- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_detach\_condition** ( **DDS\_AsyncWaitSet** \*self, **DDS\_Condition** \*condition)  
*Deaches the specified **DDS\_Condition** (p. 1169) from this **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_detach\_condition\_with\_completion\_token** ( **DDS\_AsyncWait↔Set** \*self, **DDS\_Condition** \*condition, **DDS\_AsyncWaitSetCompletionToken** \*completion\_token)  
*Detaches the specified **DDS\_Condition** (p. 1169) from this **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_attach\_condition** ( **DDS\_AsyncWaitSet** \*self, **DDS\_Condition** \*condition)  
*Attaches the specified **DDS\_Condition** (p. 1169) to this **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_attach\_condition\_with\_completion\_token** ( **DDS\_AsyncWaitSet** \*self, **DDS\_Condition** \*condition, **DDS\_AsyncWaitSetCompletionToken** \*completion\_token)  
*Attaches the specified **DDS\_Condition** (p. 1169) to this **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_unlock\_condition** ( **DDS\_AsyncWaitSet** \*self, **DDS\_Condition** \*condition)  
*Allows the **DDS\_Condition** (p. 1169) under dispatch to be available for concurrent dispatch from another thread from the pool.*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_get\_conditions** ( **DDS\_AsyncWaitSet** \*self, struct **DDS\_↔ConditionSeq** \*attached\_conditions)  
*Retrieves the list of attached **DDS\_Condition** (p. 1169) (s).*

- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_stop ( DDS\_AsyncWaitSet \*self)**  
*Initiates the stop procedure on this **DDS\_AsyncWaitSet** (p. 874) that will stop the asynchronous wait.*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_stop\_with\_completion\_token ( DDS\_AsyncWaitSet \*self, DDS\_AsyncWaitSetCompletionToken \*completion\_token)**  
*Initiates the stop procedure on this **DDS\_AsyncWaitSet** (p. 874) that will stop the asynchronous wait.*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_start ( DDS\_AsyncWaitSet \*self)**  
*Initiates the asynchronous wait on this **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_start\_with\_completion\_token ( DDS\_AsyncWaitSet \*self, DDS\_AsyncWaitSetCompletionToken \*completion\_token)**  
*Initiates the asynchronous wait on this **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_Boolean DDS\_AsyncWaitSet\_is\_started ( DDS\_AsyncWaitSet \*self)**  
*Returns whether this **DDS\_AsyncWaitSet** (p. 874) is started.*
- **DDS\_AsyncWaitSetCompletionToken \* DDS\_AsyncWaitSet\_create\_completion\_token ( DDS\_AsyncWaitSet \*self)**  
*Creates a new **DDS\_AsyncWaitSetCompletionToken** (p. 877).*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_delete\_completion\_token ( DDS\_AsyncWaitSet \*self, DDS\_AsyncWaitSetCompletionToken \*completion\_token)**  
*Deletes a **DDS\_AsyncWaitSetCompletionToken** (p. 877) previously created from this **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_AsyncWaitSet \* DDS\_AsyncWaitSet\_new (const struct DDS\_AsyncWaitSetProperty\_t \*property)**  
*Single-argument constructor that allows creating a **DDS\_AsyncWaitSet** (p. 874) with custom behavior.*
- **DDS\_AsyncWaitSet \* DDS\_AsyncWaitSet\_new\_with\_listener (const struct DDS\_AsyncWaitSetProperty\_t \*property, struct DDS\_AsyncWaitSetListener \*listener)**  
*Constructor that allows specifying a **DDS\_AsyncWaitSetListener** (p. 1326).*
- **DDS\_AsyncWaitSet \* DDS\_AsyncWaitSet\_new\_with\_thread\_factory (const struct DDS\_AsyncWaitSetProperty\_t \*property, struct DDS\_AsyncWaitSetListener \*listener, struct DDS\_ThreadFactory \*thread\_factory)**  
*Constructor with arguments that allow specifying behavior different than the default one, including specifying a **DDS\_ThreadFactory** (p. 1763) for the creation and deletion of the threads within the thread pool.*
- **DDS\_ReturnCode\_t DDS\_AsyncWaitSet\_delete ( DDS\_AsyncWaitSet \*self)**  
*Deletes a **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_DataReaderStatusConditionHandler \* DDS\_DataReaderStatusConditionHandler\_new ( DDS\_DataReader \*reader, const struct DDS\_DataReaderListener \*listener, DDS\_StatusMask listener\_mask)**  
*Creates a new **DDS\_DataReaderStatusConditionHandler** (p. 879) instance.*
- **DDS\_ReturnCode\_t DDS\_DataReaderStatusConditionHandler\_delete ( DDS\_DataReaderStatusConditionHandler \*self)**  
*Deletes a **DDS\_DataReaderStatusConditionHandler** (p. 879) instance previously created with **DDS\_DataReaderStatusConditionHandler\_new** (p. 893).*

## Variables

- **DDS\_AsyncWaitSetCompletionToken \*const DDS\_ASYNC\_WAITSET\_COMPLETION\_TOKEN\_USE\_IMPLICIT\_AND\_WAIT**  
*For the operations that allow an **DDS\_AsyncWaitSetCompletionToken** (p. 877), this sentinel can be provided to indicate an **DDS\_AsyncWaitSet** (p. 874) to use the implicit completion token and wait on it for request completion.*
- **DDS\_AsyncWaitSetCompletionToken \*const DDS\_ASYNC\_WAITSET\_COMPLETION\_TOKEN\_IGNORE**  
*For the operations that allow an **DDS\_AsyncWaitSetCompletionToken** (p. 877), this sentinel can be provided to indicate an **DDS\_AsyncWaitSet** (p. 874) to perform the action associating a 'null' completion token.*
- **const struct DDS\_AsyncWaitSetProperty\_t DDS\_ASYNC\_WAITSET\_PROPERTY\_DEFAULT**  
*Constant that defines the default property for a **DDS\_AsyncWaitSet** (p. 874).*

### 4.77.1 Detailed Description

<<*extension*>> (p. 817) A specialization of **DDS\_WaitSet** (p. 1170) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDS\_Condition** (p. 1169).

This class is a realization of the `Proactor` pattern applied to WaitSets and Conditions that provide a powerful component for your application process events leveraging concurrency.

### 4.77.2 Macro Definition Documentation

#### 4.77.2.1 DDS\_AsyncWaitSetListener\_INITIALIZER

```
#define DDS_AsyncWaitSetListener_INITIALIZER
```

Initializer for new **DDS\_AsyncWaitSetListener** (p. 1326).

No memory is allocated. New **DDS\_AsyncWaitSetListener** (p. 1326) Instances stored in the stack should be initialized with this value before they are passed to any functions.

**DDS\_AsyncWaitSet\_new** (p. 890)

**DDS\_AsyncWaitSetListener** (p. 1326)

### 4.77.3 Typedef Documentation

#### 4.77.3.1 DDS\_AsyncWaitSet

```
typedef struct DDS_AsyncWaitSetImpl DDS_AsyncWaitSet
```

A class for dispatching **DDS\_Condition** (p. 1169) objects using separate threads of execution. You can see this class as an extension of a **DDS\_WaitSet** (p. 1170) that allows asynchronously waiting for the attached **DDS\_Condition** (p. 1169) objects to trigger and provide a notification by calling **DDS\_Condition\_dispatch** (p. 1174).

**DDS\_AsyncWaitSet** (p. 874) provides a proactive model to process application events through **DDS\_Condition** (p. 1169) objects. **DDS\_AsyncWaitSet** (p. 874) owns a pool of threads to asynchronously wait for the attached **DDS\_Condition** (p. 1169) objects to trigger and dispatch them upon wakeup. The asynchronous behavior is the main key different with regards to the **DDS\_WaitSet** (p. 1170).

The class diagram and its collaborators is shown below:

#### 4.77.4 AsyncWaitSet Thread Orchestration

**DDS\_AsyncWaitSet** (p. 874) internally applies a leader-follower pattern for the orchestration of the thread pool. Once a **DDS\_AsyncWaitSet** (p. 874) starts, it will create the thread pool of  $M$  threads from which only one thread will become the Leader thread, and remaining threads will become the Followers, where:

- The `Leader` thread is the one waiting for the attached **DDS\_Condition** (p. 1169) to trigger. Remaining threads in the pool, if any, are either idle awaiting to become the leader or busy while processing active **DDS\_Condition** (p. 1169).
- Upon wait wakeup, the `Leader` thread resigns its leader status to become a `Processor` thread and dispatch the next active **DDS\_Condition** (p. 1169) through the **DDS\_Condition\_dispatch** (p. 1174) operation.
- One of the `Follower` threads wakes up and becomes the new leader to resume the wait for **DDS\_Condition** (p. 1169).

"Thread orchestration in a `::DDS_AsyncWaitSet`"

This behavior implies the following considerations:

- Only one thread a time can wait for the attached **DDS\_Condition** (p. 1169) objects to trigger. From a pool of  $M$  threads, only one is the leader,  $P$  are processing active **DDS\_Condition** (p. 1169), and  $F$  are idle followers.
- A thread can dispatch only one active **DDS\_Condition** (p. 1169) at a time.
- **DDS\_AsyncWaitSet** (p. 874) efficiently distributes threads to dispatch **DDS\_Condition** (p. 1169) objects on demand. This avoids underutilizing a thread if **DDS\_Condition** (p. 1169) objects do not trigger or trigger unfrequently.
- At a given time, all the threads in the pool could be in processing state. In this situation, the **DDS\_AsyncWaitSet** (p. 874) is not able to wait for more **DDS\_Condition** (p. 1169) objects until one thread becomes the leader.

**DDS\_AsyncWaitSet** (p. 874) has a built-in dispatcher that guarantees fairness and avoids starvation of **DDS\_Condition** (p. 1169) objects. By applying a round-robin distribution policy, each attached and active **DDS\_Condition** (p. 1169) is dispatched within a finite period of time, assuming the **DDS\_ConditionHandler** (p. 1350) always return control after the **DDS\_Condition\_dispatch** (p. 1174) operation.

#### 4.77.5 AsyncWaitSet Thread Safety

A key aspect of the **DDS\_AsyncWaitSet** (p. 874) is the thread safety. **DDS\_AsyncWaitSet** (p. 874) interface is thread safe, so you can concurrently call any operation on the **DDS\_AsyncWaitSet** (p. 874) object from multiple threads in your application.

Furthermore, **DDS\_AsyncWaitSet** (p. 874) also safely interacts with its own thread pool. Internally, the **DDS\_AsyncWaitSet** (p. 874) applies the asynchronous completion token pattern to perform activities that involve synchronization with the thread pool.

For instance to detach a **DDS\_Condition** (p. 1169), the **DDS\_AsyncWaitSet** (p. 874) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token.

#### Note

The asynchronous completion token behavior only takes place if the **DDS\_AsyncWaitSet** (p.874) is started. Otherwise the internal request will be directly executed by the calling thread.

For a finer control on this behavior, each **DDS\_AsyncWaitSet** (p.874) operation where this applies comes in two flavors:

- **Default**: the operation hides all the details of the completion token and returns after the operation completes. Operations of this kind internally use an implicit **DDS\_AsyncWaitSetCompletionToken** (p.877). The **DDS\_AsyncWaitSet** (p.874) creates and reuses **DDS\_AsyncWaitSetCompletionToken** (p.877) objects as needed. This is the recommended flavor unless your application has special resource needs.
- **With completion token**: An overloaded version of the default one that also receives an **DDS\_AsyncWaitSetCompletionToken** (p.877) object on which you can wait on at any time for the actual operation to complete. This flavor is available to assist applications with resource constraints and that want more control on the interaction with the thread pool of the **DDS\_AsyncWaitSet** (p.874).

#### 4.77.5.1 Condition Locking

**DDS\_AsyncWaitSet** (p.874) incorporates a safety mechanism that prevents calling **DDS\_Condition\_dispatch** (p.1174) concurrently. **DDS\_AsyncWaitSet** (p.874) locks the **DDS\_Condition** (p.1169) while a processor thread is dispatching it so no other thread within the pool can dispatch it again.

This mechanism ensures not only unexpected concurrent dispatch of a **DDS\_Condition** (p.1169) but also spurious thread activity. Because it is responsibility of your application to reset the Condition trigger, there is a period of time in which the dispatched condition may remain active, causing the **DDS\_AsyncWaitSet** (p.874) to enter in a continuous immediate wakeup from the wait. This behavior typically leads to thread hogging and high CPU usage.

Nevertheless, your application may still want to receive concurrent and controlled dispatch notifications. **DDS\_AsyncWaitSet** (p.874) will still allow you to unlock a **DDS\_Condition** (p.1169) so any other available thread can dispatch the same condition concurrently while preventing the above mentioned problems. You can achieve this by calling **DDS\_AsyncWaitSet\_unlock\_condition** (p.884) on the Condition being dispatched within the dispatch callback. Note that the AsyncWaitSet locks a Condition each time it dispatches it. Hence you need to unlock the Condition each time you want to enable a concurrent dispatch.

#### 4.77.6 AsyncWaitSet Events and Resources

Besides **DDS\_Condition** (p.1169) processing, you can listen to other kind of internal events related to the **DDS\_AsyncWaitSet** (p.874) and its thread pool by means of the **DDS\_AsyncWaitSetListener** (p.1326).

**DDS\_AsyncWaitSet** (p.874) exposes operations to start and stop the asynchronous wait, which involves the creation and deletion of the thread pool respectively.

**DDS\_AsyncWaitSet** (p.874) relies on thread-specific storage to provide the described functionality. Each application thread that calls an operation on a **DDS\_AsyncWaitSet** (p.874) will generate resources that will be associated with such thread. You can free these resources upon thread termination by calling **DDS\_DomainParticipantFactory\_unregister\_thread** (p.54).

MT Safety:

Safe.

**DDS\_WaitSet** (p. 1170)

**DDS\_Condition** (p. 1169)

**DDS\_AsyncWaitSetListener** (p. 1326)

**DDS\_AsyncWaitSetCompletionToken** (p. 877).

**DDS\_AsyncWaitSetProperty\_t** (p. 1327)

#### 4.77.6.1 DDS\_AsyncWaitSetCompletionToken

```
typedef struct DDS_AsyncWaitSetCompletionTokenImpl DDS_AsyncWaitSetCompletionToken
```

<<**interface**>> (p. 818) Implementation of the completion token role element of the asynchronous completion token pattern that is part of the **DDS\_AsyncWaitSet** (p. 874) behavior.

A **DDS\_AsyncWaitSetCompletionToken** (p. 877) can be in one of the following states:

- **READY**: The completion token can be used to associate a new request. Calling **DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880) on a ready completion token will return immediately with success. A ready completion token can only transition to the queued state.
- **QUEUED**: The completion token has an associated request that is pending processing. Calling **DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880) on a queued completion token will block until the request completes or times out. A queued completion token can only transition to the processed state.
- **PROCESSED**: The completion token has an associated request that has been processed but the application did not call **DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880) yet. Calling **DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880) on a processed completion token will return immediately with the return code result of processing the associated request. A processed completion token can transition to both ready or queued states.

#### 4.77.7 AsyncWaitSetCompletionToken management

The same **DDS\_AsyncWaitSetCompletionToken** (p. 877) instance can be reused multiple times to associate a request and wait for its completion. Reusing is allowed only if the completion token is either in **READY** or **PROCESSED** state. Otherwise the **DDS\_AsyncWaitSet** (p. 874) operation that associates the completion token will fail with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

The completion token functionality can be viewed as a **DDS\_AsyncWaitSet** (p. 874) internal detail from which your application should not need to know. In general, it is recommended to use the default flavor of **DDS\_AsyncWaitSet** (p. 874) operations that handle the internals of the completion tokens for you.

Nevertheless, if a completion token represents an expensive resource in your environment, your application may want to have full control of how and when completion tokens are created. It's for these reasons why is exposed as a public collaborator of the **DDS\_AsyncWaitSet** (p. 874).

**MT Safety:**

Safe.

**See also**

**DDS\_AsyncWaitSet** (p. 874)

**4.77.7.1 DDS\_AsyncWaitSetListener\_OnThreadSpawnedCallback**

```
typedef void(* DDS_AsyncWaitSetListener_OnThreadSpawnedCallback) (void *listener_data, DDS_↔
UnsignedLongLong thread_id)
```

Prototype of a **DDS\_AsyncWaitSetListener::on\_thread\_spawned** (p. 1327) function.

Each thread that conforms the thread pool of the **DDS\_AsyncWaitSet** (p. 874) will invoke this operation sequentially as soon as the thread is spawned and right before it becomes the leader or a follower thread.

This callback is invoked by each thread conforming the pool and from its own context, right after it is spawned and the underlying operating system has allocated the necessary resources.

**Parameters**

<i>listener_data</i>	<< <b>in</b> >> (p. 818) Data associated with the listener when the listener is set.
<i>thread_id</i>	<< <b>in</b> >> (p. 818) Thread ID of the current context.

**4.77.7.2 DDS\_AsyncWaitSetListener\_OnThreadDeletedCallback**

```
typedef void(* DDS_AsyncWaitSetListener_OnThreadDeletedCallback) (void *listener_data, DDS_↔
UnsignedLongLong thread_id)
```

Prototype of a **DDS\_AsyncWaitSetListener::on\_thread\_deleted** (p. 1327) function.

Each thread that conforms the thread pool of the **DDS\_AsyncWaitSet** (p. 874) will invoke this operation sequentially right before the thread finalizes its execution due to a stop request or an internal error.

This callback is invoked by each thread conforming the pool and from its own context, right before the underlying operating system releases the associated resources.

**Parameters**

<i>listener_data</i>	<< <b>in</b> >> (p. 818) Data associated with the listener when the listener is set.
<i>thread_id</i>	<< <b>in</b> >> (p. 818) Thread ID of the current context.

### 4.77.7.3 DDS\_AsyncWaitSetListener\_OnWaitTimeoutCallback

```
typedef void(* DDS_AsyncWaitSetListener_OnWaitTimeoutCallback) (void *listener_data, DDS_Unsigned↔
LongLong thread_id)
```

Prototype of a **DDS\_AsyncWaitSetListener::on\_wait\_timeout** (p. 1327) function.

The leader thread of the **DDS\_AsyncWaitSet** (p. 874) invokes this callback each time the wait operation timed out while waiting for the attached **DDS\_Condition** (p. 1169) objects to trigger.

#### Parameters

<i>listener_data</i>	<< <i>in</i> >> (p. 818) Data associated with the listener when the listener is set.
<i>thread_id</i>	<< <i>in</i> >> (p. 818) Thread ID of the current context. It always corresponds to the current leader thread.

#### See also

**DDS\_WaitSet\_wait** (p. 1180)

### 4.77.7.4 DDS\_DataReaderStatusConditionHandler

```
typedef struct DDS_DataReaderStatusConditionHandlerImpl DDS_DataReaderStatusConditionHandler
```

<<*interface*>> (p. 818) Realization of a **DDS\_ConditionHandler** (p. 1350) that handles the status of a **DDS\_Data↔Reader** (p. 608).

A **DDS\_DataReaderStatusConditionHandler** (p. 879) demultiplexes a **DDS\_DataReader** (p. 608) status change into the corresponding callback of a provided **DDS\_DataReaderListener** (p. 1372) implementation.

Note that the **DDS\_DataReaderListener** (p. 1372) notifications have different considerations than if they were made by the **DDS\_DataReader** (p. 608) directly:

- Context: The **DDS\_DataReaderListener** (p. 1372) callback context is the one of the thread that dispatches the **DDS\_Condition** (p. 1169) where this handler is set. For instance, if you attach the condition to a **DDS\_Async↔WaitSet** (p. 874), the context will be one of the threads within the pool.
- Status clearing: All the **DDS\_DataReader** (p. 608)'s enabled statuses are cleared upon condition dispatch except the **DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033), which will not be cleared until your application reads the data.
- Exclusive Area: Restrictions depend on the context of the dispatching thread. For instance, if the **DDS\_Async↔WaitSet** (p. 874) dispatches the condition, the listener notifications are free of any exclusive area restrictions.

The **DDS\_DataReaderStatusConditionHandler** (p. 879) is a convenience to handle the status changes of a **DDS\_↔DataReader** (p. 608). You can install a **DDS\_DataReaderStatusConditionHandler** (p. 879) as the handler of a reader's **DDS\_StatusCondition** (p. 1170). You can then attach it to a **DDS\_WaitSet** (p. 1170) or **DDS\_AsyncWaitSet** (p. 874) and receive status changes notifications through a specific **DDS\_DataReaderListener** (p. 1372) implementation instance.

## 4.77.8 Function Documentation

### 4.77.8.1 DDS\_AsyncWaitSetCompletionToken\_wait()

```
DDS_ReturnCode_t DDS_AsyncWaitSetCompletionToken_wait (
    DDS_AsyncWaitSetCompletionToken * self,
    const struct DDS_Duration_t * max_wait )
```

Waits for the request associated to an operation made on the **DDS\_AsyncWaitSet** (p. 874) to complete.

This operation will block the calling thread for a maximum amount of time specified by `max_wait` until the **DDS\_AsyncWaitSet** (p. 874) request associated with this completion token completes.

If there is no timeout, upon return it is guaranteed that the request associated with this token completed. This operation may fail due to an error during the wait or while processing the associated request.

If this operation is called from within the context of one the thread that conforms the thread pool of the **DDS\_AsyncWaitSet** (p. 874), it will fail with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

If the operation failed with **DDS\_RETCODE\_TIMEOUT** (p. 1025) your application can wait again on this completion token.

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>max_wait</i>	<< <i>in</i> >> (p. 818) Cannot be NULL. Maximum time to wait for the request associated to this completion token to complete before timeout.

#### Returns

One of the **Standard Return Codes** (p. 1024)

#### See also

**DDS\_AsyncWaitSet** (p. 874)

### 4.77.8.2 DDS\_AsyncWaitSet\_get\_property()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_get_property (
    DDS_AsyncWaitSet * self,
    struct DDS_AsyncWaitSetProperty_t * property )
```

Retrieves the **DDS\_AsyncWaitSetProperty\_t** (p. 1327) configuration of the associated **DDS\_AsyncWaitSet** (p. 874).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>property</i>	<< <i>out</i> >> (p. 818)

## Returns

One of the **Standard Return Codes** (p. 1024)

## 4.77.8.3 DDS\_AsyncWaitSet\_detach\_condition()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_detach_condition (
    DDS_AsyncWaitSet * self,
    DDS_Condition * condition )
```

Detaches the specified **DDS\_Condition** (p. 1169) from this **DDS\_AsyncWaitSet** (p. 874).

This operation is equivalent to call **DDS\_AsyncWaitSet\_detach\_condition\_with\_completion\_token** (p. 881) providing **DDS\_ASYNC\_WAITSET\_COMPLETION\_TOKEN\_USE\_IMPLICIT\_AND\_WAIT** (p. 894) as a *completion\_token*.

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **DDS\_Condition** (p. 1169) is detached.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>condition</i>	<< <i>in</i> >> (p. 818) <b>DDS_Condition</b> (p. 1169) to be detached.

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_detach\_condition\_with\_completion\_token** (p. 881)

## 4.77.8.4 DDS\_AsyncWaitSet\_detach\_condition\_with\_completion\_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_detach_condition_with_completion_token (
    DDS_AsyncWaitSet * self,
```

```

DDS_Condition * condition,
DDS_AsyncWaitSetCompletionToken * completion_token )

```

Detaches the specified **DDS\_Condition** (p. 1169) from this **DDS\_AsyncWaitSet** (p. 874).

If this operation succeeds, a detach request has been scheduled and your application can use the provided `completion_token` to wait for this **DDS\_AsyncWaitSet** (p. 874) to process the request. If the **DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880) operation returns successfully, it is guaranteed that the **DDS\_Condition** (p. 1169) is detached from this **DDS\_AsyncWaitSet** (p. 874).

Once the **DDS\_Condition** (p. 1169) is detached, it is guaranteed that the **DDS\_AsyncWaitSet** (p. 874) will no longer process it so it is safe for your application to release any resources associated with the detached **DDS\_Condition** (p. 1169).

**DDS\_Condition** (p. 1169) may be detached at any time independently of the state of the **DDS\_AsyncWaitSet** (p. 874).

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>condition</i>	<< <i>in</i> >> (p. 818) <b>DDS_Condition</b> (p. 1169) to be detached.
<i>completion_token</i>	<< <i>inout</i> >> (p. 818) a valid <b>DDS_AsyncWaitSetCompletionToken</b> (p. 877) instance that can be used by your application to wait for the detach request to complete. You can provide one of the special sentinels <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT</b> (p. 894) and <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE</b> (p. 894).

#### Returns

One of the **Standard Return Codes** (p. 1024)

#### See also

**DDS\_AsyncWaitSet\_detach\_condition** (p. 881)

**DDS\_AsyncWaitSet\_attach\_condition\_with\_completion\_token** (p. 883)

**DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880)

#### 4.77.8.5 DDS\_AsyncWaitSet\_attach\_condition()

```

DDS_ReturnCode_t DDS_AsyncWaitSet_attach_condition (
    DDS_AsyncWaitSet * self,
    DDS_Condition * condition )

```

Attaches the specified **DDS\_Condition** (p. 1169) to this **DDS\_AsyncWaitSet** (p. 874).

This operation is equivalent to calling **DDS\_AsyncWaitSet\_attach\_condition\_with\_completion\_token** (p. 883) providing **DDS\_ASYNC\_WAITSET\_COMPLETION\_TOKEN\_USE\_IMPLICIT\_AND\_WAIT** (p. 894) as a `completion_token`.

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **DDS\_Condition** (p. 1169) is attached.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>condition</i>	<< <i>in</i> >> (p. 818) <b>DDS_Condition</b> (p. 1169) to be attached.

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_attach\_condition\_with\_completion\_token** (p. 883)

## 4.77.8.6 DDS\_AsyncWaitSet\_attach\_condition\_with\_completion\_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_attach_condition_with_completion_token (
    DDS_AsyncWaitSet * self,
    DDS_Condition * condition,
    DDS_AsyncWaitSetCompletionToken * completion_token )
```

Attaches the specified **DDS\_Condition** (p. 1169) to this **DDS\_AsyncWaitSet** (p. 874).

If this operation succeeds, an attach request has been scheduled and your application can use the output parameter *completion\_token* to wait for this **DDS\_AsyncWaitSet** (p. 874) to process the request. **DDS\_AsyncWaitSet**↔**CompletionToken\_wait** (p. 880) operation returns successfully, it is guaranteed that the **DDS\_Condition** (p. 1169) is attached to this **DDS\_AsyncWaitSet** (p. 874).

Once the **DDS\_Condition** (p. 1169) is attached, its trigger value may cause the leader thread of the **DDS\_AsyncWait**↔**Set** (p. 874) to wake up call the **DDS\_Condition\_dispatch** (p. 1174) operation.

**DDS\_Condition** (p. 1169) may be attached at any time independently of the state of the **DDS\_AsyncWaitSet** (p. 874).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>condition</i>	<< <i>in</i> >> (p. 818) <b>DDS_Condition</b> (p. 1169) to be attached.
<i>completion_token</i>	<< <i>inout</i> >> (p. 818) a valid <b>DDS_AsyncWaitSetCompletionToken</b> (p. 877) instance that can be used by your application to wait for the attach request to complete. You can provide one of the special sentinels <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT</b> (p. 894) and <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE</b> (p. 894).

## Returns

One of the **Standard Return Codes** (p. 1024)

See also

**DDS\_AsyncWaitSet\_attach\_condition** (p. 882)

**DDS\_AsyncWaitSet\_detach\_condition\_with\_completion\_token** (p. 881)

**DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880)

#### 4.77.8.7 DDS\_AsyncWaitSet\_unlock\_condition()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_unlock_condition (
    DDS_AsyncWaitSet * self,
    DDS_Condition * condition )
```

Allows the **DDS\_Condition** (p. 1169) under dispatch to be available for concurrent dispatch from another thread from the pool.

This operation can be called from the dispatch callback of the **DDS\_Condition** (p. 1169) this **DDS\_AsyncWaitSet** (p. 874) is dispatching. After successfully calling this operation, if the **DDS\_Condition** (p. 1169) becomes active this **DDS\_AsyncWaitSet** (p. 874) is allowed to dispatch it again from any available thread from the pool.

You may call this operation any time you need the same **DDS\_Condition** (p. 1169) to be dispatched concurrently.

This operation will fail with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025) if you call it from a different context than the dispatch callback or on a different **DDS\_Condition** (p. 1169).

Returns

One of the **Standard Return Codes** (p. 1024)

#### 4.77.8.8 DDS\_AsyncWaitSet\_get\_conditions()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_get_conditions (
    DDS_AsyncWaitSet * self,
    struct DDS_ConditionSeq * attached_conditions )
```

Retrieves the list of attached **DDS\_Condition** (p. 1169) (s).

Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>attached_conditions</i>	<< <i>inout</i> >> (p. 818) a <b>DDS_ConditionSeq</b> (p. 1351) object where the list of attached conditions will be returned.

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_attach\_condition** (p. 882)

**DDS\_AsyncWaitSet\_detach\_condition** (p. 881)

## 4.77.8.9 DDS\_AsyncWaitSet\_stop()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_stop (
    DDS_AsyncWaitSet * self )
```

Initiates the stop procedure on this **DDS\_AsyncWaitSet** (p. 874) that will stop the asynchronous wait.

This operation is equivalent to calling **DDS\_AsyncWaitSet\_stop\_with\_completion\_token** (p. 885) providing **DDS\_↔ASYNC\_WAITSET\_COMPLETION\_TOKEN\_USE\_IMPLICIT\_AND\_WAIT** (p. 894) as a `completion_token`.

This operation will block until the stop request completes. Upon successful return, it is guaranteed that this **DDS\_↔AsyncWaitSet** (p. 874) stopped the asynchronous wait and dispatch.

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_start\_with\_completion\_token** (p. 886)

**DDS\_AsyncWaitSet\_stop** (p. 885)

## 4.77.8.10 DDS\_AsyncWaitSet\_stop\_with\_completion\_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_stop_with_completion_token (
    DDS_AsyncWaitSet * self,
    DDS_AsyncWaitSetCompletionToken * completion_token )
```

Initiates the stop procedure on this **DDS\_AsyncWaitSet** (p. 874) that will stop the asynchronous wait.

If this operation succeeds, a stop request has been scheduled and your application can use the provided `completion_token` to wait for this **DDS\_AsyncWaitSet** (p. 874) to process the request. If the **DDS\_Async\_↔WaitSetCompletionToken\_wait** (p. 880) operation returns successfully, it is guaranteed that the thread pool has been deleted and this **DDS\_AsyncWaitSet** (p. 874) no longer process any of the attached **DDS\_Condition** (p. 1169) objects.

Once this **DDS\_AsyncWaitSet** (p. 874) is stopped, the **DDS\_Condition\_dispatch** (p. 1174) will no longer be called on any of the attached **DDS\_Condition** (p. 1169), no matter what their trigger value is.

The stop procedure causes the **DDS\_AsyncWaitSet** (p. 874) to delete all the threads within the thread pool, which involves the underlying operating system to release the associated thread stack and context of each thread. If a **DDS\_↔\_AsyncWaitSetListener** (p. 1326) is installed, this **DDS\_AsyncWaitSet** (p. 874) will sequentially invoke the **DDS\_↔\_AsyncWaitSetListener::on\_thread\_deleted** (p. 1327) once per deleted thread.

If this **DDS\_AsyncWaitSet** (p. 874) is already stopped, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>completion_token</i>	<< <i>inout</i> >> (p. 818) a valid <b>DDS_AsyncWaitSetCompletionToken</b> (p. 877) instance that can be used by your application to wait for the stop request to complete. You can provide one of the special sentinels <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT</b> (p. 894) and <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE</b> (p. 894).

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_stop** (p. 885)

**DDS\_AsyncWaitSet\_start\_with\_completion\_token** (p. 886)

4.77.8.11 **DDS\_AsyncWaitSet\_start()**

```
DDS_ReturnCode_t DDS_AsyncWaitSet_start (
    DDS_AsyncWaitSet * self )
```

Initiates the asynchronous wait on this **DDS\_AsyncWaitSet** (p. 874).

This operation is equivalent to calling **DDS\_AsyncWaitSet\_start\_with\_completion\_token** (p. 886) providing **DDS\_↔ASYNC\_WAITSET\_COMPLETION\_TOKEN\_USE\_IMPLICIT\_AND\_WAIT** (p. 894) as a *completion\_token*.

This operation blocks until the start request completes. Upon successful return, it is guaranteed that this **DDS\_Async\_↔WaitSet** (p. 874) has initiated the asynchronous wait and dispatch.

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_start\_with\_completion\_token** (p. 886)

**DDS\_AsyncWaitSet\_stop** (p. 885)

## 4.77.8.12 DDS\_AsyncWaitSet\_start\_with\_completion\_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_start_with_completion_token (
    DDS_AsyncWaitSet * self,
    DDS_AsyncWaitSetCompletionToken * completion_token )
```

Initiates the asynchronous wait on this **DDS\_AsyncWaitSet** (p. 874).

If this operation succeeds, a start request has been scheduled and your application can use the provided `completion_token` to wait for this **DDS\_AsyncWaitSet** (p. 874) to process the request. If the **DDS\_AsyncWaitSetCompletionToken\_wait** (p. 880) operation returns successfully, it is guaranteed that the thread pool has been created and the leader thread is waiting for the attached **DDS\_Condition** (p. 1169) to trigger.

Once this **DDS\_AsyncWaitSet** (p. 874) is started, attached **DDS\_Condition** (p. 1169) will be dispatched through the **DDS\_Condition\_dispatch** (p. 1174) operation when they trigger.

The start procedure causes the **DDS\_AsyncWaitSet** (p. 874) to spawn all the threads within the thread pool, which involves the underlying operating system to allocate the associated thread stack and context for each thread. If a **DDS\_AsyncWaitSetListener** (p. 1326) is installed, this **DDS\_AsyncWaitSet** (p. 874) will sequentially invoke the **DDS\_AsyncWaitSetListener::on\_thread\_spawned** (p. 1327) once per spawned thread.

A **DDS\_AsyncWaitSet** (p. 874) can be restarted after a stop. If this **DDS\_AsyncWaitSet** (p. 874) is already started, this operation will return immediately with success, and waiting on the `completion_token` will also return immediately with success.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>completion_token</i>	<< <i>inout</i> >> (p. 818) a valid <b>DDS_AsyncWaitSetCompletionToken</b> (p. 877) instance that can be used by your application to wait for the start request to complete. You can provide one of the special sentinels <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT</b> (p. 894) and <b>DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE</b> (p. 894).

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_start** (p. 886)

**DDS\_AsyncWaitSet\_stop\_with\_completion\_token** (p. 885)

**DDS\_WaitSet\_wait** (p. 1180)

#### 4.77.8.13 DDS\_AsyncWaitSet\_is\_started()

```
DDS_Boolean DDS_AsyncWaitSet_is_started (  
    DDS_AsyncWaitSet * self )
```

Returns whether this **DDS\_AsyncWaitSet** (p. 874) is started.

A **DDS\_AsyncWaitSet** (p. 874) is started if all the threads within the thread pool have been created and are running.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if started.

## 4.77.8.14 DDS\_AsyncWaitSet\_create\_completion\_token()

```
DDS_AsyncWaitSetCompletionToken * DDS_AsyncWaitSet_create_completion_token (
    DDS_AsyncWaitSet * self )
```

Creates a new **DDS\_AsyncWaitSetCompletionToken** (p. 877).

All the created **DDS\_AsyncWaitSetCompletionToken** (p. 877) must be deleted by calling **DDS\_AsyncWaitSet\_delete\_completion\_token** (p. 889).

## Returns

A new **DDS\_AsyncWaitSetCompletionToken** (p. 877) or NULL on error.

## See also

**DDS\_AsyncWaitSet\_delete\_completion\_token** (p. 889)

**DDS\_AsyncWaitSet\_delete** (p. 892)

## 4.77.8.15 DDS\_AsyncWaitSet\_delete\_completion\_token()

```
DDS_ReturnCode_t DDS_AsyncWaitSet_delete_completion_token (
    DDS_AsyncWaitSet * self,
    DDS_AsyncWaitSetCompletionToken * completion_token )
```

Deletes a **DDS\_AsyncWaitSetCompletionToken** (p. 877) previously created from this **DDS\_AsyncWaitSet** (p. 874).

This operation will fail if the specified `completion_token` was not created from this **DDS\_AsyncWaitSet** (p. 874).

This operation will fail if the specified `completion_token` is associated with a request that has not completed yet.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>completion_token</i>	<< <i>inout</i> >> (p. 818) a valid <b>DDS_AsyncWaitSetCompletionToken</b> (p. 877) created from this <b>DDS_AsyncWaitSet</b> (p. 874).

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_AsyncWaitSet\_create\_completion\_token** (p. 889)

**DDS\_AsyncWaitSet\_delete** (p. 892)

4.77.8.16 **DDS\_AsyncWaitSet\_new()**

```
DDS_AsyncWaitSet * DDS_AsyncWaitSet_new (
    const struct DDS_AsyncWaitSetProperty_t * property )
```

Single-argument constructor that allows creating a a **DDS\_AsyncWaitSet** (p. 874) with custom behavior.

You can provide **DDS\_ASYNC\_WAITSET\_PROPERTY\_DEFAULT** (p. 894) as *property* to create an **DDS\_AsyncWaitSet** (p. 874) with default behavior.

The **DDS\_AsyncWaitSet** (p. 874) is created with no listener installed.

## Parameters

<i>property</i>	<< <i>in</i> >> (p. 818) configuration <b>DDS_AsyncWaitSetProperty_t</b> (p. 1327)
-----------------	------------------------------------------------------------------------------------

## Returns

A new **DDS\_AsyncWaitSet** (p. 874) or NULL if one could not be allocated.

4.77.8.17 **DDS\_AsyncWaitSet\_new\_with\_listener()**

```
DDS_AsyncWaitSet * DDS_AsyncWaitSet_new_with_listener (
    const struct DDS_AsyncWaitSetProperty_t * property,
    struct DDS_AsyncWaitSetListener * listener )
```

---

Constructor that allows specifying a **DDS\_AsyncWaitSetListener** (p. 1326).

Creates a new **DDS\_AsyncWaitSet** (p. 874) with the specified property **DDS\_AsyncWaitSetProperty\_t** (p. 1327) and **DDS\_AsyncWaitSetListener** (p. 1326).

## Parameters

<i>property</i>	<< <i>in</i> >> (p. 818) configuration <b>DDS_AsyncWaitSetProperty_t</b> (p. 1327)
<i>listener</i>	<< <i>in</i> >> (p. 818) the <b>DDS_AsyncWaitSetListener</b> (p. 1326). Cannot be NULL.

## Returns

A new **DDS\_AsyncWaitSet** (p. 874) or NULL if one could not be allocated.

4.77.8.18 **DDS\_AsyncWaitSet\_new\_with\_thread\_factory()**

```
DDS_AsyncWaitSet * DDS_AsyncWaitSet_new_with_thread_factory (
    const struct DDS_AsyncWaitSetProperty_t * property,
    struct DDS_AsyncWaitSetListener * listener,
    struct DDS_ThreadFactory * thread_factory )
```

Constructor with arguments that allow specifying behavior different than the default one, including specifying a **DDS\_↔ThreadFactory** (p. 1763) for the creation and deletion of the threads within the thread pool.

This operation extends **DDS\_AsyncWaitSet\_new\_with\_listener** (p. 890) by allowing to provide a **DDS\_ThreadFactory** (p. 1763)

## Parameters

<i>property</i>	<< <i>in</i> >> (p. 818) configuration <b>DDS_AsyncWaitSetProperty_t</b> (p. 1327)
<i>listener</i>	<< <i>in</i> >> (p. 818) the <b>DDS_AsyncWaitSetListener</b> (p. 1326). Cannot be NULL.
<i>thread_factory</i>	<< <i>in</i> >> (p. 818) <b>DDS_ThreadFactory</b> (p. 1763) for the creation and deletion of threads.

## Returns

A new **DDS\_AsyncWaitSet** (p. 874) or NULL if one could not be allocated.

4.77.8.19 **DDS\_AsyncWaitSet\_delete()**

```
DDS_ReturnCode_t DDS_AsyncWaitSet_delete (
    DDS_AsyncWaitSet * self )
```

Deletes a **DDS\_AsyncWaitSet** (p. 874).

If the **DDS\_AsyncWaitSet** (p. 874) is started, this operation will initiate the stop procedure and block until it completes.

The deletion will fail if there are outstanding **DDS\_AsyncWaitSetCompletionToken** (p. 877) that have not been deleted.

Any outstanding **DDS\_AsyncWaitSet** (p. 874) must be deleted before finalizing the **DDS\_DomainParticipantFactory** (p. 28). Otherwise undefined behavior may occur.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## See also

**DDS\_AsyncWaitSet\_new** (p. 890)

## 4.77.8.20 DDS\_DataReaderStatusConditionHandler\_new()

```
DDS_DataReaderStatusConditionHandler * DDS_DataReaderStatusConditionHandler_new (
    DDS_DataReader * reader,
    const struct DDS_DataReaderListener * listener,
    DDS_StatusMask listener_mask )
```

Creates a new **DDS\_DataReaderStatusConditionHandler** (p. 879) instance.

The created DataReaderStatusConditionHandler can set as **DDS\_ConditionHandler** (p. 1350) in any **DDS\_Condition** (p. 1169) and will demultiplex the specified status changes from the specified **DDS\_DataReader** (p. 608)

## Parameters

<i>reader</i>	<< <i>in</i> >> (p. 818) The <b>DDS_DataReader</b> (p. 608) for which the status changes are demultiplexed to the specified <i>listener</i>
<i>listener</i>	<< <i>in</i> >> (p. 818) that receives the status changes notifications from the specified <i>reader</i> .
<i>listener_mask</i>	<< <i>in</i> >> (p. 818) Specifies which status changes from the reader to demultiplex to the <i>listener</i> .

## Returns

A new instance or NULL on error.

## See also

**DDS\_DataReader** (p. 608)

**DDS\_DataReader\_set\_listener** (p. 682)

**DDS\_StatusCondition** (p. 1170)

**DDS\_ConditionHandler** (p. 1350)

#### 4.77.8.21 DDS\_DataReaderStatusConditionHandler\_delete()

```
DDS_ReturnCode_t DDS_DataReaderStatusConditionHandler_delete (
    DDS_DataReaderStatusConditionHandler * self )
```

Deletes a **DDS\_DataReaderStatusConditionHandler** (p.879) instance previously created with **DDS\_DataReaderStatusConditionHandler\_new** (p.893).

Returns

One of the **Standard Return Codes** (p.1024)

### 4.77.9 Variable Documentation

#### 4.77.9.1 DDS\_ASYNC\_WAITSET\_COMPLETION\_TOKEN\_USE\_IMPLICIT\_AND\_WAIT

```
DDS_AsyncWaitSetCompletionToken* const DDS_ASYNC_WAITSET_COMPLETION_TOKEN_USE_IMPLICIT_AND_WAIT
```

For the operations that allow an **DDS\_AsyncWaitSetCompletionToken** (p.877), this sentinel can be provided to indicate an **DDS\_AsyncWaitSet** (p.874) to use the implicit completion token and wait on it for request completion.

If this sentinel is used, the **DDS\_AsyncWaitSet** (p.874) will use the completion token associated with the calling thread and will wait with an infinite timeout until the request completes successfully.

#### 4.77.9.2 DDS\_ASYNC\_WAITSET\_COMPLETION\_TOKEN\_IGNORE

```
DDS_AsyncWaitSetCompletionToken* const DDS_ASYNC_WAITSET_COMPLETION_TOKEN_IGNORE
```

For the operations that allow an **DDS\_AsyncWaitSetCompletionToken** (p.877), this sentinel can be provided to indicate an **DDS\_AsyncWaitSet** (p.874) to perform the action associating a 'null' completion token.

This sentinel is a realization of the null object pattern of an **DDS\_AsyncWaitSetCompletionToken** (p.877). If this object is provided to a **DDS\_AsyncWaitSet** (p.874) operation, the resulting operation request will be associated with a 'null' completion token that behaves as no-op.

When 'nul' completion token is provided, the **DDS\_AsyncWaitSet** (p.874) operation returns immediately after it issues the internal request, and there is no mean for your application to wait for the request to complete.

You can use this sentinel when your application can operate on an **DDS\_AsyncWaitSet** (p.874) without needing to know when operation requests complete or your application uses other strategies to synchronize resources.

This sentinel is also useful when you need to perform operations on **DDS\_AsyncWaitSet** (p.874) from within one of the threads from its thread pool, where waiting on a valid **DDS\_AsyncWaitSetCompletionToken** (p.877) is forbidden.

### 4.77.9.3 DDS\_ASYNC\_WAITSET\_PROPERTY\_DEFAULT

```
const struct DDS_AsyncWaitSetProperty_t DDS_ASYNC_WAITSET_PROPERTY_DEFAULT
```

Constant that defines the default property for a **DDS\_AsyncWaitSet** (p. 874).

Value: `wait_set_property = DDS_WaitSetProperty_t_INITIALIZER` (p. 1168), `thread_pool_size = 1`, `thread_settings DDS_THREAD_SETTINGS_DEFAULT`, `thread_base_name = NULL` `wait_timeout = DDS_DURATION_INFINITE` (p. 1011) `level = 1`

## 4.78 Participant Built-in Topics

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connext.

### Data Structures

- struct **DDS\_ParticipantBuiltinTopicData**  
*Entry created when a DomainParticipant object is discovered.*
- struct **DDS\_ParticipantBuiltinTopicDataSeq**  
*Instantiates `FooSeq` (p. 1845) < `DDS_ParticipantBuiltinTopicData` (p. 1616) > .*
- struct **DDS\_ParticipantBuiltinTopicDataTypeSupport**  
*Instantiates `TypeSupport` < `DDS_ParticipantBuiltinTopicData` (p. 1616) > .*

### Typedefs

### Variables

- const char \* **DDS\_PARTICIPANT\_TOPIC\_NAME**  
*Participant topic name.*

### 4.78.1 Detailed Description

Builtin topic for accessing information about the DomainParticipants discovered by RTI Connext.

### 4.78.2 Typedef Documentation

#### 4.78.2.1 DDS\_ParticipantBuiltinTopicData

```
typedef struct DDS_ParticipantBuiltinTopicData DDS_ParticipantBuiltinTopicData
```

Entry created when a DomainParticipant object is discovered.

Data associated with the built-in topic **DDS\_PARTICIPANT\_TOPIC\_NAME** (p. 896). It contains QoS policies and additional information that apply to the remote **DDS\_DomainParticipant** (p. 72).

See also

**DDS\_PARTICIPANT\_TOPIC\_NAME** (p. 896)

**DDS\_ParticipantBuiltinTopicDataDataReader** (p. 896)

#### 4.78.2.2 DDS\_ParticipantBuiltinTopicDataDataReader

```
typedef struct DDS_ParticipantBuiltinTopicDataDataReader DDS_ParticipantBuiltinTopicDataData↔
Reader
```

Instantiates `DataReader < DDS_ParticipantBuiltinTopicData (p. 1616) > .`

**DDS\_DataReader** (p. 608) of topic **DDS\_PARTICIPANT\_TOPIC\_NAME** (p. 896) used for accessing **DDS\_↔ParticipantBuiltinTopicData** (p. 1616) of the remote **DDS\_DomainParticipant** (p. 72).

Instantiates:

`<<generic>> (p. 818) FooDataReader (p. 1845)`

See also

**DDS\_ParticipantBuiltinTopicData** (p. 1616)

**DDS\_PARTICIPANT\_TOPIC\_NAME** (p. 896)

### 4.78.3 Variable Documentation

#### 4.78.3.1 DDS\_PARTICIPANT\_TOPIC\_NAME

```
const char* DDS_PARTICIPANT_TOPIC_NAME [extern]
```

Participant topic name.

Topic name of **DDS\_ParticipantBuiltinTopicDataDataReader** (p. 896)

See also

**DDS\_ParticipantBuiltinTopicData** (p. 1616)

**DDS\_ParticipantBuiltinTopicDataDataReader** (p. 896)

## 4.79 Topic Built-in Topics

Builtin topic for accessing information about the Topics discovered by RTI Connex.

### Data Structures

- struct **DDS\_TopicBuiltinTopicData**  
*Entry created when a Topic object discovered.*
- struct **DDS\_TopicBuiltinTopicDataSeq**  
*Instantiates `FooSeq` (p. 1845) < `DDS_TopicBuiltinTopicData` (p. 1770) > .*
- struct **DDS\_TopicBuiltinTopicDataTypeSupport**  
*Instantiates `TypeSupport` < `DDS_TopicBuiltinTopicData` (p. 1770) > .*

### Typedefs

- typedef struct **DDS\_TopicBuiltinTopicData DDS\_TopicBuiltinTopicData**  
*Entry created when a Topic object discovered.*
- typedef struct **DDS\_TopicBuiltinTopicDataDataReader DDS\_TopicBuiltinTopicDataDataReader**  
*Instantiates `DataReader` < `DDS_TopicBuiltinTopicData` (p. 1770) > .*

### Variables

- const char \* **DDS\_TOPIC\_TOPIC\_NAME**  
*Topic topic name.*

#### 4.79.1 Detailed Description

Builtin topic for accessing information about the Topics discovered by RTI Connex.

#### 4.79.2 Typedef Documentation

#### 4.79.2.1 DDS\_TopicBuiltinTopicData

```
typedef struct DDS_TopicBuiltinTopicData DDS_TopicBuiltinTopicData
```

Entry created when a Topic object discovered.

Data associated with the built-in topic **DDS\_TOPIC\_TOPIC\_NAME** (p. 898). It contains QoS policies and additional information that apply to the remote **DDS\_Topic** (p. 172).

Note: The **DDS\_TopicBuiltinTopicData** (p. 1770) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS\_PublicationBuiltinTopicData** (p. 1648) and **DDS\_SubscriptionBuiltinTopicData** (p. 1748)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

See also

**DDS\_TOPIC\_TOPIC\_NAME** (p. 898)

**DDS\_TopicBuiltinTopicDataDataReader** (p. 898)

#### 4.79.2.2 DDS\_TopicBuiltinTopicDataDataReader

```
typedef struct DDS_TopicBuiltinTopicDataDataReader DDS_TopicBuiltinTopicDataDataReader
```

Instantiates `DataReader < DDS_TopicBuiltinTopicData (p. 1770) >` .

**DDS\_DataReader** (p. 608) of topic **DDS\_TOPIC\_TOPIC\_NAME** (p. 898) used for accessing **DDS\_TopicBuiltinTopicData** (p. 1770) of the remote **DDS\_Topic** (p. 172).

Note: The **DDS\_TopicBuiltinTopicData** (p. 1770) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS\_PublicationBuiltinTopicData** (p. 1648) and **DDS\_SubscriptionBuiltinTopicData** (p. 1748)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

Instantiates:

`<<generic>>` (p. 818) **FooDataReader** (p. 1845)

See also

**DDS\_TopicBuiltinTopicData** (p. 1770)

**DDS\_TOPIC\_TOPIC\_NAME** (p. 898)

### 4.79.3 Variable Documentation

### 4.79.3.1 DDS\_TOPIC\_TOPIC\_NAME

```
const char* DDS_TOPIC_TOPIC_NAME [extern]
```

Topic topic name.

Topic name of `DDS_TopicBuiltinTopicDataDataReader` (p. 898)

See also

`DDS_TopicBuiltinTopicData` (p. 1770)

`DDS_TopicBuiltinTopicDataDataReader` (p. 898)

## 4.80 Publication Built-in Topics

Builtin topic for accessing information about the Publications discovered by RTI Connex.

### Data Structures

- struct `DDS_PublicationBuiltinTopicData`  
*Entry created when a `DDS_DataWriter` (p. 478) is discovered in association with its Publisher.*
- struct `DDS_PublicationBuiltinTopicDataSeq`  
*Instantiates `FooSeq` (p. 1845) < `DDS_PublicationBuiltinTopicData` (p. 1648) > .*
- struct `DDS_PublicationBuiltinTopicDataTypeSupport`  
*Instantiates `TypeSupport` < `DDS_PublicationBuiltinTopicData` (p. 1648) > .*

### Typedefs

- typedef struct `DDS_PublicationBuiltinTopicData DDS_PublicationBuiltinTopicData`  
*Entry created when a `DDS_DataWriter` (p. 478) is discovered in association with its Publisher.*
- typedef struct `DDS_PublicationBuiltinTopicDataDataReader DDS_PublicationBuiltinTopicDataDataReader`  
*Instantiates `DataReader` < `DDS_PublicationBuiltinTopicData` (p. 1648) > .*

### Variables

- const char \* `DDS_PUBLICATION_TOPIC_NAME`  
*Publication topic name.*

### 4.80.1 Detailed Description

Builtin topic for accessing information about the Publications discovered by RTI Connex.

## 4.80.2 Typedef Documentation

### 4.80.2.1 DDS\_PublicationBuiltinTopicData

```
typedef struct DDS_PublicationBuiltinTopicData DDS_PublicationBuiltinTopicData
```

Entry created when a **DDS\_DataWriter** (p. 478) is discovered in association with its Publisher.

Data associated with the built-in topic **DDS\_PUBLICATION\_TOPIC\_NAME** (p. 900). It contains QoS policies and additional information that apply to the remote **DDS\_DataWriter** (p. 478) the related **DDS\_Publisher** (p. 436).

See also

**DDS\_PUBLICATION\_TOPIC\_NAME** (p. 900)

**DDS\_PublicationBuiltinTopicDataDataReader** (p. 900)

### 4.80.2.2 DDS\_PublicationBuiltinTopicDataDataReader

```
typedef struct DDS_PublicationBuiltinTopicDataDataReader DDS_PublicationBuiltinTopicDataData↔
Reader
```

Instantiates `DataReader < DDS_PublicationBuiltinTopicData (p. 1648) > .`

**DDS\_DataReader** (p. 608) of topic **DDS\_PUBLICATION\_TOPIC\_NAME** (p. 900) used for accessing **DDS\_↔PublicationBuiltinTopicData** (p. 1648) of the remote **DDS\_DataWriter** (p. 478) and the associated **DDS\_Publisher** (p. 436).

Instantiates:

`<<generic>> (p. 818) FooDataReader (p. 1845)`

See also

**DDS\_PublicationBuiltinTopicData** (p. 1648)

**DDS\_PUBLICATION\_TOPIC\_NAME** (p. 900)

## 4.80.3 Variable Documentation

### 4.80.3.1 DDS\_PUBLICATION\_TOPIC\_NAME

```
const char* DDS_PUBLICATION_TOPIC_NAME [extern]
```

Publication topic name.

Topic name of `DDS_PublicationBuiltinTopicDataDataReader` (p. 900)

See also

`DDS_PublicationBuiltinTopicData` (p. 1648)

`DDS_PublicationBuiltinTopicDataDataReader` (p. 900)

## 4.81 Subscription Built-in Topics

Builtin topic for accessing information about the Subscriptions discovered by RTI Connex.

### Data Structures

- struct `DDS_SubscriptionBuiltinTopicData`  
*Entry created when a `DDS_DataReader` (p. 608) is discovered in association with its Subscriber.*
- struct `DDS_SubscriptionBuiltinTopicDataSeq`  
*Instantiates `FooSeq` (p. 1845) < `DDS_SubscriptionBuiltinTopicData` (p. 1748) > .*
- struct `DDS_SubscriptionBuiltinTopicDataTypeSupport`  
*Instantiates `TypeSupport` < `DDS_SubscriptionBuiltinTopicData` (p. 1748) > .*

### Typedefs

- typedef struct `DDS_SubscriptionBuiltinTopicData DDS_SubscriptionBuiltinTopicData`  
*Entry created when a `DDS_DataReader` (p. 608) is discovered in association with its Subscriber.*
- typedef struct `DDS_SubscriptionBuiltinTopicDataDataReader DDS_SubscriptionBuiltinTopicDataDataReader`  
*Instantiates `DataReader` < `DDS_SubscriptionBuiltinTopicData` (p. 1748) > .*

### Variables

- const char \* `DDS_SUBSCRIPTION_TOPIC_NAME`  
*Subscription topic name.*

### 4.81.1 Detailed Description

Builtin topic for accessing information about the Subscriptions discovered by RTI Connex.

## 4.81.2 Typedef Documentation

### 4.81.2.1 DDS\_SubscriptionBuiltinTopicData

```
typedef struct DDS_SubscriptionBuiltinTopicData DDS_SubscriptionBuiltinTopicData
```

Entry created when a **DDS\_DataReader** (p. 608) is discovered in association with its Subscriber.

Data associated with the built-in topic **DDS\_SUBSCRIPTION\_TOPIC\_NAME** (p. 902). It contains QoS policies and additional information that apply to the remote **DDS\_DataReader** (p. 608) the related **DDS\_Subscriber** (p. 565).

See also

**DDS\_SUBSCRIPTION\_TOPIC\_NAME** (p. 902)

**DDS\_SubscriptionBuiltinTopicDataDataReader** (p. 902)

### 4.81.2.2 DDS\_SubscriptionBuiltinTopicDataDataReader

```
typedef struct DDS_SubscriptionBuiltinTopicDataDataReader DDS_SubscriptionBuiltinTopicDataData↔
Reader
```

Instantiates `DataReader < DDS_SubscriptionBuiltinTopicData (p. 1748) > .`

**DDS\_DataReader** (p. 608) of topic **DDS\_SUBSCRIPTION\_TOPIC\_NAME** (p. 902) used for accessing **DDS\_↔SubscriptionBuiltinTopicData** (p. 1748) of the remote **DDS\_DataReader** (p. 608) and the associated **DDS\_↔Subscriber** (p. 565).

Instantiates:

`<<generic>> (p. 818) FooDataReader` (p. 1845)

See also

**DDS\_SubscriptionBuiltinTopicData** (p. 1748)

**DDS\_SUBSCRIPTION\_TOPIC\_NAME** (p. 902)

## 4.81.3 Variable Documentation

### 4.81.3.1 DDS\_SUBSCRIPTION\_TOPIC\_NAME

```
const char* DDS_SUBSCRIPTION_TOPIC_NAME [extern]
```

Subscription topic name.

Topic name of **DDS\_SubscriptionBuiltinTopicDataDataReader** (p. 902)

See also

**DDS\_SubscriptionBuiltinTopicData** (p. 1748)

**DDS\_SubscriptionBuiltinTopicDataDataReader** (p. 902)

## 4.82 ServiceRequest Built-in Topic

Builtin topic for accessing requests from different services within RTI Connex.

### Data Structures

- struct **DDS\_ServiceRequest**  
*A request coming from one of the built-in services.*
- struct **DDS\_ServiceRequestSeq**  
*Instantiates FooSeq (p. 1845) < DDS\_ServiceRequest (p. 1736) > .*
- struct **DDS\_ServiceRequestTypeSupport**  
*Instantiates TypeSupport < DDS\_ServiceRequest (p. 1736) > .*

### Typedefs

- typedef struct **DDS\_ServiceRequest DDS\_ServiceRequest**  
*A request coming from one of the built-in services.*
- typedef struct **DDS\_ServiceRequestDataReader DDS\_ServiceRequestDataReader**  
*Instantiates DataReader < DDS\_ServiceRequest (p. 1736) > .*

### Variables

- const **DDS\_Long DDS\_UNKNOWN\_SERVICE\_REQUEST\_ID**  
*An invalid Service Id.*
- const **DDS\_Long DDS\_TOPIC\_QUERY\_SERVICE\_REQUEST\_ID**  
*Service Id for the DDS\_TopicQuery (p. 698) Service.*
- const **DDS\_Long DDS\_LOCATOR\_REACHABILITY\_SERVICE\_REQUEST\_ID**  
*Service Id for the Locator Reachability Service.*
- const **DDS\_Long DDS\_INSTANCE\_STATE\_SERVICE\_REQUEST\_ID**  
*Service Id for the Instance State Request service.*
- const **DDS\_Long DDS\_MONITORING\_LIBRARY\_COMMAND\_SERVICE\_REQUEST\_ID**  
*Service Id for RTI Monitoring Library 2.0 Command Service Request.*
- const **DDS\_Long DDS\_MONITORING\_LIBRARY\_REPLY\_SERVICE\_REQUEST\_ID**  
*Service Id for RTI Monitoring Library 2.0 Reply Service Requests.*
- const char \* **DDS\_SERVICE\_REQUEST\_TOPIC\_NAME**  
*Service Request topic name.*

## 4.82.1 Detailed Description

Builtin topic for accessing requests from different services within RTI Connex.

Currently, the **DDS\_TopicQuery** (p. 698), Locator Reachability Instance State Consistency and Controlability (part of Observability) all rely on this topic.

See also

**Topic Queries** (p. 695) for an explanation of how TopicQueries use ServiceRequests and how you can access the ServiceRequests for debugging purposes in the section **The Built-in ServiceRequest DataReader** (p. 697).

## 4.82.2 Typedef Documentation

### 4.82.2.1 DDS\_ServiceRequest

```
typedef struct DDS_ServiceRequest DDS_ServiceRequest
```

A request coming from one of the built-in services.

Data associated with the built-in topic **DDS\_SERVICE\_REQUEST\_TOPIC\_NAME** (p. 906). It contains service-specific information.

See also

**DDS\_SERVICE\_REQUEST\_TOPIC\_NAME** (p. 906)

**DDS\_ParticipantBuiltinTopicDataDataReader** (p. 896)

### 4.82.2.2 DDS\_ServiceRequestDataReader

```
typedef struct DDS_ServiceRequestDataReader DDS_ServiceRequestDataReader
```

Instantiates `DataReader < DDS_ServiceRequest (p. 1736) >` .

**DDS\_DataReader** (p. 608) of topic **DDS\_SERVICE\_REQUEST\_TOPIC\_NAME** (p. 906) used for accessing **DDS\_↔ServiceRequest** (p. 1736) samples.

Instantiates:

`<<generic>>` (p. 818) **FooDataReader** (p. 1845)

See also

**DDS\_ServiceRequest** (p. 1736)

**DDS\_SERVICE\_REQUEST\_TOPIC\_NAME** (p. 906)

### 4.82.3 Variable Documentation

#### 4.82.3.1 DDS\_UNKNOWN\_SERVICE\_REQUEST\_ID

```
const DDS_Long DDS_UNKNOWN_SERVICE_REQUEST_ID [extern]
```

An invalid Service Id.

#### 4.82.3.2 DDS\_TOPIC\_QUERY\_SERVICE\_REQUEST\_ID

```
const DDS_Long DDS_TOPIC_QUERY_SERVICE_REQUEST_ID [extern]
```

Service Id for the **DDS\_TopicQuery** (p. 698) Service.

#### 4.82.3.3 DDS\_LOCATOR\_REACHABILITY\_SERVICE\_REQUEST\_ID

```
const DDS_Long DDS_LOCATOR_REACHABILITY_SERVICE_REQUEST_ID [extern]
```

Service Id for the Locator Reachability Service.

#### 4.82.3.4 DDS\_INSTANCE\_STATE\_SERVICE\_REQUEST\_ID

```
const DDS_Long DDS_INSTANCE_STATE_SERVICE_REQUEST_ID [extern]
```

Service Id for the Instance State Request service.

#### 4.82.3.5 DDS\_MONITORING\_LIBRARY\_COMMAND\_SERVICE\_REQUEST\_ID

```
const DDS_Long DDS_MONITORING_LIBRARY_COMMAND_SERVICE_REQUEST_ID [extern]
```

Service Id for RTI Monitoring Library 2.0 Command Service Request.

RTI Monitoring Library 2.0 remote commands are sent using this service.

#### 4.82.3.6 DDS\_MONITORING\_LIBRARY\_REPLY\_SERVICE\_REQUEST\_ID

```
const DDS_Long DDS_MONITORING_LIBRARY_REPLY_SERVICE_REQUEST_ID [extern]
```

Service Id for RTI Monitoring Library 2.0 Reply Service Requests.

Replies to RTI Monitoring Library 2.0 remote commands are sent using this service.

#### 4.82.3.7 DDS\_SERVICE\_REQUEST\_TOPIC\_NAME

```
const char* DDS_SERVICE_REQUEST_TOPIC_NAME [extern]
```

Service Request topic name.

Topic name of the `DDS_ServiceRequestDataReader` (p. 904)

See also

`DDS_ServiceRequest` (p. 1736)

`DDS_ServiceRequestDataReader` (p. 904)

## 4.83 Common types and functions

Types and functions related to the built-in topics.

### Data Structures

- struct `DDS_Locator_t`
  - <<*extension*>> (p. 817) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.
- struct `DDS_LocatorSeq`
  - Declares IDL sequence < `DDS_Locator_t` (p. 1579) >
- struct `DDS_ProtocolVersion_t`
  - <<*extension*>> (p. 817) Type used to represent the version of the RTPS protocol.
- struct `DDS_VendorId_t`
  - <<*extension*>> (p. 817) Type used to represent the vendor of the service implementing the RTPS protocol.
- struct `DDS_ProductVersion_t`
  - <<*extension*>> (p. 817) Type used to represent the current version of RTI Connex.
- struct `DDS_TransportInfo_t`
  - Contains the `class_id` and `message_size_max` of an installed transport.
- struct `DDS_TransportInfoSeq`
  - Instantiates `FooSeq` (p. 1845) < `DDS_TransportInfo_t` (p. 1787) > .
- struct `DDS_BuiltinTopicKey_t`
  - The key type of the built-in topic types.
- struct `DDS_ContentFilterProperty_t`
  - <<*extension*>> (p. 817) Type used to provide all the required information to enable content filtering.

## Macros

- `#define DDS_LOCATOR_ADDRESS_LENGTH_MAX 16`  
*Declares length of address field in locator.*
- `#define DDS_PROTOCOLVERSION_1_0 { 1, 0 }`  
*The protocol version 1.0.*
- `#define DDS_PROTOCOLVERSION_1_1 { 1, 1 }`  
*The protocol version 1.1.*
- `#define DDS_PROTOCOLVERSION_1_2 { 1, 2 }`  
*The protocol version 1.2.*
- `#define DDS_PROTOCOLVERSION_2_0 { 2, 0 }`  
*The protocol version 2.0.*
- `#define DDS_PROTOCOLVERSION_2_1 { 2, 1 }`  
*The protocol version 2.1.*
- `#define DDS_PROTOCOLVERSION { 2, 1 }`  
*The most recent protocol version. Currently 2.1.*
- `#define DDS_VENDOR_ID_LENGTH_MAX 2`  
*Length of vendor id.*
- `#define DDS_PRODUCTVERSION_UNKNOWN`  
*The value used when the product version is unknown.*
- `#define DDS_BuiltinTopicKey_t_INITIALIZER`  
*Initializer for new Keys.*

## Typedefs

- `typedef struct DDS_Locator_t DDS_Locator_t`  
*<<extension>> (p. 817) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.*
- `typedef struct DDS_ProtocolVersion_t DDS_ProtocolVersion_t`  
*<<extension>> (p. 817) Type used to represent the version of the RTPS protocol.*
- `typedef struct DDS_BuiltinTopicKey_t DDS_BuiltinTopicKey_t`  
*The key type of the built-in topic types.*

## Functions

- `DDS_Boolean DDS_BuiltinTopicKey_equals (const DDS_BuiltinTopicKey_t *self, const DDS_BuiltinTopicKey_t *other)`  
*Compares this Key with another Key for equality.*
- `void DDS_BuiltinTopicKey_copy ( DDS_BuiltinTopicKey_t *dst, const DDS_BuiltinTopicKey_t *src)`  
*Copies another Key into this Key.*
- `void DDS_BuiltinTopicKey_to_guid (const DDS_BuiltinTopicKey_t *self, DDS_GUID_t *dst)`  
*Converts this Key into a GUID.*
- `void DDS_BuiltinTopicKey_from_guid ( DDS_BuiltinTopicKey_t *self, const DDS_GUID_t *src)`  
*Initializes this Key from the input GUID.*
- `DDS_Boolean DDS_BuiltinTopicKey_to_instance_handle (const DDS_BuiltinTopicKey_t *self, DDS_InstanceHandle_t *dst)`  
*Converts this Key into an InstanceHandle.*
- `DDS_Boolean DDS_BuiltinTopicKey_from_instance_handle ( DDS_BuiltinTopicKey_t *self, const DDS_InstanceHandle_t *src)`  
*Initializes this Key from the input InstanceHandle.*

## Variables

- const struct **DDS\_Locator\_t DDS\_LOCATOR\_INVALID**  
*An invalid locator.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_INVALID**  
*Locator of this kind is invalid.*
- const **DDS\_UnsignedLong DDS\_LOCATOR\_PORT\_INVALID**  
*An invalid port.*
- const **DDS\_Octet DDS\_LOCATOR\_ADDRESS\_INVALID [ DDS\_LOCATOR\_ADDRESS\_LENGTH\_MAX]**  
*An invalid address.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_UDPv4**  
*A locator for a UDPv4 address.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_UDPv4\_WAN**  
*A locator for a UDPv4 asymmetric transport address.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_SHMEM**  
*A locator for an address accessed via shared memory.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_SHMEM\_510**  
*A locator for an address accessed via shared memory for RTI Connex 5.1.0 and earlier.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_UDPv6**  
*A locator for a UDPv6 address.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_UDPv6\_510**  
*A locator for a UDPv6 address for RTI Connex 5.1.0 and earlier.*
- const **DDS\_Long DDS\_LOCATOR\_KIND\_RESERVED**  
*Locator of this kind is reserved.*

### 4.83.1 Detailed Description

Types and functions related to the built-in topics.

### 4.83.2 Macro Definition Documentation

#### 4.83.2.1 DDS\_LOCATOR\_ADDRESS\_LENGTH\_MAX

```
#define DDS_LOCATOR_ADDRESS_LENGTH_MAX 16
```

Declares length of address field in locator.

#### 4.83.2.2 DDS\_PROTOCOLVERSION\_1\_0

```
#define DDS_PROTOCOLVERSION_1_0 { 1, 0 }
```

The protocol version 1.0.

#### 4.83.2.3 DDS\_PROTOCOLVERSION\_1\_1

```
#define DDS_PROTOCOLVERSION_1_1 { 1, 1 }
```

The protocol version 1.1.

#### 4.83.2.4 DDS\_PROTOCOLVERSION\_1\_2

```
#define DDS_PROTOCOLVERSION_1_2 { 1, 2 }
```

The protocol version 1.2.

#### 4.83.2.5 DDS\_PROTOCOLVERSION\_2\_0

```
#define DDS_PROTOCOLVERSION_2_0 { 2, 0 }
```

The protocol version 2.0.

#### 4.83.2.6 DDS\_PROTOCOLVERSION\_2\_1

```
#define DDS_PROTOCOLVERSION_2_1 { 2, 1 }
```

The protocol version 2.1.

#### 4.83.2.7 DDS\_PROTOCOLVERSION

```
#define DDS_PROTOCOLVERSION { 2, 1 }
```

The most recent protocol version. Currently 2.1.

#### 4.83.2.8 DDS\_VENDOR\_ID\_LENGTH\_MAX

```
#define DDS_VENDOR_ID_LENGTH_MAX 2
```

Length of vendor id.

#### 4.83.2.9 DDS\_PRODUCTVERSION\_UNKNOWN

```
#define DDS_PRODUCTVERSION_UNKNOWN
```

**Value:**

```
{ \
  DDS_PRODUCTVERSION_MAJOR_UNKNOWN, \
  DDS_PRODUCTVERSION_MINOR_UNKNOWN, \
  DDS_PRODUCTVERSION_RELEASE_UNKNOWN, \
  DDS_PRODUCTVERSION_REVISION_UNKNOWN \
}
```

The value used when the product version is unknown.

#### 4.83.2.10 DDS\_BuiltinTopicKey\_t\_INITIALIZER

```
#define DDS_BuiltinTopicKey_t_INITIALIZER
```

Initializer for new Keys.

### 4.83.3 Typedef Documentation

#### 4.83.3.1 DDS\_Locator\_t

```
typedef struct DDS_Locator_t DDS_Locator_t
```

<<**extension**>> (p. 817) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

#### 4.83.3.2 DDS\_ProtocolVersion\_t

```
typedef struct DDS_ProtocolVersion_t DDS_ProtocolVersion_t
```

<<**extension**>> (p. 817) Type used to represent the version of the RTPS protocol.

### 4.83.3.3 DDS\_BuiltinTopicKey\_t

```
typedef struct DDS_BuiltinTopicKey_t DDS_BuiltinTopicKey_t
```

The key type of the built-in topic types.

Each remote **DDS\_Entity** (p. 1160) to be discovered can be uniquely identified by this key. This is the key of all the built-in topic data types.

See also

**DDS\_ParticipantBuiltinTopicData** (p. 1616)

**DDS\_TopicBuiltinTopicData** (p. 1770)

**DDS\_PublicationBuiltinTopicData** (p. 1648)

**DDS\_SubscriptionBuiltinTopicData** (p. 1748)

## 4.83.4 Function Documentation

### 4.83.4.1 DDS\_BuiltinTopicKey\_equals()

```
DDS_Boolean DDS_BuiltinTopicKey_equals (
    const DDS_BuiltinTopicKey_t * self,
    const DDS_BuiltinTopicKey_t * other )
```

Compares this Key with another Key for equality.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) This Key. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 818) The other Key to be compared with this Key. Cannot be NULL.

Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the two Keys have equal values, or **DDS\_BOOLEAN\_FALSE** (p. 1004) otherwise.

### 4.83.4.2 DDS\_BuiltinTopicKey\_copy()

```
void DDS_BuiltinTopicKey_copy (
    DDS_BuiltinTopicKey_t * dst,
    const DDS_BuiltinTopicKey_t * src )
```

Copies another Key into this Key.

## Parameters

<i>dst</i>	<< <b>out</b> >> (p. 818) This Key. Cannot be NULL.
<i>src</i>	<< <b>in</b> >> (p. 818) The other Key to be copied. Cannot be NULL.

**4.83.4.3 DDS\_BuiltinTopicKey\_to\_guid()**

```
void DDS_BuiltinTopicKey_to_guid (
    const DDS_BuiltinTopicKey_t * self,
    DDS_GUID_t * dst )
```

Converts this Key into a GUID.

## Parameters

<i>self</i>	<< <b>in</b> >> (p. 818) This Key. Cannot be NULL.
<i>dst</i>	<< <b>out</b> >> (p. 818) The destination GUID. Cannot be NULL.

**4.83.4.4 DDS\_BuiltinTopicKey\_from\_guid()**

```
void DDS_BuiltinTopicKey_from_guid (
    DDS_BuiltinTopicKey_t * self,
    const DDS_GUID_t * src )
```

Initializes this Key from the input GUID.

## Parameters

<i>self</i>	<< <b>out</b> >> (p. 818) This Key. Cannot be NULL.
<i>src</i>	<< <b>in</b> >> (p. 818) The GUID to be used to initialize this Key. Cannot be NULL.

**4.83.4.5 DDS\_BuiltinTopicKey\_to\_instance\_handle()**

```
DDS_Boolean DDS_BuiltinTopicKey_to_instance_handle (
    const DDS_BuiltinTopicKey_t * self,
    DDS_InstanceHandle_t * dst )
```

Converts this Key into an InstanceHandle.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) This Key. Cannot be NULL.
<i>dst</i>	<< <i>out</i> >> (p. 818) The destination InstanceHandle. Cannot be NULL.

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) on success or **DDS\_BOOLEAN\_FALSE** (p. 1004) on failure

## 4.83.4.6 DDS\_BuiltinTopicKey\_from\_instance\_handle()

```
DDS_Boolean DDS_BuiltinTopicKey_from_instance_handle (
    DDS_BuiltinTopicKey_t * self,
    const DDS_InstanceHandle_t * src )
```

Initializes this Key from the input InstanceHandle.

## Parameters

<i>self</i>	<< <i>out</i> >> (p. 818) This Key. Cannot be NULL.
<i>src</i>	<< <i>in</i> >> (p. 818) The InstanceHandle to be used to initialize this Key. Cannot be NULL.

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) on success or **DDS\_BOOLEAN\_FALSE** (p. 1004) on failure

## 4.83.5 Variable Documentation

## 4.83.5.1 DDS\_LOCATOR\_INVALID

```
const struct DDS_Locator_t DDS_LOCATOR_INVALID [extern]
```

An invalid locator.

## 4.83.5.2 DDS\_LOCATOR\_KIND\_INVALID

```
const DDS_Long DDS_LOCATOR_KIND_INVALID [extern]
```

Locator of this kind is invalid.

#### 4.83.5.3 DDS\_LOCATOR\_PORT\_INVALID

```
const DDS_UnsignedLong DDS_LOCATOR_PORT_INVALID [extern]
```

An invalid port.

#### 4.83.5.4 DDS\_LOCATOR\_ADDRESS\_INVALID

```
const DDS_Octet DDS_LOCATOR_ADDRESS_INVALID[ DDS_LOCATOR_ADDRESS_LENGTH_MAX] [extern]
```

An invalid address.

#### 4.83.5.5 DDS\_LOCATOR\_KIND\_UDPv4

```
const DDS_Long DDS_LOCATOR_KIND_UDPv4 [extern]
```

A locator for a UDPv4 address.

#### 4.83.5.6 DDS\_LOCATOR\_KIND\_UDPv4\_WAN

```
const DDS_Long DDS_LOCATOR_KIND_UDPv4_WAN [extern]
```

A locator for a UDPv4 asymmetric transport address.

#### 4.83.5.7 DDS\_LOCATOR\_KIND\_SHMEM

```
const DDS_Long DDS_LOCATOR_KIND_SHMEM [extern]
```

A locator for an address accessed via shared memory.

#### 4.83.5.8 DDS\_LOCATOR\_KIND\_SHMEM\_510

```
const DDS_Long DDS_LOCATOR_KIND_SHMEM_510 [extern]
```

A locator for an address accessed via shared memory for RTI Connex 5.1.0 and earlier.

#### 4.83.5.9 DDS\_LOCATOR\_KIND\_UDPv6

```
const DDS_Long DDS_LOCATOR_KIND_UDPv6 [extern]
```

A locator for a UDPv6 address.

#### 4.83.5.10 DDS\_LOCATOR\_KIND\_UDPv6\_510

```
const DDS_Long DDS_LOCATOR_KIND_UDPv6_510 [extern]
```

A locator for a UDPv6 address for RTI Connex 5.1.0 and earlier.

#### 4.83.5.11 DDS\_LOCATOR\_KIND\_RESERVED

```
const DDS_Long DDS_LOCATOR_KIND_RESERVED [extern]
```

Locator of this kind is reserved.

## 4.84 String Built-in Type

Built-in type consisting of a single character string.

### Data Structures

- struct **DDS\_StringTypeSupport**  
    <<*interface*>> (p. 818) *String type support.*

### Typedefs

- typedef struct **DDS\_StringDataWriter DDS\_StringDataWriter**  
    <<*interface*>> (p. 818) *Instantiates DataWriter < char\* >.*
- typedef struct **DDS\_StringDataReader DDS\_StringDataReader**  
    <<*interface*>> (p. 818) *Instantiates DataReader < char\* >.*

## Functions

- **DDS\_ReturnCode\_t DDS\_StringTypeSupport\_register\_type** ( DDS\_DomainParticipant \*participant, const char \*type\_name)
 

*Allows an application to communicate to RTI Connexx the existence of the char\* data type.*
- **DDS\_ReturnCode\_t DDS\_StringTypeSupport\_unregister\_type** ( DDS\_DomainParticipant \*participant, const char \*type\_name)
 

*Allows an application to unregister the char\* data type from RTI Connexx. After calling unregister\_type, no further communication using this type is possible.*
- const char \* **DDS\_StringTypeSupport\_get\_type\_name** (void)
 

*Get the default name for the char\* type.*
- void **DDS\_StringTypeSupport\_print\_data** (const char \*a\_data)
 

<<extension>> (p. 817) Print value of data type to standard out.
- **DDS\_TypeCode \* DDS\_StringTypeSupport\_get\_typecode** (void)
 

<<extension>> (p. 817) Retrieves the TypeCode for the Type.
- **DDS\_ReturnCode\_t DDS\_StringTypeSupport\_serialize\_data\_to\_cdr\_buffer** (char \*buffer, unsigned int \*length, const char \*a\_data)
 

<<extension>> (p. 817) Serializes the input sample into a CDR buffer of octets.
- **DDS\_ReturnCode\_t DDS\_StringTypeSupport\_serialize\_data\_to\_cdr\_buffer\_ex** (char \*buffer, unsigned int \*length, const char \*a\_data, DDS\_DataRepresentationId\_t representation)
 

<<extension>> (p. 817) Serializes the input sample into a buffer of octets.
- **DDS\_ReturnCode\_t DDS\_StringTypeSupport\_deserialize\_data\_from\_cdr\_buffer** (char \*\*a\_data, const char \*buffer, unsigned int length)
 

<<extension>> (p. 817) Deserializes a sample from a buffer of octets.
- **DDS\_ReturnCode\_t DDS\_StringTypeSupport\_data\_to\_string** (const char \*sample, char \*str, DDS\_↔ UnsignedLong \*str\_size, DDS\_PrintFormatProperty \*property)
 

<<extension>> (p. 817) Get the string representation of an input sample.
- **DDS\_StringDataWriter \* DDS\_StringDataWriter\_narrow** ( DDS\_DataWriter \*writer)
 

*Narrow the given DDS\_DataWriter (p. 478) pointer to a DDS\_StringDataWriter (p. 917) pointer.*
- **DDS\_DataWriter \* DDS\_StringDataWriter\_as\_datawriter** ( DDS\_StringDataWriter \*writer)
 

*Widen the given DDS\_StringDataWriter (p. 917) pointer to a DDS\_DataWriter (p. 478) pointer.*
- char \* **DDS\_StringDataWriter\_create\_data** ( DDS\_StringDataWriter \*self)
 

*Creates a string data instance.*
- **DDS\_Boolean DDS\_StringDataWriter\_delete\_data** ( DDS\_StringDataWriter \*self, char \*sample)
 

*Destroys a string data instance created by DDS\_StringDataWriter\_create\_data (p. 922).*
- **DDS\_ReturnCode\_t DDS\_StringDataWriter\_write** ( DDS\_StringDataWriter \*self, const char \*instance\_data, const DDS\_InstanceHandle\_t \*handle)
 

*Modifies the value of a string data instance.*
- **DDS\_ReturnCode\_t DDS\_StringDataWriter\_write\_w\_timestamp** ( DDS\_StringDataWriter \*self, const char \*instance\_data, const DDS\_InstanceHandle\_t \*handle, const struct DDS\_Time\_t \*source\_timestamp)
 

*Performs the same function as DDS\_StringDataWriter\_write (p. 923) except that it also provides the value for the source\_timestamp.*
- **DDS\_ReturnCode\_t DDS\_StringDataWriter\_write\_w\_params** ( DDS\_StringDataWriter \*self, const char \*instance\_data, struct DDS\_WriteParams\_t \*params)
 

*Performs the same function as DDS\_StringDataWriter\_write (p. 923) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- **DDS\_StringDataReader \* DDS\_StringDataReader\_narrow** ( DDS\_DataReader \*reader)
 

*Narrow the given DDS\_DataReader (p. 608) pointer to a DDS\_StringDataReader (p. 917) pointer.*
- **DDS\_DataReader \* DDS\_StringDataReader\_as\_datareader** ( DDS\_StringDataReader \*reader)

Widen the given *DDS\_StringDataReader* (p. 917) pointer to a *DDS\_DataReader* (p. 608) pointer.

- **DDS\_ReturnCode\_t DDS\_StringDataReader\_read** ( *DDS\_StringDataReader* \*self, struct *DDS\_StringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max\_samples, *DDS\_SampleStateMask* sample\_states, *DDS\_ViewStateMask* view\_states, *DDS\_InstanceStateMask* instance\_states)

Access a collection of data samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_StringDataReader\_take** ( *DDS\_StringDataReader* \*self, struct *DDS\_StringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max\_samples, *DDS\_SampleStateMask* sample\_mask, *DDS\_ViewStateMask* view\_mask, *DDS\_InstanceStateMask* instance\_mask)

Access a collection of data-samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_StringDataReader\_read\_w\_condition** ( *DDS\_StringDataReader* \*self, struct *DDS\_StringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max\_samples, *DDS\_↔ReadCondition* \*condition)

Accesses via *DDS\_StringDataReader\_read* (p. 925) the samples that match the criteria specified in the *DDS\_Read↔Condition* (p. 686).

- **DDS\_ReturnCode\_t DDS\_StringDataReader\_take\_w\_condition** ( *DDS\_StringDataReader* \*self, struct *DDS\_StringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max\_samples, *DDS\_↔ReadCondition* \*condition)

Analogous to *DDS\_StringDataReader\_read\_w\_condition* (p. 925) except it accesses samples via the *DDS\_String↔DataReader\_take* (p. 925) operation.

- **DDS\_ReturnCode\_t DDS\_StringDataReader\_read\_next\_sample** ( *DDS\_StringDataReader* \*self, char \*received\_data, struct *DDS\_SampleInfo* \*sample\_info)

Copies the next not-previously-accessed data value from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_StringDataReader\_take\_next\_sample** ( *DDS\_StringDataReader* \*self, char \*received\_data, struct *DDS\_SampleInfo* \*sample\_info)

Copies the next not-previously-accessed data value from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_StringDataReader\_return\_loan** ( *DDS\_StringDataReader* \*self, struct *DDS\_↔StringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq)

Indicates to the *DDS\_DataReader* (p. 608) that the application is done accessing the collection of *received\_data* and *info\_seq* obtained by some earlier invocation of *read* or *take* on the *DDS\_DataReader* (p. 608).

### 4.84.1 Detailed Description

Built-in type consisting of a single character string.

### 4.84.2 Typedef Documentation

#### 4.84.2.1 DDS\_StringDataWriter

```
typedef struct DDS_StringDataWriter DDS_StringDataWriter
```

<<*interface*>> (p. 818) Instantiates *DataWriter* < char\* >.

See also

**FooDataWriter** (p. 1845)

**DDS\_DataWriter** (p. 478)

**String Support** (p. 1311)

### 4.84.2.2 DDS\_StringDataReader

```
typedef struct DDS_StringDataReader DDS_StringDataReader
```

<<*interface*>> (p. 818) Instantiates DataReader < char\* >.

See also

**FooDataReader** (p. 1845)

**DDS\_DataReader** (p. 608)

**String Support** (p. 1311)

### 4.84.3 Function Documentation

#### 4.84.3.1 DDS\_StringTypeSupport\_register\_type()

```
DDS_ReturnCode_t DDS_StringTypeSupport_register_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to communicate to RTI Connexx the existence of the char\* data type.

By default, The char\* built-in type is automatically registered when a DomainParticipant is created using the type\_name returned by **DDS\_StringTypeSupport\_get\_type\_name** (p. 920). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin\_↔type.auto\_register".

This function can also be used to register the same **DDS\_StringTypeSupport** (p. 1742) with a **DDS\_Domain\_↔Participant** (p. 72) using different values for the type\_name.

If register\_type is called multiple times with the same **DDS\_DomainParticipant** (p. 72) and type\_name, the second (and subsequent) registrations are ignored by the operation.

#### Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818) the <b>DDS_DomainParticipant</b> (p. 72) to register the data type char* with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 818) the type name under with the data type char* is registered with the participant; this type name is used when creating a new <b>DDS_Topic</b> (p. 172). (See <b>DDS_DomainParticipant_create_topic</b> (p. 112).) The name may not be NULL or longer than 255 characters.

#### Returns

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025) or **DDS\_↔\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

**MT Safety:**

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

**See also**

**DDS\_DomainParticipant\_create\_topic** (p. 112)

**4.84.3.2 DDS\_StringTypeSupport\_unregister\_type()**

```
DDS_ReturnCode_t DDS_StringTypeSupport_unregister_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to unregister the char\* data type from RTI Connex. After calling `unregister_type`, no further communication using this type is possible.

**Precondition**

The char\* type with `type_name` is registered with the participant and all **DDS\_Topic** (p. 172) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS\_Topic** (p. 172) is associated with the type, the operation will fail with **DDS\_RETCODE\_ERROR** (p. 1025).

**Postcondition**

All information about the type is removed from RTI Connex. No further communication using this type is possible.

**Parameters**

<i>participant</i>	<< <i>in</i> >> (p. 818) the <b>DDS_DomainParticipant</b> (p. 72) to unregister the data type char* from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 818) the type name under with the data type char* is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

**Returns**

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_BAD\_PARAMETER** (p. 1025) or **DDS\_RETCODE\_ERROR** (p. 1025)

**MT Safety:**

SAFE.

See also

**DDS\_StringTypeSupport\_register\_type** (p. 918)

#### 4.84.3.3 DDS\_StringTypeSupport\_get\_type\_name()

```
const char * DDS_StringTypeSupport_get_type_name (
    void )
```

Get the default name for the char\* type.

Can be used for calling **DDS\_StringTypeSupport\_register\_type** (p. 918) or creating **DDS\_Topic** (p. 172).

Returns

default name for the char\* type.

See also

**DDS\_StringTypeSupport\_register\_type** (p. 918)

**DDS\_DomainParticipant\_create\_topic** (p. 112)

#### 4.84.3.4 DDS\_StringTypeSupport\_print\_data()

```
void DDS_StringTypeSupport_print_data (
    const char * a_data )
```

<<**extension**>> (p. 817) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

<code>a_data</code>	<< <b>in</b> >> (p. 818) String to be printed.
---------------------	------------------------------------------------

#### 4.84.3.5 DDS\_StringTypeSupport\_get\_typecode()

```
DDS_TypeCode * DDS_StringTypeSupport_get_typecode (
    void )
```

<<**extension**>> (p. 817) Retrieves the TypeCode for the Type.

See also

**FooTypeSupport\_get\_typecode** (p. 222)

#### 4.84.3.6 DDS\_StringTypeSupport\_serialize\_data\_to\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_StringTypeSupport_serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int * length,
    const char * a_data )
```

<<**extension**>> (p. 817) Serializes the input sample into a CDR buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.84.3.7 DDS\_StringTypeSupport\_serialize\_data\_to\_cdr\_buffer\_ex()

```
DDS_ReturnCode_t DDS_StringTypeSupport_serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int * length,
    const char * a_data,
    DDS_DataRepresentationId_t representation )
```

<<**extension**>> (p. 817) Serializes the input sample into a buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.84.3.8 DDS\_StringTypeSupport\_deserialize\_data\_from\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_StringTypeSupport_deserialize_data_from_cdr_buffer (
    char ** a_data,
    const char * buffer,
    unsigned int length )
```

<<**extension**>> (p. 817) Deserializes a sample from a buffer of octets.

See also

**FooTypeSupport\_deserialize\_data\_from\_cdr\_buffer** (p. 220)

#### 4.84.3.9 DDS\_StringTypeSupport\_data\_to\_string()

```
DDS_ReturnCode_t DDS_StringTypeSupport_data_to_string (
    const char * sample,
    char * str,
    DDS_UnsignedLong * str_size,
    DDS_PrintfFormatProperty * property )
```

<<*extension*>> (p. 817) Get the string representation of an input sample.

See also

**FooTypeSupport\_data\_to\_string** (p. 221)

#### 4.84.3.10 DDS\_StringDataWriter\_narrow()

```
DDS_StringDataWriter * DDS_StringDataWriter_narrow (
    DDS_DataWriter * writer )
```

Narrow the given **DDS\_DataWriter** (p. 478) pointer to a **DDS\_StringDataWriter** (p. 917) pointer.

See also

**FooDataWriter\_narrow** (p. 483)

#### 4.84.3.11 DDS\_StringDataWriter\_as\_datawriter()

```
DDS_DataWriter * DDS_StringDataWriter_as_datawriter (
    DDS_StringDataWriter * writer )
```

Widen the given **DDS\_StringDataWriter** (p. 917) pointer to a **DDS\_DataWriter** (p. 478) pointer.

See also

**FooDataWriter\_as\_datawriter** (p. 483)

#### 4.84.3.12 DDS\_StringDataWriter\_create\_data()

```
char * DDS_StringDataWriter_create_data (
    DDS_StringDataWriter * self )
```

Creates a string data instance.

The size of the instance including the NULL terminated character is determined by the DataWriter property **dds.builtin\_type.string.alloc\_size**.

Default size: **dds.builtin\_type.string.max\_size** property of DomainParticipant if defined. Otherwise 1024.

Created instances must be deleted with **DDS\_StringDataWriter\_delete\_data** (p. 923).

##### Returns

Newly created string data, or NULL on failure.

##### See also

BuiltinTypeMemoryManagement section of Built-in Types

#### 4.84.3.13 DDS\_StringDataWriter\_delete\_data()

```
DDS_Boolean DDS_StringDataWriter_delete_data (
    DDS_StringDataWriter * self,
    char * sample )
```

Destroys a string data instance created by **DDS\_StringDataWriter\_create\_data** (p. 922).

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) upon successful deletion.

#### 4.84.3.14 DDS\_StringDataWriter\_write()

```
DDS_ReturnCode_t DDS_StringDataWriter_write (
    DDS_StringDataWriter * self,
    const char * instance_data,
    const DDS_InstanceHandle_t * handle )
```

Modifies the value of a string data instance.

##### See also

**FooDataWriter\_write** (p. 489)

#### 4.84.3.15 DDS\_StringDataWriter\_write\_w\_timestamp()

```
DDS_ReturnCode_t DDS_StringDataWriter_write_w_timestamp (
    DDS_StringDataWriter * self,
    const char * instance_data,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_StringDataWriter\_write** (p. 923) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_write\_w\_timestamp** (p. 493)

#### 4.84.3.16 DDS\_StringDataWriter\_write\_w\_params()

```
DDS_ReturnCode_t DDS_StringDataWriter_write_w_params (
    DDS_StringDataWriter * self,
    const char * instance_data,
    struct DDS_WriteParams_t * params )
```

Performs the same function as **DDS\_StringDataWriter\_write** (p. 923) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

**FooDataWriter\_write\_w\_params** (p. 494)

#### 4.84.3.17 DDS\_StringDataReader\_narrow()

```
DDS_StringDataReader * DDS_StringDataReader_narrow (
    DDS_DataReader * reader )
```

Narrow the given **DDS\_DataReader** (p. 608) pointer to a **DDS\_StringDataReader** (p. 917) pointer.

See also

**FooDataReader\_narrow** (p. 617)

**4.84.3.18 DDS\_StringDataReader\_as\_datareader()**

```
DDS_DataReader * DDS_StringDataReader_as_datareader (
    DDS_StringDataReader * reader )
```

Widen the given **DDS\_StringDataReader** (p. 917) pointer to a **DDS\_DataReader** (p. 608) pointer.

See also

**FooDataReader\_as\_datareader** (p. 617)

**4.84.3.19 DDS\_StringDataReader\_read()**

```
DDS_ReturnCode_t DDS_StringDataReader_read (
    DDS_StringDataReader * self,
    struct DDS_StringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read** (p. 618)

**4.84.3.20 DDS\_StringDataReader\_take()**

```
DDS_ReturnCode_t DDS_StringDataReader_take (
    DDS_StringDataReader * self,
    struct DDS_StringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_mask,
    DDS_ViewStateMask view_mask,
    DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take** (p. 619)

#### 4.84.3.21 DDS\_StringDataReader\_read\_w\_condition()

```
DDS_ReturnCode_t DDS_StringDataReader_read_w_condition (
    DDS_StringDataReader * self,
    struct DDS_StringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_StringDataReader\_read** (p. 925) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_w\_condition** (p. 623)

#### 4.84.3.22 DDS\_StringDataReader\_take\_w\_condition()

```
DDS_ReturnCode_t DDS_StringDataReader_take_w_condition (
    DDS_StringDataReader * self,
    struct DDS_StringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Analogous to **DDS\_StringDataReader\_read\_w\_condition** (p. 925) except it accesses samples via the **DDS\_StringDataReader\_take** (p. 925) operation.

