7.11.7.6 DDS_g_tc_float	89
7.11.7.7 DDS_g_tc_double	89
7.11.7.8 DDS_g_tc_boolean	90
7.11.7.9 DDS_g_tc_char	90
7.11.7.10 DDS_g_tc_octet	90
7.11.7.11 DDS_g_tc_longlong	91
7.11.7.12 DDS_g_tc_ulonglong	91
7.11.7.13 DDS_g_tc_longdouble	91
7.11.7.14 DDS_g_tc_wchar	92
7.12 Built-in Types	92
7.12.1 Detailed Description	92
7.12.2 Managing Memory for Builtin Types	93
7.12.3 Typecodes for Builtin Types	94
7.13 Built-in Topic's Trust Types	95
7.13.1 Detailed Description	96
7.13.2 Typedef Documentation	96
7.13.2.1 DDS_ParticipantTrustAttributesMask	96
7.13.2.2 DDS_PluginParticipantTrustAttributesMask	96
7.13.2.3 DDS_ParticipantTrustProtectionInfo	97
7.13.2.4 DDS_EndpointTrustAttributesMask	97
7.13.2.5 DDS_PluginEndpointTrustAttributesMask	97
7.13.2.6 DDS_VendorEndpointTrustAttributesMask	97

7.13.2.7 DDS_EndpointTrustProtectionInfo	97
7.13.2.8 DDS_TrustAlgorithmBit	97
7.13.2.9 DDS_TrustAlgorithmSet	97
7.13.2.10 DDS_TrustAlgorithmRequirements	98
7.13.2.11 DDS_ParticipantTrustSignatureAlgorithmInfo	98
7.13.2.12 DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo	98
7.13.2.13 DDS_ParticipantTrustInterceptorAlgorithmInfo	98
7.13.2.14 DDS_ParticipantTrustAlgorithmInfo	98
7.13.2.15 DDS_EndpointTrustInterceptorAlgorithmInfo	99
7.13.2.16 DDS_EndpointTrustAlgorithmInfo	99
7.14 Dynamic Data	99
7.14.1 Detailed Description	100
7.14.2 Macro Definition Documentation	101
7.14.2.1 DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED	101
7.14.3 Typedef Documentation	101
7.14.3.1 DDS_DynamicDataMemberId	101
7.14.4 Variable Documentation	102
7.14.4.1 DDS_DYNAMIC_DATA_PROPERTY_DEFAULT	102
7.14.4.2 DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT	102
7.14.4.3 DDS_DYNAMIC_DATA_JSON_PARSER_PROPERTIES_DEFAULT	103
7.15 Publication Module	103
7.15.1 Detailed Description	103
7.16 Publishers	103
7.16.1 Detailed Description	104
7.16.2 Function Documentation	105
7.16.2.1 DDS_PublisherQos_equals()	105
7.16.2.2 print()	105
7.16.2.3 to_string() [1/6]	106
7.16.2.4 to_string() [2/6]	106
7.16.2.5 to_string() [3/6]	107
7.16.2.6 to_string() [4/6]	108
7.16.2.7 to_string() [5/6]	109
7.16.2.8 to_string() [6/6]	109
7.16.3 Variable Documentation	110
7.16.3.1 DDS_DATAWRITER_QOS_DEFAULT	110
7.16.3.2 DDS_DATAWRITER_QOS_USE_TOPIC_QOS	111
7.17 Data Writers	111
7.17.1 Detailed Description	112
7.17.2 Function Documentation	113

7.17.2.1 DDS_DataWriterQos_equals()	113
7.17.2.2 print()	113
7.17.2.3 to_string() [1/6]	114
7.17.2.4 to_string() [2/6]	114
7.17.2.5 to_string() [3/6]	115
7.17.2.6 to_string() [4/6]	116
7.17.2.7 to_string() [5/6]	117
7.17.2.8 to_string() [6/6]	117
7.18 Flow Controllers	118
7.18.1 Detailed Description	119
7.18.2 Enumeration Type Documentation	119
7.18.2.1 DDS_FlowControllerSchedulingPolicy	119
7.18.3 Variable Documentation	121
7.18.3.1 DDS_DEFAULT_FLOW_CONTROLLER_NAME	121
7.18.3.2 DDS_FIXED_RATE_FLOW_CONTROLLER_NAME	122
7.18.3.3 DDS_ON_DEMAND_FLOW_CONTROLLER_NAME	123
7.19 Subscription Module	124
7.19.1 Detailed Description	125
7.19.2 Access to data samples	125
7.19.2.1 Data access patterns	125
7.20 Subscribers	126
7.20.1 Detailed Description	127
7.20.2 Function Documentation	127
7.20.2.1 DDS_SubscriberQos_equals()	127
7.20.2.2 print()	128
7.20.2.3 to_string() [1/6]	128
7.20.2.4 to_string() [2/6]	129
7.20.2.5 to_string() [3/6]	130
7.20.2.6 to_string() [4/6]	130
7.20.2.7 to_string() [5/6]	131
7.20.2.8 to_string() [6/6]	132
7.20.3 Variable Documentation	132
7.20.3.1 DDS_DATAREADER_QOS_DEFAULT	133
7.20.3.2 DDS_DATAREADER_QOS_USE_TOPIC_QOS	133
7.21 DataReaders	134
7.21.1 Detailed Description	136
7.21.2 Enumeration Type Documentation	136
7.21.2.1 DDS_SampleLostStatusKind	136
7.21.2.2 DDS_SampleRejectedStatusKind	140

7.21.3 Function Documentation	142
7.21.3.1 DDS_DataReaderQos_equals()	142
7.21.3.2 print()	142
7.21.3.3 to_string() [1/6]	143
7.21.3.4 to_string() [2/6]	144
7.21.3.5 to_string() [3/6]	144
7.21.3.6 to_string() [4/6]	145
7.21.3.7 to_string() [5/6]	146
7.21.3.8 to_string() [6/6]	147
7.22 Read Conditions	147
7.22.1 Detailed Description	148
7.23 Query Conditions	148
7.23.1 Detailed Description	148
7.24 Data Samples	148
7.24.1 Detailed Description	149
7.24.2 Function Documentation	149
7.24.2.1 DDS_CoherentSetInfo_equals()	149
7.24.2.2 DDS_CoherentSetInfo_copy()	150
7.24.2.3 DDS_SampleInfo_get_sample_identity()	150
7.24.2.4 DDS_SampleInfo_get_related_sample_identity()	150
7.25 Topic Queries	151
7.25.1 Detailed Description	152
7.25.2 Debugging Topic Queries	152
7.25.2.1 The Built-in ServiceRequest DataReader	153
7.25.2.2 The on_service_request_accepted DataWriter Listener Callback	153
7.25.2.3 Reading TopicQuery Samples	153
7.25.3 Typedef Documentation	154
7.25.3.1 DDS_TopicQuerySelection	154
7.25.3.2 DDS_TopicQueryData	154
7.25.4 Enumeration Type Documentation	154
7.25.4.1 DDS_TopicQuerySelectionKind	154
7.25.5 Variable Documentation	155
7.25.5.1 DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER	155
7.25.5.2 DDS_TOPIC_QUERY_SELECTION_SELECT_ALL	155
7.26 Sample States	155
7.26.1 Detailed Description	156
7.26.2 Typedef Documentation	156
7.26.2.1 DDS_SampleStateMask	156
7.26.3 Enumeration Type Documentation	156

7.26.3.1 DDS_SampleStateKind	156
7.26.4 Variable Documentation	157
7.26.4.1 DDS_ANY_SAMPLE_STATE	157
7.27 View States	157
7.27.1 Detailed Description	158
7.27.2 Typedef Documentation	158
7.27.2.1 DDS_ViewStateMask	158
7.27.3 Enumeration Type Documentation	158
7.27.3.1 DDS_ViewStateKind	158
7.27.4 Variable Documentation	159
7.27.4.1 DDS_ANY_VIEW_STATE	159
7.28 Instance States	159
7.28.1 Detailed Description	160
7.28.2 Typedef Documentation	160
7.28.2.1 DDS_InstanceStateMask	160
7.28.3 Enumeration Type Documentation	160
7.28.3.1 DDS_InstanceStateKind	160
7.28.4 Variable Documentation	161
7.28.4.1 DDS_ANY_INSTANCE_STATE	161
7.28.4.2 DDS_NOT_ALIVE_INSTANCE_STATE	161
7.29 Stream Kinds	161
7.29.1 Detailed Description	162
7.29.2 Typedef Documentation	162
7.29.2.1 DDS_StreamKindMask	162
7.29.3 Enumeration Type Documentation	162
7.29.3.1 DDS_StreamKind	162
7.30 Infrastructure Module	162
7.30.1 Detailed Description	164
7.30.2 Variable Documentation	164
7.30.2.1 DDS_QOS_PRINT_ALL	164
7.31 Built-in Sequences	164
7.31.1 Detailed Description	165
7.32 Multi-channel DataWriters	165
7.32.1 What is a Multi-channel DataWriter?	166
7.32.2 Configuration on the Writer Side	166
7.32.3 Configuration on the Reader Side	166
7.32.4 Reliability with Multi-Channel DataWriters	166
7.32.4.1 Reliable Delivery	166
7.32.4.2 Reliable Protocol Considerations	167

7.33 Transports	167
7.33.1 Detailed Description	168
7.33.2 Overview	168
7.33.3 Transport Aliases	168
7.33.4 Transport Lifecycle	169
7.33.5 Transport Class Attributes	169
7.33.6 Transport Instance Attributes	170
7.33.7 Transport Network Address	171
7.33.8 Transport Send Route	171
7.33.9 Transport Receive Route	171
7.34 Installing Transport Plugins	172
7.34.1 Detailed Description	172
7.34.2 Loading Transport Plugins through Property QoS Policy of Domain Participant	173
7.34.3 Typedef Documentation	175
7.34.3.1 NDDS_Transport_Handle_t	175
7.34.3.2 NDDS_Transport_create_plugin	175
7.34.4 Function Documentation	176
7.34.4.1 NDDS_Transport_Handle_is_nil()	176
7.34.5 Variable Documentation	176
7.34.5.1 NDDS_TRANSPORT_HANDLE_NIL	176
7.35 Built-in Transport Plugins	176
7.35.1 Detailed Description	177
7.36 Creating New Transport Plugins	177
7.37 Common Types and Declarations	178
7.37.1 Detailed Description	178
7.38 Queries and Filters Syntax	178
7.38.1 Syntax for DDS Queries and Filters	178
7.38.2 SQL grammar in BNF	179
7.38.3 Token expression	179
7.38.4 String Parameters	182
7.38.5 Type compatability in Predicate	182
7.38.6 SQL Extension: Regular Expression Matching	182
7.38.7 Character Encoding	183
7.38.8 Unicode Normalization	183
7.38.9 Examples	184
7.39 Logging and Version	184
7.39.1 Detailed Description	184
7.40 General Utilities	184
7.40.1 Detailed Description	185

7.41 Observability	185
7.41.1 Detailed Description	185
7.42 Request-Reply Pattern	185
7.42.1 Detailed Description	185
7.43 Requester	186
7.43.1 Detailed Description	186
7.44 Replier	186
7.44.1 Detailed Description	186
7.45 Infrastructure	187
7.45.1 Detailed Description	188
7.45.2 Function Documentation	188
7.45.2.1 make_valid_sample_iterator()	188
7.45.2.2 move()	189
7.46 Utilities	189
7.46.1 Detailed Description	190
7.47 Durability and Persistence	190
7.47.1 Durable Writer History	190
7.47.2 Durable Reader State	191
7.47.3 Data Durability	191
7.47.4 Durability and Persistence Based on Virtual GUID	191
7.47.5 Configuring Durable Writer History	192
7.47.6 Configuring Durable Reader State	194
7.47.7 Configuring Data Durability	195
7.48 System Properties	195
7.48.1 System Properties List	195
7.48.2 System Resource Consideration	196
7.49 Configuring QoS Profiles with XML	196
7.49.1 Loading QoS Profiles from XML Resources	196
7.49.2 URL	198
7.49.2.1 URL groups	198
7.49.2.2 NDDS_QOS_PROFILES environment variable	198
7.49.2.3 Built-In QoS Profiles	198
7.50 Publication Example	198
7.50.1 A typical publication example	199
7.51 Subscription Example	199
7.51.1 A typical subscription example	200
7.52 Participant Use Cases	200
7.52.1 Turning off auto-enable of newly created participant(s)	201
7.52.2 Getting the factory	201

7.52.3 Setting up a participant	201
7.52.4 Tearing down a participant	202
7.53 Topic Use Cases	202
7.53.1 Registering a user data type	202
7.53.2 Setting up a topic	202
7.53.3 Tearing down a topic	203
7.54 FlowController Use Cases	203
7.54.1 Creating a flow controller	203
7.54.2 Flow controlling a data writer	203
7.54.3 Using the built-in flow controllers	204
7.54.4 Shaping the network traffic for a particular transport	205
7.54.5 Coalescing multiple samples in a single network packet	205
7.55 Publisher Use Cases	205
7.55.1 Setting up a publisher	205
7.55.2 Tearing down a publisher	205
7.56 DataWriter Use Cases	206
7.56.1 Setting up a data writer	206
7.56.2 Managing instances	206
7.56.3 Sending data	207
7.56.4 Tearing down a data writer	207
7.57 Subscriber Use Cases	207
7.57.1 Setting up a subscriber	207
7.57.2 Set up subscriber to access received data	208
7.57.3 Access received data via a subscriber	208
7.57.4 Access received data coherently and/or in order	209
7.57.5 Tearing down a subscriber	209
7.58 DataReader Use Cases	209
7.58.1 Setting up a data reader	209
7.58.2 Managing instances	210
7.58.3 Set up reader to access received data	210
7.58.4 Access received data via a reader	210
7.58.5 Taking data	210
7.58.6 Reading data	211
7.58.7 Tearing down a data reader	212
7.59 Entity Use Cases	212
7.59.1 Enabling an entity	212
7.59.2 Checking if a status changed on an entity.	212
7.59.3 Changing the QoS for an entity	212
7.59.4 Changing the listener and enabling/disabling statuses associated with it	213

7.59.5 Enabling/Disabling statuses associated with a status condition	213
7.60 Waitset Use Cases	214
7.60.1 Setting up a wait-set	214
7.60.2 Waiting for condition(s) to trigger	215
7.60.3 Tearing down a wait-set	215
7.61 Transport Use Cases	215
7.61.1 Changing the automatically registered built-in transports	215
7.61.2 Changing the properties of the automatically registered builtin transports	216
7.61.3 Creating a transport	216
7.61.4 Deleting a transport	216
7.61.5 Registering a transport with a participant	217
7.61.6 Adding receive routes for a transport	218
7.61.7 Adding send routes for a transport	218
7.62 Filter Use Cases	218
7.62.1 Introduction 	218
7.62.1.1 Overview of ContentFilteredTopic	219
7.62.1.2 Overview of QueryCondition	219
7.62.2 Filtering with ContentFilteredTopic	220
7.62.3 Filtering with Query Conditions	220
7.62.4 Filtering Performance	221
7.63 Creating Custom Content Filters	221
7.63.1 Introduction	222
7.63.2 The Custom Content Filter API	222
7.63.2.1 The compile function	222
7.63.2.2 The evaluate function	222
7.63.2.3 The finalize function	223
7.63.3 Example Using C format strings	223
7.63.3.1 Writing the Compile Function	223
7.63.3.2 Writing the Evaluate Function	223

Chapter 1

RTI Connex

Core Libraries and Utilities

Real-Time Innovations, Inc.

RTI Connex is network middleware for real-time distributed applications. It provides the communications services that programmers need to distribute time-critical data between embedded and/or enterprise devices or nodes. RTI Connex uses the publish-subscribe communications model to make data distribution efficient and robust.

The RTI Connex Application Programming Interface (API) is based on the OMG's Data Distribution Service (DDS) specification, version 1.4. The most recent publication of this specification can be found in the `Catalog of OMG Specifications` under "Platform Categories".

Note: this documentation is for the **RTI Connex Traditional C++ API**, the `RTI Connex Modern C++ API` is also available.

1.1 Available Documentation.

The documentation for this release is provided in two forms: the API Reference HTML documentation and PDF documents. If you are new to RTI Connex, the **Documentation Roadmap** (p. 234) will provide direction on how to learn about this product.

1.1.1 The documents for the Core Libraries and Utilities are:

- **What 's New.** An overview of the new features in this release.
- **Release Notes.** System requirements, compatibility, what's fixed in this release, and known issues.
- **Platform Notes.** Specific details, such as compilation setting and libraries, related to building and using RTI Connex on the various supported platforms.
- **Getting Started Guide.** Core value and concepts behind the product, taking you step-by-step through the creation of a simple example application. Developers should read this document first.
- **Code Generator User's Manual.** Information about using rtdsgen to generate code from data types.
- **User's Manual.** Introduction to RTI Connex, product tour and conceptual presentation of the functionality of RTI Connex.
- **QoS Reference Guide.** A compact summary of supported Quality of Service (QoS) policies.
- **XML-Based Application Creation Getting Started Guide.** Details on how to use XML-Based Application Creation.
- **Extensible Types Guide.** Additional information about extensible types.
- See more `documentation` on RTI Community.

1.1.2 The API Reference HTML documentation contains:

- **RTI Connex DDS API Reference** (p. 238) - The RTI Connex API reference.
- **RTI Connex Messaging API Reference** (p. 241) - RTI Connex API's for additional communication patterns
- **Programming How-To's** (p. 242) - Describes and shows the common tasks done using the API.

The API Reference HTML documentation can be accessed through the tree view in the left frame of the web browser window. The bulk of the documentation is found under the entry labeled "Modules".

1.2 Feedback and Support for this Release.

We welcome any input on how to improve RTI Connex to suit your needs. If you have questions or comments about this release, please visit the RTI Customer Portal at <https://support.rti.com>.

The Customer Portal provides access to RTI software, documentation, and support. It also allows you to log support cases. Furthermore, the portal provides detailed solutions and a free public knowledge base. To access the software, documentation or log support cases, the RTI Customer Portal requires a username and password. You will receive this in the email confirming your purchase. If you do not have this email, please contact license@rti.com. Resetting your login password can be done directly at the RTI Customer Portal.

Module Index

2.1 Modules

Here is a list of all modules:

Common Types and Declarations	178
Interface	243
Documentation Roadmap	234
Conventions	235
Using DDS:: Namespace	237
RTI Connex DDS API Reference	238
Domain Module	39
DomainParticipantFactory	40
DomainParticipantConfigParams	516
DomainParticipants	49
Built-in Topics	59
Participant Built-in Topics	293
Topic Built-in Topics	294
Publication Built-in Topics	296
Subscription Built-in Topics	297
ServiceRequest Built-in Topic	299
Common types and functions	302
Topic Module	61
Topics	62
Zero Copy Transfer Over Shared Memory	70
User Data Type Support	71
Type Code Support	76
Built-in Types	92
String Built-in Type	311
KeyedString Built-in Type	311
Octets Built-in Type	312
KeyedOctets Built-in Type	313
Built-in Topic's Trust Types	95
Dynamic Data	99
DDS-Specific Primitive Types	314

FlatData Topic-Types	562
FlatData Builders	552
FlatData Samples	555
FlatData Offsets	558
Publication Module	103
Publishers	103
Data Writers	111
Flow Controllers	118
Multi-channel DataWriters	165
Subscription Module	124
Subscribers	126
DataReaders	134
Read Conditions	147
Query Conditions	148
Topic Queries	151
Data Samples	148
Sample States	155
View States	157
Instance States	159
Stream Kinds	161
SampleProcessor	544
Infrastructure Module	162
Clock Selection	38
Time Support	319
GUID Support	327
Sequence Number Support	330
Exception Codes	332
Return Codes	334
Status Kinds	336
QoS Policies	352
ASYNCHRONOUS_PUBLISHER	362
AVAILABILITY	363
BATCH	363
DATABASE	364
DATA_READER_PROTOCOL	365
DATA_READER_RESOURCE_LIMITS	366
DATA_REPRESENTATION	368
Compression Settings	371
DATA_TAG	375
DATA_WRITER_PROTOCOL	380
DATA_WRITER_RESOURCE_LIMITS	381
DATA_WRITER_TRANSFER_MODE	384
DEADLINE	384
DESTINATION_ORDER	385
DISCOVERY	387
NDDS_DISCOVERY_PEERS	464
DISCOVERY_CONFIG	388
DOMAIN_PARTICIPANT_RESOURCE_LIMITS	395
DURABILITY	397
DURABILITY_SERVICE	401
ENTITY_FACTORY	401
ENTITY_NAME	402
EVENT	403

EXCLUSIVE_AREA	404
HISTORY	404
GROUP_DATA	406
LATENCY_BUDGET	407
LIFESPAN	408
LIVELINESS	409
LOCATORFILTER	410
LOGGING	411
MONITORING	412
MULTICHANNEL	413
OWNERSHIP	414
OWNERSHIP_STRENGTH	415
PARTITION	416
PRESENTATION	417
PROFILE	418
PROPERTY	419
PUBLISH_MODE	429
READER_DATA_LIFECYCLE	432
RECEIVER_POOL	432
RELIABILITY	433
RESOURCE_LIMITS	437
SERVICE	438
SYSTEM_RESOURCE_LIMITS	439
TIME_BASED_FILTER	440
TOPIC_DATA	441
TOPIC_QUERY_DISPATCH	442
TRANSPORT_BUILTIN	442
TRANSPORT_MULTICAST	447
Multicast Settings	463
Multicast Mapping	463
TRANSPORT_MULTICAST_MAPPING	448
TRANSPORT_PRIORITY	449
TRANSPORT_SELECTION	450
TRANSPORT_UNICAST	450
Unicast Settings	462
TYPE_CONSISTENCY_ENFORCEMENT	451
TYPESUPPORT	453
USER_DATA	455
WRITER_DATA_LIFECYCLE	456
WIRE_PROTOCOL	456
Extended Qos Support	462
Thread Settings	349
Entity Support	470
Conditions and WaitSets	470
AsyncWaitSet	291
Cookie	472
Sample Flags	472
WriteParams	475
Heap Support in C	478
Builtin Qos Profiles	480
User-managed Threads	518
Octet Buffer Support	541
Sequence Support	544
Built-in Sequences	164

String Support	545
Transports	167
Installing Transport Plugins	172
Built-in Transport Plugins	176
UDP Transport Plugin definitions	257
Shared Memory Transport	259
UDPv4 Transport	266
Real-Time WAN Transport	276
UDPv6 Transport	282
Creating New Transport Plugins	177
Transport Plugins Configuration	244
Transport Address	251
Queries and Filters Syntax	178
Logging and Version	184
Version	521
Logging	522
Activity Context	528
General Utilities	184
Heap Monitoring	534
Network Capture	535
Other Utilities	541
Observability	185
Observability Library	519
Durability and Persistence	190
System Properties	195
Configuring QoS Profiles with XML	196
RTI Connex Messaging API Reference	241
Request-Reply Pattern	185
Requester	186
Replier	186
Infrastructure	187
RTI Connex Exceptions	37
Utilities	189
Programming How-To's	242
Publication Example	198
Subscription Example	199
Participant Use Cases	200
Topic Use Cases	202
FlowController Use Cases	203
Publisher Use Cases	205
DataWriter Use Cases	206
Subscriber Use Cases	207
DataReader Use Cases	209
Entity Use Cases	212
Waitset Use Cases	214
Transport Use Cases	215
Filter Use Cases	218
Creating Custom Content Filters	221
Large Data Use Cases	224
Request-Reply Examples	225

Chapter 3

Namespace Index

3.1 Namespace List

Here is a list of all documented namespaces with brief descriptions:

connect	
Namespace for Connect	565
rti	
The RTI namespace	567
rti::flat	
<< <i>extension</i> >> (p. 236) Support for FlatData Topic-Types (p. 562)	567

Chapter 4

Hierarchical Index

4.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

rti::flat::AbstractBuilder	573
rti::flat::AbstractListBuilder	575
rti::flat::AbstractSequenceBuilder	578
rti::flat::PrimitiveSequenceBuilder< char >	1841
rti::flat::StringBuilder	1920
rti::flat::FinalSequenceBuilder< ElementOffset >	1629
rti::flat::MutableSequenceBuilder< ElementBuilder >	1726
rti::flat::PrimitiveSequenceBuilder< T >	1841
rti::flat::MutableArrayBuilder< ElementBuilder, N >	1722
rti::flat::AggregationBuilder	579
rti::flat::UnionBuilder< int32_t >	1924
MyFlatUnionBuilder	1746
MyFlatMutableBuilder	1732
rti::flat::UnionBuilder< Discriminator >	1924
DDS_AcknowledgmentInfo	580
DDS_AckResponseData_t	582
DDS_AllocationSettings_t	582
DDS_AnnotationParameterValue	584
DDS_AsynchronousPublisherQosPolicy	584
DDS_AsyncWaitSetProperty_t	588
DDS_AvailabilityQosPolicy	590
DDS_BatchQosPolicy	594
DDS_BooleanSeq	598
DDS_BuiltinTopicKey_t	598
DDS_BuiltinTopicReaderResourceLimits_t	599
DDS_ChannelSettings_t	604
DDS_ChannelSettingsSeq	606
DDS_CharSeq	607
DDS_CoherentSetInfo_t	607
DDS_CompressionSettings_t	608

DDS_ContentFilterProperty_t	610
DDS_Cookie_t	612
DDS_CookieSeq	613
DDS_DatabaseQosPolicy	613
DDS_DataReaderCacheStatus	617
DDS_DataReaderProtocolQosPolicy	624
DDS_DataReaderProtocolStatus	627
DDS_DataReaderQos	638
DDS_DataReaderResourceLimitsInstanceReplacementSettings	647
DDS_DataReaderResourceLimitsQosPolicy	648
DDS_DataRepresentationIdSeq	661
DDS_DataRepresentationQosPolicy	662
DDS_DataTags	664
DDS_DataWriterCacheStatus	665
DDS_DataWriterProtocolQosPolicy	667
DDS_DataWriterProtocolStatus	672
DDS_DataWriterQos	683
DDS_DataWriterResourceLimitsQosPolicy	692
DDS_DataWriterShmemRefTransferModeSettings	699
DDS_DataWriterTransferModeQosPolicy	700
DDS_DeadlineQosPolicy	701
DDS_DestinationOrderQosPolicy	703
DDS_DiscoveryConfigQosPolicy	706
DDS_DiscoveryQosPolicy	725
DDS_DomainParticipantConfigParams_t	728
DDS_DomainParticipantFactoryQos	731
DDS_DomainParticipantProtocolStatus	734
DDS_DomainParticipantQos	735
DDS_DomainParticipantResourceLimitsQosPolicy	740
DDS_DoubleSeq	761
DDS_DurabilityQosPolicy	761
DDS_DurabilityServiceQosPolicy	765
DDS_Duration_t	768
DDS_DynamicData	769
DDS_DynamicDataInfo	877
DDS_DynamicDataJsonParserProperties_t	878
DDS_DynamicDataMemberInfo	878
DDS_DynamicDataProperty_t	880
DDS_DynamicDataSeq	882
DDS_DynamicDataTypeProperty_t	882
DDS_DynamicDataTypeSerializationProperty_t	883
DDS_EndpointGroup_t	885
DDS_EndpointGroupSeq	885
DDS_EndpointTrustAlgorithmInfo	886
DDS_EndpointTrustInterceptorAlgorithmInfo	887
DDS_EndpointTrustProtectionInfo	887
DDS_EntityFactoryQosPolicy	888
DDS_EntityNameQosPolicy	890
DDS_EnumMember	891
DDS_EnumMemberSeq	892
DDS_EventQosPolicy	893
DDS_ExclusiveAreaQosPolicy	895
DDS_ExpressionProperty	896
DDS_FilterSampleInfo	897

DDS_FloatSeq	899
DDS_FlowControllerProperty_t	899
DDS_FlowControllerTokenBucketProperty_t	901
DDS_GroupDataQosPolicy	903
DDS_GUID_t	905
DDS_HistoryQosPolicy	906
DDS_InconsistentTopicStatus	908
DDS_InstanceHandleSeq	910
DDS_Int8Seq	910
DDS_InvalidLocalIdentityAdvanceNoticeStatus	911
DDS_KeyedOctets	911
DDS_KeyedOctetsSeq	913
DDS_KeyedString	914
DDS_KeyedStringSeq	916
DDS_LatencyBudgetQosPolicy	916
DDS_LifespanQosPolicy	918
DDS_LivelinessChangedStatus	919
DDS_LivelinessLostStatus	921
DDS_LivelinessQosPolicy	923
DDS_Locator_t	926
DDS_LocatorFilter_t	927
DDS_LocatorFilterQosPolicy	928
DDS_LocatorFilterSeq	930
DDS_LocatorSeq	930
DDS_LoggingQosPolicy	930
DDS_LongDoubleSeq	934
DDS_LongLongSeq	934
DDS_LongSeq	935
DDS_MonitoringDedicatedParticipantSettings	935
DDS_MonitoringDistributionSettings	937
DDS_MonitoringEventDistributionSettings	939
DDS_MonitoringLoggingDistributionSettings	941
DDS_MonitoringLoggingForwardingSettings	943
DDS_MonitoringMetricSelection	945
DDS_MonitoringMetricSelectionSeq	947

Chapter 5

Class Index

5.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

rti::flat::AbstractAlignedList< ElementOffset >	
Base class of Offsets to sequences and arrays of non-primitive members	571
rti::flat::AbstractBuilder	
Base class of all Builders (p. 552)	573
rti::flat::AbstractListBuilder	
Base class of all array and sequence builders	575
rti::flat::AbstractPrimitiveList< T >	
Base class for Offsets to sequences and arrays of primitive types	576
rti::flat::AbstractSequenceBuilder	
Base class of Builders for sequence members	578
rti::flat::AggregationBuilder	
Base class of struct and union builders	579
connext::AlreadyDeletedException	
The object target of this operation has already been deleted	579
connext::BadParameterException	
Illegal parameter value	580
DDS_AcknowledgmentInfo	
Information about an application-level acknowledged sample	580
DDS_AckResponseData_t	
Data payload of an application-level acknowledgment	582
DDS_AllocationSettings_t	
Resource allocation settings	582
DDS_AnnotationParameterValue	
Annotation parameter value	584
DDS_AsynchronousPublisherQosPolicy	
Configures the mechanism that sends user data in an external middleware thread	584
DDS_AsyncWaitSetProperty_t	
Specifies the DDSAsyncWaitSet (p. 1243) behavior	588
DDS_AvailabilityQosPolicy	
Configures the availability of data	590

DDS_BatchQosPolicy	
Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples	594
DDS_BooleanSeq	
Instantiates FooSeq (p. 1680) < DDS_Boolean (p. 319) >	598
DDS_BuiltinTopicKey_t	
The key type of the built-in topic types	598
DDS_BuiltinTopicReaderResourceLimits_t	
Built-in topic reader's resource limits	599
DDS_ChannelSettings_t	
Type used to configure the properties of a channel	604
DDS_ChannelSettingsSeq	
Declares IDL <i>sequence</i> < DDS_ChannelSettings_t (p. 604) >	606
DDS_CharSeq	
Instantiates FooSeq (p. 1680) < DDS_Char (p. 316) >	607
DDS_CoherentSetInfo_t	
<< <i>extension</i> >> (p. 236) Type definition for a coherent set info	607
DDS_CompressionSettings_t	
<< <i>extension</i> >> (p. 236) Settings related to compressing user data	608
DDS_ContentFilterProperty_t	
<< <i>extension</i> >> (p. 236) Type used to provide all the required information to enable content filtering	610
DDS_Cookie_t	
<< <i>extension</i> >> (p. 236) Sequence of bytes	612
DDS_CookieSeq	
Declares IDL <i>sequence</i> < DDS_Cookie_t (p. 612) >	613
DDS_DatabaseQosPolicy	
Various threads and resource limits settings used by RTI Connex to control its internal database . .	613
DDS_DataReaderCacheStatus	
<< <i>extension</i> >> (p. 236) The status of the reader's cache	617
DDS_DataReaderProtocolQosPolicy	
Along with DDS_WireProtocolQosPolicy (p. 1228) and DDS_DataWriterProtocolQosPolicy (p. 667), this QoS policy configures the DDS on-the-network protocol (RTPS)	624
DDS_DataReaderProtocolStatus	
<< <i>extension</i> >> (p. 236) The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic	627
DDS_DataReaderQos	
QoS policies supported by a DDSDDataReader (p. 1272) entity	638
DDS_DataReaderResourceLimitsInstanceReplacementSettings	
Instance replacement kind applied to each instance state	647
DDS_DataReaderResourceLimitsQosPolicy	
Various settings that configure how a DDSDDataReader (p. 1272) allocates and uses physical memory for internal resources	648
DDS_DataRepresentationIdSeq	
Declares IDL <i>sequence</i> < DDS_DataRepresentationId_t (p. 369) >	661
DDS_DataRepresentationQosPolicy	
This QoS policy contains a list of representation identifiers and compression settings used by DDSDDataWriter (p. 1305) and DDSDDataReader (p. 1272) entities to negotiate which data representation and compression settings to use	662
DDS_DataTags	
Definition of DDS_DataTagQosPolicy (p. 376)	664
DDS_DataWriterCacheStatus	
<< <i>extension</i> >> (p. 236) The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue	665

DDS_DataWriterProtocolQosPolicy	
Protocol that applies only to DDSDataWriter (p. 1305) instances	667
DDS_DataWriterProtocolStatus	
<<extension>> (p. 236) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic	672
DDS_DataWriterQos	
QoS policies supported by a DDSDataWriter (p. 1305) entity	683
DDS_DataWriterResourceLimitsQosPolicy	
Various settings that configure how a DDSDataWriter (p. 1305) allocates and uses physical memory for internal resources	692
DDS_DataWriterShmemRefTransferModeSettings	
Settings related to transferring data using shared memory references	699
DDS_DataWriterTransferModeQosPolicy	
<<extension>> (p. 236) Qos related to transferring data	700
DDS_DeadlineQosPolicy	
Expresses the maximum duration (deadline) within which an instance is expected to be updated	701
DDS_DestinationOrderQosPolicy	
Controls how the middleware will deal with data sent by multiple DDSDataWriter (p. 1305) entities for the same instance of data (i.e., same DDSTopic (p. 1601) and key)	703
DDS_DiscoveryConfigQosPolicy	
Settings for discovery configuration	706
DDS_DiscoveryQosPolicy	
<<extension>> (p. 236) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications	725
DDS_DomainParticipantConfigParams_t	
<<extension>> (p. 236) Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration	728
DDS_DomainParticipantFactoryQos	
QoS policies supported by a DDSDomainParticipantFactory (p. 1409)	731
DDS_DomainParticipantProtocolStatus	
<<extension>> (p. 236) The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message	734
DDS_DomainParticipantQos	
QoS policies supported by a DDSDomainParticipant (p. 1335) entity	735
DDS_DomainParticipantResourceLimitsQosPolicy	
Various settings that configure how a DDSDomainParticipant (p. 1335) allocates and uses physical memory for internal resources, including the maximum sizes of various properties	740
DDS_DoubleSeq	
Instantiates FooSeq (p. 1680) < DDS_Double (p.318) >	761
DDS_DurabilityQosPolicy	
This QoS policy specifies whether or not RTI Connex will store and deliver previously published data samples to new DDSDataReader (p. 1272) entities that join the network later	761
DDS_DurabilityServiceQosPolicy	
Various settings to configure the external <i>RTI Persistence Service</i> used by RTI Connex for Data↔ Writers with a DDS_DurabilityQosPolicy (p. 761) setting of DDS_PERSISTENT_DURABILITY_↔QOS (p. 400) or DDS_TRANSIENT_DURABILITY_QOS (p. 400)	765
DDS_Duration_t	
Type for <i>duration</i> representation	768
DDS_DynamicData	
A sample of any complex data type, which can be inspected and manipulated reflectively	769
DDS_DynamicDataInfo	
A descriptor for a DDS_DynamicData (p. 769) object	877
DDS_DynamicDataJsonParserProperties_t	
A collection of attributes used to configure DDS_DynamicData (p. 769) objects	878

DDS_DynamicDataMemberInfo	
A descriptor for a single member (i.e. field) of dynamically defined data type	878
DDS_DynamicDataProperty_t	
A collection of attributes used to configure DDS_DynamicData (p. 769) objects	880
DDS_DynamicDataSeq	
An ordered collection of DDS_DynamicData (p. 769) elements	882
DDS_DynamicDataTypeProperty_t	
A collection of attributes used to configure DDSDynamicDataTypeSupport (p. 1439) objects	882
DDS_DynamicDataTypeSerializationProperty_t	
Properties that govern how data of a certain type will be serialized on the network	883
DDS_EndpointGroup_t	
Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum	885
DDS_EndpointGroupSeq	
A sequence of DDS_EndpointGroup_t (p. 885)	885
DDS_EndpointTrustAlgorithmInfo	
Trust Plugins algorithm information associated with the discovered endpoint	886
DDS_EndpointTrustInterceptorAlgorithmInfo	
Trust Plugins interception algorithm information associated with the discovered endpoint	887
DDS_EndpointTrustProtectionInfo	
Trust Plugins Protection information associated with the discovered endpoint	887
DDS_EntityFactoryQosPolicy	
A QoS policy for all DDSEntity (p. 1446) types that can act as factories for one or more other DDSEntity (p. 1446) types	888
DDS_EntityNameQosPolicy	
Assigns a name and a role name to a DDSDomainParticipant (p. 1335), DDSPublisher (p. 1534), DDSSubscriber (p. 1576), DDSDataWriter (p. 1305) or DDSDataReader (p. 1272). Except for DDSPublisher (p. 1534) and DDSSubscriber (p. 1576), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system	890
DDS_EnumMember	
A description of a member of an enumeration	891
DDS_EnumMemberSeq	
Defines a sequence of enumerator members	892
DDS_EventQosPolicy	
Settings for event	893
DDS_ExclusiveAreaQosPolicy	
Configures multi-thread concurrency and deadlock prevention capabilities	895
DDS_ExpressionProperty	
Provides additional information about the filter expression passed to DDSWriterContentFilter ↔ ::writer_compile (p. 1622)	896
DDS_FilterSampleInfo	
Provides meta information associated with the sample	897
DDS_FloatSeq	
Instantiates FooSeq (p. 1680) < DDS_Float (p. 318) >	899
DDS_FlowControllerProperty_t	
Determines the flow control characteristics of the DDSFlowController (p. 1451)	899
DDS_FlowControllerTokenBucketProperty_t	
DDSFlowController (p. 1451) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties	901
DDS_GroupDataQosPolicy	
Attaches a buffer of opaque data that is distributed by means of Built-in Topics (p. 59) during discovery	903
DDS_GUID_t	
Type for <i>GUID</i> (Global Unique Identifier) representation	905

DDS_HistoryQosPolicy	
Specifies the behavior of RTI Connex in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers	906
DDS_InconsistentTopicStatus	
DDS_INCONSISTENT_TOPIC_STATUS (p. 342)	908
DDS_InstanceHandleSeq	
Instantiates FooSeq (p. 1680) < DDS_InstanceHandle_t (p. 74) >	910
DDS_Int8Seq	
Instantiates FooSeq (p. 1680) < DDS_Int8 (p. 317) >	910
DDS_InvalidLocalIdentityAdvanceNoticeStatus	
DDS_INVALID_LOCAL_IDENTITY_ADVANCE_NOTICE_STATUS (p. 346)	911
DDS_KeyedOctets	
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key	911
DDS_KeyedOctetsSeq	
Instantiates FooSeq (p. 1680) < DDS_KeyedOctets (p. 911) >	913
DDS_KeyedString	
Keyed string built-in type	914
DDS_KeyedStringSeq	
Instantiates FooSeq (p. 1680) < DDS_KeyedString (p. 914) >	916
DDS_LatencyBudgetQosPolicy	
Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications	916
DDS_LifespanQosPolicy	
Specifies how long the data written by the DDSDDataWriter (p. 1305) is considered valid	918
DDS_LivelinessChangedStatus	
DDS_LIVELINESS_CHANGED_STATUS (p. 345)	919
DDS_LivelinessLostStatus	
DDS_LIVELINESS_LOST_STATUS (p. 345)	921
DDS_LivelinessQosPolicy	
Specifies and configures the mechanism that allows DDSDDataReader (p. 1272) entities to detect when DDSDDataWriter (p. 1305) entities become disconnected or "dead."	923
DDS_Locator_t	
<< <i>extension</i> >> (p. 236) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports	926
DDS_LocatorFilter_t	
Specifies the configuration of an individual channel within a MultiChannel DataWriter	927
DDS_LocatorFilterQosPolicy	
The QoS policy used to report the configuration of a MultiChannel DataWriter as part of DDS_↔PublicationBuiltinTopicData (p. 997)	928
DDS_LocatorFilterSeq	
Declares IDL <i>sequence</i> < DDS_LocatorFilter_t (p. 927) >	930
DDS_LocatorSeq	
Declares IDL <i>sequence</i> < DDS_Locator_t (p. 926) >	930
DDS_LoggingQosPolicy	
Configures the RTI Connex logging facility	930
DDS_LongDoubleSeq	
Instantiates FooSeq (p. 1680) < DDS_LongDouble (p. 318) >	934
DDS_LongLongSeq	
Instantiates FooSeq (p. 1680) < DDS_LongLong (p. 318) >	934
DDS_LongSeq	
Instantiates FooSeq (p. 1680) < DDS_Long (p. 317) >	935
DDS_MonitoringDedicatedParticipantSettings	
Configures the use of a dedicated DDSDomainParticipant (p. 1335) to distribute the RTI Connex application telemetry data	935

DDS_MonitoringDistributionSettings	
Configures the distribution of telemetry data	937
DDS_MonitoringEventDistributionSettings	
Configures the distribution of event metrics	939
DDS_MonitoringLoggingDistributionSettings	
Configures the distribution of log messages	941
DDS_MonitoringLoggingForwardingSettings	
Configures the forwarding levels of log messages for the different NDDS_Config_LogFacility (p. 527)	943
DDS_MonitoringMetricSelection	
This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources	945
DDS_MonitoringMetricSelectionSeq	
Declares IDL <code>sequence < DDS_MonitoringMetricSelection (p. 945) ></code>	947
DDS_MonitoringPeriodicDistributionSettings	
Configures the distribution of periodic metrics	948
DDS_MonitoringQosPolicy	
Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connexet telemetry data	949
DDS_MonitoringTelemetryData	
Configures the telemetry data that will be distributed	951
DDS_MultiChannelQosPolicy	
Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data	952
DDS_Octets	
Built-in type consisting of a variable-length array of opaque bytes	954
DDS_OctetSeq	
Instantiates FooSeq (p. 1680) < DDS_Octet (p. 316) >	956
DDS_OctetsSeq	
Instantiates FooSeq (p. 1680) < DDS_Octets (p. 954) >	957
DDS_OfferedDeadlineMissedStatus	
DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 342)	957
DDS_OfferedIncompatibleQosStatus	
DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343)	958
DDS_OwnershipQosPolicy	
Specifies whether it is allowed for multiple DDSDataWriter (p. 1305) (s) to write the same instance of the data and if so, how these modifications should be arbitrated	960
DDS_OwnershipStrengthQosPolicy	
Specifies the value of the strength used to arbitrate among multiple DDSDataWriter (p. 1305) objects that attempt to modify the same instance of a data type (identified by DDSTopic (p. 1601) + key)	965
DDS_ParticipantBuiltinTopicData	
Entry created when a DomainParticipant object is discovered	966
DDS_ParticipantBuiltinTopicDataSeq	
Instantiates FooSeq (p. 1680) < DDS_ParticipantBuiltinTopicData (p. 966) >	971
DDS_ParticipantTrustAlgorithmInfo	
Trust Plugins algorithm information associated with the discovered DomainParticipant	971
DDS_ParticipantTrustInterceptorAlgorithmInfo	
Trust Plugins interception algorithm information associated with the discovered DomainParticipant	972
DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo	
Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant	973
DDS_ParticipantTrustProtectionInfo	
Trust Plugins Protection information associated with the discovered DomainParticipant	974
DDS_ParticipantTrustSignatureAlgorithmInfo	
Trust Plugins signature algorithm information associated with the discovered DomainParticipant	975

DDS_PartitionQosPolicy	
Set of strings that introduces logical partitions in DDSDomainParticipant (p. 1335), DDSPublisher (p. 1534), or DDSSubscriber (p. 1576) entities	976
DDS_PersistentStorageSettings	
Configures durable writer history and durable reader state	978
DDS_PresentationQosPolicy	
Specifies how the samples representing changes to data instances are presented to a subscribing application	983
DDS_PrintFormatProperty	
A collection of attributes used to configure how data samples will be formatted when converted to a string	988
DDS_ProductVersion_t	
<<extension>> (p. 236) Type used to represent the current version of RTI Connext	990
DDS_ProfileQosPolicy	
Configures the way that XML documents containing QoS profiles are loaded by RTI Connext	991
DDS_Property_t	
Properties are name/value pairs objects	993
DDS_PropertyQosPolicy	
Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery	994
DDS_PropertySeq	
Declares IDL <i>sequence</i> < DDS_Property_t (p. 993) >	996
DDS_ProtocolVersion_t	
<<extension>> (p. 236) Type used to represent the version of the RTPS protocol	997
DDS_PublicationBuiltinTopicData	
Entry created when a DDSDataWriter (p. 1305) is discovered in association with its Publisher	997
DDS_PublicationBuiltinTopicDataSeq	
Instantiates FooSeq (p. 1680) < DDS_PublicationBuiltinTopicData (p. 997) >	1006
DDS_PublicationMatchedStatus	
DDS_PUBLICATION_MATCHED_STATUS (p. 346)	1007
DDS_PublisherQos	
QoS policies supported by a DDSPublisher (p. 1534) entity	1009
DDS_PublishModeQosPolicy	
Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its <i>own</i> thread to send data, instead of the user thread	1012
DDS_QosPolicyCount	
Type to hold a counter for a DDS_QosPolicyId_t (p. 359)	1016
DDS_QosPolicyCountSeq	
Declares IDL <i>sequence</i> < DDS_QosPolicyCount (p. 1016) >	1017
DDS_QosPrintAll_t	
Special type which is used to select the <i>to_string</i> overloads when printing QoS objects	1017
DDS_QosPrintFormat	
A collection of attributes used to configure how a QoS appears when printed	1017
DDS_QueryConditionParams	
<<extension>> (p. 236) Input parameters for DDSDataReader::create_querycondition_w_↵ params (p. 1278)	1019
DDS_ReadConditionParams	
<<extension>> (p. 236) Input parameters for DDSDataReader::create_readcondition_w_↵ params (p. 1277)	1020
DDS_ReaderDataLifecycleQosPolicy	
Controls how a DataReader manages the lifecycle of the data that it has received	1022

DDS_ReceiverPoolQosPolicy	
Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets)	1025
DDS_ReliabilityQosPolicy	
Indicates the level of reliability offered/requested by RTI Connex	1027
DDS_ReliableReaderActivityChangedStatus	
<<extension>> (p. 236) Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer	1030
DDS_ReliableWriterCacheChangedStatus	
<<extension>> (p. 236) A summary of the state of a data writer's cache of unacknowledged samples written	1032
DDS_ReliableWriterCacheEventCount	
<<extension>> (p. 236) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold	1035
DDS_RequestedDeadlineMissedStatus	
DDS_REQUESTED_DEADLINE_MISSED_STATUS (p. 343)	1036
DDS_RequestedIncompatibleQosStatus	
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 343)	1037
DDS_ResourceLimitsQosPolicy	
Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics	1038
DDS_RTPS_EntityId_t	
From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers	1042
DDS_RTPS_GUID_t	
From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier	1043
DDS_RtpsReliableReaderProtocol_t	
Qos related to reliable reader protocol defined in RTPS	1043
DDS_RtpsReliableWriterProtocol_t	
QoS related to the reliable writer protocol defined in RTPS	1047
DDS_RtpsWellKnownPorts_t	
RTPS well-known port mapping configuration	1062
DDS_SampleIdentity_t	
Type definition for a Sample Identity	1067
DDS_SampleInfo	
Information that accompanies each sample that is read or taken	1068
DDS_SampleInfoSeq	
Declares IDL <i>sequence</i> < DDS_SampleInfo (p. 1068) >	1078
DDS_SampleLostStatus	
DDS_SAMPLE_LOST_STATUS (p. 344)	1079
DDS_SampleRejectedStatus	
DDS_SAMPLE_REJECTED_STATUS (p. 344)	1080
DDS_SequenceNumber_t	
Type for <i>sequence</i> number representation	1081
DDS_ServiceQosPolicy	
Service associated with a DDS entity	1082
DDS_ServiceRequest	
A request coming from one of the built-in services	1083
DDS_ServiceRequestAcceptedStatus	
DDS_SERVICE_REQUEST_ACCEPTED_STATUS (p. 347)	1084
DDS_ServiceRequestSeq	
Instantiates FooSeq (p. 1680) < DDS_ServiceRequest (p. 1083) >	1086

DDS_ShortSeq	
Instantiates FooSeq (p. 1680) < DDS_Short (p. 317) >	1087
DDS_StringSeq	
Instantiates FooSeq (p. 1680) < char* > with value type semantics	1087
DDS_StructMember	
A description of a member of a struct	1088
DDS_StructMemberSeq	
Defines a sequence of struct members	1090
DDS_SubscriberQos	
QoS policies supported by a DDSSubscriber (p. 1576) entity	1090
DDS_SubscriptionBuiltinTopicData	
Entry created when a DDSDataReader (p. 1272) is discovered in association with its Subscriber	1094
DDS_SubscriptionBuiltinTopicDataSeq	
Instantiates FooSeq (p. 1680) < DDS_SubscriptionBuiltinTopicData (p. 1094) >	1103
DDS_SubscriptionMatchedStatus	
DDS_SUBSCRIPTION_MATCHED_STATUS (p. 346)	1103
DDS_SystemResourceLimitsQosPolicy	
<<extension>> (p. 236) Configures DDSDomainParticipant (p. 1335)-independent resources used by RTI Connext. Mainly used to change the maximum number of DDSDomainParticipant (p. 1335) entities that can be created within a single process (address space)	1105
DDS_Tag	
Tags are name/value pair objects	1107
DDS_TagSeq	
Declares IDL <i>sequence</i> < DDS_Tag (p. 1107) >	1108
DDS_ThreadSettings_t	
The properties of a thread of execution	1108
DDS_Time_t	
Type for <i>time</i> representation	1110
DDS_TimeBasedFilterQosPolicy	
Filter that allows a DDSDataReader (p. 1272) to specify that it is interested only in (potentially) a subset of the values of the data	1111
DDS_TopicBuiltinTopicData	
Entry created when a Topic object discovered	1113
DDS_TopicBuiltinTopicDataSeq	
Instantiates FooSeq (p. 1680) < DDS_TopicBuiltinTopicData (p. 1113) >	1118
DDS_TopicDataQosPolicy	
Attaches a buffer of opaque data that is distributed by means of Built-in Topics (p. 59) during discovery	1118
DDS_TopicQos	
QoS policies supported by a DDSTopic (p. 1601) entity	1120
DDS_TopicQueryData	
<<extension>> (p. 236) Provides information about a DDSTopicQuery (p. 1611)	1125
DDS_TopicQueryDispatchQosPolicy	
Configures the ability of a DDSDataWriter (p. 1305) to publish samples in response to a DDSTopicQuery (p. 1611)	1126
DDS_TopicQuerySelection	
<<extension>> (p. 236) Specifies the data query that defines a DDSTopicQuery (p. 1611)	1128
DDS_TransportBuiltinQosPolicy	
Specifies which built-in transports are used	1129
DDS_TransportInfo_t	
Contains the <i>class_id</i> and <i>message_size_max</i> of an installed transport	1130
DDS_TransportInfoSeq	
Instantiates FooSeq (p. 1680) < DDS_TransportInfo_t (p. 1130) >	1131

DDS_TransportMulticastMapping_t	Type representing a list of multicast mapping elements	1132
DDS_TransportMulticastMappingFunction_t	Type representing an external mapping function	1133
DDS_TransportMulticastMappingQosPolicy	Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data	1134
DDS_TransportMulticastMappingSeq	Declares IDL <code>sequence< DDS_TransportMulticastMapping_t</code> (p. 1132) >	1136
DDS_TransportMulticastQosPolicy	Specifies the multicast address on which a DDSDataReader (p. 1272) wants to receive its data. It can also specify a port number as well as a subset of the available (at the DDSDomainParticipant (p. 1335) level) transports with which to receive the multicast data	1136
DDS_TransportMulticastSettings_t	Type representing a list of multicast locators	1138
DDS_TransportMulticastSettingsSeq	Declares IDL <code>sequence< DDS_TransportMulticastSettings_t</code> (p. 1138) >	1140
DDS_TransportPriorityQosPolicy	This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities	1140
DDS_TransportSelectionQosPolicy	Specifies the physical transports a DDSDataWriter (p. 1305) or DDSDataReader (p. 1272) may use to send or receive data	1142
DDS_TransportUnicastQosPolicy	Specifies a subset of transports and a port number that can be used by an Entity to receive data	1143
DDS_TransportUnicastSettings_t	Type representing a list of unicast locators	1145
DDS_TransportUnicastSettingsSeq	Declares IDL <code>sequence< DDS_TransportUnicastSettings_t</code> (p. 1145) >	1146
DDS_TrustAlgorithmRequirements	Type to describe Trust Plugins algorithm requirements for an entity	1147
DDS_TypeAllocationParams_t	Configures whether or not to allocate pointer and optional members	1147
DDS_TypeCode	The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with <code>rtiddsgen</code> (see the <code>Code Generator User's Manual</code>) or to modify types you define yourself at runtime	1149
DDS_TypeCodeFactory	A singleton factory for creating, copying, and deleting data type definitions dynamically	1194
DDS_TypeCodePrintFormatProperty	A collection of attributes used to configure how a <code>TypeCode</code> appears when converted to a string	1208
DDS_TypeConsistencyEnforcementQosPolicy	Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it	1211
DDS_TypeDeallocationParams_t	Configures whether to release or not pointer and optional members	1214
DDS_TypeSupportQosPolicy	Allows you to attach application-specific values to a DDSDataWriter (p. 1305) or DDSDataReader (p. 1272), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization	1216
DDS_UInt8Seq	Instantiates FooSeq (p. 1680) < DDS_UInt8 (p. 317) >	1218
DDS_UnionMember	A description of a member of a union	1218

DDS_UnionMemberSeq	Defines a sequence of union members	1219
DDS_UnsignedLongLongSeq	Instantiates FooSeq (p. 1680) < DDS_UnsignedLongLong (p. 318) >	1220
DDS_UnsignedLongSeq	Instantiates FooSeq (p. 1680) < DDS_UnsignedLong (p. 317) >	1220
DDS_UnsignedShortSeq	Instantiates FooSeq (p. 1680) < DDS_UnsignedShort (p. 317) >	1221
DDS_UserDataQosPolicy	Attaches a buffer of opaque data that is distributed by means of Built-in Topics (p. 59) during discovery	1221
DDS_ValueMember	A description of a member of a value type	1222
DDS_ValueMemberSeq	Defines a sequence of value members	1225
DDS_VendorId_t	<< extension >> (p. 236) Type used to represent the vendor of the service implementing the RTPS protocol	1225
DDS_WaitSetProperty_t	<< extension >> (p. 236) Specifies the DDSWaitSet (p. 1613) behavior for multiple trigger events	1226
DDS_WcharSeq	Instantiates FooSeq (p. 1680) < DDS_Wchar (p. 316) >	1227
DDS_WireProtocolQosPolicy	Specifies the wire-protocol-related attributes for the DDSDomainParticipant (p. 1335)	1228
DDS_WriteParams_t	<< extension >> (p. 236) Input parameters for writing with FooDataWriter::write_w_params (p. 1671), FooDataWriter::dispose_w_params (p. 1674), FooDataWriter::register_instance_w_params (p. 1663), FooDataWriter::unregister_instance_w_params (p. 1666)	1234
DDS_WriterDataLifecycleQosPolicy	Controls how a DDSDataWriter (p. 1305) handles the lifecycle of the instances (keys) that it is registered to manage	1240
DDS_WstringSeq	Instantiates FooSeq (p. 1680) < DDS_Wchar (p. 316)* >	1243
DDSAsyncWaitSet	A class for dispatching DDSCondition (p. 1260) objects using separate threads of execution. You can see this class as an extension of a DDSWaitSet (p. 1613) that allows asynchronously waiting for the attached DDSCondition (p. 1260) objects to trigger and provide a notification by calling DDSCondition::dispatch (p. 1262)	1243
DDSAsyncWaitSetCompletionToken	<< interface >> (p. 236) Implementation of the completion token role element of the asynchronous completion token pattern that is part of the DDSAsyncWaitSet (p. 1243) behavior	1257
DDSAsyncWaitSetListener	<< interface >> (p. 236) Listener for receiving event notifications related to the thread pool of the DDSAsyncWaitSet (p. 1243)	1259
DDSCondition	<< interface >> (p. 236) Root class for all the conditions that may be attached to a DDSWaitSet (p. 1613)	1260
DDSConditionHandler	<< extension >> (p. 236) << interface >> (p. 236) Handler called by the DDSCondition (p. 1262)	1262
DDSConditionSeq	Instantiates FooSeq (p. 1680) < DDSCondition (p. 1260) >	1263

DDSTContentFilter	
<< <i>interface</i> >> (p. 236) Interface to be used by a custom filter of a DDSTContentFilteredTopic (p. 1267)	1264
DDSTContentFilteredTopic	
<< <i>interface</i> >> (p. 236) Specialization of DDSTopicDescription (p. 1608) that allows for content-based subscriptions	1267
DDSTDataReader	
<< <i>interface</i> >> (p. 236) Allows the application to: (1) declare the data it wishes to receive (i.e. make a subscription) and (2) access the data received by the attached DDSTSubscriber (p. 1576) .	1272
DDSTDataReaderListener	
<< <i>interface</i> >> (p. 236) DDSTListener (p. 1509) for reader status	1299
DDSTDataReaderSeq	
Declares IDL <i>sequence</i> < DDSTDataReader (p. 1272) >	1301
DDSTDataReaderStatusConditionHandler	
<< <i>interface</i> >> (p. 236) Realization of a DDSTConditionHandler (p. 1262) that handles the status of a DDSTDataReader (p. 1272)	1302
DDSTDataTagQosPolicyHelper	
Policy helpers that facilitate management of the data tags in the input policy	1304
DDSTDataWriter	
<< <i>interface</i> >> (p. 236) Allows an application to set the value of the data to be published under a given DDSTopic (p. 1601)	1305
DDSTDataWriterListener	
<< <i>interface</i> >> (p. 236) DDSTListener (p. 1509) for writer status	1328
DDSTDomainEntity	
<< <i>interface</i> >> (p. 236) Abstract base class for all DDS entities except for the DDSTDomainParticipant (p. 1335)	1334
DDSTDomainParticipant	
<< <i>interface</i> >> (p. 236) Container for all DDSTDomainEntity (p. 1334) objects	1335
DDSTDomainParticipantFactory	
<< <i>singleton</i> >> (p. 237) << <i>interface</i> >> (p. 236) Allows creation and destruction of DDSTDomainParticipant (p. 1335) objects	1409
DDSTDomainParticipantListener	
<< <i>interface</i> >> (p. 236) Listener for participant status	1437
DDSTDynamicDataReader	
Reads (subscribes to) objects of type DDS_DynamicData (p. 769)	1439
DDSTDynamicDataTypesupport	
A factory for registering a dynamically defined type and creating DDS_DynamicData (p. 769) objects	1439
DDSTDynamicDataWriter	
Writes (publishes) objects of type DDS_DynamicData (p. 769)	1445
DDSTEntity	
<< <i>interface</i> >> (p. 236) Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition	1446
DDSTFlowController	
<< <i>interface</i> >> (p. 236) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous DDSTDataWriter (p. 1305) instances are allowed to write data	1451
DDSTGuardCondition	
<< <i>interface</i> >> (p. 236) A specific DDSTCondition (p. 1260) whose <i>trigger_value</i> is completely under the control of the application	1454
DDSTKeyedOctetsDataReader	
<< <i>interface</i> >> (p. 236) Instantiates <i>DataReader</i> < DDS_KeyedOctets (p. 911) >	1456
DDSTKeyedOctetsDataWriter	
<< <i>interface</i> >> (p. 236) Instantiates <i>DataWriter</i> < DDS_KeyedOctets (p. 911) >	1465

DDSKeyedOctetsTypeSupport	
<< <i>interface</i> >> (p. 236) DDS_KeyedOctets (p. 911) type support	1478
DDSKeyedStringDataReader	
<< <i>interface</i> >> (p. 236) Instantiates DataReader < DDS_KeyedString (p. 914) >	1484
DDSKeyedStringDataWriter	
<< <i>interface</i> >> (p. 236) Instantiates DataWriter < DDS_KeyedString (p. 914) >	1493
DDSKeyedStringTypeSupport	
<< <i>interface</i> >> (p. 236) Keyed string type support	1503
DDSListener	
<< <i>interface</i> >> (p. 236) Abstract base class for all Listener interfaces	1509
DDSMultiTopic	
[Not supported (optional)] << <i>interface</i> >> (p. 236) A specialization of DDSTopicDescription	
(p. 1608) that allows subscriptions that combine/filter/rearrange data coming from several topics	1513
DDSOctetsDataReader	
<< <i>interface</i> >> (p. 236) Instantiates DataReader < DDS_Octets (p. 954) >	1516
DDSOctetsDataWriter	
<< <i>interface</i> >> (p. 236) Instantiates DataWriter < DDS_Octets (p. 954) >	1520
DDSOctetsTypeSupport	
<< <i>interface</i> >> (p. 236) DDS_Octets (p. 954) type support	1527
DDSParticipantBuiltinTopicDataDataReader	
Instantiates DataReader < DDS_ParticipantBuiltinTopicData (p. 966) >	1532
DDSParticipantBuiltinTopicDataTypeSupport	
Instantiates TypeSupport < DDS_ParticipantBuiltinTopicData (p. 966) >	1532
DDSPROPERTYQosPolicyHelper	
Policy helpers that facilitate management of the properties in the input policy	1533
DDSPublicationBuiltinTopicDataDataReader	
Instantiates DataReader < DDS_PublicationBuiltinTopicData (p. 997) >	1533
DDSPublicationBuiltinTopicDataTypeSupport	
Instantiates TypeSupport < DDS_PublicationBuiltinTopicData (p. 997) >	1534
DDSPublisher	
<< <i>interface</i> >> (p. 236) A publisher is the object responsible for the actual dissemination of publications	1534
DDSPublisherListener	
<< <i>interface</i> >> (p. 236) DDSListener (p. 1509) for DDSPublisher (p. 1534) status	1555
DDSPublisherSeq	
Declares IDL <i>sequence</i> < DDSPublisher (p. 1534) >	1556
DDSTypeCondition	
<< <i>interface</i> >> (p. 236) These are specialised DDSReadCondition (p. 1558) objects that allow the application to also specify a filter on the locally available data	1557
DDSReadCondition	
<< <i>interface</i> >> (p. 236) Conditions specifically dedicated to read operations and attached to one DDSDataReader (p. 1272)	1558
DDSServiceRequestDataReader	
Instantiates DataReader < DDS_ServiceRequest (p. 1083) >	1561
DDSServiceRequestTypeSupport	
Instantiates TypeSupport < DDS_ServiceRequest (p. 1083) >	1561
DDSTypeCondition	
<< <i>interface</i> >> (p. 236) A specific DDSCondition (p. 1260) that is associated with each DDSEntity (p. 1446)	1562
DDSTypeStringDataReader	
<< <i>interface</i> >> (p. 236) Instantiates DataReader < char* >	1564
DDSTypeStringDataWriter	
<< <i>interface</i> >> (p. 236) Instantiates DataWriter < char* >	1568

DDSSStringTypeSupport	
<< <i>interface</i> >> (p. 236) String type support	1571
DDSSSubscriber	
<< <i>interface</i> >> (p. 236) A subscriber is the object responsible for actually receiving data from a subscription	1576
DDSSSubscriberListener	
<< <i>interface</i> >> (p. 236) DDSListener (p. 1509) for status about a subscriber	1597
DDSSSubscriberSeq	
Declares IDL <i>sequence</i> < DDSSSubscriber (p. 1576) >	1598
DDSSubscriptionBuiltinTopicDataDataReader	
Instantiates <i>DataReader</i> < DDS_SubscriptionBuiltinTopicData (p. 1094) >	1598
DDSSubscriptionBuiltinTopicDataTypeSupport	
Instantiates <i>TypeSupport</i> < DDS_SubscriptionBuiltinTopicData (p. 1094) >	1599
DDSThreadFactory	
<< <i>extension</i> >> (p. 236) << <i>interface</i> >> (p. 236) Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the DDSThreadFactory_OnSpawnedFunction (p. 518) that specifies the operation to run in the new thread	1599
DDSTopic	
<< <i>interface</i> >> (p. 236) The most basic description of the data to be published and subscribed	1601
DDSTopicBuiltinTopicDataDataReader	
Instantiates <i>DataReader</i> < DDS_TopicBuiltinTopicData (p. 1113) >	1606
DDSTopicBuiltinTopicDataTypeSupport	
Instantiates <i>TypeSupport</i> < DDS_TopicBuiltinTopicData (p. 1113) >	1607
DDSTopicDescription	
<< <i>interface</i> >> (p. 236) Base class for DDSTopic (p. 1601), DDSContentFilteredTopic (p. 1267), and DDSMultiTopic (p. 1513)	1608
DDSTopicListener	
<< <i>interface</i> >> (p. 236) DDSListener (p. 1509) for DDSTopic (p. 1601) entities	1610
DDSTopicQuery	
<< <i>extension</i> >> (p. 236) Allows a DDSDataReader (p. 1272) to query the sample cache of its matching DDSDataWriter (p. 1305)	1611
DDSTopicQueryHelper	
Helpers to provide utility operations related to DDSTopicQuery (p. 1611)	1612
DDSTypeSupport	
<< <i>interface</i> >> (p. 236) An abstract <i>marker</i> interface that has to be specialized for each concrete user data type that will be used by the application	1613
DDSWaitSet	
<< <i>interface</i> >> (p. 236) Allows an application to wait until one or more of the attached DDSCondition (p. 1260) objects has a <i>trigger_value</i> of DDS_BOOLEAN_TRUE (p. 316) or else until the timeout expires	1613
DDSWriterContentFilter	
<< <i>interface</i> >> (p. 236) Interface to be used by a custom filter of a DDSContentFilteredTopic (p. 1267)	1621
rti::flat::FinalAlignedArrayOffset< ElementOffset, N >	
Offset to an array of final elements	1625
rti::flat::FinalArrayOffset< ElementOffset, N >	
Offset to an array of final elements	1627
rti::flat::FinalOffset< T >	
The base class of all Offsets to a final struct type	1628
rti::flat::FinalSequenceBuilder< ElementOffset >	
Builds a sequence member of fixed-size elements	1629
rti::flat::flat_type_traits< T >	
Given a Sample (p. 1893), an Offset or a Builder , it allows obtaining the other types	1631

Foo	A representative user-defined data type	1632
FooDataReader	<< <i>interface</i> >> (p. 236) << <i>generic</i> >> (p. 236) User data type-specific data reader	1632
FooDataWriter	<< <i>interface</i> >> (p. 236) << <i>generic</i> >> (p. 236) User data type specific data writer	1659
FooSeq	<< <i>interface</i> >> (p. 236) << <i>generic</i> >> (p. 236) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as Foo (p. 1632)	1680
FooTypeSupport	<< <i>interface</i> >> (p. 236) << <i>generic</i> >> (p. 236) User data type specific interface	1693
connext::IllegalOperationException	The operation was called under improper circumstances	1706
connext::ImmutablePolicyException	Application attempted to modify an immutable QoS policy	1706
connext::InconsistentPolicyException	Application specified a set of QoS policies that are not consistent with each other	1707
connext::IsInvalidSamplePredicate< T >	Predicate-class to determine if a sample contains invalid data	1707
connext::IsReplyRelatedPredicate< T >	Predicate-class to match replies by their related request	1707
connext::IsValidSamplePredicate< T >	Predicate-class to determine if a sample contains valid data	1709
connext::LoanedSamples< T >	Provides access to a collection of middleware-loaned samples	1709
connext::LoanedSamples< T >::LoanMemento	A simple value-type for the internal representation of the a LoanedSamples (p. 1709) object	1718
connext::LogicException	Base class of all RTI Connext exceptions caused by a logic error	1719
connext::MessagingLibraryVersion	The Connext Messaging Library version	1719
connext::MessagingVersion	The Connext Messaging version	1720
rti::flat::MutableArrayBuilder< ElementBuilder, N >	Builds an array member of variable-size elements	1722
rti::flat::MutableArrayOffset< ElementOffset, N >	Offset to an array of variable-size elements	1724
rti::flat::MutableOffset	The base class of all Offsets to a final struct type	1725
rti::flat::MutableSequenceBuilder< ElementBuilder >	Builds a sequence member of variable-size elements	1726
MyFlatFinalOffset	Represents the Offset to an arbitrary user-defined FlatData final IDL struct	1728
MyFlatMutableBuilder	Represents the Builder for an arbitrary user-defined mutable type	1732
MyFlatMutableOffset	Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct	1739
MyFlatUnionBuilder	Represents the Builder for an arbitrary user-defined mutable IDL union	1746
MyFlatUnionOffset	Represents the Offset to an arbitrary user-defined FlatData mutable IDL union	1749
NDDS_Config_LibraryVersion_t	The version of a single library shipped as part of an RTI Connext distribution	1753

NDDS_Config_LogMessage	
Log message	1754
NDDS_Transport_Address_t	
Addresses are stored individually as network-ordered bytes	1756
NDDS_Transport_Interface_t	
Storage for the description of a network interface used by a Transport Plugin	1757
NDDS_Transport_Property_t	
Base configuration structure that must be inherited by derived Transport Plugin classes	1758
NDDS_Transport_Shmem_Property_t	
Subclass of NDDS_Transport_Property_t (p. 1758) allowing specification of parameters that are specific to the shared-memory transport	1766
NDDS_Transport_UDP_WAN_CommPortsMappingInfo	
Type for storing UDP WAN communication ports	1769
NDDS_Transport_UDPv4_Property_t	
Configurable IPv4/UDP Transport-Plugin properties	1770
NDDS_Transport_UDPv4_WAN_Property_t	
Configurable IPv4/UDP WAN Transport-Plugin properties	1780
NDDS_Transport_UDPv6_Property_t	
Configurable IPv6/UDP Transport-Plugin properties	1789
NDDS_Transport_UUID	
Univocally identifies a transport plugin instance	1799
NDDS_Utility_NetworkCaptureParams_t	
Input parameters for starting network capture	1799
NDDSSConfigActivityContext	
Activity Context APIs	1801
NDDSSConfigLogger	
<< <i>interface</i> >> (p. 236) The singleton type used to configure RTI Connex logging	1801
NDDSSConfigLoggerDevice	
<< <i>interface</i> >> (p. 236) Logging device interface. Use for user-defined logging devices	1807
NDDSSConfigVersion	
<< <i>interface</i> >> (p. 236) The version of an RTI Connex distribution	1808
NDDSTransportSupport	
<< <i>interface</i> >> (p. 236) The utility class used to configure RTI Connex pluggable transports	1810
NDDSSUtility	
Other Utilities APIs	1816
NDDSSUtilityHeapMonitoring	
Heap Monitoring APIs	1819
NDDSSUtilityNetworkCapture	
Network Capture APIs	1823
connect::NotEnabledException	
Operation invoked on a DDSEntity (p. 1446) that is not yet enabled	1832
rti::flat::OffsetBase	
Base class of all Offset types	1833
connect::OutOfResourcesException	
RTI Connex ran out of the resources needed to complete the operation	1837
connect::PreconditionNotMetException	
A pre-condition for the operation was not met	1838
rti::flat::PrimitiveArrayOffset< T, N >	
Offset to an array of primitive elements	1838
rti::flat::PrimitiveConstOffset< T >	
A const Offset to an optional primitive member	1839
rti::flat::PrimitiveOffset< T >	
An Offset to an optional primitive member	1840

rti::flat::PrimitiveSequenceBuilder< T >	
Builds a sequence of primitive members	1841
rti::flat::PrimitiveSequenceOffset< T >	
Offset to a sequence of primitive elements	1844
connext::Replier< TReq, TRep >	
Allows receiving requests and sending replies	1845
connext::ReplierListener< TReq, TRep >	
Called when a connext::Replier (p. 1845) has new available requests	1857
connext::ReplierParams< TReq, TRep >	
Contains the parameters for creating a connext::Replier (p. 1845)	1858
connext::Requester< TReq, TRep >	
Allows sending requests and receiving replies	1863
connext::RequesterParams	
Contains the parameters for creating a connext::Requester (p. 1863)	1884
connext::RuntimeException	
Generic, unspecified error	1889
connext::Sample< T >	
A data sample and related info received from the middleware	1889
rti::flat::Sample< OffsetType >	
The generic definition of FlatData topic-types	1893
connext::SampleIterator< T, IsConst >	
STL-compliant random-access iterator for SampleRef<T>	1897
connext::SampleRef< T >	
A data sample and related information received from the middleware	1897
rti::flat::SequenceIterator< E, OffsetKind >	
Iterator for collections of Offsets	1903
rti::flat::SequenceOffset< ElementOffset >	
Offset to a sequence of non-primitive elements	1911
connext::SimpleReplier< TReq, TRep >	
A callback-based repplier	1912
connext::SimpleReplierListener< TReq, TRep >	
The listener called by a SimpleReplier (p. 1912)	1914
connext::SimpleReplierParams< TReq, TRep >	
Contains the parameters for creating a connext::SimpleReplier (p. 1912)	1916
rti::flat::StringBuilder	
Builds a string	1920
rti::flat::StringOffset	
Offset to a string	1922
connext::TimeoutException	
The operation timed out (does not apply to wait or receive operations)	1923
TransportAllocationSettings_t	
Allocation settings used by various internal buffers	1924
rti::flat::UnionBuilder< Discriminator >	
Base class of builders for user-defined mutable unions	1924
connext::UnsupportedException	
Unsupported operation	1925
connext::WriteSample< T >	
A sample for writing data	1925
connext::WriteSampleRef< T >	
A reference to a data sample for writing	1929

6.1 File List

Here is a list of all documented files with brief descriptions:

AggregationBuilders.hpp	1933
Builder.hpp	1938
BuilderHelper.hpp	1945
ExceptionHandler.hpp	1948
FlatSample.hpp	1950
FlatSampleImpl.hpp	1953
FlatTypeTraits.hpp	1954
Offset.hpp	1955
rtiflat.hpp	1963
SequenceBuilders.hpp	1964
SequenceIterator.hpp	1971
SequenceOffsets.hpp	1974
Interpreter.hpp	1981
Stream.hpp	1984

Chapter 7

Module Documentation

7.1 RTI Connex Exceptions

RTI Connex return-code exceptions.

Classes

- class **connex::RuntimeException**
Generic, unspecified error.
- class **connex::LogicException**
Base class of all RTI Connex exceptions caused by a logic error.
- class **connex::UnsupportedException**
Unsupported operation.
- class **connex::BadParameterException**
Illegal parameter value.
- class **connex::PreconditionNotMetException**
A pre-condition for the operation was not met.
- class **connex::ImmutablePolicyException**
Application attempted to modify an immutable QoS policy.
- class **connex::InconsistentPolicyException**
Application specified a set of QoS policies that are not consistent with each other.
- class **connex::NotEnabledException**
*Operation invoked on a **DDSEntity** (p. 1446) that is not yet enabled.*
- class **connex::AlreadyDeletedException**
The object target of this operation has already been deleted.
- class **connex::IllegalOperationException**
The operation was called under improper circumstances.
- class **connex::TimeoutException**
The operation timed out (does not apply to wait or receive operations)
- class **connex::OutOfResourcesException**
RTI Connex ran out of the resources needed to complete the operation.

7.1.1 Detailed Description

RTI Connex return-code exceptions.

The request-reply API reports internal DDS errors as exceptions. Each RTI Connex return code maps to a exception.

All exceptions inherit from the C++ standard exceptions `std::logic_error` or `std::runtime_error`.

Note that `RETCODE_TIMEOUT` and `RETCODE_NO_DATA` are not thrown in the request-reply API, because they are not considered errors. For example in case of no data or timeouts operations may return empty containers (e.g. `connex::Requester::take_replies(int)` (p. 1876)) or false (e.g. `connex::Requester::wait_for_replies(int, const Duration_t&)` (p. 1873)).

7.2 Clock Selection

APIs related to clock selection.

APIs related to clock selection.

RTI Connex uses clocks to measure time and generate timestamps.

The middleware uses two clocks, an internal clock and an external clock. The internal clock is used to measure time and handles all timing in the middleware. The external clock is used solely to generate timestamps, such as the source timestamp and the reception timestamp, in addition to providing the time given by `DDSDomainParticipant::get_current_time` (p. 1381).

7.2.1 Available Clocks

Two clock implementations are generally available, the monotonic clock and the realtime clock.

The monotonic clock provides times that are monotonic from a clock that is not adjustable. This clock is useful to use in order to not be subject to changes in the system or realtime clock, which may be adjusted by the user or via time synchronization protocols. However, this time generally starts from an arbitrary point in time, such as system startup. Note that this clock is not available for all architectures. Please see the `Platform Notes` for the architectures on which it is supported. For the purposes of clock selection, this clock can be referenced by the name "monotonic".

The realtime clock provides the realtime of the system. This clock may generally be monotonic but may not be guaranteed to be so. It is adjustable and may be subject to small and large changes in time. The time obtained from this clock is generally a meaningful time in that it is the amount of time from a known epoch. For the purposes of clock selection, this clock can be referenced by the names "realtime" or "system".

7.2.2 Clock Selection Strategy

By default, both the internal and external clocks use the real-time clock. If you want your application to be robust to changes in the system time, you may use the monotonic clock as the internal clock, and leave the system clock as the external clock. Note, however, that this may slightly diminish performance in that both the send and receive paths may need to obtain times from both clocks. Since the monotonic clock is not available on all architectures, you may want to specify "monotonic,realtime" for the internal_clock (see the table below). By doing so, the middleware will attempt to use the monotonic clock if available, and will fall back to the realtime clock if the monotonic clock is not available.

If you want your application to be robust to changes in the system time, you are not relying on source timestamps, and you want to avoid obtaining times from both clocks, you may use the monotonic clock for both the internal and external clocks.

7.2.3 Configuring Clock Selection

To configure the clock selection, use the **PROPERTY** (p. 419) QoS policy associated with the **DDSDomainParticipant** (p. 1335).

See also

DDS_PropertyQosPolicy (p. 994)

The following table lists the supported clock selection properties.

Table 7.1 Clock Selection Properties

Property	Description
dds.clock.external_clock	Comma-delimited list of clocks to use for the external clock, in the order of preference. Valid clock names are "realtime", "system", and "monotonic". Default: "realtime"
dds.clock.internal_clock	Comma-delimited list of clocks to use for the internal clock, in the order of preference. Valid clock names are "realtime", "system", and "monotonic". Default: "realtime"

7.3 Domain Module

Contains the **DDSDomainParticipant** (p. 1335) class that acts as an entrypoint of RTI Connex and acts as a factory for many of the classes. The **DDSDomainParticipant** (p. 1335) also acts as a container for the other objects that make up RTI Connex.

Modules

- **DomainParticipantFactory**
DDSDomainParticipantFactory (p. 1409) entity and associated elements
- **DomainParticipants**
DDSDomainParticipant (p. 1335) entity and associated elements
- **Built-in Topics**
Built-in objects created by RTI Connex but accessible to the application.

7.3.1 Detailed Description

Contains the **DDSDomainParticipant** (p. 1335) class that acts as an endpoint of RTI Connex and acts as a factory for many of the classes. The **DDSDomainParticipant** (p. 1335) also acts as a container for the other objects that make up RTI Connex.

7.4 DomainParticipantFactory

DDSDomainParticipantFactory (p. 1409) entity and associated elements

Modules

- **DomainParticipantConfigParams**
<<extension>> (p. 236) *DDS_DomainParticipantConfigParams_t* (p. 728)

Classes

- struct **DDS_DomainParticipantFactoryQos**
QoS policies supported by a DDSDomainParticipantFactory (p. 1409).
- class **DDSDomainParticipantFactory**
<<singleton>> (p. 237) *<<interface>>* (p. 236) *Allows creation and destruction of DDSDomainParticipant* (p. 1335) objects.

Macros

- **#define DDSTheParticipantFactory DDSDomainParticipantFactory::get_instance()**
Can be used as an alias for the singleton factory returned by the operation DDSDomainParticipantFactory::get_instance (p. 1412).

Typedefs

- typedef **DDS_ReturnCode_t**(* **DDSDomainParticipantFactory_RegisterTypeFunction**) (**DDSDomainParticipant** *participant, const char *type_name)
Prototype of a register type function.

Functions

- **DDS_Boolean DDS_DomainParticipantFactoryQos_equals** (const struct **DDS_DomainParticipantFactoryQos** *self, const struct **DDS_DomainParticipantFactoryQos** *other)
*Compares two **DDS_DomainParticipantFactoryQos** (p. 731) for equality.*
- **DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::print** () const
*Prints this **DDS_DomainParticipantFactoryQos** (p. 731) to stdout.*
- **DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string** (char *string, **DDS_UnsignedLong** &string_size) const
*Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).*
- **DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DomainParticipantFactoryQos** &base) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DomainParticipantFactoryQos** &base, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*

Variables

- const struct **DDS_DomainParticipantQos DDS_PARTICIPANT_QOS_DEFAULT**
*Special value for creating a **DomainParticipant** with default QoS.*
- const struct **DDS_DomainParticipantConfigParams_t DDS_PARTICIPANT_CONFIG_PARAMS_DEFAULT**
*Special value for creating a **DDSDomainParticipant** (p. 1335) from configuration using default parameters.*

7.4.1 Detailed Description

DDSDomainParticipantFactory (p. 1409) entity and associated elements

7.4.2 Macro Definition Documentation

7.4.2.1 DDSTheParticipantFactory

```
#define DDSTheParticipantFactory DDSDomainParticipantFactory::get_instance()
```

Can be used as an alias for the singleton factory returned by the operation `DDSDomainParticipantFactory::get_instance` (p. 1412).

`DDSDomainParticipantFactory::get_instance` (p. 1412)

Examples

`HelloWorld_publisher.cxx`, and `HelloWorld_subscriber.cxx`.

7.4.3 Typedef Documentation

7.4.3.1 DDSDomainParticipantFactory_RegisterTypeFunction

```
typedef DDS_ReturnCode_t (* DDSDomainParticipantFactory_RegisterTypeFunction) ( DDSDomainParticipant
*participant, const char *type_name)
```

Prototype of a register type function.

Parameters

<i>participant</i>	<< <i>inout</i> >> (p. 237) DDSDomainParticipant (p. 1335) participant the type is registered with.
<i>type_name</i>	<< <i>in</i> >> (p. 237) Name the type is registered with.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

7.4.4 Function Documentation

7.4.4.1 DDS_DomainParticipantFactoryQos_equals()

```
DDS_Boolean DDS_DomainParticipantFactoryQos_equals (
    const struct DDS_DomainParticipantFactoryQos * self,
    const struct DDS_DomainParticipantFactoryQos * other )
```

Compares two **DDS_DomainParticipantFactoryQos** (p. 731) for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This DomainParticipantFactoryQos.
<i>other</i>	<< <i>in</i> >> (p. 237) The other DomainParticipantFactoryQos to be compared with this DomainParticipantFactoryQos.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Qos objects are equal or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Referenced by **DDS_DomainParticipantFactoryQos::operator!=()**, and **DDS_DomainParticipantFactoryQos::operator==()**.

7.4.4.2 print()

```
DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::print ( ) const [inline]
```

Prints this **DDS_DomainParticipantFactoryQos** (p. 731) to stdout.

Only the differences between this **DDS_DomainParticipantFactoryQos** (p. 731) and the documented default are printed. If you wish to print everything regardless, see **DDS_DomainParticipantFactoryQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantFactoryQos&, const DDS_QosPrintFormat&) const** (p. 45). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.4.4.3 to_string() [1/6]

```
DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).

Only the differences between this **DDS_DomainParticipantFactoryQos** (p. 731) and the documented default are printed to the string. If you wish to print everything regardless, see **DDS_DomainParticipantFactoryQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantFactoryQos&, const DDS_QosPrintFormat&) const** (p. 45). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DomainParticipantFactoryQos** (p. 731) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantFactoryQos (p. 731). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantFactoryQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantFactoryQos&, const DDS_QosPrintFormat&) const (p. 45)

7.4.4.4 to_string() [2/6]

```
DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DomainParticipantFactoryQos & base ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).

This overload behaves the same as **DDS_DomainParticipantFactoryQos::to_string** (p. 43) but allows the caller to specify the **DDS_DomainParticipantFactoryQos** (p. 731), which is used as the base profile. Only the differences between the QoS and the base profile are included in the output string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantFactoryQos (p. 731). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_DomainParticipantFactoryQos (p. 731) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantFactoryQos::to_string(char*, **DDS_UnsignedLong**&, **const DDS_DomainParticipantFactoryQos**&, **const DDS_QosPrintFormat**&) **const** (p. 45)

References **DDS_QosPrintFormat_INITIALIZER**.

7.4.4.5 to_string() [3/6]

```
DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).

This overload behaves the same as **DDS_DomainParticipantFactoryQos::to_string** (p. 43) but allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the output.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantFactoryQos (p. 731). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantFactoryQos::to_string(char*, **DDS_UnsignedLong**&, **const DDS_DomainParticipantFactoryQos**&, **const DDS_QosPrintFormat**&) **const** (p. 45)

References **DDS_RETCODE_ERROR**, and **DDS_RETCODE_OK**.

7.4.4.6 to_string() [4/6]

```
DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DomainParticipantFactoryQos & base,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).

Only the differences between this **DDS_DomainParticipantFactoryQos** (p. 731) and the **DDS_DomainParticipantFactoryQos** (p. 731) supplied as the base are printed to the string.

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DomainParticipantFactoryQos** (p. 731) is written to the buffer.

Parameters

<i>string</i>	<< <i>out</i> >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantFactoryQos (p. 731). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< <i>inout</i> >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< <i>in</i> >> (p. 237) The DDS_DomainParticipantFactoryQos (p. 731) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.
<i>format</i>	<< <i>in</i> >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.4.4.7 to_string() [5/6]

```
DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).

This overload behaves the same as **DDS_DomainParticipantFactoryQos::to_string** (p. 43) but prints the entire **DDS_DomainParticipantFactoryQos** (p. 731) object. The only valid value for the argument of type **DDS_QosPrintAll_t** (p. 1017) is **DDS_QOS_PRINT_ALL** (p. 164).

For example

```
DomainParticipantFactoryQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, QOS_PRINT_ALL);
```

The resultant string is formatted according to the default value for **DDS_QosPrintFormat** (p. 1017).

Parameters

<i>string</i>	<< <i>out</i> >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantFactoryQos (p. 731). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< <i>inout</i> >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

References **DDS_QosPrintFormat_INITIALIZER**.

7.4.4.8 to_string() [6/6]

```
DDS_ReturnCode_t DDS_DomainParticipantFactoryQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).

This overload behaves the same as the **DDS_DomainParticipantFactoryQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 46) overload. The only difference is that it allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the resultant string.

Parameters

<i>string</i>	<< <i>out</i> >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantFactoryQos (p. 731). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< <i>inout</i> >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< <i>in</i> >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantFactoryQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantFactoryQos&, const DDS_QosPrintFormat&) const (p. 45)

7.4.5 Variable Documentation

7.4.5.1 DDS_PARTICIPANT_QOS_DEFAULT

```
const struct DDS_DomainParticipantQos DDS_PARTICIPANT_QOS_DEFAULT [extern]
```

Special value for creating a DomainParticipant with default QoS.

When used in **DDSDomainParticipantFactory::create_participant** (p. 1425), this special value is used to indicate that the **DDSDomainParticipant** (p. 1335) should be created with the default **DDSDomainParticipant** (p. 1335) QoS by means of the operation **DDSDomainParticipantFactory::get_default_participant_qos()** (p. 1415) and using the resulting QoS to create the **DDSDomainParticipant** (p. 1335).

When used in **DDSDomainParticipantFactory::set_default_participant_qos** (p. 1413), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDSDomainParticipantFactory::set_default_participant_qos** (p. 1413) operation had never been called.

When used in **DDSDomainParticipant::set_qos** (p. 1391), this special value is used to indicate that the QoS of the **DDSDomainParticipant** (p. 1335) should be changed to match the current default QoS set in the **DDSDomainParticipantFactory** (p. 1409) that the **DDSDomainParticipant** (p. 1335) belongs to.

RTI Connexx treats this special value as a constant.

Warning

This value is a constant and should never be modified. You cannot use this value to *get* the default QoS values from the DomainParticipant factory; for this purpose, use **DDSDomainParticipantFactory::get_default_participant_qos** (p. 1415).

NDDS_DISCOVERY_PEERS (p. 464)
DDSDomainParticipantFactory::create_participant() (p. 1425)
DDSDomainParticipantFactory::set_default_participant_qos() (p. 1413)
DDSDomainParticipant::set_qos() (p. 1391)

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

7.4.5.2 DDS_PARTICIPANT_CONFIG_PARAMS_DEFAULT

```
const struct DDS_DomainParticipantConfigParams_t DDS_PARTICIPANT_CONFIG_PARAMS_DEFAULT [extern]
```

Special value for creating a **DDSDomainParticipant** (p. 1335) from configuration using default parameters.

This value can be used only in **DDSDomainParticipantFactory::create_participant_from_config_w_params** (p. 1433) and indicates that the **DDSDomainParticipant** (p. 1335) must be created applying the information defined in the participant configuration. That is, the domain ID, participant entity name, and QoS profiles for all the entities will be retrieved from the configuration.

RTI Connext treats this special value as a constant.

7.5.1 Detailed Description

DDSDomainParticipant (p. 1335) entity and associated elements

7.5.2 Typedef Documentation

7.5.2.1 DDS_DomainId_t

```
typedef DDS_DOMAINID_TYPE_NATIVE DDS_DomainId_t
```

An integer that indicates in which domain a **DDSDomainParticipant** (p. 1335) communicates.

Participants with the same **DDS_DomainId_t** (p. 51) are said to be in the same domain, and can thus communicate with one another.

The lower limit for a domain ID is 0. The upper limit for a domain ID is determined by the guidelines stated in **DDS_↔RtpsWellKnownPorts_t** (p. 1062) (specifically **DDS_RtpsWellKnownPorts_t::domain_id_gain** (p. 1064))

7.5.3 Function Documentation

7.5.3.1 DDS_DomainParticipantQos_equals()

```
DDS_Boolean DDS_DomainParticipantQos_equals (
    const struct DDS_DomainParticipantQos * self,
    const struct DDS_DomainParticipantQos * other )
```

Compares two **DDS_DomainParticipantQos** (p. 735) for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This DomainParticipantQos.
<i>other</i>	<< <i>in</i> >> (p. 237) The other DomainParticipantQos to be compared with this DomainParticipantQos.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Qos objects are equal or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Referenced by **DDS_DomainParticipantQos::operator!=()**, and **DDS_DomainParticipantQos::operator==()**.

7.5.3.2 print()

```
DDS_ReturnCode_t DDS_DomainParticipantQos::print ( ) const [inline]
```

Prints this **DDS_DomainParticipantQos** (p. 735) to stdout.

Only the differences between this **DDS_DomainParticipantQos** (p. 735) and the documented default are printed. If you wish to print everything regardless, see **DDS_DomainParticipantQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantQos&, const DDS_QosPrintFormat&) const** (p. 54). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.5.3.3 to_string() [1/6]

```
DDS_ReturnCode_t DDS_DomainParticipantQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).

Only the differences between this **DDS_DomainParticipantQos** (p. 735) and the documented default are printed. If you wish to print everything regardless, see **DDS_DomainParticipantQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantQos&, const DDS_QosPrintFormat&) const** (p. 54). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DomainParticipantQos** (p. 735) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantQos (p. 735). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantQos&, const DDS_QosPrintFormat&) const (p. 54)

7.5.3.4 to_string() [2/6]

```
DDS_ReturnCode_t DDS_DomainParticipantQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DomainParticipantQos & base ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).

This overload behaves the same as **DDS_DomainParticipantQos::to_string** (p. 52) but allows the caller to specify the **DDS_DomainParticipantQos** (p. 735), which is used as the base profile. Only the differences between the QoS and the base profile are included in the output string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantQos (p. 735). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_DomainParticipantQos (p. 735) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantQos&, const DDS_QosPrintFormat&) const (p. 54)

References **DDS_QosPrintFormat_INITIALIZER**.

7.5.3.5 to_string() [3/6]

```
DDS_ReturnCode_t DDS_DomainParticipantQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).

This overload behaves the same as **DDS_DomainParticipantQos::to_string** (p. 52) but allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the output.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantQos (p. 735). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantQos::to_string(char*, **DDS_UnsignedLong**&, const **DDS_DomainParticipantQos**&, const **DDS_QosPrintFormat**&) const (p. 54)

References **DDS_RETCODE_ERROR**, and **DDS_RETCODE_OK**.

7.5.3.6 to_string() [4/6]

```
DDS_ReturnCode_t DDS_DomainParticipantQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DomainParticipantQos & base,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).

Only the differences between this **DDS_DomainParticipantQos** (p. 735) and the **DDS_DomainParticipantQos** (p. 735) supplied as the base are printed to the string.

If the supplied buffer is NULL, the required length of the string is returned via the *string_size* parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DomainParticipantQos** (p. 735) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantQos (p. 735). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_DomainParticipantQos (p. 735) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.5.3.7 to_string() [5/6]

```
DDS_ReturnCode_t DDS_DomainParticipantQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).

This overload behaves the same as **DDS_DomainParticipantQos::to_string** (p. 52) but prints the entire **DDS_DomainParticipantQos** (p. 735) object. The only valid value for the argument of type **DDS_QosPrintAll_t** (p. 1017) is **DDS_QOS_PRINT_ALL** (p. 164).

For example

```
DomainParticipantQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, QOS_PRINT_ALL);
```

The resultant string is formatted according to the default value for **DDS_QosPrintFormat** (p. 1017).

Parameters

<i>string</i>	<< <i>out</i> >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantQos (p. 735). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< <i>inout</i> >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DomainParticipantQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantQos&, const DDS_QosPrintFormat&) const (p. 54)

References **DDS_QosPrintFormat_INITIALIZER**.

7.5.3.8 to_string() [6/6]

```
DDS_ReturnCode_t DDS_DomainParticipantQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).

This overload behaves the same as the **DDS_DomainParticipantQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 55) overload. The only difference is that it allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the resultant string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DomainParticipantQos (p. 735). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

DDS_DomainParticipantQos::to_string(char*, DDS_UnsignedLong&, const DDS_DomainParticipantQos&, const DDS_QosPrintFormat&) const (p. 54)

7.5.4 Variable Documentation

7.5.4.1 DDS_TOPIC_QOS_DEFAULT

```
const struct DDS_TopicQos DDS_TOPIC_QOS_DEFAULT [extern]
```

Special value for creating a **DDSTopic** (p. 1601) with default QoS.

When used in **DDSDomainParticipant::create_topic** (p. 1366), this special value is used to indicate that the **DDSTopic** (p. 1601) should be created with the default **DDSTopic** (p. 1601) QoS by means of the operation `get_default_topic_qos` and using the resulting QoS to create the **DDSTopic** (p. 1601).

When used in **DDSDomainParticipant::set_default_topic_qos** (p. 1353), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDSDomainParticipant::set_default_topic_qos** (p. 1353) operation had never been called.

When used in **DDSTopic::set_qos** (p. 1603), this special value is used to indicate that the QoS of the **DDSTopic** (p. 1601) should be changed to match the current default QoS set in the **DDSDomainParticipant** (p. 1335) that the **DDSTopic** (p. 1601) belongs to.

Warning

This value is a constant and should never be modified. You cannot use this value to *get* the default QoS values for a Topic; for this purpose, use **DDSDomainParticipant::get_default_topic_qos** (p. 1352).

See also

DDSDomainParticipant::create_topic (p. 1366)
DDSDomainParticipant::set_default_topic_qos (p. 1353)
DDSTopic::set_qos (p. 1603)

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

7.5.4.2 DDS_PUBLISHER_QOS_DEFAULT

```
const struct DDS_PublisherQos DDS_PUBLISHER_QOS_DEFAULT [extern]
```

Special value for creating a **DDSPublisher** (p. 1534) with default QoS.

When used in **DDSDomainParticipant::create_publisher** (p. 1359), this special value is used to indicate that the **DDSPublisher** (p. 1534) should be created with the default **DDSPublisher** (p. 1534) QoS by means of the operation **get_default_publisher_qos** and using the resulting QoS to create the **DDSPublisher** (p. 1534).

When used in **DDSDomainParticipant::set_default_publisher_qos** (p. 1355), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDSDomainParticipant::set_default_publisher_qos** (p. 1355) operation had never been called.

When used in **DDSPublisher::set_qos** (p. 1552), this special value is used to indicate that the QoS of the **DDSPublisher** (p. 1534) should be changed to match the current default QoS set in the **DDSDomainParticipant** (p. 1335) that the **DDSPublisher** (p. 1534) belongs to.

Warning

This value is a constant and should never be modified. You cannot use this value to *get* the default QoS values for a Publisher; for this purpose, use **DDSDomainParticipant::get_default_publisher_qos** (p. 1354).

Examples

HelloWorld_publisher.cxx.

7.5.4.3 DDS_SUBSCRIBER_QOS_DEFAULT

```
const struct DDS_SubscriberQos DDS_SUBSCRIBER_QOS_DEFAULT [extern]
```

Special value for creating a **DDSSubscriber** (p. 1576) with default QoS.

When used in **DDSDomainParticipant::create_subscriber** (p. 1362), this special value is used to indicate that the **DDSSubscriber** (p. 1576) should be created with the default **DDSSubscriber** (p. 1576) QoS by means of the operation **get_default_subscriber_qos** and using the resulting QoS to create the **DDSSubscriber** (p. 1576).

When used in **DDSDomainParticipant::set_default_subscriber_qos** (p. 1358), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDSDomainParticipant::set_default_subscriber_qos** (p. 1358) operation had never been called.

When used in **DDSSubscriber::set_qos** (p. 1593), this special value is used to indicate that the QoS of the **DDSSubscriber** (p. 1576) should be changed to match the current default QoS set in the **DDSDomainParticipant** (p. 1335) that the **DDSSubscriber** (p. 1576) belongs to.

Warning

This value is a constant and should never be modified. You cannot use this value to *get* the default QoS values for a Subscriber; for this purpose, use **DDSDomainParticipant::get_default_subscriber_qos** (p. 1357).

See also

DDSDomainParticipant::create_subscriber (p. 1362)

7.5.4.4 DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT

```
const struct DDS_FlowControllerProperty_t DDS_FLOW_CONTROLLER_PROPERTY_DEFAULT [extern]
```

<<*extension*>> (p. 236) Special value for creating a **DDSFlowController** (p. 1451) with default property.

When used in **DDSDomainParticipant::create_flowcontroller** (p. 1374) and **DDSFlowController::set_property** (p. 1452), this special value represents the set of values specified on the last successful call to **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346), or else, if the call was never made, the default values listed in **DDS_FlowControllerProperty_t** (p. 899).

When used in **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346), this special value indicates that the default QoS should be reset back to the initial value that would be used if the **DDSDomainParticipant::set_default_flowcontroller_property** (p. 1346) operation had never been called.

Warning

This value is a constant and should never be modified. You cannot use this value to *get* the default properties for a FlowController; for this purpose, use **DDSDomainParticipant::get_default_flowcontroller_property** (p. 1346).

See also

DDSDomainParticipant::create_flowcontroller (p. 1374)

DDSDomainParticipant::set_default_flowcontroller_property (p. 1346)

DDSFlowController::set_property (p. 1452)

7.5.4.5 DDS_SQLFILTER_NAME

```
const char* const DDS_SQLFILTER_NAME
```

<<**extension**>> (p. 236) The name of the built-in SQL filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.

See also

Queries and Filters Syntax (p. 178)

7.5.4.6 DDS_STRINGMATCHFILTER_NAME

```
const char* const DDS_STRINGMATCHFILTER_NAME
```

<<**extension**>> (p. 236) The name of the built-in StringMatch filter that can be used with ContentFilteredTopics and MultiChannel DataWriters.

The StringMatch Filter is a subset of the SQL filter; it only supports the MATCH relational operator on a single string field.

See also

Queries and Filters Syntax (p. 178)

7.6 Built-in Topics

Built-in objects created by RTI Connext but accessible to the application.

Modules

- **Participant Built-in Topics**

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connex.

- **Topic Built-in Topics**

Builtin topic for accessing information about the Topics discovered by RTI Connex.

- **Publication Built-in Topics**

Builtin topic for accessing information about the Publications discovered by RTI Connex.

- **Subscription Built-in Topics**

Builtin topic for accessing information about the Subscriptions discovered by RTI Connex.

- **ServiceRequest Built-in Topic**

Builtin topic for accessing requests from different services within RTI Connex.

- **Common types and functions**

Types and functions related to the built-in topics.

7.6.1 Detailed Description

Built-in objects created by RTI Connex but accessible to the application.

RTI Connex must discover and keep track of the remote entities, such as new participants in the domain. This information may also be important to the application, which may want to react to this discovery, or else access it on demand.

A set of built-in topics and corresponding **DDSDataReader** (p. 1272) objects are introduced to be used by the application to access these discovery information.

The information can be accessed as if it was normal application data. This allows the application to know when there are any changes in those values by means of the **DDSListener** (p. 1509) or the **DDSCondition** (p. 1260) mechanisms.

The built-in data-readers all belong to a built-in **DDSSubscriber** (p. 1576), which can be retrieved by using the method **DDSDomainParticipant::get_builtin_subscriber** (p. 1376). The built-in **DDSDataReader** (p. 1272) objects can be retrieved by using the operation **DDSSubscriber::lookup_datareader** (p. 1588), with the topic name as a parameter.

Built-in entities have default listener settings as well. The built-in **DDSSubscriber** (p. 1576) and all of its built-in topics have 'nil' listeners with all statuses appearing in their listener masks (acting as a NO-OP listener that does not reset communication status). The built-in DataReaders have null listeners with no statuses in their masks.

The information that is accessible about the remote entities by means of the built-in topics includes all the QoS policies that apply to the corresponding remote Entity. This QoS policies appear as normal 'data' fields inside the data read by means of the built-in Topic. Additional information is provided to identify the Entity and facilitate the application logic.

The built-in **DDSDataReader** (p. 1272) will not provide data pertaining to entities created from the same **DDSDomain**↔**Participant** (p. 1335) under the assumption that such entities are already known to the application that created them.

Refer to **DDS_ParticipantBuiltinTopicData** (p. 966), **DDS_TopicBuiltinTopicData** (p. 1113), **DDS_Subscription**↔**BuiltinTopicData** (p. 1094) and **DDS_PublicationBuiltinTopicData** (p. 997) for a description of all the built-in topics and their contents.

The QoS of the built-in **DDSSubscriber** (p. 1576) and **DDSDataReader** (p. 1272) objects is given by the following table:

Table 7.18 QoS of built-in *DDSSubscriber* (p. 1576) and *DDSDataReader* (p. 1272)

QoS	Value
DDS_UserDataQosPolicy (p. 1221)	0-length sequence
DDS_TopicDataQosPolicy (p. 1118)	0-length sequence
DDS_GroupDataQosPolicy (p. 903)	0-length sequence
DDS_DurabilityQosPolicy (p. 761)	DDS_TRANSIENT_LOCAL_DURABILITY_QOS (p. 400)
DDS_DurabilityServiceQosPolicy (p. 765)	Does not apply as DDS_DurabilityQosPolicyKind (p. 399) is DDS_TRANSIENT_LOCAL_DURABILITY_QOS (p. 400)
DDS_PresentationQosPolicy (p. 983)	access_scope = DDS_TOPIC_PRESENTATION_QOS (p. 418) coherent_access = DDS_BOOLEAN_FALSE (p. 316) ordered_access = DDS_BOOLEAN_FALSE (p. 316)
DDS_DeadlineQosPolicy (p. 701)	Period = infinite
DDS_LatencyBudgetQosPolicy (p. 916)	duration = 0
DDS_OwnershipQosPolicy (p. 960)	DDS_SHARED_OWNERSHIP_QOS (p. 415)
DDS_OwnershipStrengthQosPolicy (p. 965)	value = 0
DDS_LivelinessQosPolicy (p. 923)	kind = DDS_AUTOMATIC_LIVELINESS_QOS (p. 410) lease_duration = 0
DDS_TimeBasedFilterQosPolicy (p. 1111)	minimum_separation = 0
DDS_PartitionQosPolicy (p. 976)	0-length sequence
DDS_ReliabilityQosPolicy (p. 1027)	kind = DDS_RELIABLE_RELIABILITY_QOS (p. 435) max_blocking_time = 100 milliseconds
DDS_DestinationOrderQosPolicy (p. 703)	DDS_BY_RECEPTION_TIMESTAMP ↔ DESTINATIONORDER_QOS (p. 386)
DDS_HistoryQosPolicy (p. 906)	kind = DDS_KEEP_LAST_HISTORY_QOS (p. 406) depth = 1
DDS_ResourceLimitsQosPolicy (p. 1038)	max_samples = DDS_LENGTH_UNLIMITED (p. 437) max_instances = DDS_LENGTH_UNLIMITED (p. 437) max_samples_per_instance = DDS_LENGTH_UNLIMITED (p. 437)
DDS_ReaderDataLifecycleQosPolicy (p. 1022)	autopurge_nowriter_samples_delay = infinite autopurge_disposed_samples_delay = infinite
DDS_EntityFactoryQosPolicy (p. 888)	autoenable_created_entities = DDS_BOOLEAN_TRUE (p. 316)

7.7 Topic Module

Contains the **DDSTopic** (p. 1601), **DDSTopicFilteredTopic** (p. 1267), and **DDSMultiTopic** (p. 1513) classes, the **DDSTopicListener** (p. 1610) interface, and more generally, all that is needed by an application to define **DDSTopic** (p. 1601) objects and attach QoS policies to them.

Modules

- Topics

DDSTopic (p. 1601) entity and associated elements

- **Zero Copy Transfer Over Shared Memory**

<<extension>> (p. 236) Zero Copy transfer over shared memory

- **User Data Type Support**

Defines generic classes and macros to support user data types.

- **Type Code Support**

<<extension>> (p. 236) A **DDS_TypeCode** (p. 1149) is a mechanism for representing a type at runtime. RTI Connext can use type codes to send type definitions on the network. You will need to understand this API in order to use the **Dynamic Data** (p. 99) capability or to inspect the type information you receive from remote readers and writers.

- **Built-in Types**

RTI Connext provides a set of very simple data types for you to use with the topics in your application.

- **Built-in Topic's Trust Types**

*Types used as part of **DDS_ParticipantBuiltinTopicData** (p. 966), **DDS_PublicationBuiltinTopicData** (p. 997), **DDS_SubscriptionBuiltinTopicData** (p. 1094) to describe Trust Plugins configuration.*

- **Dynamic Data**

<<extension>> (p. 236) The Dynamic Data API provides a way to interact with arbitrarily complex data types at runtime without the need for code generation.

- **DDS-Specific Primitive Types**

Basic DDS value types for use in user data types.

- **FlatData Topic-Types**

<<extension>> (p. 236) FlatData Language Binding for IDL topic-types

7.7.1 Detailed Description

Contains the **DDSTopic** (p. 1601), **DDSContentFilteredTopic** (p. 1267), and **DDSMultiTopic** (p. 1513) classes, the **DDSTopicListener** (p. 1610) interface, and more generally, all that is needed by an application to define **DDSTopic** (p. 1601) objects and attach QoS policies to them.

7.8 Topics

DDSTopic (p. 1601) entity and associated elements

Classes

- struct **DDS_PrintFormatProperty**

A collection of attributes used to configure how data samples will be formatted when converted to a string.

- struct **DDS_InconsistentTopicStatus**

DDS_INCONSISTENT_TOPIC_STATUS (p. 342)

- struct **DDS_TopicQos**

*QoS policies supported by a **DDSTopic** (p. 1601) entity.*

- struct **DDS_ExpressionProperty**

*Provides additional information about the filter expression passed to **DDSWriterContentFilter::writer_compile** (p. 1622).*

- struct **DDS_FilterSampleInfo**

Provides meta information associated with the sample.

- class **DDSTopicDescription**
 <<*interface*>> (p. 236) Base class for **DDSTopic** (p. 1601), **DDSContentFilteredTopic** (p. 1267), and **DDSMultiTopic** (p. 1513).
- class **DDSContentFilteredTopic**
 <<*interface*>> (p. 236) Specialization of **DDSTopicDescription** (p. 1608) that allows for content-based subscriptions.
- class **DDSMultiTopic**
 [Not supported (optional)] <<*interface*>> (p. 236) A specialization of **DDSTopicDescription** (p. 1608) that allows subscriptions that combine/filter/rearrange data coming from several topics.
- class **DDSTopic**
 <<*interface*>> (p. 236) The most basic description of the data to be published and subscribed.
- class **DDSTopicListener**
 <<*interface*>> (p. 236) **DDSTopicListener** (p. 1509) for **DDSTopic** (p. 1601) entities.
- class **DDSContentFilter**
 <<*interface*>> (p. 236) Interface to be used by a custom filter of a **DDSContentFilteredTopic** (p. 1267)
- class **DDSWriterContentFilter**
 <<*interface*>> (p. 236) Interface to be used by a custom filter of a **DDSContentFilteredTopic** (p. 1267).

Typedefs

- typedef struct **DDS_PrintFormatProperty DDS_PrintFormatProperty**
 A collection of attributes used to configure how data samples will be formatted when converted to a string.

Enumerations

- enum **DDS_PrintFormatKind** {
DDS_DEFAULT_PRINT_FORMAT ,
DDS_XML_PRINT_FORMAT ,
DDS_JSON_PRINT_FORMAT }
 Format kinds available when converting data samples to string representations.

Functions

- **DDS_Boolean DDS_TopicQos_equals** (const struct **DDS_TopicQos** *self, const struct **DDS_TopicQos** *other)
 Compares two **DDS_TopicQos** (p. 1120) for equality.
- **DDS_ReturnCode_t DDS_TopicQos::print** () const
 Prints this **DDS_TopicQos** (p. 1120) to stdout.
- **DDS_ReturnCode_t DDS_TopicQos::to_string** (char *string, **DDS_UnsignedLong** &string_size) const
 Obtains a string representation of this **DDS_TopicQos** (p. 1120).
- **DDS_ReturnCode_t DDS_TopicQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_TopicQos** &base) const
 Obtains a string representation of this **DDS_TopicQos** (p. 1120).
- **DDS_ReturnCode_t DDS_TopicQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
 Obtains a string representation of this **DDS_TopicQos** (p. 1120).

- **DDS_ReturnCode_t DDS_TopicQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_TopicQos** &base, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this **DDS_TopicQos** (p. 1120).
- **DDS_ReturnCode_t DDS_TopicQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
Obtains a string representation of this **DDS_TopicQos** (p. 1120).
- **DDS_ReturnCode_t DDS_TopicQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this **DDS_TopicQos** (p. 1120).

Variables

- const struct **DDS_PrintFormatProperty DDS_PRINT_FORMAT_PROPERTY_DEFAULT**
Sentinel constant indicating default values for **DDS_PrintFormatProperty** (p. 988).

7.8.1 Detailed Description

DDSTopic (p. 1601) entity and associated elements

7.8.2 Typedef Documentation

7.8.2.1 DDS_PrintFormatProperty

```
typedef struct DDS_PrintFormatProperty DDS_PrintFormatProperty
```

A collection of attributes used to configure how data samples will be formatted when converted to a string.

7.8.3 Enumeration Type Documentation

7.8.3.1 DDS_PrintFormatKind

```
enum DDS_PrintFormatKind
```

Format kinds available when converting data samples to string representations.

Enumerator

DDS_DEFAULT_PRINT_FORMAT	Use a default format specific to RTI Connex to represent the data when converting to a string.
DDS_XML_PRINT_FORMAT	Use an XML format to represent the data when converting to a string.
DDS_JSON_PRINT_FORMAT	Use a JSON format to represent the data when converting to a string.

7.8.4 Function Documentation

7.8.4.1 DDS_TopicQos_equals()

```
DDS_Boolean DDS_TopicQos_equals (
    const struct DDS_TopicQos * self,
    const struct DDS_TopicQos * other )
```

Compares two **DDS_TopicQos** (p. 1120) for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This TopicQos.
<i>other</i>	<< <i>in</i> >> (p. 237) The other TopicQos to be compared with this TopicQos

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Qos objects are equal or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Referenced by **DDS_TopicQos::operator!=()**, and **DDS_TopicQos::operator==()**.

7.8.4.2 print()

```
DDS_ReturnCode_t DDS_TopicQos::print ( ) const [inline]
```

Prints this **DDS_TopicQos** (p. 1120) to stdout.

Only the differences between this **DDS_TopicQos** (p. 1120) and the documented default are printed. If you wish to print everything regardless, see **DDS_TopicQos::to_string(char*, DDS_UnsignedLong&, const DDS_TopicQos&, const DDS_QosPrintFormat&) const** (p. 68). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.8.4.3 to_string() [1/6]

```
DDS_ReturnCode_t DDS_TopicQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size ) const [inline]
```

Obtains a string representation of this **DDS_TopicQos** (p. 1120).

Only the differences between this **DDS_TopicQos** (p. 1120) and the documented default are printed to the string. If you wish to print everything regardless, see **DDS_TopicQos::to_string(char*, DDS_UnsignedLong&, const DDS_TopicQos&, const DDS_QosPrintFormat&) const** (p. 68). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

If the supplied buffer is NULL, the required length of the string is returned via the `string_size` parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_TopicQos** (p. 1120) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_TopicQos (p. 1120). If NULL, this function will return the required length of this buffer through the <code>string_size</code> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_TopicQos::to_string(char*, DDS_UnsignedLong&, const DDS_TopicQos&, const DDS_QosPrintFormat&) const (p. 68)

7.8.4.4 to_string() [2/6]

```
DDS_ReturnCode_t DDS_TopicQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_TopicQos & base ) const [inline]
```

Obtains a string representation of this **DDS_TopicQos** (p. 1120).

This overload behaves the same as **DDS_TopicQos::to_string** (p. 65) but allows the caller to specify the **DDS_TopicQos** (p. 1120), which is used as the base profile. Only the differences between the QoS and the base profile are included in the output string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_TopicQos (p. 1120). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_TopicQos (p. 1120) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_TopicQos::to_string(char*, DDS_UnsignedLong&, const DDS_TopicQos&, const DDS_QosPrintFormat&) const (p. 68)

References **DDS_QosPrintFormat_INITIALIZER**.

7.8.4.5 to_string() [3/6]

```
DDS_ReturnCode_t DDS_TopicQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_TopicQos** (p. 1120).

This overload behaves the same as **DDS_TopicQos::to_string** (p. 65) but allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the output.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_TopicQos (p. 1120). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_TopicQos::to_string(char*, **DDS_UnsignedLong**&, const **DDS_TopicQos**&, const **DDS_QosPrintFormat**&) const (p. 68)

References **DDS_RETCODE_ERROR**, and **DDS_RETCODE_OK**.

7.8.4.6 to_string() [4/6]

```
DDS_ReturnCode_t DDS_TopicQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_TopicQos & base,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_TopicQos** (p. 1120).

Only the differences between this **DDS_TopicQos** (p. 1120) and the **DDS_TopicQos** (p. 1120) supplied as the base are printed to the string.

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_TopicQos** (p. 1120) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_TopicQos (p. 1120). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_TopicQos (p. 1120) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.8.4.7 to_string() [5/6]

```
DDS_ReturnCode_t DDS_TopicQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ) const [inline]
```

Obtains a string representation of this **DDS_TopicQos** (p. 1120).

This overload behaves the same as **DDS_TopicQos::to_string** (p. 65) but prints the entire **DDS_TopicQos** (p. 1120) object. The only valid value for the argument of type **DDS_QosPrintAll_t** (p. 1017) is **DDS_QOS_PRINT_ALL** (p. 164).

For example

```
TopicQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, QOS_PRINT_ALL);
```

The resultant string is formatted according to the default value for **DDS_QosPrintFormat** (p. 1017).

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_TopicQos (p. 1120). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_TopicQos::to_string(char*, DDS_UnsignedLong&, const DDS_TopicQos&, const DDS_QosPrintFormat&) const (p. 68)

References **DDS_QosPrintFormat_INITIALIZER**.

7.8.4.8 to_string() [6/6]

```
DDS_ReturnCode_t DDS_TopicQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_TopicQos** (p. 1120).

This overload behaves the same as the **DDS_TopicQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 68) overload. The only difference is that it allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the resultant string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_TopicQos (p. 1120). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_TopicQos::to_string(char*, **DDS_UnsignedLong**&, const **DDS_TopicQos**&, const **DDS_QosPrintFormat**&) const (p. 68)

7.8.5 Variable Documentation

7.8.5.1 DDS_PRINT_FORMAT_PROPERTY_DEFAULT

```
const struct DDS_PrintFormatProperty DDS_PRINT_FORMAT_PROPERTY_DEFAULT
```

Sentinel constant indicating default values for **DDS_PrintFormatProperty** (p. 988).

Pass this object instead of your own **DDS_PrintFormatProperty** (p. 988) object to use the default property values:

```
retCode = FooTypeSupport::data_to_string(
    sample,
    DDS_PRINT_FORMAT_PROPERTY_DEFAULT);
```

DDS_PrintFormatProperty (p. 988)

7.9 Zero Copy Transfer Over Shared Memory

<<**extension**>> (p. 236) Zero Copy transfer over shared memory

<<**extension**>> (p. 236) Zero Copy transfer over shared memory

Note

For a description of Zero Copy transfer over shared memory and its benefits, and a tutorial, see the "Sending Large Data" chapter in the **RTI Connex User's Manual**.

For buildable **code examples**, see <https://community.rti.com/kb/flatdata-and-zerocopy-examples>.

Zero Copy transfer over shared memory is available in the C API, in the Traditional C++ API, and in the Modern C++ API.

7.10 User Data Type Support

Defines generic classes and macros to support user data types.

Classes

- struct **DDS_TypeAllocationParams_t**
Configures whether or not to allocate pointer and optional members.
- struct **DDS_TypeDeallocationParams_t**
Configures whether to release or not pointer and optional members.
- struct **Foo**
A representative user-defined data type.
- struct **DDS_InstanceHandleSeq**
*Instantiates **FooSeq** (p. 1680) < **DDS_InstanceHandle_t** (p. 74) > .*
- class **FooTypeSupport**
<<interface>> (p. 236) <<generic>> (p. 236) User data type specific interface.
- class **DDSTypeSupport**
<<interface>> (p. 236) An abstract marker interface that has to be specialized for each concrete user data type that will be used by the application.

Macros

- #define **DDS_TYPESUPPORT_CPP**(TTypeSupport, TData)
Declares the interface required to support a user data type.
- #define **DDS_DATAWRITER_CPP**(TDataWriter, TData)
Declares the interface required to support a user data type specific data writer.
- #define **DDS_DATAREADER_W_DATA_CONSISTENCY_CHECK**(TDataReader, TDataSeq, TData)
Declares the interface required to support a user data type-specific data reader.

Typedefs

- typedef DDS_HANDLE_TYPE_NATIVE **DDS_InstanceHandle_t**
Type definition for an instance handle.

Functions

- **DDS_Boolean DDS_InstanceHandle_equals** (const **DDS_InstanceHandle_t** *self, const **DDS_InstanceHandle_t** *other)
Compares this instance handle with another handle for equality.
- **int DDS_InstanceHandle_compare** (const **DDS_InstanceHandle_t** *self, const **DDS_InstanceHandle_t** *other)
Compares this instance handle with another handle.
- **void DDS_InstanceHandle_copy** (**DDS_InstanceHandle_t** *self, const **DDS_InstanceHandle_t** *other)
Copies this instance handle into another handle.
- **DDS_Boolean DDS_InstanceHandle_is_nil** (const **DDS_InstanceHandle_t** *self)
*Compare this handle to **DDS_HANDLE_NIL** (p. 76).*

Variables

- const **DDS_InstanceHandle_t DDS_HANDLE_NIL**

The NIL instance handle.

7.10.1 Detailed Description

Defines generic classes and macros to support user data types.

DDS specifies strongly typed interfaces to read and write user data. For each data class defined by the application, there is a number of specialised classes that are required to facilitate the type-safe interaction of the application with RTI Connext.

RTI Connext provides an automatic means to generate all these type-specific classes with the `rtiddsgen` utility. The complete set of automatic classes created for a hypothetical user data type named **Foo** (p. 1632) are shown below.

an application data type named **Foo** (p. 1632) "

The macros defined here declare the strongly typed APIs needed to support an arbitrary user defined data of type **Foo** (p. 1632).

See also

the `Code Generator User's Manual`

7.10.2 Macro Definition Documentation

7.10.2.1 DDS_TYPESUPPORT_CPP

```
#define DDS_TYPESUPPORT_CPP(
    TTypeSupport,
    TData )
```

Declares the interface required to support a user data type.

Defines:

FooTypeSupport (p. 1693) TypeSupport of type **Foo** (p. 1632), i.e. **FooTypeSupport** (p. 1693)

Examples

HelloWorldSupport.cxx.

7.10.2.2 DDS_DATAWRITER_CPP

```
#define DDS_DATAWRITER_CPP (
    TDataWriter,
    TData )
```

Declares the interface required to support a user data type specific data writer.

Uses:

FooTypeSupport (p. 1693) user data type, **Foo** (p. 1632)

Defines:

FooDataWriter (p. 1659) **DDSDataWriter** (p. 1305) of type **Foo** (p. 1632), i.e. **FooDataWriter** (p. 1659)

7.10.2.3 DDS_DATAREADER_W_DATA_CONSISTENCY_CHECK

```
#define DDS_DATAREADER_W_DATA_CONSISTENCY_CHECK (
    TDataReader,
    TDataSeq,
    TData )
```

Declares the interface required to support a user data type-specific data reader.

Uses:

FooTypeSupport (p. 1693) user data type, **Foo** (p. 1632)
FooSeq (p. 1680) sequence of user data type, `sequence< : : Foo >`

Defines:

FooDataReader (p. 1632) **DDSDataReader** (p. 1272) of type **Foo** (p. 1632), i.e. **FooDataReader** (p. 1632)

See also

FooSeq (p. 1680)

Examples

HelloWorldSupport.cxx.

7.10.3 Typedef Documentation

7.10.3.1 DDS_InstanceHandle_t

```
typedef DDS_HANDLE_TYPE_NATIVE DDS_InstanceHandle_t
```

Type definition for an instance handle.

Handle to identify different instances of the same **DDSTopic** (p. 1601) of a certain type.

See also

FooDataWriter::register_instance (p. 1661)

DDS_SampleInfo::instance_handle (p. 1072)

7.10.4 Function Documentation

7.10.4.1 DDS_InstanceHandle_equals()

```
DDS_Boolean DDS_InstanceHandle_equals (
    const DDS_InstanceHandle_t * self,
    const DDS_InstanceHandle_t * other )
```

Compares this instance handle with another handle for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This handle. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 237) The other handle to be compared with this handle. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two handles have equal values, or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

See also

DDS_InstanceHandle_is_nil (p. 75)

7.10.4.2 DDS_InstanceHandle_compare()

```
int DDS_InstanceHandle_compare (
    const DDS_InstanceHandle_t * self,
    const DDS_InstanceHandle_t * other )
```

Compares this instance handle with another handle.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This handle. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 237) The other handle to be compared with this handle. Cannot be NULL.

Returns

If the two handles are equal, the function returns 0. If *self* is greater than *other* the function returns a positive number; otherwise, it returns a negative number.

See also

DDS_InstanceHandle_is_nil (p. 75)

7.10.4.3 DDS_InstanceHandle_copy()

```
void DDS_InstanceHandle_copy (
    DDS_InstanceHandle_t * self,
    const DDS_InstanceHandle_t * other )
```

Copies this instance handle into another handle.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) The source handle. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 237) The destination handle to be copied into. Cannot be NULL.

7.10.4.4 DDS_InstanceHandle_is_nil()

```
DDS_Boolean DDS_InstanceHandle_is_nil (
    const DDS_InstanceHandle_t * self )
```

Compare this handle to **DDS_HANDLE_NIL** (p. 76).

Returns

DDS_BOOLEAN_TRUE (p. 316) if the given instance handle is equal to **DDS_HANDLE_NIL** (p. 76) or **DDS_↵
BOOLEAN_FALSE** (p. 316) otherwise.

See also

DDS_InstanceHandle_equals (p. 74)

7.10.5 Variable Documentation

7.10.5.1 DDS_HANDLE_NIL

```
const DDS_InstanceHandle_t DDS_HANDLE_NIL [extern]
```

The NIL instance handle.

Special **DDS_InstanceHandle_t** (p. 74) value

See also

DDS_InstanceHandle_is_nil (p. 75)

Examples

HelloWorld_publisher.cxx.

7.11 Type Code Support

<<*extension*>> (p. 236) A **DDS_TypeCode** (p. 1149) is a mechanism for representing a type at runtime. RTI Connext can use type codes to send type definitions on the network. You will need to understand this API in order to use the **Dynamic Data** (p. 99) capability or to inspect the type information you receive from remote readers and writers.

Classes

- struct **DDS_TypeCodePrintFormatProperty**
A collection of attributes used to configure how a TypeCode appears when converted to a string.
- struct **DDS_TypeCode**
*The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with rtiddsgen (see the *Code Generator User's Manual*) or to modify types you define yourself at runtime.*
- struct **DDS_StructMember**
A description of a member of a struct.
- struct **DDS_StructMemberSeq**
Defines a sequence of struct members.
- struct **DDS_UnionMember**
A description of a member of a union.
- struct **DDS_UnionMemberSeq**
Defines a sequence of union members.
- struct **DDS_EnumMember**
A description of a member of an enumeration.
- struct **DDS_EnumMemberSeq**
Defines a sequence of enumerator members.
- struct **DDS_ValueMember**
A description of a member of a value type.
- struct **DDS_ValueMemberSeq**
Defines a sequence of value members.
- struct **DDS_TypeCodeFactory**
A singleton factory for creating, copying, and deleting data type definitions dynamically.

Macros

- #define **DDS_TYPECODE_MEMBER_ID_INVALID**
*A sentinel indicating an invalid **DDS_TypeCode** (p. 1149) member ID.*
- #define **DDS_TYPECODE_INDEX_INVALID**
*A sentinel indicating an invalid **DDS_TypeCode** (p. 1149) member index.*
- #define **DDS_TYPECODE_NOT_BITFIELD**
Indicates that a member of a type is not a bitfield.
- #define **DDS_VM_NONE**
Constant used to indicate that a value type has no modifiers.
- #define **DDS_VM_CUSTOM**
*Constant used to indicate that a value type has the *custom* modifier.*
- #define **DDS_VM_ABSTRACT**
*Constant used to indicate that a value type has the *abstract* modifier.*
- #define **DDS_VM_TRUNCATABLE**
*Constant used to indicate that a value type has the *truncatable* modifier.*
- #define **DDS_PRIVATE_MEMBER**
Constant used to indicate that a value type member is private.
- #define **DDS_PUBLIC_MEMBER**
Constant used to indicate that a value type member is public.

- **#define DDS_TYPECODE_NONKEY_MEMBER**
A flag indicating that a type member is optional and not part of the key.
- **#define DDS_TYPECODE_KEY_MEMBER**
A flag indicating that a type member is part of the key for that type, and therefore required.
- **#define DDS_TYPECODE_NONKEY_REQUIRED_MEMBER**
A flag indicating that a type member is not part of the key but is nevertheless required.
- **#define DDS_TypeCode_PrintFormat_INITIALIZER**
*Static initializer for **DDS_TypeCodePrintFormatProperty** (p. 1208).*

Typedefs

- **typedef short DDS_ValueModifier**
Modifier type for a value type.
- **typedef short DDS_Visibility**
Type to indicate the visibility of a value type member.

Enumerations

- **enum DDS_TypeCodePrintFormatKind {**
 DDS_TYPE_CODE_PRINT_KIND_IDL ,
 DDS_TYPE_CODE_PRINT_KIND_XML }
*The different formats to print a **DDS_TypeCode** (p. 1149).*
- **enum DDS_TCKind {**
 DDS_TK_NULL ,
 DDS_TK_SHORT ,
 DDS_TK_LONG ,
 DDS_TK_USHORT ,
 DDS_TK_ULONG ,
 DDS_TK_FLOAT ,
 DDS_TK_DOUBLE ,
 DDS_TK_BOOLEAN ,
 DDS_TK_CHAR ,
 DDS_TK_OCTET ,
 DDS_TK_STRUCT ,
 DDS_TK_UNION ,
 DDS_TK_ENUM ,
 DDS_TK_STRING ,
 DDS_TK_SEQUENCE ,
 DDS_TK_ARRAY ,
 DDS_TK_ALIAS ,
 DDS_TK_LONGLONG ,
 DDS_TK_ULONGLONG ,
 DDS_TK_LONGDOUBLE ,
 DDS_TK_WCHAR ,
 DDS_TK_WSTRING ,
 DDS_TK_VALUE ,
 DDS_TK_SPARSE ,
 DDS_TK_RAW_BYTES = 0x7e ,
 DDS_TK_RAW_BYTES_KEYED = 0x7f ,
}

```

DDS_TK_FINAL_EXTENSIBILITY = 0x4000 ,
DDS_TK_MUTABLE_EXTENSIBILITY = 0x2000 ,
DDS_TK_FLAT_DATA_LANGUAGE_BINDING = RTI_XCDR_TK_FLAGS_IS_FLAT_DATA ,
DDS_TK_SHMEM_REF_TRANSFER_MODE = RTI_XCDR_TK_FLAGS_IS_SHMEM_REF }

```

*Enumeration type for **DDS_TypeCode** (p. 1149) kinds.*

- enum **DDS_ExtensibilityKind** {
DDS_FINAL_EXTENSIBILITY ,
DDS_EXTENSIBLE_EXTENSIBILITY ,
DDS_MUTABLE_EXTENSIBILITY }

Type to indicate the extensibility of a type.

Variables

- **DDS_TypeCode DDS_g_tc_null**
Basic NULL type.
- **DDS_TypeCode DDS_g_tc_short**
Basic 16-bit signed integer type.
- **DDS_TypeCode DDS_g_tc_long**
Basic 32-bit signed integer type.
- **DDS_TypeCode DDS_g_tc_ushort**
Basic unsigned 16-bit integer type.
- **DDS_TypeCode DDS_g_tc_ulong**
Basic unsigned 32-bit integer type.
- **DDS_TypeCode DDS_g_tc_float**
Basic 32-bit floating point type.
- **DDS_TypeCode DDS_g_tc_double**
Basic 64-bit floating point type.
- **DDS_TypeCode DDS_g_tc_boolean**
Basic Boolean type.
- **DDS_TypeCode DDS_g_tc_char**
Basic single-byte character type.
- **DDS_TypeCode DDS_g_tc_octet**
Basic octet/byte type.
- **DDS_TypeCode DDS_g_tc_longlong**
Basic 64-bit integer type.
- **DDS_TypeCode DDS_g_tc_ulonglong**
Basic unsigned 64-bit integer type.
- **DDS_TypeCode DDS_g_tc_longdouble**
Basic 128-bit floating point type.
- **DDS_TypeCode DDS_g_tc_wchar**
Basic four-byte character type.

7.11.1 Detailed Description

<<*extension*>> (p. 236) A **DDS_TypeCode** (p. 1149) is a mechanism for representing a type at runtime. RTI Connext can use type codes to send type definitions on the network. You will need to understand this API in order to use the **Dynamic Data** (p. 99) capability or to inspect the type information you receive from remote readers and writers.

Type codes are values that are used to describe arbitrarily complex types at runtime. Type code values are manipulated via the **DDS_TypeCode** (p. 1149) class, which has an analogue in CORBA.

A **DDS_TypeCode** (p. 1149) value consists of a type code *kind* (represented by the **DDS_TCKind** (p. 86) enumeration) and a list of *members* (that is, fields). These members are recursive: each one has its own **DDS_TypeCode** (p. 1149), and in the case of complex types (structures, arrays, and so on), these contained type codes contain their own members.

There are a number of uses for type codes. The type code mechanism can be used to unambiguously match type representations. The **DDS_TypeCode::equal** (p. 1155) method is a more reliable test than comparing the string type names, requiring equivalent definitions of the types.

7.11.2 Accessing a Local ::DDS_TypeCode

When generating types with `rtiddsgen`, type codes are always enabled. For these types, a **DDS_TypeCode** (p. 1149) may be accessed by calling the `Foo_get_typecode` function for a type "Foo", which returns a **DDS_TypeCode** (p. 1149) pointer. via the **FooTypeCode.VALUE** member. This API also includes support for dynamic creation of **DDS_TypeCode** (p. 1149) values, typically for use with the **Dynamic Data** (p. 99) API. You can create a **DDS_TypeCode** (p. 1149) using the **DDS_TypeCodeFactory** (p. 1194) class. You will construct the **DDS_TypeCode** (p. 1149) recursively, from the outside in: start with the type codes for primitive types, then compose them into complex types like arrays, structures, and so on. You will find the following methods helpful:

- **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197), which provides the **DDS_TypeCode** (p. 1149) instances corresponding to the primitive types (e.g. **DDS_TK_LONG** (p. 86), **DDS_TK_SHORT** (p. 86), and so on).
- **DDS_TypeCodeFactory::create_string_tc** (p. 1205) and **DDS_TypeCodeFactory::create_wstring_tc** (p. 1206) create a **DDS_TypeCode** (p. 1149) representing a text string with a certain *bound* (i.e. maximum length).
- **DDS_TypeCodeFactory::create_array_tc** (p. 1207) and **DDS_TypeCodeFactory::create_sequence_tc** (p. 1206) create a **DDS_TypeCode** (p. 1149) for a collection based on the **DDS_TypeCode** (p. 1149) for its elements.
- **DDS_TypeCodeFactory::create_struct_tc** (p. 1198) and **DDS_TypeCodeFactory::create_value_tc** (p. 1199) create a **DDS_TypeCode** (p. 1149) for a structured type.

7.11.3 Accessing a Remote ::DDS_TypeCode

In addition to being used locally, RTI Connext can transmit **DDS_TypeCode** (p. 1149) on the network between participants. This information can be used to access information about types used remotely at runtime, for example to be able to publish or subscribe to topics of arbitrarily types (see **Dynamic Data** (p. 99)). This functionality is useful for a generic system monitoring tool like `rtiddsspy`.

Remote **DDS_TypeCode** (p. 1149) information is shared during discovery over the publication and subscription built-in topics and can be accessed using the built-in readers for these topics; see **Built-in Topics** (p. 59). Discovered **DDS_TypeCode** (p. 1149) values are not cached by RTI Connext upon receipt and are therefore not available from the built-in topic data returned by **DDSDDataWriter::get_matched_subscription_data** (p. 1316) or **DDSDDataReader::get_matched_publication_data** (p. 1284).

The space available locally to deserialize a discovered remote **DDS_TypeCode** (p. 1149) is specified by the **DDSDomainParticipant** (p. 1335)'s **DDS_DomainParticipantResourceLimitsQosPolicy::type_code_max_serialized_length** (p. 754) QoS parameter. To support especially complex type codes, it may be necessary for you to increase the value of this parameter.

7.11.4 Macro Definition Documentation

7.11.4.1 DDS_TYPECODE_MEMBER_ID_INVALID

```
#define DDS_TYPECODE_MEMBER_ID_INVALID
```

A sentinel indicating an invalid **DDS_TypeCode** (p. 1149) member ID.

7.11.4.2 DDS_TYPECODE_INDEX_INVALID

```
#define DDS_TYPECODE_INDEX_INVALID
```

A sentinel indicating an invalid **DDS_TypeCode** (p. 1149) member index.

7.11.4.3 DDS_TYPECODE_NOT_BITFIELD

```
#define DDS_TYPECODE_NOT_BITFIELD
```

Indicates that a member of a type is not a bitfield.

7.11.4.4 DDS_VM_NONE

```
#define DDS_VM_NONE
```

Constant used to indicate that a value type has no modifiers.

See also

DDS_ValueModifier (p. 85)

Examples

HelloWorld.cxx.

7.11.4.5 DDS_VM_CUSTOM

```
#define DDS_VM_CUSTOM
```

Constant used to indicate that a value type has the `custom` modifier.

This modifier is used to specify whether the value type uses custom marshaling.

See also

DDS_ValueModifier (p. 85)

7.11.4.6 DDS_VM_ABSTRACT

```
#define DDS_VM_ABSTRACT
```

Constant used to indicate that a value type has the `abstract` modifier.

An abstract value type may not be instantiated.

See also

DDS_ValueModifier (p. 85)

7.11.4.7 DDS_VM_TRUNCATABLE

```
#define DDS_VM_TRUNCATABLE
```

Constant used to indicate that a value type has the `truncatable` modifier.

A value with a state that derives from another value with a state can be declared as truncatable. A truncatable type means the object can be truncated to the base type.

See also

DDS_ValueModifier (p. 85)

7.11.4.8 DDS_PRIVATE_MEMBER

```
#define DDS_PRIVATE_MEMBER
```

Constant used to indicate that a value type member is private.

See also

DDS_Visibility (p. 85)

DDS_PUBLIC_MEMBER (p. 83)

7.11.4.9 DDS_PUBLIC_MEMBER

```
#define DDS_PUBLIC_MEMBER
```

Constant used to indicate that a value type member is public.

See also

DDS_Visibility (p. 85)

DDS_PRIVATE_MEMBER (p. 82)

Examples

HelloWorld.cxx.

7.11.4.10 DDS_TYPECODE_NONKEY_MEMBER

```
#define DDS_TYPECODE_NONKEY_MEMBER
```

A flag indicating that a type member is optional and not part of the key.

If a type is used with the **Dynamic Data** (p. 99) facility, a **DDS_DynamicData** (p. 769) sample of the type will only contain a value for a **DDS_TYPECODE_NONKEY_MEMBER** (p. 83) field if one has been explicitly set (see, for example, **DDS_DynamicData::set_long** (p. 841)). The middleware will *not* assume any default value.

See also

DDS_TYPECODE_KEY_MEMBER (p. 83)

DDS_TYPECODE_NONKEY_REQUIRED_MEMBER (p. 84)

DDS_TYPECODE_KEY_MEMBER (p. 83)

DDS_TypeCode::add_member (p. 1183)

DDS_TypeCode::add_member_ex (p. 1185)

DDS_TypeCode::is_member_key (p. 1162)

DDS_TypeCode::is_member_required (p. 1164)

DDS_StructMember::is_key (p. 1089)

DDS_ValueMember::is_key (p. 1224)

7.11.4.11 DDS_TYPECODE_KEY_MEMBER

```
#define DDS_TYPECODE_KEY_MEMBER
```

A flag indicating that a type member is part of the key for that type, and therefore required.

If a type is used with the **Dynamic Data** (p. 99) facility, all **DDS_DynamicData** (p. 769) samples of the type will contain a value for all **DDS_TYPECODE_KEY_MEMBER** (p. 83) fields. If you do not set a value of the member explicitly (see, for example, **DDS_DynamicData::set_long** (p. 841)), the middleware will assume a default "zero" value: numeric values will be set to zero; strings and sequences will be of zero length.

See also

- DDS_TYPECODE_NONKEY_REQUIRED_MEMBER** (p. 84)
- DDS_TYPECODE_NONKEY_MEMBER** (p. 83)
- DDS_TypeCode::add_member** (p. 1183)
- DDS_TypeCode::add_member_ex** (p. 1185)
- DDS_TypeCode::is_member_key** (p. 1162)
- DDS_TypeCode::is_member_required** (p. 1164)
- DDS_StructMember::is_key** (p. 1089)
- DDS_ValueMember::is_key** (p. 1224)

7.11.4.12 DDS_TYPECODE_NONKEY_REQUIRED_MEMBER

```
#define DDS_TYPECODE_NONKEY_REQUIRED_MEMBER
```

A flag indicating that a type member is not part of the key but is nevertheless required.

This is the most common kind of member.

If a type is used with the **Dynamic Data** (p. 99) facility, all **DDS_DynamicData** (p. 769) samples of the type will contain a value for all **DDS_TYPECODE_NONKEY_REQUIRED_MEMBER** (p. 84) fields. If you do not set a value of the member explicitly (see, for example, **DDS_DynamicData::set_long** (p. 841)), the middleware will assume a default "zero" value: numeric values will be set to zero; strings and sequences will be of zero length.

7.11.4.13 DDS_TypeCode_PrintFormat_INITIALIZER

```
#define DDS_TypeCode_PrintFormat_INITIALIZER
```

Static initializer for **DDS_TypeCodePrintFormatProperty** (p. 1208).

Use this initializer to ensure that new objects don't have uninitialized contents.

```
struct DDS_TypeCodePrintFormatProperty property = DDS_TypeCodePrintFormatProperty;
```

7.11.5 Typedef Documentation

7.11.5.1 DDS_ValueModifier

```
typedef short DDS_ValueModifier
```

Modifier type for a value type.

See also

DDS_VM_NONE (p. 81)

DDS_VM_ABSTRACT (p. 82)

DDS_VM_TRUNCATABLE (p. 82)

7.11.5.2 DDS_Visibility

```
typedef short DDS_Visibility
```

Type to indicate the visibility of a value type member.

See also

DDS_PRIVATE_MEMBER (p. 82)

DDS_PUBLIC_MEMBER (p. 83)

7.11.6 Enumeration Type Documentation

7.11.6.1 DDS_TypeCodePrintFormatKind

```
enum DDS_TypeCodePrintFormatKind
```

The different formats to print a **DDS_TypeCode** (p. 1149).

Enumerator

DDS_TYPE_CODE_PRINT_KIND_IDL	Indicates that a DDS_TypeCode (p. 1149) is to be printed in IDL format.
DDS_TYPE_CODE_PRINT_KIND_XML	Indicates that a DDS_TypeCode (p. 1149) is to be printed in XML format.

7.11.6.2 DDS_TCKind

```
enum DDS_TCKind
```

Enumeration type for **DDS_TypeCode** (p. 1149) kinds.

Type code kinds are modeled as values of this type.

Enumerator

DDS_TK_NULL	Indicates that a type code does not describe anything.
DDS_TK_SHORT	short type.
DDS_TK_LONG	long type.
DDS_TK_USHORT	unsigned short type.
DDS_TK_ULONG	unsigned long type.
DDS_TK_FLOAT	float type.
DDS_TK_DOUBLE	double type.
DDS_TK_BOOLEAN	boolean type.
DDS_TK_CHAR	char type.
DDS_TK_OCTET	octet type.
DDS_TK_STRUCT	struct type.
DDS_TK_UNION	union type.
DDS_TK_ENUM	enumerated type.
DDS_TK_STRING	string type.
DDS_TK_SEQUENCE	sequence type.
DDS_TK_ARRAY	array type.
DDS_TK_ALIAS	alias (typedef) type.
DDS_TK_LONGLONG	long long type.
DDS_TK_ULONGLONG	unsigned long long type.
DDS_TK_LONGDOUBLE	long double type.
DDS_TK_WCHAR	wide char type.
DDS_TK_WSTRING	wide string type.
DDS_TK_VALUE	value type.

7.11.6.3 DDS_ExtensibilityKind

enum **DDS_ExtensibilityKind**

Type to indicate the extensibility of a type.

Enumerator

DDS_FINAL_EXTENSIBILITY	Specifies that a type has FINAL extensibility. A type may be final, indicating that the range of its possible values is strictly defined. In particular, it is not possible to add elements to members of collection or aggregated types while maintaining type assignability. The following types are always final: <ul style="list-style-type: none"> • DDS_TK_ARRAY (p. 86) • All primitive types
DDS_EXTENSIBLE_EXTENSIBILITY	Specifies that a type has EXTENSIBLE extensibility. A type may be extensible, indicating that two types, where one contains all of the elements/members of the other plus additional elements/members appended to the end, may remain assignable.
DDS_MUTABLE_EXTENSIBILITY	Specifies that a type has MUTABLE extensibility. A type may be mutable, indicating that two types may differ from one another in the additional, removal, and/or transposition of elements/members while remaining assignable. The following types are always mutable: <ul style="list-style-type: none"> • DDS_TK_SEQUENCE (p. 86) • DDS_TK_STRING (p. 86) • DDS_TK_WSTRING (p. 86)

7.11.7 Variable Documentation

7.11.7.1 DDS_g_tc_null

DDS_TypeCode DDS_g_tc_null

Basic NULL type.

For new code, **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197) is preferred to using this global variable.

See also

DDS_TypeCodeFactory::get_primitive_tc (p. 1197)

7.11.7.2 DDS_g_tc_short

`DDS_TypeCode DDS_g_tc_short`

Basic 16-bit signed integer type.

For new code, `DDS_TypeCodeFactory::get_primitive_tc` (p. 1197) is preferred to using this global variable.

See also

`DDS_TypeCodeFactory::get_primitive_tc` (p. 1197)

`DDS_Short` (p. 317)

7.11.7.3 DDS_g_tc_long

`DDS_TypeCode DDS_g_tc_long`

Basic 32-bit signed integer type.

For new code, `DDS_TypeCodeFactory::get_primitive_tc` (p. 1197) is preferred to using this global variable.

See also

`DDS_TypeCodeFactory::get_primitive_tc` (p. 1197)

`DDS_Long` (p. 317)

7.11.7.4 DDS_g_tc_ushort

`DDS_TypeCode DDS_g_tc_ushort`

Basic unsigned 16-bit integer type.

For new code, `DDS_TypeCodeFactory::get_primitive_tc` (p. 1197) is preferred to using this global variable.

See also

`DDS_TypeCodeFactory::get_primitive_tc` (p. 1197)

`DDS_UnsignedShort` (p. 317)

7.11.7.5 DDS_g_tc_ulong

DDS_TypeCode DDS_g_tc_ulong

Basic unsigned 32-bit integer type.

For new code, **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197) is preferred to using this global variable.

See also

DDS_TypeCodeFactory::get_primitive_tc (p. 1197)

DDS_UnsignedLong (p. 317)

7.11.7.6 DDS_g_tc_float

DDS_TypeCode DDS_g_tc_float

Basic 32-bit floating point type.

For new code, **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197) is preferred to using this global variable.

See also

DDS_TypeCodeFactory::get_primitive_tc (p. 1197)

DDS_Float (p. 318)

7.11.7.7 DDS_g_tc_double

DDS_TypeCode DDS_g_tc_double

Basic 64-bit floating point type.

For new code, **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197) is preferred to using this global variable.

See also

DDS_TypeCodeFactory::get_primitive_tc (p. 1197)

DDS_Double (p. 318)

7.11.7.8 DDS_g_tc_boolean

DDS_TypeCode DDS_g_tc_boolean

Basic Boolean type.

For new code, **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197) is preferred to using this global variable.

See also

DDS_TypeCodeFactory::get_primitive_tc (p. 1197)

DDS_Boolean (p. 319)

7.11.7.9 DDS_g_tc_char

DDS_TypeCode DDS_g_tc_char

Basic single-byte character type.

For new code, **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197) is preferred to using this global variable.

See also

DDS_TypeCodeFactory::get_primitive_tc (p. 1197)

DDS_Char (p. 316)

7.11.7.10 DDS_g_tc_octet

DDS_TypeCode DDS_g_tc_octet

Basic octet/byte type.

For new code, **DDS_TypeCodeFactory::get_primitive_tc** (p. 1197) is preferred to using this global variable.

See also

DDS_TypeCodeFactory::get_primitive_tc (p. 1197)

DDS_Octet (p. 316)

7.11.7.11 DDS_g_tc_longlong

`DDS_TypeCode DDS_g_tc_longlong`

Basic 64-bit integer type.

For new code, `DDS_TypeCodeFactory::get_primitive_tc` (p. 1197) is preferred to using this global variable.

See also

`DDS_TypeCodeFactory::get_primitive_tc` (p. 1197)

`DDS_LongLong` (p. 318)

7.11.7.12 DDS_g_tc_ulonglong

`DDS_TypeCode DDS_g_tc_ulonglong`

Basic unsigned 64-bit integer type.

For new code, `DDS_TypeCodeFactory::get_primitive_tc` (p. 1197) is preferred to using this global variable.

See also

`DDS_TypeCodeFactory::get_primitive_tc` (p. 1197)

`DDS_UnsignedLongLong` (p. 318)

7.11.7.13 DDS_g_tc_longdouble

`DDS_TypeCode DDS_g_tc_longdouble`

Basic 128-bit floating point type.

For new code, `DDS_TypeCodeFactory::get_primitive_tc` (p. 1197) is preferred to using this global variable.

See also

`DDS_TypeCodeFactory::get_primitive_tc` (p. 1197)

`DDS_LongDouble` (p. 318)

7.11.7.14 DDS_g_tc_wchar

`DDS_TypeCode DDS_g_tc_wchar`

Basic four-byte character type.

For new code, `DDS_TypeCodeFactory::get_primitive_tc` (p. 1197) is preferred to using this global variable.

See also

`DDS_TypeCodeFactory::get_primitive_tc` (p. 1197)

`DDS_Wchar` (p. 316)

7.12 Built-in Types

RTI Connext provides a set of very simple data types for you to use with the topics in your application.

Modules

- **String Built-in Type**
Built-in type consisting of a single character string.
- **KeyedString Built-in Type**
Built-in type consisting of a string payload and a second string that is the key.
- **Octets Built-in Type**
Built-in type consisting of a variable-length array of opaque bytes.
- **KeyedOctets Built-in Type**
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

7.12.1 Detailed Description

RTI Connext provides a set of very simple data types for you to use with the topics in your application.

The middleware provides four built-in types:

- **String**: A payload consisting of a single string of characters. This type has no key.
- **DDS_KeyedString** (p. 914): A payload consisting of a single string of characters and a second string, the key, that identifies the instance to which the sample belongs.
- **DDS_Octets** (p. 954): A payload consisting of an opaque variable-length array of bytes. This type has no key.
- **DDS_KeyedOctets** (p. 911): A payload consisting of an opaque variable-length array of bytes and a string, the key, that identifies the instance to which the sample belongs.

The **String** and **DDS_KeyedString** (p. 914) types are appropriate for simple text-based applications. The **DDS_Octets** (p. 954) and **DDS_KeyedOctets** (p. 911) types are appropriate for applications that perform their own custom data serialization, such as legacy applications still in the process of migrating to RTI Connext. In most cases, string-based or structured data is preferable to opaque data, because the latter cannot be easily visualized in tools or used with content-based filters (see **DDSContentFilteredTopic** (p. 1267)).

The built-in types are very simple in order to get you up and running as quickly as possible. If you need a structured data type you can define your own type with exactly the fields you need in one of two ways:

- At compile time, by generating code from an IDL or XML file using the `rtiddsgen` utility
- At runtime, by using the **Dynamic Data** (p. 99) API

7.12.2 Managing Memory for Builtin Types

When a sample is written, the `DataWriter` serializes it and stores the result in a buffer obtained from a pool of preallocated buffers. In the same way, when a sample is received, the `DataReader` deserializes it and stores the result in a sample coming from a pool of preallocated samples.

For builtin types, the maximum size of the buffers/samples and depends on the nature of the application using the builtin type.

You can configure the maximum size of the builtin types on a per-`DataWriter` and per-`DataReader` basis using the **DDS_PropertyQosPolicy** (p. 994) in `DataWriters`, `DataReaders` or `Participants`.

The following table lists the supported builtin type properties to configure memory allocation. When the properties are defined in the `DomainParticipant`, they are applicable to all `DataWriters` and `DataReaders` belonging to the `DomainParticipant` unless they are overwritten in the `DataWriters` and `DataReaders`.

Table 7.33 Builtin Types Allocation Properties

Property	Description
<code>dds.builtin_type.string.alloc_size</code>	Maximum size of the strings published by the DDSStringDataWriter (p. 1568) or received by the DDSStringDataReader (p. 1564) (includes the NULL-terminated character). Default: <code>dds.builtin_type.string.max_size</code> if defined. Otherwise, 1024.
<code>dds.builtin_type.keyed_string.alloc_key_size</code>	Maximum size of the keys used by the DDSKeyedStringDataWriter (p. 1493) or DDSKeyedStringDataReader (p. 1484) (includes the NULL-terminated character). Default: <code>dds.builtin_type.keyed_string.max_key_size</code> if defined. Otherwise, 1024.
<code>dds.builtin_type.keyed_string.alloc_size</code>	Maximum size of the strings published by the DDSKeyedStringDataWriter (p. 1493) or received by the DDSKeyedStringDataReader (p. 1484) (includes the NULL-terminated character). Default: <code>dds.builtin_type.keyed_string.max_size</code> if defined. Otherwise, 1024.
<code>dds.builtin_type.octets.alloc_size</code>	Maximum size of the octet sequences published by the DDSOctetsDataWriter (p. 1520) or received by the DDSOctetsDataReader (p. 1516). Default: <code>dds.builtin_type.octets.max_size</code> if defined. Otherwise, 2048.
<code>dds.builtin_type.keyed_octets.alloc_key_size</code>	Maximum size of the key published by the DDSKeyedOctetsDataWriter (p. 1465) or received by the DDSKeyedOctetsDataReader (p. 1456) (includes the NULL-terminated character). Default: <code>dds.builtin_type.keyed_octets.max_key_size</code> if defined. Otherwise, 1024.
<code>dds.builtin_type.keyed_octets.alloc_size</code>	Maximum size of the octets sequences published by a DDSKeyedOctetsDataWriter (p. 1465) or received by a DDSKeyedOctetsDataReader (p. 1456). Default: <code>dds.builtin_type.keyed_octets.max_size</code> if defined. Otherwise, 2048.

The previous properties must be set consistently with respect to the corresponding `*.max_size` properties that set the maximum size of the builtin types in the typecode.

7.12.3 Typecodes for Builtin Types

The typecodes associated with the builtin types are generated from the following IDL type definitions:

```
module DDS {
    struct String {
        string value;
    };
    <P>
    struct KeyedString {
        string key;
        string value;
    };
    <P>
    struct Octets {
        sequence<octet> value;
    };
    <P>
    struct KeyedOctets {
        string key;
        sequence<octet> value;
    };
};
```

The maximum size of the strings and sequences that will be included in the type code definitions can be configured on a per-DomainParticipant-basis by using the properties in following table.

Table 7.34 Properties for Allocating Size of Builtin Types, per DomainParticipant

Property	Description
<code>dds.builtin_type.string.max_size</code>	Maximum size of the strings published by the <code>StringDataWriters</code> and received by the <code>StringDataReaders</code> belonging to a <code>DomainParticipant</code> (includes the NULL-terminated character). Default: 1024.
<code>dds.builtin_type.keyed_string.max_key_size</code>	Maximum size of the keys used by the <code>KeyedStringDataWriters</code> and <code>KeyedStringDataReaders</code> belonging to a <code>DomainParticipant</code> (includes the NULL-terminated character). Default: 1024.
<code>dds.builtin_type.keyed_string.max_size</code>	Maximum size of the strings published by the <code>KeyedStringDataWriters</code> and received by the <code>KeyedStringDataReaders</code> belonging to a <code>DomainParticipant</code> using the builtin type (includes the NULL-terminated character). Default: 1024.
<code>dds.builtin_type.octets.max_size</code>	Maximum size of the octet sequences published by the <code>OctetsDataWriters</code> and received by the <code>OctetsDataReader</code> belonging to a <code>DomainParticipant</code> . Default: 2048.
<code>dds.builtin_type.keyed_octets.max_key_size</code>	Maximum size of the keys used by the <code>KeyedOctetsStringDataWriters</code> and <code>KeyedOctetsStringDataReaders</code> belonging to a <code>DomainParticipant</code> (includes the NULL-terminated character). Default: 1024.
<code>dds.builtin_type.keyed_octets.max_size</code>	Maximum size of the octet sequences published by the <code>KeyedOctetsDataWriters</code> and received by the <code>KeyedOctetsDataReaders</code> belonging to a <code>DomainParticipant</code> . Default: 2048.

For more information about the built-in types, including how to control memory usage and maximum lengths, please see the "Data Types and DDS Data Samples" chapter in the `User's Manual`.

7.13 Built-in Topic's Trust Types

Types used as part of `DDS_ParticipantBuiltinTopicData` (p. 966), `DDS_PublicationBuiltinTopicData` (p. 997), `DDS_SubscriptionBuiltinTopicData` (p. 1094) to describe Trust Plugins configuration.

Classes

- struct **DDS_ParticipantTrustProtectionInfo**
Trust Plugins Protection information associated with the discovered DomainParticipant.
- struct **DDS_EndpointTrustProtectionInfo**
Trust Plugins Protection information associated with the discovered endpoint.
- struct **DDS_TrustAlgorithmRequirements**
Type to describe Trust Plugins algorithm requirements for an entity.
- struct **DDS_ParticipantTrustSignatureAlgorithmInfo**
Trust Plugins signature algorithm information associated with the discovered DomainParticipant.
- struct **DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo**
Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.
- struct **DDS_ParticipantTrustInterceptorAlgorithmInfo**
Trust Plugins interception algorithm information associated with the discovered DomainParticipant.
- struct **DDS_ParticipantTrustAlgorithmInfo**
Trust Plugins algorithm information associated with the discovered DomainParticipant.
- struct **DDS_EndpointTrustInterceptorAlgorithmInfo**
Trust Plugins interception algorithm information associated with the discovered endpoint.
- struct **DDS_EndpointTrustAlgorithmInfo**
Trust Plugins algorithm information associated with the discovered endpoint.

Typedefs

- typedef **DDS_UnsignedLong DDS_ParticipantTrustAttributesMask**
- typedef **DDS_UnsignedLong DDS_PluginParticipantTrustAttributesMask**
- typedef struct **DDS_ParticipantTrustProtectionInfo DDS_ParticipantTrustProtectionInfo**
Trust Plugins Protection information associated with the discovered DomainParticipant.
- typedef **DDS_UnsignedLong DDS_EndpointTrustAttributesMask**
- typedef **DDS_UnsignedLong DDS_PluginEndpointTrustAttributesMask**
- typedef **DDS_UnsignedLong DDS_VendorEndpointTrustAttributesMask**
- typedef struct **DDS_EndpointTrustProtectionInfo DDS_EndpointTrustProtectionInfo**
Trust Plugins Protection information associated with the discovered endpoint.
- typedef **DDS_UnsignedLong DDS_TrustAlgorithmBit**
- typedef **DDS_UnsignedLong DDS_TrustAlgorithmSet**

- typedef struct **DDS_TrustAlgorithmRequirements** **DDS_TrustAlgorithmRequirements**
Type to describe Trust Plugins algorithm requirements for an entity.
- typedef struct **DDS_ParticipantTrustSignatureAlgorithmInfo** **DDS_ParticipantTrustSignatureAlgorithmInfo**
Trust Plugins signature algorithm information associated with the discovered DomainParticipant.
- typedef struct **DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo** **DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo**↔
Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.
- typedef struct **DDS_ParticipantTrustInterceptorAlgorithmInfo** **DDS_ParticipantTrustInterceptorAlgorithmInfo**↔
Trust Plugins interception algorithm information associated with the discovered DomainParticipant.
- typedef struct **DDS_ParticipantTrustAlgorithmInfo** **DDS_ParticipantTrustAlgorithmInfo**
Trust Plugins algorithm information associated with the discovered DomainParticipant.
- typedef struct **DDS_EndpointTrustInterceptorAlgorithmInfo** **DDS_EndpointTrustInterceptorAlgorithmInfo**
Trust Plugins interception algorithm information associated with the discovered endpoint.
- typedef struct **DDS_EndpointTrustAlgorithmInfo** **DDS_EndpointTrustAlgorithmInfo**
Trust Plugins algorithm information associated with the discovered endpoint.

7.13.1 Detailed Description

Types used as part of **DDS_ParticipantBuiltinTopicData** (p. 966), **DDS_PublicationBuiltinTopicData** (p. 997), **DDS_SubscriptionBuiltinTopicData** (p. 1094) to describe Trust Plugins configuration.

These types are used to describe how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins.

The meaning of the contents of these types may vary depending on what Trust Plugins the DomainParticipant is using. For information about how these types interact with the RTI Security Plugins, please refer to the *RTI Security Plugins User's Manual*.

7.13.2 Typedef Documentation

7.13.2.1 DDS_ParticipantTrustAttributesMask

```
typedef DDS_UnsignedLong DDS_ParticipantTrustAttributesMask
```

7.13.2.2 DDS_PluginParticipantTrustAttributesMask

```
typedef DDS_UnsignedLong DDS_PluginParticipantTrustAttributesMask
```

7.13.2.3 DDS_ParticipantTrustProtectionInfo

```
typedef struct DDS_ParticipantTrustProtectionInfo DDS_ParticipantTrustProtectionInfo
```

Trust Plugins Protection information associated with the discovered DomainParticipant.

7.13.2.4 DDS_EndpointTrustAttributesMask

```
typedef DDS_UnsignedLong DDS_EndpointTrustAttributesMask
```

7.13.2.5 DDS_PluginEndpointTrustAttributesMask

```
typedef DDS_UnsignedLong DDS_PluginEndpointTrustAttributesMask
```

7.13.2.6 DDS_VendorEndpointTrustAttributesMask

```
typedef DDS_UnsignedLong DDS_VendorEndpointTrustAttributesMask
```

7.13.2.7 DDS_EndpointTrustProtectionInfo

```
typedef struct DDS_EndpointTrustProtectionInfo DDS_EndpointTrustProtectionInfo
```

Trust Plugins Protection information associated with the discovered endpoint.

7.13.2.8 DDS_TrustAlgorithmBit

```
typedef DDS_UnsignedLong DDS_TrustAlgorithmBit
```

7.13.2.9 DDS_TrustAlgorithmSet

```
typedef DDS_UnsignedLong DDS_TrustAlgorithmSet
```

7.13.2.10 DDS_TrustAlgorithmRequirements

```
typedef struct DDS_TrustAlgorithmRequirements DDS_TrustAlgorithmRequirements
```

Type to describe Trust Plugins algorithm requirements for an entity.

7.13.2.11 DDS_ParticipantTrustSignatureAlgorithmInfo

```
typedef struct DDS_ParticipantTrustSignatureAlgorithmInfo DDS_ParticipantTrustSignatureAlgorithmInfo
```

Trust Plugins signature algorithm information associated with the discovered DomainParticipant.

7.13.2.12 DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo

```
typedef struct DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo
```

Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.

7.13.2.13 DDS_ParticipantTrustInterceptorAlgorithmInfo

```
typedef struct DDS_ParticipantTrustInterceptorAlgorithmInfo DDS_ParticipantTrustInterceptorAlgorithmInfo
```

Trust Plugins interception algorithm information associated with the discovered DomainParticipant.

7.13.2.14 DDS_ParticipantTrustAlgorithmInfo

```
typedef struct DDS_ParticipantTrustAlgorithmInfo DDS_ParticipantTrustAlgorithmInfo
```

Trust Plugins algorithm information associated with the discovered DomainParticipant.

7.13.2.15 DDS_EndpointTrustInterceptorAlgorithmInfo

```
typedef struct DDS_EndpointTrustInterceptorAlgorithmInfo DDS_EndpointTrustInterceptorAlgorithmInfo
```

Trust Plugins interception algorithm information associated with the discovered endpoint.

7.13.2.16 DDS_EndpointTrustAlgorithmInfo

```
typedef struct DDS_EndpointTrustAlgorithmInfo DDS_EndpointTrustAlgorithmInfo
```

Trust Plugins algorithm information associated with the discovered endpoint.

7.14 Dynamic Data

<<**extension**>> (p. 236) The Dynamic Data API provides a way to interact with arbitrarily complex data types at runtime without the need for code generation.

Classes

- struct **DDS_DynamicDataProperty_t**
*A collection of attributes used to configure **DDS_DynamicData** (p. 769) objects.*
- struct **DDS_DynamicDataTypeSerializationProperty_t**
Properties that govern how data of a certain type will be serialized on the network.
- struct **DDS_DynamicDataInfo**
*A descriptor for a **DDS_DynamicData** (p. 769) object.*
- struct **DDS_DynamicDataMemberInfo**
A descriptor for a single member (i.e. field) of dynamically defined data type.
- struct **DDS_DynamicData**
A sample of any complex data type, which can be inspected and manipulated reflectively.
- struct **DDS_DynamicDataSeq**
*An ordered collection of **DDS_DynamicData** (p. 769) elements.*
- struct **DDS_DynamicDataTypeProperty_t**
*A collection of attributes used to configure **DDSDynamicDataTypeSupport** (p. 1439) objects.*
- struct **DDS_DynamicDataJsonParserProperties_t**
*A collection of attributes used to configure **DDS_DynamicData** (p. 769) objects.*
- class **DDSDynamicDataTypeSupport**
*A factory for registering a dynamically defined type and creating **DDS_DynamicData** (p. 769) objects.*
- class **DDSDynamicDataReader**
*Reads (subscribes to) objects of type **DDS_DynamicData** (p. 769).*
- class **DDSDynamicDataWriter**
*Writes (publishes) objects of type **DDS_DynamicData** (p. 769).*

Macros

- `#define DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED`
A sentinel value that indicates that no member ID is needed in order to perform some operation.

Typedefs

- `typedef DDS_Long DDS_DynamicDataMemberId`
An integer that uniquely identifies some member of a data type within that type.

Variables

- `const struct DDS_DynamicDataProperty_t DDS_DYNAMIC_DATA_PROPERTY_DEFAULT`
Sentinel constant indicating default values for `DDS_DynamicDataProperty_t` (p. 880).
- `const struct DDS_DynamicDataTypeProperty_t DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT`
Sentinel constant indicating default values for `DDS_DynamicDataTypeProperty_t` (p. 882).
- `struct DDS_DynamicDataJsonParserProperties_t DDS_DYNAMIC_DATA_JSON_PARSER_PROPERTIES_DEFAULT`
Sentinel constant indicating default values for `DDS_DynamicDataProperty_t` (p. 880).

7.14.1 Detailed Description

<<**extension**>> (p. 236) The Dynamic Data API provides a way to interact with arbitrarily complex data types at runtime without the need for code generation.

This API allows you to define new data types, modify existing data types, and interact reflectively with samples. To use it, you will take the following steps:

1. Obtain a `DDS_TypeCode` (p. 1149) (see `Type Code Support` (p. 76)) that defines the type definition you want to use.

A `DDS_TypeCode` (p. 1149) includes a type's *kind* (`DDS_TCKind` (p. 86)), *name*, and *members* (that is, fields). You can create your own `DDS_TypeCode` (p. 1149) using the `DDS_TypeCodeFactory` (p. 1194) class – see, for example, the `DDS_TypeCodeFactory::create_struct_tc` (p. 1198) method. Alternatively, you can use a remote `DDS_TypeCode` (p. 1149) that you discovered on the network (see **Built-in Topics** (p. 59)) or one generated by `rtiddsgen` (see the `Code Generator User's Manual`).

2. Wrap the `DDS_TypeCode` (p. 1149) in a `DDSDynamicDataTypeSupport` (p. 1439) object.

See the constructor `DDSDynamicDataTypeSupport::DDSDynamicDataTypeSupport` (p. 1440). This object lets you connect the type definition to a `DDSDomainParticipant` (p. 1335) and manage data samples (of type `DDS_DynamicData` (p. 769)).

3. Register the `DDSDynamicDataTypeSupport` (p. 1439) with one or more domain participants.

See `DDSDynamicDataTypeSupport::register_type` (p. 1442). This action associates the data type with a logical name that you can use to create topics. (Starting with this step, working with a dynamically defined data type is almost exactly the same as working with a generated one.)

4. Create a `DDSTopic` (p. 1601) from the `DDSDomainParticipant` (p. 1335).

Use the name under which you registered your data type – see `DDSDomainParticipant::create_topic` (p. 1366). This `DDSTopic` (p. 1601) is what you will use to produce and consume data.

5. Create a DDSDynamicDataWriter (p. 1445) and/or DDSDynamicDataReader (p. 1439).

These objects will produce and/or consume data (of type **DDS_DynamicData** (p. 769)) on the **DDSTopic** (p. 1601). You can create these objects directly from the **DDSDomainParticipant** (p. 1335) – see **DDSDomainParticipant::create_datawriter** (p. 1398) and **DDSDomainParticipant::create_datareader** (p. 1401) – or by first creating intermediate **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576) objects – see **DDSDomainParticipant::create_publisher** (p. 1359) and **DDSDomainParticipant::create_subscriber** (p. 1362).

6. Write and/or read the data of interest.**7. Tear down the objects described above.**

You should delete them in the reverse order in which you created them. Note that unregistering your data type with the **DDSDomainParticipant** (p. 1335) is optional; all types are automatically unregistered when the **DDSDomainParticipant** (p. 1335) itself is deleted.

7.14.2 Macro Definition Documentation**7.14.2.1 DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED**

```
#define DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED
```

A sentinel value that indicates that no member ID is needed in order to perform some operation.

Most commonly, this constant will be used in "get" operations to indicate that a lookup should be performed based on a name, not on an ID.

See also

DDS_DynamicDataMemberId (p. 101)

7.14.3 Typedef Documentation**7.14.3.1 DDS_DynamicDataMemberId**

```
typedef DDS_Long DDS_DynamicDataMemberId
```

An integer that uniquely identifies some member of a data type within that type.

The range of a member ID is the range of an unsigned short integer, except for the value 0, which is reserved.

See also

DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101)

7.14.4 Variable Documentation

7.14.4.1 DDS_DYNAMIC_DATA_PROPERTY_DEFAULT

```
const struct DDS_DynamicDataProperty_t DDS_DYNAMIC_DATA_PROPERTY_DEFAULT [extern]
```

Sentinel constant indicating default values for **DDS_DynamicDataProperty_t** (p. 880).

Pass this object instead of your own **DDS_DynamicDataProperty_t** (p. 880) object to use the default property values:

```
DDS_DynamicData* sample = new DDS_DynamicData(  
    myTypeCode,  
    &DDS_DYNAMIC_DATA_PROPERTY_DEFAULT);
```

See also

DDS_DynamicDataProperty_t (p. 880)

Examples

HelloWorldPlugin.cxx.

7.14.4.2 DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT

```
const struct DDS_DynamicDataTypeProperty_t DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT [extern]
```

Sentinel constant indicating default values for **DDS_DynamicDataTypeProperty_t** (p. 882).

Pass this object instead of your own **DDS_DynamicDataTypeProperty_t** (p. 882) object to use the default property values:

```
DDS_DynamicDataTypeSupport* support = new DDS_DynamicDataTypeSupport(  
    myTypeCode,  
    &DDS_DYNAMIC_DATA_TYPE_PROPERTY_DEFAULT);
```

See also

DDS_DynamicDataTypeProperty_t (p. 882)

7.14.4.3 DDS_DYNAMIC_DATA_JSON_PARSER_PROPERTIES_DEFAULT

```
struct DDS_DynamicDataJsonParserProperties_t DDS_DYNAMIC_DATA_JSON_PARSER_PROPERTIES_DEFAULT
[extern]
```

Sentinel constant indicating default values for **DDS_DynamicDataProperty_t** (p. 880).

Pass this object instead of your own **DDS_DynamicDataProperty_t** (p. 880) object to use the default property values:

```
DDS_DynamicData* sample = new DDS_DynamicData(
    myTypeCode,
    &DDS_DYNAMIC_DATA_PROPERTY_DEFAULT);
```

7.15 Publication Module

Contains the **DDSFlowController** (p. 1451), **DDSPublisher** (p. 1534), and **DDSDataWriter** (p. 1305) classes as well as the **DDSPublisherListener** (p. 1555) and **DDSDataWriterListener** (p. 1328) interfaces, and more generally, all that is needed on the publication side.

Modules

- **Publishers**
 - DDSPublisher* (p. 1534) entity and associated elements
- **Data Writers**
 - DDSDataWriter* (p. 1305) entity and associated elements
- **Flow Controllers**
 - <<extension>> (p. 236) *DDSFlowController* (p. 1451) and associated elements
- **Multi-channel DataWriters**
 - APIs related to Multi-channel DataWriters.*

7.15.1 Detailed Description

Contains the **DDSFlowController** (p. 1451), **DDSPublisher** (p. 1534), and **DDSDataWriter** (p. 1305) classes as well as the **DDSPublisherListener** (p. 1555) and **DDSDataWriterListener** (p. 1328) interfaces, and more generally, all that is needed on the publication side.

"DCPS Publication package"

7.16 Publishers

DDSPublisher (p. 1534) entity and associated elements

Classes

- struct **DDS_PublisherQos**
*QoS policies supported by a **DDSPublisher** (p. 1534) entity.*
- class **DDSPublisherListener**
*<<interface>> (p. 236) **DDSListener** (p. 1509) for **DDSPublisher** (p. 1534) status.*
- class **DDSPublisherSeq**
*Declares IDL sequence < **DDSPublisher** (p. 1534) > .*
- class **DDSPublisher**
<<interface>> (p. 236) A publisher is the object responsible for the actual dissemination of publications.

Functions

- **DDS_Boolean DDS_PublisherQos_equals** (const struct **DDS_PublisherQos** *self, const struct **DDS_PublisherQos** *other)
*Compares two **DDS_PublisherQos** (p. 1009) for equality.*
- **DDS_ReturnCode_t DDS_PublisherQos::print** () const
*Prints this **DDS_PublisherQos** (p. 1009) to stdout.*
- **DDS_ReturnCode_t DDS_PublisherQos::to_string** (char *string, **DDS_UnsignedLong** &string_size) const
*Obtains a string representation of this **DDS_PublisherQos** (p. 1009).*
- **DDS_ReturnCode_t DDS_PublisherQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_PublisherQos** &base) const
*Obtains a string representation of this **DDS_PublisherQos** (p. 1009).*
- **DDS_ReturnCode_t DDS_PublisherQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_PublisherQos** (p. 1009).*
- **DDS_ReturnCode_t DDS_PublisherQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_PublisherQos** &base, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_PublisherQos** (p. 1009).*
- **DDS_ReturnCode_t DDS_PublisherQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
*Obtains a string representation of this **DDS_PublisherQos** (p. 1009).*
- **DDS_ReturnCode_t DDS_PublisherQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_PublisherQos** (p. 1009).*

Variables

- const struct **DDS_DataWriterQos DDS_DATAWRITER_QOS_DEFAULT**
*Special value for creating **DDSDDataWriter** (p. 1305) with default QoS.*
- const struct **DDS_DataWriterQos DDS_DATAWRITER_QOS_USE_TOPIC_QOS**
*Special value for creating **DDSDDataWriter** (p. 1305) with a combination of the default **DDS_DataWriterQos** (p. 683) and the **DDS_TopicQos** (p. 1120).*

7.16.1 Detailed Description

DDSPublisher (p. 1534) entity and associated elements

7.16.2 Function Documentation

7.16.2.1 DDS_PublisherQos_equals()

```
DDS_Boolean DDS_PublisherQos_equals (
    const struct DDS_PublisherQos * self,
    const struct DDS_PublisherQos * other )
```

Compares two **DDS_PublisherQos** (p. 1009) for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This PublisherQos.
<i>other</i>	<< <i>in</i> >> (p. 237) The other PublisherQos to be compared with this PublisherQos.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Qos objects are equal or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Referenced by **DDS_PublisherQos::operator!=()**, and **DDS_PublisherQos::operator==()**.

7.16.2.2 print()

```
DDS_ReturnCode_t DDS_PublisherQos::print ( ) const [inline]
```

Prints this **DDS_PublisherQos** (p. 1009) to stdout.

Only the differences between this **DDS_PublisherQos** (p. 1009) and the documented default are printed. If you wish to print everything regardless, see **DDS_PublisherQos::to_string(char*, DDS_UnsignedLong&, const DDS_PublisherQos&, const DDS_QosPrintFormat&) const** (p. 108). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.16.2.3 to_string() [1/6]

```
DDS_ReturnCode_t DDS_PublisherQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size ) const [inline]
```

Obtains a string representation of this **DDS_PublisherQos** (p. 1009).

Only the differences between this **DDS_PublisherQos** (p. 1009) and the documented default are printed to `idref_PublisherQos` string. If you wish to print everything regardless, see **DDS_PublisherQos::to_string(char*, DDS_UnsignedLong&, const DDS_PublisherQos&, const DDS_QosPrintFormat&) const** (p. 108). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

If the supplied buffer is NULL, the required length of the string is returned via the `string_size` parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_PublisherQos** (p. 1009) is written to the buffer.

Parameters

<i>string</i>	<< <i>out</i> >> (p. 237) The char buffer that will be used to store the string representation of this DDS_PublisherQos (p. 1009). If NULL, this function will return the required length of this buffer through the <code>string_size</code> parameter.
<i>string_size</i>	<< <i>inout</i> >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_PublisherQos::to_string(char*, DDS_UnsignedLong&, const DDS_PublisherQos&, const DDS_QosPrintFormat&) const (p. 108)

7.16.2.4 to_string() [2/6]

```
DDS_ReturnCode_t DDS_PublisherQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_PublisherQos & base ) const [inline]
```

Obtains a string representation of this **DDS_PublisherQos** (p. 1009).

This overload behaves the same as **DDS_PublisherQos::to_string** (p. 105) but allows the caller to specify the **DDS_PublisherQos** (p. 1009), which is used as the base profile. Only the differences between the QoS and the base profile are included in the output string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_PublisherQos (p. 1009). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_PublisherQos (p. 1009) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_PublisherQos::to_string(char*, DDS_UnsignedLong&, const DDS_PublisherQos&, const DDS_QosPrintFormat&) const (p. 108)

References **DDS_QosPrintFormat_INITIALIZER**.

7.16.2.5 to_string() [3/6]

```
DDS_ReturnCode_t DDS_PublisherQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_PublisherQos** (p. 1009).

