DDS_RTPS_AUTO_ID;
```

NOTE: If you are using **DDS_RTPS_AUTO_ID_FROM_MAC** (p. 460) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connexthandle will take responsibility for them). RTI recommends that you always specify the two parts separately in order to clearly show the difference.

9.233.3 Member Data Documentation

9.233.3.1 participant_id

DDS_Long DDS_WireProtocolQosPolicy::participant_id

A value used to distinguish among different participants belonging to the same domain on the same host.

Determines the unicast port on which meta-traffic is received. Also defines the *default* unicast port for receiving user-traffic for DataReaders and DataWriters (can be overridden by the **DDS_DataReaderQos::unicast** (p. 645) or **DDS_DataWriterQos::unicast** (p. 690)).

For more information on port mapping, please refer to **DDS_RtpsWellKnownPorts_t** (p. 1062).

Each **DDSDomainParticipant** (p. 1335) in the same domain and running on the same host, must have a unique **participant_id**. The participants may be in the same address space or in distinct address spaces.

A negative number (-1) means that RTI Connexthandle will *automatically* resolve the participant ID as follows.

- RTI Connexthandle will pick the *smallest* participant ID based on the unicast ports available on the transports enabled for discovery.
- RTI Connexthandle will attempt to resolve an automatic port index either when a DomainParticipant is enabled, or when a DataReader or DataWriter is created. Therefore, all the transports enabled for discovery must have been registered by this time. Otherwise, the discovery transports registered after resolving the automatic port index may produce port conflicts when the DomainParticipant is enabled.

[default] -1 [automatic], i.e. RTI Connexthandle will automatically pick the **participant_id**, as described above.

[range] [≥ 0], or -1, and does not violate guidelines stated in **DDS_RtpsWellKnownPorts_t** (p. 1062).

See also

DDSEntity::enable() (p. 1449)

NDDSTransportSupport::register_transport() (p. 1811)

9.233.3.2 rtps_host_id

`DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_host_id`

The RTPS Host ID of the domain participant.

A specific host ID that is unique in the domain.

[default] `DDS_RTPS_AUTO_ID` (p. ??). The default value is interpreted as follows:

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS_RTPS_AUTO_ID_FROM_IP` (p. 460), the value will be interpreted as the IPv4 address of the *first* up and running interface of the host machine.

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS_RTPS_AUTO_ID_FROM_MAC` (p. 460), the value will be interpreted as the first 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS_RTPS_AUTO_ID_FROM_UUID` (p. 460), the value will be the first 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

9.233.3.3 rtps_app_id

`DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_app_id`

The RTPS App ID of the domain participant.

A participant specific ID that, together with the `rtps_instance_id`, is unique within the scope of the `rtps_host_id`.

If a participant dies and is restarted, it is recommended that it be given an app ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] `DDS_RTPS_AUTO_ID` (p. ??). The default value is interpreted as follows:

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS_RTPS_AUTO_ID_FROM_IP` (p. 460) the value will be the process (or task) ID.

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS_RTPS_AUTO_ID_FROM_MAC` (p. 460) the value will be the last 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS_RTPS_AUTO_ID_FROM_UUID` (p. 460), the value will be the middle 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

9.233.3.4 rtps_instance_id

`DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_instance_id`

The RTPS Instance ID of the **DDSDomainParticipant** (p. 1335).

This is an instance-specific ID of a participant that, together with the `rtps_app_id`, is unique within the scope of the `rtps_host_id`.

If a participant dies and is restarted, it is recommended that it be given an instance ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] `DDS RTPS_AUTO_ID` (p. ??). The default value is interpreted as follows:

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS RTPS_AUTO_ID_FROM_IP` (p. 460), a counter is assigned that is incremented per new participant. For VxWorks-653, the first 8 bits are assigned to the partition id for the application.

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS RTPS_AUTO_ID_FROM_MAC` (p. 460), the first 24 bits are assigned to the application/task identifier and the last 8 bits are assigned to a counter that is incremented per new participant.

If `DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1233) is equal to `DDS RTPS_AUTO_ID_FROM_UUID` (p. 460), the value will be the last 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff] **NOTE:** If you use `DDS RTPS_AUTO_ID_FROM_MAC` (p. 460) as `rtps_auto_id_kind` and you decide to manually handle the `rtps_instance_id` field, you must ensure that both the two parts are non-zero, otherwise the middleware will take responsibility for them. We recommend that you always specify the two parts separately in order to avoid errors. ([examples](#))

9.233.3.5 rtps_well_known_ports

`struct DDS_RtpsWellKnownPorts_t DDS_WireProtocolQosPolicy::rtps_well_known_ports`

Configures the RTPS well-known port mappings.

Determines the well-known multicast and unicast port mappings for discovery (meta) traffic and user traffic.

[default] `DDS INTEROPERABLE RTPS_WELL_KNOWN_PORTS` (p. 461)

9.233.3.6 rtps_reserved_port_mask

`DDS_RtpsReservedPortKindMask DDS_WireProtocolQosPolicy::rtps_reserved_port_mask`

Specifies which well-known ports to reserve when enabling the participant.

Specifies which of the well-known multicast and unicast ports will be reserved when the DomainParticipant is enabled. Failure to allocate a port that is computed based on the `DDS_RtpsWellKnownPorts_t` (p. 1062) will be detected at this time, and the enable operation will fail.

[default] `DDS RTPS_RESERVED_PORT_MASK_DEFAULT` (p. 458)

9.233.3.7 rtps_auto_id_kind

DDS_WireProtocolQosPolicyAutoKind `DDS_WireProtocolQosPolicy::rtps_auto_id_kind`

Kind of auto mechanism used to calculate the GUID prefix.

[default] **DDS_RTPS_AUTO_ID_FROM_UUID** (p. 460)

9.233.3.8 compute_crc

DDS_Boolean `DDS_WireProtocolQosPolicy::compute_crc`

Adds RTPS CRC submessage to every message when this field is set to **DDS_BOOLEAN_TRUE** (p. 316).

The computed CRC covers the entire RTPS message excluding the RTPS header.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.233.3.9 check_crc

DDS_Boolean `DDS_WireProtocolQosPolicy::check_crc`

Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to **DDS_BOOLEAN_TRUE** (p. 316).

DDS_WireProtocolQosPolicy::compute_crc (p. 1234) must be enabled at the publishing application for validating the message at the subscribing application.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.234 DDS_WriteParams_t Struct Reference

<<*extension*>> (p. 236) Input parameters for writing with **FooDataWriter::write_w_params** (p. 1671), **FooDataWriter::dispose_w_params** (p. 1674), **FooDataWriter::register_instance_w_params** (p. 1663), **FooDataWriter::unregister_instance_w_params** (p. 1666)

Public Attributes

- **DDS_Boolean** `replace_auto`
Allows retrieving the actual value of those fields that were automatic.
- struct **DDS_SampleIdentity_t** `identity`
Identity of the sample.
- struct **DDS_SampleIdentity_t** `related_sample_identity`
The identity of another sample related to this one.
- struct **DDS_Time_t** `source_timestamp`
Source timestamp upon write.
- struct **DDS_Cookie_t** `cookie`
Octet sequence identifying written data sample.
- **DDS_InstanceHandle_t** `handle`
Instance handle.
- **DDS_Long** `priority`
Publication priority.
- **DDS_SampleFlag** `flag`
Flags associated with the sample.
- struct **DDS_GUID_t** `source_guid`
Identifies the application logical data source associated with the sample being written.
- struct **DDS_GUID_t** `related_source_guid`
Identifies the application logical data source that is related to the sample being written.
- struct **DDS_GUID_t** `related_reader_guid`
Identifies a DataReader that is logically related to the sample that is being written.

9.234.1 Detailed Description

<<*extension*>> (p. 236) Input parameters for writing with **FooDataWriter::write_w_params** (p. 1671), **FooDataWriter::dispose_w_params** (p. 1674), **FooDataWriter::register_instance_w_params** (p. 1663), **FooDataWriter::unregister_instance_w_params** (p. 1666)

9.234.2 Member Data Documentation

9.234.2.1 `replace_auto`

```
DDS_Boolean DDS_WriteParams_t::replace_auto
```

Allows retrieving the actual value of those fields that were automatic.

When this field is set, the fields that were configured with an automatic value (for example, **DDS_AUTO_SAMPLE_IDENTITY** (p. 477)) receive their actual value after **FooDataWriter::write_w_params** (p. 1671) is called.

To reset those fields to their automatic value after calling **FooDataWriter::write_w_params** (p. 1671), use **DDS_WriteParams_reset** (p. 477)

9.234.2.2 identity

```
struct DDS_SampleIdentity_t DDS_WriteParams_t::identity
```

Identity of the sample.

Identifies the sample being written. The identity consists of a pair (Virtual Writer GUID, Virtual Sequence Number).

Use the default value to let RTI Connexx determine the sample identity as follows:

- The Virtual Writer GUID is the virtual GUID associated with the writer writing the sample. This virtual GUID is configured using **DDS_DataWriterProtocolQosPolicy::virtual_guid** (p. 668).
- The sequence number is increased by one with respect to the previous value.

The virtual sequence numbers for a virtual writer must be strictly monotonically increasing. If the user tries to write a sample with a sequence number smaller or equal to the last sequence number, the write operation will fail.

A DataReader can access the identity of a received sample by using the fields **DDS_SampleInfo::original_publication_virtual_guid** (p. 1075) and **DDS_SampleInfo::original_publication_virtual_sequence_number** (p. 1076) in the **DDS_SampleInfo** (p. 1068).

[default] **DDS_AUTO_SAMPLE_IDENTITY** (p. 477).

Referenced by **connext::WriteSample< T >::identity()**, and **connext::WriteSampleRef< T >::identity()**.

9.234.2.3 related_sample_identity

```
struct DDS_SampleIdentity_t DDS_WriteParams_t::related_sample_identity
```

The identity of another sample related to this one.

Identifies another sample that is logically related to the one that is written.

When this field is set, the related sample identity is propagated and subscribing applications can retrieve it from the **DDS_SampleInfo** (p. 1068) (see **DDS_SampleInfo::get_related_sample_identity** (p. 150)).

The default value is **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 478), and is not propagated.

A DataReader can access the related identity of a received sample by using the fields **DDS_SampleInfo::related_original_publication_virtual_guid** (p. 1076) and **DDS_SampleInfo::related_original_publication_virtual_sequence_number** (p. 1076) in the **DDS_SampleInfo** (p. 1068).

[default] **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 478)

9.234.2.4 source_timestamp

```
struct DDS_Time_t DDS_WriteParams_t::source_timestamp
```

Source timestamp upon write.

Specifies the source timestamp that will be available to the **DDSDataReader** (p. 1272) objects by means of the `source_timestamp` attribute within the **DDS_SampleInfo** (p. 1068).

[default] **DDS_TIME_INVALID** (p. 325).

9.234.2.5 cookie

```
struct DDS_Cookie_t DDS_WriteParams_t::cookie
```

Octet sequence identifying written data sample.

Used in the callback **DDSDataWriterListener::on_sample_removed** (p. 1332) to associate a removed sample with a written sample.

[default] Empty sequence (zero-length).

9.234.2.6 handle

```
DDS_InstanceHandle_t DDS_WriteParams_t::handle
```

Instance handle.

Either the handle returned by a previous call to **FooDataWriter::register_instance** (p. 1661), or else the special value **DDS_HANDLE_NIL** (p. 76).

[default] **DDS_HANDLE_NIL** (p. 76)

9.234.2.7 priority

```
DDS_Long DDS_WriteParams_t::priority
```

Publication priority.

A positive integer value designating the relative priority of the sample, used to determine the transmission order of pending writes.

Use of publication priorities requires an asynchronous publisher (**DDS_ASYNCHRONOUS_PUBLISH_MODE**↔**_QOS** (p. 431)) with **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900) set to **DDS_HPF_FLOW**↔**CONTROLLER_SCHED_POLICY** (p. 121).

Larger numbers have higher priority.

For multi-channel DataWriters, the publication priority of a sample may be used as a filter criteria for determining channel membership.

If the publication priority of the parent DataWriter, or for multi-channel DataWriters, if the publication priority of the parent channel, is set to **DDS_PUBLICATION_PRIORITY_AUTOMATIC** (p. 430), then the DataWriter or channel will be assigned the priority of the largest publication priority of all samples in the DataWriter or channel.

If the publication priority of the parent DataWriter, and for multi-channel DataWriters, if the publication priority of the parent channel, are set to **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430), then the DataWriter or channel will be assigned the lowest priority, regardless of the value of the publication priorities of samples written to the DataWriter or channel.

The publication priority of each sample can be set in the **DDS_WriteParams_t** (p. 1234) of **FooDataWriter::write_w_params** (p. 1671).

For dispose and unregister samples, use the **DDS_WriteParams_t** (p. 1234) of **FooDataWriter::dispose_w_params** (p. 1674) and **FooDataWriter::unregister_instance_w_params** (p. 1666).

[default] 0 (lowest priority)

See also

DDS_ChannelSettings_t::priority (p. 605)

9.234.2.8 flag

DDS_SampleFlag **DDS_WriteParams_t::flag**

Flags associated with the sample.

The flags are represented as a 32-bit integer, of which only the 16 least-significant bits are used.

RTI reserves least-significant bits [0-7] for middleware-specific usage.

The application can use least-significant bits [8-15].

The first bit (**DDS_REDELIVERED_SAMPLE** (p. 474)) is reserved for marking samples as redelivered when using RTI Queuing Service.

The second bit (**DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 474)) is used to indicate that a response sample is not the last response sample for a given request. This bit is usually set by a Replier sending multiple responses for a request.

An application can inspect the flags associated with a received sample by checking the field **DDS_SampleInfo::flag** (p. 1077).

[default] 0 (no flags are set)

9.234.2.9 source_guid

```
struct DDS_GUID_t DDS_WriteParams_t::source_guid
```

Identifies the application logical data source associated with the sample being written.

When this field is set, the `source_guid` is propagated and subscribing applications can retrieve it from the **DDS_SampleInfo** (p. 1068) (see **DDS_SampleInfo::source_guid** (p. 1077)).

The default value is **DDS_GUID_AUTO** (p. 330), and is not propagated.

The main use case for `source_guid` and `related_source_guid` is a request/reply scenario in which a reply has to be sent only to the Requester that issue the related request.

In this case, the Requester's DataWriter will send a request setting the `source_guid` to a unique value. This value must be the same value even after Requester restart.

The Replier's DataReader will get the request's `source_guid` from the `SampleInfo` and it will send it as the `related_source_guid` of the reply using the Replier's DataWriter.

The Requester's DataReader will install a CFT on the `related_source_guid` using a filter expression. For example:
`@related_source_guid.value = &hex(00000000000000000000000000000001)`

This way the reply will be send only to the right Requester.

The `source_guid` and `related_source_guid` fields are used by RTI Queuing Service in a request/reply scenario.

[default] DDS_GUID_AUTO (p.330) (the `source_guid` is automatically set to the **DDSDataWriter** (p.1305) virtual GUID).

See also

DDS_WriteParams_t::related_source_guid (p. 1239)

9.234.2.10 related_source_guid

```
struct DDS_GUID_t DDS_WriteParams_t::related_source_guid
```

Identifies the application logical data source that is related to the sample being written.

When this field is set, the `related_source_guid` is propagated and subscribing applications can retrieve it from the **DDS_SampleInfo** (p. 1068) (see **DDS_SampleInfo::related_source_guid** (p. 1077)).

The default value is **DDS_GUID_UNKNOWN** (p. 330), and is not propagated.

[default] DDS_GUID_UNKNOWN (p. 330)

See also

DDS_WriteParams_t::source_guid (p. 1238)

9.234.2.11 related_reader_guid

```
struct DDS_GUID_t DDS_WriteParams_t::related_reader_guid
```

Identifies a DataReader that is logically related to the sample that is being written.

When this field is set, the `related_reader_guid` is propagated and subscribing applications can retrieve it from the `DDS_SampleInfo` (p. 1068) (see `DDS_SampleInfo::related_subscription_guid` (p. 1077)).

The default value is `DDS_GUID_UNKNOWN` (p. 330), and is not propagated.

The main use case for this field is point-to-point sample distribution using CFT. DataReaders install a CFT on the `related_reader_guid` using a unique GUID. For example, the filter for DataReader 'n' can be:

```
@related_reader_guid.value = &hex(00000000000000000000000000000001)
```

Then, a DataWriter that wants to send the sample to DataReader 'n' will use the `FooDataWriter::write_w_params` (p. 1671) method and set `related_reader_guid` to the value used by DataReader 'n' in its filter expression.

This field is currently used by RTI Queuing Service to distribute a sample to only one of the Consumer's DataReaders attached to a SharedReaderQueue.

[default] `DDS_GUID_UNKNOWN` (p. 330)

9.235 DDS_WriterDataLifecycleQosPolicy Struct Reference

Controls how a `DDSDDataWriter` (p. 1305) handles the lifecycle of the instances (keys) that it is registered to manage.

Public Attributes

- **DDS_Boolean autodispose_unregistered_instances**
Boolean flag that controls the behavior when the `DDSDDataWriter` (p. 1305) unregisters an instance by means of the unregister operations.
- struct **DDS_Duration_t autopurge_unregistered_instances_delay**
<<extension>> (p. 236) Maximum duration for which the `DDSDDataWriter` (p. 1305) will maintain information regarding an instance once it has unregistered the instance.
- struct **DDS_Duration_t autopurge_disposed_instances_delay**
<<extension>> (p. 236) Maximum duration for which the `DDSDDataWriter` (p. 1305) will maintain information regarding an instance once it has disposed the instance.

9.235.1 Detailed Description

Controls how a `DDSDDataWriter` (p. 1305) handles the lifecycle of the instances (keys) that it is registered to manage.

Entity:

DDSDDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = YES (p. ??)

9.235.2 Usage

This policy determines how the **DDSDataWriter** (p. 1305) acts with regards to the lifecycle of the data instances it manages (data instances that have been either explicitly registered with the **DDSDataWriter** (p. 1305) or implicitly registered by directly writing the data).

You may use **FooDataWriter::unregister_instance** (p. 1663) to indicate that the **DDSDataWriter** (p. 1305) no longer wants to send data for a **DDSTopic** (p. 1601).

The behavior controlled by this QoS policy applies on a per instance (key) basis for keyed Topics, so that when a **DDSDataWriter** (p. 1305) unregisters an instance, RTI Connexx can automatically also dispose that instance. This is the default behavior.

In many cases where the ownership of a Topic is shared (see **DDS_OwnershipQosPolicy** (p. 960)), DataWriters may want to relinquish their ownership of a particular instance of the Topic to allow other DataWriters to send updates for the value of that instance regardless of Ownership Strength. In that case, you may only want a DataWriter to unregister an instance without disposing the instance. *Disposing* an instance is a statement that an instance no longer exists. User applications may be coded to trigger on the disposal of instances, thus the ability to unregister without disposing may be useful to properly maintain the semantic of disposal.

9.235.3 Member Data Documentation

9.235.3.1 autodispose_unregistered_instances

DDS_Boolean DDS_WriterDataLifecycleQosPolicy::autodispose_unregistered_instances

Boolean flag that controls the behavior when the **DDSDataWriter** (p. 1305) unregisters an instance by means of the unregister operations.

- **DDS_BOOLEAN_TRUE** (p. 316)
The **DDSDataWriter** (p. 1305) will dispose of the instance each time it is unregistered. The behavior is identical to explicitly calling one of the `dispose` operations on the instance prior to calling the `unregister` operation.
- **DDS_BOOLEAN_FALSE** (p. 316) (default)
The **DDSDataWriter** (p. 1305) will not dispose of the instance. The application can still call one of the `dispose` operations prior to unregistering the instance and dispose of the instance that way.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.235.3.2 autopurge_unregistered_instances_delay

```
struct DDS_Duration_t DDS_WriterDataLifecycleQosPolicy::autopurge_unregistered_instances_delay
```

<<**extension**>> (p. 236) Maximum duration for which the **DDSDDataWriter** (p. 1305) will maintain information regarding an instance once it has unregistered the instance.

Determines how long the **DDSDDataWriter** (p. 1305) will maintain information regarding an instance that has been unregistered. By default, the **DDSDDataWriter** (p. 1305) resources associated with an instance (e.g., the space needed to remember the Instance Key or KeyHash) are released lazily. This means the resources are only reclaimed when the space is needed for another instance because **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) is exceeded. This behavior can be changed by setting `autopurge_unregistered_instances_delay` to a value other than **DDS_DURATION_INFINITE** (p. 325).

After this time elapses, the **DDSDDataWriter** (p. 1305) will purge all internal information regarding the instance, including historical samples, even if **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) has not been reached.

The purging of unregistered instances can be done based on the source timestamp of the unregister sample or the time where the unregister sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): `dds.data_writer.history.source_timestamp_based_autopurge_instances_delay`.

For durable writer history, `autopurge_unregistered_instances_delay` supports only the **DDS_DURATION_INFINITE** (p. 325) value.

[default] **DDS_DURATION_INFINITE** (p. 325) (disabled) for all **DDSDDataWriter** (p. 1305) except for the built-in discovery DataWriters

DDS_DURATION_ZERO (p. 326) for built-in discovery DataWriters (see **DDS_DiscoveryConfigQosPolicy::publication_writer_data_lifecycle** (p. 713), **DDS_DiscoveryConfigQosPolicy::subscription_writer_data_lifecycle** (p. 714) and **DDS_DiscoveryConfigQosPolicy::participant_configuration_writer_data_lifecycle** (p. 724)).

[range] [0, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.235.3.3 autopurge_disposed_instances_delay

```
struct DDS_Duration_t DDS_WriterDataLifecycleQosPolicy::autopurge_disposed_instances_delay
```

<<**extension**>> (p. 236) Maximum duration for which the **DDSDDataWriter** (p. 1305) will maintain information regarding an instance once it has disposed the instance.

Determines how long the **DDSDDataWriter** (p. 1305) will maintain information regarding an instance that has been disposed of. By default, disposing of an instance does not make it eligible to be purged. By setting `autopurge_disposed_instances_delay` to a value other than **DDS_DURATION_INFINITE** (p. 325), the DataWriter will delete the resources associated with an instance (including historical samples) once the time has elapsed and all matching DataReaders have acknowledged all the samples for this instance including the dispose sample.

The purging of disposed instances can be done based on the source timestamp of the dispose sample or the time when the dispose sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): `dds.data_writer.history.source_timestamp_based_autopurge_instances_delay`.

This QoS value is supported with durable DataWriter queues only for **DDS_DURATION_ZERO** (p. 326) and **DDS_DURATION_INFINITE** (p. 325) values (finite values are not supported).

[default] **DDS_DURATION_INFINITE** (p. 325) (disabled)

[range] [0, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.236 DDS_WstringSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_Wchar** (p. 316)* >

9.236.1 Detailed Description

Instantiates **FooSeq** (p. 1680) < **DDS_Wchar** (p. 316)* >

Instantiates:

<<*generic*>> (p. 236) **FooSeq** (p. 1680)

9.237 DDSAsyncWaitSet Class Reference

A class for dispatching **DDSCondition** (p. 1260) objects using separate threads of execution. You can see this class as an extension of a **DDSWaitSet** (p. 1613) that allows asynchronously waiting for the attached **DDSCondition** (p. 1260) objects to trigger and provide a notification by calling **DDSCondition::dispatch** (p. 1262).

Public Member Functions

- virtual **DDS_ReturnCode_t** **start** ()
*Initiates the asynchronous wait on this **DDSAsyncWaitSet** (p. 1243).*
- virtual **DDS_ReturnCode_t** **start_with_completion_token** (**DDSAsyncWaitSetCompletionToken** *completion_token)
*Initiates the asynchronous wait on this **DDSAsyncWaitSet** (p. 1243).*
- virtual **DDS_ReturnCode_t** **stop** ()
*Initiates the stop procedure on this **DDSAsyncWaitSet** (p. 1243) that will stop the asynchronous wait.*
- virtual **DDS_ReturnCode_t** **stop_with_completion_token** (**DDSAsyncWaitSetCompletionToken** *completion_token)
*Initiates the stop procedure on this **DDSAsyncWaitSet** (p. 1243) that will stop the asynchronous wait.*
- virtual **DDS_ReturnCode_t** **attach_condition** (**DDSCondition** *condition)
*Attaches the specified **DDSCondition** (p. 1260) to this **DDSAsyncWaitSet** (p. 1243).*
- virtual **DDS_ReturnCode_t** **detach_condition** (**DDSCondition** *condition)
*Deaches the specified **DDSCondition** (p. 1260) from this **DDSAsyncWaitSet** (p. 1243).*
- virtual **DDS_ReturnCode_t** **attach_condition_with_completion_token** (**DDSCondition** *condition, **DDSAsyncWaitSetCompletionToken** *completion_token)
*Attaches the specified **DDSCondition** (p. 1260) to this **DDSAsyncWaitSet** (p. 1243).*

- virtual **DDS_ReturnCode_t detach_condition_with_completion_token** (**DDSCondition** *condition, **DDSAsyncWaitSetCompletionToken** *completion_token)
*Detaches the specified **DDSCondition** (p. 1260) from this **DDSAsyncWaitSet** (p. 1243).*
- virtual **DDS_ReturnCode_t unlock_condition** (**DDSCondition** *condition)
*Allows the **DDSCondition** (p. 1260) under dispatch to be available for concurrent dispatch from another thread from the pool.*
- virtual **DDS_ReturnCode_t get_property** (**DDS_AsyncWaitSetProperty_t** &property)
*Retrieves the **DDS_AsyncWaitSetProperty_t** (p. 588) configuration of the associated **DDSAsyncWaitSet** (p. 1243).*
- virtual **DDS_ReturnCode_t get_conditions** (**DDSConditionSeq** &attached_conditions)
*Retrieves the list of attached **DDSCondition** (p. 1260) (s).*
- virtual **DDSAsyncWaitSetCompletionToken * create_completion_token** ()
*Creates a new **DDSAsyncWaitSetCompletionToken** (p. 1257).*
- virtual **DDS_ReturnCode_t delete_completion_token** (**DDSAsyncWaitSetCompletionToken** *completion_token)
*Deletes a **DDSAsyncWaitSetCompletionToken** (p. 1257) previously created from this **DDSAsyncWaitSet** (p. 1243).*
- **DDSAsyncWaitSet** ()
*Creates a **DDSAsyncWaitSet** (p. 1243) with default property.*
- **DDSAsyncWaitSet** (const **DDS_AsyncWaitSetProperty_t** &property)
*Single-argument constructor that allows creating a **DDSAsyncWaitSet** (p. 1243) with custom behavior.*
- **DDSAsyncWaitSet** (const **DDS_AsyncWaitSetProperty_t** &property, **DDSAsyncWaitSetListener** *listener)
*Constructor that allows specifying a **DDSAsyncWaitSetListener** (p. 1259).*
- **DDSAsyncWaitSet** (const **DDS_AsyncWaitSetProperty_t** &property, **DDSAsyncWaitSetListener** *listener, **DDSThreadFactory** *thread_factory)
*Constructor with arguments that allow specifying behavior different than the default one, including specifying a **DDSThreadFactory** (p. 1599) for the creation and deletion of the threads within the thread pool.*
- virtual **~DDSAsyncWaitSet** ()
*Deletes a **DDSAsyncWaitSet** (p. 1243).*

Static Public Attributes

- static **DDSAsyncWaitSetCompletionToken *const COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT**
*For the operations that allow an **DDSAsyncWaitSetCompletionToken** (p. 1257), this sentinel can be provided to indicate an **DDSAsyncWaitSet** (p. 1243) to use the implicit completion token and wait on it for request completion.*
- static **DDSAsyncWaitSetCompletionToken *const COMPLETION_TOKEN_IGNORE**
*For the operations that allow an **DDSAsyncWaitSetCompletionToken** (p. 1257), this sentinel can be provided to indicate an **DDSAsyncWaitSet** (p. 1243) to perform the action associating a 'null' completion token.*

9.237.1 Detailed Description

A class for dispatching **DDSCondition** (p. 1260) objects using separate threads of execution. You can see this class as an extension of a **DDSWaitSet** (p. 1613) that allows asynchronously waiting for the attached **DDSCondition** (p. 1260) objects to trigger and provide a notification by calling **DDSCondition::dispatch** (p. 1262).

DDSAsyncWaitSet (p. 1243) provides a proactive model to process application events through **DDSCondition** (p. 1260) objects. **DDSAsyncWaitSet** (p. 1243) owns a pool of threads to asynchronously wait for the attached **DDSCondition** (p. 1260) objects to trigger and dispatch them upon wakeup. The asynchronous behavior is the main key different with regards to the **DDSWaitSet** (p. 1613).

The class diagram and its collaborators is shown below:

9.237.2 AsyncWaitSet Thread Orchestration

DDSAsyncWaitSet (p. 1243) internally applies a leader-follower pattern for the orchestration of the thread pool. Once a **DDSAsyncWaitSet** (p. 1243) starts, it will create the thread pool of M threads from which only one thread will become the Leader thread, and remaining threads will become the Followers, where:

- The `Leader` thread is the one waiting for the attached **DDSCondition** (p. 1260) to trigger. Remaining threads in the pool, if any, are either idle awaiting to become the leader or busy while processing active **DDSCondition** (p. 1260).
- Upon wait wakeup, the `Leader` thread resigns its leader status to become a `Processor` thread and dispatch the next active **DDSCondition** (p. 1260) through the **DDSCondition::dispatch** (p. 1262) operation.
- One of the `Follower` threads wakes up and becomes the new leader to resume the wait for **DDSCondition** (p. 1260).

"Thread orchestration in a `::DDSAsyncWaitSet`"

This behavior implies the following considerations:

- Only one thread a time can wait for the attached **DDSCondition** (p. 1260) objects to trigger. From a pool of M threads, only one is the leader, P are processing active **DDSCondition** (p. 1260), and F are idle followers.
- A thread can dispatch only one active **DDSCondition** (p. 1260) at a time.
- **DDSAsyncWaitSet** (p. 1243) efficiently distributes threads to dispatch **DDSCondition** (p. 1260) objects on demand. This avoids underutilizing a thread if **DDSCondition** (p. 1260) objects do not trigger or trigger unfrequently.
- At a given time, all the threads in the pool could be in processing state. In this situation, the **DDSAsyncWaitSet** (p. 1243) is not able to wait for more **DDSCondition** (p. 1260) objects until one thread becomes the leader.

DDSAsyncWaitSet (p. 1243) has a built-in dispatcher that guarantees fairness and avoids starvation of **DDSCondition** (p. 1260) objects. By applying a round-robin distribution policy, each attached and active **DDSCondition** (p. 1260) is dispatched within a finite period of time, assuming the **DDSConditionHandler** (p. 1262) always return control after the **DDSCondition::dispatch** (p. 1262) operation.

9.237.3 AsyncWaitSet Thread Safety

A key aspect of the **DDSAsyncWaitSet** (p. 1243) is the thread safety. **DDSAsyncWaitSet** (p. 1243) interface is thread safe, so you can concurrently call any operation on the **DDSAsyncWaitSet** (p. 1243) object from multiple threads in your application.

Furthermore, **DDSAsyncWaitSet** (p. 1243) also safely interacts with its own thread pool. Internally, the **DDSAsyncWaitSet** (p. 1243) applies the asynchronous completion token pattern to perform activities that involve synchronization with the thread pool.

For instance to detach a **DDSCondition** (p. 1260), the **DDSAsyncWaitSet** (p. 1243) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token.

Note

The asynchronous completion token behavior only takes place if the **DDSAsyncWaitSet** (p. 1243) is started. Otherwise the internal request will be directly executed by the calling thread.

For a finer control on this behavior, each **DDSAsyncWaitSet** (p. 1243) operation where this applies comes in two flavors:

- **Default**: the operation hides all the details of the completion token and returns after the operation completes. Operations of this kind internally use an implicit **DDSAsyncWaitSetCompletionToken** (p. 1257). The **DDSAsyncWaitSet** (p. 1243) creates and reuses **DDSAsyncWaitSetCompletionToken** (p. 1257) objects as needed. This is the recommended flavor unless your application has special resource needs.
- **With completion token**: An overloaded version of the default one that also receives an **DDSAsyncWaitSetCompletionToken** (p. 1257) object on which you can wait on at any time for the actual operation to complete. This flavor is available to assist applications with resource constraints and that want more control on the interaction with the thread pool of the **DDSAsyncWaitSet** (p. 1243).

9.237.3.1 Condition Locking

DDSAsyncWaitSet (p. 1243) incorporates a safety mechanism that prevents calling **DDSCondition::dispatch** (p. 1262) concurrently. **DDSAsyncWaitSet** (p. 1243) locks the **DDSCondition** (p. 1260) while a processor thread is dispatching it so no other thread within the pool can dispatch it again.

This mechanism ensures not only unexpected concurrent dispatch of a **DDSCondition** (p. 1260) but also spurious thread activity. Because it is responsibility of your application to reset the Condition trigger, there is a period of time in which the dispatched condition may remain active, causing the **DDSAsyncWaitSet** (p. 1243) to enter in a continuous immediate wakeup from the wait. This behavior typically leads to thread hogging and high CPU usage.

Nevertheless, your application may still want to receive concurrent and controlled dispatch notifications. **DDSAsyncWaitSet** (p. 1243) will still allow you to unlock a **DDSCondition** (p. 1260) so any other available thread can dispatch the same condition concurrently while preventing the above mentioned problems. You can achieve this by calling **DDSAsyncWaitSet::unlock_condition** (p. 1254) on the Condition being dispatched within the dispatch callback. Note that the AsyncWaitSet locks a Condition each time it dispatches it. Hence you need to unlock the Condition each time you want to enable a concurrent dispatch.

9.237.4 AsyncWaitSet Events and Resources

Besides **DDSCondition** (p. 1260) processing, you can listen to other kind of internal events related to the **DDSAsyncWaitSet** (p. 1243) and its thread pool by means of the **DDSAsyncWaitSetListener** (p. 1259).

DDSAsyncWaitSet (p. 1243) exposes operations to start and stop the asynchronous wait, which involves the creation and deletion of the thread pool respectively.

DDSAsyncWaitSet (p. 1243) relies on thread-specific storage to provide the described functionality. Each application thread that calls an operation on a **DDSAsyncWaitSet** (p. 1243) will generate resources that will be associated with such thread. You can free these resources upon thread termination by calling **DDSDomainParticipantFactory::unregister_thread** (p. 1431).

MT Safety:

Safe.

9.237.5 Constructor & Destructor Documentation

9.237.5.1 DDSAsyncWaitSet() [1/4]

```
DDSAsyncWaitSet::DDSAsyncWaitSet ( )
```

Creates a **DDSAsyncWaitSet** (p. 1243) with default property.

9.237.5.2 DDSAsyncWaitSet() [2/4]

```
DDSAsyncWaitSet::DDSAsyncWaitSet (
    const DDS_AsyncWaitSetProperty_t & property )
```

Single-argument constructor that allows creating a **DDSAsyncWaitSet** (p. 1243) with custom behavior.

You can provide **DDS_ASYNC_WAITSET_PROPERTY_DEFAULT** (p. 292) as `property` to create an **DDSAsyncWaitSet** (p. 1243) with default behavior.

The **DDSAsyncWaitSet** (p. 1243) is created with no listener installed.

Parameters

<i>property</i>	<< <i>in</i> >> (p. 237) configuration DDS_AsyncWaitSetProperty_t (p. 588)
-----------------	---

9.237.5.3 DDSAsyncWaitSet() [3/4]

```
DDSAsyncWaitSet::DDSAsyncWaitSet (
```

```
const DDS_AsyncWaitSetProperty_t & property,
      DDSAsyncWaitSetListener * listener )
```

Constructor that allows specifying a **DDSAsyncWaitSetListener** (p. 1259).

Creates a new **DDSAsyncWaitSet** (p. 1243) with the specified property **DDS_AsyncWaitSetProperty_t** (p. 588) and **DDSAsyncWaitSetListener** (p. 1259).

Parameters

<i>property</i>	<< <i>in</i> >> (p. 237) configuration DDS_AsyncWaitSetProperty_t (p. 588)
<i>listener</i>	<< <i>in</i> >> (p. 237) the DDSAsyncWaitSetListener (p. 1259). Cannot be NULL.

9.237.5.4 DDSAsyncWaitSet() [4/4]

```
DDSAsyncWaitSet::DDSAsyncWaitSet (
    const DDS_AsyncWaitSetProperty_t & property,
    DDSAsyncWaitSetListener * listener,
    DDSThreadFactory * thread_factory )
```

Constructor with arguments that allow specifying behavior different than the default one, including specifying a **DDSThreadFactory** (p. 1599) for the creation and deletion of the threads within the thread pool.

This operation extends **DDSAsyncWaitSet::DDSAsyncWaitSet()** (p. 1247) by allowing to provide a **DDSThreadFactory** (p. 1599)

Parameters

<i>property</i>	<< <i>in</i> >> (p. 237) configuration DDS_AsyncWaitSetProperty_t (p. 588)
<i>listener</i>	<< <i>in</i> >> (p. 237) the DDSAsyncWaitSetListener (p. 1259). Cannot be NULL.
<i>thread_factory</i>	<< <i>in</i> >> (p. 237) DDSThreadFactory (p. 1599) for the creation and deletion of threads.

9.237.5.5 ~DDSAsyncWaitSet()

```
virtual DDSAsyncWaitSet::~DDSAsyncWaitSet ( ) [virtual]
```

Deletes a **DDSAsyncWaitSet** (p. 1243).

If the **DDSAsyncWaitSet** (p. 1243) is started, this operation will initiate the stop procedure and block until it completes.

The deletion will fail if there are outstanding **DDSAsyncWaitSetCompletionToken** (p. 1257) that have not been deleted.

Any outstanding **DDSAsyncWaitSet** (p. 1243) must be deleted before finalizing the **DDSDomainParticipantFactory** (p. 1409). Otherwise undefined behavior may occur.

DDSAsyncWaitSet::DDSAsyncWaitSet() (p. 1247)

9.237.6 Member Function Documentation

9.237.6.1 start()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::start ( ) [virtual]
```

Initiates the asynchronous wait on this **DDSAsyncWaitSet** (p. 1243).

This operation is equivalent to calling **DDSAsyncWaitSet::start_with_completion_token** (p. 1249) providing **DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 292) as a *completion_token*.

This operation blocks until the start request completes. Upon successful return, it is guaranteed that this **DDSAsyncWaitSet** (p. 1243) has initiated the asynchronous wait and dispatch.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDSAsyncWaitSet::start_with_completion_token (p. 1249)

DDSAsyncWaitSet::stop (p. 1250)

9.237.6.2 start_with_completion_token()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::start_with_completion_token (
    DDSAsyncWaitSetCompletionToken * completion_token ) [virtual]
```

Initiates the asynchronous wait on this **DDSAsyncWaitSet** (p. 1243).

If this operation succeeds, a start request has been scheduled and your application can use the provided *completion_token* to wait for this **DDSAsyncWaitSet** (p. 1243) to process the request. If the **DDSAsyncWaitSetCompletionToken::wait** (p. 1258) operation returns successfully, it is guaranteed that the thread pool has been created and the leader thread is waiting for the attached **DDSCondition** (p. 1260) to trigger.

Once this **DDSAsyncWaitSet** (p. 1243) is started, attached **DDSCondition** (p. 1260) will be dispatched through the **DDSCondition::dispatch** (p. 1262) operation when they trigger.

The start procedure causes the **DDSAsyncWaitSet** (p. 1243) to spawn all the threads within the thread pool, which involves the underlying operating system to allocate the associated thread stack and context for each thread. If a **DDSAsyncWaitSetListener** (p. 1259) is installed, this **DDSAsyncWaitSet** (p. 1243) will sequentially invoke the **DDSAsyncWaitSetListener::on_thread_spawned** (p. 1259) once per spawned thread.

A **DDSAsyncWaitSet** (p. 1243) can be restarted after a stop. If this **DDSAsyncWaitSet** (p. 1243) is already started, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

<i>completion_token</i>	<< <i>inout</i> >> (p. 237) a valid DDSAsyncWaitSetCompletionToken (p. 1257) instance that can be used by your application to wait for the start request to complete. You can provide one of the special sentinels DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT (p. 292) and DDSAsyncWaitSet::COMPLETION_TOKEN_IGNORE (p. 292).
-------------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSAsyncWaitSet::start (p. 1249)

DDSAsyncWaitSet::stop_with_completion_token (p. 1251)

DDSWaitSet::wait (p. 1617)

9.237.6.3 stop()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::stop ( ) [virtual]
```

Initiates the stop procedure on this **DDSAsyncWaitSet** (p. 1243) that will stop the asynchronous wait.

This operation is equivalent to calling **DDSAsyncWaitSet::stop_with_completion_token** (p. 1251) providing **DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 292) as a `completion_token`.

This operation will block until the stop request completes. Upon successful return, it is guaranteed that this **DDSAsyncWaitSet** (p. 1243) stopped the asynchronous wait and dispatch.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSAsyncWaitSet::start_with_completion_token (p. 1249)

DDSAsyncWaitSet::stop (p. 1250)

9.237.6.4 stop_with_completion_token()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::stop_with_completion_token (
    DDSAsyncWaitSetCompletionToken * completion_token ) [virtual]
```

Initiates the stop procedure on this **DDSAsyncWaitSet** (p. 1243) that will stop the asynchronous wait.

If this operation succeeds, a stop request has been scheduled and your application can use the provided `completion_token` to wait for this **DDSAsyncWaitSet** (p. 1243) to process the request. If the **DDSAsyncWaitSetCompletionToken::wait** (p. 1258) operation returns successfully, it is guaranteed that the thread pool has been deleted and this **DDSAsyncWaitSet** (p. 1243) no longer process any of the attached **DDSCondition** (p. 1260) objects.

Once this **DDSAsyncWaitSet** (p. 1243) is stopped, the **DDSCondition::dispatch** (p. 1262) will no longer be called on any of the attached **DDSCondition** (p. 1260), no matter what their trigger value is.

The stop procedure causes the **DDSAsyncWaitSet** (p. 1243) to delete all the threads within the thread pool, which involves the underlying operating system to release the associated thread stack and context of each thread. If a **DDSAsyncWaitSetListener** (p. 1259) is installed, this **DDSAsyncWaitSet** (p. 1243) will sequentially invoke the **DDSAsyncWaitSetListener::on_thread_deleted** (p. 1259) once per deleted thread.

If this **DDSAsyncWaitSet** (p. 1243) is already stopped, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

Parameters

<i>completion_token</i>	<< <i>inout</i> >> (p. 237) a valid DDSAsyncWaitSetCompletionToken (p. 1257) instance that can be used by your application to wait for the stop request to complete. You can provide one of the special sentinels DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT (p. 292) and DDSAsyncWaitSet::COMPLETION_TOKEN_IGNORE (p. 292).

9.237.6.5 attach_condition()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::attach_condition (
    DDSCondition * condition ) [virtual]
```

Attaches the specified **DDSCondition** (p. 1260) to this **DDSAsyncWaitSet** (p. 1243).

This operation is equivalent to calling **DDSAsyncWaitSet::attach_condition_with_completion_token** (p. 1253) providing **DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 292) as a `completion_token`.

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **DDSCondition** (p. 1260) is attached.

Parameters

<i>condition</i>	<< <i>in</i> >> (p. 237) DDSCondition (p. 1260) to be attached.
------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSAsyncWaitSet::attach_condition_with_completion_token (p. 1253)

9.237.6.6 detach_condition()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::detach_condition (
    DDSCondition * condition ) [virtual]
```

Deaches the specified **DDSCondition** (p. 1260) from this **DDSAsyncWaitSet** (p. 1243).

This operation is equivalent to call **DDSAsyncWaitSet::detach_condition_with_completion_token** (p. 1253) providing **DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT** (p. 292) as a `completion_token`.

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **DDSCondition** (p. 1260) is detached.

Parameters

<i>condition</i>	<< <i>in</i> >> (p. 237) DDSCondition (p. 1260) to be detached.
------------------	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDSAsyncWaitSet::detach_condition_with_completion_token (p. 1253)

9.237.6.7 attach_condition_with_completion_token()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::attach_condition_with_completion_token (
    DDSCondition * condition,
    DDSAsyncWaitSetCompletionToken * completion_token ) [virtual]
```

Attaches the specified **DDSCondition** (p. 1260) to this **DDSAsyncWaitSet** (p. 1243).

If this operation succeeds, an attach request has been scheduled and your application can use the output parameter *completion_token* to wait for this **DDSAsyncWaitSet** (p. 1243) to process the request. **DDSAsyncWaitSet**↔**CompletionToken::wait** (p. 1258) operation returns successfully, it is guaranteed that the **DDSCondition** (p. 1260) is attached to this **DDSAsyncWaitSet** (p. 1243).

Once the **DDSCondition** (p. 1260) is attached, its trigger value may cause the leader thread of the **DDSAsyncWaitSet** (p. 1243) to wake up call the **DDSCondition::dispatch** (p. 1262) operation.

DDSCondition (p. 1260) may be attached at any time independently of the state of the **DDSAsyncWaitSet** (p. 1243).

Parameters

<i>condition</i>	<< <i>in</i> >> (p. 237) DDSCondition (p. 1260) to be attached.
<i>completion_token</i>	<< <i>inout</i> >> (p. 237) a valid DDSAsyncWaitSetCompletionToken (p. 1257) instance that can be used by your application to wait for the attach request to complete. You can provide one of the special sentinels DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT (p. 292) and DDSAsyncWaitSet::COMPLETION_TOKEN_IGNORE (p. 292).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDSAsyncWaitSetCompletionToken::wait (p. 1258)

9.237.6.8 detach_condition_with_completion_token()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::detach_condition_with_completion_token (
    DDSCondition * condition,
    DDSAsyncWaitSetCompletionToken * completion_token ) [virtual]
```

Detaches the specified **DDSCondition** (p. 1260) from this **DDSAsyncWaitSet** (p. 1243).

If this operation succeeds, a detach request has been scheduled and your application can use the provided `completion_token` to wait for this **DDSAsyncWaitSet** (p. 1243) to process the request. If the **DDSAsyncWaitSetCompletionToken::wait** (p. 1258) operation returns successfully, it is guaranteed that the **DDSCondition** (p. 1260) is detached from this **DDSAsyncWaitSet** (p. 1243).

Once the **DDSCondition** (p. 1260) is detached, it is guaranteed that the **DDSAsyncWaitSet** (p. 1243) will no longer process it so it is safe for your application to release any resources associated with the detached **DDSCondition** (p. 1260).

DDSCondition (p. 1260) may be detached at any time independently of the state of the **DDSAsyncWaitSet** (p. 1243).

Parameters

<i>condition</i>	<< <i>in</i> >> (p. 237) DDSCondition (p. 1260) to be detached.
<i>completion_token</i>	<< <i>inout</i> >> (p. 237) a valid DDSAsyncWaitSetCompletionToken (p. 1257) instance that can be used by your application to wait for the detach request to complete. You can provide one of the special sentinels DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT (p. 292) and DDSAsyncWaitSet::COMPLETION_TOKEN_IGNORE (p. 292).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.237.6.9 unlock_condition()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::unlock_condition (
    DDSCondition * condition ) [virtual]
```

Allows the **DDSCondition** (p. 1260) under dispatch to be available for concurrent dispatch from another thread from the pool.

This operation can be called from the dispatch callback of the **DDSCondition** (p. 1260) this **DDSAsyncWaitSet** (p. 1243) is dispatching. After successfully calling this operation, if the **DDSCondition** (p. 1260) becomes active this **DDSAsyncWaitSet** (p. 1243) is allowed to dispatch it again from any available thread from the pool.

You may call this operation any time you need the same **DDSCondition** (p. 1260) to be dispatched concurrently.

This operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if you call it from a different context than the dispatch callback or on a different **DDSCondition** (p. 1260).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.237.6.10 get_property()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::get_property (
    DDS_AsyncWaitSetProperty_t & property ) [virtual]
```

Retrieves the **DDS_AsyncWaitSetProperty_t** (p. 588) configuration of the associated **DDSAsyncWaitSet** (p. 1243).

Parameters

<i>property</i>	<< <i>out</i> >> (p. 237)
-----------------	---------------------------

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.237.6.11 get_conditions()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSet::get_conditions (
    DDSConditionSeq & attached_conditions ) [virtual]
```

Retrieves the list of attached **DDSCondition** (p. 1260) (s).

Parameters

<i>attached_conditions</i>	<< <i>inout</i> >> (p. 237) a DDSConditionSeq (p. 1263) object where the list of attached conditions will be returned.
----------------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)

9.238 DDSAsyncWaitSetCompletionToken Class Reference

<<*interface*>> (p. 236) Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **DDSAsyncWaitSet** (p. 1243) behavior.

Public Member Functions

- virtual **DDS_ReturnCode_t wait** (const **DDS_Duration_t** &max_wait)=0

*Waits for the request associated to an operation made on the **DDSAsyncWaitSet** (p. 1243) to complete.*

9.238.1 Detailed Description

<<*interface*>> (p. 236) Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **DDSAsyncWaitSet** (p. 1243) behavior.

A **DDSAsyncWaitSetCompletionToken** (p. 1257) can be in one of the following states:

- **READY**: The completion token can be used to associate a new request. Calling **DDSAsyncWaitSetCompletionToken::wait** (p. 1258) on a ready completion token will return immediately with success. A ready completion token can only transition to the queued state.
- **QUEUED**: The completion token has an associated request that is pending processing. Calling **DDSAsyncWaitSetCompletionToken::wait** (p. 1258) on a queued completion token will block until the request completes or times out. A queued completion token can only transition to the processed state.
- **PROCESS**: The completion token has an associated request that has been processed but the application did not call **DDSAsyncWaitSetCompletionToken::wait** (p. 1258) yet. Calling **DDSAsyncWaitSetCompletionToken::wait** (p. 1258) on a processed completion token will return immediately with the return code result of processing the associated request. A processed completion token can transition to both ready or queued states.

9.238.2 AsyncWaitSetCompletionToken management

The same **DDSAsyncWaitSetCompletionToken** (p. 1257) instance can be reused multiple times to associate a request and wait for its completion. Reusing is allowed only if the completion token is either in `READY` or `PROCESSED` state. Otherwise the **DDSAsyncWaitSet** (p. 1243) operation that associates the completion token will fail with **DDS_↵**
RETCODE_PRECONDITION_NOT_MET (p. 335).

The completion token functionality can be viewed as a **DDSAsyncWaitSet** (p. 1243) internal detail from which your application should not need to know. In general, it is recommended to use the default flavor of **DDSAsyncWaitSet** (p. 1243) operations that handle the internals of the completion tokens for you.

Nevertheless, if a completion token represents an expensive resource in your environment, your application may want to have full control of how and when completion tokens are created. It's for these reasons why is exposed as a public collaborator of the **DDSAsyncWaitSet** (p. 1243).

MT Safety:

Safe.

DDSAsyncWaitSet (p. 1243)

9.238.3 Member Function Documentation

9.238.3.1 wait()

```
virtual DDS_ReturnCode_t DDSAsyncWaitSetCompletionToken::wait (
    const DDS_Duration_t & max_wait ) [pure virtual]
```

Waits for the request associated to an operation made on the **DDSAsyncWaitSet** (p. 1243) to complete.

This operation will block the calling thread for a maximum amount of time specified by `max_wait` until the **DDSAsync↵**
WaitSet (p. 1243) request associated with this completion token completes.

If there is no timeout, upon return it is guaranteed that the request associated with this token completed. This operation may fail due to an error during the wait or while processing the associated request.

If this operation is called from within the context of one the thread that conforms the thread pool of the **DDSAsyncWaitSet** (p. 1243), it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

If the operation failed with **DDS_RETCODE_TIMEOUT** (p. 336) your application can wait again on this completion token.

Parameters

<i>max_wait</i>	<< <i>in</i> >> (p. 237) Cannot be NULL. Maximum time to wait for the request associated to this completion token to complete before timeout.
-----------------	---

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.239 DDSAsyncWaitSetListener Class Reference

<<*interface*>> (p. 236) Listener for receiving event notifications related to the thread pool of the **DDSAsyncWaitSet** (p. 1243).

Public Member Functions

- virtual void **on_thread_spawned** (RTI_UINT64 thread_id)
*Handles the spawning of each thread conforming the thread pool of the **DDSAsyncWaitSet** (p. 1243).*
- virtual void **on_thread_deleted** (RTI_UINT64 thread_id)
*Handles the deletion of each thread conforming the thread pool of the **DDSAsyncWaitSet** (p. 1243).*
- virtual void **on_wait_timeout** (RTI_UINT64 thread_id)
*Handles the wait timeout generated by the leader thread of the **DDSAsyncWaitSet** (p. 1243).*

9.239.1 Detailed Description

<<*interface*>> (p. 236) Listener for receiving event notifications related to the thread pool of the **DDSAsyncWaitSet** (p. 1243).

9.239.2 Member Function Documentation

9.239.2.1 on_thread_spawned()

```
virtual void DDSAsyncWaitSetListener::on_thread_spawned (
    RTI_UINT64 thread_id ) [virtual]
```

Handles the spawning of each thread conforming the thread pool of the **DDSAsyncWaitSet** (p. 1243).

9.239.2.2 on_thread_deleted()

```
virtual void DDSAsyncWaitSetListener::on_thread_deleted (
    RTI_UINT64 thread_id ) [virtual]
```

Handles the deletion of each thread conforming the thread pool of the **DDSAsyncWaitSet** (p. 1243).

9.239.2.3 on_wait_timeout()

```
virtual void DDSAsyncWaitSetListener::on_wait_timeout (
    RTI_UINT64 thread_id ) [virtual]
```

Handles the wait timeout generated by the leader thread of the **DDSAsyncWaitSet** (p. 1243).

9.240 DDSCondition Class Reference

<<**interface**>> (p. 236) Root class for all the conditions that may be attached to a **DDSWaitSet** (p. 1613).

Inheritance diagram for DDSCondition:

Public Member Functions

- virtual **DDS_Boolean** **get_trigger_value** ()=0
Retrieve the trigger_value.
- virtual **DDS_ReturnCode_t** **set_handler** (**DDSConditionHandler** *handler)
<<**extension**>> (p. 236) Registers a **DDSConditionHandler** (p. 1262) in this **DDSCondition** (p. 1260).
- virtual **DDSConditionHandler** * **get_handler** ()
<<**extension**>> (p. 236) Returns the registered **DDSConditionHandler** (p. 1262).
- virtual void **dispatch** ()
<<**extension**>> (p. 236) Calls **DDSConditionHandler::on_condition_triggered** (p. 1263) of the registered **DDSConditionHandler** (p. 1262).

9.240.1 Detailed Description

<<*interface*>> (p. 236) Root class for all the conditions that may be attached to a **DDSWaitSet** (p. 1613).

This basic class is specialised in three classes:

DDSGuardCondition (p. 1454), **DDSStatusCondition** (p. 1562), and **DDSReadCondition** (p. 1558).

A **DDSCondition** (p.1260) has a `trigger_value` that can be **DDS_BOOLEAN_TRUE** (p.316) or **DDS_BOOLEAN_FALSE** (p.316) and is set automatically by RTI Connex.

See also

DDSWaitSet (p. 1613)

9.240.2 Member Function Documentation

9.240.2.1 `get_trigger_value()`

```
virtual DDS_Boolean DDSCondition::get_trigger_value ( ) [pure virtual]
```

Retrieve the `trigger_value`.

Returns

the trigger value.

Implemented in **DDSGuardCondition** (p. 1456).

9.240.2.2 `set_handler()`

```
virtual DDS_ReturnCode_t DDSCondition::set_handler (
    DDSConditionHandler * handler ) [virtual]
```

<<*extension*>> (p. 236) Registers a **DDSConditionHandler** (p. 1262) in this **DDSCondition** (p. 1260).

This operation replaces any existing registered handler. If there is any resources associated with an existing registered handler that need to be released, you may first call **DDSCondition::get_handler** (p. 1262) to retrieve the handler.

MT Safety:

It is not safe to call **DDSCondition::set_handler** (p.1261), **DDSCondition::get_handler** (p.1262) or **DDSCondition::dispatch** (p. 1262) concurrently.

Parameters

<i>handler</i>	The DDSConditionHandler (p. 1262) to be called by DDSCondition::dispatch (p. 1262). If this parameter is null, an no-op handler implementation will be set.
----------------	---

9.240.2.3 get_handler()

```
virtual DDSConditionHandler * DDSCondition::get_handler ( ) [virtual]
```

<<**extension**>> (p. 236) Returns the registered **DDSConditionHandler** (p. 1262).

If no **DDSConditionHandler** (p. 1262) is registered, this operation returns a no-op **DDSConditionHandler** (p. 1262) implementation.

9.240.2.4 dispatch()

```
virtual void DDSCondition::dispatch ( ) [virtual]
```

<<**extension**>> (p. 236) Calls **DDSConditionHandler::on_condition_triggered** (p. 1263) of the registered **DDSConditionHandler** (p. 1262).

If the trigger value is true, calling this operation will call the registered.

If no **DDSConditionHandler** (p. 1262) is registered, this operation is a no-op.

9.241 DDSConditionHandler Class Reference

<<**extension**>> (p. 236) <<**interface**>> (p. 236) Handler called by the **DDSCondition::dispatch** (p. 1262).

Inheritance diagram for DDSConditionHandler:

**Public Member Functions**

- virtual void **on_condition_triggered** (**DDSCondition** *condition)=0
*Handles the dispatch of a **DDSCondition** (p. 1260).*

9.241.1 Detailed Description

<<*extension*>> (p. 236) <<*interface*>> (p. 236) Handler called by the **DDSCondition::dispatch** (p. 1262).

Direct known implementations: **DDSDataReaderStatusConditionHandler** (p. 1302)

9.241.2 Member Function Documentation

9.241.2.1 on_condition_triggered()

```
virtual void DDSConditionHandler::on_condition_triggered (  
    DDSCondition * condition ) [pure virtual]
```

Handles the dispatch of a **DDSCondition** (p. 1260).

This callback is called by **DDSCondition::dispatch** (p. 1262).

Implemented in **DDSDataReaderStatusConditionHandler** (p. 1304).

9.242 DDSConditionSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDSCondition** (p. 1260) >

9.242.1 Detailed Description

9.243 DDSContentFilter Class Reference

<<*interface*>> (p. 236) Interface to be used by a custom filter of a **DDSContentFilteredTopic** (p. 1267)

Inheritance diagram for DDSContentFilter:

Public Member Functions

- virtual **DDS_ReturnCode_t compile** (void **new_compile_data, const char *expression, const **DDS_StringSeq** ¶meters, const **DDS_TypeCode** *type_code, const char *type_class_name, void *old_compile_data)=0
Compile an instance of the content filter according to the filter expression and parameters of the given data type.
- virtual **DDS_Boolean evaluate** (void *compile_data, const void *sample, const struct **DDS_FilterSampleInfo** *meta_data)=0
Evaluate whether the sample is passing the filter or not according to the sample content.
- virtual void **finalize** (void *compile_data)=0
A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

9.243.1 Detailed Description

<<*interface*>> (p. 236) Interface to be used by a custom filter of a **DDSContentFilteredTopic** (p. 1267)

Entity:

DDSContentFilteredTopic (p. 1267)

This interface can be implemented by an application-provided class and then registered with the **DDSDomainParticipant** (p. 1335) such that samples can be filtered for a **DDSContentFilteredTopic** (p. 1267) with the given filter name.

Note: the API for using a custom content filter is subject to change in a future release.

See also

DDSContentFilteredTopic (p. 1267)

DDSDomainParticipant::register_contentfilter (p. 1347)

9.243.2 Member Function Documentation

9.243.2.1 compile()

```
virtual DDS_ReturnCode_t DDSContentFilter::compile (
    void ** new_compile_data,
    const char * expression,
    const DDS_StringSeq & parameters,
    const DDS_TypeCode * type_code,
    const char * type_class_name,
    void * old_compile_data ) [pure virtual]
```

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

This method is called when an instance of the locally registered content filter is created or when the expression parameter for the locally registered content filter instance is changed.

An instance of the locally registered content filter is created every time a local **DDSContentFilteredTopic** (p. 1267) with the matching filter name is created, or when a **DDSDataReader** (p. 1272) with a matching filter name is discovered.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

<i>new_compile_data</i>	<< out >> (p. 237) User specified opaque pointer of this instance of the content filter. This value is then passed to the DDSContentFilter::evaluate (p. 1266) and DDSContentFilter::finalize (p. 1266) functions for this instance of the content filter. Can be set to NULL .
<i>expression</i>	<< in >> (p. 237) An ASCIIZ string with the filter expression. The memory used by this string is owned by RTI Connex and must not be freed. If you want to manipulate this string, you must first make a copy of it.
<i>parameters</i>	<< in >> (p. 237) A string sequence with the expression parameters the DDSContentFilteredTopic (p. 1267) was created with. The string sequence is equal (but not identical) to the string sequence passed to DDSDomainParticipant::create_contentfilteredtopic (p. 1369). Note that the sequence passed to the compile function is owned by RTI Connex and must not be referenced outside the compile function.
<i>type_code</i>	<< in >> (p. 237) A pointer to the type code for the related DDSTopic (p. 1601) of the DDSContentFilteredTopic (p. 1267). A type_code is a description of a type in terms of which types it contains (such as long, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
<i>type_class_name</i>	<< in >> (p. 237) Fully qualified class name of the related DDSTopic (p. 1601).
<i>old_compile_data</i>	<< in >> (p. 237) The previous new_compile_data value from a previous call to this instance of a content filter. If the compile function is called more than once for an instance of a DDSContentFilteredTopic (p. 1267), e.g., if the expression parameters are changed, then the new_compile_data value returned by the previous invocation is passed in the old_compile_data parameter (which can be NULL). If this is a new instance of the filter, NULL is passed. This parameter is useful for freeing or reusing previously allocated resources.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.243.2.2 evaluate()

```
virtual DDS_Boolean DDSContentFilter::evaluate (
    void * compile_data,
    const void * sample,
    const struct DDS_FilterSampleInfo * meta_data ) [pure virtual]
```

Evaluate whether the sample is passing the filter or not according to the sample content.

This method is called when a sample for a locally created **DDSDataReader** (p. 1272) associated with the filter is received, or when a sample for a discovered **DDSDataReader** (p. 1272) associated with the filter needs to be sent.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

<i>compile_data</i>	<< <i>in</i> >> (p. 237) The last return value of the DDSContentFilter::compile (p. 1264) function for this instance of the content filter. Can be NULL .
<i>sample</i>	<< <i>in</i> >> (p. 237) Pointer to a deserialized sample to be filtered
<i>meta_data</i>	<< <i>in</i> >> (p. 237) Pointer to meta data associated with the sample.

Returns

The function must return 0 if the sample should be filtered out, non zero otherwise

9.243.2.3 finalize()

```
virtual void DDSContentFilter::finalize (
    void * compile_data ) [pure virtual]
```

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

This method is called when an instance of the locally registered content filter is deleted.

An instance of the locally registered content filter is deleted every time a local **DDSContentFilteredTopic** (p. 1267) with the matching filter name is deleted, or when a **DDSDataReader** (p. 1272) with a matching filter name is removed due to discovery.

This method is also called on all instances of the discovered **DDSDataReader** (p. 1272) with a matching filter name if the filter is unregistered with **DDSDomainParticipant::unregister_contentfilter** (p. 1349).

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

<i>compile_data</i>	<< <i>in</i> >> (p. 237) The last return value of the DDSContentFilter::compile (p. 1264) function for this instance of the content filter. Can be NULL
---------------------	--

9.244 DDSContentFilteredTopic Class Reference

<<*interface*>> (p. 236) Specialization of **DDSTopicDescription** (p. 1608) that allows for content-based subscriptions.

Inheritance diagram for DDSContentFilteredTopic:

Public Member Functions

- virtual const char * **get_filter_expression** ()=0
Get the filter_expression.
- virtual **DDS_ReturnCode_t** **get_expression_parameters** (**DDS_StringSeq** ¶meters)=0
Get the expression_parameters.
- virtual **DDS_ReturnCode_t** **set_expression_parameters** (const **DDS_StringSeq** ¶meters)=0
Set the expression_parameters.
- virtual **DDS_ReturnCode_t** **set_expression** (const char *expression, const **DDS_StringSeq** ¶meters)=0
Set the filter_expression and expression_parameters.
- virtual **DDS_ReturnCode_t** **append_to_expression_parameter** (const **DDS_Long** index, const char *val)=0
<<*extension*>> (p. 236) Appends a string term to the specified parameter string.
- virtual **DDS_ReturnCode_t** **remove_from_expression_parameter** (const **DDS_Long** index, const char *val)=0
<<*extension*>> (p. 236) Removes a string term from the specified parameter string.
- virtual **DDSTopic** * **get_related_topic** ()=0
Get the related_topic.

Static Public Member Functions

- static **DDSContentFilteredTopic** * **narrow** (**DDSTopicDescription** *topic_description)
Narrow the given DDSTopicDescription (p. 1608) pointer to a DDSContentFilteredTopic (p. 1267) pointer.

9.244.1 Detailed Description

<<*interface*>> (p. 236) Specialization of **DDSTopicDescription** (p. 1608) that allows for content-based subscriptions.

It describes a more sophisticated subscription that indicates a **DDSDataReader** (p. 1272) does not want to necessarily see all values of each instance published under the **DDSTopic** (p. 1601). Rather, it wants to see only the values whose contents satisfy certain criteria. This class therefore can be used to request content-based subscriptions.

The selection of the content is done using the `filter_expression` with parameters `expression_↵` parameters.

- The `filter_expression` attribute is a string that specifies the criteria to select the data samples of interest. It is similar to the WHERE part of an SQL clause.
- The `expression_parameters` attribute is a sequence of strings that give values to the 'parameters' (i.e. "%n" tokens) in the `filter_expression`. The number of supplied parameters must fit with the requested values in the `filter_expression` (i.e. the number of n tokens).

Queries and Filters Syntax (p.178) describes the syntax of `filter_expression` and `expression_↵` parameters.

9.244.2 Member Function Documentation

9.244.2.1 narrow()

```
static DDSContentFilteredTopic * DDSContentFilteredTopic::narrow (
    DDSTopicDescription * topic_description ) [static]
```

Narrow the given **DDSTopicDescription** (p. 1608) pointer to a **DDSContentFilteredTopic** (p. 1267) pointer.

Returns

DDSContentFilteredTopic (p.1267) if this **DDSTopicDescription** (p.1608) is a **DDSContentFilteredTopic** (p. 1267). Otherwise, return NULL.

9.244.2.2 get_filter_expression()

```
virtual const char * DDSContentFilteredTopic::get_filter_expression ( ) [pure virtual]
```

Get the filter_expression.

Return the filter_expression associated with the **DDSContentFilteredTopic** (p.1267). filter_expression is either specified on the last successful call to **DDSContentFilteredTopic::set_expression** (p.1270) or, if that method is never called, the expression specified when the **DDSContentFilteredTopic** (p.1267) was created.

Returns

the filter_expression.

9.244.2.3 get_expression_parameters()

```
virtual DDS_ReturnCode_t DDSContentFilteredTopic::get_expression_parameters (
    DDS_StringSeq & parameters ) [pure virtual]
```

Get the expression_parameters.

Return the expression_parameters associated with the **DDSContentFilteredTopic** (p.1267). expression_parameters is either specified on the last successful call to **DDSContentFilteredTopic::set_expression_parameters** (p.1269), **DDSContentFilteredTopic::set_expression** (p.1270) or, if that method is never called, the parameters specified when the **DDSContentFilteredTopic** (p.1267) was created.

Parameters

<i>parameters</i>	<< inout >> (p.237) the filter expression parameters. The memory for the strings in this sequence is managed according to the conventions described in String Conventions (p.546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.
-------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p.335)
------------	---

See also

DDSDomainParticipant::create_contentfilteredtopic (p.1369)

DDSContentFilteredTopic::set_expression_parameters (p.1269)

9.244.2.4 set_expression_parameters()

```
virtual DDS_ReturnCode_t DDSContentFilteredTopic::set_expression_parameters (
    const DDS_StringSeq & parameters ) [pure virtual]
```

Set the `expression_parameters`.

Change the `expression_parameters` associated with the **DDSContentFilteredTopic** (p. 1267).

Parameters

<i>parameters</i>	<< <i>in</i> >> (p. 237) the filter expression parameters Length of sequence cannot be greater than 100.
-------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.244.2.5 set_expression()

```
virtual DDS_ReturnCode_t DDSContentFilteredTopic::set_expression (
    const char * expression,
    const DDS_StringSeq & parameters ) [pure virtual]
```

Set the `filter_expression` and `expression_parameters`.

Changes the `filter_expression` and `expression_parameters` associated with the **DDSContentFilteredTopic** (p. 1267).

Parameters

<i>expression</i>	<< <i>in</i> >> (p. 237) the filter expression.
<i>parameters</i>	<< <i>in</i> >> (p. 237) the filter expression parameters Length of sequence cannot be greater than 100.

Returns

One of the **Standard Return Codes** (p. 335)

9.244.2.6 append_to_expression_parameter()

```
virtual DDS_ReturnCode_t DDSContentFilteredTopic::append_to_expression_parameter (
    const DDS_Long index,
    const char * val ) [pure virtual]
```

<<**extension**>> (p. 236) Appends a string term to the specified parameter string.

Appends the input string to the end of the specified parameter string, separated by a comma. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks.

This method can be used in expression parameters associated with MATCH operators in order to add a pattern to the match pattern list. For example, if the filter expression parameter value is:

'IBM'

Then `append_to_expression_parameter(0, "MSFT")` would generate the new value:

'IBM,MSFT'

Parameters

<i>index</i>	<< in >> (p. 237) The index of the parameter string to be modified. The first index is index 0. When using the DDS_STRINGMATCHFILTER_NAME (p. 59) filter, <i>index</i> <i>must</i> be 0.
<i>val</i>	<< in >> (p. 237) The string term to be appended to the parameter string.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.244.2.7 `remove_from_expression_parameter()`

```
virtual DDS_ReturnCode_t DDSContentFilteredTopic::remove_from_expression_parameter (
    const DDS_Long index,
    const char * val ) [pure virtual]
```

<<**extension**>> (p. 236) Removes a string term from the specified parameter string.

Removes the input string from the specified parameter string. To be found and removed, the input string must exist as a complete term, bounded by comma separators or the strong boundary. If the original parameter string is enclosed in quotation marks ("), the resultant string will also be enclosed in quotation marks. If the removed term was the last entry in the string, the result will be a string of empty quotation marks.

This method can be used in expression parameters associated with MATCH operators in order to remove a pattern from the match pattern list. For example, if the filter expression parameter value is:

'IBM,MSFT'

Then `remove_from_expression_parameter(0, "IBM")` would generate the expression:

'MSFT'

Parameters

<i>index</i>	<< <i>in</i> >> (p. 237) The index of the parameter string to be modified. The first index is index 0. When using the DDS_STRINGMATCHFILTER_NAME (p. 59) filter, <i>index must</i> be 0.
<i>val</i>	<< <i>in</i> >> (p. 237) The string term to be removed from the parameter string.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.244.2.8 get_related_topic()

```
virtual DDSTopic * DDSContentFilteredTopic::get_related_topic ( ) [pure virtual]
```

Get the `related_topic`.

Return the **DDSTopic** (p. 1601) specified when the **DDSContentFilteredTopic** (p. 1267) was created.

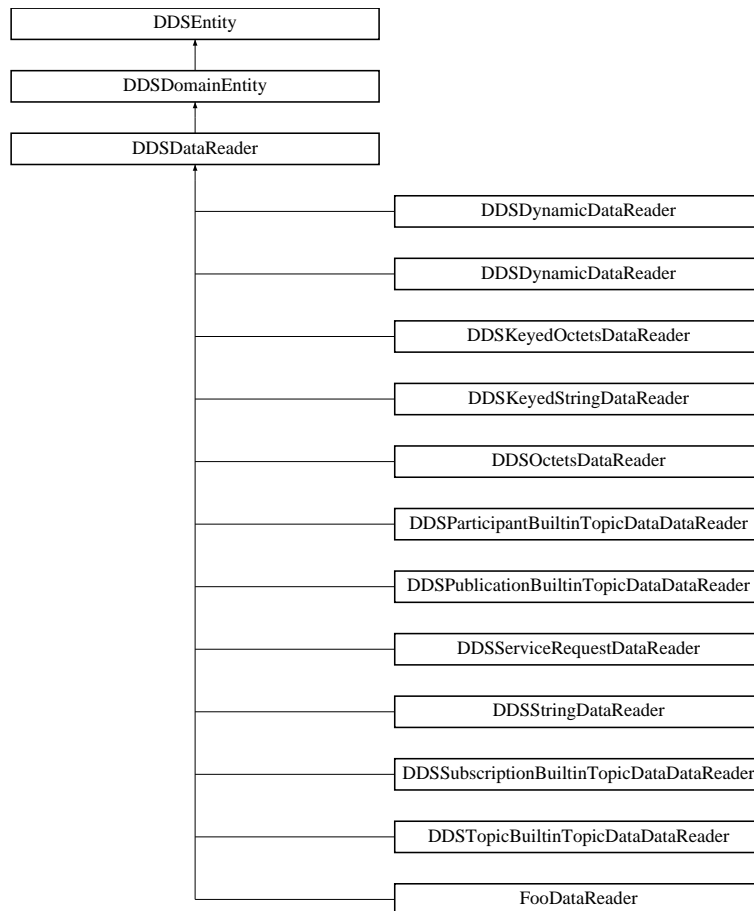

Returns

The **DDSTopic** (p. 1601) associated with the **DDSContentFilteredTopic** (p. 1267).

9.245 DDSDataReader Class Reference

<<*interface*>> (p. 236) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **DDSSubscriber** (p. 1576).

Inheritance diagram for DDSDataReader:

Public Member Functions

- virtual **DDSReadCondition *** **create_readcondition** (**DDS_SampleStateMask** sample_states, **DDS_View↔StateMask** view_states, **DDS_InstanceStateMask** instance_states)
Creates a **DDSReadCondition** (p. 1558).
- virtual **DDSReadCondition *** **create_readcondition_w_params** (**DDS_ReadConditionParams** ¶ms)
<<extension>> (p. 236) Creates a **DDSReadCondition** (p. 1558) with parameters.
- virtual **DDSQueryCondition *** **create_querycondition** (**DDS_SampleStateMask** sample_states, **DDS_View↔ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states, const char *query_expression, const struct **DDS_StringSeq** &query_parameters)
Creates a **DDSQueryCondition** (p. 1557).
- virtual **DDSQueryCondition *** **create_querycondition_w_params** (**DDS_QueryConditionParams** ¶ms)
<<extension>> (p. 236) Creates a **DDSQueryCondition** (p. 1557) with parameters.
- virtual **DDS_ReturnCode_t** **delete_readcondition** (**DDSReadCondition** *condition)
Deletes a **DDSReadCondition** (p. 1558) or **DDSQueryCondition** (p. 1557) attached to the **DDSDataReader** (p. 1272).
- virtual **DDS_ReturnCode_t** **delete_contained_entities** ()
Deletes all the entities that were created by means of the "create" operations on the **DDSDataReader** (p. 1272).
- virtual **DDS_ReturnCode_t** **wait_for_historical_data** (const **DDS_Duration_t** &max_wait)
Waits until all "historical" data is received for **DDSDataReader** (p. 1272) entities that have a non-VOLATILE Durability Qos kind.

- virtual **DDS_ReturnCode_t** **acknowledge_sample** (const **DDS_SampleInfo** &sample_info)
 <<extension>> (p. 236) Acknowledges a single sample explicitly.
- virtual **DDS_ReturnCode_t** **acknowledge_all** ()
 <<extension>> (p. 236) Acknowledges all previously accessed samples.
- virtual **DDS_ReturnCode_t** **acknowledge_sample** (const **DDS_SampleInfo** &sample_info, const **DDS_AckResponseData_t** &response_data)
 <<extension>> (p. 236) Acknowledges a single sample explicitly.
- virtual **DDS_ReturnCode_t** **acknowledge_all** (const **DDS_AckResponseData_t** &response_data)
 <<extension>> (p. 236) Acknowledges all previously accessed samples.
- virtual **DDS_ReturnCode_t** **get_matched_publications** (**DDS_InstanceHandleSeq** &publication_handles)
 Retrieves the list of publications currently "associated" with this **DDSDataReader** (p. 1272).
- virtual **DDS_ReturnCode_t** **get_matched_publication_data** (**DDS_PublicationBuiltinTopicData** &publication_data, const **DDS_InstanceHandle_t** &publication_handle)
 Retrieves the information on a publication that is currently "associated" with the **DDSDataReader** (p. 1272).
- virtual **DDS_ReturnCode_t** **is_matched_publication_alive** (**DDS_Boolean** &is_alive, const **DDS_InstanceHandle_t** &publication_handle)
 Check if a publication currently matched with a **DataReader** is alive.
- virtual **DDS_ReturnCode_t** **get_matched_publication_participant_data** (**DDS_ParticipantBuiltinTopicData** &participant_data, const **DDS_InstanceHandle_t** &publication_handle)
 <<extension>> (p. 236) Retrieves the information on the discovered **DDSDomainParticipant** (p. 1335) associated with the publication that is currently matching with the **DDSDataReader** (p. 1272).
- virtual **DDSTopicDescription *** **get_topicdescription** ()
 Returns the **DDSTopicDescription** (p. 1608) associated with the **DDSDataReader** (p. 1272).
- virtual **DDSSubscriber *** **get_subscriber** ()
 Returns the **DDSSubscriber** (p. 1576) to which the **DDSDataReader** (p. 1272) belongs.
- virtual **DDS_ReturnCode_t** **get_sample_rejected_status** (**DDS_SampleRejectedStatus** &status)
 Accesses the **DDS_SAMPLE_REJECTED_STATUS** (p. 344) communication status.
- virtual **DDS_ReturnCode_t** **get_liveliness_changed_status** (**DDS_LivelinessChangedStatus** &status)
 Accesses the **DDS_LIVELINESS_CHANGED_STATUS** (p. 345) communication status.
- virtual **DDS_ReturnCode_t** **get_requested_deadline_missed_status** (**DDS_RequestedDeadlineMissedStatus** &status)
 Accesses the **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 343) communication status.
- virtual **DDS_ReturnCode_t** **get_requested_incompatible_qos_status** (**DDS_RequestedIncompatibleQosStatus** &status)
 Accesses the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343) communication status.
- virtual **DDS_ReturnCode_t** **get_sample_lost_status** (**DDS_SampleLostStatus** &status)
 Accesses the **DDS_SAMPLE_LOST_STATUS** (p. 344) communication status.
- virtual **DDS_ReturnCode_t** **get_subscription_matched_status** (**DDS_SubscriptionMatchedStatus** &status)
 Accesses the **DDS_SUBSCRIPTION_MATCHED_STATUS** (p. 346) communication status.
- virtual **DDS_ReturnCode_t** **get_datareader_cache_status** (**DDS_DataReaderCacheStatus** &status)
 <<extension>> (p. 236) Gets the datareader cache status for this reader.
- virtual **DDS_ReturnCode_t** **get_datareader_protocol_status** (**DDS_DataReaderProtocolStatus** &status)
 <<extension>> (p. 236) Gets the datareader protocol status for this reader.
- virtual **DDS_ReturnCode_t** **get_matched_publication_datareader_protocol_status** (**DDS_DataReaderProtocolStatus** &status, const **DDS_InstanceHandle_t** &publication_handle)
 <<extension>> (p. 236) Gets the datareader protocol status for this reader, per matched publication identified by the publication_handle.
- virtual **DDS_ReturnCode_t** **set_qos** (const **DDS_DataReaderQos** &qos)

Sets the reader QoS.

- virtual **DDS_ReturnCode_t** **get_qos** (**DDS_DataReaderQos** &qos)

Gets the reader QoS.

- virtual **DDS_ReturnCode_t** **set_qos_with_profile** (const char *library_name, const char *profile_name)

<<*extension*>> (p. 236) *Changes the QoS of this reader using the input XML QoS profile.*

- virtual **DDS_ReturnCode_t** **set_property** (const char *property_name, const char *value, bool propagate)

Set the value for a property that applies to a DataReader.

- virtual **DDS_ReturnCode_t** **set_listener** (**DDSDDataReaderListener** *, **DDS_StatusMask** mask= **DDS_↔STATUS_MASK_ALL**)

Sets the reader listener.

- virtual **DDSDDataReaderListener** * **get_listener** ()

Gets the reader listener.

- virtual **DDSTopicQuery** * **create_topic_query** (const **DDS_TopicQuerySelection** &selection)

*Creates a **DDSTopicQuery** (p. 1611).*

- virtual **DDS_ReturnCode_t** **delete_topic_query** (**DDSTopicQuery** *query)

*Deletes a **DDSTopicQuery** (p. 1611).*

- virtual **DDSTopicQuery** * **lookup_topic_query** (const **DDS_GUID_t** &guid)

*Retrieves an existing **DDSTopicQuery** (p. 1611).*

- virtual **DDS_ReturnCode_t** **take_discovery_snapshot** ()

Take a snapshot of the compatible and incompatible remote writers matched by a local reader.

- virtual **DDS_ReturnCode_t** **take_discovery_snapshot** (const char *file_name)

Take a snapshot of the compatible and incompatible remote writers matched by a local reader.

- virtual **DDS_ReturnCode_t** **enable** ()

*Enables the **DDSEntity** (p. 1446).*

- virtual **DDSStatusCondition** * **get_statuscondition** ()

*Allows access to the **DDSStatusCondition** (p. 1562) associated with the **DDSEntity** (p. 1446).*

- virtual **DDS_StatusMask** **get_status_changes** ()

*Retrieves the list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.*

- virtual **DDS_InstanceHandle_t** **get_instance_handle** ()

*Allows access to the **DDS_InstanceHandle_t** (p. 74) associated with the **DDSEntity** (p. 1446).*

9.245.1 Detailed Description

<<*interface*>> (p. 236) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached **DDSSubscriber** (p. 1576).

QoS:

DDS_DataReaderQos (p. 638)

Status:

DDS_DATA_AVAILABLE_STATUS (p. 344);
DDS_LIVELINESS_CHANGED_STATUS (p. 345), **DDS_LivelinessChangedStatus** (p. 919);
DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 343), **DDS_RequestedDeadlineMissedStatus** (p. 1036);
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_RequestedIncompatibleQosStatus** (p. 1037);
DDS_SAMPLE_LOST_STATUS (p. 344), **DDS_SampleLostStatus** (p. 1079);
DDS_SAMPLE_REJECTED_STATUS (p. 344), **DDS_SampleRejectedStatus** (p. 1080);
DDS_SUBSCRIPTION_MATCHED_STATUS (p. 346), **DDS_SubscriptionMatchedStatus** (p. 1103);

Listener:

DDSDataReaderListener (p. 1299)

A **DDSDataReader** (p. 1272) refers to exactly one **DDSTopicDescription** (p. 1608) (either a **DDSTopic** (p. 1601), a **DDSContentFilteredTopic** (p. 1267) or a **DDSMultiTopic** (p. 1513)) that identifies the data to be read.

The subscription has a unique resulting type. The data-reader may give access to several instances of the resulting type, which can be distinguished from each other by their `key`.

DDSDataReader (p. 1272) is an abstract class. It must be specialised for each particular application data-type (see **USER_DATA** (p. 455)). The additional methods or functions that must be defined in the auto-generated class for a hypothetical application type **Foo** (p. 1632) are specified in the generic type **FooDataReader** (p. 1632).

The following operations may be called even if the **DDSDataReader** (p. 1272) is not enabled. Other operations will fail with the value **DDS_RETCODE_NOT_ENABLED** (p. 336) if called on a disabled **DDSDataReader** (p. 1272):

- The base-class operations **DDSDataReader::set_qos** (p. 1290), **DDSDataReader::get_qos** (p. 1291), **DDSDataReader::set_listener** (p. 1293), **DDSDataReader::get_listener** (p. 1293), **DDSEntity::enable** (p. 1449), **DDSEntity::get_statuscondition** (p. 1450), **DDSEntity::get_status_changes** (p. 1450),
- **DDSDataReader::get_liveliness_changed_status** (p. 1286), **DDSDataReader::get_requested_deadline_missed_status** (p. 1287), **DDSDataReader::get_requested_incompatible_qos_status** (p. 1287), **DDSDataReader::get_sample_lost_status** (p. 1288), **DDSDataReader::get_sample_rejected_status** (p. 1286), **DDSDataReader::get_subscription_matched_status** (p. 1288)

All sample-accessing operations, namely: **FooDataReader::read** (p. 1635), **FooDataReader::take** (p. 1636), **FooDataReader::read_w_condition** (p. 1640), and **FooDataReader::take_w_condition** (p. 1641) may fail with the error **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) as described in **DDSSubscriber::begin_access** (p. 1589).

Access to data samples (p. 125)

Examples

HelloWorldSupport.cxx, and **HelloWorld_subscriber.cxx**.

9.245.2 Member Function Documentation

9.245.2.1 create_readcondition()

```
virtual DDSReadCondition * DDSDataReader::create_readcondition (
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [inline], [virtual]
```

Creates a **DDSReadCondition** (p. 1558).

The returned **DDSReadCondition** (p. 1558) will be attached and belong to the **DDSDataReader** (p. 1272).

Parameters

<i>sample_states</i>	<< <i>in</i> >> (p. 237) sample state of the data samples that are of interest
<i>view_states</i>	<< <i>in</i> >> (p. 237) view state of the data samples that are of interest
<i>instance_states</i>	<< <i>in</i> >> (p. 237) instance state of the data samples that are of interest

Returns

return **DDSReadCondition** (p. 1558) created. Returns NULL in case of failure.

9.245.2.2 create_readcondition_w_params()

```
virtual DDSReadCondition * DDSDataReader::create_readcondition_w_params (
    DDS_ReadConditionParams & params ) [inline], [virtual]
```

<<*extension*>> (p. 236) Creates a **DDSReadCondition** (p. 1558) with parameters.

The returned **DDSReadCondition** (p. 1558) will be attached and belong to the **DDSDataReader** (p. 1272).

Parameters

<i>params</i>	<< <i>in</i> >> (p. 237) creation parameters.
---------------	---

Returns

return **DDSReadCondition** (p. 1558) created. Returns NULL in case of failure.

9.245.2.3 create_querycondition()

```
virtual DDSQueryCondition * DDSDataReader::create_querycondition (
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states,
    const char * query_expression,
    const struct DDS_StringSeq & query_parameters ) [inline], [virtual]
```

Creates a **DDSQueryCondition** (p. 1557).

The returned **DDSQueryCondition** (p. 1557) will be attached and belong to the **DDSDataReader** (p. 1272).

Queries and Filters Syntax (p. 178) describes the syntax of `query_expression` and `query_parameters`.

Parameters

<i>sample_states</i>	<< <i>in</i> >> (p. 237) sample state of the data samples that are of interest
<i>view_states</i>	<< <i>in</i> >> (p. 237) view state of the data samples that are of interest
<i>instance_states</i>	<< <i>in</i> >> (p. 237) instance state of the data samples that are of interest
<i>query_expression</i>	<< <i>in</i> >> (p. 237) Expression for the query. Cannot be NULL.
<i>query_parameters</i>	<< <i>in</i> >> (p. 237) Parameters for the query expression.

Returns

return **DDSQueryCondition** (p. 1557) created. Returns NULL in case of failure.

9.245.2.4 create_querycondition_w_params()

```
virtual DDSQueryCondition * DDSDataReader::create_querycondition_w_params (
    DDS_QueryConditionParams & params ) [inline], [virtual]
```

<<*extension*>> (p. 236) Creates a **DDSQueryCondition** (p. 1557) with parameters.

The returned **DDSQueryCondition** (p. 1557) will be attached and belong to the **DDSDataReader** (p. 1272).

Parameters

<i>params</i>	<< <i>in</i> >> (p. 237) creation parameters.
---------------	---

Returns

return **DDSQueryCondition** (p. 1557) created. Returns NULL in case of failure.

9.245.2.5 delete_readcondition()

```
virtual DDS_ReturnCode_t DDSDataReader::delete_readcondition (
    DDSReadCondition * condition ) [inline], [virtual]
```

Deletes a **DDSReadCondition** (p. 1558) or **DDSQueryCondition** (p. 1557) attached to the **DDSDataReader** (p. 1272).

Since **DDSQueryCondition** (p. 1557) specializes **DDSReadCondition** (p. 1558), it can also be used to delete a **DDSQueryCondition** (p. 1557).

Precondition

The **DDSReadCondition** (p. 1558) must be attached to the **DDSDataReader** (p. 1272), or the operation will fail with the error **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>condition</i>	<< <i>in</i> >> (p. 237) Condition to be deleted.
------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
------------	---

9.245.2.6 delete_contained_entities()

```
virtual DDS_ReturnCode_t DDSDataReader::delete_contained_entities ( ) [inline], [virtual]
```

Deletes all the entities that were created by means of the "create" operations on the **DDSDataReader** (p. 1272).

Deletes all contained **DDSReadCondition** (p. 1558), **DDSQueryCondition** (p. 1557), and **DDSTopicQuery** (p. 1611) objects.

The operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if the any of the contained entities is in a state where it cannot be deleted.

Once **DDSDataReader::delete_contained_entities** (p. 1279) completes successfully, the application may delete the **DDSDataReader** (p. 1272).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
------------	---

9.245.2.7 wait_for_historical_data()

```
virtual DDS_ReturnCode_t DDSDataReader::wait_for_historical_data (
    const DDS_Duration_t & max_wait ) [inline], [virtual]
```

Waits until all "historical" data is received for **DDSDataReader** (p. 1272) entities that have a non-VOLATILE Durability Qos kind.

This operation is intended only for **DDSDataReader** (p. 1272) entities that have a non-VOLATILE Durability QoS kind.

As soon as an application enables a non-VOLATILE **DDSDataReader** (p. 1272), it will start receiving both "historical" data (i.e., the data that was written prior to the time the **DDSDataReader** (p. 1272) joined the domain) as well as any new data written by the **DDSDataWriter** (p. 1305) entities. There are situations where the application logic may require the application to wait until all "historical" data is received. This is the purpose of the **DDSDataReader::wait_for_historical_data** (p. 1280) operations.

DDSDataReader::wait_for_historical_data() (p. 1280) blocks the calling thread until either all "historical" data is received, or until the duration specified by the `max_wait` parameter elapses, whichever happens first. It will return immediately if no DataWriters have been discovered at the time the operation is called; therefore it is advisable to make sure at least one **DDSDataWriter** (p. 1305) has been discovered before calling this operation. (One way to do this is by using **DDSDataReader::get_subscription_matched_status** (p. 1288).)

A successful completion indicates that all the "historical" data was "received"; timing out indicates that `max_wait` elapsed before all the data was received.

Parameters

<i>max_wait</i>	<< <i>in</i> >> (p. 237) Timeout value.
-----------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	---

9.245.2.8 acknowledge_sample() [1/2]

```
virtual DDS_ReturnCode_t DDSDataReader::acknowledge_sample (
    const DDS_SampleInfo & sample_info ) [inline], [virtual]
```

<<*extension*>> (p. 236) Acknowledges a single sample explicitly.

Applicable only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) = **DDS_APPLICATION_↵EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the DataReader to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **DDS_Rtps_↵ReliableReaderProtocol_t::samples_per_app_ack** (p. 1046) and **DDS_RtpsReliableReaderProtocol_t::app_ack_↵_period** (p. 1046).

Parameters

<i>sample_info</i>	<< <i>in</i> >> (p. 237) DDS_SampleInfo (p. 1068) identifying the sample being acknowledged.
--------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.9 acknowledge_all() [1/2]

```
virtual DDS_ReturnCode_t DDSDataReader::acknowledge_all ( ) [inline], [virtual]
```

<<*extension*>> (p. 236) Acknowledges all previously accessed samples.

Applicable only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) = **DDS_APPLICATION_↵EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the DataReader to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **DDS_Rtps_↵ReliableReaderProtocol_t::samples_per_app_ack** (p. 1046) and **DDS_RtpsReliableReaderProtocol_t::app_ack_↵_period** (p. 1046).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.10 acknowledge_sample() [2/2]

```
virtual DDS_ReturnCode_t DDSDataReader::acknowledge_sample (
    const DDS_SampleInfo & sample_info,
    const DDS_AckResponseData_t & response_data ) [inline], [virtual]
```

<<**extension**>> (p. 236) Acknowledges a single sample explicitly.

Applicable only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) = **DDS_APPLICATION_↵
EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the DataReader to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **DDS_Rtps_↵
ReliableReaderProtocol_t::samples_per_app_ack** (p. 1046) and **DDS_RtpsReliableReaderProtocol_t::app_ack_↵
_period** (p. 1046).

The maximum length of the response is configured using **DDS_DataReaderResourceLimitsQosPolicy::max_app_↵
ack_response_length** (p. 658)

Parameters

<i>sample_info</i>	<< in >> (p. 237) DDS_SampleInfo (p. 1068) identifying the sample being acknowledged.
<i>response_data</i>	<< in >> (p. 237) Response data sent to DDSDataWriter (p. 1305) upon acknowledgment (via DDSDataWriterListener::on_application_acknowledgment (p. 1333))

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.11 acknowledge_all() [2/2]

```
virtual DDS_ReturnCode_t DDSDataReader::acknowledge_all (
    const DDS_AckResponseData_t & response_data ) [inline], [virtual]
```

<<**extension**>> (p. 236) Acknowledges all previously accessed samples.

Applicable only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) = **DDS_APPLICATION_↵
EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436)

A call to this method does not necessarily trigger the sending of an AppAck RTPS message from the DataReader to the DataWriter. How and when AppAck messages are sent can be configured using the QoS values **DDS_Rtps_↵
ReliableReaderProtocol_t::samples_per_app_ack** (p. 1046) and **DDS_RtpsReliableReaderProtocol_t::app_ack_↵
_period** (p. 1046).

The maximum length of the response is configured using **DDS_DataReaderResourceLimitsQosPolicy::max_app_↵
ack_response_length** (p. 658).

Parameters

<i>response_data</i>	<< in >> (p. 237) Response data sent to DDSDataWriter (p. 1305) upon acknowledgment
----------------------	---

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.245.2.12 get_matched_publications()

```
virtual DDS_ReturnCode_t DDSDataReader::get_matched_publications (
    DDS_InstanceHandleSeq & publication_handles ) [inline], [virtual]
```

Retrieves the list of publications currently "associated" with this **DDSDataReader** (p. 1272).

A publication is considered to be matching if all of the following criteria are true:

- The publication is within the same domain as this subscription.
- The publication has a matching **DDSTopic** (p. 1601).
- The publication has compatible QoS.
- If the applications are using partitions, the publication shares a common partition with this subscription.
- The **DDSDomainParticipant** (p. 1335) has not indicated that the publication's **DDSDomainParticipant** (p. 1335) should be "ignored" by means of the **DDSDomainParticipant::ignore_publication** (p. 1379) API.
- If the subscription is using a **DDSContentFilteredTopic** (p. 1267) and the publication is using the **DDS_MultiChannelQosPolicy** (p. 952), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the reader has completed the key exchange with the writer.

The handles returned in the `publication_handles` list are the ones that are used by the RTI Connext implementation to locally identify the corresponding matched **DDSDataWriter** (p. 1305) entities. These handles match the ones that appear in the `instance_handle` field of the **DDS_SampleInfo** (p. 1068) when reading the **DDS_PUBLICATION_TOPIC_NAME** (p. 297) builtin topic.

This API may return the publication handles of publications that are not alive. **DDSDataReader::is_matched_publication_alive** (p. 1284) can be used to check the liveness of the remote publication.

Parameters

<i>publication_handles</i>	<p><<<i>inout</i>>> (p. 237). The sequence will be grown if the sequence has ownership and the system has the corresponding resources. Use a sequence without ownership to avoid dynamic memory allocation. If the sequence is too small to store all of the matches and the system cannot resize the sequence, this method will fail with DDS_RETCODE_OUT_OF_RESOURCES (p. 336). The maximum number of matches possible is configured with DDS_DomainParticipantResourceLimitsQosPolicy (p. 740). You can use a zero-maximum sequence without ownership to quickly check whether there are any matches without allocating any memory.</p>
----------------------------	--

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_OUT_OF_RESOURCES (p. 336) if the sequence is too small and the system cannot resize it, or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	--

9.245.2.13 `get_matched_publication_data()`

```
virtual DDS_ReturnCode_t DDSDataReader::get_matched_publication_data (
    DDS_PublicationBuiltinTopicData & publication_data,
    const DDS_InstanceHandle_t & publication_handle ) [inline], [virtual]
```

Retrieves the information on a publication that is currently "associated" with the **DDSDataReader** (p. 1272).

The `publication_handle` must correspond to a publication currently associated with the **DDSDataReader** (p. 1272). Otherwise, the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335). Use the operation **DDSDataReader::get_matched_publications** (p. 1283) to find the publications that are currently matched with the **DDSDataReader** (p. 1272).

Note: This operation does not retrieve the **DDS_PublicationBuiltinTopicData::type_code** (p. 1003). This information is available through **DDSDataReaderListener::on_data_available()** (p. 1301) (if a reader listener is installed on the **DDSPublicationBuiltinTopicDataDataReader** (p. 1533)).

Parameters

<code>publication_data</code>	<< <i>inout</i> >> (p. 237). The information to be filled in on the associated publication. Cannot be NULL.
<code>publication_handle</code>	<< <i>in</i> >> (p. 237). Handle to a specific publication associated with the DDSDataWriter (p. 1305). Must correspond to a publication currently associated with the DDSDataReader (p. 1272).

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

9.245.2.14 `is_matched_publication_alive()`

```
virtual DDS_ReturnCode_t DDSDataReader::is_matched_publication_alive (
    DDS_Boolean & is_alive,
    const DDS_InstanceHandle_t & publication_handle ) [inline], [virtual]
```

Check if a publication currently matched with a DataReader is alive.

This API is used for querying the endpoint liveliness of a matched publication. A matched publication will be marked as not alive if the liveliness that it committed to through its **LIVELINESS** (p. 409) QoS policy was not respected. Note that if the participant associated with the matched publication loses liveliness, the **DDS_InstanceHandle_t** (p. 74) will become invalid and this function will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335).

Parameters

<i>publication_handle</i>	<< in >> (p. 237) The DDS_InstanceHandle_t (p. 74) of the matched publication. See DDSDataReader::get_matched_publications (p. 1283) for a description of what is considered a matched publication.
<i>is_alive</i>	<< out >> (p. 237) Indicates whether or not the matched publication is alive.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.245.2.15 get_matched_publication_participant_data()

```
virtual DDS_ReturnCode_t DDSDataReader::get_matched_publication_participant_data (
    DDS_ParticipantBuiltinTopicData & participant_data,
    const DDS_InstanceHandle_t & publication_handle ) [inline], [virtual]
```

<<**extension**>> (p. 236) Retrieves the information on the discovered **DDSDomainParticipant** (p. 1335) associated with the publication that is currently matching with the **DDSDataReader** (p. 1272).

The *publication_handle* must correspond to a publication currently associated with the **DDSDataReader** (p. 1272). Otherwise, the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335). The operation may also fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if the publication corresponds to the same **DDSDomainParticipant** (p. 1335) that the DataReader belongs to. Use the operation **DDSDataReader::get_matched_publications** (p. 1283) to find the publications that are currently matched with the **DDSDataReader** (p. 1272).

Parameters

<i>participant_data</i>	<< inout >> (p. 237). The information to be filled in on the associated participant. Cannot be NULL.
<i>publication_handle</i>	<< in >> (p. 237). Handle to a specific publication associated with a DDSDataWriter (p. 1305). Must correspond to a publication currently associated with the DDSDataReader (p. 1272).

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

9.245.2.16 get_topicdescription()

```
virtual DDSTopicDescription * DDSDataReader::get_topicdescription ( ) [inline], [virtual]
```

Returns the **DDSTopicDescription** (p. 1608) associated with the **DDSDataReader** (p. 1272).

Returns that same **DDSTopicDescription** (p. 1608) that was used to create the **DDSDataReader** (p. 1272).

Returns

DDSTopicDescription (p. 1608) associated with the **DDSDataReader** (p. 1272).

9.245.2.17 get_subscriber()

```
virtual DDSSubscriber * DDSDataReader::get_subscriber ( ) [inline], [virtual]
```

Returns the **DDSSubscriber** (p. 1576) to which the **DDSDataReader** (p. 1272) belongs.

Returns

DDSSubscriber (p. 1576) to which the **DDSDataReader** (p. 1272) belongs.

9.245.2.18 get_sample_rejected_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_sample_rejected_status (
    DDS_SampleRejectedStatus & status ) [inline], [virtual]
```

Accesses the **DDS_SAMPLE_REJECTED_STATUS** (p. 344) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_SampleRejectedStatus (p. 1080) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.19 get_liveliness_changed_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_liveliness_changed_status (
    DDS_LivelinessChangedStatus & status ) [inline], [virtual]
```

Accesses the **DDS_LIVELINESS_CHANGED_STATUS** (p. 345) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_LivelinessChangedStatus (p. 919) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.20 get_requested_deadline_missed_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_requested_deadline_missed_status (
    DDS_RequestedDeadlineMissedStatus & status ) [inline], [virtual]
```

Accesses the **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 343) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_RequestedDeadlineMissedStatus (p. 1036) to be filled in.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.21 get_requested_incompatible_qos_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_requested_incompatible_qos_status (
    DDS_RequestedIncompatibleQosStatus & status ) [inline], [virtual]
```

Accesses the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_RequestedIncompatibleQosStatus (p. 1037) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.22 get_sample_lost_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_sample_lost_status (
    DDS_SampleLostStatus & status ) [inline], [virtual]
```

Accesses the **DDS_SAMPLE_LOST_STATUS** (p. 344) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_SampleLostStatus (p. 1079) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.23 get_subscription_matched_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_subscription_matched_status (
    DDS_SubscriptionMatchedStatus & status ) [inline], [virtual]
```

Accesses the **DDS_SUBSCRIPTION_MATCHED_STATUS** (p. 346) communication status.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_SubscriptionMatchedStatus (p. 1103) to be filled in.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.24 get_datareader_cache_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_datareader_cache_status (
    DDS_DataReaderCacheStatus & status ) [inline], [virtual]
```

<<**extension**>> (p. 236) Gets the datareader cache status for this reader.

Parameters

<i>status</i>	<< inout >> (p. 237) DDS_DataReaderCacheStatus (p. 617) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.245.2.25 get_datareader_protocol_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_datareader_protocol_status (
    DDS_DataReaderProtocolStatus & status ) [inline], [virtual]
```

<<**extension**>> (p. 236) Gets the datareader protocol status for this reader.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< inout >> (p. 237) DDS_DataReaderProtocolStatus (p. 627) to be filled in.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.245.2.26 get_matched_publication_datareader_protocol_status()

```
virtual DDS_ReturnCode_t DDSDataReader::get_matched_publication_datareader_protocol_status (
    DDS_DataReaderProtocolStatus & status,
    const DDS_InstanceHandle_t & publication_handle ) [inline], [virtual]
```

<<**extension**>> (p. 236) Gets the datareader protocol status for this reader, per matched publication identified by the `publication_handle`.

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters

<i>status</i>	<< inout >> (p. 237). The information to be filled in on the associated publication. Cannot be NULL.
<i>publication_handle</i>	<< in >> (p. 237). Handle to a specific publication associated with the DDSDataWriter (p. 1305). . Must correspond to a publication currently associated with the DDSDataReader (p. 1272).

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

9.245.2.27 set_qos()

```
virtual DDS_ReturnCode_t DDSDataReader::set_qos (
    const DDS_DataReaderQos & qos ) [inline], [virtual]
```

Sets the reader QoS.

Modifies the QoS of the **DDSDataReader** (p. 1272).

The **DDS_DataReaderQos::user_data** (p. 643), **DDS_DataReaderQos::deadline** (p. 642), **DDS_DataReaderQos::latency_budget** (p. 642), **DDS_DataReaderQos::time_based_filter** (p. 644), **DDS_DataReaderQos::reader_data_lifecycle** (p. 644) can be changed. The other policies are immutable.

Parameters

<i>qos</i>	<< in >> (p. 237) The DDS_DataReaderQos (p. 638) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDSDataReader (p. 1272) is enabled. The special value DDS_DATAREADER_QOS_DEFAULT (p. 132) can be used to indicate that the QoS of the DDSDataReader (p. 1272) should be changed to match the current default DDS_DataReaderQos (p. 638) set in the DDSSubscriber (p. 1576).
------------	---

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336).
-----	---

See also

DDS_DataReaderQos (p. 638) for rules on consistency among QoS

DDSDataReader::set_qos (p. 1290)

Operations Allowed in Listener Callbacks (p. ??)

9.245.2.28 get_qos()

```
virtual DDS_ReturnCode_t DDSDataReader::get_qos (
    DDS_DataReaderQos & qos ) [inline], [virtual]
```

Gets the reader QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) The DDS_DataReaderQos (p. 638) to be filled up.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

get_qos (abstract) (p. ??)