See also

**FooDataReader\_take\_w\_condition** (p. 625)

#### 4.84.3.23 DDS\_StringDataReader\_read\_next\_sample()

```
DDS_ReturnCode_t DDS_StringDataReader_read_next_sample (
    DDS_StringDataReader * self,
    char * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read\_next\_sample** (p. 626)

#### 4.84.3.24 DDS\_StringDataReader\_take\_next\_sample()

```
DDS_ReturnCode_t DDS_StringDataReader_take_next_sample (
    DDS_StringDataReader * self,
    char * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take\_next\_sample** (p. 627)

#### 4.84.3.25 DDS\_StringDataReader\_return\_loan()

```
DDS_ReturnCode_t DDS_StringDataReader_return_loan (
    DDS_StringDataReader * self,
    struct DDS_StringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS\_DataReader** (p. 608) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_return\_loan** (p. 639)

## 4.85 KeyedString Built-in Type

Built-in type consisting of a string payload and a second string that is the key.

### Data Structures

- struct **DDS\_KeyedString**  
*Keyed string built-in type.*
- struct **DDS\_KeyedStringSeq**  
*Instantiates `FooSeq` (p. 1845) < `DDS_KeyedString` (p. 1565) > .*
- struct **DDS\_KeyedStringTypeSupport**  
*<<interface>> (p. 818) Keyed string type support.*

## Typedefs

- typedef struct **DDS\_KeyedString** **DDS\_KeyedString**  
*Keyed string built-in type.*
- typedef struct **DDS\_KeyedStringDataWriter** **DDS\_KeyedStringDataWriter**  
<<*interface*>> (p. 818) *Instantiates DataWriter < DDS\_KeyedString (p. 1565) >.*
- typedef struct **DDS\_KeyedStringDataReader** **DDS\_KeyedStringDataReader**  
<<*interface*>> (p. 818) *Instantiates DataReader < DDS\_KeyedString (p. 1565) >.*

## Functions

- **DDS\_KeyedString \* DDS\_KeyedString\_new** (void)  
*Constructor.*
- **DDS\_KeyedString \* DDS\_KeyedString\_new\_w\_size** (int key\_size, int size)  
*Constructor that specifies the allocated sizes.*
- void **DDS\_KeyedString\_delete** ( **DDS\_KeyedString** \*self)  
*Destructor.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringTypeSupport\_register\_type** ( **DDS\_DomainParticipant** \*participant, const char \*type\_name)  
*Allows an application to communicate to RTI Connexx the existence of the **DDS\_KeyedString** (p. 1565) data type.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringTypeSupport\_unregister\_type** ( **DDS\_DomainParticipant** \*participant, const char \*type\_name)  
*Allows an application to unregister the **DDS\_KeyedString** (p. 1565) data type from RTI Connexx. After calling unregister\_type, no further communication using this type is possible.*
- const char \* **DDS\_KeyedStringTypeSupport\_get\_type\_name** (void)  
*Get the default name for the **DDS\_KeyedString** (p. 1565) type.*
- void **DDS\_KeyedStringTypeSupport\_print\_data** (const **DDS\_KeyedString** \*a\_data)  
<<*extension*>> (p. 817) *Print value of data type to standard out.*
- **DDS\_TypeCode \* DDS\_KeyedStringTypeSupport\_get\_typecode** (void)  
<<*extension*>> (p. 817) *Retrieves the TypeCode for the Type.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringTypeSupport\_serialize\_data\_to\_cdr\_buffer** (char \*buffer, unsigned int \*length, const **DDS\_KeyedString** \*a\_data)  
<<*extension*>> (p. 817) *Serializes the input sample into a CDR buffer of octets.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringTypeSupport\_serialize\_data\_to\_cdr\_buffer\_ex** (char \*buffer, unsigned int \*length, const **DDS\_KeyedString** \*a\_data, **DDS\_DataRepresentationId\_t** representation)  
<<*extension*>> (p. 817) *Serializes the input sample into a buffer of octets.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringTypeSupport\_deserialize\_data\_from\_cdr\_buffer** ( **DDS\_KeyedString** \*a\_data, const char \*buffer, unsigned int length)  
<<*extension*>> (p. 817) *Deserializes a sample from a buffer of octets.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringTypeSupport\_data\_to\_string** (const **DDS\_KeyedString** \*sample, char \*str, **DDS\_UnsignedLong** \*str\_size, **DDS\_PrintfFormatProperty** \*property)  
<<*extension*>> (p. 817) *Get the string representation of an input sample.*
- **DDS\_KeyedStringDataWriter \* DDS\_KeyedStringDataWriter\_narrow** ( **DDS\_DataWriter** \*writer)  
*Narrow the given **DDS\_DataWriter** (p. 478) pointer to a **DDS\_KeyedStringDataWriter** (p. 932) pointer.*
- **DDS\_DataWriter \* DDS\_KeyedStringDataWriter\_as\_datawriter** ( **DDS\_KeyedStringDataWriter** \*writer)  
*Widen the given **DDS\_KeyedStringDataWriter** (p. 932) pointer to a **DDS\_DataWriter** (p. 478) pointer.*
- **DDS\_InstanceHandle\_t DDS\_KeyedStringDataWriter\_register\_instance** ( **DDS\_KeyedStringDataWriter** \*self, const **DDS\_KeyedString** \*instance\_data)

*Informs RTI Connexx that the application will be modifying a particular instance.*

- **DDS\_InstanceHandle\_t DDS\_KeyedStringDataWriter\_register\_instance\_w\_key** ( DDS\_KeyedStringDataWriter \*self, const char \*key)
 

*<<extension>> (p. 817) Informs RTI Connexx that the application will be modifying a particular instance.*
- **DDS\_InstanceHandle\_t DDS\_KeyedStringDataWriter\_register\_instance\_w\_timestamp** ( DDS\_KeyedStringDataWriter \*self, const DDS\_KeyedString \*instance\_data, const struct DDS\_Time\_t \*source\_timestamp)
 

*Performs the same functions as DDS\_KeyedStringDataWriter\_register\_instance (p. 939) except that the application provides the value for the source\_timestamp.*
- **DDS\_InstanceHandle\_t DDS\_KeyedStringDataWriter\_register\_instance\_w\_key\_w\_timestamp** ( DDS\_KeyedStringDataWriter \*self, const char \*key, const struct DDS\_Time\_t \*source\_timestamp)
 

*<<extension>> (p. 817) Performs the same functions as DDS\_KeyedStringDataWriter\_register\_instance\_w\_key (p. 939) except that the application provides the value for the source\_timestamp.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_unregister\_instance** ( DDS\_KeyedStringDataWriter \*self, const DDS\_KeyedString \*instance\_data, const DDS\_InstanceHandle\_t \*handle)
 

*Reverses the action of DDS\_KeyedStringDataWriter\_register\_instance (p. 939).*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_key** ( DDS\_KeyedStringDataWriter \*self, const char \*key, const DDS\_InstanceHandle\_t \*handle)
 

*<<extension>> (p. 817) Reverses the action of DDS\_KeyedStringDataWriter\_register\_instance\_w\_key (p. 939).*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_timestamp** ( DDS\_KeyedStringDataWriter \*self, const DDS\_KeyedString \*instance\_data, const DDS\_InstanceHandle\_t \*handle, const struct DDS\_Time\_t \*source\_timestamp)
 

*Performs the same function as DDS\_KeyedStringDataWriter\_unregister\_instance (p. 940) except that it also provides the value for the source\_timestamp.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_key\_w\_timestamp** ( DDS\_KeyedStringDataWriter \*self, const char \*key, const DDS\_InstanceHandle\_t \*handle, const struct DDS\_Time\_t \*source\_timestamp)
 

*<<extension>> (p. 817) Performs the same function as DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_key (p. 940) except that it also provides the value for the source\_timestamp.*
- **DDS\_KeyedString \* DDS\_KeyedStringDataWriter\_create\_data** ( DDS\_KeyedStringDataWriter \*self)
 

*Creates a keyed string data instance.*
- **DDS\_Boolean DDS\_KeyedStringDataWriter\_delete\_data** ( DDS\_KeyedStringDataWriter \*self, DDS\_KeyedString \*sample)
 

*Destroys a keyed string data instance created by DDS\_KeyedStringDataWriter\_create\_data (p. 941).*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_write** ( DDS\_KeyedStringDataWriter \*self, const DDS\_KeyedString \*instance\_data, const DDS\_InstanceHandle\_t \*handle)
 

*Modifies the value of a DDS\_KeyedString (p. 1565) data instance.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_write\_string\_w\_key** ( DDS\_KeyedStringDataWriter \*self, const char \*key, const char \*str, const DDS\_InstanceHandle\_t \*handle)
 

*<<extension>> (p. 817) Modifies the value of a DDS\_KeyedString (p. 1565) data instance.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_write\_w\_timestamp** ( DDS\_KeyedStringDataWriter \*self, const DDS\_KeyedString \*instance\_data, const DDS\_InstanceHandle\_t \*handle, const struct DDS\_Time\_t \*source\_timestamp)
 

*Performs the same function as DDS\_KeyedStringDataWriter\_write (p. 942) except that it also provides the value for the source\_timestamp.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_write\_string\_w\_key\_w\_timestamp** ( DDS\_KeyedStringDataWriter \*self, const char \*key, const char \*str, const DDS\_InstanceHandle\_t \*handle, const struct DDS\_Time\_t \*source\_timestamp)
 

*<<extension>> (p. 817) Performs the same function as DDS\_KeyedStringDataWriter\_write\_string\_w\_key (p. 942) except that it also provides the value for the source\_timestamp.*

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_write\_w\_params** ( **DDS\_KeyedStringDataWriter** \*self, const **DDS\_KeyedString** \*instance\_data, struct **DDS\_WriteParams\_t** \*params)
 

*Performs the same function as **DDS\_KeyedStringDataWriter\_write** (p. 942) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_write\_string\_w\_key\_w\_params** ( **DDS\_KeyedStringDataWriter** \*self, const char \*key, const char \*str, struct **DDS\_WriteParams\_t** \*params)
 

*<<extension>> (p. 817) Performs the same function as **DDS\_KeyedStringDataWriter\_write\_string\_w\_key** (p. 942) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_dispose** ( **DDS\_KeyedStringDataWriter** \*self, const **DDS\_KeyedString** \*instance\_data, const **DDS\_InstanceHandle\_t** \*instance\_handle)
 

*Requests the middleware to delete the data.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_dispose\_w\_key** ( **DDS\_KeyedStringDataWriter** \*self, const char \*key, const **DDS\_InstanceHandle\_t** \*instance\_handle)
 

*<<extension>> (p. 817) Requests the middleware to delete the data.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_dispose\_w\_timestamp** ( **DDS\_KeyedStringDataWriter** \*self, const **DDS\_KeyedString** \*instance\_data, const **DDS\_InstanceHandle\_t** \*instance\_handle, const struct **DDS\_Time\_t** \*source\_timestamp)
 

*Performs the same functions as **DDS\_KeyedStringDataWriter\_dispose** (p. 944) except that the application provides the value for the *source\_timestamp* that is made available to **DDS\_DataReader** (p. 608) objects by means of the *source\_timestamp* attribute inside the **DDS\_SampleInfo** (p. 1720).*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_dispose\_w\_key\_w\_timestamp** ( **DDS\_KeyedStringDataWriter** \*self, const char \*key, const **DDS\_InstanceHandle\_t** \*instance\_handle, const struct **DDS\_Time\_t** \*source\_timestamp)
 

*<<extension>> (p. 817) Performs the same functions as **DDS\_KeyedStringDataWriter\_dispose\_w\_key** (p. 944) except that the application provides the value for the *source\_timestamp* that is made available to **DDS\_DataReader** (p. 608) objects by means of the *source\_timestamp* attribute inside the **DDS\_SampleInfo** (p. 1720).*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_get\_key\_value** ( **DDS\_KeyedStringDataWriter** \*self, **DDS\_KeyedString** \*key\_holder, const **DDS\_InstanceHandle\_t** \*handle)
 

*Retrieve the instance *key* that corresponds to an instance *handle*.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataWriter\_get\_key\_value\_w\_key** ( **DDS\_KeyedStringDataWriter** \*self, char \*key, const **DDS\_InstanceHandle\_t** \*handle)
 

*<<extension>> (p. 817) Retrieve the instance *key* that corresponds to an instance *handle*.*
- **DDS\_InstanceHandle\_t DDS\_KeyedStringDataWriter\_lookup\_instance** ( **DDS\_KeyedStringDataWriter** \*self, const **DDS\_KeyedString** \*key\_holder)
 

*Retrieve the instance *handle* that corresponds to an instance *key\_holder*.*
- **DDS\_InstanceHandle\_t DDS\_KeyedStringDataWriter\_lookup\_instance\_w\_key** ( **DDS\_KeyedStringDataWriter** \*self, const char \*key)
 

*<<extension>> (p. 817) Retrieve the instance *handle* that corresponds to an instance *key*.*
- **DDS\_KeyedStringDataReader \* DDS\_KeyedStringDataReader\_narrow** ( **DDS\_DataReader** \*reader)
 

*Narrow the given **DDS\_DataReader** (p. 608) pointer to a **DDS\_KeyedStringDataReader** (p. 933) pointer.*
- **DDS\_DataReader \* DDS\_KeyedStringDataReader\_as\_datareader** ( **DDS\_KeyedStringDataReader** \*reader)
 

*Widen the given **DDS\_KeyedStringDataReader** (p. 933) pointer to a **DDS\_DataReader** (p. 608) pointer.*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_read** ( **DDS\_KeyedStringDataReader** \*self, struct **DDS\_KeyedStringSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_SampleStateMask** sample\_states, **DDS\_ViewStateMask** view\_states, **DDS\_InstanceStateMask** instance\_states)
 

*Access a collection of data samples from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_take** ( **DDS\_KeyedStringDataReader** \*self, struct **DDS\_KeyedStringSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_SampleStateMask** sample\_mask, **DDS\_ViewStateMask** view\_mask, **DDS\_InstanceStateMask** instance\_mask)
 

*Access a collection of data samples from the **DDS\_DataReader** (p. 608).*

Access a collection of data-samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_read\_w\_condition** ( *DDS\_KeyedStringDataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, *DDS\_ReadCondition* \*condition)

Accesses via *DDS\_KeyedStringDataReader\_read* (p. 947) the samples that match the criteria specified in the *DDS\_←\_ReadCondition* (p. 686).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_take\_w\_condition** ( *DDS\_KeyedStringDataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, *DDS\_ReadCondition* \*condition)

Analogous to *DDS\_KeyedStringDataReader\_read\_w\_condition* (p. 948) except it accesses samples via the *DDS\_←\_KeyedStringDataReader\_take* (p. 948) operation.

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_read\_next\_sample** ( *DDS\_KeyedStringDataReader* \*self, *DDS\_KeyedString* \*received\_data, struct *DDS\_SampleInfo* \*sample\_info)

Copies the next not-previously-accessed data value from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_take\_next\_sample** ( *DDS\_KeyedStringDataReader* \*self, *DDS\_KeyedString* \*received\_data, struct *DDS\_SampleInfo* \*sample\_info)

Copies the next not-previously-accessed data value from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_read\_instance** ( *DDS\_KeyedStringDataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, const *DDS\_InstanceHandle\_t* \*a\_handle, *DDS\_SampleStateMask* sample\_states, *DDS\_View←\_StateMask* view\_states, *DDS\_InstanceStateMask* instance\_states)

Access a collection of data samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_take\_instance** ( *DDS\_KeyedStringDataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, const *DDS\_InstanceHandle\_t* \*a\_handle, *DDS\_SampleStateMask* sample\_states, *DDS\_View←\_StateMask* view\_states, *DDS\_InstanceStateMask* instance\_states)

Access a collection of data samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_read\_instance\_w\_condition** ( *DDS\_KeyedString←\_DataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, const *DDS\_InstanceHandle\_t* \*a\_handle, *DDS\_ReadCondition* \*condition)

Accesses via *DDS\_KeyedStringDataReader\_read\_instance* (p. 949) the samples that match the criteria specified in the *DDS\_ReadCondition* (p. 686).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_take\_instance\_w\_condition** ( *DDS\_KeyedString←\_DataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, const *DDS\_InstanceHandle\_t* \*a\_handle, *DDS\_ReadCondition* \*condition)

Accesses via *DDS\_KeyedStringDataReader\_take\_instance* (p. 950) the samples that match the criteria specified in the *DDS\_ReadCondition* (p. 686).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_read\_next\_instance** ( *DDS\_KeyedStringDataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, const *DDS\_InstanceHandle\_t* \*previous\_handle, *DDS\_SampleStateMask* sample\_states, *DDS\_←\_ViewStateMask* view\_states, *DDS\_InstanceStateMask* instance\_states)

Access a collection of data samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_take\_next\_instance** ( *DDS\_KeyedStringDataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max←\_samples, const *DDS\_InstanceHandle\_t* \*previous\_handle, *DDS\_SampleStateMask* sample\_states, *DDS\_←\_ViewStateMask* view\_states, *DDS\_InstanceStateMask* instance\_states)

Access a collection of data samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedStringDataReader\_read\_next\_instance\_w\_condition** ( *DDS\_Keyed←\_StringDataReader* \*self, struct *DDS\_KeyedStringSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info←\_seq, *DDS\_Long* max←\_samples, const *DDS\_InstanceHandle\_t* \*previous\_handle, *DDS\_ReadCondition* \*condition)

Accesses via `DDS_KeyedStringDataReader_read_next_instance` (p. 951) the samples that match the criteria specified in the `DDS_ReadCondition` (p. 686).

- `DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance_w_condition` ( `DDS_KeyedStringDataReader *self`, struct `DDS_KeyedStringSeq *received_data`, struct `DDS_SampleInfoSeq *info_seq`, `DDS_Long` `max_samples`, const `DDS_InstanceHandle_t *previous_handle`, `DDS_ReadCondition *condition`)

Accesses via `DDS_KeyedStringDataReader_take_next_instance` (p. 951) the samples that match the criteria specified in the `DDS_ReadCondition` (p. 686).

- `DDS_ReturnCode_t DDS_KeyedStringDataReader_return_loan` ( `DDS_KeyedStringDataReader *self`, struct `DDS_KeyedStringSeq *received_data`, struct `DDS_SampleInfoSeq *info_seq`)

Indicates to the `DDS_DataReader` (p. 608) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the `DDS_DataReader` (p. 608).

- `DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value` ( `DDS_KeyedStringDataReader *self`, `DDS_KeyedString *key_holder`, const `DDS_InstanceHandle_t *handle`)

Retrieve the instance `key` that corresponds to an instance `handle`.

- `DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value_w_key` ( `DDS_KeyedStringDataReader *self`, char `*key`, const `DDS_InstanceHandle_t *handle`)

<<extension>> (p. 817) Retrieve the instance `key` that corresponds to an instance `handle`.

- `DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance` ( `DDS_KeyedStringDataReader *self`, const `DDS_KeyedString *key_holder`)

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

- `DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance_w_key` ( `DDS_KeyedStringDataReader *self`, const char `*key`)

<<extension>> (p. 817) Retrieve the instance `handle` that corresponds to an instance `key`.

## Variables

- char \* `DDS_KeyedString::key`  
Instance key associated with the specified value.
- char \* `DDS_KeyedString::value`  
String value.

### 4.85.1 Detailed Description

Built-in type consisting of a string payload and a second string that is the key.

### 4.85.2 Typedef Documentation

#### 4.85.2.1 DDS\_KeyedString

```
typedef struct DDS_KeyedString DDS_KeyedString
```

Keyed string built-in type.

### 4.85.2.2 DDS\_KeyedStringDataWriter

```
typedef struct DDS_KeyedStringDataWriter DDS_KeyedStringDataWriter
```

<<*interface*>> (p. 818) Instantiates DataWriter < **DDS\_KeyedString** (p. 1565) >.

See also

**FooDataWriter** (p. 1845)

**DDS\_DataWriter** (p. 478)

### 4.85.2.3 DDS\_KeyedStringDataReader

```
typedef struct DDS_KeyedStringDataReader DDS_KeyedStringDataReader
```

<<*interface*>> (p. 818) Instantiates DataReader < **DDS\_KeyedString** (p. 1565) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string in a destination data sample is NULL, the middleware will allocate a new string for you of sufficient length to hold the received string. The new string will be allocated with **DDS\_String\_alloc** (p. 1313); the sample's destructor will delete it.

A non- NULL string is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

**FooDataReader** (p. 1845)

**DDS\_DataReader** (p. 608)

## 4.85.3 Function Documentation

### 4.85.3.1 DDS\_KeyedString\_new()

```
DDS_KeyedString * DDS_KeyedString_new (
    void )
```

Constructor.

The default constructor initializes the newly created object with NULL key and value.

Returns

A new **DDS\_KeyedString** (p. 1565) or NULL if failure.

### 4.85.3.2 DDS\_KeyedString\_new\_w\_size()

```
DDS_KeyedString * DDS_KeyedString_new_w_size (
    int key_size,
    int size )
```

Constructor that specifies the allocated sizes.

The allocated strings are initialized to empty ("").

## Parameters

<i>key_size</i>	<< <i>in</i> >> (p. 818) Size of the allocated key string (with NULL-terminated character). Cannot be smaller than zero.
<i>size</i>	<< <i>in</i> >> (p. 818) Size of the allocated value string (with NULL-terminated character). Cannot be smaller than zero.

## Returns

A new **DDS\_KeyedString** (p. 1565) or NULL if failure.

## 4.85.3.3 DDS\_KeyedString\_delete()

```
void DDS_KeyedString_delete (
    DDS_KeyedString * self )
```

Destructor.

## 4.85.3.4 DDS\_KeyedStringTypeSupport\_register\_type()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_register_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to communicate to RTI Connexx the existence of the **DDS\_KeyedString** (p. 1565) data type.

By default, The **DDS\_KeyedString** (p. 1565) built-in type is automatically registered when a DomainParticipant is created using the *type\_name* returned by **DDS\_KeyedStringTypeSupport\_get\_type\_name** (p. 936). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin\_type.auto\_register".

This function can also be used to register the same **DDS\_KeyedStringTypeSupport** (p. 1565) with a **DDS\_DomainParticipant** (p. 72) using different values for the *type\_name*.

If *register\_type* is called multiple times with the same **DDS\_DomainParticipant** (p. 72) and *type\_name*, the second (and subsequent) registrations are ignored by the operation.

## Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818) the <b>DDS_DomainParticipant</b> (p. 72) to register the data type <b>DDS_KeyedString</b> (p. 1565) with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 818) the type name under which the data type <b>DDS_KeyedString</b> (p. 1565) is registered with the participant; this type name is used when creating a new <b>DDS_Topic</b> (p. 172). (See <b>DDS_DomainParticipant_create_topic</b> (p. 112).) The name may not be NULL or longer than 255 characters.

## Returns

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025) or **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

## MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

## See also

**DDS\_DomainParticipant\_create\_topic** (p. 112)

## 4.85.3.5 DDS\_KeyedStringTypeSupport\_unregister\_type()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_unregister_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to unregister the **DDS\_KeyedString** (p.1565) data type from RTI Connex. After calling `unregister_type`, no further communication using this type is possible.

## Precondition

The **DDS\_KeyedString** (p. 1565) type with `type_name` is registered with the participant and all **DDS\_Topic** (p. 172) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS\_Topic** (p. 172) is associated with the type, the operation will fail with **DDS\_RETCODE\_ERROR** (p. 1025).

## Postcondition

All information about the type is removed from RTI Connex. No further communication using this type is possible.

## Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818) the <b>DDS_DomainParticipant</b> (p. 72) to unregister the data type <b>DDS_KeyedString</b> (p. 1565) from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 818) the type name under with the data type <b>DDS_KeyedString</b> (p. 1565) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

## Returns

One of the **Standard Return Codes** (p.1024), **DDS\_RETCODE\_BAD\_PARAMETER** (p.1025) or **DDS\_RETCODE\_ERROR** (p. 1025)

MT Safety:

SAFE.

See also

**DDS\_KeyedStringTypeSupport\_register\_type** (p. 934)

#### 4.85.3.6 DDS\_KeyedStringTypeSupport\_get\_type\_name()

```
const char * DDS_KeyedStringTypeSupport_get_type_name (
    void )
```

Get the default name for the **DDS\_KeyedString** (p. 1565) type.

Can be used for calling **DDS\_KeyedStringTypeSupport\_register\_type** (p. 934) or creating **DDS\_Topic** (p. 172).

Returns

default name for the **DDS\_KeyedString** (p. 1565) type.

See also

**DDS\_KeyedStringTypeSupport\_register\_type** (p. 934)

**DDS\_DomainParticipant\_create\_topic** (p. 112)

#### 4.85.3.7 DDS\_KeyedStringTypeSupport\_print\_data()

```
void DDS_KeyedStringTypeSupport_print_data (
    const DDS_KeyedString * a_data )
```

<<*extension*>> (p. 817) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

<i>a_data</i>	<< <i>in</i> >> (p. 818) <b>DDS_KeyedString</b> (p. 1565) to be printed.
---------------	--------------------------------------------------------------------------

#### 4.85.3.8 DDS\_KeyedStringTypeSupport\_get\_typecode()

```
DDS_TypeCode * DDS_KeyedStringTypeSupport_get_typecode (
    void )
```

<<*extension*>> (p. 817) Retrieves the TypeCode for the Type.

See also

**FooTypeSupport\_get\_typecode** (p. 222)

#### 4.85.3.9 DDS\_KeyedStringTypeSupport\_serialize\_data\_to\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int * length,
    const DDS_KeyedString * a_data )
```

<<*extension*>> (p. 817) Serializes the input sample into a CDR buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.85.3.10 DDS\_KeyedStringTypeSupport\_serialize\_data\_to\_cdr\_buffer\_ex()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int * length,
    const DDS_KeyedString * a_data,
    DDS_DataRepresentationId_t representation )
```

<<*extension*>> (p. 817) Serializes the input sample into a buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.85.3.11 DDS\_KeyedStringTypeSupport\_deserialize\_data\_from\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_deserialize_data_from_cdr_buffer (
    DDS_KeyedString * a_data,
    const char * buffer,
    unsigned int length )
```

<<*extension*>> (p. 817) Deserializes a sample from a buffer of octets.

See also

[FooTypeSupport\\_deserialize\\_data\\_from\\_cdr\\_buffer](#) (p. 220)

#### 4.85.3.12 DDS\_KeyedStringTypeSupport\_data\_to\_string()

```
DDS_ReturnCode_t DDS_KeyedStringTypeSupport_data_to_string (
    const DDS_KeyedString * sample,
    char * str,
    DDS_UnsignedLong * str_size,
    DDS_PrintfFormatProperty * property )
```

<<*extension*>> (p. 817) Get the string representation of an input sample.

See also

[FooTypeSupport\\_data\\_to\\_string](#) (p. 221)

#### 4.85.3.13 DDS\_KeyedStringDataWriter\_narrow()

```
DDS_KeyedStringDataWriter * DDS_KeyedStringDataWriter_narrow (
    DDS_DataWriter * writer )
```

Narrow the given [DDS\\_DataWriter](#) (p. 478) pointer to a [DDS\\_KeyedStringDataWriter](#) (p. 932) pointer.

See also

[FooDataWriter\\_narrow](#) (p. 483)

#### 4.85.3.14 DDS\_KeyedStringDataWriter\_as\_datawriter()

```
DDS_DataWriter * DDS_KeyedStringDataWriter_as_datawriter (
    DDS_KeyedStringDataWriter * writer )
```

Widen the given **DDS\_KeyedStringDataWriter** (p. 932) pointer to a **DDS\_DataWriter** (p. 478) pointer.

See also

**FooDataWriter\_as\_datawriter** (p. 483)

#### 4.85.3.15 DDS\_KeyedStringDataWriter\_register\_instance()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data )
```

Informs RTI Connexxt that the application will be modifying a particular instance.

See also

**FooDataWriter\_register\_instance** (p. 484)

#### 4.85.3.16 DDS\_KeyedStringDataWriter\_register\_instance\_w\_key()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key (
    DDS_KeyedStringDataWriter * self,
    const char * key )
```

<<**extension**>> (p. 817) Informs RTI Connexxt that the application will be modifying a particular instance.

See also

**FooDataWriter\_register\_instance** (p. 484)

#### 4.85.3.17 DDS\_KeyedStringDataWriter\_register\_instance\_w\_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same functions as **DDS\_KeyedStringDataWriter\_register\_instance** (p. 939) except that the application provides the value for the `source_timestamp`.

See also

**FooDataWriter\_register\_instance\_w\_timestamp** (p. 485)

#### 4.85.3.18 DDS\_KeyedStringDataWriter\_register\_instance\_w\_key\_w\_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_register_instance_w_key_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same functions as **DDS\_KeyedStringDataWriter\_register\_instance\_w\_key** (p. 939) except that the application provides the value for the `source_timestamp`.

See also

**FooDataWriter\_register\_instance\_w\_timestamp** (p. 485)

#### 4.85.3.19 DDS\_KeyedStringDataWriter\_unregister\_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    const DDS_InstanceHandle_t * handle )
```

Reverses the action of **DDS\_KeyedStringDataWriter\_register\_instance** (p. 939).

See also

**FooDataWriter\_unregister\_instance** (p. 486)

## 4.85.3.20 DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Reverses the action of **DDS\_KeyedStringDataWriter\_register\_instance\_w\_key** (p. 939).

See also

**FooDataWriter\_unregister\_instance** (p. 486)

## 4.85.3.21 DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_KeyedStringDataWriter\_unregister\_instance** (p. 940) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_unregister\_instance\_w\_timestamp** (p. 488)

## 4.85.3.22 DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_key\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_unregister_instance_w_key_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same function as **DDS\_KeyedStringDataWriter\_unregister\_instance\_w\_key** (p. 940) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_unregister\_instance\_w\_timestamp** (p. 488)

#### 4.85.3.23 DDS\_KeyedStringDataWriter\_create\_data()

```
DDS_KeyedString * DDS_KeyedStringDataWriter_create_data (
    DDS_KeyedStringDataWriter * self )
```

Creates a keyed string data instance.

The size of the instance including the NULL terminated character is determined by the DataWriter property **dds.builtin\_type.keyed\_string.alloc\_size**.

Default size: **dds.builtin\_type.keyed\_string.max\_size** property of DomainParticipant if defined. Otherwise 1024.

Created instances must be deleted with **DDS\_KeyedStringDataWriter\_delete\_data** (p. 942).

##### Returns

Newly created keyed string data, or NULL on failure.

##### See also

BuiltinTypeMemoryManagement section of Built-in Types

#### 4.85.3.24 DDS\_KeyedStringDataWriter\_delete\_data()

```
DDS_Boolean DDS_KeyedStringDataWriter_delete_data (
    DDS_KeyedStringDataWriter * self,
    DDS_KeyedString * sample )
```

Destroys a keyed string data instance created by **DDS\_KeyedStringDataWriter\_create\_data** (p. 941).

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) upon successful deletion.

#### 4.85.3.25 DDS\_KeyedStringDataWriter\_write()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    const DDS_InstanceHandle_t * handle )
```

Modifies the value of a **DDS\_KeyedString** (p. 1565) data instance.

##### See also

**FooDataWriter\_write** (p. 489)

#### 4.85.3.26 DDS\_KeyedStringDataWriter\_write\_string\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const char * str,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Modifies the value of a **DDS\_KeyedString** (p. 1565) data instance.

See also

**FooDataWriter\_write** (p. 489)

#### 4.85.3.27 DDS\_KeyedStringDataWriter\_write\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_KeyedStringDataWriter\_write** (p. 942) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_write\_w\_timestamp** (p. 493)

#### 4.85.3.28 DDS\_KeyedStringDataWriter\_write\_string\_w\_key\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const char * str,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same function as **DDS\_KeyedStringDataWriter\_write\_string\_w\_key** (p. 942) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_write\_w\_timestamp** (p. 493)

#### 4.85.3.29 DDS\_KeyedStringDataWriter\_write\_w\_params()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_w_params (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    struct DDS_WriteParams_t * params )
```

Performs the same function as **DDS\_KeyedStringDataWriter\_write** (p.942) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

**FooDataWriter\_write\_w\_params** (p.494)

#### 4.85.3.30 DDS\_KeyedStringDataWriter\_write\_string\_w\_key\_w\_params()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_write_string_w_key_w_params (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const char * str,
    struct DDS_WriteParams_t * params )
```

<<*extension*>> (p.817) Performs the same function as **DDS\_KeyedStringDataWriter\_write\_string\_w\_key** (p.942) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

**FooDataWriter\_write\_w\_params** (p.494)

#### 4.85.3.31 DDS\_KeyedStringDataWriter\_dispose()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    const DDS_InstanceHandle_t * instance_handle )
```

Requests the middleware to delete the data.

See also

**FooDataWriter\_dispose** (p.495)

**4.85.3.32 DDS\_KeyedStringDataWriter\_dispose\_w\_key()**

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * instance_handle )
```

<<*extension*>> (p. 817) Requests the middleware to delete the data.

See also

**FooDataWriter\_dispose** (p. 495)

**4.85.3.33 DDS\_KeyedStringDataWriter\_dispose\_w\_timestamp()**

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * instance_data,
    const DDS_InstanceHandle_t * instance_handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same functions as **DDS\_KeyedStringDataWriter\_dispose** (p. 944) except that the application provides the value for the `source_timestamp` that is made available to **DDS\_DataReader** (p. 608) objects by means of the `source_timestamp` attribute inside the **DDS\_SampleInfo** (p. 1720).

See also

**FooDataWriter\_dispose\_w\_timestamp** (p. 496)

**4.85.3.34 DDS\_KeyedStringDataWriter\_dispose\_w\_key\_w\_timestamp()**

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_dispose_w_key_w_timestamp (
    DDS_KeyedStringDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * instance_handle,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same functions as **DDS\_KeyedStringDataWriter\_dispose\_w\_key** (p. 944) except that the application provides the value for the `source_timestamp` that is made available to **DDS\_DataReader** (p. 608) objects by means of the `source_timestamp` attribute inside the **DDS\_SampleInfo** (p. 1720).

See also

**FooDataWriter\_dispose\_w\_timestamp** (p. 496)

#### 4.85.3.35 DDS\_KeyedStringDataWriter\_get\_key\_value()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_value (
    DDS_KeyedStringDataWriter * self,
    DDS_KeyedString * key_holder,
    const DDS_InstanceHandle_t * handle )
```

Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataWriter\\_get\\_key\\_value](#) (p. 498)

#### 4.85.3.36 DDS\_KeyedStringDataWriter\_get\_key\_value\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataWriter_get_key_value_w_key (
    DDS_KeyedStringDataWriter * self,
    char * key,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataWriter\\_get\\_key\\_value](#) (p. 498)

#### 4.85.3.37 DDS\_KeyedStringDataWriter\_lookup\_instance()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance (
    DDS_KeyedStringDataWriter * self,
    const DDS_KeyedString * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

[FooDataWriter\\_lookup\\_instance](#) (p. 499)

#### 4.85.3.38 DDS\_KeyedStringDataWriter\_lookup\_instance\_w\_key()

```
DDS_InstanceHandle_t DDS_KeyedStringDataWriter_lookup_instance_w_key (
    DDS_KeyedStringDataWriter * self,
    const char * key )
```

<<**extension**>> (p. 817) Retrieve the instance handle that corresponds to an instance key.

See also

**FooDataWriter\_lookup\_instance** (p. 499)

#### 4.85.3.39 DDS\_KeyedStringDataReader\_narrow()

```
DDS_KeyedStringDataReader * DDS_KeyedStringDataReader_narrow (
    DDS_DataReader * reader )
```

Narrow the given **DDS\_DataReader** (p. 608) pointer to a **DDS\_KeyedStringDataReader** (p. 933) pointer.

See also

**FooDataReader\_narrow** (p. 617)

#### 4.85.3.40 DDS\_KeyedStringDataReader\_as\_datareader()

```
DDS_DataReader * DDS_KeyedStringDataReader_as_datareader (
    DDS_KeyedStringDataReader * reader )
```

Widen the given **DDS\_KeyedStringDataReader** (p. 933) pointer to a **DDS\_DataReader** (p. 608) pointer.

See also

**FooDataReader\_as\_datareader** (p. 617)

#### 4.85.3.41 DDS\_KeyedStringDataReader\_read()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read** (p. 618)

#### 4.85.3.42 DDS\_KeyedStringDataReader\_take()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_mask,
    DDS_ViewStateMask view_mask,
    DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take** (p. 619)

#### 4.85.3.43 DDS\_KeyedStringDataReader\_read\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_w_condition (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_KeyedStringDataReader\_read** (p. 947) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_w\_condition** (p. 623)

#### 4.85.3.44 DDS\_KeyedStringDataReader\_take\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_w_condition (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Analogous to **DDS\_KeyedStringDataReader\_read\_w\_condition** (p. 948) except it accesses samples via the **DDS\_KeyedStringDataReader\_take** (p. 948) operation.

See also

**FooDataReader\_take\_w\_condition** (p. 625)

#### 4.85.3.45 DDS\_KeyedStringDataReader\_read\_next\_sample()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_sample (
    DDS_KeyedStringDataReader * self,
    DDS_KeyedString * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read\_next\_sample** (p. 626)

#### 4.85.3.46 DDS\_KeyedStringDataReader\_take\_next\_sample()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_sample (
    DDS_KeyedStringDataReader * self,
    DDS_KeyedString * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take\_next\_sample** (p. 627)

#### 4.85.3.47 DDS\_KeyedStringDataReader\_read\_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_instance (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read\_instance** (p. 628)

#### 4.85.3.48 DDS\_KeyedStringDataReader\_take\_instance()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_instance (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take\_instance** (p. 629)

#### 4.85.3.49 DDS\_KeyedStringDataReader\_read\_instance\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_instance_w_condition (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_KeyedStringDataReader\_read\_instance** (p. 949) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_instance\_w\_condition** (p. 631)

**4.85.3.50 DDS\_KeyedStringDataReader\_take\_instance\_w\_condition()**

```

DDS_ReturnCode_t DDS_KeyedStringDataReader_take_instance_w_condition (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_ReadCondition * condition )

```

Accesses via **DDS\_KeyedStringDataReader\_take\_instance** (p. 950) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_take\_instance\_w\_condition** (p. 632)

**4.85.3.51 DDS\_KeyedStringDataReader\_read\_next\_instance()**

```

DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )

```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read\_next\_instance** (p. 633)

**4.85.3.52 DDS\_KeyedStringDataReader\_take\_next\_instance()**

```

DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )

```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take\_next\_instance** (p. 635)

#### 4.85.3.53 DDS\_KeyedStringDataReader\_read\_next\_instance\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_read_next_instance_w_condition (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_KeyedStringDataReader\_read\_next\_instance** (p. 951) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_next\_instance\_w\_condition** (p. 636)

#### 4.85.3.54 DDS\_KeyedStringDataReader\_take\_next\_instance\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_take_next_instance_w_condition (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_KeyedStringDataReader\_take\_next\_instance** (p. 951) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_take\_next\_instance\_w\_condition** (p. 638)

#### 4.85.3.55 DDS\_KeyedStringDataReader\_return\_loan()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_return_loan (
    DDS_KeyedStringDataReader * self,
    struct DDS_KeyedStringSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS\_DataReader** (p. 608) that the application is done accessing the collection of *received\_data* and *info\_seq* obtained by some earlier invocation of read or take on the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_return\_loan** (p. 639)

#### 4.85.3.56 DDS\_KeyedStringDataReader\_get\_key\_value()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value (
    DDS_KeyedStringDataReader * self,
    DDS_KeyedString * key_holder,
    const DDS_InstanceHandle_t * handle )
```

Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataReader\\_get\\_key\\_value](#) (p. 640)

#### 4.85.3.57 DDS\_KeyedStringDataReader\_get\_key\_value\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedStringDataReader_get_key_value_w_key (
    DDS_KeyedStringDataReader * self,
    char * key,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataReader\\_get\\_key\\_value](#) (p. 640)

#### 4.85.3.58 DDS\_KeyedStringDataReader\_lookup\_instance()

```
DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance (
    DDS_KeyedStringDataReader * self,
    const DDS_KeyedString * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

[FooDataReader\\_lookup\\_instance](#) (p. 641)

### 4.85.3.59 DDS\_KeyedStringDataReader\_lookup\_instance\_w\_key()

```
DDS_InstanceHandle_t DDS_KeyedStringDataReader_lookup_instance_w_key (
    DDS_KeyedStringDataReader * self,
    const char * key )
```

<<*extension*>> (p. 817) Retrieve the instance handle that corresponds to an instance key.

See also

**FooDataReader\_lookup\_instance** (p. 641)

## 4.85.4 Variable Documentation

### 4.85.4.1 key

```
char* DDS_KeyedString::key
```

Instance key associated with the specified value.

### 4.85.4.2 value

```
char* DDS_KeyedString::value
```

String value.

## 4.86 Octets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes.

### Data Structures

- struct **DDS\_Octets**  
*Built-in type consisting of a variable-length array of opaque bytes.*
- struct **DDS\_OctetsSeq**  
*Instantiates **FooSeq** (p. 1845) < **DDS\_Octets** (p. 1606) > .*
- struct **DDS\_OctetsTypeSupport**  
*<<interface>> (p. 818) **DDS\_Octets** (p. 1606) type support.*

## Typedefs

- typedef struct **DDS\_Octets DDS\_Octets**  
*Built-in type consisting of a variable-length array of opaque bytes.*
- typedef struct **DDS\_OctetsDataWriter DDS\_OctetsDataWriter**  
*<<interface>> (p. 818) Instantiates `DataWriter` < **DDS\_Octets** (p. 1606) >.*
- typedef struct **DDS\_OctetsDataReader DDS\_OctetsDataReader**  
*<<interface>> (p. 818) Instantiates `DataReader` < **DDS\_Octets** (p. 1606) >.*

## Functions

- **DDS\_Octets \* DDS\_Octets\_new** (void)  
*Constructor.*
- **DDS\_Octets \* DDS\_Octets\_new\_w\_size** (int size)  
*Constructor that specifies the size of the allocated octets array.*
- void **DDS\_Octets\_delete** (**DDS\_Octets** \*self)  
*Destructor.*
- **DDS\_ReturnCode\_t DDS\_OctetsTypeSupport\_register\_type** (**DDS\_DomainParticipant** \*participant, const char \*type\_name)  
*Allows an application to communicate to RTI Connext the existence of the **DDS\_Octets** (p. 1606) data type.*
- **DDS\_ReturnCode\_t DDS\_OctetsTypeSupport\_unregister\_type** (**DDS\_DomainParticipant** \*participant, const char \*type\_name)  
*Allows an application to unregister the **DDS\_Octets** (p. 1606) data type from RTI Connext. After calling `unregister_type`, no further communication using this type is possible.*
- const char \* **DDS\_OctetsTypeSupport\_get\_type\_name** (void)  
*Get the default name for the **DDS\_Octets** (p. 1606) type.*

- **DDS\_ReturnCode\_t DDS\_OctetsDataWriter\_write\_octets\_seq** ( **DDS\_OctetsDataWriter** \*self, const struct **DDS\_OctetSeq** \*octets, const **DDS\_InstanceHandle\_t** \*handle)  
*<<extension>> (p. 817) Modifies the value of a **DDS\_Octets** (p. 1606) data instance.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataWriter\_write\_w\_timestamp** ( **DDS\_OctetsDataWriter** \*self, const **DDS\_Octets** \*instance\_data, const **DDS\_InstanceHandle\_t** \*handle, const struct **DDS\_Time\_t** \*source\_← timestamp)  
*Performs the same function as **DDS\_OctetsDataWriter\_write** (p. 964) except that it also provides the value for the **source\_timestamp**.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataWriter\_write\_octets\_w\_timestamp** ( **DDS\_OctetsDataWriter** \*self, const unsigned char \*octets, int length, const **DDS\_InstanceHandle\_t** \*handle, const struct **DDS\_Time\_← t** \*source\_timestamp)  
*<<extension>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets** (p. 965) except that it also provides the value for the **source\_timestamp**.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataWriter\_write\_octets\_seq\_w\_timestamp** ( **DDS\_OctetsDataWriter** \*self, const struct **DDS\_OctetSeq** \*octets, const **DDS\_InstanceHandle\_t** \*handle, const struct **DDS\_Time\_t** \*source\_timestamp)  
*<<extension>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets\_seq** (p. 965) except that it also provides the value for the **source\_timestamp**.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataWriter\_write\_w\_params** ( **DDS\_OctetsDataWriter** \*self, const **DDS\_← \_Octets** \*instance\_data, struct **DDS\_WriteParams\_t** \*params)  
*Performs the same function as **DDS\_OctetsDataWriter\_write** (p. 964) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataWriter\_write\_octets\_w\_params** ( **DDS\_OctetsDataWriter** \*self, const unsigned char \*octets, int length, struct **DDS\_WriteParams\_t** \*params)  
*<<extension>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets** (p. 965) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataWriter\_write\_octets\_seq\_w\_params** ( **DDS\_OctetsDataWriter** \*self, const struct **DDS\_OctetSeq** \*octets, struct **DDS\_WriteParams\_t** \*params)  
*<<extension>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets\_seq** (p. 965) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.*
- **DDS\_OctetsDataReader \* DDS\_OctetsDataReader\_narrow** ( **DDS\_DataReader** \*reader)  
*Narrow the given **DDS\_DataReader** (p. 608) pointer to a **DDS\_OctetsDataReader** (p. 958) pointer.*
- **DDS\_DataReader \* DDS\_OctetsDataReader\_as\_datareader** ( **DDS\_OctetsDataReader** \*reader)  
*Widen the given **DDS\_OctetsDataReader** (p. 958) pointer to a **DDS\_DataReader** (p. 608) pointer.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataReader\_read** ( **DDS\_OctetsDataReader** \*self, struct **DDS\_OctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_SampleStateMask** sample\_states, **DDS\_ViewStateMask** view\_states, **DDS\_InstanceStateMask** instance\_states)  
*Access a collection of data samples from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_OctetsDataReader\_take** ( **DDS\_OctetsDataReader** \*self, struct **DDS\_OctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_SampleStateMask** sample\_mask, **DDS\_ViewStateMask** view\_mask, **DDS\_InstanceStateMask** instance\_mask)  
*Access a collection of data-samples from the **DDS\_DataReader** (p. 608).*

- **DDS\_ReturnCode\_t DDS\_OctetsDataReader\_read\_w\_condition** ( **DDS\_OctetsDataReader** \*self, struct **DDS\_OctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_↔ReadCondition** \*condition)  
*Accesses via **DDS\_OctetsDataReader\_read** (p. 969) the samples that match the criteria specified in the **DDS\_Read↔Condition** (p. 686).*
- **DDS\_ReturnCode\_t DDS\_OctetsDataReader\_take\_w\_condition** ( **DDS\_OctetsDataReader** \*self, struct **DDS\_OctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_↔ReadCondition** \*condition)  
*Analogous to **DDS\_OctetsDataReader\_read\_w\_condition** (p. 970) except it accesses samples via the **DDS\_Octets↔DataReader\_take** (p. 969) operation.*
- **DDS\_ReturnCode\_t DDS\_OctetsDataReader\_read\_next\_sample** ( **DDS\_OctetsDataReader** \*self, **DDS\_↔Octets** \*received\_data, struct **DDS\_SampleInfo** \*sample\_info)  
*Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_OctetsDataReader\_take\_next\_sample** ( **DDS\_OctetsDataReader** \*self, **DDS\_↔Octets** \*received\_data, struct **DDS\_SampleInfo** \*sample\_info)  
*Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_OctetsDataReader\_return\_loan** ( **DDS\_OctetsDataReader** \*self, struct **DDS\_↔OctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq)  
*Indicates to the **DDS\_DataReader** (p. 608) that the application is done accessing the collection of *received\_data* and *info\_seq* obtained by some earlier invocation of *read* or *take* on the **DDS\_DataReader** (p. 608).*

## Variables

- int **DDS\_Octets::length**  
*Number of octets to serialize.*
- unsigned char \* **DDS\_Octets::value**  
***DDS\_Octets** (p. 1606) array value.*

### 4.86.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

### 4.86.2 Typedef Documentation

#### 4.86.2.1 DDS\_Octets

```
typedef struct DDS_Octets DDS_Octets
```

Built-in type consisting of a variable-length array of opaque bytes.

#### 4.86.2.2 DDS\_OctetsDataWriter

```
typedef struct DDS_OctetsDataWriter DDS_OctetsDataWriter
```

<<*interface*>> (p. 818) Instantiates DataWriter < **DDS\_Octets** (p. 1606) >.

See also

**FooDataWriter** (p. 1845)

**DDS\_DataWriter** (p. 478)

#### 4.86.2.3 DDS\_OctetsDataReader

```
typedef struct DDS_OctetsDataReader DDS_OctetsDataReader
```

<<*interface*>> (p. 818) Instantiates DataReader < **DDS\_Octets** (p. 1606) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and the byte array in a destination data sample is NULL, the middleware will allocate a new array for you of sufficient length to hold the received data. The new array will be allocated with **DDS\_OctetBuffer\_alloc** (p. 1287); the sample's destructor will delete it.

A non- NULL array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

See also

**FooDataReader** (p. 1845)

**DDS\_DataReader** (p. 608)

### 4.86.3 Function Documentation

#### 4.86.3.1 DDS\_Octets\_new()

```
DDS_Octets * DDS_Octets_new (
    void )
```

Constructor.

The default constructor initializes the newly created object with NULL value, and zero length.

Returns

A new **DDS\_Octets** (p. 1606) or NULL if failure.

#### 4.86.3.2 DDS\_Octets\_new\_w\_size()

```
DDS_Octets * DDS_Octets_new_w_size (
    int size )
```

Constructor that specifies the size of the allocated octets array.

After this function is called, length is set to zero.

## Parameters

<i>size</i>	<< <i>in</i> >> (p. 818) Size of the allocated octets array Cannot be smaller than zero.
-------------	------------------------------------------------------------------------------------------

## Returns

A new **DDS\_Octets** (p. 1606) or NULL if failure.

## 4.86.3.3 DDS\_Octets\_delete()

```
void DDS_Octets_delete (
    DDS_Octets * self )
```

Destructor.

## 4.86.3.4 DDS\_OctetsTypeSupport\_register\_type()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_register_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to communicate to RTI Connext the existence of the **DDS\_Octets** (p. 1606) data type.

By default, The **DDS\_Octets** (p. 1606) built-in type is automatically registered when a DomainParticipant is created using the *type\_name* returned by **DDS\_OctetsTypeSupport\_get\_type\_name** (p. 961). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin\_type.auto\_register".

This function can also be used to register the same **DDS\_OctetsTypeSupport** (p. 1607) with a **DDS\_DomainParticipant** (p. 72) using different values for the *type\_name*.

If *register\_type* is called multiple times with the same **DDS\_DomainParticipant** (p. 72) and *type\_name*, the second (and subsequent) registrations are ignored by the operation.

## Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818) the <b>DDS_DomainParticipant</b> (p. 72) to register the data type <b>DDS_Octets</b> (p. 1606) with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 818) the type name under with the data type <b>DDS_Octets</b> (p. 1606) is registered with the participant; this type name is used when creating a new <b>DDS_Topic</b> (p. 172). (See <b>DDS_DomainParticipant_create_topic</b> (p. 112).) The name may not be NULL or longer than 255 characters.

**Returns**

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025) or **DDS\_↔\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

**MT Safety:**

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

**See also**

**DDS\_DomainParticipant\_create\_topic** (p. 112)

**4.86.3.5 DDS\_OctetsTypeSupport\_unregister\_type()**

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_unregister_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to unregister the **DDS\_Octets** (p. 1606) data type from RTI Connext. After calling `unregister_type`, no further communication using this type is possible.

**Precondition**

The **DDS\_Octets** (p. 1606) type with `type_name` is registered with the participant and all **DDS\_Topic** (p. 172) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS\_Topic** (p. 172) is associated with the type, the operation will fail with **DDS\_RETCODE\_ERROR** (p. 1025).

**Postcondition**

All information about the type is removed from RTI Connext. No further communication using this type is possible.

**Parameters**

<i>participant</i>	<< <i>in</i> >> (p. 818) the <b>DDS_DomainParticipant</b> (p. 72) to unregister the data type <b>DDS_Octets</b> (p. 1606) from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 818) the type name under with the data type <b>DDS_Octets</b> (p. 1606) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

**Returns**

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_BAD\_PARAMETER** (p. 1025) or **DDS\_↔\_RETCODE\_ERROR** (p. 1025)

MT Safety:

SAFE.

See also

**DDS\_OctetsTypeSupport\_register\_type** (p. 959)

#### 4.86.3.6 DDS\_OctetsTypeSupport\_get\_type\_name()

```
const char * DDS_OctetsTypeSupport_get_type_name (
    void )
```

Get the default name for the **DDS\_Octets** (p. 1606) type.

Can be used for calling **DDS\_OctetsTypeSupport\_register\_type** (p. 959) or creating **DDS\_Topic** (p. 172).

Returns

default name for the **DDS\_Octets** (p. 1606) type.

See also

**DDS\_OctetsTypeSupport\_register\_type** (p. 959)

**DDS\_DomainParticipant\_create\_topic** (p. 112)

#### 4.86.3.7 DDS\_OctetsTypeSupport\_print\_data()

```
void DDS_OctetsTypeSupport_print_data (
    const DDS_Octets * a_data )
```

<<**extension**>> (p. 817) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

Parameters

<code>a_data</code>	<< <b>in</b> >> (p. 818) <b>DDS_Octets</b> (p. 1606) to be printed.
---------------------	---------------------------------------------------------------------

#### 4.86.3.8 DDS\_OctetsTypeSupport\_get\_typecode()

```
DDS_TypeCode * DDS_OctetsTypeSupport_get_typecode (
    void )
```

<<*extension*>> (p. 817) Retrieves the TypeCode for the Type.

See also

**FooTypeSupport\_get\_typecode** (p. 222)

#### 4.86.3.9 DDS\_OctetsTypeSupport\_serialize\_data\_to\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int * length,
    const DDS_Octets * a_data )
```

<<*extension*>> (p. 817) Serializes the input sample into a CDR buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.86.3.10 DDS\_OctetsTypeSupport\_serialize\_data\_to\_cdr\_buffer\_ex()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int * length,
    const DDS_Octets * a_data,
    DDS_DataRepresentationId_t representation )
```

<<*extension*>> (p. 817) Serializes the input sample into a buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.86.3.11 DDS\_OctetsTypeSupport\_deserialize\_data\_from\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_deserialize_data_from_cdr_buffer (
    DDS_Octets * a_data,
    const char * buffer,
    unsigned int length )
```

<<*extension*>> (p. 817) Deserializes a sample from a buffer of octets.

See also

**FooTypeSupport\_deserialize\_data\_from\_cdr\_buffer** (p. 220)

#### 4.86.3.12 DDS\_OctetsTypeSupport\_data\_to\_string()

```
DDS_ReturnCode_t DDS_OctetsTypeSupport_data_to_string (
    const DDS_Octets * sample,
    char * str,
    DDS_UnsignedLong * str_size,
    DDS_PrintFormatProperty * property )
```

<<*extension*>> (p. 817) Get the string representation of an input sample.

See also

**FooTypeSupport\_data\_to\_string** (p. 221)

#### 4.86.3.13 DDS\_OctetsDataWriter\_narrow()

```
DDS_OctetsDataWriter * DDS_OctetsDataWriter_narrow (
    DDS_DataWriter * writer )
```

Narrow the given **DDS\_DataWriter** (p. 478) pointer to a **DDS\_OctetsDataWriter** (p. 957) pointer.

See also

**FooDataWriter\_narrow** (p. 483)

#### 4.86.3.14 DDS\_OctetsDataWriter\_as\_datawriter()

```
DDS_DataWriter * DDS_OctetsDataWriter_as_datawriter (
    DDS_OctetsDataWriter * writer )
```

Widen the given **DDS\_OctetsDataWriter** (p. 957) pointer to a **DDS\_DataWriter** (p. 478) pointer.

See also

**FooDataWriter\_as\_datawriter** (p. 483)

#### 4.86.3.15 DDS\_OctetsDataWriter\_create\_data()

```
DDS_Octets * DDS_OctetsDataWriter_create_data (
    DDS_OctetsDataWriter * self )
```

Creates an octet data sequence.

The size of the instance is determined by the DataWriter property **dds.builtin\_type.octets.alloc\_size**.

Default size: **dds.builtin\_type.octets.max\_size** property of DomainParticipant if defined. Otherwise 2048.

Created instances must be deleted with **DDS\_OctetsDataWriter\_delete\_data** (p. 964).

Returns

Newly created octet sequence data, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types.

#### 4.86.3.16 DDS\_OctetsDataWriter\_delete\_data()

```
DDS_Boolean DDS_OctetsDataWriter_delete_data (
    DDS_OctetsDataWriter * self,
    DDS_Octets * sample )
```

Destroys a octet data sequence created by **DDS\_OctetsDataWriter\_create\_data** (p. 964).

Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) upon successful deletion.

## 4.86.3.17 DDS\_OctetsDataWriter\_write()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write (
    DDS_OctetsDataWriter * self,
    const DDS_Octets * instance_data,
    const DDS_InstanceHandle_t * handle )
```

Modifies the value of a **DDS\_Octets** (p. 1606) data instance.

See also

**FooDataWriter\_write** (p. 489)

## 4.86.3.18 DDS\_OctetsDataWriter\_write\_octets()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets (
    DDS_OctetsDataWriter * self,
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t * handle )
```

<<**extension**>> (p. 817) Modifies the value of a **DDS\_Octets** (p. 1606) data instance.

Parameters

<i>self</i>	<< <b>in</b> >> (p. 818) Cannot be NULL.
<i>octets</i>	<< <b>in</b> >> (p. 818) Array of octets to be published.
<i>length</i>	<< <b>in</b> >> (p. 818) Number of octets to be published.
<i>handle</i>	<< <b>in</b> >> (p. 818) The special value <b>DDS_HANDLE_NIL</b> (p. 224) should be used always.

See also

**FooDataWriter\_write** (p. 489)

## 4.86.3.19 DDS\_OctetsDataWriter\_write\_octets\_seq()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq (
    DDS_OctetsDataWriter * self,
    const struct DDS_OctetSeq * octets,
    const DDS_InstanceHandle_t * handle )
```

<<**extension**>> (p. 817) Modifies the value of a **DDS\_Octets** (p. 1606) data instance.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>octets</i>	<< <i>in</i> >> (p. 818) Sequence of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 818) The special value <b>DDS_HANDLE_NIL</b> (p. 224) should be used always.

## See also

**FooDataWriter\_write** (p. 489)

## 4.86.3.20 DDS\_OctetsDataWriter\_write\_w\_timestamp()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_timestamp (
    DDS_OctetsDataWriter * self,
    const DDS_Octets * instance_data,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_OctetsDataWriter\_write** (p. 964) except that it also provides the value for the `source_timestamp`.

## See also

**FooDataWriter\_write\_w\_timestamp** (p. 493)

## 4.86.3.21 DDS\_OctetsDataWriter\_write\_octets\_w\_timestamp()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_w_timestamp (
    DDS_OctetsDataWriter * self,
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets** (p. 965) except that it also provides the value for the `source_timestamp`.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>octets</i>	<< <i>in</i> >> (p. 818) Array of octets to be published.
<i>length</i>	<< <i>in</i> >> (p. 818) Number of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 818) The special value <b>DDS_HANDLE_NIL</b> (p. 224) should be used always.
<i>source_timestamp</i>	<< <i>in</i> >> (p. 818) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See <b>FooDataWriter_write_w_timestamp</b> (p. 493). Cannot be NULL.

See also

**FooDataWriter\_write\_w\_timestamp** (p. 493)

#### 4.86.3.22 DDS\_OctetsDataWriter\_write\_octets\_seq\_w\_timestamp()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_timestamp (
    DDS_OctetsDataWriter * self,
    const struct DDS_OctetSeq * octets,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets\_seq** (p. 965) except that it also provides the value for the `source_timestamp`.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>octets</i>	<< <i>in</i> >> (p. 818) Sequence of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 818) The special value <b>DDS_HANDLE_NIL</b> (p. 224) should be used always.
<i>source_timestamp</i>	<< <i>in</i> >> (p. 818) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See <b>FooDataWriter_write_w_timestamp</b> (p. 493). Cannot be NULL.

See also

**FooDataWriter\_write\_w\_timestamp** (p. 493)

#### 4.86.3.23 DDS\_OctetsDataWriter\_write\_w\_params()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_w_params (
    DDS_OctetsDataWriter * self,
    const DDS_Octets * instance_data,
    struct DDS_WriteParams_t * params )
```

Performs the same function as **DDS\_OctetsDataWriter\_write** (p. 964) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

See also

**FooDataWriter\_write\_w\_params** (p. 494)

#### 4.86.3.24 DDS\_OctetsDataWriter\_write\_octets\_w\_params()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_w_params (
    DDS_OctetsDataWriter * self,
    const unsigned char * octets,
    int length,
    struct DDS_WriteParams_t * params )
```

<<**extension**>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets** (p. 965) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

##### Parameters

<i>self</i>	<< <b>in</b> >> (p. 818) Cannot be NULL.
<i>octets</i>	<< <b>in</b> >> (p. 818) Array of octets to be published.
<i>length</i>	<< <b>in</b> >> (p. 818) Number of octets to be published.
<i>params</i>	<< <b>in</b> >> (p. 818) The <b>DDS_WriteParams_t</b> (p. 1833) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See <b>FooDataWriter_write_w_params</b> (p. 494). Cannot be NULL.

##### See also

**FooDataWriter\_write\_w\_params** (p. 494)

#### 4.86.3.25 DDS\_OctetsDataWriter\_write\_octets\_seq\_w\_params()

```
DDS_ReturnCode_t DDS_OctetsDataWriter_write_octets_seq_w_params (
    DDS_OctetsDataWriter * self,
    const struct DDS_OctetSeq * octets,
    struct DDS_WriteParams_t * params )
```

<<**extension**>> (p. 817) Performs the same function as **DDS\_OctetsDataWriter\_write\_octets\_seq** (p. 965) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

##### Parameters

<i>self</i>	<< <b>in</b> >> (p. 818) Cannot be NULL.
<i>octets</i>	<< <b>in</b> >> (p. 818) Sequence of octets to be published.
<i>params</i>	<< <b>in</b> >> (p. 818) The <b>DDS_WriteParams_t</b> (p. 1833) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See <b>FooDataWriter_write_w_params</b> (p. 494). Cannot be NULL.

##### See also

**FooDataWriter\_write\_w\_params** (p. 494)

#### 4.86.3.26 DDS\_OctetsDataReader\_narrow()

```
DDS_OctetsDataReader * DDS_OctetsDataReader_narrow (
    DDS_DataReader * reader )
```

Narrow the given **DDS\_DataReader** (p. 608) pointer to a **DDS\_OctetsDataReader** (p. 958) pointer.

See also

**FooDataReader\_narrow** (p. 617)

#### 4.86.3.27 DDS\_OctetsDataReader\_as\_datareader()

```
DDS_DataReader * DDS_OctetsDataReader_as_datareader (
    DDS_OctetsDataReader * reader )
```

Widen the given **DDS\_OctetsDataReader** (p. 958) pointer to a **DDS\_DataReader** (p. 608) pointer.

See also

**FooDataReader\_as\_datareader** (p. 617)

#### 4.86.3.28 DDS\_OctetsDataReader\_read()

```
DDS_ReturnCode_t DDS_OctetsDataReader_read (
    DDS_OctetsDataReader * self,
    struct DDS_OctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read** (p. 618)

#### 4.86.3.29 DDS\_OctetsDataReader\_take()

```
DDS_ReturnCode_t DDS_OctetsDataReader_take (
    DDS_OctetsDataReader * self,
    struct DDS_OctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_mask,
    DDS_ViewStateMask view_mask,
    DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take** (p. 619)

#### 4.86.3.30 DDS\_OctetsDataReader\_read\_w\_condition()

```
DDS_ReturnCode_t DDS_OctetsDataReader_read_w_condition (
    DDS_OctetsDataReader * self,
    struct DDS_OctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_OctetsDataReader\_read** (p. 969) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_w\_condition** (p. 623)

#### 4.86.3.31 DDS\_OctetsDataReader\_take\_w\_condition()

```
DDS_ReturnCode_t DDS_OctetsDataReader_take_w_condition (
    DDS_OctetsDataReader * self,
    struct DDS_OctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Analogous to **DDS\_OctetsDataReader\_read\_w\_condition** (p. 970) except it accesses samples via the **DDS\_OctetsDataReader\_take** (p. 969) operation.

See also

**FooDataReader\_take\_w\_condition** (p. 625)

### 4.86.3.32 DDS\_OctetsDataReader\_read\_next\_sample()

```
DDS_ReturnCode_t DDS_OctetsDataReader_read_next_sample (
    DDS_OctetsDataReader * self,
    DDS_Octets * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read\_next\_sample** (p. 626)

### 4.86.3.33 DDS\_OctetsDataReader\_take\_next\_sample()

```
DDS_ReturnCode_t DDS_OctetsDataReader_take_next_sample (
    DDS_OctetsDataReader * self,
    DDS_Octets * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take\_next\_sample** (p. 627)

### 4.86.3.34 DDS\_OctetsDataReader\_return\_loan()

```
DDS_ReturnCode_t DDS_OctetsDataReader_return_loan (
    DDS_OctetsDataReader * self,
    struct DDS_OctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS\_DataReader** (p. 608) that the application is done accessing the collection of `received_data` and `info_seq` obtained by some earlier invocation of `read` or `take` on the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_return\_loan** (p. 639)

## 4.86.4 Variable Documentation

#### 4.86.4.1 length

```
int DDS_Octets::length
```

Number of octets to serialize.

#### 4.86.4.2 value

```
unsigned char* DDS_Octets::value
```

**DDS\_Octets** (p. 1606) array value.

## 4.87 KeyedOctets Built-in Type

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

### Data Structures

- struct **DDS\_KeyedOctets**  
*Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.*
- struct **DDS\_KeyedOctetsSeq**  
*Instantiates `FooSeq` (p. 1845) < `DDS_KeyedOctets` (p. 1564) >.*
- struct **DDS\_KeyedOctetsTypeSupport**  
*<<interface>> (p. 818) `DDS_KeyedOctets` (p. 1564) type support.*

### Typedefs

- typedef struct **DDS\_KeyedOctets DDS\_KeyedOctets**  
*Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.*
- typedef struct **DDS\_KeyedOctetsDataWriter DDS\_KeyedOctetsDataWriter**  
*<<interface>> (p. 818) Instantiates `DataWriter` < `DDS_KeyedOctets` (p. 1564) >.*
- typedef struct **DDS\_KeyedOctetsDataReader DDS\_KeyedOctetsDataReader**  
*<<interface>> (p. 818) Instantiates `DataReader` < `DDS_KeyedOctets` (p. 1564) >.*

## Functions

- **DDS\_KeyedOctets \* DDS\_KeyedOctets\_new** (void)  
*Constructor.*
- **DDS\_KeyedOctets \* DDS\_KeyedOctets\_new\_w\_size** (int key\_size, int size)  
*Constructor that specifies the allocated sizes.*
- void **DDS\_KeyedOctets\_delete** ( DDS\_KeyedOctets \*self)  
*Destructor.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsTypeSupport\_register\_type** ( DDS\_DomainParticipant \*participant, const char \*type\_name)  
*Allows an application to communicate to RTI Connexx the existence of the **DDS\_KeyedOctets** (p. 1564) data type.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsTypeSupport\_unregister\_type** ( DDS\_DomainParticipant \*participant, const char \*type\_name)  
*Allows an application to unregister the **DDS\_KeyedOctets** (p. 1564) data type from RTI Connexx. After calling unregister\_type, no further communication using this type is possible.*
- const char \* **DDS\_KeyedOctetsTypeSupport\_get\_type\_name** (void)  
*Get the default name for the **DDS\_KeyedOctets** (p. 1564) type.*
- void **DDS\_KeyedOctetsTypeSupport\_print\_data** (const DDS\_KeyedOctets \*a\_data)  
*<<extension>> (p. 817) Print value of data type to standard out.*
- **DDS\_TypeCode \* DDS\_KeyedOctetsTypeSupport\_get\_typecode** (void)  
*<<extension>> (p. 817) Retrieves the TypeCode for the Type.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsTypeSupport\_serialize\_data\_to\_cdr\_buffer** (char \*buffer, unsigned int \*length, const DDS\_KeyedOctets \*a\_data)  
*<<extension>> (p. 817) Serializes the input sample into a CDR buffer of octets.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsTypeSupport\_serialize\_data\_to\_cdr\_buffer\_ex** (char \*buffer, unsigned int \*length, const DDS\_KeyedOctets \*a\_data, DDS\_DataRepresentationId\_t representation)  
*<<extension>> (p. 817) Serializes the input sample into a buffer of octets.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsTypeSupport\_deserialize\_data\_from\_cdr\_buffer** ( DDS\_KeyedOctets \*a\_data, const char \*buffer, unsigned int length)  
*<<extension>> (p. 817) Deserializes a sample from a buffer of octets.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsTypeSupport\_data\_to\_string** (const DDS\_KeyedOctets \*sample, char \*str, DDS\_UnsignedLong \*str\_size, DDS\_PrintFormatProperty \*property)  
*<<extension>> (p. 817) Get the string representation of an input sample.*
- **DDS\_KeyedOctetsDataWriter \* DDS\_KeyedOctetsDataWriter\_narrow** ( DDS\_DataWriter \*writer)  
*Narrow the given **DDS\_DataWriter** (p. 478) pointer to a **DDS\_KeyedOctetsDataWriter** (p. 978) pointer.*
- **DDS\_DataWriter \* DDS\_KeyedOctetsDataWriter\_as\_datawriter** ( DDS\_KeyedOctetsDataWriter \*writer)  
*Widen the given **DDS\_KeyedOctetsDataWriter** (p. 978) pointer to a **DDS\_DataWriter** (p. 478) pointer.*
- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataWriter\_register\_instance** ( DDS\_KeyedOctetsDataWriter \*self, const DDS\_KeyedOctets \*instance\_data)  
*Informs RTI Connexx that the application will be modifying a particular instance.*
- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key** ( DDS\_KeyedOctetsDataWriter \*self, const char \*key)  
*<<extension>> (p. 817) Informs RTI Connexx that the application will be modifying a particular instance.*
- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_timestamp** ( DDS\_KeyedOctetsDataWriter \*self, const DDS\_KeyedOctets \*instance\_data, const struct DDS\_Time\_t \*source\_timestamp)  
*Performs the same functions as **DDS\_KeyedOctetsDataWriter\_register\_instance** (p. 984) except that the application provides the value for the *source\_timestamp*.*

- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key\_w\_timestamp** ( DDS\_↔  
KeyedOctetsDataWriter \*self, const char \*key, const struct DDS\_Time\_t \*source\_timestamp)  
 <<extension>> (p. 817) Performs the same functions as *DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key* (p. 985) except that the application provides the value for the *source\_timestamp*.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_unregister\_instance** ( DDS\_KeyedOctetsDataWriter  
\*self, const DDS\_KeyedOctets \*instance\_data, const DDS\_InstanceHandle\_t \*handle)  
 Reverses the action of *DDS\_KeyedOctetsDataWriter\_register\_instance* (p. 984).
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_key** ( DDS\_KeyedOctets↔  
DataWriter \*self, const char \*key, const DDS\_InstanceHandle\_t \*handle)  
 <<extension>> (p. 817) Reverses the action of *DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key* (p. 985).
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_timestamp** ( DDS\_Keyed↔  
OctetsDataWriter \*self, const DDS\_KeyedOctets \*instance\_data, const DDS\_InstanceHandle\_t \*handle,  
const struct DDS\_Time\_t \*source\_timestamp)  
 Performs the same function as *DDS\_KeyedOctetsDataWriter\_unregister\_instance* (p. 986) except that it also provides  
the value for the *source\_timestamp*.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_key\_w\_timestamp** ( DDS\_↔  
KeyedOctetsDataWriter \*self, const char \*key, const DDS\_InstanceHandle\_t \*handle, const struct DDS\_↔  
Time\_t \*source\_timestamp)  
 <<extension>> (p. 817) Performs the same function as *DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_key*  
(p. 986) except that it also provides the value for the *source\_timestamp*.
- **DDS\_KeyedOctets \* DDS\_KeyedOctetsDataWriter\_create\_data** ( DDS\_KeyedOctetsDataWriter \*self)  
 Creates a keyed octet sequence.
- **DDS\_Boolean DDS\_KeyedOctetsDataWriter\_delete\_data** ( DDS\_KeyedOctetsDataWriter \*self, DDS\_↔  
KeyedOctets \*sample)  
 Destroys a string data instance created by *DDS\_StringDataWriter\_create\_data* (p. 922).
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write** ( DDS\_KeyedOctetsDataWriter \*self, const  
DDS\_KeyedOctets \*instance\_data, const DDS\_InstanceHandle\_t \*handle)  
 Modifies the value of a *DDS\_KeyedOctets* (p. 1564) data instance.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key** ( DDS\_KeyedOctetsDataWriter  
\*self, const char \*key, const unsigned char \*octets, int length, const DDS\_InstanceHandle\_t \*handle)  
 <<extension>> (p. 817) Modifies the value of a *DDS\_KeyedOctets* (p. 1564) data instance.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key** ( DDS\_KeyedOctetsData↔  
Writer \*self, const char \*key, const struct DDS\_OctetSeq \*octets, const DDS\_InstanceHandle\_t \*handle)  
 <<extension>> (p. 817) Modifies the value of a *DDS\_KeyedOctets* (p. 1564) data instance.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_w\_timestamp** ( DDS\_KeyedOctetsDataWriter  
\*self, const DDS\_KeyedOctets \*instance\_data, const DDS\_InstanceHandle\_t \*handle, const struct DDS\_↔  
Time\_t \*source\_timestamp)  
 Performs the same function as *DDS\_KeyedOctetsDataWriter\_write* (p. 988) except that it also provides the value for the  
*source\_timestamp*.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key\_w\_timestamp** ( DDS\_Keyed↔  
OctetsDataWriter \*self, const char \*key, const unsigned char \*octets, int length, const DDS\_InstanceHandle↔  
\_t \*handle, const struct DDS\_Time\_t \*source\_timestamp)  
 Performs the same function as *DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key* (p. 988) except that it also provides  
the value for the *source\_timestamp*.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key\_w\_timestamp** ( DDS\_↔  
KeyedOctetsDataWriter \*self, const char \*key, const struct DDS\_OctetSeq \*octets, const DDS\_Instance↔  
Handle\_t \*handle, const struct DDS\_Time\_t \*source\_timestamp)  
 Performs the same function as *DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key* (p. 989) except that it also pro-  
vides the value for the *source\_timestamp*.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_w\_params** ( DDS\_KeyedOctetsDataWriter \*self,  
const DDS\_KeyedOctets \*instance\_data, struct DDS\_WriteParams\_t \*params)

Performs the same function as *DDS\_KeyedOctetsDataWriter\_write* (p. 988) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key\_w\_params** (*DDS\_KeyedOctetsDataWriter* \*self, const char \*key, const unsigned char \*octets, int length, struct *DDS\_WriteParams\_t* \*params)
 

Performs the same function as *DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key* (p. 988) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key\_w\_params** (*DDS\_KeyedOctetsDataWriter* \*self, const char \*key, const struct *DDS\_OctetSeq* \*octets, struct *DDS\_WriteParams\_t* \*params)
 

Performs the same function as *DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key* (p. 989) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_dispose** (*DDS\_KeyedOctetsDataWriter* \*self, const *DDS\_KeyedOctets* \*instance\_data, const *DDS\_InstanceHandle\_t* \*instance\_handle)
 

Requests the middleware to delete the data.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_dispose\_w\_key** (*DDS\_KeyedOctetsDataWriter* \*self, const char \*key, const *DDS\_InstanceHandle\_t* \*instance\_handle)
 

<<extension>> (p. 817) Requests the middleware to delete the data.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_dispose\_w\_timestamp** (*DDS\_KeyedOctetsDataWriter* \*self, const *DDS\_KeyedOctets* \*instance\_data, const *DDS\_InstanceHandle\_t* \*instance\_handle, const struct *DDS\_Time\_t* \*source\_timestamp)
 

Performs the same functions as *DDS\_KeyedOctetsDataWriter\_dispose* (p. 992) except that the application provides the value for the *source\_timestamp* that is made available to *DDS\_DataReader* (p. 608) objects by means of the *source\_timestamp* attribute inside the *DDS\_SampleInfo* (p. 1720).
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_dispose\_w\_key\_w\_timestamp** (*DDS\_KeyedOctetsDataWriter* \*self, const char \*key, const *DDS\_InstanceHandle\_t* \*instance\_handle, const struct *DDS\_Time\_t* \*source\_timestamp)
 

<<extension>> (p. 817) Performs the same functions as *DDS\_KeyedOctetsDataWriter\_dispose\_w\_key* (p. 992) except that the application provides the value for the *source\_timestamp* that is made available to *DDS\_DataReader* (p. 608) objects by means of the *source\_timestamp* attribute inside the *DDS\_SampleInfo* (p. 1720).
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_get\_key\_value** (*DDS\_KeyedOctetsDataWriter* \*self, *DDS\_KeyedOctets* \*key\_holder, const *DDS\_InstanceHandle\_t* \*handle)
 

Retrieve the instance key that corresponds to an instance handle.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataWriter\_get\_key\_value\_w\_key** (*DDS\_KeyedOctetsDataWriter* \*self, char \*key, const *DDS\_InstanceHandle\_t* \*handle)
 

<<extension>> (p. 817) Retrieve the instance key that corresponds to an instance handle.
- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataWriter\_lookup\_instance** (*DDS\_KeyedOctetsDataWriter* \*self, const *DDS\_KeyedOctets* \*key\_holder)
 

Retrieve the instance handle that corresponds to an instance key\_holder.
- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataWriter\_lookup\_instance\_w\_key** (*DDS\_KeyedOctetsDataWriter* \*self, const char \*key)
 

<<extension>> (p. 817) Retrieve the instance handle that corresponds to an instance key.
- **DDS\_KeyedOctetsDataReader \* DDS\_KeyedOctetsDataReader\_narrow** (*DDS\_DataReader* \*reader)
 

Narrow the given *DDS\_DataReader* (p. 608) pointer to a *DDS\_KeyedOctetsDataReader* (p. 978) pointer.
- **DDS\_DataReader \* DDS\_KeyedOctetsDataReader\_as\_datareader** (*DDS\_KeyedOctetsDataReader* \*reader)
 

Widen the given *DDS\_KeyedOctetsDataReader* (p. 978) pointer to a *DDS\_DataReader* (p. 608) pointer.
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_read** (*DDS\_KeyedOctetsDataReader* \*self, struct *DDS\_KeyedOctetsSeq* \*received\_data, struct *DDS\_SampleInfoSeq* \*info\_seq, *DDS\_Long* max\_samples, *DDS\_SampleStateMask* sample\_states, *DDS\_ViewStateMask* view\_states, *DDS\_InstanceStateMask* instance\_states)
 

Access a collection of data samples from the *DDS\_DataReader* (p. 608).

- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_take** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_SampleStateMask** sample\_mask, **DDS\_ViewStateMask** view\_mask, **DDS\_InstanceStateMask** instance\_mask)

*Access a collection of data-samples from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_read\_w\_condition** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_ReadCondition** \*condition)

*Accesses via **DDS\_KeyedOctetsDataReader\_read** (p. 995) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_take\_w\_condition** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, **DDS\_ReadCondition** \*condition)

*Analogous to **DDS\_KeyedOctetsDataReader\_read\_w\_condition** (p. 996) except it accesses samples via the **DDS\_KeyedOctetsDataReader\_take** (p. 996) operation.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_read\_next\_sample** ( **DDS\_KeyedOctetsDataReader** \*self, **DDS\_KeyedOctets** \*received\_data, struct **DDS\_SampleInfo** \*sample\_info)

*Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_take\_next\_sample** ( **DDS\_KeyedOctetsDataReader** \*self, **DDS\_KeyedOctets** \*received\_data, struct **DDS\_SampleInfo** \*sample\_info)

*Copies the next not-previously-accessed data value from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_read\_instance** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, const **DDS\_InstanceHandle\_t** \*a\_handle, **DDS\_SampleStateMask** sample\_states, **DDS\_ViewStateMask** view\_states, **DDS\_InstanceStateMask** instance\_states)

*Access a collection of data samples from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_take\_instance** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, const **DDS\_InstanceHandle\_t** \*a\_handle, **DDS\_SampleStateMask** sample\_states, **DDS\_ViewStateMask** view\_states, **DDS\_InstanceStateMask** instance\_states)

*Access a collection of data samples from the **DDS\_DataReader** (p. 608).*

*Accesses via **DDS\_KeyedOctetsDataReader\_read\_instance** (p. 997) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_take\_instance\_w\_condition** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, const **DDS\_InstanceHandle\_t** \*a\_handle, **DDS\_ReadCondition** \*condition)

*Accesses via **DDS\_KeyedOctetsDataReader\_take\_instance** (p. 998) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_read\_next\_instance** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, const **DDS\_InstanceHandle\_t** \*previous\_handle, **DDS\_SampleStateMask** sample\_states, **DDS\_ViewStateMask** view\_states, **DDS\_InstanceStateMask** instance\_states)

*Access a collection of data samples from the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_take\_next\_instance** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, const **DDS\_InstanceHandle\_t** \*previous\_handle, **DDS\_SampleStateMask** sample\_states, **DDS\_ViewStateMask** view\_states, **DDS\_InstanceStateMask** instance\_states)

*Access a collection of data samples from the **DDS\_DataReader** (p. 608).*

- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_read\_next\_instance\_w\_condition** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, const **DDS\_InstanceHandle\_t** \*previous\_handle, **DDS\_ReadCondition** \*condition)  
*Accesses via **DDS\_KeyedOctetsDataReader\_read\_next\_instance** (p. 999) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_take\_next\_instance\_w\_condition** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq, **DDS\_Long** max\_samples, const **DDS\_InstanceHandle\_t** \*previous\_handle, **DDS\_ReadCondition** \*condition)  
*Accesses via **DDS\_KeyedOctetsDataReader\_take\_next\_instance** (p. 999) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_return\_loan** ( **DDS\_KeyedOctetsDataReader** \*self, struct **DDS\_KeyedOctetsSeq** \*received\_data, struct **DDS\_SampleInfoSeq** \*info\_seq)  
*Indicates to the **DDS\_DataReader** (p. 608) that the application is done accessing the collection of *received\_data* and *info\_seq* obtained by some earlier invocation of *read* or *take* on the **DDS\_DataReader** (p. 608).*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_get\_key\_value** ( **DDS\_KeyedOctetsDataReader** \*self, **DDS\_KeyedOctets** \*key\_holder, const **DDS\_InstanceHandle\_t** \*handle)  
*Retrieve the instance *key* that corresponds to an instance *handle*.*
- **DDS\_ReturnCode\_t DDS\_KeyedOctetsDataReader\_get\_key\_value\_w\_key** ( **DDS\_KeyedOctetsDataReader** \*self, char \*key, const **DDS\_InstanceHandle\_t** \*handle)  
*<<extension>> (p. 817) Retrieve the instance *key* that corresponds to an instance *handle*.*
- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataReader\_lookup\_instance** ( **DDS\_KeyedOctetsDataReader** \*self, const **DDS\_KeyedOctets** \*key\_holder)  
*Retrieve the instance *handle* that corresponds to an instance *key\_holder*.*
- **DDS\_InstanceHandle\_t DDS\_KeyedOctetsDataReader\_lookup\_instance\_w\_key** ( **DDS\_KeyedOctetsDataReader** \*self, const char \*key)  
*<<extension>> (p. 817) Retrieve the instance *handle* that corresponds to an instance *key*.*

## Variables

- char \* **DDS\_KeyedOctets::key**  
*Instance key associated with the specified value.*
- int **DDS\_KeyedOctets::length**  
*Number of octets to serialize.*
- unsigned char \* **DDS\_KeyedOctets::value**  
***DDS\_Octets** (p. 1606) array value.*

### 4.87.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

### 4.87.2 Typedef Documentation

### 4.87.2.1 DDS\_KeyedOctets

```
typedef struct DDS_KeyedOctets DDS_KeyedOctets
```

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

### 4.87.2.2 DDS\_KeyedOctetsDataWriter

```
typedef struct DDS_KeyedOctetsDataWriter DDS_KeyedOctetsDataWriter
```

<<*interface*>> (p. 818) Instantiates `DataWriter` < **DDS\_KeyedOctets** (p. 1564) >.

See also

**FooDataWriter** (p. 1845)

**DDS\_DataWriter** (p. 478)

### 4.87.2.3 DDS\_KeyedOctetsDataReader

```
typedef struct DDS_KeyedOctetsDataReader DDS_KeyedOctetsDataReader
```

<<*interface*>> (p. 818) Instantiates `DataReader` < **DDS\_KeyedOctets** (p. 1564) >.

When reading or taking data with this reader, if you request a copy of the samples instead of a loan, and a string or byte array in a destination data sample is NULL, the middleware will allocate a new string or array for you of sufficient length to hold the received data. New strings will be allocated with **DDS\_String\_alloc** (p. 1313); new arrays will be allocated with **DDS\_OctetBuffer\_alloc** (p. 1287). The sample's destructor will delete them.

A non- NULL string or array is assumed to be allocated to sufficient length to store the incoming data. It will not be reallocated.

**DDS\_DataReader** (p. 608)

## 4.87.3 Function Documentation

### 4.87.3.1 DDS\_KeyedOctets\_new()

```
DDS_KeyedOctets * DDS_KeyedOctets_new (
    void )
```

Constructor.

The default constructor initializes the newly created object with NULL key, NULL value, and zero length.

Returns

A new **DDS\_KeyedOctets** (p. 1564) or NULL if failure.

### 4.87.3.2 DDS\_KeyedOctets\_new\_w\_size()

```
DDS_KeyedOctets * DDS_KeyedOctets_new_w_size (
    int key_size,
    int size )
```

Constructor that specifies the allocated sizes.

After this function is called, key is initialized with the empty string and length is set to zero.

Parameters

<i>key_size</i>	<< <i>in</i> >> (p. 818) Size of the allocated key (with NULL-terminated character). Cannot be smaller than zero.
<i>size</i>	<< <i>in</i> >> (p. 818) Size of the allocated octets array. Cannot be smaller than zero.

Returns

A new **DDS\_KeyedOctets** (p. 1564) or NULL if failure.

### 4.87.3.3 DDS\_KeyedOctets\_delete()

```
void DDS_KeyedOctets_delete (
    DDS_KeyedOctets * self )
```

Destructor.

#### 4.87.3.4 DDS\_KeyedOctetsTypeSupport\_register\_type()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_register_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to communicate to RTI Connexx the existence of the **DDS\_KeyedOctets** (p. 1564) data type.

By default, The **DDS\_KeyedOctets** (p. 1564) built-in type is automatically registered when a DomainParticipant is created using the type\_name returned by **DDS\_KeyedOctetsTypeSupport\_get\_type\_name** (p. 981). Therefore, the usage of this function is optional and it is only required when the automatic built-in type registration is disabled using the participant property "dds.builtin\_type.auto\_register".

This function can also be used to register the same **DDS\_KeyedOctetsTypeSupport** (p. 1564) with a **DDS\_DomainParticipant** (p. 72) using different values for the type\_name.

If register\_type is called multiple times with the same **DDS\_DomainParticipant** (p. 72) and type\_name, the second (and subsequent) registrations are ignored by the operation.

##### Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818) the <b>DDS_DomainParticipant</b> (p. 72) to register the data type <b>DDS_Octets</b> (p. 1606) with. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p. 818) the type name under with the data type <b>DDS_KeyedOctets</b> (p. 1564) is registered with the participant; this type name is used when creating a new <b>DDS_Topic</b> (p. 172). (See <b>DDS_DomainParticipant_create_topic</b> (p. 112).) The name may not be NULL or longer than 255 characters.

##### Returns

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025) or **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

##### MT Safety:

UNSAFE on the FIRST call. It is not safe for two threads to simultaneously make the first call to register a type. Subsequent calls are thread safe.

##### See also

**DDS\_DomainParticipant\_create\_topic** (p. 112)

## 4.87.3.5 DDS\_KeyedOctetsTypeSupport\_unregister\_type()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_unregister_type (
    DDS_DomainParticipant * participant,
    const char * type_name )
```

Allows an application to unregister the **DDS\_KeyedOctets** (p.1564) data type from RTI Connex. After calling `unregister_type`, no further communication using this type is possible.

## Precondition

The **DDS\_KeyedOctets** (p.1564) type with `type_name` is registered with the participant and all **DDS\_Topic** (p.172) objects referencing the type have been destroyed. If the type is not registered with the participant, or if any **DDS\_Topic** (p.172) is associated with the type, the operation will fail with **DDS\_RETCODE\_ERROR** (p.1025).

## Postcondition

All information about the type is removed from RTI Connex. No further communication using this type is possible.

## Parameters

<i>participant</i>	<< <i>in</i> >> (p.818) the <b>DDS_DomainParticipant</b> (p.72) to unregister the data type <b>DDS_KeyedOctets</b> (p.1564) from. Cannot be NULL.
<i>type_name</i>	<< <i>in</i> >> (p.818) the type name under with the data type <b>DDS_KeyedOctets</b> (p.1564) is registered with the participant. The name should match a name that has been previously used to register a type with the participant. Cannot be NULL.

## Returns

One of the **Standard Return Codes** (p.1024), **DDS\_RETCODE\_BAD\_PARAMETER** (p.1025) or **DDS\_↔  
RETCODE\_ERROR** (p.1025)

## MT Safety:

SAFE.

## See also

**DDS\_KeyedOctetsTypeSupport\_register\_type** (p.979)

#### 4.87.3.6 DDS\_KeyedOctetsTypeSupport\_get\_type\_name()

```
const char * DDS_KeyedOctetsTypeSupport_get_type_name (
    void )
```

Get the default name for the **DDS\_KeyedOctets** (p. 1564) type.

Can be used for calling **DDS\_KeyedOctetsTypeSupport\_register\_type** (p. 979) or creating **DDS\_Topic** (p. 172).

##### Returns

default name for the **DDS\_KeyedOctets** (p. 1564) type.

##### See also

**DDS\_KeyedOctetsTypeSupport\_register\_type** (p. 979)

**DDS\_DomainParticipant\_create\_topic** (p. 112)

#### 4.87.3.7 DDS\_KeyedOctetsTypeSupport\_print\_data()

```
void DDS_KeyedOctetsTypeSupport_print_data (
    const DDS_KeyedOctets * a_data )
```

<<**extension**>> (p. 817) Print value of data type to standard out.

The *generated* implementation of the operation knows how to print value of a data type.

##### Parameters

<code>a_data</code>	<< <b>in</b> >> (p. 818) <b>DDS_KeyedOctets</b> (p. 1564) to be printed.
---------------------	--------------------------------------------------------------------------

#### 4.87.3.8 DDS\_KeyedOctetsTypeSupport\_get\_typecode()

```
DDS_TypeCode * DDS_KeyedOctetsTypeSupport_get_typecode (
    void )
```

<<**extension**>> (p. 817) Retrieves the TypeCode for the Type.

##### See also

**FooTypeSupport\_get\_typecode** (p. 222)

#### 4.87.3.9 DDS\_KeyedOctetsTypeSupport\_serialize\_data\_to\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer (
    char * buffer,
    unsigned int * length,
    const DDS_KeyedOctets * a_data )
```

<<*extension*>> (p. 817) Serializes the input sample into a CDR buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.87.3.10 DDS\_KeyedOctetsTypeSupport\_serialize\_data\_to\_cdr\_buffer\_ex()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_serialize_data_to_cdr_buffer_ex (
    char * buffer,
    unsigned int * length,
    const DDS_KeyedOctets * a_data,
    DDS_DataRepresentationId_t representation )
```

<<*extension*>> (p. 817) Serializes the input sample into a buffer of octets.

See also

**FooTypeSupport\_serialize\_data\_to\_cdr\_buffer** (p. 219)

#### 4.87.3.11 DDS\_KeyedOctetsTypeSupport\_deserialize\_data\_from\_cdr\_buffer()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_deserialize_data_from_cdr_buffer (
    DDS_KeyedOctets * a_data,
    const char * buffer,
    unsigned int length )
```

<<*extension*>> (p. 817) Deserializes a sample from a buffer of octets.

See also

**FooTypeSupport\_deserialize\_data\_from\_cdr\_buffer** (p. 220)

#### 4.87.3.12 DDS\_KeyedOctetsTypeSupport\_data\_to\_string()

```
DDS_ReturnCode_t DDS_KeyedOctetsTypeSupport_data_to_string (
    const DDS_KeyedOctets * sample,
    char * str,
    DDS_UnsignedLong * str_size,
    DDS_PrintFormatProperty * property )
```

<<*extension*>> (p. 817) Get the string representation of an input sample.

See also

**FooTypeSupport\_data\_to\_string** (p. 221)

#### 4.87.3.13 DDS\_KeyedOctetsDataWriter\_narrow()

```
DDS_KeyedOctetsDataWriter * DDS_KeyedOctetsDataWriter_narrow (
    DDS_DataWriter * writer )
```

Narrow the given **DDS\_DataWriter** (p. 478) pointer to a **DDS\_KeyedOctetsDataWriter** (p. 978) pointer.

See also

**FooDataWriter\_narrow** (p. 483)

#### 4.87.3.14 DDS\_KeyedOctetsDataWriter\_as\_datawriter()

```
DDS_DataWriter * DDS_KeyedOctetsDataWriter_as_datawriter (
    DDS_KeyedOctetsDataWriter * writer )
```

Widen the given **DDS\_KeyedOctetsDataWriter** (p. 978) pointer to a **DDS\_DataWriter** (p. 478) pointer.

See also

**FooDataWriter\_as\_datawriter** (p. 483)

#### 4.87.3.15 DDS\_KeyedOctetsDataWriter\_register\_instance()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data )
```

Informs RTI Connexx that the application will be modifying a particular instance.

See also

**FooDataWriter\_register\_instance** (p. 484)

#### 4.87.3.16 DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_key (
    DDS_KeyedOctetsDataWriter * self,
    const char * key )
```

<<*extension*>> (p. 817) Informs RTI Connexx that the application will be modifying a particular instance.

See also

**FooDataWriter\_register\_instance** (p. 484)

#### 4.87.3.17 DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same functions as **DDS\_KeyedOctetsDataWriter\_register\_instance** (p. 984) except that the application provides the value for the `source_timestamp`.

See also

**FooDataWriter\_register\_instance\_w\_timestamp** (p. 485)

#### 4.87.3.18 DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key\_w\_timestamp()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_register_instance_w_key_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same functions as **DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key** (p. 985) except that the application provides the value for the `source_timestamp`.

See also

**FooDataWriter\_register\_instance\_w\_timestamp** (p. 485)

#### 4.87.3.19 DDS\_KeyedOctetsDataWriter\_unregister\_instance()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    const DDS_InstanceHandle_t * handle )
```

Reverses the action of **DDS\_KeyedOctetsDataWriter\_register\_instance** (p. 984).

See also

**FooDataWriter\_unregister\_instance** (p. 486)

#### 4.87.3.20 DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Reverses the action of **DDS\_KeyedOctetsDataWriter\_register\_instance\_w\_key** (p. 985).

See also

**FooDataWriter\_unregister\_instance** (p. 486)

#### 4.87.3.21 DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_KeyedOctetsDataWriter\_unregister\_instance** (p.986) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_unregister\_instance\_w\_timestamp** (p.488)

#### 4.87.3.22 DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_key\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_unregister_instance_w_key_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p.817) Performs the same function as **DDS\_KeyedOctetsDataWriter\_unregister\_instance\_w\_key** (p.986) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_unregister\_instance\_w\_timestamp** (p.488)

#### 4.87.3.23 DDS\_KeyedOctetsDataWriter\_create\_data()

```
DDS_KeyedOctets * DDS_KeyedOctetsDataWriter_create_data (
    DDS_KeyedOctetsDataWriter * self )
```

Creates a keyed octet sequence.

The size of the instance is determined by the DataWriter property **dds.builtin\_type.keyed\_octets.alloc\_size**.

Default size: **dds.builtin\_type.keyed\_octets.max\_size** property of DomainParticipant if defined. Otherwise 2048.

Created instances must be deleted with **DDS\_KeyedOctetsDataWriter\_delete\_data** (p.987).

Returns

Newly created keyed octet sequence, or NULL on failure.

See also

BuiltinTypeMemoryManagement section of Built-in Types.

#### 4.87.3.24 DDS\_KeyedOctetsDataWriter\_delete\_data()

```
DDS_Boolean DDS_KeyedOctetsDataWriter_delete_data (
    DDS_KeyedOctetsDataWriter * self,
    DDS_KeyedOctets * sample )
```

Destroys a string data instance created by **DDS\_StringDataWriter\_create\_data** (p. 922).

Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) upon successful deletion.

#### 4.87.3.25 DDS\_KeyedOctetsDataWriter\_write()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    const DDS_InstanceHandle_t * handle )
```

Modifies the value of a **DDS\_KeyedOctets** (p. 1564) data instance.

See also

**FooDataWriter\_write** (p. 489)

#### 4.87.3.26 DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Modifies the value of a **DDS\_KeyedOctets** (p. 1564) data instance.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>key</i>	<< <i>in</i> >> (p. 818) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 818) Array of octets to be published.
<i>length</i>	<< <i>in</i> >> (p. 818) Number of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 818) Either the handle returned by a previous call to <b>DDS_KeyedOctetsDataWriter_register_instance</b> (p. 984), or else the special value <b>DDS_HANDLE_NIL</b> (p. 224). See <b>FooDataWriter_write</b> (p. 489).

See also

**FooDataWriter\_write** (p. 489)

#### 4.87.3.27 DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const struct DDS_OctetSeq * octets,
    const DDS_InstanceHandle_t * handle )
```

<<**extension**>> (p. 817) Modifies the value of a **DDS\_KeyedOctets** (p. 1564) data instance.

Parameters

<i>self</i>	<< <b>in</b> >> (p. 818) Cannot be NULL.
<i>key</i>	<< <b>in</b> >> (p. 818) Instance key.
<i>octets</i>	<< <b>in</b> >> (p. 818) Sequence of octets to be published.
<i>handle</i>	<< <b>in</b> >> (p. 818) Either the handle returned by a previous call to <b>DDS_KeyedOctetsDataWriter_register_instance</b> (p. 984), or else the special value <b>DDS_HANDLE_NIL</b> (p. 224). See <b>FooDataWriter_write</b> (p. 489).

See also

**FooDataWriter\_write** (p. 489)

#### 4.87.3.28 DDS\_KeyedOctetsDataWriter\_write\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_KeyedOctetsDataWriter\_write** (p. 988) except that it also provides the value for the `source_timestamp`.

See also

**FooDataWriter\_write\_w\_timestamp** (p. 493)

#### 4.87.3.29 DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const unsigned char * octets,
    int length,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key** (p. 988) except that it also provides the value for the `source_timestamp`.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>key</i>	<< <i>in</i> >> (p. 818) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 818) Array of octets to be published.
<i>length</i>	<< <i>in</i> >> (p. 818) Number of octets to be published.
<i>handle</i>	<< <i>in</i> >> (p. 818) Either the handle returned by a previous call to <b>DDS_KeyedOctetsDataWriter_register_instance</b> (p. 984), or else the special value <b>DDS_HANDLE_NIL</b> (p. 224). See <b>FooDataWriter_write</b> (p. 489).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 818) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See <b>FooDataWriter_write_w_timestamp</b> (p. 493). Cannot be NULL.

##### See also

**FooDataWriter\_write** (p. 489)

#### 4.87.3.30 DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const struct DDS_OctetSeq * octets,
    const DDS_InstanceHandle_t * handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same function as **DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key** (p. 989) except that it also provides the value for the `source_timestamp`.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>key</i>	<< <i>in</i> >> (p. 818) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 818) Sequence of octets to be published.

## Parameters

<i>handle</i>	<< <i>in</i> >> (p. 818) Either the handle returned by a previous call to <b>DDS_KeyedOctetsDataWriter_register_instance</b> (p. 984), or else the special value <b>DDS_HANDLE_NIL</b> (p. 224). See <b>FooDataWriter_write</b> (p. 489).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 818) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation. See <b>FooDataWriter_write_w_timestamp</b> (p. 493). Cannot be NULL.

## See also

**FooDataWriter\_write** (p. 489)

## 4.87.3.31 DDS\_KeyedOctetsDataWriter\_write\_w\_params()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_w_params (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    struct DDS_WriteParams_t * params )
```

Performs the same function as **DDS\_KeyedOctetsDataWriter\_write** (p. 988) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

## See also

**FooDataWriter\_write\_w\_params** (p. 494)

## 4.87.3.32 DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key\_w\_params()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_w_key_w_params (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const unsigned char * octets,
    int length,
    struct DDS_WriteParams_t * params )
```

Performs the same function as **DDS\_KeyedOctetsDataWriter\_write\_octets\_w\_key** (p. 988) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>key</i>	<< <i>in</i> >> (p. 818) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 818) Array of octets to be published.
<i>length</i>	<< <i>in</i> >> (p. 818) Number of octets to be published.
<i>params</i>	<< <i>in</i> >> (p. 818) The <b>DDS_WriteParams_t</b> (p. 1833) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See <b>FooDataWriter_write_w_params</b> (p. 494). Cannot be NULL.

See also

**FooDataWriter\_write\_w\_params** (p. 494)

#### 4.87.3.33 DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key\_w\_params()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_write_octets_seq_w_key_w_params (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const struct DDS_OctetSeq * octets,
    struct DDS_WriteParams_t * params )
```

Performs the same function as **DDS\_KeyedOctetsDataWriter\_write\_octets\_seq\_w\_key** (p. 989) except that it also allows specification of the instance handle, source timestamp, publication priority, and cookie.

Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>key</i>	<< <i>in</i> >> (p. 818) Instance key.
<i>octets</i>	<< <i>in</i> >> (p. 818) Sequence of octets to be published.
<i>params</i>	<< <i>in</i> >> (p. 818) The <b>DDS_WriteParams_t</b> (p. 1833) parameter containing the instance handle, source timestamp, publication priority, and cookie to be used in write operation. See <b>FooDataWriter_write_w_params</b> (p. 494). Cannot be NULL.

See also

**FooDataWriter\_write\_w\_params** (p. 494)

#### 4.87.3.34 DDS\_KeyedOctetsDataWriter\_dispose()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    const DDS_InstanceHandle_t * instance_handle )
```

Requests the middleware to delete the data.

See also

**FooDataWriter\_dispose** (p. 495)

## 4.87.3.35 DDS\_KeyedOctetsDataWriter\_dispose\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_key (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * instance_handle )
```

<<*extension*>> (p. 817) Requests the middleware to delete the data.

See also

**FooDataWriter\_dispose** (p. 495)

## 4.87.3.36 DDS\_KeyedOctetsDataWriter\_dispose\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * instance_data,
    const DDS_InstanceHandle_t * instance_handle,
    const struct DDS_Time_t * source_timestamp )
```

Performs the same functions as **DDS\_KeyedOctetsDataWriter\_dispose** (p. 992) except that the application provides the value for the `source_timestamp` that is made available to **DDS\_DataReader** (p. 608) objects by means of the `source_timestamp` attribute inside the **DDS\_SampleInfo** (p. 1720).

See also

**FooDataWriter\_dispose\_w\_timestamp** (p. 496)

## 4.87.3.37 DDS\_KeyedOctetsDataWriter\_dispose\_w\_key\_w\_timestamp()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_dispose_w_key_w_timestamp (
    DDS_KeyedOctetsDataWriter * self,
    const char * key,
    const DDS_InstanceHandle_t * instance_handle,
    const struct DDS_Time_t * source_timestamp )
```

<<*extension*>> (p. 817) Performs the same functions as **DDS\_KeyedOctetsDataWriter\_dispose\_w\_key** (p. 992) except that the application provides the value for the `source_timestamp` that is made available to **DDS\_DataReader** (p. 608) objects by means of the `source_timestamp` attribute inside the **DDS\_SampleInfo** (p. 1720).

See also

**FooDataWriter\_dispose\_w\_timestamp** (p. 496)

#### 4.87.3.38 DDS\_KeyedOctetsDataWriter\_get\_key\_value()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_get_key_value (
    DDS_KeyedOctetsDataWriter * self,
    DDS_KeyedOctets * key_holder,
    const DDS_InstanceHandle_t * handle )
```

Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataWriter\\_get\\_key\\_value](#) (p. 498)

#### 4.87.3.39 DDS\_KeyedOctetsDataWriter\_get\_key\_value\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataWriter_get_key_value_w_key (
    DDS_KeyedOctetsDataWriter * self,
    char * key,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataWriter\\_get\\_key\\_value](#) (p. 498)

#### 4.87.3.40 DDS\_KeyedOctetsDataWriter\_lookup\_instance()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_instance (
    DDS_KeyedOctetsDataWriter * self,
    const DDS_KeyedOctets * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

[FooDataWriter\\_lookup\\_instance](#) (p. 499)

#### 4.87.3.41 DDS\_KeyedOctetsDataWriter\_lookup\_instance\_w\_key()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataWriter_lookup_instance_w_key (
    DDS_KeyedOctetsDataWriter * self,
    const char * key )
```

<<*extension*>> (p. 817) Retrieve the instance handle that corresponds to an instance key.

See also

**FooDataWriter\_lookup\_instance** (p. 499)

#### 4.87.3.42 DDS\_KeyedOctetsDataReader\_narrow()

```
DDS_KeyedOctetsDataReader * DDS_KeyedOctetsDataReader_narrow (
    DDS_DataReader * reader )
```

Narrow the given **DDS\_DataReader** (p. 608) pointer to a **DDS\_KeyedOctetsDataReader** (p. 978) pointer.

See also

**FooDataReader\_narrow** (p. 617)

#### 4.87.3.43 DDS\_KeyedOctetsDataReader\_as\_datareader()

```
DDS_DataReader * DDS_KeyedOctetsDataReader_as_datareader (
    DDS_KeyedOctetsDataReader * reader )
```

Widen the given **DDS\_KeyedOctetsDataReader** (p. 978) pointer to a **DDS\_DataReader** (p. 608) pointer.

See also

**FooDataReader\_as\_datareader** (p. 617)

#### 4.87.3.44 DDS\_KeyedOctetsDataReader\_read()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )
```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read** (p. 618)

#### 4.87.3.45 DDS\_KeyedOctetsDataReader\_take()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_SampleStateMask sample_mask,
    DDS_ViewStateMask view_mask,
    DDS_InstanceStateMask instance_mask )
```

Access a collection of data-samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take** (p. 619)

#### 4.87.3.46 DDS\_KeyedOctetsDataReader\_read\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_w_condition (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_KeyedOctetsDataReader\_read** (p. 995) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_w\_condition** (p. 623)

4.87.3.47 `DDS_KeyedOctetsDataReader_take_w_condition()`

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_w_condition (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    DDS_ReadCondition * condition )
```

Analogous to `DDS_KeyedOctetsDataReader_read_w_condition` (p. 996) except it accesses samples via the `DDS_KeyedOctetsDataReader_take` (p. 996) operation.

See also

`FooDataReader_take_w_condition` (p. 625)

4.87.3.48 `DDS_KeyedOctetsDataReader_read_next_sample()`

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_sample (
    DDS_KeyedOctetsDataReader * self,
    DDS_KeyedOctets * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the `DDS_DataReader` (p. 608).

See also

`FooDataReader_read_next_sample` (p. 626)

4.87.3.49 `DDS_KeyedOctetsDataReader_take_next_sample()`

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_sample (
    DDS_KeyedOctetsDataReader * self,
    DDS_KeyedOctets * received_data,
    struct DDS_SampleInfo * sample_info )
```

Copies the next not-previously-accessed data value from the `DDS_DataReader` (p. 608).

See also

`FooDataReader_take_next_sample` (p. 627)

#### 4.87.3.50 DDS\_KeyedOctetsDataReader\_read\_instance()

```

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )

```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read\_instance** (p. 628)

#### 4.87.3.51 DDS\_KeyedOctetsDataReader\_take\_instance()

```

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )

```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take\_instance** (p. 629)

#### 4.87.3.52 DDS\_KeyedOctetsDataReader\_read\_instance\_w\_condition()

```

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_instance_w_condition (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_ReadCondition * condition )

```

Accesses via **DDS\_KeyedOctetsDataReader\_read\_instance** (p. 997) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_instance\_w\_condition** (p. 631)

**4.87.3.53 DDS\_KeyedOctetsDataReader\_take\_instance\_w\_condition()**

```

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_instance_w_condition (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * a_handle,
    DDS_ReadCondition * condition )

```

Accesses via **DDS\_KeyedOctetsDataReader\_take\_instance** (p. 998) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_take\_instance\_w\_condition** (p. 632)

**4.87.3.54 DDS\_KeyedOctetsDataReader\_read\_next\_instance()**

```

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )

```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_read\_next\_instance** (p. 633)

**4.87.3.55 DDS\_KeyedOctetsDataReader\_take\_next\_instance()**

```

DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_instance (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_SampleStateMask sample_states,
    DDS_ViewStateMask view_states,
    DDS_InstanceStateMask instance_states )

```

Access a collection of data samples from the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_take\_next\_instance** (p. 635)

#### 4.87.3.56 DDS\_KeyedOctetsDataReader\_read\_next\_instance\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_read_next_instance_w_condition (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_KeyedOctetsDataReader\_read\_next\_instance** (p. 999) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_read\_next\_instance\_w\_condition** (p. 636)

#### 4.87.3.57 DDS\_KeyedOctetsDataReader\_take\_next\_instance\_w\_condition()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_take_next_instance_w_condition (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq,
    DDS_Long max_samples,
    const DDS_InstanceHandle_t * previous_handle,
    DDS_ReadCondition * condition )
```

Accesses via **DDS\_KeyedOctetsDataReader\_take\_next\_instance** (p. 999) the samples that match the criteria specified in the **DDS\_ReadCondition** (p. 686).

See also

**FooDataReader\_take\_next\_instance\_w\_condition** (p. 638)

#### 4.87.3.58 DDS\_KeyedOctetsDataReader\_return\_loan()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_return_loan (
    DDS_KeyedOctetsDataReader * self,
    struct DDS_KeyedOctetsSeq * received_data,
    struct DDS_SampleInfoSeq * info_seq )
```

Indicates to the **DDS\_DataReader** (p. 608) that the application is done accessing the collection of *received\_data* and *info\_seq* obtained by some earlier invocation of read or take on the **DDS\_DataReader** (p. 608).

See also

**FooDataReader\_return\_loan** (p. 639)

#### 4.87.3.59 DDS\_KeyedOctetsDataReader\_get\_key\_value()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_value (
    DDS_KeyedOctetsDataReader * self,
    DDS_KeyedOctets * key_holder,
    const DDS_InstanceHandle_t * handle )
```

Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataReader\\_get\\_key\\_value](#) (p. 640)

#### 4.87.3.60 DDS\_KeyedOctetsDataReader\_get\_key\_value\_w\_key()

```
DDS_ReturnCode_t DDS_KeyedOctetsDataReader_get_key_value_w_key (
    DDS_KeyedOctetsDataReader * self,
    char * key,
    const DDS_InstanceHandle_t * handle )
```

<<*extension*>> (p. 817) Retrieve the instance `key` that corresponds to an instance handle.

See also

[FooDataReader\\_get\\_key\\_value](#) (p. 640)

#### 4.87.3.61 DDS\_KeyedOctetsDataReader\_lookup\_instance()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance (
    DDS_KeyedOctetsDataReader * self,
    const DDS_KeyedOctets * key_holder )
```

Retrieve the instance `handle` that corresponds to an instance `key_holder`.

See also

[FooDataReader\\_lookup\\_instance](#) (p. 641)

### 4.87.3.62 DDS\_KeyedOctetsDataReader\_lookup\_instance\_w\_key()

```
DDS_InstanceHandle_t DDS_KeyedOctetsDataReader_lookup_instance_w_key (
    DDS_KeyedOctetsDataReader * self,
    const char * key )
```

<<*extension*>> (p. 817) Retrieve the instance handle that corresponds to an instance key.

See also

**FooDataReader\_lookup\_instance** (p. 641)

## 4.87.4 Variable Documentation

### 4.87.4.1 key

```
char* DDS_KeyedOctets::key
```

Instance key associated with the specified value.

### 4.87.4.2 length

```
int DDS_KeyedOctets::length
```

Number of octets to serialize.

### 4.87.4.3 value

```
unsigned char* DDS_KeyedOctets::value
```

**DDS\_Octets** (p. 1606) array value.

## 4.88 DDS-Specific Primitive Types

Basic DDS value types for use in user data types.

## Macros

- #define **DDS\_BOOLEAN\_TRUE**  
*Defines "true" value of **DDS\_Boolean** (p. 1007) data type.*
- #define **DDS\_BOOLEAN\_FALSE**  
*Defines "false" value of **DDS\_Boolean** (p. 1007) data type.*

## Typedefs

- typedef RTICdrChar **DDS\_Char**  
*Defines a character data type, equivalent to IDL/CDR *char*.*
- typedef RTICdrWchar **DDS\_Wchar**  
*Defines a wide character data type, equivalent to IDL/CDR *wchar*.*
- typedef RTICdrOctet **DDS\_Octet**  
*Defines an opaque byte data type, equivalent to IDL/CDR *octet*.*
- typedef RTICdrOctet **DDS\_UInt8**  
*Defines a data type, equivalent to IDL/CDR *uint8*.*
- typedef RTICdrInt8 **DDS\_Int8**  
*Defines a data type, equivalent to IDL/CDR *int8*.*
- typedef RTICdrShort **DDS\_Short**  
*Defines a short integer data type, equivalent to IDL/CDR *short*.*
- typedef RTICdrUnsignedShort **DDS\_UnsignedShort**  
*Defines an unsigned short integer data type, equivalent to IDL/CDR *unsigned short*.*
- typedef RTICdrLong **DDS\_Long**  
*Defines a long integer data type, equivalent to IDL/CDR *long*.*
- typedef RTICdrUnsignedLong **DDS\_UnsignedLong**  
*Defines an unsigned long integer data type, equivalent to IDL/CDR *unsigned long*.*
- typedef RTICdrLongLong **DDS\_LongLong**  
*Defines an extra-long integer data type, equivalent to IDL/CDR *long long*.*
- typedef RTICdrUnsignedLongLong **DDS\_UnsignedLongLong**  
*Defines an unsigned extra-long data type, equivalent to IDL/CDR *unsigned long long*.*
- typedef RTICdrFloat **DDS\_Float**  
*Defines a single-precision floating-point data type, equivalent to IDL/CDR *float*.*
- typedef RTICdrDouble **DDS\_Double**  
*Defines a double-precision floating-point data type, equivalent to IDL/CDR *double*.*
- typedef RTICdrLongDouble **DDS\_LongDouble**  
*Defines an extra-precision floating-point data type, equivalent to IDL/CDR *long double*.*
- typedef RTICdrBoolean **DDS\_Boolean**  
*Defines a Boolean data type, equivalent to IDL/CDR *boolean*.*
- typedef RTICdrEnum **DDS\_Enum**  
*Defines an enumerated data type.*

### 4.88.1 Detailed Description

Basic DDS value types for use in user data types.

As part of the finalization of the DDS standard, a number of DDS-specific primitive types will be introduced. By using these types, you will ensure that your data is serialized consistently across platforms even if the C/C++ built-in types have different sizes on those platforms.

In this version of RTI Connext, the DDS primitive types are defined using the OMG's Common Data Representation (CDR) standard. In a future version of RTI Connext, you will be given the choice of whether to use these CDR-based types or C/C++ built-in types through a flag provided to the rtdsngen tool.

Typedef's that begin with RTICdr are defined in `<NDDSHOME>/include/ndds/cdr/cdr_type.h`, which uses types that are further defined in `<NDDSHOME>/include/ndds/osapi/osapi_type.h`.

### 4.88.2 Macro Definition Documentation

#### 4.88.2.1 DDS\_BOOLEAN\_TRUE

```
#define DDS_BOOLEAN_TRUE
```

Defines "true" value of **DDS\_Boolean** (p. 1007) data type.

#### Examples

**HelloWorld.c**, and **HelloWorld\_publisher.c**.

#### 4.88.2.2 DDS\_BOOLEAN\_FALSE

```
#define DDS_BOOLEAN_FALSE
```

Defines "false" value of **DDS\_Boolean** (p. 1007) data type.

#### Examples

**HelloWorld.c**.

### 4.88.3 Typedef Documentation

#### 4.88.3.1 DDS\_Char

```
typedef RTICdrChar DDS_Char
```

Defines a character data type, equivalent to IDL/CDR `char`.

An 8-bit quantity that encodes a single byte character from any byte-oriented code set.

#### 4.88.3.2 DDS\_Wchar

```
typedef RTICdrWchar DDS_Wchar
```

Defines a wide character data type, equivalent to IDL/CDR `wchar`.

A 16-bit quantity that contains a wide character encoded in UTF-16.

#### 4.88.3.3 DDS\_Octet

```
typedef RTICdrOctet DDS_Octet
```

Defines an opaque byte data type, equivalent to IDL/CDR `octet`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

#### 4.88.3.4 DDS\_UInt8

```
typedef RTICdrOctet DDS_UInt8
```

Defines a data type, equivalent to IDL/CDR `uint8`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

#### 4.88.3.5 DDS\_Int8

```
typedef RTICdrInt8 DDS_Int8
```

Defines a data type, equivalent to IDL/CDR `int8`.

An 8-bit quantity that is guaranteed not to undergo any conversion when transmitted by the middleware.

#### 4.88.3.6 DDS\_Short

```
typedef RTICdrShort DDS_Short
```

Defines a short integer data type, equivalent to IDL/CDR `short`.

A 16-bit signed short integer value.

#### 4.88.3.7 DDS\_UnsignedShort

```
typedef RTICdrUnsignedShort DDS_UnsignedShort
```

Defines an unsigned short integer data type, equivalent to IDL/CDR unsigned short.

A 16-bit unsigned short integer value.

#### 4.88.3.8 DDS\_Long

```
typedef RTICdrLong DDS_Long
```

Defines a long integer data type, equivalent to IDL/CDR long.

A 32-bit signed long integer value.

#### 4.88.3.9 DDS\_UnsignedLong

```
typedef RTICdrUnsignedLong DDS_UnsignedLong
```

Defines an unsigned long integer data type, equivalent to IDL/CDR unsigned long.

A 32-bit unsigned long integer value.

#### 4.88.3.10 DDS\_LongLong

```
typedef RTICdrLongLong DDS_LongLong
```

Defines an extra-long integer data type, equivalent to IDL/CDR long long.

A 64-bit signed long long integer value.

#### 4.88.3.11 DDS\_UnsignedLongLong

```
typedef RTICdrUnsignedLongLong DDS_UnsignedLongLong
```

Defines an unsigned extra-long data type, equivalent to IDL/CDR unsigned long long.

A 64-bit unsigned long long integer value.

#### 4.88.3.12 DDS\_Float

```
typedef RTICdrFloat DDS_Float
```

Defines a single-precision floating-point data type, equivalent to IDL/CDR float.

A 32-bit floating-point value.

#### 4.88.3.13 DDS\_Double

```
typedef RTICdrDouble DDS_Double
```

Defines a double-precision floating-point data type, equivalent to IDL/CDR `double`.

A 64-bit floating-point value.

#### 4.88.3.14 DDS\_LongDouble

```
typedef RTICdrLongDouble DDS_LongDouble
```

Defines an extra-precision floating-point data type, equivalent to IDL/CDR `long double`.

A 128-bit floating-point value.

Since some architectures do not support long double, RTI has defined character arrays that match the expected size of this type. On systems that do have native long double, you have to define `RTI_CDR_SIZEOF_LONG_DOUBLE` as 16 to map them to native types.

#### 4.88.3.15 DDS\_Boolean

```
typedef RTICdrBoolean DDS_Boolean
```

Defines a Boolean data type, equivalent to IDL/CDR `boolean`.

An 8-bit Boolean value that is used to denote a data item that can only take one of the values **DDS\_BOOLEAN\_TRUE** (p. 1004) (1) or **DDS\_BOOLEAN\_FALSE** (p. 1004) (0).

#### Examples

```
HelloWorld.c.
```

#### 4.88.3.16 DDS\_Enum

```
typedef RTICdrEnum DDS_Enum
```

Defines an enumerated data type.

Encoded as a signed 32-bit integer value. By default, the first enum identifier has the numeric value zero (0) (unless the value is provided explicitly). Successive enum identifiers take ascending numeric values, in order of declaration from left to right.

## 4.89 Time Support

Time and duration types and defines.

### Data Structures

- struct **DDS\_Duration\_t**  
*Type for duration representation.*
- struct **DDS\_Time\_t**  
*Type for time representation.*

### Macros

- #define **DDS\_TIME\_ZERO**  
*The default instant in time: zero seconds and zero nanoseconds.*

### Functions

- **DDS\_Boolean DDS\_Time\_is\_zero** (const struct **DDS\_Time\_t** \*time)  
*Check if time is zero.*
- **DDS\_Boolean DDS\_Time\_is\_invalid** (const struct **DDS\_Time\_t** \*time)
- **DDS\_Boolean DDS\_Duration\_is\_infinite** (const struct **DDS\_Duration\_t** \*duration)
- **DDS\_Boolean DDS\_Duration\_is\_auto** (const struct **DDS\_Duration\_t** \*duration)
- **DDS\_Boolean DDS\_Duration\_is\_zero** (const struct **DDS\_Duration\_t** \*duration)

### Variables

- const struct **DDS\_Time\_t DDS\_TIME\_MAX**  
*The maximum value of time.*
- const **DDS\_LongLong DDS\_TIME\_INVALID\_SEC**  
*A sentinel indicating an invalid second of time.*
- const **DDS\_UnsignedLong DDS\_TIME\_INVALID\_NSEC**  
*A sentinel indicating an invalid nano-second of time.*
- const struct **DDS\_Time\_t DDS\_TIME\_INVALID**  
*A sentinel indicating an invalid time.*
- const **DDS\_Long DDS\_DURATION\_INFINITE\_SEC**  
*An infinite second period of time.*
- const **DDS\_UnsignedLong DDS\_DURATION\_INFINITE\_NSEC**  
*An infinite nano-second period of time.*
- const struct **DDS\_Duration\_t DDS\_DURATION\_INFINITE**  
*An infinite period of time.*
- const **DDS\_Long DDS\_DURATION\_AUTO\_SEC**  
*An auto second period of time.*
- const **DDS\_UnsignedLong DDS\_DURATION\_AUTO\_NSEC**

*An auto nano-second period of time.*

- const struct **DDS\_Duration\_t** **DDS\_DURATION\_AUTO**

*Duration is automatically assigned.*

- const **DDS\_Long** **DDS\_DURATION\_ZERO\_SEC**

*A zero-length second period of time.*

- const **DDS\_UnsignedLong** **DDS\_DURATION\_ZERO\_NSEC**

*A zero-length nano-second period of time.*

- const struct **DDS\_Duration\_t** **DDS\_DURATION\_ZERO**

*A zero-length period of time.*

## 4.89.1 Detailed Description

Time and duration types and defines.

## 4.89.2 Macro Definition Documentation

### 4.89.2.1 DDS\_TIME\_ZERO

```
#define DDS_TIME_ZERO
```

The default instant in time: zero seconds and zero nanoseconds.

## 4.89.3 Function Documentation

### 4.89.3.1 DDS\_Time\_is\_zero()

```
DDS_Boolean DDS_Time_is_zero (
    const struct DDS_Time_t * time )
```

Check if time is zero.

Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the given time is equal to **DDS\_TIME\_ZERO** (p. 1009) or **DDS\_BOOLEAN\_↔\_FALSE** (p. 1004) otherwise.

#### 4.89.3.2 DDS\_Time\_is\_invalid()

```
DDS_Boolean DDS_Time_is_invalid (
    const struct DDS_Time_t * time )
```

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the given time is not valid (i.e. is negative)

#### 4.89.3.3 DDS\_Duration\_is\_infinite()

```
DDS_Boolean DDS_Duration_is_infinite (
    const struct DDS_Duration_t * duration )
```

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the given duration is of infinite length.

#### 4.89.3.4 DDS\_Duration\_is\_auto()

```
DDS_Boolean DDS_Duration_is_auto (
    const struct DDS_Duration_t * duration )
```

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the given duration has auto value.

#### 4.89.3.5 DDS\_Duration\_is\_zero()

```
DDS_Boolean DDS_Duration_is_zero (
    const struct DDS_Duration_t * duration )
```

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the given duration is of zero length.

### 4.89.4 Variable Documentation

#### 4.89.4.1 DDS\_TIME\_MAX

```
const struct DDS_Time_t DDS_TIME_MAX [extern]
```

The maximum value of time.

#### 4.89.4.2 DDS\_TIME\_INVALID\_SEC

```
const DDS_LongLong DDS_TIME_INVALID_SEC [extern]
```

A sentinel indicating an invalid second of time.

#### 4.89.4.3 DDS\_TIME\_INVALID\_NSEC

```
const DDS_UnsignedLong DDS_TIME_INVALID_NSEC [extern]
```

A sentinel indicating an invalid nano-second of time.

#### 4.89.4.4 DDS\_TIME\_INVALID

```
const struct DDS_Time_t DDS_TIME_INVALID [extern]
```

A sentinel indicating an invalid time.

#### 4.89.4.5 DDS\_DURATION\_INFINITE\_SEC

```
const DDS_Long DDS_DURATION_INFINITE_SEC [extern]
```

An infinite second period of time.

#### 4.89.4.6 DDS\_DURATION\_INFINITE\_NSEC

```
const DDS_UnsignedLong DDS_DURATION_INFINITE_NSEC [extern]
```

An infinite nano-second period of time.

#### 4.89.4.7 DDS\_DURATION\_INFINITE

```
const struct DDS_Duration_t DDS_DURATION_INFINITE [extern]
```

An infinite period of time.

#### 4.89.4.8 DDS\_DURATION\_AUTO\_SEC

```
const DDS_Long DDS_DURATION_AUTO_SEC [extern]
```

An auto second period of time.

#### 4.89.4.9 DDS\_DURATION\_AUTO\_NSEC

```
const DDS_UnsignedLong DDS_DURATION_AUTO_NSEC [extern]
```

An auto nano-second period of time.

#### 4.89.4.10 DDS\_DURATION\_AUTO

```
const struct DDS_Duration_t DDS_DURATION_AUTO [extern]
```

Duration is automatically assigned.

#### 4.89.4.11 DDS\_DURATION\_ZERO\_SEC

```
const DDS_Long DDS_DURATION_ZERO_SEC [extern]
```

A zero-length second period of time.

#### 4.89.4.12 DDS\_DURATION\_ZERO\_NSEC

```
const DDS_UnsignedLong DDS_DURATION_ZERO_NSEC [extern]
```

A zero-length nano-second period of time.

#### 4.89.4.13 DDS\_DURATION\_ZERO

```
const struct DDS_Duration_t DDS_DURATION_ZERO [extern]
```

A zero-length period of time.

## 4.90 GUID Support

<<*extension*>> (p. 817) GUID type and defines.

### Data Structures

- struct **DDS\_RTPS\_EntityId\_t**  
*From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.*
- struct **DDS\_RTPS\_GUID\_t**  
*From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.*
- struct **DDS\_GUID\_t**  
*Type for GUID (Global Unique Identifier) representation.*

### Typedefs

- typedef **DDS\_Octet DDS\_RTPS\_GuidPrefix\_t**[DDS\_RTPS\_GUID\_PREFIX\_LENGTH]  
*From the DDS-RTPS specification: type used to hold the prefix of the globally-unique RTPS-entity identifiers.*
- typedef struct **DDS\_RTPS\_EntityId\_t DDS\_RTPS\_EntityId\_t**  
*From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.*
- typedef struct **DDS\_RTPS\_GUID\_t DDS\_RTPS\_GUID\_t**  
*From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.*
- typedef struct **DDS\_GUID\_t DDS\_GUID\_t**  
*Type for GUID (Global Unique Identifier) representation.*

### Functions

- **DDS\_Boolean DDS\_GUID\_equals** (const struct **DDS\_GUID\_t** \*self, const struct **DDS\_GUID\_t** \*other)  
*Compares this GUID with another GUID for equality.*
- int **DDS\_GUID\_compare** (const struct **DDS\_GUID\_t** \*self, const struct **DDS\_GUID\_t** \*other)  
*Compares two GUIDs.*
- void **DDS\_GUID\_copy** (struct **DDS\_GUID\_t** \*self, const struct **DDS\_GUID\_t** \*other)  
*Copies another GUID into this GUID.*

## Variables

- const struct **DDS\_GUID\_t DDS\_GUID\_AUTO**  
*Indicates that RTI Connex should choose an appropriate virtual GUID.*
- const struct **DDS\_GUID\_t DDS\_GUID\_UNKNOWN**  
*Unknown GUID.*
- const struct **DDS\_GUID\_t DDS\_GUID\_ZERO**  
*Zero GUID.*

### 4.90.1 Detailed Description

<<*extension*>> (p. 817) GUID type and defines.

### 4.90.2 Typedef Documentation

#### 4.90.2.1 DDS\_RTPS\_GuidPrefix\_t

```
typedef DDS_Octet DDS_RTPS_GuidPrefix_t [DDS_RTPS_GUID_PREFIX_LENGTH]
```

From the DDS-RTPS specification: type used to hold the prefix of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

#### 4.90.2.2 DDS\_RTPS\_EntityId\_t

```
typedef struct DDS_RTPS_EntityId_t DDS_RTPS_EntityId_t
```

From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

#### 4.90.2.3 DDS\_RTPS\_GUID\_t

```
typedef struct DDS_RTPS_GUID_t DDS_RTPS_GUID_t
```

From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

#### 4.90.2.4 DDS\_GUID\_t

```
typedef struct DDS_GUID_t DDS_GUID_t
```

Type for *GUID* (Global Unique Identifier) representation.

Represents a 128 bit GUID.

Alternative representation of **DDS\_RTSPS\_GUID\_t** (p. 1695). Memory and wire representation for this type is the same as the one for **DDS\_RTSPS\_GUID\_t** (p. 1695).

### 4.90.3 Function Documentation

#### 4.90.3.1 DDS\_GUID\_equals()

```
DDS_Boolean DDS_GUID_equals (
    const struct DDS_GUID_t * self,
    const struct DDS_GUID_t * other )
```

Compares this GUID with another GUID for equality.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) This GUID.
<i>other</i>	<< <i>in</i> >> (p. 818) The other GUID to be compared with this GUID.

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the two GUIDs have equal values, or **DDS\_BOOLEAN\_FALSE** (p. 1004) otherwise.

#### 4.90.3.2 DDS\_GUID\_compare()

```
int DDS_GUID_compare (
    const struct DDS_GUID_t * self,
    const struct DDS_GUID_t * other )
```

Compares two GUIDs.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) GUID to compare.
<i>other</i>	<< <i>in</i> >> (p. 818) GUID to compare.

## Returns

If the two GUIDs are equal or NULL, the function returns 0. If *self* is greater than *other*, the function returns a positive number; otherwise, it returns a negative number. Note that non-NULL is considered greater than NULL.

## 4.90.3.3 DDS\_GUID\_copy()

```
void DDS_GUID_copy (
    struct DDS_GUID_t * self,
    const struct DDS_GUID_t * other )
```

Copies another GUID into this GUID.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) This GUID. Cannot be NULL.
<i>other</i>	<< <i>in</i> >> (p. 818) The other GUID to be copied. Cannot be NULL.

## 4.90.4 Variable Documentation

## 4.90.4.1 DDS\_GUID\_AUTO

```
const struct DDS_GUID_t DDS_GUID_AUTO [extern]
```

Indicates that RTI Connexx should choose an appropriate virtual GUID.

If this special value is assigned to `DDS_DataWriterProtocolQosPolicy::virtual_guid` (p. 1423) or `DDS_DataReaderProtocolQosPolicy::virtual_guid` (p. 1376), RTI Connexx will assign the virtual GUID automatically based on the RTPS or physical GUID.

## 4.90.4.2 DDS\_GUID\_UNKNOWN

```
const struct DDS_GUID_t DDS_GUID_UNKNOWN [extern]
```

Unknown GUID.

#### 4.90.4.3 DDS\_GUID\_ZERO

```
const struct DDS_GUID_t DDS_GUID_ZERO [extern]
```

Zero GUID.

## 4.91 Sequence Number Support

<<*extension*>> (p. 817) Sequence number type and defines.

### Data Structures

- struct **DDS\_SequenceNumber\_t**  
*Type for sequence number representation.*

### Typedefs

- typedef struct **DDS\_SequenceNumber\_t** **DDS\_SequenceNumber\_t**  
*Type for sequence number representation.*

### Functions

- void **DDS\_SequenceNumber\_subtract** (struct **DDS\_SequenceNumber\_t** \*answer, const struct **DDS\_↔  
SequenceNumber\_t** \*sn1, const struct **DDS\_SequenceNumber\_t** \*sn2)  
*Stores the value (sn1 - sn2) in answer*
- void **DDS\_SequenceNumber\_add** (struct **DDS\_SequenceNumber\_t** \*answer, const struct **DDS\_↔  
Number\_t** \*sn1, const struct **DDS\_SequenceNumber\_t** \*sn2)  
*Stores the value (sn1 + sn2) in answer*
- void **DDS\_SequenceNumber\_plusplus** (struct **DDS\_SequenceNumber\_t** \*sn)  
*Increases the value of the input sequence number by one*
- void **DDS\_SequenceNumber\_minusminus** (struct **DDS\_SequenceNumber\_t** \*sn)  
*Decreases the value of the input sequence number by one*
- int **DDS\_SequenceNumber\_compare** (const struct **DDS\_SequenceNumber\_t** \*sn1, const struct **DDS\_↔  
SequenceNumber\_t** \*sn2)  
*Compares two sequence numbers.*

### Variables

- const struct **DDS\_SequenceNumber\_t** **DDS\_SEQUENCE\_NUMBER\_UNKNOWN**  
*Unknown sequence number.*
- const struct **DDS\_SequenceNumber\_t** **DDS\_SEQUENCE\_NUMBER\_ZERO**  
*Zero value for the sequence number.*
- const struct **DDS\_SequenceNumber\_t** **DDS\_SEQUENCE\_NUMBER\_MAX**  
*Highest, most positive value for the sequence number.*
- const struct **DDS\_SequenceNumber\_t** **DDS\_AUTO\_SEQUENCE\_NUMBER**  
*The sequence number is internally determined by RTI Connex.*

### 4.91.1 Detailed Description

<<*extension*>> (p. 817) Sequence number type and defines.

### 4.91.2 Typedef Documentation

#### 4.91.2.1 DDS\_SequenceNumber\_t

```
typedef struct DDS_SequenceNumber_t DDS_SequenceNumber_t
```

Type for *sequence* number representation.

Represents a 64-bit sequence number.

### 4.91.3 Function Documentation

#### 4.91.3.1 DDS\_SequenceNumber\_subtract()

```
void DDS_SequenceNumber_subtract (
    struct DDS_SequenceNumber_t * answer,
    const struct DDS_SequenceNumber_t * sn1,
    const struct DDS_SequenceNumber_t * sn2 )
```

Stores the value (sn1 - sn2) in answer

#### Parameters

<i>answer</i>	<< <i>out</i> >> (p. 818) Result sequence number. Cannot be NULL.
<i>sn1</i>	<< <i>in</i> >> (p. 818) First sequence number. Cannot be NULL.
<i>sn2</i>	<< <i>in</i> >> (p. 818) Second sequence number. Cannot be NULL.

#### 4.91.3.2 DDS\_SequenceNumber\_add()

```
void DDS_SequenceNumber_add (
    struct DDS_SequenceNumber_t * answer,
```

```
const struct DDS_SequenceNumber_t * sn1,
const struct DDS_SequenceNumber_t * sn2 )
```

Stores the value (sn1 + sn2) in answer

#### Parameters

<i>answer</i>	<< <b>out</b> >> (p. 818) Result sequence number. Cannot be NULL.
<i>sn1</i>	<< <b>in</b> >> (p. 818) First sequence number. Cannot be NULL.
<i>sn2</i>	<< <b>in</b> >> (p. 818) Second sequence number. Cannot be NULL.

#### 4.91.3.3 DDS\_SequenceNumber\_plusplus()

```
void DDS_SequenceNumber_plusplus (
    struct DDS_SequenceNumber_t * sn )
```

Increases the value of the input sequence number by one

#### Parameters

<i>sn</i>	<< <b>inout</b> >> (p. 818) Sequence number. Cannot be NULL.
-----------	--------------------------------------------------------------

#### 4.91.3.4 DDS\_SequenceNumber\_minusminus()

```
void DDS_SequenceNumber_minusminus (
    struct DDS_SequenceNumber_t * sn )
```

Decreases the value of the input sequence number by one

#### Parameters

<i>sn</i>	<< <b>inout</b> >> (p. 818) Sequence number. Cannot be NULL.
-----------	--------------------------------------------------------------

#### 4.91.3.5 DDS\_SequenceNumber\_compare()

```
int DDS_SequenceNumber_compare (
    const struct DDS_SequenceNumber_t * sn1,
    const struct DDS_SequenceNumber_t * sn2 )
```

Compares two sequence numbers.

**Parameters**

<i>sn1</i>	<< <i>in</i> >> (p. 818) Sequence number to compare. Cannot be NULL.
<i>sn2</i>	<< <i>in</i> >> (p. 818) Sequence number to compare. Cannot be NULL.

**Returns**

If the two sequence numbers are equal, the function returns 0. If *sn1* is greater than *sn2* the function returns a positive number; otherwise, it returns a negative number.

**4.91.4 Variable Documentation****4.91.4.1 DDS\_SEQUENCE\_NUMBER\_UNKNOWN**

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_UNKNOWN [extern]
```

Unknown sequence number.

**4.91.4.2 DDS\_SEQUENCE\_NUMBER\_ZERO**

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_ZERO [extern]
```

Zero value for the sequence number.

**4.91.4.3 DDS\_SEQUENCE\_NUMBER\_MAX**

```
const struct DDS_SequenceNumber_t DDS_SEQUENCE_NUMBER_MAX [extern]
```

Highest, most positive value for the sequence number.

**4.91.4.4 DDS\_AUTO\_SEQUENCE\_NUMBER**

```
const struct DDS_SequenceNumber_t DDS_AUTO_SEQUENCE_NUMBER [extern]
```

The sequence number is internally determined by RTI Connex.

## 4.92 Exception Codes

<<*extension*>> (p. 817) Exception codes.

### Enumerations

- enum `DDS_ExceptionCode_t` {  
`DDS_NO_EXCEPTION_CODE` ,  
`DDS_USER_EXCEPTION_CODE` ,  
`DDS_SYSTEM_EXCEPTION_CODE` ,  
`DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE` ,  
`DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE` ,  
`DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE` ,  
`DDS_BADKIND_USER_EXCEPTION_CODE` ,  
`DDS_BOUNDS_USER_EXCEPTION_CODE` ,  
`DDS_IMMUTABLE_TYPECODE_SYSTEM_EXCEPTION_CODE = 8` ,  
`DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE = 9` ,  
`DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE = 10` }

*Error codes used by the `DDS_TypeCode` (p. 1806) class.*

### 4.92.1 Detailed Description

<<*extension*>> (p. 817) Exception codes.

These exceptions are used for error handling by the **Type Code Support** (p. 224) API.

### 4.92.2 Enumeration Type Documentation

#### 4.92.2.1 `DDS_ExceptionCode_t`

```
enum DDS_ExceptionCode_t
```

Error codes used by the `DDS_TypeCode` (p. 1806) class.

Exceptions are modeled via a special parameter passed to the operations.

#### Enumerator

<code>DDS_NO_EXCEPTION_CODE</code>	No failure occurred.
<code>DDS_USER_EXCEPTION_CODE</code>	User exception. This class is based on a similar class in CORBA.
<code>DDS_SYSTEM_EXCEPTION_CODE</code>	System exception. This class is based on a similar class in CORBA.

## Enumerator

DDS_BAD_PARAM_SYSTEM_EXCEPTION_CODE	Exception thrown when a parameter passed to a call is considered illegal.
DDS_NO_MEMORY_SYSTEM_EXCEPTION_CODE	Exception thrown when there is not enough memory for a dynamic memory allocation.
DDS_BAD_TYPECODE_SYSTEM_EXCEPTION_CODE ↔	Exception thrown when a malformed type code is found (for example, a type code with an invalid TCKind value).
DDS_BADKIND_USER_EXCEPTION_CODE	The exception BadKind is thrown when an inappropriate operation is invoked on a TypeCode object.
DDS_BOUNDS_USER_EXCEPTION_CODE	A user exception thrown when a parameter is not within the legal bounds.
DDS_IMMUTABLE_TYPECODE_SYSTEM_EXCEPTION_CODE ↔	An attempt was made to modify a <b>DDS_TypeCode</b> (p. 1806) that was received from a remote object. The built-in publication and subscription readers provide access to information about the remote <b>DDS_DataWriter</b> (p. 478) and <b>DDS_DataReader</b> (p. 608) entities in the distributed system. Among other things, the data from these built-in readers contains the <b>DDS_TypeCode</b> (p. 1806) for these entities. Modifying this received <b>DDS_TypeCode</b> (p. 1806) is not permitted.
DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE ↔	The specified <b>DDS_TypeCode</b> (p. 1806) member name is invalid. This failure can occur, for example, when querying a field by name when no such name is defined in the type.  See also  <b>DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE</b> (p. 1023)
DDS_BAD_MEMBER_ID_USER_EXCEPTION_CODE	The specified <b>DDS_TypeCode</b> (p. 1806) member ID is invalid. This failure can occur, for example, when querying a field by ID when no such ID is defined in the type.  See also  <b>DDS_BAD_MEMBER_NAME_USER_EXCEPTION_CODE</b> (p. 1023)

## 4.93 Return Codes

Types of return codes.

### Enumerations

- enum **DDS\_ReturnCode\_t** {  
  **DDS\_RETCODE\_OK** ,

```

DDS_RETCODE_ERROR ,
DDS_RETCODE_UNSUPPORTED ,
DDS_RETCODE_BAD_PARAMETER ,
DDS_RETCODE_PRECONDITION_NOT_MET ,
DDS_RETCODE_OUT_OF_RESOURCES ,
DDS_RETCODE_NOT_ENABLED ,
DDS_RETCODE_IMMUTABLE_POLICY ,
DDS_RETCODE_INCONSISTENT_POLICY ,

*Type for return codes.*

### 4.93.1 Detailed Description

Types of return codes.

### 4.93.2 Standard Return Codes

Any operation with return type `DDS_ReturnCode_t` (p.1024) may return `DDS_RETCODE_OK` (p.1025) `DDS_RETCODE_ERROR` (p.1025) or `DDS_RETCODE_ILLEGAL_OPERATION` (p.1025). Any operation that takes one or more input parameters may additionally return `DDS_RETCODE_BAD_PARAMETER` (p.1025). Any operation on an object created from any of the factories may additionally return `DDS_RETCODE_ALREADY_DELETED` (p.1025). Any operation that is stated as optional may additionally return `DDS_RETCODE_UNSUPPORTED` (p.1025).

Thus, the standard return codes are:

- `DDS_RETCODE_ERROR` (p.1025)
- `DDS_RETCODE_ILLEGAL_OPERATION` (p.1025)
- `DDS_RETCODE_ALREADY_DELETED` (p.1025)
- `DDS_RETCODE_BAD_PARAMETER` (p.1025)
- `DDS_RETCODE_UNSUPPORTED` (p.1025)

Operations that may return any of the additional return codes will state so explicitly.

### 4.93.3 Enumeration Type Documentation

#### 4.93.3.1 `DDS_ReturnCode_t`

```
enum DDS_ReturnCode_t
```

Type for return codes.

Errors are modeled as operation return codes of this type.

## Enumerator

DDS_RETCODE_OK	Successful return.
DDS_RETCODE_ERROR	Generic, unspecified error.
DDS_RETCODE_UNSUPPORTED	Unsupported operation. Only returned by operations that are unsupported.
DDS_RETCODE_BAD_PARAMETER	Illegal parameter value. The value of the parameter that is passed in has illegal value. Things that fall into this category include NULL parameters and parameter values that are out of range.
DDS_RETCODE_PRECONDITION_NOT_MET	A pre-condition for the operation was not met. The system is not in the expected state when the function is called, or the parameter itself is not in the expected state when the function is called.
DDS_RETCODE_OUT_OF_RESOURCES	RTI Connex ran out of the resources needed to complete the operation.
DDS_RETCODE_NOT_ENABLED	Operation invoked on a <b>DDS_Entity</b> (p. 1160) that is not yet enabled.
DDS_RETCODE_IMMUTABLE_POLICY	Application attempted to modify an immutable QoS policy.
DDS_RETCODE_INCONSISTENT_POLICY	Application specified a set of QoS policies that are not consistent with each other.
DDS_RETCODE_ALREADY_DELETED	The object target of this operation has already been deleted.
DDS_RETCODE_TIMEOUT	The operation timed out.
DDS_RETCODE_NO_DATA	Indicates a transient situation where the operation did not return any data but there is no inherent error.
DDS_RETCODE_ILLEGAL_OPERATION	The operation was called under improper circumstances. An operation was invoked on an inappropriate object or at an inappropriate time. This return code is similar to <b>DDS_RETCODE_PRECONDITION_NOT_MET</b> (p. 1025), except that there is no precondition that could be changed to make the operation succeed.
DDS_RETCODE_NOT_ALLOWED_BY_SECURITY	An operation on the DDS API that fails because the security plugins do not allow it. An operation on the DDS API that fails because the security plugins do not allow it. Currently unused because security checks happen during create, not enable, and create doesn't return a ReturnCode (SEC-731).

## 4.94 Status Kinds

*Type for status kinds.*

### 4.94.1 Detailed Description

Kinds of communication status.

Entity:

**DDS\_Entity** (p. 1160)

QoS:

**QoS Policies** (p. 1041)

Listener:

**DDS\_Listener** (p. 1569)

Each concrete **DDS\_Entity** (p. 1160) is associated with a set of Status objects whose value represents the communication status of that entity. Each status value can be accessed with a corresponding function on the **DDS\_Entity** (p. 1160).

When these status values change, the corresponding **DDS\_StatusCondition** (p. 1170) objects are activated and the proper **DDS\_Listener** (p. 1569) objects are invoked to asynchronously inform the application.

An application is notified of communication status by means of the **DDS\_Listener** (p. 1569) or the **DDS\_WaitSet** (p. 1170) / **DDS\_Condition** (p. 1169) mechanism. The two mechanisms may be combined in the application (e.g., using **DDS\_WaitSet** (p. 1170) (s) / **DDS\_Condition** (p. 1169) (s) to access the data and **DDS\_Listener** (p. 1569) (s) to be warned asynchronously of erroneous communication statuses).

It is likely that the application will choose one or the other mechanism for each particular communication status (not both). However, if both mechanisms are enabled, then the **DDS\_Listener** (p. 1569) mechanism is used first and then the **DDS\_WaitSet** (p. 1170) objects are signalled.

The statuses may be classified into:

- *read communication statuses*: i.e., those that are related to arrival of data, namely **DDS\_DATA\_ON\_READERS\_STATUS** (p. 1033) and **DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033).
- *plain communication statuses*: i.e., all the others.

Read communication statuses are treated slightly differently than the others because they don't change independently. In other words, at least two changes will appear at the same time (**DDS\_DATA\_ON\_READERS\_STATUS** (p. 1033) and **DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033)) and even several of the last kind may be part of the set. This 'grouping' has to be communicated to the application.

For each plain communication status, there is a corresponding structure to hold the status value. These values contain the information related to the change of status, as well as information related to the statuses themselves (e.g., contains cumulative counts).

"Status Values"

## 4.94.2 Changes in Status

Associated with each one of an **DDS\_Entity** (p. 1160)'s communication status is a logical `StatusChangedFlag`. This flag indicates whether that particular communication status has changed since the last time the status was read by the application. The way the status changes is slightly different for the Plain Communication Status and the Read Communication status.

"\p StatusChangedFlag indicates if status has changed"

### 4.94.2.1 Changes in plain communication status

For the plain communication status, the `StatusChangedFlag` flag is initially set to `FALSE`. It becomes `TRUE` whenever the plain communication status changes and it is reset to **DDS\_BOOLEAN\_FALSE** (p. 1004) each time the application accesses the plain communication status via the proper `get_<plain communication status>()` operation on the **DDS\_Entity** (p. 1160).

The communication status is also reset to `FALSE` whenever the associated listener operation is called as the listener implicitly accesses the status which is passed as a parameter to the operation. The fact that the status is reset prior to calling the listener means that if the application calls the `get_<plain communication status>` from inside the listener it will see the status already reset.

An exception to this rule is when the associated listener is the 'nil' listener. The 'nil' listener is treated as a NOOP and the act of calling the 'nil' listener does not reset the communication status.

For example, the value of the `StatusChangedFlag` associated with the **DDS\_REQUESTED\_DEADLINE\_MISSED\_STATUS** (p. 1032) will become `TRUE` each time new deadline occurs (which increases **DDS\_RequestedDeadlineMissedStatus::total\_count** (p. 1688)). The value changes to `FALSE` when the application accesses the status via the corresponding **DDS\_DataReader\_get\_requested\_deadline\_missed\_status** (p. 674) method on the proper Entity

"Changes in \p StatusChangedFlag for plain communication status"

### 4.94.2.2 Changes in read communication status

For the read communication status, the `StatusChangedFlag` flag is initially set to `FALSE`. The `StatusChangedFlag` becomes `TRUE` when either a data-sample arrives or else the **DDS\_ViewStateKind** (p. 704), **DDS\_SampleStateKind** (p. 702), or **DDS\_InstanceStateKind** (p. 706) of any existing sample changes for any reason other than a call to **FooDataReader\_read** (p. 618), **FooDataReader\_take** (p. 619) or their variants. Specifically any of the following events will cause the `StatusChangedFlag` to become `TRUE`:

- The arrival of new data.
- A change in the **DDS\_InstanceStateKind** (p. 706) of a contained instance. This can be caused by either:
  - The arrival of the notification that an instance has been disposed by:
    - \* the **DDS\_DataWriter** (p. 478) that owns it if **OWNERSHIP** (p. 1102) QoS kind= **DDS\_EXCLUSIVE\_OWNERSHIP\_QOS** (p. 1103)
    - \* or by any **DDS\_DataWriter** (p. 478) if **OWNERSHIP** (p. 1102) QoS kind= **DDS\_SHARED\_OWNERSHIP\_QOS** (p. 1103)

- The loss of liveness of the **DDS\_DataWriter** (p. 478) of an instance for which there is no other **DDS\_DataWriter** (p. 478).
- The arrival of the notification that an instance has been unregistered by the only **DDS\_DataWriter** (p. 478) that is known to be writing the instance.

Depending on the kind of `StatusChangedFlag`, the flag transitions to `FALSE` again as follows:

- The **DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033) `StatusChangedFlag` becomes `FALSE` when either the corresponding listener operation (`on_data_available`) is called or the read or take operation (or their variants) is called on the associated **DDS\_DataReader** (p. 608).
- The **DDS\_DATA\_ON\_READERS\_STATUS** (p. 1033) `StatusChangedFlag` becomes `FALSE` when any of the following events occurs:
  - The corresponding listener operation (`on_data_on_readers`) is called.
  - The `on_data_available` listener operation is called on any **DDS\_DataReader** (p. 608) belonging to the **DDS\_Subscriber** (p. 565).
  - The read or take operation (or their variants) is called on any **DDS\_DataReader** (p. 608) belonging to the **DDS\_Subscriber** (p. 565).

"Changes in `\p StatusChangedFlag` for read communication status"

### 4.94.3 Macro Definition Documentation

#### 4.94.3.1 DDS\_STATUS\_MASK\_NONE

```
#define DDS_STATUS_MASK_NONE
```

No bits are set.

Examples

**HelloWorld\_publisher.c**, and **HelloWorld\_subscriber.c**.

### 4.94.3.2 DDS\_STATUS\_MASK\_ALL

```
#define DDS_STATUS_MASK_ALL
```

All bits are set.

#### Examples

**HelloWorld\_subscriber.c.**

## 4.94.4 Typedef Documentation

### 4.94.4.1 DDS\_StatusMask

```
typedef DDS_UnsignedLong DDS_StatusMask
```

A bit-mask (list) of concrete status types, i.e. **DDS\_StatusKind** (p. 1030)[].

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS\_StatusKind** (p. 1030) values.

Bits in the mask correspond to different statuses. You can choose which changes in status will trigger a callback by setting the corresponding status bits in this bit-mask and installing callbacks for each of those statuses.

The bits that are true indicate that the listener will be called back for changes in the corresponding status.

#### For example:

```
DDS_StatusMask mask = DDS_REQUESTED_DEADLINE_MISSED_STATUS |  
                    DDS_DATA_AVAILABLE_STATUS;  
datareader->set_listener(listener, mask);
```

#### Or

```
DDS_StatusMask mask = DDS_REQUESTED_DEADLINE_MISSED_STATUS |  
                    DDS_DATA_AVAILABLE_STATUS;  
datareader = subscriber->create_datareader(topic,  
                    DDS_DATAREADER_QOS_DEFAULT,  
                    listener, mask);
```

## 4.94.5 Enumeration Type Documentation

## 4.94.5.1 DDS\_StatusKind

```
enum DDS_StatusKind
```

Type for *status* kinds.

Each concrete **DDS\_Entity** (p. 1160) is associated with a set of \**Status* objects whose values represent the communication status of that **DDS\_Entity** (p. 1160).

The communication statuses whose changes can be communicated to the application depend on the **DDS\_Entity** (p. 1160).

Each status value can be accessed with a corresponding function on the **DDS\_Entity** (p. 1160). The changes on these status values cause activation of the corresponding **DDS\_StatusCondition** (p. 1170) objects and trigger invocation of the proper **DDS\_Listener** (p. 1569) objects to asynchronously inform the application. Note that not all statuses will activate the **DDS\_StatusCondition** (p. 1170) or have a corresponding listener callback. Refer to the documentation of the individual statuses for that information.

## Enumerator

<p>DDS_RELIABLE_WRITER_CACHE_CHANGED_↔ STATUS</p>	<p>&lt;&lt;<i>extension</i>&gt;&gt; (p. 817) The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point. This status is considered changed at the following times: the cache is empty (i.e., contains no unacknowledged samples), the cache is full (i.e., the sample count has reached the value specified in <b>DDS_ResourceLimitsQosPolicy::max_samples</b> (p. 1693)), or the number of samples has reached a high (see <b>DDS_RtpsReliableWriterProtocol_t::high_↔ watermark</b> (p. 1701)) or low (see <b>DDS_RtpsReliableWriterProtocol_t::low_watermark</b> (p. 1701)) watermark.</p> <p>Entity:</p> <p style="padding-left: 40px;"><b>DDS_DataWriter</b> (p. 478)</p> <p>Status:</p> <p style="padding-left: 40px;"><b>DDS_ReliableWriterCacheChangedStatus</b> (p. 1684)</p> <p>Listener:</p> <p style="padding-left: 40px;"><b>DDS_DataWriterListener</b> (p. 1417)</p>
<p>DDS_RELIABLE_READER_ACTIVITY_CHANGED_↔ STATUS</p>	<p>&lt;&lt;<i>extension</i>&gt;&gt; (p. 817) One or more reliable readers has become active or inactive. A reliable reader is considered active by a reliable writer with which it is matched if that reader acknowledges the samples it has been sent in a timely fashion. For the definition of "timely" in this case, see <b>DDS_RtpsReliableWriterProtocol_t</b> (p. 1699) and <b>DDS_ReliableReaderActivityChangedStatus</b> (p. 1682).</p> <p>See also</p> <p style="padding-left: 40px;"><b>DDS_RtpsReliableWriterProtocol_t</b> (p. 1699)</p> <p style="padding-left: 40px;"><b>DDS_ReliableReaderActivityChangedStatus</b> (p. 1682)</p>
<p>DDS_DATA_WRITER_CACHE_STATUS</p>	<p>&lt;&lt;<i>extension</i>&gt;&gt; (p. 817) The status of the writer's cache. Changes to this status do not trigger a <b>DDS_StatusCondition</b> (p. 1170).</p>
<p>DDS_DATA_WRITER_PROTOCOL_STATUS</p>	<p>&lt;&lt;<i>extension</i>&gt;&gt; (p. 817) The status of a writer's internal protocol related metrics The status of a writer's internal protocol-related metrics, such as the number of samples pushed, pulled, and filtered and the status of wire protocol traffic. Changes to this status information do not trigger a <b>DDS_StatusCondition</b> (p. 1170).</p>

## Enumerator

DDS_DATA_READER_CACHE_STATUS	<< <i>extension</i> >> (p. 817) The status of the reader's cache. Changes to this status do not trigger a <b>DDS_StatusCondition</b> (p. 1170).
DDS_DATA_READER_PROTOCOL_STATUS	<< <i>extension</i> >> (p. 817) The status of a reader's internal protocol related metrics The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic. Changes to this status do not trigger a <b>DDS_StatusCondition</b> (p. 1170).
DDS_DATA_WRITER_SAMPLE_REMOVED_STATUS	<< <i>extension</i> >> (p. 817) A <b>DDS_DataWriter</b> (p. 478) has removed a sample from its queue. Enables a <b>DDS_DataWriter</b> (p. 478) callback that is called when a sample is removed from its queue.  Entity:  <b>DDS_DataWriter</b> (p. 478)  Listener:  <b>DDS_DataWriterListener</b> (p. 1417)

## 4.95 Thread Settings

The properties of a thread of execution. Consult `Platform Notes` for additional platform specific details.

### Data Structures

- struct **DDS\_ThreadSettings\_t**  
*The properties of a thread of execution.*

### Macros

- #define **DDS\_THREAD\_SETTINGS\_KIND\_MASK\_DEFAULT**  
*The mask of default thread options.*

### Typedefs

- typedef **DDS\_UnsignedLong DDS\_ThreadSettingsKindMask**  
*A mask of which each bit is taken from **DDS\_ThreadSettingsKind** (p. 1040).*

## Enumerations

- enum `DDS_ThreadSettingsKind` {  
    `DDS_THREAD_SETTINGS_FLOATING_POINT` ,  
    `DDS_THREAD_SETTINGS_STUDIO` ,  
    `DDS_THREAD_SETTINGS_REALTIME_PRIORITY` ,  
    `DDS_THREAD_SETTINGS_PRIORITY_ENFORCE` ,  
    `DDS_THREAD_SETTINGS_CANCEL_ASYNCHRONOUS` }

*A collection of flags used to configure threads of execution.*

- enum `DDS_ThreadSettingsCpuRotationKind` {  
    `DDS_THREAD_SETTINGS_CPU_NO_ROTATION` ,  
    `DDS_THREAD_SETTINGS_CPU_RR_ROTATION` }

*Determines how `DDS_ThreadSettings_t::cpu_list` (p. 1766) affects processor affinity for thread-related QoS policies that apply to multiple threads.*

### 4.95.1 Detailed Description

The properties of a thread of execution. Consult `Platform Notes` for additional platform specific details.

### 4.95.2 Macro Definition Documentation

#### 4.95.2.1 `DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT`

```
#define DDS_THREAD_SETTINGS_KIND_MASK_DEFAULT
```

The mask of default thread options.

### 4.95.3 Typedef Documentation

#### 4.95.3.1 `DDS_ThreadSettingsKindMask`

```
typedef DDS_UnsignedLong DDS_ThreadSettingsKindMask
```

A mask of which each bit is taken from `DDS_ThreadSettingsKind` (p. 1040).

See also

`DDS_ThreadSettings_t` (p. 1764)

## 4.95.4 Enumeration Type Documentation

### 4.95.4.1 DDS\_ThreadSettingsKind

enum `DDS_ThreadSettingsKind`

A collection of flags used to configure threads of execution.

Not all of these options may be relevant for all operating systems. Consult `Platform Notes` for additional details.

See also

`DDS_ThreadSettingsKindMask` (p. 1039)

Enumerator

<code>DDS_THREAD_SETTINGS_FLOATING_POINT</code>	Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.
<code>DDS_THREAD_SETTINGS_STDIO</code>	Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.
<code>DDS_THREAD_SETTINGS_REALTIME_PRIORITY</code>	The thread will be scheduled on a FIFO basis.
<code>DDS_THREAD_SETTINGS_PRIORITY_ENFORCE</code>	Strictly enforce this thread's priority.
<code>DDS_THREAD_SETTINGS_CANCEL_↔ ASYNCHRONOUS</code>	Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

### 4.95.4.2 DDS\_ThreadSettingsCpuRotationKind

enum `DDS_ThreadSettingsCpuRotationKind`

Determines how `DDS_ThreadSettings_t::cpu_list` (p. 1766) affects processor affinity for thread-related QoS policies that apply to multiple threads.

## 4.95.5 Controlling CPU Core Affinity for RTI Threads

Most thread-related QoS settings apply to a single thread (such as for the `DDS_EventQoSPolicy` (p. 1547), `DDS_↔  
DatabaseQoSPolicy` (p. 1361), and `DDS_AsynchronousPublisherQoSPolicy` (p. 1323)). However, the thread settings in the `DDS_ReceiverPoolQoSPolicy` (p. 1676) control every receive thread created. In this case, there are several schemes to map M threads to N processors; the rotation kind controls which scheme is used.

Controlling CPU Core Affinity is only relevant to the **DDS\_ReceiverPoolQoSPolicy** (p. 1676). It is ignored within other QoS policies that include **DDS\_ThreadSettings\_t** (p. 1764).

If **DDS\_ThreadSettings\_t::cpu\_list** (p. 1766) is empty, the rotation is irrelevant since no affinity adjustment will occur. Suppose instead that **DDS\_ThreadSettings\_t::cpu\_list** (p. 1766) = {0, 1} and that the middleware creates three receive threads: {A, B, C}. If **DDS\_ThreadSettings\_t::cpu\_rotation** (p. 1766) is **DDS\_THREAD\_SETTINGS\_CPU\_NO\_ROTATION** (p. 1041), threads A, B and C will have the same processor affinities (0-1), and the OS will control thread scheduling within this bound. It is common to denote CPU affinities as a bitmask, where set bits represent allowed processors to run on. This mask is printed in hex, so a CPU core affinity of 0-1 can be represented by the mask 0x3.

If **DDS\_ThreadSettings\_t::cpu\_rotation** (p. 1766) is **DDS\_THREAD\_SETTINGS\_CPU\_RR\_ROTATION** (p. 1041), each thread will be assigned in round-robin fashion to one of the processors in **DDS\_ThreadSettings\_t::cpu\_list** (p. 1766); perhaps thread A to 0, B to 1, and C to 0. Note that the order in which internal middleware threads spawn is unspecified.

Not all of these options may be relevant for all operating systems. Refer to the Platform Notes for further information.

#### Enumerator

DDS_THREAD_SETTINGS_CPU_NO_ROTATION	Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.
DDS_THREAD_SETTINGS_CPU_RR_ROTATION	Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

## 4.96 QoS Policies

Quality of Service (QoS) policies.

### Modules

- **ASYNCHRONOUS\_PUBLISHER**
  - <<extension>> (p. 817) Specifies the asynchronous publishing settings of the **DDS\_Publisher** (p. 436) instances.
- **AVAILABILITY**
  - <<extension>> (p. 817) Configures the availability of data.
- **BATCH**
  - <<extension>> (p. 817) Batch QoS policy used to enable batching in **DDS\_DataWriter** (p. 478) instances.
- **DATABASE**
  - <<extension>> (p. 817) Various threads and resource limits settings used by RTI Connex to control its internal database.
- **DATA\_READER\_PROTOCOL**
  - <<extension>> (p. 817) Specifies the DataReader-specific protocol QoS.
- **DATA\_READER\_RESOURCE\_LIMITS**
  - <<extension>> (p. 817) Various settings that configure how DataReaders allocate and use physical memory for internal resources.
- **DATA\_REPRESENTATION**

A list of data representations and compression methods supported by a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608).

- **DATA\_TAG**

Stores (name, value) pairs that can be used to determine access permissions.

- **DATA\_WRITER\_PROTOCOL**

<<extension>> (p. 817) Along with **DDS\_WireProtocolQoSPolicy** (p. 1827) and **DDS\_DataReaderProtocolQoSPolicy** (p. 1375), this QoS policy configures the DDS on-the-network protocol (RTPS).

- **DATA\_WRITER\_RESOURCE\_LIMITS**

<<extension>> (p. 817) Various settings that configure how a **DDS\_DataWriter** (p. 478) allocates and uses physical memory for internal resources.

- **DATA\_WRITER\_TRANSFER\_MODE**

<<extension>> (p. 817) Specifies the DataWriter transfer mode QoS.

- **DEADLINE**

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

- **DESTINATION\_ORDER**

Controls the criteria used to determine the logical order among changes made by **DDS\_Publisher** (p. 436) entities to the same instance of data (i.e., matching **DDS\_Topic** (p. 172) and key).

- **DISCOVERY**

<<extension>> (p. 817) Specifies the attributes required to discover participants in the domain.

- **DISCOVERY\_CONFIG**

<<extension>> (p. 817) Specifies the discovery configuration QoS.

- **DOMAIN\_PARTICIPANT\_RESOURCE\_LIMITS**

<<extension>> (p. 817) Various settings that configure how a **DDS\_DomainParticipant** (p. 72) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

- **DURABILITY**

This QoS policy specifies whether or not RTI ConnexT will store and deliver previously published data samples to new **DDS\_DataReader** (p. 608) entities that join the network later.

- **DURABILITY\_SERVICE**

Various settings to configure the external RTI Persistence Service used by RTI ConnexT for DataWriters with a **DDS\_DurabilityQoSPolicy** (p. 1516) setting of **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_DURABILITY\_QOS** (p. 1089).

- **ENTITY\_FACTORY**

A QoS policy for all **DDS\_Entity** (p. 1160) types that can act as factories for one or more other **DDS\_Entity** (p. 1160) types.

- **ENTITY\_NAME**

<<extension>> (p. 817) Assigns a name to a **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565), **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). Except for **DDS\_Publisher** (p. 436) and **DDS\_Subscriber** (p. 565), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

- **EVENT**

<<extension>> (p. 817) Configures the internal thread in a DomainParticipant that handles timed events.

- **HISTORY**

Specifies the behavior of RTI ConnexT in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

- **GROUP\_DATA**

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

- **LATENCY\_BUDGET**

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

- **LIFESPAN**

*Specifies how long the data written by the **DDS\_DataWriter** (p. 478) is considered valid.*

- **LIVELINESS**

*Specifies and configures the mechanism that allows **DDS\_DataReader** (p. 608) entities to detect when **DDS\_DataWriter** (p. 478) entities become disconnected or "dead."*

- **LOCATORFILTER**

*<<extension>> (p. 817) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS\_↔\_PublicationBuiltinTopicData** (p. 1648).*

- **LOGGING**

*<<extension>> (p. 817) Configures the RTI Connex logging facility.*

- **MONITORING**

*Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.*

- **MULTICHANNEL**

*<<extension>> (p. 817) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.*

- **OWNERSHIP**

*Specifies whether it is allowed for multiple **DDS\_DataWriter** (p. 478) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

- **OWNERSHIP\_STRENGTH**

*Specifies the value of the strength used to arbitrate among multiple **DDS\_DataWriter** (p. 478) objects that attempt to modify the same instance of a data type (identified by **DDS\_Topic** (p. 172) + key).*

- **PARTITION**

*Set of strings that introduces logical partitions in **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), or **DDS\_↔\_Subscriber** (p. 565) entities.*

- **PRESENTATION**

*Specifies how the samples representing changes to data instances are presented to a subscribing application.*

- **PROFILE**

*<<extension>> (p. 817) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.*

- **PROPERTY**

*<<extension>> (p. 817) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.*

- **PUBLISH\_MODE**

*<<extension>> (p. 817) Specifies how RTI Connex sends application data on the network. This QoS policy can be used to tell RTI Connex to use its own thread to send data, instead of the user thread.*

- **READER\_DATA\_LIFECYCLE**

*Controls how a DataReader manages the lifecycle of the data that it has received.*

- **RECEIVER\_POOL**

*<<extension>> (p. 817) Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).*

- **RELIABILITY**

*Indicates the level of reliability offered/requested by RTI Connex.*

- **RESOURCE\_LIMITS**

*Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.*

- **SERVICE**

*<<extension>> (p. 817) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.*

- **SYSTEM\_RESOURCE\_LIMITS**

*<<extension>> (p. 817) Configures DomainParticipant-independent resources used by RTI Connex.*

- **TIME\_BASED\_FILTER**

Filter that allows a **DDS\_DataReader** (p. 608) to specify that it is interested only in (potentially) a subset of the values of the data.

- **TOPIC\_DATA**

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

- **TOPIC\_QUERY\_DISPATCH**

Configures the ability of a **DDS\_DataWriter** (p. 478) to publish historical samples.

- **TRANSPORT\_BUILTIN**

<<extension>> (p. 817) Specifies which built-in transports are used.

- **TRANSPORT\_MULTICAST**

<<extension>> (p. 817) Specifies the multicast address on which a **DDS\_DataReader** (p. 608) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDS\_DomainParticipant** (p. 72) level) transports with which to receive the multicast data.

- **TRANSPORT\_MULTICAST\_MAPPING**

<<extension>> (p. 817) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

- **TRANSPORT\_PRIORITY**

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

- **TRANSPORT\_SELECTION**

<<extension>> (p. 817) Specifies the physical transports that a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) may use to send or receive data.

- **TRANSPORT\_UNICAST**

<<extension>> (p. 817) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

- **TYPE\_CONSISTENCY\_ENFORCEMENT**

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

- **TYPESUPPORT**

<<extension>> (p. 817) Allows you to attach application-specific values to a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

- **USER\_DATA**

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

- **WRITER\_DATA\_LIFECYCLE**

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

- **WIRE\_PROTOCOL**

<<extension>> (p. 817) Specifies the wire protocol related attributes for the **DDS\_DomainParticipant** (p. 72).

- **Extended QoS Support**

<<extension>> (p. 817) Types and defines used in extended QoS policies.

## Data Structures

- struct **DDS\_QoSPrintFormat**

A collection of attributes used to configure how a QoS appears when printed.

- struct **DDS\_QoSPolicyCount**

Type to hold a counter for a **DDS\_QoSPolicyId\_t** (p. 1048).

- struct **DDS\_QoSPolicyCountSeq**

Declares IDL sequence < **DDS\_QoSPolicyCount** (p. 1667) >

## Macros

- `#define DDS_QosPrintFormat_INITIALIZER`  
*Static initializer for `DDS_QosPrintFormat` (p. 1668).*
- `#define DDS_QOS_POLICY_COUNT`  
*Number of QoS policies in `DDS_QosPolicyId_t` (p. 1048).*

## Enumerations

- enum `DDS_QosPolicyId_t` {

*Type to identify QoS Policies.*

#### 4.96.1 Detailed Description

Quality of Service (QoS) policies.

Data Distribution Service (DDS) relies on the use of QoS. A QoS is a set of characteristics that controls some aspect of the behavior of DDS. A QoS is comprised of individual QoS policies (objects conceptually deriving from an *abstract QoSPolicy* class).

"Supported QoS policies"

The QoSPolicy provides the basic mechanism for an application to specify quality of service parameters. It has an attribute name that is used to uniquely identify each QoSPolicy.

QoSPolicy implementation is comprised of a name, an ID, and a type. The type of a QoSPolicy value may be atomic, such as an integer or float, or compound (a structure). Compound types are used whenever multiple parameters must be set coherently to define a consistent value for a QoSPolicy.

QoS (i.e., a list of QoSPolicy objects) may be associated with all **DDS\_Entity** (p. 1160) objects in the system such as **DDS\_Topic** (p. 172), **DDS\_DataWriter** (p. 478), **DDS\_DataReader** (p. 608), **DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565), and **DDS\_DomainParticipant** (p. 72).

## 4.96.2 Specifying QoS on entities

QoS Policies can be set programmatically when an **DDS\_Entity** (p. 1160) is created, or modified with the **DDS\_Entity** (p. 1160)'s **set\_qos (abstract)** (p. 1161) function.

QoS Policies can also be configured from XML resources (files, strings). With this approach, you can change the QoS without recompiling the application. For more information, see **Configuring QoS Profiles with XML** (p. 776).

To customize a **DDS\_Entity** (p. 1160)'s QoS before creating the entity, the correct pattern is:

- First, initialize a QoS object with the appropriate **INITIALIZER** constant.
- Call the relevant `get_<entity>_default_qos()` method.
- Modify the QoS values as desired.
- Finally, create the entity.

Each `QoSPolicy` is treated independently from the others. This approach has the advantage of being very extensible. However, there may be cases where several policies are in conflict. Consistency checking is performed each time the policies are modified via the **set\_qos (abstract)** (p. 1161) operation, or when the **DDS\_Entity** (p. 1160) is created.

When a policy is changed after being set to a given value, it is not required that the new value be applied instantaneously; RTI Connext is allowed to apply it after a transition phase. In addition, some `QoSPolicy` have immutable semantics, meaning that they can only be specified either at **DDS\_Entity** (p. 1160) creation time or else prior to calling the **DDS\_Entity\_enable** (p. 1163) operation on the entity.

Each **DDS\_Entity** (p. 1160) can be configured with a list of `QoSPolicy` objects. However, not all QoS Policies are supported by each **DDS\_Entity** (p. 1160). For instance, a **DDS\_DomainParticipant** (p. 72) supports a different set of QoS Policies than a **DDS\_Topic** (p. 172) or a **DDS\_Publisher** (p. 436).

Additional properties that are not exposed through the formal QoS policies can also be set for an **DDS\_Entity** (p. 1160) via the **DDS\_PropertyQoSPolicy** (p. 1645). These properties are described in the `Property Reference Guide`.

## 4.96.3 QoS compatibility

In several cases, for communications to occur properly (or efficiently), a `QoSPolicy` on the publisher side must be compatible with a corresponding policy on the subscriber side. For example, if a **DDS\_Subscriber** (p. 565) requests to receive data reliably while the corresponding **DDS\_Publisher** (p. 436) defines a best-effort policy, communication will not happen as requested.

To address this issue and maintain the desirable decoupling of publication and subscription as much as possible, the `QoSPolicy` specification follows the **subscriber-requested, publisher-offered pattern**.

In this pattern, the subscriber side can specify a "requested" value for a particular `QoSPolicy`. The publisher side specifies an "offered" value for that `QoSPolicy`. RTI Connext will then determine whether the value requested by the subscriber side is compatible with what is offered by the publisher side. If the two policies are compatible, then communication will be established. If the two policies are not compatible, RTI Connext will not establish communications between the two **DDS\_Entity** (p. 1160) objects and will record this fact by means of the **DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032) on the publisher end and **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032) on the subscriber end. The application can detect this fact by means of a **DDS\_Listener** (p. 1569) or a **DDS\_Condition** (p. 1169).

The following **properties** are defined on a `QoSPolicy`.

- **RxO (p. 1048) property**

The QosPolicy objects that need to be set in a compatible manner between the **publisher** and **subscriber** end are indicated by the setting of the **RxO** (p. 1048) property:

- **RxO** (p. 1048) = **YES**  
indicates that the policy can be set both at the publishing and subscribing ends and the values must be set in a compatible manner. In this case the compatible values are explicitly defined.
- **RxO** (p. 1048) = **NO**  
indicates that the policy can be set both at the publishing and subscribing ends but the two settings are independent. That is, all combinations of values are compatible.
- **RxO** (p. 1048) = **N/A**  
indicates that the policy can only be specified at either the publishing or the subscribing end, but not at both ends. So compatibility does not apply.

- **Changeable (p. 1048)property**

Determines whether a QosPolicy can be changed.

- **NO** (p. 1048) -- policy can only be specified at **DDS\_Entity** (p. 1160) creation time.
- **UNTIL ENABLE** (p. 1048) -- policy can only be changed before the **DDS\_Entity** (p. 1160) is enabled.
- **YES** (p. 1048) -- policy can be changed at any time.

## 4.96.4 Macro Definition Documentation

### 4.96.4.1 DDS\_QosPrintFormat\_INITIALIZER

```
#define DDS_QosPrintFormat_INITIALIZER
```

Static initializer for **DDS\_QosPrintFormat** (p. 1668).

Use this initializer to ensure that new objects do not have uninitialized contents.

```
struct DDS_QosPrintFormat format = DDS_QosPrintFormat_INITIALIZER;
```

See also

**DDS\_QosPrintFormat** (p. 1668)

### 4.96.4.2 DDS\_QOS\_POLICY\_COUNT

```
#define DDS_QOS_POLICY_COUNT
```

Number of QoS policies in **DDS\_QosPolicyId\_t** (p. 1048).

## 4.96.5 Enumeration Type Documentation

### 4.96.5.1 DDS\_QosPolicyId\_t

```
enum DDS_QosPolicyId_t
```

Type to identify QoS Policies.

## Enumerator

DDS_INVALID_QOS_POLICY_ID	Identifier for an invalid QoS policy.
DDS_USERDATA_QOS_POLICY_ID	Identifier for <b>DDS_UserDataQosPolicy</b> (p. 1820).
DDS_DURABILITY_QOS_POLICY_ID	Identifier for <b>DDS_DurabilityQosPolicy</b> (p. 1516).
DDS_PRESENTATION_QOS_POLICY_ID	Identifier for <b>DDS_PresentationQosPolicy</b> (p. 1634).
DDS_DEADLINE_QOS_POLICY_ID	Identifier for <b>DDS_DeadlineQosPolicy</b> (p. 1455).
DDS_LATENCYBUDGET_QOS_POLICY_ID	Identifier for <b>DDS_LatencyBudgetQosPolicy</b> (p. 1566).
DDS_OWNERSHIP_QOS_POLICY_ID	Identifier for <b>DDS_OwnershipQosPolicy</b> (p. 1610).
DDS_OWNERSHIPSTRENGTH_QOS_POLICY_ID	Identifier for <b>DDS_OwnershipStrengthQosPolicy</b> (p. 1615).
DDS_LIVELINESS_QOS_POLICY_ID	Identifier for <b>DDS_LivelinessQosPolicy</b> (p. 1575).
DDS_TIMEBASEDFILTER_QOS_POLICY_ID	Identifier for <b>DDS_TimeBasedFilterQosPolicy</b> (p. 1767).
DDS_PARTITION_QOS_POLICY_ID	Identifier for <b>DDS_PartitionQosPolicy</b> (p. 1627).
DDS_RELIABILITY_QOS_POLICY_ID	Identifier for <b>DDS_ReliabilityQosPolicy</b> (p. 1678).
DDS_DESTINATIONORDER_QOS_POLICY_ID	Identifier for <b>DDS_DestinationOrderQosPolicy</b> (p. 1457).
DDS_HISTORY_QOS_POLICY_ID	Identifier for <b>DDS_HistoryQosPolicy</b> (p. 1558).
DDS_RESOURCELIMITS_QOS_POLICY_ID	Identifier for <b>DDS_ResourceLimitsQosPolicy</b> (p. 1690).
DDS_ENTITYFACTORY_QOS_POLICY_ID	Identifier for <b>DDS_EntityFactoryQosPolicy</b> (p. 1543).
DDS_WRITERDATALIFECYCLE_QOS_POLICY_ID	Identifier for <b>DDS_WriterDataLifecycleQosPolicy</b> (p. 1838).
DDS_READERDATALIFECYCLE_QOS_POLICY_ID	Identifier for <b>DDS_ReaderDataLifecycleQosPolicy</b> (p. 1673).
DDS_TOPICDATA_QOS_POLICY_ID	Identifier for <b>DDS_TopicDataQosPolicy</b> (p. 1775).
DDS_GROUPDATA_QOS_POLICY_ID	Identifier for <b>DDS_GroupDataQosPolicy</b> (p. 1556).
DDS_TRANSPORTPRIORITY_QOS_POLICY_ID	Identifier for <b>DDS_TransportPriorityQosPolicy</b> (p. 1797).
DDS_LIFESPAN_QOS_POLICY_ID	Identifier for <b>DDS_LifespanQosPolicy</b> (p. 1567).
DDS_DURABILITYSERVICE_QOS_POLICY_ID	Identifier for <b>DDS_DurabilityServiceQosPolicy</b> (p. 1519).
DDS_DATA_REPRESENTATION_QOS_POLICY_ID	Identifier for <b>DDS_DataRepresentationQosPolicy</b> (p. 1412).
DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_ID	Identifier for <b>DDS_TypeConsistencyEnforcementQosPolicy</b> (p. 1811).
DDS_DATATAG_QOS_POLICY_ID	Identifier for <b>DDS_DataTagQosPolicy</b> (p. 1065).
DDS_WIREPROTOCOL_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_WireProtocolQosPolicy</b> (p. 1827)
DDS_DISCOVERY_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DiscoveryQosPolicy</b> (p. 1479)
DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DataReaderResourceLimitsQosPolicy</b> (p. 1398)
DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DataWriterResourceLimitsQosPolicy</b> (p. 1446)

## Enumerator

DDS_DATAREADERPROTOCOL_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DataReaderProtocolQosPolicy</b> (p. 1375)
DDS_DATAWRITERPROTOCOL_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DataWriterProtocolQosPolicy</b> (p. 1422)
DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_ID ↵	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DomainParticipantResourceLimitsQosPolicy</b> (p. 1494)
DDS_EVENT_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_EventQosPolicy</b> (p. 1547)
DDS_DATABASE_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DatabaseQosPolicy</b> (p. 1361)
DDS_RECEIVERPOOL_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_ReceiverPoolQosPolicy</b> (p. 1676)
DDS_DISCOVERYCONFIG_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DiscoveryConfigQosPolicy</b> (p. 1460)
DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_SystemResourceLimitsQosPolicy</b> (p. 1760)
DDS_TRANSPORTSELECTION_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_TransportSelectionQosPolicy</b> (p. 1799)
DDS_TRANSPORTUNICAST_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_TransportUnicastQosPolicy</b> (p. 1800)
DDS_TRANSPORTMULTICAST_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_TransportMulticastQosPolicy</b> (p. 1793)
DDS_TRANSPORTBUILTIN_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_TransportBuiltinQosPolicy</b> (p. 1786)
DDS_TYPESUPPORT_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_TypeSupportQosPolicy</b> (p. 1815)
DDS_PROPERTY_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_PropertyQosPolicy</b> (p. 1645)
DDS_PUBLISHMODE_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_PublishModeQosPolicy</b> (p. 1664)
DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_ID ↵	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_AsynchronousPublisherQosPolicy</b> (p. 1323)
DDS_ENTITYNAME_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_EntityNameQosPolicy</b> (p. 1545)
DDS_BATCH_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_BatchQosPolicy</b> (p. 1334)
DDS_PROFILE_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_ProfileQosPolicy</b> (p. 1642)
DDS_LOCATORFILTER_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_LocatorFilterQosPolicy</b> (p. 1581)
DDS_MULTICHANNEL_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_MultiChannelQosPolicy</b> (p. 1603)
DDS_AVAILABILITY_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_AvailabilityQosPolicy</b> (p. 1330)
DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_ID ↵	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_TransportMulticastMappingQosPolicy</b> (p. 1791)

## Enumerator

DDS_LOGGING_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_LoggingQosPolicy</b> (p. 1583)
DDS_TOPICQUERYDISPATCH_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_TopicQueryDispatchQosPolicy</b> (p. 1783)
DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_ID ↔	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_DataWriterTransferModeQosPolicy</b> (p. 1454)
DDS_MONITORING_QOS_POLICY_ID	<< <i>extension</i> >> (p. 817) Identifier for <b>DDS_MonitoringQosPolicy</b> (p. 1601)

## 4.97 ASYNCHRONOUS\_PUBLISHER

<<*extension*>> (p. 817) Specifies the asynchronous publishing settings of the **DDS\_Publisher** (p. 436) instances.

### Data Structures

- struct **DDS\_AsynchronousPublisherQosPolicy**

*Configures the mechanism that sends user data in an external middleware thread.*

### Variables

- const char \*const **DDS\_ASYNCHRONOUSPUBLISHER\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_AsynchronousPublisherQosPolicy** (p. 1323).*

#### 4.97.1 Detailed Description

<<*extension*>> (p. 817) Specifies the asynchronous publishing settings of the **DDS\_Publisher** (p. 436) instances.

#### 4.97.2 Variable Documentation

##### 4.97.2.1 DDS\_ASYNCHRONOUSPUBLISHER\_QOS\_POLICY\_NAME

```
const char* const DDS_ASYNCHRONOUSPUBLISHER_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_AsynchronousPublisherQosPolicy** (p. 1323).

## 4.98 AVAILABILITY

<<*extension*>> (p. 817) Configures the availability of data.

### Data Structures

- struct **DDS\_EndpointGroup\_t**  
*Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.*
- struct **DDS\_EndpointGroupSeq**  
*A sequence of **DDS\_EndpointGroup\_t** (p. 1539).*
- struct **DDS\_AvailabilityQosPolicy**  
*Configures the availability of data.*

### Variables

- const char \*const **DDS\_AVAILABILITY\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_AvailabilityQosPolicy** (p. 1330).*

#### 4.98.1 Detailed Description

<<*extension*>> (p. 817) Configures the availability of data.

#### 4.98.2 Variable Documentation

##### 4.98.2.1 DDS\_AVAILABILITY\_QOS\_POLICY\_NAME

```
const char* const DDS_AVAILABILITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_AvailabilityQosPolicy** (p. 1330).

## 4.99 BATCH

<<*extension*>> (p. 817) Batch QoS policy used to enable batching in **DDS\_DataWriter** (p. 478) instances.

### Data Structures

- struct **DDS\_BatchQosPolicy**  
*Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.*

## Variables

- const char \*const **DDS\_BATCH\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_BatchQosPolicy** (p. 1334).*

### 4.99.1 Detailed Description

<<*extension*>> (p. 817) Batch QoS policy used to enable batching in **DDS\_DataWriter** (p. 478) instances.

### 4.99.2 Variable Documentation

#### 4.99.2.1 DDS\_BATCH\_QOS\_POLICY\_NAME

```
const char* const DDS_BATCH_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_BatchQosPolicy** (p. 1334).

## 4.100 DATABASE

<<*extension*>> (p. 817) Various threads and resource limits settings used by RTI Connex to control its internal database.

## Data Structures

- struct **DDS\_DatabaseQosPolicy**  
*Various threads and resource limits settings used by RTI Connex to control its internal database.*

## Variables

- const char \*const **DDS\_DATABASE\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DatabaseQosPolicy** (p. 1361).*

### 4.100.1 Detailed Description

<<*extension*>> (p. 817) Various threads and resource limits settings used by RTI Connex to control its internal database.

## 4.100.2 Variable Documentation

### 4.100.2.1 DDS\_DATABASE\_QOS\_POLICY\_NAME

```
const char* const DDS_DATABASE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DatabaseQosPolicy** (p. 1361).

## 4.101 DATA\_READER\_PROTOCOL

<<*extension*>> (p. 817) Specifies the DataReader-specific protocol QoS.

### Data Structures

- struct **DDS\_DataReaderProtocolQosPolicy**

*Along with **DDS\_WireProtocolQosPolicy** (p. 1827) and **DDS\_DataWriterProtocolQosPolicy** (p. 1422), this QoS policy configures the DDS on-the-network protocol (RTPS).*

### Variables

- const char \*const **DDS\_DATAREADERPROTOCOL\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_DataReaderProtocolQosPolicy** (p. 1375).*

### 4.101.1 Detailed Description

<<*extension*>> (p. 817) Specifies the DataReader-specific protocol QoS.

### 4.101.2 Variable Documentation

#### 4.101.2.1 DDS\_DATAREADERPROTOCOL\_QOS\_POLICY\_NAME

```
const char* const DDS_DATAREADERPROTOCOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DataReaderProtocolQosPolicy** (p. 1375).

## 4.102 DATA\_READER\_RESOURCE\_LIMITS

<<**extension**>> (p. 817) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

### Data Structures

- struct **DDS\_DataReaderResourceLimitsInstanceReplacementSettings**  
*Instance replacement kind applied to each instance state.*
- struct **DDS\_DataReaderResourceLimitsQosPolicy**  
*Various settings that configure how a **DDS\_DataReader** (p. 608) allocates and uses physical memory for internal resources.*

### Enumerations

- enum **DDS\_DataReaderInstanceRemovalKind** {  
**DDS\_NO\_INSTANCE\_REMOVAL** = PRES\_NO\_INSTANCE\_REMOVAL ,  
**DDS\_EMPTY\_INSTANCE\_REMOVAL** = PRES\_EMPTY\_INSTANCE\_REMOVAL ,  
**DDS\_FULLY\_PROCESSED\_INSTANCE\_REMOVAL** = PRES\_FULLY\_PROCESSED\_INSTANCE\_REMOVAL ,  
**DDS\_ANY\_INSTANCE\_REMOVAL** = PRES\_ANY\_INSTANCE\_REMOVAL }  
*Sets the kinds of instances that can be replaced when instance resource limits (**DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693)) are reached.*

### Variables

- const char \*const **DDS\_DATAREADERRESOURCELIMITS\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DataReaderResourceLimitsQosPolicy** (p. 1398).*
- const **DDS\_Long DDS\_AUTO\_MAX\_TOTAL\_INSTANCES**  
<<**extension**>> (p. 817) This value is used to make **DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances** (p. 1405) equal to **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693).

#### 4.102.1 Detailed Description

<<**extension**>> (p. 817) Various settings that configure how DataReaders allocate and use physical memory for internal resources.

#### 4.102.2 Enumeration Type Documentation

##### 4.102.2.1 DDS\_DataReaderInstanceRemovalKind

```
enum DDS_DataReaderInstanceRemovalKind
```

Sets the kinds of instances that can be replaced when instance resource limits (**DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693)) are reached.

See also

**DDS\_DataReaderResourceLimitsQosPolicy::instance\_replacement** (p. 1409)

## Enumerator

DDS_NO_INSTANCE_REMOVAL	<p>No instance can be removed. If an instance resource is required because <b>DDS_ResourceLimitsQosPolicy::max_instances</b> (p. 1693) is reached, this setting will disallow instances from being replaced. Samples for new instances will be dropped and reported as lost with reason <b>DDS_LOST_BY_INSTANCES_LIMIT</b> (p. 611).</p>
DDS_EMPTY_INSTANCE_REMOVAL	<p>Only empty instances can be removed. Instances can be replaced only if they are empty. An instance is considered empty when all samples have been taken or removed from the DataReader queue due to the <b>DDS_LifespanQosPolicy</b> (p. 1567) or sample purging due to the <b>DDS_ReaderDataLifecycleQosPolicy</b> (p. 1673), and there are no outstanding loans on any of the instance's samples.</p>
DDS_FULLY_PROCESSED_INSTANCE_REMOVAL	<p>Only fully-processed instances can be removed. An instance is considered fully processed if every sample for the instance has been processed by the application. A sample is considered processed by the application depending on the <b>DDS_ReliabilityQosPolicy::kind</b> (p. 1681):</p> <ul style="list-style-type: none"> <li>• <b>DDS_RELIABLE_RELIABILITY_QOS</b> (p. 1124) (depends on the <b>DDS_ReliabilityQosPolicy</b>↔ <b>AcknowledgmentModeKind</b> (p. 1124)):       <ul style="list-style-type: none"> <li>– <b>DDS_PROTOCOL</b>↔ <b>ACKNOWLEDGMENT_MODE</b> (p. 1124) or <b>DDS_APPLICATION_AUTO</b>↔ <b>ACKNOWLEDGMENT_MODE</b> (p. 1124): The sample is considered processed when it has been read or taken by the application and <code>return_loan</code> has been called.</li> <li>– <b>DDS_APPLICATION_EXPLICIT</b>↔ <b>ACKNOWLEDGMENT_MODE</b> (p. 1125): The sample is considered processed when the subscribing application has explicitly acknowledged the DDS sample, the <code>AppAckConf</code> has been received, and the application has called <code>return_loan</code>.</li> </ul> </li> <li>• <b>DDS_BEST_EFFORT_RELIABILITY_QOS</b> (p. 1124): All samples are considered processed when they have been read or taken by the application and <code>return_loan</code> has been called.</li> </ul>
DDS_ANY_INSTANCE_REMOVAL	<p>Any instance can be removed. Instances can be replaced regardless of whether the subscribing application has processed all of the samples. Samples that have not been processed will be removed.</p>

### 4.102.3 Variable Documentation

#### 4.102.3.1 DDS\_DATAREADERRESOURCELIMITS\_QOS\_POLICY\_NAME

```
const char* const DDS_DATAREADERRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DataReaderResourceLimitsQosPolicy** (p. 1398).

#### 4.102.3.2 DDS\_AUTO\_MAX\_TOTAL\_INSTANCES

```
const DDS_Long DDS_AUTO_MAX_TOTAL_INSTANCES [extern]
```

<<**extension**>> (p. 817) This value is used to make **DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances** (p. 1405) equal to **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693).

## 4.103 DATA\_REPRESENTATION

A list of data representations and compression methods supported by a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608).

### Modules

- **Compression Settings**

<<**extension**>> (p. 817) *Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.*

### Data Structures

- struct **DDS\_DataRepresentationIdSeq**

*Declares IDL sequence < DDS\_DataRepresentationId\_t (p. 1058) >*

- struct **DDS\_DataRepresentationQosPolicy**

*This QoS policy contains a list of representation identifiers and compression settings used by DDS\_DataWriter (p. 478) and DDS\_DataReader (p. 608) entities to negotiate which data representation and compression settings to use.*

### Typedefs

- typedef **DDS\_Short DDS\_DataRepresentationId\_t**

*A two-byte signed integer that identifies a data representation.*

## Variables

- const **DDS\_DataRepresentationId\_t DDS\_XCDR\_DATA\_REPRESENTATION**  
*Corresponds to the Extended Common Data Representation encoding version 1.*
- const **DDS\_DataRepresentationId\_t DDS\_XML\_DATA\_REPRESENTATION**  
*Corresponds to the XML Data Representation (unsupported).*
- const **DDS\_DataRepresentationId\_t DDS\_XCDR2\_DATA\_REPRESENTATION**  
*Corresponds to the Extended Common Data Representation encoding version 2.*
- const **DDS\_DataRepresentationId\_t DDS\_AUTO\_DATA\_REPRESENTATION**  
*Representation is automatically chosen based on the type.*
- const char \*const **DDS\_DATA\_REPRESENTATION\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DataRepresentationQosPolicy** (p. 1412).*

### 4.103.1 Detailed Description

A list of data representations and compression methods supported by a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608).

### 4.103.2 Typedef Documentation

#### 4.103.2.1 DDS\_DataRepresentationId\_t

```
typedef DDS_Short DDS_DataRepresentationId_t
```

A two-byte signed integer that identifies a data representation.

### 4.103.3 Variable Documentation

#### 4.103.3.1 DDS\_XCDR\_DATA\_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XCDR_DATA_REPRESENTATION [extern]
```

Corresponds to the Extended Common Data Representation encoding version 1.

### 4.103.3.2 DDS\_XML\_DATA\_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XML_DATA_REPRESENTATION [extern]
```

Corresponds to the XML Data Representation (unsupported).

#### Note

This value is currently not supported.

### 4.103.3.3 DDS\_XCDR2\_DATA\_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_XCDR2_DATA_REPRESENTATION [extern]
```

Corresponds to the Extended Common Data Representation encoding version 2.

### 4.103.3.4 DDS\_AUTO\_DATA\_REPRESENTATION

```
const DDS_DataRepresentationId_t DDS_AUTO_DATA_REPRESENTATION [extern]
```

Representation is automatically chosen based on the type.

For plain language binding, if the `allowed_data_representation` annotation is not specified or if it contains the value XCDR, RTI Connexx translates this field to **DDS\_XCDR\_DATA\_REPRESENTATION** (p. 1058). Otherwise, it translates this field to **DDS\_XCDR2\_DATA\_REPRESENTATION** (p. 1059).

For the **FlatData language binding** (p.205), RTI Connexx translates this field to **DDS\_XCDR2\_DATA\_↔ REPRESENTATION** (p. 1059).

#### Examples

```
HelloWorldPlugin.c.
```

### 4.103.3.5 DDS\_DATA\_REPRESENTATION\_QOS\_POLICY\_NAME

```
const char* const DDS_DATA_REPRESENTATION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DataRepresentationQosPolicy** (p. 1412).

## 4.104 Compression Settings

<<*extension*>> (p. 817) Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.

### Data Structures

- struct **DDS\_CompressionSettings\_t**  
<<*extension*>> (p. 817) Settings related to compressing user data.

### Macros

- #define **DDS\_COMPRESSION\_ID\_MASK\_NONE** (( **DDS\_CompressionIdMask**) (0))  
<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) used to disable user-data compression for an endpoint.
- #define **DDS\_COMPRESSION\_ID\_MASK\_ALL**  
<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) mask with all the supported built-in compression algorithms enabled.
- #define **DDS\_COMPRESSION\_LEVEL\_BEST\_COMPRESSION** (10)  
<<*extension*>> (p. 817) The best compression ratio possible for a compression algorithm.
- #define **DDS\_COMPRESSION\_LEVEL\_BEST\_SPEED** (1)  
<<*extension*>> (p. 817) The best compression speed possible for a compression algorithm.
- #define **DDS\_COMPRESSION\_LEVEL\_DEFAULT DDS\_COMPRESSION\_LEVEL\_BEST\_COMPRESSION**  
<<*extension*>> (p. 817) Default level of compression.
- #define **DDS\_COMPRESSION\_THRESHOLD\_DEFAULT** 8192  
<<*extension*>> (p. 817) Default threshold from which a serialized sample will be eligible to be compressed.
- #define **DDS\_COMPRESSION\_ID\_MASK\_PUBLICATION\_DEFAULT DDS\_COMPRESSION\_ID\_MASK\_↔ NONE**  
<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) mask with the default value for publication.
- #define **DDS\_COMPRESSION\_ID\_MASK\_SUBSCRIPTION\_DEFAULT**  
<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) mask with the default value for subscription.

### Typedefs

- typedef **DDS\_UnsignedLong DDS\_CompressionId\_t**  
<<*extension*>> (p. 817) A four-byte signed integer that identifies a single compression algorithm.
- typedef **DDS\_UnsignedLong DDS\_CompressionIdMask**  
<<*extension*>> (p. 817) A four-byte signed integer that identifies a mask of the compression IDs that the algorithms enabled.

### Variables

- const **DDS\_CompressionId\_t DDS\_COMPRESSION\_ID\_ZLIB**  
<<*extension*>> (p. 817) Corresponds to the ID of the compression algorithm ZLIB. This is the only built-in compression algorithm that is supported when batching is enabled.
- const **DDS\_CompressionId\_t DDS\_COMPRESSION\_ID\_BZIP2**  
<<*extension*>> (p. 817) Corresponds to the ID of the compression algorithm BZIP2.
- const **DDS\_CompressionId\_t DDS\_COMPRESSION\_ID\_LZ4**  
<<*extension*>> (p. 817) Corresponds to the ID of the compression algorithm LZ4.

### 4.104.1 Detailed Description

<<*extension*>> (p. 817) Compression settings that can be applied to data that is sent and received by DataWriters and DataReaders.

### 4.104.2 Macro Definition Documentation

#### 4.104.2.1 DDS\_COMPRESSION\_ID\_MASK\_NONE

```
#define DDS_COMPRESSION_ID_MASK_NONE (( DDS_CompressionIdMask) (0))
```

<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) used to disable user-data compression for an endpoint.

#### 4.104.2.2 DDS\_COMPRESSION\_ID\_MASK\_ALL

```
#define DDS_COMPRESSION_ID_MASK_ALL
```

**Value:**

```
((DDS_CompressionIdMask) \  
 (DDS_COMPRESSION_ID_ZLIB_BIT | DDS_COMPRESSION_ID_BZIP2_BIT \  
 | DDS_COMPRESSION_ID_LZ4_BIT))
```

<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) mask with all the supported built-in compression algorithms enabled.

#### 4.104.2.3 DDS\_COMPRESSION\_LEVEL\_BEST\_COMPRESSION

```
#define DDS_COMPRESSION_LEVEL_BEST_COMPRESSION (10)
```

<<*extension*>> (p. 817) The best compression ratio possible for a compression algorithm.

See also

**DDS\_CompressionSettings\_t::writer\_compression\_level** (p. 1349)

#### 4.104.2.4 DDS\_COMPRESSION\_LEVEL\_BEST\_SPEED

```
#define DDS_COMPRESSION_LEVEL_BEST_SPEED (1)
```

<<*extension*>> (p. 817) The best compression speed possible for a compression algorithm.

See also

**DDS\_CompressionSettings\_t::writer\_compression\_level** (p. 1349)

#### 4.104.2.5 DDS\_COMPRESSION\_LEVEL\_DEFAULT

```
#define DDS_COMPRESSION_LEVEL_DEFAULT DDS_COMPRESSION_LEVEL_BEST_COMPRESSION
```

<<*extension*>> (p. 817) Default level of compression.

See also

**DDS\_CompressionSettings\_t::writer\_compression\_level** (p. 1349)

#### 4.104.2.6 DDS\_COMPRESSION\_THRESHOLD\_DEFAULT

```
#define DDS_COMPRESSION_THRESHOLD_DEFAULT 8192
```

<<*extension*>> (p. 817) Default threshold from which a serialized sample will be eligible to be compressed.

See also

**DDS\_CompressionSettings\_t::writer\_compression\_threshold** (p. 1350)

This value has been decided after some performance tests, it's a prudent value that will ensure, in most cases with all of the algorithms, that we are going to compress the sample.

#### 4.104.2.7 DDS\_COMPRESSION\_ID\_MASK\_PUBLICATION\_DEFAULT

```
#define DDS_COMPRESSION_ID_MASK_PUBLICATION_DEFAULT DDS_COMPRESSION_ID_MASK_NONE
```

<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) mask with the default value for publication.

See also

**DDS\_CompressionSettings\_t::compression\_ids** (p. 1349)

**DDS\_COMPRESSION\_ID\_MASK\_SUBSCRIPTION\_DEFAULT** (p. 1062)

### 4.104.2.8 DDS\_COMPRESSION\_ID\_MASK\_SUBSCRIPTION\_DEFAULT

```
#define DDS_COMPRESSION_ID_MASK_SUBSCRIPTION_DEFAULT
```

**Value:**

```
(DDS_COMPRESSION_ID_ZLIB_BIT | DDS_COMPRESSION_ID_BZIP2_BIT \  
 | DDS_COMPRESSION_ID_LZ4_BIT)
```

<<*extension*>> (p. 817) **DDS\_CompressionIdMask** (p. 1063) mask with the default value for subscription.

**DDS\_CompressionSettings\_t::compression\_ids** (p. 1349)

**DDS\_COMPRESSION\_ID\_MASK\_PUBLICATION\_DEFAULT** (p. 1062)

## 4.104.3 Typedef Documentation

### 4.104.3.1 DDS\_CompressionId\_t

```
typedef DDS_UnsignedLong DDS_CompressionId_t
```

<<*extension*>> (p. 817) A four-byte signed integer that identifies a single compression algorithm.

### 4.104.3.2 DDS\_CompressionIdMask

```
typedef DDS_UnsignedLong DDS_CompressionIdMask
```

<<*extension*>> (p. 817) A four-byte signed integer that identifies a mask of the compression IDs that the algorithms enabled.

## 4.104.4 Variable Documentation

### 4.104.4.1 DDS\_COMPRESSION\_ID\_ZLIB

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_ZLIB [extern]
```

<<*extension*>> (p. 817) Corresponds to the ID of the compression algorithm ZLIB. This is the only built-in compression algorithm that is supported when batching is enabled.