This overload behaves the same as **DDS_PublisherQos::to_string** (p. 105) but allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the output.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_PublisherQos (p. 1009). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_PublisherQos::to_string(char*, **DDS_UnsignedLong**&, const **DDS_PublisherQos**&, const **DDS_QosPrintFormat**&) const (p. 108)

References **DDS_RETCODE_ERROR**, and **DDS_RETCODE_OK**.

7.16.2.6 to_string() [4/6]

```
DDS_ReturnCode_t DDS_PublisherQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_PublisherQos & base,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_PublisherQos** (p. 1009).

Only the differences between this **DDS_PublisherQos** (p. 1009) and the **DDS_PublisherQos** (p. 1009) supplied as the base are printed to the string.

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_PublisherQos** (p. 1009) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_PublisherQos (p. 1009). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_PublisherQos (p. 1009) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.16.2.7 to_string() [5/6]

```
DDS_ReturnCode_t DDS_PublisherQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ) const [inline]
```

Obtains a string representation of this **DDS_PublisherQos** (p. 1009).

This overload behaves the same as **DDS_PublisherQos::to_string** (p. 105) but prints the entire **DDS_PublisherQos** (p. 1009) object. The only valid value for the argument of type **DDS_QosPrintAll_t** (p. 1017) is **DDS_QOS_PRINT_ALL** (p. 164).

For example

```
PublisherQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, QOS_PRINT_ALL);
```

The resultant string is formatted according to the default value for **DDS_QosPrintFormat** (p. 1017).

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_PublisherQos (p. 1009). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_PublisherQos::to_string(char*, DDS_UnsignedLong&, const DDS_PublisherQos&, const DDS_QosPrintFormat&) const (p. 108)

References **DDS_QosPrintFormat_INITIALIZER**.

7.16.2.8 to_string() [6/6]

```
DDS_ReturnCode_t DDS_PublisherQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_PublisherQos** (p. 1009).

This overload behaves the same as the **DDS_PublisherQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 108) overload. The only difference is that it allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the resultant string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_PublisherQos (p. 1009). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_PublisherQos::to_string(char*, **DDS_UnsignedLong**&, const **DDS_PublisherQos**&, const **DDS_QosPrintFormat**&) const (p. 108)

7.16.3 Variable Documentation

7.16.3.1 DDS_DATAWRITER_QOS_DEFAULT

```
const struct DDS_DataWriterQos DDS_DATAWRITER_QOS_DEFAULT [extern]
```

Special value for creating **DDSDDataWriter** (p. 1305) with default QoS.

When used in **DDSPublisher::create_datawriter** (p. 1542), this special value is used to indicate that the **DDSDDataWriter** (p. 1305) should be created with the default **DDSDDataWriter** (p. 1305) QoS by means of the operation **get_default_datawriter_qos** and using the resulting QoS to create the **DDSDDataWriter** (p. 1305).

When used in **DDSPublisher::set_default_datawriter_qos** (p. 1538), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDSPublisher::set_default_datawriter_qos** (p. 1538) operation had never been called.

When used in **DDSDDataWriter::set_qos** (p. 1320), this special value is used to indicate that the QoS of the **DDSDDataWriter** (p. 1305) should be changed to match the current default QoS set in the **DDSPublisher** (p. 1534) that the **DDSDDataWriter** (p. 1305) belongs to.

Warning

This value is a constant and should never be modified. You cannot use this value to *get* the default QoS values for a DataWriter; for this purpose, use **DDSDomainParticipant::get_default_datawriter_qos** (p. 1342).

See also

DDSPublisher::create_datawriter (p. 1542)
DDSPublisher::set_default_datawriter_qos (p. 1538)
DDSDDataWriter::set_qos (p. 1320)

Examples

HelloWorld_publisher.cxx.

7.16.3.2 DDS_DATAWRITER_QOS_USE_TOPIC_QOS

```
const struct DDS_DataWriterQos DDS_DATAWRITER_QOS_USE_TOPIC_QOS [extern]
```

Special value for creating **DDSDataWriter** (p. 1305) with a combination of the default **DDS_DataWriterQos** (p. 683) and the **DDS_TopicQos** (p. 1120).

The use of this value is equivalent to the application obtaining the default **DDS_DataWriterQos** (p. 683) and the **DDS_TopicQos** (p. 1120) (by means of the operation **DDSTopic::get_qos** (p. 1605)) and then combining these two QoS using the operation **DDSPublisher::copy_from_topic_qos** (p. 1550) whereby any policy that is set on the **DDS_TopicQos** (p. 1120) "overrides" the corresponding policy on the default QoS. The resulting QoS is then applied to the creation of the **DDSDataWriter** (p. 1305).

This value should only be used in **DDSPublisher::create_datawriter** (p. 1542).

- struct **DDS_ReliableWriterCacheEventCount**
<<extension>> (p. 236) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.
- struct **DDS_ReliableWriterCacheChangedStatus**
<<extension>> (p. 236) A summary of the state of a data writer's cache of unacknowledged samples written.
- struct **DDS_ReliableReaderActivityChangedStatus**
<<extension>> (p. 236) Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer.

- struct **DDS_DataWriterCacheStatus**
<<extension>> (p. 236) The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue.
- struct **DDS_DataWriterProtocolStatus**
<<extension>> (p. 236) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.
- struct **DDS_AcknowledgmentInfo**
Information about an application-level acknowledged sample.
- struct **DDS_DataWriterQos**
*QoS policies supported by a **DDSDataWriter** (p. 1305) entity.*
- class **FooDataWriter**
<<interface>> (p. 236) <<generic>> (p. 236) User data type specific data writer.
- class **DDSDataWriterListener**
*<<interface>> (p. 236) **DDSListener** (p. 1509) for writer status.*
- class **DDSDataWriter**
*<<interface>> (p. 236) Allows an application to set the value of the data to be published under a given **DDSTopic** (p. 1601).*

Functions

- **DDS_Boolean DDS_DataWriterQos_equals** (const struct **DDS_DataWriterQos** *self, const struct **DDS_DataWriterQos** *other)
*Compares two **DDS_DataWriterQos** (p. 683) for equality.*
- **DDS_ReturnCode_t DDS_DataWriterQos::print** () const
*Prints this **DDS_DataWriterQos** (p. 683) to stdout.*
- **DDS_ReturnCode_t DDS_DataWriterQos::to_string** (char *string, **DDS_UnsignedLong** &string_size) const
*Obtains a string representation of this **DDS_DataWriterQos** (p. 683).*
- **DDS_ReturnCode_t DDS_DataWriterQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DataWriterQos** &base) const
*Obtains a string representation of this **DDS_DataWriterQos** (p. 683).*
- **DDS_ReturnCode_t DDS_DataWriterQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DataWriterQos** (p. 683).*
- **DDS_ReturnCode_t DDS_DataWriterQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DataWriterQos** &base, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DataWriterQos** (p. 683).*
- **DDS_ReturnCode_t DDS_DataWriterQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
*Obtains a string representation of this **DDS_DataWriterQos** (p. 683).*
- **DDS_ReturnCode_t DDS_DataWriterQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DataWriterQos** (p. 683).*

7.17.1 Detailed Description

DDSDataWriter (p. 1305) entity and associated elements

7.17.2 Function Documentation

7.17.2.1 DDS_DataWriterQos_equals()

```
DDS_Boolean DDS_DataWriterQos_equals (
    const struct DDS_DataWriterQos * self,
    const struct DDS_DataWriterQos * other )
```

Compares two **DDS_DataWriterQos** (p. 683) for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This DataWriterQos.
<i>other</i>	<< <i>in</i> >> (p. 237) The other DataWriterQos to be compared with this DataWriterQos.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Qos objects are equal or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Referenced by **DDS_DataWriterQos::operator!=()**, and **DDS_DataWriterQos::operator==()**.

7.17.2.2 print()

```
DDS_ReturnCode_t DDS_DataWriterQos::print ( ) const [inline]
```

Prints this **DDS_DataWriterQos** (p. 683) to stdout.

Only the differences between this **DDS_DataWriterQos** (p. 683) and the documented default are printed. If you wish to print everything regardless, see **DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataWriterQos&, const DDS_QosPrintFormat&) const** (p. 116). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.17.2.3 to_string() [1/6]

```
DDS_ReturnCode_t DDS_DataWriterQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size ) const [inline]
```

Obtains a string representation of this **DDS_DataWriterQos** (p. 683).

Only the differences between this **DDS_DataWriterQos** (p. 683) and the documented default are printed to the string. If you wish to print everything regardless, see **DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataWriterQos&, const DDS_QosPrintFormat&) const** (p. 116). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DataWriterQos** (p. 683) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataWriterQos (p. 683). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataWriterQos&, const DDS_QosPrintFormat&) const (p. 116)

7.17.2.4 to_string() [2/6]

```
DDS_ReturnCode_t DDS_DataWriterQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DataWriterQos & base ) const [inline]
```

Obtains a string representation of this **DDS_DataWriterQos** (p. 683).

This overload behaves the same as **DDS_DataWriterQos::to_string** (p. 113) but allows the caller to specify the **DDS_DataWriterQos** (p. 683), which is used as the base profile. Only the differences between the QoS and the base profile are included in the output string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataWriterQos (p. 683). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_DataWriterQos (p. 683) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataWriterQos&, const DDS_QosPrintFormat&) const (p. 116)

References **DDS_QosPrintFormat_INITIALIZER**.

7.17.2.5 to_string() [3/6]

```
DDS_ReturnCode_t DDS_DataWriterQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DataWriterQos** (p. 683).

This overload behaves the same as **DDS_DataWriterQos::to_string** (p. 113) but allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the output.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataWriterQos (p. 683). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataWriterQos&, const DDS_QosPrintFormat&) const (p. 116)

References **DDS_RETCODE_ERROR**, and **DDS_RETCODE_OK**.

7.17.2.6 to_string() [4/6]

```
DDS_ReturnCode_t DDS_DataWriterQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DataWriterQos & base,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DataWriterQos** (p. 683).

Only the differences between this **DDS_DataWriterQos** (p. 683) and the **DDS_DataWriterQos** (p. 683) supplied as the base are printed to the string.

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DataWriterQos** (p. 683) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataWriterQos (p. 683). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_DataWriterQos (p. 683) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.17.2.7 to_string() [5/6]

```
DDS_ReturnCode_t DDS_DataWriterQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ) const [inline]
```

Obtains a string representation of this **DDS_DataWriterQos** (p. 683).

This overload behaves the same as **DDS_DataWriterQos::to_string** (p. 113) but prints the entire **DDS_DataWriterQos** (p. 683) object. The only valid value for the argument of type **DDS_QosPrintAll_t** (p. 1017) is **DDS_QOS_PRINT_ALL** (p. 164).

For example

```
DataWriterQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, QOS_PRINT_ALL);
```

The resultant string is formatted according to the default value for **DDS_QosPrintFormat** (p. 1017).

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataWriterQos (p. 683). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataWriterQos&, const DDS_QosPrintFormat&) const (p. 116)

References **DDS_QosPrintFormat_INITIALIZER**.

7.17.2.8 to_string() [6/6]

```
DDS_ReturnCode_t DDS_DataWriterQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DataWriterQos** (p. 683).

This overload behaves the same as the **DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 116) overload. The only difference is that it allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the resultant string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataWriterQos (p. 683). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

DDS_DataWriterQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataWriterQos&, const DDS_QosPrintFormat&) const (p. 116)

7.18 Flow Controllers

<<**extension**>> (p. 236) **DDSFlowController** (p. 1451) and associated elements

Classes

- struct **DDS_FlowControllerTokenBucketProperty_t**
***DDSFlowController** (p. 1451) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.*
- struct **DDS_FlowControllerProperty_t**
*Determines the flow control characteristics of the **DDSFlowController** (p. 1451).*
- class **DDSFlowController**
<<**interface**>> (p. 236) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **DDSDataWriter** (p. 1305) instances are allowed to write data.

Enumerations

- enum **DDS_FlowControllerSchedulingPolicy** {
DDS_RR_FLOW_CONTROLLER_SCHED_POLICY ,
DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY ,
DDS_HPF_FLOW_CONTROLLER_SCHED_POLICY }
Kinds of flow controller scheduling policy.

Variables

- char * **DDS_DEFAULT_FLOW_CONTROLLER_NAME**
[default] Special value of **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014) that refers to the built-in default flow controller.
- char * **DDS_FIXED_RATE_FLOW_CONTROLLER_NAME**
Special value of **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014) that refers to the built-in fixed-rate flow controller.
- char * **DDS_ON_DEMAND_FLOW_CONTROLLER_NAME**
Special value of **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014) that refers to the built-in on-demand flow controller.

7.18.1 Detailed Description

<<*extension*>> (p. 236) **DDSFlowController** (p. 1451) and associated elements

DDSFlowController (p. 1451) provides the network traffic shaping capability to asynchronous **DDSDataWriter** (p. 1305) instances. For use cases and advantages of publishing asynchronously, please refer to **DDS_PublishModeQosPolicy** (p. 1012) of **DDS_DataWriterQos** (p. 683).

See also

DDS_PublishModeQosPolicy (p. 1012)
DDS_DataWriterQos::publish_mode (p. 690)
DDS_AsynchronousPublisherQosPolicy (p. 584)

7.18.2 Enumeration Type Documentation

7.18.2.1 DDS_FlowControllerSchedulingPolicy

```
enum DDS_FlowControllerSchedulingPolicy
```

Kinds of flow controller scheduling policy.

Samples written by an asynchronous **DDSDataWriter** (p. 1305) are not sent in the context of the **FooDataWriter::write** (p. 1666) call. Instead, the middleware puts the samples in a queue for future processing. The **DDSFlowController** (p. 1451) associated with each asynchronous DataWriter instance determines when the samples are actually sent.

Each **DDSFlowController** (p. 1451) maintains a separate FIFO queue for each unique destination (remote application). Samples written by asynchronous **DDSDataWriter** (p. 1305) instances associated with the flow controller, are placed in the queues that correspond to the intended destinations of the sample.

When tokens become available, a flow controller must decide which queue(s) to grant tokens first. This is determined by the flow controller's scheduling policy. Once a queue has been granted tokens, it is serviced by the asynchronous publishing thread. The queued up samples will be coalesced and sent to the corresponding destination. The number of samples sent depends on the data size and the number of tokens granted.

QoS:

DDS_FlowControllerProperty_t (p. 899)

Enumerator

DDS_RR_FLOW_CONTROLLER_SCHED_POLICY	<p>Indicates to flow control in a round-robin fashion. Whenever tokens become available, the flow controller distributes the tokens uniformly across all of its (non-empty) destination queues. No destinations are prioritized. Instead, all destinations are treated equally and are serviced in a round-robin fashion.</p>
DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY	<p>Indicates to flow control in an earliest-deadline-first fashion. A sample's deadline is determined by the time it was written plus the latency budget of the <code>DataWriter</code> at the time of the write call (as specified in the DDS_LatencyBudgetQosPolicy (p. 916)). The relative priority of a flow controller's destination queue is determined by the earliest deadline across all samples it contains.</p> <p>When tokens become available, the DDSFlowController (p. 1451) distributes tokens to the destination queues in order of their deadline priority. In other words, the queue containing the sample with the earliest deadline is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal deadline value, the corresponding destination queues are serviced in a round-robin fashion.</p> <p>Hence, under the default DDS_LatencyBudgetQosPolicy::duration (p. 918) setting, an <code>EDF_FLOW_CONTROLLER_SCHED_POLICY</code> DDSFlowController (p. 1451) preserves the order in which the user calls FooDataWriter::write (p. 1666) across the <code>DataWriters</code> associated with the flow controller.</p> <p>Since the DDS_LatencyBudgetQosPolicy (p. 916) is mutable, a sample written second may contain an earlier deadline than the sample written first if the DDS_LatencyBudgetQosPolicy::duration (p. 918) value is sufficiently decreased in between writing the two samples. In that case, if the first sample is not yet written (still in queue waiting for its turn), it inherits the priority corresponding to the (earlier) deadline from the second sample.</p> <p>In other words, the priority of a destination queue is always determined by the earliest deadline among all samples contained in the queue. This priority inheritance approach is required in order to both honor the updated DDS_LatencyBudgetQosPolicy::duration (p. 918) and adhere to the DDSDataWriter (p. 1305) in-order data delivery guarantee.</p> <p>[default] for DDSDataWriter (p. 1305)</p>

Enumerator

DDS_HPF_FLOW_CONTROLLER_SCHED_POLICY	<p>Indicates to flow control in a highest-priority-first fashion. Determines the next destination queue to service as determined by the publication priority of the DDSDataWriter (p. 1305), channel of multi-channel DataWriter, or individual sample.</p> <p>The relative priority of a flow controller's destination queue is determined by the highest publication priority of all samples it contains.</p> <p>When tokens become available, the DDSFlowController (p. 1451) distributes tokens to the destination queues in order of their publication priority. In other words, the queue containing the sample with the highest publication priority is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal publication priority, the corresponding destination queues are serviced in a round-robin fashion.</p> <p>This priority inheritance approach is required in order to both honor the designated publication priority and adhere to the DDSDataWriter (p. 1305) in-order data delivery guarantee.</p>
--------------------------------------	--

7.18.3 Variable Documentation

7.18.3.1 DDS_DEFAULT_FLOW_CONTROLLER_NAME

```
char* DDS_DEFAULT_FLOW_CONTROLLER_NAME [extern]
```

[default] Special value of **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014) that refers to the built-in default flow controller.

RTI Connext provides several built-in **DDSFlowController** (p. 1451) for use with an asynchronous **DDSDataWriter** (p. 1305). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

By default, flow control is disabled. That is, the built-in **DDS_DEFAULT_FLOW_CONTROLLER_NAME** (p. 121) flow controller does not apply any flow control. Instead, it allows data to be sent asynchronously as soon as it is written by the **DDSDataWriter** (p. 1305).

Essentially, this is equivalent to a user-created **DDSFlowController** (p. 1451) with the following **DDS_FlowController**←
Property_t (p. 899) settings:

- **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900) = **DDS_EDF_FLOW_CONTROLLER_SCHED↵_POLICY** (p. 120)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **max_tokens** = **DDS_LENGTH_UNLIMITED** (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **tokens_added_per_period** = **DDS_LENGTH↵_UNLIMITED** (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **tokens_leaked_per_period** = 0
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **period** = 60 seconds
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **bytes_per_token** = **DDS_LENGTH_UNLIMITED** (p. 437)

See also

DDSPublisher::create_datawriter (p. 1542)
DDSDomainParticipant::lookup_flowcontroller (p. 1375)
DDSFlowController::set_property (p. 1452)
DDS_PublishModeQosPolicy (p. 1012)
DDS_AsynchronousPublisherQosPolicy (p. 584)

7.18.3.2 DDS_FIXED_RATE_FLOW_CONTROLLER_NAME

```
char* DDS_FIXED_RATE_FLOW_CONTROLLER_NAME [extern]
```

Special value of **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014) that refers to the built-in fixed-rate flow controller.

RTI Connext provides several builtin **DDSFlowController** (p. 1451) for use with an asynchronous **DDSDataWriter** (p. 1305). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in **DDS_FIXED_RATE_FLOW_CONTROLLER_NAME** (p. 122) flow controller shapes the network traffic by allowing data to be sent only once every second. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

Essentially, this is equivalent to a user-created **DDSFlowController** (p. 1451) with the following **DDS_FlowController↵Property_t** (p. 899) settings:

- **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900) = **DDS_EDF_FLOW_CONTROLLER_SCHED↵_POLICY** (p. 120)

- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) `max_tokens = DDS_LENGTH_UNLIMITED` (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) `tokens_added_per_period = DDS_LENGTH_UNLIMITED` (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) `tokens_leaked_per_period = DDS_LENGTH_UNLIMITED` (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) `period = 1 second`
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) `bytes_per_token = DDS_LENGTH_UNLIMITED` (p. 437)

See also

DDSPublisher::create_datawriter (p. 1542)
DDSDomainParticipant::lookup_flowcontroller (p. 1375)
DDSFlowController::set_property (p. 1452)
DDS_PublishModeQosPolicy (p. 1012)
DDS_AsynchronousPublisherQosPolicy (p. 584)

7.18.3.3 DDS_ON_DEMAND_FLOW_CONTROLLER_NAME

```
char* DDS_ON_DEMAND_FLOW_CONTROLLER_NAME [extern]
```

Special value of **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014) that refers to the built-in on-demand flow controller.

RTI Connext provides several builtin **DDSFlowController** (p. 1451) for use with an asynchronous **DDSDataWriter** (p. 1305). The user can choose to use the built-in flow controllers and optionally modify their properties or can create a custom flow controller.

The built-in **DDS_ON_DEMAND_FLOW_CONTROLLER_NAME** (p. 123) allows data to be sent only when the user calls **DDSFlowController::trigger_flow** (p. 1453). With each trigger, all accumulated data since the previous trigger is sent (across all **DDSPublisher** (p. 1534) or **DDSDataWriter** (p. 1305) instances). In other words, the network traffic shape is fully controlled by the user. Any accumulated samples destined for the same destination are coalesced into as few network packets as possible.

This external trigger source is ideal for users who want to implement some form of closed-loop flow control or who want to only put data on the wire every so many samples (e.g. with the number of samples based on **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761)).

Essentially, this is equivalent to a user-created **DDSFlowController** (p. 1451) with the following **DDS_FlowController_Property_t** (p. 899) settings:

- **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900) = **DDS_EDF_FLOW_CONTROLLER_SCHED↵**
_POLICY (p. 120)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **max_tokens** = **DDS_LENGTH_UNLIMITED** (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **tokens_added_per_period** = **DDS_LENGTH↵**
_UNLIMITED (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **tokens_leaked_per_period** = **DDS↵**
LENGTH_UNLIMITED (p. 437)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **period** = **DDS_DURATION_INFINITE** (p. 325)
- **DDS_FlowControllerProperty_t::token_bucket** (p. 900) **bytes_per_token** = **DDS_LENGTH_UNLIMITED**
(p. 437)

7.19 Subscription Module

Contains the **DDSSubscriber** (p. 1576), **DDSDataReader** (p. 1272), **DDSReadCondition** (p. 1558), **DDSQuery↵**
Condition (p. 1557), and **DDSTopicQuery** (p. 1611) classes, as well as the **DDSSubscriberListener** (p. 1597) and
DDSDataReaderListener (p. 1299) interfaces, and more generally, all that is needed on the subscription side.

Modules

- **Subscribers**
DDSSubscriber (p. 1576) entity and associated elements
- **DataReaders**
DDSDataReader (p. 1272) entity and associated elements
- **Data Samples**
DDS_SampleInfo (p. 1068), *DDS_SampleStateKind* (p. 156), *DDS_ViewStateKind* (p. 158), *DDS_InstanceStateKind*
(p. 160) and associated elements
- **SampleProcessor**
<<experimental>> (p. 236) *<<extension>>* (p. 236) Utility to concurrently read and process the data samples re-
ceived by *DDSDataReader* (p. 1272).

7.19.1 Detailed Description

Contains the **DDSSubscriber** (p. 1576), **DDSDataReader** (p. 1272), **DDSReadCondition** (p. 1558), **DDSQueryCondition** (p. 1557), and **DDSTopicQuery** (p. 1611) classes, as well as the **DDSSubscriberListener** (p. 1597) and **DDSDataReaderListener** (p. 1299) interfaces, and more generally, all that is needed on the subscription side.

"DCPS Subscription package"

7.19.2 Access to data samples

Data is made available to the application by the following operations on **DDSDataReader** (p. 1272) objects: **FooDataReader::read** (p. 1635), **FooDataReader::read_w_condition** (p. 1640), **FooDataReader::take** (p. 1636), **FooDataReader::take_w_condition** (p. 1641), and the other variants of `read()` and `take()`.

The general semantics of the `read()` operation is that the application only gets access to the corresponding data (i.e. a precise instance value); the data remains the responsibility of RTI Connext and can be read again.

The semantics of the `take()` operations is that the application takes full responsibility for the data; that data will no longer be available locally to RTI Connext. Consequently, it is possible to access the same information multiple times only if all previous accesses were `read()` operations, not `take()`.

Each of these operations returns a collection of `Data` values and associated **DDS_SampleInfo** (p. 1068) objects. Each data value represents an atom of data information (i.e., a value for one instance). This collection may contain samples related to the same or different instances (identified by the key). Multiple samples can refer to the same instance if the settings of the **HISTORY** (p. 404) QoS allow for it.

These operations reset the read communication statuses; see **Changes in read communication status** (p. ??).

To return the memory back to the middleware, every `read()` or `take()` that retrieves a sequence of samples must be followed with a call to `FooDataReader::return_loan` (p. 1655).

See also

Interpretation of the SampleInfo (p. 1069)

7.19.2.1 Data access patterns

The application accesses data by means of the operations `read` or `take` on the **DDSDataReader** (p. 1272). These operations return an ordered collection of `DataSamples` consisting of a **DDS_SampleInfo** (p. 1068) part and a `Data` part.

The way RTI Connext builds the collection depends on QoS policies set on the **DDSDataReader** (p. 1272) and **DDSSubscriber** (p. 1576), as well as the `source_timestamp` of the samples, and the parameters passed to the `read()` / `take()` operations, namely:

- the desired sample states (any combination of **DDS_SampleStateKind** (p. 156))
- the desired view states (any combination of **DDS_ViewStateKind** (p. 158))

- the desired instance states (any combination of **DDS_InstanceStateKind** (p. 160))

The `read()` and `take()` operations are non-blocking and just deliver what is currently available that matches the specified states.

The `read_w_condition()` and `take_w_condition()` operations take a **DDSReadCondition** (p. 1558) object as a parameter instead of sample, view or instance states. The behaviour is that the samples returned will only be those for which the condition is **DDS_BOOLEAN_TRUE** (p. 316). These operations, in conjunction with **DDSReadCondition** (p. 1558) objects and a **DDSWaitSet** (p. 1613), allow performing waiting reads.

Once the data samples are available to the data readers, they can be read or taken by the application. The basic rule is that the application may do this in any order it wishes. This approach is very flexible and allows the application ultimate control.

To access data coherently, or in order, the **PRESENTATION** (p. 417) QoS must be set properly.

7.20 Subscribers

DDSSubscriber (p. 1576) entity and associated elements

Classes

- struct **DDS_SubscriberQos**
*QoS policies supported by a **DDSSubscriber** (p. 1576) entity.*
- class **DDSSubscriberListener**
*<<interface>> (p. 236) **DDSListener** (p. 1509) for status about a subscriber.*
- class **DDSSubscriberSeq**
*Declares IDL sequence < **DDSSubscriber** (p. 1576) > .*
- class **DDSSubscriber**
<<interface>> (p. 236) A subscriber is the object responsible for actually receiving data from a subscription.

Functions

- **DDS_Boolean DDS_SubscriberQos_equals** (const struct **DDS_SubscriberQos** *self, const struct **DDS_SubscriberQos** *other)
*Compares two **DDS_SubscriberQos** (p. 1090) for equality.*
- **DDS_ReturnCode_t DDS_SubscriberQos::print** () const
*Prints this **DDS_SubscriberQos** (p. 1090) to stdout.*
- **DDS_ReturnCode_t DDS_SubscriberQos::to_string** (char *string, **DDS_UnsignedLong** &string_size) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*
- **DDS_ReturnCode_t DDS_SubscriberQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_SubscriberQos** &base) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*
- **DDS_ReturnCode_t DDS_SubscriberQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).*

- **DDS_ReturnCode_t DDS_SubscriberQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_SubscriberQos** &base, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).
- **DDS_ReturnCode_t DDS_SubscriberQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).
- **DDS_ReturnCode_t DDS_SubscriberQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).

Variables

- const struct **DDS_DataReaderQos DDS_DATAREADER_QOS_DEFAULT**
Special value for creating data reader with default QoS.
- const struct **DDS_DataReaderQos DDS_DATAREADER_QOS_USE_TOPIC_QOS**
Special value for creating **DDSDataReader** (p. 1272) with a combination of the default **DDS_DataReaderQos** (p. 638) and the **DDS_TopicQos** (p. 1120).

7.20.1 Detailed Description

DDSSubscriber (p. 1576) entity and associated elements

7.20.2 Function Documentation

7.20.2.1 DDS_SubscriberQos_equals()

```
DDS_Boolean DDS_SubscriberQos_equals (
    const struct DDS_SubscriberQos * self,
    const struct DDS_SubscriberQos * other )
```

Compares two **DDS_SubscriberQos** (p. 1090) for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This SubscriberQos.
<i>other</i>	<< <i>in</i> >> (p. 237) The other SubscriberQos to be compared with this SubscriberQos.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Qos objects are equal or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Referenced by **DDS_SubscriberQos::operator!=()**, and **DDS_SubscriberQos::operator==()**.

7.20.2.2 print()

```
DDS_ReturnCode_t DDS_SubscriberQos::print ( ) const [inline]
```

Prints this **DDS_SubscriberQos** (p. 1090) to stdout.

Only the differences between this **DDS_SubscriberQos** (p. 1090) and the documented default are printed. If you wish to print everything regardless, see **DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_SubscriberQos&, const DDS_QosPrintFormat&) const** (p. 130). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.20.2.3 to_string() [1/6]

```
DDS_ReturnCode_t DDS_SubscriberQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size ) const [inline]
```

Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).

Only the differences between this **DDS_SubscriberQos** (p. 1090) and the documented default are printed to the string. If you wish to print everything regardless, see **DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_SubscriberQos&, const DDS_QosPrintFormat&) const** (p. 130). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

If the supplied buffer is NULL, the required length of the string is returned via the `string_size` parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_SubscriberQos** (p. 1090) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_SubscriberQos (p. 1090). If NULL, this function will return the required length of this buffer through the <code>string_size</code> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

**DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_SubscriberQos&, const DDS_↵
QosPrintFormat&) const** (p. 130)

7.20.2.4 to_string() [2/6]

```
DDS_ReturnCode_t DDS_SubscriberQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_SubscriberQos & base ) const [inline]
```

Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).

This overload behaves the same as **DDS_SubscriberQos::to_string** (p. 128) but allows the caller to specify the **DDS_↵
_SubscriberQos** (p. 1090), which is used as the base profile. Only the differences between the QoS and the base profile are included in the output string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_SubscriberQos (p. 1090). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_SubscriberQos (p. 1090) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

**DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_SubscriberQos&, const DDS_↵
QosPrintFormat&) const** (p. 130)

References **DDS_QosPrintFormat_INITIALIZER**.

7.20.2.5 to_string() [3/6]

```
DDS_ReturnCode_t DDS_SubscriberQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).

This overload behaves the same as **DDS_SubscriberQos::to_string** (p. 128) but allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the output.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_SubscriberQos (p. 1090). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_SubscriberQos&, const DDS_QosPrintFormat&) const (p. 130)

References **DDS_RETCODE_ERROR**, and **DDS_RETCODE_OK**.

7.20.2.6 to_string() [4/6]

```
DDS_ReturnCode_t DDS_SubscriberQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_SubscriberQos & base,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).

Only the differences between this **DDS_SubscriberQos** (p. 1090) and the **DDS_SubscriberQos** (p. 1090) supplied as the base are printed to the string.

If the supplied buffer is NULL, the required length of the string is returned via the *string_size* parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_SubscriberQos** (p. 1090) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_SubscriberQos (p. 1090). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_SubscriberQos (p. 1090) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.20.2.7 to_string() [5/6]

```
DDS_ReturnCode_t DDS_SubscriberQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ) const [inline]
```

Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).

This overload behaves the same as **DDS_SubscriberQos::to_string** (p. 128) but prints the entire **DDS_SubscriberQos** (p. 1090) object. The only valid value for the argument of type **DDS_QosPrintAll_t** (p. 1017) is **DDS_QOS_PRINT_ALL** (p. 164).

For example

```
SubscriberQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, QOS_PRINT_ALL);
```

The resultant string is formatted according to the default value for **DDS_QosPrintFormat** (p. 1017).

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_SubscriberQos (p. 1090). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_SubscriberQos&, const DDS_QosPrintFormat&) const (p. 130)

References **DDS_QosPrintFormat_INITIALIZER**.

7.20.2.8 to_string() [6/6]

```
DDS_ReturnCode_t DDS_SubscriberQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_SubscriberQos** (p. 1090).

This overload behaves the same as the **DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 131) overload. The only difference is that it allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the resultant string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_SubscriberQos (p. 1090). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_SubscriberQos::to_string(char*, DDS_UnsignedLong&, const DDS_SubscriberQos&, const DDS_QosPrintFormat&) const (p. 130)

7.20.3 Variable Documentation

7.20.3.1 DDS_DATAREADER_QOS_DEFAULT

```
const struct DDS_DataReaderQos DDS_DATAREADER_QOS_DEFAULT [extern]
```

Special value for creating data reader with default QoS.

When used in **DDSSubscriber::create_datareader** (p. 1583), this special value is used to indicate that the **DDSDataReader** (p. 1272) should be created with the default **DDSDataReader** (p. 1272) QoS by means of the operation **get_default_datareader_qos** and using the resulting QoS to create the **DDSDataReader** (p. 1272).

When used in **DDSSubscriber::set_default_datareader_qos** (p. 1579), this special value is used to indicate that the default QoS should be reset back to the initial value that would be used if the **DDSSubscriber::set_default_datareader_qos** (p. 1579) operation had never been called.

When used in **DDSDataReader::set_qos** (p. 1290), this special value is used to indicate that the QoS of the **DDSDataReader** (p. 1272) should be changed to match the current default QoS set in the **DDSSubscriber** (p. 1576) that the **DDSDataReader** (p. 1272) belongs to.

Warning

This value is a constant and should never be modified. You cannot use this value to *get* the default QoS values for a DataReader; for this purpose, use **DDSDomainParticipant::get_default_datareader_qos** (p. 1344).

See also

DDSSubscriber::create_datareader (p. 1583)
DDSSubscriber::set_default_datareader_qos (p. 1579)
DDSDataReader::set_qos (p. 1290)

Examples

HelloWorld_subscriber.cxx.

7.20.3.2 DDS_DATAREADER_QOS_USE_TOPIC_QOS

```
const struct DDS_DataReaderQos DDS_DATAREADER_QOS_USE_TOPIC_QOS [extern]
```

Special value for creating **DDSDataReader** (p. 1272) with a combination of the default **DDS_DataReaderQos** (p. 638) and the **DDS_TopicQos** (p. 1120).

The use of this value is equivalent to the application obtaining the default **DDS_DataReaderQos** (p. 638) and the **DDS_TopicQos** (p. 1120) (by means of the operation **DDSTopic::get_qos** (p. 1605)) and then combining these two QoS using the operation **DDSSubscriber::copy_from_topic_qos** (p. 1592) whereby any policy that is set on the **DDS_TopicQos** (p. 1120) "overrides" the corresponding policy on the default QoS. The resulting QoS is then applied to the creation of the **DDSDataReader** (p. 1272).

This value should only be used in **DDSSubscriber::create_datareader** (p. 1583).

- **DDS_ReturnCode_t DDS_DataReaderQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
Obtains a string representation of this **DDS_DataReaderQos** (p. 638).
- **DDS_ReturnCode_t DDS_DataReaderQos::to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this **DDS_DataReaderQos** (p. 638).

7.21.1 Detailed Description

DDSDataReader (p. 1272) entity and associated elements

7.21.2 Enumeration Type Documentation

7.21.2.1 DDS_SampleLostStatusKind

enum **DDS_SampleLostStatusKind**

<<**extension**>> (p. 236) Kinds of reasons why a sample was lost.

MONITOR-273 We assign an integer to the names in order to be compatible with the DDSMonitoring types.

Enumerator

DDS_NOT_LOST	The sample was not lost. This constant is an extension to the DDS standard.
DDS_LOST_BY_WRITER	A DDSDataWriter (p. 1305) removed the sample before being received by the DDSDataReader (p. 1272). This constant is an extension to the DDS standard.
DDS_LOST_BY_INSTANCES_LIMIT	A resource limit on the number of instances (DDS_ResourceLimitsQosPolicy::max_instances (p. 1041)) was reached. This constant is an extension to the DDS standard. See also DDS_ResourceLimitsQosPolicy (p. 1038)
DDS_LOST_BY_REMOTE_WRITERS_PER_INSTANCE_LIMIT	A resource limit on the number of remote writers for a single instance from which a DDSDataReader (p. 1272) may read (DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers_per_instance (p. 650)) was reached. This constant is an extension to the DDS standard. See also DDS_DataReaderResourceLimitsQosPolicy (p. 648)

Enumerator

DDS_LOST_BY_INCOMPLETE_COHERENT_SET	<p>A sample is lost because it is part of an incomplete coherent set. An incomplete coherent set is a coherent set for which some of the samples are missing. For example, consider a DDSDataWriter (p. 1305) using DDS_KEEP_LAST_HISTORY_QOS (p. 406) with a depth of 1. The DataWriter publishes two samples of the same instance as part of a coherent set 'CS1'; the first sample of 'CS1' is replaced by a new sample before it can be successfully delivered to the DDSDataReader (p. 1272). In this case, the coherent set containing the two samples is considered incomplete. The new sample, by default, will not be provided to the application, and will be reported as LOST_BY_INCOMPLETE_COHERENT_SET. (You can change this default behavior by setting DDS_PresentationQosPolicy::drop_incomplete_coherent_set (p. 987) to FALSE. If you do, the new sample will be provided to the application, but it will be marked as part of an incomplete coherent set in the DDS_SampleInfo (p. 1068) structure.)</p> <p>This constant is an extension to the DDS standard.</p>
DDS_LOST_BY_LARGE_COHERENT_SET	<p>A sample is lost because it is part of a large coherent set. A large coherent set is a coherent set that cannot fit all at once into the DDSDataReader (p. 1272) queue because resource limits are exceeded. For example, if DDS_ResourceLimitsQosPolicy::max_samples_per_instance (p. 1041) on the DataReader is 10 and the coherent set has 15 samples for a given instance, the coherent set is a large coherent set that will be considered incomplete.</p> <p>The resource limits that can lead to large coherent sets are: DDS_ResourceLimitsQosPolicy::max_samples (p. 1041), DDS_ResourceLimitsQosPolicy::max_samples_per_instance (p. 1041), DDS_ResourceLimitsQosPolicy::max_instances (p. 1041), and DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_remote_writer (p. 651).</p> <p>This constant is an extension to the DDS standard.</p>

Enumerator

<p>DDS_LOST_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT↔</p>	<p>When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435): a resource limit on the number of samples from a given remote writer that a DDSDataReader (p. 1272) may store (DDS_DataReaderResourceLimitsQosPolicy↔::max_samples_per_remote_writer (p. 651)) was reached. When using DDS_RELIABLE_RELIABILITY_QOS (p. 435), reaching DDS_DataReaderResourceLimitsQosPolicy↔::max_samples_per_remote_writer (p. 651) will trigger a rejection, not a loss, with reason DDS_REJECTED_BY_SAMPLES_PER_REMOTE_WRITER_LIMIT (p. 141). This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_DataReaderResourceLimitsQosPolicy (p. 648)</p>
<p>DDS_LOST_BY_VIRTUAL_WRITERS_LIMIT</p>	<p>A resource limit on the number of virtual writers from which a DDSDataReader (p. 1272) may read (DDS_DataReaderResourceLimitsQosPolicy↔::max_remote_virtual_writers (p. 656)) was reached. This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_DataReaderResourceLimitsQosPolicy (p. 648)</p>
<p>DDS_LOST_BY_REMOTE_WRITERS_PER_SAMPLE_LIMIT↔</p>	<p>A resource limit on the number of remote writers per sample (DDS_DataReaderResourceLimitsQosPolicy↔::max_remote_writers_per_sample (p. 657)) was reached. This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_DataReaderResourceLimitsQosPolicy (p. 648)</p>
<p>DDS_LOST_BY_AVAILABILITY_WAITING_TIME</p>	<p>DDS_AvailabilityQosPolicy↔::max_data_availability_waiting_time (p. 593) expired. This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_AvailabilityQosPolicy (p. 590)</p>

Enumerator

DDS_LOST_BY_REMOTE_WRITER_SAMPLES_↵ PER_VIRTUAL_QUEUE_LIMIT	<p>A resource limit on the number of samples published by a remote writer on behalf of a virtual writer that a DDSDDataReader (p. 1272) may store was reached. (This field is currently not used.) This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_DataReaderResourceLimitsQosPolicy (p. 648)</p>
DDS_LOST_BY_OUT_OF_MEMORY	<p>A sample was lost because there was not enough memory to store the sample. This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_DataReaderResourceLimitsQosPolicy (p. 648)</p>
DDS_LOST_BY_UNKNOWN_INSTANCE	<p>A received sample was lost because it doesn't contain enough information for the reader to know what instance it is associated with. This constant is an extension to the DDS standard.</p>
DDS_LOST_BY_DESERIALIZATION_FAILURE	<p>A received sample was lost because it could not be deserialized. This constant is an extension to the DDS standard.</p>
DDS_LOST_BY_DECODE_FAILURE	<p>When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435): A received sample was lost because it could not be decoded. When using DDS_RELIABLE_RELIABILITY_QOS (p. 435), the sample will be rejected, not lost, with reason DDS_REJECTED_BY_DECODE_FAILURE (p. 142). This constant is an extension to the DDS standard.</p>
DDS_LOST_BY_SAMPLES_PER_INSTANCE_LIMIT	<p>When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435): A resource limit on the number of samples per instance (DDS_ResourceLimitsQosPolicy::max_samples_↵ per_instance (p. 1041)) was reached. When using DDS_RELIABLE_RELIABILITY_QOS (p. 435), reaching DDS_ResourceLimitsQosPolicy::max_↵ samples_per_instance (p. 1041) will trigger a rejection, not a loss, with reason DDS_REJECTED_BY_↵ SAMPLES_PER_INSTANCE_LIMIT (p. 141). This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_ResourceLimitsQosPolicy (p. 1038)</p>

Enumerator

DDS_LOST_BY_SAMPLES_LIMIT	<p>When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435): A resource limit on the number of samples (DDS_ResourceLimitsQosPolicy::max_samples (p. 1041)) was reached. When using DDS_RELIABLE_RELIABILITY_QOS (p. 435), reaching DDS_ResourceLimitsQosPolicy::max_samples (p. 1041) will trigger a rejection, not a loss, with reason DDS_REJECTED_BY_SAMPLES_LIMIT (p. 140). This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_ResourceLimitsQosPolicy (p. 1038)</p>
---------------------------	---

7.21.2.2 DDS_SampleRejectedStatusKind

enum **DDS_SampleRejectedStatusKind**

Kinds of reasons for rejecting a sample.

MONITOR-273 We assign an integer to the names in order to be compatible with the DDSMonitoring types.

Enumerator

DDS_NOT_REJECTED	The sample was not rejected.
DDS_REJECTED_BY_INSTANCES_LIMIT	<p>Connex DDS does not reject samples based on instance limits (DDS_ResourceLimitsQosPolicy::max_instances (p. 1041)), so this value will never be used.</p> <p>See also</p> <p>DDS_LOST_BY_INSTANCES_LIMIT<P> (p. 136) This value is not currently used by our middleware, but has been kept because it is part of the DDS specification.</p>
DDS_REJECTED_BY_SAMPLES_LIMIT	<p>When using DDS_RELIABLE_RELIABILITY_QOS (p. 435): A resource limit on the number of samples (DDS_ResourceLimitsQosPolicy::max_samples (p. 1041)) was reached. When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435), reaching DDS_ResourceLimitsQosPolicy::max_samples (p. 1041) will trigger a loss, not a rejection, with reason DDS_LOST_BY_SAMPLES_LIMIT (p. 140).</p> <p>See also</p>
	<p>DDS_ResourceLimitsQosPolicy (p. 1038)</p> <p>Generated by Doxygen</p>

Enumerator

<p>DDS_REJECTED_BY_SAMPLES_PER_INSTANCE_↵ _LIMIT</p>	<p>When using DDS_RELIABLE_RELIABILITY_QOS (p. 435): A resource limit on the number of samples per instance (DDS_ResourceLimitsQosPolicy::max_↵ samples_per_instance (p. 1041)) was reached. When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435), reaching DDS_ResourceLimitsQosPolicy_↵ ::max_samples_per_instance (p. 1041) will trigger a loss, not a rejection, with reason DDS_LOST_BY_SAMPLES_PER_INSTANCE_LIMIT (p. 139).</p> <p>See also</p> <p>ResourceLimitsQosPolicy</p>
<p>DDS_REJECTED_BY_SAMPLES_PER_REMOTE_↵ WRITER_LIMIT</p>	<p>When using DDS_RELIABLE_RELIABILITY_QOS (p. 435): a resource limit on the number of samples from a given remote writer that a DDSDataReader (p. 1272) may store (DDS_DataReaderResourceLimitsQos_↵ Policy::max_samples_per_remote_writer (p. 651)) was reached. When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435), reaching DDS_DataReaderResourceLimitsQos_↵ Policy::max_samples_per_remote_writer (p. 651) will trigger a loss, not a rejection, with reason DDS_LOST_↵ _BY_SAMPLES_PER_REMOTE_WRITER_LIMIT (p. 138). This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_DataReaderResourceLimitsQosPolicy (p. 648)</p>
<p>DDS_REJECTED_BY_REMOTE_WRITER_↵ SAMPLES_PER_VIRTUAL_QUEUE_LIMIT</p>	<p>A resource limit on the number of samples published by a remote writer on behalf of a virtual writer that a DDSDataReader (p. 1272) may store was reached. (This field is currently not used.) This constant is an extension to the DDS standard.</p> <p>See also</p> <p>DDS_DataReaderResourceLimitsQosPolicy (p. 648)</p>

Enumerator

DDS_REJECTED_BY_DECODE_FAILURE	<p>When using DDS_RELIABLE_RELIABILITY_QOS (p. 435): A received sample was rejected because it could not be decoded. When using DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435), the sample will be lost, not rejected, with reason DDS_LOST_BY_DECODE_FAILURE (p. 139). If a sample was rejected for this reason and the DDSDataWriter (p. 1305) set DDS_DataWriter↔ProtocolQosPolicy::disable_inline_keyhash (p. 669) to DDS_BOOLEAN_TRUE (p. 316), then DDS_SampleRejectedStatus::last_instance_handle (p. 1081) may not be correct if the sample was encrypted.</p> <p>This constant is an extension to the DDS standard.</p>
--------------------------------	--

7.21.3 Function Documentation

7.21.3.1 DDS_DataReaderQos_equals()

```
DDS_Boolean DDS_DataReaderQos_equals (
    const struct DDS_DataReaderQos * self,
    const struct DDS_DataReaderQos * other )
```

Compares two **DDS_DataReaderQos** (p. 638) for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This DataReaderQos.
<i>other</i>	<< <i>in</i> >> (p. 237) The other DataReaderQos to be compared with this DataReaderQos.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Qos objects are equal or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

Referenced by **DDS_DataReaderQos::operator!=()**, and **DDS_DataReaderQos::operator==(())**.

7.21.3.2 print()

```
DDS_ReturnCode_t DDS_DataReaderQos::print ( ) const [inline]
```

Prints this **DDS_DataReaderQos** (p. 638) to stdout.

Only the differences between this **DDS_DataReaderQos** (p. 638) and the documented default are printed. If you wish to print everything regardless, see **DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataReaderQos&, const DDS_QosPrintFormat&) const** (p. 145). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.21.3.3 to_string() [1/6]

```
DDS_ReturnCode_t DDS_DataReaderQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size ) const [inline]
```

Obtains a string representation of this **DDS_DataReaderQos** (p. 638).

Only the differences between this **DDS_DataReaderQos** (p. 638) and the documented default are printed to the string. If you wish to print everything regardless, see **DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataReaderQos&, const DDS_QosPrintFormat&) const** (p. 145). The output is formatted according to the default values for **DDS_QosPrintFormat** (p. 1017).

If the supplied buffer is NULL, the required length of the string is returned via the string_size parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DataReaderQos** (p. 638) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataReaderQos (p. 638). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataReaderQos&, const DDS_QosPrintFormat&) const (p. 145)

7.21.3.4 to_string() [2/6]

```
DDS_ReturnCode_t DDS_DataReaderQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DataReaderQos & base ) const [inline]
```

Obtains a string representation of this **DDS_DataReaderQos** (p. 638).

This overload behaves the same as **DDS_DataReaderQos::to_string** (p. 143) but allows the caller to specify the **DDS_DataReaderQos** (p. 638), which is used as the base profile. Only the differences between the QoS and the base profile are included in the output string.

Parameters

<i>string</i>	<< <i>out</i> >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataReaderQos (p. 638). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< <i>inout</i> >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< <i>in</i> >> (p. 237) The DDS_DataReaderQos (p. 638) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataReaderQos&, const DDS_QosPrintFormat&) const (p. 145)

References **DDS_QosPrintFormat_INITIALIZER**.

7.21.3.5 to_string() [3/6]

```
DDS_ReturnCode_t DDS_DataReaderQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DataReaderQos** (p. 638).

This overload behaves the same as **DDS_DataReaderQos::to_string** (p. 143) but allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the output.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataReaderQos (p. 638). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataReaderQos::to_string(char*, **DDS_UnsignedLong**&, const **DDS_DataReaderQos**&, const **DDS_QosPrintFormat**&) const (p. 145)

References **DDS_RETCODE_ERROR**, and **DDS_RETCODE_OK**.

7.21.3.6 to_string() [4/6]

```
DDS_ReturnCode_t DDS_DataReaderQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_DataReaderQos & base,
    const DDS_QosPrintFormat & format ) const [inline]
```

Obtains a string representation of this **DDS_DataReaderQos** (p. 638).

Only the differences between this **DDS_DataReaderQos** (p. 638) and the **DDS_DataReaderQos** (p. 638) supplied as the base are printed to the string.

If the supplied buffer is NULL, the required length of the string is returned via the *string_size* parameter.

If the supplied buffer is not NULL, the string representation of the **DDS_DataReaderQos** (p. 638) is written to the buffer.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataReaderQos (p. 638). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>base</i>	<< in >> (p. 237) The DDS_DataReaderQos (p. 638) to be used as the base QoS profile. Only the differences with respect to this base profile will be included in the output string.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

7.21.3.7 to_string() [5/6]

```
DDS_ReturnCode_t DDS_DataReaderQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ) const [inline]
```

Obtains a string representation of this **DDS_DataReaderQos** (p. 638).

This overload behaves the same as **DDS_DataReaderQos::to_string** (p. 143) but prints the entire **DDS_DataReaderQos** (p. 638) object. The only valid value for the argument of type **DDS_QosPrintAll_t** (p. 1017) is **DDS_QOS_PRINT_ALL** (p. 164).

For example

```
DataReaderQos qos;
char *str = NULL;
DDS_UnsignedLong str_size = 0;
qos.to_string(str, str_size, QOS_PRINT_ALL);
```

The resultant string is formatted according to the default value for **DDS_QosPrintFormat** (p. 1017).

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataReaderQos (p. 638). If NULL, this function will return the required length of this buffer through the <i>string_size</i> parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

See also

DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataReaderQos&, const DDS_QosPrintFormat&) const (p. 145)

References **DDS_QosPrintFormat_INITIALIZER**.

7.21.3.8 to_string() [6/6]

```

DDS_ReturnCode_t DDS_DataReaderQos::to_string (
    char * string,
    DDS_UnsignedLong & string_size,
    const DDS_QosPrintAll_t & ,
    const DDS_QosPrintFormat & format ) const [inline]

```

Obtains a string representation of this **DDS_DataReaderQos** (p. 638).

This overload behaves the same as the **DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const** (p. 146) overload. The only difference is that it allows the caller to specify the **DDS_QosPrintFormat** (p. 1017) which is used to format the resultant string.

Parameters

<i>string</i>	<< out >> (p. 237) The char buffer that will be used to store the string representation of this DDS_DataReaderQos (p. 638). If NULL, this function will return the required length of this buffer through the string_size parameter.
<i>string_size</i>	<< inout >> (p. 237) Cannot be NULL. The size of the supplied buffer. If the supplied buffer is NULL, or if the supplied buffer is not large enough, this value will be updated with the required length of the buffer.
<i>format</i>	<< in >> (p. 237) The DDS_QosPrintFormat (p. 1017) to be used to format the output string.

Returns

DDS_RETCODE_OK (p. 335) if no error was encountered.

DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_DataReaderQos&, const DDS_QosPrintFormat&) const (p. 145)

7.22 Read Conditions

DDSReadCondition (p. 1558) and associated elements

Classes

- struct **DDS_ReadConditionParams**
 - <<**extension**>> (p. 236) Input parameters for **DDSDDataReader::create_readcondition_w_params** (p. 1277)
- class **DDSReadCondition**
 - <<**interface**>> (p. 236) Conditions specifically dedicated to read operations and attached to one **DDSDDataReader** (p. 1272).

7.22.1 Detailed Description

DDSReadCondition (p. 1558) and associated elements

7.23 Query Conditions

DDSQueryCondition (p. 1557) and associated elements

Classes

- struct **DDS_QueryConditionParams**
*<<extension>> (p. 236) Input parameters for **DDSDataReader::create_querycondition_w_params** (p. 1278)*
- class **DDSQueryCondition**
*<<interface>> (p. 236) These are specialised **DDSReadCondition** (p. 1558) objects that allow the application to also specify a filter on the locally available data.*

7.23.1 Detailed Description

DDSQueryCondition (p. 1557) and associated elements

7.24 Data Samples

DDS_SampleInfo (p. 1068), **DDS_SampleStateKind** (p. 156), **DDS_ViewStateKind** (p. 158), **DDS_InstanceStateKind** (p. 160) and associated elements

Modules

- **Sample States**
***DDS_SampleStateKind** (p. 156) and associated elements*
- **View States**
***DDS_ViewStateKind** (p. 158) and associated elements*
- **Instance States**
***DDS_InstanceStateKind** (p. 160) and associated elements*
- **Stream Kinds**
***DDS_StreamKind** (p. 162) and associated elements*

Classes

- struct **DDS_CoherentSetInfo_t**
 <<*extension*>> (p. 236) Type definition for a coherent set info.
- struct **DDS_SampleInfo**
 Information that accompanies each sample that is *read* or *taken*.
- struct **DDS_SampleInfoSeq**
 Declares IDL sequence < **DDS_SampleInfo** (p. 1068) > .

Functions

- **DDS_Boolean DDS_CoherentSetInfo_equals** (const struct **DDS_CoherentSetInfo_t** *self, const struct **DDS_CoherentSetInfo_t** *other)
 Compares this CoherentSetInfo with another CoherentSetInfo for equality.
- void **DDS_CoherentSetInfo_copy** (struct **DDS_CoherentSetInfo_t** *self, const struct **DDS_CoherentSetInfo_t** *other)
 Copies another CoherentSetInfo into this CoherentSetInfo.
- void **DDS_SampleInfo_get_sample_identity** (const struct **DDS_SampleInfo** *self, struct **DDS_SampleIdentity_t** *identity)
 <<*extension*>> (p. 236) Retrieves the identity of the sample
- void **DDS_SampleInfo_get_related_sample_identity** (const struct **DDS_SampleInfo** *self, struct **DDS_SampleIdentity_t** *related_identity)
 <<*extension*>> (p. 236) Retrieves the identity of a sample related to this one

7.24.1 Detailed Description

DDS_SampleInfo (p. 1068), **DDS_SampleStateKind** (p. 156), **DDS_ViewStateKind** (p. 158), **DDS_InstanceStateKind** (p. 160) and associated elements

7.24.2 Function Documentation

7.24.2.1 DDS_CoherentSetInfo_equals()

```
DDS_Boolean DDS_CoherentSetInfo_equals (
    const struct DDS_CoherentSetInfo_t * self,
    const struct DDS_CoherentSetInfo_t * other )
```

Compares this CoherentSetInfo with another CoherentSetInfo for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This CoherentSetInfo. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 237) The other CoherentSetInfo to be compared with this GUID. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p.316) if the two `CoherentSetInfos` have equal values, or **DDS_BOOLEAN_FALSE** (p.316) otherwise.

7.24.2.2 DDS_CoherentSetInfo_copy()

```
void DDS_CoherentSetInfo_copy (
    struct    DDS_CoherentSetInfo_t * self,
    const struct    DDS_CoherentSetInfo_t * other )
```

Copies another `CoherentSetInfo` into this `CoherentSetInfo`.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This <code>CoherentSetInfo</code> . Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 237) The other <code>CoherentSetInfo</code> to be copied.

7.24.2.3 DDS_SampleInfo_get_sample_identity()

```
void DDS_SampleInfo_get_sample_identity (
    const struct    DDS_SampleInfo * self,
    struct    DDS_SampleIdentity_t * identity )
```

<<*extension*>> (p. 236) Retrieves the identity of the sample

The identity is composed of the **DDS_SampleInfo::original_publication_virtual_guid** (p.1075) and the **DDS_SampleInfo::original_publication_virtual_sequence_number** (p.1076)

See also

DDS_SampleInfo_get_related_sample_identity (p.150)

7.24.2.4 DDS_SampleInfo_get_related_sample_identity()

```
void DDS_SampleInfo_get_related_sample_identity (
    const struct    DDS_SampleInfo * self,
    struct    DDS_SampleIdentity_t * related_identity )
```

<<*extension*>> (p. 236) Retrieves the identity of a sample related to this one

A sample can be logically related to another sample, when the **DDSDDataWriter** (p.1305) wrote it using **DDS_WriteParams_t::related_sample_identity** (p.1236). By default, a sample does not have a related sample, and this operation returns **DDS_UNKNOWN_SAMPLE_IDENTITY** (p.478).

The related identity is composed of the **DDS_SampleInfo::related_original_publication_virtual_guid** (p.1076) and the **DDS_SampleInfo::related_original_publication_virtual_sequence_number** (p.1076)

*<<extension>> (p. 236) Provides information about a **DDSTopicQuery** (p. 1611)*

Enumerations

- enum **DDS_TopicQuerySelectionKind** {
DDS_TOPIC_QUERY_SELECTION_KIND_HISTORY_SNAPSHOT ,
DDS_TOPIC_QUERY_SELECTION_KIND_CONTINUOUS }
Kinds of TopicQuerySelection.

Variables

- const struct **DDS_TopicQuerySelection DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER**
*Special value for creating a **DDSTopicQuery** (p. 1611) that applies the same filter as the DataReader's **DDSContentFilteredTopic** (p. 1267).*
- const struct **DDS_TopicQuerySelection DDS_TOPIC_QUERY_SELECTION_SELECT_ALL**
*Special value for creating a **DDSTopicQuery** (p. 1611) that selects all the samples in a **DDSDataWriter** (p. 1305) cache.*

7.25.1 Detailed Description

DDSTopicQuery (p. 1611) and associated elements.

TopicQueries allow a **DDSDataReader** (p. 1272) to query the sample cache of its matching **DDSDataWriter** (p. 1305). A user can create a **DDSTopicQuery** (p. 1611) with the **DDSDataReader::create_topic_query** (p. 1293) API. When a DataReader

creates a TopicQuery, DDS will propagate it to other DomainParticipants and their DataWriters. When a DataWriter matching with the DataReader that created the TopicQuery receives it, it will send the cached samples that pass the TopicQuery's filter.

To configure how to dispatch a TopicQuery, the **DDS_DataWriterQos** (p. 683) includes the **DDS_TopicQuery↔DispatchQosPolicy** (p. 1126) policy. By default, a DataWriter ignores TopicQueries unless they are explicitly enabled using this policy.

The delivery of TopicQuery samples occurs in a separate RTPS channel. This allows DataReaders to receive Topic↔Query samples and live samples in parallel. This is a key difference with respect to the Durability QoS policy.

Late-joining DataWriters will also discover existing TopicQueries. To delete a TopicQuery you must use **DDSData↔Reader::delete_topic_query** (p. 1294).

After deleting a TopicQuery, new DataWriters won't discover it and existing DataWriters currently publishing cached samples may stop before delivering all of them.

By default, a TopicQuery queries the samples that were in the DataWriter cache at the time the DataWriter receives the TopicQuery. However a TopicQuery can be created in a "continuous" mode. A DataWriter will continue delivering samples that pass a continuous TopicQuery filter until the DataReader application explicitly deletes it.

The samples received in response to a TopicQuery are stored in the associated DataReader's cache. Any of the read/take operations can retrieve TopicQuery samples. The field **DDS_SampleInfo::topic_query_guid** (p. 1077) associates each sample to its TopicQuery. If the read sample is not in response to a TopicQuery then this field will be **DDS_GUID_UNKNOWN** (p. 330). Note that the same data may be received several times, depending on how many TopicQueries the DataReader creates and their TopicQuerySelection.

You can choose to read or take only TopicQuery samples, only live samples, or both. To support this ReadConditions and QueryConditions provide the **DDSDataReader::create_querycondition_w_params** (p. 1278) and **DDSDataReader↔::create_readcondition_w_params** (p. 1277) APIs.

Each TopicQuery is identified by a GUID that can be accessed using the **DDSTopicQuery::get_guid** (p. 1611) method.

7.25.2 Debugging Topic Queries

There are a number of ways in which to gain more insight into what is happening in an application that is creating Topic Queries.

7.25.2.1 The Built-in ServiceRequest DataReader

TopicQueries are communicated to publishing applications through a built-in **DDS_ServiceRequest** (p. 1083) channel. The ServiceRequest channel is designed to be generic so that it can be used for many different purposes, one of which is TopicQueries.

When a DataReader creates a TopicQuery, a **DDS_ServiceRequest** (p. 1083) message is sent containing the TopicQuery information. Just as there are built-in DataReaders for **DDS_ParticipantBuiltinTopicData** (p. 966), **DDS_SubscriptionBuiltinTopicData** (p. 1094), and **DDS_PublicationBuiltinTopicData** (p. 997), there is a fourth built-in DataReader for ServiceRequests.

The new built-in DataReader can be retrieved using the built-in subscriber and **DDSSubscriber::lookup_datareader** (p. 1588). The topic name is **DDS_SERVICE_REQUEST_TOPIC_NAME** (p. 302). Installing a listener with the **DDSDataReaderListener::on_data_available** (p. 1301) callback implemented will allow a publishing application to be notified whenever a TopicQuery has been received from a subscribing application.

The **DDS_ServiceRequest::service_id** (p. 1083) of a **DDS_ServiceRequest** (p. 1083) corresponding to a **DDSTopicQuery** (p. 1611) will be **DDS_TOPIC_QUERY_SERVICE_REQUEST_ID** (p. 301) and the **DDS_ServiceRequest::instance_id** (p. 1084) will be equal to the GUID of the **DDSTopicQuery** (p. 1611) (see **DDSTopicQuery::get_guid** (p. 1611)).

The **DDS_ServiceRequest::request_body** (p. 1084) is a sequence of bytes containing more information about the TopicQuery. This information can be retrieved using the **DDSTopicQueryHelper::topic_query_data_from_service_request** (p. 1612) function. The resulting **DDS_TopicQueryData** (p. 1125) contains the **DDS_TopicQuerySelection** (p. 1128) that the **DDSTopicQuery** (p. 1611) was created with, the GUID of the original DataReader that created the TopicQuery, and the topic name of that DataReader. Note: When TopicQueries are propagated through one or more Routing Services, the last DataReader that issued the TopicQuery will be a Routing Service DataReader. The **DDS_TopicQueryData::original_related_reader_guid** (p. 1125), however, will be that of the first DataReader to have created the TopicQuery.

7.25.2.2 The on_service_request_accepted DataWriter Listener Callback

It is possible that a **DDS_ServiceRequest** (p. 1083) for a **DDSTopicQuery** (p. 1611) is received but is not immediately dispatched to a DataWriter. This can happen, for example, if a DataWriter was not matching with a DataReader at the time that the TopicQuery was received by the publishing application. The **DDSDataWriterListener::on_service_request_accepted** (p. 1334) callback notifies a DataWriter when a ServiceRequest has been dispatched to that DataWriter. The **DDS_ServiceRequestAcceptedStatus** (p. 1084) provides information about how many ServiceRequests have been accepted by the DataWriter since the last time that the status was read. The status also includes the **DDS_ServiceRequestAcceptedStatus::last_request_handle** (p. 1086), which is the **DDS_InstanceHandle_t** (p. 74) of the last ServiceRequest that was accepted. This instance handle can be used to read samples per instance from the built-in ServiceRequest DataReader and correlate which ServiceRequests have been dispatched to which DataWriters.

7.25.2.3 Reading TopicQuery Samples

Data samples that are received by a DataReader in response to a TopicQuery can be identified with two pieces of information from the corresponding **DDS_SampleInfo** (p. 1068) to the sample. First, if the **DDS_SampleInfo::topic_query_guid** (p. 1077) is not equal to **DDS_GUID_UNKNOWN** (p. 330) then the sample is in response to the TopicQuery with that GUID (see **DDSTopicQuery::get_guid** (p. 1611)). Second, if the sample is in response to a TopicQuery and the **DDS_SampleInfo::flag** (p. 1077) **DDS_INTERMEDIATE_TOPIC_QUERY_SAMPLE** (p. 474) flag is set then this is not the last sample in response to the TopicQuery for a DataWriter identified by **DDS_SampleInfo::original_publication_virtual_guid** (p. 1075). If that flag is not set then there will be no more samples corresponding to that TopicQuery coming from the DataWriter.

7.25.3 Typedef Documentation

7.25.3.1 DDS_TopicQuerySelection

```
typedef struct DDS_TopicQuerySelection DDS_TopicQuerySelection
```

<<*extension*>> (p. 236) Specifies the data query that defines a **DDSTopicQuery** (p. 1611)

The query format is similar to the expression and parameters of a **DDSQueryCondition** (p. 1557) or a **DDSContentFilteredTopic** (p. 1267), as described in **DDSDomainParticipant::create_contentfilteredtopic_with_filter** (p. 1370).

There are two special queries:

- **DDS_TOPIC_QUERY_SELECTION_SELECT_ALL** (p. 155)
- **DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER** (p. 155)

See also

Queries and Filters Syntax (p. 178)

7.25.3.2 DDS_TopicQueryData

```
typedef struct DDS_TopicQueryData DDS_TopicQueryData
```

<<*extension*>> (p. 236) Provides information about a **DDSTopicQuery** (p. 1611)

Contains the information about a TopicQuery that can be retrieved using **DDSTopicQueryHelper::topic_query_data_from_service_request** (p. 1612).

See also

DDSTopicQueryHelper::topic_query_data_from_service_request (p. 1612)

7.25.4 Enumeration Type Documentation

7.25.4.1 DDS_TopicQuerySelectionKind

```
enum DDS_TopicQuerySelectionKind
```

Kinds of TopicQuerySelection.

See also

DDS_TopicQuerySelection (p. 1128)

Enumerator

DDS_TOPIC_QUERY_SELECTION_KIND_↔ HISTORY_SNAPSHOT	Indicates that the DDSTopicQuery (p. 1611) may only select samples that were in the DataWriter cache upon reception. [default]
DDS_TOPIC_QUERY_SELECTION_KIND_↔ CONTINUOUS	Indicates that the DDSTopicQuery (p. 1611) may continue selecting samples published after its reception. The subscribing application must explicitly delete the TopicQuery (see DDSDataReader::delete_topic_query (p. 1294)) to signal the DataWriters to stop publishing samples for it.

7.25.5 Variable Documentation

7.25.5.1 DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER

```
const struct DDS_TopicQuerySelection DDS_TOPIC_QUERY_SELECTION_USE_READER_CONTENT_FILTER [extern]
```

Special value for creating a **DDSTopicQuery** (p. 1611) that applies the same filter as the DataReader's **DDSContent**↔
FilteredTopic (p. 1267).

If the **DDSDataReader** (p. 1272) that creates the **DDSTopicQuery** (p. 1611) uses a **DDSContentFilteredTopic** (p. 1267), this **DDS_TopicQuerySelection** (p. 1128) value indicates that the TopicQuery should use the same filter.

Otherwise it behaves as **DDS_TOPIC_QUERY_SELECTION_SELECT_ALL** (p. 155).

7.25.5.2 DDS_TOPIC_QUERY_SELECTION_SELECT_ALL

```
const struct DDS_TopicQuerySelection DDS_TOPIC_QUERY_SELECTION_SELECT_ALL [extern]
```

Special value for creating a **DDSTopicQuery** (p. 1611) that selects all the samples in a **DDSDataWriter** (p. 1305) cache.

7.26 Sample States

DDS_SampleStateKind (p. 156) and associated elements

Typedefs

- typedef **DDS_UnsignedLong** **DDS_SampleStateMask**
*A bit-mask (list) of sample states, i.e. **DDS_SampleStateKind** (p. 156).*

Enumerations

- enum **DDS_SampleStateKind** {
DDS_READ_SAMPLE_STATE = 0x0001 << 0 ,
DDS_NOT_READ_SAMPLE_STATE = 0x0001 << 1 }

Indicates whether or not a sample has ever been read.

Variables

- const **DDS_SampleStateMask** **DDS_ANY_SAMPLE_STATE**

*Any sample state **DDS_READ_SAMPLE_STATE** (p. 157) | **DDS_NOT_READ_SAMPLE_STATE** (p. 157).*

7.26.1 Detailed Description

DDS_SampleStateKind (p. 156) and associated elements

7.26.2 Typedef Documentation

7.26.2.1 DDS_SampleStateMask

```
typedef DDS_UnsignedLong DDS_SampleStateMask
```

A bit-mask (list) of sample states, i.e. **DDS_SampleStateKind** (p. 156).

7.26.3 Enumeration Type Documentation

7.26.3.1 DDS_SampleStateKind

```
enum DDS_SampleStateKind
```

Indicates whether or not a sample has ever been read.

For each sample received, the middleware internally maintains a sample_state relative to each **DDSDataReader** (p. 1272). The sample state can be either:

- **DDS_READ_SAMPLE_STATE** (p. 157) indicates that the **DDSDataReader** (p. 1272) has already accessed that sample by means of a read or take operation.
- **DDS_NOT_READ_SAMPLE_STATE** (p. 157) indicates that the **DDSDataReader** (p. 1272) has not accessed that sample before.

The sample state will, in general, be different for each sample in the collection returned by read or take.

Enumerator

DDS_READ_SAMPLE_STATE	Sample has been read.
DDS_NOT_READ_SAMPLE_STATE	Sample has not been read.

7.26.4 Variable Documentation

7.26.4.1 DDS_ANY_SAMPLE_STATE

```
const DDS_SampleStateMask DDS_ANY_SAMPLE_STATE [extern]
```

Any sample state **DDS_READ_SAMPLE_STATE** (p. 157) | **DDS_NOT_READ_SAMPLE_STATE** (p. 157).

Examples

HelloWorld_subscriber.cxx.

7.27 View States

DDS_ViewStateKind (p. 158) and associated elements

Typedefs

- typedef **DDS_UnsignedLong DDS_ViewStateMask**
A bit-mask (list) of view states, i.e. **DDS_ViewStateKind** (p. 158).

Enumerations

- enum **DDS_ViewStateKind** {
DDS_NEW_VIEW_STATE = 0x0001 << 0 ,
DDS_NOT_NEW_VIEW_STATE = 0x0001 << 1 }
Indicates whether or not an instance is new.

Variables

- const **DDS_ViewStateMask DDS_ANY_VIEW_STATE**
Any view state **DDS_NEW_VIEW_STATE** (p. 159) | **DDS_NOT_NEW_VIEW_STATE** (p. 159).

7.27.1 Detailed Description

DDS_ViewStateKind (p. 158) and associated elements

7.27.2 Typedef Documentation

7.27.2.1 DDS_ViewStateMask

```
typedef DDS_UnsignedLong DDS_ViewStateMask
```

A bit-mask (list) of view states, i.e. **DDS_ViewStateKind** (p. 158).

7.27.3 Enumeration Type Documentation

7.27.3.1 DDS_ViewStateKind

```
enum DDS_ViewStateKind
```

Indicates whether or not an instance is new.

For each instance (identified by the key), the middleware internally maintains a view state relative to each **DDSDataReader** (p. 1272). The view state can be either:

- **DDS_NEW_VIEW_STATE** (p. 159) indicates that either this is the first time that the **DDSDataReader** (p. 1272) has ever accessed samples of that instance, or else that the **DDSDataReader** (p. 1272) has accessed previous samples of the instance, but the instance has since been reborn (i.e. become not-alive and then alive again). These two cases are distinguished by examining the **DDS_SampleInfo::disposed_generation_count** (p. 1073) and the **DDS_SampleInfo::no_writers_generation_count** (p. 1073).
- **DDS_NOT_NEW_VIEW_STATE** (p. 159) indicates that the **DDSDataReader** (p. 1272) has already accessed samples of the same instance and that the instance has not been reborn since.

The view_state available in the **DDS_SampleInfo** (p. 1068) is a snapshot of the view state of the instance relative to the **DDSDataReader** (p. 1272) used to access the samples at the time the collection was obtained (i.e. at the time read or take was called). The view_state is therefore the same for all samples in the returned collection that refer to the same instance.

Once an instance has been detected as not having any "live" writers and all the samples associated with the instance are "taken" from the **DDSDataReader** (p. 1272), the middleware can reclaim all local resources regarding the instance. Future samples will be treated as "never seen."

Enumerator

DDS_NEW_VIEW_STATE	New instance. This latest generation of the instance has not previously been accessed.
DDS_NOT_NEW_VIEW_STATE	Not a new instance. This latest generation of the instance has previously been accessed.

7.27.4 Variable Documentation

7.27.4.1 DDS_ANY_VIEW_STATE

```
const DDS_ViewStateMask DDS_ANY_VIEW_STATE [extern]
```

Any view state **DDS_NEW_VIEW_STATE** (p. 159) | **DDS_NOT_NEW_VIEW_STATE** (p. 159).

Examples

HelloWorld_subscriber.cxx.

7.28 Instance States

DDS_InstanceStateKind (p. 160) and associated elements

Typedefs

- typedef **DDS_UnsignedLong DDS_InstanceStateMask**
A bit-mask (list) of instance states, i.e. **DDS_InstanceStateKind** (p. 160).

Enumerations

- enum **DDS_InstanceStateKind** {
DDS_ALIVE_INSTANCE_STATE = 0x0001 << 0 ,
DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE = 0x0001 << 1 ,
DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE = 0x0001 << 2 }
*Indicates if the samples are from a live **DDSDataWriter** (p. 1305) or not.*

Variables

- const **DDS_InstanceStateMask DDS_ANY_INSTANCE_STATE**
Any instance state **ALIVE_INSTANCE_STATE** | **NOT_ALIVE_DISPOSED_INSTANCE_STATE** | **NOT_ALIVE_NO_WRITERS_INSTANCE_STATE**.
- const **DDS_InstanceStateMask DDS_NOT_ALIVE_INSTANCE_STATE**
Not alive instance state **NOT_ALIVE_DISPOSED_INSTANCE_STATE** | **NOT_ALIVE_NO_WRITERS_INSTANCE_STATE**.

7.28.1 Detailed Description

DDS_InstanceStateKind (p. 160) and associated elements

7.28.2 Typedef Documentation

7.28.2.1 DDS_InstanceStateMask

```
typedef DDS_UnsignedLong DDS_InstanceStateMask
```

A bit-mask (list) of instance states, i.e. **DDS_InstanceStateKind** (p. 160).

7.28.3 Enumeration Type Documentation

7.28.3.1 DDS_InstanceStateKind

```
enum DDS_InstanceStateKind
```

Indicates if the samples are from a live **DDSDDataWriter** (p. 1305) or not.

For each instance, the middleware internally maintains an instance state. The instance state can be:

- **DDS_ALIVE_INSTANCE_STATE** (p. 161) indicates that (a) samples have been received for the instance, (b) there are live **DDSDDataWriter** (p. 1305) entities writing the instance, and (c) the instance has not been explicitly disposed (or else more samples have been received after it was disposed).
- **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) indicates the instance was explicitly disposed by a **DDSDDataWriter** (p. 1305) by means of the dispose operation.
- **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) indicates the instance has been declared as not-alive by the **DDSDDataReader** (p. 1272) because it detected that there are no live **DDSDDataWriter** (p. 1305) entities writing that instance.

The precise behavior events that cause the instance state to change depends on the setting of the OWNERSHIP QoS:

- If **OWNERSHIP** (p. 414) is set to **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 415), then the instance state becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) only if the **DDSDDataWriter** (p. 1305) that "owns" the instance explicitly disposes it. The instance state becomes **DDS_ALIVE_INSTANCE_STATE** (p. 161) again only if the **DDSDDataWriter** (p. 1305) that owns the instance writes it.
- If **OWNERSHIP** (p. 414) is set to **DDS_SHARED_OWNERSHIP_QOS** (p. 415), then the instance state becomes **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) if any **DDSDDataWriter** (p. 1305) explicitly disposes the instance. The instance state becomes **DDS_ALIVE_INSTANCE_STATE** (p. 161) as soon as any **DDSDDataWriter** (p. 1305) writes the instance again.

The instance state available in the **DDS_SampleInfo** (p. 1068) is a snapshot of the instance state of the instance at the time the collection was obtained (i.e. at the time read or take was called). The instance state is therefore the same for all samples in the returned collection that refer to the same instance.

Enumerator

DDS_ALIVE_INSTANCE_STATE	Instance is currently in existence.
DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE	Not alive disposed instance. The instance has been disposed by a DataWriter.
DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE	Not alive no writers for instance. None of the DDSDataWriter (p. 1305) objects that are currently alive (according to the LIVELINESS (p. 409)) are writing the instance.

7.28.4 Variable Documentation

7.28.4.1 DDS_ANY_INSTANCE_STATE

```
const DDS_InstanceStateMask DDS_ANY_INSTANCE_STATE [extern]
```

Any instance state ALIVE_INSTANCE_STATE | NOT_ALIVE_DISPOSED_INSTANCE_STATE | NOT_ALIVE_NO_↵
WRITERS_INSTANCE_STATE.

Examples

HelloWorld_subscriber.cxx.

7.28.4.2 DDS_NOT_ALIVE_INSTANCE_STATE

```
const DDS_InstanceStateMask DDS_NOT_ALIVE_INSTANCE_STATE [extern]
```

Not alive instance state NOT_ALIVE_DISPOSED_INSTANCE_STATE | NOT_ALIVE_NO_WRITERS_INSTANCE_↵
STATE.

7.29 Stream Kinds

DDS_StreamKind (p. 162) and associated elements

Typedefs

- typedef **DDS_UnsignedLong** **DDS_StreamKindMask**
*A bit-mask (list) of stream kinds, i.e. **DDS_StreamKind** (p. 162).*

Enumerations

- enum **DDS_StreamKind** {
DDS_LIVE_STREAM = 0x0001 << 0 ,
DDS_TOPIC_QUERY_STREAM = 0x0001 << 1 }
Indicates if the samples are TopicQuery samples or not.

7.29.1 Detailed Description

DDS_StreamKind (p. 162) and associated elements

7.29.2 Typedef Documentation

7.29.2.1 DDS_StreamKindMask

```
typedef DDS_UnsignedLong DDS_StreamKindMask
```

A bit-mask (list) of stream kinds, i.e. **DDS_StreamKind** (p. 162).

7.29.3 Enumeration Type Documentation

7.29.3.1 DDS_StreamKind

```
enum DDS_StreamKind
```

Indicates if the samples are TopicQuery samples or not.

Enumerator

DDS_LIVE_STREAM	Sample is a live data sample.
DDS_TOPIC_QUERY_STREAM	Sample is a TopicQuery sample.

7.30 Infrastructure Module

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

Modules

- **Clock Selection**
APIs related to clock selection.
- **Time Support**
Time and duration types and defines.
- **GUID Support**
<<extension>> (p. 236) GUID type and defines.
- **Sequence Number Support**
<<extension>> (p. 236) Sequence number type and defines.
- **Exception Codes**
<<extension>> (p. 236) Exception codes.
- **Return Codes**
Types of return codes.
- **Status Kinds**
Kinds of communication status.
- **QoS Policies**
Quality of Service (QoS) policies.
- **Entity Support**
***DDSEntity** (p. 1446), **DDSListener** (p. 1509) and related items.*
- **Conditions and WaitSets**
***DDSCondition** (p. 1260) and **DDSWaitSet** (p. 1613) and related items.*
- **Cookie**
<<extension>> (p. 236) Unique identifier for a written data sample
- **Sample Flags**
<<extension>> (p. 236) Flags for samples.
- **WriteParams**
<<extension>> (p. 236)
- **Heap Support in C**
<<extension>> (p. 236) Heap allocation and free routines in C
- **Builtin Qos Profiles**
<<extension>> (p. 236) QoS libraries, profiles, and snippets that are automatically built into RTI Connext.
- **User-managed Threads**
User-managed thread infrastructure.
- **Octet Buffer Support**
<<extension>> (p. 236) Octet buffer creation, cloning, and deletion.
- **Sequence Support**
*The **FooSeq** (p. 1680) interface allows you to work with variable-length collections of homogeneous data.*
- **String Support**
<<extension>> (p. 236) String creation, cloning, assignment, and deletion.

Classes

- struct **DDS_QosPrintAll_t**
Special type which is used to select the `to_string` overloads when printing Qos objects.

Variables

- `const DDS_QosPrintAll_t DDS_QOS_PRINT_ALL`

Sentinel value that is used to select the `to_string` overload which prints all of the values of a Qos object.

7.30.1 Detailed Description

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

"DCPS Infrastructure package"

7.30.2 Variable Documentation

7.30.2.1 DDS_QOS_PRINT_ALL

```
const DDS_QosPrintAll_t DDS_QOS_PRINT_ALL [extern]
```

Sentinel value that is used to select the `to_string` overload which prints all of the values of a Qos object.

This sentinel value is used to select the `to_string` overload which prints the entirety of a Qos object (e.g., `DDS_DataReaderQos::to_string(char*, DDS_UnsignedLong&, const DDS_QosPrintAll_t&) const` (p. 146)).

7.31.1 Detailed Description

Defines sequences of primitive data type. .

7.32 Multi-channel DataWriters

APIs related to Multi-channel DataWriters.

APIs related to Multi-channel DataWriters.

7.32.1 What is a Multi-channel DataWriter?

A Multi-channel **DDSDataWriter** (p. 1305) is a **DDSDataWriter** (p. 1305) that is configured to send data over multiple multicast addresses, according to some filtering criteria applied to the data.

To determine which multicast addresses will be used to send the data, the middleware evaluates a set of filters that are configured for the **DDSDataWriter** (p. 1305). Each filter "guards" a channel (a set of multicast addresses). Each time a multi-channel **DDSDataWriter** (p. 1305) writes data, the filters are applied. If a filter evaluates to true, the data is sent over that filter's associated channel (set of multicast addresses). We refer to this type of filter as a Channel Guard filter.

7.32.2 Configuration on the Writer Side

To configure a multi-channel **DDSDataWriter** (p. 1305), simply define a list of all its channels in the **DDS_MultiChannelQosPolicy** (p. 952).

The **DDS_MultiChannelQosPolicy** (p. 952) is propagated along with discovery traffic. The value of this policy is available in **DDS_PublicationBuiltinTopicData::locator_filter** (p. 1005).

7.32.3 Configuration on the Reader Side

No special changes are required in a subscribing application to get data from a multichannel **DDSDataWriter** (p. 1305). If you want the **DDSDataReader** (p. 1272) to subscribe to only a subset of the channels, use a **DDSContentFilteredTopic** (p. 1267).

For more information on Multi-channel DataWriters, refer to the `User's Manual`.

7.32.4 Reliability with Multi-Channel DataWriters

7.32.4.1 Reliable Delivery

Reliable delivery is only guaranteed when the **DDS_PresentationQosPolicy::access_scope** (p. 987) is set to **DDS_INSTANCE_PRESENTATION_QOS** (p. 418) and the filters in **DDS_MultiChannelQosPolicy** (p. 952) are keyed-only based.

If any of the guard filters are based on non-key fields, RTI Connext only guarantees reception of the most recent data from the MultiChannel DataWriter.

7.32.4.2 Reliable Protocol Considerations

Reliability is maintained on a per-channel basis. Each channel has its own reliability channel send queue. The size of that queue is limited by **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) and/or **DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 694).

The protocol parameters described in **DDS_DataWriterProtocolQosPolicy** (p. 667) are applied per channel, with the following exceptions:

DDS_RtpsReliableWriterProtocol_t::low_watermark (p. 1049) and **DDS_RtpsReliableWriterProtocol_t::high_watermark** (p. 1049): The low watermark and high watermark control the queue levels (in number of samples) that determine when to switch between regular and fast heartbeat rates. With MultiChannel DataWriters, **high_watermark** and **low_watermark** refer to the DataWriter's queue (not the reliability channel queue). Therefore, periodic heartbeating cannot be controlled on a per-channel basis.

Important: With MultiChannel DataWriters, **low_watermark** and **high_watermark** refer to application samples even if batching is enabled. This behavior differs from the one without MultiChannel DataWriters (where **low_watermark** and **high_watermark** refer to batches).

DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples (p. 1053): This field defines the number of heartbeats per send queue. For MultiChannel DataWriters, the value is applied per channel. However, the send queue size that is used to calculate the a piggyback heartbeat rate is defined per DataWriter (see **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041))

Important: With MultiChannel DataWriters, **heartbeats_per_max_samples** refers to samples even if batching is enabled. This behavior differs from the one without MultiChannels DataWriters (where **heartbeats_per_max_samples** refers to batches).

With batching and MultiChannel DataWriters, the size of the DataWriter's send queue should be configured using **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) instead of **max_batches** **DDS_DataWriterResourceLimitsQosPolicy::max_batches** (p. 694) in order to take advantage of **heartbeats_per_max_samples**.

7.33 Transports

APIs related to RTI Connext pluggable transports.

Modules

- **Installing Transport Plugins**

Installing and configuring transports used by RTI Connext.

- **Built-in Transport Plugins**

Transport plugins delivered with RTI Connext.

- **Creating New Transport Plugins**

Developing new transport plugins for RTI Connext.

- **Transport Plugins Configuration**

Transport plugins configuration with RTI Connext.

- **Transport Address**

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

7.33.1 Detailed Description

APIs related to RTI Connext pluggable transports.

7.33.2 Overview

RTI Connext has a pluggable transports architecture. The core of RTI Connext is transport agnostic; it does not make any assumptions about the actual transports used to send and receive messages. Instead, the RTI Connext core uses an abstract "transport API" to interact with the **transport plugins** which implement that API.

A transport plugin implements the abstract transport API and performs the actual work of sending and receiving messages over a physical transport. A collection of **builtin plugins** (see **Built-in Transport Plugins** (p. 176)) is delivered with RTI Connext for commonly used transports. New transport plugins can easily be created, thus enabling RTI Connext applications to run over transports that may not even be conceived yet. This is a powerful capability and that distinguishes RTI Connext from competing middleware approaches.

RTI Connext also provides a set of APIs for installing and configuring transport plugins to be used in an application. So that RTI Connext applications work out of the box, a subset of the builtin transport plugins is preconfigured by default (see **DDS_TransportBuiltinQosPolicy** (p. 1129)). You can "turn-off" some or all of the builtin transport plugins. In addition, you can configure other transport plugins for use by the application.

7.33.3 Transport Aliases

In order to use a transport plugin instance in an RTI Connext application, it must be registered with a **DDSDomainParticipant** (p. 1335). When you register a transport, you specify a sequence of "alias" strings to symbolically refer to the transport plugin. The same alias strings can be used to register more than one transport plugin.

You can register multiple transport plugins with a **DDSDomainParticipant** (p. 1335). An **alias** symbolically refers to one or more transport plugins registered with the **DDSDomainParticipant** (p. 1335). Builtin transport plugin instances can be referred to using preconfigured aliases (see **TRANSPORT_BUILTIN** (p. 442)).

A transport plugin's class name is automatically used as an implicit alias. It can be used to refer to all the transport plugin instances of that class.

You can use aliases to refer to transport plugins, in order to specify:

- the transport plugins to use for **discovery** (see **DDS_DiscoveryQosPolicy::enabled_transports** (p. 726)), and for **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) entities (see **DDS_TransportSelectionQosPolicy** (p. 1142)).
- the **multicast** addresses on which to receive discovery messages (see **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 727)), and the multicast addresses and ports on which to receive user data (see **DDS_DataReaderQos::multicast** (p. 645)).
- the **unicast ports** used for user data (see **DDS_TransportUnicastQosPolicy** (p. 1143)) on both **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) entities.
- the transport plugins used to parse an address string in a locator (**Locator Format** (p. ??) and **NDDS_DISCOVERY_PEERS** (p. 464)).

A **DDSDomainParticipant** (p. 1335) (and contained its entities) start using a transport plugin after the **DDSDomainParticipant** (p. 1335) is enabled (see **DDSEntity::enable** (p. 1449)). An entity will use *all* the transport plugins that match the specified transport QoS policy. All transport plugins are treated uniformly, regardless of how they were created or registered; there is no notion of some transports being more "special" than others.

7.33.4 Transport Lifecycle

A transport plugin is owned by whomever creates it. Thus, if you create and register a transport plugin with a **DDSDomainParticipant** (p. 1335), you are responsible for deleting it by calling its destructor. Note that builtin transport plugins (**TRANSPORT_BUILTIN** (p. 442)) and transport plugins that are loaded through the **PROPERTY** (p. 419) QoS policy (see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 173)) are automatically managed by RTI Connext.

A user-created transport plugin must not be deleted while it is still in use by a **DDSDomainParticipant** (p. 1335). This generally means that a user-created transport plugin instance can only be deleted after the **DDSDomainParticipant** (p. 1335) with which it was registered is deleted (see **DDSDomainParticipantFactory::delete_participant** (p. 1428)). Note that a transport plugin *cannot* be "unregistered" from a **DDSDomainParticipant** (p. 1335).

A transport plugin instance cannot be registered with more than one **DDSDomainParticipant** (p. 1335) at a time. This requirement is necessary to guarantee the multi-threaded safety of the transport API.

If the same physical transport resources are to be used with more than one **DDSDomainParticipant** (p. 1335) in the same address space, the transport plugin should be written in such a way so that it can be instantiated multiple times—once for each **DDSDomainParticipant** (p. 1335) in the address space. Note that it is always possible to write the transport plugin so that multiple transport plugin instances share the same underlying resources; however the burden (if any) of guaranteeing multi-threaded safety to access shared resource shifts to the transport plugin developer.

7.33.5 Transport Class Attributes

A transport plugin instance is associated with two kinds of attributes:

- the *class* attributes that are decided by the plugin writer; these are invariant across all instances of the transport plugin class, and
- the *instance* attributes that can be set on a per instance basis by the transport plugin user.

Every transport plugin must specify the following class attributes.

transport class id (see **NDDS_Transport_Property_t::classid** (p. 1759)) Identifies a transport plugin implementation class. It denotes a unique "class" to which the transport plugin instance belongs. The class is used to distinguish between different transport plugin implementations. Thus, a transport plugin vendor should ensure that its transport plugin implementation has a unique class.

Two transport plugin instances report the same class *iff* they have compatible implementations. Transport plugin instances with mismatching classes are not allowed (by the RTI Connext Core) to communicate with one another.

Multiple implementations (possibly from different vendors) for a physical transport mechanism can co-exist in an RTI Connext application, provided they use different transport class IDs.

The class ID can also be used to distinguish between different transport protocols over the same physical transport network (e.g., UDP vs. TCP over the IP routing infrastructure).

transport significant address bit count (see **NDDS_Transport_Property_t::address_bit_count** (p. 1760)) RTI Connext's addressing is modeled after the IPv6 and uses 128-bit addresses (**Transport Address** (p. 251)) to route messages.

A transport plugin is expected to map the transport's internal addressing scheme to 128-bit addresses. Depending on the sign of this attribute, this mapping uses only *N* least significant bits (LSB) if positive or *N* most significant bits (MSB) if negative; these bits are specified by this attribute.

```

<P>
>----- netmask -----<
+-----+-----+
|           Network Address           | Transport Local Address |
+-----+-----+
>----- N -----<
          address_bits_count

<P>
                                Only these bits are used
                                by the transport plugin
                                if sign is positive.

<P>
                                >----- netmask -----<
+-----+-----+
| Transport Local Address |           Network Address           |
+-----+-----+
>----- N -----<
          address_bits_count

<P>
                                Only these bits are used
                                by the transport plugin
                                if sign is negative.

```

The remaining bits of an address using the $128 - \text{abs}(\text{bit address})$ representation will be considered as part of the "network address" (see **Transport Network Address** (p. ??)) and thus ignored by the transport plugin's internal addressing scheme.

For *unicast* addresses, the transport plugin is expected to ignore the higher ($128 - \text{NDDS_Transport_Property_t::address_bit_count}$ (p. 1760)) bits. RTI Connext is free to manipulate those bits freely in the addresses passed in/out to the transport plugin APIs.

Theoretically, the significant address bits count, N is related to the size of the underlying transport network as follows:

$$\text{address_bits_count} \geq \text{ceil}(\log_2(\text{total_addressable_transport_unicast_interfaces}))$$

The equality holds when the most compact (theoretical) internal address mapping scheme is used. A practical address mapping scheme may waste some bits.

7.33.6 Transport Instance Attributes

The *per instance* attributes to configure the plugin instance are generally passed in to the plugin constructor. These are defined by the transport plugin writer, and can be used to:

- customize the behavior of an instance of a transport plugin, including the send and the receiver buffer sizes, the maximum message size, various transport level classes of service (CoS), and so on.
- specify the resource values, network interfaces to use, various transport level policies, and so on.

RTI Connext requires that every transport plugin instance must specify the **NDDS_Transport_Property_t::message_size_max** (p. 1761) and **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761).

It is up to the transport plugin developer to make these available for configuration to transport plugin user.

Note that it is important that the instance attributes are "compatible" between the sending side and the receiving side of communicating applications using different instances of a transport plugin class. For example, if one side is configured to send messages larger than can be received by the other side, then communications via the plugin may fail.

7.33.7 Transport Network Address

The address bits not used by the transport plugin for its internal addressing constitute its network address bits.

In order for RTI Connex to properly route the messages, each unicast interface in the RTI Connex *domain* must have a unique address. RTI Connex allows the user to specify the value of the network address when installing a transport plugin via the **NDDSTransportSupport::register_transport()** (p. 1811) API.

The network address for a transport plugin should be chosen such that the resulting fully qualified 128-bit address will be unique in the RTI Connex domain. Thus, if two instances of a transport plugin are registered with a **DDSDomain**↔**Participant** (p. 1335), they will be at different network addresses in order for their unicast interfaces to have unique fully qualified 128-bit addresses. It is also possible to create multiple transports with the same network address, as it can be useful for certain use cases; note that this will require special entity configuration for most transports to avoid clashes in resource use (e.g. sockets for UDPv4 transport).

7.33.8 Transport Send Route

By default, a transport plugin is configured to send outgoing messages destined to addresses in the network address range at which the plugin was registered.

RTI Connex allows the user to configure the routing of outgoing messages via the **NDDSTransportSupport::add_send_route()** (p. 1812) API, so that a transport plugin will be used to send messages only to certain ranges of destination addresses. The method can be called multiple times for a transport plugin, with different address ranges.

-----+ 	Outgoing Address Range 1	->	Transport Plugin	
-----+ 	:	->	:	
-----+ 	Outgoing Address Range K	->	Transport Plugin	
-----+				

The user can set up a routing table to restrict the use of a transport plugin to send messages to selected addresses ranges.

7.33.9 Transport Receive Route

By default, a transport plugin is configured to receive incoming messages destined to addresses in the network address range at which the plugin was registered.

RTI Connex allows the user to configure the routing of incoming messages via the **NDDSTransportSupport::add_receive_route()** (p. 1813) API, so that a transport plugin will be used to receive messages only on certain ranges of addresses. The method can be called multiple times for a transport plugin, with different address ranges.

-----+ 	Transport Plugin	<-	Incoming Address Range 1	
-----+ 	:	<-	:	
-----+ 	Transport Plugin	<-	Incoming Address Range M	
-----+				

The user can set up a routing table to restrict the use of a transport plugin to receive messages from selected ranges. For example, the user may restrict a transport plugin to

- receive messages from a certain multicast address range.
- receive messages only on certain unicast interfaces (when multiple unicast interfaces are available on the transport plugin).

7.34 Installing Transport Plugins

Installing and configuring transports used by RTI Connex.

Classes

- class **NDDSTransportSupport**
<<interface>> (p. 236) The utility class used to configure RTI Connex pluggable transports.

Typedefs

- typedef NDDS_TRANSPORT_HANDLE_TYPE_NATIVE **NDDS_Transport_Handle_t**
*An opaque type representing the handle to a transport plugin registered with a **DDSDomainParticipant** (p. 1335).*
- typedef NDDS_Transport_Plugin *(* **NDDS_Transport_create_plugin**) (**NDDS_Transport_Address_t** *default_network_address_out, const struct **DDS_PropertyQoSPolicy** *property_in)
*Function prototype for creating plugin through **DDS_PropertyQoSPolicy** (p. 994).*

Functions

- **DDS_Boolean NDDS_Transport_Handle_is_nil** (const **NDDS_Transport_Handle_t** *self)
Is the given transport handle the NIL transport handle?

Variables

- const **NDDS_Transport_Handle_t NDDS_TRANSPORT_HANDLE_NIL**
The NIL transport handle.

7.34.1 Detailed Description

Installing and configuring transports used by RTI Connex.

There is more than one way to install a transport plugin for use with RTI Connex:

- If it is a builtin transport plugin, by specifying a bitmask in **DDS_TransportBuiltinQoSPolicy** (p. 1129) (see **Built-in Transport Plugins** (p. 176))
- For all other non-builtin transport plugins, by dynamically loading the plugin through **PROPERTY** (p. 419) QoS policy settings of **DDSDomainParticipant** (p. 1335) (only supported on architectures that support dynamic libraries, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 173))
- By explicitly creating a transport plugin and registering the plugin with a **DDSDomainParticipant** (p. 1335) through **NDDSTransportSupport::register_transport** (p. 1811) (for both builtin and non-builtin plugins)

In the first two cases, the lifecycle of the transport plugin is automatically managed by RTI Connex. In the last case, user is responsible for deleting the transport plugin after the **DDSDomainParticipant** (p. 1335) is deleted. See **Transport Lifecycle** (p. ??) for details.

7.34.2 Loading Transport Plugins through Property QoS Policy of Domain Participant

On architectures that support dynamic libraries, a non-builtin transport plugin written in C/C++ and built as a dynamic-link library (*.dll/*.so) can be loaded by RTI Connext through the **PROPERTY** (p. 419) QoS policy settings of the **DDSDomainParticipant** (p. 1335).

Dynamic libraries are supported on all architectures except INTEGRITY and certain VxWorks platforms. For VxWorks, dynamic libraries are only supported for architectures that are on Pentium/Arm CPUs AND use kernel mode.

The dynamic-link library (and all the dependent libraries) need to be in the library search path during runtime (in the **LD_LIBRARY_PATH** environment variable on Linux systems, **DYLD_LIBRARY_PATH** on macOS systems, or **Path** on Windows systems).

To allow dynamic loading of the transport plugin, the transport plugin must implement the RTI Connext abstract transport API and must provide a function with the signature **NDDS_Transport_create_plugin** (p. 175) that can be called by RTI Connext to create an instance of the transport plugin. The name of the dynamic library that contains the transport plugin implementation, the name of the function and properties that can be used to create the plugin, and the aliases and network address that are used to register the plugin can all be specified through the **PROPERTY** (p. 419) QoS policy of the **DDSDomainParticipant** (p. 1335).

The following table lists the property names that are used to load the transport plugins dynamically:

Table 7.73 Properties for dynamically loading and registering transport plugins

Property Name	Description	Required?
dds.transport.load_plugins	Comma-separated strings indicating the prefix names of all plugins that will be loaded by RTI Connext. Up to 8 plugins may be specified. For example, "dds.transport.TCPv4.tcp1, dds.↵transport.TCPv4.tcp2", In the following examples, <TRANSPORT_↵PREFIX> is used to indicate one element of this string that is used as a prefix in the property names for all the settings that are related to the plugin. <TRANSPORT_PREFIX> must begin with "dds.transport." (such as "dds.transport.↵mytransport").	YES
<TRANSPORT_PREFIX>.library	Should be set to the name of the dynamic library (*.so for Linux systems, *.dylib for macOS systems, and *.dll for Windows systems) that contains the transport plugin implementation. This library (and all the other dependent dynamic libraries) needs to be in the library search path used by RTI Connext during run time (pointed to by the environment variable LD_LIBRARY_↵PATH on Linux systems, DYLD_LIBRARY_PATH on macOS systems, or Path on Windows systems).	YES
<TRANSPORT_PREFIX>.create_function	Should be set to the name of the function with the prototype of NDDS_Transport_create_↵plugin (p. 175) that can be called by RTI Connext to create an instance of the plugin. The resulting transport plugin will then be registered by RTI Connext through NDDSTransport_↵	YES
Generated by Doxygen	Support::register_transport (p. 1811)	

Property Name	Description	Required?
<TRANSPORT_PREFIX>.aliases	Used to register the transport plugin returned by NDDS_Transport_create_plugin (p.175) (as specified by <TRANSPORT_PREFIX>.create_function) to the DDSDomainParticipant (p.1335). Refer to aliases_in parameter in NDDSTransportSupport::register_transport (p.1811) for details. Aliases should be specified as a comma-separated string, with each comma delimiting an alias. If it is not specified, <TRANSPORT_PREFIX> –without the leading "dds.transport" – is used as the default alias for the plugin.	NO
<TRANSPORT_PREFIX>.network_address	Used to register the transport plugin returned by NDDS_Transport_create_plugin (p.175) (as specified by <TRANSPORT_PREFIX>.create_function) to the DDSDomainParticipant (p.1335). Refer to network_address_in parameter in NDDSTransportSupport::register_transport (p.1811) for details. If it is not specified, the network_address_out output parameter from NDDS_Transport_create_plugin (p.175) is used. The default value is a zeroed out network address.	NO
<TRANSPORT_PREFIX>.<property_name>	Property that is passed into NDDS_Transport_create_plugin (p.175) (as specified by <TRANSPORT_PREFIX>.create_function) for creating the transport plugin. This property name-value pair will be passed to NDDS_Transport_create_plugin (p.175) after stripping out <TRANSPORT_PREFIX> from the property name. The parsing of this property and configuring the transport using this property should be handled by the implementation of each transport plugin. Multiple <TRANSPORT_PREFIX>.<property_name> can be specified. Note: "library", "create_function", "aliases" and "network_address" cannot be used as the <property_name> due to conflicts with other builtin property names.	NO

A transport plugin is dynamically created and registered to the **DDSDomainParticipant** (p.1335) by RTI Connex when:

- the **DDSDomainParticipant** (p.1335) is enabled,
- the first DataWriter/DataReader is created, or
- you lookup a builtin DataReader (**DDSSubscriber::lookup_datareader** (p.1588)),

whichever happens first.

Any changes to the transport plugin related properties in the **PROPERTY** (p. 419) QoS policy after the transport plugin has been registered with the **DDSDomainParticipant** (p. 1335) will have no effect.

See also

Transport Use Cases (p. 215)

7.34.3 Typedef Documentation

7.34.3.1 NDDS_Transport_Handle_t

```
typedef NDDS_TRANSPORT_HANDLE_TYPE_NATIVE NDDS_Transport_Handle_t
```

An opaque type representing the handle to a transport plugin registered with a **DDSDomainParticipant** (p. 1335).

A transport handle represents the association between a **DDSDomainParticipant** (p. 1335) and a transport plugin.

7.34.3.2 NDDS_Transport_create_plugin

```
typedef NDDS_Transport_Plugin *(* NDDS_Transport_create_plugin) ( NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in)
```

Function prototype for creating plugin through **DDS_PropertyQosPolicy** (p. 994).

By specifying some predefined property names in **DDS_PropertyQosPolicy** (p. 994), RTI Connexx can call a function from a dynamic library to create a transport plugin and register the returned plugin with a **DDSDomainParticipant** (p. 1335).

This is the function prototype of the function as specified in "<TRANSPORT_PREFIX>.create_function" of **DDS_PropertyQosPolicy** (p. 994) QoS policy that will be called by RTI Connexx to create the transport plugin. See **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 173) for details.

Parameters

<i>default_network_address_out</i>	<< out >> (p. 237) Optional output parameter. If the network address is not specified in "<TRANSPORT_PREFIX>.network_address" in DDS_PropertyQosPolicy (p. 994), this is the default network address that is used to register the returned transport plugin using NDDSTransportSupport::register_transport (p. 1811) . This parameter will never be null. The default value is a zeroed-out network address.
<i>property_in</i>	<< in >> (p. 237) property_in contains all the name-value pair properties that matches the format "<TRANSPORT_PREFIX>.<property_name>" in DDS_PropertyQosPolicy (p. 994) that can be used to create the transport plugin. Only <property_name> is passed in - the plugin prefix will be stripped out in the property name. Note: predefined <TRANSPORT_PREFIX> properties "library", "create_function", "aliases" and "network_address" will not be passed to this function. This parameter will never be null.
Generated by Doxygen	

Returns

Upon success, a valid non-NIL transport plugin. NIL upon failure.

7.34.4 Function Documentation**7.34.4.1 NDDS_Transport_Handle_is_nil()**

```
DDS_Boolean NDDS_Transport_Handle_is_nil (
    const NDDS_Transport_Handle_t * self )
```

Is the given transport handle the NIL transport handle?

Returns

DDS_BOOLEAN_TRUE (p. 316) if the given transport handle is equal to **NDDS_TRANSPORT_HANDLE_NIL** (p. 176) or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

7.34.5 Variable Documentation**7.34.5.1 NDDS_TRANSPORT_HANDLE_NIL**

```
const NDDS_Transport_Handle_t NDDS_TRANSPORT_HANDLE_NIL [extern]
```

The NIL transport handle.

7.35 Built-in Transport Plugins

Transport plugins delivered with RTI Connext.

Modules

- **UDP Transport Plugin definitions**

UDP Transport Plugin definitions.

- **Shared Memory Transport**

*Built-in transport plug-in for inter-process communications using shared memory (**NDDS_TRANSPORT_CLASSID_SHARED_MEM** (p. 248)).*

- **UDPv4 Transport**

*Transport plug-in using UDP/IPv4 (**NDDS_TRANSPORT_CLASSID_UDPv4** (p. 248)).*

- **Real-Time WAN Transport**

*Transport plug-in using UDP/IPv4 for WAN communications. (**NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (p. 250)).*

- **UDPv6 Transport**

*Transport plug-in using UDP/IPv6 (**NDDS_TRANSPORT_CLASSID_UDPv6** (p. 249)).*

7.35.1 Detailed Description

Transport plugins delivered with RTI Connext.

The **TRANSPORT_BUILTIN** (p. 442) specifies the collection of transport plugins that can be automatically configured and managed by RTI Connext as a convenience to the user.

These transport plugins can simply be turned "on" or "off" by specifying a bitmask in **DDS_TransportBuiltinQosPolicy** (p. 1129), thus bypassing the steps for setting up a transport plugin. RTI Connext preconfigures the transport plugin properties, the network address, and the aliases to "factory defined" values.

If a builtin transport plugin is turned "on" in **DDS_TransportBuiltinQosPolicy** (p. 1129), the plugin is implicitly created and registered to the corresponding **DDSDomainParticipant** (p. 1335) by RTI Connext when:

- the **DDSDomainParticipant** (p. 1335) is enabled,
- the first DataWriter/DataReader is created, or
- you lookup a builtin DataReader (**DDSSubscriber::lookup_datareader** (p. 1588)),

whichever happens first.

Each builtin transport contains its own set of properties. For example, the **::UDPv4 Transport** (p. 266) allows the application to specify whether or not multicast is supported, the maximum size of the message, and provides a mechanism for the application to filter out network interfaces.

The builtin transport plugin properties can be changed by the method **NDDSTransportSupport::set_builtin_transport_property()** (p. 1815) or by using the **PROPERTY** (p. 419) QoS policy associated with the **DDSDomainParticipant** (p. 1335). Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 994) always overwrite the ones specified through **NDDSTransportSupport::set_builtin_transport_property()** (p. 1815). Refer to the specific builtin transport for the list of property names that can be specified through **PROPERTY** (p. 419) QoS policy.

Any changes to the builtin transport properties after the builtin transports have been registered with will have no effect.

See also

NDDSTransportSupport::set_builtin_transport_property() (p. 1815) **DDS_PropertyQosPolicy** (p. 994)

The built-in transport plugins can also be instantiated and registered by the user, following the steps for **Registering a transport with a participant** (p. 217). This is useful when the application needs different values for the network addresses.

7.36 Creating New Transport Plugins

Developing new transport plugins for RTI Connext.

Developing new transport plugins for RTI Connext.

RTI Connext provides an abstract "C" language API for creating new transport plugins. If you are interested in creating a new transport plugin for RTI Connext, please contact your RTI representative or email sales@rti.com.

7.37 Common Types and Declarations

Basic types and macros used by the RTI Connext Transport Plugin APIs.

Modules

- **Interface**

Abstraction of a Transport Plugin network interface.

7.37.1 Detailed Description

Basic types and macros used by the RTI Connext Transport Plugin APIs.

7.38 Queries and Filters Syntax

7.38.1 Syntax for DDS Queries and Filters

A subset of the WHERE clause in SQL is used in several parts of the specification:

- The `filter_expression` in the **DDSContentFilteredTopic** (p. 1267)
- The `query_expression` in the **DDSQueryCondition** (p. 1557)
- `<<extension>>` (p. 236) The `filter_expression` in the **DDS_TopicQuerySelection** (p. 1128)
- `<<extension>>` (p. 236) The `filter_expression` in the **DDS_ChannelSettings_t** (p. 604)

Those expressions may use a subset of SQL, extended with the possibility to use program variables in the SQL expression. The allowed SQL expressions are defined with the BNF-grammar below.

The following notational conventions are made:

- *NonTerminals* are typeset in italics.
- 'Terminals' are quoted and typeset in a fixed width font. They are written in upper case in most cases in the BNF-grammar below, but should be case insensitive.
- **TOKENS** are typeset in bold.
- The notation (*element* // ',') represents a non-empty comma-separated list of *elements*.

7.38.2 SQL grammar in BNF

```

FilterExpression ::= Condition
Condition      ::= Predicate
                | Condition 'AND' Condition
                | Condition 'OR' Condition
                | 'NOT' Condition
                | '(' Condition ')'
Predicate      ::= ComparisonPredicate
                | BetweenPredicate
ComparisonPredicate ::= ComparisonTerm RelOp ComparisonTerm
ComparisonTerm    ::= FieldIdentifier
                | Parameter
BetweenPredicate  ::= FieldIdentifier 'BETWEEN' Range
                | FieldIdentifier 'NOT BETWEEN' Range
FieldIdentifier    ::= FIELDNAME
                | IDENTIFIER
RelOp             ::= '=' | '>' | '>=' | '<' | '<=' | '<>' | 'LIKE' | 'MATCH'
Range             ::= Parameter 'AND' Parameter
Parameter ::= INTEGERVALUE
            | CHARVALUE
            | FLOATVALUE
            | STRING
            | ENUMERATEDVALUE
            | BOOLEANVALUE
            | NULLVALUE
            | PARAMETER

```

7.38.3 Token expression

The syntax and meaning of the tokens used in the SQL grammar is described as follows:

- **IDENTIFIER** - An identifier for a FIELDNAME, and is defined as any series of characters 'a', ..., 'z', 'A', ..., 'Z', '0', ..., '9', '_' but may not start with a digit.

Formal notation:

```

IDENTIFIER: LETTER ( PART_LETTER)*
where LETTER: [ "A"-"Z", "_", "a"-"z" ]
PART_LETTER: [ "A"-"Z", "_", "a"-"z", "0"-"9" ]

```

- **FIELDNAME** - A fieldname is a reference to a field in the data structure. The dot '.' is used to navigate through nested structures. The number of dots that may be used in a FIELDNAME is unlimited. The FIELDNAME can refer to fields at any depth in the data structure. The names of the field are those specified in the IDL definition of the corresponding structure, which may or may not match the fieldnames that appear on the language-specific (e.g., C/C++, Java) mapping of the structure. To reference to the $n+1$ element in an array or sequence, use the notation '[n]', where n is a natural number (zero included). FIELDNAME must resolve to a primitive IDL type; that is either boolean, octet, (unsigned) short, (unsigned) long, (unsigned) long long, float double, char, wchar, string, wstring, or enum.

Formal notation:

```

FIELDNAME: FieldNamePart ( "." FieldNamePart ) *
where FieldNamePart : IDENTIFIER ( "[" Index "]" ) *
      Index > : ( ["0"-"9"] ) +
                | ["0x", "0X"] ( ["0"-"9", "A"-"F", "a"-"f"] ) +

```

Primitive IDL types referenced by FIELDNAME are treated as different types in *Predicate* according to the following table:

Predicate Data Type	IDL Type
BOOLEANVALUE	boolean
INTEGERVALUE	octet, (unsigned) short, (unsigned) long, (unsigned) long long
FLOATVALUE	float, double
CHARVALUE	char, wchar
STRING	string, wstring
ENUMERATEDVALUE	enum

- **TOPICNAME** - A topic name is an identifier for a topic, and is defined as any series of characters 'a', ..., 'z', 'A', ..., 'Z', '0', ..., '9', '_' but may not start with a digit.

Formal notation:

```

TOPICNAME : IDENTIFIER

```

- **INTEGERVALUE** - Any series of digits, optionally preceded by a plus or minus sign, representing a decimal integer value within the range of the system. 64-bit integers (int64 and uint64) must be followed by either l or L, otherwise the value is treated as a 32-bit integer. A hexadecimal number is preceded by 0x and must be a valid hexadecimal expression.

Formal notation:

```

INTEGERVALUE : ( ["+", "-"] ) ? ( ["0"-"9"] ) + [ ("l", "L") ] ?
              | ( ["+", "-"] ) ? ["0x", "0X"] ( ["0"-"9", "A"-"F", "a"-"f"] ) + [ ("l", "L") ] ?

```

- **CHARVALUE** - A single character enclosed between single quotes.

Formal notation:

```

CHARVALUE : "'" (~["'"]) ? "'"

```

- **FLOATVALUE** - Any series of digits, optionally preceded by a plus or minus sign and optionally including a floating point ('.'). A power-of-ten expression may be postfixed, which has the syntax *en* or *En*, where *n* is a number, optionally preceded by a plus or minus sign.

Formal notation:

```

FLOATVALUE : ([ "+", "-" ])? ([ "0"-"9" ])* ( "." )? ([ "0"-"9" ])+ ( EXPONENT )?
where EXPONENT: [ "e", "E" ] ([ "+", "-" ])? ([ "0"-"9" ])+

```

- **STRING** - Any series of characters encapsulated in single quotes, except the single quote itself.

Formal notation:

```

STRING : "'" (~["'"]) * "'"

```

- **ENUMERATEDVALUE** - An enumerated value is a reference to a value declared within an enumeration. Enumerated values consist of the name of the enumeration label enclosed in single quotes. The name used for the enumeration label must correspond to the label names specified in the IDL definition of the enumeration.

Formal notation:

```

ENUMERATEDVALUE : "'" [ "A" - "Z", "a" - "z" ] [ "A" - "Z", "a" - "z", "_", "0" - "9" ]* "'"

```

- **BOOLEANVALUE** - Can either be 'TRUE' or 'FALSE', case insensitive.

Formal notation (case insensitive):

```

BOOLEANVALUE : [ "TRUE", "FALSE" ]

```

- **NULLVALUE** - Can be null, and is case insensitive.

Formal notation (case insensitive):

```

NULLVALUE : "null"

```

- **PARAMETER** - A parameter is of the form %*n*, where *n* represents a natural number (zero included) smaller than 100. It refers to the *n* + 1th argument in the given context. Argument can only in primitive type value format. It cannot be a FIELDNAME.

Formal notation:

```

PARAMETER : "%" ([ "0"-"9" ])+

```

7.38.4 String Parameters

Strings used as parameter values must contain the enclosing quotation marks (') within the parameter value, and not place the quotation marks within the expression statement. For example, the following expression is legal:

```
" symbol MATCH %0 " with parameter 0 = " 'IBM' "
```

whereas the following expression will not compile:

```
" symbol MATCH '%0' " with parameter 0 = " IBM "
```

7.38.5 Type compatability in Predicate

Only certain combination of type comparisons are valid in *Predicate*. The following table marked all the compatible pairs with 'YES':

	BOOLEANVALUE	INTEGERVALUE	FLOATVALUE	CHARVALUE	STRING	ENUMERATEDVALUE
BOOLEAN	YES					
INTEGERVALUE		YES	YES			
FLOATVALUE		YES	YES			
CHARVALUE				YES	YES	YES
STRING				YES	YES(*1)	YES
ENUMERATEDVALUE		YES		YES(*2)	YES(*2)	YES(*3)

- (*1) See **SQL Extension: Regular Expression Matching** (p. 182)
- (*2) Because the formal notation of the Enumeration values, they are compatible with string and char literals, but they are not compatible with string or char variables, i.e., "MyEnum='EnumValue'" would be correct, but "MyEnum=MyString" is not allowed.
- (*3) Only for same type Enums.

7.38.6 SQL Extension: Regular Expression Matching

The relational operator MATCH may only be used with string fields. The right-hand operator is a string *pattern*. A string pattern specifies a template that the left-hand field value must match. The characters ,^?*[]-^!% have special meanings unless they are escaped by the escape character "\". MATCH is case-sensitive. The pattern allows limited "wild card" matching under the following rules: <TABLE> <TR> <TD>Character</TD> <TD>← Meaning</TD></TR> <TR> <TD>,</TD> <TD>"," separates a list of alternate patterns. The field string is matched if it matches one or more of the patterns.</TD> </TR> <TR> <TD>/</TD> <TD>"/" in the pattern string matches a / in the field string. This character is used to separate a sequence of mandatory substrings.</TD> </TR> <TR> <TD>?</TD> <TD>"?" in the pattern string matches any single <i>non-special</i> characters in the field string.</TD> </TR> <TR> <TD>*</TD> <TD>"*" in the pattern string matches 0 or more <i>non-special</i> characters in field string.</TD> </TR> <TR> <TD>[<i>charlist</i></TD> <TD>Matches any one of the characters from the list of characters

in `<i>charlist</i>.</TD> </TR> <TR> <TD>[<i>s</i>-<i>e</i>]</TD> <TD>Matches any character any character from <i>s</i> to <i>e</i>, inclusive.</TD> </TR> <TR> <TD>%</TD> <TD>"%" is used to designate filter expressions parameters.</TD> </TR> <TR> <TD>[!<i>charlist</i>] or [^<i>charlist</i>]</TD> <TD>Matches any characters not in <i>charlist</i> (not supported).</TD> </TR> <TR> <TD>[!<i>s</i>-<i>e</i>] or [^<i>s</i>-<i>e</i>]</TD> <TD>Matches any characters not in the interval [s-e] (not supported).</TD> </TR> <TR> <TD>\\</TD> <TD>Escape character for special characters.</TD> </TR> </TABLE> The syntax is similar to the POSIX fnmatch syntax (1003.2-1992 section B.6). The MATCH syntax is also similar to the 'subject' strings of TIBCO Rendezvous. Note: To use special characters as regular characters in regular expressions, you must escape them using the character ". For example, 'A[' is considered a malformed expression and the result is undefined.`

7.38.7 Character Encoding

The default encoding for IDL strings is UTF-8. RTI Connexx offers ISO 8859-1 as an alternative encoding for IDL strings.

In order to configure ISO 8859-1 as the encoding for filtering of IDL strings, you can set the DomainParticipant property **dds.domain_participant.filtering_character_encoding** to ISO-8859:

The possible values for **dds.domain_participant.filtering_character_encoding** are:

- **UTF-8** (default value)
- **ISO-8859-1**

7.38.8 Unicode Normalization

Unicode supports multiple ways to encode some characters, most notably accented characters. A composed character in Unicode can often have a number of different ways of representing the character. For example:

- Precomposed is represented by `\u1e3c`
- Composed = L + ^ is represented by `\u004c + \u032d`

The lexical comparison of the two characters above will return false. In order to do the correct comparison the characters need to be normalized, that is, reduced to the same character composition.

When the character encoding for filtering of IDL strings is UTF-8, the Unicode normalization behavior can be controlled using a DomainParticipant property called **dds.domain_participant.filtering_unicode_normalization**.

The possible values of the normalization property are:

- **OFF**: Disables normalization
- **NFD**: Canonical Decomposition
- **NFC (default value)**: Canonical Decomposition, followed by Canonical Composition
- **NFK**: Compatibility Decomposition, followed by Canonical Composition
- **NFKC_Casefold**: Casefold followed by NFKC normalization

Because normalization may affect performance, and it is enabled by default, the property allows disabling the normalization process per DomainParticipant using the value OFF. However, you should be aware that doing this may lead to unexpected behavior.

7.38.9 Examples

Assuming Topic "Location" has as an associated type a structure with fields "flight_id, x, y, z", and Topic "FlightPlan" has as fields "flight_id, source, destination". The following are examples of using these expressions.

Example of a **filter_expression** (for **DDSContentFilteredTopic** (p. 1267)) or a **query_expression** (for **DDSQueryCondition** (p. 1557)):

- `"z < 1000 AND x < 23"`

Examples of a **filter_expression** using **MATCH** (for **DDSContentFilteredTopic** (p. 1267)) operator:

- `"symbol MATCH 'NASDAQ/GOOG' "`
- `"symbol MATCH 'NASDAQ/[A-M]*' "`

7.39 Logging and Version

APIs of troubleshooting utilities that configure the middleware.

Modules

- **Version**
Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.
- **Logging**
Configure how much debugging information is reported during runtime and where it is logged.

7.39.1 Detailed Description

APIs of troubleshooting utilities that configure the middleware.

7.40 General Utilities

API of general utilities used in the RTI Connext distribution.

Modules

- **Heap Monitoring**
Monitor memory allocations done by the middleware on the native heap.
- **Network Capture**
Save network traffic into a capture file for further analysis.
- **Other Utilities**
*Other Utilities, such as **NDDSUtility::spin** (p. 1817).*

7.40.1 Detailed Description

API of general utilities used in the RTI Connex distribution.

7.41 Observability

API of RTI Connex Observability Framework.

Modules

- **Observability Library**
RTI Monitoring Library 2.0.

7.41.1 Detailed Description

API of RTI Connex Observability Framework.

7.42 Request-Reply Pattern

Support for the request-reply communication pattern.

Modules

- **Requester**
`connex::Requester` (p. 1863) and associated elements
- **Replier**
`connex::Replier` (p. 1845), `connex::SimpleReplier` (p. 1912) and associated elements

7.42.1 Detailed Description

Support for the request-reply communication pattern.

There are two basic entities that enable this pattern:

- **`connex::Requester`** (p. 1863)
- **`connex::Replier`** (p. 1845) (and a simpler version **`connex::SimpleReplier`** (p. 1912))

This functionality is built on top of RTI Connex.

A Requester publishes a request topic and subscribes to a reply topic. A Replier subscribes to the request topic and publishes the reply topic.

You can find more information about this pattern in `Request-Reply`, in the Core Libraries User's Manual.

Internal RTI Connex errors are reported as **exceptions** (p. 37).

To use request-reply in your application, include the following header file:

```
"ndds/ndds_requestreply_cpp.h"
```

See also

Request-Reply Examples (p. 225).

7.43 Requester

connext::Requester (p. 1863) and associated elements

Classes

- class **connext::Requester**< TReq, TRep >
Allows sending requests and receiving replies.
- class **connext::RequesterParams**
*Contains the parameters for creating a **connext::Requester** (p. 1863).*

7.43.1 Detailed Description

connext::Requester (p. 1863) and associated elements

7.44 Replier

connext::Replier (p. 1845), **connext::SimpleReplier** (p. 1912) and associated elements

Classes

- class **connext::Replier**< TReq, TRep >
Allows receiving requests and sending replies.
- class **connext::SimpleReplierListener**< TReq, TRep >
*The listener called by a **SimpleReplier** (p. 1912).*
- class **connext::ReplierListener**< TReq, TRep >
*Called when a **connext::Replier** (p. 1845) has new available requests.*
- class **connext::ReplierParams**< TReq, TRep >
*Contains the parameters for creating a **connext::Replier** (p. 1845).*
- class **connext::SimpleReplierParams**< TReq, TRep >
*Contains the parameters for creating a **connext::SimpleReplier** (p. 1912).*
- class **connext::SimpleReplier**< TReq, TRep >
A callback-based replier.

7.44.1 Detailed Description

connext::Replier (p. 1845), **connext::SimpleReplier** (p. 1912) and associated elements

7.45 Infrastructure

Infrastructure types for RTI Connex Messaging.

Modules

- **RTI Connex Exceptions**

RTI Connex return-code exceptions.

Classes

- class **connex::Sample**< T >
A data sample and related info received from the middleware.
- class **connex::SampleRef**< T >
A data sample and related information received from the middleware.
- class **connex::WriteSample**< T >
A sample for writing data.
- class **connex::WriteSampleRef**< T >
A reference to a data sample for writing.
- class **connex::IsValidSamplePredicate**< T >
Predicate-class to determine if a sample contains valid data.
- class **connex::IsInvalidSamplePredicate**< T >
Predicate-class to determine if a sample contains invalid data.
- class **connex::IsReplyRelatedPredicate**< T >
Predicate-class to match replies by their related request.
- class **connex::SampleIterator**< T, IsConst >
STL-compliant random-access iterator for SampleRef<T>
- class **connex::LoanedSamples**< T >
Provides access to a collection of middleware-loaned samples.

Functions

- template<typename T, bool IsConst>
ValidSampleIterator< T, IsConst > **connex::make_valid_sample_iterator** (SampleIterator< T, IsConst > related_iterator)
Creates an iterator that only returns valid samples.
- template<typename T >
LoanedSamples< T > **connex::move** (LoanedSamples< T > &ls) throw ()
*Creates a new **LoanedSamples** (p. 1709) instance by moving the contents of an existing one.*

7.45.1 Detailed Description

Infrastructure types for RTI Connext Messaging.

This section describes the sample types used for reading and writing. These types encapsulate data and related information:

- **connext::Sample** (p. 1889) (used for reading)
- **connext::WriteSample** (p. 1925) (used for writing)

Sample and WriteSample are value types. They own the data and the related information and their constructor and destructor initializes and releases the data types.

There are two parallel versions that behave as reference types and hold references to existing data and information instances:

- **connext::SampleRef** (p. 1897)
- **connext::WriteSampleRef** (p. 1929)

There are different operations that provide loaned samples from the middleware. They return a **connext::LoanedSamples** (p. 1709). This container provides STL-compliant iterators.

Other convenience functions and types, useful in combination with STL algorithms are:

- **connext::make_valid_sample_iterator()** (p. 188)
- **connext::IsValidSamplePredicate** (p. 1709)
- **connext::IsReplyRelatedPredicate** (p. 1707)

7.45.2 Function Documentation

7.45.2.1 make_valid_sample_iterator()

```
template<typename T , bool IsConst>
ValidSampleIterator< T, IsConst > connext::make_valid_sample_iterator (
    SampleIterator< T, IsConst > related_iterator )
```

Creates an iterator that only returns valid samples.

This operation returns an iterator adapter that behaves as the associated **connext::SampleIterator** (p. 1897) expect that it skips samples where **SampleRef::info()** (p. 1900).`valid_data` is false

Parameters

<i>related_iterator</i>	A regular SampleIterator (p. 1897) (e.g. connext::LoanedSamples::begin (p. 1717)) that serves as the start point.
-------------------------	---

Returns

An iterator pointing to the first valid sample on or after *related_iterator* or the end of the associated **connext::LoanedSamples** (p. 1709) if there are no valid samples.

See also

connext::LoanedSamples::begin (p. 1717)

Taking samples by copy (p. 228)

7.45.2.2 move()

```
template<typename T >
LoanedSamples< T > connext::move (
    LoanedSamples< T > & ls ) throw ( )
```

Creates a new **LoanedSamples** (p. 1709) instance by moving the contents of an existing one.

The parameter object loses the ownership of the underlying samples and its state is reset as if it was default initialized. This function must be used to move any named **LoanedSamples** instance (lvalue) in and out of a function by-value. Using this function is not necessary if the original **LoanedSamples** is an rvalue. Moving is a very efficient operation and is guaranteed to not throw any exception.

Parameters

<i>ls</i>	The LoanedSamples (p. 1709) object that transfers its ownership of the contained samples into the returned object. After this call, <i>ls</i> is empty.
-----------	--

Returns

A new **LoanedSamples** (p. 1709) object, the new loan owner, with the same contents as *ls* had.

See also

connext::LoanedSamples (p. 1709)

7.46 Utilities

Utilities for the RTI Connext Messaging module.

Classes

- class **connext::MessagingLibraryVersion**
The Connext Messaging Library version.
- class **connext::MessagingVersion**
The Connext Messaging version.

7.46.1 Detailed Description

Utilities for the RTI Connext Messaging module.

Connext Messaging Utilities

7.47 Durability and Persistence

APIs related to RTI Connext Durability and Persistence.

APIs related to RTI Connext Durability and Persistence.

RTI Connext offers the following mechanisms for achieving durability and persistence:

- **Durable Writer History** (p. 190)
- **Durable Reader State** (p. 191)
- **Data Durability** (p. 191)

To use the first two features, you need a relational database, which is not included with RTI Connext. Supported databases are listed in the [Release Notes](#).

The third feature, provided by RTI Persistence Service, can use the filesystem or a relational database to persist information.

These three features can be used separately or in combination.

7.47.1 Durable Writer History

This feature allows a **DDSDDataWriter** (p. 1305) to locally persist its local history cache so that it can survive shutdowns, crashes and restarts. When an application restarts, each **DDSDDataWriter** (p. 1305) that has been configured to have durable writer history automatically loads all the data in its history cache from disk and can carry on sending data as if it had never stopped executing. To the rest of the system, it will appear as if the **DDSDDataWriter** (p. 1305) had been temporarily disconnected from the network and then reappeared.

See also

Configuring Durable Writer History (p. 192)

7.47.2 Durable Reader State

This feature allows a **DDSDDataReader** (p. 1272) to locally persist its state and remember the sequence numbers it has already received. When an application restarts, each **DDSDDataReader** (p. 1272) that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the **DDSDDataReader** (p. 1272) before the restart will not be provided to the application again.

See also

Configuring Durable Reader State (p. 194)

7.47.3 Data Durability

This feature is a full implementation of the OMG DDS Persistence Profile. The **DURABILITY** (p. 397) QoS lets an application configure a **DDSDDataWriter** (p. 1305) such that the information written by the **DDSDDataWriter** (p. 1305) survives beyond the lifetime of the **DDSDDataWriter** (p. 1305). In this manner, a late-joining **DDSDDataReader** (p. 1272) can subscribe and receive the information even after the **DDSDDataWriter** (p. 1305) application is no longer executing. To use this feature, you need RTI Persistence Service – an optional product that can be purchased separately.

7.47.4 Durability and Persistence Based on Virtual GUID

Every modification to the global dataspace made by a **DDSDDataWriter** (p. 1305) is identified by a pair (virtual GUID, sequence number).

- The virtual GUID (Global Unique Identifier) is a 16-byte character identifier associated with a **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272); it is used to uniquely identify this entity in the global data space.
- The sequence number is a 64-bit identifier that identifies changes published by a specific **DDSDDataWriter** (p. 1305).

Several **DDSDDataWriter** (p. 1305) entities can be configured with the same virtual GUID. If each of these **DDSDDataWriter** (p. 1305) entities publishes a sample with sequence number '0', the sample will only be received once by the **DDSDDataReader** (p. 1272) entities subscribing to the content published by the **DDSDDataWriter** (p. 1305) entities.

RTI Connext also uses the virtual GUID (Global Unique Identifier) to associate a persisted state (state in permanent storage) to the corresponding DDS entity.

For example, the history of a **DDSDDataWriter** (p. 1305) will be persisted in a database table with a name generated from the virtual GUID of the **DDSDDataWriter** (p. 1305). If the **DDSDDataWriter** (p. 1305) is restarted, it must have associated the same virtual GUID to restore its previous history.

Likewise, the state of a **DDSDDataReader** (p. 1272) will be persisted in a database table whose name is generated from the **DDSDDataReader** (p. 1272) virtual GUID.

A **DDSDDataWriter** (p. 1305)'s virtual GUID can be configured using **DDS_DataWriterProtocolQosPolicy::virtual_guid** (p. 668). Similarly, a **DDSDDataReader** (p. 1272)'s virtual GUID can be configured using **DDS_DataReaderProtocolQosPolicy::virtual_guid** (p. 625).

The **DDS_PublicationBuiltinTopicData** (p. 997) and **DDS_SubscriptionBuiltinTopicData** (p. 1094) structures include the virtual GUID associated with the discovered publication or subscription.

Refer to the `User's Manual` for additional use cases.

See also

DDS_DataWriterProtocolQosPolicy::virtual_guid (p. 668) **DDS_DataReaderProtocolQosPolicy::virtual_guid** (p. 625).

7.47.5 Configuring Durable Writer History

To configure a **DDSDataWriter** (p. 1305) to have durable writer history, use the **PROPERTY** (p. 419) QoS policy associated with the **DDSDataWriter** (p. 1305) or the **DDSDomainParticipant** (p. 1335).

Properties defined for the **DDSDomainParticipant** (p. 1335) will be applied to all the **DDSDataWriter** (p. 1305) objects belonging to the **DDSDomainParticipant** (p. 1335), unless the property is overwritten by the **DDSDataWriter** (p. 1305).

See also

DDS_PropertyQosPolicy (p. 994)

The following table lists the supported durable writer history properties.

Table 7.79 Durable Writer History Properties

Property	Description
dds.data_writer.history.plugin_name	Must be set to "dds.data_writer.history.odbc_plugin.builtin" to enable durable writer history in the DataWriter. This property is required.
dds.data_writer.history.odbc_plugin.builtin.dsn	The ODBC DSN (Data Source Name) associated with the database where the writer history must be persisted. This property is required.
dds.data_writer.history.odbc_plugin.builtin.driver	This property tells RTI Connex which ODBC driver to load. If the property is not specified, RTI Connex will try to use the standard ODBC driver manager library : UnixOdbc (odbc32.dll) on Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems.
dds.data_writer.history.odbc_plugin.builtin.username	Configures the username used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_writer.history.odbc_plugin.builtin.password	Configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_writer.history.odbc_plugin.builtin.shared	If set to 1, RTI Connex creates a single connection per DSN that will be shared across DataWriters within the same Publisher. If set to 0 (the default), a DDSDataWriter (p. 1305) will create its own database connection. Default: 0

Property	Description
dds.data_writer.history.odbc_plugin.builtin.instance_↔ cache_max_size	These properties configure the resource limits associated with the ODBC writer history caches. To minimize the number of accesses to the database, RTI Connexx uses two caches, one for samples and one for instances. The initial and maximum sizes of these caches are configured using these properties. The resource limits <code>initial_instances</code> , <code>max_↔instances</code> , <code>initial_samples</code> , <code>max_samples</code> and <code>max_↔samples_per_instance</code> in the DDS_ResourceLimits_↔QosPolicy (p. 1038) are used to configure the maximum number of samples and instances that can be stored in the relational database. Default: DDS_Resource_↔LimitsQosPolicy::max_instances (p. 1041)
dds.data_writer.history.odbc_plugin.builtin.instance_↔ cache_init_size	See description above. Default: DDS_Resource_↔LimitsQosPolicy::initial_instances (p. 1042)
dds.data_writer.history.odbc_plugin.builtin.sample_↔ cache_max_size	See description above. Default: 32 (the minimum)
dds.data_writer.history.odbc_plugin.builtin.sample_↔ cache_init_size	See description above. Default: 32
dds.data_writer.history.odbc_plugin.builtin.restore	This property indicates whether or not the persisted writer history must be restored once the DDSDDataWriter (p. 1305) is restarted. If the value is 0, the content of the database associated with the DDSDDataWriter (p. 1305) being restarted will be deleted. If the value is 1, the DDSDDataWriter (p. 1305) will restore its previous state from the database content. Default: 1
dds.data_writer.history.odbc_plugin.builtin.in_memory_↔ _state	This property determines how much state will be kept in memory by the ODBC writer history in order to avoid accessing the database. When <code>in_memory_state</code> is equal to 1, <code>instance_↔cache_max_size</code> is always equal to DDS_Resource_↔LimitsQosPolicy::max_instances (p. 1041) (it cannot be changed). In addition, the ODBC writer history will keep in memory a fixed state overhead of 24 bytes per sample. In this operating mode, the ODBC writer history provides the best performance. However, the restore operation will be slower and the maximum number of samples that the writer history can manage will be limited by the available physical memory. If <code>in_memory_state</code> is equal to 0, all the state will be kept in the underlying database. In this operating mode, the maximum number of samples in the writer history will not be limited by the physical memory available unless the underlying database is an in-memory database (Times_↔Ten). Default: 1

7.47.6 Configuring Durable Reader State

To configure a **DDSDataReader** (p. 1272) with durable reader state, use the **PROPERTY** (p. 419) QoS policy associated with the **DDSDataReader** (p. 1272) or **DDSDomainParticipant** (p. 1335).

A property defined in the **DDSDomainParticipant** (p. 1335) will be applicable to all the **DDSDataReader** (p. 1272) belonging to the **DDSDomainParticipant** (p. 1335) unless it is overwritten by the **DDSDataReader** (p. 1272).

See also

DDS_PropertyQosPolicy (p. 994)

The following table lists the supported durable reader state properties.

Table 7.80 Durable Reader State Properties

Property	Description
dds.data_reader.state.odbc.dsn	The ODBC DSN (Data Source Name) associated with the database where the DDSDataReader (p. 1272) state must be persisted. This property is required.
dds.data_reader.state.filter_redundant_samples	To enable durable reader state, this property must be set to 1. Otherwise, the reader state will not be kept and/or persisted. When the reader state is not maintained, RTI Connext does not filter duplicate samples that may be coming from the same virtual writer. By default, this property is set to 1.
dds.data_reader.state.odbc.driver	This property is used to indicate which ODBC driver to load. If the property is not specified, RTI Connext will try to use the standard ODBC driver manager library: UnixOdbc (odbc32.dll) on Linux systems; the Windows ODBC driver manager (libodbc.so) on Windows systems).
dds.data_reader.state.odbc.username	This property configures the username used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_reader.state.odbc.password	This property configures the password used to connect to the database. This property is not used if it is unspecified. There is no default value.
dds.data_reader.state.restore	This property indicates if the persisted DDSDataReader (p. 1272) state must be restored or not once the DDSDataReader (p. 1272) is restarted. If this property is 0, the previous state will be deleted from the database. If it is 1, the DDSDataReader (p. 1272) will restore its previous state from the database content. Default: 1
dds.data_reader.state.checkpoint_frequency	This property controls how often the reader state is stored in the database. A value of N means to store the state once every N samples. A high value will provide better performance. However, if the reader is restarted it may receive some duplicate samples. These samples will be filtered by the middleware and they will not be propagated to the application. Default: 1

Property	Description
dds.data_reader.state.persistence_service.request_↔ depth	This property indicates the number of most recent historical samples that the persisted DDSDataReader (p. 1272) wants to receive when it starts up. Default: 0

7.47.7 Configuring Data Durability

RTI Connext implements **DDS_TRANSIENT_DURABILITY_QOS** (p. 400) and **DDS_PERSISTENT_DURABILITY_↔
QOS** (p. 400) durability using RTI Persistence Service, available for purchase as a separate RTI product.

For more information on RTI Persistence Service, refer to the `User's Manual`, or the RTI Persistence Service API Reference HTML documentation.

See also

DURABILITY (p. 397)

7.48 System Properties

System Properties.

System Properties.

RTI Connext uses the **DDS_PropertyQosPolicy** (p. 994) of a DomainParticipant to maintain a set of properties that provide system information such as hostname.

Unless the default **DDS_DomainParticipantQos** (p. 735) value is overwritten, the system properties are automatically set in the **DDS_DomainParticipantQos** (p. 735) obtained by calling the method **DDSDomainParticipantFactory↔
::get_default_participant_qos** (p. 1415) or using the constant **DDS_PARTICIPANT_QOS_DEFAULT** (p. 48).

System properties are also automatically set in the **DDS_DomainParticipantQos** (p. 735) loaded from an XML QoS profile unless you disable property inheritance using the attribute **inherit** in the XML tag **<property>**.

By default, the system properties are propagated to other DomainParticipants in the system and can be accessed through **DDS_ParticipantBuiltinTopicData::property** (p. 967).

You can disable the propagation of individual properties by setting the flag **DDS_Property_t::propagate** (p. 994) to **DDS_BOOLEAN_FALSE** (p. 316) or by removing the property using the method **DDSPropertyQosPolicyHelper↔
::remove_property** (p. 427).

The number of system properties set on the **DDS_DomainParticipantQos** (p. 735) is platform specific.

7.48.1 System Properties List

The following table lists the supported system properties. For more information, see `System Properties`, in the Core Libraries User's Manual.

Property Name	Description
dds.sys_info.hostname	Name of the host where the process is running
dds.sys_info.process_id	Process ID
dds.sys_info.username	Name of the user running the process
dds.sys_info.execution_timestamp	Time when the execution started
dds.sys_info.creation_timestamp	Time when the executable was created
dds.sys_info.executable_filepath	Name and full path of the executable
dds.sys_info.target	Architecture for which the library was compiled

7.48.2 System Resource Consideration

System properties are affected by the resource limits `DDS_DomainParticipantResourceLimitsQosPolicy::participant_property_list_max_length` (p. 756) and `DDS_DomainParticipantResourceLimitsQosPolicy::participant_property_string_max_length` (p. 756).

7.49 Configuring QoS Profiles with XML

APIs related to XML QoS Profiles.

APIs related to XML QoS Profiles.

7.49.1 Loading QoS Profiles from XML Resources

A 'QoS profile' is a group of QoS settings, specified in XML format. By using QoS profiles, you can change QoS settings without recompiling the application.

The Qos profiles are loaded the first time any of the following operations are called:

- `DDSDomainParticipantFactory::create_participant` (p. 1425)
- `DDSDomainParticipantFactory::create_participant_with_profile` (p. 1426)
- `DDSDomainParticipantFactory::set_default_participant_qos_with_profile` (p. 1414)
- `DDSDomainParticipantFactory::get_default_participant_qos` (p. 1415)
- `DDSDomainParticipantFactory::set_default_library` (p. 1416)
- `DDSDomainParticipantFactory::set_default_profile` (p. 1417)
- `DDSDomainParticipantFactory::get_participant_qos_from_profile` (p. 1419)
- `DDSDomainParticipantFactory::get_topic_qos_from_profile` (p. 1423)
- `DDSDomainParticipantFactory::get_topic_qos_from_profile_w_topic_name` (p. 1424)

- **DDSDomainParticipantFactory::get_publisher_qos_from_profile** (p. 1420)
- **DDSDomainParticipantFactory::get_subscriber_qos_from_profile** (p. 1420)
- **DDSDomainParticipantFactory::get_datawriter_qos_from_profile** (p. 1421)
- **DDSDomainParticipantFactory::get_datawriter_qos_from_profile_w_topic_name** (p. 1421)
- **DDSDomainParticipantFactory::get_datareader_qos_from_profile** (p. 1422)
- **DDSDomainParticipantFactory::get_datareader_qos_from_profile_w_topic_name** (p. 1423)
- **DDSDomainParticipantFactory::get_qos_profile_libraries** (p. 1425)
- **DDSDomainParticipantFactory::get_qos_profiles** (p. 1425)
- **DDSDomainParticipantFactory::load_profiles** (p. 1430)

The QoS profiles are reloaded replacing previously loaded profiles when the following operations are called:

- **DDSDomainParticipantFactory::set_qos** (p. 1429)
- **DDSDomainParticipantFactory::reload_profiles** (p. 1430)

The **DDSDomainParticipantFactory::unload_profiles** (p. 1431) operation will free the resources associated with the XML QoS profiles.

There are five ways to configure the XML resources (listed by load order):

- The file `NDDS_QOS_PROFILES.xml` in `$NDDSHOME/resource/xml` is loaded if it exists and **DDS_ProfileQosPolicy::ignore_resource_profile** (p. 993) in **DDS_ProfileQosPolicy** (p. 991) is set to **DDS_BOOLEAN_FALSE** (p. 316) (first to be loaded). An example file, `NDDS_QOS_PROFILES.example.xml`, is available for reference.
- The URL groups separated by semicolons referenced by the environment variable `NDDS_QOS_PROFILES` are loaded if they exist and **DDS_ProfileQosPolicy::ignore_environment_profile** (p. 993) in **DDS_ProfileQosPolicy** (p. 991) is set to **DDS_BOOLEAN_FALSE** (p. 316).
- The file `USER_QOS_PROFILES.xml` in the working directory will be loaded if it exists and **DDS_ProfileQosPolicy::ignore_user_profile** (p. 993) in **DDS_ProfileQosPolicy** (p. 991) is set to **DDS_BOOLEAN_FALSE** (p. 316).
- The URL groups referenced by **DDS_ProfileQosPolicy::url_profile** (p. 992) in **DDS_ProfileQosPolicy** (p. 991) will be loaded if specified.
- The sequence of XML strings referenced by **DDS_ProfileQosPolicy::string_profile** (p. 992) will be loaded if specified (last to be loaded).

The above methods can be combined together.

7.49.2 URL

The location of the XML resources (only files and strings are supported) is specified using a URL (Uniform Resource Locator) format. For example:

File Specification: `file:///usr/local/default_dds.xml`

String Specification: `str://"<dds><qos_library> . . . lt;/qos_library><dds>"`

If the URL schema name is omitted, RTI Connex will assume a file name. For example:

File Specification: `/usr/local/default_dds.xml`

7.49.2.1 URL groups

To provide redundancy and fault tolerance, you can specify multiple locations for a single XML document via URL groups. The syntax of a URL group is as follows:

`[URL1 | URL2 | URL2 | . . . | URLn]`

For example:

`[file:///usr/local/default_dds.xml | file:///usr/local/alternative_default_dds.xml]`

Only one of the elements in the group will be loaded by RTI Connex, starting from the left.

Brackets are not required for groups with a single URL.

7.49.2.2 NDDS_QOS_PROFILES environment variable

The environment variable `NDDS_QOS_PROFILES` contains a list of URL groups separated by ';'.

The URL groups referenced by the environment variable are loaded if they exist and `DDS_ProfileQosPolicy::ignore_environment_profile` (p. 993) is set to `DDS_BOOLEAN_FALSE` (p. 316)

7.49.2.3 Built-In QoS Profiles

There are also a number of built-in QoS profiles that can be used without having to load any configurations from outside XML resources. For more information on these built-in profiles see **Built-in QoS Profiles** (p. 480).

For more information on XML Configuration, refer to the `User's Manual`.

7.50 Publication Example

A data publication example.

A data publication example.

7.50.1 A typical publication example

Prep

- Create user data types using `rtiddsgen`. See the `Code Generator User's Manual`.

Set up

- **Get the factory** (p. 201)
- **Set up participant** (p. 201)
- **Set up publisher** (p. 205)
- **Register user data type(s)** (p. 202)
- **Set up topic(s)** (p. 202)
- **Set up data writer(s)** (p. 206)

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 212)

Send data

- **Send data** (p. 207)

Tear down

- **Tear down data writer(s)** (p. 207)
- **Tear down topic(s)** (p. 203)
- **Tear down publisher** (p. 205)
- **Tear down participant** (p. 202)

7.51 Subscription Example

A data subscription example.

A data subscription example.

7.51.1 A typical subscription example

Prep

- Create user data types using `rtiddsgen`. See the `Code Generator User's Manual`.

Set up

- **Get the factory** (p. 201)
- **Set up participant** (p. 201)
- **Set up subscriber** (p. 207)
- **Register user data type(s)** (p. 202)
- **Set up topic(s)** (p. 202)
- **Set up data reader(s)** (p. 209)

- **Set up data reader** (p. 210) **OR** **Set up subscriber** (p. 208) to receive data

Adjust the desired quality of service (QoS)

- **Adjust QoS on entities as necessary** (p. 212)

Receive data

- Access received data either **via a reader** (p. 210) **OR** **via a subscriber** (p. 208) (possibly in a **ordered or coherent** (p. 209) manner)

Tear down

- **Tear down data reader(s)** (p. 212)
- **Tear down topic(s)** (p. 203)
- **Tear down subscriber** (p. 209)
- **Tear down participant** (p. 202)

7.52 Participant Use Cases

Working with domain participants.

Working with domain participants.

7.52.1 Turning off auto-enable of newly created participant(s)

- Get the factory (p. 201)
- Change the value of the **ENTITY_FACTORY** (p. 401) for the **DDSDomainParticipantFactory** (p. 1409)

```
DDS_DomainParticipantFactoryQos factory_qos;

if (factory->get_qos(factory_qos) != DDS_RETCODE_OK) {
    printf("***Error: failed to get domain participant factory qos\n");
}
/* Change the QosPolicy to create disabled participants */
factory_qos.entity_factory.autoenable_created_entities = DDS_BOOLEAN_FALSE;
if (factory->set_qos(factory_qos) != DDS_RETCODE_OK) {
    printf("***Error: failed to set domain participant factory qos\n");
}
```

7.52.2 Getting the factory

- Get the **DDSDomainParticipantFactory** (p. 1409) instance:

```
DDSDomainParticipantFactory* factory = NULL;
factory = DDSDomainParticipantFactory::get_instance();
if (factory == NULL) {
    // ... error
}
```

7.52.3 Setting up a participant

- Get the factory (p. 201)
- Create **DDSDomainParticipant** (p. 1335):

```
DDS_DomainParticipantQos participant_qos;
DDSDomainParticipantListener* participant_listener = NULL;
DDS_ReturnCode_t retcode;
// Set the initial peers. This list includes all the computers the
// application may communicate with, along with the maximum number of
// RTI Data Distribution Service participants that can concurrently
// run on that computer. This list only needs to be a superset of the
// actual list of computers and participants that will be running at
// any time.
const char* NDDS_DISCOVERY_INITIAL_PEERS[] = {
    "host1",
    "10.10.30.192",
    "1@localhost",
    "2@host2",
    "my://", /* all unicast addrs on transport plugins with alias "my" */
    "2@shmem://", /* shared memory */
    "FF00:ABCD::0",
    "sf://0/0/R", /* StarFabric transport plugin */
    "1@FF00:0:1234::0",
    "225.1.2.3",
    "3@225.1.0.55",
    "FAA0::0#0/0/R",
};
const DDS_Long NDDS_DISCOVERY_INITIAL_PEERS_LENGTH =
    sizeof(NDDS_DISCOVERY_INITIAL_PEERS)/sizeof(const char*);
// initialize participant_qos with default values
retcode = factory->get_default_participant_qos(participant_qos);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default participant qos\n");
}
if (!participant_qos.discovery.initial_peers.from_array(
    NDDS_DISCOVERY_INITIAL_PEERS,
    NDDS_DISCOVERY_INITIAL_PEERS_LENGTH)) {
    printf("***Error: failed to set discovery.initial_peers qos\n");
}
// Create the participant
```

```

DDSDomainParticipant* participant =
    factory->create_participant(domain_id,
                                participant_qos,
                                participant_listener,
                                DDS_STATUS_MASK_NONE);

if (participant == NULL) {
    printf("***Error: failed to create domain participant\n");
};
return participant;

```

7.52.4 Tearing down a participant

- **Get the factory** (p. 201)
- **Delete DDSDomainParticipant** (p. 1335):

```

DDS_ReturnCode_t retcode;
retcode = factory->delete_participant(participant);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}

```

7.53 Topic Use Cases

Working with topics.

Working with topics.

7.53.1 Registering a user data type

- **Set up participant** (p. 201)
- **Register user data type of type T under the name "My_Type"**

```

const char* type_name = "My_Type";
DDS_ReturnCode_t retcode;
retcode = FooTypeSupport::register_type(participant, type_name);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}

```

7.53.2 Setting up a topic

- **Set up participant** (p. 201)
- **Ensure user data type is registered** (p. 202)
- **Create a DDSTopic** (p. 1601) under the name "my_topic"

```

const char* topic_name = "my_topic";
const char* type_type = "My_Type"; // user data type
DDS_TopicQos topic_qos;
DDS_ReturnCode_t retcode;
// MyTopicListener is user defined and
// extends DDSTopicListener
DDSTopicListener* topic_listener = new MyTopicListener(); // or = NULL
retcode = participant->get_default_topic_qos(topic_qos);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
DDSTopic* topic = participant->create_topic(topic_name, type_name,
                                            topic_qos, topic_listener,
                                            DDS_STATUS_MASK_ALL);

if (topic == NULL) {
    // ... error
};

```

7.53.3 Tearing down a topic

- Delete **DDSTopic** (p. 1601):

```
DDS_ReturnCode_t retcode;
retcode = participant->delete_topic(topic);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.54 FlowController Use Cases

Working with flow controllers.

Working with flow controllers.

7.54.1 Creating a flow controller

- Set up participant (p. 201)
- Create a flow controller

```
DDS_ReturnCode_t retcode;
DDSFlowController *controller = NULL;
DDS_FlowControllerProperty_t property;
retcode = participant->get_default_flowcontroller_property(property);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get default flow controller property\n");
}
// optionally modify flow controller property values
controller = participant->create_flowcontroller(
    "my flow controller name", property);
if (controller == NULL) {
    printf("***Error: failed to create flow controller\n");
}
```

7.54.2 Flow controlling a data writer

- Set up participant (p. 201)
- Create flow controller (p. 203)
- Create an asynchronous data writer, **FooDataWriter** (p. 1659), of user data type **Foo** (p. 1632) :

```
DDS_DataWriterQos writer_qos;
DDS_ReturnCode_t retcode;
// MyWriterListener is user defined and
// extends DDSDataWriterListener
MyWriterListener* writer_listener = new MyWriterListener(); // or = NULL
retcode = publisher->get_default_datawriter_qos(writer_qos);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
/* Change the writer QoS to publish asynchronously */
writer_qos.publish_mode.kind = DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS;
/* Setup to use the previously created flow controller */
writer_qos.publish_mode.flow_controller_name =
    DDS_String_dup("my flow controller name");
/* Samples queued for asynchronous write are subject to the History Qos policy */
writer_qos.history.kind = DDS_KEEP_ALL_HISTORY_QOS;
FooDataWriter* writer = publisher->create_datawriter(topic,
                                                    writer_qos,
                                                    writer_listener,
                                                    DDS_STATUS_MASK_ALL);
```

```

if (writer == NULL) {
    // ... error
};
/* Send data asynchronously... */
/* Wait for asynchronous send completes, if desired */
retcode = writer->wait_for_asynchronous_publishing(timeout);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to wait for asynchronous publishing\n");
}

```

7.54.3 Using the built-in flow controllers

RTI Connext provides several built-in flow controllers.

The **DDS_DEFAULT_FLOW_CONTROLLER_NAME** (p. 121) built-in flow controller provides the basic asynchronous writer behavior. When calling **FooDataWriter::write** (p. 1666), the call signals the **DDSPublisher** (p. 1534) asynchronous publishing thread (**DDS_PublisherQos::asynchronous_publisher** (p. 1012)) to send the actual data. As with any **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431) **DDSDataWriter** (p. 1305), the **FooDataWriter::write** (p. 1666) call returns immediately afterwards. The data is sent immediately in the context of the **DDSPublisher** (p. 1534) asynchronous publishing thread.

When using the **DDS_FIXED_RATE_FLOW_CONTROLLER_NAME** (p. 122) flow controller, data is also sent in the context of the **DDSPublisher** (p. 1534) asynchronous publishing thread, but at a regular fixed interval. The thread accumulates samples from different **DDSDataWriter** (p. 1305) instances and generates data on the wire only once per **DDS_FlowControllerTokenBucketProperty_t::period** (p. 902).

In contrast, the **DDS_ON_DEMAND_FLOW_CONTROLLER_NAME** (p. 123) flow controller permits flow only when **DDSFlowController::trigger_flow** (p. 1453) is called. The data is still sent in the context of the **DDSPublisher** (p. 1534) asynchronous publishing thread. The thread accumulates samples from different **DDSDataWriter** (p. 1305) instances (across any **DDSPublisher** (p. 1534)) and sends all data since the previous trigger.

The properties of the built-in **DDSFlowController** (p. 1451) instances can be adjusted.

- Set up participant (p. 201)

- Lookup built-in flow controller

```

DDSFlowController *controller = NULL;
controller = participant->lookup_flowcontroller(
    DDS_DEFAULT_FLOW_CONTROLLER_NAME);
/* This should never happen, built-in flow controllers are always created */
if (controller == NULL) {
    printf("***Error: failed to lookup flow controller\n");
}

```

- Change property of built-in flow controller, if desired

```

DDS_ReturnCode_t retcode;
DDS_FlowControllerProperty_t property;
/* Get the property of the flow controller */
retcode = controller->get_property(property);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to get flow controller property\n");
}
/* Change the property value as desired */
property.token_bucket.period.sec = 2;
property.token_bucket.period.nanosec = 0;
/* Update the flow controller property */
retcode = controller->set_property(property);
if (retcode != DDS_RETCODE_OK) {
    printf("***Error: failed to set flow controller property\n");
}

```

- Create a data writer using the correct flow controller name (p. 203)

7.54.4 Shaping the network traffic for a particular transport

- **Set up participant** (p. 201)
- **Create the transports** (p. 215)
- **Create a separate flow controller for each transport** (p. 203)
- Configure **DDSDataWriter** (p. 1305) instances to only use a single transport
- **Associate all data writers using the same transport to the corresponding flow controller** (p. 203)
- For each transport, the corresponding flow controller limits the network traffic based on the token bucket properties

7.54.5 Coalescing multiple samples in a single network packet

- **Set up participant** (p. 201)
- **Create a flow controller with a desired token bucket period** (p. 203)
- **Associate the data writer with the flow controller** (p. 203)
- Multiple samples written within the specified period will be coalesced into a single network packet (provided that `tokens_added_per_period` and `bytes_per_token` permit).

7.55 Publisher Use Cases

Working with publishers.

Working with publishers.

7.55.1 Setting up a publisher

- **Set up participant** (p. 201)
- **Create a DDSPublisher** (p. 1534)

```
DDS_PublisherQos publisher_qos;
// MyPublisherListener is user defined and
// extends DDSPublisherListener
DDSPublisherListener* publisher_listener =
    = new MyPublisherListener(); // or = NULL
participant->get_default_publisher_qos(publisher_qos);
DDSPublisher* publisher = participant->create_publisher(publisher_qos,
    publisher_listener,
    DDS_STATUS_MASK_ALL);

if (publisher == NULL) {
    // ... error
};
```

7.55.2 Tearing down a publisher

- **Delete DDSPublisher** (p. 1534):

```
DDS_ReturnCode_t retcode;
retcode = participant->delete_publisher(publisher);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.56 DataWriter Use Cases

Working with data writers.

Working with data writers.

7.56.1 Setting up a data writer

- Set up publisher (p. 205)
- Set up a topic (p. 202)
- Create a data writer, **FooDataWriter** (p. 1659), of user data type **Foo** (p. 1632) :

```
DDS_DataWriterQos writer_qos;
DDS_ReturnCode_t retcode;
// MyWriterListener is user defined and
// extends DDSDataWriterListener
MyWriterListener* writer_listener = new MyWriterListener(); // or = NULL
retcode = publisher->get_default_datawriter_qos(writer_qos);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
FooDataWriter* writer = publisher->create_datawriter(topic,
                                                    writer_qos,
                                                    writer_listener,
                                                    DDS_STATUS_MASK_ALL);

if (writer == NULL) {
    // ... error
};
```

7.56.2 Managing instances

- Getting an instance "key" value of user data type **Foo** (p. 1632)

```
Foo* data = ...; // user data
retcode = writer->get_key_value(*data, instance_handle);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

- Registering an instance of type **Foo** (p. 1632)

```
DDS_InstanceHandle_t instance_handle = DDS_HANDLE_NIL;
instance_handle = writer->register_instance(data);
```

- Unregistering an instance of type **Foo** (p. 1632)

```
retcode = writer->unregister_instance(data, instance_handle);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

- Disposing of an instance of type **Foo** (p. 1632)

```
retcode = writer->dispose(data, instance_handle);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.56.3 Sending data

- **Set up data writer** (p. 206)
- **Register instance** (p. 206)
- **Write instance of type Foo** (p. 1632)

```
Foo* data; // user data
DDS_InstanceHandle_t instance_handle =
    DDS_HANDLE_NIL; // or a valid registered handle
DDS_ReturnCode_t retcode;
retcode = writer->write(data, instance_handle);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.56.4 Tearing down a data writer

- **Delete DDSDataWriter** (p. 1305):

```
DDS_ReturnCode_t retcode;
retcode = publisher->delete_datawriter(writer);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.57 Subscriber Use Cases

Working with subscribers.

Working with subscribers.

7.57.1 Setting up a subscriber

- **Set up participant** (p. 201)
- **Create a DDSSubscriber** (p. 1576)

```
DDS_SubscriberQos subscriber_qos;
DDS_ReturnCode_t retcode;
// MySubscriberListener is user defined and
// extends DDSSubscriberListener
DDSSubscriberListener* subscriber_listener =
    new MySubscriberListener(); // or = NULL
retcode = participant->get_default_subscriber_qos(subscriber_qos);
if (retcode != DDS_RETCODE_OK) {
    // ... error
};
DDSSubscriber* subscriber =
    participant->create_subscriber(subscriber_qos,
                                   subscriber_listener,
                                   DDS_STATUS_MASK_ALL);

if (subscriber == NULL) {
    // ... error
};
```

7.57.2 Set up subscriber to access received data

- **Set up subscriber** (p. 207)
- Set up to handle the `DDS_DATA_ON_READERS_STATUS` status, in one or both of the following two ways.
- **Enable `DDS_DATA_ON_READERS_STATUS` for the `DDSSubscriberListener` associated with the subscriber** (p. 213)
 - The processing to handle the status change is done in the `DDSSubscriberListener::on_data_on_readers()` (p. 1598) method of the attached listener.
 - Typical processing will **access the received data** (p. 208), either in arbitrary order or in a **coherent and ordered manner** (p. 209).
- **Enable `DDS_DATA_ON_READERS_STATUS` for the `DDSStatusCondition` associated with the subscriber** (p. 213)
 - The processing to handle the status change is done **when the subscriber's attached status condition is triggered** (p. 215) and the `DDS_DATA_ON_READERS_STATUS` status on the subscriber is changed.
 - Typical processing will **access the received data** (p. 208), either in an arbitrary order or in a **coherent and ordered manner** (p. 209).

7.57.3 Access received data via a subscriber

- **Ensure subscriber is set up to access received data** (p. 208)
- Get the list of readers that have data samples available:

```
DDSDataReaderSeq reader_seq; // holder for list/set of readers
DDS_SampleStateMask sample_state_mask = DDS_NOT_READ_SAMPLE_STATE;
DDS_ViewStateMask view_state_mask = DDS_ANY_VIEW_STATE;
DDS_InstanceStateMask instance_state_mask = DDS_ANY_INSTANCE_STATE;
DDS_ReturnCode_t retcode;
// get_datareadersX is not supported yet.
retcode = subscriber->get_datareaders(reader_seq,
                                     sample_state_mask,
                                     view_state_mask,
                                     instance_state_mask);

if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```
- Upon successfully getting the list of readers with data, process the data readers to either:
 - **Read the data in each reader** (p. 211), OR
 - **Take the data in each reader** (p. 210)

If the intent is to access the data **coherently or in order** (p. 209), the list of data readers *must* be processed in the order returned:

```
for(int i = 0; i < reader_seq.length(); ++i) {

    TDataReader* reader = reader_seq[i];
    // Take the data from reader,
    // OR
    // Read the data from reader
}
```

- **Alternatively**, call `DDSSubscriber::notify_datareaders` (p. 1592) to invoke the `DDSDataReaderListener` (p. 1299) for each of the data readers.

```
retcode = subscriber->notify_datareaders();
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.57.4 Access received data coherently and/or in order

To access the received data coherently and/or in an ordered manner, according to the settings of the **DDS_←PresentationQosPolicy** (p. 983) attached to a **DDSSubscriber** (p. 1576):

- **Ensure subscriber is set up to access received data** (p. 208)
- Indicate that data will be accessed via the subscriber:

```
retcode = subscriber->begin_access();
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```
- **Access received data via the subscriber, making sure that the data readers are processed in the order returned.** (p. 208)
- Indicate that the data access via the subscriber is done:

```
retcode = subscriber->end_access();
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.57.5 Tearing down a subscriber

- **Delete DDSSubscriber** (p. 1576):

```
DDS_ReturnCode_t retcode;
retcode = participant->delete_subscriber(subscriber);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.58 DataReader Use Cases

Working with data readers.

Working with data readers.

7.58.1 Setting up a data reader

- **Set up subscriber** (p. 207)
- **Set up a topic** (p. 202)
- **Create a data reader, FooDataReader** (p. 1632), of user data type **Foo** (p. 1632) :

```
DDS_DataReaderQos reader_qos;
DDS_ReturnCode_t retcode;
// MyReaderListener is user defined and
// extends DDSDataReaderListener
DDSDataReaderListener* reader_listener =
    new MyReaderListener(); // or = NULL
retcode = subscriber->get_default_datareader_qos(reader_qos);
if (retcode != DDS_RETCODE_OK) {
    // ... error
};
FooDataReader* reader = subscriber->create_datareader(topic,
                                                    reader_qos,
                                                    reader_listener,
                                                    DDS_STATUS_MASK_ALL);

if (reader == NULL) {
    // ... error
};
```

7.58.2 Managing instances

- Given a data reader

```
FooDataReader* reader = ...;
```
- Getting an instance "key" value of user data type **Foo** (p. 1632)

```
Foo data;          // user data of type Foo
// ...
retcode = reader->get_key_value(data, instance_handle);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.58.3 Set up reader to access received data

- **Set up data reader** (p. 209)
- Set up to handle the **DDS_DATA_AVAILABLE_STATUS** status, in one or both of the following two ways.
- **Enable DDS_DATA_AVAILABLE_STATUS for the DDSDataReaderListener associated with the data reader** (p. 213)
 - The processing to handle the status change is done in the **DDSDataReaderListener::on_data_available** (p. 1301) method of the attached listener.
 - Typical processing will **access the received data** (p. 210).
- **Enable DDS_DATA_AVAILABLE_STATUS for the DDSStatusCondition associated with the data reader** (p. 213)
 - The processing to handle the status change is done **when the data reader's attached status condition is triggered** (p. 215) and the **DDS_DATA_AVAILABLE_STATUS** status on the data reader is changed.
 - Typical processing will **access the received data** (p. 210).

7.58.4 Access received data via a reader

- **Ensure reader is set up to access received data** (p. 210)
- Access the received data, by either:
 - **Taking the received data in the reader** (p. 210), **OR**
 - **Reading the received data in the reader** (p. 211)

7.58.5 Taking data

- **Ensure reader is set up to access received data** (p. 210)

- Take samples of user data type T. The samples are removed from the Service. The caller is responsible for deallocating the buffers.

```

FooSeq          data_seq; // holder for sequence of user data type Foo
DDS_SampleInfoSeq info_seq; // holder for sequence of DDS_SampleInfo
long            max_samples = DDS_LENGTH_UNLIMITED;
DDS_SampleStateMask sample_state_mask = DDS_ANY_SAMPLE_STATE;
DDS_ViewStateMask view_state_mask = DDS_ANY_VIEW_STATE;
DDS_InstanceStateMask instance_state_mask = DDS_ANY_INSTANCE_STATE;
DDS_ReturnCode_t retcode;
retcode = reader->take(data_seq, info_seq,
                      max_samples,
                      sample_state_mask,
                      view_state_mask,
                      instance_state_mask);
if (retcode == DDS_RETCODE_NO_DATA) {
    return;
} else if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}

```

- Use the received data

```

// Use the received data samples 'data_seq' and associated information 'info_seq'
for(int i = 0; i < data_seq.length(); ++i) {
    // use... data_seq[i] ...
    // use... info_seq[i] ...
}

```

- Return the data samples and the information buffers back to the middleware. *IMPORTANT*: Once this call returns, you must not retain any pointers to any part of any sample or sample info object.

```

retcode = reader->return_loan(data_seq, info_seq);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}

```

7.58.6 Reading data

- Ensure reader is set up to access received data (p.210)
- Read samples of user data type **Foo** (p.1632). The samples are not removed from the Service. It remains responsible for deallocating the buffers.

```

FooSeq          data_seq; // holder for sequence of user data type Foo
DDS_SampleInfoSeq info_seq; // holder for sequence of DDS_SampleInfo
long            max_samples = DDS_LENGTH_UNLIMITED;
DDS_SampleStateMask sample_state_mask = DDS_NOT_READ_SAMPLE_STATE;
DDS_ViewStateMask view_state_mask = DDS_ANY_VIEW_STATE;
DDS_InstanceStateMask instance_state_mask = DDS_ANY_INSTANCE_STATE;
DDS_ReturnCode_t retcode;
retcode = reader->read(data_seq, info_seq,
                      max_samples,
                      sample_state_mask,
                      view_state_mask,
                      instance_state_mask);
if (retcode == DDS_RETCODE_NO_DATA) {
    return;
} else if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}

```

- Use the received data

```

// Use the received data samples 'data_seq' and associated
// information 'info_seq'
for(int i = 0; i < data_seq.length(); ++i) {
    // use... data_seq[i] ...
    // use... info_seq[i] ...
}

```

- Return the data samples and the information buffers back to the middleware

```

retcode = reader->return_loan(data_seq, info_seq);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}

```

7.58.7 Tearing down a data reader

- Delete **DDSDataReader** (p. 1272):

```
DDS_ReturnCode_t retcode;
retcode = subscriber->delete_datareader(reader);
if (retcode != DDS_RETCODE_OK) {
    // ... check for cause of failure
}
```

7.59 Entity Use Cases

Working with entities.