9.245.2.29 set_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSDataReader::set_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [inline], [virtual]
```

<<*extension*>> (p. 236) Changes the QoS of this reader using the input XML QoS profile.

This operation modifies the QoS of the **DDSDataReader** (p. 1272).

The **DDS_DataReaderQos::user_data** (p. 643), **DDS_DataReaderQos::deadline** (p. 642), **DDS_DataReaderQos::latency_budget** (p. 642), **DDS_DataReaderQos::time_based_filter** (p. 644), **DDS_DataReaderQos::reader_data_lifecycle** (p. 644) can be changed. The other policies are immutable.

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If <i>library_name</i> is null RTI Connex will use the default library (see DDSSubscriber::set_default_library (p. 1581)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If <i>profile_name</i> is null RTI Connex will use the default profile (see DDSSubscriber::set_default_profile (p. 1582)).

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336).
-----	---

DDS_DataReaderQos (p. 638) for rules on consistency among QoS

DDSDataReader::set_qos (p. 1290)

Operations Allowed in Listener Callbacks (p. ??)

9.245.2.30 set_property()

```
virtual DDS_ReturnCode_t DDSDataReader::set_property (
    const char * property_name,
    const char * value,
    bool propagate ) [inline], [virtual]
```

Set the value for a property that applies to a DataReader.

Warning

This method is not implemented in all APIs and it's intended only for testing purposes. You should use **DDSDataReader::set_qos** (p. 1290) instead.

Parameters

<i>property_name</i>	<< <i>in</i> >> (p. 237). Name of the property that you want to set.
<i>value</i>	<< <i>in</i> >> (p. 237). New value for the property.
<i>propagate</i>	<< <i>in</i> >> (p. 237). Indicates if the property will be propagated or not.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDSDomainParticipant::set_property (p. 1390)

DDSDataReader::set_qos (p. 1290)

9.245.2.31 set_listener()

```
virtual DDS_ReturnCode_t DDSDataReader::set_listener (
    DDSDataReaderListener * l,
    DDS_StatusMask mask = DDS_STATUS_MASK_ALL ) [inline], [virtual]
```

Sets the reader listener.

Parameters

<i>l</i>	<< <i>in</i> >> (p. 237) DDSDataReaderListener (p. 1299) to set to
<i>mask</i>	<< <i>in</i> >> (p. 237) DDS_StatusMask (p. 340) associated with the DDSDataReaderListener (p. 1299).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

set_listener (abstract) (p. ??)

9.245.2.32 get_listener()

```
virtual DDSDataReaderListener * DDSDataReader::get_listener ( ) [inline], [virtual]
```

Gets the reader listener.

Returns

DDSDataReaderListener (p. 1299) of the **DDSDataReader** (p. 1272).

See also

get_listener (abstract) (p. ??)

9.245.2.33 create_topic_query()

```
virtual DDSTopicQuery * DDSDataReader::create_topic_query (
    const DDS_TopicQuerySelection & selection ) [inline], [virtual]
```

Creates a **DDSTopicQuery** (p. 1611).

The returned **DDSTopicQuery** (p. 1611) will have been issued if the **DDSDataReader** (p. 1272) is enabled. Otherwise, the **DDSTopicQuery** (p. 1611) will be issued once the **DDSDataReader** (p. 1272) is enabled

Parameters

<i>selection</i>	<< <i>in</i> >> (p. 237) The selection with which to create the DDSTopicQuery (p. 1611). The special values DDS_TOPIC_QUERY_SELECTION_SELECT_ALL (p. 155) and DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER (p. 155) can be used. The expression can start with the special condition "@instance_state = ALIVE AND" followed by the rest of the expression. This restricts the selection to samples of alive instances.
------------------	--

Returns

return Created **DDSTopicQuery** (p. 1611). Returns NULL in case of failure.

9.245.2.34 delete_topic_query()

```
virtual DDS_ReturnCode_t DDSDataReader::delete_topic_query (
    DDSTopicQuery * query ) [inline], [virtual]
```

Deletes a **DDSTopicQuery** (p. 1611).

Cancels an active **DDSTopicQuery** (p. 1611). After deleting a TopicQuery, new DataWriters won't discover it and existing DataWriters currently publishing cached samples may stop before delivering all of them.

Parameters

<i>query</i>	<< <i>in</i> >> (p. 237) The DDSTopicQuery (p. 1611) to delete.
--------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.245.2.35 lookup_topic_query()

```
virtual DDSTopicQuery * DDSDataReader::lookup_topic_query (
```

```
const DDS_GUID_t & guid ) [inline], [virtual]
```

Retrieves an existing **DDSTopicQuery** (p. 1611).

Retrieves the **DDSTopicQuery** (p. 1611) that corresponds to the input **DDS_GUID_t** (p. 905).

If no TopicQuery is found for the specified GUID or the TopicQuery is marked for deletion, this returns NULL.

To get the **DDS_GUID_t** (p. 905) associated with a **DDSTopicQuery** (p. 1611), use the method **DDSTopicQuery::get_↵_guid** (p. 1611).

Parameters

<i>guid</i>	<< <i>in</i> >> (p. 237) The DDSTopicQuery (p. 1611) GUID.
-------------	---

9.245.2.36 take_discovery_snapshot() [1/2]

```
virtual DDS_ReturnCode_t DDSDataReader::take_discovery_snapshot ( ) [inline], [virtual]
```

Take a snapshot of the compatible and incompatible remote writers matched by a local reader.

The snapshot will be printed through the **NDDSConfigLogger** (p. 1801). A possible output may be the following:

```
Remote writers that match the local reader domain=0 name="readerTestName"
guid="0x0101542A,0x2C59B595,0xA1693BDF:0x80000004"
topic="FooTopic" type="FooType"
```

```
-----
Compatible writers:
1. 0x0101D8D1,0x20B83C0D,0x4495246E:0x80000003 name="writer1TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
liveliness="ALIVE"
Incompatible writers:
1. 0x0101D8D1,0x20B83C0D,0x4495246E:0x80000103 name="writer2TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
reason="Inconsistent QoS"
-----
```

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335).
------------	---

9.245.2.37 take_discovery_snapshot() [2/2]

```
virtual DDS_ReturnCode_t DDSDataReader::take_discovery_snapshot (
    const char * file_name ) [inline], [virtual]
```

Take a snapshot of the compatible and incompatible remote writers matched by a local reader.

The snapshot will be printed in the file specified by `file_name`. A possible output may be the following:

```
Remote writers that match the local reader domain=0 name="readerTestName"
guid="0x0101542A,0x2C59B595,0xA1693BDF:0x80000004"
topic="FooTopic" type="FooType"
```

Compatible writers:

```
1. 0x0101D8D1,0x20B83C0D,0x4495246E:0x80000003 name="writer1TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
liveliness="ALIVE"
```

Incompatible writers:

```
1. 0x0101D8D1,0x20B83C0D,0x4495246E:0x80000103 name="writer2TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
reason="Inconsistent QoS"
```

Parameters

<i>file_name</i>	<< <i>in</i> >> (p. 237) Name of the file where snapshot should be printed.
------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335).
------------	---

9.245.2.38 enable()

```
virtual DDS_ReturnCode_t DDSDataReader::enable ( ) [inline], [virtual]
```

Enables the **DDSEntity** (p. 1446).

This operation enables the Entity. Entity objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY_FACTORY** (p. 401) QoS policy on the corresponding factory for the **DDSEntity** (p. 1446).

By default, **ENTITY_FACTORY** (p. 401) is set so that it is not necessary to explicitly call **DDSEntity::enable** (p. 1449) on newly created entities.

The **DDSEntity::enable** (p. 1449) operation is idempotent. Calling enable on an already enabled Entity returns OK and has no effect.

If a **DDSEntity** (p. 1446) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **DDSEntity::get_statuscondition** (p. 1450)
- 'factory' operations
- **DDSEntity::get_status_changes** (p. 1450) and other get status operations (although the status of a disabled entity never changes)
- 'lookup' operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **DDS_RETCODE_NOT_ENABLED** (p. 336).

It is legal to delete an **DDSEntity** (p. 1446) that has not been enabled by calling the proper operation on its factory .

Entities created from a factory Entity that is disabled are created disabled, regardless of the setting of the **DDS_EntityFactoryQosPolicy** (p. 888).

Calling enable on an Entity whose factory Entity is not enabled will fail and return **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

If **DDS_EntityFactoryQosPolicy::autoenable_created_entities** (p. 890) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **DDSPublisher** (p. 1534) will enable all its contained **DDSDataWriter** (p. 1305) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value == FALSE`.

Exceptions

One	of the Standard Return Codes (p. 335), Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
-----	--

Implements **DDSEntity** (p. 1449).

9.245.2.39 get_statuscondition()

```
virtual DDSStatusCondition * DDSDataReader::get_statuscondition ( ) [inline], [virtual]
```

Allows access to the **DDSStatusCondition** (p. 1562) associated with the **DDSEntity** (p. 1446).

The returned condition can then be added to a **DDSWaitSet** (p. 1613) so that the application can wait for specific status changes that affect the **DDSEntity** (p. 1446).

Returns

the status condition associated with this entity.

Implements **DDSEntity** (p. 1450).

9.245.2.40 `get_status_changes()`

```
virtual DDS_StatusMask DDSDataReader::get_status_changes ( ) [inline], [virtual]
```

Retrieves the list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the `get_*_status()` method.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the `get_status_changes` operation will be empty.

The list of statuses returned by the `get_status_changes` operation refers to the status that are triggered on the Entity itself and does not include statuses that apply to contained entities.

Returns

list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.

See also

Status Kinds (p. 336)

Implements **DDSEntity** (p. 1450).

9.245.2.41 `get_instance_handle()`

```
virtual DDS_InstanceHandle_t DDSDataReader::get_instance_handle ( ) [inline], [virtual]
```

Allows access to the **DDS_InstanceHandle_t** (p. 74) associated with the **DDSEntity** (p. 1446).

This operation returns the **DDS_InstanceHandle_t** (p. 74) that represents the **DDSEntity** (p. 1446).

Returns

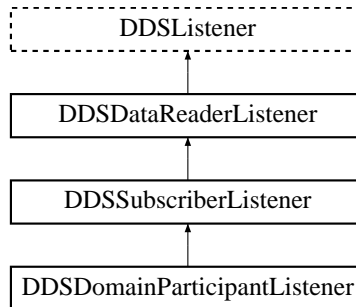

the instance handle associated with this entity.

Implements **DDSEntity** (p. 1451).

9.246 DDSDataReaderListener Class Reference

<<*interface*>> (p. 236) **DDSListener** (p. 1509) for reader status.

9.246.1 Detailed Description

<<*interface*>> (p. 236) **DDSListener** (p. 1509) for reader status.

Entity:

DDSDataReader (p. 1272)

Status:

DDS_DATA_AVAILABLE_STATUS (p. 344);
DDS_LIVELINESS_CHANGED_STATUS (p. 345), **DDS_LivelinessChangedStatus** (p. 919);
DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 343), **DDS_RequestedDeadlineMissedStatus** (p. 1036);
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_RequestedIncompatibleQosStatus** (p. 1037);
DDS_SAMPLE_LOST_STATUS (p. 344), **DDS_SampleLostStatus** (p. 1079);
DDS_SAMPLE_REJECTED_STATUS (p. 344), **DDS_SampleRejectedStatus** (p. 1080);
DDS_SUBSCRIPTION_MATCHED_STATUS (p. 346), **DDS_SubscriptionMatchedStatus** (p. 1103);

9.246.2 Member Function Documentation

9.246.2.1 on_requested_deadline_missed()

```
virtual void DDSDataReaderListener::on_requested_deadline_missed (
    DDSDataReader * reader,
    const DDS_RequestedDeadlineMissedStatus & status ) [virtual]
```

Handles the **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 343) communication status.

9.246.2.2 on_liveliness_changed()

```
virtual void DDSDataReaderListener::on_liveliness_changed (
    DDSDataReader * reader,
    const DDS_LivelinessChangedStatus & status ) [virtual]
```

Handles the **DDS_LIVELINESS_CHANGED_STATUS** (p. 345) communication status.

9.246.2.3 on_requested_incompatible_qos()

```
virtual void DDSDataReaderListener::on_requested_incompatible_qos (
    DDSDataReader * reader,
    const DDS_RequestedIncompatibleQosStatus & status ) [virtual]
```

Handles the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343) communication status.

9.246.2.4 on_sample_rejected()

```
virtual void DDSDataReaderListener::on_sample_rejected (
    DDSDataReader * reader,
    const DDS_SampleRejectedStatus & status ) [virtual]
```

Handles the **DDS_SAMPLE_REJECTED_STATUS** (p. 344) communication status.

9.246.2.5 on_data_available()

```
virtual void DDSDataReaderListener::on_data_available (
    DDSDataReader * reader ) [virtual]
```

Handle the **DDS_DATA_AVAILABLE_STATUS** (p. 344) communication status.

9.246.2.6 on_sample_lost()

```
virtual void DDSDataReaderListener::on_sample_lost (
    DDSDataReader * reader,
    const DDS_SampleLostStatus & status ) [virtual]
```

Handles the **DDS_SAMPLE_LOST_STATUS** (p. 344) communication status.

9.246.2.7 on_subscription_matched()

```
virtual void DDSDataReaderListener::on_subscription_matched (
    DDSDataReader * reader,
    const DDS_SubscriptionMatchedStatus & status ) [virtual]
```

Handles the **DDS_SUBSCRIPTION_MATCHED_STATUS** (p. 346) communication status.

9.247 DDSDataReaderSeq Class Reference

Declares IDL sequence < **DDSDataReader** (p. 1272) > .

9.247.1 Detailed Description

Declares IDL sequence < **DDSDDataReader** (p. 1272) > .

FooSeq (p. 1680)

9.248 DDSDataReaderStatusConditionHandler Class Reference

<<*interface*>> (p. 236) Realization of a **DDSConditionHandler** (p. 1262) that handles the status of a **DDSDData**↔
Reader (p. 1272).

Inheritance diagram for DDSDataReaderStatusConditionHandler:

Public Member Functions

- virtual void **on_condition_triggered** (**DDSCondition** *condition)
*Handles the dispatch of a **DDSCondition** (p. 1260).*
- **DDSDDataReaderStatusConditionHandler** (**DDSDDataReader** *reader, **DDSDDataReaderListener** *listener, **DDS_StatusMask** listener_mask)
*Creates a new **DDSDDataReaderStatusConditionHandler** (p. 1302) instance.*
- virtual ~**DDSDDataReaderStatusConditionHandler** ()
*Deletes a **DDSDDataReaderStatusConditionHandler** (p. 1302) instance previously created with **DDSDData**↔
StatusConditionHandler::DDSDDataReaderStatusConditionHandler (p. 1303).*

9.248.1 Detailed Description

<<*interface*>> (p. 236) Realization of a **DDSConditionHandler** (p. 1262) that handles the status of a **DDSDData**↔
Reader (p. 1272).

A **DDSDDataReaderStatusConditionHandler** (p. 1302) demultiplexes a **DDSDDataReader** (p. 1272) status change into the corresponding callback of a provided **DDSDDataReaderListener** (p. 1299) implementation.

Note that the **DDSDDataReaderListener** (p. 1299) notifications have different considerations than if the were made by the **DDSDDataReader** (p. 1272) directly:

- Context: The **DDSDDataReaderListener** (p. 1299) callback context is the one of the thread that dispatches the **DDSCondition** (p. 1260) where this handler is set. For instance, if you attach the condition to a **DDSA**↔
WaitSet (p. 1243), the context will be one of the threads within the pool.

- Status clearing: All the **DDSDataReader** (p. 1272)'s enabled statuses are cleared upon condition dispatch except the **DDS_DATA_AVAILABLE_STATUS** (p. 344), which will not be cleared until your application reads the data.
- Exclusive Area: Restrictions depend on the context of the dispatching thread. For instance, if the **DDSAsyncWaitSet** (p. 1243) dispatches the condition, the listener notifications are free of any exclusive area restrictions.

The **DDSDataReaderStatusConditionHandler** (p.1302) is a convenience to handle the status changes of a **DDSDataReader** (p.1272). You can install a **DDSDataReaderStatusConditionHandler** (p.1302) as the handler of a reader's **DDSStatusCondition** (p.1562). You can then attach it to a **DDSWaitSet** (p. 1613) or **DDSAsyncWaitSet** (p. 1243) and receive status changes notifications through a specific **DDSDataReaderListener** (p. 1299) implementation instance.

9.248.2 Constructor & Destructor Documentation

9.248.2.1 DDSDataReaderStatusConditionHandler()

```
DDSDataReaderStatusConditionHandler::DDSDataReaderStatusConditionHandler (
    DDSDataReader * reader,
    DDSDataReaderListener * listener,
    DDS_StatusMask listener_mask )
```

Creates a new **DDSDataReaderStatusConditionHandler** (p. 1302) instance.

The created DataReaderStatusConditionHandler can set as **DDSConditionHandler** (p.1262) in any **DDSCondition** (p. 1260) and will demultiplex the specified status changes from the specified **DDSDataReader** (p. 1272)

Parameters

<i>reader</i>	<< <i>in</i> >> (p. 237) The DDSDataReader (p. 1272) for which the status changes are demultiplexed to the specified <i>listener</i>
<i>listener</i>	<< <i>in</i> >> (p. 237) that receives the status changes notifications from the specified <i>reader</i> .
<i>listener_mask</i>	<< <i>in</i> >> (p. 237) Specifies which status changes from the reader to demultiplex to the <i>listener</i> .

See also

DDSDataReader (p. 1272)
DDSDataReader::set_listener (p. 1293)
DDSStatusCondition (p. 1562)
DDSConditionHandler (p. 1262)

9.248.2.2 ~DDSDataReaderStatusConditionHandler()

```
virtual DDSDataReaderStatusConditionHandler::~DDSDataReaderStatusConditionHandler ( ) [virtual]
```

Deletes a **DDSDataReaderStatusConditionHandler** (p. 1302) instance previously created with **DDSDataReader**↔
StatusConditionHandler::DDSDataReaderStatusConditionHandler (p. 1303).

9.248.3 Member Function Documentation

9.248.3.1 on_condition_triggered()

```
virtual void DDSDataReaderStatusConditionHandler::on_condition_triggered (
    DDSCondition * condition ) [virtual]
```

Handles the dispatch of a **DDSCondition** (p. 1260).

This callback is called by **DDSCondition::dispatch** (p. 1262).

Implements **DDSConditionHandler** (p. 1263).

9.249 DDSDataTagQosPolicyHelper Class Reference

Policy helpers that facilitate management of the data tags in the input policy.

Static Public Member Functions

- static **DDS_Long** **get_number_of_tags** (**DDS_DataTagQosPolicy** &policy)
Gets the number of data tags in the input policy.
- static **DDS_ReturnCode_t** **assert_tag** (**DDS_DataTagQosPolicy** &policy, const char *name, const char *value)
Asserts the tag identified by name in the input policy.
- static **DDS_ReturnCode_t** **add_tag** (**DDS_DataTagQosPolicy** &policy, const char *name, const char *value)
Adds a new tag to the input policy.
- static struct **DDS_Tag** * **lookup_tag** (**DDS_DataTagQosPolicy** &policy, const char *name)
Searches by tag name for a tag in the input policy.
- static **DDS_ReturnCode_t** **remove_tag** (**DDS_DataTagQosPolicy** &policy, const char *name)
Removes a tag from the input policy.

9.249.1 Detailed Description

Policy helpers that facilitate management of the data tags in the input policy.

9.250 DDSDataWriter Class Reference

<<**interface**>> (p. 236) Allows an application to set the value of the data to be published under a given **DDSTopic** (p. 1601).

Inheritance diagram for DDSDataWriter:

Public Member Functions

- virtual **DDS_ReturnCode_t** **get_liveliness_lost_status** (**DDS_LivelinessLostStatus** &status)
*Accesses the **DDS_LIVELINESS_LOST_STATUS** (p. 345) communication status.*
- virtual **DDS_ReturnCode_t** **get_offered_deadline_missed_status** (**DDS_OfferedDeadlineMissedStatus** &status)
*Accesses the **DDS_OFFERED_DEADLINE_MISSED_STATUS** (p. 342) communication status.*
- virtual **DDS_ReturnCode_t** **get_offered_incompatible_qos_status** (**DDS_OfferedIncompatibleQosStatus** &status)
*Accesses the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 343) communication status.*
- virtual **DDS_ReturnCode_t** **get_publication_matched_status** (**DDS_PublicationMatchedStatus** &status)
*Accesses the **DDS_PUBLICATION_MATCHED_STATUS** (p. 346) communication status.*
- virtual **DDS_ReturnCode_t** **get_reliable_writer_cache_changed_status** (**DDS_ReliableWriterCacheChangedStatus** &status)
 <<**extension**>> (p. 236) Get the reliable cache status for this writer.
- virtual **DDS_ReturnCode_t** **get_reliable_reader_activity_changed_status** (**DDS_ReliableReaderActivityChangedStatus** &status)
 <<**extension**>> (p. 236) Get the reliable reader activity changed status for this writer.
- virtual **DDS_ReturnCode_t** **get_datawriter_cache_status** (**DDS_DataWriterCacheStatus** &status)
 <<**extension**>> (p. 236) Get the datawriter cache status for this writer.
- virtual **DDS_ReturnCode_t** **get_datawriter_protocol_status** (**DDS_DataWriterProtocolStatus** &status)
 <<**extension**>> (p. 236) Get the datawriter protocol status for this writer.
- virtual **DDS_ReturnCode_t** **get_matched_subscription_datawriter_protocol_status** (**DDS_DataWriterProtocolStatus** &status, const **DDS_InstanceHandle_t** &subscription_handle)
 <<**extension**>> (p. 236) Get the datawriter protocol status for this writer, per matched subscription identified by the subscription_handle.
- virtual **DDS_ReturnCode_t** **is_matched_subscription_active** (**DDS_Boolean** &is_active, const **DDS_InstanceHandle_t** &subscription_handle)
Check if a subscription currently matched with a DataWriter is active.
- virtual **DDS_ReturnCode_t** **get_service_request_accepted_status** (**DDS_ServiceRequestAcceptedStatus** &status)
*Accesses the **DDS_SERVICE_REQUEST_ACCEPTED_STATUS** (p. 347) communication status.*
- virtual **DDS_ReturnCode_t** **get_matched_subscription_datawriter_protocol_status_by_locator** (**DDS_DataWriterProtocolStatus** &status, const **DDS_Locator_t** &locator)

- <<**extension**>> (p. 236) Get the datawriter protocol status for this writer, per matched subscription identified by the locator.
- virtual **DDS_ReturnCode_t assert_liveliness** ()
*This operation manually asserts the liveliness of this **DDSDDataWriter** (p. 1305).*
 - virtual **DDS_ReturnCode_t get_matched_subscription_locators** (**DDS_LocatorSeq** &locators)
 <<**extension**>> (p. 236) Retrieve the list of locators for subscriptions currently "associated" with this **DDSDDataWriter** (p. 1305).
 - virtual **DDS_ReturnCode_t get_matched_subscriptions** (**DDS_InstanceHandleSeq** &subscription_handles)
*Retrieve the list of subscriptions currently "associated" with this **DDSDDataWriter** (p. 1305).*
 - virtual **DDS_ReturnCode_t get_matched_subscription_data** (**DDS_SubscriptionBuiltinTopicData** &subscription_data, const **DDS_InstanceHandle_t** &subscription_handle)
*This operation retrieves the information on a subscription that is currently "associated" with the **DDSDDataWriter** (p. 1305).*
 - virtual **DDS_ReturnCode_t get_matched_subscription_participant_data** (**DDS_ParticipantBuiltinTopicData** &participant_data, const **DDS_InstanceHandle_t** &subscription_handle)
*This operation retrieves the information on the discovered **DDSDomainParticipant** (p. 1335) associated with the subscription that is currently matching with the **DDSDDataWriter** (p. 1305).*
 - virtual **DDSTopic * get_topic** ()
*This operation returns the **DDSTopic** (p. 1601) associated with the **DDSDDataWriter** (p. 1305).*
 - virtual **DDSPublisher * get_publisher** ()
*This operation returns the **DDSPublisher** (p. 1534) to which the **DDSDDataWriter** (p. 1305) belongs.*
 - virtual **DDS_ReturnCode_t wait_for_acknowledgments** (const **DDS_Duration_t** &max_wait)
*Blocks the calling thread until all data written by reliable **DDSDDataWriter** (p. 1305) entity is acknowledged, or until timeout expires.*
 - virtual **DDS_ReturnCode_t is_sample_app_acknowledged** (**DDS_Boolean** &is_app_ack, const struct **DDS_SampleIdentity_t** &identity)
This method can be used to see if a sample has been application acknowledged.
 - virtual **DDS_ReturnCode_t wait_for_asynchronous_publishing** (const **DDS_Duration_t** &max_wait)
 <<**extension**>> (p. 236) Blocks the calling thread until asynchronous sending is complete.
 - virtual **DDS_ReturnCode_t set_qos** (const **DDS_DataWriterQos** &qos)
Sets the writer QoS.
 - virtual **DDS_ReturnCode_t set_property** (const char *property_name, const char *value, bool propagate)
Set the value for a property that applies to a DataWriter.
 - virtual **DDS_ReturnCode_t set_qos_with_profile** (const char *library_name, const char *profile_name)
 <<**extension**>> (p. 236) Change the QoS of this writer using the input XML QoS profile.
 - virtual **DDS_ReturnCode_t get_qos** (**DDS_DataWriterQos** &qos)
Gets the writer QoS.
 - virtual **DDS_ReturnCode_t set_listener** (**DDSDDataWriterListener** *, **DDS_StatusMask** mask= **DDS_STATUS_MASK_ALL**)
Sets the writer listener.
 - virtual **DDSDDataWriterListener * get_listener** ()
Get the writer listener.
 - virtual **DDS_ReturnCode_t flush** ()
 <<**extension**>> (p. 236) Flushes the batch in progress in the context of the calling thread.
 - virtual **DDS_ReturnCode_t take_discovery_snapshot** ()
Take a snapshot of the compatible and incompatible remote readers matched by a local writer.
 - virtual **DDS_ReturnCode_t take_discovery_snapshot** (const char *file_name)
Take a snapshot of the compatible and incompatible remote readers matched by a local writer.
 - virtual **DDS_ReturnCode_t enable** ()

Enables the **DDSEntity** (p. 1446).

- virtual **DDSStatusCondition * get_statuscondition** ()
Allows access to the **DDSStatusCondition** (p. 1562) associated with the **DDSEntity** (p. 1446).
- virtual **DDS_StatusMask get_status_changes** ()
Retrieves the list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.
- virtual **DDS_InstanceHandle_t get_instance_handle** ()
Allows access to the **DDS_InstanceHandle_t** (p. 74) associated with the **DDSEntity** (p. 1446).

9.250.1 Detailed Description

<<**interface**>> (p. 236) Allows an application to set the value of the data to be published under a given **DDSTopic** (p. 1601).

QoS:

DDS_DataWriterQos (p. 683)

Status:

DDS_LIVELINESS_LOST_STATUS (p. 345), **DDS_LivelinessLostStatus** (p. 921);
DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 342), **DDS_OfferedDeadlineMissedStatus** (p. 957);
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_OfferedIncompatibleQosStatus** (p. 958);
DDS_PUBLICATION_MATCHED_STATUS (p. 346), **DDS_PublicationMatchedStatus** (p. 1007);
DDS_RELIABLE_READER_ACTIVITY_CHANGED_STATUS (p. 348), **DDS_ReliableReaderActivity**↔
ChangedStatus (p. 1030);
DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS (p. 348), **DDS_ReliableWriterCacheChanged**↔
Status (p. 1032).

Listener:

DDSDataWriterListener (p. 1328)

A **DDSDataWriter** (p. 1305) is attached to exactly one **DDSPublisher** (p. 1534), that acts as a factory for it.

A **DDSDataWriter** (p. 1305) is bound to exactly one **DDSTopic** (p. 1601) and therefore to exactly one data type. The **DDSTopic** (p. 1601) must exist prior to the **DDSDataWriter** (p. 1305)'s creation.

DDSDataWriter (p. 1305) is an abstract class. It must be specialized for each particular application data-type (see **USER_DATA** (p. 455)). The additional methods or functions that must be defined in the auto-generated class for a hypothetical application type **Foo** (p. 1632) are specified in the example type **DDSDataWriter** (p. 1305).

The following operations may be called even if the **DDSDataWriter** (p. 1305) is not enabled. Other operations will fail with **DDS_RETCODE_NOT_ENABLED** (p. 336) if called on a disabled **DDSDataWriter** (p. 1305):

- The base-class operations **DDSDataWriter::set_qos** (p. 1320), **DDSDataWriter::get_qos** (p. 1322), **DDSDataWriter::set_listener** (p. 1323), **DDSDataWriter::get_listener** (p. 1323), **DDSEntity::enable** (p. 1449), **DDSEntity::get_statuscondition** (p. 1450) and **DDSEntity::get_status_changes** (p. 1450)

- **DDSDataWriter::get_liveliness_lost_status** (p. 1308), **DDSDataWriter::get_offered_deadline_missed_status** (p. 1308), **DDSDataWriter::get_offered_incompatible_qos_status** (p. 1309), **DDSDataWriter::get_publication_matched_status** (p. 1309), **DDSDataWriter::get_reliable_writer_cache_changed_status** (p. 1310), **DDSDataWriter::get_reliable_reader_activity_changed_status** (p. 1310) **DDSDataWriter::get_service_request_accepted_status** (p. 1312)

Several **DDSDataWriter** (p. 1305) may operate in different threads. If they share the same **DDSPublisher** (p. 1534), the middleware guarantees that its operations are thread-safe.

FooDataWriter (p. 1659)

Operations Allowed in Listener Callbacks (p. ??)

Examples

HelloWorldSupport.cxx, and **HelloWorld_publisher.cxx**.

9.250.2 Member Function Documentation

9.250.2.1 get_liveliness_lost_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_liveliness_lost_status (
    DDS_LivelinessLostStatus & status ) [inline], [virtual]
```

Accesses the **DDS_LIVELINESS_LOST_STATUS** (p. 345) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_LivelinessLostStatus (p. 921) to be filled in.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.250.2.2 get_offered_deadline_missed_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_offered_deadline_missed_status (
    DDS_OfferedDeadlineMissedStatus & status ) [inline], [virtual]
```

Accesses the **DDS_OFFERED_DEADLINE_MISSED_STATUS** (p. 342) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_OfferedDeadlineMissedStatus (p. 957) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.250.2.3 get_offered_incompatible_qos_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_offered_incompatible_qos_status (
    DDS_OfferedIncompatibleQosStatus & status ) [inline], [virtual]
```

Accesses the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 343) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_OfferedIncompatibleQosStatus (p. 958) to be filled in.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.250.2.4 get_publication_matched_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_publication_matched_status (
    DDS_PublicationMatchedStatus & status ) [inline], [virtual]
```

Accesses the **DDS_PUBLICATION_MATCHED_STATUS** (p. 346) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_PublicationMatchedStatus (p. 1007) to be filled in.
---------------	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.250.2.5 get_reliable_writer_cache_changed_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_reliable_writer_cache_changed_status (
    DDS_ReliableWriterCacheChangedStatus & status ) [inline], [virtual]
```

<<**extension**>> (p. 236) Get the reliable cache status for this writer.

This also resets the status so that it is no longer considered changed.

Parameters

status	<< inout >> (p. 237) DDS_ReliableWriterCacheChangedStatus (p. 1032) to be filled in.
--------	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.250.2.6 get_reliable_reader_activity_changed_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_reliable_reader_activity_changed_status (
    DDS_ReliableReaderActivityChangedStatus & status ) [inline], [virtual]
```

<<**extension**>> (p. 236) Get the reliable reader activity changed status for this writer.

This also resets the status so that it is no longer considered changed.

Parameters

status	<< inout >> (p. 237) DDS_ReliableReaderActivityChangedStatus (p. 1030) to be filled in.
--------	---

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.250.2.7 get_datawriter_cache_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_datawriter_cache_status (
    DDS_DataWriterCacheStatus & status ) [inline], [virtual]
```

<<**extension**>> (p. 236) Get the datawriter cache status for this writer.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< inout >> (p. 237) DDS_DataWriterCacheStatus (p. 665) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.250.2.8 get_datawriter_protocol_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_datawriter_protocol_status (
    DDS_DataWriterProtocolStatus & status ) [inline], [virtual]
```

<<**extension**>> (p. 236) Get the datawriter protocol status for this writer.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< inout >> (p. 237) DDS_DataWriterProtocolStatus (p. 672) to be filled in.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.250.2.9 get_matched_subscription_datawriter_protocol_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_matched_subscription_datawriter_protocol_status (
    DDS_DataWriterProtocolStatus & status,
    const DDS_InstanceHandle_t & subscription_handle ) [inline], [virtual]
```

<<**extension**>> (p. 236) Get the datawriter protocol status for this writer, per matched subscription identified by the `subscription_handle`.

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters

<i>status</i>	<< inout >> (p. 237) DDS_DataWriterProtocolStatus (p. 672) to be filled in.
<i>subscription_handle</i>	<< in >> (p. 237) Handle to a specific subscription associated with the DDSDataReader (p. 1272). Must correspond to a subscription currently associated with the DDSDataWriter (p. 1305).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.250.2.10 `is_matched_subscription_active()`

```
virtual DDS_ReturnCode_t DDSDataWriter::is_matched_subscription_active (
    DDS_Boolean & is_active,
    const DDS_InstanceHandle_t & subscription_handle ) [inline], [virtual]
```

Check if a subscription currently matched with a DataWriter is active.

This API is used for querying the endpoint liveliness of a matched subscription. A matched subscription will be marked as inactive when it becomes nonprogressing (e.g., not responding to a DataWriter's heartbeats, or letting its internal queue fill up without taking the available data). Note that if the participant associated with the matched subscription loses liveliness, the **DDS_InstanceHandle_t** (p. 74) will become invalid and this function will fail with **DDS_RETCODE_↵BAD_PARAMETER** (p. 335).

Parameters

<i>subscription_handle</i>	<< in >> (p. 237) The DDS_InstanceHandle_t (p. 74) of the matched subscription. See DDSDataWriter::get_matched_subscriptions (p. 1315) for a description of what is considered a matched subscription.
<i>is_active</i>	<< out >> (p. 237) Indicates whether or not the matched subscription is active.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.250.2.11 get_service_request_accepted_status()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_service_request_accepted_status (
    DDS_ServiceRequestAcceptedStatus & status ) [inline], [virtual]
```

Accesses the **DDS_SERVICE_REQUEST_ACCEPTED_STATUS** (p. 347) communication status.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_ServiceRequestAcceptedStatus (p. 1084) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.250.2.12 get_matched_subscription_datawriter_protocol_status_by_locator()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_matched_subscription_datawriter_protocol_status_by_↵
locator (
    DDS_DataWriterProtocolStatus & status,
    const DDS_Locator_t & locator ) [inline], [virtual]
```

<<**extension**>> (p. 236) Get the datawriter protocol status for this writer, per matched subscription identified by the locator.

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_DataWriterProtocolStatus (p. 672) to be filled in
<i>locator</i>	<< <i>in</i> >> (p. 237) Locator to a specific locator associated with the DDSDataReader (p. 1272). Must correspond to a locator of one or more subscriptions currently associated with the DDSDataWriter (p. 1305).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.250.2.13 `assert_liveliness()`

```
virtual DDS_ReturnCode_t DDSDataWriter::assert_liveliness ( ) [inline], [virtual]
```

This operation manually asserts the liveliness of this **DDSDataWriter** (p. 1305).

This is used in combination with the **LIVELINESS** (p. 409) policy to indicate to RTI Connexx that the **DDSDataWriter** (p. 1305) remains active.

You only need to use this operation if the **LIVELINESS** (p. 409) setting is either **DDS_MANUAL_BY_PARTICIPANT** ↔ **LIVELINESS_QOS** (p. 410) or **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 410). Otherwise, it has no effect.

Note: writing data via the **FooDataWriter::write** (p. 1666) or **FooDataWriter::write_w_timestamp** (p. 1670) operation asserts liveliness on the **DDSDataWriter** (p. 1305) itself, and its **DDSDomainParticipant** (p. 1335). Consequently the use of **assert_liveliness()** (p. 1313) is only needed if the application is not writing data regularly.

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

See also

DDS_LivelinessQosPolicy (p. 923)

9.250.2.14 `get_matched_subscription_locators()`

```
virtual DDS_ReturnCode_t DDSDataWriter::get_matched_subscription_locators (
    DDS_LocatorSeq & locators ) [inline], [virtual]
```

<<**extension**>> (p. 236) Retrieve the list of locators for subscriptions currently "associated" with this **DDSDataWriter** (p. 1305).

The locators returned in the `locators` list are the ones that are used by the DDS implementation to communicate with the corresponding matched **DDSDataReader** (p. 1272) entities.

Parameters

<i>locators</i>	<< inout >> (p. 237). Handles of all the matched subscription locators.
-----------------	--

The sequence will be grown if the sequence has ownership and the system has the corresponding resources. Use a sequence without ownership to avoid dynamic memory allocation. If the sequence is too small to store all the matches and the system can not resize the sequence, this method will fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336). .

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_OUT_OF_RESOURCES (p. 336) if the sequence is too small and the system can not resize it, or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

9.250.2.15 get_matched_subscriptions()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_matched_subscriptions (
    DDS_InstanceHandleSeq & subscription_handles ) [inline], [virtual]
```

Retrieve the list of subscriptions currently "associated" with this **DDSDataWriter** (p. 1305).

A subscription is considered to be matching if all of the following criteria are true:

- The subscription is within the same domain as this publication.
- The subscription has a matching **DDSTopic** (p. 1601).
- The subscription has compatible QoS.
- If the applications are using partitions, the subscription shares a common partition with this publication.
- The **DDSDomainParticipant** (p. 1335) has not indicated that the subscription's **DDSDomainParticipant** (p. 1335) should be "ignored" by means of the **DDSDomainParticipant::ignore_publication** (p. 1379) API.
- If the publication is using the **DDS_MultiChannelQosPolicy** (p.952) and the subscription is using a **DDSContentFilteredTopic** (p. 1267), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the writer has completed the key exchange with reader.

The handles returned in the `subscription_handles` list are the ones that RTI Connexx uses to locally identify the corresponding matched **DDSDataReader** (p.1272) entities. These handles match the ones that appear in the **DDS_SampleInfo::instance_handle** (p.1072) field of the **DDS_SampleInfo** (p. 1068) when reading the **DDS_↵SUBSCRIPTION_TOPIC_NAME** (p. 299) builtin topic.

This API may return the subscription handles of subscriptions that are inactive. **DDSDataWriter::is_matched_↵subscription_active** (p. 1312) can be used to check this.

Parameters

<code>subscription_handles</code>	<< <i>inout</i> >> (p. 237). The handles of all the matched subscriptions.
-----------------------------------	--

The sequence will be grown if the sequence has ownership and the system has the corresponding resources. Use a sequence without ownership to avoid dynamic memory allocation. If the sequence is too small to store all of the matches and the system cannot resize the sequence, this method will fail with **DDS_RETCODE_OUT_OF_↵RESOURCES** (p. 336).

The maximum number of matches possible is configured with **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 740). You can use a zero-maximum sequence without ownership to quickly check whether there are any matches without allocating any memory. .

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_OUT_OF_RESOURCES (p. 336) if the sequence is too small and the system cannot resize it, or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	--

9.250.2.16 get_matched_subscription_data()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_matched_subscription_data (
    DDS_SubscriptionBuiltinTopicData & subscription_data,
    const DDS_InstanceHandle_t & subscription_handle ) [inline], [virtual]
```

This operation retrieves the information on a subscription that is currently "associated" with the **DDSDataWriter** (p. 1305).

The `subscription_handle` must correspond to a subscription currently associated with the **DDSDataWriter** (p. 1305). Otherwise, the operation will fail and fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335). Use **DDSDataWriter::get_matched_subscriptions** (p. 1315) to find the subscriptions that are currently matched with the **DDSDataWriter** (p. 1305).

The above information is also available through **DDSDataReaderListener::on_data_available()** (p. 1301) (if a reader listener is installed on the **DDSSubscriptionBuiltinTopicDataDataReader** (p. 1598)).

When the subscription data is updated, for example when the content filter property changes, there is a small window of time in between when the DataWriter is made aware of these changes and when they actually take effect. Taking effect in this example means that the DataWriter will perform writer-side filtering using the new filter property values (filter expression and/or parameters).

When the DataWriter is made aware of the changes they will first be seen in the **DDSDataReaderListener::on_data_available()** (p. 1301) of the **DDSSubscriptionBuiltinTopicDataDataReader** (p. 1598). When these changes are applied, they will be seen in the output of this API because this API blocks until the most recent changes known to the DataWriter have taken effect. This API will only block when called outside of a listener callback, in order to not block the internal threads from making progress.

If application behavior depends on being made aware of information about a subscription only after it has taken effect on the DataWriter, the recommended pattern for usage of this API is to wait for subscription data to be received either through polling this API or by installing a listener on the **DDSSubscriptionBuiltinTopicDataDataReader** (p. 1598). When a new sample is received by the builtin DataReader, this API may be called in a separate thread and will return the expected matched subscription data once it has been applied to the DataWriter.

Because this API blocks, it is possible for this API to time out while waiting for the changes to be applied. A timeout may happen if the DataReader's subscription data is changing rapidly, preventing the DataWriter from returning valid information before newer data has been received, or if an application is performing a task in a listener callback, thereby preventing the middleware's threads from executing events in a timely manner.

Note: This operation does not retrieve the **DDS_SubscriptionBuiltinTopicData::type_code** (p. 1099). This information is available through **DDSDataReaderListener::on_data_available()** (p. 1301) (if a reader listener is installed on the **DDSSubscriptionBuiltinTopicDataDataReader** (p. 1598)).

Parameters

<i>subscription_data</i>	<< <i>inout</i> >> (p. 237). The information to be filled in on the associated subscription. Cannot be NULL.
<i>subscription_handle</i>	<< <i>in</i> >> (p. 237). Handle to a specific subscription associated with the DDSDataReader (p. 1272). Must correspond to a subscription currently associated with the DDSDataWriter (p. 1305).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_NOT_ENABLED (p. 336), or DDS_RETCODE_TIMEOUT (p. 336)
------------	---

9.250.2.17 get_matched_subscription_participant_data()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_matched_subscription_participant_data (
    DDS_ParticipantBuiltinTopicData & participant_data,
    const DDS_InstanceHandle_t & subscription_handle ) [inline], [virtual]
```

This operation retrieves the information on the discovered **DDSDomainParticipant** (p. 1335) associated with the subscription that is currently matching with the **DDSDataWriter** (p. 1305).

The *subscription_handle* must correspond to a subscription currently associated with the **DDSDataWriter** (p. 1305). Otherwise, the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335). The operation may also fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if the subscription corresponds to the same **DDSDomainParticipant** (p. 1335) that the DataWriter belongs to. Use **DDSDataWriter::get_matched_subscriptions** (p. 1315) to find the subscriptions that are currently matched with the **DDSDataWriter** (p. 1305).

Parameters

<i>participant_data</i>	<< <i>inout</i> >> (p. 237). The information to be filled in on the associated participant Cannot be NULL.
<i>subscription_handle</i>	<< <i>in</i> >> (p. 237). Handle to a specific subscription associated with the DDSDataReader (p. 1272). Must correspond to a subscription currently associated with the DDSDataWriter (p. 1305).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	--

9.250.2.18 get_topic()

```
virtual DDSTopic * DDSDataWriter::get_topic ( ) [inline], [virtual]
```

This operation returns the **DDSTopic** (p. 1601) associated with the **DDSDataWriter** (p. 1305).

This is the same **DDSTopic** (p. 1601) that was used to create the **DDSDataWriter** (p. 1305).

Returns

DDSTopic (p. 1601) that was used to create the **DDSDataWriter** (p. 1305).

9.250.2.19 get_publisher()

```
virtual DDSPublisher * DDSDataWriter::get_publisher ( ) [inline], [virtual]
```

This operation returns the **DDSPublisher** (p. 1534) to which the **DDSDataWriter** (p. 1305) belongs.

Returns

DDSPublisher (p. 1534) to which the **DDSDataWriter** (p. 1305) belongs.

9.250.2.20 wait_for_acknowledgments()

```
virtual DDS_ReturnCode_t DDSDataWriter::wait_for_acknowledgments (
    const DDS_Duration_t & max_wait ) [inline], [virtual]
```

Blocks the calling thread until all data written by reliable **DDSDataWriter** (p. 1305) entity is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable **DDSDataWriter** (p. 1305) entity is acknowledged by (a) all reliable **DDSDataReader** (p. 1272) entities that are matched and alive and (b) by all required subscriptions, or until the duration specified by the `max_wait` parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged by all reliable matched data readers and by all required subscriptions; a timeout indicates that `max_wait` elapsed before all the data was acknowledged.

Note that if a thread is blocked in the call to `wait_for_acknowledgments` on a `DataWriter` and a different thread writes new samples on the same `DataWriter`, the new samples must be acknowledged before unblocking the thread waiting on `wait_for_acknowledgments`.

If the **DDSDataWriter** (p. 1305) does not have **DDS_ReliabilityQosPolicy** (p. 1027) kind set to `RELIABLE`, this operation will complete immediately with **DDS_RETCODE_OK** (p. 335)

Parameters

<code>max_wait</code>	<< <i>in</i> >> (p. 237) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 768) .
-----------------------	---

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_NOT_ENABLED (p. 336), DDS_RETCODE_TIMEOUT (p. 336)
-----	--

9.250.2.21 is_sample_app_acknowledged()

```
virtual DDS_ReturnCode_t DDSDataWriter::is_sample_app_acknowledged (
    DDS_Boolean & is_app_ack,
    const struct DDS_SampleIdentity_t & identity ) [inline], [virtual]
```

This method can be used to see if a sample has been application acknowledged.

This method can be used to see if a sample has been application acknowledged by all the matching DataReaders that were alive when the sample was written.

If a DataReader does not enable application acknowledgment (by setting **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) to a value other than **DDS_PROTOCOL_ACKNOWLEDGMENT_MODE** (p. 435)), the sample is considered application acknowledged for that DataReader.

Parameters

<i>is_app_ack</i>	<< out >> (p. 237) This value will be set to DDS_BOOLEAN_TRUE (p. 316) when the sample has been acknowledged.
<i>identity</i>	<< in >> (p. 237) Sample identity.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.250.2.22 wait_for_asynchronous_publishing()

```
virtual DDS_ReturnCode_t DDSDataWriter::wait_for_asynchronous_publishing (
    const DDS_Duration_t & max_wait ) [inline], [virtual]
```

<<**extension**>> (p. 236) Blocks the calling thread until asynchronous sending is complete.

This operation blocks the calling thread (up to `max_wait`) until all data written by the asynchronous **DDSDataWriter** (p. 1305) is sent and acknowledged (if reliable) by all matched **DDSDataReader** (p. 1272) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; a time out indicates that `max_wait` elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **DDSDataReader** (p. 1272) is complete in addition to what **DDSDataWriter::wait_for_acknowledgments** (p. 1318) provides.

If the **DDSDataWriter** (p. 1305) does not have **DDS_PublishModeQosPolicy** (p. 1012) kind set to **DDS_↔
ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431) the operation will complete immediately with **DDS_RETCODE_↔
_OK** (p. 335).

Parameters

<i>max_wait</i>	<< <i>in</i> >> (p. 237) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 768) .
-----------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_NOT_ENABLED (p. 336), DDS_RETCODE_TIMEOUT (p. 336)
------------	--

9.250.2.23 set_qos()

```
virtual DDS_ReturnCode_t DDSDataWriter::set_qos (
    const DDS_DataWriterQos & qos ) [inline], [virtual]
```

Sets the writer QoS.

This operation modifies the QoS of the **DDSDataWriter** (p. 1305).

The **DDS_DataWriterQos::user_data** (p. 688), **DDS_DataWriterQos::deadline** (p. 687), **DDS_DataWriterQos_↔
::latency_budget** (p. 687), **DDS_DataWriterQos::ownership_strength** (p. 688), **DDS_DataWriterQos::transport_↔
_priority** (p. 688), **DDS_DataWriterQos::lifespan** (p. 688) and **DDS_DataWriterQos::writer_data_lifecycle** (p. 689) can be changed. The other policies are immutable.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) The DDS_DataWriterQos (p. 683) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDSDataWriter (p. 1305) is enabled. The special value DDS_DATAWRITER_QOS_DEFAULT (p. 110) can be used to indicate that the QoS of the DDSDataWriter (p. 1305) should be changed to match the current default DDS_DataWriterQos (p. 683) set in the DDSPublisher (p. 1534).
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336) or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	---

See also

DDS_DataWriterQos (p. 683) for rules on consistency among QoS

set_qos (abstract) (p. ??)

Operations Allowed in Listener Callbacks (p. ??)

9.250.2.24 set_property()

```
virtual DDS_ReturnCode_t DDSDataWriter::set_property (
    const char * property_name,
    const char * value,
    bool propagate ) [inline], [virtual]
```

Set the value for a property that applies to a DataWriter.

Warning

This method is not implemented in all APIs and it's intended only for testing purposes. You should use **DDSDataWriter::set_qos** (p. 1320) instead.

Parameters

<i>property_name</i>	<< <i>in</i> >> (p. 237). Name of the property that you want to set.
<i>value</i>	<< <i>in</i> >> (p. 237). New value for the property.
<i>propagate</i>	<< <i>in</i> >> (p. 237). Indicates if the property will be propagated or not.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSDomainParticipant::set_property (p. 1390)

DDSDataReader::set_property (p. 1292)

DDSDataWriter::set_qos (p. 1320)

9.250.2.25 set_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSDataWriter::set_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [inline], [virtual]
```

<<*extension*>> (p. 236) Change the QoS of this writer using the input XML QoS profile.

This operation modifies the QoS of the **DDSDataWriter** (p. 1305).

The **DDS_DataWriterQos::user_data** (p. 688), **DDS_DataWriterQos::deadline** (p. 687), **DDS_DataWriterQos::latency_budget** (p. 687), **DDS_DataWriterQos::ownership_strength** (p. 688), **DDS_DataWriterQos::transport_priority** (p. 688), **DDS_DataWriterQos::lifespan** (p. 688) and **DDS_DataWriterQos::writer_data_lifecycle** (p. 689) can be changed. The other policies are immutable.

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexx will use the default library (see DDSPublisher::set_default_library (p. 1539)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexx will use the default profile (see DDSPublisher::set_default_profile (p. 1540)).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336) or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	---

See also

DDS_DataWriterQos (p. 683) for rules on consistency among QoS
Operations Allowed in Listener Callbacks (p. ??)

9.250.2.26 get_qos()

```
virtual DDS_ReturnCode_t DDSDataWriter::get_qos (
    DDS_DataWriterQos & qos ) [inline], [virtual]
```

Gets the writer QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) The DDS_DataWriterQos (p. 683) to be filled up.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

get_qos (abstract) (p. ??)

9.250.2.27 set_listener()

```
virtual DDS_ReturnCode_t DDSDataWriter::set_listener (
    DDSDataWriterListener * l,
    DDS_StatusMask mask = DDS_STATUS_MASK_ALL ) [inline], [virtual]
```

Sets the writer listener.

Parameters

<i>l</i>	<< <i>in</i> >> (p. 237) DDSDataWriterListener (p. 1328) to set to
<i>mask</i>	<< <i>in</i> >> (p. 237) DDS_StatusMask (p. 340) associated with the DDSDataWriterListener (p. 1328).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

set_listener (abstract) (p. ??)

9.250.2.28 get_listener()

```
virtual DDSDataWriterListener * DDSDataWriter::get_listener ( ) [inline], [virtual]
```

Get the writer listener.

Returns

DDSDataWriterListener (p. 1328) of the **DDSDataWriter** (p. 1305).

See also

get_listener (abstract) (p. ??)

9.250.2.29 flush()

```
virtual DDS_ReturnCode_t DDSDataWriter::flush ( ) [inline], [virtual]
```

<<*extension*>> (p. 236) Flushes the batch in progress in the context of the calling thread.

After being flushed, the batch is available to be sent on the network.

If the **DDSDataWriter** (p.1305) does not have **DDS_PublishModeQosPolicy** (p.1012) kind set to **DDS_←
ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431), the batch will be sent on the network immediately (in the context of the calling thread).

If the **DDSDataWriter** (p. 1305) does have **DDS_PublishModeQosPolicy** (p. 1012) kind set to **DDS_←
ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431), the batch will be sent in the context of the asynchronous publishing thread.

This operation may block in the same conditions as **FooDataWriter::write** (p. 1666).

If this operation does block, the **RELIABILITY max_blocking_time** configures the maximum time the write operation may block (waiting for space to become available). If **max_blocking_time** elapses before the **DDS_DataWriter** is able to store the modification without exceeding the limits, the operation will fail with **DDS_RETCODE_TIMEOUT**.

MT Safety:

flush() (p. 1323) is only thread-safe with batching if **DDS_BatchQosPolicy::thread_safe_write** (p. 597) is **TRUE**.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

9.250.2.30 take_discovery_snapshot() [1/2]

```
virtual DDS_ReturnCode_t DDSDataWriter::take_discovery_snapshot ( ) [inline], [virtual]
```

Take a snapshot of the compatible and incompatible remote readers matched by a local writer.

The snapshot will be printed through the **NDDConfigLogger** (p. 1801). A possible output may be the following:

```
Remote readers that match the local writer domain=0 name="writerTestName"
guid="0x0101D8D1,0x20B83C0D,0x4495246E:0x80000003"
topic="FooTopic" type="FooType"
-----
Compatible readers:
1. 0x0101542A,0x2C59B595,0xA1693BDF:0x80000004 name="reader1TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
liveliness="ALIVE"
Incompatible readers:
1. 0x0101542A,0x2C59B595,0xA1693BDF:0x80000104 name="reader2TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
reason="Inconsistent QoS"
-----
```

Exceptions

One	of the Standard Return Codes (p. 335).
-----	---

9.250.2.31 take_discovery_snapshot() [2/2]

```
virtual DDS_ReturnCode_t DDSDataWriter::take_discovery_snapshot (
    const char * file_name ) [inline], [virtual]
```

Take a snapshot of the compatible and incompatible remote readers matched by a local writer.

The snapshot will be printed in the file specified by `file_name`. A possible output may be the following:

```
Remote readers that match the local writer domain=0 name="writerTestName"
guid="0x0101D8D1,0x20B83C0D,0x4495246E:0x80000003"
topic="FooTopic" type="FooType"
-----
Compatible readers:
1. 0x0101542A,0x2C59B595,0xA1693BDF:0x80000004 name="reader1TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
liveliness="ALIVE"
Incompatible readers:
1. 0x0101542A,0x2C59B595,0xA1693BDF:0x80000104 name="reader2TestName"
kind="unkeyed user datareader"
unicastLocators="udp4://192.168.1.170:7411"
reason="Inconsistent QoS"
-----
```

Parameters

<i>file_name</i>	<< <i>in</i> >> (p. 237) Name of the file where snapshot should be printed.
------------------	---

Exceptions

One	of the Standard Return Codes (p. 335).
-----	---

9.250.2.32 enable()

```
virtual DDS_ReturnCode_t DDSDataWriter::enable ( ) [inline], [virtual]
```

Enables the **DDSEntity** (p. 1446).

This operation enables the Entity. Entity objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY_FACTORY** (p. 401) QoS policy on the corresponding factory for the **DDSEntity** (p. 1446).

By default, **ENTITY_FACTORY** (p. 401) is set so that it is not necessary to explicitly call **DDSEntity::enable** (p. 1449) on newly created entities.

The **DDSEntity::enable** (p. 1449) operation is idempotent. Calling enable on an already enabled Entity returns OK and has no effect.

If a **DDSEntity** (p. 1446) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **DDSEntity::get_statuscondition** (p. 1450)
- 'factory' operations
- **DDSEntity::get_status_changes** (p. 1450) and other get status operations (although the status of a disabled entity never changes)
- 'lookup' operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **DDS_RETCODE_NOT_ENABLED** (p. 336).

It is legal to delete an **DDSEntity** (p. 1446) that has not been enabled by calling the proper operation on its factory .

Entities created from a factory Entity that is disabled are created disabled, regardless of the setting of the **DDS_EntityFactoryQosPolicy** (p. 888).

Calling enable on an Entity whose factory Entity is not enabled will fail and return **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

If **DDS_EntityFactoryQosPolicy::autoenable_created_entities** (p. 890) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **DDSPublisher** (p. 1534) will enable all its contained **DDSDataWriter** (p. 1305) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value == FALSE`.

Exceptions

One	of the Standard Return Codes (p. 335), Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
-----	--

Implements **DDSEntity** (p. 1449).

9.250.2.33 get_statuscondition()

```
virtual DDSStatusCondition * DDSDataWriter::get_statuscondition ( ) [inline], [virtual]
```

Allows access to the **DDSStatusCondition** (p. 1562) associated with the **DDSEntity** (p. 1446).

The returned condition can then be added to a **DDSWaitSet** (p. 1613) so that the application can wait for specific status changes that affect the **DDSEntity** (p. 1446).

Returns

the status condition associated with this entity.

Implements **DDSEntity** (p. 1450).

9.250.2.34 get_status_changes()

```
virtual DDS_StatusMask DDSDataWriter::get_status_changes ( ) [inline], [virtual]
```

Retrieves the list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the `get_*_status()` method.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the `get_status_changes` operation will be empty.

The list of statuses returned by the `get_status_changes` operation refers to the status that are triggered on the Entity itself and does not include statuses that apply to contained entities.

Returns

list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.

See also

Status Kinds (p. 336)

Implements **DDSEntity** (p. 1450).

9.250.2.35 get_instance_handle()

```
virtual DDS_InstanceHandle_t DDSDataWriter::get_instance_handle ( ) [inline], [virtual]
```

Allows access to the **DDS_InstanceHandle_t** (p. 74) associated with the **DDSEntity** (p. 1446).

This operation returns the **DDS_InstanceHandle_t** (p. 74) that represents the **DDSEntity** (p. 1446).

Returns

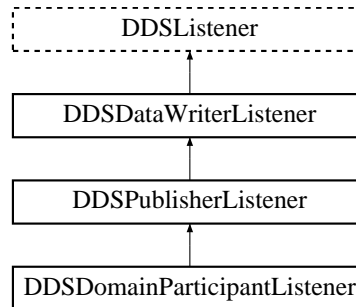

the instance handle associated with this entity.

Implements **DDSEntity** (p. 1451).

9.251.1 Detailed Description

<<*interface*>> (p. 236) **DDSTListener** (p. 1509) for writer status.

Entity:

DDSDataWriter (p. 1305)

Status:

DDS_LIVELINESS_LOST_STATUS (p. 345), **DDS_LivelinessLostStatus** (p. 921);
DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 342), **DDS_OfferedDeadlineMissedStatus** (p. 957);
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_OfferedIncompatibleQosStatus** (p. 958);
DDS_PUBLICATION_MATCHED_STATUS (p. 346), **DDS_PublicationMatchedStatus** (p. 1007);
DDS_RELIABLE_READER_ACTIVITY_CHANGED_STATUS (p. 348), **DDS_ReliableReaderActivity**↔
ChangedStatus (p. 1030);
DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS (p. 348), **DDS_ReliableWriterCacheChanged**↔
Status (p. 1032);

DDSTListener (p. 1509)

Status Kinds (p. 336)

Operations Allowed in Listener Callbacks (p. ??)

9.251.2 Member Function Documentation

9.251.2.1 on_offered_deadline_missed()

```
virtual void DDSDataWriterListener::on_offered_deadline_missed (
    DDSDataWriter * writer,
    const DDS_OfferedDeadlineMissedStatus & status ) [virtual]
```

Handles the **DDS_OFFERED_DEADLINE_MISSED_STATUS** (p. 342) status.

This callback is called when the deadline that the **DDSDataWriter** (p. 1305) has committed through its **DEADLINE** (p. 384) qos policy was not respected for a specific instance. This callback is called for each deadline period elapsed during which the **DDSDataWriter** (p. 1305) failed to provide data for an instance.

Parameters

<i>writer</i>	<< <i>out</i> >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>status</i>	<< <i>out</i> >> (p. 237) Current deadline missed status of locally created DDSDataWriter (p. 1305)

9.251.2.2 on_liveliness_lost()

```
virtual void DDSDataWriterListener::on_liveliness_lost (
    DDSDataWriter * writer,
    const DDS_LivelinessLostStatus & status ) [virtual]
```

Handles the **DDS_LIVELINESS_LOST_STATUS** (p. 345) status.

This callback is called when the liveliness that the **DDSDataWriter** (p. 1305) has committed through its **LIVELINESS** (p. 409) qos policy was not respected; this **DDSDataReader** (p. 1272) entities will consider the **DDSDataWriter** (p. 1305) as no longer "alive/active". This callback will not be called when an already not alive **DDSDataWriter** (p. 1305) simply remains not alive for another liveliness period.

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>status</i>	<< out >> (p. 237) Current liveliness lost status of locally created DDSDataWriter (p. 1305)

9.251.2.3 on_offered_incompatible_qos()

```
virtual void DDSDataWriterListener::on_offered_incompatible_qos (
    DDSDataWriter * writer,
    const DDS_OfferedIncompatibleQosStatus & status ) [virtual]
```

Handles the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 343) status.

This callback is called when the **DDS_DataWriterQos** (p. 683) of the **DDSDataWriter** (p. 1305) was incompatible with what was requested by a **DDSDataReader** (p. 1272). This callback is called when a **DDSDataWriter** (p. 1305) has discovered a **DDSDataReader** (p. 1272) for the same **DDSTopic** (p. 1601) and common partition, but with a requested QoS that is incompatible with that offered by the **DDSDataWriter** (p. 1305).

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>status</i>	<< out >> (p. 237) Current incompatible qos status of locally created DDSDataWriter (p. 1305)

9.251.2.4 on_publication_matched()

```
virtual void DDSDataWriterListener::on_publication_matched (
    DDSDataWriter * writer,
    const DDS_PublicationMatchedException & status ) [virtual]
```

Handles the **DDS_PUBLICATION_MATCHED_STATUS** (p. 346) status.

This callback is called when the **DDSDataWriter** (p. 1305) has found a **DDSDataReader** (p. 1272) that matches the **DDSTopic** (p. 1601), has a common partition and compatible QoS, or has ceased to be matched with a **DDSDataReader** (p. 1272) that was previously considered to be matched.

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>status</i>	<< out >> (p. 237) Current publication match status of locally created DDSDataWriter (p. 1305)

9.251.2.5 on_reliable_writer_cache_changed()

```
virtual void DDSDataWriterListener::on_reliable_writer_cache_changed (
    DDSDataWriter * writer,
    const DDS_ReliableWriterCacheChangedStatus & status ) [virtual]
```

<<**extension**>> (p. 236) A change has occurred in the writer's cache of unacknowledged samples.

This listener callback is triggered when:

- The cache is empty (contains no unacknowledged samples).
- The cache is full (the number of unacknowledged samples has reached the value specified in **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041)).
- The number of unacknowledged samples has reached **DDS_RtpsReliableWriterProtocol_t::high_watermark** (p. 1049) or **DDS_RtpsReliableWriterProtocol_t::low_watermark** (p. 1049).

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>status</i>	<< out >> (p. 237) Current reliable writer cache changed status of locally created DDSDataWriter (p. 1305)

9.251.2.6 on_reliable_reader_activity_changed()

```
virtual void DDSDataWriterListener::on_reliable_reader_activity_changed (
    DDSDataWriter * writer,
    const DDS_ReliableReaderActivityChangedStatus & status ) [virtual]
```

<<**extension**>> (p. 236) A matched reliable reader has become active or become inactive.

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDDataWriter (p. 1305) that triggers the listener callback
<i>status</i>	<< out >> (p. 237) Current reliable reader activity changed status of locally created DDSDDataWriter (p. 1305)

9.251.2.7 on_sample_removed()

```
virtual void DDSDataWriterListener::on_sample_removed (
    DDSDDataWriter * writer,
    const DDS_Cookie_t & cookie ) [virtual]
```

<<**extension**>> (p. 236) Called when a sample is removed from the DataWriter queue.

This callback is called only if the sample was written with a **DDS_Cookie_t** (p. 612) with **FooDataWriter::write_w_params** (p. 1671), or if this writer uses **Zero Copy** (p. 70) transfer over shared memory" or **FlatData Topic-Types** (p. 562) "FlatData language binding".

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDDataWriter (p. 1305) that triggers the listener callback
<i>cookie</i>	<< out >> (p. 237) <ul style="list-style-type: none"> • If this sample was written with FooDataWriter::write_w_params (p. 1671), this field contains a copy of the cookie set in DDS_WriteParams_t (p. 1234). • If this writer uses Zero Copy transfer over shared memory (p. 70) or FlatData language binding (p. 562), this field contains the absolute address of the sample that is removed. The address of the sample can be obtained by using DDS_Cookie_t::to_pointer (p. 472)

See also

FooDataWriter::get_loan (p. 1678)

9.251.2.8 on_instance_replaced()

```
virtual void DDSDataWriterListener::on_instance_replaced (
    DDSDDataWriter * writer,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Notifies when an instance is replaced in DataWriter queue.

This callback is called when an instance is replaced by the **DDSDataWriter** (p. 1305) due to instance resource limits being reached. This callback returns to the user the handle of the replaced instance, which can be used to get the key of the replaced instance using the **FooDataWriter::get_key_value** (p. 1674) API.

Because this callback can be called within the context of an in-progress write, dispose, or unregister call, most APIs on the DataWriter must not be used. The only DataWriter APIs that are safe to call within this callback are:

- **FooDataWriter::get_key_value** (p. 1674)
- **FooDataWriter::narrow** (p. 1661)
- **FooDataWriter::create_data** (p. 1677)
- **FooDataWriter::delete_data** (p. 1677)
- **DDSDataWriter::get_matched_subscriptions** (p. 1315)
- **DDSDataWriter::is_matched_subscription_active** (p. 1312)
- **DDSDataWriter::get_matched_subscription_participant_data** (p. 1317)
- **DDSDataWriter::get_topic** (p. 1317)
- **DDSDataWriter::get_publisher** (p. 1318)
- **DDSDataWriter::is_sample_app_acknowledged** (p. 1319)

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>handle</i>	<< out >> (p. 237) Handle of the replaced instance

9.251.2.9 on_application_acknowledgment()

```
virtual void DDSDataWriterListener::on_application_acknowledgment (
    DDSDataWriter * writer,
    const DDS_AcknowledgmentInfo & info ) [virtual]
```

<<**extension**>> (p. 236) Called when a sample is application-acknowledged

Applicable only when **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) = **DDS_APPLICATION_AUTO**↔**_ACKNOWLEDGMENT_MODE** (p. 435) or **DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436)

Called when a sample is application-level acknowledged. Provides identities of the sample and the acknowledging **DDSDataReader** (p. 1272). Also provides user-specified response data sent from the **DDSDataReader** (p. 1272) by the acknowledgment message.

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>info</i>	<< out >> (p. 237) DDS_AcknowledgmentInfo (p. 580) of the acknowledged sample

9.251.2.10 on_service_request_accepted()

```
virtual void DDSDataWriterListener::on_service_request_accepted (
    DDSDataWriter * writer,
    const DDS_ServiceRequestAcceptedStatus & status ) [virtual]
```

<<**extension**>> (p. 236) Called when a **DDS_ServiceRequest** (p. 1083) for the **DDSTopicQuery** (p. 1611) service is dispatched to this **DDSDataWriter** (p. 1305) for processing.

Parameters

<i>writer</i>	<< out >> (p. 237) Locally created DDSDataWriter (p. 1305) that triggers the listener callback
<i>status</i>	<< out >> (p. 237) Current service request accepted status of locally created DDSDataWriter (p. 1305)

 <<extension>> (p. 236) Set the default **DDS_SubscriberQos** (p. 1090) values for this DomainParticipant based on the input XML QoS profile.
- virtual **DDSPublisher * create_publisher** (const **DDS_PublisherQos** &qos, **DDSPublisherListener** *listener, **DDS_StatusMask** mask)=0
 Creates a **DDSPublisher** (p. 1534) with the desired QoS policies and attaches to it the specified **DDSPublisherListener** (p. 1555).
- virtual **DDSPublisher * create_publisher_with_profile** (const char *library_name, const char *profile_name, **DDSPublisherListener** *listener, **DDS_StatusMask** mask)=0
 <<extension>> (p. 236) Creates a new **DDSPublisher** (p. 1534) object using the **DDS_PublisherQos** (p. 1009) associated with the input XML QoS profile.
- virtual **DDS_ReturnCode_t delete_publisher** (**DDSPublisher** *p)=0
 Deletes an existing **DDSPublisher** (p. 1534).
- virtual **DDSSubscriber * create_subscriber** (const **DDS_SubscriberQos** &qos, **DDSSubscriberListener** *listener, **DDS_StatusMask** mask)=0
 Creates a **DDSSubscriber** (p. 1576) with the desired QoS policies and attaches to it the specified **DDSSubscriber**↵
Listener (p. 1597).

- virtual **DDSSubscriber** * **create_subscriber_with_profile** (const char *library_name, const char *profile_name, **DDSSubscriberListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a new **DDSSubscriber** (p. 1576) object using the **DDS_PublisherQos** (p. 1009) associated with the input XML QoS profile.*
- virtual **DDS_ReturnCode_t** **delete_subscriber** (**DDSSubscriber** *s)=0
*Deletes an existing **DDSSubscriber** (p. 1576).*
- virtual **DDS_ReturnCode_t** **get_publishers** (**DDSPublisherSeq** &publishers)=0
<<extension>> (p. 236) Allows the application to access all the publishers the participant has.
- virtual **DDS_ReturnCode_t** **get_subscribers** (**DDSSubscriberSeq** &subscribers)=0
<<extension>> (p. 236) Allows the application to access all the subscribers the participant has.
- virtual **DDSTopic** * **create_topic** (const char *topic_name, const char *type_name, const **DDS_TopicQos** &qos, **DDSTopicListener** *listener, **DDS_StatusMask** mask)=0
*Creates a **DDSTopic** (p. 1601) with the desired QoS policies and attaches to it the specified **DDSTopicListener** (p. 1610).*
- virtual **DDSTopic** * **create_topic_with_profile** (const char *topic_name, const char *type_name, const char *library_name, const char *profile_name, **DDSTopicListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a new **DDSTopic** (p. 1601) object using the **DDS_PublisherQos** (p. 1009) associated with the input XML QoS profile.*
- virtual **DDS_ReturnCode_t** **delete_topic** (**DDSTopic** *topic)=0
*Deletes a **DDSTopic** (p. 1601).*
- virtual **DDSTContentFilteredTopic** * **create_contentfilteredtopic** (const char *name, **DDSTopic** *related_topic, const char *filter_expression, const **DDS_StringSeq** &expression_parameters)=0
*Creates a **DDSTContentFilteredTopic** (p. 1267), that can be used to do content-based subscriptions.*
- virtual **DDSTContentFilteredTopic** * **create_contentfilteredtopic_with_filter** (const char *name, **DDSTopic** *related_topic, const char *filter_expression, const **DDS_StringSeq** &expression_parameters, const char *filter_name= **DDS_SQLFILTER_NAME**)=0
*<<extension>> (p. 236) Creates a **DDSTContentFilteredTopic** (p. 1267) using the specified filter to do content-based subscriptions.*
- virtual **DDS_ReturnCode_t** **delete_contentfilteredtopic** (**DDSTContentFilteredTopic** *a_contentfilteredtopic)=0
*Deletes a **DDSTContentFilteredTopic** (p. 1267).*
- virtual **DDSMultiTopic** * **create_multitopic** (const char *name, const char *type_name, const char *subscription_expression, const **DDS_StringSeq** &expression_parameters)=0
*[Not supported (optional)] Creates a **MultiTopic** that can be used to subscribe to multiple topics and combine/filter the received data into a resulting type.*
- virtual **DDS_ReturnCode_t** **delete_multitopic** (**DDSMultiTopic** *a_multitopic)=0
*[Not supported (optional)] Deletes a **DDSMultiTopic** (p. 1513).*
- virtual **DDSTopic** * **find_topic** (const char *topic_name, const **DDS_Duration_t** &timeout)=0
*Finds an existing (or ready to exist) **DDSTopic** (p. 1601), based on its name.*
- virtual **DDSTopicDescription** * **lookup_topicdescription** (const char *topic_name)=0
*Looks up an existing, locally created **DDSTopicDescription** (p. 1608), based on its name.*
- virtual **DDSFlowController** * **create_flowcontroller** (const char *name, const **DDS_FlowControllerProperty_t** &prop)=0
*<<extension>> (p. 236) Creates a **DDSFlowController** (p. 1451) with the desired property.*
- virtual **DDS_ReturnCode_t** **delete_flowcontroller** (**DDSFlowController** *fc)=0
*<<extension>> (p. 236) Deletes an existing **DDSFlowController** (p. 1451).*
- virtual **DDSFlowController** * **lookup_flowcontroller** (const char *name)=0
*<<extension>> (p. 236) Looks up an existing locally-created **DDSFlowController** (p. 1451), based on its name.*
- virtual **DDSSubscriber** * **get_builtin_subscriber** ()=0
*Accesses the **built-in DDSSubscriber** (p. 1576).*
- virtual **DDS_ReturnCode_t** **ignore_participant** (const **DDS_InstanceHandle_t** &handle)=0

- Instructs RTI Connex to locally ignore a remote **DDSDomainParticipant** (p. 1335).*
- virtual **DDS_ReturnCode_t banish_ignored_participants** ()=0
 - <<extension>> (p. 236) Prevents ignored remote DomainParticipants from receiving traffic from the local **DDSDomainParticipant** (p. 1335).*
- virtual **DDS_ReturnCode_t ignore_topic** (const **DDS_InstanceHandle_t** &handle)=0
 - Instructs RTI Connex to locally ignore a **DDSTopic** (p. 1601).*
- virtual **DDS_ReturnCode_t ignore_publication** (const **DDS_InstanceHandle_t** &handle)=0
 - Instructs RTI Connex to locally ignore a publication.*
- virtual **DDS_ReturnCode_t ignore_subscription** (const **DDS_InstanceHandle_t** &handle)=0
 - Instructs RTI Connex to locally ignore a subscription.*
- virtual **DDS_DomainId_t get_domain_id** ()=0
 - Get the unique domain identifier.*
- virtual **DDS_ReturnCode_t get_current_time** (**DDS_Time_t** ¤t_time)=0
 - Returns the current value of the time.*
- virtual **DDS_ReturnCode_t register_durable_subscription** (const **DDS_EndpointGroup_t** &group, const char *topic_name)=0
 - <<extension>> (p. 236) Registers a Durable Subscription on the specified **DDSTopic** (p. 1601) on all Persistence Services.*
- virtual **DDS_ReturnCode_t delete_durable_subscription** (const **DDS_EndpointGroup_t** &group)=0
 - <<extension>> (p. 236) Deletes an existing Durable Subscription on all Persistence Services.*
- virtual **DDS_ReturnCode_t assert_liveliness** ()=0
 - Manually asserts the liveliness of this **DDSDomainParticipant** (p. 1335).*
- virtual **DDS_ReturnCode_t resume_endpoint_discovery** (const **DDS_InstanceHandle_t** &remote_participant_handle)=0
 - <<extension>> (p. 236) Initiates endpoint discovery with the specified remote **DDSDomainParticipant** (p. 1335).*
- virtual **DDS_ReturnCode_t delete_contained_entities** ()=0
 - Delete all the entities that were created by means of the "create" operations on the **DDSDomainParticipant** (p. 1335).*
- virtual **DDS_ReturnCode_t get_discovered_participants** (**DDS_InstanceHandleSeq** &participant_handles)=0
 - Returns a list of discovered **DDSDomainParticipant** (p. 1335) entities.*
- virtual **DDS_ReturnCode_t get_discovered_participants_from_subject_name** (**DDS_InstanceHandleSeq** &participant_handles, const char *subject_name)=0
 - <<extension>> (p. 236) Returns a list of discovered **DDSDomainParticipant** (p. 1335) entities that have the given **DDS_EntityNameQosPolicy::name** (p. 891).*
- virtual **DDS_ReturnCode_t get_discovered_participant_data** (struct **DDS_ParticipantBuiltinTopicData** &participant_data, const **DDS_InstanceHandle_t** &participant_handle)=0
 - Returns **DDS_ParticipantBuiltinTopicData** (p. 966) for the specified **DDSDomainParticipant** (p. 1335).*
- virtual **DDS_ReturnCode_t get_discovered_participant_subject_name** (char *subject_name, **DDS_UnsignedLong** &subject_name_size, const **DDS_InstanceHandle_t** &participant_handle)=0
 - <<extension>> (p. 236) Returns **DDS_EntityNameQosPolicy::name** (p. 891) for the specified **DDSDomainParticipant** (p. 1335).*
- virtual **DDS_ReturnCode_t get_discovered_topics** (**DDS_InstanceHandleSeq** &topic_handles)=0
 - Returns list of discovered **DDSTopic** (p. 1601) objects.*
- virtual **DDS_ReturnCode_t get_discovered_topic_data** (struct **DDS_TopicBuiltinTopicData** &topic_data, const **DDS_InstanceHandle_t** &topic_handle)=0
 - Returns **DDS_TopicBuiltinTopicData** (p. 1113) for the specified **DDSTopic** (p. 1601).*
- virtual **DDS_Boolean contains_entity** (const **DDS_InstanceHandle_t** &a_handle)=0
 - Completes successfully with **DDS_BOOLEAN_TRUE** (p. 316) if the referenced **DDSEntity** (p. 1446) is contained by the **DDSDomainParticipant** (p. 1335).*

- virtual **DDS_ReturnCode_t** **get_participant_protocol_status** (struct **DDS_DomainParticipantProtocol** &status)=0
<<extension>> (p. 236) Get the domain participant protocol status for this participant.
- virtual **DDS_ReturnCode_t** **set_property** (const char *property_name, const char *value, bool propagate)=0
Set the value for a property that applies to a DomainParticipant.
- virtual **DDS_ReturnCode_t** **set_qos** (const **DDS_DomainParticipantQos** &qos)=0
Change the QoS of this DomainParticipant.
- virtual **DDS_ReturnCode_t** **set_qos_with_profile** (const char *library_name, const char *profile_name)=0
<<extension>> (p. 236) Change the QoS of this domain participant using the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **get_qos** (**DDS_DomainParticipantQos** &qos)=0
Get the participant QoS.
- virtual **DDS_ReturnCode_t** **add_peer** (const char *peer_desc_string)=0
<<extension>> (p. 236) Attempt to contact one or more additional peer participants.
- virtual **DDS_ReturnCode_t** **remove_peer** (const char *peer_desc_string)=0
*<<extension>> (p. 236) Remove one or more peer participants from the list of peers with which this **DDSDomainParticipant** (p. 1335) will try to communicate.*
- virtual **DDS_ReturnCode_t** **get_dns_tracker_polling_period** (**DDS_Duration_t** &polling_period)=0
<<extension>> (p. 236) Retrieves the frequency used by the DNS tracker thread to query the DNS service.
- virtual **DDS_ReturnCode_t** **set_dns_tracker_polling_period** (const **DDS_Duration_t** &polling_period)=0
<<extension>> (p. 236) Configures the frequency in which the DNS tracker queries the DNS service.
- virtual **DDS_ReturnCode_t** **set_listener** (**DDSDomainParticipantListener** *l, **DDS_StatusMask** mask=**DDS_STATUS_MASK_ALL**)=0
Sets the participant listener.
- virtual **DDSDomainParticipantListener** * **get_listener** ()=0
Get the participant listener.
- virtual **DDSPublisher** * **get_implicit_publisher** ()=0
*<<extension>> (p. 236) Returns the implicit **DDSPublisher** (p. 1534). If an implicit Publisher does not already exist, this creates one.*
- virtual **DDSSubscriber** * **get_implicit_subscriber** ()=0
*<<extension>> (p. 236) Returns the implicit **DDSSubscriber** (p. 1576). If an implicit Subscriber does not already exist, this creates one.*
- virtual **DDSDataWriter** * **create_datawriter** (**DDSTopic** *topic, const **DDS_DataWriterQos** &qos, **DDSDataWriterListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a **DDSDataWriter** (p. 1305) that will be attached and belong to the implicit **DDSPublisher** (p. 1534).*
- virtual **DDSDataWriter** * **create_datawriter_with_profile** (**DDSTopic** *topic, const char *library_name, const char *profile_name, **DDSDataWriterListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a **DDSDataWriter** (p. 1305) using a XML QoS profile that will be attached and belong to the implicit **DDSPublisher** (p. 1534).*
- virtual **DDS_ReturnCode_t** **delete_datawriter** (**DDSDataWriter** *a_datawriter)=0
*<<extension>> (p. 236) Deletes a **DDSDataWriter** (p. 1305) that belongs to the implicit **DDSPublisher** (p. 1534).*
- virtual **DDSDataReader** * **create_datareader** (**DDSTopicDescription** *topic, const **DDS_DataReaderQos** &qos, **DDSDataReaderListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a **DDSDataReader** (p. 1272) that will be attached and belong to the implicit **DDSSubscriber** (p. 1576).*
- virtual **DDSDataReader** * **create_datareader_with_profile** (**DDSTopicDescription** *topic, const char *library_name, const char *profile_name, **DDSDataReaderListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a **DDSDataReader** (p. 1272) using a XML QoS profile that will be attached and belong to the implicit **DDSSubscriber** (p. 1576).*

- virtual **DDS_ReturnCode_t delete_datareader** (**DDSDDataReader** *a_datareader)=0
 <<*extension*>> (p. 236) Deletes a **DDSDDataReader** (p. 1272) that belongs to the implicit **DDSSubscriber** (p. 1576).
- virtual **DDSPublisher * lookup_publisher_by_name** (const char *publisher_name)=0
 <<*extension*>> (p. 236) Looks up a **DDSPublisher** (p. 1534) by its entity name within this **DDSDomainParticipant** (p. 1335).
- virtual **DDSSubscriber * lookup_subscriber_by_name** (const char *subscriber_name)=0
 <<*extension*>> (p. 236) Retrieves a **DDSSubscriber** (p. 1576) by its entity name within this **DDSDomainParticipant** (p. 1335).
- virtual **DDSDDataWriter * lookup_datawriter_by_name** (const char *datawriter_full_name)=0
 <<*extension*>> (p. 236) Looks up a **DDSDDataWriter** (p. 1305) by its entity name within this **DDSDomainParticipant** (p. 1335).
- virtual **DDSDDataReader * lookup_datareader_by_name** (const char *datareader_full_name)=0
 <<*extension*>> (p. 236) Retrieves up a **DDSDDataReader** (p. 1272) by its entity name in this **DDSDomainParticipant** (p. 1335).
- virtual **DDS_ReturnCode_t take_discovery_snapshot** ()=0
 Take a snapshot of the remote participants discovered by a local one.
- virtual **DDS_ReturnCode_t take_discovery_snapshot** (const char *file_name)=0
 Take a snapshot of the remote participants discovered by a local one.

9.253.1 Detailed Description

<<*interface*>> (p. 236) Container for all **DDSDomainEntity** (p. 1334) objects.

The DomainParticipant object plays several roles:

- It acts as a container for all other **DDSEntity** (p. 1446) objects.
- It acts as a *factory* for the **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSTopic** (p. 1601) and **DDSMultiTopic** (p. 1513) **DDSEntity** (p. 1446) objects.
- It represents the participation of the application on a communication plane that isolates applications running on the same set of physical computers from each other. A domain establishes a virtual network linking all applications that share the same `domainId` and isolating them from applications running on different domains. In this way, several independent distributed applications can coexist in the same physical network without interfering, or even being aware of each other.
- It provides administration services in the domain, offering operations that allow the application to ignore locally any information about a given participant (**DDSDomainParticipant::ignore_participant** (p. 1376)), publication (**DDSDomainParticipant::ignore_publication** (p. 1379)), subscription (**DDSDomainParticipant::ignore_subscription** (p. 1379)) or topic (**DDSDomainParticipant::ignore_topic** (p. 1378)).

The following operations may be called even if the **DDSDomainParticipant** (p. 1335) is not enabled. Operations NOT in this list will fail with **DDS_RETCODE_NOT_ENABLED** (p. 336) \ if called on a disabled DomainParticipant.

- **DDSEntity::enable** (p. 1449),

- **DDSDomainParticipant::set_qos** (p. 1391), **DDSDomainParticipant::set_qos_with_profile** (p. 1391), **DDSDomainParticipant::get_qos** (p. 1392),
- **DDSDomainParticipant::set_listener** (p. 1396), **DDSDomainParticipant::get_listener** (p. 1397),
- Factory operations: **DDSDomainParticipant::create_flowcontroller** (p. 1374), **DDSDomainParticipant::create_topic** (p. 1366), **DDSDomainParticipant::create_topic_with_profile** (p. 1367), **DDSDomainParticipant::create_publisher** (p. 1359), **DDSDomainParticipant::create_publisher_with_profile** (p. 1360), **DDSDomainParticipant::create_subscriber** (p. 1362), **DDSDomainParticipant::create_subscriber_with_profile** (p. 1363), **DDSDomainParticipant::delete_flowcontroller** (p. 1375), **DDSDomainParticipant::delete_topic** (p. 1368), **DDSDomainParticipant::delete_publisher** (p. 1361), **DDSDomainParticipant::delete_subscriber** (p. 1364), **DDSDomainParticipant::set_default_topic_qos** (p. 1353), **DDSDomainParticipant::set_default_topic_qos_with_profile** (p. 1353), **DDSDomainParticipant::get_default_topic_qos** (p. 1352), **DDSDomainParticipant::set_default_publisher_qos** (p. 1355), **DDSDomainParticipant::set_default_publisher_qos_with_profile** (p. 1356), **DDSDomainParticipant::get_default_publisher_qos** (p. 1354), **DDSDomainParticipant::set_default_subscriber_qos** (p. 1358), **DDSDomainParticipant::set_default_subscriber_qos_with_profile** (p. 1358), **DDSDomainParticipant::get_default_subscriber_qos** (p. 1357), **DDSDomainParticipant::delete_contained_entities** (p. 1384), **DDSDomainParticipant::set_default_datareader_qos** (p. 1344), **DDSDomainParticipant::set_default_datareader_qos_with_profile** (p. 1345), **DDSDomainParticipant::get_default_datareader_qos** (p. 1344), **DDSDomainParticipant::set_default_datawriter_qos** (p. 1342), **DDSDomainParticipant::set_default_datawriter_qos_with_profile** (p. 1343), **DDSDomainParticipant::get_default_datawriter_qos** (p. 1342), **DDSDomainParticipant::set_default_library** (p. 1350), **DDSDomainParticipant::set_default_profile** (p. 1351), **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346), **DDSDomainParticipant::get_default_flowcontroller_property** (p. 1346), ;
- Operations for looking up topics: **DDSDomainParticipant::lookup_topicdescription** (p. 1373);
- Operations that access status: **DDSEntity::get_statuscondition** (p. 1450), **DDSEntity::get_status_changes** (p. 1450).

QoS:

DDS_DomainParticipantQos (p. 735)

Status:

Status Kinds (p. 336)

Listener:

DDSDomainParticipantListener (p. 1437)

See also

Operations Allowed in Listener Callbacks (p. ??)

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

9.253.2 Member Function Documentation

9.253.2.1 `get_default_datawriter_qos()`

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_default_datawriter_qos (
    DDS_DataWriterQos & qos ) [pure virtual]
```

<<*extension*>> (p. 236) Copy the default **DDS_DataWriterQos** (p. 683) values into the provided **DDS_DataWriterQos** (p. 683) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **DDSDomainParticipant::set_default_datawriter_qos** (p. 1342), or **DDSDomainParticipant::set_default_datawriter_qos_with_profile** (p. 1343), or else, if the call was never made, the default values listed in **DDS_DataWriterQos** (p. 683).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataWriterQoS from a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datawriter_qos** (p. 1342).

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) Qos to be filled up.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.253.2.2 `set_default_datawriter_qos()`

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_datawriter_qos (
    const DDS_DataWriterQos & qos ) [pure virtual]
```

<<*extension*>> (p. 236) Set the default DataWriterQos values for this DomainParticipant.

This set of default values will be inherited for a newly created **DDSPublisher** (p. 1534).

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336).

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datawriter_qos** (p. 1342) or **DDSDomainParticipant::get_default_datawriter_qos** (p. 1342) or calling **DDSDomainParticipant::create_datawriter** (p. 1398) with **DDS_DATAWRITER_QOS_DEFAULT** (p. 110) as the `qos` parameter.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Default qos to be set. The special value DDS_DATAWRITER_QOS_DEFAULT (p. 110) may be passed as <code>qos</code> to indicate that the default QoS should be reset back to the initial values the factory would use if DDSDomainParticipant::set_default_datawriter_qos (p. 1342) had never been called.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	--

9.253.2.3 set_default_datawriter_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_datawriter_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<*extension*>> (p. 236) Set the default **DDS_DataWriterQos** (p. 683) values for this domain participant based on the input XML QoS profile.

This set of default values will be inherited for a newly created **DDSPublisher** (p. 1534).

Precondition

The **DDS_DataWriterQos** (p. 683) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datawriter_qos** (p. 1342) or **DDSDomainParticipant::get_default_datawriter_qos** (p. 1342)

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If <code>library_name</code> is null RTI Connext will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If <code>profile_name</code> is null RTI Connext will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
-----	--

9.253.2.4 get_default_datareader_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_default_datareader_qos (
    DDS_DataReaderQos & qos ) [pure virtual]
```

<<**extension**>> (p. 236) Copy the default **DDS_DataReaderQos** (p. 638) values into the provided **DDS_DataReaderQos** (p. 638) instance.

The retrieved qos will match the set of values specified on the last successful call to **DDSDomainParticipant::set_default_datareader_qos** (p. 1344), or **DDSDomainParticipant::set_default_datareader_qos_with_profile** (p. 1345), or else, if the call was never made, the default values listed in **DDS_DataReaderQos** (p. 638).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataReader QoS from a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datareader_qos** (p. 1344).

Parameters

qos	<< inout >> (p. 237) Qos to be filled up.
-----	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.253.2.5 set_default_datareader_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_datareader_qos (
    const DDS_DataReaderQos & qos ) [pure virtual]
```

<<**extension**>> (p. 236) Set the default **DDS_DataReaderQos** (p. 638) values for this domain participant.

This set of default values will be inherited for a newly created **DDSSubscriber** (p. 1576).

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_↵
RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datareader_qos** (p. 1344) or **DDSDomain↵
Participant::get_default_datareader_qos** (p. 1344).

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Default qos to be set. The special value DDS_DATAREADER_QOS_DEFAULT (p. 132) may be passed as <i>qos</i> to indicate that the default QoS should be reset back to the initial values the factory would used if DDSDomainParticipant::set_default_datareader_qos (p. 1344) had never been called.
------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	--

9.253.2.6 set_default_datareader_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_datareader_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<*extension*>> (p. 236) Set the default **DDS_DataReaderQos** (p. 638) values for this DomainParticipant based on the input XML QoS profile.

This set of default values will be inherited for a newly created **DDSSubscriber** (p. 1576).

Precondition

The **DDS_DataReaderQos** (p. 638) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datareader_qos** (p. 1344) or **DDSDomain↵
Participant::get_default_datareader_qos** (p. 1344).

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If <i>library_name</i> is null RTI Connex will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If <i>profile_name</i> is null RTI Connex will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	--

9.253.2.7 get_default_flowcontroller_property()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_default_flowcontroller_property (
    DDS_FlowControllerProperty_t & prop ) [pure virtual]
```

<<*extension*>> (p. 236) Copies the default **DDS_FlowControllerProperty_t** (p. 899) values for this domain participant into the given **DDS_FlowControllerProperty_t** (p. 899) instance.

The retrieved *property* will match the set of values specified on the last successful call to **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346), or else, if the call was never made, the default values listed in **DDS_FlowControllerProperty_t** (p. 899).

MT Safety:

UNSAFE. It is not safe to retrieve the default flow controller properties from a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346)

Parameters

<i>prop</i>	<< <i>in</i> >> (p. 237) Default property to be retrieved.
-------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 58)

DDSDomainParticipant::create_flowcontroller (p. 1374)

9.253.2.8 set_default_flowcontroller_property()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_flowcontroller_property (
    const DDS_FlowControllerProperty_t & prop ) [pure virtual]
```

<<**extension**>> (p. 236) Set the default **DDS_FlowControllerProperty_t** (p. 899) values for this domain participant.

This default value will be used for newly created **DDSFlowController** (p. 1451) if **DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 58) is specified as the `property` parameter when **DDSDomainParticipant::create_flowcontroller** (p. 1374) is called.

Precondition

The specified property values must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default flow controller properties for a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346), **DDSDomainParticipant::get_default_flowcontroller_property** (p. 1346) or calling **DDSDomainParticipant::create_flowcontroller** (p. 1374) with **DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 58) as the `qos` parameter.

Parameters

<i>prop</i>	<< in >> (p. 237) Default property to be set. The special value DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 58) may be passed as <code>property</code> to indicate that the default property should be reset to the default values the factory would use if DDSDomainParticipant::set_default_flowcontroller_property (p. 1346) had never been called.
-------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	--

See also

DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 58)

DDSDomainParticipant::create_flowcontroller (p. 1374)

9.253.2.9 register_contentfilter()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::register_contentfilter (
    const char * filter_name,
    const DDSContentFilter * contentfilter ) [pure virtual]
```

<<*extension*>> (p. 236) Register a content filter which can be used to create a **DDSContentFilteredTopic** (p. 1267).

DDS specifies a SQL-like content filter for use by content filtered topics. If this filter does not meet your filtering requirements, you can register a custom filter.

To use a custom filter, it must be registered in the following places:

- In any application that uses the custom filter to create a **DDSContentFilteredTopic** (p. 1267) and the corresponding **DDSDataReader** (p. 1272).
- In each application that writes the data to the applications mentioned above.

For example, suppose Application A on the subscription side creates a Topic named X and a ContentFilteredTopic named filteredX (and a corresponding DataReader), using a previously registered content filter, myFilter. With only that, you will have filtering at the subscription side. If you also want to perform filtering in any application that publishes Topic X, then you also need to register the same definition of the ContentFilter myFilter in that application.

Each `filter_name` can only be used to registered a content filter once with a **DDSDomainParticipant** (p. 1335).

Parameters

<i>filter_name</i>	<< <i>in</i> >> (p. 237) Name of the filter. The name must be unique within the DDSDomainParticipant (p. 1335) and must not exceed 255 characters. Cannot be NULL.
<i>contentfilter</i>	<< <i>in</i> >> (p. 237) Content filter to be registered. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSDomainParticipant::unregister_contentfilter (p. 1349)

9.253.2.10 lookup_contentfilter()

```
virtual DDSContentFilter * DDSDomainParticipant::lookup_contentfilter (
    const char * filter_name ) [pure virtual]
```

<<*extension*>> (p. 236) Lookup a content filter previously registered with **DDSDomainParticipant::register_contentfilter** (p. 1347).

Parameters

<i>filter_name</i>	<< <i>in</i> >> (p. 237) Name of the filter. Cannot be NULL.
--------------------	--

Returns

NULL if the given `filter_name` has not been previously registered to the **DDSDomainParticipant** (p. 1335) with **DDSDomainParticipant::register_contentfilter** (p. 1347). Otherwise, return the **DDSContentFilter** (p. 1264) that has been previously registered with the given `filter_name`.

See also

DDSDomainParticipant::register_contentfilter (p. 1347)

9.253.2.11 unregister_contentfilter()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::unregister_contentfilter (
    const char * filter_name ) [pure virtual]
```

<<*extension*>> (p. 236) Unregister a content filter previously registered with **DDSDomainParticipant::register_contentfilter** (p. 1347).

A `filter_name` can be unregistered only if it has been previously registered to the **DDSDomainParticipant** (p. 1335) with **DDSDomainParticipant::register_contentfilter** (p. 1347).

The unregistration of filter is not allowed if there are any existing **DDSContentFilteredTopic** (p. 1267) objects that are using the filter. If the operation is called on a filter with existing **DDSContentFilteredTopic** (p. 1267) objects attached to it, this operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

If there are still existing discovered **DDSDataReader** (p. 1272) s with the same `filter_name` and the filter's compile method of the filter have previously been called on the discovered **DDSDataReader** (p. 1272) s, `finalize` method of the filter will be called on those discovered **DDSDataReader** (p. 1272) s before the content filter is unregistered. This means filtering will now be performed on the application that is creating the **DDSDataReader** (p. 1272).

Parameters

<i>filter_name</i>	<< <i>in</i> >> (p. 237) Name of the filter. Cannot be NULL.
--------------------	--

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
-----	--

See also

DDSDomainParticipant::register_contentfilter (p. 1347)

9.253.2.12 `get_default_library()`

```
virtual const char * DDSDomainParticipant::get_default_library ( ) [pure virtual]
```

<<*extension*>> (p. 236) Gets the default XML library associated with a **DDSDomainParticipant** (p. 1335).

Returns

The default library or null if the default library was not set.

See also

DDSDomainParticipant::set_default_library (p. 1350)

9.253.2.13 `get_default_profile()`

```
virtual const char * DDSDomainParticipant::get_default_profile ( ) [pure virtual]
```

<<*extension*>> (p. 236) Gets the default XML profile associated with a **DDSDomainParticipant** (p. 1335).

Returns

The default profile or null if the default profile was not set.

See also

DDSDomainParticipant::set_default_profile (p. 1351)

9.253.2.14 `get_default_profile_library()`

```
virtual const char * DDSDomainParticipant::get_default_profile_library ( ) [pure virtual]
```

<<*extension*>> (p. 236) Gets the library where the default XML QoS profile is contained for a **DDSDomainParticipant** (p. 1335).

The default profile library is automatically set when **DDSDomainParticipant::set_default_profile** (p. 1351) is called.

This library can be different than the **DDSDomainParticipant** (p. 1335) default library (see **DDSDomainParticipant::get_default_library** (p. 1349)).

Returns

The default profile library or null if the default profile was not set.

See also

DDSDomainParticipant::set_default_profile (p. 1351)

9.253.2.15 set_default_library()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_library (
    const char * library_name ) [pure virtual]
```

<<**extension**>> (p. 236) Sets the default XML library for a **DDSDomainParticipant** (p. 1335).

This method specifies the library that will be used as the default the next time a default library is needed during a call to one of this DomainParticipant's operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the **DDSDomainParticipant** (p. 1335) inherits the default from the **DDSDomainParticipantFactory** (p. 1409) (see **DDSDomainParticipantFactory::set_default_library** (p. 1416)).

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name. If library_name is null any previous default is unset.
---------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSDomainParticipant::get_default_library (p. 1349)

9.253.2.16 set_default_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Sets the default XML profile for a **DDSDomainParticipant** (p. 1335).

This method specifies the profile that will be used as the default the next time a default DomainParticipant profile is needed during a call to one of this DomainParticipant's operations. When calling a **DDSDomainParticipant** (p. 1335) method that requires a profile_name parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **DDSDomainParticipant** (p. 1335) inherits the default from the **DDSDomainParticipantFactory** (p. 1409) (see **DDSDomainParticipantFactory::set_default_profile** (p. 1417)).

This method does not set the default QoS for entities created by the **DDSDomainParticipant** (p. 1335); for this functionality, use the methods set_default_<entity>_qos_with_profile (you may pass in NULL after having called **set_default_profile**() (p. 1351)).

This method does not set the default QoS for newly created DomainParticipants; for this functionality, use **DDSDomainParticipantFactory::set_default_participant_qos_with_profile** (p. 1414).

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) The library name containing the profile.
<i>profile_name</i>	<< <i>in</i> >> (p. 237) The profile name. If profile_name is null any previous default is unset.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSDomainParticipant::get_default_profile (p. 1350)

DDSDomainParticipant::get_default_profile_library (p. 1350)

9.253.2.17 get_default_topic_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_default_topic_qos (
    DDS_TopicQos & qos ) [pure virtual]
```

Copies the default **DDS_TopicQos** (p. 1120) values for this domain participant into the given **DDS_TopicQos** (p. 1120) instance.

The retrieved qos will match the set of values specified on the last successful call to **DDSDomainParticipant::set_default_topic_qos** (p. 1353), or **DDSDomainParticipant::set_default_topic_qos_with_profile** (p. 1353) or else, if the call was never made, the default values listed in **DDS_TopicQos** (p. 1120).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default Topic QoS from a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_topic_qos** (p. 1353)

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Default qos to be retrieved.
------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

DDS_TOPIC_QOS_DEFAULT (p. 56)

DDSDomainParticipant::create_topic (p. 1366)

9.253.2.18 set_default_topic_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_topic_qos (
    const DDS_TopicQos & qos ) [pure virtual]
```

Set the default **DDS_TopicQos** (p. 1120) values for this domain participant.

This default value will be used for newly created **DDSTopic** (p. 1601) if **DDS_TOPIC_QOS_DEFAULT** (p. 56) is specified as the `qos` parameter when **DDSDomainParticipant::create_topic** (p. 1366) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_↵ RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_topic_qos** (p. 1353), **DDSDomainParticipant::get_↵ default_topic_qos** (p. 1352) or calling **DDSDomainParticipant::create_topic** (p. 1366) with **DDS_TOPIC_↵ QOS_DEFAULT** (p. 56) as the `qos` parameter.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Default qos to be set. The special value DDS_TOPIC_QOS_DEFAULT (p. 56) may be passed as <code>qos</code> to indicate that the default QoS should be reset back to the initial values the factory would use if DDSDomainParticipant::set_default_topic_qos (p. 1353) had never been called.
------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	--

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_default_topic_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Set the default **DDS_TopicQos** (p. 1120) values for this domain participant based on the input XML QoS profile.

This default value will be used for newly created **DDSTopic** (p. 1601) if **DDS_TOPIC_QOS_DEFAULT** (p. 56) is specified as the `qos` parameter when **DDSDomainParticipant::create_topic** (p. 1366) is called.

Precondition

The **DDS_TopicQos** (p. 1120) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a DomainParticipant while another thread may be simultaneously calling **DDSDomainParticipant::set_default_topic_qos** (p. 1353), **DDSDomainParticipant::get_default_topic_qos** (p. 1352) or calling **DDSDomainParticipant::create_topic** (p. 1366) with **DDS_TOPIC_QOS_DEFAULT** (p. 56) as the `qos` parameter.

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If <code>library_name</code> is null RTI Connext will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If <code>profile_name</code> is null RTI Connext will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).

If the input profile cannot be found the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
-----	--

DDS_SUBSCRIBER_QOS_DEFAULT (p. 57)

DDSDomainParticipant::create_subscriber_with_profile (p. 1363)

9.253.2.26 create_publisher()

```
virtual DDSPublisher * DDSDomainParticipant::create_publisher (
    const DDS_PublisherQos & qos,
    DDSPublisherListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

Creates a **DDSPublisher** (p. 1534) with the desired QoS policies and attaches to it the specified **DDSPublisherListener** (p. 1555).

Precondition

The specified QoS policies must be consistent, or the operation will fail and no **DDSPublisher** (p. 1534) will be created.

MT Safety:

UNSAFE. If **DDS_PUBLISHER_QOS_DEFAULT** (p. 57) is used for `qos`, it is not safe to create the publisher while another thread may be simultaneously calling **DDSDomainParticipant::set_default_publisher_qos** (p. 1355).

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) QoS to be used for creating the new DDSPublisher (p. 1534). The special value DDS_PUBLISHER_QOS_DEFAULT (p. 57) can be used to indicate that the DDSPublisher (p. 1534) should be created with the default DDS_PublisherQos (p. 1009) set in the DDSDomainParticipant (p. 1335).
<i>listener</i>	<< <i>in</i> >> (p. 237). Listener to be attached to the newly created DDSPublisher (p. 1534).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

newly created publisher object or NULL on failure.

See also

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation
DDS_PublisherQos (p. 1009) for rules on consistency among QoS
DDS_PUBLISHER_QOS_DEFAULT (p. 57)
DDSDomainParticipant::create_publisher_with_profile (p. 1360)
DDSDomainParticipant::get_default_publisher_qos (p. 1354)
DDSPublisher::set_listener (p. 1554)

Examples

HelloWorld_publisher.cxx.

9.253.2.27 create_publisher_with_profile()

```
virtual DDSPublisher * DDSDomainParticipant::create_publisher_with_profile (
    const char * library_name,
    const char * profile_name,
    DDSPublisherListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a new **DDSPublisher** (p. 1534) object using the **DDS_PublisherQos** (p. 1009) associated with the input XML QoS profile.

Precondition

The **DDS_PublisherQos** (p. 1009) in the input profile must be consistent, or the operation will fail and no **DDSPublisher** (p. 1534) will be created.

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If <i>library_name</i> is null RTI Connex will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If <i>profile_name</i> is null RTI Connex will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).
<i>listener</i>	<< in >> (p. 237). Listener to be attached to the newly created DDSPublisher (p. 1534).
<i>mask</i>	<< in >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

newly created publisher object or NULL on failure.

See also

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDS_PublisherQos (p. 1009) for rules on consistency among QoS

DDSDomainParticipant::create_publisher (p. 1359)

DDSDomainParticipant::get_default_publisher_qos (p. 1354)

DDSPublisher::set_listener (p. 1554)

9.253.2.28 delete_publisher()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_publisher (
    DDSPublisher * p ) [pure virtual]
```

Deletes an existing **DDSPublisher** (p. 1534).

Precondition

The **DDSPublisher** (p. 1534) must not have any attached **DDSDataWriter** (p. 1305) objects. If there are existing **DDSDataWriter** (p. 1305) objects, it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

DDSPublisher (p. 1534) must have been created by this **DDSDomainParticipant** (p. 1335), or else it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

Listener installed on the **DDSPublisher** (p. 1534) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>p</i>	<< <i>in</i> >> (p. 237) DDSPublisher (p. 1534) to be deleted.
----------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	--

9.253.2.29 create_subscriber()

```
virtual DDSSubscriber * DDSDomainParticipant::create_subscriber (
    const DDS_SubscriberQos & qos,
    DDSSubscriberListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

Creates a **DDSSubscriber** (p. 1576) with the desired QoS policies and attaches to it the specified **DDSSubscriber**↵
Listener (p. 1597).

Precondition

The specified QoS policies must be consistent, or the operation will fail and no **DDSSubscriber** (p. 1576) will be created.

MT Safety:

UNSAFE. If **DDS_SUBSCRIBER_QOS_DEFAULT** (p.57) is used for *qos*, it is not safe to create the subscriber while another thread may be simultaneously calling **DDSDomainParticipant::set_default_subscriber**↵
_qos (p. 1358).

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) QoS to be used for creating the new DDSSubscriber (p. 1576). The special value DDS_SUBSCRIBER_QOS_DEFAULT (p. 57) can be used to indicate that the DDSSubscriber (p. 1576) should be created with the default DDS_SubscriberQos (p. 1090) set in the DDSDomainParticipant (p. 1335).
<i>listener</i>	<< <i>in</i> >> (p. 237). Listener to be attached to the newly created DDSSubscriber (p. 1576).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

newly created subscriber object or NULL on failure.

See also

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDS_SUBSCRIBER_QOS_DEFAULT (p. 57)
DDSDomainParticipant::create_subscriber_with_profile (p. 1363)
DDSDomainParticipant::get_default_subscriber_qos (p. 1357)
DDSSubscriber::set_listener (p. 1595)

Examples

HelloWorld_subscriber.cxx.

9.253.2.30 create_subscriber_with_profile()

```
virtual DDSSubscriber * DDSDomainParticipant::create_subscriber_with_profile (
    const char * library_name,
    const char * profile_name,
    DDSSubscriberListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a new **DDSSubscriber** (p. 1576) object using the **DDS_PublisherQos** (p. 1009) associated with the input XML QoS profile.

Precondition

The **DDS_SubscriberQos** (p. 1090) in the input profile must be consistent, or the operation will fail and no **DDSSubscriber** (p. 1576) will be created.

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).
<i>listener</i>	<< <i>in</i> >> (p. 237). Listener to be attached to the newly created DDSSubscriber (p. 1576).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

newly created subscriber object or NULL on failure.

See also

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDS_SubscriberQos (p. 1090) for rules on consistency among QoS

DDSDomainParticipant::create_subscriber (p. 1362)

DDSDomainParticipant::get_default_subscriber_qos (p. 1357)

DDSSubscriber::set_listener (p. 1595)

9.253.2.31 delete_subscriber()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_subscriber (
    DDSSubscriber * s ) [pure virtual]
```

Deletes an existing **DDSSubscriber** (p. 1576).

Precondition

The **DDSSubscriber** (p. 1576) must not have any attached **DDSDataReader** (p. 1272) objects. If there are existing **DDSDataReader** (p. 1272) objects, it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335)

The **DDSSubscriber** (p. 1576) must have been created by this **DDSDomainParticipant** (p. 1335), or else it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

A Listener installed on the **DDSSubscriber** (p. 1576) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>s</i>	<< <i>in</i> >> (p. 237) DDSSubscriber (p. 1576) to be deleted.
----------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	--

9.253.2.32 get_publishers()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_publishers (
    DDSPublisherSeq & publishers ) [pure virtual]
```

<<*extension*>> (p. 236) Allows the application to access all the publishers the participant has.

If the sequence doesn't own its buffer, and its maximum is less than the total number of publishers, it will be filled up to its maximum, and fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

MT Safety:

Safe.

Parameters

<i>publishers</i>	<< <i>inout</i> >> (p. 237) a PublisherSeq object where the set or list of publishers will be returned
-------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

9.253.2.33 get_subscribers()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_subscribers (
    DDSSubscriberSeq & subscribers ) [pure virtual]
```

<<*extension*>> (p. 236) Allows the application to access all the subscribers the participant has.

If the sequence doesn't own its buffer, and its maximum is less than the total number of subscribers, it will be filled up to its maximum, and fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

MT Safety:

Safe.

Parameters

<i>subscribers</i>	<< <i>inout</i> >> (p. 237) a SubscriberSeq object where the set or list of subscribers will be returned
--------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

9.253.2.34 create_topic()

```
virtual DDSTopic * DDSDomainParticipant::create_topic (
    const char * topic_name,
    const char * type_name,
    const DDS_TopicQos & qos,
    DDSTopicListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

Creates a **DDSTopic** (p. 1601) with the desired QoS policies and attaches to it the specified **DDSTopicListener** (p. 1610).

Precondition

The application is not allowed to create two **DDSTopic** (p. 1601) objects with the same `topic_name` attached to the same **DDSDomainParticipant** (p. 1335). If the application attempts this, this method will fail and return a NULL topic.

The specified QoS policies must be consistent, or the operation will fail and no **DDSTopic** (p. 1601) will be created.

Prior to creating a **DDSTopic** (p. 1601), the type must have been registered with RTI Connex. This is done using the **FooTypeSupport::register_type** (p. 1695) operation on a derived class of the **DDSTypeSupport** (p. 1613) interface.

MT Safety:

UNSAFE. It is not safe to create a topic while another thread is trying to lookup that topic description with **DDSDomainParticipant::lookup_topicdescription** (p. 1373).

MT Safety:

UNSAFE. If **DDS_TOPIC_QOS_DEFAULT** (p. 56) is used for `qos`, it is not safe to create the topic while another thread may be simultaneously calling **DDSDomainParticipant::set_default_topic_qos** (p. 1353).

Parameters

<i>topic_name</i>	<< <i>in</i> >> (p. 237) Name for the new topic, must not exceed 255 characters. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) The type to which the new DDSTopic (p. 1601) will be bound. Cannot be NULL.
<i>qos</i>	<< <i>in</i> >> (p. 237) QoS to be used for creating the new DDSTopic (p. 1601). The special value DDS_TOPIC_QOS_DEFAULT (p. 56) can be used to indicate that the DDSTopic (p. 1601) should be created with the default DDS_TopicQos (p. 1120) set in the DDSDomainParticipant (p. 1335).
<i>listener</i>	<< <i>in</i> >> (p. 237). Listener to be attached to the newly created DDSTopic (p. 1601).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See

Returns

newly created topic, or NULL on failure

See also

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDS_TopicQos (p. 1120) for rules on consistency among QoS

DDS_TOPIC_QOS_DEFAULT (p. 56)

DDSDomainParticipant::create_topic_with_profile (p. 1367)

DDSDomainParticipant::get_default_topic_qos (p. 1352)

DDSTopic::set_listener (p. 1605)

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

9.253.2.35 create_topic_with_profile()

```
virtual DDSTopic * DDSDomainParticipant::create_topic_with_profile (
    const char * topic_name,
    const char * type_name,
    const char * library_name,
    const char * profile_name,
    DDSTopicListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a new **DDSTopic** (p. 1601) object using the **DDS_PublisherQos** (p. 1009) associated with the input XML QoS profile.

Precondition

The application is not allowed to create two **DDSTopicDescription** (p. 1608) objects with the same `topic_name` attached to the same **DDSDomainParticipant** (p. 1335). If the application attempts this, this method will fail and return a NULL topic.

The **DDS_TopicQos** (p. 1120) in the input profile must be consistent, or the operation will fail and no **DDSTopic** (p. 1601) will be created.

Prior to creating a **DDSTopic** (p. 1601), the type must have been registered with RTI Connex. This is done using the **FooTypeSupport::register_type** (p. 1695) operation on a derived class of the **DDSTypeSupport** (p. 1613) interface.

MT Safety:

UNSAFE. It is not safe to create a topic while another thread is trying to lookup that topic description with **DDSDomainParticipant::lookup_topicdescription** (p. 1373).

Parameters

<i>topic_name</i>	<< <i>in</i> >> (p. 237) Name for the new topic, must not exceed 255 characters. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) The type to which the new DDSTopic (p. 1601) will be bound. Cannot be NULL.
<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).
<i>listener</i>	<< <i>in</i> >> (p. 237). Listener to be attached to the newly created DDSTopic (p. 1601).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

newly created topic, or NULL on failure

See also

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDS_TopicQos (p. 1120) for rules on consistency among QoS

DDSDomainParticipant::create_topic (p. 1366)

DDSDomainParticipant::get_default_topic_qos (p. 1352)

DDSTopic::set_listener (p. 1605)

9.253.2.36 delete_topic()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_topic (
    DDSTopic * topic ) [pure virtual]
```

Deletes a **DDSTopic** (p. 1601).

Precondition

If the **DDSTopic** (p. 1601) does not belong to the application's **DDSDomainParticipant** (p. 1335), this operation fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Make sure no objects are using the topic. More specifically, there must be no existing **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305), **DDSContentFilteredTopic** (p. 1267), or **DDSMultiTopic** (p. 1513) objects belonging to the same **DDSDomainParticipant** (p. 1335) that are using the **DDSTopic** (p. 1601). If delete_topic is called on a **DDSTopic** (p. 1601) with any of these existing objects attached to it, it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

Listener installed on the **DDSTopic** (p. 1601) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>topic</i>	<< <i>in</i> >> (p. 237) DDSTopic (p. 1601) to be deleted.
--------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
------------	---

9.253.2.37 create_contentfilteredtopic()

```
virtual DDSTopicFilteredTopic * DDSDomainParticipant::create_contentfilteredtopic (
    const char * name,
    DDSTopic * related_topic,
    const char * filter_expression,
    const DDS_StringSeq & expression_parameters ) [pure virtual]
```

Creates a **DDSTopicFilteredTopic** (p. 1267), that can be used to do content-based subscriptions.

The **DDSTopicFilteredTopic** (p. 1267) only relates to samples published under that **DDSTopic** (p. 1601), filtered according to their content. The filtering is done by means of evaluating a logical expression that involves the values of some of the data-fields in the sample. The logical expression derived from the *filter_expression* and *expression_parameters* arguments.

Queries and Filters Syntax (p. 178) describes the syntax of *filter_expression* and *expression_parameters*.

Precondition

The application is not allowed to create two **DDSTopicFilteredTopic** (p. 1267) objects with the same *topic_name* attached to the same **DDSDomainParticipant** (p. 1335). If the application attempts this, this method will fail and returns NULL.

If *related_topic* does not belong to this **DDSDomainParticipant** (p. 1335), this operation returns NULL.

This function will create a content filter using the builtin SQL filter which implements a superset of the DDS specification. This filter **requires** that all IDL types have been compiled with typecodes. If this precondition is not met, this operation returns NULL.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name for the new content filtered topic, must not exceed 255 characters. Cannot be NULL.
<i>related_topic</i>	<< <i>in</i> >> (p. 237) DDSTopic (p. 1601) to be filtered. Cannot be NULL.
<i>filter_expression</i>	<< <i>in</i> >> (p. 237) Cannot be NULL
<i>expression_parameters</i>	<< <i>in</i> >> (p. 237) An empty sequence must be used if the filter expression does not contain any parameters. Length of sequence cannot be greater than 100.

Returns

newly created **DDSContentFilteredTopic** (p. 1267), or NULL on failure

9.253.2.38 create_contentfilteredtopic_with_filter()

```
virtual DDSContentFilteredTopic * DDSDomainParticipant::create_contentfilteredtopic_with_filter (
    const char * name,
    DDSTopic * related_topic,
    const char * filter_expression,
    const DDS_StringSeq & expression_parameters,
    const char * filter_name = DDS_SQLFILTER_NAME ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a **DDSContentFilteredTopic** (p. 1267) using the specified filter to do content-based subscriptions.

Parameters

<i>name</i>	<< in >> (p. 237) Name for the new content filtered topic. Cannot exceed 255 characters. Cannot be NULL.
<i>related_topic</i>	<< in >> (p. 237) DDSTopic (p. 1601) to be filtered. Cannot be NULL.
<i>filter_expression</i>	<< in >> (p. 237) Cannot be NULL.
<i>expression_parameters</i>	<< in >> (p. 237) . An empty sequence must be used if the filter expression does not contain any parameters. Length of the sequence cannot be greater than 100.
<i>filter_name</i>	<< in >> (p. 237) Name of content filter to use. Must previously have been registered with DDSDomainParticipant::register_contentfilter (p. 1347) on the same DDSDomainParticipant (p. 1335). Cannot be NULL. Builtin filter names are DDS_SQLFILTER_NAME (p. 59) and DDS_STRINGMATCHFILTER_NAME (p. 59)

Returns

newly created **DDSContentFilteredTopic** (p. 1267), or NULL on failure

9.253.2.39 delete_contentfilteredtopic()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_contentfilteredtopic (
    DDSContentFilteredTopic * a_contentfilteredtopic ) [pure virtual]
```

Deletes a **DDSContentFilteredTopic** (p. 1267).

Precondition

The deletion of a **DDSContentFilteredTopic** (p.1267) is not allowed if there are any existing **DDSDataReader** (p.1272) objects that are using the **DDSContentFilteredTopic** (p.1267). If the operation is called on a **DDSContentFilteredTopic** (p.1267) with existing **DDSDataReader** (p.1272) objects attached to it, it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p.335).

The **DDSContentFilteredTopic** (p.1267) must be created by this **DDSDomainParticipant** (p.1335), or else this operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p.335).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>a_contentfilteredtopic</i>	<< <i>in</i> >> (p.237)
-------------------------------	-------------------------

Exceptions

<i>One</i>	of the Standard Return Codes (p.335) or DDS_RETCODE_PRECONDITION_NOT_MET (p.335)
------------	--

9.253.2.40 create_multitopic()

```
virtual DDSMultiTopic * DDSDomainParticipant::create_multitopic (
    const char * name,
    const char * type_name,
    const char * subscription_expression,
    const DDS_StringSeq & expression_parameters ) [pure virtual]
```

[Not supported (optional)] Creates a MultiTopic that can be used to subscribe to multiple topics and combine/filter the received data into a resulting type.

The resulting type is specified by the `type_name` argument. The list of topics and the logic used to combine, filter, and rearrange the information from each **DDSTopic** (p.1601) are specified using the `subscription_expression` and `expression_parameters` arguments.

Queries and Filters Syntax (p.178) describes the syntax of `subscription_expression` and `expression_parameters`.

Precondition

The application is not allowed to create two **DDSTopicDescription** (p.1608) objects with the same `name` attached to the same **DDSDomainParticipant** (p.1335). If the application attempts this, this method will fail and return NULL.

Prior to creating a **DDSMultiTopic** (p.1513), the type must have been registered with RTI Connext. This is done using the **FooTypeSupport::register_type** (p.1695) operation on a derived class of the **DDSTypeSupport** (p.1613) interface. Otherwise, this method will return NULL.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of the newly create DDSMultiTopic (p. 1513). Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) Cannot be NULL.
<i>subscription_expression</i>	<< <i>in</i> >> (p. 237) Cannot be NULL.
<i>expression_parameters</i>	<< <i>in</i> >> (p. 237)

Returns

NULL

9.253.2.41 delete_multitopic()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_multitopic (
    DDSMultiTopic * a_multitopic ) [pure virtual]
```

[Not supported (optional)] Deletes a **DDSMultiTopic** (p. 1513).

Precondition

The deletion of a **DDSMultiTopic** (p. 1513) is not allowed if there are any existing **DDSDataReader** (p. 1272) objects that are using the **DDSMultiTopic** (p. 1513). If the delete_multitopic operation is called on a **DDSMultiTopic** (p. 1513) with existing **DDSDataReader** (p. 1272) objects attached to it, it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

The **DDSMultiTopic** (p. 1513) must be created by this **DDSDomainParticipant** (p. 1335), or else this operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>a_multitopic</i>	<< <i>in</i> >> (p. 237)
---------------------	--------------------------

9.253.2.42 find_topic()

```
virtual DDSTopic * DDSDomainParticipant::find_topic (
    const char * topic_name,
    const DDS_Duration_t & timeout ) [pure virtual]
```

Finds an existing (or ready to exist) **DDSTopic** (p. 1601), based on its name.

This call can be used to block for a specified duration to wait for the **DDSTopic** (p. 1601) to be created.

If the requested **DDSTopic** (p. 1601) already exists, it is returned. Otherwise, **find_topic()** (p. 1372) waits until another thread creates it or else returns when the specified timeout occurs.

find_topic() (p. 1372) is useful when multiple threads are concurrently creating and looking up topics. In that case, one thread can call **find_topic()** (p. 1372) and, if another thread has not yet created the topic being looked up, it can wait for some period of time for it to do so. In almost all other cases, it is more straightforward to call **DDSDomainParticipant::lookup_topicdescription** (p. 1373).

The **DDSDomainParticipant** (p. 1335) must already be enabled.

Note: Each **DDSTopic** (p. 1601) obtained by **DDSDomainParticipant::find_topic** (p. 1372) must also be deleted by means of **DDSDomainParticipant::delete_topic** (p. 1368). If **DDSTopic** (p. 1601) is obtained multiple times by means of **DDSDomainParticipant::find_topic** (p. 1372) or **DDSDomainParticipant::create_topic** (p. 1366), it must also be deleted that same number of times using **DDSDomainParticipant::delete_topic** (p. 1368).

Parameters

<i>topic_name</i>	<< <i>in</i> >> (p. 237) Name of the DDSTopic (p. 1601) to search for. Cannot be NULL.
<i>timeout</i>	<< <i>in</i> >> (p. 237) The time to wait if the DDSTopic (p. 1601) does not exist already.

Returns

the topic, if it exists, or NULL

9.253.2.43 lookup_topicdescription()

```
virtual DDSTopicDescription * DDSDomainParticipant::lookup_topicdescription (
    const char * topic_name ) [pure virtual]
```

Looks up an existing, locally created **DDSTopicDescription** (p. 1608), based on its name.

DDSTopicDescription (p. 1608) is the base class for **DDSTopic** (p. 1601), **DDSMultiTopic** (p. 1513) and **DDSContentFilteredTopic** (p. 1267). So you can narrow the **DDSTopicDescription** (p. 1608) returned from this operation to a **DDSTopic** (p. 1601) or **DDSContentFilteredTopic** (p. 1267) as appropriate.

Unlike **DDSDomainParticipant::find_topic** (p. 1372), which logically returns a new **DDSTopic** (p. 1601) object that must be independently deleted, *this* operation returns a reference to the original local object.

The **DDSDomainParticipant** (p. 1335) does not have to be enabled when you call **lookup_topicdescription()** (p. 1373).

The returned topic may be either enabled or disabled.

MT Safety:

UNSAFE. It is not safe to lookup a topic description while another thread is creating that topic.

Parameters

<i>topic_name</i>	<< <i>in</i> >> (p. 237) Name of DDSTopicDescription (p. 1608) to search for. This string must be no more than 255 characters; it cannot be NULL.
-------------------	--

Returns

The topic description, if it has already been created locally, otherwise it returns NULL.

9.253.2.44 create_flowcontroller()

```
virtual DDSFlowController * DDSDomainParticipant::create_flowcontroller (
    const char * name,
    const DDS_FlowControllerProperty_t & prop ) [pure virtual]
```

<<*extension*>> (p. 236) Creates a **DDSFlowController** (p. 1451) with the desired property.

The created **DDSFlowController** (p. 1451) is associated with a **DDSDataWriter** (p. 1305) via **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014). A single FlowController may service multiple DataWriters instances, even if they belong to a different **DDSPublisher** (p. 1534). The *property* determines how the FlowController shapes the network traffic.

Precondition

The specified *property* must be consistent, or the operation will fail and no **DDSFlowController** (p. 1451) will be created.

MT Safety:

UNSAFE. If **DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT** (p. 58) is used for *property*, it is not safe to create the flow controller while another thread may be simultaneously calling **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346) or trying to lookup that flow controller with **DDSDomainParticipant::lookup_flowcontroller** (p. 1375).

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) name of the DDSFlowController (p. 1451) to create. A DDSDataWriter (p. 1305) is associated with a DDSFlowController (p. 1451) by name. Limited to 255 characters.
<i>prop</i>	<< <i>in</i> >> (p. 237) property to be used for creating the new DDSFlowController (p. 1451). The special value DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 58) can be used to indicate that the DDSFlowController (p. 1451) should be created with the default DDS_FlowControllerProperty_t (p. 899) set in the DDSDomainParticipant (p. 1335).

Returns

Newly created flow controller object or NULL on failure.

See also

DDS_FlowControllerProperty_t (p. 899) for rules on consistency among property

DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 58)

DDSDomainParticipant::get_default_flowcontroller_property (p. 1346)

9.253.2.45 delete_flowcontroller()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_flowcontroller (
    DDSFlowController * fc ) [pure virtual]
```

<<**extension**>> (p. 236) Deletes an existing **DDSFlowController** (p. 1451).

Precondition

The **DDSFlowController** (p. 1451) must not have any attached **DDSDataWriter** (p. 1305) objects. If there are any attached **DDSDataWriter** (p. 1305) objects, it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

The **DDSFlowController** (p. 1451) must have been created by this **DDSDomainParticipant** (p. 1335), or else it will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

The **DDSFlowController** (p. 1451) is deleted if this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>fc</i>	<< in >> (p. 237) The DDSFlowController (p. 1451) to be deleted.
-----------	--

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
-----	--

9.253.2.46 lookup_flowcontroller()

```
virtual DDSFlowController * DDSDomainParticipant::lookup_flowcontroller (
    const char * name ) [pure virtual]
```

<<*extension*>> (p. 236) Looks up an existing locally-created **DDSFlowController** (p. 1451), based on its name.

Looks up a previously created **DDSFlowController** (p. 1451), including the built-in ones. Once a **DDSFlowController** (p. 1451) has been deleted, subsequent lookups will fail.

MT Safety:

UNSAFE. It is not safe to lookup a flow controller description while another thread is creating that flow controller.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237) Name of DDSFlowController (p. 1451) to search for. Limited to 255 characters. Cannot be NULL.
-------------	---

Returns

The flow controller if it has already been created locally, or NULL otherwise.

9.253.2.47 get_builtin_subscriber()

```
virtual DDSSubscriber * DDSDomainParticipant::get_builtin_subscriber ( ) [pure virtual]
```

Accesses the **built-in DDSSubscriber** (p. 1576).

Each **DDSDomainParticipant** (p. 1335) contains several built-in **DDSTopic** (p. 1601) objects as well as corresponding **DDSDataReader** (p. 1272) objects to access them. All of these **DDSDataReader** (p. 1272) objects belong to a single built-in **DDSSubscriber** (p. 1576).

The built-in Topics are used to communicate information about other **DDSDomainParticipant** (p. 1335), **DDSTopic** (p. 1601), **DDSDataReader** (p. 1272), and **DDSDataWriter** (p. 1305) objects.

The built-in subscriber is created when this operation is called for the first time. The built-in subscriber is deleted automatically when the **DDSDomainParticipant** (p. 1335) is deleted.

Returns

The built-in **DDSSubscriber** (p. 1576) singleton.

9.253.2.48 ignore_participant()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::ignore_participant (
    const DDS_InstanceHandle_t & handle ) [pure virtual]
```

Instructs RTI Connex to locally ignore a remote **DDSDomainParticipant** (p. 1335).

From the time of this call onwards, RTI Connex will locally behave as if the remote participant did not exist. This means it will ignore any topic, publication, or subscription that originates on that **DDSDomainParticipant** (p. 1335).

There is no way to reverse this operation.

This operation can be used in conjunction with the discovery of remote participants offered by means of the **DDS_↔ParticipantBuiltinTopicData** (p. 966) to provide access control.

Application data can be associated with a **DDSDomainParticipant** (p. 1335) by means of the **USER_DATA** (p. 455) policy. This application data is propagated as a field in the built-in topic and can be used by an application to implement its own access control policy.

The **DDSDomainParticipant** (p. 1335) to ignore is identified by the `handle` argument. This `handle` is the one that appears in the **DDS_SampleInfo** (p. 1068) retrieved when reading the data-samples available for the built-in **DDSData↔Reader** (p. 1272) to the **DDSDomainParticipant** (p. 1335) topic. The built-in **DDSDataReader** (p. 1272) is read with the same **FooDataReader::read** (p. 1635) and **FooDataReader::take** (p. 1636) operations used for any **DDSDataReader** (p. 1272).

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 237) DDS_InstanceHandle_t (p. 74) of the DDSDomainParticipant (p. 1335) to be ignored.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336), DDS_RETCODE_NOT_ENABLED (p. 336)
------------	---

DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.253.2.49 banish_ignored_participants()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::banish_ignored_participants ( ) [pure virtual]
```

<<*extension*>> (p. 236) Prevents ignored remote DomainParticipants from receiving traffic from the local **DDSDomainParticipant** (p. 1335).

This method complements **DDSDomainParticipant::ignore_participant** (p. 1376): `ignore_participant` prevents the local **DDSDomainParticipant** (p. 1335) from processing traffic from the remote `DomainParticipant`, while this method prevents already ignored remote `DomainParticipants` from processing traffic from the local `DomainParticipant`.

Note: this method is currently only supported when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

See also

DDSDomainParticipant::ignore_participant (p. 1376)

9.253.2.50 ignore_topic()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::ignore_topic (
    const DDS_InstanceHandle_t & handle ) [pure virtual]
```

Instructs RTI Connex to locally ignore a **DDSTopic** (p. 1601).

This means it will locally ignore any publication, or subscription to the **DDSTopic** (p. 1601).

There is no way to reverse this operation.

This operation can be used to save local resources when the application knows that it will never publish or subscribe to data under certain topics.

The **DDSTopic** (p. 1601) to ignore is identified by the `handle` argument. This is the handle of a **DDSTopic** (p. 1601) that appears in the **DDS_SampleInfo** (p. 1068) retrieved when reading data samples from the built-in **DDSDataReader** (p. 1272) for the **DDSTopic** (p. 1601).

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 237) Handle of the DDSTopic (p. 1601) to be ignored.
---------------	---

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

See also

DDS_TopicBuiltinTopicData (p. 1113)

DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.253.2.51 ignore_publication()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::ignore_publication (
    const DDS_InstanceHandle_t & handle ) [pure virtual]
```

Instructs RTI Connex to locally ignore a publication.

A publication is defined by the association of a topic name, user data, and partition set on the **DDSPublisher** (p. 1534) (see **DDS_PublicationBuiltinTopicData** (p. 997)). After this call, any data written by that publication's **DDSDataWriter** (p. 1305) will be ignored.

This operation can be used to ignore local *and* remote DataWriters.

The publication (DataWriter) to ignore is identified by the `handle` argument.

- To ignore a *remote* DataWriter, the `handle` can be obtained from the **DDS_SampleInfo** (p. 1068) retrieved when reading data samples from the built-in **DDSDataReader** (p. 1272) for the publication topic.
- To ignore a *local* DataWriter, the `handle` can be obtained by calling **DDSEntity::get_instance_handle** (p. 1451) for the local DataWriter.

There is no way to reverse this operation.

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 237) Handle of the DDSDataWriter (p. 1305) to be ignored.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	---

See also

DDS_PUBLICATION_TOPIC_NAME (p. 297)
DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.253.2.52 ignore_subscription()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::ignore_subscription (
    const DDS_InstanceHandle_t & handle ) [pure virtual]
```

Instructs RTI Connex to locally ignore a subscription.

A subscription is defined by the association of a topic name, user data, and partition set on the **DDSSubscriber** (p. 1576) (see **DDS_SubscriptionBuiltinTopicData** (p. 1094)). After this call, any data received related to that subscription's **DDSDataReader** (p. 1272) will be ignored.

This operation can be used to ignore local *and* remote DataReaders.

The subscription to ignore is identified by the `handle` argument.

- To ignore a *remote* DataReader, the `handle` can be obtained from the **DDS_SampleInfo** (p. 1068) retrieved when reading data samples from the built-in **DDSDataReader** (p. 1272) for the subscription topic.
- To ignore a *local* DataReader, the `handle` can be obtained by calling **DDSEntity::get_instance_handle** (p. 1451) for the local DataReader.

There is no way to reverse this operation.