#### 4.104.4.2 DDS\_COMPRESSION\_ID\_BZIP2

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_BZIP2 [extern]
```

<<*extension*>> (p. 817) Corresponds to the ID of the compression algorithm BZIP2.

#### 4.104.4.3 DDS\_COMPRESSION\_ID\_LZ4

```
const DDS_CompressionId_t DDS_COMPRESSION_ID_LZ4 [extern]
```

<<*extension*>> (p. 817) Corresponds to the ID of the compression algorithm LZ4.

### 4.105 DATA\_TAG

Stores (name, value) pairs that can be used to determine access permissions.

#### Data Structures

- struct **DDS\_Tag**  
*Tags are name/value pair objects.*
- struct **DDS\_TagSeq**  
*Declares IDL sequence < DDS\_Tag (p. 1762) >*
- struct **DDS\_DataTags**  
*Definition of DDS\_DataTagQosPolicy (p. 1065).*

#### Typedefs

- typedef struct **DDS\_DataTags DDS\_DataTagQosPolicy**  
*Stores (name, value) pairs that can be used to determine access permissions.*

#### Functions

- struct **DDS\_Tag \* DDS\_DataTagQosPolicyHelper\_lookup\_tag** (const **DDS\_DataTagQosPolicy** \*policy, const char \*name)  
*Searches by tag name for a tag in the input policy.*
- **DDS\_ReturnCode\_t DDS\_DataTagQosPolicyHelper\_assert\_tag** ( **DDS\_DataTagQosPolicy** \*policy, const char \*name, const char \*value)  
*Asserts the tag identified by name in the input policy.*
- **DDS\_ReturnCode\_t DDS\_DataTagQosPolicyHelper\_add\_tag** ( **DDS\_DataTagQosPolicy** \*policy, const char \*name, const char \*value)  
*Adds a new tag to the input policy.*
- **DDS\_ReturnCode\_t DDS\_DataTagQosPolicyHelper\_remove\_tag** ( **DDS\_DataTagQosPolicy** \*policy, const char \*name)  
*Removes a tag from the input policy.*
- **DDS\_Long DDS\_DataTagQosPolicyHelper\_get\_number\_of\_tags** (const **DDS\_DataTagQosPolicy** \*policy)  
*Gets the number of data tags in the input policy.*

## Variables

- const char \*const **DDS\_DATATAG\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DataTagQosPolicy** (p. 1065).*

### 4.105.1 Detailed Description

Stores (name, value) pairs that can be used to determine access permissions.

The **DDS\_DataTagQosPolicy** (p. 1065) can be used to associate a set of tags in the form of (name, value) pairs with a **DDS\_DataReader** (p. 608) or **DDS\_DataWriter** (p. 478). This is similar to the **DDS\_PropertyQosPolicy** (p. 1645), except you cannot select whether or not a particular pair should be propagated (included in the built-in topic). Data tags are always propagated. The Access Control plugin may use the tags to determine publish and subscribe permissions.

### 4.105.2 Typedef Documentation

#### 4.105.2.1 DDS\_DataTagQosPolicy

```
typedef struct DDS_DataTags DDS_DataTagQosPolicy
```

Stores (name, value) pairs that can be used to determine access permissions.

Entity:

**DDS\_DataReader** (p. 608) **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A;  
**Changeable** (p. 1048) = **NO** (p. 1048)

### 4.105.3 Usage

The DATA\_TAG QoS policy can be used to associate a set of tags in the form of (name, value) pairs with a **DDS\_DataReader** (p. 608) or **DDS\_DataWriter** (p. 478). This is similar to the **DDS\_PropertyQosPolicy** (p. 1645), except for the following differences:

- Data tags are always propagated. You cannot select whether or not a particular pair should be propagated.
- Data tags are not exposed to API functions, such as **DDS\_DataWriter\_get\_matched\_subscription\_data** (p. 533), that receive **DDS\_PublicationBuiltinTopicData** (p. 1648) or **DDS\_SubscriptionBuiltinTopicData** (p. 1748) as a parameter.
- Connex passes data tags to the Access Control Security Plugin, which may use them to decide whether to allow or deny the corresponding entities.

There are helper functions to facilitate working with data tags. See the **DATA\_TAG** (p. 1064) page.

## 4.105.4 Function Documentation

### 4.105.4.1 DDS\_DataTagQosPolicyHelper\_lookup\_tag()

```
struct DDS_Tag * DDS_DataTagQosPolicyHelper_lookup_tag (
    const DDS_DataTagQosPolicy * policy,
    const char * name )
```

Searches by tag name for a tag in the input policy.

#### Precondition

policy, name and value cannot be NULL.

#### Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Tag name.

#### Returns

The function returns the first tag with the given name. If such a tag does not exist, the function returns NULL.

### 4.105.4.2 DDS\_DataTagQosPolicyHelper\_assert\_tag()

```
DDS_ReturnCode_t DDS_DataTagQosPolicyHelper_assert_tag (
    DDS_DataTagQosPolicy * policy,
    const char * name,
    const char * value )
```

Asserts the tag identified by name in the input policy.

If the tag already exists, this function replaces its current value with the new one.

If the tag identified by name does not exist, this function adds it to the tag set.

This function increases the maximum number of elements of the policy sequence by 10 when this number is not enough to store the new tag.

#### Precondition

policy, name and value cannot be NULL.

## Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Tag name.
<i>value</i>	<< <i>in</i> >> (p. 818) Tag value.

## Returns

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025)

## 4.105.4.3 DDS\_DataTagQosPolicyHelper\_add\_tag()

```
DDS_ReturnCode_t DDS_DataTagQosPolicyHelper_add_tag (
    DDS_DataTagQosPolicy * policy,
    const char * name,
    const char * value )
```

Adds a new tag to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connex.

If the maximum number of elements of the policy sequence is not enough to store the new tag, this function will increase it by 10.

If the tag already exists, the function will fail with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

## Precondition

policy, name and value cannot be NULL.

The tag is not in the policy.

## Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Tag name.
<i>value</i>	<< <i>in</i> >> (p. 818) Tag value.

## Returns

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025), **DDS←  
\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025)

#### 4.105.4.4 DDS\_DataTagQosPolicyHelper\_remove\_tag()

```
DDS_ReturnCode_t DDS_DataTagQosPolicyHelper_remove_tag (
    DDS_DataTagQosPolicy * policy,
    const char * name )
```

Removes a tag from the input policy.

If the tag does not exist, the function fails with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

##### Precondition

policy and name cannot be NULL.

The tag is in the policy.

##### Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Tag name.

##### Returns

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025)

#### 4.105.4.5 DDS\_DataTagQosPolicyHelper\_get\_number\_of\_tags()

```
DDS_Long DDS_DataTagQosPolicyHelper_get_number_of_tags (
    const DDS_DataTagQosPolicy * policy )
```

Gets the number of data tags in the input policy.

##### Precondition

policy cannot be NULL.

##### Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
---------------	----------------------------------------

##### Returns

Number of data tags.

### 4.105.5 Variable Documentation

#### 4.105.5.1 DDS\_DATATAG\_QOS\_POLICY\_NAME

```
const char* const DDS_DATATAG_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DataTagQosPolicy** (p. 1065).

## 4.106 DATA\_WRITER\_PROTOCOL

<<*extension*>> (p. 817) Along with **DDS\_WireProtocolQosPolicy** (p. 1827) and **DDS\_DataReaderProtocolQosPolicy** (p. 1375), this QoS policy configures the DDS on-the-network protocol (RTPS).

### Data Structures

- struct **DDS\_DataWriterProtocolQosPolicy**  
*Protocol that applies only to **DDS\_DataWriter** (p. 478) instances.*

### Variables

- const char \*const **DDS\_DATAWRITERPROTOCOL\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DataWriterProtocolQosPolicy** (p. 1422).*

### 4.106.1 Detailed Description

<<*extension*>> (p. 817) Along with **DDS\_WireProtocolQosPolicy** (p. 1827) and **DDS\_DataReaderProtocolQosPolicy** (p. 1375), this QoS policy configures the DDS on-the-network protocol (RTPS).

### 4.106.2 Variable Documentation

#### 4.106.2.1 DDS\_DATAWRITERPROTOCOL\_QOS\_POLICY\_NAME

```
const char* const DDS_DATAWRITERPROTOCOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DataWriterProtocolQosPolicy** (p. 1422).

## 4.107 DATA\_WRITER\_RESOURCE\_LIMITS

<<*extension*>> (p. 817) Various settings that configure how a **DDS\_DataWriter** (p. 478) allocates and uses physical memory for internal resources.

### Data Structures

- struct **DDS\_DataWriterResourceLimitsQosPolicy**

*Various settings that configure how a **DDS\_DataWriter** (p. 478) allocates and uses physical memory for internal resources.*

### Enumerations

- enum **DDS\_DataWriterResourceLimitsInstanceReplacementKind** {  
  **DDS\_UNREGISTERED\_INSTANCE\_REPLACEMENT** ,  
  **DDS\_ALIVE\_INSTANCE\_REPLACEMENT** ,  
  **DDS\_DISPOSED\_INSTANCE\_REPLACEMENT** ,  
  **DDS\_ALIVE\_THEN\_DISPOSED\_INSTANCE\_REPLACEMENT** ,  
  **DDS\_DISPOSED\_THEN\_ALIVE\_INSTANCE\_REPLACEMENT** ,  
  **DDS\_ALIVE\_OR\_DISPOSED\_INSTANCE\_REPLACEMENT** }

*Sets the kinds of instances that can be replaced when instance resource limits are reached.*

### Variables

- const char \*const **DDS\_DATAWRITERRESOURCELIMITS\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_DataWriterResourceLimitsQosPolicy** (p. 1446).*

#### 4.107.1 Detailed Description

<<*extension*>> (p. 817) Various settings that configure how a **DDS\_DataWriter** (p. 478) allocates and uses physical memory for internal resources.

#### 4.107.2 Enumeration Type Documentation

### 4.107.2.1 DDS\_DataWriterResourceLimitsInstanceReplacementKind

enum **DDS\_DataWriterResourceLimitsInstanceReplacementKind**

Sets the kinds of instances that can be replaced when instance resource limits are reached.

When **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693) is reached, a **DDS\_DataWriter** (p. 478) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kind specified by **DDS\_DataWriterResourceLimitsQosPolicy::instance\_replacement** (p. 1449).

Only instances whose states match the specified kinds are eligible to be replaced. In addition, an instance must have had all of its samples fully acknowledged for it to be considered replaceable.

For all kinds, a **DDS\_DataWriter** (p. 478) will replace the oldest instance satisfying that kind. For example, when the kind is **DDS\_UNREGISTERED\_INSTANCE\_REPLACEMENT** (p. 1071), a **DDS\_DataWriter** (p. 478) will remove the oldest, fully acknowledged, unregistered instance, if such an instance exists.

If no replaceable instance exists, the invoked function will either return with an appropriate out-of-resources return code, or in the case of a write, it may first block to wait for an instance to be acknowledged. Otherwise, the **DDS\_DataWriter** (p. 478) will replace the old instance with the new instance, and invoke, if available, the **DDS\_DataWriterListener::on\_↔\_instance\_replaced** (p. 1420) to notify the user about an instance being replaced.

A **DDS\_DataWriter** (p. 478) checks for replaceable instances in the following order, stopping once a replaceable instance is found:

- If **DDS\_DataWriterResourceLimitsQosPolicy::replace\_empty\_instances** (p. 1449) is **DDS\_BOOLEAN\_↔\_TRUE** (p. 1004), a **DDS\_DataWriter** (p. 478) first tries replacing instances that have no samples. These empty instances can be unregistered, disposed, or alive.
- Next, a **DDS\_DataWriter** (p. 478) tries replacing unregistered instances. Since an unregistered instance indicates that the **DDS\_DataWriter** (p. 478) is done modifying it, unregistered instances are replaced before instances of any other state (alive, disposed). This is the same as the **DDS\_UNREGISTERED\_INSTANCE\_REPLACEMENT** (p. 1071) kind.
- Then, a **DDS\_DataWriter** (p. 478) tries replacing what is specified by **DDS\_DataWriterResourceLimitsQos\_↔\_Policy::instance\_replacement** (p. 1449). With unregistered instances already checked, this leaves alive and disposed instances. When both alive and disposed instances may be replaced, the kind specifies whether the particular order matters (e.g., **DISPOSED\_THEN\_ALIVE**, **ALIVE\_THEN\_DISPOSED**) or not (**ALIVE\_OR\_DISPOSED**).

QoS:

**DDS\_DataWriterResourceLimitsQosPolicy** (p. 1446)

Enumerator

DDS_UNREGISTERED_INSTANCE_REPLACEMENT	Allows a <b>DDS_DataWriter</b> (p. 478) to reclaim unregistered acknowledged instances. By default, all instance replacement kinds first attempt to reclaim an unregistered, acknowledged instance. Used in <b>DDS_DataWriterResourceLimitsQosPolicy_↔_::instance_replacement</b> (p. 1449) <b>[default]</b>
---------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Enumerator

DDS_ALIVE_INSTANCE_REPLACEMENT	Allows a <b>DDS_DataWriter</b> (p. 478) to reclaim alive, acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a <b>DDS_DataWriter</b> (p. 478) to reclaim an alive, acknowledged instance, where an alive instance is a registered, non-disposed instance. The least recently registered or written alive instance will be reclaimed.
DDS_DISPOSED_INSTANCE_REPLACEMENT	Allows a <b>DDS_DataWriter</b> (p. 478) to reclaim disposed acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a <b>DDS_DataWriter</b> (p. 478) to reclaim a disposed, acknowledged instance. The least recently disposed instance will be reclaimed.
DDS_ALIVE_THEN_DISPOSED_INSTANCE_↔ REPLACEMENT	Allows a <b>DDS_DataWriter</b> (p. 478) first to reclaim an alive, acknowledged instance, and then, if necessary, a disposed, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a <b>DDS_DataWriter</b> (p. 478) to first try reclaiming an alive, acknowledged instance. If no instance is reclaimable, then it tries reclaiming a disposed, acknowledged instance. The least recently used (i.e., registered, written, or disposed) instance will be reclaimed.
DDS_DISPOSED_THEN_ALIVE_INSTANCE_↔ REPLACEMENT	Allows a <b>DDS_DataWriter</b> (p. 478) first to reclaim a disposed, acknowledged instance, and then, if necessary, an alive, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a <b>DDS_DataWriter</b> (p. 478) to first try reclaiming a disposed, acknowledged instance. If no instance is reclaimable, then it tries reclaiming an alive, acknowledged instance. The least recently used (i.e., disposed, registered, or written) instance will be reclaimed.
DDS_ALIVE_OR_DISPOSED_INSTANCE_↔ REPLACEMENT	Allows a <b>DDS_DataWriter</b> (p. 478) to reclaim either an alive acknowledged instance or a disposed acknowledged instance. When an unregistered acknowledged instance is not available to reclaim, this kind allows a <b>DDS_DataWriter</b> (p. 478) to reclaim either an alive, acknowledged instance or a disposed, acknowledged instance. If both instance kinds are available to reclaim, the <b>DDS_DataWriter</b> (p. 478) will reclaim the least recently used (i.e. disposed, registered, or written) instance.

## 4.107.3 Variable Documentation

### 4.107.3.1 DDS\_DATAWRITERRESOURCELIMITS\_QOS\_POLICY\_NAME

```
const char* const DDS_DATAWRITERRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DataWriterResourceLimitsQosPolicy** (p. 1446).

## 4.108 DATA\_WRITER\_TRANSFER\_MODE

<<*extension*>> (p. 817) Specifies the DataWriter transfer mode QoS.

### Data Structures

- struct **DDS\_DataWriterShmemRefTransferModeSettings**  
*Settings related to transferring data using shared memory references.*
- struct **DDS\_DataWriterTransferModeQosPolicy**  
<<*extension*>> (p. 817) *Qos related to transferring data*

### Variables

- const char \*const **DDS\_DATAWRITERTRANSFERMODE\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DataWriterTransferModeQosPolicy** (p. 1454).*

### 4.108.1 Detailed Description

<<*extension*>> (p. 817) Specifies the DataWriter transfer mode QoS.

### 4.108.2 Variable Documentation

#### 4.108.2.1 DDS\_DATAWRITERTRANSFERMODE\_QOS\_POLICY\_NAME

```
const char* const DDS_DATAWRITERTRANSFERMODE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DataWriterTransferModeQosPolicy** (p. 1454).

## 4.109 DEADLINE

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

## Data Structures

- struct **DDS\_DeadlineQosPolicy**  
*Expresses the maximum duration (deadline) within which an instance is expected to be updated.*

## Variables

- const char \*const **DDS\_DEADLINE\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DeadlineQosPolicy** (p. 1455).*

### 4.109.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

### 4.109.2 Variable Documentation

#### 4.109.2.1 DDS\_DEADLINE\_QOS\_POLICY\_NAME

```
const char* const DDS_DEADLINE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DeadlineQosPolicy** (p. 1455).

## 4.110 DESTINATION\_ORDER

Controls the criteria used to determine the logical order among changes made by **DDS\_Publisher** (p. 436) entities to the same instance of data (i.e., matching **DDS\_Topic** (p. 172) and key).

## Data Structures

- struct **DDS\_DestinationOrderQosPolicy**  
*Controls how the middleware will deal with data sent by multiple **DDS\_DataWriter** (p. 478) entities for the same instance of data (i.e., same **DDS\_Topic** (p. 172) and key).*

## Enumerations

- enum **DDS\_DestinationOrderQosPolicyKind** {  
**DDS\_BY\_RECEPTION\_TIMESTAMP\_DESTINATIONORDER\_QOS** ,  
**DDS\_BY\_SOURCE\_TIMESTAMP\_DESTINATIONORDER\_QOS** }
- Kinds of destination order.*
- enum **DDS\_DestinationOrderQosPolicyScopeKind** {  
**DDS\_INSTANCE\_SCOPE\_DESTINATIONORDER\_QOS** ,  
**DDS\_TOPIC\_SCOPE\_DESTINATIONORDER\_QOS** }
- Scope of source destination order.*

## Variables

- const char \*const **DDS\_DESTINATIONORDER\_QOS\_POLICY\_NAME**  
Stringified human-readable name for *DDS\_DestinationOrderQosPolicy* (p. 1457).

### 4.110.1 Detailed Description

Controls the criteria used to determine the logical order among changes made by **DDS\_Publisher** (p. 436) entities to the same instance of data (i.e., matching **DDS\_Topic** (p. 172) and key).

### 4.110.2 Enumeration Type Documentation

#### 4.110.2.1 DDS\_DestinationOrderQosPolicyKind

enum **DDS\_DestinationOrderQosPolicyKind**

Kinds of destination order.

QoS:

**DDS\_DestinationOrderQosPolicy** (p. 1457)

Enumerator

<p>DDS_BY_RECEPTION_TIMESTAMP_↔ DESTINATIONORDER_QOS</p>	<p><b>[default]</b> Indicates that data is ordered based on the reception time at each <b>DDS_Subscriber</b> (p. 565). Since each subscriber may receive the data at different times there is no guarantee that the changes will be seen in the same order. Consequently, it is possible for each subscriber to end up with a different final value for the data.</p>
<p>DDS_BY_SOURCE_TIMESTAMP_↔ DESTINATIONORDER_QOS</p>	<p>Indicates that data is ordered based on a time-stamp placed at the source (by RTI Connex or by the application). In any case this guarantees a consistent final value for the data in all subscribers.</p> <p>Note: If Batching is needed along with <b>DDS_BY_↔ SOURCE_TIMESTAMP_DESTINATIONORDER_QOS</b> (p. 1075) and <b>DDS_INSTANCE_SCOPE_↔ DESTINATIONORDER_QOS</b> (p. 1076), then the <b>DDS_BatchQosPolicy::source_timestamp_↔ resolution</b> (p. 1336) and <b>DDS_BatchQosPolicy::thread_safe_write</b> (p. 1337) setting of <b>DDS_BatchQosPolicy</b> (p. 1334) should be set to <b>DDS_DURATION_ZERO</b> (p. 1012) and <b>DDS_BOOLEAN_TRUE</b> (p. 1004) respectively.</p>

### 4.110.2.2 DDS\_DestinationOrderQosPolicyScopeKind

enum `DDS_DestinationOrderQosPolicyScopeKind`

Scope of source destination order.

QoS:

`DDS_DestinationOrderQosPolicy` (p. 1457)

Enumerator

<code>DDS_INSTANCE_SCOPE_DESTINATIONORDER_↔ QOS</code>	<p><b>[default]</b> Indicates that data is ordered on a per instance basis if used along with <code>DDS_BY_SOURCE_↔ _TIMESTAMP_DESTINATIONORDER_QOS</code> (p. 1075). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same instance. The tolerance check is also applied per instance.</p>
<code>DDS_TOPIC_SCOPE_DESTINATIONORDER_QOS</code>	<p>Indicates that data is ordered on a per topic basis if used along with <code>DDS_BY_SOURCE_TIMESTAMP_↔ DESTINATIONORDER_QOS</code> (p. 1075). The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same topic. The tolerance check is also applied per topic.</p>

### 4.110.3 Variable Documentation

#### 4.110.3.1 DDS\_DESTINATIONORDER\_QOS\_POLICY\_NAME

const char\* const `DDS_DESTINATIONORDER_QOS_POLICY_NAME` [extern]

Stringified human-readable name for `DDS_DestinationOrderQosPolicy` (p. 1457).

## 4.111 DISCOVERY

<<*extension*>> (p. 817) Specifies the attributes required to discover participants in the domain.

## Modules

- **NDDS\_DISCOVERY\_PEERS**

Environment variable or a file that specifies the default values of **DDS\_DiscoveryQosPolicy::initial\_peers** (p. 1480) and **DDS\_DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481) contained in the **DDS\_DomainParticipantQos::discovery** (p. 1492) qos policy.

## Data Structures

- struct **DDS\_DiscoveryQosPolicy**

<<**extension**>> (p. 817) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

## Variables

- const char \*const **DDS\_DISCOVERY\_QOS\_POLICY\_NAME**

Stringified human-readable name for **DDS\_DiscoveryQosPolicy** (p. 1479).

### 4.111.1 Detailed Description

<<**extension**>> (p. 817) Specifies the attributes required to discover participants in the domain.

### 4.111.2 Variable Documentation

#### 4.111.2.1 DDS\_DISCOVERY\_QOS\_POLICY\_NAME

```
const char* const DDS_DISCOVERY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DiscoveryQosPolicy** (p. 1479).

## 4.112 DISCOVERY\_CONFIG

<<**extension**>> (p. 817) Specifies the discovery configuration QoS.

## Data Structures

- struct **DDS\_BuiltinTopicReaderResourceLimits\_t**

Built-in topic reader's resource limits.

- struct **DDS\_DiscoveryConfigQosPolicy**

Settings for discovery configuration.

## Macros

- **#define DDS\_DISCOVERYCONFIG\_BUILTIN\_PLUGIN\_MASK\_NONE**  
*No bits are set.*
- **#define DDS\_DISCOVERYCONFIG\_BUILTIN\_PLUGIN\_MASK\_DEFAULT**  
*The default value of `DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins` (p. 1469).*
- **#define DDS\_DISCOVERYCONFIG\_BUILTIN\_CHANNEL\_MASK\_NONE**  
*No bits are set, indicating that all channels that can be disabled, are disabled. Not all builtin channels can be disabled by the user. Only builtin channels represented by `DDS_DiscoveryConfigBuiltinChannelKind` (p. 1082) are able to be enabled or disabled by the user.*
- **#define DDS\_DISCOVERYCONFIG\_BUILTIN\_CHANNEL\_MASK\_DEFAULT** (( `DDS_DiscoveryConfigBuiltinChannelKindMask`) `DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL`)  
*The default value of `DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels` (p. 1469).*
- **#define DDS\_DISCOVERYCONFIG\_BUILTIN\_CHANNEL\_MASK\_ALL**  
*All bits are set, indicating that all channels are enabled.*

## Typedefs

- **typedef DDS\_Long DDS\_DiscoveryConfigBuiltinPluginKindMask**  
*A bit-mask (list) of built-in discovery plugins.*
- **typedef DDS\_UnsignedLong DDS\_DiscoveryConfigBuiltinChannelKindMask**  
*A bit-mask (list) of built-in channels.*

## Enumerations

- **enum DDS\_DiscoveryConfigBuiltinPluginKind** {  
`DDS_DISCOVERYCONFIG_BUILTIN_SPDP` ,  
`DDS_DISCOVERYCONFIG_BUILTIN_SEDP` ,  
`DDS_DISCOVERYCONFIG_BUILTIN_SDP` ,  
`DDS_DISCOVERYCONFIG_BUILTIN_EDS = 0x0001 << 2` ,  
`DDS_DISCOVERYCONFIG_BUILTIN_DPSE` ,  
`DDS_DISCOVERYCONFIG_BUILTIN_SPDP2` ,  
`DDS_DISCOVERYCONFIG_BUILTIN_SDP2` }  
*Built-in discovery plugins that can be used.*

## Variables

- **const char \*const DDS\_DISCOVERYCONFIG\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for `DDS_DiscoveryConfigQosPolicy` (p. 1460).*

### 4.112.1 Detailed Description

<<*extension*>> (p. 817) Specifies the discovery configuration QoS.

### 4.112.2 Macro Definition Documentation

#### 4.112.2.1 DDS\_DISCOVERYCONFIG\_BUILTIN\_PLUGIN\_MASK\_NONE

```
#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_NONE
```

No bits are set.

See also

**DDS\_DiscoveryConfigBuiltinPluginKindMask** (p. 1080)

#### 4.112.2.2 DDS\_DISCOVERYCONFIG\_BUILTIN\_PLUGIN\_MASK\_DEFAULT

```
#define DDS_DISCOVERYCONFIG_BUILTIN_PLUGIN_MASK_DEFAULT
```

The default value of **DDS\_DiscoveryConfigQosPolicy::builtin\_discovery\_plugins** (p. 1469).

See also

**DDS\_DiscoveryConfigBuiltinPluginKindMask** (p. 1080)

#### 4.112.2.3 DDS\_DISCOVERYCONFIG\_BUILTIN\_CHANNEL\_MASK\_NONE

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_NONE
```

No bits are set, indicating that all channels that can be disabled, are disabled. Not all builtin channels can be disabled by the user. Only builtin channels represented by **DDS\_DiscoveryConfigBuiltinChannelKind** (p. 1082) are able to be enabled or disabled by the user.

See also

**DDS\_DiscoveryConfigBuiltinChannelKindMask** (p. 1080)

#### 4.112.2.4 DDS\_DISCOVERYCONFIG\_BUILTIN\_CHANNEL\_MASK\_DEFAULT

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_DEFAULT (( DDS_DiscoveryConfigBuiltinChannelKindMask) DDS_DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL)
```

The default value of `DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels` (p. 1469).

See also

`DDS_DiscoveryConfigBuiltinChannelKindMask` (p. 1080)

#### 4.112.2.5 DDS\_DISCOVERYCONFIG\_BUILTIN\_CHANNEL\_MASK\_ALL

```
#define DDS_DISCOVERYCONFIG_BUILTIN_CHANNEL_MASK_ALL
```

All bits are set, indicating that all channels are enabled.

See also

`DDS_DiscoveryConfigBuiltinChannelKindMask` (p. 1080)

### 4.112.3 Typedef Documentation

#### 4.112.3.1 DDS\_DiscoveryConfigBuiltinPluginKindMask

```
typedef DDS_Long DDS_DiscoveryConfigBuiltinPluginKindMask
```

A bit-mask (list) of built-in discovery plugins.

The bit-mask is an efficient and compact representation of a fixed-length list of `DDS_DiscoveryConfigBuiltinPluginKind` (p. 1081) values.

QoS:

`DDS_DiscoveryConfigQosPolicy` (p. 1460)

### 4.112.3.2 DDS\_DiscoveryConfigBuiltinChannelKindMask

```
typedef DDS_UnsignedLong DDS_DiscoveryConfigBuiltinChannelKindMask
```

A bit-mask (list) of built-in channels.

The bit-mask is an efficient and compact representation of a fixed-length list of **DDS\_DiscoveryConfigBuiltinChannelKind** (p. 1082) values.

QoS:

**DDS\_DiscoveryConfigQosPolicy** (p. 1460)

## 4.112.4 Enumeration Type Documentation

### 4.112.4.1 DDS\_DiscoveryConfigBuiltinPluginKind

```
enum DDS_DiscoveryConfigBuiltinPluginKind
```

Built-in discovery plugins that can be used.

See also

**DDS\_DiscoveryConfigBuiltinPluginKindMask** (p. 1080)

Enumerator

DDS_DISCOVERYCONFIG_BUILTIN_SPDP	Simple Participant Discovery Protocol. Enables the first phase of the Simple Discovery Protocol (SDP), in which DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant declaration messages, also known as participant DATA submessages or participant announcements.
DDS_DISCOVERYCONFIG_BUILTIN_SEDP	Simple Endpoint Discovery Protocol. Enables the second phase of the Simple Discovery Protocol (SDP), in which the information (GUID, QoS, etc.) about your application's DataReaders and DataWriters is exchanged by sending publication/subscription declarations in DATA messages, also known as publication DATAs and subscription DATAs.
DDS_DISCOVERYCONFIG_BUILTIN_SDP	<b>[default]</b> Simple discovery plugin. It is equivalent to SPDP + SEDP.

## Enumerator

DDS_DISCOVERYCONFIG_BUILTIN_DPSE	Dynamic Participant discovery, Static Endpoint discovery. Enables static endpoint discovery for a DomainParticipant. In this type of discovery, information from remote endpoints is extracted from a local DDS-XML file instead of being received over the network, reducing the number of exchanged packets and consequently reducing bandwidth consumption used for discovery. Using this value in <b>DDS_DiscoveryConfigBuiltinPluginKindMask</b> (p. 1080) requires the 'librtlibedisc' library (included in the RTI Connex Professional bundles) to be reachable (PATH, LD_LIBRARY_PATH or DYLD_LIBRARY_PATH).
DDS_DISCOVERYCONFIG_BUILTIN_SPDP2	Simple Participant Discovery Protocol 2.0 (SPDP2) Enables the Simple Participant Discovery Protocol 2.0, in which a DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant bootstrap messages. These bootstrap messages contain only a subset of the information in the Simple Participant Discovery Protocol (SPDP) participant announcements that is required to match two participants and bootstrap the system. The DomainParticipant's full configuration is then sent reliably with participant configuration announcements. Two DomainParticipants that use SPDP2 will maintain liveliness using liveliness participant messages.
DDS_DISCOVERYCONFIG_BUILTIN_SDP2	Simple discovery plugin 2.0. It is equivalent to SPDP2 + SEDP.

## 4.112.4.2 DDS\_DiscoveryConfigBuiltinChannelKind

```
enum DDS_DiscoveryConfigBuiltinChannelKind
```

Built-in channels that can be enabled.

See also

**DDS\_DiscoveryConfigBuiltinChannelKindMask** (p. 1080)

## Enumerator

DDS_DISCOVERYCONFIG_SERVICE_REQUEST_↔ CHANNEL	<b>[default]</b> Built-in ServiceRequest channel. Enables the ServiceRequest channel, which is required by the TopicQuery and locator reachability features. Disabling the ServiceRequest channel reduces resource consumption including network bandwidth, CPU utilization, and memory.
--------------------------------------------------	------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## 4.112.4.3 DDS\_RemoteParticipantPurgeKind

enum **DDS\_RemoteParticipantPurgeKind**

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

When discovery communication with a remote participant has been lost, the local participant must make a decision about whether to continue attempting to communicate with that participant and its contained entities. This "kind" is used to select the desired behavior.

This "kind" does not pertain to the situation in which a remote participant has been gracefully deleted and notification of that deletion have been successfully received by its peers. In that case, the local participant will immediately stop attempting to communicate with those entities and will remove the associated remote entity records from its internal database.

See also

**DDS\_DiscoveryConfigQosPolicy::remote\_participant\_purge\_kind** (p. 1463)

Enumerator

<p>DDS_LIVELINESS_BASED_REMOTE_↔ PARTICIPANT_PURGE</p>	<p><b>[default]</b> Maintain knowledge of the remote participant for as long as it maintains its liveliness contract. A participant will continue attempting communication with its peers, even if discovery communication with them is lost, as long as the remote participants maintain their liveliness. If both discovery communication and participant liveliness are lost, however, the local participant will remove all records of the remote participant and its contained endpoints, and no further data communication with them will occur until and unless they are rediscovered.</p> <p>The liveliness contract a participant promises to its peers – its "liveliness lease duration" – is specified in its <b>DDS_DiscoveryConfigQosPolicy::participant_↔ liveliness_lease_duration</b> (p. 1462) QoS field. It maintains that contract by writing data to those other participants with a writer that has a <b>DDS_LivelinessQosPolicyKind</b> (p. 1097) of <b>DDS_AUTOMATIC_LIVELINESS_QOS</b> (p. 1098) or <b>DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_↔ QOS</b> (p. 1098) and by asserting itself (at the <b>DDS_DiscoveryConfigQosPolicy::participant_↔ liveliness_assert_period</b> (p. 1463)) over the Simple Discovery Protocol.</p>
------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Enumerator

DDS_NO_REMOTE_PARTICIPANT_PURGE	<p>Never "forget" a remote participant with which discovery communication has been lost. If a participant with this behavior loses discovery communication with a remote participant, it will nevertheless remember that remote participant and its endpoints and continue attempting to communicate with them indefinitely.</p> <p>This value has consequences for a participant's resource usage. If discovery communication with a remote participant is lost, but the same participant is later rediscovered, any relevant records that remain in the database will be reused. However, if it is not rediscovered, the records will continue to take up space in the database for as long as the local participant remains in existence.</p>
---------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

#### 4.112.5 Variable Documentation

##### 4.112.5.1 DDS\_DISCOVERYCONFIG\_QOS\_POLICY\_NAME

```
const char* const DDS_DISCOVERYCONFIG_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DiscoveryConfigQosPolicy** (p. 1460).

#### 4.113 DOMAIN\_PARTICIPANT\_RESOURCE\_LIMITS

<<*extension*>> (p. 817) Various settings that configure how a **DDS\_DomainParticipant** (p. 72) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

#### Data Structures

- struct **DDS\_AllocationSettings\_t**  
*Resource allocation settings.*
- struct **DDS\_DomainParticipantResourceLimitsQosPolicy**  
*Various settings that configure how a **DDS\_DomainParticipant** (p. 72) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.*

#### Enumerations

- enum **DDS\_DomainParticipantResourceLimitsIgnoredEntityReplacementKind** {  
**DDS\_NO\_REPLACEMENT\_IGNORED\_ENTITY\_REPLACEMENT** ,  
**DDS\_NOT\_ALIVE\_FIRST\_IGNORED\_ENTITY\_REPLACEMENT** }  
*Available replacement policies for the ignored entities.*

## Variables

- const **DDS\_Long DDS\_AUTO\_COUNT**  
A special value indicating a quantity that is derived from another QoS value.
- const char \*const **DDS\_DOMAINPARTICIPANTRESOURCELIMITS\_QOS\_POLICY\_NAME**  
Stringified human-readable name for *DDS\_DomainParticipantResourceLimitsQosPolicy* (p. 1494).

### 4.113.1 Detailed Description

<<*extension*>> (p. 817) Various settings that configure how a **DDS\_DomainParticipant** (p. 72) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

### 4.113.2 Enumeration Type Documentation

#### 4.113.2.1 DDS\_DomainParticipantResourceLimitsIgnoredEntityReplacementKind

```
enum DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind
```

Available replacement policies for the ignored entities.

QoS:

**DDS\_DomainParticipantResourceLimitsQosPolicy** (p. 1494)

Enumerator

DDS_NO_REPLACEMENT_IGNORED_ENTITY_↔ REPLACEMENT	Default value for ignored_entity_replacement_kind, no replacement is done, the ignore will fail if the ignored_entity table is full.
DDS_NOT_ALIVE_FIRST_IGNORED_ENTITY_↔ REPLACEMENT	If the ignored_entity table is full and if there is at least one ignored participant in the table, the participant record that has been not updated for the longest time will be replaced. Note that if the table is full and there are no participant records to replace, the ignore will fail.

### 4.113.3 Variable Documentation

### 4.113.3.1 DDS\_AUTO\_COUNT

```
const DDS_Long DDS_AUTO_COUNT [extern]
```

A special value indicating a quantity that is derived from another QoS value.

### 4.113.3.2 DDS\_DOMAINPARTICIPANTRESOURCELIMITS\_QOS\_POLICY\_NAME

```
const char* const DDS_DOMAINPARTICIPANTRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DomainParticipantResourceLimitsQosPolicy** (p. 1494).

## 4.114 DURABILITY

This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDS\_DataReader** (p. 608) entities that join the network later.

### Data Structures

- struct **DDS\_PersistentStorageSettings**  
*Configures durable writer history and durable reader state.*
- struct **DDS\_DurabilityQosPolicy**  
*This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDS\_DataReader** (p. 608) entities that join the network later.*

### Enumerations

- enum **DDS\_PersistentJournalKind** {  
**DDS\_DELETE\_PERSISTENT\_JOURNAL** ,  
**DDS\_TRUNCATE\_PERSISTENT\_JOURNAL** ,  
**DDS\_PERSIST\_PERSISTENT\_JOURNAL** ,  
**DDS\_MEMORY\_PERSISTENT\_JOURNAL** ,  
**DDS\_WAL\_PERSISTENT\_JOURNAL** ,  
**DDS\_OFF\_PERSISTENT\_JOURNAL** }  
*Sets the journal mode of the persistent storage.*
- enum **DDS\_PersistentSynchronizationKind** {  
**DDS\_NORMAL\_PERSISTENT\_SYNCHRONIZATION** ,  
**DDS\_FULL\_PERSISTENT\_SYNCHRONIZATION** ,  
**DDS\_OFF\_PERSISTENT\_SYNCHRONIZATION** }  
*Determines the level of synchronization with the physical disk.*
- enum **DDS\_DurabilityQosPolicyKind** {  
**DDS\_VOLATILE\_DURABILITY\_QOS** ,  
**DDS\_TRANSIENT\_LOCAL\_DURABILITY\_QOS** ,  
**DDS\_TRANSIENT\_DURABILITY\_QOS** ,  
**DDS\_PERSISTENT\_DURABILITY\_QOS** }  
*Kinds of durability.*

## Variables

- const char \*const **DDS\_DURABILITY\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_DurabilityQosPolicy** (p. 1516).*
- const **DDS\_Long DDS\_AUTO\_WRITER\_DEPTH**  
*A special value used as the default value for **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518).*

### 4.114.1 Detailed Description

This QoS policy specifies whether or not RTI Connexx will store and deliver previously published data samples to new **DDS\_DataReader** (p. 608) entities that join the network later.

### 4.114.2 Enumeration Type Documentation

#### 4.114.2.1 DDS\_PersistentJournalKind

enum **DDS\_PersistentJournalKind**

Sets the journal mode of the persistent storage.

The rollback journal is used in SQLite to store the state of the persistent storage before a transaction is committed.

QoS:

**DDS\_DurabilityQosPolicy** (p. 1516)

Enumerator

DDS_DELETE_PERSISTENT_JOURNAL	Deletes the rollback journal at the conclusion of each transaction.
DDS_TRUNCATE_PERSISTENT_JOURNAL	Commits transactions by truncating the rollback journal to zero-length instead of deleting it.
DDS_PERSIST_PERSISTENT_JOURNAL	Prevents the rollback journal from being deleted at the end of each transaction. Instead, the header of the journal is overwritten with zeros.
DDS_MEMORY_PERSISTENT_JOURNAL	Stores the rollback journal in volatile RAM. This saves disk I/O.
DDS_WAL_PERSISTENT_JOURNAL	Uses a write-ahead log instead of a rollback journal to implement transactions.
DDS_OFF_PERSISTENT_JOURNAL	Completely disables the rollback journal. If the application crashes in the middle of a transaction when the OFF journaling mode is set, the persistent storage will very likely be corrupted.

#### 4.114.2.2 DDS\_PersistentSynchronizationKind

enum `DDS_PersistentSynchronizationKind`

Determines the level of synchronization with the physical disk.

QoS:

**DDS\_DurabilityQosPolicy** (p. 1516)

Enumerator

DDS_NORMAL_PERSISTENT_SYNCHRONIZATION	Data (e.g., new sample) is written to disk at critical moments.
DDS_FULL_PERSISTENT_SYNCHRONIZATION	Data (e.g., new sample) is written to physical disk immediately.
DDS_OFF_PERSISTENT_SYNCHRONIZATION	No synchronization is enforced. Data will be written to physical disk when the operating system flushes its buffers.

#### 4.114.2.3 DDS\_DurabilityQosPolicyKind

enum `DDS_DurabilityQosPolicyKind`

Kinds of durability.

QoS:

**DDS\_DurabilityQosPolicy** (p. 1516)

Enumerator

DDS_VOLATILE_DURABILITY_QOS	<p><b>[default]</b> RTI Connexx does not need to keep any samples of data instances on behalf of any <b>DDS_DataReader</b> (p. 608) that is unknown by the <b>DDS_DataWriter</b> (p. 478) at the time the instance is written. In other words, RTI Connexx will only attempt to provide the data to existing subscribers.</p> <p>This option does not require RTI Persistence Service.</p>
-----------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Enumerator

DDS_TRANSIENT_LOCAL_DURABILITY_QOS	<p>RTI Connex will attempt to keep some samples so that they can be delivered to any potential late-joining <b>DDS_DataReader</b> (p. 608). Which particular samples are kept depends on other QoS such as <b>DDS_HistoryQosPolicy</b> (p. 1558) and <b>DDS_ResourceLimitsQosPolicy</b> (p. 1690). RTI Connex is only required to keep the data in memory of the <b>DDS_DataWriter</b> (p. 478) that wrote the data. Data is not required to survive the <b>DDS_DataWriter</b> (p. 478).</p> <p>For this setting to be effective, you must also set the <b>DDS_ReliabilityQosPolicy::kind</b> (p. 1681) to <b>DDS_RELIABLE_RELIABILITY_QOS</b> (p. 1124). This option does not require RTI Persistence Service.</p>
DDS_TRANSIENT_DURABILITY_QOS	<p>RTI Connex will attempt to keep some samples so that they can be delivered to any potential late-joining <b>DDS_DataReader</b> (p. 608). Which particular samples are kept depends on other QoS such as <b>DDS_HistoryQosPolicy</b> (p. 1558) and <b>DDS_ResourceLimitsQosPolicy</b> (p. 1690). RTI Connex is only required to keep the data in memory and not in permanent storage.</p> <p>Data is not tied to the lifecycle of the <b>DDS_DataWriter</b> (p. 478). Data will survive the <b>DDS_DataWriter</b> (p. 478).</p> <p>This option requires RTI Persistence Service.</p>
DDS_PERSISTENT_DURABILITY_QOS	<p>Data is kept on permanent storage, so that they can outlive a system session. This option requires RTI Persistence Service.</p>

### 4.114.3 Variable Documentation

#### 4.114.3.1 DDS\_DURABILITY\_QOS\_POLICY\_NAME

```
const char* const DDS_DURABILITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DurabilityQosPolicy** (p. 1516).

#### 4.114.3.2 DDS\_AUTO\_WRITER\_DEPTH

```
const DDS_Long DDS_AUTO_WRITER_DEPTH [extern]
```

A special value used as the default value for **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518).

This values resolves to the following:

- **DDS\_HistoryQosPolicy::depth** (p. 1560) if the history kind is **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094).
- **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693) in the **DDS\_ResourceLimitsQosPolicy** (p. 1690) if the history kind is **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094).

## 4.115 DURABILITY\_SERVICE

Various settings to configure the external *RTI Persistence Service* used by RTI Connex for DataWriters with a **DDS\_↔ DurabilityQosPolicy** (p. 1516) setting of **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_↔ DURABILITY\_QOS** (p. 1089).

### Data Structures

- struct **DDS\_DurabilityServiceQosPolicy**

*Various settings to configure the external RTI Persistence Service used by RTI Connex for DataWriters with a **DDS\_↔ DurabilityQosPolicy** (p. 1516) setting of **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_↔ DURABILITY\_QOS** (p. 1089).*

### Variables

- const char \*const **DDS\_DURABILITYSERVICE\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_DurabilityServiceQosPolicy** (p. 1519).*

#### 4.115.1 Detailed Description

Various settings to configure the external *RTI Persistence Service* used by RTI Connex for DataWriters with a **DDS\_↔ DurabilityQosPolicy** (p. 1516) setting of **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_↔ DURABILITY\_QOS** (p. 1089).

#### 4.115.2 Variable Documentation

##### 4.115.2.1 DDS\_DURABILITYSERVICE\_QOS\_POLICY\_NAME

```
const char* const DDS_DURABILITYSERVICE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_DurabilityServiceQosPolicy** (p. 1519).

## 4.116 ENTITY\_FACTORY

A QoS policy for all **DDS\_Entity** (p. 1160) types that can act as factories for one or more other **DDS\_Entity** (p. 1160) types.

## Data Structures

- struct **DDS\_EntityFactoryQosPolicy**

*A QoS policy for all **DDS\_Entity** (p. 1160) types that can act as factories for one or more other **DDS\_Entity** (p. 1160) types.*

## Variables

- const char \*const **DDS\_ENTITYFACTORY\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_EntityFactoryQosPolicy** (p. 1543).*

### 4.116.1 Detailed Description

A QoS policy for all **DDS\_Entity** (p. 1160) types that can act as factories for one or more other **DDS\_Entity** (p. 1160) types.

### 4.116.2 Variable Documentation

#### 4.116.2.1 DDS\_ENTITYFACTORY\_QOS\_POLICY\_NAME

```
const char* const DDS_ENTITYFACTORY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_EntityFactoryQosPolicy** (p. 1543).

## 4.117 ENTITY\_NAME

<<*extension*>> (p. 817) Assigns a name to a **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), **DDS\_↔Subscriber** (p. 565), **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). Except for **DDS\_Publisher** (p. 436) and **DDS\_Subscriber** (p. 565), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

## Data Structures

- struct **DDS\_EntityNameQosPolicy**

*Assigns a name and a role name to a **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565), **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). Except for **DDS\_Publisher** (p. 436) and **DDS\_↔Subscriber** (p. 565), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.*

## Variables

- const char \*const **DDS\_ENTITYNAME\_QOS\_POLICY\_NAME**  
Stringified human-readable name for *DDS\_EntityNameQosPolicy* (p. 1545).

### 4.117.1 Detailed Description

<<*extension*>> (p. 817) Assigns a name to a **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), **DDS\_↔Subscriber** (p. 565), **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). Except for **DDS\_Publisher** (p. 436) and **DDS\_Subscriber** (p. 565), these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

### 4.117.2 Variable Documentation

#### 4.117.2.1 DDS\_ENTITYNAME\_QOS\_POLICY\_NAME

```
const char* const DDS_ENTITYNAME_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_EntityNameQosPolicy** (p. 1545).

## 4.118 EVENT

<<*extension*>> (p. 817) Configures the internal thread in a DomainParticipant that handles timed events.

### Data Structures

- struct **DDS\_EventQosPolicy**  
*Settings for event.*

## Variables

- const char \*const **DDS\_EVENT\_QOS\_POLICY\_NAME**  
Stringified human-readable name for *DDS\_EventQosPolicy* (p. 1547).

### 4.118.1 Detailed Description

<<*extension*>> (p. 817) Configures the internal thread in a DomainParticipant that handles timed events.

## 4.118.2 Variable Documentation

### 4.118.2.1 DDS\_EVENT\_QOS\_POLICY\_NAME

```
const char* const DDS_EVENT_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_EventQosPolicy** (p. 1547).

## 4.119 HISTORY

Specifies the behavior of RTI Connex in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

### Data Structures

- struct **DDS\_HistoryQosPolicy**

*Specifies the behavior of RTI Connex in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.*

### Enumerations

- enum **DDS\_HistoryQosPolicyKind** {  
    **DDS\_KEEP\_LAST\_HISTORY\_QOS** ,  
    **DDS\_KEEP\_ALL\_HISTORY\_QOS** }

*Kinds of history.*

### Variables

- const char \*const **DDS\_HISTORY\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_HistoryQosPolicy** (p. 1558).*

## 4.119.1 Detailed Description

Specifies the behavior of RTI Connex in the case where the value of an instance changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

## 4.119.2 Enumeration Type Documentation

### 4.119.2.1 DDS\_HistoryQosPolicyKind

```
enum DDS_HistoryQosPolicyKind
```

Kinds of history.

QoS:

**DDS\_HistoryQosPolicy** (p. 1558)

## Enumerator

DDS_KEEP_LAST_HISTORY_QOS	<p><b>[default]</b> Keep the last <code>depth</code> samples. On the publishing side, RTI Connexx will only attempt to keep the most recent <code>depth</code> samples of each instance of data (identified by its key) managed by the <b>DDS_DataWriter</b> (p. 478). Invalid samples representing a disposal or unregistration of an instance count towards the depth and may replace other DDS samples currently in the DataWriter queue for the same instance.</p> <p>On the subscribing side, the <b>DDS_DataReader</b> (p. 608) will only attempt to keep the most recent <code>depth</code> samples received for each instance (identified by its key) until the application takes them via the <b>DDS_DataReader</b> (p. 608) 's <b>take()</b> operation.</p> <p>Invalid samples representing a disposal or unregistration of an instance do not count towards the history depth and will not replace other DDS samples currently in the DataReader queue for the same instance.</p>
DDS_KEEP_ALL_HISTORY_QOS	<p>Keep <i>all</i> the samples. On the publishing side, RTI Connexx will attempt to keep all samples (representing each value written) of each instance of data (identified by its key) managed by the <b>DDS_DataWriter</b> (p. 478) until they can be delivered to all subscribers.</p> <p>On the subscribing side, RTI Connexx will attempt to keep all samples of each instance of data (identified by its key) managed by the <b>DDS_DataReader</b> (p. 608). These samples are kept until the application takes them from RTI Connexx via the <b>take()</b> operation.</p>

### 4.119.3 Variable Documentation

#### 4.119.3.1 DDS\_HISTORY\_QOS\_POLICY\_NAME

```
const char* const DDS_HISTORY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_HistoryQosPolicy** (p. 1558).

## 4.120 GROUP\_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

### Data Structures

- struct **DDS\_GroupDataQosPolicy**

*Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.*

## Variables

- const char \*const **DDS\_GROUPDATA\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_GroupDataQosPolicy** (p. 1556).*

### 4.120.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

### 4.120.2 Variable Documentation

#### 4.120.2.1 DDS\_GROUPDATA\_QOS\_POLICY\_NAME

```
const char* const DDS_GROUPDATA_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_GroupDataQosPolicy** (p. 1556).

## 4.121 LATENCY\_BUDGET

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

## Data Structures

- struct **DDS\_LatencyBudgetQosPolicy**  
*Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.*

## Variables

- const char \*const **DDS\_LATENCYBUDGET\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_LatencyBudgetQosPolicy** (p. 1566).*

### 4.121.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

## 4.121.2 Variable Documentation

### 4.121.2.1 DDS\_LATENCYBUDGET\_QOS\_POLICY\_NAME

```
const char* const DDS_LATENCYBUDGET_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_LatencyBudgetQosPolicy** (p. 1566).

## 4.122 LIFESPAN

Specifies how long the data written by the **DDS\_DataWriter** (p. 478) is considered valid.

### Data Structures

- struct **DDS\_LifespanQosPolicy**

*Specifies how long the data written by the **DDS\_DataWriter** (p. 478) is considered valid.*

### Variables

- const char \*const **DDS\_LIFESPAN\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_LifespanQosPolicy** (p. 1567).*

### 4.122.1 Detailed Description

Specifies how long the data written by the **DDS\_DataWriter** (p. 478) is considered valid.

## 4.122.2 Variable Documentation

### 4.122.2.1 DDS\_LIFESPAN\_QOS\_POLICY\_NAME

```
const char* const DDS_LIFESPAN_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_LifespanQosPolicy** (p. 1567).

## 4.123 LIVELINESS

Specifies and configures the mechanism that allows **DDS\_DataReader** (p. 608) entities to detect when **DDS\_DataWriter** (p. 478) entities become disconnected or "dead".

### Data Structures

- struct **DDS\_LivelinessQosPolicy**

*Specifies and configures the mechanism that allows **DDS\_DataReader** (p. 608) entities to detect when **DDS\_DataWriter** (p. 478) entities become disconnected or "dead".*

### Enumerations

- enum **DDS\_LivelinessQosPolicyKind** {  
**DDS\_AUTOMATIC\_LIVELINESS\_QOS** ,  
**DDS\_MANUAL\_BY\_PARTICIPANT\_LIVELINESS\_QOS** ,  
**DDS\_MANUAL\_BY\_TOPIC\_LIVELINESS\_QOS** }

*Kinds of liveliness.*

### Variables

- const char \*const **DDS\_LIVELINESS\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_LivelinessQosPolicy** (p. 1575).*

#### 4.123.1 Detailed Description

Specifies and configures the mechanism that allows **DDS\_DataReader** (p. 608) entities to detect when **DDS\_DataWriter** (p. 478) entities become disconnected or "dead".

#### 4.123.2 Enumeration Type Documentation

##### 4.123.2.1 DDS\_LivelinessQosPolicyKind

```
enum DDS_LivelinessQosPolicyKind
```

*Kinds of liveliness.*

QoS:

**DDS\_LivelinessQosPolicy** (p. 1575)

## Enumerator

DDS_AUTOMATIC_LIVELINESS_QOS	<b>[default]</b> The infrastructure will automatically signal liveliness for the <b>DDS_DataWriter</b> (p. 478) (s) at least as often as required by the <b>DDS_DataWriter</b> (p. 478) (S) <code>lease_duration</code> . A <b>DDS_DataWriter</b> (p. 478) with this setting does not need to take any specific action in order to be considered 'alive.' The <b>DDS_DataWriter</b> (p. 478) is only 'not alive' when the participant to which it belongs terminates (gracefully or not), or when there is a network problem that prevents the current participant from contacting that remote participant.
DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS	RTI Connext will assume that as long as at least one <b>DDS_DataWriter</b> (p. 478) belonging to the <b>DDS_DomainParticipant</b> (p. 72) (or the <b>DDS_DomainParticipant</b> (p. 72) itself) has asserted its liveliness, then the other DataWriters belonging to that same <b>DDS_DomainParticipant</b> (p. 72) are also alive. The user application takes responsibility to signal liveliness to RTI Connext either by calling <b>DDS_DomainParticipant_assert_liveliness</b> (p. 133), or by calling <b>DDS_DataWriter_assert_liveliness</b> (p. 531), or <b>FooDataWriter_write</b> (p. 489) on any <b>DDS_DataWriter</b> (p. 478) belonging to the <b>DDS_DomainParticipant</b> (p. 72).
DDS_MANUAL_BY_TOPIC_LIVELINESS_QOS	RTI Connext will only assume liveliness of the <b>DDS_DataWriter</b> (p. 478) if the application has asserted liveliness of that <b>DDS_DataWriter</b> (p. 478) itself. The user application takes responsibility to signal liveliness to RTI Connext using the <b>DDS_DataWriter_assert_liveliness</b> (p. 531) function, or by writing some data.

### 4.123.3 Variable Documentation

#### 4.123.3.1 DDS\_LIVELINESS\_QOS\_POLICY\_NAME

```
const char* const DDS_LIVELINESS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_LivelinessQosPolicy** (p. 1575).

## 4.124 LOCATORFILTER

<<*extension*>> (p. 817) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS\_PublicationBuiltinTopicData** (p. 1648).

## Data Structures

- struct **DDS\_LocatorFilter\_t**  
*Specifies the configuration of an individual channel within a MultiChannel DataWriter.*
- struct **DDS\_LocatorFilterSeq**  
*Declares IDL sequence < DDS\_LocatorFilter\_t (p. 1580) >.*
- struct **DDS\_LocatorFilterQosPolicy**  
*The QoS policy used to report the configuration of a MultiChannel DataWriter as part of DDS\_PublicationBuiltinTopicData (p. 1648).*

## Variables

- const char \*const **DDS\_LOCATORFILTER\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for DDS\_LocatorFilterQosPolicy (p. 1581).*

### 4.124.1 Detailed Description

<<*extension*>> (p. 817) The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS\_PublicationBuiltinTopicData** (p. 1648).

### 4.124.2 Variable Documentation

#### 4.124.2.1 DDS\_LOCATORFILTER\_QOS\_POLICY\_NAME

```
const char* const DDS_LOCATORFILTER_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_LocatorFilterQosPolicy** (p. 1581).

## 4.125 LOGGING

<<*extension*>> (p. 817) Configures the RTI Connex logging facility.

## Data Structures

- struct **DDS\_LoggingQosPolicy**  
*Configures the RTI Connex logging facility.*

### 4.125.1 Detailed Description

<<*extension*>> (p. 817) Configures the RTI Connex logging facility.

## 4.126 MONITORING

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

### Data Structures

- struct **DDS\_MonitoringDedicatedParticipantSettings**  
*Configures the use of a dedicated **DDS\_DomainParticipant** (p. 72) to distribute the RTI Connex application telemetry data.*
- struct **DDS\_MonitoringEventDistributionSettings**  
*Configures the distribution of event metrics.*
- struct **DDS\_MonitoringPeriodicDistributionSettings**  
*Configures the distribution of periodic metrics.*
- struct **DDS\_MonitoringLoggingDistributionSettings**  
*Configures the distribution of log messages.*
- struct **DDS\_MonitoringDistributionSettings**  
*Configures the distribution of telemetry data.*
- struct **DDS\_MonitoringMetricSelection**  
*This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.*
- struct **DDS\_MonitoringMetricSelectionSeq**  
*Declares IDL sequence < **DDS\_MonitoringMetricSelection** (p. 1597) >*
- struct **DDS\_MonitoringLoggingForwardingSettings**  
*Configures the forwarding levels of log messages for the different **NDDS\_Config\_LogFacility** (p. 1243).*
- struct **DDS\_MonitoringTelemetryData**  
*Configures the telemetry data that will be distributed.*
- struct **DDS\_MonitoringQosPolicy**  
*Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.*

### Variables

- const char \*const **DDS\_MONITORING\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_MonitoringQosPolicy** (p. 1601).*

### 4.126.1 Detailed Description

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI Connex telemetry data.

## 4.126.2 Variable Documentation

### 4.126.2.1 DDS\_MONITORING\_QOS\_POLICY\_NAME

```
const char* const DDS_MONITORING_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_MonitoringQosPolicy** (p. 1601).

## 4.127 MULTICHANNEL

<<*extension*>> (p. 817) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

### Data Structures

- struct **DDS\_ChannelSettings\_t**  
*Type used to configure the properties of a channel.*
- struct **DDS\_ChannelSettingsSeq**  
*Declares IDL sequence< DDS\_ChannelSettings\_t (p. 1344) >*
- struct **DDS\_MultiChannelQosPolicy**  
*Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.*

### Variables

- const char \*const **DDS\_MULTICHANNEL\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for DDS\_MultiChannelQosPolicy (p. 1603).*

### 4.127.1 Detailed Description

<<*extension*>> (p. 817) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

### 4.127.2 Variable Documentation

#### 4.127.2.1 DDS\_MULTICHANNEL\_QOS\_POLICY\_NAME

```
const char* const DDS_MULTICHANNEL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_MultiChannelQosPolicy** (p. 1603).

## 4.128 OWNERSHIP

Specifies whether it is allowed for multiple **DDS\_DataWriter** (p. 478) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

### Data Structures

- struct **DDS\_OwnershipQosPolicy**

*Specifies whether it is allowed for multiple **DDS\_DataWriter** (p. 478) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.*

### Enumerations

- enum **DDS\_OwnershipQosPolicyKind** {  
    **DDS\_SHARED\_OWNERSHIP\_QOS** ,  
    **DDS\_EXCLUSIVE\_OWNERSHIP\_QOS** }

*Kinds of ownership.*

### Variables

- const char \*const **DDS\_OWNERSHIP\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_OwnershipQosPolicy** (p. 1610).*

#### 4.128.1 Detailed Description

Specifies whether it is allowed for multiple **DDS\_DataWriter** (p. 478) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

#### 4.128.2 Enumeration Type Documentation

##### 4.128.2.1 DDS\_OwnershipQosPolicyKind

```
enum DDS_OwnershipQosPolicyKind
```

Kinds of ownership.

QoS:

**DDS\_OwnershipQosPolicy** (p. 1610)

## Enumerator

DDS_SHARED_OWNERSHIP_QOS	<b>[default]</b> Indicates shared ownership for each instance. Multiple writers are allowed to update the same instance and all the updates are made available to the readers. In other words there is no concept of an owner for the instances. This is the <b>default</b> behavior if the <b>OWNERSHIP</b> (p. 1102) policy is not specified or supported.
DDS_EXCLUSIVE_OWNERSHIP_QOS	Indicates each instance can only be owned by one <b>DDS_DataWriter</b> (p. 478), but the owner of an instance can change dynamically. The selection of the owner is controlled by the setting of the <b>OWNERSHIP_STRENGTH</b> (p. 1103) policy. The owner is always set to be the highest-strength <b>DDS_DataWriter</b> (p. 478) object among the ones currently active (as determined by the <b>LIVELINESS</b> (p. 1097)).

### 4.128.3 Variable Documentation

#### 4.128.3.1 DDS\_OWNERSHIP\_QOS\_POLICY\_NAME

```
const char* const DDS_OWNERSHIP_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_OwnershipQosPolicy** (p. 1610).

## 4.129 OWNERSHIP\_STRENGTH

Specifies the value of the strength used to arbitrate among multiple **DDS\_DataWriter** (p. 478) objects that attempt to modify the same instance of a data type (identified by **DDS\_Topic** (p. 172) + key).

### Data Structures

- struct **DDS\_OwnershipStrengthQosPolicy**

*Specifies the value of the strength used to arbitrate among multiple **DDS\_DataWriter** (p. 478) objects that attempt to modify the same instance of a data type (identified by **DDS\_Topic** (p. 172) + key).*

### Variables

- const char \*const **DDS\_OWNERSHIPSTRENGTH\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_OwnershipStrengthQosPolicy** (p. 1615).*

### 4.129.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **DDS\_DataWriter** (p. 478) objects that attempt to modify the same instance of a data type (identified by **DDS\_Topic** (p. 172) + key).

### 4.129.2 Variable Documentation

#### 4.129.2.1 DDS\_OWNERSHIPSTRENGTH\_QOS\_POLICY\_NAME

```
const char* const DDS_OWNERSHIPSTRENGTH_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_OwnershipStrengthQosPolicy** (p. 1615).

## 4.130 PARTITION

Set of strings that introduces logical partitions in **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), or **DDS\_↔\_Subscriber** (p. 565) entities.

### Data Structures

- struct **DDS\_PartitionQosPolicy**

*Set of strings that introduces logical partitions in **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), or **DDS\_↔\_Subscriber** (p. 565) entities.*

### Variables

- const char \*const **DDS\_PARTITION\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_PartitionQosPolicy** (p. 1627).*

### 4.130.1 Detailed Description

Set of strings that introduces logical partitions in **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), or **DDS\_↔\_Subscriber** (p. 565) entities.

### 4.130.2 Variable Documentation

#### 4.130.2.1 DDS\_PARTITION\_QOS\_POLICY\_NAME

```
const char* const DDS_PARTITION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_PartitionQosPolicy** (p. 1627).

## 4.131 PRESENTATION

Specifies how the samples representing changes to data instances are presented to a subscribing application.

### Data Structures

- struct **DDS\_PresentationQosPolicy**

*Specifies how the samples representing changes to data instances are presented to a subscribing application.*

### Enumerations

- enum **DDS\_PresentationQosPolicyAccessScopeKind** {  
    **DDS\_INSTANCE\_PRESENTATION\_QOS** ,  
    **DDS\_TOPIC\_PRESENTATION\_QOS** ,  
    **DDS\_GROUP\_PRESENTATION\_QOS** ,  
    **DDS\_HIGHEST\_OFFERED\_PRESENTATION\_QOS** }

*Kinds of presentation "access scope".*

### Variables

- const char \*const **DDS\_PRESENTATION\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_PresentationQosPolicy** (p. 1634).*

#### 4.131.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

#### 4.131.2 Enumeration Type Documentation

##### 4.131.2.1 DDS\_PresentationQosPolicyAccessScopeKind

```
enum DDS_PresentationQosPolicyAccessScopeKind
```

Kinds of presentation "access scope".

Access scope determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

QoS:

**DDS\_PresentationQosPolicy** (p. 1634)

## Enumerator

DDS_INSTANCE_PRESENTATION_QOS	<b>[default]</b> Scope spans only a single instance. Indicates that changes to one instance need not be coherent nor ordered with respect to changes to any other instance. In other words, order and coherent changes apply to each instance separately.
DDS_TOPIC_PRESENTATION_QOS	Scope spans all instances within the same <b>DDS_DataWriter</b> (p. 478), but not across instances in different <b>DDS_DataWriter</b> (p. 478) entities.
DDS_GROUP_PRESENTATION_QOS	Scope spans all instances belonging to <b>DDS_DataWriter</b> (p. 478) entities within the same <b>DDS_Publisher</b> (p. 436).
DDS_HIGHEST_OFFERED_PRESENTATION_QOS	This value only applies to a <b>DDS_Subscriber</b> (p. 565). The <b>DDS_Subscriber</b> (p. 565) will use the access scope specified by each remote <b>DDS_Publisher</b> (p. 436).

### 4.131.3 Variable Documentation

#### 4.131.3.1 DDS\_PRESENTATION\_QOS\_POLICY\_NAME

```
const char* const DDS_PRESENTATION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_PresentationQosPolicy** (p. 1634).

## 4.132 PROFILE

<<*extension*>> (p. 817) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

### Data Structures

- struct **DDS\_ProfileQosPolicy**

*Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.*

### Variables

- const char \*const **DDS\_PROFILE\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_ProfileQosPolicy** (p. 1642).*

### 4.132.1 Detailed Description

<<*extension*>> (p. 817) Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

### 4.132.2 Variable Documentation

#### 4.132.2.1 DDS\_PROFILE\_QOS\_POLICY\_NAME

```
const char* const DDS_PROFILE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_ProfileQosPolicy** (p. 1642).

## 4.133 PROPERTY

<<*extension*>> (p. 817) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

### Data Structures

- struct **DDS\_Property\_t**  
*Properties are name/value pairs objects.*
- struct **DDS\_PropertySeq**  
*Declares IDL sequence < DDS\_Property\_t (p. 1644) >*
- struct **DDS\_PropertyQosPolicy**  
*Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.*

### Typedefs

- typedef struct **DDS\_PropertyQosPolicy DDS\_PropertyQosPolicy**  
*Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.*
- typedef enum **DDS\_PropertyQosPolicyMutability DDS\_PropertyQosPolicyMutability**  
*Determines if, and when, the value of a property can change.*

## Enumerations

- enum **DDS\_PropertyQosPolicyMutability** {  
**DDS\_PROPERTY\_QOS\_MUTABLE** ,  
**DDS\_PROPERTY\_QOS\_MUTABLE\_UNTIL\_ENABLE** ,  
**DDS\_PROPERTY\_QOS\_IMMUTABLE** }

*Determines if, and when, the value of a property can change.*

## Functions

- **DDS\_Long DDS\_PropertyQosPolicyHelper\_get\_number\_of\_properties** (const struct **DDS\_PropertyQosPolicy** \*policy)  
*Gets the number of properties in the input policy.*
- **DDS\_ReturnCode\_t DDS\_PropertyQosPolicyHelper\_assert\_property** (struct **DDS\_PropertyQosPolicy** \*policy, const char \*name, const char \*value, **DDS\_Boolean** propagate)  
*Asserts the property identified by name in the input policy.*
- **DDS\_ReturnCode\_t DDS\_PropertyQosPolicyHelper\_add\_property** (struct **DDS\_PropertyQosPolicy** \*policy, const char \*name, const char \*value, **DDS\_Boolean** propagate)  
*Adds a new property to the input policy.*
- **DDS\_ReturnCode\_t DDS\_PropertyQosPolicyHelper\_assert\_pointer\_property** (struct **DDS\_PropertyQosPolicy** \*policy, const char \*name, const void \*pointer)  
*Asserts the property identified by name in the input policy. Used when the property to store is a pointer.*
- **DDS\_ReturnCode\_t DDS\_PropertyQosPolicyHelper\_add\_pointer\_property** (struct **DDS\_PropertyQosPolicy** \*policy, const char \*name, const void \*pointer)  
*Adds a new property to the input policy. Used when the property to store is a pointer.*
- struct **DDS\_Property\_t** \* **DDS\_PropertyQosPolicyHelper\_lookup\_property** (const struct **DDS\_PropertyQosPolicy** \*policy, const char \*name)  
*Searches for a property in the input policy given its name.*
- struct **DDS\_Property\_t** \* **DDS\_PropertyQosPolicyHelper\_lookup\_property\_with\_prefix** (const struct **DDS\_PropertyQosPolicy** \*policy, const char \*prefix, const char \*name)  
*Searches for a property in the input policy given its prefix and name.*
- **DDS\_ReturnCode\_t DDS\_PropertyQosPolicyHelper\_remove\_property** (struct **DDS\_PropertyQosPolicy** \*policy, const char \*name)  
*Removes a property from the input policy.*
- **DDS\_ReturnCode\_t DDS\_PropertyQosPolicyHelper\_get\_properties** (const struct **DDS\_PropertyQosPolicy** \*policy, struct **DDS\_PropertySeq** \*properties, const char \*name\_prefix)  
*Retrieves a list of properties whose names match the input prefix.*
- **DDS\_ReturnCode\_t DDS\_PropertyQosPolicyHelper\_get\_properties\_into\_policy** (const struct **DDS\_PropertyQosPolicy** \*policy, struct **DDS\_PropertyQosPolicy** \*outPolicy, const char \*name\_prefix)  
*This function gets the properties from a policy with a given prefix and sets them into the properties of the output policy.*
- **DDS\_PropertyQosPolicyMutability DDS\_PropertyQosPolicyHelper\_get\_property\_mutability** (const char \*name, const struct **DDS\_PropertyQosPolicy** \*policy)  
*Returns the mutability type of a property.*

## Variables

- const char \*const **DDS\_PROPERTY\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_PropertyQosPolicy** (p. 1645).*

### 4.133.1 Detailed Description

<<*extension*>> (p. 817) Stores (name, value) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

RTI Connex will automatically set some system properties in the **DDS\_PropertyQosPolicy** (p. 1645) associated with a **DDS\_DomainParticipantQos** (p. 1490). See **System Properties** (p. 775) for additional details.

### 4.133.2 Typedef Documentation

#### 4.133.2.1 DDS\_PropertyQosPolicy

```
typedef struct DDS_PropertyQosPolicy DDS_PropertyQosPolicy
```

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

**DDS\_DomainParticipant** (p. 72) **DDS\_DataReader** (p. 608) **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A;

**Changeable** (p. 1048) = **YES** (p. 1048)

See also

**DDS\_DomainParticipant\_get\_builtin\_subscriber** (p. 126)

### 4.133.3 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478), or **DDS\_DomainParticipant** (p. 72). This is similar to the **DDS\_UserDataQosPolicy** (p. 1820), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the `Property Reference Guide`.

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 771)
- Durable Reader State, see **Configuring Durable Reader State** (p. 773)
- Builtin Transport Plugins, see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 848), **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 864), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 842)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 719)
- **Clock Selection** (p. 21)

In addition, you may add your own name/value pairs to the Property QoS policy of an Entity. Via this QoS policy, you can direct RTI Connex to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **DDS\_UserDataQoSPolicy** (p. 1820) or **DDS\_GroupDataQoSPolicy** (p. 1556)).

#### 4.133.3.1 Reasons for Using the PropertyQoSPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connex capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 1107) page.

#### 4.133.3.2 DDS\_PropertyQoSPolicyMutability

```
typedef enum DDS_PropertyQoSPolicyMutability DDS_PropertyQoSPolicyMutability
```

Determines if, and when, the value of a property can change.

#### 4.133.4 Enumeration Type Documentation

##### 4.133.4.1 DDS\_PropertyQoSPolicyMutability

```
enum DDS_PropertyQoSPolicyMutability
```

Determines if, and when, the value of a property can change.

## Enumerator

DDS_PROPERTY_QOS_MUTABLE	The property is mutable: it can be changed at any time.
DDS_PROPERTY_QOS_MUTABLE_UNTIL_ENABLE	The property can only be changed before enabling the entity.
DDS_PROPERTY_QOS_IMMUTABLE	The property is immutable: it can only be specified when creating the entity.

## 4.133.5 Function Documentation

### 4.133.5.1 DDS\_PropertyQosPolicyHelper\_get\_number\_of\_properties()

```
DDS_Long DDS_PropertyQosPolicyHelper_get_number_of_properties (
    const struct DDS_PropertyQosPolicy * policy )
```

Gets the number of properties in the input policy.

#### Precondition

policy cannot be NULL.

#### Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
---------------	----------------------------------------

#### Returns

Number of properties.

### 4.133.5.2 DDS\_PropertyQosPolicyHelper\_assert\_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_property (
    struct DDS_PropertyQosPolicy * policy,
    const char * name,
    const char * value,
    DDS_Boolean propagate )
```

Asserts the property identified by name in the input policy.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

**Precondition**

policy, name and value cannot be NULL.

**Parameters**

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Property name.
<i>value</i>	<< <i>in</i> >> (p. 818) Property value.
<i>propagate</i>	<< <i>in</i> >> (p. 818) Indicates if the property will be propagated on discovery.

**Returns**

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025)

**4.133.5.3 DDS\_PropertyQosPolicyHelper\_add\_property()**

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_property (
    struct DDS_PropertyQosPolicy * policy,
    const char * name,
    const char * value,
    DDS_Boolean propagate )
```

Adds a new property to the input policy.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connex.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

**Precondition**

policy, name and value cannot be NULL.

The property is not in the policy.

**Parameters**

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Property name.
<i>value</i>	<< <i>in</i> >> (p. 818) Property value.
<i>propagate</i>	<< <i>in</i> >> (p. 818) Indicates if the property will be propagated on discovery.

## Returns

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025), **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025)

## 4.133.5.4 DDS\_PropertyQosPolicyHelper\_assert\_pointer\_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_assert_pointer_property (
    struct DDS_PropertyQosPolicy * policy,
    const char * name,
    const void * pointer )
```

Asserts the property identified by name in the input policy. Used when the property to store is a pointer.

This is a function similar to **DDS\_PropertyQosPolicyHelper\_assert\_property** (p. 1111). However, instead of passing a stringified version of the pointer, this function receives a pointer as the value.

If the property already exists, this function replaces its current value with the new one.

If the property identified by name does not exist, this function adds it to the property set.

This function increases the maximum number of elements of the policy sequence when this number is not enough to store the new property.

The properties asserted by this function will not be propagated on discovery.

## Precondition

policy and name cannot be NULL.

## Parameters

<i>policy</i>	<< <b>in</b> >> (p. 818) Input policy.
<i>name</i>	<< <b>in</b> >> (p. 818) Property name.
<i>pointer</i>	<< <b>in</b> >> (p. 818) The pointer to store in the property.

## Returns

One of the **Standard Return Codes** (p. 1024) or **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

## 4.133.5.5 DDS\_PropertyQosPolicyHelper\_add\_pointer\_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_add_pointer_property (
    struct DDS_PropertyQosPolicy * policy,
```

```

const char * name,
const void * pointer )

```

Adds a new property to the input policy. Used when the property to store is a pointer.

This is a function similar to **DDS\_PropertyQosPolicyHelper\_add\_property** (p. 1112). However, instead of passing a stringified version of the pointer, this function receives a pointer as the value.

This function will allocate memory to store the (name, value) pair. The memory allocated is owned by RTI Connex.

If the maximum number of elements of the policy sequence is not enough to store the new property, this function will increase it.

If the property already exists the function fails with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

The properties added by this function will not be propagated on discovery.

#### Precondition

policy and name cannot be NULL.

The property is not in the policy.

#### Parameters

<i>policy</i>	<< <b>in</b> >> (p. 818) Input policy.
<i>name</i>	<< <b>in</b> >> (p. 818) Property name.
<i>pointer</i>	<< <b>in</b> >> (p. 818) The pointer to store in the property.

#### Returns

One of the **Standard Return Codes** (p. 1024) or **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025) or **DDS\_↔  
RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025)

#### 4.133.5.6 DDS\_PropertyQosPolicyHelper\_lookup\_property()

```

struct DDS_Property_t * DDS_PropertyQosPolicyHelper_lookup_property (
    const struct DDS_PropertyQosPolicy * policy,
    const char * name )

```

Searches for a property in the input policy given its name.

#### Precondition

policy, name and value cannot be NULL.

## Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Property name.

## Returns

The function returns the first property with the given name. If such a property does not exist, the function returns NULL.

## 4.133.5.7 DDS\_PropertyQosPolicyHelper\_lookup\_property\_with\_prefix()

```
struct DDS_Property_t * DDS_PropertyQosPolicyHelper_lookup_property_with_prefix (
    const struct DDS_PropertyQosPolicy * policy,
    const char * prefix,
    const char * name )
```

Searches for a property in the input policy given its prefix and name.

## Precondition

policy, name and value cannot be NULL.

## Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>prefix</i>	<< <i>in</i> >> (p. 818) Property name prefix.
<i>name</i>	<< <i>in</i> >> (p. 818) Property name.

## Returns

The function returns the first property with the given prefix and name. If such a property does not exist, the function returns NULL.

## 4.133.5.8 DDS\_PropertyQosPolicyHelper\_remove\_property()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_remove_property (
    struct DDS_PropertyQosPolicy * policy,
    const char * name )
```

Removes a property from the input policy.

If the property does not exist, the function fails with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

**Precondition**

policy and name cannot be NULL.

The property is in the policy.

**Parameters**

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>name</i>	<< <i>in</i> >> (p. 818) Property name.

**Returns**

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025)

**4.133.5.9 DDS\_PropertyQosPolicyHelper\_get\_properties()**

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_get_properties (
    const struct DDS_PropertyQosPolicy * policy,
    struct DDS_PropertySeq * properties,
    const char * name_prefix )
```

Retrieves a list of properties whose names match the input prefix.

If the properties sequence doesn't own its buffer, and its maximum is less than the total number of properties matching the input prefix, it will be filled up to its maximum and fail with an error of **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

**Precondition**

policy, properties and name\_prefix cannot be NULL.

**Parameters**

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>properties</i>	<< <i>inout</i> >> (p. 818) A <b>DDS_PropertySeq</b> (p. 1647) object where the set or list of properties will be returned.
<i>name_prefix</i>	Name prefix.

**Returns**

One of the **Standard Return Codes** (p. 1024), **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025)

#### 4.133.5.10 DDS\_PropertyQosPolicyHelper\_get\_properties\_into\_policy()

```
DDS_ReturnCode_t DDS_PropertyQosPolicyHelper_get_properties_into_policy (
    const struct DDS_PropertyQosPolicy * policy,
    struct DDS_PropertyQosPolicy * outPolicy,
    const char * name_prefix )
```

This function gets the properties from a policy with a given prefix and sets them into the properties of the output policy.

##### Precondition

inProperties, outProperties and name\_prefix cannot be NULL.

##### Parameters

<i>policy</i>	<< <i>in</i> >> (p. 818) Input policy.
<i>outPolicy</i>	<< <i>out</i> >> (p. 818) Output policy where the properties with the given prefix will be stored. The structure must be initialized.
<i>name_prefix</i>	<< <i>in</i> >> (p. 818) Name prefix.

##### Returns

DDS\_RETCODE\_OK if success, DDS\_RETCODE\_ERROR otherwise.

#### 4.133.5.11 DDS\_PropertyQosPolicyHelper\_get\_property\_mutability()

```
DDS_PropertyQosPolicyMutability DDS_PropertyQosPolicyHelper_get_property_mutability (
    const char * name,
    const struct DDS_PropertyQosPolicy * policy )
```

Returns the mutability type of a property.

If the property does not exist, **DDS\_PROPERTY\_QOS\_MUTABLE** (p. 1111) is returned. Otherwise, it returns the mutability type of the specified property. See **DDS\_PropertyQosPolicyMutability** (p. 1110) for more information of the different mutability types.

##### Parameters

<i>name</i>	<< <i>in</i> >> (p. 818). The name of the property for which we want to know the mutability type.
<i>policy</i>	<< <i>in</i> >> (p. 818). These are the properties in which we are going to look for the property with the provided name.

**Returns**

The mutability type of the input property.

**4.133.6 Variable Documentation****4.133.6.1 DDS\_PROPERTY\_QOS\_POLICY\_NAME**

```
const char* const DDS_PROPERTY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_PropertyQosPolicy** (p. 1645).

**4.134 PUBLISH\_MODE**

<<**extension**>> (p. 817) Specifies how RTI Connexx sends application data on the network. This QoS policy can be used to tell RTI Connexx to use its *own* thread to send data, instead of the user thread.

**Data Structures**

- struct **DDS\_PublishModeQosPolicy**

*Specifies how RTI Connexx sends application data on the network. This QoS policy can be used to tell RTI Connexx to use its own thread to send data, instead of the user thread.*

**Macros**

- #define **DDS\_PUBLICATION\_PRIORITY\_UNDEFINED**

*Initializer value for **DDS\_PublishModeQosPolicy::priority** (p. 1666) and/or **DDS\_ChannelSettings\_t::priority** (p. 1345).*

- #define **DDS\_PUBLICATION\_PRIORITY\_AUTOMATIC**

*Constant value for **DDS\_PublishModeQosPolicy::priority** (p. 1666) and/or **DDS\_ChannelSettings\_t::priority** (p. 1345).*

**Enumerations**

- enum **DDS\_PublishModeQosPolicyKind** {  
**DDS\_SYNCHRONOUS\_PUBLISH\_MODE\_QOS** ,  
**DDS\_ASYNCHRONOUS\_PUBLISH\_MODE\_QOS** }

*Kinds of publishing mode.*

**Variables**

- const char \*const **DDS\_PUBLISHMODE\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_PublishModeQosPolicy** (p. 1664).*

### 4.134.1 Detailed Description

<<*extension*>> (p. 817) Specifies how RTI Connexx sends application data on the network. This QoS policy can be used to tell RTI Connexx to use its *own* thread to send data, instead of the user thread.

### 4.134.2 Macro Definition Documentation

#### 4.134.2.1 DDS\_PUBLICATION\_PRIORITY\_UNDEFINED

```
#define DDS_PUBLICATION_PRIORITY_UNDEFINED
```

Initializer value for **DDS\_PublishModeQosPolicy::priority** (p. 1666) and/or **DDS\_ChannelSettings\_t::priority** (p. 1345).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the lowest possible value. For multi-channel data writers, if either the data writer or channel priority is NOT set to this value, then the publication priority of the entity will be set to the defined value.

#### 4.134.2.2 DDS\_PUBLICATION\_PRIORITY\_AUTOMATIC

```
#define DDS_PUBLICATION_PRIORITY_AUTOMATIC
```

Constant value for **DDS\_PublishModeQosPolicy::priority** (p. 1666) and/or **DDS\_ChannelSettings\_t::priority** (p. 1345).

When assigned this value, the publication priority of the data writer, or channel of a multi-channel data writer, will be set to the largest priority value of any sample currently queued for publication by the data writer or data writer channel.

### 4.134.3 Enumeration Type Documentation

#### 4.134.3.1 DDS\_PublishModeQosPolicyKind

```
enum DDS_PublishModeQosPolicyKind
```

Kinds of publishing mode.

QoS:

**DDS\_PublishModeQosPolicy** (p. 1664)

## Enumerator

DDS_SYNCHRONOUS_PUBLISH_MODE_QOS	<p>Indicates to send data synchronously. If <b>DDS_DataWriterProtocolQosPolicy::push_on_write</b> (p. 1424) is <b>DDS_BOOLEAN_TRUE</b> (p. 1004), data is sent immediately in the context of <b>FooDataWriter_write</b> (p. 489). As data is sent immediately in the context of the user thread, no flow control is applied.</p> <p>See also</p> <p><b>DDS_DataWriterProtocolQosPolicy::push_on_write</b> (p. 1424)</p> <p><b>[default]</b> for <b>DDS_DataWriter</b> (p. 478)</p>
DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS	<p>Indicates to send data asynchronously. Configures the <b>DDS_DataWriter</b> (p. 478) to delegate the task of data transmission to a separate publishing thread. The <b>FooDataWriter_write</b> (p. 489) call does not send the data, but instead schedules the data to be sent later by its associated <b>DDS_Publisher</b> (p. 436). Each <b>DDS_Publisher</b> (p. 436) uses its dedicated publishing thread (<b>DDS_PublisherQos::asynchronous_publisher</b> (p. 1663)) to send data for all its asynchronous DataWriters. For each asynchronous DataWriter, the associated <b>DDS_FlowController</b> (p. 551) determines when the publishing thread is allowed to send the data. <b>DDS_DataWriter_wait_for_asynchronous_publishing</b> (p. 537) and <b>DDS_Publisher_wait_for_asynchronous_publishing</b> (p. 461) enable you to determine when the data has actually been sent.</p> <p>See also</p> <p><b>DDS_FlowController</b> (p. 551)</p> <p><b>DDS_HistoryQosPolicy</b> (p. 1558)</p> <p><b>DDS_DataWriter_wait_for_asynchronous_publishing</b> (p. 537)</p> <p><b>DDS_Publisher_wait_for_asynchronous_publishing</b> (p. 461)</p> <p><b>NDDS_Transport_Property_t::gather_send_buffer_count_max</b> (p. 1857)</p>

## 4.134.4 Variable Documentation

#### 4.134.4.1 DDS\_PUBLISHMODE\_QOS\_POLICY\_NAME

```
const char* const DDS_PUBLISHMODE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_PublishModeQosPolicy** (p. 1664).

## 4.135 READER\_DATA\_LIFECYCLE

Controls how a DataReader manages the lifecycle of the data that it has received.

### Data Structures

- struct **DDS\_ReaderDataLifecycleQosPolicy**  
*Controls how a DataReader manages the lifecycle of the data that it has received.*

### Variables

- const char \*const **DDS\_READERDATALIFECYCLE\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_ReaderDataLifecycleQosPolicy** (p. 1673).*

#### 4.135.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

#### 4.135.2 Variable Documentation

##### 4.135.2.1 DDS\_READERDATALIFECYCLE\_QOS\_POLICY\_NAME

```
const char* const DDS_READERDATALIFECYCLE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_ReaderDataLifecycleQosPolicy** (p. 1673).

## 4.136 RECEIVER\_POOL

<<*extension*>> (p. 817) Configures threads used by RTI Connext to receive and process data from transports (for example, UDP sockets).

## Data Structures

- struct **DDS\_ReceiverPoolQosPolicy**

*Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).*

## Variables

- const char \*const **DDS\_RECEIVERPOOL\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_ReceiverPoolQosPolicy** (p. 1676).*
- const **DDS\_Long** **DDS\_LENGTH\_AUTO**  
*A special value indicating that the actual value will be automatically resolved.*

### 4.136.1 Detailed Description

<<**extension**>> (p. 817) Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

### 4.136.2 Variable Documentation

#### 4.136.2.1 DDS\_RECEIVERPOOL\_QOS\_POLICY\_NAME

```
const char* const DDS_RECEIVERPOOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_ReceiverPoolQosPolicy** (p. 1676).

#### 4.136.2.2 DDS\_LENGTH\_AUTO

```
const DDS_Long DDS_LENGTH_AUTO [extern]
```

A special value indicating that the actual value will be automatically resolved.

## 4.137 RELIABILITY

Indicates the level of reliability offered/requested by RTI Connex.

## Data Structures

- struct **DDS\_ReliabilityQosPolicy**  
*Indicates the level of reliability offered/requested by RTI Connex.*

## Enumerations

- enum **DDS\_ReliabilityQosPolicyKind** {  
  **DDS\_BEST\_EFFORT\_RELIABILITY\_QOS** ,  
  **DDS\_RELIABLE\_RELIABILITY\_QOS** }
- Kinds of reliability.*
- enum **DDS\_ReliabilityQosPolicyAcknowledgmentModeKind** {  
  **DDS\_PROTOCOL\_ACKNOWLEDGMENT\_MODE** ,  
  **DDS\_APPLICATION\_AUTO\_ACKNOWLEDGMENT\_MODE** ,  
  **DDS\_APPLICATION\_ORDERED\_ACKNOWLEDGMENT\_MODE** ,  
  **DDS\_APPLICATION\_EXPLICIT\_ACKNOWLEDGMENT\_MODE** }
- <<*extension*>> (p. 817) *Kinds of acknowledgment.*
- enum **DDS\_InstanceStateConsistencyKind** {  
  **DDS\_NO\_RECOVER\_INSTANCE\_STATE\_CONSISTENCY** ,  
  **DDS\_RECOVER\_INSTANCE\_STATE\_CONSISTENCY** }
- <<*extension*>> (p. 817) *Whether instance state consistency is enabled.*

## Variables

- const char \*const **DDS\_RELIABILITY\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_ReliabilityQosPolicy** (p. 1678).*

### 4.137.1 Detailed Description

Indicates the level of reliability offered/requested by RTI Connex.

### 4.137.2 Enumeration Type Documentation

#### 4.137.2.1 DDS\_ReliabilityQosPolicyKind

```
enum DDS_ReliabilityQosPolicyKind
```

Kinds of reliability.

QoS:

**DDS\_ReliabilityQosPolicy** (p. 1678)

## Enumerator

DDS_BEST_EFFORT_RELIABILITY_QOS	<p>Indicates that it is acceptable to not retry propagation of any samples. Presumably new values for the samples are generated often enough that it is not necessary to re-send or acknowledge any samples.</p> <p><b>[default]</b> for <b>DDS_DataReader</b> (p. 608) and <b>DDS_Topic</b> (p. 172)</p>
DDS_RELIABLE_RELIABILITY_QOS	<p>Specifies RTI Connexx will attempt to deliver all samples in its history. Missed samples may be retried. In steady-state (no modifications communicated via the <b>DDS_DataWriter</b> (p. 478)), RTI Connexx guarantees that all samples in the <b>DDS_DataWriter</b> (p. 478) history will eventually be delivered to all the <b>DDS_DataReader</b> (p. 608) objects (subject to timeouts that indicate loss of communication with a particular <b>DDS_Subscriber</b> (p. 565)). Outside steady state, the <b>HISTORY</b> (p. 1093) and <b>RESOURCE_LIMITS</b> (p. 1126) policies will determine how samples become part of the history and whether samples can be discarded from it.</p> <p><b>[default]</b> for <b>DDS_DataWriter</b> (p. 478)</p>

## 4.137.2.2 DDS\_ReliabilityQosPolicyAcknowledgmentModeKind

```
enum DDS_ReliabilityQosPolicyAcknowledgmentModeKind
```

<<*extension*>> (p. 817) Kinds of acknowledgment.

QoS:

**DDS\_ReliabilityQosPolicy** (p. 1678)

## Enumerator

DDS_PROTOCOL_ACKNOWLEDGMENT_MODE	<p>Samples are acknowledged by RTPS protocol. Samples are acknowledged according to the Real-Time Publish-Subscribe (RTPS) interoperability protocol.</p>
DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_↔ MODE	<p>Samples are acknowledged automatically after a subscribing application has accessed them. A sample received by a <b>FooDataReader</b> (p. 1845) is acknowledged after the subscribing application accesses it, either through calling <b>FooDataReader_take</b> (p. 619) or <b>FooDataReader_read</b> (p. 618) on the DDS sample. If the read or take operation loans the samples, the acknowledgment is done after <b>FooDataReader_return_loan</b> (p. 639) is called. Otherwise, for read or take operations that make a copy, acknowledgment is done after the read or take operations are executed.</p>

## Enumerator

<p>DDS_APPLICATION_EXPLICIT_↔ ACKNOWLEDGMENT_MODE</p>	<p>Samples are acknowledged after the subscribing application explicitly calls <code>acknowledge</code> on the samples. Samples received by a <b>DDS_DataReader</b> (p. 608) are explicitly acknowledged by the subscribing application, after it calls either <b>DDS_DataReader_acknowledge_all</b> (p. 669) or <b>DDS_DataReader_acknowledge_sample</b> (p. 669).</p>
-----------------------------------------------------------	-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## 4.137.2.3 DDS\_InstanceStateConsistencyKind

enum **DDS\_InstanceStateConsistencyKind**

<<*extension*>> (p. 817) Whether instance state consistency is enabled.

QoS:

**DDS\_ReliabilityQoSPolicy** (p. 1678)

## Enumerator

<p>DDS_NO_RECOVER_INSTANCE_STATE_↔ CONSISTENCY</p>	<p>Instance state is not restored on a DataReader after reconnecting with a DataWriter until the DataWriter sends a new sample. When DataReaders rediscover DataWriters, they will not request updated instance state data. DataWriters always provide instance state data alongside each sample update regardless of this setting.</p>
<p>DDS_RECOVER_INSTANCE_STATE_↔ CONSISTENCY</p>	<p>Instance state is restored on the DataReader after it reconnects with a DataWriter that has regained liveliness, even before the DataWriter sends a new sample. When DataReaders rediscover DataWriters, they will request updated instance state data. DataWriters will respond to requests for updated instance state data and publish updates on the ServiceRequest channel. DataWriters still provide instance state data alongside each sample update regardless of this setting.</p> <p>The following limitation applies to using <code>RECOVER_INSTANCE_STATE_↔CONSISTENCY</code>: If the <b>DDS_DestinationOrderQoSPolicyKind</b> (p. 1075) is set to <b>DDS_BY_SOURCE_TIMESTAMP_↔DESTINATIONORDER_QOS</b> (p. 1075), <code>RECOVER_INSTANCE_STATE_↔CONSISTENCY</code> can only be used if scope is set to <code>idref_DestinationOrderQoSPolicyScopeKind_↔INSTANCE_SCOPE_DESTINATIONORDER_QOS</code> (the default).</p>

### 4.137.3 Variable Documentation

#### 4.137.3.1 DDS\_RELIABILITY\_QOS\_POLICY\_NAME

```
const char* const DDS_RELIABILITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_ReliabilityQosPolicy** (p. 1678).