Working with entities.

7.59.1 Enabling an entity

- To enable an **DDSEntity** (p. 1446)

```
if (entity->enable() != DDS_RETCODE_OK) {
    printf("***Error: failed to enable entity\n");
}
```

7.59.2 Checking if a status changed on an entity.

- Given an **DDSEntity** (p. 1446) and a **DDS_StatusKind** (p. 341) to check for, get the list of statuses that have changed since the last time they were respectively cleared.

```
DDS_StatusMask status_changes_mask = entity->get_status_changes();
```
- Check if `status_kind` was changed since the last time it was cleared. A plain communication status change is cleared when the status is read using the entity's `get_<plain communication status>()` method. A read communication status change is cleared when the data is taken from the middleware via a `TDataReader_↵take()` call [see **Changes in Status** (p. 338) for details].

```
if (status_changes_mask & status_kind) {
    return true;
} else {
    /* ... YES, status_kind changed ... */
    return false; /* ... NO, status_kind did NOT change ... */
}
```

7.59.3 Changing the QoS for an entity

The QoS for an entity can be specified at the entity creation time. Once an entity has been created, its QoS can be manipulated as follows.

- Get an entity's QoS settings using **get_qos (abstract)** (p. ??)

```
if (entity->get_qos(qos) != DDS_RETCODE_OK) {
    printf("***Error: failed to get qos\n");
}
```
- Change the desired qos policy fields

```
/* Change the desired qos policies */
/* qos.policy.field = ... */
```

- Set the qos using **set_qos (abstract)** (p. ??).

```
switch (entity->set_qos(qos)) {
    case DDS_RETCODE_OK: { /* success */
        } break;
    case DDS_RETCODE_IMMUTABLE_POLICY: {
        printf("***Error: tried changing a policy that can only be"
              "          set at entity creation time\n");
        } break;
    case DDS_RETCODE_INCONSISTENT_POLICY: {
        printf("***Error: tried changing a policy to a value inconsistent"
              "          with other policy settings\n");
        } break;
    default: {
        printf("***Error: some other failure\n");
    }
}
```

7.59.4 Changing the listener and enabling/disabling statuses associated with it

The listener for an entity can be specified at the entity creation time. By default the listener is *enabled* for all the statuses supported by the entity.

Once an entity has been created, its listener and/or the statuses for which it is enabled can be manipulated as follows.

- User defines entity listener methods

```
/* ... methods defined by EntityListener ... */
public class MyEntityListener implements DDSListener {
    // ... methods defined by EntityListener ...
}
```

- Get an entity's listener using **get_listener (abstract)** (p. ??)

```
entity_listener = entity->get_listener();
```

- Enable status_kind for the listener

```
enabled_status_list |= status_kind;
```

- Disable status_kind for the listener

```
enabled_status_list &= ~status_kind;
```

- Set an entity's listener to entity_listener using **set_listener (abstract)** (p. ??). Only enable the listener for the statuses specified by the enabled_status_list.

```
if (entity->set_listener(entity_listener, enabled_status_list)
    != DDS_RETCODE_OK) {
    printf("***Error: setting entity listener\n");
}
```

7.59.5 Enabling/Disabling statuses associated with a status condition

Upon entity creation, by default, all the statuses are *enabled* for the DDS_StatusCondition associated with the entity.

Once an entity has been created, the list of statuses for which the DDS_StatusCondition is triggered can be manipulated as follows.

- Given an entity, a status_kind, and the associated status_condition:

```
statuscondition = entity->get_statuscondition();
```

- Get the list of statuses enabled for the status_condition

```
enabled_status_list = statuscondition->get_enabled_statuses();
```

- Check if the given `status_kind` is enabled for the `status_condition`

```
if (enabled_status_list & status_kind) {
    /*... YES, status_kind is enabled ... */
} else {
    /* ... NO, status_kind is NOT enabled ... */
}
```

- Enable `status_kind` for the `status_condition`

```
if (statuscondition->set_enabled_statuses(enabled_status_list | status_kind)
    != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

- Disable `status_kind` for the `status_condition`

```
if (statuscondition->set_enabled_statuses(enabled_status_list & ~status_kind)
    != DDS_RETCODE_OK) {
    /* ... check for cause of failure */
}
```

7.60 Waitset Use Cases

Using wait-sets and conditions.

Using wait-sets and conditions.

7.60.1 Setting up a wait-set

- Create a wait-set

```
DDSWaitSet* waitset = new DDSWaitSet();
```

- Attach conditions

```
DDSCondition* cond1 = ...;
DDSCondition* cond2 = entity->get_statuscondition();
DDSCondition* cond3 = reader->create_readcondition(DDS_NOT_READ_SAMPLE_STATE,
                                                    DDS_ANY_VIEW_STATE,
                                                    DDS_ANY_INSTANCE_STATE);
DDSCondition* cond4 = new DDSGuardCondition();
DDSCondition* cond5 = ...;
DDS_ReturnCode_t retcode;
retcode = waitset->attach_condition(cond1);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
retcode = waitset->attach_condition(cond2);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
retcode = waitset->attach_condition(cond3);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
retcode = waitset->attach_condition(cond4);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
retcode = waitset->attach_condition(cond5);
if (retcode != DDS_RETCODE_OK) {
    // ... error
}
```

7.60.2 Waiting for condition(s) to trigger

- Set up a wait-set (p. 214)

- Wait for a condition to trigger or timeout, whichever occurs first

```
DDS_Duration_t timeout = { 0, 1000000 }; // 1ms
DDSConditionSeq active_conditions; // holder for active conditions
bool is_cond1_triggered = false;
bool is_cond2_triggered = false;
DDS_ReturnCode_t retcode;
retcode = waitset->wait(active_conditions, timeout);
if (retcode != DDS_RETCODE_OK) {
    if (retcode == DDS_RETCODE_TIMEOUT) {
        // Timeout
    } else {
        // Failure
    }
} else {
    // success, check if "cond1" or "cond2" are triggered:
    for(int i = 0; i < active_conditions.length(); ++i) {
        if (active_conditions[i] == cond1) {
            printf("Cond1 was triggered!");
            is_cond1_triggered = true;
        }
        if (active_conditions[i] == cond2) {
            printf("Cond2 was triggered!");
            is_cond2_triggered = true;
        }
        if (is_cond1_triggered && is_cond2_triggered) {
            break;
        }
    }
}
if (is_cond1_triggered) {
    // ... do something because "cond1" was triggered ...
}
if (is_cond2_triggered) {
    // ... do something because "cond2" was triggered ...
}
return retcode;
```

7.60.3 Tearing down a wait-set

- Delete the wait-set

```
delete waitset;
waitset = NULL;
```

7.61 Transport Use Cases

Working with pluggable transports.

Working with pluggable transports.

7.61.1 Changing the automatically registered built-in transports

- The **DDS_TRANSPORTBUILTIN_MASK_DEFAULT** (p. 444) specifies the transport plugins that will be automatically registered with a newly created **DDSDomainParticipant** (p. 1335) by default.
- This default can be changed by changing the value of the value of **TRANSPORT_BUILTIN** (p. 442) Qos Policy on the **DDSDomainParticipant** (p. 1335)
- To change the **DDS_DomainParticipantQos::transport_builtin** (p. 738) Qos Policy:

```
DDS_DomainParticipantQos participant_qos;

factory->get_default_participant_qos(participant_qos);

participant_qos.transport_builtin.mask = DDS_TRANSPORTBUILTIN_SHMEM |
DDS_TRANSPORTBUILTIN_UDPv4;
```

7.61.2 Changing the properties of the automatically registered builtin transports

The behavior of the automatically registered builtin transports can be altered by changing their properties.

- Tell the **DDSDomainParticipantFactory** (p. 1409) to create the participants disabled, as described in **Turning off auto-enable of newly created participant(s)** (p. 201)

- Get the property of the desired builtin transport plugin, say **::UDIPv4 Transport** (p. 266)

```
struct NDDS_Transport_UDPv4_Property_t property = NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT;

if (NDDSTransportSupport::get_builtin_transport_property(
    participant,
    DDS_TRANSPORTBUILTIN_UDPv4,
    (struct NDDS_Transport_Property_t&)property)
    != DDS_RETCODE_OK) {
    printf("***Error: get builtin transport property\n");
}
```

- Change the property fields as desired. Note that the properties should be changed carefully, as inappropriate values may prevent communications. For example, the **::UDIPv4 Transport** (p. 266) properties can be changed to support **large messages** (assuming the underlying operating system's UDPv4 stack supports the large message size). Note: if message_size_max is increased from the default for any of the built-in transports, then the **DDS←_ReceiverPoolQosPolicy::buffer_size** (p. 1026) on the DomainParticipant should also be changed.

```
/* Decrease the UDPv4 maximum message size to 9K (small messages). */
property.parent.message_size_max = 9216;
property.recv_socket_buffer_size = 9216;
property.send_socket_buffer_size = 9216;
```

- Set the property of the desired builtin transport plugin, say **::UDIPv4 Transport** (p. 266)

```
if (NDDSTransportSupport::set_builtin_transport_property(
    participant,
    DDS_TRANSPORTBUILTIN_UDPv4,
    (struct NDDS_Transport_Property_t&)property)
    != DDS_RETCODE_OK) {
    printf("***Error: set builtin transport property\n");
}
```

- **Enable the participant** (p. 212) to turn on communications with other participants in the domain using the new properties for the automatically registered builtin transport plugins.

7.61.3 Creating a transport

- A transport plugin is created using methods provided by the supplier of the transport plugin.

- For example to create an instance of the **::UDIPv4 Transport** (p. 266)

```
NDDS_Transport_Plugin* transport = NULL;
struct NDDS_Transport_UDPv4_Property_t property = NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT;
transport = NDDS_Transport_UDPv4_new(&property);
if (transport == NULL) {
    printf("***Error: creating transport plugin\n");
}
```

7.61.4 Deleting a transport

- A transport plugin can only be deleted only after the **DDSDomainParticipant** (p. 1335) with which it is registered is deleted.

- The virtual destructor provided by the abstract transport plugin API can be used to delete a transport plugin.

```
transport->delete_cEA(transport, NULL);
```

7.61.5 Registering a transport with a participant

The basic steps for setting up transport plugins for use in an RTI Connex application are described below.

- Tell the **DDSDomainParticipantFactory** (p. 1409) to create the participants disabled, as described in **Turning off auto-enable of newly created participant(s)** (p. 201)

Optionally Changing the automatically registered built-in transports (p. 215)

Optionally Changing the properties of the automatically registered builtin transports (p. 216)

- Create a disabled **DDSDomainParticipant** (p. 1335), as described in **Setting up a participant** (p. 201)
- Decide on the **network address** (p. ??) for the transport plugin. The network address should be chosen so that the resulting fully qualified address is globally unique (across all transports used in the domain).

```
/* Decide on a network address (96 bits for UDPv4), such that the fully
   qualified unicast address for the transport's interfaces will be
   globally unique. For example, we use the network address:
       1234:1234:1234:0000
   It will be prepended to the unicast addresses of the transport plugin's
   interfaces, to give a fully qualified address that is unique in the
   domain.
*/
NDDS_Transport_Address_t network_address = {{1,2,3,4, 1,2,3,4, 1,2,3,4, 0,0,0,0}};
```

- Decide on the **aliases** (p. ??) for the transport plugin. An alias can refer to one or more transport plugins. The transport class name (see **Builtin Transport Class Names** (p. 469)) are automatically appended to the user-provided aliases. Alias names are useful in creating logical groupings of transports, e.g. all the transports that are configured to support large messages may be given the alias "large_message".

```
/* Decide aliases, i.e. the names by which this transport plugin will be known */
const char* ALIASES[] = {
    "my",
    "large_message",
};
const DDS_Long ALIASES_LENGTH = sizeof(ALIASES)/sizeof(const char*);

/* Initialize the aliases StringSeq */
DDS_StringSeq aliases;
if (!aliases.from_array(ALIASES, ALIASES_LENGTH)) {
    printf("***Error: creating initializing aliases\n");
}
```

- Register the transport plugin with the **DDSDomainParticipant** (p. 1335). Note that a transport plugin should **NOT be registered with more than one DomainParticipant**. It is the responsibility of the application programmer to ensure that this requirement is not violated.

```
NDDS_Transport_Handle_t handle = NDDS_TRANSPORT_HANDLE_NIL;

handle = NDDSTransportSupport::register_transport(
    participant,          /* Disabled Domain Participant */
    transport,            /* Transport plugin */
    aliases,              /* Transport aliases */
    network_address);     /* Transport network address */
if (NDDS_Transport_Handle_is_nil(&handle)) {
    printf("***Error: registering transport\n");
}
```

Optionally Adding receive routes for a transport (p. 218)

Optionally Adding send routes for a transport (p. 218)

- **Enable the participant** (p. 212) to turn on communications with other participants in the domain, using the newly registered transport plugins, and automatically registered builtin transport plugins (if any).

7.61.6 Adding receive routes for a transport

- Receive routes can be added to restrict address ranges on which incoming messages can be received. Any number of receive routes can be added, but these must be done before the participant is enabled.
- To restrict the address range from which incoming messages can be received by the transport plugin:

```
/* Restrict to receiving messages only on interfaces
   1234:1234:1234:10.10.*.*
*/
NDDS_Transport_Address_t subnet = {{1,2,3,4, 1,2,3,4, 1,2,3,4, 10,10,0,0}};
if (NDDSTransportSupport::add_receive_route(handle, subnet, 112)
    != DDS_RETCODE_OK) {
    printf("***Error: adding receive route\n");
}
```

7.61.7 Adding send routes for a transport

- Send routes can be added to restrict the address ranges to which outgoing messages can be sent by the transport plugin. Any number of send routes can be added, but these must be done before the participant is enabled.
- To restrict address ranges to which outgoing messages can be sent by the transport plugin:

```
/* Restrict to sending messages only to addresses (subnets)
   1234:1234:1234:10.10.30.*
*/
NDDS_Transport_Address_t subnet = {{1,2,3,4, 1,2,3,4, 1,2,3,4, 10,10,30,0}};
if (NDDSTransportSupport::add_send_route(handle, subnet, 120)
    != DDS_RETCODE_OK) {
    printf("***Error: adding send route\n");
}
```

7.62 Filter Use Cases

Working with data filters.

Working with data filters.

7.62.1 Introduction

RTI Connexx supports filtering data either during the exchange from **DDSDDataWriter** (p.1305) to **DDSDDataReader** (p.1272), or after the data has been stored at the **DDSDDataReader** (p.1272).

Filtering during the exchange process is performed by a **DDSContentFilteredTopic** (p.1267), which is created by the **DDSDDataReader** (p.1272) as a way of specifying a subset of the data samples that it wishes to receive.

Filtering samples that have already been received by the **DDSDDataReader** (p.1272) is performed by creating a **DDSQueryCondition** (p.1557), which can then be used to check for matching samples, be alerted when matching samples arrive, or retrieve matching samples through use of the **FooDataReader::read_w_condition** (p.1640) or **FooDataReader::take_w_condition** (p.1641) functions. (Conditions may also be used with the APIs **FooDataReader::read_next_instance_w_condition** (p.1653) and **FooDataReader::take_next_instance_w_condition** (p.1654).)

Filtering may be performed on any topic, either keyed or un-keyed, except the **Built-in Topics** (p.59). Filtering may be performed on any field, subset of fields, or combination of fields, subject only to the limitations of the filter syntax, and some restrictions against filtering some *sparse value types* of the **Dynamic Data** (p.99) API.

RTI Connexx contains built in support for filtering using SQL syntax, described in the **Queries and Filters Syntax** (p.178) module.

7.62.1.1 Overview of ContentFilteredTopic

Each **DDSContentFilteredTopic** (p. 1267) is created based on an existing **DDSTopic** (p. 1601). The **DDSTopic** (p. 1601) specifies the **field_names** and **field_types** of the data contained within the topic. The **DDSContentFilteredTopic** (p. 1267), by means of its **filter_expression** and **expression_parameters**, further specifies the *values* of the data which the **DDSDataReader** (p. 1272) wishes to receive.

Custom filters may also be constructed and utilized as described in the **Creating Custom Content Filters** (p. 221) module.

Once the **DDSContentFilteredTopic** (p. 1267) has been created, a **DDSDataReader** (p. 1272) can be created using the filtered topic. The filter's characteristics are exchanged between the **DDSDataReader** (p. 1272) and any matching **DDSDataWriter** (p. 1305) during the discovery process.

If the **DDSDataWriter** (p. 1305) allows (by **DDS_DataWriterResourceLimitsQosPolicy::max_remote_reader_filters** (p. 694)), and the **DDSDataReader** (p. 1272) 's **DDS_TransportMulticastQosPolicy** (p. 1136) is empty, then the **DDSDataWriter** (p. 1305) will filter out samples that don't meet the filtering criteria.

If disallowed by the **DDSDataWriter** (p. 1305), or the **DDSDataReader** (p. 1272) has set the **DDS_TransportMulticastQosPolicy** (p. 1136), then the **DDSDataWriter** (p. 1305) sends all samples to the **DDSDataReader** (p. 1272), and the **DDSDataReader** (p. 1272) discards any samples that do not meet the filtering criteria.

The **expression_parameters** can be modified using **DDSContentFilteredTopic::set_expression_parameters** (p. 1269). Any changes made to the filtering criteria by means of **DDSContentFilteredTopic::set_expression_parameters** (p. 1269), will be conveyed to any connected **DDSDataWriter** (p. 1305). New samples will be subject to the modified filtering criteria, but samples that have already been accepted or rejected are unaffected. However, if the **DDSDataReader** (p. 1272) connects to a **DDSDataWriter** (p. 1305) that *re-sends* its data, the re-sent samples will be subjected to the new filtering criteria.

7.62.1.2 Overview of QueryCondition

DDSQueryCondition (p. 1557) combine aspects of the content filtering capabilities of **DDSContentFilteredTopic** (p. 1267) with state filtering capabilities of **DDSReadCondition** (p. 1558) to create a reconfigurable means of filtering or searching data in the **DDSDataReader** (p. 1272) queue.

DDSQueryCondition (p. 1557) may be created on a disabled **DDSDataReader** (p. 1272), or after the **DDSDataReader** (p. 1272) has been enabled. If the **DDSDataReader** (p. 1272) is enabled, and has already received and stored samples in its queue, then all data samples in the are filtered against the **DDSQueryCondition** (p. 1557) filter criteria at the time that the **DDSQueryCondition** (p. 1557) is created. (Note that an exclusive lock is held on the **DDSDataReader** (p. 1272) sample queue for the duration of the **DDSQueryCondition** (p. 1557) creation).

Once created, incoming samples are filtered against all **DDSQueryCondition** (p. 1557) filter criteria at the time of their arrival and storage into the **DDSDataReader** (p. 1272) queue.

The number of **DDSQueryCondition** (p. 1557) filters that an individual **DDSDataReader** (p. 1272) may create is set by **DDS_DataReaderResourceLimitsQosPolicy::max_query_condition_filters** (p. 658), to an upper maximum of 32.

7.62.2 Filtering with ContentFilteredTopic

- **Set up subscriber** (p. 207)
- **Set up a topic** (p. 202)
- **Create a ContentFilteredTopic, of user data type Foo** (p. 1632) :

```
DDSContentFilteredTopic *cft = NULL;
DDS_StringSeq cft_parameters(2);
const char* cft_param_list[] = {"1", "100"};
cft_parameters.from_array(cft_param_list, 2);
cft = participant->create_contentfilteredtopic("ContentFilteredTopic",
                                             Foo_topic,
                                             "value > %0 AND value < %1",
                                             cft_parameters);

if (cft == NULL) {
    printf("create_contentfilteredtopic error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

- **Create a FooReader using the ContentFilteredTopic:**

```
DDSDataReader *reader = NULL;
reader = subscriber->create_datareader(cft,
                                       datareader_qos, // or DDS_DATAREADER_QOS_DEFAULT
                                       reader_listener, // or NULL
                                       DDS_STATUS_MASK_ALL);

if (reader == NULL) {
    printf("create_datareader error\n");
    subscriber_shutdown(participant);
    return -1;
}
FooDataReader *Foo_reader = FooDataReader::narrow(reader);
if (Foo_reader == NULL) {
    printf("DataReader narrow error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

Once setup, reading samples with a **DDSContentFilteredTopic** (p. 1267) is exactly the same as normal reads or takes, as described in **DataReader Use Cases** (p. 209).

- **Changing filter criteria using set_expression_parameters:**

```
cft->get_expression_parameters(cft_parameters);
DDS_String_free(cft_parameters[0]);
DDS_String_free(cft_parameters[1]);
cft_parameters[0] = DDS_String_dup("5");
cft_parameters[1] = DDS_String_dup("9");
retcode = cft->set_expression_parameters(cft_parameters);
if (retcode != DDS_RETCODE_OK) {
    printf("set_expression_parameters error\n");
    subscriber_shutdown(participant);
    return -1;
}
```

7.62.3 Filtering with Query Conditions

- **Given a data reader of type Foo** (p. 1632)

```
DDSDataReader *reader = ...;
FooDataReader *Foo_reader = FooDataReader::narrow(reader);
```

- **Creating a QueryCondition**

```
DDSQueryCondition *queryCondition = NULL;
DDS_StringSeq qc_parameters(2);
const char *qc_param_list[] = {"0", "100"};
qc_parameters.from_array(qc_param_list, 2);
queryCondition = reader->create_querycondition(DDS_NOT_READ_SAMPLE_STATE,
                                              DDS_ANY_VIEW_STATE,
                                              DDS_ALIVE_INSTANCE_STATE,
                                              "value > %0 AND value < %1",
                                              qc_parameters);
```

```

if (queryCondition == NULL) {
    printf("create_query_condition error\n");
    goto error_exit;
}

```

- Reading matching samples with a **DDSQueryCondition** (p. 1557)

```

FooSeq data_seq;
DDS_SampleInfoSeq info_seq;
retcode = Foo_reader->read_w_condition(data_seq, info_seq,
                                       DDS_LENGTH_UNLIMITED,
                                       queryCondition);

if (retcode == DDS_RETCODE_NO_DATA) {
    printf("no matching data\n");
} else if (retcode != DDS_RETCODE_OK) {
    printf("read_w_condition error %d\n", retcode);
    subscriber_shutdown(participant);
    return -1;
} else {
    for (i = 0; i < data_seq.length(); ++i) {
        if (info_seq[i].valid_data) {
            /* process your data here */
        }
    }
    retcode = Foo_reader->return_loan(data_seq, info_seq);
    if (retcode != DDS_RETCODE_OK) {
        printf("return loan error %d\n", retcode);
        subscriber_shutdown(participant);
        return -1;
    }
}

```

- **DDSQueryCondition::set_query_parameters** (p. 1558) is used similarly to **DDSContentFilteredTopic::set_expression_parameters** (p. 1269), and the same coding techniques can be used.
- Any **DDSQueryCondition** (p. 1557) that have been created must be deleted before the **DDSDataReader** (p. 1272) can be deleted. This can be done using **DDSDataReader::delete_contained_entities** (p. 1279) or manually as in:

```

retcode = reader->delete_readcondition(queryCondition);

```

7.62.4 Filtering Performance

Although RTI Connexx supports filtering on any field or combination of fields using the SQL syntax of the built-in filter, filters for keyed topics that filter solely on the contents of key fields have the potential for much higher performance. This is because for key-only filters, the **DDSDataReader** (p. 1272) caches the results of the filter (pass or not pass) for each instance. When another sample of the same instance is seen at the **DDSDataReader** (p. 1272), the filter results are retrieved from the cache, dispensing with the need to call the filter function.

This optimization applies to all filtering using the built-in SQL filter, performed by the **DDSDataReader** (p. 1272), for either **DDSContentFilteredTopic** (p. 1267) or **DDSQueryCondition** (p. 1557). This does *not* apply to filtering performed for **DDSContentFilteredTopic** (p. 1267) by the **DDSDataWriter** (p. 1305).

7.63 Creating Custom Content Filters

Working with custom content filters.

Working with custom content filters.

7.63.1 Introduction

By default, RTI Connex creates content filters with the `DDS_SQL_FILTER`, which implements a superset of the DDS-specified SQL WHERE clause. However, in many cases this filter may not be what you want. Some examples are:

- The default filter can only filter based on the content of a sample, not on a computation on the content of a sample. You can use a custom filter that is customized for a specific type and can filter based on a computation of the type members.
- You want to use a different filter language than SQL

This HOWTO explains how to write your own custom filter and is divided into the following sections:

- **The Custom Content Filter API** (p. 222)
- **Example Using C format strings** (p. 223)

7.63.2 The Custom Content Filter API

A custom content filter is created by calling the `DDSDomainParticipant::register_contentfilter` (p. 1347) function with a `DDSContentFilter` (p. 1264) that contains a `compile`, an `evaluate` function and a `finalize` function. `DDSContentFilteredTopic` (p. 1267) can be created with `DDSDomainParticipant::create_contentfilteredtopic_←with_filter` (p. 1370) to use this filter.

A custom content filter is used by RTI Connex at the following times during the life-time of a `DDSContentFilteredTopic` (p. 1267) (the function called is shown in parenthesis).

- When a `DDSContentFilteredTopic` (p. 1267) is created (`compile` (p. 222))
- When the filter parameters are changed on the `DDSContentFilteredTopic` (p. 1267) (`compile` (p. 222)) with `DDSContentFilteredTopic::set_expression_parameters` (p. 1269)
- When a sample is filtered (`evaluate` (p. 222)). This function is called by the RTI Connex core with a de-serialized sample
- When a `DDSContentFilteredTopic` (p. 1267) is deleted (`finalize` (p. 223))

7.63.2.1 The compile function

The `compile` (p. 223) function is used to `compile` a filter expression and expression parameters. Please note that the term `compile` is intentionally loosely defined. It is up to the user to decide what this function should do and return.

See `DDSContentFilter::compile` (p. 1264) for details.

7.63.2.2 The evaluate function

The `evaluate` (p. 223) function is called each time a sample is received to determine if a sample should be filtered out and discarded.

See `DDSContentFilter::evaluate` (p. 1266) for details.

7.63.2.3 The finalize function

The **finalize** (p. 223) function is called when an instance of the custom content filter is no longer needed. When this function is called, it is safe to free all resources used by this particular instance of the custom content filter.

See **DDSContentFilter::finalize** (p. 1266) for details.

7.63.3 Example Using C format strings

Assume that you have a type **Foo** (p. 1632).

You want to write a custom filter function that will drop all samples where the value of `Foo.x > x` and `x` is a value determined by an expression parameter. The filter will **only** be used to filter samples of type **Foo** (p. 1632).

7.63.3.1 Writing the Compile Function

The first thing to note is that we can ignore the filter expression, since we already know what the expression is. The second is that `x` is a parameter that can be changed. By using this information, the compile function is very easy to implement. Simply return the parameter string. This string will then be passed to the evaluate function every time a sample of this type is filtered.

Below is the entire **compile** (p. 222) function.

```
DDS_ReturnCode_t MyContentFilter::compile(
    void** new_compile_data, const char * /* expression */,
    const DDS_StringSeq& parameters, const DDS_TypeCode* /* type_code */,
    const char * /* type_class_name */,
    void * /* old_compile_data */) {
    *new_compile_data = (void*)DDS_String_dup(parameters[0]);
    return DDS_RETCODE_OK;
}
```

7.63.3.2 Writing the Evaluate Function

The next step is to implement the **evaluate** function. The evaluate function receives the parameter string with the actual value to test against. Thus the evaluate function must read the actual value from the parameter string before evaluating the expression. Below is the entire **evaluate** (p. 222) function.

```
DDS_Boolean MyContentFilter::evaluate(
    void* compile_data, const void* sample, const struct DDS_FilterSampleInfo * meta_data) {
    char *parameter = (char*)compile_data;
    DDS_Long x;
    Foo *foo_sample = (Foo*)sample;
    sscanf(parameter, "%d", &x);
    return (foo_sample->x > x ? DDS_BOOLEAN_FALSE : DDS_BOOLEAN_TRUE);
}
```

7.63.3.3 Writing the Finalize Function

The last function to write is the finalize function. It is safe to free all resources used by this particular instance of the custom content filter that is allocated in **compile**. Below is the entire **finalize** (p. 223) function.

```
void MyContentFilter::finalize(
    void* compile_data) {
    /* free parameter string from compile function */
    DDS_String_free((char *)compile_data);
}
```

7.63.3.4 Registering the Filter

Before the custom filter can be used, it must be registered with RTI Connex:

```
DDSDomainParticipant *myParticipant=NULL;
/* myParticipant = .... */
DDSContentFilter *myCustomFilter = new MyContentFilter();
if (myParticipant->register_contentfilter(
    (char*)"MyCustomFilter",
    myCustomFilter) != DDS_RETCODE_OK) {
    printf("Failed to register custom filter\n");
}
```

7.63.3.5 Unregistering the Filter

When the filter is no longer needed, it can be unregistered from RTI Connex:

```
DDSDomainParticipant *myParticipant = NULL;
/* myParticipant = .... */
DDSContentFilter *myCustomFilter =
    myParticipant->lookup_contentfilter((char*)"MyCustomFilter");
if (myCustomFilter != NULL) {
    if (myParticipant->unregister_contentfilter(
        (char*)"MyCustomFilter") != DDS_RETCODE_OK) {
        printf("Failed to unregister custom filter\n");
    }
    delete myCustomFilter;
}
```

7.64 Large Data Use Cases

Working with large data types.

Working with large data types.

7.64.1 Introduction

RTI Connex supports data types whose size exceeds the maximum message size of the underlying transports. A **DDSDataWriter** (p. 1305) will fragment data samples when required. Fragments are automatically reassembled at the receiving end.

Once all fragments of a sample have been received, the new sample is passed to the **DDSDataReader** (p. 1272) which can then make it available to the user. Note that the new sample is treated as a regular sample at that point and its availability depends on standard QoS settings such as **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) and **DDS_KEEP_LAST_HISTORY_QOS** (p. 406).

The large data feature is fully supported by all DDS API's, so its use is mostly transparent. Some additional considerations apply as explained below.

7.64.2 Writing Large Data

In order to use the large data feature with the **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) setting, the **DDSDataWriter** (p. 1305) must be configured as an asynchronous writer (**DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431)) with associated **DDSFlowController** (p. 1451).

While the use of an asynchronous writer and flow controller is optional when using the **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435) setting, most large data use cases will benefit from the use of a flow controller to prevent flooding the network when fragments are being sent.

- **Set up writer** (p. 206)
- **Add flow control** (p. 203)

7.64.3 Receiving Large Data

Large data is supported by default and in most cases, no further changes are required.

The **DDS_DataReaderResourceLimitsQosPolicy** (p. 648) allows tuning the resources available to the **DDSDataReader** (p. 1272) for reassembling fragmented large data.

- **Set up reader** (p. 209)

7.65 Request-Reply Examples

Examples on how to use the request-reply API .

Examples on how to use the request-reply API .

Request-Reply code examples.

7.65.1 Request-Reply Examples

Requesters and Repliers provide a way to use the Request-Reply communication pattern on top of the DDS entities. An application uses a Requester to send requests to a Replier; another application using a Replier receives a request and can send one or more replies for that request. The Requester that sent the request (and only that one) will receive the reply (or replies).

DDS Types

RTI Connex uses DDS data types for sending and receiving requests and replies. Valid types are those generated by the `rtiddsgen` code generator, the DDS built-in types, and `DynamicData`. Refer to the `Core Libraries User's Manual` and the following links for more information:

- `Code Generator User's Manual`,
- **Using the DDS built-in types** (p. 92),
- **Using `DynamicData`** (p. 99)

Set up

- **Create a `DomainParticipant`** (p. 201)
- **Create a requester** (p. 227)
- **Create a requester with parameters** (p. 227)
- **Create a replier** (p. 231)

Requester: sending requests and receiving replies

- **Basic Requester example** (p. 227)
- **Taking loaned samples** (p. 228)
- **Taking samples by copy** (p. 228)
- **Correlation between requests and replies** (p. 229)

Replier: receiving requests and sending replies

- **Basic Replier example** (p. 231)
- **SimpleReplier example** (p. 232)
- **Taking loaned samples** (p. 228)
- **Taking samples by copy** (p. 228)

Error handling

- **Error handling example** (p. 232)

Note

To use Request-Reply you need to build and link your application with the additional `rticonnextmsgcpp` library and include `ndds/ndds_requestreply_cpp.h`.

7.65.2 Requester Creation

- [Setting up a participant \(p. 201\)](#)

- Creating a Requester

```
using namespace connex;
// Note: error checking omitted for simplicity
// Create a DomainParticipant
DDS::DomainParticipant * participant =
    DDS::DomainParticipantFactory::get_instance()->create_participant(
        domain_id, DDS::PARTICIPANT_QOS_DEFAULT,
        NULL, DDS::STATUS_MASK_NONE);
// Create a Requester (if creation fails, the constructor throws)
Requester<Foo, Bar> * requester =
    new Requester<Foo, Bar>(participant, "TestService");
```

7.65.3 Creating a Requester with optional parameters

- [Setting up a participant \(p. 201\)](#)

- Creating a Requester with additional parameters

```
using namespace connex;
// Note: error checking omitted for simplicity
// Create a DomainParticipant
DDS::DomainParticipant * participant =
    DDS::DomainParticipantFactory::get_instance()->create_participant(
        domain_id, DDS::PARTICIPANT_QOS_DEFAULT,
        NULL, DDS::STATUS_MASK_NONE);
// Create a Requester with a QoS profile (located for example in
// USER_QOS_PROFILES.xml, in the current working directory)
RequesterParams requester_params(participant);
requester_params.service_name("TestService");
requester_params.qos_profile(
    "RequestReplyExampleProfiles", "RequesterExampleProfile");
Requester<Foo, Bar> * requester = new Requester<Foo, Bar>(requester_params);
```

See also

[Requester Creation \(p. 227\)](#)

[Configuring Request-Reply QoS profiles \(p. 233\)](#)

7.65.4 Basic Requester example

- [Requester Creation \(p. 227\)](#)
- [Creating a Requester with optional parameters \(p. 227\)](#)
- Basic Requester example

```
using namespace connex;
// Send request
WriteSample<Foo> request;
strcpy(request.data().message, "A Request");
requester->send_request(request);
// Create a reply Sample
Sample<Bar> reply;
// Receive reply (wait for it and get the sample)
bool received = requester->receive_reply(reply, MAX_WAIT);
if (received) {
    if(reply.info().valid_data) {
        std::cout << "Received reply: " << reply.data().message << std::endl;
    } else {
        std::cout << "Received invalid reply" << std::endl;
    }
} else {
    std::cout << "Reply not received" << std::endl;
}
```

- Basic Requester example using the **String built-in type** (p. 311)

```
using namespace connex;
// Create a Requester (this time we create it on the stack)
// The template parameter std::string maps to the String DDS built-in type
Requester<std::string, std::string> requester(participant, "TestServiceString");
// Send a request
requester.send_request("A string request");
// Receive reply
LoanedSamples<std::string> replies = requester.receive_replies(MAX_WAIT);
for (LoanedSamples<std::string>::iterator it = replies.begin();
     it != replies.end();
     ++it) {
    if (it->info().valid_data) {
        std::cout << "Received string reply: " << it->data() << std::endl;
    }
}
// When replies go out of scope, the loan is automatically returned
```

Basic Replier example (p. 231)

SimpleReplier example (p. 232)

7.65.5 Taking loaned samples

- Requester Creation (p. 227)
- Get iterator to loaned replies (no copies)

```
using namespace connex;
// Get loaned samples
// Unlike receive_replies(), take_replies() doesn't block and returns an
// empty collection if there are no replies at that moment.
// (before that we can call requester->wait_for_replies)
LoanedSamples<Bar> replies = requester->take_replies();
// Iterate through the container of loaned samples.
// If there were no replies, the container is empty
for (LoanedSamples<Bar>::const_iterator it = replies.begin();
     it != replies.end();
     ++it) {
    if (it->info().valid_data) {
        std::cout << "Received reply: " << it->data().message << std::endl;
    }
}
// When replies go out of scope, the loan is automatically returned
```

Basic Requester example (p. 227)

Basic Replier example (p. 231)

Taking samples by copy (p. 228)

7.65.6 Taking samples by copy

- Requester Creation (p. 227)
- Get copies of the replies:

```
using namespace connex;
// Get loaned samples
LoanedSamples<Bar> replies = requester->take_replies();
// Copy the contents using the STL-compliant iterator in LoanedSamples
std::list<Sample<Bar> > my_list;
std::copy(replies.begin(), replies.end(), std::back_inserter(my_list));
```

```
// We can copy to a container of Bar rather than Sample<Bar>,
// thanks to the implicit conversion from Sample<Bar> to Bar.
// If our application works with instances, we may have received
// invalid data (e.g. disposed instance). We can iterate through valid
// samples only using an iterator adapter.
std::vector<Bar> my_vector;
std::copy(
    make_valid_sample_iterator(replies.begin()),
    make_valid_sample_iterator(replies.end()),
    std::back_inserter(my_vector));
// When replies go out of scope, the loan is automatically returned
```

Basic Replier example (p. 231)

Taking loaned samples (p. 228)

7.65.7 Correlating requests and replies

- **Requester Creation** (p. 227)
- **Example 1) Waiting for a reply to a specific request**

```
using namespace connex;
// Create requests
WriteSample<Foo> request1, request2;
strcpy(request1.data().message, "Request 1");
strcpy(request2.data().message, "Request 2");
// Send requests using WriteSample
requester->send_request(request1);
requester->send_request(request2);
// Wait for a reply to the second request
Sample<Bar> reply;
bool received = requester->wait_for_replies(
    1, MAX_WAIT, request2.identity());
if (!received) {
    std::cout << "Did not receive reply for request 2" << std::endl;
    return;
}
// Take that reply
requester->take_reply(reply, request2.identity());
// This postcondition should always be true
if (reply.related_identity() != request2.identity()) {
    throw std::runtime_error("postcondition failed");
}
if (reply.info().valid_data) {
    std::cout << "Received reply for request 2: "
              << reply.data().message << std::endl;
}
// Wait for a reply to the first request
received = requester->wait_for_replies(1, MAX_WAIT, request1.identity());
if (!received) {
    std::cout << "Did not receive reply for request 1" << std::endl;
    return;
}
// Take that reply
requester->take_reply(reply, request1.identity());
// This postcondition should always be true
if (reply.related_identity() != request1.identity()) {
    throw std::runtime_error("postcondition failed");
}
if (reply.info().valid_data) {
    std::cout << "Received reply for request 1: "
              << reply.data().message << std::endl;
}
}
```

- **Example 2) Correlating a reply after receiving it**

```
using namespace connex;
// Create requests
WriteSample<Foo> request1, request2;
strcpy(request1.data().message, "Request 1");
strcpy(request2.data().message, "Request 2");
```

```

// Send requests using WriteSample
requester->send_request(request1);
requester->send_request(request2);
// Wait for two replies. In this case we don't mind the
// reception order
bool received = requester->wait_for_replies(2, MAX_WAIT);
if (!received) {
    std::cout << "Replies not received" << std::endl;
    return;
}
LoanedSamples<Bar>::iterator it;
// Get all the replies
LoanedSamples<Bar> replies = requester->take_replies();
// Find the reply for request 1.
//
// We search using the STL find_if algorithm. The search range is all
// the elements in the replies container (from beginning to end).
// We use a predicate included in the Connex namespace that evaluates to
// true when a Sample's related_identity equals the identity that
// is passed to the constructor (request1's, in this case)
it = std::find_if(replies.begin(), replies.end(),
    IsReplyRelatedPredicate<Bar>(request1.identity()));
if (it != replies.end()) {
    std::cout << "Received reply for request 1: "
        << it->data().message << std::endl;
}
// Find the reply for request 2
it = std::find_if(replies.begin(), replies.end(),
    IsReplyRelatedPredicate<Bar>(request2.identity()));
if (it != replies.end()) {
    std::cout << "Received reply for request 2: "
        << it->data().message << std::endl;
}
// When replies go out of scope, the loan is automatically returned

```

Basic Requester example (p. 227)

Basic Replier example (p. 231)

7.65.8 Basic Requester example using SampleRef

This example is similar to **Basic Requester example** (p. 227) except it uses a `SampleRef` instance instead of a `Sample` instance.

- Assuming the variables you want to use already exist:

```

Foo request_data;
DDS::WriteParams_t request_params;
Bar reply_data;
DDS::SampleInfo reply_info;
// ...

```

- You can use `WriteSampleRef` and `SampleRef`:

```

using namespace connex;
// Create a request WriteSampleRef
WriteSampleRef<Foo> request;
request.set_data(request_data);
request.set_info(request_params);
// Send request
requester->send_request(request);
// Create a reply SampleRef
SampleRef<Bar> reply;
reply.set_data(reply_data);
reply.set_info(reply_info);
// Receive reply
bool received = requester->receive_reply(reply, MAX_WAIT);
if (received) {
    if(reply_info.valid_data) {
        std::cout << "Received reply: " << reply_data.message << std::endl;
    }
}

```

```

    } else {
        std::cout << "Received invalid reply" << std::endl;
    }
} else {
    std::cout << "Reply not received" << std::endl;
}

```

7.65.9 Creating a Replier

- **Setting up a participant** (p. 201)
- **Create a Replier**

```

using namespace connext;
// Note: error checking omitted for simplicity
// Create a DomainParticipant
DDS::DomainParticipant * participant =
    DDS::DomainParticipantFactory::get_instance()->create_participant(
        domain_id, DDS::PARTICIPANT_QOS_DEFAULT,
        NULL, DDS::STATUS_MASK_NONE);
// Create a Replier (if creation fails, the constructor throws exception)
Replier<Foo, Bar> * replier =
    new Replier<Foo, Bar>(participant, "TestService");

```

7.65.10 Basic Replier example

- **Creating a Replier** (p. 231)
- **Basic Replier example**

```

using namespace connext;
Sample<Foo> request;
// Receive one request
bool received = replier->receive_request(request, MAX_WAIT);
if (!received) {
    std::cout << "Requests not received" << std::endl;
    return false;
}
// A WriteSample automatically initializes and finalizes
// the data using the TypeSupport (in this case BarTypeSupport)
WriteSample<Bar> reply;
if (request.info().valid_data) {
    sprintf(reply.data().message, "Reply for %s", request.data().message);
    // Send a reply for that request
    replier->send_reply(reply, request.identity());
    // Note: a replier can send more than one reply for the same request
}

```

Basic Requester example (p. 227)

7.65.11 SimpleReplier example

- Implement a listener

```
class MySimpleReplierListener : public SimpleReplierListener<Foo, Bar>
{
public:
    Bar * on_request_available(SampleRef<Foo> request)
    {
        if (!request.info().valid_data) {
            // In this example we don't reply to invalid data samples.
            // In other cases, it could make sense to reply
            // to a disposed instance, for example.
            return NULL;
        }
        sprintf(_reply.data().message, "Simple reply for %s",
            request.data().message);
        return &_reply.data();
    }
    void return_loan(Bar * reply)
    {
        // nothing to do
    }
private:
    // By using a WriteSample (instead of just Bar), the sample is
    // automatically initialized and released.
    WriteSample<Bar> _reply;
};
```

- And create a SimpleReplier with the listener

```
using namespace connex;
// Note: error checking omitted for simplicity
MySimpleReplierListener * listener = new MySimpleReplierListener();
SimpleReplier<Foo, Bar> * replier = new SimpleReplier<Foo, Bar>(
    participant, "TestService", *listener);
// After creation the SimpleReplier is already active and may call
// the listener
```

- This next example shows how to implement a listener for a SimpleReplier using the std::string type

```
class MyStringSimpleReplierListener :
    public SimpleReplierListener<std::string, std::string>
{
public:
    // Note that the actual received type is const char*,
    // because internally, the middleware uses char*
    std::string * on_request_available(SampleRef<const char*> request)
    {
        if (!request.info().valid_data) {
            return NULL;
        }
        _reply = std::string("Simple string reply for ") + request.data();
        return &_reply;
    }
    void return_loan(std::string * reply)
    {
        // nothing to do
    }
private:
    std::string _reply;
};
```

See also

Basic Requester example (p. 227)

7.65.12 Error handling example

- Catching an exception from the request-reply API

```
using namespace connex;
// All the operations in the request-reply API
// throw exceptions in case of error.
// You can also set the verbosity level to warning for
// additional information
NDDConfigLogger::get_instance()->set_verbosity(
```

```

        NDDS_CONFIG_LOG_VERBOSITY_WARNING);
//
// For example, this replier is sending a reply for a nonexistent request
//
WriteSample<Bar> reply;
DDS::SampleIdentity_t invalid_request_id;
try {
    replier->send_reply(reply, invalid_request_id);
} catch (const BadParameterException& ex) {
    std::cout << "Exception while sending reply: "
               << ex.what() << std::endl;
}
// Exceptions inherit from std::runtime_error or std::logic_error,
// so you can have a more general catch statement:
//
// This piece of code produces the same result as the previous one:
//
try {
    replier->send_reply(reply, invalid_request_id);
} catch (const std::exception& ex) {
    std::cout << "Exception while sending request: "
               << ex.what() << std::endl;
}
}

```

7.65.13 Configuring Request-Reply QoS profiles

If you do not specify your own QoS parameters (in `connext::RequesterParams` (p. 1884) and `connext::ReplierParams` (p. 1858)), a `connext::Requester` (p. 1863) and `connext::Replier` (p. 1845) are created using a default configuration. That configuration is equivalent to the one in the following QoS profile called "default":

```

<?xml version="1.0" encoding="UTF-8"?>
<!--

```

```

Description
XML QoS Profile for HelloWorld

```

```

(c) Copyright, Real-Time Innovations, 2012. All rights reserved.
RTI grants Licensee a license to use, modify, compile, and create derivative
works of the software solely for use with RTI Connext DDS. Licensee may
redistribute copies of the software provided that all such copies are
subject to this license. The software is provided "as is", with no warranty
of any type, including any warranty for fitness for any purpose. RTI is
under no obligation to maintain or support the software. RTI shall not be
liable for any incidental or consequential damages arising out of the use
or inability to use the software.

```

```

The QoS configuration of the DDS entities in the generated example is loaded
from this file.

```

```

This file is used only when it is in the current working directory or when the
environment variable NDDS_QOS_PROFILES is defined and points to this file.

```

```

The profile in this file inherits from the builtin QoS profile
BuiltinQosLib::Generic.StrictReliable. That profile, along with all of the
other built-in QoS profiles can be found in the
BuiltinProfiles.documentationONLY.xml file located in the
$NDDSHOME/resource/xml/ directory.

```

```

You may use any of these QoS configurations in your application simply by
referring to them by the name shown in the
BuiltinProfiles.documentationONLY.xml file.

```

```

Also, following the QoS Profile composition pattern you can use QoS Snippets
to easily create your final QoS Profile. For further information visit:
https://community.rti.com/best-practices/qos-profile-inheritance-and-composition-guidance

```

```

There is a QoS Snippet library that contains a collection of
QoS Snippets that set some specific features or configurations. You can find
them in the BuiltinProfiles.documentationONLY.xml file as well.

```

```

You should not edit the file BuiltinProfiles.documentationONLY.xml directly.
However, if you wish to modify any of the values in a built-in profile, the
recommendation is to create a profile of your own and inherit from the built-in
profile you wish to modify. The NDDS_QOS_PROFILES.example.xml file (contained in
the same directory as the BuiltinProfiles.documentationONLY.xml file) shows how
to inherit from the built-in profiles.

```

For more information about XML QoS Profiles see the "Configuring QoS with XML" chapter in the RTI Connext DDS Core Libraries User's Manual.

            <domain_participant_qos>
                <!--
                    The participant name, if it is set, will be displayed in the
                    RTI tools, making it easier for you to tell one
                    application from another when you're debugging.
                -->
                <participant_name>
                    <name>HelloWorldParticipant</name>
                    <role_name>HelloWorldParticipantRole</role_name>
                </participant_name>
            </domain_participant_qos>
        </qos_profile>
    </qos_library>
</dds>
```

You can use the profile called "RequesterExampleProfile", which modifies some parameters from the default. The example **Creating a Requester with optional parameters** (p. 227) shows how to create a `connext::Requester` (p. 1863) using this profile.

7.66 Documentation Roadmap

This section contains a roadmap for the new user with pointers on what to read first.

If you are new to RTI Connext, we recommend starting in the following order:

- See the *Getting Started Guide*. This document provides download and installation instructions. It also lays out the core value and concepts behind the product and takes you step-by-step through the creation of a simple example application.
- The *User's Manual* describes the features of the product and how to use them. It is organized around the structure of the DDS APIs and certain common high-level tasks.

- The documentation in the **RTI Connext DDS API Reference** (p. 238) provides an overview of API classes and modules for the DDS data-centric publish-subscribe (DCPS) package from a programmer's perspective. Start by reading the documentation on the main page.
- After reading the high level module documentation, look at the **Publication Example** (p. 198) and **Subscription Example** (p. 199) for step-by-step examples of creating a publication and subscription. These are hyperlinked code snippets to the full API documentation, and provide a good place to begin learning the APIs.
- Next, work through your own application using the example code files generated by `rtiddsgen`. See the `Code Generator User's Manual`.
- To integrate similar code into your own application and build system, you will likely need to refer to the `Platform Notes`.

7.67 Conventions

This section describes the conventions used in the API documentation.

7.67.1 Unsupported Features

[Not supported (optional)] This note means that the optional feature from the DDS specification is not supported in the current release.

7.67.2 API Naming Conventions

7.67.2.1 Structure & Class Names

RTI Data Distribution Service 4 makes a distinction between *value types* and *interface types*. Value types are types such as primitives, enumerations, strings, and structures whose identity and equality are determined solely by explicit state. Interface types are those abstract opaque data types that conceptually have an identity apart from their explicit state. Examples include all of the **DDSEntity** (p. 1446) subtypes, the **DDSCondition** (p. 1260) subtypes, and **DDSWaitSet** (p. 1613). Instances of value types are frequently transitory and are declared on the stack. Instances of interface types typically have longer lifecycles, are accessible by pointer only, and may be managed by a factory object.

Value and interface types are distinguished by their names: value types have names beginning with "DDS_" (i.e. with an underscore); interface types have names beginning with "DDS" (i.e. with no underscore). Another way to think of it: C-style types – structures, enumerations, etc. – have names beginning with "DDS_"; C++ classes have names beginning with "DDS."

7.67.3 API Documentation Terms

In the API documentation, the term module refers to a logical grouping of documentation and elements in the API.

At this time, typedefs that occur in the API, such as **DDS_ReturnCode_t** (p. 335) do not show up in the compound list or indices. This is a known limitation in the generated HTML.

7.67.4 Stereotypes

Commonly used stereotypes in the API documentation include the following.

7.67.4.1 Extensions

- `<<extension>>` (p. 236)
 - An RTI Connex product extension to the DDS standard specification.
 - The extension APIs complement the standard APIs specified by the OMG DDS specification. They are provided to improve product usability and enable access to product-specific features such as pluggable transports.

7.67.4.2 Experimental

- `<<experimental>>` (p. 236)
 - RTI Connex experimental features are used to evaluate new features and get user feedback.
 - These features are not guaranteed to be fully supported and might be implemented only of some of the programming languages supported by RTI Connex
 - The functional APIs corresponding to experimental features can be distinguished from other APIs by the suffix '_exp'.
 - Experimental features may or may not appear in future product releases.
 - The name of the experimental features APIs will change if they become officially supported. At the very least the suffix '_exp' will be removed.
 - Experimental features should not be used in production.

7.67.4.3 Types

- `<<interface>>` (p. 236)
 - Pure interface type with *no state*.
 - Languages such as Java natively support the concept of an *interface* type, which is a collection of method signatures devoid of any dynamic state.
 - In C++, this is achieved via a class with all *pure virtual* methods and devoid of any instance variables (ie no dynamic state).
 - Interfaces are generally organized into a type hierarchy. Static typecasting along the interface type hierarchy is "safe" for valid objects.
- `<<generic>>` (p. 236)
 - A *generic* type is a *skeleton* class written in terms of generic parameters. Type-specific instantiations of such types are conventionally referred to in this documentation in terms of the hypothetical type "Foo"; for example: **FooSeq** (p. 1680), **FooDataType**, **FooDataWriter** (p. 1659), and **FooDataReader** (p. 1632).

- For portability and efficiency, we implement generics using C preprocessor macros, rather than using C++ templates.
 - A *generic* type interface is declared via a `#define` macro.
 - Concrete types are generated from the generic type statically at compile time. The implementation of the concrete types is provided via the generic macros which can then be compiled as normal C or C++ code.
- `<<singleton>>` (p. 237)
 - Singleton class. There is a single instance of the class.
 - Generally accessed via a `get_instance()` static method.

7.67.4.4 Method Parameters

- `<<in>>` (p. 237)
 - An *input* parameter.
- `<<out>>` (p. 237)
 - An *output* parameter.
- `<<inout>>` (p. 237)
 - An *input* and *output* parameter.

7.68 Using DDS:: Namespace

This section describes the C++ namespace support in the DDS API.

7.68.1 DDS Namespace Support

In this documentation, all C++ classes, value types, interface types and constants have names beginning with either **"DDS_"** or **"DDS"**. Alternatively, **DDS** namespace can also be used to refer to all these classes, types or constant.

All the C++ API that begins with either **"DDS_"** or **"DDS"** can be replaced with its namespace equivalent. For example, **DDSDomainParticipant** (p. 1335) has a namespace equivalent of **DDS::DomainParticipant**, and **DDS_DomainParticipantQos** (p. 735) has a namespace equivalent of **DDS::DomainParticipantQos**.

In order to use the **DDS** namespace, an additional header file, **ndds_namespace_cpp.h**, will need to be included in your source file:

```
#include "ndds/ndds_cpp.h"
#include "ndds/ndds_namespace_cpp.h"
DDS::DomainParticipant *participant = NULL;
DDS::DomainParticipantQos participant_qos;
DDS::DomainParticipantListener *listener = NULL;
DDS::StatusKind status_kind = DDS::INCONSISTENT_TOPIC_STATUS;
DDS::Long counter = 0L;
```

If the namespace header file is not included in the source file, DDS namespace cannot be used in the RTI Connext API.

7.68.2 DDS Namespace and Primitive Types

By default, **DDS** namespace support for primitive types are included. With **DDS** namespace support, the difference between DDS types and native types can just be the capitalization in some cases:

```
#include "ndds/ndds_cpp.h"
#include "ndds/ndds_namespace_cpp.h"
using namespace DDS;
Long ddsCounter = 0L;
long nativeCounter = 0L;
```

If you want to exclude the DDS namespace support for primitive types, you can define **NDDS_EXCLUDE_PRIMITIVE_TYPES_FROM_NAMESPACE** in your application before including the namespace header file. **DDS** namespace support for primitive types will then be excluded:

```
#include "ndds/ndds_cpp.h"
#define NDDS_EXCLUDE_PRIMITIVE_TYPES_FROM_NAMESPACE
#include "ndds/ndds_namespace_cpp.h"
using namespace DDS;
DDS_Long ddsCounter = 0;
long nativeCounter = 0;
```

For the rest of the documentation, the **DDS** prefix is used for all class /types/constants names. However, all the API with the **DDS** prefix can be replaced with **DDS** namespace instead if the namespace header file is included.

7.69 RTI Connex DDS API Reference

RTI Connex modules following the DDS module definitions.

Modules

- **Domain Module**

*Contains the **DDSDomainParticipant** (p. 1335) class that acts as an endpoint of RTI Connex and acts as a factory for many of the classes. The **DDSDomainParticipant** (p. 1335) also acts as a container for the other objects that make up RTI Connex.*

- **Topic Module**

*Contains the **DDSTopic** (p. 1601), **DDSContentFilteredTopic** (p. 1267), and **DDSMultiTopic** (p. 1513) classes, the **DDSTopicListener** (p. 1610) interface, and more generally, all that is needed by an application to define **DDSTopic** (p. 1601) objects and attach QoS policies to them.*

- **Publication Module**

*Contains the **DDSFlowController** (p. 1451), **DDSPublisher** (p. 1534), and **DDSDataWriter** (p. 1305) classes as well as the **DDSPublisherListener** (p. 1555) and **DDSDataWriterListener** (p. 1328) interfaces, and more generally, all that is needed on the publication side.*

- **Subscription Module**

*Contains the **DDSSubscriber** (p. 1576), **DDSDataReader** (p. 1272), **DDSReadCondition** (p. 1558), **DDSQueryCondition** (p. 1557), and **DDSTopicQuery** (p. 1611) classes, as well as the **DDSSubscriberListener** (p. 1597) and **DDSDataReaderListener** (p. 1299) interfaces, and more generally, all that is needed on the subscription side.*

- **Infrastructure Module**

Defines the abstract classes and the interfaces that are refined by the other modules. Contains common definitions such as return codes, status values, and QoS policies.

- **Transports**

APIs related to RTI Connex pluggable transports.

- **Queries and Filters Syntax**

- **Logging and Version**

APIs of troubleshooting utilities that configure the middleware.

- **General Utilities**

API of general utilities used in the RTI Connex distribution.

- **Observability**

API of RTI Connex Observability Framework.

- **Durability and Persistence**

APIs related to RTI Connex Durability and Persistence.

- **System Properties**

System Properties.

- **Configuring QoS Profiles with XML**

APIs related to XML QoS Profiles.

- **RTI Connex Messaging API Reference**

Extensions to the RTI Connex publish-subscribe functionality.

7.69.1 Detailed Description

RTI Connex modules following the DDS module definitions.

7.69.2 Overview

Information flows with the aid of the following constructs: **DDSPublisher** (p. 1534) and **DDSDataWriter** (p. 1305) on the sending side, **DDSSubscriber** (p. 1576) and **DDSDataReader** (p. 1272) on the receiving side.

- A **DDSPublisher** (p. 1534) is an object responsible for data distribution. It may publish data of different data types. A **TDataWriter** acts as a *typed* (i.e. each **DDSDataWriter** (p. 1305) object is dedicated to one application data type) accessor to a publisher. A **DDSDataWriter** (p. 1305) is the object the application must use to communicate to a publisher the existence and value of data objects of a given type. When data object values have been communicated to the publisher through the appropriate data-writer, it is the publisher's responsibility to perform the distribution (the publisher will do this according to its own QoS, or the QoS attached to the corresponding data-writer). A *publication* is defined by the association of a data-writer to a publisher. This association expresses the intent of the application to publish the data described by the data-writer in the context provided by the publisher.
- A **DDSSubscriber** (p. 1576) is an object responsible for receiving published data and making it available (according to the Subscriber's QoS) to the receiving application. It may receive and dispatch data of different specified types. To access the received data, the application must use a *typed* **TDataReader** attached to the subscriber. Thus, a *subscription* is defined by the association of a data-reader with a subscriber. This association expresses the intent of the application to subscribe to the data described by the data-reader in the context provided by the subscriber.

DDSTopic (p. 1601) objects conceptually fit between publications and subscriptions. Publications must be known in such a way that subscriptions can refer to them unambiguously. A **DDSTopic** (p. 1601) is meant to fulfill that purpose: it associates a name (unique in the domain i.e. the set of applications that are communicating with each other), a data type, and QoS related to the data itself. In addition to the topic QoS, the QoS of the **DDSDataWriter** (p. 1305) associated with that Topic and the QoS of the **DDSPublisher** (p. 1534) associated to the **DDSDataWriter** (p. 1305) control the behavior on the publisher's side, while the corresponding **DDSTopic** (p. 1601), **DDSDataReader** (p. 1272) and **DDSSubscriber** (p. 1576) QoS control the behavior on the subscriber's side.

When an application wishes to publish data of a given type, it must create a **DDSPublisher** (p. 1534) (or reuse an already created one) and a **DDSDataWriter** (p. 1305) with all the characteristics of the desired publication. Similarly, when an application wishes to receive data, it must create a **DDSSubscriber** (p. 1576) (or reuse an already created one) and a **DDSDataReader** (p. 1272) to define the subscription.

7.69.3 Conceptual Model

The overall conceptual model is shown below.

Notice that all the main communication objects (the specializations of Entity) follow unified patterns of:

- Supporting QoS (made up of several QoSPolicy); QoS provides a generic mechanism for the application to control the behavior of the Service and tailor it to its needs. Each **DDSEntity** (p. 1446) supports its own specialized kind of QoS policies (see **QoS Policies** (p. 352)).
- Accepting a **DDSLListener** (p. 1509); listeners provide a generic mechanism for the middleware to notify the application of relevant asynchronous events, such as arrival of data corresponding to a subscription, violation of a QoS setting, etc. Each **DDSEntity** (p. 1446) supports its own specialized kind of listener. Listeners are related to changes in status conditions (see **Status Kinds** (p. 336)).

Note that only one Listener per entity is allowed (instead of a list of them). The reason for that choice is that this allows a much simpler (and, thus, more efficient) implementation as far as the middleware is concerned. Moreover, if it were required, the application could easily implement a listener that, when triggered, triggers in return attached 'sub-listeners'.

- Accepting a **DDSStatusCondition** (p.1562) (and a set of **DDSReadCondition** (p.1558) objects for the **DDSDataReader** (p.1272)); conditions (in conjunction with **DDSWaitSet** (p.1613) objects) provide support for an alternate communication style between the middleware and the application (i.e., wait-based rather than notification-based).

All DCPS entities are attached to a **DDSDomainParticipant** (p. 1335). A domain participant represents the local membership of the application in a domain. A *domain* is a distributed concept that links all the applications able to communicate with each other. It represents a communication plane: only the publishers and the subscribers attached to the same domain may interact.

DDSDomainEntity (p. 1334) is an intermediate object whose only purpose is to state that a DomainParticipant cannot contain other domain participants.

At the DCPS level, data types represent information that is sent atomically. For performance reasons, only plain data structures are handled by this level.

By default, each data modification is propagated individually, independently, and uncorrelated with other modifications. However, an application may request that several modifications be sent as a whole and interpreted as such at the recipient side. This functionality is offered on a Publisher/Subscriber basis. That is, these relationships can only be specified among **DDSDataWriter** (p. 1305) objects attached to the same **DDSPublisher** (p. 1534) and retrieved among **DDSDataReader** (p. 1272) objects attached to the same **DDSSubscriber** (p. 1576).

By definition, a **DDSTopic** (p. 1601) corresponds to a single data type. However, several topics may refer to the same data type. Therefore, a **DDSTopic** (p. 1601) identifies data of a single type, ranging from one single instance to a whole collection of instances of that given type. This is shown below for the hypothetical data type **Foo** (p. 1632).

In case a set of instances is gathered under the same topic, different instances must be distinguishable. This is achieved by means of the values of some data fields that form the **key** to that data set. The *key description* (i.e., the list of data fields whose value forms the key) has to be indicated to the middleware. The rule is simple: *different data samples with the same key value represent successive values for the same instance, while different data samples with different key values represent different instances*. If no key is provided, the data set associated with the **DDSTopic** (p. 1601) is restricted to a *single instance*.

Topics need to be known by the middleware and potentially propagated. Topic objects are created using the create operations provided by **DDSDomainParticipant** (p. 1335).

The interaction style is straightforward on the publisher's side: when the application decides that it wants to make data available for publication, it calls the appropriate operation on the related **DDSDataWriter** (p. 1305) (this, in turn, will trigger its **DDSPublisher** (p. 1534)).

On the subscriber's side however, there are more choices: relevant information may arrive when the application is busy doing something else or when the application is just waiting for that information. Therefore, depending on the way the application is designed, asynchronous notifications or synchronous access may be more appropriate. Both interaction modes are allowed, a **DDSListener** (p. 1509) is used to provide a callback for synchronous access and a **DDSWaitSet** (p. 1613) associated with one or several **DDSCondition** (p. 1260) objects provides asynchronous data access.

The same synchronous and asynchronous interaction modes can also be used to access changes that affect the middleware communication status (see **Status Kinds** (p. 336)). For instance, this may occur when the middleware asynchronously detects an inconsistency. In addition, other middleware information that may be relevant to the application (such as the list of the existing topics) is made available by means of **built-in topics** (p. 59) that the application can access as plain application data, using built-in data-readers.

7.69.4 Modules

DCPS consists of five modules:

- **Infrastructure module** (p. 162) defines the abstract classes and the interfaces that are refined by the other modules. It also provides support for the two interaction styles (notification-based and wait-based) with the middleware.
- **Domain module** (p. 39) contains the **DDSDomainParticipant** (p. 1335) class that acts as an entrypoint of the Service and acts as a factory for many of the classes. The **DDSDomainParticipant** (p. 1335) also acts as a container for the other objects that make up the Service.
- **Topic module** (p. 61) contains the **DDSTopic** (p. 1601) class, the **DDSTopicListener** (p. 1610) interface, and more generally, all that is needed by the application to define **DDSTopic** (p. 1601) objects and attach QoS policies to them.
- **Publication module** (p. 103) contains the **DDSPublisher** (p. 1534) and **DDSDataWriter** (p. 1305) classes as well as the **DDSPublisherListener** (p. 1555) and **DDSDataWriterListener** (p. 1328) interfaces, and more generally, all that is needed on the publication side.
- **Subscription module** (p. 124) contains the **DDSSubscriber** (p. 1576), **DDSDataReader** (p. 1272), **DDSReadCondition** (p. 1558), and **DDSQueryCondition** (p. 1557) classes, as well as the **DDSSubscriberListener** (p. 1597) and **DDSDataReaderListener** (p. 1299) interfaces, and more generally, all that is needed on the subscription side.

7.70 RTI Connex Messaging API Reference

Extensions to the RTI Connex publish-subscribe functionality.

Modules

- **Request-Reply Pattern**
Support for the request-reply communication pattern.
- **Infrastructure**
Infrastructure types for RTI Connex Messaging.
- **Utilities**
Utilities for the RTI Connex Messaging module.

7.70.1 Detailed Description

Extensions to the RTI Connex publish-subscribe functionality.

RTI Connex Messaging includes the **Request-Reply communication pattern API** (p. 185).

7.71 Programming How-To's

These "How To"s illustrate how to apply RTI Connex APIs to common use cases.

Modules

- **Publication Example**
A data publication example.
- **Subscription Example**
A data subscription example.
- **Participant Use Cases**
Working with domain participants.
- **Topic Use Cases**
Working with topics.
- **FlowController Use Cases**
Working with flow controllers.
- **Publisher Use Cases**
Working with publishers.
- **DataWriter Use Cases**
Working with data writers.
- **Subscriber Use Cases**
Working with subscribers.
- **DataReader Use Cases**
Working with data readers.
- **Entity Use Cases**

Working with entities.

- **Waitset Use Cases**

Using wait-sets and conditions.

- **Transport Use Cases**

Working with pluggable transports.

- **Filter Use Cases**

Working with data filters.

- **Creating Custom Content Filters**

Working with custom content filters.

- **Large Data Use Cases**

Working with large data types.

- **Request-Reply Examples**

Examples on how to use the request-reply API .

7.71.1 Detailed Description

These "How To"s illustrate how to apply RTI Connex API to common use cases.

These are a good starting point to familiarize yourself with DDS. You can use these code fragments as "templates" for writing your own code.

7.72 Interface

Abstraction of a Transport Plugin network interface.

Classes

- struct **NDDS_Transport_Interface_t**

Storage for the description of a network interface used by a Transport Plugin.

Enumerations

- enum **NDDS_Transport_Interface_Status_t** {
 NDDS_TRANSPORT_INTERFACE_OFF = 0 ,
 NDDS_TRANSPORT_INTERFACE_ON = 1 }

Interface status.

7.72.1 Detailed Description

Abstraction of a Transport Plugin network interface.

A Transport Plugin may be able to use several logical or physical network interfaces in a single node (machine). For example, there may be multiple NICs for IP networks or multiple serial ports for serial networks.

An instance of a Transport Plugin is a conduit to one or more network interfaces associated with the transport.

Instances of a Transport Plugin must assign a unique unicast address to each of the network interfaces that it can use to send and receive messages. The unicast address should be within the range of addresses that are addressable by the Transport Plugin (as defined by the plugin itself).

Then, when RTI Connext sends a message to an unicast destination address, the destination address will be made of two parts. The network address and an interface address. The network address portion will be used by RTI Connext to select the Transport Plugin instance that will send the message. The interface address portion is passed to the Transport Plugin instance as the destination interface to which the message should be sent.

See also

NDDS_Transport_Address_t (p. 1756) **NDDS_Transport_ClassId_t** (p. 251)

7.72.2 Enumeration Type Documentation

7.72.2.1 NDDS_Transport_Interface_Status_t

enum **NDDS_Transport_Interface_Status_t**

Interface status.

Enumerator

NDDS_TRANSPORT_INTERFACE_OFF	The transport interface is OFF.
NDDS_TRANSPORT_INTERFACE_ON	The transport interface is ON.

7.73 Transport Plugins Configuration

Transport plugins configuration with RTI Connext.

Classes

- struct **NDDS_Transport_UUID**

Univocally identifies a transport plugin instance.

- struct **TransportAllocationSettings_t**

Allocation settings used by various internal buffers.

- struct **NDDS_Transport_Property_t**

Base configuration structure that must be inherited by derived Transport Plugin classes.

Macros

- #define **NDDS_TRANSPORT_PORT_INVALID** ((NDDS_Transport_Port_t) 0)
Port 0 is considered to be invalid.
- #define **NDDS_TRANSPORT_UUID_SIZE** 12
Size of a NDDS_Transport_UUID (p. 1799).
- #define **NDDS_TRANSPORT_LENGTH_UNLIMITED** -1
Represent an unlimited length.
- #define **NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN** 0
Rank interface as unknown or not yet set.
- #define **NDDS_TRANSPORT_UUID_UNKNOWN** {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
Value for UUIDs that have no known value. Used as default.
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (-1)
*The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 1924).*
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC** (-1)
*The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 1924).*
- #define **NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT**
*The constant used as default value for the struct **TransportAllocationSettings_t** (p. 1924).*
- #define **NDDS_TRANSPORT_CLASSID_INVALID** (-1)
Invalid Transport Class ID.
- #define **NDDS_TRANSPORT_CLASSID_UDPv4** (1)
Builtin IPv4 UDP/IP Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_SHMEM** (0x01000000)
Builtin Shared-Memory Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_SHMEM_510** (2)
Builtin Shared-Memory Transport Plugin class ID for Connex 5.1.0 and earlier.
- #define **NDDS_TRANSPORT_CLASSID_UDPv6** (2)
Builtin IPv6 UDP/IP Transport Plugin class ID.
- #define **NDDS_TRANSPORT_CLASSID_UDPv6_510** (5)
Builtin IPv6 UDP/IP Transport Plugin class ID for Connex 5.1.0 and earlier.
- #define **NDDS_TRANSPORT_CLASSID_TCPV4_LAN** (8)
IPv4 TCP/IP Transport Plugin class ID for LAN case.
- #define **NDDS_TRANSPORT_CLASSID_TCPV4_WAN** (9)
IPv4 TCP/IP Transport Plugin class ID for WAN case.
- #define **NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN** "tcpv4_wan"
IPv4 TCP/IP Transport Plugin class name for WAN case.
- #define **NDDS_TRANSPORT_CLASSID_TLsv4_LAN** (10)
IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.
- #define **NDDS_TRANSPORT_CLASSID_TLsv4_WAN** (11)

- *IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.*
• **#define NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (0x01000001)
- *Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.*
• **#define NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (1000)
- *Transport Plugin class IDs below this are reserved by RTI.*
• **#define NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED** (0x2)
- *Specified zero-copy behavior of transport.*
• **#define NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN** (3)
- *Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.*

Typedefs

- **typedef RTI_UINT32 NDDS_Transport_Port_t**
Type for storing RTI Connex RTPS ports.
- **typedef RTI_INT32 NDDS_Transport_ClassId_t**
Type for storing RTI Connex Transport Plugin class IDs.

7.73.1 Detailed Description

Transport plugins configuration with RTI Connex.

Transport plugins are configured using properties. Each transport plugin must derive its property from a base configuration structure **NDDS_Transport_Property_t** (p. 1758).

To see how to configure the Built-in Transport Plugins, see **Built-in Transport Plugins** (p. 176).

See also

Built-in Transport Plugins (p. 176)

7.73.2 Macro Definition Documentation

7.73.2.1 NDDS_TRANSPORT_PORT_INVALID

```
#define NDDS_TRANSPORT_PORT_INVALID (( NDDS_Transport_Port_t) 0)
```

Port 0 is considered to be invalid.

7.73.2.2 NDDS_TRANSPORT_UUID_SIZE

```
#define NDDS_TRANSPORT_UUID_SIZE 12
```

Size of a **NDDS_Transport_UUID** (p. 1799).

7.73.2.3 NDDS_TRANSPORT_LENGTH_UNLIMITED

```
#define NDDS_TRANSPORT_LENGTH_UNLIMITED -1
```

Represent an unlimited length.

7.73.2.4 NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN

```
#define NDDS_TRANSPORT_INTERFACE_RANK_UNKNOWN 0
```

Rank interface as unknown or not yet set.

7.73.2.5 NDDS_TRANSPORT_UUID_UNKNOWN

```
#define NDDS_TRANSPORT_UUID_UNKNOWN {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
```

Value for UUIDs that have no known value. Used as default.

7.73.2.6 NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED (-1)
```

The constant used as 'unlimited' for the 'max_count' field of the structure **TransportAllocationSettings_t** (p. 1924).

7.73.2.7 NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC (-1)
```

The constant used as 'automatic' for the 'incremental_count' field of the structure **TransportAllocationSettings_t** (p. 1924).

Automatic means the buffer size will double at every reallocation.

7.73.2.8 NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT

```
#define NDDS_TRANSPORT_ALLOCATION_SETTINGS_DEFAULT
```

Value:

```
{
    2L, /* initial_count */ \
    NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED, /* max_count */ \
    NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC /* incremental_count */ \
}
```

The constant used as default value for the struct **TransportAllocationSettings_t** (p. 1924).

The default value defined in this constant, sets the buffer to have:

- initial_count = 2 elements
- max_count = **NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED** (p. 247)
- incremental_count = **NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC**

7.73.2.9 NDDS_TRANSPORT_CLASSID_INVALID

```
#define NDDS_TRANSPORT_CLASSID_INVALID (-1)
```

Invalid Transport Class ID.

Transport-Plugins implementations should set their class ID to a value different than this.

7.73.2.10 NDDS_TRANSPORT_CLASSID_UDPv4

```
#define NDDS_TRANSPORT_CLASSID_UDPv4 (1)
```

Builtin IPv4 UDP/IP Transport Plugin class ID.

7.73.2.11 NDDS_TRANSPORT_CLASSID_SHMEM

```
#define NDDS_TRANSPORT_CLASSID_SHMEM (0x01000000)
```

Builtin Shared-Memory Transport Plugin class ID.

7.73.2.12 NDDS_TRANSPORT_CLASSID_SHMEM_510

```
#define NDDS_TRANSPORT_CLASSID_SHMEM_510 (2)
```

Builtin Shared-Memory Transport Plugin class ID for Connex 5.1.0 and earlier.

7.73.2.13 NDDS_TRANSPORT_CLASSID_UDPv6

```
#define NDDS_TRANSPORT_CLASSID_UDPv6 (2)
```

Builtin IPv6 UDP/IP Transport Plugin class ID.

7.73.2.14 NDDS_TRANSPORT_CLASSID_UDPv6_510

```
#define NDDS_TRANSPORT_CLASSID_UDPv6_510 (5)
```

Builtin IPv6 UDP/IP Transport Plugin class ID for Connex 5.1.0 and earlier.

7.73.2.15 NDDS_TRANSPORT_CLASSID_TCPV4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_LAN (8)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case.

7.73.2.16 NDDS_TRANSPORT_CLASSID_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TCPV4_WAN (9)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case.

7.73.2.17 NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN

```
#define NDDS_TRANSPORT_CLASSNAME_TCPV4_WAN "tcpv4_wan"
```

IPv4 TCP/IP Transport Plugin class name for WAN case.

7.73.2.18 NDDS_TRANSPORT_CLASSID_TLsv4_LAN

```
#define NDDS_TRANSPORT_CLASSID_TLsv4_LAN (10)
```

IPv4 TCP/IP Transport Plugin class ID for LAN case with TLS enabled.

7.73.2.19 NDDS_TRANSPORT_CLASSID_TLsv4_WAN

```
#define NDDS_TRANSPORT_CLASSID_TLsv4_WAN (11)
```

IPv4 TCP/IP Transport Plugin class ID for WAN case with TLS enabled.

7.73.2.20 NDDS_TRANSPORT_CLASSID_UDPv4_WAN

```
#define NDDS_TRANSPORT_CLASSID_UDPv4_WAN (0x01000001)
```

Builtin IPv4 UDP/IP Asymmetric Transport Plugin class ID.

7.73.2.21 NDDS_TRANSPORT_CLASSID_RESERVED_RANGE

```
#define NDDS_TRANSPORT_CLASSID_RESERVED_RANGE (1000)
```

Transport Plugin class IDs below this are reserved by RTI.

User-defined Transport-Plugins should use a class ID greater than this number.

7.73.2.22 NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED

```
#define NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (0x2)
```

Specified zero-copy behavior of transport.

A Transport Plugin may commit to one of three behaviors for zero copy receives:

1. Always does zero copy.
2. Sometimes does zero copy, up to the transport discretion.
3. Never does zero copy.

This bit should be set only if the Transport Plugin commits to always doing a zero copy receive, or more specifically, always loaning a buffer through its `receive_rEA()` call.

In that case, RTI Connexx will not need to allocate storage for a message that it retrieves with the `receive_rEA()` call.

7.73.2.23 NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN

```
#define NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN (3)
```

Minimum number of gather-send buffers that must be supported by a Transport Plugin implementation.

For the **NDDS_Transport_Property_t** (p. 1758) structure to be valid, the value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761) must be greater than or equal to this value.

7.73.3 Typedef Documentation

7.73.3.1 NDDS_Transport_Port_t

```
typedef RTI_UINT32 NDDS_Transport_Port_t
```

Type for storing RTI Connex RTPS ports.

Unlike IPv4 Socket API ports, which are 2 bytes long, the RTI Connex representation of an RTPS port is 4 bytes.

7.73.3.2 NDDS_Transport_ClassId_t

```
typedef RTI_INT32 NDDS_Transport_ClassId_t
```

Type for storing RTI Connex Transport Plugin class IDs.

Each implementation of a Transport Plugin must have a unique ID. For example, a UDP/IP Transport Plugin implementation must have a different ID than a Shared Memory Transport Plugin.

User-implemented Transport Plugins must have an ID higher than **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 250).

7.74 Transport Address

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

Classes

- struct **NDDS_Transport_Address_t**
Addresses are stored individually as network-ordered bytes.

Macros

- **#define NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER** {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
- An invalid transport address. Used as an initializer.*
- **#define NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (72)
- The minimum size of the buffer that should be passed to **NDDS_Transport_Address_to_string** (p. 254).*

Functions

- **RTI_INT32 NDDS_Transport_Address_to_string** (const **NDDS_Transport_Address_t** *self, char *buffer_↵
inout, RTI_INT32 buffer_length_in)
- Converts a numerical address to a printable string representation.*
- **RTIBool NDDS_Transport_Address_to_string_with_protocol_family_format** (const **NDDS_Transport_↵
Address_t** *me, char *buffer, RTI_INT32 buffer_length_in, RTIOsapiSocketAFKind family)
- Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.*
- **RTI_INT32 NDDS_Transport_Address_from_string** (**NDDS_Transport_Address_t** *address_out, const char *address_in)
- Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.*
- **void NDDS_Transport_Address_print** (const **NDDS_Transport_Address_t** *address_in, const char *desc_in, RTI_INT32 indent_in)
- Prints an address to standard out.*
- **RTI_INT32 NDDS_Transport_Address_is_ipv4** (const **NDDS_Transport_Address_t** *address_in)
- Checks if an address is an IPv4 address.*
- **RTI_INT32 NDDS_Transport_Address_is_multicast** (const **NDDS_Transport_Address_t** *address_in)
- Checks if an address is an IPv4 or IPv6 multicast address.*

Variables

- **const NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID**
- An invalid transport address.*

7.74.1 Detailed Description

Transport-independent addressing scheme using IPv6 presentation strings and numerically stored in network-ordered format.

The APIs of RTI Connex uses IPv6 address notation for all transports.

Transport Plugin implementations that are not IP-based are required to map whatever addressing scheme natively used by the physical transport (if any) to an address in IPv6 notation and vice versa.

IPv6 addresses are numerically stored in 16 bytes. An IPv6 address can be presented In string notation in a variety of ways. For example,

```
"00AF:0000:0037:FE01:0000:0000:034B:0089"
"AF:0:37:FE01:0:0:34B:89"
"AF:0:37:FE01::34B:89"
```

are all valid IPv6 presentation of the same address.

IPv4 address in dot notation can be used to specify the last 4 bytes of the address. For example,

```
"0000:0000:0000:0000:0000:0000:192.168.0.1"
"0:0:0:0:0:0:192.168.0.1"
"::192.168.0.1"
```

are all valid IPv6 presentation of the same address.

For a complete description of valid IPv6 address notation, consult the IPv6 Addressing Architecture (RFC 2373).

Addresses are divided into unicast addresses and multicast addresses.

Multicast addresses are defined as

- Addresses that start with 0xFF. That is `FFxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx`.

or an IPv4 multicast address

- Address in the range `::224.0.0.0, ::239.255.255.255]`

Multicast addresses do not refer to any specific destination (network interface). Instead, they usually refer to a group of network interfaces, often called a "multicast group".

Unicast addresses always refer to a specific network interface.

7.74.2 Macro Definition Documentation

7.74.2.1 NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER

```
#define NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER {{0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0}}
```

An invalid transport address. Used as an initializer.

For example: `NDDS_Transport_Address_t` (p.1756) `address = NDDS_TRANSPORT_ADDRESS_INVALID_INITIALIZER;`

7.74.2.2 NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE

```
#define NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE (72)
```

The minimum size of the buffer that should be passed to `NDDS_Transport_Address_to_string` (p.254).

For regular addresses, the string size needs to be at least 40 to include space for 8 tuples of 4 characters each plus 7 delimiting colons plus a terminating NULL.

To support UDPv4_WAN strings, it has been adjusted to 72 to fit the following representation (plus NULL terminator):
`f=XXXXRBPU,u={FF,FF,FF,FF,FF,FF,FF,FF,FF},p=255.255.255.255:65555:65555`

7.74.3 Function Documentation

7.74.3.1 NDDS_Transport_Address_to_string()

```
RTI_INT32 NDDS_Transport_Address_to_string (
    const NDDS_Transport_Address_t * self,
    char * buffer_inout,
    RTI_INT32 buffer_length_in )
```

Converts a numerical address to a printable string representation.

Precondition

The *buffer_inout* provided must be at least **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 253) characters long.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) The address to be converted.
<i>buffer_inout</i>	<< <i>inout</i> >> (p. 237) Storage passed in which to return the string corresponding to the address.
<i>buffer_length_in</i>	<< <i>in</i> >> (p. 237) The length of the storage buffer. Must be >= NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE (p. 253)

Returns

1 upon success; 0 upon failure (not enough space in the provided buffer)

7.74.3.2 NDDS_Transport_Address_to_string_with_protocol_family_format()

```
RTIBool NDDS_Transport_Address_to_string_with_protocol_family_format (
    const NDDS_Transport_Address_t * me,
    char * buffer,
    RTI_INT32 buffer_length_in,
    RTIOsapiSocketAFKind family )
```

Converts a numerical address to a printable string representation with IPv4 dotted notation or IPv6 presentation string depending on the provided protocol family.

Precondition

The *buffer_inout* provided must be at least **NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE** (p. 253) characters long.

Parameters

<i>me</i>	<< <i>in</i> >> (p. 237) The address to be converted.
<i>buffer</i>	<< <i>inout</i> >> (p. 237) Storage passed in which to return the string corresponding to the address.
<i>buffer_length</i> <i>_in</i>	<< <i>in</i> >> (p. 237) The length of the storage buffer. Must be >= NDDS_TRANSPORT_ADDRESS_STRING_BUFFER_SIZE (p. 253)
<i>family</i>	<< <i>in</i> >> (p. 237) The protocol family RTI_OSAPI_SOCKET_AF_INET or RTI_OSAPI_SOCKET_AF_INET6

Returns

RTI_TRUE upon success; 0 upon failure (not enough space in the provided buffer)

7.74.3.3 NDDS_Transport_Address_from_string()

```
RTI_INT32 NDDS_Transport_Address_from_string (
    NDDS_Transport_Address_t * address_out,
    const char * address_in )
```

Converts an address (IPv4 dotted notation or IPv6 presentation string) into a numerical address.

The address string must be in IPv4 dotted notation (X.X.X.X) or IPv6 presentation notation. The string cannot be a hostname since this function does not perform a hostname lookup.

Parameters

<i>address_out</i>	<< <i>out</i> >> (p. 237) Numerical value of the address.
<i>address_in</i>	<< <i>in</i> >> (p. 237) String representation of an address.

Returns

1 if address_out contains a valid address
0 if it was not able to convert the string into an address.

7.74.3.4 NDDS_Transport_Address_print()

```
void NDDS_Transport_Address_print (
    const NDDS_Transport_Address_t * address_in,
    const char * desc_in,
    RTI_INT32 indent_in )
```

Prints an address to standard out.

Parameters

<i>address↵ _in</i>	<< <i>in</i> >> (p. 237) Address to be printed.
<i>desc_in</i>	<< <i>in</i> >> (p. 237) A prefix to be printed before the address.
<i>indent_in</i>	<< <i>in</i> >> (p. 237) Indentation level for the printout.

7.74.3.5 NDDS_Transport_Address_is_ipv4()

```
RTI_INT32 NDDS_Transport_Address_is_ipv4 (
    const  NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 address.

Parameters

<i>address↵ _in</i>	<< <i>in</i> >> (p. 237) Address to be tested.
-------------------------	--

Note

May be implemented as a macro for efficiency.

Returns

1 if address is an IPv4 address
0 otherwise.

7.74.3.6 NDDS_Transport_Address_is_multicast()

```
RTI_INT32 NDDS_Transport_Address_is_multicast (
    const  NDDS_Transport_Address_t * address_in )
```

Checks if an address is an IPv4 or IPv6 multicast address.

Parameters

<i>address↵ _in</i>	<< <i>in</i> >> (p. 237) Address to be tested.
-------------------------	--

May be implemented as a macro for efficiency.

Returns

- 1 if address is a multicast address
- 0 otherwise.

7.74.4 Variable Documentation

7.74.4.1 NDDS_TRANSPORT_ADDRESS_INVALID

```
const NDDS_Transport_Address_t NDDS_TRANSPORT_ADDRESS_INVALID
```

An invalid transport address.

7.75 UDP Transport Plugin definitions

UDP Transport Plugin definitions.

Classes

- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo**
Type for storing UDP WAN communication ports.

Macros

- #define **NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT** (0)
Default value of NDDS_Transport_Property_t::properties_bitmap (p. 1760).
- #define **NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** (16)
Default value of NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1761).
- #define **NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT** (-1)
Used to specify that os default be used to specify socket buffer size.
- #define **NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT** (131072)
Default value of send_socket_buffer_size.
- #define **NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT** (131072)
Default value of recv_socket_buffer_size.
- #define **NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT** (1)
Default value of multicast_ttl.

Typedefs

- typedef RTI_UINT16 **NDDS_Transport_UDP_Port**
UDP port.

7.75.1 Detailed Description

UDP Transport Plugin definitions.

7.75.2 Macro Definition Documentation

7.75.2.1 NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT (0)
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1760).

7.75.2.2 NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (16)
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761).

This is also the maximum value that can be used when instantiating the udp transport.

16 is sufficient for RTI Connext, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

7.75.2.3 NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT (-1)
```

Used to specify that os default be used to specify socket buffer size.

7.75.2.4 NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT (131072)
```

Default value of send_socket_buffer_size.

7.75.2.5 NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT (131072)
```

Default value of recv_socket_buffer_size.

7.75.2.6 NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT (1)
```

Default value of multicast_ttl.

7.75.3 Typedef Documentation

7.75.3.1 NDDS_Transport_UDP_Port

```
typedef RTI_UINT16 NDDS_Transport_UDP_Port
```

UDP port.

7.76 Shared Memory Transport

Built-in transport plug-in for inter-process communications using shared memory (**NDDS_TRANSPORT_CLASSID_SHMEM** (p. 248)) .

Classes

- struct **NDDS_Transport_Shmem_Property_t**

*Subclass of **NDDS_Transport_Property_t** (p. 1758) allowing specification of parameters that are specific to the shared-memory transport.*

Macros

- **#define NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT** (-96)
Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1760).
- **#define NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT** (`NDDS_TRANSPORT_↔
PROPERTY_BIT_BUFFER_ALWAYS_LOANED`)
Default value of `NDDS_Transport_Property_t::properties_bitmap` (p. 1760).
- **#define NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** (1024)
Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1761).
- **#define NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT** (65536)
Default value of `NDDS_Transport_Property_t::message_size_max` (p. 1761).
- **#define NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT** (64)
Default value of `NDDS_Transport_Shmem_Property_t::received_message_count_max` (p. 1767).
- **#define NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT**
Default value of `NDDS_Transport_Shmem_Property_t::receive_buffer_size` (p. 1767).
- **#define NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX** (2)
Major version for the transport plugin after fixing bug 14240 (RTI-28)
- **#define NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT**
Use this to initialize stack variable.

Functions

- `NDDS_Transport_Plugin * NDDS_Transport_Shmem_new` (const struct `NDDS_Transport_Shmem_↔
Property_t` *property_in)
Create a new shmem process transport.
- `NDDS_Transport_Plugin * NDDS_Transport_Shmem_create` (`NDDS_Transport_Address_t` *default_↔
network_address_out, const struct `DDS_PropertyQosPolicy` *property_in, const struct `DDS_Product_↔
Version_t` *minimum_compatibility_version)
Create a new shmem process transport, using PropertyQosPolicy.

7.76.1 Detailed Description

Built-in transport plug-in for inter-process communications using shared memory (`NDDS_TRANSPORT_CLASSID_↔
SHMEM` (p. 248)) .

This transport plugin uses System Shared Memory to send messages between processes on the same node. This transport is installed as a built-in transport plugin with the alias `DDS_TRANSPORTBUILTIN_SHMEM_ALIAS` (p. 446).

The transport plugin has exactly one "receive interface"; since the `address_bit_count` is 0, it can be assigned any address. Thus the interface is located by the "network address" associated with the transport plugin.

7.76.2 Compatibility of Sender and Receiver Transports

Opening a receiver "port" on shared memory corresponds to creating a shared memory segment using a name based on the port number. The transport plugin's properties are embedded in the shared memory segment.

When a sender tries to send to the shared memory port, it verifies that properties of the receiver's shared memory transport are compatible with those specified in its transport plugin. If not, the sender will fail to attach to the port and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
<P>
NDDS_Transport_Shmem_attachShmem:failed to initialize incompatible properties
NDDS_Transport_Shmem_attachShmem:countMax 0 > -19417345 or max size -19416188 > 2147482624
```

In this scenario, the properties of the sender or receiver transport plugin instances should be adjusted, so that they are compatible.

7.76.3 Crashing and Restarting Programs

If a process using shared memory crashes (say because the user typed in `^C`), resources associated with its shared memory ports may not be properly cleaned up. Later, if another RTI Connex process needs to open the same ports (say, the crashed program is restarted), it will attempt to reuse the shared memory segment left behind by the crashed process.

The reuse is allowed iff the properties of transport plugin are compatible with those embedded in the shared memory segment (i.e., of the original creator). Otherwise, the process will fail to open the ports, and will output messages such as below (with numbers appropriate to the properties of the transport plugins involved).

```
NDDS_Transport_Shmem_create_recvresource_rrEA:failed to initialize shared
memory resource Cannot recycle existing shmem: size not compatible for key 0x1234
```

In this scenario, the shared memory segments must be cleaned up using appropriate platform specific commands. For details, please refer to the `Platform Notes`.

7.76.4 Shared Resource Keys

The transport uses the **shared memory segment keys**, given by the formula below.

```
<P>
0x400000 + port
```

The transport also uses signaling **shared semaphore** keys given by the formula below.

```
<P>
0x800000 + port
```

The transport also uses mutex **shared semaphore keys** given by the formula below.

```
<P>
0xb00000 + port
```

where the `port` is a function of the `domain_id` and the `participant_id`, as described in [DDS_WireProtocolQosPolicy::participant_id](#) (p. 1231)

See also

[DDS_WireProtocolQosPolicy::participant_id](#) (p. 1231)

[NDDSTransportSupport::set_builtin_transport_property\(\)](#) (p. 1815)

7.76.5 Creating and Registering Shared Memory Transport Plugin

RTI Connex can implicitly create this plugin and register with the **DDSDomainParticipant** (p. 1335) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 1129).

To specify the properties of the builtin shared memory transport that is implicitly registered, you can either:

- call **NDDSTransportSupport::set_builtin_transport_property** (p. 1815) or
- specify the pre-defined property names in **DDS_PropertyQosPolicy** (p. 994) associated with the **DDSDomainParticipant** (p. 1335). (see **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. ??)).

Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 994) always overwrite the ones specified through **NDDSTransportSupport::set_builtin_transport_property()** (p. 1815). The default value is assumed on any unspecified property. Note that all properties should be set before the transport is implicitly created and registered by RTI Connex. See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered.

To explicitly create an instance of this plugin, **NDDS_Transport_Shmem_new()** (p. 265) should be called. The instance should be registered with RTI Connex, see **NDDSTransportSupport::register_transport** (p. 1811). In some configurations, you may have to disable the builtin shared memory transport plugin instance (**DDS_TransportBuiltinQosPolicy** (p. 1129), **DDS_TRANSPORTBUILTIN_SHMEM** (p. 445)), to avoid port conflicts with the newly created plugin instance.

7.76.6 Shared Memory Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **DDS_DomainParticipantQos::property** (p. 739) to to configure the builtin shared memory transport plugin.

Table 7.89 Property Strings for Shared Memory Transport

Name	Descriptions
dds.transport.shmem.builtin.parent.address_bit_count	See NDDS_Transport_Property_t::address_bit_count (p. 1760)
dds.transport.shmem.builtin.parent.properties_bitmap	See NDDS_Transport_Property_t::properties_bitmap (p. 1760)
dds.transport.shmem.builtin.parent.gather_send_buffer_count_max	See NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1761)
dds.transport.shmem.builtin.parent.message_size_max	See NDDS_Transport_Property_t::message_size_max (p. 1761)
dds.transport.shmem.builtin.parent.allow_interfaces	See NDDS_Transport_Property_t::allow_interfaces_list (p. 1761) and NDDS_Transport_Property_t::allow_interfaces_list_length (p. 1762). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0

Name	Descriptions
dds.transport.shmem.builtin.parent.deny_interfaces	See NDDS_Transport_Property_t::deny_interfaces_list (p. 1762) and NDDS_Transport_Property_t::deny_interfaces_list_length (p. 1763). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.allow_multicast_interfaces	See NDDS_Transport_Property_t::allow_multicast_interfaces_list (p. 1763) and NDDS_Transport_Property_t::allow_multicast_interfaces_list_length (p. 1764). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.deny_multicast_interfaces	See NDDS_Transport_Property_t::deny_multicast_interfaces_list (p. 1764) and NDDS_Transport_Property_t::deny_multicast_interfaces_list_length (p. 1764). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.shmem.builtin.parent.max_interface_count	See NDDS_Transport_Property_t::max_interface_count (p. 1765)
dds.transport.shmem.builtin.parent.thread_name_prefix	See NDDS_Transport_Property_t::thread_name_prefix (p. 1765)
dds.transport.shmem.builtin.received_message_count_max	See NDDS_Transport_Shmem_Property_t::received_message_count_max (p. 1767)
dds.transport.shmem.builtin.receive_buffer_size	See NDDS_Transport_Shmem_Property_t::receive_buffer_size (p. 1767)
dds.transport.shmem.builtin.enable_udp_debugging	See NDDS_Transport_Shmem_Property_t::enable_udp_debugging (p. 1768)
dds.transport.shmem.builtin.udp_debugging_address	See NDDS_Transport_Shmem_Property_t::udp_debugging_address (p. 1768)
dds.transport.shmem.builtin.udp_debugging_port	See NDDS_Transport_Shmem_Property_t::udp_debugging_port (p. 1769)

7.76.7 Macro Definition Documentation

7.76.7.1 NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_SHMEM_ADDRESS_BIT_COUNT (-96)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1760).

7.76.7.2 NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTIES_BITMAP_DEFAULT ( NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_↵  
ALWAYS_LOANED )
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1760).

7.76.7.3 NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT (1024)
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761).

7.76.7.4 NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT (65536)
```

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1761).

7.76.7.5 NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT (64)
```

Default value of **NDDS_Transport_Shmem_Property_t::received_message_count_max** (p. 1767).

7.76.7.6 NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT
```

Value:

```
(NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT * \  
NDDS_TRANSPORT_SHMEM_MESSAGE_SIZE_MAX_DEFAULT / 4)
```

Default value of **NDDS_Transport_Shmem_Property_t::receive_buffer_size** (p. 1767).

7.76.7.7 NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX

```
#define NDDS_TRANSPORT_SHMEM_MAJOR_AFTER_BUG_14240_FIX (2)
```

Major version for the transport plugin after fixing bug 14240 (RTI-28)

7.76.7.8 NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_SHMEM_PROPERTY_DEFAULT
```

Use this to initialize stack variable.

7.76.8 Function Documentation**7.76.8.1 NDDS_Transport_Shmem_new()**

```
NDDS_Transport_Plugin * NDDS_Transport_Shmem_new (
    const struct NDDS_Transport_Shmem_Property_t * property_in )
```

Create a new shmem process transport.

An application may create multiple transports, possibly for use in different domains.

Parameters

<i>property_in</i>	<< <i>in</i> >> (p. 237) Desired behavior of this transport. May be NULL for default property. The transport plugin can only support one unicast receive interface; therefore the interface selection lists are ignored.
--------------------	--

Returns

handle to a Shmem inter-process Transport Plugin on success
 NULL on failure.

7.76.8.2 NDDS_Transport_Shmem_create()

```
NDDS_Transport_Plugin * NDDS_Transport_Shmem_create (
    NDDS_Transport_Address_t * default_network_address_out,
```

```
const struct DDS_PropertyQosPolicy * property_in,
const struct DDS_ProductVersion_t * minimum_compatibility_version )
```

Create a new shmemp process transport, using PropertyQosPolicy.

An application may create multiple transports, possibly for use in different domains.

Parameters

<i>default_network_address_out</i>	<< out >> (p. 237) Network address to be used when registering the transport.
<i>property_in</i>	<< in >> (p. 237) Desired behavior of this transport. May be NULL for default property. The transport plugin can only support one unicast receive interface; therefore the interface selection lists are ignored.
<i>minimum_compatibility_version</i>	<< in >> (p. 237) Desired product version for the shared memory transport. If NULL, the default shared memory transport is used (no additional compatibility restrictions for the transport version). Please refer to the <code>minimum_compatibility_version</code> property for more information.

Returns

handle to a Shmem inter-process Transport Plugin on success
 NULL on failure.

7.77 UDPv4 Transport

Transport plug-in using UDP/IPv4 (**NDDS_TRANSPORT_CLASSID_UDPv4** (p. 248)) .

Classes

- struct **NDDS_Transport_UDPv4_Property_t**
Configurable IPv4/UDP Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPv4_ADDRESS_BIT_COUNT** (32)
Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1760).
- #define **NDDS_TRANSPORT_UDPv4_WAN_ADDRESS_BIT_COUNT** (128)
Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1760) for UDPv4 asymmetric transport.
- #define **NDDS_TRANSPORT_UDPv4_PROPERTIES_BITMAP_DEFAULT** **NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT**
Default value of `NDDS_Transport_Property_t::properties_bitmap` (p. 1760).
- #define **NDDS_TRANSPORT_UDPv4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** **NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT**
Default value of `NDDS_Transport_Property_t::gather_send_buffer_count_max` (p. 1761).

- **#define NDDS_TRANSPORT_UDPv4_SOCKET_BUFFER_SIZE_OS_DEFAULT NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT**
Used to specify that os default be used to specify socket buffer size.
- **#define NDDS_TRANSPORT_UDPv4_SEND_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT**
Default value for `NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size` (p. 1772) and `NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size` (p. 1781).
- **#define NDDS_TRANSPORT_UDPv4_RECV_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT**
Default value for `NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size` (p. 1772) and `NDDS_Transport_UDPv4_WAN_Property_t::recv_socket_buffer_size` (p. 1781).
- **#define NDDS_TRANSPORT_UDPv4_PAYLOAD_SIZE_MAX (65507)**
Maximum value of `NDDS_Transport_Property_t::message_size_max` (p. 1761).
- **#define NDDS_TRANSPORT_UDPv4_MESSAGE_SIZE_MAX_DEFAULT NDDS_TRANSPORT_UDPv4_PAYLOAD_SIZE_MAX**
Maximum value of `NDDS_Transport_Property_t::message_size_max` (p. 1761).
- **#define NDDS_TRANSPORT_UDPv4_MULTICAST_TTL_DEFAULT NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT**
Default value of `NDDS_Transport_UDPv4_Property_t::multicast_ttl` (p. 1773).
- **#define NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER**
Value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1775) to specify non-blocking sockets.
- **#define NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS**
[default] Value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1775) to specify blocking sockets.
- **#define NDDS_TRANSPORT_UDPv4_BLOCKING_DEFAULT NDDS_TRANSPORT_UDP_BLOCKING_DEFAULT**
Default value for `NDDS_Transport_UDPv4_Property_t::send_blocking` (p. 1775) to specify blocking sockets.
- **#define NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT**
Use this to initialize a `NDDS_Transport_UDPv4_Property_t` (p. 1770) structure.
- **#define NDDS_Transport_UDPv4_string_to_address_cEA NDDS_Transport_UDP_string_to_address_cEA**
Realization of `NDDS_Transport_String_To_Address_Fcn_cEA` for IP transports.

Functions

- `NDDS_Transport_Plugin * NDDS_Transport_UDPv4_new (const struct NDDS_Transport_UDPv4_Property_t *property_in)`
Create an instance of a UDPv4 Transport Plugin.
- `NDDS_Transport_Plugin * NDDS_Transport_UDPv4_create (NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in)`
Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy.
- `NDDS_Transport_Plugin * NDDS_Transport_UDPv4_create_from_properties_with_prefix (NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in, const char *propertyPrefix)`
Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy. Same as `NDDS_Transport_UDPv4_create` but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

7.77.1 Detailed Description

Transport plug-in using UDP/IPv4 (**NDDS_TRANSPORT_CLASSID_UDPv4** (p. 248)) .

This transport plugin uses UDPv4 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **DDS_TRANSPORTBUILTIN_UDPv4_ALIAS** (p. 446).

You can configure an instance of this plugin to only use unicast or only use multicast, see **NDDS_Transport_UDPv4_Property_t::unicast_enabled** (p. 1772) and **NDDS_Transport_UDPv4_Property_t::multicast_enabled** (p. 1773).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **NDDS_Transport_Property_t::max_interface_count** (p. 1765) and the "white" and "black" lists in the base property's fields (**NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762), **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1763), **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1764)).

RTI Connexx can implicitly create this plugin and register with the **DDSDomainParticipant** (p. 1335) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 1129).

To specify the properties of the builtin UDPv4 transport that is implicitly registered, you can either:

- call **NDDSTransportSupport::set_builtin_transport_property** (p. 1815) or
- specify the predefined property names in **DDS_PropertyQosPolicy** (p. 994) associated with the **DDSDomainParticipant** (p. 1335). (see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 268)). Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 994) always overwrite the ones specified through **NDDSTransportSupport::set_builtin_transport_property()** (p. 1815). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connexx. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered. To explicitly create an instance of this plugin, **NDDS_Transport_UDPv4_new()** (p. 274) should be called. The instance should be registered with RTI Connexx, see **NDDSTransportSupport::register_transport** (p. 1811). In some configurations one may have to disable the builtin UDPv4 transport plugin instance (**DDS_TransportBuiltinQosPolicy** (p. 1129), **DDS_TRANSPORTBUILTIN_UDPv4** (p. 445)), to avoid port conflicts with the newly created plugin instance.

7.77.2 UDPv4 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **DDS_DomainParticipantQos::property** (p. 739) to configure the builtin UDPv4 transport plugin.

Table 7.92 *Property Names for UDPv4 Transport Plugin*

Property Name	Description
dds.transport.UDPv4.builtin.parent.classid	See NDDS_Transport_Property_t::classid (p. 1759) Should be set to "NDDS_TRANSPORT_CLASSID_↵ UDPv6 (p. 248)"
dds.transport.UDPv4.builtin.parent.address_bit_count	See NDDS_Transport_Property_t::address_bit_↵ count (p. 1760)
dds.transport.UDPv4.builtin.parent.properties_bitmap	See NDDS_Transport_Property_t::properties_↵ bitmap (p. 1760)
dds.transport.UDPv4.builtin.parent.gather_send_↵ buffer_count_max	See NDDS_Transport_Property_t::gather_send_↵ buffer_count_max (p. 1761)
dds.transport.UDPv4.builtin.parent.message_size_max	See NDDS_Transport_Property_t::message_size_↵ max (p. 1761)
dds.transport.UDPv4.builtin.parent.allow_interfaces	See NDDS_Transport_Property_t::allow_↵ interfaces_list (p. 1761) and NDDS_Transport_↵ Property_t::allow_interfaces_list_length (p. 1762). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_interfaces	See NDDS_Transport_Property_t::deny_interfaces_↵ _list (p. 1762) and NDDS_Transport_Property_t_↵ ::deny_interfaces_list_length (p. 1763). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.allow_multicast_↵ interfaces	See NDDS_Transport_Property_t::allow_multicast_↵ _interfaces_list (p. 1763) and NDDS_Transport_↵ Property_t::allow_multicast_interfaces_list_length (p. 1764). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.deny_multicast_↵ interfaces	See NDDS_Transport_Property_t::deny_multicast_↵ _interfaces_list (p. 1764) and NDDS_Transport_↵ Property_t::deny_multicast_interfaces_list_length (p. 1764). Interfaces should be specified as comma- separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv4.builtin.parent.max_interface_count	See NDDS_Transport_Property_t::max_interface_↵ count (p. 1765)
dds.transport.UDPv4.builtin.parent.thread_name_prefix	See NDDS_Transport_Property_t::thread_name_↵ prefix (p. 1765)
dds.transport.UDPv4.builtin.send_socket_buffer_size	See NDDS_Transport_UDPv4_Property_t::send_↵ socket_buffer_size (p. 1772)
dds.transport.UDPv4.builtin.recv_socket_buffer_size	See NDDS_Transport_UDPv4_Property_t::recv_↵ socket_buffer_size (p. 1772)
dds.transport.UDPv4.builtin.unicast_enabled	See NDDS_Transport_UDPv4_Property_t::unicast_↵ _enabled (p. 1772)
dds.transport.UDPv4.builtin.multicast_enabled	See NDDS_Transport_UDPv4_Property_t_↵ ::multicast_enabled (p. 1773)

Property Name	Description
dds.transport.UDPv4.builtin.multicast_ttl	See NDDS_Transport_UDPv4_Property_t::multicast_ttl (p. 1773)
dds.transport.UDPv4.builtin.multicast_loopback_↵disabled	See NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled (p. 1773)
dds.transport.UDPv4.builtin.ignore_loopback_interface	See NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface (p. 1773)
dds.transport.UDPv4.builtin.ignore_nonrunning_↵interfaces	See NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces (p. 1774)
dds.transport.UDPv4.builtin.ignore_nonup_interfaces	[DEPRECATED] See NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces (p. 1774)
dds.transport.UDPv4.builtin.no_zero_copy	[DEPRECATED] See NDDS_Transport_UDPv4_Property_t::no_zero_copy (p. 1775)
dds.transport.UDPv4.builtin.send_blocking	See NDDS_Transport_UDPv4_Property_t::send_blocking (p. 1775)
dds.transport.UDPv4.builtin.transport_priority_mask	See NDDS_Transport_UDPv4_Property_t::transport_priority_mask (p. 1776)
dds.transport.UDPv4.builtin.transport_priority_↵mapping_low	See NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low (p. 1776)
dds.transport.UDPv4.builtin.transport_priority_↵mapping_high	See NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high (p. 1776)
dds.transport.UDPv4.builtin.send_ping	See NDDS_Transport_UDPv4_Property_t::send_ping (p. 1777)
dds.transport.UDPv4.builtin.force_interface_poll_↵detection	See NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection (p. 1777)
dds.transport.UDPv4.builtin.interface_poll_period	See NDDS_Transport_UDPv4_Property_t::interface_poll_period (p. 1777)
dds.transport.UDPv4.builtin.reuse_multicast_receive_↵resource	See NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource (p. 1777)
dds.transport.UDPv4.builtin.protocol_overhead_max	See NDDS_Transport_UDPv4_Property_t::protocol_overhead_max (p. 1778)
dds.transport.UDPv4.builtin.disable_interface_tracking	See NDDS_Transport_UDPv4_Property_t::disable_interface_tracking (p. 1778)
dds.transport.UDPv4.builtin.public_address	See NDDS_Transport_UDPv4_Property_t::public_address (p. 1779)
dds.transport.UDPv4.builtin.join_multicast_group_↵timeout	See NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout (p. 1778)

7.77.3 Macro Definition Documentation

7.77.3.1 NDDS_TRANSPORT_UDPv4_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPv4_ADDRESS_BIT_COUNT (32)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1760).

7.77.3.2 NDDS_TRANSPORT_UDPv4_WAN_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPv4_WAN_ADDRESS_BIT_COUNT (128)
```

Default value of **NDDS_Transport_Property_t::address_bit_count** (p. 1760) for UDPv4 asymmetric transport.

7.77.3.3 NDDS_TRANSPORT_UDPv4_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_PROPERTIES_BITMAP_DEFAULT  NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_↔  
DEFAULT
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1760).

7.77.3.4 NDDS_TRANSPORT_UDPv4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT  NDDS_TRANSPORT_UDP_GATHER_↔  
SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for RTI Connext, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

7.77.3.5 NDDS_TRANSPORT_UDPv4_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_SOCKET_BUFFER_SIZE_OS_DEFAULT  NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↔  
SIZE_OS_DEFAULT
```

Used to specify that os default be used to specify socket buffer size.

7.77.3.6 NDDS_TRANSPORT_UDPv4_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_SEND_SOCKET_BUFFER_SIZE_DEFAULT  NDDS_TRANSPORT_UDP_SEND_SOCKET_↵  
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size** (p. 1772) and **NDDS_Transport_↵
_UDPv4_WAN_Property_t::send_socket_buffer_size** (p. 1781).

7.77.3.7 NDDS_TRANSPORT_UDPv4_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_RECV_SOCKET_BUFFER_SIZE_DEFAULT  NDDS_TRANSPORT_UDP_RECV_SOCKET_↵  
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size** (p. 1772) and **NDDS_Transport_↵
_UDPv4_WAN_Property_t::recv_socket_buffer_size** (p. 1781).

7.77.3.8 NDDS_TRANSPORT_UDPv4_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPv4_PAYLOAD_SIZE_MAX  (65507)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1761).

7.77.3.9 NDDS_TRANSPORT_UDPv4_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_MESSAGE_SIZE_MAX_DEFAULT  NDDS_TRANSPORT_UDPv4_PAYLOAD_SIZE_MAX
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1761).

7.77.3.10 NDDS_TRANSPORT_UDPv4_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_MULTICAST_TTL_DEFAULT  NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of **NDDS_Transport_UDPv4_Property_t::multicast_ttl** (p. 1773).

7.77.3.11 NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER
```

Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1775) to specify non-blocking sockets.

7.77.3.12 NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS
```

[default] Value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1775) to specify blocking sockets.

7.77.3.13 NDDS_TRANSPORT_UDPv4_BLOCKING_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_BLOCKING_DEFAULT NDDS_TRANSPORT_UDP_BLOCKING_DEFAULT
```

Default value for **NDDS_Transport_UDPv4_Property_t::send_blocking** (p. 1775) to specify blocking sockets.

7.77.3.14 NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_PROPERTY_DEFAULT
```

Use this to initialize a **NDDS_Transport_UDPv4_Property_t** (p. 1770) structure.

7.77.3.15 NDDS_Transport_UDPv4_string_to_address_cEA

```
#define NDDS_Transport_UDPv4_string_to_address_cEA NDDS_Transport_UDP_string_to_address_cEA
```

Realization of **NDDS_Transport_String_To_Address_Fcn_cEA** for IP transports.

Converts a host name string to a IPv4 address.

Parameters

<i>self</i>	NOT USED. May be NULL.
<i>address_out</i>	<< out >> (p. 237) The corresponding numerical value in IPv4 format.
<i>address_in</i>	<< in >> (p. 237) The name of the IPv4 address. It can be a dot notation name or a host name. If

`NDDS_Transport_String_To_Address_Fcn_cEA` for complete documentation.

7.77.4 Function Documentation

7.77.4.1 `NDDS_Transport_UDPv4_new()`

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_new (
    const struct  NDDS_Transport_UDPv4_Property_t * property_in )
```

Create an instance of a UDPv4 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connext. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connext domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the `NDDS_Transport_UDP_↵_Property_t::parent`:

- `NDDS_Transport_Property_t::allow_interfaces_list` (p. 1761),
- `NDDS_Transport_Property_t::deny_interfaces_list` (p. 1762),
- `NDDS_Transport_Property_t::allow_multicast_interfaces_list` (p. 1763),
- `NDDS_Transport_Property_t::deny_multicast_interfaces_list` (p. 1764)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<code>property_↵_in</code>	<< <i>in</i> >> (p. 237) Desired behavior of this transport. May be NULL for default property.
----------------------------	--

Returns

A UDPv4 Transport Plugin instance on success; or NULL on failure.

7.77.4.2 NDDS_Transport_UDPv4_create()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_create (
    NDDS_Transport_Address_t * default_network_address_out,
    const struct DDS_PropertyQosPolicy * property_in )
```

Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv4_Property_t::parent** (p. 1772):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1763),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1764)

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<i>default_network_address_out</i>	<< out >> (p. 237) Network address to be used when registering the transport.
<i>property_in</i>	<< in >> (p. 237) Desired behavior of this transport as defined in the DDS_DomainParticipantQos::property (p. 739).

Returns

A UDPv4 Transport Plugin instance on success; or NULL on failure.

7.77.4.3 NDDS_Transport_UDPv4_create_from_properties_with_prefix()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_create_from_properties_with_prefix (
    NDDS_Transport_Address_t * default_network_address_out,
    const struct DDS_PropertyQosPolicy * property_in,
    const char * propertyPrefix )
```

Create an instance of a UDPv4 Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv4_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

Parameters

<i>default_network_address_out</i>	<< <i>out</i> >> (p. 237) Network address to be used when registering the transport.
<i>property_in</i>	<< <i>in</i> >> (p. 237) Desired behavior of this transport as defined in the DDS_DomainParticipantQos::property (p. 739).
<i>propertyPrefix</i>	a prefix for the properties. Expected UDP properties have the form prefix.property_name

7.78 Real-Time WAN Transport

Transport plug-in using UDP/IPv4 for WAN communications. (**NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (p. 250))

Classes

- struct **NDDS_Transport_UDPv4_WAN_Property_t**
Configurable IPv4/UDP WAN Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPv4_WAN_PROPERTY_DEFAULT**
*Use this to initialize a **NDDS_Transport_UDPv4_WAN_Property_t** (p. 1780) structure.*

Functions

- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_WAN_new** (const struct **NDDS_Transport_UDPv4_WAN_Property_t** *property_in)
Create an instance of a UDPv4_WAN Transport Plugin.
- NDDS_Transport_Plugin * **NDDS_Transport_UDPv4_WAN_create** (NDDS_Transport_Address_t *default_network_address_out, const struct **DDS_PropertyQosPolicy** *property_in)

Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy.

- `NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_create_from_properties_with_prefix (NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in, const char *propertyPrefix)`

Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv4_WAN_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

7.78.1 Detailed Description

Transport plug-in using UDP/IPv4 for WAN communications. (**NDDS_TRANSPORT_CLASSID_UDPv4_WAN** (p. 250))

RTI Real-Time WAN Transport (RWT) is a transport that enables secure, scalable, and high-performance communication over wide area networks (WANs), including public networks.

It extends RTI Connex capabilities to WAN environments. Real-Time WAN Transport uses UDPv4 as the underlying IP transport-layer protocol to better anticipate and adapt to the challenges of diverse network conditions, device mobility, and the dynamic nature of WAN system architectures.

Real-Time WAN Transport, in combination with RTI Cloud Discovery Service (CDS), provides a complete, seamless solution out of the box for WAN connectivity.

This transport is not installed as part of an RTI Connex package; it must be downloaded and installed separately.

Real-Time WAN Transport replaces the transport capabilities of the Secure WAN Transport optionally available with previous RTI Connex releases (prior to 7.0.0), and provides the following capabilities:

- NAT (Network Address Translator) traversal: Ability to communicate between DomainParticipants running in a Local Area Network (LAN) that is behind a NAT-enabled router, and DomainParticipants on the outside of the NAT across a WAN. This functionality is provided in combination with Cloud Discovery Service.
- IP mobility: Support for network transitions and changes in IP addresses in any of the DomainParticipants participating in the communication.
- Security: Secure communications between DomainParticipants using Security Plugins.

Real-Time WAN Transport does not require third-party components, such as STUN servers, or protocols like SIP to handle session establishment. Using a single API and security model, you can leverage the extensive capabilities of the RTI Connex framework and ecosystem, including tools and infrastructure services, even for real-time connectivity from edge to cloud and back in highly distributed systems that communicate across wide area networks.

This transport plugin uses UDPv4 sockets to send and receive messages. It supports unicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and "UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS** (p. 446).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node by specifying the **NDDS_Transport_Property_t::max_interface_count** (p. 1765) and the "white" and "black" lists in the base property's fields (**NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762)).

RTI Connex can implicitly create this plugin and register with the **DDSDomainParticipant** (p. 1335) if this transport is specified in **DDS_TransportBuiltinQosPolicy** (p. 1129).

To specify the properties of the Real-Time WAN Transport that is implicitly registered, you can either:

- call **NDDSTransportSupport::set_builtin_transport_property** (p. 1815) or
- specify the predefined property names in **DDS_PropertyQosPolicy** (p. 994) associated with the **DDSDomainParticipant** (p. 1335). (see **Real-Time WAN Transport Property** (p. 278)). Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 994) always overwrite the ones specified through **NDDSTransportSupport::set_builtin_transport_property()** (p. 1815). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connex. Any properties set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered. To explicitly create an instance of this plugin, **NDDS_Transport_UDPv4_WAN_new()** (p. 280) should be called. The instance should be registered with RTI Connex, see **NDDSTransportSupport::register_transport** (p. 1811). In some configurations one may have to disable the builtin UDPv4 transport plugin instance (**DDS_TransportBuiltinQosPolicy** (p. 1129), **DDS_TRANSPORTBUILTIN_UDPv4_WAN** (p. 445)), to avoid port conflicts with the newly created plugin instance.

For additional details on how to configure and use the Real-Time WAN Transport, see the **Core Libraries User's Manual**.

7.78.2 Real-Time WAN Transport Property

Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in the **DDS_DomainParticipantQos::property** (p. 739) to configure the Real-Time WAN Transport plugin.

Table 7.97 Property Names for Real-Time WAN Transport Plugin

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.classid	See NDDS_Transport_Property_t::classid (p. 1759). Should be set to " NDDS_TRANSPORT_CLASSID_UDPv4_WAN (p. 250)".
dds.transport.UDPv4_WAN.builtin.parent.address_bit_count	See NDDS_Transport_Property_t::address_bit_count (p. 1760).
dds.transport.UDPv4_WAN.builtin.parent.properties_bitmap	See NDDS_Transport_Property_t::properties_bitmap (p. 1760).
dds.transport.UDPv4_WAN.builtin.parent.gather_send_buffer_count_max	See NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1761).
dds.transport.UDPv4_WAN.builtin.parent.message_size_max	See NDDS_Transport_Property_t::message_size_max (p. 1761).
dds.transport.UDPv4_WAN.builtin.parent.allow_interfaces	See NDDS_Transport_Property_t::allow_interfaces_list (p. 1761) and NDDS_Transport_Property_t::allow_interfaces_list_length (p. 1762). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example, 127.0.0.1,eth0
dds.transport.UDPv4_WAN.builtin.parent.deny_interfaces	See NDDS_Transport_Property_t::deny_interfaces_list (p. 1762) and NDDS_Transport_Property_t::deny_interfaces_list_length (p. 1763). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0

Property Name	Description
dds.transport.UDPv4_WAN.builtin.parent.max_ interface_count	See <code>NDDS_Transport_Property_t::max_interface_ count</code> (p. 1765)
dds.transport.UDPv4_WAN.builtin.parent.thread_ name_prefix	See <code>NDDS_Transport_Property_t::thread_name_ prefix</code> (p. 1765)
dds.transport.UDPv4_WAN.builtin.send_socket_ buffer_size	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::send_socket_buffer_size</code> (p. 1781)
dds.transport.UDPv4_WAN.builtin.recv_socket_buffer_ _size	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::recv_socket_buffer_size</code> (p. 1781)
dds.transport.UDPv4_WAN.builtin.ignore_loopback_ interface	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::ignore_loopback_interface</code> (p. 1782)
dds.transport.UDPv4_WAN.builtin.ignore_nonrunning_ _interfaces	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::ignore_nonrunning_interfaces</code> (p. 1783)
dds.transport.UDPv4_WAN.builtin.ignore_nonup_ interfaces	[DEPRECATED] See <code>NDDS_Transport_UDPv4_ WAN_Property_t::ignore_nonup_interfaces</code> (p. 1782)
dds.transport.UDPv4_WAN.builtin.no_zero_copy	[DEPRECATED] See <code>NDDS_Transport_UDPv4_ WAN_Property_t::no_zero_copy</code> (p. 1783)
dds.transport.UDPv4_WAN.builtin.send_blocking	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::send_blocking</code> (p. 1784)
dds.transport.UDPv4_WAN.builtin.transport_priority_ mask	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::transport_priority_mask</code> (p. 1784)
dds.transport.UDPv4_WAN.builtin.transport_priority_ mapping_low	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::transport_priority_mapping_low</code> (p. 1785)
dds.transport.UDPv4_WAN.builtin.transport_priority_ mapping_high	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::transport_priority_mapping_high</code> (p. 1785)
dds.transport.UDPv4_WAN.builtin.send_ping	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::send_ping</code> (p. 1785)
dds.transport.UDPv4_WAN.builtin.force_interface_ poll_detection	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::force_interface_poll_detection</code> (p. 1786)
dds.transport.UDPv4_WAN.builtin.interface_poll_period	See <code>NDDS_Transport_UDPv4_WAN_Property_t_ ::interface_poll_period</code> (p. 1786)

NDDSTransportSupport::set_builtin_transport_property() (p. 1815)

7.78.3 Macro Definition Documentation

7.78.3.1 NDDS_TRANSPORT_UDPv4_WAN_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPv4_WAN_PROPERTY_DEFAULT
```

Use this to initialize a **NDDS_Transport_UDPv4_WAN_Property_t** (p. 1780) structure.

7.78.4 Function Documentation

7.78.4.1 NDDS_Transport_UDPv4_WAN_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_new (
    const struct  NDDS_Transport_UDPv4_WAN_Property_t * property_in )
```

Create an instance of a UDPv4_WAN Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface "white" and "black" lists specified in the **NDDS_Transport_UDP_Property_t**↔
::parent:

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762),

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<i>property</i> ↔ <i>_in</i>	<< <i>in</i> >> (p. 237) Desired behavior of this transport. May be NULL for default property.
---------------------------------	--

Returns

A UDPv4_WAN Transport Plugin instance on success; or NULL on failure.

7.78.4.2 NDDS_Transport_UDPv4_WAN_create()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_create (
    NDDS_Transport_Address_t * default_network_address_out,
    const struct DDS_PropertyQosPolicy * property_in )
```

Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface "white" and "black" lists specified in the **NDDS_Transport_UDPv4_WAN_↔Property_t::parent** (p. 1781):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762),

The format of a string in these lists is assumed to be in standard IPv4 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<i>default_network_address_out</i>	<< <i>out</i> >> (p. 237) Network address to be used when registering the transport.
<i>property_in</i>	<< <i>in</i> >> (p. 237) Desired behavior of this transport as defined in the DDS_DomainParticipantQos::property (p. 739).

Returns

A UDPv4_WAN Transport Plugin instance on success; or NULL on failure.

7.78.4.3 NDDS_Transport_UDPv4_WAN_create_from_properties_with_prefix()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv4_WAN_create_from_properties_with_prefix (
    NDDS_Transport_Address_t * default_network_address_out,
    const struct DDS_PropertyQosPolicy * property_in,
    const char * propertyPrefix )
```

Create an instance of a UDPv4_WAN Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv4_WAN_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

Parameters

<i>default_network_address_out</i>	<< <i>out</i> >> (p. 237) Network address to be used when registering the transport.
<i>property_in</i>	<< <i>in</i> >> (p. 237) Desired behavior of this transport as defined in the DDS_DomainParticipantQos::property (p. 739).
<i>propertyPrefix</i>	Prefix for the properties. Expected UDP properties have the form prefix.property_name

7.79 UDPv6 Transport

Transport plug-in using UDP/IPv6 (**NDDS_TRANSPORT_CLASSID_UDPv6** (p. 249)) .

Classes

- struct **NDDS_Transport_UDPv6_Property_t**
Configurable IPv6/UDP Transport-Plugin properties.

Macros

- #define **NDDS_TRANSPORT_UDPv6_ADDRESS_BIT_COUNT** (128)
Default value of NDDS_Transport_Property_t::address_bit_count (p. 1760).
- #define **NDDS_TRANSPORT_UDPv6_PROPERTIES_BITMAP_DEFAULT** **NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_DEFAULT**
Default value of NDDS_Transport_Property_t::properties_bitmap (p. 1760).
- #define **NDDS_TRANSPORT_UDPv6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT** **NDDS_TRANSPORT_UDP_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT**
Default value of NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1761).

- **#define NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT NDDS_TRANSPORT_UDP_SOCKET_BUFFER_SIZE_OS_DEFAULT**
Used to specify that os default be used to specify socket buffer size.
- **#define NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_UDP_SEND_SOCKET_BUFFER_SIZE_DEFAULT**
Default value for `NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size` (p. 1791).
- **#define NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT NDDS_TRANSPORT_UDP_RECV_SOCKET_BUFFER_SIZE_DEFAULT**
Default value for `NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size` (p. 1791).
- **#define NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX (65487)**
Maximum value of `NDDS_Transport_Property_t::message_size_max` (p. 1761).
- **#define NDDS_TRANSPORT_UDPv6_MESSAGE_SIZE_MAX_DEFAULT NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX**
Default value of `NDDS_Transport_Property_t::message_size_max` (p. 1761).
- **#define NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT**
Default value of `NDDS_Transport_UDPv6_Property_t::multicast_ttl` (p. 1792).
- **#define NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER**
Value for `NDDS_Transport_UDPv6_Property_t::send_blocking` (p. 1794) to specify non-blocking sockets.
- **#define NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS**
[default] Value for `NDDS_Transport_UDPv6_Property_t::send_blocking` (p. 1794) to specify blocking sockets.
- **#define NDDS_TRANSPORT_UDPv6_PROPERTY_DEFAULT**
Use this to initialize a `NDDS_Transport_UDPv6_Property_t` (p. 1789) structure.
- **#define NDDS_Transport_UDPv6_string_to_address_cEA NDDS_Transport_UDP_string_to_address_cEA**
Realization of `NDDS_Transport_String_To_Address_Fcn_cEA` for IP transports.

Functions

- **NDDS_Transport_Plugin * NDDS_Transport_UDPv6_new (const struct NDDS_Transport_UDPv6_Property_t *property_in)**
Create an instance of a UDPv6 Transport Plugin.
- **NDDS_Transport_Plugin * NDDS_Transport_UDPv6_create (NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in)**
Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy.
- **NDDS_Transport_Plugin * NDDS_Transport_UDPv6_create_from_properties_with_prefix (NDDS_Transport_Address_t *default_network_address_out, const struct DDS_PropertyQosPolicy *property_in, const char *propertyPrefix)**
Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy. Same as `NDDS_Transport_UDPv6_create` but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

7.79.1 Detailed Description

Transport plug-in using UDP/IPv6 (`NDDS_TRANSPORT_CLASSID_UDPv6` (p. 249)) .

This transport plugin uses UDPv6 sockets to send and receive messages. It supports both unicast and multicast communications in a single instance of the plugin. By default, this plugin will use all interfaces that it finds enabled and

"UP" at instantiation time to send and receive messages. This transport is installed as a built-in transport plugin with the alias **DDS_TRANSPORTBUILTIN_UDPv6_ALIAS** (p. 446).

You can configure an instance of this plugin to only use unicast or only use multicast, see **NDDS_Transport_UDPv6_Property_t::unicast_enabled** (p. 1792) and **NDDS_Transport_UDPv6_Property_t::multicast_enabled** (p. 1792).

In addition, you can configure an instance of this plugin to selectively use the network interfaces of a node (and restrict a plugin from sending multicast messages on specific interfaces) by specifying the **NDDS_Transport_Property_t::max_interface_count** (p. 1765) and the "white" and "black" lists in the base property's fields (**NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761), **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762), **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1763), **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1764)).

RTI Connexant can implicitly create this plugin and register it with the **DDSDomainParticipant** (p. 1335) if this transport is specified in the **DDS_TransportBuiltinQosPolicy** (p. 1129).

To specify the properties of the builtin UDPv6 transport that is implicitly registered, you can either:

- call **NDDSTransportSupport::set_builtin_transport_property** (p. 1815) or
- specify the predefined property names in **DDS_PropertyQosPolicy** (p. 994) associated with the **DDSDomainParticipant** (p. 1335). (see **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 284)). Builtin transport plugin properties specified in **DDS_PropertyQosPolicy** (p. 994) always overwrite the ones specified through **NDDSTransportSupport::set_builtin_transport_property()** (p. 1815). The default value is assumed on any unspecified property.

Note that all properties should be set before the transport is implicitly created and registered by RTI Connexant. Any properties that are set after the builtin transport is registered will be ignored. See **Built-in Transport Plugins** (p. 176) for details on when a builtin transport is registered.

To explicitly create an instance of this plugin, **NDDS_Transport_UDPv6_new()** (p. 289) should be called. The instance should be registered with RTI Connexant, see **NDDSTransportSupport::register_transport** (p. 1811). In some configurations, you may have to disable the builtin UDPv6 transport plugin instance (**DDS_TransportBuiltinQosPolicy** (p. 1129), **DDS_TRANSPORTBUILTIN_UDPv6** (p. 445)), to avoid port conflicts with the newly created plugin instance.

7.79.2 UDPv6 Transport Property Names in Property QoS Policy of Domain Participant

The following table lists the predefined property names that can be set in **DDS_PropertyQosPolicy** (p. 994) of a **DDSDomainParticipant** (p. 1335) to configure the builtin UDPv6 transport plugin.

Table 7.101 Property Names for UDPv6 Transport Plugin

Property Name	Description
dds.transport.UDPv6.builtin.parent.address_bit_count	See NDDS_Transport_Property_t::address_bit_count (p. 1760)
dds.transport.UDPv6.builtin.parent.properties_bitmap	See NDDS_Transport_Property_t::properties_bitmap (p. 1760)
dds.transport.UDPv6.builtin.parent.gather_send_buffer_count_max	See NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1761)

Property Name	Description
dds.transport.UDPv6.builtin.parent.message_size_max	See NDDS_Transport_Property_t::message_size_max (p. 1761)
dds.transport.UDPv6.builtin.parent.allow_interfaces	See NDDS_Transport_Property_t::allow_interfaces_list (p.1761) and NDDS_Transport_Property_t::allow_interfaces_list_length (p. 1762). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_interfaces	See NDDS_Transport_Property_t::deny_interfaces_list (p.1762) and NDDS_Transport_Property_t::deny_interfaces_list_length (p. 1763). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.allow_multicast_interfaces	See NDDS_Transport_Property_t::allow_multicast_interfaces_list (p.1763) and NDDS_Transport_Property_t::allow_multicast_interfaces_list_length (p. 1764). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.deny_multicast_interfaces	See NDDS_Transport_Property_t::deny_multicast_interfaces_list (p.1764) and NDDS_Transport_Property_t::deny_multicast_interfaces_list_length (p.1764). Interfaces should be specified as comma-separated strings, with each comma delimiting an interface. For example: 127.0.0.1,eth0
dds.transport.UDPv6.builtin.parent.max_interface_count	See NDDS_Transport_Property_t::max_interface_count (p. 1765)
dds.transport.UDPv6.builtin.parent.thread_name_prefix	See NDDS_Transport_Property_t::thread_name_prefix (p. 1765)
dds.transport.UDPv6.builtin.send_socket_buffer_size	See NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size (p. 1791)
dds.transport.UDPv6.builtin.recv_socket_buffer_size	See NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size (p. 1791)
dds.transport.UDPv6.builtin.unicast_enabled	See NDDS_Transport_UDPv6_Property_t::unicast_enabled (p. 1792)
dds.transport.UDPv6.builtin.multicast_enabled	See NDDS_Transport_UDPv6_Property_t::multicast_enabled (p. 1792)
dds.transport.UDPv6.builtin.multicast_ttl	See NDDS_Transport_UDPv6_Property_t::multicast_ttl (p. 1792)
dds.transport.UDPv6.builtin.multicast_loopback_disabled	See NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled (p. 1792)
dds.transport.UDPv6.builtin.ignore_loopback_interface	See NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface (p. 1793)
dds.transport.UDPv6.builtin.ignore_nonrunning_interfaces	See NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces (p. 1793)
dds.transport.UDPv6.builtin.no_zero_copy	[DEPRECATED] See NDDS_Transport_UDPv6_Property_t::no_zero_copy (p. 1794)

Property Name	Description
dds.transport.UDPv6.builtin.send_blocking	See <code>NDDS_Transport_UDPv6_Property_t::send_blocking</code> (p. 1794)
dds.transport.UDPv6.builtin.enable_v4mapped	See <code>NDDS_Transport_UDPv6_Property_t::enable_v4mapped</code> (p. 1794)
dds.transport.UDPv6.builtin.transport_priority_mask	See <code>NDDS_Transport_UDPv6_Property_t::transport_priority_mask</code> (p. 1795)
dds.transport.UDPv6.builtin.transport_priority_mapping_low	See <code>NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low</code> (p. 1795)
dds.transport.UDPv6.builtin.transport_priority_mapping_high	See <code>NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high</code> (p. 1795)
dds.transport.UDPv6.builtin.send_ping	See <code>NDDS_Transport_UDPv6_Property_t::send_ping</code> (p. 1796) <code>interface_poll_detection_kind</code>
dds.transport.UDPv6.builtin.force_interface_poll_detection	See <code>NDDS_Transport_UDPv6_Property_t::force_interface_poll_detection</code> (p. 1796)
dds.transport.UDPv6.builtin.interface_poll_period	See <code>NDDS_Transport_UDPv6_Property_t::interface_poll_period</code> (p. 1796)
dds.transport.UDPv6.builtin.reuse_multicast_receive_resource	See <code>NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource</code> (p. 1796)
dds.transport.UDPv6.builtin.protocol_overhead_max	See <code>NDDS_Transport_UDPv6_Property_t::protocol_overhead_max</code> (p. 1797)
dds.transport.UDPv6.builtin.disable_interface_tracking	See <code>NDDS_Transport_UDPv6_Property_t::disable_interface_tracking</code> (p. 1797)
dds.transport.UDPv6.builtin.public_address	See <code>NDDS_Transport_UDPv6_Property_t::public_address</code> (p. 1798)
dds.transport.UDPv6.builtin.join_multicast_group_timeout	See <code>NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout</code> (p. 1797)

`NDDSTransportSupport::set_builtin_transport_property()` (p. 1815)

7.79.3 Macro Definition Documentation

7.79.3.1 NDDS_TRANSPORT_UDPv6_ADDRESS_BIT_COUNT

```
#define NDDS_TRANSPORT_UDPv6_ADDRESS_BIT_COUNT (128)
```

Default value of `NDDS_Transport_Property_t::address_bit_count` (p. 1760).

7.79.3.2 NDDS_TRANSPORT_UDPv6_PROPERTIES_BITMAP_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_PROPERTIES_BITMAP_DEFAULT  NDDS_TRANSPORT_UDP_PROPERTIES_BITMAP_↔  
DEFAULT
```

Default value of **NDDS_Transport_Property_t::properties_bitmap** (p. 1760).

7.79.3.3 NDDS_TRANSPORT_UDPv6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_GATHER_SEND_BUFFER_COUNT_MAX_DEFAULT  NDDS_TRANSPORT_UDP_GATHER_↔  
SEND_BUFFER_COUNT_MAX_DEFAULT
```

Default value of **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761).

This is also the maximum value that can be used when instantiating the UDP transport.

16 is sufficient for NDDS, but more may improve discovery and reliable performance. Porting note: find out what the maximum gather buffer count is on your OS!

7.79.3.4 NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_SOCKET_BUFFER_SIZE_OS_DEFAULT  NDDS_TRANSPORT_UDP_SOCKET_BUFFER_↔  
SIZE_OS_DEFAULT
```

Used to specify that os default be used to specify socket buffer size.

7.79.3.5 NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_SEND_SOCKET_BUFFER_SIZE_DEFAULT  NDDS_TRANSPORT_UDP_SEND_SOCKET_↔  
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size** (p. 1791).

7.79.3.6 NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_RECV_SOCKET_BUFFER_SIZE_DEFAULT  NDDS_TRANSPORT_UDP_RECV_SOCKET_↔  
BUFFER_SIZE_DEFAULT
```

Default value for **NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size** (p. 1791).

7.79.3.7 NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX

```
#define NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX (65487)
```

Maximum value of **NDDS_Transport_Property_t::message_size_max** (p. 1761).

7.79.3.8 NDDS_TRANSPORT_UDPv6_MESSAGE_SIZE_MAX_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_MESSAGE_SIZE_MAX_DEFAULT NDDS_TRANSPORT_UDPv6_PAYLOAD_SIZE_MAX
```

Default value of **NDDS_Transport_Property_t::message_size_max** (p. 1761).

7.79.3.9 NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_MULTICAST_TTL_DEFAULT NDDS_TRANSPORT_UDP_MULTICAST_TTL_DEFAULT
```

Default value of **NDDS_Transport_UDPv6_Property_t::multicast_ttl** (p. 1792).

7.79.3.10 NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER

```
#define NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER
```

Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 1794) to specify non-blocking sockets.

7.79.3.11 NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS

```
#define NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS
```

[default] Value for **NDDS_Transport_UDPv6_Property_t::send_blocking** (p. 1794) to specify blocking sockets.

7.79.3.12 NDDS_TRANSPORT_UDPv6_PROPERTY_DEFAULT

```
#define NDDS_TRANSPORT_UDPv6_PROPERTY_DEFAULT
```

Use this to initialize a **NDDS_Transport_UDPv6_Property_t** (p. 1789) structure.

7.79.3.13 NDDS_Transport_UDPv6_string_to_address_cEA

```
#define NDDS_Transport_UDPv6_string_to_address_cEA NDDS_Transport_UDP_string_to_address_cEA
```

Realization of **NDDS_Transport_String_To_Address_Fcn_cEA** for IP transports.

Converts a host name string to a IPv6 address.

Parameters

<i>self</i>	NOT USED. May be NULL.
<i>address_out</i>	<< out >> (p. 237) The corresponding numerical value in IPv6 format.
<i>address_in</i>	<< in >> (p. 237) The name of the IPv6 address. It can be a dot notation name or a host name. If NULL, then the IP address of the localhost will be returned.

See also

NDDS_Transport_String_To_Address_Fcn_cEA for complete documentation.

7.79.4 Function Documentation

7.79.4.1 NDDS_Transport_UDPv6_new()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_new (
    const struct  NDDS_Transport_UDPv6_Property_t * property_in )
```

Create an instance of a UDPv6 Transport Plugin.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv6_Property_t::parent** (p. 1791):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1763),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1764)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- 10.10.30.232
- 10.10.*.*
- 192.168.1.*
- etc. Strings not in the correct format will be ignored.

Parameters

<i>property_in</i>	<< <i>in</i> >> (p. 237) Desired behavior of this transport. May be NULL for default property.
--------------------	--

Returns

A UDPv6 Transport Plugin instance on success; or NULL on failure.

7.79.4.2 NDDS_Transport_UDPv6_create()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_create (
    NDDS_Transport_Address_t * default_network_address_out,
    const struct DDS_PropertyQosPolicy * property_in )
```

Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy.

An application may create and register multiple instances of this Transport Plugin with RTI Connex. Multiple instances of the plugin may be useful for partitioning the network interfaces across multiple RTI Connex domains. However, note that the underlying transport, the operating system's IP layer, is still a "singleton." For example, if a unicast transport has already bound to a port, and another unicast transport tries to bind to the same port, the second attempt will fail.

The transport plugin honors the interface/multicast "white" and "black" lists specified in the **NDDS_Transport_UDPv6_Property_t::parent** (p. 1791):

- **NDDS_Transport_Property_t::allow_interfaces_list** (p. 1761),
- **NDDS_Transport_Property_t::deny_interfaces_list** (p. 1762),
- **NDDS_Transport_Property_t::allow_multicast_interfaces_list** (p. 1763),
- **NDDS_Transport_Property_t::deny_multicast_interfaces_list** (p. 1764)

The format of a string in these lists is assumed to be in standard IPv6 dot notation, possibly containing wildcards. For example:

- *:*:*:*:*:*:*
- FE80:aBc::202:*:*
- *:aBC::2::2*
- etc. Strings not in the correct format will be ignored.

Parameters

<i>default_network_address_out</i>	<< <i>out</i> >> (p. 237) Network address to be used when registering the transport.
<i>property_in</i>	<< <i>in</i> >> (p. 237) Desired behavior of this transport as defined in the DDS_DomainParticipantQos::property (p. 739).

Returns

A UDPv6 Transport Plugin instance on success; or NULL on failure.

7.79.4.3 NDDS_Transport_UDPv6_create_from_properties_with_prefix()

```
NDDS_Transport_Plugin * NDDS_Transport_UDPv6_create_from_properties_with_prefix (
    NDDS_Transport_Address_t * default_network_address_out,
    const struct DDS_PropertyQosPolicy * property_in,
    const char * propertyPrefix )
```

Create an instance of a UDPv6 Transport Plugin, using the PropertyQosPolicy. Same as NDDS_Transport_UDPv6_create but with a prefix for the input properties. It is used to create pluggable transports that use an underlying UDP transport.

Parameters

<i>default_network_address_out</i>	<< out >> (p. 237) Network address to be used when registering the transport.
<i>property_in</i>	<< in >> (p. 237) Desired behavior of this transport as defined in the DDS_DomainParticipantQos::property (p. 739).
<i>propertyPrefix</i>	a prefix for the properties. Expected UDP properties have the form prefix.property_name

7.80 AsyncWaitSet

<<**extension**>> (p. 236) A specialization of **DDSWaitSet** (p. 1613) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDSCondition** (p. 1260).

Classes

- struct **DDS_AsyncWaitSetProperty_t**
Specifies the **DDSAsyncWaitSet** (p. 1243) behavior.
- class **DDSAsyncWaitSetListener**
<<**interface**>> (p. 236) Listener for receiving event notifications related to the thread pool of the **DDSAsyncWaitSet** (p. 1243).
- class **DDSAsyncWaitSetCompletionToken**
<<**interface**>> (p. 236) Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **DDSAsyncWaitSet** (p. 1243) behavior.
- class **DDSAsyncWaitSet**
A class for dispatching **DDSCondition** (p. 1260) objects using separate threads of execution. You can see this class as an extension of a **DDSWaitSet** (p. 1613) that allows asynchronously waiting for the attached **DDSCondition** (p. 1260) objects to trigger and provide a notification by calling **DDSCondition::dispatch** (p. 1262).
- class **DDSDataReaderStatusConditionHandler**
<<**interface**>> (p. 236) Realization of a **DDSConditionHandler** (p. 1262) that handles the status of a **DDSDataReader** (p. 1272).

Variables

- const struct **DDS_AsyncWaitSetProperty_t** **DDS_ASYNC_WAITSET_PROPERTY_DEFAULT**
Constant that defines the default property for a **DDSAsyncWaitSet** (p. 1243).
- static **DDSAsyncWaitSetCompletionToken** *const **DDSAsyncWaitSet::COMPLETION_TOKEN_USE_↔IMPLICIT_AND_WAIT**
For the operations that allow an **DDSAsyncWaitSetCompletionToken** (p. 1257), this sentinel can be provided to indicate an **DDSAsyncWaitSet** (p. 1243) to use the implicit completion token and wait on it for request completion.
- static **DDSAsyncWaitSetCompletionToken** *const **DDSAsyncWaitSet::COMPLETION_TOKEN_IGNORE**
For the operations that allow an **DDSAsyncWaitSetCompletionToken** (p. 1257), this sentinel can be provided to indicate an **DDSAsyncWaitSet** (p. 1243) to perform the action associating a 'null' completion token.

7.80.1 Detailed Description

<<**extension**>> (p. 236) A specialization of **DDSWaitSet** (p. 1613) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDSCondition** (p. 1260).

This class is a realization of the **Proactor** pattern applied to WaitSets and Conditions that provide a powerful component for your application process events leveraging concurrency.

7.80.2 Variable Documentation

7.80.2.1 DDS_ASYNC_WAITSET_PROPERTY_DEFAULT

```
const struct DDS_AsyncWaitSetProperty_t DDS_ASYNC_WAITSET_PROPERTY_DEFAULT
```

Constant that defines the default property for a **DDSAsyncWaitSet** (p. 1243).

Value: `wait_set_property = DDS_WaitSetProperty_t_INITIALIZER (p.471), thread_pool_size = 1, thread_settings DDS_THREAD_SETTINGS_DEFAULT, thread_base_name = NULL wait_timeout = DDS_DURATION_INFINITE (p.325) level = 1`

7.80.2.2 COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT

```
DDSAsyncWaitSetCompletionToken* const DDSAsyncWaitSet::COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT  
[static]
```

For the operations that allow an **DDSAsyncWaitSetCompletionToken** (p. 1257), this sentinel can be provided to indicate an **DDSAsyncWaitSet** (p. 1243) to use the implicit completion token and wait on it for request completion.

If this sentinel is used, the **DDSAsyncWaitSet** (p. 1243) will use the completion token associated with the calling thread and will wait with an infinite timeout until the request completes successfully.

7.80.2.3 COMPLETION_TOKEN_IGNORE

```
DDSAsyncWaitSetCompletionToken* const DDSAsyncWaitSet::COMPLETION_TOKEN_IGNORE [static]
```

For the operations that allow an **DDSAsyncWaitSetCompletionToken** (p. 1257), this sentinel can be provided to indicate an **DDSAsyncWaitSet** (p. 1243) to perform the action associating a 'null' completion token.

This sentinel is a realization of the null object pattern of an **DDSAsyncWaitSetCompletionToken** (p. 1257). If this object is provided to a **DDSAsyncWaitSet** (p. 1243) operation, the resulting operation request will be associated with a 'null' completion token that behaves as no-op.

When 'nul' completion token is provided, the **DDSAsyncWaitSet** (p. 1243) operation returns immediately after it issues the internal request, and there is no mean for your application to wait for the request to complete.

You can use this sentinel when your application can operate on an **DDSAsyncWaitSet** (p. 1243) without needing to know when operation requests complete or your application uses other strategies to synchronize resources.

This sentinel is also useful when you need to perform operations on **DDSAsyncWaitSet** (p. 1243) from within one of the threads from its thread pool, where waiting on a valid **DDSAsyncWaitSetCompletionToken** (p. 1257) is forbidden.

7.81 Participant Built-in Topics

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connex.

Classes

- struct **DDS_ParticipantBuiltinTopicData**
Entry created when a DomainParticipant object is discovered.
- struct **DDS_ParticipantBuiltinTopicDataSeq**
Instantiates `FooSeq` (p. 1680) < `DDS_ParticipantBuiltinTopicData` (p. 966) > .
- class **DDSParticipantBuiltinTopicDataTypeSupport**
Instantiates `TypeSupport` < `DDS_ParticipantBuiltinTopicData` (p. 966) > .
- class **DDSParticipantBuiltinTopicDataDataReader**
Instantiates `DataReader` < `DDS_ParticipantBuiltinTopicData` (p. 966) > .

Typedefs

- typedef struct **DDS_ParticipantBuiltinTopicData** **DDS_ParticipantBuiltinTopicData**
Entry created when a DomainParticipant object is discovered.

Variables

- const char * **DDS_PARTICIPANT_TOPIC_NAME**
Participant topic name.

7.81.1 Detailed Description

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connex.

7.81.2 Typedef Documentation

7.81.2.1 DDS_ParticipantBuiltinTopicData

```
typedef struct DDS_ParticipantBuiltinTopicData DDS_ParticipantBuiltinTopicData
```

Entry created when a DomainParticipant object is discovered.

Data associated with the built-in topic **DDS_PARTICIPANT_TOPIC_NAME** (p. 294). It contains QoS policies and additional information that apply to the remote **DDSDomainParticipant** (p. 1335).

See also

DDS_PARTICIPANT_TOPIC_NAME (p. 294)

DDSParticipantBuiltinTopicDataDataReader (p. 1532)

7.81.3 Variable Documentation

7.81.3.1 DDS_PARTICIPANT_TOPIC_NAME

```
const char* DDS_PARTICIPANT_TOPIC_NAME [extern]
```

Participant topic name.

Topic name of **DDSParticipantBuiltinTopicDataDataReader** (p. 1532)

See also

DDS_ParticipantBuiltinTopicData (p. 966)

DDSParticipantBuiltinTopicDataDataReader (p. 1532)

7.82 Topic Built-in Topics

Builtin topic for accessing information about the Topics discovered by RTI Connex.

Classes

- struct **DDS_TopicBuiltinTopicData**
Entry created when a Topic object discovered.
- struct **DDS_TopicBuiltinTopicDataSeq**
Instantiates `FooSeq` (p. 1680) < `DDS_TopicBuiltinTopicData` (p. 1113) > .
- class **DDSTopicBuiltinTopicDataTypeSupport**
Instantiates `TypeSupport` < `DDS_TopicBuiltinTopicData` (p. 1113) > .
- class **DDSTopicBuiltinTopicDataDataReader**
Instantiates `DataReader` < `DDS_TopicBuiltinTopicData` (p. 1113) > .

Typedefs

- typedef struct **DDS_TopicBuiltinTopicData** **DDS_TopicBuiltinTopicData**
Entry created when a Topic object discovered.

Variables

- const char * **DDS_TOPIC_TOPIC_NAME**
Topic topic name.

7.82.1 Detailed Description

Builtin topic for accessing information about the Topics discovered by RTI Connex.

7.82.2 Typedef Documentation

7.82.2.1 DDS_TopicBuiltinTopicData

```
typedef struct DDS_TopicBuiltinTopicData DDS_TopicBuiltinTopicData
```

Entry created when a Topic object discovered.

Data associated with the built-in topic **DDS_TOPIC_TOPIC_NAME** (p. 296). It contains QoS policies and additional information that apply to the remote **DDSTopic** (p. 1601).

Note: The **DDS_TopicBuiltinTopicData** (p. 1113) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS_PublicationBuiltinTopicData** (p. 997) and **DDS_SubscriptionBuiltinTopicData** (p. 1094)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

*Instantiates **DataReader** < **DDS_SubscriptionBuiltinTopicData** (p. 1094) > .*

Typedefs

- typedef struct **DDS_SubscriptionBuiltinTopicData DDS_SubscriptionBuiltinTopicData**
*Entry created when a **DDSDDataReader** (p. 1272) is discovered in association with its Subscriber.*

Variables

- const char * **DDS_SUBSCRIPTION_TOPIC_NAME**
Subscription topic name.

7.84.1 Detailed Description

Builtin topic for accessing information about the Subscriptions discovered by RTI Connex.

7.84.2 Typedef Documentation

7.84.2.1 DDS_SubscriptionBuiltinTopicData

```
typedef struct DDS_SubscriptionBuiltinTopicData DDS_SubscriptionBuiltinTopicData
```

Entry created when a **DDSDDataReader** (p. 1272) is discovered in association with its Subscriber.

Data associated with the built-in topic **DDS_SUBSCRIPTION_TOPIC_NAME** (p. 299). It contains QoS policies and additional information that apply to the remote **DDSDDataReader** (p. 1272) the related **DDSSubscriber** (p. 1576).

See also

- DDS_SUBSCRIPTION_TOPIC_NAME** (p. 299)
- DDSSubscriptionBuiltinTopicDataDataReader** (p. 1598)

7.84.3 Variable Documentation

7.84.3.1 DDS_SUBSCRIPTION_TOPIC_NAME

```
const char* DDS_SUBSCRIPTION_TOPIC_NAME [extern]
```

Subscription topic name.

Topic name of **DDSSubscriptionBuiltinTopicDataDataReader** (p. 1598)

See also

DDS_SubscriptionBuiltinTopicData (p. 1094)

DDSSubscriptionBuiltinTopicDataDataReader (p. 1598)

7.85 ServiceRequest Built-in Topic

Builtin topic for accessing requests from different services within RTI Connex.

Classes

- struct **DDS_ServiceRequest**
A request coming from one of the built-in services.
- struct **DDS_ServiceRequestSeq**
*Instantiates **FooSeq** (p. 1680) < **DDS_ServiceRequest** (p. 1083) > .*
- class **DDSServiceRequestTypeSupport**
*Instantiates **TypeSupport** < **DDS_ServiceRequest** (p. 1083) > .*
- class **DDSServiceRequestDataReader**
*Instantiates **DataReader** < **DDS_ServiceRequest** (p. 1083) > .*

Typedefs

- typedef struct **DDS_ServiceRequest** **DDS_ServiceRequest**
A request coming from one of the built-in services.

Variables

- const **DDS_Long DDS_UNKNOWN_SERVICE_REQUEST_ID**
An invalid Service Id.
- const **DDS_Long DDS_TOPIC_QUERY_SERVICE_REQUEST_ID**
*Service Id for the **DDSTopicQuery** (p. 1611) Service.*
- const **DDS_Long DDS_LOCATOR_REACHABILITY_SERVICE_REQUEST_ID**
Service Id for the Locator Reachability Service.
- const **DDS_Long DDS_INSTANCE_STATE_SERVICE_REQUEST_ID**
Service Id for the Instance State Request service.
- const **DDS_Long DDS_MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID**
Service Id for RTI Monitoring Library 2.0 Command Service Request.
- const **DDS_Long DDS_MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID**
Service Id for RTI Monitoring Library 2.0 Reply Service Requests.
- const char * **DDS_SERVICE_REQUEST_TOPIC_NAME**
Service Request topic name.

7.85.1 Detailed Description

Builtin topic for accessing requests from different services within RTI Connex.

Currently, the **DDSTopicQuery** (p. 1611), Locator Reachability Instance State Consistency and Controlability (part of Observability) all rely on this topic.

See also

Topic Queries (p. 151) for an explanation of how TopicQueries use ServiceRequests and how you can access the ServiceRequests for debugging purposes in the section **The Built-in ServiceRequest DataReader** (p. 153).

7.85.2 Typedef Documentation

7.85.2.1 DDS_ServiceRequest

```
typedef struct DDS_ServiceRequest DDS_ServiceRequest
```

A request coming from one of the built-in services.

Data associated with the built-in topic **DDS_SERVICE_REQUEST_TOPIC_NAME** (p. 302). It contains service-specific information.

See also

DDS_SERVICE_REQUEST_TOPIC_NAME (p. 302)

DDSParticipantBuiltinTopicDataDataReader (p. 1532)

7.85.3 Variable Documentation

7.85.3.1 DDS_UNKNOWN_SERVICE_REQUEST_ID

```
const DDS_Long DDS_UNKNOWN_SERVICE_REQUEST_ID [extern]
```

An invalid Service Id.

7.85.3.2 DDS_TOPIC_QUERY_SERVICE_REQUEST_ID

```
const DDS_Long DDS_TOPIC_QUERY_SERVICE_REQUEST_ID [extern]
```

Service Id for the **DDSTopicQuery** (p. 1611) Service.

7.85.3.3 DDS_LOCATOR_REACHABILITY_SERVICE_REQUEST_ID

```
const DDS_Long DDS_LOCATOR_REACHABILITY_SERVICE_REQUEST_ID [extern]
```

Service Id for the Locator Reachability Service.

7.85.3.4 DDS_INSTANCE_STATE_SERVICE_REQUEST_ID

```
const DDS_Long DDS_INSTANCE_STATE_SERVICE_REQUEST_ID [extern]
```

Service Id for the Instance State Request service.

7.85.3.5 DDS_MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID

```
const DDS_Long DDS_MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID [extern]
```

Service Id for RTI Monitoring Library 2.0 Command Service Request.

RTI Monitoring Library 2.0 remote commands are sent using this service.

7.85.3.6 DDS_MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID

```
const DDS_Long DDS_MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID [extern]
```

Service Id for RTI Monitoring Library 2.0 Reply Service Requests.

Replies to RTI Monitoring Library 2.0 remote commands are sent using this service.

7.85.3.7 DDS_SERVICE_REQUEST_TOPIC_NAME

```
const char* DDS_SERVICE_REQUEST_TOPIC_NAME [extern]
```

Service Request topic name.

Topic name of the `DDSServiceRequestDataReader` (p. 1561)

See also

`DDS_ServiceRequest` (p. 1083)

`DDSServiceRequestDataReader` (p. 1561)

7.86 Common types and functions

Types and functions related to the built-in topics.

Classes

- struct **DDS_Locator_t**
<<extension>> (p. 236) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.
- struct **DDS_LocatorSeq**
Declares IDL sequence < DDS_Locator_t (p. 926) >
- struct **DDS_ProtocolVersion_t**
<<extension>> (p. 236) Type used to represent the version of the RTPS protocol.
- struct **DDS_VendorId_t**
<<extension>> (p. 236) Type used to represent the vendor of the service implementing the RTPS protocol.
- struct **DDS_ProductVersion_t**
<<extension>> (p. 236) Type used to represent the current version of RTI Connext.
- struct **DDS_TransportInfo_t**
Contains the class_id and message_size_max of an installed transport.
- struct **DDS_TransportInfoSeq**
Instantiates FooSeq (p. 1680) < DDS_TransportInfo_t (p. 1130) > .
- struct **DDS_BuiltinTopicKey_t**
The key type of the built-in topic types.
- struct **DDS_ContentFilterProperty_t**
<<extension>> (p. 236) Type used to provide all the required information to enable content filtering.

Macros

- **#define DDS_LOCATOR_ADDRESS_LENGTH_MAX 16**
Declares length of address field in locator.
- **#define DDS_PROTOCOLVERSION_1_0 { 1, 0 }**
The protocol version 1.0.
- **#define DDS_PROTOCOLVERSION_1_1 { 1, 1 }**
The protocol version 1.1.
- **#define DDS_PROTOCOLVERSION_1_2 { 1, 2 }**
The protocol version 1.2.
- **#define DDS_PROTOCOLVERSION_2_0 { 2, 0 }**
The protocol version 2.0.
- **#define DDS_PROTOCOLVERSION_2_1 { 2, 1 }**
The protocol version 2.1.
- **#define DDS_PROTOCOLVERSION { 2, 1 }**
The most recent protocol version. Currently 2.1.
- **#define DDS_VENDOR_ID_LENGTH_MAX 2**
Length of vendor id.
- **#define DDS_PRODUCTVERSION_UNKNOWN**
The value used when the product version is unknown.

Typedefs

- **typedef struct DDS_Locator_t DDS_Locator_t**
<<**extension**>> (p. 236) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.
- **typedef struct DDS_ProtocolVersion_t DDS_ProtocolVersion_t**
<<**extension**>> (p. 236) Type used to represent the version of the RTPS protocol.
- **typedef struct DDS_BuiltinTopicKey_t DDS_BuiltinTopicKey_t**
The key type of the built-in topic types.

Functions

- **DDS_Boolean DDS_BuiltinTopicKey_equals** (const **DDS_BuiltinTopicKey_t** *self, const **DDS_BuiltinTopicKey_t** *other)
Compares this Key with another Key for equality.
- **void DDS_BuiltinTopicKey_copy** (**DDS_BuiltinTopicKey_t** *dst, const **DDS_BuiltinTopicKey_t** *src)
Copies another Key into this Key.
- **void DDS_BuiltinTopicKey_to_guid** (const **DDS_BuiltinTopicKey_t** *self, **DDS_GUID_t** *dst)
Converts this Key into a GUID.
- **void DDS_BuiltinTopicKey_from_guid** (**DDS_BuiltinTopicKey_t** *self, const **DDS_GUID_t** *src)
Initializes this Key from the input GUID.
- **DDS_Boolean DDS_BuiltinTopicKey_to_instance_handle** (const **DDS_BuiltinTopicKey_t** *self, **DDS_InstanceHandle_t** *dst)
Converts this Key into an InstanceHandle.
- **DDS_Boolean DDS_BuiltinTopicKey_from_instance_handle** (**DDS_BuiltinTopicKey_t** *self, const **DDS_InstanceHandle_t** *src)
Initializes this Key from the input InstanceHandle.

Variables

- const struct **DDS_Locator_t DDS_LOCATOR_INVALID**
An invalid locator.
- const **DDS_Long DDS_LOCATOR_KIND_INVALID**
Locator of this kind is invalid.
- const **DDS_UnsignedLong DDS_LOCATOR_PORT_INVALID**
An invalid port.
- const **DDS_Octet DDS_LOCATOR_ADDRESS_INVALID [DDS_LOCATOR_ADDRESS_LENGTH_MAX]**
An invalid address.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv4**
A locator for a UDPv4 address.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv4_WAN**
A locator for a UDPv4 asymmetric transport address.
- const **DDS_Long DDS_LOCATOR_KIND_SHMEM**
A locator for an address accessed via shared memory.
- const **DDS_Long DDS_LOCATOR_KIND_SHMEM_510**
A locator for an address accessed via shared memory for RTI Connex 5.1.0 and earlier.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv6**
A locator for a UDPv6 address.
- const **DDS_Long DDS_LOCATOR_KIND_UDPv6_510**
A locator for a UDPv6 address for RTI Connex 5.1.0 and earlier.
- const **DDS_Long DDS_LOCATOR_KIND_RESERVED**
Locator of this kind is reserved.

7.86.1 Detailed Description

Types and functions related to the built-in topics.

7.86.2 Macro Definition Documentation

7.86.2.1 DDS_LOCATOR_ADDRESS_LENGTH_MAX

```
#define DDS_LOCATOR_ADDRESS_LENGTH_MAX 16
```

Declares length of address field in locator.

7.86.2.2 DDS_PROTOCOLVERSION_1_0

```
#define DDS_PROTOCOLVERSION_1_0 { 1, 0 }
```

The protocol version 1.0.

7.86.2.3 DDS_PROTOCOLVERSION_1_1

```
#define DDS_PROTOCOLVERSION_1_1 { 1, 1 }
```

The protocol version 1.1.

7.86.2.4 DDS_PROTOCOLVERSION_1_2

```
#define DDS_PROTOCOLVERSION_1_2 { 1, 2 }
```

The protocol version 1.2.

7.86.2.5 DDS_PROTOCOLVERSION_2_0

```
#define DDS_PROTOCOLVERSION_2_0 { 2, 0 }
```

The protocol version 2.0.

7.86.2.6 DDS_PROTOCOLVERSION_2_1

```
#define DDS_PROTOCOLVERSION_2_1 { 2, 1 }
```

The protocol version 2.1.

7.86.2.7 DDS_PROTOCOLVERSION

```
#define DDS_PROTOCOLVERSION { 2, 1 }
```

The most recent protocol version. Currently 2.1.

7.86.2.8 DDS_VENDOR_ID_LENGTH_MAX

```
#define DDS_VENDOR_ID_LENGTH_MAX 2
```

Length of vendor id.

7.86.2.9 DDS_PRODUCTVERSION_UNKNOWN

```
#define DDS_PRODUCTVERSION_UNKNOWN
```

Value:

```
{ \
    DDS_PRODUCTVERSION_MAJOR_UNKNOWN, \
    DDS_PRODUCTVERSION_MINOR_UNKNOWN, \
    DDS_PRODUCTVERSION_RELEASE_UNKNOWN, \
    DDS_PRODUCTVERSION_REVISION_UNKNOWN \
}
```

The value used when the product version is unknown.

7.86.3 Typedef Documentation

7.86.3.1 DDS_Locator_t

```
typedef struct DDS_Locator_t DDS_Locator_t
```

<<*extension*>> (p. 236) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

7.86.3.2 DDS_ProtocolVersion_t

```
typedef struct DDS_ProtocolVersion_t DDS_ProtocolVersion_t
```

<<*extension*>> (p. 236) Type used to represent the version of the RTPS protocol.

7.86.3.3 DDS_BuiltinTopicKey_t

```
typedef struct DDS_BuiltinTopicKey_t DDS_BuiltinTopicKey_t
```

The key type of the built-in topic types.

Each remote **DDSEntity** (p. 1446) to be discovered can be uniquely identified by this key. This is the key of all the built-in topic data types.

See also

DDS_ParticipantBuiltinTopicData (p. 966)

DDS_SubscriptionBuiltinTopicData (p. 1094)

7.86.4 Function Documentation

7.86.4.1 DDS_BuiltinTopicKey_equals()

```
DDS_Boolean DDS_BuiltinTopicKey_equals (
    const DDS_BuiltinTopicKey_t * self,
    const DDS_BuiltinTopicKey_t * other )
```

Compares this Key with another Key for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This Key. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 237) The other Key to be compared with this Key. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two Keys have equal values, or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

7.86.4.2 DDS_BuiltinTopicKey_copy()

```
void DDS_BuiltinTopicKey_copy (
    DDS_BuiltinTopicKey_t * dst,
    const DDS_BuiltinTopicKey_t * src )
```

Copies another Key into this Key.

Parameters

<i>dst</i>	<< out >> (p. 237) This Key. Cannot be NULL.
<i>src</i>	<< in >> (p. 237) The other Key to be copied. Cannot be NULL.

7.86.4.3 DDS_BuiltinTopicKey_to_guid()

```
void DDS_BuiltinTopicKey_to_guid (
    const DDS_BuiltinTopicKey_t * self,
    DDS_GUID_t * dst )
```

Converts this Key into a GUID.

Parameters

<i>self</i>	<< in >> (p. 237) This Key. Cannot be NULL.
<i>dst</i>	<< out >> (p. 237) The destination GUID. Cannot be NULL.

7.86.4.4 DDS_BuiltinTopicKey_from_guid()

```
void DDS_BuiltinTopicKey_from_guid (
    DDS_BuiltinTopicKey_t * self,
    const DDS_GUID_t * src )
```

Initializes this Key from the input GUID.

Parameters

<i>self</i>	<< out >> (p. 237) This Key. Cannot be NULL.
<i>src</i>	<< in >> (p. 237) The GUID to be used to initialize this Key. Cannot be NULL.

7.86.4.5 DDS_BuiltinTopicKey_to_instance_handle()

```
DDS_Boolean DDS_BuiltinTopicKey_to_instance_handle (
    const DDS_BuiltinTopicKey_t * self,
    DDS_InstanceHandle_t * dst )
```

Converts this Key into an InstanceHandle.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This Key. Cannot be NULL.
<i>dst</i>	<< <i>out</i> >> (p. 237) The destination InstanceHandle. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 316) on success or **DDS_BOOLEAN_FALSE** (p. 316) on failure

7.86.4.6 DDS_BuiltinTopicKey_from_instance_handle()

```
DDS_Boolean DDS_BuiltinTopicKey_from_instance_handle (
    DDS_BuiltinTopicKey_t * self,
    const DDS_InstanceHandle_t * src )
```

Initializes this Key from the input InstanceHandle.

Parameters

<i>self</i>	<< <i>out</i> >> (p. 237) This Key. Cannot be NULL.
<i>src</i>	<< <i>in</i> >> (p. 237) The InstanceHandle to be used to initialize this Key. Cannot be NULL.

Returns

DDS_BOOLEAN_TRUE (p. 316) on success or **DDS_BOOLEAN_FALSE** (p. 316) on failure

7.86.5 Variable Documentation

7.86.5.1 DDS_LOCATOR_INVALID

```
const struct DDS_Locator_t DDS_LOCATOR_INVALID [extern]
```

An invalid locator.

7.86.5.2 DDS_LOCATOR_KIND_INVALID

```
const DDS_Long DDS_LOCATOR_KIND_INVALID [extern]
```

Locator of this kind is invalid.

7.86.5.3 DDS_LOCATOR_PORT_INVALID

```
const DDS_UnsignedLong DDS_LOCATOR_PORT_INVALID [extern]
```

An invalid port.

7.86.5.4 DDS_LOCATOR_ADDRESS_INVALID

```
const DDS_Octet DDS_LOCATOR_ADDRESS_INVALID[ DDS_LOCATOR_ADDRESS_LENGTH_MAX] [extern]
```

An invalid address.

7.86.5.5 DDS_LOCATOR_KIND_UDPv4

```
const DDS_Long DDS_LOCATOR_KIND_UDPv4 [extern]
```

A locator for a UDPv4 address.

7.86.5.6 DDS_LOCATOR_KIND_UDPv4_WAN

```
const DDS_Long DDS_LOCATOR_KIND_UDPv4_WAN [extern]
```

A locator for a UDPv4 asymmetric transport address.

7.86.5.7 DDS_LOCATOR_KIND_SHMEM

```
const DDS_Long DDS_LOCATOR_KIND_SHMEM [extern]
```

A locator for an address accessed via shared memory.

7.86.5.8 DDS_LOCATOR_KIND_SHMEM_510

```
const DDS_Long DDS_LOCATOR_KIND_SHMEM_510 [extern]
```

A locator for an address accessed via shared memory for RTI Connex 5.1.0 and earlier.

7.86.5.9 DDS_LOCATOR_KIND_UDPv6

```
const DDS_Long DDS_LOCATOR_KIND_UDPv6 [extern]
```

A locator for a UDPv6 address.

7.86.5.10 DDS_LOCATOR_KIND_UDPv6_510

```
const DDS_Long DDS_LOCATOR_KIND_UDPv6_510 [extern]
```

A locator for a UDPv6 address for RTI Connex 5.1.0 and earlier.

7.86.5.11 DDS_LOCATOR_KIND_RESERVED

```
const DDS_Long DDS_LOCATOR_KIND_RESERVED [extern]
```

Locator of this kind is reserved.

7.87 String Built-in Type

Built-in type consisting of a single character string.

Classes

- class **DDSSStringTypeSupport**
 <<*interface*>> (p. 236) *String type support.*
- class **DDSSStringDataReader**
 <<*interface*>> (p. 236) *Instantiates DataReader < char* >.*
- class **DDSSStringDataWriter**
 <<*interface*>> (p. 236) *Instantiates DataWriter < char* >.*

7.87.1 Detailed Description

Built-in type consisting of a single character string.

7.88 KeyedString Built-in Type

Built-in type consisting of a string payload and a second string that is the key.

Classes

- struct **DDS_KeyedString**
Keyed string built-in type.
- struct **DDS_KeyedStringSeq**
Instantiates `FooSeq` (p. 1680) < `DDS_KeyedString` (p. 914) > .
- class **DDSKeyedStringTypeSupport**
<<interface>> (p. 236) Keyed string type support.
- class **DDSKeyedStringDataReader**
<<interface>> (p. 236) Instantiates `DataReader` < `DDS_KeyedString` (p. 914) > .
- class **DDSKeyedStringDataWriter**
<<interface>> (p. 236) Instantiates `DataWriter` < `DDS_KeyedString` (p. 914) > .

Typedefs

- typedef struct **DDS_KeyedString** **DDS_KeyedString**
Keyed string built-in type.

7.88.1 Detailed Description

Built-in type consisting of a string payload and a second string that is the key.

7.88.2 Typedef Documentation

7.88.2.1 DDS_KeyedString

```
typedef struct DDS_KeyedString DDS_KeyedString
```

Keyed string built-in type.

7.89 Octets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes.

Classes

- struct **DDS_Octets**
Built-in type consisting of a variable-length array of opaque bytes.
- struct **DDS_OctetsSeq**
Instantiates `FooSeq` (p. 1680) < `DDS_Octets` (p. 954) > .
- class **DDSOctetsTypeSupport**
<<interface>> (p. 236) `DDS_Octets` (p. 954) type support.
- class **DDSOctetsDataReader**
<<interface>> (p. 236) Instantiates `DataReader` < `DDS_Octets` (p. 954) > .
- class **DDSOctetsDataWriter**
<<interface>> (p. 236) Instantiates `DataWriter` < `DDS_Octets` (p. 954) > .

Typedefs

- typedef struct **DDS_Octets DDS_Octets**
Built-in type consisting of a variable-length array of opaque bytes.

7.89.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

7.89.2 Typedef Documentation

7.89.2.1 DDS_Octets

```
typedef struct DDS_Octets DDS_Octets
```

Built-in type consisting of a variable-length array of opaque bytes.

7.90 KeyedOctets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

Classes

- struct **DDS_KeyedOctets**
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.
- struct **DDS_KeyedOctetsSeq**
Instantiates `FooSeq` (p. 1680) < `DDS_KeyedOctets` (p. 911) >.
- class **DDSKeyedOctetsTypeSupport**
<<interface>> (p. 236) `DDS_KeyedOctets` (p. 911) type support.
- class **DDSKeyedOctetsDataReader**
<<interface>> (p. 236) Instantiates `DataReader` < `DDS_KeyedOctets` (p. 911) >.
- class **DDSKeyedOctetsDataWriter**
<<interface>> (p. 236) Instantiates `DataWriter` < `DDS_KeyedOctets` (p. 911) >.

Typedefs

- typedef struct **DDS_KeyedOctets DDS_KeyedOctets**
Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

7.90.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

7.90.2 Typedef Documentation

7.90.2.1 DDS_KeyedOctets

```
typedef struct DDS_KeyedOctets DDS_KeyedOctets
```

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

7.91 DDS-Specific Primitive Types

Basic DDS value types for use in user data types.

Macros

- #define **DDS_BOOLEAN_TRUE**
Defines "true" value of `DDS_Boolean` (p. 319) data type.
- #define **DDS_BOOLEAN_FALSE**
Defines "false" value of `DDS_Boolean` (p. 319) data type.

Typedefs

- typedef RTICdrChar **DDS_Char**
Defines a character data type, equivalent to IDL/CDR char.
- typedef RTICdrWchar **DDS_Wchar**
Defines a wide character data type, equivalent to IDL/CDR wchar.
- typedef RTICdrOctet **DDS_Octet**
Defines an opaque byte data type, equivalent to IDL/CDR octet.
- typedef RTICdrOctet **DDS_UInt8**
Defines a data type, equivalent to IDL/CDR uint8.
- typedef RTICdrInt8 **DDS_Int8**
Defines a data type, equivalent to IDL/CDR int8.
- typedef RTICdrShort **DDS_Short**
Defines a short integer data type, equivalent to IDL/CDR short.
- typedef RTICdrUnsignedShort **DDS_UnsignedShort**
Defines an unsigned short integer data type, equivalent to IDL/CDR unsigned short.
- typedef RTICdrLong **DDS_Long**
Defines a long integer data type, equivalent to IDL/CDR long.
- typedef RTICdrUnsignedLong **DDS_UnsignedLong**
Defines an unsigned long integer data type, equivalent to IDL/CDR unsigned long.
- typedef RTICdrLongLong **DDS_LongLong**
Defines an extra-long integer data type, equivalent to IDL/CDR long long.
- typedef RTICdrUnsignedLongLong **DDS_UnsignedLongLong**
Defines an unsigned extra-long data type, equivalent to IDL/CDR unsigned long long.
- typedef RTICdrFloat **DDS_Float**
Defines a single-precision floating-point data type, equivalent to IDL/CDR float.
- typedef RTICdrDouble **DDS_Double**
Defines a double-precision floating-point data type, equivalent to IDL/CDR double.
- typedef RTICdrLongDouble **DDS_LongDouble**
Defines an extra-precision floating-point data type, equivalent to IDL/CDR long double.
- typedef RTICdrBoolean **DDS_Boolean**
Defines a Boolean data type, equivalent to IDL/CDR boolean.
- typedef RTICdrEnum **DDS_Enum**
Defines an enumerated data type.

7.91.1 Detailed Description

Basic DDS value types for use in user data types.

As part of the finalization of the DDS standard, a number of DDS-specific primitive types will be introduced. By using these types, you will ensure that your data is serialized consistently across platforms even if the C/C++ built-in types have different sizes on those platforms.

In this version of RTI Connex, the DDS primitive types are defined using the OMG's Common Data Representation (CDR) standard. In a future version of RTI Connex, you will be given the choice of whether to use these CDR-based types or C/C++ built-in types through a flag provided to the rtdsngen tool.

Typedef's that begin with RTICdr are defined in `<NDDSHOME>/include/ndds/cdr/cdr_type.h`, which uses types that are further defined in `<NDDSHOME>/include/ndds/osapi/osapi_type.h`.

7.91.2 Macro Definition Documentation

7.91.2.1 DDS_BOOLEAN_TRUE

```
#define DDS_BOOLEAN_TRUE
```

Defines "true" value of **DDS_Boolean** (p. 319) data type.

Examples

HelloWorld.cxx.

7.91.2.2 DDS_BOOLEAN_FALSE

```
#define DDS_BOOLEAN_FALSE
```

Defines "false" value of **DDS_Boolean** (p. 319) data type.

Examples

HelloWorld.cxx.

7.91.3 Typedef Documentation

7.91.3.1 DDS_Char

```
typedef RTICdrChar DDS_Char
```

Defines a character data type, equivalent to IDL/CDR `char`.

An 8-bit quantity that encodes a single byte character from any byte-oriented code set.

7.91.3.2 DDS_Wchar

```
typedef RTICdrWchar DDS_Wchar
```

Defines a wide character data type, equivalent to IDL/CDR `wchar`.

A 16-bit quantity that contains a wide character encoded in UTF-16.

7.91.3.3 DDS_Octet

```
typedef RTICdrOctet DDS_Octet
```

Defines an opaque byte data type, equivalent to IDL/CDR `octet`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

7.91.3.4 DDS_UInt8

```
typedef RTICdrOctet DDS_UInt8
```

Defines a data type, equivalent to IDL/CDR `uint8`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

7.91.3.5 DDS_Int8

```
typedef RTICdrInt8 DDS_Int8
```

Defines a data type, equivalent to IDL/CDR `int8`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

7.91.3.6 DDS_Short

```
typedef RTICdrShort DDS_Short
```

Defines a short integer data type, equivalent to IDL/CDR `short`.

A 16-bit signed short integer value.

7.91.3.7 DDS_UnsignedShort

```
typedef RTICdrUnsignedShort DDS_UnsignedShort
```

Defines an unsigned short integer data type, equivalent to IDL/CDR `unsigned short`.

A 16-bit unsigned short integer value.

7.91.3.8 DDS_Long

```
typedef RTICdrLong DDS_Long
```

Defines a long integer data type, equivalent to IDL/CDR `long`.

A 32-bit signed long integer value.

7.91.3.9 DDS_UnsignedLong

```
typedef RTICdrUnsignedLong DDS_UnsignedLong
```

Defines an unsigned long integer data type, equivalent to IDL/CDR `unsigned long`.

A 32-bit unsigned long integer value.

7.91.3.10 DDS_LongLong

```
typedef RTICdrLongLong DDS_LongLong
```

Defines an extra-long integer data type, equivalent to IDL/CDR `long long`.

A 64-bit signed long long integer value.

7.91.3.11 DDS_UnsignedLongLong

```
typedef RTICdrUnsignedLongLong DDS_UnsignedLongLong
```

Defines an unsigned extra-long data type, equivalent to IDL/CDR `unsigned long long`.

A 64-bit unsigned long long integer value.

7.91.3.12 DDS_Float

```
typedef RTICdrFloat DDS_Float
```

Defines a single-precision floating-point data type, equivalent to IDL/CDR `float`.

A 32-bit floating-point value.

7.91.3.13 DDS_Double

```
typedef RTICdrDouble DDS_Double
```

Defines a double-precision floating-point data type, equivalent to IDL/CDR `double`.

A 64-bit floating-point value.

7.91.3.14 DDS_LongDouble

```
typedef RTICdrLongDouble DDS_LongDouble
```

Defines an extra-precision floating-point data type, equivalent to IDL/CDR `long double`.

A 128-bit floating-point value.

Since some architectures do not support long double, RTI has defined character arrays that match the expected size of this type. On systems that do have native long double, you have to define `RTI_CDR_SIZEOF_LONG_DOUBLE` as 16 to map them to native types.

7.91.3.15 DDS_Boolean

```
typedef RTICdrBoolean DDS_Boolean
```

Defines a Boolean data type, equivalent to IDL/CDR `boolean`.

An 8-bit Boolean value that is used to denote a data item that can only take one of the values `DDS_BOOLEAN_TRUE` (p. 316) (1) or `DDS_BOOLEAN_FALSE` (p. 316) (0).

Examples

HelloWorld.cxx.

7.91.3.16 DDS_Enum

```
typedef RTICdrEnum DDS_Enum
```

Defines an enumerated data type.

Encoded as a signed 32-bit integer value. By default, the first enum identifier has the numeric value zero (0) (unless the value is provided explicitly). Successive enum identifiers take ascending numeric values, in order of declaration from left to right.

7.92 Time Support

Time and duration types and defines.

Classes

- struct **DDS_Duration_t**
Type for duration representation.
- struct **DDS_Time_t**
Type for time representation.

Macros

- **#define DDS_TIME_ZERO**
The default instant in time: zero seconds and zero nanoseconds.

Functions

- static **DDS_Duration_t DDS_Duration_t::from_micros (DDS_UnsignedLongLong microseconds)**
Creates a new duration object from a duration expressed in microseconds.
- static **DDS_Duration_t DDS_Duration_t::from_millis (DDS_UnsignedLongLong milliseconds)**
Creates a new duration object from a duration expressed in milliseconds.
- static **DDS_Duration_t DDS_Duration_t::from_nanos (DDS_UnsignedLongLong nanoseconds)**
Creates a new duration object from a duration expressed in nanoseconds.
- static **DDS_Duration_t DDS_Duration_t::from_seconds (DDS_UnsignedLongLong seconds)**
Creates a new duration object from a duration expressed in seconds.
- static **DDS_Time_t DDS_Time_t::from_micros (DDS_UnsignedLongLong microseconds)**
Creates a new time object from a time expressed in microseconds.
- static **DDS_Time_t DDS_Time_t::from_millis (DDS_UnsignedLongLong milliseconds)**
Creates a new time object from a time expressed in milliseconds.
- static **DDS_Time_t DDS_Time_t::from_nanos (DDS_UnsignedLongLong nanoseconds)**
Creates a new time object from a time expressed in nanoseconds.
- static **DDS_Time_t DDS_Time_t::from_seconds (DDS_UnsignedLongLong seconds)**
Creates a new time object from a time expressed in seconds.
- **DDS_Boolean DDS_Time_is_zero (const struct DDS_Time_t *time)**
Check if time is zero.
- **DDS_Boolean DDS_Time_is_invalid (const struct DDS_Time_t *time)**
- **DDS_Boolean DDS_Duration_is_infinite (const struct DDS_Duration_t *duration)**
- **DDS_Boolean DDS_Duration_is_auto (const struct DDS_Duration_t *duration)**
- **DDS_Boolean DDS_Duration_is_zero (const struct DDS_Duration_t *duration)**

Variables

- const struct **DDS_Time_t DDS_TIME_MAX**
The maximum value of time.
- const **DDS_LongLong DDS_TIME_INVALID_SEC**
A sentinel indicating an invalid second of time.
- const **DDS_UnsignedLong DDS_TIME_INVALID_NSEC**
A sentinel indicating an invalid nano-second of time.
- const struct **DDS_Time_t DDS_TIME_INVALID**
A sentinel indicating an invalid time.
- const **DDS_Long DDS_DURATION_INFINITE_SEC**
An infinite second period of time.
- const **DDS_UnsignedLong DDS_DURATION_INFINITE_NSEC**
An infinite nano-second period of time.
- const struct **DDS_Duration_t DDS_DURATION_INFINITE**
An infinite period of time.

- const **DDS_Long** **DDS_DURATION_AUTO_SEC**
An auto second period of time.
- const **DDS_UnsignedLong** **DDS_DURATION_AUTO_NSEC**
An auto nano-second period of time.
- const struct **DDS_Duration_t** **DDS_DURATION_AUTO**
Duration is automatically assigned.
- const **DDS_Long** **DDS_DURATION_ZERO_SEC**
A zero-length second period of time.
- const **DDS_UnsignedLong** **DDS_DURATION_ZERO_NSEC**
A zero-length nano-second period of time.
- const struct **DDS_Duration_t** **DDS_DURATION_ZERO**
A zero-length period of time.

7.92.1 Detailed Description

Time and duration types and defines.

7.92.2 Macro Definition Documentation

7.92.2.1 DDS_TIME_ZERO

```
#define DDS_TIME_ZERO
```

The default instant in time: zero seconds and zero nanoseconds.

7.92.3 Function Documentation

7.92.3.1 from_micros() [1/2]

```
static DDS_Duration_t DDS_Duration_t::from_micros (
    DDS_UnsignedLongLong microseconds ) [static]
```

Creates a new duration object from a duration expressed in microseconds.

In case of an overflow this function returns **DDS_DURATION_INFINITE** (p. 325).

7.92.3.2 from_millis() [1/2]

```
static DDS_Duration_t DDS_Duration_t::from_millis (
    DDS_UnsignedLongLong milliseconds ) [static]
```

Creates a new duration object from a duration expressed in milliseconds.

In case of an overflow this function returns **DDS_DURATION_INFINITE** (p. 325).

7.92.3.3 from_nanos() [1/2]

```
static DDS_Duration_t DDS_Duration_t::from_nanos (
    DDS_UnsignedLongLong nanoseconds ) [static]
```

Creates a new duration object from a duration expressed in nanoseconds.

In case of an overflow this function returns **DDS_DURATION_INFINITE** (p. 325).

7.92.3.4 from_seconds() [1/2]

```
static DDS_Duration_t DDS_Duration_t::from_seconds (
    DDS_UnsignedLong seconds ) [static]
```

Creates a new duration object from a duration expressed in seconds.

In case of an overflow this function returns **DDS_DURATION_INFINITE** (p. 325).

7.92.3.5 from_micros() [2/2]

```
static DDS_Time_t DDS_Time_t::from_micros (
    DDS_UnsignedLongLong microseconds ) [static]
```

Creates a new time object from a time expressed in microseconds.

In case of an overflow this function returns **DDS_TIME_MAX** (p. 324).

7.92.3.6 from_millis() [2/2]

```
static DDS_Time_t DDS_Time_t::from_millis (
    DDS_UnsignedLongLong milliseconds ) [static]
```

Creates a new time object from a time expressed in milliseconds.

In case of an overflow this function returns **DDS_TIME_MAX** (p. 324).

7.92.3.7 from_nanos() [2/2]

```
static DDS_Time_t DDS_Time_t::from_nanos (
    DDS_UnsignedLongLong nanoseconds ) [static]
```

Creates a new time object from a time expressed in nanoseconds.

In case of an overflow this function returns **DDS_TIME_MAX** (p. 324).

7.92.3.8 from_seconds() [2/2]

```
static DDS_Time_t DDS_Time_t::from_seconds (
    DDS_UnsignedLongLong seconds ) [static]
```

Creates a new time object from a time expressed in seconds.

In case of an overflow this function returns **DDS_TIME_MAX** (p. 324).

7.92.3.9 DDS_Time_is_zero()

```
DDS_Boolean DDS_Time_is_zero (
    const struct DDS_Time_t * time )
```

Check if time is zero.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the given time is equal to **DDS_TIME_ZERO** (p. 321) or **DDS_BOOLEAN_↵**
FALSE (p. 316) otherwise.

7.92.3.10 DDS_Time_is_invalid()

```
DDS_Boolean DDS_Time_is_invalid (
    const struct DDS_Time_t * time )
```

Returns

DDS_BOOLEAN_TRUE (p. 316) if the given time is not valid (i.e. is negative)

7.92.3.11 DDS_Duration_is_infinite()

```
DDS_Boolean DDS_Duration_is_infinite (
    const struct DDS_Duration_t * duration )
```

Returns

DDS_BOOLEAN_TRUE (p. 316) if the given duration is of infinite length.

7.92.3.12 DDS_Duration_is_auto()

```
DDS_Boolean DDS_Duration_is_auto (
    const struct DDS_Duration_t * duration )
```

Returns

DDS_BOOLEAN_TRUE (p. 316) if the given duration has auto value.

7.92.3.13 DDS_Duration_is_zero()

```
DDS_Boolean DDS_Duration_is_zero (
    const struct DDS_Duration_t * duration )
```

Returns

DDS_BOOLEAN_TRUE (p. 316) if the given duration is of zero length.

7.92.4 Variable Documentation

7.92.4.1 DDS_TIME_MAX

```
const struct DDS_Time_t DDS_TIME_MAX [extern]
```

The maximum value of time.

7.92.4.2 DDS_TIME_INVALID_SEC

```
const DDS_LongLong DDS_TIME_INVALID_SEC [extern]
```

A sentinel indicating an invalid second of time.

7.92.4.3 DDS_TIME_INVALID_NSEC

```
const DDS_UnsignedLong DDS_TIME_INVALID_NSEC [extern]
```

A sentinel indicating an invalid nano-second of time.

7.92.4.4 DDS_TIME_INVALID

```
const struct DDS_Time_t DDS_TIME_INVALID [extern]
```

A sentinel indicating an invalid time.

7.92.4.5 DDS_DURATION_INFINITE_SEC

```
const DDS_Long DDS_DURATION_INFINITE_SEC [extern]
```

An infinite second period of time.

7.92.4.6 DDS_DURATION_INFINITE_NSEC

```
const DDS_UnsignedLong DDS_DURATION_INFINITE_NSEC [extern]
```

An infinite nano-second period of time.

7.92.4.7 DDS_DURATION_INFINITE

```
const struct DDS_Duration_t DDS_DURATION_INFINITE [extern]
```

An infinite period of time.

7.92.4.8 DDS_DURATION_AUTO_SEC

```
const DDS_Long DDS_DURATION_AUTO_SEC [extern]
```

An auto second period of time.

7.92.4.9 DDS_DURATION_AUTO_NSEC

```
const DDS_UnsignedLong DDS_DURATION_AUTO_NSEC [extern]
```

An auto nano-second period of time.

7.92.4.10 DDS_DURATION_AUTO

```
const struct DDS_Duration_t DDS_DURATION_AUTO [extern]
```

Duration is automatically assigned.

7.92.4.11 DDS_DURATION_ZERO_SEC

```
const DDS_Long DDS_DURATION_ZERO_SEC [extern]
```

A zero-length second period of time.

7.92.4.12 DDS_DURATION_ZERO_NSEC

```
const DDS_UnsignedLong DDS_DURATION_ZERO_NSEC [extern]
```

A zero-length nano-second period of time.

7.92.4.13 DDS_DURATION_ZERO

```
const struct DDS_Duration_t DDS_DURATION_ZERO [extern]
```

A zero-length period of time.

7.93 GUID Support

<<*extension*>> (p. 236) GUID type and defines.

Classes

- struct **DDS_RTPS_EntityId_t**
From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.
- struct **DDS_RTPS_GUID_t**
From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.
- struct **DDS_GUID_t**
Type for GUID (Global Unique Identifier) representation.

Typedefs

- typedef **DDS_Octet DDS_RTPS_GuidPrefix_t**[DDS_RTPS_GUID_PREFIX_LENGTH]
From the DDS-RTPS specification: type used to hold the prefix of the globally-unique RTPS-entity identifiers.
- typedef struct **DDS_RTPS_EntityId_t DDS_RTPS_EntityId_t**
From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.
- typedef struct **DDS_RTPS_GUID_t DDS_RTPS_GUID_t**
From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.
- typedef struct **DDS_GUID_t DDS_GUID_t**
Type for GUID (Global Unique Identifier) representation.

Functions

- **DDS_Boolean DDS_GUID_equals** (const struct **DDS_GUID_t** *self, const struct **DDS_GUID_t** *other)
Compares this GUID with another GUID for equality.
- int **DDS_GUID_compare** (const struct **DDS_GUID_t** *self, const struct **DDS_GUID_t** *other)
Compares two GUIDs.
- void **DDS_GUID_copy** (struct **DDS_GUID_t** *self, const struct **DDS_GUID_t** *other)
Copies another GUID into this GUID.

Variables

- const struct **DDS_GUID_t DDS_GUID_AUTO**
Indicates that RTI Connexx should choose an appropriate virtual GUID.
- const struct **DDS_GUID_t DDS_GUID_UNKNOWN**
Unknown GUID.
- const struct **DDS_GUID_t DDS_GUID_ZERO**
Zero GUID.

7.93.1 Detailed Description

<<*extension*>> (p. 236) GUID type and defines.

7.93.2 Typedef Documentation

7.93.2.1 DDS_RTPS_GuidPrefix_t

```
typedef DDS_Octet DDS_RTPS_GuidPrefix_t [DDS_RTPS_GUID_PREFIX_LENGTH]
```

From the DDS-RTPS specification: type used to hold the prefix of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

7.93.2.2 DDS_RTPS_EntityId_t

```
typedef struct DDS_RTPS_EntityId_t DDS_RTPS_EntityId_t
```

From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

7.93.2.3 DDS_RTPS_GUID_t

```
typedef struct DDS_RTPS_GUID_t DDS_RTPS_GUID_t
```

From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

7.93.2.4 DDS_GUID_t

```
typedef struct DDS_GUID_t DDS_GUID_t
```

Type for *GUID* (Global Unique Identifier) representation.

Represents a 128 bit GUID.

Alternative representation of **DDS_RTPS_GUID_t** (p. 1043). Memory and wire representation for this type is the same as the one for **DDS_RTPS_GUID_t** (p. 1043).

7.93.3 Function Documentation

7.93.3.1 DDS_GUID_equals()

```
DDS_Boolean DDS_GUID_equals (
    const struct DDS_GUID_t * self,
    const struct DDS_GUID_t * other )
```

Compares this GUID with another GUID for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This GUID.
<i>other</i>	<< <i>in</i> >> (p. 237) The other GUID to be compared with this GUID.

Returns

DDS_BOOLEAN_TRUE (p. 316) if the two GUIDs have equal values, or **DDS_BOOLEAN_FALSE** (p. 316) otherwise.

7.93.3.2 DDS_GUID_compare()

```
int DDS_GUID_compare (
    const struct DDS_GUID_t * self,
    const struct DDS_GUID_t * other )
```

Compares two GUIDs.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) GUID to compare.
<i>other</i>	<< <i>in</i> >> (p. 237) GUID to compare.

Returns

If the two GUIDs are equal or NULL, the function returns 0. If *self* is greater than *other*, the function returns a positive number; otherwise, it returns a negative number. Note that non-NULL is considered greater than NULL.

7.93.3.3 DDS_GUID_copy()

```
void DDS_GUID_copy (
    struct DDS_GUID_t * self,
    const struct DDS_GUID_t * other )
```

Copies another GUID into this GUID.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This GUID. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 237) The other GUID to be copied. Cannot be NULL.

7.93.4 Variable Documentation

7.93.4.1 DDS_GUID_AUTO

```
const struct DDS_GUID_t DDS_GUID_AUTO [extern]
```

Indicates that RTI Connexx should choose an appropriate virtual GUID.

If this special value is assigned to **DDS_DataWriterProtocolQosPolicy::virtual_guid** (p. 668) or **DDS_DataReaderProtocolQosPolicy::virtual_guid** (p. 625), RTI Connexx will assign the virtual GUID automatically based on the RTPS or physical GUID.

7.93.4.2 DDS_GUID_UNKNOWN

```
const struct DDS_GUID_t DDS_GUID_UNKNOWN [extern]
```

Unknown GUID.

7.93.4.3 DDS_GUID_ZERO

```
const struct DDS_GUID_t DDS_GUID_ZERO [extern]
```

Zero GUID.

7.94 Sequence Number Support

<<*extension*>> (p. 236) Sequence number type and defines.

Classes

- struct **DDS_SequenceNumber_t**
Type for sequence number representation.

Typedefs

- typedef struct **DDS_SequenceNumber_t** **DDS_SequenceNumber_t**
Type for sequence number representation.

Variables

- const struct **DDS_SequenceNumber_t** **DDS_SEQUENCE_NUMBER_UNKNOWN**
Unknown sequence number.
- const struct **DDS_SequenceNumber_t** **DDS_SEQUENCE_NUMBER_ZERO**
Zero value for the sequence number.
- const struct **DDS_SequenceNumber_t** **DDS_SEQUENCE_NUMBER_MAX**
Highest, most positive value for the sequence number.
- const struct **DDS_SequenceNumber_t** **DDS_AUTO_SEQUENCE_NUMBER**
The sequence number is internally determined by RTI Connext.

7.94.1 Detailed Description

<<*extension*>> (p. 236) Sequence number type and defines.

7.94.2 Typedef Documentation

7.94.2.1 DDS_SequenceNumber_t

```
typedef struct DDS_SequenceNumber_t DDS_SequenceNumber_t
```

Type for *sequence* number representation.

Represents a 64-bit sequence number.

7.94.3 Variable Documentation

7.94.3.1 DDS_SEQUENCE_NUMBER_UNKNOWN

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_UNKNOWN [extern]
```

Unknown sequence number.