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 237) Handle of the DDSDataReader (p. 1272) to be ignored.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	---

See also

DDS_SubscriptionBuiltinTopicData (p. 1094)
DDS_SUBSCRIPTION_TOPIC_NAME (p. 299)
DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.253.2.53 get_domain_id()

```
virtual DDS_DomainId_t DDSDomainParticipant::get_domain_id ( ) [pure virtual]
```

Get the unique domain identifier.

This operation retrieves the domain id used to create the **DDSDomainParticipant** (p. 1335). The domain id identifies the DDS domain to which the **DDSDomainParticipant** (p. 1335) belongs. Each DDS domain represents a separate data 'communication plane' isolated from other domains.

Returns

the unique `domainId` that was used to create the domain

See also

DDSDomainParticipantFactory::create_participant (p. 1425)

DDSDomainParticipantFactory::create_participant_with_profile (p. 1426)

9.253.2.54 get_current_time()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_current_time (
    DDS_Time_t & current_time ) [pure virtual]
```

Returns the current value of the time.

The current value of the time that RTI Connext uses to time-stamp **DDSDataWriter** (p. 1305) and to set the reception-timestamp for the data updates that it receives.

Parameters

<i>current_time</i>	<< <i>inout</i> >> (p. 237) Current time to be filled up.
---------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.253.2.55 register_durable_subscription()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::register_durable_subscription (
    const DDS_EndpointGroup_t & group,
    const char * topic_name ) [pure virtual]
```

<<*extension*>> (p. 236) Registers a Durable Subscription on the specified **DDSTopic** (p. 1601) on all Persistence Services.

If you need to receive all samples published on a **DDSTopic** (p. 1601), including the ones published while a **DDSDataReader** (p. 1272) is inactive or before it may be created, create a Durable Subscription using this method.

In this way, the Persistence Service will ensure that all the samples on that **DDSTopic** (p. 1601) are retained until they are acknowledged by at least *N* DataReaders belonging to the Durable Subscription where *N* is the quorum count.

If the same Durable Subscription is created on a different **DDSTopic** (p. 1601), the Persistence Service will implicitly delete the previous Durable Subscription and create a new one on the new **DDSTopic** (p. 1601).

Parameters

<i>group</i>	<< <i>in</i> >> (p. 237) DDS_EndpointGroup_t (p. 885) The Durable Subscription name and quorum.
<i>topic_name</i>	<< <i>in</i> >> (p. 237) The topic name for which the Durable Subscription is created.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.253.2.56 delete_durable_subscription()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_durable_subscription (
    const DDS_EndpointGroup_t & group ) [pure virtual]
```

<<**extension**>> (p. 236) Deletes an existing Durable Subscription on all Persistence Services.

The Persistence Service will delete the Durable Subscription and the quorum of the existing samples will be considered satisfied.

Parameters

<i>group</i>	<< <i>in</i> >> (p. 237) DDS_EndpointGroup_t (p. 885) specifying the Durable Subscription name. Quorum is not required for this operation.
--------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.253.2.57 assert_liveliness()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::assert_liveliness ( ) [pure virtual]
```

Manually asserts the liveliness of this **DDSDomainParticipant** (p. 1335).

This is used in combination with the **DDS_LivelinessQosPolicy** (p. 923) to indicate to RTI Connext that the entity remains active.

You need to use this operation if the **DDSDomainParticipant** (p. 1335) contains **DDSDataWriter** (p. 1305) entities with the **DDS_LivelinessQosPolicy::kind** (p. 925) set to **DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS** (p. 410) and it only affects the liveliness of those **DDSDataWriter** (p. 1305) entities. Otherwise, it has no effect.

Note: writing data via the **FooDataWriter::write** (p. 1666) or **FooDataWriter::write_w_timestamp** (p. 1670) operation asserts liveliness on the **DDSDataWriter** (p. 1305) itself and its **DDSDomainParticipant** (p. 1335). Consequently the use of **assert_liveliness()** (p. 1382) is only needed if the application is not writing data regularly.

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	--

See also

DDS_LivelinessQosPolicy (p. 923)

9.253.2.58 resume_endpoint_discovery()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::resume_endpoint_discovery (
    const DDS_InstanceHandle_t & remote_participant_handle ) [pure virtual]
```

<<**extension**>> (p. 236) Initiates endpoint discovery with the specified remote **DDSDomainParticipant** (p. 1335).

If the operation returns **DDS_RETCODE_OK** (p. 335), the **DDSDomainParticipant** (p. 1335) will initiate endpoint discovery with the remote **DDSDomainParticipant** (p. 1335) provided as a parameter.

When **DDS_DiscoveryQosPolicy::enable_endpoint_discovery** (p. 728) is set to **DDS_BOOLEAN_FALSE** (p. 316), this operation allows the RTI Connex application to select for which remote DomainParticipants endpoint discovery is performed. By disabling endpoint discovery, the DomainParticipant will not store any state about remote endpoints and will not send local endpoint information to remote DomainParticipants.

If **DDS_DiscoveryQosPolicy::enable_endpoint_discovery** (p. 728) is set to **DDS_BOOLEAN_TRUE** (p. 316), endpoint discovery will automatically occur for every discovered **DDSDomainParticipant** (p. 1335). In this case, invoking this operation will have no effect and will return **DDS_RETCODE_OK** (p. 335).

When **DDS_DiscoveryQosPolicy::enable_endpoint_discovery** (p. 728) is set to **DDS_BOOLEAN_FALSE** (p. 316), you have two options after a remote **DDSDomainParticipant** (p. 1335) is discovered:

- Call this operation to enable endpoint discovery. After invoking this operation, the **DDSDomainParticipant** (p. 1335) will start to exchange endpoint information so that matching and communication can occur with the remote **DDSDomainParticipant** (p. 1335).
- Call the **DDSDomainParticipant::ignore_participant** (p. 1376) operation to permanently ignore endpoint discovery with the remote **DDSDomainParticipant** (p. 1335).

Setting **DDS_DiscoveryQosPolicy::enable_endpoint_discovery** (p. 728) to **DDS_BOOLEAN_FALSE** (p. 316) enables application-level authentication use cases, in which a **DDSDomainParticipant** (p. 1335) will initiate endpoint discovery with a remote **DDSDomainParticipant** (p. 1335) after successful authentication at the application level.

The `remote_participant_handle` parameter is the one that appears in the **DDS_SampleInfo** (p. 1068) retrieved when reading the data samples available for the built-in **DDSParticipantBuiltinTopicDataDataReader** (p. 1532).

If the specified remote **DDSDomainParticipant** (p. 1335) is not in the database of discovered DomainParticipants or has been previously ignored, this operation will fail with **DDS_RETCODE_ERROR** (p. 335).

This operation can be called multiple times on the same remote participant. If endpoint discovery has already been resumed, successive calls will have no effect and will return **DDS_RETCODE_OK** (p. 335).

Parameters

<i>remote_participant_handle</i>	<< <i>in</i> >> (p. 237) Handle of a discovered DDSDomainParticipant (p. 1335) for which endpoint discovery is to be resumed.
----------------------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	--

See also

DDS_DiscoveryQosPolicy (p. 725)

9.253.2.59 delete_contained_entities()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_contained_entities ( ) [pure virtual]
```

Delete all the entities that were created by means of the "create" operations on the **DDSDomainParticipant** (p. 1335).

This operation deletes all contained **DDSPublisher** (p. 1534) (including an implicit Publisher, if one exists), **DDSSubscriber** (p. 1576) (including implicit Subscriber), **DDSTopic** (p. 1601), **DDSContentFilteredTopic** (p. 1267), and **DDSMultiTopic** (p. 1513) objects.

Prior to deleting each contained entity, this operation will recursively call the corresponding **delete_contained_entities()** (p. 1384) operation on each contained entity (if applicable). This pattern is applied recursively. In this manner the operation **delete_contained_entities()** (p. 1384) on the **DDSDomainParticipant** (p. 1335) will end up recursively deleting all the entities contained in the **DDSDomainParticipant** (p. 1335), including the **DDSDataWriter** (p. 1305), **DDSDataReader** (p. 1272), as well as the **DDSQueryCondition** (p. 1557), **DDSReadCondition** (p. 1558), and **DDSTopicQuery** (p. 1611) objects belonging to the contained **DDSDataReader** (p. 1272).

The operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if any of the contained entities is in a state where it cannot be deleted .

If **delete_contained_entities()** (p. 1384) completes successfully, the application may delete the **DDSDomainParticipant** (p. 1335).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	--

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

9.253.2.60 get_discovered_participants()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_discovered_participants (
    DDS_InstanceHandleSeq & participant_handles ) [pure virtual]
```

Returns a list of discovered **DDSDomainParticipant** (p. 1335) entities.

This operation retrieves the list of **DDSDomainParticipant** (p. 1335) entities that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **DDSDomainParticipant::ignore_participant** (p. 1376) operation. When using **DDS_DISCOVERYCONFIG_BUILTIN_SPDP2** (p. 393), this list only includes **DDSDomainParticipant** (p. 1335) entities that the application has received configuration information from.

Parameters

<i>participant_handles</i>	<< <i>inout</i> >> (p. 237) DDS_InstanceHandleSeq (p. 910) to be filled with handles of the discovered DDSDomainParticipant (p. 1335) entities.
----------------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	---

9.253.2.61 get_discovered_participants_from_subject_name()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_discovered_participants_from_subject_name (
    DDS_InstanceHandleSeq & participant_handles,
    const char * subject_name ) [pure virtual]
```

<<*extension*>> (p. 236) Returns a list of discovered **DDSDomainParticipant** (p. 1335) entities that have the given **DDS_EntityNameQosPolicy::name** (p. 891).

This operation retrieves the same list as **DDSDomainParticipant::get_discovered_participants** (p. 1385), except this list contains only the participants that have the given **DDS_EntityNameQosPolicy::name** (p. 891).

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the **RTI Security Plugins User's Manual** for more information.

MT Safety:

Safe.

Parameters

<i>participant_handles</i>	<< <i>inout</i> >> (p. 237) DDS_InstanceHandleSeq (p. 910) to be filled with handles of the discovered DDSDomainParticipant (p. 1335) entities.
<i>subject_name</i>	<< <i>in</i> >> (p. 237) The DDS_EntityNameQosPolicy::name (p. 891) by which to filter the list.

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

9.253.2.62 `get_discovered_participant_data()`

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_discovered_participant_data (
    struct DDS_ParticipantBuiltinTopicData & participant_data,
    const DDS_InstanceHandle_t & participant_handle ) [pure virtual]
```

Returns **DDS_ParticipantBuiltinTopicData** (p. 966) for the specified **DDSDomainParticipant** (p. 1335).

This operation retrieves information on a **DDSDomainParticipant** (p. 1335) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **DDSDomainParticipant::ignore_participant** (p. 1376) operation.

The *participant_handle* must correspond to such a DomainParticipant. Otherwise, the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Use the operation **DDSDomainParticipant::get_discovered_participants** (p. 1385) to find the **DDSDomainParticipant** (p. 1335) entities that are currently discovered.

MT Safety:

Safe.

Parameters

<i>participant_data</i>	<< <i>inout</i> >> (p. 237) DDS_ParticipantBuiltinTopicData (p. 966) to be filled in with the data for the specified DDSDomainParticipant (p. 1335).
<i>participant_handle</i>	<< <i>in</i> >> (p. 237) DDS_InstanceHandle_t (p. 74) of DDSDomainParticipant (p. 1335).

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
-----	---

See also

DDS_ParticipantBuiltinTopicData (p. 966)

DDSDomainParticipant::get_discovered_participants (p. 1385)

9.253.2.63 get_discovered_participant_subject_name()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_discovered_participant_subject_name (
    char * subject_name,
    DDS_UnsignedLong & subject_name_size,
    const DDS_InstanceHandle_t & participant_handle ) [pure virtual]
```

<<**extension**>> (p. 236) Returns **DDS_EntityNameQosPolicy::name** (p. 891) for the specified **DDSDomainParticipant** (p. 1335).

This operation retrieves the **DDS_EntityNameQosPolicy::name** (p. 891) of a **DDSDomainParticipant** (p. 1335) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **DDSDomainParticipant::ignore_participant** (p. 1376) operation.

The `participant_handle` must correspond to such a DomainParticipant. If the `participant_handle` is **DDS_HANDLE_NIL** (p. 76) or is not a valid **DDS_InstanceHandle_t** (p. 74) for a DomainParticipant, then the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335). If the `participant_handle` corresponds to a DomainParticipant that has not been discovered, then the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Use the operation **DDSDomainParticipant::get_discovered_participants** (p. 1385) to find the **DDSDomainParticipant** (p. 1335) entities that are currently discovered.

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the **RTI Security Plugins User's Manual** for more information.

MT Safety:

Safe.

Parameters

<i>subject_name</i>	<< out >> (p. 237) The char buffer that will be used to store the DDS_EntityNameQosPolicy::name (p. 891) of the discovered DDSDomainParticipant (p. 1335). If NULL, this function will return the required length of this buffer through the <code>subject_name_size</code> parameter.
<i>subject_name_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied char buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer, which includes space for the NUL terminator. If the supplied buffer is not NULL but this value is not large enough, then this function will fail with DDS_RETCODE_BAD_PARAMETER (p. 335). If the DDS_EntityNameQosPolicy::name (p. 891) is NULL, then this value will be set to 0.
<i>participant_handle</i>	<< in >> (p. 237) DDS_InstanceHandle_t (p. 74) of DDSDomainParticipant (p. 1335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	---

See also

DDS_EntityNameQosPolicy::name (p. 891)

9.253.2.64 get_discovered_topics()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_discovered_topics (
    DDS_InstanceHandleSeq & topic_handles ) [pure virtual]
```

Returns list of discovered **DDSTopic** (p. 1601) objects.

This operation retrieves the list of **DDSTopic** (p. 1601) s that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **DDSDomainParticipant::ignore_topic** (p. 1378) operation.

Parameters

<i>topic_handles</i>	<< <i>inout</i> >> (p. 237) DDS_InstanceHandleSeq (p. 910) to be filled with handles of the discovered DDSTopic (p. 1601) objects
----------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	---

9.253.2.65 get_discovered_topic_data()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_discovered_topic_data (
    struct DDS_TopicBuiltinTopicData & topic_data,
    const DDS_InstanceHandle_t & topic_handle ) [pure virtual]
```

Returns **DDS_TopicBuiltinTopicData** (p. 1113) for the specified **DDSTopic** (p. 1601).

This operation retrieves information on a **DDSTopic** (p. 1601) that has been discovered by the local Participant and must not have been "ignored" by means of the **DDSDomainParticipant::ignore_topic** (p. 1378) operation.

The *topic_handle* must correspond to such a topic. Otherwise, the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

This call is not supported for remote topics. If a remote `topic_handle` is used, the operation will fail with **DDS_↵ RETCODE_UNSUPPORTED** (p. 335).

Use the operation **DDSDomainParticipant::get_discovered_topics** (p. 1388) to find the topics that are currently discovered.

Parameters

<i>topic_data</i>	<< <i>inout</i> >> (p. 237) DDS_TopicBuiltinTopicData (p. 1113) to be filled with the specified DDSTopic (p. 1601)'s data.
<i>topic_handle</i>	<< <i>in</i> >> (p. 237) DDS_InstanceHandle_t (p. 74) of DDSTopic (p. 1601).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	---

See also

DDS_TopicBuiltinTopicData (p. 1113)

DDSDomainParticipant::get_discovered_topics (p. 1388)

9.253.2.66 contains_entity()

```
virtual DDS_Boolean DDSDomainParticipant::contains_entity (
    const DDS_InstanceHandle_t & a_handle ) [pure virtual]
```

Completes successfully with **DDS_BOOLEAN_TRUE** (p. 316) if the referenced **DDSEntity** (p. 1446) is contained by the **DDSDomainParticipant** (p. 1335).

This operation checks whether or not the given `a_handle` represents an **DDSEntity** (p. 1446) that was created from the **DDSDomainParticipant** (p. 1335). The containment applies recursively. That is, it applies both to entities (**DDSTopicDescription** (p. 1608), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576)) created directly using the **DDSDomainParticipant** (p. 1335) as well as entities created using a contained **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) as the factory, and so forth.

The `instance` handle for an **DDSEntity** (p. 1446) may be obtained from built-in topic data, from various statuses, or from the operation **DDSEntity::get_instance_handle** (p. 1451).

Parameters

<i>a_handle</i>	<< <i>in</i> >> (p. 237) DDS_InstanceHandle_t (p. 74) of the DDSEntity (p. 1446) to be checked.
-----------------	---

Returns

DDS_BOOLEAN_TRUE (p. 316) if **DDSEntity** (p. 1446) is contained by the **DDSDomainParticipant** (p. 1335), or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

9.253.2.67 get_participant_protocol_status()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_participant_protocol_status (
    struct DDS_DomainParticipantProtocolStatus & status ) [pure virtual]
```

<<*extension*>> (p. 236) Get the domain participant protocol status for this participant.

This also resets the status so that it is no longer considered changed.

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) DDS_DomainParticipantProtocolStatus (p. 734) to be filled in.
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.253.2.68 set_property()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_property (
    const char * property_name,
    const char * value,
    bool propagate ) [pure virtual]
```

Set the value for a property that applies to a DomainParticipant.

Warning

This method is not implemented in all APIs and it's intended only for testing purposes. You should use **DDSDomainParticipant::set_qos** (p. 1391) instead.

Parameters

<i>property_name</i>	<< <i>in</i> >> (p. 237). Name of the property that you want to set.
<i>value</i>	<< <i>in</i> >> (p. 237). New value for the property.
<i>propagate</i>	<< <i>in</i> >> (p. 237). Indicates if the property will be propagated or not.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSDataWriter::set_property (p. 1321)

DDSDataReader::set_property (p. 1292)

DDSDomainParticipant::set_qos (p. 1391)

9.253.2.69 set_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_qos (
    const DDS_DomainParticipantQos & qos ) [pure virtual]
```

Change the QoS of this DomainParticipant.

The **DDS_DomainParticipantQos::user_data** (p. 737) and **DDS_DomainParticipantQos::entity_factory** (p. 738) can be changed. The other policies are immutable.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Set of policies to be applied to DDSDomainParticipant (p. 1335). Policies must be consistent. Immutable policies cannot be changed after DDSDomainParticipant (p. 1335) is enabled. The special value DDS_PARTICIPANT_QOS_DEFAULT (p. 48) can be used to indicate that the QoS of the DDSDomainParticipant (p. 1335) should be changed to match the current default DDS_DomainParticipantQos (p. 735) set in the DDSDomainParticipantFactory (p. 1409).
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336) if an immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 336) if policies are inconsistent
------------	---

See also

DDS_DomainParticipantQos (p. 735) for rules on consistency among QoS policies

set_qos (abstract) (p. ??)

9.253.2.70 set_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Change the QoS of this domain participant using the input XML QoS profile.

The **DDS_DomainParticipantQos::user_data** (p. 737) and **DDS_DomainParticipantQos::entity_factory** (p. 738) can be changed. The other policies are immutable.

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexnt will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexnt will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 336) if policies are inconsistent
------------	--

See also

DDS_DomainParticipantQos (p. 735) for rules on consistency among QoS

9.253.2.71 get_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_qos (
    DDS_DomainParticipantQos & qos ) [pure virtual]
```

Get the participant QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

<i>qos</i>	<< inout >> (p. 237) QoS to be filled up.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

get_qos (abstract) (p. ??)

9.253.2.72 add_peer()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::add_peer (
    const char * peer_desc_string ) [pure virtual]
```

<<**extension**>> (p. 236) Attempt to contact one or more additional peer participants.

Add the given peer description to the list of peers with which this **DDSDomainParticipant** (p. 1335) will try to communicate.

This method may be called at any time after this **DDSDomainParticipant** (p. 1335) has been created (before or after it has been enabled).

If this method is called after **DDSEntity::enable** (p. 1449), an attempt will be made to contact the new peer(s) immediately.

If this method is called *before* the DomainParticipant is enabled, the peer description will simply be added to the list that was populated by **DDS_DiscoveryQosPolicy::initial_peers** (p. 726); the first attempted contact will take place after this **DDSDomainParticipant** (p. 1335) is enabled.

Adding a peer description with this method does not guarantee that any peer(s) discovered as a result will exactly correspond to those described:

- This **DDSDomainParticipant** (p. 1335) will attempt to discover peer participants at the given locations but may not succeed if no such participants are available. In this case, this method will not wait for contact attempt(s) to be made and it will not report an error.
- If remote participants described by the given peer description *are* discovered, the distributed application is configured with asymmetric peer lists, and **DDS_DiscoveryQosPolicy::accept_unknown_peers** (p. 728) is set to **DDS_BOOLEAN_TRUE** (p. 316). Thus, this **DDSDomainParticipant** (p. 1335) may actually discover *more* peers than are described in the given peer description.

To be informed of the exact remote participants that are discovered, regardless of which peers this **DDSDomainParticipant** (p. 1335) *attempts* to discover, use the built-in participant topic: **DDS_PARTICIPANT_TOPIC_NAME** (p. 294).

To remove specific peer locators, you may use **DDSDomainParticipant::remove_peer** (p. 1394). If a peer is removed, the add_peer operation will add it back to the list of peers.

To stop communicating with a peer **DDSDomainParticipant** (p. 1335) that has been discovered, use **DDSDomainParticipant::ignore_participant** (p. 1376).

Adding a peer description with this method has no effect on the **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) that may be subsequently retrieved with **DDSDomainParticipant::get_qos()** (p. 1392) (because **DDS_DiscoveryQosPolicy** (p. 725) is immutable).

Parameters

<i>peer_desc_string</i>	<< in >> (p. 237) New peer descriptor to be added. The format is specified in Peer Descriptor Format (p. 465).
-------------------------	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

Peer Descriptor Format (p. 465)
DDS_DiscoveryQosPolicy::initial_peers (p. 726)
DDS_PARTICIPANT_TOPIC_NAME (p. 294)
DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.253.2.73 remove_peer()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::remove_peer (
    const char * peer_desc_string ) [pure virtual]
```

<<**extension**>> (p. 236) Remove one or more peer participants from the list of peers with which this **DDSDomainParticipant** (p. 1335) will try to communicate.

This method may be called any time after this **DDSDomainParticipant** (p. 1335) has been enabled

Calling this method has the following effects:

- If a **DDSDomainParticipant** (p. 1335) was already discovered, it will be locally removed along with all its entities.
- Any further requests coming from a **DDSDomainParticipant** (p. 1335) located on any of the removed peers will be ignored.
- All the locators contained in the peer description will be removed from the peer list. The local **DDSDomainParticipant** (p. 1335) will stop sending announcement to those locators.

If remote participants located on a peer that was previously removed are discovered, they will be ignored until the related peer is added back by using **DDSDomainParticipant::add_peer** (p. 1392).

Removing a peer description with this method has no effect on the **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) that may be subsequently retrieved with **DDSDomainParticipant::get_qos()** (p. 1392) (because **DDS_DiscoveryQosPolicy** (p. 725) is immutable).

Parameters

<i>peer_desc_string</i>	<< in >> (p. 237) Peer descriptor to be removed. The format is specified in Peer Descriptor Format (p. 465).
-------------------------	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

Peer Descriptor Format (p. 465)

DDS_DiscoveryQosPolicy::initial_peers (p. 726)

DDSDomainParticipant::add_peer (p. 1392)

9.253.2.74 get_dns_tracker_polling_period()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::get_dns_tracker_polling_period (
    DDS_Duration_t & polling_period ) [pure virtual]
```

<<**extension**>> (p. 236) Retrieves the frequency used by the DNS tracker thread to query the DNS service.

The DNS tracker queries the DNS for hostnames specified in the initial peers of a DomainParticipant. The frequency of these queries is defined by **DDS_DiscoveryConfigQosPolicy::dns_tracker_polling_period** (p. 722). If the value returned is **DDS_DURATION_INFINITE** (p. 325), the DNS tracker is disabled.

Parameters

<i>polling_period</i>	<< out >> (p. 237) Duration that the API populates with the period of the DNS tracker.
-----------------------	---

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDS_DiscoveryConfigQosPolicy::dns_tracker_polling_period (p. 722)

9.253.2.75 set_dns_tracker_polling_period()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_dns_tracker_polling_period (
    const DDS_Duration_t & polling_period ) [pure virtual]
```

<<**extension**>> (p. 236) Configures the frequency in which the DNS tracker queries the DNS service.

This API allows you to change the frequency of the polling period for the DNS tracker. The range of accepted values, in seconds, goes from 1 second to 1 year. **DDS_DURATION_INFINITE** (p. 325) is also accepted as a valid value. If the duration is set to **DDS_DURATION_INFINITE** (p. 325), the DNS tracker is disabled.

Modifying the DNS tracker polling period through this has no effect on the **DDS_DiscoveryConfigQosPolicy::dns_tracker_polling_period** (p. 722) when it is retrieved with **DDSDomainParticipant::get_qos()** (p. 1392).

Parameters

<i>polling_period</i>	<< <i>in</i> >> (p. 237) Duration that is set as the polling period for the DNS tracker.
-----------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_DiscoveryConfigQosPolicy::dns_tracker_polling_period (p. 722)

DDSDomainParticipant::add_peer (p. 1392)

9.253.2.76 set_listener()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::set_listener (
    DDSDomainParticipantListener * l,
    DDS_StatusMask mask = DDS_STATUS_MASK_ALL ) [pure virtual]
```

Sets the participant listener.

Parameters

<i>l</i>	<< <i>in</i> >> (p. 237) Listener to be installed on the entity.
<i>mask</i>	<< <i>in</i> >> (p. 237) Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

MT Safety:

Unsafe. This method is not synchronized with the listener callbacks, so it is possible to set a new listener on a participant when the old listener is in a callback.

Care should therefore be taken not to delete any listener that has been set on an enabled participant unless some application-specific means are available of ensuring that the old listener cannot still be in use.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

set_listener (abstract) (p. ??)**9.253.2.77 get_listener()**

```
virtual DDSDomainParticipantListener * DDSDomainParticipant::get_listener ( ) [pure virtual]
```

Get the participant listener.

Returns

Existing listener attached to the **DDSDomainParticipant** (p. 1335).

See also

get_listener (abstract) (p. ??)**9.253.2.78 get_implicit_publisher()**

```
virtual DDSPublisher * DDSDomainParticipant::get_implicit_publisher ( ) [pure virtual]
```

<<**extension**>> (p. 236) Returns the implicit **DDSPublisher** (p. 1534). If an implicit Publisher does not already exist, this creates one.

There can only be one implicit Publisher per DomainParticipant.

The implicit Publisher is created with **DDS_PUBLISHER_QOS_DEFAULT** (p. 57) and no Listener.

This implicit Publisher will be deleted automatically when the following methods are called: **DDSDomainParticipant::delete_contained_entities** (p. 1384), or **DDSDomainParticipant::delete_publisher** (p. 1361) with the implicit publisher as a parameter. Additionally, when a DomainParticipant is deleted, if there are no attached DataWriters that belong to the implicit Publisher, the implicit Publisher will be implicitly deleted.

Returns

The implicit publisher

See also

DDS_PUBLISHER_QOS_DEFAULT (p. 57)**DDSDomainParticipant::create_publisher** (p. 1359)

9.253.2.79 get_implicit_subscriber()

```
virtual DDSSubscriber * DDSDomainParticipant::get_implicit_subscriber ( ) [pure virtual]
```

<<*extension*>> (p. 236) Returns the implicit **DDSSubscriber** (p. 1576). If an implicit Subscriber does not already exist, this creates one.

There can only be one implicit Subscriber per DomainParticipant.

The implicit Subscriber is created with **DDS_SUBSCRIBER_QOS_DEFAULT** (p. 57) and no Listener.

This implicit Subscriber will be deleted automatically when the following methods are called: **DDSDomainParticipant::delete_contained_entities** (p. 1384), or **DDSDomainParticipant::delete_subscriber** (p. 1364) with the subscriber as a parameter. Additionally, when a DomainParticipant is deleted, if there are no attached DataReaders that belong to the implicit Subscriber, the implicit Subscriber will be implicitly deleted.

MT Safety:

UNSAFE. it is not safe to create the implicit subscriber while another thread may be simultaneously calling **DDSDomainParticipant::set_default_subscriber_qos** (p. 1358).

Returns

The implicit subscriber

See also

DDS_SUBSCRIBER_QOS_DEFAULT (p. 57)

DDSDomainParticipant::create_subscriber (p. 1362)

9.253.2.80 create_datawriter()

```
virtual DDSDataWriter * DDSDomainParticipant::create_datawriter (
    DDSTopic * topic,
    const DDS_DataWriterQos & qos,
    DDSDataWriterListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<*extension*>> (p. 236) Creates a **DDSDataWriter** (p. 1305) that will be attached and belong to the implicit **DDSPublisher** (p. 1534).

Precondition

The given **DDSTopic** (p. 1601) must have been created from the same DomainParticipant as the implicit Publisher. If it was created from a different DomainParticipant, this method will fail.

The **DDSDataWriter** (p. 1305) created using this method will be associated with the implicit Publisher. This Publisher is automatically created (if it does not exist) using **DDS_PUBLISHER_QOS_DEFAULT** (p. 57) when the following methods are called: **DDSDomainParticipant::create_datawriter** (p. 1398), **DDSDomainParticipant::create_datawriter_with_profile** (p. 1399), or **DDSDomainParticipant::get_implicit_publisher** (p. 1397).

MT Safety:

UNSAFE. If **DDS_DATAWRITER_QOS_DEFAULT** (p. 110) is used for the *qos* parameter, it is not safe to create the DataWriter while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datawriter_qos** (p. 1342).

Parameters

<i>topic</i>	<< <i>in</i> >> (p. 237) The DDSTopic (p. 1601) that the DDSDataWriter (p. 1305) will be associated with.
<i>qos</i>	<< <i>in</i> >> (p. 237) QoS to be used for creating the new DDSDataWriter (p. 1305). The special value DDS_DATAWRITER_QOS_DEFAULT (p. 110) can be used to indicate that the DDSDataWriter (p. 1305) should be created with the default DDS_DataWriterQos (p. 683) set in the implicit DDSPublisher (p. 1534). The special value DDS_DATAWRITER_QOS_USE_TOPIC_QOS (p. 110) can be used to indicate that the DDSDataWriter (p. 1305) should be created with the combination of the default DDS_DataWriterQos (p. 683) set on the DDSPublisher (p. 1534) and the DDS_TopicQos (p. 1120) of the DDSTopic (p. 1601).
<i>listener</i>	<< <i>in</i> >> (p. 237) The listener of the DDSDataWriter (p. 1305).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDataWriter** (p. 1305) of a derived class specific to the data type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

See also

DDSTopic::set_qos (p. 1603)

DDSDataWriter::set_listener (p. 1323)

9.253.2.81 create_datawriter_with_profile()

```
virtual DDSDataWriter * DDSDomainParticipant::create_datawriter_with_profile (
    DDSTopic * topic,
    const char * library_name,
    const char * profile_name,
    DDSDataWriterListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<*extension*>> (p. 236) Creates a **DDSDataWriter** (p. 1305) using a XML QoS profile that will be attached and belong to the implicit **DDSPublisher** (p. 1534).

Precondition

The given **DDSTopic** (p. 1601) must have been created from the same DomainParticipant as the implicit Publisher. If it was created from a different DomainParticipant, this method will return NULL.

The **DDSDataWriter** (p. 1305) created using this method will be associated with the implicit Publisher. This Publisher is automatically created (if it does not exist) using **DDS_PUBLISHER_QOS_DEFAULT** (p. 57) when the following methods are called: **DDSDomainParticipant::create_datawriter** (p. 1398), **DDSDomainParticipant::create_datawriter←_with_profile** (p. 1399), or **DDSDomainParticipant::get_implicit_publisher** (p. 1397)

Parameters

<i>topic</i>	<< <i>in</i> >> (p. 237) The DDSTopic (p. 1601) that the DDSDataWriter (p. 1305) will be associated with.
<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexx will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexx will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).
<i>listener</i>	<< <i>in</i> >> (p. 237) The listener of the DDSDataWriter (p. 1305).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDataWriter** (p. 1305) of a derived class specific to the data type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

See also

FooDataWriter (p. 1659)

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDSDomainParticipant::get_default_datawriter_qos (p. 1342)

DDSDomainParticipant::get_implicit_publisher (p. 1397)

DDSTopic::set_qos (p. 1603)

DDSDataWriter::set_listener (p. 1323)

9.253.2.82 delete_datawriter()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_datawriter (
    DDSDataWriter * a_datawriter ) [pure virtual]
```

<<*extension*>> (p. 236) Deletes a **DDSDataWriter** (p. 1305) that belongs to the implicit **DDSPublisher** (p. 1534).

The deletion of the **DDSDataWriter** (p. 1305) will automatically unregister all instances.

Precondition

If the **DDSDataWriter** (p. 1305) does not belong to the implicit **DDSPublisher** (p. 1534), the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

Listener installed on the **DDSDataWriter** (p. 1305) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>a_datawriter</i>	<< <i>in</i> >> (p. 237) The DDSDataWriter (p. 1305) to be deleted.
---------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	---

See also

DDSDomainParticipant::get_implicit_publisher (p. 1397)

9.253.2.83 create_datareader()

```
virtual DDSDataReader * DDSDomainParticipant::create_datareader (
    DDSTopicDescription * topic,
    const DDS_DataReaderQos & qos,
    DDSDataReaderListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a **DDSDataReader** (p. 1272) that will be attached and belong to the implicit **DDSSubscriber** (p. 1576).

Precondition

The given **DDSTopicDescription** (p. 1608) must have been created from the same DomainParticipant as the implicit Subscriber. If it was created from a different DomainParticipant, this method will return NULL.

The **DDSDataReader** (p. 1272) created using this method will be associated with the implicit Subscriber. This Subscriber is automatically created (if it does not exist) using **DDS_SUBSCRIBER_QOS_DEFAULT** (p. 57) when the following methods are called: **DDSDomainParticipant::create_datareader** (p. 1401), **DDSDomainParticipant::create_datareader_with_profile** (p. 1402), or **DDSDomainParticipant::get_implicit_subscriber** (p. 1397).

MT Safety:

UNSAFE. If **DDS_DATAREADER_QOS_DEFAULT** (p. 132) is used for the `qos` parameter, it is not safe to create the datareader while another thread may be simultaneously calling **DDSDomainParticipant::set_default_datareader_qos** (p. 1344).

Parameters

<i>topic</i>	<< <i>in</i> >> (p. 237) The DDSTopicDescription (p. 1608) that the DDSDataReader (p. 1272) will be associated with.
<i>qos</i>	<< <i>in</i> >> (p. 237) The qos of the DDSDataReader (p. 1272). The special value DDS_DATAREADER_QOS_DEFAULT (p. 132) can be used to indicate that the DDSDataReader (p. 1272) should be created with the default DDS_DataReaderQos (p. 638) set in the implicit DDSSubscriber (p. 1576). If DDSTopicDescription (p. 1608) is of type DDSTopic (p. 1601) or DDSContentFilteredTopic (p. 1267), the special value DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 133) can be used to indicate that the DDSDataReader (p. 1272) should be created with the combination of the default DDS_DataReaderQos (p. 638) set on the implicit DDSSubscriber (p. 1576) and the DDS_TopicQos (p. 1120) (in the case of a DDSContentFilteredTopic (p. 1267), the DDS_TopicQos (p. 1120) of the related DDSTopic (p. 1601)). if DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 133) is used, <code>topic</code> cannot be a DDSMultiTopic (p. 1513).
<i>listener</i>	<< <i>in</i> >> (p. 237) The listener of the DDSDataReader (p. 1272).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDataReader** (p. 1272) of a derived class specific to the data-type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

See also

FooDataReader (p. 1632)

DDSDomainParticipant::get_default_datareader_qos (p. 1344)

DDSDomainParticipant::get_implicit_subscriber (p. 1397)

DDSTopic::set_qos (p. 1603)

DDSDataReader::set_listener (p. 1293)

9.253.2.84 create_datareader_with_profile()

```
virtual DDSDataReader * DDSDomainParticipant::create_datareader_with_profile (
    DDSTopicDescription * topic,
    const char * library_name,
    const char * profile_name,
    DDSDataReaderListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a **DDSDataReader** (p. 1272) using a XML QoS profile that will be attached and belong to the implicit **DDSSubscriber** (p. 1576).

Precondition

The given **DDSTopicDescription** (p. 1608) must have been created from the same DomainParticipant as the implicit subscriber. If it was created from a different DomainParticipant, this method will return NULL.

The **DDSDataReader** (p. 1272) created using this method will be associated with the implicit Subscriber. This Subscriber is automatically created (if it does not exist) using **DDS_SUBSCRIBER_QOS_DEFAULT** (p. 57) when the following methods are called: **DDSDomainParticipant::create_datareader** (p. 1401), **DDSDomainParticipant::create_datareader_with_profile** (p. 1402), or **DDSDomainParticipant::get_implicit_subscriber** (p. 1397)

Parameters

<i>topic</i>	<< in >> (p. 237) The DDSTopicDescription (p. 1608) that the DDSDataReader (p. 1272) will be associated with.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).
<i>listener</i>	<< in >> (p. 237) The listener of the DDSDataReader (p. 1272).
<i>mask</i>	<< in >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDataReader** (p. 1272) of a derived class specific to the data-type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

DDSTopic::set_qos (p. 1603)
DDSDataReader::set_listener (p. 1293)

9.253.2.85 delete_datareader()

```
virtual DDS_ReturnCode_t DDSDomainParticipant::delete_datareader (
    DDSDataReader * a_datareader ) [pure virtual]
```

<<**extension**>> (p. 236) Deletes a **DDSDataReader** (p. 1272) that belongs to the implicit **DDSSubscriber** (p. 1576).

Precondition

If the **DDSDataReader** (p. 1272) does not belong to the implicit **DDSSubscriber** (p. 1576), or if there are any existing **DDSReadCondition** (p. 1558) or **DDSQueryCondition** (p. 1557) objects that are attached to the **DDSDataReader** (p. 1272), or if there are outstanding loans on samples (as a result of a call to `read()`, `take()`, or one of the variants thereof), the operation fails with the error **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

Listener installed on the **DDSDataReader** (p. 1272) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>a_datareader</i>	<< in >> (p. 237) The DDSDataReader (p. 1272) to be deleted.
---------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	---

See also

DDSDomainParticipant::get_implicit_subscriber (p. 1397)

9.253.2.86 lookup_publisher_by_name()

```
virtual DDSPublisher * DDSDomainParticipant::lookup_publisher_by_name (
    const char * publisher_name ) [pure virtual]
```

<<**extension**>> (p. 236) Looks up a **DDSPublisher** (p. 1534) by its entity name within this **DDSDomainParticipant** (p. 1335).

Every **DDSPublisher** (p. 1534) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 402).

This operation retrieves a **DDSPublisher** (p. 1534) within the **DDSDomainParticipant** (p. 1335) given the entity's name. If there are several **DDSPublisher** (p. 1534) with the same name within the **DDSDomainParticipant** (p. 1335), this function returns the first matching occurrence.

Parameters

<i>publisher_name</i>	<< <i>in</i> >> (p. 237) Entity name of the DDSPublisher (p. 1534).
-----------------------	--

Returns

The first **DDSPublisher** (p. 1534) found with the specified name or NULL if it is not found.

See also

DDSDomainParticipant::lookup_datawriter_by_name (p. 1405)

9.253.2.87 lookup_subscriber_by_name()

```
virtual DDSSubscriber * DDSDomainParticipant::lookup_subscriber_by_name (
    const char * subscriber_name ) [pure virtual]
```

<<*extension*>> (p. 236) Retrieves a **DDSSubscriber** (p. 1576) by its entity name within this **DDSDomainParticipant** (p. 1335).

Every **DDSSubscriber** (p. 1576) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 402).

This operation retrieves a **DDSSubscriber** (p. 1576) within the **DDSDomainParticipant** (p. 1335) given the entity's name. If there are several **DDSSubscriber** (p. 1576) with the same name within the **DDSDomainParticipant** (p. 1335), this function returns the first matching occurrence.

Parameters

<i>subscriber_name</i>	<< <i>in</i> >> (p. 237) Entity name of the DDSSubscriber (p. 1576).
------------------------	---

Returns

The first **DDSSubscriber** (p. 1576) found with the specified name or NULL if it is not found.

See also

DDSDomainParticipant::lookup_datareader_by_name (p. 1406)

9.253.2.88 lookup_datawriter_by_name()

```
virtual DDSDDataWriter * DDSDomainParticipant::lookup_datawriter_by_name (
    const char * datawriter_full_name ) [pure virtual]
```

<<*extension*>> (p. 236) Looks up a **DDSDDataWriter** (p. 1305) by its entity name within this **DDSDomainParticipant** (p. 1335).

Every **DDSDDataWriter** (p. 1305) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 402).

Every **DDSPublisher** (p. 1534) in the system has an entity name which is also configured and stored in the EntityName policy.

This operation retrieves a **DDSDDataWriter** (p. 1305) within a **DDSPublisher** (p. 1534) given the specified name which encodes both to the **DDSDDataWriter** (p. 1305) and the **DDSPublisher** (p. 1534) name.

If there are several **DDSDDataWriter** (p. 1305) with the same name within the corresponding **DDSPublisher** (p. 1534) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **DDSPublisher** (p. 1534) to which the **DDSDDataWriter** (p. 1305) belongs and the entity name of of the **DDSDDataWriter** (p. 1305) itself, separated by a double colon "::". For example: MyPublisherName::MyDataWriterName

The plain name contains the **DDSDDataWriter** (p. 1305) name only. In this situation it is implied that the **DDSDDataWriter** (p. 1305) belongs to the implicit **DDSPublisher** (p. 1534) so the use of a plain name is equivalent to specifying a fully qualified name with the **DDSPublisher** (p. 1534) name part being "implicit". For example: the plain name "MyDataWriterName" is equivalent to specifying the fully qualified name "implicit::MyDataWriterName"

The **DDSDDataWriter** (p. 1305) is only looked up within the **DDSPublisher** (p. 1534) specified in the fully qualified name, or within the implicit **DDSPublisher** (p. 1534) if the name was not fully qualified.

Parameters

<i>datawriter_full_name</i>	<< <i>in</i> >> (p. 237) Entity name or fully-qualified entity name of the DDSDDataWriter (p. 1305).
-----------------------------	---

Returns

The first **DDSDDataWriter** (p. 1305) found with the specified name or NULL if it is not found.

See also

DDSPublisher::lookup_datawriter_by_name (p. 1555)

DDSDomainParticipant::lookup_publisher_by_name (p. 1404)

9.253.2.89 lookup_datareader_by_name()

```
virtual DDSDataReader * DDSDomainParticipant::lookup_datareader_by_name (
    const char * datareader_full_name ) [pure virtual]
```

<<**extension**>> (p. 236) Retrieves up a **DDSDataReader** (p. 1272) by its entity name in this **DDSDomainParticipant** (p. 1335).

Every **DDSDataReader** (p. 1272) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 402).

Every **DDSSubscriber** (p. 1576) in the system has an entity name which is also configured and stored in the EntityName policy, **ENTITY_NAME** (p. 402).

This operation retrieves a **DDSDataReader** (p. 1272) within a **DDSSubscriber** (p. 1576) given the specified name which encodes both to the **DDSDataReader** (p. 1272) and the **DDSSubscriber** (p. 1576) name.

If there are several **DDSDataReader** (p. 1272) with the same name within the corresponding **DDSSubscriber** (p. 1576) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **DDSSubscriber** (p. 1576) to which the **DDSDataReader** (p. 1272) belongs and the entity name of of the **DDSDataReader** (p. 1272) itself, separated by a double colon ":". For example: MySubscriberName::MyDataReaderName

The plain name contains the **DDSDataReader** (p. 1272) name only. In this situation it is implied that the **DDSDataReader** (p. 1272) belongs to the implicit **DDSSubscriber** (p. 1576) so the use of a plain name is equivalent to specifying a fully qualified name with the **DDSSubscriber** (p. 1576) name part being "implicit". For example: the plain name "MyDataReaderName" is equivalent to specifying the fully qualified name "implicit::MyDataReaderName"

The **DDSDataReader** (p. 1272) is only looked up within the **DDSSubscriber** (p. 1576) specified in the fully qualified name, or within the implicit **DDSSubscriber** (p. 1576) if the name was not fully qualified.

Parameters

<i>datareader_full_name</i>	<< in >> (p. 237) Full entity name of the DDSDataReader (p. 1272).
-----------------------------	--

Returns

The first **DDSDataReader** (p. 1272) found with the specified name or NULL if it is not found.

 <<extension>> (p. 236) Gets the **DDS_DataWriterQos** (p. 683) values associated with the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **get_datawriter_qos_from_profile_w_topic_name** (**DDS_DataWriterQos** &qos, const char *library_name, const char *profile_name, const char *topic_name)=0
 <<extension>> (p. 236) Gets the **DDS_DataWriterQos** (p. 683) values associated with the input XML QoS profile while applying topic filters to the input topic name.
- virtual **DDS_ReturnCode_t** **get_datareader_qos_from_profile** (**DDS_DataReaderQos** &qos, const char *library_name, const char *profile_name)=0
 <<extension>> (p. 236) Gets the **DDS_DataReaderQos** (p. 638) values associated with the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **get_datareader_qos_from_profile_w_topic_name** (**DDS_DataReaderQos** &qos, const char *library_name, const char *profile_name, const char *topic_name)=0
 <<extension>> (p. 236) Gets the **DDS_DataReaderQos** (p. 638) values associated with the input XML QoS profile while applying topic filters to the input topic name.
- virtual **DDS_ReturnCode_t** **get_topic_qos_from_profile** (**DDS_TopicQos** &qos, const char *library_name, const char *profile_name)=0
 <<extension>> (p. 236) Gets the **DDS_TopicQos** (p. 1120) values associated with the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **get_topic_qos_from_profile_w_topic_name** (**DDS_TopicQos** &qos, const char *library_name, const char *profile_name, const char *topic_name)=0
 <<extension>> (p. 236) Gets the **DDS_TopicQos** (p. 1120) values associated with the input XML QoS profile while applying topic filters to the input topic name.
- virtual **DDS_ReturnCode_t** **get_qos_profile_libraries** (struct **DDS_StringSeq** &library_names)=0
 <<extension>> (p. 236) Gets the names of all XML QoS profile libraries associated with the **DDSDomainParticipantFactory** (p. 1409)
- virtual **DDS_ReturnCode_t** **get_qos_profiles** (struct **DDS_StringSeq** &profile_names, const char *library_name)=0
 <<extension>> (p. 236) Gets the names of all XML QoS profiles associated with the input XML QoS profile library.
- virtual **DDSDomainParticipant *** **create_participant** (**DDS_DomainId_t** domainId, const **DDS_DomainParticipantQos** &qos, **DDSDomainParticipantListener** *listener, **DDS_StatusMask** mask)=0
 Creates a new **DDSDomainParticipant** (p. 1335) object.
- virtual **DDSDomainParticipant *** **create_participant_with_profile** (**DDS_DomainId_t** domainId, const char *library_name, const char *profile_name, **DDSDomainParticipantListener** *listener, **DDS_StatusMask** mask)=0
 <<extension>> (p. 236) Creates a new **DDSDomainParticipant** (p. 1335) object using the **DDS_DomainParticipantQos** (p. 735) associated with the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **delete_participant** (**DDSDomainParticipant** *a_participant)=0
 Deletes an existing **DDSDomainParticipant** (p. 1335).
- virtual **DDSDomainParticipant *** **lookup_participant** (**DDS_DomainId_t** domainId)=0
 Locates an existing **DDSDomainParticipant** (p. 1335).
- virtual **DDS_ReturnCode_t** **set_qos** (const **DDS_DomainParticipantFactoryQos** &qos)=0
 Sets the value for a participant factory QoS.
- virtual **DDS_ReturnCode_t** **get_qos** (**DDS_DomainParticipantFactoryQos** &qos)=0
 Gets the value for participant factory QoS.
- virtual **DDS_ReturnCode_t** **load_profiles** ()=0
 <<extension>> (p. 236) Loads the XML QoS profiles.
- virtual **DDS_ReturnCode_t** **reload_profiles** ()=0
 <<extension>> (p. 236) Reloads the XML QoS profiles.
- virtual **DDS_ReturnCode_t** **unload_profiles** ()=0
 <<extension>> (p. 236) Unloads the XML QoS profiles.

- virtual **DDS_ReturnCode_t** **unregister_thread** ()=0
 <<extension>> (p. 236) Allows the user to release thread specific resources kept by the middleware.
- virtual const **DDS_TypeCode** * **get_typecode_from_config** (const char *type_name)=0
 <<extension>> (p. 236) Gets a **DDS_TypeCode** (p. 1149) from a definition provided in an XML configuration file.
- virtual **DDSDomainParticipant** * **create_participant_from_config** (const char *configuration_name)=0
 <<extension>> (p. 236) Creates a **DDSDomainParticipant** (p. 1335) given its configuration name from a description provided in an XML configuration file.
- virtual **DDSDomainParticipant** * **create_participant_from_config_w_params** (const char *configuration_name, const **DDS_DomainParticipantConfigParams_t** ¶ms)=0
 <<extension>> (p. 236) Creates a **DDSDomainParticipant** (p. 1335) given its configuration name from a description provided in an XML configuration file and a set of parameters that allow changing some properties of such configuration.
- virtual **DDSDomainParticipant** * **lookup_participant_by_name** (const char *participant_name)=0
 <<extension>> (p. 236) Looks up a **DDSDomainParticipant** (p. 1335) by its entity name in the **DDSDomainParticipantFactory** (p. 1409).
- virtual **DDS_ReturnCode_t** **register_type_support** (**DDSDomainParticipantFactory_RegisterTypeFunction** register_type_fcn, const char *type_name)=0
 <<extension>> (p. 236) Registers a **DDSTypeSupport** (p. 1613) with the **DDSDomainParticipantFactory** (p. 1409) to enable automatic registration if the corresponding type, should it be needed by a **DDSDomainParticipant** (p. 1335).
- virtual **DDS_ReturnCode_t** **get_participants** (**DDSDomainParticipantSeq** &participants)=0
 <<extension>> (p. 236) Allows the application to access all the participants the DomainParticipantFactory has.
- virtual **DDS_ReturnCode_t** **set_thread_factory** (**DDSThreadFactory** *thread_factory)=0
 <<extension>> (p. 236) Sets a **DDSThreadFactory** (p. 1599) in the **DDSDomainParticipantFactory** (p. 1409) that will be used to create the internal threads of the DDS middleware.

Static Public Member Functions

- static **DDSDomainParticipantFactory** * **get_instance** ()
 Gets the singleton instance of this class.
- static **DDS_ReturnCode_t** **finalize_instance** ()
 <<extension>> (p. 236) Destroys the singleton instance of this class.

9.254.1 Detailed Description

<<**singleton**>> (p. 237) <<**interface**>> (p. 236) Allows creation and destruction of **DDSDomainParticipant** (p. 1335) objects.

The sole purpose of this class is to allow the creation and destruction of **DDSDomainParticipant** (p. 1335) objects. This class itself is a <<**singleton**>> (p. 237), and accessed via the **get_instance()** (p. 1412) method, and destroyed with **finalize_instance()** (p. 1412) method.

A single application can participate in multiple domains by instantiating multiple **DDSDomainParticipant** (p. 1335) objects.

An application may even instantiate multiple participants in the same domain. Participants in the same domain exchange data in the same way regardless of whether they are in the same application or different applications or on the same node or different nodes; their location is transparent.

There are two important caveats:

- When there are multiple participants on the same node (in the same application or different applications) in the same domain, the application(s) must make sure that the participants do not try to bind to the same port numbers. You must disambiguate between the participants by setting a participant ID for each participant (**DDS_Wire↔ProtocolQosPolicy::participant_id** (p. 1231)). The port numbers used by a participant are calculated based on both the participant index and the domain ID, so if all participants on the same node have different participant indexes, they can coexist in the same domain.
- You cannot mix entities from different participants. For example, you cannot delete a topic on a different participant than you created it from, and you cannot ask a subscriber to create a reader for a topic created from a participant different than the subscriber's own participant. (Note that it is permissible for an application built on top of RTI Connext to know about entities from different participants. For example, an application could keep references to a reader from one domain and a writer from another and then bridge the domains by writing the data received in the reader callback.)

DDSDomainParticipant (p. 1335)

9.254.2 Member Function Documentation

9.254.2.1 `get_instance()`

```
static DDSDomainParticipantFactory * DDSDomainParticipantFactory::get_instance ( ) [static]
```

Gets the singleton instance of this class.

DDSTheParticipantFactory (p. 41) can be used as an alias for the singleton factory returned by this operation.

Returns

The singleton **DDSDomainParticipantFactory** (p. 1409) instance.

MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this method while another thread may be simultaneously calling **DDSDomainParticipantFactory::get_instance** (p. 1412), **DDSDomainParticipantFactory::finalize_instance** (p. 1412), **DDS_TypeCodeFactory::get_instance** (p. 1196), **NDDUtilityNetworkCapture::enable** (p. 1824), or **NDDUtilityNetworkCapture::disable** (p. 1825).

See also

DDSTheParticipantFactory (p. 41)

9.254.2.2 finalize_instance()

```
static DDS_ReturnCode_t DDSDomainParticipantFactory::finalize_instance ( ) [static]
```

<<**extension**>> (p. 236) Destroys the singleton instance of this class.

Only necessary to explicitly reclaim resources used by the participant factory singleton. Note that on many OSs, these resources are automatically reclaimed by the OS when the program terminates. However, some memory-check tools still flag these as unreclaimed. So this method provides a way to clean up memory used by the participant factory.

Precondition

All participants created from the factory have been deleted.

Postcondition

All resources belonging to the factory have been reclaimed. Another call to **DDSDomainParticipantFactory**↔**::get_instance** (p. 1412) will return a new lifecycle of the singleton.

MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this method while another thread may be simultaneously calling **DDSDomainParticipantFactory::get_instance** (p. 1412), **DDSDomainParticipantFactory::finalize_instance** (p. 1412), **DDS_TypeCodeFactory::get_instance** (p. 1196), **NDDUtilityNetworkCapture::enable** (p. 1824), or **NDDUtilityNetworkCapture::disable** (p. 1825).

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
-----	---

DDSTheParticipantFactory (p. 41)

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

9.254.2.3 set_default_participant_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::set_default_participant_qos (
    const DDS_DomainParticipantQos & qos ) [pure virtual]
```

Sets the default **DDS_DomainParticipantQos** (p. 735) values for this domain participant factory.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) Qos to be filled up. The special value DDS_PARTICIPANT_QOS_DEFAULT (p. 48) may be passed as <i>qos</i> to indicate that the default QoS should be reset back to the initial values the factory would use if DDSDomainParticipantFactory::set_default_participant_qos (p. 1413) had never been called.
------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_PARTICIPANT_QOS_DEFAULT (p. 48)

DDSDomainParticipantFactory::create_participant (p. 1425)

9.254.2.4 set_default_participant_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::set_default_participant_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<*extension*>> (p. 236) Sets the default **DDS_DomainParticipantQos** (p. 735) values for this domain participant factory based on the input XML QoS profile.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

This default value will be used for newly created **DDSDomainParticipant** (p. 1335) if **DDS_PARTICIPANT_QOS_DEFAULT** (p. 48) is specified as the *qos* parameter when **DDSDomainParticipantFactory::create_participant** (p. 1425) is called.

Precondition

The **DDS_DomainParticipantQos** (p. 735) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a domain participant factory while another thread may be simultaneously calling **DDSDomainParticipantFactory::set_default_participant_qos** (p. 1413)

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connext will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connext will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	--

See also

DDS_PARTICIPANT_QOS_DEFAULT (p. 48)

DDSDomainParticipantFactory::create_participant_with_profile (p. 1426)

9.254.2.5 get_default_participant_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_default_participant_qos (
    DDS_DomainParticipantQos & qos ) [pure virtual]
```

Initializes the **DDS_DomainParticipantQos** (p. 735) instance with default values.

The retrieved qos will match the set of values specified on the last successful call to **DDSDomainParticipantFactory::set_default_participant_qos** (p. 1413), or **DDSDomainParticipantFactory::set_default_participant_qos_with_profile** (p. 1414), or else, if the call was never made, the default values listed in **DDS_DomainParticipantQos** (p. 735).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

<i>qos</i>	<< <i>out</i> >> (p. 237) the domain participant's QoS
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_PARTICIPANT_QOS_DEFAULT (p. 48)

DDSDomainParticipantFactory::create_participant (p. 1425)

9.254.2.6 set_default_library()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::set_default_library (
    const char * library_name ) [pure virtual]
```

<<**extension**>> (p. 236) Sets the default XML library for a **DDSDomainParticipantFactory** (p. 1409).

Any API requiring a library_name as a parameter can use NULL to refer to the default library set with this function.

Note: if the library set with this function no longer exists after reloading the QoS profiles (for example, by changing **DDS_DomainParticipantFactoryQos::profile** (p. 733)) the default library will be set to the last library containing a profile with the attribute `is_default_qos=true` or NULL no such library exists.

See also

DDSDomainParticipantFactory::set_default_profile (p. 1417) for more information.

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name. If library_name is NULL any previous default is unset.
---------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSDomainParticipantFactory::get_default_library (p. 1416)

9.254.2.7 get_default_library()

```
virtual const char * DDSDomainParticipantFactory::get_default_library ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the default XML library associated with a **DDSDomainParticipantFactory** (p. 1409).

Returns

The returned library name is determined as follows:

- If it was previously set with **DDSDomainParticipantFactory::set_default_library** (p. 1416), this function returns that library name
- Otherwise, if one or more profiles have the XML attribute `is_default_qos="true"`, this function returns the library where the last one is contained.
- Otherwise, this function returns NULL.

See also

DDSDomainParticipantFactory::set_default_library (p. 1416)

9.254.2.8 set_default_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::set_default_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Sets the default XML profile for a **DDSDomainParticipantFactory** (p. 1409).

This method specifies the profile that will be used as the default the next time a default DomainParticipantFactory profile is needed during a call to a DomainParticipantFactory method. When calling a **DDSDomainParticipantFactory** (p. 1409) method that requires a `profile_name` parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

This method does not set the default QoS for newly created DomainParticipants; for this functionality, use **DDSDomainParticipantFactory::set_default_participant_qos_with_profile** (p. 1414) (you may pass in NULL after having called **set_default_profile()** (p. 1417)).

Note: if the profile set with this function no longer exists after reloading the QoS profiles (for example, by changing **DDS_DomainParticipantFactoryQos::profile** (p. 733)) the default profile will be set to the last one marked with the attribute `is_default_qos=true` or NULL no such profile exists.

Parameters

<i>library_name</i>	<< in >> (p. 237) The library name containing the profile.
<i>profile_name</i>	<< in >> (p. 237) The profile name. If profile_name is NULL any previous default is unset.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDSDomainParticipantFactory::get_default_profile (p. 1418)

DDSDomainParticipantFactory::get_default_profile_library (p. 1418)

9.254.2.9 get_default_profile()

```
virtual const char * DDSDomainParticipantFactory::get_default_profile ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the default XML profile associated with a **DDSDomainParticipantFactory** (p. 1409).

Returns

The returned profile name is determined as follows:

- If it was previously set with **DDSDomainParticipantFactory::set_default_profile** (p. 1417), this function returns that profile name
- Otherwise, if one or more profiles have the XML attribute `is_default_qos="true"`, this function returns the name of one of them
- Otherwise, this function returns NULL.

See also

DDSDomainParticipantFactory::set_default_profile (p. 1417)

9.254.2.10 get_default_profile_library()

```
virtual const char * DDSDomainParticipantFactory::get_default_profile_library ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the library where the default XML profile is contained for a **DDSDomainParticipantFactory** (p. 1409).

The default profile library is automatically set when **DDSDomainParticipantFactory::set_default_profile** (p. 1417) is called.

This library can be different than the **DDSDomainParticipantFactory** (p. 1409) default library (see **DDSDomainParticipantFactory::get_default_library** (p. 1416)).

Returns

The default profile library for the profile returned by **DDSDomainParticipantFactory::get_default_profile** (p. 1418), or NULL if that profile is NULL.

See also

DDSDomainParticipantFactory::get_default_profile (p. 1418)

9.254.2.11 get_participant_factory_qos_from_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_participant_factory_qos_from_profile (
    DDS_DomainParticipantFactoryQos & qos,
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the **DDS_DomainParticipantFactoryQos** (p. 731) values associated with the input XML QoS profile.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexnt will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexnt will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.12 get_participant_qos_from_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_participant_qos_from_profile (
    DDS_DomainParticipantQos & qos,
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the **DDS_DomainParticipantQos** (p. 735) values associated with the input XML QoS profile.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexnt will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexnt will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.13 `get_publisher_qos_from_profile()`

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_publisher_qos_from_profile (
    DDS_PublisherQos & qos,
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the **DDS_PublisherQos** (p. 1009) values associated with the input XML QoS profile.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.14 `get_subscriber_qos_from_profile()`

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_subscriber_qos_from_profile (
    DDS_SubscriberQos & qos,
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the **DDS_SubscriberQos** (p. 1090) values associated with the input XML QoS profile.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
------------	--

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexnt will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexnt will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.254.2.15 get_datawriter_qos_from_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_datawriter_qos_from_profile (
    DDS_DataWriterQos & qos,
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<*extension*>> (p. 236) Gets the **DDS_DataWriterQos** (p. 683) values associated with the input XML QoS profile.

Parameters

<i>qos</i>	<< <i>out</i> >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexnt will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexnt will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.254.2.16 get_datawriter_qos_from_profile_w_topic_name()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_datawriter_qos_from_profile_w_topic_↵
name (
```

```

    DDS_DataWriterQos & qos,
    const char * library_name,
    const char * profile_name,
    const char * topic_name ) [pure virtual]

```

<<**extension**>> (p. 236) Gets the **DDS_DataWriterQos** (p. 683) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).
<i>topic_name</i>	<< in >> (p. 237) Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Connex will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.17 get_datareader_qos_from_profile()

```

virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_datareader_qos_from_profile (
    DDS_DataReaderQos & qos,
    const char * library_name,
    const char * profile_name ) [pure virtual]

```

<<**extension**>> (p. 236) Gets the **DDS_DataReaderQos** (p. 638) values associated with the input XML QoS profile.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.18 get_datareader_qos_from_profile_w_topic_name()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_datareader_qos_from_profile_w_topic_name (
    DDS_DataReaderQos & qos,
    const char * library_name,
    const char * profile_name,
    const char * topic_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the **DDS_DataReaderQos** (p. 638) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).
<i>topic_name</i>	<< in >> (p. 237) Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Connex will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.19 get_topic_qos_from_profile()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_topic_qos_from_profile (
    DDS_TopicQos & qos,
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the **DDS_TopicQos** (p. 1120) values associated with the input XML QoS profile.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexnt will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexnt will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.20 get_topic_qos_from_profile_w_topic_name()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_topic_qos_from_profile_w_topic_name (
    DDS_TopicQos & qos,
    const char * library_name,
    const char * profile_name,
    const char * topic_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the **DDS_TopicQos** (p. 1120) values associated with the input XML QoS profile while applying topic filters to the input topic name.

Parameters

<i>qos</i>	<< out >> (p. 237) Qos to be filled up. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexnt will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexnt will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).
<i>topic_name</i>	<< in >> (p. 237) Topic name that will be evaluated against the topic_filter attribute in the XML QoS profile. If topic_name is null, RTI Connexnt will match only QoSs without explicit topic_filter expressions.

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.21 get_qos_profile_libraries()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_qos_profile_libraries (
    struct DDS_StringSeq & library_names ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the names of all XML QoS profile libraries associated with the **DDSDomainParticipantFactory** (p. 1409)

Parameters

<i>library_names</i>	<< out >> (p. 237) DDS_StringSeq (p. 1087) to be filled with names of XML QoS profile libraries. Cannot be NULL.
----------------------	--

9.254.2.22 get_qos_profiles()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_qos_profiles (
    struct DDS_StringSeq & profile_names,
    const char * library_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the names of all XML QoS profiles associated with the input XML QoS profile library.

Parameters

<i>profile_names</i>	<< out >> (p. 237) DDS_StringSeq (p. 1087) to be filled with names of XML QoS profiles. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).

9.254.2.23 create_participant()

```
virtual DDSDomainParticipant * DDSDomainParticipantFactory::create_participant (
    DDS_DomainId_t domainId,
    const DDS_DomainParticipantQos & qos,
    DDSDomainParticipantListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

Creates a new **DDSDomainParticipant** (p. 1335) object.

Precondition

The specified QoS policies must be consistent or the operation will fail and no **DDSDomainParticipant** (p. 1335) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **DDS_WireProtocolQosPolicy** (p. 1228)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

Safe.

Parameters

<i>domain← Id</i>	<< <i>in</i> >> (p. 237) ID of the domain that the application intends to join. [range] [≥ 0], and does not violate guidelines stated in DDS_RtpsWellKnownPorts_t (p. 1062).
<i>qos</i>	<< <i>in</i> >> (p. 237) the DomainParticipant's QoS. The special value DDS_PARTICIPANT_QOS_DEFAULT (p. 48) can be used to indicate that the DDSDomainParticipant (p. 1335) should be created with the default DDS_DomainParticipantQos (p. 735) set in the DDSDomainParticipantFactory (p. 1409).
<i>listener</i>	<< <i>in</i> >> (p. 237) the domain participant's listener.
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

domain participant or NULL on failure

See also

DDSDomainParticipantFactory::create_participant_with_profile (p. 1426)

DDSDomainParticipantFactory::get_default_participant_qos (p. 1415)

DDSDomainParticipant::set_listener (p. 1396)

9.254.2.24 create_participant_with_profile()

```
virtual DDSDomainParticipant * DDSDomainParticipantFactory::create_participant_with_profile (
    DDS_DomainId_t domainId,
    const char * library_name,
    const char * profile_name,
    DDSDomainParticipantListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a new **DDSDomainParticipant** (p. 1335) object using the **DDS_Domain**↵
ParticipantQos (p. 735) associated with the input XML QoS profile.

Precondition

The **DDS_DomainParticipantQos** (p. 735) in the input profile must be consistent, or the operation will fail and no **DDSDomainParticipant** (p. 1335) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **DDS_WireProtocolQosPolicy** (p. 1228)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

Safe.

Parameters

<i>domainId</i>	<< in >> (p. 237) ID of the domain that the application intends to join. [range] [≥ 0], and does not violate guidelines stated in DDS_RtpsWellKnownPorts_t (p. 1062).
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSDomainParticipantFactory::set_default_library (p. 1416)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSDomainParticipantFactory::set_default_profile (p. 1417)).
<i>listener</i>	<< in >> (p. 237) the DomainParticipant's listener.
<i>mask</i>	<< in >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

domain participant or NULL on failure

See also

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDS_DomainParticipantQos (p. 735) for rules on consistency among QoS

DDS_PARTICIPANT_QOS_DEFAULT (p. 48)

NDDS_DISCOVERY_PEERS (p. 464)

DDSDomainParticipantFactory::create_participant() (p. 1425)

DDSDomainParticipantFactory::get_default_participant_qos() (p. 1415)

DDSDomainParticipant::set_listener() (p. 1396)

9.254.2.25 delete_participant()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::delete_participant (
    DDSDomainParticipant * a_participant ) [pure virtual]
```

Deletes an existing **DDSDomainParticipant** (p. 1335).

Precondition

All domain entities belonging to the participant must have already been deleted. Otherwise it fails with the error **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

Listener installed on the **DDSDomainParticipant** (p. 1335) will not be called after this method returns successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>a_participant</i>	<< <i>in</i> >> (p. 237) DDSDomainParticipant (p. 1335) to be deleted.
----------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	--

9.254.2.26 lookup_participant()

```
virtual DDSDomainParticipant * DDSDomainParticipantFactory::lookup_participant (
    DDS_DomainId_t domainId ) [pure virtual]
```

Locates an existing **DDSDomainParticipant** (p. 1335).

If no such **DDSDomainParticipant** (p. 1335) exists, the operation will return NULL value.

If multiple **DDSDomainParticipant** (p. 1335) entities belonging to that domainId exist, then the operation will return one of them. It is not specified which one.

Parameters

<i>domainId</i>	<< <i>in</i> >> (p. 237) ID of the domain participant to lookup.
-----------------	--

Returns

domain participant if it exists, or NULL

9.254.2.27 set_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::set_qos (
    const DDS_DomainParticipantFactoryQos & qos ) [pure virtual]
```

Sets the value for a participant factory QoS.

The **DDS_DomainParticipantFactoryQos::entity_factory** (p. 733) can be changed. The other policies are immutable.

Note that despite having QoS, the **DDSDomainParticipantFactory** (p. 1409) is not an **DDSEntity** (p. 1446).

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Set of policies to be applied to DDSDomainParticipantFactory (p. 1409). Policies must be consistent. Immutable policies can only be changed before calling any other RTI Connex methods except for DDSDomainParticipantFactory::get_qos (p. 1430)
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 336) if policies are inconsistent
------------	--

See also

DDS_DomainParticipantFactoryQos (p. 731) for rules on consistency among QoS

9.254.2.28 get_qos()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_qos (
    DDS_DomainParticipantFactoryQos & qos ) [pure virtual]
```

Gets the value for participant factory QoS.

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) QoS to be filled up.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.254.2.29 load_profiles()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::load_profiles ( ) [pure virtual]
```

<<*extension*>> (p. 236) Loads the XML QoS profiles.

The XML QoS profiles are loaded implicitly after the first **DDSDomainParticipant** (p. 1335) is created or explicitly, after a call to this method.

This has the same effect as **DDSDomainParticipantFactory::reload_profiles()** (p. 1430).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_ProfileQosPolicy (p. 991)

9.254.2.30 reload_profiles()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::reload_profiles ( ) [pure virtual]
```

<<**extension**>> (p. 236) Reloads the XML QoS profiles.

The XML QoS profiles are loaded implicitly after the first **DDSDomainParticipant** (p. 1335) is created or explicitly, after a call to this method.

This has the same effect as **DDSDomainParticipantFactory::load_profiles()** (p. 1430).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDS_ProfileQosPolicy (p. 991)

9.254.2.31 unload_profiles()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::unload_profiles ( ) [pure virtual]
```

<<**extension**>> (p. 236) Unloads the XML QoS profiles.

The resources associated with the XML QoS profiles are freed. Any reference to the profiles after calling this method will fail with an error.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDS_ProfileQosPolicy (p. 991)

9.254.2.32 unregister_thread()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::unregister_thread ( ) [pure virtual]
```

<<**extension**>> (p. 236) Allows the user to release thread specific resources kept by the middleware.

This function should be called by the user right before exiting a thread where DDS API were used. In this way the middleware will be able to free all the resources related to this specific thread. The best approach is to call the function during the thread deletion after all the DDS related API have been called.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.254.2.33 get_typecode_from_config()

```
virtual const DDS_TypeCode * DDSDomainParticipantFactory::get_typecode_from_config (
    const char * type_name ) [pure virtual]
```

<<**extension**>> (p. 236) Gets a **DDS_TypeCode** (p. 1149) from a definition provided in an XML configuration file.

Parameters

<i>type_name</i>	<< in >> (p. 237) Name of the type in the configuration file.
------------------	--

Returns

The **DDS_TypeCode** (p. 1149) or NULL if a type with that name doesn't exist or an error occurs.

9.254.2.34 create_participant_from_config()

```
virtual DDSDomainParticipant * DDSDomainParticipantFactory::create_participant_from_config (
    const char * configuration_name ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a **DDSDomainParticipant** (p. 1335) given its configuration name from a description provided in an XML configuration file.

This operation creates a **DDSDomainParticipant** (p. 1335) registering all the necessary data types and creating all the contained entities (**DDSTopic** (p. 1601), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDataWriter** (p. 1305), **DDSDataReader** (p. 1272)) from a description given in an XML configuration file.

The configuration name is the fully qualified name of the XML participant object, consisting of the name of the participant library plus the name of participant configuration.

For example the name "MyParticipantLibrary::PublicationParticipant" can be used to create the domain participant from the description in an XML file with contents shown in the snippet below:

```
<participant_library name="MyParticipantLibrary">
```

```
    <domain_participant name="PublicationParticipant" domain_ref="MyDomainLibrary::HelloWorldDomain">
```

```
        <publisher name="MyPublisher">
```

```
            <data_writer name="HelloWorldWriter" topic_ref="HelloWorldTopic"/>
```

```
        </publisher>
```

```
    </domain_participant>
```

```
</participant_library>
```

The entities belonging to the newly created **DDSDomainParticipant** (p. 1335) can be retrieved with the help of lookup operations such as: **DDSDomainParticipant::lookup_datareader_by_name** (p. 1406).

This operation is equivalent to call **DDSDomainParticipantFactory::create_participant_from_config_w_params** (p. 1433) passing **DDS_PARTICIPANT_CONFIG_PARAMS_DEFAULT** (p. 48) as parameters.

MT Safety:

Safe.

Parameters

<i>configuration_name</i>	<< <i>in</i> >> (p. 237) Name of the participant configuration in the XML file.
---------------------------	---

Returns

The created **DDSDomainParticipant** (p. 1335) or NULL on error.

See also

DDSDomainParticipantFactory::lookup_participant_by_name (p. 1434)

DDSDomainParticipant::lookup_topicdescription (p. 1373)

DDSDomainParticipant::lookup_subscriber_by_name (p. 1405)

DDSDomainParticipant::lookup_datareader_by_name (p. 1406)

DDSDomainParticipant::lookup_datawriter_by_name (p. 1405)

DDSPublisher::lookup_datawriter_by_name (p. 1555)

DDSSubscriber::lookup_datareader_by_name (p. 1596)

9.254.2.35 create_participant_from_config_w_params()

```
virtual DDSDomainParticipant * DDSDomainParticipantFactory::create_participant_from_config_w_params (
    const char * configuration_name,
    const DDS_DomainParticipantConfigParams_t & params ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a **DDSDomainParticipant** (p. 1335) given its configuration name from a description provided in an XML configuration file and a set of parameters that allow changing some properties of such configuration.

The operation will create a **DDSDomainParticipant** (p. 1335) the same way specified in **DDSDomainParticipantFactory::create_participant_from_config** (p. 1432).

In addition, this operation allows overriding the domain ID, participant name, and entities QoS specified in the configuration.

MT Safety:

Safe.

Parameters

<i>configuration_name</i>	<< <i>in</i> >> (p. 237) Name of the participant configuration in the XML file.
<i>params</i>	<< <i>in</i> >> (p. 237) input parameters that allow changing some properties of the configuration referred to by <i>configuration_name</i> .

Returns

The created **DDSDomainParticipant** (p. 1335) or NULL on error.

9.254.2.36 lookup_participant_by_name()

```
virtual DDSDomainParticipant * DDSDomainParticipantFactory::lookup_participant_by_name (
    const char * participant_name ) [pure virtual]
```

<<*extension*>> (p. 236) Looks up a **DDSDomainParticipant** (p. 1335) by its entity name in the **DDSDomainParticipantFactory** (p. 1409).

Every **DDSDomainParticipant** (p. 1335) in the system has an entity name which is configured and stored in the Entity↵ Name policy, **ENTITY_NAME** (p. 402).

This operation retrieves a **DDSDomainParticipant** (p. 1335) within the **DDSDomainParticipantFactory** (p. 1409) given the entity's name. If there are several **DDSDomainParticipant** (p. 1335) with the same name within the **DDSDomainParticipantFactory** (p. 1409) this function returns the first matching occurrence.

Parameters

<i>participant_name</i>	<< <i>in</i> >> (p. 237) Entity name of the DDSDomainParticipant (p. 1335). Cannot be NULL.
-------------------------	--

Returns

The first **DDSDomainParticipant** (p. 1335) found with the specified name or NULL if it is not found.

9.254.2.37 register_type_support()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::register_type_support (
    DDSDomainParticipantFactory_RegisterTypeFunction register_type_fcn,
    const char * type_name ) [pure virtual]
```

<<*extension*>> (p. 236) Registers a **DDSTypeSupport** (p. 1613) with the **DDSDomainParticipantFactory** (p. 1409) to enable automatic registration if the corresponding type, should it be needed by a **DDSDomainParticipant** (p. 1335).

Types referred by the **DDSTopic** (p. 1601) entities within a **DDSDomainParticipant** (p. 1335) must be registered with the **DDSDomainParticipant** (p. 1335).

Type registration in a **DDSDomainParticipant** (p. 1335) is performed by a call to the **FooTypeSupport::register_type** (p. 1695) operation. This can be done directly from the application code or indirectly by the RTI Connex infrastructure as a result of parsing an XML configuration file that refers to that type.

The **DDSDomainParticipantFactory::register_type_support** (p. 1434) operation provides the **DDSDomainParticipantFactory** (p. 1409) with the information it needs to automatically call the **FooTypeSupport::register_type** (p. 1695) operation and register the corresponding type if the type is needed as a result of parsing an XML configuration file.

Automatic type registration while parsing XML files can also be done by the RTI Connex infrastructure based on the type description provided in the XML files. If the **DDSTypeSupport** (p. 1613) has been registered with the **DDSDomainParticipantFactory** (p. 1409) this definition takes precedence over the description of the type given in the XML file.

The **DDSDomainParticipantFactory::register_type_support** (p. 1434) operation receives a **FooTypeSupport::register_type** (p. 1695) function as a parameter. This function is normally generated using `rtiddsgen` from a description of the corresponding type in IDL, XML, or XSD.

The typical workflow when using this function is as follows: Define the data-type in IDL (or XML, or XSD) in a file. E.g. `Foo.idl` Run `rtiddsgen` in that file to generate the TypeSupport files, for the desired programming language. E.g. in C++ `FooTypeSupport.h` `FooTypeSupport.cxx` Include the proper header file (e.g. `FooTypeSupport.h`) in your program and call **DDSDomainParticipantFactory::register_type_support** (p. 1434) passing the function that was generated by `rtiddsgen`. E.g. **FooTypeSupport::register_type** (p. 1695) Include the TypeSupport source file in your project such that it is compiled and linked. E.g. `FooTypeSupport.cxx`

You may refer to the [Getting Started Guide](#) for additional details in this process.

Note that only one register function is allowed per registered type name.

Parameters

<i>register_type_fcn</i>	<< <i>in</i> >> (p. 237) DDSDomainParticipantFactory_RegisterTypeFunction (p. 42) to be used for registering the type with a DDSDomainParticipant (p. 1335).
<i>type_name</i>	<< <i>in</i> >> (p. 237) Name the type is registered with.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.254.2.38 get_participants()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::get_participants (
    DDSDomainParticipantSeq & participants ) [pure virtual]
```

<<*extension*>> (p. 236) Allows the application to access all the participants the DomainParticipantFactory has.

If the sequence doesn't own its buffer, and its maximum is less than the total number of participants, it will be filled up to its maximum, and fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

MT Safety:

Safe.

Parameters

<i>participants</i>	<< <i>inout</i> >> (p. 237) a DomainParticipantSeq object where the set or list of participants will be returned
---------------------	--

Returns

One of the **Standard Return Codes** (p. 335) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336)

9.254.2.39 set_thread_factory()

```
virtual DDS_ReturnCode_t DDSDomainParticipantFactory::set_thread_factory (
    DDSThreadFactory * thread_factory ) [pure virtual]
```

<<*extension*>> (p. 236) Sets a **DDSThreadFactory** (p. 1599) in the **DDSDomainParticipantFactory** (p. 1409) that will be used to create the internal threads of the DDS middleware.

DDS threads are managed by the **DDSDomainParticipant** (p. 1335), which is responsible for creating and deleting threads throughout its lifecycle. Some threads are created when the **DDSDomainParticipant** (p. 1335) gets enabled (i.e., database, event, etc.) and others when special features are enabled (i.e., asynchronous publication thread).

DDS threads have **DDSDomainParticipant** (p. 1335) scope. This means every DomainParticipant creates all the necessary threads to operate and each **DDSDomainParticipant** (p. 1335) will create its own independent set of threads.

Each **DDSDomainParticipant** (p. 1335) creates an independent set of DDS threads and will use the **DDSThreadFactory** (p. 1599) that is held by the **DDSDomainParticipantFactory** (p. 1409) at the time the DomainParticipant is created. A **DDSThreadFactory** (p. 1599) is immutable from a **DDSDomainParticipant** (p. 1335) point of view. This means that a **DDSDomainParticipant** (p. 1335) will use throughout its lifecycle the same **DDSThreadFactory** (p. 1599) that was set when it was created, even if a new **DDSThreadFactory** (p. 1599) is set in the **DDSDomainParticipantFactory** (p. 1409) later. That is, if a new **DDSThreadFactory** (p. 1599) is set, a previously created **DDSDomainParticipant** (p. 1335) will not be affected.

ThreadFactory lifecycle: A **DDSThreadFactory** (p. 1599) instance must be alive while there are DomainParticipants using it. A **DDSThreadFactory** (p. 1599) instance can be deleted only after all DomainParticipants using it are deleted.

By default, the **DDSDomainParticipantFactory** (p. 1409) has an internal **DDSThreadFactory** (p. 1599) so threads are created automatically by the core product. These threads are usually created using the typical framework for the target platform (i.e., pthread for Linux systems).

MT Safety:

: Safe. Creation and deletion of a **DDSDomainParticipant** (p. 1335) can occur concurrently with setting a **DDSThreadFactory** (p. 1599).

Parameters

<i>thread_factory</i>	<< <i>in</i> >> (p. 237) Instance of a DDSThreadFactory (p. 1599) to be used for creating the DDS threads. If null is specified, the current DDSThreadFactory (p. 1599) is removed and the internal default will be used.
-----------------------	---

Exceptions

One	of the Standard Return Codes (p. 335)

- virtual void **on_invalid_local_identity_status_advance_notice** (**DDSDomainParticipant** *participant, const **DDS_InvalidLocalIdentityAdvanceNoticeStatus** &status)

*Notifies the user that the identity of the local **DDSDomainParticipant** (p. 1335) is about to expire.*

9.255.1 Detailed Description

<<**interface**>> (p. 236) Listener for participant status.

Entity:

DDSDomainParticipant (p. 1335)

Status:

Status Kinds (p. 336)

This is the interface that can be implemented by an application-provided class and then registered with the **DDSDomainParticipant** (p. 1335) such that the application can be notified by RTI Connext of relevant status changes.

The **DDSDomainParticipantListener** (p. 1437) interface extends all other Listener interfaces and has no additional operation beyond the ones defined by the more general listeners.

The purpose of the **DDSDomainParticipantListener** (p. 1437) is to be the listener of last resort that is notified of all status changes not captured by more specific listeners attached to the **DDSDomainEntity** (p. 1334) objects. When a relevant status change occurs, RTI Connext will first attempt to notify the listener attached to the concerned **DDSDomainEntity** (p. 1334) if one is installed. Otherwise, RTI Connext will notify the Listener attached to the **DDSDomainParticipant** (p. 1335).

Important: Because a **DDSDomainParticipantListener** (p. 1437) may receive callbacks pertaining to many different entities, it is possible for the same listener to receive multiple callbacks simultaneously in different threads. (Such is not the case for listeners of other types.) It is therefore critical that users of this listener provide their own protection for any thread-unsafe activities undertaken in a **DDSDomainParticipantListener** (p. 1437) callback.

Note: Due to a thread-safety issue, the destruction of a DomainParticipantListener from an enabled DomainParticipant should be avoided – even if the DomainParticipantListener has been removed from the DomainParticipant. (This limitation does not affect the Java API.)

- **virtual ~DDSDynamicDataTypeSupport ()**
*Delete a **DDSDynamicDataTypeSupport** (p. 1439) object.*

9.257.1 Detailed Description

A factory for registering a dynamically defined type and creating **DDS_DynamicData** (p. 769) objects.

A **DDSDynamicDataTypeSupport** (p. 1439) has three roles:

1. It associates a **DDS_TypeCode** (p. 1149) with policies for managing objects of that type. See the constructor, **DDSDynamicDataTypeSupport::DDSDynamicDataTypeSupport** (p. 1440).
2. It registers its type under logical names with a **DDSDomainParticipant** (p. 1335). See **DDSDynamicDataTypeSupport::register_type** (p. 1442).
3. It creates **DDS_DynamicData** (p. 769) samples pre-initialized with the type and properties of the type support itself. See **DDSDynamicDataTypeSupport::create_data** (p. 1443).

9.257.2 Constructor & Destructor Documentation

9.257.2.1 DDSDynamicDataTypeSupport()

```
DDSDynamicDataTypeSupport::DDSDynamicDataTypeSupport (
    const DDS_TypeCode * type,
    const struct DDS_DynamicDataTypeProperty_t & props )
```

Construct a new **DDSDynamicDataTypeSupport** (p. 1439) object.

This step is usually followed by type registration.

NOTE that RTI Connexx does not explicitly generate any exceptions in this constructor, because C++ exception support is not consistent across all platforms on which RTI Connexx runs. Therefore, to check whether construction succeeded, you must use the **DDSDynamicDataTypeSupport::is_valid** (p. 1442) method.

The **DDS_TypeCode** (p. 1149) object that is passed to this constructor is cloned and stored internally; no pointer is retained to the object passed in. It is therefore safe to delete the **DDS_TypeCode** (p. 1149) after this method returns.

Parameters

<i>type</i>	The DDS_TypeCode (p. 1149) that describes the members of this type. The new object will contain a <i>copy</i> of this DDS_TypeCode (p. 1149); you may delete the argument after this constructor returns.
<i>props</i>	Policies that describe how to manage the memory and other properties of the data samples created by this factory. In most cases, the default values will be appropriate; see DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT (p. 102).

See also

DDSDynamicDataTypeSupport::is_valid (p. 1442)
DDSDynamicDataTypeSupport::register_type (p. 1442)
DDSDynamicDataTypeSupport::~DDSDynamicDataTypeSupport (p. 1441)

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.257.2.2 ~DDSDynamicDataTypeSupport()

```
virtual DDSDynamicDataTypeSupport::~DDSDynamicDataTypeSupport ( ) [virtual]
```

Delete a **DDSDynamicDataTypeSupport** (p. 1439) object.

A **DDSDynamicDataTypeSupport** (p. 1439) cannot be deleted while it is still in use. For each **DDSDomainParticipant** (p. 1335) with which the **DDSDynamicDataTypeSupport** (p. 1439) is registered, either the type must be unregistered or the participant must be deleted.

See also

DDSDynamicDataTypeSupport::unregister_type (p. 1442)
DDSDynamicDataTypeSupport::DDSDynamicDataTypeSupport (p. 1440)

9.257.3 Member Function Documentation

9.257.3.1 `is_valid()`

```
DDS_Boolean DDSDynamicDataTypeSupport::is_valid ( )
```

Indicates whether the object was constructed properly.

This method returns **DDS_BOOLEAN_TRUE** (p. 316) if the constructor succeeded; it returns **DDS_BOOLEAN_FALSE** (p. 316) if the constructor failed for any reason, which should also have resulted in a log message.

Possible failure reasons include passing an invalid type or invalid properties to the constructor.

This method is necessary because C++ exception support is not consistent across all of the platforms on which RTI Connext runs. Therefore, the implementation does not throw any exceptions in the constructor.

See also

DDSDynamicDataTypeSupport::DDSDynamicDataTypeSupport (p. 1440)

9.257.3.2 `register_type()`

```
DDS_ReturnCode_t DDSDynamicDataTypeSupport::register_type (
    DDSDomainParticipant * participant,
    const char * type_name )
```

Associate the **DDS_TypeCode** (p. 1149) with the given **DDSDomainParticipant** (p. 1335) under the given logical name.

Once a type has been registered, it can be referenced by name when creating a topic. Statically and dynamically defined types behave the same way in this respect.

If the type cannot be registered, this function will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

See also

FooTypeSupport::register_type (p. 1695)

DDSDomainParticipant::create_topic (p. 1366)

DDSDynamicDataTypeSupport::unregister_type (p. 1442)

9.257.3.3 unregister_type()

```
DDS_ReturnCode_t DDSDynamicDataTypeSupport::unregister_type (
    DDSDomainParticipant * participant,
    const char * type_name )
```

Remove the definition of this type from the **DDSDomainParticipant** (p. 1335).

This operation is optional; all types are automatically unregistered when a **DDSDomainParticipant** (p. 1335) is deleted. Most application will not need to manually unregister types.

A type cannot be unregistered while it is still in use; that is, while any **DDSTopic** (p. 1601) is still referring to it.

If the type cannot be unregistered, this function will fail with **DDS_RETCODE_ERROR** (p. 335) or **DDS_RETCODE_↵BAD_PARAMETER** (p. 335).

See also

FooTypeSupport::unregister_type (p. 1696)

DDSDynamicDataTypeSupport::register_type (p. 1442)

9.257.3.4 get_type_name()

```
const char * DDSDynamicDataTypeSupport::get_type_name ( ) const
```

Get the default name of this type.

The **DDS_TypeCode** (p. 1149) that is wrapped by this **DDSDynamicDataTypeSupport** (p. 1439) includes a name; this operation returns that name.

This operation is useful when registering a type, because in most cases it is not necessary for the physical and logical names of the type to be different.

```
myTypeSupport->register_type(myParticipant, myTypeSupport->get_type_name());
```

See also

FooTypeSupport::get_type_name (p. 1702)

9.257.3.5 get_data_type()

```
const DDS_TypeCode * DDSDynamicDataTypeSupport::get_data_type ( ) const
```

Get the **DDS_TypeCode** (p. 1149) wrapped by this **DDSDynamicDataTypeSupport** (p. 1439).

9.257.3.6 create_data()

```
DDS_DynamicData * DDSDynamicDataTypeSupport::create_data ( )
```

Create a new **DDS_DynamicData** (p. 769) sample initialized with the **DDS_TypeCode** (p. 1149) and properties of this **DDSDynamicDataTypeSupport** (p. 1439).

You must delete your **DDS_DynamicData** (p. 769) object when you are finished with it.

```
DDS_DynamicData* sample = myTypeSupport->create_data();
```

```
// Do something...
```

```
myTypeSupport->delete_data(sample);
```

See also

DDSDynamicDataTypeSupport::delete_data (p. 1444)

FooTypeSupport::create_data (p. 1697)

DDS_DynamicData::DDS_DynamicData(const **DDS_TypeCode** *, const **DDS_DynamicDataProperty_t** &) (p. 784)

DDS_DynamicDataTypeProperty_t::data (p. 882)

9.257.3.7 delete_data()

```
DDS_ReturnCode_t DDSDynamicDataTypeSupport::delete_data (
    DDS_DynamicData * a_data )
```

Finalize and deallocate the **DDS_DynamicData** (p. 769) sample.

See also

FooTypeSupport::delete_data (p. 1698)

DDSDynamicDataTypeSupport::create_data (p. 1443)

9.257.3.8 print_data()

```
void DDSDynamicDataTypeSupport::print_data (
    const DDS_DynamicData * a_data ) const
```

Print a string representation of the given sample to the given file.

This method is equivalent to **DDS_DynamicData::print** (p. 791).

See also

DDS_DynamicData::print (p. 791)

9.257.3.9 copy_data()

```
DDS_ReturnCode_t DDSDynamicDataTypeSupport::copy_data (
    DDS_DynamicData * dest,
    const DDS_DynamicData * source ) const
```

Deeply copy the given data samples.

9.259.1 Detailed Description

<<**interface**>> (p. 236) Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.

All operations except for `set_qos()`, `get_qos()`, `set_listener()`, `get_listener()` and **enable()** (p. 1449), may return the value **DDS_RETCODE_NOT_ENABLED** (p. 336).

QoS:

QoS Policies (p. 352)

Status:

Status Kinds (p. 336)

Listener:

DDSLListener (p. 1509)

9.259.2 Abstract operations

Each derived entity provides the following operations specific to its role in RTI Connext.

9.259.2.1 set_qos (abstract)

This operation sets the QoS policies of the **DDSEntity** (p.1446). Each of the derived entity classes provides this operation: **DDSEntity** (p.1446) classes (**DDSDomainParticipant** (p.1335), **DDSTopic** (p.1601), **DDSPublisher** (p.1534), **DDSDataWriter** (p.1305), **DDSSubscriber** (p.1576), and **DDSDataReader** (p.1272)) so that the policies that are meaningful to each **DDSEntity** (p.1446) can be set. For example, see **DDSDomainParticipant::set_qos** (p.1391).

Precondition

Certain policies are immutable (see **QoS Policies** (p.352)): they can only be set at **DDSEntity** (p.1446) creation time or before the entity is enabled. If `set_qos()` is invoked after the **DDSEntity** (p.1446) is enabled and it attempts to change the value of an immutable policy, the operation will fail and return **DDS_RETCODE_IMMUTABLE_POLICY** (p.336).

Certain values of QoS policies can be incompatible with the settings of the other policies. The `set_qos()` operation will also fail if it specifies a set of values that, once combined with the existing values, would result in an inconsistent set of policies. In this case, the operation will fail and return **DDS_RETCODE_INCONSISTENT_POLICY** (p.336).

If the application supplies a non-default value for a QoS policy that is not supported by the implementation of the service, the `set_qos` operation will fail and return **DDS_RETCODE_UNSUPPORTED** (p.335).

Postcondition

The existing set of policies is only changed if the `set_qos()` operation succeeds. This is indicated by a return code of **DDS_RETCODE_OK** (p.335). In all other cases, none of the policies are modified.

Each derived **DDSEntity** (p.1446) class (**DDSDomainParticipant** (p.1335), **DDSTopic** (p.1601), **DDSPublisher** (p.1534), **DDSDataWriter** (p.1305), **DDSSubscriber** (p.1576), **DDSDataReader** (p.1272)) has a corresponding special value of the QoS (**DDS_PARTICIPANT_QOS_DEFAULT** (p.48), **DDS_PUBLISHER_QOS_DEFAULT** (p.57), **DDS_SUBSCRIBER_QOS_DEFAULT** (p.57), **DDS_TOPIC_QOS_DEFAULT** (p.56), **DDS_DATAWRITER_QOS_DEFAULT** (p.110), **DDS_DATAREADER_QOS_DEFAULT** (p.132)). This special value may be used as a parameter to the `set_qos` operation to indicate that the QoS of the **DDSEntity** (p.1446) should be changed to match the current default QoS set in the **DDSEntity** (p.1446)'s factory. The operation `set_qos` cannot modify the immutable QoS, so a successful return of the operation indicates that the mutable QoS for the Entity has been modified to match the current default for the **DDSEntity** (p.1446)'s factory.

The set of policies specified in the `qos` parameter are applied on top of the existing QoS, replacing the values of any policies previously set.

Possible error codes returned in addition to **Standard Return Codes** (p.335) : **DDS_RETCODE_IMMUTABLE_POLICY** (p.336), **DDS_RETCODE_INCONSISTENT_POLICY** (p.336).

9.259.2.2 `get_qos` (abstract)

This operation allows access to the existing set of QoS policies for the **DDSEntity** (p. 1446). This operation must be provided by each of the derived **DDSEntity** (p. 1446) classes (**DDSDomainParticipant** (p. 1335), **DDSTopic** (p. 1601), **DDSPublisher** (p. 1534), **DDSDataWriter** (p. 1305), **DDSSubscriber** (p. 1576), and **DDSDataReader** (p. 1272)), so that the policies that are meaningful to each **DDSEntity** (p. 1446) can be retrieved. For example, see **DDSDomainParticipant::get_qos** (p. 1392).

Possible error codes are **Standard Return Codes** (p. 335).

9.259.2.3 `set_listener` (abstract)

This operation installs a **DDSListener** (p. 1509) on the **DDSEntity** (p. 1446). The listener will only be invoked on the changes of communication status indicated by the specified `mask`.

This operation must be provided by each of the derived **DDSEntity** (p. 1446) classes (**DDSDomainParticipant** (p. 1335), **DDSTopic** (p. 1601), **DDSPublisher** (p. 1534), **DDSDataWriter** (p. 1305), **DDSSubscriber** (p. 1576), and **DDSDataReader** (p. 1272)), so that the listener is of the concrete type suitable to the particular **DDSEntity** (p. 1446).

There are two components involved when setting up listeners: the listener itself and the mask. Both of these can be NULL.

Listeners for some Entities derive from the Connex DDS Listeners for related Entities. This means that the derived Listener has all of the methods of its parent class. You can install Listeners at all levels of the object hierarchy. At the top is the DomainParticipantListener; only one can be installed in a DomainParticipant. Then every Subscriber and Publisher can have their own Listener. Finally, each Topic, DataReader and DataWriter can have their own listeners. All are optional.

Suppose, however, that an Entity does not install a Listener, or installs a Listener that does not have particular communication status selected in the bitmask. In this case, if/when that particular status changes for that Entity, the corresponding Listener for that Entity's parent is called. Status changes are "propagated" from child Entity to parent Entity until a Listener is found that is registered for that status. Connex DDS will give up and drop the status-change event only if no Listeners have been installed in the object hierarchy to be called back for the specific status.

The following table describes the effect of different combinations of Listeners and Status Bit Masks considering the hierarchical processing.

Table 9.666 Effect of Different Combinations of Listeners and Status Bit Masks

	No Bits Set in Mask	Some/All Bits Set in Mask
Listener is Specified	Connex DDS finds the next most relevant listener for the changed status	For the statuses that are enabled in the mask, the most relevant listener will be called. The 'statusChangedFlag' for the relevant status is reset
Listener is NULL	Connex DDS behaves as if the listener is not installed and finds the next most relevant listener for that status	Connex DDS behaves as if the listener is installed, but the callback is doing nothing. This is called a "nil" listener

Postcondition

Only one listener can be attached to each **DDSEntity** (p. 1446). If a listener was already set, the operation `set_listener()` will replace it with the new one. Consequently, if the value `NULL` is passed for the listener parameter to the `set_listener` operation, any existing listener will be removed.

9.259.2.4 get_listener (abstract)

This operation allows access to the existing **DDSListener** (p. 1509) attached to the **DDSEntity** (p. 1446).

This operation must be provided by each of the derived **DDSEntity** (p. 1446) classes (**DDSDomainParticipant** (p. 1335), **DDSTopic** (p. 1601), **DDSPublisher** (p. 1534), **DDSDataWriter** (p. 1305), **DDSSubscriber** (p. 1576), and **DDSDataReader** (p. 1272)) so that the listener is of the concrete type suitable to the particular **DDSEntity** (p. 1446).

If no listener is installed on the **DDSEntity** (p. 1446), this operation will return `NULL`.

9.259.3 Member Function Documentation**9.259.3.1 enable()**

```
virtual DDS_ReturnCode_t DDSEntity::enable ( ) [pure virtual]
```

Enables the **DDSEntity** (p. 1446).

This operation enables the Entity. Entity objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY_FACTORY** (p. 401) QoS policy on the corresponding factory for the **DDSEntity** (p. 1446).

By default, **ENTITY_FACTORY** (p. 401) is set so that it is not necessary to explicitly call **DDSEntity::enable** (p. 1449) on newly created entities.

The **DDSEntity::enable** (p. 1449) operation is idempotent. Calling `enable` on an already enabled Entity returns `OK` and has no effect.

If a **DDSEntity** (p. 1446) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **DDSEntity::get_statuscondition** (p. 1450)
- 'factory' operations
- **DDSEntity::get_status_changes** (p. 1450) and other get status operations (although the status of a disabled entity never changes)
- 'lookup' operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **DDS_RETCODE_NOT_ENABLED** (p. 336).

It is legal to delete an **DDSEntity** (p. 1446) that has not been enabled by calling the proper operation on its factory .

Entities created from a factory Entity that is disabled are created disabled, regardless of the setting of the **DDS_EntityFactoryQosPolicy** (p. 888).

Calling enable on an Entity whose factory Entity is not enabled will fail and return **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

If **DDS_EntityFactoryQosPolicy::autoenable_created_entities** (p. 890) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **DDSPublisher** (p. 1534) will enable all its contained **DDSDataWriter** (p. 1305) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value == FALSE`.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	--

Implemented in **DDSDataWriter** (p. 1325), and **DDSDataReader** (p. 1296).

9.259.3.2 `get_statuscondition()`

```
virtual DDSStatusCondition * DDSEntity::get_statuscondition ( ) [pure virtual]
```

Allows access to the **DDSStatusCondition** (p. 1562) associated with the **DDSEntity** (p. 1446).

The returned condition can then be added to a **DDSWaitSet** (p. 1613) so that the application can wait for specific status changes that affect the **DDSEntity** (p. 1446).

Returns

the status condition associated with this entity.

Implemented in **DDSDataWriter** (p. 1326), and **DDSDataReader** (p. 1297).

9.259.3.3 get_status_changes()

```
virtual DDS_StatusMask DDSEntity::get_status_changes ( ) [pure virtual]
```

Retrieves the list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the `get_*_status()` method.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the `get_status_changes` operation will be empty.

The list of statuses returned by the `get_status_changes` operation refers to the status that are triggered on the Entity itself and does not include statuses that apply to contained entities.

Returns

list of communication statuses in the **DDSEntity** (p. 1446) that are triggered.

See also

Status Kinds (p. 336)

Implemented in **DDSDataWriter** (p. 1327), and **DDSDataReader** (p. 1297).

9.259.3.4 get_instance_handle()

```
virtual DDS_InstanceHandle_t DDSEntity::get_instance_handle ( ) [pure virtual]
```

Allows access to the **DDS_InstanceHandle_t** (p. 74) associated with the **DDSEntity** (p. 1446).

This operation returns the **DDS_InstanceHandle_t** (p. 74) that represents the **DDSEntity** (p. 1446).

Returns

the instance handle associated with this entity.

Implemented in **DDSDataWriter** (p. 1327), and **DDSDataReader** (p. 1298).

9.260 DDSFlowController Class Reference

<<**interface**>> (p. 236) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **DDSDataWriter** (p. 1305) instances are allowed to write data.

Public Member Functions

- virtual **DDS_ReturnCode_t** **set_property** (const struct **DDS_FlowControllerProperty_t** &prop)=0
*Sets the **DDSFlowController** (p. 1451) property.*
- virtual **DDS_ReturnCode_t** **get_property** (struct **DDS_FlowControllerProperty_t** &prop)=0
*Gets the **DDSFlowController** (p. 1451) property.*
- virtual **DDS_ReturnCode_t** **trigger_flow** ()=0
*Provides an external trigger to the **DDSFlowController** (p. 1451).*
- virtual const char * **get_name** ()=0
*Returns the name of the **DDSFlowController** (p. 1451).*
- virtual **DDSDomainParticipant** * **get_participant** ()=0
*Returns the **DDSDomainParticipant** (p. 1335) to which the **DDSFlowController** (p. 1451) belongs.*

9.260.1 Detailed Description

<<**interface**>> (p. 236) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **DDSDataWriter** (p. 1305) instances are allowed to write data.

QoS:

DDS_FlowControllerProperty_t (p. 899)

9.260.2 Member Function Documentation

9.260.2.1 set_property()

```
virtual DDS_ReturnCode_t DDSFlowController::set_property (
    const struct DDS_FlowControllerProperty_t & prop ) [pure virtual]
```

Sets the **DDSFlowController** (p. 1451) property.

This operation modifies the property of the **DDSFlowController** (p. 1451).

Once a **DDSFlowController** (p. 1451) has been instantiated, only the **DDS_FlowControllerProperty_t::token_bucket** (p. 900) can be changed. The **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900) is immutable.

A new **DDS_FlowControllerTokenBucketProperty_t::period** (p. 902) only takes effect at the next scheduled token distribution time (as determined by its previous value).

Parameters

<i>prop</i>	<< <i>in</i> >> (p. 237) The new DDS_FlowControllerProperty_t (p. 899). Property must be consistent. Immutable fields cannot be changed after DDSFlowController (p. 1451) has been created. The special value DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT (p. 58) can be used to indicate that the property of the DDSFlowController (p. 1451) should be changed to match the current default DDS_FlowControllerProperty_t (p. 899) set in the DDSDomainParticipant (p. 1335).
-------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336).
------------	---

See also

DDS_FlowControllerProperty_t (p. 899) for rules on consistency among property values.

9.260.2.2 get_property()

```
virtual DDS_ReturnCode_t DDSFlowController::get_property (
    struct DDS_FlowControllerProperty_t & prop ) [pure virtual]
```

Gets the **DDSFlowController** (p. 1451) property.

Parameters

<i>prop</i>	<< <i>in</i> >> (p. 237) DDSFlowController (p. 1451) to be filled in.
-------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.260.2.3 trigger_flow()

```
virtual DDS_ReturnCode_t DDSFlowController::trigger_flow ( ) [pure virtual]
```

Provides an external trigger to the **DDSFlowController** (p. 1451).

Typically, a **DDSFlowController** (p. 1451) uses an internal trigger to periodically replenish its tokens. The period by which this trigger is called is determined by the **DDS_FlowControllerTokenBucketProperty_t::period** (p. 902) property setting.

This function provides an additional, external trigger to the **DDSFlowController** (p. 1451). This trigger adds **DDS_↵_FlowControllerTokenBucketProperty_t::tokens_added_per_period** (p. 902) tokens each time it is called (subject to the other property settings of the **DDSFlowController** (p. 1451)).

An *on-demand* **DDSFlowController** (p. 1451) can be created with a **DDS_DURATION_INFINITE** (p. 325) as **DDS_↵_FlowControllerTokenBucketProperty_t::period** (p. 902), in which case the only trigger source is external (i.e. the FlowController is solely triggered by the user on demand).

DDSFlowController::trigger_flow (p. 1453) can be called on both strict *on-demand* FlowController and hybrid Flow↵Controller (internally and externally triggered).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.260.2.4 get_name()

```
virtual const char * DDSFlowController::get_name ( ) [pure virtual]
```

Returns the name of the **DDSFlowController** (p. 1451).

Returns

The name of the **DDSFlowController** (p. 1451).

9.260.2.5 get_participant()

```
virtual DDSDomainParticipant * DDSFlowController::get_participant ( ) [pure virtual]
```

Returns the **DDSDomainParticipant** (p. 1335) to which the **DDSFlowController** (p. 1451) belongs.

Returns

The **DDSDomainParticipant** (p. 1335) to which the **DDSFlowController** (p. 1451) belongs.

9.261 DDSGuardCondition Class Reference

<<**interface**>> (p. 236) A specific **DDSCondition** (p. 1260) whose `trigger_value` is completely under the control of the application.

Inheritance diagram for DDSGuardCondition:

Public Member Functions

- virtual **DDS_Boolean** **get_trigger_value** ()
Retrieve the `trigger_value`.
- virtual **DDS_ReturnCode_t** **set_trigger_value** (**DDS_Boolean** value)
Set the guard condition trigger value.
- **DDSGuardCondition** ()
No argument constructor.
- virtual **~DDSGuardCondition** ()
Destructor.

9.261.1 Detailed Description

<<*interface*>> (p. 236) A specific **DDSCondition** (p. 1260) whose `trigger_value` is completely under the control of the application.

The **DDSGuardCondition** (p. 1454) provides a way for an application to manually wake up a **DDSWaitSet** (p. 1613). This is accomplished by attaching the **DDSGuardCondition** (p. 1454) to the **DDSWaitSet** (p. 1613) and then setting the `trigger_value` by means of the **DDSGuardCondition::set_trigger_value** (p. 1456) operation.

See also

DDSWaitSet (p. 1613)

9.261.2 Constructor & Destructor Documentation

9.261.2.1 DDSGuardCondition()

```
DDSGuardCondition::DDSGuardCondition ( )
```

No argument constructor.

The default constructor initializes the guard condition with trigger value **DDS_BOOLEAN_FALSE** (p. 316)

9.261.2.2 ~DDSGuardCondition()

```
virtual DDSGuardCondition::~~DDSGuardCondition ( ) [virtual]
```

Destructor.

Releases the resources associated with this object.

Deleting a NULL condition is safe and has no effect.

9.261.3 Member Function Documentation

9.261.3.1 `get_trigger_value()`

```
virtual DDS_Boolean DDSGuardCondition::get_trigger_value ( ) [virtual]
```

Retrieve the `trigger_value`.

Returns

the trigger value.

Implements **DDSCondition** (p. 1261).

9.261.3.2 `set_trigger_value()`

```
virtual DDS_ReturnCode_t DDSGuardCondition::set_trigger_value (
    DDS_Boolean value ) [virtual]
```

Set the guard condition trigger value.

Parameters

<i>value</i>	<< <i>in</i> >> (p. 237) the new trigger value.
--------------	---

9.262 DDSKeyedOctetsDataReader Class Reference

<<*interface*>> (p. 236) Instantiates `DataReader` < **DDS_KeyedOctets** (p. 911) >.

Inheritance diagram for `DDSKeyedOctetsDataReader`:

Public Member Functions

- virtual **DDS_ReturnCode_t** **read** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data-samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_w_condition** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDSReadCondition** *condition)
*Accesses via **DDSKeyedOctetsDataReader::read** (p. 1459) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **take_w_condition** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDSReadCondition** *condition)
*Analogous to **DDSKeyedOctetsDataReader::read_w_condition** (p. 1459) except it accesses samples via the **DDSKeyedOctetsDataReader::take** (p. 1459) operation.*
- virtual **DDS_ReturnCode_t** **read_next_sample** (**DDS_KeyedOctets** &received_data, **DDS_SampleInfo** &sample_info)
*Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take_next_sample** (**DDS_KeyedOctets** &received_data, **DDS_SampleInfo** &sample_info)
*Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_instance** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &a_handle= **DDS_HANDLE_NIL**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take_instance** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &a_handle= **DDS_HANDLE_NIL**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_instance_w_condition** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &a_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)
*Accesses via **DDSKeyedOctetsDataReader::read_instance** (p. 1460) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **take_instance_w_condition** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &a_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)
*Accesses via **DDSKeyedOctetsDataReader::take_instance** (p. 1461) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **read_next_instance** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)

Access a collection of data samples from the *DDSDDataReader* (p. 1272).

- virtual **DDS_ReturnCode_t** **take_next_instance** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)

Access a collection of data samples from the *DDSDDataReader* (p. 1272).

- virtual **DDS_ReturnCode_t** **read_next_instance_w_condition** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)

Accesses via *DDSKeyedOctetsDataReader::read_next_instance* (p. 1462) the samples that match the criteria specified in the *DDSReadCondition* (p. 1558).

- virtual **DDS_ReturnCode_t** **take_next_instance_w_condition** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)

Accesses via *DDSKeyedOctetsDataReader::take_next_instance* (p. 1462) the samples that match the criteria specified in the *DDSReadCondition* (p. 1558).

- virtual **DDS_ReturnCode_t** **return_loan** (**DDS_KeyedOctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq)

Indicates to the *DDSDDataReader* (p. 1272) that the application is done accessing the collection of *received_data* and *info_seq* obtained by some earlier invocation of *read* or *take* on the *DDSDDataReader* (p. 1272).

- virtual **DDS_ReturnCode_t** **get_key_value** (**DDS_KeyedOctets** &key_holder, const **DDS_InstanceHandle_t** &handle)

Retrieve the instance *key* that corresponds to an instance *handle*.

- virtual **DDS_ReturnCode_t** **get_key_value** (char *key, const **DDS_InstanceHandle_t** &handle)

<<extension>> (p. 236) Retrieve the instance *key* that corresponds to an instance *handle*.

- virtual **DDS_InstanceHandle_t** **lookup_instance** (const **DDS_KeyedOctets** &key_holder)

Retrieve the instance *handle* that corresponds to an instance *key_holder*.

- virtual **DDS_InstanceHandle_t** **lookup_instance** (const char *key)

<<extension>> (p. 236) Retrieve the instance *handle* that corresponds to an instance *key*.

Static Public Member Functions

- static **DDSKeyedOctetsDataReader** * **narrow** (**DDSDDataReader** *reader)

Narrow the given *DDSDDataReader* (p. 1272) pointer to a *DDSKeyedOctetsDataReader* (p. 1456) pointer.

9.262.1 Detailed Description

<<interface>> (p. 236) Instantiates *DataReader* < **DDS_KeyedOctets** (p. 911) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string or byte array in a destination data sample is NULL, the middleware will allocate a new string or array for you of sufficient length to hold the received data. New strings will be allocated with **DDS_String_alloc** (p. 547); new arrays will be allocated with **DDS_OctetBuffer_alloc** (p. 542). The sample's destructor will delete them.

A non- NULL string or array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

DDSDDataReader (p. 1272)

9.262.2 Member Function Documentation

9.262.2.1 read()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::read (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::read (p. 1635)

9.262.2.2 take()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::take (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data-samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::take (p. 1636)

9.262.2.3 read_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::read_w_condition (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Accesses via **DDSKeyedOctetsDataReader::read** (p. 1459) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_w_condition (p. 1640)

9.262.2.4 take_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::take_w_condition (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Analogous to **DDSKeyedOctetsDataReader::read_w_condition** (p.1459) except it accesses samples via the **DDSKeyedOctetsDataReader::take** (p.1459) operation.

See also

FooDataReader::take_w_condition (p.1641)

9.262.2.5 read_next_sample()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::read_next_sample (
    DDS_KeyedOctets & received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDDataReader** (p.1272).

See also

FooDataReader::read_next_sample (p.1642)

9.262.2.6 take_next_sample()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::take_next_sample (
    DDS_KeyedOctets & received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDDataReader** (p.1272).

See also

FooDataReader::take_next_sample (p.1643)

9.262.2.7 read_instance()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::read_instance (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & a_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::read_instance (p. 1645)

9.262.2.8 take_instance()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::take_instance (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & a_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::take_instance (p. 1646)

9.262.2.9 read_instance_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::read_instance_w_condition (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & a_handle = DDS_HANDLE_NIL,
    DDSReadCondition * condition = NULL ) [virtual]
```

Accesses via **DDSKeyedOctetsDataReader::read_instance** (p. 1460) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_instance_w_condition (p. 1647)

9.262.2.10 take_instance_w_condition()

    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::read_next_instance (p. 1650)

9.262.2.12 take_next_instance()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::take_next_instance (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::take_next_instance (p. 1651)

9.262.2.13 read_next_instance_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::read_next_instance_w_condition (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDSReadCondition * condition = NULL ) [virtual]
```

Accesses via **DDSKeyedOctetsDataReader::read_next_instance** (p. 1462) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_next_instance_w_condition (p. 1653)

9.262.2.14 take_next_instance_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::take_next_instance_w_condition (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDSReadCondition * condition = NULL ) [virtual]
```

Accesses via **DDSKeyedOctetsDataReader::take_next_instance** (p. 1462) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::take_next_instance_w_condition (p. 1654)

9.262.2.15 return_loan()

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::return_loan (
    DDS_KeyedOctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq ) [virtual]
```

Indicates to the **DDSDDataReader** (p. 1272) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDSDDataReader** (p. 1272).