## 4.138 RESOURCE\_LIMITS

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

### Data Structures

- struct **DDS\_ResourceLimitsQosPolicy**

*Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.*

### Variables

- const char \*const **DDS\_RESOURCELIMITS\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_ResourceLimitsQosPolicy** (p. 1690).*
- const **DDS\_Long** **DDS\_LENGTH\_UNLIMITED**  
*A special value indicating an unlimited quantity.*

#### 4.138.1 Detailed Description

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

#### 4.138.2 Variable Documentation

### 4.138.2.1 DDS\_RESOURCELIMITS\_QOS\_POLICY\_NAME

```
const char* const DDS_RESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_ResourceLimitsQosPolicy** (p. 1690).

### 4.138.2.2 DDS\_LENGTH\_UNLIMITED

```
const DDS_Long DDS_LENGTH_UNLIMITED [extern]
```

A special value indicating an unlimited quantity.

#### Examples

```
HelloWorld_subscriber.c.
```

## 4.139 SERVICE

<<*extension*>> (p. 817) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

### Data Structures

- struct **DDS\_ServiceQosPolicy**  
*Service associated with a DDS entity.*

### Enumerations

- enum **DDS\_ServiceQosPolicyKind** {  
**DDS\_NO\_SERVICE\_QOS** ,  
**DDS\_PERSISTENCE\_SERVICE\_QOS** ,  
**DDS\_QUEUING\_SERVICE\_QOS** ,  
**DDS\_ROUTING\_SERVICE\_QOS** ,  
**DDS\_RECORDING\_SERVICE\_QOS** ,  
**DDS\_REPLAY\_SERVICE\_QOS** ,  
**DDS\_DATABASE\_INTEGRATION\_SERVICE\_QOS** ,  
**DDS\_WEB\_INTEGRATION\_SERVICE\_QOS** ,  
**DDS\_OBSERVABILITY\_COLLECTOR\_SERVICE\_QOS** }  
*Kinds of service.*

### Variables

- const char \*const **DDS\_SERVICE\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_ServiceQosPolicy** (p. 1736).*

### 4.139.1 Detailed Description

<<*extension*>> (p. 817) Service QoS policy is used to indicate what kind of service is associated with the DDS entity.

### 4.139.2 Enumeration Type Documentation

#### 4.139.2.1 DDS\_ServiceQosPolicyKind

```
enum DDS_ServiceQosPolicyKind
```

Kinds of service.

QoS:

**DDS\_ServiceQosPolicy** (p. 1736)

Enumerator

DDS_NO_SERVICE_QOS	There is no service associated with the entity.
DDS_PERSISTENCE_SERVICE_QOS	The entity is an entity created by RTI Persistence Service.
DDS_QUEUING_SERVICE_QOS	The entity is an entity created by RTI Queuing Service.
DDS_ROUTING_SERVICE_QOS	The entity is an entity created by RTI Routing Service.
DDS_RECORDING_SERVICE_QOS	The entity is an entity created by RTI Recording Service.
DDS_REPLAY_SERVICE_QOS	The entity is an entity created by RTI Replay Service.
DDS_DATABASE_INTEGRATION_SERVICE_QOS	The entity is an entity created by RTI Database Integration Service.
DDS_WEB_INTEGRATION_SERVICE_QOS	The entity is an entity created by RTI Web Integration Service.
DDS_OBSERVABILITY_COLLECTOR_SERVICE_QOS	The entity is an entity created by RTI Observability Collector Service.

### 4.139.3 Variable Documentation

#### 4.139.3.1 DDS\_SERVICE\_QOS\_POLICY\_NAME

```
const char* const DDS_SERVICE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_ServiceQosPolicy** (p. 1736).

## 4.140 SYSTEM\_RESOURCE\_LIMITS

<<*extension*>> (p. 817) Configures DomainParticipant-independent resources used by RTI Connex.

### Data Structures

- struct **DDS\_SystemResourceLimitsQosPolicy**

<<*extension*>> (p. 817) Configures **DDS\_DomainParticipant** (p. 72)-independent resources used by RTI Connex. Mainly used to change the maximum number of **DDS\_DomainParticipant** (p. 72) entities that can be created within a single process (address space).

### Variables

- const char \*const **DDS\_SYSTEMRESOURCELIMITS\_QOS\_POLICY\_NAME**

Stringified human-readable name for **DDS\_SystemResourceLimitsQosPolicy** (p. 1760).

#### 4.140.1 Detailed Description

<<*extension*>> (p. 817) Configures DomainParticipant-independent resources used by RTI Connex.

#### 4.140.2 Variable Documentation

##### 4.140.2.1 DDS\_SYSTEMRESOURCELIMITS\_QOS\_POLICY\_NAME

```
const char* const DDS_SYSTEMRESOURCELIMITS_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_SystemResourceLimitsQosPolicy** (p. 1760).

## 4.141 TIME\_BASED\_FILTER

Filter that allows a **DDS\_DataReader** (p. 608) to specify that it is interested only in (potentially) a subset of the values of the data.

### Data Structures

- struct **DDS\_TimeBasedFilterQosPolicy**

Filter that allows a **DDS\_DataReader** (p. 608) to specify that it is interested only in (potentially) a subset of the values of the data.

## Variables

- const char \*const **DDS\_TIMEBASEDFILTER\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_TimeBasedFilterQosPolicy** (p. 1767).*

### 4.141.1 Detailed Description

Filter that allows a **DDS\_DataReader** (p. 608) to specify that it is interested only in (potentially) a subset of the values of the data.

### 4.141.2 Variable Documentation

#### 4.141.2.1 DDS\_TIMEBASEDFILTER\_QOS\_POLICY\_NAME

```
const char* const DDS_TIMEBASEDFILTER_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TimeBasedFilterQosPolicy** (p. 1767).

## 4.142 TOPIC\_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

## Data Structures

- struct **DDS\_TopicDataQosPolicy**  
*Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.*

## Variables

- const char \*const **DDS\_TOPICDATA\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_TopicDataQosPolicy** (p. 1775).*

### 4.142.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

## 4.142.2 Variable Documentation

### 4.142.2.1 DDS\_TOPICDATA\_QOS\_POLICY\_NAME

```
const char* const DDS_TOPICDATA_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TopicDataQosPolicy** (p. 1775).

## 4.143 TOPIC\_QUERY\_DISPATCH

Configures the ability of a **DDS\_DataWriter** (p. 478) to publish historical samples.

### Data Structures

- struct **DDS\_TopicQueryDispatchQosPolicy**

*Configures the ability of a **DDS\_DataWriter** (p. 478) to publish samples in response to a **DDS\_TopicQuery** (p. 698).*

### Variables

- const char \*const **DDS\_TOPICQUERYDISPATCH\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_TopicQueryDispatchQosPolicy** (p. 1783).*

### 4.143.1 Detailed Description

Configures the ability of a **DDS\_DataWriter** (p. 478) to publish historical samples.

## 4.143.2 Variable Documentation

### 4.143.2.1 DDS\_TOPICQUERYDISPATCH\_QOS\_POLICY\_NAME

```
const char* const DDS_TOPICQUERYDISPATCH_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TopicQueryDispatchQosPolicy** (p. 1783).

## 4.144 TRANSPORT\_BUILTIN

<<*extension*>> (p. 817) Specifies which built-in transports are used.

### Data Structures

- struct **DDS\_TransportBuiltinQosPolicy**  
*Specifies which built-in transports are used.*

### Macros

- #define **DDS\_TRANSPORTBUILTIN\_MASK\_NONE**  
*None of the built-in transports will be registered automatically when the **DDS\_DomainParticipant** (p. 72) is enabled.*
- #define **DDS\_TRANSPORTBUILTIN\_MASK\_DEFAULT**  
*The default value of **DDS\_TransportBuiltinQosPolicy::mask** (p. 1787).*
- #define **DDS\_TRANSPORTBUILTIN\_MASK\_ALL**  
*All the available built-in transports are registered automatically when the **DDS\_DomainParticipant** (p. 72) is enabled.*

### Typedefs

- typedef **DDS\_Long DDS\_TransportBuiltinKindMask**  
*A mask of **DDS\_TransportBuiltinKind** (p. 1134) bits.*

### Enumerations

- enum **DDS\_TransportBuiltinKind** {  
**DDS\_TRANSPORTBUILTIN\_UDPv4** ,  
**DDS\_TRANSPORTBUILTIN\_SHMEM** ,  
**DDS\_TRANSPORTBUILTIN\_INTRA** = 0x00000001 << 2 ,  
**DDS\_TRANSPORTBUILTIN\_UDPv6** ,  
**DDS\_TRANSPORTBUILTIN\_UDPv4\_WAN** }  
*Built-in transport kind.*

### Variables

- const char \*const **DDS\_TRANSPORTBUILTIN\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_TransportBuiltinQosPolicy** (p. 1786).*
- const char \*const **DDS\_TRANSPORTBUILTIN\_SHMEM\_ALIAS**  
*Alias name for the shared memory built-in transport: "builtin.shmem".*
- const char \*const **DDS\_TRANSPORTBUILTIN\_UDPv4\_ALIAS**  
*Alias name for the UDPv4 built-in transport: "builtin.udpv4".*
- const char \*const **DDS\_TRANSPORTBUILTIN\_UDPv4\_WAN\_ALIAS**  
*Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4\_wan".*
- const char \*const **DDS\_TRANSPORTBUILTIN\_UDPv6\_ALIAS**  
*Alias name for the UDPv6 built-in transport: "builtin.udpv6".*

### 4.144.1 Detailed Description

<<*extension*>> (p. 817) Specifies which built-in transports are used.

See also

**Changing the automatically registered built-in transports** (p. 796)

### 4.144.2 Macro Definition Documentation

#### 4.144.2.1 DDS\_TRANSPORTBUILTIN\_MASK\_NONE

```
#define DDS_TRANSPORTBUILTIN_MASK_NONE
```

None of the built-in transports will be registered automatically when the **DDS\_DomainParticipant** (p. 72) is enabled.

The user must explicitly register transports using **NDDS\_Transport\_Support\_register\_transport** (p. 722).

See also

**DDS\_TransportBuiltinKindMask** (p. 1134)

#### 4.144.2.2 DDS\_TRANSPORTBUILTIN\_MASK\_DEFAULT

```
#define DDS_TRANSPORTBUILTIN_MASK_DEFAULT
```

The default value of **DDS\_TransportBuiltinQosPolicy::mask** (p. 1787).

The set of builtin transport plugins that will be automatically registered with the participant by default. The user can register additional transports using **NDDS\_Transport\_Support\_register\_transport** (p. 722).

**[default]** [UDPv4|Shmem]

See also

**DDS\_TransportBuiltinKindMask** (p. 1134)

### 4.144.2.3 DDS\_TRANSPORTBUILTIN\_MASK\_ALL

```
#define DDS_TRANSPORTBUILTIN_MASK_ALL
```

All the available built-in transports are registered automatically when the **DDS\_DomainParticipant** (p. 72) is enabled.

See also

**DDS\_TransportBuiltinKindMask** (p. 1134)

## 4.144.3 Typedef Documentation

### 4.144.3.1 DDS\_TransportBuiltinKindMask

```
typedef DDS_Long DDS_TransportBuiltinKindMask
```

A mask of **DDS\_TransportBuiltinKind** (p. 1134) bits.

QoS:

**DDS\_TransportBuiltinQosPolicy** (p. 1786)

## 4.144.4 Enumeration Type Documentation

### 4.144.4.1 DDS\_TransportBuiltinKind

```
enum DDS_TransportBuiltinKind
```

Built-in transport kind.

See also

**DDS\_TransportBuiltinKindMask** (p. 1134)

Enumerator

DDS_TRANSPORTBUILTIN_UDPv4	Built-in UDPv4 transport, :: <b>UDPv4 Transport</b> (p. 846).
DDS_TRANSPORTBUILTIN_SHMEM	Built-in shared memory transport, :: <b>Shared Memory Transport</b> (p. 839).
DDS_TRANSPORTBUILTIN_UDPv6	Built-in UDPv6 transport, :: <b>UDPv6 Transport</b> (p. 862).
DDS_TRANSPORTBUILTIN_UDPv4_WAN	Built-in UDPv4 asymmetric transport, :: <b>Real-Time WAN Transport</b> (p. 856).

## 4.144.5 Variable Documentation

### 4.144.5.1 DDS\_TRANSPORTBUILTIN\_QOS\_POLICY\_NAME

```
const char* const DDS_TRANSPORTBUILTIN_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TransportBuiltinQosPolicy** (p. 1786).

### 4.144.5.2 DDS\_TRANSPORTBUILTIN\_SHMEM\_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_SHMEM_ALIAS [extern]
```

Alias name for the shared memory built-in transport: "builtin.shmem".

### 4.144.5.3 DDS\_TRANSPORTBUILTIN\_UDPv4\_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv4_ALIAS [extern]
```

Alias name for the UDPv4 built-in transport: "builtin.udpv4".

### 4.144.5.4 DDS\_TRANSPORTBUILTIN\_UDPv4\_WAN\_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv4_WAN_ALIAS [extern]
```

Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4\_wan".

### 4.144.5.5 DDS\_TRANSPORTBUILTIN\_UDPv6\_ALIAS

```
const char* const DDS_TRANSPORTBUILTIN_UDPv6_ALIAS [extern]
```

Alias name for the UDPv6 built-in transport: "builtin.udpv6".

## 4.145 TRANSPORT\_MULTICAST

<<*extension*>> (p. 817) Specifies the multicast address on which a **DDS\_DataReader** (p. 608) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDS\_DomainParticipant** (p. 72) level) transports with which to receive the multicast data.

### Modules

- **Multicast Settings**  
*Multicast communication settings.*
- **Multicast Mapping**  
*Multicast communication mapping.*

### Data Structures

- struct **DDS\_TransportMulticastQosPolicy**  
*Specifies the multicast address on which a **DDS\_DataReader** (p. 608) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDS\_DomainParticipant** (p. 72) level) transports with which to receive the multicast data.*

### Enumerations

- enum **DDS\_TransportMulticastQosPolicyKind** {  
  **DDS\_AUTOMATIC\_TRANSPORT\_MULTICAST\_QOS** ,  
  **DDS\_UNICAST\_ONLY\_TRANSPORT\_MULTICAST\_QOS** }
- Transport Multicast Policy Kind.*

### Variables

- const char \*const **DDS\_TRANSPORTMULTICAST\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_TransportMulticastQosPolicy** (p. 1793).*

#### 4.145.1 Detailed Description

<<*extension*>> (p. 817) Specifies the multicast address on which a **DDS\_DataReader** (p. 608) wants to receive its data. It can also specify a port number, as well as a subset of the available (at the **DDS\_DomainParticipant** (p. 72) level) transports with which to receive the multicast data.

#### 4.145.2 Enumeration Type Documentation

##### 4.145.2.1 DDS\_TransportMulticastQosPolicyKind

```
enum DDS_TransportMulticastQosPolicyKind
Transport Multicast Policy Kind.
```

See also

**DDS\_TransportMulticastQosPolicy** (p. 1793)

## Enumerator

DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS	Selects the multicast address automatically. NOTE: This setting is required when using the <b>DDS_TransportMulticastMappingQosPolicy</b> (p. 1791).
DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_↔ QOS	Selects a unicast-only mode.

### 4.145.3 Variable Documentation

#### 4.145.3.1 DDS\_TRANSPORTMULTICAST\_QOS\_POLICY\_NAME

```
const char* const DDS_TRANSPORTMULTICAST_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TransportMulticastQosPolicy** (p. 1793).

## 4.146 TRANSPORT\_MULTICAST\_MAPPING

<<**extension**>> (p. 817) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

### Data Structures

- struct **DDS\_TransportMulticastMappingQosPolicy**

*Specifies a list of topic\_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.*

### Variables

- const char \*const **DDS\_TRANSPORTMULTICASTMAPPING\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_TransportMulticastMappingQosPolicy** (p. 1791).*

#### 4.146.1 Detailed Description

<<**extension**>> (p. 817) Specifies a list of topic expressions and addresses that can be used by an Entity with a specific topic name to receive data.

## 4.146.2 Variable Documentation

### 4.146.2.1 DDS\_TRANSPORTMULTICASTMAPPING\_QOS\_POLICY\_NAME

```
const char* const DDS_TRANSPORTMULTICASTMAPPING_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TransportMulticastMappingQosPolicy** (p. 1791).

## 4.147 TRANSPORT\_PRIORITY

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

### Data Structures

- struct **DDS\_TransportPriorityQosPolicy**

*This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.*

### Variables

- const char \*const **DDS\_TRANSPORTPRIORITY\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_TransportPriorityQosPolicy** (p. 1797).*

### 4.147.1 Detailed Description

This QoS policy allows the application to take advantage of transport that are capable of sending messages with different priorities.

### 4.147.2 Variable Documentation

#### 4.147.2.1 DDS\_TRANSPORTPRIORITY\_QOS\_POLICY\_NAME

```
const char* const DDS_TRANSPORTPRIORITY_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TransportPriorityQosPolicy** (p. 1797).

## 4.148 TRANSPORT\_SELECTION

<<*extension*>> (p. 817) Specifies the physical transports that a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) may use to send or receive data.

### Data Structures

- struct **DDS\_TransportSelectionQosPolicy**

*Specifies the physical transports a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) may use to send or receive data.*

### Variables

- const char \*const **DDS\_TRANSPORTSELECTION\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_TransportSelectionQosPolicy** (p. 1799).*

#### 4.148.1 Detailed Description

<<*extension*>> (p. 817) Specifies the physical transports that a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) may use to send or receive data.

#### 4.148.2 Variable Documentation

##### 4.148.2.1 DDS\_TRANSPORTSELECTION\_QOS\_POLICY\_NAME

```
const char* const DDS_TRANSPORTSELECTION_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TransportSelectionQosPolicy** (p. 1799).

## 4.149 TRANSPORT\_UNICAST

<<*extension*>> (p. 817) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

### Modules

- **Unicast Settings**

*Unicast communication settings.*

## Data Structures

- struct **DDS\_TransportUnicastQosPolicy**

*Specifies a subset of transports and a port number that can be used by an Entity to receive data.*

## Variables

- const char \*const **DDS\_TRANSPORTUNICAST\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_TransportUnicastQosPolicy** (p. 1800).*

### 4.149.1 Detailed Description

<<*extension*>> (p. 817) Specifies a subset of transports and a port number that can be used by an Entity to receive data.

### 4.149.2 Variable Documentation

#### 4.149.2.1 DDS\_TRANSPORTUNICAST\_QOS\_POLICY\_NAME

```
const char* const DDS_TRANSPORTUNICAST_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TransportUnicastQosPolicy** (p. 1800).

## 4.150 TYPE\_CONSISTENCY\_ENFORCEMENT

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

## Data Structures

- struct **DDS\_TypeConsistencyEnforcementQosPolicy**

*Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.*

## Enumerations

- enum **DDS\_TypeConsistencyKind** {  
**DDS\_DISALLOW\_TYPE\_COERCION** ,  
**DDS\_ALLOW\_TYPE\_COERCION** ,  
**DDS\_AUTO\_TYPE\_COERCION** }

*Kinds of type consistency.*

## Variables

- `const char *const DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME`  
Stringified human-readable name for *DDS\_TypeConsistencyEnforcementQosPolicy* (p. 1811).

### 4.150.1 Detailed Description

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

### 4.150.2 Enumeration Type Documentation

#### 4.150.2.1 DDS\_TypeConsistencyKind

```
enum DDS_TypeConsistencyKind
```

Kinds of type consistency.

QoS:

**DDS\_TypeConsistencyEnforcementQosPolicy** (p. 1811)

Enumerator

DDS_DISALLOW_TYPE_COERCION	The DataWriter and the DataReader must support the same data type in order for them to communicate. This is the degree of type consistency enforcement required by the <a href="#">OMG DDS Specification</a> prior to the <a href="#">OMG Extensible and Dynamic Topic Types for DDS Specification</a> .
DDS_ALLOW_TYPE_COERCION	The DataWriter and the DataReader need not support the same data type in order for them to communicate as long as the DataReader's type is assignable from the DataWriter's type. For example, the following two extensible types will be assignable to each other since MyDerivedType contains all the members of MyBaseType (member_1) plus some additional elements (member_2). <pre>struct MyBaseType {     long member_1; };  struct MyDerivedType: MyBaseType {     long member_2; };</pre> <p>Even if MyDerivedType was not explicitly inheriting from MyBaseType the types would still be assignable. For example:</p> <pre>struct MyBaseType {     long member_1; };  struct MyDerivedType {     long member_1;     long member_2; };</pre>
Generated by Doxygen	<del>For additional information on type assignability refer to the <a href="#">OMG Extensible and Dynamic Topic Types for DDS Specification</a>.</del>

## Enumerator

DDS_AUTO_TYPE_COERCION	This AUTO value will be applied as <b>DDS_DISALLOW_TYPE_COERCION</b> (p. 1141) when the data type is annotated with <code>@transfer_mode(SHMEM_REF)</code> and the <code>@language_binding</code> is PLAIN (default) while using C, Traditional C++, or Modern C++ APIs. In all other cases, this AUTO value will be applied as <b>DDS_ALLOW_TYPE_COERCION</b> (p. 1141). <b>[default]</b>
------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### 4.150.3 Variable Documentation

#### 4.150.3.1 DDS\_TYPE\_CONSISTENCY\_ENFORCEMENT\_QOS\_POLICY\_NAME

```
const char* const DDS_TYPE_CONSISTENCY_ENFORCEMENT_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TypeConsistencyEnforcementQosPolicy** (p. 1811).

## 4.151 TYPESUPPORT

<<**extension**>> (p. 817) Allows you to attach application-specific values to a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

### Data Structures

- struct **DDS\_TypeSupportQosPolicy**

*Allows you to attach application-specific values to a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.*

### Enumerations

- enum **DDS\_CdrPaddingKind** {  
**DDS\_ZERO\_CDR\_PADDING** ,  
**DDS\_NOT\_SET\_CDR\_PADDING** ,  
**DDS\_AUTO\_CDR\_PADDING** }

*The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.*

### Variables

- const char \*const **DDS\_TYPESUPPORT\_QOS\_POLICY\_NAME**

*Stringified human-readable name for **DDS\_TypeSupportQosPolicy** (p. 1815).*

### 4.151.1 Detailed Description

<<*extension*>> (p. 817) Allows you to attach application-specific values to a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

### 4.151.2 Enumeration Type Documentation

#### 4.151.2.1 DDS\_CdrPaddingKind

```
enum DDS_CdrPaddingKind
```

The CDR padding kind determines whether or not the padding bytes will be set to zero during CDR serialization.

Enumerator

DDS_ZERO_CDR_PADDING	Padding bytes will be set to zeros during CDR serialization.
DDS_NOT_SET_CDR_PADDING	Padding bytes will not be set to any value during CDR serialization.
DDS_AUTO_CDR_PADDING	When set on a <b>DDS_DomainParticipant</b> (p. 72) the default behavior is <b>DDS_NOT_SET_CDR_PADDING</b> (p. 1143). When set on a <b>DDS_DataWriter</b> (p. 478) or <b>DDS_DataReader</b> (p. 608) the behavior is to inherit the value from the <b>DDS_DomainParticipant</b> (p. 72).

### 4.151.3 Variable Documentation

#### 4.151.3.1 DDS\_TYPESUPPORT\_QOS\_POLICY\_NAME

```
const char* const DDS_TYPESUPPORT_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_TypeSupportQosPolicy** (p. 1815).

## 4.152 USER\_DATA

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

## Data Structures

- struct **DDS\_UserDataQosPolicy**

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

## Variables

- const char \*const **DDS\_USERDATA\_QOS\_POLICY\_NAME**

Stringified human-readable name for **DDS\_UserDataQosPolicy** (p. 1820).

### 4.152.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

### 4.152.2 Variable Documentation

#### 4.152.2.1 DDS\_USERDATA\_QOS\_POLICY\_NAME

```
const char* const DDS_USERDATA_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_UserDataQosPolicy** (p. 1820).

## 4.153 WRITER\_DATA\_LIFECYCLE

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

## Data Structures

- struct **DDS\_WriterDataLifecycleQosPolicy**

Controls how a **DDS\_DataWriter** (p. 478) handles the lifecycle of the instances (keys) that it is registered to manage.

## Variables

- const char \*const **DDS\_WRITERDATALIFECYCLE\_QOS\_POLICY\_NAME**

Stringified human-readable name for **DDS\_WriterDataLifecycleQosPolicy** (p. 1838).

### 4.153.1 Detailed Description

Controls how a DataWriter handles the lifecycle of the instances (keys) that it is registered to manage.

### 4.153.2 Variable Documentation

#### 4.153.2.1 DDS\_WRITERDATALIFECYCLE\_QOS\_POLICY\_NAME

```
const char* const DDS_WRITERDATALIFECYCLE_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_WriterDataLifecycleQosPolicy** (p. 1838).

## 4.154 WIRE\_PROTOCOL

<<*extension*>> (p. 817) Specifies the wire protocol related attributes for the **DDS\_DomainParticipant** (p. 72).

### Data Structures

- struct **DDS\_RtpsWellKnownPorts\_t**  
*RTPS well-known port mapping configuration.*
- struct **DDS\_WireProtocolQosPolicy**  
*Specifies the wire-protocol-related attributes for the **DDS\_DomainParticipant** (p. 72).*

### Macros

- #define **DDS\_RTPS\_RESERVED\_PORT\_MASK\_DEFAULT**  
*The default value of **DDS\_WireProtocolQosPolicy::rtps\_reserved\_port\_mask** (p. 1832).*
- #define **DDS\_RTPS\_RESERVED\_PORT\_MASK\_NONE**  
*No bits are set.*
- #define **DDS\_RTPS\_RESERVED\_PORT\_MASK\_ALL**  
*All bits are set.*

### Typedefs

- typedef **DDS\_Long DDS\_RtpsReservedPortKindMask**  
*A mask of **DDS\_RtpsReservedPortKind** (p. 1148) bits.*

## Enumerations

- enum **DDS\_RtpsReservedPortKind** {  
**DDS RTPS\_RESERVED\_PORT\_BUILTIN\_UNICAST** = 0x0001 << 0 ,  
**DDS RTPS\_RESERVED\_PORT\_BUILTIN\_MULTICAST** = 0x0001 << 1 ,  
**DDS RTPS\_RESERVED\_PORT\_USER\_UNICAST** = 0x0001 << 2 ,  
**DDS RTPS\_RESERVED\_PORT\_USER\_MULTICAST** = 0x0001 << 3 }  
*RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.*
- enum **DDS\_WireProtocolQosPolicyAutoKind** {  
**DDS RTPS\_AUTO\_ID\_FROM\_IP** = 0 ,  
**DDS RTPS\_AUTO\_ID\_FROM\_MAC** = 1 ,  
**DDS RTPS\_AUTO\_ID\_FROM\_UUID** = 2 }  
*Mechanism to automatically calculate the GUID prefix.*

## Variables

- const struct **DDS\_RtpsWellKnownPorts\_t** **DDS RTI\_BACKWARDS\_COMPATIBLE RTPS\_WELL\_KNOWN\_PORTS**  
*Assign to use well-known port mappings which are compatible with previous versions of the RTI Connex middleware.*
- const struct **DDS\_RtpsWellKnownPorts\_t** **DDS\_INTEROPERABLE RTPS\_WELL\_KNOWN\_PORTS**  
*Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.*
- const char \*const **DDS\_WIREPROTOCOL\_QOS\_POLICY\_NAME**  
*Stringified human-readable name for **DDS\_WireProtocolQosPolicy** (p. 1827).*

### 4.154.1 Detailed Description

<<*extension*>> (p. 817) Specifies the wire protocol related attributes for the **DDS\_DomainParticipant** (p. 72).

### 4.154.2 Macro Definition Documentation

#### 4.154.2.1 DDS RTPS\_RESERVED\_PORT\_MASK\_DEFAULT

```
#define DDS RTPS_RESERVED_PORT_MASK_DEFAULT
```

#### Value:

```
((DDS_RtpsReservedPortKindMask) DDS RTPS_RESERVED_PORT_BUILTIN_UNICAST \
 | DDS RTPS_RESERVED_PORT_BUILTIN_MULTICAST | DDS RTPS_RESERVED_PORT_USER_UNICAST)
```

The default value of **DDS\_WireProtocolQosPolicy::rtps\_reserved\_port\_mask** (p. 1832).

Most of the ports that may be needed by DDS will be reserved by the transport when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **DDS\_RtpsWellKnownPorts\_t** (p. 1714) will be detected at this time and the enable operation will fail.

This setting will avoid reserving the **usertraffic** multicast port, which is not actually used unless there are DataReaders that enable multicast but fail to specify a port.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

**DDS\_RtpsReservedPortKindMask** (p. 1147)

### 4.154.2.2 DDS\_RTPS\_RESERVED\_PORT\_MASK\_NONE

```
#define DDS_RTPS_RESERVED_PORT_MASK_NONE
```

No bits are set.

None of the ports that are needed by DDS will be allocated until they are specifically required. With this value set, automatic participant Id selection will be based on selecting a port for discovery (metatraffic) unicast traffic on a single transport.

See also

**DDS\_RtpsReservedPortKindMask** (p. 1147)

### 4.154.2.3 DDS\_RTPS\_RESERVED\_PORT\_MASK\_ALL

```
#define DDS_RTPS_RESERVED_PORT_MASK_ALL
```

All bits are set.

All of the ports that may be needed by DDS will be reserved when the participant is enabled. With this value set, failure to allocate a port that is computed based on the **DDS\_RtpsWellKnownPorts\_t** (p. 1714) will be detected at this time, and the enable operation will fail.

Note that this will also reserve the **usertraffic** multicast port which is not actually used unless there are DataReaders that enable multicast but fail to specify a port. To avoid unnecessary resource usage for these ports, use **RTPS\_RESERVED\_PORT\_MASK\_DEFAULT**.

Automatic participant ID selection will be based on finding a participant index with both the discovery (metatraffic) unicast port and usertraffic unicast port available.

See also

**DDS\_RtpsReservedPortKindMask** (p. 1147)

## 4.154.3 Typedef Documentation

### 4.154.3.1 DDS\_RtpsReservedPortKindMask

```
typedef DDS_Long DDS_RtpsReservedPortKindMask
```

A mask of **DDS\_RtpsReservedPortKind** (p. 1148) bits.

QoS:

**DDS\_WireProtocolQosPolicy** (p. 1827)

## 4.154.4 Enumeration Type Documentation

### 4.154.4.1 DDS\_RtpsReservedPortKind

enum `DDS_RtpsReservedPortKind`

RTPS reserved port kind, used to identify the types of ports that can be reserved on domain participant enable.

See also

`DDS_WireProtocolQosPolicy::rtps_reserved_port_mask` (p. 1832)

Enumerator

<code>DDS_RTPS_RESERVED_PORT_BUILTIN_UNICAST</code>	Select the <b>metatraffic</b> unicast port.
<code>DDS_RTPS_RESERVED_PORT_BUILTIN_MULTICAST</code>	Select the <b>metatraffic</b> multicast port.
<code>DDS_RTPS_RESERVED_PORT_USER_UNICAST</code>	Select the <b>usertraffic</b> unicast port.
<code>DDS_RTPS_RESERVED_PORT_USER_MULTICAST</code>	Select the <b>usertraffic</b> multicast port.

### 4.154.4.2 DDS\_WireProtocolQosPolicyAutoKind

enum `DDS_WireProtocolQosPolicyAutoKind`

Mechanism to automatically calculate the GUID prefix.

See also

`DDS_WireProtocolQosPolicy::rtps_auto_id_kind` (p. 1832)

Enumerator

<code>DDS_RTPS_AUTO_ID_FROM_IP</code>	Builds the GUID prefix using the IPv4 address and process ID. Uses the IPv4 address of the first up-and-running interface of the host machine and the process ID to build the GUID prefix.
<code>DDS_RTPS_AUTO_ID_FROM_MAC</code>	Builds the GUID prefix using the MAC address and process ID. Uses the first 32 bits of the MAC address assigned to the first up-and-running interface and the process ID to build the GUID prefix. Note to Android Users: <code>DDS_RTPS_AUTO_ID_FROM_MAC</code> is not supported in recent versions of Android (6.0 and later).
<code>DDS_RTPS_AUTO_ID_FROM_UUID</code>	Builds the GUID prefix by selecting the UUID-based algorithm (default). This method of generating the GUID prefix does not require having a network interface and is friendly to IP mobility scenarios in which an RTI Connex application may start in a node that does not have a physical network interface enabled.
	Generated by Doxygen

## 4.154.5 Variable Documentation

### 4.154.5.1 DDS\_RTI\_BACKWARDS\_COMPATIBLE RTPS\_WELL\_KNOWN\_PORTS

```
const struct DDS_RtpsWellKnownPorts_t DDS_RTI_BACKWARDS_COMPATIBLE RTPS_WELL_KNOWN_PORTS [extern]
```

Assign to use well-known port mappings which are compatible with previous versions of the RTI Connex middleware.

Assign **DDS\_WireProtocolQosPolicy::rtps\_well\_known\_ports** (p. 1832) to this value to remain compatible with previous versions of the RTI Connex middleware that used fixed port mappings.

The following are the `rtps_well_known_ports` values for **DDS\_RTI\_BACKWARDS\_COMPATIBLE RTPS\_WELL\_KNOWN\_PORTS** (p. 1149):

```
port_base = 7400
domain_id_gain = 10
participant_id_gain = 1000
builtin_multicast_port_offset = 2
builtin_unicast_port_offset = 0
user_multicast_port_offset = 1
user_unicast_port_offset = 3
```

These settings are *not* compliant with OMG's DDS Interoperability Wire Protocol. To comply with the specification, please use **DDS\_INTEROPERABLE RTPS\_WELL\_KNOWN\_PORTS** (p. 1149).

See also

**DDS\_WireProtocolQosPolicy::rtps\_well\_known\_ports** (p. 1832)

**DDS\_INTEROPERABLE RTPS\_WELL\_KNOWN\_PORTS** (p. 1149)

### 4.154.5.2 DDS\_INTEROPERABLE RTPS\_WELL\_KNOWN\_PORTS

```
const struct DDS_RtpsWellKnownPorts_t DDS_INTEROPERABLE RTPS_WELL_KNOWN_PORTS [extern]
```

Assign to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

Assign **DDS\_WireProtocolQosPolicy::rtps\_well\_known\_ports** (p. 1832) to this value to use well-known port mappings which are compliant with OMG's DDS Interoperability Wire Protocol.

The following are the `rtps_well_known_ports` values for **DDS\_INTEROPERABLE RTPS\_WELL\_KNOWN\_PORTS** (p. 1149):

```
port_base = 7400
domain_id_gain = 250
participant_id_gain = 2
builtin_multicast_port_offset = 0
builtin_unicast_port_offset = 10
user_multicast_port_offset = 1
user_unicast_port_offset = 11
```

Assuming a maximum port number of 65535 (UDPv4), the above settings enable the use of about 230 domains with up to 120 Participants per node per domain.

These settings are *not* backwards compatible with previous versions of the RTI Connex middleware that used fixed port mappings. For backwards compability, please use **DDS\_RTI\_BACKWARDS\_COMPATIBLE RTPS\_WELL\_KNOWN\_PORTS** (p. 1149).

See also

**DDS\_WireProtocolQosPolicy::rtps\_well\_known\_ports** (p. 1832)

**DDS\_RTI\_BACKWARDS\_COMPATIBLE\_RTPS\_WELL\_KNOWN\_PORTS** (p. 1149)

#### 4.154.5.3 DDS\_WIREPROTOCOL\_QOS\_POLICY\_NAME

```
const char* const DDS_WIREPROTOCOL_QOS_POLICY_NAME [extern]
```

Stringified human-readable name for **DDS\_WireProtocolQosPolicy** (p. 1827).

## 4.155 Extended Qos Support

<<*extension*>> (p. 817) Types and defines used in extended QoS policies.

### Modules

*Declares IDL sequence < DDS\_TransportMulticastMapping\_t (p. 1789) >*

### 4.158.1 Detailed Description

Multicast communication mapping.

## 4.159 NDDS\_DISCOVERY\_PEERS

Environment variable or a file that specifies the default values of **DDS\_DiscoveryQosPolicy::initial\_peers** (p. 1480) and **DDS\_DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481) contained in the **DDS\_Domain**↔**ParticipantQos::discovery** (p. 1492) qos policy.

Environment variable or a file that specifies the default values of **DDS\_DiscoveryQosPolicy::initial\_peers** (p. 1480) and **DDS\_DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481) contained in the **DDS\_Domain**↔**ParticipantQos::discovery** (p. 1492) qos policy.

The default value of the **DDS\_DomainParticipantQos** (p. 1490) is obtained by calling **DDS\_DomainParticipant**↔**Factory\_get\_default\_participant\_qos()** (p. 37).

NDDS\_DISCOVERY\_PEERS specifies the default value of the **DDS\_DiscoveryQosPolicy::initial\_peers** (p. 1480) and **DDS\_DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481) fields, when the default participant QoS policies have not been explicitly set by the user (i.e., **DDS\_DomainParticipantFactory\_set\_default\_participant\_qos()** (p. 35) has never been called or was called using **DDS\_PARTICIPANT\_QOS\_DEFAULT** (p. 60)).

If NDDS\_DISCOVERY\_PEERS does *not* contain a multicast address, then the string sequence **DDS\_DiscoveryQos**↔**Policy::multicast\_receive\_addresses** (p. 1481) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If NDDS\_DISCOVERY\_PEERS contains one or more multicast addresses, the addresses will be stored in **DDS**↔**DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481), starting at element 0. They will be stored in the order in which they appear in NDDS\_DISCOVERY\_PEERS.

Note: IPv4 multicast addresses must have a prefix. Therefore, when using the UDPv6 transport: if there are any IPv4 multicast addresses in the peers list, make sure they have "udp4://" in front of them (such as udp4://239.255.0.1).

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **DDS**↔**DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481).

NDDS\_DISCOVERY\_PEERS provides a mechanism to dynamically switch the discovery configuration of an RTI Connext application without recompilation. The application programmer is free to not use the default values; instead use values supplied by other means.

NDDS\_DISCOVERY\_PEERS can be specified either in an environment variable as comma (',') separated "peer descriptors" (see **Peer Descriptor Format** (p. 1153)) or in a file. These formats are described below.

### 4.159.1 Peer Descriptor Format

A **peer descriptor** string specifies a range of participants at a given `locator`. Peer descriptor strings are used in the `DDS_DiscoveryQosPolicy::initial_peers` (p. 1480) field and the `DDS_DomainParticipant_add_peer()` (p. 146) operation.

The anatomy of a `peer` descriptor is illustrated below using a UDPv4 transport and a custom "StarFabric" transport example.

A peer descriptor consists of:

optional **Participant ID Limit**. If a simple integer is specified, it indicates the maximum participant ID to be contacted by the RTI Connex discovery mechanism at the given `locator`. If that integer is enclosed in square brackets (e.g.: [2]) *only* that Participant ID will be used. You can also specify a range in the form of [a-b]: in this case only the Participant IDs in that specific range are contacted. If omitted, a default value of 4 is implied: participant IDs 0,1,2,3, and 4 will be contacted.

- **Locator**. See **Locator Format** (p. 1153).

These are separated by the '@' character. The separator may be omitted if a participant ID limit is not explicitly specified.

Note that the "participant ID limit" only applies to unicast locators; it is ignored for multicast locators (and therefore should be omitted for multicast peer descriptors).

#### 4.159.1.1 Locator Format

A **locator** string specifies a transport and an address in string format. Locators are used to form peer descriptors. A locator is equivalent to a peer descriptor with the default maximum participant ID.

A locator consists of:

optional **Transport name** (**alias** or `class`). This identifies the set of transport plugins (**Transport Aliases** (p. 713)) that may be used to parse the `address` portion of the locator. Note that a transport class name is an implicit alias that is used to refer to all the transport plugin instances of that class.

optional **Address**. See **Address Format** (p. 1154).

These are separated by the "://" string. The separator is specified if and only if a transport name is specified.

If a transport name is specified, the address may be omitted; in that case, all the unicast addresses (across all transport plugin instances) associated with the transport class are implied. Thus, a locator string may specify several addresses.

If an address is specified, the transport name and the separator string may be omitted; in that case all the available transport plugins (for the **DDS\_Entity** (p. 1160)) may be used to parse the address string.

### 4.159.1.2 Address Format

An **address** string specifies a transport-independent network address that qualifies a **transport-dependent** address string. Addresses are used to form locators. Addresses are also used in **DDS\_DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481), and **DDS\_TransportMulticastSettings\_t::receive\_address** (p. 1796) fields. An address is equivalent to a locator in which the transport name and separator are omitted.

An address consists of:

optional **Network Address**. An address in IPv4 or IPv6 string notation. If omitted, the network address of the transport is implied (**Transport Network Address** (p. 716)).

optional **Transport Address**. A string that is passed to the transport for processing. The transport maps this string into **NDDS\_Transport\_Property\_t::address\_bit\_count** (p. 1856) bits. If omitted the network address is used as the fully qualified address.

These are separated by the '#' character. If a separator is specified, it must be followed by a non-empty string which is passed to the transport plugin. If the separator is omitted, it is treated as a transport address with an implicit network address (of the transport plugin). The implicit network address is the address used when registering the transport: e.g, the UDPv4 implicit network address is 0.0.0.0.0.0.0.0.0.0.

The bits resulting from the transport address string are combined with the network address. The least or most significant **NDDS\_Transport\_Property\_t::address\_bit\_count** (p. 1856) bits of the network address are ignored and replaced with the transport address. The sign of the **NDDS\_Transport\_Property\_t::address\_bit\_count** (p. 1856) value determines whether the most significant bits (negative sign) or least significant bits (positive sign) are ignored (**Transport Network Address** (p. 716)).

### 4.159.2 NDDS\_DISCOVERY\_PEERS Environment Variable Format

NDDS\_DISCOVERY\_PEERS can be specified via an environment variable of the same name, consisting of a sequence of peer descriptors separated by the comma (',') character.

#### Examples

Multicast (maximum participant ID is irrelevant)

- 239.255.0.1

Default maximum participant ID on localhost

- localhost

Default maximum participant ID on host 192.168.1.1 (IPv4)

- 192.168.1.1

Default maximum participant ID on host FAA0::0 (IPv6)

- FAA0::1

Default maximum participant ID on host himalaya accessed using the "udp4" transport plugin(s) (IPv4)

- udp4://himalaya

Default maximum participant ID on localhost using the "udp4" transport plugin(s) registered at network address FAA0::0

- udp4://FAA0::0#localhost

Default maximum participant ID on host 0/0/R (StarFabric)

- 0/0/R
- #0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s)

- starfabric://0/0/R
- starfabric://#0/0/R

Default maximum participant ID on host 0/0/R (StarFabric) using the "starfabric" (StarFabric) transport plugin(s) registered at network address FAA0::0

- starfabric://FBB0::0#0/0/R

Default maximum participant ID on all unicast addresses accessed via the "starfabric" (StarFabric) transport plugin(s)

- starfabric://

Default maximum participant ID on all unicast addresses accessed via the "shmem" (shared memory) transport plugin(s) registered at network address FCC0::0

- shmem://FCC0::0

Default maximum participant ID on hosts himalaya and gangotri

- himalaya,gangotri

Maximum participant ID of 1 on hosts himalaya and gangotri

- 1@himalaya,1@gangotri

Combinations of above

- 239.255.0.1,localhost,192.168.1.1,0/0/R
- FAA0::1,FAA0::0#localhost,FBB0::0#0/0/R
- udp4://himalaya,udp4://FAA0::0#localhost,#0/0/R
- starfabric://0/0/R,starfabric://FBB0::0#0/0/R,shmem://
- starfabric://,shmem://FCC0::0,1@himalaya,1@gangotri

### 4.159.3 NDDS\_DISCOVERY\_PEERS File Format

NDDS\_DISCOVERY\_PEERS can be specified via a file of the same name in the program's current working directory. A NDDS\_DISCOVERY\_PEERS file would contain a sequence of peer descriptors separated by whitespace or the comma (',') character. The file may also contain comments starting with a semicolon (;) character till the end of the line.

#### Example:

```
;; NDDS_DISCOVERY_PEERS - Discovery Configuration File

;;

;;

;; NOTE:

;; 1. This file must be in the current working directory, i.e.
;;    in the folder from which the application is launched.

;;

;; 2. This file takes precedence over the environment variable NDDS_DISCOVERY_PEERS

;;

;; Multicast

239.255.0.1           ; The default dds discovery multicast address

;; Unicast

localhost,192.168.1.1 ; A comma can be used a separator

FAA0::1 FAA0::0#localhost ; Whitespace can be used as a separator

1@himalaya           ; Maximum participant ID of 1 on 'himalaya'

1@gangotri

;; UDPv4

udpv4://himalaya     ; 'himalaya' via 'udpv4' transport plugin(s)

udpv4://FAA0::0#localhost ; 'localhost' via 'udpv4' transport
                        ; plugin registered at network address FAA0::0

;; Shared Memory

shmem://              ; All 'shmem' transport plugin(s)

builtin.shmem://      ; The builtin 'shmem' transport plugin

shmem://FCC0::0       ; Shared memory transport plugin registered
                        ;
                        ; at network address FCC0::0

;; StarFabric

0/0/R                 ; StarFabric node 0/0/R

starfabric://0/0/R    ; 0/0/R accessed via 'starfabric'
                        ;
                        ; transport plugin(s)
```

```

starfabric://FBB0::0#0/0/R ; StarFabric transport plugin registered
                        ;           at network address FBB0::0
starfabric://           ; All 'starfabric' transport plugin(s)

```

#### 4.159.4 NDDS\_DISCOVERY\_PEERS Precedence

If the current working directory from which the RTI Connex application is launched contains a file called NDDS\_↔DISCOVERY\_PEERS, and an environment variable named NDDS\_DISCOVERY\_PEERS is also defined, the file takes precedence; the environment variable is ignored.

#### 4.159.5 NDDS\_DISCOVERY\_PEERS Default Value

If NDDS\_DISCOVERY\_PEERS is not specified (either as a file in the current working directory, or as an environment variable), it implicitly defaults to the following.

```

;; Multicast (only on platforms which allow UDPv4 multicast out of the box)
;;
;; This allows any dds applications anywhere on the local network to
;; discover each other over UDPv4.
builtin.udpv4://239.255.0.1 ; dds's default discovery multicast address
                        ; This is also the default multicast receive address
;; Unicast - UDPv4 (on all platforms)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over UDP/IPv4.
builtin.udpv4://127.0.0.1
;; Unicast - Shared Memory (only on platforms that support shared memory)
;;
;; This allows two dds applications using participant IDs up to the maximum
;; default participant ID on the local host and domain to discover each
;; other over shared memory.
builtin.shmem://

```

#### 4.159.6 Builtin Transport Class Names

The class names for the builtin transport plugins are:

- `shmem` - **::Shared Memory Transport** (p. 839)
- `udpv4` - **::UDpv4 Transport** (p. 846)
- `udpv6` - **::UDpv6 Transport** (p. 862)

These may be used as the transport names in the **Locator Format** (p. 1153).

#### 4.159.7 NDDS\_DISCOVERY\_PEERS and Local Host Communication

Suppose you want to communicate with other RTI Connex applications on the same host and you are setting `NDDS_DISCOVERY_PEERS` explicitly (generally in order to use unicast discovery with applications on other hosts).

If the local host platform does not support the shared memory transport, then you can include the name of the local host in the `NDDS_DISCOVERY_PEERS` list.

If the local host platform supports the shared memory transport, then you can do one of the following:

- Include `"shmem://"` in the `NDDS_DISCOVERY_PEERS` list. This will cause shared memory to be used for discovery and data traffic for applications on the same host.

or:

- Include the name of the local host in the `NDDS_DISCOVERY_PEERS` list and disable the shared memory transport in the **DDS\_TransportBuiltinQosPolicy** (p. 1786) of the **DDS\_DomainParticipant** (p. 72). This will cause UDP loopback to be used for discovery and data traffic for applications on the same host.

(To check if your platform supports shared memory, see the `Platform Notes`.)

## 4.160 Entity Support

**DDS\_Entity** (p. 1160), **DDS\_Listener** (p. 1569) and related items.

### Data Structures

- struct **DDS\_Listener**  
 <<*interface*>> (p. 818) Abstract base class for all Listener interfaces.

### Macros

- #define **DDS\_Listener\_INITIALIZER**  
 Initialize the **DDS\_Listener::listener\_data** (p. 1572) pointer to NULL.

### Typedefs

- typedef struct DDS\_EntityImpl **DDS\_Entity**  
 <<*interface*>> (p. 818) Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.
- typedef struct DDS\_DomainEntityImpl **DDS\_DomainEntity**  
 <<*interface*>> (p. 818) Abstract base class for all DDS entities except for the **DDS\_DomainParticipant** (p. 72).

### Functions

- **DDS\_ReturnCode\_t DDS\_Entity\_enable** ( **DDS\_Entity** \*self)  
 Enables the **DDS\_Entity** (p. 1160).
- **DDS\_StatusCondition \* DDS\_Entity\_get\_statuscondition** ( **DDS\_Entity** \*self)  
 Allows access to the **DDS\_StatusCondition** (p. 1170) associated with the **DDS\_Entity** (p. 1160).
- **DDS\_StatusMask DDS\_Entity\_get\_status\_changes** ( **DDS\_Entity** \*self)  
 Retrieves the list of communication statuses in the **DDS\_Entity** (p. 1160) that are triggered.
- **DDS\_InstanceHandle\_t DDS\_Entity\_get\_instance\_handle** (const **DDS\_Entity** \*self)  
 Allows access to the **DDS\_InstanceHandle\_t** (p. 210) associated with the **DDS\_Entity** (p. 1160).
- **DDS\_EntityKind\_t DDS\_Entity\_get\_entity\_kind** ( **DDS\_Entity** \*self)  
 Allows access to the **DDS\_InstanceHandle\_t** (p. 210) associated with the **DDS\_Entity** (p. 1160).

#### 4.160.1 Detailed Description

**DDS\_Entity** (p. 1160), **DDS\_Listener** (p. 1569) and related items.

**DDS\_Entity** (p. 1160) subtypes are created and destroyed by factory objects. With the exception of **DDS\_DomainParticipant** (p. 72), whose factory is **DDS\_DomainParticipantFactory** (p. 28), all **DDS\_Entity** (p. 1160) factory objects are themselves **DDS\_Entity** (p. 1160) subtypes as well.

*Important:* all **DDS\_Entity** (p. 1160) delete operations are inherently thread-unsafe. The user must take extreme care that a given **DDS\_Entity** (p. 1160) is not destroyed in one thread while being used concurrently (including being deleted concurrently) in another thread. An operation's effect in the presence of the concurrent deletion of the operation's target **DDS\_Entity** (p. 1160) is undefined.

## 4.160.2 Macro Definition Documentation

### 4.160.2.1 DDS\_Listener\_INITIALIZER

```
#define DDS_Listener_INITIALIZER
```

Initialize the **DDS\_Listener::listener\_data** (p. 1572) pointer to NULL.

## 4.160.3 Typedef Documentation

### 4.160.3.1 DDS\_Entity

```
typedef struct DDS_EntityImpl DDS_Entity
```

<<**interface**>> (p. 818) Abstract base class for all the DDS objects that support QoS policies, a listener, and a status condition.

All operations except for `set_qos()`, `get_qos()`, `set_listener()`, `get_listener()` and `enable()`, may return the value **DDS\_↔ RETCODE\_NOT\_ENABLED** (p. 1025).

QoS:

**QoS Policies** (p. 1041)

Status:

**Status Kinds** (p. 1025)

Listener:

**DDS\_Listener** (p. 1569)

## 4.160.4 Abstract operations

Each derived entity provides the following operations specific to its role in RTI Connext.

#### 4.160.4.1 set\_qos (abstract)

This operation sets the QoS policies of the **DDS\_Entity** (p. 1160). Each of the derived entity classes provides this operation: **DDS\_Entity** (p. 1160) classes (**DDS\_DomainParticipant** (p. 72), **DDS\_Topic** (p. 172), **DDS\_Publisher** (p. 436), **DDS\_DataWriter** (p. 478), **DDS\_Subscriber** (p. 565), and **DDS\_DataReader** (p. 608)) so that the policies that are meaningful to each **DDS\_Entity** (p. 1160) can be set. For example, see **DDS\_DomainParticipant\_set\_qos** (p. 148).

##### Precondition

Certain policies are immutable (see **QoS Policies** (p. 1041)): they can only be set at **DDS\_Entity** (p. 1160) creation time or before the entity is enabled. If `set_qos()` is invoked after the **DDS\_Entity** (p. 1160) is enabled and it attempts to change the value of an immutable policy, the operation will fail and return **DDS\_RETCODE\_IMMUTABLE\_POLICY** (p. 1025).

Certain values of QoS policies can be incompatible with the settings of the other policies. The `set_qos()` operation will also fail if it specifies a set of values that, once combined with the existing values, would result in an inconsistent set of policies. In this case, the operation will fail and return **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025).

If the application supplies a non-default value for a QoS policy that is not supported by the implementation of the service, the `set_qos` operation will fail and return **DDS\_RETCODE\_UNSUPPORTED** (p. 1025).

##### Postcondition

The existing set of policies is only changed if the `set_qos()` operation succeeds. This is indicated by a return code of **DDS\_RETCODE\_OK** (p. 1025). In all other cases, none of the policies are modified.

Each derived **DDS\_Entity** (p. 1160) class (**DDS\_DomainParticipant** (p. 72), **DDS\_Topic** (p. 172), **DDS\_Publisher** (p. 436), **DDS\_DataWriter** (p. 478), **DDS\_Subscriber** (p. 565), **DDS\_DataReader** (p. 608)) has a corresponding special value of the QoS (**DDS\_PARTICIPANT\_QOS\_DEFAULT** (p. 60), **DDS\_PUBLISHER\_QOS\_DEFAULT** (p. 158), **DDS\_SUBSCRIBER\_QOS\_DEFAULT** (p. 159), **DDS\_TOPIC\_QOS\_DEFAULT** (p. 157), **DDS\_DATAWRITER\_QOS\_DEFAULT** (p. 463), **DDS\_DATAREADER\_QOS\_DEFAULT** (p. 593)). This special value may be used as a parameter to the `set_qos` operation to indicate that the QoS of the **DDS\_Entity** (p. 1160) should be changed to match the current default QoS set in the **DDS\_Entity** (p. 1160)'s factory. The operation `set_qos` cannot modify the immutable QoS, so a successful return of the operation indicates that the mutable QoS for the Entity has been modified to match the current default for the **DDS\_Entity** (p. 1160)'s factory.

The set of policies specified in the `qos` parameter are applied on top of the existing QoS, replacing the values of any policies previously set.

Possible error codes returned in addition to **Standard Return Codes** (p. 1024) : **DDS\_RETCODE\_IMMUTABLE\_POLICY** (p. 1025), **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025).

#### 4.160.4.2 get\_qos (abstract)

This operation allows access to the existing set of QoS policies for the **DDS\_Entity** (p. 1160). This operation must be provided by each of the derived **DDS\_Entity** (p. 1160) classes (**DDS\_DomainParticipant** (p. 72), **DDS\_Topic** (p. 172), **DDS\_Publisher** (p. 436), **DDS\_DataWriter** (p. 478), **DDS\_Subscriber** (p. 565), and **DDS\_DataReader** (p. 608)), so that the policies that are meaningful to each **DDS\_Entity** (p. 1160) can be retrieved. For example, see **DDS\_DomainParticipant\_get\_qos** (p. 149).

Possible error codes are **Standard Return Codes** (p. 1024).

#### 4.160.4.3 `set_listener` (abstract)

This operation installs a **DDS\_Listener** (p. 1569) on the **DDS\_Entity** (p. 1160). The listener will only be invoked on the changes of communication status indicated by the specified `mask`.

This operation must be provided by each of the derived **DDS\_Entity** (p. 1160) classes (**DDS\_DomainParticipant** (p. 72), **DDS\_Topic** (p. 172), **DDS\_Publisher** (p. 436), **DDS\_DataWriter** (p. 478), **DDS\_Subscriber** (p. 565), and **DDS\_DataReader** (p. 608)), so that the listener is of the concrete type suitable to the particular **DDS\_Entity** (p. 1160).

There are two components involved when setting up listeners: the listener itself and the mask. Both of these can be NULL.

Listeners for some Entities derive from the Connex DDS Listeners for related Entities. This means that the derived Listener has all of the methods of its parent class. You can install Listeners at all levels of the object hierarchy. At the top is the DomainParticipantListener; only one can be installed in a DomainParticipant. Then every Subscriber and Publisher can have their own Listener. Finally, each Topic, DataReader and DataWriter can have their own listeners. All are optional.

Suppose, however, that an Entity does not install a Listener, or installs a Listener that does not have particular communication status selected in the bitmask. In this case, if/when that particular status changes for that Entity, the corresponding Listener for that Entity's parent is called. Status changes are "propagated" from child Entity to parent Entity until a Listener is found that is registered for that status. Connex DDS will give up and drop the status-change event only if no Listeners have been installed in the object hierarchy to be called back for the specific status.

The following table describes the effect of different combinations of Listeners and Status Bit Masks considering the hierarchical processing.

**Table 4.877 Effect of Different Combinations of Listeners and Status Bit Masks**

	No Bits Set in Mask	Some/All Bits Set in Mask
Listener is Specified	Connex DDS finds the next most relevant listener for the changed status	For the statuses that are enabled in the mask, the most relevant listener will be called. The 'statusChangedFlag' for the relevant status is reset
Listener is NULL	Connex DDS behaves as if the listener is not installed and finds the next most relevant listener for that status	Connex DDS behaves as if the listener is installed, but the callback is doing nothing. This is called a "nil" listener

#### Postcondition

Only one listener can be attached to each **DDS\_Entity** (p. 1160). If a listener was already set, the operation `set_listener()` will replace it with the new one. Consequently, if the value NULL is passed for the listener parameter to the `set_listener` operation, any existing listener will be removed.

#### 4.160.4.4 `get_listener` (abstract)

This operation allows access to the existing **DDS\_Listener** (p. 1569) attached to the **DDS\_Entity** (p. 1160).

This operation must be provided by each of the derived **DDS\_Entity** (p. 1160) classes (**DDS\_DomainParticipant** (p. 72), **DDS\_Topic** (p. 172), **DDS\_Publisher** (p. 436), **DDS\_DataWriter** (p. 478), **DDS\_Subscriber** (p. 565), and **DDS\_DataReader** (p. 608)) so that the listener is of the concrete type suitable to the particular **DDS\_Entity** (p. 1160).

If no listener is installed on the **DDS\_Entity** (p. 1160), this operation will return NULL.

#### 4.160.4.5 DDS\_DomainEntity

```
typedef struct DDS_DomainEntityImpl DDS_DomainEntity
```

<<*interface*>> (p. 818) Abstract base class for all DDS entities except for the **DDS\_DomainParticipant** (p. 72).

Its sole purpose is to *conceptually* express that **DDS\_DomainParticipant** (p.72) is a special kind of **DDS\_Entity** (p. 1160) that acts as a container of all other **DDS\_Entity** (p. 1160) but itself cannot contain other **DDS\_DomainParticipant** (p. 72).

### 4.160.5 Function Documentation

#### 4.160.5.1 DDS\_Entity\_enable()

```
DDS_ReturnCode_t DDS_Entity_enable (
    DDS_Entity * self )
```

Enables the **DDS\_Entity** (p. 1160).

This operation enables the Entity. Entity objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY\_FACTORY** (p. 1090) QoS policy on the corresponding factory for the **DDS\_Entity** (p. 1160).

By default, **ENTITY\_FACTORY** (p. 1090) is set so that it is not necessary to explicitly call **DDS\_Entity\_enable** (p. 1163) on newly created entities.

The **DDS\_Entity\_enable** (p. 1163) operation is idempotent. Calling enable on an already enabled Entity returns OK and has no effect.

If a **DDS\_Entity** (p. 1160) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **DDS\_Entity\_get\_statuscondition** (p. 1164)
- 'factory' operations
- **DDS\_Entity\_get\_status\_changes** (p. 1164) and other get status operations (although the status of a disabled entity never changes)
- 'lookup' operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **DDS\_RETCODE\_NOT\_ENABLED** (p. 1025).

It is legal to delete an **DDS\_Entity** (p. 1160) that has not been enabled by calling the proper operation on its factory .

Entities created from a factory Entity that is disabled are created disabled, regardless of the setting of the **DDS\_EntityFactoryQosPolicy** (p. 1543).

Calling enable on an Entity whose factory Entity is not enabled will fail and return **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

If **DDS\_EntityFactoryQosPolicy::autoenable\_created\_entities** (p. 1544) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **DDS\_Publisher** (p. 436) will enable all its contained **DDS\_DataWriter** (p. 478) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value == FALSE`.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

One of the **Standard Return Codes** (p.1024), **Standard Return Codes** (p.1024) or **DDS\_RETCODE\_↔PRECONDITION\_NOT\_MET** (p.1025).

## 4.160.5.2 DDS\_Entity\_get\_statuscondition()

```
DDS_StatusCondition * DDS_Entity_get_statuscondition (
    DDS_Entity * self )
```

Allows access to the **DDS\_StatusCondition** (p.1170) associated with the **DDS\_Entity** (p.1160).

The returned condition can then be added to a **DDS\_WaitSet** (p.1170) so that the application can wait for specific status changes that affect the **DDS\_Entity** (p.1160).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

the status condition associated with this entity.

## 4.160.5.3 DDS\_Entity\_get\_status\_changes()

```
DDS_StatusMask DDS_Entity_get_status_changes (
    DDS_Entity * self )
```

Retrieves the list of communication statuses in the **DDS\_Entity** (p.1160) that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the `get_*_status()` function.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the `get_status_changes` operation will be empty.

The list of statuses returned by the `get_status_changes` operation refers to the status that are triggered on the Entity itself and does not include statuses that apply to contained entities.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

list of communication statuses in the **DDS\_Entity** (p. 1160) that are triggered.

## See also

**Status Kinds** (p. 1025)

#### 4.160.5.4 DDS\_Entity\_get\_instance\_handle()

```
DDS_InstanceHandle_t DDS_Entity_get_instance_handle (  
    const DDS_Entity * self )
```

Allows access to the **DDS\_InstanceHandle\_t** (p. 210) associated with the **DDS\_Entity** (p. 1160).

This operation returns the **DDS\_InstanceHandle\_t** (p. 210) that represents the **DDS\_Entity** (p. 1160).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

the instance handle associated with this entity.

#### 4.160.5.5 DDS\_Entity\_get\_entity\_kind()

```
DDS_EntityKind_t DDS_Entity_get_entity_kind (  
    DDS_Entity * self )
```

Allows access to the **DDS\_InstanceHandle\_t** (p. 210) associated with the **DDS\_Entity** (p. 1160).

This operation returns the **DDS\_InstanceHandle\_t** (p. 210) that represents the **DDS\_Entity** (p. 1160).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

the instance handle associated with this entity.

## 4.161 Conditions and WaitSets

**DDS\_Condition** (p. 1169) and **DDS\_WaitSet** (p. 1170) and related items.

### Modules

- **AsyncWaitSet**

<<*extension*>> (p. 817) A specialization of **DDS\_WaitSet** (p. 1170) that provides a mechanism to perform the wait asynchronously and uses a thread pool to dispatch the attached active **DDS\_Condition** (p. 1169).

### Data Structures

- struct **DDS\_ConditionSeq**

Instantiates *FooSeq* (p. 1845) < **DDS\_Condition** (p. 1169) >

- struct **DDS\_ConditionHandler**

<<*extension*>> (p. 817) <<*interface*>> (p. 818) Handler called by the **DDS\_Condition\_dispatch** (p. 1174).

- struct **DDS\_WaitSetProperty\_t**

<<*extension*>> (p. 817) Specifies the **DDS\_WaitSet** (p. 1170) behavior for multiple trigger events.

### Macros

- #define **DDS\_ConditionHandler\_INITIALIZER**

<<*experimental*>> (p. 817) <<*extension*>> (p. 817) Initializer for new **DDS\_ConditionHandler** (p. 1350).

- #define **DDS\_WaitSetProperty\_t\_INITIALIZER**

<<*extension*>> (p. 817) Initializer for new property instances.

### Typedefs

- typedef struct DDS\_ConditionImpl **DDS\_Condition**

<<*interface*>> (p. 818) Root class for all the conditions that may be attached to a **DDS\_WaitSet** (p. 1170).

- typedef void(\* **DDS\_ConditionHandler\_OnConditionTriggeredCallback**) (void \*handler\_data, **DDS\_Condition** \*condition)

Prototype of a **DDS\_ConditionHandler** (p. 1350) *on\_condition\_triggered* function.

- typedef struct DDS\_GuardConditionImpl **DDS\_GuardCondition**

<<*interface*>> (p. 818) A specific **DDS\_Condition** (p. 1169) whose *trigger\_value* is completely under the control of the application.

- typedef struct DDS\_StatusConditionImpl **DDS\_StatusCondition**

<<*interface*>> (p. 818) A specific **DDS\_Condition** (p. 1169) that is associated with each **DDS\_Entity** (p. 1160).

- typedef struct DDS\_WaitSetImpl **DDS\_WaitSet**

<<*interface*>> (p. 818) Allows an application to wait until one or more of the attached **DDS\_Condition** (p. 1169) objects has a *trigger\_value* of **DDS\_BOOLEAN\_TRUE** (p. 1004) or else until the timeout expires.

## Functions

- **DDS\_Boolean DDS\_Condition\_get\_trigger\_value** ( DDS\_Condition \*self)
 

*Retrieve the trigger\_value.*
- **DDS\_ReturnCode\_t DDS\_Condition\_set\_handler** ( DDS\_Condition \*self, const struct DDS\_ConditionHandler \*handler)
 

<<extension>> (p. 817) Registers a **DDS\_ConditionHandler** (p. 1350) in this **DDS\_Condition** (p. 1169).
- struct **DDS\_ConditionHandler DDS\_Condition\_get\_handler** ( DDS\_Condition \*self)
 

<<extension>> (p. 817) Returns the registered **DDS\_ConditionHandler** (p. 1350).
- void **DDS\_Condition\_dispatch** ( DDS\_Condition \*self)
 

<<extension>> (p. 817) Calls **DDS\_ConditionHandler::on\_condition\_triggered** (p. 1351) of the registered **DDS\_ConditionHandler** (p. 1350).
- **DDS\_Condition \* DDS\_GuardCondition\_as\_condition** ( DDS\_GuardCondition \*guardCondition)
 

*Access a **DDS\_GuardCondition** (p. 1169)'s supertype instance.*
- **DDS\_GuardCondition \* DDS\_GuardCondition\_new** (void)
 

*No argument constructor.*
- **DDS\_ReturnCode\_t DDS\_GuardCondition\_delete** ( DDS\_GuardCondition \*self)
 

*Destructor.*
- **DDS\_ReturnCode\_t DDS\_GuardCondition\_set\_trigger\_value** ( DDS\_GuardCondition \*self, DDS\_Boolean value)
 

*Set the guard condition trigger value.*
- **DDS\_Condition \* DDS\_StatusCondition\_as\_condition** ( DDS\_StatusCondition \*statusCondition)
 

*Access a **DDS\_StatusCondition** (p. 1170)'s supertype instance.*
- **DDS\_StatusMask DDS\_StatusCondition\_get\_enabled\_statuses** ( DDS\_StatusCondition \*self)
 

*Get the list of statuses enabled on an **DDS\_Entity** (p. 1160).*
- **DDS\_ReturnCode\_t DDS\_StatusCondition\_set\_enabled\_statuses** ( DDS\_StatusCondition \*self, DDS\_StatusMask mask)
 

*This operation defines the list of communication statuses that determine the trigger\_value of the **DDS\_StatusCondition** (p. 1170).*
- **DDS\_Entity \* DDS\_StatusCondition\_get\_entity** ( DDS\_StatusCondition \*self)
 

*Get the **DDS\_Entity** (p. 1160) associated with the **DDS\_StatusCondition** (p. 1170).*
- **DDS\_WaitSet \* DDS\_WaitSet\_new** (void)
 

*Default no-argument constructor.*
- **DDS\_WaitSet \* DDS\_WaitSet\_new\_ex** (const struct DDS\_WaitSetProperty\_t \*prop)
 

<<extension>> (p. 817) Constructor for a **DDS\_WaitSet** (p. 1170) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first
- **DDS\_ReturnCode\_t DDS\_WaitSet\_delete** ( DDS\_WaitSet \*self)
 

*Destructor.*
- **DDS\_ReturnCode\_t DDS\_WaitSet\_set\_property** ( DDS\_WaitSet \*self, const struct DDS\_WaitSetProperty\_t \*prop)
 

<<extension>> (p. 817) Sets the **DDS\_WaitSetProperty\_t** (p. 1825), to configure the associated **DDS\_WaitSet** (p. 1170) to return after one or more trigger events have occurred.
- **DDS\_ReturnCode\_t DDS\_WaitSet\_get\_property** ( DDS\_WaitSet \*self, struct DDS\_WaitSetProperty\_t \*prop)
 

<<extension>> (p. 817) Retrieves the **DDS\_WaitSetProperty\_t** (p. 1825) configuration of the associated **DDS\_WaitSet** (p. 1170).
- **DDS\_ReturnCode\_t DDS\_WaitSet\_wait** ( DDS\_WaitSet \*self, struct DDS\_ConditionSeq \*active\_conditions, const struct DDS\_Duration\_t \*timeout)
 

*Allows an application thread to wait for the occurrence of certain conditions.*

- **DDS\_ReturnCode\_t DDS\_WaitSet\_attach\_condition** ( **DDS\_WaitSet** \*self, **DDS\_Condition** \*cond)  
*Attaches a **DDS\_Condition** (p. 1169) to the **DDS\_WaitSet** (p. 1170).*
- **DDS\_ReturnCode\_t DDS\_WaitSet\_detach\_condition** ( **DDS\_WaitSet** \*self, **DDS\_Condition** \*cond)  
*Detaches a **DDS\_Condition** (p. 1169) from the **DDS\_WaitSet** (p. 1170).*
- **DDS\_ReturnCode\_t DDS\_WaitSet\_get\_conditions** ( **DDS\_WaitSet** \*self, struct **DDS\_ConditionSeq** \*attached\_conditions)  
*Retrieves the list of attached **DDS\_Condition** (p. 1169) (s).*

### 4.161.1 Detailed Description

**DDS\_Condition** (p. 1169) and **DDS\_WaitSet** (p. 1170) and related items.

### 4.161.2 Macro Definition Documentation

#### 4.161.2.1 DDS\_ConditionHandler\_INITIALIZER

```
#define DDS_ConditionHandler_INITIALIZER
```

<<*experimental*>> (p. 817) <<*extension*>> (p. 817) Initializer for new **DDS\_ConditionHandler** (p. 1350).

No memory is allocated. New **DDS\_ConditionHandler** (p. 1350) instances stored in the stack should be initialized with this value before they are passed to any functions.

See also

**DDS\_ConditionHandler** (p. 1350)

#### 4.161.2.2 DDS\_WaitSetProperty\_t\_INITIALIZER

```
#define DDS_WaitSetProperty_t_INITIALIZER
```

**Value:**

```
{ \
  1, DDS_DURATION_INFINITE_VALUE \
}
```

<<*extension*>> (p. 817) Initializer for new property instances.

Default property specifies `max_event_count = 1` and `max_event_delay = DDS_DURATION_INFINITE`

### 4.161.3 Typedef Documentation

#### 4.161.3.1 DDS\_Condition

```
typedef struct DDS_ConditionImpl DDS_Condition
```

<<*interface*>> (p. 818) Root class for all the conditions that may be attached to a **DDS\_WaitSet** (p. 1170).

This basic class is specialised in three classes:

**DDS\_GuardCondition** (p. 1169), **DDS\_StatusCondition** (p. 1170), and **DDS\_ReadCondition** (p. 686).

A **DDS\_Condition** (p. 1169) has a `trigger_value` that can be **DDS\_BOOLEAN\_TRUE** (p. 1004) or **DDS\_BOOLEAN\_FALSE** (p. 1004) and is set automatically by RTI Connex.

See also

**DDS\_WaitSet** (p. 1170)

#### 4.161.3.2 DDS\_ConditionHandler\_OnConditionTriggeredCallback

```
typedef void(* DDS_ConditionHandler_OnConditionTriggeredCallback) (void *handler_data, DDS_↔  
Condition *condition)
```

Prototype of a **DDS\_ConditionHandler** (p. 1350) `on_condition_triggered` function.

Parameters

<i>handler_data</i>	<< <i>in</i> >> (p. 818) Data associated with the handler when the handler is set.
<i>condition</i>	st_in associated <b>DDS_Condition</b> (p. 1169) on which the <b>DDS_Condition_dispatch</b> (p. 1174) is called.

#### 4.161.3.3 DDS\_GuardCondition

```
typedef struct DDS_GuardConditionImpl DDS_GuardCondition
```

<<*interface*>> (p. 818) A specific **DDS\_Condition** (p. 1169) whose `trigger_value` is completely under the control of the application.

The **DDS\_GuardCondition** (p. 1169) provides a way for an application to manually wake up a **DDS\_WaitSet** (p. 1170). This is accomplished by attaching the **DDS\_GuardCondition** (p. 1169) to the **DDS\_WaitSet** (p. 1170) and then setting the `trigger_value` by means of the **DDS\_GuardCondition\_set\_trigger\_value** (p. 1175) operation.

See also

**DDS\_WaitSet** (p. 1170)

#### 4.161.3.4 DDS\_StatusCondition

```
typedef struct DDS_StatusConditionImpl DDS_StatusCondition
```

<<*interface*>> (p. 818) A specific **DDS\_Condition** (p. 1169) that is associated with each **DDS\_Entity** (p. 1160).

The `trigger_value` of the **DDS\_StatusCondition** (p. 1170) depends on the communication status of that entity (e.g., arrival of data, loss of information, etc.), 'filtered' by the set of `enabled_statuses` on the **DDS\_StatusCondition** (p. 1170).

See also

**Status Kinds** (p. 1025)

**DDS\_WaitSet** (p. 1170), **DDS\_Condition** (p. 1169)

**DDS\_Listener** (p. 1569)

#### 4.161.3.5 DDS\_WaitSet

```
typedef struct DDS_WaitSetImpl DDS_WaitSet
```

<<*interface*>> (p. 818) Allows an application to wait until one or more of the attached **DDS\_Condition** (p. 1169) objects has a `trigger_value` of **DDS\_BOOLEAN\_TRUE** (p. 1004) or else until the timeout expires.

#### 4.161.4 Usage

**DDS\_Condition** (p. 1169) (s) (in conjunction with wait-sets) provide an alternative mechanism to allow the middleware to communicate communication status changes (including arrival of data) to the application.

"::DDS\_WaitSet and ::DDS\_Condition (s)"

This mechanism is wait-based. Its general use pattern is as follows:

- The application indicates which relevant information it wants to get by creating **DDS\_Condition** (p. 1169) objects (**DDS\_StatusCondition** (p. 1170), **DDS\_ReadCondition** (p. 686) or **DDS\_QueryCondition** (p. 691)) and attaching them to a **DDS\_WaitSet** (p. 1170).

- It then waits on that **DDS\_WaitSet** (p. 1170) until the `trigger_value` of one or several **DDS\_Condition** (p. 1169) objects become **DDS\_BOOLEAN\_TRUE** (p. 1004).
- It then uses the result of the wait (i.e., `active_conditions`, the list of **DDS\_Condition** (p. 1169) objects with `trigger_value == DDS_BOOLEAN_TRUE` (p. 1004)) to actually get the information:
  - by calling **DDS\_Entity\_get\_status\_changes** (p. 1164) and then `get_<communication_status>()` on the relevant **DDS\_Entity** (p. 1160), if the condition is a **DDS\_StatusCondition** (p. 1170) and the status changes, refer to plain communication status;
  - by calling **DDS\_Entity\_get\_status\_changes** (p. 1164) and then **DDS\_Subscriber\_get\_datareaders** (p. 581) on the relevant **DDS\_Subscriber** (p. 565) (and then **FooDataReader\_read()** (p. 618) or **FooDataReader\_take** (p. 619) on the returned **DDS\_DataReader** (p. 608) objects), if the condition is a **DDS\_StatusCondition** (p. 1170) and the status changes refers to **DDS\_DATA\_ON\_READERS\_STATUS** (p. 1033);
  - by calling **DDS\_Entity\_get\_status\_changes** (p. 1164) and then **FooDataReader\_read()** (p. 618) or **FooDataReader\_take** (p. 619) on the relevant **DDS\_DataReader** (p. 608), if the condition is a **DDS\_StatusCondition** (p. 1170) and the status changes refers to **DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033);
  - by calling directly **FooDataReader\_read\_w\_condition** (p. 623) or **FooDataReader\_take\_w\_condition** (p. 625) on a **DDS\_DataReader** (p. 608) with the **DDS\_Condition** (p. 1169) as a parameter if it is a **DDS\_ReadCondition** (p. 686) or a **DDS\_QueryCondition** (p. 691).

Usually the first step is done in an initialization phase, while the others are put in the application main loop.

As there is no extra information passed from the middleware to the application when a wait returns (only the list of triggered **DDS\_Condition** (p. 1169) objects), **DDS\_Condition** (p. 1169) objects are meant to embed all that is needed to react properly when enabled. In particular, **DDS\_Entity** (p. 1160)-related conditions are related to exactly one **DDS\_Entity** (p. 1160) and cannot be shared.

The blocking behavior of the **DDS\_WaitSet** (p. 1170) is illustrated below.

blocking behavior"

The result of a **DDS\_WaitSet\_wait** (p. 1180) operation depends on the state of the **DDS\_WaitSet** (p. 1170), which in turn depends on whether at least one attached **DDS\_Condition** (p. 1169) has a `trigger_value` of **DDS\_BOOLEAN\_TRUE** (p. 1004). If the wait operation is called on **DDS\_WaitSet** (p. 1170) with state **BLOCKED**, it will block the calling thread. If wait is called on a **DDS\_WaitSet** (p. 1170) with state **UNBLOCKED**, it will return immediately. In addition, when the **DDS\_WaitSet** (p. 1170) transitions from **BLOCKED** to **UNBLOCKED** it wakes up any threads that had called wait on it.

A key aspect of the Condition and WaitSet mechanism is the setting of the `trigger_value` of each **DDS\_Condition** (p. 1169).

The **DDS\_WaitSet** (p. 1170) cannot be used after calling **DDS\_DomainParticipantFactory\_finalize\_instance** (p. 34).

#### 4.161.5 Trigger State of a `::DDS_StatusCondition`

The `trigger_value` of a `DDS_StatusCondition` (p. 1170) is the boolean OR of the `ChangedStatusFlag` of all the communication statuses (see **Status Kinds** (p. 1025)) to which it is sensitive. That is, `trigger_value == DDS_↵  
BOOLEAN_FALSE` (p. 1004) only if all the values of the `ChangedStatusFlags` are `DDS_BOOLEAN_FALSE` (p. 1004).

The sensitivity of the `DDS_StatusCondition` (p. 1170) to a particular communication status is controlled by the list of `enabled_statuses` set on the condition by means of the `DDS_StatusCondition_set_enabled_statuses` (p. 1176) operation.

Once the `trigger_value` of a `StatusCondition` becomes true, it remains true until the status that changed is reset. To reset a status, call the related `get_*_status()` operation. Or, in the case of the data available status, call `read()`, `take()`, or one of their variants. Therefore, if you are using a `DDS_StatusCondition` (p. 1170) on a `DDS_WaitSet` (p. 1170) to be notified of events, your thread will wake up when one of the statuses associated with the `StatusCondition` becomes true. If you do not reset the status, the `StatusCondition trigger_value` remains true and your `WaitSet` will not block again; it will immediately wake up when you call `DDS_WaitSet_wait` (p. 1180).

#### 4.161.6 Trigger State of a `::DDS_ReadCondition`

Similar to the `DDS_StatusCondition` (p. 1170), a `DDS_ReadCondition` (p. 686) also has a `trigger_value` that determines whether the attached `DDS_WaitSet` (p. 1170) is `BLOCKED` or `UNBLOCKED`. However, unlike the `DDS_↵  
_StatusCondition` (p. 1170), the `trigger_value` of the `DDS_ReadCondition` (p. 686) is tied to the presence of *at least a sample* managed by RTI Connex with `DDS_SampleStateKind` (p. 702) and `DDS_ViewStateKind` (p. 704) matching those of the `DDS_ReadCondition` (p. 686). Furthermore, for the `DDS_QueryCondition` (p. 691) to have a `trigger_value == DDS_BOOLEAN_TRUE` (p. 1004), the data associated with the sample must be such that the `query_expression` evaluates to `DDS_BOOLEAN_TRUE` (p. 1004).

The fact that the `trigger_value` of a `DDS_ReadCondition` (p. 686) depends on the presence of samples on the associated `DDS_DataReader` (p. 608) implies that a single `take` operation can potentially change the `trigger_value` of several `DDS_ReadCondition` (p. 686) or `DDS_QueryCondition` (p. 691) conditions. For example, if all samples are taken, any `DDS_ReadCondition` (p. 686) and `DDS_QueryCondition` (p. 691) conditions associated with the `DDS_↵  
_DataReader` (p. 608) that had their `trigger_value==TRUE` before will see the `trigger_value` change to `FALSE`. Note that this does not guarantee that `DDS_WaitSet` (p. 1170) objects that were separately attached to those conditions will not be woken up. Once we have `trigger_value==TRUE` on a condition, it may wake up the attached `DDS_WaitSet` (p. 1170), the condition transitioning to `trigger_value==FALSE` does not necessarily 'unwake up' the `WaitSet` as 'unwakening' may not be possible in general.

The consequence is that an application blocked on a `DDS_WaitSet` (p. 1170) may return from the wait with a list of conditions, some of which are not no longer 'active'. This is unavoidable if multiple threads are concurrently waiting on separate `DDS_WaitSet` (p. 1170) objects and taking data associated with the same `DDS_DataReader` (p. 608) entity.

To elaborate further, consider the following example: A `DDS_ReadCondition` (p. 686) that has a `sample_state_↵  
_mask = {DDS_NOT_READ_SAMPLE_STATE` (p. 702)} will have `trigger_value` of `DDS_BOOLEAN_TRUE` (p. 1004) whenever a new sample arrives and will transition to `DDS_BOOLEAN_FALSE` (p. 1004) as soon as all the newly-arrived samples are either read (so their sample state changes to `READ`) or taken (so they are no longer managed by RTI Connex). However if the same `DDS_ReadCondition` (p. 686) had a `sample_state_mask = { DDS_↵  
_READ_SAMPLE_STATE` (p. 702), `DDS_NOT_READ_SAMPLE_STATE` (p. 702) }, then the `trigger_value` would only become `DDS_BOOLEAN_FALSE` (p. 1004) once all the newly-arrived samples are taken (it is not sufficient to read them as that would only change the sample state to `READ`), which overlaps the mask on the `DDS_ReadCondition` (p. 686).

### 4.161.7 Trigger State of a ::DDS\_GuardCondition

The `trigger_value` of a `DDS_GuardCondition` (p. 1169) is completely controlled by the application via the operation `DDS_GuardCondition_set_trigger_value` (p. 1175).

### 4.161.8 Function Documentation

#### 4.161.8.1 DDS\_Condition\_get\_trigger\_value()

```
DDS_Boolean DDS_Condition_get_trigger_value (
    DDS_Condition * self )
```

Retrieve the `trigger_value`.

Parameters

<code>self</code>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------------	------------------------------------------

Returns

the trigger value.

#### 4.161.8.2 DDS\_Condition\_set\_handler()

```
DDS_ReturnCode_t DDS_Condition_set_handler (
    DDS_Condition * self,
    const struct DDS_ConditionHandler * handler )
```

<<*extension*>> (p. 817) Registers a `DDS_ConditionHandler` (p. 1350) in this `DDS_Condition` (p. 1169).

This operation replaces any existing registered handler. If there is any resources associated with an existing registered handler that need to be released, you may first call `DDS_Condition_get_handler` (p. 1174) to retrieve the handler.

MT Safety:

It is not safe to call `DDS_Condition_set_handler` (p. 1173), `DDS_Condition_get_handler` (p. 1174) or `DDS_↔Condition_dispatch` (p. 1174) concurrently.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>handler</i>	The <b>DDS_ConditionHandler</b> (p. 1350) to be called by <b>DDS_Condition_dispatch</b> (p. 1174). If this parameter is null, an no-op handler implementation will be set.

**4.161.8.3 DDS\_Condition\_get\_handler()**

```
struct DDS_ConditionHandler DDS_Condition_get_handler (
    DDS_Condition * self )
```

<<*extension*>> (p. 817) Returns the registered **DDS\_ConditionHandler** (p. 1350).

If no **DDS\_ConditionHandler** (p. 1350) is registered, this operation returns a no-op **DDS\_ConditionHandler** (p. 1350) implementation.

**4.161.8.4 DDS\_Condition\_dispatch()**

```
void DDS_Condition_dispatch (
    DDS_Condition * self )
```

<<*extension*>> (p. 817) Calls **DDS\_ConditionHandler::on\_condition\_triggered** (p. 1351) of the registered **DDS\_ConditionHandler** (p. 1350).

If the trigger value is true, calling this operation will call the registered.

If no **DDS\_ConditionHandler** (p. 1350) is registered, this operation is a no-op.

**4.161.8.5 DDS\_GuardCondition\_as\_condition()**

```
DDS_Condition * DDS_GuardCondition_as_condition (
    DDS_GuardCondition * guardCondition )
```

Access a **DDS\_GuardCondition** (p. 1169)'s supertype instance.

## Parameters

<i>guardCondition</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-----------------------	------------------------------------------

#### 4.161.8.6 DDS\_GuardCondition\_new()

```
DDS_GuardCondition * DDS_GuardCondition_new (
    void )
```

No argument constructor.

Construct a new guard condition on the heap.

##### Returns

A new condition with trigger value **DDS\_BOOLEAN\_FALSE** (p. 1004), or NULL if a condition could not be allocated.

##### See also

**DDS\_GuardCondition\_delete** (p. 1175)

#### 4.161.8.7 DDS\_GuardCondition\_delete()

```
DDS_ReturnCode_t DDS_GuardCondition_delete (
    DDS_GuardCondition * self )
```

Destructor.

Releases the resources associated with this object.

##### MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this function while another thread may be simultaneously calling **DDS\_DomainParticipantFactory\_get\_instance** (p. 34), **DDS\_DomainParticipantFactory\_finalize\_instance** (p. 34), **DDS\_TypeCodeFactory\_get\_instance** (p. 285), **DDS\_GuardCondition\_new** (p. 1174), **DDS\_WaitSet\_new** (p. 1177), **DDS\_WaitSet\_new\_ex** (p. 1178), **DDS\_GuardCondition\_delete** (p. 1175), **DDS\_WaitSet\_delete** (p. 1178), **DDS\_TypeCodeFactory\_finalize\_instance** (p. 285), **NDDS\_Utility\_enable\_network\_capture**, or **NDDS\_Utility\_disable\_network\_capture**.

Deleting a NULL condition is safe and has no effect.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

#### 4.161.8.8 DDS\_GuardCondition\_set\_trigger\_value()

```
DDS_ReturnCode_t DDS_GuardCondition_set_trigger_value (
    DDS_GuardCondition * self,
    DDS_Boolean value )
```

Set the guard condition trigger value.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>value</i>	<< <i>in</i> >> (p. 818) the new trigger value.

#### 4.161.8.9 DDS\_StatusCondition\_as\_condition()

```
DDS_Condition * DDS_StatusCondition_as_condition (
    DDS_StatusCondition * statusCondition )
```

Access a **DDS\_StatusCondition** (p. 1170)'s supertype instance.

##### Parameters

<i>statusCondition</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
------------------------	------------------------------------------

#### 4.161.8.10 DDS\_StatusCondition\_get\_enabled\_statuses()

```
DDS_StatusMask DDS_StatusCondition_get_enabled_statuses (
    DDS_StatusCondition * self )
```

Get the list of statuses enabled on an **DDS\_Entity** (p. 1160).

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

##### Returns

list of enabled statuses.

## 4.161.8.11 DDS\_StatusCondition\_set\_enabled\_statuses()

```
DDS_ReturnCode_t DDS_StatusCondition_set_enabled_statuses (
    DDS_StatusCondition * self,
    DDS_StatusMask mask )
```

This operation defines the list of communication statuses that determine the `trigger_value` of the **DDS\_StatusCondition** (p. 1170).

This operation may change the `trigger_value` of the **DDS\_StatusCondition** (p. 1170).

**DDS\_WaitSet** (p. 1170) objects' behavior depends on the changes of the `trigger_value` of their attached conditions. Therefore, any **DDS\_WaitSet** (p. 1170) to which the **DDS\_StatusCondition** (p. 1170) is attached is potentially affected by this operation.

If this function is not invoked, the default list of enabled statuses includes all the statuses.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>mask</i>	<< <i>in</i> >> (p. 818) the list of enables statuses (see <b>Status Kinds</b> (p. 1025))

## Returns

One of the **Standard Return Codes** (p. 1024)

## 4.161.8.12 DDS\_StatusCondition\_get\_entity()

```
DDS_Entity * DDS_StatusCondition_get_entity (
    DDS_StatusCondition * self )
```

Get the **DDS\_Entity** (p. 1160) associated with the **DDS\_StatusCondition** (p. 1170).

There is exactly one **DDS\_Entity** (p. 1160) associated with each **DDS\_StatusCondition** (p. 1170).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

**DDS\_Entity** (p. 1160) associated with the **DDS\_StatusCondition** (p. 1170).

#### 4.161.8.13 DDS\_WaitSet\_new()

```
DDS_WaitSet * DDS_WaitSet_new (
    void )
```

Default no-argument constructor.

Construct a new **DDS\_WaitSet** (p. 1170).

##### MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this function while another thread may be simultaneously calling **DDS\_DomainParticipantFactory\_get\_instance** (p.34), **DDS\_DomainParticipantFactory\_finalize\_instance** (p.34), **DDS\_TypeCodeFactory\_get\_instance** (p.285), **DDS\_GuardCondition\_new** (p.1174), **DDS\_WaitSet↔\_new** (p.1177), **DDS\_WaitSet\_new\_ex** (p.1178), **DDS\_GuardCondition\_delete** (p.1175), **DDS\_WaitSet↔\_delete** (p.1178), **DDS\_TypeCodeFactory\_finalize\_instance** (p.285), **NDDS\_Utility\_enable\_network\_capture**, or **NDDS\_Utility\_disable\_network\_capture**.

##### Returns

A new **DDS\_WaitSet** (p. 1170) or NULL if one could not be allocated.

#### 4.161.8.14 DDS\_WaitSet\_new\_ex()

```
DDS_WaitSet * DDS_WaitSet_new_ex (
    const struct DDS_WaitSetProperty_t * prop )
```

<<**extension**>> (p. 817) Constructor for a **DDS\_WaitSet** (p. 1170) that may delay for more while specifying that will be woken up after the given number of events or delay period, whichever happens first

Constructs a new **DDS\_WaitSet** (p. 1170).

##### MT Safety:

UNSAFE. In VxWorks, it is unsafe to call this function while another thread may be simultaneously calling **DDS\_DomainParticipantFactory\_get\_instance** (p.34), **DDS\_DomainParticipantFactory\_finalize\_instance** (p.34), **DDS\_TypeCodeFactory\_get\_instance** (p.285), **DDS\_GuardCondition\_new** (p.1174), **DDS\_WaitSet↔\_new** (p.1177), **DDS\_WaitSet\_new\_ex** (p.1178), **DDS\_GuardCondition\_delete** (p.1175), **DDS\_WaitSet↔\_delete** (p.1178), **DDS\_TypeCodeFactory\_finalize\_instance** (p.285), **NDDS\_Utility\_enable\_network\_capture**, or **NDDS\_Utility\_disable\_network\_capture**.

##### Returns

A new **DDS\_WaitSet** (p. 1170) or NULL if one could not be allocated.

## 4.161.8.15 DDS\_WaitSet\_delete()

```
DDS_ReturnCode_t DDS_WaitSet_delete (
    DDS_WaitSet * self )
```

Destructor.

Releases the resources associated with this **DDS\_WaitSet** (p. 1170).

Freeing a null pointer is safe and does nothing.

**MT Safety:**

UNSAFE. It is not safe to delete a **DDS\_WaitSet** (p. 1170) while another thread is calling an API that uses the entity. For instance, a thread must not delete a WaitSet while another thread is blocked with **DDS\_WaitSet\_wait** (p. 1180). To properly handle this scenario, you can use a **DDS\_GuardCondition** (p. 1169) to wake up the WaitSet and then wait for the finalization of the thread. In VxWorks, it is unsafe to call this function while another thread may be simultaneously calling **DDS\_DomainParticipantFactory\_get\_instance** (p. 34), **DDS\_DomainParticipantFactory\_finalize\_instance** (p. 34), **DDS\_TypeCodeFactory\_get\_instance** (p. 285), **DDS\_GuardCondition\_new** (p. 1174), **DDS\_WaitSet\_new** (p. 1177), **DDS\_WaitSet\_new\_ex** (p. 1178), **DDS\_GuardCondition\_delete** (p. 1175), **DDS\_WaitSet\_delete** (p. 1178), **DDS\_TypeCodeFactory\_finalize\_instance** (p. 285), **NDDS\_Utility\_enable\_network\_capture**, or **NDDS\_Utility\_disable\_network\_capture**.

**Parameters**

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## 4.161.8.16 DDS\_WaitSet\_set\_property()

```
DDS_ReturnCode_t DDS_WaitSet_set_property (
    DDS_WaitSet * self,
    const struct DDS_WaitSetProperty_t * prop )
```

<<**extension**>> (p. 817) Sets the **DDS\_WaitSetProperty\_t** (p. 1825), to configure the associated **DDS\_WaitSet** (p. 1170) to return after one or more trigger events have occurred.

**Parameters**

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>prop</i>	<< <i>in</i> >> (p. 818)

**Returns**

One of the **Standard Return Codes** (p. 1024)

#### 4.161.8.17 DDS\_WaitSet\_get\_property()

```
DDS_ReturnCode_t DDS_WaitSet_get_property (
    DDS_WaitSet * self,
    struct DDS_WaitSetProperty_t * prop )
```

<<*extension*>> (p. 817) Retrieves the **DDS\_WaitSetProperty\_t** (p. 1825) configuration of the associated **DDS\_WaitSet** (p. 1170).

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>prop</i>	<< <i>out</i> >> (p. 818)

##### Returns

One of the **Standard Return Codes** (p. 1024)

#### 4.161.8.18 DDS\_WaitSet\_wait()

```
DDS_ReturnCode_t DDS_WaitSet_wait (
    DDS_WaitSet * self,
    struct DDS_ConditionSeq * active_conditions,
    const struct DDS_Duration_t * timeout )
```

Allows an application thread to wait for the occurrence of certain conditions.

If none of the conditions attached to the **DDS\_WaitSet** (p. 1170) have a `trigger_value` of **DDS\_BOOLEAN\_TRUE** (p. 1004), the wait operation will block, suspending the calling thread.

The result of the wait operation is the list of all the attached conditions that have a `trigger_value` of **DDS\_BOOLEAN\_TRUE** (p. 1004) (i.e., the conditions that unblocked the wait).

The wait operation takes a `timeout` argument that specifies the maximum duration for the wait. If this duration is exceeded and none of the attached **DDS\_Condition** (p. 1169) objects are **DDS\_BOOLEAN\_TRUE** (p. 1004), wait fails with **DDS\_RETCODE\_TIMEOUT** (p. 1025). In this case, the resulting list of conditions will be empty. If a negative duration is passed, wait fails with **DDS\_RETCODE\_BAD\_PARAMETER** (p. 1025).

Note: The resolution of the `timeout` period is constrained by the resolution of the system clock.

When the **DDS\_WaitSet** (p. 1170) is configured to wait for more than one trigger event and the timeout is exceeded before that number is reached, this function returns normally as long as at least one trigger event has occurred.

It is not allowable for more than one application thread to be waiting on the same **DDS\_WaitSet** (p. 1170). If the wait operation is invoked on a **DDS\_WaitSet** (p. 1170) that already has a thread blocking on it, the operation will return immediately with the value **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

## Parameters

<i>active_conditions</i>	<< <i>inout</i> >> (p. 818) a valid non-NULL <b>DDS_ConditionSeq</b> (p. 1351) object. Note that RTI Connexit will not allocate a new object if <i>active_conditions</i> is NULL; the function will return <b>DDS_RETCODE_PRECONDITION_NOT_MET</b> (p. 1025).
<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>timeout</i>	<< <i>in</i> >> (p. 818) a wait timeout

## Returns

One of the **Standard Return Codes** (p. 1024) or **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025) or **DDS\_RETCODE\_TIMEOUT** (p. 1025).

## 4.161.8.19 DDS\_WaitSet\_attach\_condition()

```
DDS_ReturnCode_t DDS_WaitSet_attach_condition (
    DDS_WaitSet * self,
    DDS_Condition * cond )
```

Attaches a **DDS\_Condition** (p. 1169) to the **DDS\_WaitSet** (p. 1170).

It is possible to attach a **DDS\_Condition** (p. 1169) on a **DDS\_WaitSet** (p. 1170) that is currently being waited upon (via the wait operation). In this case, if the **DDS\_Condition** (p. 1169) has a *trigger\_value* of **DDS\_BOOLEAN\_TRUE** (p. 1004), then attaching the condition will unblock the **DDS\_WaitSet** (p. 1170).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>cond</i>	<< <i>in</i> >> (p. 818) Condition to be attached.

## Returns

One of the **Standard Return Codes** (p. 1024), or **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

## 4.161.8.20 DDS\_WaitSet\_detach\_condition()

```
DDS_ReturnCode_t DDS_WaitSet_detach_condition (
    DDS_WaitSet * self,
    DDS_Condition * cond )
```

Detaches a **DDS\_Condition** (p. 1169) from the **DDS\_WaitSet** (p. 1170).

It is possible to detach a **DDS\_Condition** (p. 1169) on a **DDS\_WaitSet** (p. 1170) that is currently being waited upon (via the wait operation). If the **DDS\_Condition** (p. 1169) was not attached to the **DDS\_WaitSet** (p. 1170), the operation will return **DDS\_RETCODE\_BAD\_PARAMETER** (p. 1025).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>cond</i>	<< <i>in</i> >> (p. 818) Condition to be detached.

## Returns

One of the **Standard Return Codes** (p. 1024), or **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025).

## 4.161.8.21 DDS\_WaitSet\_get\_conditions()

```
DDS_ReturnCode_t DDS_WaitSet_get_conditions (
    DDS_WaitSet * self,
    struct DDS_ConditionSeq * attached_conditions )
```

Retrieves the list of attached **DDS\_Condition** (p. 1169) (s).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>attached_conditions</i>	<< <i>inout</i> >> (p. 818) a <b>DDS_ConditionSeq</b> (p. 1351) object where the list of attached conditions will be returned

## Returns

One of the **Standard Return Codes** (p. 1024), or **DDS\_RETCODE\_OUT\_OF\_RESOURCES** (p. 1025).

## 4.162 Cookie

<<*extension*>> (p. 817) Unique identifier for a written data sample

## Data Structures

- struct **DDS\_Cookie\_t**  
     <<*extension*>> (p. 817) Sequence of bytes.
- struct **DDS\_CookieSeq**  
     Declares IDL sequence < **DDS\_Cookie\_t** (p. 1360) > .

## Functions

- **DDS\_Boolean DDS\_Cookie\_from\_pointer** (struct **DDS\_Cookie\_t** \*self, const void \*pointer)  
     Stores a pointer in a cookie.
- void \* **DDS\_Cookie\_to\_pointer** (const struct **DDS\_Cookie\_t** \*self)  
     Returns the pointer previously stored in the cookie.

### 4.162.1 Detailed Description

<<*extension*>> (p. 817) Unique identifier for a written data sample

### 4.162.2 Function Documentation

#### 4.162.2.1 DDS\_Cookie\_from\_pointer()