7.94.3.2 DDS_SEQUENCE_NUMBER_ZERO

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_ZERO [extern]
```

Zero value for the sequence number.

7.94.3.3 DDS_SEQUENCE_NUMBER_MAX

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_MAX [extern]
```

Highest, most positive value for the sequence number.

7.94.3.4 DDS_AUTO_SEQUENCE_NUMBER

```
const struct DDS_SequenceNumber_t DDS_AUTO_SEQUENCE_NUMBER [extern]
```

The sequence number is internally determined by RTI Connext.

7.95 Exception Codes

<<*extension*>> (p. 236) Exception codes.

Enumerations

- enum **DDS_ExceptionCode_t** {
DDS_NO_EXCEPTION_CODE ,
DDS_USER_EXCEPTION_CODE ,
DDS_SYSTEM_EXCEPTION_CODE ,
DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE ,
DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE ,
DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE ,
DDS_BADKIND_USER_EXCEPTION_CODE ,
DDS_BOUNDS_USER_EXCEPTION_CODE ,
DDS_IMMUTABLE_TYPECODE_SYSTEM_EXCEPTION_CODE = 8 ,
DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE = 9 ,
DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE = 10 }

*Error codes used by the **DDS_TypeCode** (p. 1149) class.*

7.95.1 Detailed Description

<<*extension*>> (p. 236) Exception codes.

These exceptions are used for error handling by the **Type Code Support** (p. 76) API.

7.95.2 Enumeration Type Documentation

7.95.2.1 DDS_ExceptionCode_t

```
enum DDS_ExceptionCode_t
```

Error codes used by the **DDS_TypeCode** (p. 1149) class.

Exceptions are modeled via a special parameter passed to the operations.

Enumerator

DDS_NO_EXCEPTION_CODE	No failure occurred.
DDS_USER_EXCEPTION_CODE	User exception. This class is based on a similar class in CORBA.
DDS_SYSTEM_EXCEPTION_CODE	System exception. This class is based on a similar class in CORBA.
DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE	Exception thrown when a parameter passed to a call is considered illegal.
DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE	Exception thrown when there is not enough memory for a dynamic memory allocation.
DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE	Exception thrown when a malformed type code is found (for example, a type code with an invalid TCKind value).
DDS_BADKIND_USER_EXCEPTION_CODE	The exception BadKind is thrown when an inappropriate operation is invoked on a TypeCode object.
DDS_BOUNDS_USER_EXCEPTION_CODE	A user exception thrown when a parameter is not within the legal bounds.
DDS_IMMUTABLE_TYPECODE_SYSTEM_EXCEPTION_CODE	An attempt was made to modify a DDS_TypeCode (p. 1149) that was received from a remote object. The built-in publication and subscription readers provide access to information about the remote DDSDataWriter (p. 1305) and DDSDataReader (p. 1272) entities in the distributed system. Among other things, the data from these built-in readers contains the DDS_TypeCode (p. 1149) for these entities. Modifying this received DDS_TypeCode (p. 1149) is not permitted.

Enumerator

DDS_BAD_MEMBER_NAME_USER_EXCEPTION_↔ CODE	<p>The specified DDS_TypeCode (p. 1149) member name is invalid. This failure can occur, for example, when querying a field by name when no such name is defined in the type.</p> <p>See also</p> <p>DDS_BAD_MEMBER_ID_USER_EXCEPTION_↔ _CODE (p. 334)</p>
DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE	<p>The specified DDS_TypeCode (p. 1149) member ID is invalid. This failure can occur, for example, when querying a field by ID when no such ID is defined in the type.</p> <p>See also</p> <p>DDS_BAD_MEMBER_NAME_USER_↔ EXCEPTION_CODE (p. 334)</p>

7.96 Return Codes

Types of return codes.

Enumerations

- enum **DDS_ReturnCode_t** {
DDS_RETCODE_OK ,
DDS_RETCODE_ERROR ,
DDS_RETCODE_UNSUPPORTED ,
DDS_RETCODE_BAD_PARAMETER ,
DDS_RETCODE_PRECONDITION_NOT_MET ,
DDS_RETCODE_OUT_OF_RESOURCES ,
DDS_RETCODE_NOT_ENABLED ,
DDS_RETCODE_IMMUTABLE_POLICY ,
DDS_RETCODE_INCONSISTENT_POLICY ,
DDS_RETCODE_ALREADY_DELETED ,
DDS_RETCODE_TIMEOUT ,
DDS_RETCODE_NO_DATA ,
DDS_RETCODE_ILLEGAL_OPERATION ,
DDS_RETCODE_NOT_ALLOWED_BY_SECURITY }

Type for return codes.

7.96.1 Detailed Description

Types of return codes.

7.96.2 Standard Return Codes

Any operation with return type **DDS_ReturnCode_t** (p. 335) may return **DDS_RETCODE_OK** (p. 335) **DDS_RETCODE_ERROR** (p. 335) or **DDS_RETCODE_ILLEGAL_OPERATION** (p. 336). Any operation that takes one or more input parameters may additionally return **DDS_RETCODE_BAD_PARAMETER** (p. 335). Any operation on an object created from any of the factories may additionally return **DDS_RETCODE_ALREADY_DELETED** (p. 336). Any operation that is stated as optional may additionally return **DDS_RETCODE_UNSUPPORTED** (p. 335).

Thus, the standard return codes are:

- **DDS_RETCODE_ERROR** (p. 335)
- **DDS_RETCODE_ILLEGAL_OPERATION** (p. 336)
- **DDS_RETCODE_ALREADY_DELETED** (p. 336)
- **DDS_RETCODE_BAD_PARAMETER** (p. 335)
- **DDS_RETCODE_UNSUPPORTED** (p. 335)

Operations that may return any of the additional return codes will state so explicitly.

7.96.3 Enumeration Type Documentation

7.96.3.1 DDS_ReturnCode_t

```
enum DDS_ReturnCode_t
```

Type for return codes.

Errors are modeled as operation return codes of this type.

Enumerator

DDS_RETCODE_OK	Successful return.
DDS_RETCODE_ERROR	Generic, unspecified error.
DDS_RETCODE_UNSUPPORTED	Unsupported operation. Only returned by operations that are unsupported.
DDS_RETCODE_BAD_PARAMETER	Illegal parameter value. The value of the parameter that is passed in has illegal value. Things that fall into this category include NULL parameters and parameter values that are out of range.
DDS_RETCODE_PRECONDITION_NOT_MET	A pre-condition for the operation was not met. The system is not in the expected state when the function is called, or the parameter itself is not in the expected state when the function is called.

Enumerator

DDS_RETCODE_OUT_OF_RESOURCES	RTI Connexant ran out of the resources needed to complete the operation.
DDS_RETCODE_NOT_ENABLED	Operation invoked on a DDSEntity (p. 1446) that is not yet enabled.
DDS_RETCODE_IMMUTABLE_POLICY	Application attempted to modify an immutable QoS policy.
DDS_RETCODE_INCONSISTENT_POLICY	Application specified a set of QoS policies that are not consistent with each other.
DDS_RETCODE_ALREADY_DELETED	The object target of this operation has already been deleted.
DDS_RETCODE_TIMEOUT	The operation timed out.
DDS_RETCODE_NO_DATA	Indicates a transient situation where the operation did not return any data but there is no inherent error.
DDS_RETCODE_ILLEGAL_OPERATION	The operation was called under improper circumstances. An operation was invoked on an inappropriate object or at an inappropriate time. This return code is similar to DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), except that there is no precondition that could be changed to make the operation succeed.
DDS_RETCODE_NOT_ALLOWED_BY_SECURITY	An operation on the DDS API that fails because the security plugins do not allow it. An operation on the DDS API that fails because the security plugins do not allow it. Currently unused because security checks happen during create, not enable, and create doesn't return a ReturnCode (SEC-731).

7.97 Status Kinds

Kinds of communication status.

Macros

Type for status kinds.

7.97.1 Detailed Description

Kinds of communication status.

Entity:

DDSEntity (p. 1446)

QoS:

QoS Policies (p. 352)

Listener:

DDSListener (p. 1509)

Each concrete **DDSEntity** (p. 1446) is associated with a set of Status objects whose value represents the communication status of that entity. Each status value can be accessed with a corresponding method on the **DDSEntity** (p. 1446).

When these status values change, the corresponding **DDSStatusCondition** (p. 1562) objects are activated and the proper **DDSListener** (p. 1509) objects are invoked to asynchronously inform the application.

An application is notified of communication status by means of the **DDSListener** (p. 1509) or the **DDSWaitSet** (p. 1613) / **DDSCondition** (p. 1260) mechanism. The two mechanisms may be combined in the application (e.g., using **DDSWaitSet** (p. 1613) (s) / **DDSCondition** (p. 1260) (s) to access the data and **DDSListener** (p. 1509) (s) to be warned asynchronously of erroneous communication statuses).

It is likely that the application will choose one or the other mechanism for each particular communication status (not both). However, if both mechanisms are enabled, then the **DDSListener** (p. 1509) mechanism is used first and then the **DDSWaitSet** (p. 1613) objects are signalled.

The statuses may be classified into:

- *read communication statuses*: i.e., those that are related to arrival of data, namely **DDS_DATA_ON_READERS_STATUS** (p. 344) and **DDS_DATA_AVAILABLE_STATUS** (p. 344).
- *plain communication statuses*: i.e., all the others.

Read communication statuses are treated slightly differently than the others because they don't change independently. In other words, at least two changes will appear at the same time (**DDS_DATA_ON_READERS_STATUS** (p. 344) and **DDS_DATA_AVAILABLE_STATUS** (p. 344)) and even several of the last kind may be part of the set. This 'grouping' has to be communicated to the application.

For each plain communication status, there is a corresponding structure to hold the status value. These values contain the information related to the change of status, as well as information related to the statuses themselves (e.g., contains cumulative counts).

"Status Values"

7.97.2 Changes in Status

Associated with each one of an **DDSEntity** (p. 1446)'s communication status is a logical `StatusChangedFlag`. This flag indicates whether that particular communication status has changed since the last time the status was read by the application. The way the status changes is slightly different for the Plain Communication Status and the Read Communication status.

"\p StatusChangedFlag indicates if status has changed"

7.97.2.1 Changes in plain communication status

For the plain communication status, the `StatusChangedFlag` flag is initially set to `FALSE`. It becomes `TRUE` whenever the plain communication status changes and it is reset to `DDS_BOOLEAN_FALSE` (p.316) each time the application accesses the plain communication status via the proper `get_<plain communication status>()` operation on the `DDSEntity` (p. 1446).

The communication status is also reset to `FALSE` whenever the associated listener operation is called as the listener implicitly accesses the status which is passed as a parameter to the operation. The fact that the status is reset prior to calling the listener means that if the application calls the `get_<plain communication status>` from inside the listener it will see the status already reset.

An exception to this rule is when the associated listener is the 'nil' listener. The 'nil' listener is treated as a NOOP and the act of calling the 'nil' listener does not reset the communication status.

For example, the value of the `StatusChangedFlag` associated with the `DDS_REQUESTED_DEADLINE_MISSED_STATUS` (p.343) will become `TRUE` each time new deadline occurs (which increases `DDS_RequestedDeadlineMissedStatus::total_count` (p. 1036)). The value changes to `FALSE` when the application accesses the status via the corresponding `DDSDataReader::get_requested_deadline_missed_status` (p. 1287) method on the proper Entity

"Changes in \p StatusChangedFlag for plain communication status"

7.97.2.2 Changes in read communication status

For the read communication status, the `StatusChangedFlag` flag is initially set to `FALSE`. The `StatusChangedFlag` becomes `TRUE` when either a data-sample arrives or else the `DDS_ViewStateKind` (p.158), `DDS_SampleStateKind` (p. 156), or `DDS_InstanceStateKind` (p. 160) of any existing sample changes for any reason other than a call to `FooDataReader::read` (p. 1635), `FooDataReader::take` (p. 1636) or their variants. Specifically any of the following events will cause the `StatusChangedFlag` to become `TRUE`:

- The arrival of new data.
- A change in the `DDS_InstanceStateKind` (p. 160) of a contained instance. This can be caused by either:
 - The arrival of the notification that an instance has been disposed by:
 - * the `DDSDataWriter` (p.1305) that owns it if `OWNERSHIP` (p.414) QoS kind= `DDS_EXCLUSIVE_OWNERSHIP_QOS` (p. 415)
 - * or by any `DDSDataWriter` (p.1305) if `OWNERSHIP` (p.414) QoS kind= `DDS_SHARED_OWNERSHIP_QOS` (p. 415)
 - The loss of liveness of the `DDSDataWriter` (p. 1305) of an instance for which there is no other `DDSDataWriter` (p. 1305).
 - The arrival of the notification that an instance has been unregistered by the only `DDSDataWriter` (p. 1305) that is known to be writing the instance.

Depending on the kind of `StatusChangedFlag`, the flag transitions to `FALSE` again as follows:

- The `DDS_DATA_AVAILABLE_STATUS` (p.344) `StatusChangedFlag` becomes `FALSE` when either the corresponding listener operation (`on_data_available`) is called or the read or take operation (or their variants) is called on the associated `DDSDataReader` (p. 1272).

- The **DDS_DATA_ON_READERS_STATUS** (p. 344) `StatusChangedFlag` becomes `FALSE` when any of the following events occurs:
 - The corresponding listener operation (`on_data_on_readers`) is called.
 - The `on_data_available` listener operation is called on any **DDSDataReader** (p. 1272) belonging to the **DDSSubscriber** (p. 1576).
 - The read or take operation (or their variants) is called on any **DDSDataReader** (p. 1272) belonging to the **DDSSubscriber** (p. 1576).

7.97.3 Macro Definition Documentation

7.97.3.1 DDS_STATUS_MASK_NONE

```
#define DDS_STATUS_MASK_NONE
```

No bits are set.

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

7.97.3.2 DDS_STATUS_MASK_ALL

```
#define DDS_STATUS_MASK_ALL
```

All bits are set.

7.97.4 Typedef Documentation

7.97.4.1 DDS_StatusMask

```
typedef DDS_UnsignedLong DDS_StatusMask
```

A bit-mask (list) of concrete status types, i.e. **DDS_StatusKind** (p. 341)[].

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS_StatusKind** (p. 341) values.

Bits in the mask correspond to different statuses. You can choose which changes in status will trigger a callback by setting the corresponding status bits in this bit-mask and installing callbacks for each of those statuses.

The bits that are true indicate that the listener will be called back for changes in the corresponding status.

For example:

```
DDS_StatusMask mask = DDS_REQUESTED_DEADLINE_MISSED_STATUS |
                      DDS_DATA_AVAILABLE_STATUS;
datareader->set_listener(listener, mask);
```

or

```
DDS_StatusMask mask = DDS_REQUESTED_DEADLINE_MISSED_STATUS |
                      DDS_DATA_AVAILABLE_STATUS;
datareader = subscriber->create_datareader(topic,
                      DDS_DATAREADER_QOS_DEFAULT,
                      listener, mask);
```

7.97.5 Enumeration Type Documentation

7.97.5.1 DDS_StatusKind

```
enum DDS_StatusKind
```

Type for *status* kinds.

Each concrete **DDSEntity** (p. 1446) is associated with a set of **Status* objects whose values represent the communication status of that **DDSEntity** (p. 1446).

The communication statuses whose changes can be communicated to the application depend on the **DDSEntity** (p. 1446).

Each status value can be accessed with a corresponding method on the **DDSEntity** (p. 1446). The changes on these status values cause activation of the corresponding **DDSStatusCondition** (p. 1562) objects and trigger invocation of the proper **DDSListener** (p. 1509) objects to asynchronously inform the application. Note that not all statuses will activate the **DDSStatusCondition** (p. 1562) or have a corresponding listener callback. Refer to the documentation of the individual statuses for that information.

Enumerator

DDS_RELIABLE_WRITER_CACHE_CHANGED_↔ STATUS	<p><<extension>> (p. 236) The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point. This status is considered changed at the following times: the cache is empty (i.e. contains no unacknowledge samples), full (i.e. the sample count has reached the value specified in DDS_ResourceLimitsQosPolicy::max_samples (p. 1041)), or the number of samples has reached a high (see DDS_RtpsReliableWriterProtocol_t::high_↔watermark (p. 1049)) or low (see DDS_RtpsReliableWriterProtocol_t::low_watermark (p. 1049)) watermark.</p> <p>Entity:</p> <p>DDSDDataWriter (p. 1305)</p> <p>Status:</p> <p>DDS_ReliableWriterCacheChangedStatus (p. 1032)</p> <p>Listener:</p> <p>DDSDDataWriterListener (p. 1328)</p>
DDS_RELIABLE_READER_ACTIVITY_CHANGED_↔ STATUS	<p><<extension>> (p. 236) One or more reliable readers has become active or inactive. A reliable reader is considered active by a reliable writer with which it is matched if that reader acknowledges the samples it has been sent in a timely fashion. For the definition of "timely" in this case, see DDS_RtpsReliableWriterProtocol_t (p. 1047) and DDS_ReliableReaderActivityChangedStatus (p. 1030).</p> <p>See also</p> <p>DDS_RtpsReliableWriterProtocol_t (p. 1047)</p> <p>DDS_ReliableReaderActivityChangedStatus (p. 1030)</p>
DDS_DATA_WRITER_CACHE_STATUS	<p><<extension>> (p. 236) The status of the writer's cache. Changes to this status do not trigger a DDSStatusCondition (p. 1562).</p>
DDS_DATA_WRITER_PROTOCOL_STATUS	<p><<extension>> (p. 236) The status of a writer's internal protocol related metrics The status of a writer's internal protocol-related metrics, such as the number of samples pushed, pulled, and filtered and the status of wire protocol traffic. Changes to this status information do not trigger a DDSStatusCondition (p. 1562).</p>

Enumerator

DDS_DATA_READER_CACHE_STATUS	<< <i>extension</i> >> (p. 236) The status of the reader's cache. Changes to this status do not trigger a DDSStatusCondition (p. 1562).
DDS_DATA_READER_PROTOCOL_STATUS	<< <i>extension</i> >> (p. 236) The status of a reader's internal protocol related metrics The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic. Changes to this status do not trigger a DDSStatusCondition (p. 1562).
DDS_DATA_WRITER_SAMPLE_REMOVED_STATUS	<< <i>extension</i> >> (p. 236) A DDSDataWriter (p. 1305) has removed a sample from its queue. Enables a DDSDataWriter (p. 1305) callback that is called when a sample is removed from its queue. Entity: DDSDataWriter (p. 1305) Listener: DDSDataWriterListener (p. 1328)

7.98 Thread Settings

The properties of a thread of execution. Consult `Platform Notes` for additional platform specific details.

Classes

- struct **DDS_ThreadSettings_t**
The properties of a thread of execution.

Macros

- #define **DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT**
The mask of default thread options.

Typedefs

- typedef **DDS_UnsignedLong DDS_ThreadSettingsKindMask**
*A mask of which each bit is taken from **DDS_ThreadSettingsKind** (p. 351).*

Enumerations

- enum **DDS_ThreadSettingsKind** {
DDS_THREAD_SETTINGS_FLOATING_POINT ,
DDS_THREAD_SETTINGS_STDIO ,
DDS_THREAD_SETTINGS_REALTIME_PRIORITY ,
DDS_THREAD_SETTINGS_PRIORITY_ENFORCE ,
DDS_THREAD_SETTINGS_CANCEL_ASYNCHRONOUS }

A collection of flags used to configure threads of execution.

- enum **DDS_ThreadSettingsCpuRotationKind** {
DDS_THREAD_SETTINGS_CPU_NO_ROTATION ,
DDS_THREAD_SETTINGS_CPU_RR_ROTATION }

*Determines how **DDS_ThreadSettings_t::cpu_list** (p. 1109) affects processor affinity for thread-related QoS policies that apply to multiple threads.*

7.98.1 Detailed Description

The properties of a thread of execution. Consult `Platform Notes` for additional platform specific details.

7.98.2 Macro Definition Documentation

7.98.2.1 DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT

```
#define DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT
```

The mask of default thread options.

7.98.3 Typedef Documentation

7.98.3.1 DDS_ThreadSettingsKindMask

```
typedef DDS_UnsignedLong DDS_ThreadSettingsKindMask
```

A mask of which each bit is taken from **DDS_ThreadSettingsKind** (p. 351).

See also

DDS_ThreadSettings_t (p. 1108)

7.98.4 Enumeration Type Documentation

7.98.4.1 DDS_ThreadSettingsKind

enum **DDS_ThreadSettingsKind**

A collection of flags used to configure threads of execution.

Not all of these options may be relevant for all operating systems. Consult `Platform Notes` for additional details.

See also

DDS_ThreadSettingsKindMask (p. 350)

Enumerator

DDS_THREAD_SETTINGS_FLOATING_POINT	Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.
DDS_THREAD_SETTINGS_STUDIO	Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.
DDS_THREAD_SETTINGS_REALTIME_PRIORITY	The thread will be scheduled on a FIFO basis.
DDS_THREAD_SETTINGS_PRIORITY_ENFORCE	Strictly enforce this thread's priority.
DDS_THREAD_SETTINGS_CANCEL_↔ ASYNCHRONOUS	Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

7.98.4.2 DDS_ThreadSettingsCpuRotationKind

enum **DDS_ThreadSettingsCpuRotationKind**

Determines how **DDS_ThreadSettings_t::cpu_list** (p. 1109) affects processor affinity for thread-related QoS policies that apply to multiple threads.

7.98.5 Controlling CPU Core Affinity for RTI Threads

Most thread-related QoS settings apply to a single thread (such as for the **DDS_EventQosPolicy** (p. 893), **DDS_↔DatabaseQosPolicy** (p. 613), and **DDS_AsynchronousPublisherQosPolicy** (p. 584)). However, the thread settings in the **DDS_ReceiverPoolQosPolicy** (p. 1025) control every receive thread created. In this case, there are several schemes to map M threads to N processors; the rotation kind controls which scheme is used.

Controlling CPU Core Affinity is only relevant to the **DDS_ReceiverPoolQoSPolicy** (p. 1025). It is ignored within other QoS policies that include **DDS_ThreadSettings_t** (p. 1108).

If **DDS_ThreadSettings_t::cpu_list** (p. 1109) is empty, the rotation is irrelevant since no affinity adjustment will occur. Suppose instead that **DDS_ThreadSettings_t::cpu_list** (p. 1109) = {0, 1} and that the middleware creates three receive threads: {A, B, C}. If **DDS_ThreadSettings_t::cpu_rotation** (p. 1109) is **DDS_THREAD_SETTINGS_CPU_↔ NO_ROTATION** (p. 352), threads A, B and C will have the same processor affinities (0-1), and the OS will control thread scheduling within this bound. It is common to denote CPU affinities as a bitmask, where set bits represent allowed processors to run on. This mask is printed in hex, so a CPU core affinity of 0-1 can be represented by the mask 0x3.

If **DDS_ThreadSettings_t::cpu_rotation** (p. 1109) is **DDS_THREAD_SETTINGS_CPU_RR_ROTATION** (p. 352), each thread will be assigned in round-robin fashion to one of the processors in **DDS_ThreadSettings_t::cpu_list** (p. 1109); perhaps thread A to 0, B to 1, and C to 0. Note that the order in which internal middleware threads spawn is unspecified.

Not all of these options may be relevant for all operating systems. Refer to the Platform Notes for further information.

Enumerator

DDS_THREAD_SETTINGS_CPU_NO_ROTATION	Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.
DDS_THREAD_SETTINGS_CPU_RR_ROTATION	Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

7.99 QoS Policies

Quality of Service (QoS) policies.

Modules

<<extension>> (p. 236) Configures the availability of data.

- **BATCH**

<<extension>> (p. 236) Batch QoS policy used to enable batching in **DDSDataWriter** (p. 1305) instances.

- **DATABASE**

<<extension>> (p. 236) Various threads and resource limits settings used by RTI Connext to control its internal database.

- **DATA_READER_PROTOCOL**

<<extension>> (p. 236) Specifies the **DataReader**-specific protocol QoS.

- **DATA_READER_RESOURCE_LIMITS**

<<extension>> (p. 236) Various settings that configure how **DataReaders** allocate and use physical memory for internal resources.

- **DATA_REPRESENTATION**

A list of data representations and compression methods supported by a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272).

- **DATA_TAG**

Stores (name, value) pairs that can be used to determine access permissions.

- **DATA_WRITER_PROTOCOL**

*<<extension>> (p. 236) Along with **DDS_WireProtocolQosPolicy** (p. 1228) and **DDS_DataReaderProtocolQosPolicy** (p. 624), this QoS policy configures the DDS on-the-network protocol (RTPS).*

- **DATA_WRITER_RESOURCE_LIMITS**

*<<extension>> (p. 236) Various settings that configure how a **DDSDataWriter** (p. 1305) allocates and uses physical memory for internal resources.*

- **DATA_WRITER_TRANSFER_MODE**

<<extension>> (p. 236) Specifies the DataWriter transfer mode QoS.

- **DEADLINE**

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

- **DESTINATION_ORDER**

*Controls the criteria used to determine the logical order among changes made by **DDSPublisher** (p. 1534) entities to the same instance of data (i.e., matching **DDSTopic** (p. 1601) and key).*

- **DISCOVERY**

<<extension>> (p. 236) Specifies the attributes required to discover participants in the domain.

- **DISCOVERY_CONFIG**

<<extension>> (p. 236) Specifies the discovery configuration QoS.

- **DOMAIN_PARTICIPANT_RESOURCE_LIMITS**

*<<extension>> (p. 236) Various settings that configure how a **DDSDomainParticipant** (p. 1335) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.*

- **DURABILITY**

*This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDSDataReader** (p. 1272) entities that join the network later.*

- **DURABILITY_SERVICE**

*Various settings to configure the external RTI Persistence Service used by RTI Connexx for DataWriters with a **DDS_DurabilityQosPolicy** (p. 761) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 400).*

- **ENTITY_FACTORY**

*A QoS policy for all **DDSEntity** (p. 1446) types that can act as factories for one or more other **DDSEntity** (p. 1446) types.*

- **ENTITY_NAME**

*<<extension>> (p. 236) Assigns a name to a **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). Except for **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.*

- **EVENT**

<<extension>> (p. 236) Configures the internal thread in a DomainParticipant that handles timed events.

- **EXCLUSIVE_AREA**

<<extension>> (p. 236) Configures multi-thread concurrency and deadlock prevention capabilities.

- **HISTORY**

Specifies the behavior of RTI Connexx in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

- **GROUP_DATA**

*Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.*

- **LATENCY_BUDGET**

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

- **LIFESPAN**

*Specifies how long the data written by the **DDSDataWriter** (p. 1305) is considered valid.*

- **LIVELINESS**

*Specifies and configures the mechanism that allows **DDSDataReader** (p. 1272) entities to detect when **DDSDataWriter** (p. 1305) entities become disconnected or "dead".*

- **LOCATORFILTER**

*<<extension>> (p. 236) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS↔_PublicationBuiltinTopicData** (p. 997).*

- **LOGGING**

<<extension>> (p. 236) Configures the RTI Connex logging facility.

- **MONITORING**

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

- **MULTICHANNEL**

<<extension>> (p. 236) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

- **OWNERSHIP**

*Specifies whether it is allowed for multiple **DDSDataWriter** (p. 1305) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

- **OWNERSHIP_STRENGTH**

*Specifies the value of the strength used to arbitrate among multiple **DDSDataWriter** (p. 1305) objects that attempt to modify the same instance of a data type (identified by **DDSTopic** (p. 1601) + key).*

- **PARTITION**

*Set of strings that introduces logical partitions in **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) entities.*

- **PRESENTATION**

Specifies how the samples representing changes to data instances are presented to a subscribing application.

- **PROFILE**

<<extension>> (p. 236) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

- **PROPERTY**

<<extension>> (p. 236) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

- **PUBLISH_MODE**

<<extension>> (p. 236) Specifies how RTI Connex sends application data on the network. This QoS policy can be used to tell RTI Connex to use its own thread to send data, instead of the user thread.

- **READER_DATA_LIFECYCLE**

Controls how a DataReader manages the lifecycle of the data that it has received.

- **RECEIVER_POOL**

<<extension>> (p. 236) Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

- **RELIABILITY**

Indicates the level of reliability offered/requested by RTI Connex.

- **RESOURCE_LIMITS**

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

- **SERVICE**

<<extension>> (p. 236) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

- **SYSTEM_RESOURCE_LIMITS**

<<extension>> (p. 236) Configures DomainParticipant-independent resources used by RTI Connex.

- **TIME_BASED_FILTER**

Filter that allows a **DDSDataReader** (p. 1272) to specify that it is interested only in (potentially) a subset of the values of the data.

- **TOPIC_DATA**

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

- **TOPIC_QUERY_DISPATCH**

Configures the ability of a **DDSDataWriter** (p. 1305) to publish historical samples.

- **TRANSPORT_BUILTIN**

<<extension>> (p. 236) Specifies which built-in transports are used.

- **TRANSPORT_MULTICAST**

<<extension>> (p. 236) Specifies the multicast address on which a **DDSDataReader** (p. 1272) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDSDomainParticipant** (p. 1335) level) transports with which to receive the multicast data.

- **TRANSPORT_MULTICAST_MAPPING**

<<extension>> (p. 236) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

- **TRANSPORT_PRIORITY**

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

- **TRANSPORT_SELECTION**

<<extension>> (p. 236) Specifies the physical transports that a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272) may use to send or receive data.

- **TRANSPORT_UNICAST**

<<extension>> (p. 236) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

- **TYPE_CONSISTENCY_ENFORCEMENT**

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

- **TYPESUPPORT**

<<extension>> (p. 236) Allows you to attach application-specific values to a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

- **USER_DATA**

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

- **WRITER_DATA_LIFECYCLE**

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

- **WIRE_PROTOCOL**

<<extension>> (p. 236) Specifies the wire protocol related attributes for the **DDSDomainParticipant** (p. 1335).

- **Extended Qos Support**

<<extension>> (p. 236) Types and defines used in extended QoS policies.

Classes

- struct **DDS_QosPrintFormat**

A collection of attributes used to configure how a QoS appears when printed.

- struct **DDS_QosPolicyCount**

Type to hold a counter for a **DDS_QosPolicyId_t** (p. 359).

- struct **DDS_QosPolicyCountSeq**

Declares IDL sequence < **DDS_QosPolicyCount** (p. 1016) >

Macros

- `#define DDS_QosPrintFormat_INITIALIZER`
Static initializer for `DDS_QosPrintFormat` (p. 1017).
- `#define DDS_QOS_POLICY_COUNT`
Number of QoS policies in `DDS_QosPolicyId_t` (p. 359).

Enumerations

Type to identify QoS Policies.

7.99.1 Detailed Description

Quality of Service (QoS) policies.

Data Distribution Service (DDS) relies on the use of QoS. A QoS is a set of characteristics that controls some aspect of the behavior of DDS. A QoS is comprised of individual QoS policies (objects conceptually deriving from an *abstract QosPolicy* class).

"Supported QoS policies"

The QosPolicy provides the basic mechanism for an application to specify quality of service parameters. It has an attribute name that is used to uniquely identify each *QosPolicy*.

QosPolicy implementation is comprised of a name, an ID, and a type. The type of a *QosPolicy* value may be atomic, such as an integer or float, or compound (a structure). Compound types are used whenever multiple parameters must be set coherently to define a consistent value for a QosPolicy.

QoS (i.e., a list of *QosPolicy* objects) may be associated with all **DDSEntity** (p. 1446) objects in the system such as **DDSTopic** (p. 1601), **DDSDataWriter** (p. 1305), **DDSDataReader** (p. 1272), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), and **DDSDomainParticipant** (p. 1335).

7.99.2 Specifying QoS on entities

QoS Policies can be set programmatically when an **DDSEntity** (p. 1446) is created, or modified with the **DDSEntity** (p. 1446)'s **set_qos (abstract)** (p. ??) method.

QoS Policies can also be configured from XML resources (files, strings). With this approach, you can change the QoS without recompiling the application. For more information, see **Configuring QoS Profiles with XML** (p. 196).

To customize a **DDSEntity** (p. 1446)'s QoS before creating the entity, the correct pattern is:

- First, initialize a QoS object with the appropriate **INITIALIZER** constructor.
- Call the relevant **get_<entity>_default_qos()** method.
- Modify the QoS values as desired.
- Finally, create the entity.

Each **QoSPolicy** is treated independently from the others. This approach has the advantage of being very extensible. However, there may be cases where several policies are in conflict. Consistency checking is performed each time the policies are modified via the **set_qos (abstract)** (p. ??) operation, or when the **DDSEntity** (p. 1446) is created.

When a policy is changed after being set to a given value, it is not required that the new value be applied instantaneously; RTI Connext is allowed to apply it after a transition phase. In addition, some **QoSPolicy** have immutable semantics, meaning that they can only be specified either at **DDSEntity** (p. 1446) creation time or else prior to calling the **DDSEntity::enable** (p. 1449) operation on the entity.

Each **DDSEntity** (p. 1446) can be configured with a list of **QoSPolicy** objects. However, not all QoS Policies are supported by each **DDSEntity** (p. 1446). For instance, a **DDSDomainParticipant** (p. 1335) supports a different set of QoS Policies than a **DDSTopic** (p. 1601) or a **DDSPublisher** (p. 1534).

Additional properties that are not exposed through the formal QoS policies can also be set for an **DDSEntity** (p. 1446) via the **DDS_PropertyQoSPolicy** (p. 994). These properties are described in the *Property Reference Guide*.

7.99.3 QoS compatibility

In several cases, for communications to occur properly (or efficiently), a **QoSPolicy** on the publisher side must be compatible with a corresponding policy on the subscriber side. For example, if a **DDSSubscriber** (p. 1576) requests to receive data reliably while the corresponding **DDSPublisher** (p. 1534) defines a best-effort policy, communication will not happen as requested.

To address this issue and maintain the desirable decoupling of publication and subscription as much as possible, the **QoSPolicy** specification follows the **subscriber-requested, publisher-offered pattern**.

In this pattern, the subscriber side can specify a "requested" value for a particular **QoSPolicy**. The publisher side specifies an "offered" value for that **QoSPolicy**. RTI Connext will then determine whether the value requested by the subscriber side is compatible with what is offered by the publisher side. If the two policies are compatible, then communication will be established. If the two policies are not compatible, RTI Connext will not establish communications between the two **DDSEntity** (p. 1446) objects and will record this fact by means of the **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 343) on the publisher end and **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343) on the subscriber end. The application can detect this fact by means of a **DDSListener** (p. 1509) or a **DDSCondition** (p. 1260).

The following **properties** are defined on a **QoSPolicy**.

- **RxO (p. ??)property**

The QoSPolicy objects that need to be set in a compatible manner between the **publisher** and **subscriber** end are indicated by the setting of the **RxO (p. ??)** property:

- **RxO (p. ??) = YES**

indicates that the policy can be set both at the publishing and subscribing ends and the values must be set in a compatible manner. In this case the compatible values are explicitly defined.

- **RxO (p. ??) = NO**

indicates that the policy can be set both at the publishing and subscribing ends but the two settings are independent. That is, all combinations of values are compatible.

- **RxO (p. ??) = N/A**

indicates that the policy can only be specified at either the publishing or the subscribing end, but not at both ends. So compatibility does not apply.

- **Changeable (p. ??)property**

Determines whether a QoSPolicy can be changed.

NO (p. ??) -- policy can only be specified at **DDSEntity** (p. 1446) creation time.

UNTIL ENABLE (p. ??) -- policy can only be changed before the **DDSEntity** (p. 1446) is enabled.

YES (p. ??) -- policy can be changed at any time.

7.99.4 Macro Definition Documentation

7.99.4.1 DDS_QosPrintFormat_INITIALIZER

```
#define DDS_QosPrintFormat_INITIALIZER
```

Static initializer for **DDS_QosPrintFormat** (p. 1017).

Use this initializer to ensure that new objects do not have uninitialized contents.

```
struct DDS_QosPrintFormat format = DDS_QosPrintFormat_INITIALIZER;
```

See also

DDS_QosPrintFormat (p. 1017)

7.99.4.2 DDS_QOS_POLICY_COUNT

```
#define DDS_QOS_POLICY_COUNT
```

Number of QoS policies in **DDS_QosPolicyId_t** (p. 359).

7.99.5 Enumeration Type Documentation

7.99.5.1 DDS_QosPolicyId_t

```
enum DDS_QosPolicyId_t
```

Type to identify QoS Policies.

Enumerator

DDS_INVALID_QOS_POLICY_ID	Identifier for an invalid QoS policy.
DDS_USERDATA_QOS_POLICY_ID	Identifier for DDS_UserDataQosPolicy (p. 1221).
DDS_DURABILITY_QOS_POLICY_ID	Identifier for DDS_DurabilityQosPolicy (p. 761).
DDS_PRESENTATION_QOS_POLICY_ID	Identifier for DDS_PresentationQosPolicy (p. 983).
DDS_DEADLINE_QOS_POLICY_ID	Identifier for DDS_DeadlineQosPolicy (p. 701).
DDS_LATENCYBUDGET_QOS_POLICY_ID	Identifier for DDS_LatencyBudgetQosPolicy (p. 916).
DDS_OWNERSHIP_QOS_POLICY_ID	Identifier for DDS_OwnershipQosPolicy (p. 960).
DDS_OWNERSHIPSTRENGTH_QOS_POLICY_ID	Identifier for DDS_OwnershipStrengthQosPolicy (p. 965).
DDS_LIVELINESS_QOS_POLICY_ID	Identifier for DDS_LivelinessQosPolicy (p. 923).
DDS_TIMEBASEDFILTER_QOS_POLICY_ID	Identifier for DDS_TimeBasedFilterQosPolicy (p. 1111).
DDS_PARTITION_QOS_POLICY_ID	Identifier for DDS_PartitionQosPolicy (p. 976).
DDS_RELIABILITY_QOS_POLICY_ID	Identifier for DDS_ReliabilityQosPolicy (p. 1027).
DDS_DESTINATIONORDER_QOS_POLICY_ID	Identifier for DDS_DestinationOrderQosPolicy (p. 703).
DDS_HISTORY_QOS_POLICY_ID	Identifier for DDS_HistoryQosPolicy (p. 906).
DDS_RESOURCELIMITS_QOS_POLICY_ID	Identifier for DDS_ResourceLimitsQosPolicy (p. 1038).
DDS_ENTITYFACTORY_QOS_POLICY_ID	Identifier for DDS_EntityFactoryQosPolicy (p. 888).
DDS_WRITERDATA_LIFECYCLE_QOS_POLICY_ID	Identifier for DDS_WriterDataLifecycleQosPolicy (p. 1240).
DDS_READERDATA_LIFECYCLE_QOS_POLICY_ID	Identifier for DDS_ReaderDataLifecycleQosPolicy (p. 1022).
DDS_TOPICDATA_QOS_POLICY_ID	Identifier for DDS_TopicDataQosPolicy (p. 1118).
DDS_GROUPDATA_QOS_POLICY_ID	Identifier for DDS_GroupDataQosPolicy (p. 903).
DDS_TRANSPORTPRIORITY_QOS_POLICY_ID	Identifier for DDS_TransportPriorityQosPolicy (p. 1140).
DDS_LIFESPAN_QOS_POLICY_ID	Identifier for DDS_LifespanQosPolicy (p. 918).
DDS_DURABILITYSERVICE_QOS_POLICY_ID	Identifier for DDS_DurabilityServiceQosPolicy (p. 765).
DDS_DATA_REPRESENTATION_QOS_POLICY_ID	Identifier for DDS_DataRepresentationQosPolicy (p. 662).
DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_ID	Identifier for DDS_TypeConsistencyEnforcementQosPolicy (p. 1211).
DDS_DATATAG_QOS_POLICY_ID	Identifier for DDS_DataTagQosPolicy (p. 376).
DDS_WIREPROTOCOL_QOS_POLICY_ID	<<extension>> (p. 236) Identifier for DDS_WireProtocolQosPolicy (p. 1228)
DDS_DISCOVERY_QOS_POLICY_ID	<<extension>> (p. 236) Identifier for DDS_DiscoveryQosPolicy (p. 725)
DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_ID	<<extension>> (p. 236) Identifier for DDS_DataReaderResourceLimitsQosPolicy (p. 648)
DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_ID	<<extension>> (p. 236) Identifier for DDS_DataWriterResourceLimitsQosPolicy (p. 692)

Enumerator

DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_ID ↵	<< <i>extension</i> >> (p. 236) Identifier for DDS_DataWriterTransferModeQosPolicy (p. 700)
DDS_MONITORING_QOS_POLICY_ID	<< <i>extension</i> >> (p. 236) Identifier for DDS_MonitoringQosPolicy (p. 949)

7.100 ASYNCHRONOUS_PUBLISHER

<<*extension*>> (p. 236) Specifies the asynchronous publishing settings of the **DDSPublisher** (p. 1534) instances.

Classes

- struct **DDS_AsynchronousPublisherQosPolicy**
Configures the mechanism that sends user data in an external middleware thread.

Variables

- const char *const **DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_AsynchronousPublisherQosPolicy** (p. 584).*

7.100.1 Detailed Description

<<*extension*>> (p. 236) Specifies the asynchronous publishing settings of the **DDSPublisher** (p. 1534) instances.

7.100.2 Variable Documentation

7.100.2.1 DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_NAME

```
const char* const DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_AsynchronousPublisherQosPolicy** (p. 584).

7.101 AVAILABILITY

<<**extension**>> (p. 236) Configures the availability of data.

Classes

- struct **DDS_EndpointGroup_t**
Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.
- struct **DDS_EndpointGroupSeq**
*A sequence of **DDS_EndpointGroup_t** (p. 885).*
- struct **DDS_AvailabilityQosPolicy**
Configures the availability of data.

Variables

- const char *const **DDS_AVAILABILITY_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_AvailabilityQosPolicy** (p. 590).*

7.101.1 Detailed Description

<<**extension**>> (p. 236) Configures the availability of data.

7.101.2 Variable Documentation

7.101.2.1 DDS_AVAILABILITY_QOS_POLICY_NAME

```
const char* const DDS_AVAILABILITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_AvailabilityQosPolicy** (p. 590).

7.102 BATCH

<<**extension**>> (p. 236) Batch QoS policy used to enable batching in **DDSDataWriter** (p. 1305) instances.

Classes

- struct **DDS_BatchQosPolicy**
Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

Variables

- `const char *const DDS_BATCH_QOS_POLICY_NAME`
*Stringified human-readable name for **DDS_BatchQosPolicy** (p. 594).*

7.102.1 Detailed Description

<<**extension**>> (p. 236) Batch QoS policy used to enable batching in **DDSDataWriter** (p. 1305) instances.

7.102.2 Variable Documentation

7.102.2.1 DDS_BATCH_QOS_POLICY_NAME

```
const char* const DDS_BATCH_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_BatchQosPolicy** (p. 594).

7.103 DATABASE

<<**extension**>> (p. 236) Various threads and resource limits settings used by RTI Connex to control its internal database.

Classes

- `struct DDS_DatabaseQosPolicy`
Various threads and resource limits settings used by RTI Connex to control its internal database.

Variables

- `const char *const DDS_DATABASE_QOS_POLICY_NAME`
*Stringified human-readable name for **DDS_DatabaseQosPolicy** (p. 613).*

7.103.1 Detailed Description

<<**extension**>> (p. 236) Various threads and resource limits settings used by RTI Connex to control its internal database.

7.103.2 Variable Documentation

7.103.2.1 DDS_DATABASE_QOS_POLICY_NAME

```
const char* const DDS_DATABASE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DatabaseQosPolicy** (p. 613).

7.104 DATA_READER_PROTOCOL

<<**extension**>> (p. 236) Specifies the DataReader-specific protocol QoS.

Classes

- struct **DDS_DataReaderProtocolQosPolicy**

*Along with **DDS_WireProtocolQosPolicy** (p. 1228) and **DDS_DataWriterProtocolQosPolicy** (p. 667), this QoS policy configures the DDS on-the-network protocol (RTPS).*

Variables

- const char *const **DDS_DATAREADERPROTOCOL_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_DataReaderProtocolQosPolicy** (p. 624).*

7.104.1 Detailed Description

<<**extension**>> (p. 236) Specifies the DataReader-specific protocol QoS.

7.104.2 Variable Documentation

7.104.2.1 DDS_DATAREADERPROTOCOL_QOS_POLICY_NAME

```
const char* const DDS_DATAREADERPROTOCOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataReaderProtocolQosPolicy** (p. 624).

7.105 DATA_READER_RESOURCE_LIMITS

<<**extension**>> (p. 236) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

Classes

- struct **DDS_DataReaderResourceLimitsInstanceReplacementSettings**
Instance replacement kind applied to each instance state.
- struct **DDS_DataReaderResourceLimitsQosPolicy**
*Various settings that configure how a **DDSDataReader** (p. 1272) allocates and uses physical memory for internal resources.*

Enumerations

- enum **DDS_DataReaderInstanceRemovalKind** {
DDS_NO_INSTANCE_REMOVAL = PRES_NO_INSTANCE_REMOVAL ,
DDS_EMPTY_INSTANCE_REMOVAL = PRES_EMPTY_INSTANCE_REMOVAL ,
DDS_FULLY_PROCESSED_INSTANCE_REMOVAL = PRES_FULLY_PROCESSED_INSTANCE_REMOVAL ,
DDS_ANY_INSTANCE_REMOVAL = PRES_ANY_INSTANCE_REMOVAL }
*Sets the kinds of instances that can be replaced when instance resource limits (**DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041)) are reached.*

Variables

- const char *const **DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_DataReaderResourceLimitsQosPolicy** (p. 648).*
- const **DDS_Long** **DDS_AUTO_MAX_TOTAL_INSTANCES**
<<**extension**>> (p. 236) This value is used to make **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 655) equal to **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041).

7.105.1 Detailed Description

<<**extension**>> (p. 236) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

7.105.2 Enumeration Type Documentation

7.105.2.1 DDS_DataReaderInstanceRemovalKind

enum **DDS_DataReaderInstanceRemovalKind**

Sets the kinds of instances that can be replaced when instance resource limits (**DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041)) are reached.

See also

DDS_DataReaderResourceLimitsQosPolicy::instance_replacement (p. 660)

Enumerator

DDS_NO_INSTANCE_REMOVAL	<p>No instance can be removed. If an instance resource is required because DDS_ResourceLimitsQosPolicy::max_instances (p. 1041) is reached, this setting will disallow instances from being replaced. Samples for new instances will be dropped and reported as lost with reason DDS_LOST_BY_INSTANCES_LIMIT (p. 136).</p>
DDS_EMPTY_INSTANCE_REMOVAL	<p>Only empty instances can be removed. Instances can be replaced only if they are empty. An instance is considered empty when all samples have been taken or removed from the DataReader queue due to the DDS_LifespanQosPolicy (p. 918) or sample purging due to the DDS_ReaderDataLifecycleQosPolicy (p. 1022), and there are no outstanding loans on any of the instance's samples.</p>
DDS_FULLY_PROCESSED_INSTANCE_REMOVAL	<p>Only fully-processed instances can be removed. An instance is considered fully processed if every sample for the instance has been processed by the application. A sample is considered processed by the application depending on the DDS_ReliabilityQosPolicy::kind (p. 1029):</p> <ul style="list-style-type: none"> • DDS_RELIABLE_RELIABILITY_QOS (p. 435) (depends on the DDS_ReliabilityQosPolicy↔ AcknowledgmentModeKind (p. 435)): <ul style="list-style-type: none"> – DDS_PROTOCOL↔ ACKNOWLEDGMENT_MODE (p. 435) or DDS_APPLICATION_AUTO↔ ACKNOWLEDGMENT_MODE (p. 435): The sample is considered processed when it has been read or taken by the application and <code>return_loan</code> has been called. – DDS_APPLICATION_EXPLICIT↔ ACKNOWLEDGMENT_MODE (p. 436): The sample is considered processed when the subscribing application has explicitly acknowledged the DDS sample, the <code>AppAckConf</code> has been received, and the application has called <code>return_loan</code>. • DDS_BEST_EFFORT_RELIABILITY_QOS (p. 435): All samples are considered processed when they have been read or taken by the application and <code>return_loan</code> has been called.
DDS_ANY_INSTANCE_REMOVAL	<p>Any instance can be removed. Instances can be replaced regardless of whether the subscribing application has processed all of the samples. Samples that have not been processed will be removed.</p>

7.105.3 Variable Documentation

7.105.3.1 DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataReaderResourceLimitsQosPolicy** (p. 648).

7.105.3.2 DDS_AUTO_MAX_TOTAL_INSTANCES

```
const DDS_Long DDS_AUTO_MAX_TOTAL_INSTANCES [extern]
```

<<**extension**>> (p. 236) This value is used to make **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 655) equal to **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041).

7.106 DATA_REPRESENTATION

A list of data representations and compression methods supported by a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272).

Modules

- **Compression Settings**

<<**extension**>> (p. 236) *Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.*

Classes

- struct **DDS_DataRepresentationIdSeq**

Declares IDL sequence < DDS_DataRepresentationId_t (p. 369) >

- struct **DDS_DataRepresentationQosPolicy**

*This QoS policy contains a list of representation identifiers and compression settings used by **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) entities to negotiate which data representation and compression settings to use.*

Typedefs

- typedef **DDS_Short DDS_DataRepresentationId_t**

A two-byte signed integer that identifies a data representation.

Variables

- const **DDS_DataRepresentationId_t DDS_XCDR_DATA_REPRESENTATION**
Corresponds to the Extended Common Data Representation encoding version 1.
- const **DDS_DataRepresentationId_t DDS_XML_DATA_REPRESENTATION**
Corresponds to the XML Data Representation (unsupported).
- const **DDS_DataRepresentationId_t DDS_XCDR2_DATA_REPRESENTATION**
Corresponds to the Extended Common Data Representation encoding version 2.
- const **DDS_DataRepresentationId_t DDS_AUTO_DATA_REPRESENTATION**
Representation is automatically chosen based on the type.
- const char *const **DDS_DATA_REPRESENTATION_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_DataRepresentationQosPolicy** (p. 662).*

7.106.1 Detailed Description

A list of data representations and compression methods supported by a **DDSDDataWriter** (p. 1305) or **DDSDDataReader** (p. 1272).

7.106.2 Typedef Documentation

7.106.2.1 DDS_DataRepresentationId_t

```
typedef DDS_Short DDS_DataRepresentationId_t
```

A two-byte signed integer that identifies a data representation.

7.106.3 Variable Documentation

7.106.3.1 DDS_XCDR_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XCDR_DATA_REPRESENTATION [extern]
```

Corresponds to the Extended Common Data Representation encoding version 1.

7.106.3.2 DDS_XML_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XML_DATA_REPRESENTATION [extern]
```

Corresponds to the XML Data Representation (unsupported).

Note

This value is currently not supported.

7.106.3.3 DDS_XCDR2_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XCDR2_DATA_REPRESENTATION [extern]
```

Corresponds to the Extended Common Data Representation encoding version 2.

7.106.3.4 DDS_AUTO_DATA_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_AUTO_DATA_REPRESENTATION [extern]
```

Representation is automatically chosen based on the type.

For plain language binding, if the `allowed_data_representation` annotation is not specified or if it contains the value XCDR, RTI Connexx translates this field to **DDS_XCDR_DATA_REPRESENTATION** (p. 369). Otherwise, it translates this field to **DDS_XCDR2_DATA_REPRESENTATION** (p. 370).

For the **FlatData language binding** (p. 562), RTI Connexx translates this field to **DDS_XCDR2_DATA_REPRESENTATION** (p. 370).

Examples

HelloWorldPlugin.cxx.

7.106.3.5 DDS_DATA_REPRESENTATION_QOS_POLICY_NAME

```
const char* const DDS_DATA_REPRESENTATION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataRepresentationQosPolicy** (p. 662).

7.107 Compression Settings

<<*extension*>> (p. 236) Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.

Classes

- struct **DDS_CompressionSettings_t**
<<*extension*>> (p. 236) Settings related to compressing user data.

Macros

- #define **DDS_COMPRESSION_ID_MASK_NONE** ((**DDS_CompressionIdMask**) (0))
<<*extension*>> (p. 236) **DDS_CompressionIdMask** (p. 374) used to disable user-data compression for an endpoint.
- #define **DDS_COMPRESSION_ID_MASK_ALL**
<<*extension*>> (p. 236) **DDS_CompressionIdMask** (p. 374) mask with all the supported built-in compression algorithms enabled.
- #define **DDS_COMPRESSION_LEVEL_BEST_COMPRESSION** (10)
<<*extension*>> (p. 236) The best compression ratio possible for a compression algorithm.
- #define **DDS_COMPRESSION_LEVEL_BEST_SPEED** (1)
<<*extension*>> (p. 236) The best compression speed possible for a compression algorithm.
- #define **DDS_COMPRESSION_LEVEL_DEFAULT DDS_COMPRESSION_LEVEL_BEST_COMPRESSION**
<<*extension*>> (p. 236) Default level of compression.
- #define **DDS_COMPRESSION_THRESHOLD_DEFAULT** 8192
<<*extension*>> (p. 236) Default threshold from which a serialized sample will be eligible to be compressed.
- #define **DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT DDS_COMPRESSION_ID_MASK_↵**
NONE
<<*extension*>> (p. 236) **DDS_CompressionIdMask** (p. 374) mask with the default value for publication.
- #define **DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT**
<<*extension*>> (p. 236) **DDS_CompressionIdMask** (p. 374) mask with the default value for subscription.

Typedefs

- typedef **DDS_UnsignedLong DDS_CompressionId_t**
<<*extension*>> (p. 236) A four-byte signed integer that identifies a single compression algorithm.
- typedef **DDS_UnsignedLong DDS_CompressionIdMask**
<<*extension*>> (p. 236) A four-byte signed integer that identifies a mask of the compression IDs that the algorithms enabled.

Variables

- const **DDS_CompressionId_t DDS_COMPRESSION_ID_ZLIB**
<<*extension*>> (p. 236) Corresponds to the ID of the compression algorithm ZLIB. This is the only built-in compression algorithm that is supported when batching is enabled.
- const **DDS_CompressionId_t DDS_COMPRESSION_ID_BZIP2**
<<*extension*>> (p. 236) Corresponds to the ID of the compression algorithm BZIP2.
- const **DDS_CompressionId_t DDS_COMPRESSION_ID_LZ4**
<<*extension*>> (p. 236) Corresponds to the ID of the compression algorithm LZ4.

7.107.1 Detailed Description

<<*extension*>> (p. 236) Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.

7.107.2 Macro Definition Documentation

7.107.2.1 DDS_COMPRESSION_ID_MASK_NONE

```
#define DDS_COMPRESSION_ID_MASK_NONE (( DDS_CompressionIdMask) (0))
```

<<*extension*>> (p. 236) **DDS_CompressionIdMask** (p. 374) used to disable user-data compression for an endpoint.

7.107.2.2 DDS_COMPRESSION_ID_MASK_ALL

```
#define DDS_COMPRESSION_ID_MASK_ALL
```

Value:

```
((DDS_CompressionIdMask) \
  (DDS_COMPRESSION_ID_ZLIB_BIT | DDS_COMPRESSION_ID_BZIP2_BIT \
   | DDS_COMPRESSION_ID_LZ4_BIT))
```

<<*extension*>> (p. 236) **DDS_CompressionIdMask** (p. 374) mask with all the supported built-in compression algorithms enabled.

7.107.2.3 DDS_COMPRESSION_LEVEL_BEST_COMPRESSION

```
#define DDS_COMPRESSION_LEVEL_BEST_COMPRESSION (10)
```

<<*extension*>> (p. 236) The best compression ratio possible for a compression algorithm.

See also

DDS_CompressionSettings_t::writer_compression_level (p. 609)

7.107.2.4 DDS_COMPRESSION_LEVEL_BEST_SPEED

```
#define DDS_COMPRESSION_LEVEL_BEST_SPEED (1)
```

<<**extension**>> (p. 236) The best compression speed possible for a compression algorithm.

See also

DDS_CompressionSettings_t::writer_compression_level (p. 609)

7.107.2.5 DDS_COMPRESSION_LEVEL_DEFAULT

```
#define DDS_COMPRESSION_LEVEL_DEFAULT DDS_COMPRESSION_LEVEL_BEST_COMPRESSION
```

<<**extension**>> (p. 236) Default level of compression.

See also

DDS_CompressionSettings_t::writer_compression_level (p. 609)

7.107.2.6 DDS_COMPRESSION_THRESHOLD_DEFAULT

```
#define DDS_COMPRESSION_THRESHOLD_DEFAULT 8192
```

<<**extension**>> (p. 236) Default threshold from which a serialized sample will be eligible to be compressed.

See also

DDS_CompressionSettings_t::writer_compression_threshold (p. 610)

This value has been decided after some performance tests, it's a prudent value that will ensure, in most cases with all of the algorithms, that we are going to compress the sample.

7.107.2.7 DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT

```
#define DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT DDS_COMPRESSION_ID_MASK_NONE
```

<<**extension**>> (p. 236) **DDS_CompressionIdMask** (p. 374) mask with the default value for publication.

See also

DDS_CompressionSettings_t::compression_ids (p. 609)

DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT (p. 373)

7.107.2.8 DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT

```
#define DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT
```

Value:

```
(DDS_COMPRESSION_ID_ZLIB_BIT | DDS_COMPRESSION_ID_BZIP2_BIT \
 | DDS_COMPRESSION_ID_LZ4_BIT)
```

<<**extension**>> (p. 236) **DDS_CompressionIdMask** (p. 374) mask with the default value for subscription.

See also

DDS_CompressionSettings_t::compression_ids (p. 609)

DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT (p. 373)

7.107.3 Typedef Documentation

7.107.3.1 DDS_CompressionId_t

```
typedef DDS_UnsignedLong DDS_CompressionId_t
```

<<**extension**>> (p. 236) A four-byte signed integer that identifies a single compression algorithm.

7.107.3.2 DDS_CompressionIdMask

```
typedef DDS_UnsignedLong DDS_CompressionIdMask
```

<<**extension**>> (p. 236) A four-byte signed integer that identifies a mask of the compression IDs that the algorithms enabled.

7.107.4 Variable Documentation

7.107.4.1 DDS_COMPRESSION_ID_ZLIB

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_ZLIB [extern]
```

<<**extension**>> (p. 236) Corresponds to the ID of the compression algorithm ZLIB. This is the only built-in compression algorithm that is supported when batching is enabled.

7.107.4.2 DDS_COMPRESSION_ID_BZIP2

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_BZIP2 [extern]
```

<<*extension*>> (p. 236) Corresponds to the ID of the compression algorithm BZIP2.

7.107.4.3 DDS_COMPRESSION_ID_LZ4

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_LZ4 [extern]
```

<<*extension*>> (p. 236) Corresponds to the ID of the compression algorithm LZ4.

7.108 DATA_TAG

Stores (name, value) pairs that can be used to determine access permissions.

Classes

- struct **DDS_Tag**
Tags are name/value pair objects.
- struct **DDS_TagSeq**
Declares IDL sequence < DDS_Tag (p. 1107) >
- struct **DDS_DataTags**
Definition of DDS_DataTagQosPolicy (p. 376).
- class **DDSDataTagQosPolicyHelper**
Policy helpers that facilitate management of the data tags in the input policy.

Typedefs

- typedef struct **DDS_DataTags DDS_DataTagQosPolicy**
Stores (name, value) pairs that can be used to determine access permissions.

Functions

- static **DDS_Long** **DDSDataTagQosPolicyHelper::get_number_of_tags** (**DDS_DataTagQosPolicy** &policy)
Gets the number of data tags in the input policy.
- static **DDS_ReturnCode_t** **DDSDataTagQosPolicyHelper::assert_tag** (**DDS_DataTagQosPolicy** &policy, const char *name, const char *value)
Asserts the tag identified by name in the input policy.
- static **DDS_ReturnCode_t** **DDSDataTagQosPolicyHelper::add_tag** (**DDS_DataTagQosPolicy** &policy, const char *name, const char *value)
Adds a new tag to the input policy.
- static struct **DDS_Tag *** **DDSDataTagQosPolicyHelper::lookup_tag** (**DDS_DataTagQosPolicy** &policy, const char *name)
Searches by tag name for a tag in the input policy.
- static **DDS_ReturnCode_t** **DDSDataTagQosPolicyHelper::remove_tag** (**DDS_DataTagQosPolicy** &policy, const char *name)
Removes a tag from the input policy.

Variables

- `const char *const DDS_DATATAG_QOS_POLICY_NAME`

*Stringified human-readable name for **DDS_DataTagQosPolicy** (p. 376).*

7.108.1 Detailed Description

Stores (name, value) pairs that can be used to determine access permissions.

The **DDS_DataTagQosPolicy** (p. 376) can be used to associate a set of tags in the form of (name, value) pairs with a **DDSDataReader** (p. 1272) or **DDSDataWriter** (p. 1305). This is similar to the **DDS_PropertyQosPolicy** (p. 994), except you cannot select whether or not a particular pair should be propagated (included in the built-in topic). Data tags are always propagated. The Access Control plugin may use the tags to determine publish and subscribe permissions.

7.108.2 Typedef Documentation

7.108.2.1 DDS_DataTagQosPolicy

```
typedef struct DDS_DataTags DDS_DataTagQosPolicy
```

Stores (name, value) pairs that can be used to determine access permissions.

Entity:

DDSDataReader (p. 1272) **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = N/A;

Changeable (p. ??) = **NO** (p. ??)

7.108.3 Usage

The **DATA_TAG** QoS policy can be used to associate a set of tags in the form of (name, value) pairs with a **DDSDataReader** (p. 1272) or **DDSDataWriter** (p. 1305). This is similar to the **DDS_PropertyQosPolicy** (p. 994), except for the following differences:

- Data tags are always propagated. You cannot select whether or not a particular pair should be propagated.
- Data tags are not exposed to API functions, such as **DDSDataWriter::get_matched_subscription_data** (p. 1316), that receive **DDS_PublicationBuiltinTopicData** (p. 997) or **DDS_SubscriptionBuiltinTopicData** (p. 1094) as a parameter.
- Connnext passes data tags to the Access Control Security Plugin, which may use them to decide whether to allow or deny the corresponding entities.

There are helper functions to facilitate working with data tags. See the **DATA_TAG** (p. 375) page.

7.108.4 Function Documentation

7.108.4.1 get_number_of_tags()

```
static DDS_Long DDSDataTagQosPolicyHelper::get_number_of_tags (
    DDS_DataTagQosPolicy & policy ) [static]
```

Gets the number of data tags in the input policy.

Precondition

policy cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
---------------	--

Returns

Number of data tags.

7.108.4.2 assert_tag()

```
static DDS_ReturnCode_t DDSDataTagQosPolicyHelper::assert_tag (
    DDS_DataTagQosPolicy & policy,
    const char * name,
    const char * value ) [static]
```

Asserts the tag identified by name in the input policy.

If the tag already exists, this function replaces its current value with the new one.

If the tag identified by name does not exist, this function adds it to the tag set.

This function increases the maximum number of elements of the policy sequence by 10 when this number is not enough to store the new tag.

Precondition

policy, name and value cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Tag name.
<i>value</i>	<< <i>in</i> >> (p. 237) Tag value.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

7.108.4.3 add_tag()

```
static DDS_ReturnCode_t DDSDataTagQosPolicyHelper::add_tag (
    DDS_DataTagQosPolicy & policy,
    const char * name,
    const char * value ) [static]
```

Adds a new tag to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connex.

If the maximum number of elements of the policy sequence is not enough to store the new tag, this function will increase it by 10.

If the tag already exists, the function will fail with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Precondition

policy, name and value cannot be NULL.

The tag is not in the policy.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Tag name.
<i>value</i>	<< <i>in</i> >> (p. 237) Tag value.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

7.108.4.4 lookup_tag()

```
static struct DDS_Tag * DDSDataTagQosPolicyHelper::lookup_tag (
    DDS_DataTagQosPolicy & policy,
    const char * name ) [static]
```

Searches by tag name for a tag in the input policy.

Precondition

policy, name and value cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Tag name.

Returns

The function returns the first tag with the given name. If such a tag does not exist, the function returns NULL.

7.108.4.5 remove_tag()

```
static DDS_ReturnCode_t DDSDataTagQosPolicyHelper::remove_tag (
    DDS_DataTagQosPolicy & policy,
    const char * name ) [static]
```

Removes a tag from the input policy.

If the tag does not exist, the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Precondition

policy and name cannot be NULL.

The tag is in the policy.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Tag name.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
-----	--

7.108.5 Variable Documentation

7.108.5.1 DDS_DATATAG_QOS_POLICY_NAME

```
const char* const DDS_DATATAG_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataTagQosPolicy** (p. 376).

7.109 DATA_WRITER_PROTOCOL

<<**extension**>> (p. 236) Along with **DDS_WireProtocolQosPolicy** (p. 1228) and **DDS_DataReaderProtocolQosPolicy** (p. 624), this QoS policy configures the DDS on-the-network protocol (RTPS).

Classes

- struct **DDS_DataWriterProtocolQosPolicy**
*Protocol that applies only to **DDSDataWriter** (p. 1305) instances.*

Variables

- const char *const **DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_DataWriterProtocolQosPolicy** (p. 667).*

7.109.1 Detailed Description

<<**extension**>> (p. 236) Along with **DDS_WireProtocolQosPolicy** (p. 1228) and **DDS_DataReaderProtocolQosPolicy** (p. 624), this QoS policy configures the DDS on-the-network protocol (RTPS).

7.109.2 Variable Documentation

7.109.2.1 DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME

```
const char* const DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataWriterProtocolQosPolicy** (p. 667).

7.110 DATA_WRITER_RESOURCE_LIMITS

<<**extension**>> (p. 236) Various settings that configure how a **DDSDataWriter** (p. 1305) allocates and uses physical memory for internal resources.

Classes

- struct **DDS_DataWriterResourceLimitsQosPolicy**

*Various settings that configure how a **DDSDataWriter** (p. 1305) allocates and uses physical memory for internal resources.*

Enumerations

- enum **DDS_DataWriterResourceLimitsInstanceReplacementKind** {
DDS_UNREGISTERED_INSTANCE_REPLACEMENT ,
DDS_ALIVE_INSTANCE_REPLACEMENT ,
DDS_DISPOSED_INSTANCE_REPLACEMENT ,
DDS_ALIVE_THEN_DISPOSED_INSTANCE_REPLACEMENT ,
DDS_DISPOSED_THEN_ALIVE_INSTANCE_REPLACEMENT ,
DDS_ALIVE_OR_DISPOSED_INSTANCE_REPLACEMENT }

Sets the kinds of instances that can be replaced when instance resource limits are reached.

Variables

- const char *const **DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_DataWriterResourceLimitsQosPolicy** (p. 692).*

7.110.1 Detailed Description

<<**extension**>> (p. 236) Various settings that configure how a **DDSDataWriter** (p. 1305) allocates and uses physical memory for internal resources.

7.110.2 Enumeration Type Documentation

7.110.2.1 DDS_DataWriterResourceLimitsInstanceReplacementKind

enum **DDS_DataWriterResourceLimitsInstanceReplacementKind**

Sets the kinds of instances that can be replaced when instance resource limits are reached.

When **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) is reached, a **DDSDDataWriter** (p. 1305) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kind specified by **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 695).

Only instances whose states match the specified kinds are eligible to be replaced. In addition, an instance must have had all of its samples fully acknowledged for it to be considered replaceable.

For all kinds, a **DDSDDataWriter** (p. 1305) will replace the oldest instance satisfying that kind. For example, when the kind is **DDS_UNREGISTERED_INSTANCE_REPLACEMENT** (p. 382), a **DDSDDataWriter** (p. 1305) will remove the oldest, fully acknowledged, unregistered instance, if such an instance exists.

If no replaceable instance exists, the invoked function will either return with an appropriate out-of-resources return code, or in the case of a write, it may first block to wait for an instance to be acknowledged. Otherwise, the **DDSDDataWriter** (p. 1305) will replace the old instance with the new instance, and invoke, if available, the **DDSDDataWriterListener::on_instance_replaced** (p. 1332) to notify the user about an instance being replaced.

A **DDSDDataWriter** (p. 1305) checks for replaceable instances in the following order, stopping once a replaceable instance is found:

- If **DDS_DataWriterResourceLimitsQosPolicy::replace_empty_instances** (p. 695) is **DDS_BOOLEAN_TRUE** (p. 316), a **DDSDDataWriter** (p. 1305) first tries replacing instances that have no samples. These empty instances can be unregistered, disposed, or alive.
- Next, a **DDSDDataWriter** (p. 1305) tries replacing unregistered instances. Since an unregistered instance indicates that the **DDSDDataWriter** (p. 1305) is done modifying it, unregistered instances are replaced before instances of any other state (alive, disposed). This is the same as the **DDS_UNREGISTERED_INSTANCE_REPLACEMENT** (p. 382) kind.
- Then, a **DDSDDataWriter** (p. 1305) tries replacing what is specified by **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 695). With unregistered instances already checked, this leaves alive and disposed instances. When both alive and disposed instances may be replaced, the kind specifies whether the particular order matters (e.g., **DISPOSED_THEN_ALIVE**, **ALIVE_THEN_DISPOSED**) or not (**ALIVE_OR_DISPOSED**).

QoS:

DDS_DataWriterResourceLimitsQosPolicy (p. 692)

Enumerator

DDS_UNREGISTERED_INSTANCE_REPLACEMENT	Allows a DDSDDataWriter (p. 1305) to reclaim unregistered acknowledged instances. By default, all instance replacement kinds first attempt to reclaim an unregistered, acknowledged instance. Used in DDS_DataWriterResourceLimitsQosPolicy::instance_replacement (p. 695) [default]
---------------------------------------	--

Enumerator

DDS_ALIVE_INSTANCE_REPLACEMENT	Allows a DDSDDataWriter (p. 1305) to reclaim alive, acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a DDSDDataWriter (p. 1305) to reclaim an alive, acknowledged instance, where an alive instance is a registered, non-disposed instance. The least recently registered or written alive instance will be reclaimed.
DDS_DISPOSED_INSTANCE_REPLACEMENT	Allows a DDSDDataWriter (p. 1305) to reclaim disposed acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a DDSDDataWriter (p. 1305) to reclaim a disposed, acknowledged instance. The least recently disposed instance will be reclaimed.
DDS_ALIVE_THEN_DISPOSED_INSTANCE_↔ REPLACEMENT	Allows a DDSDDataWriter (p. 1305) first to reclaim an alive, acknowledged instance, and then, if necessary, a disposed, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a DDSDDataWriter (p. 1305) to first try reclaiming an alive, acknowledged instance. If no instance is reclaimable, then it tries reclaiming a disposed, acknowledged instance. The least recently used (i.e., registered, written, or disposed) instance will be reclaimed.
DDS_DISPOSED_THEN_ALIVE_INSTANCE_↔ REPLACEMENT	Allows a DDSDDataWriter (p. 1305) first to reclaim a disposed, acknowledged instance, and then, if necessary, an alive, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a DDSDDataWriter (p. 1305) to first try reclaiming a disposed, acknowledged instance. If no instance is reclaimable, then it tries reclaiming an alive, acknowledged instance. The least recently used (i.e., disposed, registered, or written) instance will be reclaimed.
DDS_ALIVE_OR_DISPOSED_INSTANCE_↔ REPLACEMENT	Allows a DDSDDataWriter (p. 1305) to reclaim either an alive acknowledged instance or a disposed acknowledged instance. When an unregistered acknowledged instance is not available to reclaim, this kind allows a DDSDDataWriter (p. 1305) to reclaim either an alive, acknowledged instance or a disposed, acknowledged instance. If both instance kinds are available to reclaim, the DDSDDataWriter (p. 1305) will reclaim the least recently used (i.e. disposed, registered, or written) instance.

7.110.3 Variable Documentation

7.110.3.1 DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataWriterResourceLimitsQosPolicy** (p. 692).

7.111 DATA_WRITER_TRANSFER_MODE

<<**extension**>> (p. 236) Specifies the DataWriter transfer mode QoS.

Classes

- struct **DDS_DataWriterShmemRefTransferModeSettings**
Settings related to transferring data using shared memory references.
- struct **DDS_DataWriterTransferModeQosPolicy**
<<**extension**>> (p. 236) Qos related to transferring data

Variables

- const char *const **DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_DataWriterTransferModeQosPolicy** (p. 700).*

7.111.1 Detailed Description

<<**extension**>> (p. 236) Specifies the DataWriter transfer mode QoS.

7.111.2 Variable Documentation

7.111.2.1 DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_NAME

```
const char* const DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DataWriterTransferModeQosPolicy** (p. 700).

7.112 DEADLINE

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Classes

- struct **DDS_DeadlineQosPolicy**
Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Variables

- const char *const **DDS_DEADLINE_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_DeadlineQosPolicy** (p. 701).*

7.112.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

7.112.2 Variable Documentation

7.112.2.1 DDS_DEADLINE_QOS_POLICY_NAME

```
const char* const DDS_DEADLINE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DeadlineQosPolicy** (p. 701).

7.113 DESTINATION_ORDER

Controls the criteria used to determine the logical order among changes made by **DDSPublisher** (p. 1534) entities to the same instance of data (i.e., matching **DDSTopic** (p. 1601) and key).

Classes

- struct **DDS_DestinationOrderQosPolicy**
*Controls how the middleware will deal with data sent by multiple **DDSDataWriter** (p. 1305) entities for the same instance of data (i.e., same **DDSTopic** (p. 1601) and key).*

Enumerations

- enum **DDS_DestinationOrderQosPolicyKind** {
 DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS ,
 DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS }
Kinds of destination order.
- enum **DDS_DestinationOrderQosPolicyScopeKind** {
 DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS ,
 DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS }
Scope of source destination order.

Variables

- `const char *const DDS_DESTINATIONORDER_QOS_POLICY_NAME`
Stringified human-readable name for **DDS_DestinationOrderQosPolicy** (p. 703).

7.113.1 Detailed Description

Controls the criteria used to determine the logical order among changes made by **DDSPublisher** (p. 1534) entities to the same instance of data (i.e., matching **DDSTopic** (p. 1601) and key).

7.113.2 Enumeration Type Documentation

7.113.2.1 DDS_DestinationOrderQosPolicyKind

`enum DDS_DestinationOrderQosPolicyKind`

Kinds of destination order.

QoS:

DDS_DestinationOrderQosPolicy (p. 703)

Enumerator

<code>DDS_BY_RECEPTION_TIMESTAMP_↔ DESTINATIONORDER_QOS</code>	<p>[default] Indicates that data is ordered based on the reception time at each DDSSubscriber (p. 1576). Since each subscriber may receive the data at different times there is no guarantee that the changes will be seen in the same order. Consequently, it is possible for each subscriber to end up with a different final value for the data.</p>
<code>DDS_BY_SOURCE_TIMESTAMP_↔ DESTINATIONORDER_QOS</code>	<p>Indicates that data is ordered based on a time-stamp placed at the source (by RTI Connext or by the application). In any case this guarantees a consistent final value for the data in all subscribers.</p> <p>Note: If Batching is needed along with DDS_BY_↔ SOURCE_TIMESTAMP_DESTINATIONORDER_QOS (p. 386) and DDS_INSTANCE_SCOPE_↔ DESTINATIONORDER_QOS (p. 387), then the DDS_BatchQosPolicy::source_timestamp_↔ resolution (p. 596) and DDS_BatchQosPolicy::thread_safe_write (p. 597) setting of DDS_BatchQosPolicy (p. 594) should be set to DDS_DURATION_ZERO (p. 326) and DDS_BOOLEAN_TRUE (p. 316) respectively.</p>

7.113.2.2 DDS_DestinationOrderQosPolicyScopeKind

enum **DDS_DestinationOrderQosPolicyScopeKind**

Scope of source destination order.

QoS:

DDS_DestinationOrderQosPolicy (p. 703)

Enumerator

DDS_INSTANCE_SCOPE_DESTINATIONORDER_ QOS	[default] Indicates that data is ordered on a per instance basis if used along with DDS_BY_SOURCE_ _TIMESTAMP_DESTINATIONORDER_QOS (p. 386). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same instance. The tolerance check is also applied per instance.
DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS	Indicates that data is ordered on a per topic basis if used along with DDS_BY_SOURCE_TIMESTAMP_ DESTINATIONORDER_QOS (p. 386). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same topic. The tolerance check is also applied per topic.

7.113.3 Variable Documentation

7.113.3.1 DDS_DESTINATIONORDER_QOS_POLICY_NAME

const char* const DDS_DESTINATIONORDER_QOS_POLICY_NAME [extern]

Stringified human-readable name for **DDS_DestinationOrderQosPolicy** (p. 703).

7.114 DISCOVERY

<<**extension**>> (p. 236) Specifies the attributes required to discover participants in the domain.

Modules

- **NDDS_DISCOVERY_PEERS**

Environment variable or a file that specifies the default values of **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 727) contained in the **DDS_DomainParticipantQos**↔**::discovery** (p. 738) qos policy.

Classes

- struct **DDS_DiscoveryQosPolicy**

<<**extension**>> (p. 236) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Variables

- const char *const **DDS_DISCOVERY_QOS_POLICY_NAME**

Stringified human-readable name for **DDS_DiscoveryQosPolicy** (p. 725).

7.114.1 Detailed Description

<<**extension**>> (p. 236) Specifies the attributes required to discover participants in the domain.

7.114.2 Variable Documentation

7.114.2.1 DDS_DISCOVERY_QOS_POLICY_NAME

```
const char* const DDS_DISCOVERY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DiscoveryQosPolicy** (p. 725).

7.115 DISCOVERY_CONFIG

<<**extension**>> (p. 236) Specifies the discovery configuration QoS.

Classes

- struct **DDS_BuiltinTopicReaderResourceLimits_t**

Built-in topic reader's resource limits.

- struct **DDS_DiscoveryConfigQosPolicy**

Settings for discovery configuration.

Macros

- **#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_NONE**
No bits are set.
- **#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_DEFAULT**
The default value of `DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins` (p. 715).
- **#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_NONE**
No bits are set, indicating that all channels that can be disabled, are disabled. Not all builtin channels can be disabled by the user. Only builtin channels represented by `DDS_DiscoveryConfigBuiltinChannelKind` (p. 393) are able to be enabled or disabled by the user.
- **#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_DEFAULT** ((`DDS_DiscoveryConfigBuiltinChannelKindMask`) `DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL`)
The default value of `DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels` (p. 715).
- **#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_ALL**
All bits are set, indicating that all channels are enabled.

Typedefs

- **typedef DDS_Long DDS_DiscoveryConfigBuiltinPluginKindMask**
A bit-mask (list) of built-in discovery plugins.
- **typedef DDS_UnsignedLong DDS_DiscoveryConfigBuiltinChannelKindMask**
A bit-mask (list) of built-in channels.

Enumerations

- **enum DDS_DiscoveryConfigBuiltinPluginKind** {
 DDS_DISCOVERYCONFIG_BUILTIN_SPDP ,
 DDS_DISCOVERYCONFIG_BUILTIN_SEDP ,
 DDS_DISCOVERYCONFIG_BUILTIN_SDP ,
 DDS_DISCOVERYCONFIG_BUILTIN_EDS = 0x0001 << 2 ,
 DDS_DISCOVERYCONFIG_BUILTIN_DPSE ,
 DDS_DISCOVERYCONFIG_BUILTIN_SPDP2 ,
 DDS_DISCOVERYCONFIG_BUILTIN_SDP2 }
Built-in discovery plugins that can be used.
- **enum DDS_DiscoveryConfigBuiltinChannelKind** { **DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL** }
Built-in channels that can be enabled.
- **enum DDS_RemoteParticipantPurgeKind** {
 DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE ,
 DDS_NO_REMOTE_PARTICIPANT_PURGE }
Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

Variables

- **const char *const DDS_DISCOVERYCONFIG_QOS_POLICY_NAME**
Stringified human-readable name for `DDS_DiscoveryConfigQosPolicy` (p. 706).

7.115.1 Detailed Description

<<*extension*>> (p. 236) Specifies the discovery configuration QoS.

7.115.2 Macro Definition Documentation

7.115.2.1 DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_NONE

```
#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_NONE
```

No bits are set.

See also

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 391)

7.115.2.2 DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_DEFAULT

```
#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_DEFAULT
```

The default value of **DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins** (p. 715).

See also

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 391)

7.115.2.3 DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_NONE

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_NONE
```

No bits are set, indicating that all channels that can be disabled, are disabled. Not all builtin channels can be disabled by the user. Only builtin channels represented by **DDS_DiscoveryConfigBuiltinChannelKind** (p. 393) are able to be enabled or disabled by the user.

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 391)

7.115.2.4 DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_DEFAULT

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_DEFAULT (( DDS_DiscoveryConfigBuiltinChannelKindMask) DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL)
```

The default value of **DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels** (p. 715).

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 391)

7.115.2.5 DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_ALL

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_ALL
```

All bits are set, indicating that all channels are enabled.

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 391)

7.115.3 Typedef Documentation

7.115.3.1 DDS_DiscoveryConfigBuiltinPluginKindMask

```
typedef DDS_Long DDS_DiscoveryConfigBuiltinPluginKindMask
```

A bit-mask (list) of built-in discovery plugins.

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS_DiscoveryConfigBuiltinPluginKind** (p. 392) values.

QoS:

DDS_DiscoveryConfigQosPolicy (p. 706)

7.115.3.2 DDS_DiscoveryConfigBuiltinChannelKindMask

```
typedef DDS_UnsignedLong DDS_DiscoveryConfigBuiltinChannelKindMask
```

A bit-mask (list) of built-in channels.

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS_DiscoveryConfigBuiltinChannelKind** (p. 393) values.

QoS:

DDS_DiscoveryConfigQosPolicy (p. 706)

7.115.4 Enumeration Type Documentation

7.115.4.1 DDS_DiscoveryConfigBuiltinPluginKind

```
enum DDS_DiscoveryConfigBuiltinPluginKind
```

Built-in discovery plugins that can be used.

See also

DDS_DiscoveryConfigBuiltinPluginKindMask (p. 391)

Enumerator

DDS_DISCOVERYCONFIG_BUILTIN_SPDP	Simple Participant Discovery Protocol. Enables the first phase of the Simple Discovery Protocol (SDP), in which DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant declaration messages, also known as participant DATA submessages or participant announcements.
DDS_DISCOVERYCONFIG_BUILTIN_SEDP	Simple Endpoint Discovery Protocol. Enables the second phase of the Simple Discovery Protocol (SDP), in which the information (GUID, QoS, etc.) about your application's DataReaders and DataWriters is exchanged by sending publication/subscription declarations in DATA messages, also known as publication DATAs and subscription DATAs.
DDS_DISCOVERYCONFIG_BUILTIN_SDP	[default] Simple discovery plugin. It is equivalent to SPDP + SEDP.

Enumerator

DDS_DISCOVERYCONFIG_BUILTIN_DPSE	Dynamic Participant discovery, Static Endpoint discovery. Enables static endpoint discovery for a DomainParticipant. In this type of discovery, information from remote endpoints is extracted from a local DDS-XML file instead of being received over the network, reducing the number of exchanged packets and consequently reducing bandwidth consumption used for discovery. Using this value in DDS_DiscoveryConfigBuiltinPluginKindMask (p. 391) requires the 'librtlibedisc' library (included in the RTI Connex Professional bundles) to be reachable (PATH, LD_LIBRARY_PATH or DYLD_LIBRARY_PATH).
DDS_DISCOVERYCONFIG_BUILTIN_SPDP2	Simple Participant Discovery Protocol 2.0 (SPDP2) Enables the Simple Participant Discovery Protocol 2.0, in which a DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant bootstrap messages. These bootstrap messages contain only a subset of the information in the Simple Participant Discovery Protocol (SPDP) participant announcements that is required to match two participants and bootstrap the system. The DomainParticipant's full configuration is then sent reliably with participant configuration announcements. Two DomainParticipants that use SPDP2 will maintain liveliness using liveliness participant messages.
DDS_DISCOVERYCONFIG_BUILTIN_SDP2	Simple discovery plugin 2.0. It is equivalent to SPDP2 + SEDP.

7.115.4.2 DDS_DiscoveryConfigBuiltinChannelKind

```
enum DDS_DiscoveryConfigBuiltinChannelKind
```

Built-in channels that can be enabled.

See also

DDS_DiscoveryConfigBuiltinChannelKindMask (p. 391)

Enumerator

DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL	[default] Built-in ServiceRequest channel. Enables the ServiceRequest channel, which is required by the TopicQuery and locator reachability features. Disabling the ServiceRequest channel reduces resource consumption including network bandwidth, CPU utilization, and memory.
---	--

7.115.4.3 DDS_RemoteParticipantPurgeKind

enum **DDS_RemoteParticipantPurgeKind**

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

When discovery communication with a remote participant has been lost, the local participant must make a decision about whether to continue attempting to communicate with that participant and its contained entities. This "kind" is used to select the desired behavior.

This "kind" does not pertain to the situation in which a remote participant has been gracefully deleted and notification of that deletion have been successfully received by its peers. In that case, the local participant will immediately stop attempting to communicate with those entities and will remove the associated remote entity records from its internal database.

See also

DDS_DiscoveryConfigQosPolicy::remote_participant_purge_kind (p. 709)

Enumerator

<p>DDS_LIVELINESS_BASED_REMOTE_↔ PARTICIPANT_PURGE</p>	<p>[default] Maintain knowledge of the remote participant for as long as it maintains its liveliness contract. A participant will continue attempting communication with its peers, even if discovery communication with them is lost, as long as the remote participants maintain their liveliness. If both discovery communication and participant liveliness are lost, however, the local participant will remove all records of the remote participant and its contained endpoints, and no further data communication with them will occur until and unless they are rediscovered.</p> <p>The liveliness contract a participant promises to its peers – its "liveliness lease duration" – is specified in its DDS_DiscoveryConfigQosPolicy::participant_↔ liveliness_lease_duration (p. 708) QoS field. It maintains that contract by writing data to those other participants with a writer that has a DDS_LivelinessQosPolicyKind (p. 409) of DDS_AUTOMATIC_LIVELINESS_QOS (p. 410) or DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_↔ QOS (p. 410) and by asserting itself (at the DDS_DiscoveryConfigQosPolicy::participant_↔ liveliness_assert_period (p. 709)) over the Simple Discovery Protocol.</p>
---	---

Enumerator

DDS_NO_REMOTE_PARTICIPANT_PURGE	<p>Never "forget" a remote participant with which discovery communication has been lost. If a participant with this behavior loses discovery communication with a remote participant, it will nevertheless remember that remote participant and its endpoints and continue attempting to communicate with them indefinitely.</p> <p>This value has consequences for a participant's resource usage. If discovery communication with a remote participant is lost, but the same participant is later rediscovered, any relevant records that remain in the database will be reused. However, if it is not rediscovered, the records will continue to take up space in the database for as long as the local participant remains in existence.</p>
---------------------------------	--

7.115.5 Variable Documentation

7.115.5.1 DDS_DISCOVERYCONFIG_QOS_POLICY_NAME

```
const char* const DDS_DISCOVERYCONFIG_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DiscoveryConfigQosPolicy** (p. 706).

7.116 DOMAIN_PARTICIPANT_RESOURCE_LIMITS

<<*extension*>> (p. 236) Various settings that configure how a **DDSDomainParticipant** (p. 1335) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Classes

- struct **DDS_AllocationSettings_t**
Resource allocation settings.
- struct **DDS_DomainParticipantResourceLimitsQosPolicy**
*Various settings that configure how a **DDSDomainParticipant** (p. 1335) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.*

Enumerations

- enum **DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind** {
DDS_NO_REPLACEMENT_IGNORED_ENTITY_REPLACEMENT ,
DDS_NOT_ALIVE_FIRST_IGNORED_ENTITY_REPLACEMENT }
Available replacement policies for the ignored entities.

Variables

- const **DDS_Long DDS_AUTO_COUNT**
A special value indicating a quantity that is derived from another QoS value.
- const char *const **DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 740).*

7.116.1 Detailed Description

<<**extension**>> (p. 236) Various settings that configure how a **DDSDomainParticipant** (p. 1335) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

7.116.2 Enumeration Type Documentation

7.116.2.1 DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind

enum **DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind**

Available replacement policies for the ignored entities.

QoS:

DDS_DomainParticipantResourceLimitsQosPolicy (p. 740)

Enumerator

DDS_NO_REPLACEMENT_IGNORED_ENTITY_↔ REPLACEMENT	Default value for ignored_entity_replacement_kind, no replacement is done, the ignore will fail if the ignored_entity table is full.
DDS_NOT_ALIVE_FIRST_IGNORED_ENTITY_↔ REPLACEMENT	If the ignored_entity table is full and if there is at least one ignored participant in the table, the participant record that has been not updated for the longest time will be replaced. Note that if the table is full and there are no participant records to replace, the ignore will fail.

7.116.3 Variable Documentation

7.116.3.1 DDS_AUTO_COUNT

```
const DDS_Long DDS_AUTO_COUNT [extern]
```

A special value indicating a quantity that is derived from another QoS value.

7.116.3.2 DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 740).

7.117 DURABILITY

This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDSDataReader** (p. 1272) entities that join the network later.

Classes

- struct **DDS_PersistentStorageSettings**
Configures durable writer history and durable reader state.
- struct **DDS_DurabilityQosPolicy**
*This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDSDataReader** (p. 1272) entities that join the network later.*

Enumerations

- enum **DDS_PersistentJournalKind** {
 DDS_DELETE_PERSISTENT_JOURNAL ,
 DDS_TRUNCATE_PERSISTENT_JOURNAL ,
 DDS_PERSIST_PERSISTENT_JOURNAL ,
 DDS_MEMORY_PERSISTENT_JOURNAL ,
 DDS_WAL_PERSISTENT_JOURNAL ,
 DDS_OFF_PERSISTENT_JOURNAL }
Sets the journal mode of the persistent storage.
- enum **DDS_PersistentSynchronizationKind** {
 DDS_NORMAL_PERSISTENT_SYNCHRONIZATION ,
 DDS_FULL_PERSISTENT_SYNCHRONIZATION ,
 DDS_OFF_PERSISTENT_SYNCHRONIZATION }
Determines the level of synchronization with the physical disk.
- enum **DDS_DurabilityQosPolicyKind** {
 DDS_VOLATILE_DURABILITY_QOS ,
 DDS_TRANSIENT_LOCAL_DURABILITY_QOS ,
 DDS_TRANSIENT_DURABILITY_QOS ,
 DDS_PERSISTENT_DURABILITY_QOS }
Kinds of durability.

Variables

- `const char *const DDS_DURABILITY_QOS_POLICY_NAME`
*Stringified human-readable name for **DDS_DurabilityQosPolicy** (p. 761).*
- `const DDS_Long DDS_AUTO_WRITER_DEPTH`
*A special value used as the default value for **DDS_DurabilityQosPolicy::writer_depth** (p. 764).*

7.117.1 Detailed Description

This QoS policy specifies whether or not RTI Connex will store and deliver previously published data samples to new **DDSDataReader** (p. 1272) entities that join the network later.

7.117.2 Enumeration Type Documentation

7.117.2.1 DDS_PersistentJournalKind

`enum DDS_PersistentJournalKind`

Sets the journal mode of the persistent storage.

The rollback journal is used in SQLite to store the state of the persistent storage before a transaction is committed.

QoS:

DDS_DurabilityQosPolicy (p. 761)

Enumerator

DDS_DELETE_PERSISTENT_JOURNAL	Deletes the rollback journal at the conclusion of each transaction.
DDS_TRUNCATE_PERSISTENT_JOURNAL	Commits transactions by truncating the rollback journal to zero-length instead of deleting it.
DDS_PERSIST_PERSISTENT_JOURNAL	Prevents the rollback journal from being deleted at the end of each transaction. Instead, the header of the journal is overwritten with zeros.
DDS_MEMORY_PERSISTENT_JOURNAL	Stores the rollback journal in volatile RAM. This saves disk I/O.
DDS_WAL_PERSISTENT_JOURNAL	Uses a write-ahead log instead of a rollback journal to implement transactions.
DDS_OFF_PERSISTENT_JOURNAL	Completely disables the rollback journal. If the application crashes in the middle of a transaction when the OFF journaling mode is set, the persistent storage will very likely be corrupted.

7.117.2.2 DDS_PersistentSynchronizationKind

enum **DDS_PersistentSynchronizationKind**

Determines the level of synchronization with the physical disk.

QoS:

DDS_DurabilityQosPolicy (p. 761)

Enumerator

DDS_NORMAL_PERSISTENT_SYNCHRONIZATION	Data (e.g., new sample) is written to disk at critical moments.
DDS_FULL_PERSISTENT_SYNCHRONIZATION	Data (e.g., new sample) is written to physical disk immediately.
DDS_OFF_PERSISTENT_SYNCHRONIZATION	No synchronization is enforced. Data will be written to physical disk when the operating system flushes its buffers.

7.117.2.3 DDS_DurabilityQosPolicyKind

enum **DDS_DurabilityQosPolicyKind**

Kinds of durability.

QoS:

DDS_DurabilityQosPolicy (p. 761)

Enumerator

DDS_VOLATILE_DURABILITY_QOS	<p>[default] RTI Connext does not need to keep any samples of data instances on behalf of any DDSDataReader (p. 1272) that is unknown by the DDSDataWriter (p. 1305) at the time the instance is written. In other words, RTI Connext will only attempt to provide the data to existing subscribers.</p> <p>This option does not require RTI Persistence Service.</p>
-----------------------------	--

Enumerator

DDS_TRANSIENT_LOCAL_DURABILITY_QOS	<p>RTI Connex will attempt to keep some samples so that they can be delivered to any potential late-joining DDSDataReader (p. 1272). Which particular samples are kept depends on other QoS such as DDS_HistoryQosPolicy (p. 906) and DDS_ResourceLimitsQosPolicy (p. 1038). RTI Connex is only required to keep the data in memory of the DDSDataWriter (p. 1305) that wrote the data. Data is not required to survive the DDSDataWriter (p. 1305).</p> <p>For this setting to be effective, you must also set the DDS_ReliabilityQosPolicy::kind (p. 1029) to DDS_RELIABLE_RELIABILITY_QOS (p. 435). This option does not require RTI Persistence Service.</p>
DDS_TRANSIENT_DURABILITY_QOS	<p>RTI Connex will attempt to keep some samples so that they can be delivered to any potential late-joining DDSDataReader (p. 1272). Which particular samples are kept depends on other QoS such as DDS_HistoryQosPolicy (p. 906) and DDS_ResourceLimitsQosPolicy (p. 1038). RTI Connex is only required to keep the data in memory and not in permanent storage. Data is not tied to the lifecycle of the DDSDataWriter (p. 1305). Data will survive the DDSDataWriter (p. 1305).</p> <p>This option requires RTI Persistence Service.</p>
DDS_PERSISTENT_DURABILITY_QOS	<p>Data is kept on permanent storage, so that they can outlive a system session. This option requires RTI Persistence Service.</p>

7.117.3 Variable Documentation

7.117.3.1 DDS_DURABILITY_QOS_POLICY_NAME

```
const char* const DDS_DURABILITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DurabilityQosPolicy** (p. 761).

7.117.3.2 DDS_AUTO_WRITER_DEPTH

```
const DDS_Long DDS_AUTO_WRITER_DEPTH [extern]
```

A special value used as the default value for **DDS_DurabilityQosPolicy::writer_depth** (p. 764).

This values resolves to the following:

- **DDS_HistoryQosPolicy::depth** (p. 908) if the history kind is **DDS_KEEP_LAST_HISTORY_QOS** (p. 406).
- **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041) in the **DDS_ResourceLimitsQosPolicy** (p. 1038) if the history kind is **DDS_KEEP_ALL_HISTORY_QOS** (p. 406).

7.118 DURABILITY_SERVICE

Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **DDS_↵_DurabilityQosPolicy** (p. 761) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_↵DURABILITY_QOS** (p. 400).

Classes

- struct **DDS_DurabilityServiceQosPolicy**

*Various settings to configure the external RTI Persistence Service used by RTI Connext for DataWriters with a **DDS_↵_DurabilityQosPolicy** (p. 761) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_↵DURABILITY_QOS** (p. 400).*

Variables

- const char *const **DDS_DURABILITYSERVICE_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_DurabilityServiceQosPolicy** (p. 765).*

7.118.1 Detailed Description

Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **DDS_↵_DurabilityQosPolicy** (p. 761) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_↵DURABILITY_QOS** (p. 400).

7.118.2 Variable Documentation

7.118.2.1 DDS_DURABILITYSERVICE_QOS_POLICY_NAME

```
const char* const DDS_DURABILITYSERVICE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_DurabilityServiceQosPolicy** (p. 765).

7.119 ENTITY_FACTORY

A QoS policy for all **DDSEntity** (p. 1446) types that can act as factories for one or more other **DDSEntity** (p. 1446) types.

Classes

- struct **DDS_EntityFactoryQosPolicy**

*A QoS policy for all **DDSEntity** (p. 1446) types that can act as factories for one or more other **DDSEntity** (p. 1446) types.*

Variables

- `const char *const DDS_ENTITYFACTORY_QOS_POLICY_NAME`
Stringified human-readable name for **DDS_EntityFactoryQosPolicy** (p. 888).

7.119.1 Detailed Description

A QoS policy for all **DDSEntity** (p. 1446) types that can act as factories for one or more other **DDSEntity** (p. 1446) types.

7.119.2 Variable Documentation

7.119.2.1 DDS_ENTITYFACTORY_QOS_POLICY_NAME

```
const char* const DDS_ENTITYFACTORY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_EntityFactoryQosPolicy** (p. 888).

7.120 ENTITY_NAME

<<*extension*>> (p. 236) Assigns a name to a **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). Except for **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

Classes

- `struct DDS_EntityNameQosPolicy`
*Assigns a name and a role name to a **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). Except for **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.*

Variables

- `const char *const DDS_ENTITYNAME_QOS_POLICY_NAME`
Stringified human-readable name for **DDS_EntityNameQosPolicy** (p. 890).

7.120.1 Detailed Description

<<*extension*>> (p. 236) Assigns a name to a **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). Except for **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

7.120.2 Variable Documentation

7.120.2.1 DDS_ENTITYNAME_QOS_POLICY_NAME

```
const char* const DDS_ENTITYNAME_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_EntityNameQosPolicy** (p. 890).

7.121 EVENT

<<*extension*>> (p. 236) Configures the internal thread in a DomainParticipant that handles timed events.

Classes

- struct **DDS_EventQosPolicy**
Settings for event.

Variables

- const char *const **DDS_EVENT_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_EventQosPolicy** (p. 893).*

7.121.1 Detailed Description

<<*extension*>> (p. 236) Configures the internal thread in a DomainParticipant that handles timed events.

7.121.2 Variable Documentation

7.121.2.1 DDS_EVENT_QOS_POLICY_NAME

```
const char* const DDS_EVENT_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_EventQosPolicy** (p. 893).

7.122 EXCLUSIVE_AREA

<<**extension**>> (p. 236) Configures multi-thread concurrency and deadlock prevention capabilities.

Classes

- struct **DDS_ExclusiveAreaQosPolicy**
Configures multi-thread concurrency and deadlock prevention capabilities.

Variables

- const char *const **DDS_EXCLUSIVEAREA_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_ExclusiveAreaQosPolicy** (p. 895).*

7.122.1 Detailed Description

<<**extension**>> (p. 236) Configures multi-thread concurrency and deadlock prevention capabilities.

7.122.2 Variable Documentation

7.122.2.1 DDS_EXCLUSIVEAREA_QOS_POLICY_NAME

```
const char* const DDS_EXCLUSIVEAREA_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_ExclusiveAreaQosPolicy** (p. 895).

7.123 HISTORY

Specifies the behavior of RTI Connex in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Classes

- struct **DDS_HistoryQosPolicy**

Specifies the behavior of RTI Connex in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Enumerations

- enum **DDS_HistoryQosPolicyKind** {
 DDS_KEEP_LAST_HISTORY_QOS ,
 DDS_KEEP_ALL_HISTORY_QOS }

Kinds of history.

Variables

- const char *const **DDS_HISTORY_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_HistoryQosPolicy** (p. 906).*

7.123.1 Detailed Description

Specifies the behavior of RTI Connex in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

7.123.2 Enumeration Type Documentation

7.123.2.1 DDS_HistoryQosPolicyKind

enum **DDS_HistoryQosPolicyKind**

Kinds of history.

QoS:

DDS_HistoryQosPolicy (p. 906)

Enumerator

DDS_KEEP_LAST_HISTORY_QOS	<p>[default] Keep the last <code>depth</code> samples. On the publishing side, RTI Connexx will only attempt to keep the most recent <code>depth</code> samples of each instance of data (identified by its key) managed by the DDSDataWriter (p. 1305). Invalid samples representing a disposal or unregistration of an instance count towards the depth and may replace other DDS samples currently in the DataWriter queue for the same instance.</p> <p>On the subscribing side, the DDSDataReader (p. 1272) will only attempt to keep the most recent <code>depth</code> samples received for each instance (identified by its key) until the application takes them via the DDSDataReader (p. 1272) 's take() operation.</p> <p>Invalid samples representing a disposal or unregistration of an instance do not count towards the history depth and will not replace other DDS samples currently in the DataReader queue for the same instance.</p>
DDS_KEEP_ALL_HISTORY_QOS	<p>Keep <i>all</i> the samples. On the publishing side, RTI Connexx will attempt to keep all samples (representing each value written) of each instance of data (identified by its key) managed by the DDSDataWriter (p. 1305) until they can be delivered to all subscribers.</p> <p>On the subscribing side, RTI Connexx will attempt to keep all samples of each instance of data (identified by its key) managed by the DDSDataReader (p. 1272). These samples are kept until the application takes them from RTI Connexx via the take() operation.</p>

7.123.3 Variable Documentation

7.123.3.1 DDS_HISTORY_QOS_POLICY_NAME

```
const char* const DDS_HISTORY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_HistoryQosPolicy** (p. 906).

7.124 GROUP_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Classes

- struct **DDS_GroupDataQosPolicy**

*Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.*

Variables

- `const char *const DDS_GROUPDATA_QOS_POLICY_NAME`
*Stringified human-readable name for **DDS_GroupDataQosPolicy** (p. 903).*

7.124.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

7.124.2 Variable Documentation

7.124.2.1 DDS_GROUPDATA_QOS_POLICY_NAME

```
const char* const DDS_GROUPDATA_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_GroupDataQosPolicy** (p. 903).

7.125 LATENCY_BUDGET

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Classes

- `struct DDS_LatencyBudgetQosPolicy`
Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Variables

- `const char *const DDS_LATENCYBUDGET_QOS_POLICY_NAME`
*Stringified human-readable name for **DDS_LatencyBudgetQosPolicy** (p. 916).*

7.125.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

7.125.2 Variable Documentation

7.125.2.1 DDS_LATENCYBUDGET_QOS_POLICY_NAME

```
const char* const DDS_LATENCYBUDGET_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_LatencyBudgetQosPolicy** (p. 916).

7.126 LIFESPAN

Specifies how long the data written by the **DDSDataWriter** (p. 1305) is considered valid.

Classes

- struct **DDS_LifespanQosPolicy**

*Specifies how long the data written by the **DDSDataWriter** (p. 1305) is considered valid.*

Variables

- const char *const **DDS_LIFESPAN_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_LifespanQosPolicy** (p. 918).*

7.126.1 Detailed Description

Specifies how long the data written by the **DDSDataWriter** (p. 1305) is considered valid.

7.126.2 Variable Documentation

7.126.2.1 DDS_LIFESPAN_QOS_POLICY_NAME

```
const char* const DDS_LIFESPAN_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_LifespanQosPolicy** (p. 918).

7.127 LIVELINESS

Specifies and configures the mechanism that allows **DDSDataReader** (p. 1272) entities to detect when **DDSDataWriter** (p. 1305) entities become disconnected or "dead".

Classes

- struct **DDS_LivelinessQosPolicy**

*Specifies and configures the mechanism that allows **DDSDataReader** (p. 1272) entities to detect when **DDSDataWriter** (p. 1305) entities become disconnected or "dead".*

Enumerations

- enum **DDS_LivelinessQosPolicyKind** {
 DDS_AUTOMATIC_LIVELINESS_QOS ,
 DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS ,
 DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS }

Kinds of liveliness.

Variables

- const char *const **DDS_LIVELINESS_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_LivelinessQosPolicy** (p. 923).*

7.127.1 Detailed Description

Specifies and configures the mechanism that allows **DDSDataReader** (p. 1272) entities to detect when **DDSDataWriter** (p. 1305) entities become disconnected or "dead".

7.127.2 Enumeration Type Documentation

7.127.2.1 DDS_LivelinessQosPolicyKind

enum **DDS_LivelinessQosPolicyKind**

Kinds of liveliness.

QoS:

DDS_LivelinessQosPolicy (p. 923)

Enumerator

DDS_AUTOMATIC_LIVELINESS_QOS	[default] The infrastructure will automatically signal liveliness for the DDSDDataWriter (p. 1305) (s) at least as often as required by the DDSDDataWriter (p. 1305) (S) <code>lease_duration</code> . A DDSDDataWriter (p. 1305) with this setting does not need to take any specific action in order to be considered 'alive.' The DDSDDataWriter (p. 1305) is only 'not alive' when the participant to which it belongs terminates (gracefully or not), or when there is a network problem that prevents the current participant from contacting that remote participant.
DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS	RTI Connext will assume that as long as at least one DDSDDataWriter (p. 1305) belonging to the DDSDDomainParticipant (p. 1335) (or the DDSDDomainParticipant (p. 1335) itself) has asserted its liveliness, then the other DataWriters belonging to that same DDSDDomainParticipant (p. 1335) are also alive. The user application takes responsibility to signal liveliness to RTI Connext either by calling DDSDDomainParticipant::assert_liveliness (p. 1382), or by calling DDSDDataWriter::assert_liveliness (p. 1313), or FooDataWriter::write (p. 1666) on any DDSDDataWriter (p. 1305) belonging to the DDSDDomainParticipant (p. 1335).
DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS	RTI Connext will only assume liveliness of the DDSDDataWriter (p. 1305) if the application has asserted liveliness of that DDSDDataWriter (p. 1305) itself. The user application takes responsibility to signal liveliness to RTI Connext using the DDSDDataWriter::assert_liveliness (p. 1313) method, or by writing some data.

7.127.3 Variable Documentation

7.127.3.1 DDS_LIVELINESS_QOS_POLICY_NAME

```
const char* const DDS_LIVELINESS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_LivelinessQosPolicy** (p. 923).

7.128 LOCATORFILTER

<<**extension**>> (p. 236) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 997).

Classes

- struct **DDS_LocatorFilter_t**
Specifies the configuration of an individual channel within a MultiChannel DataWriter.
- struct **DDS_LocatorFilterSeq**
Declares IDL `sequence< DDS_LocatorFilter_t` (p. 927) >.
- struct **DDS_LocatorFilterQosPolicy**
*The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 997).*

Variables

- const char *const **DDS_LOCATORFILTER_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_LocatorFilterQosPolicy** (p. 928).*

7.128.1 Detailed Description

<<**extension**>> (p. 236) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 997).

7.128.2 Variable Documentation

7.128.2.1 DDS_LOCATORFILTER_QOS_POLICY_NAME

```
const char* const DDS_LOCATORFILTER_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_LocatorFilterQosPolicy** (p. 928).

7.129 LOGGING

<<**extension**>> (p. 236) Configures the RTI Connext logging facility.

Classes

- struct **DDS_LoggingQosPolicy**
Configures the RTI Connext logging facility.

7.129.1 Detailed Description

<<**extension**>> (p. 236) Configures the RTI Connex logging facility.

7.130 MONITORING

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

Classes

- struct **DDS_MonitoringDedicatedParticipantSettings**
*Configures the use of a dedicated **DDSDomainParticipant** (p. 1335) to distribute the RTI Connex application telemetry data.*
- struct **DDS_MonitoringEventDistributionSettings**
Configures the distribution of event metrics.
- struct **DDS_MonitoringPeriodicDistributionSettings**
Configures the distribution of periodic metrics.
- struct **DDS_MonitoringLoggingDistributionSettings**
Configures the distribution of log messages.
- struct **DDS_MonitoringDistributionSettings**
Configures the distribution of telemetry data.
- struct **DDS_MonitoringMetricSelection**
This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.
- struct **DDS_MonitoringMetricSelectionSeq**
*Declares IDL sequence < **DDS_MonitoringMetricSelection** (p. 945) >*
- struct **DDS_MonitoringLoggingForwardingSettings**
*Configures the forwarding levels of log messages for the different **NDDS_Config_LogFacility** (p. 527).*
- struct **DDS_MonitoringTelemetryData**
Configures the telemetry data that will be distributed.
- struct **DDS_MonitoringQosPolicy**
Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

Variables

- const char *const **DDS_MONITORING_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_MonitoringQosPolicy** (p. 949).*

7.130.1 Detailed Description

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

7.130.2 Variable Documentation

7.130.2.1 DDS_MONITORING_QOS_POLICY_NAME

```
const char* const DDS_MONITORING_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_MonitoringQosPolicy** (p. 949).

7.131 MULTICHANNEL

<<**extension**>> (p. 236) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Classes

- struct **DDS_ChannelSettings_t**
Type used to configure the properties of a channel.
- struct **DDS_ChannelSettingsSeq**
Declares IDL sequence< DDS_ChannelSettings_t (p. 604) >
- struct **DDS_MultiChannelQosPolicy**
Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Variables

- const char *const **DDS_MULTICHANNEL_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_MultiChannelQosPolicy** (p. 952).*

7.131.1 Detailed Description

<<**extension**>> (p. 236) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

7.131.2 Variable Documentation

7.131.2.1 DDS_MULTICHANNEL_QOS_POLICY_NAME

```
const char* const DDS_MULTICHANNEL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_MultiChannelQosPolicy** (p. 952).

7.132 OWNERSHIP

Specifies whether it is allowed for multiple **DDSDataWriter** (p. 1305) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Classes

- struct **DDS_OwnershipQosPolicy**

*Specifies whether it is allowed for multiple **DDSDataWriter** (p. 1305) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

Enumerations

- enum **DDS_OwnershipQosPolicyKind** {
 DDS_SHARED_OWNERSHIP_QOS ,
 DDS_EXCLUSIVE_OWNERSHIP_QOS }

Kinds of ownership.

Variables

- const char *const **DDS_OWNERSHIP_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_OwnershipQosPolicy** (p. 960).*

7.132.1 Detailed Description

Specifies whether it is allowed for multiple **DDSDataWriter** (p. 1305) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

7.132.2 Enumeration Type Documentation

7.132.2.1 DDS_OwnershipQosPolicyKind

```
enum DDS_OwnershipQosPolicyKind
```

Kinds of ownership.

QoS:

DDS_OwnershipQosPolicy (p. 960)

Enumerator

DDS_SHARED_OWNERSHIP_QOS	[default] Indicates shared ownership for each instance. Multiple writers are allowed to update the same instance and all the updates are made available to the readers. In other words there is no concept of an owner for the instances. This is the default behavior if the OWNERSHIP (p. 414) policy is not specified or supported.
DDS_EXCLUSIVE_OWNERSHIP_QOS	Indicates each instance can only be owned by one DDSDDataWriter (p. 1305), but the owner of an instance can change dynamically. The selection of the owner is controlled by the setting of the OWNERSHIP_STRENGTH (p. 415) policy. The owner is always set to be the highest-strength DDSDDataWriter (p. 1305) object among the ones currently active (as determined by the LIVELINESS (p. 409)).

7.132.3 Variable Documentation

7.132.3.1 DDS_OWNERSHIP_QOS_POLICY_NAME

```
const char* const DDS_OWNERSHIP_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_OwnershipQosPolicy** (p. 960).

7.133 OWNERSHIP_STRENGTH

Specifies the value of the strength used to arbitrate among multiple **DDSDDataWriter** (p. 1305) objects that attempt to modify the same instance of a data type (identified by **DDSTopic** (p. 1601) + key).

Classes

- struct **DDS_OwnershipStrengthQosPolicy**

*Specifies the value of the strength used to arbitrate among multiple **DDSDDataWriter** (p. 1305) objects that attempt to modify the same instance of a data type (identified by **DDSTopic** (p. 1601) + key).*

Variables

- const char *const **DDS_OWNERSHIPSTRENGTH_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_OwnershipStrengthQosPolicy** (p. 965).*

7.133.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **DDSDDataWriter** (p. 1305) objects that attempt to modify the same instance of a data type (identified by **DDSTopic** (p. 1601) + key).

7.133.2 Variable Documentation

7.133.2.1 DDS_OWNERSHIPSTRENGTH_QOS_POLICY_NAME

```
const char* const DDS_OWNERSHIPSTRENGTH_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_OwnershipStrengthQosPolicy** (p. 965).

7.134 PARTITION

Set of strings that introduces logical partitions in **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) entities.

Classes

- struct **DDS_PartitionQosPolicy**

*Set of strings that introduces logical partitions in **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) entities.*

Variables

- const char *const **DDS_PARTITION_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_PartitionQosPolicy** (p. 976).*

7.134.1 Detailed Description

Set of strings that introduces logical partitions in **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) entities.

7.134.2 Variable Documentation

7.134.2.1 DDS_PARTITION_QOS_POLICY_NAME

```
const char* const DDS_PARTITION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_PartitionQosPolicy** (p. 976).

7.135 PRESENTATION

Specifies how the samples representing changes to data instances are presented to a subscribing application.

Classes

- struct **DDS_PresentationQosPolicy**

Specifies how the samples representing changes to data instances are presented to a subscribing application.

Enumerations

- enum **DDS_PresentationQosPolicyAccessScopeKind** {
DDS_INSTANCE_PRESENTATION_QOS ,
DDS_TOPIC_PRESENTATION_QOS ,
DDS_GROUP_PRESENTATION_QOS ,
DDS_HIGHEST_OFFERED_PRESENTATION_QOS }

Kinds of presentation "access scope".

Variables

- const char *const **DDS_PRESENTATION_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_PresentationQosPolicy** (p. 983).*

7.135.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

7.135.2 Enumeration Type Documentation**7.135.2.1 DDS_PresentationQosPolicyAccessScopeKind**

```
enum DDS_PresentationQosPolicyAccessScopeKind
```

Kinds of presentation "access scope".

Access scope determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

QoS:

DDS_PresentationQosPolicy (p. 983)

Enumerator

DDS_INSTANCE_PRESENTATION_QOS	[default] Scope spans only a single instance. Indicates that changes to one instance need not be coherent nor ordered with respect to changes to any other instance. In other words, order and coherent changes apply to each instance separately.
DDS_TOPIC_PRESENTATION_QOS	Scope spans all instances within the same DDSDDataWriter (p. 1305), but not across instances in different DDSDDataWriter (p. 1305) entities.
DDS_GROUP_PRESENTATION_QOS	Scope spans all instances belonging to DDSDDataWriter (p. 1305) entities within the same DDSPublisher (p. 1534).
DDS_HIGHEST_OFFERED_PRESENTATION_QOS	This value only applies to a DDSSubscriber (p. 1576). The DDSSubscriber (p. 1576) will use the access scope specified by each remote DDSPublisher (p. 1534).

7.135.3 Variable Documentation

7.135.3.1 DDS_PRESENTATION_QOS_POLICY_NAME

```
const char* const DDS_PRESENTATION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_PresentationQosPolicy** (p. 983).

7.136 PROFILE

<<**extension**>> (p. 236) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

Classes

- struct **DDS_ProfileQosPolicy**

Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

Variables

- const char *const **DDS_PROFILE_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_ProfileQosPolicy** (p. 991).*

7.136.1 Detailed Description

<<*extension*>> (p. 236) Configures the way that XML documents containing QoS profiles are loaded by RTI Connext.

7.136.2 Variable Documentation

7.136.2.1 DDS_PROFILE_QOS_POLICY_NAME

```
const char* const DDS_PROFILE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_ProfileQosPolicy** (p. 991).

7.137 PROPERTY

<<*extension*>> (p. 236) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Classes

- struct **DDS_Property_t**
Properties are name/value pairs objects.
- struct **DDS_PropertySeq**
Declares IDL sequence < DDS_Property_t (p. 993) >
- struct **DDS_PropertyQosPolicy**
Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.
- class **DDSPROPERTYQOSPolicyHelper**
Policy helpers that facilitate management of the properties in the input policy.

Typedefs

- typedef struct **DDS_PropertyQosPolicy DDS_PropertyQosPolicy**
Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connext that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.
- typedef enum **DDS_PropertyQosPolicyMutability DDS_PropertyQosPolicyMutability**
Determines if, and when, the value of a property can change.

Enumerations

- enum **DDS_PropertyQosPolicyMutability** {
DDS_PROPERTY_QOS_MUTABLE ,
DDS_PROPERTY_QOS_MUTABLE_UNTIL_ENABLE ,
DDS_PROPERTY_QOS_IMMUTABLE }

Determines if, and when, the value of a property can change.

Functions

- **DDS_PropertyQosPolicyMutability** **DDS_PropertyQosPolicyHelper_get_property_mutability** (const char *name, const struct **DDS_PropertyQosPolicy** *policy)
Returns the mutability type of a property.
- static **DDS_Long** **DDSPROPERTYQosPolicyHelper::get_number_of_properties** (**DDS_PropertyQosPolicy** &policy)
Gets the number of properties in the input policy.
- static **DDS_ReturnCode_t** **DDSPROPERTYQosPolicyHelper::assert_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const char *value, **DDS_Boolean** propagate)
Asserts the property identified by name in the input policy.
- static **DDS_ReturnCode_t** **DDSPROPERTYQosPolicyHelper::add_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const char *value, **DDS_Boolean** propagate)
Adds a new property to the input policy.
- static **DDS_ReturnCode_t** **DDSPROPERTYQosPolicyHelper::assert_pointer_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const void *pointer)
Asserts the property identified by name in the input policy. Used when the property to store is a pointer.
- static **DDS_ReturnCode_t** **DDSPROPERTYQosPolicyHelper::add_pointer_property** (**DDS_PropertyQosPolicy** &policy, const char *name, const void *pointer)
Adds a new property to the input policy. Used when the property to store is a pointer.
- static struct **DDS_Property_t** * **DDSPROPERTYQosPolicyHelper::lookup_property** (**DDS_PropertyQosPolicy** &policy, const char *name)
Searches for a property in the input policy given its name.
- static **DDS_ReturnCode_t** **DDSPROPERTYQosPolicyHelper::remove_property** (**DDS_PropertyQosPolicy** &policy, const char *name)
Removes a property from the input policy.
- static **DDS_ReturnCode_t** **DDSPROPERTYQosPolicyHelper::get_properties** (**DDS_PropertyQosPolicy** &policy, struct **DDS_PropertySeq** &properties, const char *name_prefix)
Retrieves a list of properties whose names match the input prefix.

Variables

- const char *const **DDS_PROPERTY_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_PropertyQosPolicy** (p. 994).*

7.137.1 Detailed Description

<<**extension**>> (p. 236) Stores (name, value) pairs that can be used to configure certain parameters of RTI Context that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

RTI Connex will automatically set some system properties in the **DDS_PropertyQosPolicy** (p. 994) associated with a **DDS_DomainParticipantQos** (p. 735). See **System Properties** (p. 195) for additional details.

7.137.2 Typedef Documentation

7.137.2.1 DDS_PropertyQosPolicy

```
typedef struct DDS_PropertyQosPolicy DDS_PropertyQosPolicy
```

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

DDSDomainParticipant (p. 1335) **DDSDataReader** (p. 1272) **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = N/A;
Changeable (p. ??) = YES (p. ??)

See also

DDSDomainParticipant::get_builtin_subscriber (p. 1376)

7.137.3 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305), or **DDSDomainParticipant** (p. 1335). This is similar to the **DDS_UserDataQosPolicy** (p. 1221), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the `Property Reference Guide`.

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 192)
- Durable Reader State, see **Configuring Durable Reader State** (p. 194)
- Builtin Transport Plugins, see **UDIPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 268), **UDIPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 284), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. ??)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 173)
- **Clock Selection** (p. 38)

In addition, you may add your own name/value pairs to the Property QoS policy of an Entity. Via this QoS policy, you can direct RTI Connex to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **DDS_UserDataQosPolicy** (p. 1221) or **DDS_GroupDataQosPolicy** (p. 903)).

7.137.3.1 Reasons for Using the PropertyQoSPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connex capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 419) page.

7.137.3.2 DDS_PropertyQoSPolicyMutability

```
typedef enum DDS_PropertyQoSPolicyMutability DDS_PropertyQoSPolicyMutability
```

Determines if, and when, the value of a property can change.

7.137.4 Enumeration Type Documentation

7.137.4.1 DDS_PropertyQoSPolicyMutability

```
enum DDS_PropertyQoSPolicyMutability
```

Determines if, and when, the value of a property can change.

Enumerator

DDS_PROPERTY_QOS_MUTABLE	The property is mutable: it can be changed at any time.
DDS_PROPERTY_QOS_MUTABLE_UNTIL_ENABLE	The property can only be changed before enabling the entity.
DDS_PROPERTY_QOS_IMMUTABLE	The property is immutable: it can only be specified when creating the entity.

7.137.5 Function Documentation

7.137.5.1 DDS_PropertyQosPolicyHelper_get_property_mutability()

```
DDS_PropertyQosPolicyMutability DDS_PropertyQosPolicyHelper_get_property_mutability (
    const char * name,
    const struct DDS_PropertyQosPolicy * policy )
```

Returns the mutability type of a property.

If the property does not exist, **DDS_PROPERTY_QOS_MUTABLE** (p. 422) is returned. Otherwise, it returns the mutability type of the specified property. See **DDS_PropertyQosPolicyMutability** (p. 422) for more information of the different mutability types.

Parameters

<i>name</i>	<< <i>in</i> >> (p. 237). The name of the property for which we want to know the mutability type.
<i>policy</i>	<< <i>in</i> >> (p. 237). These are the properties in which we are going to look for the property with the provided name.

Returns

The mutability type of the input property.

7.137.5.2 get_number_of_properties()

```
static DDS_Long DDSPropertyQosPolicyHelper::get_number_of_properties (
    DDS_PropertyQosPolicy & policy ) [static]
```

Gets the number of properties in the input policy.

Precondition

policy cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
---------------	--

Returns

Number of properties.

7.137.5.3 assert_property()

```
static DDS_ReturnCode_t DDSPropertyQosPolicyHelper::assert_property (
    DDS_PropertyQosPolicy & policy,
    const char * name,
    const char * value,
    DDS_Boolean propagate ) [static]
```

Asserts the property identified by name in the input policy.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

Precondition

policy, name and value cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Property name.
<i>value</i>	<< <i>in</i> >> (p. 237) Property value.
<i>propagate</i>	<< <i>in</i> >> (p. 237) Indicates if the property will be propagated on discovery.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

7.137.5.4 add_property()

```
static DDS_ReturnCode_t DDSPropertyQosPolicyHelper::add_property (
    DDS_PropertyQosPolicy & policy,
    const char * name,
```

```
const char * value,
    DDS_Boolean propagate ) [static]
```

Adds a new property to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connex.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Precondition

policy, name and value cannot be NULL.

The property is not in the policy.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Property name.
<i>value</i>	<< <i>in</i> >> (p. 237) Property value.
<i>propagate</i>	<< <i>in</i> >> (p. 237) Indicates if the property will be propagated on discovery.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
-----	--

7.137.5.5 assert_pointer_property()

```
static DDS_ReturnCode_t DDSPropertyQosPolicyHelper::assert_pointer_property (
    DDS_PropertyQosPolicy & policy,
    const char * name,
    const void * pointer ) [static]
```

Asserts the property identified by name in the input policy. Used when the property to store is a pointer.

This is a function similar to **DDSPropertyQosPolicyHelper::assert_property** (p. 424). However, instead of passing a stringified version of the pointer, this function receives a pointer as the value.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

The properties asserted by this function will not be propagated on discovery.

Precondition

policy and name cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Property name.
<i>pointer</i>	<< <i>in</i> >> (p. 237) The pointer to store in the property.

Returns

One of the **Standard Return Codes** (p. 335) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

7.137.5.6 add_pointer_property()

```
static DDS_ReturnCode_t DDSPropertyQosPolicyHelper::add_pointer_property (
    DDS_PropertyQosPolicy & policy,
    const char * name,
    const void * pointer ) [static]
```

Adds a new property to the input policy. Used when the property to store is a pointer.

This is a function similar to **DDSPropertyQosPolicyHelper::add_property** (p. 424). However, instead of passing a stringified version of the pointer, this function receives a pointer as the value.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connex.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

The properties added by this function will not be propagated on discovery.

Precondition

policy and name cannot be NULL.

The property is not in the policy.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Property name.
<i>pointer</i>	<< <i>in</i> >> (p. 237) The pointer to store in the property.

Returns

One of the **Standard Return Codes** (p. 335) or **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336) or **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335)

7.137.5.7 lookup_property()

```
static struct DDS_Property_t * DDSPropertyQosPolicyHelper::lookup_property (
    DDS_PropertyQosPolicy & policy,
    const char * name ) [static]
```

Searches for a property in the input policy given its name.

Precondition

policy, name and value cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Property name.

Returns

The function returns the first property with the given name. If such a property does not exist, the function returns NULL.

7.137.5.8 remove_property()

```
static DDS_ReturnCode_t DDSPropertyQosPolicyHelper::remove_property (
    DDS_PropertyQosPolicy & policy,
    const char * name ) [static]
```

Removes a property from the input policy.

If the property does not exist, the function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

Precondition

policy and name cannot be NULL.

The property is in the policy.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 237) Property name.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
------------	--

7.137.5.9 `get_properties()`

```
static DDS_ReturnCode_t DDSPropertyQosPolicyHelper::get_properties (
    DDS_PropertyQosPolicy & policy,
    struct DDS_PropertySeq & properties,
    const char * name_prefix ) [static]
```

Retrieves a list of properties whose names match the input prefix.

If the properties sequence doesn't own its buffer, and its maximum is less than the total number of properties matching the input prefix, it will be filled up to its maximum and fail with an error of **DDS_RETCODE_OUT_OF_RESOURCES** (p. 336).

Precondition

policy, properties and name_prefix cannot be NULL.

Parameters

<i>policy</i>	<< <i>in</i> >> (p. 237) Input policy.
<i>properties</i>	<< <i>inout</i> >> (p. 237) A DDS_PropertySeq (p. 996) object where the set or list of properties will be returned.
<i>name_prefix</i>	Name prefix.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335), DDS_RETCODE_PRECONDITION_NOT_MET (p. 335)
------------	--

7.137.6 Variable Documentation

7.137.6.1 DDS_PROPERTY_QOS_POLICY_NAME

```
const char* const DDS_PROPERTY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_PropertyQosPolicy** (p. 994).

7.138 PUBLISH_MODE

<<**extension**>> (p. 236) Specifies how RTI Connex sends application data on the network. This QoS policy can be used to tell RTI Connex to use its *own* thread to send data, instead of the user thread.

Classes

- struct **DDS_PublishModeQosPolicy**

Specifies how RTI Connex sends application data on the network. This QoS policy can be used to tell RTI Connex to use its own thread to send data, instead of the user thread.

Macros

- #define **DDS_PUBLICATION_PRIORITY_UNDEFINED**

*Initializer value for **DDS_PublishModeQosPolicy::priority** (p. 1015) and/or **DDS_ChannelSettings_t::priority** (p. 605).*

- #define **DDS_PUBLICATION_PRIORITY_AUTOMATIC**

*Constant value for **DDS_PublishModeQosPolicy::priority** (p. 1015) and/or **DDS_ChannelSettings_t::priority** (p. 605).*

Enumerations

- enum **DDS_PublishModeQosPolicyKind** {
DDS_SYNCHRONOUS_PUBLISH_MODE_QOS ,
DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS }

Kinds of publishing mode.

Variables

- const char *const **DDS_PUBLISHMODE_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_PublishModeQosPolicy** (p. 1012).*

7.138.1 Detailed Description

<<**extension**>> (p. 236) Specifies how RTI Connex sends application data on the network. This QoS policy can be used to tell RTI Connex to use its *own* thread to send data, instead of the user thread.

7.138.2 Macro Definition Documentation

7.138.2.1 DDS_PUBLICATION_PRIORITY_UNDEFINED

```
#define DDS_PUBLICATION_PRIORITY_UNDEFINED
```

Initializer value for **DDS_PublishModeQosPolicy::priority** (p. 1015) and/or **DDS_ChannelSettings_t::priority** (p. 605).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the lowest possible value. For multi-channel data writers, if either the data writer or channel priority is NOT set to this value, then the publication priority of the entity will be set to the defined value.

7.138.2.2 DDS_PUBLICATION_PRIORITY_AUTOMATIC

```
#define DDS_PUBLICATION_PRIORITY_AUTOMATIC
```

Constant value for **DDS_PublishModeQosPolicy::priority** (p. 1015) and/or **DDS_ChannelSettings_t::priority** (p. 605).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the largest priority value of any sample currently queued for publication by the data writer or data writer channel.

7.138.3 Enumeration Type Documentation

7.138.3.1 DDS_PublishModeQosPolicyKind

```
enum DDS_PublishModeQosPolicyKind
```

Kinds of publishing mode.

QoS:

DDS_PublishModeQosPolicy (p. 1012)

Enumerator

DDS_SYNCHRONOUS_PUBLISH_MODE_QOS	<p>Indicates to send data synchronously. If DDS_DataWriterProtocolQosPolicy::push_on_write (p. 669) is DDS_BOOLEAN_TRUE (p. 316), data is sent immediately in the context of FooDataWriter::write (p. 1666).</p> <p>As data is sent immediately in the context of the user thread, no flow control is applied.</p> <p>See also</p> <p>DDS_DataWriterProtocolQosPolicy::push_on_write (p. 669)</p> <p>[default] for DDSDDataWriter (p. 1305)</p>
DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS	<p>Indicates to send data asynchronously. Configures the DDSDDataWriter (p. 1305) to delegate the task of data transmission to a separate publishing thread. The FooDataWriter::write (p. 1666) call does not send the data, but instead schedules the data to be sent later by its associated DDSPublisher (p. 1534).</p> <p>Each DDSPublisher (p. 1534) uses its dedicated publishing thread (DDS_PublisherQos::asynchronous_publisher (p. 1012)) to send data for all its asynchronous DataWriters. For each asynchronous DataWriter, the associated DDSFlowController (p. 1451) determines when the publishing thread is allowed to send the data.</p> <p>DDSDDataWriter::wait_for_asynchronous_publishing (p. 1319) and DDSPublisher::wait_for_asynchronous_publishing (p. 1551) enable you to determine when the data has actually been sent.</p> <p>See also</p> <p>DDSFlowController (p. 1451)</p> <p>DDS_HistoryQosPolicy (p. 906)</p> <p>DDSDDataWriter::wait_for_asynchronous_publishing (p. 1319)</p> <p>DDSPublisher::wait_for_asynchronous_publishing (p. 1551)</p> <p>NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1761)</p>

7.138.4 Variable Documentation

7.138.4.1 DDS_PUBLISHMODE_QOS_POLICY_NAME

```
const char* const DDS_PUBLISHMODE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_PublishModeQosPolicy** (p. 1012).

7.139 READER_DATA_LIFECYCLE

Controls how a DataReader manages the lifecycle of the data that it has received.

Classes

- struct **DDS_ReaderDataLifecycleQosPolicy**
Controls how a DataReader manages the lifecycle of the data that it has received.

Variables

- const char *const **DDS_READERDATALIFECYCLE_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_ReaderDataLifecycleQosPolicy** (p. 1022).*

7.139.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

7.139.2 Variable Documentation

7.139.2.1 DDS_READERDATALIFECYCLE_QOS_POLICY_NAME

```
const char* const DDS_READERDATALIFECYCLE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_ReaderDataLifecycleQosPolicy** (p. 1022).

7.140 RECEIVER_POOL

<<**extension**>> (p. 236) Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

Classes

- struct **DDS_ReceiverPoolQosPolicy**

Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

Variables

- const char *const **DDS_RECEIVERPOOL_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_ReceiverPoolQosPolicy** (p. 1025).*

- const **DDS_Long** **DDS_LENGTH_AUTO**

A special value indicating that the actual value will be automatically resolved.

7.140.1 Detailed Description

<<**extension**>> (p. 236) Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

7.140.2 Variable Documentation

7.140.2.1 DDS_RECEIVERPOOL_QOS_POLICY_NAME

```
const char* const DDS_RECEIVERPOOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_ReceiverPoolQosPolicy** (p. 1025).

7.140.2.2 DDS_LENGTH_AUTO

```
const DDS_Long DDS_LENGTH_AUTO [extern]
```

A special value indicating that the actual value will be automatically resolved.

7.141 RELIABILITY

Indicates the level of reliability offered/requested by RTI Connex.

Classes

- struct **DDS_ReliabilityQosPolicy**
Indicates the level of reliability offered/requested by RTI Connext.

Enumerations

- enum **DDS_ReliabilityQosPolicyKind** {
 DDS_BEST_EFFORT_RELIABILITY_QOS ,
 DDS_RELIABLE_RELIABILITY_QOS }
Kinds of reliability.
- enum **DDS_ReliabilityQosPolicyAcknowledgmentModeKind** {
 DDS_PROTOCOL_ACKNOWLEDGMENT_MODE ,
 DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_MODE ,
 DDS_APPLICATION_ORDERED_ACKNOWLEDGMENT_MODE ,
 DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE }
 <<*extension*>> (p. 236) *Kinds of acknowledgment.*
- enum **DDS_InstanceStateConsistencyKind** {
 DDS_NO_RECOVER_INSTANCE_STATE_CONSISTENCY ,
 DDS_RECOVER_INSTANCE_STATE_CONSISTENCY }
 <<*extension*>> (p. 236) *Whether instance state consistency is enabled.*

Variables

- const char *const **DDS_RELIABILITY_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_ReliabilityQosPolicy** (p. 1027).*

7.141.1 Detailed Description

Indicates the level of reliability offered/requested by RTI Connext.

7.141.2 Enumeration Type Documentation

7.141.2.1 DDS_ReliabilityQosPolicyKind

```
enum DDS_ReliabilityQosPolicyKind
```

Kinds of reliability.

QoS:

DDS_ReliabilityQosPolicy (p. 1027)

Enumerator

DDS_BEST_EFFORT_RELIABILITY_QOS	<p>Indicates that it is acceptable to not retry propagation of any samples. Presumably new values for the samples are generated often enough that it is not necessary to re-send or acknowledge any samples.</p> <p>[default] for DDSDDataReader (p. 1272) and DDSTopic (p. 1601)</p>
DDS_RELIABLE_RELIABILITY_QOS	<p>Specifies RTI Connexx will attempt to deliver all samples in its history. Missed samples may be retried. In steady-state (no modifications communicated via the DDSDDataWriter (p. 1305)), RTI Connexx guarantees that all samples in the DDSDDataWriter (p. 1305) history will eventually be delivered to all the DDSDDataReader (p. 1272) objects (subject to timeouts that indicate loss of communication with a particular DDSSubscriber (p. 1576)). Outside steady state, the HISTORY (p. 404) and RESOURCE_LIMITS (p. 437) policies will determine how samples become part of the history and whether samples can be discarded from it.</p> <p>[default] for DDSDDataWriter (p. 1305)</p>

7.141.2.2 DDS_ReliabilityQosPolicyAcknowledgmentModeKind

enum **DDS_ReliabilityQosPolicyAcknowledgmentModeKind**

<<**extension**>> (p. 236) Kinds of acknowledgment.

QoS:

DDS_ReliabilityQosPolicy (p. 1027)

Enumerator

DDS_PROTOCOL_ACKNOWLEDGMENT_MODE	<p>Samples are acknowledged by RTPS protocol. Samples are acknowledged according to the Real-Time Publish-Subscribe (RTPS) interoperability protocol.</p>
DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_↔ MODE	<p>Samples are acknowledged automatically after a subscribing application has accessed them. A sample received by a FooDataReader (p. 1632) is acknowledged after the subscribing application accesses it, either through calling FooDataReader::take (p. 1636) or FooDataReader::read (p. 1635) on the DDS sample. If the read or take operation loans the samples, the acknowledgment is done after FooDataReader::return_loan (p. 1655) is called. Otherwise, for read or take operations that make a copy, acknowledgment is done after the read or take operations are executed.</p>

Enumerator

DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE ↩	Samples are acknowledged after the subscribing application explicitly calls acknowledge on the samples. Samples received by a DDSDataReader (p. 1272) are explicitly acknowledged by the subscribing application, after it calls either DDSDataReader::acknowledge_all (p. 1281) or DDSDataReader::acknowledge_sample (p. 1280).
--	---

7.141.2.3 DDS_InstanceStateConsistencyKind

enum **DDS_InstanceStateConsistencyKind** ↩

<<*extension*>> (p. 236) Whether instance state consistency is enabled.

QoS:

DDS_ReliabilityQosPolicy (p. 1027)

Enumerator

DDS_NO_RECOVER_INSTANCE_STATE_CONSISTENCY ↩	Instance state is not restored on a DataReader after reconnecting with a DataWriter until the DataWriter sends a new sample. When DataReaders rediscover DataWriters, they will not request updated instance state data. DataWriters always provide instance state data alongside each sample update regardless of this setting.
DDS_RECOVER_INSTANCE_STATE_CONSISTENCY	Instance state is restored on the DataReader after it reconnects with a DataWriter that has regained liveliness, even before the DataWriter sends a new sample. When DataReaders rediscover DataWriters, they will request updated instance state data. DataWriters will respond to requests for updated instance state data and publish updates on the ServiceRequest channel. DataWriters still provide instance state data alongside each sample update regardless of this setting.

7.141.3 Variable Documentation

7.141.3.1 DDS_RELIABILITY_QOS_POLICY_NAME

```
const char* const DDS_RELIABILITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_ReliabilityQosPolicy** (p. 1027).

7.142 RESOURCE_LIMITS

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Classes

- struct **DDS_ResourceLimitsQosPolicy**

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Variables

- const char *const **DDS_RESOURCELIMITS_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_ResourceLimitsQosPolicy** (p. 1038).*
- const **DDS_Long** **DDS_LENGTH_UNLIMITED**
A special value indicating an unlimited quantity.

7.142.1 Detailed Description

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

7.142.2 Variable Documentation

7.142.2.1 DDS_RESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_RESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_ResourceLimitsQosPolicy** (p. 1038).

7.142.2.2 DDS_LENGTH_UNLIMITED

```
const DDS_Long DDS_LENGTH_UNLIMITED [extern]
```

A special value indicating an unlimited quantity.

Examples

HelloWorld_subscriber.cxx.

Referenced by `connext::Requester< TReq, TRep >::read_replies()`, and `connext::Requester< TReq, TRep >::take_replies()`.

7.143 SERVICE

<<**extension**>> (p. 236) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

Classes

- struct **DDS_ServiceQosPolicy**
Service associated with a DDS entity.

Enumerations

- enum **DDS_ServiceQosPolicyKind** {
DDS_NO_SERVICE_QOS ,
DDS_PERSISTENCE_SERVICE_QOS ,
DDS_QUEUEING_SERVICE_QOS ,
DDS_ROUTING_SERVICE_QOS ,
DDS_RECORDING_SERVICE_QOS ,
DDS_REPLAY_SERVICE_QOS ,
DDS_DATABASE_INTEGRATION_SERVICE_QOS ,
DDS_WEB_INTEGRATION_SERVICE_QOS ,
DDS_OBSERVABILITY_COLLECTOR_SERVICE_QOS }
Kinds of service.

Variables

- const char *const **DDS_SERVICE_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_ServiceQosPolicy** (p. 1082).*

7.143.1 Detailed Description

<<**extension**>> (p. 236) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

7.143.2 Enumeration Type Documentation

7.143.2.1 DDS_ServiceQosPolicyKind

enum `DDS_ServiceQosPolicyKind`

Kinds of service.

QoS:

DDS_ServiceQosPolicy (p. 1082)

Enumerator

<code>DDS_NO_SERVICE_QOS</code>	There is no service associated with the entity.
<code>DDS_PERSISTENCE_SERVICE_QOS</code>	The entity is an entity created by RTI Persistence Service.
<code>DDS_QUEUEING_SERVICE_QOS</code>	The entity is an entity created by RTI Queuing Service.
<code>DDS_ROUTING_SERVICE_QOS</code>	The entity is an entity created by RTI Routing Service.
<code>DDS_RECORDING_SERVICE_QOS</code>	The entity is an entity created by RTI Recording Service.
<code>DDS_REPLAY_SERVICE_QOS</code>	The entity is an entity created by RTI Replay Service.
<code>DDS_DATABASE_INTEGRATION_SERVICE_QOS</code>	The entity is an entity created by RTI Database Integration Service.
<code>DDS_WEB_INTEGRATION_SERVICE_QOS</code>	The entity is an entity created by RTI Web Integration Service.
<code>DDS_OBSERVABILITY_COLLECTOR_SERVICE_QOS</code>	The entity is an entity created by RTI Observability Collector Service.

7.143.3 Variable Documentation

7.143.3.1 DDS_SERVICE_QOS_POLICY_NAME

const char* const `DDS_SERVICE_QOS_POLICY_NAME` [extern]

Stringified human-readable name for **DDS_ServiceQosPolicy** (p. 1082).

7.144 SYSTEM_RESOURCE_LIMITS

<<**extension**>> (p. 236) Configures DomainParticipant-independent resources used by RTI Connex.

Classes

- struct **DDS_SystemResourceLimitsQosPolicy**

<<*extension*>> (p. 236) Configures **DDSDomainParticipant** (p. 1335)-independent resources used by RTI Connex. Mainly used to change the maximum number of **DDSDomainParticipant** (p. 1335) entities that can be created within a single process (address space).

Variables

- const char *const **DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME**

Stringified human-readable name for **DDS_SystemResourceLimitsQosPolicy** (p. 1105).

7.144.1 Detailed Description

<<*extension*>> (p. 236) Configures DomainParticipant-independent resources used by RTI Connex.

7.144.2 Variable Documentation

7.144.2.1 DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME

```
const char* const DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_SystemResourceLimitsQosPolicy** (p. 1105).

7.145 TIME_BASED_FILTER

Filter that allows a **DDSDataReader** (p. 1272) to specify that it is interested only in (potentially) a subset of the values of the data.

Classes

- struct **DDS_TimeBasedFilterQosPolicy**

Filter that allows a **DDSDataReader** (p. 1272) to specify that it is interested only in (potentially) a subset of the values of the data.

Variables

- const char *const **DDS_TIMEBASEDFILTER_QOS_POLICY_NAME**

Stringified human-readable name for **DDS_TimeBasedFilterQosPolicy** (p. 1111).

7.145.1 Detailed Description

Filter that allows a **DDSDataReader** (p. 1272) to specify that it is interested only in (potentially) a subset of the values of the data.

7.145.2 Variable Documentation

7.145.2.1 DDS_TIMEBASEDFILTER_QOS_POLICY_NAME

```
const char* const DDS_TIMEBASEDFILTER_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TimeBasedFilterQosPolicy** (p. 1111).

7.146 TOPIC_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Classes

- struct **DDS_TopicDataQosPolicy**

*Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.*

Variables

- const char *const **DDS_TOPICDATA_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_TopicDataQosPolicy** (p. 1118).*

7.146.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

7.146.2 Variable Documentation

7.146.2.1 DDS_TOPICDATA_QOS_POLICY_NAME

```
const char* const DDS_TOPICDATA_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TopicDataQosPolicy** (p. 1118).

7.147 TOPIC_QUERY_DISPATCH

Configures the ability of a **DDSDataWriter** (p. 1305) to publish historical samples.

Classes

- struct **DDS_TopicQueryDispatchQosPolicy**
*Configures the ability of a **DDSDataWriter** (p. 1305) to publish samples in response to a **DDSTopicQuery** (p. 1611).*

Variables

- const char *const **DDS_TOPICQUERYDISPATCH_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_TopicQueryDispatchQosPolicy** (p. 1126).*

7.147.1 Detailed Description

Configures the ability of a **DDSDataWriter** (p. 1305) to publish historical samples.

7.147.2 Variable Documentation

7.147.2.1 DDS_TOPICQUERYDISPATCH_QOS_POLICY_NAME

```
const char* const DDS_TOPICQUERYDISPATCH_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TopicQueryDispatchQosPolicy** (p. 1126).

7.148 TRANSPORT_BUILTIN

<<**extension**>> (p. 236) Specifies which built-in transports are used.

Classes

- struct **DDS_TransportBuiltinQosPolicy**
Specifies which built-in transports are used.

Macros

- #define **DDS_TRANSPORTBUILTIN_MASK_NONE**
*None of the built-in transports will be registered automatically when the **DDSDomainParticipant** (p. 1335) is enabled.*
- #define **DDS_TRANSPORTBUILTIN_MASK_DEFAULT**
*The default value of **DDS_TransportBuiltinQosPolicy::mask** (p. 1130).*
- #define **DDS_TRANSPORTBUILTIN_MASK_ALL**
*All the available built-in transports are registered automatically when the **DDSDomainParticipant** (p. 1335) is enabled.*

Typedefs

- typedef **DDS_Long DDS_TransportBuiltinKindMask**
*A mask of **DDS_TransportBuiltinKind** (p. 445) bits.*

Enumerations

- enum **DDS_TransportBuiltinKind** {
DDS_TRANSPORTBUILTIN_UDPv4 ,
DDS_TRANSPORTBUILTIN_SHMEM ,
DDS_TRANSPORTBUILTIN_INTRA = 0x00000001 << 2 ,
DDS_TRANSPORTBUILTIN_UDPv6 ,
DDS_TRANSPORTBUILTIN_UDPv4_WAN }
Built-in transport kind.

Variables

- const char *const **DDS_TRANSPORTBUILTIN_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_TransportBuiltinQosPolicy** (p. 1129).*
- const char *const **DDS_TRANSPORTBUILTIN_SHMEM_ALIAS**
Alias name for the shared memory built-in transport: "builtin.shmem".
- const char *const **DDS_TRANSPORTBUILTIN_UDPv4_ALIAS**
Alias name for the UDPv4 built-in transport: "builtin.udpv4".
- const char *const **DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS**
Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".
- const char *const **DDS_TRANSPORTBUILTIN_UDPv6_ALIAS**
Alias name for the UDPv6 built-in transport: "builtin.udpv6".

7.148.1 Detailed Description

<<**extension**>> (p. 236) Specifies which built-in transports are used.

See also

Changing the automatically registered built-in transports (p. 215)

7.148.2 Macro Definition Documentation

7.148.2.1 DDS_TRANSPORTBUILTIN_MASK_NONE

```
#define DDS_TRANSPORTBUILTIN_MASK_NONE
```

None of the built-in transports will be registered automatically when the **DDSDomainParticipant** (p. 1335) is enabled.

The user must explicitly register transports using **NDDSTransportSupport::register_transport** (p. 1811).

See also

DDS_TransportBuiltinKindMask (p. 445)

7.148.2.2 DDS_TRANSPORTBUILTIN_MASK_DEFAULT

```
#define DDS_TRANSPORTBUILTIN_MASK_DEFAULT
```

The default value of **DDS_TransportBuiltinQosPolicy::mask** (p. 1130).

The set of builtin transport plugins that will be automatically registered with the participant by default. The user can register additional transports using **NDDSTransportSupport::register_transport** (p. 1811).

[default] [UDPv4|Shmem]

See also

DDS_TransportBuiltinKindMask (p. 445)

7.148.2.3 DDS_TRANSPORTBUILTIN_MASK_ALL

```
#define DDS_TRANSPORTBUILTIN_MASK_ALL
```

All the available built-in transports are registered automatically when the **DDSDomainParticipant** (p. 1335) is enabled.