See also

FooDataReader::return_loan (p. 1655)

9.262.2.16 get_key_value() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::get_key_value (
    DDS_KeyedOctets & key_holder,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader::get_key_value (p. 1656)

9.262.2.17 get_key_value() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataReader::get_key_value (
    char * key,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader::get_key_value (p. 1656)

9.262.2.18 lookup_instance() [1/2]

```
virtual DDS_InstanceHandle_t DDSKeyedOctetsDataReader::lookup_instance (
    const DDS_KeyedOctets & key_holder ) [virtual]
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

FooDataReader::lookup_instance (p. 1657)

9.262.2.19 lookup_instance() [2/2]

```
virtual DDS_InstanceHandle_t DDSKeyedOctetsDataReader::lookup_instance (
    const char * key ) [virtual]
```

<<*extension*>> (p. 236) Retrieve the instance handle that corresponds to an instance key.

See also

FooDataReader::lookup_instance (p. 1657)

9.262.2.20 narrow()

```
static DDSKeyedOctetsDataReader * DDSKeyedOctetsDataReader::narrow (
    DDSDataReader * reader ) [static]
```

Narrow the given **DDSDataReader** (p. 1272) pointer to a **DDSKeyedOctetsDataReader** (p. 1456) pointer.

See also

FooDataReader::narrow (p. 1634)

9.263 DDSKeyedOctetsDataWriter Class Reference

<<*interface*>> (p. 236) Instantiates **DataWriter** < **DDS_KeyedOctets** (p. 911) >.

Inheritance diagram for DDSKeyedOctetsDataWriter:

Public Member Functions

- virtual **DDS_InstanceHandle_t register_instance** (const **DDS_KeyedOctets** &instance_data)
Informs RTI Connexx that the application will be modifying a particular instance.
- virtual **DDS_InstanceHandle_t register_instance** (const char *key)
 <<extension>> (p. 236) *Informs RTI Connexx that the application will be modifying a particular instance.*
- virtual **DDS_InstanceHandle_t register_instance_w_timestamp** (const **DDS_KeyedOctets** &instance_data, const **DDS_Time_t** &source_timestamp)
*Performs the same functions as **DDSKeyedOctetsDataWriter::register_instance** (p. 1468) except that the application provides the value for the **source_timestamp**.*
- virtual **DDS_InstanceHandle_t register_instance_w_timestamp** (const char *key, const **DDS_Time_t** &source_timestamp)
 <<extension>> (p. 236) *Performs the same functions as **DDSKeyedOctetsDataWriter::register_instance** (p. 1468) except that the application provides the value for the **source_timestamp**.*
- virtual **DDS_ReturnCode_t unregister_instance** (const **DDS_KeyedOctets** &instance_data, const **DDS_InstanceHandle_t** &handle)
*Reverses the action of **DDSKeyedOctetsDataWriter::register_instance** (p. 1468).*
- virtual **DDS_ReturnCode_t unregister_instance** (const char *key, const **DDS_InstanceHandle_t** &handle)
 <<extension>> (p. 236) *Reverses the action of **DDSKeyedOctetsDataWriter::register_instance** (p. 1468).*
- virtual **DDS_ReturnCode_t unregister_instance_w_timestamp** (const **DDS_KeyedOctets** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSKeyedOctetsDataWriter::unregister_instance** (p. 1469) except that it also provides the value for the **source_timestamp**.*
- virtual **DDS_ReturnCode_t unregister_instance_w_timestamp** (const char *key, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSKeyedOctetsDataWriter::unregister_instance** (p. 1469) except that it also provides the value for the **source_timestamp**.*
- virtual **DDS_KeyedOctets * create_data** (const **DDS_TypeAllocationParams_t** &alloc_params)
Creates a keyed octet sequence.
- virtual **DDS_Boolean delete_data** (**DDS_KeyedOctets** *sample, const **DDS_TypeDeallocationParams_t** &dealloc_params)
*Destroys a string data instance created by **DDSStringDataWriter::create_data** (p. 1569).*
- virtual **DDS_ReturnCode_t write** (const **DDS_KeyedOctets** &instance_data, const **DDS_InstanceHandle_t** &handle)
*Modifies the value of a **DDS_KeyedOctets** (p. 911) data instance.*
- virtual **DDS_ReturnCode_t write** (const char *key, const unsigned char *octets, int length, const **DDS_InstanceHandle_t** &handle)
 <<extension>> (p. 236) *Modifies the value of a **DDS_KeyedOctets** (p. 911) data instance.*
- virtual **DDS_ReturnCode_t write** (const char *key, const **DDS_OctetSeq** &octets, const **DDS_InstanceHandle_t** &handle)
 <<extension>> (p. 236) *Modifies the value of a **DDS_KeyedOctets** (p. 911) data instance.*
- virtual **DDS_ReturnCode_t write_w_timestamp** (const **DDS_KeyedOctets** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also provides the value for the **source_timestamp**.*
- virtual **DDS_ReturnCode_t write_w_timestamp** (const char *key, const unsigned char *octets, int length, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also provides the value for the **source_timestamp**.*

- virtual **DDS_ReturnCode_t write_w_timestamp** (const char *key, const **DDS_OctetSeq** &octets, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also provides the value for the `source_timestamp`.*
- virtual **DDS_ReturnCode_t write_w_params** (const **DDS_KeyedOctets** &instance_data, **DDS_WriteParams_t** ¶ms)
*Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- virtual **DDS_ReturnCode_t write_w_params** (const char *key, const unsigned char *octets, int length, **DDS_WriteParams_t** ¶ms)
*Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- virtual **DDS_ReturnCode_t write_w_params** (const char *key, const **DDS_OctetSeq** &octets, **DDS_WriteParams_t** ¶ms)
*Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- virtual **DDS_ReturnCode_t dispose** (const **DDS_KeyedOctets** &instance_data, const **DDS_InstanceHandle_t** &handle)
Requests the middleware to delete the data.
- virtual **DDS_ReturnCode_t dispose** (const char *key, const **DDS_InstanceHandle_t** &instance_handle)
<<extension>> (p. 236) Requests the middleware to delete the data.
- virtual **DDS_ReturnCode_t dispose_w_timestamp** (const **DDS_KeyedOctets** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same functions as **DDSKeyedOctetsDataWriter::dispose** (p. 1476) except that the application provides the value for the `source_timestamp` that is made available to **DDSDDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068).*
- virtual **DDS_ReturnCode_t dispose_w_timestamp** (const char *key, const **DDS_InstanceHandle_t** &instance_handle, const **DDS_Time_t** &source_timestamp)
*<<extension>> (p. 236) Performs the same functions as **DDSKeyedOctetsDataWriter::dispose** (p. 1476) except that the application provides the value for the `source_timestamp` that is made available to **DDSDDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068).*
- virtual **DDS_ReturnCode_t get_key_value** (**DDS_KeyedOctets** &key_holder, const **DDS_InstanceHandle_t** &handle)
Retrieve the instance `key` that corresponds to an instance `handle`.
- virtual **DDS_ReturnCode_t get_key_value** (char *key, const **DDS_InstanceHandle_t** &handle)
<<extension>> (p. 236) Retrieve the instance `key` that corresponds to an instance `handle`.
- virtual **DDS_InstanceHandle_t lookup_instance** (const **DDS_KeyedOctets** &key_holder)
Retrieve the instance `handle` that corresponds to an instance `key_holder`.
- virtual **DDS_InstanceHandle_t lookup_instance** (const char *key)
<<extension>> (p. 236) Retrieve the instance `handle` that corresponds to an instance `key`.

Static Public Member Functions

- static **DDSKeyedOctetsDataWriter * narrow** (**DDSDDataWriter** *writer)
*Narrow the given **DDSDDataWriter** (p. 1305) pointer to a **DDSKeyedOctetsDataWriter** (p. 1465) pointer.*

9.263.1 Detailed Description

<<*interface*>> (p. 236) Instantiates `DataWriter` < `DDS_KeyedOctets` (p. 911) >.

See also

`FooDataWriter` (p. 1659)

`DDSDataWriter` (p. 1305)

9.263.2 Member Function Documentation

9.263.2.1 `narrow()`

```
static DDSKeyedOctetsDataWriter * DDSKeyedOctetsDataWriter::narrow (  
    DDSDataWriter * writer ) [static]
```

Narrow the given `DDSDataWriter` (p. 1305) pointer to a `DDSKeyedOctetsDataWriter` (p. 1465) pointer.

See also

`FooDataWriter::narrow` (p. 1661)

9.263.2.2 `register_instance()` [1/2]

```
virtual DDS_InstanceHandle_t DDSKeyedOctetsDataWriter::register_instance (  
    const DDS_KeyedOctets & instance_data ) [virtual]
```

Informs RTI Connexx that the application will be modifying a particular instance.

See also

`FooDataWriter::register_instance` (p. 1661)

9.263.2.3 register_instance() [2/2]

```
virtual DDS_InstanceHandle_t DDSKeyedOctetsDataWriter::register_instance (
    const char * key ) [virtual]
```

<<*extension*>> (p. 236) Informs RTI Connexxt that the application will be modifying a particular instance.

See also

FooDataWriter::register_instance (p. 1661)

9.263.2.4 register_instance_w_timestamp() [1/2]

```
virtual DDS_InstanceHandle_t DDSKeyedOctetsDataWriter::register_instance_w_timestamp (
    const DDS_KeyedOctets & instance_data,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same functions as **DDSKeyedOctetsDataWriter::register_instance** (p. 1468) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter::register_instance_w_timestamp (p. 1662)

9.263.2.5 register_instance_w_timestamp() [2/2]

```
virtual DDS_InstanceHandle_t DDSKeyedOctetsDataWriter::register_instance_w_timestamp (
    const char * key,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<*extension*>> (p. 236) Performs the same functions as **DDSKeyedOctetsDataWriter::register_instance** (p. 1468) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter::register_instance_w_timestamp (p. 1662)

9.263.2.6 unregister_instance() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::unregister_instance (
    const DDS_KeyedOctets & instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Reverses the action of **DDSKeyedOctetsDataWriter::register_instance** (p. 1468).

See also

FooDataWriter::unregister_instance (p. 1663)

9.263.2.7 unregister_instance() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::unregister_instance (
    const char * key,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<*extension*>> (p. 236) Reverses the action of **DDSKeyedOctetsDataWriter::register_instance** (p. 1468).

See also

FooDataWriter::unregister_instance (p. 1663)

9.263.2.8 unregister_instance_w_timestamp() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::unregister_instance_w_timestamp (
    const DDS_KeyedOctets & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::unregister_instance** (p. 1469) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::unregister_instance_w_timestamp (p. 1665)

9.263.2.9 unregister_instance_w_timestamp() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::unregister_instance_w_timestamp (
    const char * key,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::unregister_instance** (p. 1469) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::unregister_instance_w_timestamp (p. 1665)

9.263.2.10 create_data()

```
virtual DDS_KeyedOctets * DDSKeyedOctetsDataWriter::create_data (
    const DDS_TypeAllocationParams_t & alloc_params ) [virtual]
```

Creates a keyed octet sequence.

The size of the instance is determined by the DataWriter property **dds.builtin_type.keyed_octets.alloc_size**.

Default size: **dds.builtin_type.keyed_octets.max_size** property of DomainParticipant if defined. Otherwise 2048.

Created instances must be deleted with **DDSKeyedOctetsDataWriter::delete_data** (p. 1471).

Returns

Newly created keyed octet sequence, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types.

9.263.2.11 delete_data()

```
virtual DDS_Boolean DDSKeyedOctetsDataWriter::delete_data (
    DDS_KeyedOctets * sample,
    const DDS_TypeDeallocationParams_t & dealloc_params ) [virtual]
```

Destroys a string data instance created by **DDSStringDataWriter::create_data** (p. 1569).

Returns

DDS_BOOLEAN_TRUE (p. 316) upon successful deletion.

9.263.2.12 write() [1/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write (
    const DDS_KeyedOctets & instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Modifies the value of a **DDS_KeyedOctets** (p. 911) data instance.

See also

FooDataWriter::write (p. 1666)

9.263.2.13 write() [2/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write (
    const char * key,
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Modifies the value of a **DDS_KeyedOctets** (p. 911) data instance.

Parameters

<i>key</i>	<< in >> (p. 237) Instance key.
<i>octets</i>	<< in >> (p. 237) Array of octets to be published.
<i>length</i>	<< in >> (p. 237) Number of octets to be published.
<i>handle</i>	<< in >> (p. 237) Either the handle returned by a previous call to DDSKeyedOctetsDataWriter::register_instance (p. 1468), or else the special value DDS_HANDLE_NIL (p. 76). See FooDataWriter::write (p. 1666).

See also

FooDataWriter::write (p. 1666)

9.263.2.14 write() [3/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write (
    const char * key,
    const DDS_OctetSeq & octets,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Modifies the value of a **DDS_KeyedOctets** (p. 911) data instance.

Parameters

<i>key</i>	<< <i>in</i> >> (p. 237) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 237) Sequence of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 237) Either the handle returned by a previous call to DDSKeyedOctetsDataWriter::register_instance (p. 1468), or else the special value DDS_HANDLE_NIL (p. 76). See FooDataWriter::write (p. 1666).

See also

FooDataWriter::write (p. 1666)

9.263.2.15 write_w_timestamp() [1/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write_w_timestamp (
    const DDS_KeyedOctets & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::write_w_timestamp (p. 1670)

9.263.2.16 write_w_timestamp() [2/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write_w_timestamp (
    const char * key,
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also provides the value for the `source_timestamp`.

Parameters

<i>key</i>	<< <i>in</i> >> (p. 237) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 237) Array of octets to be published.
<i>length</i>	<< <i>in</i> >> (p. 237) Number of octets to be published.
<i>handle</i> Generated by Doxygen	<< <i>in</i> >> (p. 237) Either the handle returned by a previous call to DDSKeyedOctetsDataWriter::register_instance (p. 1468), or else the special value DDS_HANDLE_NIL (p. 76). See FooDataWriter::write (p. 1666).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter::write_w_timestamp (p. 1670).

See also

FooDataWriter::write (p. 1666)

9.263.2.17 write_w_timestamp() [3/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write_w_timestamp (
    const char * key,
    const DDS_OctetSeq & octets,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also provides the value for the `source_timestamp`.

Parameters

<i>key</i>	<< <i>in</i> >> (p. 237) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 237) Sequence of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 237) Either the handle returned by a previous call to DDSKeyedOctetsDataWriter::register_instance (p. 1468), or else the special value DDS_HANDLE_NIL (p. 76). See FooDataWriter::write (p. 1666).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter::write_w_timestamp (p. 1670).

See also

FooDataWriter::write (p. 1666)

9.263.2.18 write_w_params() [1/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write_w_params (
    const DDS_KeyedOctets & instance_data,
    DDS_WriteParams_t & params ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter::write_w_params (p. 1671)

9.263.2.19 write_w_params() [2/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write_w_params (
    const char * key,
    const unsigned char * octets,
    int length,
    DDS_WriteParams_t & params ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

<i>key</i>	<< <i>in</i> >> (p. 237) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 237) Array of octets to be published.
<i>length</i>	<< <i>in</i> >> (p. 237) Number of octets to be published.
<i>params</i>	<< <i>in</i> >> (p. 237) The DDS_WriteParams_t (p. 1234) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See FooDataWriter::write_w_params (p. 1671).

See also

FooDataWriter::write_w_params (p. 1671)

9.263.2.20 write_w_params() [3/3]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::write_w_params (
    const char * key,
    const DDS_OctetSeq & octets,
    DDS_WriteParams_t & params ) [virtual]
```

Performs the same function as **DDSKeyedOctetsDataWriter::write** (p. 1471) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

<i>key</i>	<< <i>in</i> >> (p. 237) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 237) Sequence of octets to be published.
<i>params</i>	<< <i>in</i> >> (p. 237) The DDS_WriteParams_t (p. 1234) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See FooDataWriter::write_w_params (p. 1671).

See also

FooDataWriter::write_w_params (p. 1671)

9.263.2.21 `dispose()` [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::dispose (
    const DDS_KeyedOctets & instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Requests the middleware to delete the data.

See also

FooDataWriter::dispose (p. 1672)

9.263.2.22 `dispose()` [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::dispose (
    const char * key,
    const DDS_InstanceHandle_t & instance_handle ) [virtual]
```

<<**extension**>> (p. 236) Requests the middleware to delete the data.

See also

FooDataWriter::dispose (p. 1672)

9.263.2.23 `dispose_w_timestamp()` [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::dispose_w_timestamp (
    const DDS_KeyedOctets & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same functions as **DDSKeyedOctetsDataWriter::dispose** (p. 1476) except that the application provides the value for the `source_timestamp` that is made available to **DDSDDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068).

See also

FooDataWriter::dispose_w_timestamp (p. 1673)

9.263.2.24 dispose_w_timestamp() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::dispose_w_timestamp (
    const char * key,
    const DDS_InstanceHandle_t & instance_handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<**extension**>> (p. 236) Performs the same functions as **DDSKeyedOctetsDataWriter::dispose** (p. 1476) except that the application provides the value for the `source_timestamp` that is made available to **DDSDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068).

See also

FooDataWriter::dispose_w_timestamp (p. 1673)

9.263.2.25 get_key_value() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::get_key_value (
    DDS_KeyedOctets & key_holder,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Retrieve the instance key that corresponds to an instance handle.

See also

FooDataWriter::get_key_value (p. 1674)

9.263.2.26 get_key_value() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedOctetsDataWriter::get_key_value (
    char * key,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Retrieve the instance key that corresponds to an instance handle.

9.264 DDSKeyedOctetsTypeSupport Class Reference

<<**interface**>> (p. 236) **DDS_KeyedOctets** (p. 911) type support.

Inheritance diagram for DDSKeyedOctetsTypeSupport:

Static Public Member Functions

- static **DDS_ReturnCode_t** **register_type** (**DDSDomainParticipant** *participant, const char *type_name="DDS::KeyedOctets")
*Allows an application to communicate to RTI Connexx the existence of the **DDS_KeyedOctets** (p. 911) data type.*
- static **DDS_ReturnCode_t** **unregister_type** (**DDSDomainParticipant** *participant, const char *type_name="DDS::KeyedOctets")
*Allows an application to unregister the **DDS_KeyedOctets** (p. 911) data type from RTI Connexx. After calling unregister_type, no further communication using this type is possible.*
- static const char * **get_type_name** ()
*Get the default name for the **DDS_KeyedOctets** (p. 911) type.*
- static void **print_data** (const **DDS_KeyedOctets** *a_data)
<<extension>> (p. 236) Print value of data type to standard out.
- static **DDS_TypeCode** * **get_typecode** ()
<<extension>> (p. 236) Retrieves the TypeCode for the Type.
- static **DDS_ReturnCode_t** **serialize_data_to_cdr_buffer** (char *buffer, unsigned int &length, const **DDS_KeyedOctets** *a_data)
<<extension>> (p. 236) Serializes the input sample into a CDR buffer of octets.
- static **DDS_ReturnCode_t** **serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int &length, const **DDS_KeyedOctets** *a_data, **DDS_DataRepresentationId_t** representation)
<<extension>> (p. 236) Serializes the input sample into a buffer of octets.
- static **DDS_ReturnCode_t** **deserialize_data_from_cdr_buffer** (**DDS_KeyedOctets** *a_data, const char *buffer, unsigned int length)
<<extension>> (p. 236) Deserializes a sample from a buffer of octets.
- static **DDS_ReturnCode_t** **data_to_string** (**DDS_KeyedOctets** *sample, char *str, **DDS_UnsignedLong** &str_size, const **DDS_PrintfFormatProperty** &property)
<<extension>> (p. 236) Get the string representation of an input sample.

9.264.1 Detailed Description

<<interface>> (p. 236) **DDS_KeyedOctets** (p. 911) type support.

9.264.2 Member Function Documentation

9.264.2.1 register_type()

```
static DDS_ReturnCode_t DDSKeyedOctetsTypeSupport::register_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::KeyedOctets" ) [static]
```

Allows an application to communicate to RTI Connexx the existence of the **DDS_KeyedOctets** (p. 911) data type.

By default, The **DDS_KeyedOctets** (p. 911) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDSKeyedOctetsTypeSupport::get_type_name** (p. 1482). Therefore, the usage of

this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This method can also be used to register the same **DDSKeyedOctetsTypeSupport** (p. 1478) with a **DDSDomain**↔**Participant** (p. 1335) using different values for the type_name.

If `register_type` is called multiple times with the same **DDSDomainParticipant** (p. 1335) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to register the data type DDS_Octets (p. 954) with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type DDS_KeyedOctets (p. 911) is registered with the participant; this type name is used when creating a new DDSTopic (p. 1601). (See DDSDomainParticipant::create_topic (p. 1366).) The name may not be NULL or longer than 255 characters.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336).
------------	---

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDSDomainParticipant::create_topic (p. 1366)

9.264.2.2 unregister_type()

```
static DDS_ReturnCode_t DDSKeyedOctetsTypeSupport::unregister_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::KeyedOctets" ) [static]
```

Allows an application to unregister the **DDS_KeyedOctets** (p.911) data type from RTI Connex. After calling `unregister_type`, no further communication using this type is possible.

Precondition

The **DDS_KeyedOctets** (p.911) type with `type_name` is registered with the participant and all **DDSTopic** (p. 1601) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDSTopic** (p. 1601) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 335).

Postcondition

All information about the type is removed from RTI Connex. No further communication using this type is possible.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to unregister the data type DDS_KeyedOctets (p. 911) from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type DDS_KeyedOctets (p. 911) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_BAD_PARAMETER (p. 335) or DDS_RETCODE_ERROR (p. 335)
------------	--

MT Safety:

SAFE.

See also

DDSKeyedOctetsTypeSupport::register_type (p. 1479)

9.264.2.3 **get_type_name()**

```
static const char * DDSKeyedOctetsTypeSupport::get_type_name ( ) [static]
```

Get the default name for the **DDS_KeyedOctets** (p. 911) type.

Can be used for calling **DDSKeyedOctetsTypeSupport::register_type** (p. 1479) or creating **DDSTopic** (p. 1601).

Returns

default name for the **DDS_KeyedOctets** (p. 911) type.

See also

DDSKeyedOctetsTypeSupport::register_type (p. 1479)

DDSDomainParticipant::create_topic (p. 1366)

9.264.2.4 **print_data()**

```
static void DDSKeyedOctetsTypeSupport::print_data (
    const DDS_KeyedOctets * a_data ) [static]
```

<<*extension*>> (p. 236) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

<i>a_data</i>	<< <i>in</i> >> (p. 237) DDS_KeyedOctets (p. 911) to be printed.
---------------	---

9.264.2.5 get_typecode()

```
static DDS_TypeCode * DDSKeyedOctetsTypeSupport::get_typecode ( ) [static]
```

<<*extension*>> (p. 236) Retrieves the TypeCode for the Type.

See also

FooTypeSupport::get_typecode (p. 1705)

9.264.2.6 serialize_data_to_cdr_buffer()

```
static DDS_ReturnCode_t DDSKeyedOctetsTypeSupport::serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int & length,
    const DDS_KeyedOctets * a_data ) [static]
```

<<*extension*>> (p. 236) Serializes the input sample into a CDR buffer of octets.

See also

FooTypeSupport::serialize_data_to_cdr_buffer (p. 1703)

9.264.2.7 serialize_data_to_cdr_buffer_ex()

```
static DDS_ReturnCode_t DDSKeyedOctetsTypeSupport::serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int & length,
    const DDS_KeyedOctets * a_data,
    DDS_DataRepresentationId_t representation ) [static]
```

<<*extension*>> (p. 236) Serializes the input sample into a buffer of octets.

See also

FooTypeSupport::serialize_data_to_cdr_buffer (p. 1703)

9.264.2.8 deserialize_data_from_cdr_buffer()

```
static DDS_ReturnCode_t DDSKeyedOctetsTypeSupport::deserialize_data_from_cdr_buffer (
    DDS_KeyedOctets * a_data,
    const char * buffer,
    unsigned int length ) [static]
```

<<**extension**>> (p. 236) Deserializes a sample from a buffer of octets.

See also

FooTypeSupport::deserialize_data_from_cdr_buffer (p. 1704)

9.264.2.9 data_to_string()

```
static DDS_ReturnCode_t DDSKeyedOctetsTypeSupport::data_to_string (
    DDS_KeyedOctets * sample,
    char * str,
    DDS_UnsignedLong & str_size,
    const DDS_PrintFormatProperty & property ) [static]
```

<<**extension**>> (p. 236) Get the string representation of an input sample.

See also

FooTypeSupport::data_to_string (p. 1705)

9.265 DDSKeyedStringDataReader Class Reference

<<**interface**>> (p. 236) Instantiates DataReader < **DDS_KeyedString** (p. 914) >.

Inheritance diagram for DDSKeyedStringDataReader:

Public Member Functions

- virtual **DDS_ReturnCode_t** **read** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data-samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_w_condition** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDSReadCondition** *condition)

*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_instance_w_condition** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &a_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)
*Accesses via **DDSKeyedStringDataReader::read_instance** (p. 1488) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **take_instance_w_condition** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &a_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)
*Accesses via **DDSKeyedStringDataReader::take_instance** (p. 1489) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **read_next_instance** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

- virtual **DDS_ReturnCode_t** **take_next_instance** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDS_SampleStateMask** sample_states= **DDS_ANY_SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

- virtual **DDS_ReturnCode_t** **read_next_instance_w_condition** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)

Accesses via **DDSKeyedStringDataReader::read_next_instance** (p. 1490) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

- virtual **DDS_ReturnCode_t** **take_next_instance_w_condition** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples= **DDS_LENGTH_UNLIMITED**, const **DDS_InstanceHandle_t** &previous_handle= **DDS_HANDLE_NIL**, **DDSReadCondition** *condition=NULL)

Accesses via **DDSKeyedStringDataReader::take_next_instance** (p. 1490) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

- virtual **DDS_ReturnCode_t** **return_loan** (**DDS_KeyedStringSeq** &received_data, **DDS_SampleInfoSeq** &info_seq)

Indicates to the **DDSDDataReader** (p. 1272) that the application is done accessing the collection of *received_data* and *info_seq* obtained by some earlier invocation of *read* or *take* on the **DDSDDataReader** (p. 1272).

- virtual **DDS_ReturnCode_t** **get_key_value** (**DDS_KeyedString** &key_holder, const **DDS_InstanceHandle_t** &handle)

Retrieve the instance *key* that corresponds to an instance *handle*.

- virtual **DDS_ReturnCode_t** **get_key_value** (char *key, const **DDS_InstanceHandle_t** &handle)

<<extension>> (p. 236) Retrieve the instance *key* that corresponds to an instance *handle*.

- virtual **DDS_InstanceHandle_t** **lookup_instance** (const **DDS_KeyedString** &key_holder)

Retrieve the instance *handle* that corresponds to an instance *key_holder*.

- virtual **DDS_InstanceHandle_t** **lookup_instance** (const char *key)

<<extension>> (p. 236) Retrieve the instance *handle* that corresponds to an instance *key*.

Static Public Member Functions

- static **DDSKeyedStringDataReader** * **narrow** (**DDSDDataReader** *reader)

Narrow the given **DDSDDataReader** (p. 1272) pointer to a **DDSKeyedStringDataReader** (p. 1484) pointer.

9.265.1 Detailed Description

<<interface>> (p. 236) Instantiates **DataReader** < **DDS_KeyedString** (p. 914) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string in a destination data sample is NULL, the middleware will allocate a new string for you of sufficient length to hold the received string. The new string will be allocated with **DDS_String_alloc** (p. 547); the sample's destructor will delete it.

A non- NULL string is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

FooDataReader (p. 1632)

DDSDDataReader (p. 1272)

9.265.2 Member Function Documentation

9.265.2.1 read()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::read (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::read (p. 1635)

9.265.2.2 take()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::take (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data-samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::take (p. 1636)

9.265.2.3 read_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::read_w_condition (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Accesses via **DDSKeyedStringDataReader::read** (p. 1487) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_w_condition (p. 1640)

9.265.2.4 take_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::take_w_condition (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Analogous to **DDSKeyedStringDataReader::read_w_condition** (p.1487) except it accesses samples via the **DDSKeyedStringDataReader::take** (p.1487) operation.

See also

FooDataReader::take_w_condition (p.1641)

9.265.2.5 read_next_sample()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::read_next_sample (
    DDS_KeyedString & received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDataReader** (p.1272).

See also

FooDataReader::read_next_sample (p.1642)

9.265.2.6 take_next_sample()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::take_next_sample (
    DDS_KeyedString & received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDataReader** (p.1272).

See also

FooDataReader::take_next_sample (p.1643)

9.265.2.7 read_instance()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::read_instance (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & a_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::read_instance (p. 1645)

9.265.2.8 take_instance()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::take_instance (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & a_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::take_instance (p. 1646)

9.265.2.9 read_instance_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::read_instance_w_condition (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & a_handle = DDS_HANDLE_NIL,
    DDSReadCondition * condition = NULL ) [virtual]
```

Accesses via **DDSKeyedStringDataReader::read_instance** (p. 1488) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_instance_w_condition (p. 1647)

9.265.2.10 take_instance_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::take_instance_w_condition (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & a_handle = DDS_HANDLE_NIL,
    DDSReadCondition * condition = NULL ) [virtual]
```

Accesses via **DDSKeyedStringDataReader::take_instance** (p. 1489) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::take_instance_w_condition (p. 1648)

9.265.2.11 read_next_instance()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::read_next_instance (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::read_next_instance (p. 1650)

9.265.2.12 take_next_instance()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::take_next_instance (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::take_next_instance (p. 1651)

9.265.2.13 read_next_instance_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::read_next_instance_w_condition (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDSReadCondition * condition = NULL ) [virtual]
```

Accesses via **DDSKeyedStringDataReader::read_next_instance** (p. 1490) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_next_instance_w_condition (p. 1653)

9.265.2.14 take_next_instance_w_condition()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::take_next_instance_w_condition (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    const DDS_InstanceHandle_t & previous_handle = DDS_HANDLE_NIL,
    DDSReadCondition * condition = NULL ) [virtual]
```

Accesses via **DDSKeyedStringDataReader::take_next_instance** (p. 1490) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::take_next_instance_w_condition (p. 1654)

9.265.2.15 return_loan()

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::return_loan (
    DDS_KeyedStringSeq & received_data,
    DDS_SampleInfoSeq & info_seq ) [virtual]
```

Indicates to the **DDSDDataReader** (p. 1272) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDSDDataReader** (p. 1272).

See also

FooDataReader::return_loan (p. 1655)

9.265.2.16 get_key_value() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::get_key_value (
    DDS_KeyedString & key_holder,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader::get_key_value (p. 1656)

9.265.2.17 get_key_value() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataReader::get_key_value (
    char * key,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataReader::get_key_value (p. 1656)

9.265.2.18 lookup_instance() [1/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataReader::lookup_instance (
    const DDS_KeyedString & key_holder ) [virtual]
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

FooDataReader::lookup_instance (p. 1657)

9.265.2.19 lookup_instance() [2/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataReader::lookup_instance (
    const char * key ) [virtual]
```

<<**extension**>> (p. 236) Retrieve the instance handle that corresponds to an instance key.

See also

FooDataReader::lookup_instance (p. 1657)

9.265.2.20 narrow()

```
static DDSKeyedStringDataReader * DDSKeyedStringDataReader::narrow (
    DDSDataReader * reader ) [static]
```

Narrow the given **DDSDataReader** (p. 1272) pointer to a **DDSKeyedStringDataReader** (p. 1484) pointer.

See also

FooDataReader::narrow (p. 1634)

9.266 DDSKeyedStringDataWriter Class Reference

<<**interface**>> (p. 236) Instantiates `DataWriter < DDS_KeyedString` (p. 914) >.

Inheritance diagram for DDSKeyedStringDataWriter:

Public Member Functions

- virtual **DDS_InstanceHandle_t register_instance** (const **DDS_KeyedString** &instance_data)
Informs RTI Connexx that the application will be modifying a particular instance.
- virtual **DDS_InstanceHandle_t register_instance** (const char *key)
 <<extension>> (p. 236) *Informs RTI Connexx that the application will be modifying a particular instance.*
- virtual **DDS_InstanceHandle_t register_instance_w_timestamp** (const **DDS_KeyedString** &instance_data, const **DDS_Time_t** &source_timestamp)
*Performs the same functions as **DDSKeyedStringDataWriter::register_instance** (p. 1496) except that the application provides the value for the *source_timestamp*.*
- virtual **DDS_InstanceHandle_t register_instance_w_timestamp** (const char *key, const **DDS_Time_t** &source_timestamp)
 <<extension>> (p. 236) *Performs the same functions as **DDSKeyedStringDataWriter::register_instance** (p. 1496) except that the application provides the value for the *source_timestamp*.*
- virtual **DDS_ReturnCode_t unregister_instance** (const **DDS_KeyedString** &instance_data, const **DDS_InstanceHandle_t** &handle)
*Reverses the action of **DDSKeyedStringDataWriter::register_instance** (p. 1496).*
- virtual **DDS_ReturnCode_t unregister_instance** (const char *key, const **DDS_InstanceHandle_t** &handle)
 <<extension>> (p. 236) *Reverses the action of **DDSKeyedStringDataWriter::register_instance** (p. 1496).*
- virtual **DDS_ReturnCode_t unregister_instance_w_timestamp** (const **DDS_KeyedString** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSKeyedStringDataWriter::unregister_instance** (p. 1497) except that it also provides the value for the *source_timestamp*.*
- virtual **DDS_ReturnCode_t unregister_instance_w_timestamp** (const char *key, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
 <<extension>> (p. 236) *Performs the same function as **DDSKeyedStringDataWriter::unregister_instance** (p. 1497) except that it also provides the value for the *source_timestamp*.*
- virtual **DDS_KeyedString * create_data** (const **DDS_TypeAllocationParams_t** &alloc_params)
Creates a keyed string data instance.
- virtual **DDS_Boolean delete_data** (**DDS_KeyedString** *sample, const **DDS_TypeDeallocationParams_t** &dealloc_params)
*Destroys a keyed string data instance created by **DDSKeyedStringDataWriter::create_data** (p. 1498).*
- virtual **DDS_ReturnCode_t write** (const **DDS_KeyedString** &instance_data, const **DDS_InstanceHandle_t** &handle)
*Modifies the value of a **DDS_KeyedString** (p. 914) data instance.*
- virtual **DDS_ReturnCode_t write** (const char *key, const char *str, const **DDS_InstanceHandle_t** &handle)
 <<extension>> (p. 236) *Modifies the value of a **DDS_KeyedString** (p. 914) data instance.*
- virtual **DDS_ReturnCode_t write_w_timestamp** (const **DDS_KeyedString** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also provides the value for the *source_timestamp*.*
- virtual **DDS_ReturnCode_t write_w_timestamp** (const char *key, const char *str, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
 <<extension>> (p. 236) *Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also provides the value for the *source_timestamp*.*
- virtual **DDS_ReturnCode_t write_w_params** (const **DDS_KeyedString** &instance_data, **DDS_WriteParams_t** ¶ms)
*Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*

- virtual **DDS_ReturnCode_t write_w_params** (const char *key, const char *str, **DDS_WriteParams_t** ¶ms)
 <<extension>> (p. 236) Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.
- virtual **DDS_ReturnCode_t dispose** (const **DDS_KeyedString** &instance_data, const **DDS_InstanceHandle_t** &handle)
 Requests the middleware to delete the data.
- virtual **DDS_ReturnCode_t dispose** (const char *key, const **DDS_InstanceHandle_t** &instance_handle)
 <<extension>> (p. 236) Requests the middleware to delete the data.
- virtual **DDS_ReturnCode_t dispose_w_timestamp** (const **DDS_KeyedString** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
 Performs the same functions as **DDSKeyedStringDataWriter::dispose** (p. 1501) except that the application provides the value for the *source_timestamp* that is made available to **DDSDDataReader** (p. 1272) objects by means of the *source_timestamp* attribute inside the **DDS_SampleInfo** (p. 1068).
- virtual **DDS_ReturnCode_t dispose_w_timestamp** (const char *key, const **DDS_InstanceHandle_t** &instance_handle, const **DDS_Time_t** &source_timestamp)
 <<extension>> (p. 236) Performs the same functions as **DDSKeyedStringDataWriter::dispose** (p. 1501) except that the application provides the value for the *source_timestamp* that is made available to **DDSDDataReader** (p. 1272) objects by means of the *source_timestamp* attribute inside the **DDS_SampleInfo** (p. 1068).
- virtual **DDS_ReturnCode_t get_key_value** (**DDS_KeyedString** &key_holder, const **DDS_InstanceHandle_t** &handle)
 Retrieve the instance *key* that corresponds to an instance *handle*.
- virtual **DDS_ReturnCode_t get_key_value** (char *key, const **DDS_InstanceHandle_t** &handle)
 <<extension>> (p. 236) Retrieve the instance *key* that corresponds to an instance *handle*.
- virtual **DDS_InstanceHandle_t lookup_instance** (const **DDS_KeyedString** &key_holder)
 Retrieve the instance *handle* that corresponds to an instance *key_holder*.
- virtual **DDS_InstanceHandle_t lookup_instance** (const char *key)
 <<extension>> (p. 236) Retrieve the instance *handle* that corresponds to an instance *key*.

Static Public Member Functions

- static **DDSKeyedStringDataWriter * narrow** (**DDSDDataWriter** *writer)
 Narrow the given **DDSDDataWriter** (p. 1305) pointer to a **DDSKeyedStringDataWriter** (p. 1493) pointer.

9.266.1 Detailed Description

<<**interface**>> (p. 236) Instantiates **DataWriter** < **DDS_KeyedString** (p. 914) >.

See also

FooDataWriter (p. 1659)

DDSDDataWriter (p. 1305)

9.266.2 Member Function Documentation

9.266.2.1 narrow()

```
static DDSKeyedStringDataWriter * DDSKeyedStringDataWriter::narrow (
    DDSDataWriter * writer ) [static]
```

Narrow the given **DDSDataWriter** (p. 1305) pointer to a **DDSKeyedStringDataWriter** (p. 1493) pointer.

See also

FooDataWriter::narrow (p. 1661)

9.266.2.2 register_instance() [1/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataWriter::register_instance (
    const DDS_KeyedString & instance_data ) [virtual]
```

Informs RTI Connexx that the application will be modifying a particular instance.

See also

FooDataWriter::register_instance (p. 1661)

9.266.2.3 register_instance() [2/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataWriter::register_instance (
    const char * key ) [virtual]
```

<<**extension**>> (p. 236) Inform s RTI Connexx that the application will be modifying a particular instance.

See also

FooDataWriter::register_instance (p. 1661)

9.266.2.4 register_instance_w_timestamp() [1/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataWriter::register_instance_w_timestamp (
    const DDS_KeyedString & instance_data,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same functions as **DDSKeyedStringDataWriter::register_instance** (p. 1496) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter::register_instance_w_timestamp (p. 1662)

9.266.2.5 register_instance_w_timestamp() [2/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataWriter::register_instance_w_timestamp (
    const char * key,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<**extension**>> (p. 236) Performs the same functions as **DDSKeyedStringDataWriter::register_instance** (p. 1496) except that the application provides the value for the `source_timestamp`.

See also

FooDataWriter::register_instance_w_timestamp (p. 1662)

9.266.2.6 unregister_instance() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::unregister_instance (
    const DDS_KeyedString & instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Reverses the action of **DDSKeyedStringDataWriter::register_instance** (p. 1496).

See also

FooDataWriter::unregister_instance (p. 1663)

9.266.2.7 unregister_instance() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::unregister_instance (
    const char * key,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Reverses the action of **DDSKeyedStringDataWriter::register_instance** (p. 1496).

See also

FooDataWriter::unregister_instance (p. 1663)

9.266.2.8 unregister_instance_w_timestamp() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::unregister_instance_w_timestamp (
    const DDS_KeyedString & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSKeyedStringDataWriter::unregister_instance** (p. 1497) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::unregister_instance_w_timestamp (p. 1665)

9.266.2.9 unregister_instance_w_timestamp() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::unregister_instance_w_timestamp (
    const char * key,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<**extension**>> (p. 236) Performs the same function as **DDSKeyedStringDataWriter::unregister_instance** (p. 1497) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::unregister_instance_w_timestamp (p. 1665)

9.266.2.10 create_data()

```
virtual DDS_KeyedString * DDSKeyedStringDataWriter::create_data (
    const DDS_TypeAllocationParams_t & alloc_params ) [virtual]
```

Creates a keyed string data instance.

The size of the instance including the NULL terminated character is determined by the DataWriter property **dds.builtin_type.keyed_string.alloc_size**.

Default size: **dds.builtin_type.keyed_string.max_size** property of DomainParticipant if defined. Otherwise 1024.

Created instances must be deleted with **DDSKeyedStringDataWriter::delete_data** (p. 1498).

Returns

Newly created keyed string data, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types

9.266.2.11 delete_data()

```
virtual DDS_Boolean DDSKeyedStringDataWriter::delete_data (
    DDS_KeyedString * sample,
    const DDS_TypeDeallocationParams_t & dealloc_params ) [virtual]
```

Destroys a keyed string data instance created by **DDSKeyedStringDataWriter::create_data** (p. 1498).

Returns

DDS_BOOLEAN_TRUE (p. 316) upon successful deletion.

9.266.2.12 write() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::write (
    const DDS_KeyedString & instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Modifies the value of a **DDS_KeyedString** (p. 914) data instance.

See also

FooDataWriter::write (p. 1666)

9.266.2.13 write() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::write (
    const char * key,
    const char * str,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Modifies the value of a **DDS_KeyedString** (p. 914) data instance.

See also

FooDataWriter::write (p. 1666)

9.266.2.14 write_w_timestamp() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::write_w_timestamp (
    const DDS_KeyedString & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::write_w_timestamp (p. 1670)

9.266.2.15 write_w_timestamp() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::write_w_timestamp (
    const char * key,
    const char * str,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<**extension**>> (p. 236) Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::write_w_timestamp (p. 1670)

9.266.2.16 write_w_params() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::write_w_params (
    const DDS_KeyedString & instance_data,
    DDS_WriteParams_t & params ) [virtual]
```

Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter::write_w_params (p. 1671)

9.266.2.17 write_w_params() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::write_w_params (
    const char * key,
    const char * str,
    DDS_WriteParams_t & params ) [virtual]
```

<<**extension**>> (p. 236) Performs the same function as **DDSKeyedStringDataWriter::write** (p. 1499) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter::write_w_params (p. 1671)

9.266.2.18 dispose() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::dispose (
    const DDS_KeyedString & instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Requests the middleware to delete the data.

See also

FooDataWriter::dispose (p. 1672)

9.266.2.19 dispose() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::dispose (
    const char * key,
    const DDS_InstanceHandle_t & instance_handle ) [virtual]
```

<<**extension**>> (p. 236) Requests the middleware to delete the data.

See also

FooDataWriter::dispose (p. 1672)

9.266.2.20 dispose_w_timestamp() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::dispose_w_timestamp (
    const DDS_KeyedString & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same functions as **DDSKeyedStringDataWriter::dispose** (p. 1501) except that the application provides the value for the `source_timestamp` that is made available to **DDSDDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068).

See also

FooDataWriter::dispose_w_timestamp (p. 1673)

9.266.2.21 dispose_w_timestamp() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::dispose_w_timestamp (
    const char * key,
    const DDS_InstanceHandle_t & instance_handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<*extension*>> (p. 236) Performs the same functions as **DDSKeyedStringDataWriter::dispose** (p. 1501) except that the application provides the value for the `source_timestamp` that is made available to **DDSDDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068).

See also

FooDataWriter::dispose_w_timestamp (p. 1673)

9.266.2.22 get_key_value() [1/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::get_key_value (
    DDS_KeyedString & key_holder,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Retrieve the instance key that corresponds to an instance handle.

See also

FooDataWriter::get_key_value (p. 1674)

9.266.2.23 get_key_value() [2/2]

```
virtual DDS_ReturnCode_t DDSKeyedStringDataWriter::get_key_value (
    char * key,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Retrieve the instance `key` that corresponds to an instance `handle`.

See also

FooDataWriter::get_key_value (p. 1674)

9.266.2.24 lookup_instance() [1/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataWriter::lookup_instance (
    const DDS_KeyedString & key_holder ) [virtual]
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

FooDataWriter::lookup_instance (p. 1675)

9.266.2.25 lookup_instance() [2/2]

```
virtual DDS_InstanceHandle_t DDSKeyedStringDataWriter::lookup_instance (
    const char * key ) [virtual]
```

<<**extension**>> (p. 236) Retrieve the instance `handle` that corresponds to an instance `key`.

See also

FooDataWriter::lookup_instance (p. 1675)

9.267 DDSKeyedStringTypeSupport Class Reference

<<**interface**>> (p. 236) Keyed string type support.

Inheritance diagram for DDSKeyedStringTypeSupport:

Static Public Member Functions

- static **DDS_ReturnCode_t** **register_type** (**DDSDomainParticipant** *participant, const char *type_name="DDS::KeyedString")
*Allows an application to communicate to RTI Connexx the existence of the **DDS_KeyedString** (p. 914) data type.*
- static **DDS_ReturnCode_t** **unregister_type** (**DDSDomainParticipant** *participant, const char *type_name="DDS::KeyedString")
*Allows an application to unregister the **DDS_KeyedString** (p. 914) data type from RTI Connexx. After calling unregister_type, no further communication using this type is possible.*
- static const char * **get_type_name** ()
*Get the default name for the **DDS_KeyedString** (p. 914) type.*
- static void **print_data** (const **DDS_KeyedString** *a_data)
<<extension>> (p. 236) Print value of data type to standard out.
- static **DDS_TypeCode** * **get_typecode** ()
<<extension>> (p. 236) Retrieves the TypeCode for the Type.
- static **DDS_ReturnCode_t** **serialize_data_to_cdr_buffer** (char *buffer, unsigned int &length, const **DDS_KeyedString** *a_data)
<<extension>> (p. 236) Serializes the input sample into a CDR buffer of octets.
- static **DDS_ReturnCode_t** **serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int &length, const **DDS_KeyedString** *a_data, **DDS_DataRepresentationId_t** representation)
<<extension>> (p. 236) Serializes the input sample into a buffer of octets.
- static **DDS_ReturnCode_t** **deserialize_data_from_cdr_buffer** (**DDS_KeyedString** *a_data, const char *buffer, unsigned int length)
<<extension>> (p. 236) Deserializes a sample from a buffer of octets.
- static **DDS_ReturnCode_t** **data_to_string** (**DDS_KeyedString** *sample, char *str, **DDS_UnsignedLong** &str_size, const **DDS_PrintfFormatProperty** &property)
<<extension>> (p. 236) Get the string representation of an input sample.

9.267.1 Detailed Description

<<*interface*>> (p. 236) Keyed string type support.

9.267.2 Member Function Documentation

9.267.2.1 register_type()

```
static DDS_ReturnCode_t DDSKeyedStringTypeSupport::register_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::KeyedString" ) [static]
```

Allows an application to communicate to RTI Connexx the existence of the **DDS_KeyedString** (p. 914) data type.

By default, The **DDS_KeyedString** (p. 914) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDSKeyedStringTypeSupport::get_type_name** (p. 1507). Therefore, the usage

of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This method can also be used to register the same **DDSKeyedStringTypeSupport** (p. 1503) with a **DDSDomain**↔**Participant** (p. 1335) using different values for the `type_name`.

If `register_type` is called multiple times with the same **DDSDomainParticipant** (p. 1335) and `type_name`, the second (and subsequent) registrations are ignored by the operation.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to register the data type DDS_KeyedString (p. 914) with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type DDS_KeyedString (p. 914) is registered with the participant; this type name is used when creating a new DDSTopic (p. 1601). (See DDSDomainParticipant::create_topic (p. 1366).) The name may not be NULL or longer than 255 characters.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336).
------------	---

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

DDSDomainParticipant::create_topic (p. 1366)

9.267.2.2 unregister_type()

```
static DDS_ReturnCode_t DDSKeyedStringTypeSupport::unregister_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::KeyedString" ) [static]
```

Allows an application to unregister the **DDS_KeyedString** (p. 914) data type from RTI Connex. After calling unregister↵_type, no further communication using this type is possible.

Precondition

The **DDS_KeyedString** (p. 914) type with *type_name* is registered with the participant and all **DDSTopic** (p. 1601) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDSTopic** (p. 1601) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 335).

Postcondition

All information about the type is removed from RTI Connex. No further communication using this type is possible.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to unregister the data type DDS_KeyedString (p. 914) from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type DDS_KeyedString (p. 914) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_BAD_PARAMETER (p. 335) or DDS_RETCODE_ERROR (p. 335)
------------	--

MT Safety:

SAFE.

9.267.2.3 get_type_name()

```
static const char * DDSKeyedStringTypeSupport::get_type_name ( ) [static]
```

Get the default name for the **DDS_KeyedString** (p. 914) type.

Can be used for calling **DDSKeyedStringTypeSupport::register_type** (p. 1504) or creating **DDSTopic** (p. 1601).

Returns

default name for the **DDS_KeyedString** (p. 914) type.

9.268 DDSListener Class Reference

<<**interface**>> (p. 236) Abstract base class for all Listener interfaces.

Inheritance diagram for DDSListener:

9.268.1 Detailed Description

<<*interface*>> (p. 236) Abstract base class for all Listener interfaces.

Entity:

DDSEntity (p. 1446)

QoS:

QoS Policies (p. 352)

Status:

Status Kinds (p. 336)

All the supported kinds of concrete **DDSListener** (p. 1509) interfaces (one per concrete **DDSEntity** (p. 1446) type) derive from this root and add methods whose prototype depends on the concrete Listener.

Listeners provide a way for RTI Connex to asynchronously alert the application when there are relevant status changes.

Almost every application will have to implement listener interfaces.

Each dedicated listener presents a list of operations that correspond to the relevant communication status changes to which an application may respond.

The same **DDSListener** (p. 1509) instance may be shared among multiple entities if you so desire. Consequently, the provided parameter contains a reference to the concerned **DDSEntity** (p. 1446).

9.268.2 Access to Plain Communication Status

The general mapping between the plain communication statuses (see **Status Kinds** (p. 336)) and the listeners' operations is as follows:

- For each communication status, there is a corresponding operation whose name is `on_<communication_↵_status>()`, which takes a parameter of type `<communication_status>` as listed in **Status Kinds** (p. 336).
- `on_<communication_status>` is available on the relevant **DDSEntity** (p. 1446) as well as those that embed it, as expressed in the following figure:

listener processing. The most *specific* relevant enabled listener is called."

- When the application attaches a listener on an entity, it must set a mask. The mask indicates to RTI Connex which operations are enabled within the listener (cf. operation **DDSEntity** (p. 1446) `set_listener()`).
- When a plain communication status changes, RTI Connex triggers the most specific relevant listener operation that is enabled. In case the most specific relevant listener operation corresponds to an application-installed 'nil' listener the operation will be considered handled by a NO-OP operation that does not reset the communication status.

This behavior allows the application to set a default behavior (e.g., in the listener associated with the **DDSDomain**↵**Participant** (p. 1335)) and to set dedicated behaviors only where needed.

9.268.3 Access to Read Communication Status

The two statuses related to data arrival are treated slightly differently. Since they constitute the core purpose of the Data Distribution Service, there is no need to provide a default mechanism (as is done for the plain communication statuses above).

The rule is as follows. Each time the read communication status changes:

- First, RTI Connex tries to trigger the **DDSSubscriberListener::on_data_on_readers** (p. 1598) with a parameter of the related **DDSSubscriber** (p. 1576);
- If this does not succeed (there is no listener or the operation is not enabled), RTI Connex tries to trigger **DDSDataReaderListener::on_data_available** (p. 1301) on all the related **DDSDataReaderListener** (p. 1299) objects, with a parameter of the related **DDSDataReader** (p. 1272).

The rationale is that either the application is interested in relations among data arrivals and it must use the first option (and then get the corresponding **DDSDataReader** (p. 1272) objects by calling **DDSSubscriber::get_datareaders** (p. 1590) on the related **DDSSubscriber** (p. 1576) and then get the data by calling **FooDataReader::read** (p. 1635) or **FooDataReader::take** (p. 1636) on the returned **DDSDataReader** (p. 1272) objects), or it wants to treat each **DDSDataReader** (p. 1272) independently and it may choose the second option (and then get the data by calling **FooDataReader::read** (p. 1635) or **FooDataReader::take** (p. 1636) on the related **DDSDataReader** (p. 1272)).

Note that if **DDSSubscriberListener::on_data_on_readers** (p. 1598) is called, RTI Connex will *not* try to call **DDSDataReaderListener::on_data_available** (p. 1301). However, an application can force a call to the **DDSDataReader** (p. 1272) objects that have data by calling **DDSSubscriber::notify_datareaders** (p. 1592).

9.268.4 Operations Allowed in Listener Callbacks

The operations that are allowed in **DDSListener** (p. 1509) callbacks depend on the **DDS_ExclusiveAreaQosPolicy** (p. 895) QoS policy of the **DDSEntity** (p. 1446) to which the **DDSListener** (p. 1509) is attached -- or in the case of a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272) listener, on the **DDS_ExclusiveAreaQosPolicy** (p. 895) QoS of the parent **DDSPublisher** (p. 1534) or **DDSSubscriber** (p. 1576). For instance, the **DDS_ExclusiveAreaQosPolicy** (p. 895) settings of a **DDSSubscriber** (p. 1576) will determine which operations are allowed within the callbacks of the listeners associated with all the DataReaders created through that **DDSSubscriber** (p. 1576).

Note: these restrictions do not apply to builtin topic listener callbacks.

Regardless of whether **DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area** (p. 896) is set to **DDS_BOOLEAN_TRUE** (p. 316) or **DDS_BOOLEAN_FALSE** (p. 316), the following operations are *not* allowed:

- Within any listener callback, deleting the entity to which the **DDSListener** (p. 1509) is attached
- Within a **DDSTopic** (p. 1601) listener callback, any operations on any subscribers, readers, publishers or writers

An attempt to call a disallowed method from within a callback will result in **DDS_RETCODE_ILLEGAL_OPERATION** (p. 336).

If **DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area** (p. 896) is set to **DDS_BOOLEAN_FALSE** (p. 316), the setting which allows more concurrency among RTI Connex threads, the following are *not* allowed:

- Within any listener callback, creating any entity
- Within any listener callback, deleting any entity
- Within any listener callback, enabling any entity
- Within any listener callback, setting the QoS of any entities
- Within a **DDSDDataReader** (p. 1272) or **DDSSubscriber** (p. 1576) listener callback, invoking any operation on any other **DDSSubscriber** (p. 1576) or on any **DDSDDataReader** (p. 1272) belonging to another **DDSSubscriber** (p. 1576).
- Within a **DDSDDataReader** (p. 1272) or **DDSSubscriber** (p. 1576) listener callback, invoking any operation on any **DDSPublisher** (p. 1534) (or on any **DDSDDataWriter** (p. 1305) belonging to such a **DDSPublisher** (p. 1534)) that has **DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area** (p. 896) set to **DDS_BOOLEAN_TRUE** (p. 316).
- Within a **DDSDDataWriter** (p. 1305) of **DDSPublisher** (p. 1534) listener callback, invoking any operation on another Publisher or on a **DDSDDataWriter** (p. 1305) belonging to another **DDSPublisher** (p. 1534).
- Within a **DDSDDataWriter** (p. 1305) of **DDSPublisher** (p. 1534) listener callback, invoking any operation on any **DDSSubscriber** (p. 1576) or **DDSDDataReader** (p. 1272).

An attempt to call a disallowed method from within a callback will result in **DDS_RETCODE_ILLEGAL_OPERATION** (p. 336).

The above limitations can be lifted by setting **DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area** (p. 896) to **DDS_BOOLEAN_TRUE** (p. 316) on the **DDSPublisher** (p. 1534) or **DDSSubscriber** (p. 1576) (or on the **DDSPublisher** (p. 1534) or **DDSSubscriber** (p. 1576) of the **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272)) to which the listener is attached. However, the application will pay the cost of reduced concurrency between the affected publishers and subscribers.

9.268.5 Best Practices with Listeners

Note that all the issues described below are avoided by using **DDSWaitSet** (p. 1613).

Avoid blocking or performing a lot of processing in Listener callbacks

Listeners are invoked by internal threads that perform critical functions within the middleware and need to run in a timely manner. By default, Connex DDS creates a few threads to use to receive data and only a single thread to handle periodic events.

Because of this, user applications installing Listeners should never block in a Listener callback. There are several negative consequences of blocking in a listener callback:

- The application may lose data for the DataReader the listener is installed on, because the receive thread is not removing it from the socket buffer and it gets overwritten.
- The application may receive strictly reliable data with a delay, because the receive thread is not removing it from the socket buffer and if it gets overwritten it must be re-sent.
- The application may lose or delay data for other DataReaders, because by default all DataReaders created with the same DomainParticipant share the same threads.
- The application may not be notified of periodic events on time

If the application needs to make a blocking call when data is available, or when another event occurs, the application should use **DDSWaitSet** (p. 1613).

Avoid taking application mutexes/semaphores in Listener callbacks

Taking application mutexes/semaphores within a Listener callback may lead to unexpected deadlock scenarios.

When a Listener callback is invoked the EA (Exclusive Area) of the Entity 'E' to which the callback applies is taken by the middleware.

If the application takes an application mutex 'M' within a critical section in which the application makes DDS calls affecting 'E', this may lead to following deadlock:

The middleware thread is within the entity EA trying to acquire the mutex 'M'. At the same time, the application thread has acquired 'M' and is blocked trying to acquire the entity EA.

Do not write data with a DataWriter within the on_data_available callback

Avoid writing data with a DataWriter within the **DDSDataReaderListener::on_data_available()** (p. 1301) callback. If the write operation blocks because e.g. the send window is full, this will lead to a deadlock.

Do not call wait_for_acknowledgements within the on_data_available callback

Do not call the **DDSDataWriter::wait_for_acknowledgments** (p. 1318) within the **DDSDataReaderListener::on_data_available()** (p. 1301) callback. This will lead to deadlock.

*Narrow the given **DDSTopicDescription** (p. 1608) pointer to a **DDSMultiTopic** (p. 1513) pointer.*

9.269.1 Detailed Description

[Not supported (optional)] <<*interface*>> (p. 236) A specialization of **DDSTopicDescription** (p. 1608) that allows subscriptions that combine/filter/rearrange data coming from several topics.

DDSMultiTopic (p. 1513) allows a more sophisticated subscription that can select and combine data received from multiple topics into a single resulting type (specified by the inherited `type_name`). The data will then be filtered (selection) and possibly re-arranged (aggregation/projection) according to a `subscription_expression` with parameters `expression_parameters`.

- The `subscription_expression` is a string that identifies the selection and re-arrangement of data from the associated topics. It is similar to an SQL statement where the SELECT part provides the fields to be kept, the FROM part provides the names of the topics that are searched for those fields, and the WHERE clause gives the content filter. The Topics combined may have different types but they are restricted in that the type of the fields used for the NATURAL JOIN operation must be the same.
- The `expression_parameters` attribute is a sequence of strings that give values to the 'parameters' (i.e. "%n" tokens) in the `subscription_expression`. The number of supplied parameters must fit with the requested values in the `subscription_expression` (i.e. the number of n tokens).
- **DDSDataReader** (p. 1272) entities associated with a **DDSMultiTopic** (p. 1513) are alerted of data modifications by the usual **DDSListener** (p. 1509) or **DDSWaitSet** (p. 1613) / **DDSCondition** (p. 1260) mechanisms whenever modifications occur to the data associated with any of the topics relevant to the **DDSMultiTopic** (p. 1513).

Note that the source for data may not be restricted to a single topic.

DDSDataReader (p. 1272) entities associated with a **DDSMultiTopic** (p. 1513) may access instances that are "constructed" at the **DDSDataReader** (p. 1272) side from the instances written by multiple **DDSDataWriter** (p. 1305) entities. The **DDSMultiTopic** (p. 1513) access instance will begin to exist as soon as all the constituting **DDSTopic** (p. 1601) instances are in existence. The `view_state` and `instance_state` is computed from the corresponding states of the constituting instances:

- The `view_state` of the **DDSMultiTopic** (p. 1513) instance is **DDS_NEW_VIEW_STATE** (p. 159) if at least one of the constituting instances has `view_state = DDS_NEW_VIEW_STATE` (p. 159). Otherwise, it will be **DDS_NOT_NEW_VIEW_STATE** (p. 159).
- The `instance_state` of the **DDSMultiTopic** (p. 1513) instance is **DDS_ALIVE_INSTANCE_STATE** (p. 161) if the `instance_state` of all the constituting **DDSTopic** (p. 1601) instances is **DDS_ALIVE_INSTANCE_STATE** (p. 161). It is **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) if at least one of the constituting **DDSTopic** (p. 1601) instances is **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161). Otherwise, it is **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).

Queries and Filters Syntax (p. 178) describes the syntax of `subscription_expression` and `expression_parameters`.

9.269.2 Member Function Documentation

9.269.2.1 narrow()

```
static DDSMultiTopic * DDSMultiTopic::narrow (
    DDSTopicDescription * topic_description ) [static]
```

Narrow the given **DDSTopicDescription** (p. 1608) pointer to a **DDSMultiTopic** (p. 1513) pointer.

Returns

DDSMultiTopic (p. 1513) if this **DDSTopicDescription** (p. 1608) is a **DDSMultiTopic** (p. 1513). Otherwise, return NULL.

9.269.2.2 get_subscription_expression()

```
virtual const char * DDSMultiTopic::get_subscription_expression ( ) [pure virtual]
```

Get the expression for this **DDSMultiTopic** (p. 1513).

The expressions syntax is described in the DDS specification. It is specified when the **DDSMultiTopic** (p. 1513) is created.

Returns

`subscription_expression` of the **DDSMultiTopic** (p. 1513).

9.269.2.3 get_expression_parameters()

```
virtual DDS_ReturnCode_t DDSMultiTopic::get_expression_parameters (
    DDS_StringSeq & parameters ) [pure virtual]
```

Get the expression parameters.

The expressions syntax is described in the DDS specification.

The `parameters` is either specified on the last successful call to **DDSMultiTopic::set_expression_parameters** (p. 1516), or if **DDSMultiTopic::set_expression_parameters** (p. 1516) was never called, the `parameters` specified when the **DDSMultiTopic** (p. 1513) was created.

Parameters

<i>parameters</i>	<< <i>inout</i> >> (p. 237) Fill in this sequence with the expression parameters. The memory for the strings in this sequence is managed according to the conventions described in String Conventions (p. 546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.
-------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.269.2.4 set_expression_parameters()

```
virtual DDS_ReturnCode_t DDSMultiTopic::set_expression_parameters (
    const DDS_StringSeq & parameters ) [pure virtual]
```

Set the `expression_parameters`.

Changes the `expression_parameters` associated with the **DDSMultiTopic** (p. 1513).

Parameters

<i>parameters</i>	<< <i>in</i> >> (p. 237) the filter expression parameters
-------------------	---

Returns

One of the **Standard Return Codes** (p. 335).

9.270 DDSOctetsDataReader Class Reference

<<*interface*>> (p. 236) Instantiates `DataReader` < **DDS_Octets** (p. 954) >.

Inheritance diagram for `DDSOctetsDataReader`:

Public Member Functions

- virtual **DDS_ReturnCode_t** **read** (**DDS_OctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_↵_Long** max_samples= **DDS_LENGTH_UNLIMITED**, **DDS_SampleStateMask** sample_states= **DDS_ANY_↵SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take** (**DDS_OctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_↵_Long** max_samples= **DDS_LENGTH_UNLIMITED**, **DDS_SampleStateMask** sample_states= **DDS_ANY_↵SAMPLE_STATE**, **DDS_ViewStateMask** view_states= **DDS_ANY_VIEW_STATE**, **DDS_InstanceStateMask** instance_states= **DDS_ANY_INSTANCE_STATE**)
*Access a collection of data-samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_w_condition** (**DDS_OctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDSReadCondition** *condition)
*Accesses via **DDSOctetsDataReader::read** (p. 1518) the samples that match the criteria specified in the **DDSRead_↵Condition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **take_w_condition** (**DDS_OctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDSReadCondition** *condition)
*Analogous to **DDSOctetsDataReader::read_w_condition** (p. 1518) except it accesses samples via the **DDSOctets_↵DataReader::take** (p. 1518) operation.*
- virtual **DDS_ReturnCode_t** **read_next_sample** (**DDS_Octets** &received_data, **DDS_SampleInfo** &sample_↵_info)
*Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take_next_sample** (**DDS_Octets** &received_data, **DDS_SampleInfo** &sample_↵_info)
*Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **return_loan** (**DDS_OctetsSeq** &received_data, **DDS_SampleInfoSeq** &info_seq)
*Indicates to the **DDSDDataReader** (p. 1272) that the application is done accessing the collection of *received_data* and *info_seq* obtained by some earlier invocation of *read* or *take* on the **DDSDDataReader** (p. 1272).*

Static Public Member Functions

- static **DDSOctetsDataReader** * **narrow** (**DDSDDataReader** *reader)
*Narrow the given **DDSDDataReader** (p. 1272) pointer to a **DDSOctetsDataReader** (p. 1516) pointer.*

9.270.1 Detailed Description

<<**interface**>> (p. 236) Instantiates **DataReader** < **DDS_Octets** (p. 954) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and the byte array in a destination data sample is NULL, the middleware will allocate a new array for you of sufficient length to hold the received data. The new array will be allocated with **DDS_OctetBuffer_alloc** (p. 542); the sample's destructor will delete it.

A non- NULL array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

FooDataReader (p. 1632)

DDSDDataReader (p. 1272)

9.270.2 Member Function Documentation

9.270.2.1 read()

```
virtual DDS_ReturnCode_t DDSOctetsDataReader::read (
    DDS_OctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::read (p. 1635)

9.270.2.2 take()

```
virtual DDS_ReturnCode_t DDSOctetsDataReader::take (
    DDS_OctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data-samples from the **DDSDataReader** (p. 1272).

See also

FooDataReader::take (p. 1636)

9.270.2.3 read_w_condition()

```
virtual DDS_ReturnCode_t DDSOctetsDataReader::read_w_condition (
    DDS_OctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Accesses via **DDSOctetsDataReader::read** (p. 1518) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_w_condition (p. 1640)

9.270.2.4 take_w_condition()

```
virtual DDS_ReturnCode_t DDSOctetsDataReader::take_w_condition (
    DDS_OctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Analogous to **DDSOctetsDataReader::read_w_condition** (p. 1518) except it accesses samples via the **DDSOctetsDataReader::take** (p. 1518) operation.

See also

FooDataReader::take_w_condition (p. 1641)

9.270.2.5 read_next_sample()

```
virtual DDS_ReturnCode_t DDSOctetsDataReader::read_next_sample (
    DDS_Octets & received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::read_next_sample (p. 1642)

9.270.2.6 take_next_sample()

```
virtual DDS_ReturnCode_t DDSOctetsDataReader::take_next_sample (
    DDS_Octets & received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::take_next_sample (p. 1643)

9.270.2.7 return_loan()

```
virtual DDS_ReturnCode_t DDSOctetsDataReader::return_loan (
    DDS_OctetsSeq & received_data,
    DDS_SampleInfoSeq & info_seq ) [virtual]
```

Indicates to the **DDSDataReader** (p. 1272) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDSDataReader** (p. 1272).

See also

FooDataReader::return_loan (p. 1655)

9.270.2.8 narrow()

```
static DDSOctetsDataReader * DDSOctetsDataReader::narrow (
    DDSDataReader * reader ) [static]
```

Narrow the given **DDSDataReader** (p. 1272) pointer to a **DDSOctetsDataReader** (p. 1516) pointer.

See also

FooDataReader::narrow (p. 1634)

9.271 DDSOctetsDataWriter Class Reference

<<**interface**>> (p. 236) Instantiates `DataWriter` < **DDS_Octets** (p. 954) >.

Inheritance diagram for **DDSOctetsDataWriter**:

Public Member Functions

- virtual **DDS_Octets** * **create_data** (const **DDS_TypeAllocationParams_t** &alloc_params)
Creates an octet data sequence.
- virtual **DDS_Boolean** **delete_data** (**DDS_Octets** *sample, const **DDS_TypeDeallocationParams_t** &dealloc_params)
*Destroys a octet data sequence created by **DDSOctetsDataWriter::create_data** (p. 1522).*
- virtual **DDS_ReturnCode_t** **write** (const **DDS_Octets** &instance_data, const **DDS_InstanceHandle_t** &handle)
*Modifies the value of a **DDS_Octets** (p. 954) data instance.*
- virtual **DDS_ReturnCode_t** **write** (const unsigned char *octets, int length, const **DDS_InstanceHandle_t** &handle)
*<<extension>> (p. 236) Modifies the value of a **DDS_Octets** (p. 954) data instance.*
- virtual **DDS_ReturnCode_t** **write** (const **DDS_OctetSeq** &octets, const **DDS_InstanceHandle_t** &handle)
*<<extension>> (p. 236) Modifies the value of a **DDS_Octets** (p. 954) data instance.*
- virtual **DDS_ReturnCode_t** **write_w_timestamp** (const **DDS_Octets** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also provides the value for the **source_timestamp**.*
- virtual **DDS_ReturnCode_t** **write_w_timestamp** (const unsigned char *octets, int length, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*<<extension>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also provides the value for the **source_timestamp**.*
- virtual **DDS_ReturnCode_t** **write_w_timestamp** (const **DDS_OctetSeq** &octets, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)
*<<extension>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also provides the value for the **source_timestamp**.*
- virtual **DDS_ReturnCode_t** **write_w_params** (const **DDS_Octets** &instance_data, **DDS_WriteParams_t** ¶ms)
*Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- virtual **DDS_ReturnCode_t** **write_w_params** (const unsigned char *octets, int length, **DDS_WriteParams_t** ¶ms)
*<<extension>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- virtual **DDS_ReturnCode_t** **write_w_params** (const **DDS_OctetSeq** &octets, **DDS_WriteParams_t** ¶ms)
*<<extension>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*

Static Public Member Functions

- static **DDSOctetsDataWriter** * **narrow** (**DDSDDataWriter** *writer)
*Narrow the given **DDSDDataWriter** (p. 1305) pointer to a **DDSOctetsDataWriter** (p. 1520) pointer.*

9.271.1 Detailed Description

<<**interface**>> (p. 236) Instantiates **DataWriter** < **DDS_Octets** (p. 954) >.

See also

FooDataWriter (p. 1659)

DDSDDataWriter (p. 1305)

9.271.2 Member Function Documentation

9.271.2.1 narrow()

```
static DDSOctetsDataWriter * DDSOctetsDataWriter::narrow (
    DDSDataWriter * writer ) [static]
```

Narrow the given **DDSDataWriter** (p. 1305) pointer to a **DDSOctetsDataWriter** (p. 1520) pointer.

See also

FooDataWriter::narrow (p. 1661)

9.271.2.2 create_data()

```
virtual DDS_Octets * DDSOctetsDataWriter::create_data (
    const DDS_TypeAllocationParams_t & alloc_params ) [virtual]
```

Creates an octet data sequence.

The size of the instance is determined by the DataWriter property **dds.builtin_type.octets.alloc_size**.

Default size: **dds.builtin_type.octets.max_size** property of DomainParticipant if defined. Otherwise 2048.

Created instances must be deleted with **DDSOctetsDataWriter::delete_data** (p. 1522).

Returns

Newly created octet sequence data, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types.

9.271.2.3 delete_data()

```
virtual DDS_Boolean DDSOctetsDataWriter::delete_data (
    DDS_Octets * sample,
    const DDS_TypeDeallocationParams_t & dealloc_params ) [virtual]
```

Destroys a octet data sequence created by **DDSOctetsDataWriter::create_data** (p. 1522).

Returns

DDS_BOOLEAN_TRUE (p. 316) upon successful deletion.

9.271.2.4 write() [1/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write (
    const DDS_Octets & instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Modifies the value of a **DDS_Octets** (p. 954) data instance.

See also

FooDataWriter::write (p. 1666)

9.271.2.5 write() [2/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write (
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<**extension**>> (p. 236) Modifies the value of a **DDS_Octets** (p. 954) data instance.

Parameters

<i>octets</i>	<< in >> (p. 237) Array of octets to be published.
<i>length</i>	<< in >> (p. 237) Number of octets to be published.
<i>handle</i>	<< in >> (p. 237) The special value DDS_HANDLE_NIL (p. 76) should be used always.

See also

FooDataWriter::write (p. 1666)

9.271.2.6 write() [3/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write (
    const DDS_OctetSeq & octets,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

<<*extension*>> (p. 236) Modifies the value of a **DDS_Octets** (p. 954) data instance.

Parameters

<i>octets</i>	<< <i>in</i> >> (p. 237) Sequence of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 237) The special value DDS_HANDLE_NIL (p. 76) should be used always.

See also

FooDataWriter::write (p. 1666)

9.271.2.7 write_w_timestamp() [1/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write_w_timestamp (
    const DDS_Octets & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also provides the value for the `source_timestamp`.

See also

FooDataWriter::write_w_timestamp (p. 1670)

9.271.2.8 write_w_timestamp() [2/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write_w_timestamp (
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<*extension*>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also provides the value for the `source_timestamp`.

Parameters

<i>octets</i>	<< <i>in</i> >> (p. 237) Array of octets to be published.
<i>length</i>	<< <i>in</i> >> (p. 237) Number of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 237) The special value DDS_HANDLE_NIL (p. 76) should be used always.
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter::write_w_timestamp (p. 1670).

See also

FooDataWriter::write_w_timestamp (p. 1670)

9.271.2.9 write_w_timestamp() [3/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write_w_timestamp (
    const DDS_OctetSeq & octets,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

<<*extension*>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also provides the value for the *source_timestamp*.

Parameters

<i>octets</i>	<< <i>in</i> >> (p. 237) Sequence of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 237) The special value DDS_HANDLE_NIL (p. 76) should be used always.
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See FooDataWriter::write_w_timestamp (p. 1670).

See also

FooDataWriter::write_w_timestamp (p. 1670)

9.271.2.10 write_w_params() [1/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write_w_params (
    const DDS_Octets & instance_data,
    DDS_WriteParams_t & params ) [virtual]
```

Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter::write_w_params (p. 1671)

9.271.2.11 write_w_params() [2/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write_w_params (
    const unsigned char * octets,
    int length,
    DDS_WriteParams_t & params ) [virtual]
```

<<**extension**>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

<i>octets</i>	<< in >> (p. 237) Array of octets to be published.
<i>length</i>	<< in >> (p. 237) Number of octets to be published.
<i>params</i>	<< in >> (p. 237) The DDS_WriteParams_t (p. 1234) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See FooDataWriter::write_w_params (p. 1671).

See also

FooDataWriter::write_w_params (p. 1671)

9.271.2.12 write_w_params() [3/3]

```
virtual DDS_ReturnCode_t DDSOctetsDataWriter::write_w_params (
    const DDS_OctetSeq & octets,
    DDS_WriteParams_t & params ) [virtual]
```

<<**extension**>> (p. 236) Performs the same function as **DDSOctetsDataWriter::write** (p. 1523) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

<i>octets</i>	<< in >> (p. 237) Sequence of octets to be published.
<i>params</i>	<< in >> (p. 237) The DDS_WriteParams_t (p. 1234) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See FooDataWriter::write_w_params (p. 1671).

See also

FooDataWriter::write_w_params (p. 1671)

9.272 DDSOctetsTypeSupport Class Reference

<<*interface*>> (p. 236) **DDS_Octets** (p. 954) type support.

Inheritance diagram for DDSOctetsTypeSupport:

Static Public Member Functions

- static **DDS_ReturnCode_t register_type** (**DDSDomainParticipant** *participant, const char *type_name="DDS::Octets")
*Allows an application to communicate to RTI Connext the existence of the **DDS_Octets** (p. 954) data type.*
- static **DDS_ReturnCode_t unregister_type** (**DDSDomainParticipant** *participant, const char *type_name="DDS::Octets")
*Allows an application to unregister the **DDS_Octets** (p. 954) data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.*
- static const char * **get_type_name** ()
*Get the default name for the **DDS_Octets** (p. 954) type.*
- static void **print_data** (const **DDS_Octets** *a_data)
 <<*extension*>> (p. 236) Print value of data type to standard out.
- static **DDS_TypeCode** * **get_typecode** ()
 <<*extension*>> (p. 236) Retrieves the TypeCode for the Type.
- static **DDS_ReturnCode_t serialize_data_to_cdr_buffer** (char *buffer, unsigned int &length, const **DDS_Octets** *a_data)
 <<*extension*>> (p. 236) Serializes the input sample into a CDR buffer of octets.
- static **DDS_ReturnCode_t serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int &length, const **DDS_Octets** *a_data, **DDS_DataRepresentationId_t** representation)
 <<*extension*>> (p. 236) Serializes the input sample into a buffer of octets.
- static **DDS_ReturnCode_t deserialize_data_from_cdr_buffer** (**DDS_Octets** *a_data, const char *buffer, unsigned int length)
 <<*extension*>> (p. 236) Deserializes a sample from a buffer of octets.
- static **DDS_ReturnCode_t data_to_string** (**DDS_Octets** *sample, char *str, **DDS_UnsignedLong** &str_size, const **DDS_PrintfFormatProperty** &property)
 <<*extension*>> (p. 236) Get the string representation of an input sample.

9.272.1 Detailed Description

<<*interface*>> (p. 236) **DDS_Octets** (p. 954) type support.

9.272.2 Member Function Documentation

9.272.2.1 register_type()

```
static DDS_ReturnCode_t DDSOctetsTypeSupport::register_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::Octets" ) [static]
```

Allows an application to communicate to RTI Connext the existence of the **DDS_Octets** (p. 954) data type.

By default, The **DDS_Octets** (p. 954) built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDSOctetsTypeSupport::get_type_name** (p. 1529). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_type.auto_register".

This method can also be used to register the same **DDSOctetsTypeSupport** (p. 1527) with a **DDSDomainParticipant** (p. 1335) using different values for the type_name.

If **register_type** is called multiple times with the same **DDSDomainParticipant** (p. 1335) and type_name, the second (and subsequent) registrations are ignored by the operation.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to register the data type DDS_Octets (p. 954) with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type DDS_Octets (p. 954) is registered with the participant; this type name is used when creating a new DDSTopic (p. 1601). (See DDSDomainParticipant::create_topic (p. 1366).) The name may not be NULL or longer than 255 characters.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336).
------------	---

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDSDomainParticipant::create_topic (p. 1366)

9.272.2.2 unregister_type()

```
static DDS_ReturnCode_t DDSOctetsTypeSupport::unregister_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::Octets" ) [static]
```

Allows an application to unregister the **DDS_Octets** (p. 954) data type from RTI Connex. After calling `unregister_type`, no further communication using this type is possible.

Precondition

The **DDS_Octets** (p. 954) type with `type_name` is registered with the participant and all **DDSTopic** (p. 1601) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDSTopic** (p. 1601) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 335).

Postcondition

All information about the type is removed from RTI Connex. No further communication using this type is possible.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to unregister the data type DDS_Octets (p. 954) from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type DDS_Octets (p. 954) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_BAD_PARAMETER (p. 335) or DDS_RETCODE_ERROR (p. 335)
------------	--

MT Safety:

SAFE.

See also

DDSOctetsTypeSupport::register_type (p. 1528)

9.272.2.3 get_type_name()

```
static const char * DDSOctetsTypeSupport::get_type_name ( ) [static]
```

Get the default name for the **DDS_Octets** (p. 954) type.

Can be used for calling **DDSOctetsTypeSupport::register_type** (p. 1528) or creating **DDSTopic** (p. 1601).

Returns

default name for the **DDS_Octets** (p. 954) type.

See also

DDSOctetsTypeSupport::register_type (p. 1528)

DDSDomainParticipant::create_topic (p. 1366)

9.272.2.4 print_data()

```
static void DDSOctetsTypeSupport::print_data (
    const DDS_Octets * a_data ) [static]
```

<<**extension**>> (p. 236) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

<i>a_data</i>	<< in >> (p. 237) DDS_Octets (p. 954) to be printed.
---------------	--

9.272.2.5 get_typecode()

```
static DDS_TypeCode * DDSOctetsTypeSupport::get_typecode ( ) [static]
```

<<**extension**>> (p. 236) Retrieves the TypeCode for the Type.

See also

FooTypeSupport::get_typecode (p. 1705)

9.272.2.6 serialize_data_to_cdr_buffer()

```
static DDS_ReturnCode_t DDSOctetsTypeSupport::serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int & length,
    const DDS_Octets * a_data ) [static]
```

<<**extension**>> (p. 236) Serializes the input sample into a CDR buffer of octets.

See also

FooTypeSupport::serialize_data_to_cdr_buffer (p. 1703)

9.272.2.7 serialize_data_to_cdr_buffer_ex()

```
static DDS_ReturnCode_t DDSOctetsTypeSupport::serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int & length,
    const DDS_Octets * a_data,
    DDS_DataRepresentationId_t representation ) [static]
```

<<**extension**>> (p. 236) Serializes the input sample into a buffer of octets.

See also

FooTypeSupport::serialize_data_to_cdr_buffer (p. 1703)

9.272.2.8 deserialize_data_from_cdr_buffer()

```
static DDS_ReturnCode_t DDSOctetsTypeSupport::deserialize_data_from_cdr_buffer (
    DDS_Octets * a_data,
    const char * buffer,
    unsigned int length ) [static]
```

<<**extension**>> (p. 236) Deserializes a sample from a buffer of octets.

See also

FooTypeSupport::deserialize_data_from_cdr_buffer (p. 1704)

9.272.2.9 data_to_string()

```
static DDS_ReturnCode_t DDSOctetsTypeSupport::data_to_string (
    DDS_Octets * sample,
    char * str,
    DDS_UnsignedLong & str_size,
    const DDS_PrintFormatProperty & property ) [static]
```

<<**extension**>> (p. 236) Get the string representation of an input sample.

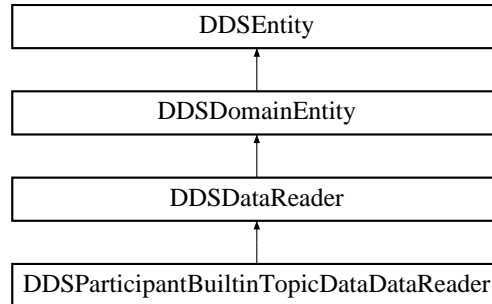

See also

FooTypeSupport::data_to_string (p. 1705)

9.275 DDSPropertyQosPolicyHelper Class Reference

Policy helpers that facilitate management of the properties in the input policy.

Static Public Member Functions

- static **DDS_Long** **get_number_of_properties** (**DDS_PropertyQosPolicy** &policy)
Gets the number of properties in the input policy.
- static **DDS_ReturnCode_t** **assert_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const char *value, **DDS_Boolean** propagate)
Asserts the property identified by name in the input policy.
- static **DDS_ReturnCode_t** **add_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const char *value, **DDS_Boolean** propagate)
Adds a new property to the input policy.
- static **DDS_ReturnCode_t** **assert_pointer_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const void *pointer)
Asserts the property identified by name in the input policy. Used when the property to store is a pointer.
- static **DDS_ReturnCode_t** **add_pointer_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const void *pointer)
Adds a new property to the input policy. Used when the property to store is a pointer.
- static struct **DDS_Property_t** * **lookup_property** (**DDS_PropertyQosPolicy** &policy, const char *name)
Searches for a property in the input policy given its name.
- static **DDS_ReturnCode_t** **remove_property** (**DDS_PropertyQosPolicy** &policy, const char *name)
Removes a property from the input policy.
- static **DDS_ReturnCode_t** **get_properties** (**DDS_PropertyQosPolicy** &policy, struct **DDS_PropertySeq** &properties, const char *name_prefix)
Retrieves a list of properties whose names match the input prefix.

9.275.1 Detailed Description

Policy helpers that facilitate management of the properties in the input policy.

- virtual const char * **get_default_profile_library** ()=0
*<<extension>> (p. 236) Gets the library where the default XML QoS profile is contained for a **DDSPublisher** (p. 1534).*
- virtual **DDSDDataWriter** * **create_datawriter** (**DDSTopic** *topic, const **DDS_DataWriterQos** &qos, **DDSDDataWriterListener** *listener, **DDS_StatusMask** mask)=0
*Creates a **DDSDDataWriter** (p. 1305) that will be attached and belong to the **DDSPublisher** (p. 1534).*
- virtual **DDSDDataWriter** * **create_datawriter_with_profile** (**DDSTopic** *topic, const char *library_name, const char *profile_name, **DDSDDataWriterListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a **DDSDDataWriter** (p. 1305) object using the **DDS_DataWriterQos** (p. 683) associated with the input XML QoS profile.*
- virtual **DDS_ReturnCode_t** **delete_datawriter** (**DDSDDataWriter** *a_datawriter)=0
*Deletes a **DDSDDataWriter** (p. 1305) that belongs to the **DDSPublisher** (p. 1534).*
- virtual **DDSDDataWriter** * **lookup_datawriter** (const char *topic_name)=0
*Retrieves the **DDSDDataWriter** (p. 1305) for a specific **DDSTopic** (p. 1601).*
- virtual **DDS_ReturnCode_t** **get_all_datawriters** (**DDSDDataWriterSeq** &writers)=0
Retrieve all the DataWriters created from this Publisher.
- virtual **DDS_ReturnCode_t** **suspend_publications** ()=0
*Indicates to RTI Connexx that the application is about to make multiple modifications using **DDSDDataWriter** (p. 1305) objects belonging to the **DDSPublisher** (p. 1534).*
- virtual **DDS_ReturnCode_t** **resume_publications** ()=0
*Indicates to RTI Connexx that the application has completed the multiple changes initiated by the previous **DDSPublisher::suspend_publications** (p. 1546).*
- virtual **DDS_ReturnCode_t** **begin_coherent_changes** ()=0
*Indicates that the application will begin a coherent set of modifications using **DDSDDataWriter** (p. 1305) objects attached to the **DDSPublisher** (p. 1534).*
- virtual **DDS_ReturnCode_t** **end_coherent_changes** ()=0
*Terminates the coherent set initiated by the matching call to **DDSPublisher::begin_coherent_changes** (p. 1548).*
- virtual **DDSDomainParticipant** * **get_participant** ()=0
*Returns the **DDSDomainParticipant** (p. 1335) to which the **DDSPublisher** (p. 1534) belongs.*
- virtual **DDS_ReturnCode_t** **delete_contained_entities** ()=0
*Deletes all the entities that were created by means of the "create" operation on the **DDSPublisher** (p. 1534).*

- virtual **DDS_ReturnCode_t** **copy_from_topic_qos** (**DDS_DataWriterQos** &a_datawriter_qos, const **DDS_↵
TopicQos** &a_topic_qos)=0
*Copies the policies in the **DDS_TopicQos** (p. 1120) to the corresponding policies in the **DDS_DataWriterQos** (p. 683).*
- virtual **DDS_ReturnCode_t** **wait_for_acknowledgments** (const **DDS_Duration_t** &max_wait)=0
Blocks the calling thread until all data written by the Publisher's reliable DataWriters is acknowledged, or until timeout expires.
- virtual **DDS_ReturnCode_t** **wait_for_asynchronous_publishing** (const **DDS_Duration_t** &max_wait)=0
<<extension>> (p. 236) Blocks the calling thread until asynchronous sending is complete.
- virtual **DDS_ReturnCode_t** **set_qos** (const **DDS_PublisherQos** &qos)=0
Sets the publisher QoS.
- virtual **DDS_ReturnCode_t** **set_qos_with_profile** (const char *library_name, const char *profile_name)=0
<<extension>> (p. 236) Change the QoS of this publisher using the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **get_qos** (**DDS_PublisherQos** &qos)=0
Gets the publisher QoS.
- virtual **DDS_ReturnCode_t** **set_listener** (**DDSPublisherListener** *l, **DDS_StatusMask** mask= **DDS_↵
STATUS_MASK_ALL**)=0
Sets the publisher listener.
- virtual **DDSPublisherListener** * **get_listener** ()=0
Get the publisher listener.
- virtual **DDSDataWriter** * **lookup_datawriter_by_name** (const char *datawriter_name)=0
*<<extension>> (p. 236) Retrieves a **DDSDataWriter** (p. 1305) contained within the **DDSPublisher** (p. 1534) the **DDSDataWriter** (p. 1305) entity name.*

9.278.1 Detailed Description

<<**interface**>> (p. 236) A publisher is the object responsible for the actual dissemination of publications.

QoS:

DDS_PublisherQos (p. 1009)

Listener:

DDSPublisherListener (p. 1555)

A publisher acts on the behalf of one or several **DDSDataWriter** (p. 1305) objects that belong to it. When it is informed of a change to the data associated with one of its **DDSDataWriter** (p. 1305) objects, it decides when it is appropriate to actually send the data-update message. In making this decision, it considers any extra information that goes with the data (timestamp, writer, etc.) as well as the QoS of the **DDSPublisher** (p. 1534) and the **DDSDataWriter** (p. 1305).

The following operations may be called even if the **DDSPublisher** (p. 1534) is not enabled. Other operations will fail with the value **DDS_RETCODE_NOT_ENABLED** (p. 336) if called on a disabled **DDSPublisher** (p. 1534):

- **DDSEntity::enable** (p. 1449),
- **DDSPublisher::set_qos** (p. 1552), **DDSPublisher::get_qos** (p. 1553) , **DDSPublisher::set_qos_with_profile** (p. 1553)

- **DDSPublisher::set_listener** (p. 1554), **DDSPublisher::get_listener** (p. 1554),
- **DDSEntity::get_statuscondition** (p. 1450), **DDSEntity::get_status_changes** (p. 1450)
- **DDSPublisher::create_datawriter** (p. 1542), **DDSPublisher::create_datawriter_with_profile** (p. 1543), **DDSPublisher::delete_contained_entities** (p. 1549), **DDSPublisher::delete_datawriter** (p. 1545),
- **DDSPublisher::set_default_datawriter_qos** (p. 1538), **DDSPublisher::set_default_datawriter_qos_↵
with_profile** (p. 1539), **DDSPublisher::get_default_datawriter_qos** (p. 1537), **DDSPublisher::wait_for_↵
acknowledgments** (p. 1551), **DDSPublisher::set_default_library** (p. 1539), **DDSPublisher::set_default_↵
profile** (p. 1540),

Operations Allowed in Listener Callbacks (p. ??)

Examples

HelloWorld_publisher.cxx.

9.278.2 Member Function Documentation

9.278.2.1 get_default_datawriter_qos()

```
virtual DDS_ReturnCode_t DDSPublisher::get_default_datawriter_qos (
    DDS_DataWriterQos & qos ) [pure virtual]
```

Copies the default **DDS_DataWriterQos** (p. 683) values into the provided **DDS_DataWriterQos** (p. 683) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **DDSPublisher::set_default_↵
_datawriter_qos** (p. 1538) or **DDSPublisher::set_default_datawriter_qos_with_profile** (p. 1539), or else, if the call was never made, the default values from its owning **DDSDomainParticipant** (p. 1335).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a **DDSPublisher** (p. 1534) while another thread may be simultaneously calling **DDSPublisher::set_default_datawriter_qos** (p. 1538).

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) DDS_DataWriterQos (p. 683) to be filled-up.
------------	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDS_DATAWRITER_QOS_DEFAULT (p. 110)

DDSPublisher::create_datawriter (p. 1542)

9.278.2.2 set_default_datawriter_qos()

```
virtual DDS_ReturnCode_t DDSPublisher::set_default_datawriter_qos (
    const DDS_DataWriterQos & qos ) [pure virtual]
```

Sets the default **DDS_DataWriterQos** (p. 683) values for this publisher.

This call causes the default values inherited from the owning **DDSDomainParticipant** (p. 1335) to be overridden.

This default value will be used for newly created **DDSDataWriter** (p. 1305) if **DDS_DATAWRITER_QOS_DEFAULT** (p. 110) is specified as the `qos` parameter when **DDSPublisher::create_datawriter** (p. 1542) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_↵
RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a **DDSPublisher** (p. 1534) while another thread may be simultaneously calling **DDSPublisher::set_default_datawriter_qos** (p. 1538), **DDSPublisher::get_default_↵
_datawriter_qos** (p. 1537) or calling **DDSPublisher::create_datawriter** (p. 1542) with **DDS_DATAWRITER_↵
QOS_DEFAULT** (p. 110) as the `qos` parameter.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Default qos to be set. The special value DDS_DATAREADER_QOS_DEFAULT (p. 132) may be passed as <code>qos</code> to indicate that the default QoS should be reset back to the initial values the factory would use if DDSPublisher::set_default_datawriter_qos (p. 1538) had never been called.
------------	--

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
-----	--

9.278.2.3 set_default_datawriter_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSPublisher::set_default_datawriter_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Set the default **DDS_DataWriterQos** (p. 683) values for this publisher based on the input XML QoS profile.

This default value will be used for newly created **DDSDataWriter** (p. 1305) if **DDS_DATAWRITER_QOS_DEFAULT** (p. 110) is specified as the `qos` parameter when **DDSPublisher::create_datawriter** (p. 1542) is called.

Precondition

The **DDS_DataWriterQos** (p. 683) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a **DDSPublisher** (p. 1534) while another thread may be simultaneously calling **DDSPublisher::set_default_datawriter_qos** (p. 1538), **DDSPublisher::get_default_datawriter_qos** (p. 1537) or calling **DDSPublisher::create_datawriter** (p. 1542) with **DDS_DATAWRITER_QOS_DEFAULT** (p. 110) as the `qos` parameter.

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If <code>library_name</code> is null RTI Connexx will use the default library (see DDSPublisher::set_default_library (p. 1539)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If <code>profile_name</code> is null RTI Connexx will use the default profile (see DDSPublisher::set_default_profile (p. 1540)).

If the input profile cannot be found, the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
-----	--

See also

DDS_DATAWRITER_QOS_DEFAULT (p. 110)

DDSPublisher::create_datawriter_with_profile (p. 1543)

9.278.2.4 set_default_library()

```
virtual DDS_ReturnCode_t DDSPublisher::set_default_library (
    const char * library_name ) [pure virtual]
```

<<**extension**>> (p. 236) Sets the default XML library for a **DDSPublisher** (p. 1534).

This method specifies the library that will be used as the default the next time a default library is needed during a call to one of this Publisher's operations.

Any API requiring a library_name as a parameter can use null to refer to the default library.

If the default library is not set, the **DDSPublisher** (p. 1534) inherits the default from the **DDSDomainParticipant** (p. 1335) (see **DDSDomainParticipant::set_default_library** (p. 1350)).

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name. If library_name is null any previous default is unset.
---------------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSPublisher::get_default_library (p. 1540)

9.278.2.5 get_default_library()

```
virtual const char * DDSPublisher::get_default_library ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the default XML library associated with a **DDSPublisher** (p. 1534).

Returns

The default library or null if the default library was not set.

See also

DDSPublisher::set_default_library (p. 1539)

9.278.2.6 set_default_profile()

```
virtual DDS_ReturnCode_t DDSPublisher::set_default_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Sets the default XML profile for a **DDSPublisher** (p. 1534).

This method specifies the profile that will be used as the default the next time a default Publisher profile is needed during a call to one of this Publisher's operations. When calling a **DDSPublisher** (p. 1534) method that requires a `profile_name` parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **DDSPublisher** (p. 1534) inherits the default from the **DDSDomainParticipant** (p. 1335) (see **DDSDomainParticipant::set_default_profile** (p. 1351)).

This method does not set the default QoS for **DDSDataWriter** (p. 1305) objects created by the **DDSPublisher** (p. 1534); for this functionality, use **DDSPublisher::set_default_datawriter_qos_with_profile** (p. 1539) (you may pass in NULL after having called **set_default_profile()** (p. 1540)).

This method does not set the default QoS for newly created Publishers; for this functionality, use **DDSDomainParticipant::set_default_publisher_qos_with_profile** (p. 1356).

Parameters

<i>library_name</i>	<< in >> (p. 237) The library name containing the profile.
<i>profile_name</i>	<< in >> (p. 237) The profile name. If profile_name is null any previous default is unset.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDSPublisher::get_default_profile (p. 1541)

DDSPublisher::get_default_profile_library (p. 1542)

9.278.2.7 get_default_profile()

```
virtual const char * DDSPublisher::get_default_profile ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the default XML profile associated with a **DDSPublisher** (p. 1534).

Returns

The default profile or null if the default profile was not set.

See also

DDSPublisher::set_default_profile (p. 1540)

9.278.2.8 get_default_profile_library()

```
virtual const char * DDSPublisher::get_default_profile_library ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the library where the default XML QoS profile is contained for a **DDSPublisher** (p. 1534).

The default profile library is automatically set when **DDSPublisher::set_default_profile** (p. 1540) is called.

This library can be different than the **DDSPublisher** (p. 1534) default library (see **DDSPublisher::get_default_library** (p. 1540)).

Returns

The default profile library or null if the default profile was not set.

See also

DDSPublisher::set_default_profile (p. 1540)

9.278.2.9 create_datawriter()

```
virtual DDSDDataWriter * DDSPublisher::create_datawriter (
    DDSTopic * topic,
    const DDS_DataWriterQos & qos,
    DDSDDataWriterListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

Creates a **DDSDDataWriter** (p. 1305) that will be attached and belong to the **DDSPublisher** (p. 1534).

For each application-defined type, **Foo** (p. 1632), there is an implied, auto-generated class **FooDataWriter** (p. 1659) that extends **DDSDDataWriter** (p. 1305) and contains the operations to write data of type **Foo** (p. 1632).

Note that a common application pattern to construct the QoS for the **DDSDDataWriter** (p. 1305) is to:

- Retrieve the QoS policies on the associated **DDSTopic** (p. 1601) by means of the **DDSTopic::get_qos** (p. 1605) operation.
- Retrieve the default **DDSDDataWriter** (p. 1305) qos by means of the **DDSPublisher::get_default_datawriter_qos** (p. 1537) operation.
- Combine those two QoS policies (for example, using **DDSPublisher::copy_from_topic_qos** (p. 1550)) and selectively modify policies as desired.

When a **DDSDDataWriter** (p. 1305) is created, only those transports already registered are available to the **DDSDDataWriter** (p. 1305). See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DDSDataWriter** (p. 1305) will be created.

The given **DDSTopic** (p. 1601) must have been created from the same participant as this publisher. If it was created from a different participant, this method will fail.

MT Safety:

UNSAFE. If **DDS_DATAWRITER_QOS_DEFAULT** (p. 110) is used for the `qos` parameter, it is not safe to create the datawriter while another thread may be simultaneously calling **DDSPublisher::set_default_datawriter_qos** (p. 1538).

Parameters

<i>topic</i>	<< <i>in</i> >> (p. 237) The DDSTopic (p. 1601) that the DDSDataWriter (p. 1305) will be associated with. Cannot be NULL.
<i>qos</i>	<< <i>in</i> >> (p. 237) QoS to be used for creating the new DDSDataWriter (p. 1305). The special value DDS_DATAWRITER_QOS_DEFAULT (p. 110) can be used to indicate that the DDSDataWriter (p. 1305) should be created with the default DDS_DataWriterQos (p. 683) set in the DDSPublisher (p. 1534). The special value DDS_DATAWRITER_QOS_USE_TOPIC_QOS (p. 110) can be used to indicate that the DDSDataWriter (p. 1305) should be created with the combination of the default DDS_DataWriterQos (p. 683) set on the DDSPublisher (p. 1534) and the DDS_TopicQos (p. 1120) of the DDSTopic (p. 1601).
<i>listener</i>	<< <i>in</i> >> (p. 237) The listener of the DDSDataWriter (p. 1305).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDataWriter** (p. 1305) of a derived class specific to the data type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

See also

FooDataWriter (p. 1659)

DDSPublisher::copy_from_topic_qos (p. 1550)

DDSDataWriter::set_listener (p. 1323)

Examples

HelloWorld_publisher.cxx.

9.278.2.10 create_datawriter_with_profile()

```
virtual DDSDDataWriter * DDSPublisher::create_datawriter_with_profile (
    DDSTopic * topic,
    const char * library_name,
    const char * profile_name,
    DDSDDataWriterListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a **DDSDDataWriter** (p. 1305) object using the **DDS_DataWriterQos** (p. 683) associated with the input XML QoS profile.

The **DDSDDataWriter** (p. 1305) will be attached and belong to the **DDSPublisher** (p. 1534).

For each application-defined type, **Foo** (p. 1632), there is an implied, auto-generated class **FooDataWriter** (p. 1659) that extends **DDSDDataWriter** (p. 1305) and contains the operations to write data of type **Foo** (p. 1632).

When a **DDSDDataWriter** (p. 1305) is created, only those transports already registered are available to the **DDSDDataWriter** (p. 1305). See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered.

Precondition

If publisher is enabled, topic must have been enabled. Otherwise, this operation will fail and no **DDSDDataWriter** (p. 1305) will be created.

The given **DDSTopic** (p. 1601) must have been created from the same participant as this publisher. If it was created from a different participant, this method will return NULL.

Parameters

<i>topic</i>	<< in >> (p. 237) The DDSTopic (p. 1601) that the DDSDDataWriter (p. 1305) will be associated with. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSPublisher::set_default_library (p. 1539)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSPublisher::set_default_profile (p. 1540)).
<i>listener</i>	<< in >> (p. 237) The listener of the DDSDDataWriter (p. 1305).
<i>mask</i>	<< in >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDDataWriter** (p. 1305) of a derived class specific to the data type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

See also

DDSPublisher::copy_from_topic_qos (p. 1550)
DDSDataWriter::set_listener (p. 1323)

9.278.2.11 delete_datawriter()

```
virtual DDS_ReturnCode_t DDSPublisher::delete_datawriter (
    DDSDataWriter * a_datawriter ) [pure virtual]
```

Deletes a **DDSDataWriter** (p. 1305) that belongs to the **DDSPublisher** (p. 1534).

The deletion of the **DDSDataWriter** (p. 1305) will automatically unregister all instances.

Precondition

If the **DDSDataWriter** (p. 1305) does not belong to the **DDSPublisher** (p. 1534), the operation will fail with **DDS↔_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

Listener installed on the **DDSDataWriter** (p. 1305) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>a_datawriter</i>	<< <i>in</i> >> (p. 237) The DDSDataWriter (p. 1305) to be deleted.
---------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	---

9.278.2.12 lookup_datawriter()

```
virtual DDSDataWriter * DDSPublisher::lookup_datawriter (
```

```
const char * topic_name ) [pure virtual]
```

Retrieves the **DDSDDataWriter** (p. 1305) for a specific **DDSTopic** (p. 1601).

This returned **DDSDDataWriter** (p. 1305) is either enabled or disabled.

If more than one **DDSDDataWriter** (p. 1305) is attached to the **DDSPublisher** (p. 1534) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **DDSDDataWriter** (p. 1305) in one thread while another thread is simultaneously creating or destroying that **DDSDDataWriter** (p. 1305).

Parameters

<i>topic_name</i>	<< <i>in</i> >> (p. 237) Name of the DDSTopic (p. 1601) associated with the DDSDDataWriter (p. 1305) that is to be looked up. Cannot be NULL.
-------------------	---

Returns

A **DDSDDataWriter** (p. 1305) that belongs to the **DDSPublisher** (p. 1534) attached to the **DDSTopic** (p. 1601) with `topic_name`. If no such **DDSDDataWriter** (p. 1305) exists, this operation returns NULL.

9.278.2.13 get_all_datawriters()

```
virtual DDS_ReturnCode_t DDSPublisher::get_all_datawriters (
    DDSDataWriterSeq & writers ) [pure virtual]
```

Retrieve all the DataWriters created from this Publisher.

Parameters

<i>writers</i>	<< <i>inout</i> >> (p. 237) Sequence where the DataWriters will be added
----------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.278.2.14 suspend_publications()

```
virtual DDS_ReturnCode_t DDSPublisher::suspend_publications ( ) [pure virtual]
```

Indicates to RTI Connex that the application is about to make multiple modifications using **DDSDataWriter** (p. 1305) objects belonging to the **DDSPublisher** (p. 1534).

It is a **hint** to RTI Connex so it can optimize its performance by e.g., holding the dissemination of the modifications and then batching them.

The use of this operation must be matched by a corresponding call to **DDSPublisher::resume_publications** (p. 1547) indicating that the set of modifications has completed.

If the **DDSPublisher** (p. 1534) is deleted before **DDSPublisher::resume_publications** (p. 1547) is called, any suspended updates yet to be published will be discarded.

RTI Connex is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using *asynchronous publishing*. Combined with **DDSFlowController** (p. 1451), **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431) **DDSDataWriter** (p. 1305) instances allow the user even finer control of traffic shaping and sample coalescing.

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	--

See also

DDSFlowController (p. 1451)
DDSFlowController::trigger_flow (p. 1453)
DDS_ON_DEMAND_FLOW_CONTROLLER_NAME (p. 123)
DDS_PublishModeQosPolicy (p. 1012)

9.278.2.15 resume_publications()

```
virtual DDS_ReturnCode_t DDSPublisher::resume_publications ( ) [pure virtual]
```

Indicates to RTI Connex that the application has completed the multiple changes initiated by the previous **DDSPublisher::suspend_publications** (p. 1546).

This is a **hint** to RTI Connex that can be used for example, to batch all the modifications made since the **DDSPublisher::suspend_publications** (p. 1546).

RTI Connex is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using *asynchronous publishing*. Combined with **DDSFlowController** (p. 1451), **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431) **DDSDataWriter** (p. 1305) instances allow the user even finer control of traffic shaping and sample coalescing.

Precondition

A call to **DDSPublisher::resume_publications** (p. 1547) must match a previous call to **DDSPublisher::suspend_publications** (p. 1546). Otherwise the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	--

See also

DDSFlowController (p. 1451)

DDS_PublishModeQosPolicy (p. 1012)

9.278.2.16 begin_coherent_changes()

```
virtual DDS_ReturnCode_t DDSPublisher::begin_coherent_changes ( ) [pure virtual]
```

Indicates that the application will begin a coherent set of modifications using **DDSDataWriter** (p. 1305) objects attached to the **DDSPublisher** (p. 1534).

A 'coherent set' is a set of modifications that must be propagated in such a way that they are interpreted at the receiver's side as a consistent set of modifications; that is, the receiver will only be able to access the data after all the modifications in the set are available at the receiver end.

A connectivity change may occur in the middle of a set of coherent changes; for example, the set of partitions used by the **DDSPublisher** (p. 1534) or one of its subscribers (**DDSSubscriber** (p. 1576)) may change, a late-joining **DDSDataReader** (p. 1272) may appear on the network, or a communication failure may occur. In the event that such a change prevents an entity from receiving the entire set of coherent changes, that entity must behave as if it had received none of the set.

These calls can be nested. In that case, the coherent set terminates only with the last call to **DDSPublisher::end_coherent_changes** (p. 1549). Publisher's samples (samples published by any of the DataWriters within the Publisher) that are not published within a `begin_coherent_changes/end_coherent_changes` block will not be provided to the DataReaders as a set.

The support for coherent changes enables a publishing application to change the value of several data-instances that could belong to the same or different topics and have those changes be seen *atomically* by the readers. This is useful in cases where the values are inter-related (for example, if there are two data-instances representing the altitude and velocity vector of the same aircraft and both are changed, it may be useful to communicate those values in a way the reader can see both together; otherwise, it may, e.g., erroneously interpret that the aircraft is on a collision course).

Note

Coherent sets don't apply to Topic Queries. If a **DDSTopicQuery** (p. 1611) selects only a subset of samples that was published as a coherent set, the subscribing application will receive them regardless of their membership to the coherent set.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

See also

DDS_PresentationQosPolicy (p. 983)

9.278.2.17 end_coherent_changes()

```
virtual DDS_ReturnCode_t DDSPublisher::end_coherent_changes ( ) [pure virtual]
```

Terminates the coherent set initiated by the matching call to **DDSPublisher::begin_coherent_changes** (p. 1548).

Precondition

If there is no matching call to **DDSPublisher::begin_coherent_changes** (p. 1548) the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

9.278.2.18 get_participant()

```
virtual DDSDomainParticipant * DDSPublisher::get_participant ( ) [pure virtual]
```

Returns the **DDSDomainParticipant** (p. 1335) to which the **DDSPublisher** (p. 1534) belongs.

Returns

the **DDSDomainParticipant** (p. 1335) to which the **DDSPublisher** (p. 1534) belongs.

9.278.2.19 delete_contained_entities()

```
virtual DDS_ReturnCode_t DDSPublisher::delete_contained_entities ( ) [pure virtual]
```

Deletes all the entities that were created by means of the "create" operation on the **DDSPublisher** (p. 1534).

Deletes all contained **DDSDataWriter** (p. 1305) objects. Once **DDSPublisher::delete_contained_entities** (p. 1549) completes successfully, the application may delete the **DDSPublisher** (p. 1534), knowing that it has no contained **DDSDataWriter** (p. 1305) objects.

The operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if any of the contained entities is in a state where it cannot be deleted.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
-----	---

9.278.2.20 copy_from_topic_qos()

```
virtual DDS_ReturnCode_t DDSPublisher::copy_from_topic_qos (
    DDS_DataWriterQos & a_datawriter_qos,
    const DDS_TopicQos & a_topic_qos ) [pure virtual]
```

Copies the policies in the **DDS_TopicQos** (p. 1120) to the corresponding policies in the **DDS_DataWriterQos** (p. 683).

Copies the policies in the **DDS_TopicQos** (p. 1120) to the corresponding policies in the **DDS_DataWriterQos** (p. 683) (replacing values in the **DDS_DataWriterQos** (p. 683), if present).

This is a "convenience" operation most useful in combination with the operations **DDSPublisher::get_default_datawriter_qos** (p. 1537) and **DDSTopic::get_qos** (p. 1605). The operation **DDSPublisher::copy_from_topic_qos** (p. 1550) can be used to merge the **DDSDataWriter** (p. 1305) default QoS policies with the corresponding ones on the **DDSTopic** (p. 1601). The resulting QoS can then be used to create a new **DDSDataWriter** (p. 1305), or set its QoS.

This operation does not check the resulting **DDS_DataWriterQos** (p. 683) for consistency. This is because the 'merged' **DDS_DataWriterQos** (p. 683) may not be the final one, as the application can still modify some policies prior to applying the policies to the **DDSDataWriter** (p. 1305).

Parameters

<i>a_datawriter_qos</i>	<< <i>inout</i> >> (p. 237) DDS_DataWriterQos (p. 683) to be filled-up.
<i>a_topic_qos</i>	<< <i>in</i> >> (p. 237) DDS_TopicQos (p. 1120) to be merged with DDS_DataWriterQos (p. 683).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.278.2.21 wait_for_acknowledgments()

```
virtual DDS_ReturnCode_t DDSPublisher::wait_for_acknowledgments (
    const DDS_Duration_t & max_wait ) [pure virtual]
```

Blocks the calling thread until all data written by the Publisher's reliable DataWriters is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable DataWriters entities is acknowledged by (a) all reliable **DDSDataReader** (p. 1272) entities that are matched and alive and (b) by all required subscriptions, or until the duration specified by the `max_wait` parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged; a timeout indicates that `max_wait` elapsed before all the data was acknowledged.

Note that if a thread is blocked in the call to this operation on a **DDSPublisher** (p. 1534) and a different thread writes new samples on any of the reliable DataWriters that belong to this Publisher, the new samples must be acknowledged before unblocking the thread that is waiting on this operation.

If none of the **DDSDataWriter** (p. 1305) instances have **DDS_ReliabilityQosPolicy** (p. 1027) kind set to RELIABLE, the operation will complete successfully.

Parameters

<code>max_wait</code>	<< <i>in</i> >> (p. 237) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 768) .
-----------------------	---

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_NOT_ENABLED (p. 336), DDS_RETCODE_TIMEOUT (p. 336)
-----	--

9.278.2.22 wait_for_asynchronous_publishing()

```
virtual DDS_ReturnCode_t DDSPublisher::wait_for_asynchronous_publishing (
    const DDS_Duration_t & max_wait ) [pure virtual]
```

<<*extension*>> (p. 236) Blocks the calling thread until asynchronous sending is complete.

This operation blocks the calling thread (up to `max_wait`) until all data written by the asynchronous **DDSDataWriter** (p. 1305) entities is sent and acknowledged (if reliable) by all matched **DDSDataReader** (p. 1272) entities. A successful

completion indicates that all the samples written have been sent and acknowledged where applicable; if it times out, this indicates that `max_wait` elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **DDSDataReader** (p. 1272) is complete in addition to what **DDSPublisher::wait_for_acks** (p. 1551) provides.

If none of the **DDSDataWriter** (p. 1305) instances have **DDS_PublishModeQosPolicy::kind** (p. 1014) set to **DDS_↵
ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431), the operation will complete immediately, with **DDS_RETCODE_↵
_OK** (p. 335).

Parameters

<code>max_wait</code>	<< <i>in</i> >> (p. 237) Specifies maximum time to wait for acknowledgements DDS_Duration_t (p. 768).
-----------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_NOT_ENABLED (p. 336), DDS_RETCODE_TIMEOUT (p. 336)
------------	--

9.278.2.23 set_qos()

```
virtual DDS_ReturnCode_t DDSPublisher::set_qos (
    const DDS_PublisherQos & qos ) [pure virtual]
```

Sets the publisher QoS.

This operation modifies the QoS of the **DDSPublisher** (p. 1534).

The **DDS_PublisherQos::group_data** (p. 1011), **DDS_PublisherQos::partition** (p. 1011) and **DDS_PublisherQos_↵
::entity_factory** (p. 1012) can be changed. The other policies are immutable.

Parameters

<code>qos</code>	<< <i>in</i> >> (p. 237) DDS_PublisherQos (p. 1009) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDSPublisher (p. 1534) is enabled. The special value DDS_PUBLISHER_QOS_DEFAULT (p. 57) can be used to indicate that the QoS of the DDSPublisher (p. 1534) should be changed to match the current default DDS_PublisherQos (p. 1009) set in the DDSDomainParticipant (p. 1335).
------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336).
------------	---

Operations Allowed in Listener Callbacks (p. ??)

9.278.2.24 set_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSPublisher::set_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Change the QoS of this publisher using the input XML QoS profile.

This operation modifies the QoS of the **DDSPublisher** (p. 1534).

The **DDS_PublisherQos::group_data** (p. 1011), **DDS_PublisherQos::partition** (p. 1011) and **DDS_PublisherQos::entity_factory** (p. 1012) can be changed. The other policies are immutable.

Parameters

<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexxt will use the default library (see DDSPublisher::set_default_library (p. 1539)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexxt will use the default profile (see DDSPublisher::set_default_profile (p. 1540)).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336).
------------	---

```

Get the publisher listener.

Returns

DDSPublisherListener (p. 1555) of the **DDSPublisher** (p. 1534).

See also

get_listener (abstract) (p. ??)

9.278.2.28 lookup_datawriter_by_name()

```
virtual DDSDDataWriter * DDSPublisher::lookup_datawriter_by_name (
    const char * datawriter_name ) [pure virtual]
```

<<**extension**>> (p. 236) Retrieves a **DDSDDataWriter** (p. 1305) contained within the **DDSPublisher** (p. 1534) the **DDSDDataWriter** (p. 1305) entity name.

Every **DDSDDataWriter** (p. 1305) in the system has an entity name which is configured and stored in the <<**extension**>> (p. 236) EntityName policy, **ENTITY_NAME** (p. 402).

This operation retrieves the **DDSDDataWriter** (p. 1305) within the **DDSPublisher** (p. 1534) whose name matches the one specified. If there are several **DDSDDataWriter** (p. 1305) with the same name within the **DDSPublisher** (p. 1534), the operation returns the first matching occurrence.

Parameters

<i>datawriter_name</i>	<< in >> (p. 237) Entity name of the DDSDDataWriter (p. 1305).
------------------------	--

Returns

The first **DDSDDataWriter** (p. 1305) found with the specified name or NULL if it is not found.

9.281 DDSQueryCondition Class Reference

`<<interface>>` (p. 236) These are specialised **DDSReadCondition** (p. 1558) objects that allow the application to also specify a filter on the locally available data.

Inheritance diagram for DDSQueryCondition:

Public Member Functions

- virtual const char * **get_query_expression** ()=0
Retrieves the query expression.
- virtual **DDS_ReturnCode_t** **get_query_parameters** (**DDS_StringSeq** &query_parameters)=0
Retrieves the query parameters.
- virtual **DDS_ReturnCode_t** **set_query_parameters** (const **DDS_StringSeq** &query_parameters)=0
Sets the query parameters.

9.281.1 Detailed Description

`<<interface>>` (p. 236) These are specialised **DDSReadCondition** (p. 1558) objects that allow the application to also specify a filter on the locally available data.

Each query condition filter is composed of a **DDSReadCondition** (p. 1558) state filter and a content filter expressed as a `query_expression` and `query_parameters`.

The query (`query_expression`) is similar to an SQL WHERE clause and can be parameterised by arguments that are dynamically changeable by the **set_query_parameters()** (p. 1558) operation.

Two query conditions that have the same `query_expression` will require unique query condition content filters if their `query_parameters` differ. Query conditions that differ only in their state masks will share the same query condition content filter.

Queries and Filters Syntax (p. 178) describes the syntax of `query_expression` and `query_parameters`.

9.281.2 Member Function Documentation

9.281.2.1 `get_query_expression()`

```
virtual const char * DDSQueryCondition::get_query_expression ( ) [pure virtual]
```

Retrieves the query expression.

9.281.2.2 `get_query_parameters()`

```
virtual DDS_ReturnCode_t DDSQueryCondition::get_query_parameters (
    DDS_StringSeq & query_parameters ) [pure virtual]
```

Retrieves the query parameters.

Parameters

<i>query_parameters</i>	<< <i>inout</i> >> (p. 237) the query parameters are returned here. The memory for the strings in this sequence is managed according to the conventions described in String Conventions (p. 546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.
-------------------------	---

9.281.2.3 `set_query_parameters()`

```
virtual DDS_ReturnCode_t DDSQueryCondition::set_query_parameters (
    const DDS_StringSeq & query_parameters ) [pure virtual]
```

Sets the query parameters.

Parameters

<i>query_parameters</i>	<< <i>in</i> >> (p. 237) the new query parameters
-------------------------	---

9.282 DDSReadCondition Class Reference

<<*interface*>> (p. 236) Conditions specifically dedicated to read operations and attached to one **DDSDataReader**

(p. 1272).

Inheritance diagram for DDSReadCondition:

Public Member Functions

- virtual **DDS_SampleStateMask** **get_sample_state_mask** ()=0
Retrieves the set of `sample_states` for the condition.
- virtual **DDS_ViewStateMask** **get_view_state_mask** ()=0
Retrieves the set of `view_states` for the condition.
- virtual **DDS_InstanceStateMask** **get_instance_state_mask** ()=0
Retrieves the set of `instance_states` for the condition.
- virtual **DDS_StreamKindMask** **get_stream_kind_mask** ()=0
Retrieves the set of `instance_states` for the condition.
- virtual **DDSDataReader *** **get_datareader** ()=0
*Returns the **DDSDataReader** (p. 1272) associated with the **DDSReadCondition** (p. 1558).*

9.282.1 Detailed Description

<<*interface*>> (p. 236) Conditions specifically dedicated to read operations and attached to one **DDSDataReader** (p. 1272).

DDSReadCondition (p. 1558) objects allow an application to specify the data samples it is interested in (by specifying the desired `sample_states`, `view_states` as well as `instance_states` in **FooDataReader::read** (p. 1635) and **FooDataReader::take** (p. 1636) variants.

This allows RTI Connext to enable the condition only when suitable information is available. They are to be used in conjunction with a WaitSet as normal conditions.

More than one **DDSReadCondition** (p. 1558) may be attached to the same **DDSDataReader** (p. 1272).

Examples

HelloWorld_subscriber.cxx.

9.282.2 Member Function Documentation

9.282.2.1 `get_sample_state_mask()`

```
virtual DDS_SampleStateMask DDSReadCondition::get_sample_state_mask ( ) [pure virtual]
```

Retrieves the set of `sample_states` for the condition.

9.282.2.2 `get_view_state_mask()`

```
virtual DDS_ViewStateMask DDSReadCondition::get_view_state_mask ( ) [pure virtual]
```

Retrieves the set of `view_states` for the condition.

9.282.2.3 `get_instance_state_mask()`

```
virtual DDS_InstanceStateMask DDSReadCondition::get_instance_state_mask ( ) [pure virtual]
```

Retrieves the set of `instance_states` for the condition.

9.282.2.4 `get_stream_kind_mask()`

```
virtual DDS_StreamKindMask DDSReadCondition::get_stream_kind_mask ( ) [pure virtual]
```

Retrieves the set of `instance_states` for the condition.

9.282.2.5 `get_datareader()`

```
virtual DDSDataReader * DDSReadCondition::get_datareader ( ) [pure virtual]
```

Returns the **DDSDataReader** (p. 1272) associated with the **DDSReadCondition** (p. 1558).

There is exactly one **DDSDataReader** (p. 1272) associated with each **DDSReadCondition** (p. 1558).

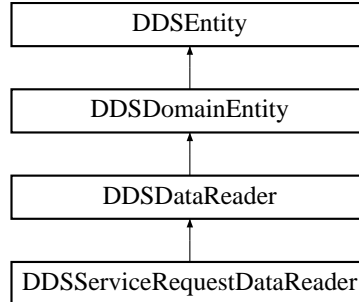

Returns

DDSDataReader (p. 1272) associated with the **DDSReadCondition** (p. 1558).

9.283 DDSServiceRequestDataReader Class Reference

Instantiates `DataReader < DDS_ServiceRequest (p. 1083) > .`

Inheritance diagram for DDSServiceRequestDataReader:

Additional Inherited Members

9.283.1 Detailed Description

Instantiates `DataReader < DDS_ServiceRequest (p. 1083) > .`

DDSDataReader (p. 1272) of topic **DDS_SERVICE_REQUEST_TOPIC_NAME** (p. 302) used for accessing **DDS_↵ServiceRequest** (p. 1083) samples.

Instantiates:

`<<generic>> (p. 236) FooDataReader` (p. 1632)

See also

DDS_ServiceRequest (p. 1083)

DDS_SERVICE_REQUEST_TOPIC_NAME (p. 302)

9.284 DDSServiceRequestTypeSupport Class Reference

Instantiates `TypeSupport < DDS_ServiceRequest (p. 1083) > .`

9.284.1 Detailed Description

Instantiates `TypeSupport < DDS_ServiceRequest (p. 1083) > .`

Instantiates:

`<<generic>> (p. 236) FooTypeSupport` (p. 1693)

See also

DDS_ServiceRequest (p. 1083)

9.285 DDSStatusCondition Class Reference

<<*interface*>> (p. 236) A specific **DDSCondition** (p. 1260) that is associated with each **DDSEntity** (p. 1446).

Inheritance diagram for DDSStatusCondition:

Public Member Functions

- virtual **DDS_StatusMask** **get_enabled_statuses** ()=0
*Get the list of statuses enabled on an **DDSEntity** (p. 1446).*
- virtual **DDS_ReturnCode_t** **set_enabled_statuses** (**DDS_StatusMask** mask)=0
*This operation defines the list of communication statuses that determine the *trigger_value* of the **DDSStatusCondition** (p. 1562).*
- virtual **DDSEntity *** **get_entity** ()=0
*Get the **DDSEntity** (p. 1446) associated with the **DDSStatusCondition** (p. 1562).*

9.285.1 Detailed Description

<<*interface*>> (p. 236) A specific **DDSCondition** (p. 1260) that is associated with each **DDSEntity** (p. 1446).

The `trigger_value` of the **DDSStatusCondition** (p. 1562) depends on the communication status of that entity (e.g., arrival of data, loss of information, etc.), 'filtered' by the set of `enabled_statuses` on the **DDSStatusCondition** (p. 1562).