```
DDS_Boolean DDS_Cookie_from_pointer (
    struct DDS_Cookie_t * self,
    const void * pointer )
```

Stores a pointer in a cookie.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>pointer</i>	<< <i>in</i> >> (p. 818) The pointer to be stored in the cookie. Can be NULL.

##### Returns

DDS\_BOOLEAN\_TRUE if the cookie was successfully filled with the pointer, DDS\_BOOLEAN\_FALSE otherwise.

#### 4.162.2.2 DDS\_Cookie\_to\_pointer()

```
void * DDS_Cookie_to_pointer (
    const struct DDS_Cookie_t * self )
```

Returns the pointer previously stored in the cookie.

##### Precondition

The cookie's value was filled with a pointer; otherwise, the value returned may not be a valid memory address.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

**Returns**

The pointer stored in the cookie.

**4.163 Sample Flags**

<<*extension*>> (p. 817) Flags for samples.

**Typedefs**

- typedef enum **DDS\_SampleFlagBits** **DDS\_SampleFlagBits**  
*Type to identify the sample flags reserved by RTI.*
- typedef **DDS\_Long** **DDS\_SampleFlag**  
*A set of flags that can be associated with a sample.*

**Enumerations**

- enum **DDS\_SampleFlagBits** {  
**DDS\_REDELIVERED\_SAMPLE** ,  
**DDS\_INTERMEDIATE\_REPLY\_SEQUENCE\_SAMPLE** ,  
**DDS\_REPLICATE\_SAMPLE** ,  
**DDS\_LAST\_SHARED\_READER\_QUEUE\_SAMPLE** ,  
**DDS\_INTERMEDIATE\_TOPIC\_QUERY\_SAMPLE** ,  
**DDS\_WRITER\_REMOVED\_BATCH\_SAMPLE** = PRES\_WRITER\_REMOVED\_BATCH\_SAMPLE ,  
**DDS\_DISCOVERY\_SERVICE\_SAMPLE** = PRES\_DISCOVERY\_SERVICE\_SAMPLE }  
*Type to identify the sample flags reserved by RTI.*

**4.163.1 Detailed Description**

<<*extension*>> (p. 817) Flags for samples.

**4.163.2 Typedef Documentation****4.163.2.1 DDS\_SampleFlagBits**

```
typedef enum DDS_SampleFlagBits DDS_SampleFlagBits
```

Type to identify the sample flags reserved by RTI.

### 4.163.2.2 DDS\_SampleFlag

```
typedef DDS_Long DDS_SampleFlag
```

A set of flags that can be associated with a sample.

- Least-significant bits [0-7] are reserved by RTI
- Least-significant bits [8-15] are application specific
- Least-significant bits [16-31] are invalid and cannot be used

## 4.163.3 Enumeration Type Documentation

### 4.163.3.1 DDS\_SampleFlagBits

```
enum DDS_SampleFlagBits
```

Type to identify the sample flags reserved by RTI.

Enumerator

DDS_REDELIVERED_SAMPLE	Indicates that a sample has been redelivered by RTI Queuing Service.
DDS_INTERMEDIATE_REPLY_SEQUENCE_SAMPLE	Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connex Repliers sending multiple responses for a request.
DDS_REPLICATE_SAMPLE	Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.
DDS_LAST_SHARED_READER_QUEUE_SAMPLE	Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.
DDS_INTERMEDIATE_TOPIC_QUERY_SAMPLE	Indicates that a sample for a TopicQuery will be followed by more samples. This flag only applies to samples that have been published as a response to a <b>DDS_TopicQuery</b> (p. 698). When this bit is not set and <b>DDS_SampleInfo::topic_query_guid</b> (p. 1731) is different from <b>DDS_GUID_UNKNOWN</b> (p. 1016), this sample is the last sample for that TopicQuery coming from the DataWriter identified by <b>DDS_SampleInfo::original_publication_virtual_guid</b> (p. 1729).

## Enumerator

DDS_WRITER_REMOVED_BATCH_SAMPLE	<p>This flag will be set if the sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed. A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the</p> <p><b>DDS_KEEP_LAST_HISTORY_QOS</b> (p. 1094) <b>DDS_HistoryQosPolicy</b> (p. 1558) QoS or because the duration in <b>DDS_LifespanQosPolicy</b> (p. 1567) was reached.</p> <p>If the DataReader sets the property "dds.data_reader.accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.</p>
DDS_DISCOVERY_SERVICE_SAMPLE	<p>This flag will be set if the sample was sent by Cloud Discovery Service. The samples sent by Cloud Discovery Service are participant announcement samples on the ParticipantBuiltinTopic.</p>

## 4.164 WriteParams

<<extension>> (p. 817)

### Data Structures

- struct **DDS\_SampleIdentity\_t**  
*Type definition for a Sample Identity.*
- struct **DDS\_AckResponseData\_t**  
*Data payload of an application-level acknowledgment.*
- struct **DDS\_WriteParams\_t**  
<<extension>> (p. 817) Input parameters for writing with **FooDataWriter\_write\_w\_params** (p. 494), **FooDataWriter\_dispose\_w\_params** (p. 497), **FooDataWriter\_register\_instance\_w\_params** (p. 486), **FooDataWriter\_unregister\_instance\_w\_params** (p. 489)

### Functions

- **DDS\_Boolean DDS\_SampleIdentity\_equals** (const struct **DDS\_SampleIdentity\_t** \*self, const struct **DDS\_SampleIdentity\_t** \*other)  
*Compares this sample identity with another sample identity for equality.*
- void **DDS\_WriteParams\_reset** (struct **DDS\_WriteParams\_t** \*self)  
*Resets all the fields to their default values.*

## Variables

- struct **DDS\_GUID\_t DDS\_SampleIdentity\_t::writer\_guid**  
*16-byte identifier identifying the virtual GUID.*
- struct **DDS\_SequenceNumber\_t DDS\_SampleIdentity\_t::sequence\_number**  
*monotonically increasing 64-bit integer that identifies the sample in the data source.*
- const struct **DDS\_SampleIdentity\_t DDS\_AUTO\_SAMPLE\_IDENTITY**  
*The AUTO sample identity.*
- const struct **DDS\_SampleIdentity\_t DDS\_UNKNOWN\_SAMPLE\_IDENTITY**  
*An invalid or unknown sample identity.*
- const struct **DDS\_WriteParams\_t DDS\_WRITEPARAMS\_DEFAULT**  
*Initializer for **DDS\_WriteParams\_t** (p. 1833).*

### 4.164.1 Detailed Description

<<*extension*>> (p. 817)

### 4.164.2 Function Documentation

#### 4.164.2.1 DDS\_SampleIdentity\_equals()

```
DDS_Boolean DDS_SampleIdentity_equals (
    const struct DDS_SampleIdentity_t * self,
    const struct DDS_SampleIdentity_t * other )
```

Compares this sample identity with another sample identity for equality.

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) This sample identity.
<i>other</i>	<< <i>in</i> >> (p. 818) The other sample identity to be compared with this sample identity.

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the two sample identities have equal values, or **DDS\_BOOLEAN\_FALSE** (p. 1004) otherwise.

#### 4.164.2.2 DDS\_WriteParams\_reset()

```
void DDS_WriteParams_reset (
    struct DDS_WriteParams_t * self )
```

Resets all the fields to their default values.

This operation is useful to reset all the fields to their automatic value when `DDS_WriteParams_t::replace_auto` (p. 1834) is enabled and the same params instance is used in multiple calls to `FooDataWriter_write_w_params` (p. 494)

### 4.164.3 Variable Documentation

#### 4.164.3.1 `writer_guid`

```
struct DDS_GUID_t DDS_SampleIdentity_t::writer_guid
```

16-byte identifier identifying the virtual GUID.

#### 4.164.3.2 `sequence_number`

```
struct DDS_SequenceNumber_t DDS_SampleIdentity_t::sequence_number
```

monotonically increasing 64-bit integer that identifies the sample in the data source.

#### 4.164.3.3 `DDS_AUTO_SAMPLE_IDENTITY`

```
const struct DDS_SampleIdentity_t DDS_AUTO_SAMPLE_IDENTITY [extern]
```

The AUTO sample identity.

Special `DDS_AUTO_SAMPLE_IDENTITY` (p. 1188) value {`DDS_GUID_AUTO` (p. 1016), `DDS_AUTO_SEQUENCE_NUMBER` (p. 1021)}

#### 4.164.3.4 `DDS_UNKNOWN_SAMPLE_IDENTITY`

```
const struct DDS_SampleIdentity_t DDS_UNKNOWN_SAMPLE_IDENTITY [extern]
```

An invalid or unknown sample identity.

Special `DDS_UNKNOWN_SAMPLE_IDENTITY` (p. 1188) value {`DDS_GUID_UNKNOWN` (p. 1016), `DDS_SEQUENCE_NUMBER_UNKNOWN` (p. 1021)}

### 4.164.3.5 DDS\_WRITEPARAMS\_DEFAULT

```
const struct DDS_WriteParams_t DDS_WRITEPARAMS_DEFAULT [extern]
```

Initializer for **DDS\_WriteParams\_t** (p. 1833).

## 4.165 Heap Support in C

<<*extension*>> (p. 817) Heap allocation and free routines in C

### Functions

- void \* **DDS\_Heap\_calloc** (size\_t numElem, size\_t size)  
*Performs the logical equivalent of calloc().*
- void \* **DDS\_Heap\_malloc** (size\_t size)  
*Performs the logical equivalent of malloc().*
- void **DDS\_Heap\_free** (void \*ptr)  
*Performs the logical equivalent of free().*

### 4.165.1 Detailed Description

<<*extension*>> (p. 817) Heap allocation and free routines in C

The functions in this class ensure consistent cross-platform implementations for memory allocation (**DDS\_Heap\_malloc()** (p. 1190) and **DDS\_Heap\_calloc()** (p. 1189)) and deletion (**DDS\_Heap\_free()** (p. 1190)).

Applications need to use these routines to reserve memory that the middleware will release or to free memory that the middleware has allocated.

For example, to allocate an optional member in a sample use **DDS\_Heap\_malloc()** (p. 1190)/ **DDS\_Heap\_calloc()** (p. 1189); to release an optional member previously reserved by **FootTypeSupport\_create\_data\_w\_params()** (p. 211), use **DDS\_Heap\_free()** (p. 1190).

### 4.165.2 Function Documentation

#### 4.165.2.1 DDS\_Heap\_calloc()

```
void * DDS_Heap_calloc (
    size_t numElem,
    size_t size )
```

Performs the logical equivalent of calloc().

Allocates unused space for an array with numElem elements each of whose size in bytes is size. The memory will be initialized to zeros.

**Parameters**

<i>numElem</i>	<< <i>in</i> >> (p. 818) The number of elements in the array to be allocated
<i>size</i>	<< <i>in</i> >> (p. 818) The size in bytes of each element in the array

**Returns**

If insufficient memory is available, this function will return NULL. Otherwise, upon success it returns a pointer to the allocated space.

**4.165.2.2 DDS\_Heap\_malloc()**

```
void * DDS_Heap_malloc (
    size_t size )
```

Performs the logical equivalent of malloc().

Allocates unused space for an object of the specified *size*. The memory will be initialized to zeros.

**Parameters**

<i>size</i>	<< <i>in</i> >> (p. 818) The size in bytes of the object to be allocated
-------------	--------------------------------------------------------------------------

**Returns**

If insufficient memory is available, this function will return NULL. Otherwise, upon success it returns a pointer to the allocated space.

**4.165.2.3 DDS\_Heap\_free()**

```
void DDS_Heap_free (
    void * ptr )
```

Performs the logical equivalent of free().

Deallocates the space pointed to by *ptr* and made available for further allocation.

**Parameters**

<i>ptr</i>	<< <i>in</i> >> (p. 818) A pointer to the space to be deallocated
------------	-------------------------------------------------------------------

## 4.166 Builtin Qos Profiles

<<**extension**>> (p. 817) QoS libraries, profiles, and snippets that are automatically built into RTI Connex.

### Variables

- const char \*const **DDS\_BUILTIN\_QOS\_LIB**  
*A library of non-experimental QoS profiles.*
- const char \*const **DDS\_PROFILE\_BASELINE\_ROOT**  
*The root baseline QoS values from which all other Baseline.X.X.X profiles inherit.*
- const char \*const **DDS\_PROFILE\_BASELINE**  
*The most up-to-date QoS default values.*
- const char \*const **DDS\_PROFILE\_BASELINE\_5\_0\_0**  
*The QoS default values for version 5.0.0.*
- const char \*const **DDS\_PROFILE\_BASELINE\_5\_1\_0**  
*The QoS default values for version 5.1.0.*
- const char \*const **DDS\_PROFILE\_BASELINE\_5\_2\_0**  
*The QoS default values for version 5.2.0.*
- const char \*const **DDS\_PROFILE\_BASELINE\_5\_3\_0**  
*The QoS default values for version 5.3.0.*
- const char \*const **DDS\_PROFILE\_BASELINE\_6\_0\_0**  
*The QoS default values for version 6.0.0.*
- const char \*const **DDS\_PROFILE\_BASELINE\_6\_1\_0**  
*The QoS default values for version 6.1.0.*
- const char \*const **DDS\_PROFILE\_BASELINE\_7\_0\_0**  
*The QoS default values for version 7.0.0.*
- const char \*const **DDS\_PROFILE\_BASELINE\_7\_1\_0**  
*The QoS default values for version 7.1.0.*
- const char \*const **DDS\_PROFILE\_GENERIC\_COMMON**  
*A common Participant base profile.*
- const char \*const **DDS\_PROFILE\_GENERIC\_MONITORING\_COMMON**  
*Enables RTI Monitoring Library.*
- const char \*const **DDS\_PROFILE\_GENERIC\_CONNEXT\_MICRO\_COMPATIBILITY**  
*Sets the values necessary to communicate with RTI Connex Micro.*
- const char \*const **DDS\_PROFILE\_GENERIC\_CONNEXT\_MICRO\_COMPATIBILITY\_2\_4\_9**  
*Sets the values necessary to communicate with RTI Connex Micro versions 2.4.4 through at least 2.4.9.*
- const char \*const **DDS\_PROFILE\_GENERIC\_CONNEXT\_MICRO\_COMPATIBILITY\_2\_4\_3**  
*Sets the values necessary to communicate with RTI Connex Micro versions 2.4.3 and earlier.*
- const char \*const **DDS\_PROFILE\_GENERIC\_OTHER\_DDS\_VENDOR\_COMPATIBILITY**  
*Sets the values necessary to interoperate with other DDS vendors.*
- const char \*const **DDS\_PROFILE\_GENERIC\_510\_TRANSPORT\_COMPATIBILITY**  
*Sets the values necessary to interoperate with RTI Connex 5.1.0 using the UDPv6 and/or SHMEM transports.*
- const char \*const **DDS\_BUILTIN\_QOS\_LIB\_EXP**  
*A library of experimental QoS profiles.*
- const char \*const **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE**  
*Enables strict reliability.*

- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE**  
*Enables keep-last reliability.*
- const char \*const **DDS\_PROFILE\_GENERIC\_BEST\_EFFORT**  
*Enables best-effort reliability kind.*
- const char \*const **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_HIGH\_THROUGHPUT**  
*A profile that can be used to achieve high throughput.*
- const char \*const **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LOW\_LATENCY**  
*A profile that can be used to achieve low latency.*
- const char \*const **DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA**  
*A common Participant base profile to facilitate sending large data.*
- const char \*const **DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA\_MONITORING**  
*Configures Participants for large data and monitoring.*
- const char \*const **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA**  
*Configures endpoints for sending large data with strict reliability.*
- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA**  
*Configures endpoints for sending large data with keep-last reliability.*
- const char \*const **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA\_FAST\_FLOW**  
*Configures strictly reliable communication for large data with a fast flow controller.*
- const char \*const **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA\_MEDIUM\_FLOW**  
*Configures strictly reliable communication for large data with a medium flow controller.*
- const char \*const **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA\_SLOW\_FLOW**  
*Configures strictly reliable communication for large data with a slow flow controller.*
- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA\_FAST\_FLOW**  
*Configures keep-last reliable communication for large data with a fast flow controller.*
- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA\_MEDIUM\_FLOW**  
*Configures keep-last reliable communication for large data with a medium flow controller.*
- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA\_SLOW\_FLOW**  
*Configures keep-last reliable communication for large data with a slow flow controller.*
- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_TRANSIENT\_LOCAL**  
*Persists the samples of a DataWriter as long as the entity exists.*
- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_TRANSIENT**  
*Persists samples using RTI Persistence Service.*
- const char \*const **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_PERSISTENT**  
*Persists samples in permanent storage, like a disk, using RTI Persistence Service.*
- const char \*const **DDS\_PROFILE\_GENERIC\_AUTO\_TUNING**  
*Enables the Turbo Mode batching and Auto Throttle experimental features.*
- const char \*const **DDS\_PROFILE\_GENERIC\_MINIMAL\_MEMORY\_FOOTPRINT**  
*Uses a set of QoS which reduces the memory footprint of the application.*
- const char \*const **DDS\_PROFILE\_GENERIC\_SECURITY**  
*Loads the DDS Secure builtin plugins.*
- const char \*const **DDS\_PROFILE\_GENERIC\_MONITORING2**  
*The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.*
- const char \*const **DDS\_PROFILE\_PATTERN\_PERIODIC\_DATA**  
*Used for applications that expect periodic data.*
- const char \*const **DDS\_PROFILE\_PATTERN\_STREAMING**  
*Used for applications that stream data.*
- const char \*const **DDS\_PROFILE\_PATTERN\_RELIABLE\_STREAMING**

*Used for applications that stream data and require reliable communication.*

- const char \*const **DDS\_PROFILE\_PATTERN\_EVENT**

*Used for applications that handle events.*

- const char \*const **DDS\_PROFILE\_PATTERN\_ALARM\_EVENT**

*Used for applications that handle alarm events.*

- const char \*const **DDS\_PROFILE\_PATTERN\_STATUS**

*Used for applications whose samples represent statuses.*

- const char \*const **DDS\_PROFILE\_PATTERN\_ALARM\_STATUS**

*Used for applications in which samples represent alarm statuses.*

- const char \*const **DDS\_PROFILE\_PATTERN\_LAST\_VALUE\_CACHE**

*Used for applications that only need the last published value.*

- const char \*const **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB**

*A library of QoS Snippets.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_COMMON**

*QoS Snippet that configures the reliability protocol with a common configuration.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_KEEP\_ALL**

*QoS Snippet that configures the reliability protocol for KEEP\_ALL.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_KEEP\_LAST**

*QoS Snippet that configures the reliability protocol for KEEP\_LAST.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_HIGH\_RATE**

*QoS Snippet that configures the reliability protocol for sending data at a high rate.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_LOW\_LATENCY**

*QoS Snippet that configures the reliability protocol for sending data at low latency.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_LARGE\_DATA**

*QoS Snippet that configures the reliability protocol for large data.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_DATACACHE\_LARGE\_DATA\_DYNAMICMEMALLOC**

*Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_DISCOVERY\_COMMON**

*QoS Snippet that optimizes discovery with a common configuration.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_DISCOVERY\_PARTICIPANT\_COMPACT**

*QoS Snippet that optimizes the Participant QoS to send less discovery information.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_DISCOVERY\_ENDPOINT\_FAST**

*QoS Snippet that optimizes the Endpoint Discovery to be faster.*

- const char \*const **DDS\_SNIPPET\_OPTIMIZATION\_TRANSPORT\_LARGE\_BUFFERS**

*QoS Snippet that increases the Participant default buffer that shm and udpv4 use.*

- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_RELIABILITY\_RELIABLE**

*QoS Snippet that sets RELIABILITY QoS to RELIABLE.*

- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_RELIABILITY\_BEST Effort**

*QoS Snippet that sets RELIABILITY QoS to BEST\_EFFORT.*

- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_HISTORY\_KEEP\_LAST\_1**

*QoS Snippet that sets HISTORY QoS to KEEP\_LAST kind with depth 1.*

- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_HISTORY\_KEEP\_ALL**

*QoS Snippet that sets HISTORY QoSPolicy to KEEP\_ALL kind.*

- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_PUBLISH\_MODE\_ASYNCHRONOUS**

*QoS Snippet that sets PUBLISH\_MODE QoSPolicy to ASYNCHRONOUS kind.*

- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_DURABILITY\_TRANSIENT\_LOCAL**

*QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT\_LOCAL kind.*

- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_DURABILITY\_TRANSIENT**  
*QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT kind.*
- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_DURABILITY\_PERSISTENT**  
*QoS Snippet that sets DURABILITY QoSPolicy to PERSISTENT kind.*
- const char \*const **DDS\_SNIPPET\_QOS\_POLICY\_BATCHING\_ENABLE**  
*QoS Snippet that sets BATCH QoSPolicy to true.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_FLOW\_CONTROLLER\_838MBPS**  
*QoS Snippet that configures and set a FlowController of 838 Mbps.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_FLOW\_CONTROLLER\_209MBPS**  
*QoS Snippet that configures and sets a FlowController of 209 Mbps.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_FLOW\_CONTROLLER\_52MBPS**  
*QoS Snippet that configures and sets a FlowController of 52 Mbps.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_AUTO\_TUNING\_ENABLE**  
*QoS Snippet that enables auto\_throttle and turbo\_mode to true.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_MONITORING\_ENABLE**  
*QoS Snippet that enables the use of the RTI Monitoring Library.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_MONITORING2\_ENABLE**  
*QoS Snippet that enables the use of the RTI Monitoring Library 2.0.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_SECURITY\_ENABLE**  
*QoS Snippet that enables security using the Builtin Security Plugins.*
- const char \*const **DDS\_SNIPPET\_FEATURE\_TOPIC\_QUERY\_ENABLE**  
*QoS Snippet that enables Topic Query.*
- const char \*const **DDS\_SNIPPET\_TRANSPORT\_TCP\_LAN\_CLIENT**  
*QoS Snippet that configures a TCP LAN Client over DDS.*
- const char \*const **DDS\_SNIPPET\_TRANSPORT\_TCP\_WAN\_SYMMETRIC\_CLIENT**  
*QoS Snippet that configures a symmetric WAN TCP Client over DDS.*
- const char \*const **DDS\_SNIPPET\_TRANSPORT\_TCP\_WAN\_ASYMMETRIC\_SERVER**  
*QoS Snippet that an asymmetric WAN TCP Server over DDS.*
- const char \*const **DDS\_SNIPPET\_TRANSPORT\_TCP\_WAN\_ASYMMETRIC\_CLIENT**  
*QoS Snippet that configures an asymmetric WAN TCP Client over DDS.*
- const char \*const **DDS\_SNIPPET\_TRANSPORT\_UDP\_AVOID\_IP\_FRAGMENTATION**  
*QoS Snippet that configures RTI Connex and the UDP built-in transports (UDPv4, UDPv6, UDPv4\_WAN) to avoid IP fragmentation.*
- const char \*const **DDS\_SNIPPET\_TRANSPORT\_UDP\_WAN**  
*QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4\_WAN).*
- const char \*const **DDS\_SNIPPET\_COMPATIBILITY\_CONNEXT\_MICRO\_VERSION\_2\_4\_3**  
*QoS Snippet that configures sets LIVELINESS QoS to be compatible with RTI Connex Micro 2.4.3.*
- const char \*const **DDS\_SNIPPET\_COMPATIBILITY\_OTHER\_DDS\_VENDORS\_ENABLE**  
*QoS Snippet that configures RTI Connex to interoperate with other DDS vendors.*
- const char \*const **DDS\_SNIPPET\_5\_1\_0\_TRANSPORT\_ENABLE**  
*QoS Snippet that configures RTI Connex to interoperate with RTI Connex 5.1.0 and below for UDPv6 and SHMEM transports.*

### 4.166.1 Detailed Description

<<*extension*>> (p. 817) QoS libraries, profiles, and snippets that are automatically built into RTI Connex.

The built-in profiles can be accessed in QoS XML configuration files and by using any of the APIs that accept library and profiles names by using the constants or string versions as documented on this page.

The built-in profiles are provided as a way to quickly and easily configure RTI Connex applications with a set of QoS values aimed at achieving a specific behavior.

There are three built-in QoS libraries:

- **BuiltinQoSLib:** A library containing built-in QoS Profiles.
- **BuiltinQoSLibExp:** A library containing experimental QoS Profiles. Experimental QoS Profiles are new QoS Profiles that have been tested internally but have not gone through an extensive validation period. Therefore, some of the settings may change in future releases based on customer and internal feedback. After validation, experimental QoS Profiles will be moved into the non-experimental library.
- **BuiltinQoSSnippetLib:** A library containing QoS Snippets that are ready to use as elements for the QoS Profile composition pattern. For further information about this pattern visit the following article: <https://community.rti.com/best-practices/qos-profile-inheritance-and-composition-guidance>

There are three types of profiles:

- **Baseline.X.X.X:** These profiles represent the QoS defaults for /ndds version X.X.X. To access the defaults for the latest RTI Connex version, use the `BuiltinQoSLib::Baseline` profile.
- **Generic.X:** These profiles allow you to easily configure different features and communication use-cases with RTI Connex. For example, there is a `Generic.StrictReliable` profile for use when your application has a requirement for no data loss.
- **Pattern.X:** These profiles inherit from the `Generic.X` profiles and allow you to configure various domain-specific communication use cases. For example, there is a `Pattern.Alarm` profile that can be used to manage the generation and consumption of alarm events.

There are several types of QoS Snippets. These are the current QoS Snippets available:

- **Optimization.X:** these QoS Snippets optimize one or more parameters related to the X QoS Policy or a specific use-case.
- **QoSPolicy.X.Y:** these QoS Snippets set a specific QoS Policy X to the value Y.
- **Feature.X:** these QoS Snippets set all the needed QoS values to enable/modify a specific feature.
- **Transport.X:** these QoS Snippets set a specific transport defined by X. This transport may have specific scenarios that are also specified in the name.
- **Compatibility.X:** these QoS Snippets change the specific QoS policies to ensure compatibility with specific products or versions specified by X.

These QoS Profiles can be used as base profiles in XML configuration, then QoS Snippets can modify specific aspects of this base QoS Profile, and finally files and values can be modified to fit a specific system's needs. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.Common">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">
    <base_name>
      <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>
    </base_name>
    <!-- Override and add values -->
  </domain_participant_qos>
</qos_profile>
```

The QoS Profiles can also be used in any APIs that call for a QoS library and profile name, for example, the `create_*_with_profile()` APIs. To create a **DDS\_DataWriter** (p. 478) configured to send large data:

```
writer = DDS_DomainParticipant_create_datawriter_with_profile(
    participant, topic,
    ::DDS_BUILTIN_QOS_LIB,
    ::DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW,
    NULL, ::DDS_STATUS_MASK_NONE);
```

All the built-in QoS Profiles and QoS Snippets are documented in the `BaselineRoot.documentationONLY.xml` and `BuiltinProfiles.documentationONLY.xml` files that are included in the `NDDSHOME/xml` directory of the RTI Connex installation.

- `BaselineRoot.documentationONLY.xml` contains the root baseline QoS profile that corresponds to the default values of RTI Connex 5.0.0.
- `BuiltinProfiles.documentationONLY.xml` contains the rest of the built-in QoS Profiles and QoS Snippets.

## 4.166.2 Variable Documentation

### 4.166.2.1 DDS\_BUILTIN\_QOS\_LIB

```
const char* const DDS_BUILTIN_QOS_LIB [extern]
```

A library of non-experimental QoS profiles.

String-version: "BuiltinQosLib"

#### 4.166.2.2 DDS\_PROFILE\_BASELINE\_ROOT

```
const char* const DDS_PROFILE_BASELINE_ROOT [extern]
```

The root baseline QoS values from which all other Baseline.X.X.X profiles inherit.

This profile contains the root baseline QoS values from which all other Baseline.X.X.X profiles inherit. These values correspond to the default values for RTI Connex 5.0.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.Root"

#### 4.166.2.3 DDS\_PROFILE\_BASELINE

```
const char* const DDS_PROFILE_BASELINE [extern]
```

The most up-to-date QoS default values.

You can use this profile if you want your application to pick up and use any new QoS default settings each time a new RTI Connex version is released – without changing your application code.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline"

#### 4.166.2.4 DDS\_PROFILE\_BASELINE\_5\_0\_0

```
const char* const DDS_PROFILE_BASELINE_5_0_0 [extern]
```

The QoS default values for version 5.0.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.5.0.0"

#### 4.166.2.5 DDS\_PROFILE\_BASELINE\_5\_1\_0

```
const char* const DDS_PROFILE_BASELINE_5_1_0 [extern]
```

The QoS default values for version 5.1.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.5.1.0"

#### 4.166.2.6 DDS\_PROFILE\_BASELINE\_5\_2\_0

```
const char* const DDS_PROFILE_BASELINE_5_2_0 [extern]
```

The QoS default values for version 5.2.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.5.2.0"

#### 4.166.2.7 DDS\_PROFILE\_BASELINE\_5\_3\_0

```
const char* const DDS_PROFILE_BASELINE_5_3_0 [extern]
```

The QoS default values for version 5.3.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.5.3.0"

#### 4.166.2.8 DDS\_PROFILE\_BASELINE\_6\_0\_0

```
const char* const DDS_PROFILE_BASELINE_6_0_0 [extern]
```

The QoS default values for version 6.0.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.6.0.0"

#### 4.166.2.9 DDS\_PROFILE\_BASELINE\_6\_1\_0

```
const char* const DDS_PROFILE_BASELINE_6_1_0 [extern]
```

The QoS default values for version 6.1.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.6.1.0"

#### 4.166.2.10 DDS\_PROFILE\_BASELINE\_7\_0\_0

```
const char* const DDS_PROFILE_BASELINE_7_0_0 [extern]
```

The QoS default values for version 7.0.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.7.0.0"

**4.166.2.11 DDS\_PROFILE\_BASELINE\_7\_1\_0**

```
const char* const DDS_PROFILE_BASELINE_7_1_0 [extern]
```

The QoS default values for version 7.1.0.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Baseline.7.1.0"

**4.166.2.12 DDS\_PROFILE\_GENERIC\_COMMON**

```
const char* const DDS_PROFILE_GENERIC_COMMON [extern]
```

A common Participant base profile.

All Generic.X and Pattern.X profiles inherit from this profile.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.Common"

**4.166.2.13 DDS\_PROFILE\_GENERIC\_MONITORING\_COMMON**

```
const char* const DDS_PROFILE_GENERIC_MONITORING_COMMON [extern]
```

Enables RTI Monitoring Library.

Generic Base participant QoS Profile that enables RTI Monitoring Library.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Monitoring.Common", apply the QoS Snippet "BuiltinQos← SnippetLib::Feature.Monitoring.Enable" via composition. For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring.Enable</element>
  </base_name>
</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Monitoring.Common">
</qos_profile>
```

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.Monitoring.Common"

#### 4.166.2.14 DDS\_PROFILE\_GENERIC\_CONNEXT\_MICRO\_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY [extern]
```

Sets the values necessary to communicate with RTI Connex Micro.

This profile will always represent the QoS values required for interoperability between the most recent version of RTI Connex Micro at the time of release of the most recent version of RTI Connex.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.ConnexMicroCompatibility"

#### 4.166.2.15 DDS\_PROFILE\_GENERIC\_CONNEXT\_MICRO\_COMPATIBILITY\_2\_4\_9

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_9 [extern]
```

Sets the values necessary to communicate with RTI Connex Micro versions 2.4.4 through at least 2.4.9.

At the time of the release of RTI Connex 5.3.0 it was not necessary to set any QoS values in order to interoperate with RTI Connex Micro. This applies to RTI Connex Micro versions 2.4.4 and later. The most recent version of RTI Connex Micro at the time of release of RTI Connex 5.3.0 was 2.4.9. There is no guarantee that this profile will interoperate with versions of RTI Connex Micro after 2.4.9.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.ConnexMicroCompatibility.2.4.9"

#### 4.166.2.16 DDS\_PROFILE\_GENERIC\_CONNEXT\_MICRO\_COMPATIBILITY\_2\_4\_3

```
const char* const DDS_PROFILE_GENERIC_CONNEXT_MICRO_COMPATIBILITY_2_4_3 [extern]
```

Sets the values necessary to communicate with RTI Connex Micro versions 2.4.3 and earlier.

RTI Connex Micro versions 2.4.3 and earlier only supported the **DDS\_MANUAL\_BY\_TOPIC\_LIVELINESS\_QOS** (p. 1098) LivelinessQos kind. In order to be compatible with these versions of RTI Connex Micro, the **DDS\_DataReader** (p. 608) and **DDS\_DataWriter** (p. 478) must have their Liveliness kind changed to this value because the default kind in RTI Connex is **DDS\_AUTOMATIC\_LIVELINESS\_QOS** (p. 1098).

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.ConnexMicroCompatibility.2.4.3"

#### 4.166.2.17 DDS\_PROFILE\_GENERIC\_OTHER\_DDS\_VENDOR\_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_OTHER_DDS_VENDOR_COMPATIBILITY [extern]
```

Sets the values necessary to interoperate with other DDS vendors.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.OtherDDSVendorCompatibility"

#### 4.166.2.18 DDS\_PROFILE\_GENERIC\_510\_TRANSPORT\_COMPATIBILITY

```
const char* const DDS_PROFILE_GENERIC_510_TRANSPORT_COMPATIBILITY [extern]
```

Sets the values necessary to interoperate with RTI Connex 5.1.0 using the UDPv6 and/or SHMEM transports.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.510TransportCompatibility"

#### 4.166.2.19 DDS\_BUILTIN\_QOS\_LIB\_EXP

```
const char* const DDS_BUILTIN_QOS_LIB_EXP [extern]
```

A library of experimental QoS profiles.

Experimental profiles are new profiles that have been tested internally but have not gone through an extensive validation period. Therefore some of the settings may change in future releases based on customer and internal feedback. After validation, experimental profiles will be moved into the non-experimental library.

QoS Profiles in this library are deprecated. They have been moved to "BuiltinQosLib". You should use the QoS Profiles from "BuiltinQosLib" instead of the ones in "BuiltinQosLibExp". The experimental profiles are still defined here to avoid backward compatibility issues.

String-version: "BuiltinQosLibExp"

#### 4.166.2.20 DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE [extern]
```

Enables strict reliability.

Configures communication to be "strict reliable" where every sample is reliably delivered.

Combines the use of the **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124) for **DDS\_ReliabilityQosPolicy** (p. 1678) with a **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094) for the **DDS\_HistoryQosPolicyKind** (p. 1093).

This QoS Profile also optimizes the reliability protocol setting for this configuration.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.StrictReliable"

#### 4.166.2.21 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE [extern]
```

Enables keep-last reliability.

Like the Generic.StrictReliable profile, this profile ensures in-order delivery of samples. However, new data can overwrite data that has not yet been acknowledged by the reader, therefore causing possible sample loss.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable"

#### 4.166.2.22 DDS\_PROFILE\_GENERIC\_BEST\_EFFORT

```
const char* const DDS_PROFILE_GENERIC_BEST_EFFORT [extern]
```

Enables best-effort reliability kind.

This profile enables best-effort communication. No effort or resources are spent to track whether or not sent samples are received. Minimal resources are used. This is the most deterministic method of sending data since there is no indeterministic delay that can be introduced by resending data. Data samples may be lost. This setting is good for periodic data.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.BestEffort"

#### 4.166.2.23 DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_HIGH\_THROUGHPUT

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_HIGH_THROUGHPUT [extern]
```

A profile that can be used to achieve high throughput.

This QoS Profile extends the **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE** (p. 1201) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE** (p. 1201) QoS Profile..

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.StrictReliable.HighThroughput"

#### 4.166.2.24 DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LOW\_LATENCY

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LOW_LATENCY [extern]
```

A profile that can be used to achieve low latency.

This QoS Profile extends the **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE** (p. 1201) QoS Profile to perform additional, fine-grained performance tuning specific to applications that send continuously streaming data. The parameters specified here add to and/or override the parameters specified in the **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE** (p. 1201) QoS Profile.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.StrictReliable.LowLatency"

#### 4.166.2.25 DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA

```
const char* const DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA [extern]
```

A common Participant base profile to facilitate sending large data.

This is a common Participant base QoS Profile that configures 3 different flow controllers: 838, 209, and 52 Mbps that can each be used to throttle application data flow at different rates.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.Participant.LargeData"

#### 4.166.2.26 DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA\_MONITORING

```
const char* const DDS_PROFILE_GENERIC_PARTICIPANT_LARGE_DATA_MONITORING [extern]
```

Configures Participants for large data *and* monitoring.

This is a common base Participant QoS Profile to configure Participants to both handle large data and use RTI Monitoring Library.

This QoS Profile is deprecated. It is included for backwards compatibility.

It is recommended that instead of inheriting from this QoS Profile, new applications apply the following QoS Snippets to their application-specific QoS Profiles:

Enable Monitoring

- **DDS\_SNIPPET\_FEATURE\_MONITORING\_ENABLE** (p. 1222)

Enable Large Data + optimizations

- **DDS\_SNIPPET\_QOS\_POLICY\_PUBLISH\_MODE\_ASYNCHRONOUS** (p. 1218)
- **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_LARGE\_DATA** (p. 1214)
- **DDS\_SNIPPET\_OPTIMIZATION\_DATACACHE\_LARGE\_DATA\_DYNAMICMEMALLOC** (p. 1214) In Library↔ : **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.Participant.LargeData.Monitoring"

See also

**DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA** (p. 1202)

**DDS\_PROFILE\_GENERIC\_MONITORING\_COMMON** (p. 1199)

#### 4.166.2.27 DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA [extern]
```

Configures endpoints for sending large data with strict reliability.

This QoS Profile extends the **DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA** (p. 1202) QoS Profile to handle sending large samples. This QoS Profile optimizes memory usage per sample within RTI Connex, but it does not do any flow control. You can use this QoS Profile directly, which enables asynchronous publication with the default flow controller (i.e. no flow control) or you can use one of the three QoS Profiles below (Generic.StrictReliable.LargeData.\*↔Flow), which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in **DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA** (p. 1202) in order to throttle application data flow.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.StrictReliable.LargeData"

#### 4.166.2.28 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA [extern]
```

Configures endpoints for sending large data with keep-last reliability.

This QoS Profile is similar to the **DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA** (p. 1202) QoS Profile, but also adds QoS Snippets to handle sending large data. You can use this QoS Profile directly, which enables the default flow controller (i.e., no flow control) or you can choose one of the three QoS Profiles below (Generic.KeepLastReliable.↔LargeData.\*Flow) which uses this QoS Profile as a common base QoS Profile. Each of these three QoS Profiles uses one of the three flow controllers defined in **DDS\_PROFILE\_GENERIC\_PARTICIPANT\_LARGE\_DATA** (p. 1202) in order to throttle application data flow.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable.LargeData"

#### 4.166.2.29 DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA\_FAST\_FLOW

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_FAST_FLOW [extern]
```

Configures strictly reliable communication for large data with a fast flow controller.

Strictly reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.StrictReliable.LargeData.FastFlow"

**4.166.2.30 DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA\_MEDIUM\_FLOW**

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_MEDIUM_FLOW [extern]
```

Configures strictly reliable communication for large data with a medium flow controller.

Strictly reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.StrictReliable.LargeData.MediumFlow"

**4.166.2.31 DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LARGE\_DATA\_SLOW\_FLOW**

```
const char* const DDS_PROFILE_GENERIC_STRICT_RELIABLE_LARGE_DATA_SLOW_FLOW [extern]
```

Configures strictly reliable communication for large data with a slow flow controller.

Strictly reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.StrictReliable.LargeData.SlowFlow"

**4.166.2.32 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA\_FAST\_FLOW**

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_FAST_FLOW [extern]
```

Configures keep-last reliable communication for large data with a fast flow controller.

Keep-last reliable communication for large data with a 838 Mbps (~ 100 MB/sec) flow controller.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable.LargeData.FastFlow"

**4.166.2.33 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA\_MEDIUM\_FLOW**

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_MEDIUM_FLOW [extern]
```

Configures keep-last reliable communication for large data with a medium flow controller.

Keep-last reliable communication for large data with a 209Mbps (~ 25 MB/sec) flow controller.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable.LargeData.MediumFlow"

#### 4.166.2.34 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA\_SLOW\_FLOW

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_LARGE_DATA_SLOW_FLOW [extern]
```

Configures keep-last reliable communication for large data with a slow flow controller.

Keep-last reliable communication for large data with a 52 MB/sec (~ 6.25 MB/sec) flow controller.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable.LargeData.SlowFlow"

#### 4.166.2.35 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_TRANSIENT\_LOCAL

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT_LOCAL [extern]
```

Persists the samples of a DataWriter as long as the entity exists.

This profile extends the **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE** (p. 1201) profile, but persists the samples of a **DDS\_DataWriter** (p. 478) as long as the entity exists in order to deliver them to late-joining DataReaders.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable.TransientLocal"

#### 4.166.2.36 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_TRANSIENT

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_TRANSIENT [extern]
```

Persists samples using RTI Persistence Service.

This profile extends the **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE** (p. 1201) profile, but persists samples using Persistence Service in order to deliver them to late-joining DataReaders.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable.Transient"

#### 4.166.2.37 DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_PERSISTENT

```
const char* const DDS_PROFILE_GENERIC_KEEP_LAST_RELIABLE_PERSISTENT [extern]
```

Persists samples in permanent storage, like a disk, using RTI Persistence Service.

This profile extends the **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE** (p. 1201) profile, but persists samples in permanent storage, such as a disk, using Persistence Service in order to deliver them to late-joining DataReaders.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.KeepLastReliable.Persistent"

**4.166.2.38 DDS\_PROFILE\_GENERIC\_AUTO\_TUNING**

```
const char* const DDS_PROFILE_GENERIC_AUTO_TUNING [extern]
```

Enables the Turbo Mode batching and Auto Throttle experimental features.

Turbo Mode batching adjusts the maximum number of bytes of a batch based on how frequently samples are being written. Auto Throttle auto-adjusts the speed at which a writer will write samples, based on the number of unacknowledged samples in its queue.

These features are designed to auto-adjust the publishing behavior within a system in order to achieve the best possible performance with regards to throughput and latency.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.AutoTuning"

**4.166.2.39 DDS\_PROFILE\_GENERIC\_MINIMAL\_MEMORY\_FOOTPRINT**

```
const char* const DDS_PROFILE_GENERIC_MINIMAL_MEMORY_FOOTPRINT [extern]
```

Uses a set of QoS which reduces the memory footprint of the application.

Uses a set of QoS which reduces the memory footprint of the application.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Generic.MinimalMemoryFootprint"

**4.166.2.40 DDS\_PROFILE\_GENERIC\_SECURITY**

```
const char* const DDS_PROFILE_GENERIC_SECURITY [extern]
```

Loads the DDS Secure builtin plugins.

Generic Base Participant Profile that enables the builtin DDS Security Plugins.

Use of this QoS Profile is deprecated. It is included for backwards compatibility.

Instead of using the (deprecated) "BuiltinQosLib::Generic.Security", apply the QoS Snippet "BuiltinQosSnippetLib::Feature.Security.Enable" via composition. For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Security.Enable</element>
  </base_name>
</qos_profile>
```

Legacy applications may use this QoS Profile via inheritance. To do this, create a derived QoS Profile that inherits from this one. For example:

```
<qos_profile name="MyProfile" base_name="BuiltinQosLib::Generic.StrictReliable">
  <domain_participant_qos base_name="BuiltinQosLib::Generic.Security">
  </domain_participant_qos>
</qos_profile>
```

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196)

String-version: "Generic.Security"

#### 4.166.2.41 DDS\_PROFILE\_GENERIC\_MONITORING2

```
const char* const DDS_PROFILE_GENERIC_MONITORING2 [extern]
```

The default QoS profile that the DDS entities created by the RTI Monitoring Library 2.0 use.

This profile inherits from **DDS\_PROFILE\_GENERIC\_MINIMAL\_MEMORY\_FOOTPRINT** (p. 1207).

The following DomainParticipant QoS policy of this profile cannot be modified and it is overwritten by the RTI Monitoring Library 2.0:

- Discovery Config Built-in Channel Kind.

The following DataWriter and DataReader QoS policies of this profile cannot be modified and they are overwritten by the RTI Monitoring Library 2.0:

- Reliability Kind.
- Durability Kind.
- History Kind.
- Publish Mode Kind.
- Protocol -> RTPS Reliable Writer -> Max Heartbeat Retries.

This profile uses Topic Filters to select the DataWriter and DataReader QoS depending on the Observability Distribution Topic.

You should be using this profile or a profile inheriting from it when you configure the distribution of telemetry data using the <distribution\_settings> tag under <monitoring> for the <participant\_factory\_qos>.

Note: This profile does not enable the use of the RTI Monitoring Library 2.0. To do that you can use the Snippet **DDS\_SNIPPET\_FEATURE\_MONITORING2\_ENABLE** (p. 1223).

String-version: "Generic.Monitoring2"

See also

**RTI\_MONITORING\_PERIODIC\_TOPIC\_NAME** (p. 1233)

**RTI\_MONITORING\_EVENT\_TOPIC\_NAME** (p. 1233)

**RTI\_MONITORING\_LOGGING\_TOPIC\_NAME** (p. 1233)

#### 4.166.2.42 DDS\_PROFILE\_PATTERN\_PERIODIC\_DATA

```
const char* const DDS_PROFILE_PATTERN_PERIODIC_DATA [extern]
```

Used for applications that expect periodic data.

This QoS Profile is intended to be used for applications that expect periodic data such as sensor data. The deadline that is set in this profile can be used to detect when DataWriters are not publishing data with the expected periodicity.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.PeriodicData"

#### 4.166.2.43 DDS\_PROFILE\_PATTERN\_STREAMING

```
const char* const DDS_PROFILE_PATTERN_STREAMING [extern]
```

Used for applications that stream data.

The data sent in streaming applications is commonly periodic. Therefore this profile simply inherits from the **DDS\_PROFILE\_PATTERN\_PERIODIC\_DATA** (p. 1208) profile. Note: With this QoS Profile, the application may lose data, which may be acceptable in use cases such as video conferencing.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.Streaming"

#### 4.166.2.44 DDS\_PROFILE\_PATTERN\_RELIABLE\_STREAMING

```
const char* const DDS_PROFILE_PATTERN_RELIABLE_STREAMING [extern]
```

Used for applications that stream data *and* require reliable communication.

Sometimes streaming applications require reliable communication while still tolerating some data loss. In this case, we inherit from the **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE** (p. 1201) QoS Profile and the following QoS Snippets:

- **DDS\_SNIPPET\_QOS\_POLICY\_RELIABILITY\_RELIABLE** (p. 1216)
- **DDS\_SNIPPET\_QOS\_POLICY\_HISTORY\_KEEP\_LAST\_1** (p. 1217)
- **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_KEEP\_LAST** (p. 1212)

This QoS Snippet also increases the **DDS\_HistoryQosPolicy::depth** (p. 1560) to reduce the probability of losing samples.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.ReliableStreaming"

#### 4.166.2.45 DDS\_PROFILE\_PATTERN\_EVENT

```
const char* const DDS_PROFILE_PATTERN_EVENT [extern]
```

Used for applications that handle events.

This QoS Profile can be used by applications in which samples represent events such as button pushes or alerts. When events are triggered, the system should almost always do something, meaning that you don't want the system to lose the event. This means that the system requires strictly reliable communication. To enable it, use the following QoS Snippets:

- **DDS\_SNIPPET\_QOS\_POLICY\_RELIABILITY\_RELIABLE** (p. 1216)
- **DDS\_SNIPPET\_QOS\_POLICY\_HISTORY\_KEEP\_ALL** (p. 1218)
- **DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_KEEP\_ALL** (p. 1212)

Since events and alerts are critical and non-periodic data, it is important to detect situations in which communication between a **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) is broken. This is why this profile sets the **DDS\_LivelinessQosPolicy** (p. 1575). If the **DDS\_DataWriter** (p. 478) does not assert its liveliness in a timely manner, the **DDS\_DataReader** (p. 608) will report 'loss of liveliness' to the application.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.Event"

#### 4.166.2.46 DDS\_PROFILE\_PATTERN\_ALARM\_EVENT

```
const char* const DDS_PROFILE_PATTERN_ALARM_EVENT [extern]
```

Used for applications that handle alarm events.

An alarm is a type of event; therefore this profile simply inherits from **DDS\_PROFILE\_PATTERN\_EVENT** (p. 1209).

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.AlarmEvent"

#### 4.166.2.47 DDS\_PROFILE\_PATTERN\_STATUS

```
const char* const DDS_PROFILE_PATTERN_STATUS [extern]
```

Used for applications whose samples represent statuses.

This QoS Profile can be used by applications in which samples represent state variables whose values remain valid as long as they don't explicitly change. State variables typically do not change periodically. State variables and their values should also be available to applications that appear after the value originally changed because it is unreasonable to have to wait until the next change of state, which may be indeterminate.

Whether to use this QoS Profile or **DDS\_PROFILE\_PATTERN\_PERIODIC\_DATA** (p. 1208) can often be an application choice. For example, if a DataWriter is publishing temperature sensor data, it could use the **DDS\_PROFILE\_PATTERN\_PERIODIC\_DATA** (p. 1208) QoS Profile and publish the data at a fixed rate or it could use the **DDS\_PROFILE\_PATTERN\_STATUS** (p. 1210) QoS Profile and only publish the temperature when it changes more than 1 degree.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.Status"

#### 4.166.2.48 DDS\_PROFILE\_PATTERN\_ALARM\_STATUS

```
const char* const DDS_PROFILE_PATTERN_ALARM_STATUS [extern]
```

Used for applications in which samples represent alarm statuses.

An alarm status is a type of status; therefore this QoS Profile simply inherits from **DDS\_PROFILE\_PATTERN\_STATUS** (p. 1210).

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.AlarmStatus"

#### 4.166.2.49 DDS\_PROFILE\_PATTERN\_LAST\_VALUE\_CACHE

```
const char* const DDS_PROFILE_PATTERN_LAST_VALUE_CACHE [extern]
```

Used for applications that only need the last published value.

With this QoS Profile, a **DDS\_DataWriter** (p. 478) will keep in its queue the last value that was published for each sample instance. Late-joining DataReaders will get that value when they join the system. This QoS Profile inherits from **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_TRANSIENT\_LOCAL** (p. 1206) because the use case requires delivery to late-joiners.

In Library: **DDS\_BUILTIN\_QOS\_LIB** (p. 1196) and **DDS\_BUILTIN\_QOS\_LIB\_EXP** (p. 1201)

String-version: "Pattern.LastValueCache"

#### 4.166.2.50 DDS\_BUILTIN\_QOS\_SNIPPET\_LIB

```
const char* const DDS_BUILTIN_QOS_SNIPPET_LIB [extern]
```

A library of QoS Snippets.

String-version: "BuiltinQosSnippetLib"

#### 4.166.2.51 DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_COMMON

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_COMMON [extern]
```

QoS Snippet that configures the reliability protocol with a common configuration.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet defines parameters common to a set of "alternative" QoS Snippets that configure the reliability protocol.

Modified QoS Parameters:

- **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ResourceLimitsQosPolicy** (p. 1690)
- **DDS\_DataReaderProtocolQosPolicy::rtps\_reliable\_reader** (p. 1378)

This QoS Snippet configures the reliability protocol parameters for more aggressive (faster) heartbeats so that sample loss is detected and repaired faster.

This QoS Snippet also sets the **DDS\_RtpsReliableWriterProtocol\_t::max\_heartbeat\_retries** (p. 1704), which works in combination with the heartbeat rate to determine when the **DDS\_DataWriter** (p. 478) considers a **DDS\_DataReader** (p. 608) non-responsive. This QoS Snippet configures the **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426) parameters so that the **DDS\_DataWriter** (p. 478) considers the **DDS\_DataReader** (p. 608) to be "inactive" after 500 unresponded heartbeats.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.ReliabilityProtocol.Common"

#### 4.166.2.52 DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_KEEP\_ALL

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_ALL [extern]
```

QoS Snippet that configures the reliability protocol for KEEP\_ALL.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDS\_DataWriter** (p. 478) reliable protocol parameters for a reliable **DDS\_DataWriter** (p. 478) with **DDS\_HistoryQosPolicyKind** (p. 1093) set to **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094).

Modified QoS Parameters:

- **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ResourceLimitsQosPolicy** (p. 1690)
- **DDS\_DataReaderProtocolQosPolicy::rtps\_reliable\_reader** (p. 1378)

Note that this QoS Snippet does not configure the **DDS\_ReliabilityQosPolicy** (p. 1678) or **DDS\_HistoryQosPolicy** (p. 1558) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.ReliabilityProtocol.KeepAll"

#### 4.166.2.53 DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_KEEP\_LAST

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_KEEP_LAST [extern]
```

QoS Snippet that configures the reliability protocol for KEEP\_LAST.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDS\_DataWriter** (p. 478) reliable protocol parameters for a reliable **DDS\_DataWriter** (p. 478) with **DDS\_HistoryQoSPolicyKind** (p. 1093) set to **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094).

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_ResourceLimitsQoSPolicy** (p. 1690)
- **DDS\_DataWriterProtocolQoSPolicy::rtps\_reliable\_writer** (p. 1426)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ResourceLimitsQoSPolicy** (p. 1690)
- **DDS\_DataReaderProtocolQoSPolicy::rtps\_reliable\_reader** (p. 1378)

Note that this QoS Snippet does not configure the **DDS\_ReliabilityQoSPolicy** (p. 1678) or **DDS\_HistoryQoSPolicy** (p. 1558) QoS policies. It is intended to be used in combination with other QoS Snippets that configure those policies.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.ReliabilityProtocol.KeepLast"

#### 4.166.2.54 DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_HIGH\_RATE

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_HIGH_RATE [extern]
```

QoS Snippet that configures the reliability protocol for sending data at a high rate.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet optimizes the **DDS\_DataWriter** (p. 478) reliable protocol parameters for a reliable **DDS\_DataWriter** (p. 478) that is writing messages at high rates, especially in situations where throughput is favored over latency.

Modified QoS Parameters:

- **DDS\_DataWriterProtocolQoSPolicy::rtps\_reliable\_writer** (p. 1426)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ResourceLimitsQoSPolicy** (p. 1690)
- **DDS\_DataReaderProtocolQoSPolicy::rtps\_reliable\_reader** (p. 1378)

This QoS Snippet sets a fast rate of heartbeats so that errors are detected and repaired more swiftly.

Note that to get the highest throughput you may need to apply additional changes to the final QoS Profile. See the QoS Profile **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_HIGH\_THROUGHPUT** (p. 1202) for further information.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.ReliabilityProtocol.HighRate"

#### 4.166.2.55 DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_LOW\_LATENCY

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LOW_LATENCY [extern]
```

QoS Snippet that configures the reliability protocol for sending data at low latency.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

This QoS Snippet modifies the Reliable Protocol parameters to accomplish low latency.

Modified QoS Parameters:

- **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ResourceLimitsQosPolicy** (p. 1690)
- **DDS\_DataReaderProtocolQosPolicy::rtps\_reliable\_reader** (p. 1378)

Note that to get the lowest latency you may need to apply additional changes to the final QoS Profile. See the QoS Profile **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE\_LOW\_LATENCY** (p. 1202) for further information.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.ReliabilityProtocol.LowLatency"

#### 4.166.2.56 DDS\_SNIPPET\_OPTIMIZATION\_RELIABILITY\_PROTOCOL\_LARGE\_DATA

```
const char* const DDS_SNIPPET_OPTIMIZATION_RELIABILITY_PROTOCOL_LARGE_DATA [extern]
```

QoS Snippet that configures the reliability protocol for large data.

The QoS Snippets starting with "Optimization.ReliabilityProtocol." provide alternative configurations of the same QoS Policies. Choose just one QoS Snippet of the alternatives when defining a new QoS Profile or QoS Snippet.

Modifies the Reliable Protocol parameters and Resource Limits to work with Large Data.

Modified QoS Parameters:

- **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ResourceLimitsQosPolicy** (p. 1690)
- **DDS\_DataReaderProtocolQosPolicy::rtps\_reliable\_reader** (p. 1378)

Note that to send large data you need to apply additional changes that configure the data caches, asynchronous writing, transport buffers, etc. See, for example, **DDS\_PROFILE\_GENERIC\_KEEP\_LAST\_RELIABLE\_LARGE\_DATA** (p. 1204), and derivatives for fully functional Large Data QoS Profiles.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.ReliabilityProtocol.LargeData"

#### 4.166.2.57 DDS\_SNIPPET\_OPTIMIZATION\_DATACACHE\_LARGE\_DATA\_DYNAMICMEMALLOC

```
const char* const DDS_SNIPPET_OPTIMIZATION_DATACACHE_LARGE_DATA_DYNAMICMEMALLOC [extern]
```

Configures the DataWriter and DataReader caches to use dynamic memory allocation for Large Data samples.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_ResourceLimitsQosPolicy** (p. 1690)
- **DDS\_DataWriterQos** (p. 1438) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.data\_writer.history.<->memory\_manager.\*"
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ResourceLimitsQosPolicy** (p. 1690)
- **DDS\_DataReaderResourceLimitsQosPolicy** (p. 1398)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.data\_reader.history.<->memory\_manager.\*"

This configuration is needed to handle data that contains unbounded sequences or strings. This QoS Snippet is also recommended if samples can have very different sizes and the bigger samples can be very large.

If dynamic memory allocation is not used for the larger samples, then all samples are allocated to their maximum size which can consume a lot of resources.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.DataCache.LargeData.DynamicMemAlloc"

#### 4.166.2.58 DDS\_SNIPPET\_OPTIMIZATION\_DISCOVERY\_COMMON

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_COMMON [extern]
```

QoS Snippet that optimizes discovery with a common configuration.

Optimizes the **DDS\_DomainParticipantQos** (p. 1490) to detect faster discovery changes. This QoS Snippet increases the speed moderately so that it fits the normal scenarios.

Modified QoS Parameters:

- **DDS\_DiscoveryConfigQosPolicy::participant\_liveliness\_lease\_duration** (p. 1462)
- **DDS\_DiscoveryConfigQosPolicy::participant\_liveliness\_assert\_period** (p. 1463)
- **DDS\_DiscoveryConfigQosPolicy::max\_liveliness\_loss\_detection\_period** (p. 1464)
- **DDS\_DiscoveryConfigQosPolicy::initial\_participant\_announcements** (p. 1464)
- **DDS\_DiscoveryConfigQosPolicy::publication\_writer** (p. 1467)
- **DDS\_DiscoveryConfigQosPolicy::subscription\_writer** (p. 1468)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.Discovery.Common"

#### 4.166.2.59 DDS\_SNIPPET\_OPTIMIZATION\_DISCOVERY\_PARTICIPANT\_COMPACT

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_PARTICIPANT_COMPACT [extern]
```

QoS Snippet that optimizes the Participant QoS to send less discovery information.

Modified QoS Parameters:

- **DDS\_DomainParticipantQos** (p. 1490) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.participant.inter\_↔ participant.\*"
- **DDS\_DomainParticipantQos** (p. 1490) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.sys\_info.\*"

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.Discovery.Participant.Compact"

#### 4.166.2.60 DDS\_SNIPPET\_OPTIMIZATION\_DISCOVERY\_ENDPOINT\_FAST

```
const char* const DDS_SNIPPET_OPTIMIZATION_DISCOVERY_ENDPOINT_FAST [extern]
```

QoS Snippet that optimizes the Endpoint Discovery to be faster.

This is useful when using security, to prevent a noticeable delay.

Modified QoS Parameters:

- **DDS\_DiscoveryConfigQosPolicy::publication\_writer** (p. 1467)
- **DDS\_DiscoveryConfigQosPolicy::subscription\_writer** (p. 1468)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.Discovery.Endpoint.Fast"

#### 4.166.2.61 DDS\_SNIPPET\_OPTIMIZATION\_TRANSPORT\_LARGE\_BUFFERS

```
const char* const DDS_SNIPPET_OPTIMIZATION_TRANSPORT_LARGE_BUFFERS [extern]
```

QoS Snippet that increases the Participant default buffer that shmем and udpv4 use.

This is useful when using Large Data

Modified QoS Parameters:

- **DDS\_ReceiverPoolQosPolicy** (p. 1676)
- **DDS\_TransportBuiltinQosPolicy** (p. 1786)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Optimization.Transport.LargeBuffers"

#### 4.166.2.62 DDS\_SNIPPET\_QOS\_POLICY\_RELIABILITY\_RELIABLE

```
const char* const DDS_SNIPPET_QOS_POLICY_RELIABILITY_RELIABLE [extern]
```

QoS Snippet that sets RELIABILITY QoS to RELIABLE.

This also configures a blocking time in case the **DDS\_DataWriter** (p. 478) writes faster than the DataReaders can accommodate.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_ReliabilityQosPolicy** (p. 1678)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ReliabilityQosPolicy** (p. 1678)

Note that by itself enabling reliability does not ensure that every sample written is delivered to the DataReaders. This is because the **DDS\_DataWriter** (p. 478) and/or **DDS\_DataReader** (p. 608) can be configured to override samples in its cache based on the configuration of the **DDS\_HistoryQosPolicy** (p. 1558) QoS policy.

To ensure delivery of every sample (at the expense of potentially blocking the **DDS\_DataWriter** (p. 478)), use the QoS Profile **DDS\_PROFILE\_GENERIC\_STRICT\_RELIABLE** (p. 1201) or one of the derived QoS Profiles.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QosPolicy.Reliability.Reliable"

#### 4.166.2.63 DDS\_SNIPPET\_QOS\_POLICY\_RELIABILITY\_BEST\_EFFORT

```
const char* const DDS_SNIPPET_QOS_POLICY_RELIABILITY_BEST_EFFORT [extern]
```

QoS Snippet that sets RELIABILITY QoS to BEST\_EFFORT.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_ReliabilityQosPolicy** (p. 1678)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_ReliabilityQosPolicy** (p. 1678)

With best-effort, there are no resources spent to confirm delivery of samples nor repairs of any samples that may be lost.

Best-effort communication reduces jitter; therefore, the delay between sending data and receiving it is more deterministic for the samples that are actually received. Best-effort is good for periodic data where it may be better to get the next value than to wait for the previous one to be repaired.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QosPolicy.Reliability.BestEffort"

#### 4.166.2.64 DDS\_SNIPPET\_QOS\_POLICY\_HISTORY\_KEEP\_LAST\_1

```
const char* const DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_LAST_1 [extern]
```

QoS Snippet that sets HISTORY QoS to KEEP\_LAST kind with depth 1.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_HistoryQosPolicy** (p. 1558)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_HistoryQosPolicy** (p. 1558)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QosPolicy.History.KeepLast\_1"

#### 4.166.2.65 DDS\_SNIPPET\_QOS\_POLICY\_HISTORY\_KEEP\_ALL

```
const char* const DDS_SNIPPET_QOS_POLICY_HISTORY_KEEP_ALL [extern]
```

QoS Snippet that sets HISTORY QoSPolicy to KEEP\_ALL kind.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_HistoryQosPolicy** (p. 1558)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_HistoryQosPolicy** (p. 1558)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QosPolicy.History.KeepAll"

#### 4.166.2.66 DDS\_SNIPPET\_QOS\_POLICY\_PUBLISH\_MODE\_ASYNCHRONOUS

```
const char* const DDS_SNIPPET_QOS_POLICY_PUBLISH_MODE_ASYNCHRONOUS [extern]
```

QoS Snippet that sets PUBLISH\_MODE QoSPolicy to ASYNCHRONOUS kind.

Modified QoS Parameters:

- **DDS\_PublishModeQosPolicy** (p. 1664)

Asynchronous Publish mode decouples the application thread that calls the **DDS\_DataWriter** (p.478) "write" operation from the thread used to send the data on the network. See <https://community.rti.com/glossary/asynchronous-writer>

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QosPolicy.PublishMode.Asynchronous"

#### 4.166.2.67 DDS\_SNIPPET\_QOS\_POLICY\_DURABILITY\_TRANSIENT\_LOCAL

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT_LOCAL [extern]
```

QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT\_LOCAL kind.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_DurabilityQosPolicy** (p. 1516)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_DurabilityQosPolicy** (p. 1516)

DataWriters will store and send previously published DDS samples for delivery to newly discovered DataReaders as long as the **DDS\_DataWriter** (p. 478) still exists. For this setting to be effective, you must also set the **DDS\_ReliabilityQosPolicyKind** (p. 1123) to **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124) (not Best Effort). Which particular DDS samples are kept depends on other QoS settings such as **DDS\_HistoryQosPolicy** (p. 1558) and **DDS\_ResourceLimitsQosPolicy** (p. 1690).

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QoSPolicy.Durability.TransientLocal"

#### 4.166.2.68 DDS\_SNIPPET\_QOS\_POLICY\_DURABILITY\_TRANSIENT

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_TRANSIENT [extern]
```

QoS Snippet that sets DURABILITY QoSPolicy to TRANSIENT kind.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_DurabilityQosPolicy** (p. 1516)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_DurabilityQosPolicy** (p. 1516)

RTI Connext will store previously published DDS samples in memory using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **DDS\_HistoryQosPolicy** (p. 1558) and **DDS\_ResourceLimitsQosPolicy** (p. 1690) of the Persistence Service DataWriters. These QoS Policies can be configured in the Persistence Service configuration file or through the **DDS\_DurabilityQosPolicyKind** (p. 1088) of the DataWriters configured with **DDS\_TRANSIENT\_DURABILITY\_QOS** (p. 1089).

You need a Persistence Service instance running to use this behavior.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QoSPolicy.Durability.Transient"

#### 4.166.2.69 DDS\_SNIPPET\_QOS\_POLICY\_DURABILITY\_PERSISTENT

```
const char* const DDS_SNIPPET_QOS_POLICY_DURABILITY_PERSISTENT [extern]
```

QoS Snippet that sets DURABILITY QoS Policy to PERSISTENT kind.

Modified QoS Parameters:

- **DDS\_DataWriterQos** (p. 1438) => **DDS\_DurabilityQosPolicy** (p. 1516)
- **DDS\_DataReaderQos** (p. 1390) => **DDS\_DurabilityQosPolicy** (p. 1516)

RTI Connext will store previously published DDS samples in permanent storage, like a disk, using Persistence Service, which will send the stored data to newly discovered DataReaders. Which particular DDS samples are kept and sent by Persistence Service depends on the **DDS\_HistoryQosPolicy** (p. 1558) and **DDS\_ResourceLimitsQosPolicy** (p. 1690) in the Persistence Service DataWriters. These QoS Policies can be configured in the Persistence Service configuration file or through the **DDS\_DurabilityQosPolicyKind** (p. 1088) of the DataWriters configured with **DDS\_PERSISTENT** ↔ **\_DURABILITY\_QOS** (p. 1089).

You need a Persistence Service instance running to use this behavior.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QoSPolicy.Durability.Persistent"

#### 4.166.2.70 DDS\_SNIPPET\_QOS\_POLICY\_BATCHING\_ENABLE

```
const char* const DDS_SNIPPET_QOS_POLICY_BATCHING_ENABLE [extern]
```

QoS Snippet that sets BATCH QoS Policy to true.

Modified QoS Parameters:

- **DDS\_BatchQosPolicy** (p. 1334)

This QoS Snippet specifies and configures the mechanism that allows RTI Connext to collect multiple user data DDS samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "QoSPolicy.Batching.Enable"

#### 4.166.2.71 DDS\_SNIPPET\_FEATURE\_FLOW\_CONTROLLER\_838MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_838MBPS [extern]
```

QoS Snippet that configures and set a FlowController of 838 Mbps.

Defines a **DDS\_FlowController** (p. 551) and configures the **DDS\_DataWriterQos** (p. 1438) with it.

This is a **DDS\_FlowController** (p. 551) of 838 Mbps (~ 100 MB/sec)

Modified QoS Parameters:

- **DDS\_DomainParticipantQos** (p. 1490) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.flow\_controller.↔ token\_bucket.\*"
- **DDS\_PublishModeQosPolicy** (p. 1664)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.FlowController.838Mbps"

#### 4.166.2.72 DDS\_SNIPPET\_FEATURE\_FLOW\_CONTROLLER\_209MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_209MBPS [extern]
```

QoS Snippet that configures and sets a FlowController of 209 Mbps.

Defines a **DDS\_FlowController** (p. 551) and configures the **DDS\_DataWriterQos** (p. 1438) with it.

This is a **DDS\_FlowController** (p. 551) of 209 Mbps (~ 25 MB/sec)

Modified QoS Parameters:

- **DDS\_DomainParticipantQos** (p. 1490) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.flow\_controller.↔ token\_bucket.\*"
- **DDS\_PublishModeQosPolicy** (p. 1664)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.FlowController.209Mbps"

#### 4.166.2.73 DDS\_SNIPPET\_FEATURE\_FLOW\_CONTROLLER\_52MBPS

```
const char* const DDS_SNIPPET_FEATURE_FLOW_CONTROLLER_52MBPS [extern]
```

QoS Snippet that configures and sets a FlowController of 52 Mbps.

Defines a **DDS\_FlowController** (p. 551) and configures the **DDS\_DataWriterQos** (p. 1438) with it.

This is a **DDS\_FlowController** (p. 551) of 52 Mbps (~ 6.25 MB/sec)

Modified QoS Parameters:

- **DDS\_DomainParticipantQos** (p. 1490) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.flow\_controller.↔ token\_bucket.\*"
- **DDS\_PublishModeQosPolicy** (p. 1664)

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.FlowController.52Mbps"

#### 4.166.2.74 DDS\_SNIPPET\_FEATURE\_AUTO\_TUNING\_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_AUTO_TUNING_ENABLE [extern]
```

QoS Snippet that enables auto\_throttle and turbo\_mode to true.

Sets the **DDS\_DomainParticipantQos** (p. 1490) properties to enable auto\_throttle and turbo\_mode to true.

Modified QoS Parameters:

- **DDS\_DomainParticipantQos** (p. 1490) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.domain\_↔ participant.auto\_throttle"
- **DDS\_DataWriterQos** (p. 1438) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.data\_writer.auto\_throttle.↔ enable"
- **DDS\_DataWriterQos** (p. 1438) => **DDS\_PropertyQosPolicy** (p. 1645) named "dds.data\_writer.enable\_turbo\_↔ \_mode"

The domain\_participant.auto\_throttle configures the **DDS\_DomainParticipant** (p. 72) to gather internal measurements (during **DDS\_DomainParticipant** (p. 72) creation) that are required for the Auto Throttle feature. This allows DataWriters belonging to this **DDS\_DomainParticipant** (p. 72) to use the Auto Throttle feature.

The turbo\_mode adjusts the batch max\_data\_bytes based on how frequently the **DDS\_DataWriter** (p. 478) writes data.

Data\_writer.auto\_throttle enables automatic throttling in the **DDS\_DataWriter** (p. 478) so it can automatically adjust the writing rate and the send window size; this minimizes the need for repairing DDS samples and improves latency.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.AutoTuning.Enable"

**4.166.2.75 DDS\_SNIPPET\_FEATURE\_MONITORING\_ENABLE**

```
const char* const DDS_SNIPPET_FEATURE_MONITORING_ENABLE [extern]
```

QoS Snippet that enables the use of the RTI Monitoring Library.

To enable the use of RTI Monitoring Library apply this QoS Snippet to the QoS Profile used to create your **DDS\_↔ DomainParticipant** (p. 72). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.Monitoring.Enable</element>
  </base_name>
</qos_profile>
```

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.Monitoring.Enable"

**4.166.2.76 DDS\_SNIPPET\_FEATURE\_MONITORING2\_ENABLE**

```
const char* const DDS_SNIPPET_FEATURE_MONITORING2_ENABLE [extern]
```

QoS Snippet that enables the use of the RTI Monitoring Library 2.0.

QoS Snippet to enable the use of the RTI Monitoring Library 2.0 with a dedicated DomainParticipant publishing telemetry data from your application in domain ID 2. All metrics are enabled for all resources in this profile.

To enable the use of RTI Monitoring Library 2.0, apply this QoS Snippet to the QoS Profile used to create your Domain↔ ParticipantFactory. For example:

```
<qos_profile name="MyProfile" is_default_participant_factory_profile="true">
  <base_name>
    <element>BuiltinQosSnippetLib::Feature.Monitoring2.Enable</element>
  </base_name>
</qos_profile>
```

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.Monitoring2.Enable"

**4.166.2.77 DDS\_SNIPPET\_FEATURE\_SECURITY\_ENABLE**

```
const char* const DDS_SNIPPET_FEATURE_SECURITY_ENABLE [extern]
```

QoS Snippet that enables security using the Builtin Security Plugins.

To enable the use of the Builtin DDS Security Library apply this QoS Snippet to the QoS Profile used to create your **DDS\_DomainParticipant** (p. 72). For example:

```
<qos_profile name="MyProfile">
  <base_name>
    <element>BuiltinQosLib::Feature.Security.Enable</element>
  </base_name>
</qos_profile>
```

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.Security.Enable"

#### 4.166.2.78 DDS\_SNIPPET\_FEATURE\_TOPIC\_QUERY\_ENABLE

```
const char* const DDS_SNIPPET_FEATURE_TOPIC_QUERY_ENABLE [extern]
```

QoS Snippet that enables Topic Query.

To enable the use of the RTI Connex **DDS\_TopicQuery** (p. 698) feature, apply this QoS Snippet to the QoS Profile used to create your **DDS\_DataWriter** (p. 478). For example:

```
<qos_profile name="MyProfile">  
  <base_name>  
    <element>BuiltinQosLib::Feature.TopicQuery.Enable</element>  
  </base_name>  
</qos_profile>
```

For more information on Topic Query see the "Topic Queries" chapter in the `User's Manual`.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Feature.TopicQuery.Enable"

#### 4.166.2.79 DDS\_SNIPPET\_TRANSPORT\_TCP\_LAN\_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_LAN_CLIENT [extern]
```

QoS Snippet that configures a TCP LAN Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the `initial_peers` and the property `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Therefore, they must be modified:

- `initial_peers`: should point to the remote client IP and port.
- `server_bind_port`: is the port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **DDS\_Entity** (p. 1160). These new values will overwrite the current invalid values.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Transport.TCP.LAN.Client"

#### 4.166.2.80 DDS\_SNIPPET\_TRANSPORT\_TCP\_WAN\_SYMMETRIC\_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_SYMMETRIC_CLIENT [extern]
```

QoS Snippet that configures a symmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties `dds.transport.TCPv4.tcp1.public_address` and `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Also the `initial_peers` information is not correct. Therefore, the following must be modified:

- `initial_peers`: should point to the remote client IP and port.
- `public_address`: public IP address where this application can be reached.
- `server_bind_port`: port this application will be using.

This modification should be done in the QoS Profile that will be used to create the **DDS\_Entity** (p. 1160). These new values will overwrite the current invalid values.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Transport.TCP.WAN.Symmetric.Client"

#### 4.166.2.81 DDS\_SNIPPET\_TRANSPORT\_TCP\_WAN\_ASYMMETRIC\_SERVER

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_SERVER [extern]
```

QoS Snippet that an asymmetric WAN TCP Server over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The values of the properties `dds.transport.TCPv4.tcp1.public_address` and `dds.transport.TCPv4.tcp1.server_bind_port` are incorrect (just sample strings). Therefore, they must be modified to the corresponding `public_address` and `port_number`. This modification should be done in the QoS Profile that will be used to create the **DDS\_Entity** (p. 1160). These new values will overwrite the current invalid values.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Transport.TCP.WAN.Asymmetric.Server"

#### 4.166.2.82 DDS\_SNIPPET\_TRANSPORT\_TCP\_WAN\_ASYMMETRIC\_CLIENT

```
const char* const DDS_SNIPPET_TRANSPORT_TCP_WAN_ASYMMETRIC_CLIENT [extern]
```

QoS Snippet that configures an asymmetric WAN TCP Client over DDS.

This QoS Snippet sets all the mandatory properties; however the final QoS Profile requires additional configuration.

The value of `discovery.initial_peers` and `public_ip` have to match the values set on the Server side (**DDS\_SNIPPET\_TRANSPORT\_TCP\_WAN\_ASYMMETRIC\_SERVER** (p. 1225)). This modification should be done in the QoS Profile that will be used to create the **DDS\_Entity** (p. 1160). This new value will overwrite the current invalid value.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Transport.TCP.WAN.Asymmetric.Client"

#### 4.166.2.83 DDS\_SNIPPET\_TRANSPORT\_UDP\_AVOID\_IP\_FRAGMENTATION

```
const char* const DDS_SNIPPET_TRANSPORT_UDP_AVOID_IP_FRAGMENTATION [extern]
```

QoS Snippet that configures RTI Connex and the UDP built-in transports (UDPv4, UDPv6, UDPv4\_WAN) to avoid IP fragmentation.

For WAN communications and, in general, for communications in third party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

This snippet provides a way to avoid IP fragmentation in Connex applications using the built-in UDP transports. Instead, Connex will be responsible for fragmentation, which is done at the RTPS level.

Among other changes, this configuration changes the transport MTU (`message_size_max`) to be 1400 bytes. Notice that this change will affect other transports such as SHMEM since Connex chooses the minimum transport MTU across all enabled transports to determine the maximum size of outgoing RTPS messages.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Transport.UDP.AvoidIPFragmentation"

#### 4.166.2.84 DDS\_SNIPPET\_TRANSPORT\_UDP\_WAN

```
const char* const DDS_SNIPPET_TRANSPORT_UDP_WAN [extern]
```

QoS Snippet that enables the RTI Real-Time WAN Transport (UDPv4\_WAN).

The snippet disables all the other built-in transports and avoids the use of IP fragmentation.

For WAN communications and, in general, for communications in third-party networks, it is not a good idea to rely on IP fragmentation. IP fragmentation causes significant issues in UDP, where there is no integrated support for a path MTU (maximum transmission unit) discovery protocol as there is in TCP.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Transport.UDP.WAN"

#### 4.166.2.85 DDS\_SNIPPET\_COMPATIBILITY\_CONNEXT\_MICRO\_VERSION\_2\_4\_3

```
const char* const DDS_SNIPPET_COMPATIBILITY_CONNEXT_MICRO_VERSION_2_4_3 [extern]
```

QoS Snippet that configures sets LIVENESS QoS to be compatible with RTI Connex Micro 2.4.3.

QoS Snippet that sets the **DDS\_DataReaderQos** (p. 1390) and **DDS\_DataWriterQos** (p. 1438) **DDS\_LivelinessQos**↔ **PolicyKind** (p. 1097) to **DDS\_MANUAL\_BY\_TOPIC\_LIVENESS\_QOS** (p. 1098) It also disables the built-in shared memory transport.

Modified QoS Parameters:

- **DDS\_DataReaderQos** (p. 1390) => **DDS\_LivelinessQosPolicy** (p. 1575)
- **DDS\_DataWriterQos** (p. 1438) => **DDS\_LivelinessQosPolicy** (p. 1575)
- **DDS\_TransportBuiltinQosPolicy** (p. 1786)

RTI Connex Micro versions 2.4.3 and earlier only supported **DDS\_MANUAL\_BY\_TOPIC\_LIVENESS\_QOS** (p. 1098) **DDS\_LivelinessQosPolicyKind** (p. 1097). In order to be compatible with RTI Connex Micro 2.4.3, the **DDS\_Data**↔ **Reader** (p. 608) and **DDS\_DataWriter** (p. 478) must have their **DDS\_LivelinessQosPolicyKind** (p. 1097) changed to this value because the default kind in RTI Connex is **DDS\_AUTOMATIC\_LIVENESS\_QOS** (p. 1098).

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Compatibility.ConnexMicro.Version243"

**4.166.2.86 DDS\_SNIPPET\_COMPATIBILITY\_OTHER\_DDS\_VENDORS\_ENABLE**

```
const char* const DDS_SNIPPET_COMPATIBILITY_OTHER_DDS_VENDORS_ENABLE [extern]
```

QoS Snippet that configures RTI Connex to interoperate with other DDS vendors.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Compatibility.OtherDDSVendor.Enable"

**4.166.2.87 DDS\_SNIPPET\_5\_1\_0\_TRANSPORT\_ENABLE**

```
const char* const DDS_SNIPPET_5_1_0_TRANSPORT_ENABLE [extern]
```

QoS Snippet that configures RTI Connex to interoperate with RTI Connex 5.1.0 and below for UDPv6 and SHMEM transports.

In Library: **DDS\_BUILTIN\_QOS\_SNIPPET\_LIB** (p. 1211)

String-version: "Compatibility.510Transport.Enable"

**4.167 DomainParticipantConfigParams**

<<*extension*>> (p. 817) **DDS\_DomainParticipantConfigParams\_t** (p. 1482)

**Data Structures**

- struct **DDS\_DomainParticipantConfigParams\_t**

<<*extension*>> (p. 817) *Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.*

**Macros**

- #define **DDS\_DomainParticipantConfigParams\_t\_INITIALIZER**

<<*extension*>> (p. 817) *Initializer for new DDS\_DomainParticipantConfigParams\_t (p. 1482).*

**Variables**

- const int **DDS\_DOMAIN\_ID\_USE\_XML\_CONFIG**

<<*extension*>> (p. 817) *Special value to be used with DDS\_DomainParticipantConfigParams\_t (p. 1482) to indicate that a participant is created using the domain ID specified in the participant configuration.*

- const char \* **DDS\_ENTITY\_NAME\_USE\_XML\_CONFIG**

<<*extension*>> (p. 817) *Special value to be used with DDS\_DomainParticipantConfigParams\_t (p. 1482) to indicate that a participant created is with an autogenerated entity name.*

- const char \* **DDS\_QOS\_ELEMENT\_NAME\_USE\_XML\_CONFIG**

<<*extension*>> (p. 817) *Special value to be used with DDS\_DomainParticipantConfigParams\_t (p. 1482) to indicate that entities are created from the QoS profile specified in the participant configuration.*

### 4.167.1 Detailed Description

<<*extension*>> (p. 817) **DDS\_DomainParticipantConfigParams\_t** (p. 1482)

### 4.167.2 Macro Definition Documentation

#### 4.167.2.1 DDS\_DomainParticipantConfigParams\_t\_INITIALIZER

```
#define DDS_DomainParticipantConfigParams_t_INITIALIZER
```

<<*extension*>> (p. 817) Initializer for new **DDS\_DomainParticipantConfigParams\_t** (p. 1482).

No memory is allocated. New **DDS\_DomainParticipantConfigParams\_t** (p. 1482) instances stored in the stack should be initialized with this value before they are passed to any functions. .

### 4.167.3 Variable Documentation

#### 4.167.3.1 DDS\_DOMAIN\_ID\_USE\_XML\_CONFIG

```
const int DDS_DOMAIN_ID_USE_XML_CONFIG [extern]
```

<<*extension*>> (p. 817) Special value to be used with **DDS\_DomainParticipantConfigParams\_t** (p. 1482) to indicate that a participant is created using the domain ID specified in the participant configuration.

This variable contains a constant sentinel value that is compared when creating the entities from configuration.

#### 4.167.3.2 DDS\_ENTITY\_NAME\_USE\_XML\_CONFIG

```
const char* DDS_ENTITY_NAME_USE_XML_CONFIG [extern]
```

<<*extension*>> (p. 817) Special value to be used with **DDS\_DomainParticipantConfigParams\_t** (p. 1482) to indicate that a participant created is with an autogenerated entity name.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

### 4.167.3.3 DDS\_QOS\_ELEMENT\_NAME\_USE\_XML\_CONFIG

```
const char* DDS_QOS_ELEMENT_NAME_USE_XML_CONFIG [extern]
```

<<*extension*>> (p. 817) Special value to be used with **DDS\_DomainParticipantConfigParams\_t** (p. 1482) to indicate that entities are created from the QoS profile specified in the participant configuration.

This variable contains a constant sentinel value that is lexicographically compared when creating the entities from configuration.

## 4.168 User-managed Threads

User-managed thread infrastructure.

### Data Structures

- struct **DDS\_ThreadFactory**

<<*extension*>> (p. 817) <<*interface*>> (p. 818) Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDS\_ThreadFactory\_OnSpawned**↔**Function** (p. 1230) that specifies the operation to run in the new thread.

### Macros

- #define **DDS\_ThreadFactory\_INITIALIZER**

<<*extension*>> (p. 817) Initializer for new **DDS\_ThreadFactory** (p. 1763).

### Typedefs

- typedef void (\*)(**DDS\_ThreadFactory\_OnSpawnedFunction**) (void \*thread\_param)  
*Prototype of the function that must be called on a new thread created by a **DDS\_ThreadFactory** (p. 1763).*
- typedef void (\*)(**DDS\_ThreadFactory\_CreateThreadCallback**) (void \*factory\_data, const char \*thread\_name, const struct **DDS\_ThreadSettings\_t** \*settings, **DDS\_ThreadFactory\_OnSpawnedFunction** on\_spawned, void \*threadParam)  
*Prototype of a **DDS\_ThreadFactory** (p. 1763) create\_thread function.*
- typedef void (\*)(**DDS\_ThreadFactory\_DeleteThreadCallback**) (void \*factory\_data, void \*thread)  
*Prototype of a **DDS\_ThreadFactory** (p. 1763) delete\_thread function.*

### 4.168.1 Detailed Description

User-managed thread infrastructure.

Core feature that allows users to provide the threads to RTI Connext.

```
"::DDS_ThreadFactory"
```

The model follows the abstract factory pattern. A **DDS\_ThreadFactory** (p. 1763) instance can be set in the **DDS\_**↔**DomainParticipantFactory** (p. 28) so that **DDS\_DomainParticipant** (p. 72) will use it for thread creation and deletion.

## 4.168.2 Macro Definition Documentation

### 4.168.2.1 DDS\_ThreadFactory\_INITIALIZER

```
#define DDS_ThreadFactory_INITIALIZER
```

<<**extension**>> (p. 817) Initializer for new **DDS\_ThreadFactory** (p. 1763).

No memory is allocated. New **DDS\_ThreadFactory** (p. 1763) instances stored in the stack should be initialized with this value before they are passed to any functions.

## 4.168.3 Typedef Documentation

### 4.168.3.1 DDS\_ThreadFactory\_OnSpawnedFunction

```
typedef void *(* DDS_ThreadFactory_OnSpawnedFunction) (void *thread_param)
```

Prototype of the function that must be called on a new thread created by a **DDS\_ThreadFactory** (p. 1763).

#### Parameters

<i>thread_param</i>	<< <b>in</b> >> (p. 818) Single argument that this operation receives. It is the data this operation needs to perform.
---------------------	------------------------------------------------------------------------------------------------------------------------

### 4.168.3.2 DDS\_ThreadFactory\_CreateThreadCallback

```
typedef void *(* DDS_ThreadFactory_CreateThreadCallback) (void *factory_data, const char *thread_name, const struct DDS_ThreadSettings_t *settings, DDS_ThreadFactory_OnSpawnedFunction on_spawned, void *threadParam)
```

Prototype of a **DDS\_ThreadFactory** (p. 1763) create\_thread function.

#### Parameters

<i>factory_data</i>	<< <b>in</b> >> (p. 818) Data associated with the factory when the factory is set.
<i>thread_name</i>	<< <b>in</b> >> (p. 818) Name of the thread given by the middleware.
<i>settings</i>	<< <b>in</b> >> (p. 818) Attributes of the new thread (i.e., priority, stack size, etc.). These attributes are specified in the QoS settings corresponding to each kind of thread (i.e., database, event, etc).
<i>on_spawned</i>	<< <b>in</b> >> (p. 818) Function provided by the middleware to be called in the newly created thread.
<i>threadParam</i>	<< <b>in</b> >> (p. 818) Parameters provided by the middleware to be passed in the call to on_spawned.

**Returns**

An opaque pointer to the newly created thread. The same pointer will be provided to the **DDS\_ThreadFactory**↔  
**::delete\_thread** (p. 1764) operation when deletion is requested.

**4.168.3.3 DDS\_ThreadFactory\_DeleteThreadCallback**

```
typedef void(* DDS_ThreadFactory_DeleteThreadCallback) (void *factory_data, void *thread)
```

Prototype of a **DDS\_ThreadFactory** (p. 1763) `delete_thread` function.

**Parameters**

<i>factory_data</i>	<< <i>in</i> >> (p. 818) Data associated with the factory when the factory is set.
<i>thread</i>	<< <i>in</i> >> (p. 818) Thread to be deleted. The thread was previously created by the same <b>DDS_ThreadFactory</b> (p. 1763).

**4.169 Observability Library**

RTI Monitoring Library 2.0.

**Functions**

- void **RTI\_Monitoring\_initialize** (void)  
*Initializes Monitoring Library 2.0.*

**Variables**

- const char \*const **RTI\_MONITORING\_PERIODIC\_TOPIC\_NAME**  
*The name of the Monitoring Topic used for periodic metrics distribution.*
- const char \*const **RTI\_MONITORING\_EVENT\_TOPIC\_NAME**  
*The name of the Monitoring Topic used for event metrics distribution.*
- const char \*const **RTI\_MONITORING\_LOGGING\_TOPIC\_NAME**  
*The name of the Monitoring Topic used for log messages distribution.*

## 4.169.1 Detailed Description

RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 is one component of the RTI Connex Observability Framework which allows collecting and distributing telemetry data (metrics and logs) associated with the observable resources created by an RTI Connex application.

In this release, the only Observable resources are the following entities: **DDS\_DataWriter** (p. 478), **DDS\_DataReader** (p. 608), **DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565), **DDS\_DomainParticipant** (p. 72), **DDS\_Topic** (p. 172) and Application (a process running RTI Connex).

The library also accepts remote commands to change the set of distributed telemetry data at run-time.

The data distributed by RTI Monitoring Library 2.0 is sent to an RTI Observability Collector Service instance, which forwards the data to other RTI Observability Collector Service instances or stores the data in third-party observability backends such as Prometheus or Grafana Loki.

RTI Monitoring Library 2.0 is a separate library (rtmonitoring2), and applications can use it in three different modes:

- **Dynamically loaded:** This is the default mode, and it requires that the rtmonitoring2 shared library is in the library search path.
- **Dynamic linking:** The application is linked with the rtmonitoring2 shared library.
- **Static linking:** The application is linked with the rtmonitoring2 static library.

The last two modes require calling the API **RTI\_Monitoring\_initialize** (p. 1232) in your application before any other RTI Connex APIs.

Dynamic and static linking are only supported in C and C++ applications.

To enable use of RTI Monitoring Library 2.0 and configure its behavior, use the **DDS\_MonitoringQoSPolicy** (p. 1601) QoS policy on the **DDS\_DomainParticipantFactory** (p. 28). This QoS policy can be configured programmatically or via XML.

## 4.169.2 Function Documentation

### 4.169.2.1 RTI\_Monitoring\_initialize()

```
void RTI_Monitoring_initialize (  
    void )
```

Initializes Monitoring Library 2.0.

This function must be called before calling any other RTI Connex API if the application links with RTI Monitoring Library 2.0 dynamically or statically.

## 4.169.3 Variable Documentation

### 4.169.3.1 RTI\_MONITORING\_PERIODIC\_TOPIC\_NAME

```
const char* const RTI_MONITORING_PERIODIC_TOPIC_NAME
```

The name of the Monitoring Topic used for periodic metrics distribution.

String version: "DCPSPeriodicStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

### 4.169.3.2 RTI\_MONITORING\_EVENT\_TOPIC\_NAME

```
const char* const RTI_MONITORING_EVENT_TOPIC_NAME
```

The name of the Monitoring Topic used for event metrics distribution.

String version: "DCPSEventStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

### 4.169.3.3 RTI\_MONITORING\_LOGGING\_TOPIC\_NAME

```
const char* const RTI_MONITORING_LOGGING_TOPIC_NAME
```

The name of the Monitoring Topic used for log messages distribution.

String version: "DCPSLoggingStatusMonitoring".

This topic is used internally by Monitoring Library 2.0 and RTI Observability Collector Service. You should not publish or subscribe to it.

## 4.170 Version

Retrieve information for the RTI Connex product, the core library, and the C, C++ or Java libraries.

## Data Structures

- struct **NDDS\_Config\_LibraryVersion\_t**  
*The version of a single library shipped as part of an RTI Connex distribution.*
- struct **NDDS\_Config\_Version\_t**  
<<*interface*>> (p. 818) *The version of an RTI Connex distribution.*

## Functions

- const struct **DDS\_ProductVersion\_t** \* **NDDS\_Config\_Version\_get\_product\_version** (void)  
*Get the RTI Connex product version.*
- const struct **NDDS\_Config\_LibraryVersion\_t** \* **NDDS\_Config\_Version\_get\_api\_version** (void)  
*Get the version of the C API library.*
- const struct **NDDS\_Config\_LibraryVersion\_t** \* **NDDS\_Config\_Version\_get\_core\_version** (void)  
*Get the version of the core library.*
- const char \* **NDDS\_Config\_Version\_to\_string** (void)  
*Get this version in string form.*

### 4.170.1 Detailed Description

Retrieve information for the RTI Connex product, the core library, and the C, C++ or Java libraries.

There are three ways to obtain version information: looking at the revision files, using Visual Studio or the command line, or programmatically at run time. This HTML documentation includes a reference for consulting the APIs that allow you to get version information programmatically. For more information see the RTI Connex DDS Core Libraries User's Manual.

The version information includes four fields:

- Major product version.
- Minor product version.
- Release letter for product version.
- Revision number of product.

### 4.170.2 Function Documentation

#### 4.170.2.1 NDDS\_Config\_Version\_get\_product\_version()

```
const struct DDS_ProductVersion_t * NDDS_Config_Version_get_product_version (  
    void )
```

Get the RTI Connex product version.

#### 4.170.2.2 NDDS\_Config\_Version\_get\_api\_version()

```
const struct NDDS_Config_LibraryVersion_t * NDDS_Config_Version_get_api_version (
    void )
```

Get the version of the C API library.

#### 4.170.2.3 NDDS\_Config\_Version\_get\_core\_version()

```
const struct NDDS_Config_LibraryVersion_t * NDDS_Config_Version_get_core_version (
    void )
```

Get the version of the core library.

#### 4.170.2.4 NDDS\_Config\_Version\_to\_string()

```
const char * NDDS_Config_Version_to_string (
    void )
```

Get this version in string form.

Combine all of the constituent library versions into a single string.

The memory in which the string is stored is internal to this **NDDS\_Config\_Version\_t** (p. 1851). The caller should not modify it.

## 4.171 Logging

Configure how much debugging information is reported during runtime and where it is logged.

### Modules

- **Activity Context**  
*Add contextual information to log messages.*

### Data Structures

- struct **NDDS\_Config\_Logger**  
<<*interface*>> (p. 818) *The singleton type used to configure RTI Connex logging.*
- struct **NDDS\_Config\_LogMessage**  
*Log message.*
- struct **NDDS\_Config\_LoggerDevice**  
<<*interface*>> (p. 818) *Logging device interface. Use for user-defined logging devices.*

## Macros

- `#define NDDS_Config_LoggerDevice_INITIALIZER`

*Initializer for new Logger Device instances.*

## Typedefs

- `typedef void(* NDDS_Config_LoggerDeviceWriteFnc) (struct NDDS_Config_LoggerDevice *device, const struct NDDS_Config_LogMessage *message)`

*Prototype of a `NDDS_Config_LoggerDevice` (p. 1848) write function.*

- `typedef void(* NDDS_Config_LoggerDeviceCloseFnc) (struct NDDS_Config_LoggerDevice *device)`

*Prototype of a `NDDS_Config_LoggerDevice` (p. 1848) close function.*

## Enumerations

- `enum NDDS_Config_LogVerbosity {  
NDDS_CONFIG_LOG_VERBOSITY_SILENT ,  
NDDS_CONFIG_LOG_VERBOSITY_ERROR ,  
NDDS_CONFIG_LOG_VERBOSITY_WARNING ,  
NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL ,  
NDDS_CONFIG_LOG_VERBOSITY_STATUS_REMOTE ,  
NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL }`

*The verbositys at which RTI Connexxt diagnostic information is logged.*

- `enum NDDS_Config_LogLevel {  
NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR ,  
NDDS_CONFIG_LOG_LEVEL_ERROR ,  
NDDS_CONFIG_LOG_LEVEL_WARNING ,  
NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL ,  
NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE ,  
NDDS_CONFIG_LOG_LEVEL_DEBUG }`

*Level category assigned to RTI Connexxt log messages returned to an output device.*

- `enum NDDS_Config_SyslogLevel {  
NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY ,  
NDDS_CONFIG_SYSLOG_LEVEL_ALERT ,  
NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL ,  
NDDS_CONFIG_SYSLOG_LEVEL_ERROR ,  
NDDS_CONFIG_SYSLOG_LEVEL_WARNING ,  
NDDS_CONFIG_SYSLOG_LEVEL_NOTICE ,  
NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL ,  
NDDS_CONFIG_SYSLOG_LEVEL_DEBUG }`

*Syslog level category assigned to RTI Connexxt log messages. See `Syslog Level and Verbosity Mapping`, in the `Core Libraries User's Manual`, for more information.*

- `enum NDDS_Config_LogCategory {  
NDDS_CONFIG_LOG_CATEGORY_PLATFORM ,  
NDDS_CONFIG_LOG_CATEGORY_COMMUNICATION ,  
NDDS_CONFIG_LOG_CATEGORY_DATABASE ,  
NDDS_CONFIG_LOG_CATEGORY_ENTITIES ,  
NDDS_CONFIG_LOG_CATEGORY_API ,  
NDDS_CONFIG_LOG_CATEGORY_DISCOVERY ,  
NDDS_CONFIG_LOG_CATEGORY_SECURITY ,  
NDDS_CONFIG_LOG_CATEGORY_USER ,  
NDDS_CONFIG_LOG_CATEGORY_ALL }`

*Categories of logged messages.*

- enum **NDDS\_Config\_LogPrintFormat** { }  
*The format used to output RTI Connex diagnostic information.*
- enum **NDDS\_Config\_LogFacility** {  
**NDDS\_CONFIG\_LOG\_FACILITY\_USER** ,  
**NDDS\_CONFIG\_LOG\_FACILITY\_SECURITY\_EVENT** ,  
**NDDS\_CONFIG\_LOG\_FACILITY\_SERVICE** ,  
**NDDS\_CONFIG\_LOG\_FACILITY\_MIDDLEWARE** }  
*A number that identifies the source of a log message.*
- enum **NDDS\_Config\_SyslogVerbosity** {  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_SILENT** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_EMERGENCY** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_ALERT** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_CRITICAL** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_ERROR** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_WARNING** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_NOTICE** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_INFORMATIONAL** ,  
**NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_DEBUG** }

*The Syslog verbosity at which RTI Connex diagnostic information is logged. These Syslog verbosity are mapped to **NDDS\_Config\_LogVerbosity** (p.1240). See *Syslog Level and Verbosity Mapping*, in the *Core Libraries User's Manual*, for more information.*

## Functions

- **NDDS\_Config\_Logger \* NDDS\_Config\_Logger\_get\_instance** (void)  
*Get the singleton instance of this type.*
- **NDDS\_Config\_LogVerbosity NDDS\_Config\_Logger\_get\_verbosity** (const **NDDS\_Config\_Logger** \*self)  
*Get the verbosity at which RTI Connex is currently logging diagnostic information.*
- **NDDS\_Config\_LogVerbosity NDDS\_Config\_Logger\_get\_verbosity\_by\_category** (const **NDDS\_Config\_Logger** \*self, **NDDS\_Config\_LogCategory** category)  
*Get the verbosity at which RTI Connex is currently logging diagnostic information in the given category.*
- void **NDDS\_Config\_Logger\_set\_verbosity** (**NDDS\_Config\_Logger** \*self, **NDDS\_Config\_LogVerbosity** verbosity)  
*Set the verbosity at which RTI Connex will log diagnostic information.*
- void **NDDS\_Config\_Logger\_set\_verbosity\_by\_category** (**NDDS\_Config\_Logger** \*self, **NDDS\_Config\_LogCategory** category, **NDDS\_Config\_LogVerbosity** verbosity)  
*Set the verbosity at which RTI Connex will log diagnostic information in the given category.*
- FILE \* **NDDS\_Config\_Logger\_get\_output\_file** (**NDDS\_Config\_Logger** \*self)  
*Get the file to which the logged output is redirected.*
- **DDS\_Boolean NDDS\_Config\_Logger\_set\_output\_file** (**NDDS\_Config\_Logger** \*self, FILE \*out)  
*Set the file to which the logged output is redirected.*
- **DDS\_Boolean NDDS\_Config\_Logger\_set\_output\_file\_name** (**NDDS\_Config\_Logger** \*self, const char \*file\_name)  
*Set the name of the file to which the logged output is redirected.*
- **DDS\_Boolean NDDS\_Config\_Logger\_set\_output\_file\_set** (**NDDS\_Config\_Logger** \*self, const char \*file\_prefix, const char \*file\_suffix, int max\_capacity, int max\_files)  
*Configure a set of files to redirect the logged output.*
- **NDDS\_Config\_LogPrintFormat NDDS\_Config\_Logger\_get\_print\_format** (const **NDDS\_Config\_Logger** \*self)

Get the current message format for the log level `NDDS_CONFIG_LOG_LEVEL_ERROR` (p. 1241).