See also

DDS_TransportBuiltinKindMask (p. 445)

7.148.3 Typedef Documentation

7.148.3.1 DDS_TransportBuiltinKindMask

```
typedef DDS_Long DDS_TransportBuiltinKindMask
```

A mask of **DDS_TransportBuiltinKind** (p. 445) bits.

QoS:

DDS_TransportBuiltinQosPolicy (p. 1129)

7.148.4 Enumeration Type Documentation

7.148.4.1 DDS_TransportBuiltinKind

```
enum DDS_TransportBuiltinKind
```

Built-in transport kind.

See also

DDS_TransportBuiltinKindMask (p. 445)

Enumerator

DDS_TRANSPORTBUILTIN_UDPv4	Built-in UDPv4 transport, :: UDPv4 Transport (p. 266).
DDS_TRANSPORTBUILTIN_SHMEM	Built-in shared memory transport, :: Shared Memory Transport (p. 259).
DDS_TRANSPORTBUILTIN_UDPv6	Built-in UDPv6 transport, :: UDPv6 Transport (p. 282).
DDS_TRANSPORTBUILTIN_UDPv4_WAN	Built-in UDPv4 asymmetric transport, :: Real-Time WAN Transport (p. 276).
Generated by Doxygen	

7.148.5 Variable Documentation

7.148.5.1 DDS_TRANSPORTBUILTIN_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTBUILTIN_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TransportBuiltinQosPolicy** (p. 1129).

7.148.5.2 DDS_TRANSPORTBUILTIN_SHMEM_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_SHMEM_ALIAS [extern]
```

Alias name for the shared memory built-in transport: "builtin.shmem".

7.148.5.3 DDS_TRANSPORTBUILTIN_UDPv4_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv4_ALIAS [extern]
```

Alias name for the UDPv4 built-in transport: "builtin.udpv4".

7.148.5.4 DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS [extern]
```

Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".

7.148.5.5 DDS_TRANSPORTBUILTIN_UDPv6_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv6_ALIAS [extern]
```

Alias name for the UDPv6 built-in transport: "builtin.udpv6".

7.149 TRANSPORT_MULTICAST

<<**extension**>> (p. 236) Specifies the multicast address on which a **DDSDataReader** (p. 1272) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDSDomainParticipant** (p. 1335) level) transports with which to receive the multicast data.

Modules

- **Multicast Settings**
Multicast communication settings.
- **Multicast Mapping**
Multicast communication mapping.

Classes

- struct **DDS_TransportMulticastQosPolicy**
*Specifies the multicast address on which a **DDSDataReader** (p. 1272) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDSDomainParticipant** (p. 1335) level) transports with which to receive the multicast data.*

Enumerations

- enum **DDS_TransportMulticastQosPolicyKind** {
 DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS ,
 DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_QOS }
Transport Multicast Policy Kind.

Variables

- const char *const **DDS_TRANSPORTMULTICAST_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_TransportMulticastQosPolicy** (p. 1136).*

7.149.1 Detailed Description

<<**extension**>> (p. 236) Specifies the multicast address on which a **DDSDataReader** (p. 1272) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDSDomainParticipant** (p. 1335) level) transports with which to receive the multicast data.

7.149.2 Enumeration Type Documentation

7.149.2.1 DDS_TransportMulticastQosPolicyKind

```
enum DDS_TransportMulticastQosPolicyKind
```

Transport Multicast Policy Kind.

See also

DDS_TransportMulticastQosPolicy (p. 1136)

Enumerator

DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS	Selects the multicast address automatically. NOTE: This setting is required when using the DDS_TransportMulticastMappingQosPolicy (p. 1134).
DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_QOS	Selects a unicast-only mode.

7.149.3 Variable Documentation

7.149.3.1 DDS_TRANSPORTMULTICAST_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTMULTICAST_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TransportMulticastQosPolicy** (p. 1136).

7.150 TRANSPORT_MULTICAST_MAPPING

<<**extension**>> (p. 236) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

Classes

- struct **DDS_TransportMulticastMappingQosPolicy**

Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

Variables

- const char *const **DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_TransportMulticastMappingQosPolicy** (p. 1134).*

7.150.1 Detailed Description

<<**extension**>> (p. 236) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

7.150.2 Variable Documentation

7.150.2.1 DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TransportMulticastMappingQosPolicy** (p. 1134).

7.151 TRANSPORT_PRIORITY

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

Classes

- struct **DDS_TransportPriorityQosPolicy**

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

Variables

- const char *const **DDS_TRANSPORTPRIORITY_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_TransportPriorityQosPolicy** (p. 1140).*

7.151.1 Detailed Description

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

7.151.2 Variable Documentation

7.151.2.1 DDS_TRANSPORTPRIORITY_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTPRIORITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TransportPriorityQosPolicy** (p. 1140).

7.152 TRANSPORT_SELECTION

<<*extension*>> (p. 236) Specifies the physical transports that a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272) may use to send or receive data.

Classes

- struct **DDS_TransportSelectionQosPolicy**

*Specifies the physical transports a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272) may use to send or receive data.*

Variables

- const char *const **DDS_TRANSPORTSELECTION_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_TransportSelectionQosPolicy** (p. 1142).*

7.152.1 Detailed Description

<<*extension*>> (p. 236) Specifies the physical transports that a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272) may use to send or receive data.

7.152.2 Variable Documentation

7.152.2.1 DDS_TRANSPORTSELECTION_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTSELECTION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TransportSelectionQosPolicy** (p. 1142).

7.153 TRANSPORT_UNICAST

<<*extension*>> (p. 236) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Modules

- **Unicast Settings**

Unicast communication settings.

Classes

- struct **DDS_TransportUnicastQosPolicy**

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Variables

- const char *const **DDS_TRANSPORTUNICAST_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_TransportUnicastQosPolicy** (p. 1143).*

7.153.1 Detailed Description

<<*extension*>> (p. 236) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

7.153.2 Variable Documentation

7.153.2.1 DDS_TRANSPORTUNICAST_QOS_POLICY_NAME

```
const char* const DDS_TRANSPORTUNICAST_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TransportUnicastQosPolicy** (p. 1143).

7.154 TYPE_CONSISTENCY_ENFORCEMENT

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Classes

- struct **DDS_TypeConsistencyEnforcementQosPolicy**

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

Enumerations

- enum **DDS_TypeConsistencyKind** {
DDS_DISALLOW_TYPE_COERCION ,
DDS_ALLOW_TYPE_COERCION ,
DDS_AUTO_TYPE_COERCION }

Kinds of type consistency.

Variables

- `const char *const DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME`

*Stringified human-readable name for **DDS_TypeConsistencyEnforcementQosPolicy** (p. 1211).*

7.154.1 Detailed Description

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

7.154.2 Enumeration Type Documentation

7.154.2.1 DDS_TypeConsistencyKind

```
enum DDS_TypeConsistencyKind
```

Kinds of type consistency.

QoS:

DDS_TypeConsistencyEnforcementQosPolicy (p. 1211)

Enumerator

DDS_DISALLOW_TYPE_COERCION	The DataWriter and the DataReader must support the same data type in order for them to communicate. This is the degree of type consistency enforcement required by the <code>OMG DDS Specification</code> prior to the <code>OMG Extensible and Dynamic Topic Types for DDS Specification</code> .
DDS_ALLOW_TYPE_COERCION	<p>The DataWriter and the DataReader need not support the same data type in order for them to communicate as long as the DataReader's type is assignable from the DataWriter's type. For example, the following two extensible types will be assignable to each other since <code>MyDerivedType</code> contains all the members of <code>MyBaseType</code> (<code>member_1</code>) plus some additional elements (<code>member_2</code>).</p> <pre>struct MyBaseType { long member_1; }; struct MyDerivedType: MyBaseType { long member_2; };</pre> <p>Even if <code>MyDerivedType</code> was not explicitly inheriting from <code>MyBaseType</code> the types would still be assignable. For example:</p> <pre>struct MyBaseType { long member_1; }; struct MyDerivedType { long member_1; long member_2; };</pre> <p>For additional information on type assignability refer to the <code>OMG Extensible and Dynamic Topic Types for DDS Specification</code>.</p>
DDS_AUTO_TYPE_COERCION	This AUTO value will be applied as DDS_DISALLOW_TYPE_COERCION (p. 452) when the data type is annotated with <code>@transfer_mode(SHMEM_REF)</code> while using C, Traditional C++, or Modern C++ APIs. In all other cases, this AUTO value will be applied as DDS_ALLOW_TYPE_COERCION (p. 452). [default]

7.154.3 Variable Documentation

7.154.3.1 DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME

```
const char* const DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TypeConsistencyEnforcementQosPolicy** (p. 1211).

7.155 TYPESUPPORT

<<**extension**>> (p. 236) Allows you to attach application-specific values to a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

Classes

- struct **DDS_TypeSupportQosPolicy**

*Allows you to attach application-specific values to a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.*

Enumerations

- enum **DDS_CdrPaddingKind** {
DDS_ZERO_CDR_PADDING ,
DDS_NOT_SET_CDR_PADDING ,
DDS_AUTO_CDR_PADDING }

The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.

Variables

- const char *const **DDS_TYPESUPPORT_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_TypeSupportQosPolicy** (p. 1216).*

7.155.1 Detailed Description

<<**extension**>> (p. 236) Allows you to attach application-specific values to a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

7.155.2 Enumeration Type Documentation

7.155.2.1 DDS_CdrPaddingKind

`enum` **DDS_CdrPaddingKind**

The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.

Enumerator

DDS_ZERO_CDR_PADDING	Padding bytes will be set to zeros during CDR serialization.
DDS_NOT_SET_CDR_PADDING	Padding bytes will not be set to any value during CDR serialization.
DDS_AUTO_CDR_PADDING	When set on a DDSDomainParticipant (p. 1335) the default behavior is DDS_NOT_SET_CDR_PADDING (p. 455). When set on a DDSDataWriter (p. 1305) or DDSDataReader (p. 1272) the behavior is to inherit the value from the DDSDomainParticipant (p. 1335).

7.155.3 Variable Documentation

7.155.3.1 DDS_TYPESUPPORT_QOS_POLICY_NAME

```
const char* const DDS_TYPESUPPORT_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_TypeSupportQosPolicy** (p. 1216).

7.156 USER_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Classes

- struct **DDS_UserDataQosPolicy**

*Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.*

Variables

- const char *const **DDS_USERDATA_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_UserDataQosPolicy** (p. 1221).*

7.156.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

7.156.2 Variable Documentation

7.156.2.1 DDS_USERDATA_QOS_POLICY_NAME

```
const char* const DDS_USERDATA_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_UserDataQosPolicy** (p. 1221).

7.157 WRITER_DATA_LIFECYCLE

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

Classes

- struct **DDS_WriterDataLifecycleQosPolicy**

*Controls how a **DDSDDataWriter** (p. 1305) handles the lifecycle of the instances (keys) that it is registered to manage.*

Variables

- const char *const **DDS_WRITERDATALIFECYCLE_QOS_POLICY_NAME**

*Stringified human-readable name for **DDS_WriterDataLifecycleQosPolicy** (p. 1240).*

7.157.1 Detailed Description

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

7.157.2 Variable Documentation

7.157.2.1 DDS_WRITERDATALIFECYCLE_QOS_POLICY_NAME

```
const char* const DDS_WRITERDATALIFECYCLE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_WriterDataLifecycleQosPolicy** (p. 1240).

7.158 WIRE_PROTOCOL

<<**extension**>> (p. 236) Specifies the wire protocol related attributes for the **DDSDomainParticipant** (p. 1335).

Classes

- struct **DDS_RtpsWellKnownPorts_t**
RTPS well-known port mapping configuration.
- struct **DDS_WireProtocolQosPolicy**
*Specifies the wire-protocol-related attributes for the **DDSDomainParticipant** (p. 1335).*

Macros

- #define **DDS_RTPS_RESERVED_PORT_MASK_DEFAULT**
*The default value of **DDS_WireProtocolQosPolicy::rtps_reserved_port_mask** (p. 1233).*
- #define **DDS_RTPS_RESERVED_PORT_MASK_NONE**
No bits are set.
- #define **DDS_RTPS_RESERVED_PORT_MASK_ALL**
All bits are set.

Typedefs

- typedef **DDS_Long DDS_RtpsReservedPortKindMask**
*A mask of **DDS_RtpsReservedPortKind** (p. 459) bits.*

Enumerations

- enum **DDS_RtpsReservedPortKind** {
DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST = 0x0001 << 0 ,
DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST = 0x0001 << 1 ,
DDS_RTPS_RESERVED_PORT_USER_UNICAST = 0x0001 << 2 ,
DDS_RTPS_RESERVED_PORT_USER_MULTICAST = 0x0001 << 3 }
RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.
- enum **DDS_WireProtocolQosPolicyAutoKind** {
DDS_RTPS_AUTO_ID_FROM_IP = 0 ,
DDS_RTPS_AUTO_ID_FROM_MAC = 1 ,
DDS_RTPS_AUTO_ID_FROM_UUID = 2 }
Mechanism to automatically calculate the GUID prefix.

Variables

- const struct **DDS_RtpsWellKnownPorts_t DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS**
Assign to use well-known port mappings which are compatible with previous versions of the RTI Connext middleware.
- const struct **DDS_RtpsWellKnownPorts_t DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS**
Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.
- const char *const **DDS_WIREPROTOCOL_QOS_POLICY_NAME**
*Stringified human-readable name for **DDS_WireProtocolQosPolicy** (p. 1228).*

7.158.1 Detailed Description

<<*extension*>> (p. 236) Specifies the wire protocol related attributes for the **DDSDomainParticipant** (p. 1335).

7.158.2 Macro Definition Documentation

7.158.2.1 DDS_RTPS_RESERVED_PORT_MASK_DEFAULT

```
#define DDS_RTPS_RESERVED_PORT_MASK_DEFAULT
```

Value:

```
((DDS_RtpsReservedPortKindMask) DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST \
 | DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST | DDS_RTPS_RESERVED_PORT_USER_UNICAST)
```

The default value of **DDS_WireProtocolQosPolicy::rtps_reserved_port_mask** (p. 1233).

Most of the ports that may be needed by DDS will be reserved by the transport when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **DDS_RtpsWellKnownPorts_t** (p. 1062) will be detected at this time and the enable operation will fail.

This setting will avoid reserving the **usertraffic** multicast port, which is not actually used unless there are DataReaders that enable multicast but fail to specify a port.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

DDS_RtpsReservedPortKindMask (p. 459)

7.158.2.2 DDS_RTPS_RESERVED_PORT_MASK_NONE

```
#define DDS_RTPS_RESERVED_PORT_MASK_NONE
```

No bits are set.

None of the ports that are needed by DDS will be allocated until they are specifically required. With this value set, automatic participant ID selection will be based on selecting a port for discovery (metatraffic) unicast traffic on a single transport.

See also

DDS_RtpsReservedPortKindMask (p. 459)

7.158.2.3 DDS_RTPS_RESERVED_PORT_MASK_ALL

```
#define DDS_RTPS_RESERVED_PORT_MASK_ALL
```

All bits are set.

All of the ports that may be needed by DDS will be reserved when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **DDS_RtpsWellKnownPorts_t** (p. 1062) will be detected at this time, and the enable operation will fail.

Note that this will also reserve the **usertraffic** multicast port which is not actually used unless there are DataReaders that enable multicast but fail to specify a port. To avoid unnecessary resource usage for these ports, use **RTPS_RESERVED_PORT_MASK_DEFAULT**.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

DDS_RtpsReservedPortKindMask (p. 459)

7.158.3 Typedef Documentation

7.158.3.1 DDS_RtpsReservedPortKindMask

```
typedef DDS_Long DDS_RtpsReservedPortKindMask
```

A mask of **DDS_RtpsReservedPortKind** (p. 459) bits.

QoS:

DDS_WireProtocolQosPolicy (p. 1228)

7.158.4 Enumeration Type Documentation

7.158.4.1 DDS_RtpsReservedPortKind

```
enum DDS_RtpsReservedPortKind
```

RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.

See also

DDS_WireProtocolQosPolicy::rtps_reserved_port_mask (p. 1233)

Enumerator

DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST	Select the metatraffic unicast port.
DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST	Select the metatraffic multicast port.
DDS_RTPS_RESERVED_PORT_USER_UNICAST	Select the usertraffic unicast port.
DDS_RTPS_RESERVED_PORT_USER_MULTICAST	Select the usertraffic multicast port.

7.158.4.2 DDS_WireProtocolQosPolicyAutoKind

```
enum DDS_WireProtocolQosPolicyAutoKind
```

Mechanism to automatically calculate the GUID prefix.

See also

DDS_WireProtocolQosPolicy::rtps_auto_id_kind (p. 1233)

Enumerator

DDS_RTPS_AUTO_ID_FROM_IP	Builds the GUID prefix using the IPv4 address and process ID. Uses the IPv4 address of the first up-and-running interface of the host machine and the process ID to build the GUID prefix.
DDS_RTPS_AUTO_ID_FROM_MAC	Builds the GUID prefix using the MAC address and process ID. Uses the first 32 bits of the MAC address assigned to the first up-and-running interface and the process ID to build the GUID prefix. Note to Android Users: DDS_RTPS_AUTO_ID_FROM_MAC is not supported in recent versions of Android (6.0 and later).
DDS_RTPS_AUTO_ID_FROM_UUID	Builds the GUID prefix by selecting the UUID-based algorithm (default). This method of generating the GUID prefix does not require having a network interface and is friendly to IP mobility scenarios in which an RTI Connext application may start in a node that does not have a physical network interface enabled.

7.158.5 Variable Documentation

7.158.5.1 DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS

```
const struct DDS_RtpsWellKnownPorts_t DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS [extern]
```

Assign to use well-known port mappings which are compatible with previous versions of the RTI Connext middleware.

Assign **DDS_WireProtocolQosPolicy::rtps_well_known_ports** (p. 1233) to this value to remain compatible with previous versions of the RTI Connext middleware that used fixed port mappings.

The following are the `rtps_well_known_ports` values for **DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS** (p. 460):

```
port_base = 7400
domain_id_gain = 10
participant_id_gain = 1000
builtin_multicast_port_offset = 2
builtin_unicast_port_offset = 0
user_multicast_port_offset = 1
user_unicast_port_offset = 3
```

These settings are *not* compliant with OMG's DDS Interoperability Wire Protocol. To comply with the specification, please use **DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS** (p. 461).

See also

DDS_WireProtocolQosPolicy::rtps_well_known_ports (p. 1233)

DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS (p. 461)

7.158.5.2 DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS

```
const struct DDS_RtpsWellKnownPorts_t DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS [extern]
```

Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

Assign **DDS_WireProtocolQosPolicy::rtps_well_known_ports** (p. 1233) to this value to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

The following are the `rtps_well_known_ports` values for **DDS_INTEROPERABLE_RTPS_WELL_KNOWN_PORTS** (p. 461):

```
port_base = 7400
domain_id_gain = 250
participant_id_gain = 2
builtin_multicast_port_offset = 0
builtin_unicast_port_offset = 10
user_multicast_port_offset = 1
user_unicast_port_offset = 11
```

Assuming a maximum port number of 65535 (UDPv4), the above settings enable the use of about 230 domains with up to 120 Participants per node per domain.

These settings are *not* backwards compatible with previous versions of the RTI Connext middleware that used fixed port mappings. For backwards compability, please use **DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS** (p. 460).

See also

DDS_WireProtocolQosPolicy::rtps_well_known_ports (p. 1233)

DDS_RTI_BACKWARDS_COMPATIBLE_RTPS_WELL_KNOWN_PORTS (p. 460)

7.158.5.3 DDS_WIREPROTOCOL_QOS_POLICY_NAME

```
const char* const DDS_WIREPROTOCOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS_WireProtocolQosPolicy** (p. 1228).

7.159 Extended Qos Support

<<**extension**>> (p. 236) Types and defines used in extended QoS policies.

Modules

- **Thread Settings**

The properties of a thread of execution. Consult Platform Notes for additional platform specific details.

Classes

- struct **DDS_RtpsReliableReaderProtocol_t**

Qos related to reliable reader protocol defined in RTPS.

- struct **DDS_RtpsReliableWriterProtocol_t**

QoS related to the reliable writer protocol defined in RTPS.

7.159.1 Detailed Description

<<**extension**>> (p. 236) Types and defines used in extended QoS policies.

7.160 Unicast Settings

Unicast communication settings.

Classes

- struct **DDS_TransportUnicastSettings_t**

Type representing a list of unicast locators.

- struct **DDS_TransportUnicastSettingsSeq**

Declares IDL sequence < DDS_TransportUnicastSettings_t (p. 1145) >

7.160.1 Detailed Description

Unicast communication settings.

7.161 Multicast Settings

Multicast communication settings.

Classes

- struct **DDS_TransportMulticastSettings_t**
Type representing a list of multicast locators.
- struct **DDS_TransportMulticastSettingsSeq**
Declares IDL sequence < DDS_TransportMulticastSettings_t (p. 1138) >

7.161.1 Detailed Description

Multicast communication settings.

7.162 Multicast Mapping

Multicast communication mapping.

Classes

- struct **DDS_TransportMulticastMappingFunction_t**
Type representing an external mapping function.
- struct **DDS_TransportMulticastMapping_t**
Type representing a list of multicast mapping elements.
- struct **DDS_TransportMulticastMappingSeq**
Declares IDL sequence < DDS_TransportMulticastMapping_t (p. 1132) >

7.162.1 Detailed Description

Multicast communication mapping.

7.163 NDDS_DISCOVERY_PEERS

Environment variable or a file that specifies the default values of **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 727) contained in the **DDS_DomainParticipantQos**↵
::discovery (p. 738) qos policy.

Environment variable or a file that specifies the default values of **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 727) contained in the **DDS_DomainParticipantQos**↵
::discovery (p. 738) qos policy.

The default value of the **DDS_DomainParticipantQos** (p. 735) is obtained by calling **DDSDomainParticipantFactory**↵
::get_default_participant_qos() (p. 1415).

NDDS_DISCOVERY_PEERS specifies the default value of the **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) and **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 727) fields, when the default participant QoS policies have not been explicitly set by the user (i.e., **DDSDomainParticipantFactory::set_default_participant_qos()** (p. 1413) has never been called or was called using **DDS_PARTICIPANT_QOS_DEFAULT** (p. 48)).

If NDDS_DISCOVERY_PEERS does *not* contain a multicast address, then the string sequence **DDS_DiscoveryQos**↵
Policy::multicast_receive_addresses (p. 727) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS_DISCOVERY_PEERS contains one or more multicast addresses, the addresses will be stored in **DDS**↵
DiscoveryQosPolicy::multicast_receive_addresses (p. 727), starting at element 0. They will be stored in the order in which they appear in NDDS_DISCOVERY_PEERS.

Note: IPv4 multicast addresses must have a prefix. Therefore, when using the UDPv6 transport: if there are any IPv4 multicast addresses in the peers list, make sure they have "udp4://" in front of them (such as udp4://239.255.0.1).

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **DDS**↵
DiscoveryQosPolicy::multicast_receive_addresses (p. 727).

NDDS_DISCOVERY_PEERS provides a mechanism to dynamically switch the discovery configuration of an RTI Connext application without recompilation. The application programmer is free to not use the default values; instead use values supplied by other means.

NDDS_DISCOVERY_PEERS can be specified either in an environment variable as comma (',') separated "peer descriptors" (see **Peer Descriptor Format** (p. 465)) or in a file. These formats are described below.

7.163.1 Peer Descriptor Format

A **peer descriptor** string specifies a range of participants at a given `locator`. Peer descriptor strings are used in the `DDS_DiscoveryQosPolicy::initial_peers` (p. 726) field and the `DDSDomainParticipant::add_peer()` (p. 1392) operation.

The anatomy of a `peer` descriptor is illustrated below using a UDPv4 transport and a custom "StarFabric" transport example.

A peer descriptor consists of:

optional **Participant ID Limit**. If a simple integer is specified, it indicates the maximum participant ID to be contacted by the RTI Connex discovery mechanism at the given `locator`. If that integer is enclosed in square brackets (e.g.: [2]) *only* that Participant ID will be used. You can also specify a range in the form of [a-b]: in this case only the Participant IDs in that specific range are contacted. If omitted, a default value of 4 is implied: participant IDs 0,1,2,3, and 4 will be contacted.

- **Locator**. See **Locator Format** (p. ??).

These are separated by the '@' character. The separator may be omitted if a participant ID limit is not explicitly specified.

Note that the "participant ID limit" only applies to unicast locators; it is ignored for multicast locators (and therefore should be omitted for multicast peer descriptors).

7.163.1.1 Locator Format

A **locator** string specifies a transport and an address in string format. Locators are used to form peer descriptors. A locator is equivalent to a peer descriptor with the default maximum participant ID.

A locator consists of:

optional **Transport name** (**alias** or **class**). This identifies the set of transport plugins (**Transport Aliases** (p. ??)) that may be used to parse the `address` portion of the locator. Note that a transport class name is an implicit alias that is used to refer to all the transport plugin instances of that class.

optional **Address**. See **Address Format** (p. ??).

These are separated by the "://" string. The separator is specified if and only if a transport name is specified.

If a transport name is specified, the address may be omitted; in that case, all the unicast addresses (across all transport plugin instances) associated with the transport class are implied. Thus, a locator string may specify several addresses.

If an address is specified, the transport name and the separator string may be omitted; in that case all the available transport plugins (for the **DDSEntity** (p. 1446)) may be used to parse the address string.

7.163.1.2 Address Format

An **address** string specifies a transport-independent network address that qualifies a **transport-dependent** address string. Addresses are used to form locators. Addresses are also used in **DDS_DiscoveryQosPolicy::multicast_receive_addresses** (p. 727), and **DDS_TransportMulticastSettings_t::receive_address** (p. 1139) fields. An address is equivalent to a locator in which the transport name and separator are omitted.

An address consists of:

optional **Network Address**. An address in IPv4 or IPv6 string notation. If omitted, the network address of the transport is implied (**Transport Network Address** (p. ??)).

optional **Transport Address**. A string that is passed to the transport for processing. The transport maps this string into **NDDS_Transport_Property_t::address_bit_count** (p. 1760) bits. If omitted the network address is used as the fully qualified address.

These are separated by the '#' character. If a separator is specified, it must be followed by a non-empty string which is passed to the transport plugin. If the separator is omitted, it is treated as a transport address with an implicit network address (of the transport plugin). The implicit network address is the address used when registering the transport: e.g., the UDPv4 implicit network address is 0.0.0.0.0.0.0.0.0.0.

The bits resulting from the transport address string are prepended with the network address. The least significant **NDDS_Transport_Property_t::address_bit_count** (p. 1760) bits of the network address are ignored (**Transport Network Address** (p. ??)).

7.163.2 NDDS_DISCOVERY_PEERS Environment Variable Format

NDDS_DISCOVERY_PEERS can be specified via an environment variable of the same name, consisting of a sequence of peer descriptors separated by the comma (',') character.

Examples

Multicast (maximum participant ID is irrelevant)

- 239.255.0.1

Default maximum participant ID on localhost

- localhost

Default maximum participant ID on host 192.168.1.1 (IPv4)

- 192.168.1.1

Default maximum participant ID on host FAA0::0 (IPv6)

- FAA0::1

Default maximum participant ID on host himalaya accessed using the "udp4" transport plugin(s) (IPv4)

- udp4://himalaya

Default maximum participant ID on localhost using the "udp4" transport plugin(s) registered at network address FAA0::0

- udp4://FAA0::0#localhost

Default maximum participant ID on host 0/0/R (StarFabric)

- 0/0/R
- #0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s)

- starfabric://0/0/R
- starfabric://#0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s) registered at network address FAA0::0

- starfabric://FBB0::0#0/0/R

Default maximum participant ID on all unicast addresses accessed via the "starfabric" (StarFabric) transport plugin(s)

- starfabric://

Default maximum participant ID on all unicast addresses accessed via the "shmem" (shared memory) transport plugin(s) registered at network address FCC0::0

- shmem://FCC0::0

Default maximum participant ID on hosts himalaya and gangotri

- himalaya,gangotri

Maximum participant ID of 1 on hosts himalaya and gangotri

- 1@himalaya,1@gangotri

Combinations of above

- 239.255.0.1,localhost,192.168.1.1,0/0/R
- FAA0::1,FAA0::0#localhost,FBB0::0#0/0/R
- udp4://himalaya,udp4://FAA0::0#localhost,#0/0/R
- starfabric://0/0/R,starfabric://FBB0::0#0/0/R,shmem://
- starfabric://,shmem://FCC0::0,1@himalaya,1@gangotri

7.163.3 NDDS_DISCOVERY_PEERS File Format

NDDS_DISCOVERY_PEERS can be specified via a file of the same name in the program's current working directory. A NDDS_DISCOVERY_PEERS file would contain a sequence of peer descriptors separated by whitespace or the comma (',') character. The file may also contain comments starting with a semicolon (';') character till the end of the line.

Example:

```
;; NDDS_DISCOVERY_PEERS - Discovery Configuration File
;;
;;
;; NOTE:
;;   1. This file must be in the current working directory, i.e.
;;      in the folder from which the application is launched.
;;
;;   2. This file takes precedence over the environment variable NDDS_DISCOVERY_PEERS
;;

;; Multicast
239.255.0.1           ; The default dds discovery multicast address

;; Unicast
localhost,192.168.1.1 ; A comma can be used a separator
FAA0::1 FAA0::0#localhost ; Whitespace can be used as a separator
1@himalaya           ; Maximum participant ID of 1 on 'himalaya'
1@gangotri

;; UDPv4
udp4://himalaya       ; 'himalaya' via 'udp4' transport plugin(s)
udp4://FAA0::0#localhost ; 'localhost' via 'udp4' transport
                        ; plugin registered at network address FAA0::0

;; Shared Memory
shmem://              ; All 'shmem' transport plugin(s)
builtin.shmem://      ; The builtin 'shmem' transport plugin
shmem://FCC0::0       ; Shared memory transport plugin registered
                        ; at network address FCC0::0

;; StarFabric
0/0/R                 ; StarFabric node 0/0/R
starfabric://0/0/R    ; 0/0/R accessed via 'starfabric'
                        ; transport plugin(s)
starfabric://FBB0::0#0/0/R ; StarFabric transport plugin registered
                        ; at network address FBB0::0
starfabric://          ; All 'starfabric' transport plugin(s)
```

7.163.4 NDDS_DISCOVERY_PEERS Precedence

If the current working directory from which the RTI Connext application is launched contains a file called NDDS_↔
DISCOVERY_PEERS, and an environment variable named NDDS_DISCOVERY_PEERS is also defined, the file takes precedence; the environment variable is ignored.

7.163.5 NDDS_DISCOVERY_PEERS Default Value

If NDDS_DISCOVERY_PEERS is not specified (either as a file in the current working directory, or as an environment variable), it implicitly defaults to the following.

```

;; Multicast (only on platforms which allow UDPv4 multicast out of the box)
;;
;; This allows any dds applications anywhere on the local network to
;; discover each other over UDPv4.
builtin.udpv4://239.255.0.1 ; dds's default discovery multicast address
                           ; This is also the default multicast receive address

;; Unicast - UDPv4 (on all platforms)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over UDP/IPv4.
builtin.udpv4://127.0.0.1

;; Unicast - Shared Memory (only on platforms that support shared memory)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over shared memory.
builtin.shmem://

```

7.163.6 Builtin Transport Class Names

The class names for the builtin transport plugins are:

- `shmem - ::Shared Memory Transport` (p. 259)
- `udpv4 - ::UDPv4 Transport` (p. 266)
- `udpv6 - ::UDPv6 Transport` (p. 282)

These may be used as the transport names in the **Locator Format** (p. ??).

7.163.7 NDDS_DISCOVERY_PEERS and Local Host Communication

Suppose you want to communicate with other RTI Connex applications on the same host and you are setting `NDDS_DISCOVERY_PEERS` explicitly (generally in order to use unicast discovery with applications on other hosts).

If the local host platform does not support the shared memory transport, then you can include the name of the local host in the `NDDS_DISCOVERY_PEERS` list.

If the local host platform supports the shared memory transport, then you can do one of the following:

- Include `"shmem://"` in the `NDDS_DISCOVERY_PEERS` list. This will cause shared memory to be used for discovery and data traffic for applications on the same host.

or:

- Include the name of the local host in the `NDDS_DISCOVERY_PEERS` list and disable the shared memory transport in the **DDS_TransportBuiltinQosPolicy** (p. 1129) of the **DDSDomainParticipant** (p. 1335). This will cause UDP loopback to be used for discovery and data traffic for applications on the same host.

(To check if your platform supports shared memory, see the `Platform Notes`.)

7.164 Entity Support

DDSEntity (p. 1446), **DDSListener** (p. 1509) and related items.

Classes

- class **DDSListener**
 <<*interface*>> (p. 236) Abstract base class for all Listener interfaces.
- class **DDSEntity**
 <<*interface*>> (p. 236) Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.
- class **DDSDomainEntity**
 <<*interface*>> (p. 236) Abstract base class for all DDS entities except for the **DDSDomainParticipant** (p. 1335).

7.164.1 Detailed Description

DDSEntity (p. 1446), **DDSListener** (p. 1509) and related items.

DDSEntity (p. 1446) subtypes are created and destroyed by factory objects. With the exception of **DDSDomainParticipant** (p. 1335), whose factory is **DDSDomainParticipantFactory** (p. 1409), all **DDSEntity** (p. 1446) factory objects are themselves **DDSEntity** (p. 1446) subtypes as well.

Important: all **DDSEntity** (p. 1446) delete operations are inherently thread-unsafe. The user must take extreme care that a given **DDSEntity** (p. 1446) is not destroyed in one thread while being used concurrently (including being deleted concurrently) in another thread. An operation's effect in the presence of the concurrent deletion of the operation's target **DDSEntity** (p. 1446) is undefined.

7.165 Conditions and WaitSets

DDSCondition (p. 1260) and **DDSWaitSet** (p. 1613) and related items.

Modules

- **AsyncWaitSet**

<<*extension*>> (p. 236) A specialization of **DDSWaitSet** (p. 1613) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDSCondition** (p. 1260).

Classes

- struct **DDS_WaitSetProperty_t**

<<*extension*>> (p. 236) Specifies the **DDSWaitSet** (p. 1613) behavior for multiple trigger events.

- struct **DDSConditionSeq**

Instantiates **FooSeq** (p. 1680) < **DDSCondition** (p. 1260) >

- class **DDSConditionHandler**

<<*extension*>> (p. 236) <<*interface*>> (p. 236) Handler called by the **DDSCondition::dispatch** (p. 1262).

- class **DDSCondition**

<<*interface*>> (p. 236) Root class for all the conditions that may be attached to a **DDSWaitSet** (p. 1613).

- class **DDSGuardCondition**

<<*interface*>> (p. 236) A specific **DDSCondition** (p. 1260) whose *trigger_value* is completely under the control of the application.

- class **DDSStatusCondition**

<<*interface*>> (p. 236) A specific **DDSCondition** (p. 1260) that is associated with each **DDSEntity** (p. 1446).

- class **DDSWaitSet**

<<*interface*>> (p. 236) Allows an application to wait until one or more of the attached **DDSCondition** (p. 1260) objects has a *trigger_value* of **DDS_BOOLEAN_TRUE** (p. 316) or else until the timeout expires.

Macros

- **#define DDS_WaitSetProperty_t_INITIALIZER**

<<*extension*>> (p. 236) Initializer for new property instances.

7.165.1 Detailed Description

DDSCondition (p. 1260) and **DDSWaitSet** (p. 1613) and related items.

7.165.2 Macro Definition Documentation

7.165.2.1 DDS_WaitSetProperty_t_INITIALIZER

```
#define DDS_WaitSetProperty_t_INITIALIZER
```

Value:

```
{ \
  1, DDS_DURATION_INFINITE_VALUE \
}
```

<<*extension*>> (p. 236) Initializer for new property instances.

Default property specifies `max_event_count = 1` and `max_event_delay = DDS_DURATION_INFINITE`

7.166 Cookie

<<*extension*>> (p. 236) Unique identifier for a written data sample

Classes

- struct **DDS_Cookie_t**
 <<*extension*>> (p. 236) *Sequence of bytes.*
- struct **DDS_CookieSeq**
 Declares IDL sequence < DDS_Cookie_t (p. 612) > .

Functions

- void * **DDS_Cookie_t::to_pointer** () const
 Returns a pointer stored in the cookie.

7.166.1 Detailed Description

<<*extension*>> (p. 236) Unique identifier for a written data sample

7.166.2 Function Documentation

7.166.2.1 to_pointer()

```
void * DDS_Cookie_t::to_pointer ( ) const
```

Returns a pointer stored in the cookie.

Precondition

The cookie's value was filled with a pointer; otherwise, the value returned may not be a valid memory address.

7.167 Sample Flags

<<*extension*>> (p. 236) Flags for samples.

Typedefs

- typedef enum **DDS_SampleFlagBits** **DDS_SampleFlagBits**

Type to identify the sample flags reserved by RTI.

- typedef **DDS_Long** **DDS_SampleFlag**

A set of flags that can be associated with a sample.

Enumerations

- enum **DDS_SampleFlagBits** {
DDS_REDELIVERED_SAMPLE ,
DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE ,
DDS_REPLICATE_SAMPLE ,
DDS_LAST_SHARED_READER_QUEUE_SAMPLE ,
DDS_INTERMEDIATE_TOPIC_QUERY_SAMPLE ,
DDS_WRITER_REMOVED_BATCH_SAMPLE = PRES_WRITER_REMOVED_BATCH_SAMPLE ,
DDS_DISCOVERY_SERVICE_SAMPLE = PRES_DISCOVERY_SERVICE_SAMPLE }

Type to identify the sample flags reserved by RTI.

7.167.1 Detailed Description

<<*extension*>> (p. 236) Flags for samples.

7.167.2 Typedef Documentation

7.167.2.1 DDS_SampleFlagBits

```
typedef enum DDS_SampleFlagBits DDS_SampleFlagBits
```

Type to identify the sample flags reserved by RTI.

7.167.2.2 DDS_SampleFlag

```
typedef DDS_Long DDS_SampleFlag
```

A set of flags that can be associated with a sample.

- Least-significant bits [0-7] are reserved by RTI
- Least-significant bits [8-15] are application specific
- Least-significant bits [16-31] are invalid and cannot be used

7.167.3 Enumeration Type Documentation

7.167.3.1 DDS_SampleFlagBits

enum **DDS_SampleFlagBits**

Type to identify the sample flags reserved by RTI.

Enumerator

DDS_REDELIVERED_SAMPLE	Indicates that a sample has been redelivered by RTI Queuing Service.
DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE	Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connex Repliers sending multiple responses for a request.
DDS_REPLICATE_SAMPLE	Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.
DDS_LAST_SHARED_READER_QUEUE_SAMPLE	Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.
DDS_INTERMEDIATE_TOPIC_QUERY_SAMPLE	Indicates that a sample for a TopicQuery will be followed by more samples. This flag only applies to samples that have been published as a response to a DDSTopicQuery (p. 1611). When this bit is not set and DDS_SampleInfo::topic_query_guid (p. 1077) is different from DDS_GUID_UNKNOWN (p. 330), this sample is the last sample for that TopicQuery coming from the DataWriter identified by DDS_SampleInfo::original_publication_virtual_guid (p. 1075).
DDS_WRITER_REMOVED_BATCH_SAMPLE	This flag will be set if the sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed. A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the DDS_KEEP_LAST_HISTORY_QOS (p. 406) DDS_HistoryQosPolicy (p. 906) QoS or because the duration in DDS_LifespanQosPolicy (p. 918) was reached. If the DataReader sets the property "dds.data_reader.accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.
DDS_DISCOVERY_SERVICE_SAMPLE	This flag will be set if the sample was sent by Cloud Discovery Service. The samples sent by Cloud Discovery Service are participant announcement samples on the ParticipantBuiltinTopic.

7.168 WriteParams

<<*extension*>> (p. 236)

Classes

- struct **DDS_SampleIdentity_t**
Type definition for a Sample Identity.
- struct **DDS_AckResponseData_t**
Data payload of an application-level acknowledgment.
- struct **DDS_WriteParams_t**
<<*extension*>> (p. 236) Input parameters for writing with **FooDataWriter::write_w_params** (p. 1671), **FooDataWriter::dispose_w_params** (p. 1674), **FooDataWriter::register_instance_w_params** (p. 1663), **FooDataWriter::unregister_instance_w_params** (p. 1666)

Functions

- **DDS_Boolean DDS_SampleIdentity_equals** (const struct **DDS_SampleIdentity_t** *self, const struct **DDS_SampleIdentity_t** *other)
Compares this sample identity with another sample identity for equality.
- void **DDS_WriteParams_reset** (struct **DDS_WriteParams_t** *self)
Resets all the fields to their default values.

Variables

- struct **DDS_GUID_t DDS_SampleIdentity_t::writer_guid**
16-byte identifier identifying the virtual GUID.
- struct **DDS_SequenceNumber_t DDS_SampleIdentity_t::sequence_number**
monotonically increasing 64-bit integer that identifies the sample in the data source.
- const struct **DDS_SampleIdentity_t DDS_AUTO_SAMPLE_IDENTITY**
The AUTO sample identity.
- const struct **DDS_SampleIdentity_t DDS_UNKNOWN_SAMPLE_IDENTITY**
An invalid or unknown sample identity.
- const struct **DDS_WriteParams_t DDS_WRITEPARAMS_DEFAULT**
*Initializer for **DDS_WriteParams_t** (p. 1234).*

7.168.1 Detailed Description

<<*extension*>> (p. 236)

7.168.2 Function Documentation

7.168.2.1 DDS_SampleIdentity_equals()

```
DDS_Boolean DDS_SampleIdentity_equals (
    const struct DDS_SampleIdentity_t * self,
    const struct DDS_SampleIdentity_t * other )
```

Compares this sample identity with another sample identity for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 237) This sample identity.
<i>other</i>	<< <i>in</i> >> (p. 237) The other sample identity to be compared with this sample identity.

Returns

DDS_BOOLEAN_TRUE (p.316) if the two sample identities have equal values, or **DDS_BOOLEAN_FALSE** (p.316) otherwise.

7.168.2.2 DDS_WriteParams_reset()

```
void DDS_WriteParams_reset (
    struct DDS_WriteParams_t * self )
```

Resets all the fields to their default values.

This operation is useful to reset all the fields to their automatic value when **DDS_WriteParams_t::replace_auto** (p.1235) is enabled and the same params instance is used in multiple calls to **FooDataWriter::write_w_params** (p.1671)

7.168.3 Variable Documentation

7.168.3.1 writer_guid

```
struct DDS_GUID_t DDS_SampleIdentity_t::writer_guid
```

16-byte identifier identifying the virtual GUID.

7.168.3.2 sequence_number

```
struct DDS_SequenceNumber_t DDS_SampleIdentity_t::sequence_number
```

monotonically increasing 64-bit integer that identifies the sample in the data source.

7.168.3.3 DDS_AUTO_SAMPLE_IDENTITY

```
const struct DDS_SampleIdentity_t DDS_AUTO_SAMPLE_IDENTITY [extern]
```

The AUTO sample identity.

Special **DDS_AUTO_SAMPLE_IDENTITY** (p. 477) value {**DDS_GUID_AUTO** (p. 330), **DDS_AUTO_SEQUENCE_↵**
NUMBER (p. 332)}

7.168.3.4 DDS_UNKNOWN_SAMPLE_IDENTITY

```
const struct DDS_SampleIdentity_t DDS_UNKNOWN_SAMPLE_IDENTITY [extern]
```

An invalid or unknown sample identity.

Special **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 478) value {**DDS_GUID_UNKNOWN** (p. 330), **DDS_SEQUENCE_↵**
_NUMBER_UNKNOWN (p. 331)}

7.168.3.5 DDS_WRITEPARAMS_DEFAULT

```
const struct DDS_WriteParams_t DDS_WRITEPARAMS_DEFAULT [extern]
```

Initializer for **DDS_WriteParams_t** (p. 1234).

7.169 Heap Support in C

<<**extension**>> (p. 236) Heap allocation and free routines in C

Functions

- void * **DDS_Heap_calloc** (size_t numElem, size_t size)
Performs the logical equivalent of calloc().
- void * **DDS_Heap_malloc** (size_t size)
Performs the logical equivalent of malloc().
- void **DDS_Heap_free** (void *ptr)
Performs the logical equivalent of free().

7.169.1 Detailed Description

<<**extension**>> (p. 236) Heap allocation and free routines in C

The methods in this class ensure consistent cross-platform implementations for memory allocation (**DDS_Heap_↵**
malloc() (p. 479) and **DDS_Heap_calloc()** (p. 479)) and deletion (**DDS_Heap_free()** (p. 479)).

Applications need to use these routines to reserve memory that the middleware will release or to free memory that the middleware has allocated.

For example, to allocate an optional member in a sample use **DDS_Heap_malloc()** (p. 479)/ **DDS_Heap_calloc()** (p. 479); to release an optional member previously reserved by **FooTypeSupport::create_data()** (p. 1697), use **DDS_↵**
_Heap_free() (p. 479).

7.169.2 Function Documentation

7.169.2.1 DDS_Heap_calloc()

```
void * DDS_Heap_calloc (
    size_t numElem,
    size_t size )
```

Performs the logical equivalent of calloc().

Allocates unused space for an array with `numElem` elements each of whose size in bytes is `size`. The memory will be initialized to zeros.

Parameters

<i>numElem</i>	<< <i>in</i> >> (p. 237) The number of elements in the array to be allocated
<i>size</i>	<< <i>in</i> >> (p. 237) The size in bytes of each element in the array

Returns

If insufficient memory is available, this method will return NULL. Otherwise, upon success it returns a pointer to the allocated space.

7.169.2.2 DDS_Heap_malloc()

```
void * DDS_Heap_malloc (
    size_t size )
```

Performs the logical equivalent of malloc().

Allocates unused space for an object of the specified `size`. The memory will be initialized to zeros.

Parameters

<i>size</i>	<< <i>in</i> >> (p. 237) The size in bytes of the object to be allocated
-------------	--

Returns

If insufficient memory is available, this method will return NULL. Otherwise, upon success it returns a pointer to the allocated space.

7.169.2.3 DDS_Heap_free()

```
void DDS_Heap_free (
    void * ptr )
```

Performs the logical equivalent of free().

Deallocates the space pointed to by `ptr` and made available for further allocation.

Parameters

<i>ptr</i>	<< <i>in</i> >> (p. 237) A pointer to the space to be deallocated
------------	---

7.170 Builtin Qos Profiles

<<*extension*>> (p. 236) QoS libraries, profiles, and snippets that are automatically built into RTI Connext.

Variables

- const char *const **DDS_BUILTIN_QOS_LIB**
A library of non-experimental QoS profiles.
- const char *const **DDS_PROFILE_BASELINE_ROOT**
The root baseline QoS values from which all other Baseline.X.X.X profiles inherit.
- const char *const **DDS_PROFILE_BASELINE**
The most up-to-date QoS default values.
- const char *const **DDS_PROFILE_BASELINE_5_0_0**
The QoS default values for version 5.0.0.
- const char *const **DDS_PROFILE_BASELINE_5_1_0**
The QoS default values for version 5.1.0.
- const char *const **DDS_PROFILE_BASELINE_5_2_0**
The QoS default values for version 5.2.0.
- const char *const **DDS_PROFILE_BASELINE_5_3_0**
The QoS default values for version 5.3.0.
- const char *const **DDS_PROFILE_BASELINE_6_0_0**
The QoS default values for version 6.0.0.
- const char *const **DDS_PROFILE_BASELINE_6_1_0**
The QoS default values for version 6.1.0.
- const char *const **DDS_PROFILE_BASELINE_7_0_0**
The QoS default values for version 7.0.0.
- const char *const **DDS_PROFILE_BASELINE_7_1_0**
The QoS default values for version 7.1.0.
- const char *const **DDS_PROFILE_GENERIC_COMMON**
A common Participant base profile.
- const char *const **DDS_PROFILE_GENERIC_MONITORING_COMMON**

Enables RTI Monitoring Library.

- const char *const **DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY**
Sets the values necessary to communicate with RTI Connex Micro.
- const char *const **DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_9**
Sets the values necessary to communicate with RTI Connex Micro versions 2.4.4 through at least 2.4.9.
- const char *const **DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_3**
Sets the values necessary to communicate with RTI Connex Micro versions 2.4.3 and ealier.
- const char *const **DDS_PROFILE_GENERIC_OTHER_DDS_VENDOR_COMPATIBILITY**
Sets the values necessary to interoperate with other DDS vendors.
- const char *const **DDS_PROFILE_GENERIC_510_TRANSPORT_COMPATIBILITY**
Sets the values necessary to interoperate with RTI Connex 5.1.0 using the UDPv6 and/or SHMEM transports.
- const char *const **DDS_BUILTIN_QOS_LIB_EXP**
A library of experimental QoS profiles.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE**
Enables strict reliability.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE**
Enables keep-last reliability.
- const char *const **DDS_PROFILE_GENERIC_BEST_EFFORT**
Enables best-effort reliability kind.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT**
A profile that can be used to achieve high throughput.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY**
A profile that can be used to achieve low latency.
- const char *const **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA**
A common Participant base profile to facilitate sending large data.
- const char *const **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA_MONITORING**
Configures Participants for large data and monitoring.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA**
Configures endpoints for sending large data with strict reliability.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA**
Configures endpoints for sending large data with keep-last reliability.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW**
Configures strictly reliable communication for large data with a fast flow controller.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_MEDIUM_FLOW**
Configures strictly reliable communication for large data with a medium flow controller.
- const char *const **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_SLOW_FLOW**
Configures strictly reliable communication for large data with a slow flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_FAST_FLOW**
Configures keep-last reliable communication for large data with a fast flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_MEDIUM_FLOW**
Configures keep-last reliable communication for large data with a medium flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_SLOW_FLOW**
Configures keep-last reliable communication for large data with a slow flow controller.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL**
Persists the samples of a DataWriter as long as the entity exists.
- const char *const **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT**
Persists samples using RTI Persistence Service.

- `const char *const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_PERSISTENT`
Persists samples in permanent storage, like a disk, using RTI Persistence Service.
- `const char *const DDS_PROFILE_GENERIC_AUTO_TUNING`
Enables the Turbo Mode batching and Auto Throttle experimental features.
- `const char *const DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT`
Uses a set of QoS which reduces the memory footprint of the application.
- `const char *const DDS_PROFILE_GENERIC_SECURITY`
Loads the DDS Secure builtin plugins.
- `const char *const DDS_PROFILE_GENERIC_MONITORING2`
The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.
- `const char *const DDS_PROFILE_PATTERN_PERIODIC_DATA`
Used for applications that expect periodic data.
- `const char *const DDS_PROFILE_PATTERN_STREAMING`
Used for applications that stream data.
- `const char *const DDS_PROFILE_PATTERN_RELIABLE_STREAMING`
Used for applications that stream data and require reliable communication.
- `const char *const DDS_PROFILE_PATTERN_EVENT`
Used for applications that handle events.
- `const char *const DDS_PROFILE_PATTERN_ALARM_EVENT`
Used for applications that handle alarm events.
- `const char *const DDS_PROFILE_PATTERN_STATUS`
Used for applications whose samples represent statuses.
- `const char *const DDS_PROFILE_PATTERN_ALARM_STATUS`
Used for applications in which samples represent alarm statuses.
- `const char *const DDS_PROFILE_PATTERN_LAST_VALUE_CACHE`
Used for applications that only need the last published value.
- `const char *const DDS_BUILTIN_QOS_SNIPPET_LIB`
A library of QoS Snippets.
- `const char *const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_COMMON`
QoS Snippet that configures the reliability protocol with a common configuration.
- `const char *const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL`
QoS Snippet that configures the reliability protocol for KEEP_ALL.
- `const char *const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST`
QoS Snippet that configures the reliability protocol for KEEP_LAST.
- `const char *const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_HIGH_RATE`
QoS Snippet that configures the reliability protocol for sending data at a high rate.
- `const char *const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LOW_LATENCY`
QoS Snippet that configures the reliability protocol for sending data at low latency.
- `const char *const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA`
QoS Snippet that configures the reliability protocol for large data.
- `const char *const DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC`
Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.
- `const char *const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_COMMON`
QoS Snippet that optimizes discovery with a common configuration.
- `const char *const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_PARTICIPANT_COMPACT`
QoS Snippet that optimizes the Participant QoS to send less discovery information.
- `const char *const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_ENDPOINT_FAST`

- QoS Snippet that optimizes the Endpoint Discovery to be faster.*

 - const char *const **DDS_SNIPPET_OPTIMIZATION_TRANSPORT_LARGE_BUFFERS**
- QoS Snippet that increases the Participant default buffer that shm and udpv4 use.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE**
- QoS Snippet that sets RELIABILITY QoS to RELIABLE.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_RELIABILITY_BEST_EFFORT**
- QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1**
- QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL**
- QoS Snippet that sets HISTORY QoSPolicy to KEEP_ALL kind.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS**
- QoS Snippet that sets PUBLISH_MODE QoSPolicy to ASYNCHRONOUS kind.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT_LOCAL**
- QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT_LOCAL kind.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT**
- QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT kind.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_DURABILITY_PERSISTENT**
- QoS Snippet that sets DURABILITY QoSPolicy to PERSISTENT kind.*

 - const char *const **DDS_SNIPPET_QOS_POLICY_BATCHING_ENABLE**
- QoS Snippet that sets BATCH QoSPolicy to true.*

 - const char *const **DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_838MBPS**
- QoS Snippet that configures and set a FlowController of 838 Mbps.*

 - const char *const **DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_209MBPS**
- QoS Snippet that configures and sets a FlowController of 209 Mbps.*

 - const char *const **DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_52MBPS**
- QoS Snippet that configures and sets a FlowController of 52 Mbps.*

 - const char *const **DDS_SNIPPET_FEATURE_AUTO_TUNING_ENABLE**
- QoS Snippet that enables auto_throttle and turbo_mode to true.*

 - const char *const **DDS_SNIPPET_FEATURE_MONITORING_ENABLE**
- QoS Snippet that enables the use of the RTI Monitoring Library.*

 - const char *const **DDS_SNIPPET_FEATURE_MONITORING2_ENABLE**
- QoS Snippet that enables the use of the RTI Monitoring Library 2.0.*

 - const char *const **DDS_SNIPPET_FEATURE_SECURITY_ENABLE**
- QoS Snippet that enables security using the Builtin Security Plugins.*

 - const char *const **DDS_SNIPPET_FEATURE_TOPIC_QUERY_ENABLE**
- QoS Snippet that enables Topic Query.*

 - const char *const **DDS_SNIPPET_TRANSPORT_TCP_LAN_CLIENT**
- QoS Snippet that configures a TCP LAN Client over DDS.*

 - const char *const **DDS_SNIPPET_TRANSPORT_TCP_WAN_SYMMETRIC_CLIENT**
- QoS Snippet that configures a symmetric WAN TCP Client over DDS.*

 - const char *const **DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER**
- QoS Snippet that an asymmetric WAN TCP Server over DDS.*

 - const char *const **DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_CLIENT**
- QoS Snippet that configures an asymmetric WAN TCP Client over DDS.*

 - const char *const **DDS_SNIPPET_TRANSPORT_UDP_AVOID_IP_FRAGMENTATION**

QoS Snippet that configures RTI Connex and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.

- `const char *const DDS_SNIPPET_TRANSPORT_UDP_WAN`

QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).

- `const char *const DDS_SNIPPET_COMPATIBILITY_CONNEXT_MICRO_VERSION_2_4_3`

QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connex Micro 2.4.3.

- `const char *const DDS_SNIPPET_COMPATIBILITY_OTHER_DDS_VENDORS_ENABLE`

QoS Snippet that configures RTI Connex to interoperate with other DDS vendors.

- `const char *const DDS_SNIPPET_5_1_0_TRANSPORT_ENABLE`

QoS Snippet that configures RTI Connex to interoperate with RTI Connex 5.1.0 and below for UDPv6 and SHMEM transports.

7.170.1 Detailed Description

<<**extension**>> (p. 236) QoS libraries, profiles, and snippets that are automatically built into RTI Connex.

The built-in profiles can be accessed in QoS XML configuration files and by using any of the APIs that accept library and profiles names by using the constants or string versions as documented on this page.

The built-in profiles are provided as a way to quickly and easily configure RTI Connex applications with a set of QoS values aimed at achieving a specific behavior.

There are three built-in QoS libraries:

- **BuiltinQosLib**: A library containing built-in QoS Profiles.
- **BuiltinQosLibExp**: A library containing experimental QoS Profiles. Experimental QoS Profiles are new QoS Profiles that have been tested internally but have not gone through an extensive validation period. Therefore, some of the settings may change in future releases based on customer and internal feedback. After validation, experimental QoS Profiles will be moved into the non-experimental library.
- **BuiltinQosSnippetLib**: A library containing QoS Snippets that are ready to use as elements for the QoS Profile composition pattern. For further information about this pattern visit the following article: <https://community.rti.com/best-practices/qos-profile-inheritance-and-composition-guidance>

There are three types of profiles:

- **Baseline.X.X.X**: These profiles represent the QoS defaults for /ndds version X.X.X. To access the defaults for the latest RTI Connex version, use the **BuiltinQosLib::Baseline** profile.
- **Generic.X**: These profiles allow you to easily configure different features and communication use-cases with RTI Connex. For example, there is a **Generic.StrictReliable** profile for use when your application has a requirement for no data loss.
- **Pattern.X**: These profiles inherit from the **Generic.X** profiles and allow you to configure various domain-specific communication use cases. For example, there is a **Pattern.Alarm** profile that can be used to manage the generation and consumption of alarm events.

There are several types of QoS Snippets. These are the current QoS Snippets available:

- Optimization.X: these QoS Snippets optimize one or more parameters related to the X QoS Policy or a specific use-case.
- QosPolicy.X.Y: these QoS Snippets set a specific QoS Policy X to the value Y.
- Feature.X: these QoS Snippets set all the needed QoS values to enable/modify a specific feature.
- Transport.X: these QoS Snippets set a specific transport defined by X. This transport may have specific scenarios that are also specified in the name.
- Compatibility.X: these QoS Snippets change the specific QoS policies to ensure compatibility with specific products or versions specified by X.

These QoS Profiles can be used as base profiles in XML configuration, then QoS Snippets can modify specific aspects of this base QoS Profile, and finally files and values can be modified to fit a specific system's needs. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.Common">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">
    <base_name>
      <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>
    </base_name>
    <!-- Override and add values -->
  </domain_participant_qos>
</qos_profile>
```

The QoS Profiles can also be used in any APIs that call for a QoS library and profile name, for example, the create_*↔_with_profile() APIs. To create a **DDSDDataWriter** (p. 1305) configured to send large data:

```
writer = DDS_DomainParticipant_create_datawriter_with_profile(
    participant, topic,
    ::DDS_BUILTIN_QOS_LIB,
    ::DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW,
    NULL, ::DDS_STATUS_MASK_NONE);
```

All the built-in QoS Profiles and QoS Snippets are documented in the BaselineRoot.documentationONLY.xml and BuiltinProfiles.documentationONLY.xml files that are included in the NDDSHOME/xml directory of the RTI Connex installation.

- BaselineRoot.documentationONLY.xml contains the root baseline QoS profile that corresponds to the default values of RTI Connex 5.0.0.
- BuiltinProfiles.documentationONLY.xml contains the rest of the built-in QoS Profiles and QoS Snippets.

7.170.2 Variable Documentation

7.170.2.1 DDS_BUILTIN_QOS_LIB

```
const char* const DDS_BUILTIN_QOS_LIB [extern]
```

A library of non-experimental QoS profiles.

String-version: "BuiltinQosLib"

7.170.2.2 DDS_PROFILE_BASELINE_ROOT

```
const char* const DDS_PROFILE_BASELINE_ROOT [extern]
```

The root baseline QoS values from which all other Baseline.X.X.X profiles inherit.

This profile contains the root baseline QoS values from which all other Baseline.X.X.X profiles inherit. These values correspond to the default values for RTI Connex 5.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.Root"

7.170.2.3 DDS_PROFILE_BASELINE

```
const char* const DDS_PROFILE_BASELINE [extern]
```

The most up-to-date QoS default values.

You can use this profile if you want your application to pick up and use any new QoS default settings each time a new RTI Connex version is released – without changing your application code.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline"

7.170.2.4 DDS_PROFILE_BASELINE_5_0_0

```
const char* const DDS_PROFILE_BASELINE_5_0_0 [extern]
```

The QoS default values for version 5.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.5.0.0"

7.170.2.5 DDS_PROFILE_BASELINE_5_1_0

```
const char* const DDS_PROFILE_BASELINE_5_1_0 [extern]
```

The QoS default values for version 5.1.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.5.1.0"

7.170.2.6 DDS_PROFILE_BASELINE_5_2_0

```
const char* const DDS_PROFILE_BASELINE_5_2_0 [extern]
```

The QoS default values for version 5.2.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.5.2.0"

7.170.2.7 DDS_PROFILE_BASELINE_5_3_0

```
const char* const DDS_PROFILE_BASELINE_5_3_0 [extern]
```

The QoS default values for version 5.3.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.5.3.0"

7.170.2.8 DDS_PROFILE_BASELINE_6_0_0

```
const char* const DDS_PROFILE_BASELINE_6_0_0 [extern]
```

The QoS default values for version 6.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.6.0.0"

7.170.2.9 DDS_PROFILE_BASELINE_6_1_0

```
const char* const DDS_PROFILE_BASELINE_6_1_0 [extern]
```

The QoS default values for version 6.1.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.6.1.0"

7.170.2.10 DDS_PROFILE_BASELINE_7_0_0

```
const char* const DDS_PROFILE_BASELINE_7_0_0 [extern]
```

The QoS default values for version 7.0.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.7.0.0"

7.170.2.11 DDS_PROFILE_BASELINE_7_1_0

```
const char* const DDS_PROFILE_BASELINE_7_1_0 [extern]
```

The QoS default values for version 7.1.0.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Baseline.7.1.0"

7.170.2.12 DDS_PROFILE_GENERIC_COMMON

```
const char* const DDS_PROFILE_GENERIC_COMMON [extern]
```

A common Participant base profile.

All Generic.X and Pattern.X profiles inherit from this profile.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.Common"

7.170.2.13 DDS_PROFILE_GENERIC_MONITORING_COMMON

```
const char* const DDS_PROFILE_GENERIC_MONITORING_COMMON [extern]
```

Enables RTI Monitoring Library.

Generic Base participant QoS Profile that enables RTI Monitoring Library.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Monitoring.Common", apply the QoS Snippet "BuiltinQos↔ SnippetLib::Feature.Monitoring.Enable" via composition. For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>
  </base_name>
</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">
</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.Monitoring.Common"

7.170.2.14 DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY [extern]
```

Sets the values necessary to communicate with RTI Connext Micro.

This profile will always represent the QoS values required for interoperability between the most recent version of RTI Connext Micro at the time of release of the most recent version of RTI Connext.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.ConnnextMicroCompatibility"

7.170.2.15 DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_9

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_9 [extern]
```

Sets the values necessary to communicate with RTI Connext Micro versions 2.4.4 through at least 2.4.9.

At the time of the release of RTI Connext 5.3.0 it was not necessary to set any QoS values in order to interoperate with RTI Connext Micro. This applies to RTI Connext Micro versions 2.4.4 and later. The most recent version of RTI Connext Micro at the time of release of RTI Connext 5.3.0 was 2.4.9. There is no guarantee that this profile will interoperate with versions of RTI Connext Micro after 2.4.9.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.ConnnextMicroCompatibility.2.4.9"

7.170.2.16 DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_3

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_3 [extern]
```

Sets the values necessary to communicate with RTI Connext Micro versions 2.4.3 and earlier.

RTI Connext Micro versions 2.4.3 and earlier only supported the **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 410) LivelinessQos kind. In order to be compatible with these versions of RTI Connext Micro, the **DDSDDataReader** (p. 1272) and **DDSDDataWriter** (p. 1305) must have their Liveliness kind changed to this value because the default kind in RTI Connext is **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 410).

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.ConnnextMicroCompatibility.2.4.3"

7.170.2.17 DDS_PROFILE_GENERIC_OTHER_DDS_VENDOR_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_OTHER_DDS_VENDOR_COMPATIBILITY [extern]
```

Sets the values necessary to interoperate with other DDS vendors.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.OtherDDSVendorCompatibility"

7.170.2.18 DDS_PROFILE_GENERIC_510_TRANSPORT_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_510_TRANSPORT_COMPATIBILITY [extern]
```

Sets the values necessary to interoperate with RTI Connex 5.1.0 using the UDPv6 and/or SHMEM transports.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.510TransportCompatibility"

7.170.2.19 DDS_BUILTIN_QOS_LIB_EXP

```
const char* const DDS_BUILTIN_QOS_LIB_EXP [extern]
```

A library of experimental QoS profiles.

Experimental profiles are new profiles that have been tested internally but have not gone through an extensive validation period. Therefore some of the settings may change in future releases based on customer and internal feedback. After validation, experimental profiles will be moved into the non-experimental library.

QoS Profiles in this library are deprecated. They have been moved to "BuiltinQosLib". You should use the QoS Profiles from "BuiltinQosLib" instead of the ones in "BuiltinQosLibExp". The experimental profiles are still defined here to avoid backward compatibility issues.

String-version: "BuiltinQosLibExp"

7.170.2.20 DDS_PROFILE_GENERIC_STRICT_RELIABLE

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE [extern]
```

Enables strict reliability.

Configures communication to be "strict reliable" where every sample is reliably delivered.

Combines the use of the **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) for **DDS_ReliabilityQosPolicy** (p. 1027) with a **DDS_KEEP_ALL_HISTORY_QOS** (p. 406) for the **DDS_HistoryQosPolicyKind** (p. 405).

This QoS Profile also optimizes the reliability protocol setting for this configuration.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.StrictReliable"

7.170.2.21 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE [extern]
```

Enables keep-last reliability.

Like the Generic.StrictReliable profile, this profile ensures in-order delivery of samples. However, new data can overwrite data that has not yet been acknowledged by the reader, therefore causing possible sample loss.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable"

7.170.2.22 DDS_PROFILE_GENERIC_BEST_EFFORT

```
const char* const DDS_PROFILE_GENERIC_BEST_EFFORT [extern]
```

Enables best-effort reliability kind.

This profile enables best-effort communication. No effort or resources are spent to track whether or not sent samples are received. Minimal resources are used. This is the most deterministic method of sending data since there is no indeterministic delay that can be introduced by resending data. Data samples may be lost. This setting is good for periodic data.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.BestEffort"

7.170.2.23 DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT [extern]
```

A profile that can be used to achieve high throughput.

This QoS Profile extends the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 490) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 490) QoS Profile..

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.StrictReliable.HighThroughput"

7.170.2.24 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY [extern]
```

A profile that can be used to achieve low latency.

This QoS Profile extends the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 490) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 490) QoS Profile.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.StrictReliable.LowLatency"

7.170.2.25 DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA

```
const char* const DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA [extern]
```

A common Participant base profile to facilitate sending large data.

This is a common Participant base QoS Profile that configures 3 different flow controllers: 838, 209, and 52 Mbps that can each be used to throttle application data flow at different rates.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.Participant.LargeData"

7.170.2.26 DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA_MONITORING

```
const char* const DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA_MONITORING [extern]
```

Configures Participants for large data *and* monitoring.

This is a common base Participant QoS Profile to configure Participants to both handle large data and use RTI Monitoring Library.

This QoS Profile is deprecated. It is included for backwards compatibility.

It is recommended that instead of inheriting from this QoS Profile, new applications apply the following QoS Snippets to their application-specific QoS Profiles:

Enable Monitoring

- **DDS_SNIPPET_FEATURE_MONITORING_ENABLE** (p. 511)

Enable Large Data + optimizations

- **DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS** (p. 507)
- **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA** (p. 503)
- **DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC** (p. 503) In Library↔
: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.Participant.LargeData.Monitoring"

See also

DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA (p. 491)

DDS_PROFILE_GENERIC_MONITORING_COMMON (p. 488)

7.170.2.27 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA [extern]
```

Configures endpoints for sending large data with strict reliability.

This QoS Profile extends the **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA** (p. 491) QoS Profile to handle sending large samples. This QoS Profile optimizes memory usage per sample within RTI Connext, but it does not do any flow control. You can use this QoS Profile directly, which enables asynchronous publication with the default flow controller (i.e. no flow control) or you can use one of the three QoS Profiles below (Generic.StrictReliable.LargeData.*↔Flow), which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA** (p. 491) in order to throttle application data flow.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.StrictReliable.LargeData"

7.170.2.28 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA [extern]
```

Configures endpoints for sending large data with keep-last reliability.

This QoS Profile is similar to the **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA** (p. 491) QoS Profile, but also adds QoS Snippets to handle sending large data. You can use this QoS Profile directly, which enables the default flow controller (i.e., no flow control) or you can choose one of the three QoS Profiles below (Generic.KeepLastReliable.↔LargeData.*Flow) which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in **DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA** (p. 491) in order to throttle application data flow.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable.LargeData"

7.170.2.29 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW [extern]
```

Configures strictly reliable communication for large data with a fast flow controller.

Strictly reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.StrictReliable.LargeData.FastFlow"

7.170.2.30 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_MEDIUM_FLOW

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_MEDIUM_FLOW [extern]
```

Configures strictly reliable communication for large data with a medium flow controller.

Strictly reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.StrictReliable.LargeData.MediumFlow"

7.170.2.31 DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_SLOW_FLOW

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_SLOW_FLOW [extern]
```

Configures strictly reliable communication for large data with a slow flow controller.

Strictly reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.StrictReliable.LargeData.SlowFlow"

7.170.2.32 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_FAST_FLOW

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_FAST_FLOW [extern]
```

Configures keep-last reliable communication for large data with a fast flow controller.

Keep-last reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable.LargeData.FastFlow"

7.170.2.33 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_MEDIUM_FLOW

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_MEDIUM_FLOW [extern]
```

Configures keep-last reliable communication for large data with a medium flow controller.

Keep-last reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable.LargeData.MediumFlow"

7.170.2.34 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_SLOW_FLOW

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_SLOW_FLOW [extern]
```

Configures keep-last reliable communication for large data with a slow flow controller.

Keep-last reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable.LargeData.SlowFlow"

7.170.2.35 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL [extern]
```

Persists the samples of a DataWriter as long as the entity exists.

This profile extends the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 490) profile, but persists the samples of a **DDSDDataWriter** (p. 1305) as long as the entity exists in order to deliver them to late-joining DataReaders.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable.TransientLocal"

7.170.2.36 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT [extern]
```

Persists samples using RTI Persistence Service.

This profile extends the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 490) profile, but persists samples using Persistence Service in order to deliver them to late-joining DataReaders.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable.Transient"

7.170.2.37 DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_PERSISTENT

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_PERSISTENT [extern]
```

Persists samples in permanent storage, like a disk, using RTI Persistence Service.

This profile extends the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 490) profile, but persists samples in permanent storage, such as a disk, using Persistence Service in order to deliver them to late-joining DataReaders.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.KeepLastReliable.Persistent"

7.170.2.38 DDS_PROFILE_GENERIC_AUTO_TUNING

```
const char* const DDS_PROFILE_GENERIC_AUTO_TUNING [extern]
```

Enables the Turbo Mode batching and Auto Throttle experimental features.

Turbo Mode batching adjusts the maximum number of bytes of a batch based on how frequently samples are being written. Auto Throttle auto-adjusts the speed at which a writer will write samples, based on the number of unacknowledged samples in its queue.

These features are designed to auto-adjust the publishing behavior within a system in order to achieve the best possible performance with regards to throughput and latency.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.AutoTuning"

7.170.2.39 DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT

```
const char* const DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT [extern]
```

Uses a set of QoS which reduces the memory footprint of the application.

Uses a set of QoS which reduces the memory footprint of the application.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Generic.MinimalMemoryFootprint"

7.170.2.40 DDS_PROFILE_GENERIC_SECURITY

```
const char* const DDS_PROFILE_GENERIC_SECURITY [extern]
```

Loads the DDS Secure builtin plugins.

Generic Base Participant Profile that enables the builtin DDS Security Plugins.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Security", apply the QoS Snippet "BuiltinQosSnippetLib::↵ Feature.Security.Enable" via composition. For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Security.Enable</element>
  </base_name>
</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Security">
  </domain_participant_qos>
</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485)

String-version: "Generic.Security"

7.170.2.41 DDS_PROFILE_GENERIC_MONITORING2

```
const char* const DDS_PROFILE_GENERIC_MONITORING2 [extern]
```

The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.

This profile inherits from **DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT** (p. 496).

The following DomainParticipant QoS policy of this profile cannot be modified and it is overwritten by the RTI Monitoring Library 2.0:

- Discovery Config Built-in Channel Kind.

The following DataWriter and DataReader QoS policies of this profile cannot be modified and they are overwritten by the RTI Monitoring Library 2.0:

- Reliability Kind.
- Durability Kind.
- History Kind.
- Publish Mode Kind.
- Protocol -> RTPS Reliable Writer -> Max Heartbeat Retries.

This profile uses Topic Filters to select the DataWriter and DataReader QoS depending on the Observability Distribution Topic.

You should be using this profile or a profile inheriting from it when you configure the distribution of telemetry data using the `<distribution_settings>` tag under `<monitoring>` for the `<participant_factory_qos>`.

Note: This profile does not enable the use of the RTI Monitoring Library 2.0. To do that you can use the Snippet **DDS_SNIPPET_FEATURE_MONITORING2_ENABLE** (p. 512).

String-version: "Generic.Monitoring2"

See also

RTI_MONITORING_PERIODIC_TOPIC_NAME (p. 520)

RTI_MONITORING_EVENT_TOPIC_NAME (p. 520)

RTI_MONITORING_LOGGING_TOPIC_NAME (p. 521)

7.170.2.42 DDS_PROFILE_PATTERN_PERIODIC_DATA

```
const char* const DDS_PROFILE_PATTERN_PERIODIC_DATA [extern]
```

Used for applications that expect periodic data.

This QoS Profile is intended to be used for applications that expect periodic data such as sensor data. The deadline that is set in this profile can be used to detect when DataWriters are not publishing data with the expected periodicity.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.PeriodicData"

7.170.2.43 DDS_PROFILE_PATTERN_STREAMING

```
const char* const DDS_PROFILE_PATTERN_STREAMING [extern]
```

Used for applications that stream data.

The data sent in streaming applications is commonly periodic. Therefore this profile simply inherits from the **DDS_PROFILE_PATTERN_PERIODIC_DATA** (p. 497) profile. Note: With this QoS Profile, the application may lose data, which may be acceptable in use cases such as video conferencing.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.Streaming"

7.170.2.44 DDS_PROFILE_PATTERN_RELIABLE_STREAMING

```
const char* const DDS_PROFILE_PATTERN_RELIABLE_STREAMING [extern]
```

Used for applications that stream data *and* require reliable communication.

Sometimes streaming applications require reliable communication while still tolerating some data loss. In this case, we inherit from the **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE** (p. 490) QoS Profile and the following QoS Snippets:

- **DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE** (p. 505)
- **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1** (p. 506)
- **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST** (p. 501)

This QoS Snippet also increases the **DDS_HistoryQosPolicy::depth** (p. 908) to reduce the probability of losing samples.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.ReliableStreaming"

7.170.2.45 DDS_PROFILE_PATTERN_EVENT

```
const char* const DDS_PROFILE_PATTERN_EVENT [extern]
```

Used for applications that handle events.

This QoS Profile can be used by applications in which samples represent events such as button pushes or alerts. When events are triggered, the system should almost always do something, meaning that you don't want the system to lose the event. This means that the system requires strictly reliable communication. To enable it, use the following QoS Snippets:

- **DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE** (p. 505)
- **DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL** (p. 507)
- **DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL** (p. 501)

Since events and alerts are critical and non-periodic data, it is important to detect situations in which communication between a **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) is broken. This is why this profile sets the **DDS_↵_LivelinessQosPolicy** (p. 923). If the **DDSDataWriter** (p. 1305) does not assert its liveliness in a timely manner, the **DDSDataReader** (p. 1272) will report 'loss of liveliness' to the application.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.Event"

7.170.2.46 DDS_PROFILE_PATTERN_ALARM_EVENT

```
const char* const DDS_PROFILE_PATTERN_ALARM_EVENT [extern]
```

Used for applications that handle alarm events.

An alarm is a type of event; therefore this profile simply inherits from **DDS_PROFILE_PATTERN_EVENT** (p. 498).

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.AlarmEvent"

7.170.2.47 DDS_PROFILE_PATTERN_STATUS

```
const char* const DDS_PROFILE_PATTERN_STATUS [extern]
```

Used for applications whose samples represent statuses.

This QoS Profile can be used by applications in which samples represent state variables whose values remain valid as long as they don't explicitly change. State variables typically do not change periodically. State variables and their values should also be available to applications that appear after the value originally changed because it is unreasonable to have to wait until the next change of state, which may be indeterminate.

Whether to use this QoS Profile or **DDS_PROFILE_PATTERN_PERIODIC_DATA** (p. 497) can often be an application choice. For example, if a DataWriter is publishing temperature sensor data, it could use the **DDS_PROFILE_↵_PATTERN_PERIODIC_DATA** (p. 497) QoS Profile and publish the data at a fixed rate or it could use the **DDS_↵_PROFILE_PATTERN_STATUS** (p. 499) QoS Profile and only publish the temperature when it changes more than 1 degree.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.Status"

7.170.2.48 DDS_PROFILE_PATTERN_ALARM_STATUS

```
const char* const DDS_PROFILE_PATTERN_ALARM_STATUS [extern]
```

Used for applications in which samples represent alarm statuses.

An alarm status is a type of status; therefore this QoS Profile simply inherits from **DDS_PROFILE_PATTERN_STATUS** (p. 499).

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.AlarmStatus"

7.170.2.49 DDS_PROFILE_PATTERN_LAST_VALUE_CACHE

```
const char* const DDS_PROFILE_PATTERN_LAST_VALUE_CACHE [extern]
```

Used for applications that only need the last published value.

With this QoS Profile, a **DDSDDataWriter** (p. 1305) will keep in its queue the last value that was published for each sample instance. Late-joining DataReaders will get that value when they join the system. This QoS Profile inherits from **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL** (p. 495) because the use case requires delivery to late-joiners.

In Library: **DDS_BUILTIN_QOS_LIB** (p. 485) and **DDS_BUILTIN_QOS_LIB_EXP** (p. 490)

String-version: "Pattern.LastValueCache"

7.170.2.50 DDS_BUILTIN_QOS_SNIPPET_LIB

```
const char* const DDS_BUILTIN_QOS_SNIPPET_LIB [extern]
```

A library of QoS Snippets.

String-version: "BuiltinQosSnippetLib"

7.170.2.51 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_COMMON

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_COMMON [extern]
```

QoS Snippet that configures the reliability protocol with a common configuration.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet defines parameters common to a set of "alternative" QoS Snippets that configure the reliability protocol.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671)
- **DDS_DataReaderQos** (p. 638) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 627)

This QoS Snippet configures the reliability protocol parameters for more aggressive (faster) heartbeats so that sample loss is detected and repaired faster.

This QoS Snippet also sets the **DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries** (p. 1052), which works in combination with the heartbeat rate to determine when the **DDSDataWriter** (p. 1305) considers a **DDSDataReader** (p. 1272) non-responsive. This QoS Snippet configures the **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671) parameters so that the **DDSDataWriter** (p. 1305) considers the **DDSDataReader** (p. 1272) to be "inactive" after 500 unresponded heartbeats.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.ReliabilityProtocol.Common"

7.170.2.52 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL [extern]
```

QoS Snippet that configures the reliability protocol for KEEP_ALL.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDSDataWriter** (p. 1305) reliable protocol parameters for a reliable **DDSDataWriter** (p. 1305) with **DDS_HistoryQosPolicyKind** (p. 405) set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 406).

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671)
- **DDS_DataReaderQos** (p. 638) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 627)

Note that this QoS Snippet does not configure the **DDS_ReliabilityQosPolicy** (p. 1027) or **DDS_HistoryQosPolicy** (p. 906) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.ReliabilityProtocol.KeepAll"

7.170.2.53 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST [extern]
```

QoS Snippet that configures the reliability protocol for KEEP_LAST.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDSDDataWriter** (p. 1305) reliable protocol parameters for a reliable **DDSDDataWriter** (p. 1305) with **DDS_HistoryQosPolicyKind** (p. 405) set to **DDS_KEEP_LAST_HISTORY_QOS** (p. 406).

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671)
- **DDS_DataReaderQos** (p. 638) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 627)

Note that this QoS Snippet does not configure the **DDS_ReliabilityQosPolicy** (p. 1027) or **DDS_HistoryQosPolicy** (p. 906) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.ReliabilityProtocol.KeepLast"

7.170.2.54 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_HIGH_RATE

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_HIGH_RATE [extern]
```

QoS Snippet that configures the reliability protocol for sending data at a high rate.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDSDDataWriter** (p. 1305) reliable protocol parameters for a reliable **DDSDDataWriter** (p. 1305) that is writing messages at high rates, especially in situations where throughput is favored over latency.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671)
- **DDS_DataReaderQos** (p. 638) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 627)

This QoS Snippet sets a fast rate of heartbeats so that errors are detected and repaired more swiftly.

Note that to get the highest throughput you may need to apply additional changes to the final QoS Profile. See the QoS Profile **DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT** (p. 491) for further information.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.ReliabilityProtocol.HighRate"

7.170.2.55 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LOW_LATENCY

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LOW_LATENCY [extern]
```

QoS Snippet that configures the reliability protocol for sending data at low latency.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet modifies the Reliable Protocol parameters to accomplish low latency.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671)
- **DDS_DataReaderQos** (p. 638) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 627)

Note that to get the lowest latency you may need to apply additional changes to the final QoS Profile. See the QoS Profile **DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY** (p. 491) for further information.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.ReliabilityProtocol.LowLatency"

7.170.2.56 DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA [extern]
```

QoS Snippet that configures the reliability protocol for large data.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

Modifies the Reliable Protocol parameters and Resource Limits to work with Large Data.

Modified QoS Parameters:

- **DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer** (p. 671)
- **DDS_DataReaderQos** (p. 638) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader** (p. 627)

Note that to send large data you need to apply additional changes that configure the data caches, asynchronous writing, transport buffers, etc. See, for example, **DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA** (p. 493), and derivatives for fully functional Large Data QoS Profiles.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.ReliabilityProtocol.LargeData"

7.170.2.57 DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC

```
const char* const DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC [extern]
```

Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataWriterQos** (p. 683) => **DDS_PropertyQosPolicy** (p. 994) named "dds.data_writer.history.memory_↔manager.*"
- **DDS_DataReaderQos** (p. 638) => **DDS_ResourceLimitsQosPolicy** (p. 1038)
- **DDS_DataReaderResourceLimitsQosPolicy** (p. 648)
- **DDS_DataReaderQos** (p. 638) => **DDS_PropertyQosPolicy** (p. 994) named "dds.data_reader.history.↔memory_manager.*"

This configuration is needed to handle data that contains unbounded sequences or strings. This QoS Snippet is also recommended if samples can have very different sizes and the bigger samples can be very large.

If dynamic memory allocation is not used for the larger samples, then all samples are allocated to their maximum size which can consume a lot of resources.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.DataCache.LargeData.DynamicMemAlloc"

7.170.2.58 DDS_SNIPPET_OPTIMIZATION_DISCOVERY_COMMON

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_COMMON [extern]
```

QoS Snippet that optimizes discovery with a common configuration.

Optimizes the **DDS_DomainParticipantQos** (p. 735) to detect faster discovery changes. This QoS Snippet increases the speed moderately so that it fits the normal scenarios.

Modified QoS Parameters:

- **DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration** (p. 708)
- **DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period** (p. 709)
- **DDS_DiscoveryConfigQosPolicy::max_liveliness_loss_detection_period** (p. 710)
- **DDS_DiscoveryConfigQosPolicy::initial_participant_announcements** (p. 710)
- **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713)
- **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.Discovery.Common"

7.170.2.59 DDS_SNIPPET_OPTIMIZATION_DISCOVERY_PARTICIPANT_COMPACT

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_PARTICIPANT_COMPACT [extern]
```

QoS Snippet that optimizes the Participant QoS to send less discovery information.

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 735) => **DDS_PropertyQosPolicy** (p. 994) named "dds.participant.inter_↔ participant.*"
- **DDS_DomainParticipantQos** (p. 735) => **DDS_PropertyQosPolicy** (p. 994) named "dds.sys_info.*"

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.Discovery.Participant.Compact"

7.170.2.60 DDS_SNIPPET_OPTIMIZATION_DISCOVERY_ENDPOINT_FAST

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_ENDPOINT_FAST [extern]
```

QoS Snippet that optimizes the Endpoint Discovery to be faster.

This is useful when using security, to prevent a noticeable delay.

Modified QoS Parameters:

- **DDS_DiscoveryConfigQosPolicy::publication_writer** (p. 713)
- **DDS_DiscoveryConfigQosPolicy::subscription_writer** (p. 714)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.Discovery.Endpoint.Fast"

7.170.2.61 DDS_SNIPPET_OPTIMIZATION_TRANSPORT_LARGE_BUFFERS

```
const char* const DDS_SNIPPET_OPTIMIZATION_TRANSPORT_LARGE_BUFFERS [extern]
```

QoS Snippet that increases the Participant default buffer that shm and udpv4 use.

This is useful when using Large Data

Modified QoS Parameters:

- **DDS_ReceiverPoolQosPolicy** (p. 1025)
- **DDS_TransportBuiltinQosPolicy** (p. 1129)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Optimization.Transport.LargeBuffers"

7.170.2.62 DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE

```
const char* const DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE [extern]
```

QoS Snippet that sets RELIABILITY QoS to RELIABLE.

This also configures a blocking time in case the **DDSDataWriter** (p. 1305) writes faster than the DataReaders can accommodate.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_ReliabilityQosPolicy** (p. 1027)
- **DDS_DataReaderQos** (p. 638) => **DDS_ReliabilityQosPolicy** (p. 1027)

Note that by itself enabling reliability does not ensure that every sample written is delivered to the DataReaders. This is because the **DDSDataWriter** (p. 1305) and/or **DDSDataReader** (p. 1272) can be configured to override samples in its cache based on the configuration of the **DDS_HistoryQosPolicy** (p. 906) QoS policy.

To ensure delivery of every sample (at the expense of potentially blocking the **DDSDataWriter** (p. 1305)), use the QoS Profile **DDS_PROFILE_GENERIC_STRICT_RELIABLE** (p. 490) or one of the derived QoS Profiles.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QosPolicy.Reliability.Reliable"

7.170.2.63 DDS_SNIPPET_QOS_POLICY_RELIABILITY_BEST_EFFORT

```
const char* const DDS_SNIPPET_QOS_POLICY_RELIABILITY_BEST_EFFORT [extern]
```

QoS Snippet that sets RELIABILITY QoS to BEST_EFFORT.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_ReliabilityQosPolicy** (p. 1027)
- **DDS_DataReaderQos** (p. 638) => **DDS_ReliabilityQosPolicy** (p. 1027)

With best-effort, there are no resources spent to confirm delivery of samples nor repairs of any samples that may be lost.

Best-effort communication reduces jitter; therefore, the delay between sending data and receiving it is more deterministic for the samples that are actually received. Best-effort is good for periodic data where it may be better to get the next value than to wait for the previous one to be repaired.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QosPolicy.Reliability.BestEffort"

7.170.2.64 DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1

```
const char* const DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1 [extern]
```

QoS Snippet that sets HISTORY QoS to KEEP_LAST kind with depth 1.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_HistoryQosPolicy** (p. 906)
- **DDS_DataReaderQos** (p. 638) => **DDS_HistoryQosPolicy** (p. 906)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QosPolicy.History.KeepLast_1"

7.170.2.65 DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL

```
const char* const DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL [extern]
```

QoS Snippet that sets HISTORY QosPolicy to KEEP_ALL kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_HistoryQosPolicy** (p. 906)
- **DDS_DataReaderQos** (p. 638) => **DDS_HistoryQosPolicy** (p. 906)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QosPolicy.History.KeepAll"

7.170.2.66 DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS

```
const char* const DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS [extern]
```

QoS Snippet that sets PUBLISH_MODE QosPolicy to ASYNCHRONOUS kind.

Modified QoS Parameters:

- **DDS_PublishModeQosPolicy** (p. 1012)

Asynchronous Publish mode decouples the application thread that calls the **DDSDataWriter** (p.1305) "write" operation from the thread used to send the data on the network. See <https://community.rti.com/glossary/asynchronous-writer>

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QosPolicy.PublishMode.Asynchronous"

7.170.2.67 DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT_LOCAL

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT_LOCAL [extern]
```

QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT_LOCAL kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_DurabilityQosPolicy** (p. 761)
- **DDS_DataReaderQos** (p. 638) => **DDS_DurabilityQosPolicy** (p. 761)

DataWriters will store and send previously published DDS samples for delivery to newly discovered DataReaders as long as the **DDSDDataWriter** (p. 1305) still exists. For this setting to be effective, you must also set the **DDS_ReliabilityQosPolicyKind** (p. 434) to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) (not Best Effort). Which particular DDS samples are kept depends on other QoS settings such as **DDS_HistoryQosPolicy** (p. 906) and **DDS_ResourceLimitsQosPolicy** (p. 1038).

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QoSPolicy.Durability.TransientLocal"

7.170.2.68 DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT [extern]
```

QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_DurabilityQosPolicy** (p. 761)
- **DDS_DataReaderQos** (p. 638) => **DDS_DurabilityQosPolicy** (p. 761)

RTI Connext will store previously published DDS samples in memory using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **DDS_HistoryQosPolicy** (p. 906) and **DDS_ResourceLimitsQosPolicy** (p. 1038) of the Persistence Service DataWriters. These QoS Policies can be configured in the Persistence Service configuration file or through the **DDS_DurabilityQosPolicyKind** (p. 399) of the DataWriters configured with **DDS_TRANSIENT_DURABILITY_QOS** (p. 400).

You need a Persistence Service instance running to use this behavior.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QoSPolicy.Durability.Transient"

7.170.2.69 DDS_SNIPPET_QOS_POLICY_DURABILITY_PERSISTENT

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_PERSISTENT [extern]
```

QoS Snippet that sets DURABILITY QosPolicy to PERSISTENT kind.

Modified QoS Parameters:

- **DDS_DataWriterQos** (p. 683) => **DDS_DurabilityQosPolicy** (p. 761)
- **DDS_DataReaderQos** (p. 638) => **DDS_DurabilityQosPolicy** (p. 761)

RTI Connext will store previously published DDS samples in permanent storage, like a disk, using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **DDS_HistoryQosPolicy** (p. 906) and **DDS_ResourceLimitsQosPolicy** (p. 1038) in the Persistence Service DataWriters. These QosPolicies can be configured in the Persistence Service configuration file or through the **DDS_DurabilityQosPolicyKind** (p. 399) of the DataWriters configured with **DDS_PERSISTENT_↔DURABILITY_QOS** (p. 400).

You need a Persistence Service instance running to use this behavior.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QosPolicy.Durability.Persistent"

7.170.2.70 DDS_SNIPPET_QOS_POLICY_BATCHING_ENABLE

```
const char* const DDS_SNIPPET_QOS_POLICY_BATCHING_ENABLE [extern]
```

QoS Snippet that sets BATCH QosPolicy to true.

Modified QoS Parameters:

- **DDS_BatchQosPolicy** (p. 594)

This QoS Snippet specifies and configures the mechanism that allows RTI Connext to collect multiple user data DDS samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "QosPolicy.Batching.Enable"

7.170.2.71 DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_838MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_838MBPS [extern]
```

QoS Snippet that configures and set a FlowController of 838 Mbps.

Defines a **DDSFlowController** (p. 1451) and configures the **DDS_DataWriterQos** (p. 683) with it.

This is a **DDSFlowController** (p. 1451) of 838 Mbps (~ 100 MB/sec)

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 735) => **DDS_PropertyQosPolicy** (p. 994) named "dds.flow_controller.↔ token_bucket.*"
- **DDS_PublishModeQosPolicy** (p. 1012)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.FlowController.838Mbps"

7.170.2.72 DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_209MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_209MBPS [extern]
```

QoS Snippet that configures and sets a FlowController of 209 Mbps.

Defines a **DDSFlowController** (p. 1451) and configures the **DDS_DataWriterQos** (p. 683) with it.

This is a **DDSFlowController** (p. 1451) of 209 Mbps (~ 25 MB/sec)

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 735) => **DDS_PropertyQosPolicy** (p. 994) named "dds.flow_controller.↔ token_bucket.*"
- **DDS_PublishModeQosPolicy** (p. 1012)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.FlowController.209Mbps"

7.170.2.73 DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_52MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_52MBPS [extern]
```

QoS Snippet that configures and sets a FlowController of 52 Mbps.

Defines a **DDSFlowController** (p. 1451) and configures the **DDS_DataWriterQos** (p. 683) with it.

This is a **DDSFlowController** (p. 1451) of 52 Mbps (~ 6.25 MB/sec)

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 735) => **DDS_PropertyQosPolicy** (p. 994) named "dds.flow_controller.token_bucket.*"
- **DDS_PublishModeQosPolicy** (p. 1012)

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.FlowController.52Mbps"

7.170.2.74 DDS_SNIPPET_FEATURE_AUTO_TUNING_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_AUTO_TUNING_ENABLE [extern]
```

QoS Snippet that enables auto_throttle and turbo_mode to true.

Sets the **DDS_DomainParticipantQos** (p. 735) properties to enable auto_throttle and turbo_mode to true.

Modified QoS Parameters:

- **DDS_DomainParticipantQos** (p. 735) => **DDS_PropertyQosPolicy** (p. 994) named "dds.domain_participant.auto_throttle"
- **DDS_DataWriterQos** (p. 683) => **DDS_PropertyQosPolicy** (p. 994) named "dds.data_writer.auto_throttle.enable"
- **DDS_DataWriterQos** (p. 683) => **DDS_PropertyQosPolicy** (p. 994) named "dds.data_writer.enable_turbo_mode"

The domain_participant.auto_throttle configures the **DDSDomainParticipant** (p. 1335) to gather internal measurements (during **DDSDomainParticipant** (p. 1335) creation) that are required for the Auto Throttle feature. This allows Data Writers belonging to this **DDSDomainParticipant** (p. 1335) to use the Auto Throttle feature.

The turbo_mode adjusts the batch max_data_bytes based on how frequently the **DDSDataWriter** (p. 1305) writes data.

Data_writer.auto_throttle enables automatic throttling in the **DDSDataWriter** (p. 1305) so it can automatically adjust the writing rate and the send window size; this minimizes the need for repairing DDS samples and improves latency.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.AutoTuning.Enable"

7.170.2.75 DDS_SNIPPET_FEATURE_MONITORING_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_MONITORING_ENABLE [extern]
```

QoS Snippet that enables the use of the RTI Monitoring Library.

To enable the use of RTI Monitoring Library apply this QoS Snippet to the QoS Profile used to create your **DDSDomain**↔
Participant (p. 1335). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.Monitoring.Enable</element>
  </base_name>
</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.Monitoring.Enable"

7.170.2.76 DDS_SNIPPET_FEATURE_MONITORING2_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_MONITORING2_ENABLE [extern]
```

QoS Snippet that enables the use of the RTI Monitoring Library 2.0.

QoS Snippet to enable the use of the RTI Monitoring Library 2.0 with a dedicated DomainParticipant publishing telemetry data from your application in domain ID 2. All metrics are enabled for all resources in this profile.

To enable the use of RTI Monitoring Library 2.0, apply this QoS Snippet to the QoS Profile used to create your Domain↔
ParticipantFactory. For example:

```
<qos_profile name="MyProfile" is_default_participant_factory_profile="true">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring2.Enable</element>
  </base_name>
</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.Monitoring2.Enable"

7.170.2.77 DDS_SNIPPET_FEATURE_SECURITY_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_SECURITY_ENABLE [extern]
```

QoS Snippet that enables security using the Builtin Security Plugins.

To enable the use of the Builtin DDS Security Library apply this QoS Snippet to the QoS Profile used to create your **DDSDomainParticipant** (p. 1335). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.Security.Enable</element>
  </base_name>
</qos_profile>
```

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.Security.Enable"

7.170.2.78 DDS_SNIPPET_FEATURE_TOPIC_QUERY_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_TOPIC_QUERY_ENABLE [extern]
```

QoS Snippet that enables Topic Query.

To enable the use of the RTI Connext **DDSTopicQuery** (p. 1611) feature, apply this QoS Snippet to the QoS Profile used to create your **DDSDataWriter** (p. 1305). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.TopicQuery.Enable</element>
  </base_name>
</qos_profile>
```

For more information on Topic Query see the "Topic Queries" chapter in the `User's Manual`.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Feature.TopicQuery.Enable"

7.170.2.79 DDS_SNIPPET_TRANSPORT_TCP_LAN_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_LAN_CLIENT [extern]
```

QoS Snippet that configures a TCP LAN Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the `initial_peers` and the property `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Therefore, they must be modified:

- `initial_peers`: should point to the remote client IP and port.
- `server_bind_port`: is the port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **DDSEntity** (p. 1446). These new values will overwrite the current invalid values.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Transport.TCP.LAN.Client"

7.170.2.80 DDS_SNIPPET_TRANSPORT_TCP_WAN_SYMMETRIC_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_SYMMETRIC_CLIENT [extern]
```

QoS Snippet that configures a symmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties `dds.transport.TCPv4.tcp1.public_address` and `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Also the `initial_peers` information is not correct. Therefore, the following must be modified:

- `initial_peers`: should point to the remote client IP and port.
- `public_address`: public IP address where this application can be reached.
- `server_bind_port`: port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **DDSEntity** (p. 1446). These new values will overwrite the current invalid values.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Transport.TCP.WAN.Symmetric.Client"

7.170.2.81 DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER [extern]
```

QoS Snippet that an asymmetric WAN TCP Server over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties `dds.transport.TCPv4.tcp1.public_address` and `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Therefore, they must be modified to the corresponding `public_address` and `port_↔` number. This modification should be done in the QoS Profile that will be used to create the **DDSEntity** (p. 1446). These new values will overwrite the current invalid values.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Transport.TCP.WAN.Asymmetric.Server"

7.170.2.82 DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_CLIENT [extern]
```

QoS Snippet that configures an asymmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The value of `discovery.initial_peers` and `public_ip` have to match the values set on the Server side (**DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER** (p. 514)). This modification should be done in the QoS Profile that will be used to create the **DDSEntity** (p. 1446). This new value will overwrite the current invalid value.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Transport.TCP.WAN.Asymmetric.Client"

7.170.2.83 DDS_SNIPPET_TRANSPORT_UDP_AVOID_IP_FRAGMENTATION

```
const char* const DDS_SNIPPET_TRANSPORT_UDP_AVOID_IP_FRAGMENTATION [extern]
```

QoS Snippet that configures RTI Connex and the UDP built-in transports (UDPv4, UDPv6, UDPv4_WAN) to avoid IP fragmentation.

For WAN communications and, in general, for communications in third party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

This snippet provides a way to avoid IP fragmentation in Connex applications using the built-in UDP transports. Instead, Connex will be responsible for fragmentation, which is done at the RTPS level.

Among other changes, this configuration changes the transport MTU (message_size_max) to be 1400 bytes. Notice that this change will affect other transports such as SHMEM since Connex chooses the minimum transport MTU across all enabled transports to determine the maximum size of outgoing RTPS messages.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Transport.UDP.AvoidIPFragmentation"

7.170.2.84 DDS_SNIPPET_TRANSPORT_UDP_WAN

```
const char* const DDS_SNIPPET_TRANSPORT_UDP_WAN [extern]
```

QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4_WAN).

The snippet disables all the other built-in transports and avoids the use of IP fragmentation.

For WAN communications and, in general, for communications in third-party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Transport.UDP.WAN"

7.170.2.85 DDS_SNIPPET_COMPATIBILITY_CONNEXT_MICRO_VERSION_2_4_3

```
const char* const DDS_SNIPPET_COMPATIBILITY_CONNEXT_MICRO_VERSION_2_4_3 [extern]
```

QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connex Micro 2.4.3.

QoS Snippet that sets the **DDS_DataReaderQos** (p. 638) and **DDS_DataWriterQos** (p. 683) **DDS_LivelinessQosPolicyKind** (p. 409) to **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 410) It also disables the built-in shared memory transport.

Modified QoS Parameters:

- **DDS_DataReaderQos** (p. 638) => **DDS_LivelinessQosPolicy** (p. 923)
- **DDS_DataWriterQos** (p. 683) => **DDS_LivelinessQosPolicy** (p. 923)
- **DDS_TransportBuiltinQosPolicy** (p. 1129)

RTI Connex Micro versions 2.4.3 and earlier only supported **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 410) **DDS_LivelinessQosPolicyKind** (p. 409). In order to be compatible with RTI Connex Micro 2.4.3, the **DDSDataReader** (p. 1272) and **DDSDataWriter** (p. 1305) must have their **DDS_LivelinessQosPolicyKind** (p. 409) changed to this value because the default kind in RTI Connex is **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 410).

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Compatibility.ConnexMicro.Version243"

7.170.2.86 DDS_SNIPPET_COMPATIBILITY_OTHER_DDS_VENDORS_ENABLE

```
const char* const DDS_SNIPPET_COMPATIBILITY_OTHER_DDS_VENDORS_ENABLE [extern]
```

QoS Snippet that configures RTI Connex to interoperate with other DDS vendors.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Compatibility.OtherDDSVendor.Enable"

7.170.2.87 DDS_SNIPPET_5_1_0_TRANSPORT_ENABLE

```
const char* const DDS_SNIPPET_5_1_0_TRANSPORT_ENABLE [extern]
```

QoS Snippet that configures RTI Connex to interoperate with RTI Connex 5.1.0 and below for UDPv6 and SHMEM transports.

In Library: **DDS_BUILTIN_QOS_SNIPPET_LIB** (p. 500)

String-version: "Compatibility.510Transport.Enable"

7.171 DomainParticipantConfigParams

<<*extension*>> (p. 236) **DDS_DomainParticipantConfigParams_t** (p. 728)

Classes

- struct **DDS_DomainParticipantConfigParams_t**
 <<*extension*>> (p. 236) Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

Macros

- #define **DDS_DomainParticipantConfigParams_t_INITIALIZER**
 <<*extension*>> (p. 236) Initializer for new **DDS_DomainParticipantConfigParams_t** (p. 728).

Variables

- const int **DDS_DOMAIN_ID_USE_XML_CONFIG**
 <<*extension*>> (p. 236) Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 728) to indicate that a participant is created using the domain ID specified in the participant configuration.
- const char * **DDS_ENTITY_NAME_USE_XML_CONFIG**
 <<*extension*>> (p. 236) Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 728) to indicate that a participant created is with an autogenerated entity name.
- const char * **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG**
 <<*extension*>> (p. 236) Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 728) to indicate that entities are created from the QoS profile specified in the participant configuration.

7.171.1 Detailed Description

<<*extension*>> (p. 236) **DDS_DomainParticipantConfigParams_t** (p. 728)

7.171.2 Macro Definition Documentation

7.171.2.1 DDS_DomainParticipantConfigParams_t_INITIALIZER

```
#define DDS_DomainParticipantConfigParams_t_INITIALIZER
```

<<*extension*>> (p. 236) Initializer for new **DDS_DomainParticipantConfigParams_t** (p. 728).

No memory is allocated. New **DDS_DomainParticipantConfigParams_t** (p. 728) instances stored in the stack should be initialized with this value before they are passed to any methods. .

7.171.3 Variable Documentation

7.171.3.1 DDS_DOMAIN_ID_USE_XML_CONFIG

```
const int DDS_DOMAIN_ID_USE_XML_CONFIG [extern]
```

<<*extension*>> (p. 236) Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 728) to indicate that a participant is created using the domain ID specified in the participant configuration.

This variable contains a constant sentinel value that is compared when creating the entities from configuration.

7.171.3.2 DDS_ENTITY_NAME_USE_XML_CONFIG

```
const char* DDS_ENTITY_NAME_USE_XML_CONFIG [extern]
```

<<*extension*>> (p. 236) Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 728) to indicate that a participant created is with an autogenerated entity name.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

7.171.3.3 DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG

```
const char* DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG [extern]
```

<<**extension**>> (p. 236) Special value to be used with **DDS_DomainParticipantConfigParams_t** (p. 728) to indicate that entities are created from the QoS profile specified in the participant configuration.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

7.172 User-managed Threads

User-managed thread infrastructure.

Classes

- class **DDSThreadFactory**

<<**extension**>> (p. 236) <<**interface**>> (p. 236) Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDSThreadFactory_OnSpawnedFunction** (p. 518) that specifies the operation to run in the new thread.

Typedefs

- typedef DDS_ThreadFactory_OnSpawnedFunction **DDSThreadFactory_OnSpawnedFunction**
*Prototype of the function that must be called on a new thread created by a **DDSThreadFactory** (p. 1599).*

7.172.1 Detailed Description

User-managed thread infrastructure.

Core feature that allows users to provide the threads to RTI Connext.

"::DDSThreadFactory"

The model follows the abstract factory pattern. A **DDSThreadFactory** (p.1599) instance can be set in the **DDSDomainParticipantFactory** (p. 1409) so that **DDSDomainParticipant** (p.1335) will use it for thread creation and deletion.

7.172.2 Typedef Documentation

7.172.2.1 DDSThreadFactory_OnSpawnedFunction

```
typedef DDS_ThreadFactory_OnSpawnedFunction DDSThreadFactory_OnSpawnedFunction
```

Prototype of the function that must be called on a new thread created by a **DDSThreadFactory** (p. 1599).

Parameters

<i>thread_param</i>	<< <i>in</i> >> (p. 237) Single argument that this operation receives. It is the data this operation needs to perform.
---------------------	--

7.173 Observability Library

RTI Monitoring Library 2.0.

Functions

- void **RTI_Monitoring_initialize** (void)
Initializes Monitoring Library 2.0.

Variables

- const char *const **RTI_MONITORING_PERIODIC_TOPIC_NAME**
The name of the Monitoring Topic used for periodic metrics distribution.
- const char *const **RTI_MONITORING_EVENT_TOPIC_NAME**
The name of the Monitoring Topic used for event metrics distribution.
- const char *const **RTI_MONITORING_LOGGING_TOPIC_NAME**
The name of the Monitoring Topic used for log messages distribution.

7.173.1 Detailed Description

RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 is one component of the RTI Connex Observability Framework which allows collecting and distributing telemetry data (metrics and logs) associated with the observable resources created by an RTI Connex application.

In this release, the only Observable resources are the following entities: **DDSDDataWriter** (p. 1305), **DDSDDataReader** (p. 1272), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDomainParticipant** (p. 1335), **DDSTopic** (p. 1601) and Application (a process running RTI Connex).

The library also accepts remote commands to change the set of distributed telemetry data at run-time.

The data distributed by RTI Monitoring Library 2.0 is sent to an RTI Observability Collector Service instance, which forwards the data to other RTI Observability Collector Service instances or stores the data in third-party observability backends such as Prometheus or Grafana Loki.

RTI Monitoring Library 2.0 is a separate library (rtimonitoring2), and applications can use it in three different modes:

- **Dynamically loaded:** This is the default mode, and it requires that the `rtmonitoring2` shared library is in the library search path.
- **Dynamic linking:** The application is linked with the `rtmonitoring2` shared library.
- **Static linking:** The application is linked with the `rtmonitoring2` static library.

The last two modes require calling the API **RTI_Monitoring_initialize** (p. 520) in your application before any other RTI Connex API.

Dynamic and static linking are only supported in C and C++ applications.

To enable use of RTI Monitoring Library 2.0 and configure its behavior, use the **DDS_MonitoringQosPolicy** (p. 949) QoS policy on the **DDSDomainParticipantFactory** (p. 1409). This QoS policy can be configured programmatically or via XML.

7.173.2 Function Documentation

7.173.2.1 RTI_Monitoring_initialize()

```
void RTI_Monitoring_initialize (
    void )
```

Initializes Monitoring Library 2.0.

This method must be called before calling any other RTI Connex API if the application links with RTI Monitoring Library 2.0 dynamically or statically.

7.173.3 Variable Documentation

7.173.3.1 RTI_MONITORING_PERIODIC_TOPIC_NAME

```
const char* const RTI_MONITORING_PERIODIC_TOPIC_NAME
```

The name of the Monitoring Topic used for periodic metrics distribution.

String version: "DCPSPeriodicStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

7.173.3.2 RTI_MONITORING_EVENT_TOPIC_NAME

```
const char* const RTI_MONITORING_EVENT_TOPIC_NAME
```

The name of the Monitoring Topic used for event metrics distribution.

String version: "DCPSEventStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

7.173.3.3 RTI_MONITORING_LOGGING_TOPIC_NAME

```
const char* const RTI_MONITORING_LOGGING_TOPIC_NAME
```

The name of the Monitoring Topic used for log messages distribution.

String version: "DCPSLoggingStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

7.174 Version

Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

Classes

- struct **NDDS_Config_LibraryVersion_t**
The version of a single library shipped as part of an RTI Connext distribution.
- class **NDDSConfigVersion**
<<interface>> (p. 236) The version of an RTI Connext distribution.

7.174.1 Detailed Description

Retrieve information for the RTI Connext product, the core library, and the C, C++ or Java libraries.

There are three ways to obtain version information: looking at the revision files, using Visual Studio or the command line, or programmatically at run time. This HTML documentation includes a reference for consulting the APIs that allow you to get version information programmatically. For more information see the RTI Connext DDS Core Libraries User's Manual.

The version information includes four fields:

- Major product version.
- Minor product version.
- Release letter for product version.
- Revision number of product.

7.175 Logging

Configure how much debugging information is reported during runtime and where it is logged.

Modules

- **Activity Context**

Add contextual information to log messages.

Classes

- struct **NDDS_Config_LogMessage**

Log message.

- class **NDDSSConfigLoggerDevice**

<<interface>> (p. 236) Logging device interface. Use for user-defined logging devices.

- class **NDDSSConfigLogger**

<<interface>> (p. 236) The singleton type used to configure RTI Connex logging.

Enumerations

- enum **NDDS_Config_LogVerbosity** {
NDDS_CONFIG_LOG_VERBOSITY_SILENT ,
NDDS_CONFIG_LOG_VERBOSITY_ERROR ,
NDDS_CONFIG_LOG_VERBOSITY_WARNING ,
NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL ,
NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE ,
NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL }

The verbositys at which RTI Connex diagnostic information is logged.

- enum **NDDS_Config_LogLevel** {
NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR ,
NDDS_CONFIG_LOG_LEVEL_ERROR ,
NDDS_CONFIG_LOG_LEVEL_WARNING ,
NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL ,
NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE ,
NDDS_CONFIG_LOG_LEVEL_DEBUG }

Level category assigned to RTI Connex log messages returned to an output device.

- enum **NDDS_Config_SyslogLevel** {
NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY ,
NDDS_CONFIG_SYSLOG_LEVEL_ALERT ,
NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL ,
NDDS_CONFIG_SYSLOG_LEVEL_ERROR ,
NDDS_CONFIG_SYSLOG_LEVEL_WARNING ,
NDDS_CONFIG_SYSLOG_LEVEL_NOTICE ,
NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL ,
NDDS_CONFIG_SYSLOG_LEVEL_DEBUG }

Syslog level category assigned to RTI Connex log messages.

- enum **NDDS_Config_LogCategory** {
NDDS_CONFIG_LOG_CATEGORY_PLATFORM ,
NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION ,
NDDS_CONFIG_LOG_CATEGORY_DATABASE ,
NDDS_CONFIG_LOG_CATEGORY_ENTITIES ,
NDDS_CONFIG_LOG_CATEGORY_API ,
NDDS_CONFIG_LOG_CATEGORY_DISCOVERY ,
NDDS_CONFIG_LOG_CATEGORY_SECURITY ,
NDDS_CONFIG_LOG_CATEGORY_ALL }

Categories of logged messages.

- enum **NDDS_Config_LogPrintFormat** { }

The format used to output RTI Connex diagnostic information.

- enum **NDDS_Config_LogFacility** {
NDDS_CONFIG_LOG_FACILITY_USER ,
NDDS_CONFIG_LOG_FACILITY_SECURITY ,
NDDS_CONFIG_LOG_FACILITY_SERVICE ,
NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE }

A number that identifies the source of a log message.

- enum **NDDS_Config_SyslogVerbosity** {
NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT ,
NDDS_CONFIG_SYSLOG_VERBOSITY_EMERGENCY ,
NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT ,
NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL ,
NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR ,
NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING ,
NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE ,
NDDS_CONFIG_SYSLOG_VERBOSITY_INFORMATIONAL ,
NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG }

The Syslog verbositys at which RTI Connex diagnostic information is logged.

7.175.1 Detailed Description

Configure how much debugging information is reported during runtime and where it is logged.

7.175.2 Enumeration Type Documentation

7.175.2.1 NDDS_Config_LogVerbosity

```
enum NDDS_Config_LogVerbosity
```

The verbositys at which RTI Connex diagnostic information is logged.

Enumerator

NDDS_CONFIG_LOG_VERBOSITY_SILENT	No further output will be logged.
---	-----------------------------------

Enumerator

NDDS_CONFIG_LOG_VERBOSITY_ERROR	Only error and fatal error messages will be logged. An error indicates something wrong in the functioning of RTI Connex. The most common cause of errors is incorrect configuration.
NDDS_CONFIG_LOG_VERBOSITY_WARNING	Both error and warning messages will be logged. A warning indicates that RTI Connex is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL	Errors, warnings, and verbose information about the lifecycles of local RTI Connex objects will be logged.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_↔ REMOTE	Errors, warnings, and verbose information about the lifecycles of remote RTI Connex objects will be logged.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL	Errors, warnings, verbose information about the lifecycles of local and remote RTI Connex objects, and periodic information about RTI Connex threads will be logged.

7.175.2.2 NDDS_Config_LogLevel

enum **NDDS_Config_LogLevel**

Level category assigned to RTI Connex log messages returned to an output device.

Enumerator

NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR	The message describes a fatal error. A fatal error indicates an unrecoverable situation in the functioning of RTI Connex. Error messages with this log level usually indicate a violation of an internal invariant or a segfault, and may include the function call stack where the fatal error happened.
NDDS_CONFIG_LOG_LEVEL_ERROR	The message describes an error. An error indicates a non-fatal problem in the functioning of RTI Connex. Errors are usually recoverable and will not stop application execution, although they may prevent some features from working properly. The most common cause of non-fatal errors is incorrect configuration and incorrect arguments.
NDDS_CONFIG_LOG_LEVEL_WARNING	The message describes a warning. A warning indicates that RTI Connex is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL	The message contains information about the lifecycles of local RTI Connex objects will be logged.
NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE	The message contains information about the lifecycles of remote RTI Connex objects will be logged.
NDDS_CONFIG_LOG_LEVEL_DEBUG	The message contains debug information that might be relevant to your application.

7.175.2.3 NDDS_Config_SyslogLevel

enum **NDDS_Config_SyslogLevel**

Syslog level category assigned to RTI Connex log messages.

Enumerator

NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY	System is unusable. Equivalent to NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR (p. 524).
NDDS_CONFIG_SYSLOG_LEVEL_ALERT	Should be corrected immediately. RTI Connex does not produce these messages.
NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL	Critical conditions. RTI Connex does not produce these messages.
NDDS_CONFIG_SYSLOG_LEVEL_ERROR	Error conditions. Equivalent to NDDS_CONFIG_LOG_LEVEL_ERROR (p. 524).
NDDS_CONFIG_SYSLOG_LEVEL_WARNING	May indicate that an error will occur if action is not taken. Equivalent to NDDS_CONFIG_LOG_LEVEL_WARNING (p. 524).
NDDS_CONFIG_SYSLOG_LEVEL_NOTICE	Events that are unusual, but not error conditions. RTI Connex does not produce these messages.
NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL	Normal operational messages that require no action. Equivalent to NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL (p. 524) and NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE (p. 524).
NDDS_CONFIG_SYSLOG_LEVEL_DEBUG	Information useful to developers for debugging the application. Equivalent to NDDS_CONFIG_LOG_LEVEL_DEBUG (p. 524).

7.175.2.4 NDDS_Config_LogCategory

enum **NDDS_Config_LogCategory**

Categories of logged messages.

The **NDDSSConfigLogger::get_verbosity_by_category** (p. 1803) and **NDDSSConfigLogger::set_verbosity_by_category** (p. 1804) can be used to specify different verbosity levels for different categories of messages.

Enumerator

NDDS_CONFIG_LOG_CATEGORY_PLATFORM	Log messages pertaining to the underlying platform (hardware and OS) on which RTI Connex is running are in this category.
NDDS_CONFIG_LOG_CATEGORY_↔ COMMUNICATION	Log messages pertaining to data serialization and deserialization and network traffic are in this category.
NDDS_CONFIG_LOG_CATEGORY_DATABASE	Log messages pertaining to the internal database in which RTI Connex objects are stored are in this category.
NDDS_CONFIG_LOG_CATEGORY_ENTITIES	Log messages pertaining to local and remote entities, and to a subset of the discovery process, are in this category. (To see all discovery-related messages, use the DISCOVERY category.)
NDDS_CONFIG_LOG_CATEGORY_API	Log messages pertaining to the API layer of RTI Connex (such as method argument validation) are in this category.
NDDS_CONFIG_LOG_CATEGORY_DISCOVERY	Log messages pertaining to discovery are in this category.
NDDS_CONFIG_LOG_CATEGORY_SECURITY	Log messages pertaining to Security Plugins are in this category.
NDDS_CONFIG_LOG_CATEGORY_ALL	Log messages pertaining to all categories in RTI Connex.

7.175.2.5 NDDS_Config_LogPrintFormat

```
enum NDDS_Config_LogPrintFormat
```

The format used to output RTI Connex diagnostic information.

Enumerator

NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT	(default) Print message, method name, log level, Activity Context (p. 528) (what was happening when the event occurred), and logging category.
NDDS_CONFIG_LOG_PRINT_FORMAT_↔ TIMESTAMPED	Print message, method name, log level, Activity Context (p. 528), logging category, and timestamp.
NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE	Print message with all available context information (includes thread identifier, message location).
NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE↔ _TIMESTAMPED	Print message with all available context information, and timestamp.
NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG	Print a set of fields (including message number and backtrace information) that may be useful for internal debugging.
NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL	Print only message number and message location.
NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL	Print all available fields.

7.175.2.6 NDDS_Config_LogFacility

enum **NDDS_Config_LogFacility**

A number that identifies the source of a log message.

In the Syslog Protocol, the Facility is a numerical code that represents the machine process that created a Syslog event. RTI Connex uses the facility to represent the source of a given log message.

Enumerator

NDDS_CONFIG_LOG_FACILITY_USER	A log message produced by the user's application.
NDDS_CONFIG_LOG_FACILITY_SECURITY	A security-related message. A "security-related message" is a log message that meets any of the following: <ul style="list-style-type: none"> • A security event logged with the RTI Security Plugins Logging Plugin. • RTI TLS Support log messages related to OpenSSL.
NDDS_CONFIG_LOG_FACILITY_SERVICE	A log message produced by an Infrastructure Service.
NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE	A log message produced by RTI Connex.

7.175.2.7 NDDS_Config_SyslogVerbosity

enum **NDDS_Config_SyslogVerbosity**

The Syslog verbosity levels at which RTI Connex diagnostic information is logged.

Enumerator

NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT	No output will be logged. Equivalent to NDDS_CONFIG_LOG_VERBOSITY_SILENT (p. 523).
NDDS_CONFIG_SYSLOG_VERBOSITY_↔ EMERGENCY	Only fatal log messages will be logged. Only log messages with NDDS_Config_LogLevel (p. 524) equals to NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR (p. 524) will be part of this Syslog verbosity level.
NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT	Only fatal log messages will be logged. Equivalent to NDDS_CONFIG_SYSLOG_VERBOSITY_↔ EMERGENCY (p. 527).
NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL	Only fatal log messages will be logged. Equivalent to NDDS_CONFIG_SYSLOG_VERBOSITY_↔ EMERGENCY (p. 527).

Enumerator

NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR	Only error and fatal error messages will be logged. Only log messages with NDDS_Config_LogLevel (p. 524) equals to NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR (p. 524) or NDDS_CONFIG_LOG_LEVEL_ERROR (p. 524) will be part of this Syslog verbosity level.
NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING	Fatal, error and warning messages will be logged. Only log messages with NDDS_Config_LogLevel (p. 524) equals to NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR (p. 524), NDDS_CONFIG_LOG_LEVEL_ERROR (p. 524) or NDDS_CONFIG_LOG_LEVEL_WARNING (p. 524) will be part of this Syslog verbosity level.
NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE	Fatal, error and warning messages will be logged. Equivalent to NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING (p. 528).
NDDS_CONFIG_SYSLOG_VERBOSITY_↔ INFORMATIONAL	Local, remote, fatal, error and warning messages will be logged. Only log messages with NDDS_Config_LogLevel (p. 524) equals to NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR (p. 524), NDDS_CONFIG_LOG_LEVEL_ERROR (p. 524), NDDS_CONFIG_LOG_LEVEL_WARNING (p. 524), NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL (p. 524) or NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE (p. 524) will be part of this Syslog verbosity level.
NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG	All messages will be logged.

7.176 Activity Context

Add contextual information to log messages.

Classes

- class **NDDSConfigActivityContext**
Activity Context APIs.

Macros

- #define **NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_DEFAULT** RTI_OSAPI_ACTIVITY_↔
CONTEXT_ATTRIBUTE_MASK_DEFAULT
Provide the default attributes of the resource of the Activity Context.

- `#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_NONE` RTI_OSAPI_ACTIVITY_↔
CONTEXT_ATTRIBUTE_MASK_NONE

Not provide any attribute of the resource of the Activity Context.

- `#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_ALL` RTI_OSAPI_ACTIVITY_↔
CONTEXT_ATTRIBUTE_MASK_ALL

Provide all the possibles attributes of the resource of the Activity Context.

Typedefs

- typedef **DDS_Long** **NDDS_Config_ActivityContextAttributeKindMask**

*The attributes **NDDS_Config_ActivityContextAttributeKind** (p. 531) used in the string representation of the Activity Context can be configured through this mask.*

Enumerations

- enum **NDDS_Config_ActivityContextAttributeKind** {
 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_GUID_PREFIX ,
 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_TOPIC ,
 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_TYPE ,
 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_ENTITY_KIND ,
 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_DOMAIN_ID ,
 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_ENTITY_NAME }

*The resources of the **Activity Context** (p. 528) can have multiple associated attributes. Those attributes provide extra information about the entity such as GUID prefix, Topic, data type, entity kind, entity name and domain ID. They are used to indicate what attributes of the resources are included in the activity context.*

Functions

- static void **NDDSConfigActivityContext::set_attribute_mask** (**NDDS_Config_ActivityContextAttribute**↔
KindMask attribute_format)

*Set the **NDDS_Config_ActivityContextAttributeKindMask** (p. 531) of the Activity Context.*

7.176.1 Detailed Description

Add contextual information to log messages.

The Activity Context is a group of resources and activities associated with an action such as the creation of an entity.

- A resource is a abstraction of an entity. It can contain attributes such as Topic or domain ID.
- An activity is a general task that the resource is doing, such as "Getting QoS".

Logging context is one of the formats RTI Connexx logging infrastructure supports. It is used by default in **NDDS**↔
_CONFIG_LOG_PRINT_FORMAT_DEFAULT (p.526). It provides information about resources and activities. The activity context is used in two places:

- Logging: activity context is one of the **NDDS_Config_LogPrintFormat** (p. 526) DDS logging infrastructure supports. If that format is set every time RTI Connexx logs a message, it will contain the contextual information.
- Heap monitoring: every time memory is allocated and heap monitoring is enabled, the string representation of the activity context will be associated with the allocation. This information will be available when taking the snapshot.

For example, in the creation of a `DataWriter`, the activity context will provide information about:

- Resource: the Publisher creating the `DataWriter`. Attributes of the publisher will be GUID, kind, name and domain ID.
- Activity: entity creation. It will have two parameters, the entity kind and the Topic. In the example below, these are "Writer" and "TestTopic".

The string representation of the above activity context would be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000088{Entity=Pu,Name=TestPublisher,Domain=1}|CREATE Writer WITH TOPIC TestTopic]
```

Another example could be when a `DataWriter` writes a sample. The activity context will provide information about:

- Resource: the `DataWriter` writing the sample. The attributes of the `DataWriter` will be GUID, name, kind, Topic, data type, and the domain ID.
- Activity will be "write a sample".

The string representation of the activity context will be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
```

7.176.2 Macro Definition Documentation

7.176.2.1 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_DEFAULT

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_DEFAULT RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE↔  
_MASK_DEFAULT
```

Provide the default attributes of the resource of the Activity Context.

7.176.2.2 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_NONE

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_NONE RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE↔  
MASK_NONE
```

Not provide any attribute of the resource of the Activity Context.

7.176.2.3 NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_ALL

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_ALL RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE_↵  
MASK_ALL
```

Provide all the possibles attributes of the resource of the Activity Context.

7.176.3 Typedef Documentation

7.176.3.1 NDDS_Config_ActivityContextAttributeKindMask

```
typedef DDS_Long NDDS_Config_ActivityContextAttributeKindMask
```

The attributes **NDDS_Config_ActivityContextAttributeKind** (p. 531) used in the string representation of the Activity Context can be configured through this mask.

This mask indicates what attributes of the resource are used when RTI Connexx logs a message or when the Heap Monitoring utility saves statistics for a memory allocation.

7.176.4 Enumeration Type Documentation

7.176.4.1 NDDS_Config_ActivityContextAttributeKind

```
enum NDDS_Config_ActivityContextAttributeKind
```

The resources of the **Activity Context** (p. 528) can have multiple associated attributes. Those attributes provide extra information about the entity such as GUID prefix, Topic, data type, entity kind, entity name and domain ID. They are used to indicate what attributes of the resources are included in the activity context.

Enumerator

<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_GUID_PREFIX</p>	<p>Provide the entity GUID prefix to the resource of the Activity Context. For example:</p> <ul style="list-style-type: none"> For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}] The GUID prefix is 0X101A76B,0X79E5D71,0X50EE914. If the bit NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_GUID_PREFIX (p. 532) is not set, the string representation will not show the GUID prefix: [:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}]
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TOPIC</p>	<p>Provide the Topic to the resource of the Activity Context. The topic attribute is specified by "Topic". For example:</p> <ul style="list-style-type: none"> For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}] The Topic is "test." If the bit NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TOPIC (p. 532) is not set, the string representation will not show the Topic: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Type=Foo}]
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TYPE</p>	<p>Provide the data type to the resource of the Activity Context. The type attribute is specified by "Type". For example:</p> <ul style="list-style-type: none"> For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}] The data type is "Foo." If the bit NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TYPE (p. 532) is not set, the string representation will not show the data type: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test}]

Enumerator

<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_KIND</p>	<p>Provide the entity kind to the resource of the Activity Context. The kind attribute is specified by "Entity". For example:</p> <ul style="list-style-type: none"> For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName}] The entity kind is "Writer." If the bit NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_KIND (p. 533) is not set, the string representation will not show the entity kind: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName}]
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_DOMAIN_ID</p>	<p>Provide the domain ID to the resource of the Activity Context. The domain attribute is specified by "Domain". For example:</p> <ul style="list-style-type: none"> For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName}] The domain ID is "1." If the bit NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_DOMAIN_ID (p. 533) is not set, the string representation will not show the domain ID: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName}]
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_NAME</p>	<p>Provide the entity name to the resource of the Activity Context. The name attribute is specified by "Name". For example:</p> <ul style="list-style-type: none"> For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName}] The entity name is "testDataWriterName." If the bit NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_NAME (p. 533) is not set, the string representation will not show the entity name: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Entity=DW,Topic=testDataWriterName}]

7.176.5 Function Documentation

7.176.5.1 set_attribute_mask()

```
static void NDDSSConfigActivityContext::set_attribute_mask (
    NDDSS_Config_ActivityContextAttributeKindMask attribute_format ) [static]
```

Set the **NDDSS_Config_ActivityContextAttributeKindMask** (p. 531) of the Activity Context.

7.177 Heap Monitoring

Monitor memory allocations done by the middleware on the native heap.

Classes

- class **NDDSSUtilityHeapMonitoring**
Heap Monitoring APIs.

Enumerations

- enum **NDDSS_Utility_HeapMonitoringSnapshotContentFormat** {
NDDSS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_TOPIC ,
NDDSS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_FUNCTION ,

NDDSS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_MINIMAL }
Bitmap used to decide which information of the snapshot will be displayed.

7.177.1 Detailed Description

Monitor memory allocations done by the middleware on the native heap.

RTI Connexx allows you to monitor the memory allocations done by the middleware on the native heap. This feature can be used to analyze and debug unexpected memory growth.

After **NDDSSUtilityHeapMonitoring::enable** (p. 1820) is called, you may invoke **NDDSSUtilityHeapMonitoring::take_↔ heap_snapshot** (p. 1821) to save the current heap memory usage to a file. By comparing two snapshots, you can tell if new memory has been allocated and, in many cases, where.

7.177.2 Enumeration Type Documentation

7.177.2.1 NDDSS_Utility_HeapMonitoringSnapshotContentFormat

```
enum NDDSS_Utility_HeapMonitoringSnapshotContentFormat
```

Bitmap used to decide which information of the snapshot will be displayed.

Enumerator

NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_BIT_TOPIC	Add the topic to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_BIT_FUNCTION	Add the function name to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_BIT_ACTIVITY	Add the activity context to the snapshot of heap monitoring. The user can select the information that will be part of the activity context by using the API NDDSSConfigActivityContext::set_attribute_mask (p. 533).
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_DEFAULT	Add all the optional attributes to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_MINIMAL	Not add any optional attribute to the snapshot of heap monitoring.

7.178 Network Capture

Save network traffic into a capture file for further analysis.

Classes

- struct **NDDS_Utility_NetworkCaptureParams_t**
Input parameters for starting network capture.
- class **NDDSSUtilityNetworkCapture**
Network Capture APIs.

Macros

- #define **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT**
*Default mask for **NDDS_Utility_NetworkCaptureContentKind** (p. 539): do not remove any content.*
- #define **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE**
The RTPS frames in the capture file will be saved as they are.
- #define **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_ALL**
The RTPS frames in the capture file will not include user data (either plain or encrypted).
- #define **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT**
*Default mask for **NDDS_Utility_NetworkCaptureTrafficKindMask** (p. 539).*
- #define **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_NONE**
Do not capture any traffic.
- #define **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL**
Capture all traffic (both inbound and outbound).

Typedefs

- typedef **DDS_Long NDDS_Utility_NetworkCaptureContentKindMask**
Mask that indicates a combination of content types.
- typedef **DDS_Long NDDS_Utility_NetworkCaptureTrafficKindMask**
Mask that indicates the traffic direction to capture.
- typedef struct **NDDS_Utility_NetworkCaptureParams_t NDDS_Utility_NetworkCaptureParams_t**
Input parameters for starting network capture.

Enumerations

- enum **NDDS_Utility_NetworkCaptureContentKind** {
 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_USER_SERIALIZED_DATA ,
 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_ENCRYPTED_DATA }
Bitmap used to specify a content type, i.e., a part of the RTPS frame.
- enum **NDDS_Utility_NetworkCaptureTrafficKind** {
 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_OUT ,
 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_IN }
Bitmap used to specify whether we want to capture inbound or outbound traffic.

Variables

- const **NDDS_Utility_NetworkCaptureParams_t NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_↵**
DEFAULT
Default parameters used in Network Capture.

7.178.1 Detailed Description

Save network traffic into a capture file for further analysis.

RTI Connexx allows you to capture the network traffic that one or more DomainParticipants send or receive. This feature can be used to analyze and debug communication problems between your DDS applications. When network capture is enabled, each DomainParticipant will generate a pcap-based file that can then be opened by a packet analyzer like Wireshark, provided the right dissectors are installed.

To some extent, network capture can be used as an alternative to existing pcap-based network capture software (such as Wireshark). This will be the case when you are only interested in analyzing the traffic a DomainParticipant sends/receives. In this scenario, network capture will actually have some advantages over using more general pcap-based network capture applications: RTI's network capture includes additional information such as security-related data; it also removes information that is not needed, such as user data, when you want to reduce the capture size. That said, RTI's network capture is not a replacement for other pcap-based network capture applications: it only captures the traffic exchanged by the DomainParticipants, but it does not capture any other traffic exchanged through the system network interfaces.

To capture network traffic **NDDSUtalityNetworkCapture::enable** (p.1824) must be invoked before creating any DomainParticipant. Similarly, **NDDSUtalityNetworkCapture::disable** (p.1825) must be called after deleting all participants. In between these calls, you may start, stop, pause or resume capturing traffic for one or all participants.

7.178.2 Capturing

Shared Memory Traffic

Every RTPS frame in network capture has a source and a destination associated with it. In the case of shared memory traffic, a process identifier and a port determine the source and destination endpoints.

Access to the process identifier (PID) of the source for inbound traffic requires changes in the shared memory segments. These changes would break shared memory compatibility with previous versions of RTI Connext. For this reason, by default, network capture will not populate the value of the source PID for inbound shared memory traffic.

If interoperability with previous versions of RTI Connext is not necessary, you can generate capture files containing the source PID for inbound traffic. To do so, configure the value of the `'dds.transport.minimum_compatibility_version'` property to 6.1.0. (See **DDS_PropertyQosPolicy** (p. 994)).

```
<domain_participant_qos>
  <property>
    <value>
      <element>
        <name>dds.transport.minimum_compatibility_version</name>
        <value>6.1.0</value>
        <propagate>false</propagate>
      </element>
    </value>
  </property>
</domain_participant_qos>
```

This property is never propagated, so it must be consistently configured throughout the whole system.

Note: Changing the value of this property affects the type of shared memory segments that RTI Connext uses. For that reason, you may see the following warning, resulting from leftover shared memory segments:

```
[0xC733A001,0xB248F671,0xAEC4A0C1:0x000001C1{Domain=200}|CREATE DP|ENABLE]
  NDDS_Transport_Shmem_is_segment_compatible:incompatible shared memory protocol detected.
Current version 4.0 not compatible with 2.0.
```

The leftover shared memory segments can be removed using the `ipcrm` command. See <https://community.rti.com/kb/what-are-possible-solutions-common-shared-memory-issues> for more information.

7.178.3 Macro Definition Documentation

7.178.3.1 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT
```

Default mask for **NDDS_Utility_NetworkCaptureContentKind** (p. 539): do not remove any content.

It is equivalent to **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE** (p. 537).

[default] Do not remove any content.

7.178.3.2 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE
```

The RTPS frames in the capture file will be saved as they are.

7.178.3.3 NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_ALL

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_ALL
```

The RTPS frames in the capture file will not include user data (either plain or encrypted).

Its value is the result of setting the bits for removing user data and removing encrypted data: (**NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_USER_SERIALIZED_DATA** (p. 540)) | **NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_ENCRYPTED_DATA** (p. 540))

7.178.3.4 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT
```

Default mask for **NDDS_UTILITY_NetworkCaptureTrafficKindMask** (p. 539).

It is equivalent to **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL** (p. 538).

[default] Capture all traffic: inbound and outbound.

7.178.3.5 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_NONE

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_NONE
```

Do not capture any traffic.

7.178.3.6 NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL
```

Capture all traffic (both inbound and outbound).

The value is equal to setting both the input and output bits of the mask: (**NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_IN** (p. 540) | **NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_OUT** (p. 540)).

7.178.4 Typedef Documentation

7.178.4.1 `NDDS_Utility_NetworkCaptureContentKindMask`

```
typedef DDS_Long NDDS_Utility_NetworkCaptureContentKindMask
```

Mask that indicates a combination of content types.

The masks are based on a combination (or only one) of the `NDDS_Utility_NetworkCaptureContentKind` (p. 539) bitmaps.

See also

`NDDS_Utility_NetworkCaptureContentKind` (p. 539)

7.178.4.2 `NDDS_Utility_NetworkCaptureTrafficKindMask`

```
typedef DDS_Long NDDS_Utility_NetworkCaptureTrafficKindMask
```

Mask that indicates the traffic direction to capture.

The masks are based on a combination (or only one) of the `NDDS_Utility_NetworkCaptureTrafficKind` (p. 540) bitmaps.

See also

`NDDS_Utility_NetworkCaptureTrafficKind` (p. 540)

7.178.4.3 `NDDS_Utility_NetworkCaptureParams_t`

```
typedef struct NDDS_Utility_NetworkCaptureParams_t NDDS_Utility_NetworkCaptureParams_t
```

Input parameters for starting network capture.

7.178.5 Enumeration Type Documentation

7.178.5.1 `NDDS_Utility_NetworkCaptureContentKind`

```
enum NDDS_Utility_NetworkCaptureContentKind
```

Bitmap used to specify a content type, i.e., a part of the RTPS frame.

Several values can be combined. Read `NDDS_Utility_NetworkCaptureContentKindMask` (p. 539) for typical combinations.

Enumerator

NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_USER_↔ SERIALIZED_DATA	The serialized data coming from a user.
NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_ENCRYPTED_↔ DATA	The encrypted user data.

7.178.5.2 NDDS_Utility_NetworkCaptureTrafficKind

```
enum NDDS_Utility_NetworkCaptureTrafficKind
```

Bitmap used to specify whether we want to capture inbound or outbound traffic.

Several values can be combined. Read **NDDS_Utility_NetworkCaptureTrafficKindMask** (p. 539) for typical combinations.

Enumerator

NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_OUT	Do not capture outbound traffic.
NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_IN	Do not capture inbound traffic.

7.178.6 Variable Documentation

7.178.6.1 NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT

```
const NDDS_Utility_NetworkCaptureParams_t NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT [extern]
```

Default parameters used in Network Capture.

The default parameters can be used as initializers to ensure that new objects do not have uninitialized contents.

Initialization of a **NDDS_Utility_NetworkCaptureParams_t** (p. 1799) type can be done either by assigning to the default parameters:

```
struct NDDS_Utility_NetworkCaptureParams_t params = NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT;
```

Or equivalently, by using its initializer method:

```
struct NDDS_Utility_NetworkCaptureParams_t params;  
NDDS_Utility_NetworkCaptureParams_t_initialize(&params);
```

In either case, do not forget to finalize the parameters when you don't need them any more:

```
NDDS_Utility_NetworkCaptureParams_t_finalize(&params);
```

The values that are used by default for the parameters can be found in the description of each of the members in **NDDS_Utility_NetworkCaptureParams_t** (p. 1799).

7.179 Other Utilities

Other Utilities, such as **NDDSUtility::spin** (p. 1817).

Classes

- class **NDDSUtility**
Other Utilities APIs.

7.179.1 Detailed Description

Other Utilities, such as **NDDSUtility::spin** (p. 1817).

7.180 Octet Buffer Support

<<**extension**>> (p. 236) Octet buffer creation, cloning, and deletion.

Functions

- unsigned char * **DDS_OctetBuffer_alloc** (unsigned int size)
Create a new empty OctetBuffer that can hold up to `size` octets.
- unsigned char * **DDS_OctetBuffer_dup** (const unsigned char *buffer, unsigned int size)
Clone an OctetBuffer.
- void **DDS_OctetBuffer_free** (unsigned char *buffer)
Delete an OctetBuffer.

7.180.1 Detailed Description

<<**extension**>> (p. 236) Octet buffer creation, cloning, and deletion.

The methods in this class ensure consistent cross-platform implementations for OctetBuffer creation (**DDS_OctetBuffer_alloc()** (p. 542)), deletion (**DDS_OctetBuffer_free()** (p. 543)), and cloning (**DDS_OctetBuffer_dup()** (p. 543)) that preserve the mutable value type semantics. These are to be viewed as methods that define an `OctetBuffer` class whose data is represented by a `'unsigned char*'`.

7.180.2 Conventions

The following conventions govern the memory management of OctetBuffers in RTI Connex.

- The DDS implementation ensures that when value types containing OctetBuffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the `OctetBuffer` class methods.
 - Value types containing OctetBuffers have ownership of the contained OctetBuffer. Thus, when a value type is deleted, the contained octet buffer field is also deleted.
- The user must ensure that when value types containing OctetBuffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the `OctetBuffer` class methods.

The representation of an OctetBuffer in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a OctetBuffer. RTI Connex must therefore make some assumptions when a user requests that a OctetBuffer be copied into. The following rules apply when RTI Connex is copying into an OctetBuffer.

- If the 'unsigned char*' is NULL, RTI Connex will allocate a new OctetBuffer on behalf of the user. *To avoid leaking memory, you must ensure that the OctetBuffer will be freed (see **Usage** (p. 542) below) in C. For C++, the destructor of the valuetype containing the OctetBuffer will free it automatically..*
- If the 'unsigned char*' is not NULL, RTI Connex will assume that you are managing the OctetBuffer's memory yourself and have allocated enough memory to store the OctetBuffer to be copied. *RTI Connex will copy into your memory; to avoid memory corruption, be sure to allocate enough of it. Also, do not pass structures containing junk pointers into RTI Connex; you are likely to crash.*

7.180.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating OctetBuffers.

Always use
 `DDS_OctetBuffer_alloc()` to create,
 `DDS_OctetBuffer_dup()` to clone,
 `DDS_OctetBuffer_free()` to delete
 a 'unsigned char*' that is passed back and forth between
 user code and the DDS C/C++ APIs.

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of `DDS_OctetBuffer_alloc()` (p. 542), with matching occurrences of `DDS_OctetBuffer_free()` (p. 543) in the code.
- Finalize value types containing OctetBuffer. In C++ the destructor accomplishes this automatically. in C, explicit "destructor" functions are provided.

7.180.4 Function Documentation

7.180.4.1 DDS_OctetBuffer_alloc()

```
unsigned char * DDS_OctetBuffer_alloc (
    unsigned int size )
```

Create a new empty OctetBuffer that can hold up to `size` octets.

An OctetBuffer created by this method must be deleted using **DDS_OctetBuffer_free()** (p. 543).

This function will allocate enough memory to hold an OctetBuffer of `size` octets.

Parameters

<i>size</i>	<< <i>in</i> >> (p. 237) Size of the buffer.
-------------	--

Returns

A newly created non-NULL OctetBuffer upon success or NULL upon failure.

Referenced by **DDS_KeyedOctets::DDS_KeyedOctets()**, and **DDS_Octets::DDS_Octets()**.

7.180.4.2 DDS_OctetBuffer_dup()

```
unsigned char * DDS_OctetBuffer_dup (
    const unsigned char * buffer,
    unsigned int size )
```

Clone an OctetBuffer.

An OctetBuffer created by this method must be deleted using `DDS_OctetBuffer_free()`

Parameters

<i>buffer</i>	<< <i>in</i> >> (p. 237) The OctetBuffer to duplicate.
<i>size</i>	<< <i>in</i> >> (p. 237) Size of the OctetBuffer to duplicate.

Returns

If `src == NULL` or `size < 0`, this method always returns NULL. Otherwise, upon success it returns a newly created OctetBuffer whose value is `src`; upon failure it returns NULL.

7.180.4.3 DDS_OctetBuffer_free()

```
void DDS_OctetBuffer_free (
    unsigned char * buffer )
```

Delete an OctetBuffer.

Precondition

`buffer` must be either NULL, or must have been created using **DDS_OctetBuffer_alloc()** (p. 542), **DDS_OctetBuffer_dup()** (p. 543)

Parameters

<code>buffer</code>	<< <i>in</i> >> (p. 237) The buffer to delete.
---------------------	--

Referenced by **DDS_KeyedOctets::~~DDS_KeyedOctets()**, and **DDS_Octets::~~DDS_Octets()**.

7.181 SampleProcessor

<<*experimental*>> (p. 236) <<*extension*>> (p. 236) Utility to concurrently read and process the data samples received by **DDSDataReader** (p. 1272).

<<*experimental*>> (p. 236) <<*extension*>> (p. 236) Utility to concurrently read and process the data samples received by **DDSDataReader** (p. 1272).

7.182 Sequence Support

The **FooSeq** (p. 1680) interface allows you to work with variable-length collections of homogeneous data.

Modules

- **Built-in Sequences**

Defines sequences of primitive data type. .

Classes

- struct **FooSeq**

<<*interface*>> (p. 236) <<*generic*>> (p. 236) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **Foo** (p. 1632).

7.182.1 Detailed Description

The **FooSeq** (p. 1680) interface allows you to work with variable-length collections of homogeneous data.

This interface is instantiated for each concrete element type in order to provide compile-time type safety to applications. The **Built-in Sequences** (p. 164) are pre-defined instantiations for the primitive data types.

When you use the `rtiddsgen` code generation tool, it will automatically generate concrete sequence instantiations for each of your own custom types.

7.183 String Support

<<**extension**>> (p. 236) String creation, cloning, assignment, and deletion.

Functions

- `char * DDS_String_alloc (size_t length)`
Create a new empty string that can hold up to `length` characters.
- `char * DDS_String_dup (const char *str)`
Clone a string. Creates a new string that duplicates the value of `string`.
- `char * DDS_String_replace (char **string_ptr, const char *new_value)`
Assign a new value to a string. Replaces the string pointed to by `string_ptr`, with a string whose value is `new_value`.
- `void DDS_String_free (char *str)`
Delete a string.
- `DDS_Wchar * DDS_Wstring_alloc (DDS_UnsignedLong length)`
Create a new empty string that can hold up to `length` wide characters.
- `DDS_UnsignedLong DDS_Wstring_length (const DDS_Wchar *str)`
Get the number of wide characters in the given string.
- `DDS_Wchar * DDS_Wstring_copy (DDS_Wchar *dst, const DDS_Wchar *src)`
Copy the source string over the destination string reallocating the space if it's necessary.
- `DDS_Wchar * DDS_Wstring_copy_and_widen (DDS_Wchar *dst, const char *src)`
Copy the source string over the destination string, widening each character.
- `DDS_Wchar * DDS_Wstring_dup (const DDS_Wchar *str)`
Clone a string of wide characters. Creates a new string that duplicates the value of `string`.
- `DDS_Wchar * DDS_Wstring_dup_and_widen (const char *str)`
Clone a string of characters as a string of wide characters.
- `void DDS_Wstring_free (DDS_Wchar *str)`
Delete a string.

7.183.1 Detailed Description

<<**extension**>> (p. 236) String creation, cloning, assignment, and deletion.

The methods in this class ensure consistent cross-platform implementations for string creation (**DDS_String_alloc()** (p. 547)), deletion (**DDS_String_free()** (p. 548)), and cloning (**DDS_String_dup()** (p. 547)) that preserve the mutable value type semantics. These are to be viewed as methods that define a `string` class whose data is represented by a `'char*'`.

7.183.2 String Conventions

The following conventions govern the memory management of strings in RTI Connex.

- The DDS implementation ensures that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the `string` class methods.
 - Value types containing strings have ownership of the contained string. Thus, when a value type is deleted, the contained string field is also deleted.
 - **DDS_StringSeq** (p. 1087) is a value type that contains strings; it owns the memory for the contained strings. When a **DDS_StringSeq** (p. 1087) is assigned or deleted, the contained strings are also assigned or deleted respectively.
- The user must ensure that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the `String` class methods.

The representation of a string in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a string. RTI Connex must therefore make some assumptions when a user requests that a string be copied into. The following rules apply when RTI Connex is copying into a string or string sequence:

- If the 'char*' is NULL, RTI Connex will log a warning and allocate a new string on behalf of the user. *To avoid leaking memory, you must ensure that the string will be freed (see **Usage** (p. 546) below).*
- If the 'char*' is not NULL, RTI Connex will assume that you are managing the string's memory yourself and have allocated enough memory to store the string to be copied. *RTI Connex will copy into your memory; to avoid memory corruption, be sure to allocate enough of it. Also, do not pass structures containing junk pointers into RTI Connex; you are likely to crash.*

7.183.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating strings.

Always use
 `DDS_String_alloc()` to create,
 `DDS_String_dup()` to clone,
 `DDS_String_free()` to delete
 a string 'char*' that is passed back and forth between
 user code and the DDS C/C++ APIs.

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of **DDS_String_alloc()** (p. 547), **DDS_String_dup()** (p. 547), with matching occurrences of **DDS_String_free()** (p. 548) in the code.
- Finalize value types containing strings. In C++ the destructor accomplishes this automatically. In C, explicit "destructor" functions are provided; these functions are typically called "finalize."

Note

When dealing with the **DDS_PublishModeQosPolicy::flow_controller_name** (p. 1014) and **DDS_MultiChannelQosPolicy::filter_name** (p. 953) fields, we advise taking a look at the sample code for how to properly assign new values and free the old ones.

DDS_StringSeq (p. 1087)

7.183.4 Function Documentation

7.183.4.1 DDS_String_alloc()

```
char * DDS_String_alloc (
    size_t length )
```

Create a new empty string that can hold up to `length` characters.

A string created by this method must be deleted using **DDS_String_free()** (p. 548).

This function will allocate enough memory to hold a string of `length` characters, **plus** one additional byte to hold the NULL terminating character.

Parameters

<i>length</i>	<< <i>in</i> >> (p. 237) Capacity of the string.
---------------	--

Returns

A newly created non-NULL string upon success or NULL upon failure.

Examples

HelloWorld.cxx.

Referenced by **DDS_KeyedOctets::DDS_KeyedOctets()**, and **DDS_KeyedString::DDS_KeyedString()**.

7.183.4.2 DDS_String_dup()

```
char * DDS_String_dup (
    const char * str )
```

Clone a string. Creates a new string that duplicates the value of `string`.

A string created by this method must be deleted using **DDS_String_free()** (p. 548)

Parameters

<i>str</i>	<< <i>in</i> >> (p. 237) The string to duplicate.
------------	---

Returns

If `string == NULL`, this method always returns `NULL`. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns `NULL`.

7.183.4.3 DDS_String_replace()

```
char * DDS_String_replace (
    char ** string_ptr,
    const char * new_value )
```

Assign a new value to a string. Replaces the string pointed to by `string_ptr`, with a string whose value is `new_value`.

A string created by this method must be deleted using **DDS_String_free()** (p. 548).

This function is most commonly used when manipulating string sequences, **DDS_StringSeq** (p. 1087).

Precondition

`string_ptr` be a non-NULL pointer. `*string_ptr` must be either `NULL`, or a string created using **DDS_String_alloc()** (p. 547) or **DDS_String_dup()** (p. 547), or **DDS_String_replace()** (p. 548).

Parameters

<i>string_ptr</i>	<< <i>inout</i> >> (p. 237) Pointer to the string to replace.
<i>new_value</i>	<< <i>in</i> >> (p. 237) The value of the replacement string.

Returns

If `new_value = NULL`, this method always returns `NULL`. Otherwise, upon success it returns `*string_ptr` whose value is `new_value`; upon failure it returns `NULL`.

Postcondition

If `new_value = NULL`, `*string_ptr == NULL`. Otherwise, upon success `string_ptr` contains a pointer to a string whose value is `new_value`; upon failure, `string_ptr` is left unchanged.

7.183.4.4 DDS_String_free()

```
void DDS_String_free (
    char * str )
```

Delete a string.

Precondition

`string` must be either NULL, or must have been created using `DDS_String_alloc()` (p. 547), `DDS_String_dup()` (p. 547)

Parameters

<i>str</i>	<< <i>in</i> >> (p. 237) The string to delete.
------------	--

Examples

HelloWorld.cxx.

Referenced by `DDS_KeyedOctets::DDS_KeyedOctets()`, `DDS_KeyedString::DDS_KeyedString()`, `DDS_KeyedOctets::~~DDS_KeyedOctets()`, and `DDS_KeyedString::~~DDS_KeyedString()`.

7.183.4.5 DDS_Wstring_alloc()

```
DDS_Wchar * DDS_Wstring_alloc (
    DDS_UnsignedLong length )
```

Create a new empty string that can hold up to `length` wide characters.

A string created by this method must be deleted using `DDS_Wstring_free()` (p. 551)

This function will allocate enough memory to hold a string of `length` characters, **plus** one additional wide character to hold the NULL terminator.

Parameters

<i>length</i>	<< <i>in</i> >> (p. 237) Capacity of the string.
---------------	--

Returns

A newly created non-NULL string upon success or NULL upon failure.

7.183.4.6 DDS_Wstring_length()

```
DDS_UnsignedLong DDS_Wstring_length (
    const DDS_Wchar * str )
```

Get the number of wide characters in the given string.

The result does not count the terminating zero character.

Parameters

<i>str</i>	<< <i>in</i> >> (p. 237) A non-NULL string.
------------	---

Returns

The number of wide characters in the string.

7.183.4.7 DDS_Wstring_copy()

```
DDS_Wchar * DDS_Wstring_copy (
    DDS_Wchar * dst,
    const DDS_Wchar * src )
```

Copy the source string over the destination string reallocating the space if it's necessary.

Parameters

<i>dst</i>	
<i>src</i>	

Returns

dst

7.183.4.8 DDS_Wstring_copy_and_widen()

```
DDS_Wchar * DDS_Wstring_copy_and_widen (
    DDS_Wchar * dst,
    const char * src )
```

Copy the source string over the destination string, widening each character.

Parameters

<i>dst</i>	<< <i>in</i> >> (p. 237) A non-NULL string to be overwritten by <i>src</i> .
<i>src</i>	<< <i>in</i> >> (p. 237) A non-NULL string to be copied over <i>dst</i> .

Returns

`dst`

7.183.4.9 DDS_Wstring_dup()

```
DDS_Wchar * DDS_Wstring_dup (
    const DDS_Wchar * str )
```

Clone a string of wide characters. Creates a new string that duplicates the value of `string`.

A string created by this method must be deleted using **DDS_Wstring_free()** (p. 551).

Parameters

<i>str</i>	<< <i>in</i> >> (p. 237) The string to duplicate.
------------	---

Returns

If `string == NULL`, this method always returns `NULL`. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns `NULL`.

7.183.4.10 DDS_Wstring_dup_and_widen()

```
DDS_Wchar * DDS_Wstring_dup_and_widen (
    const char * str )
```

Clone a string of characters as a string of wide characters.

A string created by this method must be deleted using **DDS_Wstring_free()** (p. 551)

Parameters

<i>str</i>	<< <i>in</i> >> (p. 237) The string to duplicate.
------------	---

Returns

If `string == NULL`, this method always returns `NULL`. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns `NULL`.

7.183.4.11 DDS_Wstring_free()

```
void DDS_Wstring_free (
    DDS_Wchar * str )
```

Delete a string.

Precondition

`string` must either NULL, or must have been created using `DDS_Wstring_alloc()` (p. 549), `DDS_Wstring_↔dup()` (p. 551), or `DDS_Wstring_replace()`

Parameters

<i>str</i>	<< <i>in</i> >> (p. 237) The string to delete.
------------	--

7.184 FlatData Builders

A Builder allows creating and initializing variable-size data.

Classes

- class **rti::flat::AggregationBuilder**
Base class of struct and union builders.
- class **rti::flat::UnionBuilder< Discriminator >**
Base class of builders for user-defined mutable unions.
- class **MyFlatMutableBuilder**
Represents the Builder for an arbitrary user-defined mutable type.
- class **MyFlatUnionBuilder**
Represents the Builder for an arbitrary user-defined mutable IDL union.
- class **rti::flat::AbstractBuilder**
*Base class of all **Builders** (p. 552).*
- class **rti::flat::AbstractListBuilder**
Base class of all array and sequence builders.
- class **rti::flat::MutableArrayBuilder< ElementBuilder, N >**
Builds an array member of variable-size elements.
- class **rti::flat::AbstractSequenceBuilder**
Base class of Builders for sequence members.
- class **rti::flat::MutableSequenceBuilder< ElementBuilder >**
Builds a sequence member of variable-size elements.
- class **rti::flat::FinalSequenceBuilder< ElementOffset >**
Builds a sequence member of fixed-size elements.
- class **rti::flat::PrimitiveSequenceBuilder< T >**
Builds a sequence of primitive members.
- class **rti::flat::StringBuilder**
Builds a string.

Functions

- `template<typename TopicType >`
`rti::flat::flat_type_traits< TopicType >::builder rti::flat::build_data (typename TopicType::DataWriter *writer)`
Begins building a new sample.
- `template<typename BuilderType >`
`void rti::flat::discard_builder (typename rti::flat::flat_type_traits< BuilderType >::flat_type::DataWriter *writer, BuilderType &builder)`
Discards a sample builder.

7.184.1 Detailed Description

A Builder allows creating and initializing variable-size data.

Builders allow creating variable-size **FlatData samples** (p. 555), as described in **Publishing FlatData** (p. 564).

There are the following Builder types:

Category	Builder type
User types	<p>For example:</p> <ul style="list-style-type: none"> • MyFlatMutableBuilder (p. 1732), a mutable struct • MyFlatUnionBuilder (p. 1746), a union • Final structs are fixed-size and do not have a Builder (see for example MyFlatMutableBuilder::add_my_final() (p. 1737)).
Arrays	<ul style="list-style-type: none"> • rti::flat::MutableArrayBuilder (p. 1722) • Arrays of final elements are fixed-size and do not have a Builder (see for example MyFlatMutableBuilder::add_my_final_array() (p. 1737)).
Sequences	<ul style="list-style-type: none"> • rti::flat::MutableSequenceBuilder (p. 1726) for sequences of mutable elements • rti::flat::FinalSequenceBuilder (p. 1629) for sequences of final elements • rti::flat::PrimitiveSequenceBuilder (p. 1841) for sequences of primitive elements • rti::flat::StringBuilder (p. 1920)
Primitive types	<ul style="list-style-type: none"> • Primitive members are added using one of the member functions of the Builder of the type that contains them. See for example MyFlatMutableBuilder::add_my_primitive() (p. 1736).

Builder for user types, such as **MyFlatMutableBuilder** (p. 1732), can behave as **sample builders**, when they build a sample, or **member builders** when they build a member for another Builder (such as the Builder returned by **MyFlatMutableBuilder::build_my_mutable()** (p. 1738)). All the other Builder types (sequences, arrays) are always member builders (such as the Builder returned by **MyFlatMutableBuilder::build_my_final_seq()** (p. 1737)).

Builders are **move-only** types. They cannot be copied, only moved. When you assign a Builder as the return value of a function, this happens automatically.

```
// the return value of 'build_data' is moved into 'builder'
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
```

To explicitly move a Builder variable in the Traditional C++ API, call its **move()** (p. 189) member function

7.184.2 Builder Error Management

The Traditional C++ API reports Builder errors by setting a flag that can be checked with the member function **check_failure()** (p. 575). After each Builder operation, **check_failure()** must be called to check (and clear) the error flag.

In addition, in case of error, operations that return another Builder, such as **MyFlatMutableBuilder::build_my_mutable()** (p. 1738), return an invalid Builder (**is_valid()** (p. 574) is *false*). Operations that return an Offset, such as **MyFlatMutableBuilder::add_my_final()** (p. 1737) return a "null" Offset when they fail (see **Offset Error Management** (p. 560)).

See also

MyFlatMutableBuilder (p. 1732) for more information specific to builders for user types.

7.184.3 Function Documentation

7.184.3.1 build_data()

```
template<typename TopicType >
rti::flat::flat_type_traits< TopicType >::builder rti::flat::build_data (
    typename TopicType::DataWriter * writer )
```

Begins building a new sample.

Template Parameters

<i>TopicType</i>	A FlatData mutable type that corresponds to the type of the DataWriter argument.
------------------	--

Parameters

<i>writer</i>	The writer that will be used to write this sample.
---------------	--

Returns

The Builder to build the sample. For example if TopicType is **MyFlatMutable** (p. 556), this function returns a **MyFlatMutableBuilder** (p. 1732). In case of error, this function returns an **invalid Builder** (p. 574)

Once you have completed the sample, call **finish_sample()** (p. 1735) to obtain a **MyFlatMutable** (p. 556) sample that can be written with `writer`.

If the building of this sample needs to be aborted before calling `finish_sample()`, use **rti::flat::discard_builder()** (p. 555). If, after obtaining a sample with `finish_sample()`, this sample is not written, then discard it with **FooDataWriter**↔**::discard_loan()** (p. 1679).

See also

FooDataWriter::get_loan (p. 1678), the function that **build_data()** (p. 554) uses to obtain the memory required to build the sample.

Publishing FlatData (p. 564)

References **DDS_BOOLEAN_TRUE**, and **DDS_RETCODE_OK**.

7.184.3.2 discard_builder()

```
template<typename BuilderType >
void rti::flat::discard_builder (
    typename rti::flat::flat_type_traits< BuilderType >::flat_type::DataWriter * writer,
    BuilderType & builder )
```

Discards a sample builder.

Template Parameters

<i>TopicType</i>	An IDL-defined FlatData type that corresponds to the type of the DataWriter argument.
------------------	---

This function invalidates and discards a builder before it is `finished()` and before the sample it would have created was written.

Parameters

<i>writer</i>	The writer that was used to create the builder
<i>builder</i>	The builder, created with <code>rti::flat::build_data(writer);</code>

7.185 FlatData Samples

A Sample represents an instance of the IDL topic-type and contains the data in serialized format.

Classes

- class **rti::flat::Sample**< **OffsetType** >

The generic definition of FlatData topic-types.

- struct **rti::flat::flat_type_traits**< T >

*Given a **Sample** (p. 1893), an Offset or a Builder, it allows obtaining the other types.*

Typedefs

- typedef **rti::flat::Sample**< **MyFlatFinalOffset** > **MyFlatFinal**
Represents an arbitrary user-defined FlatData final IDL struct.
- typedef **rti::flat::Sample**< **MyFlatMutableOffset** > **MyFlatMutable**
Represents an arbitrary user-defined flat mutable IDL struct.
- typedef **rti::flat::Sample**< **MyFlatUnionOffset** > **MyFlatUnion**
Represents an arbitrary user-defined flat mutable IDL union.

7.185.1 Detailed Description

A Sample represents an instance of the IDL topic-type and contains the data in serialized format.

All FlatData topic-types are instantiations of **rti::flat::Sample** (p. 1893). This documentation uses the following three example types to illustrate the different ways FlatData IDL types map to C++:

- **MyFlatFinal** (p. 556), the type generated for a final IDL struct
- **MyFlatMutable** (p. 556), the type generated for a mutable IDL struct
- **MyFlatUnion** (p. 557), the type generated for an IDL union

7.185.2 Typedef Documentation

7.185.2.1 MyFlatFinal

```
typedef rti::flat::Sample< MyFlatFinalOffset> MyFlatFinal
```

Represents an arbitrary user-defined FlatData final IDL struct.

This documentation uses the following example IDL definition of MyFlatFinal:

```
@language_binding(FLAT_DATA)
@final
struct MyFlatFinal {
    long my_primitive;
    FlatFinalBar my_complex; // Another arbitrary final FlatData type
    long my_primitive_array[10];
    FlatFinalBar my_complex_array[10];
};
```

For this type, **rtiddsgen** generates:

- **MyFlatFinal** (this instantiation of Sample),
- **MyFlatFinalOffset** (p. 1728).

Note that, as a final FlatData type, MyFlatFinal can only contain fixed-size types, such as primitives, other final FlatData structs, and arrays of fixed-size types.

Samples of MyFlatFinal are created with **FooDataWriter::get_loan** (p. 1678). After creating a final Sample, modify its values using the **MyFlatFinalOffset** (p. 1728) returned by **root()** (p. 1895).

7.185.2.2 MyFlatMutable

```
typedef rti::flat::Sample< MyFlatMutableOffset> MyFlatMutable
```

Represents an arbitrary user-defined flat mutable IDL struct.

This documentation uses the following example IDL definition of MyFlatMutable:

```
@language_binding(FLAT_DATA)
@mutable
struct MyFlatMutable {
    long my_primitive;
    @optional long my_optional_primitive;
    long my_primitive_array[10];
    sequence<long, 10> my_primitive_seq;
    MyFlatFinal my_final;
    MyFlatFinal my_final_array[10];
    sequence<MyFlatFinal, 10> my_final_seq;
    FlatMutableBar my_mutable;
    FlatMutableBar my_mutable_array[10];
    sequence<FlatMutableBar, 10> my_mutable_seq;
    string<255> my_string;
    sequence<string<255>, 10> my_string_seq;
};
```

For this type, **rtiddsgen** generates:

- MyFlatMutable (this instantiation of Sample),
- **MyFlatMutableOffset** (p. 1739),
- **MyFlatMutableBuilder** (p. 1732).

As a mutable FlatData type, MyFlatMutable is not restricted to fixed-size members. Samples of MyFlatMutable are created with **rti::flat::build_data()** (p. 554), which returns a **MyFlatMutableBuilder** (p. 1732). Once built, a mutable Sample can't change in size, but the value of members that already exist can be changed using the **MyFlatMutableOffset** (p. 1739) returned by **root()** (p. 1895).

7.185.2.3 MyFlatUnion

```
typedef rti::flat::Sample< MyFlatUnionOffset> MyFlatUnion
```

Represents an arbitrary user-defined flat mutable IDL union.

This documentation uses the following example IDL definition of MyFlatUnion:

```
@language_binding(FLAT_DATA)
@mutable
union MyFlatUnion switch (long) {
    case 0:
        long my_primitive;
    case 1:
    case 2:
        MyFlatMutable my_mutable;
    case 3:
        MyFlatFinal my_final;
};
```

Note

FlatData unions can only be **mutable** since unions are, by definition, variable-size types.

For this type, **rtiddsgen** generates:

- MyFlatUnion (this instantiation of Sample),
- **MyFlatUnionOffset** (p. 1749),
- **MyFlatUnionBuilder** (p. 1746).

7.186 FlatData Offsets

Offsets provide access to the members of a FlatData Sample.

Classes

- class **MyFlatFinalOffset**
Represents the Offset to an arbitrary user-defined FlatData final IDL struct.
- class **MyFlatMutableOffset**
Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.
- class **MyFlatUnionOffset**
Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.
- class **rti::flat::OffsetBase**
Base class of all Offset types.
- class **rti::flat::FinalOffset< T >**
The base class of all Offsets to a final struct type.
- class **rti::flat::MutableOffset**
The base class of all Offsets to a final struct type.
- struct **rti::flat::PrimitiveConstOffset< T >**
A const Offset to an optional primitive member.
- struct **rti::flat::PrimitiveOffset< T >**
An Offset to an optional primitive member.
- class **rti::flat::Sequenceliterator< E, OffsetKind >**
Iterator for collections of Offsets.
- class **rti::flat::AbstractPrimitiveList< T >**
Base class for Offsets to sequences and arrays of primitive types.
- class **rti::flat::PrimitiveSequenceOffset< T >**
Offset to a sequence of primitive elements.
- class **rti::flat::PrimitiveArrayOffset< T, N >**
Offset to an array of primitive elements.
- class **rti::flat::StringOffset**
Offset to a string.
- class **rti::flat::AbstractAlignedList< ElementOffset >**
Base class of Offsets to sequences and arrays of non-primitive members.
- class **rti::flat::SequenceOffset< ElementOffset >**
Offset to a sequence of non-primitive elements.
- class **rti::flat::MutableArrayOffset< ElementOffset, N >**
Offset to an array of variable-size elements.
- class **rti::flat::FinalArrayOffset< ElementOffset, N >**
Offset to an array of final elements.
- class **rti::flat::FinalAlignedArrayOffset< ElementOffset, N >**
Offset to an array of final elements.

Functions

- `template<typename OffsetType >`
flat_type_traits< OffsetType >::plain_type * **rti::flat::plain_cast** (OffsetType &offset)
Casts into an equivalent plain C++ type.
- `template<typename OffsetType >`
const flat_type_traits< OffsetType >::plain_type * **rti::flat::plain_cast** (const OffsetType &offset)
Const version of plain_cast.

7.186.1 Detailed Description

Offsets provide access to the members of a FlatData Sample.

An Offset represents a position within a **FlatData Sample** (p.555) that allows accessing a member of that Sample, or the Sample's **root** (p.1895).

Offsets can be described as **iterators**. They represent a position in a buffer, not the value itself. As such, they're lightweight objects that can be copied to point to the same data.

There are the following Offset types to access the different IDL types:

Category	Offset type
User types	For example: <ul style="list-style-type: none"> • MyFlatFinalOffset (p.1728), an Offset to a final struct • MyFlatMutableOffset (p.1739), an Offset to a mutable struct • MyFlatUnionOffset (p.1749), an Offset to a union
Arrays	<ul style="list-style-type: none"> • rti::flat::PrimitiveArrayOffset (p.1838) • rti::flat::FinalArrayOffset (p.1627) (array of final elements in a final type) • rti::flat::FinalAlignedArrayOffset (p.1625) (array of final elements in a mutable type) • rti::flat::MutableArrayOffset (p.1724)
Sequences	<ul style="list-style-type: none"> • rti::flat::PrimitiveSequenceOffset (p.1844) • rti::flat::SequenceOffset (p.1911)
Primitive types	<ul style="list-style-type: none"> • The type itself, such as <code>double</code> • rti::flat::PrimitiveOffset (p.1840) (when the member is optional)

Offsets for user types are generated by **rtiddsgen** and provide methods to access the type's members by their names. Offsets for arrays and sequences provide methods to access each element.

Some offsets allow accessing the data through a pointer to the equivalent plain C++ type, which generally provides better performance. See `rti::flat::plain_cast()` (p. 560).

7.186.2 Offset Error Management

Functions that return an Offset may return a "null" Offset (one such that `is_null()` (p. 1834) returns `true`).

An Offset may be null if a member doesn't exist in the **Sample** (p. 555). For example, if the member 'my_final' in **MyFlatMutable** (p. 556) doesn't exist (because it wasn't added while building the Sample, or because it wasn't received in the subscribing application), `MyFlatMutableOffset::my_final()` (p. 1744) returns a null Offset. Note that a **member in a final type** (for example, `MyFlatFinalOffset::my_complex()` (p. 1731)) always exists, except in the case of an error.

In addition to that, a function may return a null Offset for any error condition.

7.186.3 Function Documentation

7.186.3.1 `plain_cast()` [1/2]

```
template<typename OffsetType >
flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (
    OffsetType & offset )
```

Casts into an equivalent plain C++ type.

Some FlatData types can be cast to their equivalent **plain** definition as a regular non-FlatData C++ type. This is a more efficient way to access the data. This function casts, if possible, the member pointed to by the offset argument to an equivalent plain C++ type. Any changes made through the plain type are reflected in the FlatData sample.

Template Parameters

<i>OffsetType</i>	The Offset type
-------------------	-----------------

Precondition

`plain_cast` requires the type to meet the following restrictions:

- The type must be a final struct, or an array or sequence of members of a type that meets these restrictions (including primitive types)
- The type must be defined in a way such that the packing of the plain C++ type doesn't differ from the padding in XCDR2.
- The type may not inherit from another type.
- In addition, the sample must be serialized in the native endianness. For example, if a subscribing application on a little-endian platform receives a sample published from a big-endian system, it is not possible to `plain_cast` the sample or any of its members, except if the member is a primitive array or sequence of 1-byte elements.

offset.is_cpp_compatible() (p. 1834) indicates if the member meets the requirements. If the type doesn't, this function returns NULL.

Parameters

<i>offset</i>	The offset to the member to cast.
---------------	-----------------------------------

Returns

The data that *offset* referred to, cast as a plain C++ type with the same definition. If *offset* is an array or sequence member, the returned pointer represents a C++ array with the same number of elements.

The following table summarizes the possible parameters to this function (assuming that they meet the previous requirements), and the return type in each case:

OffsetType	return type
Offset to a final struct, such as MyFlatFinalOffset (p. 1728)	<code>MyFlatFinalPlainHelper*</code> (pointer to a single element). This is a type with the same IDL definition, but without <code>@language_binding(FLAT_DATA)</code> .
Offset to an array of final structs, such as FinalArrayOffset (p. 1627) <code><MyFlatFinalOffset (p. 1728), N></code>	<code>MyFlatFinalPlainHelper*</code> (array of N elements)
Offset to a sequence of final structs, such as SequenceOffset (p. 1911) <code><MyFlatFinalOffset (p. 1728)></code>	<code>MyFlatFinalPlainHelper*</code> (array of <code>offset.element_count()</code> elements)
Offset to an array of primitive types, such as PrimitiveArrayOffset (p. 1838) <code><int32_t, N></code>	<code>int32_t*</code> (array of N elements)
Offset to a sequence of primitive types, such as PrimitiveSequenceOffset (p. 1844) <code><int32_t></code>	<code>int32_t*</code> (array of <code>offset.element_count()</code> elements)

Due to the performance advantages that `plain_cast` offers, it is recommended to define FlatData types in a way that their largest member(s) can be `plain_cast`.

The following example shows how to use `plain_cast` to cast a **MyFlatFinalOffset** (p. 1728) into the type with the same IDL definition as **MyFlatFinal** (p. 556), but without the `@language_binding(FLAT_DATA)` annotation:

```
MyFlatMutable *my_sample = ...;
auto my_root = my_sample->root();
auto my_final = my_root.my_final();
// Get the plain C++ type and modify an array
auto my_final_plain = rti::flat::plain_cast(my_final);
my_final_plain->my_primitive(3); // this is using the plain C++ setter
my_final_plain->my_complex_array()[1].x(20); // this is a std::array
// The change to my_complex_array is reflected in the FlatData sample
std::cout << my_final.my_primitive() << std::endl; // 3
std::cout << my_final.my_complex_array().get_element(1).x() << std::endl; // 20
```

This example shows how to use `plain_cast` to efficiently build a sequence of final elements and a sequence of integers, both members of a mutable type:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
// 1)
//
// Build a sequence of 5 elements with add_n() instead of 5 calls to
// add_next()
```

```

rti::flat::FinalSequenceBuilder<MyFlatFinalOffset> seq_builder =
    builder.build_my_final_seq();
seq_builder.add_n(5);
// Finish the member, getting the offset to the member
rti::flat::SequenceOffset<MyFlatFinalOffset> seq_offset = seq_builder.finish();
// Cast it to an array of plain C++ type and initialize it.
// This way to initialize it is more efficient than add_next().
auto seq_elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 5; i++) {
    seq_elements[i].my_primitive(i);
    // ...
}
// 2)
//
// Build a sequence of 1000 integers
auto seq_builder = builder.build_my_primitive_seq();
// make space for 1000 elements, but leave them uninitialized
seq_builder.add_n(1000);
auto seq_offset = seq_builder.finish();
// Initialize the elements:
int32_t *elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 1000; i++) {
    elements[i] = ...;
}
// ... continue building the sample using 'builder'

```

7.186.3.2 plain_cast() [2/2]

```

template<typename OffsetType >
const flat_type_traits< OffsetType >::plain_type * rti::flat::plain_cast (
    const OffsetType & offset )

```

Const version of plain_cast.