See also

Status Kinds (p. 336)
DDSWaitSet (p. 1613), **DDSCondition** (p. 1260)
DDSListener (p. 1509)

9.285.2 Member Function Documentation

9.285.2.1 get_enabled_statuses()

```
virtual DDS_StatusMask DDSStatusCondition::get_enabled_statuses ( ) [pure virtual]
```

Get the list of statuses enabled on an **DDSEntity** (p. 1446).

Returns

list of enabled statuses.

9.285.2.2 set_enabled_statuses()

```
virtual DDS_ReturnCode_t DDSStatusCondition::set_enabled_statuses (
    DDS_StatusMask mask ) [pure virtual]
```

This operation defines the list of communication statuses that determine the `trigger_value` of the **DDSStatusCondition** (p. 1562).

This operation may change the `trigger_value` of the **DDSStatusCondition** (p. 1562).

DDSWaitSet (p. 1613) objects' behavior depends on the changes of the `trigger_value` of their attached conditions. Therefore, any **DDSWaitSet** (p. 1613) to which the **DDSStatusCondition** (p. 1562) is attached is potentially affected by this operation.

If this function is not invoked, the default list of enabled statuses includes all the statuses.

Parameters

<i>mask</i>	<< <i>in</i> >> (p. 237) the list of enables statuses (see Status Kinds (p. 336))
-------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.285.2.3 get_entity()

```
virtual DDSEntity * DDSStatusCondition::get_entity ( ) [pure virtual]
```

Get the **DDSEntity** (p. 1446) associated with the **DDSStatusCondition** (p. 1562).

There is exactly one **DDSEntity** (p. 1446) associated with each **DDSStatusCondition** (p. 1562).

Returns

DDSEntity (p. 1446) associated with the **DDSStatusCondition** (p. 1562).

9.286 DDSStringDataReader Class Reference

<<**interface**>> (p. 236) Instantiates `DataReader < char* >`.

Inheritance diagram for `DDStringDataReader`:

Public Member Functions

- virtual `DDS_ReturnCode_t read (DDS_StringSeq &received_data, DDS_SampleInfoSeq &info_seq, DDS_Long max_samples= DDS_LENGTH_UNLIMITED, DDS_SampleStateMask sample_states= DDS_ANY_SAMPLE_STATE, DDS_ViewStateMask view_states= DDS_ANY_VIEW_STATE, DDS_InstanceStateMask instance_states= DDS_ANY_INSTANCE_STATE)`
*Access a collection of data samples from the **DDSEntity** (p. 1272).*
- virtual `DDS_ReturnCode_t take (DDS_StringSeq &received_data, DDS_SampleInfoSeq &info_seq, DDS_Long max_samples= DDS_LENGTH_UNLIMITED, DDS_SampleStateMask sample_states= DDS_ANY_SAMPLE_STATE, DDS_ViewStateMask view_states= DDS_ANY_VIEW_STATE, DDS_InstanceStateMask instance_states= DDS_ANY_INSTANCE_STATE)`
*Access a collection of data-samples from the **DDSEntity** (p. 1272).*
- virtual `DDS_ReturnCode_t read_w_condition (DDS_StringSeq &received_data, DDS_SampleInfoSeq &info_seq, DDS_Long max_samples, DDSReadCondition *condition)`
*Accesses via **DDStringDataReader::read** (p. 1565) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual `DDS_ReturnCode_t take_w_condition (DDS_StringSeq &received_data, DDS_SampleInfoSeq &info_seq, DDS_Long max_samples, DDSReadCondition *condition)`
*Analogous to **DDStringDataReader::read_w_condition** (p. 1565) except it accesses samples via the **DDStringDataReader::take** (p. 1565) operation.*
- virtual `DDS_ReturnCode_t read_next_sample (char *received_data, DDS_SampleInfo &sample_info)`
*Copies the next not-previously-accessed data value from the **DDSEntity** (p. 1272).*
- virtual `DDS_ReturnCode_t take_next_sample (char *received_data, DDS_SampleInfo &sample_info)`
*Copies the next not-previously-accessed data value from the **DDSEntity** (p. 1272).*
- virtual `DDS_ReturnCode_t return_loan (DDS_StringSeq &received_data, DDS_SampleInfoSeq &info_seq)`
*Indicates to the **DDSEntity** (p. 1272) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDSEntity** (p. 1272).*

Static Public Member Functions

- static `DDStringDataReader * narrow (DDSEntity *reader)`
*Narrow the given **DDSEntity** (p. 1272) pointer to a **DDStringDataReader** (p. 1564) pointer.*

9.286.1 Detailed Description

<<*interface*>> (p. 236) Instantiates DataReader < char* >.

See also

FooDataReader (p. 1632)

DDSDDataReader (p. 1272)

String Support (p. 545)

9.286.2 Member Function Documentation

9.286.2.1 read()

```
virtual DDS_ReturnCode_t DDSStringDataReader::read (
    DDS_StringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::read (p. 1635)

9.286.2.2 take()

```
virtual DDS_ReturnCode_t DDSStringDataReader::take (
    DDS_StringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples = DDS_LENGTH_UNLIMITED,
    DDS_SampleStateMask sample_states = DDS_ANY_SAMPLE_STATE,
    DDS_ViewStateMask view_states = DDS_ANY_VIEW_STATE,
    DDS_InstanceStateMask instance_states = DDS_ANY_INSTANCE_STATE ) [virtual]
```

Access a collection of data-samples from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::take (p. 1636)

9.286.2.3 read_w_condition()

```
virtual DDS_ReturnCode_t DDSStringDataReader::read_w_condition (
    DDS_StringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Accesses via **DDSStringDataReader::read** (p. 1565) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

See also

FooDataReader::read_w_condition (p. 1640)

9.286.2.4 take_w_condition()

```
virtual DDS_ReturnCode_t DDSStringDataReader::take_w_condition (
    DDS_StringSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [virtual]
```

Analogous to **DDSStringDataReader::read_w_condition** (p. 1565) except it accesses samples via the **DDSStringDataReader::take** (p. 1565) operation.

See also

FooDataReader::take_w_condition (p. 1641)

9.286.2.5 read_next_sample()

```
virtual DDS_ReturnCode_t DDSStringDataReader::read_next_sample (
    char * received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDataReader** (p. 1272).

See also

FooDataReader::read_next_sample (p. 1642)

9.286.2.6 take_next_sample()

```
virtual DDS_ReturnCode_t DDSStringDataReader::take_next_sample (
    char * received_data,
    DDS_SampleInfo & sample_info ) [virtual]
```

Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).

See also

FooDataReader::take_next_sample (p. 1643)

9.286.2.7 return_loan()

```
virtual DDS_ReturnCode_t DDSStringDataReader::return_loan (
    DDS_StringSeq & received_data,
    DDS_SampleInfoSeq & info_seq ) [virtual]
```

Indicates to the **DDSDDataReader** (p. 1272) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDSDDataReader** (p. 1272).

See also

FooDataReader::return_loan (p. 1655)

9.286.2.8 narrow()

```
static DDSStringDataReader * DDSStringDataReader::narrow (
    DDSDDataReader * reader ) [static]
```

Narrow the given **DDSDDataReader** (p. 1272) pointer to a **DDSStringDataReader** (p. 1564) pointer.

See also

FooDataReader::narrow (p. 1634)

9.287 DDSStringDataWriter Class Reference

<<*interface*>> (p. 236) Instantiates `DataWriter < char* >`.

Inheritance diagram for DDSStringDataWriter:

Public Member Functions

- virtual `char *` **create_data** (const `DDS_TypeAllocationParams_t` &alloc_params)
Creates a string data instance.
- virtual `DDS_Boolean` **delete_data** (char *sample, const `DDS_TypeDeallocationParams_t` &dealloc_params)
Destroys a string data instance created by `DDSStringDataWriter::create_data` (p. 1569).
- virtual `DDS_ReturnCode_t` **write** (const char *instance_data, const `DDS_InstanceHandle_t` &handle)
Modifies the value of a string data instance.
- virtual `DDS_ReturnCode_t` **write_w_timestamp** (const char *instance_data, const `DDS_InstanceHandle_t` &handle, const `DDS_Time_t` &source_timestamp)
Performs the same function as `DDSStringDataWriter::write` (p. 1570) except that it also provides the value for the `source_timestamp`.
- virtual `DDS_ReturnCode_t` **write_w_params** (const char *instance_data, `DDS_WriteParams_t` ¶ms)
Performs the same function as `DDSStringDataWriter::write` (p. 1570) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Static Public Member Functions

- static `DDSStringDataWriter *` **narrow** (`DDSDataWriter *`writer)
Narrow the given `DDSDataWriter` (p. 1305) pointer to a `DDSStringDataWriter` (p. 1568) pointer.

9.287.1 Detailed Description

<<*interface*>> (p. 236) Instantiates `DataWriter < char* >`.

See also

FooDataWriter (p. 1659)

DDSDataWriter (p. 1305)

String Support (p. 545)

9.287.2 Member Function Documentation

9.287.2.1 narrow()

```
static DDStringDataWriter * DDSStringDataWriter::narrow (
    DDSDataWriter * writer ) [static]
```

Narrow the given **DDSDataWriter** (p. 1305) pointer to a **DDStringDataWriter** (p. 1568) pointer.

See also

FooDataWriter::narrow (p. 1661)

9.287.2.2 create_data()

```
virtual char * DDSStringDataWriter::create_data (
    const DDS_TypeAllocationParams_t & alloc_params ) [virtual]
```

Creates a string data instance.

The size of the instance including the NULL terminated character is determined by the DataWriter property **dds.builtin_type.string.alloc_size**.↔

Default size: **dds.builtin_type.string.max_size** property of DomainParticipant if defined. Otherwise 1024.

Created instances must be deleted with **DDStringDataWriter::delete_data** (p. 1569).

Returns

Newly created string data, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types

9.287.2.3 delete_data()

```
virtual DDS_Boolean DDSStringDataWriter::delete_data (
    char * sample,
    const DDS_TypeDeallocationParams_t & dealloc_params ) [virtual]
```

Destroys a string data instance created by **DDSStrngDataWriter::create_data** (p. 1569).

Returns

DDS_BOOLEAN_TRUE (p. 316) upon successful deletion.

9.287.2.4 write()

```
virtual DDS_ReturnCode_t DDSStringDataWriter::write (
    const char * instance_data,
    const DDS_InstanceHandle_t & handle ) [virtual]
```

Modifies the value of a string data instance.

See also

FooDataWriter::write (p. 1666)

9.287.2.5 write_w_timestamp()

```
virtual DDS_ReturnCode_t DDSStringDataWriter::write_w_timestamp (
    const char * instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [virtual]
```

Performs the same function as **DDSStrngDataWriter::write** (p. 1570) except that it also provides the value for the *source_timestamp*.

See also

FooDataWriter::write_w_timestamp (p. 1670)

9.287.2.6 write_w_params()

```
virtual DDS_ReturnCode_t DDSStringDataWriter::write_w_params (
    const char * instance_data,
    DDS_WriteParams_t & params ) [virtual]
```

Performs the same function as **DDSStringDataWriter::write** (p. 1570) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

FooDataWriter::write_w_params (p. 1671)

9.288 DDSStringTypeSupport Class Reference

<<**interface**>> (p. 236) String type support.

Inheritance diagram for DDSStringTypeSupport:

Static Public Member Functions

- static **DDS_ReturnCode_t register_type** (**DDSDomainParticipant** *participant, const char *type_↵
name="DDS::String")
Allows an application to communicate to RTI Connext the existence of the char data type.*
- static **DDS_ReturnCode_t unregister_type** (**DDSDomainParticipant** *participant, const char *type_↵
name="DDS::String")
Allows an application to unregister the char data type from RTI Connext. After calling unregister_type, no further communication using this type is possible.*
- static const char * **get_type_name** ()
Get the default name for the char type.*
- static void **print_data** (const char *a_data)
<<**extension**>> (p. 236) Print value of data type to standard out.
- static **DDS_TypeCode** * **get_typecode** ()
<<**extension**>> (p. 236) Retrieves the TypeCode for the Type.
- static **DDS_ReturnCode_t serialize_data_to_cdr_buffer** (char *buffer, unsigned int &length, const char *a_↵
data)
<<**extension**>> (p. 236) Serializes the input sample into a CDR buffer of octets.
- static **DDS_ReturnCode_t serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int &length, const char
*a_data, **DDS_DataRepresentationId_t** representation)
<<**extension**>> (p. 236) Serializes the input sample into a buffer of octets.
- static **DDS_ReturnCode_t deserialize_data_from_cdr_buffer** (char **a_data, const char *buffer, unsigned
int length)
<<**extension**>> (p. 236) Deserializes a sample from a buffer of octets.
- static **DDS_ReturnCode_t data_to_string** (char *sample, char *str, **DDS_UnsignedLong** &str_size, const
DDS_PrintFormatProperty &property)
<<**extension**>> (p. 236) Get the string representation of an input sample.

9.288.1 Detailed Description

<<*interface*>> (p. 236) String type support.

9.288.2 Member Function Documentation

9.288.2.1 register_type()

```
static DDS_ReturnCode_t DDSStringTypeSupport::register_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::String" ) [static]
```

Allows an application to communicate to RTI Connexx the existence of the char* data type.

By default, The char* built-in type is automatically registered when a DomainParticipant is created using the type_name returned by **DDSStringTypeSupport::get_type_name** (p. 1573). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin_↔type.auto_register".

This method can also be used to register the same **DDSStringTypeSupport** (p. 1571) with a **DDSDomainParticipant** (p. 1335) using different values for the type_name.

If **register_type** is called multiple times with the same **DDSDomainParticipant** (p. 1335) and type_name, the second (and subsequent) registrations are ignored by the operation.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to register the data type char* with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type char* is registered with the participant; this type name is used when creating a new DDSTopic (p. 1601). (See DDSDomainParticipant::create_topic (p. 1366).) The name may not be NULL or longer than 255 characters.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336).
------------	---

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDSDomainParticipant::create_topic (p. 1366)

9.288.2.2 unregister_type()

```
static DDS_ReturnCode_t DDSStringTypeSupport::unregister_type (
    DDSDomainParticipant * participant,
    const char * type_name = "DDS::String" ) [static]
```

Allows an application to unregister the char* data type from RTI Connex. After calling unregister_type, no further communication using this type is possible.

Precondition

The char* type with type_name is registered with the participant and all **DDSTopic** (p. 1601) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDSTopic** (p. 1601) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 335).

Postcondition

All information about the type is removed from RTI Connex. No further communication using this type is possible.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to unregister the data type char* from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type char* is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_BAD_PARAMETER (p. 335) or DDS_RETCODE_ERROR (p. 335)
------------	--

MT Safety:

SAFE.

See also

DDSStringTypeSupport::register_type (p. 1572)

9.288.2.3 get_type_name()

```
static const char * DDSStringTypeSupport::get_type_name ( ) [static]
```

Get the default name for the char* type.

Can be used for calling **DDSStringTypeSupport::register_type** (p. 1572) or creating **DDSTopic** (p. 1601).

Returns

default name for the char* type.

See also

DDSStringTypeSupport::register_type (p. 1572)

DDSDomainParticipant::create_topic (p. 1366)

9.288.2.4 print_data()

```
static void DDSStringTypeSupport::print_data (
    const char * a_data ) [static]
```

<<**extension**>> (p. 236) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

<i>a_data</i>	<< in >> (p. 237) String to be printed.
---------------	--

9.288.2.5 get_typecode()

```
static DDS_TypeCode * DDSStringTypeSupport::get_typecode ( ) [static]
```

<<**extension**>> (p. 236) Retrieves the TypeCode for the Type.

See also

FooTypeSupport::get_typecode (p. 1705)

9.288.2.6 serialize_data_to_cdr_buffer()

```
static DDS_ReturnCode_t DDSStringTypeSupport::serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int & length,
    const char * a_data ) [static]
```

<<**extension**>> (p. 236) Serializes the input sample into a CDR buffer of octets.

See also

FooTypeSupport::serialize_data_to_cdr_buffer (p. 1703)

9.288.2.7 serialize_data_to_cdr_buffer_ex()

```
static DDS_ReturnCode_t DDSStringTypeSupport::serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int & length,
    const char * a_data,
    DDS_DataRepresentationId_t representation ) [static]
```

<<**extension**>> (p. 236) Serializes the input sample into a buffer of octets.

See also

FooTypeSupport::serialize_data_to_cdr_buffer (p. 1703)

9.288.2.8 deserialize_data_from_cdr_buffer()

```
static DDS_ReturnCode_t DDSStringTypeSupport::deserialize_data_from_cdr_buffer (
    char ** a_data,
    const char * buffer,
    unsigned int length ) [static]
```

<<**extension**>> (p. 236) Deserializes a sample from a buffer of octets.

See also

FooTypeSupport::deserialize_data_from_cdr_buffer (p. 1704)

9.288.2.9 data_to_string()

```
static DDS_ReturnCode_t DDSStringTypeSupport::data_to_string (
    char * sample,
    char * str,
    DDS_UnsignedLong & str_size,
    const DDS_PrintFormatProperty & property ) [static]
```

<<**extension**>> (p. 236) Get the string representation of an input sample.

FooTypeSupport::data_to_string (p. 1705)

9.289 DDSSubscriber Class Reference

<<**interface**>> (p. 236) A subscriber is the object responsible for actually receiving data from a subscription.

Inheritance diagram for DDSSubscriber:

Public Member Functions

- virtual **DDS_ReturnCode_t get_default_datareader_qos** (**DDS_DataReaderQos** &qos)=0
Copies the default **DDS_DataReaderQos** (p. 638) values into the provided **DDS_DataReaderQos** (p. 638) instance.
- virtual **DDS_ReturnCode_t set_default_datareader_qos** (const **DDS_DataReaderQos** &qos)=0
Sets the default **DDS_DataReaderQos** (p. 638) values for this subscriber.
- virtual **DDS_ReturnCode_t set_default_datareader_qos_with_profile** (const char *library_name, const char *profile_name)=0
<<**extension**>> (p. 236) Set the default **DDS_DataReaderQos** (p. 638) values for this subscriber based on the input XML QoS profile.
- virtual **DDS_ReturnCode_t set_default_library** (const char *library_name)=0
<<**extension**>> (p. 236) Sets the default XML library for a **DDSSubscriber** (p. 1576).
- virtual const char * **get_default_library** ()=0
<<**extension**>> (p. 236) Gets the default XML library associated with a **DDSSubscriber** (p. 1576).
- virtual **DDS_ReturnCode_t set_default_profile** (const char *library_name, const char *profile_name)=0
<<**extension**>> (p. 236) Sets the default XML profile for a **DDSSubscriber** (p. 1576).
- virtual const char * **get_default_profile** ()=0
<<**extension**>> (p. 236) Gets the default XML profile associated with a **DDSSubscriber** (p. 1576).

- virtual const char * **get_default_profile_library** ()=0
*<<extension>> (p. 236) Gets the library where the default XML QoS profile is contained for a **DDSSubscriber** (p. 1576).*
- virtual **DDSDataReader** * **create_datareader** (**DDSTopicDescription** *topic, const **DDS_DataReaderQos** &qos, **DDSDataReaderListener** *listener, **DDS_StatusMask** mask)=0
*Creates a **DDSDataReader** (p. 1272) that will be attached and belong to the **DDSSubscriber** (p. 1576).*
- virtual **DDSDataReader** * **create_datareader_with_profile** (**DDSTopicDescription** *topic, const char *library_name, const char *profile_name, **DDSDataReaderListener** *listener, **DDS_StatusMask** mask)=0
*<<extension>> (p. 236) Creates a **DDSDataReader** (p. 1272) object using the **DDS_DataReaderQos** (p. 638) associated with the input XML QoS profile.*
- virtual **DDS_ReturnCode_t** **delete_datareader** (**DDSDataReader** *a_datareader)=0
*Deletes a **DDSDataReader** (p. 1272) that belongs to the **DDSSubscriber** (p. 1576).*
- virtual **DDS_ReturnCode_t** **delete_contained_entities** ()=0
*Deletes all the entities that were created by means of the "create" operation on the **DDSSubscriber** (p. 1576).*
- virtual **DDSDataReader** * **lookup_datareader** (const char *topic_name)=0
*Retrieves an existing **DDSDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **begin_access** ()=0
*Indicates that the application is about to access the data samples in any of the **DDSDataReader** (p. 1272) objects attached to the **DDSSubscriber** (p. 1576).*
- virtual **DDS_ReturnCode_t** **end_access** ()=0
*Indicates that the application has finished accessing the data samples in **DDSDataReader** (p. 1272) objects managed by the **DDSSubscriber** (p. 1576).*
- virtual **DDS_ReturnCode_t** **get_datareaders** (**DDSDataReaderSeq** &readers, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)=0
*Allows the application to access the **DDSDataReader** (p. 1272) objects that contain samples with the specified *sample↔_states, view_states and instance_states*.*
- virtual **DDS_ReturnCode_t** **get_all_datareaders** (**DDSDataReaderSeq** &readers)=0
Retrieve all the DataReaders created from this Subscriber.
- virtual **DDS_ReturnCode_t** **notify_datareaders** ()=0
*Invokes the operation **DDSDataReaderListener::on_data_available()** (p. 1301) on the **DDSDataReaderListener** (p. 1299) objects attached to contained **DDSDataReader** (p. 1272) entities with **DDS_DATA_AVAILABLE_STATUS** (p. 344) that is considered changed as described in *Changes in read communication status* (p. ??).*
- virtual **DDSDomainParticipant** * **get_participant** ()=0
*Returns the **DDSDomainParticipant** (p. 1335) to which the **DDSSubscriber** (p. 1576) belongs.*
- virtual **DDS_ReturnCode_t** **copy_from_topic_qos** (**DDS_DataReaderQos** &datareader_qos, const **DDS_↔TopicQos** &topic_qos)=0
*Copies the policies in the **DDS_TopicQos** (p. 1120) to the corresponding policies in the **DDS_DataReaderQos** (p. 638).*
- virtual **DDS_ReturnCode_t** **set_qos** (const **DDS_SubscriberQos** &qos)=0
Sets the subscriber QoS.
- virtual **DDS_ReturnCode_t** **set_qos_with_profile** (const char *library_name, const char *profile_name)=0
<<extension>> (p. 236) Change the QoS of this subscriber using the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **get_qos** (**DDS_SubscriberQos** &qos)=0
Gets the subscriber QoS.
- virtual **DDS_ReturnCode_t** **set_listener** (**DDSSubscriberListener** *l, **DDS_StatusMask** mask= **DDS_↔STATUS_MASK_ALL**)=0
Sets the subscriber listener.
- virtual **DDSSubscriberListener** * **get_listener** ()=0
Get the subscriber listener.
- virtual **DDSDataReader** * **lookup_datareader_by_name** (const char *datareader_name)=0
*<<extension>> (p. 236) Retrieves a **DDSDataReader** (p. 1272) contained within the **DDSSubscriber** (p. 1576) the **DDSDataReader** (p. 1272) entity name.*

9.289.1 Detailed Description

<<**interface**>> (p. 236) A subscriber is the object responsible for actually receiving data from a subscription.

QoS:

DDS_SubscriberQos (p. 1090)

Status:

DDS_DATA_ON_READERS_STATUS (p. 344)

Listener:

DDSSubscriberListener (p. 1597)

A subscriber acts on the behalf of one or several **DDSDataReader** (p. 1272) objects that are related to it. When it receives data (from the other parts of the system), it builds the list of concerned **DDSDataReader** (p. 1272) objects and then indicates to the application that data is available through its listener or by enabling related conditions.

The application can access the list of concerned **DDSDataReader** (p.1272) objects through the operation **DDSSubscriber::get_datareaders** (p. 1590) and then access the data available through operations on the **DDSDataReader** (p. 1272).

The following operations may be called even if the **DDSSubscriber** (p. 1576) is not enabled. Other operations will the value **DDS_RETCODE_NOT_ENABLED** (p. 336) if called on a disabled **DDSSubscriber** (p. 1576):

- **DDSEntity::enable** (p. 1449),
- **DDSSubscriber::set_qos** (p. 1593), **DDSSubscriber::get_qos** (p. 1595) , **idref_Subscriber_set_qos_with_↔** profile
- **DDSSubscriber::set_listener** (p. 1595), **DDSSubscriber::get_listener** (p. 1596),
- **DDSEntity::get_statuscondition** (p. 1450), **DDSEntity::get_status_changes** (p. 1450)
- **DDSSubscriber::create_datareader** (p. 1583), **DDSSubscriber::create_datareader_with_profile** (p. 1585), **DDSSubscriber::delete_contained_entities** (p. 1587), **DDSSubscriber::delete_datareader** (p. 1586),
- **DDSSubscriber::set_default_datareader_qos** (p. 1579), **DDSSubscriber::set_default_datareader_qos_↔** _with_profile (p. 1580), **DDSSubscriber::get_default_datareader_qos** (p. 1579), **DDSSubscriber::set_↔** default_library (p. 1581), **DDSSubscriber::set_default_profile** (p. 1582)

All operations except for **DDSSubscriber::set_qos** (p. 1593), **DDSSubscriber::set_qos_with_profile** (p. 1594), **DDSSubscriber::get_qos** (p. 1595), **DDSSubscriber::set_listener** (p. 1595), **DDSSubscriber::get_listener** (p. 1596), **DDSEntity::enable** (p. 1449) and **DDSSubscriber::create_datareader** (p. 1583) may fail with **DDS_↔** **RETCODE_NOT_ENABLED** (p. 336).

Operations Allowed in Listener Callbacks (p. ??)

Examples

HelloWorld_subscriber.cxx.

9.289.2 Member Function Documentation

9.289.2.1 `get_default_datareader_qos()`

```
virtual DDS_ReturnCode_t DDSSubscriber::get_default_datareader_qos (
    DDS_DataReaderQos & qos ) [pure virtual]
```

Copies the default **DDS_DataReaderQos** (p. 638) values into the provided **DDS_DataReaderQos** (p. 638) instance.

The retrieved `qos` will match the set of values specified on the last successful call to **DDSSubscriber::set_default_datareader_qos** (p. 1579), or **DDSSubscriber::set_default_datareader_qos_with_profile** (p. 1580), or else, if the call was never made, the default values from its owning **DDSDomainParticipant** (p. 1335).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

MT Safety:

UNSAFE. It is not safe to retrieve the default QoS value from a subscriber while another thread may be simultaneously calling **DDSSubscriber::set_default_datareader_qos** (p. 1579).

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) DDS_DataReaderQos (p. 638) to be filled-up.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_DATAREADER_QOS_DEFAULT (p. 132)

DDSSubscriber::create_datareader (p. 1583)

9.289.2.2 `set_default_datareader_qos()`

```
virtual DDS_ReturnCode_t DDSSubscriber::set_default_datareader_qos (
    const DDS_DataReaderQos & qos ) [pure virtual]
```

Sets the default **DDS_DataReaderQos** (p. 638) values for this subscriber.

This call causes the default values inherited from the owning **DDSDomainParticipant** (p. 1335) to be overridden.

This default value will be used for newly created **DDSDataReader** (p. 1272) if **DDS_DATAREADER_QOS_DEFAULT** (p. 132) is specified as the `qos` parameter when **DDSSubscriber::create_datareader** (p. 1583) is called.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **DDS_↵
RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a subscriber while another thread may be simultaneously calling **DDSSubscriber::set_default_datareader_qos** (p. 1579), **DDSSubscriber::get_default_↵
_datareader_qos** (p. 1579) or calling **DDSSubscriber::create_datareader** (p. 1583) with **DDS_DATAREADER_↵
_QOS_DEFAULT** (p. 132) as the `qos` parameter.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) The default DDS_DataReaderQos (p. 638) to be set to. The special value DDS_DATAREADER_QOS_DEFAULT (p. 132) may be passed as <code>qos</code> to indicate that the default QoS should be reset back to the initial values the factory would use if DDSSubscriber::set_default_datareader_qos (p. 1579) had never been called.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	---

9.289.2.3 set_default_datareader_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSSubscriber::set_default_datareader_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<*extension*>> (p. 236) Set the default **DDS_DataReaderQos** (p. 638) values for this subscriber based on the input XML QoS profile.

This default value will be used for newly created **DDSDataReader** (p. 1272) if **DDS_DATAREADER_QOS_DEFAULT** (p. 132) is specified as the `qos` parameter when **DDSSubscriber::create_datareader** (p. 1583) is called.

Precondition

The **DDS_DataReaderQos** (p. 638) contained in the specified XML QoS profile must be consistent, or else the operation will have no effect and fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336)

MT Safety:

UNSAFE. It is not safe to set the default QoS value from a **DDSSubscriber** (p. 1576) while another thread may be simultaneously calling **DDSSubscriber::set_default_datareader_qos** (p. 1579), **DDSSubscriber_↵
::get_default_datareader_qos** (p. 1579) or calling **DDSSubscriber::create_datareader** (p. 1583) with **DDS_↵
DATAREADER_QOS_DEFAULT** (p. 132) as the `qos` parameter.

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If <i>library_name</i> is null RTI Connexx will use the default library (see DDSSubscriber::set_default_library (p. 1581)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If <i>profile_name</i> is null RTI Connexx will use the default profile (see DDSSubscriber::set_default_profile (p. 1582)).

If the input profile cannot be found the method fails with **DDS_RETCODE_ERROR** (p. 335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336)
------------	--

See also

DDS_DATAREADER_QOS_DEFAULT (p. 132)

DDSSubscriber::create_datareader_with_profile (p. 1585)

9.289.2.4 set_default_library()

```
virtual DDS_ReturnCode_t DDSSubscriber::set_default_library (
    const char * library_name ) [pure virtual]
```

<<*extension*>> (p. 236) Sets the default XML library for a **DDSSubscriber** (p. 1576).

This method specifies the library that will be used as the default the next time a default library is needed during a call to one of this Subscriber's operations.

Any API requiring a *library_name* as a parameter can use null to refer to the default library.

If the default library is not set, the **DDSSubscriber** (p. 1576) inherits the default from the **DDSDomainParticipant** (p. 1335) (see **DDSDomainParticipant::set_default_library** (p. 1350)).

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name. If <i>library_name</i> is null any previous default is unset.
---------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSSubscriber::get_default_library (p. 1582)

9.289.2.5 get_default_library()

```
virtual const char * DDSSubscriber::get_default_library ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the default XML library associated with a **DDSSubscriber** (p. 1576).

Returns

The default library or null if the default library was not set.

See also

DDSSubscriber::set_default_library (p. 1581)

9.289.2.6 set_default_profile()

```
virtual DDS_ReturnCode_t DDSSubscriber::set_default_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<**extension**>> (p. 236) Sets the default XML profile for a **DDSSubscriber** (p. 1576).

This method specifies the profile that will be used as the default the next time a default Subscriber profile is needed during a call to one of this Subscriber's operations. When calling a **DDSSubscriber** (p. 1576) method that requires a `profile_name` parameter, you can use NULL to refer to the default profile. (This same information applies to setting a default library.)

If the default profile is not set, the **DDSSubscriber** (p. 1576) inherits the default from the **DDSDomainParticipant** (p. 1335) (see **DDSDomainParticipant::set_default_profile** (p. 1351)).

This method does not set the default QoS for **DDSDataReader** (p. 1272) objects created by this **DDSSubscriber** (p. 1576); for this functionality, use **DDSSubscriber::set_default_datareader_qos_with_profile** (p. 1580) (you may pass in NULL after having called **set_default_profile()** (p. 1582)).

This method does not set the default QoS for newly created Subscribers; for this functionality, use **DDSDomainParticipant::set_default_subscriber_qos_with_profile** (p. 1358).

Parameters

<i>library_name</i>	<< in >> (p. 237) The library name containing the profile.
<i>profile_name</i>	<< in >> (p. 237) The profile name. If profile_name is null any previous default is unset.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDSSubscriber::get_default_profile (p. 1583)**DDSSubscriber::get_default_profile_library** (p. 1583)**9.289.2.7 get_default_profile()**

```
virtual const char * DDSSubscriber::get_default_profile ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the default XML profile associated with a **DDSSubscriber** (p. 1576).

Returns

The default profile or null if the default profile was not set.

See also

DDSSubscriber::set_default_profile (p. 1582)**9.289.2.8 get_default_profile_library()**

```
virtual const char * DDSSubscriber::get_default_profile_library ( ) [pure virtual]
```

<<**extension**>> (p. 236) Gets the library where the default XML QoS profile is contained for a **DDSSubscriber** (p. 1576).The default profile library is automatically set when **DDSSubscriber::set_default_profile** (p. 1582) is called.This library can be different than the **DDSSubscriber** (p. 1576) default library (see **DDSSubscriber::get_default_library** (p. 1582)).

Returns

The default profile library or null if the default profile was not set.

See also

DDSSubscriber::set_default_profile (p. 1582)

9.289.2.9 create_datareader()

```
virtual DDSDDataReader * DDSSubscriber::create_datareader (
    DDSTopicDescription * topic,
    const DDS_DataReaderQos & qos,
    DDSDDataReaderListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

Creates a **DDSDDataReader** (p. 1272) that will be attached and belong to the **DDSSubscriber** (p. 1576).

For each application-defined type **Foo** (p. 1632), there is an implied, auto-generated class **FooDataReader** (p. 1632) (an incarnation of **FooDataReader** (p. 1632)) that extends **DDSDDataReader** (p. 1272) and contains the operations to read data of type **Foo** (p. 1632).

Note that a common application pattern to construct the QoS for the **DDSDDataReader** (p. 1272) is to:

- Retrieve the QoS policies on the associated **DDSTopic** (p. 1601) by means of the **DDSTopic::get_qos** (p. 1605) operation.
- Retrieve the default **DDSDDataReader** (p. 1272) qos by means of the **DDSSubscriber::get_default_datareader_qos** (p. 1579) operation.
- Combine those two QoS policies (for example, using **DDSSubscriber::copy_from_topic_qos** (p. 1592)) and selectively modify policies as desired
- Use the resulting QoS policies to construct the **DDSDDataReader** (p. 1272).

When a **DDSDDataReader** (p. 1272) is created, only those transports already registered are available to the **DDSDDataReader** (p. 1272). See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered.

MT Safety:

UNSAFE. If **DDS_DATAREADER_QOS_DEFAULT** (p. 132) is used for the *qos* parameter, it is not safe to create the datareader while another thread may be simultaneously calling **DDSSubscriber::set_default_datareader_qos** (p. 1579).

Precondition

If subscriber is enabled, the topic must be enabled. If it is not, this operation will fail and no **DDSDDataReader** (p. 1272) will be created.

The given **DDSTopicDescription** (p. 1608) must have been created from the same participant as this subscriber. If it was created from a different participant, this method will return NULL.

If *qos* is **DDS_DATAREADER_QOS_USE_TOPIC_QOS** (p. 133), *topic* cannot be **DDSMultiTopic** (p. 1513), or else this method will return NULL.

Parameters

<i>topic</i>	<< <i>in</i> >> (p. 237) The DDSTopicDescription (p. 1608) that the DDSDDataReader (p. 1272) will be associated with. Cannot be NULL.
--------------	---

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) The qos of the DDSDataReader (p. 1272). The special value DDS_DATAREADER_QOS_DEFAULT (p. 132) can be used to indicate that the DDSDataReader (p. 1272) should be created with the default DDS_DataReaderQos (p. 638) set in the DDSSubscriber (p. 1576). If DDSTopicDescription (p. 1608) is of type DDSTopic (p. 1601) or DDSSubscriberFilteredTopic (p. 1267), the special value DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 133) can be used to indicate that the DDSDataReader (p. 1272) should be created with the combination of the default DDS_DataReaderQos (p. 638) set on the DDSSubscriber (p. 1576) and the DDS_TopicQos (p. 1120) (in the case of a DDSSubscriberFilteredTopic (p. 1267), the DDS_TopicQos (p. 1120) of the related DDSTopic (p. 1601)). if DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 133) is used, <i>topic</i> cannot be a DDSMultiTopic (p. 1513).
<i>listener</i>	<< <i>in</i> >> (p. 237) The listener of the DDSDataReader (p. 1272).
<i>mask</i>	<< <i>in</i> >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDataReader** (p. 1272) of a derived class specific to the data-type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

See also

FooDataReader (p. 1632)

Specifying QoS on entities (p. 358) for information on setting QoS before entity creation

DDSSubscriber::get_default_datareader_qos (p. 1579)

DDSTopic::set_qos (p. 1603)

DDSSubscriber::copy_from_topic_qos (p. 1592)

DDSDataReader::set_listener (p. 1293)

Examples

HelloWorld_subscriber.cxx.

9.289.2.10 create_datareader_with_profile()

```
virtual DDSDataReader * DDSSubscriber::create_datareader_with_profile (
    DDSTopicDescription * topic,
    const char * library_name,
    const char * profile_name,
    DDSDataReaderListener * listener,
    DDS_StatusMask mask ) [pure virtual]
```

<<**extension**>> (p. 236) Creates a **DDSDDataReader** (p. 1272) object using the **DDS_DataReaderQos** (p. 638) associated with the input XML QoS profile.

The **DDSDDataReader** (p. 1272) will be attached and belong to the **DDSSubscriber** (p. 1576).

For each application-defined type **Foo** (p. 1632), there is an implied, auto-generated class **FooDataReader** (p. 1632) (an incarnation of **FooDataReader** (p. 1632)) that extends **DDSDDataReader** (p. 1272) and contains the operations to read data of type **Foo** (p. 1632).

When a **DDSDDataReader** (p. 1272) is created, only those transports already registered are available to the **DDSDDataReader** (p. 1272). See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered.

Precondition

If subscriber is enabled, the topic must be enabled. If it is not, this operation will fail and no **DDSDDataReader** (p. 1272) will be created.

The given **DDSTopicDescription** (p. 1608) must have been created from the same participant as this subscriber. If it was created from a different participant, this method will return NULL.

Parameters

<i>topic</i>	<< in >> (p. 237) The DDSTopicDescription (p. 1608) that the DDSDDataReader (p. 1272) will be associated with. Cannot be NULL.
<i>library_name</i>	<< in >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connex will use the default library (see DDSSubscriber::set_default_library (p. 1581)).
<i>profile_name</i>	<< in >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connex will use the default profile (see DDSSubscriber::set_default_profile (p. 1582)).
<i>listener</i>	<< in >> (p. 237) The listener of the DDSDDataReader (p. 1272).
<i>mask</i>	<< in >> (p. 237). Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Returns

A **DDSDDataReader** (p. 1272) of a derived class specific to the data-type associated with the **DDSTopic** (p. 1601) or NULL if an error occurred.

DDS_DATAREADER_QOS_USE_TOPIC_QOS (p. 133)
DDSSubscriber::create_datareader (p. 1583)
DDSSubscriber::get_default_datareader_qos (p. 1579)
DDSTopic::set_qos (p. 1603)
DDSSubscriber::copy_from_topic_qos (p. 1592)
DDSDDataReader::set_listener (p. 1293)

9.289.2.11 delete_datareader()

```
virtual DDS_ReturnCode_t DDSSubscriber::delete_datareader (
    DDSDataReader * a_datareader ) [pure virtual]
```

Deletes a **DDSDataReader** (p. 1272) that belongs to the **DDSSubscriber** (p. 1576).

Precondition

If the **DDSDataReader** (p. 1272) does not belong to the **DDSSubscriber** (p. 1576), or if there are any existing **DDSReadCondition** (p. 1558) or **DDSQueryCondition** (p. 1557) objects that are attached to the **DDSDataReader** (p. 1272), or if there are outstanding loans on samples (as a result of a call to `read()`, `take()`, or one of the variants thereof), the operation fails with the error **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Postcondition

Listener installed on the **DDSDataReader** (p. 1272) will not be called after this method completes successfully.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Parameters

<i>a_datareader</i>	<< <i>in</i> >> (p. 237) The DDSDataReader (p. 1272) to be deleted.
---------------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	---

9.289.2.12 delete_contained_entities()

```
virtual DDS_ReturnCode_t DDSSubscriber::delete_contained_entities ( ) [pure virtual]
```

Deletes all the entities that were created by means of the "create" operation on the **DDSSubscriber** (p. 1576).

Deletes all contained **DDSDataReader** (p. 1272) objects. This pattern is applied recursively. In this manner, the operation **DDSSubscriber::delete_contained_entities** (p. 1587) on the **DDSSubscriber** (p. 1576) will end up deleting all the entities recursively contained in the **DDSSubscriber** (p. 1576), including the **DDSQueryCondition** (p. 1557), **DDSReadCondition** (p. 1558), and **DDSTopicQuery** (p. 1611) objects belonging to the contained **DDSDataReader** (p. 1272).

The operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if any of the contained entities is in a state where it cannot be deleted. This will occur, for example, if a contained **DDSDataReader** (p. 1272) cannot

be deleted because the application has called a **FooDataReader::read** (p. 1635) or **FooDataReader::take** (p. 1636) operation and has not called the corresponding **FooDataReader::return_loan** (p. 1655) operation to return the loaned samples.

Once **DDSSubscriber::delete_contained_entities** (p. 1587) completes successfully, the application may delete the **DDSSubscriber** (p. 1576).

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
-----	---

9.289.2.13 lookup_datareader()

```
virtual DDSDDataReader * DDSSubscriber::lookup_datareader (
    const char * topic_name ) [pure virtual]
```

Retrieves an existing **DDSDDataReader** (p. 1272).

Use this operation on the built-in **DDSSubscriber** (p. 1576) (**Built-in Topics** (p. 59)) to access the built-in **DDSDDataReader** (p. 1272) entities for the built-in topics.

The built-in **DDSDDataReader** (p. 1272) is created when this operation is called on a built-in topic for the first time. The built-in **DDSDDataReader** (p. 1272) is deleted automatically when the **DDSDomainParticipant** (p. 1335) is deleted.

To ensure that builtin **DDSDDataReader** (p. 1272) entities receive all the discovery traffic, it is suggested that you lookup the builtin **DDSDDataReader** (p. 1272) before the **DDSDomainParticipant** (p. 1335) is enabled. Looking up builtin **DDSDDataReader** (p. 1272) may implicitly register builtin transports due to creation of **DDSDDataReader** (p. 1272) (see **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered). Therefore, if you are want to modify builtin transport properties, do so *before* using this operation.

Therefore the suggested sequence when looking up builtin DataReaders is:

- Create a disabled **DDSDomainParticipant** (p. 1335).
- (optional) Modify builtin transport properties
- Call **DDSDomainParticipant::get_builtin_subscriber()** (p. 1376).
- Call **DDSSubscriber::lookup_datareader()** (p. 1588).
- Call **enable()** (p. 1449) on the DomainParticipant.

Parameters

<i>topic_name</i>	<< <i>in</i> >> (p. 237) Name of the DDSTopicDescription (p. 1608) that the retrieved DDSDataReader (p. 1272) is attached to. Cannot be NULL.
-------------------	---

Returns

A **DDSDataReader** (p. 1272) that belongs to the **DDSSubscriber** (p. 1576) attached to the **DDSTopicDescription** (p. 1608) with *topic_name*. If no such **DDSDataReader** (p. 1272) exists, this operation returns NULL.

The returned **DDSDataReader** (p. 1272) may be enabled or disabled.

If more than one **DDSDataReader** (p. 1272) is attached to the **DDSSubscriber** (p. 1576), this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **DDSDataReader** (p. 1272) in one thread while another thread is simultaneously creating or destroying that **DDSDataReader** (p. 1272).

9.289.2.14 begin_access()

```
virtual DDS_ReturnCode_t DDSSubscriber::begin_access ( ) [pure virtual]
```

Indicates that the application is about to access the data samples in any of the **DDSDataReader** (p. 1272) objects attached to the **DDSSubscriber** (p. 1576).

If the **DDS_PresentationQosPolicy::access_scope** (p. 987) of the **DDSSubscriber** (p. 1576) is **DDS_GROUP_PresentationQosPolicy::access_scope** (p. 418) or **DDS_HIGHEST_OFFERED_PRESENTATION_QOS** (p. 418) and **DDS_PresentationQosPolicy::ordered_access** (p. 987) is **DDS_BOOLEAN_TRUE** (p. 316), the application is required to use this operation to access the samples in order across DataWriters of the same group (**DDSPublisher** (p. 1534) with **DDS_PresentationQosPolicy::access_scope** (p. 987) set to **DDS_GROUP_PresentationQosPolicy::access_scope** (p. 418)).

In the above case, this operation must be called prior to calling any of the sample-accessing operations, **DDSSubscriber::get_datareaders** (p. 1590) on the **DDSSubscriber** (p. 1576), and **FooDataReader::read** (p. 1635), **FooDataReader::take** (p. 1636), **FooDataReader::read_w_condition** (p. 1640), and **FooDataReader::take_w_condition** (p. 1641) on any **DDSDataReader** (p. 1272).

Once the application has finished accessing the data samples, it must call **DDSSubscriber::end_access** (p. 1590)

The application is not required to call **DDSSubscriber::begin_access** (p. 1589) / **DDSSubscriber::end_access** (p. 1590) to access the samples in order if the **PRESENTATION** (p. 417) policy in the **DDSPublisher** (p. 1534) has **DDS_PresentationQosPolicy::access_scope** (p. 987) set to something other than **DDS_GROUP_PresentationQosPolicy::access_scope** (p. 418). In this case, calling **DDSSubscriber::begin_access** (p. 1589) / **DDSSubscriber::end_access** (p. 1590) is not considered an error and has no effect.

Calls to **DDSSubscriber::begin_access** (p. 1589) / **DDSSubscriber::end_access** (p. 1590) may be nested and must be balanced.

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	--

See also

Access to data samples (p. 125)

DDSSubscriber::get_datareaders (p. 1590)

PRESENTATION (p. 417)

9.289.2.15 end_access()

```
virtual DDS_ReturnCode_t DDSSubscriber::end_access ( ) [pure virtual]
```

Indicates that the application has finished accessing the data samples in **DDSDataReader** (p. 1272) objects managed by the **DDSSubscriber** (p. 1576).

This operation must be used to close a corresponding **begin_access()** (p. 1589).

This call must close a previous call to **DDSSubscriber::begin_access()** (p. 1589), otherwise the operation will fail with the error **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	--

9.289.2.16 get_datareaders()

```
virtual DDS_ReturnCode_t DDSSubscriber::get_datareaders (
    DDSDataReaderSeq & readers,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [pure virtual]
```

Allows the application to access the **DDSDataReader** (p. 1272) objects that contain samples with the specified `sample_states`, `view_states` and `instance_states`.

If the application is outside a **begin_access()** (p. 1589)/**end_access()** block, or if the **DDS_PresentationQosPolicy**↔**::access_scope** (p. 987) of the **DDSSubscriber** (p. 1576) is **DDS_INSTANCE_PRESENTATION_QOS** (p. 418) or **DDS_TOPIC_PRESENTATION_QOS** (p. 418), or if the **DDS_PresentationQosPolicy::ordered_access** (p. 987) of

the **DDSSubscriber** (p. 1576) is **DDS_BOOLEAN_FALSE** (p. 316), the returned collection is a 'set' containing each **DDSDataReader** (p. 1272) at most once, in no specified order.

If the application is within a **begin_access()** (p. 1589)/**end_access()** block, and the **PRESENTATION** (p. 417) policy of the **DDSSubscriber** (p. 1576) is **DDS_GROUP_PRESENTATION_QOS** (p. 418) or **DDS_HIGHEST_OFFERED_PRESENTATION_QOS** (p. 418), and **DDS_PresentationQosPolicy::ordered_access** (p. 987) in the **DDSSubscriber** (p. 1576) is **DDS_BOOLEAN_TRUE** (p. 316), the returned collection is a 'list' of DataReaders where a DataReader may appear more than one time.

To retrieve the samples in the order they were published across DataWriters of the same group (**DDSPublisher** (p. 1534) configured with **DDS_GROUP_PRESENTATION_QOS** (p. 418)), the application should **read()/take()** from each DataReader in the same order as it appears in the output sequence. The application will move to the next DataReader when the **read()/take()** operation fails with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>readers</i>	<< <i>inout</i> >> (p. 237) a DDSDataReaderSeq (p. 1301) object where the set or list of readers will be returned.
<i>sample_states</i>	<< <i>in</i> >> (p. 237) the returned DataReader must contain samples that have one of these <i>sample_states</i> .
<i>view_states</i>	<< <i>in</i> >> (p. 237) the returned DataReader must contain samples that have one of these <i>view_states</i> .
<i>instance_states</i>	<< <i>in</i> >> (p. 237) the returned DataReader must contain samples that have one of these <i>instance_states</i> .

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

Access to data samples (p. 125)
DDSSubscriber::begin_access (p. 1589)
DDSSubscriber::end_access (p. 1590)
PRESENTATION (p. 417)

9.289.2.17 get_all_datareaders()

```
virtual DDS_ReturnCode_t DDSSubscriber::get_all_datareaders (
    DDSDataReaderSeq & readers ) [pure virtual]
```

Retrieve all the DataReaders created from this Subscriber.

Parameters

<i>readers</i>	<< <i>inout</i> >> (p. 237) Sequence where the DataReaders will be added
----------------	--

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.289.2.18 notify_datareaders()

```
virtual DDS_ReturnCode_t DDSSubscriber::notify_datareaders ( ) [pure virtual]
```

Invokes the operation **DDSDataReaderListener::on_data_available()** (p. 1301) on the **DDSDataReaderListener** (p. 1299) objects attached to contained **DDSDataReader** (p. 1272) entities with **DDS_DATA_AVAILABLE_STATUS** (p. 344) that is considered changed as described in **Changes in read communication status** (p. ??).

This operation is typically invoked from the **DDSSubscriberListener::on_data_on_readers** (p. 1598) operation in the **DDSSubscriberListener** (p. 1597). That way the **DDSSubscriberListener** (p. 1597) can delegate to the **DDSDataReaderListener** (p. 1299) objects the handling of the data.

The operation will notify the data readers that have a `sample_state` of **DDS_NOT_READ_SAMPLE_STATE** (p. 157), `view_state` of **DDS_ANY_SAMPLE_STATE** (p. 157) and `instance_state` of **DDS_ANY_INSTANCE_STATE** (p. 161).

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

9.289.2.19 get_participant()

```
virtual DDSDomainParticipant * DDSSubscriber::get_participant ( ) [pure virtual]
```

Returns the **DDSDomainParticipant** (p. 1335) to which the **DDSSubscriber** (p. 1576) belongs.

Returns

the **DDSDomainParticipant** (p. 1335) to which the **DDSSubscriber** (p. 1576) belongs.

9.289.2.20 copy_from_topic_qos()

```
virtual DDS_ReturnCode_t DDSSubscriber::copy_from_topic_qos (
    DDS_DataReaderQos & datareader_qos,
    const DDS_TopicQos & topic_qos ) [pure virtual]
```

Copies the policies in the **DDS_TopicQos** (p. 1120) to the corresponding policies in the **DDS_DataReaderQos** (p. 638).

Copies the policies in the **DDS_TopicQos** (p. 1120) to the corresponding policies in the **DDS_DataReaderQos** (p. 638) (replacing values in the **DDS_DataReaderQos** (p. 638), if present).

This is a "convenience" operation most useful in combination with the operations **DDSSubscriber::get_default_datareader_qos** (p. 1579) and **DDSTopic::get_qos** (p. 1605). The operation **DDSSubscriber::copy_from_topic_qos** (p. 1592) can be used to merge the **DDSDataReader** (p. 1272) default QoS policies with the corresponding ones on the **DDSTopic** (p. 1601). The resulting QoS can then be used to create a new **DDSDataReader** (p. 1272), or set its QoS.

This operation does not check the resulting **DDS_DataReaderQos** (p. 638) for consistency. This is because the 'merged' **DDS_DataReaderQos** (p. 638) may not be the final one, as the application can still modify some policies prior to applying the policies to the **DDSDataReader** (p. 1272).

Parameters

<i>datareader_qos</i>	<< <i>inout</i> >> (p. 237) DDS_DataReaderQos (p. 638) to be filled-up.
<i>topic_qos</i>	<< <i>in</i> >> (p. 237) DDS_TopicQos (p. 1120) to be merged with DDS_DataReaderQos (p. 638).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.289.2.21 set_qos()

```
virtual DDS_ReturnCode_t DDSSubscriber::set_qos (
    const DDS_SubscriberQos & qos ) [pure virtual]
```

Sets the subscriber QoS.

This operation modifies the QoS of the **DDSSubscriber** (p. 1576).

The **DDS_SubscriberQos::group_data** (p. 1093), **DDS_SubscriberQos::partition** (p. 1093) and **DDS_SubscriberQos::entity_factory** (p. 1093) can be changed. The other policies are immutable.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) DDS_SubscriberQos (p. 1090) to be set to. Policies must be consistent. Immutable policies cannot be changed after DDSSubscriber (p. 1576) is enabled. The special value DDS_SUBSCRIBER_QOS_DEFAULT (p. 57) can be used to indicate that the QoS of the DDSSubscriber (p. 1576) should be changed to match the current default DDS_SubscriberQos (p. 1090) set in the DDSDomainParticipant (p. 1335).
------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336).
------------	---

See also

set_qos (abstract) (p. ??)

Operations Allowed in Listener Callbacks (p. ??)

9.289.2.22 set_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSSubscriber::set_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<*extension*>> (p. 236) Change the QoS of this subscriber using the input XML QoS profile.

This operation modifies the QoS of the **DDSSubscriber** (p. 1576).

The **DDS_SubscriberQos::group_data** (p. 1093), **DDS_SubscriberQos::partition** (p. 1093) and **DDS_SubscriberQos::entity_factory** (p. 1093) can be changed. The other policies are immutable.

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If library_name is null RTI Connexx will use the default library (see DDSSubscriber::set_default_library (p. 1581)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If profile_name is null RTI Connexx will use the default profile (see DDSSubscriber::set_default_profile (p. 1582)).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336), or DDS_RETCODE_INCONSISTENT_POLICY (p. 336).
------------	---

9.289.2.23 get_qos()

```
virtual DDS_ReturnCode_t DDSSubscriber::get_qos (
    DDS_SubscriberQos & qos ) [pure virtual]
```

Gets the subscriber QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) DDS_SubscriberQos (p. 1090) to be filled in.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

get_qos (abstract) (p. ??)

9.289.2.24 set_listener()

```
virtual DDS_ReturnCode_t DDSSubscriber::set_listener (
    DDSSubscriberListener * l,
    DDS_StatusMask mask = DDS_STATUS_MASK_ALL ) [pure virtual]
```

Sets the subscriber listener.

Parameters

<i>l</i>	<< <i>in</i> >> (p. 237) DDSSubscriberListener (p. 1597) to set to.
<i>mask</i>	<< <i>in</i> >> (p. 237) DDS_StatusMask (p. 340) associated with the DDSSubscriberListener (p. 1597).

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

set_listener (abstract) (p. ??)

9.289.2.25 get_listener()

```
virtual DDSSubscriberListener * DDSSubscriber::get_listener ( ) [pure virtual]
```

Get the subscriber listener.

Returns

DDSSubscriberListener (p. 1597) of the **DDSSubscriber** (p. 1576).

See also

get_listener (abstract) (p. ??)

9.289.2.26 lookup_datareader_by_name()

```
virtual DDSDataReader * DDSSubscriber::lookup_datareader_by_name (
    const char * datareader_name ) [pure virtual]
```

<<*extension*>> (p. 236) Retrieves a **DDSDataReader** (p. 1272) contained within the **DDSSubscriber** (p. 1576) the **DDSDataReader** (p. 1272) entity name.

Every **DDSDataReader** (p. 1272) in the system has an entity name which is configured and stored in the <<*extension*>> (p. 236) EntityName policy, **ENTITY_NAME** (p. 402).

This operation retrieves the **DDSDataReader** (p. 1272) within the **DDSSubscriber** (p. 1576) whose name matches the one specified. If there are several **DDSDataReader** (p. 1272) with the same name within the **DDSSubscriber** (p. 1576), the operation returns the first matching occurrence.

Parameters

<i>datareader_name</i>	<< <i>in</i> >> (p. 237) Entity name of the DDSDataReader (p. 1272).
------------------------	---

Returns

The first **DDSDataReader** (p. 1272) found with the specified name or NULL if it is not found.

9.294 DDSThreadFactory Class Reference

`<<extension>> (p. 236) <<interface>> (p. 236)` Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDSThreadFactory_OnSpawnedFunction** (p. 518) that specifies the operation to run in the new thread.

Inherited by `NDDSSStackManagedThreadFactory`.

Public Member Functions

- virtual void * **create_thread** (const char *thread_name, const struct **DDS_ThreadSettings_t** &settings, **DDSThreadFactory_OnSpawnedFunction** on_spawned, void *thread_param)=0

Handles the creation of new threads.

- virtual void **delete_thread** (void *thread)=0

Handles the deletion of threads previously created by this factory.

9.294.1 Detailed Description

<<**extension**>> (p. 236) <<**interface**>> (p. 236) Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDSThreadFactory_OnSpawnedFunction** (p. 518) that specifies the operation to run in the new thread.

9.294.2 Member Function Documentation

9.294.2.1 create_thread()

```
virtual void * DDSThreadFactory::create_thread (
    const char * thread_name,
    const struct DDS_ThreadSettings_t & settings,
    DDSThreadFactory_OnSpawnedFunction on_spawned,
    void * thread_param ) [pure virtual]
```

Handles the creation of new threads.

This callback is called by the middleware whenever it needs to create a new thread. The operation creates a new thread of control that will call the function specified by **DDSThreadFactory_OnSpawnedFunction** (p. 518). On success, this operation must guarantee that after return the new thread of control been spawned and its execution has started or will start some time after.

The **DDSThreadFactory_OnSpawnedFunction** (p. 518), function must be called in the new thread and return its value on finalization. The function should be called as follows:

```
void * thread_out = on_spawned(thread_params);
...
return thread_out;
```

Some thread frameworks do this directly by just receiving the function and its parameters as arguments on thread creation. For instance, POSIX follows this model when creating a thread and the start_routine function has the same signature as **DDSThreadFactory_OnSpawnedFunction** (p. 518), so the parameter can be passed directly:

```
int result = pthread_create(&pthread_handle, &attr, on_spawned, thread_params);
...
return &pthread_handle;
```

9.294.2.2 delete_thread()

```
virtual void DDSThreadFactory::delete_thread (
    void * thread ) [pure virtual]
```

Handles the deletion of threads previously created by this factory.

This callback is called by the middleware whenever it needs to delete a thread. This operation deletes a thread previously created via a call to **DDSThreadFactory::create_thread** (p. 1600) on the same factory object. On success, the thread must be deleted but it does not have to guarantee that the execution has finished. Likewise, resources associated with the underlying operating system may be still in use. Depending on the thread framework, resources allocated on thread creation are released upon thread finalization. POSIX follows this model so no actions are required on the thread handle returned by `pthread_create()`.

9.295 DDSTopic Class Reference

<<**interface**>> (p. 236) The most basic description of the data to be published and subscribed.

Inheritance diagram for DDSTopic:

Public Member Functions

- virtual **DDS_ReturnCode_t** **get_inconsistent_topic_status** (**DDS_InconsistentTopicStatus** &status)=0
Allows the application to retrieve the **DDS_INCONSISTENT_TOPIC_STATUS** (p. 342) status of a **DDSTopic** (p. 1601).
- virtual **DDS_ReturnCode_t** **set_qos** (const **DDS_TopicQos** &qos)=0
Set the topic QoS.
- virtual **DDS_ReturnCode_t** **set_qos_with_profile** (const char *library_name, const char *profile_name)=0
<<**extension**>> (p. 236) Change the QoS of this topic using the input XML QoS profile.
- virtual **DDS_ReturnCode_t** **get_qos** (**DDS_TopicQos** &qos)=0
Get the topic QoS.
- virtual **DDS_ReturnCode_t** **set_listener** (**DDSTopicListener** *l, **DDS_StatusMask** mask= **DDS_STATUS_MASK_ALL**)=0
Set the topic listener.
- virtual **DDSTopicListener** * **get_listener** ()=0
Get the topic listener.

Static Public Member Functions

- static **DDSTopic** * **narrow** (**DDSTopicDescription** *topic_description)
*Narrow the given **DDSTopicDescription** (p. 1608) pointer to a **DDSTopic** (p. 1601) pointer.*

9.295.1 Detailed Description

<<**interface**>> (p. 236) The most basic description of the data to be published and subscribed.

QoS:

DDS_TopicQos (p. 1120)

Status:

DDS_INCONSISTENT_TOPIC_STATUS (p. 342), **DDS_InconsistentTopicStatus** (p. 908)

Listener:

DDSTopicListener (p. 1610)

A **DDSTopic** (p. 1601) is identified by its name, which must be unique in the whole domain. In addition (by virtue of extending **DDSTopicDescription** (p. 1608)) it fully specifies the type of the data that can be communicated when publishing or subscribing to the **DDSTopic** (p. 1601).

DDSTopic (p. 1601) is the only **DDSTopicDescription** (p. 1608) that can be used for publications and therefore associated with a **DDSDataWriter** (p. 1305).

The following operations may be called even if the **DDSTopic** (p. 1601) is not enabled. Other operations will fail with the value **DDS_RETCODE_NOT_ENABLED** (p. 336) if called on a disabled **DDSTopic** (p. 1601):

- **DDSEntity::enable** (p. 1449)
- **DDSTopic::set_qos** (p. 1603), **DDSTopic::get_qos** (p. 1605)
- **DDSTopic::set_qos_with_profile** (p. 1604)
- **DDSTopic::set_listener** (p. 1605), **DDSTopic::get_listener** (p. 1606)
- **DDSEntity::get_statuscondition** (p. 1450), **DDSEntity::get_status_changes** (p. 1450)
- **DDSTopic::get_inconsistent_topic_status** (p. 1603)

See also

Operations Allowed in Listener Callbacks (p. ??)

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

9.295.2 Member Function Documentation

9.295.2.1 narrow()

```
static DDSTopic * DDSTopic::narrow (
    DDSTopicDescription * topic_description ) [static]
```

Narrow the given **DDSTopicDescription** (p. 1608) pointer to a **DDSTopic** (p. 1601) pointer.

Returns

DDSTopic (p. 1601) if this **DDSTopicDescription** (p. 1608) is a **DDSTopic** (p. 1601). Otherwise, return NULL.

9.295.2.2 get_inconsistent_topic_status()

```
virtual DDS_ReturnCode_t DDSTopic::get_inconsistent_topic_status (
    DDS_InconsistentTopicStatus & status ) [pure virtual]
```

Allows the application to retrieve the **DDS_INCONSISTENT_TOPIC_STATUS** (p. 342) status of a **DDSTopic** (p. 1601).

Retrieve the current **DDS_InconsistentTopicStatus** (p. 908)

Parameters

<i>status</i>	<< <i>inout</i> >> (p. 237) Status to be retrieved.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_InconsistentTopicStatus (p. 908)

9.295.2.3 set_qos()

```
virtual DDS_ReturnCode_t DDSTopic::set_qos (
    const DDS_TopicQos & qos ) [pure virtual]
```

Set the topic QoS.

The **DDS_TopicQos::topic_data** (p.1122) and **DDS_TopicQos::deadline** (p.1123), **DDS_TopicQos::latency**↔**_budget** (p.1123), **DDS_TopicQos::transport_priority** (p.1124) and **DDS_TopicQos::lifespan** (p.1124) can be changed. The other policies are immutable.

Parameters

<i>qos</i>	<< <i>in</i> >> (p. 237) Set of policies to be applied to DDSTopic (p. 1601).
------------	--

Policies must be consistent. Immutable policies cannot be changed after **DDSTopic** (p. 1601) is enabled. The special value **DDS_TOPIC_QOS_DEFAULT** (p. 56) can be used to indicate that the QoS of the **DDSTopic** (p. 1601) should be changed to match the current default **DDS_TopicQos** (p. 1120) set in the **DDSDomainParticipant** (p. 1335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 336) if policies are inconsistent
------------	--

See also

DDS_TopicQos (p. 1120) for rules on consistency among QoS

set_qos (abstract) (p. ??)

Operations Allowed in Listener Callbacks (p. ??)

9.295.2.4 set_qos_with_profile()

```
virtual DDS_ReturnCode_t DDSTopic::set_qos_with_profile (
    const char * library_name,
    const char * profile_name ) [pure virtual]
```

<<*extension*>> (p. 236) Change the QoS of this topic using the input XML QoS profile.

The **DDS_TopicQos::topic_data** (p.1122) and **DDS_TopicQos::deadline** (p.1123), **DDS_TopicQos::latency**↔**_budget** (p.1123), **DDS_TopicQos::transport_priority** (p.1124) and **DDS_TopicQos::lifespan** (p.1124) can be changed. The other policies are immutable.

Parameters

<i>library_name</i>	<< <i>in</i> >> (p. 237) Library name containing the XML QoS profile. If <i>library_name</i> is null RTI Connexx will use the default library (see DDSDomainParticipant::set_default_library (p. 1350)).
<i>profile_name</i>	<< <i>in</i> >> (p. 237) XML QoS Profile name. If <i>profile_name</i> is null RTI Connexx will use the default profile (see DDSDomainParticipant::set_default_profile (p. 1351)).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_IMMUTABLE_POLICY (p. 336) if immutable policy is changed, or DDS_RETCODE_INCONSISTENT_POLICY (p. 336) if policies are inconsistent
------------	--

See also

DDS_TopicQos (p. 1120) for rules on consistency among QoS

Operations Allowed in Listener Callbacks (p. ??)

9.295.2.5 `get_qos()`

```
virtual DDS_ReturnCode_t DDSTopic::get_qos (
    DDS_TopicQos & qos ) [pure virtual]
```

Get the topic QoS.

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

Parameters

<i>qos</i>	<< <i>inout</i> >> (p. 237) QoS to be filled up.
------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

get_qos (abstract) (p. ??)

9.295.2.6 `set_listener()`

```
virtual DDS_ReturnCode_t DDSTopic::set_listener (
    DDSTopicListener * l,
    DDS_StatusMask mask = DDS_STATUS_MASK_ALL ) [pure virtual]
```

Set the topic listener.

Parameters

<i>l</i>	<< <i>in</i> >> (p. 237) Listener to be installed on entity.
<i>mask</i>	<< <i>in</i> >> (p. 237) Changes of communication status to be invoked on the listener. See DDS_StatusMask (p. 340).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

set_listener (abstract) (p. ??)

9.295.2.7 get_listener()

```
virtual DDSTopicListener * DDSTopic::get_listener ( ) [pure virtual]
```

Get the topic listener.

Returns

Existing listener attached to the **DDSTopic** (p. 1601).

See also

get_listener (abstract) (p. ??)

9.296 DDSTopicBuiltinTopicDataDataReader Class Reference

Instantiates `DataReader < DDS_TopicBuiltinTopicData (p. 1113) > .`

Inheritance diagram for DDSTopicBuiltinTopicDataDataReader:

Additional Inherited Members

9.296.1 Detailed Description

Instantiates `DataReader < DDS_TopicBuiltinTopicData (p. 1113) > .`

DDSDataReader (p. 1272) of topic **DDS_TOPIC_TOPIC_NAME** (p. 296) used for accessing **DDS_TopicBuiltinTopicData** (p. 1113) of the remote **DDSTopic** (p. 1601).

Note: The **DDS_TopicBuiltinTopicData** (p. 1113) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS_PublicationBuiltinTopicData** (p. 997) and **DDS_SubscriptionBuiltinTopicData** (p. 1094)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

Instantiates:

`<<generic>> (p. 236) FooDataReader (p. 1632)`

See also

DDS_TopicBuiltinTopicData (p. 1113)

DDS_TOPIC_TOPIC_NAME (p. 296)

9.297 DDS**TopicBuiltinTopicDataTypeSupport** Class Reference

Instantiates `TypeSupport < DDS_TopicBuiltinTopicData (p. 1113) > .`

9.297.1 Detailed Description

Instantiates `TypeSupport < DDS_TopicBuiltinTopicData (p. 1113) > .`

Instantiates:

9.298 DDSTopicDescription Class Reference

<<*interface*>> (p. 236) Base class for **DDSTopic** (p. 1601), **DDSContentFilteredTopic** (p. 1267), and **DDSMultiTopic** (p. 1513).

Inheritance diagram for DDSTopicDescription:

Public Member Functions

- virtual const char * **get_type_name** ()=0
Get the associated `type_name`.
- virtual const char * **get_name** ()=0
*Get the name used to create this **DDSTopicDescription** (p. 1608) .*
- virtual **DDSDomainParticipant** * **get_participant** ()=0
*Get the **DDSDomainParticipant** (p. 1335) to which the **DDSTopicDescription** (p. 1608) belongs.*

9.298.1 Detailed Description

<<*interface*>> (p. 236) Base class for **DDSTopic** (p. 1601), **DDSContentFilteredTopic** (p. 1267), and **DDSMultiTopic** (p. 1513).

DDSTopicDescription (p. 1608) represents the fact that both publications and subscriptions are tied to a single data-type. Its attribute `type_name` defines a unique resulting type for the publication or the subscription and therefore creates an implicit association with a **DDSTypeSupport** (p. 1613).

DDSTopicDescription (p. 1608) has also a `name` that allows it to be retrieved locally.

See also

DDSTypeSupport (p. 1613), **FooTypeSupport** (p. 1693)

9.298.2 Member Function Documentation

9.298.2.1 get_type_name()

```
virtual const char * DDSTopicDescription::get_type_name ( ) [pure virtual]
```

Get the associated `type_name`.

The type name defines a locally unique type for the publication or the subscription.

The `type_name` corresponds to a unique string used to register a type via the **FooTypeSupport::register_type** (p. 1695) method.

Thus, the `type_name` implies an association with a corresponding **DDSTypeSupport** (p. 1613) and this **DDSTopicDescription** (p. 1608).

Returns

the type name. The returned type name is valid until the **DDSTopicDescription** (p. 1608) is deleted.

Postcondition

The result is non-NULL.

See also

DDSTypeSupport (p. 1613), **FooTypeSupport** (p. 1693)

9.298.2.2 get_name()

```
virtual const char * DDSTopicDescription::get_name ( ) [pure virtual]
```

Get the name used to create this **DDSTopicDescription** (p. 1608) .

Returns

the name used to create this **DDSTopicDescription** (p. 1608). The returned topic name is valid until the **DDSTopicDescription** (p. 1608) is deleted.

Postcondition

The result is non-NULL.

9.298.2.3 get_participant()

```
virtual DDSDomainParticipant * DDSTopicDescription::get_participant ( ) [pure virtual]
```

Get the **DDSDomainParticipant** (p. 1335) to which the **DDSTopicDescription** (p. 1608) belongs.

Returns

The **DDSDomainParticipant** (p. 1335) to which the **DDSTopicDescription** (p. 1608) belongs.

Postcondition

The result is non-NULL.

9.299 DDSTopicListener Class Reference

<<*interface*>> (p. 236) **DDSListener** (p. 1509) for **DDSTopic** (p. 1601) entities.

Inheritance diagram for DDSTopicListener:

Public Member Functions

- virtual void **on_inconsistent_topic** (**DDSTopic** *topic, const **DDS_InconsistentTopicStatus** &status)
Handle the **DDS_INCONSISTENT_TOPIC_STATUS** (p. 342) status.

9.299.1 Detailed Description

<<*interface*>> (p. 236) **DDSListener** (p. 1509) for **DDSTopic** (p. 1601) entities.

Entity:

DDSTopic (p. 1601)

Status:

DDS_INCONSISTENT_TOPIC_STATUS (p. 342), **DDS_InconsistentTopicStatus** (p. 908)

This is the interface that can be implemented by an application-provided class and then registered with the **DDSTopic** (p. 1601) such that the application can be notified by RTI Connex of relevant status changes.

See also

- Status Kinds** (p. 336)
- DDSListener** (p. 1509)
- DDSTopic::set_listener** (p. 1605)
- Operations Allowed in Listener Callbacks** (p. ??)

9.299.2 Member Function Documentation

9.299.2.1 on_inconsistent_topic()

```
virtual void DDSTopicListener::on_inconsistent_topic (
    DDSTopic * topic,
    const DDS_InconsistentTopicStatus & status ) [virtual]
```

Handle the **DDS_INCONSISTENT_TOPIC_STATUS** (p. 342) status.

This callback is called when a remote **DDSTopic** (p. 1601) is discovered but is inconsistent with the locally created **DDSTopic** (p. 1601) of the same topic name.

Parameters

<i>topic</i>	<< out >> (p. 237) Locally created DDSTopic (p. 1601) that triggers the listener callback
<i>status</i>	<< out >> (p. 237) Current inconsistent status of locally created DDSTopic (p. 1601)

9.300 DDSTopicQuery Class Reference

<<**extension**>> (p. 236) Allows a **DDSDataReader** (p. 1272) to query the sample cache of its matching **DDSData**↵
Writer (p. 1305).

Public Member Functions

- virtual **DDS_ReturnCode_t** **get_guid** (**DDS_GUID_t** &guid)
Get the TopicQuery's GUID.

9.300.1 Detailed Description

<<**extension**>> (p. 236) Allows a **DDSDataReader** (p. 1272) to query the sample cache of its matching **DDSData**↵
Writer (p. 1305).

9.300.2 Member Function Documentation

9.300.2.1 get_guid()

```
virtual DDS_ReturnCode_t DDSTopicQuery::get_guid (
    DDS_GUID_t & guid ) [inline], [virtual]
```

Get the TopicQuery's GUID.

Parameters

<i>guid</i>	<< out >> (p. 237) The GUID of the DDSTopicQuery (p. 1611).
-------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.301 DDSTopicQueryHelper Class Reference

Helpers to provide utility operations related to **DDSTopicQuery** (p. 1611).

Static Public Member Functions

- static **DDS_Boolean** **topic_query_data_from_service_request** (**DDS_TopicQueryData** &topic_query_data, const **DDS_ServiceRequest** &service_request)

*Retrieves the **DDS_TopicQueryData** (p. 1125) data contained in the specified **DDS_ServiceRequest** (p. 1083).*

9.301.1 Detailed Description

Helpers to provide utility operations related to **DDSTopicQuery** (p. 1611).

9.301.2 Member Function Documentation

9.301.2.1 topic_query_data_from_service_request()

```
static DDS_Boolean DDSTopicQueryHelper::topic_query_data_from_service_request (
    DDS_TopicQueryData & topic_query_data,
    const DDS_ServiceRequest & service_request ) [static]
```

Retrieves the **DDS_TopicQueryData** (p. 1125) data contained in the specified **DDS_ServiceRequest** (p. 1083).

This operation will extract the content from the request body of the **DDS_ServiceRequest** (p. 1083) and place it into the specified **DDS_TopicQueryData** (p. 1125) object.

The specified **DDS_ServiceRequest** (p. 1083) must be a valid sample associated with the service id **DDS_TOPIC_QUERY_SERVICE_REQUEST_ID** (p. 301). Otherwise this operation will return **DDS_BOOLEAN_FALSE** (p. 316).

This operation can be called within the context of a **DDSDataWriterListener::on_service_request_accepted** (p. 1334) to retrieve the **DDS_TopicQueryData** (p. 1125) of a **DDS_ServiceRequest** (p. 1083) that has been received with service id **DDS_TOPIC_QUERY_SERVICE_REQUEST_ID** (p. 301)

Parameters

<i>topic_query_data</i>	<< <i>inout</i> >> (p. 237) A DDS_TopicQueryData (p. 1125) object where the content from the service request is extracted.
<i>service_request</i>	<< <i>in</i> >> (p. 237) Input DDS_ServiceRequest (p. 1083) that contains the DDS_TopicQueryData (p. 1125) as part of its request body.

Returns

DDS_BOOLEAN_TRUE (p. 316) on success.

9.302 DDSTypeSupport Class Reference

<<*interface*>> (p. 236) An abstract *marker* interface that has to be specialized for each concrete user data type that will be used by the application.

Inheritance diagram for DDSTypeSupport:

9.302.1 Detailed Description

<<*interface*>> (p. 236) An abstract *marker* interface that has to be specialized for each concrete user data type that will be used by the application.

The implementation provides an automatic means to generate a type-specific class, **FooTypeSupport** (p. 1693), from a description of the type in IDL.

A **DDSTypeSupport** (p. 1613) must be registered using the **FooTypeSupport::register_type** (p. 1695) operation on this type-specific class before it can be used to create **DDSTopic** (p. 1601) objects.

See also

FooTypeSupport (p. 1693)
the `Code Generator User's Manual`

Examples

HelloWorldSupport.cxx.

9.303 DDSWaitSet Class Reference

<<*interface*>> (p. 236) Allows an application to wait until one or more of the attached **DDSCondition** (p. 1260) objects has a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 316) or else until the timeout expires.

Public Member Functions

- virtual **DDS_ReturnCode_t** wait (**DDSConditionSeq** &active_conditions, const **DDS_Duration_t** &timeout)
Allows an application thread to wait for the occurrence of certain conditions.
- virtual **DDS_ReturnCode_t** attach_condition (**DDSCondition** *cond)
*Attaches a **DDSCondition** (p. 1260) to the **DDSWaitSet** (p. 1613).*
- virtual **DDS_ReturnCode_t** detach_condition (**DDSCondition** *cond)
*Detaches a **DDSCondition** (p. 1260) from the **DDSWaitSet** (p. 1613).*
- virtual **DDS_ReturnCode_t** get_conditions (**DDSConditionSeq** &attached_conditions)
*Retrieves the list of attached **DDSCondition** (p. 1260) (s).*
- virtual **DDS_ReturnCode_t** set_property (const **DDS_WaitSetProperty_t** &prop)
*<<extension>> (p. 236) Sets the **DDS_WaitSetProperty_t** (p. 1226), to configure the associated **DDSWaitSet** (p. 1613) to return after one or more trigger events have occurred.*
- virtual **DDS_ReturnCode_t** get_property (**DDS_WaitSetProperty_t** &prop)
*<<extension>> (p. 236) Retrieves the **DDS_WaitSetProperty_t** (p. 1226) configuration of the associated **DDSWaitSet** (p. 1613).*
- virtual ~**DDSWaitSet** ()
Destructor.
- **DDSWaitSet** ()
Default no-argument constructor.
- **DDSWaitSet** (const **DDS_WaitSetProperty_t** &prop)
*<<extension>> (p. 236) Constructor for a **DDSWaitSet** (p. 1613) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first*

9.303.1 Detailed Description

<<**interface**>> (p. 236) Allows an application to wait until one or more of the attached **DDSCondition** (p. 1260) objects has a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 316) or else until the timeout expires.

9.303.2 Usage

DDSCondition (p. 1260) (s) (in conjunction with wait-sets) provide an alternative mechanism to allow the middleware to communicate communication status changes (including arrival of data) to the application.

"::DDSWaitSet and ::DDSCondition (s)"

This mechanism is wait-based. Its general use pattern is as follows:

- The application indicates which relevant information it wants to get by creating **DDSCondition** (p. 1260) objects (**DDSStatusCondition** (p. 1562), **DDSReadCondition** (p. 1558) or **DDSQueryCondition** (p. 1557)) and attaching them to a **DDSWaitSet** (p. 1613).
- It then waits on that **DDSWaitSet** (p. 1613) until the `trigger_value` of one or several **DDSCondition** (p. 1260) objects become **DDS_BOOLEAN_TRUE** (p. 316).

- It then uses the result of the wait (i.e., `active_conditions`, the list of **DDSCondition** (p. 1260) objects with `trigger_value == DDS_BOOLEAN_TRUE` (p. 316)) to actually get the information:
 - by calling **DDSEntity::get_status_changes** (p. 1450) and then `get_<communication_status>()` on the relevant **DDSEntity** (p. 1446), if the condition is a **DDSStatusCondition** (p. 1562) and the status changes, refer to plain communication status;
 - by calling **DDSEntity::get_status_changes** (p. 1450) and then **DDSSubscriber::get_datareaders** (p. 1590) on the relevant **DDSSubscriber** (p. 1576) (and then **FooDataReader::read()** (p. 1635) or **FooDataReader::take** (p. 1636) on the returned **DDSDataReader** (p. 1272) objects), if the condition is a **DDSStatusCondition** (p. 1562) and the status changes refers to **DDS_DATA_ON_READERS_STATUS** (p. 344);
 - by calling **DDSEntity::get_status_changes** (p. 1450) and then **FooDataReader::read()** (p. 1635) or **FooDataReader::take** (p. 1636) on the relevant **DDSDataReader** (p. 1272), if the condition is a **DDSStatusCondition** (p. 1562) and the status changes refers to **DDS_DATA_AVAILABLE_STATUS** (p. 344);
 - by calling directly **FooDataReader::read_w_condition** (p. 1640) or **FooDataReader::take_w_condition** (p. 1641) on a **DDSDataReader** (p. 1272) with the **DDSCondition** (p. 1260) as a parameter if it is a **DDSReadCondition** (p. 1558) or a **DDSQueryCondition** (p. 1557).

Usually the first step is done in an initialization phase, while the others are put in the application main loop.

As there is no extra information passed from the middleware to the application when a wait returns (only the list of triggered **DDSCondition** (p. 1260) objects), **DDSCondition** (p. 1260) objects are meant to embed all that is needed to react properly when enabled. In particular, **DDSEntity** (p. 1446)-related conditions are related to exactly one **DDSEntity** (p. 1446) and cannot be shared.

The blocking behavior of the **DDSWaitSet** (p. 1613) is illustrated below.

blocking behavior"

The result of a **DDSWaitSet::wait** (p. 1617) operation depends on the state of the **DDSWaitSet** (p. 1613), which in turn depends on whether at least one attached **DDSCondition** (p. 1260) has a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 316). If the wait operation is called on **DDSWaitSet** (p. 1613) with state **BLOCKED**, it will block the calling thread. If wait is called on a **DDSWaitSet** (p. 1613) with state **UNBLOCKED**, it will return immediately. In addition, when the **DDSWaitSet** (p. 1613) transitions from **BLOCKED** to **UNBLOCKED** it wakes up any threads that had called wait on it.

A key aspect of the Condition and WaitSet mechanism is the setting of the `trigger_value` of each **DDSCondition** (p. 1260).

The **DDSWaitSet** (p. 1613) cannot be used after calling **DDSDomainParticipantFactory::finalize_instance** (p. 1412).

9.303.3 Trigger State of a ::DDSStatusCondition

The `trigger_value` of a **DDSStatusCondition** (p. 1562) is the boolean OR of the `ChangedStatusFlag` of all the communication statuses (see **Status Kinds** (p. 336)) to which it is sensitive. That is, `trigger_value == DDS_BOOLEAN_FALSE` (p. 316) only if all the values of the `ChangedStatusFlags` are **DDS_BOOLEAN_FALSE** (p. 316).

The sensitivity of the **DDSStatusCondition** (p. 1562) to a particular communication status is controlled by the list of `enabled_statuses` set on the condition by means of the **DDSStatusCondition::set_enabled_statuses** (p. 1563) operation.

Once the `trigger_value` of a **StatusCondition** becomes true, it remains true until the status that changed is reset. To reset a status, call the related `get_*_status()` operation. Or, in the case of the data available status, call `read()`, `take()`, or one of their variants. Therefore, if you are using a **DDSStatusCondition** (p. 1562) on a **DDSWaitSet** (p. 1613) to be notified of events, your thread will wake up when one of the statuses associated with the **StatusCondition** becomes true. If you do not reset the status, the **StatusCondition** `trigger_value` remains true and your **WaitSet** will not block again; it will immediately wake up when you call **DDSWaitSet::wait** (p. 1617).

9.303.4 Trigger State of a ::DDSReadCondition

Similar to the **DDSStatusCondition** (p. 1562), a **DDSReadCondition** (p. 1558) also has a `trigger_value` that determines whether the attached **DDSWaitSet** (p. 1613) is BLOCKED or UNBLOCKED. However, unlike the **DDSStatusCondition** (p. 1562), the `trigger_value` of the **DDSReadCondition** (p. 1558) is tied to the presence of *at least a sample* managed by RTI Connext with **DDS_SampleStateKind** (p. 156) and **DDS_ViewStateKind** (p. 158) matching those of the **DDSReadCondition** (p. 1558). Furthermore, for the **DDSQueryCondition** (p. 1557) to have a `trigger_value == DDS_BOOLEAN_TRUE` (p. 316), the data associated with the sample must be such that the `query_expression` evaluates to **DDS_BOOLEAN_TRUE** (p. 316).

The fact that the `trigger_value` of a **DDSReadCondition** (p. 1558) depends on the presence of samples on the associated **DDSDataReader** (p. 1272) implies that a single take operation can potentially change the `trigger_value` of several **DDSReadCondition** (p. 1558) or **DDSQueryCondition** (p. 1557) conditions. For example, if all samples are taken, any **DDSReadCondition** (p. 1558) and **DDSQueryCondition** (p. 1557) conditions associated with the **DDSDataReader** (p. 1272) that had their `trigger_value==TRUE` before will see the `trigger_value` change to FALSE. Note that this does not guarantee that **DDSWaitSet** (p. 1613) objects that were separately attached to those conditions will not be woken up. Once we have `trigger_value==TRUE` on a condition, it may wake up the attached **DDSWaitSet** (p. 1613), the condition transitioning to `trigger_value==FALSE` does not necessarily 'unwake' the WaitSet as 'unwakening' may not be possible in general.

The consequence is that an application blocked on a **DDSWaitSet** (p. 1613) may return from the wait with a list of conditions, some of which are not no longer 'active'. This is unavoidable if multiple threads are concurrently waiting on separate **DDSWaitSet** (p. 1613) objects and taking data associated with the same **DDSDataReader** (p. 1272) entity.

To elaborate further, consider the following example: A **DDSReadCondition** (p. 1558) that has a `sample_state_mask = {DDS_NOT_READ_SAMPLE_STATE (p. 157)}` will have `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 316) whenever a new sample arrives and will transition to **DDS_BOOLEAN_FALSE** (p. 316) as soon as all the newly-arrived samples are either read (so their sample state changes to READ) or taken (so they are no longer managed by RTI Connext). However if the same **DDSReadCondition** (p. 1558) had a `sample_state_mask = { DDS_READ_SAMPLE_STATE (p. 157), DDS_NOT_READ_SAMPLE_STATE (p. 157) }`, then the `trigger_value` would only become **DDS_BOOLEAN_FALSE** (p. 316) once all the newly-arrived samples are taken (it is not sufficient to read them as that would only change the sample state to READ), which overlaps the mask on the **DDSReadCondition** (p. 1558).

9.303.5 Trigger State of a ::DDSGuardCondition

The `trigger_value` of a **DDSGuardCondition** (p. 1454) is completely controlled by the application via the operation **DDSGuardCondition::set_trigger_value** (p. 1456).

Examples

HelloWorld_subscriber.cxx.

9.303.6 Constructor & Destructor Documentation

9.303.6.1 ~DDSWaitSet()

```
virtual DDSWaitSet::~~DDSWaitSet ( ) [virtual]
```

Destructor.

Releases the resources associated with this **DDSWaitSet** (p. 1613).

Freeing a null pointer is safe and does nothing.

MT Safety:

UNSAFE. It is not safe to delete a **DDSWaitSet** (p. 1613) while another thread is calling an API that uses the entity. For instance, a thread must not delete a WaitSet while another thread is blocked with **DDSWaitSet::wait** (p. 1617). To properly handle this scenario, you can use a **DDSGuardCondition** (p. 1454) to wake up the WaitSet and then wait for the finalization of the thread.

9.303.6.2 DDSWaitSet() [1/2]

```
DDSWaitSet::DDSWaitSet ( )
```

Default no-argument constructor.

Construct a new **DDSWaitSet** (p. 1613).

9.303.6.3 DDSWaitSet() [2/2]

```
DDSWaitSet::DDSWaitSet (
    const DDS_WaitSetProperty_t & prop )
```

<<**extension**>> (p. 236) Constructor for a **DDSWaitSet** (p. 1613) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first

Constructs a new **DDSWaitSet** (p. 1613).

9.303.7 Member Function Documentation

9.303.7.1 wait()

```
virtual DDS_ReturnCode_t DDSWaitSet::wait (
    DDSConditionSeq & active_conditions,
    const DDS_Duration_t & timeout ) [virtual]
```

Allows an application thread to wait for the occurrence of certain conditions.

If none of the conditions attached to the **DDSWaitSet** (p. 1613) have a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 316), the wait operation will block, suspending the calling thread.

The result of the wait operation is the list of all the attached conditions that have a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 316) (i.e., the conditions that unblocked the wait).

The wait operation takes a `timeout` argument that specifies the maximum duration for the wait. If this duration is exceeded and none of the attached **DDSCondition** (p. 1260) objects are **DDS_BOOLEAN_TRUE** (p. 316), wait fails with **DDS_RETCODE_TIMEOUT** (p. 336). In this case, the resulting list of conditions will be empty. If a negative duration is passed, wait fails with **DDS_RETCODE_BAD_PARAMETER** (p. 335).

Note: The resolution of the `timeout` period is constrained by the resolution of the system clock.

When the **DDSWaitSet** (p. 1613) is configured to wait for more than one trigger event and the timeout is exceeded before that number is reached, this function returns normally as long as at least one trigger event has occurred.

It is not allowable for more than one application thread to be waiting on the same **DDSWaitSet** (p. 1613). If the wait operation is invoked on a **DDSWaitSet** (p. 1613) that already has a thread blocking on it, the operation will return immediately with the value **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Parameters

<i>active_conditions</i>	<< <i>inout</i> >> (p. 237) a valid non-NULL DDSConditionSeq (p. 1263) object. Note that RTI Connext will not allocate a new object if <code>active_conditions</code> is NULL; the method will return DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
<i>timeout</i>	<< <i>in</i> >> (p. 237) a wait timeout

Returns

One of the **Standard Return Codes** (p. 335) or **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) or **DDS_RETCODE_TIMEOUT** (p. 336).

Examples

HelloWorld_subscriber.cxx.

9.303.7.2 attach_condition()

```
virtual DDS_ReturnCode_t DDSWaitSet::attach_condition (
    DDSCondition * cond ) [virtual]
```

Attaches a **DDSCondition** (p. 1260) to the **DDSWaitSet** (p. 1613).

It is possible to attach a **DDSCondition** (p. 1260) on a **DDSWaitSet** (p. 1613) that is currently being waited upon (via the wait operation). In this case, if the **DDSCondition** (p. 1260) has a `trigger_value` of **DDS_BOOLEAN_TRUE** (p. 316), then attaching the condition will unblock the **DDSWaitSet** (p. 1613).

Parameters

<i>cond</i>	<< <i>in</i> >> (p. 237) Condition to be attached.
-------------	--

Returns

One of the **Standard Return Codes** (p. 335), or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

Examples

HelloWorld_subscriber.cxx.

9.303.7.3 detach_condition()

```
virtual DDS_ReturnCode_t DDSWaitSet::detach_condition (
    DDSCondition * cond ) [virtual]
```

Detaches a **DDSCondition** (p. 1260) from the **DDSWaitSet** (p. 1613).

If the **DDSCondition** (p. 1260) was not attached to the **DDSWaitSet** (p. 1613) the operation will return **DDS_RETCODE_BAD_PARAMETER** (p. 335).

Parameters

<i>cond</i>	<< <i>in</i> >> (p. 237) Condition to be detached.
-------------	--

Returns

One of the **Standard Return Codes** (p. 335), or **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

9.303.7.4 get_conditions()

```
virtual DDS_ReturnCode_t DDSWaitSet::get_conditions (
    DDSConditionSeq & attached_conditions ) [virtual]
```

Retrieves the list of attached **DDSCondition** (p. 1260) (s).

Parameters

<i>attached_conditions</i>	<< <i>inout</i> >> (p. 237) a DDSConditionSeq (p. 1263) object where the list of attached conditions will be returned
----------------------------	--

Returns

One of the **Standard Return Codes** (p. 335), or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

9.303.7.5 set_property()

```
virtual DDS_ReturnCode_t DDSWaitSet::set_property (
    const DDS_WaitSetProperty_t & prop ) [virtual]
```

<<*extension*>> (p. 236) Sets the **DDS_WaitSetProperty_t** (p. 1226), to configure the associated **DDSWaitSet** (p. 1613) to return after one or more trigger events have occurred.

Parameters

<i>prop</i>	<< <i>in</i> >> (p. 237)
-------------	--------------------------

Returns

One of the **Standard Return Codes** (p. 335)

9.303.7.6 get_property()

```
virtual DDS_ReturnCode_t DDSWaitSet::get_property (
    DDS_WaitSetProperty_t & prop ) [virtual]
```

<<*extension*>> (p. 236) Retrieves the **DDS_WaitSetProperty_t** (p. 1226) configuration of the associated **DDSWaitSet** (p. 1613).

Parameters

<i>prop</i>	<< <i>out</i> >> (p. 237)
-------------	---------------------------

Returns

One of the **Standard Return Codes** (p. 335)

9.304 DDSWriterContentFilter Class Reference

<<**interface**>> (p. 236) Interface to be used by a custom filter of a **DDSContentFilteredTopic** (p. 1267).

Inheritance diagram for DDSWriterContentFilter:

Public Member Functions

- virtual **DDS_ReturnCode_t** **writer_compile** (void *writer_filter_data, **DDS_ExpressionProperty** *prop, const char *expression, const **DDS_StringSeq** *parameters, const **DDS_TypeCode** *type_code, const char *type↵_class_name, const **DDS_Cookie_t** *cookie)=0
*A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **DDSDataReader** (p. 1272).*

*A writer-side filtering API to clean up a previously created state using **DDSWriterContentFilter::writer_attach** (p. 1624).*
- virtual void **writer_return_loan** (void *writer_filter_data, **DDS_CookieSeq** *cookies)=0
*A writer-side filtering API to return the loan on the list of DataReaders returned by **DDSWriterContentFilter::writer_↵evaluate** (p. 1623).*

9.304.1 Detailed Description

<<**interface**>> (p. 236) Interface to be used by a custom filter of a **DDSContentFilteredTopic** (p. 1267).

Entity:

DDSContentFilteredTopic (p. 1267)

This interface can be implemented by an application-provided class and then registered with the **DDSDomain↵Participant** (p. 1335) such that samples can be filtered for a **DDSContentFilteredTopic** (p. 1267) with the given filter name.

Note: The API for using a custom content filter is subject to change in a future release.

See also

DDSContentFilteredTopic (p. 1267)

DDSDomainParticipant::register_contentfilter (p. 1347)

9.304.2 Member Function Documentation

9.304.2.1 writer_compile()

```
virtual DDS_ReturnCode_t DDSWriterContentFilter::writer_compile (
    void * writer_filter_data,
    DDS_ExpressionProperty * prop,
    const char * expression,
    const DDS_StringSeq * parameters,
    const DDS_TypeCode * type_code,
    const char * type_class_name,
    const DDS_Cookie_t * cookie ) [pure virtual]
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **DDSDDataReader** (p. 1272).

This method is called when the **DDSDDataWriter** (p. 1305) discovers a **DDSDDataReader** (p. 1272) with a **DDSContentFilteredTopic** (p. 1267) or when a **DDSDDataWriter** (p. 1305) is notified of a change in a DataReader's filter parameter for the locally registered content filter instance.

It is possible for multiple threads to be calling into this function at the same time.

Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 237) A pointer to the state created using DDSWriterContentFilter::writer_attach (p. 1624) .
<i>prop</i>	<< <i>out</i> >> (p. 237) A pointer to DDS_ExpressionProperty (p. 896) that allows you to indicate to RTI Connex if a filter expression can be optimized.
<i>expression</i>	<< <i>in</i> >> (p. 237) An ASCIIZ string with the filter expression. The memory used by this string is owned by RTI Connex and must not be freed. If you want to manipulate this string, you must first make a copy of it.
<i>parameters</i>	<< <i>in</i> >> (p. 237) A string sequence with the expression parameters with which the DDSContentFilteredTopic (p. 1267) was created. The string sequence is equal (but not identical) to the string sequence passed to DDSDomainParticipant::create_contentfilteredtopic (p. 1369). Note that the sequence passed to the compile function is owned by RTI Connex and must not be referenced outside the compile function.
<i>type_code</i>	<< <i>in</i> >> (p. 237) A pointer to the type code for the related DDSTopic (p. 1601) of the DDSContentFilteredTopic (p. 1267). A type_code is a description of a type in terms of which types it contains (such as long, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
<i>type_class_name</i>	<< <i>in</i> >> (p. 237) Fully qualified class name of the related DDSTopic (p. 1601).
<i>cookie</i>	<< <i>in</i> >> (p. 237) DDS_Cookie_t (p. 612) to uniquely identify DDSDDataReader (p. 1272) for which DDSWriterContentFilter::writer_compile (p. 1622) was called.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.304.2.2 writer_evaluate()

```
virtual struct DDS_CookieSeq * DDSWriterContentFilter::writer_evaluate (
    void * writer_filter_data,
    const void * sample,
    const DDS_FilterSampleInfo * meta_data ) [pure virtual]
```

A writer-side filtering API to retrieve a list of DataReaders whose content filters pass the sample.

This method is called every time a **DDSDDataWriter** (p. 1305) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **DDSDDataWriter** (p. 1305) is performing writer-side filtering and return the list of **DDS_Cookie_t** (p. 612) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 237) A pointer to the state created using DDSWriterContentFilter::writer_attach (p. 1624) .
<i>sample</i>	<< <i>in</i> >> (p. 237) Pointer to a deserialized sample to be filtered.
<i>meta_data</i>	<< <i>in</i> >> (p. 237) Pointer to meta data associated with the sample.

Returns

The function returns **DDS_CookieSeq** (p. 613) which identifies the set of DataReaders whose filters pass the sample.

9.304.2.3 writer_finalize()

```
virtual void DDSWriterContentFilter::writer_finalize (
    void * writer_filter_data,
    const DDS_Cookie_t * cookie ) [pure virtual]
```

A writer-side filtering API to clean up a previously compiled instance of the content filter.

This method is called to notify the filter implementation that the **DDSDDataWriter** (p. 1305) is no longer matching with a **DDSDDataReader** (p. 1272) for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the **DDSDDataReader** (p. 1272).

It is possible for multiple threads to be calling into this function at the same time.

Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 237) A pointer to the state created using DDSWriterContentFilter::writer_attach (p. 1624).
<i>cookie</i>	DDS_Cookie_t (p. 612) to uniquely identify DDSDataReader (p. 1272) for which DDSWriterContentFilter::writer_finalize (p. 1623) was called.

9.304.2.4 writer_attach()

```
virtual DDS_ReturnCode_t DDSWriterContentFilter::writer_attach (
    void ** writer_filter_data ) [pure virtual]
```

A writer-side filtering API to create some state that can facilitate filtering on the writer side.

This method is called to create some state required to perform filtering on the writer side using writer-side filtering APIs. This method will be called for every **DDSDataWriter** (p. 1305); it will be called only the first time the **DDSDataWriter** (p. 1305) matches a **DDSDataReader** (p. 1272) using the specified filter. This function will not be called for any subsequent DataReaders that match the DataWriter and are using the same filter.

Parameters

<i>writer_filter_data</i>	<< <i>out</i> >> (p. 237) A user-specified opaque pointer to some state created on the DDSDataWriter (p. 1305) that will help perform writer-side filtering efficiently.
---------------------------	---

9.304.2.5 writer_detach()

```
virtual void DDSWriterContentFilter::writer_detach (
    void * writer_filter_data ) [pure virtual]
```

A writer-side filtering API to clean up a previously created state using **DDSWriterContentFilter::writer_attach** (p. 1624).

This method is called to delete any state created using the **DDSWriterContentFilter::writer_attach** (p. 1624) function. This method will be called when the **DDSDataWriter** (p. 1305) is deleted.

Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 237) A pointer to the state created using DDSWriterContentFilter::writer_attach (p. 1624).
---------------------------	---

9.304.2.6 writer_return_loan()

```
virtual void DDSWriterContentFilter::writer_return_loan (
    void * writer_filter_data,
    DDS_CookieSeq * cookies ) [pure virtual]
```

A writer-side filtering API to return the loan on the list of DataReaders returned by **DDSWriterContentFilter::writer_← evaluate** (p. 1623).

This method is called to return the loan on **DDS_CookieSeq** (p. 613) returned by **DDSWriterContentFilter::writer_← return_loan** (p. 1624). It is possible for multiple threads to be calling into this function at the same time.

Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 237) A pointer to the state created using DDSWriterContentFilter::writer_attach (p. 1624).
<i>cookies</i>	<< <i>in</i> >> (p. 237) DDS_CookieSeq (p. 613) for which the DDSWriterContentFilter::writer_return_loan (p. 1624). was invoked.

9.305 rti::flat::FinalAlignedArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of final elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::FinalAlignedArrayOffset< ElementOffset, N >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)
Gets the Offset to an element.

Additional Inherited Members

9.305.1 Detailed Description

```
template<typename ElementOffset, unsigned int N>
class rti::flat::FinalAlignedArrayOffset< ElementOffset, N >
```

Offset to an array of final elements.

Template Parameters

<i>ElementOffset</i>	A final struct Offset, such as MyFlatFinalOffset (p. 1728).
<i>N</i>	The array bound. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

The following code shows how to use a **FinalAlignedArrayOffset** (p. 1625) to initialize an array member with **MyFlat**↵
MutableBuilder (p. 1732):

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto array_offset = builder.add_my_final_array();
for (MyFlatFinalOffset element_offset : array_offset) {
    element_offset.my_primitive(3);
    // ...
}
// Or access an element directly:
auto element_offset = array_offset.get_element(3);
element_offset.my_primitive(3);
```

A more efficient way to access a final array, provided it complies with the required preconditions, is through **rti::flat**↵
::plain_cast() (p. 560).

FinalArrayOffset (p. 1627) and **FinalAlignedArrayOffset** (p. 1625) provide the same interface, but have different implementation details. **FinalArrayOffset** (p. 1627) is used when the array member is part of a final type too, whereas **FinalAlignedArrayOffset** (p. 1625) corresponds to an array inside a mutable type.

A **FinalAlignedArrayOffset** (p. 1625) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast()** (p. 560)).

See also

MutableArrayOffset (p. 1724) encapsulates arrays of variable-size elements

9.305.2 Member Function Documentation

9.305.2.1 get_element()

```
template<typename ElementOffset , unsigned int N>
ElementOffset rti::flat::FinalAlignedArrayOffset< ElementOffset, N >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

The Offset to the element in the i-th position

See also

`rti::flat::plain_cast()` (p. 560) for a method to access all the elements at once

Gets the Offset to an element.

9.306.1 Detailed Description

```
template<typename ElementOffset, unsigned int N>
class rti::flat::FinalArrayOffset< ElementOffset, N >
```

Offset to an array of final elements.

Template Parameters

<i>ElementOffset</i>	A final struct Offset, such as MyFlatFinalOffset (p. 1728).
<i>N</i>	The array bound. For multidimensional arrays, N is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

FinalArrayOffset (p. 1627) and **FinalAlignedArrayOffset** (p. 1625) provide the same interface, but have different implementation details. **FinalArrayOffset** (p. 1627) is used when the array member is part of a final type too, whereas **FinalAlignedArrayOffset** (p. 1625) corresponds to an array inside a mutable type.

A **FinalArrayOffset** (p. 1627) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast()** (p. 560)).

9.306.2 Member Function Documentation

9.306.2.1 **get_element()**

```
template<typename ElementOffset , unsigned int N>
ElementOffset rti::flat::FinalArrayOffset< ElementOffset, N >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

The Offset to the element in the i-th position

9.307 **rti::flat::FinalOffset< T >** Class Template Reference

The base class of all Offsets to a final struct type.

```
#include <Offset.hpp>
```

Inheritance diagram for **rti::flat::FinalOffset< T >**:

Additional Inherited Members

9.307.1 Detailed Description

```
template<typename T>
class rti::flat::FinalOffset< T >
```

The base class of all Offsets to a final struct type.

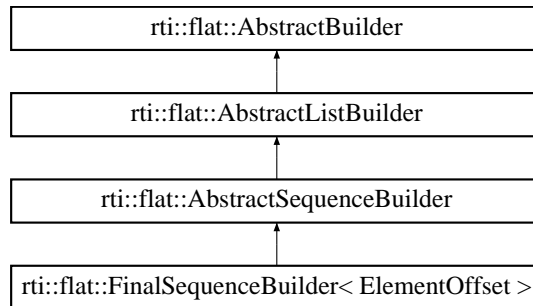

This class contains only implementation details; all the public accessors are defined in the generated type (**MyFlat**↔**FinalOffset** (p. 1728)).

9.308 rti::flat::FinalSequenceBuilder< ElementOffset > Class Template Reference

Builds a sequence member of fixed-size elements.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::FinalSequenceBuilder< ElementOffset >:

Public Member Functions

- ElementOffset **add_next** ()
Adds the next element.
- FinalSequenceBuilder & **add_n** (unsigned int count)
Adds a number of elements at once.
- Offset **finish** ()
Finishes building the sequence.

Additional Inherited Members

9.308.1 Detailed Description

```
template<typename ElementOffset>
class rti::flat::FinalSequenceBuilder< ElementOffset >
```

Builds a sequence member of fixed-size elements.

Template Parameters

<i>ElementOffset</i>	The Offset type for the elements of the sequence
----------------------	--

To add an element, call **add_next()** (p. 1630) and use the ElementOffset it returns to initialize the element's values. An empty sequence can be built by calling **finish()** (p. 1630) without any call to **add_next()** (p. 1630).

This class doesn't enforce the sequence bound set in IDL.

The following example uses a **FinalSequenceBuilder** (p. 1629) to initialize a sequence member of **MyFlatMutableBuilder** (p. 1732) with two elements:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto seq_builder = builder.build_my_final_seq();
MyFlatFinalOffset element = seq_builder.add_next();
element.my_primitive(1);
// ... continue initializing the first element
element = seq_builder.add_next();
element.my_primitive(2);
// ... continue initializing the second element

seq_builder.finish();
```

If the element type meets certain requirements, **rti::flat::plain_cast()** (p. 560) provides a more efficient way to initialize a sequence of final elements.

9.308.2 Member Function Documentation

9.308.2.1 add_next()

```
template<typename ElementOffset >
ElementOffset rti::flat::FinalSequenceBuilder< ElementOffset >::add_next ( ) [inline]
```

Adds the next element.

Returns

The Offset that can be used to set the element values

9.308.2.2 add_n()

```
template<typename ElementOffset >
FinalSequenceBuilder & rti::flat::FinalSequenceBuilder< ElementOffset >::add_n (
    unsigned int count ) [inline]
```

Adds a number of elements at once.

This is an alternative to **add_next()** (p. 1630).

To initialize the elements, call **finish()** (p. 1630) and use the Offset it returns to access the elements.

9.308.2.3 finish()

```
template<typename ElementOffset >
Offset rti::flat::FinalSequenceBuilder< ElementOffset >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

discard() (p. 574)

9.309 rti::flat::flat_type_traits< T > Struct Template Reference

Given a **Sample** (p. 1893), an Offset or a Builder, it allows obtaining the other types.

9.309.1 Detailed Description

```
template<typename T>
struct rti::flat::flat_type_traits< T >
```

Given a **Sample** (p. 1893), an Offset or a Builder, it allows obtaining the other types.

Template Parameters

<i>T</i>	<p>One of the following:</p> <ul style="list-style-type: none"> • A Sample (p. 1893) type, such as MyFlatMutable (p. 556) • An Offset type, such as MyFlatMutableOffset (p. 1739) • A Builder type, such as MyFlatMutableBuilder (p. 1732)
----------	---

Given T, this type provides the following typedefs:

- `flat_type_traits<T>::offset`, T's related offset type (undefined if T itself is an Offset)
- `flat_type_traits<T>::builder`, T's related builder type (undefined if T itself is a Builder, or the topic-type is not mutable)
- `flat_type_traits<T>::flat_type`, T's related **Sample** (p. 1893) type (undefined if T itself is a **Sample** (p. 1893) type)

- `flat_type_traits<T>::plain_type`, T's equivalent definition as a plain (non-FlatData) type.

For example, for `T = MyFlatMutable` (p. 556), `flat_type_traits` (p. 1631) is defined as follows:

```
template <>
struct flat_type_traits<MyFlatMutable> {
    typedef MyFlatMutablePlainHelper plain_type;
    typedef MyFlatMutableOffset offset;
    typedef MyFlatMutableBuilder builder;
};
```

Or if `T = MyFlatMutableOffset` (p. 1739):

```
template <>
struct flat_type_traits<MyFlatMutableOffset> {
    typedef MyFlatMutable flat_type;
    typedef MyFlatMutablePlainHelper plain_type;
    typedef MyFlatMutableBuilder builder;
};
```

9.310 Foo Struct Reference

A representative user-defined data type.

9.310.1 Detailed Description

A representative user-defined data type.

Foo (p. 1632) represents a user-defined data-type that is intended to be distributed using DDS.

The type **Foo** (p. 1632) is usually defined using IDL syntax and placed in a ".idl" file that is then processed using `rtiddsgen`. The `rtiddsgen` utility generates the helper classes **FooSeq** (p. 1680) as well as the necessary code for DDS to manipulate the type (serialize it so that it can be sent over the network) as well as the implied **FooDataReader** (p. 1632) and **FooDataWriter** (p. 1659) types that allow the application to send and receive data of this type.

Public Member Functions

- virtual **DDS_ReturnCode_t** **read** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)=0
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)=0
*Access a collection of data-samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_w_condition** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDSReadCondition** *condition)=0
*Accesses via **FooDataReader::read** (p. 1635) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **take_w_condition** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, **DDSReadCondition** *condition)=0
*Analogous to **FooDataReader::read_w_condition** (p. 1640) except it accesses samples via the **FooDataReader::take** (p. 1636) operation.*
- virtual **DDS_ReturnCode_t** **read_next_sample** (**Foo** &received_data, **DDS_SampleInfo** &sample_info)=0
*Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take_next_sample** (**Foo** &received_data, **DDS_SampleInfo** &sample_info)=0
*Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_instance** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &a_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)=0
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take_instance** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &a_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)=0
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_instance_w_condition** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &previous_handle, **DDSReadCondition** *condition)=0
*<<extension>> (p. 236) Accesses via **FooDataReader::read_instance** (p. 1645) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **take_instance_w_condition** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &previous_handle, **DDSReadCondition** *condition)=0
*<<extension>> (p. 236) Accesses via **FooDataReader::take_instance** (p. 1646) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).*
- virtual **DDS_ReturnCode_t** **read_next_instance** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &previous_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)=0
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **take_next_instance** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &previous_handle, **DDS_SampleStateMask** sample_states, **DDS_ViewStateMask** view_states, **DDS_InstanceStateMask** instance_states)=0
*Access a collection of data samples from the **DDSDDataReader** (p. 1272).*
- virtual **DDS_ReturnCode_t** **read_next_instance_w_condition** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &previous_handle, **DDSReadCondition** *condition)=0

Accesses via **FooDataReader::read_next_instance** (p. 1650) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

- virtual **DDS_ReturnCode_t take_next_instance_w_condition** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq, **DDS_Long** max_samples, const **DDS_InstanceHandle_t** &previous_handle, **DDSReadCondition** *condition)=0

Accesses via **FooDataReader::take_next_instance** (p. 1651) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

- virtual **DDS_ReturnCode_t return_loan** (**FooSeq** &received_data, **DDS_SampleInfoSeq** &info_seq)=0

Indicates to the **DDSDDataReader** (p. 1272) that the application is done accessing the collection of *received_data* and *info_seq* obtained by some earlier invocation of read or take on the **DDSDDataReader** (p. 1272).

- virtual **DDS_ReturnCode_t get_key_value** (**Foo** &key_holder, const **DDS_InstanceHandle_t** handle)=0

Retrieve the instance *key* that corresponds to an instance *handle*.

- virtual **DDS_InstanceHandle_t lookup_instance** (const **Foo** &key_holder)=0

Retrieves the instance *handle* that corresponds to an instance *key_holder*.

- virtual **DDS_ReturnCode_t is_data_consistent** (**DDS_Boolean** &is_data_consistent, const **TData** *sample, const **DDS_SampleInfo** *sample_info)=0

When using Zero Copy transfer over shared memory, checks if the sample has been overwritten by the **DataWriter**.

Static Public Member Functions

- static **FooDataReader * narrow** (**DDSDDataReader** *reader)

Narrow the given **DDSDDataReader** (p. 1272) pointer to a **FooDataReader** (p. 1632) pointer.

9.311.1 Detailed Description

<<**interface**>> (p. 236) <<**generic**>> (p. 236) User data type-specific data reader.

Defines the user data type specific reader interface generated for each application class.

The concrete user data type reader automatically generated by the implementation is an incarnation of this class.

Foo (p. 1632)

FooDataWriter (p. 1659)

the Code Generator User's Manual

9.311.2 Member Function Documentation

9.311.2.1 narrow()

```
static FooDataReader * FooDataReader::narrow (
    DDSDataReader * reader ) [static]
```

Narrow the given **DDSDataReader** (p. 1272) pointer to a **FooDataReader** (p. 1632) pointer.

9.311.2.2 read()

```
virtual DDS_ReturnCode_t FooDataReader::read (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [pure virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

This operation offers the same functionality and API as **FooDataReader::take** (p. 1636) except that the samples returned remain in the **DDSDataReader** (p. 1272) such that they can be retrieved again by means of a read or take operation.

Please refer to the documentation of **FooDataReader::take()** (p. 1636) for details on the number of samples returned within the received_data and info_seq as well as the order in which the samples appear in these sequences.

The act of reading a sample changes its sample_state to **DDS_READ_SAMPLE_STATE** (p. 157). If the sample belongs to the most recent generation of the instance, it will also set the view_state of the instance to be **DDS_↵ NOT_NEW_VIEW_STATE** (p. 159). It will not affect the instance_state of the instance.

Once the application completes its use of the samples, it must 'return the loan' to the **DDSDataReader** (p. 1272) by calling the **FooDataReader::return_loan** (p. 1655) operation.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **DDS_SampleInfo** (p. 1068) objects after the call to **FooDataReader::return_loan** (p. 1655). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While you must call **FooDataReader::return_loan** (p. 1655) at some point, you do *not* have to do so before the next **FooDataReader::take** (p. 1636) call. However, failure to return the loan will eventually deplete the **DDSDataReader** (p. 1272) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **DDSDataReader** (p. 1272) is specified by the **DDS_ResourceLimitsQosPolicy** (p. 1038) and the **DDS_DataReaderResourceLimitsQosPolicy** (p. 648).

Important: If the samples "returned" by this method are loaned from RTI Connext (see **FooDataReader::take** (p. 1636) for more information on memory loaning), it is important that their contents not be changed. Because the memory in which the data is stored belongs to the middleware, any modifications made to the data will be seen the next time the same samples are read or taken; the samples will no longer reflect the state that was received from the network.

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) User data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) A DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>sample_states</i>	<< <i>in</i> >> (p. 237) Data samples matching one of these <i>sample_states</i> are returned.
<i>view_states</i>	<< <i>in</i> >> (p. 237) Data samples matching one of these <i>view_state</i> are returned.
<i>instance_states</i>	<< <i>in</i> >> (p. 237) Data samples matching ones of these <i>instance_state</i> are returned.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

FooDataReader::take (p. 1636)
FooDataReader::read_w_condition (p. 1640),
FooDataReader::take_w_condition (p. 1641)
DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.3 take()

```

virtual DDS_ReturnCode_t FooDataReader::take (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [pure virtual]

```

Access a collection of data-samples from the **DDSDataReader** (p. 1272).

The operation will return the list of samples received by the **DDSDataReader** (p. 1272) since the last **FooDataReader**↵
::take (p. 1636) operation that matches the specified **DDS_SampleStateMask** (p. 156), **DDS_ViewStateMask** (p. 158)
and **DDS_InstanceStateMask** (p. 160).

This operation may fail with **DDS_RETCODE_ERROR** (p. 335) if the **DDS_DataReaderResourceLimitsQosPolicy**↵
::max_outstanding_reads (p. 653) limit has been exceeded.

The actual number of samples returned depends on the information that has been received by the middleware as well as the **DDS_HistoryQosPolicy** (p. 906), **DDS_ResourceLimitsQosPolicy** (p. 1038), **DDS_DataReader**↵
ResourceLimitsQosPolicy (p. 648) and the characteristics of the data-type that is associated with the **DDSDataReader**
(p. 1272):

- In the case where the **DDS_HistoryQosPolicy::kind** (p. 908) is **DDS_KEEP_LAST_HISTORY_QOS** (p. 406), the call will return at most **DDS_HistoryQosPolicy::depth** (p. 908) samples for each ALIVE instance and (**DDS_HistoryQosPolicy::depth** (p. 908) + 1) samples for each NOT_ALIVE instance. The extra sample is an invalid sample (**DDS_SampleInfo::valid_data** (p. 1074) is FALSE) that is used to indicate the instance state transition from ALIVE to NOT_ALIVE.
- The maximum number of samples returned is limited by **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041), and by **DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_read** (p. 653).
- For multiple instances, the number of samples returned is additionally limited by the product (**DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041)
 - **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041))
- If **DDS_DataReaderResourceLimitsQosPolicy::max_infos** (p. 651) is limited, the number of samples returned may also be limited if insufficient **DDS_SampleInfo** (p. 1068) resources are available.

If the read or take succeeds and the number of samples returned has been limited (by means of a maximum limit, as listed above, or insufficient **DDS_SampleInfo** (p. 1068) resources), the call will complete successfully and provide those samples the reader is able to return. The user may need to make additional calls, or return outstanding loaned buffers in the case of insufficient resources, in order to access remaining samples.

Note that in the case where the **DDSTopic** (p. 1601) associated with the **DDSDataReader** (p. 1272) is bound to a data-type that has no key definition, then there will be at most one instance in the **DDSDataReader** (p. 1272). So the per-sample limits will apply.

The act of *taking* a sample removes it from RTI Connexx so it cannot be read or taken again. If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the sample's instance to **DDS_NOT_NEW_VIEW_STATE** (p. 159). It will not affect the `instance_state` of the sample's instance.

After **FooDataReader::take** (p. 1636) completes, `received_data` and `info_seq` will be of the same length and contain the received data.

If the sequences are empty (maximum size equals 0) when the **FooDataReader::take** (p. 1636) is called, the samples returned in the `received_data` and the corresponding `info_seq` are 'loaned' to the application from buffers provided by the **DDSDataReader** (p. 1272). The application can use them as desired and has guaranteed exclusive access to them.

Once the application completes its use of the samples it must 'return the loan' to the **DDSDataReader** (p. 1272) by calling the **FooDataReader::return_loan** (p. 1655) operation.

Important: When you loan data from the middleware, you *must not* keep any pointers to any part of the data samples or the **DDS_SampleInfo** (p. 1068) objects after the call to **FooDataReader::return_loan** (p. 1655). Returning the loan places the objects back into a pool, allowing the middleware to overwrite them with new data.

Note: While you must call **FooDataReader::return_loan** (p. 1655) at some point, you do *not* have to do so before the next **FooDataReader::take** (p. 1636) call. However, failure to return the loan will eventually deplete the **DDSDataReader** (p. 1272) of the buffers it needs to receive new samples and eventually samples will start to be lost. The total number of buffers available to the **DDSDataReader** (p. 1272) is specified by the **DDS_ResourceLimitsQosPolicy** (p. 1038) and the **DDS_DataReaderResourceLimitsQosPolicy** (p. 648).

If the sequences are not empty (maximum size not equal to 0 and length not equal to 0) when **FooDataReader::take** (p. 1636) is called, samples are copied to `received_data` and `info_seq`. The application will not need to call **FooDataReader::return_loan** (p. 1655).

The order of the samples returned to the caller depends on the **DDS_PresentationQosPolicy** (p. 983).