- `NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format_by_log_level` (const `NDDS_Config_Logger *self`, `NDDS_Config_LogLevel log_level`)

Get the current message format, by log level, that RTI Connex is using to log diagnostic information.

- `DDS_Boolean NDDS_Config_Logger_set_print_format` (`NDDS_Config_Logger *self`, `NDDS_Config_LogPrintFormat print_format`)

Set the message format that RTI Connex will use to log diagnostic information for all the log levels, except for `NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR` (p. 1241). When the **Activity Context** (p. 1251) is printed, the user can select the information that will be part of the **Activity Context** (p. 1251) by using the API `NDDS_Config_ActivityContext_set_attribute_mask` (p. 1256).

- `DDS_Boolean NDDS_Config_Logger_set_print_format_by_log_level` (`NDDS_Config_Logger *self`, `NDDS_Config_LogPrintFormat print_format`, `NDDS_Config_LogLevel log_level`)

Set the message format that RTI Connex will use to log diagnostic information for all the log levels, except for `NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR` (p. 1241). When the **Activity Context** (p. 1251) is printed, the user can select the information that will be part of the **Activity Context** (p. 1251) by using the API `NDDS_Config_ActivityContext_set_attribute_mask` (p. 1256).

- `void NDDS_Config_Logger_emergency` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY` (p. 1241) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `void NDDS_Config_Logger_alert` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_ALERT` (p. 1241) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `void NDDS_Config_Logger_critical` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL` (p. 1241) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `void NDDS_Config_Logger_error` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_ERROR` (p. 1241) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `void NDDS_Config_Logger_warning` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_WARNING` (p. 1241) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `void NDDS_Config_Logger_notice` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_NOTICE` (p. 1241) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `void NDDS_Config_Logger_informational` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL` (p. 1242) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `void NDDS_Config_Logger_debug` (`NDDS_Config_Logger *self`, const char \*msg)

Logs message with `NDDS_CONFIG_SYSLOG_LEVEL_DEBUG` (p. 1242) and `NDDS_CONFIG_LOG_CATEGORY_USER` (p. 1242).

- `struct NDDS_Config_LoggerDevice * NDDS_Config_Logger_get_output_device` (`NDDS_Config_Logger *self`)

Return the user device registered with the logger.

- `DDS_Boolean NDDS_Config_Logger_set_output_device` (`NDDS_Config_Logger *self`, `struct NDDS_Config_LoggerDevice *device`)

Register a `NDDS_Config_LoggerDevice` (p. 1848).

#### 4.171.1 Detailed Description

Configure how much debugging information is reported during runtime and where it is logged.

## 4.171.2 Macro Definition Documentation

### 4.171.2.1 NDDS\_Config\_LoggerDevice\_INITIALIZER

```
#define NDDS_Config_LoggerDevice_INITIALIZER
```

Initializer for new Logger Device instances.

## 4.171.3 Typedef Documentation

### 4.171.3.1 NDDS\_Config\_LoggerDeviceWriteFnc

```
typedef void(* NDDS_Config_LoggerDeviceWriteFnc) (struct NDDS_Config_LoggerDevice *device, const
struct NDDS_Config_LogMessage *message)
```

Prototype of a **NDDS\_Config\_LoggerDevice** (p. 1848) write function.

Write a log message to the input device.

**Note:** It is not safe to make any calls to the RTI Connex core library, including calls to **DDS\_DomainParticipant\_get↔\_current\_time** (p. 135), from any of the logging device operations.

#### Parameters

<i>device</i>	<< <i>in</i> >> (p. 818) Logging device.
<i>message</i>	<< <i>in</i> >> (p. 818) Message to log.

### 4.171.3.2 NDDS\_Config\_LoggerDeviceCloseFnc

```
typedef void(* NDDS_Config_LoggerDeviceCloseFnc) (struct NDDS_Config_LoggerDevice *device)
```

Prototype of a **NDDS\_Config\_LoggerDevice** (p. 1848) close function.

Close the input device.

**Note:** It is not safe to make any calls to the RTI Connex core library, including calls to **DDS\_DomainParticipant\_get↔\_current\_time** (p. 135), from any of the logging device operations.

## Parameters

<i>device</i>	<< <i>in</i> >> (p. 818) Logging device.
---------------	------------------------------------------

#### 4.171.4 Enumeration Type Documentation

##### 4.171.4.1 NDDS\_Config\_LogVerbosity

enum **NDDS\_Config\_LogVerbosity**

The verbosity levels at which RTI Connexx diagnostic information is logged.

###### Enumerator

NDDS_CONFIG_LOG_VERBOSITY_SILENT	No further output will be logged.
NDDS_CONFIG_LOG_VERBOSITY_ERROR	Only error and fatal error messages will be logged. An error indicates something wrong in the functioning of RTI Connexx. The most common cause of errors is incorrect configuration.
NDDS_CONFIG_LOG_VERBOSITY_WARNING	Both error and warning messages will be logged. A warning indicates that RTI Connexx is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_LOCAL	Errors, warnings, and verbose information about the lifecycles of local RTI Connexx objects will be logged.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_↔ REMOTE	Errors, warnings, and verbose information about the lifecycles of remote RTI Connexx objects will be logged.
NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL	Errors, warnings, verbose information about the lifecycles of local and remote RTI Connexx objects, and periodic information about RTI Connexx threads will be logged.

##### 4.171.4.2 NDDS\_Config\_LogLevel

enum **NDDS\_Config\_LogLevel**

Level category assigned to RTI Connexx log messages returned to an output device.

## Enumerator

NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR	The message describes a fatal error. A fatal error indicates an unrecoverable situation in the functioning of RTI Connex. Error messages with this log level usually indicate a violation of an internal invariant or a segfault, and may include the function call stack where the fatal error happened.
NDDS_CONFIG_LOG_LEVEL_ERROR	The message describes an error. An error indicates a non-fatal problem in the functioning of RTI Connex. Errors are usually recoverable and will not stop application execution, although they may prevent some features from working properly. The most common cause of non-fatal errors is incorrect configuration and incorrect arguments.
NDDS_CONFIG_LOG_LEVEL_WARNING	The message describes a warning. A warning indicates that RTI Connex is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL	The message contains information about the lifecycles of local RTI Connex objects will be logged.
NDDS_CONFIG_LOG_LEVEL_STATUS_REMOTE	The message contains information about the lifecycles of remote RTI Connex objects will be logged.
NDDS_CONFIG_LOG_LEVEL_DEBUG	The message contains debug information that might be relevant to your application.

## 4.171.4.3 NDDS\_Config\_SyslogLevel

```
enum NDDS_Config_SyslogLevel
```

Syslog level category assigned to RTI Connex log messages. See [Syslog Level and Verbosity Mapping](#), in the Core Libraries User's Manual, for more information.

## Enumerator

NDDS_CONFIG_SYSLOG_LEVEL_EMERGENCY	System is unusable. Maps to <b>NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR</b> (p. 1241).
NDDS_CONFIG_SYSLOG_LEVEL_ALERT	Should be corrected immediately. Maps to <b>NDDS_CONFIG_LOG_LEVEL_ERROR</b> (p. 1241).
NDDS_CONFIG_SYSLOG_LEVEL_CRITICAL	Critical conditions. Maps to <b>NDDS_CONFIG_LOG_LEVEL_ERROR</b> (p. 1241).
NDDS_CONFIG_SYSLOG_LEVEL_ERROR	Error conditions. Maps to <b>NDDS_CONFIG_LOG_LEVEL_ERROR</b> (p. 1241).
NDDS_CONFIG_SYSLOG_LEVEL_WARNING	May indicate that an error will occur if action is not taken. Maps to <b>NDDS_CONFIG_LOG_LEVEL_WARNING</b> (p. 1241).
NDDS_CONFIG_SYSLOG_LEVEL_NOTICE	Events that are unusual, but not error conditions. Maps to <b>NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL</b> (p. 1241).

## Enumerator

NDDS_CONFIG_SYSLOG_LEVEL_INFORMATIONAL	Normal operational messages that require no action. Maps to <b>NDDS_CONFIG_LOG_LEVEL_STATUS_LOCAL</b> (p. 1241).
NDDS_CONFIG_SYSLOG_LEVEL_DEBUG	Information useful to developers for debugging the application. Maps to <b>NDDS_CONFIG_LOG_LEVEL_DEBUG</b> (p. 1241).

## 4.171.4.4 NDDS\_Config\_LogCategory

```
enum NDDS_Config_LogCategory
```

Categories of logged messages.

The **NDDS\_Config\_Logger\_get\_verbosity\_by\_category** (p. 1245) and **NDDS\_Config\_Logger\_set\_verbosity\_by\_category** (p. 1246) can be used to specify different verbosity levels for different categories of messages.

## Enumerator

NDDS_CONFIG_LOG_CATEGORY_PLATFORM	Log messages pertaining to the underlying platform (hardware and OS) on which RTI Connex is running are in this category.
NDDS_CONFIG_LOG_CATEGORY_↔ COMMUNICATION	Log messages pertaining to data serialization and deserialization and network traffic are in this category.
NDDS_CONFIG_LOG_CATEGORY_DATABASE	Log messages pertaining to the internal database in which RTI Connex objects are stored are in this category.
NDDS_CONFIG_LOG_CATEGORY_ENTITIES	Log messages pertaining to local and remote entities, and to a subset of the discovery process, are in this category. (To see all discovery-related messages, use the DISCOVERY category.)
NDDS_CONFIG_LOG_CATEGORY_API	Log messages pertaining to the API layer of RTI Connex (such as function argument validation) are in this category.
NDDS_CONFIG_LOG_CATEGORY_DISCOVERY	Log messages pertaining to discovery are in this category.
NDDS_CONFIG_LOG_CATEGORY_SECURITY	Log messages pertaining to security are in this category. These messages include any messages logged by RTI Connex components even if they are not related to the Security Plugins.
NDDS_CONFIG_LOG_CATEGORY_USER	Log messages that are generated by the user using the following log APIs: <b>NDDS_Config_Logger_emergency</b> (p. 1248), <b>NDDS_Config_Logger_alert</b> (p. 1249), <b>NDDS_Config_Logger_critical</b> (p. 1249), <b>NDDS_Config_Logger_error</b> (p. 1249), <b>NDDS_Config_Logger_warning</b> (p. 1249), <b>NDDS_Config_Logger_notice</b> (p. 1250),
	<b>NDDS_Config_Logger_informational</b> (p. 1250), <b>NDDS_Config_Logger_debug</b> (p. 1250).

## Enumerator

NDDS_CONFIG_LOG_CATEGORY_ALL	Log messages pertaining to all categories in RTI Connex.
------------------------------	----------------------------------------------------------

## 4.171.4.5 NDDS\_Config\_LogPrintFormat

enum **NDDS\_Config\_LogPrintFormat**

The format used to output RTI Connex diagnostic information.

## Enumerator

NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT	(default) Print message, method name, log level, <b>Activity Context</b> (p. 1251) (what was happening when the event occurred), and logging category.
NDDS_CONFIG_LOG_PRINT_FORMAT_↔ TIMESTAMPED	Print message, method name, log level, <b>Activity Context</b> (p. 1251), logging category, and timestamp.
NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE	Print message with all available context information (includes thread identifier, message location).
NDDS_CONFIG_LOG_PRINT_FORMAT_VERBOSE↔ _TIMESTAMPED	Print message with all available context information, and timestamp.
NDDS_CONFIG_LOG_PRINT_FORMAT_DEBUG	Print a set of fields (including message number and backtrace information) that may be useful for internal debugging.
NDDS_CONFIG_LOG_PRINT_FORMAT_MINIMAL	Print only message number and message location.
NDDS_CONFIG_LOG_PRINT_FORMAT_MAXIMAL	Print all available fields.

## 4.171.4.6 NDDS\_Config\_LogFacility

enum **NDDS\_Config\_LogFacility**

A number that identifies the source of a log message.

In the Syslog Protocol, the Facility is a numerical code that represents the machine process that created a Syslog event. RTI Connex uses the facility to represent the source of a given log message.

## Enumerator

NDDS_CONFIG_LOG_FACILITY_USER	A log message produced by the APIs that log user messages in <b>NDDS_Config_Logger</b> (p. 1848) (e.g, <b>NDDS_Config_Logger_emergency</b> (p. 1248)). Numerical code: 1
-------------------------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## Enumerator

NDDS_CONFIG_LOG_FACILITY_SECURITY_EVENT	A security-related message logged by the RTI Security Plugins Logging Plugin. Numerical code: 10
NDDS_CONFIG_LOG_FACILITY_SERVICE	A log message produced by an Infrastructure Service, such as Routing Service. Infrastructure Services operate using the Core Libraries. The messages that the Core Libraries create are categorized under the MIDDLEWARE facility. Log messages that are directly generated by the Infrastructure Service itself are marked with the SERVICE facility. Numerical code: 22
NDDS_CONFIG_LOG_FACILITY_MIDDLEWARE	A log message produced by RTI Connex Core Libraries. Numerical code: 23

## 4.171.4.7 NDDS\_Config\_SyslogVerbosity

```
enum NDDS_Config_SyslogVerbosity
```

The Syslog verbosity levels at which RTI Connex diagnostic information is logged. These Syslog verbosity levels are mapped to **NDDS\_Config\_LogVerbosity** (p. 1240). See *Syslog Level and Verbosity Mapping*, in the Core Libraries User's Manual, for more information.

## Enumerator

NDDS_CONFIG_SYSLOG_VERBOSITY_SILENT	No messages will be logged. (lowest verbosity) Equivalent to <b>NDDS_CONFIG_LOG_VERBOSITY_SILENT</b> (p. 1240).
NDDS_CONFIG_SYSLOG_VERBOSITY_↔ EMERGENCY	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_VERBOSITY_ERROR</b> (p. 1240) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency messages.)
NDDS_CONFIG_SYSLOG_VERBOSITY_ALERT	Emergency, critical, and alert messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_VERBOSITY_ERROR</b> (p. 1240) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency, critical and alert messages.)
NDDS_CONFIG_SYSLOG_VERBOSITY_CRITICAL	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_VERBOSITY_ERROR</b> (p. 1240) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency and critical messages.)
NDDS_CONFIG_SYSLOG_VERBOSITY_ERROR	Emergency, critical, alert, and error messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_VERBOSITY_ERROR</b> (p. 1240) when interpreted by RTI Connex.

## Enumerator

NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING	Emergency, critical, alert, error, and warning messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_VERBOSITY_WARNING</b> (p. 1240) when interpreted by RTI Connex.
NDDS_CONFIG_SYSLOG_VERBOSITY_NOTICE	Emergency, critical, alert, error, warning, notice and informational messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_↔ VERBOSITY_STATUS_REMOTE</b> (p. 1240) when interpreted by RTI Connex. (That's why this level actually logs more than just emergency, critical, alert, error, warning and notice messages.)
NDDS_CONFIG_SYSLOG_VERBOSITY_↔ INFORMATIONAL	Emergency, critical, alert, error, warning, notice, and informational messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_↔ VERBOSITY_STATUS_REMOTE</b> (p. 1240) when interpreted by RTI Connex.
NDDS_CONFIG_SYSLOG_VERBOSITY_DEBUG	All messages will be logged. This Syslog verbosity level is translated to <b>NDDS_CONFIG_LOG_VERBOSITY_STATUS_ALL</b> (p. 1240) when interpreted by RTI Connex.

## 4.171.5 Function Documentation

## 4.171.5.1 NDDS\_Config\_Logger\_get\_instance()

```
NDDS_Config_Logger * NDDS_Config_Logger_get_instance (
    void )
```

Get the singleton instance of this type.

## 4.171.5.2 NDDS\_Config\_Logger\_get\_verbosity()

```
NDDS_Config_LogVerbosity NDDS_Config_Logger_get_verbosity (
    const NDDS_Config_Logger * self )
```

Get the verbosity at which RTI Connex is currently logging diagnostic information.

The default verbosity if **NDDS\_Config\_Logger\_set\_verbosity** (p. 1246) is never called is **NDDS\_CONFIG\_LOG\_↔  
VERBOSITY\_ERROR** (p. 1240).

If **NDDS\_Config\_Logger\_set\_verbosity\_by\_category** (p. 1246) has been used to set different verbosity levels for different categories of messages, this function will return the maximum verbosity of all categories.

#### 4.171.5.3 NDDS\_Config\_Logger\_get\_verbosity\_by\_category()

```
NDDS_Config_LogVerbosity NDDS_Config_Logger_get_verbosity_by_category (
    const NDDS_Config_Logger * self,
    NDDS_Config_LogCategory category )
```

Get the verbosity at which RTI Connex is currently logging diagnostic information in the given category.

The default verbosity if `NDDS_Config_Logger_set_verbosity` (p. 1246) and `NDDS_Config_Logger_set_verbosity_by_category` (p. 1246) are never called is `NDDS_CONFIG_LOG_VERBOSITY_ERROR` (p. 1240).

#### 4.171.5.4 NDDS\_Config\_Logger\_set\_verbosity()

```
void NDDS_Config_Logger_set_verbosity (
    NDDS_Config_Logger * self,
    NDDS_Config_LogVerbosity verbosity )
```

Set the verbosity at which RTI Connex will log diagnostic information.

*Note:* Logging at high verbosity levels will be detrimental to your application's performance. Your default setting should typically remain at `NDDS_CONFIG_LOG_VERBOSITY_WARNING` (p. 1240) or below. (The default verbosity if you never set it is `NDDS_CONFIG_LOG_VERBOSITY_ERROR` (p. 1240).)

#### 4.171.5.5 NDDS\_Config\_Logger\_set\_verbosity\_by\_category()

```
void NDDS_Config_Logger_set_verbosity_by_category (
    NDDS_Config_Logger * self,
    NDDS_Config_LogCategory category,
    NDDS_Config_LogVerbosity verbosity )
```

Set the verbosity at which RTI Connex will log diagnostic information in the given category.

#### 4.171.5.6 NDDS\_Config\_Logger\_get\_output\_file()

```
FILE * NDDS_Config_Logger_get_output_file (
    NDDS_Config_Logger * self )
```

Get the file to which the logged output is redirected.

If no output file has been registered through `NDDS_Config_Logger_set_output_file` (p. 1246), this function will return `NULL`. In this case, logged output will on most platforms go to standard out as if through `printf`.

#### 4.171.5.7 `NDDS_Config_Logger_set_output_file()`

```
DDS_Boolean NDDS_Config_Logger_set_output_file (
    NDDS_Config_Logger * self,
    FILE * out )
```

Set the file to which the logged output is redirected.

The file passed may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

For better performance when log messages are generated frequently, the log messages are not flushed into a file immediately after they are generated. In other words, while writing a log message, RTI Connexx only calls the function `fwrite()` (see <https://pubs.opengroup.org/onlinepubs/009695399/functions/fwrite.html>); it does not call the function `fflush()` (see <https://pubs.opengroup.org/onlinepubs/009695399/functions/fflush.html>). If your application requires a different flushing behavior, you may use `NDDS_Config_Logger_set_output_device` (p. 1251) to configure a custom logging device.

#### 4.171.5.8 `NDDS_Config_Logger_set_output_file_name()`

```
DDS_Boolean NDDS_Config_Logger_set_output_file_name (
    NDDS_Config_Logger * self,
    const char * file_name )
```

Set the name of the file to which the logged output is redirected.

The name may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

See `NDDS_Config_Logger_set_output_file` (p. 1246) for the flushing behavior.

#### 4.171.5.9 `NDDS_Config_Logger_set_output_file_set()`

```
DDS_Boolean NDDS_Config_Logger_set_output_file_set (
    NDDS_Config_Logger * self,
    const char * file_prefix,
    const char * file_suffix,
    int max_capacity,
    int max_files )
```

Configure a set of files to redirect the logged output.

The logged output will be redirected to a set of files whose names are configured with a prefix and a suffix. The maximum number of bytes configures how many bytes to write into a file before opening the next file. After reaching the maximum number of files, the first one is overwritten.

For example, if the prefix is 'Foo (p. 1841)', the suffix is '.txt', the max number of bytes is 1GB, and the max number of files is 3, the logger will create (at most) these files: Foo1.txt, Foo2.txt, and Foo3.txt. It will write to Foo1.txt, and after writing 1GB, it will move on to Foo2.txt, then to Foo3.txt, then to Foo1.txt again, and so on.

To stop logging to these files and redirect the output to the platform-specific location, pass NULL, NULL, 0, 0.

See `NDDS_Config_Logger_set_output_file` (p. 1246) for the flushing behavior.

#### 4.171.5.10 `NDDS_Config_Logger_get_print_format()`

```
NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format (
    const NDDS_Config_Logger * self )
```

Get the current message format for the log level `NDDS_CONFIG_LOG_LEVEL_ERROR` (p. 1241).

Use `NDDS_Config_Logger_get_print_format_by_log_level` (p. 1248) to retrieve the format for other log levels.

If `NDDS_Config_Logger_set_print_format` (p. 1248) is never called, the default format is `NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT` (p. 1243).

#### 4.171.5.11 `NDDS_Config_Logger_get_print_format_by_log_level()`

```
NDDS_Config_LogPrintFormat NDDS_Config_Logger_get_print_format_by_log_level (
    const NDDS_Config_Logger * self,
    NDDS_Config_LogLevel log_level )
```

Get the current message format, by log level, that RTI Connexx is using to log diagnostic information.

If `NDDS_Config_Logger_set_print_format` (p. 1248) is never called, the default format is `NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT` (p. 1243).

#### 4.171.5.12 `NDDS_Config_Logger_set_print_format()`

```
DDS_Boolean NDDS_Config_Logger_set_print_format (
    NDDS_Config_Logger * self,
    NDDS_Config_LogPrintFormat print_format )
```

Set the message format that RTI Connexx will use to log diagnostic information for all the log levels, except for `NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR` (p. 1241). When the **Activity Context** (p. 1251) is printed, the user can select the information that will be part of the **Activity Context** (p. 1251) by using the API `NDDS_Config_ActivityContext_set_attribute_mask` (p. 1256).

Set print mask for all the log levels, except for (`RTI_LOG_LEVEL_FATAL_ERROR`).

#### 4.171.5.13 `NDDS_Config_Logger_set_print_format_by_log_level()`

```
DDS_Boolean NDDS_Config_Logger_set_print_format_by_log_level (
    NDDS_Config_Logger * self,
    NDDS_Config_LogPrintFormat print_format,
    NDDS_Config_LogLevel log_level )
```

Set the message format that RTI Connexx will use to log diagnostic information for all the log levels, except for `NDDS_CONFIG_LOG_LEVEL_FATAL_ERROR` (p. 1241). When the **Activity Context** (p. 1251) is printed, the user can select the information that will be part of the **Activity Context** (p. 1251) by using the API `NDDS_Config_ActivityContext_set_attribute_mask` (p. 1256).

#### 4.171.5.14 NDDS\_Config\_Logger\_emergency()

```
void NDDS_Config_Logger_emergency (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_EMERGENCY** (p.1241) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.15 NDDS\_Config\_Logger\_alert()

```
void NDDS_Config_Logger_alert (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_ALERT** (p.1241) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.16 NDDS\_Config\_Logger\_critical()

```
void NDDS_Config_Logger_critical (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_CRITICAL** (p.1241) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.17 NDDS\_Config\_Logger\_error()

```
void NDDS_Config_Logger_error (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_ERROR** (p.1241) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.18 NDDS\_Config\_Logger\_warning()

```
void NDDS_Config_Logger_warning (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_WARNING** (p.1241) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.19 NDDS\_Config\_Logger\_notice()

```
void NDDS_Config_Logger_notice (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_NOTICE** (p.1241) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.20 NDDS\_Config\_Logger\_informational()

```
void NDDS_Config_Logger_informational (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_INFORMATIONAL** (p.1242) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.21 NDDS\_Config\_Logger\_debug()

```
void NDDS_Config_Logger_debug (
    NDDS_Config_Logger * self,
    const char * msg )
```

Logs message with **NDDS\_CONFIG\_SYSLOG\_LEVEL\_DEBUG** (p.1242) and **NDDS\_CONFIG\_LOG\_CATEGORY\_USER** (p.1242).

#### 4.171.5.22 NDDS\_Config\_Logger\_get\_output\_device()

```
struct NDDS_Config_LoggerDevice * NDDS_Config_Logger_get_output_device (
    NDDS_Config_Logger * self )
```

Return the user device registered with the logger.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

## Returns

Registered user device or NULL if no user device is registered.

4.171.5.23 **NDDS\_Config\_Logger\_set\_output\_device()**

```
DDS_Boolean NDDS_Config_Logger_set_output_device (
    NDDS_Config_Logger * self,
    struct NDDS_Config_LoggerDevice * device )
```

Register a **NDDS\_Config\_LoggerDevice** (p. 1848).

Register the specified logging device with the logger.

There can be at most only one device registered with the logger at any given time.

When a device is installed, the logger will stop sending the log messages to the standard output and to the file set with **NDDS\_Config\_Logger\_set\_output\_file** (p. 1246).

To remove an existing device, use this function with NULL as the device parameter. After a device is removed the logger will continue sending log messages to the standard output and to the output file.

To replace an existing device with a new device, use this function providing the new device as the device parameter.

When a device is unregistered (by setting it to NULL), **NDDS\_Config\_LoggerDevice** (p. 1848) calls the function **NDDS\_Config\_LoggerDevice::close** (p. 1849).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>device</i>	<< <i>in</i> >> (p. 818) Logging device.

## 4.172 Activity Context

Add contextual information to log messages.

## Macros

- #define **NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_MASK\_DEFAULT** RTI\_OSAPI\_ACTIVITY\_↔  
CONTEXT\_ATTRIBUTE\_MASK\_DEFAULT

*Provide the default attributes of the resource of the Activity Context.*

- #define **NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_MASK\_NONE** RTI\_OSAPI\_ACTIVITY\_↔  
CONTEXT\_ATTRIBUTE\_MASK\_NONE

*Not provide any attribute of the resource of the Activity Context.*

- #define **NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_MASK\_ALL** RTI\_OSAPI\_ACTIVITY\_↔  
CONTEXT\_ATTRIBUTE\_MASK\_ALL

*Provide all the possibles attributes of the resource of the Activity Context.*

## Typedefs

- typedef **DDS\_Long NDDS\_Config\_ActivityContextAttributeKindMask**

*The attributes **NDDS\_Config\_ActivityContextAttributeKind** (p. 1254) used in the string representation of the Activity Context can be configured through this mask.*

## Enumerations

- enum **NDDS\_Config\_ActivityContextAttributeKind** {  
**NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_GUID\_PREFIX** ,  
**NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_TOPIC** ,  
**NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_TYPE** ,  
**NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_ENTITY\_KIND** ,  
**NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_DOMAIN\_ID** ,  
**NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_ENTITY\_NAME** }

*The resources of the **Activity Context** (p. 1251) can have multiple associated attributes. Those attributes provide extra information about the entity such as GUID prefix, Topic, data type, entity kind, entity name and domain ID. They are used to indicate what attributes of the resources are included in the activity context.*

## Functions

- void **NDDS\_Config\_ActivityContext\_set\_attribute\_mask** ( **NDDS\_Config\_ActivityContextAttributeKind**↔  
**Mask** attribute\_mask)

*Set the **NDDS\_Config\_ActivityContextAttributeKindMask** (p. 1254) of the Activity Context.*

### 4.172.1 Detailed Description

Add contextual information to log messages.

The Activity Context is a group of resources and activities associated with an action such as the creation of an entity.

- A resource is a abstraction of an entity. It can contain attributes such as Topic or domain ID.
- An activity is a general task that the resource is doing, such as "Getting QoS".

Logging context is one of the formats RTI Connex logging infrastructure supports. It is used by default in **NDDS**↔  
**\_CONFIG\_LOG\_PRINT\_FORMAT\_DEFAULT** (p.1243). It provides information about resources and activities. The activity context is used in two places:

- Logging: activity context is one of the **NDDS\_Config\_LogPrintFormat** (p. 1243) DDS logging infrastructure supports. If that format is set every time RTI Connexx logs a message, it will contain the contextual information.
- Heap monitoring: every time memory is allocated and heap monitoring is enabled, the string representation of the activity context will be associated with the allocation. This information will be available when taking the snapshot.

For example, in the creation of a DataWriter, the activity context will provide information about:

- Resource: the Publisher creating the DataWriter. Attributes of the publisher will be GUID, kind, name and domain ID.
- Activity: entity creation. It will have two parameters, the entity kind and the Topic. In the example below, these are "Writer" and "TestTopic".

The string representation of the above activity context would be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000088{Entity=Pu,Name=TestPublisher,Domain=1}|CREATE Writer WITH TOPIC TestTopic]
```

Another example could be when a DataWriter writes a sample. The activity context will provide information about:

- Resource: the DataWriter writing the sample. The attributes of the DataWriter will be GUID, name, kind, Topic, data type, and the domain ID.
- Activity will be "write a sample".

The string representation of the activity context will be:

```
[0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo,Domain=1}|Write]
```

## 4.172.2 Macro Definition Documentation

### 4.172.2.1 NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_MASK\_DEFAULT

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_DEFAULT RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE↔  
_MASK_DEFAULT
```

Provide the default attributes of the resource of the Activity Context.

### 4.172.2.2 NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_MASK\_NONE

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_NONE RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE↔  
MASK_NONE
```

Not provide any attribute of the resource of the Activity Context.

### 4.172.2.3 NDDS\_CONFIG\_ACTIVITY\_CONTEXT\_ATTRIBUTE\_MASK\_ALL

```
#define NDDS_CONFIG_ACTIVITY_CONTEXT_ATTRIBUTE_MASK_ALL RTI_OSAPI_ACTIVITY_CONTEXT_ATTRIBUTE_↔  
MASK_ALL
```

Provide all the possible attributes of the resource of the Activity Context.

## 4.172.3 Typedef Documentation

### 4.172.3.1 NDDS\_Config\_ActivityContextAttributeKindMask

```
typedef DDS_Long NDDS_Config_ActivityContextAttributeKindMask
```

The attributes **NDDS\_Config\_ActivityContextAttributeKind** (p. 1254) used in the string representation of the Activity Context can be configured through this mask.

This mask indicates what attributes of the resource are used when RTI Connexx logs a message or when the Heap Monitoring utility saves statistics for a memory allocation.

## 4.172.4 Enumeration Type Documentation

### 4.172.4.1 NDDS\_Config\_ActivityContextAttributeKind

```
enum NDDS_Config_ActivityContextAttributeKind
```

The resources of the **Activity Context** (p. 1251) can have multiple associated attributes. Those attributes provide extra information about the entity such as GUID prefix, Topic, data type, entity kind, entity name and domain ID. They are used to indicate what attributes of the resources are included in the activity context.

## Enumerator

<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_GUID_PREFIX</p>	<p>Provide the entity GUID prefix to the resource of the Activity Context. For example:</p> <ul style="list-style-type: none"> <li>For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}]</li> <li>The GUID prefix is 0X101A76B,0X79E5D71,0X50EE914. If the bit <b>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_GUID_PREFIX</b> (p. 1255) is not set, the string representation will not show the GUID prefix: [:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}]</li> </ul>
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TOPIC</p>	<p>Provide the Topic to the resource of the Activity Context. The topic attribute is specified by "Topic". For example:</p> <ul style="list-style-type: none"> <li>For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}]</li> <li>The Topic is "test." If the bit <b>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TOPIC</b> (p. 1255) is not set, the string representation will not show the Topic: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Type=Foo}]</li> </ul>
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TYPE</p>	<p>Provide the data type to the resource of the Activity Context. The type attribute is specified by "Type". For example:</p> <ul style="list-style-type: none"> <li>For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test,Type=Foo}]</li> <li>The data type is "Foo." If the bit <b>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_TYPE</b> (p. 1255) is not set, the string representation will not show the data type: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWriterName,Entity=DW,Topic=test}]</li> </ul>

## Enumerator

<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_KIND</p>	<p>Provide the entity kind to the resource of the Activity Context. The kind attribute is specified by "Entity". For example:</p> <ul style="list-style-type: none"> <li>For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite</li> <li>The entity kind is "Writer." If the bit <b>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_KIND</b> (p. 1256) is not set, the string representation will not show the entity kind: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite</li> </ul>
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_DOMAIN_ID</p>	<p>Provide the domain ID to the resource of the Activity Context. The domain attribute is specified by "Domain". For example:</p> <ul style="list-style-type: none"> <li>For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite</li> <li>The domain ID is "1." If the bit <b>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_DOMAIN_ID</b> (p. 1256) is not set, the string representation will not show the domain ID: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite</li> </ul>
<p>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_NAME</p>	<p>Provide the entity name to the resource of the Activity Context. The name attribute is specified by "Name". For example:</p> <ul style="list-style-type: none"> <li>For the following string representation of the context: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Name=testDataWrite</li> <li>The entity name is "testDataWriterName." If the bit <b>NDDS_CONFIG_ACTIVITY_CONTEXT_↔ ATTRIBUTE_ENTITY_NAME</b> (p. 1256) is not set, the string representation will not show the entity name: [0X101A76B,0X79E5D71,0X50EE914:0X1C1:0X80000003{Entity=DW, Topic=te</li> </ul>

## 4.172.5 Function Documentation

#### 4.172.5.1 NDDS\_Config\_ActivityContext\_set\_attribute\_mask()

```
void NDDS_Config_ActivityContext_set_attribute_mask (
    NDDS_Config_ActivityContextAttributeKindMask attribute_mask )
```

Set the **NDDS\_Config\_ActivityContextAttributeKindMask** (p. 1254) of the Activity Context.

## 4.173 Compliance Configuration

APIs to configure compliance with certain standard specifications.

### Macros

- **#define NDDS\_CONFIG\_XTYPES\_COMPLIANCE\_MASK\_VENDOR**  
*XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.*
- **#define NDDS\_CONFIG\_XTYPES\_COMPLIANCE\_MASK\_DEFAULT**  
*Default XTypes compliance mask.*

### Typedefs

- typedef **DDS\_UnsignedLong NDDS\_Config\_XTypesComplianceMask**  
*XTypes compliance mask.*

### Enumerations

- enum **NDDS\_Config\_XTypesComplianceMaskBits** {  
**NDDS\_CONFIG\_XTYPES\_DHEADER\_IN\_NON\_PRIMITIVE\_COLLECTIONS\_BIT** ,  
**NDDS\_CONFIG\_XTYPES\_ENUM\_AS\_PRIMITIVE\_IN\_COLLECTIONS\_BIT** ,  
**NDDS\_CONFIG\_XTYPES\_PARAMETER\_LENGTH\_WITH\_PADDING\_BIT** ,  
**NDDS\_CONFIG\_XTYPES\_ENCAPSULATION\_OPTIONS\_WITH\_PADDING\_BIT** }  
*The bits for the **NDDS\_Config\_XTypesComplianceMask** (p. 1258) with different aspects of the Extended CDR encoding (XCDR and XCDR2).*

### Functions

- **NDDS\_Config\_XTypesComplianceMask NDDS\_Config\_get\_xtypes\_compliance\_mask** (void)  
*Gets the XTypes compliance mask value for the application.*
- void **NDDS\_Config\_set\_xtypes\_compliance\_mask** ( **NDDS\_Config\_XTypesComplianceMask** mask)  
*Sets the level of compliance of the application with the XTypes specification.*
- **DDS\_Boolean NDDS\_Config\_load\_compliance\_masks** (void)  
*Load the compliance masks from the environment variables.*

### 4.173.1 Detailed Description

APIs to configure compliance with certain standard specifications.

### 4.173.2 Macro Definition Documentation

#### 4.173.2.1 NDDS\_CONFIG\_XTYPES\_COMPLIANCE\_MASK\_VENDOR

```
#define NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_VENDOR
```

XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.

The mask sets the following bits:

- **NDDS\_CONFIG\_XTYPES\_DHEADER\_IN\_NON\_PRIMITIVE\_COLLECTIONS\_BIT** (p. 1260)
- **NDDS\_CONFIG\_XTYPES\_ENCAPSULATION\_OPTIONS\_WITH\_PADDING\_BIT** (p. 1261)

The HEX value for the mask is: 0x00000009.

#### 4.173.2.2 NDDS\_CONFIG\_XTYPES\_COMPLIANCE\_MASK\_DEFAULT

```
#define NDDS_CONFIG_XTYPES_COMPLIANCE_MASK_DEFAULT
```

Default XTypes compliance mask.

The mask sets the following bits:

- **NDDS\_CONFIG\_XTYPES\_PARAMETER\_LENGTH\_WITH\_PADDING\_BIT** (p. 1260)
- **NDDS\_CONFIG\_XTYPES\_ENCAPSULATION\_OPTIONS\_WITH\_PADDING\_BIT** (p. 1261)

The HEX value for the mask is: 0x0000000C.

### 4.173.3 Typedef Documentation

### 4.173.3.1 NDDS\_Config\_XTypesComplianceMask

```
typedef DDS_UnsignedLong NDDS_Config_XTypesComplianceMask
```

XTypes compliance mask.

The **NDDS\_Config\_XTypesComplianceMask** (p. 1258) configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

Applications that don't use the exact same XTypes compliance mask may not be interoperable.

By default, data serialization is not fully compliant with Extended CDR encoding due to bugs when implementing the standard. These bugs do not result in breaking functional correctness. They only affect interoperability with other vendors.

You can change the default compliance mask for an application using any of the following mechanisms:

- Setting the environment variable **NDDS\_XTYPES\_COMPLIANCE\_MASK**
- Calling the function **NDDS\_Config\_set\_xtypes\_compliance\_mask** (p. 1262)

The environment variable will be automatically loaded when a **DDS\_DomainParticipantFactory** (p. 28) is created. If you need to load it before that, use the function **NDDS\_Config\_load\_compliance\_masks** (p. 1262).

The format of the environment variable is an unsigned integer, which can be in HEX notation. For example: 0x00000001.

The default value is **NDDS\_CONFIG\_XTYPES\_COMPLIANCE\_MASK\_DEFAULT** (p. 1258).

To be fully compliant with the XTypes specification, set the mask to **NDDS\_CONFIG\_XTYPES\_COMPLIANCE\_MASK\_VENDOR** (p. 1258).

[default] **NDDS\_CONFIG\_XTYPES\_COMPLIANCE\_MASK\_DEFAULT** (p. 1258)

## 4.173.4 Enumeration Type Documentation

### 4.173.4.1 NDDS\_Config\_XTypesComplianceMaskBits

```
enum NDDS_Config_XTypesComplianceMaskBits
```

The bits for the **NDDS\_Config\_XTypesComplianceMask** (p. 1258) with different aspects of the Extended CDR encoding (XCDR and XCDR2).

See also

**NDDS\_Config\_XTypesComplianceMask<P>** (p. 1258)

## Enumerator

<p>NDDS_CONFIG_XTYPES_DHEADER_IN_NON_↔ PRIMITIVE_COLLECTIONS_BIT</p>	<p>When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER. Value: 0x00000001 To be compatible with the XTypes specification, this bit must be set. This bit only applies to XCDR2 encoding. Limitation: For FlatData, the compliant encoding is applied to arrays and sequences of mutable types, but not final types . The serialization of final types containing arrays of non-primitive types in the FlatData language binding is not compliant with Extended CDR encoding version 2 in any case.</p>
<p>NDDS_CONFIG_XTYPES_ENUM_AS_PRIMITIVE_↔ IN_COLLECTIONS_BIT</p>	<p>When this bit is set, enums are considered primitive types in collection types. Value: 0x00000002 A DHEADER will not be added to collections of enums if <b>NDDS_CONFIG_XTYPES_DHEADER_IN_NON_↔ PRIMITIVE_COLLECTIONS_BIT</b> (p. 1260) is set. To be compatible with the XTypes specification, this bit must be unset. This bit only applies to XCDR2 encoding.</p>
<p>NDDS_CONFIG_XTYPES_PARAMETER_LENGTH_↔ _WITH_PADDING_BIT</p>	<p>When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary. Value: 0x00000004 To be compatible with the XTypes specification, this bit must be unset. This bit only applies to XCDR encoding.</p>

## Enumerator

<p>NDDS_CONFIG_XTYPES_ENCAPSULATION_OPTIONS_WITH_PADDING_BIT ↔</p>	<p>When this bit is set, RTI Connex will set the padding bits in the options field of the encapsulation header of a serialized payload. Value: 0x00000008</p> <p>When this bit is set RTI Connex will set the least significant two bits in the second byte of the options field to a value that encodes the number of padding bytes needed after the end of the serialized payload in order to reach the next 4-byte aligned offset. Specifically, the least significant two bits shall be set to binary 00 if no padding bits would be needed and binary 01, 10, or 11 if, respectively, there would be one, two, or three bytes of padding needed. These bits in the options field will be interpreted by a DataReader to determine where the serialized data exactly ended.</p> <p>To be compatible with the XTypes specification, this bit must be set.</p> <p>To be compatible with the following Micro versions this bit must be unset because those versions of Micro did not support padding bits and will discard any data with encapsulations options not set to 0.</p> <ul style="list-style-type: none"> <li>• RTI Connex Micro 3.x.y.z</li> <li>• RTI Connex Micro 2.4.15.1</li> <li>• RTI Connex Micro 2.4.14.0 and 2.4.14.1</li> <li>• RTI Connex Micro 2.4.13.1 through 2.4.13.5</li> <li>• RTI Connex Micro 2.4.12.z</li> </ul> <p>This bit applies to both, XCDR and XCDR2 encodings.</p>
--------------------------------------------------------------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

## 4.173.5 Function Documentation

### 4.173.5.1 NDDS\_Config\_get\_xtypes\_compliance\_mask()

```
NDDS_Config_XTypesComplianceMask NDDS_Config_get_xtypes_compliance_mask (
    void )
```

Gets the XTypes compliance mask value for the application.

The **NDDS\_Config\_XTypesComplianceMask** (p. 1258) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

**Returns**

The **NDDS\_Config\_XTypesComplianceMask** (p. 1258) value.

**See also**

**NDDS\_Config\_XTypesComplianceMask** (p. 1258)

**NDDS\_Config\_get\_xtypes\_compliance\_mask** (p. 1261)

**NDDS\_Config\_load\_compliance\_masks** (p. 1262)

**4.173.5.2 NDDS\_Config\_set\_xtypes\_compliance\_mask()**

```
void NDDS_Config_set_xtypes_compliance_mask (
    NDDS_Config_XTypesComplianceMask mask )
```

Sets the level of compliance of the application with the XTypes specification.

The **NDDS\_Config\_XTypesComplianceMask** (p. 1258) configures different aspects of the Extended CDR encoding (XCDR and XCDR2) for the application.

Once you call this function the value of the mask will apply to all the DomainParticipants created after the call. It won't apply to DomainParticipants created before the call.

In general, applications should only set the mask once, before executing any other RTI Connex API. The mask can also be set using the environment variable **NDDS\_XTYPES\_COMPLIANCE\_MASK**.

**Parameters**

<i>mask</i>	<< <i>in</i> >> (p. 818) Compliance mask.
-------------	-------------------------------------------

**See also**

**NDDS\_Config\_XTypesComplianceMask** (p. 1258)

**NDDS\_Config\_get\_xtypes\_compliance\_mask** (p. 1261)

**NDDS\_Config\_load\_compliance\_masks** (p. 1262)

**4.173.5.3 NDDS\_Config\_load\_compliance\_masks()**

```
DDS_Boolean NDDS_Config_load_compliance_masks (
    void )
```

Load the compliance masks from the environment variables.

The only compliance mask loaded by this function is the XTypes compliance mask, which can be set using the environment variable **NDDS\_XTYPES\_COMPLIANCE\_MASK**.

## 4.174 Heap Monitoring

Monitor memory allocations done by the middleware on the native heap.

### Data Structures

- struct `NDDS_UTILITY_HeapMonitoringParams_t`  
*Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.*

### Macros

- `#define NDDS_UTILITY_HeapMonitoringParams_INITIALIZER`  
*Static initializer for `NDDS_UTILITY_HeapMonitoringParams_t` (p. 1896).*

### Typedefs

- typedef struct `NDDS_UTILITY_HeapMonitoringParams_t` `NDDS_UTILITY_HeapMonitoringParams_t`  
*Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.*

### Enumerations

- enum `NDDS_UTILITY_HeapMonitoringSnapshotOutputFormat` {  
`NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_STANDARD` ,  
`NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_OUTPUT_FORMAT_COMPRESSED` }  
*Specify the format of the output of the snapshot. RTI Connex.*
- enum `NDDS_UTILITY_HeapMonitoringSnapshotContentFormat` {  
`NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_TOPIC` ,  
`NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_FUNCTION` ,  
`NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_BIT_ACTIVITY` ,  
`NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_DEFAULT` ,  
`NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT_CONTENT_MINIMAL` }  
*Bitmap used to decide which information of the snapshot will be displayed.*

## Functions

- **DDS\_Boolean NDDS\_Utility\_enable\_heap\_monitoring** (void)  
*Starts monitoring the heap memory used by RTI Connex.*
- **DDS\_Boolean NDDS\_Utility\_enable\_heap\_monitoring\_w\_params** (const **NDDS\_Utility\_HeapMonitoringParams\_t** \*params)  
*Starts monitoring the heap memory used by RTI Connex.*
- **void NDDS\_Utility\_disable\_heap\_monitoring** (void)  
*Stops monitoring the heap memory used by RTI Connex.*
- **DDS\_Boolean NDDS\_Utility\_pause\_heap\_monitoring** (void)  
*Pauses heap monitoring.*
- **DDS\_Boolean NDDS\_Utility\_resume\_heap\_monitoring** (void)  
*Resumes heap monitoring.*
- **DDS\_Boolean NDDS\_Utility\_take\_heap\_snapshot** (const char \*filename, **DDS\_Boolean** print\_details)  
*Saves the current heap memory usage in a file.*

### 4.174.1 Detailed Description

Monitor memory allocations done by the middleware on the native heap.

RTI Connex allows you to monitor the memory allocations done by the middleware on the native heap. This feature can be used to analyze and debug unexpected memory growth.

After `NDDS_Utility_enable_heap_monitoring` is called, you may invoke **NDDS\_Utility\_take\_heap\_snapshot** (p. 1267) to save the current heap memory usage to a file. By comparing two snapshots, you can tell if new memory has been allocated and, in many cases, where.

### 4.174.2 Macro Definition Documentation

#### 4.174.2.1 NDDS\_Utility\_HeapMonitoringParams\_INITIALIZER

```
#define NDDS_Utility_HeapMonitoringParams_INITIALIZER
```

Static initializer for **NDDS\_Utility\_HeapMonitoringParams\_t** (p. 1896).

Use this initializer to ensure that new objects do not have uninitialized contents.

```
struct NDDS_Utility_HeapMonitoringParams_t param = NDDS_Utility_HeapMonitoringParams_INITIALIZER;
```

See also

**NDDS\_Utility\_HeapMonitoringParams\_t** (p. 1896)

### 4.174.3 Typedef Documentation

#### 4.174.3.1 NDDS\_Utility\_HeapMonitoringParams\_t

```
typedef struct NDDS_Utility_HeapMonitoringParams_t NDDS_Utility_HeapMonitoringParams_t
```

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

#### 4.174.4 Enumeration Type Documentation

##### 4.174.4.1 NDDS\_Utility\_HeapMonitoringSnapshotOutputFormat

```
enum NDDS_Utility_HeapMonitoringSnapshotOutputFormat
```

Specify the format of the output of the snapshot. RTI Connex.

###### Enumerator

NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _OUTPUT_FORMAT_STANDARD	The output of the snapshot will be in plain text.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _OUTPUT_FORMAT_COMPRESSED	The output of the snapshot will be compressed using Zlib technology. The file can be uncompressed using zlib-flate.

##### 4.174.4.2 NDDS\_Utility\_HeapMonitoringSnapshotContentFormat

```
enum NDDS_Utility_HeapMonitoringSnapshotContentFormat
```

Bitmap used to decide which information of the snapshot will be displayed.

###### Enumerator

NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_BIT_TOPIC	Add the topic to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_BIT_FUNCTION	Add the function name to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_BIT_ACTIVITY	Add the activity context to the snapshot of heap monitoring. The user can select the information that will be part of the activity context by using the API <b>NDDS_Config_ActivityContext_set_attribute_mask</b> (p. 1256).
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_DEFAULT	Add all the optional attributes to the snapshot of heap monitoring.
NDDS_UTILITY_HEAP_MONITORING_SNAPSHOT↔ _CONTENT_MINIMAL	Not add any optional attribute to the snapshot of heap monitoring.

## 4.174.5 Function Documentation

### 4.174.5.1 NDDS\_Utility\_enable\_heap\_monitoring()

```
DDS_Boolean NDDS_Utility_enable_heap_monitoring (
    void )
```

Starts monitoring the heap memory used by RTI Connex.

This function must be called before any other function in the RTI Connex library is called.

Once heap monitoring is enabled, you can take heap snapshots by using **NDDS\_Utility\_take\_heap\_snapshot** (p. 1267).

Use this function only for debugging purposes, since it may introduce a significant performance impact.

#### MT Safety:

UNSAFE. It is not safe to call this function while another thread may be simultaneously calling another heap-related function, including this one.

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### See also

**NDDS\_Utility\_disable\_heap\_monitoring** (p. 1266)

### 4.174.5.2 NDDS\_Utility\_enable\_heap\_monitoring\_w\_params()

```
DDS_Boolean NDDS_Utility_enable_heap_monitoring_w_params (
    const NDDS_Utility_HeapMonitoringParams_t * params )
```

Starts monitoring the heap memory used by RTI Connex.

Performs the same function as **NDDS\_Utility\_enable\_heap\_monitoring** except that it also provides the values in *params*. Those values will set the format used in the snapshot **NDDS\_Utility\_take\_heap\_snapshot** (p. 1267).

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### See also

**NDDS\_Utility\_disable\_heap\_monitoring** (p. 1266)

#### 4.174.5.3 NDDS\_Utility\_disable\_heap\_monitoring()

```
void NDDS_Utility_disable_heap_monitoring (
    void )
```

Stops monitoring the heap memory used by RTI Connex.

This function must be the last function called from RTI Connex.

See also

**NDDS\_Utility\_enable\_heap\_monitoring** (p. 1266)

#### 4.174.5.4 NDDS\_Utility\_pause\_heap\_monitoring()

```
DDS_Boolean NDDS_Utility_pause_heap_monitoring (
    void )
```

Pauses heap monitoring.

New memory allocations will not be monitored and they will not appear in the snapshot generated by **NDDS\_Utility\_take\_heap\_snapshot** (p. 1267).

Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

See also

**NDDS\_Utility\_resume\_heap\_monitoring** (p. 1267)

#### 4.174.5.5 NDDS\_Utility\_resume\_heap\_monitoring()

```
DDS_Boolean NDDS_Utility_resume_heap_monitoring (
    void )
```

Resumes heap monitoring.

Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

See also

**NDDS\_Utility\_pause\_heap\_monitoring** (p. 1267)

#### 4.174.5.6 NDDS\_UTILITY\_take\_heap\_snapshot()

```
DDS_Boolean NDDS_UTILITY_take_heap_snapshot (
    const char * filename,
    DDS_Boolean print_details )
```

Saves the current heap memory usage in a file.

After `NDDS_UTILITY_enable_heap_monitoring` is called, you may invoke this function periodically to save the current heap memory usage to a file.

By comparing two snapshots, you can tell if new memory has been allocated and in many cases where. This is why this operation can be used to debug unexpected memory growth.

The format of a snapshot is as follows:

First, there is a memory usage summary like this:

```
<P>
    Product Version: NDDSCORE_BUILD_6.0.0.0_20200316T123411Z_RTI_ENG
    Process virtual memory: 2552352768
    Process physical memory: 16187392
    Current application heap usage: 10532131
    Approximate total heap usage: 203331110
    High watermark: 10532131
    Alloc count: 17634
    Free count: 3518
```

- Process virtual memory: The amount of virtual memory in bytes taken by the process. This memory includes RTI Connex and non-RTI Connex memory.
- Process physical memory: The amount of physical memory in bytes taken by the process.
- Current application heap usage: The amount of heap memory in bytes used by the middleware. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connex memory, not memory living in the managed heap. This value does not include overhead memory allocations that are used by the Heap Monitoring utility. It therefore provides the heap usage that is used when Heap Monitoring is disabled and does not reflect the actual amount of memory that has been allocated by the middleware. That value is accounted for in 'Approximate total heap usage'.
- Approximate total heap usage: The amount of heap memory in bytes used by the middleware, including overhead allocations from the Heap Monitoring utility. When the Heap Monitoring utility is enabled, every allocation has an additional overhead number of bytes allocated so that the middleware can keep track of the meta-data that is output in the heap snapshots. This overhead is not accounted for in the 'Current application heap usage' summary field, but is included in this field. For Java and .NET APIs, this memory only accounts for unmanaged RTI Connex memory, not memory living in the managed heap.
- High watermark: The maximum amount of heap usage by RTI Connex since `NDDS_UTILITY_enable_heap_monitoring` was invoked.
- Alloc count: The number of invocations to `malloc`, `realloc`, or `calloc` operations done by RTI Connex.
- Free count: The number of invocations to the `free` operation done by RTI Connex.

After the previous summary, and only if you set the parameter `print_details` to **DDS\_BOOLEAN\_TRUE** (p. 1004), the function will print the details of every single outstanding heap allocation done by RTI Connex. For example:

```
<P>
    block_id, timestamp, block_size, alloc_method_name, type_name, pool_alloc, pool_buffer_size,
    pool_buffer_count, topic_name, function_name, activity_context

    23087, 1586943520, 16, RTIOsapiHeap_allocateArray, struct RTIEncapsulationInfo, MALLOC, 0,
    0, PRESServiceRequest, PRESWriterHistoryDriver_new,
    "0X101175A,0X76DD63D7,0X984377BC:0X1C1{Name=ShapeTypeParticipant,Domain=110}|CREATE
    Participant|ENABLE|:0X80000088{Entity=Pu,Domain=110}|CREATE Writer WITH TOPIC PRESServiceRequest"
```

- `block_id`: Block ID of the allocation. This number increases with every allocation.
- `timestamp`: Timestamp in UTC seconds corresponding to the time where the allocation was done.
- `block_size`: The number of bytes allocated.
- `alloc_method_name`: The allocation RTI Connex method name.
- `type_name`: The allocation typename.
- `pool_alloc`: Indicates if the heap allocation is a RTI Connex pool allocation (POOL) or a regular allocation (MALLOC).
- `pool_buffer_size`: For pool allocations, this number indicates the size of the elements in the pool in number of bytes. `block_size` is equal to (`pool_buffer_size * pool_buffer_count`).
- `pool_buffer_count`: For pool allocations, this number indicates the number of buffers allocated for the pool. `block_size` is equal to (`pool_buffer_size * pool_buffer_count`).
- `topic_name`: The topic name associated with the allocation or 'n/a' if it is not available.
- `function_name`: function name associated with the allocation or 'n/a' if it is not available.
- `activity_context`: **Activity Context** (p. 1251)

#### Parameters

<code>filename</code>	<< <i>in</i> >> (p. 818). Name of file in which to store the snapshot.
<code>print_details</code>	<< <i>in</i> >> (p. 818). Indicates if the snapshot will contain only the memory usage summary or the details of the individual allocations.

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

## 4.175 Network Capture

Save network traffic into a capture file for further analysis.

### Data Structures

- struct **NDDS\_Utility\_NetworkCaptureParams\_t**  
*Input parameters for starting network capture.*

## Macros

- **#define NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_DEFAULT**  
*Default mask for `NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_KIND` (p. 1274): do not remove any content.*
- **#define NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_NONE**  
*The RTPS frames in the capture file will be saved as they are.*
- **#define NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_ALL**  
*The RTPS frames in the capture file will not include user data (either plain or encrypted).*
- **#define NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_DEFAULT**  
*Default mask for `NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_KIND_MASK` (p. 1274).*
- **#define NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_NONE**  
*Do not capture any traffic.*
- **#define NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_ALL**  
*Capture all traffic (both inbound and outbound).*

## Typedefs

- **typedef DDS\_Long NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_KIND\_MASK**  
*Mask that indicates a combination of content types.*
- **typedef DDS\_Long NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_KIND\_MASK**  
*Mask that indicates the traffic direction to capture.*

*Resume capturing traffic for all DomainParticipants.*
- **DDS\_Boolean NDDS\_Utility\_resume\_network\_capture\_for\_participant** ( DDS\_DomainParticipant \*participant)  
*Resume capturing traffic for a DomainParticipant.*

## Variables

- const **NDDS\_Utility\_NetworkCaptureParams\_t NDDS\_UTILITY\_NETWORK\_CAPTURE\_PARAMETERS\_↔DEFAULT**  
*Default parameters used in Network Capture.*

### 4.175.1 Detailed Description

Save network traffic into a capture file for further analysis.

RTI Connexx allows you to capture the network traffic that one or more DomainParticipants send or receive. This feature can be used to analyze and debug communication problems between your DDS applications. When network capture is enabled, each DomainParticipant will generate a pcap-based file that can then be opened by a packet analyzer like Wireshark, provided the right dissectors are installed.

To some extent, network capture can be used as an alternative to existing pcap-based network capture software (such as Wireshark). This will be the case when you are only interested in analyzing the traffic a DomainParticipant sends/receives. In this scenario, network capture will actually have some advantages over using more general pcap-based network capture applications: RTI's network capture includes additional information such as security-related data; it also removes information that is not needed, such as user data, when you want to reduce the capture size. That said, RTI's network capture is not a replacement for other pcap-based network capture applications: it only captures the traffic exchanged by the DomainParticipants, but it does not capture any other traffic exchanged through the system network interfaces.

To capture network traffic `NDDS_Utility_enable_network_capture` must be invoked before creating any Domain↔Participant. Similarly, `NDDS_Utility_disable_network_capture` must be called after deleting all participants. In between these calls, you may start, stop, pause or resume capturing traffic for one or all participants.

## 4.175.2 Capturing

### Shared Memory Traffic

Every RTPS frame in network capture has a source and a destination associated with it. In the case of shared memory traffic, a process identifier and a port determine the source and destination endpoints.

Access to the process identifier (PID) of the source for inbound traffic requires changes in the shared memory segments. These changes would break shared memory compatibility with previous versions of RTI Connext. For this reason, by default, network capture will not populate the value of the source PID for inbound shared memory traffic.

If interoperability with previous versions of RTI Connext is not necessary, you can generate capture files containing the source PID for inbound traffic. To do so, configure the value of the `'dds.transport.minimum_compatibility_version'` property to 6.1.0. (See **DDS\_PropertyQosPolicy** (p. 1645)).

```
<domain_participant_qos>
  <property>
    <value>
      <element>
        <name>dds.transport.minimum_compatibility_version</name>
        <value>6.1.0</value>
        <propagate>false</propagate>
      </element>
    </value>
  </property>
</domain_participant_qos>
```

This property is never propagated, so it must be consistently configured throughout the whole system.

**Note:** Changing the value of this property affects the type of shared memory segments that RTI Connext uses. For that reason, you may see the following warning, resulting from leftover shared memory segments:

```
[0xC733A001,0xB248F671,0xAEC4A0C1:0x000001C1{Domain=200}|CREATE_DP|ENABLE]
  NDDS_Transport_Shmem_is_segment_compatible:incompatible shared memory protocol detected.

Current version 4.0 not compatible with 2.0.
```

The leftover shared memory segments can be removed using the `ipcrm` command. See <https://community.rti.com/kb/what-are-possible-solutions-common-shared-memory-issues> for more information.

## 4.175.3 Macro Definition Documentation

### 4.175.3.1 NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_DEFAULT

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_DEFAULT
```

Default mask for **NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_KIND** (p. 1274): do not remove any content.

It is equivalent to **NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_NONE** (p. 1272).

**[default]** Do not remove any content.

### 4.175.3.2 NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_NONE

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_NONE
```

The RTPS frames in the capture file will be saved as they are.

### 4.175.3.3 NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_ALL

```
#define NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_MASK_ALL
```

The RTPS frames in the capture file will not include user data (either plain or encrypted).

Its value is the result of setting the bits for removing user data and removing encrypted data: (**NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_USER\_SERIALIZED\_DATA** (p. 1275)) | **NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_ENCRYPTED\_DATA** (p. 1275))

### 4.175.3.4 NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_DEFAULT

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_DEFAULT
```

Default mask for **NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_KIND\_MASK** (p. 1274).

It is equivalent to **NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_ALL** (p. 1273).

**[default]** Capture all traffic: inbound and outbound.

### 4.175.3.5 NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_NONE

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_NONE
```

Do not capture any traffic.

### 4.175.3.6 NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_ALL

```
#define NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_MASK_ALL
```

Capture all traffic (both inbound and outbound).

The value is equal to setting both the input and output bits of the mask: (**NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_OUT** (p. 1275)) | **NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_IN** (p. 1275)).

## 4.175.4 Typedef Documentation

### 4.175.4.1 NDDS\_Utility\_NetworkCaptureContentKindMask

```
typedef DDS_Long NDDS_Utility_NetworkCaptureContentKindMask
```

Mask that indicates a combination of content types.

The masks are based on a combination (or only one) of the **NDDS\_Utility\_NetworkCaptureContentKind** (p. 1274) bitmaps.

See also

**NDDS\_Utility\_NetworkCaptureContentKind** (p. 1274)

### 4.175.4.2 NDDS\_Utility\_NetworkCaptureTrafficKindMask

```
typedef DDS_Long NDDS_Utility_NetworkCaptureTrafficKindMask
```

Mask that indicates the traffic direction to capture.

The masks are based on a combination (or only one) of the **NDDS\_Utility\_NetworkCaptureTrafficKind** (p. 1275) bitmaps.

See also

**NDDS\_Utility\_NetworkCaptureTrafficKind** (p. 1275)

### 4.175.4.3 NDDS\_Utility\_NetworkCaptureParams\_t

```
typedef struct NDDS_Utility_NetworkCaptureParams_t NDDS_Utility_NetworkCaptureParams_t
```

Input parameters for starting network capture.

## 4.175.5 Enumeration Type Documentation

### 4.175.5.1 NDDS\_Utility\_NetworkCaptureContentKind

```
enum NDDS_Utility_NetworkCaptureContentKind
```

Bitmap used to specify a content type, i.e., a part of the RTPS frame.

Several values can be combined. Read **NDDS\_Utility\_NetworkCaptureContentKindMask** (p. 1274) for typical combinations.

## Enumerator

NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_USER_↔ SERIALIZED_DATA	The serialized data coming from a user.
NDDS_UTILITY_NETWORK_CAPTURE_CONTENT_ENCRYPTED_↔ DATA	The encrypted user data.

## 4.175.5.2 NDDS\_UTILITY\_NetworkCaptureTrafficKind

```
enum NDDS_UTILITY_NetworkCaptureTrafficKind
```

Bitmap used to specify whether we want to capture inbound or outbound traffic.

Several values can be combined. Read **NDDS\_UTILITY\_NetworkCaptureTrafficKindMask** (p. 1274) for typical combinations.

## Enumerator

NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_OUT	Do not capture outbound traffic.
NDDS_UTILITY_NETWORK_CAPTURE_TRAFFIC_IN	Do not capture inbound traffic.

## 4.175.6 Function Documentation

## 4.175.6.1 NDDS\_UTILITY\_enable\_network\_capture()

```
DDS_Boolean NDDS_UTILITY_enable_network_capture (
    void )
```

Enable Network Capture.

This function must be called before any other Network Capture function. It must also be called before creating the participants for which we want to capture traffic.

Use this function only for debugging purposes, since it may introduce a significant performance impact.

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

**MT Safety:**

UNSAFE. It is not safe to call this function while another thread may be simultaneously calling another Network Capture related function, including this one.

**MT Safety:**

UNSAFE. In VxWorks, it is unsafe to call this function while another thread may be simulatenously calling **DDS\_↔DomainParticipantFactory\_get\_instance** (p. 34), **DDS\_DomainParticipantFactory\_finalize\_instance** (p. 34), **DDS\_TypeCodeFactory\_get\_instance** (p. 285), **DDS\_TypeCodeFactory\_finalize\_instance** (p. 285), **NDDS\_↔Utility\_enable\_network\_capture**, or **NDDS\_Utility\_disable\_network\_capture**.

**See also**

**NDDS\_Utility\_disable\_network\_capture** (p. 1276)

**4.175.6.2 NDDS\_Utility\_disable\_network\_capture()**

```
DDS_Boolean NDDS_Utility_disable_network_capture (
    void )
```

Disable Network Capture.

This function must be the last Network Capture function to be called. It must also be called after deleting the participants for which we captured traffic. Disabling Network Capture without stopping it first is not ok!

**Returns**

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

**MT Safety:**

UNSAFE. It is not safe to call this function while another thread may be simultaneously calling another Network Capture related function, including this one.

**MT Safety:**

UNSAFE. In VxWorks, it is unsafe to call this function while another thread may be simulatenously calling **DDS\_↔DomainParticipantFactory\_get\_instance** (p. 34), **DDS\_DomainParticipantFactory\_finalize\_instance** (p. 34), **DDS\_TypeCodeFactory\_get\_instance** (p. 285), **DDS\_TypeCodeFactory\_finalize\_instance** (p. 285), **NDDS\_↔Utility\_enable\_network\_capture**, or **NDDS\_Utility\_disable\_network\_capture**.

**See also**

**NDDS\_Utility\_enable\_network\_capture** (p. 1275)

### 4.175.6.3 NDDS\_Utility\_set\_default\_network\_capture\_params()

```
DDS_Boolean NDDS_Utility_set_default_network_capture_params (
    const NDDS_Utility_NetworkCaptureParams_t * params )
```

Set the default Network Capture parameters.

The default parameters are used when Network Capture is started without parameters, i.e., `NDDS_Utility_start_network_capture`.

#### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

#### Parameters

<i>params</i>	<< <i>in</i> >> (p. 818). Configuration parameters that we want to set as defaults.
---------------	-------------------------------------------------------------------------------------

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### See also

**NDDS\_Utility\_start\_network\_capture** (p. 1277)

**NDDS\_Utility\_start\_network\_capture\_for\_participant** (p. 1278)

### 4.175.6.4 NDDS\_Utility\_start\_network\_capture()

```
DDS_Boolean NDDS_Utility_start_network_capture (
    const char * filename )
```

Start capturing traffic for all DomainParticipants, with the default parameters.

#### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

#### Parameters

<i>filename</i>	<< <i>in</i> >> (p. 818). The name of the output capture file will be based on this input parameter.
-----------------	------------------------------------------------------------------------------------------------------

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-`

string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension (".pcap").

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### See also

**NDDS\_Utility\_stop\_network\_capture** (p. 1280)

**NDDS\_Utility\_start\_network\_capture\_for\_participant** (p. 1278)

### 4.175.6.5 NDDS\_Utility\_start\_network\_capture\_for\_participant()

```
DDS_Boolean NDDS_Utility_start_network_capture_for_participant (
    DDS_DomainParticipant * participant,
    const char * filename )
```

Start capturing traffic for a DomainParticipant, with the default parameters.

#### Precondition

This function requires first enabling Network Capture. See **NDDS\_Utility\_enable\_network\_capture**.

#### Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818). DomainParticipant for which we want to capture traffic.
<i>filename</i>	<< <i>in</i> >> (p. 818). The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the *filename* input parameter, and the file extension (".pcap").

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### See also

**NDDS\_Utility\_stop\_network\_capture\_for\_participant** (p. 1280)

**NDDS\_Utility\_start\_network\_capture\_w\_params\_for\_participant** (p. 1279)

**NDDS\_Utility\_enable\_network\_capture** (p. 1275)

#### 4.175.6.6 NDDS\_Utility\_start\_network\_capture\_w\_params()

```
DDS_Boolean NDDS_Utility_start_network_capture_w_params (
    const char * filename,
    const NDDS_Utility_NetworkCaptureParams_t * params )
```

Start capturing traffic for all DomainParticipants, with the provided parameters.

##### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

Performs the same function as `NDDS_Utility_start_network_capture` except that it uses the provided parameters, instead of the default ones.

##### Parameters

<i>filename</i>	<< <i>in</i> >> (p. 818). The name of the output capture file will be based on this input parameter.
-----------------	------------------------------------------------------------------------------------------------------

In particular, the name for the capture file is the concatenation of the `filename` input parameter, the `"_GUID-"` string followed by the decimal representation of bytes 8-11 of the DomainParticipant's GUID, and the file extension `".pcap"`.

##### Parameters

<i>params</i>	<< <i>in</i> >> (p. 818). Configuration parameters for the capture.
---------------	---------------------------------------------------------------------

##### Returns

`DDS_BOOLEAN_TRUE` (p. 1004) if success. Otherwise, `DDS_BOOLEAN_FALSE` (p. 1004)

##### See also

`NDDS_Utility_stop_network_capture` (p. 1280)

`NDDS_Utility_start_network_capture_w_params_for_participant` (p. 1279)

#### 4.175.6.7 NDDS\_Utility\_start\_network\_capture\_w\_params\_for\_participant()

```
DDS_Boolean NDDS_Utility_start_network_capture_w_params_for_participant (
    DDS_DomainParticipant * participant,
    const char * filename,
    const NDDS_Utility_NetworkCaptureParams_t * params )
```

Start capturing traffic for a DomainParticipant, with the provided parameters.

##### Precondition

This function requires enabling first Network Capture. See `NDDS_Utility_enable_network_capture`.

## Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818). DomainParticipant for which we want to capture traffic.
<i>filename</i>	<< <i>in</i> >> (p. 818). The name of the output capture file will be based on this input parameter.

In particular, the name for the capture file is the concatenation of the `filename` input parameter, and the file extension (`".pcap"`).

## Parameters

<i>params</i>	<< <i>in</i> >> (p. 818). Parameters for configuring the capture.
---------------	-------------------------------------------------------------------

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

## See also

**NDDS\_Utility\_stop\_network\_capture\_for\_participant** (p. 1280)

**NDDS\_Utility\_start\_network\_capture\_for\_participant** (p. 1278)

#### 4.175.6.8 NDDS\_Utility\_stop\_network\_capture()

```
DDS_Boolean NDDS_Utility_stop_network_capture (
    void )
```

Stop capturing traffic for all participants.

## Precondition

This function requires enabling first Network Capture. See `NDDS_Utility_enable_network_capture`.

This function can (and must) be called after `NDDS_Utility_start_network_capture`, not `NDDS_Utility_start_network_capture_for_participant`. That is, if we start capturing traffic globally (for all DomainParticipants), we must stop capturing traffic also globally. It is not possible to start capturing traffic for a participant but stop it globally.

It is possible to start capturing globally and then stop capturing for a participant, as long as we eventually stop capturing traffic globally.

We must stop capturing for a participant before deleting it.

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

## See also

**NDDS\_Utility\_start\_network\_capture** (p. 1277)

**NDDS\_Utility\_stop\_network\_capture\_for\_participant** (p. 1280)

#### 4.175.6.9 NDDS\_Utility\_stop\_network\_capture\_for\_participant()

```
DDS_Boolean NDDS_Utility_stop_network_capture_for_participant (
    DDS_DomainParticipant * participant )
```

Stop capturing traffic for a DomainParticipant.

##### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

##### Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818). DomainParticipant for which we want to stop capturing traffic.
--------------------	------------------------------------------------------------------------------------------

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

##### See also

**NDDS\_Utility\_start\_network\_capture\_for\_participant** (p. 1278)

**NDDS\_Utility\_stop\_network\_capture** (p. 1280)

#### 4.175.6.10 NDDS\_Utility\_pause\_network\_capture()

```
DDS_Boolean NDDS_Utility_pause_network_capture (
    void )
```

Pause capturing traffic for all DomainParticipants.

##### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

##### See also

**NDDS\_Utility\_resume\_network\_capture** (p. 1282)

**NDDS\_Utility\_pause\_network\_capture\_for\_participant** (p. 1281)

#### 4.175.6.11 NDDS\_Utility\_pause\_network\_capture\_for\_participant()

```
DDS_Boolean NDDS_Utility_pause_network_capture_for_participant (
    DDS_DomainParticipant * participant )
```

Pause capturing traffic for a DomainParticipant.

##### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

##### Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818). DomainParticipant for which we want to pause capturing traffic.
--------------------	-------------------------------------------------------------------------------------------

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

##### See also

**NDDS\_Utility\_resume\_network\_capture\_for\_participant** (p. 1282)

**NDDS\_Utility\_pause\_network\_capture** (p. 1281)

#### 4.175.6.12 NDDS\_Utility\_resume\_network\_capture()

```
DDS_Boolean NDDS_Utility_resume_network_capture (
    void )
```

Resume capturing traffic for all DomainParticipants.

##### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if success. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

##### See also

**NDDS\_Utility\_pause\_network\_capture** (p. 1281)

**NDDS\_Utility\_resume\_network\_capture\_for\_participant** (p. 1282)

#### 4.175.6.13 NDDS\_Utility\_resume\_network\_capture\_for\_participant()

```
DDS_Boolean NDDS_Utility_resume_network_capture_for_participant (
    DDS_DomainParticipant * participant )
```

Resume capturing traffic for a DomainParticipant.

##### Precondition

This function requires first enabling Network Capture. See `NDDS_Utility_enable_network_capture`.

##### Parameters

<i>participant</i>	<< <i>in</i> >> (p. 818). DomainParticipant for which we want to resume capturing traffic.
--------------------	--------------------------------------------------------------------------------------------

##### Returns

`DDS_BOOLEAN_TRUE` (p. 1004) if success. Otherwise, `DDS_BOOLEAN_FALSE` (p. 1004)

##### See also

`NDDS_Utility_pause_network_capture_for_participant` (p. 1281)

`NDDS_Utility_resume_network_capture` (p. 1282)

### 4.175.7 Variable Documentation

#### 4.175.7.1 NDDS\_UTILITY\_NETWORK\_CAPTURE\_PARAMETERS\_DEFAULT

```
const NDDS_Utility_NetworkCaptureParams_t NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT [extern]
```

Default parameters used in Network Capture.

The default parameters can be used as initializers to ensure that new objects do not have uninitialized contents.

Initialization of a `NDDS_Utility_NetworkCaptureParams_t` (p. 1897) type can be done either by assigning to the default parameters:

```
struct NDDS_Utility_NetworkCaptureParams_t params = NDDS_UTILITY_NETWORK_CAPTURE_PARAMETERS_DEFAULT;
```

Or equivalently, by using its initializer function:

```
struct NDDS_Utility_NetworkCaptureParams_t params;
```

```
NDDS_Utility_NetworkCaptureParams_t_initialize(&params);
```

In either case, do not forget to finalize the parameters when you don't need them any more:

```
NDDS_Utility_NetworkCaptureParams_t_finalize(&params);
```

The values that are used by default for the parameters can be found in the description of each of the members in `NDDS_Utility_NetworkCaptureParams_t` (p. 1897).

## 4.176 Other Utilities

Other Utilities, such as `NDDS_UTILITY.spin` (p. 1285).

### Functions

- **DDS\_Boolean NDDS\_LM\_unload\_activation\_library** (void)  
*Unloads the Activation Library (rti\_activation) if it was previously loaded.*
- void **NDDS\_UTILITY.sleep** (const struct **DDS\_Duration\_t** \*durationIn)  
*Block the calling thread for the specified duration.*
- void **NDDS\_UTILITY.spin** ( **DDS\_UnsignedLongLong** spinCount)  
*Performs the spin operation as many times as indicated.*
- **DDS\_UnsignedLongLong NDDS\_UTILITY.get\_spin\_per\_microsecond** (void)  
*Returns the number of spin operations to perform to wait 1 microsecond.*

### 4.176.1 Detailed Description

Other Utilities, such as `NDDS_UTILITY.spin` (p. 1285).

### 4.176.2 Function Documentation

#### 4.176.2.1 NDDS\_LM\_unload\_activation\_library()

```
DDS_Boolean NDDS_LM_unload_activation_library (  
    void )
```

Unloads the Activation Library (rti\_activation) if it was previously loaded.

This function should be called just before your process finishes. See the License Management section in the *Installation Guide* for additional details.

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if successful. Otherwise, **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### 4.176.2.2 NDDS\_UTILITY.sleep()

```
void NDDS_UTILITY.sleep (  
    const struct DDS_Duration_t * durationIn )
```

Block the calling thread for the specified duration.

Note that the achievable resolution of sleep is OS-dependent. That is, do not assume that you can sleep for 1 nanosecond just because you can specify a 1-nanosecond sleep duration via the API. The sleep resolution on most operating systems is usually 10 ms or greater.

## Parameters

<i>duration</i> ↔ <i>In</i>	<< <i>in</i> >> (p. 818) Sleep duration. Cannot be NULL.
--------------------------------	----------------------------------------------------------

## MT Safety:

safe

## Examples

HelloWorld\_publisher.c, and HelloWorld\_subscriber.c.

## 4.176.2.3 NDDS\_Utility\_spin()

```
void NDDS_Utility_spin (
    DDS_UnsignedLongLong spinCount )
```

Performs the spin operation as many times as indicated.

Spinning is the action of performing useless operations in a for loop in order to actively wait some time without yielding the CPU. Given that the resolution of sleep is in the order of ms, you can use this utility to wait times in the order of microseconds. To properly use this functionality, it is useful to measure previously the number of spin operations needed to wait the equivalent to microsecond (using the utility `get_spin_per_microsecond`) and then compute the corresponding spin count desired.

## Parameters

<i>spinCount</i>	<< <i>in</i> >> (p. 818) Number of spin operations to perform.
------------------	----------------------------------------------------------------

## 4.176.2.4 NDDS\_Utility\_get\_spin\_per\_microsecond()

```
DDS_UnsignedLongLong NDDS_Utility_get_spin_per_microsecond (
    void )
```

Returns the number of spin operations to perform to wait 1 microsecond.

This utility can be used to measure how many spin operations must be performed to wait 1 microsecond. Since the time that it takes the CPU to perform 1 spin operation depends on the CPU frequency, it is recommended to use this utility before using `spin()`.

**Returns**

Number of spin operations to wait 1 microsecond.

**See also**

**NDDS\_UTILITY\_spin** (p. 1285)

## 4.177 Octet Buffer Support

<<**extension**>> (p. 817) Octet buffer creation, cloning, and deletion.

**Functions**

- unsigned char \* **DDS\_OctetBuffer\_alloc** (unsigned int size)  
*Create a new empty OctetBuffer that can hold up to `size` octets.*
- unsigned char \* **DDS\_OctetBuffer\_dup** (const unsigned char \*buffer, unsigned int size)  
*Clone an OctetBuffer.*
- void **DDS\_OctetBuffer\_free** (unsigned char \*buffer)  
*Delete an OctetBuffer.*

### 4.177.1 Detailed Description

<<**extension**>> (p. 817) Octet buffer creation, cloning, and deletion.

The functions in this class ensure consistent cross-platform implementations for OctetBuffer creation (**DDS\_↵  
OctetBuffer\_alloc()** (p. 1287)), deletion (**DDS\_OctetBuffer\_free()** (p. 1288)), and cloning (**DDS\_OctetBuffer\_dup()** (p. 1287)) that preserve the mutable value type semantics. These are to be viewed as functions that define an Octet↵  
Buffer class whose data is represented by a 'unsigned char\*'.  
↵

### 4.177.2 Conventions

The following conventions govern the memory management of OctetBuffers in RTI Connex.

- The DDS implementation ensures that when value types containing OctetBuffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the OctetBuffer class functions.
  - Value types containing OctetBuffers have ownership of the contained OctetBuffer. Thus, when a value type is deleted, the contained octet buffer field is also deleted.
- The user must ensure that when value types containing OctetBuffers are passed back and forth to the DDS APIs, the OctetBuffers are created/deleted/cloned using the OctetBuffer class functions.

The representation of an OctetBuffer in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a OctetBuffer. RTI Connex must therefore make some assumptions when a user requests that a OctetBuffer be copied into. The following rules apply when RTI Connex is copying into an OctetBuffer.

- If the 'unsigned char\*' is NULL, RTI Connex will allocate a new OctetBuffer on behalf of the user. *To avoid leaking memory, you must ensure that the OctetBuffer will be freed (see **Usage** (p. 1287) below) in C. For C++, the destructor of the valuetype containing the OctetBuffer will free it automatically.*
- If the 'unsigned char\*' is not NULL, RTI Connex will assume that you are managing the OctetBuffer's memory yourself and have allocated enough memory to store the OctetBuffer to be copied. *RTI Connex will copy into your memory; to avoid memory corruption, be sure to allocate enough of it. Also, do not pass structures containing junk pointers into RTI Connex; you are likely to crash.*

### 4.177.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating OctetBuffers.

```
Always use
    DDS_OctetBuffer_alloc() to create,
    DDS_OctetBuffer_dup() to clone,
    DDS_OctetBuffer_free() to delete
a 'unsigned char*' that is passed back and forth between
user code and the DDS C/C++ APIs.
```

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of **DDS\_OctetBuffer\_alloc()** (p. 1287), with matching occurrences of **DDS\_OctetBuffer\_free()** (p. 1288) in the code.
- Finalize value types containing OctetBuffer. In C++ the destructor accomplishes this automatically. in C, explicit "destructor" functions are provided.

### 4.177.4 Function Documentation

#### 4.177.4.1 DDS\_OctetBuffer\_alloc()

```
unsigned char * DDS_OctetBuffer_alloc (
    unsigned int size )
```

Create a new empty OctetBuffer that can hold up to `size` octets.

An OctetBuffer created by this function must be deleted using **DDS\_OctetBuffer\_free()** (p. 1288).

This function will allocate enough memory to hold an OctetBuffer of `size` octets.

#### Parameters

<code>size</code>	<< <i>in</i> >> (p. 818) Size of the buffer.
-------------------	----------------------------------------------

#### Returns

A newly created non-NULL OctetBuffer upon success or NULL upon failure.

#### 4.177.4.2 DDS\_OctetBuffer\_dup()

```
unsigned char * DDS_OctetBuffer_dup (
    const unsigned char * buffer,
    unsigned int size )
```

Clone an OctetBuffer.

An OctetBuffer created by this function must be deleted using `DDS_OctetBuffer_free()`

##### Parameters

<i>buffer</i>	<< <i>in</i> >> (p. 818) The OctetBuffer to duplicate.
<i>size</i>	<< <i>in</i> >> (p. 818) Size of the OctetBuffer to duplicate.

##### Returns

If `src == NULL` or `size < 0`, this function always returns `NULL`. Otherwise, upon success it returns a newly created OctetBuffer whose value is `src`; upon failure it returns `NULL`.

#### 4.177.4.3 DDS\_OctetBuffer\_free()

```
void DDS_OctetBuffer_free (
    unsigned char * buffer )
```

Delete an OctetBuffer.

##### Precondition

`buffer` must be either `NULL`, or must have been created using `DDS_OctetBuffer_alloc()` (p. 1287), `DDS_↔OctetBuffer_dup()` (p. 1287)

##### Parameters

<i>buffer</i>	<< <i>in</i> >> (p. 818) The buffer to delete.
---------------	------------------------------------------------

## 4.178 SampleProcessor

<<*experimental*>> (p. 817) <<*extension*>> (p. 817) Utility to concurrently read and process the data samples received by `DDS_DataReader` (p. 608).

## Data Structures

- struct **DDS\_SampleHandler**  
 <<*experimental*>> (p. 817) <<*extension*>> (p. 817) <<*interface*>> (p. 818) Handler called by a sample dispatcher, such as **DDS\_SampleProcessor** (p. 1290).

## Macros

- #define **DDS\_SampleHandler\_INITIALIZER**  
 <<*experimental*>> (p. 817) <<*extension*>> (p. 817) Initializer for new **DDS\_SampleHandler** (p. 1719).

## Typedefs

- typedef struct DDS\_SampleProcessorImpl **DDS\_SampleProcessor**  
 <<*extension*>> (p. 817) <<*interface*>> (p. 818) A class for reading the samples in **DDS\_DataReader** (p. 608)'s cache concurrently. This class allows associating a **DDS\_SampleHandler** (p. 1719) with a **DDS\_DataReader** (p. 608) and notify it for each sample individually.

## Functions

- **DDS\_ReturnCode\_t DDS\_SampleProcessor\_attach\_reader** ( **DDS\_SampleProcessor** \*self, **DDS\_DataReader** \*reader, const struct **DDS\_SampleHandler** \*handler)  
 Attaches the specified **DDS\_DataReader** (p. 608) with an associated sample handler to this **DDS\_SampleProcessor** (p. 1290).
- **DDS\_ReturnCode\_t DDS\_SampleProcessor\_detach\_reader** ( **DDS\_SampleProcessor** \*self, **DDS\_DataReader** \*reader)  
 Detaches the specified **DDS\_DataReader** (p. 608) from this **DDS\_SampleProcessor** (p. 1290).
- **DDS\_ReturnCode\_t DDS\_SampleProcessor\_lookup\_sample\_handler** ( **DDS\_SampleProcessor** \*self, struct **DDS\_SampleHandler** \*handler\_out, **DDS\_DataReader** \*reader)  
 Finds the associated **DDS\_SampleHandler** (p. 1719) of the specified attached **DDS\_DataReader** (p. 608).
- **DDS\_ReturnCode\_t DDS\_SampleProcessor\_get\_datareaders** ( **DDS\_SampleProcessor** \*self, struct **DDS\_DataReaderSeq** \*attached\_readers)  
 Retrieves the list of attached **DDS\_DataReader** (p. 608) (s).
- **DDS\_ReturnCode\_t DDS\_SampleProcessor\_delete** ( **DDS\_SampleProcessor** \*self)  
 Deletes a **DDS\_SampleProcessor** (p. 1290).
- **DDS\_SampleProcessor** \* **DDS\_SampleProcessor\_new** (const struct **DDS\_AsyncWaitSetProperty\_t** \*aws\_property)  
 Single-argument constructor that allows creating a **DDS\_SampleProcessor** (p. 1290) with the configuration of the underlying **DDS\_AsyncWaitSet** (p. 874).
- **DDS\_SampleProcessor** \* **DDS\_SampleProcessor\_new\_with\_aws** ( **DDS\_AsyncWaitSet** \*aws)  
 Constructor that allows specifying an externally created **DDS\_AsyncWaitSet** (p. 874).

### 4.178.1 Detailed Description

<<*experimental*>> (p. 817) <<*extension*>> (p. 817) Utility to concurrently read and process the data samples received by **DDS\_DataReader** (p. 608).

## 4.178.2 Macro Definition Documentation

### 4.178.2.1 DDS\_SampleHandler\_INITIALIZER

```
#define DDS_SampleHandler_INITIALIZER
```

<<*experimental*>> (p. 817) <<*extension*>> (p. 817) Initializer for new **DDS\_SampleHandler** (p. 1719).

No memory is allocated. New **DDS\_SampleHandler** (p. 1719) instances stored in the stack should be initialized with this value before they are passed to any functions.

See also

**DDS\_SampleHandler** (p. 1719)

## 4.178.3 Typedef Documentation

### 4.178.3.1 DDS\_SampleProcessor

```
typedef struct DDS_SampleProcessorImpl DDS_SampleProcessor
```

<<*extension*>> (p. 817) <<*interface*>> (p. 818) A class for reading the samples in **DDS\_DataReader** (p. 608)'s cache concurrently. This class allows associating a **DDS\_SampleHandler** (p. 1719) with a **DDS\_DataReader** (p. 608) and notify it for each sample individually.

A **DDS\_SampleProcessor** (p. 1290) relies on an underlying **DDS\_AsyncWaitSet** (p. 874) to read and dispatch the data from the DataReaders. It internally creates a **DDS\_ReadCondition** (p. 686) for each attached DataReader, an associates a custom handler that contains state to read samples and notify the corresponding handler .

The SampleProcessor uses this ReadCondition to wait for data and then calls **FooDataReader\_take\_w\_condition** (p. 625) to take all the available data.

Notifications to any handler may be concurrent if the thread pool size set in **DDS\_AsyncWaitSetProperty\_t::thread↔\_pool\_size** (p. 1328) is greater than 1. The same or different handlers may be called in parallel. The SampleProcessor cycles through all attached DataReaders dispatching a sample at a time with the next available thread. This mechanism guarantees concurrent dispatching of the samples across all DataReaders.

The **DDS\_SampleProcessor** (p. 1290) internally creates and uses a **DDS\_ReadCondition** (p. 686) for each attached **DDS\_DataReader** (p. 608) to read the data. It's recommended to perform all the reading of the **DDS\_DataReader** (p. 608)'s samples through the **DDS\_SampleProcessor** (p. 1290) and avoid reading with through other mechanisms in different part of your applications. Similarly, your application must be careful to not modify the **DDS\_ReadCondition** (p. 686) associated with an attached **DDS\_DataReader** (p. 608).

In general, avoid or beware of using the following operations in combination with a **DDS\_SampleProcessor** (p. 1290):

- read or take operation (and any of its overloads) of a **DDS\_DataReader** (p. 608) from any part of your application, including a **DDS\_DataReaderListener** (p. 1372) or a handler .
- Delete all the **DDS\_DataReader** (p. 608)'s **DDS\_ReadCondition** (p. 686) by calling **DDS\_DataReader\_delete\_↔\_contained\_entities** (p. 666)
- Perform actions based on the **DDS\_StatusCondition** (p.1170) with the **DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033) enabled (for example through a **DDS\_AsyncWaitSet** (p. 874)).

On the other hand, you can externally provide the underlying **DDS\_SampleProcessor** (p. 1290)'s **DDS\_AsyncWait\_↔\_Set** (p. 874) if you want to access additional capabilities of the **DDS\_AsyncWaitSet** (p. 874) and use it to attach other **DDS\_Condition** (p. 1169) to handle other aspects of your application.

#### 4.178.4 SampleProcessor Thread Safety

Similar to the **DDS\_AsyncWaitSet** (p. 874), the **DDS\_SampleProcessor** (p. 1290) provides a thread-safe interface. All the operations of this class can be called concurrently from multiple threads.

Because the **DDS\_SampleProcessor** (p. 1290) relies on an **DDS\_AsyncWaitSet** (p. 874) to dispatch the samples the same threading concepts apply. This means that operations on a **DDS\_SampleProcessor** (p. 1290) may require synchronizing with the thread pool for safety. **DDS\_SampleProcessor** (p. 1290) also relies on the asynchronous completion pattern to effectively interact with the underlying thread pool.

For instance to detach a **DDS\_DataReader** (p. 608), the **DDS\_SampleProcessor** (p. 1290) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token on which the **DDS\_SampleProcessor** (p. 1290) waits and blocks until it completes.

Due to the concurrent processing nature of operations on a **DDS\_SampleProcessor** (p. 1290) as well as the sample handling, it's important to keep in mind the following aspects:

- The handler operation can be called concurrently for each sample. Therefore, handler implementations may need to apply thread synchronization strategies to protect shared resources.
- Calling a **DDS\_SampleProcessor** (p.1290) operation that requires internal synchronization (e.g., **DDS\_↔\_SampleProcessor\_attach\_reader** (p. 1292)) from a handler notification will result in an error.

Note that the interface of the **DDS\_SampleProcessor** (p. 1290) is similar to that of the **DDS\_AsyncWaitSet** (p. 874) but reduced and simplified. As noted above, if more advanced use and control of the thread pool is required, you can always create the **DDS\_AsyncWaitSet** (p. 874) externally when calling **DDS\_SampleProcessor\_new\_with\_aws** (p. 1295).

MT Safety:

Safe.

**DDS\_DataReader** (p. 608)

## 4.178.5 Function Documentation

### 4.178.5.1 DDS\_SampleProcessor\_attach\_reader()

```
DDS_ReturnCode_t DDS_SampleProcessor_attach_reader (
    DDS_SampleProcessor * self,
    DDS_DataReader * reader,
    const struct DDS_SampleHandler * handler )
```

Attaches the specified **DDS\_DataReader** (p. 608) with an associated sample handler to this **DDS\_SampleProcessor** (p. 1290).

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **DDS\_DataReader** (p. 608) is attached and notifications to the handler may occur.

If this operation is called multiple times for an already attached **DDS\_DataReader** (p. 608), it will result in no-op and return successfully, ignoring the specified handler. So if the handler is different, it will not be updated.

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>reader</i>	<< <i>in</i> >> (p. 818) <b>DDS_DataReader</b> (p. 608) to be attached.
<i>handler</i>	<< <i>in</i> >> (p. 818) handler to be notified on dispatching of the <i>reader</i> samples.

#### Returns

One of the **Standard Return Codes** (p. 1024)

#### See also

**DDS\_SampleProcessor\_detach\_reader** (p. 1292)

### 4.178.5.2 DDS\_SampleProcessor\_detach\_reader()

```
DDS_ReturnCode_t DDS_SampleProcessor_detach_reader (
    DDS_SampleProcessor * self,
    DDS_DataReader * reader )
```

Detaches the specified **DDS\_DataReader** (p. 608) from this **DDS\_SampleProcessor** (p. 1290).

Once the **DDS\_DataReader** (p. 608) is detached, it is guaranteed that the **DDS\_SampleProcessor** (p. 1290) will no longer process it so it is safe for your application to release any resources associated with the detached **DDS\_DataReader** (p. 608).

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **DDS\_DataReader** (p. 608) is detached.

**DDS\_DataReader** (p. 608) may be detached at any time independently of the state of the **DDS\_SampleProcessor** (p. 1290).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>reader</i>	<< <i>in</i> >> (p. 818) <b>DDS_DataReader</b> (p. 608) to be detached.

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_SampleProcessor\_attach\_reader** (p. 1292)

## 4.178.5.3 DDS\_SampleProcessor\_lookup\_sample\_handler()

```
DDS_ReturnCode_t DDS_SampleProcessor_lookup_sample_handler (
    DDS_SampleProcessor * self,
    struct DDS_SampleHandler * handler_out,
    DDS_DataReader * reader )
```

Finds the associated **DDS\_SampleHandler** (p. 1719) of the specified attached **DDS\_DataReader** (p. 608).

The operation will fail with **DDS\_RETCODE\_PRECONDITION\_NOT\_MET** (p. 1025). if the specified reader is not currently attached.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>handler_out</i>	<< <i>inout</i> >> (p. 818) a <b>DDS_SampleHandler</b> (p. 1719) object that contains the found associated handler.
<i>reader</i>	<b>DDS_DataReader</b> (p. 608) The attached reader for which the associated <b>DDS_SampleHandler</b> (p. 1719) is retrieved.

## Returns

One of the **Standard Return Codes** (p. 1024)

## See also

**DDS\_SampleProcessor\_attach\_reader** (p. 1292)

**DDS\_SampleProcessor\_detach\_reader** (p. 1292)

#### 4.178.5.4 DDS\_SampleProcessor\_get\_datareaders()

```
DDS_ReturnCode_t DDS_SampleProcessor_get_datareaders (
    DDS_SampleProcessor * self,
    struct DDS_DataReaderSeq * attached_readers )
```

Retrieves the list of attached **DDS\_DataReader** (p. 608) (s).

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>attached_readers</i>	<< <i>inout</i> >> (p. 818) a <b>DDS_DataReaderSeq</b> (p. 1411) object where the list of attached readers will be returned.

##### Returns

One of the **Standard Return Codes** (p. 1024)

##### See also

**DDS\_SampleProcessor\_attach\_reader** (p. 1292)

**DDS\_SampleProcessor\_detach\_reader** (p. 1292)

#### 4.178.5.5 DDS\_SampleProcessor\_delete()

```
DDS_ReturnCode_t DDS_SampleProcessor_delete (
    DDS_SampleProcessor * self )
```

Deletes a **DDS\_SampleProcessor** (p. 1290).

This will delete the underlying **DDS\_AsyncWaitSet** (p. 874) only if it owns it. That is, if the **DDS\_AsyncWaitSet** (p. 874) was not provided externally.

The deletion will fail if there are outstanding **DDS\_AsyncWaitSetCompletionToken** (p. 877) that have not been deleted.