7.187 FlatData Topic-Types

<<*extension*>> (p. 236) FlatData Language Binding for IDL topic-types

Modules

- **FlatData Builders**
A Builder allows creating and initializing variable-size data.
- **FlatData Samples**
A Sample represents an instance of the IDL topic-type and contains the data in serialized format.
- **FlatData Offsets**
Offsets provide access to the members of a FlatData Sample.

7.187.1 Detailed Description

<<**extension**>> (p. 236) FlatData Language Binding for IDL topic-types

Note

For a complete description of the FlatData language binding and its benefits, and a tutorial, see the "Sending Large Data" chapter in the **RTI Connex User's Manual**.

For buildable **code examples**, see <https://community.rti.com/kb/flatdata-and-zero-copy-examples>.

The FlatData language binding is available in the Traditional C++ API and in the Modern C++ API.

RTI FlatData™ is a language binding for IDL types in which the in-memory representation of a sample matches the wire representation. Therefore, the cost of serialization/deserialization is zero.

To select FlatData as the language binding of a type, annotate it with `@language_binding(FLAT_DATA)` in IDL or apply the attribute `languageBinding="flat_data"` in XML.

There are some restrictions regarding the kinds of types to which the FlatData language binding can be applied.

- For final types, the FlatData language binding can be applied only to fixed-size types. A fixed-size type is a type whose wire representation always has the same size. This includes primitive types, arrays of fixed-size types, and structs containing only members of fixed-size types. Unions are not fixed-size types.
- For mutable types, any member is permitted.
- Extensible types cannot be marked as FlatData.

Final types are more efficient, but more restrictive. In general, a good compromise is to define mutable top-level types, but making sure their largest data members are final.

When a type is marked with the FlatData language binding, its mapping into C++ is different than that of a regular type (plain language binding). Rather than a single C++ class with direct access to its members, for a FlatData type **rtiddsgen** generates the following:

- A **Sample** (p. 555), the data in serialized format
- An **Offset** (p. 558), which allows reading the data members of that type inside a Sample, and modifying them without changing the size
- A **Builder** (p. 552), if the type is mutable, which allows creating a variable-size Sample

For example, for the IDL types **MyFlatFinal** (p. 556) and **MyFlatMutable** (p. 556) **rtiddsgen** generates the following C++ types:

- The Sample types **MyFlatFinal** (p. 556) and **MyFlatMutable** (p. 556)
- The Offset types **MyFlatFinalOffset** (p. 1728) and **MyFlatMutableOffset** (p. 1739).
- The Builder type **MyFlatMutableBuilder** (p. 1732).

7.187.2 Publishing FlatData

The typical way to publish FlatData samples includes the following steps:

- Create a **FooDataWriter** (p. 1659) as you would for a non-FlatData (plain) topic-type (see **Setting up a data writer** (p. 206)).

(For final topic-types such as **MyFlatFinal** (p. 556))

- Obtain a FlatData sample with **FooDataWriter::get_loan** (p. 1678).

```
MyFlatFinal *foo_sample = writer.get_loan();
```
- Initialize the sample, starting from the **root()** (p. 1895) offset.

```
MyFlatFinalOffset foo_root = foo_sample->root();
foo_root.my_primitive(3);
auto my_complex_offset = foo_root.my_complex();
// ... initialize my_complex_offset
```

(For mutable topic-types such as **MyFlatMutable** (p. 556))

- Obtain a **Builder** (p. 552) to create a variable-size sample with **rti::flat::build_data()** (p. 554).

```
MyFlatMutableBuilder foo_builder = rti::flat::build_data(writer);
```
- Use this builder (and possibly nested member builders) to initialize the members.

```
foo_builder.add_my_primitive(3);
auto my_mutable_builder = foo_builder.build_my_mutable();
// ... build 'my_mutable' (a member with a mutable type)
my_mutable_builder.finish(); // completes a member
auto my_final_offset = foo_builder.add_my_final();
// ... initialize 'my_final' (a member with a final type)
```
- Obtain the completed sample with **MyFlatMutableBuilder::finish_sample()** (p. 1735). After that, the builder is no longer usable, and the sample size cannot change.

```
MyFlatMutable *foo_sample = foo_builder.finish_sample();
```
- Optionally, it is possible to change the values of the sample accessing its **root()**, as long as the size doesn't change. For example, if the sample was built with a sequence member with two elements, it is possible to modify any of those elements, but it's not possible to add a third element.

(For both final and mutable topic-types)

- Write the sample with **FooDataWriter::write** (p. 1666).

```
writer.write(*foo_sample);
```

After write, the DataWriter owns the FlatData sample. This allows avoiding additional copies, the main goal of the Flat↔Data language binding. This means that the sample cannot be reused. The DataWriter will return it to the sample pool when appropriate, as described in **FooDataWriter::get_loan** (p. 1678).

7.187.3 Subscribing to FlatData

To subscribe to a topic using a FlatData topic-type:

- Create a **FooDataReader** (p. 1632) normally (see **Setting up a data reader** (p. 209)).
- Read or take the samples using a loaning operation, such as **FooDataReader::take** (p. 1636) (copying read/take operations cannot be used with FlatData types).
- Access the **root()** (p. 1895) offset, and any of the sample's members from there.

Note that the language binding is a local concept. It is possible to publish with a FlatData topic-type and subscribe to it with a **plain** topic-type with the same (or assignable) definition. It is also possible to use a plain topic-type on the publisher side and subscribe to it using FlatData. The DataWriter or DataReader of the plain topic-type has to use **DDS_XCDR2_DATA_REPRESENTATION** (p. 370) in **DDS_DataRepresentationQosPolicy** (p. 662).

Chapter 8

Namespace Documentation

8.1 connext Namespace Reference

Namespace for Connex.

Classes

- class **AlreadyDeletedException**
The object target of this operation has already been deleted.
- class **BadParameterException**
Illegal parameter value.
- class **IllegalOperationException**
The operation was called under improper circumstances.
- class **ImmutablePolicyException**
Application attempted to modify an immutable QoS policy.
- class **InconsistentPolicyException**
Application specified a set of QoS policies that are not consistent with each other.
- class **IsInvalidSamplePredicate**
Predicate-class to determine if a sample contains invalid data.
- class **IsReplyRelatedPredicate**
Predicate-class to match replies by their related request.
- class **IsValidSamplePredicate**
Predicate-class to determine if a sample contains valid data.
- class **LoanedSamples**
Provides access to a collection of middleware-loaned samples.
- class **LogicException**
Base class of all RTI Connex exceptions caused by a logic error.
- class **MessagingLibraryVersion**
The Connex Messaging Library version.
- class **MessagingVersion**
The Connex Messaging version.

- class **NotEnabledException**
*Operation invoked on a **DDSEntity** (p. 1446) that is not yet enabled.*
- class **OutOfResourcesException**
RTI Connex ran out of the resources needed to complete the operation.
- class **PreconditionNotMetException**
A pre-condition for the operation was not met.
- class **Replier**
Allows receiving requests and sending replies.
- class **ReplierListener**
*Called when a **connex::Replier** (p. 1845) has new available requests.*
- class **ReplierParams**
*Contains the parameters for creating a **connex::Replier** (p. 1845).*
- class **Requester**
Allows sending requests and receiving replies.
- class **RequesterParams**
*Contains the parameters for creating a **connex::Requester** (p. 1863).*
- class **RuntimeException**
Generic, unspecified error.
- class **Sample**
A data sample and related info received from the middleware.
- class **SampleIterator**
*STL-compliant random-access iterator for **SampleRef**< T>*
- class **SampleRef**
A data sample and related information received from the middleware.
- class **SimpleReplier**
A callback-based replier.
- class **SimpleReplierListener**
*The listener called by a **SimpleReplier** (p. 1912).*
- class **SimpleReplierParams**
*Contains the parameters for creating a **connex::SimpleReplier** (p. 1912).*
- class **TimeoutException**
The operation timed out (does not apply to wait or receive operations)
- class **UnsupportedException**
Unsupported operation.
- class **WriteSample**
A sample for writing data.
- class **WriteSampleRef**
A reference to a data sample for writing.

Functions

- template<typename T , bool IsConst>
ValidSampleIterator< T, IsConst > **make_valid_sample_iterator** (**SampleIterator**< T, IsConst > related_↔ iterator)
Creates an iterator that only returns valid samples.
- template<typename T >
LoanedSamples< T > **move** (**LoanedSamples**< T > &ls throw ()
*Creates a new **LoanedSamples** (p. 1709) instance by moving the contents of an existing one.*

8.1.1 Detailed Description

Namespace for Connext.

8.2 rti Namespace Reference

The RTI namespace.

Namespaces

- namespace **flat**
<<*extension*>> (p. 236) Support for **FlatData Topic-Types** (p. 562)

8.2.1 Detailed Description

The RTI namespace.

8.3 rti::flat Namespace Reference

<<*extension*>> (p. 236) Support for **FlatData Topic-Types** (p. 562)

Classes

- class **AbstractAlignedList**
Base class of Offsets to sequences and arrays of non-primitive members.
- class **AbstractBuilder**
*Base class of all **Builders** (p. 552).*
- class **AbstractListBuilder**
Base class of all array and sequence builders.
- class **AbstractPrimitiveList**
Base class for Offsets to sequences and arrays of primitive types.
- class **AbstractSequenceBuilder**
Base class of Builders for sequence members.
- class **AggregationBuilder**
Base class of struct and union builders.
- class **FinalAlignedArrayOffset**
Offset to an array of final elements.
- class **FinalArrayOffset**
Offset to an array of final elements.
- class **FinalOffset**
The base class of all Offsets to a final struct type.

- class **FinalSequenceBuilder**
Builds a sequence member of fixed-size elements.
- struct **flat_type_traits**
*Given a **Sample** (p. 1893), an Offset or a Builder, it allows obtaining the other types.*
- class **MutableArrayBuilder**
Builds an array member of variable-size elements.
- class **MutableArrayOffset**
Offset to an array of variable-size elements.
- class **MutableOffset**
The base class of all Offsets to a final struct type.
- class **MutableSequenceBuilder**
Builds a sequence member of variable-size elements.
- class **OffsetBase**
Base class of all Offset types.
- class **PrimitiveArrayOffset**
Offset to an array of primitive elements.
- struct **PrimitiveConstOffset**
A const Offset to an optional primitive member.
- struct **PrimitiveOffset**
An Offset to an optional primitive member.
- class **PrimitiveSequenceBuilder**
Builds a sequence of primitive members.
- class **PrimitiveSequenceOffset**
Offset to a sequence of primitive elements.
- class **Sample**
The generic definition of FlatData topic-types.
- class **SequenceIterator**
Iterator for collections of Offsets.
- class **SequenceOffset**
Offset to a sequence of non-primitive elements.
- class **StringBuilder**
Builds a string.
- class **StringOffset**
Offset to a string.
- class **UnionBuilder**
Base class of builders for user-defined mutable unions.

Functions

- template<typename OffsetType >
flat_type_traits< OffsetType >::plain_type * **plain_cast** (OffsetType &offset)
Casts into an equivalent plain C++ type.
- template<typename OffsetType >
const **flat_type_traits**< OffsetType >::plain_type * **plain_cast** (const OffsetType &offset)
Const version of plain_cast.
- template<typename TopicType >
rti::flat::flat_type_traits< TopicType >::builder **build_data** (typename TopicType::DataWriter *writer)

Begins building a new sample.

- `template<typename BuilderType >`
`void discard_builder (typename rti::flat::flat_type_traits< BuilderType >::flat_type::DataWriter *writer,`
`BuilderType &builder)`

Discards a sample builder.

8.3.1 Detailed Description

<<**extension**>> (p. 236) Support for **FlatData Topic-Types** (p. 562)

Chapter 9

Class Documentation

9.1 rti::flat::AbstractAlignedList< ElementOffset > Class Template Reference

Base class of Offsets to sequences and arrays of non-primitive members.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::AbstractAlignedList< ElementOffset >:

Public Types

- typedef **Sequenceliterator**< ElementOffset, typename ElementOffset::offset_kind > **iterator**
*The iterator type, **Sequenceliterator** (p. 1903).*

Public Member Functions

- iterator** **begin** ()
Gets an iterator to the first Offset.
- iterator** **end** ()
Gets an iterator to the past-the-end element.

9.1.1 Detailed Description

```
template<typename ElementOffset>  
class rti::flat::AbstractAlignedList< ElementOffset >
```

Base class of Offsets to sequences and arrays of non-primitive members.

Template Parameters

<i>ElementOffset</i>	The Offset type of the elements
----------------------	---------------------------------

9.1.2 Member Typedef Documentation

9.1.2.1 iterator

```
template<typename ElementOffset >
typedef SequenceIterator<ElementOffset, typename ElementOffset::offset_kind> rti::flat::↔
AbstractAlignedList< ElementOffset >::iterator
```

The iterator type, **SequenceIterator** (p. 1903).

9.1.3 Member Function Documentation

9.1.3.1 begin()

```
template<typename ElementOffset >
iterator rti::flat::AbstractAlignedList< ElementOffset >::begin ( ) [inline]
```

Gets an iterator to the first Offset.

begin() (p. 572) and **end()** (p. 572) enable the use of range-for loops, for example:

```
SequenceOffset<MyFlatMutableOffset> sequence_offset = my_type_offset.my_sequence();
for (auto element : sequence_offset) {
    std::cout << element.x() << std::endl;
}
```

References **rti::flat::OffsetBase::get_buffer_size()**.

9.1.3.2 end()

```
template<typename ElementOffset >
iterator rti::flat::AbstractAlignedList< ElementOffset >::end ( ) [inline]
```

Gets an iterator to the past-the-end element.

References **rti::flat::OffsetBase::get_buffer_size()**.

9.2.2.1 ~AbstractBuilder()

```
virtual rti::flat::AbstractBuilder::~~AbstractBuilder ( ) [inline], [protected], [virtual]
```

If this is a member Builder, it calls finish().

If this Builder is building a member (that is, **is_nested()** (p. 574) is true), and the object goes out of scope before finish() has been called, its destructor calls finish(). Note, however, that it won't report any error.

If this Builder is building a sample (lis_nested()), its destructor doesn't do anything.

9.2.3 Member Function Documentation

9.2.3.1 discard()

```
void rti::flat::AbstractBuilder::discard ( ) [inline]
```

Discards a member in process of being built.

This function ends the creation of a member, returning the Builder of the type that contains the member to its previous state, as if this member had never been built.

Precondition

This object must be a member Builder, not a sample Builder.

This method is useful when during the building of a member an error occurs and the application wants to roll back, instead of finishing an incomplete member.

9.2.3.2 is_nested()

```
bool rti::flat::AbstractBuilder::is_nested ( ) const [inline]
```

Returns whether this is a member Builder.

A member Builder is a Builder that has been created by calling a "build_<member>" function on another Builder (for example, **MyFlatMutableBuilder::build_my_mutable()** (p. 1738)).

Returns

True if this is a member Builder, or false if this is a sample Builder.

9.2.3.3 is_valid()

```
bool rti::flat::AbstractBuilder::is_valid ( ) const [inline]
```

Whether this Builder is valid.

A Builder is not valid when it is default-constructed, or after any of these functions is called: `finish()`, `finish_sample()`, `discard()` (p. 574).

Since the Traditional C++ API doesn't use exceptions, certain function failures due to the Builder running out resources are also reported by invalidating the Builder.

9.2.3.4 capacity()

```
rti::xcdr::length_t rti::flat::AbstractBuilder::capacity ( ) const [inline]
```

Returns the total capacity in bytes.

The capacity is the total number of bytes this Builder can contain. For a sample Builder (that is, one such that `is_nested()` (p. 574) returns false), `rti::flat::build_data` (p. 554) reserves enough bytes to accommodate any sample of a given type.

9.2.3.5 check_failure()

```
bool rti::flat::AbstractBuilder::check_failure ( ) [inline]
```

Checks if the previous operation failed and resets the failure flag.

This function must be called after each Builder operation to check if it succeeded. Note that after calling `check_failure()` (p. 575) the error flag is reset, so a subsequent call will always return false.

Returns

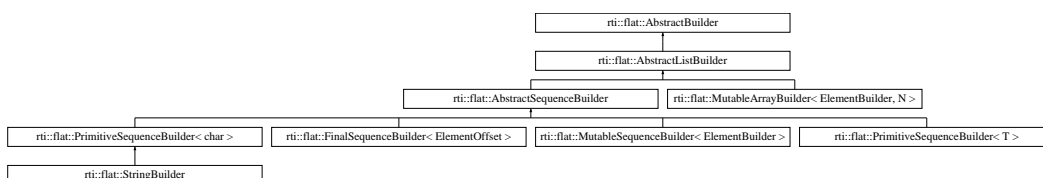

True if there was a failure in the previous operation, false if there was no failure since the last call to `check_failure`.

9.3 rti::flat::AbstractListBuilder Class Reference

Base class of all array and sequence builders.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for `rti::flat::AbstractListBuilder`:

Protected Member Functions

- unsigned int **element_count** () const
Returns the current number of elements that have been added.

Additional Inherited Members

9.3.1 Detailed Description

Base class of all array and sequence builders.

9.3.2 Member Function Documentation

9.3.2.1 element_count()

```
unsigned int rti::flat::AbstractListBuilder::element_count ( ) const [inline], [protected]
```

Returns the current number of elements that have been added.

Referenced by **rti::flat::MutableArrayBuilder< ElementBuilder, N >::build_next()**, and **rti::flat::MutableArrayBuilder< ElementBuilder, N >::finish()**.

9.4 rti::flat::AbstractPrimitiveList< T > Class Template Reference

Base class for Offsets to sequences and arrays of primitive types.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::AbstractPrimitiveList< T >:

Public Member Functions

- T **get_element** (unsigned int i) const
Returns an element by index.
- bool **set_element** (unsigned int i, T value)
Sets an element by index.

9.4.1 Detailed Description

```
template<typename T>
class rti::flat::AbstractPrimitiveList< T >
```

Base class for Offsets to sequences and arrays of primitive types.

Template Parameters

<i>T</i>	The primitive type
----------	--------------------

9.4.2 Member Function Documentation

9.4.2.1 get_element()

```
template<typename T >
T rti::flat::AbstractPrimitiveList< T >::get_element (
    unsigned int i ) const [inline]
```

Returns an element by index.

Parameters

<i>i</i>	The zero-based index of the element
----------	-------------------------------------

See also

rti::flat::plain_cast() (p. 560) for a method to access all the elements at once

9.4.2.2 set_element()

```
template<typename T >
bool rti::flat::AbstractPrimitiveList< T >::set_element (
```

```
    unsigned int i,
    T value )    [inline]
```

Sets an element by index.

Parameters

<i>i</i>	The zero-based index of the element to set
<i>value</i>	The value to set

Returns

true if it was possible to set the element, or false if this collection has less than $i - 1$ elements.

See also

rti::flat::plain_cast() (p. 560) for a method to access all the elements at once

9.5 rti::flat::AbstractSequenceBuilder Class Reference

Base class of Builders for sequence members.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::AbstractSequenceBuilder:

Additional Inherited Members

9.5.1 Detailed Description

Base class of Builders for sequence members.

This class contains only implementation details and doesn't add any public function to **AbstractListBuilder** (p. 575).

9.6 rti::flat::AggregationBuilder Class Reference

Base class of struct and union builders.

```
#include <AggregationBuilders.hpp>
```

Inheritance diagram for rti::flat::AggregationBuilder:

Additional Inherited Members

9.6.1 Detailed Description

Base class of struct and union builders.

This class contains implementation details and doesn't add any public function to **AbstractBuilder** (p. 573). See **MyFlatMutableBuilder** (p. 1732) for a concrete example of a struct builder.

9.7 connext::AlreadyDeletedException Class Reference

The object target of this operation has already been deleted.

Inheritance diagram for connext::AlreadyDeletedException:

9.7.1 Detailed Description

The object target of this operation has already been deleted.

See also

DDS_RETCODE_ALREADY_DELETED (p. 336)

9.8 connext::BadParameterException Class Reference

Illegal parameter value.

Inheritance diagram for connext::BadParameterException:

9.8.1 Detailed Description

Illegal parameter value.

See also

DDS_RETCODE_BAD_PARAMETER (p. 335)

9.9 DDS_AcknowledgmentInfo Struct Reference

Information about an application-level acknowledged sample.

Public Attributes

- **DDS_InstanceHandle_t subscription_handle**
*Subscription handle of the acknowledging **DDSDataReader** (p. 1272).*
- struct **DDS_SampleIdentity_t sample_identity**
Identity of the sample being acknowledged.
- **DDS_Boolean valid_response_data**
Flag indicating validity of the user response data in the acknowledgment.
- struct **DDS_AckResponseData_t response_data**
User data payload of application-level acknowledgment message.

9.9.1 Detailed Description

Information about an application-level acknowledged sample.

When acknowledging a sample, the reader provides the writer with information about the sample being acknowledged. The AcknowledgmentInfo structure provides the identity and cookie of the sample being acknowledged, as well as user data payload provided by the reader.

9.9.2 Member Data Documentation

9.9.2.1 subscription_handle

DDS_InstanceHandle_t DDS_AcknowledgmentInfo::subscription_handle

Subscription handle of the acknowledging **DDSDataReader** (p. 1272).

9.9.2.2 sample_identity

struct DDS_SampleIdentity_t DDS_AcknowledgmentInfo::sample_identity

Identity of the sample being acknowledged.

See also

DDS_SampleIdentity_t (p. 1067)

9.9.2.3 valid_response_data

DDS_Boolean DDS_AcknowledgmentInfo::valid_response_data

Flag indicating validity of the user response data in the acknowledgment.

This flag is true when the **DDS_RtpsReliableReaderProtocol_t::min_app_ack_response_keep_duration** (p. 1046) has not yet elapsed for the acknowledgment's response data.

The flag is false when that duration has elapsed for the response data.

9.9.2.4 response_data

struct DDS_AckResponseData_t DDS_AcknowledgmentInfo::response_data

User data payload of application-level acknowledgment message.

Response data set by **DDSDataReader** (p. 1272) when sample was acknowledged.

9.10 DDS_AckResponseData_t Struct Reference

Data payload of an application-level acknowledgment.

Public Attributes

- struct **DDS_OctetSeq** **value**
a sequence of octets

9.10.1 Detailed Description

Data payload of an application-level acknowledgment.

9.10.2 Member Data Documentation

9.10.2.1 value

```
struct DDS_OctetSeq DDS_AckResponseData_t::value
```

a sequence of octets

[default] empty (zero-length)

[range] Octet sequence of length [0, **DDS_DataReaderResourceLimitsQosPolicy::max_app_ack_response_length** (p. 658)],

9.11 DDS_AllocationSettings_t Struct Reference

Resource allocation settings.

Public Attributes

- **DDS_Long** **initial_count**
The initial count of resources.
- **DDS_Long** **max_count**
The maximum count of resources.
- **DDS_Long** **incremental_count**
The incremental count of resources.

9.11.1 Detailed Description

Resource allocation settings.

QoS:

DDS_DomainParticipantResourceLimitsQosPolicy (p. 740)

9.11.2 Member Data Documentation

9.11.2.1 initial_count

DDS_Long DDS_AllocationSettings_t::initial_count

The initial count of resources.

The initial resources to be allocated.

[default] It depends on the case.

[range] [0, 1 million], < max_count, (or = max_count only if increment_count == 0)

9.11.2.2 max_count

DDS_Long DDS_AllocationSettings_t::max_count

The maximum count of resources.

The maximum resources to be allocated.

[default] Depends on the case.

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437), > initial_count (or = initial_count only if increment_count == 0)

9.11.2.3 incremental_count

DDS_Long DDS_AllocationSettings_t::incremental_count

The incremental count of resources.

The resource to be allocated when more resources are needed.

[default] Depends on the case.

[range] -1 (Double the amount of extra memory allocated each time memory is needed) or [1,1 million] (or = 0 only if initial_count == max_count)

9.12 DDS_AnnotationParameterValue Struct Reference

Annotation parameter value.

9.12.1 Detailed Description

Annotation parameter value.

This structure is use to represent an annotation parameter value. For example, the value of the annotation **[default]** for an aggregation type member.

9.13 DDS_AynchronousPublisherQosPolicy Struct Reference

Configures the mechanism that sends user data in an external middleware thread.

Public Attributes

- **DDS_Boolean disable_asynchronous_write**
Disable asynchronous publishing.
- struct **DDS_ThreadSettings_t thread**
Settings of the publishing thread.
- **DDS_Boolean disable_asynchronous_batch**
Disable asynchronous batch flushing.
- struct **DDS_ThreadSettings_t asynchronous_batch_thread**
Settings of the batch flushing thread.
- **DDS_Boolean disable_topic_query_publication**
Disable topic query publication.
- struct **DDS_ThreadSettings_t topic_query_publication_thread**
*Settings of the **DDSTopicQuery** (p. 1611) publication thread.*

9.13.1 Detailed Description

Configures the mechanism that sends user data in an external middleware thread.

Specifies the asynchronous publishing and asynchronous batch flushing settings of the **DDSPublisher** (p. 1534) instances.

The QoS policy specifies whether asynchronous publishing and asynchronous batch flushing are enabled for the **DDSDataWriter** (p. 1305) entities belonging to this **DDSPublisher** (p. 1534). If so, the publisher will spawn up to two threads, one for asynchronous publishing and one for asynchronous batch flushing.

This policy also configures the settings of the **DDSTopicQuery** (p. 1611) publication thread. The publisher will spawn this thread only if one or more DataWriters enable TopicQueries.

See also

DDS_BatchQosPolicy (p. 594).

DDS_PublishModeQosPolicy (p. 1012).

Entity:

DDSPublisher (p. 1534)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.13.2 Usage

You can use this QoS policy to reduce the amount of time your application thread spends sending data.

You can also use it, along with **DDS_PublishModeQosPolicy** (p. 1012) and a **DDSFlowController** (p. 1451), to send large data reliably. "Large" in this context means that the data that cannot be sent as a single packet by a network transport. For example, to send data larger than 63K reliably using UDP/IP, you must configure RTI Connext to fragment the data and send it asynchronously.

The asynchronous *publisher* thread is shared by all **DDS_ASYNCRONOUS_PUBLISH_MODE_QOS** (p. 431) **DDSDataWriter** (p. 1305) instances that belong to this publisher and handles their data transmission chores.

The asynchronous *batch flushing* thread is shared by all **DDSDataWriter** (p. 1305) instances with batching enabled that belong to this publisher.

This QoS policy also allows you to adjust the settings of the asynchronous publishing and the asynchronous batch flushing threads. To use different threads for two different **DDSDataWriter** (p. 1305) entities, the instances must belong to different **DDSPublisher** (p. 1534) instances.

A **DDSPublisher** (p. 1534) must have asynchronous publishing enabled for its **DDSDataWriter** (p. 1305) instances to write asynchronously.

A **DDSPublisher** (p. 1534) must have asynchronous batch flushing enabled in order to flush the batches of its **DDSDataWriter** (p. 1305) instances asynchronously. However, no asynchronous batch flushing thread will be started until the first **DDSDataWriter** (p. 1305) instance with batching enabled is created from this **DDSPublisher** (p. 1534).

9.13.3 Member Data Documentation

9.13.3.1 `disable_asynchronous_write`

```
DDS_Boolean DDS_AsymchronousPublisherQosPolicy::disable_asynchronous_write
```

Disable asynchronous publishing.

If set to **DDS_BOOLEAN_TRUE** (p.316), any **DDSDDataWriter** (p.1305) created with **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p.431) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p.336).

[default] **DDS_BOOLEAN_FALSE** (p.316)

9.13.3.2 `thread`

```
struct DDS_ThreadSettings_t DDS_AsymchronousPublisherQosPolicy::thread
```

Settings of the publishing thread.

There is only one asynchronous publishing thread per **DDSPublisher** (p.1534).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to `Platform Notes`.

[default] The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to `Platform Notes`.

[default] mask = **DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT** (p.350)

9.13.3.3 `disable_asynchronous_batch`

```
DDS_Boolean DDS_AsymchronousPublisherQosPolicy::disable_asynchronous_batch
```

Disable asynchronous batch flushing.

If set to **DDS_BOOLEAN_TRUE** (p.316), any **DDSDDataWriter** (p.1305) created with batching enabled will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p.336).

If **DDS_BatchQosPolicy::max_flush_delay** (p.596) is different than **DDS_DURATION_INFINITE** (p.325), **DDS_AsymchronousPublisherQosPolicy::disable_asynchronous_batch** (p.586) must be set **DDS_BOOLEAN_FALSE** (p.316).

[default] **DDS_BOOLEAN_FALSE** (p.316)

9.13.3.4 asynchronous_batch_thread

```
struct DDS_ThreadSettings_t DDS_AsyncronousPublisherQosPolicy::asynchronous_batch_thread
```

Settings of the batch flushing thread.

There is only one asynchronous batch flushing thread per **DDSPublisher** (p. 1534).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to Platform Notes. **[default]** The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to Platform Notes.

[default] mask = **DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT** (p. 350)

9.13.3.5 disable_topic_query_publication

```
DDS_Boolean DDS_AsyncronousPublisherQosPolicy::disable_topic_query_publication
```

Disable topic query publication.

If set to **DDS_BOOLEAN_TRUE** (p. 316), any **DDSDataWriter** (p. 1305) created with **DDS_TopicQueryDispatchQosPolicy::enable** (p. 1127) set to **DDS_BOOLEAN_TRUE** (p. 316) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336).

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.13.3.6 topic_query_publication_thread

```
struct DDS_ThreadSettings_t DDS_AsyncronousPublisherQosPolicy::topic_query_publication_thread
```

Settings of the **DDSTopicQuery** (p. 1611) publication thread.

There is only one TopicQuery publication thread per **DDSPublisher** (p. 1534). This thread will exist as long as one or more **DDSDataWriter** (p. 1305) enables TopicQueries (via **DDS_DataWriterQos::topic_query_dispatch** (p. 691)).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

[default] mask = **DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT** (p. 350)

9.14 DDS_AsyncWaitSetProperty_t Struct Reference

Specifies the **DDSAsyncWaitSet** (p. 1243) behavior.

Public Attributes

- struct **DDS_WaitSetProperty_t** **waitset_property**
*Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **DDSWaitSet** (p. 1613).*
- **DDS_UnsignedLong** **thread_pool_size**
*Number of threads that conform the thread pool of the **DDSAsyncWaitSet** (p. 1243).*
- struct **DDS_ThreadSettings_t** **thread_settings**
***DDS_ThreadSettings_t** (p. 1108) for each thread conforming the thread pool of the **DDSAsyncWaitSet** (p. 1243).*
- char * **thread_name_prefix**
*Prefix used to composed the name of each thread that conforms the thread pool the **DDSAsyncWaitSet** (p. 1243).*
- struct **DDS_Duration_t** **wait_timeout**
Asynchronous wait timeout.
- **DDS_Long** **level**
*Specifies the level of an **DDSAsyncWaitSet** (p. 1243).*

9.14.1 Detailed Description

Specifies the **DDSAsyncWaitSet** (p. 1243) behavior.

This property allows configuring the behavior of the asynchronous wait and the **DDSCondition** (p. 1260) dispatch, as well as the parameters of the thread pool.

See also

DDS_WaitSetProperty_t (p. 1226)

DDS_ThreadSettings_t (p. 1108)

9.14.2 Member Data Documentation

9.14.2.1 waitset_property

```
struct DDS_WaitSetProperty_t DDS_AsyncWaitSetProperty_t::waitset_property
```

Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **DDSWaitSet** (p. 1613).

See also

DDS_WaitSetProperty_t (p. 1226)

9.14.2.2 thread_pool_size

```
DDS_UnsignedLong DDS_AsyncWaitSetProperty_t::thread_pool_size
```

Number of threads that conform the thread pool of the **DDSAsyncWaitSet** (p. 1243).

Size must be equal or greater than one.

[default] 1

9.14.2.3 thread_settings

```
struct DDS_ThreadSettings_t DDS_AsyncWaitSetProperty_t::thread_settings
```

DDS_ThreadSettings_t (p. 1108) for each thread conforming the thread pool of the **DDSAsyncWaitSet** (p. 1243).

Each thread within the pool is created with the same settings.

[default] Default thread settings values.

See also

DDS_ThreadSettings_t (p. 1108)

9.14.2.4 thread_name_prefix

```
char* DDS_AsyncWaitSetProperty_t::thread_name_prefix
```

Prefix used to composed the name of each thread that conforms the thread pool the **DDSAsyncWaitSet** (p. 1243).

The composed name has the form:

`thread_name_prefix##[index]AWs` where [index] is an integer that identifies the thread relative to the **DDSAsyncWaitSet** (p. 1243).

If NULL, the default prefix will be used.

[default] NULL (use default prefix)

9.14.2.5 wait_timeout

```
struct DDS_Duration_t DDS_AsyncWaitSetProperty_t::wait_timeout
```

Asynchronous wait timeout.

Specifies the maximum amount of time the leader thread of the **DDSAsyncWaitSet** (p. 1243) waits for an attached **DDSCondition** (p. 1260) to trigger before it wakes up.

Duration must be a value greater than zero.

See also

DDSWaitSet::wait (p. 1617)

[default] **DDS_DURATION_INFINITE** (p. 325)

9.14.2.6 level

```
DDS_Long DDS_AsyncWaitSetProperty_t::level
```

Specifies the level of an **DDSAsyncWaitSet** (p. 1243).

The level prevents an application to deadlock when it uses multiple **DDSAsyncWaitSet** (p. 1243) instances that call operations on each other from the context of one of their thread pool's thread.

Inside the context of one of these threads, the application can synchronize only with other **DDSAsyncWaitSet** (p. 1243) of bigger level.

[default] 1

9.15 DDS_AvailabilityQosPolicy Struct Reference

Configures the availability of data.

Public Attributes

- **DDS_Boolean enable_required_subscriptions**
*Enables support for required subscriptions in a **DDSDataWriter** (p. 1305).*
- struct **DDS_Duration_t max_data_availability_waiting_time**
Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.
- struct **DDS_Duration_t max_endpoint_availability_waiting_time**
Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).
- struct **DDS_EndpointGroupSeq required_matched_endpoint_groups**
A sequence of endpoint groups.

9.15.1 Detailed Description

Configures the availability of data.

Entity:

DDSDataReader (p. 1272), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = YES (p. ??) (only on a **DDSDataWriter** (p. 1305) except for the member **DDS_AvailabilityQosPolicy::enable_required_subscriptions** (p. 593))

9.15.2 Usage

This QoS policy is used in the context of two features:

- Collaborative DataWriters
- Required Subscriptions

Collaborative DataWriters

The Collaborative DataWriters feature allows having multiple DataWriters publishing samples from a common logical data source. The DataReaders will combine the samples coming from the DataWriters in order to reconstruct the correct order at the source.

This QoS policy allows you to configure the ordering and combination process in the DataReader and can be used to support two different use cases:

- **Ordered delivery of samples in high-availability scenarios** One example of this is RTI Persistence Service. When a late-joining DataReader configured with **DDS_DurabilityQosPolicy** (p. 761) set to **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 400) joins a DDS domain, it will start receiving historical samples from multiple DataWriters. For example, if the original DataWriter is still alive, the newly created DataReader will receive samples from the original DataWriter and one or more RTI Persistence Service DataWriters (PRSTDataWriters). This policy can be used to configure the sample ordering process on the DataReader.
- **Ordered delivery of samples in load-balanced scenarios** Multiple instances of the same application can work together to process and deliver samples. When the samples arrive through different data-paths out of order, the DataReader will be able to reconstruct the order at the destination. An example of this is when multiple instances of RTI Persistence Service are used to persist the data. Persisting data to a database on disk can be a bottleneck for throughput. You can improve scalability and performance by dividing the workload across different instances of RTI Persistence Service that use different databases. For example, samples larger than 10 are persisted by Persistence Service 1, samples less than or equal to 10 are persisted by Persistence Service 2.

- **Ordered delivery of samples with Group Ordered Access** This policy can also be used to configure the sample ordering process when the Subscriber is configured with **DDS_PresentationQosPolicy** (p. 983) `access_scope` set to **DDS_GROUP_PRESENTATION_QOS** (p. 418). In this case, the Subscriber must deliver in order the samples published by a group of DataWriters that belong to the same Publisher and have `access_scope` set to **DDS_GROUP_PRESENTATION_QOS** (p. 418).

Each sample published in a DDS domain for a given logical data source is uniquely identified by a pair (virtual GUID, virtual sequence number). Samples from the same data source (same virtual GUID) can be published by different DataWriters. A DataReader will deliver a sample (VGUIDn, VSNm) to the application if one of the following conditions is satisfied:

- (VGUIDn, VSNm-1) has already been delivered to the application.
- All the known DataWriters publishing VGUIDn have announced that they do not have (VGUIDn, VSNm-1).
- None of the known DataWriters publishing GUIDn have announced potential availability of (VGUIDn, VSNm-1) and both timeouts in this QoS policy have expired.

A DataWriter announces potential availability of samples by using virtual heartbeats (HBs).

When **DDS_PresentationQosPolicy::access_scope** (p. 987) is set to **DDS_TOPIC_PRESENTATION_QOS** (p. 418) or **DDS_INSTANCE_PRESENTATION_QOS** (p. 418), the virtual HB contains information about the samples contained in the **DDSDataWriter** (p. 1305) history.

When **DDS_PresentationQosPolicy::access_scope** (p. 987) is set to **DDS_GROUP_PRESENTATION_QOS** (p. 418), the virtual HB contains information about all DataWriters in the **DDSPublisher** (p. 1534).

The frequency at which virtual HBs are sent is controlled by the protocol parameters **DDS_RtpsReliableWriterProtocol_t::virtual_heartbeat_period** (p. 1052) and **DDS_RtpsReliableWriterProtocol_t::samples_per_virtual_heartbeat** (p. 1052).

Required Subscriptions

In the context of Required Subscriptions, this QoS policy can be used to configure a set of Required Subscriptions on a **DDSDataWriter** (p. 1305).

Required subscriptions are preconfigured, named subscriptions that may leave and subsequently rejoin the network from time to time, at the same or different physical locations. Any time a required subscription is disconnected, any samples that would have been delivered to it are stored for delivery if and when the subscription rejoins the network.

9.15.3 Consistency

For a DataWriter, the setting of **AVAILABILITY** (p. 363) must be set consistently with that of the **RELIABILITY** (p. 433) and **DURABILITY** (p. 397).

If **DDS_AvailabilityQosPolicy::enable_required_subscriptions** (p. 593) is set to **DDS_BOOLEAN_TRUE** (p. 316), **DDS_ReliabilityQosPolicy::kind** (p. 1029) must be set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435), **DDS_DurabilityQosPolicy** (p. 761) must be set to a value different than **DDS_VOLATILE_DURABILITY_QOS** (p. 399), and **DDS_DurabilityQosPolicy::writer_depth** (p. 764) must be set to either **DDS_AUTO_WRITER_DEPTH** (p. 400) or **DDS_LENGTH_UNLIMITED** (p. 437).

9.15.4 Member Data Documentation

9.15.4.1 enable_required_subscriptions

DDS_Boolean DDS_AvailabilityQosPolicy::enable_required_subscriptions

Enables support for required subscriptions in a **DDSDataWriter** (p. 1305).

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.15.4.2 max_data_availability_waiting_time

struct DDS_Duration_t DDS_AvailabilityQosPolicy::max_data_availability_waiting_time

Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.

Collaborative DataWriters

A sample identified by (VGUIDn, VSNm) will be delivered to the application if this timeout expires for the sample and the following two conditions are satisfied:

- None of the known DataWriters publishing VGUIDn have announced potential availability of (VGUIDn, VSNm-1).
- The DataWriters for all the endpoint groups specified in **required_matched_endpoint_groups** (p. 593) have been discovered or **max_endpoint_availability_waiting_time** (p. 593) has expired.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] **DDS_DURATION_AUTO** (p. 326) (**DDS_DURATION_INFINITE** (p. 325) for **DDS_GROUP_PRESENTATION_↔_QOS** (p. 418). Otherwise, 0 seconds)

[range] [0, **DDS_DURATION_INFINITE** (p. 325)], **DDS_DURATION_AUTO** (p. 326)

9.15.4.3 max_endpoint_availability_waiting_time

struct DDS_Duration_t DDS_AvailabilityQosPolicy::max_endpoint_availability_waiting_time

Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).

Collaborative DataWriters

The set of endpoint groups that are required to provide samples for a data source can be configured using **required_↔matched_endpoint_groups** (p. 593).

A non-consecutive sample identified by (VGUIDn, VSNm) cannot be delivered to the application unless DataWriters for all the endpoint groups in **required_matched_endpoint_groups** (p. 593) are discovered or this timeout expires.

Required Subscriptions

This field is not applicable to Required Subscriptions.

[default] **DDS_DURATION_AUTO** (p. 326) (**DDS_DURATION_INFINITE** (p. 325) for **DDS_GROUP_PRESENTATION_↔_QOS** (p. 418). Otherwise, 0 seconds)

[range] [0, **DDS_DURATION_INFINITE** (p. 325)], **DDS_DURATION_AUTO** (p. 326)

9.15.4.4 required_matched_endpoint_groups

```
struct DDS_EndpointGroupSeq DDS_AvailabilityQosPolicy::required_matched_endpoint_groups
```

A sequence of endpoint groups.

Collaborative DataWriters

In the context of Collaborative DataWriters, it specifies the set of endpoint groups that are expected to provide samples for the same data source.

The quorum count in a group represents the number of DataWriters that must be discovered for that group before the DataReader is allowed to provide non consecutive samples to the application.

A DataWriter becomes a member of an endpoint group by configuring the role_name in **DDS_DataWriterQos**↔
::**publication_name** (p. 691).

Required Subscriptions

In the context of Required Subscriptions, it specifies the set of Required Subscriptions on a **DDSDDataWriter** (p. 1305).

Each Required Subscription is specified by a name and a quorum count.

The quorum count represents the number of DataReaders that have to acknowledge the sample before it can be considered fully acknowledged for that Required Subscription.

A DataReader is associated with a Required Subscription by configuring the role_name in **DDS_DataReaderQos**↔
::**subscription_name** (p. 646).

[default] Empty sequence

9.16 DDS_BatchQosPolicy Struct Reference

Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

Public Attributes

- **DDS_Boolean enable**
Specifies whether or not batching is enabled.
- **DDS_Long max_data_bytes**
The maximum cumulative length of all serialized samples in a batch.
- **DDS_Long max_samples**
The maximum number of samples in a batch.
- struct **DDS_Duration_t max_flush_delay**
The maximum flush delay.
- struct **DDS_Duration_t source_timestamp_resolution**
Batch source timestamp resolution.
- **DDS_Boolean thread_safe_write**
Determines whether or not the write operation is thread safe.

9.16.1 Detailed Description

Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

This QoS policy configures the ability of the middleware to collect multiple user data samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

This QoS policy can be used to dramatically increase effective throughput for small data samples. Usually, throughput for small samples (size < 2048 bytes) is limited by CPU capacity and not by network bandwidth. Batching many smaller samples to be sent in a single large packet will increase network utilization, and thus throughput, in terms of samples per second.

Entity:

DDSDataWriter (p. 1305)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

9.16.2 Member Data Documentation

9.16.2.1 enable

DDS_Boolean DDS_BatchQosPolicy::enable

Specifies whether or not batching is enabled.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.16.2.2 max_data_bytes

DDS_Long DDS_BatchQosPolicy::max_data_bytes

The maximum cumulative length of all serialized samples in a batch.

A batch is flushed automatically when this maximum is reached.

max_data_bytes does not include the meta data associated with the batch samples. Each sample has at least 8 bytes of meta data containing information such as the timestamp and sequence number. The meta data can be as large as 52 bytes for keyed topics and 20 bytes for unkeyed topics.

Note: Batches must contain whole samples. If a new batch is started and its initial sample causes the serialized size to exceed max_data_bytes, RTI Connexx will send the sample in a single batch.

[default] 1024

[range] [1, **DDS_LENGTH_UNLIMITED** (p. 437)]

9.16.3 Consistency

The setting of **DDS_BatchQosPolicy::max_data_bytes** (p. 595) must be consistent with **DDS_BatchQosPolicy::max_samples** (p. 596). For these two values to be consistent, they cannot be both **DDS_LENGTH_UNLIMITED** (p. 437).

9.16.3.1 max_samples

```
DDS_Long DDS_BatchQosPolicy::max_samples
```

The maximum number of samples in a batch.

A batch is flushed automatically when this maximum is reached.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, **DDS_LENGTH_UNLIMITED** (p. 437)]

9.16.4 Consistency

The setting of **DDS_BatchQosPolicy::max_samples** (p. 596) must be consistent with **DDS_BatchQosPolicy::max_data_bytes** (p. 595). For these two values to be consistent, they cannot be both **DDS_LENGTH_UNLIMITED** (p. 437).

9.16.4.1 max_flush_delay

```
struct DDS_Duration_t DDS_BatchQosPolicy::max_flush_delay
```

The maximum flush delay.

A batch is flushed automatically after the delay specified by this parameter.

The delay is measured from the time the first sample in the batch is written by the application.

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [0, **DDS_DURATION_INFINITE** (p. 325)]

9.16.5 Consistency

The setting of **DDS_BatchQosPolicy::max_flush_delay** (p. 596) must be consistent with **DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_batch** (p. 586) and **DDS_BatchQosPolicy::thread_safe_write** (p. 597). If the delay is different than **DDS_DURATION_INFINITE** (p. 325), **DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_batch** (p. 586) must be set to **DDS_BOOLEAN_FALSE** (p. 316) and **DDS_BatchQosPolicy::thread_safe_write** (p. 597) must be set to **DDS_BOOLEAN_TRUE** (p. 316).

9.16.5.1 source_timestamp_resolution

```
struct DDS_Duration_t DDS_BatchQosPolicy::source_timestamp_resolution
```

Batch source timestamp resolution.

The value of this field determines how the source timestamp is associated with the samples in a batch.

A sample written with timestamp 't' inherits the source timestamp 't2' associated with the previous sample unless ('t' - 't2') > source_timestamp_resolution.

If source_timestamp_resolution is set to **DDS_DURATION_INFINITE** (p. 325), every sample in the batch will share the source timestamp associated with the first sample.

If source_timestamp_resolution is set to zero, every sample in the batch will contain its own source timestamp corresponding to the moment when the sample was written.

The performance of the batching process is better when source_timestamp_resolution is set to **DDS_DURATION_↵INFINITE** (p. 325).

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [0, **DDS_DURATION_INFINITE** (p. 325)]

9.16.6 Consistency

The setting of **DDS_BatchQosPolicy::source_timestamp_resolution** (p. 596) must be consistent with **DDS_Batch↵QosPolicy::thread_safe_write** (p. 597). If **DDS_BatchQosPolicy::thread_safe_write** (p. 597) is set to **DDS_↵BOOLEAN_FALSE** (p. 316), **DDS_BatchQosPolicy::source_timestamp_resolution** (p. 596) must be set to **DDS_↵_DURATION_INFINITE** (p. 325).

9.16.6.1 thread_safe_write

```
DDS_Boolean DDS_BatchQosPolicy::thread_safe_write
```

Determines whether or not the write operation is thread safe.

If this parameter is set to **DDS_BOOLEAN_TRUE** (p. 316), multiple threads can call write on the **DDSDataWriter** (p. 1305) concurrently.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.16.7 Consistency

The setting of **DDS_BatchQosPolicy::thread_safe_write** (p. 597) must be consistent with **DDS_BatchQosPolicy_↵::source_timestamp_resolution** (p. 596). If **DDS_BatchQosPolicy::thread_safe_write** (p. 597) is set to **DDS_↵BOOLEAN_FALSE** (p. 316), **DDS_BatchQosPolicy::source_timestamp_resolution** (p. 596) must be set to **DDS_↵_DURATION_INFINITE** (p. 325).

9.17 DDS_BooleanSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_Boolean** (p. 319) >

9.17.1 Detailed Description

Instantiates **FooSeq** (p. 1680) < **DDS_Boolean** (p. 319) >

Instantiates:

<<*generic*>> (p. 236) **FooSeq** (p. 1680)

An array of four integers that uniquely represents a remote **DDSEntity** (p. 1446).

9.19 DDS_BuiltinTopicReaderResourceLimits_t Struct Reference

Built-in topic reader's resource limits.

Public Attributes

- **DDS_Long initial_samples**
Initial number of samples.
- **DDS_Long max_samples**
Maximum number of samples.
- **DDS_Long initial_infos**
Initial number of sample infos.
- **DDS_Long max_infos**
Maximum number of sample infos.
- **DDS_Long initial_outstanding_reads**
*The initial number of outstanding reads that have not called finish yet on the same built-in topic **DDSDataReader** (p. 1272).*
- **DDS_Long max_outstanding_reads**
*The maximum number of outstanding reads that have not called finish yet on the same built-in topic **DDSDataReader** (p. 1272).*
- **DDS_Long max_samples_per_read**
*Maximum number of samples that can be read/taken on a same built-in topic **DDSDataReader** (p. 1272).*
- **DDS_Boolean disable_fragmentation_support**
*Determines whether the built-in topic **DDSDataReader** (p. 1272) can receive fragmented samples.*
- **DDS_Long max_fragmented_samples**
*The maximum number of samples for which the built-in topic **DDSDataReader** (p. 1272) may store fragments at a given point in time.*
- **DDS_Long initial_fragmented_samples**
*The initial number of samples for which a built-in topic **DDSDataReader** (p. 1272) may store fragments.*
- **DDS_Long max_fragmented_samples_per_remote_writer**
*The maximum number of samples per remote writer for which a built-in topic **DDSDataReader** (p. 1272) may store fragments.*
- **DDS_Long max_fragments_per_sample**
Maximum number of fragments for a single sample.
- **DDS_Boolean dynamically_allocate_fragmented_samples**
*Determines whether the built-in topic **DDSDataReader** (p. 1272) pre-allocates storage for storing fragmented samples.*

9.19.1 Detailed Description

Built-in topic reader's resource limits.

Defines the resources that can be used for a built-in-topic data reader.

A built-in topic data reader subscribes reliably to built-in topics containing declarations of new entities or updates to existing entities in the domain. Keys are used to differentiate among entities of the same type. RTI Connext assigns a unique key to each entity in a domain.

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

QoS:

DDS_DiscoveryConfigQosPolicy (p. 706)

9.19.2 Member Data Documentation

9.19.2.1 initial_samples

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_samples

Initial number of samples.

This should be a value between 1 and initial number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently.

[default] 64

[range] [1, 1 million], <= max_samples

9.19.2.2 max_samples

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_samples

Maximum number of samples.

This should be a value between 1 and max number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently. Also, it should not be less than initial_samples.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437), >= initial_samples

9.19.2.3 initial_infos

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_infos

Initial number of sample infos.

The initial number of info units that a built-in topic **DDSDataReader** (p. 1272) can have. Info units are used to store **DDS_SampleInfo** (p. 1068).

[default] 64

[range] [1, 1 million] <= max_infos

9.19.2.4 max_infos

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_infos

Maximum number of sample infos.

The maximum number of info units that a built-in topic **DDSDataReader** (p. 1272) can use to store **DDS_SampleInfo** (p. 1068).

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437), >= initial_infos

9.19.2.5 initial_outstanding_reads

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_outstanding_reads

The initial number of outstanding reads that have not called finish yet on the same built-in topic **DDSDataReader** (p. 1272).

Must be less than or equal to max_outstanding_reads.

[default] 2

[range] [1, 1024]

9.19.2.6 max_outstanding_reads

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_outstanding_reads

The maximum number of outstanding reads that have not called finish yet on the same built-in topic **DDSDataReader** (p. 1272).

Must be greater than or equal to initial_outstanding_reads.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1024] or **DDS_LENGTH_UNLIMITED** (p. 437)

9.19.2.7 max_samples_per_read

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_samples_per_read

Maximum number of samples that can be read/taken on a same built-in topic **DDSDataReader** (p. 1272).

[default] 1024

[range] [1, 65536]

9.19.2.8 disable_fragmentation_support

DDS_Boolean DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support

Determines whether the built-in topic **DDSDataReader** (p. 1272) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] DDS_BOOLEAN_FALSE (p. 316)

9.19.2.9 max_fragmented_samples

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_fragmented_samples

The maximum number of samples for which the built-in topic **DDSDataReader** (p. 1272) may store fragments at a given point in time.

At any given time, a built-in topic **DDSDataReader** (p. 1272) may store fragments for up to `max_fragmented_↵ samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different built-in topic **DDSDataWriter** (p. 1305) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **DDS_BuiltinTopicReaderResourceLimits_t::max_samples** (p. 600).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 602) is **DDS_↵ BOOLEAN_FALSE** (p. 316).

[default] 1024

[range] [1, 1 million]

9.19.2.10 initial_fragmented_samples

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_fragmented_samples

The initial number of samples for which a built-in topic **DDSDataReader** (p. 1272) may store fragments.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 602) is **DDS_↵
BOOLEAN_FALSE** (p. 316).

[default] 4

[range] [1,1024], <= max_fragmented_samples

9.19.2.11 max_fragmented_samples_per_remote_writer

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_fragmented_samples_per_remote_writer

The maximum number of samples per remote writer for which a built-in topic **DDSDataReader** (p. 1272) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 602) is **DDS_↵
BOOLEAN_FALSE** (p. 316).

[default] 256

[range] [1, 1 million], <= max_fragmented_samples

9.19.2.12 max_fragments_per_sample

DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_fragments_per_sample

Maximum number of fragments for a single sample.

Only applies if **DDS_BuiltinTopicReaderResourceLimits_t::disable_fragmentation_support** (p. 602) is **DDS_↵
BOOLEAN_FALSE** (p. 316).

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437)

9.19.2.13 dynamically_allocate_fragmented_samples

DDS_Boolean DDS_BuiltinTopicReaderResourceLimits_t::dynamically_allocate_fragmented_samples

Determines whether the built-in topic **DDSDataReader** (p. 1272) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to **DDS_BOOLEAN_FALSE** (p. 316), the middleware will allocate memory upfront for storing fragments for up to **DDS_DataReaderResourceLimitsQosPolicy::initial_fragmented_samples** (p. 654) samples. This memory may grow up to **DDS_DataReaderResourceLimitsQosPolicy::max_fragmented_samples** (p. 653) if needed.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 653) is **DDS_BOOLEAN_FALSE** (p. 316).

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.20 DDS_ChannelSettings_t Struct Reference

Type used to configure the properties of a channel.

Public Attributes

- struct **DDS_TransportMulticastSettingsSeq** **multicast_settings**
*A sequence of **DDS_TransportMulticastSettings_t** (p. 1138) used to configure the multicast addresses associated with a channel.*
- char * **filter_expression**
A logical expression used to determine the data that will be published in the channel.
- **DDS_Long** **priority**
Publication priority.

9.20.1 Detailed Description

Type used to configure the properties of a channel.

QoS:

DDS_MultiChannelQosPolicy (p. 952)

9.20.2 Member Data Documentation

9.20.2.1 multicast_settings

```
struct DDS_TransportMulticastSettingsSeq DDS_ChannelSettings_t::multicast_settings
```

A sequence of **DDS_TransportMulticastSettings_t** (p. 1138) used to configure the multicast addresses associated with a channel.

The sequence cannot be empty.

The maximum number of multicast locators in a channel is limited to 16 (a locator is defined by a transport alias, a multicast address and a port). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **DDS_PropertyQosPolicy** (p. 994) associated with the **DDS_DomainParticipantQos** (p. 735).

[default] Empty sequence (invalid value)

9.20.2.2 filter_expression

```
char* DDS_ChannelSettings_t::filter_expression
```

A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **DDS_MultiChannelQosPolicy::filter_name** (p. 953)

Important: This value must be an allocated string with **DDS_String_alloc** (p. 547) or **DDS_String_dup** (p. 547). It should not be assigned to a string constant.

The filter expression length (including NULL-terminated character) cannot be greater than **DDS_DomainParticipantResourceLimitsQosPolicy::channel_filter_expression_max_length** (p. 756).

See also

Queries and Filters Syntax (p. 178)

[default] NULL (invalid value)

9.20.2.3 priority

DDS_Long DDS_ChannelSettings_t::priority

Publication priority.

A positive integer value designating the relative priority of the channel, used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**DDS_ASYNCHRONOUS_PUBLISH_MODE**↵↵**_QOS** (p. 431)) with **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900) set to **DDS_HPF_FLOW_**↵↵**CONTROLLER_SCHED_POLICY** (p. 121).

Larger numbers have higher priority.

If the publication priority of the channel is any value other than **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430), then the channel's priority will take precedence over the data writer's priority.

If the publication priority of the channel is set to **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430), then the channel's priority will be set to the value of the data writer's priority.

If the publication priority of both the data writer and the channel are **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430), the channel will be assigned the lowest priority value.

If the publication priority of the channel is **DDS_PUBLICATION_PRIORITY_AUTOMATIC** (p. 430), then the channel will be assigned the priority of the largest publication priority of all samples in the channel. The publication priority of each sample can be set in the **DDS_WriteParams_t** (p. 1234) of the **FooDataWriter::write_w_params** (p. 1671) function.

[default] **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430)

9.21 DDS_ChannelSettingsSeq Struct Reference

Declares IDL `sequence< DDS_ChannelSettings_t (p. 604) >`

9.21.1 Detailed Description

Declares IDL `sequence< DDS_ChannelSettings_t (p. 604) >`

A sequence of **DDS_ChannelSettings_t** (p. 604) used to configure the channels' properties. If the length of the sequence is zero, the **DDS_MultiChannelQosPolicy** (p. 952) has no effect.

Instantiates:

9.23 DDS_CoherentSetInfo_t Struct Reference

<<*extension*>> (p. 236) Type definition for a coherent set info.

Public Attributes

- **DDS_GUID_t group_guid**
The coherent set group GUID.
- **DDS_SequenceNumber_t coherent_set_sequence_number**
*Sequence number that identifies a sample as part of a **DDSDataWriter** (p. 1305) coherent set.*
- **DDS_SequenceNumber_t group_coherent_set_sequence_number**
Sequence number that identifies a sample as part of a group coherent set.
- **DDS_Boolean incomplete_coherent_set**
Indicates if a sample is part of an incomplete coherent set.

9.23.1 Detailed Description

<<*extension*>> (p. 236) Type definition for a coherent set info.

A CoherentSetInfo provides information about the coherent set associated with a sample.

9.23.2 Member Data Documentation

9.23.2.1 group_guid

`DDS_GUID_t DDS_CoherentSetInfo_t::group_guid`

The coherent set group GUID.

This GUID identifies the **DDSDDataWriter** (p. 1305) or the group of DataWriters publishing the coherent set, depending on the value of **DDS_PresentationQosPolicy::access_scope** (p. 987) in the **DDSSubscriber** (p. 1576).

9.23.2.2 coherent_set_sequence_number

`DDS_SequenceNumber_t DDS_CoherentSetInfo_t::coherent_set_sequence_number`

Sequence number that identifies a sample as part of a **DDSDDataWriter** (p. 1305) coherent set.

When **DDS_PresentationQosPolicy::access_scope** (p. 987) in the **DDSSubscriber** (p. 1576) is set to **DDS_↔INSTANCE_PRESENTATION_QOS** (p. 418) or **DDS_TOPIC_PRESENTATION_QOS** (p. 418), the coherent set associated with a sample is identified by the pair (group_guid, coherent_set_sequence_number).

9.23.2.3 group_coherent_set_sequence_number

`DDS_SequenceNumber_t DDS_CoherentSetInfo_t::group_coherent_set_sequence_number`

Sequence number that identifies a sample as part of a group coherent set.

When **DDS_PresentationQosPolicy::access_scope** (p. 987) in the **DDSSubscriber** (p. 1576) is set to **DDS_↔GROUP_PRESENTATION_QOS** (p. 418), the coherent set associated with a sample is identified by the pair (group_↔guid, group_coherent_set_sequence_number).

9.23.2.4 incomplete_coherent_set

`DDS_Boolean DDS_CoherentSetInfo_t::incomplete_coherent_set`

Indicates if a sample is part of an incomplete coherent set.

9.24 DDS_CompressionSettings_t Struct Reference

<<*extension*>> (p. 236) Settings related to compressing user data.

Public Attributes

- **DDS_CompressionIdMask compression_ids**
<<*extension*>> (p. 236) Mask that represents the compression algorithms enabled.
- **DDS_UnsignedLong writer_compression_level**
<<*extension*>> (p. 236) The level of compression to use when compressing data.
- **DDS_Long writer_compression_threshold**
<<*extension*>> (p. 236) The threshold, in bytes, above which a serialized sample will be eligible to be compressed.

9.24.1 Detailed Description

<<*extension*>> (p. 236) Settings related to compressing user data.

QoS:

DDS_DataRepresentationQosPolicy (p. 662)

9.24.2 Member Data Documentation

9.24.2.1 compression_ids

DDS_CompressionIdMask DDS_CompressionSettings_t::compression_ids

<<*extension*>> (p. 236) Mask that represents the compression algorithms enabled.

A bitmap that represents the compression algorithm IDs (**DDS_CompressionIdMask** (p. 374)) that are supported by the endpoint. The **DDSDataWriter** (p. 1305) creation will fail if more than one algorithm is provided.

If a **DDSDataWriter** (p. 1305) inherits multiple compression IDs from a **DDSTopic** (p. 1601), only the least significant bit enabled will be inherited. This forces the following order of preference: **DDS_COMPRESSION_ID_ZLIB** (p. 374), **DDS_COMPRESSION_ID_BZIP2** (p. 374), **DDS_COMPRESSION_ID_LZ4** (p. 375).

Interactions with Security and Batching: Currently, the only algorithm that is supported when compression and batching are enabled on the same **DDSDataWriter** (p. 1305) is **DDS_COMPRESSION_ID_ZLIB** (p. 374).

The combination of compression, batching, and data protection is supported. First, compression is applied to the entire batch. Then, data protection is applied to the compressed batch.

Note: When **DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose** (p. 670) is enabled and a dispose message is sent, the serialized key is not compressed.

[default] For **DDSTopic** (p. 1601), **DDSDataWriter** (p. 1305) a **DDS_CompressionIdMask** (p. 374) mask set to **DDS_COMPRESSION_ID_MASK_NONE** (p. 372)

[default] For **DDSDataReader** (p. 1272) a **DDS_CompressionIdMask** (p. 374) mask set to **DDS_COMPRESSION_ID_MASK_ALL** (p. 372).

9.24.2.2 writer_compression_level

DDS_UnsignedLong DDS_CompressionSettings_t::writer_compression_level

<<**extension**>> (p. 236) The level of compression to use when compressing data.

Compression algorithms typically allow you to choose a level with which to compress the data. Each level has trade-offs between the resulting compression ratio and the speed of compression.

[range] [0, 10]

The value 1 represents the fastest compression time and the lowest compression ratio. The value 10 represents the slowest compression time but the highest compression ratio.

A value of 0 disables compression.

[default] DDS_COMPRESSION_LEVEL_BEST_COMPRESSION (p. 372)

Note

Only available for a **DDSDataWriter** (p. 1305) and **DDSTopic** (p. 1601).

9.24.2.3 writer_compression_threshold

DDS_Long DDS_CompressionSettings_t::writer_compression_threshold

<<**extension**>> (p. 236) The threshold, in bytes, above which a serialized sample will be eligible to be compressed.

Any sample with a serialized size greater than or equal to the threshold will be eligible to be compressed. All samples with an eligible serialized size will be compressed. Only if the compressed size is smaller than the serialized size will the sample be stored and sent compressed on the wire.

For batching we check the maximum serialized size of the batch, calculated as `serialized_sample_max_size * DDS_↔ BatchQosPolicy::max_samples` (p. 596)

[range] [0, 2147483647] or **DDS_LENGTH_UNLIMITED** (p. 437)

Setting the threshold to **DDS_LENGTH_UNLIMITED** (p. 437) disables the compression.

[default] DDS_COMPRESSION_THRESHOLD_DEFAULT (p. 373) (8192)

Note

Only available for a **DDSDataWriter** (p. 1305) and **DDSTopic** (p. 1601).

9.25 DDS_ContentFilterProperty_t Struct Reference

<<**extension**>> (p. 236) Type used to provide all the required information to enable content filtering.

Public Attributes

- char * **content_filter_topic_name**
Name of the Content-filtered Topic associated with the Reader.
- char * **related_topic_name**
Name of the Topic related to the Content-filtered Topic.
- char * **filter_class_name**
Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).
- char * **filter_expression**
The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.
- struct **DDS_StringSeq expression_parameters**
Defines the value for each parameter in the filter expression.

9.25.1 Detailed Description

<<**extension**>> (p. 236) Type used to provide all the required information to enable content filtering.

9.25.2 Member Data Documentation

9.25.2.1 content_filter_topic_name

```
char* DDS_ContentFilterProperty_t::content_filter_topic_name
```

Name of the Content-filtered Topic associated with the Reader.

9.25.2.2 related_topic_name

```
char* DDS_ContentFilterProperty_t::related_topic_name
```

Name of the Topic related to the Content-filtered Topic.

9.25.2.3 filter_class_name

```
char* DDS_ContentFilterProperty_t::filter_class_name
```

Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).

9.25.2.4 filter_expression

```
char* DDS_ContentFilterProperty_t::filter_expression
```

The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.

9.25.2.5 expression_parameters

```
struct DDS_StringSeq DDS_ContentFilterProperty_t::expression_parameters
```

Defines the value for each parameter in the filter expression.

9.26 DDS_Cookie_t Struct Reference

<<*extension*>> (p. 236) Sequence of bytes.

Public Member Functions

- void * **to_pointer** () const
Returns a pointer stored in the cookie.

Public Attributes

- struct **DDS_OctetSeq** **value**
a sequence of octets

9.26.1 Detailed Description

<<*extension*>> (p. 236) Sequence of bytes.

9.26.2 Member Data Documentation

9.26.2.1 value

```
struct DDS_OctetSeq DDS_Cookie_t::value
```

a sequence of octets

[default] Empty (zero-sized)

9.27 DDS_CookieSeq Struct Reference

Declares IDL sequence < **DDS_Cookie_t** (p. 612) > .

9.27.1 Detailed Description

Declares IDL sequence < **DDS_Cookie_t** (p. 612) > .

See also

FooSeq (p. 1680)

9.28 DDS_DatabaseQosPolicy Struct Reference

Various threads and resource limits settings used by RTI Connext to control its internal database.

Public Attributes

- struct **DDS_ThreadSettings_t** **thread**
Database thread settings.
- struct **DDS_Duration_t** **shutdown_timeout**
The maximum wait time during a shutdown.
- struct **DDS_Duration_t** **cleanup_period**
The period at which the database thread wakes up to remove deleted records.
- struct **DDS_Duration_t** **shutdown_cleanup_period**
The clean-up period used during database shut-down.
- **DDS_Long** **initial_records**
The initial number of total records.
- **DDS_Long** **max_skiplist_level**
The maximum level of the skiplist.
- **DDS_Long** **max_weak_references**
The maximum number of weak references.
- **DDS_Long** **initial_weak_references**
The initial number of weak references.

9.28.1 Detailed Description

Various threads and resource limits settings used by RTI Connex to control its internal database.

RTI uses an internal in-memory "database" to store information about entities created locally as well as remote entities found during the discovery process. This database uses a background thread to garbage-collect records related to deleted entities. When the **DDSDomainParticipant** (p. 1335) that maintains this database is deleted, it shuts down this thread.

The Database QoS policy is used to configure how RTI Connex manages its database, including how often it cleans up, the priority of the database thread, and limits on resources that may be allocated by the database.

You may be interested in modifying the **DDS_DatabaseQosPolicy::shutdown_timeout** (p. 614) and **DDS_DatabaseQosPolicy::shutdown_cleanup_period** (p. 615) parameters to decrease the time it takes to delete a **DDSDomainParticipant** (p. 1335) when your application is shutting down.

The **DDS_DomainParticipantResourceLimitsQosPolicy** (p. 740) controls the memory allocation for elements stored in the database.

This QoS policy is an extension to the DDS standard.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) **NO** (p. ??)

9.28.2 Member Data Documentation

9.28.2.1 thread

```
struct DDS_ThreadSettings_t DDS_DatabaseQosPolicy::thread
```

Database thread settings.

There is only one database thread: the clean-up thread.

[default] Priority: LOW.

The actual value depends on your architecture:

For Windows: -3

For Linux: OS default priority

For a complete list of platform specific values, please refer to `Platform Notes`.

[default] Stack Size: The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to `Platform Notes`.

[default] Mask: **DDS_THREAD_SETTINGS_STUDIO** (p. 351)

9.28.2.2 shutdown_timeout

```
struct DDS_Duration_t DDS_DatabaseQosPolicy::shutdown_timeout
```

The maximum wait time during a shutdown.

The domain participant will exit after the timeout, even if the database has not been fully cleaned up.

[default] 15 seconds

[range] [0,DDS_DURATION_INFINITE (p. 325)]

9.28.2.3 cleanup_period

```
struct DDS_Duration_t DDS_DatabaseQosPolicy::cleanup_period
```

The period at which the database thread wakes up to remove deleted records.

[default] 61 seconds

[range] [0,1 year]

9.28.2.4 shutdown_cleanup_period

```
struct DDS_Duration_t DDS_DatabaseQosPolicy::shutdown_cleanup_period
```

The clean-up period used during database shut-down.

If you would like to shorten the time taken for a DomainParticipant to shutdown, you can decrease this value.

It is recommended to set this value to something other than 0 if running in an RTOS environment, to avoid CPU starvation.

[default] 10 milliseconds

[range] [0,1 year]

9.28.2.5 initial_records

```
DDS_Long DDS_DatabaseQosPolicy::initial_records
```

The initial number of total records.

[default] 1024

[range] [1,10 million]

9.28.2.6 max_skiplist_level

DDS_Long DDS_DatabaseQosPolicy::max_skiplist_level

The maximum level of the skiplist.

The skiplist is used to keep records in the database. Usually, the search time is $\log_2(N)$, where N is the total number of records in one skiplist. However, once N exceeds 2^n , where n is the maximum skiplist level, the search time will become more and more linear. Therefore, the maximum level should be set such that 2^n is larger than the maximum(N among all skiplists). Usually, the maximum N is the maximum number of remote and local writers or readers.

[default] 7

[range] [1,31]

9.28.2.7 max_weak_references

DDS_Long DDS_DatabaseQosPolicy::max_weak_references

The maximum number of weak references.

A weak reference is an internal data structure that refers to a record within RTI Connext' internal database. This field configures the maximum number of such references that RTI Connext may create.

The actual number of weak references is permitted to grow from an initial value (indicated by **DDS_DatabaseQosPolicy::initial_weak_references** (p. 616)) to this maximum. To prevent RTI Connext from allocating any weak references after the system has reached a steady state, set the initial and maximum values equal to one another. To indicate that the number of weak references should continue to grow as needed indefinitely, set this field to **DDS_LENGTH_UNLIMITED** (p. 437). Be aware that although a single weak reference occupies very little memory, allocating a very large number of them can have a significant impact on your overall memory usage.

Tuning this value precisely is difficult without intimate knowledge of the structure of RTI Connext' database; doing so is an advanced feature not required by most applications. The default value has been chosen to be sufficient for reasonably large systems. If you believe you may need to modify this value, please consult with RTI support personnel for assistance.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 437), \geq initial_weak_references

See also

DDS_DatabaseQosPolicy::initial_weak_references (p. 616)

9.28.2.8 initial_weak_references

DDS_Long DDS_DatabaseQosPolicy::initial_weak_references

The initial number of weak references.

See **DDS_DatabaseQosPolicy::max_weak_references** (p. 616) for more information about what a weak reference is.

If the QoS set contains an initial_weak_references value that is too small to ever grow to **DDS_DatabaseQosPolicy::max_weak_references** (p. 616) using RTI ConnexT[®] internal algorithm, this value will be adjusted upwards as necessary. Subsequent accesses of this value will reveal the actual initial value used.

Changing the value of this field is an advanced feature; it is recommended that you consult with RTI support personnel before doing so.

[default] 2049, which is the minimum initial value imposed by REDA when the maximum is unlimited. If a lower value is specified, it will simply be increased to 2049 automatically.

[range] [1, 100 million], <= max_weak_references

See also

DDS_DatabaseQosPolicy::max_weak_references (p. 616)

9.29 DDS_DataReaderCacheStatus Struct Reference

<<**extension**>> (p. 236) The status of the reader's cache.

Public Attributes

- **DDS_LongLong sample_count_peak**
The highest number of samples in the reader's queue over the lifetime of the reader.
- **DDS_LongLong sample_count**
The number of samples in the reader's queue.
- **DDS_LongLong old_source_timestamp_dropped_sample_count**
*The number of samples dropped as a result of receiving a sample older than the last one, using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386).*
- **DDS_LongLong tolerance_source_timestamp_dropped_sample_count**
*The number of samples dropped as a result of receiving a sample in the future, using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386).*
- **DDS_LongLong ownership_dropped_sample_count**
The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.
- **DDS_LongLong content_filter_dropped_sample_count**
The number of user samples filtered by the DataReader due to Content-Filtered Topics.
- **DDS_LongLong time_based_filter_dropped_sample_count**
*The number of user samples filtered by the DataReader due to **DDS_TimeBasedFilterQosPolicy** (p. 1111).*
- **DDS_LongLong expired_dropped_sample_count**

The number of samples expired by the `DataReader` due to **DDS_LifespanQosPolicy** (p. 918) or the autopurge sample delays.

- **DDS_LongLong virtual_duplicate_dropped_sample_count**

The number of virtual duplicate samples dropped by the `DataReader`. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.

- **DDS_LongLong replaced_dropped_sample_count**

The number of samples replaced by the `DataReader` due to **DDS_KEEP_LAST_HISTORY_QOS** (p. 406) replacement.

- **DDS_LongLong writer_removed_batch_sample_dropped_sample_count**

The number of batch samples received by the `DataReader` that were marked as removed by the `DataWriter`.

- **DDS_LongLong total_samples_dropped_by_instance_replacement**

The number of samples with sample state **DDS_NOT_READ_SAMPLE_STATE** (p. 157) that were dropped when removing an instance due to instance replacement. See **DDS_DataReaderResourceLimitsQosPolicy::instance_replacement** (p. 660) for more details about when instances are replaced.

- **DDS_LongLong alive_instance_count**

The number of instances in the `DataReader`'s queue with an instance state equal to **DDS_ALIVE_INSTANCE_STATE** (p. 161).

- **DDS_LongLong alive_instance_count_peak**

The highest value of **DDS_DataReaderCacheStatus::alive_instance_count** (p. 621) over the lifetime of the `DataReader`.

- **DDS_LongLong no_writers_instance_count**

The number of instances in the `DataReader`'s queue with an instance state equal to **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).

- **DDS_LongLong no_writers_instance_count_peak**

The highest value of **DDS_DataReaderCacheStatus::no_writers_instance_count** (p. 622) over the lifetime of the `DataReader`.

- **DDS_LongLong disposed_instance_count**

The number of instances in the `DataReader`'s queue with an instance state equal to **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161).

- **DDS_LongLong disposed_instance_count_peak**

The highest value of **DDS_DataReaderCacheStatus::disposed_instance_count** (p. 622) over the lifetime of the `DataReader`.

- **DDS_LongLong detached_instance_count**

The number of minimal instance states currently being maintained in the `DataReader`'s queue.

- **DDS_LongLong detached_instance_count_peak**

The highest value of **DDS_DataReaderCacheStatus::detached_instance_count** (p. 623) over the lifetime of the `DataReader`.

- **DDS_LongLong compressed_sample_count**

The number of received compressed samples by a `DataWriter`.

9.29.1 Detailed Description

<<**extension**>> (p. 236) The status of the reader's cache.

Entity:

DDSDataReader (p. 1272)

9.29.2 Member Data Documentation

9.29.2.1 sample_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::sample_count_peak

The highest number of samples in the reader's queue over the lifetime of the reader.

9.29.2.2 sample_count

DDS_LongLong DDS_DataReaderCacheStatus::sample_count

The number of samples in the reader's queue.

includes samples that may not yet be available to be read or taken by the user, due to samples being received out of order or **PRESENTATION** (p. 417)

9.29.2.3 old_source_timestamp_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::old_source_timestamp_dropped_sample_count

The number of samples dropped as a result of receiving a sample older than the last one, using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386).

When the DataReader is using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386):

- If the DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped.
- If the DataReader receives a sample for an instance with a source timestamp that is equal to the last source timestamp received for the instance and the writer has a higher virtual GUID, the sample is dropped.

9.29.2.4 tolerance_source_timestamp_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::tolerance_source_timestamp_dropped_sample_count

The number of samples dropped as a result of receiving a sample in the future, using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386).

When the DataReader is using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386): the DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than the source_timestamp_tolerance. Otherwise, the sample is dropped.

9.29.2.5 ownership_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::ownership_dropped_sample_count

The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.

When using Exclusive Ownership, the DataReader receives data from multiple DataWriters. Each instance can only be owned by one DataWriter.

If other DataWriters write samples on this instance, the samples will be dropped.

9.29.2.6 content_filter_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::content_filter_dropped_sample_count

The number of user samples filtered by the DataReader due to Content-Filtered Topics.

When using a content filter on the DataReader side, if the sample received by the DataReader does not pass the filter, it will be dropped.

9.29.2.7 time_based_filter_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count

The number of user samples filtered by the DataReader due to **DDS_TimeBasedFilterQosPolicy** (p. 1111).

When using **TIME_BASED_FILTER** (p. 440) on the DataReader side, if the sample received by the DataReader does not pass the minimum_separation filter, it will be dropped.

9.29.2.8 expired_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::expired_dropped_sample_count

The number of samples expired by the DataReader due to **DDS_LifespanQosPolicy** (p. 918) or the autopurge sample delays.

- **DDS_LifespanQosPolicy** (p. 918)
When a sample expires due to **DDS_LifespanQosPolicy** (p. 918), the data is removed from the DataReader caches. This sample will be considered dropped if its **DDS_SampleStateKind** (p. 156) was **DDS_NOT_READ**↔**_SAMPLE_STATE** (p. 157).
- **DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_samples_delay** (p. 1023)
When a sample expires due to **DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_samples_delay** (p. 1023), this sample will be considered dropped if its **DDS_SampleStateKind** (p. 156) was **DDS_NOT_READ**↔**_SAMPLE_STATE** (p. 157).
- **DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_samples_delay** (p. 1023)
When a sample expires due to **DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_samples_delay** (p. 1023), this sample will be considered dropped if its **DDS_SampleStateKind** (p. 156) was **DDS_NOT_READ**↔**_SAMPLE_STATE** (p. 157).

9.29.2.9 virtual_duplicate_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::virtual_duplicate_dropped_sample_count

The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.

When two DataWriters with the same logical data source publish a sample with the same sequence_number, one sample will be dropped and the other will be received by the DataReader.

This can happen when multiple writers are writing on behalf of the same original DataWriter: for example, in systems with redundant Routing Services or when a DataReader is receiving samples both directly from the original DataWriter and from an instance of Persistence Service.

9.29.2.10 replaced_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::replaced_dropped_sample_count

The number of samples replaced by the DataReader due to **DDS_KEEP_LAST_HISTORY_QOS** (p. 406) replacement.

When the number of samples for an instance in the queue reaches the **DDS_HistoryQosPolicy::depth** (p. 908) value, a new sample for the instance will replace the oldest sample for the instance in the queue.

The new sample will be accepted and the old sample will be dropped.

This counter will only be updated if the replaced sample's **DDS_SampleStateKind** (p. 156) was **DDS_NOT_READ_SAMPLE_STATE** (p. 157).

9.29.2.11 writer_removed_batch_sample_dropped_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::writer_removed_batch_sample_dropped_sample_count

The number of batch samples received by the DataReader that were marked as removed by the DataWriter.

When the DataReader receives a batch, the batch can contain samples marked as removed by the DataWriter. Examples of removed samples in a batch could be because of sample replacement due to **DDS_KEEP_LAST_HISTORY_QOS** (p. 406) **DDS_HistoryQosPolicy** (p. 906) QoS on the DataWriter or because the duration in **DDS_LifespanQosPolicy** (p. 918) was reached. By default, any sample marked as removed from a batch is dropped (unless you set the `dds.data_reader.accept_writer_removed_batch_samples` property in the **DDS_PropertyQosPolicy** (p. 994) to true). Note: Historical data with removed batch samples written before the DataReader joined the DDS domain will also be included in the count.

9.29.2.12 total_samples_dropped_by_instance_replacement

DDS_LongLong DDS_DataReaderCacheStatus::total_samples_dropped_by_instance_replacement

The number of samples with sample state **DDS_NOT_READ_SAMPLE_STATE** (p. 157) that were dropped when removing an instance due to instance replacement. See **DDS_DataReaderResourceLimitsQosPolicy::instance_replacement** (p. 660) for more details about when instances are replaced.

9.29.2.13 alive_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::alive_instance_count

The number of instances in the DataReader's queue with an instance state equal to **DDS_ALIVE_INSTANCE_STATE** (p. 161).

9.29.2.14 alive_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::alive_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::alive_instance_count** (p. 621) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::alive_instance_count (p. 621)

9.29.2.15 no_writers_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::no_writers_instance_count

The number of instances in the DataReader's queue with an instance state equal to **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).

9.29.2.16 no_writers_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::no_writers_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::no_writers_instance_count** (p. 622) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::no_writers_instance_count (p. 622)

9.29.2.17 disposed_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::disposed_instance_count

The number of instances in the DataReader's queue with an instance state equal to **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161).

9.29.2.18 disposed_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::disposed_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::disposed_instance_count** (p. 622) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::disposed_instance_count (p. 622)

9.29.2.19 detached_instance_count

DDS_LongLong DDS_DataReaderCacheStatus::detached_instance_count

The number of minimal instance states currently being maintained in the DataReader's queue.

If **DDS_DataReaderResourceLimitsQosPolicy::keep_minimum_state_for_instances** (p. 658) is true, the DataReader will keep up to a maximum of **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 655) detached instances in its queue. For a more in-depth description of detached instances, refer to **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 655).

9.29.2.20 detached_instance_count_peak

DDS_LongLong DDS_DataReaderCacheStatus::detached_instance_count_peak

The highest value of **DDS_DataReaderCacheStatus::detached_instance_count** (p. 623) over the lifetime of the DataReader.

See also

DDS_DataReaderCacheStatus::detached_instance_count (p. 623)

9.29.2.21 compressed_sample_count

DDS_LongLong DDS_DataReaderCacheStatus::compressed_sample_count

The number of received compressed samples by a DataWriter.

9.30 DDS_DataReaderProtocolQosPolicy Struct Reference

Along with **DDS_WireProtocolQosPolicy** (p. 1228) and **DDS_DataWriterProtocolQosPolicy** (p. 667), this QoS policy configures the DDS on-the-network protocol (RTPS).

Public Attributes

- struct **DDS_GUID_t** virtual_guid
The virtual GUID (Global Unique Identifier).
- **DDS_UnsignedLong** rtps_object_id
The RTPS Object ID.
- **DDS_Boolean** expects_inline_qos
Specifies whether this DataReader expects inline QoS with every sample.
- **DDS_Boolean** disable_positive_acks
Whether the reader sends positive acknowledgements to writers.
- **DDS_Boolean** propagate_dispose_of_unregistered_instances
*Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) state without being in the **DDS_ALIVE_INSTANCE_STATE** (p. 161) state.*
- **DDS_Boolean** propagate_unregister_of_disposed_instances
*Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) state directly from the **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161).*
- struct **DDS_RtpsReliableReaderProtocol_t** rtps_reliable_reader
*RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **DDSDataReader** (p. 1272). This parameter only has effect if the reader is configured with **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) **DDS_↵ ReliabilityQosPolicyKind** (p. 434).*

9.30.1 Detailed Description

Along with **DDS_WireProtocolQosPolicy** (p. 1228) and **DDS_DataWriterProtocolQosPolicy** (p. 667), this QoS policy configures the DDS on-the-network protocol (RTPS).

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **DDS_DataReaderProtocolQosPolicy** (p. 624) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connnext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **DDS_ReliabilityQosPolicy** (p. 1027) for more information on the per-DataReader/↵ DataWriter reliability configuration. **DDS_HistoryQosPolicy** (p. 906) and **DDS_ResourceLimitsQosPolicy** (p. 1038) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

DDSDataReader (p. 1272)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.30.2 Member Data Documentation

9.30.2.1 virtual_guid

```
struct DDS_GUID_t DDS_DataReaderProtocolQosPolicy::virtual_guid
```

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDSDataReader** (p. 1272).

The association between a **DDSDataReader** (p. 1272) and its persisted state is done using the virtual GUID.

[default] **DDS_GUID_AUTO** (p. 330)

9.30.2.2 rtps_object_id

```
DDS_UnsignedLong DDS_DataReaderProtocolQosPolicy::rtps_object_id
```

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data reader according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connexant will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data reader.

A `rtps_object_id` value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connexant. In those cases, the recommendation is not to use automatic object ID assignment.

[default] **DDS_RTPS_AUTO_ID** (p. ??)

[range] [0,0x00ffffff]

9.30.2.3 expects_inline_qos

```
DDS_Boolean DDS_DataReaderProtocolQosPolicy::expects_inline_qos
```

Specifies whether this DataReader expects inline QoS with every sample.

RTI Connext DataWriters do not match with DataReaders that set this field to **DDS_BOOLEAN_TRUE** (p. 316) (because RTI Connext DataWriters do not support sending inline QoS), but here is how the field is meant to be used:

In RTI Connext, a **DDSDataReader** (p. 1272) nominally relies on Discovery to propagate QoS on a matched **DDSDataWriter** (p. 1305).

Alternatively, a **DDSDataReader** (p. 1272) may get information on a matched **DDSDataWriter** (p. 1305) through QoS sent inline with a sample.

Asserting **DDS_DataReaderProtocolQosPolicy::expects_inline_qos** (p. 625) indicates to a matching **DDSDataWriter** (p. 1305) that this **DDSDataReader** (p. 1272) expects to receive inline QoS with every sample. The complete set of inline QoS that a **DDSDataWriter** (p. 1305) may send inline is specified by the Real-Time Publish-Subscribe (RTPS) Wire Interoperability Protocol.

Because RTI Connext **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) cache Discovery information, inline QoS are largely redundant and thus unnecessary. Only for other stateless implementations whose **DDSDataReader** (p. 1272) does not cache Discovery information is inline QoS necessary.

Also note that inline QoS are additional wire-payload that consume additional bandwidth and serialization and deserialization time.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.30.2.4 disable_positive_acks

```
DDS_Boolean DDS_DataReaderProtocolQosPolicy::disable_positive_acks
```

Whether the reader sends positive acknowledgements to writers.

If set to **DDS_BOOLEAN_TRUE** (p. 316), the reader does not send positive acknowledgments (ACKs) in response to Heartbeat messages. The reader will send negative acknowledgements (NACKs) when a Heartbeat advertises samples that it has not received.

Otherwise, if set to **DDS_BOOLEAN_FALSE** (p. 316) (the default), the reader will send ACKs to writers that expect ACKs (**DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 669) = **DDS_BOOLEAN_FALSE** (p. 316)) and it will not send ACKs to writers that disable ACKs (**DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 669) = **DDS_BOOLEAN_TRUE** (p. 316))

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.30.2.5 propagate_dispose_of_unregistered_instances

DDS_Boolean DDS_DataReaderProtocolQosPolicy::propagate_dispose_of_unregistered_instances

Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) state without being in the **DDS_ALIVE_INSTANCE_STATE** (p. 161) state.

This field only applies to keyed readers.

When the field is set to **DDS_BOOLEAN_TRUE** (p. 316), the DataReader will receive dispose notifications even if the instance is not alive.

To guarantee the key availability through the usage of the API **FooDataReader::get_key_value** (p. 1656), this option should be used in combination with setting **DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose** (p. 670) on the DataWriter to **DDS_BOOLEAN_TRUE** (p. 316).

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.30.2.6 propagate_unregister_of_disposed_instances

DDS_Boolean DDS_DataReaderProtocolQosPolicy::propagate_unregister_of_disposed_instances

Indicates whether or not an instance can move to the **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161) state directly from the **DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161).

This field only applies to keyed readers.

When the field is set to **DDS_BOOLEAN_TRUE** (p. 316), the DataReader will receive unregister notifications even if the instance is not alive.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.30.2.7 rtps_reliable_reader

struct DDS_RtpsReliableReaderProtocol_t DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **DDSDDataReader** (p. 1272). This parameter only has effect if the reader is configured with **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) **DDS_↵ ReliabilityQosPolicyKind** (p. 434).

For details, refer to the **DDS_RtpsReliableReaderProtocol_t** (p. 1043)

[default] See **DDS_RtpsReliableReaderProtocol_t** (p. 1043)

9.31 DDS_DataReaderProtocolStatus Struct Reference

<<**extension**>> (p. 236) The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

Public Attributes

- **DDS_LongLong received_sample_count**
The number of samples received by a DataReader.
- **DDS_LongLong received_sample_count_change**
The change in `DDS_DataReaderProtocolStatus::received_sample_count` (p. 630) since the last time the status was read.
- **DDS_LongLong received_sample_bytes**
The number of bytes received by a DataReader.
- **DDS_LongLong received_sample_bytes_change**
The change in `DDS_DataReaderProtocolStatus::received_sample_bytes` (p. 631) since the last time the status was read.
- **DDS_LongLong duplicate_sample_count**
The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.
- **DDS_LongLong duplicate_sample_count_change**
The change in `DDS_DataReaderProtocolStatus::duplicate_sample_count` (p. 631) since the last time the status was read.
- **DDS_LongLong duplicate_sample_bytes**
The number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader.
- **DDS_LongLong duplicate_sample_bytes_change**
The change in `DDS_DataReaderProtocolStatus::duplicate_sample_bytes` (p. 632) since the last time the status was read.
- **DDS_LongLong filtered_sample_count**
[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 620) `DDS_↔DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 620)
- **DDS_LongLong filtered_sample_count_change**
[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 620) `DDS_↔DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 620)
- **DDS_LongLong filtered_sample_bytes**
[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 620) `DDS_↔DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 620)
- **DDS_LongLong filtered_sample_bytes_change**
[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 620) `DDS_↔DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 620)
- **DDS_LongLong received_heartbeat_count**
The number of Heartbeats from a remote DataWriter received by a local DataReader.
- **DDS_LongLong received_heartbeat_count_change**
The change in `DDS_DataReaderProtocolStatus::received_heartbeat_count` (p. 633) since the last time the status was read.
- **DDS_LongLong received_heartbeat_bytes**
The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.
- **DDS_LongLong received_heartbeat_bytes_change**
The change in `DDS_DataReaderProtocolStatus::received_heartbeat_bytes` (p. 633) since the last time the status was read.
- **DDS_LongLong sent_ack_count**
The number of ACKs sent from a local DataReader to a matching remote DataWriter.
- **DDS_LongLong sent_ack_count_change**
The change in `DDS_DataReaderProtocolStatus::sent_ack_count` (p. 634) since the last time the status was read.
- **DDS_LongLong sent_ack_bytes**

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

- **DDS_LongLong sent_ack_bytes_change**

The change in `DDS_DataReaderProtocolStatus::sent_ack_bytes` (p. 634) since the last time the status was read.

- **DDS_LongLong sent_nack_count**

The number of NACKs sent from a local DataReader to a matching remote DataWriter.

- **DDS_LongLong sent_nack_count_change**

The change in `DDS_DataReaderProtocolStatus::sent_nack_count` (p. 634) since the last time the status was read.

- **DDS_LongLong sent_nack_bytes**

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

- **DDS_LongLong sent_nack_bytes_change**

The change in `DDS_DataReaderProtocolStatus::sent_nack_bytes` (p. 635) since the last time the status was read.

- **DDS_LongLong received_gap_count**

The number of GAPS received from remote DataWriter to this DataReader.

- **DDS_LongLong received_gap_count_change**

The change in `DDS_DataReaderProtocolStatus::received_gap_count` (p. 635) since the last time the status was read.

- **DDS_LongLong received_gap_bytes**

The number of bytes of GAPS received from remote DataWriter to this DataReader.

- **DDS_LongLong received_gap_bytes_change**

The change in `DDS_DataReaderProtocolStatus::received_gap_bytes` (p. 635) since the last time the status was read.

- **DDS_LongLong rejected_sample_count**

The number of times a sample is rejected because it cannot be accepted by a reliable DataReader.

- **DDS_LongLong rejected_sample_count_change**

The change in `DDS_DataReaderProtocolStatus::rejected_sample_count` (p. 636) since the last time the status was read.

- struct **DDS_SequenceNumber_t first_available_sample_sequence_number**

Sequence number of the first available sample in a matched DataWriters reliability queue.

- struct **DDS_SequenceNumber_t last_available_sample_sequence_number**

Sequence number of the last available sample in a matched Datawriter's reliability queue.

- struct **DDS_SequenceNumber_t last_committed_sample_sequence_number**

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue.

- **DDS_Long uncommitted_sample_count**

Number of received samples that are not yet available to be read or taken, due to being received out of order.

- **DDS_LongLong out_of_range_rejected_sample_count**

The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

- **DDS_LongLong received_fragment_count**

The number of `DATA_FRAG` messages that have been received by this DataReader.

- **DDS_LongLong dropped_fragment_count**

The number of `DATA_FRAG` messages that have been dropped by a DataReader.

- **DDS_LongLong reassembled_sample_count**

The number of fragmented samples that have been reassembled by a DataReader.

- **DDS_LongLong sent_nack_fragment_count**

The number of NACK fragments that have been sent from a DataReader to a DataWriter.

- **DDS_LongLong sent_nack_fragment_bytes**

The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

9.31.1 Detailed Description

<<*extension*>> (p. 236) The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

Entity:

DDSDataReader (p. 1272)

9.31.2 Member Data Documentation

9.31.2.1 received_sample_count

DDS_LongLong **DDS_DataReaderProtocolStatus::received_sample_count**

The number of samples received by a DataReader.

Depending on how the **DDS_DataReaderProtocolStatus** (p. 627) was obtained this may count samples coming from a specific DataWriter or from all the DataWriters that are matched with the DataReader.

If the **DDS_DataReaderProtocolStatus** (p. 627) is obtained using the **DDSDataReader::get_datareader_protocol_status** (p. 1289) operation then it will count samples from any DataWriter. If the **DataReaderProtocolStatus** is obtained using the **DDSDataReader::get_matched_publication_datareader_protocol_status** (p. 1289) then it will count the samples for the DataWriter specified as a parameter to the function.

Duplicate samples arriving from the DataWriter(s) (e.g. via multiple network paths) are detected prior to increasing this counter. The duplicate samples are counted by **DDS_DataReaderProtocolStatus::duplicate_sample_count** (p. 631).

If the DataReader has specified a ContentFilter the received samples that do not pass the filter are part of this counter. The filtered samples are counted by **DDS_DataReaderProtocolStatus::filtered_sample_count** (p. 632).

Samples rejected because they do not fit on the DataReader Queue are also part of this counter.

Note the **received_sample_count** counts samples received from all DataWriters and it does not necessarily match the number of samples accepted into the DataReader Queue. This is because:

- Samples can also be inserted into the DataReader Queue by lifecycle events that are locally detected like an instance becoming not alive as a result of DataWriters leaving the network.
- Samples can be filtered out due to ContentFilter or TimeFilter
- Samples can be rejected because there is no space in DataReader Queue

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

9.31.2.2 received_sample_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_count_change

The change in **DDS_DataReaderProtocolStatus::received_sample_count** (p. 630) since the last time the status was read.

See also

DDS_DataReaderProtocolStatus::received_sample_count (p. 630)

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

9.31.2.3 received_sample_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_bytes

The number of bytes received by a DataReader.

See also

DDS_DataReaderProtocolStatus::received_sample_count (p. 630)

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

9.31.2.4 received_sample_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_bytes_change

The change in **DDS_DataReaderProtocolStatus::received_sample_bytes** (p. 631) since the last time the status was read.

See also

DDS_DataReaderProtocolStatus::received_sample_count_change (p. 630)

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

9.31.2.5 duplicate_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_count

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

9.31.2.6 duplicate_sample_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_count_change

The change in **DDS_DataReaderProtocolStatus::duplicate_sample_count** (p. 631) since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

9.31.2.7 duplicate_sample_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_bytes

The number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

9.31.2.8 duplicate_sample_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_bytes_change

The change in **DDS_DataReaderProtocolStatus::duplicate_sample_bytes** (p. 632) since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

9.31.2.9 filtered_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_count

[DEPRECATED]. See: **DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 620) **DDS_↔_DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 620)

9.31.2.10 filtered_sample_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_count_change

[DEPRECATED]. See: **DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count** (p. 620) **DDS_↔_DataReaderCacheStatus::content_filter_dropped_sample_count** (p. 620)

9.31.2.11 filtered_sample_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_bytes

[DEPRECATED]. See: DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count (p. 620) DDS_DataReaderCacheStatus::content_filter_dropped_sample_count (p. 620)

9.31.2.12 filtered_sample_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_bytes_change

[DEPRECATED]. See: DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count (p. 620) DDS_DataReaderCacheStatus::content_filter_dropped_sample_count (p. 620)

9.31.2.13 received_heartbeat_count

DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_count

The number of Heartbeats from a remote DataWriter received by a local DataReader.

9.31.2.14 received_heartbeat_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_count_change

The change in DDS_DataReaderProtocolStatus::received_heartbeat_count (p. 633) since the last time the status was read.

9.31.2.15 received_heartbeat_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_bytes

The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.

9.31.2.16 received_heartbeat_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_bytes_change

The change in **DDS_DataReaderProtocolStatus::received_heartbeat_bytes** (p. 633) since the last time the status was read.

9.31.2.17 sent_ack_count

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_count

The number of ACKs sent from a local DataReader to a matching remote DataWriter.

9.31.2.18 sent_ack_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_count_change

The change in **DDS_DataReaderProtocolStatus::sent_ack_count** (p. 634) since the last time the status was read.

9.31.2.19 sent_ack_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_bytes

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

9.31.2.20 sent_ack_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_ack_bytes_change

The change in **DDS_DataReaderProtocolStatus::sent_ack_bytes** (p. 634) since the last time the status was read.

9.31.2.21 sent_nack_count

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_count

The number of NACKs sent from a local DataReader to a matching remote DataWriter.

9.31.2.22 sent_nack_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_count_change

The change in **DDS_DataReaderProtocolStatus::sent_nack_count** (p. 634) since the last time the status was read.

9.31.2.23 sent_nack_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_bytes

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

9.31.2.24 sent_nack_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_bytes_change

The change in **DDS_DataReaderProtocolStatus::sent_nack_bytes** (p. 635) since the last time the status was read.

9.31.2.25 received_gap_count

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_count

The number of GAPS received from remote DataWriter to this DataReader.

9.31.2.26 received_gap_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_count_change

The change in **DDS_DataReaderProtocolStatus::received_gap_count** (p. 635) since the last time the status was read.

9.31.2.27 received_gap_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_bytes

The number of bytes of GAPS received from remote DataWriter to this DataReader.

9.31.2.28 received_gap_bytes_change

DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_bytes_change

The change in **DDS_DataReaderProtocolStatus::received_gap_bytes** (p. 635) since the last time the status was read.

9.31.2.29 rejected_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::rejected_sample_count

The number of times a sample is rejected because it cannot be accepted by a reliable DataReader.

Samples rejected by a reliable DataReader will be NACKed, and they will have to be resent by the DataWriter if they are still available in the DataWriter queue.

This counter will always be 0 when using **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435).

9.31.2.30 rejected_sample_count_change

DDS_LongLong DDS_DataReaderProtocolStatus::rejected_sample_count_change

The change in **DDS_DataReaderProtocolStatus::rejected_sample_count** (p. 636) since the last time the status was read.

This counter will always be 0 when using **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435).

9.31.2.31 first_available_sample_sequence_number

struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::first_available_sample_sequence_number

Sequence number of the first available sample in a matched DataWriters reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

9.31.2.32 last_available_sample_sequence_number

struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::last_available_sample_sequence_number

Sequence number of the last available sample in a matched Datawriter's reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

9.31.2.33 last_committed_sample_sequence_number

```
struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::last_committed_sample_sequence_number
```

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue.

Applicable only when retrieving matched DataWriter statuses.

For best-effort DataReaders, this is the sequence number of the latest sample received.

For reliable DataReaders, this is the sequence number of the latest sample that is available to be read or taken from the DataReader's queue.

9.31.2.34 uncommitted_sample_count

```
DDS_Long DDS_DataReaderProtocolStatus::uncommitted_sample_count
```

Number of received samples that are not yet available to be read or taken, due to being received out of order.

Applicable only when retrieving matched DataWriter statuses.

9.31.2.35 out_of_range_rejected_sample_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::out_of_range_rejected_sample_count
```

The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

When using **DDS_RELIABLE_RELIABILITY_QOS** (p. 435); if the DataReader received samples out-of-order, they are stored internally until the missing samples are received. The number of out-of-order samples that the DataReader can keep is set by **DDS_RtpsReliableReaderProtocol_t::receive_window_size** (p. 1045). When the received window is full any out-of-order sample received will be dropped.

9.31.2.36 received_fragment_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::received_fragment_count
```

The number of DATA_FRAG messages that have been received by this DataReader.

This statistic is incremented upon the receipt of each DATA_FRAG message. Fragments from duplicate samples do not count towards this statistic. Applicable only when data is fragmented.

9.31.2.37 dropped_fragment_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::dropped_fragment_count
```

The number of DATA_FRAG messages that have been dropped by a DataReader.

This statistic does not include malformed fragments. Applicable only when data is fragmented.

9.31.2.38 reassembled_sample_count

DDS_LongLong DDS_DataReaderProtocolStatus::reassembled_sample_count

The number of fragmented samples that have been reassembled by a DataReader.

This statistic is incremented when all of the fragments which are required to reassemble an entire sample have been received. Applicable only when data is fragmented.

9.31.2.39 sent_nack_fragment_count

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_fragment_count

The number of NACK fragments that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

9.31.2.40 sent_nack_fragment_bytes

DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_fragment_bytes

The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

9.32 DDS_DataReaderQos Struct Reference

QoS policies supported by a **DDSDDataReader** (p. 1272) entity.

Public Member Functions

- bool **operator==** (const **DDS_DataReaderQos** &r) const
Compares two DataReaderQos objects for equality.
- bool **operator!=** (const **DDS_DataReaderQos** &r) const
Compares two DataReaderQos objects for inequality.
- **DDS_ReturnCode_t print** () const
*Prints this **DDS_DataReaderQos** (p. 638) to stdout.*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size) const
*Obtains a string representation of this **DDS_DataReaderQos** (p. 638).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DataReaderQos** &base) const
*Obtains a string representation of this **DDS_DataReaderQos** (p. 638).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DataReaderQos** (p. 638).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DataReaderQos** &base, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DataReaderQos** (p. 638).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
*Obtains a string representation of this **DDS_DataReaderQos** (p. 638).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DataReaderQos** (p. 638).*

Transport priority policy, **TRANSPORT_PRIORITY** (p. 449).
- struct **DDS_TypeSupportQosPolicy** `type_support`
<<extension>> (p. 236) type support data, **TYPESUPPORT** (p. 453).

9.32.1 Detailed Description

QoS policies supported by a **DDSDataReader** (p. 1272) entity.

You must set certain members in a consistent manner:

DDS_DataReaderQos::deadline (p. 642) .period >= **DDS_DataReaderQos::time_based_filter** (p. 644) .minimum↔
_separation

DDS_DataReaderQos::history (p. 643) .depth <= **DDS_DataReaderQos::resource_limits** (p. 643) .max_samples↔
_per_instance

DDS_DataReaderQos::resource_limits (p. 643) .max_samples_per_instance <= **DDS_DataReaderQos::resource_limits** (p. 643) .max_samples **DDS_DataReaderQos::resource_limits** (p. 643) .initial_samples <= **DDS_DataReaderQos::resource_limits** (p. 643) .max_samples

DDS_DataReaderQos::resource_limits (p. 643) .initial_instances <= **DDS_DataReaderQos::resource_limits** (p. 643) .max_instances

DDS_DataReaderQos::reader_resource_limits (p. 644) .initial_remote_writers_per_instance <= **DDS_DataReaderQos::reader_resource_limits** (p. 644) .max_remote_writers_per_instance

DDS_DataReaderQos::reader_resource_limits (p. 644) .initial_infos <= **DDS_DataReaderQos::reader_resource_limits** (p. 644) .max_infos

DDS_DataReaderQos::reader_resource_limits (p. 644) .max_remote_writers_per_instance <= **DDS_DataReaderQos::reader_resource_limits** (p. 644) .max_remote_writers

DDS_DataReaderQos::reader_resource_limits (p. 644) .max_samples_per_remote_writer <= **DDS_DataReaderQos::resource_limits** (p. 643) .max_samples

length of **DDS_DataReaderQos::user_data** (p. 643) .value <= **DDS_DomainParticipantQos::resource_limits** (p. 738) .reader_user_data_max_length

If any of the above are not true, **DDSDataReader::set_qos** (p. 1290) and **DDSDataReader::set_qos_with_profile** (p. 1291) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336) and **DDSSubscriber::create_datareader** (p. 1583) will return NULL.

9.32.2 Member Function Documentation

9.32.2.1 operator==()

```
bool DDS_DataReaderQos::operator==(
    const DDS_DataReaderQos & r ) const [inline]
```

Compares two DataReaderQos objects for equality.

See also

DDS_DataReaderQos_equals (p. 142)

References **DDS_DataReaderQos_equals()**.

9.32.2.2 operator"!="()

```
bool DDS_DataReaderQos::operator!= (
    const DDS_DataReaderQos & r ) const [inline]
```

Compares two DataReaderQos objects for inequality.

See also

DDS_DataReaderQos_equals (p. 142)

References **DDS_DataReaderQos_equals()**.

9.32.3 Member Data Documentation

9.32.3.1 durability

```
struct DDS_DurabilityQosPolicy DDS_DataReaderQos::durability
```

Durability policy, **DURABILITY** (p. 397).

9.32.3.2 deadline

```
struct DDS_DeadlineQosPolicy DDS_DataReaderQos::deadline
```

Deadline policy, **DEADLINE** (p. 384).

9.32.3.3 latency_budget

```
struct DDS_LatencyBudgetQosPolicy DDS_DataReaderQos::latency_budget
```

Latency budget policy, **LATENCY_BUDGET** (p. 407).

9.32.3.4 liveliness

```
struct DDS_LivelinessQosPolicy DDS_DataReaderQos::liveliness
```

Liveliness policy, **LIVELINESS** (p. 409).

9.32.3.5 reliability

```
struct DDS_ReliabilityQosPolicy DDS_DataReaderQos::reliability
```

Reliability policy, **RELIABILITY** (p. 433).

9.32.3.6 destination_order

```
struct DDS_DestinationOrderQosPolicy DDS_DataReaderQos::destination_order
```

Destination order policy, **DESTINATION_ORDER** (p. 385).

9.32.3.7 history

```
struct DDS_HistoryQosPolicy DDS_DataReaderQos::history
```

History policy, **HISTORY** (p. 404).

9.32.3.8 resource_limits

```
struct DDS_ResourceLimitsQosPolicy DDS_DataReaderQos::resource_limits
```

Resource limits policy, **RESOURCE_LIMITS** (p. 437).

9.32.3.9 user_data

```
struct DDS_UserDataQosPolicy DDS_DataReaderQos::user_data
```

User data policy, **USER_DATA** (p. 455).

9.32.3.10 ownership

```
struct DDS_OwnershipQosPolicy DDS_DataReaderQos::ownership
```

Ownership policy, **OWNERSHIP** (p. 414).

9.32.3.11 time_based_filter

```
struct DDS_TimeBasedFilterQosPolicy DDS_DataReaderQos::time_based_filter
```

Time-based filter policy, **TIME_BASED_FILTER** (p. 440).

9.32.3.12 reader_data_lifecycle

```
struct DDS_ReaderDataLifecycleQosPolicy DDS_DataReaderQos::reader_data_lifecycle
```

Reader data lifecycle policy, **READER_DATA_LIFECYCLE** (p. 432).

9.32.3.13 representation

```
struct DDS_DataRepresentationQosPolicy DDS_DataReaderQos::representation
```

Data representation policy, **DATA_REPRESENTATION** (p. 368).

9.32.3.14 type_consistency

```
struct DDS_TypeConsistencyEnforcementQosPolicy DDS_DataReaderQos::type_consistency
```

Type consistency enforcement policy, **TYPE_CONSISTENCY_ENFORCEMENT** (p. 451).

9.32.3.15 data_tags

```
DDS_DataTagQosPolicy DDS_DataReaderQos::data_tags
```

DataTag policy, **DATA_TAG** (p. 375).

9.32.3.16 reader_resource_limits

```
struct DDS_DataReaderResourceLimitsQosPolicy DDS_DataReaderQos::reader_resource_limits
```

<<**extension**>> (p. 236) **DDSDataReader** (p. 1272) resource limits policy, **DATA_READER_RESOURCE_LIMITS** (p. 366). This policy is an extension to the DDS standard.

9.32.3.17 protocol

```
struct DDS_DataReaderProtocolQosPolicy DDS_DataReaderQos::protocol
```

<<**extension**>> (p. 236) **DDSDataReader** (p. 1272) protocol policy, **DATA_READER_PROTOCOL** (p. 365)

9.32.3.18 transport_selection

```
struct DDS_TransportSelectionQosPolicy DDS_DataReaderQos::transport_selection
```

<<**extension**>> (p. 236) Transport selection policy, **TRANSPORT_SELECTION** (p. 450).

Specifies the transports available for use by the **DDSDataReader** (p. 1272).

9.32.3.19 unicast

```
struct DDS_TransportUnicastQosPolicy DDS_DataReaderQos::unicast
```

<<**extension**>> (p. 236) Unicast transport policy, **TRANSPORT_UNICAST** (p. 450).

Specifies the unicast transport interfaces and ports on which **messages** can be received.

The unicast interfaces are used to receive messages from **DDSDataWriter** (p. 1305) entities in the domain.

9.32.3.20 multicast

```
struct DDS_TransportMulticastQosPolicy DDS_DataReaderQos::multicast
```

<<**extension**>> (p. 236) Multicast transport policy, **TRANSPORT_MULTICAST** (p. 447).

Specifies the multicast group addresses and ports on which **messages** can be received.

The multicast addresses are used to receive messages from **DDSDataWriter** (p. 1305) entities in the domain.

9.32.3.21 property

```
struct DDS_PropertyQosPolicy DDS_DataReaderQos::property
```

<<*extension*>> (p. 236) Property policy, **PROPERTY** (p. 419). See also [Property Reference Guide](#).

9.32.3.22 service

```
struct DDS_ServiceQosPolicy DDS_DataReaderQos::service
```

<<*extension*>> (p. 236) Service policy, **SERVICE** (p. 438).

9.32.3.23 availability

```
struct DDS_AvailabilityQosPolicy DDS_DataReaderQos::availability
```

<<*extension*>> (p. 236) Availability policy, **AVAILABILITY** (p. 363).

9.32.3.24 subscription_name

```
struct DDS_EntityNameQosPolicy DDS_DataReaderQos::subscription_name
```

<<*extension*>> (p. 236) EntityName policy, **ENTITY_NAME** (p. 402).

9.32.3.25 transport_priority

```
struct DDS_TransportPriorityQosPolicy DDS_DataReaderQos::transport_priority
```

Transport priority policy, **TRANSPORT_PRIORITY** (p. 449).

9.32.3.26 type_support

```
struct DDS_TypeSupportQosPolicy DDS_DataReaderQos::type_support
```

<<*extension*>> (p. 236) type support data, **TYPESUPPORT** (p. 453).

Optional value that is passed to a type plugin's `on_endpoint_attached` and `deserialization` functions.

9.33 DDS_DataReaderResourceLimitsInstanceReplacementSettings Struct Reference

Instance replacement kind applied to each instance state.

Public Attributes

- **DDS_DataReaderInstanceRemovalKind alive_instance_removal**
*Removal kind applied to alive (**DDS_ALIVE_INSTANCE_STATE** (p. 161)) instances.*
- **DDS_DataReaderInstanceRemovalKind disposed_instance_removal**
*Removal kind applied to disposed (**DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE** (p. 161)) instances.*
- **DDS_DataReaderInstanceRemovalKind no_writers_instance_removal**
*Removal kind applied to fully-unregistered (**DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161)) instances.*

9.33.1 Detailed Description

Instance replacement kind applied to each instance state.

[default]

- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::alive_instance_removal** (p. 647) = **DDS_↵_NO_INSTANCE_REMOVAL** (p. 367)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::disposed_instance_removal** (p. 647) = **DDS_EMPTY_INSTANCE_REMOVAL** (p. 367)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::no_writers_instance_removal** (p. 648) = **DDS_EMPTY_INSTANCE_REMOVAL** (p. 367)

9.33.2 Member Data Documentation

9.33.2.1 alive_instance_removal

DDS_DataReaderInstanceRemovalKind **DDS_DataReaderResourceLimitsInstanceReplacementSettings::alive↵_instance_removal**

Removal kind applied to alive (**DDS_ALIVE_INSTANCE_STATE** (p. 161)) instances.

[default] **DDS_NO_INSTANCE_REMOVAL** (p. 367)

9.33.2.2 disposed_instance_removal

`DDS_DataReaderInstanceRemovalKind DDS_DataReaderResourceLimitsInstanceReplacementSettings::disposed↔
_instance_removal`

Removal kind applied to disposed (`DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 161)) instances.

[default] `DDS_EMPTY_INSTANCE_REMOVAL` (p. 367)

9.33.2.3 no_writers_instance_removal

`DDS_DataReaderInstanceRemovalKind DDS_DataReaderResourceLimitsInstanceReplacementSettings::no_↔
writers_instance_removal`

Removal kind applied to fully-unregistered (`DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE` (p. 161)) instances.

[default] `DDS_EMPTY_INSTANCE_REMOVAL` (p. 367)

9.34 DDS_DataReaderResourceLimitsQosPolicy Struct Reference

Various settings that configure how a **DDSDataReader** (p. 1272) allocates and uses physical memory for internal resources.

Public Attributes

- **DDS_Long max_remote_writers**
*The maximum number of remote writers from which a **DDSDataReader** (p. 1272) may read, including all instances.*
- **DDS_Long max_remote_writers_per_instance**
*The maximum number of remote writers from which a **DDSDataReader** (p. 1272) may read a single instance.*
- **DDS_Long max_samples_per_remote_writer**
*The maximum number of out-of-order samples from a given remote **DDSDataWriter** (p. 1305) that a **DDSDataReader** (p. 1272) may store when maintaining a reliable connection to the **DDSDataWriter** (p. 1305).*
- **DDS_Long max_infos**
*The maximum number of info units that a **DDSDataReader** (p. 1272) can use to store **DDS_SampleInfo** (p. 1068).*
- **DDS_Long initial_remote_writers**
*The initial number of remote writers from which a **DDSDataReader** (p. 1272) may read, including all instances.*
- **DDS_Long initial_remote_writers_per_instance**
*The initial number of remote writers from which a **DDSDataReader** (p. 1272) may read a single instance.*
- **DDS_Long initial_infos**
*The initial number of info units that a **DDSDataReader** (p. 1272) can have, which are used to store **DDS_SampleInfo** (p. 1068).*
- **DDS_Long initial_outstanding_reads**
*The initial number of outstanding calls to read/take (or one of their variants) on the same **DDSDataReader** (p. 1272) for which memory has not been returned by calling **FooDataReader::return_loan** (p. 1655).*
- **DDS_Long max_outstanding_reads**

The maximum number of outstanding read/take calls (or one of their variants) on the same **DDSDataReader** (p. 1272) for which memory has not been returned by calling **FooDataReader::return_loan** (p. 1655).

- **DDS_Long max_samples_per_read**

The maximum number of data samples that the application can receive from the middleware in a single call to **FooDataReader::read** (p. 1635) or **FooDataReader::take** (p. 1636). If more data exists in the middleware, the application will need to issue multiple read/take calls.

- **DDS_Boolean disable_fragmentation_support**

Determines whether the **DDSDataReader** (p. 1272) can receive fragmented samples.

- **DDS_Long max_fragmented_samples**

The maximum number of samples for which the **DDSDataReader** (p. 1272) may store fragments at a given point in time.

- **DDS_Long initial_fragmented_samples**

The initial number of samples for which a **DDSDataReader** (p. 1272) may store fragments.

- **DDS_Long max_fragmented_samples_per_remote_writer**

The maximum number of samples per remote writer for which a **DDSDataReader** (p. 1272) may store fragments.

- **DDS_Long max_fragments_per_sample**

Maximum number of fragments for a single sample.

- **DDS_Boolean dynamically_allocate_fragmented_samples**

Determines whether the **DDSDataReader** (p. 1272) pre-allocates storage for storing fragmented samples.

- **DDS_Long max_total_instances**

Maximum number of instances for which a DataReader will keep state.

- **DDS_Long max_remote_virtual_writers**

The maximum number of remote virtual writers from which a **DDSDataReader** (p. 1272) may read, including all instances.

- **DDS_Long initial_remote_virtual_writers**

The initial number of remote virtual writers from which a **DDSDataReader** (p. 1272) may read, including all instances.

- **DDS_Long max_remote_virtual_writers_per_instance**

The maximum number of virtual remote writers that can be associated with an instance.

- **DDS_Long initial_remote_virtual_writers_per_instance**

The initial number of virtual remote writers per instance.

- **DDS_Long max_remote_writers_per_sample**

The maximum number of remote writers allowed to write the same sample.

- **DDS_Long max_query_condition_filters**

The maximum number of query condition filters a reader is allowed.

- **DDS_Long max_app_ack_response_length**

Maximum length of application-level acknowledgment response data.

- **DDS_Boolean keep_minimum_state_for_instances**

Whether or not keep a minimum instance state for up to **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 655).

- **DDS_Long initial_topic_queries**

The initial number of TopicQueries allocated by a **DDSDataReader** (p. 1272).

- **DDS_Long max_topic_queries**

The maximum number of active TopicQueries that a **DDSDataReader** (p. 1272) can create.

- struct **DDS_AllocationSettings_t shmem_ref_transfer_mode_attached_segment_allocation**

Allocation resource for the shared memory segments attached by the **DDSDataReader** (p. 1272).

- struct **DDS_DataReaderResourceLimitsInstanceReplacementSettings instance_replacement**

Sets the kind of instances allowed to be replaced for each instance state (**DDS_InstanceStateKind** (p. 160)) when a DataReader reaches **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041).

- struct **DDS_Duration_t autopurge_remote_not_alive_writer_delay**

Maximum duration for which the **DDSDataReader** (p. 1272) will maintain information regarding a **DDSDataWriter** (p. 1305) once the **DDSDataWriter** (p. 1305) has become not alive.

9.34.1 Detailed Description

Various settings that configure how a **DDSDataReader** (p. 1272) allocates and uses physical memory for internal resources.

DataReaders must allocate internal structures to handle the maximum number of DataWriters that may connect to it, whether or not a **DDSDataReader** (p. 1272) handles data fragmentation and how many data fragments that it may handle (for data samples larger than the MTU of the underlying network transport), how many simultaneous outstanding loans of internal memory holding data samples can be provided to user code, as well as others.

Most of these internal structures start at an initial size and, by default, will grow as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDSDataReader** (p. 1272). By setting the initial size to the maximum size, you will prevent RTI Connext from dynamically allocating any memory after the creation of the **DDSDataReader** (p. 1272).

This QoS policy is an extension to the DDS standard.

Entity:

DDSDataReader (p. 1272)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.34.2 Member Data Documentation

9.34.2.1 max_remote_writers

DDS_Long `DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers`

The maximum number of remote writers from which a **DDSDataReader** (p. 1272) may read, including all instances.

[default] `DDS_LENGTH_UNLIMITED` (p. 437)

[range] [1, 1 million] or `DDS_LENGTH_UNLIMITED` (p. 437), `>= initial_remote_writers`, `>= max_remote_writers_per_instance`

For unkeyed types, this value has to be equal to `max_remote_writers_per_instance` if `max_remote_writers_per_instance` is not equal to `DDS_LENGTH_UNLIMITED` (p. 437).

Note: For efficiency, set `max_remote_writers >= DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers_per_instance` (p. 650).

9.34.2.2 max_remote_writers_per_instance

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers_per_instance

The maximum number of remote writers from which a **DDSDataReader** (p. 1272) may read a single instance.

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 1024] or **DDS_LENGTH_UNLIMITED** (p. 437), <= max_remote_writers or **DDS_LENGTH_UNLIMITED** (p. 437), >= initial_remote_writers_per_instance

For unkeyed types, this value has to be equal to max_remote_writers if it is not **DDS_LENGTH_UNLIMITED** (p. 437).

Note: For efficiency, set max_remote_writers_per_instance <= **DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers** (p. 650)

9.34.2.3 max_samples_per_remote_writer

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_remote_writer

The maximum number of out-of-order samples from a given remote **DDSDataWriter** (p. 1305) that a **DDSDataReader** (p. 1272) may store when maintaining a reliable connection to the **DDSDataWriter** (p. 1305).

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 100 million] or **DDS_LENGTH_UNLIMITED** (p. 437), <= **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041)

9.34.2.4 max_infos

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_infos

The maximum number of info units that a **DDSDataReader** (p. 1272) can use to store **DDS_SampleInfo** (p. 1068).

When read/take is called on a DataReader, the DataReader passes a sequence of data samples and an associated sample info sequence. The sample info sequence contains additional information for each data sample.

max_infos determines the resources allocated for storing sample info. This memory is loaned to the application when passing a sample info sequence.

Note that sample info is a snapshot, generated when read/take is called.

max_infos should not be less than max_samples.

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437), >= initial_infos

9.34.2.5 initial_remote_writers

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_remote_writers

The initial number of remote writers from which a **DDSDDataReader** (p. 1272) may read, including all instances.

[default] 2

[range] [1, 1 million], <= max_remote_writers

For unkeyed types this value has to be equal to initial_remote_writers_per_instance.

Note: For efficiency, set initial_remote_writers >= **DDS_DataReaderResourceLimitsQosPolicy::initial_remote_writers_per_instance** (p. 652).

9.34.2.6 initial_remote_writers_per_instance

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_remote_writers_per_instance

The initial number of remote writers from which a **DDSDDataReader** (p. 1272) may read a single instance.

[default] 2

[range] [1,1024], <= max_remote_writers_per_instance

For unkeyed types this value has to be equal to initial_remote_writers.

Note: For efficiency, set initial_remote_writers_per_instance <= **DDS_DataReaderResourceLimitsQosPolicy::initial_remote_writers** (p. 651).

9.34.2.7 initial_infos

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_infos

The initial number of info units that a **DDSDDataReader** (p. 1272) can have, which are used to store **DDS_SampleInfo** (p. 1068).

[default] 32

[range] [1,1 million], <= max_infos

9.34.2.8 initial_outstanding_reads

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_outstanding_reads

The initial number of outstanding calls to read/take (or one of their variants) on the same **DDSDataReader** (p. 1272) for which memory has not been returned by calling **FooDataReader::return_loan** (p. 1655).

[default] 2

[range] [1, 65536], <= max_outstanding_reads

9.34.2.9 max_outstanding_reads

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_outstanding_reads

The maximum number of outstanding read/take calls (or one of their variants) on the same **DDSDataReader** (p. 1272) for which memory has not been returned by calling **FooDataReader::return_loan** (p. 1655).

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 65536] or DDS_LENGTH_UNLIMITED (p. 437), >= initial_outstanding_reads

9.34.2.10 max_samples_per_read

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_samples_per_read

The maximum number of data samples that the application can receive from the middleware in a single call to **FooDataReader::read** (p. 1635) or **FooDataReader::take** (p. 1636). If more data exists in the middleware, the application will need to issue multiple read/take calls.

When reading data using listeners, the expected number of samples available for delivery in a single `take` call is typically small: usually just one, in the case of unbatched data, or the number of samples in a single batch, in the case of batched data. (See **DDS_BatchQosPolicy** (p. 594) for more information about this feature.) When polling for data or using a **DDSWaitSet** (p. 1613), however, multiple samples (or batches) could be retrieved at once, depending on the data rate.

A larger value for this parameter makes the API simpler to use at the expense of some additional memory consumption.

[default] 1024

[range] [1,65536]

9.34.2.11 disable_fragmentation_support

DDS_Boolean DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support

Determines whether the **DDSDataReader** (p. 1272) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

[default] DDS_BOOLEAN_FALSE (p. 316)

9.34.2.12 max_fragmented_samples

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_fragmented_samples

The maximum number of samples for which the **DDSDataReader** (p. 1272) may store fragments at a given point in time.

At any given time, a **DDSDataReader** (p. 1272) may store fragments for up to `max_fragmented_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different **DDSDataWriter** (p. 1305) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 653) is **DDS_↔ BOOLEAN_FALSE** (p. 316).

[default] 1024

[range] [1, 1 million]

9.34.2.13 initial_fragmented_samples

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_fragmented_samples

The initial number of samples for which a **DDSDataReader** (p. 1272) may store fragments.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 653) is **DDS_↔ BOOLEAN_FALSE** (p. 316).

[default] 4

[range] [1,1024], <= max_fragmented_samples

9.34.2.14 max_fragmented_samples_per_remote_writer

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_fragmented_samples_per_remote_writer

The maximum number of samples per remote writer for which a **DDSDataReader** (p. 1272) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 653) is **DDS_↔ BOOLEAN_FALSE** (p. 316).

[default] 256

[range] [1, 1 million], <= max_fragmented_samples

9.34.2.15 max_fragments_per_sample

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_fragments_per_sample

Maximum number of fragments for a single sample.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 653) is **DDS_↵
BOOLEAN_FALSE** (p. 316).

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437)

9.34.2.16 dynamically_allocate_fragmented_samples

DDS_Boolean DDS_DataReaderResourceLimitsQosPolicy::dynamically_allocate_fragmented_samples

Determines whether the **DDSDataReader** (p. 1272) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If **dynamically_allocate_fragmented_samples** is set to **DDS_BOOLEAN_FALSE** (p. 316), the middleware will allocate memory upfront for storing fragments for up to **DDS_DataReaderResourceLimitsQosPolicy↵
::initial_fragmented_samples** (p. 654) samples. This memory may grow up to **DDS_DataReaderResourceLimits↵
QosPolicy::max_fragmented_samples** (p. 653) if needed.

Only applies if **DDS_DataReaderResourceLimitsQosPolicy::disable_fragmentation_support** (p. 653) is **DDS_↵
BOOLEAN_FALSE** (p. 316).

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.34.2.17 max_total_instances

DDS_Long `DDS_DataReaderResourceLimitsQosPolicy::max_total_instances`

Maximum number of instances for which a DataReader will keep state.

The maximum number of instances actively managed by a DataReader is determined by **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041).

These instances have associated DataWriters or samples in the DataReader's queue and are visible to the user through operations such as **FooDataReader::take** (p. 1636), **FooDataReader::read** (p. 1635), and **FooDataReader::get_key_value** (p. 1656).

The features Durable Reader State, MultiChannel DataWriters and RTI Persistence Service require RTI Connex to keep some internal state even for instances without DataWriters or samples in the DataReader's queue. The additional state is used to filter duplicate samples that could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

The total maximum number of instances that will be managed by the middleware, including instances without associated DataWriters or samples, is determined by `max_total_instances`.

When a new instance is received, RTI Connex will check the resource limit **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041). If the limit is exceeded, RTI Connex will drop the sample with the reason `LOST_BY_INSTANCES_LIMIT`. If the limit is not exceeded, RTI Connex will check `max_total_instances`. If `max_total_instances` is exceeded, RTI Connex will replace an existing instance without DataWriters and samples with the new one. The application could receive duplicate samples for the replaced instance if it becomes alive again.

The `max_total_instances` limit is not used if **DDS_DataReaderResourceLimitsQosPolicy::keep_minimum_state_for_instances** (p. 658) is false, and in that case should be left at the default value.

[default] `DDS_AUTO_MAX_TOTAL_INSTANCES` (p. 368)

[range] [1, 1 million] or `DDS_LENGTH_UNLIMITED` (p. 437) or `DDS_AUTO_MAX_TOTAL_INSTANCES` (p. 368), \geq **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041)

9.34.2.18 max_remote_virtual_writers

DDS_Long `DDS_DataReaderResourceLimitsQosPolicy::max_remote_virtual_writers`

The maximum number of remote virtual writers from which a **DDSDDataReader** (p. 1272) may read, including all instances.

When **DDS_PresentationQosPolicy::access_scope** (p. 987) is set to **DDS_GROUP_PRESENTATION_QOS** (p. 418), this value determines the maximum number of DataWriter groups that can be managed by the **DDSSubscriber** (p. 1576) containing this **DDSDDataReader** (p. 1272).

Since the **DDSSubscriber** (p. 1576) may contain more than one **DDSDDataReader** (p. 1272), only the setting of the first applies.

[default] `DDS_LENGTH_UNLIMITED` (p. 437)

[range] [1, 1 million] or `DDS_LENGTH_UNLIMITED` (p. 437), \geq `initial_remote_virtual_writers`, \geq `max_remote_virtual_writers_per_instance`

9.34.2.19 initial_remote_virtual_writers

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_remote_virtual_writers

The initial number of remote virtual writers from which a **DDSDataReader** (p. 1272) may read, including all instances.

[default] 2

[range] [1, 1 million] or **DDS_LENGTH_UNLIMITED** (p. 437), \leq max_remote_virtual_writers

9.34.2.20 max_remote_virtual_writers_per_instance

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_virtual_writers_per_instance

The maximum number of virtual remote writers that can be associated with an instance.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 1024] or **DDS_LENGTH_UNLIMITED** (p. 437), \geq initial_remote_virtual_writers_per_instance

For unkeyed types, this value is ignored.

The features of Durable Reader State and MultiChannel DataWriters, and RTI Persistence Service require RTI Connex to keep some internal state per virtual writer and instance that is used to filter duplicate samples. These duplicate samples could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

Once an association between a remote virtual writer and an instance is established, it is permanent – it will not disappear even if the physical writer incarnating the virtual writer is destroyed.

If max_remote_virtual_writers_per_instance is exceeded for an instance, RTI Connex will not associate this instance with new virtual writers. Duplicates samples from these virtual writers will not be filtered on the reader.

If you are not using Durable Reader State, MultiChannel DataWriters or RTI Persistence Service in your system, you can set this property to 1 to optimize resources.

9.34.2.21 initial_remote_virtual_writers_per_instance

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_remote_virtual_writers_per_instance

The initial number of virtual remote writers per instance.

[default] 2

[range] [1, 1024], \leq max_remote_virtual_writers_per_instance

For unkeyed types, this value is ignored.

9.34.2.22 max_remote_writers_per_sample

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers_per_sample

The maximum number of remote writers allowed to write the same sample.

One scenario in which two DataWriters may write the same sample is Persistence Service. The DataReader may receive the same sample coming from the original DataWriter and from a Persistence Service DataWriter. **[default]** 3

[range] [1, 1024]

9.34.2.23 max_query_condition_filters

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_query_condition_filters

The maximum number of query condition filters a reader is allowed.

[default] 4

[range] [0, 32]

This value determines the maximum number of unique query condition content filters that a reader may create.

Each query condition content filter is comprised of both its `query_expression` and `query_parameters`. Two query conditions that have the same `query_expression` will require unique query condition filters if their `query_parameters` differ. Query conditions that differ only in their state masks will share the same query condition filter.

9.34.2.24 max_app_ack_response_length

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_app_ack_response_length

Maximum length of application-level acknowledgment response data.

The maximum length of response data in an application-level acknowledgment.

When set to zero, no response data is sent with application-level acknowledgments.

[default] 1

[range] [0, 32768]

9.34.2.25 keep_minimum_state_for_instances

DDS_Boolean DDS_DataReaderResourceLimitsQosPolicy::keep_minimum_state_for_instances

Whether or not keep a minimum instance state for up to **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 655).

The features Durable Reader State, multi-channel DataWriters, and Persistence Service require RTI Connext to keep some minimal internal state even for instances without DataWriters or DDS samples in the DataReader's queue, or that have been purged due to a dispose. The additional state is used to filter duplicate DDS samples that could be coming from different DataWriter channels or from multiple executions of Persistence Service. The total maximum number of instances that will be managed by the middleware, including instances without associated DataWriters or DDS samples or that have been purged due to a dispose, is determined by **DDS_DataReaderResourceLimitsQosPolicy::max_total_instances** (p. 655).

This additional state will only be kept for up to max_total_instances if this field is set to **DDS_BOOLEAN_TRUE** (p. 316), otherwise the additional state will not be kept for any instances.

The minimum state includes information such as the source timestamp of the last sample received by the instance and the last sequence number received from a virtual GUID.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.34.2.26 initial_topic_queries

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::initial_topic_queries

The initial number of TopicQueries allocated by a **DDSDataReader** (p. 1272).

[default] 1

See also

DDSTopicQuery (p. 1611)

9.34.2.27 max_topic_queries

DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_topic_queries

The maximum number of active TopicQueries that a **DDSDataReader** (p. 1272) can create.

Once this limit is reached, a **DDSDataReader** (p. 1272) can create more TopicQueries only if it deletes some of the previously created ones.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

See also

DDSTopicQuery (p. 1611)

9.34.2.28 shmем_ref_transfer_mode_attached_segment_allocation

```
struct DDS_AllocationSettings_t DDS_DataReaderResourceLimitsQosPolicy::shmем_ref_transfer_mode_↵
attached_segment_allocation
```

Allocation resource for the shared memory segments attached by the **DDSDDataReader** (p. 1272).

The `max_count` does not limit the total number of shared memory segments used by the **DDSDDataReader** (p. 1272). When this limit is hit, the **DDSDDataReader** (p. 1272) will try to detach from a segment that doesn't contain any loaned samples and attach to a new segment. If samples are loaned from all attached segments, then the **DDSDDataReader** (p. 1272) will fail to attach to the new segment. This scenario will result in a sample loss.

[default] `initial_count = DDS_AUTO_COUNT` (p. 396) (**DDS_DataReaderResourceLimitsQosPolicy::initial_↵**
remote_writers (p. 651)); `max_count = DDS_AUTO_COUNT` (p. 396) (**DDS_DataReaderResourceLimitsQos_↵**
Policy::max_remote_writers (p. 650)); `incremental_count = DDS_AUTO_COUNT` (p. 396) (0 if `initial_count = max_↵`
`count`; -1 otherwise);

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.34.2.29 instance_replacement

```
struct DDS_DataReaderResourceLimitsInstanceReplacementSettings DDS_DataReaderResourceLimitsQos_↵
Policy::instance_replacement
```

Sets the kind of instances allowed to be replaced for each instance state (**DDS_InstanceStateKind** (p. 160)) when a DataReader reaches **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041).

When **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) is reached, a **DDSDDataReader** (p. 1272) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kinds specified by this field.

A DataReader can choose what kinds of instances can be replaced for each **DDS_InstanceStateKind** (p. 160) separately. This means, for example, that a DataReader can choose to not allow replacing alive (**DDS_ALIVE_INSTANCE_↵**
_STATE (p. 161)) instances but allow replacement of empty disposed (**DDS_NOT_ALIVE_DISPOSED_INSTANCE_↵**
STATE (p. 161)) instances.

Only instances whose states match the specified kinds are eligible to be replaced. In addition, there must be no outstanding loans on any of the samples belonging to the instance for it to be considered for replacement.

For all kinds, a **DDSDDataReader** (p. 1272) will replace the least-recently-updated instance satisfying that kind. An instance is considered 'updated' when a valid sample or dispose sample is received and accepted for that instance. When using **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 415), only samples that are received from the owner of the instance will cause the instance to be considered updated. An instance is not considered updated when an unregister sample is received because the unregister message simply indicates that there is one less writer that has updates for the instance, not that the instance itself was updated.

If no replaceable instance exists, the sample for the new instance will be considered lost with lost reason **DDS_LOST_↵**
_BY_INSTANCES_LIMIT (p. 136) and the instance will not be asserted into the DataReader queue.

[default]

- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::alive_instance_removal** (p. 647) = **DDS_↵**
_NO_INSTANCE_REMOVAL (p. 367)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::disposed_instance_removal** (p. 647) =
DDS_EMPTY_INSTANCE_REMOVAL (p. 367)
- **DDS_DataReaderResourceLimitsInstanceReplacementSettings::no_writers_instance_removal** (p. 648) =
DDS_EMPTY_INSTANCE_REMOVAL (p. 367)

See also

DDS_DataReaderResourceLimitsInstanceReplacementSettings (p. 647)

9.34.2.30 autopurge_remote_not_alive_writer_delay

```
struct DDS_Duration_t DDS_DataReaderResourceLimitsQosPolicy::autopurge_remote_not_alive_writer_↵
delay
```

Maximum duration for which the **DDSDDataReader** (p. 1272) will maintain information regarding a **DDSDDataWriter** (p. 1305) once the **DDSDDataWriter** (p. 1305) has become not alive.

After this time elapses, the **DDSDDataReader** (p. 1272) will purge all internal information regarding the not alive **DDSDDataWriter** (p. 1305).

See also

DDS_LivelinessQosPolicy (p. 923) for more information on when a **DDSDDataWriter** (p. 1305) is considered not alive.

When set to **DDS_DURATION_AUTO** (p. 326), this parameter is set to 10 times the value of **DDS_DiscoveryConfig↵QosPolicy::participant_liveliness_lease_duration** (p. 708).

This QoS only applies when the **DDSDDataReader** (p. 1272) is using **DDS_RECOVER_INSTANCE_STATE_↵CONSISTENCY** (p. 436) for the **DDS_ReliabilityQosPolicy::instance_state_consistency_kind** (p. 1030) QoS. When using **DDS_RECOVER_INSTANCE_STATE_CONSISTENCY** (p. 436), a **DDSDDataReader** (p. 1272) keeps state about all **DDSDDataWriter** (p. 1305) entities and the instances they were writing in order to be able to transition those instances back to their correct state if liveliness with the **DDSDDataWriter** (p. 1305) is recovered. This can cause unbounded memory growth if that state is never purged and **DDSDDataWriter** (p. 1305) entities continuously come and go in a system. This QoS avoids that unbounded memory growth by setting a time at which that state will be purged.

This QoS should be set such that it is longer than the longest period of time for which a **DDSDDataWriter** (p. 1305) and **DDSDDataReader** (p. 1272) are expected to be disconnected and then reconnected in your system.

An alternative to using this QoS to purge the state is to set the **DDS_DataReaderResourceLimitsQosPolicy::max_↵_remote_writers** (p. 650) QoS to a finite value. If that QoS is set to a finite value and the number of alive + not alive **DDSDDataWriter** (p. 1305) entities reaches the limit when a new **DDSDDataWriter** (p. 1305) is discovered, the oldest not alive **DDSDDataWriter** (p. 1305) will be replaced.

[default] **DDS_DURATION_AUTO** (p. 326)

[range] > 0 or **DDS_DURATION_AUTO** (p. 326)

9.35 DDS_DataRepresentationIdSeq Struct Reference

Declares IDL sequence < **DDS_DataRepresentationId_t** (p. 369) >

9.35.1 Detailed Description

Declares IDL sequence `< DDS_DataRepresentationId_t (p. 369) >`

`DDS_DataRepresentationId_t` (p. 369)

9.36 DDS_DataRepresentationQosPolicy Struct Reference

This QoS policy contains a list of representation identifiers and compression settings used by `DDSDataWriter` (p. 1305) and `DDSDataReader` (p. 1272) entities to negotiate which data representation and compression settings to use.

Public Attributes

- struct `DDS_DataRepresentationIdSeq` value
Sequence of representation identifiers.
- struct `DDS_CompressionSettings_t` `compression_settings`
<<extension>> (p. 236) Structure that contains the compression settings.

9.36.1 Detailed Description

This QoS policy contains a list of representation identifiers and compression settings used by `DDSDataWriter` (p. 1305) and `DDSDataReader` (p. 1272) entities to negotiate which data representation and compression settings to use.

Entity:

`DDSTopic` (p. 1601), `DDSDataReader` (p. 1272), `DDSDataWriter` (p. 1305)

Status:

`DDS_OFFERED_INCOMPATIBLE_QOS_STATUS` (p. 343), `DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS` (p. 343)

Properties:

`RxO` (p. ??) = YES
`Changeable` (p. ??) = UNTIL ENABLE (p. ??)

See also

DATA_REPRESENTATION (p. 368)

This policy has request-offer semantics for both representation and compression. For representation, a **DDSDataWriter** (p. 1305) may only offer a single representation. Attempting to put multiple representations in a **DDSDataWriter** (p. 1305) will result in **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336). A **DDSDataWriter** (p. 1305) will use its offered policy to communicate with its matched **DDSDataReader** (p. 1272) entities. A **DDSDataReader** (p. 1272) requests one or more representations. If a **DDSDataWriter** (p. 1305) offers a representation that is contained within the sequence of the **DDSDataReader** (p. 1272), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When representations are specified in the **DDS_TopicQos** (p. 1120), **DDSPublisher::copy_from_topic_qos** (p. 1550) copies the first element of the sequence, and **DDSSubscriber::copy_from_topic_qos** (p. 1592) copies the whole sequence.

For Compression, only the **DDS_CompressionSettings_t::compression_ids** (p. 609) is propagated and a **DDSDataWriter** (p. 1305) may only offer a single compression id. Attempting to put multiple compression_ids in a **DDSDataWriter** (p. 1305) will result in **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336).

A **DDSDataWriter** (p. 1305) will use its offered compression algorithm to compress data that it sends to its matched **DDSDataReader** (p. 1272) entities. A **DDSDataReader** (p. 1272) requests zero or more compression algorithms. If a **DDSDataWriter** (p. 1305) offers a representation that is contained within the algorithms requested by the **DDSDataReader** (p. 1272), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When compression IDs are specified in the **DDS_TopicQos** (p. 1120), **DDSPublisher::copy_from_topic_qos** (p. 1550) copies a single compression ID (see **DDS_CompressionSettings_t::compression_ids** (p. 609)), and **DDSSubscriber::copy_from_topic_qos** (p. 1592) copies all of the compression_ids.

9.36.2 Member Data Documentation

9.36.2.1 value

```
struct DDS_DataRepresentationIdSeq DDS_DataRepresentationQosPolicy::value
```

Sequence of representation identifiers.

[default] For **DDSTopic** (p. 1601), **DDSDataWriter** (p. 1305), and **DDSDataReader** (p. 1272), a list with one element: **DDS_AUTO_DATA_REPRESENTATION** (p. 370).

Note

An empty sequence is equivalent to a list with one element: **DDS_XCDR_DATA_REPRESENTATION** (p. 369).

9.36.2.2 compression_settings

```
struct DDS_CompressionSettings_t DDS_DataRepresentationQosPolicy::compression_settings
```

<<**extension**>> (p. 236) Structure that contains the compression settings.

compression_ids:

[default] The value depends on the entity

DDSDataWriter (p. 1305) and **DDSTopic** (p. 1601) are set to **DDS_COMPRESSION_ID_MASK_NONE** (p. 372)

DDSDataReader (p. 1272) **DDS_COMPRESSION_ID_MASK_ALL** (p. 372)

writer_compression_level:

[default] The value depends on the entity

DDSDataWriter (p. 1305) and **DDSTopic** (p. 1601) are set to **DDS_COMPRESSION_LEVEL_DEFAULT** (p. 373)

DDSDataReader (p. 1272) NOT SUPPORTED

writer_compression_threshold:

[default] The value depends on the entity

DDSDataWriter (p. 1305) and **DDSTopic** (p. 1601) are set to **DDS_COMPRESSION_THRESHOLD_DEFAULT** (p. 373)

DDSDataReader (p. 1272) NOT SUPPORTED

Sequence of data tags.

9.37.1 Detailed Description

Definition of **DDS_DataTagQosPolicy** (p. 376).

9.37.2 Member Data Documentation

9.37.2.1 tags

```
struct DDS_TagSeq DDS_DataTags::tags
```

Sequence of data tags.

[default] An empty list.

9.38 DDS_DataWriterCacheStatus Struct Reference

<<**extension**>> (p. 236) The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue.

Public Attributes

- **DDS_LongLong sample_count_peak**
*The highest value of **DDS_DataWriterCacheStatus::sample_count** (p. 666) over the lifetime of the DataWriter.*
- **DDS_LongLong sample_count**
The number of samples in the DataWriter's queue. This statistic includes meta-samples that represent the unregistration or disposal of an instance.
- **DDS_LongLong alive_instance_count**
*The number of instances currently in the DataWriter's queue that have an instance_state equal to **DDS_ALIVE**↔
INSTANCE_STATE (p. 161).*
- **DDS_LongLong alive_instance_count_peak**
*The highest value of **DDS_DataWriterCacheStatus::alive_instance_count** (p. 666) over the lifetime of the DataWriter.*
- **DDS_LongLong disposed_instance_count**
*The number of instances currently in the DataWriter's queue that have an instance_state equal to **DDS_NOT_ALIVE**↔
DISPOSED_INSTANCE_STATE (p. 161) (due to, for example, being disposed via the **FooDataWriter::dispose** (p. 1672) operation).*
- **DDS_LongLong disposed_instance_count_peak**
*The highest value of **DDS_DataWriterCacheStatus::disposed_instance_count** (p. 666) over the lifetime of the Data↔
Writer.*
- **DDS_LongLong unregistered_instance_count**
*The number of instances currently in the DataWriter's queue that the DataWriter has unregistered from via the **FooData**↔
Writer::unregister_instance (p. 1663) operation.*
- **DDS_LongLong unregistered_instance_count_peak**
*The highest value of **DDS_DataWriterCacheStatus::unregistered_instance_count** (p. 667) over the lifetime of the DataWriter.*

9.38.1 Detailed Description

<<**extension**>> (p. 236) The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue.

Entity:

DDSDDataWriter (p. 1305)

9.38.2 Member Data Documentation

9.38.2.1 sample_count_peak

DDS_LongLong DDS_DataWriterCacheStatus::sample_count_peak

The highest value of **DDS_DataWriterCacheStatus::sample_count** (p. 666) over the lifetime of the DataWriter.

9.38.2.2 sample_count

DDS_LongLong DDS_DataWriterCacheStatus::sample_count

The number of samples in the DataWriter's queue. This statistic includes meta-samples that represent the unregistration or disposal of an instance.

9.38.2.3 alive_instance_count

DDS_LongLong DDS_DataWriterCacheStatus::alive_instance_count

The number of instances currently in the DataWriter's queue that have an instance_state equal to **DDS_ALIVE_↔INSTANCE_STATE** (p. 161).

9.38.2.4 alive_instance_count_peak

DDS_LongLong DDS_DataWriterCacheStatus::alive_instance_count_peak

The highest value of **DDS_DataWriterCacheStatus::alive_instance_count** (p. 666) over the lifetime of the DataWriter.

9.38.2.5 disposed_instance_count

DDS_LongLong DDS_DataWriterCacheStatus::disposed_instance_count

The number of instances currently in the DataWriter's queue that have an instance_state equal to **DDS_NOT_↔ALIVE_DISPOSED_INSTANCE_STATE** (p. 161) (due to, for example, being disposed via the **FooDataWriter::dispose** (p. 1672) operation).

9.38.2.6 disposed_instance_count_peak

DDS_LongLong DDS_DataWriterCacheStatus::disposed_instance_count_peak

The highest value of **DDS_DataWriterCacheStatus::disposed_instance_count** (p. 666) over the lifetime of the DataWriter.

9.38.2.7 unregistered_instance_count

DDS_LongLong DDS_DataWriterCacheStatus::unregistered_instance_count

The number of instances currently in the DataWriter's queue that the DataWriter has unregistered from via the **FooDataWriter::unregister_instance** (p. 1663) operation.

9.38.2.8 unregistered_instance_count_peak

DDS_LongLong DDS_DataWriterCacheStatus::unregistered_instance_count_peak

The highest value of **DDS_DataWriterCacheStatus::unregistered_instance_count** (p. 667) over the lifetime of the DataWriter.

9.39 DDS_DataWriterProtocolQosPolicy Struct Reference

Protocol that applies only to **DDSDataWriter** (p. 1305) instances.

Public Attributes

- struct **DDS_GUID_t virtual_guid**
The virtual GUID (Global Unique Identifier).
- **DDS_UnsignedLong rtps_object_id**
The RTPS Object ID.
- **DDS_Boolean push_on_write**
Whether to push sample out when write is called.
- **DDS_Boolean disable_positive_acks**
Controls whether or not the writer expects positive acknowledgements from matching readers.
- **DDS_Boolean disable_inline_keyhash**
Controls whether or not a keyhash is propagated on the wire with each sample.
- **DDS_Boolean serialize_key_with_dispose**
Controls whether or not the serialized key is propagated on the wire with dispose samples.
- **DDS_Boolean propagate_app_ack_with_no_response**
*Controls whether or not a **DDSDataWriter** (p. 1305) receives **DDSDataWriterListener::on_application_acknowledgment** (p. 1333) notifications with an empty or invalid response.*
- struct **DDS_RtpsReliableWriterProtocol_t rtps_reliable_writer**
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **DDSDataWriter** (p. 1305). This parameter only has effect if both the writer and the matching reader are configured with **DDS_RELIABLE_RELIABILITY_QOS** (p. 435) **DDS_ReliabilityQosPolicyKind** (p. 434).*
- struct **DDS_SequenceNumber_t initial_virtual_sequence_number**
Determines, the initial virtual sequence number for this DataWriter.

9.39.1 Detailed Description

Protocol that applies only to **DDSDataWriter** (p. 1305) instances.

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **DDS_DataWriterProtocolQosPolicy** (p. 667) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per **DataWriter** or **DataReader** basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) basis) to meet the requirements of the end-user application so that data can be sent between **DataWriters** and **DataReaders** in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connexx responds to "slow" reliable **DataReaders** or ones that disconnect or are otherwise lost. See **DDS_ReliabilityQosPolicy** (p. 1027) for more information on the per-**DataReader**/**Writer** reliability configuration. **DDS_HistoryQosPolicy** (p. 906) and **DDS_ResourceLimitsQosPolicy** (p. 1038) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

DDSDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.39.2 Member Data Documentation

9.39.2.1 virtual_guid

```
struct DDS_GUID_t DDS_DataWriterProtocolQosPolicy::virtual_guid
```

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDSDataWriter** (p. 1305).

RTI Connexx uses the virtual GUID to associate a persisted writer history to a specific **DDSDataWriter** (p. 1305).

The RTI Connexx Persistence Service uses the virtual GUID to send samples on behalf of the original **DDSDataWriter** (p. 1305).

[default] **DDS_GUID_AUTO** (p. 330)

9.39.2.2 rtps_object_id

DDS_UnsignedLong DDS_DataWriterProtocolQosPolicy::rtps_object_id

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data writer according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connexx will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data writer.

A rtps_object_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connexx. In those cases, the recommendation is not to use automatic object ID assignment.

[default] DDS_RTPS_AUTO_ID (p. ??)

[range] [0,0x00ffffff]

9.39.2.3 push_on_write

DDS_Boolean DDS_DataWriterProtocolQosPolicy::push_on_write

Whether to push sample out when write is called.

If set to **DDS_BOOLEAN_TRUE** (p. 316) (the default), the writer will send a sample every time write is called. Otherwise, the sample is put into the queue waiting for a NACK from remote reader(s) to be sent out.

[default] DDS_BOOLEAN_TRUE (p. 316)

9.39.2.4 disable_positive_acks

DDS_Boolean DDS_DataWriterProtocolQosPolicy::disable_positive_acks

Controls whether or not the writer expects positive acknowledgements from matching readers.

If set to **DDS_BOOLEAN_TRUE** (p. 316), the writer does not expect readers to send positive acknowledgments to the writer. Consequently, instead of keeping a sample queued until all readers have positively acknowledged it, the writer will keep a sample for at least **DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_duration** (p. 1056), after which the sample is logically considered as positively acknowledged.

If set to **DDS_BOOLEAN_FALSE** (p. 316) (the default), the writer expects to receive positive acknowledgements from its acknowledging readers (**DDS_DataReaderProtocolQosPolicy::disable_positive_acks** (p. 626) = **DDS_BOOLEAN_FALSE** (p. 316)) and it applies the keep-duration to its non-acknowledging readers (**DDS_DataReaderProtocolQosPolicy::disable_positive_acks** (p. 626) = **DDS_BOOLEAN_TRUE** (p. 316)).

A writer with both acknowledging and non-acknowledging readers keeps a sample queued until acknowledgements have been received from all acknowledging readers and the keep-duration has elapsed for non-acknowledging readers.

[default] DDS_BOOLEAN_FALSE (p. 316)

9.39.2.5 disable_inline_keyhash

DDS_Boolean DDS_DataWriterProtocolQosPolicy::disable_inline_keyhash

Controls whether or not a keyhash is propagated on the wire with each sample.

This field only applies to keyed writers.

With each key, RTI Connexx associates an internal 16-byte representation, called a keyhash.

When this field is **DDS_BOOLEAN_FALSE** (p. 316), the keyhash is sent on the wire with every data instance.

When this field is **DDS_BOOLEAN_TRUE** (p. 316), the keyhash is not sent on the wire and the readers must compute the value using the received data.

If the *reader* is CPU bound, sending the keyhash on the wire may increase performance, because the reader does not have to get the keyhash from the data.

If the *writer* is CPU bound, sending the keyhash on the wire may decrease performance, because it requires more bandwidth (16 more bytes per sample).

Note: Setting `disable_inline_keyhash` to **DDS_BOOLEAN_TRUE** (p. 316) is not compatible with using RTI Real-Time Connect or RTI Recorder.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.39.2.6 serialize_key_with_dispose

DDS_Boolean DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose

Controls whether or not the serialized key is propagated on the wire with dispose samples.

This field only applies to keyed writers.

We recommend setting this field to **DDS_BOOLEAN_TRUE** (p. 316) if there are DataReaders where **DDS_DataReaderProtocolQosPolicy::propagate_dispose_of_unregistered_instances** (p. 626) is also **DDS_BOOLEAN_TRUE** (p. 316).

When setting `serialize_key_with_dispose` to **FALSE**, only a key hash is included in the dispose meta-sample sent by a DataWriter for a dispose action. If a dispose meta-sample only includes the key hash, then DataReaders must have previously received an actual data sample for the instance being disposed, in order for a DataReader to map a key hash/instance handle to actual key values.

If an actual data sample was never received for an instance and `serialize_key_with_dispose` is set to **FALSE**, then the DataReader application will not be able to determine the value of the key that was disposed, since **FooDataReader::get_key_value** (p. 1656) will not be able to map an instance handle to actual key values.

By setting `serialize_key_with_dispose` to **TRUE**, the values of the key members of a data type will be sent in the dispose meta-sample for a dispose action by the DataWriter. This allows the DataReader to map an instance handle to the values of the key members even when receiving a dispose meta-sample without previously having received a data sample for the instance.

Important: When this field is **DDS_BOOLEAN_TRUE** (p. 316), batching will not be compatible with RTI Connexx 4.3e, 4.4b, or 4.4c. The **DDSDDataReader** (p. 1272) entities will receive incorrect data and/or encounter deserialization errors.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.39.2.7 propagate_app_ack_with_no_response

DDS_Boolean DDS_DataWriterProtocolQosPolicy::propagate_app_ack_with_no_response

Controls whether or not a **DDSDDataWriter** (p.1305) receives **DDSDDataWriterListener::on_application_↵ acknowledgment** (p.1333) notifications with an empty or invalid response.

When this field is set to **DDS_BOOLEAN_FALSE** (p.316), the callback **DDSDDataWriterListener::on_application_↵ acknowledgment** (p.1333) will not be invoked if the sample being acknowledged has an empty or invalid response.

[default] **DDS_BOOLEAN_TRUE** (p.316)

9.39.2.8 rtps_reliable_writer

struct DDS_RtpsReliableWriterProtocol_t DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **DDSDDataWriter** (p.1305). This parameter only has effect if both the writer and the matching reader are configured with **DDS_RELIABLE_↵ RELIABILITY_QOS** (p.435) **DDS_ReliabilityQosPolicyKind** (p.434).

For details, refer to the **DDS_RtpsReliableWriterProtocol_t** (p.1047)

[default] [default] See **DDS_RtpsReliableWriterProtocol_t** (p.1047)

9.39.2.9 initial_virtual_sequence_number

struct DDS_SequenceNumber_t DDS_DataWriterProtocolQosPolicy::initial_virtual_sequence_number

Determines, the initial virtual sequence number for this DataWriter.

By default, the virtual sequence number of the first sample published by a DataWriter will be 1 for DataWriters that do not use durable writer history. For durable writers, the default virtual sequence number will be the last sequence number they published in a previous execution, plus one. So, when a non-durable DataWriter is restarted and must continue communicating with the same DataReaders, its samples start over with sequence number 1. Durable DataWriters start over where the last sequence number left off, plus one.

This QoS setting allows overwriting the default initial virtual sequence number.

Normally, this parameter is not expected to be modified; however, in some scenarios when continuing communication after restarting, applications may require the DataWriter's virtual sequence number to start at something other than the value described above. An example would be to enable non-durable DataWriters to start at the last sequence number published, plus one, similar to the durable DataWriter. This property enables you to make such a configuration, if desired.

The virtual sequence number can be overwritten as well on a per sample basis by updating **DDS_WriteParams_t_↵ ::identity** (p.1235) in the **FooDataWriter::write_w_params** (p.1671).

[default] **DDS_AUTO_SEQUENCE_NUMBER** (p.332)

9.40 DDS_DataWriterProtocolStatus Struct Reference

<<**extension**>> (p. 236) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

Public Attributes

- **DDS_LongLong pushed_sample_count**
The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.
- **DDS_LongLong pushed_sample_count_change**
The change in `DDS_DataWriterProtocolStatus::pushed_sample_count` (p. 674) since the last time the status was read.
- **DDS_LongLong pushed_sample_bytes**
The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.
- **DDS_LongLong pushed_sample_bytes_change**
The change in `DDS_DataWriterProtocolStatus::pushed_sample_bytes` (p. 674) since the last time the status was read.
- **DDS_LongLong filtered_sample_count**
[Not supported.] The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.
- **DDS_LongLong filtered_sample_count_change**
[Not supported.] The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.
- **DDS_LongLong filtered_sample_bytes**
[Not supported.] The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.
- **DDS_LongLong filtered_sample_bytes_change**
[Not supported.] The incremental change in the number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.
- **DDS_LongLong sent_heartbeat_count**
The number of Heartbeats sent between a local DataWriter and matching remote DataReader.
- **DDS_LongLong sent_heartbeat_count_change**
The change in `DDS_DataWriterProtocolStatus::sent_heartbeat_count` (p. 676) since the last time the status was read.
- **DDS_LongLong sent_heartbeat_bytes**
The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.
- **DDS_LongLong sent_heartbeat_bytes_change**
The change in `DDS_DataWriterProtocolStatus::sent_heartbeat_bytes` (p. 676) since the last time the status was read.
- **DDS_LongLong pulled_sample_count**
The number of user samples pulled from local DataWriter by matching DataReaders.
- **DDS_LongLong pulled_sample_count_change**
The change in `DDS_DataWriterProtocolStatus::pulled_sample_count` (p. 676) since the last time the status was read.
- **DDS_LongLong pulled_sample_bytes**
The number of bytes of user samples pulled from local DataWriter by matching DataReaders.
- **DDS_LongLong pulled_sample_bytes_change**
The change in `DDS_DataWriterProtocolStatus::pulled_sample_bytes` (p. 677) since the last time the status was read.
- **DDS_LongLong received_ack_count**
The number of ACKs from a remote DataReader received by a local DataWriter.
- **DDS_LongLong received_ack_count_change**
The change in `DDS_DataWriterProtocolStatus::received_ack_count` (p. 677) since the last time the status was read.
- **DDS_LongLong received_ack_bytes**

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

- **DDS_LongLong received_ack_bytes_change**

The change in `DDS_DataWriterProtocolStatus::received_ack_bytes` (p. 678) since the last time the status was read.

- **DDS_LongLong received_nack_count**

The number of NACKs from a remote DataReader received by a local DataWriter.

- **DDS_LongLong received_nack_count_change**

The change in `DDS_DataWriterProtocolStatus::received_nack_count` (p. 678) since the last time the status was read.

- **DDS_LongLong received_nack_bytes**

The number of bytes of NACKs from a remote DataReader received by a local DataWriter.

- **DDS_LongLong received_nack_bytes_change**

The change in `DDS_DataWriterProtocolStatus::received_nack_bytes` (p. 678) since the last time the status was read.

- **DDS_LongLong sent_gap_count**

The number of GAPS sent from local DataWriter to matching remote DataReaders.

- **DDS_LongLong sent_gap_count_change**

The change in `DDS_DataWriterProtocolStatus::sent_gap_count` (p. 679) since the last time the status was read.

- **DDS_LongLong sent_gap_bytes**

The number of bytes of GAPS sent from local DataWriter to matching remote DataReaders.

- **DDS_LongLong sent_gap_bytes_change**

The change in `DDS_DataWriterProtocolStatus::sent_gap_bytes` (p. 679) since the last time the status was read.

- **DDS_LongLong rejected_sample_count**

[Not supported.]

- **DDS_LongLong rejected_sample_count_change**

[Not supported.]

- **DDS_Long send_window_size**

Current maximum number of outstanding samples allowed in the DataWriter's queue.

- struct **DDS_SequenceNumber_t first_available_sample_sequence_number**

The sequence number of the first available sample currently queued in the local DataWriter.

- struct **DDS_SequenceNumber_t last_available_sample_sequence_number**

The sequence number of the last available sample currently queued in the local DataWriter.

- struct **DDS_SequenceNumber_t first_unacknowledged_sample_sequence_number**

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

- struct **DDS_SequenceNumber_t first_available_sample_virtual_sequence_number**

The virtual sequence number of the first available sample currently queued in the local DataWriter.

- struct **DDS_SequenceNumber_t last_available_sample_virtual_sequence_number**

The virtual sequence number of the last available sample currently queued in the local DataWriter.

- struct **DDS_SequenceNumber_t first_unacknowledged_sample_virtual_sequence_number**

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

- **DDS_InstanceHandle_t first_unacknowledged_sample_subscription_handle**

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

- struct **DDS_SequenceNumber_t first_unelapsed_keep_duration_sample_sequence_number**

The sequence number of the first sample whose keep duration has not yet elapsed.

- **DDS_LongLong pushed_fragment_count**

The number of DATA_FRAG messages that have been pushed by this DataWriter.

- **DDS_LongLong pushed_fragment_bytes**

The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.

- **DDS_LongLong pulled_fragment_count**

The number of DATA_FRAG messages that have been pulled from this DataWriter.

- **DDS_LongLong pulled_fragment_bytes**

The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.

- **DDS_LongLong received_nack_fragment_count**

The number of NACK_FRAG messages that have been received by this DataWriter.

- **DDS_LongLong received_nack_fragment_bytes**

The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

9.40.1 Detailed Description

<<**extension**>> (p. 236) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

Entity:

DDSDDataWriter (p. 1305)

9.40.2 Member Data Documentation

9.40.2.1 pushed_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_count

The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count is the number of sends done internally, and it may be greater than the number of user writes.

For large data, counts whole samples, not fragments. The fragment count is tracked in the **DDS_DataWriterProtocolStatus::pushed_fragment_count** (p. 682) statistic.

9.40.2.2 pushed_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_count_change

The change in **DDS_DataWriterProtocolStatus::pushed_sample_count** (p. 674) since the last time the status was read.

Counts protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing.

For large data, counts whole samples, not fragments.

9.40.2.3 pushed_sample_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes

The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts bytes of protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count of bytes corresponds to the number of sends done internally, and it may be greater than the number of user writes.

When data fragmentation is used, this statistic is incremented as fragments are written.

9.40.2.4 pushed_sample_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes_change

The change in **DDS_DataWriterProtocolStatus::pushed_sample_bytes** (p. 674) since the last time the status was read.

Counts bytes of protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing.

When data fragmentation is used, this statistic is incremented as fragments are written.

9.40.2.5 filtered_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_count

[Not supported.] The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

9.40.2.6 filtered_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_count_change

[Not supported.] The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

9.40.2.7 filtered_sample_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_bytes

[Not supported.] The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

9.40.2.8 filtered_sample_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_bytes_change

[Not supported.] The incremental change in the number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

9.40.2.9 sent_heartbeat_count

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count

The number of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

9.40.2.10 sent_heartbeat_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count_change

The change in **DDS_DataWriterProtocolStatus::sent_heartbeat_count** (p.676) since the last time the status was read.

9.40.2.11 sent_heartbeat_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes

The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

9.40.2.12 sent_heartbeat_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes_change

The change in **DDS_DataWriterProtocolStatus::sent_heartbeat_bytes** (p.676) since the last time the status was read.

9.40.2.13 pulled_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_count

The number of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 669) is **DDS_BOOLEAN_FALSE** (p. 316).

When data fragmentation is used, this statistic is incremented as fragments are written.

9.40.2.14 pulled_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_count_change

The change in **DDS_DataWriterProtocolStatus::pulled_sample_count** (p. 676) since the last time the status was read.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 669) is **DDS_BOOLEAN_FALSE** (p. 316).

For large data, counts whole samples, not fragments.

9.40.2.15 pulled_sample_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_bytes

The number of bytes of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 669) is **DDS_BOOLEAN_FALSE** (p. 316).

When data fragmentation is used, this statistic is incremented as fragments are written.

9.40.2.16 pulled_sample_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_bytes_change

The change in **DDS_DataWriterProtocolStatus::pulled_sample_bytes** (p. 677) since the last time the status was read.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when **DDS_DataWriterProtocolQosPolicy::push_on_write** (p. 669) is **DDS_BOOLEAN_FALSE** (p. 316).

For large data, counts bytes of whole samples, not fragments.

9.40.2.17 received_ack_count

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_count

The number of ACKs from a remote DataReader received by a local DataWriter.

9.40.2.18 received_ack_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_count_change

The change in **DDS_DataWriterProtocolStatus::received_ack_count** (p. 677) since the last time the status was read.

9.40.2.19 received_ack_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_bytes

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

9.40.2.20 received_ack_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_bytes_change

The change in **DDS_DataWriterProtocolStatus::received_ack_bytes** (p. 678) since the last time the status was read.

9.40.2.21 received_nack_count

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_count

The number of NACKs from a remote DataReader received by a local DataWriter.

9.40.2.22 received_nack_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_count_change

The change in **DDS_DataWriterProtocolStatus::received_nack_count** (p. 678) since the last time the status was read.

9.40.2.23 received_nack_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_bytes

The number of bytes of NACKs from a remote DataReader received by a local DataWriter.

9.40.2.24 received_nack_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_bytes_change

The change in **DDS_DataWriterProtocolStatus::received_nack_bytes** (p. 678) since the last time the status was read.

9.40.2.25 sent_gap_count

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_count

The number of GAPS sent from local DataWriter to matching remote DataReaders.

9.40.2.26 sent_gap_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_count_change

The change in **DDS_DataWriterProtocolStatus::sent_gap_count** (p. 679) since the last time the status was read.

9.40.2.27 sent_gap_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_bytes

The number of bytes of GAPS sent from local DataWriter to matching remote DataReaders.

9.40.2.28 sent_gap_bytes_change

DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_bytes_change

The change in **DDS_DataWriterProtocolStatus::sent_gap_bytes** (p. 679) since the last time the status was read.

9.40.2.29 rejected_sample_count

DDS_LongLong DDS_DataWriterProtocolStatus::rejected_sample_count

[Not supported.]

9.40.2.30 rejected_sample_count_change

DDS_LongLong DDS_DataWriterProtocolStatus::rejected_sample_count_change

[Not supported.]

9.40.2.31 send_window_size

DDS_Long DDS_DataWriterProtocolStatus::send_window_size

Current maximum number of outstanding samples allowed in the DataWriter's queue.

Spans the range from **DDS_RtpsReliableWriterProtocol_t::min_send_window_size** (p. 1058) to **DDS_RtpsReliableWriterProtocol_t::max_send_window_size** (p. 1059).

9.40.2.32 first_available_sample_sequence_number

struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_available_sample_sequence_number

The sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

9.40.2.33 last_available_sample_sequence_number

struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::last_available_sample_sequence_number

The sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

9.40.2.34 first_unacknowledged_sample_sequence_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_sequence↔  
number
```

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

9.40.2.35 first_available_sample_virtual_sequence_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_available_sample_virtual_sequence↔  
_number
```

The virtual sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

9.40.2.36 last_available_sample_virtual_sequence_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::last_available_sample_virtual_sequence↔  
_number
```

The virtual sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

9.40.2.37 first_unacknowledged_sample_virtual_sequence_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_virtual↔  
sequence_number
```

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

9.40.2.38 first_unacknowledged_sample_subscription_handle

```
DDS_InstanceHandle_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_subscription↔  
handle
```

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

Applies only for local DataWriter status.

9.40.2.39 first_unelapsed_keep_duration_sample_sequence_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unelapsed_keep_duration_sample_↵
sequence_number
```

The sequence number of the first sample whose keep duration has not yet elapsed.

Applicable only when **DDS_DataWriterProtocolQosPolicy::disable_positive_acks** (p. 669) is set.

Sequence number of the first sample kept in the DataWriter's queue whose keep_duration (applied when **DDS_Data↵WriterProtocolQosPolicy::disable_positive_acks** (p. 669) is set) has not yet elapsed.

Applies only for local DataWriter status.

9.40.2.40 pushed_fragment_count

```
DDS_LongLong DDS_DataWriterProtocolStatus::pushed_fragment_count
```

The number of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

9.40.2.41 pushed_fragment_bytes

```
DDS_LongLong DDS_DataWriterProtocolStatus::pushed_fragment_bytes
```

The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

9.40.2.42 pulled_fragment_count

```
DDS_LongLong DDS_DataWriterProtocolStatus::pulled_fragment_count
```

The number of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

9.40.2.43 pulled_fragment_bytes

```
DDS_LongLong DDS_DataWriterProtocolStatus::pulled_fragment_bytes
```

The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

9.40.2.44 received_nack_fragment_count

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_fragment_count

The number of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

9.40.2.45 received_nack_fragment_bytes

DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_fragment_bytes

The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

9.41 DDS_DataWriterQos Struct Reference

QoS policies supported by a **DDSDataWriter** (p. 1305) entity.

Public Member Functions

- **bool operator==** (const **DDS_DataWriterQos** &r) const
Compares two DataWriterQos objects for equality.
- **bool operator!=** (const **DDS_DataWriterQos** &r) const
Compares two DataWriterQos objects for inequality.
- **DDS_ReturnCode_t print** () const
*Prints this **DDS_DataWriterQos** (p. 683) to stdout.*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size) const

*Represents the maximum number of active topic queries a **DDSDataWriter** (p. 1305) will manage.*
- struct **DDS_AllocationSettings_t writer_loaned_sample_allocation**
*Represents the allocation settings of loaned samples managed by a **DDSDataWriter** (p. 1305).*
- **DDS_Boolean initialize_writer_loaned_sample**
*Whether or not to initialize loaned samples returned by a **DDSDataWriter** (p. 1305).*

9.42.1 Detailed Description

Various settings that configure how a **DDSDataWriter** (p. 1305) allocates and uses physical memory for internal resources.

DataWriters must allocate internal structures to handle the simultaneously blocking of threads trying to call **FooDataWriter::write** (p. 1666) on the same **DDSDataWriter** (p. 1305), for the storage used to batch small samples, and for content-based filters specified by DataReaders.

Most of these internal structures start at an initial size and, by default, will be grown as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDSDataWriter** (p. 1305). By setting the initial size to the maximum size, you will prevent RTI Connexx from dynamically allocating any memory after the creation of the **DDSDataWriter** (p. 1305).

This QoS policy is an extension to the DDS standard.