- If **DDS_PresentationQosPolicy::access_scope** (p. 987) is **DDS_INSTANCE_PRESENTATION_QOS** (p. 418), the returned collection is a list where samples belonging to the same data instance are consecutive.
- If **DDS_PresentationQosPolicy::access_scope** (p. 987) is **DDS_TOPIC_PRESENTATION_QOS** (p. 418) and **DDS_PresentationQosPolicy::ordered_access** (p. 987) is set to **DDS_BOOLEAN_FALSE** (p. 316), then the returned collection is a list where samples belonging to the same data instance are consecutive.
- If **DDS_PresentationQosPolicy::access_scope** (p. 987) is **DDS_TOPIC_PRESENTATION_QOS** (p. 418) and **DDS_PresentationQosPolicy::ordered_access** (p. 987) is set to **DDS_BOOLEAN_TRUE** (p. 316), then the returned collection is a list where the relative order of samples as they were written by a DataWriter is preserved also across different instances. In other words, changes made by a single DataWriter are made available to subscribers in the same order in which they occur. Samples belonging to the same instance may or may not be consecutive. This is because, to preserve order within a single DataWriter, it may be necessary to mix samples from different instances.
- If **DDS_PresentationQosPolicy::access_scope** (p. 987) is **DDS_GROUP_PRESENTATION_QOS** (p. 418) and **DDS_PresentationQosPolicy::ordered_access** (p. 987) is set to **DDS_BOOLEAN_FALSE** (p. 316), then the returned collection is a list where samples belonging to the same data instance are consecutive.
- If **DDS_PresentationQosPolicy::access_scope** (p. 987) is **DDS_GROUP_PRESENTATION_QOS** (p. 418) and **DDS_PresentationQosPolicy::ordered_access** (p. 987) is set to **DDS_BOOLEAN_TRUE** (p. 316), then changes made to instances by a set of DataWriters attached to a common Publisher are made available in the order in which they were written. For this to happen, the application must take the samples using the Subscriber's **DDSSubscriber::begin_access** (p. 1589) and **DDSSubscriber::end_access** (p. 1590) operations (see the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the *Core Libraries User's Manual*).

In all of the above cases, the relative order between the samples of one instance is consistent with the **DESTINATION_ORDER** (p. 385) policy:

- If **DDS_DestinationOrderQosPolicy::kind** (p. 705) is **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), samples belonging to the same instances will appear in the relative order in which there were received (FIFO, earlier samples ahead of the later samples).
- If **DDS_DestinationOrderQosPolicy::kind** (p. 705) is **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), samples belonging to the same instances will appear in the relative order implied by the `source_timestamp` (FIFO, smaller values of `source_timestamp` ahead of the larger values).

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

In addition to the collection of samples, the read and take operations also use a collection of **DDS_SampleInfo** (p. 1068) structures.

The initial (input) properties of the `received_data` and `info_seq` collections will determine the precise behavior of the read or take operation. For the purposes of this description, the collections are modeled as having these properties:

- whether the collection container owns the memory of the elements within (`owns`, see **FooSeq::has_ownership** (p. 1693))
- the current-length (`len`, see **FooSeq::length()** (p. 1687))
- the maximum length (`max_len`, see **FooSeq::maximum()** (p. 1689))

The initial values of the `owns`, `len` and `max_len` properties for the `received_data` and `info_seq` collections govern the behavior of the read and take operations as specified by the following rules:

1. The values of `owns`, `len` and `max_len` properties for the two collections must be identical. Otherwise read/take will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).
2. On successful output, the values of `owns`, `len` and `max_len` will be the same for both collections.
3. If the initial `max_len==0`, then the `received_data` and `info_seq` collections will be filled with elements that are loaned by the **DDSDataReader** (p. 1272). On output, `owns` will be `FALSE`, `len` will be set to the number of values returned, and `max_len` will be set to a value verifying `max_len >= len`. The use of this variant allows for Zero Copy access to the data and the application will need to return the loan to the **DDSDataWriter** (p. 1305) using **FooDataReader::return_loan** (p. 1655).
4. If the initial `max_len>0` and `owns==FALSE`, then the read or take operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335). This avoids the potential hard-to-detect memory leaks caused by an application forgetting to return the loan.
5. If initial `max_len>0` and `owns==TRUE`, then the read or take operation will copy the `received_data` values and **DDS_SampleInfo** (p. 1068) values into the elements already inside the collections. On output, `owns` will be `TRUE`, `len` will be set to the number of values copied and `max_len` will remain unchanged. The use of this variant forces a copy but the application can control where the copy is placed and the application will not need to return the loan. The number of samples copied depends on the relative values of `max_len` and `max_samples`:
 - If `max_samples == LENGTH_UNLIMITED`, then at most `max_len` values will be copied. The use of this variant lets the application limit the number of samples returned to what the sequence can accommodate.
 - If `max_samples <= max_len`, then at most `max_samples` values will be copied. The use of this variant lets the application limit the number of samples returned to fewer than what the sequence can accommodate.
 - If `max_samples > max_len`, then the read or take operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335). This avoids the potential confusion where the application expects to be able to access up to `max_samples`, but that number can never be returned, even if they are available in the **DDSDataReader** (p. 1272), because the output sequence cannot accommodate them.

As described above, upon completion, the `received_data` and `info_seq` collections may contain elements loaned from the **DDSDataReader** (p. 1272). If this is the case, the application will need to use **FooDataReader::return_loan** (p. 1655) to return the loan once it is no longer using the `received_data` in the collection. When **FooDataReader::return_loan** (p. 1655) completes, the collection will have `owns=FALSE` and `max_len=0`. The application can determine whether it is necessary to return the loan or not based on how the state of the collections when the read/take operation was called or by accessing the `owns` property. However, in many cases it may be simpler to always call **FooDataReader::return_loan** (p. 1655), as this operation is harmless (i.e., it leaves all elements unchanged) if the collection does not have a loan. To avoid potential memory leaks, the implementation of the **Foo** (p. 1632) and **DDS_SampleInfo** (p. 1068) collections should disallow changing the length of a collection for which `owns==FALSE`. Furthermore, deleting a collection for which `owns==FALSE` should be considered an error.

On output, the collection of **Foo** (p. 1632) values and the collection of **DDS_SampleInfo** (p. 1068) structures are of the same length and are in a one-to-one correspondence. Each **DDS_SampleInfo** (p. 1068) provides information, such as

the `source_timestamp`, the `sample_state`, `view_state`, and `instance_state`, etc., about the corresponding sample. Some elements in the returned collection may not have valid data. If the `instance_state` in the **DDS_SampleInfo** (p. 1068) is **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) or **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161), then the last sample for that instance in the collection (that is, the one whose **DDS_SampleInfo** (p. 1068) has `sample_rank==0`) does not contain valid data.

Samples that contain no data do not count towards the limits imposed by the **DDS_ResourceLimitsQosPolicy** (p. 1038). The act of reading/taking a sample sets its `sample_state` to **DDS_READ_SAMPLE_STATE** (p. 157).

If the sample belongs to the most recent generation of the instance, it will also set the `view_state` of the instance to **DDS_NOT_NEW_VIEW_STATE** (p. 159). It will not affect the `instance_state` of the instance.

This operation must be provided on the specialized class that is generated for the particular application data-type that is being read (**Foo** (p. 1632)).

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the operations fails with **DDS_RETCODE_NO_DATA** (p. 336). For an example on how `take` can be used, please refer to the **Access received data via a reader** (p. 210) "receive example".

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) User data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) A DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described above.
<i>sample_states</i>	<< <i>in</i> >> (p. 237) Data samples matching one of these <code>sample_states</code> are returned.
<i>view_states</i>	<< <i>in</i> >> (p. 237) Data samples matching one of these <code>view_state</code> are returned.
<i>instance_states</i>	<< <i>in</i> >> (p. 237) Data samples matching one of these <code>instance_state</code> are returned.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

FooDataReader::read (p. 1635)

FooDataReader::read_w_condition (p. 1640), **FooDataReader::take_w_condition** (p. 1641)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.4 read_w_condition()

```
virtual DDS_ReturnCode_t FooDataReader::read_w_condition (
    FooSeq & received_data,
```

```

    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [pure virtual]

```

Accesses via **FooDataReader::read** (p. 1635) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

This operation is especially useful in combination with **DDSQueryCondition** (p. 1557) to filter data samples based on the content.

The specified **DDSReadCondition** (p. 1558) must be attached to the **DDSDataReader** (p. 1272); otherwise the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

In case the **DDSReadCondition** (p. 1558) is a plain **DDSReadCondition** (p. 1558) and not the specialized **DDSQueryCondition** (p. 1557), the operation is equivalent to calling **FooDataReader::read** (p. 1635) and passing as `sample_states`, `view_states` and `instance_states` the value of the corresponding attributes in the `read_condition`. Using this operation, the application can avoid repeating the same parameters specified when creating the **DDSReadCondition** (p. 1558).

The samples are accessed with the same semantics as **FooDataReader::read** (p. 1635).

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the operation will fail with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>condition</i>	<< <i>in</i> >> (p. 237) the DDSReadCondition (p. 1558) to select samples of interest. Cannot be NULL.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).

9.311.2.5 take_w_condition()

```
virtual DDS_ReturnCode_t FooDataReader::take_w_condition (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    DDSReadCondition * condition ) [pure virtual]
```

Analogous to **FooDataReader::read_w_condition** (p. 1640) except it accesses samples via the **FooDataReader::take** (p. 1636) operation.

This operation is analogous to **FooDataReader::read_w_condition** (p. 1640) except that it accesses samples via the **FooDataReader::take** (p. 1636) operation.

The specified **DDSReadCondition** (p. 1558) must be attached to the **DDSDataReader** (p. 1272); otherwise the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

The samples are accessed with the same semantics as **FooDataReader::take** (p. 1636).

This operation is especially useful in combination with **DDSQueryCondition** (p. 1557) to filter data samples based on the content.

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_←_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>condition</i>	<< <i>in</i> >> (p. 237) the DDSReadCondition (p. 1558) to select samples of interest. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).

FooDataReader::take (p. 1636)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.6 read_next_sample()

```
virtual DDS_ReturnCode_t FooDataReader::read_next_sample (
    Foo & received_data,
    DDS_SampleInfo & sample_info ) [pure virtual]
```

Copies the next not-previously-accessed data value from the **DDSDataReader** (p. 1272).

This operation copies the next not-previously-accessed data value from the **DDSDataReader** (p. 1272). This operation also copies the corresponding **DDS_SampleInfo** (p. 1068). The implied order among the samples stored in the **DDSDataReader** (p. 1272) is the same as for the **FooDataReader::read** (p. 1635) operation.

The **FooDataReader::read_next_sample** (p. 1642) operation is semantically equivalent to the **FooDataReader::read** (p. 1635) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The **FooDataReader::read_next_sample** (p. 1642) operation provides a simplified API to 'read' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **DDSDataReader** (p. 1272), the operation will fail with **DDS_RETCODE_NO_DATA** (p. 336) and nothing is copied.

Note

Calling **FooDataReader::read_next_sample** (p. 1642) from the **DDSDataReaderListener::on_data_available()** (p. 1301) callback reads only one sample of potentially many samples in the reader queue, because **DDSDataReaderListener::on_data_available()** (p. 1301) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **FooDataReader::read_next_sample** (p. 1642) in a loop within the **on_data_available** callback until **FooDataReader::read_next_sample** (p. 1642) returns **DDS_RETCODE_NO_DATA** (p. 336). This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use **FooDataReader::read** (p. 1635) rather than **FooDataReader::read_next_sample** (p. 1642) in order to read more than one sample at a time.)

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific Foo (p. 1632) object where the next received data sample will be returned. The received_data must have been fully allocated. Otherwise, this operation may fail.
<i>sample_info</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfo (p. 1068) object where the next received sample info will be returned.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

See also

FooDataReader::read (p. 1635)

9.311.2.7 take_next_sample()

```
virtual DDS_ReturnCode_t FooDataReader::take_next_sample (
    Foo & received_data,
    DDS_SampleInfo & sample_info ) [pure virtual]
```

Copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272).

This operation copies the next not-previously-accessed data value from the **DDSDDataReader** (p. 1272) and 'removes' it from the **DDSDDataReader** (p. 1272) so that it is no longer accessible. This operation also copies the corresponding **DDS_SampleInfo** (p. 1068). This operation is analogous to the **FooDataReader::read_next_sample** (p. 1642) except for the fact that the sample is removed from the **DDSDDataReader** (p. 1272).

The **FooDataReader::take_next_sample** (p. 1643) operation is semantically equivalent to the **FooDataReader::take** (p. 1636) operation, where the input data sequences has max_len=1, the sample_states=NOT_READ, the view_↵ states=ANY_VIEW_STATE, and the instance_states=ANY_INSTANCE_STATE.

The **FooDataReader::take_next_sample** (p. 1643) operation provides a simplified API to 'take' samples, avoiding the need for the application to manage sequences and specify states.

If there is no unread data in the **DDSDDataReader** (p. 1272), the operation will fail with **DDS_RETCODE_NO_DATA** (p. 336) and nothing is copied.

Note

Calling **FooDataReader::take_next_sample** (p. 1643) from the **DDSDDataReaderListener::on_data_available()** (p. 1301) callback retrieves only one sample of potentially many samples in the reader queue, because **DDSDData↵ ReaderListener::on_data_available()** (p. 1301) is triggered only once when new samples arrive in the queue. Therefore, it is recommended that you call **FooDataReader::take_next_sample** (p. 1643) in a loop within the on_data_available callback until **FooDataReader::take_next_sample** (p. 1643) returns **DDS_RETCODE_NO_↵ DATA** (p. 336) . This ensures that all samples in the reader queue are serviced by application logic. (You may also choose to use the **FooDataReader::take** (p. 1636) rather than **FooDataReader::take_next_sample** (p. 1643) in order to take more than one sample at a time.)

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific Foo (p. 1632) object where the next received data sample will be returned. The received_data must have been fully allocated. Otherwise, this operation may fail.
<i>sample_info</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfo (p. 1068) object where the next received sample info will be returned.

Exceptions

One	of the Standard Return Codes (p. 335),
-----	---

DDS_RETCODE_NO_DATA (p. 336) or **DDS_RETCODE_NOT_ENABLED** (p. 336).

See also

FooDataReader::take (p. 1636)

9.311.2.8 read_instance()

```
virtual DDS_ReturnCode_t FooDataReader::read_instance (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t & a_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [pure virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

This operation accesses a collection of data values from the **DDSDataReader** (p. 1272). The behavior is identical to **FooDataReader::read** (p. 1635), except that all samples returned belong to the single specified instance whose handle is `a_handle`.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **DDS_SampleInfo** (p. 1068) verifies **DDS_SampleInfo::instance_handle** (p. 1072) == `a_handle`.

The **FooDataReader::read_instance** (p. 1645) operation is semantically equivalent to the **FooDataReader::read** (p. 1635) operation, except in building the collection, the **DDSDataReader** (p. 1272) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The behavior of the **FooDataReader::read_instance** (p. 1645) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **FooDataReader::read** (p. 1635), the **FooDataReader::read_instance** (p. 1645) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to the **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

This operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335) if the **DDS_InstanceHandle_t** (p. 74) `a_handle` does not correspond to an existing data-object known to the **DDSDataReader** (p. 1272).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.

Parameters

<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>a_handle</i>	<< <i>in</i> >> (p. 237) The specified instance to return samples for. The method will fail with DDS_RETCODE_BAD_PARAMETER (p. 335) if the <i>handle</i> does not correspond to an existing data-object known to the DDSDataReader (p. 1272).
<i>sample_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <i>sample_states</i> are returned.
<i>view_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <i>view_state</i> are returned.
<i>instance_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <i>instance_state</i> are returned.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

See also

FooDataReader::read (p. 1635)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.9 take_instance()

```
virtual DDS_ReturnCode_t FooDataReader::take_instance (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t & a_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [pure virtual]
```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

This operation accesses a collection of data values from the **DDSDataReader** (p. 1272). The behavior is identical to **FooDataReader::take** (p. 1636), except for that all samples returned belong to the single specified instance whose handle is *a_handle*.

The semantics are the same for the **FooDataReader::take** (p. 1636) operation, except in building the collection, the **DDSDataReader** (p. 1272) will check that the sample belongs to the specified instance, and otherwise it will not place the sample in the returned collection.

The behavior of the **FooDataReader::take_instance** (p. 1646) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the *received_data* and

`sample_info`. Similar to the **FooDataReader::read** (p. 1635), the **FooDataReader::take_instance** (p. 1646) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to the **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the method fails with **DDS_RETCODE_NO_DATA** (p. 336).

This operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335) if the **DDS_InstanceHandle_t** (p. 74) `a_handle` does not correspond to an existing data-object known to the **DDSDataReader** (p. 1272).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>a_handle</i>	<< <i>in</i> >> (p. 237) The specified instance to return samples for. The method will fail with DDS_RETCODE_BAD_PARAMETER (p. 335) if the <code>handle</code> does not correspond to an existing data-object known to the DDSDataReader (p. 1272).
<i>sample_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>sample_states</code> are returned.
<i>view_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>view_state</code> are returned.
<i>instance_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>instance_state</code> are returned.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).

FooDataReader::take (p. 1636)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.10 read_instance_w_condition()

```
virtual DDS_ReturnCode_t FooDataReader::read_instance_w_condition (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
```

```
const DDS_InstanceHandle_t & previous_handle,
      DDSReadCondition * condition ) [pure virtual]
```

<<**extension**>> (p. 236) Accesses via **FooDataReader::read_instance** (p. 1645) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

This operation accesses a collection of data values from the **DDSDataReader** (p. 1272). The behavior is identical to **FooDataReader::read_instance** (p. 1645), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to belong the single specified instance whose handle is *a_handle*, and for which the specified **DDSReadCondition** (p. 1558) evaluates to TRUE.

The behavior of the **FooDataReader::read_instance_w_condition** (p. 1647) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the *received_data* and *sample_info*. Similar to the **FooDataReader::read** (p. 1635), the **FooDataReader::read_instance_w_condition** (p. 1647) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< inout >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< inout >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< in >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>previous_handle</i>	<< in >> (p. 237) The 'next smallest' instance with a value greater than this value that has available samples will be returned.
<i>condition</i>	<< in >> (p. 237) the DDSReadCondition (p. 1558) to select samples of interest. Cannot be NULL.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).

FooDataReader::read_next_instance (p. 1650)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.11 take_instance_w_condition()

```
virtual DDS_ReturnCode_t FooDataReader::take_instance_w_condition (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t & previous_handle,
    DDSReadCondition * condition ) [pure virtual]
```

<<**extension**>> (p. 236) Accesses via **FooDataReader::take_instance** (p. 1646) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

This operation accesses a collection of data values from the **DDSDataReader** (p. 1272) and 'removes' them from the **DDSDataReader** (p. 1272). The behavior is identical to **FooDataReader::take_instance** (p. 1646), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to the single specified instance whose handle is `a_handle`, and for which the specified **DDSReadCondition** (p. 1558) evaluates to TRUE.

The operation has the same behavior as **FooDataReader::read_instance_w_condition** (p. 1647), except that the samples are 'taken' from the **DDSDataReader** (p. 1272) such that they are no longer accessible via subsequent 'read' or 'take' operations.

The behavior of the **FooDataReader::take_instance_w_condition** (p. 1648) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **FooDataReader::read** (p. 1635), the **FooDataReader::take_instance_w_condition** (p. 1648) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to the **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< inout >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< inout >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< in >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>previous_handle</i>	<< in >> (p. 237) The 'next smallest' instance with a value greater than this value that has available samples will be returned.
<i>condition</i>	<< in >> (p. 237) the DDSReadCondition (p. 1558) to select samples of interest. Cannot be NULL.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), or DDS_RETCODE_NO_DATA (p. 336), DDS_RETCODE_NOT_ENABLED (p. 336).

FooDataReader::take_next_instance (p. 1651)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.12 read_next_instance()

```
virtual DDS_ReturnCode_t FooDataReader::read_next_instance (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t & previous_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [pure virtual]
```

Access a collection of data samples from the **DDSDDataReader** (p. 1272).

This operation accesses a collection of data values from the **DDSDDataReader** (p. 1272) where all the samples belong to a single instance. The behavior is similar to **FooDataReader::read_instance** (p. 1645), except that the actual instance is not directly specified. Rather, the samples will all belong to the 'next' instance with `instance_handle` 'greater' than the specified `previous_handle` that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the **DDSDDataReader** (p. 1272). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of **FooDataReader::read_next_instance** (p. 1650) is 'as if' the **DDSDDataReader** (p. 1272) invoked **FooDataReader::read_instance** (p. 1645), passing the smallest `instance_handle` among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value **DDS_HANDLE_NIL** (p. 76) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle == DDS_HANDLE_NIL` (p. 76) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation **FooDataReader::read_next_instance** (p. 1650) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle == DDS_HANDLE_NIL` (p. 76), examines the samples returned, and then uses the `instance_handle` returned in the **DDS_SampleInfo** (p. 1068) as the value of the `previous_handle` argument to the next call to **FooDataReader::read_next_instance** (p. 1650). The iteration continues until **FooDataReader::read_next_instance** (p. 1650) fails with **DDS_RETCODE_NO_DATA** (p. 336). This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the **FooDataReader::read_next_instance** (p. 1650) operation with a `previous_handle` that does not correspond to an instance currently managed by the **DDSDDataReader** (p. 1272). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the **DDSDDataReader** (p. 1272). One practical situation where this may occur is when an application is iterating though all the instances, takes all the samples of a **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance. The behavior of the **FooDataReader::read_next_instance** (p. 1650) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **FooDataReader::read** (p. 1635), the **FooDataReader::read_instance** (p. 1645) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to the **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>previous_handle</i>	<< <i>in</i> >> (p. 237) The 'next smallest' instance with a value greater than this value that has available samples will be returned.
<i>sample_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>sample_states</code> are returned.
<i>view_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>view_state</code> are returned.
<i>instance_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>instance_state</code> are returned.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).

FooDataReader::read (p. 1635)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.13 take_next_instance()

```
virtual DDS_ReturnCode_t FooDataReader::take_next_instance (
    FooSeq & received_data,
```

```

    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t & previous_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states ) [pure virtual]

```

Access a collection of data samples from the **DDSDataReader** (p. 1272).

This operation accesses a collection of data values from the **DDSDataReader** (p. 1272) and 'removes' them from the **DDSDataReader** (p. 1272).

This operation has the same behavior as **FooDataReader::read_next_instance** (p. 1650), except that the samples are 'taken' from the **DDSDataReader** (p. 1272) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Note

Like **FooDataReader::read_next_instance** (p. 1650), this operation is intended to be used in an application-driven iteration until all samples on the reader queue are taken. The iteration continues until **FooDataReader::take_next_instance** (p. 1651) fails with the value **DDS_RETCODE_NO_DATA** (p. 336) .

Similar to the operation **FooDataReader::read_next_instance** (p. 1650), it is possible to call **FooDataReader::take_next_instance** (p. 1651) with a `previous_handle` that does not correspond to an instance currently managed by the **DDSDataReader** (p. 1272).

The behavior of the **FooDataReader::take_next_instance** (p. 1651) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to the **FooDataReader::read** (p. 1635), the **FooDataReader::take_next_instance** (p. 1651) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to the **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>previous_handle</i>	<< <i>in</i> >> (p. 237) The 'next smallest' instance with a value greater than this value that has available samples will be returned.
<i>sample_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>sample_states</code> are returned.
<i>view_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>view_state</code> are returned.
<i>instance_states</i>	<< <i>in</i> >> (p. 237) data samples matching ones of these <code>instance_state</code> are returned.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).

9.311.2.14 read_next_instance_w_condition()

```
virtual DDS_ReturnCode_t FooDataReader::read_next_instance_w_condition (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t & previous_handle,
    DDSReadCondition * condition ) [pure virtual]
```

Accesses via **FooDataReader::read_next_instance** (p. 1650) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

This operation accesses a collection of data values from the **DDSDDataReader** (p. 1272). The behavior is identical to **FooDataReader::read_next_instance** (p. 1650), except that all returned samples satisfy the specified condition. In other words, on success, all returned samples belong to the same instance, and the instance is the instance with 'smallest' *instance_handle* among the ones that verify: (a) *instance_handle* \geq *previous_handle*, and (b) have samples for which the specified **DDSReadCondition** (p. 1558) evaluates to TRUE.

Similar to the operation **FooDataReader::read_next_instance** (p. 1650), it is possible to call **FooDataReader::read_next_instance_w_condition** (p. 1653) with a *previous_handle* that does not correspond to an instance currently managed by the **DDSDDataReader** (p. 1272).

The behavior of the **FooDataReader::read_next_instance_w_condition** (p. 1653) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the *received_data* and *sample_info*. Similar to the **FooDataReader::read** (p. 1635), the **FooDataReader::read_next_instance_w_condition** (p. 1653) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to the **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
----------------------	--

Parameters

<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>previous_handle</i>	<< <i>in</i> >> (p. 237) The 'next smallest' instance with a value greater than this value that has available samples will be returned.
<i>condition</i>	<< <i>in</i> >> (p. 237) the DDSReadCondition (p. 1558) to select samples of interest. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) DDS_RETCODE_NO_DATA (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).

FooDataReader::read_next_instance (p. 1650)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.15 take_next_instance_w_condition()

```
virtual DDS_ReturnCode_t FooDataReader::take_next_instance_w_condition (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t & previous_handle,
    DDSReadCondition * condition ) [pure virtual]
```

Accesses via **FooDataReader::take_next_instance** (p.1651) the samples that match the criteria specified in the **DDSReadCondition** (p. 1558).

This operation accesses a collection of data values from the **DDSDataReader** (p.1272) and 'removes' them from the **DDSDataReader** (p. 1272).

The operation has the same behavior as **FooDataReader::read_next_instance_w_condition** (p. 1653), except that the samples are 'taken' from the **DDSDataReader** (p. 1272) such that they are no longer accessible via subsequent 'read' or 'take' operations.

Similar to the operation **FooDataReader::read_next_instance** (p. 1650), it is possible to call **FooDataReader::take_next_instance_w_condition** (p. 1654) with a *previous_handle* that does not correspond to an instance currently managed by the **DDSDataReader** (p. 1272).

The behavior of the **FooDataReader::take_next_instance_w_condition** (p. 1654) operation follows the same rules as the **FooDataReader::read** (p. 1635) operation regarding the pre-conditions and post-conditions for the `received_data` and `sample_info`. Similar to **FooDataReader::read** (p. 1635), the **FooDataReader::take_next_instance_w_condition** (p. 1654) operation may 'loan' elements to the output collections, which must then be returned by means of **FooDataReader::return_loan** (p. 1655).

Similar to the **FooDataReader::read** (p. 1635), this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

If the **DDSDDataReader** (p. 1272) has no samples that meet the constraints, the method will fail with **DDS_RETCODE_NO_DATA** (p. 336).

Parameters

<i>received_data</i>	<< <i>inout</i> >> (p. 237) user data type-specific FooSeq (p. 1680) object where the received data samples will be returned.
<i>info_seq</i>	<< <i>inout</i> >> (p. 237) a DDS_SampleInfoSeq (p. 1078) object where the received sample info will be returned.
<i>max_samples</i>	<< <i>in</i> >> (p. 237) The maximum number of samples to be returned. If the special value DDS_LENGTH_UNLIMITED (p. 437) is provided, as many samples will be returned as are available, up to the limits described in the documentation for FooDataReader::take() (p. 1636).
<i>previous_handle</i>	<< <i>in</i> >> (p. 237) The 'next smallest' instance with a value greater than this value that has available samples will be returned.
<i>condition</i>	<< <i>in</i> >> (p. 237) the DDSReadCondition (p. 1558) to select samples of interest. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), or DDS_RETCODE_NO_DATA (p. 336), DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

See also

FooDataReader::take_next_instance (p. 1651)

DDS_LENGTH_UNLIMITED (p. 437)

9.311.2.16 return_loan()

```
virtual DDS_ReturnCode_t FooDataReader::return_loan (
    FooSeq & received_data,
    DDS_SampleInfoSeq & info_seq ) [pure virtual]
```

Indicates to the **DDSDDataReader** (p. 1272) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDSDDataReader** (p. 1272).

This operation indicates to the **DDSDataReader** (p.1272) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDSDataReader** (p.1272).

The `received_data` and `info_seq` must belong to a single related "pair"; that is, they should correspond to a pair returned from a single call to `read` or `take`. The `received_data` and `info_seq` must also have been obtained from the same **DDSDataReader** (p.1272) to which they are returned. If either of these conditions is not met, the operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p.335).

The operation **FooDataReader::return_loan** (p.1655) allows implementations of the `read` and `take` operations to "loan" buffers from the **DDSDataReader** (p.1272) to the application and in this manner provide "zerocopy" access to the data. During the loan, the **DDSDataReader** (p.1272) will guarantee that the data and sample-information are not modified.

It is not necessary for an application to return the loans immediately after the `read` or `take` calls. However, as these buffers correspond to internal resources inside the **DDSDataReader** (p.1272), the application should not retain them indefinitely.

The use of **FooDataReader::return_loan** (p.1655) is only necessary if the `read` or `take` calls "loaned" buffers to the application. This only occurs if the `received_data` and `info_seq` collections had `max_len=0` at the time `read` or `take` was called.

The application may also examine the "owns" property of the collection to determine where there is an outstanding loan. However, calling **FooDataReader::return_loan** (p.1655) on a collection that does not have a loan is safe and has no side effects.

If the collections had a loan, upon completion of **FooDataReader::return_loan** (p.1655), the collections will have `max_len=0`.

Similar to `read`, this operation must be provided on the specialized class that is generated for the particular application data-type that is being taken.

Parameters

<i>received_data</i>	<< <i>in</i> >> (p.237) user data type-specific FooSeq (p.1680) object where the received data samples was obtained from earlier invocation of <code>read</code> or <code>take</code> on the DDSDataReader (p.1272).
----------------------	--

Parameters

<i>info_seq</i>	<< <i>in</i> >> (p.237) a DDS_SampleInfoSeq (p.1078) object where the received sample info was obtained from earlier invocation of <code>read</code> or <code>take</code> on the DDSDataReader (p.1272).
-----------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p.335), DDS_RETCODE_PRECONDITION_NOT_MET (p.335) or DDS_RETCODE_NOT_ENABLED (p.336).
------------	---

9.311.2.17 get_key_value()

```
virtual DDS_ReturnCode_t FooDataReader::get_key_value (
    Foo & key_holder,
    const DDS_InstanceHandle_t handle ) [pure virtual]
```

Retrieve the instance `key` that corresponds to an instance `handle`.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335) if the `handle` does not correspond to an existing data-object known to the **DDSDDataReader** (p. 1272).

Parameters

<i>key_holder</i>	<< <i>inout</i> >> (p. 237) a user data type specific key holder, whose <code>key</code> fields are filled by this operation. If Foo (p. 1632) has no key, this method has no effect.
<i>handle</i>	<< <i>in</i> >> (p. 237) the instance whose key is to be retrieved. If Foo (p. 1632) has a key, <code>handle</code> must represent an existing instance of type Foo (p. 1632) known to the DDSDDataReader (p. 1272). Otherwise, this method will fail with DDS_RETCODE_BAD_PARAMETER (p. 335).

If **Foo** (p. 1632) has a key and `handle` is **DDS_HANDLE_NIL** (p. 76), this method will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335).

If **Foo** (p. 1632) has a key and `handle` represents an instance of another type or an instance of type **Foo** (p. 1632) that has been unregistered, this method will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335). If **Foo** (p. 1632) has no key, this method has no effect.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

See also

FooDataWriter::get_key_value (p. 1674)

9.311.2.18 lookup_instance()

```
virtual DDS_InstanceHandle_t FooDataReader::lookup_instance (
    const Foo & key_holder ) [pure virtual]
```

Retrieves the instance `handle` that corresponds to an instance `key_holder`.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. If the instance is unknown to the DataReader, or if for any other reason the Service is unable to provide an instance handle, the Service will return the special value **DDS_HANDLE_NIL** (p. 76).

Parameters

<i>key_holder</i>	<< <i>in</i> >> (p. 237) a user data type specific key holder.
-------------------	--

Returns

the instance handle associated with this instance. If **Foo** (p. 1632) has no key, this method has no effect and returns **DDS_HANDLE_NIL** (p. 76)

9.311.2.19 is_data_consistent()

```
virtual DDS_ReturnCode_t FooDataReader::is_data_consistent (
    DDS_Boolean & is_data_consistent,
    const TData * sample,
    const DDS_SampleInfo * sample_info ) [pure virtual]
```

When using Zero Copy transfer over shared memory, checks if the sample has been overwritten by the DataWriter.

When a sample is received via **Zero Copy transfer over shared memory** (p. 70), the sample can be reused by the DataWriter once it is removed from the DataWriter's send queue. Since there is no synchronization between the DataReader and the DataWriter, the sample could be overwritten by the DataWriter before it is processed by the DataReader. The **FooDataReader::is_data_consistent** (p. 1658) operation can be used after processing the sample to check if it was overwritten by the DataWriter.

A precondition for using this operation is to set **DDS_DataWriterShmemRefTransferModeSettings::enable_data_consistency_check** (p. 699) to true.

Warning

This operation cannot be used when the data type is annotated with `@language_binding(FLAT_DATA)`. Reading a FlatData sample delivered with Zero Copy transfer over shared memory while the DataWriter is overwriting it is undefined behavior. An application-level synchronization mechanism is required in this case.

Parameters

<i>is_data_consistent</i>	<< <i>inout</i> >> (p. 237) Set to true if the sample is consistent (i.e., the sample has not been overwritten by the DataWriter)
<i>sample</i>	<< <i>in</i> >> (p. 237) Sample to be validated
<i>sample_info</i>	<< <i>in</i> >> (p. 237) DDS_SampleInfo (p. 1068) object received with the sample

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).

Inheritance diagram for FooDataWriter:

Public Member Functions

- virtual **DDS_InstanceHandle_t** **register_instance** (const **Foo** &instance_data)=0
Informs RTI Connexx that the application will be modifying a particular instance.
- virtual **DDS_InstanceHandle_t** **register_instance_w_timestamp** (const **Foo** &instance_data, const **DDS_↵**
Time_t &source_timestamp)=0
Performs the same functions as register_instance except that the application provides the value for the source_↵
timestamp.
- virtual **DDS_InstanceHandle_t** **register_instance_w_params** (const **Foo** &instance_data, **DDS_Write_↵**
Params_t ¶ms)=0
*Performs the same function as **FooDataWriter::register_instance** (p. 1661) and **FooDataWriter::register_instance_↵**
w_timestamp (p. 1662) except that it also provides the values contained in *params*.*
- virtual **DDS_ReturnCode_t** **unregister_instance** (const **Foo** &instance_data, const **DDS_InstanceHandle_t**
&handle)=0
*Reverses the action of **FooDataWriter::register_instance** (p. 1661).*
- virtual **DDS_ReturnCode_t** **unregister_instance_w_timestamp** (const **Foo** &instance_data, const **DDS_↵**
InstanceHandle_t &handle, const **DDS_Time_t** &source_timestamp)=0
*Performs the same function as **FooDataWriter::unregister_instance** (p. 1663) except that it also provides the value for*
the source_timestamp.
- virtual **DDS_ReturnCode_t** **unregister_instance_w_params** (const **Foo** &instance_data, **DDS_Write_↵**
Params_t ¶ms)=0
*Performs the same function as **FooDataWriter::unregister_instance** (p. 1663) and **FooDataWriter::unregister_↵**
instance_w_timestamp (p. 1665) except that it also provides the values contained in *params*.*
- virtual **DDS_ReturnCode_t** **write** (const **Foo** &instance_data, const **DDS_InstanceHandle_t** &handle)=0
Modifies the value of a data instance.

- virtual **DDS_ReturnCode_t write_w_timestamp** (const **Foo** &instance_data, const **DDS_InstanceHandle_t** &handle, const **DDS_Time_t** &source_timestamp)=0
*Performs the same function as **FooDataWriter::write** (p. 1666) except that it also provides the value for the `source_timestamp`.*
- virtual **DDS_ReturnCode_t write_w_params** (const **Foo** &instance_data, **DDS_WriteParams_t** ¶ms)=0
*Performs the same function as **FooDataWriter::write** (p. 1666) and **FooDataWriter::write_w_timestamp** (p. 1670) except that it also provides the values contained in `params`.*
- virtual **DDS_ReturnCode_t dispose** (const **Foo** &instance_data, const **DDS_InstanceHandle_t** &instance_handle)=0
Requests the middleware to delete the instance.
- virtual **DDS_ReturnCode_t dispose_w_timestamp** (const **Foo** &instance_data, const **DDS_InstanceHandle_t** &instance_handle, const **DDS_Time_t** &source_timestamp)=0
*Performs the same functions as **dispose** except that the application provides the value for the `source_timestamp` that is made available to **DDSDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068).*
- virtual **DDS_ReturnCode_t dispose_w_params** (const **Foo** &instance_data, **DDS_WriteParams_t** ¶ms)=0
*Performs the same function as **FooDataWriter::dispose** (p. 1672) and **FooDataWriter::dispose_w_timestamp** (p. 1673) except that it also provides the values contained in `params`.*
- virtual **DDS_ReturnCode_t get_key_value** (**Foo** &key_holder, const **DDS_InstanceHandle_t** &handle)=0
Retrieve the instance `key` that corresponds to an instance `handle`.
- virtual **DDS_InstanceHandle_t lookup_instance** (const **Foo** &key_holder)=0
Retrieve the instance `handle` that corresponds to an instance `key_holder`.
- virtual void * **create_data** (const **DDS_TypeAllocationParams_t** &alloc_params=DDS_TYPE_ALLOCATION_PARAMS_DEFAULT)
Creates a data sample and initializes it.
- virtual **DDS_Boolean delete_data** (void *sample, const **DDS_TypeDeallocationParams_t** &dealloc_params=DDS_TYPE_DEALLOCATION_PARAMS_DEFAULT)
Destroys a user data type instance.
- virtual **DDS_ReturnCode_t get_loan** (TData *&sample)
Gets a sample managed by the DataWriter.
- virtual **DDS_ReturnCode_t discard_loan** (TData &sample)
Returns a loaned sample back to the DataWriter.

Static Public Member Functions

- static **FooDataWriter * narrow** (**DDSDataWriter** *writer)
*Narrow the given **DDSDataWriter** (p. 1305) pointer to a **FooDataWriter** (p. 1659) pointer.*

9.312.1 Detailed Description

<<**interface**>> (p. 236) <<**generic**>> (p. 236) User data type specific data writer.

Defines the user data type specific writer interface generated for each application class.

The concrete user data type writer automatically generated by the implementation is an incarnation of this class.

DDSDataWriter (p. 1305)

Foo (p. 1632)

FooDataReader (p. 1632)

the Code Generator User's Manual

9.312.2 Member Function Documentation

9.312.2.1 narrow()

```
static FooDataWriter * FooDataWriter::narrow (
    DDSDataWriter * writer ) [static]
```

Narrow the given **DDSDataWriter** (p. 1305) pointer to a **FooDataWriter** (p. 1659) pointer.

Check if the given `writer` is of type **FooDataWriter** (p. 1659).

Parameters

<i>writer</i>	<< <i>in</i> >> (p. 237) Base-class DDSDataWriter (p. 1305) to be converted to the auto-generated class FooDataWriter (p. 1659) that extends DDSDataWriter (p. 1305).
---------------	--

Returns

FooDataWriter (p. 1659) if `writer` is of type **Foo** (p. 1632). Return NULL otherwise.

9.312.2.2 register_instance()

```
virtual DDS_InstanceHandle_t FooDataWriter::register_instance (
    const Foo & instance_data ) [pure virtual]
```

Informs RTI Connext that the application will be modifying a particular instance.

This operation is only useful for keyed data types. Using it for non-keyed types causes no effect and returns **DDS_HANDLE_NIL** (p. 76). The operation takes as a parameter an instance (of which only the key value is examined) and returns a `handle` that can be used in successive **write()** (p. 1666) or **dispose()** (p. 1672) operations.

The operation gives RTI Connext an opportunity to pre-configure itself to improve performance.

The use of this operation by an application is optional even for keyed types. If an instance has not been pre-registered, the application can use the special value **DDS_HANDLE_NIL** (p. 76) as the **DDS_InstanceHandle_t** (p. 74) parameter to the write or dispose operation and RTI Connext will auto-register the instance.

For best performance, the operation should be invoked prior to calling any operation that modifies the instance, such as **FooDataWriter::write** (p. 1666), **FooDataWriter::write_w_timestamp** (p. 1670), **FooDataWriter::dispose** (p. 1672) and **FooDataWriter::dispose_w_timestamp** (p. 1673) and the handle used in conjunction with the data for those calls.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is used.

This operation may fail and return **DDS_HANDLE_NIL** (p. 76) if **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) limit has been exceeded.

The operation is **idempotent**. If it is called for an already registered instance, it just returns the already allocated handle. This may be used to lookup and retrieve the handle allocated to a given instance.

This operation can only be called after **DDSDataWriter** (p. 1305) has been enabled. Otherwise, **DDS_HANDLE_NIL** (p. 76) will be returned.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function.
----------------------	---

Returns

For keyed data type, a handle that can be used in the calls that take a **DDS_InstanceHandle_t** (p. 74), such as `write`, `dispose`, `unregister_instance`, or return **DDS_HANDLE_NIL** (p. 76) on failure. If the `instance_data` is of a data type that has no keys, this function always returns **DDS_HANDLE_NIL** (p. 76).

See also

FooDataWriter::unregister_instance (p. 1663), **FooDataWriter::get_key_value** (p. 1674), **Relationship between registration, liveliness and ownership** (p. ??)

9.312.2.3 register_instance_w_timestamp()

```
virtual DDS_InstanceHandle_t FooDataWriter::register_instance_w_timestamp (
    const Foo & instance_data,
    const DDS_Time_t & source_timestamp ) [pure virtual]
```

Performs the same functions as `register_instance` except that the application provides the value for the `source_timestamp`.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 385) QoS policy for details.

This operation may fail and return **DDS_HANDLE_NIL** (p. 76) if **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) limit has been exceeded.

This operation can only be called after **DDSDDataWriter** (p. 1305) has been enabled. Otherwise, **DDS_HANDLE_NIL** (p. 76) will be returned.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function.
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a <i>register</i> , <i>unregister</i> , <i>dispose</i> , or <i>write</i> , with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers.

Returns

For keyed data type, return a handle that can be used in the calls that take a **DDS_InstanceHandle_t** (p. 74), such as write, dispose, unregister_instance, or return **DDS_HANDLE_NIL** (p. 76) on failure. If the instance_data is of a data type that has no keys, this function always return **DDS_HANDLE_NIL** (p. 76).

See also

FooDataWriter::unregister_instance (p. 1663), **FooDataWriter::get_key_value** (p. 1674)

9.312.2.4 register_instance_w_params()

```
virtual DDS_InstanceHandle_t FooDataWriter::register_instance_w_params (
    const Foo & instance_data,
    DDS_WriteParams_t & params ) [pure virtual]
```

Performs the same function as **FooDataWriter::register_instance** (p. 1661) and **FooDataWriter::register_instance_w_timestamp** (p. 1662) except that it also provides the values contained in params.

See also

FooDataWriter::write_w_params (p. 1671)

9.312.2.5 unregister_instance()

```
virtual DDS_ReturnCode_t FooDataWriter::unregister_instance (
    const Foo & instance_data,
    const DDS_InstanceHandle_t & handle ) [pure virtual]
```

Reverses the action of **FooDataWriter::register_instance** (p. 1661).

This operation is useful only for keyed data types. Using it for non-keyed types causes no effect and reports no error. The operation takes as a parameter an instance (of which only the key value is examined) and a handle.

This operation should only be called on an instance that is currently registered. This includes instances that have been auto-registered by calling operations such as write or dispose as described in **FooDataWriter::register_instance** (p. 1661). Otherwise, this operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335).

This only need be called just once per instance, regardless of how many times register_instance was called for that instance.

When this operation is used, RTI Connexx will automatically supply the value of the source_timestamp that is used.

This operation informs RTI Connexx that the **DDSDDataWriter** (p. 1305) is no longer going to provide any information about the instance. This operation also indicates that RTI Connexx can locally remove all information regarding that

instance. The application should not attempt to use the `handle` previously allocated to that instance after calling this function.

The special value **DDS_HANDLE_NIL** (p. 76) can be used for the parameter `handle`. This indicates that the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `handle` is any value other than **DDS_HANDLE_NIL** (p. 76), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335).

RTI Connex will not detect the error when the `handle` is any value other than **DDS_HANDLE_NIL** (p. 76), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). RTI Connex will treat as if the **unregister_instance()** (p. 1663) operation is for the instance as indicated by the `handle`.

If, after a **FooDataWriter::unregister_instance** (p. 1663), the application wants to modify (**FooDataWriter::write** (p. 1666) or **FooDataWriter::dispose** (p. 1672)) an instance, it has to register it again, or else use the special `handle` value **DDS_HANDLE_NIL** (p. 76).

This operation does not indicate that the instance is deleted (that is the purpose of **FooDataWriter::dispose** (p. 1672)). The operation **FooDataWriter::unregister_instance** (p. 1663) just indicates that the **DDSDataWriter** (p. 1305) no longer has anything to say about the instance. **DDSDataReader** (p. 1272) entities that are reading the instance may receive a sample with **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) for the instance, unless there are other **DDSDataWriter** (p. 1305) objects writing that same instance.

DDS_WriterDataLifecycleQosPolicy::autodispose_unregistered_instances (p. 1241) controls whether instances are automatically disposed when they are unregistered.

This operation can affect the ownership of the data instance (see **OWNERSHIP** (p. 414)). If the **DDSDataWriter** (p. 1305) was the exclusive owner of the instance, then calling **unregister_instance()** (p. 1663) will relinquish that ownership.

If **DDS_ReliabilityQosPolicy::kind** (p. 1029) is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) and the unregistration would overflow the resource limits of this writer or of a reader, this operation may block for up to **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029); if this writer is still unable to unregister after that period, this method will fail with **DDS_RETCODE_TIMEOUT** (p. 336).

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The instance that should be unregistered. If Foo (p. 1632) <i>has</i> a key and <code>instance_handle</code> is DDS_HANDLE_NIL (p. 76), only the fields that represent the key are examined by the function. Otherwise, <code>instance_data</code> is not used. If <code>instance_data</code> is used, it must represent an instance that has been registered. Otherwise, this method may fail with DDS_RETCODE_BAD_PARAMETER (p. 335) .
<i>handle</i>	<< <i>in</i> >> (p. 237) represents the <code>instance</code> to be unregistered. If Foo (p. 1632) <i>has</i> a key and <code>handle</code> is DDS_HANDLE_NIL (p. 76), <code>handle</code> is not used and <code>instance</code> is deduced from <code>instance_data</code> . If Foo (p. 1632) <i>has</i> no key, <code>handle</code> is not used. If <code>handle</code> is used, it must represent an instance that has been registered. Otherwise, this method may fail with DDS_RETCODE_BAD_PARAMETER (p. 335).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336)
------------	--

FooDataWriter::get_key_value (p. 1674)

Relationship between registration, liveliness and ownership (p. ??)

9.312.2.6 unregister_instance_w_timestamp()

```
virtual DDS_ReturnCode_t FooDataWriter::unregister_instance_w_timestamp (
    const Foo & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [pure virtual]
```

Performs the same function as **FooDataWriter::unregister_instance** (p. 1663) except that it also provides the value for the `source_timestamp`.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 385) QoS policy for details.

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **FooDataWriter::unregister_instance** (p. 1663) operation.

This operation may block and may time out (**DDS_RETCODE_TIMEOUT** (p. 336)) under the same circumstances described for the `unregister_instance` operation.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The instance that should be unregistered. If Foo (p. 1632) <i>has</i> a key and <code>instance_handle</code> is DDS_HANDLE_NIL (p. 76), only the fields that represent the key are examined by the function. Otherwise, <code>instance_data</code> is not used. If <code>instance_data</code> is used, it must represent an instance that has been registered. Otherwise, this method may fail with DDS_RETCODE_BAD_PARAMETER (p. 335).
<i>handle</i>	<< <i>in</i> >> (p. 237) represents the <code>instance</code> to be unregistered. If Foo (p. 1632) <i>has</i> a key and <code>handle</code> is DDS_HANDLE_NIL (p. 76), <code>handle</code> is not used and <code>instance</code> is deduced from <code>instance_data</code> . If Foo (p. 1632) has no key, <code>handle</code> is not used. If <code>handle</code> is used, it must represent an instance that has been registered. Otherwise, this method may fail with DDS_RETCODE_BAD_PARAMETER (p. 335).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a <i>register</i> , <i>unregister</i> , <i>dispose</i> , or <i>write</i> , with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

See also

FooDataWriter::register_instance (p. 1661)

FooDataWriter::unregister_instance (p. 1663)

FooDataWriter::get_key_value (p. 1674)

9.312.2.7 unregister_instance_w_params()

```
virtual DDS_ReturnCode_t FooDataWriter::unregister_instance_w_params (
    const Foo & instance_data,
    DDS_WriteParams_t & params ) [pure virtual]
```

Performs the same function as **FooDataWriter::unregister_instance** (p. 1663) and **FooDataWriter::unregister_instance_w_timestamp** (p. 1665) except that it also provides the values contained in `params`.

See also

FooDataWriter::write_w_params (p. 1671)

FooDataWriter::dispose_w_params (p. 1674)

9.312.2.8 write()

```
virtual DDS_ReturnCode_t FooDataWriter::write (
    const Foo & instance_data,
    const DDS_InstanceHandle_t & handle ) [pure virtual]
```

Modifies the value of a data instance.

When this operation is used, RTI Connexx will automatically supply the value of the `source_timestamp` that is made available to **DDSDDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068). (Refer to **DDS_SampleInfo** (p. 1068) and **DESTINATION_ORDER** (p. 385) QoS policy for details).

As a side effect, this operation asserts liveliness on the **DDSDDataWriter** (p. 1305) itself, the **DDSPublisher** (p. 1534) and the **DDSDomainParticipant** (p. 1335).

Note that the special value **DDS_HANDLE_NIL** (p. 76) can be used for the parameter `handle`. This indicates the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `handle` is any value other than **DDS_HANDLE_NIL** (p. 76), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335).

RTI Connexx will not detect the error when the `handle` is any value other than **DDS_HANDLE_NIL** (p. 76), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data`

(by means of the `key`). RTI Connext will treat as if the **write()** (p. 1666) operation is for the instance as indicated by the `handle`.

This operation may block if the **RELIABILITY** (p. 433) `kind` is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) and the modification would cause data to be lost or else cause one of the limits specified in the **RESOURCE_LIMITS** (p. 437) to be exceeded.

This operation will not block when using **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435). If you are using **BEST_EFFORT** Reliability in combination with **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431), then instead of being blocked, samples that are queued to be sent by the asynchronous publishing thread will be overwritten when the number of DDS samples that are currently queued has reached the `depth` QoS value in the **DDS_HistoryQosPolicy** (p. 906).

If **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029) elapses before the **DDSDataWriter** (p. 1305) can store the modification without exceeding the limits, the operation will fail and return **DDS_RETCODE_TIMEOUT** (p. 336) for **KEEP_ALL** configurations.

Here is how the write operation behaves when **DDS_KEEP_LAST_HISTORY_QOS** (p. 406) and **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) are used:

- The send window size is determined by the **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1059) and **DDS_RtpsReliableWriterProtocol_t::min_send_window_size** (p. 1058) fields in the **DDS_DataWriterProtocolQosPolicy** (p. 667). If a send window is specified (`max_send_window_size` is not **UNLIMITED**) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029) expires.
- Then, the **DDSDataWriter** (p. 1305) will try to add the new sample to the writer history.
- If the instance associated with the sample is present in the writer history and there are `depth` (in the **HISTORY** (p. 404)) samples in the instance, the DataWriter will replace the oldest sample of that instance independently of that sample's acknowledged status, and the write operation will return **DDS_RETCODE_OK** (p. 335). Otherwise, no sample will be replaced and the write operation will continue.
- If the instance associated with the sample is not present in the writer history and **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) is exceeded, the DataWriter will try to replace an existing instance (and its samples) according to the value of **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 695) (see **DDS_DataWriterResourceLimitsInstanceReplacementKind** (p. 381)).
 - If no instance can be replaced, the write operation returns **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).
- If **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) is exceeded, the DataWriter will try to drop a sample from a different instance as follows:
 - The DataWriter will try first to remove a fully ACKed (2) sample from a different instance 'I' as long as that sample is not the last remaining sample for the instance 'I'. To find this sample, the DataWriter starts iterating from the oldest sample in the writer history to the newest sample.
 - If no such sample is found, the DataWriter will replace the oldest sample in the writer history.
- The sample is added to the writer history, and the write operation returns **DDS_RETCODE_OK** (p. 335).

Here is how the write operation behaves when **DDS_KEEP_ALL_HISTORY_QOS** (p. 406) and **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) are used:

- The send window size is determined by the **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1059) and **DDS_RtpsReliableWriterProtocol_t::min_send_window_size** (p. 1058) fields in the **DATA_↔WRITER_PROTOCOL** (p. 380). If a send window is specified (**max_send_window_size** is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029) expires.
 - If the **max_blocking_time** expires, the write operation returns **DDS_RETCODE_TIMEOUT** (p. 336).
- When a sample is protocol-ACKed (1) before **max_blocking_time** expires, the DataWriter will try to add the sample to the writer history as follows:
 - If the instance associated with the sample is not present in the writer history and **max_instances** is exceeded, the DataWriter will try to replace an existing instance (and its samples) according to the value of **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 695) (see **DDS_DataWriter_↔ResourceLimitsInstanceReplacementKind** (p. 381)).
 - * If no instance can be replaced, the write operation returns **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).
 - If **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) is exceeded, the DataWriter will go through the samples in the order in which they were added, and it will replace the first sample that is fully ACKed (2).
 - * If no fully ACKed sample is found, the DataWriter will block (3) until a sample is fully ACKed and can be replaced or **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029) expires. If the **max_blocking_↔_time** expires, the write operation will return **DDS_RETCODE_TIMEOUT** (p. 336).
 - If **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041) is exceeded, the DataWriter will go through the samples of the instance in the order in which they were added, and it will replace the first sample that is fully ACKed.
 - * If no fully ACKed sample is found, the DataWriter will block (3) until a sample is fully ACKed and can be replaced or the **max_blocking_time** expires. If the **max_blocking_time** expires, the write operation will return **DDS_RETCODE_TIMEOUT** (p. 336).
 - The sample is added to the writer history, and the write operation returns **DDS_RETCODE_OK** (p. 335).

If there are no instance resources left, this operation may fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336). Calling **FooDataWriter::unregister_instance** (p. 1663) may help freeing up some resources.

This operation will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if the timestamp is less than the timestamp used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp).

If an instance obtained from **FooDataWriter::get_loan** (p. 1678) is modified with this operation, then all instances modified thereafter should be from **FooDataWriter::get_loan** (p. 1678).

See **DDS_ReliabilityQosPolicyAcknowledgmentModeKind** (p. 435) for more information on the following notes:

(1) A sample in the writer history is considered "protocol ACKed" when the sample has been individually ACKed at the RTPS protocol level by each one of the DataReaders that matched the DataWriter at the moment the sample was added to the writer queue.

- Late joiners do not change the protocol ACK state of a sample. If a sample is marked as protocol ACKed because it has been acknowledged by all the matching DataReaders and a DataReader joins later on, the historical sample is still considered protocol ACKed even if it has not been received by the late joiner.

- If a sample 'S1' is protocol ACKed and a TopicQuery is received, triggering the publication of 'S1', the sample is still considered protocol ACKed. If a sample 'S1' is not ACKed and a TopicQuery is received triggering the publication of 'S1', the DataWriter will require that both the matching DataReaders on the live RTPS channel and the DataReader on the TopicQuery channel individually protocol ACK the sample in order to consider the sample protocol ACKed.

(2) A sample in the writer history is considered "fully ACKed" when all of the following conditions are met:

- The sample is protocol-ACKed.
- The sample has been "application-level ACKed" by all the DataReaders matching the DataWriter that have their **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) set to **DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436) or **DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 435). Once the sample is application-level ACKed, it cannot change its status to not ACKed after new DataReaders are matched. (Application-level ACK occurs when the application acknowledges receipt of a sample.)
- If required subscriptions are enabled (see **DDS_AvailabilityQosPolicy** (p. 590)), the sample must also be ACKed by all the required subscriptions configured on the DataWriter.

(3) It is possible within a single call to the write operation for a DataWriter to block both when the send window is full and then again when **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) or **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041) is exceeded. This can happen because blocking on the send window only considers protocol-ACKed samples, while blocking based on resource limits considers fully-ACKed samples. In any case, the total max blocking time of a single call to the write operation will not exceed **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029).

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The data to write.
----------------------	---

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 237) Either the handle returned by a previous call to FooDataWriter::register_instance (p. 1661), or else the special value DDS_HANDLE_NIL (p. 76). If Foo (p. 1632) has a key and <i>handle</i> is not DDS_HANDLE_NIL (p. 76), <i>handle</i> must represent a registered instance of type Foo (p. 1632). Otherwise, this method may fail with DDS_RETCODE_BAD_PARAMETER (p. 335).
---------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336), or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

MT Safety:

It is UNSAFE to modify *instance_data* before the operation has finished. The operation is otherwise SAFE.

See also

DDSDataReader (p. 1272)

FooDataWriter::write_w_timestamp (p. 1670)

DESTINATION_ORDER (p. 385)

9.312.2.9 write_w_timestamp()

```
virtual DDS_ReturnCode_t FooDataWriter::write_w_timestamp (
    const Foo & instance_data,
    const DDS_InstanceHandle_t & handle,
    const DDS_Time_t & source_timestamp ) [pure virtual]
```

Performs the same function as **FooDataWriter::write** (p. 1666) except that it also provides the value for the `source_timestamp`.

Explicitly provides the timestamp that will be available to the **DDSDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_SampleInfo** (p. 1068). (Refer to **DDS_SampleInfo** (p. 1068) and **DESTINATION_ORDER** (p. 385) QoS policy for details)

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **FooDataWriter::write** (p. 1666) operation.

This operation may block and time out (**DDS_RETCODE_TIMEOUT** (p. 336)) under the same circumstances described for **FooDataWriter::write** (p. 1666).

If there are no instance resources left, this operation may fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336). Calling **FooDataWriter::unregister_instance** (p. 1663) may help free up some resources.

This operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335) under the same circumstances described for the write operation.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The data to write.
<i>handle</i>	<< <i>in</i> >> (p. 237) Either the handle returned by a previous call to FooDataWriter::register_instance (p. 1661), or else the special value DDS_HANDLE_NIL (p. 76). If Foo (p. 1632) has a key and <code>handle</code> is not DDS_HANDLE_NIL (p. 76), <code>handle</code> must represent a registered instance of type Foo (p. 1632). Otherwise, this method may fail with DDS_RETCODE_BAD_PARAMETER (p. 335).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) When using DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS (p. 386) the timestamp value must be greater than or equal to the timestamp value used in the last writer operation (<i>register</i> , <i>unregister</i> , <i>dispose</i> , or <i>write</i> , with either the automatically supplied timestamp or the application-provided timestamp) However, if it is less than the timestamp of the previous operation but the difference is less than the DDS_DestinationOrderQosPolicy::source_timestamp_tolerance (p. 705), the timestamp of the previous operation will be used as the source timestamp of this sample. Otherwise, if the difference is greater than DDS_DestinationOrderQosPolicy::source_timestamp_tolerance (p. 705), the function will return DDS_RETCODE_BAD_PARAMETER (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336), DDS_RETCODE_OUT_OF_RESOURCES (p. 336), or DDS_RETCODE_NOT_ENABLED (p. 336).

FooDataWriter::write (p. 1666)
DDSDataReader (p. 1272)
DESTINATION_ORDER (p. 385)

9.312.2.10 write_w_params()

```
virtual DDS_ReturnCode_t FooDataWriter::write_w_params (
    const Foo & instance_data,
    DDS_WriteParams_t & params ) [pure virtual]
```

Performs the same function as **FooDataWriter::write** (p. 1666) and **FooDataWriter::write_w_timestamp** (p. 1670) except that it also provides the values contained in `params`.

Allows provision of the sample identity, related sample identity, source timestamp, instance handle, and publication priority contained in `params`.

This operation may block and time out (**DDS_RETCODE_TIMEOUT** (p. 336)) under the same circumstances described for **FooDataWriter::write** (p. 1666).

If there are no instance resources left, this operation may fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336). Calling **FooDataWriter::unregister_instance_w_params** (p. 1666) may help free up some resources.

This operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335) under the same circumstances described for the **FooDataWriter::write** (p. 1666).

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The data to write.
<i>params</i>	<< <i>inout</i> >> (p. 237) The write parameters. Note that this is an inout parameter if you activate DDS_WriteParams_t::replace_auto (p. 1235); otherwise it won't be modified.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

FooDataWriter::write (p. 1666)

DDSDataReader (p. 1272)

9.312.2.11 dispose()

```
virtual DDS_ReturnCode_t FooDataWriter::dispose (
    const Foo & instance_data,
    const DDS_InstanceHandle_t & instance_handle ) [pure virtual]
```

Requests the middleware to delete the instance.

This operation is useful only for keyed data types. Using it for non-keyed types has no effect and reports no error.

When an instance is disposed, the **DDSDataWriter** (p. 1305) communicates this state change to **DDSDataReader** (p. 1272) objects by propagating a dispose sample. When the instance changes to a disposed state, you can see the state change on the DataReader by looking at **DDS_SampleInfo::instance_state** (p. 1072). Disposed instances have the value **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161).

The resources allocated to dispose instances on the DataWriter are not removed by default. The removal of the resources allocated to a dispose instance on the DataWriter queue can be controlled by using the QoS **DDS_Writer↔DataLifecycleQosPolicy::autopurge_disposed_instances_delay** (p. 1242).

Likewise, on the DataReader, the removal of the resources associated with an instance in the dispose state can be controlled by using the QoS **DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_instances_delay** (p. 1024).

This operation does not modify the value of the instance. The `instance_data` parameter is passed just for the purposes of identifying the instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **DDSDataReader** (p. 1272) objects by means of the `source_timestamp` attribute inside the **DDS_Sample↔Info** (p. 1068).

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the **FooDataWriter::unregister_instance** (p. 1663) operation.

The special value **DDS_HANDLE_NIL** (p. 76) can be used for the parameter `instance_handle`. This indicates the identity of the instance should be automatically deduced from the `instance_data` (by means of the key).

If `instance_handle` is any value other than **DDS_HANDLE_NIL** (p. 76), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335).

RTI Connext will not detect the error when the `instance_handle` is any value other than **DDS_HANDLE_NIL** (p. 76), and the `instance_handle` corresponds to an instance that has been registered but does not correspond to the instance deduced from the `instance_data` (by means of the key). In this case, the instance that will be disposed is the instance corresponding to the `instance_handle`, not to the `instance_data`.

This operation may block and time out (**DDS_RETCODE_TIMEOUT** (p. 336)) under the same circumstances described for **FooDataWriter::write** (p. 1666).

If there are no instance resources left, this operation may fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336). Calling **FooDataWriter::unregister_instance** (p. 1663) may help free up some resources.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The data to dispose. If Foo (p. 1632) has a key and <i>instance_handle</i> is DDS_HANDLE_NIL (p. 76), only the fields that represent the key are examined by the function. Otherwise, <i>instance_data</i> is not used.
<i>instance_handle</i>	<< <i>in</i> >> (p. 237) Either the handle returned by a previous call to FooDataWriter::register_instance (p. 1661), or else the special value DDS_HANDLE_NIL (p. 76). If Foo (p. 1632) has a key and <i>instance_handle</i> is DDS_HANDLE_NIL (p. 76), <i>instance_handle</i> is not used and it is deduced from <i>instance_data</i> . If Foo (p. 1632) has no key, <i>instance_handle</i> is not used. If <i>instance_handle</i> is used, it must represent an instance of type Foo (p. 1632) that has been written or registered with this writer. Otherwise, this method fail with DDS_RETCODE_BAD_PARAMETER (p. 335). If Foo (p. 1632) has a key, <i>instance_handle</i> cannot be DDS_HANDLE_NIL (p. 76) if <i>instance_data</i> is NULL. Otherwise, this method will fail with DDS_RETCODE_BAD_PARAMETER (p. 335).

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

See also

FooDataWriter::dispose_w_timestamp (p. 1673)

Relationship between registration, liveliness and ownership (p. ??)

9.312.2.12 dispose_w_timestamp()

```
virtual DDS_ReturnCode_t FooDataWriter::dispose_w_timestamp (
    const Foo & instance_data,
    const DDS_InstanceHandle_t & instance_handle,
    const DDS_Time_t & source_timestamp ) [pure virtual]
```

Performs the same functions as **dispose** except that the application provides the value for the *source_timestamp* that is made available to **DDSDataReader** (p. 1272) objects by means of the *source_timestamp* attribute inside the **DDS_SampleInfo** (p. 1068).

The constraints on the values of the *handle* parameter and the corresponding error behavior are the same specified for the **FooDataWriter::dispose** (p. 1672) operation.

This operation may block and time out (**DDS_RETCODE_TIMEOUT** (p. 336)) under the same circumstances described for **FooDataWriter::write** (p. 1666).

If there are no instance resources left, this operation may fail with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336). Calling **FooDataWriter::unregister_instance** (p. 1663) may help freeing up some resources.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 237) The data to dispose. If Foo (p. 1632) <i>has</i> a key and <i>instance_handle</i> is DDS_HANDLE_NIL (p. 76), only the fields that represent the key are examined by the function. Otherwise, <i>instance_data</i> is not used.
<i>instance_handle</i>	<< <i>in</i> >> (p. 237) Either the handle returned by a previous call to FooDataWriter::register_instance (p. 1661), or else the special value DDS_HANDLE_NIL (p. 76). If Foo (p. 1632) <i>has</i> a key and <i>handle</i> is not DDS_HANDLE_NIL (p. 76), <i>handle</i> must represent a registered instance of type Foo (p. 1632). Otherwise, this method may fail with DDS_RETCODE_BAD_PARAMETER (p. 335).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 237) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a <i>register</i> , <i>unregister</i> , <i>dispose</i> , or <i>write</i> , with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. This timestamp will be available to the DDSDataReader (p. 1272) objects by means of the <i>source_timestamp</i> attribute inside the DDS_SampleInfo (p. 1068).

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_TIMEOUT (p. 336), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_NOT_ENABLED (p. 336).
-----	---

FooDataWriter::dispose (p. 1672)

9.312.2.13 dispose_w_params()

```
virtual DDS_ReturnCode_t FooDataWriter::dispose_w_params (
    const Foo & instance_data,
    DDS_WriteParams_t & params ) [pure virtual]
```

Performs the same function as **FooDataWriter::dispose** (p. 1672) and **FooDataWriter::dispose_w_timestamp** (p. 1673) except that it also provides the values contained in *params*.

See also

FooDataWriter::write_w_params (p. 1671)

9.312.2.14 get_key_value()

```
virtual DDS_ReturnCode_t FooDataWriter::get_key_value (
    Foo & key_holder,
    const DDS_InstanceHandle_t & handle ) [pure virtual]
```

Retrieve the instance `key` that corresponds to an instance `handle`.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with **DDS_RETCODE_BAD_PARAMETER** (p. 335) if the `handle` does not correspond to an existing data-object known to the **DDSDDataWriter** (p. 1305).

Parameters

<i>key_holder</i>	<< <i>inout</i> >> (p. 237) a user data type specific key holder, whose <code>key</code> fields are filled by this operation. If Foo (p. 1632) has no key, this method has no effect.
-------------------	--

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 237) the <code>instance</code> whose key is to be retrieved. If Foo (p. 1632) <i>has</i> a key, <code>handle</code> must represent a registered instance of type Foo (p. 1632). Otherwise, this method will fail with DDS_RETCODE_BAD_PARAMETER (p. 335). If Foo (p. 1632) <i>has</i> a key and <code>handle</code> is DDS_HANDLE_NIL (p. 76), this method will fail with DDS_RETCODE_BAD_PARAMETER (p. 335).
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

See also

FooDataReader::get_key_value (p. 1656)

9.312.2.15 lookup_instance()

```
virtual DDS_InstanceHandle_t FooDataWriter::lookup_instance (
    const Foo & key_holder ) [pure virtual]
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. This operation does not register the instance in question. If the instance has not been previously registered, or if for any other reason RTI Connex is unable to provide an instance handle, RTI Connex will return the special value `HANDLE_NIL`.

Parameters

<i>key_holder</i>	<< <i>in</i> >> (p. 237) a user data type specific key holder.
-------------------	--

Returns

the instance handle associated with this instance. If **Foo** (p. 1632) has no key, this method has no effect and returns **DDS_HANDLE_NIL** (p. 76)

9.312.2.16 create_data()

```
virtual void * FooDataWriter::create_data (
    const DDS_TypeAllocationParams_t & alloc_params = DDS_TYPE_ALLOCATION_PARAMS_DEFAULT
) [inline], [virtual]
```

Creates a data sample and initializes it.

The behavior of this API is identical to **FooTypeSupport::create_data** (p. 1697).

Parameters

<i>alloc_params</i>	<< <i>in</i> >> (p. 237) Whether or not to recursively allocate pointers and/or optional members
---------------------	--

Returns

Newly created data type, or NULL on failure.

See also

FooDataWriter::delete_data (p. 1677)

9.312.2.17 delete_data()

```
virtual DDS_Boolean FooDataWriter::delete_data (
    void * sample,
    const DDS_TypeDeallocationParams_t & dealloc_params = DDS_TYPE_DEALLOCATION_PARAMS_↵
_DEFAULT ) [inline], [virtual]
```

Destroys a user data type instance.

The behavior of this API is identical to **FooTypeSupport::delete_data** (p. 1698).

Parameters

<i>sample</i>	<< <i>in</i> >> (p. 237) Cannot be NULL.
<i>dealloc_params</i>	<< <i>in</i> >> (p. 237) Whether or not to destroy pointers and/or optional members. By default they are destroyed (deleted).

Returns

DDS_BOOLEAN_TRUE (p. 316) on success.

See also

FooDataWriter::create_data (p. 1677)

9.312.2.18 get_loan()

```
virtual DDS_ReturnCode_t FooDataWriter::get_loan (
    TData *& sample ) [inline], [virtual]
```

Gets a sample managed by the DataWriter.

This operation is supported while using **Zero Copy transfer** (p. 70) over shared memory" or \ref RTIFlatDataModule "FlatData language binding". For FlatData types, this function should be used directly if the type is final; if the type is mutable, **rti::flat::build_data()** (p. 554) should be used to obtain a sample builder to work with the loaned sample.

The loaned sample is obtained from a DataWriter-managed sample pool and is uninitialized by default. An initialized sample can be obtained by setting **DDS_DataWriterResourceLimitsQosPolicy::initialize_writer_loaned_↵_sample** (p. 698) to **DDS_BOOLEAN_TRUE** (p. 316). The **DDS_DataWriterResourceLimitsQosPolicy::writer_↵loaned_sample_allocation** (p. 698) settings can be used to configure the DataWriter-managed sample pool.

FooDataWriter::get_loan (p. 1678) fails with **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336) if **DDS_Allocation_↵Settings_t::max_count** (p. 583) samples have been loaned, and none of those samples has been written with **Foo_↵DataWriter::write** (p. 1666) or discarded via **FooDataWriter::discard_loan** (p. 1679).

Samples returned from **FooDataWriter::get_loan** (p. 1678) have an associated state. Due to the optimized nature of the write operation while using Zero Copy transfer over shared memory or FlatData language binding, this sample state is used to control when a sample is available for reuse after the write operation. The possible sample states are free, allocated, removed or serialized. A sample that has never been allocated is "free". **FooDataWriter::get_loan** (p. 1678) takes a "free" or "removed" sample and makes it "allocated". When a sample is written, its state transitions from "allocated" to "serialized", and the DataWriter takes responsibility for returning the sample back to its sample pool. The sample remains in the "serialized" state until it is removed from the DataWriter queue. For a reliable DataWriter, the sample is removed from the DataWriter's queue when the sample is acknowledged by all DataReaders. For a best-effort DataWriter, the sample is removed from the queue immediately after the write operation. After the sample is removed from the DataWriter queue, the sample is put back into the sample pool, and its state transitions from "serialized" to "removed". At this time, a new call to **FooDataWriter::get_loan** (p. 1678) may return the same sample.

A loaned sample should not be reused to write a new value after the first write operation. Instead, a new sample from **FooDataWriter::get_loan** (p. 1678) should be used to write the new value. A loaned sample that has not been written

can be returned to the DataWriter's sample pool by using **FooDataWriter::discard_loan** (p. 1679). If the write operation fails, then the sample can be used again with a write or discard_loan operation. Disposing or unregistering an instance with loaned samples follows the same pattern. A loaned sample used successfully with a dispose or unregister operation cannot be used again. But if the dispose or unregister operation fails, the sample is available for reuse.

A DataWriter cannot write managed samples (created with get_loan) and unmanaged samples (created in any other way) at the same time. The first call to get_loan automatically prepares this DataWriter to work with managed samples. Calls to get_loan will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) if an unmanaged sample was written with this DataWriter earlier. Similarly, **FooDataWriter::write** (p. 1666) will fail to write an unmanaged sample if get_loan was called.

Parameters

<i>sample</i>	<< <i>inout</i> >> (p. 237) reference to a user data type pointer. The loaned sample is returned via this sample.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336) or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
------------	---

See also

FooDataWriter::discard_loan (p. 1679)

9.312.2.19 discard_loan()

```
virtual DDS_ReturnCode_t FooDataWriter::discard_loan (
    TData & sample ) [inline], [virtual]
```

Returns a loaned sample back to the DataWriter.

This operation is supported while using **Zero Copy transfer** (p. 70) over shared memory" or the **FlatData language binding** (p. 562).

A loaned sample that hasn't been written can be returned to the DataWriter with this operation.

Parameters

<i>sample</i>	<< <i>in</i> >> (p. 237) loaned sample to be discarded.
---------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_NOT_ENABLED (p. 336).
------------	--

FooDataWriter::get_loan (p. 1678)

9.313 FooSeq Struct Reference

<<**interface**>> (p. 236) <<**generic**>> (p. 236) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **Foo** (p. 1632).

Public Member Functions

- **FooSeq & operator=** (const struct **FooSeq** &src_seq)
Copy elements from another sequence, resizing the sequence if necessary.
- bool **copy_no_alloc** (const struct **FooSeq** &src_seq)
Copy elements from another sequence, only if the destination sequence has enough capacity.
- bool **from_array** (const **Foo** array[], **DDS_Long** length)
Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.
- bool **to_array** (**Foo** array[], **DDS_Long** length)
Copy elements to an array of elements. The original contents of the array (if any) are replaced.
- **Foo & operator[]** (**DDS_Long** i)
Set the i-th element of the sequence.
- const **Foo & operator[]** (**DDS_Long** i) const
Get the i-th element for a const sequence.
- **DDS_Long** **length** () const
Get the logical length of this sequence.
- bool **length** (**DDS_Long** new_length)
Set the sequence to the desired length, and resize the sequence if necessary.
- bool **ensure_length** (**DDS_Long** length, **DDS_Long** max)
Set the sequence to the desired length, and resize the sequence if necessary.
- **DDS_Long** **maximum** () const
Get the current maximum number of elements that can be stored in this sequence.
- bool **maximum** (**DDS_Long** new_max)
Resize this sequence to a new desired maximum.
- bool **loan_contiguous** (**Foo** *buffer, **DDS_Long** new_length, **DDS_Long** new_max)
Loan a contiguous buffer to this sequence.
- bool **loan_discontiguous** (**Foo** **buffer, **DDS_Long** new_length, **DDS_Long** new_max)
Loan a discontiguous buffer to this sequence.
- bool **unloan** ()
Return the loaned buffer in the sequence and set the maximum to 0.
- **Foo *** **get_contiguous_buffer** () const
Return the contiguous buffer of the sequence.
- **Foo **** **get_discontiguous_buffer** () const
Return the discontiguous buffer of the sequence.
- bool **has_ownership** ()
Return the value of the owned flag.

- **~FooSeq** ()
Deallocate this sequence's buffer.
- **FooSeq** (**DDS_Long** new_max=0)
Create a sequence with the given maximum.
- **FooSeq** (const struct **FooSeq** &foo_seq)
Create a sequence by copying from an existing sequence.

9.313.1 Detailed Description

<<**interface**>> (p. 236) <<**generic**>> (p. 236) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **Foo** (p. 1632).

For users who define data types in OMG IDL, this type corresponds to the IDL `sequence<Foo>` (p. 1632).

For any user-data type **Foo** (p. 1632) that an application defines for the purpose of data-distribution with RTI Context, a **FooSeq** (p. 1680) is generated. The sequence offers a subset of the methods defined by the standard OMG IDL to C++ mapping for sequences. We refer to an IDL `sequence<Foo>` (p. 1632) as **FooSeq** (p. 1680).

The state of a sequence is described by the properties 'maximum', 'length' and 'owned'.

- The 'maximum' represents the size of the underlying buffer; this is the maximum number of elements it can possibly hold. It is returned by the **FooSeq::maximum()** (p. 1689) operation.
- The 'length' represents the actual number of elements it currently holds. It is returned by the **FooSeq::length()** (p. 1687) operation.
- The 'owned' flag represents whether the sequence owns the underlying buffer. It is returned by the **FooSeq::has_ownership** (p. 1693) operation. If the sequence does not own the underlying buffer, the underlying buffer is loaned from somewhere else. This flag influences the lifecycle of the sequence and what operations are allowed on it. The general guidelines are provided below and more details are described in detail as pre-conditions and post-conditions of each of the sequence's operations:
 - If `owned == DDS_BOOLEAN_TRUE` (p. 316), the sequence has ownership on the buffer. It is then responsible for destroying the buffer when the sequence is destroyed.
 - If the `owned == DDS_BOOLEAN_FALSE` (p. 316), the sequence does not have ownership on the buffer. This implies that the sequence is loaning the buffer. The sequence cannot be destroyed until the loan is returned.
 - A sequence with a zero maximum always has `owned == DDS_BOOLEAN_TRUE` (p. 316)

9.313.2 Constructor & Destructor Documentation

9.313.2.1 ~FooSeq()

```
FooSeq::~~FooSeq ( )
```

Deallocate this sequence's buffer.

Precondition

(owned == **DDS_BOOLEAN_TRUE** (p. 316)). If this precondition is not met, no memory will be freed and an error will be logged.

Postcondition

maximum == 0 and the underlying buffer is freed.

See also

FooSeq::maximum() (p. 1689), **FooSeq::unloan** (p. 1691)

9.313.2.2 FooSeq() [1/2]

```
FooSeq::FooSeq (
    DDS_Long new_max = 0 )
```

Create a sequence with the given maximum.

This is a constructor for the sequence. The constructor will automatically allocate memory to hold new_max elements of type **Foo** (p. 1632).

This constructor will be used when the application creates a sequence using one of the following:

```
FooSeq mySeq(5);
// or
FooSeq mySeq;
// or
FooSeq* mySeqPtr = new FooSeq(5);
```

Postcondition

maximum == new_max
length == 0
owned == **DDS_BOOLEAN_TRUE** (p. 316),

Parameters

<i>new_max</i>	Must be >= 0. Otherwise the sequence will be initialized to a new_max=0.
----------------	--

9.313.2.3 FooSeq() [2/2]

```
FooSeq::FooSeq (
    const struct FooSeq & foo_seq )
```

Create a sequence by copying from an existing sequence.

This is a constructor for the sequence. The constructor will automatically allocate memory to hold `foo_seq::maximum()` elements of type **Foo** (p. 1632) and will copy the current contents of `foo_seq` into the new sequence.

This constructor will be used when the application creates a sequence using one of the following:

```
FooSeq mySeq(foo_seq);
// or
FooSeq mySeq = foo_seq;
// or
FooSeq *mySeqPtr = new FooSeq(foo_seq);
```

Postcondition

```
this::maximum == foo_seq::maximum
this::length == foo_seq::length
this[i] == foo_seq[i] for 0 <= i < foo_seq::length
this::owned == DDS_BOOLEAN_TRUE (p. 316)
```

Note

If the pre-conditions are not met, or an error occurs during copying, the constructor will initialize the new sequence to a maximum of zero.

9.313.3 Member Function Documentation

9.313.3.1 operator=()

```
FooSeq & FooSeq::operator= (
    const struct FooSeq & src_seq )
```

Copy elements from another sequence, resizing the sequence if necessary.

This method invokes **FooSeq::copy_no_alloc** (p. 1684) after ensuring that the sequence has enough capacity to hold the elements to be copied.

This operator is invoked when the following expression appears in the code:

```
target_seq = src_seq
```

Important: This method *will* allocate memory if `this::maximum < src_seq::length`.

Therefore, to programatically detect the successful completion of the operator it is recommended that the application first sets the length of this sequence to zero, makes the assignment, and then checks that the length of this sequence matches that of `src_seq`.

Parameters

<i>src_seq</i>	<< <i>in</i> >> (p. 237) the sequence from which to copy
----------------	--

See also

FooSeq::copy_no_alloc (p. 1684)

9.313.3.2 copy_no_alloc()

```
bool FooSeq::copy_no_alloc (
    const struct FooSeq & src_seq )
```

Copy elements from another sequence, only if the destination sequence has enough capacity.

Fill the elements in this sequence by copying the corresponding elements in *src_seq*. The original contents in this sequence are replaced via the element assignment operation (*Foo_copy()* function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Precondition

this::maximum >= *src_seq*::length
 this::owned == **DDS_BOOLEAN_TRUE** (p. 316)

Postcondition

this::length == *src_seq*::length
 this[i] == *src_seq*[i] for 0 <= i < *target_seq*::length
 this::owned == **DDS_BOOLEAN_TRUE** (p. 316)

Parameters

<i>src_seq</i>	<< <i>in</i> >> (p. 237) the sequence from which to copy
----------------	--

Returns

DDS_BOOLEAN_TRUE (p. 316) if the sequence was successfully copied; **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Note

If the pre-conditions are not met, the operator will print a message to stdout and leave this sequence unchanged.

See also

FooSeq::operator= (p. 1683)

9.313.3.3 from_array()

```
bool FooSeq::from_array (
    const Foo array[],
    DDS_Long length )
```

Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.

Fill the elements in this sequence by copying the corresponding elements in `array`. The original contents in this sequence are replaced via the element assignment operation (`Foo_copy()` function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Precondition

`this::owned == DDS_BOOLEAN_TRUE` (p. 316)

Postcondition

`this::length == length`
`this[i] == array[i] for 0 ≤ i < length`
`this::owned == DDS_BOOLEAN_TRUE` (p. 316)

Parameters

<i>array</i>	<< <i>in</i> >> (p. 237) The array of elements to be copy elements from
<i>length</i>	<< <i>in</i> >> (p. 237) The length of the array.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the array was successfully copied; **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Note

If the pre-conditions are not met, the method will print a message to stdout and leave this sequence unchanged.

9.313.3.4 to_array()

```
bool FooSeq::to_array (
    Foo array[],
    DDS_Long length )
```

Copy elements to an array of elements. The original contents of the array (if any) are replaced.

Copy the elements of this sequence to the corresponding elements in the array. The original contents of the array are replaced via the element assignment operation (Foo_copy() function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

Parameters

<i>array</i>	<< <i>in</i> >> (p. 237) The array of elements to be filled with elements from this sequence
<i>length</i>	<< <i>in</i> >> (p. 237) The number of elements to be copied.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the elements of the sequence were successfully copied; **DDS_BOOLEAN_**↵
FALSE (p. 316) otherwise.

9.313.3.5 operator[]() [1/2]

```
Foo & FooSeq::operator[] (
    DDS_Long i )
```

Set the *i*-th element of the sequence.

This is the operator that is invoked when the application indexes into a non- `const` sequence:

```
myElement = mySequence[i];
mySequence[i] = myElement;
```

Note that a *reference* to the *i*-th element is returned (and not a copy).

Parameters

<i>i</i>	index of element to access, must be ≥ 0 and less than FooSeq::length() (p. 1687)
----------	--

Returns

the *i*-th element

9.313.3.6 operator[]() [2/2]

```
const Foo & FooSeq::operator[] (
    DDS_Long i ) const
```

Get the `i`-th element for a `const` sequence.

This is the operator that is invoked when the application indexes into a `const` sequence:

```
myElement = mySequence[i];
```

Note that a *reference* to the `i`-th element is returned (and not a copy).

Parameters

<code>i</code>	index of element to access, must be ≥ 0 and less than FooSeq::length() (p. 1687)
----------------	--

Returns

the `i`-th element

9.313.3.7 length() [1/2]

```
DDS_Long FooSeq::length ( ) const
```

Get the logical length of this sequence.

Get the length that was last set, or zero if the length has never been set.

Returns

the length of the sequence

9.313.3.8 length() [2/2]

```
bool FooSeq::length (
    DDS_Long new_length )
```

Set the sequence to the desired length, and resize the sequence if necessary.

If the current maximum is greater than the desired length, then sequence is not resized.

Otherwise, if this sequence owns its buffer, the sequence is resized to the new length by freeing and re-allocating the buffer. However, if the sequence does not own its buffer, this operation will fail.

For sequences that are part of a type declared in IDL, the length must not exceed the maximum established for the sequence in the IDL.

Parameters

<i>new_length</i>	the new desired length. This value must be non-negative. Must be ≥ 0 .
-------------------	---

Returns

DDS_BOOLEAN_TRUE (p. 316) on success or **DDS_BOOLEAN_FALSE** (p. 316) on failure

9.313.3.9 ensure_length()

```
bool FooSeq::ensure_length (
    DDS_Long length,
    DDS_Long max )
```

Set the sequence to the desired length, and resize the sequence if necessary.

If the current maximum is greater than the new length, then the sequence is not resized.

Otherwise, if this sequence owns its buffer, the sequence is resized to the new maximum by freeing and re-allocating the buffer, and the length is set to the new length. However, if the sequence does not own its buffer, this operation will fail.

This function allows user to avoid unnecessary buffer re-allocation.

Precondition

$length \leq max$
 $max \leq$ maximum size for IDL bounded sequences
 $owned == \mathbf{DDS_BOOLEAN_TRUE}$ (p. 316) if sequence needs to be resized

Postcondition

$length == length$
 $maximum == max$ if resized

Parameters

<i>length</i>	<< <i>in</i> >> (p. 237) The new length that should be set. Must be ≥ 0 .
<i>max</i>	<< <i>in</i> >> (p. 237) If sequence need to be resized, this is the maximum that should be set. $max \geq length$

Returns

DDS_BOOLEAN_TRUE (p. 316) on success, **DDS_BOOLEAN_FALSE** (p. 316) if the preconditions are not met. In that case the sequence is not modified.

9.313.3.10 maximum() [1/2]

```
DDS_Long FooSeq::maximum ( ) const
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

`maximum` can only be changed with the **FooSeq::maximum(DDS_Long)** (p. 1689) operation.

Returns

the current maximum of the sequence.

See also

FooSeq::length() (p. 1687)

9.313.3.11 maximum() [2/2]

```
bool FooSeq::maximum (
    DDS_Long new_max )
```

Resize this sequence to a new desired maximum.

This operation does nothing if the new desired maximum matches the current maximum.

If this sequence owns its buffer and the new maximum is not equal to the old maximum, then the existing buffer will be freed and re-allocated.

Precondition

```
owned == DDS_BOOLEAN_TRUE (p. 316)
new_max <= maximum size for IDL bounded sequences.
```

Postcondition

```
owned == DDS_BOOLEAN_TRUE (p. 316)
length == MINIMUM(original length, new_max)
```

Parameters

<i>new_max</i>	Must be ≥ 0 .
----------------	--------------------

Returns

DDS_BOOLEAN_TRUE (p. 316) on success, **DDS_BOOLEAN_FALSE** (p. 316) if the preconditions are not met. In that case the sequence is not modified.

9.313.3.12 loan_contiguous()

```
bool FooSeq::loan_contiguous (
    Foo * buffer,
    DDS_Long new_length,
    DDS_Long new_max )
```

Loan a contiguous buffer to this sequence.

This operation changes the `owned` flag of the sequence to **DDS_BOOLEAN_FALSE** (p. 316) and also sets the underlying buffer used by the sequence. See the `User's Manual` for more information about sequences and memory ownership.

Use this method if you want to manage the memory used by the sequence yourself. You must provide an array of elements and integers indicating how many elements are allocated in that array (i.e. the maximum) and how many elements are valid (i.e. the length). The sequence will subsequently use the memory you provide and will not permit it to be freed by a call to **FooSeq::maximum(DDS_Long)** (p. 1689).

Once you have loaned a buffer to a sequence, make sure that you don't free it before calling **FooSeq::unloan** (p. 1691): the next time you access the sequence, you will be accessing freed memory!

You can use this method to wrap stack memory with a sequence interface, thereby avoiding dynamic memory allocation. Create a **FooSeq** (p. 1680) and an array of type **Foo** (p. 1632) and then loan the array to the sequence:

```
::Foo fooArray[10];
::FooSeq fooSeq;
fooSeq.loan_contiguous(fooArray, 0, 10);
```

By default, a sequence you create owns its memory unless you explicitly loan memory of your own to it. In a very few cases, RTI Connext will return a sequence to you that has a loan; those cases are documented as such. For example, if you call **FooDataReader::read** (p. 1635) or **FooDataReader::take** (p. 1636) and pass in sequences with no loan and no memory allocated, RTI Connext will loan memory to your sequences which must be unloaned with **FooDataReader::return_loan** (p. 1655). See the documentation of those methods for more information.

Precondition

FooSeq::maximum() (p. 1689) == 0; i.e. the sequence has no memory allocated to it.

FooSeq::has_ownership (p. 1693) == **DDS_BOOLEAN_TRUE** (p. 316); i.e. the sequence does not already have an outstanding loan

Postcondition

The sequence will store its elements in the buffer provided.

FooSeq::has_ownership (p. 1693) == **DDS_BOOLEAN_FALSE** (p. 316)

FooSeq::length() (p. 1687) == `new_length`

FooSeq::maximum() (p. 1689) == `new_max`

Parameters

<i>buffer</i>	The new buffer that the sequence will use. Must point to enough memory to hold <code>new_max</code> elements of type Foo (p. 1632). It may be NULL if <code>new_max == 0</code> .
<i>new_length</i>	The desired new length for the sequence. It must be the case that that $0 \leq \text{new_length} \leq \text{new_max}$.
<i>new_max</i>	The allocated number of elements that could fit in the loaned buffer.

Returns

DDS_BOOLEAN_TRUE (p. 316) if `buffer` is successfully loaned to this sequence or **DDS_BOOLEAN_FALSE** (p. 316) otherwise. Failure only occurs due to failing to meet the pre-conditions. Upon failure the sequence remains unmodified.

See also

FooSeq::unloan (p. 1691) , **FooSeq::loan_discontiguous** (p. 1691)

9.313.3.13 loan_discontiguous()

```
bool FooSeq::loan_discontiguous (
    Foo ** buffer,
    DDS_Long new_length,
    DDS_Long new_max )
```

Loan a discontiguous buffer to this sequence.

This method is exactly like **FooSeq::loan_contiguous** (p. 1690) except that the buffer loaned is an array of **Foo** (p. 1632) pointers, not an array of **Foo** (p. 1632).

Parameters

<i>buffer</i>	The new buffer that the sequence will use. Must point to enough memory to hold <code>new_max</code> elements of type Foo* . It may be NULL if <code>new_max == 0</code> .
<i>new_length</i>	The desired new length for the sequence. It must be the case that that $0 \leq \text{new_length} \leq \text{new_max}$.
<i>new_max</i>	The allocated number of elements that could fit in the loaned buffer.

See also

FooSeq::unloan (p. 1691), **FooSeq::loan_contiguous** (p. 1690)

9.313.3.14 `unloan()`

```
bool FooSeq::unloan ( )
```

Return the loaned buffer in the sequence and set the maximum to 0.

This method affects only the state of this sequence; it does not change the contents of the buffer in any way.

Only the user who originally loaned a buffer should return that loan, as the user may have dependencies on that memory known only to them. Unloaning someone else's buffer may cause unspecified problems. For example, suppose a sequence is loaning memory from a custom memory pool. A user of the sequence likely has no way to release the memory back into the pool, so unloaning the sequence buffer would result in a resource leak. If the user were to then re-loan a different buffer, the original creator of the sequence would have no way to discover, when freeing the sequence, that the loan no longer referred to its own memory and would thus not free the user's memory properly, exacerbating the situation and leading to undefined behavior.

Precondition

`owned == DDS_BOOLEAN_FALSE` (p. 316)

Postcondition

`owned == DDS_BOOLEAN_TRUE` (p. 316)

`maximum == 0`

Returns

DDS_BOOLEAN_TRUE (p. 316) if the preconditions were met. Otherwise **DDS_BOOLEAN_FALSE** (p. 316). The function only fails if the pre-conditions are not met, in which case it leaves the sequence unmodified.

See also

FooSeq::loan_contiguous (p. 1690), **FooSeq::loan_discontiguous** (p. 1691), **FooSeq::maximum(DDS_↵
Long)** (p. 1689)

9.313.3.15 `get_contiguous_buffer()`

```
Foo * FooSeq::get_contiguous_buffer ( ) const
```

Return the contiguous buffer of the sequence.

Get the underlying buffer where contiguous elements of the sequence are stored. The size of the buffer matches the maximum of the sequence, but only the elements up to the **FooSeq::length()** (p. 1687) of the sequence are valid.

This method provides almost no encapsulation of the sequence's underlying implementation. Certain operations, such as **FooSeq::maximum(DDS_Long)** (p. 1689), may render the buffer invalid. In light of these caveats, this operation should be used with care.

Returns

buffer that stores contiguous elements in sequence.

9.313.3.16 get_discontiguous_buffer()

```
Foo ** FooSeq::get_discontiguous_buffer ( ) const
```

Return the discontiguous buffer of the sequence.

This operation returns the underlying buffer where discontiguous elements of the sequence are stored. The size of the buffer matches the maximum of this sequence, but only the elements up to the **FooSeq::length()** (p. 1687) of the sequence are valid.

The same caveats apply to this method as to **FooSeq::get_contiguous_buffer** (p. 1692).

The sequence will dereference pointers in the discontiguous buffer to provide access to its elements by value in C and by reference in C++. If you access the discontiguous buffer directly by means of this method, do not store any NULL values into it, as accessing those values will result in a segmentation fault.

Returns

buffer that stores discontiguous elements in sequence.

9.313.3.17 has_ownership()

```
bool FooSeq::has_ownership ( )
```

Return the value of the owned flag.

Returns

DDS_BOOLEAN_TRUE (p. 316) if sequence owns the underlying buffer, or **DDS_BOOLEAN_FALSE** (p. 316) if it has an outstanding loan.

9.314 FooTypeSupport Class Reference

<<*interface*>> (p. 236) <<*generic*>> (p. 236) User data type specific interface.

Inheritance diagram for FooTypeSupport:

Static Public Member Functions

- static **DDS_ReturnCode_t register_type** (**DDSDomainParticipant** *participant, const char *type_name)
Allows an application to communicate to RTI Connext the existence of a data type.
- static **DDS_ReturnCode_t unregister_type** (**DDSDomainParticipant** *participant, const char *type_name)
<<extension>> (p. 236) Allows an application to unregister a data type from RTI Connext. After calling unregister_type, no further communication using that type is possible.
- static **Foo * create_data** (const **DDS_TypeAllocationParams_t** &alloc_params=DDS_TYPE_ALLOCATION_PARAMS_DEFAULT)
<<extension>> (p. 236) Create a data type and initialize it.
- static **Foo * create_data_ex** (**DDS_Boolean** allocatePointers)
<<extension>> (p. 236) Create a data type and initialize it.
- static **DDS_ReturnCode_t copy_data** (**Foo** *dst_data, const **Foo** *src_data)
<<extension>> (p. 236) Copy data type.
- static **DDS_ReturnCode_t delete_data** (**Foo** *a_data, const **DDS_TypeDeallocationParams_t** &dealloc_params=DDS_TYPE_DEALLOCATION_PARAMS_DEFAULT)

<<extension>> (p. 236) Finalize data type.
- static const char * **get_type_name** ()
Get the default name for this type.
- static void **print_data** (const **Foo** *a_data)
<<extension>> (p. 236) Print value of data type to standard out.
- static **DDS_ReturnCode_t serialize_data_to_cdr_buffer** (char *buffer, unsigned int &length, const **Foo** *a_data)
<<extension>> (p. 236) Serializes the input sample into a CDR buffer of octets.
- static **DDS_ReturnCode_t serialize_data_to_cdr_buffer_ex** (char *buffer, unsigned int &length, const **Foo** *a_data, **DDS_DataRepresentationId_t** representation)
<<extension>> (p. 236) Serializes the input sample into a buffer of octets.
- static **DDS_ReturnCode_t deserialize_data_from_cdr_buffer** (**Foo** *sample, const char *buffer, unsigned int length)
<<extension>> (p. 236) Deserializes a sample from a buffer of octets.
- static **DDS_ReturnCode_t data_to_string** (**Foo** *sample, char *str, **DDS_UnsignedLong** &str_size, **DDS_PrintFormatProperty** &property)
<<extension>> (p. 236) Transforms a data sample into a human-readable string representation.
- static **DDS_TypeCode * get_typecode** ()
<<extension>> (p. 236) Retrieves the TypeCode for the Type.

9.314.1 Detailed Description

<<*interface*>> (p. 236) <<*generic*>> (p. 236) User data type specific interface.

Defines the user data type specific interface generated for each application class.

The concrete user data type automatically generated by the implementation is an incarnation of this class.

See also

DDS_TYPESUPPORT_CPP (p. 72)
the Code Generator User's Manual

9.314.2 Member Function Documentation

9.314.2.1 register_type()

```
static DDS_ReturnCode_t FooTypeSupport::register_type (
    DDSDomainParticipant * participant,
    const char * type_name ) [static]
```

Allows an application to communicate to RTI Connext the existence of a data type.

The *generated* implementation of the operation embeds all the knowledge that has to be communicated to the middle-ware in order to make it able to manage the contents of data of that type. This includes in particular the key definition that will allow RTI Connext to distinguish different instances of the same type.

The same **DDSTypeSupport** (p. 1613) can be registered multiple times with a **DDSDomainParticipant** (p. 1335) using the same or different values for the `type_name`. If `register_type` is called multiple times on the same **DDSTypeSupport** (p. 1613) with the same **DDSDomainParticipant** (p. 1335) and `type_name`, the second (and subsequent) registrations are ignored but the operation returns **DDS_RETCODE_OK** (p. 335).

Precondition

Cannot use the same `type_name` to register two different **DDSTypeSupport** (p.1613) with the same **DDSDomainParticipant** (p.1335), or else the operation will fail and **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335) will be returned.

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237) the DDSDomainParticipant (p. 1335) to register the data type Foo (p. 1632) with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 237) the type name under with the data type Foo (p. 1632) is registered with the participant; this type name is used when creating a new DDSTopic (p. 1601). (See DDSDomainParticipant::create_topic (p. 1366).) The name may not be NULL or longer than 255 characters.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336).
-----	---

MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

See also

DDSDomainParticipant::create_topic (p. 1366)

9.314.2.2 unregister_type()

```
static DDS_ReturnCode_t FooTypeSupport::unregister_type (
    DDSDomainParticipant * participant,
    const char * type_name ) [static]
```

<<**extension**>> (p. 236) Allows an application to unregister a data type from RTI Connext. After calling unregister_type, no further communication using that type is possible.

The *generated* implementation of the operation removes all the information about a type from RTI Connext. No further communication using that type is possible.

Precondition

A type with `type_name` is registered with the participant and all **DDSTopic** (p. 1601) objects referencing the type have been destroyed. If any **DDSTopic** (p. 1601) is associated with the type, the operation will fail with **DDS_RETCODE_ERROR** (p. 335).

Postcondition

All information about the type is removed from RTI Connext. No further communication using this type is possible.

Parameters

<i>participant</i>	<< in >> (p. 237) the DDSDomainParticipant (p. 1335) to unregister the data type Foo (p. 1632) from. Cannot be NULL.
<i>type_name</i>	<< in >> (p. 237) the type name under with the data type Foo (p. 1632) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_BAD_PARAMETER (p. 335) or DDS_RETCODE_ERROR (p. 335)
------------	--

MT Safety:

SAFE.

FooTypeSupport::register_type (p. 1695)

9.314.2.3 create_data()

```
static Foo * FooTypeSupport::create_data (
    const DDS_TypeAllocationParams_t & alloc_params = DDS_TYPE_ALLOCATION_PARAMS_DEFAULT
) [static]
```

<<**extension**>> (p. 236) Create a data type and initialize it.

The *generated* implementation of the operation knows how to instantiate a data type and initialize it properly.

By default all memory for the type is deeply allocated, except for optional members.

Parameters

<i>alloc_params</i>	<< in >> (p. 237) Whether or not to recursively allocate pointers and/or optional members
---------------------	--

Returns

Newly created data type, or NULL on failure.

See also

FooTypeSupport::delete_data_ex (p. 1699)

9.314.2.4 create_data_ex()

```
static Foo * FooTypeSupport::create_data_ex (
    DDS_Boolean allocatePointers ) [static]
```

<<**extension**>> (p. 236) Create a data type and initialize it.

The *generated* implementation of the operation knows how to instantiate a data type and initialize it properly.

When `allocatePointers` is **DDS_BOOLEAN_TRUE** (p. 316), all the references (pointers) in the type are recursively allocated.

Parameters

<code>allocatePointers</code>	<< in >> (p. 237) Whether or not to recursively allocate pointers.
-------------------------------	---

Returns

Newly created data type, or NULL on failure.

See also

FooTypeSupport::delete_data_ex (p. 1699)

9.314.2.5 copy_data()

```
static DDS_ReturnCode_t FooTypeSupport::copy_data (
    Foo * dst_data,
    const Foo * src_data ) [static]
```

<<**extension**>> (p. 236) Copy data type.

The *generated* implementation of the operation knows how to copy value of a data type.

Parameters

<code>dst_data</code>	<< inout >> (p. 237) Data type to copy value to. Cannot be NULL.
<code>src_data</code>	<< in >> (p. 237) Data type to copy value from. Cannot be NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.314.2.6 delete_data()

```
static DDS_ReturnCode_t FooTypeSupport::delete_data (
    Foo * a_data,
```

```

        const DDS_TypeDeallocationParams_t & dealloc_params = DDS_TYPE_DEALLOCATION_PARAMS←
_DEFAULT ) [static]

```

<<**extension**>> (p. 236) Destroy a user data type instance.

The *generated* implementation of the operation knows how to destroy a data type and return all resources.

Parameters

<i>a_data</i>	<< in >> (p. 237) Cannot be NULL.
<i>dealloc_params</i>	<< in >> (p. 237) Whether or not to destroy pointers and/or optional members. By default they are deleted.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

FooTypeSupport::create_data (p. 1697)

9.314.2.7 delete_data_ex()

```

static DDS_ReturnCode_t FooTypeSupport::delete_data_ex (
    Foo * a_data,
    DDS_Boolean deletePointers ) [static]

```

<<**extension**>> (p. 236) Destroy a user data type instance.

The *generated* implementation of the operation knows how to destroy a data type and return all resources.

When `deletePointers` is **DDS_BOOLEAN_TRUE** (p. 316), all the references (pointers) are destroyed as well.

Parameters

<i>a_data</i>	<< in >> (p. 237) Cannot be NULL.
<i>deletePointers</i>	<< in >> (p. 237) Whether or not to destroy pointers.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

FooTypeSupport::create_data_ex (p. 1697)

9.314.2.8 initialize_data()

```
static DDS_ReturnCode_t FooTypeSupport::initialize_data (
    Foo * a_data,
    const DDS_TypeAllocationParams_t & alloc_params = DDS_TYPE_ALLOCATION_PARAMS_DEFAULT
) [static]
```

<<**extension**>> (p. 236) Initialize data type.

The *generated* implementation of the operation knows how to initialize a data type. This method is typically called to initialize a data type that is allocated on the stack. Calling this method more than once will cause a memory leak.

The `alloc_params` determine whether or not all of the references (pointers) and optional members in the type are recursively allocated.

Parameters

<i>a_data</i>	<< inout >> (p. 237) Cannot be NULL.
<i>alloc_params</i>	<< in >> (p. 237) Parameters that determine whether or not to recursively allocate pointers and optional members.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

FooTypeSupport::register_type (p. 1695)

DDSDomainParticipant::create_topic (p. 1366)

9.314.2.13 print_data()

```
static void FooTypeSupport::print_data (
    const Foo * a_data ) [static]
```

<<**extension**>> (p. 236) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

<i>a_data</i>	<< in >> (p. 237) Data type to be printed.
---------------	---

9.314.2.14 serialize_data_to_cdr_buffer()

```
static DDS_ReturnCode_t FooTypeSupport::serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int & length,
    const Foo * a_data ) [static]
```

<<**extension**>> (p. 236) Serializes the input sample into a CDR buffer of octets.

This method serializes a sample into a buffer of octets and it uses CDR as the data representation. Calling this method is equivalent to calling **FooTypeSupport::serialize_data_to_cdr_buffer_ex** (p. 1704) with **DDS_AUTO_↵ DATA_REPRESENTATION** (p. 370) as the representation.

The input buffer must be big enough to store the serialized representation of the sample. Otherwise, the method will return an error.

To determine the minimum size of the input buffer, the user must call this method with the buffer set to NULL.

Parameters

<i>a_data</i>	<< in >> (p. 237). Input sample. Cannot be NULL.
<i>buffer</i>	<< out >> (p. 237). Serialization buffer.
<i>length</i>	<< inout >> (p. 237). When <i>buffer</i> is set to NULL, after the method executes, <i>length</i> will contain a buffer size big enough to hold the serialized data. When <i>buffer</i> is not NULL, <i>length</i> must contain the size of the input buffer when the method is invoked. After the method executes, <i>length</i> will be updated to contain the actual size of the serialized content, which may be smaller than the size obtained when <i>buffer</i> is set to NULL.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

9.314.2.15 serialize_data_to_cdr_buffer_ex()

```
static DDS_ReturnCode_t FooTypeSupport::serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int & length,
    const Foo * a_data,
    DDS_DataRepresentationId_t representation ) [static]
```

<<**extension**>> (p. 236) Serializes the input sample into a buffer of octets.

This method serializes a sample into a buffer of octets using the input data representation. See **FooTypeSupport**↵
::**serialize_data_to_cdr_buffer** (p. 1703) for details.

Parameters

<i>a_data</i>	<< in >> (p. 237). Input sample. Cannot be NULL.
<i>buffer</i>	<< out >> (p. 237). Serialization buffer.
<i>length</i>	<< inout >> (p. 237). Serialization buffer length.
<i>representation</i>	<< in >> (p. 237). Representation used to serialize the data.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.314.2.16 deserialize_data_from_cdr_buffer()

```
static DDS_ReturnCode_t FooTypeSupport::deserialize_data_from_cdr_buffer (
    Foo * sample,
    const char * buffer,
    unsigned int length ) [static]
```

<<**extension**>> (p. 236) Deserializes a sample from a buffer of octets.

This method deserializes a sample from a CDR buffer of octets.

The content of the buffer generated by the method **FooTypeSupport::serialize_data_to_cdr_buffer** (p. 1703) can be provided to this method to get the sample back.

Parameters

<i>sample</i>	<< in >> (p. 237). Output sample. Cannot be NULL.
<i>buffer</i>	<< in >> (p. 237). Deserialization buffer. Cannot be NULL.
<i>length</i>	<< in >> (p. 237). Length of the serialized representation of the sample in the buffer.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.314.2.17 data_to_string()

```
static DDS_ReturnCode_t FooTypeSupport::data_to_string (
    Foo * sample,
    char * str,
    DDS_UnsignedLong & str_size,
    DDS_PrintFormatProperty & property ) [static]
```

<<**extension**>> (p. 236) Transforms a data sample into a human-readable string representation.

This method takes a data sample and creates a string representation of the data.

The input character buffer must be big enough to store the string representation of the sample. Otherwise, the method will return an error.

To determine the minimum size of the input character buffer, the user must call this method with the buffer set to NULL.

If the size of the output string is longer than the size of an unsigned 32-bit integer, this operation will fail with **DDS_↵ RETCODE_OUT_OF_RESOURCES** (p. 336).

This method is only provided for types that were generated with typecodes.

Parameters

<i>sample</i>	<< in >> (p. 237). The sample to get the string representation for. Cannot be NULL.
<i>str</i>	<< out >> (p. 237). Output string representing the data sample.
<i>str_size</i>	<< inout >> (p. 237). When <i>str</i> is set to NULL, after the method executes, <i>str_size</i> will contain a buffer size big enough to hold the string representation of the data. When <i>str</i> is not NULL, <i>str_size</i> must contain the size of the input buffer when the method is invoked. If the size of the input buffer is too small, after the method executes, <i>str_size</i> will be updated to contain the required size of the string content and the method will return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).
<i>property</i>	<< in >> (p. 237). Properties describing what the format of the output string should be.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
-----	--

9.314.2.18 get_typecode()

```
static DDS_TypeCode * FooTypeSupport::get_typecode ( ) [static]
```

<<*extension*>> (p. 236) Retrieves the TypeCode for the Type.

This method retrieves the **DDS_TypeCode** (p. 1149) for the Type. A **DDS_TypeCode** (p. 1149) is a mechanism for representing a type at runtime. RTI Connext can use type codes to send type definitions on the network. A **DDS_TypeCode** (p. 1149) value consists of a type code *kind* (represented by the **DDS_TCKind** (p. 86) enumeration) and a list of *members* (that is, fields). These members are recursive: each one has its own **DDS_TypeCode** (p. 1149), and in the case of complex types (structures, arrays, and so on), these contained type codes contain their own members.

Returns

The TypeCode for this type

9.315 connext::IllegalOperationException Class Reference

Provides access to a collection of middleware-loaned samples.

Classes

- struct **LoanMemento**

*A simple value-type for the internal representation of the a **LoanedSamples** (p. 1709) object.*

Public Types

- typedef **SampleIterator**< T, false > **iterator**
The iterator type.
- typedef **SampleIterator**< T, true > **const_iterator**
The const iterator type.

Public Member Functions

- **LoanedSamples** ()
*Creates an empty **LoanedSamples** (p. 1709) object.*
- void **release** (TDataReader *&reader_ptr, TSeq &data_seq, **SampleInfoSeq** &info_seq)
*Transfers the ownership of the underlying data and the **DDS_SampleInfo** (p. 1068) sequences.*
- **LoanedSamples** (**LoanMemento** loan_memento) throw ()
*Reconstruct a new **LoanedSamples** (p. 1709) object from an internal representation of another.*
- **~LoanedSamples** () throw ()
Automatically returns the loan to the middleware.
- **value_type operator[]** (size_t index)
*Provides access to the underlying **SampleRef** (p. 1897) object in array-like syntax.*
- **const_value_type operator[]** (size_t index) const
*Provides access to the underlying **SampleRef** (p. 1897) object in array-like syntax.*
- int **length** () const
Returns the number of samples.
- void **return_loan** ()
Returns the loaned samples to the middleware.
- **operator LoanMemento** () throw ()
Release the ownership of the underlying loaned data and SampleInfo and returns an internal representation object.
- **iterator begin** ()
Provides an iterator to the first element in the container.
- **iterator end** ()
Provides an iterator to the past-the-end element in the container.
- **const_iterator begin** () const
Provides an iterator to the first element in the container.
- **const_iterator end** () const
Provides an iterator to the past-the-end element in the container.

Static Public Member Functions

- static **LoanedSamples move_construct_from_loans** (TDataReader *reader, TSeq &data_seq, **SampleInfoSeq** &info_seq)
*Create a new **LoanedSamples** (p. 1709) object by moving the ownership of the data sequence and the **DDS_SampleInfo** (p. 1068) sequences.*

9.321.1 Detailed Description

```
template<typename T>
class connex::LoanedSamples< T >
```

Provides access to a collection of middleware-loaned samples.

The samples in this container are loaned from the middleware and must be returned at some point.

The loan is automatically returned in the destructor. Alternatively **return_loan** (p. 1716) can be used.

This is a move-only type. That is, The copy-construction and copy-assignment operations are explicitly disabled. In spite of that the objects of **LoanedSamples** (p. 1709) type can be passed to a function and returned from a function by-value very efficiently. The **connext::details::move()** (p. 189) should be used while passing **LoanedSamples** (p. 1709) by value in and out of a function. Moreover, as assignments are disabled, **connext::details::move()** (p. 189) must be used to transfer the ownership of the loaned samples from one object to another. **connext::details::move()** (p. 189) ensures that there exists exactly one owner of the loan.

Due to its move-only nature, instances of **LoanedSamples** (p. 1709) can't be stored in C++ standard library containers. There are two possible ways to achieve this. Both are not exception safe.

First, use dynamically allocated **LoanedSamples<T>** objects and the STL containers would store the pointers to the **LoanedSamples<T>** objects. The **LoanedSamples** (p. 1709) objects returned by the middleware can be moved in to the dynamically allocated **LoanedSamples<T>** objects using **connext::details::move()** (p. 189) . Using smart pointers for automatic memory management is highly recommended if this approach is chosen.

Second alternative is to use the **LoanMemento** (p. 1718) conversion operator. An STL container of **LoanedSamples<T>::LoanMemento** objects can be created from a **LoanedSamples<T>** object. **LoanedSamples<T>** object releases its ownership of the resources in this conversion. Therefore, when the **LoanMemento** (p. 1718) object is no longer required, the underlying resources must be returned by first creating a **LoanedSamples** (p. 1709) object from the **LoanMemento** (p. 1718). This technique does not require a dynamic allocation like the first alternative. However, this technique should be used very carefully because in case of exceptions, **LoanMemento** (p. 1718) object will not free the resources like the **LoanedSamples** (p. 1709) object does.

This container provides STL-compliant random-access iterators (**begin** (p. 1717) and **end** (p. 1717)).

The contained elements are of type **connext::SampleRef** (p. 1897) Therefore, dereferencing a **LoanedSamples** (p. 1709) iterator returns a **connext::SampleRef** (p. 1897) object, which in turn refers to the data and **DDS_SampleInfo** (p. 1068).

The contents of this container should not be modified and references to the samples it contains are only valid before the loan is returned.

Template Parameters

<i>T</i>	The data type of the contained Samples
----------	--

9.321.2 Member Typedef Documentation

9.321.2.1 iterator

```
template<typename T >
typedef SampleIterator<T, false> connext::LoanedSamples< T >::iterator
```

The iterator type.

9.321.2.2 const_iterator

```
template<typename T >
typedef SampleIterator<T, true> connext::LoanedSamples< T >::const_iterator
```

The const iterator type.

9.321.3 Constructor & Destructor Documentation

9.321.3.1 **LoanedSamples**() [1/2]

```
template<typename T >
connext::LoanedSamples< T >::LoanedSamples ( ) [inline]
```

Creates an empty **LoanedSamples** (p. 1709) object.

Referenced by **connext::LoanedSamples**< T >::move_construct_from_loans().

9.321.3.2 **LoanedSamples**() [2/2]

```
template<typename T >
connext::LoanedSamples< T >::LoanedSamples (
    LoanMemento loan_memento ) throw ( ) [inline]
```

Reconstruct a new **LoanedSamples** (p. 1709) object from an internal representation of another.

This constructor will regain the ownership of the underlying data and **::DDS_SampleInfo** sequences.

Parameters

<i>loan_memento</i>	The internal representation of another LoanedSamples (p. 1709) object.
---------------------	---

See also

connext::LoanedSamples (p. 1709)

9.321.3.3 ~LoanedSamples()

```
template<typename T >
connext::LoanedSamples< T >::~~ LoanedSamples ( ) throw ( ) [inline]
```

Automatically returns the loan to the middleware.

return_loan (p. 1716)

References **connext::LoanedSamples**< T >::return_loan().

9.321.4 Member Function Documentation

9.321.4.1 move_construct_from_loans()

```
template<typename T >
static LoanedSamples connext::LoanedSamples< T >::move_construct_from_loans (
    TDataReader * reader,
    TSeq & data_seq,
    SampleInfoSeq & info_seq ) [inline], [static]
```

Create a new **LoanedSamples** (p. 1709) object by moving the ownership of the data sequence and the **DDS_SampleInfo** (p. 1068) sequences.

Precondition

The *data_seq* and *info_seq* parameters must contained loaned sample from the same DataReader.

Parameters

<i>reader</i>	The DataReader from which the loan was taken.
<i>data_seq</i>	The FooSeq (p. 1680) object containing the loaned samples. After the call this sequence will be empty.
<i>info_seq</i>	The DDS_SampleInfoSeq (p. 1078) object containing the loaned SampleInfo. After this call the sequence will be empty.

Postcondition

The new **LoanedSamples** (p. 1709) object will manage the ownership of the loans.

Returns

void

See also

connext::LoanedSamples (p. 1709)

References **DDS_RETCODE_BAD_PARAMETER**, and **connext::LoanedSamples< T >::LoanedSamples()**.

9.321.4.2 release()

```
template<typename T >
void connext::LoanedSamples< T >::release (
    TDataReader *& reader_ptr,
    TSeq & data_seq,
    SampleInfoSeq & info_seq ) [inline]
```

Transfers the ownership of the underlying data and the **DDS_SampleInfo** (p. 1068) sequences.

Precondition

The *data_seq* and *info_seq* parameters must be default initialized prior to this call.

Parameters

<i>reader_ptr</i>	The DataReader from which the loan was taken. After the call the pointer will be updated.
<i>data_seq</i>	The FooSeq (p. 1680) object that will contain the loan previously held by the LoanedSamples (p. 1709) object. After the call this sequence will loan the underlying data.
<i>info_seq</i>	The DDS_SampleInfoSeq (p. 1078) object that will contain the SampleInfo loan previously held by the LoanedSamples (p. 1709) object. After this call this sequence will loan the underlying DDS_SampleInfoSeq (p. 1078).

Postcondition

The `data_seq` and `info_seq` objects will contain the loan previously held by the **LoanedSamples** (p. 1709). The **LoanedSamples** (p. 1709) object will release its ownership.

See also

connext::LoanedSamples (p. 1709)

References **DDS_RETCODE_PRECONDITION_NOT_MET**.

9.321.4.3 operator[]() [1/2]

```
template<typename T >
value_type connext::LoanedSamples< T >::operator[] (
    size_t index ) [inline]
```

Provides access to the underlying **SampleRef** (p. 1897) object in array-like syntax.

Parameters

<i>index</i>	The index of the Sample (p. 1889). Allowed values are from 0 to length() (p. 1716)-1.
--------------	---

Returns

A **connext::SampleRef** (p. 1897) object that refers to data and **DDS_SampleInfo** (p. 1068) at the specified `index`.

See also

connext::LoanedSamples (p. 1709)

9.321.4.4 operator[]() [2/2]

```
template<typename T >
const_value_type connext::LoanedSamples< T >::operator[] (
    size_t index ) const [inline]
```

Provides access to the underlying **SampleRef** (p. 1897) object in array-like syntax.

Parameters

<i>index</i>	The index of the Sample (p. 1889). Allowed values are from 0 to length() (p. 1716)-1.
--------------	---

Returns

A **connext::SampleRef** (p. 1897) object that refers to a constant data and constant **DDS_SampleInfo** (p. 1068) at the specified *index*.

See also

connext::LoanedSamples (p. 1709)

9.321.4.5 **length()**

```
template<typename T >
int  connext::LoanedSamples< T >::length ( ) const  [inline]
```

Returns the number of samples.

9.321.4.6 **return_loan()**

```
template<typename T >
void  connext::LoanedSamples< T >::return_loan ( )  [inline]
```

Returns the loaned samples to the middleware.

After calling this operation this object cannot be accessed again.

Calling this operation is optional, since the destructor will automatically do it.

See also

FooDataReader::return_loan (p. 1655) (for more information on how the middleware loans samples)

Referenced by **connext::LoanedSamples**< T >::~~**LoanedSamples**()

9.321.4.7 operator LoanMemento()

```
template<typename T >
connext::LoanedSamples< T >::operator LoanMemento ( ) throw ( ) [inline]
```

Release the ownership of the underlying loaned data and SampleInfo and returns an internal representation object.

LoanMemento (p. 1718) object has trivial copy semantics. Therefore, it does not manage resources automatically like **LoanedSamples** (p. 1709) does. This conversion function should be used very carefully. This conversion can be used to store **LoanedSamples** (p. 1709) in a standard library containers. However, note that resource management must be handled manually.

See also

connext::LoanedSamples (p. 1709)

9.321.4.8 begin() [1/2]

```
template<typename T >
iterator connext::LoanedSamples< T >::begin ( ) [inline]
```

Provides an iterator to the first element in the container.

Returns

A STL-compliant random-access iterator to the first element in this container

See also

connext::SampleIterator (p. 1897)

end (p. 1717)

9.321.4.9 end() [1/2]

```
template<typename T >
iterator connext::LoanedSamples< T >::end ( ) [inline]
```

Provides an iterator to the past-the-end element in the container.

Returns

A STL-compliant random-access iterator indicating the end of the container.

See also

connext::SampleIterator (p. 1897)

begin (p. 1717)

9.321.4.10 begin() [2/2]

```
template<typename T >
constexpr connext::LoanedSamples< T >::begin ( ) const [inline]
```

Provides an iterator to the first element in the container.

Returns

A STL-compliant random-access iterator to the first element in this container

See also

connext::SampleIterator (p. 1897)

end (p. 1717)

9.321.4.11 end() [2/2]

```
template<typename T >
constexpr connext::LoanedSamples< T >::end ( ) const [inline]
```

Provides an iterator to the past-the-end element in the container.

Returns

A STL-compliant random-access iterator indicating the end of the container.

See also

connext::SampleIterator (p. 1897)

begin (p. 1717)

9.322 connext::LoanedSamples< T >::LoanMemento Struct Reference

A simple value-type for the internal representation of the a **LoanedSamples** (p. 1709) object.

9.322.1 Detailed Description

```
template<typename T>
struct connext::LoanedSamples< T >::LoanMemento
```

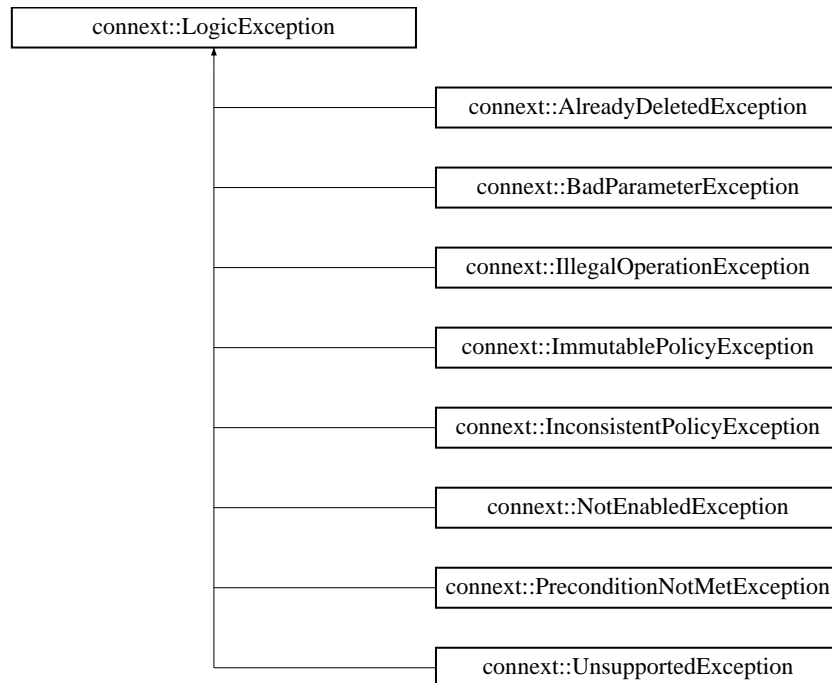

A simple value-type for the internal representation of the a **LoanedSamples** (p. 1709) object.

Objects of this type can be used to store **LoanedSamples** (p. 1709) in an STL container. Care be taken in case of exceptions because **LoanMemento** (p. 1718) does not offer support for exception-safe programming.

9.323 connext::LogicException Class Reference

Base class of all RTI Connex exceptions caused by a logic error.

Inheritance diagram for connext::LogicException:

9.323.1 Detailed Description

Base class of all RTI Connex exceptions caused by a logic error.

Its base class is `std::logic_error`, from which it inherits the `what()` method.

9.324 connext::MessagingLibraryVersion Class Reference

The Connex Messaging Library version.

Public Member Functions

```

Get the build version as a string.