Entity:

DDSDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.42.2 Member Data Documentation

9.42.2.1 initial_concurrent_blocking_threads

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::initial_concurrent_blocking_threads

The initial number of threads that are allowed to concurrently block on write call on the same **DDSDataWriter** (p. 1305).

This value only applies if **DDS_HistoryQosPolicy** (p. 906) has its kind set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 406) and **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029) is > 0.

[default] 1

[range] [1, 10000], <= max_concurrent_blocking_threads

9.42.2.2 max_concurrent_blocking_threads

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_concurrent_blocking_threads

The maximum number of threads that are allowed to concurrently block on write call on the same **DDSDataWriter** (p. 1305).

This value only applies if **DDS_HistoryQosPolicy** (p. 906) has its kind set to **DDS_KEEP_ALL_HISTORY_QOS** (p. 406) and **DDS_ReliabilityQosPolicy::max_blocking_time** (p. 1029) is > 0 .

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, 10000] or **DDS_LENGTH_UNLIMITED** (p. 437), \geq initial_concurrent_blocking_threads

9.42.2.3 max_remote_reader_filters

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_remote_reader_filters

The maximum number of remote DataReaders for which the **DDSDataWriter** (p. 1305) will perform content-based filtering.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [0, $(2^{31})-2$] or **DDS_LENGTH_UNLIMITED** (p. 437).

0: The **DDSDataWriter** (p. 1305) will not perform filtering for any **DDSDataReader** (p. 1272).

1 to $(2^{31})-2$: The DataWriter will filter for up to the specified number of DataReaders. In addition, the Datawriter will store the result of the filtering per sample per DataReader.

DDS_LENGTH_UNLIMITED (p. 437): The DataWriter will filter for up to $(2^{31})-2$ DataReaders. However, in this case, the DataWriter will not store the filtering result per sample per DataReader. Thus, if a sample is resent (such as due to a loss of reliable communication), the sample will be filtered again.

9.42.2.4 initial_batches

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::initial_batches

Represents the initial number of batches a **DDSDataWriter** (p. 1305) will manage.

[default] 8

[range] [1, 100 million]

See also

DDS_BatchQosPolicy (p. 594)

9.42.2.5 max_batches

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_batches

Represents the maximum number of batches a **DDSDataWriter** (p. 1305) will manage.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

When batching is enabled, the maximum number of samples that a **DDSDataWriter** (p. 1305) can store is limited by this value and **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041).

[range] [1,100 million] or **DDS_LENGTH_UNLIMITED** (p. 437) \geq **DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples** (p. 1053) if batching is enabled

See also

DDS_BatchQosPolicy (p. 594)

9.42.2.6 instance_replacement

DDS_DataWriterResourceLimitsInstanceReplacementKind DDS_DataWriterResourceLimitsQosPolicy::instance_replacement

Sets the kinds of instances allowed to be replaced when instance resource limits are reached.

When a **DDSDataWriter** (p. 1305)'s number of active instances is greater than **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041), it will try to make room by replacing an existing instance. This field specifies the kinds of instances allowed to be replaced.

If a replaceable instance is not available, either an out-of-resources exception will be returned, or the writer may block if the instance reclamation was done when writing.

[default] **DDS_UNREGISTERED_INSTANCE_REPLACEMENT** (p. 382)

See also

DDS_DataWriterResourceLimitsInstanceReplacementKind (p. 381)

9.42.2.7 replace_empty_instances

DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::replace_empty_instances

Whether or not to replace empty instances during instance replacement.

When a **DDSDDataWriter** (p. 1305) has more active instances than allowed by **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041), it tries to make room by replacing an existing instance. This field configures whether empty instances (i.e. instances with no samples) may be replaced. If set **DDS_BOOLEAN_TRUE** (p. 316), then a **DDSDDataWriter** (p. 1305) will first try reclaiming empty instances, before trying to replace whatever is specified by **DDS_DataWriterResourceLimitsQosPolicy::instance_replacement** (p. 695).

[default] **DDS_BOOLEAN_FALSE** (p. 316)

See also

DDS_DataWriterResourceLimitsInstanceReplacementKind (p. 381)

9.42.2.8 autoregister_instances

DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::autoregister_instances

Whether or not to automatically register new instances.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

When set to true, it is possible to write with a non-NIL handle of an instance that is not registered: the write operation will succeed and the instance will be registered. Otherwise, that write operation would fail.

See also

FooDataWriter::write (p. 1666)

9.42.2.9 initial_virtual_writers

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::initial_virtual_writers

The initial number of virtual writers supported by a **DDSDDataWriter** (p. 1305).

[default] 1

[range] [1, 1000000], or **DDS_LENGTH_UNLIMITED** (p. 437)

9.42.2.10 max_virtual_writers

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_virtual_writers

The maximum number of virtual writers supported by a **DDSDataWriter** (p. 1305).

Sets the maximum number of unique virtual writers supported by a **DDSDataWriter** (p. 1305), where virtual writers are added when samples are written with the virtual writer GUID.

This field is specially relevant in the configuration of Persistence Service DataWriters since these DataWriters will publish samples on behalf of multiple virtual writers.

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 1000000], or DDS_LENGTH_UNLIMITED (p. 437)

9.42.2.11 max_remote_readers

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_remote_readers

The maximum number of remote readers supported by a **DDSDataWriter** (p. 1305).

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 1000000], or DDS_LENGTH_UNLIMITED (p. 437)

9.42.2.12 max_app_ack_remote_readers

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_app_ack_remote_readers

The maximum number of application-level acknowledging remote readers supported by a **DDSDataWriter** (p. 1305).

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 1000000], or DDS_LENGTH_UNLIMITED (p. 437)

9.42.2.13 initial_active_topic_queries

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::initial_active_topic_queries

Represents the initial number of active topic queries a **DDSDataWriter** (p. 1305) will manage.

[default] 1

[range] [1, 1000000]

See also

DDS_TopicQueryDispatchQosPolicy (p. 1126)

9.42.2.14 max_active_topic_queries

DDS_Long DDS_DataWriterResourceLimitsQosPolicy::max_active_topic_queries

Represents the maximum number of active topic queries a **DDSDDataWriter** (p. 1305) will manage.

When topic queries are enabled, the maximum number of topic queries that a **DDSDDataWriter** (p. 1305) can publish data samples for at the same time is limited by this value.

When the DataWriter receives one topic query above this limit, it will wait to process it until it finishes publishing all the samples for at least one of the current topic queries.

[default] DDS_LENGTH_UNLIMITED (p. 437)

[range] [1, 1000000] or DDS_LENGTH_UNLIMITED (p. 437)

See also

DDS_TopicQueryDispatchQosPolicy (p. 1126)

9.42.2.15 writer_loaned_sample_allocation

struct DDS_AllocationSettings_t DDS_DataWriterResourceLimitsQosPolicy::writer_loaned_sample_allocation

Represents the allocation settings of loaned samples managed by a **DDSDDataWriter** (p. 1305).

The number of samples loaned by a **DDSDDataWriter** (p. 1305) via **FooDataWriter::get_loan** (p. 1678) is limited by the **DDS_AllocationSettings_t::max_count** (p. 583) of **DDS_DataWriterResourceLimitsQosPolicy::writer_loaned_sample_allocation** (p. 698). **FooDataWriter::get_loan** (p. 1678) returns NULL if and only if **DDS_AllocationSettings_t::max_count** (p. 583) samples have been loaned, and none of those samples has been written with **FooDataWriter::write** (p. 1666) or discarded via **FooDataWriter::discard_loan** (p. 1679).

[default] initial_count = **DDS_AUTO_COUNT** (p. 396) (**DDS_ResourceLimitsQosPolicy::initial_samples** (p. 1041) + 1); max_count = **DDS_AUTO_COUNT** (p. 396) (**DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) + 1); incremental_count = **DDS_AUTO_COUNT** (p. 396) (0 if initial_count = max_count; initial_count otherwise);

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

See also

FooDataWriter::get_loan (p. 1678)

FooDataWriter::discard_loan (p. 1679)

9.42.2.16 initialize_writer_loaned_sample

DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::initialize_writer_loaned_sample

Whether or not to initialize loaned samples returned by a **DDSDataWriter** (p. 1305).

[default] **DDS_BOOLEAN_FALSE** (p. 316)

See also

FooDataWriter::get_loan (p. 1678)

9.43 DDS_DataWriterShmemRefTransferModeSettings Struct Reference

Settings related to transferring data using shared memory references.

Public Attributes

- **DDS_Boolean enable_data_consistency_check**
Controls if samples can be checked for consistency.

9.43.1 Detailed Description

Settings related to transferring data using shared memory references.

It is used to configure a **DDSDataWriter** (p. 1305) using **Zero Copy transfer over shared memory** (p. 70).

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

QoS:

DDS_DataWriterTransferModeQosPolicy (p. 700)

9.43.2 Member Data Documentation

9.43.2.1 enable_data_consistency_check

DDS_Boolean DDS_DataWriterShmemRefTransferModeSettings::enable_data_consistency_check

Controls if samples can be checked for consistency.

When this setting is true, the **DDSDDataWriter** (p. 1305) sends an incrementing sequence number as an inline QoS with every sample. This sequence number allows a **DDSDDataReader** (p. 1272) to use the **FooDataReader::is_data_↵_consistent** (p. 1658) API to detect if the **DDSDDataWriter** (p. 1305) overwrote the sample before the **DDSDDataReader** (p. 1272) could complete processing the sample.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.44 DDS_DataWriterTransferModeQosPolicy Struct Reference

<<*extension*>> (p. 236) Qos related to transferring data

Public Attributes

- struct **DDS_DataWriterShmemRefTransferModeSettings** **shmem_ref_settings**
Settings related to transferring data using shared memory references.

9.44.1 Detailed Description

<<*extension*>> (p. 236) Qos related to transferring data

It contains qualitative settings related to the actions a **DDSDDataWriter** (p. 1305) performs while transferring its data.

Entity:

DDSDDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.44.2 Member Data Documentation

9.44.2.1 shmem_ref_settings

```
struct DDS_DataWriterShmemRefTransferModeSettings DDS_DataWriterTransferModeQosPolicy::shmem_ref_settings
```

Settings related to transferring data using shared memory references.

For details, refer to the **DDS_DataWriterShmemRefTransferModeSettings** (p. 699)

9.45 DDS_DeadlineQosPolicy Struct Reference

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

Public Attributes

- struct **DDS_Duration_t** **period**
Duration of the deadline period.

9.45.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

A **DDSDataReader** (p. 1272) expects a new sample updating the value of each instance at least once every `period`. That is, `period` specifies the maximum expected elapsed time between arriving data samples.

A **DDSDataWriter** (p. 1305) indicates that the application commits to write a new value (using the **DDSDataWriter** (p. 1305)) for each instance managed by the **DDSDataWriter** (p. 1305) at least once every `period`.

This QoS can be used during system integration to ensure that applications have been coded to meet design specifications.

It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions to prevent total system failure when data is not received in time. For topics on which data is not expected to be periodic, `period` should be set to an infinite value.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 342), **DDS_REQUESTED_DEADLINE_MISSED_STATUS** (p. 343), **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 343), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343)

Properties:

RxO (p. ??) = YES
Changeable (p. ??) = YES (p. ??)

9.45.2 Usage

This policy is useful for cases where a **DDSTopic** (p. 1601) is expected to have each instance updated periodically. On the publishing side this setting establishes a contract that the application must meet. On the subscribing side the setting establishes a minimum requirement for the remote publishers that are expected to supply the data values.

When RTI Connexx 'matches' a **DDSDataWriter** (p. 1305) and a **DDSDataReader** (p. 1272) it checks whether the settings are compatible (i.e., *offered deadline* \leq *requested deadline*); if they are not, the two entities are informed (via the **DDSListener** (p. 1509) or **DDSCondition** (p. 1260) mechanism) of the incompatibility of the QoS settings and communication will not occur.

Assuming that the reader and writer ends have compatible settings, the fulfilment of this contract is monitored by RTI Connexx and the application is informed of any violations by means of the proper **DDSListener** (p. 1509) or **DDSCondition** (p. 1260).

9.45.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered period* \leq *requested period* holds.

9.45.4 Consistency

The setting of the **DEADLINE** (p. 384) policy must be set consistently with that of the **TIME_BASED_FILTER** (p. 440).

For these two policies to be consistent the settings must be such that *deadline period* \geq *minimum_separation*.

An attempt to set these policies in an inconsistent manner will result in **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336) in **set_qos (abstract)** (p. ??), or the **DDSEntity** (p. 1446) will not be created.

For a **DDSDataReader** (p. 1272), the **DEADLINE** (p. 384) policy and **DDS_TimeBasedFilterQosPolicy** (p. 1111) may interact such that even though the **DDSDataWriter** (p. 1305) is writing samples fast enough to fulfill its commitment to its own deadline, the **DDSDataReader** (p. 1272) may see violations of its deadline. This happens because RTI Connexx will drop any samples received within the **DDS_TimeBasedFilterQosPolicy::minimum_separation** (p. 1113). To avoid triggering the **DDSDataReader** (p. 1272)'s deadline, even though the matched **DDSDataWriter** (p. 1305) is meeting its own deadline, set the two QoS parameters so that:

reader deadline \geq *reader minimum_separation* + *writer deadline*

See **DDS_TimeBasedFilterQosPolicy** (p. 1111) for more information about the interactions between deadlines and time-based filters.

9.45.5 Member Data Documentation

9.45.5.1 period

```
struct DDS_Duration_t DDS_DeadlineQosPolicy::period
```

Duration of the deadline period.

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 325), \geq **DDS_TimeBasedFilterQosPolicy**↔
::minimum_separation (p. 1113)

9.46 DDS_DestinationOrderQosPolicy Struct Reference

Controls how the middleware will deal with data sent by multiple **DDSDataWriter** (p. 1305) entities for the same instance of data (i.e., same **DDSTopic** (p. 1601) and key).

Public Attributes

- **DDS_DestinationOrderQosPolicyKind kind**
Specifies the desired kind of destination order.
- **DDS_DestinationOrderQosPolicyScopeKind scope**
Specifies the desired scope of the source destination order.
- struct **DDS_Duration_t source_timestamp_tolerance**
<<extension>> (p. 236) Allowed tolerance between source timestamps of consecutive samples.

9.46.1 Detailed Description

Controls how the middleware will deal with data sent by multiple **DDSDataWriter** (p. 1305) entities for the same instance of data (i.e., same **DDSTopic** (p. 1601) and key).

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_REQUESTED_INCOMPATIBLE_QOS_**↔
STATUS (p. 343)

Properties:

RxO (p. ??) = YES
Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

9.46.2 Usage

When multiple DataWriters send data for the same topic, the order in which data from different DataWriters are received by the applications of different DataReaders may be different. So different DataReaders may not receive the same "last" value when DataWriters stop sending data.

This QoS policy controls how each subscriber resolves the final value of a data instance that is written by multiple **DDSDataWriter** (p. 1305) entities (which may be associated with different **DDSPublisher** (p. 1534) entities) running on different nodes.

This QoS can be used to create systems that have the property of "eventual consistency." Thus intermediate states across multiple applications may be inconsistent, but when DataWriters stop sending changes to the same topic, all applications will end up having the same state.

This QoS policy can be set for both DataWriters and DataReaders.

For the DataReader:

The default setting, **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), indicates that (assuming the **OWNERSHIP_STRENGTH** (p. 415) policy allows it) the latest received value for the instance should be the one whose value is kept. That is, data will be delivered by a **DDSDataReader** (p. 1272) in the order in which it was *received* (which may lead to inconsistent final values).

For **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), if the scope is set to **DDS_INSTANCE_↵_SCOPE_DESTINATIONORDER_QOS** (p. 387) (default), within each instance, the sample's source timestamp shall be used to determine the most recent information. This is the only setting that, in the case of concurrent same-strength DataWriters updating the same instance, ensures that all DataReaders end up with the same final value for the instance. If a DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped. The **SAMPLE_REJECTED** status or the **SAMPLE_LOST** status will not be updated.

If scope is set to **DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS** (p. 387), the ordering is enforced per topic across all instances.

In addition, a DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than `source_timestamp_tolerance`. Otherwise, the DDS sample is dropped. The **SAMPLE_REJECTED** status or the **SAMPLE_LOST** status will not be updated.

For the DataWriter:

For the default setting, **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), the DataWriter will not enforce source timestamp ordering when writing samples using the **FooDataWriter::write_w_params** (p. 1671) or **FooDataWriter::write_w_timestamp** (p. 1670) API. The source timestamp of a new sample can be older than the source timestamp of the previous samples.

When using **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), If scope is set to **DDS_↵_INSTANCE_SCOPE_DESTINATIONORDER_QOS** (p. 387) (default), when writing a sample, the sample's timestamp must not be older than the timestamp of the previously written DDS sample for the same instance. If, however, the timestamp is older than the timestamp of the previously written DDS sample—but the difference is less than the `source_↵_timestamp_tolerance`—the DDS sample will use the previously written DDS sample's timestamp as its timestamp. Otherwise, if the difference is greater than the tolerance, the write will fail with retcode **DDS_RETCODE_BAD_PARAMETER** (p. 335).

If scope is set to **DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS** (p. 387), a new sample timestamp must not be older than the timestamp of the previously written DDS sample, across all instances. (The ordering is enforced across all instances.)

9.46.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind* \geq *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS_DestinationOrderQosPolicy**↵
::kind (p. 705) are considered ordered such that **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386) < **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386)

9.46.4 Member Data Documentation

9.46.4.1 kind

DDS_DestinationOrderQosPolicyKind DDS_DestinationOrderQosPolicy::kind

Specifies the desired kind of destination order.

[default] **DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386),

9.46.4.2 scope

DDS_DestinationOrderQosPolicyScopeKind DDS_DestinationOrderQosPolicy::scope

Specifies the desired scope of the source destination order.

Indicates if tolerance check and the current sample's timestamp is computed based on instance or topic basis.

[default] **DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS** (p. 387)

9.46.4.3 source_timestamp_tolerance

struct **DDS_Duration_t** DDS_DestinationOrderQosPolicy::source_timestamp_tolerance

<<**extension**>> (p. 236) Allowed tolerance between source timestamps of consecutive samples.

When a **DDSDataWriter** (p. 1305) sets **DDS_DestinationOrderQosPolicyKind** (p. 386) to **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), when writing a sample, its timestamp must not be less than the timestamp of the previously written sample. However, if it is less than the timestamp of the previously written sample but the difference is less than this tolerance, the sample will use the previously written sample's timestamp as its timestamp. Otherwise, if the difference is greater than this tolerance, the write will fail.

When a **DDSDataReader** (p. 1272) sets **DDS_DestinationOrderQosPolicyKind** (p. 386) to **DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS** (p. 386), the **DDSDataReader** (p. 1272) will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than this tolerance. Otherwise, the sample is dropped.

[default] 100 milliseconds for **DDSDataWriter** (p. 1305), 30 seconds for **DDSDataReader** (p. 1272)

9.47 DDS_DiscoveryConfigQosPolicy Struct Reference

Settings for discovery configuration.

Public Attributes

- struct **DDS_Duration_t participant_liveliness_lease_duration**
The liveliness lease duration for the participant.
- struct **DDS_Duration_t participant_liveliness_assert_period**
The period to assert liveliness for the participant.
- struct **DDS_Duration_t participant_announcement_period**
The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).
- **DDS_RemoteParticipantPurgeKind remote_participant_purge_kind**
The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
- struct **DDS_Duration_t max_liveliness_loss_detection_period**
The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
- **DDS_Long initial_participant_announcements**
The number of initial announcements sent when a participant is first enabled.
- **DDS_Long new_remote_participant_announcements**
The number of participant announcements sent when a remote participant is newly discovered.
- struct **DDS_Duration_t min_initial_participant_announcement_period**
The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
- struct **DDS_Duration_t max_initial_participant_announcement_period**
The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
- struct **DDS_BuiltinTopicReaderResourceLimits_t participant_reader_resource_limits**
Resource limits.
- struct **DDS_RtpsReliableReaderProtocol_t publication_reader**
RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.
- struct **DDS_BuiltinTopicReaderResourceLimits_t publication_reader_resource_limits**
Resource limits.
- struct **DDS_RtpsReliableReaderProtocol_t subscription_reader**
RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.
- struct **DDS_BuiltinTopicReaderResourceLimits_t subscription_reader_resource_limits**
Resource limits.
- struct **DDS_RtpsReliableWriterProtocol_t publication_writer**
RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.
- struct **DDS_WriterDataLifecycleQosPolicy publication_writer_data_lifecycle**
Writer data lifecycle settings for a built-in publication writer.
- struct **DDS_RtpsReliableWriterProtocol_t subscription_writer**
RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.
- struct **DDS_WriterDataLifecycleQosPolicy subscription_writer_data_lifecycle**
Writer data lifecycle settings for a built-in subscription writer.

- **DDS_DiscoveryConfigBuiltinPluginKindMask builtin_discovery_plugins**
Mask of built-in discovery plugin kinds.
- **DDS_DiscoveryConfigBuiltinChannelKindMask enabled_builtin_channels**
The mask specifying which built-in channels should be enabled.
- **DDS_ReliabilityQosPolicyKind participant_message_reader_reliability_kind**
Reliability policy for a built-in participant message reader.
- struct **DDS_RtpsReliableReaderProtocol_t participant_message_reader**
RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if `DDS_DiscoveryConfigQosPolicy::participant_message_reader_reliability_kind` (p. 715) is set to `DDS_RELIABLE_RELIABILITY_QOS` (p. 435).
- struct **DDS_RtpsReliableWriterProtocol_t participant_message_writer**
RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with `DDS_RELIABLE_RELIABILITY_QOS` (p. 435) `DDS_ReliabilityQosPolicyKind` (p. 434).
- struct **DDS_PublishModeQosPolicy publication_writer_publish_mode**
Publish mode policy for the built-in publication writer.
- struct **DDS_PublishModeQosPolicy subscription_writer_publish_mode**
Publish mode policy for the built-in subscription writer.
- struct **DDS_AsynchronousPublisherQosPolicy asynchronous_publisher**
Asynchronous publishing settings for the discovery `DDSPublisher` (p. 1534) and all entities that are created by it.
- struct **DDS_Duration_t default_domain_announcement_period**
The period to announce a participant to the default domain 0.
- **DDS_Boolean ignore_default_domain_announcements**
Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
- struct **DDS_RtpsReliableWriterProtocol_t service_request_writer**
RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in `DDS_ServiceRequest` (p. 1083) writer.
- struct **DDS_WriterDataLifecycleQosPolicy service_request_writer_data_lifecycle**
Writer data lifecycle settings for a built-in `DDS_ServiceRequest` (p. 1083) writer.
- struct **DDS_PublishModeQosPolicy service_request_writer_publish_mode**
Publish mode policy for the built-in service request writer.
- struct **DDS_RtpsReliableReaderProtocol_t service_request_reader**
RTPS reliable reader protocol-related configuration settings for a built-in `DDS_ServiceRequest` (p. 1083) reader.
- struct **DDS_Duration_t locator_reachability_assert_period**
Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.
- struct **DDS_Duration_t locator_reachability_lease_duration**
The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.
- struct **DDS_Duration_t locator_reachability_change_detection_period**
Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.
- struct **DDS_RtpsReliableWriterProtocol_t secure_volatile_writer**
RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.
- struct **DDS_PublishModeQosPolicy secure_volatile_writer_publish_mode**
Publish mode policy for the built-in secure volatile writer.
- struct **DDS_RtpsReliableReaderProtocol_t secure_volatile_reader**
RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
- **DDS_Long endpoint_type_object_lb_serialization_threshold**

Option to reduce the size required to propagate a `TypeObject` in Simple Endpoint Discovery.

- struct **DDS_Duration_t dns_tracker_polling_period**
Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.
- struct **DDS_PublishModeQosPolicy participant_configuration_writer_publish_mode**
Publish mode policy for the built-in participant configuration writer.
- struct **DDS_RtpsReliableWriterProtocol_t participant_configuration_writer**
RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.
- struct **DDS_WriterDataLifecycleQosPolicy participant_configuration_writer_data_lifecycle**
Writer data lifecycle settings for a built-in participant configuration writer.
- struct **DDS_RtpsReliableReaderProtocol_t participant_configuration_reader**
RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.
- struct **DDS_BuiltinTopicReaderResourceLimits_t participant_configuration_reader_resource_limits**
Resource limits for the built-in topic participant configuration reader.

9.47.1 Detailed Description

Settings for discovery configuration.

<<*extension*>> (p. 236) This QoS policy controls the amount of delay in discovering entities in the system and the amount of discovery traffic in the network.

The amount of network traffic required by the discovery process can vary widely, based on how your application has chosen to configure the middleware's network addressing (e.g., unicast vs. multicast, multicast TTL, etc.), the size of the system, whether all applications are started at the same time or whether start times are staggered, and other factors. Your application can use this policy to make tradeoffs between discovery completion time and network bandwidth utilization. In addition, you can introduce random back-off periods into the discovery process to decrease the probability of network contention when many applications start simultaneously.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.47.2 Member Data Documentation

9.47.2.1 participant_liveliness_lease_duration

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration
```

The liveliness lease duration for the participant.

This is the same as the expiration time of the DomainParticipant as defined in the RTPS protocol.

If the participant has not refreshed its own liveliness to other participants at least once within this period, it may be considered as stale by other participants in the network.

Should be strictly greater than **DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period** (p. 709).

[default] 100 seconds

[range] [1 nanosec, 1 year], > participant_liveliness_assert_period

9.47.2.2 participant_liveliness_assert_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period
```

The period to assert liveliness for the participant.

The period at which the participant will refresh its liveliness to all the peers.

Should be strictly less than **DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration** (p. 708).

[default] 30 seconds

[range] [1 nanosec, 1 year], < participant_liveliness_lease_duration

9.47.2.3 participant_announcement_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::participant_announcement_period
```

The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).

The **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) list **DDSDomainParticipant::add_peer** (p. 1392) API are used to configure a set of potential peers that a DomainParticipant may discover. The **DDS_DiscoveryConfigQosPolicy::participant_announcement_period** (p. 709) configures how frequently a DomainParticipant will announce itself to the subset of the configured potential peers that it has not matched with yet. Once a DomainParticipant matches with a DomainParticipant at one of configured potential peer locators, it will no longer announce itself to that locator at this period unless liveliness is lost.

This QoS policy is only supported when using the Simple Participant Discovery Protocol 2.0 (SPDP2). Setting this value when using the Simple Participant Discovery Protocol (SPDP) or other participant discovery protocols is not supported and will result in an error.

[default] **DDS_DURATION_AUTO** (p. 326) (Takes the value of **DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period** (p. 709))

[range] [1 nanosec, 1 year]

9.47.2.4 remote_participant_purge_kind

```
DDS_RemoteParticipantPurgeKind DDS_DiscoveryConfigQosPolicy::remote_participant_purge_kind
```

The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.

Most users will not need to change this value from its default, **DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE** (p. 394). However, **DDS_NO_REMOTE_PARTICIPANT_PURGE** (p. 395) may be a good choice if the following conditions apply:

1. Discovery communication with a remote participant may be lost while data communication remains intact. Such will not typically be the case if discovery takes place over the Simple Discovery Protocol, but may be the case if the RTI Enterprise Discovery Service is used.
2. Extensive and prolonged lack of discovery communication between participants is not expected to be common, either because participant loss itself is expected to be rare, or because participants may be lost sporadically but will typically return again.
3. Maintaining inter-participant liveliness is problematic, perhaps because a participant has no writers with the appropriate **DDS_LivelinessQosPolicyKind** (p. 409).

[default] **DDS_LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE** (p. 394)

9.47.2.5 max_liveliness_loss_detection_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::max_liveliness_loss_detection_period
```

The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.

Notification of the loss of liveliness of a remote entity may come more quickly than this duration, depending on the liveliness contract between the local and remote entities and the capabilities of the discovery mechanism in use. For example, a **DDSDDataReader** (p. 1272) will learn of the loss of liveliness of a matched **DDSDDataWriter** (p. 1305) within the reader's offered liveliness lease duration.

Shortening this duration will increase the responsiveness of entities to communication failures. However, it will also increase the CPU usage of the application, as the liveliness of remote entities will be examined more frequently.

[default] 60 seconds

[range] [1 nanosec, 1 year]

9.47.2.6 initial_participant_announcements

```
DDS_Long DDS_DiscoveryConfigQosPolicy::initial_participant_announcements
```

The number of initial announcements sent when a participant is first enabled.

[default] 5

[range] [1, 1 million]

9.47.2.7 new_remote_participant_announcements

DDS_Long DDS_DiscoveryConfigQosPolicy::new_remote_participant_announcements

The number of participant announcements sent when a remote participant is newly discovered.

These announcements are only sent to the newly discovered remote participant, they are not also broadcast to the initial_peers list.

[default] 2

[range] [0,1 million]

9.47.2.8 min_initial_participant_announcement_period

struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period

The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between this and **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 711) is introduced in between initial announcements when a new remote participant is discovered.

The setting of **DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period** (p. 711) must be consistent with **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 711). For these two values to be consistent, they must verify that:

DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period (p. 711) \leq **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 711).

[default] 10 milliseconds

[range] [1 nanosec,1 year]

9.47.2.9 max_initial_participant_announcement_period

struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period

The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between **DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period** (p. 711) and this is introduced in between initial announcements when a new remote participant is discovered.

The setting of **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 711) must be consistent with **DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period** (p. 711). For these two values to be consistent, they must verify that:

DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period (p. 711) \leq **DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period** (p. 711).

[default] 1 second

[range] [1 nanosec,1 year]

9.47.2.10 participant_reader_resource_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::participant_reader_↵  
resource_limits
```

Resource limits.

Resource limit of the built-in topic participant reader. For details, see **DDS_BuiltinTopicReaderResourceLimits_t** (p. 599).

9.47.2.11 publication_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::publication_reader
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.

For details, refer to the **DDS_RtpsReliableReaderProtocol_t** (p. 1043)

[default]

min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;

9.47.2.12 publication_reader_resource_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::publication_reader_↵  
resource_limits
```

Resource limits.

Resource limit of the built-in topic publication reader. For details, see **DDS_BuiltinTopicReaderResourceLimits_t** (p. 599).

9.47.2.13 subscription_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::subscription_reader
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.

For details, refer to the **DDS_RtpsReliableReaderProtocol_t** (p. 1043)

[default]

min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;

9.47.2.14 subscription_reader_resource_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::subscription_reader↔
_resource_limits
```

Resource limits.

Resource limit of the built-in topic subscription reader. For details, see **DDS_BuiltinTopicReaderResourceLimits_t** (p. 599).

9.47.2.15 publication_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::publication_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.

For details, refer to the **DDS_RtpsReliableWriterProtocol_t** (p. 1047)

9.47.2.16 publication_writer_data_lifecycle

```
struct DDS_WriterDataLifecycleQosPolicy DDS_DiscoveryConfigQosPolicy::publication_writer_data_↵
lifecycle
```

Writer data lifecycle settings for a built-in publication writer.

For details, refer to the **DDS_WriterDataLifecycleQosPolicy** (p. 1240). **DDS_WriterDataLifecycleQosPolicy**↵
::autodispose_unregistered_instances (p. 1241) will always be forced to **DDS_BOOLEAN_TRUE** (p. 316).

9.47.2.17 subscription_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::subscription_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.

For details, refer to the **DDS_RtpsReliableWriterProtocol_t** (p. 1047)

[default]

```

```

9.47.2.18 subscription_writer_data_lifecycle

```
struct DDS_WriterDataLifecycleQosPolicy DDS_DiscoveryConfigQosPolicy::subscription_writer_data_↵
lifecycle
```

Writer data lifecycle settings for a built-in subscription writer.

For details, refer to the **DDS_WriterDataLifecycleQosPolicy** (p. 1240). **DDS_WriterDataLifecycleQosPolicy**↵
::autodispose_unregistered_instances (p. 1241) will always be forced to **DDS_BOOLEAN_TRUE** (p. 316).

9.47.2.19 builtin_discovery_plugins

```
DDS_DiscoveryConfigBuiltinPluginKindMask DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins
```

Mask of built-in discovery plugin kinds.

There are several built-in discovery plugins. This mask enables the different plugins. Any plugin not enabled will not be created.

[default] **DDS_DISCOVERYCONFIG_BUILTIN_SDP** (p. 392)

See also

DDS_DiscoveryConfigBuiltinPluginKind (p. 392)

9.47.2.20 enabled_builtin_channels

```
DDS_DiscoveryConfigBuiltinChannelKindMask DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels
```

The mask specifying which built-in channels should be enabled.

While there are a number of built-in channels that are used by Connex DDS, the only built-in channel which can currently be enabled or disabled is the Service Request Channel. This channel is used by the Locator Reachability and Topic Query features. If you are not using these features and wish to reduce network traffic and endpoint resource usage, you may disable the service request channel with this QoS.

[default] **DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL** (p. 393)

9.47.2.21 participant_message_reader_reliability_kind

```
DDS_ReliabilityQosPolicyKind DDS_DiscoveryConfigQosPolicy::participant_message_reader_reliability_↵
_kind
```

Reliability policy for a built-in participant message reader.

For details, refer to the **DDS_ReliabilityQosPolicyKind** (p. 434).

[default] **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435)

9.47.2.22 participant_message_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::participant_message_reader
```

RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **DDS_DiscoveryConfigQosPolicy::participant_message_reader_reliability_kind** (p. 715) is set to **DDS_RELIABLE_RELIABILITY_QOS** (p. 435).

For details, refer to the **DDS_RtpsReliableReaderProtocol_t** (p. 1043)

[default]

```
min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;

9.47.2.24 publication_writer_publish_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::publication_writer_publish_mode
```

Publish mode policy for the built-in publication writer.

Determines whether the Discovery built-in publication **DDSDataWriter** (p. 1305) publishes data synchronously or asynchronously and how.

9.47.2.25 subscription_writer_publish_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::subscription_writer_publish_mode
```

Publish mode policy for the built-in subscription writer.

Determines whether the Discovery built-in subscription **DDSDataWriter** (p. 1305) publishes data synchronously or asynchronously and how.

9.47.2.26 asynchronous_publisher

```
struct DDS_AsynchronousPublisherQosPolicy DDS_DiscoveryConfigQosPolicy::asynchronous_publisher
```

Asynchronous publishing settings for the discovery **DDSPublisher** (p. 1534) and all entities that are created by it.

9.47.2.27 default_domain_announcement_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::default_domain_announcement_period
```

The period to announce a participant to the default domain 0.

The period at which a participant will announce itself to the default domain 0 using the default UDPv4 multicast group address for discovery traffic on that domain.

For domain 0, the default discovery multicast address is 239.255.0.1:7400.

To disable announcement to the default domain, set this period to **DDS_DURATION_INFINITE** (p. 325).

When this period is set to a value other than **DDS_DURATION_INFINITE** (p. 325) and **DDS_DiscoveryConfigQosPolicy::ignore_default_domain_announcements** (p. 718) is set to **DDS_BOOLEAN_FALSE** (p. 316), you can get information about participants running in different domains by creating a participant in domain 0 and implementing the on_data_available callback in the **DDS_ParticipantBuiltinTopicData** (p. 966) built-in DataReader's listener.

You can learn the domain ID associated with a participant by looking at the field **DDS_ParticipantBuiltinTopicData::domain_id** (p. 968).

[default] 30 seconds

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

See also

DDS_ParticipantBuiltinTopicData::domain_id (p. 968)

DDS_DiscoveryConfigQosPolicy::ignore_default_domain_announcements (p. 718)

9.47.2.28 ignore_default_domain_announcements

DDS_Boolean `DDS_DiscoveryConfigQosPolicy::ignore_default_domain_announcements`

Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.

This setting only applies to participants running on the default domain 0 and using the default port mapping.

When this setting is set to **DDS_BOOLEAN_TRUE** (p. 316), a participant running on the default domain 0 will ignore announcements from participants running on different domain IDs.

When this setting is set to **DDS_BOOLEAN_FALSE** (p. 316), a participant running on the default domain 0 will provide announcements from participants running on different domain IDs to the application via the **DDS_ParticipantBuiltinTopicData** (p. 966) built-in DataReader.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.47.2.30 service_request_writer_data_lifecycle

```
struct DDS_WriterDataLifecycleQosPolicy DDS_DiscoveryConfigQosPolicy::service_request_writer_↵
data_lifecycle
```

Writer data lifecycle settings for a built-in **DDS_ServiceRequest** (p. 1083) writer.

For details, refer to the **DDS_WriterDataLifecycleQosPolicy** (p. 1240).

9.47.2.31 service_request_writer_publish_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::service_request_writer_publish_mode
```

Publish mode policy for the built-in service request writer.

Determines whether the Discovery built-in service request **DDSDataWriter** (p. 1305) publishes data synchronously or asynchronously and how.

9.47.2.32 service_request_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::service_request_reader
```

RTPS reliable reader protocol-related configuration settings for a built-in **DDS_ServiceRequest** (p. 1083) reader.

For details, refer to the **DDS_RtpsReliableReaderProtocol_t** (p. 1043)

[default]

min_heartbeat_response_delay 0.0 seconds;
 max_heartbeat_response_delay 0.0 seconds;
 heartbeat_suppression_duration 0.0625 seconds;
 nack_period 5.0 seconds;
 receive_window_size 256;
 round_trip_time 0.0 seconds;
 app_ack_period 5.0 seconds;
 samples_per_app_ack 1;

9.47.2.33 locator_reachability_assert_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_assert_period
```

Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.

This setting configures the period at which this **DDSDomainParticipant** (p. 1335) will ping all the locators that it has discovered from other DomainParticipants. This period should be strictly less than **DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration** (p. 720).

If **DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration** (p. 720) is **DDS_DURATION_INFINITE** (p. 325) this parameter is ignored. The DomainParticipant will not assert remote locators.

[default] 20 seconds

[range] [1 nanosec, 1 year]

See also

DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration (p. 720)

9.47.2.34 locator_reachability_lease_duration

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration
```

The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.

For the purpose of this explanation, we will use 'local' to refer to the DomainParticipant in which we configure **locator_reachability_lease_duration** and 'remote' to refer to the other DomainParticipants communicating with the local DomainParticipant.

This setting configures a timeout announced to the remote DomainParticipants. This timeout is used by the remote DomainParticipants as the maximum period by which a remote locator must be asserted by the local DomainParticipant (through a REACHABILITY PING message) before considering this locator as "unreachable" from the local DomainParticipant.

When a remote DomainParticipant detects that one of its locators is not reachable from the local DomainParticipant, it will notify the local DomainParticipant of this event. From that moment on, and until notified otherwise, the local DomainParticipant will not send RTPS messages to remote DomainParticipants using this locator.

If this value is set to **DDS_DURATION_INFINITE** (p. 325), the local DomainParticipant will send RTPS messages to a remote DomainParticipant on the locators announced by the remote DomainParticipant, regardless of whether or not the remote DomainParticipant can be reached using these locators.

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.47.2.35 locator_reachability_change_detection_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_change_detection_period
```

Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.

This setting determines the maximum period at which this DomainParticipant will check to see if its locators are reachable from other DomainParticipants according to the other DomainParticipants' **DDS_DiscoveryConfigQosPolicy**↔**::locator_reachability_lease_duration** (p. 720) value.

If **DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration** (p. 720) is **DDS_DURATION_INFINITE** (p. 325) this parameter is ignored. The DomainParticipant will not schedule an event to see if its locators are reachable from other DomainParticipants.

[default] 60 seconds

[range] [1 nanosec, 1 year]

```

9.47.2.37 secure_volatile_writer_publish_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::secure_volatile_writer_publish_mode
```

Publish mode policy for the built-in secure volatile writer.

Determines whether the built-in secure volatile **DDSDataWriter** (p.1305) publishes data synchronously or asynchronously and how.

9.47.2.38 secure_volatile_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::secure_volatile_reader
```

RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.

For details, refer to the **DDS_RtpsReliableReaderProtocol_t** (p. 1043)

[default]

```

min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;

```

9.47.2.39 endpoint_type_object_lb_serialization_threshold

```
DDS_Long DDS_DiscoveryConfigQosPolicy::endpoint_type_object_lb_serialization_threshold
```

Option to reduce the size required to propagate a TypeObject in Simple Endpoint Discovery.

Minimum size (in bytes) of the serialized TypeObject that will trigger the serialization of a TypeObjectLb instead of the regular TypeObject.

For example, setting this property to 1000 will trigger the serialization of the TypeObjectLb for TypeObjects whose serialized size is greater than 1000 Bytes.

The sentinel value -1 disables TypeObject compression.

[default] 0. The default value 0 enables TypeObject compression by always sending TypeObjectLb.

[range] [-1, 2147483647]

9.47.2.40 dns_tracker_polling_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::dns_tracker_polling_period
```

Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.

RTI Connexx allows the use of hostnames instead of IP addresses when configuring initial peers for specific transports (e.g.: UDPv4 and UDPv6). The DNS tracker keeps the IP addresses of these hostnames updated. The DNS tracker builds a list of hostnames from the initial peers of a DomainParticipant, queries the DNS for those hostnames, and updates the resolved IP addresses when the IP addresses change. The frequency of these queries is defined by the DNS tracker polling period. When the period is set to **DDS_DURATION_INFINITE** (p. 325), the tracker is disabled.

RTI Connexx keeps information regarding the hostnames of peers if they are part of the **DDS_DiscoveryQosPolicy::initial_peers** (p. 726). The information regarding peers added through the **DDSDomainParticipant::add_peer** (p. 1392) operation is kept only if the DNS tracker has been enabled before adding a peer.

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [1 second, 1 year], **DDS_DURATION_INFINITE** (p. 325)

9.47.2.41 participant_configuration_writer_publish_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::participant_configuration_writer_↔  
publish_mode
```

Publish mode policy for the built-in participant configuration writer.

Determines whether the Discovery built-in participant configuration **DDSDataWriter** (p. 1305) publishes data synchronously or asynchronously and how.

9.47.2.42 participant_configuration_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::participant_configuration_↔  
_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.

For details, refer to the **DDS_RtpsReliableWriterProtocol_t** (p. 1047)

[default]

```

```

9.47.2.45 participant_configuration_reader_resource_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::participant_configuration←
_reader_resource_limits
```

Resource limits for the built-in topic participant configuration reader.

For details, see **DDS_BuiltinTopicReaderResourceLimits_t** (p. 599).

9.48 DDS_DiscoveryQosPolicy Struct Reference

<<**extension**>> (p. 236) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Public Attributes

- struct **DDS_StringSeq enabled_transports**
The transports available for use by the Discovery mechanism.
- struct **DDS_StringSeq initial_peers**
Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.
- struct **DDS_StringSeq multicast_receive_addresses**
*Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain←Participant.*
- **DDS_Long metatraffic_transport_priority**
The transport priority to use for the Discovery meta-traffic.
- **DDS_Boolean accept_unknown_peers**
Whether to accept a new participant that is not in the initial peers list.
- **DDS_Boolean enable_endpoint_discovery**
Whether to automatically enable endpoint discovery for all the remote participants.

9.48.1 Detailed Description

<<**extension**>> (p. 236) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.48.2 Usage

This QoS policy identifies where on the network this application can *potentially* discover other applications with which to communicate.

The middleware will periodically send network packets to these locations, announcing itself to any remote applications that may be present, and will listen for announcements from those applications.

This QoS policy is an extension to the DDS standard.

See also

NDDS_DISCOVERY_PEERS (p. 464)

DDS_DiscoveryConfigQosPolicy (p. 706)

9.48.3 Member Data Documentation

9.48.3.1 enabled_transports

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::enabled_transports
```

The transports available for use by the Discovery mechanism.

Only these transports can be used by the discovery mechanism to send meta-traffic via the builtin endpoints (built-in **DDSDataReader** (p. 1272) and **DDSDataWriter** (p. 1305)).

Also determines the unicast addresses on which the Discovery mechanism will listen for meta-traffic. These along with the `domain_id` and `participant_id` determine the unicast locators on which the Discovery mechanism can receive meta-data.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 442). These alias names are case sensitive and should be written in lowercase.

[default] Empty sequence. All the transports available to the DomainParticipant are available for use by the Discovery mechanism.

[range] Sequence of non-null, non-empty strings.

9.48.3.2 initial_peers

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::initial_peers
```

Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

As part of the participant discovery phase, the **DDSDomainParticipant** (p. 1335) will announce itself to the domain by sending participant DATA messages. The `initial_peers` specifies the initial list of peers that will be contacted. A remote **DDSDomainParticipant** (p. 1335) is discovered by receiving participant announcements from a remote peer. When the new remote **DDSDomainParticipant** (p. 1335) has been added to the participant's database, the endpoint discovery phase commences and information about the DataWriters and DataReaders is exchanged.

Each element of this list must be a peer descriptor in the proper format (see **Peer Descriptor Format** (p. 465)).

[default] builtin.udpv4://239.255.0.1, builtin.udpv4://127.0.0.1, builtin.shmem:// (See also **NDDS_DISCOVERY_PEERS** (p. 464))

[range] Sequence of arbitrary length.

See also

Peer Descriptor Format (p. 465)

DDSDomainParticipant::add_peer() (p. 1392)

9.48.3.3 multicast_receive_addresses

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::multicast_receive_addresses
```

Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain↵ Participant.

The multicast group addresses on which the Discovery mechanism will listen for meta-traffic.

Each element of this list must be a valid multicast address (IPv4 or IPv6) in the proper format (see **Address Format** (p. ??)).

The `domain_id` determines the multicast port on which the Discovery mechanism can receive meta-data.

If **NDDS_DISCOVERY_PEERS** does *not* contain a multicast address, then the string sequence **DDS_DiscoveryQos↵ Policy::multicast_receive_addresses** (p. 727) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If **NDDS_DISCOVERY_PEERS** contains one or more multicast addresses, the addresses will be stored in **DDS_↵ DiscoveryQosPolicy::multicast_receive_addresses** (p. 727), starting at element 0. They will be stored in the order they appear in **NDDS_DISCOVERY_PEERS**.

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **DDS_↵ DiscoveryQosPolicy::multicast_receive_addresses** (p. 727).

[default] builtin.udpv4://239.255.0.1 (See also **NDDS_DISCOVERY_PEERS** (p. 464))

[range] Sequence of length [0,1], whose elements are multicast addresses. Currently only the first multicast address (if any) is used. The rest are ignored.

See also

Address Format (p. ??)

9.48.3.4 metatraffic_transport_priority

DDS_Long DDS_DiscoveryQosPolicy::metatraffic_transport_priority

The transport priority to use for the Discovery meta-traffic.

The discovery metatraffic will be sent by the built-in **DDSDDataWriter** (p. 1305) using this transport priority.

[default] 0

[range] [0, MAX_UINT]

9.48.3.5 accept_unknown_peers

DDS_Boolean DDS_DiscoveryQosPolicy::accept_unknown_peers

Whether to accept a new participant that is not in the initial peers list.

If **DDS_BOOLEAN_FALSE** (p. 316), the participant will only communicate with those in the initial peers list and those added via **DDSDomainParticipant::add_peer()** (p. 1392).

If **DDS_BOOLEAN_TRUE** (p. 316), the participant will also communicate with all discovered remote participants.

Note: If `accept_unknown_peers` is **DDS_BOOLEAN_FALSE** (p. 316) and shared memory is disabled, applications on the same node will *not* communicate if only 'localhost' is specified in the peers list. If shared memory is disabled or 'shmem://' is not specified in the peers list, to communicate with other applications on the same node through the loopback interface, you must put the actual node address or hostname in **NDDS_DISCOVERY_PEERS** (p. 464).

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.48.3.6 enable_endpoint_discovery

DDS_Boolean DDS_DiscoveryQosPolicy::enable_endpoint_discovery

Whether to automatically enable endpoint discovery for all the remote participants.

If **DDS_BOOLEAN_TRUE** (p. 316), endpoint discovery will automatically occur for every discovered remote participant.

If **DDS_BOOLEAN_FALSE** (p. 316), endpoint discovery will be initially disabled and manual activation is required for each discovered participant by calling **DDSDomainParticipant::resume_endpoint_discovery** (p. 1383).

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.49 DDS_DomainParticipantConfigParams_t Struct Reference

<<**extension**>> (p. 236) Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

Public Attributes

- int **domain_id**
*Domain ID from which the **DDSDomainParticipant** (p. 1335) is created.*
- char * **participant_name**
*Name assigned to the **DDSDomainParticipant** (p. 1335).*
- char * **participant_qos_library_name**
*QoS library name containing the QoS profile from which the **DDSDomainParticipant** (p. 1335) is created.*
- char * **participant_qos_profile_name**
*QoS profile name from which the **DDSDomainParticipant** (p. 1335) is created.*
- char * **domain_entity_qos_library_name**
*QoS library name containing the QoS profile from which the all the **DDSDomainEntity** (p. 1334) defined under the participant configuration are created.*
- char * **domain_entity_qos_profile_name**
*QoS profile name from which the all the **DDSDomainEntity** (p. 1334) defined under the participant configuration are created.*

9.49.1 Detailed Description

<<**extension**>> (p. 236) Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

9.49.2 Member Data Documentation

9.49.2.1 domain_id

```
int DDS_DomainParticipantConfigParams_t::domain_id
```

Domain ID from which the **DDSDomainParticipant** (p. 1335) is created.

Allows overriding the domain ID defined in the configuration for the participant to be created. If the special value **DDS_↵_DOMAIN_ID_USE_XML_CONFIG** (p. 517) is specified then the ID in the configuration will be used.

9.49.2.2 participant_name

```
char* DDS_DomainParticipantConfigParams_t::participant_name
```

Name assigned to the **DDSDomainParticipant** (p. 1335).

This is the name the name that will be set in the **DDS_DomainParticipantQos::participant_name** (p. 739). It allows overriding the participant name that is generated automatically.

When this member is lexicographically equal to the special value **DDS_ENTITY_NAME_USE_XML_CONFIG** (p. 517) then an automatically generated name will be assigned.

9.49.2.3 participant_qos_library_name

```
char* DDS_DomainParticipantConfigParams_t::participant_qos_library_name
```

QoS library name containing the QoS profile from which the **DDSDomainParticipant** (p. 1335) is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **DDSDomainParticipant** (p. 1335).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 517) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **DDS_DomainParticipantConfigParams_t::participant_qos_profile_name** (p. 730) will be ignored.

9.49.2.4 participant_qos_profile_name

```
char* DDS_DomainParticipantConfigParams_t::participant_qos_profile_name
```

QoS profile name from which the **DDSDomainParticipant** (p. 1335) is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **DDSDomainParticipant** (p. 1335).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 517) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **DDS_DomainParticipantConfigParams_t::participant_qos_library_name** (p. 729) will be ignored.

9.49.2.5 domain_entity_qos_library_name

```
char* DDS_DomainParticipantConfigParams_t::domain_entity_qos_library_name
```

QoS library name containing the QoS profile from which the all the **DDSDomainEntity** (p. 1334) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **DDSDomainEntity** (p. 1334).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 517) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **DDS_DomainParticipantConfigParams_t::domain_entity_qos_profile_name** (p. 730) will be ignored.

9.49.2.6 domain_entity_qos_profile_name

```
char* DDS_DomainParticipantConfigParams_t::domain_entity_qos_profile_name
```

QoS profile name from which the all the **DDSDomainEntity** (p. 1334) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **DDSDomainEntity** (p. 1334).

When this member is lexicographically equal to the special value **DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG** (p. 517) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **DDS_DomainParticipantConfigParams_t::domain_entity_qos_library_name** (p. 730) will be ignored.

9.50 DDS_DomainParticipantFactoryQos Struct Reference

QoS policies supported by a **DDSDomainParticipantFactory** (p. 1409).

Public Member Functions

- bool **operator==** (const **DDS_DomainParticipantFactoryQos** &r) const
Compares two DomainParticipantFactoryQos objects for equality.
- bool **operator!=** (const **DDS_DomainParticipantFactoryQos** &r) const
Compares two DomainParticipantFactoryQos objects for inequality.
- **DDS_ReturnCode_t print** () const
*Prints this **DDS_DomainParticipantFactoryQos** (p. 731) to stdout.*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size) const
*Obtains a string representation of this **DDS_DomainParticipantQos** (p. 735).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DomainParticipantFactoryQos** &base) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_DomainParticipantFactoryQos** &base, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
*Obtains a string representation of this **DDS_DomainParticipantFactoryQos** (p. 731).*

Public Attributes

- struct **DDS_EntityFactoryQosPolicy entity_factory**
*Entity factory policy, **ENTITY_FACTORY** (p. 401).*
- struct **DDS_SystemResourceLimitsQosPolicy resource_limits**

- struct **DDS_MonitoringQosPolicy monitoring**
*<<extension>> (p. 236) Monitoring qos policy, **MONITORING** (p. 412).*

9.50.1 Detailed Description

QoS policies supported by a **DDSDomainParticipantFactory** (p. 1409).

Entity:

DDSDomainParticipantFactory (p. 1409)

See also

QoS Policies (p. 352) and allowed ranges within each Qos.

9.50.2 Member Function Documentation

9.50.2.1 operator==()

```
bool DDS_DomainParticipantFactoryQos::operator== (
    const DDS_DomainParticipantFactoryQos & r ) const [inline]
```

Compares two DomainParticipantFactoryQos objects for equality.

See also

DDS_DomainParticipantFactoryQos_equals (p. 42)

References **DDS_DomainParticipantFactoryQos_equals()**.

9.50.2.2 operator!=()

```
bool DDS_DomainParticipantFactoryQos::operator!= (
    const DDS_DomainParticipantFactoryQos & r ) const [inline]
```

Compares two DomainParticipantFactoryQos objects for inequality.

See also

DDS_DomainParticipantFactoryQos_equals (p. 42)

References **DDS_DomainParticipantFactoryQos_equals()**.

9.50.3 Member Data Documentation

9.50.3.1 entity_factory

```
struct DDS_EntityFactoryQosPolicy DDS_DomainParticipantFactoryQos::entity_factory
```

Entity factory policy, **ENTITY_FACTORY** (p. 401).

9.50.3.2 resource_limits

```
struct DDS_SystemResourceLimitsQosPolicy DDS_DomainParticipantFactoryQos::resource_limits
```

<<*extension*>> (p. 236) System resource limits, **SYSTEM_RESOURCE_LIMITS** (p. 439).

Note: This QoS policy cannot be configured from XML configuration files.

9.50.3.3 profile

```
struct DDS_ProfileQosPolicy DDS_DomainParticipantFactoryQos::profile
```

<<*extension*>> (p. 236) Qos profile policy, **PROFILE** (p. 418).

Note: This QoS policy cannot be configured from XML configuration files.

9.50.3.4 logging

```
struct DDS_LoggingQosPolicy DDS_DomainParticipantFactoryQos::logging
```

<<*extension*>> (p. 236) Logging qos policy, **LOGGING** (p. 411).

9.50.3.5 monitoring

```
struct DDS_MonitoringQosPolicy DDS_DomainParticipantFactoryQos::monitoring
```

<<*extension*>> (p. 236) Monitoring qos policy, **MONITORING** (p. 412).

This QoS policy is used to collect and emit telemetry data of a Connex application using RTI Monitoring Library 2.0.

9.51 DDS_DomainParticipantProtocolStatus Struct Reference

<<*extension*>> (p. 236) The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

Public Attributes

- **DDS_LongLong corrupted_rtps_message_count**
The number of corrupted RTPS messages detected by the domain participant.
- **DDS_LongLong corrupted_rtps_message_count_change**
The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.
- struct **DDS_Time_t last_corrupted_message_timestamp**
The timestamp when the last corrupted RTPS message was detected by the domain participant.

9.51.1 Detailed Description

<<*extension*>> (p. 236) The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

Entity:

DDSDomainParticipant (p. 1335) The corrupted messages are detected by validating the received CRC. The participant protocol status can be obtained by enabling **DDS_WireProtocolQosPolicy::compute_crc** (p. 1234) and **DDS_WireProtocolQosPolicy::check_crc** (p. 1234) at the publishing and subscribing application respectively.

9.51.2 Member Data Documentation

9.51.2.1 corrupted_rtps_message_count

DDS_LongLong DDS_DomainParticipantProtocolStatus::corrupted_rtps_message_count

The number of corrupted RTPS messages detected by the domain participant.

Counts the corrupted RTPS messages received by the participant. It includes messages belonging to discovery and user traffic.

9.51.2.2 corrupted_rtps_message_count_change

DDS_LongLong DDS_DomainParticipantProtocolStatus::corrupted_rtps_message_count_change

The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.

9.51.2.3 last_corrupted_message_timestamp

```
struct DDS_Time_t DDS_DomainParticipantProtocolStatus::last_corrupted_message_timestamp
```

The timestamp when the last corrupted RTPS message was detected by the domain participant.

9.52 DDS_DomainParticipantQos Struct Reference

QoS policies supported by a **DDSDomainParticipant** (p. 1335) entity.

Public Member Functions

- bool **operator==** (const **DDS_DomainParticipantQos** &r) const
Compares two DomainParticipantQos objects for inequality.
- bool **operator!=** (const **DDS_DomainParticipantQos** &r) const
Compares two DomainParticipantQos objects for inequality.
- **DDS_ReturnCode_t print** () const
*Prints this **DDS_DomainParticipantQos** (p. 735) to stdout.*

9.52.1 Detailed Description

QoS policies supported by a **DDSDomainParticipant** (p. 1335) entity.

Certain members must be set in a consistent manner:

Length of **DDS_DomainParticipantQos::user_data** (p. 737) .value <= **DDS_DomainParticipantQos::resource_limits** (p. 738) .participant_user_data_max_length

For **DDS_DomainParticipantQos::discovery_config** (p. 739) .publication_writer
high_watermark <= **DDS_DomainParticipantQos::resource_limits** (p. 738) .local_writer_allocation .max_count
heartbeats_per_max_samples <= **DDS_DomainParticipantQos::resource_limits** (p. 738) .local_writer_allocation.↵
max_count

For **DDS_DomainParticipantQos::discovery_config** (p. 739) .subscription_writer
high_watermark <= **DDS_DomainParticipantQos::resource_limits** (p. 738) .local_reader_allocation.max_count
heartbeats_per_max_samples <= **DDS_DomainParticipantQos::resource_limits** (p. 738) .local_reader_allocation.↵
max_count

If any of the above are not true, **DDSDomainParticipant::set_qos** (p. 1391) and **DDSDomainParticipant::set_↵
_qos_with_profile** (p. 1391) and **DDSDomainParticipantFactory::set_default_participant_qos** (p. 1413) will fail
with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336), and **DDSDomainParticipantFactory::create_participant**
(p. 1425) will fail.

Entity:

DDSDomainParticipant (p. 1335)

9.52.2 Member Function Documentation

9.52.2.1 operator==()

```
bool DDS_DomainParticipantQos::operator== (
    const DDS_DomainParticipantQos & r ) const [inline]
```

Compares two DomainParticipantQos objects for inequality.

See also

DDS_DomainParticipantQos_equals (p. 51)

References **DDS_DomainParticipantQos_equals()**.

9.52.2.2 operator!=()

```
bool DDS_DomainParticipantQos::operator!= (
    const DDS_DomainParticipantQos & r ) const [inline]
```

Compares two DomainParticipantQos objects for inequality.

See also

DDS_DomainParticipantQos_equals (p. 51)

References **DDS_DomainParticipantQos_equals()**.

9.52.3 Member Data Documentation

9.52.3.1 user_data

```
struct DDS_UserDataQosPolicy DDS_DomainParticipantQos::user_data
```

User data policy, **USER_DATA** (p. 455).

9.52.3.2 entity_factory

```
struct DDS_EntityFactoryQosPolicy DDS_DomainParticipantQos::entity_factory
```

Entity factory policy, **ENTITY_FACTORY** (p. 401).

9.52.3.3 wire_protocol

```
struct DDS_WireProtocolQosPolicy DDS_DomainParticipantQos::wire_protocol
```

<<*extension*>> (p. 236) Wire Protocol policy, **WIRE_PROTOCOL** (p. 456).

The wire protocol (RTPS) attributes associated with the participant.

9.52.3.4 transport_builtin

```
struct DDS_TransportBuiltinQosPolicy DDS_DomainParticipantQos::transport_builtin
```

<<*extension*>> (p. 236) Transport Builtin policy, **TRANSPORT_BUILTIN** (p. 442).

9.52.3.5 default_unicast

```
struct DDS_TransportUnicastQosPolicy DDS_DomainParticipantQos::default_unicast
```

<<*extension*>> (p. 236) Default Unicast Transport policy, **TRANSPORT_UNICAST** (p. 450).

9.52.3.6 discovery

```
struct DDS_DiscoveryQosPolicy DDS_DomainParticipantQos::discovery
```

<<*extension*>> (p. 236) Discovery policy, **DISCOVERY** (p. 387).

9.52.3.7 resource_limits

```
struct DDS_DomainParticipantResourceLimitsQosPolicy DDS_DomainParticipantQos::resource_limits
```

<<*extension*>> (p. 236) Domain participant resource limits policy, **DOMAIN_PARTICIPANT_RESOURCE_LIMITS** (p. 395).

9.52.3.8 event

```
struct DDS_EventQosPolicy DDS_DomainParticipantQos::event
```

<<*extension*>> (p. 236) Event policy, **EVENT** (p. 403).

9.52.3.9 receiver_pool

```
struct DDS_ReceiverPoolQosPolicy DDS_DomainParticipantQos::receiver_pool
```

<<*extension*>> (p. 236) Receiver pool policy, **RECEIVER_POOL** (p. 432).

9.52.3.10 database

```
struct DDS_DatabaseQosPolicy DDS_DomainParticipantQos::database
```

<<*extension*>> (p. 236) Database policy, **DATABASE** (p. 364).

9.52.3.11 discovery_config

```
struct DDS_DiscoveryConfigQosPolicy DDS_DomainParticipantQos::discovery_config
```

<<*extension*>> (p. 236) Discovery config policy, **DISCOVERY_CONFIG** (p. 388).

9.52.3.12 property

```
struct DDS_PropertyQosPolicy DDS_DomainParticipantQos::property
```

<<*extension*>> (p. 236) Property policy, **PROPERTY** (p. 419). See also [Property Reference Guide](#).

9.52.3.13 participant_name

```
struct DDS_EntityNameQosPolicy DDS_DomainParticipantQos::participant_name
```

<<*extension*>> (p. 236) The participant name. **ENTITY_NAME** (p. 402)

9.52.3.14 multicast_mapping

9.52.3.17 type_support

```
struct DDS_TypeSupportQosPolicy DDS_DomainParticipantQos::type_support
```

<<*extension*>> (p. 236) Type support data, **TYPESUPPORT** (p. 453).

Optional value that is passed to a type plugin's on_participant_attached function.

9.53 DDS_DomainParticipantResourceLimitsQosPolicy Struct Reference

Various settings that configure how a **DDSDomainParticipant** (p. 1335) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

Public Attributes

- struct **DDS_AllocationSettings_t local_writer_allocation**
Allocation settings applied to local DataWriters.
- struct **DDS_AllocationSettings_t local_reader_allocation**
Allocation settings applied to local DataReaders.
- struct **DDS_AllocationSettings_t local_publisher_allocation**
Allocation settings applied to local Publisher.
- struct **DDS_AllocationSettings_t local_subscriber_allocation**
Allocation settings applied to local Subscriber.
- struct **DDS_AllocationSettings_t local_topic_allocation**
Allocation settings applied to local Topic.
- struct **DDS_AllocationSettings_t remote_writer_allocation**
Allocation settings applied to remote DataWriters.
- struct **DDS_AllocationSettings_t remote_reader_allocation**
Allocation settings applied to remote DataReaders.
- struct **DDS_AllocationSettings_t remote_participant_allocation**
Allocation settings applied to remote DomainParticipants.
- struct **DDS_AllocationSettings_t matching_writer_reader_pair_allocation**
Allocation settings applied to matching local writer and remote/local reader pairs.
- struct **DDS_AllocationSettings_t matching_reader_writer_pair_allocation**
Allocation settings applied to matching local reader and remote/local writer pairs.
- struct **DDS_AllocationSettings_t ignored_entity_allocation**
Allocation settings applied to ignored entities.
- struct **DDS_AllocationSettings_t content_filtered_topic_allocation**
Allocation settings applied to content filtered topic.
- struct **DDS_AllocationSettings_t content_filter_allocation**
Allocation settings applied to content filter.
- struct **DDS_AllocationSettings_t read_condition_allocation**
Allocation settings applied to read condition pool.
- struct **DDS_AllocationSettings_t query_condition_allocation**
Allocation settings applied to query condition pool.
- struct **DDS_AllocationSettings_t outstanding_asynchronous_sample_allocation**
*Allocation settings applied to the maximum number of samples (from all **DDSDDataWriter** (p. 1305)) waiting to be asynchronously written.*
- struct **DDS_AllocationSettings_t flow_controller_allocation**
Allocation settings applied to flow controllers.
- **DDS_Long local_writer_hash_buckets**
Hash_Buckets settings applied to local DataWriters.
- **DDS_Long local_reader_hash_buckets**
Number of hash buckets for local DataReaders.
- **DDS_Long local_publisher_hash_buckets**
Number of hash buckets for local Publisher.
- **DDS_Long local_subscriber_hash_buckets**
Number of hash buckets for local Subscriber.
- **DDS_Long local_topic_hash_buckets**
Number of hash buckets for local Topic.

- **DDS_Long remote_writer_hash_buckets**
Number of hash buckets for remote DataWriters.
- **DDS_Long remote_reader_hash_buckets**
Number of hash buckets for remote DataReaders.
- **DDS_Long remote_participant_hash_buckets**
Number of hash buckets for remote DomainParticipants.
- **DDS_Long matching_writer_reader_pair_hash_buckets**
Number of hash buckets for matching local writer and remote/local reader pairs.
- **DDS_Long matching_reader_writer_pair_hash_buckets**
Number of hash buckets for matching local reader and remote/local writer pairs.
- **DDS_Long ignored_entity_hash_buckets**
Number of hash buckets for ignored entities.
- **DDS_Long content_filtered_topic_hash_buckets**
Number of hash buckets for content filtered topics.
- **DDS_Long content_filter_hash_buckets**
Number of hash buckets for content filters.
- **DDS_Long flow_controller_hash_buckets**
Number of hash buckets for flow controllers.
- **DDS_Long max_gather_destinations**
Maximum number of destinations per RTI Connex send.
- **DDS_Long participant_user_data_max_length**
*Maximum length of user data in **DDS_DomainParticipantQos** (p. 735) and **DDS_ParticipantBuiltinTopicData** (p. 966).*
- **DDS_Long topic_data_max_length**
*Maximum length of topic data in **DDS_TopicQos** (p. 1120), **DDS_TopicBuiltinTopicData** (p. 1113), **DDS_PublicationBuiltinTopicData** (p. 997) and **DDS_SubscriptionBuiltinTopicData** (p. 1094).*
- **DDS_Long publisher_group_data_max_length**
*Maximum length of group data in **DDS_PublisherQos** (p. 1009) and **DDS_PublicationBuiltinTopicData** (p. 997).*
- **DDS_Long subscriber_group_data_max_length**
*Maximum length of group data in **DDS_SubscriberQos** (p. 1090) and **DDS_SubscriptionBuiltinTopicData** (p. 1094).*
- **DDS_Long writer_user_data_max_length**
*Maximum length of user data in **DDS_DataWriterQos** (p. 683) and **DDS_PublicationBuiltinTopicData** (p. 997).*
- **DDS_Long reader_user_data_max_length**
*Maximum length of user data in **DDS_DataReaderQos** (p. 638) and **DDS_SubscriptionBuiltinTopicData** (p. 1094).*
- **DDS_Long max_partitions**
*Maximum number of partition name strings allowable in a **DDS_PartitionQosPolicy** (p. 976).*
- **DDS_Long max_partition_cumulative_characters**
*Maximum number of combined characters allowable in all partition names in a **DDS_PartitionQosPolicy** (p. 976).*
- **DDS_Long type_code_max_serialized_length**
Maximum size of serialized string for type code.
- **DDS_Long type_object_max_serialized_length**
*The maximum length, in bytes, that the buffer to serialize a **TypeObject** can consume.*
- **DDS_Long serialized_type_object_dynamic_allocation_threshold**
*A threshold, in bytes, for dynamic memory allocation for the serialized **TypeObject**.*
- **DDS_Long type_object_max_deserialized_length**
*The maximum number of bytes that a deserialized **TypeObject** can consume.*
- **DDS_Long deserialized_type_object_dynamic_allocation_threshold**
*A threshold, in bytes, for dynamic memory allocation for the deserialized **TypeObject**.*

- **DDS_Long contentfilter_property_max_length**
This field is the maximum length of all data related to a Content-filtered topic.
- **DDS_Long channel_seq_max_length**
*Maximum number of channels that can be specified in **DDS_MultiChannelQosPolicy** (p. 952) for MultiChannel Data↔ Writers.*
- **DDS_Long channel_filter_expression_max_length**
*Maximum length of a channel **DDS_ChannelSettings_t::filter_expression** (p. 605) in a MultiChannel DataWriter.*
- **DDS_Long participant_property_list_max_length**
*Maximum number of properties associated with the **DDSDomainParticipant** (p. 1335).*
- **DDS_Long participant_property_string_max_length**
*Maximum string length of the properties associated with the **DDSDomainParticipant** (p. 1335).*
- **DDS_Long writer_property_list_max_length**
*Maximum number of properties associated with a **DDSDataWriter** (p. 1305).*
- **DDS_Long writer_property_string_max_length**
*Maximum string length of the properties associated with a **DDSDataWriter** (p. 1305).*
- **DDS_Long reader_property_list_max_length**
*Maximum number of properties associated with a **DDSDataReader** (p. 1272).*
- **DDS_Long reader_property_string_max_length**
*Maximum string length of the properties associated with a **DDSDataReader** (p. 1272).*
- **DDS_Long max_endpoint_groups**
*Maximum number of **DDS_EndpointGroup_t** (p. 885) allowable in a **DDS_AvailabilityQosPolicy** (p. 590).*
- **DDS_Long max_endpoint_group_cumulative_characters**
*Maximum number of combined role_name characters allowed in all **DDS_EndpointGroup_t** (p. 885) in a **DDS_↔ AvailabilityQosPolicy** (p. 590).*
- **DDS_Long transport_info_list_max_length**
*Maximum number of installed transports to send and receive information about in **DDS_ParticipantBuiltinTopicData↔ ::transport_info** (p. 968).*
- **DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind ignored_entity_replacement_↔ kind**
*Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **DDS_Domain↔ ParticipantResourceLimitsQosPolicy::ignored_entity_allocation** (p. 747) are reached.*
- struct **DDS_AllocationSettings_t remote_topic_query_allocation**
Allocation settings applied to remote TopicQueries.
- **DDS_Long remote_topic_query_hash_buckets**
Number of hash buckets for remote TopicQueries.
- **DDS_Long writer_data_tag_list_max_length**
*Maximum number of data tags associated with a **DDSDataWriter** (p. 1305).*
- **DDS_Long writer_data_tag_string_max_length**
*Maximum string length of the data tags associated with a **DDSDataWriter** (p. 1305).*
- **DDS_Long reader_data_tag_list_max_length**
*Maximum number of data tags associated with a **DDSDataReader** (p. 1272).*
- **DDS_Long reader_data_tag_string_max_length**
*Maximum string length of the data tags associated with a **DDSDataReader** (p. 1272).*
- **DDS_UnsignedLong shmem_ref_transfer_mode_max_segments**
*Maximum number of segments created by all DataWriters belonging to a **DDSDomainParticipant** (p. 1335).*

9.53.1 Detailed Description

Various settings that configure how a **DDSDomainParticipant** (p. 1335) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

This QoS policy sets maximum size limits on variable-length parameters used by the participant and its contained Entities. It also controls the initial and maximum sizes of data structures used by the participant to store information about locally-created and remotely-discovered entities (such as DataWriters/DataReaders), as well as parameters used by the internal database to size the hash tables it uses.

By default, a **DDSDomainParticipant** (p. 1335) is allowed to dynamically allocate memory as needed as users create local Entities such as **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) or as the participant discovers new applications to store their information. By setting fixed values for the maximum parameters in this QoS policy, you can bound the memory that can be allocated by a DomainParticipant. In addition, by setting the initial values to the maximum values, you can reduce the amount of memory allocated by DomainParticipants after the initialization period. Notice that memory can still be allocated dynamically after the initialization period. For example, when a new local **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272) is created, the initial memory required for its queue is allocated dynamically.

The maximum sizes of different variable-length parameters such as the number of partitions that can be stored in the **DDS_PartitionQoSPolicy** (p. 976), the maximum length of data store in the **DDS_UserDataQoSPolicy** (p. 1221) and **DDS_GroupDataQoSPolicy** (p. 903), and many others can be changed from their defaults using this QoS policy. However, it is important that all DomainParticipants that need to communicate with each other use the *same set* of maximum values. Otherwise, when these parameters are propagated from one **DDSDomainParticipant** (p. 1335) to another, a **DDSDomainParticipant** (p. 1335) with a smaller maximum length may reject the parameter, resulting in an error.

An important parameter in this QoS policy that is often changed by users is **DDS_DomainParticipantResourceLimitsQoSPolicy::type_object_max_serialized_length** (p. 754).

This QoS policy is an extension to the DDS standard.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.53.2 Member Data Documentation

9.53.2.1 local_writer_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQoSPolicy::local_writer↵
allocation
```

Allocation settings applied to local DataWriters.

[default] initial_count = 16; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.2 local_reader_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_reader_↔  
allocation
```

Allocation settings applied to local DataReaders.

[default] initial_count = 16; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.3 local_publisher_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_publisher_↔  
allocation
```

Allocation settings applied to local Publisher.

[default] initial_count = 4; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.4 local_subscriber_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_subscriber_↔  
allocation
```

Allocation settings applied to local Subscriber.

[default] initial_count = 4; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.5 local_topic_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_topic_↔  
allocation
```

Allocation settings applied to local Topic.

[default] initial_count = 16; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.6 remote_writer_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_writer_↔
allocation
```

Allocation settings applied to remote DataWriters.

Remote DataWriters include all DataWriters, both local and remote.

[default] initial_count = 64; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.7 remote_reader_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_reader_↔
allocation
```

Allocation settings applied to remote DataReaders.

Remote DataReaders include all DataReaders, both local and remote.

[default] initial_count = 64; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.8 remote_participant_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_participant_↔
_allocation
```

Allocation settings applied to remote DomainParticipants.

Remote DomainParticipants include all DomainParticipants, both local and remote.

[default] initial_count = 16; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.9 matching_writer_reader_pair_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::matching_writer_↔
reader_pair_allocation
```

Allocation settings applied to matching local writer and remote/local reader pairs.

[default] initial_count = 32; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.10 matching_reader_writer_pair_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::matching_reader_↵  
writer_pair_allocation
```

Allocation settings applied to matching local reader and remote/local writer pairs.

[default] initial_count = 32; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.11 ignored_entity_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_↵  
allocation
```

Allocation settings applied to ignored entities.

[default] initial_count = 8; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.12 content_filtered_topic_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::content_filtered_↵  
topic_allocation
```

Allocation settings applied to content filtered topic.

[default] initial_count = 4; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.13 content_filter_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::content_filter_↵  
allocation
```

Allocation settings applied to content filter.

[default] initial_count = 4; max_count = **DDS_LENGTH_UNLIMITED** (p. 437); incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.14 read_condition_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::read_condition_↵  
allocation
```

Allocation settings applied to read condition pool.

[default] initial_count = 4; max_count = **DDS_LENGTH_UNLIMITED** (p. 437), incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.15 query_condition_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::query_condition_↵  
allocation
```

Allocation settings applied to query condition pool.

[default] initial_count = 4; max_count = **DDS_LENGTH_UNLIMITED** (p. 437), incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.16 outstanding_asynchronous_sample_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::outstanding_↵  
asynchronous_sample_allocation
```

Allocation settings applied to the maximum number of samples (from all **DDSDataWriter** (p. 1305)) waiting to be asynchronously written.

[default] initial_count = 64; max_count = **DDS_LENGTH_UNLIMITED** (p. 437), incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.17 flow_controller_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::flow_controller_↵  
allocation
```

Allocation settings applied to flow controllers.

[default] initial_count = 4; max_count = **DDS_LENGTH_UNLIMITED** (p. 437), incremental_count = -1

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.18 local_writer_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_writer_hash_buckets

Hash_Buckets settings applied to local DataWriters.

[default] 4

[range] [1, 10000]

9.53.2.19 local_reader_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_reader_hash_buckets

Number of hash buckets for local DataReaders.

[default] 4

[range] [1, 10000]

9.53.2.20 local_publisher_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_publisher_hash_buckets

Number of hash buckets for local Publisher.

[default] 1

[range] [1, 10000]

9.53.2.21 local_subscriber_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_subscriber_hash_buckets

Number of hash buckets for local Subscriber.

[default] 1

[range] [1, 10000]

9.53.2.22 local_topic_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_topic_hash_buckets

Number of hash buckets for local Topic.

[default] 4

[range] [1, 10000]

9.53.2.23 remote_writer_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_writer_hash_buckets

Number of hash buckets for remote DataWriters.

Remote DataWriters include all DataWriters, both local and remote.

[default] 16

[range] [1, 10000]

9.53.2.24 remote_reader_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_reader_hash_buckets

Number of hash buckets for remote DataReaders.

Remote DataReaders include all DataReaders, both local and remote.

[default] 16

[range] [1, 10000]

9.53.2.25 remote_participant_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_participant_hash_buckets

Number of hash buckets for remote DomainParticipants.

Remote DomainParticipants include all DomainParticipants, both local and remote.

[default] 4

[range] [1, 10000]

9.53.2.26 matching_writer_reader_pair_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::matching_writer_reader_pair_hash_buckets

Number of hash buckets for matching local writer and remote/local reader pairs.

[default] 32

[range] [1, 10000]

9.53.2.27 matching_reader_writer_pair_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::matching_reader_writer_pair_hash_buckets

Number of hash buckets for matching local reader and remote/local writer pairs.

[default] 32

[range] [1, 10000]

9.53.2.28 ignored_entity_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_hash_buckets

Number of hash buckets for ignored entities.

[default] 1

[range] [1, 10000]

9.53.2.29 content_filtered_topic_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::content_filtered_topic_hash_buckets

Number of hash buckets for content filtered topics.

[default] 1

[range] [1, 10000]

9.53.2.30 content_filter_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::content_filter_hash_buckets

Number of hash buckets for content filters.

[default] 1

[range] [1, 10000]

9.53.2.31 flow_controller_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::flow_controller_hash_buckets

Number of hash buckets for flow controllers.

[default] 1

[range] [1, 10000]

9.53.2.32 max_gather_destinations

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::max_gather_destinations

Maximum number of destinations per RTI Connex send.

When RTI Connex sends out a message, it has the capability to send to multiple destinations to be more efficient. The maximum number of destinations per RTI Connex send is specified by max_gather_destinations.

[default] 16

[range] [16, 1 million]

9.53.2.33 participant_user_data_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::participant_user_data_max_length

Maximum length of user data in **DDS_DomainParticipantQos** (p. 735) and **DDS_ParticipantBuiltinTopicData** (p. 966).

[default] 256

[range] [0,0x7ffffff]

9.53.2.34 topic_data_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::topic_data_max_length

Maximum length of topic data in **DDS_TopicQos** (p.1120), **DDS_TopicBuiltinTopicData** (p.1113), **DDS_P↵
ublicationBuiltinTopicData** (p. 997) and **DDS_SubscriptionBuiltinTopicData** (p. 1094).

[default] 256

[range] [0,0x7ffffff]

9.53.2.35 publisher_group_data_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::publisher_group_data_max_length

Maximum length of group data in **DDS_PublisherQos** (p. 1009) and **DDS_PublicationBuiltinTopicData** (p. 997).

[default] 256

[range] [0,0x7ffffff]

9.53.2.36 subscriber_group_data_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_data_max_length

Maximum length of group data in **DDS_SubscriberQos** (p. 1090) and **DDS_SubscriptionBuiltinTopicData** (p. 1094).

[default] 256

[range] [0,0x7ffffff]

9.53.2.37 writer_user_data_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_user_data_max_length

Maximum length of user data in **DDS_DataWriterQos** (p. 683) and **DDS_PublicationBuiltinTopicData** (p. 997).

[default] 256

[range] [0,0x7ffffff]

9.53.2.38 reader_user_data_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_user_data_max_length

Maximum length of user data in **DDS_DataReaderQos** (p. 638) and **DDS_SubscriptionBuiltinTopicData** (p. 1094).

[default] 256

[range] [0,0x7ffffff]

9.53.2.39 max_partitions

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions

Maximum number of partition name strings allowable in a **DDS_PartitionQosPolicy** (p. 976).

This setting is made on a per DomainParticipant basis; it cannot be set individually on a per Publisher/Subscriber basis. However, the limit is enforced and applies per Publisher/Subscriber.

This value cannot exceed 64.

[default] 64

[range] [0,64]

9.53.2.40 max_partition_cumulative_characters

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_characters

Maximum number of combined characters allowable in all partition names in a **DDS_PartitionQosPolicy** (p. 976).

The maximum number of combined characters should account for a terminating NULL ('\0') character for each partition name string.

This setting is made on a per DomainParticipant basis; it cannot be set individually on a per Publisher/Subscriber basis. However, the limit is enforced and applies per Publisher/Subscriber.

This value cannot exceed 256.

[default] 256

[range] [0,256]

9.53.2.41 type_code_max_serialized_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::type_code_max_serialized_length

Maximum size of serialized string for type code.

This parameter is an alternative to **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 754) for limiting the size of the type code that a **DDSDomainParticipant** (p. 1335) is able to store and propagate for user data types. Type codes can be used by external applications to understand user data types without having the data type predefined in compiled form. However, since type codes contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in large type codes. So it is common for users to set this parameter to a large value, if used (by default, it is set to 0). However, as with all parameters in this QoS policy defining maximum sizes for variable-length elements, all DomainParticipants in the same domain should use the same value for this parameter. Note: TypeObject is now the standard method of exchanging type information in RTI Connext. It is recommended to use **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 754) to configure the maximum serialized type object string.

[default] 0

[range] [0,0xffff]

9.53.2.42 type_object_max_serialized_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length

The maximum length, in bytes, that the buffer to serialize a TypeObject can consume.

This parameter limits the size of the TypeObject that a DomainParticipant is able to propagate. Since TypeObjects contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in TypeObjects larger than the default maximum of 8192 bytes. This field allows you to specify a larger value. The desired size for a given **DDS_TypeCode** (p. 1149) can be obtained using **DDS_TypeCode::get_type_object_serialized_size** (p. 1177).

[default] 8192

[range] [0,0x7ffffff]

9.53.2.43 serialized_type_object_dynamic_allocation_threshold

```
DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::serialized_type_object_dynamic_allocation↵
_threshold
```

A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject.

Above this threshold, the memory for a TypeObject is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

In case **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 754) is different than **DDS_LENGTH_UNLIMITED** (p. 437) and is smaller than **DDS_DomainParticipantResourceLimitsQosPolicy::serialized_type_object_dynamic_allocation_threshold** (p. 754): **DDS_DomainParticipantResourceLimitsQosPolicy::serialized_type_object_dynamic_allocation_threshold** (p. 754) will be adjusted to **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 754).

[default] 8192

[range] [0,0x7fffffff] <= **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_serialized_length** (p. 754)

9.53.2.44 type_object_max_deserialized_length

```
DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_deserialized_length
```

The maximum number of bytes that a deserialized TypeObject can consume.

This parameter limits the size of the TypeObject that a DomainParticipant is able to store.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [0,0x7fffffff] or **DDS_LENGTH_UNLIMITED** (p. 437)

9.53.2.45 deserialized_type_object_dynamic_allocation_threshold

```
DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::deserialized_type_object_dynamic_allocation↵
_threshold
```

A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject.

Above this threshold, the memory for a TypeObject is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

In case **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_deserialized_length** (p. 755) is different than **DDS_LENGTH_UNLIMITED** (p. 437) and is smaller than **DDS_DomainParticipantResourceLimitsQosPolicy::deserialized_type_object_dynamic_allocation_threshold** (p. 755): **DDS_DomainParticipantResourceLimitsQosPolicy::deserialized_type_object_dynamic_allocation_threshold** (p. 755) will be adjusted to **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_deserialized_length** (p. 755).

[default] 4096

[range] [0,0x7fffffff] <= **DDS_DomainParticipantResourceLimitsQosPolicy::type_object_max_deserialized_length** (p. 755)

9.53.2.46 contentfilter_property_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::contentfilter_property_max_length

This field is the maximum length of all data related to a Content-filtered topic.

This is the sum of the length of the ContentFilteredTopic name, the length of the related topic name, the length of the filter expression, the length of the filter parameters, and the length of the filter name. The maximum number of combined characters should account for a terminating NULL ('\0') character for each string.

[default] 256

[range] [0,0xffff]

9.53.2.47 channel_seq_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::channel_seq_max_length

Maximum number of channels that can be specified in **DDS_MultiChannelQosPolicy** (p. 952) for MultiChannel Data↔ Writers.

[default] 32

[range] [0,0xffff]

9.53.2.48 channel_filter_expression_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::channel_filter_expression_max_length

Maximum length of a channel **DDS_ChannelSettings_t::filter_expression** (p. 605) in a MultiChannel DataWriter.

The length should account for a terminating NULL ('\0') character.

[default] 256

[range] [0,0xffff]

9.53.2.49 participant_property_list_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::participant_property_list_max_length

Maximum number of properties associated with the **DDSDomainParticipant** (p. 1335).

[default] 32

[range] [0,0xffff]

9.53.2.50 participant_property_string_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::participant_property_string_max_length

Maximum string length of the properties associated with the **DDSDomainParticipant** (p. 1335).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDSDomainParticipant** (p. 1335) properties.

[default] 4096

[range] [0,0xffff]

9.53.2.51 writer_property_list_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_property_list_max_length

Maximum number of properties associated with a **DDSDataWriter** (p. 1305).

[range] [0,0xffff]

[default] 32

9.53.2.52 writer_property_string_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_property_string_max_length

Maximum string length of the properties associated with a **DDSDataWriter** (p. 1305).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDSDataWriter** (p. 1305) properties.

[default] 1024

[range] [0,0xffff]

9.53.2.53 reader_property_list_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_property_list_max_length

Maximum number of properties associated with a **DDSDataReader** (p. 1272).

[default] 32

[range] [0,0xffff]

9.53.2.54 reader_property_string_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_property_string_max_length

Maximum string length of the properties associated with a **DDSDataReader** (p. 1272).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with a **DDSDataReader** (p. 1272) properties.

[default] 1024

[range] [0,0xffff]

9.53.2.55 max_endpoint_groups

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::max_endpoint_groups

Maximum number of **DDS_EndpointGroup_t** (p. 885) allowable in a **DDS_AvailabilityQosPolicy** (p. 590).

[default] 32

[range] [0,65535]

9.53.2.56 max_endpoint_group_cumulative_characters

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::max_endpoint_group_cumulative_characters

Maximum number of combined role_name characters allowed in all **DDS_EndpointGroup_t** (p. 885) in a **DDS_↔AvailabilityQosPolicy** (p. 590).

The maximum number of combined characters should account for a terminating NULL character for each role_name string.

[default] 1024

[range] [0,65535]

9.53.2.57 transport_info_list_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::transport_info_list_max_length

Maximum number of installed transports to send and receive information about in **DDS_ParticipantBuiltinTopicData↔::transport_info** (p. 968).

[default] 12

[range] [0,100]

9.53.2.58 ignored_entity_replacement_kind

DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_replacement_kind

Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_allocation** (p. 747) are reached.

When a **DDSDomainParticipant** (p. 1335)'s number of ignored entities is greater than **DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_allocation** (p. 747), the **DDSDomainParticipant** (p. 1335) will try to make room by replacing an existing ignored participant entry. This field specifies what entity is allowed to be replaced.

If a replaceable participant entry is not available, an out-of-resources exception will be returned.

[default] **DDS_NO_REPLACEMENT_IGNORED_ENTITY_REPLACEMENT** (p. 396)

See also

DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind (p. 396)

9.53.2.59 remote_topic_query_allocation

struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_topic_query_allocation

Allocation settings applied to remote TopicQueries.

Settings applied to the allocation of information about **DDSTopicQuery** (p. 1611) objects created by other participants and discovered by this participant.

When the participant receives a new topic query that would make the current count go above `max_count`, it is not processed until the current count drops (i.e. another topic query is cancelled). The topic query stays in the Built-in ServiceRequest DataReader queue until it can be processed or it is cancelled.

[default] `initial_count = 1`; `max_count = DDS_LENGTH_UNLIMITED` (p. 437); `incremental_count = -1`

[range] See allowed ranges in struct **DDS_AllocationSettings_t** (p. 582)

9.53.2.60 remote_topic_query_hash_buckets

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_topic_query_hash_buckets

Number of hash buckets for remote TopicQueries.

[default] 1

[range] [1, 10000]

See also

DDS_DomainParticipantResourceLimitsQosPolicy::remote_topic_query_allocation (p. 759)

9.53.2.61 writer_data_tag_list_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_data_tag_list_max_length

Maximum number of data tags associated with a **DDSDataWriter** (p. 1305).

[default] 0

[range] [0,0xffff]

9.53.2.62 writer_data_tag_string_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_data_tag_string_max_length

Maximum string length of the data tags associated with a **DDSDataWriter** (p. 1305).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDSDataWriter** (p. 1305) data tags.

[default] 0

[range] [0,0xffff]

9.53.2.63 reader_data_tag_list_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_data_tag_list_max_length

Maximum number of data tags associated with a **DDSDataReader** (p. 1272).

[default] 0

[range] [0,0xffff]

9.53.2.64 reader_data_tag_string_max_length

DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_data_tag_string_max_length

Maximum string length of the data tags associated with a **DDSDataReader** (p. 1272).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDSDataReader** (p. 1272) data tags.

[default] 0

[range] [0,0xffff]

9.53.2.65 shmem_ref_transfer_mode_max_segments

DDS_UnsignedLong DDS_DomainParticipantResourceLimitsQosPolicy::shmem_ref_transfer_mode_max_↔ segments

Maximum number of segments created by all DataWriters belonging to a **DDSDomainParticipant** (p. 1335).

[default] 500

[range] [0,0xffffffff], but in practice, this value will be limited by the system-wide maximum number of shared memory segments. On a Linux machine, this value is provided by the kernel parameter shmni.

9.54 DDS_DoubleSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_Double** (p. 318) >

9.55 DDS_DurabilityQosPolicy Struct Reference

This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDSDataReader** (p. 1272) entities that join the network later.

Public Attributes

- **DDS_DurabilityQosPolicyKind kind**
The kind of durability.
- **DDS_Boolean direct_communication**
<<*extension*>> (p. 236) Indicates whether or not a **TRANSIENT** or **PERSISTENT** **DDSDataReader** (p. 1272) should receive samples directly from a **TRANSIENT** or **PERSISTENT** **DDSDataWriter** (p. 1305)
- **DDS_Long writer_depth**
<<*extension*>> (p. 236) Indicates the number of samples per instance that a durable **DDSDataWriter** (p. 1305) will send to a late-joining **DDSDataReader** (p. 1272).
- struct **DDS_PersistentStorageSettings storage_settings**
Configures durable writer history and durable reader state.

9.55.1 Detailed Description

This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDSDataReader** (p. 1272) entities that join the network later.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343)

Properties:

RxO (p. ??) = YES

Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

See also

DURABILITY_SERVICE (p. 401)

9.55.2 Usage

It is possible for a **DDSDataWriter** (p. 1305) to start publishing data before all (or any) **DDSDataReader** (p. 1272) entities have joined the network.

Moreover, a **DDSDataReader** (p. 1272) that joins the network after some data has been written could potentially be interested in accessing the most current values of the data, as well as potentially some history.

This policy makes it possible for a late-joining **DDSDataReader** (p. 1272) to obtain previously published samples.

By helping to ensure that DataReaders get all data that was sent by DataWriters, regardless of when it was sent, using this QoS policy can increase system tolerance to failure conditions.

Note that although related, this does not strictly control what data RTI Connexx will maintain internally. That is, RTI Connexx may choose to maintain some data for its own purposes (e.g., flow control) and yet not make it available to late-joining readers if the **DURABILITY** (p. 397) policy is set to **DDS_VOLATILE_DURABILITY_QOS** (p. 399).

9.55.2.1 Transient and Persistent Durability

For the purpose of implementing the DURABILITY QoS kind TRANSIENT or PERSISTENT, RTI Connexth behaves as if for each Topic that has **DDS_DurabilityQosPolicy::kind** (p. 764) of **DDS_TRANSIENT_DURABILITY_QOS** (p. 400) or **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) there is a corresponding "built-in" **DDSDataReader** (p. 1272) and **DDSDataWriter** (p. 1305) configured with the same DURABILITY kind. In other words, it is as if somewhere in the system, independent of the original **DDSDataWriter** (p. 1305), there is a built-in durable **DDSDataReader** (p. 1272) subscribing to that Topic and a built-in durable DataWriter re-publishing it as needed for the new subscribers that join the system. This functionality is provided by the *RTI Persistence Service*.

The Persistence Service can configure itself based on the QoS of your application's **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) entities. For each transient or persistent **DDSTopic** (p. 1601), the built-in fictitious Persistence Service **DDSDataReader** (p. 1272) and **DDSDataWriter** (p. 1305) have their QoS configured from the QoS of your application's **DDSDataWriter** (p. 1305) and **DDSDataReader** (p. 1272) entities that communicate on that **DDSTopic** (p. 1601).

For a given **DDSTopic** (p. 1601), the usual request/offered semantics apply to the matching between any **DDSDataWriter** (p. 1305) in the domain that writes the **DDSTopic** (p. 1601) and the built-in transient/persistent **DDSDataReader** (p. 1272) for that **DDSTopic** (p. 1601); similarly for the built-in transient/persistent **DDSDataWriter** (p. 1305) for a **DDSTopic** (p. 1601) and any **DDSDataReader** (p. 1272) for the **DDSTopic** (p. 1601). As a consequence, a **DDSDataWriter** (p. 1305) that has an incompatible QoS will not send its data to the *RTI Persistence Service*, and a **DDSDataReader** (p. 1272) that has an incompatible QoS will not get data from it.

Incompatibilities between local **DDSDataReader** (p. 1272) and **DDSDataWriter** (p. 1305) entities and the corresponding fictitious built-in transient/persistent entities cause the **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343) and **DDS_OFFERED_INCOMPATIBLE_QOS_STATUS** (p. 343) to change and the corresponding Listener invocations and/or signaling of **DDSCondition** (p. 1260) objects as they would with your application's own entities.

The value of **DDS_DurabilityServiceQosPolicy::service_cleanup_delay** (p. 767) controls when *RTI Persistence Service* is able to remove all information regarding a data instances.

Information on a data instance is maintained until the following conditions are met:

1. The instance has been explicitly disposed (instance_state = NOT_ALIVE_DISPOSED),

and

1. All samples for the disposed instance have been acknowledged, including the dispose sample itself,

and

1. A time interval longer that **DDS_DurabilityServiceQosPolicy::service_cleanup_delay** (p. 767) has elapsed since the moment RTI Connexth detected that the previous two conditions were met. (Note: Only values of zero or **DDS_DURATION_INFINITE** (p. 325) are currently supported for the service_cleanup_delay)

The utility of **DDS_DurabilityServiceQosPolicy::service_cleanup_delay** (p. 767) is apparent in the situation where an application disposes an instance and it crashes before it has a chance to complete additional tasks related to the disposition. Upon restart, the application may ask for initial data to regain its state and the delay introduced by the service_cleanup_delay will allow the restarted application to receive the information on the disposed instance and complete the interrupted tasks.

9.55.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind* \geq *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of DURABILITY kind are considered ordered such that **DDS_VOLATILE_DURABILITY_QOS** (p. 399) < **DDS_TRANSIENT_LOCAL_DURABILITY_QOS** (p. 400) < **DDS_TRANSIENT_DURABILITY_QOS** (p. 400) < **DDS_PERSISTENT_DURABILITY_QOS** (p. 400).

9.55.4 Member Data Documentation

9.55.4.1 kind

```
DDS_DurabilityQosPolicyKind DDS_DurabilityQosPolicy::kind
```

The kind of durability.

[default] **DDS_VOLATILE_DURABILITY_QOS** (p. 399)

9.55.4.2 direct_communication

```
DDS_Boolean DDS_DurabilityQosPolicy::direct_communication
```

<<**extension**>> (p. 236) Indicates whether or not a TRANSIENT or PERSISTENT **DDSDataReader** (p. 1272) should receive samples directly from a TRANSIENT or PERSISTENT **DDSDataWriter** (p. 1305)

When `direct_communication` is set to **DDS_BOOLEAN_TRUE** (p. 316), a TRANSIENT or PERSISTENT **DDSDataReader** (p. 1272) will receive samples from both the original **DDSDataWriter** (p. 1305) configured with TRANSIENT or PERSISTENT durability and the **DDSDataWriter** (p. 1305) created by the persistence service. This peer-to-peer communication pattern provides low latency between end-points.

If the same sample is received from the original **DDSDataWriter** (p. 1305) and the persistence service, the middleware will discard the duplicate.

When `direct_communication` is set to **DDS_BOOLEAN_FALSE** (p. 316), a TRANSIENT or PERSISTENT **DDSDataReader** (p. 1272) will only receive samples from the **DDSDataWriter** (p. 1305) created by the persistence service. This brokered communication pattern provides a way to guarantee eventual consistency.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.55.4.3 writer_depth

DDS_Long DDS_DurabilityQosPolicy::writer_depth

<<**extension**>> (p. 236) Indicates the number of samples per instance that a durable **DDSDataWriter** (p. 1305) will send to a late-joining **DDSDataReader** (p. 1272).

The default value, **DDS_AUTO_WRITER_DEPTH** (p. 400), makes this parameter equal to the following:

- **DDS_HistoryQosPolicy::depth** (p. 908) if the history kind is **DDS_KEEP_LAST_HISTORY_QOS** (p. 406).
- **DDS_ResourceLimitsQosPolicy::max_samples_per_instance** (p. 1041) in the **DDS_ResourceLimitsQosPolicy** (p. 1038) if the history kind is **DDS_KEEP_ALL_HISTORY_QOS** (p. 406).

The `writer_depth` must be \leq **DDS_HistoryQosPolicy::depth** (p. 908).

`writer_depth` applies only to non-volatile DataWriters (those for which the kind is **TRANSIENT_LOCAL**, **TRANSIENT**, or **PERSISTENT**).

When **DDS_BatchQosPolicy::enable** (p. 595) is set to true, `writer_depth` acts as a minimum number of samples per instance that will be sent to late joiners, as opposed to the maximum. As long as a batch contains a single sample that falls within the `writer_depth` for the instance to which it belongs, then the entire batch will be sent. This means that batches sent to late-joining DataReaders may contain more samples per instance than is specified by the `writer_depth` QoS setting.

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the `writer_depth`, not the **DDS_HistoryQosPolicy::depth** (p. 908).

Setting `writer_depth` on the DataReader side will be ignored.

[default] **DDS_AUTO_WRITER_DEPTH** (p. 400)

9.55.4.4 storage_settings

struct **DDS_PersistentStorageSettings** DDS_DurabilityQosPolicy::storage_settings

Configures durable writer history and durable reader state.

By default, durable writer history and durable reader state are disabled. This means that a DataWriter will not persist its historical cache and a DataReader will not persist its state.

To enable durable writer history and durable reader state set **DDS_PersistentStorageSettings::enable** (p. 980) to **DDS_BOOLEAN_TRUE** (p. 316).

9.56 DDS_DurabilityServiceQosPolicy Struct Reference

Various settings to configure the external *RTI Persistence Service* used by RTI Connex for DataWriters with a **DDS_DurabilityQosPolicy** (p. 761) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 400).

Public Attributes

- struct **DDS_Duration_t service_cleanup_delay**
Controls when the service is able to remove all information regarding a data instances.
- **DDS_HistoryQosPolicyKind history_kind**
The kind of history to apply in recouping durable data.
- **DDS_Long history_depth**
*Setting to use for the **DDS_DurabilityQosPolicy::writer_depth** (p. 764) when recouping durable data.*
- **DDS_Long max_samples**
Part of resource limits QoS policy to apply when feeding a late joiner.
- **DDS_Long max_instances**
Part of resource limits QoS policy to apply when feeding a late joiner.
- **DDS_Long max_samples_per_instance**
Part of resource limits QoS policy to apply when feeding a late joiner.

9.56.1 Detailed Description

Various settings to configure the external *RTI Persistence Service* used by RTI Connex for DataWriters with a **DDS_↵_DurabilityQosPolicy** (p. 761) setting of **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_↵_DURABILITY_QOS** (p. 400).

Entity:

DDSTopic (p. 1601), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = NO
Changeable (p. ??) = UNTIL ENABLE (p. ??)

See also

DURABILITY (p. 397)
HISTORY (p. 404)
RESOURCE_LIMITS (p. 437)

9.56.2 Usage

When a DataWriter's **DDS_DurabilityQosPolicy::kind** (p. 764) is **DDS_PERSISTENT_DURABILITY_QOS** (p. 400) or **DDS_TRANSIENT_DURABILITY_QOS** (p. 400), an external service, the *RTI Persistence Service*, is used to store and possibly forward the data sent by the **DDSDataWriter** (p. 1305) to **DDSDataReader** (p. 1272) objects that are created *after* the data was initially sent.

This QoS policy is used to configure certain parameters of the Persistence Service when it operates on the behalf of the **DDSDataWriter** (p. 1305), such as how much data to store. For example, it configures the **DURABILITY** (p. 397), **HISTORY** (p. 404), and the **RESOURCE_LIMITS** (p. 437) used by the fictitious DataReader and DataWriter used by the Persistence Service. Note, however, that the Persistence Service itself may be configured to ignore these values and instead use values from its own configuration file.

9.56.3 Member Data Documentation

9.56.3.1 service_cleanup_delay

```
struct DDS_Duration_t DDS_DurabilityServiceQosPolicy::service_cleanup_delay
```

Controls when the service is able to remove all information regarding a data instances.

When the service cleanup delay is set to 0, disposed instances will be completely removed from the service. Only values of 0 and **DDS_DURATION_INFINITE** (p. 325) are currently supported.

[default] 0

9.56.3.2 history_kind

```
DDS_HistoryQosPolicyKind DDS_DurabilityServiceQosPolicy::history_kind
```

The kind of history to apply in recouping durable data.

[default] **DDS_KEEP_LAST_HISTORY_QOS** (p. 406)

9.56.3.3 history_depth

```
DDS_Long DDS_DurabilityServiceQosPolicy::history_depth
```

Setting to use for the **DDS_DurabilityQosPolicy::writer_depth** (p. 764) when recouping durable data.

If the **DDS_HistoryQosPolicy::depth** (p. 908) is set to a value lower than this value, **DDS_HistoryQosPolicy::depth** (p. 908) will be set equal to the value of this field.

[default] **DDS_AUTO_WRITER_DEPTH** (p. 400) (1)

9.56.3.4 max_samples

```
DDS_Long DDS_DurabilityServiceQosPolicy::max_samples
```

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

9.56.3.5 max_instances

DDS_Long DDS_DurabilityServiceQosPolicy::max_instances

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] DDS_LENGTH_UNLIMITED (p. 437)

9.56.3.6 max_samples_per_instance

DDS_Long DDS_DurabilityServiceQosPolicy::max_samples_per_instance

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] DDS_LENGTH_UNLIMITED (p. 437)

9.57 DDS_Duration_t Struct Reference

Type for *duration* representation.

Static Public Member Functions

- static **DDS_Duration_t from_micros** (**DDS_UnsignedLongLong** microseconds)
Creates a new duration object from a duration expressed in microseconds.
- static **DDS_Duration_t from_millis** (**DDS_UnsignedLongLong** milliseconds)
Creates a new duration object from a duration expressed in milliseconds.
- static **DDS_Duration_t from_nanos** (**DDS_UnsignedLongLong** nanoseconds)
Creates a new duration object from a duration expressed in nanoseconds.
- static **DDS_Duration_t from_seconds** (**DDS_UnsignedLong** seconds)
Creates a new duration object from a duration expressed in seconds.

Public Attributes

- **DDS_Long sec**
seconds
- **DDS_UnsignedLong nanosec**
nanoseconds

9.57.1 Detailed Description

Type for *duration* representation.

Represents a time interval.

Examples

HelloWorld_publisher.cxx, and **HelloWorld_subscriber.cxx**.

9.57.2 Member Data Documentation

9.57.2.1 sec

DDS_Long DDS_Duration_t::sec

seconds

9.57.2.2 nanosec

DDS_UnsignedLong DDS_Duration_t::nanosec

nanoseconds

[range] [0,1000000000)

9.58 DDS_DynamicData Struct Reference

A sample of any complex data type, which can be inspected and manipulated reflectively.

Public Member Functions

- **DDS_DynamicData** (const **DDS_TypeCode** *type, const **DDS_DynamicDataProperty_t** &property)
The constructor for new DDS_DynamicData (p. 769) objects.
- **DDS_Boolean is_valid** () const
Indicates whether the object was constructed properly.
- **DDS_ReturnCode_t copy** (const **DDS_DynamicData** &src)
Deeply copy from the given object to this object.
- **DDS_Boolean equal** (const **DDS_DynamicData** &other) const
Indicate whether the contents of another DDS_DynamicData (p. 769) sample are the same as those of this one.
- **DDS_DynamicData & operator=** (const **DDS_DynamicData** &src)
Deeply copy from the given object to this object.
- **DDS_Boolean operator==** (const **DDS_DynamicData** &other) const
Indicate whether the contents of another DDS_DynamicData (p. 769) sample are the same as those of this one.
- **DDS_ReturnCode_t clear_all_members** ()
Clear the contents of all data members of this object.
- **DDS_ReturnCode_t clear_optional_member** (const char *member_name, **DDS_DynamicDataMemberId** member_id)
Clear the contents of a single optional data member of this object.
- **DDS_ReturnCode_t clear_member** (const char *member_name, **DDS_DynamicDataMemberId** member_id)

Clear the contents of a single data member of this object.

- **DDS_ReturnCode_t from_cdr_buffer** (const char *buffer, unsigned int length)

Deserializes a DynamicData object from a buffer of octets.

- **DDS_ReturnCode_t to_cdr_buffer** (char *buffer, unsigned int &length)

Serializes a DynamicData object into a CDR buffer of octets.

- **DDS_ReturnCode_t to_cdr_buffer_ex** (char *buffer, unsigned int &length, **DDS_DataRepresentationId_t** representation)

Serializes a DynamicData object into a buffer of octets.

- **DDS_ReturnCode_t to_string** (char *str, **DDS_UnsignedLong** &str_size, const **DDS_PrintFormatProperty** &property)

Get a string representation of a DynamicData object.

- **DDS_ReturnCode_t print** (FILE *fp, int indent) const

Output a textual representation of this object and its contents to the given file.

- void **get_info** (**DDS_DynamicDataInfo** &info_out) const

*Fill in the given descriptor with information about this **DDS_DynamicData** (p. 769).*

- **DDS_ReturnCode_t bind_type** (const **DDS_TypeCode** *type)

*If this **DDS_DynamicData** (p. 769) object is not yet associated with a data type, set that type now to the given **DDS_TypeCode** (p. 1149).*

- **DDS_ReturnCode_t unbind_type** ()

*Dissociate this **DDS_DynamicData** (p. 769) object from any particular data type.*

- **DDS_ReturnCode_t bind_complex_member** (**DDS_DynamicData** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id)

*Use another **DDS_DynamicData** (p. 769) object to provide access to a complex field of this **DDS_DynamicData** (p. 769) object.*

- **DDS_ReturnCode_t unbind_complex_member** (**DDS_DynamicData** &value)

*Tear down the association created by a **DDS_DynamicData::bind_complex_member** (p. 794) operation, committing any changes to the outer object since then.*

- const **DDS_TypeCode** * **get_type** () const

*Get the data type, of which this **DDS_DynamicData** (p. 769) represents an instance.*

- **DDS_TCKind** **get_type_kind** () const

Get the kind of this object's data type.

- **DDS_UnsignedLong** **get_member_count** () const

Get the number of members in the type.

- **DDS_Boolean** **member_exists** (const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Indicates whether a member exists in this sample.

- **DDS_Boolean** **member_exists_in_type** (const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Indicates whether a member of a particular name/ID exists in this data sample's type.

- **DDS_ReturnCode_t get_member_info** (**DDS_DynamicDataMemberInfo** &info, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

*Fill in the given descriptor with information about the identified member of this **DDS_DynamicData** (p. 769) sample.*

- **DDS_ReturnCode_t get_member_info_by_index** (struct **DDS_DynamicDataMemberInfo** &info, **DDS_UnsignedLong** index) const

*Fill in the given descriptor with information about the identified member of this **DDS_DynamicData** (p. 769) sample.*

- **DDS_ReturnCode_t get_member_type** (const **DDS_TypeCode** *&type_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get the type of the given member of this sample.

- **DDS_ReturnCode_t is_member_key** (**DDS_Boolean** &is_key_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
Indicates whether a given member forms part of the key of this sample's data type.
- **DDS_ReturnCode_t get_long** (**DDS_Long** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_Long** (p. 317) or another type implicitly convertible to it (**DDS_Octet** (p. 316), **DDS_Char** (p. 316), **DDS_Short** (p. 317), **DDS_UnsignedShort** (p. 317), or **DDS_Enum** (p. 319)).*
- **DDS_ReturnCode_t get_short** (**DDS_Short** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_Short** (p. 317) or another type implicitly convertible to it (**DDS_Octet** (p. 316) or **DDS_Char** (p. 316)).*
- **DDS_ReturnCode_t get_ulong** (**DDS_UnsignedLong** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_UnsignedLong** (p. 317) or another type implicitly convertible to it (**DDS_Octet** (p. 316), **DDS_Char** (p. 316), **DDS_Short** (p. 317), **DDS_UnsignedShort** (p. 317), or **DDS_Enum** (p. 319)).*
- **DDS_ReturnCode_t get_ushort** (**DDS_UnsignedShort** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_UnsignedShort** (p. 317) or another type implicitly convertible to it (**DDS_Octet** (p. 316) or **DDS_Char** (p. 316)).*
- **DDS_ReturnCode_t get_float** (**DDS_Float** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_Float** (p. 318).*
- **DDS_ReturnCode_t get_double** (**DDS_Double** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_Double** (p. 318) or another type implicitly convertible to it (**DDS_Float** (p. 318)).*
- **DDS_ReturnCode_t get_boolean** (**DDS_Boolean** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_Boolean** (p. 319).*
- **DDS_ReturnCode_t get_char** (**DDS_Char** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_Char** (p. 316).*
- **DDS_ReturnCode_t get_octet** (**DDS_Octet** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_Octet** (p. 316).*
- **DDS_ReturnCode_t get_longlong** (**DDS_LongLong** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_LongLong** (p. 318) or another type implicitly convertible to it (**DDS_Octet** (p. 316), **DDS_Char** (p. 316), **DDS_Short** (p. 317), **DDS_UnsignedShort** (p. 317), **DDS_Long** (p. 317), **DDS_UnsignedLong** (p. 317), or **DDS_Enum** (p. 319)).*
- **DDS_ReturnCode_t get_ulonglong** (**DDS_UnsignedLongLong** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_UnsignedLongLong** (p. 318) or another type implicitly convertible to it (**DDS_Octet** (p. 316), **DDS_Char** (p. 316), **DDS_Short** (p. 317), **DDS_UnsignedShort** (p. 317), **DDS_Long** (p. 317), **DDS_UnsignedLong** (p. 317), or **DDS_Enum** (p. 319)).*
- **DDS_ReturnCode_t get_longdouble** (**DDS_LongDouble** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const
*Get the value of the given field, which is of type **DDS_LongDouble** (p. 318) or another type implicitly convertible to it (**DDS_Float** (p. 318) or **DDS_Double** (p. 318)).*
- **DDS_ReturnCode_t get_wchar** (**DDS_Wchar** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get the value of the given field, which is of type **DDS_Wchar** (p. 316) or another type implicitly convertible to it (**DDS_Char** (p. 316)).

- **DDS_ReturnCode_t get_string** (char *&value, **DDS_UnsignedLong** *size, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get the value of the given field, which is of type char*.

- **DDS_ReturnCode_t get_wstring** (**DDS_Wchar** *&value, **DDS_UnsignedLong** *size, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get the value of the given field, which is of type **DDS_Wchar** (p. 316)*.

- **DDS_ReturnCode_t get_int8** (**DDS_Int8** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get the value of the given field, which is of type **DDS_Int8** (p. 317).

- **DDS_ReturnCode_t get_uint8** (**DDS_UInt8** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get the value of the given field, which is of type **DDS_UInt8** (p. 317).

- **DDS_ReturnCode_t get_complex_member** (**DDS_DynamicData** &value_out, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the value of the given field, which is of some composed type.

- **DDS_ReturnCode_t get_long_array** (**DDS_Long** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member. The array may contain members of type **DDS_Long** (p. 317) or **DDS_Enum** (p. 319).

- **DDS_ReturnCode_t get_short_array** (**DDS_Short** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_ulong_array** (**DDS_UnsignedLong** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member. The array may contain members of type **DDS_UnsignedLong** (p. 317) or **DDS_Enum** (p. 319).

- **DDS_ReturnCode_t get_ushort_array** (**DDS_UnsignedShort** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_float_array** (**DDS_Float** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_double_array** (**DDS_Double** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_boolean_array** (**DDS_Boolean** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_char_array** (**DDS_Char** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_octet_array** (**DDS_Octet** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_longlong_array** (**DDS_LongLong** *array, **DDS_UnsignedLong** *length, const char *member_name, **DDS_DynamicDataMemberId** member_id) const

Get a copy of the given array member.

- **DDS_ReturnCode_t get_ulonglong_array** (DDS_UnsignedLongLong *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given array member.
- **DDS_ReturnCode_t get_longdouble_array** (DDS_LongDouble *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given array member.
- **DDS_ReturnCode_t get_wchar_array** (DDS_Wchar *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given array member.
- **DDS_ReturnCode_t get_int8_array** (DDS_Int8 *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given array member.
- **DDS_ReturnCode_t get_uint8_array** (DDS_UInt8 *array, DDS_UnsignedLong *length, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given array member.
- **DDS_ReturnCode_t get_long_seq** (DDS_LongSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_short_seq** (DDS_ShortSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_ulong_seq** (DDS_UnsignedLongSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_ushort_seq** (DDS_UnsignedShortSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_float_seq** (DDS_FloatSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_double_seq** (DDS_DoubleSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_boolean_seq** (DDS_BooleanSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_char_seq** (DDS_CharSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_octet_seq** (DDS_OctetSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_longlong_seq** (DDS_LongLongSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_ulonglong_seq** (DDS_UnsignedLongLongSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.

- **DDS_ReturnCode_t get_longdouble_seq** (DDS_LongDoubleSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_wchar_seq** (DDS_WcharSeq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_int8_seq** (DDS_Int8Seq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t get_uint8_seq** (DDS_UInt8Seq &seq, const char *member_name, DDS_DynamicDataMemberId member_id) const
Get a copy of the given sequence member.
- **DDS_ReturnCode_t set_long** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_Long value)
*Set the value of the given field, which is of type **DDS_Long** (p. 317).*
- **DDS_ReturnCode_t set_short** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_Short value)
*Set the value of the given field, which is of type **DDS_Short** (p. 317).*
- **DDS_ReturnCode_t set_ulong** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLong value)
*Set the value of the given field, which is of type **DDS_UnsignedLong** (p. 317).*
- **DDS_ReturnCode_t set_ushort** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedShort value)
*Set the value of the given field, which is of type **DDS_UnsignedShort** (p. 317).*
- **DDS_ReturnCode_t set_float** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_Float value)
*Set the value of the given field, which is of type **DDS_Float** (p. 318).*
- **DDS_ReturnCode_t set_double** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_Double value)
*Set the value of the given field, which is of type **DDS_Double** (p. 318).*
- **DDS_ReturnCode_t set_boolean** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_Boolean value)
*Set the value of the given field, which is of type **DDS_Boolean** (p. 319).*
- **DDS_ReturnCode_t set_char** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_Char value)
*Set the value of the given field, which is of type **DDS_Char** (p. 316).*
- **DDS_ReturnCode_t set_octet** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_Octet value)
*Set the value of the given field, which is of type **DDS_Octet** (p. 316).*
- **DDS_ReturnCode_t set_longlong** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_LongLong value)
*Set the value of the given field, which is of type **DDS_LongLong** (p. 318).*
- **DDS_ReturnCode_t set_ulonglong** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_UnsignedLongLong value)
*Set the value of the given field, which is of type **DDS_UnsignedLongLong** (p. 318).*
- **DDS_ReturnCode_t set_longdouble** (const char *member_name, DDS_DynamicDataMemberId member_id, DDS_LongDouble value)
*Set the value of the given field, which is of type **DDS_LongDouble** (p. 318).*

- **DDS_ReturnCode_t set_wchar** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_Wchar** value)
*Set the value of the given field, which is of type **DDS_Wchar** (p. 316).*
- **DDS_ReturnCode_t set_string** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const char *value)
Set the value of the given field of type char.*
- **DDS_ReturnCode_t set_wstring** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_Wchar** *value)
*Set the value of the given field of type **DDS_Wchar** (p. 316)*.*
- **DDS_ReturnCode_t set_int8** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_Int8** value)
*Set the value of the given field, which is of type **DDS_Int8** (p. 317).*
- **DDS_ReturnCode_t set_uint8** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UInt8** value)
*Set the value of the given field, which is of type **DDS_UInt8** (p. 317).*
- **DDS_ReturnCode_t set_complex_member** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_DynamicData** &value)
*Copy the state of the given **DDS_DynamicData** (p. 769) object into a member of this object.*
- **DDS_ReturnCode_t set_long_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Long** *array)
*Set the contents of the given array member. The array may contain members of type **DDS_Long** (p. 317) or **DDS_Enum** (p. 319).*
- **DDS_ReturnCode_t set_short_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Short** *array)
Set the contents of the given array member.
- **DDS_ReturnCode_t set_ulong_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_UnsignedLong** *array)
*Set the contents of the given array member. The array may contain members of type **DDS_UnsignedLong** (p. 317) or **DDS_Enum** (p. 319).*
- **DDS_ReturnCode_t set_ushort_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_UnsignedShort** *array)
Set the contents of the given array member.
- **DDS_ReturnCode_t set_float_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Float** *array)
Set the contents of the given array member.
- **DDS_ReturnCode_t set_double_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Double** *array)
Set the contents of the given array member.
- **DDS_ReturnCode_t set_boolean_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Boolean** *array)
Set the contents of the given array member.
- **DDS_ReturnCode_t set_char_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Char** *array)
Set the contents of the given array member.
- **DDS_ReturnCode_t set_octet_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Octet** *array)
Set the contents of the given array member.
- **DDS_ReturnCode_t set_longlong_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_LongLong** *array)

Set the contents of the given array member.

- **DDS_ReturnCode_t set_ulonglong_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_UnsignedLongLong** *array)

Set the contents of the given array member.

- **DDS_ReturnCode_t set_longdouble_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_LongDouble** *array)

Set the contents of the given array member.

- **DDS_ReturnCode_t set_wchar_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Wchar** *array)

Set the contents of the given array member.

- **DDS_ReturnCode_t set_int8_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_Int8** *array)

Set the contents of the given array member.

- **DDS_ReturnCode_t set_uint8_array** (const char *member_name, **DDS_DynamicDataMemberId** member_id, **DDS_UnsignedLong** length, const **DDS_UInt8** *array)

Set the contents of the given array member.

- **DDS_ReturnCode_t set_long_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_LongSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_short_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_ShortSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_ulong_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_UnsignedLongSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_ushort_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_UnsignedShortSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_float_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_FloatSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_double_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_DoubleSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_boolean_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_BooleanSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_char_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_CharSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_octet_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_OctetSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_ulonglong_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_LongLongSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_ulonglong_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_UnsignedLongLongSeq** &value)

Set the contents of the given sequence member.

- **DDS_ReturnCode_t set_longdouble_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_LongDoubleSeq** &value)
Set the contents of the given sequence member.
- **DDS_ReturnCode_t set_wchar_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_WcharSeq** &value)
Set the contents of the given sequence member.
- **DDS_ReturnCode_t set_int8_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_Int8Seq** &value)
Set the contents of the given sequence member.
- **DDS_ReturnCode_t set_uint8_seq** (const char *member_name, **DDS_DynamicDataMemberId** member_id, const **DDS_UInt8Seq** &value)
Set the contents of the given sequence member.
- **~DDS_DynamicData ()**
*Finalize and deallocate this **DDS_DynamicData** (p. 769) sample.*

9.58.1 Detailed Description

A sample of any complex data type, which can be inspected and manipulated reflectively.

Objects of type **DDS_DynamicData** (p. 769) represent corresponding objects of the type identified by their **DDS_TypeCode** (p. 1149). Because the definition of these types may not have existed at compile time on the system on which the application is running, you will interact with the data using an API of reflective getters and setters.

For example, if you had access to your data types at compile time, you could do this:

```
theValue = theObject.theField;
```

Instead, you will do something like this:

```
theValue = get(theObject, "theField");
```

DDS_DynamicData (p. 769) objects can represent any complex data type, including those of type kinds **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86), **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86), and **DDS_TK_VALUE** (p. 86). They cannot represent objects of basic types (e.g., integers and strings). Since those type definitions always exist on every system, you can examine their objects directly.

9.58.2 Member Names and IDs

The members of a data type can be identified in one of two ways: by their name or by their numeric ID. The former is often more transparent to human users; the latter is typically faster.

You define the name and ID of a type member when you add that member to that type. If you define your type in IDL or XML, the name will be the field name that appears in the type definition; the ID will be the one-based index of the field in declaration order. For example, in the following IDL structure, the ID of `theLong` is 2.

```
struct MyNestedType {
    char theChar;

    octet theOctetArray[10];

    long long theMultidimensionalArray[4][6][12];

    sequence<long> myArrayOfSeq[8];
};
```

```
struct MyType {
    short theShort;

    long theLong;

    MyNestedType theNestedType;
};
```

For unions (**DDS_TK_UNION** (p. 86)), the ID of a member is the discriminator value corresponding to that member. To access the current discriminator of a union, you must use the **DDS_DynamicData::get_member_info_by_index** (p. 800) operation on the DynamicData object using an index value of 0. This operation fills in a **DDS_DynamicDataMemberInfo** (p. 878), then you can access the populated **DDS_DynamicDataMemberInfo::member_id** (p. 879) field to get the current discriminator. Once you know the value of the discriminator, you can use it in the proper **get/set_xxx()** operations to access and set the member's value. Here is an example of accessing the discriminator:

```
DynamicDataMemberInfo memberInfo;

myDynamicData.get_member_info_by_index(memberInfo, 0);

DynamicDataMemberId discriminatorValue = memberInfo.member_id;

DDS_Long myMemberValue = myDynamicData.get_long(NULL, discriminatorValue);
```

9.58.2.1 Hierarchical Member Names

It is possible to refer to a nested member in a type without first having to use the **DDS_DynamicData::bind_complex_member** (p. 794) API. You can do this by using a hierarchical name. A hierarchical member name is a concatenation of member names separated by the '.' character. The hierarchical name describes the complete path from a top-level type to the nested member. For example, in the above type, any DynamicData API that receives a member name will accept "theNestedType.theChar" to refer to the char member in MyNestedType:

```
char myChar = myDynamicData.get_char("theNestedType.theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

In order to access the value of `theChar` without using a hierarchical name, you would have to first bind to theNestedType and then get the value:

```
myDynamicData.bind_complex_member(myBoundData, "theNestedType", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);

DDS_Char myChar = myBoundData.get_char("theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

As you can see, using a hierarchical member name removes the need to call the **DDS_DynamicData::bind_complex_member** (p. 794) and **DDS_DynamicData::unbind_complex_member** (p. 796) APIs, and allows for access to nested members at any depth directly from the top-level type.

The member name can also contain indexes to address members in arrays and sequences. For example, to set the third member in the array `theOctetArray`, you can pass in "theNestedType.theOctetArray[2]" as the member name to the **DDS_DynamicData::set_octet** (p. 846) API. The index values when used as part of the member name are 0-based.

For multi-dimensional arrays, the indexes for each dimension should be listed comma-separated in between brackets. For example, to address a member of `theMultidimensionalArray`, the member name should be something like "theNestedType.theMultidimensionalArray[3,2,5]".

In complex types with arrays and sequences that contain other arrays and sequences, the hierarchical name may include multiple index values, one right after another. For example, in `MyNestedType`, `myArrayOfSeq` is an array of sequences. In order to set the third member of the sequence in the fourth member of the array, the member name would be "myNestedType.myArrayOfSeq[3][2]".

9.58.3 Arrays and Sequences

The "members" of array and sequence types, unlike those of structure and union types, don't have names or explicit member IDs. However, they may nevertheless be accessed by "ID": the ID is one more than the index. (The first element has ID 1, the second 2, etc.)

Multi-dimensional arrays are effectively flattened by this pattern. For example, for an array `theArray[4][5]`, accessing ID 7 is equivalent to index 6, or the second element of the second group of 5.

To determine the length of a collection-typed member of a structure or union, you have two choices:

1. Get the length along with the data: call the appropriate array accessor (see **Getters and Setters** (p. ??)) and check the resulting length.
2. Get the length without getting the data itself: call **DDS_DynamicData::get_member_info** (p. 799) and check the resulting **DDS_DynamicDataMemberInfo::element_count** (p. 880).

9.58.4 Available Functionality

The Dynamic Data API is large when measured by the number of methods it contains. But each method falls into one of a very small number of categories. You will find it easier to navigate this documentation if you understand these categories.

9.58.4.1 Lifecycle and Utility Methods

Managing the lifecycle of **DDS_DynamicData** (p. 769) objects is simple. You have two choices:

1. Usually, you will go through a **DDSDynamicDataTypeSupport** (p. 1439) factory object, which will ensure that the type and property information for the new **DDS_DynamicData** (p. 769) object corresponds to a registered type in your system.
2. In certain advanced cases, such as when you're navigating a nested structure, you will want to have a **DDS_DynamicData** (p. 769) object that is not bound up front to any particular type, or you will want to initialize the object in a custom way. In that case, you can call the constructor directly.

Table 9.5 Lifecycle

DDSDynamicDataTypeSupport (p. 1439)	DDS_DynamicData (p. 769)
DDSDynamicDataTypeSupport::create_data (p. 1443)	DDS_DynamicData::DDS_DynamicData(const DDS_TypeCode *, const DDS_DynamicData↵Property_t &) (p. 784)
DDSDynamicDataTypeSupport::delete_data (p. 1444)	DDS_DynamicData::~~DDS_DynamicData (p. 785)

You can also copy **DDS_DynamicData** (p. 769) objects:

- **DDS_DynamicData::copy** (p. 785)
- **DDS_DynamicData::operator=** (p. 786)

You can test them for equality:

- **DDS_DynamicData::equal** (p. 786)
- **DDS_DynamicData::operator==** (p. 787)

And you can print their contents:

- **DDS_DynamicData::print** (p. 791)
- **DDSDynamicDataSupport::print_data** (p. 1444)

9.58.4.2 Getters and Setters

Most methods get or set the value of some field. These methods are named according to the type of the field they access.

The names of types vary across languages. The programming API for each language reflects that programming language. However, if your chosen language does not use the same names as the language that you used to define your types (e.g., IDL), or if you need to interoperate among programming languages, you will need to understand these differences. They are explained the following table. (Note: for modern C++, see the RTI Connex Modern C++ API reference.)

Table 9.6 Type Names Across Languages

Type	IDL	C, Traditional C++	C++/CLI (C#)	Java	Ada
16-bit integer	short	DDS_Short	System::Int16	short	Standard.↔ DDS.Short
32-bit integer	long	DDS_Long	System::Int32	int	Standard.↔ DDS.Long
64-bit integer	long long	DDS_LongLong	System::Int64	long	Standard.↔ DDS.Long_↔ Long
Unsigned 16-bit integer	unsigned short	DDS_↔ UnsignedShort	System::UInt16	short	Standard.↔ DDS.↔ Unsigned_Short
Unsigned 32-bit integer	unsigned long	DDS_↔ UnsignedLong	System::UInt32	int	Standard.↔ DDS.Long
Unsigned 64-bit integer	unsigned long long	DDS_↔ Unsigned↔ LongLong	System::UInt64	long	Standard.↔ DDS.↔ Unsigned_↔ Long_Long
float	float	DDS_Float	System::Single	float	Standard.↔ DDS.Float
double	double	DDS_Double	System::Double	double	Standard.↔ DDS.Double

Type	IDL	C, Traditional C++	C++/CLI (C#)	Java	Ada
long double	long double	DDS_Long↔ Double	DDS::Long↔ Double	double	Standard.↔ DDS.Long_↔ Double
character	char	DDS_Char	System::Char	char	Standard.↔ DDS.Char
wide character	wchar	DDS_Wchar	System::Char	N/A (use short)	Standard.↔ DDS.Wchar
octet	octet	DDS_Octet	System::Byte	byte	Standard.↔ DDS.Octet
boolean	boolean	DDS_Boolean	System::↔ Boolean	boolean	Standard.↔ DDS.Boolean
string	string	DDS_Char*	System::String	String	Standard.↔ DDS.String
wstring	wstring	DDS_Wchar*	System::String	String	Standard.↔ DDS.Wide_↔ String

When working with a **DDS_DynamicData** (p. 769) object representing an array or sequence, calling one of the "get" methods below for an index that is out of bounds will result in **DDS_RETCODE_NO_DATA** (p. 336). Calling "set" for an index that is past the end of a sequence will cause that sequence to automatically lengthen (filling with default contents).

When working with a **DDS_DynamicData** (p. 769) object whose type contains optional members, calling one of the "get" methods below on an unset optional member or any member that is part of an unset complex optional member will result in **DDS_RETCODE_NO_DATA** (p. 336).

Table 9.7 Basic Types

Get	Set
DDS_DynamicData::get_long (p. 802)	DDS_DynamicData::set_long (p. 841)
DDS_DynamicData::get_ulong (p. 804)	DDS_DynamicData::set_ulong (p. 842)
DDS_DynamicData::get_short (p. 803)	DDS_DynamicData::set_short (p. 841)
DDS_DynamicData::get_ushort (p. 804)	DDS_DynamicData::set_ushort (p. 843)
DDS_DynamicData::get_longlong (p. 809)	DDS_DynamicData::set_longlong (p. 847)
DDS_DynamicData::get_ulonglong (p. 810)	DDS_DynamicData::set_ulonglong (p. 848)
DDS_DynamicData::get_float (p. 805)	DDS_DynamicData::set_float (p. 844)
DDS_DynamicData::get_double (p. 806)	DDS_DynamicData::set_double (p. 844)
DDS_DynamicData::get_longdouble (p. 810)	DDS_DynamicData::set_longdouble (p. 848)
DDS_DynamicData::get_boolean (p. 807)	DDS_DynamicData::set_boolean (p. 845)
DDS_DynamicData::get_octet (p. 808)	DDS_DynamicData::set_octet (p. 846)
DDS_DynamicData::get_char (p. 807)	DDS_DynamicData::set_char (p. 846)
DDS_DynamicData::get_wchar (p. 811)	DDS_DynamicData::set_wchar (p. 849)
DDS_DynamicData::get_string (p. 812)	DDS_DynamicData::set_string (p. 850)
DDS_DynamicData::get_wstring (p. 813)	DDS_DynamicData::set_wstring (p. 850)

Table 9.8 Structures, Arrays, and Other Complex Types

Get	Set
DDS_DynamicData::get_complex_member (p. 815)	DDS_DynamicData::set_complex_member (p. 852)

Table 9.9 Arrays of Basic Types

Get	Set
DDS_DynamicData::get_long_array (p. 816)	DDS_DynamicData::set_long_array (p. 854)
DDS_DynamicData::get_ulong_array (p. 818)	DDS_DynamicData::set_ulong_array (p. 855)
DDS_DynamicData::get_short_array (p. 817)	DDS_DynamicData::set_short_array (p. 855)
DDS_DynamicData::get_ushort_array (p. 819)	DDS_DynamicData::set_ushort_array (p. 856)
DDS_DynamicData::get_longlong_array (p. 824)	DDS_DynamicData::set_longlong_array (p. 861)
DDS_DynamicData::get_ulonglong_array (p. 825)	DDS_DynamicData::set_ulonglong_array (p. 862)
DDS_DynamicData::get_float_array (p. 820)	DDS_DynamicData::set_float_array (p. 857)
DDS_DynamicData::get_double_array (p. 820)	DDS_DynamicData::set_double_array (p. 858)
DDS_DynamicData::get_longdouble_array (p. 825)	DDS_DynamicData::set_longdouble_array (p. 863)
DDS_DynamicData::get_boolean_array (p. 821)	DDS_DynamicData::set_boolean (p. 845)
DDS_DynamicData::get_octet_array (p. 823)	DDS_DynamicData::set_octet_array (p. 860)
DDS_DynamicData::get_char_array (p. 822)	DDS_DynamicData::set_char_array (p. 860)
DDS_DynamicData::get_wchar_array (p. 826)	DDS_DynamicData::set_wchar_array (p. 864)

Table 9.10 Sequences of Basic Types

Get	Set
DDS_DynamicData::get_long_seq (p. 829)	DDS_DynamicData::set_long_seq (p. 866)
DDS_DynamicData::get_ulong_seq (p. 830)	DDS_DynamicData::set_ulong_seq (p. 867)
DDS_DynamicData::get_short_seq (p. 830)	DDS_DynamicData::set_short_seq (p. 867)
DDS_DynamicData::get_ushort_seq (p. 831)	DDS_DynamicData::set_ushort_seq (p. 868)
DDS_DynamicData::get_longlong_seq (p. 836)	DDS_DynamicData::set_longlong_seq (p. 873)
DDS_DynamicData::get_ulonglong_seq (p. 837)	DDS_DynamicData::set_ulonglong_seq (p. 873)
DDS_DynamicData::get_float_seq (p. 832)	DDS_DynamicData::set_float_seq (p. 869)
DDS_DynamicData::get_double_seq (p. 833)	DDS_DynamicData::set_double_seq (p. 870)
DDS_DynamicData::get_longdouble_seq (p. 838)	DDS_DynamicData::set_longdouble_seq (p. 874)
DDS_DynamicData::get_boolean_seq (p. 834)	DDS_DynamicData::set_boolean_seq (p. 870)
DDS_DynamicData::get_octet_seq (p. 835)	DDS_DynamicData::set_octet_seq (p. 872)
DDS_DynamicData::get_char_seq (p. 834)	DDS_DynamicData::set_char_seq (p. 871)
DDS_DynamicData::get_wchar_seq (p. 838)	DDS_DynamicData::set_wchar_seq (p. 875)

In addition to getting or setting a field, you can "clear" its value; that is, set it to a default zero value.

- **DDS_DynamicData::clear_all_members** (p. 787)
- **DDS_DynamicData::clear_optional_member** (p. 788)

9.58.4.3 Query and Iteration

Not all components of your application will have static knowledge of all of the fields of your type. Sometimes, you will want to query meta-data about the fields that appear in a given data sample.

- **DDS_DynamicData::get_type** (p. 796)
- **DDS_DynamicData::get_type_kind** (p. 797)
- **DDS_DynamicData::get_member_type** (p. 801)
- **DDS_DynamicData::get_member_info** (p. 799)
- **DDS_DynamicData::get_member_count** (p. 797)
- **DDS_DynamicData::get_member_info_by_index** (p. 800)
- **DDS_DynamicData::member_exists** (p. 797)
- **DDS_DynamicData::member_exists_in_type** (p. 798)
- **DDS_DynamicData::is_member_key** (p. 801)

9.58.4.4 Type/Object Association

Sometimes, you may want to change the association between a data object and its type. This is not something you can do with a typical object, but with **DDS_DynamicData** (p. 769) objects, it is a powerful capability. It allows you to, for example, examine nested structures without copying them by using a "bound" **DDS_DynamicData** (p. 769) object as a view into an enclosing **DDS_DynamicData** (p. 769) object.

- **DDS_DynamicData::bind_type** (p. 793)
- **DDS_DynamicData::unbind_type** (p. 793)
- **DDS_DynamicData::bind_complex_member** (p. 794)
- **DDS_DynamicData::unbind_complex_member** (p. 796)

9.58.4.5 Keys

Keys can be specified in dynamically defined types just as they can in types defined in generated code.

MT Safety:

UNSAFE. In general, using a single **DDS_DynamicData** (p. 769) object concurrently from multiple threads is *unsafe*.

Examples

HelloWorldPlugin.cxx.

9.58.5 Constructor & Destructor Documentation

9.58.5.1 DDS_DynamicData()

```
DDS_DynamicData::DDS_DynamicData (
    const   DDS_TypeCode * type,
    const   DDS_DynamicDataProperty_t & property )
```

The constructor for new **DDS_DynamicData** (p. 769) objects.

The type parameter may be NULL. In that case, this **DDS_DynamicData** (p. 769) must be *bound* with **DDS_DynamicData::bind_type** (p. 793) or **DDS_DynamicData::bind_complex_member** (p. 794) before it can be used.

If the **DDS_TypeCode** (p. 1149) is not NULL, the newly constructed **DDS_DynamicData** (p. 769) object will retain a reference to it. It is *not* safe to delete the **DDS_TypeCode** (p. 1149) until all samples that use it have themselves been deleted.

In most cases, it is not necessary to call this constructor explicitly. Instead, use **DDSDynamicDataSupport::create_data** (p. 1443), and the **DDS_TypeCode** (p. 1149) and properties will be specified for you. Using the factory method also ensures that the memory management contract documented above is followed correctly, because the **DDSDynamicDataSupport** (p. 1439) object maintains the **DDS_TypeCode** (p. 1149) used by the samples it creates.

However you create a **DDS_DynamicData** (p. 769) object, you must delete it when you are finished with it. If you choose to use this constructor, delete the object with the destructor: **DDS_DynamicData::~~DDS_DynamicData** (p. 785).

```
DDS_DynamicData* sample = new DDS_DynamicData(
```

```
    myType, myProperties);
```

```
// Failure indicated by is_valid() method.
```

```
// Do something...
```

```
delete sample;
```

NOTE that RTI Connex does not explicitly generate any exceptions in this constructor, because C++ exception support is not consistent across all platforms on which RTI Connex runs. Therefore, to check whether construction succeeded, you must use the **DDS_DynamicData::is_valid** (p. 785) method. Alternatively, you can create an **DDS_DynamicData** (p. 769) object with **DDSDynamicDataSupport::create_data** (p. 1443), which returns NULL on failure, eliminating the need to call **DDS_DynamicData::is_valid** (p. 785).

Parameters

<i>type</i>	<< <i>in</i> >> (p. 237) The type of which the new object will represent an object.
<i>property</i>	<< <i>in</i> >> (p. 237) Properties that configure the behavior of the new object. Most users can simply use DDS_DYNAMIC_DATA_PROPERTY_DEFAULT (p. 102).

DDS_DynamicData::DDS_DynamicData(const DDS_TypeCode *, const DDS_DynamicDataProperty_t &) (p. 784)

9.58.6 Member Function Documentation

9.58.6.1 is_valid()

```
DDS_Boolean DDS_DynamicData::is_valid ( ) const
```

Indicates whether the object was constructed properly.

This method returns **DDS_BOOLEAN_TRUE** (p. 316) if the constructor succeeded; it returns **DDS_BOOLEAN_FALSE** (p. 316) if the constructor failed for any reason, which should also have resulted in a log message. It is only necessary to call this method if you created the **DDS_DynamicData** (p. 769) object using the constructor, **DDS_DynamicData::↔ DDS_DynamicData**(const DDS_TypeCode *, const DDS_DynamicDataProperty_t &) (p. 784).

Possible failure reasons include passing an invalid type or invalid properties to the constructor.

This method is necessary because C++ exception support is not consistent across all of the platforms on which RTI Connext runs. Therefore, the implementation does not throw any exceptions in the constructor.

MT Safety:

UNSAFE.

See also

DDS_DynamicData::DDS_DynamicData(const DDS_TypeCode *, const DDS_DynamicDataProperty_t &) (p. 784)

9.58.6.2 copy()

```
DDS_ReturnCode_t DDS_DynamicData::copy (
    const DDS_DynamicData & src )
```

Deeply copy from the given object to this object.

MT Safety:

UNSAFE.

Exceptions

DDS_DynamicData::equal (p. 786)

9.58.6.6 clear_all_members()

```
DDS_ReturnCode_t DDS_DynamicData::clear_all_members ( )
```

Clear the contents of all data members of this object.

MT Safety:

UNSAFE.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_DynamicData::clear_optional_member (p. 788)

9.58.6.7 clear_optional_member()

```
DDS_ReturnCode_t DDS_DynamicData::clear_optional_member (
    const char * member_name,
    DDS_DynamicDataMemberId member_id )
```

Clear the contents of a single optional data member of this object.

This method is only applicable to optional members. Members of unions, sequences, and arrays are not considered optional.

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member (to look up the member by name), or NULL (to look up the member by its ID).
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member (to look up the member by its ID), or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) (to look up the member by name). See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

DDS_DynamicData::clear_all_members (p. 787)

9.58.6.8 clear_member()

```
DDS_ReturnCode_t DDS_DynamicData::clear_member (
    const char * member_name,
    DDS_DynamicDataMemberId member_id )
```

Clear the contents of a single data member of this object.

This method can be used to clear both optional and non-optional members.

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member to clear or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member to clear or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_DynamicData::clear_all_members (p. 787)

9.58.6.9 from_cdr_buffer()

```
DDS_ReturnCode_t DDS_DynamicData::from_cdr_buffer (
    const char * buffer,
    unsigned int length )
```

Deserializes a DynamicData object from a buffer of octets.

This method deserializes a DynamicData object from a CDR buffer of octets.

The content of the buffer generated by the method **DDS_DynamicData::to_cdr_buffer** (p. 790) can be provided to this method to get the DynamicData object back.

Parameters

<i>buffer</i>	<< <i>in</i> >> (p. 237). Deserialization buffer.
<i>length</i>	<< <i>in</i> >> (p. 237). Length of the serialized representation of the DynamicData object in the buffer.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.58.6.10 to_cdr_buffer()

```
DDS_ReturnCode_t DDS_DynamicData::to_cdr_buffer (
    char * buffer,
    unsigned int & length )
```

Serializes a DynamicData object into a CDR buffer of octets.

This method serializes a DynamicData object into a buffer of octets, using CDR as the data representation. Calling this method is equivalent to calling **DDS_DynamicData::to_cdr_buffer_ex** (p. 790) with **DDS_AUTO_DATA_↔ REPRESENTATION** (p. 370) as the representation.

The input buffer must be large enough to store the serialized representation of the DynamicData object. Otherwise, the method will return an error code.

To determine the minimum size of the input buffer, you must call this method with the buffer set to NULL.

Parameters

<i>buffer</i>	<< out >> (p. 237). Serialization buffer.
<i>length</i>	<< inout >> (p. 237). When the buffer is set to NULL, after the method executes, length will contain the required size for the serialization buffer. When buffer is not NULL, length must contain the size of the input buffer when the method is invoked. After the method executes, length will be updated to contain the actual size of the serialized content, which may be smaller than the size obtained when <i>buffer</i> is set to NULL.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

9.58.6.11 to_cdr_buffer_ex()

```
DDS_ReturnCode_t DDS_DynamicData::to_cdr_buffer_ex (
    char * buffer,
    unsigned int & length,
    DDS_DataRepresentationId_t representation )
```

Serializes a DynamicData object into a buffer of octets.

This method serializes a DynamicData object into a buffer of octets using the input data representation. See **DDS_↔ DynamicData::to_cdr_buffer** (p. 790) for details.

Parameters

<i>buffer</i>	<< out >> (p. 237). Serialization buffer.
<i>length</i>	<< inout >> (p. 237). Serialization buffer length.
<i>representation</i>	<< in >> (p. 237). Representation used to serialize the data

9.58.6.12 to_string()

```
DDS_ReturnCode_t DDS_DynamicData::to_string (
    char * str,
    DDS_UnsignedLong & str_size,
    const DDS_PrintFormatProperty & property )
```

Get a string representation of a DynamicData object.

This method takes a dynamic data sample and creates a string representation of the data.

The input character buffer must be big enough to store the string representation of the sample. Otherwise, the method will return an error.

To determine the minimum size of the input character buffer, the user must call this method with the buffer set to NULL.

If the size of the output string is longer than the size of an unsigned 32-bit integer, this operation will fail with **DDS_← RETCODE_OUT_OF_RESOURCES** (p. 336).

Parameters

<i>str</i>	<< out >> (p. 237). Output string representing the dynamic data sample.
<i>str_size</i>	<< inout >> (p. 237). When <i>str</i> is set to NULL, after the method executes, <i>str_size</i> will contain a buffer size big enough to hold the string representation of the data. When <i>str</i> is not NULL, <i>str_size</i> must contain the size of the input buffer when the method is invoked. If the size of the input buffer is too small, after the method executes, <i>str_size</i> will be updated to contain the required size of the string content and the method will return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).
<i>property</i>	<< in >> (p. 237). Properties describing what the format of the output string should be. Cannot be NULL.

Exceptions

One	of the Standard Return Codes (p. 335), DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
-----	--

9.58.6.13 print()

```
DDS_ReturnCode_t DDS_DynamicData::print (
```

```
FILE * fp,
int indent ) const
```

Output a textual representation of this object and its contents to the given file.

This method is equivalent to **DDSDynamicDataTypeSupport::print_data** (p. 1444).

Precondition

The type must be an aggregation or collection. That is, its **DDS_TCKind** (p. 86) must be one of: **DDS_TK_↵**
STRUCT (p. 86), **DDS_TK_VALUE** (p. 86), **DDS_TK_UNION** (p. 86), **DDS_TK_SEQUENCE** (p. 86) or **DDS_TK_↵**
_ARRAY (p. 86), otherwise this function fails with **DDS_RETCODE_PRECONDITION_NOT_MET** (p. 335).

MT Safety:

UNSAFE.

Parameters

<i>fp</i>	<< <i>in</i> >> (p. 237) The file into which the object should be printed (to print to standard output, provide the stream pointer 'stdout')
<i>indent</i>	<< <i>in</i> >> (p. 237) The output of this method will be pretty-printed. This argument indicates the amount of initial indentation of the output.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDSDynamicDataTypeSupport::print_data (p. 1444)

9.58.6.14 get_info()

```
void DDS_DynamicData::get_info (
    DDS_DynamicDataInfo & info_out ) const
```

Fill in the given descriptor with information about this **DDS_DynamicData** (p. 769).

MT Safety:

UNSAFE.

Parameters

<i>info_out</i>	<< out >> (p. 237) The descriptor object whose contents will be overwritten by this operation.
-----------------	---

9.58.6.15 bind_type()

```
DDS_ReturnCode_t DDS_DynamicData::bind_type (
    const DDS_TypeCode * type )
```

If this **DDS_DynamicData** (p. 769) object is not yet associated with a data type, set that type now to the given **DDS_TypeCode** (p. 1149).

This advanced operation allows you to reuse a single **DDS_DynamicData** (p. 769) object with multiple data types.

```
DDS_DynamicData* myData = new DDS_DynamicData(NULL, myProperties);

DDS_TypeCode* myType = ...;

myData->bind_type(myType);

// Do something...

myData->unbind_type();

delete myData;
```

Note that the **DDS_DynamicData** (p. 769) object will retain a reference to the **DDS_TypeCode** (p. 1149) object you provide. It is *not* safe to delete the **DDS_TypeCode** (p. 1149) until after it is unbound.

MT Safety:

UNSAFE.

Parameters

<i>type</i>	<< in >> (p. 237) The type to associate with this DDS_DynamicData (p. 769) object.
-------------	--

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_DynamicData::unbind_type (p. 793)

9.58.6.16 unbind_type()

```
DDS_ReturnCode_t DDS_DynamicData::unbind_type ( )
```

Dissociate this **DDS_DynamicData** (p. 769) object from any particular data type.

This step is necessary before the object can be associated with a new data type.

This operation clears all members as a side effect.

MT Safety:

UNSAFE.

Exceptions

One	of the Standard Return Codes (p. 335)
-----	--

See also

DDS_DynamicData::bind_type (p. 793)

DDS_DynamicData::clear_all_members (p. 787)

9.58.6.17 bind_complex_member()

```
DDS_ReturnCode_t DDS_DynamicData::bind_complex_member (
    DDS_DynamicData & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id )
```

Use another **DDS_DynamicData** (p. 769) object to provide access to a complex field of this **DDS_DynamicData** (p. 769) object.

For example, consider the following data types:

```
struct MyFieldType {
    float theFloat;
};

struct MyOuterType {
    MyFieldType complexMember;
};
```

Suppose you have an instance of `MyOuterType`, and you would like to examine the contents of its member `complexMember`. To do this, you must *bind* another **DDS_DynamicData** (p. 769) object to that member. This operation will bind the type code of the member to the provided **DDS_DynamicData** (p. 769) object and perform additional initialization.

The following example demonstrates the usage pattern. Note that error handling has been omitted for brevity.

```
DDS_DynamicData outer = ...;

DDS_DynamicData toBeBound(NULL, myProperties);

outer.bind_complex_member(
    toBeBound,
    "complexMember",
    DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);

float theFloatValue = 0.0f;

toBeBound.get_float(
    theFloat,
    "theFloat"
    DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);

outer.unbind_complex_member(toBeBound);
```

This operation is only permitted when the object `toBeBound` (named as in the example above) is not currently associated with any type, including already being bound to another member. You can see in the example that this object is created directly with the constructor and is not provided with a **DDS_TypeCode** (p. 1149).

Only a single member of a given **DDS_DynamicData** (p. 769) object may be bound at one time – however, members of members may be recursively bound to any depth. Furthermore, while the outer object has a bound member, it may only be modified through that bound member. That is, after calling this member, all "set" operations on the outer object will be disabled until **DDS_DynamicData::unbind_complex_member** (p. 796) has been called. Furthermore, any bound member must be unbound before a sample can be written or deleted.

This method is logically related to **DDS_DynamicData::get_complex_member** (p. 815) in that both allow you to examine the state of nested objects. They are different in an important way: this method provides a view into an outer object, such that any change made to the inner object will be reflected in the outer. But the **DDS_DynamicData::get↔_complex_member** (p. 815) operation *copies* the state of the nested object; changes to it will not be reflected in the source object.

Note that you can bind to a member of a sequence at an index that is past the current length of that sequence. In that case, this method behaves like a "set" method: it automatically lengthens the sequence (filling in default elements) to allow the bind to take place. See **Getters and Setters** (p. ??).

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) The object that you wish to bind to the field.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

See also

DDS_DynamicData::unbind_complex_member (p. 796)

DDS_DynamicData::get_complex_member (p. 815)

9.58.6.18 unbind_complex_member()

```
DDS_ReturnCode_t DDS_DynamicData::unbind_complex_member (
    DDS_DynamicData & value )
```

Tear down the association created by a **DDS_DynamicData::bind_complex_member** (p. 794) operation, committing any changes to the outer object since then.

Some changes to the outer object will not be observable until after you have performed this operation.

If you have called **DDS_DynamicData::bind_complex_member** (p. 794) on a data sample, you must unbind before writing or deleting the sample.

MT Safety:

UNSAFE.

Parameters

<i>value</i>	<< <i>in</i> >> (p. 237) The same object you passed to DDS_DynamicData::bind_complex_member (p. 794). This argument is used for error checking purposes.
--------------	---

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

See also

DDS_DynamicData::bind_complex_member (p. 794)

9.58.6.19 get_type()

```
const DDS_TypeCode * DDS_DynamicData::get_type ( ) const
```

Get the data type, of which this **DDS_DynamicData** (p. 769) represents an instance.

MT Safety:

UNSAFE.

9.58.6.20 get_type_kind()

```
DDS_TCKind DDS_DynamicData::get_type_kind ( ) const
```

Get the kind of this object's data type.

This is a convenience method. It's equivalent to calling **DDS_DynamicData::get_type** (p. 796) followed by **DDS_TypeCode::kind** (p. 1152).

MT Safety:

UNSAFE.

9.58.6.21 get_member_count()

```
DDS_UnsignedLong DDS_DynamicData::get_member_count ( ) const
```

Get the number of members in the type.

For objects of type kind **DDS_TK_ARRAY** (p. 86) or **DDS_TK_SEQUENCE** (p. 86), this method returns the number of elements in the collection.

For objects of type kind **DDS_TK_STRUCT** (p. 86) or **DDS_TK_VALUE** (p. 86), it returns the number of fields in the type.

MT Safety:

UNSAFE.

See also

DDS_DynamicData::get_member_info_by_index (p. 800)

9.58.6.22 member_exists()

```
DDS_Boolean DDS_DynamicData::member_exists (
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Indicates whether a member exists in this sample.

You only need to specify the name OR the ID (not both).

If the member doesn't exist in the type, this function returns false. In all other cases, it provides the same result as **DDS_DynamicDataMemberInfo::member_exists** (p. 879), which is retrieved with `idref_DynamicDataMember_get_↔member_info`.

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

See also

DDS_DynamicData::member_exists_in_type (p. 798)

DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101)

9.58.6.23 member_exists_in_type()

```
DDS_Boolean DDS_DynamicData::member_exists_in_type (
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Indicates whether a member of a particular name/ID exists in this data sample's type.

You only need to specify the name OR the ID (not both).

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

See also

DDS_DynamicData::member_exists (p. 797)

DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101)

9.58.6.24 get_member_info()

```
DDS_ReturnCode_t DDS_DynamicData::get_member_info (
    DDS_DynamicDataMemberInfo & info,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Fill in the given descriptor with information about the identified member of this **DDS_DynamicData** (p. 769) sample.

This operation is valid for objects of **DDS_TCKind** (p. 86) **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86), **DDS_TK_STRUCT** (p. 86), **DDS_TK_UNION** (p. 86), and **DDS_TK_VALUE** (p. 86).

MT Safety:

UNSAFE.

When this sample represents a struct, a value type, or a union:

- If the specified member is not defined in the type, this function fails with **DDS_RETCODE_NO_DATA** (p. 336).
- If the specified member is defined in the type but doesn't exist in this data sample, this function returns an object with **DDS_DynamicDataMemberInfo::member_exists** (p. 879) set to false.
- If the specified member is defined in the type and exists in this data sample, **DDS_DynamicDataMemberInfo::member_exists** (p. 879) is true.

When this sample represents a sequence and *member_id* is the 1-based element index:

- If *member_id* is greater than the sequence's maximum length, this function fails with **DDS_RETCODE_NO_DATA** (p. 336).
- If *member_id* is greater than the sequence's current length but smaller than or equal to its maximum length, this function returns an object with **DDS_DynamicDataMemberInfo::member_exists** (p. 879) set to false.
- If *member_id* is smaller than or equal to the current length, **DDS_DynamicDataMemberInfo::member_exists** (p. 879) is true.

When this sample represents an array, this function either fails with **DDS_RETCODE_NO_DATA** (p. 336) when the index is out of bounds or else returns an object with **DDS_DynamicDataMemberInfo::member_exists** (p. 879) set to true.

Parameters

<i>info</i>	<< out >> (p. 237) The descriptor object whose contents will be overwritten by this operations.
<i>member_name</i>	<< in >> (p. 237) The name of the member for which to get the info or NULL to look up the member by its ID. Only one of the name and the ID may be unspecified.
<i>member_id</i>	<< in >> (p. 237) The ID of the member for which to get the info, or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

```
DDS_ReturnCode_t DDS_DynamicData::get_member_info_by_index (
    struct DDS_DynamicDataMemberInfo & info,
    DDS_UnsignedLong index ) const
```

Fill in the given descriptor with information about the identified member of this **DDS_DynamicData** (p. 769) sample.

This operation is valid for objects of **DDS_TCKind** (p. 86) **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86), **DDS_TK_STRUCT** (p. 86), **DDS_TK_VALUE** (p. 86), and **DDS_TK_UNION** (p. 86).

MT Safety:

UNSAFE.

Parameters

<i>info</i>	<< out >> (p. 237) The descriptor object whose contents will be overwritten by this operations.
<i>index</i>	<< in >> (p. 237) The zero-base of the member for which to get the info.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)
------------	--

```
DDS_ReturnCode_t DDS_DynamicData::get_member_type (
    const DDS_TypeCode *& type_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the type of the given member of this sample.

The member can be looked up either by name or by ID.

This operation is valid for objects of **DDS_TCKind** (p. 86) **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86), **DDS_TK_STRUCT** (p. 86), and **DDS_TK_VALUE** (p. 86). For type kinds **DDS_TK_ARRAY** (p. 86) and **DDS_TK_SEQUENCE** (p. 86), the index into the collection is taken to be one less than the ID, if specified. If this index is valid, this operation will return the content type of this collection.

MT Safety:

UNSAFE.

Parameters

<i>type_out</i>	<< out >> (p. 237) If this method returned success, this argument refers to the found member's type.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)

DDS_ReturnCode_t DDS_DynamicData::is_member_key (
    DDS_Boolean & is_key_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Indicates whether a given member forms part of the key of this sample's data type.

This operation is only valid for samples of types of kind **DDS_TK_STRUCT** (p. 86) or **DDS_TK_VALUE** (p. 86).

MT Safety:

UNSAFE.

Parameters

<i>is_key_out</i>	<< out >> (p. 237) If this method returned success, this argument indicates whether the indicated member is part of the key.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335)

9.58.6.28 get_long()

```
DDS_ReturnCode_t DDS_DynamicData::get_long (
    DDS_Long & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Long** (p. 317) or another type implicitly convertible to it (**DDS_↔Octet** (p. 316), **DDS_Char** (p. 316), **DDS_Short** (p. 317), **DDS_UnsignedShort** (p. 317), or **DDS_Enum** (p. 319)).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)

```

Get the value of the given field, which is of type **DDS_UnsignedLong** (p. 317) or another type implicitly convertible to it (**DDS_Octet** (p. 316), **DDS_Char** (p. 316), **DDS_Short** (p. 317), **DDS_UnsignedShort** (p. 317), or **DDS_Enum** (p. 319)).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

```
DDS_ReturnCode_t DDS_DynamicData::get_ushort (
    DDS_UnsignedShort & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_UnsignedShort** (p. 317) or another type implicitly convertible to it (**DDS_Octet** (p. 316) or **DDS_Char** (p. 316)).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

```
DDS_ReturnCode_t DDS_DynamicData::get_float (
    DDS_Float & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Float** (p. 318).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

```
DDS_ReturnCode_t DDS_DynamicData::get_double (
    DDS_Double & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Double** (p. 318) or another type implicitly convertible to it (**DDS_↔_Float** (p. 318)).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

```
DDS_ReturnCode_t DDS_DynamicData::get_boolean (
    DDS_Boolean & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Boolean** (p. 319).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)

```
DDS_ReturnCode_t DDS_DynamicData::get_char (
    DDS_Char & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Char** (p. 316).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)

```
DDS_ReturnCode_t DDS_DynamicData::get_octet (
    DDS_Octet & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Octet** (p. 316).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)

```
DDS_ReturnCode_t DDS_DynamicData::get_wchar (
    DDS_Wchar & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Wchar** (p.316) or another type implicitly convertible to it (**DDS_↵_Char** (p.316)).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

See also

DDS_DynamicData::set_wchar (p. 849)

9.58.6.41 get_string()

```
DDS_ReturnCode_t DDS_DynamicData::get_string (
    char *& value,
    DDS_UnsignedLong * size,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type char*.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value</i>	<< out >> (p. 237) The string into which the middleware should copy the string member. The allocated size of this string is indicated by <i>size</i> argument. If the size is sufficient to hold the contents of the member, they will be copied into this string. If <i>value</i> is a pointer to NULL, the middleware will allocate a new string for you of sufficient length; it will be your responsibility to free that string. If the size is insufficient but greater than zero, the middleware will <i>not</i> free your string; instead, this operation will fail and <i>size</i> will contain the minimum required size.
<i>size</i>	<< inout >> (p. 237) As an input argument, the allocated size of the string. As an output argument, the actual size of the contents.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336). This operation may also return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).

9.58.6.42 get_wstring()

```
DDS_ReturnCode_t DDS_DynamicData::get_wstring (
    DDS_Wchar *& value,
    DDS_UnsignedLong * size,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Wchar** (p. 316)*.

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value</i>	<< out >> (p. 237) The string into which the middleware should copy the string member. The allocated size of this string is indicated by <i>size</i> argument. If the size is sufficient to hold the contents of the member, they will be copied into this string. If <i>value</i> is a pointer to NULL, the middleware will allocate a new string for you of sufficient length; it will be your responsibility to free that string. If the size is insufficient but greater than zero, the middleware will <i>not</i> free your string; instead, this operation will fail and <i>size</i> will contain the minimum required size.
<i>size</i>	<< inout >> (p. 237) As an input argument, the allocated size of the string. As an output argument, the actual size of the contents.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336). This operation may also return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).

```
DDS_ReturnCode_t DDS_DynamicData::get_int8 (
    DDS_Int8 & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_Int8** (p. 317).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< <i>out</i> >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

See also

DDS_DynamicData::set_int8 (p. 851)

9.58.6.44 get_uint8()

```
DDS_ReturnCode_t DDS_DynamicData::get_uint8 (
    DDS_UInt8 & value_out,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get the value of the given field, which is of type **DDS_UInt8** (p. 317).

The member may be specified by name or by ID.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< out >> (p. 237) If this method returned success, this argument will contain the value of the indicated member.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

See also

DDS_DynamicData::set_uint8 (p. 852)

9.58.6.45 get_complex_member()

```
DDS_ReturnCode_t DDS_DynamicData::get_complex_member (
    DDS_DynamicData & value_out,
```

```
const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the value of the given field, which is of some composed type.

The member may be of type kind **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86), **DDS_TK_STRUCT** (p. 86), **DDS_TK_VALUE** (p. 86), or **DDS_TK_UNION** (p. 86). It may be specified by name or by ID.

This method is logically related to **DDS_DynamicData::bind_complex_member** (p. 794) in that both allow you to examine the state of nested objects. They are different in an important way: this method provides a *copy* of the data; changes to it will not be reflected in the source object.

MT Safety:

UNSAFE.

Parameters

<i>value_out</i>	<< <i>out</i> >> (p. 237) The DDS_DynamicData (p. 769) sample whose contents will be overwritten by this operation. This object must <i>not</i> be a bound member of another DDS_DynamicData (p. 769) sample.
<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336). This operation may also return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).

9.58.6.46 get_long_array()

```
DDS_ReturnCode_t DDS_DynamicData::get_long_array (
    DDS_Long * array,
    DDS_UnsignedLong * length,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given array member. The array may contain members of type **DDS_Long** (p.317) or **DDS_Enum** (p.319).

This method will perform an automatic conversion from **DDS_LongSeq** (p.935).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters

<i>array</i>	<< out >> (p.237) An already-allocated array, into which the elements will be copied.
<i>length</i>	<< inout >> (p.237) As an input, the allocated length of <i>array</i> . As an output, the number of elements that were copied.
<i>member_name</i>	<< in >> (p.237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p.237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p.101) to look up by name. See Member Names and IDs (p.777).

Exceptions

<i>One</i>	of the Standard Return Codes (p.335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p.336)
------------	---

    DDS_Short * array,
    DDS_UnsignedLong * length,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_ShortSeq** (p.1087).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters

<i>array</i>	<< out >> (p. 237) An already-allocated array, into which the elements will be copied.
<i>length</i>	<< inout >> (p. 237) As an input, the allocated length of <code>array</code> . As an output, the number of elements that were copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

    DDS_UnsignedLong * array,
    DDS_UnsignedLong * length,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given array member. The array may contain members of type **DDS_UnsignedLong** (p. 317) or **DDS_Enum** (p. 319).

This method will perform an automatic conversion from **DDS_UnsignedLongSeq** (p. 1220).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters

<i>array</i>	<< out >> (p. 237) An already-allocated array, into which the elements will be copied.
<i>length</i>	<< inout >> (p. 237) As an input, the allocated length of <code>array</code> . As an output, the number of elements that were copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)

    DDS_UnsignedShort * array,
    DDS_UnsignedLong * length,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_UnsignedShortSeq** (p. 1221).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters

<i>array</i>	<< out >> (p. 237) An already-allocated array, into which the elements will be copied.
<i>length</i>	<< inout >> (p. 237) As an input, the allocated length of <i>array</i> . As an output, the number of elements that were copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336)
------------	---

    DDS_Float * array,
    DDS_UnsignedLong * length,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given array member.

This method will perform an automatic conversion from **DDS_FloatSeq** (p. 899).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters

<i>array</i>	<< out >> (p. 237) An already-allocated array, into which the elements will be copied.
<i>length</i>	<< inout >> (p. 237) As an input, the allocated length of <i>array</i> . As an output, the number of elements that were copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

UNSAFE.

Parameters

<i>seq</i>	<< out >> (p. 237) A sequence, into which the elements will be copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336). This operation may also return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).

```
DDS_ReturnCode_t DDS_DynamicData::get_octet_seq (
    DDS_OctetSeq & seq,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of **DDS_Octet** (p.316).

MT Safety:

UNSAFE.

Parameters

<i>seq</i>	<< out >> (p. 237) A sequence, into which the elements will be copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336). This operation may also return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).

DDS_ReturnCode_t DDS_DynamicData::get_longlong_seq (
    DDS_LongLongSeq & seq,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of **DDS_LongLong** (p. 318).

MT Safety:

UNSAFE.

Parameters

<i>seq</i>	<< out >> (p. 237) A sequence, into which the elements will be copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336). This operation may also return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).

DDS_ReturnCode_t DDS_DynamicData::get_ulonglong_seq (
    DDS_UnsignedLongLongSeq & seq,
    const char * member_name,
    DDS_DynamicDataMemberId member_id ) const
```

Get a copy of the given sequence member.

The provided sequence will be automatically resized as necessary.

This method will perform an automatic conversion from an array of **DDS_UnsignedLongLong** (p. 318).

MT Safety:

UNSAFE.

Parameters

<i>seq</i>	<< out >> (p. 237) A sequence, into which the elements will be copied.
<i>member_name</i>	<< in >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< in >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335). If the member is optional and not set, this operation will return DDS_RETCODE_NO_DATA (p. 336). This operation may also return DDS_RETCODE_OUT_OF_RESOURCES (p. 336).

9.58.6.92 set_uint8()

```
DDS_ReturnCode_t DDS_DynamicData::set_uint8 (
    const char * member_name,
    DDS_DynamicDataMemberId member_id,
    DDS_UInt8 value )
```

Set the value of the given field, which is of type **DDS_UInt8** (p. 317).

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).
<i>value</i>	<< <i>in</i> >> (p. 237) The value to which to set the member.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

See also

DDS_DynamicData::get_uint8 (p. 815)

9.58.6.93 set_complex_member()

```
DDS_ReturnCode_t DDS_DynamicData::set_complex_member (
    const char * member_name,
    DDS_DynamicDataMemberId member_id,
    const DDS_DynamicData & value )
```

Copy the state of the given **DDS_DynamicData** (p. 769) object into a member of this object.

The member may be of type kind **DDS_TK_ARRAY** (p. 86), **DDS_TK_SEQUENCE** (p. 86), **DDS_TK_STRUCT** (p. 86), **DDS_TK_VALUE** (p. 86), or **DDS_TK_UNION** (p. 86). It may be specified by name or by ID.

Example: Copying Data

This method can be used with **DDS_DynamicData::bind_complex_member** (p. 794) to copy from one **DDS_DynamicData** (p. 769) object to another efficiently. Suppose the following data structure:

```
struct Bar {
    short theShort;
};

struct Foo {
    Bar theBar;
};
```

Suppose we have two instances of **Foo** (p. 1632), `foo_dst` and `foo_src`, and we want to replace the contents of `foo_dst.theBar` with the contents of `foo_src.theBar`. The following example shows how to do this (error handling has been omitted for the sake of brevity).

```
DDS_DynamicData* foo_dst = ...;

DDS_DynamicData* foo_src = ...;

DDS_DynamicData* bar = new DDS_DynamicData(NULL, myProperties);

// Point to the source of the copy:
foo_src->bind_complex_member(
    bar,
    "theBar",
    DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);

// Just one copy:
foo_dst->set_complex_member(
    "theBar",
    DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED,
    bar);

// Tear down:
foo_src->unbind_complex_member(bar);

delete bar;
```

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).
<i>value</i>	<< <i>in</i> >> (p. 237) The source DDS_DynamicData (p. 769) object whose contents will be copied.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

9.58.6.94 set_long_array()

```
DDS_ReturnCode_t DDS_DynamicData::set_long_array (
    const char * member_name,
    DDS_DynamicDataMemberId member_id,
    DDS_UnsignedLong length,
    const DDS_Long * array )
```

Set the contents of the given array member. The array may contain members of type **DDS_Long** (p. 317) or **DDS_Enum** (p. 319).

This method will perform an automatic conversion to **DDS_LongSeq** (p. 935).

If the destination array is insufficiently long to store the data, this operation will fail without copying anything.

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).
<i>length</i>	<< <i>in</i> >> (p. 237) The length of <i>array</i> .
<i>array</i>	<< <i>in</i> >> (p. 237) The elements to copy.

Exceptions

```

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_Short** (p. 317).

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).
<i>value</i>	<< <i>in</i> >> (p. 237) A sequence, from which the elements will be copied.

Exceptions

One	of the Standard Return Codes (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
-----	--

```
DDS_ReturnCode_t DDS_DynamicData::set_ulong_seq (
    const char * member_name,
    DDS_DynamicDataMemberId member_id,
    const DDS_UnsignedLongSeq & value )
```

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_UnsignedLong** (p. 317).

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).
<i>value</i>	<< <i>in</i> >> (p. 237) A sequence, from which the elements will be copied.

    const DDS_UInt8Seq & value )

```

Set the contents of the given sequence member.

This method will perform an automatic conversion to an array of **DDS_UInt8** (p. 317).

MT Safety:

UNSAFE.

Parameters

<i>member_name</i>	<< <i>in</i> >> (p. 237) The name of the member or NULL to look up the member by its ID.
<i>member_id</i>	<< <i>in</i> >> (p. 237) The ID of the member or DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED (p. 101) to look up by name. See Member Names and IDs (p. 777).
<i>value</i>	<< <i>in</i> >> (p. 237) A sequence, from which the elements will be copied.

Exceptions

<i>One</i>	of the Standard Return Codes (p. 335) or DDS_RETCODE_OUT_OF_RESOURCES (p. 336)
------------	--

See also

DDS_DynamicData::get_uint8_seq (p. 840)

DDS_DynamicData::set_uint8_array (p. 865)

9.59 DDS_DynamicDataInfo Struct Reference

A descriptor for a **DDS_DynamicData** (p. 769) object.

Public Attributes

- **DDS_Long member_count**
*The number of data members in this **DDS_DynamicData** (p. 769) sample.*
- **DDS_Long stored_size**
*The number of bytes currently used to store the data of this **DDS_DynamicData** (p. 769) sample.*

9.59.1 Detailed Description

A descriptor for a **DDS_DynamicData** (p. 769) object.

See also

DDS_DynamicData::get_info (p. 792)

9.59.2 Member Data Documentation

9.59.2.1 member_count

DDS_Long DDS_DynamicDataInfo::member_count

The number of data members in this **DDS_DynamicData** (p. 769) sample.

9.59.2.2 stored_size

DDS_Long DDS_DynamicDataInfo::stored_size

The number of bytes currently used to store the data of this **DDS_DynamicData** (p. 769) sample.

9.60 DDS_DynamicDataJsonParserProperties_t Struct Reference

A collection of attributes used to configure **DDS_DynamicData** (p. 769) objects.

9.60.1 Detailed Description

A collection of attributes used to configure **DDS_DynamicData** (p. 769) objects.

9.61 DDS_DynamicDataMemberInfo Struct Reference

A descriptor for a single member (i.e. field) of dynamically defined data type.

Public Attributes

- **DDS_DynamicDataMemberId member_id**
*An integer that uniquely identifies the data member within this **DDS_DynamicData** (p. 769) sample's type.*
- **const char * member_name**
The string name of the data member.
- **DDS_Boolean member_exists**
Indicates whether the member exists in this sample.
- **DDS_TCKind member_kind**
The kind of type of this data member (e.g., integer, structure, etc.).
- **DDS_UnsignedLong element_count**
The number of elements within this data member.
- **DDS_TCKind element_kind**
The kind of type of the elements within this data member.

9.61.1 Detailed Description

A descriptor for a single member (i.e. field) of dynamically defined data type.

See also

DDS_DynamicData::get_member_info (p. 799)

9.61.2 Member Data Documentation

9.61.2.1 member_id

```
DDS_DynamicDataMemberId DDS_DynamicDataMemberInfo::member_id
```

An integer that uniquely identifies the data member within this **DDS_DynamicData** (p. 769) sample's type.

The member ID is assigned automatically by the middleware based on the member's declaration order within the type. It is a 1-based index of the member's position in the type.

See also

DDS_TCKind (p. 86)

9.61.2.2 member_name

```
const char* DDS_DynamicDataMemberInfo::member_name
```

The string name of the data member.

This name will be unique among members of the same type. However, a single named member may have multiple type representations.

9.61.2.3 member_exists

```
DDS_Boolean DDS_DynamicDataMemberInfo::member_exists
```

Indicates whether the member exists in this sample.

A member that is defined in a type may not exist in a sample of that type in the following situations

- The member is optional and is unset
- Being part of a union, the discriminator doesn't select this member
- When getting the information about a sequence element, with index *i*, and *i* is greater than the current sequence length but smaller than its maximum length.

See also

DDS_DynamicData::member_exists_in_type (p. 798)

9.61.2.4 member_kind

```
DDS_TCKind DDS_DynamicDataMemberInfo::member_kind
```

The kind of type of this data member (e.g., integer, structure, etc.).

This is a convenience field; it is equivalent to looking up the member in the **DDS_TypeCode** (p. 1149) and getting the **DDS_TCKind** (p. 86) from there.

9.61.2.5 element_count

```
DDS_UnsignedLong DDS_DynamicDataMemberInfo::element_count
```

The number of elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report zero (0) here.

9.61.2.6 element_kind

```
DDS_TCKind DDS_DynamicDataMemberInfo::element_kind
```

The kind of type of the elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report **DDS_TK_NULL** (p. 86) here.

9.62 DDS_DynamicDataProperty_t Struct Reference

A collection of attributes used to configure **DDS_DynamicData** (p. 769) objects.

Public Attributes

- **DDS_Long buffer_initial_size**
*The initial amount of memory used by the underlying **DDS_DynamicData** (p. 769) buffer, in bytes.*
- **DDS_Long buffer_max_size**
*The maximum amount of memory that the underlying **DDS_DynamicData** (p. 769) buffer may use, in bytes.*

9.62.1 Detailed Description

A collection of attributes used to configure **DDS_DynamicData** (p. 769) objects.

9.62.2 Member Data Documentation

9.62.2.1 buffer_initial_size

DDS_Long DDS_DynamicDataProperty_t::buffer_initial_size

The initial amount of memory used by the underlying **DDS_DynamicData** (p. 769) buffer, in bytes.

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The initial buffer size will be set to the minimum amount of space required to hold the overhead required by the DynamicData internal representation (about 100 bytes) in addition to the minimum deserialized size of a sample. The minimum deserialized size of a sample assumes that all strings are allocated to their default values, sequences are left to length 0, and all optional members are unset.

If set to any value other than 0: The underlying buffer will be allocated to the provided size plus the overhead required by the DynamicData internal representation (about 100 bytes). If the provided size plus the overhead is less than the size used when buffer_initial_size is left to 0, then the default value is used.

See also

DDS_DynamicDataProperty_t::buffer_max_size (p. 881)

9.62.2.2 buffer_max_size

DDS_Long DDS_DynamicDataProperty_t::buffer_max_size

The maximum amount of memory that the underlying **DDS_DynamicData** (p. 769) buffer may use, in bytes.

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

A DynamicData object will grow to this size from the initial size as needed. The buffer_max_size includes all overhead that is required for the internal DynamicData representation and therefore represents a hard upper limit on the size of the underlying DynamicData buffer.

If set to -1 (default): The buffer will grow unbounded to the size required to fit all members.

If set to any value other than -1: The buffer will not grow beyond this size. If setting a member's values requires the buffer to grow beyond this maximum, the member will fail to be set. If the buffer is required to grow beyond this maximum during deserialization, the sample will fail to be deserialized. The buffer_max_size cannot be smaller than the buffer_initial_size.

See also

DDS_DynamicDataProperty_t::buffer_initial_size (p. 881)

9.63 DDS_DynamicDataSeq Struct Reference

An ordered collection of **DDS_DynamicData** (p. 769) elements.

9.63.1 Detailed Description

An ordered collection of **DDS_DynamicData** (p. 769) elements.

Instantiates **FooSeq** (p. 1680) < **DDS_DynamicData** (p. 769) > .

See also

FooSeq (p. 1680)

DDS_DynamicData (p. 769)

9.64 DDS_DynamicDataTypeProperty_t Struct Reference

A collection of attributes used to configure **DDSDynamicDataTypeSupport** (p. 1439) objects.

Public Attributes

- struct **DDS_DynamicDataProperty_t data**
*These properties will be provided to every new **DDS_DynamicData** (p. 769) sample created from the **DDSDynamicData↔DataTypeSupport** (p. 1439).*
- struct **DDS_DynamicDataTypeSerializationProperty_t serialization**
Properties that govern how the data of this type will be serialized on the network.

9.64.1 Detailed Description

A collection of attributes used to configure **DDSDynamicDataTypeSupport** (p. 1439) objects.

The properties of a **DDSDynamicDataTypeSupport** (p. 1439) object contain the properties that will be used to instantiate any samples created by that object.

9.64.2 Member Data Documentation

9.64.2.1 data

```
struct DDS_DynamicDataProperty_t DDS_DynamicDataTypeProperty_t::data
```

These properties will be provided to every new **DDS_DynamicData** (p. 769) sample created from the **DDSDynamicDataSupport** (p. 1439).

These properties are also used to create the samples that are kept in the DataReader's queue.

9.64.2.2 serialization

```
struct DDS_DynamicDataSerializationProperty_t DDS_DynamicDataTypeProperty_t::serialization
```

Properties that govern how the data of this type will be serialized on the network.

9.65 DDS_DynamicDataSerializationProperty_t Struct Reference

Properties that govern how data of a certain type will be serialized on the network.

Public Attributes

- **DDS_Boolean use_42e_compatible_alignment**
[No longer supported] Use RTI Connext 4.2e-compatible alignment for large primitive types.
- **DDS_UnsignedLong max_size_serialized**
*[No longer supported] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_max_size** (p. 881) instead. The maximum number of bytes that objects of a given type could consume when serialized on the network.*
- **DDS_UnsignedLong min_size_serialized**
*[No longer supported] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_initial_size** (p. 881) instead. The minimum number of bytes that objects of a given type could consume when serialized on the network.*
- **DDS_Boolean trim_to_size**
Controls the growth of the buffer in a DynamicData object.

9.65.1 Detailed Description

Properties that govern how data of a certain type will be serialized on the network.

9.65.2 Member Data Documentation

9.65.2.1 use_42e_compatible_alignment

DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::use_42e_compatible_alignment

[No longer supported] Use RTI Connex 4.2e-compatible alignment for large primitive types.

In RTI Connex 4.2e, the default alignment for large primitive types – **DDS_LongLong** (p. 318), **DDS_UnsignedLong**↵
Long (p. 318), **DDS_Double** (p. 318), and **DDS_LongDouble** (p. 318) – was not RTPS-compliant. This compatibility mode allows applications targeting post-4.2e versions of RTI Connex to interoperate with 4.2e-based applications, regardless of the data types they use.

If this flag is not set, all data will be serialized in an RTPS-compliant manner, which for the types listed above, will not be interoperable with RTI Connex 4.2e.

9.65.2.2 max_size_serialized

DDS_UnsignedLong DDS_DynamicDataTypeSerializationProperty_t::max_size_serialized

[No longer supported] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_max**↵
_size (p. 881) instead. The maximum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

The effective value of the maximum serialized size will be the value of this field or the size automatically inferred from the type's **DDS_TypeCode** (p. 1149), whichever is smaller.

9.65.2.3 min_size_serialized

DDS_UnsignedLong DDS_DynamicDataTypeSerializationProperty_t::min_size_serialized

[No longer supported] If you were previously using this property, use **DDS_DynamicDataProperty_t::buffer_initial**↵
_size (p. 881) instead. The minimum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

Default: 0xFFFFFFFF, a sentinel that indicates that this value must be equal to the value specified in max_size_↵
serialized.

9.65.2.4 trim_to_size

DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::trim_to_size

Controls the growth of the buffer in a DynamicData object.

This property only applies to DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The buffer will not be reallocated unless the deserialized size of the incoming sample is greater than the current buffer size.

If set to 1: The buffer of a DynamicData object obtained from the DDS sample pool will be freed and re-allocated for each sample to just fit the size of the deserialized data of the incoming sample. The newly allocated size will not be smaller than **DDS_DynamicDataProperty_t::buffer_initial_size** (p. 881).

9.66 DDS_EndpointGroup_t Struct Reference

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

Public Attributes

- char * **role_name**
Defines the role name of the endpoint group.
- int **quorum_count**
Defines the minimum number of members that satisfies the endpoint group.

9.66.1 Detailed Description

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

9.66.2 Member Data Documentation

9.66.2.1 role_name

```
char* DDS_EndpointGroup_t::role_name
```

Defines the role name of the endpoint group.

If used in the **DDS_AvailabilityQosPolicy** (p. 590) on a **DDSDataWriter** (p. 1305), it specifies the name that identifies a Durable Subscription.

The role name can be at most 255 characters in length.

9.66.2.2 quorum_count

```
int DDS_EndpointGroup_t::quorum_count
```

Defines the minimum number of members that satisfies the endpoint group.

If used in the **DDS_AvailabilityQosPolicy** (p. 590) on a **DDSDataWriter** (p. 1305), it specifies the number of Data↔ Readers that must acknowledge a sample before the sample is considered to be acknowledged by the Durable Subscription.

9.67 DDS_EndpointGroupSeq Struct Reference

A sequence of **DDS_EndpointGroup_t** (p. 885).

9.67.1 Detailed Description

A sequence of **DDS_EndpointGroup_t** (p. 885).

In the context of Collaborative DataWriters, it can be used by a **DDSDataReader** (p. 1272) to define a group of remote DataWriters that the **DDSDataReader** (p. 1272) will wait to discover before skipping missing samples.

In the context of Durable Subscriptions, it can be used to create a set of Durable Subscriptions identified by a name and a quorum count.

Instantiates:

<<*generic*>> (p. 236) **FooSeq** (p. 1680)

Trust Plugins algorithms supported for interception of data and metadata exchanged by the endpoint.

9.70 DDS_EndpointTrustProtectionInfo Struct Reference

Trust Plugins Protection information associated with the discovered endpoint.

Public Attributes

- **DDS_EndpointTrustAttributesMask** **bitmask**

Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.

- **DDS_PluginEndpointTrustAttributesMask** **plugin_bitmask**

Internal plugin information that is opaque to DDS.

9.70.1 Detailed Description

Trust Plugins Protection information associated with the discovered endpoint.

9.70.2 Member Data Documentation

9.70.2.1 bitmask

DDS_EndpointTrustAttributesMask `DDS_EndpointTrustProtectionInfo::bitmask`

Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

9.70.2.2 plugin_bitmask

DDS_PluginEndpointTrustAttributesMask `DDS_EndpointTrustProtectionInfo::plugin_bitmask`

Internal plugin information that is opaque to DDS.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

9.71 DDS_EntityFactoryQosPolicy Struct Reference

A QoS policy for all **DDSEntity** (p. 1446) types that can act as factories for one or more other **DDSEntity** (p. 1446) types.

Public Attributes

- **DDS_Boolean autoenable_created_entities**

Specifies whether the entity acting as a factory automatically enables the instances it creates.

9.71.1 Detailed Description

A QoS policy for all **DDSEntity** (p. 1446) types that can act as factories for one or more other **DDSEntity** (p. 1446) types.

Entity:

DDSDomainParticipantFactory (p. 1409), **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = YES (p. ??)

9.71.2 Usage

This policy controls the behavior of the **DDSEntity** (p. 1446) as a factory for other entities. It controls whether or not child entities are created in the enabled state.

RTI Connext uses a factory design pattern for creating DDS Entities. That is, a parent entity must be used to create child entities. DomainParticipants create Topics, Publishers and Subscribers. Publishers create DataWriters. Subscribers create DataReaders.

By default, a child object is enabled upon creation (initialized and may be actively used). With this QoS policy, a child object can be created in a disabled state. A disabled entity is only partially initialized and cannot be used until the entity is enabled. Note: an entity can only be *enabled*; it cannot be *disabled* after it has been enabled.

This QoS policy is useful to synchronize the initialization of DDS Entities. For example, when a **DDSDataReader** (p. 1272) is created in an enabled state, its existence is immediately propagated for discovery and the **DDSDataReader** (p. 1272) object's listener called as soon as data is received. The initialization process for an application may extend beyond the creation of the **DDSDataReader** (p. 1272), and thus, it may not be desirable for the **DDSDataReader** (p. 1272) to start to receive or process any data until the initialization process is complete. So by creating readers in a disabled state, your application can make sure that no data is received until the rest of the application initialization is complete, and at that time, enable the them.

Note: if an entity is disabled, then all of the child entities it creates will be disabled too, regardless of the setting of this QoS policy. However, enabling a disabled entity will enable all of its children if this QoS policy is set to automatically enable children entities.

This policy is mutable. A change in the policy affects only the entities created after the change, not any previously created entities.

9.71.3 Member Data Documentation

9.71.3.1 autoenable_created_entities

DDS_Boolean DDS_EntityFactoryQosPolicy::autoenable_created_entities

Specifies whether the entity acting as a factory automatically enables the instances it creates.

The setting of `autoenable_created_entities` to **DDS_BOOLEAN_TRUE** (p. 316) indicates that the factory `create_<entity>` operation(s) will automatically invoke the **DDSEntity::enable** (p. 1449) operation each time a new **DDSEntity** (p. 1446) is created. Therefore, the **DDSEntity** (p. 1446) returned by `create_<entity>` will already be enabled. A setting of **DDS_BOOLEAN_FALSE** (p. 316) indicates that the **DDSEntity** (p. 1446) will not be automatically enabled. Your application will need to call **DDSEntity::enable** (p. 1449) itself.

The default setting of `autoenable_created_entities` = **DDS_BOOLEAN_TRUE** (p. 316) means that, by default, it is not necessary to explicitly call **DDSEntity::enable** (p. 1449) on newly created entities.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.72 DDS_EntityNameQosPolicy Struct Reference

Assigns a name and a role name to a **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). Except for **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Public Attributes

- char * **name**
The name of the entity.
- char * **role_name**
The entity role name.

9.72.1 Detailed Description

Assigns a name and a role name to a **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), **DDSSubscriber** (p. 1576), **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). Except for **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Entity:

DDSDomainParticipant (p. 1335), **DDSSubscriber** (p. 1576), **DDSPublisher** (p. 1534), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = NO;
Changeable (p. ??) = UNTIL ENABLE (p. ??)

9.72.2 Usage

The name and role name can be at most 255 characters in length.

The strings must be null-terminated strings allocated with **DDS_String_alloc** (p. 547) or **DDS_String_dup** (p. 547).

If you provide a non-null pointer when getting the QoS, then it should point to valid memory that can be written to, to avoid ungraceful failures.

9.72.3 Member Data Documentation

9.72.3.1 name

```
char* DDS_EntityNameQosPolicy::name
```

The name of the entity.

[default] null

[range] Null terminated string with length not exceeding 255. It can be null.

9.72.3.2 role_name

```
char* DDS_EntityNameQosPolicy::role_name
```

The entity role name.

With Durable Subscriptions this name is used to specify to which Durable Subscription the **DDSDataReader** (p. 1272) belongs.

With Collaborative DataWriters this name is used to specify to which endpoint group the **DDSDataWriter** (p. 1305) belongs.

[range] Null terminated string with length not exceeding 255. It can be null.

[default] null

9.73 DDS_EnumMember Struct Reference

A description of a member of an enumeration.

Public Attributes

- `char * name`
The name of the enumeration member.
- `DDS_Long ordinal`
The value associated the the enumeration member.

9.73.1 Detailed Description

A description of a member of an enumeration.

See also

`DDS_EnumMemberSeq` (p. 892)

`DDS_TypeCodeFactory::create_enum_tc` (p. 1202)

9.73.2 Member Data Documentation

9.73.2.1 name

```
char* DDS_EnumMember::name
```

The name of the enumeration member.

Cannot be NULL.

9.73.2.2 ordinal

```
DDS_Long DDS_EnumMember::ordinal
```

The value associated the the enumeration member.

9.74 DDS_EnumMemberSeq Struct Reference

Defines a sequence of enumerator members.

9.74.1 Detailed Description

Defines a sequence of enumerator members.

See also

DDS_EnumMember (p. 891)

FooSeq (p. 1680)

DDS_TypeCodeFactory::create_enum_tc (p. 1202)

9.75 DDS_EventQosPolicy Struct Reference

Settings for event.

Public Attributes

- struct **DDS_ThreadSettings_t** **thread**
Event thread QoS.
- **DDS_Long** **initial_count**
The initial number of events.
- **DDS_Long** **max_count**
The maximum number of events.

9.75.1 Detailed Description

Settings for event.

In a **DDSDomainParticipant** (p. 1335), a thread is dedicated to handle all timed events, including checking for timeouts and deadlines and executing internal and user-defined timeout or exception handling routines/callbacks.

This QoS policy allows you to configure thread properties such as priority level and stack size. You can also configure the maximum number of events that can be posted to the event thread. By default, a **DDSDomainParticipant** (p. 1335) will dynamically allocate memory as needed for events posted to the event thread. However, by setting a maximum value or setting the initial and maximum value to be the same, you can either bound the amount of memory allocated for the event thread or prevent a **DDSDomainParticipant** (p. 1335) from dynamically allocating memory for the event thread after initialization.

This QoS policy is an extension to the DDS standard.

Entity:

DDSDomainParticipant (p. 1335)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.75.2 Member Data Documentation

9.75.2.1 thread

```
struct DDS_ThreadSettings_t DDS_EventQosPolicy::thread
```

Event thread QoS.

There is only one event thread.

Priority:

[default] The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

Stack Size:

[default] The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

Mask:

[default] mask = `DDS_THREAD_SETTINGS_FLOATING_POINT` (p. 351) | `DDS_THREAD_SETTINGS_STUDIO` (p. 351)

9.75.2.2 initial_count

```
DDS_Long DDS_EventQosPolicy::initial_count
```

The initial number of events.

[default] 256

[range] [1, 1 million], <= max_count

9.75.2.3 max_count

```
DDS_Long DDS_EventQosPolicy::max_count
```

The maximum number of events.

The maximum number of events. If the limit is reached, no new event can be added.

[default] `DDS_LENGTH_UNLIMITED` (p. 437)

[range] [1, 1 million] or `DDS_LENGTH_UNLIMITED` (p. 437), >= initial_count

9.76 DDS_ExclusiveAreaQosPolicy Struct Reference

Configures multi-thread concurrency and deadlock prevention capabilities.

Public Attributes

- **DDS_Boolean use_shared_exclusive_area**

*Whether the **DDSEntity** (p. 1446) is protected by its own exclusive area or the shared exclusive area.*

9.76.1 Detailed Description

Configures multi-thread concurrency and deadlock prevention capabilities.

An "exclusive area" is an abstraction of a multi-thread-safe region. Each entity is protected by one and only one exclusive area, although a single exclusive area may be shared by multiple entities.

Conceptually, an exclusive area is a mutex or monitor with additional deadlock protection features. If a **DDSEntity** (p. 1446) has "entered" its exclusive area to perform a protected operation, no other **DDSEntity** (p. 1446) sharing the same exclusive area may enter it until the first **DDSEntity** (p. 1446) "exits" the exclusive area.

Entity:

DDSPublisher (p. 1534), **DDSSubscriber** (p. 1576)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

See also

DDSListener (p. 1509)

9.76.2 Usage

Exclusive Areas (EAs) allow RTI Connext to be multi-threaded while preventing deadlock in multi-threaded applications. EAs prevent a **DDSDomainParticipant** (p. 1335) object's internal threads from deadlocking with each other when executing internal code as well as when executing the code of user-registered listener callbacks.

Within an EA, all calls to the code protected by the EA are single threaded. Each **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576) entity represents a separate EA. Thus all DataWriters of the same Publisher and all DataReaders of the same Subscriber share the EA of its parent. Note: this means that operations on the DataWriters of the same Publisher and on the DataReaders of the same Subscriber will be serialized, even when invoked from multiple concurrent application threads.

Within an EA, there are limitations on how code protected by a different EA can be accessed. For example, when received data is being processed by user code in the DataReader Listener, within a Subscriber EA, the user code may call the **FooDataWriter::write** (p. 1666) operation of a DataWriter that is protected by the EA of its Publisher, so you can send data in the function called to process received data. However, you cannot create entities or call functions that are protected by the EA of the **DDSDomainParticipant** (p. 1335). See the "Exclusive Areas (EAs)" section in the `User's Manual` for more information.

With this QoS policy, you can force a **DDSPublisher** (p. 1534) or **DDSSubscriber** (p. 1576) to share the same EA as its **DDSDomainParticipant** (p. 1335). Using this capability, the restriction of not being able to create entities in a DataReader Listener's `on_data_available()` callback is lifted. However, the tradeoff is that the application has reduced concurrency through the Entities that share an EA.

Note that the restrictions on calling methods in a different EA only exist for user code that is called in registered DDS Listeners by internal DomainParticipant threads. User code may call all RTI Connex functions for any DDS Entities from their own threads at any time.

9.76.3 Member Data Documentation

9.76.3.1 `use_shared_exclusive_area`

DDS_Boolean `DDS_ExclusiveAreaQosPolicy::use_shared_exclusive_area`

Whether the **DDSEntity** (p. 1446) is protected by its own exclusive area or the shared exclusive area.

All writers belonging to the same **DDSPublisher** (p. 1534) are protected by the same exclusive area as the **DDSPublisher** (p. 1534) itself. The same is true of all readers belonging to the same **DDSSubscriber** (p. 1576). Typically, the publishers and subscribers themselves do not share their exclusive areas with each other; each has its own. This configuration maximizes the concurrency of the system because independent readers and writers do not need to take the same mutexes in order to operate. However, it places some restrictions on the operations that may be invoked from within listener callbacks because of the possibility of a deadlock. See the **DDSListener** (p. 1509) documentation for more details.

If this field is set to **DDS_BOOLEAN_FALSE** (p. 316), the default more concurrent behavior will be used. In the event that this behavior is insufficiently flexible for your application, you may set this value to **DDS_BOOLEAN_TRUE** (p. 316). In that case, the **DDSSubscriber** (p. 1576) or **DDSPublisher** (p. 1534) in question, and all of the readers or writers (as appropriate) created from it, will share a global exclusive area. This global exclusive area is shared by all entities whose value for this QoS field is **DDS_BOOLEAN_TRUE** (p. 316). By sharing the same exclusive area across a larger number of entities, the concurrency of the system will be decreased; however, some of the callback restrictions will be relaxed.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.77 DDS_ExpressionProperty Struct Reference

Provides additional information about the filter expression passed to **DDSWriterContentFilter::writer_compile** (p. 1622) .

Public Attributes

- **DDS_Boolean key_only_filter**
Indicates if the filter expression is based only on key fields. In this case, RTI Connexx itself can cache the filtering results.
- **DDS_Boolean writer_side_filter_optimization**
Indicates if the filter implementation can cache the filtering result for the provided expression.

9.77.1 Detailed Description

Provides additional information about the filter expression passed to **DDSWriterContentFilter::writer_compile** (p. 1622) .

It is used by the filter implementation to indicate to the middleware whether or not the **DDSWriterContentFilter** (p. 1621) will cache the result of filter evaluation.

9.77.2 Member Data Documentation

9.77.2.1 key_only_filter

DDS_Boolean DDS_ExpressionProperty::key_only_filter

Indicates if the filter expression is based only on key fields. In this case, RTI Connexx itself can cache the filtering results.

When this field is set to **DDS_BOOLEAN_TRUE** (p. 316), it indicates to RTI Connexx that the filter expression is based only on key fields.

9.77.2.2 writer_side_filter_optimization

DDS_Boolean DDS_ExpressionProperty::writer_side_filter_optimization

Indicates if the filter implementation can cache the filtering result for the provided expression.

When this field is set to **DDS_BOOLEAN_TRUE** (p. 316), RTI Connexx will do no caching or explicit filter evaluation for the associated **DDSDataReader** (p. 1272). Instead, it will rely on the filter implementation to provide appropriate results.

9.78 DDS_FilterSampleInfo Struct Reference

Provides meta information associated with the sample.

Public Attributes

- struct **DDS_SampleIdentity_t related_sample_identity**
The identity of another sample related to this one.
- struct **DDS_GUID_t related_source_guid**
Identifies the application logical data source that is related to the sample being written.
- struct **DDS_GUID_t related_reader_guid**
Identifies a DataReader that is logically related to the sample.

9.78.1 Detailed Description

Provides meta information associated with the sample.

This can be used by a content filter to perform filtering on meta data.

9.78.2 Member Data Documentation

9.78.2.1 related_sample_identity

```
struct DDS_SampleIdentity_t DDS_FilterSampleInfo::related_sample_identity
```

The identity of another sample related to this one.

The value of this field identifies another sample that is logically related to the one that is written. For example, the **DDSDataWriter** (p. 1305) created by a Replier uses this field to associate the identity of the request sample with a response sample.

To specify that there is no related sample identity, use the value **DDS_UNKNOWN_SAMPLE_IDENTITY** (p. 478).

A **DDSDataReader** (p. 1272) can inspect the related sample identity of a received sample by accessing the fields **DDS_SampleInfo::related_original_publication_virtual_guid** (p. 1076) and **DDS_SampleInfo::related_original_publication_virtual_sequence_number** (p. 1076).

9.78.2.2 related_source_guid

```
struct DDS_GUID_t DDS_FilterSampleInfo::related_source_guid
```

Identifies the application logical data source that is related to the sample being written.

The `related_source_guid` can be set by using the field **DDS_WriteParams_t::related_source_guid** (p. 1239) when writing a sample using the method **FooDataWriter::write_w_params** (p. 1671).

9.78.2.3 related_reader_guid

```
struct DDS_GUID_t DDS_FilterSampleInfo::related_reader_guid
```

Identifies a DataReader that is logically related to the sample.

The related_reader_guid can be set by using the field **DDS_WriteParams_t::related_reader_guid** (p. 1239) when writing a sample using the method **FooDataWriter::write_w_params** (p. 1671).

9.79 DDS_FloatSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_Float** (p. 318) >

9.79.1 Detailed Description

Instantiates **FooSeq** (p. 1680) < **DDS_Float** (p. 318) >

Instantiates:

<<*generic*>> (p. 236) **FooSeq** (p. 1680)

See also

DDS_Float (p. 318)

FooSeq (p. 1680)

9.80 DDS_FlowControllerProperty_t Struct Reference

Determines the flow control characteristics of the **DDSFlowController** (p. 1451).

Public Attributes

- **DDS_FlowControllerSchedulingPolicy scheduling_policy**
Scheduling policy.
- struct **DDS_FlowControllerTokenBucketProperty_t token_bucket**
Settings for the token bucket.

9.80.1 Detailed Description

Determines the flow control characteristics of the **DDSFlowController** (p. 1451).

The flow control characteristics shape the network traffic by determining how often and in what order associated asynchronous **DDSDataWriter** (p. 1305) instances are serviced and how much data they are allowed to send.

Note that these settings apply directly to the **DDSFlowController** (p. 1451), and do not depend on the number of **DDSDataWriter** (p. 1305) instances the **DDSFlowController** (p. 1451) is servicing. For instance, the specified flow rate does *not* double simply because two **DDSDataWriter** (p. 1305) instances are waiting to write.

Entity:

DDSFlowController (p. 1451)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??) for **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900), **YES** (p. ??) for **DDS_FlowControllerProperty_t::token_bucket** (p. 900). However, the special value of **DDS_DURATION_INFINITE** (p. 325) as **DDS_FlowControllerTokenBucketProperty_t::period** (p. 902) is strictly used to create an *on-demand* **DDSFlowController** (p. 1451). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

9.80.2 Member Data Documentation

9.80.2.1 scheduling_policy

DDS_FlowControllerSchedulingPolicy **DDS_FlowControllerProperty_t::scheduling_policy**

Scheduling policy.

Determines the scheduling policy for servicing the **DDSDataWriter** (p. 1305) instances associated with the **DDSFlowController** (p. 1451).

[default] **DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY** (p. 120)

9.80.2.2 token_bucket

struct DDS_FlowControllerTokenBucketProperty_t **DDS_FlowControllerProperty_t::token_bucket**

Settings for the token bucket.

9.81 DDS_FlowControllerTokenBucketProperty_t Struct Reference

DDSFlowController (p. 1451) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Public Attributes

- **DDS_Long max_tokens**
Maximum number of tokens than can accumulate in the token bucket.
- **DDS_Long tokens_added_per_period**
The number of tokens added to the token bucket per specified period.
- **DDS_Long tokens_leaked_per_period**
The number of tokens removed from the token bucket per specified period.
- struct **DDS_Duration_t period**
Period for adding tokens to and removing tokens from the bucket.
- **DDS_Long bytes_per_token**
Maximum number of bytes allowed to send for each token available.

9.81.1 Detailed Description

DDSFlowController (p. 1451) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Asynchronously published samples are queued up and transmitted based on the token bucket flow control scheme. The token bucket contains tokens, each of which represents a number of bytes. Samples can be sent only when there are sufficient tokens in the bucket. As samples are sent, tokens are consumed. The number of tokens consumed is proportional to the size of the data being sent. Tokens are replenished on a periodic basis.

The rate at which tokens become available and other token bucket properties determine the network traffic flow.

Note that if the same sample must be sent to multiple destinations, separate tokens are required for each destination. Only when multiple samples are destined to the same destination will they be co-alesced and sent using the same token(s). In other words, each token can only contribute to a single network packet.

Entity:

DDSFlowController (p. 1451)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **YES** (p. ??). However, the special value of **DDS_DURATION_INFINITE** (p. 325) as **DDS_FlowControllerTokenBucketProperty_t::period** (p. 902) is strictly used to create an *on-demand* **DDSFlowController** (p. 1451). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

9.81.2 Member Data Documentation

9.81.2.1 max_tokens

DDS_Long DDS_FlowControllerTokenBucketProperty_t::max_tokens

Maximum number of tokens than can accumulate in the token bucket.

The number of tokens in the bucket will never exceed this value. Any excess tokens are discarded. This property value, combined with **DDS_FlowControllerTokenBucketProperty_t::bytes_per_token** (p. 903), determines the maximum allowable data burst.

Use **DDS_LENGTH_UNLIMITED** (p. 437) to allow accumulation of an unlimited amount of tokens (and therefore potentially an unlimited burst size).

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, **DDS_LENGTH_UNLIMITED** (p. 437)]

9.81.2.2 tokens_added_per_period

DDS_Long DDS_FlowControllerTokenBucketProperty_t::tokens_added_per_period

The number of tokens added to the token bucket per specified period.

DDSFlowController (p. 1451) transmits data only when tokens are available. Tokens are periodically replenished. This field determines the number of tokens added to the token bucket with each periodic replenishment.

Available tokens are distributed to associated **DDSDataWriter** (p. 1305) instances based on the **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900).

Use **DDS_LENGTH_UNLIMITED** (p. 437) to add the maximum number of tokens allowed by **DDS_FlowControllerTokenBucketProperty_t::max_tokens** (p. 902).

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1, **DDS_LENGTH_UNLIMITED** (p. 437)]

9.81.2.3 tokens_leaked_per_period

DDS_Long DDS_FlowControllerTokenBucketProperty_t::tokens_leaked_per_period

The number of tokens removed from the token bucket per specified period.

DDSFlowController (p. 1451) transmits data only when tokens are available. When tokens are replenished and there are sufficient tokens to send all samples in the queue, this property determines whether any or all of the leftover tokens remain in the bucket.

Use **DDS_LENGTH_UNLIMITED** (p. 437) to remove all excess tokens from the token bucket once all samples have been sent. In other words, no token accumulation is allowed. When new samples are written after tokens were purged, the earliest point in time at which they can be sent is at the next periodic replenishment.

[default] 0

[range] [0, **DDS_LENGTH_UNLIMITED** (p. 437)]

9.81.2.4 period

```
struct DDS_Duration_t DDS_FlowControllerTokenBucketProperty_t::period
```

Period for adding tokens to and removing tokens from the bucket.

DDSFlowController (p. 1451) transmits data only when tokens are available. This field determines the period by which tokens are added or removed from the token bucket.

The special value **DDS_DURATION_INFINITE** (p. 325) can be used to create an *on-demand* **DDSFlowController** (p. 1451), for which tokens are no longer replenished periodically. Instead, tokens must be added explicitly by calling **DDSFlowController::trigger_flow** (p. 1453). This external trigger adds **DDS_FlowControllerTokenBucketProperty_t::tokens_added_per_period** (p. 902) tokens each time it is called (subject to the other property settings).

[default] 1 second

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.81.2.5 bytes_per_token

```
DDS_Long DDS_FlowControllerTokenBucketProperty_t::bytes_per_token
```

Maximum number of bytes allowed to send for each token available.

DDSFlowController (p. 1451) transmits data only when tokens are available. This field determines the number of bytes that can actually be transmitted based on the number of tokens.

Tokens are always consumed in whole by each **DDSDataWriter** (p. 1305). That is, in cases where **DDS_FlowControllerTokenBucketProperty_t::bytes_per_token** (p. 903) is greater than the sample size, multiple samples may be sent to the same destination using a single token (regardless of **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900)).

Where fragmentation is required, the fragment size will be **DDS_FlowControllerTokenBucketProperty_t::bytes_per_token** (p. 903) or the minimum largest message size across all transports installed with the **DDSDataWriter** (p. 1305), whichever is less.

Use **DDS_LENGTH_UNLIMITED** (p. 437) to indicate that an unlimited number of bytes can be transmitted per token. In other words, a single token allows the recipient **DDSDataWriter** (p. 1305) to transmit all its queued samples to a single destination. A separate token is required to send to each additional destination.

[default] **DDS_LENGTH_UNLIMITED** (p. 437)

[range] [1024, **DDS_LENGTH_UNLIMITED** (p. 437)]

9.82 DDS_GroupDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Public Attributes

- struct **DDS_OctetSeq** value
a sequence of octets

9.82.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 59) during discovery.

Entity:

DDSPublisher (p. 1534), **DDSSubscriber** (p. 1576)

Properties:

RxO (p. ??) = NO
Changeable (p. ??) = YES (p. ??)

See also

DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.82.2 Usage

The additional information is attached to a **DDSPublisher** (p. 1534) or **DDSSubscriber** (p. 1576). This extra data is not used by RTI Connext itself. When a remote application discovers the **DDSPublisher** (p. 1534) or **DDSSubscriber** (p. 1576), it can access that information and use it for its own purposes.

Use cases for this QoS policy, as well as the **DDS_TopicDataQosPolicy** (p. 1118) and **DDS_UserDataQosPolicy** (p. 1221), are often application-to-application identification, authentication, authorization, and encryption purposes. For example, applications can use Group or User Data to send security certificates to each other for RSA-type security.

In combination with **DDSDataReaderListener** (p. 1299), **DDSDataWriterListener** (p. 1328) and operations such as **DDSDomainParticipant::ignore_publication** (p. 1379) and **DDSDomainParticipant::ignore_subscription** (p. 1379), this QoS policy can help an application to define and enforce its own security policies. For example, an application can implement matching policies similar to those of the **DDS_PartitionQosPolicy** (p. 976), except the decision can be made based on an application-defined policy.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connext stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connext with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS_DomainParticipantResourceLimitsQosPolicy::publisher_group_data_max_length** (p. 752) and **DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_data_max_length** (p. 752).

9.82.3 Member Data Documentation

9.82.3.1 value

```
struct DDS_OctetSeq DDS_GroupDataQosPolicy::value
```

a sequence of octets

[default] Empty (zero-sized)

[range] Octet sequence of length [0,max_length]

9.83 DDS_GUID_t Struct Reference

Type for *GUID* (Global Unique Identifier) representation.

Public Attributes

- **DDS_Octet value** [DDS_GUID_LENGTH]
A 16 byte array containing the GUID value.

9.83.1 Detailed Description

Type for *GUID* (Global Unique Identifier) representation.

Represents a 128 bit GUID.

Alternative representation of **DDS RTPS_GUID_t** (p. 1043). Memory and wire representation for this type is the same as the one for **DDS RTPS_GUID_t** (p. 1043).

9.83.2 Member Data Documentation

9.83.2.1 value

```
DDS_Octet DDS_GUID_t::value [DDS_GUID_LENGTH]
```

A 16 byte array containing the GUID value.

9.84 DDS_HistoryQosPolicy Struct Reference

Specifies the behavior of RTI Connex in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

Public Attributes

- **DDS_HistoryQosPolicyKind kind**
Specifies the kind of history to be kept.
- **DDS_Long depth**
*Specifies the number of samples per instance to be kept, when the *kind* is **DDS_KEEP_LAST_HISTORY_QOS** (p. 406).*

9.84.1 Detailed Description

Specifies the behavior of RTI Connex in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

This QoS policy specifies how much data must to stored by RTI Connex for a **DDSDataWriter** (p. 1305) or **DDSDataReader** (p. 1272). It controls whether RTI Connex should deliver only the most recent value, attempt to deliver all intermediate values, or do something in between.

On the publishing side, this QoS policy controls the samples that should be maintained by the **DDSDataWriter** (p. 1305) on behalf of existing **DDSDataReader** (p. 1272) entities. The behavior with regards to a **DDSDataReader** (p. 1272) entities discovered after a sample is written is controlled by the **DURABILITY** (p. 397) policy.

On the subscribing side, this QoS policy controls the samples that should be maintained until the application "takes" them from RTI Connex.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = NO
Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

See also

DDS_ReliabilityQosPolicy (p. 1027)
DDS_HistoryQosPolicy (p. 906)

9.84.2 Usage

This policy controls the behavior of RTI Connex when the value of an instance changes before it is finally communicated to **DDSDataReader** (p. 1272) entities.

When a **DDSDataWriter** (p. 1305) sends data, or a **DDSDataReader** (p. 1272) receives data, the data sent or received is stored in a cache whose contents are controlled by this QoS policy. This QoS policy interacts with **DDS_ReliabilityQosPolicy** (p. 1027) by controlling whether RTI Connex guarantees that *all* of the sent data is received (**DDS_KEEP_ALL_HISTORY_QOS** (p. 406)) or if only the last N data values sent are guaranteed to be received (**DDS_KEEP_LAST_HISTORY_QOS** (p. 406))—this is a reduced level of reliability.

The amount of data that is sent to new DataReaders who have configured their **DDS_DurabilityQosPolicy** (p. 761) to receive previously published data is controlled by **DDS_DurabilityQosPolicy::writer_depth** (p. 764), not by the History QoS policy.

Note that the History QoS policy does not control the *physical* sizes of the send and receive queues. The memory allocation for the queues is controlled by the **DDS_ResourceLimitsQosPolicy** (p. 1038).

If *kind* is **DDS_KEEP_LAST_HISTORY_QOS** (p. 406) (the default), then RTI Connex will only attempt to keep the latest values of the instance and discard the older ones. In this case, the value of *depth* regulates the maximum number of values (up to and including the most current one) RTI Connex will maintain and deliver until the samples are fully acknowledged. After N values have been sent or received, any new data will overwrite the oldest data in the queue. Thus the queue acts like a circular buffer of length N.

For keyed-data, there is different behavior on the publishing and subscribing sides associated with how invalid samples representing the disposal of or unregistration from an instance affect history.

On the publishing side, unregistering from or disposing of an instance creates an invalid sample that is accounted for in the history depth. This means that an invalid sample may replace a value that is currently being stored in the writer queue.

On the subscribing side, however, invalid samples do not count towards history depth and will not replace a value that is being stored in the reader queue.

On both the publishing and subscribing sides, there can only ever be one invalid sample per-instance and that one sample can be in different states depending on whether the instance has been disposed, unregistered, or both.

The default (and most common setting) for *depth* is 1, indicating that only the most recent value should be delivered.

If *kind* is **DDS_KEEP_ALL_HISTORY_QOS** (p. 406), then RTI Connex will attempt to maintain and deliver all the values of the instance to existing subscribers. The resources that RTI Connex can use to keep this history are limited by the settings of the **RESOURCE_LIMITS** (p. 437). If the limit is reached, then the behavior of RTI Connex will depend on the **RELIABILITY** (p. 433). If the Reliability *kind* is **DDS_BEST_EFFORT_RELIABILITY_QOS** (p. 435), then the old values will be discarded. If Reliability *kind* is **RELIABLE**, then RTI Connex will block the **DDSDataWriter** (p. 1305) until it can deliver the necessary old values to all subscribers.

9.84.3 Consistency

This QoS policy's *depth* must be consistent with the **RESOURCE_LIMITS** (p. 437) *max_samples_per_instance*. For these two QoS to be consistent, they must verify that *depth* ≤ *max_samples_per_instance*.

See also

DDS_ResourceLimitsQosPolicy (p. 1038)

9.84.4 Member Data Documentation

9.84.4.1 kind

DDS_HistoryQosPolicyKind DDS_HistoryQosPolicy::kind

Specifies the kind of history to be kept.

For DataWriters, the samples are only kept either until they are fully acknowledged by all matching DataReaders or until they are replaced or removed. Samples can be replaced or removed for a number of reasons, including but not limited to **DDS_LifespanQosPolicy** (p. 918) expiration, replacement because the **DDS_HistoryQosPolicy::depth** (p. 908) has been exceeded, or one of the **DDS_ResourceLimitsQosPolicy** (p. 1038) settings has been exceeded.

[default] **DDS_KEEP_LAST_HISTORY_QOS** (p. 406)

9.84.4.2 depth

DDS_Long DDS_HistoryQosPolicy::depth

Specifies the number of samples per instance to be kept, when the `kind` is **DDS_KEEP_LAST_HISTORY_QOS** (p. 406).

If a value other than 1 (the default) is specified, it should be consistent with the settings of the **RESOURCE_LIMITS** (p. 437) policy. That is:

$\text{depth} \leq \text{DDS_ResourceLimitsQosPolicy::max_samples_per_instance}$ (p. 1041)

When the `kind` is **DDS_KEEP_ALL_HISTORY_QOS** (p. 406), the depth has no effect. Its implied value is *infinity* (in practice limited by the settings of the **RESOURCE_LIMITS** (p. 437) policy).

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the **DDS_DurabilityQosPolicy::writer_depth** (p. 764), not this depth.

[default] 1

[range] [1,100 million], $\leq \text{DDS_ResourceLimitsQosPolicy::max_samples_per_instance}$ (p. 1041)

9.85 DDS_InconsistentTopicStatus Struct Reference

DDS_INCONSISTENT_TOPIC_STATUS (p. 342)

Public Attributes

- **DDS_Long total_count**

*Total cumulative count of the pairs (**DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)) whose topic names match the **DDSTopic** (p. 1601) to which this status is attached and whose types are inconsistent according to the rules defined in **DDS_TypeConsistencyEnforcementQosPolicy** (p. 1211).*

- **DDS_Long total_count_change**

*The incremental number of inconsistent pairs (**DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)) for the **DDSTopic** (p. 1601) to which this status is attached, that have been discovered since the last time this status was read.*

9.85.1 Detailed Description

DDS_INCONSISTENT_TOPIC_STATUS (p. 342)

Entity:

DDSTopic (p. 1601)

Listener:

DDSTopicListener (p. 1610)

Every time a **DDSDataReader** (p. 1272) and **DDSDataWriter** (p. 1305) with the same **DDSTopic** (p. 1601) do not match because the type-consistency enforcement policy fails, the inconsistent topic status is updated for the **DDSTopic** (p. 1601).

DDS_INVALID_LOCAL_IDENTITY_ADVANCE_NOTICE_STATUS (p. 346)

Public Attributes

- struct **DDS_Time_t** **expiration_time**
The time when the local identity will expire.

9.88.1 Detailed Description

DDS_INVALID_LOCAL_IDENTITY_ADVANCE_NOTICE_STATUS (p. 346)

Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

9.88.2 Member Data Documentation

9.88.2.1 expiration_time

```
struct DDS_Time_t DDS_InvalidLocalIdentityAdvanceNoticeStatus::expiration_time
```

The time when the local identity will expire.

9.89 DDS_KeyedOctets Struct Reference

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

Public Member Functions

- **DDS_KeyedOctets** ()
Constructor.
- **DDS_KeyedOctets** (int key_size, int size)
Constructor that specifies the allocated sizes.
- **~DDS_KeyedOctets** ()
Destructor.

Public Attributes

- char * **key**
Instance key associated with the specified value.
- int **length**
Number of octets to serialize.
- unsigned char * **value**
DDS_Octets (p. 954) array value.

9.89.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

9.89.2 Constructor & Destructor Documentation

9.89.2.1 DDS_KeyedOctets() [1/2]

```
DDS_KeyedOctets::DDS_KeyedOctets ( ) [inline]
```

Constructor.

The default constructor initializes the newly created object with NULL key, NULL value, and zero length.

9.89.2.2 DDS_KeyedOctets() [2/2]

```
DDS_KeyedOctets::DDS_KeyedOctets (
    int key_size,
    int size ) [inline]
```

Constructor that specifies the allocated sizes.

After this method is called, key is initialized with the empty string and length is set to zero.

If a memory allocation failure occurs, and the **DDS_KeyedOctets** (p. 911) structure is allocated but the array and/or key string inside of it cannot be, the unallocated member will be NULL.

Parameters

<i>key_size</i>	<< <i>in</i> >> (p. 237) Size of the allocated key (with NULL-terminated character).
<i>size</i>	<< <i>in</i> >> (p. 237) Size of the allocated octets array.

References **DDS_OctetBuffer_alloc()**, **DDS_String_alloc()**, **DDS_String_free()**, **key**, and **value**.

9.89.2.3 ~DDS_KeyedOctets()

```
DDS_KeyedOctets::~~DDS_KeyedOctets ( ) [inline]
```

Destructor.

References **DDS_OctetBuffer_free()**, **DDS_String_free()**, **key**, and **value**.

9.89.3 Member Data Documentation

9.89.3.1 key

```
char* DDS_KeyedOctets::key
```

Instance key associated with the specified value.

Referenced by **DDS_KeyedOctets()**, and **~DDS_KeyedOctets()**.

9.89.3.2 length

```
int DDS_KeyedOctets::length
```

Number of octets to serialize.

9.89.3.3 value

```
unsigned char* DDS_KeyedOctets::value
```

DDS_Octets (p. 954) array value.

Referenced by **DDS_KeyedOctets()**, and **~DDS_KeyedOctets()**.

9.90 DDS_KeyedOctetsSeq Struct Reference

Instantiates **FooSeq** (p. 1680) < **DDS_KeyedOctets** (p. 911) >.

9.90.1 Detailed Description

Instantiates **FooSeq** (p. 1680) < **DDS_KeyedOctets** (p. 911) >.

9.91 DDS_KeyedString Struct Reference

Keyed string built-in type.

Public Member Functions

- **DDS_KeyedString** ()
Constructor.
- **DDS_KeyedString** (int key_size, int size)
Constructor that specifies the allocated sizes.
- **~DDS_KeyedString** ()
Destructor.

Public Attributes

- char * **key**
Instance key associated with the specified value.
- char * **value**
String value.

9.91.1 Detailed Description

Keyed string built-in type.

9.91.2 Constructor & Destructor Documentation

9.91.2.1 DDS_KeyedString() [1/2]

```
DDS_KeyedString::DDS_KeyedString ( ) [inline]
```

Constructor.

The default constructor initializes the newly created object with NULL key and value.

9.91.2.2 DDS_KeyedString() [2/2]

```
DDS_KeyedString::DDS_KeyedString (
    int key_size,
    int size ) [inline]
```

Constructor that specifies the allocated sizes.

The allocated strings are initialized to empty ("").

If a memory allocation failure occurs, and the **DDS_KeyedString** (p. 914) structure is allocated but one or both strings inside of it cannot be, the unallocated string will be NULL.

Parameters

<i>key_size</i>	<< <i>in</i> >> (p. 237) Size of the allocated key string (with NULL-terminated character).
<i>size</i>	<< <i>in</i> >> (p. 237) Size of the allocated value string (with NULL-terminated character).

References **DDS_String_alloc()**, **DDS_String_free()**, **key**, and **value**.

9.91.2.3 ~DDS_KeyedString()

```
DDS_KeyedString::~~DDS_KeyedString ( ) [inline]
```

Destructor.

References **DDS_String_free()**, **key**, and **value**.

9.91.3 Member Data Documentation

9.91.3.1 key

```
char* DDS_KeyedString::key
```

Instance key associated with the specified value.

Referenced by **DDS_KeyedString()**, and **~DDS_KeyedString()**.

9.91.3.2 value

```
char* DDS_KeyedString::value
```

String value.

Referenced by **DDS_KeyedString()**, and **~DDS_KeyedString()**.

See also

DDS_KeyedString (p. 914)

9.93 DDS_LatencyBudgetQosPolicy Struct Reference

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

Public Attributes

- struct **DDS_Duration_t** **duration**
Duration of the maximum acceptable delay.

9.93.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

This policy is a *hint* to a DDS implementation; it can be used to change how it processes and sends data that has low latency requirements. The DDS specification does not mandate whether or how this policy is used.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343)

Properties:

RxO (p. ??) = YES

Changeable (p. ??) = YES (p. ??)

See also

DDS_PublishModeQosPolicy (p. 1012)

DDSFlowController (p. 1451)

9.93.2 Usage

This policy provides a means for the application to indicate to the middleware the urgency of the data communication. By having a non-zero *duration*, RTI Connext can optimize its internal operation.

RTI Connext uses it in conjunction with **DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431) **DDSDataWriter** (p. 1305) instances associated with a **DDS_EDF_FLOW_CONTROLLER_SCHED_POLICY** (p. 120) **DDSFlowController** (p. 1451) only. Together with the time of write, **DDS_LatencyBudgetQosPolicy::duration** (p. 918) determines the deadline of each individual sample. RTI Connext uses this information to prioritize the sending of asynchronously published data; see **DDS_AsynchronousPublisherQosPolicy** (p. 584).

9.93.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered duration* ≤ *requested duration* evaluates to 'TRUE'.

9.93.4 Member Data Documentation

9.93.4.1 duration

```
struct DDS_Duration_t DDS_LatencyBudgetQosPolicy::duration
```

Duration of the maximum acceptable delay.

[default] 0 (meaning minimize the delay)

9.94 DDS_LifespanQosPolicy Struct Reference

Specifies how long the data written by the **DDSDataWriter** (p. 1305) is considered valid.

Public Attributes

- struct **DDS_Duration_t** **duration**
Maximum duration for the data's validity.

9.94.1 Detailed Description

Specifies how long the data written by the **DDSDataWriter** (p. 1305) is considered valid.

Each data sample written by the **DDSDataWriter** (p. 1305) has an associated expiration time beyond which the data should not be delivered to any application. Once the sample expires, the data will be removed from the **DDSDataReader** (p. 1272) caches as well as from the transient and persistent information caches.

The expiration time of each sample from the **DDSDataWriter** (p. 1305)'s cache is computed by adding the duration specified by this QoS policy to the time when the sample is added to the **DDSDataWriter** (p. 1305)'s cache. This timestamp is not necessarily equal to the sample's source timestamp that can be provided by the user using the **FooDataWriter::write_w_timestamp** (p. 1670) or **FooDataWriter::write_w_params** (p. 1671) API.

The expiration time of each sample from the **DDSDataReader** (p. 1272)'s cache is computed by adding the duration to the reception timestamp.

See also

FooDataWriter::write (p. 1666)
FooDataWriter::write_w_timestamp (p. 1670)

Entity:

DDSTopic (p. 1601), **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = N/A
Changeable (p. ??) = **YES** (p. ??)

9.94.2 Usage

The Lifespan QoS policy can be used to control how much data is stored by RTI Connex. Even if it is configured to store "all" of the data sent or received for a topic (see **DDS_HistoryQoSPolicy** (p. 906)), the total amount of data it stores may be limited by this QoS policy.

You may also use this QoS policy to ensure that applications do not receive or act on data, commands or messages that are too old and have 'expired.'

To avoid inconsistencies, multiple writers of the same instance should have the same lifespan.

[range] [1 nanosec, 1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.95 DDS_LivelinessChangedStatus Struct Reference

DDS_LIVELINESS_CHANGED_STATUS (p. 345)

Public Attributes

- **DDS_Long alive_count**
*The total count of currently alive **DDSDDataWriter** (p. 1305) entities that write the **DDSTopic** (p. 1601) that this **DDSDDataReader** (p. 1272) reads.*
- **DDS_Long not_alive_count**
*The total count of currently not_alive **DDSDDataWriter** (p. 1305) entities that write the **DDSTopic** (p. 1601) that this **DDSDDataReader** (p. 1272) reads.*
- **DDS_Long alive_count_change**
The change in the alive_count since the last time the listener was called or the status was read.
- **DDS_Long not_alive_count_change**
The change in the not_alive_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_publication_handle**
*This InstanceHandle can be used to look up which remote **DDSDDataWriter** (p. 1305) was the last to cause this **DataReader's** status to change, using **DDSDDataReader::get_matched_publication_data** (p. 1284).*

9.95.1 Detailed Description

DDS_LIVELINESS_CHANGED_STATUS (p. 345)

The **DDSDataReaderListener::on_liveliness_changed** (p. 1300) callback may be invoked for the following reasons:

- The liveliness of any **DDSDataWriter** (p. 1305) matching this DataReader (as defined by the **DDS_LivelinessQoSPolicyKind** (p. 409) setting) is lost.
- A DataWriter's liveliness is recovered after being lost.
- A new matching DataWriter has been discovered.
- A matching DataWriter has been deleted.
- A QoS Policy has changed such that a DataWriter that matched this DataReader before no longer matches (such as a change to the **DDS_PartitionQoSPolicy** (p. 976)). In this case, RTI Connext will no longer keep track of the DataWriter's liveliness. Furthermore, consider two scenarios:
 - DataWriter was alive when it and DataReader stopped matching: **DDS_LivelinessChangedStatus::alive_count** (p. 920) will decrease (since there's one less matching alive DataWriter) and **DDS_LivelinessChangedStatus::not_alive_count** (p. 920) will remain the same (since the DataWriter is still alive).
 - DataWriter was not alive when it and DataReader stopped matching: **DDS_LivelinessChangedStatus::alive_count** (p. 920) will remain the same (since the matching DataWriter was not alive) and **DDS_LivelinessChangedStatus::not_alive_count** (p. 920) will decrease (since there's one less not-alive matching DataWriter).

Note: There are several ways that a DataWriter and DataReader can become incompatible after the DataWriter has lost liveliness. For example, when the **DDS_LivelinessQoSPolicyKind** (p. 409) is set to **DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS**, it is possible that the DataWriter has not asserted its liveliness in a timely manner, and then a QoS change occurs on the DataWriter or DataReader that makes the entities incompatible.
- A QoS Policy (such as the **DDS_PartitionQoSPolicy** (p. 976)) has changed such that a DataWriter that was unmatched with the DataReader now matches.

9.95.2 Member Data Documentation

9.95.2.1 alive_count

DDS_Long DDS_LivelinessChangedStatus::alive_count

The total count of currently alive **DDSDataWriter** (p. 1305) entities that write the **DDSTopic** (p. 1601) that this **DDSDataReader** (p. 1272) reads.

9.95.2.2 not_alive_count

`DDS_Long DDS_LivelinessChangedStatus::not_alive_count`

The total count of currently not_alive **DDSDDataWriter** (p. 1305) entities that write the **DDSTopic** (p. 1601) that this **DDSDDataReader** (p. 1272) reads.

9.95.2.3 alive_count_change

`DDS_Long DDS_LivelinessChangedStatus::alive_count_change`

The change in the alive_count since the last time the listener was called or the status was read.

9.95.2.4 not_alive_count_change

`DDS_Long DDS_LivelinessChangedStatus::not_alive_count_change`

The change in the not_alive_count since the last time the listener was called or the status was read.

Note that a positive not_alive_count_change means one of the following:

- The DomainParticipant containing the matched DataWriter has lost liveliness or has been deleted.
- The matched DataWriter has lost liveliness or has been deleted.

9.95.2.5 last_publication_handle

`DDS_InstanceHandle_t DDS_LivelinessChangedStatus::last_publication_handle`

This InstanceHandle can be used to look up which remote **DDSDDataWriter** (p. 1305) was the last to cause this DataReader's status to change, using **DDSDDataReader::get_matched_publication_data** (p. 1284).

It's possible that the DataWriter has been purged from the discovery database. (See the "Discovery Overview" section of the *User's Manual*.) If so, the **DDSDDataReader::get_matched_publication_data** (p. 1284) method will not be able to return information about the DataWriter. In this case, the only way to get information about the lost DataWriter is if you cached the information previously.

9.96 DDS_LivelinessLostStatus Struct Reference

DDS_LIVELINESS_LOST_STATUS (p. 345)

Public Attributes

- **DDS_Long total_count**

*Total cumulative number of times that a previously-alive **DDSDDataWriter** (p. 1305) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.*

- **DDS_Long total_count_change**

The incremental changes in total_count since the last time the listener was called or the status was read.

9.96.1 Detailed Description

DDS_LIVELINESS_LOST_STATUS (p. 345)

Entity:

DDSDDataWriter (p. 1305)

Listener:

DDSDDataWriterListener (p. 1328)

The liveliness that the **DDSDDataWriter** (p. 1305) has committed through its **DDS_LivelinessQosPolicy** (p. 923) was not respected; thus **DDSDDataReader** (p. 1272) entities will consider the **DDSDDataWriter** (p. 1305) as no longer "alive/active".

9.96.2 Member Data Documentation

9.96.2.1 total_count

DDS_Long DDS_LivelinessLostStatus::total_count

Total cumulative number of times that a previously-alive **DDSDDataWriter** (p. 1305) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.

This count does not change when an already not alive **DDSDDataWriter** (p. 1305) simply remains not alive for another liveliness period.

9.96.2.2 total_count_change

DDS_Long DDS_LivelinessLostStatus::total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

9.97 DDS_LivelinessQosPolicy Struct Reference

Specifies and configures the mechanism that allows **DDSDataReader** (p. 1272) entities to detect when **DDSDataWriter** (p. 1305) entities become disconnected or "dead".

Public Attributes

- **DDS_LivelinessQosPolicyKind** kind
The kind of liveliness desired.
- struct **DDS_Duration_t** lease_duration
*The duration within which a **DDSDataWriter** (p. 1305) must be asserted, or else it is assumed to be not alive.*
- **DDS_Long** assertions_per_lease_duration
*The number of assertions a **DDSDataWriter** (p. 1305) will send during a its **DDS_LivelinessQosPolicy::lease_duration** (p. 925).*

9.97.1 Detailed Description

Specifies and configures the mechanism that allows **DDSDataReader** (p. 1272) entities to detect when **DDSDataWriter** (p. 1305) entities become disconnected or "dead".

The liveliness status of a **DDSDataWriter** (p. 1305) is used to maintain instance ownership in combination with the setting of the **OWNERSHIP** (p. 414) policy. The application is also informed via **DDSListener** (p. 1509) when an **DDSDataWriter** (p. 1305) is no longer alive.

A **DDSDataWriter** (p. 1305) commits to signalling its liveliness at intervals not to exceed the **DDS_LivelinessQosPolicy::lease_duration** (p. 925) configured on the **DDSDataWriter** (p. 1305). The rate at which the **DDSDataWriter** (p. 1305) will signal its liveliness is defined by **DDS_LivelinessQosPolicy::assertions_per_lease_duration** (p. 925).

The **DDSDataReader** (p. 1272) lease_duration specifies the maximum period at which matching DataWriters must have their liveliness asserted.

In addition, in the subscribing application Connex DDS uses an internal thread that wakes up at the period set by the DataReader's lease_duration to see if a DataWriter lease_duration has been violated.

Important: A DataReader will consider a DataWriter not alive if the DataWriter does not assert its liveliness within the DataWriter lease_duration not the DataReader lease_duration.

Listeners are used to notify a **DDSDataReader** (p. 1272) of loss of liveliness and **DDSDataWriter** (p. 1305) of violations to the liveliness contract. The on_liveliness_lost() callback is only called *once*, after the first time the lease_duration is exceeded (when the **DDSDataWriter** (p. 1305) first loses liveliness).

This QoS policy can be used during system integration to ensure that applications have been coded to meet design specifications. It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions in response to disconnected DataWriters.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_LIVELINESS_LOST_STATUS (p. 345), **DDS_LivelinessLostStatus** (p. 921);
DDS_LIVELINESS_CHANGED_STATUS (p. 345), **DDS_LivelinessChangedStatus** (p. 919);
DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_OFFERED_INCOMPATIBLE_QOS_↵**
STATUS (p. 343)

Properties:

RxO (p. ??) = YES
Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

9.97.2 Usage

This policy controls the mechanism and parameters used by RTI Connext to ensure that particular DataWriters on the network are still alive. The liveliness can also affect the ownership of a particular instance, as determined by the **OWNERSHIP** (p. 414) policy.

This policy has several settings to support both data types that are updated periodically as well as those that are changed sporadically. It also allows customisation for different application requirements in terms of the kinds of failures that will be detected by the liveliness mechanism.

The **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 410) liveliness setting is most appropriate for applications that only need to detect failures at the process-level, but not application-logic failures within a process. RTI Connext takes responsibility for renewing the leases at the required rates and thus, as long as the local process where a **DDSDomain_↵** **Participant** (p. 1335) is running and the link connecting it to remote participants remains connected, the entities within the **DDSDomainParticipant** (p. 1335) will be considered alive. This requires the lowest overhead.

The manual settings (**DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS** (p. 410), **DDS_MANUAL_BY_TOPIC_↵** **_LIVELINESS_QOS** (p. 410)) require the application on the publishing side to periodically assert the liveliness before the lease expires to indicate the corresponding **DDSEntity** (p. 1446) is still alive. The action can be explicit by calling the **DDSDataWriter::assert_liveliness** (p. 1313) operation or implicit by writing some data.

The two possible manual settings control the granularity at which the application must assert liveliness.

- The setting **DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS** (p. 410) requires only that one **DDSEntity** (p. 1446) within a participant is asserted to be alive to deduce all other **DDSEntity** (p. 1446) objects within the same **DDSDomainParticipant** (p. 1335) are also alive.
- The setting **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 410) requires that at least one instance within the **DDSDataWriter** (p. 1305) is asserted.

Changes in **LIVELINESS** (p. 409) must be detected by the Service with a time-granularity greater or equal to the **DDS_↵** **_LivelinessQosPolicy::lease_duration** (p. 925). This ensures that the value of the **DDS_LivelinessChangedStatus** (p. 919) is updated at least once during each **lease_duration** and the related Listeners and **DDSWaitSet** (p. 1613) s are notified within a **lease_duration** from the time the **LIVELINESS** (p. 409) changed.

9.97.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered kind* \geq *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS_LivelinessQosPolicyKind** (p. 409) kind are considered ordered such that: **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 410) < **DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS** (p. 410) < **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 410).
- the inequality *offered lease_duration* \leq *requested lease_duration* evaluates to **DDS_BOOLEAN_TRUE** (p. 316).

See also

Relationship between registration, liveliness and ownership (p. ??)

9.97.4 Member Data Documentation

9.97.4.1 kind

```
DDS_LivelinessQosPolicyKind DDS_LivelinessQosPolicy::kind
```

The kind of liveliness desired.

[default] **DDS_AUTOMATIC_LIVELINESS_QOS** (p. 410)

9.97.4.2 lease_duration

```
struct DDS_Duration_t DDS_LivelinessQosPolicy::lease_duration
```

The duration within which a **DDSDataWriter** (p. 1305) must be asserted, or else it is assumed to be not alive.

For a DataWriter, the *lease_duration* specifies a timeout by which liveliness must be asserted for the DataWriter or the DataWriter will be considered inactive or not alive.

For a DataReader, the *lease_duration* specifies the maximum period at which the DataReader will check to see if the matching DataWriters are still alive according to the DataWriters *lease_duration* value.

Important: A DataReader will consider a DataWriter not alive if it does not assert its liveliness within the DataWriter *lease_duration* not the DataReader *lease_duration*.

[default] **DDS_DURATION_INFINITE** (p. 325)

[range] [0,1 year] or **DDS_DURATION_INFINITE** (p. 325)

9.97.4.3 assertions_per_lease_duration

DDS_Long DDS_LivelinessQosPolicy::assertions_per_lease_duration

The number of assertions a **DDSDDataWriter** (p. 1305) will send during a its **DDS_LivelinessQosPolicy::lease_↔duration** (p. 925).

This field only applies to a **DDSDDataWriter** (p. 1305) and is not considered during QoS compatibility checks.

The default value is 3. A higher value will make the liveliness mechanism more robust against packet losses, but it will also increase the network traffic.

[default] 3

[range] [2, 100 million]

9.98 DDS_Locator_t Struct Reference

<<**extension**>> (p. 236) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

Public Attributes

- **DDS_Long** kind
The kind of locator.
- **DDS_UnsignedLong** port
the port number
- **DDS_Octet** address [**DDS_LOCATOR_ADDRESS_LENGTH_MAX**]
*A **DDS_LOCATOR_ADDRESS_LENGTH_MAX** (p. 304) octet field to hold the IP address.*

9.98.1 Detailed Description

<<**extension**>> (p. 236) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

9.98.2 Member Data Documentation

9.98.2.1 kind

DDS_Long DDS_Locator_t::kind

The kind of locator.

If the Locator_t kind is **DDS_LOCATOR_KIND_UDPv4** (p. 310), the address contains an IPv4 address. In this case, the leading 12 octets of the **DDS_Locator_t::address** (p. 927) must be zero. The last 4 octets of **DDS_Locator_t::address** (p. 927) are used to store the IPv4 address.

If the Locator_t kind is **DDS_LOCATOR_KIND_UDPv6** (p. 310), the address contains an IPv6 address. IPv6 addresses typically use a shorthand hexadecimal notation that maps one-to-one to the 16 octets in the **DDS_Locator_t::address** (p. 927) field.

9.98.2.2 port

DDS_UnsignedLong DDS_Locator_t::port

the port number

9.98.2.3 address

DDS_Octet DDS_Locator_t::address[**DDS_LOCATOR_ADDRESS_LENGTH_MAX**]

A **DDS_LOCATOR_ADDRESS_LENGTH_MAX** (p. 304) octet field to hold the IP address.

9.99 DDS_LocatorFilter_t Struct Reference

Specifies the configuration of an individual channel within a MultiChannel DataWriter.

Public Attributes

- struct **DDS_LocatorSeq** locators
*Sequence containing from one to 16 **DDS_Locator_t** (p. 926), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.*
- char * **filter_expression**
A logical expression used to determine the data that will be published in the channel.

9.99.1 Detailed Description

Specifies the configuration of an individual channel within a MultiChannel DataWriter.

QoS:

DDS_LocatorFilterQosPolicy (p. 928)

9.99.2 Member Data Documentation

9.99.2.1 locators

```
struct DDS_LocatorSeq DDS_LocatorFilter_t::locators
```

Sequence containing from one to 16 **DDS_Locator_t** (p.926), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

[default] Empty sequence.

9.99.2.2 filter_expression

```
char* DDS_LocatorFilter_t::filter_expression
```

A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **DDS_LocatorFilterQosPolicy::filter_name** (p.929)

Important: This value must be an allocated string with **DDS_String_alloc** (p.547) or **DDS_String_dup** (p.547). It should not be assigned to a string constant.

See also

Queries and Filters Syntax (p.178)

[default] NULL (invalid value)

9.100 DDS_LocatorFilterQosPolicy Struct Reference

The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p.997).

Public Attributes

- struct **DDS_LocatorFilterSeq locator_filters**

*A sequence of **DDS_LocatorFilter_t** (p.927). Each **DDS_LocatorFilter_t** (p.927) reports the configuration of a single channel of a MultiChannel DataWriter.*

- char * **filter_name**

Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

9.100.1 Detailed Description

The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS_PublicationBuiltinTopicData** (p. 997).

Entity:

DDS_PublicationBuiltinTopicData (p. 997)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.100.2 Member Data Documentation

9.100.2.1 locator_filters

```
struct DDS_LocatorFilterSeq DDS_LocatorFilterQosPolicy::locator_filters
```

A sequence of **DDS_LocatorFilter_t** (p. 927). Each **DDS_LocatorFilter_t** (p. 927) reports the configuration of a single channel of a MultiChannel DataWriter.

A sequence length of zero indicates the **DDS_MultiChannelQosPolicy** (p. 952) is not in use.

[default] Empty sequence.

9.100.2.2 filter_name

```
char* DDS_LocatorFilterQosPolicy::filter_name
```

Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported: **DDS_SQLFILTER_NAME** (p. 59) and **DDS_STRINGMATCHFILTER_NAME** (p. 59).

Warning

This value must be assigned to either one of the predefined values (**DDS_SQLFILTER_NAME** (p. 59) or **DDS_STRINGMATCHFILTER_NAME** (p. 59)), or to an allocated string with **DDS_String_alloc** (p. 547) or **DDS_String_dup** (p. 547). It should not be assigned to a string constant.

[default] **DDS_STRINGMATCHFILTER_NAME** (p. 59)

9.101 DDS_LocatorFilterSeq Struct Reference

Declares IDL `sequence< DDS_LocatorFilter_t (p. 927) >`.

9.101.1 Detailed Description

Declares IDL `sequence< DDS_LocatorFilter_t (p. 927) >`.

A sequence of **DDS_LocatorFilter_t** (p. 927) used to report the channels' properties. If the length of the sequence is zero, the **DDS_MultiChannelQosPolicy** (p. 952) is not in use.

Instantiates:

`<<generic>>` (p. 236) **FooSeq** (p. 1680)

9.103 DDS_LoggingQosPolicy Struct Reference

Configures the RTI Connext logging facility.

Public Attributes

- **NDDS_Config_LogVerbosity verbosity**
The verbosity at which RTI Connex diagnostic information is logged.
- **NDDS_Config_LogCategory category**
Categories of logged messages.
- **NDDS_Config_LogPrintFormat print_format**
The format used to output RTI Connex diagnostic information.
- char * **output_file**
Specifies the file to which log messages will be redirected to.
- char * **output_file_suffix**
Sets the file suffix when logging to a set of files.
- **DDS_Long max_bytes_per_file**
Specifies the maximum number of bytes a single file can contain.
- **DDS_Long max_files**
Specifies the maximum number of files to create before overwriting the previous ones.

9.103.1 Detailed Description

Configures the RTI Connex logging facility.

All the properties associated with RTI Connex logging can be configured using this QoS policy. This allows you to configure logging using XML QoS Profiles. See the "Troubleshooting" chapter in the `User's Manual` for details.

Entity:

DDSDomainParticipantFactory (p. 1409)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = **Changeable** (p. ??)

9.103.2 Member Data Documentation

9.103.2.1 verbosity

NDDS_Config_LogVerbosity `DDS_LoggingQosPolicy::verbosity`

The verbosity at which RTI Connex diagnostic information is logged.

[default] **NDDS_CONFIG_LOG_VERBOSITY_ERROR** (p. 524)

9.103.2.2 category

NDDS_Config_LogCategory DDS_LoggingQosPolicy::category

Categories of logged messages.

[default] Logging will be enabled for all the categories.

9.103.2.3 print_format

NDDS_Config_LogPrintFormat DDS_LoggingQosPolicy::print_format

The format used to output RTI Connex diagnostic information.

[default] **NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT** (p. 526).

9.103.2.4 output_file

char* DDS_LoggingQosPolicy::output_file

Specifies the file to which log messages will be redirected to.

If the value of output_file is set to NULL, log messages will sent to standard output.

If **DDS_LoggingQosPolicy::max_bytes_per_file** (p. 933) is not **DDS_LENGTH_UNLIMITED** (p. 437), this is used as the file name prefix for a set of numbered files.

Important: This value must be an allocated string with **DDS_String_alloc** (p. 547) or **DDS_String_dup** (p. 547). It should not be assigned to a string constant.

[default] NULL

See also

NDDSSConfigLogger::set_output_file_set (p. 1805)

9.103.2.5 output_file_suffix

```
char* DDS_LoggingQosPolicy::output_file_suffix
```

Sets the file suffix when logging to a set of files.

Note

This field only applies when `idref_LoggingQosPolicy_max_bytes_per_file` is different than **DDS_LENGTH_UNLIMITED** (p. 437).

It specifies the suffix to use for the set of files used to redirect the logging output. The prefix is **DDS_LoggingQosPolicy::output_file** (p. 932).

Important: This value must be an allocated string with **DDS_String_alloc** (p. 547) or **DDS_String_dup** (p. 547). It should not be assigned to a string constant.

[default] NULL

[default] No suffix

DDS_Long DDS_LoggingQosPolicy::max_bytes_per_file
```

Specifies the maximum number of bytes a single file can contain.

When this field is different than **DDS_LENGTH_UNLIMITED** (p. 437), it enables logging to separate files as they reach this size.

[default] **DDS_LENGTH_UNLIMITED** (p. 437) (a single file is used)

See also

NDDConfigLogger::set_output_file_set (p. 1805)

9.103.2.7 max_files

DDS_Long DDS_LoggingQosPolicy::max_files

Specifies the maximum number of files to create before overwriting the previous ones.

Note

This field only applies when idref_LoggingQosPolicy_max_bytes_per_file is different than **DDS_LENGTH_UNLIMITED** (p. 437).

When this field is different than **DDS_LENGTH_UNLIMITED** (p. 437), and the number of files reaches this number, future logging messages overwrite the previously created files.

[default] **DDS_LENGTH_UNLIMITED** (p. 437) (files aren't overwritten)

9.107 DDS_MonitoringDedicatedParticipantSettings Struct Reference

Configures the use of a dedicated **DDSDomainParticipant** (p. 1335) to distribute the RTI Connex application telemetry data.

Public Attributes

- **DDS_Boolean enable**
*Enables the use of a dedicated **DDSDomainParticipant** (p. 1335) to distribute the RTI Connex application telemetry data.*
- int **domain_id**
*The domain ID used in the creation of RTI Monitoring Library 2.0 **DDSDomainParticipant** (p. 1335).*
- char * **participant_qos_profile_name**
*The fully qualified name of the profile used to configure the **DDSDomainParticipant** (p. 1335) that will be used to distribute telemetry data.*
- struct **DDS_StringSeq collector_initial_peers**
*Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **DDS_MonitoringDistributionSettings::dedicated_participant** (p. 938).*

9.107.1 Detailed Description

Configures the use of a dedicated **DDSDomainParticipant** (p. 1335) to distribute the RTI Connex application telemetry data.

9.107.2 Member Data Documentation

9.107.2.1 enable

```
DDS_Boolean DDS_MonitoringDedicatedParticipantSettings::enable
```

Enables the use of a dedicated **DDSDomainParticipant** (p. 1335) to distribute the RTI Connex application telemetry data.

Setting this value to **DDS_BOOLEAN_FALSE** (p. 316) is not currently supported.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.107.2.2 domain_id

```
int DDS_MonitoringDedicatedParticipantSettings::domain_id
```

The domain ID used in the creation of RTI Monitoring Library 2.0 **DDSDomainParticipant** (p. 1335).

[default] 2

9.107.2.3 participant_qos_profile_name

```
char* DDS_MonitoringDedicatedParticipantSettings::participant_qos_profile_name
```

The fully qualified name of the profile used to configure the **DDSDomainParticipant** (p. 1335) that will be used to distribute telemetry data.

If NULL (the default value) then RTI Monitoring Library 2.0 uses **DDS_PROFILE_GENERIC_MONITORING2** (p. 496).

[default] NULL

9.107.2.4 collector_initial_peers

```
struct DDS_StringSeq DDS_MonitoringDedicatedParticipantSettings::collector_initial_peers
```

Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **DDS_MonitoringDistributionSettings::dedicated_participant** (p. 938).

These initial peers should correspond with the RTI Observability Collector Service with which RTI Monitoring Library 2.0 has to communicate. The `collector_initial_peers` works the same as `initial_peers` for other `DomainParticipants`, except that it allows you to easily specify the initial peer(s) for the RTI Monitoring Library 2.0 **DDSDomainParticipant** (p. 1335), which usually has different initial peer(s) than those used by your application.

If no `collector_initial_peers` are specified, or if it is explicitly set to an empty list, the **DDS_DiscoveryQosPolicy::initial_peers** (p. 726) list of **DDS_MonitoringDedicatedParticipantSettings::participant_qos_profile_name** (p. 936) will be used as the initial peers of **DDS_MonitoringDistributionSettings::dedicated_participant** (p. 938).

[default] An empty sequence.

See also

DDS_DiscoveryQosPolicy::initial_peers (p. 726) for further information about initial peers.

9.108 DDS_MonitoringDistributionSettings Struct Reference

Configures the distribution of telemetry data.

Public Attributes

- struct **DDS_MonitoringDedicatedParticipantSettings** **dedicated_participant**
*Configures the use of a dedicated **DDSDomainParticipant** (p. 1335) to distribute the RTI Connex application telemetry data.*
- char * **publisher_qos_profile_name**
The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.
- struct **DDS_MonitoringEventDistributionSettings** **event_settings**
Configures the distribution of event metrics.
- struct **DDS_MonitoringPeriodicDistributionSettings** **periodic_settings**
Configures the distribution of periodic metrics.
- struct **DDS_MonitoringLoggingDistributionSettings** **logging_settings**
Configures the distribution of logging messages.

9.108.1 Detailed Description

Configures the distribution of telemetry data.

9.108.2 Member Data Documentation

9.108.2.1 dedicated_participant

```
struct DDS_MonitoringDedicatedParticipantSettings DDS_MonitoringDistributionSettings::dedicated↔
_participant
```

Configures the use of a dedicated **DDSDomainParticipant** (p. 1335) to distribute the RTI Connex application telemetry data.

9.108.2.2 publisher_qos_profile_name

```
char* DDS_MonitoringDistributionSettings::publisher_qos_profile_name
```

The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.

There is one Publisher for each telemetry data **DDSTopic** (p.1601): **RTI_MONITORING_PERIODIC_TOPIC_↔NAME** (p.520), **RTI_MONITORING_EVENT_TOPIC_NAME** (p.520), and **RTI_MONITORING_LOGGING_TOPIC_↔NAME** (p.521).

If NULL (the default value) then RTI Monitoring Library 2.0 uses **DDS_PROFILE_GENERIC_MONITORING2** (p. 496).

[default] NULL

9.108.2.3 event_settings

```
struct DDS_MonitoringEventDistributionSettings DDS_MonitoringDistributionSettings::event_settings
```

Configures the distribution of event metrics.

9.108.2.4 periodic_settings

```
struct DDS_MonitoringPeriodicDistributionSettings DDS_MonitoringDistributionSettings::periodic_↔
settings
```

Configures the distribution of periodic metrics.

9.108.2.5 logging_settings

```
struct DDS_MonitoringLoggingDistributionSettings DDS_MonitoringDistributionSettings::logging_↵
settings
```

Configures the distribution of logging messages.

9.109 DDS_MonitoringEventDistributionSettings Struct Reference

Configures the distribution of event metrics.

Public Attributes

- **DDS_UnsignedLong concurrency_level**
Defines how concurrent the push is of event metrics to RTI Monitoring Library 2.0.
- **char * datawriter_qos_profile_name**
*The fully qualified name of the profile used to configure the **DDSDDataWriter** (p. 1305) that distributes event metrics.*
- **struct DDS_ThreadSettings_t thread**
The settings of the event metric thread.
- **struct DDS_Duration_t publication_period**
Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.

9.109.1 Detailed Description

Configures the distribution of event metrics.

Event metrics are provided to RTI Monitoring Library 2.0 when they change.

For example, if the liveliness of a **DDSDDataWriter** (p. 1305) is lost, a matching **DDSDDataReader** (p. 1272) will push the new value of **DDS_LivelinessChangedStatus** (p. 919) to RTI Monitoring Library 2.0 so that the liveliness status change can be distributed.

There are three kinds of event metrics:

- **Configuration metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to QoS policies.
- **Status metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to the event statuses such as **DDS_↵_LivelinessChangedStatus** (p. 919).
- **Resource metrics:** Provided to RTI Monitoring Library 2.0 when a resource (such as **DDSDDataWriter** (p. 1305)) is created or deleted.

The event metrics that will be distributed for an observable resource can be configured with **DDS_Monitoring_↵TelemetryData::metrics** (p. 951).

9.109.2 Member Data Documentation

9.109.2.1 concurrency_level

`DDS_UnsignedLong DDS_MonitoringEventDistributionSettings::concurrency_level`

Defines how concurrent the push is of event metrics to RTI Monitoring Library 2.0.

With a `concurrency_level` of one, all the event metrics pushed to RTI Monitoring Library 2.0 will be stored in a single queue protected by a single mutex.

With a `concurrency_level` of 'n', RTI Monitoring Library 2.0 will create 'n' queues for event metrics, each queue protected by its own mutex. Each resource (e.g, a **DDSDDataReader** (p. 1272)) will be associated with one of the queues when the resource is registered with RTI Monitoring Library 2.0. Therefore, all the event metrics for a single resource always go to the same queue.

The event metrics for two resources associated with different event queues can be pushed in parallel. This is why a higher `concurrency_level` provides more concurrency.

The event metrics added to the event queues are processed by a single thread configured using **DDS_MonitoringEventDistributionSettings::thread** (p. 940).

[default] 5

[range] [1, 100]

9.109.2.2 datawriter_qos_profile_name

`char* DDS_MonitoringEventDistributionSettings::datawriter_qos_profile_name`

The fully qualified name of the profile used to configure the **DDSDDataWriter** (p. 1305) that distributes event metrics.

The **DDSDDataWriter** (p. 1305) Topic is **RTI_MONITORING_EVENT_TOPIC_NAME** (p. 520).

If NULL (the default value), then RTI Monitoring Library 2.0 uses **DDS_PROFILE_GENERIC_MONITORING2** (p. 496).

[default] NULL

9.109.2.3 thread

`struct DDS_ThreadSettings_t DDS_MonitoringEventDistributionSettings::thread`

The settings of the event metric thread.

The event metric thread periodically publishes the event metrics pushed into RTI Monitoring Library 2.0 event metric queues after they change their values.

The thread runs at the period configured using **DDS_MonitoringEventDistributionSettings::publication_period** (p. 940).

[default] **DDS_THREAD_SETTINGS_DEFAULT**

9.109.2.4 publication_period

```
struct DDS_Duration_t DDS_MonitoringEventDistributionSettings::publication_period
```

Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.

With a period of 0 seconds, changes to event metrics will be published immediately after they are pushed into RTI Monitoring Library 2.0.

[default] 5 seconds

9.110 DDS_MonitoringLoggingDistributionSettings Struct Reference

Configures the distribution of log messages.

Public Attributes

- **DDS_UnsignedLong concurrency_level**
Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.
- **DDS_UnsignedLong max_historical_logs**
The number of log messages that RTI Monitoring Library 2.0 will keep as history.
- **char * datawriter_qos_profile_name**
*The fully qualified name of the profile used to configure the **DDSDataWriter** (p. 1305) that distributes log messages.*
- **struct DDS_ThreadSettings_t thread**
The settings of the logging thread.
- **struct DDS_Duration_t publication_period**
Period at which the logging thread publishes log messages.

9.110.1 Detailed Description

Configures the distribution of log messages.

Log messages are pushed into RTI Monitoring Library 2.0 and published by the logging thread.

The logging thread only publishes a log message with a Syslog level smaller than or equal to the forwarding level of the **NDDS_Config_LogFacility** (p. 527) associated with the log message.

The default value of the forwarding level for all facilities is **NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING** (p. 528). This value can be changed with the **DDS_MonitoringTelemetryData::logs** (p. 951) QoS Policy or by sending a command to RTI Monitoring Library 2.0.

In this release, commands can only be sent from the RTI Observability Dashboards.

RTI Monitoring Library 2.0 can be configured to keep a history of log messages for later distribution when a log snapshot is requested by a RTI Observability Collector Service.

The log messages maintained in the history are the last 'n' messages published by the logging thread (where 'n' is the value of **DDS_MonitoringLoggingDistributionSettings::max_historical_logs** (p. 942)).

9.110.2 Member Data Documentation

9.110.2.1 concurrency_level

DDS_UnsignedLong DDS_MonitoringLoggingDistributionSettings::concurrency_level

Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.

With a concurrency_level of one, all the log messages pushed to RTI Monitoring Library 2.0 will be stored into a single queue protected by a single mutex.

With a concurrency_level of 'n', RTI Monitoring Library 2.0 will create 'n' queues for log messages, each queue protected by its own mutex.

The log messages generated by a single thread will always be pushed to the same queue. The log messages for two threads associated with different log queues can be pushed in parallel. This is why a higher concurrency_level provides more concurrency.

The log messages added to the log queues are processed and published by a single thread configured using **DDS_MonitoringLoggingDistributionSettings::thread** (p. 942).

[default] 5

[range] [1, 100]

9.110.2.2 max_historical_logs

DDS_UnsignedLong DDS_MonitoringLoggingDistributionSettings::max_historical_logs

The number of log messages that RTI Monitoring Library 2.0 will keep as history.

RTI Monitoring Library 2.0 will keep as history the last max_historical_logs published messages.

A value of 0 means that RTI Monitoring Library 2.0 should not keep any history.

[default] 128

9.110.2.3 datawriter_qos_profile_name

char* DDS_MonitoringLoggingDistributionSettings::datawriter_qos_profile_name

The fully qualified name of the profile used to configure the **DDSDataWriter** (p. 1305) that distributes log messages.

The **DDSDataWriter** (p. 1305) Topic is **RTI_MONITORING_LOGGING_TOPIC_NAME** (p. 521).

If NULL (the default value), then RTI Monitoring Library 2.0 uses **DDS_PROFILE_GENERIC_MONITORING2** (p. 496).

[default] NULL

9.110.2.4 thread

```
struct DDS_ThreadSettings_t DDS_MonitoringLoggingDistributionSettings::thread
```

The settings of the logging thread.

The logging thread periodically publishes the log messages pushed into RTI Monitoring Library 2.0 log message queues after they are generated.

The thread runs at the period configured using **DDS_MonitoringLoggingDistributionSettings::publication_period** (p. 943).

[default] DDS_THREAD_SETTINGS_DEFAULT

9.110.2.5 publication_period

```
struct DDS_Duration_t DDS_MonitoringLoggingDistributionSettings::publication_period
```

Period at which the logging thread publishes log messages.

With a period of 0 seconds, log messages will be published immediately after they are pushed into RTI Monitoring Library 2.0.

[default] 1 second

9.111 DDS_MonitoringLoggingForwardingSettings Struct Reference

Configures the forwarding levels of log messages for the different **NDDS_Config_LogFacility** (p. 527).

Public Attributes

- **NDDS_Config_SyslogVerbosity middleware_forwarding_level**
*Log messages with **NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **NDDS_Config_SyslogVerbosity security_forwarding_level**
*Log messages with **NDDS_CONFIG_LOG_FACILITY_SECURITY** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **NDDS_Config_SyslogVerbosity service_forwarding_level**
*Log messages with **NDDS_CONFIG_LOG_FACILITY_SERVICE** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **NDDS_Config_SyslogVerbosity user_forwarding_level**
*Log messages with **NDDS_CONFIG_LOG_FACILITY_USER** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*

9.111.1 Detailed Description

Configures the forwarding levels of log messages for the different **NDDS_Config_LogFacility** (p. 527).

9.111.2 Member Data Documentation

9.111.2.1 middleware_forwarding_level

NDDS_Config_SyslogVerbosity DDS_MonitoringLoggingForwardingSettings::middleware_forwarding_level

Log messages with **NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[default] **NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING** (p. 528)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **NDDS_CONFIG_LOG_VERBOSITY_WARNING** (p. 524), may affect performance due to the large amount of messages produced.

9.111.2.2 security_forwarding_level

NDDS_Config_SyslogVerbosity DDS_MonitoringLoggingForwardingSettings::security_forwarding_level

Log messages with **NDDS_CONFIG_LOG_FACILITY_SECURITY** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[Not supported.]

[default] **NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING** (p. 528)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **NDDS_CONFIG_LOG_VERBOSITY_WARNING** (p. 524), may affect performance due to the large amount of messages produced.

9.111.2.3 service_forwarding_level

NDDS_Config_SyslogVerbosity DDS_MonitoringLoggingForwardingSettings::service_forwarding_level

Log messages with **NDDS_CONFIG_LOG_FACILITY_SERVICE** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[Not supported.]

[default] **NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING** (p. 528)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **NDDS_CONFIG_LOG_VERBOSITY_WARNING** (p. 524), may affect performance due to the large amount of messages produced.

9.111.2.4 user_forwarding_level

NDDS_Config_SyslogVerbosity DDS_MonitoringLoggingForwardingSettings::user_forwarding_level

Log messages with **NDDS_CONFIG_LOG_FACILITY_USER** (p. 527) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[Not supported.]

[default] **NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING** (p. 528)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **NDDS_CONFIG_LOG_VERBOSITY_WARNING** (p. 524), may affect performance due to the large amount of messages produced.

9.112 DDS_MonitoringMetricSelection Struct Reference

This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.

Public Attributes

- char * **resource_selection**

*An expression pattern used to match the resource names of observable resources to which the configured metrics through **DDS_MonitoringMetricSelection::enabled_metrics_selection** (p. 946) and **DDS_MonitoringMetricSelection::disabled_metrics_selection** (p. 946) apply.*

- struct **DDS_StringSeq enabled_metrics_selection**

*A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **DDS_MonitoringMetricSelection::resource_selection** (p. 945).*

- struct **DDS_StringSeq disabled_metrics_selection**

*A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **DDS_MonitoringMetricSelection::resource_selection** (p. 945).*

9.112.1 Detailed Description

This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.

[Not supported.]

9.112.2 Member Data Documentation

9.112.2.1 resource_selection

```
char* DDS_MonitoringMetricSelection::resource_selection
```

An expression pattern used to match the resource names of observable resources to which the configured metrics through **DDS_MonitoringMetricSelection::enabled_metrics_selection** (p. 946) and **DDS_MonitoringMetricSelection::disabled_metrics_selection** (p. 946) apply.

Following there are some examples of resource expression patterns:

- /applications/myApp/domain_participants/myParticipant
- /applications/*/domain_participants/*/subscribers/*
- /applications/myApp/domain_participants/GUID(1234.5678.4321.8765)
- //myEntity

The first expression refers to a DomainParticipant named "myParticipant" that belongs to an application named "myApp". The second expression applies to all the Subscribers in the system (resource names wildcards follow the POSIX fnmatch syntax). The third expression refers to a DomainParticipant with a specific resource GUID in the "myApp" application. The last expression uses the XPath "/" operator. It matches observable resources named "myEntity" no matter where they are located in the resource hierarchy.

See the Telemetry Data / Resources chapter of RTI Connex Observability Framework documentation for further information on the observable resource names and expression patterns.

9.112.2.2 enabled_metrics_selection

```
struct DDS_StringSeq DDS_MonitoringMetricSelection::enabled_metrics_selection
```

A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **DDS_MonitoringMetricSelection::resource_selection** (p. 945).

This sequence is evaluated first, followed by **DDS_MonitoringMetricSelection::disabled_metrics_selection** (p. 946). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Some examples of valid patterns are:

- dds.data_writer.qos.durability.writer_depth
- dds.data_reader.qos.reliability.*
- dds.application.*

The first pattern refers to a specific DataWriter metric (**DDS_DurabilityQosPolicy::writer_depth** (p. 764)). The second pattern refers to all the DataReader **DDS_ReliabilityQosPolicy** (p. 1027) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of RTI Connex Observability Framework documentation for further information on the metric names and metric patterns. The metric names to which the patterns apply are the "Backend Independent Metric Names" listed in the same chapter.

9.112.2.3 disabled_metrics_selection

```
struct DDS_StringSeq DDS_MonitoringMetricSelection::disabled_metrics_selection
```

A sequence of POSIX fnmatch patterns that mach the names of the metrics that should not be collected and distributed for the observable resources selected by **DDS_MonitoringMetricSelection::resource_selection** (p. 945).

This sequence is evaluated after **DDS_MonitoringMetricSelection::enabled_metrics_selection** (p. 946). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Some examples of valid patterns are:

- dds.data_writer.qos.durability.writer_depth
- dds.data_reader.qos.reliability.*
- dds.application.*

The first pattern refers to a specific DataWriter metric (**DDS_DurabilityQosPolicy::writer_depth** (p. 764)). The second pattern refers to all the DataReader **DDS_ReliabilityQosPolicy** (p. 1027) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of RTI Connex Observability Framework documentation for further information on the metric names and metric patterns. The metric names to which the patterns apply are the "Backend Independent Metric Names" listed in the same chapter.

9.113 DDS_MonitoringMetricSelectionSeq Struct Reference

Declares IDL `sequence` < **DDS_MonitoringMetricSelection** (p. 945) >

9.113.1 Detailed Description

Declares IDL `sequence` < **DDS_MonitoringMetricSelection** (p. 945) >

Instantiates:

<<**generic**>> (p. 236) **FooSeq** (p. 1680)

See also

DDS_MonitoringMetricSelection (p. 945)

9.114 DDS_MonitoringPeriodicDistributionSettings Struct Reference

Configures the distribution of periodic metrics.

Public Attributes

- char * **datawriter_qos_profile_name**
*The fully qualified name of the profile used to configure the **DDSDataWriter** (p. 1305) that distributes periodic metrics.*
- struct **DDS_ThreadSettings_t** **thread**
The settings of the periodic metric thread.
- struct **DDS_Duration_t** **polling_period**
Period at which the periodic metric thread polls and publishes the periodic metrics.

9.114.1 Detailed Description

Configures the distribution of periodic metrics.

Periodic metrics change often, and they are polled and published periodically by a thread created by RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 obtains periodic metrics by polling the current value of periodic statuses such as **DDS_↵DataWriterProtocolStatus** (p. 672).

The periodic metrics that will be distributed for an observable resource can be configured with **DDS_Monitoring_↵TelemetryData::metrics** (p. 951).

9.114.2 Member Data Documentation

9.114.2.1 datawriter_qos_profile_name

```
char* DDS_MonitoringPeriodicDistributionSettings::datawriter_qos_profile_name
```

The fully qualified name of the profile used to configure the **DDSDataWriter** (p. 1305) that distributes periodic metrics.

The **DDSDataWriter** (p. 1305) Topic is **RTI_MONITORING_PERIODIC_TOPIC_NAME** (p. 520).

If NULL (the default value), then RTI Monitoring Library 2.0 uses **DDS_PROFILE_GENERIC_MONITORING2** (p. 496).

[default] NULL

9.114.2.2 thread

```
struct DDS_ThreadSettings_t DDS_MonitoringPeriodicDistributionSettings::thread
```

The settings of the periodic metric thread.

The periodic metric thread periodically polls and publishes periodic event metrics.

The thread runs at the period configured using **DDS_MonitoringPeriodicDistributionSettings::polling_period** (p. 949).

[default] DDS_THREAD_SETTINGS_DEFAULT

9.114.2.3 polling_period

```
struct DDS_Duration_t DDS_MonitoringPeriodicDistributionSettings::polling_period
```

Period at which the periodic metric thread polls and publishes the periodic metrics.

[default] 5 seconds

[range] > 0 seconds

9.115 DDS_MonitoringQosPolicy Struct Reference

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

Public Attributes

- **DDS_Boolean enable**
Enables the collection and distribution of telemetry data for an RTI Connex application using RTI Monitoring Library 2.0.
- char * **application_name**
The name of the resource that represents this RTI Connex application.
- struct **DDS_MonitoringDistributionSettings distribution_settings**
Configures the distribution of telemetry data.
- struct **DDS_MonitoringTelemetryData telemetry_data**
Configures the telemetry data that will be distributed.

9.115.1 Detailed Description

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

9.115.2 Member Data Documentation

9.115.2.1 enable

`DDS_Boolean DDS_MonitoringQosPolicy::enable`

Enables the collection and distribution of telemetry data for an RTI Connex application using RTI Monitoring Library 2.0.

Note: Enabling and disabling RTI Monitoring Library 2.0 while DDS Entities are being created or deleted is not a safe operation. The entities created while RTI Monitoring Library 2.0 is being enabled may not be monitored. In that case, children entities from that entity (invisible to the library) will not be monitored either.

[default] `DDS_BOOLEAN_FALSE` (p. 316)

9.115.2.2 application_name

`char* DDS_MonitoringQosPolicy::application_name`

The name of the resource that represents this RTI Connex application.

When this member is set to a value other than NULL , the resource identifier representing this application will be:

`/applications/<application_name>`

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The `application_name` should be unique across the RTI Connex system; however, RTI Monitoring Library 2.0 does not currently enforce uniqueness.

When this member is set to NULL , RTI Monitoring Library 2.0 will automatically assign a resource identifier with this format:

`/applications/<host_name:process_id:uuid>`

[default] NULL

9.115.2.3 distribution_settings

`struct DDS_MonitoringDistributionSettings DDS_MonitoringQosPolicy::distribution_settings`

Configures the distribution of telemetry data.

9.115.2.4 telemetry_data

```
struct DDS_MonitoringTelemetryData DDS_MonitoringQosPolicy::telemetry_data
```

Configures the telemetry data that will be distributed.

9.116 DDS_MonitoringTelemetryData Struct Reference

Configures the telemetry data that will be distributed.

Public Attributes

- struct **DDS_MonitoringMetricSelectionSeq** **metrics**
*Sequence of **DDS_MonitoringMetricSelection** (p. 945) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.*
- struct **DDS_MonitoringLoggingForwardingSettings** **logs**
***DDS_MonitoringLoggingForwardingSettings** (p. 943) containing the **NDDS_Config_SyslogVerbosity** (p. 527) levels that will be forwarded for the different **NDDS_Config_LogFacility** (p. 527).*

9.116.1 Detailed Description

Configures the telemetry data that will be distributed.

9.116.2 Member Data Documentation

9.116.2.1 metrics

```
struct DDS_MonitoringMetricSelectionSeq DDS_MonitoringTelemetryData::metrics
```

Sequence of **DDS_MonitoringMetricSelection** (p. 945) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.

[Not supported.]

The different **DDS_MonitoringMetricSelection** (p. 945) in the sequence are evaluated in order.

[default] An empty sequence, meaning that no metrics will be collected and distributed for any observable resource.

See also

DDS_MonitoringEventDistributionSettings (p. 939) and **DDS_MonitoringPeriodicDistributionSettings** (p. 948) for further information on how RTI Monitoring Library 2.0 distributes **metrics** (p. 951).

9.116.2.2 logs

```
struct DDS_MonitoringLoggingForwardingSettings DDS_MonitoringTelemetryData::logs
```

DDS_MonitoringLoggingForwardingSettings (p. 943) containing the **NDDS_Config_SyslogVerbosity** (p. 527) levels that will be forwarded for the different **NDDS_Config_LogFacility** (p. 527).

See also

DDS_MonitoringLoggingDistributionSettings (p. 941) for further information on how RTI Monitoring Library 2.0 distributes log messages.

9.117 DDS_MultiChannelQosPolicy Struct Reference

Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

Public Attributes

- struct **DDS_ChannelSettingsSeq channels**
*A sequence of **DDS_ChannelSettings_t** (p. 604) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.*
- char * **filter_name**
Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

9.117.1 Detailed Description

Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

This QoS policy is used to partition the data published by a **DDSDataWriter** (p. 1305) across multiple channels. A *channel* is defined by a filter expression and a sequence of multicast locators.

Entity:

DDSDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.117.2 Usage

By using this QoS, a **DDSDataWriter** (p. 1305) can be configured to send data to different multicast groups based on the content of the data. Using syntax similar to those used in Content-Based Filters, you can associate different multicast addresses with filter expressions that operate on the values of the fields within the data. When your application's code calls **FooDataWriter::write** (p. 1666), data is sent to any multicast address for which the data passes the filter.

Multi-channel DataWriters can be used to trade off network bandwidth with the unnecessary processing of unwanted data for situations where there are multiple DataReaders that are interested in different subsets of data that come from the same data stream (Topic). For example, in Financial applications, the data stream may be quotes for different stocks at an exchange. Applications usually only want to receive data (quotes) for only a subset of the stocks being traded. In tracking applications, a data stream may carry information on hundreds or thousands of objects being tracked, but again, applications may only be interested in a subset.

The problem is that the most efficient way to deliver data to multiple applications is to use multicast, so that a data value is only sent once on the network for any number of subscribers to the data. However, using multicast, an application will receive *all* of the data sent and not just the data in which it is interested, thus extra CPU time is wasted to throw away unwanted data. With this QoS, you can analyze the data-usage patterns of your applications and optimize network vs. CPU usage by partitioning the data into multiple multicast streams. While network bandwidth is still being conserved by sending data only once using multicast, most applications will only need to listen to a subset of the multicast addresses and receive a reduced amount of unwanted data.

Your system can gain more of the benefits of using multiple multicast groups if your network uses Layer 2 Ethernet switches. Layer 2 switches can be configured to only route multicast packets to those ports that have added membership to specific multicast groups. Using those switches will ensure that only the multicast packets used by applications on a node are routed to the node; all others are filtered-out by the switch.

9.117.3 Member Data Documentation

9.117.3.1 channels

```
struct DDS_ChannelSettingsSeq DDS_MultiChannelQosPolicy::channels
```

A sequence of **DDS_ChannelSettings_t** (p. 604) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

A sequence length of zero indicates the **DDS_MultiChannelQosPolicy** (p. 952) is not in use.

The sequence length cannot be greater than **DDS_DomainParticipantResourceLimitsQosPolicy::channel_seq_max_length** (p. 756).

[default] Empty sequence.

9.117.3.2 filter_name

```
char* DDS_MultiChannelQosPolicy::filter_name
```

Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported:

- **DDS_SQLFILTER_NAME** (p. 59)
- **DDS_STRINGMATCHFILTER_NAME** (p. 59)

Warning

The value for this field can be one of the constants above or a string allocated with **DDS_String_dup()** (p. 547) to specify your own filter. You should not assign a string literal. When you assign a new value with **DDS_String_dup()** (p. 547), first check if the current value is one of the constants above. If it is, simply replace it; if it's not, you have to release the current string and assign the new one. Here is an example of such an approach:

```
struct DDS_DataWriterQos writer_qos;
char *filter_name = NULL;
DDS_DataWriterQos_initialize(&writer_qos);
...
DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
...
filter_name = writer_qos.multi_channel.filter_name;
if (filter_name == DDS_SQLFILTER_NAME
    || filter_name == DDS_STRINGMATCH_FILTER_NAME) {
    // Since the value was never on the heap, this won't leak memory
    filter_name = NULL;
} else {
    // This means the value is present on the heap
    DDS_String_free(filter_name);
}
// New value using DDS_String_dup() or one of the predefined constants
filter_name = DDS_String_dup("My custom filter name");
...
DDS_DataWriterQos_finalize(&writer_qos);
```

The strings allocated with **DDS_String_dup()** (p. 547) are released when `writer_qos` is finalized.

More information about string handling can be found under **String Conventions** (p. 546).

[default] **DDS_STRINGMATCHFILTER_NAME** (p. 59)

9.118 DDS_Octets Struct Reference

Built-in type consisting of a variable-length array of opaque bytes.

Public Member Functions

- **DDS_Octets** ()
Constructor.
- **DDS_Octets** (int size)
Constructor that specifies the size of the allocated octets array.
- **~DDS_Octets** ()
Destructor.

Public Attributes

- int **length**
Number of octets to serialize.
- unsigned char * **value**
DDS_Octets (p. 954) array value.

9.118.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

9.118.2 Constructor & Destructor Documentation

9.118.2.1 DDS_Octets() [1/2]

```
DDS_Octets::DDS_Octets ( ) [inline]
```

Constructor.

The default constructor initializes the newly created object with NULL value, and zero length.

9.118.2.2 DDS_Octets() [2/2]

```
DDS_Octets::DDS_Octets (
    int size ) [inline]
```

Constructor that specifies the size of the allocated octets array.

After this method is called, length is set to zero.

If a memory allocation failure occurs, and the **DDS_Octets** (p. 954) structure is allocated but the array inside of it cannot be, the array will be NULL.

Parameters

<i>size</i>	<< <i>in</i> >> (p. 237) Size of the allocated octets array
-------------	---

References **DDS_OctetBuffer_alloc()**, and **value**.

9.118.2.3 ~DDS_Octets()

```
DDS_Octets::~~DDS_Octets ( ) [inline]
```

Destructor.

References **DDS_OctetBuffer_free()**, and **value**.

9.118.3 Member Data Documentation

9.118.3.1 length

```
int DDS_Octets::length
```

Number of octets to serialize.

9.118.3.2 value

```
unsigned char* DDS_Octets::value
```

DDS_Octets (p. 954) array value.

Referenced by **DDS_Octets()**, and **~DDS_Octets()**.

9.121 DDS_OfferedDeadlineMissedStatus Struct Reference

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 342)

Public Attributes

- **DDS_Long total_count**
*Total cumulative count of the number of times the **DDSDataWriter** (p. 1305) failed to write within its offered deadline.*
- **DDS_Long total_count_change**
The incremental changes in total_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_instance_handle**
*Handle to the last instance in the **DDSDataWriter** (p. 1305) for which an offered deadline was missed.*

9.121.1 Detailed Description

DDS_OFFERED_DEADLINE_MISSED_STATUS (p. 342)

Entity:

DDSDataWriter (p. 1305)

Listener:

DDSDataWriterListener (p. 1328)

The deadline that the **DDSDataWriter** (p. 1305) has committed through its **DDS_DeadlineQosPolicy** (p. 701) was not respected for a specific instance.

9.121.2 Member Data Documentation

9.121.2.1 total_count

DDS_Long DDS_OfferedDeadlineMissedStatus::total_count

Total cumulative count of the number of times the **DDSDDataWriter** (p. 1305) failed to write within its offered deadline.

Missed deadlines accumulate; that is, each deadline period the `total_count` will be incremented by one.

9.121.2.2 total_count_change

DDS_Long DDS_OfferedDeadlineMissedStatus::total_count_change

The incremental changes in `total_count` since the last time the listener was called or the status was read.

9.121.2.3 last_instance_handle

DDS_InstanceHandle_t DDS_OfferedDeadlineMissedStatus::last_instance_handle

Handle to the last instance in the **DDSDDataWriter** (p. 1305) for which an offered deadline was missed.

9.122 DDS_OfferedIncompatibleQosStatus Struct Reference

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343)

Public Attributes

- **DDS_Long total_count**

*Total cumulative number of times the concerned **DDSDDataWriter** (p. 1305) discovered a **DDSDDataReader** (p. 1272) for the same **DDSTopic** (p. 1601), common partition with a requested QoS that is incompatible with that offered by the **DDSDDataWriter** (p. 1305).*

- **DDS_Long total_count_change**

The incremental changes in `total_count` since the last time the listener was called or the status was read.

- **DDS_QosPolicyId_t last_policy_id**

*The **DDS_QosPolicyId_t** (p. 359) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*

- struct **DDS_QosPolicyCountSeq policies**

*A list containing for each policy the total number of times that the concerned **DDSDDataWriter** (p. 1305) discovered a **DDSDDataReader** (p. 1272) for the same **DDSTopic** (p. 1601) and common partition with a requested QoS that is incompatible with that offered by the **DDSDDataWriter** (p. 1305).*

9.122.1 Detailed Description

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343)

Entity:

DDSDataWriter (p. 1305)

Listener:

DDSDataWriterListener (p. 1328)

The qos policy value was incompatible with what was requested.

9.122.2 Member Data Documentation

9.122.2.1 total_count

DDS_Long DDS_OfferedIncompatibleQosStatus::total_count

Total cumulative number of times the concerned **DDSDataWriter** (p. 1305) discovered a **DDSDataReader** (p. 1272) for the same **DDSTopic** (p. 1601), common partition with a requested QoS that is incompatible with that offered by the **DDSDataWriter** (p. 1305).

9.122.2.2 total_count_change

DDS_Long DDS_OfferedIncompatibleQosStatus::total_count_change

The incremental changes in total_count since the last time the listener was called or the status was read.

9.122.2.3 last_policy_id

DDS_QosPolicyId_t DDS_OfferedIncompatibleQosStatus::last_policy_id

The **DDS_QosPolicyId_t** (p. 359) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

9.122.2.4 policies

```
struct DDS_QosPolicyCountSeq DDS_OfferedIncompatibleQosStatus::policies
```

A list containing for each policy the total number of times that the concerned **DDSDataWriter** (p. 1305) discovered a **DDSDataReader** (p. 1272) for the same **DDSTopic** (p. 1601) and common partition with a requested QoS that is incompatible with that offered by the **DDSDataWriter** (p. 1305).

9.123 DDS_OwnershipQosPolicy Struct Reference

Specifies whether it is allowed for multiple **DDSDataWriter** (p. 1305) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Public Attributes

- **DDS_OwnershipQosPolicyKind** kind

The kind of ownership.

9.123.1 Detailed Description

Specifies whether it is allowed for multiple **DDSDataWriter** (p. 1305) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Entity:

DDSTopic (p. 1601), **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_REQUESTED_INCOMPATIBLE_QOS_↵
STATUS** (p. 343)

Properties:

RxO (p. ??) = YES

Changeable (p. ??) = **UNTIL ENABLE** (p. ??)

See also

OWNERSHIP_STRENGTH (p. 415)

9.123.2 Usage

Along with the **OWNERSHIP_STRENGTH** (p. 415), this QoS policy specifies if **DDSDataReader** (p. 1272) entities can receive updates to the same instance (identified by its key) from multiple **DDSDataWriter** (p. 1305) entities at the same time.

There are two kinds of ownership, selected by the setting of the `kind`: **SHARED** and **EXCLUSIVE**.

9.123.2.1 SHARED ownership

DDS_SHARED_OWNERSHIP_QOS (p. 415) indicates that RTI Connext does not enforce unique ownership for each instance. In this case, multiple writers can update the same data type instance. The subscriber to the **DDSTopic** (p. 1601) will be able to access modifications from all **DDSDataWriter** (p. 1305) objects, subject to the settings of other QoS that may filter particular samples (e.g. the **TIME_BASED_FILTER** (p. 440) or **HISTORY** (p. 404) policy). In any case, there is no "filtering" of modifications made based on the identity of the **DDSDataWriter** (p. 1305) that causes the modification.

9.123.2.2 EXCLUSIVE ownership

DDS_EXCLUSIVE_OWNERSHIP_QOS (p. 415) indicates that each instance of a data type can only be modified by one **DDSDataWriter** (p. 1305). In other words, at any point in time, a single **DDSDataWriter** (p. 1305) owns each instance and is the only one whose modifications will be visible to the **DDSDataReader** (p. 1272) objects. The owner is determined by selecting the **DDSDataWriter** (p. 1305) with the highest value of the **DDS_OwnershipStrengthQosPolicy::value** (p. 965) that is currently alive, as defined by the **LIVELINESS** (p. 409) policy, and has not violated its **DEADLINE** (p. 384) contract with regards to the data instance.

Ownership can therefore change as a result of:

- a **DDSDataWriter** (p. 1305) in the system with a higher value of the strength that modifies the instance,
- a change in the strength value of the **DDSDataWriter** (p. 1305) that owns the instance, and
- a change in the liveliness of the **DDSDataWriter** (p. 1305) that owns the instance.
- a deadline with regards to the instance that is missed by the **DDSDataWriter** (p. 1305) that owns the instance.

The behavior of the system is as if the determination was made independently by each **DDSDataReader** (p. 1272). Each **DDSDataReader** (p. 1272) may detect the change of ownership at a different time. It is not a requirement that at a particular point in time all the **DDSDataReader** (p. 1272) objects for that **DDSTopic** (p. 1601) have a consistent picture of who owns each instance.

It is also not a requirement that the **DDSDataWriter** (p. 1305) objects are aware of whether they own a particular instance. There is no error or notification given to a **DDSDataWriter** (p. 1305) that modifies an instance it does not currently own.

The requirements are chosen to (a) preserve the decoupling of publishers and subscriber, and (b) allow the policy to be implemented efficiently.

It is possible that multiple **DDSDataWriter** (p. 1305) objects with the same strength modify the same instance. If this occurs RTI Connex will pick one of the **DDSDataWriter** (p. 1305) objects as the owner. It is not specified how the owner is selected. However, the algorithm used to select the owner guarantees that all **DDSDataReader** (p. 1272) objects will make the same choice of the particular **DDSDataWriter** (p. 1305) that is the owner. It also guarantees that the owner remains the same until there is a change in strength, liveliness, the owner misses a deadline on the instance, or a new **DDSDataWriter** (p. 1305) with higher same strength, or a new **DDSDataWriter** (p. 1305) with same strength that should be deemed the owner according to the policy of the Service, modifies the instance.

Exclusive ownership is on an instance-by-instance basis. That is, a subscriber can receive values written by a lower strength **DDSDataWriter** (p. 1305) as long as they affect instances whose values have not been set by the higher-strength **DDSDataWriter** (p. 1305).

9.123.3 Compatibility

The value of the **DDS_OwnershipQosPolicyKind** (p. 414) offered must exactly match the one requested or else they are considered incompatible.

9.123.4 Relationship between registration, liveliness and ownership

The need for registering/unregistering instances stems from two use cases:

- Ownership resolution on redundant systems
- Detection of loss in topological connectivity

These two use cases also illustrate the semantic differences between the **FooDataWriter::unregister_instance** (p. 1663) and **FooDataWriter::dispose** (p. 1672).

9.123.4.1 Ownership Resolution on Redundant Systems

It is expected that users may use DDS to set up redundant systems where multiple **DDSDataWriter** (p. 1305) entities are "capable" of writing the same instance. In this situation, the **DDSDataWriter** (p. 1305) entities are configured such that:

- Either both are writing the instance "constantly"
- Or else they use some mechanism to classify each other as "primary" and "secondary", such that the primary is the only one writing, and the secondary monitors the primary and only writes when it detects that the primary "writer" is no longer writing.

Both cases above use the **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 415) and arbitrate themselves by means of the **DDS_OwnershipStrengthQosPolicy** (p. 965). Regardless of the scheme, the desired behavior from the **DDSDataReader** (p. 1272) point of view is that **DDSDataReader** (p. 1272) normally receives data from the primary unless the "primary" writer stops writing, in which case the **DDSDataReader** (p. 1272) starts to receive data from the secondary **DDSDataWriter** (p. 1305).

This approach requires some mechanism to detect that a **DDSDataWriter** (p. 1305) (the primary) is no longer "writing" the data as it should. There are several reasons why this may happen and all must be detected (but not necessarily distinguished):

crash The writing process is no longer running (e.g. the whole application has crashed)

connectivity loss Connectivity to the writing application has been lost (e.g. network disconnection)

application fault The application logic that was writing the data is faulty and has stopped calling **FooDataWriter::write** (p. 1666).

Arbitrating from a **DDSDataWriter** (p. 1305) to one of a higher strength is simple and the decision can be taken autonomously by the **DDSDataReader** (p. 1272). Switching ownership from a higher strength **DDSDataWriter** (p. 1305) to one of a lower strength **DDSDataWriter** (p. 1305) requires that the **DDSDataReader** (p. 1272) can make a determination that the stronger **DDSDataWriter** (p. 1305) is "no longer writing the instance".

9.123.4.1.1 Case where the data is periodically updated This determination is reasonably simple when the data is being written periodically at some rate. The **DDSDataWriter** (p. 1305) simply states its offered **DDS_DeadlineQosPolicy** (p. 701) (maximum interval between updates) and the **DDSDataReader** (p. 1272) automatically monitors that the **DDSDataWriter** (p. 1305) indeed updates the instance at least once per **DDS_DeadlineQosPolicy::period** (p. 702). If the deadline is missed, the **DDSDataReader** (p. 1272) considers the **DDSDataWriter** (p. 1305) "not alive" and automatically gives ownership to the next highest-strength **DDSDataWriter** (p. 1305) that *is* alive.

9.123.4.1.2 Case where data is not periodically updated The case where the **DDSDataWriter** (p. 1305) is not writing data periodically is also a very important use-case. Since the instance is not being updated at any fixed period, the "deadline" mechanism cannot be used to determine ownership. The liveliness solves this situation. Ownership is maintained while the **DDSDataWriter** (p. 1305) is "alive" and for the **DDSDataWriter** (p. 1305) to be alive it must fulfill its **DDS_LivelinessQosPolicy** (p. 923) contract. The different means to renew liveliness (automatic, manual) combined by the implied renewal each time data is written handle the three conditions above [crash], [connectivity loss], and [application fault]. Note that to handle [application fault], **LIVELINESS** must be **DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS** (p. 410). The **DDSDataWriter** (p. 1305) can retain ownership by periodically writing data or else calling **assert_liveliness** if it has no data to write. Alternatively if only protection against [crash] or [connectivity loss] is desired, it is sufficient that some task on the **DDSDataWriter** (p. 1305) process periodically writes data or calls **DDSDomainParticipant::assert_liveliness** (p. 1382). However, this scenario requires that the **DDSDataReader** (p. 1272) knows what instances are being "written" by the **DDSDataWriter** (p. 1305). That is the only way that the **DDSDataReader** (p. 1272) deduces the ownership of specific instances from the fact that the **DDSDataWriter** (p. 1305) is still "alive". Hence the need for the **DDSDataWriter** (p. 1305) to "register" and "unregister" instances. Note that while "registration" can be done lazily the first time the **DDSDataWriter** (p. 1305) writes the instance, "unregistration," in general, cannot. Similar reasoning will lead to the fact that unregistration will also require a message to be sent to the **DDSDataReader** (p. 1272).

9.123.4.2 Detection of Loss in Topological Connectivity

There are applications that are designed in such a way that their correct operation requires some minimal topological connectivity, that is, the writer needs to have a minimum number of readers or alternatively the reader must have a minimum number of writers.

A common scenario is that the application does not start doing its logic until it knows that some specific writers have the minimum configured readers (e.g. the alarm monitor is up).

A *more* common scenario is that the application logic will wait until some writers appear that can provide some needed source of information (e.g. the raw sensor data that must be processed).

Furthermore, once the application is running it is a requirement that this minimal connectivity (from the source of the data) is monitored and the application informed if it is ever lost. For the case where data is being written periodically, the **DDS_DeadlineQosPolicy** (p. 701) and the `on_deadline_missed` listener provides the notification. The case where data is not periodically updated requires the use of the **DDS_LivelinessQosPolicy** (p. 923) in combination with `register_instance/unregister_instance` to detect whether the "connectivity" has been lost, and the notification is provided by means of **DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE** (p. 161).

In terms of the required mechanisms, the scenario is very similar to the case of maintaining ownership. In both cases, the reader needs to know whether a writer is still "managing the current value of an instance" even though it is not continually writing it and this knowledge requires the writer to keep its liveliness plus some means to know which instances the writer is currently "managing" (i.e. the registered instances).

9.123.4.3 Semantic Difference between `unregister_instance` and `dispose`

FooDataWriter::dispose (p. 1672) is semantically different from **FooDataWriter::unregister_instance** (p. 1663). **FooDataWriter::dispose** (p. 1672) indicates that the data instance no longer exists (e.g. a track that has disappeared, a simulation entity that has been destroyed, a record entry that has been deleted, etc.) whereas **FooDataWriter::unregister_instance** (p. 1663) indicates that the writer is no longer taking responsibility for updating the value of the instance.

Deleting a **DDSDataWriter** (p. 1305) is equivalent to unregistering all the instances it was writing, but is *not* the same as "disposing" all the instances.

For a **DDSTopic** (p. 1601) with **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 415), if the current owner of an instance *disposes* it, the readers accessing the instance will see the `instance_state` as being "DISPOSED" and not see the values being written by the weaker writer (even after the stronger one has disposed the instance). This is because the **DDSDataWriter** (p. 1305) that owns the instance is saying that the instance no longer exists (e.g. the master of the database is saying that a record has been deleted) and thus the readers should see it as such.

For a **DDSTopic** (p. 1601) with **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 415), if the current owner of an instance *unregisters* it, then it will relinquish ownership of the instance and thus the readers may see the value updated by another writer (which will then become the owner). This is because the owner said that it no longer will be providing values for the instance and thus another writer can take ownership and provide those values.

9.123.5 Member Data Documentation

9.123.5.1 kind

DDS_OwnershipQosPolicyKind DDS_OwnershipQosPolicy::kind

The kind of ownership.

[default] **DDS_SHARED_OWNERSHIP_QOS** (p. 415)

9.124 DDS_OwnershipStrengthQosPolicy Struct Reference

Specifies the value of the strength used to arbitrate among multiple **DDSDataWriter** (p. 1305) objects that attempt to modify the same instance of a data type (identified by **DDSTopic** (p. 1601) + key).

Public Attributes

- **DDS_Long** value

The strength value used to arbitrate among multiple writers.

9.124.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **DDSDataWriter** (p. 1305) objects that attempt to modify the same instance of a data type (identified by **DDSTopic** (p. 1601) + key).

This policy only applies if the **OWNERSHIP** (p. 414) policy is of kind **DDS_EXCLUSIVE_OWNERSHIP_QOS** (p. 415).

Entity:

DDSDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **YES** (p. ??)

The value of the **OWNERSHIP_STRENGTH** (p. 415) is used to determine the ownership of a data instance (identified by the key). The arbitration is performed by the **DDSDataReader** (p. 1272).

```
struct DDS_TransportInfoSeq DDS_ParticipantBuiltinTopicData::transport_info
```

<<**extension**>> (p. 236) A sequence of **DDS_TransportInfo_t** (p. 1130) containing information about each of the installed transports of the discovered participant.

This parameter contains a sequence of **DDS_TransportInfo_t** (p. 1130) containing the `class_id` and `message_size_max` for all installed transports of the discovered participant. The maximum number of **DDS_TransportInfo_t** (p. 1130) that will be stored in this sequence is controlled by the Domain Participant's resource limit **DDS_DomainParticipantResourceLimitsQosPolicy::transport_info_list_max_length** (p. 758).

9.125.2.12 reachability_lease_duration

```
struct DDS_Duration_t DDS_ParticipantBuiltinTopicData::reachability_lease_duration
```

<<**extension**>> (p. 236) Locator reachability lease duration.

This parameter contains the value of the participant properties: **dds.domain_participant.locator_reachability_lease_duration.sec** and **dds.domain_participant.locator_reachability_lease_duration.nanosec** used to configured the locator reachability lease duration.

9.125.2.13 partition

```
struct DDS_PartitionQosPolicy DDS_ParticipantBuiltinTopicData::partition
```

<<**extension**>> (p. 236) PartitionQosPolicy of the participant.

9.125.2.14 trust_protection_info

```
DDS_ParticipantTrustProtectionInfo DDS_ParticipantBuiltinTopicData::trust_protection_info
```

<<**extension**>> (p. 236) Trust Plugins protection information associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata.

`trust_protection_info` contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two DomainParticipants will not match if their `trust_protection_info` is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

9.125.2.15 trust_algorithm_info

DDS_ParticipantTrustAlgorithmInfo `DDS_ParticipantBuiltinTopicData::trust_algorithm_info`

<<**extension**>> (p. 236) Trust Plugins algorithms associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata. `trust_algorithm_info` contains information about what algorithms the loaded Trust Plugins are running. Two DomainParticipants will not match if their `trust_algorithm_info` are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

9.125.2.16 partial_configuration

DDS_Boolean `DDS_ParticipantBuiltinTopicData::partial_configuration`

<<**extension**>> (p. 236) Indicates whether a **DDS_ParticipantBuiltinTopicData** (p. 966) only contains bootstrapping information.

If this is **DDS_BOOLEAN_TRUE** (p. 316), the **DDS_ParticipantBuiltinTopicData** (p. 966) only contains bootstrapping information. If it is **DDS_BOOLEAN_FALSE** (p. 316), it contains both bootstrapping and configuration information. The following fields are valid when this is set to **DDS_BOOLEAN_TRUE** (p. 316):

- **DDS_ParticipantBuiltinTopicData::key** (p. 967)
- **DDS_ParticipantBuiltinTopicData::property** (p. 967) (only `dds.domain_participant.domain_tag` is valid if set)
- **DDS_ParticipantBuiltinTopicData::rtps_protocol_version** (p. 967)
- **DDS_ParticipantBuiltinTopicData::rtps_vendor_id** (p. 967)
- **DDS_ParticipantBuiltinTopicData::product_version** (p. 968)
- **DDS_ParticipantBuiltinTopicData::domain_id** (p. 968)
- **DDS_ParticipantBuiltinTopicData::transport_info** (p. 968)
- **DDS_ParticipantBuiltinTopicData::partition** (p. 969)
- **DDS_ParticipantBuiltinTopicData::trust_protection_info** (p. 969)
- **DDS_ParticipantBuiltinTopicData::trust_algorithm_info** (p. 969)

All other fields are invalid.

This field will only be set to **DDS_BOOLEAN_TRUE** (p. 316) if a participant using **DDS_DISCOVERYCONFIG_BUILTIN_SPDP2** (p. 393) receives a bootstrap message and **DDS_DiscoveryConfigQosPolicy::ignore_default_domain_announcements** (p. 718) is set to **DDS_BOOLEAN_FALSE** (p. 316) (non-default).

If a participant is using **DDS_DISCOVERYCONFIG_BUILTIN_SPDP** (p. 392), this field will always be set to **DDS_BOOLEAN_FALSE** (p. 316).

9.132 DDS_PartitionQosPolicy Struct Reference

Set of strings that introduces logical partitions in **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) entities.

Public Attributes

- struct **DDS_StringSeq** **name**
A list of partition names.

9.132.1 Detailed Description

Set of strings that introduces logical partitions in **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) entities.

This QoS policy is used to set string identifiers that are used for partitioning entities that would otherwise be connected to and exchange data with each other:

- A **DDSDataWriter** (p. 1305) within a **DDSPublisher** (p. 1534) only communicates with a **DDSDataReader** (p. 1272) in a **DDSSubscriber** (p. 1576) if (in addition to matching the **DDSTopic** (p. 1601) and having compatible QoS) the **DDSPublisher** (p. 1534) and **DDSSubscriber** (p. 1576) have a common partition name string.
- **DDSDomainParticipant** (p. 1335) entities (with the same domain ID and domain tag) are visible to each other only if they have at least one partition name string in common.

Entity:

DDSPublisher (p. 1534), **DDSSubscriber** (p. 1576), **DDSDomainParticipant** (p. 1335)

Properties:

RxO (p. ??) = NO
Changeable (p. ??) = YES (p. ??)

9.132.2 Usage

The Partition QoS policy provides another way to control which entities will match-and thus communicate with-which other entities. It can be used to prevent entities that would have otherwise matched from talking to each other. Much in the same way that only applications within the same DDS domain will communicate with each other, only entities that belong to the same partition can talk to each other.

The Partition QoS policy allows you to add one or more strings, "partitions", to an entity:

- A DataWriter and DataReader for the same topic are only considered matched if their Publishers and Subscribers have partitions in common (intersecting partitions).
- DomainParticipants (with the same domain ID and domain tag) are visible to each other only if they have at least one partition in common.

Since the set of partitions for an entity can be dynamically changed, the Partition QoS policy is useful for creating temporary separation groups among entities that would otherwise be connected to and exchange data with each other.

DomainParticipant partitions and Publisher/Subscriber partitions are independent of each other. You can use both features independently or in combination to provide the right level of isolation.

Failure to match partitions is not considered an incompatible QoS and does not trigger any listeners or conditions. A change in this policy *can* potentially modify the "match" of existing DataReader and DataWriter entities. It may establish new "matches" that did not exist before, or break existing matches.

Partition strings are usually directly matched via string comparisons. However, partition strings can also contain wildcard symbols so that partitions can be matched via pattern matching. As long as the partitions or wildcard patterns of an entity intersect with the partitions or wildcard patterns of otherwise matching entities, the entities match; otherwise they do not.

These partition name patterns are regular expressions as defined by the POSIX fnmatch API (1003.2-1992 section B.6). A **DDSDomainParticipant** (p. 1335), **DDSPublisher** (p. 1534), or **DDSSubscriber** (p. 1576) entity may include regular expressions in partition names, but no two names that both contain wildcards will ever be considered to match. This means that although regular expressions may be used on the entities, RTI Connext will not try to match two regular expressions.

Each entity must belong to at least one logical partition. A regular expression is not considered to be a logical partition. If an entity has not specified a logical partition, it is assumed to be in the default partition. The default partition is defined to be an empty string (""). Put another way:

- An empty sequence of strings in this QoS policy is considered equivalent to a sequence containing only a single string, the empty string.
- A string sequence that contains only regular expressions and no literal strings, it is treated as if it had an additional element, the empty string.

Partitions are different from creating **DDSEntity** (p. 1446) objects in different domains in several ways.

- First, entities belonging to different domains are completely isolated from each other; there is no traffic, meta-traffic or any other way for an application or RTI Connext itself to see entities in a domain it does not belong to.
- Second, a **DDSEntity** (p. 1446) can only belong to one domain whereas a **DDSDataInstance** (p. 1446) can be in multiple partitions.
- Finally, as far as RTI Connext is concerned, each unique data instance is identified by the tuple (**DomainID**, **domain tag**, **DDSTopic** (p. 1601), **key**). Therefore two **DDSEntity** (p. 1446) objects in different domains cannot refer to the same data instance. On the other hand, the same data instance can be made available (published) or requested (subscribed) on one or more partitions.

For more information, see the "PARTITION QoSPolicy" section of the `Core Libraries User's Manual`.

9.132.3 Member Data Documentation

9.132.3.1 name

```
struct DDS_StringSeq DDS_PartitionQosPolicy::name
```

A list of partition names.

Several restrictions apply to the partition names in this sequence. A violation of one of the following rules will result in a **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336) when setting a **DDSPublisher** (p. 1534)'s or **DDSSubscriber** (p. 1576)'s QoS.

- A partition name string cannot be NULL, nor can it contain the reserved comma character (',').
- The maximum number of partition name strings allowable in a **DDS_PartitionQosPolicy** (p. 976) is specified on a domain basis in **DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions** (p. 753). The length of this sequence may not be greater than that value.
- The maximum cumulative length of all partition name strings in a **DDS_PartitionQosPolicy** (p. 976) is specified on a domain basis in **DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_characters** (p. 753).

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 546). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

[default] Empty sequence (zero-length sequence). Since no logical partition is specified, RTI Connexx will assume the entity to be in default partition (empty string partition "").

[range] List of partition name with above restrictions

9.133 DDS_PersistentStorageSettings Struct Reference

Configures durable writer history and durable reader state.

Public Attributes

- **DDS_Boolean enable**
*Enables durable writer history in a **DDSDataWriter** (p. 1305) and durable reader state in a **DDSDataReader** (p. 1272).*
- char * **file_name**
The file name where the durable writer history or durable reader state will be stored.
- char * **trace_file_name**
The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
- **DDS_PersistentJournalKind journal_kind**
Sets the journal mode of the persistent storage.
- **DDS_PersistentSynchronizationKind synchronization_kind**
Sets the level of synchronization with the physical disk.
- **DDS_Boolean vacuum**
Sets the auto-vacuum status of the storage.
- **DDS_Boolean restore**
Indicates if the persisted writer history or reader state must be restored.
- struct **DDS_AllocationSettings_t writer_instance_cache_allocation**
Configures the resource limits associated with the instance durable writer history cache.
- struct **DDS_AllocationSettings_t writer_sample_cache_allocation**
Configures the resource limits associated with the sample durable writer history cache.
- **DDS_Boolean writer_memory_state**
Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.
- **DDS_UnsignedLong reader_checkpoint_frequency**
Controls how often the reader state is stored into the database.

9.133.1 Detailed Description

Configures durable writer history and durable reader state.

In a **DDSDataWriter** (p. 1305), this structure configures durable writer history. This feature allows a DataWriter to persist its historical cache, so that it can survive shutdowns, crashes, and restarts. When an application restarts, each DataWriter that has been configured to have durable writer history automatically loads all of the data in this cache from disk and can carry on sending data as if it had never stopped executing.

In a **DDSDataReader** (p. 1272), this structure configures durable reader state. This feature allows a DataReader to persist its state and remember which data it has already received. When an application restarts, each DataReader that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the DataReader before the restart will be suppressed so that it is not even sent over the network.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

QoS:

DDS_DurabilityQosPolicy (p. 761)

9.133.2 Member Data Documentation

9.133.2.1 enable

DDS_Boolean DDS_PersistentStorageSettings::enable

Enables durable writer history in a **DDSDDataWriter** (p. 1305) and durable reader state in a **DDSDDataReader** (p. 1272).

When this field is set to **DDS_BOOLEAN_TRUE** (p.316), the persistent storage configuration using this structure will take precedence over the configuration using the deprecated **dds.data_writer.history.odbc_plugin.builtin.*** and **dds.data_reader.state.*** properties.

[default] **DDS_BOOLEAN_FALSE** (p.316)

9.133.2.2 file_name

char* DDS_PersistentStorageSettings::file_name

The file name where the durable writer history or durable reader state will be stored.

Setting this field to a value other than NULL is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **DDS_PersistentStorageSettings::restore** (p.981) is set to **DDS_BOOLEAN_TRUE** (p.316), the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **DDS_DataReaderProtocolQosPolicy::virtual_guid** (p.625) and **DDS_DataWriterProtocolQosPolicy::virtual_guid** (p.668) will be set by RTI Connexx based on the file content. If you change these fields, the value will be ignored.

RTI Connexx uses SQLite to store the durable writer history and durable reader state.

[default] NULL

9.133.2.3 trace_file_name

char* DDS_PersistentStorageSettings::trace_file_name

The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Setting this field to a value other than NULL will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

[default] NULL

9.133.2.4 journal_kind

DDS_PersistentJournalKind DDS_PersistentStorageSettings::journal_kind

Sets the journal mode of the persistent storage.

[default] **DDS_WAL_PERSISTENT_JOURNAL** (p. 398)

9.133.2.5 synchronization_kind

DDS_PersistentSynchronizationKind DDS_PersistentStorageSettings::synchronization_kind

Sets the level of synchronization with the physical disk.

[default] **DDS_NORMAL_PERSISTENT_SYNCHRONIZATION** (p. 399)

9.133.2.6 vacuum

DDS_Boolean DDS_PersistentStorageSettings::vacuum

Sets the auto-vacuum status of the storage.

When auto-vacuum is **DDS_BOOLEAN_TRUE** (p. 316), the storage files will be compacted automatically with every transaction.

When auto-vacuum is **DDS_BOOLEAN_FALSE** (p. 316), after data is deleted from the storage files, the files remain the same size.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.133.2.7 restore

DDS_Boolean DDS_PersistentStorageSettings::restore

Indicates if the persisted writer history or reader state must be restored.

For a **DDSDataWriter** (p. 1305), this field indicates whether or not the persisted writer history must be restored once the DataWriter is restarted.

For a **DDSDataReader** (p. 1272), this field indicates whether or not the persisted reader state must be restored once the DataReader is restarted.

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.133.2.8 writer_instance_cache_allocation

```
struct DDS_AllocationSettings_t DDS_PersistentStorageSettings::writer_instance_cache_allocation
```

Configures the resource limits associated with the instance durable writer history cache.

This field only applies to **DDSDDataWriter** (p. 1305) entities.

To minimize the number of accesses to the persisted storage, RTI Connexx uses an instance cache.

Do not confuse this limit with the initial and maximum number of instances that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041) and **DDS_ResourceLimitsQosPolicy::initial_instances** (p. 1042).

If **DDS_PersistentStorageSettings::writer_memory_state** (p. 982) is set to **DDS_BOOLEAN_TRUE** (p. 316), then the value of **DDS_AllocationSettings_t::max_count** (p. 583) is set to **DDS_LENGTH_UNLIMITED** (p. 437), overwriting any value set by the user.

DDS_AllocationSettings_t::incremental_count (p. 583) is ignored.

[range] **DDS_AllocationSettings_t::max_count** (p. 583) in interval [1, INT_MAX], **DDS_LENGTH_AUTO** (p. 433), or **DDS_LENGTH_UNLIMITED** (p. 437). **DDS_AllocationSettings_t::initial_count** (p. 583) in interval [1, INT_MAX], or **DDS_LENGTH_AUTO** (p. 433).

DDS_LENGTH_AUTO (p. 433) means that the value will be set to the equivalent value of **DDS_ResourceLimitsQosPolicy** (p. 1038).

[default] **DDS_AllocationSettings_t::max_count** (p. 583) = **DDS_LENGTH_AUTO** (p. 433) (= **DDS_ResourceLimitsQosPolicy::max_instances** (p. 1041)) and **DDS_AllocationSettings_t::initial_count** (p. 583) = **DDS_LENGTH_AUTO** (p. 433) (= **DDS_ResourceLimitsQosPolicy::initial_instances** (p. 1042)).

9.133.2.9 writer_sample_cache_allocation

```
struct DDS_AllocationSettings_t DDS_PersistentStorageSettings::writer_sample_cache_allocation
```

Configures the resource limits associated with the sample durable writer history cache.

This field only applies to **DDSDDataWriter** (p. 1305) entities.

To minimize the number of accesses to the persisted storage, RTI Connexx uses a sample cache.

Do not confuse this limit with the initial and maximum number of samples that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **DDS_ResourceLimitsQosPolicy::max_samples** (p. 1041) and **DDS_ResourceLimitsQosPolicy::initial_samples** (p. 1041).

DDS_AllocationSettings_t::incremental_count (p. 583) is ignored.

[range] **DDS_AllocationSettings_t::max_count** (p. 583) in interval [1, INT_MAX], **DDS_LENGTH_AUTO** (p. 433), or **DDS_LENGTH_UNLIMITED** (p. 437). **DDS_AllocationSettings_t::initial_count** (p. 583) in interval [1, INT_MAX], or **DDS_LENGTH_AUTO** (p. 433).

DDS_LENGTH_AUTO (p. 433) means that the value will be set to the equivalent value of **DDS_ResourceLimitsQosPolicy** (p. 1038).

[default] **DDS_AllocationSettings_t::max_count** (p. 583) = 32 and **DDS_AllocationSettings_t::initial_count** (p. 583) = 32.

9.133.2.10 writer_memory_state

DDS_Boolean DDS_PersistentStorageSettings::writer_memory_state

Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.

This field only applies to **DDSDataWriter** (p. 1305) entities.

If this field is set to **DDS_BOOLEAN_TRUE** (p. 316), then **DDS_AllocationSettings_t::max_count** (p. 583) in **DDS_PersistentStorageSettings::writer_instance_cache_allocation** (p. 981) is set to **DDS_LENGTH_UNLIMITED** (p. 437), overwriting any value set by the user.

In addition, the durable writer history will keep a fixed state overhead per sample in memory. This mode provides the best durable writer history performance. However, the restore operation will be slower, and the maximum number of samples that the durable writer history can manage is limited by the available physical memory.

If this field is set to **DDS_BOOLEAN_FALSE** (p. 316), all the state will be kept in the underlying database. In this mode, the maximum number of samples in the durable writer history is not limited by the physical memory available.

This field is always set to **DDS_BOOLEAN_FALSE** (p. 316) when the DataWriter is configured with **DDS_ReliabilityQosPolicy::acknowledgment_kind** (p. 1029) set to **DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_MODE** (p. 435) or **DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE** (p. 436), or **DDS_AvailabilityQosPolicy::enable_required_subscriptions** (p. 593) is set to **DDS_BOOLEAN_TRUE** (p. 316).

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.133.2.11 reader_checkpoint_frequency

DDS_UnsignedLong DDS_PersistentStorageSettings::reader_checkpoint_frequency

Controls how often the reader state is stored into the database.

This field only applies to **DDSDataReader** (p. 1272) entities.

A value of N means store the state once every N received and processed samples.

The circumstances under which a data sample is considered "processed by the application" depends on the DataReader configuration.

For additional information on when a sample is considered "processed by the application" see `Durable Reader State`, in the Core Libraries User's Manual.

A high value will provide better performance. However, if the DataReader is restarted it may receive some duplicate samples.

[range] [1, 1000000] [default] 1

9.134 DDS_PresentationQosPolicy Struct Reference

Specifies how the samples representing changes to data instances are presented to a subscribing application.

Public Attributes

- **DDS_PresentationQosPolicyAccessScopeKind access_scope**
Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.
- **DDS_Boolean coherent_access**
Specifies support for coherent access. Controls whether coherent access is supported within the scope `access_scope`.
- **DDS_Boolean ordered_access**
Specifies support for ordered access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.
- **DDS_Boolean drop_incomplete_coherent_set**
*<<extension>> (p. 236) Indicates whether or not a **DDSDataReader** (p. 1272) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the `SAMPLE_LOST` Status.*

9.134.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

This QoS policy controls the extent to which changes to data instances can be made dependent on each other and also the kind of dependencies that can be propagated and maintained by RTI Connext. Specifically, this policy affects the application's ability to:

- specify and receive coherent changes to instances
- specify the relative order in which changes are presented

Entity:

DDSPublisher (p. 1534), **DDSSubscriber** (p. 1576)

Status:

DDS_OFFERED_INCOMPATIBLE_QOS_STATUS (p. 343), **DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS** (p. 343)

Properties:

RxO (p. ??) = YES

Changeable (p. ??) = UNTIL ENABLE (p. ??)

9.134.2 Usage

A **DDSDataReader** (p. 1272) will usually receive data in the order that it was sent by a **DDSDataWriter** (p. 1305), and the data is presented to the **DDSDataReader** (p. 1272) as soon as the application receives the next expected value. However, sometimes you may want a set of data for the same DataWriter or different DataWriters to be presented to the DataReader(s) only after *all* of the elements of the set have been received, but not before. Or you may want the data to be presented in a different order than that in which it was sent. Specifically for keyed data, you may want the middleware to present the data in keyed – or *instance* – order, such that samples pertaining to the same instance are presented together.

The Presentation QoS policy is a request-offered QoS policy that allows you to specify different *scopes* of presentation. It also controls whether or not a set of changes within the scope is delivered at the same time or can be delivered as soon as each element is received.

- `coherent_access` controls whether RTI Connexx will preserve the groupings of changes made by a publishing application by means of the operations **DDSPublisher::begin_coherent_changes** (p. 1548) and **DDSPublisher::end_coherent_changes** (p. 1549).
- `ordered_access` controls whether RTI Connexx will preserve the order of changes.
- `access_scope` controls the granularity of the other settings. See below:

If `coherent_access` is set, then the `access_scope` set on the **DDSSubscriber** (p. 1576) controls the maximum extent of coherent changes. The behavior is as follows:

- If `access_scope` is set to **DDS_INSTANCE_PRESENTATION_QOS** (p. 418) (the default), the behavior is the same as **DDS_TOPIC_PRESENTATION_QOS** (p. 418).
- If `access_scope` is set to **DDS_TOPIC_PRESENTATION_QOS** (p. 418), then coherent changes (indicated by their enclosure within calls to **DDSPublisher::begin_coherent_changes** (p. 1548) and **DDSPublisher::end_coherent_changes** (p. 1549)) will be made available as a unit to each remote **DDSDataReader** (p. 1272) independently. That is, changes made to instances within each individual **DDSDataWriter** (p. 1305) will be presented as a unit. They will not be grouped with changes made to instances belonging to a different **DDSDataWriter** (p. 1305).
- If `access_scope` is set to **DDS_GROUP_PRESENTATION_QOS** (p. 418), then coherent changes made to instances through a set of **DDSDataWriter** (p. 1305) entities attached to a common **DDSPublisher** (p. 1534) will be made available as a unit to the **DDSDataReader** (p. 1272) entities within a **DDSSubscriber** (p. 1576).

If `ordered_access` is set, then the `access_scope` set on the **DDSSubscriber** (p. 1576) controls the maximum extent to which order will be preserved by RTI Connexx.

- If `access_scope` is set to **DDS_INSTANCE_PRESENTATION_QOS** (p. 418) (the lowest level), then the relative order of DDS samples sent by a **DDSDataWriter** (p. 1305) is only preserved on a per-instance basis. If two DDS samples refer to the same instance (identified by Topic and a particular value for the key), then the order in which they are stored in the **DDSDataReader** (p. 1272) queue is consistent with the order in which the changes occurred. However, if the two DDS samples belong to different instances, the order in which they are presented may or may not match the order in which the changes occurred. This is the case even if it is the same application thread making the changes using the same **DDSDataWriter** (p. 1305).

- If `access_scope` is set to **DDS_TOPIC_PRESENTATION_QOS** (p. 418), changes (creations, deletions, modifications) made by a single **DDSDataWriter** (p. 1305) to one or more instances are presented to a **DDSDataReader** (p. 1272) in the same order in which they occur. Changes made to instances through different **DDSDataWriter** (p. 1305) entities are not required to be presented in the order in which they occur. This is the case even if the changes are made by a single application thread using **DDSDataWriter** (p. 1305) objects attached to the same **DDSPublisher** (p. 1534).
- Finally, if `access_scope` is set to **DDS_GROUP_PRESENTATION_QOS** (p. 418), changes made to instances via **DDSDataWriter** (p. 1305) entities attached to the same **DDSPublisher** (p. 1534) object are presented to the **DDSDataReader** (p. 1272) entities within a **DDSSubscriber** (p. 1576) in the same order in which they occur. For this to happen, the application must take the samples using the Subscriber's **DDSSubscriber::begin_access** (p. 1589) and **DDSSubscriber::end_access** (p. 1590) operations (see the "Ordered Access" section in the "PRESENTATION QosPolicy" section of the [Core Libraries User's Manual](http://manual.rti-connextdds-corelibraries-usersmanual.pdf)).

If `access_scope` is set to **DDS_HIGHEST_OFFERED_PRESENTATION_QOS** (p. 418) on the **DDSSubscriber** (p. 1576), then the **DDSSubscriber** (p. 1576) will use the `access_scope` offered by the remote **DDSPublisher** (p. 1534).

Note that this QoS policy controls the scope at which related changes are made available to the subscriber. This means the subscriber **can** access the changes in a coherent manner and in the proper order; however, it does not necessarily imply that the **DDSSubscriber** (p. 1576) **will** indeed access the changes in the correct order. For that to occur, the application at the subscriber end must use the proper logic in reading the **DDSDataReader** (p. 1272) objects.

For **DDS_GROUP_PRESENTATION_QOS** (p. 418) the subscribing application must use the APIs **DDSSubscriber::begin_access** (p. 1589), **DDSSubscriber::end_access** (p. 1590) and **DDSSubscriber::get_datareaders** (p. 1590) to access the changes in the proper order. If you do not use these operations, the data may not be ordered across DataWriters that belong to the same **DDSPublisher** (p. 1534).

The field **DDS_SampleInfo::coherent_set_info** (p. 1078) is set when a sample is part of a coherent set. This field provides information to identify the coherent set that a sample is part of. In addition, **DDS_CoherentSetInfo_t::incomplete_coherent_set** (p. 608) indicates if a sample is part of an incomplete coherent set (one for which not all samples have been received). Coherent sets for which some of the samples are filtered out by content or time on the **DDSDataWriter** (p. 1305) are considered incomplete.

By default, the samples that are received from an incomplete coherent set are dropped by the DataReader(s) and they are not provided to the application. Such samples are reported as lost in the `SAMPLE_LOST` Status. By setting **DDS_PresentationQosPolicy::drop_incomplete_coherent_set** (p. 987) to **DDS_BOOLEAN_FALSE** (p. 316), you can change this behavior and, in this case, samples from incomplete coherent sets will be provided to the application. These samples have **DDS_CoherentSetInfo_t::incomplete_coherent_set** (p. 608) set to **DDS_BOOLEAN_TRUE** (p. 316).

9.134.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered access_scope* \geq *requested access_scope* evaluates to 'TRUE' or requested `access_scope` is **DDS_HIGHEST_OFFERED_PRESENTATION_QOS** (p. 418). For the purposes of this inequality, the values of `access_scope` are considered ordered such that **DDS_INSTANCE_PRESENTATION_QOS** (p. 418) $<$ **DDS_TOPIC_PRESENTATION_QOS** (p. 418) $<$ **DDS_GROUP_PRESENTATION_QOS** (p. 418).

- requested `coherent_access` is **DDS_BOOLEAN_FALSE** (p.316), or else both offered and requested `coherent_access` are **DDS_BOOLEAN_TRUE** (p.316).
- requested `ordered_access` is **DDS_BOOLEAN_FALSE** (p.316), or else both offered and requested `ordered_access` are **DDS_BOOLEAN_TRUE** (p.316).

9.134.4 Member Data Documentation

9.134.4.1 `access_scope`

DDS_PresentationQosPolicyAccessScopeKind `DDS_PresentationQosPolicy::access_scope`

Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

[default] **DDS_INSTANCE_PRESENTATION_QOS** (p. 418)

9.134.4.2 `coherent_access`

DDS_Boolean `DDS_PresentationQosPolicy::coherent_access`

Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_scope`.

That is, the ability to group a set of changes as a unit on the publishing end such that they are received as a unit at the subscribing end.

Note: To use this feature, the DataWriter must be configured for RELIABLE communication (see **DDS_RELIABLE_RELIABILITY_QOS** (p. 435)).

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.134.4.3 `ordered_access`

DDS_Boolean `DDS_PresentationQosPolicy::ordered_access`

Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.

That is, the ability of the subscriber to see changes in the same order as they occurred on the publishing end.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.134.4.4 drop_incomplete_coherent_set

DDS_Boolean DDS_PresentationQosPolicy::drop_incomplete_coherent_set

<<**extension**>> (p.236) Indicates whether or not a **DDSDataReader** (p.1272) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the **SAMPLE_LOST** Status.

Note that a coherent set will be considered incomplete if some of its samples are filtered by content or time on the DataWriter side.

By default, the samples that are received from an incomplete coherent set are dropped (and reported as lost) by the DataReader(s) and they are not provided to the application. By setting this parameter to **DDS_BOOLEAN_FALSE** (p.316), you can change this behavior.

Samples from an incomplete coherent set have **DDS_CoherentSetInfo_t::incomplete_coherent_set** (p.608) set to **DDS_BOOLEAN_TRUE** (p.316) in **DDS_SampleInfo::coherent_set_info** (p.1078).

[default] **DDS_BOOLEAN_TRUE** (p.316)

9.135 DDS_PrintFormatProperty Struct Reference

A collection of attributes used to configure how data samples will be formatted when converted to a string.

Public Attributes

- **DDS_PrintFormatKind kind**
The kind of format to be used when converting a data sample to a string.
- **DDS_Boolean pretty_print**
Choose whether to print a data sample in a more readable format or to eliminate all white space.
- **DDS_Boolean enum_as_int**
Choose whether to print enum values as integers or as strings.
- **DDS_Boolean include_root_elements**
Choose whether or not to include the root elements of the print format in the output string.

9.135.1 Detailed Description

A collection of attributes used to configure how data samples will be formatted when converted to a string.

Examples

HelloWorldPlugin.cxx.

9.135.2 Member Data Documentation

9.135.2.1 kind

```
DDS_PrintFormatKind DDS_PrintFormatProperty::kind
```

The kind of format to be used when converting a data sample to a string.

Data samples can be represented in a default, XML, or JSON format.

See also

DDS_PrintFormatKind (p. 64)

[default] **DDS_DEFAULT_PRINT_FORMAT** (p. 65)

9.135.2.2 pretty_print

```
DDS_Boolean DDS_PrintFormatProperty::pretty_print
```

Choose whether to print a data sample in a more readable format or to eliminate all white space.

A value of **DDS_BOOLEAN_TRUE** (p. 316) will add indentation and newlines to the string representation of the data sample making it more readable. For example:

```
<FooType>
  <myLong>5</myLong>
</FooType>
```

A value of **DDS_BOOLEAN_FALSE** (p. 316) will cause all white space in the string representation of the data sample to be eliminated. For example:

```
<FooType><myLong>5</myLong></FooType>
```

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.135.2.3 enum_as_int

```
DDS_Boolean DDS_PrintFormatProperty::enum_as_int
```

Choose whether to print enum values as integers or as strings.

A value of **DDS_BOOLEAN_TRUE** (p. 316) will cause enumeration literals to be printed using their integer value. For example:

```
<FooType>
  <myEnum>5</myEnum>
</FooType>
```

A value of **DDS_BOOLEAN_FALSE** (p. 316) will cause enumeration literals to be printed as strings using their member names. For example:

```
<FooType>
  <myEnum>RED</myEnum>
</FooType>
```

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.135.2.4 include_root_elements

```
DDS_Boolean DDS_PrintFormatProperty::include_root_elements
```

Choose whether or not to include the root elements of the print format in the output string.

This field only applies if the **DDS_PrintFormatProperty::kind** (p. 988) is **DDS_XML_PRINT_FORMAT** (p. 65) or **DDS_↵_JSON_PRINT_FORMAT** (p. 65)

If the value is **DDS_BOOLEAN_TRUE** (p. 316) and the kind is **DDS_XML_PRINT_FORMAT** (p. 65) then a top-level tag with the type's name in it will be included in the output. For example:

```
<FooType>
  <myLong>5</myLong>
</FooType>
```

If the value is **DDS_BOOLEAN_TRUE** (p. 316) and the kind is **DDS_JSON_PRINT_FORMAT** (p. 65) then top-level opening and closing braces will be included in the output. For example:

```
{
  "myLong":5
}
```

If the value is **DDS_BOOLEAN_FALSE** (p. 316) the elements described above will not be included in the output. For example:

```
<myLong>5</myLong>
"myLong":5
```

[default] **DDS_BOOLEAN_TRUE** (p. 316)

9.136 DDS_ProductVersion_t Struct Reference

<<*extension*>> (p. 236) Type used to represent the current version of RTI Connex.

Public Attributes

- **DDS_Char major**
Major product version.
- **DDS_Char minor**
Minor product version.
- **DDS_Char release**
Release letter for product version.
- **DDS_Char revision**
Revision number of product.

9.136.1 Detailed Description

<<*extension*>> (p. 236) Type used to represent the current version of RTI Connex.

9.136.2 Member Data Documentation

9.136.2.1 major

`DDS_Char DDS_ProductVersion_t::major`

Major product version.

9.136.2.2 minor

`DDS_Char DDS_ProductVersion_t::minor`

Minor product version.

9.136.2.3 release

`DDS_Char DDS_ProductVersion_t::release`

Release letter for product version.

9.136.2.4 revision

`DDS_Char DDS_ProductVersion_t::revision`

Revision number of product.

9.137 DDS_ProfileQosPolicy Struct Reference

Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

Public Attributes

- struct **DDS_StringSeq string_profile**
Sequence of strings containing a XML document to load.
- struct **DDS_StringSeq url_profile**
Sequence of **URL groups** (p. 198) containing a set of XML documents to load.
- **DDS_Boolean ignore_user_profile**
Ignores the file `USER_QOS_PROFILES.xml` in the current working directory.
- **DDS_Boolean ignore_environment_profile**
Ignores the value of the **NDDS_QOS_PROFILES environment variable** (p. 198).
- **DDS_Boolean ignore_resource_profile**
Ignores the file `NDDS_QOS_PROFILES.xml`.

9.137.1 Detailed Description

Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

All QoS values for Entities can be configured in QoS profiles defined in XML documents. XML documents can be passed to RTI Connex in string form or, more likely, through files found on a file system.

There are also default locations where DomainParticipants will look for files to load QoS profiles. These include the current working directory from where an application is started, a file in the distribution directory for RTI Connex, and the locations specified by an environment variable.

You may disable any or all of these default locations using the Profile QoS policy.

Entity:

DDSDomainParticipantFactory (p. 1409)

Properties:

RxO (p. ??) = NO

Changeable (p. ??) = **Changeable** (p. ??)

9.137.2 Member Data Documentation

9.137.2.1 string_profile

```
struct DDS_StringSeq DDS_ProfileQosPolicy::string_profile
```

Sequence of strings containing a XML document to load.

The concatenation of the strings in this sequence must be a valid XML document according to the XML QoS profile schema.

[default] Empty sequence (zero-length).

9.137.2.2 url_profile

```
struct DDS_StringSeq DDS_ProfileQosPolicy::url_profile
```

Sequence of **URL groups** (p. 198) containing a set of XML documents to load.

Only one of the elements of each group will be loaded by RTI Connex, starting from the left.

[default] Empty sequence (zero-length).

9.137.2.3 ignore_user_profile

```
DDS_Boolean DDS_ProfileQosPolicy::ignore_user_profile
```

Ignores the file USER_QOS_PROFILES.xml in the current working directory.

When this field is set to **DDS_BOOLEAN_TRUE** (p.316), the QoS profiles contained in the file USER_QOS_↵
PROFILES.xml in the current working directory will be ignored.

[default] **DDS_BOOLEAN_FALSE** (p.316)

9.137.2.4 ignore_environment_profile

```
DDS_Boolean DDS_ProfileQosPolicy::ignore_environment_profile
```

Ignores the value of the **NDDS_QOS_PROFILES environment variable** (p. 198).

When this field is set to **DDS_BOOLEAN_TRUE** (p. 316), the value of the environment variable NDDS_QOS_PROFILES will be ignored.

[default] **DDS_BOOLEAN_FALSE** (p. 316)

9.137.2.5 ignore_resource_profile

```
DDS_Boolean DDS_ProfileQosPolicy::ignore_resource_profile
```

Ignores the file NDDS_QOS_PROFILES.xml.

When this field is set to **DDS_BOOLEAN_TRUE** (p.316), the QoS profiles contained in the file NDDS_QOS_↵
PROFILES.xml in \$NDDSHOME/resource/xml will be ignored.

[default] **DDS_BOOLEAN_FALSE** (p.316)

9.138 DDS_Property_t Struct Reference

Properties are name/value pairs objects.

Public Attributes

- `char * name`
Property name.
- `char * value`
Property value.
- **DDS_Boolean propagate**
Indicates if the property must be propagated on discovery.

9.138.1 Detailed Description

Properties are name/value pairs objects.

9.138.2 Member Data Documentation

9.138.2.1 name

```
char* DDS_Property_t::name
```

Property name.

It must be a NULL-terminated string allocated with **DDS_String_alloc** (p. 547) or **DDS_String_dup** (p. 547).

9.138.2.2 value

```
char* DDS_Property_t::value
```

Property value.

It must be a NULL-terminated string allocated with **DDS_String_alloc** (p. 547) or **DDS_String_dup** (p. 547).

9.138.2.3 propagate

```
DDS_Boolean DDS_Property_t::propagate
```

Indicates if the property must be propagated on discovery.

9.139 DDS_PropertyQosPolicy Struct Reference

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Public Attributes

- struct **DDS_PropertySeq** value
Sequence of properties.

9.139.1 Detailed Description

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

DDSDomainParticipant (p. 1335) **DDSDataReader** (p. 1272) **DDSDataWriter** (p. 1305)

Properties:

RxO (p. ??) = N/A;
Changeable (p. ??) = YES (p. ??)

See also

DDSDomainParticipant::get_builtin_subscriber (p. 1376)

9.139.2 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **DDSDataReader** (p. 1272), **DDSDataWriter** (p. 1305), or **DDSDomainParticipant** (p. 1335). This is similar to the **DDS_UserDataQosPolicy** (p. 1221), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the [Property Reference Guide](#).

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 192)
- Durable Reader State, see **Configuring Durable Reader State** (p. 194)
- Builtin Transport Plugins, see **UDIPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 268), **UDIPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 284), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. ??)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 173)
- **Clock Selection** (p. 38)

In addition, you may add your own name/value pairs to the Property QoS policy of an Entity. Via this QoS policy, you can direct RTI Connex to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **DDS_UserDataQosPolicy** (p. 1221) or **DDS_GroupDataQosPolicy** (p. 903)).

9.139.2.1 Reasons for Using the PropertyQoSPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connexx capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 419) page.

9.139.3 Member Data Documentation

9.139.3.1 value

9.144 DDS_PublicationMatchedStatus Struct Reference

DDS_PUBLICATION_MATCHED_STATUS (p. 346)

Public Attributes

- **DDS_Long total_count**
*The total cumulative number of times that this **DDSDDataWriter** (p. 1305) discovered a "match" with a **DDSDDataReader** (p. 1272).*
- **DDS_Long total_count_change**
The changes in total_count since the last time the listener was called or the status was read.
- **DDS_Long current_count**
*The current number of DataReaders with which this **DDSDDataWriter** (p. 1305) is matched.*
- **DDS_Long current_count_peak**
*<<extension>> (p. 236) Greatest number of DataReaders that matched this **DDSDDataWriter** (p. 1305) simultaneously.*
- **DDS_Long current_count_change**
The change in current_count since the last time the listener was called or the status was read.
- **DDS_InstanceHandle_t last_subscription_handle**
*This InstanceHandle can be used to look up which remote **DDSDDataReader** (p. 1272) was the last to cause this Data↔Writer's status to change, using **DDSDDataWriter::get_matched_subscription_data** (p. 1316).*

9.144.1 Detailed Description

DDS_PUBLICATION_MATCHED_STATUS (p. 346)

A "match" happens when the **DDSDDataWriter** (p. 1305) finds a **DDSDDataReader** (p. 1272) with the same **DDSTopic** (p. 1601), same or compatible data type, and requested QoS that is compatible with that offered by the **DDSDDataWriter** (p. 1305). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDSDDataWriter** (p. 1305) will become "unmatched" from a remote **DDSDDataReader** (p. 1272) when that **DDSDDataReader** (p. 1272) goes away for any of the following reasons:

- The matched **DDSDDataReader** (p. 1272)'s **DDSDomainParticipant** (p. 1335) has lost liveliness.
- This DataWriter or the matched DataReader has changed QoS such that the entities are now incompatible.
- The matched DataReader has been deleted.

This status may reflect changes from multiple match or unmatched events, and the **DDS_PublicationMatchedStatus**↔**::current_count_change** (p. 1008) can be used to determine the number of changes since the listener was called back or the status was checked.

9.144.2 Member Data Documentation

9.144.2.1 total_count

DDS_Long DDS_PublicationMatchedStatus::total_count

The total cumulative number of times that this **DDSDDataWriter** (p. 1305) discovered a "match" with a **DDSDDataReader** (p. 1272).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **DDS_PublicationMatchedStatus** (p. 1007).

9.144.2.2 total_count_change

DDS_Long DDS_PublicationMatchedStatus::total_count_change

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times this DataWriter ever matched with a DataReader).

9.144.2.3 current_count

DDS_Long DDS_PublicationMatchedStatus::current_count

The current number of DataReaders with which this **DDSDDataWriter** (p. 1305) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **DDS_PublicationMatchedStatus** (p. 1007).

9.144.2.4 current_count_peak

DDS_Long DDS_PublicationMatchedStatus::current_count_peak

<<**extension**>> (p. 236) Greatest number of DataReaders that matched this **DDSDDataWriter** (p. 1305) simultaneously.

That is, there was no moment in time when more than this many DataReaders matched this DataWriter. (As a result, total_count can be higher than current_count_peak.)

9.144.2.5 current_count_change

DDS_Long DDS_PublicationMatchedStatus::current_count_change

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataReaders have become unmatched for one or more of the reasons described in **DDS_PublicationMatchedStatus** (p. 1007).

9.144.2.6 last_subscription_handle

DDS_InstanceHandle_t DDS_PublicationMatchedStatus::last_subscription_handle

This InstanceHandle can be used to look up which remote **DDSDDataReader** (p. 1272) was the last to cause this DataWriter's status to change, using **DDSDDataWriter::get_matched_subscription_data** (p. 1316).

If the DataReader no longer matches this DataWriter due to any of the reasons in **DDS_PublicationMatchedStatus** (p. 1007) except incompatible QoS, then the DataReader has been purged from this DataWriter's DomainParticipant discovery database. (See the "Discovery Overview" section of the *User's Manual*.) In that case, the **DDSDDataWriter::get_matched_subscription_data** (p. 1316) method will not be able to return information about the DataReader. The only way to get information about the lost DataReader is if you cached the information previously.

9.145 DDS_PublisherQos Struct Reference

QoS policies supported by a **DDSPublisher** (p. 1534) entity.

Public Member Functions

- **bool operator==** (const **DDS_PublisherQos** &r) const
Compares two PublisherQos objects for equality.
- **bool operator!=** (const **DDS_PublisherQos** &r) const
Compares two PublisherQos objects for inequality.
- **DDS_ReturnCode_t print** () const
Prints this DDS_PublisherQos (p. 1009) to stdout.
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size) const
Obtains a string representation of this DDS_PublisherQos (p. 1009).
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_PublisherQos** &base) const
Obtains a string representation of this DDS_PublisherQos (p. 1009).
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this DDS_PublisherQos (p. 1009).
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_PublisherQos** &base, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this DDS_PublisherQos (p. 1009).
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &) const
Obtains a string representation of this DDS_PublisherQos (p. 1009).
- **DDS_ReturnCode_t to_string** (char *string, **DDS_UnsignedLong** &string_size, const **DDS_QosPrintAll_t** &, const **DDS_QosPrintFormat** &format) const
Obtains a string representation of this DDS_PublisherQos (p. 1009).

Public Attributes

- struct **DDS_PresentationQosPolicy** **presentation**
*Presentation policy, **PRESENTATION** (p. 417).*
- struct **DDS_PartitionQosPolicy** **partition**
*Partition policy, **PARTITION** (p. 416).*
- struct **DDS_GroupDataQosPolicy** **group_data**
*Group data policy, **GROUP_DATA** (p. 406).*
- struct **DDS_EntityFactoryQosPolicy** **entity_factory**
*Entity factory policy, **ENTITY_FACTORY** (p. 401).*
- struct **DDS_AynchronousPublisherQosPolicy** **asynchronous_publisher**
*<<extension>> (p. 236) Asynchronous publishing settings for the **DDSPublisher** (p. 1534) and all entities that are created by it.*

- struct **DDS_EntityNameQosPolicy** **publisher_name**
*<<extension>> (p. 236) EntityName policy, **ENTITY_NAME** (p. 402).*

9.145.1 Detailed Description

QoS policies supported by a **DDSPublisher** (p. 1534) entity.

You must set certain members in a consistent manner:

length of **DDS_GroupDataQosPolicy::value** (p. 905) <= **DDS_DomainParticipantResourceLimitsQosPolicy::publisher_group_data_max_length** (p. 752)

length of **DDS_PartitionQosPolicy::name** (p. 978) <= **DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions** (p. 753)

combined number of characters (including terminating 0) in **DDS_PartitionQosPolicy::name** (p. 978) <= **DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_characters** (p. 753)

If any of the above are not true, **DDSPublisher::set_qos** (p. 1552) and **DDSPublisher::set_qos_with_profile** (p. 1553) will fail with **DDS_RETCODE_INCONSISTENT_POLICY** (p. 336) and **DDSDomainParticipant::create_publisher** (p. 1359) will return NULL.

9.145.2 Member Function Documentation

9.145.2.1 operator==()

```
bool DDS_PublisherQos::operator== (
    const DDS_PublisherQos & r ) const [inline]
```

Compares two PublisherQos objects for equality.

See also

DDS_PublisherQos_equals (p. 105)

9.146 DDS_PublishModeQosPolicy Struct Reference

Specifies how RTI Connexx sends application data on the network. This QoS policy can be used to tell RTI Connexx to use its *own* thread to send data, instead of the user thread.

Public Attributes

- **DDS_PublishModeQosPolicyKind** kind
Publishing mode.
- char * **flow_controller_name**
Name of the associated flow controller.
- **DDS_Long** priority
Publication priority.

9.146.1 Detailed Description

Specifies how RTI Connext sends application data on the network. This QoS policy can be used to tell RTI Connext to use its *own* thread to send data, instead of the user thread.

The publishing mode of a **DDSDataWriter** (p. 1305) determines whether data is written synchronously in the context of the user thread when calling **FooDataWriter::write** (p. 1666) or asynchronously in the context of a separate thread internal to the middleware.

Each **DDSPublisher** (p. 1534) spawns a single asynchronous publishing thread (**DDS_AsynchronousPublisherQosPolicy::thread** (p. 586)) to serve all its asynchronous **DDSDataWriter** (p. 1305) instances.

Entity:

DDSDataWriter (p. 1305)

Properties:

RxO (p. ??) = N/A

Changeable (p. ??) = **NO** (p. ??)

9.146.2 Usage

The fastest way for RTI Connext to send data is for the user thread to execute the middleware code that actually sends the data itself. However, there are times when user applications may need or want an internal middleware thread to send the data instead. For instance, to send large data reliably, you must use an asynchronous thread.

When data is written asynchronously, a **DDSFlowController** (p. 1451), identified by `flow_controller_name`, can be used to shape the network traffic. Shaping a data flow usually means limiting the maximum data rates at which the middleware will send data for a **DDSDataWriter** (p. 1305). The flow controller will buffer any excess data and only send it when the send rate drops below the maximum rate. The flow controller's properties determine when the asynchronous publishing thread is allowed to send data and how much.

Asynchronous publishing may increase latency, but offers the following advantages:

- The **FooDataWriter::write** (p. 1666) call does not make any network calls and is therefore faster and more deterministic. This becomes important when the user thread is executing time-critical code.
- When data is written in bursts or when sending large data types as multiple fragments, a flow controller can throttle the send rate of the asynchronous publishing thread to avoid flooding the network.
- Asynchronously written samples for the same destination will be coalesced into a single network packet which reduces bandwidth consumption.

The maximum number of samples that will be coalesced depends on **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761) (each sample requires at least 2-4 gather-send buffers). Performance can be improved by increasing **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1761). Note that the maximum value is operating system dependent.

The middleware must queue samples until they can be sent by the asynchronous publishing thread (as determined by the corresponding **DDSFlowController** (p. 1451)). The number of samples that will be queued is determined by the **DDS_HistoryQosPolicy** (p. 906). When using **DDS_KEEP_LAST_HISTORY_QOS** (p. 406), only the most recent **DDS_HistoryQosPolicy::depth** (p. 908) samples are kept in the queue. Once unsent samples are removed from the queue, they are no longer available to the asynchronous publishing thread and will therefore never be sent.

9.146.3 Member Data Documentation

9.146.3.1 kind

DDS_PublishModeQosPolicyKind `DDS_PublishModeQosPolicy::kind`

Publishing mode.

[default] **DDS_SYNCHRONOUS_PUBLISH_MODE_QOS** (p. 431)

9.146.3.2 flow_controller_name

`char* DDS_PublishModeQosPolicy::flow_controller_name`

Name of the associated flow controller.

The following builtin values are supported:

- **DDS_DEFAULT_FLOW_CONTROLLER_NAME** (p. 121)
- **DDS_FIXED_RATE_FLOW_CONTROLLER_NAME** (p. 122)
- **DDS_ON_DEMAND_FLOW_CONTROLLER_NAME** (p. 123)

NULL value or zero-length string refers to **DDS_DEFAULT_FLOW_CONTROLLER_NAME** (p. 121).

Warning

The value for this field can be one of the constants above or a string allocated with **DDS_String_dup()** (p. 547) to specify your own custom flow controller name. You should not assign a string literal. When you assign a new value with **DDS_String_dup()** (p. 547), first check if the current value is one of the constants above. If it is, simply replace it; if it's not, you have to release the current string and assign the new one. Here is an example of such an approach:

```
struct DDS_DataWriterQos writer_qos;
char *flow_controller_name = NULL;
DDS_DataWriterQos_initialize(&writer_qos);
...
DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
...
flow_controller_name = writer_qos.publish_mode.flow_controller_name;
if (flow_controller_name == DDS_DEFAULT_FLOW_CONTROLLER_NAME
    || flow_controller_name == DDS_FIXED_RATE_FLOW_CONTROLLER_NAME
    || flow_controller_name == DDS_ON_DEMAND_FLOW_CONTROLLER_NAME) {
    // Since the value was never on the heap, this won't leak memory
    flow_controller_name = NULL;
} else {
    // This means the value is present on the heap
    DDS_String_free(flow_controller_name);
}

// New value using DDS_String_dup() or one of the predefined constants
flow_controller_name = DDS_String_dup("My custom flow controller name");
...
DDS_DataWriterQos_finalize(&writer_qos);
```

The strings allocated with **DDS_String_dup()** (p. 547) are released when `writer_qos` is finalized.

More information about string handling can be found under **String Conventions** (p. 546).

[default] DDS_DEFAULT_FLOW_CONTROLLER_NAME (p. 121)

9.146.3.3 priority

DDS_Long DDS_PublishModeQosPolicy::priority

Publication priority.

A positive integer value designating the relative priority of the **DDSDataWriter** (p. 1305), used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**DDS_ASYNCHRONOUS_PUBLISH_MODE** ← **_QOS** (p. 431)) with **DDS_FlowControllerProperty_t::scheduling_policy** (p. 900) set to **DDS_HPF_FLOW** ← **CONTROLLER_SCHED_POLICY** (p. 121).

Larger numbers have higher priority.

For multi-channel DataWriters, if the publication priority of any channel is set to any value other than **DDS** ← **PUBLICATION_PRIORITY_UNDEFINED** (p. 430), then the channel's priority will take precedence over that of the DataWriter.

For multi-channel DataWriters, if the publication priority of any channel is **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430), then the channel will inherit the publication priority of the DataWriter.

If the publication priority of the DataWriter, and of any channel of a multi-channel DataWriter, are **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430), then the priority of the DataWriter or DataWriter channel will be assigned the lowest priority value.

If the publication priority of the DataWriter is **DDS_PUBLICATION_PRIORITY_AUTOMATIC** (p. 430), then the DataWriter will be assigned the priority of the largest publication priority of all samples in the DataWriter.

The publication priority of each sample can be set in the **DDS_WriteParams_t** (p. 1234) of the **FooDataWriter::write_w_params** (p. 1671) function.

For dispose and unregister samples, use the **DDS_WriteParams_t** (p. 1234) of **FooDataWriter::dispose_w_params** (p. 1674) and **FooDataWriter::unregister_instance_w_params** (p. 1666).

[default] **DDS_PUBLICATION_PRIORITY_UNDEFINED** (p. 430)

[range] [-1, MAX_INT]

9.147 DDS_QosPolicyCount Struct Reference

Type to hold a counter for a **DDS_QosPolicyId_t** (p. 359).