9.326 rti::flat::MutableArrayBuilder< ElementBuilder, N > Class Template Reference

Builds an array member of variable-size elements.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::MutableArrayBuilder< ElementBuilder, N >:

Public Types

- typedef **MutableArrayOffset**< typename ElementBuilder::Offset, N > **Offset**
The related Offset type.

Public Member Functions

- ElementBuilder **build_next** ()
Begins building the next element.
- **Offset finish** ()
Finishes building the array.

Additional Inherited Members

9.326.1 Detailed Description

```
template<typename ElementBuilder, unsigned int N>
class rti::flat::MutableArrayBuilder< ElementBuilder, N >
```

Builds an array member of variable-size elements.

Template Parameters

<i>ElementBuilder</i>	The Builder type for the elements of the array
<i>N</i>	The array bound; the exact number of elements this array builder must build. For multidimensional arrays, N is the product of each dimension bound.

Each element of this array needs to be built using the ElementBuilder returned by **build_next()** (p. 1723). N elements exactly must be built. Unlike a sequence Builder, it is not possible to finish an array with less than N elements.

This example shows how to use a **MutableArrayBuilder** (p. 1722) to build an array member of **MyFlatMutableBuilder** (p. 1732):

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto array_builder = builder.build_my_mutable_array();
for (int i = 0; i < 10; i++) {
    FlatMutableBarBuilder element_builder = array_builder.build_next();
    // ... build element
    element_builder.finish();
}
array_builder.finish();
```

Note that Builder types are not necessary for arrays of fixed-size elements, since they are added at once (see **MyFlatMutableBuilder::add_my_final_array()** (p. 1737)).

9.326.2 Member Typedef Documentation

9.326.2.1 Offset

```
template<typename ElementBuilder , unsigned int N>
typedef MutableArrayOffset<typename ElementBuilder::Offset, N> rti::flat::MutableArrayBuilder<
ElementBuilder, N >::Offset
```

The related Offset type.

9.326.3 Member Function Documentation

9.326.3.1 build_next()

```
template<typename ElementBuilder , unsigned int N>
ElementBuilder rti::flat::MutableArrayBuilder< ElementBuilder, N >::build_next ( ) [inline]
```

Begins building the next element.

Before calling **build_next()** (p. 1723) to create a new element, the element Builder returned by a previous call to **build_next** must have been finished.

References **rti::flat::AbstractListBuilder::element_count()**.

9.326.3.2 finish()

```
template<typename ElementBuilder , unsigned int N>
Offset rti::flat::MutableArrayBuilder< ElementBuilder, N >::finish ( ) [inline]
```

Finishes building the array.

Precondition

build_next() (p. 1723) must have been succesfully called *N* times exactly.

Returns

The Offset to the member that has been built.

See also

discard() (p. 574)

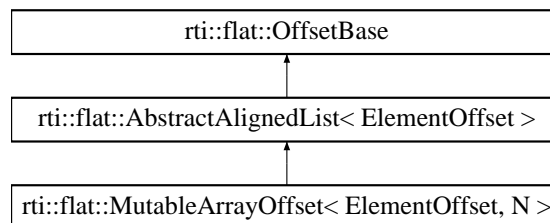

References **rti::flat::AbstractListBuilder::element_count()**.

9.327 rti::flat::MutableArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of variable-size elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for **rti::flat::MutableArrayOffset< ElementOffset, N >**:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)
Gets the Offset to an element.

Additional Inherited Members

9.327.1 Detailed Description

```
template<typename ElementOffset, unsigned int N>
class rti::flat::MutableArrayOffset< ElementOffset, N >
```

Offset to an array of variable-size elements.

Template Parameters

<i>ElementOffset</i>	An Offset for a type of variable size, such as a mutable struct (MyFlatMutableOffset (p. 1739)), union, or StringOffset (p. 1922).
<i>N</i>	The array bound. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

See also

FinalArrayOffset (p. 1627) encapsulates arrays of fixed-size elements

9.327.2 Member Function Documentation

9.327.2.1 get_element()

```
template<typename ElementOffset , unsigned int N>
ElementOffset  rti::flat::MutableArrayOffset< ElementOffset, N >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

The Offset to the element in the i-th position

9.328 rti::flat::MutableOffset Class Reference

The base class of all Offsets to a final struct type.

```
#include <Offset.hpp>
```

Inheritance diagram for rti::flat::MutableOffset:

Additional Inherited Members

9.328.1 Detailed Description

The base class of all Offsets to a final struct type.

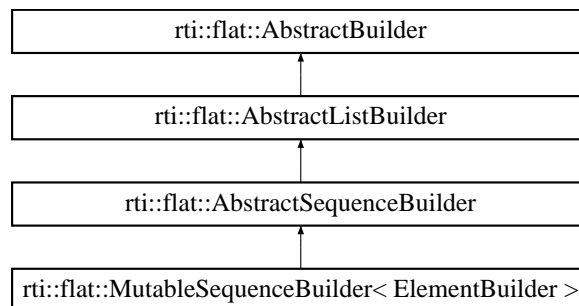

This class contains only implementation details; all the public accessors are defined in the generated type (**MyFlat**↔**MutableOffset** (p. 1739)).

9.329 rti::flat::MutableSequenceBuilder< ElementBuilder > Class Template Reference

Builds a sequence member of variable-size elements.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::MutableSequenceBuilder< ElementBuilder >:

Public Types

- typedef **SequenceOffset**< typename ElementBuilder::Offset > **Offset**
The related Offset type.

Public Member Functions

- ElementBuilder **build_next** ()
Begins building the next element.
- **Offset** **finish** ()
Finishes building the sequence.

Additional Inherited Members

9.329.1 Detailed Description

```
template<typename ElementBuilder>
class rti::flat::MutableSequenceBuilder< ElementBuilder >
```

Builds a sequence member of variable-size elements.

Template Parameters

<i>ElementBuilder</i>	The Builder type for the elements of the sequence
-----------------------	---

To build the elements use the ElementBuilder returned by **build_next()** (p. 1727). An empty sequence can be built by calling **finish()** (p. 1727) without any call to **build_next()** (p. 1727).

This class doesn't enforce the sequence bound set in IDL.

The following example uses a **MutableSequenceBuilder** (p. 1726) to initialize a sequence member of **MyFlatMutableBuilder** (p. 1732) with two elements:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto seq_builder = builder.build_my_mutable_seq();
auto element_builder = seq_builder.build_next();
// ... build the first element
element_builder.finish();
element_builder = seq_builder.build_next();
// ... build the second element
element_builder.finish();

seq_builder.finish();
```

9.329.2 Member Typedef Documentation

9.329.2.1 Offset

```
template<typename ElementBuilder >
typedef SequenceOffset<typename ElementBuilder::Offset> rti::flat::MutableSequenceBuilder<
ElementBuilder >::Offset
```

The related Offset type.

9.329.3 Member Function Documentation

9.329.3.1 build_next()

```
template<typename ElementBuilder >
ElementBuilder rti::flat::MutableSequenceBuilder< ElementBuilder >::build_next ( ) [inline]
```

Begins building the next element.

Before calling **build_next()** (p. 1727) to create a new element, the application must have called **finish()** (p. 1727) on the previous element Builder.

9.329.3.2 finish()

```
template<typename ElementBuilder >
Offset rti::flat::MutableSequenceBuilder< ElementBuilder >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

See also

discard() (p. 574)

9.330 MyFlatFinalOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData final IDL struct.

```
#include <Offset.hpp>
```

Inheritance diagram for MyFlatFinalOffset:

Public Types

- typedef MyFlatFinalConstOffset **ConstOffset**

The equivalent read-only Offset type.

Public Member Functions

- **MyFlatFinalOffset ()**
Creates a null Offset.
- **int32_t my_primitive () const**
Retrieves the value for a primitive member.
- **FlatFinalBar::ConstOffset my_complex () const**
Retrieves a const Offset to a complex member.
- **const rti::flat::PrimitiveArrayOffset< int32_t, 10 > my_primitive_array () const**
Retrieves a const Offset to a primitive array.
- **rti::flat::FinalArrayOffset< FlatFinalBar::ConstOffset, 10 > my_complex_array () const**
Retrieves a const Offset to a complex array.
- **bool my_primitive (int32_t value)**
Sets the value for a primitive member.
- **FlatFinalBar::Offset my_complex ()**
Retrieves a non-const Offset to a complex member.
- **rti::flat::PrimitiveArrayOffset< int32_t, 10 > my_primitive_array ()**
Retrieves a non-const Offset to a primitive array.
- **rti::flat::FinalArrayOffset< FlatFinalBar::Offset, 10 > my_complex_array ()**
Retrieves a non-const Offset to a complex array.

9.330.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData final IDL struct.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatFinal** (p. 556).

It provides accessors for each of its members. Accessors can return other Offsets or primitive values.

An Offset to a final type may meet the requirements to be cast to its equivalent plain C++ type (see **rti::flat::plain_cast()** (p. 560)).

9.330.2 Member Typedef Documentation

9.330.2.1 ConstOffset

```
typedef MyFlatFinalConstOffset MyFlatFinalOffset::ConstOffset
```

The equivalent read-only Offset type.

Each Offset for a user type has an equivalent const Offset that doesn't provide the methods to modify the Sample.

9.330.3 Constructor & Destructor Documentation

9.330.3.1 MyFlatFinalOffset()

```
MyFlatFinalOffset::MyFlatFinalOffset ( ) [inline]
```

Creates a null Offset.

Postcondition

`is_null()` (p. 1834)

9.330.4 Member Function Documentation

9.330.4.1 my_primitive() [1/2]

```
int32_t MyFlatFinalOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

9.330.4.2 my_complex() [1/2]

```
FlatFinalBar::ConstOffset MyFlatFinalOffset::my_complex ( ) const
```

Retrieves a const Offset to a complex member.

FlatFinalBar is another arbitrary user-defined final FlatData type.

9.330.4.3 my_primitive_array() [1/2]

```
const rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatFinalOffset::my_primitive_array ( )  
const
```

Retrieves a const Offset to a primitive array.

9.330.4.4 my_complex_array() [1/2]

```
rti::flat::FinalArrayOffset< FlatFinalBar::ConstOffset, 10 > MyFlatFinalOffset::my_complex_array  
( ) const
```

Retrieves a const Offset to a complex array.

9.330.4.5 my_primitive() [2/2]

```
bool MyFlatFinalOffset::my_primitive (   
    int32_t value )
```

Sets the value for a primitive member.

9.330.4.6 my_complex() [2/2]

```
FlatFinalBar::Offset MyFlatFinalOffset::my_complex ( )
```

Retrieves a non-const Offset to a complex member.

FlatFinalBar is another arbitrary user-defined final FlatData type.

9.330.4.7 my_primitive_array() [2/2]

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatFinalOffset::my_primitive_array ( )
```

Retrieves a non-const Offset to a primitive array.

9.330.4.8 my_complex_array() [2/2]

```
rti::flat::FinalArrayOffset< FlatFinalBar::Offset, 10 > MyFlatFinalOffset::my_complex_array ( )
```

Retrieves a non-const Offset to a complex array.

9.331 MyFlatMutableBuilder Class Reference

Represents the Builder for an arbitrary user-defined mutable type.

```
#include <Builder.hpp>
```

Inheritance diagram for MyFlatMutableBuilder:

Public Types

- typedef **MyFlatMutableOffset** **Offset**
The related offset type.

Public Member Functions

- **MyFlatMutableBuilder** ()
Creates an invalid Builder.
- **MyFlatMutableBuilder** (unsigned char *buffer, int32_t size, bool initialize_members=false)
Construct a Builder with an arbitrary buffer.
- **Offset finish** ()
Finishes building a member.
- **MyFlatMutable * finish_sample** ()
Finishes building a sample.
- bool **add_my_primitive** (int32_t value)
Adds a primitive member.
- bool **add_my_optional_primitive** (int32_t value)
Adds a primitive member.
- **rti::flat::PrimitiveArrayOffset**< int32_t, 10 > **add_my_primitive_array** ()
Adds a primitive array member.
- **rti::flat::PrimitiveSequenceBuilder**< int32_t > **build_my_primitive_seq** ()
Begins building a primitive-sequence member.
- **MyFlatFinalOffset add_my_final** ()
Adds a final complex member.
- **rti::flat::FinalAlignedArrayOffset**< **MyFlatFinalOffset**, 10 > **add_my_final_array** ()
Adds an array member of final complex elements.
- **rti::flat::FinalSequenceBuilder**< **MyFlatFinalOffset** > **build_my_final_seq** ()
Begins building a sequence member of final complex elements.
- FlatMutableBarBuilder **build_my_mutable** ()

Begins building a mutable complex member.

- **rti::flat::MutableArrayBuilder**< FlatMutableBarBuilder, 10 > **build_my_mutable_array** ()

Begins building an array member of mutable complex elements.

- **rti::flat::MutableSequenceBuilder**< FlatMutableBarBuilder > **build_my_mutable_seq** ()

Begins building a sequence member of mutable complex elements.

- **rti::flat::StringBuilder** **build_my_string** ()

Begins building a string member.

- **rti::flat::MutableSequenceBuilder**< **rti::flat::StringBuilder** > **build_my_string_seq** ()

Begins building a sequence member of string elements.

Additional Inherited Members

9.331.1 Detailed Description

Represents the Builder for an arbitrary user-defined mutable type.

This example type represents the **Builder** (p. 552) type that **rtiddsgen** would generate for **MyFlatMutable** (p. 556) and allows creating a sample or a member of that type.

The most common way to create a Builder is **rti::flat::build_data()** (p. 554), which obtains a managed sample from a **FooDataWriter** (p. 1659) as described in **Publishing FlatData** (p. 564). It is also possible to create a Builder with an arbitrary buffer using the constructor that receives the buffer and its size.

When a Builder is created, the type is empty—it doesn't contain any members. The Builder provides functions to create each member. There are two kind of functions: **add** functions and **build** functions.

9.331.1.1 Adding fixed-size members

Fixed-size members are "added", and the corresponding function is called **add_<member_name>**. "Add" functions directly place the member in the buffer, and return an **Offset** (p. 558) that allows setting its values.

By default, after calling **add_<member_name>** the member values are uninitialized. This behavior can be changed by creating the writer with **DDS_DataWriterResourceLimitsQosPolicy::initialize_writer_loaned_sample** (p. 698); this is however not recommended in general because of the performance impact for large types.

```
MyFlatMutableBuilder builder = ...;
MyFinalFooOffset member_offset = builder.add_my_final();
member_offset.my_primitive(10);
// ... add/build more members
```

9.331.1.2 Building variable-size members

Variable-size members are "built", and the function is called **build_<member_name>**. "Build" functions return another **Builder** (p. 552) to build the member.

```
MyFlatMutableBuilder builder = ...;
auto member_builder = builder.build_my_mutable();
// ... use member_builder
member_builder.finish();
// ... add/build more members
```

While a member is being built, the parent Builder is a **bound** state, which prevents any changes to it until the member has been finished by calling **member_builder.finish()**. In particular, the member Builder must be finished before adding or building any other member, or before finishing **builder**.

9.331.1.3 Choosing which members are included

The `add/build` function for each member can be called one or zero times. That is, all members are optional, even those without the `@optional` IDL annotation. However `@key` member must be added or **FooDataWriter::write** (p. 1666) will fail.

FlatData samples received by **DDSDataReader** (p. 1272) will not contain the members that were not added/built—the corresponding member getters return a null Offset. A **DDSDataReader** (p. 1272) for an equivalent non-FlatData (plain) definition of this type will assign default values to any non-optional members that were not present in the sample when written.

It is not permitted to add a member more than once, but builders don't enforce this. Trying to build/add a member more than once may cause the Builder to overflow (see **Builder Error Management** (p. 554)). If it doesn't, it may be possible to write and read the data samples, but the duplicate members will be ignored.

```

Note

Top-level builders are created with **rti::flat::build_data()** (p. 554), and member builders are created with the corresponding `build_<member>` function.

9.331.3.2 MyFlatMutableBuilder() [2/2]

```
MyFlatMutableBuilder::MyFlatMutableBuilder (
    unsigned char * buffer,
    int32_t size,
    bool initialize_members = false ) [inline]
```

Construct a Builder with an arbitrary buffer.

Note

The recommended way to create a Builder is **rti::flat::build_data()** (p. 554) as described in **Publishing FlatData** (p. 564). This constructor provides an alternative option to use an arbitrary data buffer.

Parameters

<i>buffer</i>	The buffer that will be used to build the data sample
<i>size</i>	The size of the buffer
<i>initialize_members</i>	Whether fixed-size elements added to this Builder will be initialized to their default values or will be left uninitialized (more efficient).

If the sample being built overflows the buffer size, the add/build operations will fail. See **Builder Error Management** (p. 554).

9.331.4 Member Function Documentation

9.331.4.1 finish()

```
Offset MyFlatMutableBuilder::finish ( )
```

Finishes building a member.

Returns

The Offset to the member (normally it can be ignored)

Precondition

is_nested() (p. 574). That is, this object must be a member Builder, not a sample Builder.

9.331.4.2 finish_sample()

```
MyFlatMutable * MyFlatMutableBuilder::finish_sample ( )
```

Finishes building a sample.

Precondition

!is_nested() (p. 574). That is, this object must be a sample Builder, not a member Builder.

Postcondition

!is_valid() (p. 574). That is, this Builder can no longer be used.

Returns

The sample, ready to be written.

This function completes and returns the sample built with this Builder.

See also

rti::flat::build_data() (p. 554), the function to create a **FooDataWriter** (p. 1659)-managed sample Builder.

9.331.4.3 add_my_primitive()

```
bool MyFlatMutableBuilder::add_my_primitive (
    int32_t value )
```

Adds a primitive member.

9.331.4.4 add_my_optional_primitive()

```
bool MyFlatMutableBuilder::add_my_optional_primitive (
    int32_t value )
```

Adds a primitive member.

9.331.4.5 add_my_primitive_array()

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableBuilder::add_my_primitive_array ( )
```

Adds a primitive array member.

Returns

The Offset to the array, which can be used to set its values.

9.331.4.6 build_my_primitive_seq()

```
rti::flat::PrimitiveSequenceBuilder< int32_t > MyFlatMutableBuilder::build_my_primitive_seq ( )
```

Begins building a primitive-sequence member.

9.331.4.7 add_my_final()

```
MyFlatFinalOffset MyFlatMutableBuilder::add_my_final ( )
```

Adds a final complex member.

Returns

The Offset to the member, which can be used to set its values.

9.331.4.8 add_my_final_array()

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinalOffset, 10 > MyFlatMutableBuilder::add_my_↵  
final_array ( )
```

Adds an array member of final complex elements.

Returns

The Offset to the array, which can be used to set its values.

9.331.4.9 build_my_final_seq()

```
rti::flat::FinalSequenceBuilder< MyFlatFinalOffset > MyFlatMutableBuilder::build_my_final_seq (
)
```

Begins building a sequence member of final complex elements.

9.331.4.10 build_my_mutable()

```
FlatMutableBarBuilder MyFlatMutableBuilder::build_my_mutable ( )
```

Begins building a mutable complex member.

FlatMutableBar represents another arbitrary mutable FlatData type.

9.331.4.11 build_my_mutable_array()

```
rti::flat::MutableArrayBuilder< FlatMutableBarBuilder, 10 > MyFlatMutableBuilder::build_my_↵
mutable_array ( )
```

Begins building an array member of mutable complex elements.

9.331.4.12 build_my_mutable_seq()

```
rti::flat::MutableSequenceBuilder< FlatMutableBarBuilder > MyFlatMutableBuilder::build_my_↵
mutable_seq ( )
```

Begins building a sequence member of mutable complex elements.

9.331.4.13 build_my_string()

```
rti::flat::StringBuilder MyFlatMutableBuilder::build_my_string ( )
```

Begins building a string member.

9.331.4.14 build_my_string_seq()

```
rti::flat::MutableSequenceBuilder< rti::flat::StringBuilder > MyFlatMutableBuilder::build_my_string_seq ( )
```

Begins building a sequence member of string elements.

9.332 MyFlatMutableOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.

```
#include <Offset.hpp>
```

Inheritance diagram for MyFlatMutableOffset:

Public Types

- Retrieves a non-const Offset to a sequence of strings.*

9.332.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatMutable** (p. 556).

It provides accessors for each of its members. Accessors can return other Offsets or primitive values.

9.332.2 Member Typedef Documentation

9.332.2.1 ConstOffset

```
typedef MyFlatMutableConstOffset  MyFlatMutableOffset::ConstOffset
```

The equivalent read-only Offset type.

Each Offset for a user type has an equivalent const Offset that doesn't allow modifying the underlying Sample.

9.332.3 Constructor & Destructor Documentation

9.332.3.1 MyFlatMutableOffset()

```
MyFlatMutableOffset::MyFlatMutableOffset ( ) [inline]
```

Creates a null Offset.

Postcondition

is_null() (p. 1834)

9.332.4 Member Function Documentation

9.332.4.1 my_primitive() [1/2]

```
int32_t MyFlatMutableOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

Returns

The value of the member or its default value if this member doesn't exist in this Sample.

9.332.4.2 my_optional_primitive()

```
rti::flat::PrimitiveConstOffset< int32_t > MyFlatMutableOffset::my_optional_primitive ( ) const
```

Retrieves a const Offset to an optional primitive.

Unlike the non-optional **my_primitive()** (p. 1741), which accesses the integer directly, for an optional primitive it is possible to check whether it exists or not. If it doesn't exist, the Offset this function returns will be null (**is_null()** (p. 1834)).

9.332.4.3 my_primitive_array() [1/2]

```
const rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableOffset::my_primitive_array ( )
const
```

Retrieves a const Offset to a primitive array.

9.332.4.4 my_primitive_seq() [1/2]

```
const rti::flat::PrimitiveSequenceOffset< int32_t > MyFlatMutableOffset::my_primitive_seq ( )
const
```

Retrieves a const Offset to a primitive sequence.

9.332.4.5 my_final() [1/2]

```
MyFlatFinal::ConstOffset MyFlatMutableOffset::my_final ( ) const
```

Retrieves a const Offset to a complex member.

9.332.4.6 my_final_array() [1/2]

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinal::ConstOffset, 10 > MyFlatMutableOffset::my_↵
final_array ( ) const
```

Retrieves a const Offset to a complex array.

9.332.4.7 my_final_seq() [1/2]

```
rti::flat::SequenceOffset< MyFlatFinal::ConstOffset > MyFlatMutableOffset::my_final_seq ( )
const
```

Retrieves a const Offset to a complex sequence.

9.332.4.8 my_mutable() [1/2]

```
FlatMutableBar::ConstOffset MyFlatMutableOffset::my_mutable ( ) const
```

Retrieves a const Offset to a complex member.

FlatMutableBar is another arbitrary user-defined mutable FlatData type.

9.332.4.9 my_mutable_array() [1/2]

```
rti::flat::MutableArrayOffset< FlatMutableBar::ConstOffset, 10 > MyFlatMutableOffset::my_↵  
mutable_array ( ) const
```

Retrieves a const Offset to a complex array.

9.332.4.10 my_mutable_seq() [1/2]

```
rti::flat::SequenceOffset< FlatMutableBar::ConstOffset > MyFlatMutableOffset::my_mutable_seq ( )  
const
```

Retrieves a const Offset to a complex sequence.

9.332.4.11 my_string() [1/2]

```
const rti::flat::StringOffset MyFlatMutableOffset::my_string ( ) const
```

Retrieves a const Offset to a string.

9.332.4.12 my_string_seq() [1/2]

```
rti::flat::SequenceOffset< const rti::flat::StringOffset > MyFlatMutableOffset::my_string_seq ( ) const
```

Retrieves a const Offset to a sequence of strings.

9.332.4.13 my_primitive() [2/2]

```
bool MyFlatMutableOffset::my_primitive (
    int32_t value )
```

Sets the value of a primitive member.

9.332.4.14 my_primitive_array() [2/2]

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableOffset::my_primitive_array ( )
```

Retrieves a non-const Offset to a primitive array.

9.332.4.15 my_primitive_seq() [2/2]

```
rti::flat::PrimitiveSequenceOffset< int32_t > MyFlatMutableOffset::my_primitive_seq ( )
```

Retrieves a non-const Offset to a primitive sequence.

9.332.4.16 my_final() [2/2]

```
MyFlatFinal::Offset MyFlatMutableOffset::my_final ( )
```

Retrieves a non-const Offset to a complex member.

9.332.4.17 my_final_array() [2/2]

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinal::Offset, 10 > MyFlatMutableOffset::my_final_↔  
array ( )
```

Retrieves a non-const Offset to a complex array.

9.332.4.18 my_final_seq() [2/2]

```
rti::flat::SequenceOffset< MyFlatFinal::Offset > MyFlatMutableOffset::my_final_seq ( )
```

Retrieves a non-const Offset to a complex sequence.

9.332.4.19 my_mutable() [2/2]

```
FlatMutableBar::Offset MyFlatMutableOffset::my_mutable ( )
```

Retrieves a non-const Offset to a complex member.

FlatMutableBar is another arbitrary user-defined mutable FlatData type.

9.332.4.20 my_mutable_array() [2/2]

```
rti::flat::MutableArrayOffset< FlatMutableBar::Offset, 10 > MyFlatMutableOffset::my_mutable_↵  
array ( )
```

Retrieves a non-const Offset to a complex array.

9.332.4.21 my_mutable_seq() [2/2]

```
rti::flat::SequenceOffset< FlatMutableBar::Offset > MyFlatMutableOffset::my_mutable_seq ( )
```

Retrieves a non-const Offset to a complex sequence.

9.332.4.22 my_string() [2/2]

```
rti::flat::StringOffset MyFlatMutableOffset::my_string ( )
```

Retrieves a non-const Offset to a string.

9.332.4.23 my_string_seq() [2/2]

```
rti::flat::SequenceOffset< rti::flat::StringOffset > MyFlatMutableOffset::my_string_seq ( )
```

Retrieves a non-const Offset to a sequence of strings.

9.333 MyFlatUnionBuilder Class Reference

Represents the Builder for an arbitrary user-defined mutable IDL union.

```
#include <Builder.hpp>
```

Inheritance diagram for MyFlatUnionBuilder:

Public Types

- typedef **MyFlatUnionOffset** **Offset**
The related offset type.

Public Member Functions

- **MyFlatUnionBuilder** ()
Creates an invalid Builder.
- **Offset** **finish** ()
Finishes building a member.
- **MyFlatUnion** * **finish_sample** ()
Finishes building a sample.
- bool **add_my_primitive** (int32_t value)
Adds a primitive member.
- **MyFlatMutableBuilder** **build_my_mutable** (int32_t discriminator=1)
Builds a mutable-struct member.
- **MyFlatFinal::Offset** **add_my_final** ()
Adds a final-struct member.

Additional Inherited Members

9.333.1 Detailed Description

Represents the Builder for an arbitrary user-defined mutable IDL union.

This example type represents the **Builder** (p. 552) type that **rtiddsgen** would generate for **MyFlatUnion** (p. 557) and allows creating a sample or a member of that type.

Union builders are similar to struct builders (see **MyFlatMutableBuilder** (p. 1732)), except that they only allow adding/building **one member**.

"Add" and "build" functions automatically set the discriminator value that in the IDL definition selects that member. If more than one discriminator value selects a member, the add/build function allows picking one.

9.333.2 Member Typedef Documentation

9.333.2.1 Offset

```
typedef MyFlatUnionOffset MyFlatUnionBuilder::Offset
```

The related offset type.

9.333.3 Constructor & Destructor Documentation

9.333.3.1 MyFlatUnionBuilder()

```
MyFlatUnionBuilder::MyFlatUnionBuilder ( ) [inline]
```

Creates an invalid Builder.

Postcondition

`!is_valid()`

Note

Top-level builders are created with `rti::flat::build_data()` (p. 554), and member builders are created with the corresponding `build_<member>` function.

9.333.4 Member Function Documentation

9.333.4.1 finish()

```
Offset MyFlatUnionBuilder::finish ( )
```

Finishes building a member.

See also

`MyMutableBuilder::finish()`

9.333.4.2 finish_sample()

```
MyFlatUnion * MyFlatUnionBuilder::finish_sample ( )
```

Finishes building a sample.

See also

`MyMutableBuilder::finish_sample()`

9.333.4.3 add_my_primitive()

```
bool MyFlatUnionBuilder::add_my_primitive (
    int32_t value )
```

Adds a primitive member.

This function automatically selects the discriminator 0, which corresponds to the member 'my_primitive' (see **MyFlatUnion** (p. 557))

9.333.4.4 build_my_mutable()

```
MyFlatMutableBuilder MyFlatUnionBuilder::build_my_mutable (
    int32_t discriminator = 1 )
```

Builds a mutable-struct member.

Parameters

<i>discriminator</i>	Allows selecting one of the possible discriminator values for this member: 1 or 2. This argument is optional: if not specified it selects the first 'case' label in the IDL definition (1).
----------------------	---

Returns

The Builder to build this member

9.333.4.5 add_my_final()

```
MyFlatFinal::Offset MyFlatUnionBuilder::add_my_final ( )
```

Adds a final-struct member.

Returns

The Offset to the member, which can be used to set its values.

This function automatically selects the discriminator value 3, which corresponds to the member 'my_final' (see **MyFlatUnion** (p. 557)).

9.334 MyFlatUnionOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.

```
#include <Offset.hpp>
```

Inheritance diagram for MyFlatUnionOffset:

Public Types

- typedef MyFlatUnionConstOffset **ConstOffset**
The equivalent read-only Offset type.

Public Member Functions

- **MyFlatUnionOffset** ()
Creates a null Offset.
- int32_t **_d** () const
Retrieves the union discriminator.
- int32_t **my_primitive** () const
Retrieves the value for a primitive member.
- **MyFlatMutable::ConstOffset my_mutable** () const
Retrieves a const Offset to a complex member.
- **MyFlatFinal::ConstOffset my_final** () const
Retrieves a const Offset to a complex member.
- bool **my_primitive** (int32_t value)
Sets the value for a primitive member.
- **MyFlatMutable::Offset my_mutable** ()
Retrieves a non-const Offset to a complex member.
- **MyFlatFinal::Offset my_final** ()
Retrieves a non-const Offset to a complex member.

9.334.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatUnion** (p. 557).

It provides accessors for each of its members, plus the discriminator **_d()** (p. 1750). Accessors can return other Offsets or primitive values.

Given a union, only one member, the one identified by **_d()** (p. 1750), can exist at a time. The discriminator cannot be modified.

9.334.2 Member Typedef Documentation

9.334.2.1 ConstOffset

```
typedef MyFlatUnionConstOffset  MyFlatUnionOffset::ConstOffset
```

The equivalent read-only Offset type.

9.334.3 Constructor & Destructor Documentation

9.334.3.1 MyFlatUnionOffset()

```
MyFlatUnionOffset::MyFlatUnionOffset ( ) [inline]
```

Creates a null Offset.

Postcondition

is_null() (p. 1834)

9.334.4 Member Function Documentation

9.334.4.1 `_d()`

```
int32_t MyFlatUnionOffset::_d ( ) const
```

Retrieves the union discriminator.

Returns

The union discriminator, which identifies which field this union contains.

In this example:

- 0 selects **my_primitive()** (p. 1751)
- 1 and 2 select **my_mutable()** (p. 1752)
- 3 selects **my_final**

Any other discriminator value indicates that no member or an unknown member follows.

Note that the discriminator cannot be modified, since that would potentially change the size of this Sample by selecting a different member. The discriminator is selected during the building of a Sample (see MyUnionBuilder).

9.334.4.2 `my_primitive()` [1/2]

```
int32_t MyFlatUnionOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

Returns

The value of `my_primitive` if this member is selected by `_d()` (p. 1750) or its default value otherwise.

9.334.4.3 `my_mutable()` [1/2]

```
MyFlatMutable::ConstOffset MyFlatUnionOffset::my_mutable ( ) const
```

Retrieves a const Offset to a complex member.

Returns

The Offset to the 'my_mutable' member if selected by `_d()` (p. 1750), or a **null Offset** (p. 560) otherwise

9.334.4.4 my_final() [1/2]

```
MyFlatFinal::ConstOffset MyFlatUnionOffset::my_final ( ) const
```

Retrieves a const Offset to a complex member.

Returns

The Offset to the 'my_final' member if selected by **_d()** (p. 1750), or a **null Offset** (p. 560) otherwise

9.334.4.5 my_primitive() [2/2]

```
bool MyFlatUnionOffset::my_primitive (
    int32_t value )
```

Sets the value for a primitive member.

Precondition

_d() (p. 1750) must select 'my_primitive', otherwise this function returns false.

Returns

true if my_primitive was set or false if the operation failed.

9.334.4.6 my_mutable() [2/2]

```
MyFlatMutable::Offset MyFlatUnionOffset::my_mutable ( )
```

Retrieves a non-const Offset to a complex member.

Returns

The Offset to the 'my_mutable' member if selected by **_d()** (p. 1750), or a **null Offset** (p. 560) otherwise

9.334.4.7 my_final() [2/2]

```
MyFlatFinal::Offset MyFlatUnionOffset::my_final ( )
```

Retrieves a non-const Offset to a complex member.

Returns

The Offset to the 'my_final' member if selected by **_d()** (p. 1750), or a **null Offset** (p. 560) otherwise

9.335 NDDS_Config_LibraryVersion_t Struct Reference

The version of a single library shipped as part of an RTI Connex distribution.

Public Attributes

- **DDS_Long major**
The major version of a single RTI Connex library.
- **DDS_Long minor**
The minor version of a single RTI Connex library.
- **char release**
The release letter of a single RTI Connex library.
- **DDS_Long build**
The build number of a single RTI Connex library.

9.335.1 Detailed Description

The version of a single library shipped as part of an RTI Connex distribution.

RTI Connex is comprised of a number of separate libraries. Although RTI Connex as a whole has a version, the individual libraries each have their own versions as well. It may be necessary to check these individual library versions when seeking technical support.

9.335.2 Member Data Documentation

9.335.2.1 major

DDS_Long NDDS_Config_LibraryVersion_t::major

The major version of a single RTI Connex library.

9.335.2.2 minor

DDS_Long NDDS_Config_LibraryVersion_t::minor

The minor version of a single RTI Connex library.

9.335.2.3 release

```
char NDDS_Config_LibraryVersion_t::release
```

The release letter of a single RTI Connex library.

9.335.2.4 build

```
DDS_Long NDDS_Config_LibraryVersion_t::build
```

The build number of a single RTI Connex library.

9.336 NDDS_Config_LogMessage Struct Reference

Log message.

Public Attributes

- const char * **text**
Message text.
- NDDS_Config_LogLevel **level**
Message level.
- DDS_Boolean **is_security_message**
Indicates if the message is a security-related message.
- DDS_UnsignedLong **message_id**
A numeric code that identifies an specific log message.
- struct DDS_Duration_t **timestamp**
The time when the log message was printed.
- NDDS_Config_LogFacility **facility**
*The Facility associated with the log message. See **NDDS_Config_LogFacility** (p. 527).*

9.336.1 Detailed Description

Log message.

9.336.2 Member Data Documentation

9.336.2.1 text

```
const char* NDDS_Config_LogMessage::text
```

Message text.

9.336.2.2 level

```
NDDS_Config_LogLevel NDDS_Config_LogMessage::level
```

Message level.

9.336.2.3 is_security_message

```
DDS_Boolean NDDS_Config_LogMessage::is_security_message
```

Indicates if the message is a security-related message.

This flag indicates if a log message is a security- message (e.g., SSL handshake failures or certificate validation failures).

9.336.2.4 message_id

```
DDS_UnsignedLong NDDS_Config_LogMessage::message_id
```

A numeric code that identifies an specific log message.

Two log messages that have the same message_id will have a similar structure. E.g. "ERROR: Failed to get Data↵WriterQos" and "ERROR: Failed to get TopicName". In this case, the message_id is associated to the get failure.

9.336.2.5 timestamp

```
struct DDS_Duration_t NDDS_Config_LogMessage::timestamp
```

The time when the log message was printed.

9.336.2.6 facility

`NDDS_Config_LogFacility` `NDDS_Config_LogMessage::facility`

The Facility associated with the log message. See `NDDS_Config_LogFacility` (p. 527).

9.337 NDDS_Transport_Address_t Struct Reference

Addresses are stored individually as network-ordered bytes.

Public Attributes

- unsigned char `network_ordered_value` [`NDDS_TRANSPORT_ADDRESS_LENGTH`]

9.337.1 Detailed Description

Addresses are stored individually as network-ordered bytes.

RTI Connext addresses are numerically stored in a transport independent manner. RTI Connext uses a IPv6-compatible format, which means that the data structure to hold an `NDDS_Transport_Address_t` (p. 1756) is the same size as a data structure needed to hold an IPv6 address.

In addition, the functions provided to translate a string representation of an RTI Connext address to a value assumes that the string presentation follows the IPv6 address presentation as specified in RFC 2373.

An `NDDS_Transport_Address_t` (p. 1756) always stores the address in network-byte order (which is Big Endian).

For example, IPv4 multicast address of 225.0.0.0 is represented by

`{{0,0,0,0, 0,0,0,0, 0,0,0,0, 0xE1,0,0,0}}` regardless of endianness,

where 0xE1 is the 13th byte of the structure (`network_ordered_value[12]`).

9.337.2 Member Data Documentation

9.337.2.1 network_ordered_value

`unsigned char` `NDDS_Transport_Address_t::network_ordered_value` [`NDDS_TRANSPORT_ADDRESS_LENGTH`]

network-byte ordered (i.e., bit 0 is the most significant bit and bit 128 is the least significant bit).

9.338 NDDS_Transport_Interface_t Struct Reference

Storage for the description of a network interface used by a Transport Plugin.

Public Attributes

- **NDDS_Transport_ClassId_t transport_classid**
The transport classid of the interface.
- **NDDS_Transport_Address_t address**
An unicast address that uniquely identifies this interface in the network specified by the transport class.
- **NDDS_Transport_Interface_Status_t status**
The state of the interface.
- **RTI_UINT16 rank**
Rank of the interface. Used when allow_interfaces_list Qos is set. A rank value will be assing to each of the interfaces that match the allow_interfaces_list filter allowing an endpoint to prioritace some interfaces upon others.

9.338.1 Detailed Description

Storage for the description of a network interface used by a Transport Plugin.

9.338.2 Member Data Documentation

9.338.2.1 transport_classid

NDDS_Transport_ClassId_t NDDS_Transport_Interface_t::transport_classid

The transport classid of the interface.

9.338.2.2 address

NDDS_Transport_Address_t NDDS_Transport_Interface_t::address

An unicast address that uniquely identifies this interface in the network specified by the transport class.

9.338.2.3 status

```
NDDS_Transport_Interface_Status_t NDDS_Transport_Interface_t::status
```

The state of the interface.

9.338.2.4 rank

```
RTI_UINT16 NDDS_Transport_Interface_t::rank
```

Rank of the interface. Used when `allow_interfaces_list` Qos is set. A rank value will be assing to each of the interfaces that match the `allow_interfaces_list` filter allowing an endpoint to prioritace some interfaces upon others.

9.339 NDDS_Transport_Property_t Struct Reference

Base configuration structure that must be inherited by derived Transport Plugin classes.

Public Attributes

- **NDDS_Transport_ClassId_t classid**
The Transport-Plugin Class ID.
- RTI_INT32 **address_bit_count**
Number of bits in a 16-byte address that are used by the transport. Should be between 0 and 128.
- RTI_INT32 **properties_bitmap**
A bitmap that defines various properties of the transport to the RTI Connex core.
- RTI_INT32 **gather_send_buffer_count_max**
Specifies the maximum number of buffers that RTI Connex can pass to the `send()` method of a transport plugin.
- RTI_INT32 **message_size_max**
The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.
- char ** **allow_interfaces_list**
A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length > 0`), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.
- RTI_INT32 **allow_interfaces_list_length**
Number of elements in the `allow_interfaces_list`.
- char ** **deny_interfaces_list**
A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length > 0`), deny the use of these interfaces.
- RTI_INT32 **deny_interfaces_list_length**
Number of elements in the `deny_interfaces_list`.
- char ** **allow_multicast_interfaces_list**

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length > 0`), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

- RTI_INT32 **allow_multicast_interfaces_list_length**

Number of elements in the `allow_multicast_interfaces_list`.

- char ** **deny_multicast_interfaces_list**

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length > 0`), deny the use of those interfaces for multicast.

- RTI_INT32 **deny_multicast_interfaces_list_length**

Number of elements in `deny_multicast_interfaces_list`.

- struct **NDDS_Transport_UUID** **transport_uuid**

Univocally identifies a transport plugin.

- char * **thread_name_prefix**

Prefix used to name the transport threads.

- RTI_INT32 **max_interface_count**

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

9.339.1 Detailed Description

Base configuration structure that must be inherited by derived Transport Plugin classes.

This structure contains properties that must be set before registration of any transport plugin with RTI Connex. The RTI Connex core will configure itself to use the plugin based on the properties set within this structure.

A transport plugin may extend from this structure to add transport-specific properties.

In the C-language, this can be done by creating a custom plugin property structure whose first member is a **NDDS_Transport_Property_t** (p. 1758) structure.

For example,

```
<P>
    struct MyTransport_Plugin_Property_t {
        NDDS_Transport_Property_t base_properties;
        int myIntProperty;
        < etc >;
    };
```

WARNING: The transport properties of an instance of a Transport Plugin should be considered immutable after the plugin has been created. That means the values contained in the property structure stored as a part of the transport plugin itself should not be changed. If those values are modified, the results are undefined.

9.339.2 Member Data Documentation

9.339.2.1 classid

`NDDS_Transport_ClassId_t` `NDDS_Transport_Property_t::classid`

The Transport-Plugin Class ID.

The transport plugin sets the value for this field.

Class IDs below **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 250) are reserved for RTI (Real-Time Innovations) usage.

User-defined transports should set an ID above this range.

The ID should be globally unique for each Transport-Plugin class. Transport-Plugin implementors should ensure that the class IDs do not conflict with each other amongst different Transport-Plugin classes.

Invariant

The `classid` is invariant for the lifecycle of a transport plugin.

9.339.2.2 address_bit_count

`RTI_INT32` `NDDS_Transport_Property_t::address_bit_count`

Number of bits in a 16-byte address that are used by the transport. Should be between 0 and 128.

The transport plugin sets the value for this field.

A transport plugin should define the range of addresses (starting from 0x0) that are meaningful to the plugin. It does this by setting the number of bits of an IPv6 address that will be used to designate an address in the network to which the transport plugin is connected.

For example, for an address range of 0-255, the `address_bit_count` should be set to 8. For the range of addresses used by IPv4 (4 bytes), it should be set to 32.

See also

Transport Class Attributes (p. ??)

9.339.2.3 properties_bitmap

```
RTI_INT32 NDDS_Transport_Property_t::properties_bitmap
```

A bitmap that defines various properties of the transport to the RTI Connexx core.

Currently, the only property supported is whether or not the transport plugin will always loan a buffer when RTI Connexx tries to receive a message using the plugin. This is in support of a zero-copy interface.

See also

NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (p. 250)

9.339.2.4 gather_send_buffer_count_max

```
RTI_INT32 NDDS_Transport_Property_t::gather_send_buffer_count_max
```

Specifies the maximum number of buffers that RTI Connexx can pass to the `send()` method of a transport plugin.

The transport plugin `send()` API supports a gather-send concept, where the `send()` call can take several discontinuous buffers, assemble and send them in a single message. This enables RTI Connexx to send a message from parts obtained from different sources without first having to copy the parts into a single contiguous buffer.

However, most transports that support a gather-send concept have an upper limit on the number of buffers that can be gathered and sent. Setting this value will prevent RTI Connexx from trying to gather too many buffers into a send call for the transport plugin.

RTI Connexx requires all transport-plugin implementations to support a gather-send of at least a minimum number of buffers. This minimum number is defined to be **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN** (p. 250).

If the underlying transport does not support a gather-send concept directly, then the transport plugin itself must copy the separate buffers passed into the `send()` call into a single buffer for sending or otherwise send each buffer individually. However this is done by the transport plugin, the `receive_rEA()` call of the destination application should assemble, if needed, all of the pieces of the message into a single buffer before the message is passed to the RTI Connexx layer.

9.339.2.5 message_size_max

```
RTI_INT32 NDDS_Transport_Property_t::message_size_max
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.

If the maximum size of a message that can be sent by a transport plugin is user configurable, the transport plugin should provide a default value for this property. In any case, this value must be set before the transport plugin is registered, so that RTI Connexx can properly use the plugin.

For information about the default value for different transports, see the `Core Libraries User's Manual`.

9.339.2.6 allow_interfaces_list

```
char** NDDS_Transport_Property_t::allow_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length > 0`), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

The "white" list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that DomainParticipant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.*, 192.168.*, 192.*, ether0

The left-to-right order of this list matters if you are using the `max_interface_count` to limit the allowable interfaces further. See `max_interface_count`.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDSDomainParticipant** (p. 1335) is deleted.

[default] empty list that represents all available interfaces.

See also

NDDS_Transport_Property_t::max_interface_count (p. 1765)

9.339.2.7 allow_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_interfaces_list_length
```

Number of elements in the `allow_interfaces_list`.

By default, `allow_interfaces_list_length = 0`, i.e. an empty list.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

9.339.2.8 deny_interfaces_list

```
char** NDDS_Transport_Property_t::deny_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length > 0`), deny the use of these interfaces.

This "black" list is applied *after* the `allow_interfaces_list` and filters out the interfaces that should not be used.

The resulting list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that DomainParticipant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.*, 192.168.*, 192.*, ether0

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDSDomainParticipant** (p. 1335) is deleted.

[default] empty list that represents no denied interfaces.

9.339.2.9 deny_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_interfaces_list_length
```

Number of elements in the `deny_interfaces_list`.

By default, `deny_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

9.339.2.10 `allow_multicast_interfaces_list`

```
char** NDDS_Transport_Property_t::allow_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length > 0`), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

This "white" list sub-selects from the allowed interfaces obtained *after* applying the `allow_interfaces_list` "white" list *and* the `deny_interfaces_list` "black" list.

After `allow_multicast_interfaces_list`, the `deny_multicast_interfaces_list` is applied. Multicast output will be sent and may be received over the interfaces in the resulting list.

If this list is empty, all the allowed interfaces will be potentially used for multicast. It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDSDomainParticipant** (p. 1335) is deleted.

[default] empty list that represents all available interfaces.

9.339.2.11 `allow_multicast_interfaces_list_length`

```
RTI_INT32 NDDS_Transport_Property_t::allow_multicast_interfaces_list_length
```

Number of elements in the `allow_multicast_interfaces_list`.

By default, `allow_multicast_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

9.339.2.12 `deny_multicast_interfaces_list`

```
char** NDDS_Transport_Property_t::deny_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length > 0`), deny the use of those interfaces for multicast.

This "black" list is applied after `allow_multicast_interfaces_list` and filters out interfaces that should not be used for multicast.

Multicast output will be sent and may be received over the interfaces in the resulting list.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDSDomainParticipant** (p. 1335) is deleted.

[default] empty list that represents no denied interfaces.

9.339.2.13 deny_multicast_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_multicast_interfaces_list_length
```

Number of elements in deny_multicast_interfaces_list.

By default, deny_multicast_interfaces_list_length = 0 (i.e., an empty list).

This property is not interpreted by the RTI Connex core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

9.339.2.14 transport_uuid

```
struct NDDS_Transport_UUID NDDS_Transport_Property_t::transport_uuid
```

Univocally identifies a transport plugin.

It represents the prefix of the participant GUID.

9.339.2.15 thread_name_prefix

```
char* NDDS_Transport_Property_t::thread_name_prefix
```

Prefix used to name the transport threads.

This field is optional.

The maximum size of this string is 8 characters.

If "thread_name_prefix" is not set by the user, RTI Connex creates the following prefix: 'r' + 'Tr' + participant identifier + '\0'.

Where 'r' indicates this is a thread from RTI, 'Tr' indicates the thread is related to a transport, and participant identifier contains 5 characters as follows:

If participant_name is set: The participant identifier will be the first 3 characters and the last 2 characters of the participant_name.

If participant_name is not set, then the identifier is computed as domain_id (3 characters) followed by participant_id (2 characters).

If participant_name is not set and the participant_id is set to -1 (default value), then the participant identifier is computed as the last 5 digits of the rtps_instance_id in the participant GUID.

9.339.2.16 max_interface_count

RTI_INT32 NDDS_Transport_Property_t::max_interface_count

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

By default, `max_interface_count` = `LENGTH_UNLIMITED`: all the interfaces are announced.

This feature is useful if you want to control the network interfaces on which your DomainParticipants receive data. For example, if you have one wired and one wireless interface both up and running, and `max_interface_count` is set to 1, the DomainParticipant will receive data over the interface you list first in the `allow_interfaces_list` -for example, the wired one.

RTI Connext selects the preferred interface(s) by iterating over the list of allowed interfaces until the first `max_interface_count` of active interfaces encountered are announced. The order of iteration is left to right as specified in the `allow_interfaces_list` setting.

This setting applies only if the `allow_interfaces_list` is not empty.

The `max_interface_count` setting does not consider end-to-end connectivity to select interfaces. The decision is based purely on whether interfaces are up or down in a node. Therefore, this feature is not intended to be used in the following scenarios:

- A DomainParticipant is not reachable by other DomainParticipants in all the interfaces in the `allow_interfaces_list`. This could occur if the DomainParticipant is in different subnets, and some of these subnets cannot be reached by other DomainParticipants.
- End-to-end connectivity issues lead to situations in which the interfaces selected after applying `max_interface_count` cannot be reached by other DomainParticipants.

For UDPv4 and UDPv6 transports, this feature also affects multicast traffic by limiting the interfaces over which a DomainParticipant sends multicast traffic. The `(allow/deny)_multicast_interfaces_list` applies to the interfaces selected by using the `max_interfaces_count` property.

Note: If a pattern string in the `allow_interfaces_list` matches multiple interface addresses, and `max_interface_count` is set to a finite value, the order for the matching allowed interfaces is decided based on the order in which the operating system provides these interfaces.

[default] `LENGTH_UNLIMITED`

NDDS_Transport_Property_t::allow_interfaces_list (p. 1761)

9.340 NDDS_Transport_Shmem_Property_t Struct Reference

Subclass of **NDDS_Transport_Property_t** (p. 1758) allowing specification of parameters that are specific to the shared-memory transport.

Public Attributes

- struct **NDDS_Transport_Property_t** **parent**
Generic properties of all transport plugins.
- RTI_INT32 **received_message_count_max**
Number of messages that can be buffered in the receive queue.
- RTI_INT32 **receive_buffer_size**
The total number of bytes that can be buffered in the receive queue.
- RTIBool **enable_udp_debugging**
Enables UDP debugging when using shared memory.
- **NDDS_Transport_Address_t** **udp_debugging_address**
*IP address to which shared memory traffic will be published if **NDDS_Transport_Shmem_Property_t::enable_udp_debugging** (p. 1768) is set to '1'.*
- **NDDS_Transport_Port_t** **udp_debugging_port**
*Port to which shared memory traffic will be published if **NDDS_Transport_Shmem_Property_t::enable_udp_debugging** (p. 1768) is set to '1'.*

9.340.1 Detailed Description

Subclass of **NDDS_Transport_Property_t** (p. 1758) allowing specification of parameters that are specific to the shared-memory transport.

See also

NDDSTransportSupport::set_builtin_transport_property() (p. 1815)

9.340.2 Member Data Documentation

9.340.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_Shmem_Property_t::parent
```

Generic properties of all transport plugins.

9.340.2.2 received_message_count_max

```
RTI_INT32 NDDS_Transport_Shmem_Property_t::received_message_count_max
```

Number of messages that can be buffered in the receive queue.

This does not guarantee that the Transport-Plugin will actually be able to buffer **received_message_count_max** messages of the maximum size set in **NDDS_Transport_Property_t::message_size_max** (p. 1761). The total number of bytes that can be buffered for a transport plug-in is actually controlled by **receive_buffer_size**.

See also

NDDS_Transport_Property_t (p. 1758), **NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT** (p. 264)

9.340.2.3 receive_buffer_size

RTI_INT32 NDDS_Transport_Shmem_Property_t::receive_buffer_size

The total number of bytes that can be buffered in the receive queue.

This number controls how much memory is allocated by the plugin for the receive queue. The actual number of bytes allocated is:

```
size = receive_buffer_size + message_size_max +
      received_message_count_max * fixedOverhead
```

where `fixedOverhead` is some small number of bytes used by the queue data structure. The following rules are noted:

- `receive_buffer_size < message_size_max * received_message_count_max`, then the transport plugin will not be able to store `received_message_count_max` messages of size `message_size_max`.
- `receive_buffer_size > message_size_max * received_message_count_max`, then there will be memory allocated that cannot be used by the plugin and thus wasted.

To optimize memory usage, the user is allowed to specify a size for the receive queue to be less than that required to hold the maximum number of messages which are all of the maximum size.

In most situations, the average message size may be far less than the maximum message size. So for example, if the maximum message size is 64 K bytes, and the user configures the plugin to buffer at least 10 messages, then 640 K bytes of memory would be needed if all messages were 64 K bytes. Should this be desired, then `receive_buffer_size` should be set to 640 K bytes.

However, if the average message size is only 10 K bytes, then the user could set the `receive_buffer_size` to 100 K bytes. This allows the user to optimize the memory usage of the plugin for the average case and yet allow the plugin to handle the extreme case.

NOTE, the queue will always be able to hold 1 message of `message_size_max` bytes, no matter what the value of `receive_buffer_size` is.

9.342 NDDS_Transport_UDPv4_Property_t Struct Reference

Configurable IPv4/UDP Transport-Plugin properties.

Public Attributes

- struct **NDDS_Transport_Property_t** parent
Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**
Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**
Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**
Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**
Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**
Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**
Prevents the transport plugin from putting multicast packets onto the loopback interface.
- RTI_INT32 **ignore_loopback_interface**
Prevents the transport plugin from using the IP loopback interface.

- RTI_INT32 **ignore_nonup_interfaces**
[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.
- RTI_INT32 **ignore_nonrunning_interfaces**
Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**
[DEPRECATED] Prevents the transport plugin from doing a zero copy.
- RTI_INT32 **send_blocking**
Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**
Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**
Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**
Set low value of output range to IPv4 TOS.
- RTI_INT32 **transport_priority_mapping_high**
Set high value of output range to IPv4 TOS.
- RTI_INT32 **send_ping**
Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**
Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- RTI_UINT32 **interface_poll_period**
Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**
Controls whether or not to reuse multicast receive resources.
- RTI_INT32 **protocol_overhead_max**
Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**
Disables detection of network interface changes.
- RTI_UINT32 **join_multicast_group_timeout**
[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.
- char * **public_address**
Public IP address associated with the transport instantiation.

9.342.1 Detailed Description

Configurable IPv4/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

```

Generic properties of all transport plugins.

9.342.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt ()` will be called to set the `SEND_BUF` to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 1761). The maximum value is operating system-dependent.

By default, it will be set to **NDDS_TRANSPORT_UDPv4_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 271).

If you configure this parameter to be **NDDS_TRANSPORT_UDPv4_SOCKET_BUFFER_SIZE_OS_DEFAULT** (p. 271), then `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. The transport will use the OS default.

9.342.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt ()` will be called to set the `RCV_BUF` to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 1761). The maximum value is operating system-dependent.

By default, it will be set to **NDDS_TRANSPORT_UDPv4_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (p. 272).

If you configure this parameter to be **NDDS_TRANSPORT_UDPv4_SOCKET_BUFFER_SIZE_OS_DEFAULT** (p. 271), then `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. The transport will use the OS default.

9.342.2.4 unicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

9.342.2.5 multicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use all the network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

9.342.2.6 multicast_ttl

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This value is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

See also

NDDS_TRANSPORT_UDPv4_MULTICAST_TTL_DEFAULT (p. 272)

9.342.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connex will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

[NOTE: Windows CE systems do not support multicast loopback. This field is ignored for Windows CE targets.]

9.342.2.8 ignore_loopback_interface

RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connexx decide between the above two choices.

The current "automatic" (-1) RTI Connexx policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connexx policy based on availability of the shared memory transport.

9.342.2.9 ignore_nonup_interfaces

RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_Property_t::disable_interface_tracking** (p. 1778) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

9.342.2.10 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↔_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0:** Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1:** Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

9.342.2.11 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connexx will use the zero-copy API if offered by the OS.

9.342.2.12 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS

9.342.2.13 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when `use_checksum` is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API `DDSDomainParticipant::get_participant_protocol_status` (p. 1390).

[default] 1 (enabled)

9.342.2.14 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with `NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low` (p. 1776) and `NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high` (p. 1776) to define the mapping from the DDS transport priority (see `TRANSPORT_PRIORITY` (p. 449)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

9.342.2.15 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with `NDDS_Transport_UDPv4_Property_t::transport_priority_mask` (p. 1776) and `NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high` (p. 1776) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

9.342.2.16 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p.1776) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p.1776) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

9.342.2.17 send_ping

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

9.342.2.18 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

9.342.2.19 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

9.342.2.20 reuse_multicast_receive_resource

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

Setting this to 0 (FALSE) prevents multicast crosstalk by uniquely configuring a port and creating a receive thread for each multicast group address.

[default] 1.

9.342.2.21 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1761) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective `message_size_max`, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 1761)

9.342.2.22 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connex application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connex 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

9.342.2.23 join_multicast_group_timeout

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

On Windows, a network interface may be detected before it is allowed to join a multicast group address. This property adjusts how much time (milliseconds) to wait for the ADD_MEMBERSHIP multicast operation to succeed before withdrawing.

[default] 5000

9.342.2.24 public_address

```
char* NDDS_Transport_UDPv4_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **DDSDomainParticipant** (p. 1335) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **DDS_RtpsWellKnownPorts_t** (p. 1062)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **DDSDomainParticipant** (p. 1335) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] NULL (the transport uses the IP addresses obtained from the NICs)

9.343 NDDS_Transport_UDPv4_WAN_Property_t Struct Reference

Configurable IPv4/UDP WAN Transport-Plugin properties.

Public Attributes

- struct **NDDS_Transport_Property_t** **parent**
Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**
Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**
Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **ignore_loopback_interface**
Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonup_interfaces**
[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.
- RTI_INT32 **ignore_nonrunning_interfaces**
Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**
[DEPRECATED] Prevents the transport plugin from doing a zero copy.
- RTI_INT32 **send_blocking**
Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**
Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**
Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**
Set low value of output range to IPv4 TOS.
- RTI_INT32 **transport_priority_mapping_high**
Set high value of output range to IPv4 TOS.
- RTI_INT32 **send_ping**
Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**
Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- RTI_UINT32 **interface_poll_period**
Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **protocol_overhead_max**
Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**
Disables detection of network interface changes.
- char * **public_address**
Public IP address associated with the transport instantiation.
- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo** * **comm_ports_list**
Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

- RTI_INT32 **comm_ports_list_length**

Number of elements in the `NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list` (p. 1787).

- RTI_INT32 **port_offset**

Port offset to allow coexistence with built-in UDPv4 transport.

- RTI_UINT32 **binding_ping_period**

Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

9.343.1 Detailed Description

Configurable IPv4/UDP WAN Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

NDDSTransportSupport::set_builtin_transport_property() (p. 1815)

NDDS_Transport_UDPv4_WAN_new (p. 280)

9.343.2 Member Data Documentation

9.343.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv4_WAN_Property_t::parent
```

Generic properties of all transport plugins.

9.343.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

See also

NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size (p. 1772)

9.343.2.3 `recv_socket_buffer_size`

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

See also

NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size (p. 1772)

9.343.2.4 `ignore_loopback_interface`

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connexx decide between the above two choices.

The current "automatic" (-1) RTI Connexx policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connexx policy based on availability of the shared memory transport.

9.343.2.5 ignore_nonup_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking** (p. 1786) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

9.343.2.6 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↔_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

9.343.2.7 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connexx will use the zero-copy API if offered by the OS.

9.343.2.8 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS

9.343.2.9 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **DDSDomainParticipant::get_participant_protocol_status** (p. 1390).

[default] 1 (enabled)

9.343.2.10 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 1785) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 1785) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 449)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

9.343.2.11 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 1784) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 1785) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

9.343.2.12 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 1784) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 1785) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

9.343.2.13 send_ping

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_ping

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

9.343.2.14 force_interface_poll_detection

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::force_interface_poll_detection

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

9.343.2.15 interface_poll_period

RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::interface_poll_period

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

9.343.2.16 protocol_overhead_max

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::protocol_overhead_max

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1761) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↵_max, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 1761)

9.343.2.17 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connex application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connex 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

9.343.2.18 public_address

```
char* NDDS_Transport_UDPv4_WAN_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary for the Real-Time WAN Transport associated with an external **DDSDomainParticipant** (p. 1335) (publicly reachable) in order to support the two communication scenarios shown in the Figure below.

For an external **DDSDomainParticipant** (p. 1335) behind a NAT-enabled router, this address is the public IP address of the router.

When this property is set, the DomainParticipant will announce PUBLIC+UUID locators to other DomainParticipants. These locators are reachable locators because they contain this public IP address.

For additional information on Real-Time WAN Transport locators, see the `Core Libraries User's Manual`.

with a Participant that has a Public Address"

[default] NULL (the transport will announce UUID locators)

9.343.2.19 comm_ports_list

```
struct NDDS_Transport_UDP_WAN_CommPortsMappingInfo* NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list
```

Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

Array containing the mapping between "RTPS ports", "UDP receive host ports", and "UDP receive public ports".

When the transport is configured using properties, the port mapping array is provided using a JSON string.

For example:

```
{
  "default": {"host": 8192, "public": 9678},
  "mappings": [
    {"rtps": 1234, "host": 9999, "public": 5678},
    {"rtps": 1235, "host": 9990, "public": 5679},
  ]
}
```

It is also possible to configure the mapping with XML:

```
<transport_builtin>
  <udpv4_wan>
    <comm_ports>
      <default>
        <host>8192</host>
        <public>9678</public>
      </default>
      <mappings>
        <element>
          <rtps>1234</rtps>
          <host>9999</host>
          <public>5678</public>
        </element>
        <element>
          <rtps>1235</rtps>
          <host>9990</host>
          <public>5679</public>
        </element>
      </mappings>
    </comm_ports>
  </udpv4_wan>
</transport_builtin>
```

For additional information on how to set the value of this property, see the `Core Libraries User's Manual`.

[default] NULL (The UDP ports used for communications will be derived from the RTPS ports associated with the locators for the DomainParticipant and its Endpoints (DataWriters and DataReaders)).

9.343.2.20 comm_ports_list_length

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list_length
```

Number of elements in the **NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list** (p.1787).

[default] 0

9.343.2.21 port_offset

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::port_offset
```

Port offset to allow coexistence with built-in UDPv4 transport.

This property allows using the built-in UDPv4 transport and the Real-Time WAN Transport at the same time.

```
<transport_builtin>  
  <mask>UDPv4_WAN|UDPv4</mask>  
</transport_builtin>
```

When the UDP ports used by Real-Time WAN Transport are not explicitly set, they are calculated as follows: RTPS port + port_offset.

[default] 125

9.343.2.22 binding_ping_period

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::binding_ping_period
```

Specifies the period in milliseconds at which BINDING_PINGS messages are sent to keep NAT mappings open.

Configures the period in milliseconds at which BINDING_PING messages are sent by a local transport instance to a remote transport instance. For example, 1000 means to send BINDING_PING messages every second.

BINDING_PING messages are used on the sending side to open NAT bindings from a local transport instance to a remote transport instance and they are sent periodically to keep the bindings open.

On the receiving side, BINDING_PINGS are used to calculate the public IP transport address of an UUID locator. This address will be used to send data to the locator.

For additional information on the role of BINDING_PING, see the `Core Libraries User's Manual`.

From a configuration point of view, and to avoid communication disruptions, the period at which a transport instance sends BINDING_PING messages should be smaller than the NAT binding session timeout. This timeout depends on the NAT router configuration.

[default] 1000 (1 sec)

9.344 NDDS_Transport_UDPv6_Property_t Struct Reference

Configurable IPv6/UDP Transport-Plugin properties.

Public Attributes

- struct **NDDS_Transport_Property_t** **parent**
Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**
Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**
Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**
Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**
Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**
Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**
Prevents the transport plugin from putting multicast packets onto the loopback interface.
- RTI_INT32 **ignore_loopback_interface**
Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonrunning_interfaces**
Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**
[DEPRECATED] Prevents the transport plugin from doing zero copy.
- RTI_INT32 **send_blocking**
Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **enable_v4mapped**
Specify whether UDPv6 transport will process IPv4 addresses.
- RTI_UINT32 **transport_priority_mask**
Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**
Set low value of output range to IPv6 TCLASS.
- RTI_INT32 **transport_priority_mapping_high**
Set high value of output range to IPv6 TCLASS.
- RTI_INT32 **send_ping**
Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**
Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.
- RTI_UINT32 **interface_poll_period**
Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**
Controls whether or not to reuse multicast receive resources.
- RTI_INT32 **protocol_overhead_max**
Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**
Disables detection of network interface changes.
- RTI_UINT32 **join_multicast_group_timeout**
[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.
- char * **public_address**
Public IP address associated with the transport instantiation.

9.344.1 Detailed Description

Configurable IPv6/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

NDDSTransportSupport::set_builtin_transport_property() (p. 1815)

NDDS_Transport_UDPv6_new (p. 289)

9.344.2 Member Data Documentation

9.344.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv6_Property_t::parent
```

Generic properties of all transport plugins.

9.344.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt ()` will be called to set the `SENDBUF` to the value of this parameter.

This value must be greater than or equal to **NDDS_Transport_Property_t::message_size_max** (p. 1761). The maximum value is operating system-dependent.

By default, it will be set to **NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (p. 287).

If you configure this parameter to be **NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT** (p. 287), then `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. The transport will use the OS default.

9.344.2.3 `recv_socket_buffer_size`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the `RCVBUF` to the value of this parameter.

This value must be greater than or equal to `NDDS_Transport_Property_t::message_size_max` (p. 1761). The maximum value is operating system-dependent.

By default, it will be set to `NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT` (p. 287).

If you configure this parameter to be `NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT` (p. 287), then `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. The transport will use the OS default.

9.344.2.4 `unicast_enabled`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

9.344.2.5 `multicast_enabled`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

9.344.2.6 `multicast_ttl`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

See also

NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT (p. 288)

9.344.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connex will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

9.344.2.8 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. Do not use the IP loopback interface even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient transport (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connex decide between the above two choices.

The current "automatic" (-1) RTI Connex policy is as follows.

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UDPv6 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv6 for local traffic also).

[default] -1 Automatic RTI Connex policy based on availability of the shared memory transport.

9.344.2.9 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↔_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0:** Do not check the RUNNING flag when enumerating interfaces, just make sure interface is UP.
- **1:** Check flag when enumerating interfaces and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

9.344.2.10 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. If you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off the use of zero copy.

By default this is set to 0, so RTI Connexx will use the zero copy API if offered by the OS.

9.344.2.11 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS.

9.344.2.12 enable_v4mapped

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::enable_v4mapped
```

Specify whether UDPv6 transport will process IPv4 addresses.

Set this to 1 to turn on processing of IPv4 addresses. Note that this may make it incompatible with use of the UDPv4 transport within the same domain participant.

[default] 0.

9.344.2.13 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

If transport priority mapping is supported on the platform, this mask is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low** (p.1795) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high** (p.1795) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p.449)) to the IPv6 TCLASS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv6 TCLASS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv6 TCLASS for send sockets.

[default] 0.

9.344.2.14 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p.1795) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high** (p.1795) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the low value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0.

9.344.2.15 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p. 1795) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low** (p. 1795) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the high value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0xff.

9.344.2.16 send_ping

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_ping
```

Configures whether to send PING messages.

See also

NDDS_Transport_UDPv4_Property_t::send_ping (p. 1777)

9.344.2.17 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.

See also

NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection (p. 1777)

9.344.2.18 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

See also

NDDS_Transport_UDPv4_Property_t::interface_poll_period (p. 1777)

9.344.2.19 reuse_multicast_receive_resource

RTI_INT32 NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource

Controls whether or not to reuse multicast receive resources.

See also

NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource (p. 1777)

9.344.2.20 protocol_overhead_max

RTI_INT32 NDDS_Transport_UDPv6_Property_t::protocol_overhead_max

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1761) plus this overhead is larger than the UDPv6 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size↔_max, to 65535 minus this overhead.

[default] 48.

See also

NDDS_Transport_Property_t::message_size_max (p. 1761)

9.344.2.21 disable_interface_tracking

RTI_INT32 NDDS_Transport_UDPv6_Property_t::disable_interface_tracking

Disables detection of network interface changes.

See also

NDDS_Transport_UDPv4_Property_t::disable_interface_tracking (p. 1778)

9.344.2.22 join_multicast_group_timeout

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

See also

NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout (p. 1778)

9.344.2.23 public_address

```
char* NDDS_Transport_UDPv6_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **DDSDomainParticipant** (p. 1335) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **DDS_RtpsWellKnownPorts_t** (p. 1062)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **DDSDomainParticipant** (p. 1335) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] NULL (the transport uses the IP addresses obtained from the NICs)

9.345 NDDS_Transport_UUID Struct Reference

Univocally identifies a transport plugin instance.

9.345.1 Detailed Description

Univocally identifies a transport plugin instance.

9.346 NDDS_Utility_NetworkCaptureParams_t Struct Reference

Input parameters for starting network capture.

Public Attributes

- struct **DDS_StringSeq** **transports**
List of transports to capture.
- **NDDS_Utility_NetworkCaptureContentKindMask** **dropped_content**
Exclude contents from the capture file.
- **NDDS_Utility_NetworkCaptureTrafficKindMask** **traffic**
Traffic direction to capture.
- **DDS_Boolean** **parse_encrypted_content**
If secure traffic should be decrypted or not.
- struct **DDS_ThreadSettings_t** **checkpoint_thread_settings**
The properties of the checkpoint thread.
- **DDS_Long** **frame_queue_size**
Size of the frame queue (Bytes).

9.346.1 Detailed Description

Input parameters for starting network capture.

9.346.2 Member Data Documentation

9.346.2.1 transports

```
struct DDS_StringSeq NDDS_Utility_NetworkCaptureParams_t::transports
```

List of transports to capture.

Network Capture will only save RTPS frames if the associated transport protocol is part of this sequence.

[default] Empty sequence initializer. This means that by default all transports will be captured.

9.346.2.2 dropped_content

NDDS_Utility_NetworkCaptureContentKindMask `NDDS_Utility_NetworkCaptureParams_t::dropped_content`

Exclude contents from the capture file.

It accepts values from **NDDS_Utility_NetworkCaptureContentKind** (p. 539) and **NDDS_Utility_NetworkCaptureContentKindMask** (p. 539) .

We can choose to exclude user data or encrypted content from the capture file.

[default] No content is excluded - **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT** (p. 537).

9.346.2.3 traffic

NDDS_Utility_NetworkCaptureTrafficKindMask `NDDS_Utility_NetworkCaptureParams_t::traffic`

Traffic direction to capture.

It accepts values from **NDDS_Utility_NetworkCaptureTrafficKind** (p. 540) and **NDDS_Utility_NetworkCaptureTrafficKindMask** (p. 539) .

[default] Capture both inbound and outbound traffic - **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT** (p. 538).

9.346.2.4 parse_encrypted_content

DDS_Boolean `NDDS_Utility_NetworkCaptureParams_t::parse_encrypted_content`

If secure traffic should be decrypted or not.

Network Capture supports decryption of RTPS messages and submessages. It does not support decryption of the user data payload (<data_protection_kind> tag in the GovernanceDocument).

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.346.2.5 checkpoint_thread_settings

struct DDS_ThreadSettings_t `NDDS_Utility_NetworkCaptureParams_t::checkpoint_thread_settings`

The properties of the checkpoint thread.

The checkpoint thread is a per-participant thread responsible for reading frames from a queue and saving them to disk (as soon as they are produced).

The members that can be configured are:

- **DDS_ThreadSettings_t::mask** (p. 1109). Default value of (**DDS_THREAD_SETTINGS_PRIORITY_ENFORCE** (p. 351) | **DDS_THREAD_SETTINGS_STDIO** (p. 351)).
- **DDS_ThreadSettings_t::priority** (p. 1109). Platform-dependent - Consult `Platform Notes` for additional details.
- **DDS_ThreadSettings_t::stack_size** (p. 1109). Platform-dependent - Consult `Platform Notes` for additional details.

9.346.2.6 frame_queue_size

```
DDS_Long NDDSS_Utility_NetworkCaptureParams_t::frame_queue_size
```

Size of the frame queue (Bytes).

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

[default] 2097152 (2MB).

Activity Context APIs.

Activity Context APIs.

9.348 NDDSSConfigLogger Class Reference

<<**interface**>> (p. 236) The singleton type used to configure RTI Connex logging.

Public Member Functions

- **NDDS_Config_LogVerbosity get_verbosity ()**
Get the verbosity at which RTI Connex is currently logging diagnostic information.
- **NDDS_Config_LogVerbosity get_verbosity_by_category (NDDS_Config_LogCategory category)**
Get the verbosity at which RTI Connex is currently logging diagnostic information in the given category.
- void **set_verbosity (NDDS_Config_LogVerbosity verbosity)**
Set the verbosity at which RTI Connex will log diagnostic information.
- void **set_verbosity_by_category (NDDS_Config_LogCategory category, NDDS_Config_LogVerbosity verbosity)**
Set the verbosity at which RTI Connex will log diagnostic information in the given category.
- FILE * **get_output_file ()**
Get the file to which the logged output is redirected.
- bool **set_output_file (FILE *out)**
Set the file to which the logged output is redirected.
- bool **set_output_file_set (const char *file_prefix, const char *file_suffix, int max_capacity, int max_files)**
Configure a set of files to redirect the logged output.
- **NDDSSConfigLoggerDevice * get_output_device ()**
Return the user device registered with the logger.
- bool **set_output_device (NDDSSConfigLoggerDevice *device)**
*Register a **NDDSSConfigLoggerDevice** (p. 1807).*
- **NDDS_Config_LogPrintFormat get_print_format ()**
*Get the current message format for the log level **NDDS_CONFIG_LOG_LEVEL_ERROR** (p. 524).*
- bool **set_print_format (NDDS_Config_LogPrintFormat print_format)**
*Set the message format that RTI Connex will use to log diagnostic information for all the log levels, except for **NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 524). When the **Activity Context** (p. 528) is printed, the user can select the information that will be part of the **Activity Context** (p. 528) by using the API **NDDSSConfigActivityContext::set_attribute_mask** (p. 533).*
- **NDDS_Config_LogPrintFormat get_print_format_by_log_level (NDDS_Config_LogLevel log_level)**
Get the current message format, by log level, that RTI Connex is using to log diagnostic information.
- bool **set_print_format_by_log_level (NDDS_Config_LogPrintFormat print_format, NDDS_Config_LogLevel log_level)**
*Set the message format, by log level, that RTI Connex will use to log diagnostic information. When the **Activity Context** (p. 528) is printed, the user can select the information that will be part of the **Activity Context** (p. 528) by using the API **NDDSSConfigActivityContext::set_attribute_mask** (p. 533).*

Static Public Member Functions

- static **NDDSSConfigLogger * get_instance ()**
Get the singleton instance of this type.
- static void **finalize_instance ()**
Finalize the singleton instance of this type.

9.348.1 Detailed Description

<<**interface**>> (p. 236) The singleton type used to configure RTI Connex logging.

9.348.2 Member Function Documentation

9.348.2.1 `get_instance()`

```
static NDDConfigLogger * NDDConfigLogger::get_instance ( ) [static]
```

Get the singleton instance of this type.

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

9.348.2.2 `finalize_instance()`

```
static void NDDConfigLogger::finalize_instance ( ) [static]
```

Finalize the singleton instance of this type.

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another logger-related method, including this one.

9.348.2.3 `get_verbosity()`

```
NDDS_Config_LogVerbosity NDDConfigLogger::get_verbosity ( )
```

Get the verbosity at which RTI Connex is currently logging diagnostic information.

The default verbosity if **NDDConfigLogger::set_verbosity** (p. 1804) is never called is **NDDS_CONFIG_LOG_↔
VERBOSITY_ERROR** (p. 524).

If **NDDConfigLogger::set_verbosity_by_category** (p. 1804) has been used to set different verbositys for different categories of messages, this method will return the maximum verbosity of all categories.

9.348.2.4 `get_verbosity_by_category()`

```
NDDS_Config_LogVerbosity NDDSSConfigLogger::get_verbosity_by_category (
    NDDS_Config_LogCategory category )
```

Get the verbosity at which RTI Connex is currently logging diagnostic information in the given category.

The default verbosity if `NDDSSConfigLogger::set_verbosity` (p. 1804) and `NDDSSConfigLogger::set_verbosity_by_category` (p. 1804) are never called is `NDDS_CONFIG_LOG_VERBOSITY_ERROR` (p. 524).

9.348.2.5 `set_verbosity()`

```
void NDDSSConfigLogger::set_verbosity (
    NDDS_Config_LogVerbosity verbosity )
```

Set the verbosity at which RTI Connex will log diagnostic information.

Note: Logging at high verbosity levels will be detrimental to your application's performance. Your default setting should typically remain at `NDDS_CONFIG_LOG_VERBOSITY_WARNING` (p. 524) or below. (The default verbosity if you never set it is `NDDS_CONFIG_LOG_VERBOSITY_ERROR` (p. 524).)

Examples

`HelloWorld_publisher.cxx`, and `HelloWorld_subscriber.cxx`.

9.348.2.6 `set_verbosity_by_category()`

```
void NDDSSConfigLogger::set_verbosity_by_category (
    NDDS_Config_LogCategory category,
    NDDS_Config_LogVerbosity verbosity )
```

Set the verbosity at which RTI Connex will log diagnostic information in the given category.

9.348.2.7 `get_output_file()`

```
FILE * NDDSSConfigLogger::get_output_file ( )
```

Get the file to which the logged output is redirected.

If no output file has been registered through `NDDSSConfigLogger::set_output_file` (p. 1804), this method will return `NULL`. In this case, logged output will on most platforms go to standard out as if through `printf`.

9.348.2.8 set_output_file()

```
bool NDDConfigLogger::set_output_file (
    FILE * out )
```

Set the file to which the logged output is redirected.

The file passed may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

For better performance when log messages are generated frequently, the log messages are not flushed into a file immediately after they are generated. In other words, while writing a log message, RTI Connex only calls the function `fwrite()` (see <https://pubs.opengroup.org/onlinepubs/009695399/functions/fwrite.html>); it does not call the function `fflush()` (see <https://pubs.opengroup.org/onlinepubs/009695399/functions/fflush.html>). If your application requires a different flushing behavior, you may use **NDDConfigLogger::set_output_device** (p. 1805) to configure a custom logging device.

9.348.2.9 set_output_file_set()

```
bool NDDConfigLogger::set_output_file_set (
    const char * file_prefix,
    const char * file_suffix,
    int max_capacity,
    int max_files )
```

Configure a set of files to redirect the logged output.

The logged output will be redirected to a set of files whose names are configured with a prefix and a suffix. The maximum number of bytes configures how many bytes to write into a file before opening the next file. After reaching the maximum number of files, the first one is overwritten.

For example, if the prefix is '**Foo** (p. 1632)', the suffix is '.txt', the max number of bytes is 1GB, and the max number of files is 3, the logger will create (at most) these files: Foo1.txt, Foo2.txt, and Foo3.txt. It will write to Foo1.txt, and after writing 1GB, it will move on to Foo2.txt, then to Foo3.txt, then to Foo1.txt again, and so on.

To stop logging to these files and redirect the output to the platform-specific location, pass NULL, NULL, 0, 0.

See **NDDConfigLogger::set_output_file** (p. 1804) for the flushing behavior.

9.348.2.10 get_output_device()

```
NDDConfigLoggerDevice * NDDConfigLogger::get_output_device ( )
```

Return the user device registered with the logger.

Returns

Registered user device or NULL if no user device is registered.

9.348.2.11 set_output_device()

```
bool NDDSSConfigLogger::set_output_device (
    NDDSSConfigLoggerDevice * device )
```

Register a **NDDSSConfigLoggerDevice** (p. 1807).

Register the specified logging device with the logger.

There can be at most only one device registered with the logger at any given time.

When a device is installed, the logger will stop sending the log messages to the standard output and to the file set with **NDDSSConfigLogger::set_output_file** (p. 1804).

To remove an existing device, use this method with NULL as the device parameter. After a device is removed the logger will continue sending log messages to the standard output and to the output file.

To replace an existing device with a new device, use this method providing the new device as the device parameter.

When a device is unregistered (by setting it to NULL), **NDDSSConfigLoggerDevice** (p.1807) calls the method **NDDSSConfigLoggerDevice::close** (p. 1808).

Parameters

<i>device</i>	<< <i>in</i> >> (p. 237) Logging device.
---------------	--

9.348.2.12 get_print_format()

```
NDDSS_Config_LogPrintFormat NDDSSConfigLogger::get_print_format ( )
```

Get the current message format for the log level **NDDSS_CONFIG_LOG_LEVEL_ERROR** (p. 524).

Use **NDDSSConfigLogger::get_print_format_by_log_level** (p. 1806) to retrieve the format for other log levels.

If **NDDSSConfigLogger::set_print_format** (p.1806) is never called, the default format is **NDDSS_CONFIG_LOG_LEVEL_PRINT_FORMAT_DEFAULT** (p. 526).

9.348.2.13 set_print_format()

```
bool NDDSSConfigLogger::set_print_format (
    NDDSS_Config_LogPrintFormat print_format )
```

Set the message format that RTI Connexx will use to log diagnostic information for all the log levels, except for **NDDSS_CONFIG_LOG_LEVEL_FATAL_ERROR** (p. 524). When the **Activity Context** (p. 528) is printed, the user can select the information that will be part of the **Activity Context** (p. 528) by using the API **NDDSSConfigActivityContext::set_attribute_mask** (p. 533).

9.348.2.14 get_print_format_by_log_level()

```
NDDS_Config_LogPrintFormat NDDSSConfigLogger::get_print_format_by_log_level (
    NDDS_Config_LogLevel log_level )
```

Get the current message format, by log level, that RTI Connex is using to log diagnostic information.

If `NDDSSConfigLogger::set_print_format` (p. 1806) is never called, the default format is `NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT` (p. 526).

9.348.2.15 set_print_format_by_log_level()

```
bool NDDSSConfigLogger::set_print_format_by_log_level (
    NDDS_Config_LogPrintFormat print_format,
    NDDS_Config_LogLevel log_level )
```

Set the message format, by log level, that RTI Connex will use to log diagnostic information. When the **Activity Context** (p. 528) is printed, the user can select the information that will be part of the **Activity Context** (p. 528) by using the API `NDDSSConfigActivityContext::set_attribute_mask` (p. 533).

9.349 NDDSSConfigLoggerDevice Class Reference

<<*interface*>> (p. 236) Logging device interface. Use for user-defined logging devices.

Public Member Functions

- virtual void **write** (const `NDDS_Config_LogMessage` *message)=0
Write a log message to a specified logging device.
- virtual void **close** ()
Close the logging device.

9.349.1 Detailed Description

<<*interface*>> (p. 236) Logging device interface. Use for user-defined logging devices.

Interface for handling log messages.

By default, the logger sends the log messages generated by RTI Connex to the standard output.

You can use the method `NDDSSConfigLogger::set_output_file` (p. 1804) to redirect the log messages to a file.

To further customize the management of generated log messages, the logger offers the method `NDDSSConfigLogger::set_output_device` (p. 1805) that allows you to install a user-defined logging device.

The logging device installed by the user must implement this interface.

Note: It is not safe to make any calls to the RTI Connex core library, including calls to `DDSDomainParticipant::get_current_time` (p. 1381), from any of the logging device operations.

9.349.2 Member Function Documentation

9.349.2.1 write()

```
virtual void NDDSSConfigLoggerDevice::write (
    const NDDSS_Config_LogMessage * message ) [pure virtual]
```

Write a log message to a specified logging device.

Note: It is not safe to make any calls to the RTI Connex core library, including calls to **DDSDomainParticipant::get_↵_current_time** (p. 1381), from any of the logging device operations.

Parameters

<i>message</i>	<< <i>in</i> >> (p. 237) Message to log.
----------------	--

9.349.2.2 close()

```
virtual void NDDSSConfigLoggerDevice::close ( ) [virtual]
```

Close the logging device.

Note: It is not safe to make any calls to the RTI Connex core library, including calls to **DDSDomainParticipant::get_↵_current_time** (p. 1381), from any of the logging device operations.

9.350 NDDSSConfigVersion Class Reference

<<*interface*>> (p. 236) The version of an RTI Connex distribution.

Public Member Functions

- const **DDS_ProductVersion_t** & **get_product_version** () const
Get the RTI Connex product version.
- const **NDDSS_Config_LibraryVersion_t** & **get_cpp_api_version** () const
Get the version of the C++ API library.
- const **NDDSS_Config_LibraryVersion_t** & **get_c_api_version** () const
Get the version of the C API library.
- const **NDDSS_Config_LibraryVersion_t** & **get_core_version** () const
Get the version of the core library.
- const char * **to_string** () const
Get this version in string form.

Static Public Member Functions

- static const **NDDSConfigVersion** & **get_instance** ()

Get the singleton instance of this type.

9.350.1 Detailed Description

<<*interface*>> (p. 236) The version of an RTI Connex distribution.

The complete version is made up of the versions of the individual libraries that make up the product distribution.

9.350.2 Member Function Documentation

9.350.2.1 **get_instance()**

```
static const NDDSConfigVersion & NDDSConfigVersion::get_instance ( ) [static]
```

Get the singleton instance of this type.

9.350.2.2 **get_product_version()**

```
const DDS_ProductVersion_t & NDDSConfigVersion::get_product_version ( ) const
```

Get the RTI Connex product version.

9.350.2.3 **get_cpp_api_version()**

```
const NDDS_Config_LibraryVersion_t & NDDSConfigVersion::get_cpp_api_version ( ) const
```

Get the version of the C++ API library.

9.350.2.4 **get_c_api_version()**

```
const NDDS_Config_LibraryVersion_t & NDDSConfigVersion::get_c_api_version ( ) const
```

Get the version of the C API library.

9.350.2.5 get_core_version()

```
const NDDS_Config_LibraryVersion_t & NDDSSConfigVersion::get_core_version ( ) const
```

Get the version of the core library.

9.350.2.6 to_string()

```
const char * NDDSSConfigVersion::to_string ( ) const
```

Get this version in string form.

Combine all of the constituent library versions into a single string.

The memory in which the string is stored is internal to this **NDDSSConfigVersion** (p. 1808). The caller should not modify it.

9.351 NDDSTransportSupport Class Reference

<<*interface*>> (p. 236) The utility class used to configure RTI Connexx pluggable transports.

Static Public Member Functions

- static **DDS_ReturnCode_t** **set_builtin_transport_property** (**DDSDomainParticipant** *participant_in,
DDS_TransportBuiltinKind builtin_transport_kind_in, const struct **NDDS_Transport_Property_t** &builtin_↵
_transport_property_in)
Set the properties used to create a builtin transport plugin.
- static **NDDS_Transport_Plugin *** **get_transport_plugin** (**DDSDomainParticipant** *participant_in, const char
*alias_in)
*Retrieve a transport plugin registered in a **DDSDomainParticipant** (p. 1335) by its alias.*

9.351.1 Detailed Description

<<*interface*>> (p. 236) The utility class used to configure RTI Connexx pluggable transports.

9.351.2 Member Function Documentation

9.351.2.1 register_transport()

```
static NDDS_Transport_Handle_t NDDSTransportSupport::register_transport (
    DDSDomainParticipant * participant_in,
    NDDS_Transport_Plugin * transport_in,
    const DDS_StringSeq & aliases_in,
    const NDDS_Transport_Address_t & network_address_in ) [static]
```

Register a transport plugin for use with a **DDSDomainParticipant** (p. 1335), assigning it a `network_address`.

A transport plugin instance can be used by exactly one **DDSDomainParticipant** (p. 1335) at a time.

When a `DataWriter/DataReader` is created, only those transports already registered to the corresponding **DDSDomainParticipant** (p. 1335) are available to the `DataWriter/DataReader`.

Builtin transports can be automatically registered by RTI Connexx as a convenience to the user. See **Built-in Transport Plugins** (p. 176) for details on how to control the builtin transports that are automatically registered.

Precondition

A disabled **DDSDomainParticipant** (p. 1335) and a transport plugin that will be registered exclusively with it.

Parameters

<i>participant_in</i>	<< <i>in</i> >> (p. 237) A non-null, disabled DDSDomainParticipant (p. 1335).
<i>transport_in</i>	<< <i>in</i> >> (p. 237) A non-null transport plugin that is currently not registered with another DDSDomainParticipant (p. 1335).
<i>aliases_in</i>	<< <i>in</i> >> (p. 237) A non-null sequence of strings used as aliases to symbolically refer to the transport plugins. The transport plugin will be "available for use" by a DDSEntity (p. 1446) in the DDSDomainParticipant (p. 1335) if the transport alias list associated with the DDSEntity (p. 1446) contains one of these transport aliases. An empty alias list represents a wildcard and matches all aliases. Alias names for the builtin transports are defined in TRANSPORT_BUILTIN (p. 442).
<i>network_address_in</i>	<< <i>in</i> >> (p. 237) The network address at which to register this transport plugin. The least significant <code>transport_in.property.address_bit_count</code> will be truncated. The remaining bits are the network address of the transport plugin. (see Transport Class Attributes (p. ??)).

Returns

Upon success, a valid non-NIL transport handle, representing the association between the **DDSDomainParticipant** (p. 1335) and the transport plugin; a **NDDS_TRANSPORT_HANDLE_NIL** (p. 176) upon failure.

Note that a transport plugin's class name is automatically registered as an implicit alias for the plugin. Thus, a class name can be used to refer to all the transport plugin instance of that class.

See also

Transport Class Attributes (p. ??)

Transport Network Address (p. ??)

Locator Format (p. ??)

NDDS_DISCOVERY_PEERS (p. 464)

9.351.2.2 lookup_transport()

```
static NDDS_Transport_Handle_t NDDSTransportSupport::lookup_transport (
    DDSDomainParticipant * participant_in,
    DDS_StringSeq & aliases_out,
    NDDS_Transport_Address_t & network_address_out,
    NDDS_Transport_Plugin * transport_in ) [static]
```

Look up a transport plugin within a **DDSDomainParticipant** (p. 1335).

The transport plugin should have already been registered with the **DDSDomainParticipant** (p. 1335).

Parameters

<i>participant_in</i>	<< <i>in</i> >> (p. 237) A non-null DDSDomainParticipant (p. 1335).
<i>aliases_out</i>	<< <i>inout</i> >> (p. 237) A sequence of string where the aliases used to refer to the transport plugin symbolically will be returned. null if not interested.
<i>network_address_out</i>	<< <i>inout</i> >> (p. 237) The network address at which to register the transport plugin will be returned here. null if not interested.
<i>transport_in</i>	<< <i>in</i> >> (p. 237) A non-null transport plugin that is already registered with the DDSDomainParticipant (p. 1335).

Returns

Upon success, a valid non-NIL transport handle, representating the association between the **DDSDomainParticipant** (p. 1335) and the transport plugin; a **NDDS_TRANSPORT_HANDLE_NIL** (p. 176) upon failure.

See also

Transport Class Attributes (p. ??)

Transport Network Address (p. ??)

9.351.2.3 add_send_route()

```
static DDS_ReturnCode_t NDDSTransportSupport::add_send_route (
    const NDDS_Transport_Handle_t & transport_handle_in,
    const NDDS_Transport_Address_t & address_range_in,
    DDS_Long address_range_bit_count_in ) [static]
```

Add a route for outgoing messages.

This method can be used to narrow the range of addresses to which outgoing messages can be sent.

Precondition

A disabled **DDSDomainParticipant** (p. 1335).

Parameters

<i>transport_handle_in</i>	<< <i>in</i> >> (p. 237) A valid non-NIL transport handle as a result of a call to NDDSTransportSupport::register_transport() (p. 1811).
<i>address_range_in</i>	<< <i>in</i> >> (p. 237) The outgoing address range for which to use this transport plugin.
<i>address_range_bit_count_in</i>	<< <i>in</i> >> (p. 237) The number of most significant bits used to specify the address range.

Returns

One of the **Standard Return Codes** (p. 335), or **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

See also

Transport Send Route (p. ??)

9.351.2.4 add_receive_route()

```
static DDS_ReturnCode_t NDDSTransportSupport::add_receive_route (
    const NDDS_Transport_Handle_t & transport_handle_in,
    const NDDS_Transport_Address_t & address_range_in,
    DDS_Long address_range_bit_count_in ) [static]
```

Add a route for incoming messages.

This method can be used to narrow the range of addresses at which to receive incoming messages.

Precondition

A disabled **DDSDomainParticipant** (p. 1335).

Parameters

<i>transport_handle_in</i>	<< <i>in</i> >> (p. 237) A valid non-NIL transport handle as a result of a call to NDDSTransportSupport::register_transport() (p. 1811).
<i>address_range_in</i>	<< <i>in</i> >> (p. 237) The incoming address range for which to use this transport plugin.
<i>address_range_bit_count↔_in</i>	<< <i>in</i> >> (p. 237) The number of most significant bits used to specify the address range.

Returns

One of the **Standard Return Codes** (p. 335), or **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

See also

Transport Receive Route (p. 171)

9.351.2.5 get_builtin_transport_property()

```
static DDS_ReturnCode_t NDDSTransportSupport::get_builtin_transport_property (
    DDSDomainParticipant * participant_in,
    DDS_TransportBuiltinKind builtin_transport_kind_in,
    struct NDDS_Transport_Property_t & builtin_transport_property_inout ) [static]
```

Get the properties used to create a builtin transport plugin.

Retrieves the properties that will be used to create a builtin transport plugin.

Precondition

The *builtin_transport_property_inout* parameter must be of the type specified by the *builtin↔_transport_kind_in*.

Parameters

<i>participant_in</i>	<< <i>in</i> >> (p. 237) A valid non-null DDSDomainParticipant (p. 1335)
<i>builtin_transport_kind_in</i>	<< <i>in</i> >> (p. 237) The builtin transport kind for which to retrieve the properties.
<i>builtin_transport_property_inout</i>	<< <i>inout</i> >> (p. 237) The storage area where the retrieved property will be output. The specific type required by the <i>builtin_transport_kind_in</i> must be used.

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
-----	--

See also

NDDSTransportSupport::set_builtin_transport_property() (p. 1815)

9.351.2.6 set_builtin_transport_property()

```
static DDS_ReturnCode_t NDDSTransportSupport::set_builtin_transport_property (
    DDSDomainParticipant * participant_in,
    DDS_TransportBuiltinKind builtin_transport_kind_in,
    const struct NDDS_Transport_Property_t & builtin_transport_property_in ) [static]
```

Set the properties used to create a builtin transport plugin.

Specifies the properties that will be used to create a builtin transport plugin.

If the builtin transport is already registered when this operation is called, these property changes will *not* have any effect. Builtin transport properties should always be set before the transport is registered. See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered.

Precondition

A disabled **DDSDomainParticipant** (p. 1335). The `builtin_transport_property_inout` parameter must be of the type specified by the `builtin_transport_kind_in`.

Parameters

<i>participant_in</i>	<< <i>in</i> >> (p. 237) A valid non-null DDSDomainParticipant (p. 1335) that has not been enabled.
<i>builtin_transport_kind_in</i>	<< <i>in</i> >> (p. 237) The builtin transport kind for which to specify the properties.
<i>builtin_transport_property_in</i>	<< <i>inout</i> >> (p. 237) The new transport property that will be used to create the builtin transport plugin. The specific type required by the <code>builtin_transport_kind_in</code> must be used.

Exceptions

One	of the Standard Return Codes (p. 335), or DDS_RETCODE_PRECONDITION_NOT_MET (p. 335).
-----	--

See also

NDDSTransportSupport::get_builtin_transport_property() (p. 1814)

9.351.2.7 get_transport_plugin()

```
static NDDS_Transport_Plugin * NDDSTransportSupport::get_transport_plugin (
    DDSDomainParticipant * participant_in,
    const char * alias_in ) [static]
```

Retrieve a transport plugin registered in a **DDSDomainParticipant** (p. 1335) by its alias.

This method can be used to get a pointer to a transport Plugin that has been registered into the **DDSDomainParticipant** (p. 1335).

Parameters

<i>participant_in</i>	<< <i>in</i> >> (p. 237) A non-null DDSDomainParticipant (p. 1335).
<i>alias_in</i>	<< <i>in</i> >> (p. 237) A non-null string used to symbolically refer to the transport plugins.

Returns

Upon success, a valid non-null pointer to a registered plugin; a null pointer if a plugin with that alias is not registered/found in that participant.

9.352 NDDSTUtility Class Reference

Other Utilities APIs.

Static Public Member Functions

- static void **sleep** (const struct **DDS_Duration_t** &durationIn)
Block the calling thread for the specified duration.
- static void **spin** (**DDS_UnsignedLongLong** spinCount)
Performs the spin operation as many times as indicated.
- static **DDS_UnsignedLongLong** **get_spin_per_microsecond** ()
Returns the number of spin operations to perform to wait 1 microsecond.
- static **DDS_Boolean** **enable_heap_monitoring** ()
[DEPRECATED] See: NDDSTUtilityHeapMonitoring::enable (p. 1820).

[DEPRECATED] See: NDDSTUtilityHeapMonitoring::take_heap_snapshot (p. 1821).

9.352.1 Detailed Description

Other Utilities APIs.

9.352.2 Member Function Documentation

9.352.2.1 sleep()

```
static void NDDSTility::sleep (
    const struct DDS_Duration_t & durationIn ) [static]
```

Block the calling thread for the specified duration.

Note that the achievable resolution of sleep is OS-dependent. That is, do not assume that you can sleep for 1 nanosecond just because you can specify a 1-nanosecond sleep duration via the API. The sleep resolution on most operating systems is usually 10 ms or greater.

Parameters

<i>duration</i> ↔ <i>In</i>	<< <i>in</i> >> (p. 237) Sleep duration.
--------------------------------	--

MT Safety:

safe

Examples

HelloWorld_publisher.cxx.

9.352.2.2 spin()

```
static void NDDSTility::spin (
    DDS_UnsignedLongLong spinCount ) [static]
```

Performs the spin operation as many times as indicated.

Spinning is the action of performing useless operations in a for loop in order to actively wait some time without yielding the CPU. Given that the resolution of sleep is in the order of ms, you can use this utility to wait times in the order of microseconds. To properly use this functionality, it is useful to measure previously the number of spin operations needed to wait the equivalent to microsecond (using the utility `get_spin_per_microsecond`) and then compute the corresponding spin count desired.

Parameters

<i>spinCount</i>	<< <i>in</i> >> (p. 237) Number of spin operations to perform.
------------------	--

9.352.2.3 get_spin_per_microsecond()

```
static DDS_UnsignedLongLong NDDUtility::get_spin_per_microsecond ( ) [static]
```

Returns the number of spin operations to perform to wait 1 microsecond.

This utility can be used to measure how many spin operations must be performed to wait 1 microsecond. Since the time that it takes the CPU to perform 1 spin operation depends on the CPU frequency, it is recommended to use this utility before using **spin()** (p. 1817).

Returns

Number of spin operations to wait 1 microsecond.

```
static DDS_Boolean NDDUtility::enable_heap_monitoring ( ) [static]
```

[DEPRECATED] See: **NDDUtilityHeapMonitoring::enable** (p. 1820).

9.352.2.5 disable_heap_monitoring()

```
static void NDDUtility::disable_heap_monitoring ( ) [static]
```

[DEPRECATED] See: **NDDUtilityHeapMonitoring::disable** (p. 1820).

9.352.2.6 pause_heap_monitoring()

```
static DDS_Boolean NDDSTility::pause_heap_monitoring ( ) [static]
```

[DEPRECATED] See: `NDDSTilityHeapMonitoring::pause` (p. 1821).

9.352.2.7 resume_heap_monitoring()

```
static DDS_Boolean NDDSTility::resume_heap_monitoring ( ) [static]
```

[DEPRECATED] See: `NDDSTilityHeapMonitoring::resume` (p. 1821)

9.352.2.8 take_heap_snapshot()

```
static DDS_Boolean NDDSTility::take_heap_snapshot (
    const char * filename,
    DDS_Boolean print_details ) [static]
```

[DEPRECATED] See: `NDDSTilityHeapMonitoring::take_heap_snapshot` (p. 1821).

9.353 NDDSTilityHeapMonitoring Class Reference

Heap Monitoring APIs.

Static Public Member Functions

- static **DDS_Boolean enable** ()
Starts monitoring the heap memory used by RTI Connex.
- static **DDS_Boolean enable** (const NDDSTilityHeapMonitoringParams_t ¶ms)
Starts monitoring the heap memory used by RTI Connex.
- static void **disable** ()
Stops monitoring the heap memory used by RTI Connex.
- static **DDS_Boolean pause** ()
Pauses heap monitoring.
- static **DDS_Boolean resume** ()
Resumes heap monitoring.
- static **DDS_Boolean take_heap_snapshot** (const char *filename, **DDS_Boolean** print_details)
Saves the current heap memory usage in a file.

9.353.1 Detailed Description

Heap Monitoring APIs.

9.353.2 Member Function Documentation

9.353.2.1 `enable()` [1/2]

```
static DDS_Boolean NDDUtilityHeapMonitoring::enable ( ) [static]
```

Starts monitoring the heap memory used by RTI Connex.

This function must be called before any other function in the RTI Connex library is called.

Once heap monitoring is enabled, you can take heap snapshots by using **NDDUtilityHeapMonitoring::take_heap_snapshot** (p. 1821).

Use this method only for debugging purposes, since it may introduce a significant performance impact.

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another heap-related method, including this one.

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityHeapMonitoring::disable (p. 1820)

9.353.2.2 `enable()` [2/2]

```
static DDS_Boolean NDDUtilityHeapMonitoring::enable (
    const NDDUtilityHeapMonitoringParams_t & params ) [static]
```

Starts monitoring the heap memory used by RTI Connex.

Performs the same function as **NDDUtilityHeapMonitoring::enable** (p. 1820) except that it also provides the values in *params*. Those values will set the format used in the snapshot **NDDUtilityHeapMonitoring::take_heap_snapshot** (p. 1821).

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityHeapMonitoring::disable (p. 1820)

9.353.2.3 disable()

```
static void NDDSTilityHeapMonitoring::disable ( ) [static]
```

Stops monitoring the heap memory used by RTI Connex.

This method must be the last method called from RTI Connex.

See also

NDDSTilityHeapMonitoring::enable (p. 1820)

9.353.2.4 pause()

```
static DDS_Boolean NDDSTilityHeapMonitoring::pause ( ) [static]
```

Pauses heap monitoring.

New memory allocations will not be monitored and they will not appear in the snapshot generated by **NDDSTilityHeapMonitoring::take_heap_snapshot** (p. 1821).

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDSTilityHeapMonitoring::resume (p. 1821)

9.353.2.5 resume()

```
static DDS_Boolean NDDSTilityHeapMonitoring::resume ( ) [static]
```

Resumes heap monitoring.

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDSTilityHeapMonitoring::pause (p. 1821)

9.353.2.6 take_heap_snapshot()

```
static DDS_Boolean NDDUtilityHeapMonitoring::take_heap_snapshot (
    const char * filename,
    DDS_Boolean print_details ) [static]
```

Saves the current heap memory usage in a file.

After **NDDUtilityHeapMonitoring::enable** (p.1820) is called, you may invoke this method periodically to save the current heap memory usage to a file.

By comparing two snapshots, you can tell if new memory has been allocated and in many cases where. This is why this operation can be used to debug unexpected memory growth.

The format of a snapshot is as follows:

First, there is a memory usage summary like this:

```
<P>
    Product Version: NDDSCORE_BUILD_6.0.0.0_20200316T123411Z_RTI_ENG
    Process virtual memory: 2552352768
    Process physical memory: 16187392
    Current application heap usage: 10532131
    Approximate total heap usage: 203331110
    High watermark: 10532131
    Alloc count: 17634
    Free count: 3518
```

- Process virtual memory: The amount of virtual memory in bytes taken by the process. This memory includes RTI Connex and non-RTI Connex memory.
- Process virtual memory: The amount of physical memory in bytes taken by the process.
- Current application heap usage: The amount of heap memory in bytes used by the middleware. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connex memory, not memory living in the managed heap. This value does not include overhead memory allocations that are used by the Heap Monitoring utility. It therefore provides the heap usage that is used when Heap Monitoring is disabled and does not reflect the actual amount of memory that has been allocated by the middleware. That value is accounted for in 'Approximate total heap usage'.
- Approximate total heap usage: The amount of heap memory in bytes used by the middleware, including overhead allocations from the Heap Monitoring utility. When the Heap Monitoring utility is enabled, every allocation has an additional overhead number of bytes allocated so that the middleware can keep track of the meta-data that is output in the heap snapshots. This overhead is not accounted for in the 'Current application heap usage' summary field, but is included in this field. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connex memory, not memory living in the managed heap.
- High watermark: The maximum amount of heap usage by RTI Connex since **NDDUtilityHeapMonitoring::enable** (p.1820) was invoked.
- Alloc count: The number of invocations to malloc, realloc, or calloc operations done by RTI Connex.
- Free count: The number of invocations to the free operation done by RTI Connex.

After the previous summary, and only if you set the parameter print_details to **DDS_BOOLEAN_TRUE** (p.316), the method will print the details of every single outstanding heap allocation done by RTI Connex. For example:

```
<P>
    block_id, timestamp, block_size, alloc_method_name, type_name, pool_alloc, pool_buffer_size,
    pool_buffer_count, topic_name, function_name, activity_context
    23087, 1586943520, 16, RTIOsapiHeap_allocateArray, struct RTIEncapsulationInfo, MALLOC, 0,
    0, PRESServiceRequest, PRESWriterHistoryDriver_new,
    "0X101175A,0X76DD63D7,0X984377BC:0X1C1{Name=ShapeTypeParticipant,Domain=110}|CREATE
    Participant|ENABLE|:0X80000088{Entity=Pu,Domain=110}|CREATE Writer WITH TOPIC PRESServiceRequest"
```

- `block_id`: Block ID of the allocation. This number increases with every allocation.
- `timestamp`: Timestamp in UTC seconds corresponding to the time where the allocation was done.
- `block_size`: The number of bytes allocated.
- `alloc_method_name`: The allocation RTI Connex method name.
- `type_name`: The allocation typename.
- `pool_alloc`: Indicates if the heap allocation is a RTI Connex pool allocation (POOL) or a regular allocation (MALLOC).
- `pool_buffer_size`: For pool allocations, this number indicates the size of the elements in the pool in number of bytes. `block_size` is equal to (`pool_buffer_size * pool_buffer_count`).
- `pool_buffer_count`: For pool allocations, this number indicates the number of buffers allocated for the pool. `block_size` is equal to (`pool_buffer_size * pool_buffer_count`).
- `topic_name`: The topic name associated with the allocation or 'n/a' if it is not available.
- `function_name`: function name associated with the allocation or 'n/a' if it is not available.
- `activity_context`: **Activity Context** (p. 528)

Parameters

<i>filename</i>	<< <i>in</i> >> (p. 237). Name of file in which to store the snapshot.
<i>print_details</i>	<< <i>in</i> >> (p. 237). Indicates if the snapshot will contain only the memory usage summary or the details of the individual allocations.

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

Resume capturing traffic for all DomainParticipants.

 - static **DDS_Boolean resume** (**DDSDomainParticipant** *participant)

Resume capturing traffic for a DomainParticipant.

9.354.1 Detailed Description

Network Capture APIs.

9.354.2 Member Function Documentation

9.354.2.1 enable()

```
static DDS_Boolean NDDUtilityNetworkCapture::enable ( ) [static]
```

Enable Network Capture.

This method must be called before any other Network Capture method. It must also be called before creating the participants for which we want to capture traffic.

Use this method only for debugging purposes, since it may introduce a significant performance impact.

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Capture related method, including this one.

MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this method while another thread may be simulatenously calling **DDSDomainParticipantFactory::get_instance** (p. 1412), **DDSDomainParticipantFactory::finalize_instance** (p. 1412), **DDS_TypeCodeFactory::get_instance** (p. 1196), **NDDUtilityNetworkCapture::enable** (p. 1824), or **NDDUtilityNetworkCapture::disable** (p. 1825).

See also

NDDUtilityNetworkCapture::disable (p. 1825)

9.354.2.2 disable()

```
static DDS_Boolean NDDUtilityNetworkCapture::disable ( ) [static]
```

Disable Network Capture.

This method must be the last Network Capture method to be called. It must also be called after deleting the participants for which we captured traffic. Disabling Network Capture without stopping it first is not ok!

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

MT Safety:

UNSAFE. It is not safe to call this method while another thread may be simultaneously calling another Network Capture related method, including this one.

MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this method while another thread may be simulatenously calling **DDSDomainParticipantFactory::get_instance** (p. 1412), **DDSDomainParticipantFactory::finalize_instance** (p. 1412), **DDS_TypeCodeFactory::get_instance** (p. 1196), **NDDUtilityNetworkCapture::enable** (p. 1824), or **NDDUtilityNetworkCapture::disable** (p. 1825).

See also

NDDUtilityNetworkCapture::enable (p. 1824)

9.354.2.3 `set_default_params()`

```
static DDS_Boolean NDDUtilityNetworkCapture::set_default_params (
    const NDDUtility_NetworkCaptureParams_t & params ) [static]
```

Set the default Network Capture parameters.

The default parameters are used when Network Capture is started without parameters, i.e., **NDDUtilityNetworkCapture::start** (p. 1826).

Precondition

This method requires first enabling Network Capture. See **NDDUtilityNetworkCapture::enable** (p. 1824).

Parameters

<i>params</i>	<< <i>in</i> >> (p. 237). Configuration parameters that we want to set as defaults.
---------------	---

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityNetworkCapture::start (p. 1826)

NDDUtilityNetworkCapture::start(DDSDomainParticipant *, const char *) (p. 1827)

9.354.2.4 `start()` [1/4]

```
static DDS_Boolean NDDUtilityNetworkCapture::start (
    const char * filename ) [static]
```

Start capturing traffic for all DomainParticipants, with the default parameters.

Precondition

This method requires first enabling Network Capture. See **NDDUtilityNetworkCapture::enable** (p. 1824).

Parameters

<i>filename</i>	<< <i>in</i> >> (p. 237). The name of the output capture file will be based on this input parameter.
-----------------	--

In particular, the name for the capture file is the concatenation of the *filename* input parameter, the "_GUID-"

string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (".pcap").

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityNetworkCapture::stop (p. 1829)

NDDUtilityNetworkCapture::start(DDSDomainParticipant *, const char *) (p. 1827)

9.354.2.5 start() [2/4]

```
static DDS_Boolean NDDUtilityNetworkCapture::start (
    DDSDomainParticipant * participant,
    const char * filename ) [static]
```

Start capturing traffic for a DomainParticipant, with the default parameters.

Precondition

This method requires first enabling Network Capture. See **NDDUtilityNetworkCapture::enable** (p. 1824).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237). DomainParticipant for which we want to capture traffic.
<i>filename</i>	<< <i>in</i> >> (p. 237). The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the *filename* input parameter, and the file extension (".pcap").

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityNetworkCapture::stop(DDSDomainParticipant *) (p. 1829)

**NDDUtilityNetworkCapture::start(DDSDomainParticipant *, const char *, const NDDUtility_Network←
CaptureParams_t&)** (p. 1828)

NDDUtilityNetworkCapture::enable (p. 1824)

9.354.2.6 start() [3/4]

```
static DDS_Boolean NDDUtilityNetworkCapture::start (
    const char * filename,
    const NDDS_Utility_NetworkCaptureParams_t & params ) [static]
```

Start capturing traffic for all DomainParticipants, with the provided parameters.

Precondition

This method requires first enabling Network Capture. See **NDDUtilityNetworkCapture::enable** (p. 1824).

Performs the same function as **NDDUtilityNetworkCapture::start** (p. 1826) except that it uses the provided parameters, instead of the default ones.

Parameters

<i>filename</i>	<< <i>in</i> >> (p. 237). The name of the output capture file will be based on this input parameter.
-----------------	--

In particular, the name for the capture file is the concatenation of the *filename* input parameter, the "_GUID-" string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (".pcap").

Parameters

<i>params</i>	<< <i>in</i> >> (p. 237). Configuration parameters for the capture.
---------------	---

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityNetworkCapture::stop (p. 1829)

NDDUtilityNetworkCapture::start(DDSDomainParticipant *, const char *, const NDDS_Utility_NetworkCaptureParams_t&) (p. 1828)

9.354.2.7 start() [4/4]

```
static DDS_Boolean NDDUtilityNetworkCapture::start (
    DDSDomainParticipant * participant,
    const char * filename,
    const NDDS_Utility_NetworkCaptureParams_t & params ) [static]
```

Start capturing traffic for a DomainParticipant, with the provided parameters.

Precondition

This method requires enabling first Network Capture. See **NDDUtilityNetworkCapture::enable** (p. 1824).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237). DomainParticipant for which we want to capture traffic.
<i>filename</i>	<< <i>in</i> >> (p. 237). The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

Parameters

<i>params</i>	<< <i>in</i> >> (p. 237). Parameters for configuring the capture.
---------------	---

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDSUtilityNetworkCapture::stop(DDSDomainParticipant *) (p. 1829)

NDDSUtilityNetworkCapture::start(DDSDomainParticipant *, const char *) (p. 1827)

9.354.2.8 stop() [1/2]

```
static DDS_Boolean NDDSUtilityNetworkCapture::stop ( ) [static]
```

Stop capturing traffic for all participants.

Precondition

This method requires enabling first Network Capture. See **NDDSUtilityNetworkCapture::enable** (p. 1824).

This method can (and must) be called after **NDDSUtilityNetworkCapture::start** (p. 1826), not **NDDSUtilityNetworkCapture::start(DDSDomainParticipant *, const char *)** (p. 1827). That is, if we start capturing traffic globally (for all DomainParticipants), we must stop capturing traffic also globally. It is not possible to start capturing traffic for a participant but stop it globally.

It is possible to start capturing globally and then stop capturing for a participant, as long as we eventually stop capturing traffic globally.

We must stop capturing for a participant before deleting it.

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDSUtilityNetworkCapture::start (p. 1826)

NDDSUtilityNetworkCapture::stop(DDSDomainParticipant *) (p. 1829)

9.354.2.9 stop() [2/2]

```
static DDS_Boolean NDDSUtilityNetworkCapture::stop (
    DDSDomainParticipant * participant ) [static]
```

Stop capturing traffic for a DomainParticipant.

Precondition

This method requires first enabling Network Capture. See **NDDSUtilityNetworkCapture::enable** (p. 1824).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237). DomainParticipant for which we want to stop capturing traffic.
--------------------	--

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDSUtilityNetworkCapture::start(DDSDomainParticipant *, const char *) (p. 1827)

NDDSUtilityNetworkCapture::stop (p. 1829)

9.354.2.10 pause() [1/2]

```
static DDS_Boolean NDDSUtilityNetworkCapture::pause ( ) [static]
```

Pause capturing traffic for all DomainParticipants.

Precondition

This method requires first enabling Network Capture. See **NDDSUtilityNetworkCapture::enable** (p. 1824).

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDSUtilityNetworkCapture::resume (p. 1831)

NDDSUtilityNetworkCapture::pause(DDSDomainParticipant *) (p. 1830)

9.354.2.11 pause() [2/2]

```
static DDS_Boolean NDDUtilityNetworkCapture::pause (
    DDSDomainParticipant * participant ) [static]
```

Pause capturing traffic for a DomainParticipant.

Precondition

This method requires first enabling Network Capture. See **NDDUtilityNetworkCapture::enable** (p. 1824).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237). DomainParticipant for which we want to pause capturing traffic.
--------------------	---

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityNetworkCapture::resume(DDSDomainParticipant *) (p. 1831)

NDDUtilityNetworkCapture::pause (p. 1830)

9.354.2.12 resume() [1/2]

```
static DDS_Boolean NDDUtilityNetworkCapture::resume ( ) [static]
```

Resume capturing traffic for all DomainParticipants.

Precondition

This method requires first enabling Network Capture. See **NDDUtilityNetworkCapture::enable** (p. 1824).

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDUtilityNetworkCapture::pause (p. 1830)

NDDUtilityNetworkCapture::resume(DDSDomainParticipant *) (p. 1831)

9.354.2.13 resume() [2/2]

```
static DDS_Boolean NDDSUtilityNetworkCapture::resume (
    DDSDomainParticipant * participant ) [static]
```

Resume capturing traffic for a DomainParticipant.

Precondition

This method requires first enabling Network Capture. See **NDDSUtilityNetworkCapture::enable** (p. 1824).

Parameters

<i>participant</i>	<< <i>in</i> >> (p. 237). DomainParticipant for which we want to resume capturing traffic.
--------------------	--

Returns

DDS_BOOLEAN_TRUE (p. 316) if success. Otherwise, **DDS_BOOLEAN_FALSE** (p. 316)

See also

NDDSUtilityNetworkCapture::pause(DDSDomainParticipant *) (p. 1830)

NDDSUtilityNetworkCapture::resume (p. 1831)

9.355 connext::NotEnabledException Class Reference

Operation invoked on a **DDSEntity** (p. 1446) that is not yet enabled.

Inheritance diagram for connext::NotEnabledException:

**9.355.1 Detailed Description**

Operation invoked on a **DDSEntity** (p. 1446) that is not yet enabled.

See also

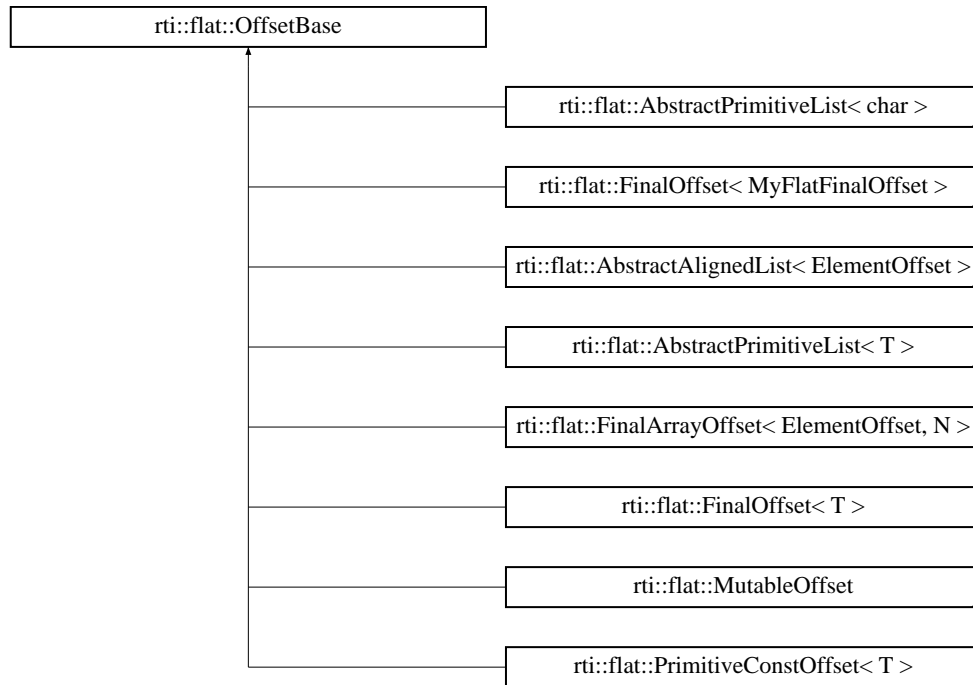

DDS_RETCODE_NOT_ENABLED (p. 336)

9.356 rti::flat::OffsetBase Class Reference

Base class of all Offset types.

```
#include <Offset.hpp>
```

Inheritance diagram for rti::flat::OffsetBase:

Public Member Functions

- bool **is_null** () const
Indicates whether this Offset doesn't point to a valid element.
- bool **is_cpp_compatible** () const
*Indicates whether **rti::flat::plain_cast()** (p. 560) is possible.*
- const unsigned char * **get_buffer** () const
Gets this member's position in the buffer.
- offset_t **get_buffer_size** () const
Gets the size, in bytes, of this member in the buffer.

Friends

- bool **operator<** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.
- bool **operator>** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.

- bool **operator<=** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.
- bool **operator>=** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.
- bool **operator==** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Determines if two offsets point to the same position.
- bool **operator!=** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Determines if two offsets point to different positions.

9.356.1 Detailed Description

Base class of all Offset types.

See also

FlatData Offsets (p. 558)

9.356.2 Member Function Documentation

9.356.2.1 is_null()

```
bool rti::flat::OffsetBase::is_null ( ) const [inline]
```

Indicates whether this Offset doesn't point to a valid element.

See also

Offset Error Management (p. 560)

Referenced by **get_buffer()**.

9.356.2.2 is_cpp_compatible()

```
bool rti::flat::OffsetBase::is_cpp_compatible ( ) const [inline]
```

Indicates whether **rti::flat::plain_cast()** (p. 560) is possible.

Returns

True only if the data pointed to by this Offset can be **rti::flat::plain_cast()** (p. 560)

See also

rti::flat::plain_cast() (p. 560) for the requirements that a type needs to meet

9.356.2.3 get_buffer()

```
const unsigned char * rti::flat::OffsetBase::get_buffer ( ) const [inline]
```

Gets this member's position in the buffer.

Note

This function should be used for debugging purposes only. To access the data in this Offset use the Offset accessor methods or, if this type allows it, **rti::flat::plain_cast()** (p. 560).

Returns the position within the **Sample** (p. 1893)'s buffer that this Offset points to.

See also

get_buffer_size() (p. 1835)

References **is_null()**.

Referenced by **rti::flat::StringOffset::get_string()**.

9.356.2.4 get_buffer_size()

```
offset_t rti::flat::OffsetBase::get_buffer_size ( ) const [inline]
```

Gets the size, in bytes, of this member in the buffer.

Returns the number of bytes that this member comprises after the position returned by **get_buffer()**.

Referenced by **rti::flat::AbstractAlignedList< ElementOffset >::begin()**, and **rti::flat::AbstractAlignedList< ElementOffset >::end()**.

9.356.3 Friends And Related Function Documentation

9.356.3.1 operator<

```
bool operator< (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position smaller than s2's.

9.356.3.2 operator>

```
bool operator> (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position greater than s2's.

9.356.3.3 operator<=

```
bool operator<= (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position equal to or smaller than s2's.

9.356.3.4 operator>=

```
bool operator>= (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position equal to or greater than s2's.

9.356.3.5 operator==

```
bool operator== (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Determines if two offsets point to the same position.

Returns

True if s1 points to the same position as s2.

9.356.3.6 operator!=

```
bool operator!= (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Determines if two offsets point to different positions.

Returns

True if s1 points to a different position than s2.

9.357 connext::OutOfResourcesException Class Reference

RTI Connex ran out of the resources needed to complete the operation.

DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)

9.359 rti::flat::PrimitiveArrayOffset< T, N > Class Template Reference

Offset to an array of primitive elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::PrimitiveArrayOffset< T, N >:

Public Member Functions

- unsigned int **element_count** () const

Returns the number of elements, N.

9.359.1 Detailed Description

```
template<typename T, unsigned int N>
class rti::flat::PrimitiveArrayOffset< T, N >
```

Offset to an array of primitive elements.

Template Parameters

<i>T</i>	The primitive type
<i>N</i>	The array bound. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

A **PrimitiveArrayOffset** (p. 1838) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast()** (p. 560)).

9.359.2 Member Function Documentation

9.359.2.1 element_count()

```
template<typename T , unsigned int N>
unsigned int  rti::flat::PrimitiveArrayOffset< T, N >::element_count ( ) const [inline]
```

Returns the number of elements, *N*.

9.360 rti::flat::PrimitiveConstOffset< T > Struct Template Reference

A const Offset to an optional primitive member.

```
#include <Offset.hpp>
```

Inheritance diagram for rti::flat::PrimitiveConstOffset< T >:

Public Member Functions

- **T** **get** () const
Gets the value of this primitive member.

9.360.1 Detailed Description

```
template<typename T>
struct rti::flat::PrimitiveConstOffset< T >
```

A const Offset to an optional primitive member.

Read-only version of **PrimitiveOffset** (p. 1840).

If `!is_null()`, the value can be retrieved with **get()** (p. 1840).

9.360.2 Member Function Documentation

9.360.2.1 `get()`

```
template<typename T >
T rti::flat::PrimitiveConstOffset< T >::get ( ) const [inline]
```

Gets the value of this primitive member.

Precondition

`!is_null()`

9.361 `rti::flat::PrimitiveOffset< T >` Struct Template Reference

An Offset to an optional primitive member.

```
#include <Offset.hpp>
```

Inheritance diagram for `rti::flat::PrimitiveOffset< T >`:

Public Member Functions

- bool **set** (T value)
Sets a value for this primitive member.

9.361.1 Detailed Description

```
template<typename T>
struct rti::flat::PrimitiveOffset< T >
```

An Offset to an optional primitive member.

Template Parameters

<i>T</i>	The primitive type
----------	--------------------

Non-optional primitive members are accessed directly using its container type's methods; however, since an optional member may not exist, this Offset is returned instead. The only purpose of the type **PrimitiveOffset** (p. 1840) is to provide a way to check for the member's existence.

If `!is_null()`, the value can be retrieved with **get()** (p. 1840) or set with **set()** (p. 1841).

See also

MyFlatMutableOffset::my_optional_primitive (p. 1741) vs. **MyFlatMutableOffset::my_primitive** (p. 1741)

9.361.2 Member Function Documentation

9.361.2.1 set()

```
template<typename T >
bool  rti::flat::PrimitiveOffset< T >::set (
        T value )  [inline]
```

Sets a value for this primitive member.

Precondition

`!is_null()`

9.362 rti::flat::PrimitiveSequenceBuilder< T > Class Template Reference

Builds a sequence of primitive members.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for `rti::flat::PrimitiveSequenceBuilder< T >`:

Public Member Functions

- **PrimitiveSequenceBuilder** & **add_next** (T value)
Adds the next element.
- **PrimitiveSequenceBuilder** & **add_n** (const T *array, unsigned int count)
Adds all the elements in an array.
- **PrimitiveSequenceBuilder** & **add_n** (unsigned int count, T value)
Adds a number of elements with the same value.
- **PrimitiveSequenceBuilder** & **add_n** (unsigned int count)
Adds a number of uninitialized elements.
- **Offset finish** ()
Finishes building the sequence.

Additional Inherited Members

9.362.1 Detailed Description

```
template<typename T>
class rti::flat::PrimitiveSequenceBuilder< T >
```

Builds a sequence of primitive members.

The elements can be added one by one with `add_next()` or all at once with **`add_n()`** (p. 1842).

9.362.2 Member Function Documentation

9.362.2.1 `add_next()`

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_next (
    T value ) [inline]
```

Adds the next element.

Parameters

<i>value</i>	The primitive element to add
--------------	------------------------------

9.362.2.2 add_n() [1/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
    const T * array,
    unsigned int count ) [inline]
```

Adds all the elements in an array.

Parameters

<i>array</i>	The array containing the values to add
<i>count</i>	The size of the array

9.362.2.3 add_n() [2/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
    unsigned int count,
    T value ) [inline]
```

Adds a number of elements with the same value.

This overload initializes all the elements to a value.

Note

This operation is $O(\text{count})$. The other overloads, **add_n(unsigned int)** (p. 1843) and **add_n(const T*, unsigned int)** (p. 1842), are more efficient

Parameters

<i>count</i>	The number of elements to add
<i>value</i>	The value to set for each element

9.362.2.4 add_n() [3/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
    unsigned int count ) [inline]
```

Adds a number of uninitialized elements.

This operation is $O(1)$, since it leaves the elements uninitialized. They can be initialized using the Offset returned by **finish()** (p. 1844) and **rti::flat::plain_cast()** (p. 560). For example:

```
MyFlatMutableBuilder builder = ...;
auto seq_builder = builder.build_my_primitive_seq();
seq_builder.add_n(1000);
auto seq_offset = seq_builder.finish();
int32_t *elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 1000; i++) {
    elements[i] = ...;
}
```

Parameters

<i>count</i>	The number of elements to add
--------------	-------------------------------

9.362.2.5 finish()

```
template<typename T >
Offset rti::flat::PrimitiveSequenceBuilder< T >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

See also

discard() (p. 574)

9.363 rti::flat::PrimitiveSequenceOffset< T > Class Template Reference

Offset to a sequence of primitive elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for `rti::flat::PrimitiveSequenceOffset< T >`:

Public Member Functions

- unsigned int **element_count** () const
Returns the number of elements.

9.363.1 Detailed Description

```
template<typename T>
class rti::flat::PrimitiveSequenceOffset< T >
```

Offset to a sequence of primitive elements.

Template Parameters

<i>T</i>	The primitive type
----------	--------------------

9.363.2 Member Function Documentation

9.363.2.1 element_count()

```
template<typename T >
unsigned int rti::flat::PrimitiveSequenceOffset< T >::element_count ( ) const [inline]
```

Returns the number of elements.

Referenced by **rti::flat::StringOffset::element_count()**.

9.364 connext::Replier< TReq, TRep > Class Template Reference

Allows receiving requests and sending replies.

Public Types

- typedef TReq **Request**
The request type.
- typedef TRep **Reply**
The reply type.
- typedef dds_type_traits< TRep >::DataWriter **ReplyDataWriter**
The typed DataWriter for type TRep.
- typedef dds_type_traits< TReq >::DataReader **RequestDataReader**
The typed DataReader for type TReq.

Public Member Functions

- **Replier** (**DDSDomainParticipant** *participant, const std::string &service_name)
*Creates a **Replier** (p. 1845) with the minimum set of parameters.*
- **Replier** (const **ReplierParams**< TReq, TRep > ¶ms)
*Creates a **Replier** (p. 1845) with parameters.*
- virtual **~Replier** ()
*Releases the internal entities created by this **Replier** (p. 1845).*
- template<typename URep >
void **send_reply** (const URep &reply, const **SampleIdentity_t** &related_request_id)
Sends a reply for a previous request.
- template<typename URep >
void **send_reply** (**WriteSample**< URep > &reply, const **SampleIdentity_t** &related_request_id)
Sends a reply for a previous request.
- template<typename URep >
void **send_reply** (**WriteSampleRef**< URep > &reply, const **SampleIdentity_t** &related_request_id)
*Sends a reply for a previous request using a **SampleRef** (p. 1897).*
- bool **receive_request** (**connext::Sample**< TReq > &request, const **DDS_Duration_t** &max_wait)
*Waits for a request and copies its contents into a **Sample** (p. 1889).*
- bool **receive_request** (**connext::SampleRef**< TReq > request, const **DDS_Duration_t** &max_wait)
*Waits for a request and copies its contents into a **SampleRef** (p. 1897).*
- **LoanedSamplesType** **receive_requests** (const **DDS_Duration_t** &max_wait)
Waits for multiple requests and provides a loaned container to access them.
- **LoanedSamplesType** **receive_requests** (int min_request_count, int max_request_count, const **DDS_↔
Duration_t** &max_wait)
Waits for multiple requests and provides a loaned container to access them.
- bool **wait_for_requests** (const **DDS_Duration_t** &max_wait)
Waits for requests.
- bool **wait_for_requests** (int min_count, const **DDS_Duration_t** &max_wait)
Waits for requests.
- bool **take_request** (**connext::Sample**< TReq > &request)
*Copies the contents of a request into a **Sample** (p. 1889).*
- bool **take_request** (**connext::SampleRef**< TReq > request)
*Copies the contents of a request into a **SampleRef** (p. 1897).*
- **LoanedSamplesType** **take_requests** (int max_samples= **DDS_LENGTH_UNLIMITED**)
Provides a loaned container to access the existing requests.
- bool **read_request** (**connext::Sample**< TReq > &request)
*Copies the contents of a request into a **Sample** (p. 1889).*
- bool **read_request** (**connext::SampleRef**< TReq > request)
*Copies the contents of a request into a **SampleRef** (p. 1897).*
- **LoanedSamplesType** **read_requests** (int max_samples= **DDS_LENGTH_UNLIMITED**)
Provides a loaned container to access the existing requests.
- **RequestDataReader** * **get_request_datareader** () const
*Retrieves the underlying **DDSDataReader** (p. 1272).*
- **ReplyDataWriter** * **get_reply_datawriter** () const
*Retrieves the underlying **DDSDataWriter** (p. 1305).*

9.364.1 Detailed Description

```
template<typename TReq, typename TRep>
class connext::Replier< TReq, TRep >
```

Allows receiving requests and sending replies.

A **Replier** (p. 1845) is an entity with two associated **topics** (p. 61): a request topic and a reply topic. It can receive requests by subscribing to the request topic and can send replies to those requests by publishing the reply topic.

Valid types for these topics (**TReq** and **TRep**) are: those generated by **rtiddsgen**, the **DDS built-in types** (p. 92), and **DDS_DynamicData** (p. 769). See **Creating a Replier** (p. 231).

A **Replier** (p. 1845) has four main types of operations:

- Waiting for requests to be received from the middleware
- Getting those requests
- Receiving requests (a convenience operation that is a combination of waiting and getting in a single operation)
- Sending a reply for a previously received request (i.e., publishing a reply sample on the reply topic with special meta-data so that the original **Requester** (p. 1863) can identify it)

For multi-reply scenarios in which a **connext::Replier** (p. 1845) generates more than one reply for a request, the **connext::Replier** (p. 1845) should mark all the intermediate replies (all but the last) using the **DDS_INTERMEDIATE↔_REPLY_SEQUENCE_SAMPLE** (p. 474) flag in **DDS_WriteParams_t::flag** (p. 1238).

Much like a **Requester** (p. 1863), a **Replier** (p. 1845) has an associated **DDSDomainParticipant** (p. 1335), which can be shared with other Repliers or RTI Connex routines. All the other entities required for the request-reply interaction, including a **DDSDataWriter** (p. 1305) for writing replies and a **DDSDataReader** (p. 1272) for reading requests, are automatically created when the **Replier** (p. 1845) is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **connext::RequesterParams↔::qos_profile** (p. 1886)). By default, they are created with **DDS_RELIABLE_RELIABILITY_QOS** (p. 435). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 233)

There are several ways to use a **Replier** (p. 1845):

- A thread **receives** (p. 1853) requests and then dispatches them. If the computation of a reply is a simple operation, consider using a **connext::SimpleReplier** (p. 1912) instead of a **Replier** (p. 1845).
- Polling without waiting, using **take_requests(int)** (p. 1855) directly.
- Using a **connext::ReplierListener** (p. 1857) to get notified and **get** (p. 1855) the requests within the callback.

Template Parameters

<i>TReq</i>	The data type for the request topic
<i>TRep</i>	The data type for the reply topic

connext::Requester (p. 1863)

Request-Reply Examples (p. 225)

Basic Replier example (p. 231)

9.364.2 Member Typedef Documentation

9.364.2.1 Request

```
template<typename TReq , typename TRep >
typedef TReq  connext::Replier< TReq, TRep >::Request
```

The request type.

9.364.2.2 Reply

```
template<typename TReq , typename TRep >
typedef TRep  connext::Replier< TReq, TRep >::Reply
```

The reply type.

9.364.2.3 ReplyDataWriter

```
template<typename TReq , typename TRep >
typedef dds_type_traits<TRep>::DataWriter  connext::Replier< TReq, TRep >::ReplyDataWriter
```

The typed DataWriter for type TRep.

9.364.2.4 RequestDataReader

```
template<typename TReq , typename TRep >
typedef dds_type_traits<TReq>::DataReader  connext::Replier< TReq, TRep >::RequestDataReader
```

The typed DataReader for type TReq.

9.364.3 Constructor & Destructor Documentation

9.364.3.1 Replier() [1/2]

```
template<typename TReq , typename TRep >  
connext::Replier< TReq, TRep >::Replier (   
    DDSDomainParticipant * participant,  
    const std::string & service_name )
```

Creates a **Replier** (p. 1845) with the minimum set of parameters.

Parameters

<i>participant</i>	The DomainParticipant that this Replier (p. 1845) uses to join a domain.
<i>service_name</i>	The service name. See connext::ReplierParams::service_name (p. 1860)

Exceptions

<i>One</i>	of the RTI Connext Exceptions (p. 37)
------------	--

9.364.3.2 Replier() [2/2]

```
template<typename TReq , typename TRep >
connext::Replier< TReq, TRep >::Replier (
    const ReplierParams< TReq, TRep > & params ) [explicit]
```

Creates a **Replier** (p. 1845) with parameters.

Parameters

<i>params</i>	All the parameters that configure this Replier (p. 1845)
---------------	---

Exceptions

<i>One</i>	of the RTI Connext Exceptions (p. 37)
------------	--

See also

connext::ReplierParams (p. 1858)

Creating a Replier (p. 231)

9.364.3.3 ~Replier()

```
template<typename TReq , typename TRep >
connext::Replier< TReq, TRep >::~~Replier [virtual]
```

Releases the internal entities created by this **Replier** (p. 1845).

Among other internal resources, it deletes the **Replier** (p. 1845)'s underlying DataReader and DataWriter.

See also

DDSSubscriber::delete_datareader (p. 1586)

DDSPublisher::delete_datawriter (p. 1545)

9.364.4 Member Function Documentation

9.364.4.1 send_reply() [1/3]

```
template<typename TReq , typename TRep >
template<typename URep >
void connext::Replier< TReq, TRep >::send_reply (
    const URep & reply,
    const SampleIdentity_t & related_request_id )
```

Sends a reply for a previous request.

The related request identity can be retrieved from an existing request sample (**connext::Sample** (p. 1889)).

Parameters

<i>reply</i>	The reply to be sent.
<i>related_request_id</i>	The identity of a previously received request

Exceptions

One	of the RTI Connex Exceptions (p. 37)
-----	---

See also

connext::Sample::identity() (p. 1891)
receive_request(Sample<TReq>&, const Duration_t&) (p. 1852)
receive_requests(int, int, const Duration_t&) (p. 1853)
take_request(Sample<TReq>&) (p. 1855)
take_requests(int) (p. 1855)
Basic Replier example (p. 231)

9.364.4.2 send_reply() [2/3]

```
template<typename TReq , typename TRep >
template<typename URep >
void connext::Replier< TReq, TRep >::send_reply (
    WriteSample< URep > & reply,
    const SampleIdentity_t & related_request_id )
```

Sends a reply for a previous request.

Allows you to set custom parameters for writing a reply.

Contrary to the **connext::Requester** (p. 1863), where retrieving the sample identity for correlation is common, on the **Replier** (p. 1845) side using a **WriteSample** (p. 1925) is only necessary when the default write parameters need to be overridden, and **send_reply(const URep&, const SampleIdentity_t&)** (p. 1851) may be used if that is not necessary.

One reason to override the default write parameters is a multi-reply scenario in which a **connext::Replier** (p. 1845) generates more than one reply for a request. In this case, all the intermediate replies (all but the last) should be marked with the **DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 474) flag in **DDS_WriteParams_t::flag** (p. 1238) within **connext::WriteSample::info()** (p. 1928).

A **connext::Requester** (p. 1863) can detect if a reply is the last reply of a sequence of replies by checking that the flag **DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 474) is not set in **DDS_SampleInfo::flag** (p. 1077) within **connext::Sample::info()** (p. 1892).

See also

send_reply(const URep&, const SampleIdentity_t&) (p. 1851)
connext::WriteSample (p. 1925)

9.364.4.3 send_reply() [3/3]

```
template<typename TReq , typename TRep >
template<typename URep >
void connext::Replier< TReq, TRep >::send_reply (
    WriteSampleRef< URep > & reply,
    const SampleIdentity_t & related_request_id )
```

Sends a reply for a previous request using a **SampleRef** (p. 1897).

See also

connext::WriteSampleRef (p. 1929)
connext::Requester::send_request(WriteSampleRef<UReq>&) (p. 1870)
connext::Replier::send_reply(WriteSample<URep>&, const SampleIdentity_t&) (p. 1851)
Basic Requester example using SampleRef (p. 230)

9.364.4.4 receive_request() [1/2]

```
template<typename TReq , typename TRep >
bool  connext::Replier< TReq, TRep >::receive_request (
    connext::Sample< TReq > & request,
    const DDS_Duration_t & max_wait )
```

Waits for a request and copies its contents into a **Sample** (p. 1889).

Equivalent to using **wait_for_requests(int, const Duration_t&)** (p.1854) and **take_request(Sample<TReq>&)** (p. 1855)

See also

connext::Sample (p. 1889)
wait_for_requests(int, const Duration_t&) (p. 1854)
take_request(Sample<TReq>&) (p. 1855)
Basic Replier example (p. 231)

9.364.4.5 receive_request() [2/2]

```
template<typename TReq , typename TRep >
bool  connext::Replier< TReq, TRep >::receive_request (
    connext::SampleRef< TReq > request,
    const DDS_Duration_t & max_wait )
```

Waits for a request and copies its contents into a **SampleRef** (p. 1897).

See also

connext::Requester::receive_reply(SampleRef<TRep>, const Duration_t&) (p. 1871)

9.364.4.6 receive_requests() [1/2]

```
template<typename TReq , typename TRep >
Replier< TReq, TRep >::LoanedSamplesType  connext::Replier< TReq, TRep >::receive_requests (
    const DDS_Duration_t & max_wait )
```

Waits for multiple requests and provides a loaned container to access them.

Equivalent to using **receive_requests(int, int, const Duration_t&)** (p.1853) with `min_count=1` and `max_count=DDS_LENGTH_UNLIMITED` (p. 437)

See also

connext::LoanedSamples (p. 1709)
receive_requests(int, int, const Duration_t&) (p. 1853)

9.364.4.7 receive_requests() [2/2]

```
template<typename TReq , typename TRep >
Replier< TReq, TRep >::LoanedSamplesType connext::Replier< TReq, TRep >::receive_requests (
    int min_request_count,
    int max_request_count,
    const DDS_Duration_t & max_wait )
```

Waits for multiple requests and provides a loaned container to access them.

Equivalent to using **wait_for_requests(int, const Duration_t&)** (p. 1854) and **take_requests(int)** (p. 1855)

See also

connext::LoanedSamples (p. 1709)

wait_for_requests(int, const Duration_t&) (p. 1854)

take_requests(int) (p. 1855)

9.364.4.8 wait_for_requests() [1/2]

```
template<typename TReq , typename TRep >
bool connext::Replier< TReq, TRep >::wait_for_requests (
    const DDS_Duration_t & max_wait )
```

Waits for requests.

Equivalent to **wait_for_requests(int, const Duration_t&)** (p. 1854) with min_count=1

See also

wait_for_requests(int, const Duration_t&) (p. 1854)

9.364.4.9 wait_for_requests() [2/2]

```
template<typename TReq , typename TRep >
bool connext::Replier< TReq, TRep >::wait_for_requests (
    int min_count,
    const DDS_Duration_t & max_wait )
```

Waits for requests.

This operation waits for min_count requests to be available. It will wait up to max_wait .

This operation is similar to **connext::Requester::wait_for_replies(int, const Duration_t&)** (p. 1873).

Parameters

<i>min_count</i>	Minimum number of requests that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum waiting time after which this operation unblocks regardless of how many requests are available.

Returns

true if at least `min_count` requests were available before `max_wait` elapsed, or false otherwise.

take_requests(int) (p. 1855)

connext::Requester::wait_for_replies(int, const Duration_t&) (p. 1873)

9.364.4.10 take_request() [1/2]

```
template<typename TReq , typename TRep >
bool  connext::Replier< TReq, TRep >::take_request (
        connext::Sample< TReq > & request )
```

Copies the contents of a request into a **Sample** (p. 1889).

See also

connext::Requester::take_reply(Sample<TRep>&) (p. 1875)

9.364.4.11 take_request() [2/2]

```
template<typename TReq , typename TRep >
bool  connext::Replier< TReq, TRep >::take_request (
        connext::SampleRef< TReq > request )
```

Copies the contents of a request into a **SampleRef** (p. 1897).

See also

connext::Requester::take_reply(SampleRef<TRep>) (p. 1875)

9.364.4.12 take_requests()

```
template<typename TReq , typename TRep >
Replier< TReq, TRep >::LoanedSamplesType connext::Replier< TReq, TRep >::take_requests (
    int max_samples = DDS_LENGTH_UNLIMITED )
```

Provides a loaned container to access the existing requests.

See also

connext::Requester::take_replies(int) (p. 1876)

9.364.4.13 read_request() [1/2]

```
template<typename TReq , typename TRep >
bool connext::Replier< TReq, TRep >::read_request (
    connext::Sample< TReq > & request )
```

Copies the contents of a request into a **Sample** (p. 1889).

This operation is equivalent to **connext::Replier::take_request(Sample<TReq>&)** (p. 1855) except the request remains in the **Replier** (p. 1845) and can be read or taken again.

9.364.4.14 read_request() [2/2]

```
template<typename TReq , typename TRep >
bool connext::Replier< TReq, TRep >::read_request (
    connext::SampleRef< TReq > request )
```

Copies the contents of a request into a **SampleRef** (p. 1897).

See also

connext::Requester::read_reply(SampleRef<TRep>) (p. 1881)

9.364.4.15 read_requests()

```
template<typename TReq , typename TRep >
Replier< TReq, TRep >::LoanedSamplesType connext::Replier< TReq, TRep >::read_requests (
    int max_samples = DDS_LENGTH_UNLIMITED )
```

Provides a loaned container to access the existing requests.

This operation is equivalent to **connext::Replier::take_requests(int)** (p. 1855) except the requests remain in the **Replier** (p. 1845) and can be read or taken again.

9.364.4.16 get_request_datareader()

```
template<typename TReq , typename TRep >
Replier< TReq, TRep > ::RequestDataReader * connext::Replier< TReq, TRep >::get_request_↵
datareader [inline]
```

Retrieves the underlying **DDSDataReader** (p. 1272).

See also

connext::Requester::get_reply_datareader() (p. 1883)

9.364.4.17 get_reply_datawriter()

```
template<typename TReq , typename TRep >
Replier< TReq, TRep > ::ReplyDataWriter * connext::Replier< TReq, TRep >::get_reply_datawriter
[inline]
```

Retrieves the underlying **DDSDataWriter** (p. 1305).

See also

connext::Requester::get_request_datawriter() (p. 1883)

9.365 connext::ReplierListener< TReq, TRep > Class Template Reference

Called when a **connext::Replier** (p. 1845) has new available requests.

Public Member Functions

- virtual void **on_request_available** (**Replier**< TReq, TRep > &replier)=0
User callback.

9.365.1 Detailed Description

```
template<class TReq, class TRep>
class connext::ReplierListener< TReq, TRep >
```

Called when a **connext::Replier** (p. 1845) has new available requests.

A repplier listener is a way to implement a callback that will be invoked when requests are available. It is an optional **connext::ReplierParams** (p. 1858).

This listener simply notifies when requests are available. The callback implementation can then use **connext::Replier**↵
::take_requests(int) (p. 1855) to retrieve them.

A simpler callback mechanism, where one request sample is a parameter and the reply is the callback return value, is implemented by the **connext::SimpleReplier** (p. 1912).

See also

connext::Replier::Replier(const ReplierParams&) (p. 1850)

9.365.2 Member Function Documentation

9.365.2.1 on_request_available()

```
template<class TReq , class TRep >
virtual void connext::ReplierListener< TReq, TRep >::on_request_available (
    Replier< TReq, TRep > & replier ) [pure virtual]
```

User callback.

See also

DDSDataReaderListener::on_data_available (p. 1301)

9.366 connext::ReplierParams< TReq, TRep > Class Template Reference

Contains the parameters for creating a **connext::Replier** (p. 1845).

Inherits **connext::details::EntityParams**.

Public Member Functions

- **ReplierParams** (**DDS::DomainParticipant** *participant)
*Creates a **ReplierParams** (p. 1858) with the parameters that a **Replier** (p. 1845) always needs.*
- **ReplierParams** & **replier_listener** (**ReplierListener**< TReq, TRep > &listener)
Sets a listener that is called when requests are available.
- **ReplierParams** & **service_name** (const std::string &service_name)
*The service name the **Replier** (p. 1845) offers and Requesters use to match.*
- **ReplierParams** & **request_topic_name** (const std::string &req_topic)
Sets a specific request topic name.
- **ReplierParams** & **reply_topic_name** (const std::string &rep_topic)
Sets a specific reply topic name.
- **ReplierParams** & **qos_profile** (const std::string &qos_library_name, const std::string &qos_profile_name)
Sets a QoS profile for the entities in this replier.
- **ReplierParams** & **datawriter_qos** (const **DDS_DataWriterQos** &qos)
Sets the quality of service of the reply DataWriter.
- **ReplierParams** & **datareader_qos** (const **DDS_DataReaderQos** &qos)
Sets the quality of service of the request DataReader.
- **ReplierParams** & **publisher** (**DDS::Publisher** *publisher)
Sets a specific Publisher.
- **ReplierParams** & **subscriber** (**DDS::Subscriber** *subscriber)
Sets a specific Subscriber.
- **ReplierParams** & **request_type_support** (**DDS::TypeSupport** *type_support)
Sets the type support for the request type.
- **ReplierParams** & **reply_type_support** (**DDS::TypeSupport** *type_support)
Sets the type support for the reply type.

9.366.1 Detailed Description

```
template<typename TReq, typename TRep>
class connext::ReplierParams< TReq, TRep >
```

Contains the parameters for creating a **connext::Replier** (p. 1845).

See also

connext::RequesterParams (p. 1884)

9.366.2 Constructor & Destructor Documentation

9.366.2.1 ReplierParams()

```
template<typename TReq , typename TRep >
connext::ReplierParams< TReq, TRep >::ReplierParams (
    DDS::DomainParticipant * participant ) [inline], [explicit]
```

Creates a **ReplierParams** (p. 1858) with the parameters that a **Replier** (p. 1845) always needs.

In addition to the participant , a **Replier** (p. 1845) needs either:

- A service name (**service_name** (p. 1860)), or
- Custom topic names (**reply_topic_name** (p. 1860) and **request_topic_name** (p. 1860)).

When **DDS_DynamicData** (p. 769) is used, **connext::ReplierParams::request_type_support** (p. 1862) and/or **connext::ReplierParams::reply_type_support** (p. 1862) are required as well.

The other parameters are optional.

Parameters

<i>participant</i>	The DomainParticipant that this replier uses to join a domain.
--------------------	--

9.366.3 Member Function Documentation

9.366.3.1 replier_listener()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::replier_listener (
    ReplierListener< TReq, TRep > & listener ) [inline]
```

Sets a listener that is called when requests are available.

See also

connext::ReplierListener (p. 1857)

9.366.3.2 service_name()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::service_name (
    const std::string & service_name ) [inline]
```

The service name the **Replier** (p. 1845) offers and Requesters use to match.

See also

connext::RequesterParams::service_name (p. 1886)

9.366.3.3 request_topic_name()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::request_topic_name (
    const std::string & req_topic ) [inline]
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **service_name** (p. 1860). If that topic already exists, it will be reused. This is useful to have the **Replier** (p. 1845) use a **DDSContent**←
FilteredTopic (p. 1267) to receive only certain requests.

9.366.3.4 reply_topic_name()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::reply_topic_name (
    const std::string & rep_topic ) [inline]
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on c the **service_name** (p. 1860). If that topic already exists, it will be reused.

9.366.3.5 qos_profile()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::qos_profile (
    const std::string & qos_library_name,
    const std::string & qos_profile_name ) [inline]
```

Sets a QoS profile for the entities in this replier.

Specifies the XML QoS profile that will be used to configure the quality of service for the **Replier** (p. 1845)'s underlying reply DataWriter and request DataReader.

Parameters

<i>qos_library_name</i>	The name of the QoS library
<i>qos_profile_name</i>	The name of the QoS profile inside the QoS library

See also

connext::RequesterParams::qos_profile (p. 1886)

Configuring Request-Reply QoS profiles (p. 233)

Configuring QoS Profiles with XML (p. 196)

9.366.3.6 datawriter_qos()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::datawriter_qos (
    const DDS_DataWriterQos & qos ) [inline]
```

Sets the quality of service of the reply DataWriter.

See also

qos_profile (p. 1860)

9.366.3.7 datareader_qos()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::datareader_qos (
    const DDS_DataReaderQos & qos ) [inline]
```

Sets the quality of service of the request DataReader.

See also

qos_profile (p. 1860)

9.366.3.8 publisher()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::publisher (
    DDS::Publisher * publisher ) [inline]
```

Sets a specific Publisher.

See also

connext::RequesterParams::publisher (p. 1887)

9.366.3.9 subscriber()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::subscriber (
    DDS::Subscriber * subscriber ) [inline]
```

Sets a specific Subscriber.

See also

connext::RequesterParams::subscriber (p. 1888)

9.366.3.10 request_type_support()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::request_type_support (
    DDS::TypeSupport * type_support ) [inline]
```

Sets the type support for the request type.

This parameter is required when TReq is **DDS_DynamicData** (p. 769).

In all other cases, this parameter is ignored and the singleton Reply<TReq, TRep>::RequestTypeSupport is used instead

See also

DDSDynamicDataTypeSupport (p. 1439)

9.366.3.11 reply_type_support()

```
template<typename TReq , typename TRep >
ReplierParams & connext::ReplierParams< TReq, TRep >::reply_type_support (
    DDS::TypeSupport * type_support ) [inline]
```

Sets the type support for the reply type.

This parameter is required when TRep is **DDS_DynamicData** (p. 769).

In all other cases, this parameter is ignored and the singleton Reply<TReq, TRep>::RequestTypeSupport is used instead

See also

DDSDynamicDataTypeSupport (p. 1439)

9.367 connext::Requester< TReq, TRep > Class Template Reference

Allows sending requests and receiving replies.

Public Types

- typedef TReq **Request**
The request type.
- typedef TRep **Reply**
The reply type.
- typedef dds_type_traits< TReq > ::**DataWriter RequestDataWriter**
The typed DataWriter for type TReq.
- typedef dds_type_traits< TRep > ::**DataReader ReplyDataReader**
The typed DataReader for type TRep.
- typedef dds_type_traits< TReq > ::**TypeSupport RequestTypeSupport**
The type support for type TReq.
- typedef dds_type_traits< TRep > ::**TypeSupport ReplyTypeSupport**
The type support for type TRep.

Public Member Functions

- **Requester** (**DDSDomainParticipant** *participant, const std::string &service_name)
*Creates a **Requester** (p. 1863) with the minimum set of parameters.*
- **Requester** (const **RequesterParams** ¶ms)
*Creates a **Requester** (p. 1863) with parameters.*
- virtual **~Requester** ()
Releases the internal entities created by this object.
- template<typename UReq >
void **send_request** (const UReq &request)
Sends a request.
- template<typename UReq >
void **send_request** (**WriteSample**< UReq > &request)
Sends a request and gets back information about it that allows correlation with future replies.
- template<typename UReq >
void **send_request** (**WriteSampleRef**< UReq > &request)
Sends a request and gets back information about it that allows correlation with future replies.
- bool **receive_reply** (**Sample**< TRep > &reply, const **DDS_Duration_t** &timeout)
*Waits for a reply and copies its contents into a **Sample** (p. 1889).*

*Waits for a reply and copies its contents into a **SampleRef** (p. 1897).*
- **LoanedSamples**< TRep > **receive_replies** (const **DDS_Duration_t** &max_wait)
Waits for multiple replies and provides a loaned container to access them.
- **LoanedSamples**< TRep > **receive_replies** (int min_count, int max_count, const **DDS_Duration_t** &max_wait)
Waits for multiple replies and provides a loaned container to access them.
- bool **wait_for_replies** (int min_count, const **DDS_Duration_t** &max_wait)
Waits for replies to any request.
- bool **wait_for_replies** (const **DDS_Duration_t** &max_wait)
Waits for replies to any request.
- bool **wait_for_replies** (int min_count, const **DDS_Duration_t** &max_wait, const **SampleIdentity_t** &related_request_id)
Waits for replies to a specific request.
- bool **take_reply** (**Sample**< TRep > &reply)
*Copies the contents of a reply into a **Sample** (p. 1889).*
- bool **take_reply** (**SampleRef**< TRep > reply)
*Copies the contents of a reply into a **SampleRef** (p. 1897).*
- **LoanedSamples**< TRep > **take_replies** (int max_count= **DDS_LENGTH_UNLIMITED**)
Provides a loaned container to access the existing replies.
- bool **take_reply** (**Sample**< TRep > &reply, const **SampleIdentity_t** &related_request_id)
Copies the contents of a reply for a specific request.
- bool **take_reply** (**SampleRef**< TRep > reply, const **SampleIdentity_t** &related_request_id)
Copies the contents of a reply for a specific request.
- **LoanedSamples**< TRep > **take_replies** (int max_count, const **SampleIdentity_t** &related_request_id)
Provides a loaned container to access the existing replies for a specific request.
- **LoanedSamples**< TRep > **take_replies** (const **SampleIdentity_t** &related_request_id)
Provides a loaned container to access the existing replies for a specific request.
- bool **read_reply** (**Sample**< TRep > &reply)

- Copies the contents of a reply into a **Sample** (p. 1889).*
- `bool read_reply (SampleRef< TRep > reply)`
*Copies the contents of a reply into a **SampleRef** (p. 1897).*
- `LoanedSamples< TRep > read_replies (int max_count= DDS_LENGTH_UNLIMITED)`
Provides a loaned container to access the existing replies.
- `bool read_reply (Sample< TRep > &reply, const SampleIdentity_t &related_request_id)`
Copies the contents of a reply for a specific request.
- `bool read_reply (SampleRef< TRep > reply, const SampleIdentity_t &related_request_id)`
Copies the contents of a reply for a specific request.
- `LoanedSamples< TRep > read_replies (int max_count, const SampleIdentity_t &related_request_id)`
Provides a loaned container to access the existing replies for a specific request.
- `LoanedSamples< TRep > read_replies (const SampleIdentity_t &related_request_id)`
Provides a loaned container to access the existing replies for a specific request.
- `RequestDataWriter * get_request_datawriter ()`
*Retrieves the underlying **DDSDDataWriter** (p. 1305).*
- `ReplyDataReader * get_reply_datareader ()`
*Retrieves the underlying **DDSDDataReader** (p. 1272).*

9.367.1 Detailed Description

```
template<typename TReq, typename TRep>
class connext::Requester< TReq, TRep >
```

Allows sending requests and receiving replies.

A requester is an entity with two associated **topics** (p.61): a request topic and a reply topic. It can send requests by publishing samples of the request topic and receive replies to those requests by subscribing to the reply topic.

Valid types for these topics (TReq and TRep) are: those generated by rtiddsgen, the **DDS built-in types** (p. 92), and **DDS_DynamicData** (p. 769).

For example:

```
using namespace connext;
<P>

Requester<Foo, Bar> requester(...);
Requester<DDS::DynamicData, Bar> requester(...);
Requester<Foo, DDS::Octets> requester(...);
```

A **Replier** (p. 1845) and a **Requester** (p. 1863) communicate when they use the same topics for requests and replies (see `connext::RequesterParams::service_name` (p. 1886)) on the same **domain** (p. 51).

A **Requester** (p. 1863) can send requests and receive one or multiple replies. It does that using the following operations:

- Sending requests (i.e. publishing request samples on the request topic)
- Waiting for replies to be received by the middleware (for any request or for a specific request)
- Getting those replies from the middleware. There are two ways to do this: take (the data samples are removed from the middleware), read (the data samples remain in the middleware and can be read or taken again).

- A convenience operation, receive (which is a combination of wait and take).

In all cases, the middleware guarantees that a requester only receives reply samples that are associated with those requests that it sends.

For multi-reply scenarios, in which a **Requester** (p. 1863) receives multiple replies from a **Replier** (p. 1845) for a given request, the **Requester** (p. 1863) can check if a reply is the last reply of a sequence of replies. To do so, see if the bit **DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE** (p. 474) is set in **DDS_SampleInfo::flag** (p. 1077) after receiving each reply. This indicates it is NOT the last reply.

A requester has an associated **DDSDomainParticipant** (p. 1335), which can be shared with other requesters or RTI Connex routines. All the other RTI Connex entities required for the request-reply interaction, including a **DDSDataWriter** (p. 1305) for writing requests and a **DDSDataReader** (p. 1272) for reading replies, are automatically created when the requester is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **connex::RequesterParams** (p. 1886)). By default, they are created with **DDS_RELIABLE_RELIABILITY_QOS** (p. 435). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 233)

Template Parameters

<i>TReq</i>	The data type for the request topic
<i>TRep</i>	The data type for the reply topic

9.367.2 Member Typedef Documentation

9.367.2.1 Request

```
template<typename TReq , typename TRep >
typedef TReq connex::Requester< TReq, TRep >::Request
```

The request type.

9.367.2.2 Reply

```
template<typename TReq , typename TRep >
typedef TRep connex::Requester< TReq, TRep >::Reply
```

The reply type.

9.367.2.3 RequestDataWriter

```
template<typename TReq , typename TRep >
typedef dds_type_traits<TReq> ::DataWriter  connext::Requester< TReq, TRep >::RequestDataWriter
```

The typed DataWriter for type TReq.

9.367.2.4 ReplyDataReader

```
template<typename TReq , typename TRep >
typedef dds_type_traits<TRep> ::DataReader  connext::Requester< TReq, TRep >::ReplyDataReader
```

The typed DataReader for type TRep.

9.367.2.5 RequestTypeSupport

```
template<typename TReq , typename TRep >
typedef dds_type_traits<TReq> ::TypeSupport  connext::Requester< TReq, TRep >::RequestType←
Support
```

The type support for type TReq.

9.367.2.6 ReplyTypeSupport

```
template<typename TReq , typename TRep >
typedef dds_type_traits<TRep> ::TypeSupport  connext::Requester< TReq, TRep >::ReplyTypeSupport
```

The type support for type TRep.

9.367.3 Constructor & Destructor Documentation

9.367.3.1 Requester() [1/2]

```
template<typename TReq , typename TRep >
connext::Requester< TReq, TRep >::Requester (
    DDSDomainParticipant * participant,
    const std::string & service_name )
```

Creates a **Requester** (p. 1863) with the minimum set of parameters.

Parameters

<i>participant</i>	The DomainParticipant this requester uses to join a DDS domain
<i>service_name</i>	The service name. See connext::RequesterParams::service_name (p. 1886)

Exceptions

<i>One</i>	of the RTI Connext Exceptions (p. 37)
------------	--

9.367.3.2 Requester() [2/2]

```
template<typename TReq , typename TRep >
connext::Requester< TReq, TRep >::Requester (
    const RequesterParams & params ) [explicit]
```

Creates a **Requester** (p. 1863) with parameters.

Parameters

<i>params</i>	All the parameters that configure this requester. See connext::RequesterParams (p. 1884) for the list of mandatory parameters.
---------------	---

Exceptions

<i>One</i>	of the RTI Connext Exceptions (p. 37)
------------	--

See also

connext::RequesterParams (p. 1884)

Requester Creation (p. 227)

9.367.3.3 ~Requester()

```
template<typename TReq , typename TRep >
connext::Requester< TReq, TRep >::~~Requester [virtual]
```

Releases the internal entities created by this object.

Among other internal resources, it deletes the underlying DataReader and DataWriter.

See also

DDSSubscriber::delete_datareader (p. 1586)

DDSPublisher::delete_datawriter (p. 1545)

9.367.4 Member Function Documentation

9.367.4.1 send_request() [1/3]

```
template<typename TReq , typename TRep >
template<typename UReq >
void connext::Requester< TReq, TRep >::send_request (
    const UReq & request )
```

Sends a request.

If a future reply needs to be correlated to exactly this request, use `connext::Requester::send_request(WriteSample<UReq>&)` (p. 1869).

Parameters

<i>request</i>	The request to be sent
----------------	------------------------

Exceptions

<i>One</i>	of the RTI Connex Exceptions (p. 37)
------------	---

MT Safety:

SAFE

See also

`send_request(WriteSample<UReq>&)` (p. 1869)

9.367.4.2 send_request() [2/3]

```
template<typename TReq , typename TRep >
template<typename UReq >
void connext::Requester< TReq, TRep >::send_request (
    WriteSample< UReq > & request )
```

Sends a request and gets back information about it that allows correlation with future replies.

After calling this operation, the sample contains a valid identity that can be used for correlation with future replies.

See example code in **Correlating requests and replies** (p. 229).

Parameters

<i>request</i>	<< <i>inout</i> >> (p. 237) Contains the request and optional write parameters. When this call ends successfully, connext::WriteSample (p. 1925) contains a valid identity that can be used for correlation with future replies.
----------------	---

Exceptions

<i>One</i>	of the RTI Connext Exceptions (p. 37) ; connext::TimeoutException (p. 1923) may be reported in the same conditions as in FooDataWriter::write (p. 1666).
------------	---

MT Safety:

SAFE

See also

connext::WriteSample::identity() (p. 1928)**wait_for_replies(int, const Duration_t&, const SampleIdentity_t&)** (p. 1874)**take_replies(int, const SampleIdentity_t&)** (p. 1878)**Correlating requests and replies** (p. 229)**9.367.4.3 send_request()** [3/3]

```
template<typename TReq , typename TRep >
template<typename UReq >
void connext::Requester< TReq, TRep >::send_request (
    WriteSampleRef< UReq > & request )
```

Sends a request and gets back information about it that allows correlation with future replies.

This operation is equivalent to **connext::Requester::send_request(WriteSample<UReq>&)** (p. 1869) except it uses a **WriteSampleRef** (p. 1929).

A **WriteSampleRef** (p. 1929) needs to be initialized with references to existing data and info objects before it can be used. See an example here: **Basic Requester example using SampleRef** (p. 230)

See also

connext::Requester::send_request(WriteSample<UReq>&) (p. 1869)**Basic Requester example using SampleRef** (p. 230)

9.367.4.4 receive_reply() [1/2]

```
template<typename TReq , typename TRep >
bool  connext::Requester< TReq, TRep >::receive_reply (
    Sample< TRep > & reply,
    const DDS_Duration_t & timeout ) [inline]
```

Waits for a reply and copies its contents into a **Sample** (p. 1889).

This operation is equivalent to using **wait_for_replies(int, const Duration_t&)** (p. 1873) and **take_reply(Sample<TRep>&)** (p. 1875).

MT Safety:

Same restrictions as **wait_for_replies(int, const Duration_t&)** (p. 1873)

See also

connext::Sample (p. 1889)
wait_for_replies(int, const Duration_t&) (p. 1873)
take_reply(Sample<TRep>&) (p. 1875)

9.367.4.5 receive_reply() [2/2]

```
template<typename TReq , typename TRep >
bool  connext::Requester< TReq, TRep >::receive_reply (
    SampleRef< TRep > reply,
    const DDS_Duration_t & timeout ) [inline]
```

Waits for a reply and copies its contents into a **SampleRef** (p. 1897).

This operation is equivalent to using **wait_for_replies(int, const Duration_t&)** (p. 1873) and **take_reply(SampleRef<TRep>)** (p. 1875).

MT Safety:

Same restrictions as **wait_for_replies(int, const Duration_t&)** (p. 1873)

See also

connext::SampleRef (p. 1897)
wait_for_replies(int, const Duration_t&) (p. 1873)
take_reply(SampleRef<TRep>) (p. 1875)
Basic Requester example using SampleRef (p. 230)

9.367.4.6 receive_replies() [1/2]

```
template<typename TReq , typename TRep >
LoanedSamples< TRep > connext::Requester< TReq, TRep >::receive_replies (
    const DDS_Duration_t & max_wait )
```

Waits for multiple replies and provides a loaned container to access them.

This operation is equivalent to using **receive_replies(int,int, const **Duration_t**&)** (p. 1872) with `min_count=1` and `max_count=DDS_LENGTH_UNLIMITED` (p. 437)

MT Safety:

See **wait_for_replies(int, const **Duration_t**&)** (p. 1873)

See also

connext::LoanedSamples (p. 1709)

receive_replies(int,int, const **Duration_t&)** (p. 1872)

9.367.4.7 receive_replies() [2/2]

```
template<typename TReq , typename TRep >
LoanedSamples< TRep > connext::Requester< TReq, TRep >::receive_replies (
    int min_count,
    int max_count,
    const DDS_Duration_t & max_wait )
```

Waits for multiple replies and provides a loaned container to access them.

This operation is equivalent to using **wait_for_replies(int, const **Duration_t**&)** (p. 1873) and **take_replies(int)** (p. 1876).

MT Safety:

See **wait_for_replies(int, const **Duration_t**&)** (p. 1873)

Exceptions

<i>One</i>	of the RTI Connext Exceptions (p. 37)
------------	--

See also

connext::LoanedSamples (p. 1709)
wait_for_replies(int, const Duration_t&) (p. 1873)
take_replies(int) (p. 1876)

9.367.4.8 wait_for_replies() [1/3]

```
template<typename TReq , typename TRep >
bool  connext::Requester< TReq, TRep >::wait_for_replies (
    int min_count,
    const  DDS_Duration_t & max_wait )
```

Waits for replies to any request.

This operation waits for min_count requests to be available for up to max_wait .

If this operation is called several times but the available replies are not taken (with **take_replies(int)** (p. 1876)), this operation may return immediately and will not wait for new replies. New replies may replace existing ones if they are not taken, depending on the **DDS_HistoryQosPolicy** (p. 906) used to configure this **Requester** (p. 1863).

Parameters

<i>min_count</i>	Minimum number of replies that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum waiting time after which this operation unblocks, regardless of how many replies are available.

Returns

true if at least min_count replies were available before max_wait elapsed, or false otherwise.

MT Safety:

Concurrent calls to this operation on the same object are not allowed. However, waiting for replies for specific requests in parallel is supported (see **wait_for_replies(int, const Duration_t&, const SampleIdentity_t&)** (p. 1874)).

See also

take_replies(int) (p. 1876)

9.367.4.9 wait_for_replies() [2/3]

```
template<typename TReq , typename TRep >
bool   connext::Requester< TReq, TRep >::wait_for_replies (
    const   DDS_Duration_t & max_wait )
```

Waits for replies to any request.

This operation is equivalent to using **wait_for_replies(int, const Duration_t&)** (p. 1873) with `min_count=1`.

See also

wait_for_replies(int, const Duration_t&) (p. 1873)

9.367.4.10 wait_for_replies() [3/3]

```
template<typename TReq , typename TRep >
bool   connext::Requester< TReq, TRep >::wait_for_replies (
    int min_count,
    const   DDS_Duration_t & max_wait,
    const   SampleIdentity_t & related_request_id )
```

Waits for replies to a specific request.

This operation is analogous to **wait_for_replies(int, const Duration_t&)** (p. 1873) except this operation waits for replies for a specific request.

Parameters

<i>min_count</i>	Minimum number of replies for the related request that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum wait time after which this operation unblocks, regardless of how many replies are available.
<i>related_request_id</i>	The identity of a request previously sent by this Requester (p. 1863)

Returns

true if at least `min_count` replies for the related request were available before `max_wait` elapsed, or false otherwise.

Exceptions

One	of the RTI Connext Exceptions (p. 37)
-----	--

MT Safety:

SAFE

See also

wait_for_replies(int, const Duration_t&) (p. 1873)

9.367.4.11 take_reply() [1/4]

```
template<typename TReq , typename TRep >
bool  connext::Requester< TReq, TRep >::take_reply (
    Sample< TRep > & reply ) [inline]
```

Copies the contents of a reply into a **Sample** (p. 1889).

Takes a reply sample from the **Requester** (p. 1863) and makes a copy.

This operation may be used after a call to **wait_for_replies**(int, const Duration_t&) (p. 1873).

To avoid copies, you can use **take_replies**(int) (p. 1876).

Parameters

<i>reply</i>	The sample where the reply data and the related SampleInfo are copied
--------------	---

Returns

true if there was a reply to get. If this operation returns false, the contents of *reply* remain unchanged, except **DDS_SampleInfo::valid_data** (p. 1074) becomes false.

Exceptions

<i>One</i>	of the RTI Connex Exceptions (p. 37)
------------	---

MT Safety:

SAFE

See also

connext::Sample (p. 1889)

wait_for_replies(int, const Duration_t&) (p. 1873)

9.367.4.12 take_reply() [2/4]

```
template<typename TReq , typename TRep >
bool connex::Requester< TReq, TRep >::take_reply (
    SampleRef< TRep > reply ) [inline]
```

Copies the contents of a reply into a **SampleRef** (p. 1897).

This operation is analogous to **connex::Requester::take_reply(Sample<TRep>&)** (p.1875) except it uses a **SampleRef** (p. 1897) instance.

A **SampleRef** (p. 1897) needs to be initialized with references to existing data and info objects before it can be used. See an example here: **Basic Requester example using SampleRef** (p. 230)

MT Safety:

SAFE

```
template<typename TReq , typename TRep >
LoanedSamples< TRep > connex::Requester< TReq, TRep >::take_replies (
    int max_count = DDS_LENGTH_UNLIMITED )
```

Provides a loaned container to access the existing replies.

Takes all the existing replies up to `max_count` and provides a loaned container to access them.

This operation does not make a copy of the data.

The loan is returned with **connex::LoanedSamples::return_loan** (p. 1716) or in the destructor

This operation may be used after a call to **wait_for_replies(int, const Duration_t&)** (p. 1873)

See an **example** here: **Taking loaned samples** (p. 228)

Parameters

<i>max_count</i>	The maximum number of samples that are taken at a time. The special value DDS_LENGTH_UNLIMITED (p. 437) may be used. This value will read up to the limit specified by DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_read (p. 653)
------------------	---

Returns

A container with up to max_count elements. May be empty if there were no replies to get.

Exceptions

One	of the RTI Connex Exceptions (p. 37)
-----	---

MT Safety:

SAFE

9.367.4.14 take_reply() [3/4]

```
template<typename TReq , typename TRep >
bool  connext::Requester< TReq, TRep >::take_reply (
    Sample< TRep > & reply,
    const SampleIdentity_t & related_request_id ) [inline]
```

Copies the contents of a reply for a specific request.

This operation is analogous to **take_reply(Sample<TRep>&)** (p. 1875) except the reply corresponds to a specific request.

Parameters

<i>reply</i>	The sample where a reply is copied into
<i>related_request_id</i>	The identity of a request previously sent by this Requester (p. 1863)

Returns

true if there was a reply to get. If this operation returns false, the contents of `reply` remain unchanged, except **DDS_SampleInfo::valid_data** (p. 1074) becomes false.

MT Safety:

SAFE

```
template<typename TReq , typename TRep >
LoanedSamples< TRep > connext::Requester< TReq, TRep >::read_replies (
    int max_count = DDS_LENGTH_UNLIMITED )
```

Provides a loaned container to access the existing replies.

This operation is equivalent to **connext::Requester::take_replies(int)** (p. 1876) except the replies remain in the **Requester** (p. 1863) and can be read or taken again.

9.367.4.21 read_reply() [3/4]

```
template<typename TReq , typename TRep >
bool connext::Requester< TReq, TRep >::read_reply (
    Sample< TRep > & reply,
    const SampleIdentity_t & related_request_id ) [inline]
```

Copies the contents of a reply for a specific request.

This operation is equivalent to **connext::Requester::take_reply(Sample<TRep>&, const SampleIdentity_t&)** (p. 1877) except the reply remains in the **Requester** (p. 1863) and can be read or taken again.

9.367.4.22 read_reply() [4/4]

```
template<typename TReq , typename TRep >
bool connext::Requester< TReq, TRep >::read_reply (
    SampleRef< TRep > reply,
    const SampleIdentity_t & related_request_id ) [inline]
```

Copies the contents of a reply for a specific request.

This operation is analogous to **connext::Requester::read_reply(Sample<TRep>&, const SampleIdentity_t&)** (p. 1881) except it uses a **SampleRef** (p. 1897) instance.

A **SampleRef** (p. 1897) needs to be initialized with references to existing data and info objects before it can be used. See an example here: **Basic Requester example using SampleRef** (p. 230)

MT Safety:

9.368 connext::RequesterParams Class Reference

Contains the parameters for creating a **connext::Requester** (p. 1863).

Inherits connext::details::EntityParams.

Public Member Functions

- **RequesterParams** (**DomainParticipant** *participant)
*Creates a **RequesterParams** (p. 1884) with the parameters a **Requester** (p. 1863) always needs.*
- **RequesterParams** & **service_name** (const std::string &name)
*The service name that Repliers and **Requester** (p. 1863) use to match and communicate.*
- **RequesterParams** & **request_topic_name** (const std::string &name)
Sets a specific request topic name.
- **RequesterParams** & **reply_topic_name** (const std::string &name)
Sets a specific reply topic name.
- **RequesterParams** & **qos_profile** (const std::string &qos_library_name, const std::string &qos_profile_name)

Sets a QoS profile for the entities in this requester.

- **RequesterParams & datawriter_qos** (const **DDS_DataWriterQos** &qos)
Sets the quality of service of the request DataWriter.
- **RequesterParams & datareader_qos** (const **DDS_DataReaderQos** &qos)
Sets the quality of service of the request DataReader.
- **RequesterParams & publisher** (**DDSPublisher** *publisher)
Sets a specific Publisher.
- **RequesterParams & subscriber** (**DDSSubscriber** *subscriber)
Sets a specific Subscriber.
- **RequesterParams & request_type_support** (**TypeSupport** *type_support)
Sets the type support for the request type.
- **RequesterParams & reply_type_support** (**TypeSupport** *type_support)
Sets the type support for the reply type.

9.368.1 Detailed Description

Contains the parameters for creating a **connext::Requester** (p. 1863).

See also

Creating a Requester with optional parameters (p. 227)

9.368.2 Constructor & Destructor Documentation

9.368.2.1 RequesterParams()

```
connext::RequesterParams::RequesterParams (
    DomainParticipant * participant ) [explicit]
```

Creates a **RequesterParams** (p. 1884) with the parameters a **Requester** (p. 1863) always needs.

In addition to the participant , a **Requester** (p. 1863) needs either:

- A service name (**service_name** (p. 1886)),
- Or custom topic names (**request_topic_name** (p. 1886) and **reply_topic_name** (p. 1886))

When **DDS_DynamicData** (p. 769) is used, **connext::RequesterParams::request_type_support** (p. 1888) and/or **connext::RequesterParams::reply_type_support** (p. 1888) are required as well.

The rest of the parameters that can be set in a **RequesterParams** (p. 1884) object are optional.

Parameters

<i>participant</i>	The DDSDomainParticipant (p. 1335) this requester uses to join a domain.
--------------------	---

See also

Creating a Requester with optional parameters (p. 227)

9.368.3 Member Function Documentation

9.368.3.1 service_name()

```
RequesterParams & connext::RequesterParams::service_name (
    const std::string & name )
```

The service name that Repliers and **Requester** (p. 1863) use to match and communicate.

A **Requester** (p. 1863) and a **Replier** (p. 1845) need to be configured with the same topic names in order to match.

The service name is used to generate a request topic and a reply topic that the **Requester** (p. 1863) and **Replier** (p. 1845) will use to communicate. For example, the service name "MyService" will be used to create topics named "MyServiceRequest" and "MyServiceReply".

In some cases, the name of these topics is known beforehand or needs to be customized for another reason. The service name can be overridden by setting specific request and reply topic names using **request_topic_name** (p. 1886) and **reply_topic_name** (p. 1886).

9.368.3.2 request_topic_name()

```
RequesterParams & connext::RequesterParams::request_topic_name (
    const std::string & name )
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **service_name** (p. 1886). If that topic already exists, it will be reused.

9.368.3.3 reply_topic_name()

```
RequesterParams & connext::RequesterParams::reply_topic_name (
    const std::string & name )
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **service_name** (p. 1886). If that topic already exists, it will be reused.

9.368.3.4 qos_profile()

```
RequesterParams & connext::RequesterParams::qos_profile (
    const std::string & qos_library_name,
    const std::string & qos_profile_name )
```

Sets a QoS profile for the entities in this requester.

Specifies an XML QoS profile that will be used to configure the quality of service of a **Requester** (p. 1863)'s underlying request DataWriter and reply DataReader.

Within that profile, the DataWriter QoS in <datawriter_qos> will be used to configure the request DataWriter and the DataReader.

Alternatively, you can set the QoS using the DataWriterQos and DataReaderQos objects (**connext::RequesterParams::datawriter_qos** (p. 1887), **connext::RequesterParams::datareader_qos** (p. 1887)).

Parameters

<i>qos_library_name</i>	The name of the QoS library
<i>qos_profile_name</i>	The name of the QoS profile inside the QoS library

See also

Configuring Request-Reply QoS profiles (p. 233)

Configuring QoS Profiles with XML (p. 196)

9.368.3.5 datawriter_qos()

```
RequesterParams & connext::RequesterParams::datawriter_qos (
    const DDS_DataWriterQos & qos )
```

Sets the quality of service of the request DataWriter.

See also

qos_profile (p. 1886)

9.368.3.6 datareader_qos()

```
RequesterParams & connext::RequesterParams::datareader_qos (
    const DDS_DataReaderQos & qos )
```

Sets the quality of service of the request DataReader.

See also

qos_profile (p. 1886)

9.368.3.7 publisher()

```
RequesterParams & connext::RequesterParams::publisher (
    DDSPublisher * publisher )
```

Sets a specific Publisher.

By default, a **Requester** (p. 1863) uses the DomainParticipant's implicit Publisher. Sometimes a different Publisher may be needed, for example, to use non-default PublisherQos.

9.368.3.8 subscriber()

```
RequesterParams & connext::RequesterParams::subscriber (
    DDSSubscriber * subscriber )
```

Sets a specific Subscriber.

By default, a **Requester** (p. 1863) uses the DomainParticipant's implicit Subscriber. Sometimes a different Subscriber may be needed, for example, to use non-default SubscriberQos.

9.368.3.9 request_type_support()

```
RequesterParams & connext::RequesterParams::request_type_support (
    TypeSupport * type_support )
```

Sets the type support for the request type.

This parameter is required when TReq is **DDS_DynamicData** (p. 769).

In all other cases, this parameter is ignored and the singleton **Requester<TReq, TRep>::RequestTypeSupport** (p. 1867) is used instead.

See also

DDSDynamicDataTypeSupport (p. 1439)

9.368.3.10 reply_type_support()

```
RequesterParams & connext::RequesterParams::reply_type_support (
    TypeSupport * type_support )
```

Sets the type support for the reply type.

This parameter is required when TRep is **DDS_DynamicData** (p. 769).

In all other cases, this parameter is ignored and the singleton **Requester<TReq, TRep>::ReplyTypeSupport** (p. 1867) is used instead.

See also

DDSDynamicDataTypeSupport (p. 1439)

9.369 connext::RuntimeException Class Reference

Generic, unspecified error.

Inheritance diagram for connext::RuntimeException:

9.369.1 Detailed Description

Generic, unspecified error.

Its base class is `std::runtime_error`, from which it inherits the `what()` method.

See also

DDS_RETCODE_ERROR (p. 335)

9.370 connext::Sample< T > Class Template Reference

A data sample and related info received from the middleware.

Inherits `connext::details::SampleBase< T, I >`.

Public Member Functions

- **Sample()**
Creates a sample with default data and info values.
- **Sample**(const **Sample**< T > &other)
Creates a sample making a deep copy of another sample.
- **Sample**(**SampleRef**< T > sample_ref)
*Creates a sample as a deep copy of the contents referenced by a **WriteSampleRef** (p. 1929).*
- **SampleIdentity_t identity**() const
Gets the identity of this sample.
- **SampleIdentity_t related_identity**() const
Gets the identity of a sample that is related to this one.
- T & **data**()
Gets the data this sample contains.
- **SampleInfo & info**()
Gets the sample information.
- const T & **data**()
Gets the data this sample contains.
- const **SampleInfo & info**()
Gets the sample information.

9.370.1 Detailed Description

```
template<typename T>
class connext::Sample< T >
```

A data sample and related info received from the middleware.

Samples contain data received from the middleware and information associated to the data.

Template Parameters

<i>T</i>	The data type that this sample contains
----------	---

See also

connext::Requester::receive_reply(Sample<TRep>&, const Duration_t&) (p. 1870)

connext::Requester::take_reply(Sample<TRep>&) (p. 1875)

connext::Replier::receive_request(Sample<TReq>&, const Duration_t&) (p. 1852)

9.370.2 Constructor & Destructor Documentation

9.370.2.1 Sample() [1/3]

```
template<typename T >
connext::Sample< T >::Sample ( ) [inline]
```

Creates a sample with default data and info values.

The data is deeply initialized using the corresponding TypeSupport

See also

FooTypeSupport::initialize_data (p. 1700)

9.370.2.2 Sample() [2/3]

```
template<typename T >
connext::Sample< T >::Sample (
    const Sample< T > & other ) [inline]
```

Creates a sample making a deep copy of another sample.

9.370.2.3 Sample() [3/3]

```
template<typename T >
connext::Sample< T >::Sample (
    SampleRef< T > sample_ref )
```

Creates a sample as a deep copy of the contents referenced by a **WriteSampleRef** (p. 1929).

9.370.3 Member Function Documentation

9.370.3.1 identity()

```
template<typename T >
SampleIdentity_t connext::Sample< T >::identity ( ) const [inline]
```

Gets the identity of this sample.

The identity is assigned by the middleware upon reception.

See also

Correlating requests and replies (p. 229)

References **connext::Sample< T >::info()**.

9.370.3.2 related_identity()

```
template<typename T >
SampleIdentity_t connext::Sample< T >::related_identity ( ) const [inline]
```

Gets the identity of a sample that is related to this one.

When a **connext::Requester** (p. 1863) receives a reply, the reply **Sample** (p. 1889) contains the identity of the related request.

Returns

The identity of another sample that is related to this one, or **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 478) if there is not a related sample.

See also

connext::Requester::receive_reply(Sample<TRep>&, const Duration_t&) (p. 1870)

References **connext::Sample< T >::info()**.

9.370.3.3 data() [1/2]

```
template<typename T >
T & connext::Sample< T >::data ( )
```

Gets the data this sample contains.

See also

Basic Requester example (p. 227)

9.370.3.4 info() [1/2]

```
template<typename T >
SampleInfo & connext::Sample< T >::info ( )
```

Gets the sample information.

See also

DDS_SampleInfo (p. 1068)

Basic Requester example (p. 227)

Referenced by **connext::Sample< T >::identity()**, and **connext::Sample< T >::related_identity()**.

9.370.3.5 data() [2/2]

```
template<typename T >
const T & connext::Sample< T >::data ( )
```

Gets the data this sample contains.

See also

Basic Requester example (p. 227)

9.370.3.6 info() [2/2]

```
template<typename T >
const SampleInfo & connext::Sample< T >::info ( )
```

Gets the sample information.

See also

DDS_SampleInfo (p. 1068)

Basic Requester example (p. 227)

9.371 rti::flat::Sample< OffsetType > Class Template Reference

The generic definition of FlatData topic-types.

```
#include <FlatSample.hpp>
```

Inherits rti::flat::SampleBase.

Public Types

- typedef OffsetType **Offset**
The related Offset type.
- typedef OffsetType::ConstOffset **ConstOffset**
The related read-only Offset type.

Public Member Functions

- **Offset** root ()
Provides the Offset to the top-level type.
- **ConstOffset** root () const
Provides the Offset to the top-level type.
- **Sample**< OffsetType > * **clone** () const
*Clones a **Sample** (p. 1893), creating an unmanaged **Sample** (p. 1893).*

Static Public Member Functions

- static **Sample**< OffsetType > * **create_data** ()
*Creates an unmanaged FlatData **Sample** (p. 1893).*
- static void **delete_data** (rti::flat::Sample< OffsetType > *sample)
*Releases an unmanaged **Sample** (p. 1893).*

9.371.1 Detailed Description

```
template<typename OffsetType>
class rti::flat::Sample< OffsetType >
```

The generic definition of FlatData topic-types.

Template Parameters

<i>OffsetType</i>	The Offset to the beginning of the data Sample (p. 1893) (the root), for example MyFlatFinalOffset (p. 1728), or MyFlatMutableOffset (p. 1739).
-------------------	--

For a FlatData IDL type, **rtiddsgen** generates an instantiation of this class, such as **MyFlatFinal** or **MyFlatMutable**. That's the **topic-type** used to declare a **DDSTopic** (p. 1601) and write or read FlatData samples.

A FlatData **Sample** (p. 1893) owns an inline buffer that contains the serialized data. To access the **Sample** (p. 1893) data members we use **Offsets** (p. 558), iterators that point to the position of a member in the **Sample** (p. 1893) buffer. The **root()** (p. 1895) is the Offset to the top-level element (for example **MyFlatMutableOffset** (p. 1739)). From there **MyFlatMutableOffset** (p. 1739)'s member functions provide access to its members.

The method to create a **Sample** (p. 1893) varies depending on whether the type is final or mutable.

Samples of **final** FlatData types always have the same size, and can be obtained directly with **FooDataWriter::get_loan()** (p. 1678).

Samples of **mutable** FlatData types need to be "built" using the Builder returned by **rti::flat::build_data()** (p. 554) (**MyFlatMutableBuilder** (p. 1732) in this example). A Builder allows adding each member individually in any order, and sizing sequences as needed.

See **Publishing FlatData** (p. 564) for code snippets.

Samples created with **FooDataWriter::get_loan()** (p. 1678) or **rti::flat::build_data()** (p. 554) are DataWriter-managed and do not need to be explicitly deleted. See **FooDataWriter::get_loan()** (p. 1678) for an explanation of the lifecycle of DataWriter-managed samples.

Samples received with a **FooDataReader** (p. 1632) can be examined by obtaining the **root()** (p. 1895), but cannot be modified. See **Subscribing to FlatData** (p. 564).

FlatData samples are not value types. They don't provide copy constructors or assignment operators, because of their definition as an inline buffer that contains the serialized **Sample** (p. 1893) at all times. A **Sample** (p. 1893) can be cloned with the static function **clone()** (p. 1896). A cloned **Sample** (p. 1893) is unmanaged and has to be deleted with the static function **delete_data()** (p. 1896).

9.371.2 Member Typedef Documentation

9.371.2.1 Offset

```
template<typename OffsetType >
typedef OffsetType rti::flat::Sample< OffsetType >::Offset
```

The related Offset type.

This is the template parameter, OffsetType

9.371.2.2 ConstOffset

```
template<typename OffsetType >
typedef OffsetType::ConstOffset rti::flat::Sample< OffsetType >::ConstOffset
```

The related read-only Offset type.

For example, **MyFlatMutableOffset::ConstOffset** (p. 1740).

9.371.3 Member Function Documentation

9.371.3.1 root() [1/2]

```
template<typename OffsetType >
Offset rti::flat::Sample< OffsetType >::root ( ) [inline]
```

Provides the Offset to the top-level type.

Returns

An Offset that allows reading and modifying the members of this **Sample** (p. 1893), for example **MyFlatFinalOffset** (p. 1728) or **MyFlatMutableOffset** (p. 1739).

This overload allows modifying the **Sample** (p. 1893).

Example:

```
MyFlatFinal *my_sample = ...; // for example, created with DataWriter::get_loan()
MyFlatFinalOffset my_sample_root = my_sample->root();
my_sample_root.my_primitive(33);
auto my_member_offset = my_sample_root.my_complex();
// ... modify my_member_offset
```

9.371.3.2 root() [2/2]

```
template<typename OffsetType >
ConstOffset rti::flat::Sample< OffsetType >::root ( ) const [inline]
```

Provides the Offset to the top-level type.

Returns

An Offset that allows reading the members of this **Sample** (p. 1893). For example, **MyFlatFinalOffset::ConstOffset** (p. 1729) or **MyFlatMutableOffset::ConstOffset** (p. 1740).

This overload doesn't allow modifying the **Sample** (p. 1893).

Example:

```
const MyFlatMutable *my_sample = ...; // for example, read from a DataReader
MyFlatMutableOffset::ConstOffset my_sample_root = my_sample->root();
std::cout << my_sample_root.my_primitive() << std::endl;
auto my_member_offset = my_sample_root.my_mutable_seq();
// ... read my_member_offset
```

9.371.3.3 create_data()

```
template<typename OffsetType >
Sample< OffsetType > * rti::flat::Sample< OffsetType >::create_data [static]
```

Creates an unmanaged FlatData **Sample** (p. 1893).

Note

In general on the publication side it is recommended to create DataWriter-managed samples using **FooDataWriter::get_loan** (p. 1678) (for final types) and **rti::flat::build_data()** (p. 554) (for mutable types).

If the topic-type is final, the returned **Sample** (p. 1893) can be initialized by obtaining the **root()** (p. 1895).

If the topic-type is mutable, the resulting **Sample** (p. 1893) has no members, and **root()** (p. 1895) returns a **null** (p. 1834) Offset. The result of **create_data()** (p. 1895) must be used to create a Builder. This is a rare use case, and **rti::flat::build_data()** (p. 554) should be used in most situations.

In all cases, the returned **Sample** (p. 1893) must be explicitly deleted with **delete_data()** (p. 1896).

9.371.3.4 clone()

```
template<typename OffsetType >
Sample< OffsetType > * rti::flat::Sample< OffsetType >::clone ( ) const [inline]
```

Clones a **Sample** (p. 1893), creating an unmanaged **Sample** (p. 1893).

Warning

When this **Sample** (p. 1893) has been created with **FooDataWriter::get_loan** (p. 1678) or **rti::flat::build_data()** (p. 554), the clone this function creates cannot be used in **FooDataWriter::write** (p. 1666), because the DataWriter is managing the lifecycle of its samples.

Creates a new **Sample** (p. 1893) and copies the underlying serialized buffer.

delete_data() (p. 1896) must be called to release the **Sample** (p. 1893).

9.371.3.5 delete_data()

```
template<typename OffsetType >
static void rti::flat::Sample< OffsetType >::delete_data (
    rti::flat::Sample< OffsetType > * sample ) [inline], [static]
```

Releases an unmanaged **Sample** (p. 1893).

Unmanaged samples are those created with **create_data()** (p. 1895) or **clone()** (p. 1896).

Precondition

sample cannot have been created with **FooDataWriter::get_loan** (p. 1678) or **rti::flat::build_data()** (p. 554).

Postcondition

sample becomes invalid and shouldn't be used

9.372 connext::SampleIterator< T, IsConst > Class Template Reference

STL-compliant random-access iterator for SampleRef<T>

9.372.1 Detailed Description

```
template<typename T, bool IsConst>
class connext::SampleIterator< T, IsConst >
```

STL-compliant random-access iterator for SampleRef<T>

See also

connext::LoanedSamples::begin (p. 1717)

9.373 connext::SampleRef< T > Class Template Reference

A data sample and related information received from the middleware.

Public Member Functions

- **SampleRef** ()
Creates an object with no data.
- **SampleRef** (T * **data**, Info * **info**)
Creates an object with a reference to a data object.
- **SampleRef** (T & **data**, Info & **info**)
Creates an object with a reference to a data object.
- **SampleRef** (**Sample**< T > &sample)
Copies the references to data and info.
- **SampleRef** & **operator=** (**Sample**< T > &sample)
Copies the references to data and info.
- T & **data** () const
Gets the data this sample contains.
- Info & **info** () const
Gets the SampleInfo.
- **operator T&** () const
Gets the data this sample contains.
- void **set_data** (T & **data**)
Sets a reference to a data object.
- void **set_info** (**DDS_SampleInfo** & **info**)
Sets the info object.
- bool **is_nil_data** () const
*Indicates if this **SampleRef** (p. 1897) contains a reference to data or not.*
- bool **is_nil_info** () const
*Indicates if this **SampleRef** (p. 1897) contains a reference to data or not.*
- **SampleIdentity_t** **identity** () const
Gets the identity of this sample.
- **SampleIdentity_t** **related_identity** () const
Gets the identity of a sample that is related to this one.

9.373.1 Detailed Description

```
template<typename T>
class connex::SampleRef< T >
```

A data sample and related information received from the middleware.

A **SampleRef** (p. 1897) can be used much like a **connex::Sample** (p. 1889), but it's different in that it holds references to data and **DDS_SampleInfo** (p. 1068), whereas a **Sample** (p. 1889) is a value type and owns its data and info.

When calling an operation that copies data from the middleware into a **Sample** (p. 1889) (e.g. **connex::Requester**↔**::take_reply(Sample<TRep>&)** (p. 1875)), the references to its data and information must have been set explicitly (see **connex::SampleRef::set_data(T&)** (p. 1901) and **connex::SampleRef::set_info(DDS_SampleInfo&)** (p. 1902))

When a **SampleRef** (p. 1897) is copied, the destination **SampleRef** (p. 1897) references the same data and info objects as the source. Copying and passing by value are inexpensive operations.

SampleRef (p. 1897) is also the type of the elements in a **connex::LoanedSamples** (p. 1709) container and they hold references to data from the middleware.

Template Parameters

<i>T</i>	The data type that this sample contains
----------	---

See also

connex::Requester::receive_reply(Sample<TRep>&, const Duration_t&) (p. 1870)

connex::Requester::take_reply(Sample<TRep>&) (p. 1875)

connex::Replier::receive_request(Sample<TReq>&, const Duration_t&) (p. 1852)

Basic Requester example using SampleRef (p. 230)

Template Parameters

<i>T</i>	The data type that this sample can contain
----------	--

9.373.2 Constructor & Destructor Documentation

9.373.2.1 SampleRef() [1/4]

```
template<typename T >
connex::SampleRef< T >::SampleRef ( ) [inline]
```

Creates an object with no data.

See also

set_data(T&) (p. 1901)

Referenced by **connext::SampleRef< T >::operator=()**.

9.373.2.2 SampleRef() [2/4]

```
template<typename T >
connext::SampleRef< T >::SampleRef (
    T * data,
    Info * info ) [inline]
```

Creates an object with a reference to a data object.

See also

set_data(T&) (p. 1901)

9.373.2.3 SampleRef() [3/4]

```
template<typename T >
connext::SampleRef< T >::SampleRef (
    T & data,
    Info & info ) [inline]
```

Creates an object with a reference to a data object.

See also

set_data(T&) (p. 1901)

9.373.2.4 SampleRef() [4/4]

```
template<typename T >
connext::SampleRef< T >::SampleRef (
    Sample< T > & sample ) [inline]
```

Copies the references to data and info.

After this operation, this object contains a reference to the same data and info instances as the source.

9.373.3 Member Function Documentation

9.373.3.1 operator=()

```
template<typename T >
SampleRef & connext::SampleRef< T >::operator= (
    Sample< T > & sample ) [inline]
```

Copies the references to data and info.

After this operation, this object contains a reference to the same data and info instances as the source.

References **connext::SampleRef**< T >::**SampleRef**().

9.373.3.2 data()

```
template<typename T >
T & connext::SampleRef< T >::data ( ) const [inline]
```

Gets the data this sample contains.

Precondition

Data must have been set before

See also

connext::WriteSampleRef::set_data (p. 1931)

connext::WriteSample::data() (p. 1927)

Referenced by **connext::SampleRef**< T >::**set_data**().

9.373.3.3 info()

```
template<typename T >
Info & connext::SampleRef< T >::info ( ) const [inline]
```

Gets the SampleInfo.

Precondition

The info object must have been set

See also

set_info(DDS_SampleInfo&) (p. 1902)

connext::SampleRef::identity() (p. 1902)

Referenced by **connext::SampleRef< T >::identity**(), **connext::SampleRef< T >::related_identity**(), and **connext::SampleRef< T >::set_info**().

9.373.3.4 operator T&()

```
template<typename T >
connext::SampleRef< T >::operator T& ( ) const [inline]
```

Gets the data this sample contains.

Precondition

Data must have been set before

See also

connext::WriteSampleRef::set_data (p. 1931)

connext::WriteSample::data() (p. 1927)

9.373.3.5 set_data()

```
template<typename T >
void connext::SampleRef< T >::set_data (
    T & data ) [inline]
```

Sets a reference to a data object.

Parameters

<i>data</i>	The data object this sample will reference
-------------	--

References `connext::SampleRef< T >::data()`.

9.373.3.6 set_info()

```
template<typename T >
void connext::SampleRef< T >::set_info (
    DDS_SampleInfo & info ) [inline]
```

Sets the info object.

References `connext::SampleRef< T >::info()`.

9.373.3.7 is_nil_data()

```
template<typename T >
bool connext::SampleRef< T >::is_nil_data ( ) const [inline]
```

Indicates if this **SampleRef** (p. 1897) contains a reference to data or not.

Returns

True if this sample does not contain a reference to data.

See also

`connext::SampleRef::data` (p. 1900)

`connext::SampleRef::set_data(T&)` (p. 1901)

9.373.3.8 is_nil_info()

```
template<typename T >
bool connext::SampleRef< T >::is_nil_info ( ) const [inline]
```

Indicates if this **SampleRef** (p. 1897) contains a reference to data or not.

Returns

True if this sample does not contain a reference to info.

See also

`connext::SampleRef::info()` (p. 1900)

`connext::SampleRef::set_info(DDS_SampleInfo&)` (p. 1902)

9.373.3.9 identity()

```
template<typename T >
SampleIdentity_t connext::SampleRef< T >::identity ( ) const [inline]
```

Gets the identity of this sample.

Precondition

The info object must have been set

See also

set_info(DDS_SampleInfo&) (p. 1902)

connext::Sample::identity() (p. 1891)

References **connext::SampleRef< T >::info()**.

9.373.3.10 related_identity()

```
template<typename T >
SampleIdentity_t connext::SampleRef< T >::related_identity ( ) const [inline]
```

Gets the identity of a sample that is related to this one.

Precondition

The info object must have been set

See also

connext::Sample::related_identity() (p. 1891)

References **connext::SampleRef< T >::info()**.

9.374 rti::flat::SequencerIterator< E, OffsetKind > Class Template Reference

Iterator for collections of Offsets.

```
#include <SequenceIterator.hpp>
```

Public Types

- `typedef std::forward_iterator_tag iterator_category`
The iterator category.
- `typedef E value_type`
The element type.
- `typedef value_type reference`
The reference type is the same as the value type, an Offset.
- `typedef value_type pointer`
The pointer type is the same as the value type, an Offset.
- `typedef std::ptrdiff_t difference_type`
The difference type.

Public Member Functions

- **Sequenceliterator** ()
Constructs an invalid iterator.
- `bool is_null () const`
Returns whether the iterator is invalid.
- `value_type operator* () const`
Returns the Offset of the current element.
- `value_type operator-> () const`
Returns the Offset of the current element.
- `bool advance ()`
Advances to the next element, reporting any errors by returning false.
- `Sequenceliterator & operator++ ()`
Advances to the next element.
- `Sequenceliterator operator++ (int)`
Advances to the next element.

Friends

- `bool operator< (const Sequenceliterator &s1, const Sequenceliterator &s2)`
Compares two iterators.
- `bool operator> (const Sequenceliterator &s1, const Sequenceliterator &s2)`
Compares two iterators.
- `bool operator<= (const Sequenceliterator &s1, const Sequenceliterator &s2)`
Compares two iterators.
- `bool operator>= (const Sequenceliterator &s1, const Sequenceliterator &s2)`
Compares two iterators.
- `bool operator== (const Sequenceliterator &s1, const Sequenceliterator &s2)`
Compares two iterators.
- `bool operator!= (const Sequenceliterator &s1, const Sequenceliterator &s2)`
Compares two iterators.

9.374.1 Detailed Description

```
template<typename E, typename OffsetKind>  
class rti::flat::Sequenceliterator< E, OffsetKind >
```

Iterator for collections of Offsets.

Template Parameters

<i>E</i>	The Offset type of the elements
<i>OffsetKind</i>	(implementation detail)

Note

This type should not be declared directly. For example, for a **SequenceOffset** (p. 1911), use **SequenceOffset**↵
::iterator (p. 572) (or simply `auto`).

A **Sequenceliterator** (p. 1903) moves through the Offset to elements of a sequence or array **Offset** (p. 558), and provides the functionality of a standard `forward_iterator`.

Note that a dereferenced **Sequenceliterator** (p. 1903) returns **by value** the Offset to the current element; it doesn't return it by reference.

Since the Traditional C++ API doesn't use exceptions, it is recommended to use the function **advance()** (p. 1908) instead of `operator++` to check for errors

9.374.2 Member Typedef Documentation

9.374.2.1 iterator_category

```
template<typename E , typename OffsetKind >
typedef std::forward_iterator_tag rti::flat::SequenceIterator< E, OffsetKind >::iterator_↵
category
```

The iterator category.

9.374.2.2 value_type

```
template<typename E , typename OffsetKind >
typedef E rti::flat::SequenceIterator< E, OffsetKind >::value_type
```

The element type.

9.374.2.3 reference

```
template<typename E , typename OffsetKind >
typedef value_type rti::flat::SequenceIterator< E, OffsetKind >::reference
```

The reference type is the same as the value type, an Offset.

9.374.2.4 pointer

```
template<typename E , typename OffsetKind >
typedef value_type rti::flat::SequenceIterator< E, OffsetKind >::pointer
```

The pointer type is the same as the value type, an Offset.

9.374.2.5 difference_type

```
template<typename E , typename OffsetKind >
typedef std::ptrdiff_t rti::flat::SequenceIterator< E, OffsetKind >::difference_type
```

The difference type.

9.374.3 Constructor & Destructor Documentation

9.374.3.1 SequenceIterator()

```
template<typename E , typename OffsetKind >
rti::flat::SequenceIterator< E, OffsetKind >::SequenceIterator ( ) [inline]
```

Constructs an invalid iterator.

9.374.4 Member Function Documentation

9.374.4.1 is_null()

```
template<typename E , typename OffsetKind >
bool rti::flat::SequenceIterator< E, OffsetKind >::is_null ( ) const [inline]
```

Returns whether the iterator is invalid.

9.374.4.2 operator*()

```
template<typename E , typename OffsetKind >
value_type rti::flat::SequenceIterator< E, OffsetKind >::operator* ( ) const [inline]
```

Returns the Offset of the current element.

Returns

The Offset to the current element. Note that this function returns by value, not by reference. This Offset may be **null** (p. 1834) if the iterator has surpassed the length of the collection. See **Offset Error Management** (p. 560).

9.374.4.3 operator->()

```
template<typename E , typename OffsetKind >
value_type rti::flat::SequenceIterator< E, OffsetKind >::operator-> ( ) const [inline]
```

Returns the Offset of the current element.

9.374.4.4 advance()

```
template<typename E , typename OffsetKind >
bool rti::flat::SequenceIterator< E, OffsetKind >::advance ( ) [inline]
```

Advances to the next element, reporting any errors by returning false.

Since the Traditional C++ API doesn't support exceptions, this function is recommended instead of operator++.

Returns

True if the function succeeds, or false if there was an error

9.374.4.5 operator++() [1/2]

```
template<typename E , typename OffsetKind >  
SequenceIterator & rti::flat::SequenceIterator< E, OffsetKind >::operator++ ( ) [inline]
```

Advances to the next element.

Warning

Since the Traditional C++ API doesn't use exceptions, use **advance()** (p. 1908) instead of this operator to check for errors.

9.374.4.6 operator++() [2/2]

```
template<typename E , typename OffsetKind >  
SequenceIterator rti::flat::SequenceIterator< E, OffsetKind >::operator++ (   
    int ) [inline]
```

Advances to the next element.

Warning

Since the Traditional C++ API doesn't use exceptions, use **advance()** (p. 1908) instead of this operator to check for errors.

9.374.5 Friends And Related Function Documentation

9.374.5.1 operator<

```
template<typename E , typename OffsetKind >  
bool operator< (   
    const SequenceIterator< E, OffsetKind > & s1,  
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

9.374.5.2 operator>

```
template<typename E , typename OffsetKind >
bool operator> (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

9.374.5.3 operator<=

```
template<typename E , typename OffsetKind >
bool operator<= (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

9.374.5.4 operator>=

```
template<typename E , typename OffsetKind >
bool operator>= (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

9.374.5.5 operator==

```
template<typename E , typename OffsetKind >
bool operator== (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

9.374.5.6 operator"!=

```
template<typename E , typename OffsetKind >
bool operator!= (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

9.375 rti::flat::SequenceOffset< ElementOffset > Class Template Reference

Offset to a sequence of non-primitive elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::SequenceOffset< ElementOffset >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)
Gets the Offset to an element.
- unsigned int **element_count** () const
The number of elements.

Additional Inherited Members

9.375.1 Detailed Description

```
template<typename ElementOffset>
class rti::flat::SequenceOffset< ElementOffset >
```

Offset to a sequence of non-primitive elements.

Template Parameters

<i>ElementOffset</i>	The Offset type, for example MyFlatMutableOffset (p. 1739), MyFlatFinalOffset (p. 1728), or StringOffset (p. 1922).
----------------------	--

Represents an Offset to a sequence member and allows getting an Offset to each of its elements.

A **SequenceOffset** (p. 1911) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast** (p. 560)), if the `ElementOffset` is a final type.

9.375.2 Member Function Documentation

9.375.2.1 `get_element()`

```
template<typename ElementOffset >
ElementOffset rti::flat::SequenceOffset< ElementOffset >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

The Offset to the element in the i-th position

9.375.2.2 `element_count()`

```
template<typename ElementOffset >
unsigned int rti::flat::SequenceOffset< ElementOffset >::element_count ( ) const [inline]
```

The number of elements.

9.376 `connex::SimpleReplier< TReq, TRep >` Class Template Reference

A callback-based replier.

Public Member Functions

- **SimpleReplier** (**DDSDomainParticipant** *participant, const std::string &service_name, **SimpleReplier**↵
Listener< TReq, TRep > &listener)
*Creates a new **SimpleReplier** (p. 1912).*
- **SimpleReplier** (const **SimpleReplierParams**< TReq, TRep > ¶ms)
*Creates a new **SimpleReplier** (p. 1912).*
- virtual ~**SimpleReplier** ()
*Releases the resources created by this **SimpleReplier** (p. 1912).*

9.376.1 Detailed Description

```
template<typename TReq, typename TRep>
class connext::SimpleReplier< TReq, TRep >
```

A callback-based replier.

A **SimpleReplier** (p. 1912) is based on a **connext::SimpleReplierListener** (p. 1914) that users provide . Requests are passed to the callback, which returns a reply. The reply is directed only to the **Requester** (p. 1863) that sent the request.

SimpleRepliers are useful for simple use cases where a single reply for a request can be generated quickly, for example, looking up a table.

When more than one reply for a request can be generated or the processing is complex or needs to happen asynchronously, use a **connext::Replier** (p. 1845) instead.

See also

connext::Replier (p. 1845)
connext::SimpleReplierListener (p. 1914)
SimpleReplier example (p. 232)

9.376.2 Constructor & Destructor Documentation

9.376.2.1 SimpleReplier() [1/2]

```
template<typename TReq , typename TRep >
connext::SimpleReplier< TReq, TRep >::SimpleReplier (
    DDSDomainParticipant * participant,
    const std::string & service_name,
    SimpleReplierListener< TReq, TRep > & listener )
```

Creates a new **SimpleReplier** (p. 1912).

See also

connext::SimpleReplierParams (p. 1916)
connext::SimpleReplierListener (p. 1914)

9.376.2.2 SimpleReplier() [2/2]

```
template<typename TReq , typename TRep >
connect::SimpleReplier< TReq, TRep >::SimpleReplier (
    const SimpleReplierParams< TReq, TRep > & params ) [explicit]
```

Creates a new **SimpleReplier** (p. 1912).

See also

connect::SimpleReplierParams (p. 1916)
connect::SimpleReplierListener (p. 1914)

9.376.2.3 ~SimpleReplier()

```
template<typename TReq , typename TRep >
connect::SimpleReplier< TReq, TRep >::~~ SimpleReplier [virtual]
```

Releases the resources created by this **SimpleReplier** (p. 1912).

See also

connect::Replier::~~Replier() (p. 1850)

9.377 connect::SimpleReplierListener< TReq, TRep > Class Template Reference

The listener called by a **SimpleReplier** (p. 1912).

Public Member Functions

- virtual TRep * **on_request_available** (typename dds_type_traits< TReq >::SampleRefType request)=0
User callback that receives a request and provides a reply.
- virtual void **return_loan** (TRep *reply)=0
Returns a previously generated reply to the user.

9.377.1 Detailed Description

```
template<class TReq, class TRep>
class connect::SimpleReplierListener< TReq, TRep >
```

The listener called by a **SimpleReplier** (p. 1912).

See also

connect::SimpleReplier (p. 1912)
SimpleReplier example (p. 232)

9.377.2 Member Function Documentation

9.377.2.1 on_request_available()

```
template<class TReq , class TRep >
virtual TRep * connext::SimpleReplierListener< TReq, TRep >::on_request_available (
    typename dds_type_traits< TReq >::SampleRefType request ) [pure virtual]
```

User callback that receives a request and provides a reply.

This operation gets called when a request is available and expects a reply that is automatically sent. Immediately after that, **return_loan** (p. 1915) is called.

Parameters

<i>request</i>	The received request
----------------	----------------------

Returns

A reply for that request

9.377.2.2 return_loan()

```
template<class TReq , class TRep >
virtual void connext::SimpleReplierListener< TReq, TRep >::return_loan (
    TRep * reply ) [pure virtual]
```

Returns a previously generated reply to the user.

This operation is always called right after sending the reply created by **on_request_available** (p. 1915). It can be used to release any resources from the reply creation. If there are no resources to release, the implementation body can be empty.

Parameters

<i>reply</i>	The reply previously provided in on_request_available (p. 1915)
--------------	--

9.378 connext::SimpleReplierParams< TReq, TRep > Class Template Reference

Contains the parameters for creating a **connext::SimpleReplier** (p. 1912).

Inherits **connext::details::EntityParams**.

Public Member Functions

- **SimpleReplierParams** (**DDS::DomainParticipant** *participant, **SimpleReplierListener**< TReq, TRep > &listener)
*Creates **SimpleReplierParams** (p. 1916) with the parameters that a **SimpleReplier** (p. 1912) always needs.*
- **SimpleReplierParams** & **service_name** (const std::string &service_name)
*The service name the **Replier** (p. 1845) offers and Requesters use to match.*
- **SimpleReplierParams** & **request_topic_name** (const std::string &req_topic)
Sets a specific request topic name.
- **SimpleReplierParams** & **reply_topic_name** (const std::string &rep_topic)
Sets a specific reply topic name.
- **SimpleReplierParams** & **qos_profile** (const std::string &qos_library_name, const std::string &qos_profile_name)
Sets a QoS profile for the entities in this replier.
- **SimpleReplierParams** & **datawriter_qos** (const **DDS_DataWriterQos** &qos)
*Sets the quality of service of the reply **DataWriter**.*
- **SimpleReplierParams** & **datareader_qos** (const **DDS_DataReaderQos** &qos)
*Sets the quality of service of the request **DataReader**.*
- **SimpleReplierParams** & **publisher** (**DDSPublisher** *publisher)
*Sets a specific **Publisher**.*
- **SimpleReplierParams** & **subscriber** (**DDSSubscriber** *subscriber)
*Sets a specific **Subscriber**.*
- **SimpleReplierParams** & **request_type_support** (**DDS::TypeSupport** *type_support)
Sets the type support for the request type.
- **SimpleReplierParams** & **reply_type_support** (**DDS::TypeSupport** *type_support)
Sets the type support for the reply type.

9.378.1 Detailed Description

```
template<typename TReq, typename TRep>
class connext::SimpleReplierParams< TReq, TRep >
```

Contains the parameters for creating a **connext::SimpleReplier** (p. 1912).

The parameters for a **SimpleReplier** (p. 1912) are identical to those of the **Replier** (p. 1845), except for the **SimpleReplierListener** (p. 1914), which is required and has a different user callback.

See also

connext::ReplierParams (p. 1858)

9.378.2 Constructor & Destructor Documentation

9.378.2.1 SimpleReplierParams()

```
template<typename TReq , typename TRep >
connext::SimpleReplierParams< TReq, TRep >::SimpleReplierParams (
    DDS::DomainParticipant * participant,
    SimpleReplierListener< TReq, TRep > & listener ) [inline]
```

Creates **SimpleReplierParams** (p. 1916) with the parameters that a **SimpleReplier** (p. 1912) always needs.

In addition to these parameters, a **SimpleReplier** (p. 1912) needs either:

- A service name (**service_name** (p. 1917)), or
- Custom topic names (**reply_topic_name** (p. 1918) and **request_topic_name** (p. 1917)).

The other parameters are optional.

Parameters

<i>participant</i>	The DomainParticipant that this SimpleReplier (p. 1912) uses to join a domain.
<i>listener</i>	The listener where the user callback that a SimpleReplier (p. 1912) calls is implemented.

9.378.3 Member Function Documentation

9.378.3.1 service_name()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::service_name (
    const std::string & service_name ) [inline]
```

The service name the **Replier** (p. 1845) offers and Requesters use to match.

See also

connext::RequesterParams::service_name (p. 1886)

9.378.3.2 request_topic_name()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::request_topic_name (
    const std::string & req_topic ) [inline]
```

Sets a specific request topic name.

This is an alternative to **service_name** (p. 1917)

9.378.3.3 reply_topic_name()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::reply_topic_name (
    const std::string & rep_topic ) [inline]
```

Sets a specific reply topic name.

This is an alternative to **service_name** (p. 1917)

9.378.3.4 qos_profile()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::qos_profile (
    const std::string & qos_library_name,
    const std::string & qos_profile_name ) [inline]
```

Sets a QoS profile for the entities in this replier.

See also

connext::ReplierParams::qos_profile (p. 1860)

9.378.3.5 datawriter_qos()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::datawriter_qos (
    const DDS_DataWriterQos & qos ) [inline]
```

Sets the quality of service of the reply DataWriter.

See also

qos_profile (p. 1918)

9.378.3.6 datareader_qos()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::datareader_qos (
    const DDS_DataReaderQos & qos ) [inline]
```

Sets the quality of service of the request DataReader.

See also

qos_profile (p. 1918)

9.378.3.7 publisher()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::publisher (
    DDSPublisher * publisher ) [inline]
```

Sets a specific Publisher.

See also

connext::RequesterParams::publisher (p. 1887)

9.378.3.8 subscriber()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::subscriber (
    DDSSubscriber * subscriber ) [inline]
```

Sets a specific Subscriber.

See also

connext::RequesterParams::subscriber (p. 1888)

9.378.3.9 request_type_support()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::request_type_support (
    DDS::TypeSupport * type_support ) [inline]
```

Sets the type support for the request type.

See also

connext::ReplierParams::request_type_support (p. 1862)

9.378.3.10 reply_type_support()

```
template<typename TReq , typename TRep >
SimpleReplierParams & connext::SimpleReplierParams< TReq, TRep >::reply_type_support (
    DDS::TypeSupport * type_support ) [inline]
```

Sets the type support for the reply type.

See also

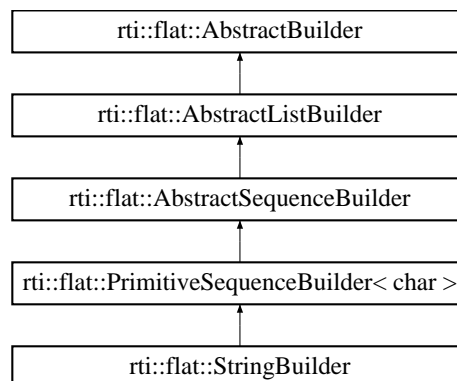

connext::ReplierParams::reply_type_support (p. 1862)

9.379 rti::flat::StringBuilder Class Reference

Builds a string.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::StringBuilder:

Public Member Functions

- **StringBuilder & set_string** (const char *value)
Sets the string value.
- **Offset finish** ()
Finishes building the string.

Additional Inherited Members

9.379.1 Detailed Description

Builds a string.

A **StringBuilder** (p. 1920) only provides one method, **set_string()** (p. 1921), so it can be typically used as follows:

```
MyFlatMutableBuilder my_builder = ...;  
my_builder.build_my_string().set_string("Hello!");
```

Note that by relying on the builder destructor, there is no need to call **finish()** (p. 1921) on the object returned by build↵
_my_string().

9.379.2 Member Function Documentation

9.379.2.1 set_string()

```
StringBuilder & rti::flat::StringBuilder::set_string (  
    const char * value ) [inline]
```

Sets the string value.

References **rti::flat::PrimitiveSequenceBuilder< char >::add_n()**.

9.379.2.2 finish()

```
Offset rti::flat::StringBuilder::finish ( ) [inline]
```

Finishes building the string.

Returns

An Offset to the member that has been built.

See also

discard() (p. 574)

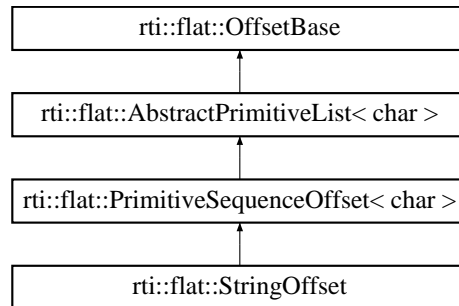

References **rti::flat::PrimitiveSequenceBuilder< char >::add_next()**.

9.380 rti::flat::StringOffset Class Reference

Offset to a string.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::StringOffset:

Public Member Functions

- char * **get_string** ()
Gets the string.
- const char * **get_string** () const
Gets the string (const)
- unsigned int **element_count** () const
Returns the number of characters.

9.380.1 Detailed Description

Offset to a string.

9.380.2 Member Function Documentation

9.380.2.1 get_string() [1/2]

```
char * rti::flat::StringOffset::get_string ( ) [inline]
```

Gets the string.

The string returned can be modified as long as its size doesn't change.

References **rti::flat::OffsetBase::get_buffer()**.

9.380.2.2 get_string() [2/2]

```
const char * rti::flat::StringOffset::get_string ( ) const [inline]
```

Gets the string (const)

References `rti::flat::OffsetBase::get_buffer()`.

9.380.2.3 element_count()

```
unsigned int rti::flat::StringOffset::element_count ( ) const [inline]
```

Returns the number of characters.

This number doesn't include the null terminating character.

References `rti::flat::PrimitiveSequenceOffset< T >::element_count()`.

9.381 connext::TimeoutException Class Reference

The operation timed out (does not apply to wait or receive operations)

Inheritance diagram for `connext::TimeoutException`:

9.381.1 Detailed Description

The operation timed out (does not apply to wait or receive operations)

Operations that wait for samples (e.g. `connext::Requester::wait_for_replies(int, const Duration_t&)` (p. 1873) or `connext::Replier::receive_requests(int, int, const Duration_t&)` (p. 1853)) do not throw this exception.

See also

`DDS_RETCODE_TIMEOUT` (p. 336)

9.382 TransportAllocationSettings_t Struct Reference

Allocation settings used by various internal buffers.

9.382.1 Detailed Description

Allocation settings used by various internal buffers.

An allocation setting structure defines the rules of memory management used by internal buffers.

An internal buffer can provide blocks of memory of fixed size. They are used in several places of any transport, and this structure defines its starting size, limits, and how to increase its capacity.

It contains three values:

- `initial_count`: the number of individual elements that are allocated when the buffer is created.
- `max_count`: the maximum number of elements the buffer can hold. The buffer will grow up to this amount. After this limit is reached, new allocation requests will fail. For unlimited size, use the value `NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED`
- `incremental_count`: The amount of elements that are allocated at every increment. You can use the value `NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC` to have the buffer double its size at every reallocation request.

9.383 rti::flat::UnionBuilder< Discriminator > Class Template Reference

Base class of builders for user-defined mutable unions.

```
#include <AggregationBuilders.hpp>
```

Inheritance diagram for `rti::flat::UnionBuilder< Discriminator >`:

Additional Inherited Members

9.383.1 Detailed Description

```
template<typename Discriminator>  
class rti::flat::UnionBuilder< Discriminator >
```

Base class of builders for user-defined mutable unions.

Union builders can only add or build a single member.

This class contains implementation details and doesn't add any public function to **AbstractBuilder** (p. 573).

9.384 connext::UnsupportedException Class Reference

Unsupported operation.

9.385 connext::WriteSample< T > Class Template Reference

A sample for writing data.

Inherits connext::details::SampleBase< T, I >.

Public Member Functions

- **WriteSample** ()
Creates a sample with default data and info values.
- **WriteSample** (const **WriteSample**< T > &other)
Creates a sample making a deep copy of another sample.
- **WriteSample** (const T & data)
Creates a sample making a deep copy of another sample.
- **WriteSample** (**WriteSampleRef**< T > wsref)
Creates a sample deep copying the data and info the source references.
- T & **data** ()
Gets the data this sample contains.
- **WriteParams_t** & **info** ()
Gets the write parameters.
- const T & **data** ()
Gets the data this sample contains.
- const **WriteParams_t** & **info** ()
Gets the write parameters.
- **SampleIdentity_t** **identity** () const
Gets the identity of this sample.

9.385.1 Detailed Description

```
template<typename T>
class connext::WriteSample< T >
```

A sample for writing data.

WriteSamples are value types containing data that can be sent and optional parameters that configure how the data is written.

The data is automatically initialized using the corresponding **TypeSupport** (p. 1693) for type T, and the memory is released in the destructor.

When the data already exists and allocating a new instance is not required, **connext::WriteSampleRef** (p. 1929) can be used instead.

Template Parameters

<i>T</i>	The data type that this sample contains
----------	---

9.385.2 Constructor & Destructor Documentation

9.385.2.1 WriteSample() [1/4]

```
template<typename T >
connext::WriteSample< T >::WriteSample ( ) [inline]
```

Creates a sample with default data and info values.

The data is deeply initialized using the corresponding TypeSupport

See also

FooTypeSupport::initialize_data (p. 1700)

9.385.2.2 WriteSample() [2/4]

```
template<typename T >
connext::WriteSample< T >::WriteSample (
    const WriteSample< T > & other ) [inline]
```

Creates a sample making a deep copy of another sample.

9.385.2.3 WriteSample() [3/4]

```
template<typename T >
connext::WriteSample< T >::WriteSample (
    const T & data )
```

Creates a sample making a deep copy of another sample.

9.385.2.4 WriteSample() [4/4]

```
template<typename T >
connext::WriteSample< T >::WriteSample (
    WriteSampleRef< T > wsref ) [inline]
```

Creates a sample deep copying the data and info the source references.

9.385.3 Member Function Documentation

9.385.3.1 data() [1/2]

```
template<typename T >
T & connext::WriteSample< T >::data ( )
```

Gets the data this sample contains.

9.385.3.2 info() [1/2]

```
template<typename T >
WriteParams_t & connext::WriteSample< T >::info ( )
```

Gets the write parameters.

The parameters are input and output to write operations. They can be set to configure the write operation (e.g. setting a specific publication timestamp) or they can be looked up afterward (e.g. what was the actual timestamp the sample was written with).

See also

connext::Requester::send_request(WriteSample<UReq>&) (p. 1869)

connext::Replier::send_reply(WriteSample<URep>&, const SampleIdentity_t&) (p. 1851)

Referenced by **connext::WriteSample< T >::identity()**.

9.385.3.3 data() [2/2]

```
template<typename T >
const T & connext::WriteSample< T >::data ( )
```

Gets the data this sample contains.

9.385.3.4 info() [2/2]

```
template<typename T >
const WriteParams_t & connext::WriteSample< T >::info ( )
```

Gets the write parameters.

The parameters are input and output to write operations. They can be set to configure the write operation (e.g. setting a specific publication timestamp) or they can be looked up afterward (e.g. what was the actual timestamp the sample was written with).

See also

connext::Requester::send_request(WriteSample<UReq>&) (p. 1869)

connext::Replier::send_reply(WriteSample<URep>&, const SampleIdentity_t&) (p. 1851)

9.385.3.5 identity()

```
template<typename T >
SampleIdentity_t connext::WriteSample< T >::identity ( ) const [inline]
```

Gets the identity of this sample.

The identity is assigned by the middleware after writing.

Correlating requests and replies (p. 229)

References **DDS_WriteParams_t::identity**, and **connext::WriteSample< T >::info()**.

9.386 connext::WriteSampleRef< T > Class Template Reference

A reference to a data sample for writing.

Public Member Functions

- **WriteSampleRef ()**
Creates an object with no data.
- **WriteSampleRef (T & data, WriteParams_t &wparams)**
Creates an object with a reference to a data object.
- **WriteSampleRef (WriteSample< T > &ws)**
Copies the references to data and params.
- T & **data () const**
Gets the data this sample contains.
- **WriteParams_t & info () const**
Gets the write parameters.
- void **set_data** (T & data)
Sets a reference to the data to be written.
- void **set_info** (WriteParams_t & info)
Copies the new parameters, overwriting the existing ones
- bool **is_nil_data () const**
Indicates if this WriteSampleRef (p. 1929) contains a reference to data or not.
- **SampleIdentity_t identity () const**
Gets the identity of this sample.

9.386.1 Detailed Description

```
template<typename T>
class connext::WriteSampleRef< T >
```

A reference to a data sample for writing.

A **WriteSampleRef** (p. 1929) can be used much like a **connext::WriteSample** (p. 1925), but it's different in that it holds references to data and write parameters, which need to be explicitly set to existing objects, whereas **WriteSample** (p. 1925) is a value type and it owns its data and info.

Template Parameters

<i>T</i>	The data type that this sample can contain
----------	--

9.386.2 Constructor & Destructor Documentation

9.386.2.1 WriteSampleRef() [1/3]

```
template<typename T >
connect::WriteSampleRef< T >::WriteSampleRef ( ) [inline]
```

Creates an object with no data.

See also

set_data (p. 1931)

9.386.2.2 WriteSampleRef() [2/3]

```
template<typename T >
connect::WriteSampleRef< T >::WriteSampleRef (
    T & data,
    WriteParams_t & wparams ) [inline]
```

Creates an object with a reference to a data object.

See also

set_data (p. 1931)

9.386.2.3 WriteSampleRef() [3/3]

```
template<typename T >
connect::WriteSampleRef< T >::WriteSampleRef (
    WriteSample< T > & ws ) [inline]
```

Copies the references to data and params.

After this operation, this object contains a reference to the same data and WriteParams instances as the source.

9.386.3 Member Function Documentation

9.386.3.1 data()

```
template<typename T >
T & connext::WriteSampleRef< T >::data ( ) const [inline]
```

Gets the data this sample contains.

Precondition

Data must have been set before

See also

set_data (p. 1931)

connext::WriteSample::data() (p. 1927)

Referenced by **connext::WriteSampleRef< T >::set_data()**.

9.386.3.2 info()

```
template<typename T >
WriteParams_t & connext::WriteSampleRef< T >::info ( ) const [inline]
```

Gets the write parameters.

Precondition

The info object must have been set

See also

set_info() (p. 1932)

connext::WriteSample::identity() (p. 1928)

Referenced by **connext::WriteSampleRef< T >::identity()**, and **connext::WriteSampleRef< T >::set_info()**.

9.386.3.3 set_data()

```
template<typename T >
void connext::WriteSampleRef< T >::set_data (
    T & data ) [inline]
```

Sets a reference to the data to be written.

Assigns a reference to the

Parameters

<i>data</i>	The data this sample will hold a reference to
-------------	---

References **connext::WriteSampleRef< T >::data()**.

9.386.3.4 set_info()

```
template<typename T >
void connext::WriteSampleRef< T >::set_info (
    WriteParams_t & info ) [inline]
```

Copies the new parameters, overwriting the existing ones

References **connext::WriteSampleRef< T >::info()**.

9.386.3.5 is_nil_data()

```
template<typename T >
bool connext::WriteSampleRef< T >::is_nil_data ( ) const [inline]
```

Indicates if this **WriteSampleRef** (p. 1929) contains a reference to data or not.

Returns

True if this sample does not contain a reference to data.

See also

data() (p. 1931)

set_data (p. 1931)

9.386.3.6 identity()

```
template<typename T >
SampleIdentity_t connext::WriteSampleRef< T >::identity ( ) const [inline]
```

Gets the identity of this sample.

Precondition

The info object must have been set

See also

set_info() (p. 1932)

connext::WriteSample::identity() (p. 1928)

References **DDS_WriteParams_t::identity**, and **connext::WriteSampleRef< T >::info()**.

Chapter 11

Example Documentation

11.1 HelloWorld.idl

11.1.1 IDL Type Description

The data type to be disseminated by RTI Connex is described in language-independent IDL. The IDL file is input to `rtiddsgen` (see the `Code Generator User's Manual` for more information), which produces the following files.

The programming language specific type representation of the type **Foo** (p. 1632) = HelloWorld, for use in the application code.

- HelloWorld.h
- HelloWorld.cxx

User Data Type Support (p. 71) types as required by the DDS specification for use in the application code.

- HelloWorldSupport.h
- HelloWorldSupport.cxx

Methods required by the RTI Connex implementation. These contains the auto-generated methods for serializing and deserializing the type.

- HelloWorldPlugin.h
- HelloWorldPlugin.cxx

11.1.1.1 HelloWorld.idl

```
struct HelloWorld {  
    string<128> msg;  
};
```

11.2 HelloWorld.cxx

11.2.1 Programming Language Type Description

The following programming language specific type representation is generated by rtiddsgen (see the Code Generator User's Manual for more information) for use in application code, where:

- **Foo** (p. 1632) = HelloWorld
- **FooSeq** (p. 1680) = HelloWorldSeq

11.2.1.1 HelloWorld.h

```