Any outstanding **DDS\_SampleProcessor** (p. 1290) must be deleted before finalizing the **DDS\_DomainParticipantFactory** (p. 28). Otherwise undefined behavior may occur.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

See also

**DDS\_SampleProcessor\_new** (p. 1295)

#### 4.178.5.6 DDS\_SampleProcessor\_new()

```
DDS_SampleProcessor * DDS_SampleProcessor_new (
    const struct DDS_AsyncWaitSetProperty_t * aws_property )
```

Single-argument constructor that allows creating a **DDS\_SampleProcessor** (p. 1290) with the configuration of the underlying **DDS\_AsyncWaitSet** (p. 874).

You can provide **DDS\_ASYNC\_WAITSET\_PROPERTY\_DEFAULT** (p. 894) as *property* to create the underlying **DDS\_AsyncWaitSet** (p. 874) with default behavior.

This constructor creates **DDS\_AsyncWaitSet** (p. 874) with no listener installed and will call **DDS\_AsyncWaitSet\_start** (p. 886) right after its creation.

Parameters

<i>aws_property</i>	<< <i>in</i> >> (p. 818) configuraiton of the underlying <b>DDS_AsyncWaitSet</b> (p. 874).
---------------------	--------------------------------------------------------------------------------------------

Returns

A new **DDS\_SampleProcessor** (p. 1290) or NULL if one could not be allocated.

See also

**DDS\_SampleProcessor\_new\_with\_aws** (p. 1295)

#### 4.178.5.7 DDS\_SampleProcessor\_new\_with\_aws()

```
DDS_SampleProcessor * DDS_SampleProcessor_new_with_aws (
    DDS_AsyncWaitSet * aws )
```

Constructor that allows specifying an externally created **DDS\_AsyncWaitSet** (p. 874).

Creates a new **DDS\_SampleProcessor** (p. 1290) with the specified **DDS\_AsyncWaitSet** (p. 874).

This constructor flavor decouples the lifecycle of the **DDS\_SampleProcessor** (p. 1290) from the **DDS\_AsyncWaitSet** (p. 874). It allows the application to have more control on the **DDS\_AsyncWaitSet** (p. 874), such as to install an **DDS\_AsyncWaitSetListener** (p. 1326), a custom **DDS\_ThreadFactory** (p. 1763), and controlling when it starts or stops.

Note that this constructor will not call **DDS\_AsyncWaitSet\_start** (p. 886), so it's the caller responsibility to start and stop it. You can provide the external **DDS\_AsyncWaitSet\_start** (p. 886) in either started or stopped state.

### Parameters

<code>aws</code>	<< <i>in</i> >> (p. 818) the externally created <b>DDS_AsyncWaitSet</b> (p. 874).
------------------	-----------------------------------------------------------------------------------

### Returns

A new **DDS\_SampleProcessor** (p. 1290) or NULL if one could not be allocated.

### See also

**DDS\_SampleProcessor\_new** (p. 1295)

## 4.179 Sequence Support

The **FooSeq** (p. 1845) interface allows you to work with variable-length collections of homogeneous data.

### Modules

- **Built-in Sequences**

*Defines sequences of primitive data type. .*

### Data Structures

- struct **FooSeq**

<<*interface*>> (p. 818) <<*generic*>> (p. 818) *A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **Foo** (p. 1841).*

### Macros

- #define **DDS\_SEQUENCE\_INITIALIZER**

*An initializer for new sequence instances.*

## Functions

- **DDS\_Boolean FooSeq\_initialize** (struct **FooSeq** \*self)  
*Initialize sequence instances.*
- **DDS\_Long FooSeq\_get\_maximum** (const struct **FooSeq** \*self)  
*Get the current maximum number of elements that can be stored in this sequence.*
- **DDS\_Boolean FooSeq\_set\_maximum** (struct **FooSeq** \*self, **DDS\_Long** new\_max)  
*Resize this sequence to a new desired maximum.*
- **DDS\_Long FooSeq\_get\_length** (const struct **FooSeq** \*self)  
*Get the logical length of this sequence.*
- **DDS\_Boolean FooSeq\_set\_length** (struct **FooSeq** \*self, **DDS\_Long** new\_length)  
*Set the sequence to the desired length, and resize the sequence if necessary.*
- **DDS\_Boolean FooSeq\_ensure\_length** (struct **FooSeq** \*self, **DDS\_Long** length, **DDS\_Long** max)  
*Set the sequence to the desired length, and resize the sequence if necessary.*
- **Foo FooSeq\_get** (const struct **FooSeq** \*self, **DDS\_Long** i)  
*Get the i-th element for a const sequence.*
- **Foo \* FooSeq\_get\_reference** (const struct **FooSeq** \*self, **DDS\_Long** i)  
*Get the pointer to the i-th element of this sequence.*
- **DDS\_Boolean FooSeq\_copy\_no\_alloc** (struct **FooSeq** \*self, const struct **FooSeq** \*src\_seq)  
*Copy elements from another sequence, only if the destination sequence has enough capacity.*
- **FooSeq \* FooSeq\_copy** (struct **FooSeq** \*self, const struct **FooSeq** \*src\_seq)  
*Copy elements from another sequence, resizing the sequence if necessary.*
- **DDS\_Boolean FooSeq\_from\_array** (struct **FooSeq** \*self, const **Foo** array[], **DDS\_Long** length)  
*Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.*
- **DDS\_Boolean FooSeq\_to\_array** (struct **FooSeq** \*self, **Foo** array[], **DDS\_Long** length)  
*Copy elements to an array of elements. The original contents of the array (if any) are replaced.*
- **DDS\_Boolean FooSeq\_loan\_contiguous** (struct **FooSeq** \*self, **Foo** \*buffer, **DDS\_Long** new\_length, **DDS\_Long** new\_max)  
*Loan a contiguous buffer to this sequence.*
- **DDS\_Boolean FooSeq\_loan\_discontiguous** (struct **FooSeq** \*self, **Foo** \*\*buffer, **DDS\_Long** new\_length, **DDS\_Long** new\_max)  
*Loan a discontiguous buffer to this sequence.*
- **DDS\_Boolean FooSeq\_unloan** (struct **FooSeq** \*self)  
*Return the loaned buffer in the sequence and set the maximum to 0.*
- **Foo \* FooSeq\_get\_contiguous\_buffer** (const struct **FooSeq** \*self)  
*Return the contiguous buffer of the sequence.*
- **Foo \*\* FooSeq\_get\_discontiguous\_buffer** (const struct **FooSeq** \*self)  
*Return the discontiguous buffer of the sequence.*
- **DDS\_Boolean FooSeq\_has\_ownership** (const struct **FooSeq** \*self)  
*Return the value of the owned flag.*
- **DDS\_Boolean FooSeq\_finalize** (struct **FooSeq** \*self)  
*Deallocate this sequence's buffer.*

### 4.179.1 Detailed Description

The **FooSeq** (p. 1845) interface allows you to work with variable-length collections of homogeneous data.

This interface is instantiated for each concrete element type in order to provide compile-time type safety to applications. The **Built-in Sequences** (p. 710) are pre-defined instantiations for the primitive data types.

When you use the `rtiddsgen` code generation tool, it will automatically generate concrete sequence instantiations for each of your own custom types.

### 4.179.2 Macro Definition Documentation

#### 4.179.2.1 DDS\_SEQUENCE\_INITIALIZER

```
#define DDS_SEQUENCE_INITIALIZER
```

An initializer for new sequence instances.

This constant will initialize a new sequence to a valid empty state. C language users should assign it to uninitialized sequence instances before using them, at the time they are declared, or use **FooSeq\_initialize** (p. 1298) as an alternative function to initialize new sequences.

#### Examples

```
HelloWorld_subscriber.c.
```

### 4.179.3 Function Documentation

#### 4.179.3.1 FooSeq\_initialize()

```
DDS_Boolean FooSeq_initialize (  
    struct FooSeq * self )
```

Initialize sequence instances.

Use this function to initialize new sequences to a valid empty state. C users should initialize sequences before using them.

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

See also

**DDS\_SEQUENCE\_INITIALIZER** (p. 1298)

#### 4.179.3.2 FooSeq\_get\_maximum()

```
DDS_Long FooSeq_get_maximum (
    const struct FooSeq * self )
```

Get the current maximum number of elements that can be stored in this sequence.

The `maximum` of the sequence represents the maximum number of elements that the underlying buffer can hold. It does not represent the current number of elements.

The `maximum` is a non-negative number. It is initialized when the sequence is first created.

`maximum` can only be changed with the **FooSeq\_set\_maximum** (p. 1299) operation.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

##### Returns

the current maximum of the sequence.

See also

**FooSeq\_get\_length** (p. 1300)

#### 4.179.3.3 FooSeq\_set\_maximum()

```
DDS_Boolean FooSeq_set_maximum (
    struct FooSeq * self,
    DDS_Long new_max )
```

Resize this sequence to a new desired maximum.

This operation does nothing if the new desired maximum matches the current maximum.

If this sequence owns its buffer and the new maximum is not equal to the old maximum, then the existing buffer will be freed and re-allocated.

**Precondition**

owned == **DDS\_BOOLEAN\_TRUE** (p. 1004)  
 new\_max <= maximum size for IDL bounded sequences.

**Postcondition**

owned == **DDS\_BOOLEAN\_TRUE** (p. 1004)  
 length == MINIMUM(original length, new\_max)

**Parameters**

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>new_max</i>	Must be >= 0.

**Returns**

**DDS\_BOOLEAN\_TRUE** (p. 1004) on success, **DDS\_BOOLEAN\_FALSE** (p. 1004) if the preconditions are not met. In that case the sequence is not modified.

**4.179.3.4 FooSeq\_get\_length()**

```
DDS_Long FooSeq_get_length (
    const struct FooSeq * self )
```

Get the logical length of this sequence.

Get the length that was last set, or zero if the length has never been set.

**Parameters**

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

**Returns**

the length of the sequence

**4.179.3.5 FooSeq\_set\_length()**

```
DDS_Boolean FooSeq_set_length (
    struct FooSeq * self,
    DDS_Long new_length )
```

Set the sequence to the desired length, and resize the sequence if necessary.

If the current maximum is greater than the desired length, then sequence is not resized.

Otherwise, if this sequence owns its buffer, the sequence is resized to the new length by freeing and re-allocating the buffer. However, if the sequence does not own its buffer, this operation will fail.

For sequences that are part of a type declared in IDL, the length must not exceed the maximum established for the sequence in the IDL.

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>new_length</i>	the new desired length. This value must be non-negative. Must be $\geq 0$ .

#### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) on success or **DDS\_BOOLEAN\_FALSE** (p. 1004) on failure

#### 4.179.3.6 FooSeq\_ensure\_length()

```
DDS_Boolean FooSeq_ensure_length (
    struct FooSeq * self,
    DDS_Long length,
    DDS_Long max )
```

Set the sequence to the desired length, and resize the sequence if necessary.

If the current maximum is greater than the new length, then the sequence is not resized.

Otherwise, if this sequence owns its buffer, the sequence is resized to the new maximum by freeing and re-allocating the buffer, and the length is set to the new length. However, if the sequence does not own its buffer, this operation will fail.

This function allows user to avoid unnecessary buffer re-allocation.

#### Precondition

```
length <= max
max <= maximum size for IDL bounded sequences
owned == DDS_BOOLEAN_TRUE (p. 1004) if sequence needs to be resized
```

#### Postcondition

```
length == length
maximum == max if resized
```

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>length</i>	<< <i>in</i> >> (p. 818) The new length that should be set. Must be $\geq 0$ .
<i>max</i>	<< <i>in</i> >> (p. 818) If sequence need to be resized, this is the maximum that should be set. $max \geq length$

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) on success, **DDS\_BOOLEAN\_FALSE** (p. 1004) if the preconditions are not met. In that case the sequence is not modified.

## 4.179.3.7 FooSeq\_get()

```

Foo FooSeq_get (
    const struct FooSeq * self,
    DDS_Long i )

```

Get the *i*-th element for a `const` sequence.

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>i</i>	index of element to access, must be $\geq 0$ and less than <b>FooSeq_get_length</b> (p. 1300)

## Returns

the *i*-th element

## 4.179.3.8 FooSeq\_get\_reference()

```

Foo * FooSeq_get_reference (
    const struct FooSeq * self,
    DDS_Long i )

```

Get the pointer to the *i*-th element of this sequence.

This operation can used to modify the elements of the sequence in place.

```

struct DDS_LongSeq my_seq = DDS_SEQUENCE_INITIALIZER;

DDS_Long* first_element = NULL;

DDS_LongSeq_ensure_length(1, 1);

first_element = DDS_LongSeq_get_reference(&my_seq, 0);

*first_element = 5;

```

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>i</i>	index of element to access, must be $\geq 0$ and less than <b>FooSeq_get_length</b> (p. 1300)

## Returns

a pointer to the *i*-th element

## 4.179.3.9 FooSeq\_copy\_no\_alloc()

```
DDS_Boolean FooSeq_copy_no_alloc (
    struct FooSeq * self,
    const struct FooSeq * src_seq )
```

Copy elements from another sequence, only if the destination sequence has enough capacity.

Fill the elements in this sequence by copying the corresponding elements in *src\_seq*. The original contents in this sequence are replaced via the element assignment operation (*Foo\_copy()* function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

## Precondition

```
this::maximum  $\geq$  src_seq::length
this::owned == DDS_BOOLEAN_TRUE (p. 1004)
```

## Postcondition

```
this::length == src_seq::length
this[i] == src_seq[i] for  $0 \leq i < \text{target\_seq::length}$ 
this::owned == DDS_BOOLEAN_TRUE (p. 1004)
```

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>src_seq</i>	<< <i>in</i> >> (p. 818) the sequence from which to copy

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the sequence was successfully copied; **DDS\_BOOLEAN\_FALSE** (p. 1004) otherwise.

**Note**

If the pre-conditions are not met, the operator will print a message to stdout and leave this sequence unchanged.

**See also**

**FooSeq\_copy** (p. 1304)

**4.179.3.10 FooSeq\_copy()**

```

FooSeq * FooSeq_copy (
    struct FooSeq * self,
    const struct FooSeq * src_seq )

```

Copy elements from another sequence, resizing the sequence if necessary.

This function invokes **FooSeq\_copy\_no\_alloc** (p. 1303) after ensuring that the sequence has enough capacity to hold the elements to be copied.

**Parameters**

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>src_seq</i>	<< <i>in</i> >> (p. 818) the sequence from which to copy

**Returns**

*self*, this sequence

**See also**

**FooSeq\_copy\_no\_alloc** (p. 1303)

**4.179.3.11 FooSeq\_from\_array()**

```

DDS_Boolean FooSeq_from_array (
    struct FooSeq * self,
    const Foo array[],
    DDS_Long length )

```

Copy elements from an array of elements, resizing the sequence if necessary. The original contents of the sequence (if any) are replaced.

Fill the elements in this sequence by copying the corresponding elements in *array*. The original contents in this sequence are replaced via the element assignment operation (*Foo\_copy()* function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

**Precondition**

`this::owned == DDS_BOOLEAN_TRUE` (p. 1004)

**Postcondition**

`this::length == length`

`this[i] == array[i]` for  $0 \leq i < \text{length}$

`this::owned == DDS_BOOLEAN_TRUE` (p. 1004)

**Parameters**

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>array</i>	<< <i>in</i> >> (p. 818) The array of elements to be copy elements from
<i>length</i>	<< <i>in</i> >> (p. 818) The length of the array.

**Returns**

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the array was successfully copied; **DDS\_BOOLEAN\_FALSE** (p. 1004) otherwise.

**Note**

If the pre-conditions are not met, the function will print a message to stdout and leave this sequence unchanged.

**4.179.3.12 FooSeq\_to\_array()**

```
DDS_Boolean FooSeq_to_array (
    struct FooSeq * self,
    Foo array[],
    DDS_Long length )
```

Copy elements to an array of elements. The original contents of the array (if any) are replaced.

Copy the elements of this sequence to the corresponding elements in the array. The original contents of the array are replaced via the element assignment operation (`Foo_copy()` function). By default, elements are discarded; 'delete' is not invoked on the discarded elements.

**Parameters**

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>array</i>	<< <i>in</i> >> (p. 818) The array of elements to be filled with elements from this sequence
<i>length</i>	<< <i>in</i> >> (p. 818) The number of elements to be copied.

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the elements of the sequence were successfully copied; **DDS\_BOOLEAN\_FALSE** (p. 1004) otherwise.

## 4.179.3.13 FooSeq\_loan\_contiguous()

```
DDS_Boolean FooSeq_loan_contiguous (
    struct FooSeq * self,
    Foo * buffer,
    DDS_Long new_length,
    DDS_Long new_max )
```

Loan a contiguous buffer to this sequence.

This operation changes the `owned` flag of the sequence to **DDS\_BOOLEAN\_FALSE** (p. 1004) and also sets the underlying buffer used by the sequence. See the `User's Manual` for more information about sequences and memory ownership.

Use this function if you want to manage the memory used by the sequence yourself. You must provide an array of elements and integers indicating how many elements are allocated in that array (i.e. the maximum) and how many elements are valid (i.e. the length). The sequence will subsequently use the memory you provide and will not permit it to be freed by a call to **FooSeq\_set\_maximum** (p. 1299).

Once you have loaned a buffer to a sequence, make sure that you don't free it before calling **FooSeq\_unloan** (p. 1307): the next time you access the sequence, you will be accessing freed memory!

You can use this function to wrap stack memory with a sequence interface, thereby avoiding dynamic memory allocation. Create a **FooSeq** (p. 1845) and an array of type **Foo** (p. 1841) and then loan the array to the sequence:

```
struct ::Foo fooArray[10];

struct ::FooSeq fooSeq = ::DDS_SEQUENCE_INITIALIZER;

::FooSeq_loan_contiguous(&fooSeq, fooArray, 0, 10);
```

By default, a sequence you create owns its memory unless you explicitly loan memory of your own to it. In a very few cases, RTI Connexx will return a sequence to you that has a loan; those cases are documented as such. For example, if you call **FooDataReader\_read** (p. 618) or **FooDataReader\_take** (p. 619) and pass in sequences with no loan and no memory allocated, RTI Connexx will loan memory to your sequences which must be unloaned with **FooDataReader\_return\_loan** (p. 639). See the documentation of those functions for more information.

## Precondition

**FooSeq\_get\_maximum** (p. 1299) == 0; i.e. the sequence has no memory allocated to it.

**FooSeq\_has\_ownership** (p. 1309) == **DDS\_BOOLEAN\_TRUE** (p. 1004); i.e. the sequence does not already have an outstanding loan

## Postcondition

The sequence will store its elements in the buffer provided.

**FooSeq\_has\_ownership** (p. 1309) == **DDS\_BOOLEAN\_FALSE** (p. 1004)

**FooSeq\_get\_length** (p. 1300) == `new_length`

**FooSeq\_get\_maximum** (p. 1299) == `new_max`

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>buffer</i>	The new buffer that the sequence will use. Must point to enough memory to hold <code>new_max</code> elements of type <b>Foo</b> (p. 1841). It may be NULL if <code>new_max == 0</code> .
<i>new_length</i>	The desired new length for the sequence. It must be the case that that $0 \leq \text{new\_length} \leq \text{new\_max}$ .
<i>new_max</i>	The allocated number of elements that could fit in the loaned buffer.

## Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if `buffer` is successfully loaned to this sequence or **DDS\_BOOLEAN\_FALSE** (p. 1004) otherwise. Failure only occurs due to failing to meet the pre-conditions. Upon failure the sequence remains unmodified.

## See also

**FooSeq\_unloan** (p. 1307) , **FooSeq\_loan\_discontiguous** (p. 1307)

## 4.179.3.14 FooSeq\_loan\_discontiguous()

```
DDS_Boolean FooSeq_loan_discontiguous (
    struct FooSeq * self,
    Foo ** buffer,
    DDS_Long new_length,
    DDS_Long new_max )
```

Loan a discontiguous buffer to this sequence.

This function is exactly like **FooSeq\_loan\_contiguous** (p. 1306) except that the buffer loaned is an array of **Foo** (p. 1841) pointers, not an array of **Foo** (p. 1841).

## Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
<i>buffer</i>	The new buffer that the sequence will use. Must point to enough memory to hold <code>new_max</code> elements of type <code>Foo*</code> . It may be NULL if <code>new_max == 0</code> .
<i>new_length</i>	The desired new length for the sequence. It must be the case that that $0 \leq \text{new\_length} \leq \text{new\_max}$ .
<i>new_max</i>	The allocated number of elements that could fit in the loaned buffer.

## See also

**FooSeq\_unloan** (p. 1307), **FooSeq\_loan\_contiguous** (p. 1306)

#### 4.179.3.15 FooSeq\_unloan()

```
DDS_Boolean FooSeq_unloan (
    struct FooSeq * self )
```

Return the loaned buffer in the sequence and set the maximum to 0.

This function affects only the state of this sequence; it does not change the contents of the buffer in any way.

Only the user who originally loaned a buffer should return that loan, as the user may have dependencies on that memory known only to them. Unloaning someone else's buffer may cause unspecified problems. For example, suppose a sequence is loaning memory from a custom memory pool. A user of the sequence likely has no way to release the memory back into the pool, so unloaning the sequence buffer would result in a resource leak. If the user were to then re-loan a different buffer, the original creator of the sequence would have no way to discover, when freeing the sequence, that the loan no longer referred to its own memory and would thus not free the user's memory properly, exacerbating the situation and leading to undefined behavior.

##### Precondition

owned == **DDS\_BOOLEAN\_FALSE** (p. 1004)

##### Postcondition

owned == **DDS\_BOOLEAN\_TRUE** (p. 1004)

maximum == 0

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if the preconditions were met. Otherwise **DDS\_BOOLEAN\_FALSE** (p. 1004). The function only fails if the pre-conditions are not met, in which case it leaves the sequence unmodified.

##### See also

**FooSeq\_loan\_contiguous** (p. 1306), **FooSeq\_loan\_discontiguous** (p. 1307), **FooSeq\_set\_maximum** (p. 1299)

#### 4.179.3.16 FooSeq\_get\_contiguous\_buffer()

```
Foo * FooSeq_get_contiguous_buffer (
    const struct FooSeq * self )
```

Return the contiguous buffer of the sequence.

Get the underlying buffer where contiguous elements of the sequence are stored. The size of the buffer matches the maximum of the sequence, but only the elements up to the **FooSeq\_get\_length** (p. 1300) of the sequence are valid.

This function provides almost no encapsulation of the sequence's underlying implementation. Certain operations, such as **FooSeq\_set\_maximum** (p. 1299), may render the buffer invalid. In light of these caveats, this operation should be used with care.

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

#### Returns

buffer that stores contiguous elements in sequence.

#### 4.179.3.17 FooSeq\_get\_discontiguous\_buffer()

```
Foo ** FooSeq_get_discontiguous_buffer (
    const struct FooSeq * self )
```

Return the discontiguous buffer of the sequence.

This operation returns the underlying buffer where discontiguous elements of the sequence are stored. The size of the buffer matches the maximum of this sequence, but only the elements up to the **FooSeq\_get\_length** (p. 1300) of the sequence are valid.

The same caveats apply to this function as to **FooSeq\_get\_contiguous\_buffer** (p. 1308).

The sequence will dereference pointers in the discontiguous buffer to provide access to its elements by value in C and by reference in C++. If you access the discontiguous buffer directly by means of this function, do not store any NULL values into it, as accessing those values will result in a segmentation fault.

#### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

#### Returns

buffer that stores discontiguous elements in sequence.

#### 4.179.3.18 FooSeq\_has\_ownership()

```
DDS_Boolean FooSeq_has_ownership (
    const struct FooSeq * self )
```

Return the value of the owned flag.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

##### Returns

**DDS\_BOOLEAN\_TRUE** (p. 1004) if sequence owns the underlying buffer, or **DDS\_BOOLEAN\_FALSE** (p. 1004) if it has an outstanding loan.

#### 4.179.3.19 FooSeq\_finalize()

```
DDS_Boolean FooSeq_finalize (
    struct FooSeq * self )
```

Deallocate this sequence's buffer.

Note that this function deletes this sequence's *buffer*, not this sequence itself. To avoid memory leaks, it should be called even on sequences declared on the stack. And after it has been called on a sequence located in dynamic memory, it is still necessary to call `free()`.

##### Precondition

(owned == **DDS\_BOOLEAN\_TRUE** (p. 1004)). If this precondition is not met, no memory will be freed and an error will be logged.

##### Parameters

<i>self</i>	<< <i>in</i> >> (p. 818) Cannot be NULL.
-------------	------------------------------------------

##### Postcondition

maximum == 0 and the underlying buffer is freed.

*Clone a string of characters as a string of wide characters.*
- void **DDS\_Wstring\_free** ( DDS\_Wchar \*str)  
*Delete a string.*

### 4.180.1 Detailed Description

<<*extension*>> (p. 817) String creation, cloning, assignment, and deletion.

The functions in this class ensure consistent cross-platform implementations for string creation (**DDS\_String\_alloc()** (p. 1313)), deletion (**DDS\_String\_free()** (p. 1314)), and cloning (**DDS\_String\_dup()** (p. 1313)) that preserve the mutable value type semantics. These are to be viewed as functions that define a `string` class whose data is represented by a `'char*'`.

## 4.180.2 String Conventions

The following conventions govern the memory management of strings in RTI Connex.

- The DDS implementation ensures that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the `string` class functions.
  - Value types containing strings have ownership of the contained string. Thus, when a value type is deleted, the contained string field is also deleted.
  - **DDS\_StringSeq** (p. 1741) is a value type that contains strings; it owns the memory for the contained strings. When a **DDS\_StringSeq** (p. 1741) is assigned or deleted, the contained strings are also assigned or deleted respectively.
- The user must ensure that when value types containing strings are passed back and forth to the DDS APIs, the strings are created/deleted/assigned/cloned using the `String` class functions.

The representation of a string in C/C++ unfortunately does not allow programs to detect how much memory has been allocated for a string. RTI Connex must therefore make some assumptions when a user requests that a string be copied into. The following rules apply when RTI Connex is copying into a string or string sequence:

- If the 'char\*' is NULL, RTI Connex will log a warning and allocate a new string on behalf of the user. *To avoid leaking memory, you must ensure that the string will be freed (see **Usage** (p. 1312) below).*
- If the 'char\*' is not NULL, RTI Connex will assume that you are managing the string's memory yourself and have allocated enough memory to store the string to be copied. *RTI Connex will copy into your memory; to avoid memory corruption, be sure to allocate enough of it. Also, do not pass structures containing junk pointers into RTI Connex; you are likely to crash.*

## 4.180.3 Usage

This requirement can generally be assured by adhering to the following *idiom* for manipulating strings.

Always use  
`DDS_String_alloc()` to create,  
`DDS_String_dup()` to clone,  
`DDS_String_free()` to delete  
 a string 'char\*' that is passed back and forth between  
 user code and the DDS C/C++ APIs.

Not adhering to this idiom can result in bad pointers, and incorrect memory being freed.

In addition, the user code should be vigilant to avoid memory leaks. It is good practice to:

- Balance occurrences of **DDS\_String\_alloc()** (p. 1313), **DDS\_String\_dup()** (p. 1313), with matching occurrences of **DDS\_String\_free()** (p. 1314) in the code.
- Finalize value types containing strings. In C++ the destructor accomplishes this automatically. In C, explicit "destructor" functions are provided; these functions are typically called "finalize."

### Note

When dealing with the **DDS\_PublishModeQosPolicy::flow\_controller\_name** (p.1665) and **DDS\_Multi↔ChannelQosPolicy::filter\_name** (p. 1605) fields, we advise taking a look at the sample code for how to properly assign new values and free the old ones.

### See also

**DDS\_StringSeq** (p. 1741)

## 4.180.4 Function Documentation

### 4.180.4.1 DDS\_String\_alloc()

```
char * DDS_String_alloc (
    size_t length )
```

Create a new empty string that can hold up to `length` characters.

A string created by this function must be deleted using **DDS\_String\_free()** (p. 1314).

This function will allocate enough memory to hold a string of `length` characters, **plus** one additional byte to hold the NULL terminating character.

#### Parameters

<code>length</code>	<< <i>in</i> >> (p. 818) Capacity of the string.
---------------------	--------------------------------------------------

#### Returns

A newly created non-NULL string upon success or NULL upon failure.

#### Examples

**HelloWorld.c.**

### 4.180.4.2 DDS\_String\_dup()

```
char * DDS_String_dup (
    const char * str )
```

Clone a string. Creates a new string that duplicates the value of `string`.

A string created by this function must be deleted using **DDS\_String\_free()** (p. 1314)

#### Parameters

<code>str</code>	<< <i>in</i> >> (p. 818) The string to duplicate.
------------------	---------------------------------------------------

**Returns**

If `string == NULL`, this function always returns `NULL`. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns `NULL`.

**4.180.4.3 DDS\_String\_replace()**

```
char * DDS_String_replace (
    char ** string_ptr,
    const char * new_value )
```

Assign a new value to a string. Replaces the string pointed to by `string_ptr`, with a string whose value is `new_value`.

A string created by this function must be deleted using **DDS\_String\_free()** (p. 1314).

This function is most commonly used when manipulating string sequences, **DDS\_StringSeq** (p. 1741).

**Precondition**

`string_ptr` be a non-NULL pointer. `*string_ptr` must be either `NULL`, or a string created using **DDS\_String\_alloc()** (p. 1313) or **DDS\_String\_dup()** (p. 1313), or **DDS\_String\_replace()** (p. 1314).

**Parameters**

<code>string_ptr</code>	<< <i>inout</i> >> (p. 818) Pointer to the string to replace.
<code>new_value</code>	<< <i>in</i> >> (p. 818) The value of the replacement string.

**Returns**

If `new_value = NULL`, this function always returns `NULL`. Otherwise, upon success it returns `*string_ptr` whose value is `new_value`; upon failure it returns `NULL`.

**Postcondition**

If `new_value = NULL`, `*string_ptr == NULL`. Otherwise, upon success `string_ptr` contains a pointer to a string whose value is `new_value`; upon failure, `string_ptr` is left unchanged.

**4.180.4.4 DDS\_String\_free()**

```
void DDS_String_free (
    char * str )
```

Delete a string.

**Precondition**

`string` must be either NULL, or must have been created using **DDS\_String\_alloc()** (p. 1313), **DDS\_String\_↵dup()** (p. 1313)

**Parameters**

<i>str</i>	<< <i>in</i> >> (p. 818) The string to delete.
------------	------------------------------------------------

**Examples**

**HelloWorld.c.**

**4.180.4.5 DDS\_Wstring\_alloc()**

```
DDS_Wchar * DDS_Wstring_alloc (
    DDS_UnsignedLong length )
```

Create a new empty string that can hold up to `length` wide characters.

A string created by this function must be deleted using **DDS\_Wstring\_free()** (p. 1317)

This function will allocate enough memory to hold a string of `length` characters, **plus** one additional wide character to hold the NULL terminator.

**Parameters**

<i>length</i>	<< <i>in</i> >> (p. 818) Capacity of the string.
---------------	--------------------------------------------------

**Returns**

A newly created non-NULL string upon success or NULL upon failure.

**4.180.4.6 DDS\_Wstring\_length()**

```
DDS_UnsignedLong DDS_Wstring_length (
    const DDS_Wchar * str )
```

Get the number of wide characters in the given string.

The result does not count the terminating zero character.

## Parameters

<i>str</i>	<< <i>in</i> >> (p. 818) A non-NULL string.
------------	---------------------------------------------

## Returns

The number of wide characters in the string.

## 4.180.4.7 DDS\_Wstring\_copy()

```
DDS_Wchar * DDS_Wstring_copy (
    DDS_Wchar * dst,
    const DDS_Wchar * src )
```

Copy the source string over the destination string reallocating the space if it's necessary.

## Parameters

<i>dst</i>	
<i>src</i>	

## Returns

*dst*

## 4.180.4.8 DDS\_Wstring\_copy\_and\_widen()

```
DDS_Wchar * DDS_Wstring_copy_and_widen (
    DDS_Wchar * dst,
    const char * src )
```

Copy the source string over the destination string, widening each character.

## Parameters

<i>dst</i>	<< <i>in</i> >> (p. 818) A non-NULL string to be overwritten by <i>src</i> .
<i>src</i>	<< <i>in</i> >> (p. 818) A non-NULL string to be copied over <i>dst</i> .

**Returns**

dst

**4.180.4.9 DDS\_Wstring\_dup()**

```
DDS_wchar * DDS_Wstring_dup (
    const DDS_wchar * str )
```

Clone a string of wide characters. Creates a new string that duplicates the value of `string`.

A string created by this function must be deleted using **DDS\_Wstring\_free()** (p. 1317).

**Parameters**

<i>str</i>	<< <i>in</i> >> (p. 818) The string to duplicate.
------------	---------------------------------------------------

**Returns**

If `string == NULL`, this function always returns `NULL`. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns `NULL`.

**4.180.4.10 DDS\_Wstring\_dup\_and\_widen()**

```
DDS_wchar * DDS_Wstring_dup_and_widen (
    const char * str )
```

Clone a string of characters as a string of wide characters.

A string created by this function must be deleted using **DDS\_Wstring\_free()** (p. 1317)

**Parameters**

<i>str</i>	<< <i>in</i> >> (p. 818) The string to duplicate.
------------	---------------------------------------------------

**Returns**

If `string == NULL`, this function always returns `NULL`. Otherwise, upon success it returns a newly created string whose value is `string`; upon failure it returns `NULL`.

#### 4.180.4.11 DDS\_Wstring\_free()

```
void DDS_Wstring_free (  
    DDS_Wchar * str )
```

Delete a string.

##### Precondition

*string* must either NULL, or must have been created using **DDS\_Wstring\_alloc()** (p. 1315), **DDS\_Wstring\_↔dup()** (p. 1317), or **DDS\_Wstring\_replace()**

##### Parameters

<i>str</i>	<< <i>in</i> >> (p. 818) The string to delete.
------------	------------------------------------------------

## Chapter 5

# Data Structure Documentation

### 5.1 DDS\_AcknowledgmentInfo Struct Reference

Information about an application-level acknowledged sample.

#### Data Fields

- **DDS\_InstanceHandle\_t subscription\_handle**  
*Subscription handle of the acknowledging DDS\_DataReader (p. 608).*
- struct **DDS\_SampleIdentity\_t sample\_identity**  
*Identity of the sample being acknowledged.*
- **DDS\_Boolean valid\_response\_data**  
*Flag indicating validity of the user response data in the acknowledgment.*
- struct **DDS\_AckResponseData\_t response\_data**  
*User data payload of application-level acknowledgment message.*

#### 5.1.1 Detailed Description

Information about an application-level acknowledged sample.

When acknowledging a sample, the reader provides the writer with information about the sample being acknowledged. The AcknowledgmentInfo structure provides the identity and cookie of the sample being acknowledged, as well as user data payload provided by the reader.

#### 5.1.2 Field Documentation

### 5.1.2.1 subscription\_handle

```
DDS_InstanceHandle_t DDS_AcknowledgmentInfo::subscription_handle
```

Subscription handle of the acknowledging **DDS\_DataReader** (p. 608).

### 5.1.2.2 sample\_identity

```
struct DDS_SampleIdentity_t DDS_AcknowledgmentInfo::sample_identity
```

Identity of the sample being acknowledged.

See also

**DDS\_SampleIdentity\_t** (p. 1720)

### 5.1.2.3 valid\_response\_data

```
DDS_Boolean DDS_AcknowledgmentInfo::valid_response_data
```

Flag indicating validity of the user response data in the acknowledgment.

This flag is true when the **DDS\_RtpsReliableReaderProtocol\_t::min\_app\_ack\_response\_keep\_duration** (p. 1698) has not yet elapsed for the acknowledgment's response data.

The flag is false when that duration has elapsed for the response data.

### 5.1.2.4 response\_data

```
struct DDS_AckResponseData_t DDS_AcknowledgmentInfo::response_data
```

User data payload of application-level acknowledgment message.

Response data set by **DDS\_DataReader** (p. 608) when sample was acknowledged.

## 5.2 DDS\_AckResponseData\_t Struct Reference

Data payload of an application-level acknowledgment.

## Data Fields

- struct **DDS\_OctetSeq** **value**  
*a sequence of octets*

### 5.2.1 Detailed Description

Data payload of an application-level acknowledgment.

### 5.2.2 Field Documentation

#### 5.2.2.1 value

```
struct DDS_OctetSeq DDS_AckResponseData_t::value
```

a sequence of octets

**[default]** empty (zero-length)

**[range]** Octet sequence of length [0, **DDS\_DataReaderResourceLimitsQosPolicy::max\_app\_ack\_response\_length** (p. 1407)],

## 5.3 DDS\_AllocationSettings\_t Struct Reference

Resource allocation settings.

## Data Fields

- **DDS\_Long initial\_count**  
*The initial count of resources.*
- **DDS\_Long max\_count**  
*The maximum count of resources.*
- **DDS\_Long incremental\_count**  
*The incremental count of resources.*

### 5.3.1 Detailed Description

Resource allocation settings.

QoS:

**DDS\_DomainParticipantResourceLimitsQosPolicy** (p. 1494)

## 5.3.2 Field Documentation

### 5.3.2.1 initial\_count

`DDS_Long DDS_AllocationSettings_t::initial_count`

The initial count of resources.

The initial resources to be allocated.

**[default]** It depends on the case.

**[range]** [0, 1 million], < max\_count, (or = max\_count only if increment\_count == 0)

### 5.3.2.2 max\_count

`DDS_Long DDS_AllocationSettings_t::max_count`

The maximum count of resources.

The maximum resources to be allocated.

**[default]** Depends on the case.

**[range]** [1, 1 million] or `DDS_LENGTH_UNLIMITED` (p. 1127), > initial\_count (or = initial\_count only if increment\_count == 0)

### 5.3.2.3 incremental\_count

`DDS_Long DDS_AllocationSettings_t::incremental_count`

The incremental count of resources.

The resource to be allocated when more resources are needed.

**[default]** Depends on the case.

**[range]** -1 (Double the amount of extra memory allocated each time memory is needed) or [1,1 million] (or = 0 only if initial\_count == max\_count)

## 5.4 DDS\_AnnotationParameterValue Struct Reference

Annotation parameter value.

### 5.4.1 Detailed Description

Annotation parameter value.

This structure is use to represent an annotation parameter value. For example, the value of the annotation **[default]** for an aggregation type member.

## 5.5 DDS\_AsyncronousPublisherQosPolicy Struct Reference

Configures the mechanism that sends user data in an external middleware thread.

### Data Fields

- **DDS\_Boolean disable\_asynchronous\_write**  
*Disable asynchronous publishing.*
- struct **DDS\_ThreadSettings\_t thread**  
*Settings of the publishing thread.*
- **DDS\_Boolean disable\_asynchronous\_batch**  
*Disable asynchronous batch flushing.*
- struct **DDS\_ThreadSettings\_t asynchronous\_batch\_thread**  
*Settings of the batch flushing thread.*
- **DDS\_Boolean disable\_topic\_query\_publication**  
*Disable topic query publication.*
- struct **DDS\_ThreadSettings\_t topic\_query\_publication\_thread**  
*Settings of the **DDS\_TopicQuery** (p. 698) publication thread.*

### 5.5.1 Detailed Description

Configures the mechanism that sends user data in an external middleware thread.

Specifies the asynchronous publishing and asynchronous batch flushing settings of the **DDS\_Publisher** (p. 436) instances.

The QoS policy specifies whether asynchronous publishing and asynchronous batch flushing are enabled for the **DDS\_↔\_DataWriter** (p. 478) entities belonging to this **DDS\_Publisher** (p. 436). If so, the publisher will spawn up to two threads, one for asynchronous publishing and one for asynchronous batch flushing.

This policy also configures the settings of the **DDS\_TopicQuery** (p. 698) publication thread. The publisher will spawn this thread only if one or more DataWriters enable TopicQueries.

See also

**DDS\_BatchQosPolicy** (p. 1334).

**DDS\_PublishModeQosPolicy** (p. 1664).

Entity:

**DDS\_Publisher** (p. 436)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.5.2 Usage

You can use this QoS policy to reduce the amount of time your application thread spends sending data.

You can also use it, along with **DDS\_PublishModeQosPolicy** (p. 1664) and a **DDS\_FlowController** (p. 551), to send large data reliably. "Large" in this context means that the data that cannot be sent as a single packet by a network transport. For example, to send data larger than 63K reliably using UDP/IP, you must configure RTI Connex to fragment the data and send it asynchronously.

The asynchronous *publisher* thread is shared by all **DDS\_ASYNCHRONOUS\_PUBLISH\_MODE\_QOS** (p. 1120) **DDS\_↔\_DataWriter** (p. 478) instances that belong to this publisher and handles their data transmission chores.

The asynchronous *batch flushing* thread is shared by all **DDS\_DataWriter** (p. 478) instances with batching enabled that belong to this publisher.

This QoS policy also allows you to adjust the settings of the asynchronous publishing and the asynchronous batch flushing threads. To use different threads for two different **DDS\_DataWriter** (p. 478) entities, the instances must belong to different **DDS\_Publisher** (p. 436) instances.

A **DDS\_Publisher** (p. 436) must have asynchronous publishing enabled for its **DDS\_DataWriter** (p. 478) instances to write asynchronously.

A **DDS\_Publisher** (p. 436) must have asynchronous batch flushing enabled in order to flush the batches of its **DDS\_↔\_DataWriter** (p. 478) instances asynchronously. However, no asynchronous batch flushing thread will be started until the first **DDS\_DataWriter** (p. 478) instance with batching enabled is created from this **DDS\_Publisher** (p. 436).

## 5.5.3 Field Documentation

### 5.5.3.1 disable\_asynchronous\_write

**DDS\_Boolean** `DDS_AsynchronousPublisherQosPolicy::disable_asynchronous_write`

Disable asynchronous publishing.

If set to **DDS\_BOOLEAN\_TRUE** (p. 1004), any **DDS\_DataWriter** (p. 478) created with **DDS\_ASYNCHRONOUS\_↔\_PUBLISH\_MODE\_QOS** (p. 1120) will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025).

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.5.3.2 thread

```
struct DDS_ThreadSettings_t DDS_AsyncronousPublisherQosPolicy::thread
```

Settings of the publishing thread.

There is only one asynchronous publishing thread per **DDS\_Publisher** (p. 436).

**[default]** priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

**[default]** The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

**[default]** mask = **DDS\_THREAD\_SETTINGS\_KIND\_MASK\_DEFAULT** (p. 1039)

### 5.5.3.3 disable\_asynchronous\_batch

```
DDS_Boolean DDS_AsyncronousPublisherQosPolicy::disable_asynchronous_batch
```

Disable asynchronous batch flushing.

If set to **DDS\_BOOLEAN\_TRUE** (p. 1004), any **DDS\_DataWriter** (p. 478) created with batching enabled will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025).

If **DDS\_BatchQosPolicy::max\_flush\_delay** (p. 1336) is different than **DDS\_DURATION\_INFINITE** (p. 1011), **DDS\_AsyncronousPublisherQosPolicy::disable\_asynchronous\_batch** (p. 1325) must be set **DDS\_BOOLEAN\_FALSE** (p. 1004).

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.5.3.4 asynchronous\_batch\_thread

```
struct DDS_ThreadSettings_t DDS_AsyncronousPublisherQosPolicy::asynchronous_batch_thread
```

Settings of the batch flushing thread.

There is only one asynchronous batch flushing thread per **DDS\_Publisher** (p. 436).

**[default]** priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#). **[default]** The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

**[default]** mask = **DDS\_THREAD\_SETTINGS\_KIND\_MASK\_DEFAULT** (p. 1039)

### 5.5.3.5 disable\_topic\_query\_publication

**DDS\_Boolean** DDS\_AsyncronousPublisherQosPolicy::disable\_topic\_query\_publication

Disable topic query publication.

If set to **DDS\_BOOLEAN\_TRUE** (p. 1004), any **DDS\_DataWriter** (p. 478) created with **DDS\_TopicQueryDispatchQosPolicy::enable** (p. 1784) set to **DDS\_BOOLEAN\_TRUE** (p. 1004) will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025).

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.5.3.6 topic\_query\_publication\_thread

**struct DDS\_ThreadSettings\_t** DDS\_AsyncronousPublisherQosPolicy::topic\_query\_publication\_thread

Settings of the **DDS\_TopicQuery** (p. 698) publication thread.

There is only one TopicQuery publication thread per **DDS\_Publisher** (p. 436). This thread will exist as long as one or more **DDS\_DataWriter** (p. 478) enables TopicQueries (via **DDS\_DataWriterQos::topic\_query\_dispatch** (p. 1445)).

[default] priority below normal.

The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to `Platform Notes`. [default] The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to `Platform Notes`.

[default] mask = **DDS\_THREAD\_SETTINGS\_KIND\_MASK\_DEFAULT** (p. 1039)

## 5.6 DDS\_AsyncWaitSetListener Struct Reference

<<*interface*>> (p. 818) Listener for receiving event notifications related to the thread pool of the **DDS\_AsyncWaitSet** (p. 874).

### Data Fields

- void \* **listener\_data**  
*A place for listener implementors to keep a pointer to data that may be needed by their listener.*
- **DDS\_AsyncWaitSetListener\_OnThreadSpawnedCallback on\_thread\_spawned**  
*Handles the spawning of each thread conforming the thread pool of the **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_AsyncWaitSetListener\_OnThreadDeletedCallback on\_thread\_deleted**  
*Handles the deletion of each thread conforming the thread pool of the **DDS\_AsyncWaitSet** (p. 874).*
- **DDS\_AsyncWaitSetListener\_OnWaitTimeoutCallback on\_wait\_timeout**  
*Handles the wait timeout generated by the leader thread of the **DDS\_AsyncWaitSet** (p. 874).*

## 5.6.1 Detailed Description

<<*interface*>> (p. 818) Listener for receiving event notifications related to the thread pool of the **DDS\_AsyncWaitSet** (p. 874).

## 5.6.2 Field Documentation

### 5.6.2.1 listener\_data

```
void* DDS_AsyncWaitSetListener::listener_data
```

A place for listener implementors to keep a pointer to data that may be needed by their listener.

### 5.6.2.2 on\_thread\_spawned

```
DDS_AsyncWaitSetListener_OnThreadSpawnedCallback DDS_AsyncWaitSetListener::on_thread_spawned
```

Handles the spawning of each thread conforming the thread pool of the **DDS\_AsyncWaitSet** (p. 874).

### 5.6.2.3 on\_thread\_deleted

```
DDS_AsyncWaitSetListener_OnThreadDeletedCallback DDS_AsyncWaitSetListener::on_thread_deleted
```

Handles the deletion of each thread conforming the thread pool of the **DDS\_AsyncWaitSet** (p. 874).

### 5.6.2.4 on\_wait\_timeout

```
DDS_AsyncWaitSetListener_OnWaitTimeoutCallback DDS_AsyncWaitSetListener::on_wait_timeout
```

Handles the wait timeout generated by the leader thread of the **DDS\_AsyncWaitSet** (p. 874).

## 5.7 DDS\_AsyncWaitSetProperty\_t Struct Reference

Specifies the **DDS\_AsyncWaitSet** (p. 874) behavior.

## Data Fields

- struct **DDS\_WaitSetProperty\_t** **waitset\_property**  
*Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **DDS\_WaitSet** (p. 1170).*
- **DDS\_UnsignedLong** **thread\_pool\_size**  
*Number of threads that conform the thread pool of the **DDS\_AsyncWaitSet** (p. 874).*
- struct **DDS\_ThreadSettings\_t** **thread\_settings**  
**DDS\_ThreadSettings\_t** (p. 1764) for each thread conforming the thread pool of the **DDS\_AsyncWaitSet** (p. 874).
- char \* **thread\_name\_prefix**  
*Prefix used to composed the name of each thread that conforms the thread pool the **DDS\_AsyncWaitSet** (p. 874).*
- struct **DDS\_Duration\_t** **wait\_timeout**  
*Asynchronous wait timeout.*
- **DDS\_Long** **level**  
*Specifies the level of an **DDS\_AsyncWaitSet** (p. 874).*

### 5.7.1 Detailed Description

Specifies the **DDS\_AsyncWaitSet** (p. 874) behavior.

This property allows configuring the behavior of the asynchronous wait and the **DDS\_Condition** (p. 1169) dispatch, as well as the parameters of the thread pool.

See also

**DDS\_WaitSetProperty\_t** (p. 1825)

**DDS\_ThreadSettings\_t** (p. 1764)

### 5.7.2 Field Documentation

#### 5.7.2.1 waitset\_property

```
struct DDS_WaitSetProperty_t DDS_AsyncWaitSetProperty_t::waitset_property
```

Specifies the behavior of the asynchronous wait behavior, which is equivalent to the wait mechanism of a **DDS\_WaitSet** (p. 1170).

[default] **DDS\_WaitSetProperty\_t\_INITIALIZER** (p. 1168)

See also

**DDS\_WaitSetProperty\_t** (p. 1825)

### 5.7.2.2 thread\_pool\_size

```
DDS_UnsignedLong DDS_AsyncWaitSetProperty_t::thread_pool_size
```

Number of threads that conform the thread pool of the **DDS\_AsyncWaitSet** (p. 874).

Size must be equal or greater than one.

**[default]** 1

### 5.7.2.3 thread\_settings

```
struct DDS_ThreadSettings_t DDS_AsyncWaitSetProperty_t::thread_settings
```

**DDS\_ThreadSettings\_t** (p. 1764) for each thread conforming the thread pool of the **DDS\_AsyncWaitSet** (p. 874).

Each thread within the pool is created with the same settings.

**[default]** Default thread settings values.

See also

**DDS\_ThreadSettings\_t** (p. 1764)

### 5.7.2.4 thread\_name\_prefix

```
char* DDS_AsyncWaitSetProperty_t::thread_name_prefix
```

Prefix used to composed the name of each thread that conforms the thread pool the **DDS\_AsyncWaitSet** (p. 874).

The composed name has the form:

`thread_name_prefix##[index]AWs` where [index] is an integer that identifies the thread relative to the **DDS\_AsyncWaitSet** (p. 874).

If NULL, the default prefix will be used.

**[default]** NULL (use default prefix)

### 5.7.2.5 wait\_timeout

```
struct DDS_Duration_t DDS_AsyncWaitSetProperty_t::wait_timeout
```

Asynchronous wait timeout.

Specifies the maximum amount of time the leader thread of the **DDS\_AsyncWaitSet** (p. 874) waits for an attached **DDS\_Condition** (p. 1169) to trigger before it wakes up.

Duration must be a value greater than zero.

See also

**DDS\_WaitSet\_wait** (p. 1180)

[default] **DDS\_DURATION\_INFINITE** (p. 1011)

### 5.7.2.6 level

```
DDS_Long DDS_AsyncWaitSetProperty_t::level
```

Specifies the level of an **DDS\_AsyncWaitSet** (p. 874).

The level prevents an application to deadlock when it uses multiple **DDS\_AsyncWaitSet** (p. 874) instances that call operations on each other from the context of one of their thread pool's thread.

Inside the context of one of these threads, the application can synchronize only with other **DDS\_AsyncWaitSet** (p. 874) of bigger level.

[default] 1

## 5.8 DDS\_AvailabilityQosPolicy Struct Reference

Configures the availability of data.

### Data Fields

- **DDS\_Boolean enable\_required\_subscriptions**  
*Enables support for required subscriptions in a **DDS\_DataWriter** (p. 478).*
- struct **DDS\_Duration\_t max\_data\_availability\_waiting\_time**  
*Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.*
- struct **DDS\_Duration\_t max\_endpoint\_availability\_waiting\_time**  
*Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).*
- struct **DDS\_EndpointGroupSeq required\_matched\_endpoint\_groups**  
*A sequence of endpoint groups.*

## 5.8.1 Detailed Description

Configures the availability of data.

Entity:

**DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **YES** (p. 1048) (only on a **DDS\_DataWriter** (p. 478) except for the member **DDS\_↔ AvailabilityQosPolicy::enable\_required\_subscriptions** (p. 1333))

## 5.8.2 Usage

This QoS policy is used in the context of two features:

- Collaborative DataWriters
- Required Subscriptions

### Collaborative DataWriters

The Collaborative DataWriters feature allows having multiple DataWriters publishing samples from a common logical data source. The DataReaders will combine the samples coming from the DataWriters in order to reconstruct the correct order at the source.

This QoS policy allows you to configure the ordering and combination process in the DataReader and can be used to support two different use cases:

- **Ordered delivery of samples in high-availability scenarios** One example of this is RTI Persistence Service. When a late-joining DataReader configured with **DDS\_DurabilityQosPolicy** (p. 1516) set to **DDS\_↔ PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_DURABILITY\_QOS** (p. 1089) joins a DDS domain, it will start receiving historical samples from multiple DataWriters. For example, if the original DataWriter is still alive, the newly created DataReader will receive samples from the original DataWriter and one or more RTI Persistence Service DataWriters (PRSTDataWriters). This policy can be used to configure the sample ordering process on the DataReader.
- **Ordered delivery of samples in load-balanced scenarios** Multiple instances of the same application can work together to process and deliver samples. When the samples arrive through different data-paths out of order, the DataReader will be able to reconstruct the order at the destination. An example of this is when multiple instances of RTI Persistence Service are used to persist the data. Persisting data to a database on disk can be a bottleneck for throughput. You can improve scalability and performance by dividing the workload across different instances of RTI Persistence Service that use different databases. For example, samples larger than 10 are persisted by Persistence Service 1, samples less than or equal to 10 are persisted by Persistence Service 2.

- **Ordered delivery of samples with Group Ordered Access** This policy can also be used to configure the sample ordering process when the Subscriber is configured with **DDS\_PresentationQosPolicy** (p. 1634) `access_scope` set to **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106). In this case, the Subscriber must deliver in order the samples published by a group of DataWriters that belong to the same Publisher and have `access_scope` set to **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106).

Each sample published in a DDS domain for a given logical data source is uniquely identified by a pair (virtual GUID, virtual sequence number). Samples from the same data source (same virtual GUID) can be published by different DataWriters. A DataReader will deliver a sample (VGUIDn, VSNm) to the application if one of the following conditions is satisfied:

- (VGUIDn, VSNm-1) has already been delivered to the application.
- All the known DataWriters publishing VGUIDn have announced that they do not have (VGUIDn, VSNm-1).
- None of the known DataWriters publishing GUIDn have announced potential availability of (VGUIDn, VSNm-1) and both timeouts in this QoS policy have expired.

A DataWriter announces potential availability of samples by using virtual heartbeats (HBs).

When **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) is set to **DDS\_TOPIC\_PRESENTATION\_QOS** (p. 1106) or **DDS\_INSTANCE\_PRESENTATION\_QOS** (p. 1106), the virtual HB contains information about the samples contained in the **DDS\_DataWriter** (p. 478) history.

When **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) is set to **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106), the virtual HB contains information about all DataWriters in the **DDS\_Publisher** (p. 436).

The frequency at which virtual HBs are sent is controlled by the protocol parameters **DDS\_RtpsReliableWriterProtocol\_t::virtual\_heartbeat\_period** (p. 1704) and **DDS\_RtpsReliableWriterProtocol\_t::samples\_per\_virtual\_heartbeat** (p. 1704).

### Required Subscriptions

In the context of Required Subscriptions, this QoS policy can be used to configure a set of Required Subscriptions on a **DDS\_DataWriter** (p. 478).

Required subscriptions are preconfigured, named subscriptions that may leave and subsequently rejoin the network from time to time, at the same or different physical locations. Any time a required subscription is disconnected, any samples that would have been delivered to it are stored for delivery if and when the subscription rejoins the network.

### 5.8.3 Consistency

For a DataWriter, the setting of **AVAILABILITY** (p. 1052) must be set consistently with that of the **RELIABILITY** (p. 1122) and **DURABILITY** (p. 1086).

If **DDS\_AvailabilityQosPolicy::enable\_required\_subscriptions** (p. 1333) is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), **DDS\_ReliabilityQosPolicy::kind** (p. 1681) must be set to **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124), **DDS\_DurabilityQosPolicy** (p. 1516) must be set to a value different than **DDS\_VOLATILE\_DURABILITY\_QOS** (p. 1088), and **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518) must be set to either **DDS\_AUTO\_WRITER\_DEPTH** (p. 1089) or **DDS\_LENGTH\_UNLIMITED** (p. 1127).

## 5.8.4 Field Documentation

### 5.8.4.1 enable\_required\_subscriptions

```
DDS_Boolean DDS_AvailabilityQosPolicy::enable_required_subscriptions
```

Enables support for required subscriptions in a **DDS\_DataWriter** (p. 478).

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.8.4.2 max\_data\_availability\_waiting\_time

```
struct DDS_Duration_t DDS_AvailabilityQosPolicy::max_data_availability_waiting_time
```

Defines how much time to wait before delivering a sample to the application without having received some of the previous samples.

#### Collaborative DataWriters

A sample identified by (VGUIDn, VSNm) will be delivered to the application if this timeout expires for the sample and the following two conditions are satisfied:

- None of the known DataWriters publishing VGUIDn have announced potential availability of (VGUIDn, VSNm-1).
- The DataWriters for all the endpoint groups specified in **required\_matched\_endpoint\_groups** (p. 1333) have been discovered or **max\_endpoint\_availability\_waiting\_time** (p. 1333) has expired.

#### Required Subscriptions

This field is not applicable to Required Subscriptions.

**[default]** **DDS\_DURATION\_AUTO** (p. 1012) (**DDS\_DURATION\_INFINITE** (p. 1011) for **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106)). Otherwise, 0 seconds

**[range]** [0, **DDS\_DURATION\_INFINITE** (p. 1011)], **DDS\_DURATION\_AUTO** (p. 1012)

### 5.8.4.3 max\_endpoint\_availability\_waiting\_time

```
struct DDS_Duration_t DDS_AvailabilityQosPolicy::max_endpoint_availability_waiting_time
```

Defines how much time to wait to discover DataWriters providing samples for the same data source (virtual GUID).

#### Collaborative DataWriters

The set of endpoint groups that are required to provide samples for a data source can be configured using **required\_matched\_endpoint\_groups** (p. 1333).

A non-consecutive sample identified by (VGUIDn, VSNm) cannot be delivered to the application unless DataWriters for all the endpoint groups in **required\_matched\_endpoint\_groups** (p. 1333) are discovered or this timeout expires.

#### Required Subscriptions

This field is not applicable to Required Subscriptions.

**[default]** **DDS\_DURATION\_AUTO** (p. 1012) (**DDS\_DURATION\_INFINITE** (p. 1011) for **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106)). Otherwise, 0 seconds

**[range]** [0, **DDS\_DURATION\_INFINITE** (p. 1011)], **DDS\_DURATION\_AUTO** (p. 1012)

#### 5.8.4.4 required\_matched\_endpoint\_groups

```
struct DDS_EndpointGroupSeq DDS_AvailabilityQosPolicy::required_matched_endpoint_groups
```

A sequence of endpoint groups.

##### Collaborative DataWriters

In the context of Collaborative DataWriters, it specifies the set of endpoint groups that are expected to provide samples for the same data source.

The quorum count in a group represents the number of DataWriters that must be discovered for that group before the DataReader is allowed to provide non consecutive samples to the application.

A DataWriter becomes a member of an endpoint group by configuring the role\_name in **DDS\_DataWriterQos**↔  
::**publication\_name** (p. 1445).

##### Required Subscriptions

In the context of Required Subscriptions, it specifies the set of Required Subscriptions on a **DDS\_DataWriter** (p. 478).

Each Required Subscription is specified by a name and a quorum count.

The quorum count represents the number of DataReaders that have to acknowledge the sample before it can be considered fully acknowledged for that Required Subscription.

A DataReader is associated with a Required Subscription by configuring the role\_name in **DDS\_DataReaderQos**↔  
::**subscription\_name** (p. 1396).

[default] Empty sequence

## 5.9 DDS\_BatchQosPolicy Struct Reference

Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

### Data Fields

- **DDS\_Boolean enable**  
*Specifies whether or not batching is enabled.*
- **DDS\_Long max\_data\_bytes**  
*The maximum cumulative length of all serialized samples in a batch.*
- **DDS\_Long max\_samples**  
*The maximum number of samples in a batch.*
- struct **DDS\_Duration\_t max\_flush\_delay**  
*The maximum flush delay.*
- struct **DDS\_Duration\_t source\_timestamp\_resolution**  
*Batch source timestamp resolution.*
- **DDS\_Boolean thread\_safe\_write**  
*Determines whether or not the write operation is thread safe.*

## 5.9.1 Detailed Description

Used to configure batching of multiple samples into a single network packet in order to increase throughput for small samples.

This QoS policy configures the ability of the middleware to collect multiple user data samples to be sent in a single network packet, to take advantage of the efficiency of sending larger packets and thus increase effective throughput.

This QoS policy can be used to dramatically increase effective throughput for small data samples. Usually, throughput for small samples (size < 2048 bytes) is limited by CPU capacity and not by network bandwidth. Batching many smaller samples to be sent in a single large packet will increase network utilization, and thus throughput, in terms of samples per second.

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

## 5.9.2 Field Documentation

### 5.9.2.1 enable

```
DDS_Boolean DDS_BatchQoSPolicy::enable
```

Specifies whether or not batching is enabled.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.9.2.2 max\_data\_bytes

```
DDS_Long DDS_BatchQoSPolicy::max_data_bytes
```

The maximum cumulative length of all serialized samples in a batch.

A batch is flushed automatically when this maximum is reached.

`max_data_bytes` does not include the meta data associated with the batch samples. Each sample has at least 8 bytes of meta data containing information such as the timestamp and sequence number. The meta data can be as large as 52 bytes for keyed topics and 20 bytes for unkeyed topics.

Note: Batches must contain whole samples. If a new batch is started and its initial sample causes the serialized size to exceed `max_data_bytes`, RTI Connexx will send the sample in a single batch.

**[default]** 1024

**[range]** [1, **DDS\_LENGTH\_UNLIMITED** (p. 1127)]

### 5.9.3 Consistency

The setting of `DDS_BatchQosPolicy::max_data_bytes` (p. 1335) must be consistent with `DDS_BatchQosPolicy::max_samples` (p. 1336). For these two values to be consistent, they cannot be both `DDS_LENGTH_UNLIMITED` (p. 1127).

#### 5.9.3.1 max\_samples

```
DDS_Long DDS_BatchQosPolicy::max_samples
```

The maximum number of samples in a batch.

A batch is flushed automatically when this maximum is reached.

[default] `DDS_LENGTH_UNLIMITED` (p. 1127)

[range] [1, `DDS_LENGTH_UNLIMITED` (p. 1127)]

### 5.9.4 Consistency

The setting of `DDS_BatchQosPolicy::max_samples` (p. 1336) must be consistent with `DDS_BatchQosPolicy::max_data_bytes` (p. 1335). For these two values to be consistent, they cannot be both `DDS_LENGTH_UNLIMITED` (p. 1127).

#### 5.9.4.1 max\_flush\_delay

```
struct DDS_Duration_t DDS_BatchQosPolicy::max_flush_delay
```

The maximum flush delay.

A batch is flushed automatically after the delay specified by this parameter.

The delay is measured from the time the first sample in the batch is written by the application.

[default] `DDS_DURATION_INFINITE` (p. 1011)

[range] [0, `DDS_DURATION_INFINITE` (p. 1011)]

### 5.9.5 Consistency

The setting of `DDS_BatchQosPolicy::max_flush_delay` (p. 1336) must be consistent with `DDS_AynchronousPublisherQosPolicy::disable_asynchronous_batch` (p. 1325) and `DDS_BatchQosPolicy::thread_safe_write` (p. 1337). If the delay is different than `DDS_DURATION_INFINITE` (p. 1011), `DDS_AynchronousPublisherQosPolicy::disable_asynchronous_batch` (p. 1325) must be set to `DDS_BOOLEAN_FALSE` (p. 1004) and `DDS_BatchQosPolicy::thread_safe_write` (p. 1337) must be set to `DDS_BOOLEAN_TRUE` (p. 1004).

### 5.9.5.1 source\_timestamp\_resolution

```
struct DDS_Duration_t DDS_BatchQosPolicy::source_timestamp_resolution
```

Batch source timestamp resolution.

The value of this field determines how the source timestamp is associated with the samples in a batch.

A sample written with timestamp 't' inherits the source timestamp 't2' associated with the previous sample unless ('t' - 't2') > source\_timestamp\_resolution.

If source\_timestamp\_resolution is set to **DDS\_DURATION\_INFINITE** (p. 1011), every sample in the batch will share the source timestamp associated with the first sample.

If source\_timestamp\_resolution is set to zero, every sample in the batch will contain its own source timestamp corresponding to the moment when the sample was written.

The performance of the batching process is better when source\_timestamp\_resolution is set to **DDS\_DURATION\_↔INFINITE** (p. 1011).

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011)

**[range]** [0, **DDS\_DURATION\_INFINITE** (p. 1011)]

## 5.9.6 Consistency

The setting of **DDS\_BatchQosPolicy::source\_timestamp\_resolution** (p. 1336) must be consistent with **DDS\_Batch\_↔QosPolicy::thread\_safe\_write** (p. 1337). If **DDS\_BatchQosPolicy::thread\_safe\_write** (p. 1337) is set to **DDS\_↔BOOLEAN\_FALSE** (p. 1004), **DDS\_BatchQosPolicy::source\_timestamp\_resolution** (p. 1336) must be set to **DDS\_↔\_DURATION\_INFINITE** (p. 1011).

### 5.9.6.1 thread\_safe\_write

```
DDS_Boolean DDS_BatchQosPolicy::thread_safe_write
```

Determines whether or not the write operation is thread safe.

If this parameter is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), multiple threads can call write on the **DDS\_DataWriter** (p. 478) concurrently.

**[default]** **DDS\_BOOLEAN\_TRUE** (p. 1004)

## 5.9.7 Consistency

The setting of **DDS\_BatchQosPolicy::thread\_safe\_write** (p. 1337) must be consistent with **DDS\_BatchQosPolicy\_↔::source\_timestamp\_resolution** (p. 1336). If **DDS\_BatchQosPolicy::thread\_safe\_write** (p. 1337) is set to **DDS\_↔BOOLEAN\_FALSE** (p. 1004), **DDS\_BatchQosPolicy::source\_timestamp\_resolution** (p. 1336) must be set to **DDS\_↔\_DURATION\_INFINITE** (p. 1011).

## 5.10 DDS\_BooleanSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Boolean** (p. 1007) >

### 5.10.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_Boolean** (p. 1007) >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_Boolean** (p. 1007)

**FooSeq** (p. 1845)

## 5.11 DDS\_BuiltinTopicKey\_t Struct Reference

The key type of the built-in topic types.

### Data Fields

- **DDS\_BUILTIN\_TOPIC\_KEY\_TYPE\_NATIVE value** [DDS\_BUILTIN\_TOPIC\_KEY\_TYPE\_NATIVE\_LENGTH]  
*An array of four integers that uniquely represents a remote **DDS\_Entity** (p. 1160).*

### 5.11.1 Detailed Description

The key type of the built-in topic types.

Each remote **DDS\_Entity** (p. 1160) to be discovered can be uniquely identified by this key. This is the key of all the built-in topic data types.

See also

**DDS\_ParticipantBuiltinTopicData** (p. 1616)

## 5.11.2 Field Documentation

### 5.11.2.1 value

```
DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE DDS_BuiltinTopicKey_t::value[DDS_BUILTIN_TOPIC_KEY_TYPE_NATIVE↔
_LENGTH]
```

An array of four integers that uniquely represents a remote **DDS\_Entity** (p. 1160).

## 5.12 DDS\_BuiltinTopicReaderResourceLimits\_t Struct Reference

Built-in topic reader's resource limits.

### Data Fields

- **DDS\_Long initial\_samples**  
*Initial number of samples.*
- **DDS\_Long max\_samples**  
*Maximum number of samples.*
- **DDS\_Long initial\_infos**  
*Initial number of sample infos.*
- **DDS\_Long max\_infos**  
*Maximum number of sample infos.*
- **DDS\_Long initial\_outstanding\_reads**  
*The initial number of outstanding reads that have not called finish yet on the same built-in topic **DDS\_DataReader** (p. 608).*
- **DDS\_Long max\_outstanding\_reads**  
*The maximum number of outstanding reads that have not called finish yet on the same built-in topic **DDS\_DataReader** (p. 608).*
- **DDS\_Long max\_samples\_per\_read**  
*Maximum number of samples that can be read/taken on a same built-in topic **DDS\_DataReader** (p. 608).*
- **DDS\_Boolean disable\_fragmentation\_support**  
*Determines whether the built-in topic **DDS\_DataReader** (p. 608) can receive fragmented samples.*
- **DDS\_Long max\_fragmented\_samples**  
*The maximum number of samples for which the built-in topic **DDS\_DataReader** (p. 608) may store fragments at a given point in time.*
- **DDS\_Long initial\_fragmented\_samples**  
*The initial number of samples for which a built-in topic **DDS\_DataReader** (p. 608) may store fragments.*
- **DDS\_Long max\_fragmented\_samples\_per\_remote\_writer**  
*The maximum number of samples per remote writer for which a built-in topic **DDS\_DataReader** (p. 608) may store fragments.*
- **DDS\_Long max\_fragments\_per\_sample**  
*Maximum number of fragments for a single sample.*
- **DDS\_Boolean dynamically\_allocate\_fragmented\_samples**  
*Determines whether the built-in topic **DDS\_DataReader** (p. 608) pre-allocates storage for storing fragmented samples.*

### 5.12.1 Detailed Description

Built-in topic reader's resource limits.

Defines the resources that can be used for a built-in-topic data reader.

A built-in topic data reader subscribes reliably to built-in topics containing declarations of new entities or updates to existing entities in the domain. Keys are used to differentiate among entities of the same type. RTI Connext assigns a unique key to each entity in a domain.

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

QoS:

**DDS\_DiscoveryConfigQosPolicy** (p. 1460)

### 5.12.2 Field Documentation

#### 5.12.2.1 initial\_samples

**DDS\_Long** `DDS_BuiltinTopicReaderResourceLimits_t::initial_samples`

Initial number of samples.

This should be a value between 1 and initial number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently.

**[default]** 64

**[range]** [1, 1 million], <= max\_samples

#### 5.12.2.2 max\_samples

**DDS\_Long** `DDS_BuiltinTopicReaderResourceLimits_t::max_samples`

Maximum number of samples.

This should be a value between 1 and max number of instance of the built-in-topic reader, depending on how many instances are sending data concurrently. Also, it should not be less than initial\_samples.

**[default]** `DDS_LENGTH_UNLIMITED` (p. 1127)

**[range]** [1, 1 million] or `DDS_LENGTH_UNLIMITED` (p. 1127), >= initial\_samples

### 5.12.2.3 initial\_infos

`DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_infos`

Initial number of sample infos.

The initial number of info units that a built-in topic **DDS\_DataReader** (p. 608) can have. Info units are used to store **DDS\_SampleInfo** (p. 1720).

**[default]** 64

**[range]** [1, 1 million] <= max\_infos

### 5.12.2.4 max\_infos

`DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_infos`

Maximum number of sample infos.

The maximum number of info units that a built-in topic **DDS\_DataReader** (p. 608) can use to store **DDS\_SampleInfo** (p. 1720).

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127), >= initial\_infos

### 5.12.2.5 initial\_outstanding\_reads

`DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::initial_outstanding_reads`

The initial number of outstanding reads that have not called finish yet on the same built-in topic **DDS\_DataReader** (p. 608).

Must be less than or equal to max\_outstanding\_reads.

**[default]** 2

**[range]** [1, 1024]

### 5.12.2.6 max\_outstanding\_reads

`DDS_Long DDS_BuiltinTopicReaderResourceLimits_t::max_outstanding_reads`

The maximum number of outstanding reads that have not called finish yet on the same built-in topic **DDS\_DataReader** (p. 608).

Must be greater than or equal to initial\_outstanding\_reads.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1024] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.12.2.7 max\_samples\_per\_read

**DDS\_Long** DDS\_BuiltinTopicReaderResourceLimits\_t::max\_samples\_per\_read

Maximum number of samples that can be read/taken on a same built-in topic **DDS\_DataReader** (p. 608).

**[default]** 1024

**[range]** [1, 65536]

### 5.12.2.8 disable\_fragmentation\_support

**DDS\_Boolean** DDS\_BuiltinTopicReaderResourceLimits\_t::disable\_fragmentation\_support

Determines whether the built-in topic **DDS\_DataReader** (p. 608) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.12.2.9 max\_fragmented\_samples

**DDS\_Long** DDS\_BuiltinTopicReaderResourceLimits\_t::max\_fragmented\_samples

The maximum number of samples for which the built-in topic **DDS\_DataReader** (p. 608) may store fragments at a given point in time.

At any given time, a built-in topic **DDS\_DataReader** (p. 608) may store fragments for up to `max_fragmented_↔ samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different built-in topic **DDS\_DataWriter** (p. 478) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **DDS\_BuiltinTopicReaderResourceLimits\_t::max\_samples** (p. 1340).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **DDS\_BuiltinTopicReaderResourceLimits\_t::disable\_fragmentation\_support** (p. 1342) is **DDS\_↔ BOOLEAN\_FALSE** (p. 1004).

**[default]** 1024

**[range]** [1, 1 million]

### 5.12.2.10 initial\_fragmented\_samples

**DDS\_Long** DDS\_BuiltinTopicReaderResourceLimits\_t::initial\_fragmented\_samples

The initial number of samples for which a built-in topic **DDS\_DataReader** (p. 608) may store fragments.

Only applies if **DDS\_BuiltinTopicReaderResourceLimits\_t::disable\_fragmentation\_support** (p. 1342) is **DDS\_↔  
BOOLEAN\_FALSE** (p. 1004).

**[default]** 4

**[range]** [1,1024], <= max\_fragmented\_samples

### 5.12.2.11 max\_fragmented\_samples\_per\_remote\_writer

**DDS\_Long** DDS\_BuiltinTopicReaderResourceLimits\_t::max\_fragmented\_samples\_per\_remote\_writer

The maximum number of samples per remote writer for which a built-in topic **DDS\_DataReader** (p. 608) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if **DDS\_BuiltinTopicReaderResourceLimits\_t::disable\_fragmentation\_support** (p. 1342) is **DDS\_↔  
BOOLEAN\_FALSE** (p. 1004).

**[default]** 256

**[range]** [1, 1 million], <= max\_fragmented\_samples

### 5.12.2.12 max\_fragments\_per\_sample

**DDS\_Long** DDS\_BuiltinTopicReaderResourceLimits\_t::max\_fragments\_per\_sample

Maximum number of fragments for a single sample.

Only applies if **DDS\_BuiltinTopicReaderResourceLimits\_t::disable\_fragmentation\_support** (p. 1342) is **DDS\_↔  
BOOLEAN\_FALSE** (p. 1004).

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.12.2.13 dynamically\_allocate\_fragmented\_samples

**DDS\_Boolean** DDS\_BuiltinTopicReaderResourceLimits\_t::dynamically\_allocate\_fragmented\_samples

Determines whether the built-in topic **DDS\_DataReader** (p. 608) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), the middleware will allocate memory upfront for storing fragments for up to **DDS\_DataReaderResourceLimitsQoSPolicy::initial\_fragmented\_samples** (p. 1403) samples. This memory may grow up to **DDS\_DataReaderResourceLimitsQoSPolicy::max\_fragmented\_samples** (p. 1403) if needed.

Only applies if **DDS\_DataReaderResourceLimitsQoSPolicy::disable\_fragmentation\_support** (p. 1403) is **DDS\_BOOLEAN\_FALSE** (p. 1004).

[default] **DDS\_BOOLEAN\_TRUE** (p. 1004)

## 5.13 DDS\_ChannelSettings\_t Struct Reference

Type used to configure the properties of a channel.

### Data Fields

- struct **DDS\_TransportMulticastSettingsSeq** **multicast\_settings**  
*A sequence of **DDS\_TransportMulticastSettings\_t** (p. 1795) used to configure the multicast addresses associated with a channel.*
- char \* **filter\_expression**  
*A logical expression used to determine the data that will be published in the channel.*
- **DDS\_Long** **priority**  
*Publication priority.*

### 5.13.1 Detailed Description

Type used to configure the properties of a channel.

QoS:

**DDS\_MultiChannelQoSPolicy** (p. 1603)

## 5.13.2 Field Documentation

### 5.13.2.1 multicast\_settings

```
struct DDS_TransportMulticastSettingsSeq DDS_ChannelSettings_t::multicast_settings
```

A sequence of **DDS\_TransportMulticastSettings\_t** (p. 1795) used to configure the multicast addresses associated with a channel.

The sequence cannot be empty.

The maximum number of multicast locators in a channel is limited to 16 (a locator is defined by a transport alias, a multicast address and a port). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain\_participant.max\_announced\_locator\_list\_size' property in the **DDS\_PropertyQosPolicy** (p. 1645) associated with the **DDS\_DomainParticipantQos** (p. 1490).

**[default]** Empty sequence (invalid value)

### 5.13.2.2 filter\_expression

```
char* DDS_ChannelSettings_t::filter_expression
```

A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **DDS\_MultiChannelQosPolicy::filter\_name** (p. 1605)

*Important:* This value must be an allocated string with **DDS\_String\_alloc** (p. 1313) or **DDS\_String\_dup** (p. 1313). It should not be assigned to a string constant.

The filter expression length (including NULL-terminated character) cannot be greater than **DDS\_DomainParticipant↔ResourceLimitsQosPolicy::channel\_filter\_expression\_max\_length** (p. 1510).

See also

**Queries and Filters Syntax** (p. 730)

**[default]** NULL (invalid value)

### 5.13.2.3 priority

**DDS\_Long** DDS\_ChannelSettings\_t::priority

Publication priority.

A positive integer value designating the relative priority of the channel, used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**DDS\_ASYNCHRONOUS\_PUBLISH\_MODE**↔**\_QOS** (p. 1120)) with **DDS\_FlowControllerProperty\_t::scheduling\_policy** (p. 1552) set to **DDS\_HPF\_FLOW**↔**CONTROLLER\_SCHED\_POLICY** (p. 554).

Larger numbers have higher priority.

If the publication priority of the channel is any value other than **DDS\_PUBLICATION\_PRIORITY\_UNDEFINED** (p. 1119), then the channel's priority will take precedence over the data writer's priority.

If the publication priority of the channel is set to **DDS\_PUBLICATION\_PRIORITY\_UNDEFINED** (p. 1119), then the channel's priority will be set to the value of the data writer's priority.

If the publication priority of both the data writer and the channel are **DDS\_PUBLICATION\_PRIORITY\_UNDEFINED** (p. 1119), the channel will be assigned the lowest priority value.

If the publication priority of the channel is **DDS\_PUBLICATION\_PRIORITY\_AUTOMATIC** (p. 1119), then the channel will be assigned the priority of the largest publication priority of all samples in the channel. The publication priority of each sample can be set in the **DDS\_WriteParams\_t** (p. 1833) of the **FooDataWriter\_write\_w\_params** (p. 494) function.

[default] **DDS\_PUBLICATION\_PRIORITY\_UNDEFINED** (p. 1119)

## 5.14 DDS\_ChannelSettingsSeq Struct Reference

Declares IDL `sequence< DDS_ChannelSettings_t (p. 1344) >`

### 5.14.1 Detailed Description

Declares IDL `sequence< DDS_ChannelSettings_t (p. 1344) >`

A sequence of **DDS\_ChannelSettings\_t** (p. 1344) used to configure the channels' properties. If the length of the sequence is zero, the **DDS\_MultiChannelQosPolicy** (p. 1603) has no effect.

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_ChannelSettings\_t** (p. 1344)

## 5.15 DDS\_CharSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Char** (p. 1004) >

### 5.15.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_Char** (p. 1004) >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_Char** (p. 1004)

**FooSeq** (p. 1845)

## 5.16 DDS\_CoherentSetInfo\_t Struct Reference

<<*extension*>> (p. 817) Type definition for a coherent set info.

### Data Fields

- **DDS\_GUID\_t group\_guid**  
*The coherent set group GUID.*
- **DDS\_SequenceNumber\_t coherent\_set\_sequence\_number**  
*Sequence number that identifies a sample as part of a **DDS\_DataWriter** (p. 478) coherent set.*
- **DDS\_SequenceNumber\_t group\_coherent\_set\_sequence\_number**  
*Sequence number that identifies a sample as part of a group coherent set.*
- **DDS\_Boolean incomplete\_coherent\_set**  
*Indicates if a sample is part of an incomplete coherent set.*

### 5.16.1 Detailed Description

<<*extension*>> (p. 817) Type definition for a coherent set info.

A CoherentSetInfo provides information about the coherent set associated with a sample.

### 5.16.2 Field Documentation

### 5.16.2.1 group\_guid

```
DDS_GUID_t DDS_CoherentSetInfo_t::group_guid
```

The coherent set group GUID.

This GUID identifies the **DDS\_DataWriter** (p. 478) or the group of DataWriters publishing the coherent set, depending on the value of **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) in the **DDS\_Subscriber** (p. 565).

### 5.16.2.2 coherent\_set\_sequence\_number

```
DDS_SequenceNumber_t DDS_CoherentSetInfo_t::coherent_set_sequence_number
```

Sequence number that identifies a sample as part of a **DDS\_DataWriter** (p. 478) coherent set.

When **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) in the **DDS\_Subscriber** (p. 565) is set to **DDS\_↔INSTANCE\_PRESENTATION\_QOS** (p. 1106) or **DDS\_TOPIC\_PRESENTATION\_QOS** (p. 1106), the coherent set associated with a sample is identified by the pair (group\_guid, coherent\_set\_sequence\_number).

### 5.16.2.3 group\_coherent\_set\_sequence\_number

```
DDS_SequenceNumber_t DDS_CoherentSetInfo_t::group_coherent_set_sequence_number
```

Sequence number that identifies a sample as part of a group coherent set.

When **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) in the **DDS\_Subscriber** (p. 565) is set to **DDS\_↔GROUP\_PRESENTATION\_QOS** (p. 1106), the coherent set associated with a sample is identified by the pair (group\_↔\_guid, group\_coherent\_set\_sequence\_number).

### 5.16.2.4 incomplete\_coherent\_set

```
DDS_Boolean DDS_CoherentSetInfo_t::incomplete_coherent_set
```

Indicates if a sample is part of an incomplete coherent set.

## 5.17 DDS\_CompressionSettings\_t Struct Reference

<<*extension*>> (p. 817) Settings related to compressing user data.

### Data Fields

- **DDS\_CompressionIdMask compression\_ids**  
<<*extension*>> (p. 817) Mask that represents the compression algorithms enabled.
- **DDS\_UnsignedLong writer\_compression\_level**  
<<*extension*>> (p. 817) The level of compression to use when compressing data.
- **DDS\_Long writer\_compression\_threshold**  
<<*extension*>> (p. 817) The threshold, in bytes, above which a serialized sample will be eligible to be compressed.

## 5.17.1 Detailed Description

<<*extension*>> (p. 817) Settings related to compressing user data.

QoS:

**DDS\_DataRepresentationQosPolicy** (p. 1412)

## 5.17.2 Field Documentation

### 5.17.2.1 compression\_ids

**DDS\_CompressionIdMask** DDS\_CompressionSettings\_t::compression\_ids

<<*extension*>> (p. 817) Mask that represents the compression algorithms enabled.

A bitmap that represents the compression algorithm IDs (**DDS\_CompressionIdMask** (p. 1063)) that are supported by the endpoint. The **DDS\_DataWriter** (p. 478) creation will fail if more than one algorithm is provided.

If a **DDS\_DataWriter** (p. 478) inherits multiple compression IDs from a **DDS\_Topic** (p. 172), only the least significant bit enabled will be inherited. This forces the following order of preference: **DDS\_COMPRESSION\_ID\_ZLIB** (p. 1063), **DDS\_COMPRESSION\_ID\_BZIP2** (p. 1063), **DDS\_COMPRESSION\_ID\_LZ4** (p. 1064).

Interactions with Security and Batching: Currently, the only algorithm that is supported when compression and batching are enabled on the same **DDS\_DataWriter** (p. 478) is **DDS\_COMPRESSION\_ID\_ZLIB** (p. 1063).

The combination of compression, batching, and data protection is supported. First, compression is applied to the entire batch. Then, data protection is applied to the compressed batch.

Note: When **DDS\_DataWriterProtocolQosPolicy::serialize\_key\_with\_dispose** (p. 1425) is enabled and a dispose message is sent, the serialized key is not compressed.

**[default]** For **DDS\_Topic** (p. 172), **DDS\_DataWriter** (p. 478) a **DDS\_CompressionIdMask** (p. 1063) mask set to **DDS\_COMPRESSION\_ID\_MASK\_NONE** (p. 1061)

**[default]** For **DDS\_DataReader** (p. 608) a **DDS\_CompressionIdMask** (p. 1063) mask set to **DDS\_COMPRESSION\_ID\_MASK\_ALL** (p. 1061).

### 5.17.2.2 writer\_compression\_level

`DDS_UnsignedLong DDS_CompressionSettings_t::writer_compression_level`

<<**extension**>> (p. 817) The level of compression to use when compressing data.

Compression algorithms typically allow you to choose a level with which to compress the data. Each level has trade-offs between the resulting compression ratio and the speed of compression.

**[range]** [0, 10]

The value 1 represents the fastest compression time and the lowest compression ratio. The value 10 represents the slowest compression time but the highest compression ratio.

A value of 0 disables compression.

**[default]** `DDS_COMPRESSION_LEVEL_BEST_COMPRESSION` (p. 1061)

#### Note

Only available for a `DDS_DataWriter` (p. 478) and `DDS_Topic` (p. 172).

### 5.17.2.3 writer\_compression\_threshold

`DDS_Long DDS_CompressionSettings_t::writer_compression_threshold`

<<**extension**>> (p. 817) The threshold, in bytes, above which a serialized sample will be eligible to be compressed.

Any sample with a serialized size greater than or equal to the threshold will be eligible to be compressed. All samples with an eligible serialized size will be compressed. Only if the compressed size is smaller than the serialized size will the sample be stored and sent compressed on the wire.

For batching we check the maximum serialized size of the batch, calculated as `serialized_sample_max_size * DDS_↔ BatchQosPolicy::max_samples` (p. 1336)

**[range]** [0, 2147483647] or `DDS_LENGTH_UNLIMITED` (p. 1127)

Setting the threshold to `DDS_LENGTH_UNLIMITED` (p. 1127) disables the compression.

**[default]** `DDS_COMPRESSION_THRESHOLD_DEFAULT` (p. 1062) (8192)

#### Note

Only available for a `DDS_DataWriter` (p. 478) and `DDS_Topic` (p. 172).

## 5.18 DDS\_ConditionHandler Struct Reference

<<**extension**>> (p. 817) <<**interface**>> (p. 818) Handler called by the `DDS_Condition_dispatch` (p. 1174).

## Data Fields

- void \* **handler\_data**  
*A place for handler implementors to keep a pointer to data that may be needed by their handler.*
- **DDS\_ConditionHandler\_OnConditionTriggeredCallback on\_condition\_triggered**  
*Handles the dispatch of a **DDS\_Condition** (p. 1169).*

### 5.18.1 Detailed Description

<<**extension**>> (p. 817) <<**interface**>> (p. 818) Handler called by the **DDS\_Condition\_dispatch** (p. 1174).

Direct known implementations: **DDS\_DataReaderStatusConditionHandler** (p. 879)

### 5.18.2 Field Documentation

#### 5.18.2.1 handler\_data

```
void* DDS_ConditionHandler::handler_data
```

A place for handler implementors to keep a pointer to data that may be needed by their handler.

#### 5.18.2.2 on\_condition\_triggered

```
DDS_ConditionHandler_OnConditionTriggeredCallback DDS_ConditionHandler::on_condition_triggered
```

Handles the dispatch of a **DDS\_Condition** (p. 1169).

This callback is called by **DDS\_Condition\_dispatch** (p. 1174).

## 5.19 DDS\_ConditionSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Condition** (p. 1169) >

### 5.19.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_Condition** (p. 1169) >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

**DDS\_WaitSet** (p. 1170)

**FooSeq** (p. 1845)

## 5.20 DDS\_ContentFilter Struct Reference

<<*interface*>> (p. 818) Interface to be used by a custom filter of a **DDS\_ContentFilteredTopic** (p. 173)

### Data Fields

- **DDS\_ContentFilterCompileFunction compile**  
*Compile an instance of the content filter according to the filter expression and parameters of the given data type.*
- **DDS\_ContentFilterWriterCompileFunction writer\_compile**  
*A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **DDS\_DataReader** (p. 608).*
- **DDS\_ContentFilterEvaluateFunction evaluate**  
*Evaluate whether the sample is passing the filter or not according to the sample content.*
- **DDS\_ContentFilterWriterEvaluateFunction writer\_evaluate**  
*A writer-side filtering API to retrieve a list of DataReaders whose content filters pass the sample.*
- **DDS\_ContentFilterFinalizeFunction finalize**  
*A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.*
- **DDS\_ContentFilterWriterFinalizeFunction writer\_finalize**  
*A writer-side filtering API to clean up a previously compiled instance of the content filter.*
- **DDS\_ContentFilterWriterAttachFunction writer\_attach**  
*A writer-side filtering API to create some state that can facilitate filtering on the writer side.*
- **DDS\_ContentFilterWriterDetachFunction writer\_detach**  
*A writer-side filtering API to clean up a previously created state using **DDS\_ContentFilter::writer\_attach** (p. 1357).*
- **DDS\_ContentFilterWriterReturnLoanFunction writer\_return\_loan**  
*A writer-side filtering API to return the loan on the list of DataReaders returned by **DDS\_ContentFilter::writer\_evaluate** (p. 1355).*
- void \* **filter\_data**  
*A place for filter implementors to keep a pointer to data that may be needed by their filter.*

## 5.20.1 Detailed Description

<<*interface*>> (p. 818) Interface to be used by a custom filter of a **DDS\_ContentFilteredTopic** (p. 173)

Entity:

**DDS\_ContentFilteredTopic** (p. 173)

This interface can be implemented by an application-provided class and then registered with the **DDS\_Domain**↔**Participant** (p. 72) such that samples can be filtered for a **DDS\_ContentFilteredTopic** (p. 173) with the given filter name.

**Note:** the API for using a custom content filter is subject to change in a future release.

See also

**DDS\_ContentFilteredTopic** (p. 173)

**DDS\_DomainParticipant\_register\_contentfilter** (p. 117)

## 5.20.2 Field Documentation

### 5.20.2.1 compile

**DDS\_ContentFilterCompileFunction** DDS\_ContentFilter::compile

Compile an instance of the content filter according to the filter expression and parameters of the given data type.

This function is called when an instance of the locally registered content filter is created or when the expression parameter for the locally registered content filter instance is changed.

An instance of the locally registered content filter is created every time a local **DDS\_ContentFilteredTopic** (p. 173) with the matching filter name is created, or when a **DDS\_DataReader** (p. 608) with a matching filter name is discovered.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

Parameters

<i>new_compile_data</i>	<< <i>out</i> >> (p. 818) User specified opaque pointer of this instance of the content filter. This value is then passed to the <b>DDS_ContentFilter::evaluate</b> (p. 1355) and <b>DDS_ContentFilter::finalize</b> (p. 1356) functions for this instance of the content filter. Can be set to NULL .
<i>expression</i>	<< <i>in</i> >> (p. 818) An ASCIIZ string with the filter expression. The memory used by this string is owned by RTI Connex and <b>must</b> not be freed. If you want to manipulate this string, you <b>must</b> first make a copy of it.

## Parameters

<i>parameters</i>	<< <i>in</i> >> (p. 818) A string sequence with the expression parameters the <b>DDS_ContentFilteredTopic</b> (p. 173) was created with. The string sequence is <b>equal</b> (but <b>not</b> identical) to the string sequence passed to <b>DDS_DomainParticipant_create_contentfilteredtopic</b> (p. 115). Note that the sequence passed to the compile function is <b>owned</b> by RTI Connex and <b>must not</b> be referenced outside the compile function.
<i>type_code</i>	<< <i>in</i> >> (p. 818) A pointer to the type code for the related <b>DDS_Topic</b> (p. 172) of the <b>DDS_ContentFilteredTopic</b> (p. 173). A <i>type_code</i> is a description of a type in terms of which types it contains (such as long, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
<i>type_class_name</i>	<< <i>in</i> >> (p. 818) Fully qualified class name of the related <b>DDS_Topic</b> (p. 172).
<i>old_compile_data</i>	<< <i>in</i> >> (p. 818) The previous <i>new_compile_data</i> value from a previous call to this instance of a content filter. If the compile function is called more than once for an instance of a <b>DDS_ContentFilteredTopic</b> (p. 173), e.g., if the expression parameters are changed, then the <i>new_compile_data</i> value returned by the previous invocation is passed in the <i>old_compile_data</i> parameter (which can be NULL ). If this is a new instance of the filter, NULL is passed. This parameter is useful for freeing or reusing previously allocated resources.

## Returns

One of the **Standard Return Codes** (p. 1024)

## 5.20.2.2 writer\_compile

**DDS\_ContentFilterWriterCompileFunction** `DDS_ContentFilter::writer_compile`

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **DDS\_DataReader** (p. 608).

This function is called when the **DDS\_DataWriter** (p. 478) discovers a **DDS\_DataReader** (p. 608) with a **DDS\_ContentFilteredTopic** (p. 173) or when a **DDS\_DataWriter** (p. 478) is notified of a change in a DataReader's filter parameter for the locally registered content filter instance.

It is possible for multiple threads to be calling into this function at the same time.

## Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 818) A pointer to the state created using <b>DDS_ContentFilter::writer_attach</b> (p. 1357) .
<i>prop</i>	<< <i>out</i> >> (p. 818) A pointer to <b>DDS_ExpressionProperty</b> (p. 1549) that allows you to indicate to RTI Connex if a filter expression can be optimized.
<i>expression</i>	<< <i>in</i> >> (p. 818) An ASCII string with the filter expression. The memory used by this string is owned by RTI Connex and <b>must</b> not be freed. If you want to manipulate this string, you <b>must</b> first make a copy of it.

## Parameters

<i>parameters</i>	<< <i>in</i> >> (p. 818) A string sequence with the expression parameters with which the <b>DDS_ContentFilteredTopic</b> (p. 173) was created. The string sequence is <b>equal</b> (but <b>not</b> identical) to the string sequence passed to <b>DDS_DomainParticipant_create_contentfilteredtopic</b> (p. 115). Note that the sequence passed to the compile function is <b>owned</b> by RTI Connex and <b>must not</b> be referenced outside the compile function.
<i>type_code</i>	<< <i>in</i> >> (p. 818) A pointer to the type code for the related <b>DDS_Topic</b> (p. 172) of the <b>DDS_ContentFilteredTopic</b> (p. 173). A type_code is a description of a type in terms of which types it contains (such as long, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
<i>type_class_name</i>	<< <i>in</i> >> (p. 818) Fully qualified class name of the related <b>DDS_Topic</b> (p. 172).
<i>cookie</i>	<< <i>in</i> >> (p. 818) <b>DDS_Cookie_t</b> (p. 1360) to uniquely identify <b>DDS_DataReader</b> (p. 608) for which <b>DDS_ContentFilter::writer_compile</b> (p. 1354) was called.

## Returns

One of the **Standard Return Codes** (p. 1024)

## 5.20.2.3 evaluate

```
DDS_ContentFilterEvaluateFunction DDS_ContentFilter::evaluate
```

Evaluate whether the sample is passing the filter or not according to the sample content.

This function is called when a sample for a locally created **DDS\_DataReader** (p. 608) associated with the filter is received, or when a sample for a discovered **DDS\_DataReader** (p. 608) associated with the filter needs to be sent.

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

## Parameters

<i>compile_data</i>	<< <i>in</i> >> (p. 818) The last return value of the <b>DDS_ContentFilter::compile</b> (p. 1353) function for this instance of the content filter. Can be NULL .
<i>sample</i>	<< <i>in</i> >> (p. 818) Pointer to a deserialized sample to be filtered
<i>meta_data</i>	<< <i>in</i> >> (p. 818) Pointer to meta data associated with the sample.

## Returns

The function must return 0 if the sample should be filtered out, non zero otherwise

### 5.20.2.4 writer\_evaluate

**DDS\_ContentFilterWriterEvaluateFunction** DDS\_ContentFilter::writer\_evaluate

A writer-side filtering API to retrieve a list of DataReaders whose content filters pass the sample.

This function is called every time a **DDS\_DataWriter** (p.478) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **DDS\_DataWriter** (p.478) is performing writer-side filtering and return the list of **DDS\_Cookie\_t** (p.1360) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

#### Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p.818) A pointer to the state created using <b>DDS_ContentFilter::writer_attach</b> (p.1357) .
<i>sample</i>	<< <i>in</i> >> (p.818) Pointer to a deserialized sample to be filtered.
<i>meta_data</i>	<< <i>in</i> >> (p.818) Pointer to meta data associated with the sample.

#### Returns

The function returns **DDS\_CookieSeq** (p.1361) which identifies the set of DataReaders whose filters pass the sample.

### 5.20.2.5 finalize

**DDS\_ContentFilterFinalizeFunction** DDS\_ContentFilter::finalize

A previously compiled instance of the content filter is no longer in use and resources can now be cleaned up.

This function is called when an instance of the locally registered content filter is deleted.

An instance of the locally registered content filter is deleted every time a local **DDS\_ContentFilteredTopic** (p.173) with the matching filter name is deleted, or when a **DDS\_DataReader** (p.608) with a matching filter name is removed due to discovery.

This function is also called on all instances of the discovered **DDS\_DataReader** (p.608) with a matching filter name if the filter is unregistered with **DDS\_DomainParticipant\_unregister\_contentfilter** (p.118).

It is possible for multiple threads to be calling into this function at the same time. However, this function will never be called on a content filter that has been unregistered.

#### Parameters

<i>compile_data</i>	<< <i>in</i> >> (p.818) The last return value of the <b>DDS_ContentFilter::compile</b> (p.1353) function for this instance of the content filter. Can be NULL
---------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------

### 5.20.2.6 writer\_finalize

**DDS\_ContentFilterWriterFinalizeFunction** DDS\_ContentFilter::writer\_finalize

A writer-side filtering API to clean up a previously compiled instance of the content filter.

This function is called to notify the filter implementation that the **DDS\_DataWriter** (p. 478) is no longer matching with a **DDS\_DataReader** (p. 608) for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the **DDS\_DataReader** (p. 608).

It is possible for multiple threads to be calling into this function at the same time.

#### Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 818) A pointer to the state created using <b>DDS_ContentFilter::writer_attach</b> (p. 1357).
<i>cookie</i>	<b>DDS_Cookie_t</b> (p. 1360) to uniquely identify <b>DDS_DataReader</b> (p. 608) for which <b>DDS_ContentFilter::writer_finalize</b> (p. 1357) was called.

### 5.20.2.7 writer\_attach

**DDS\_ContentFilterWriterAttachFunction** DDS\_ContentFilter::writer\_attach

A writer-side filtering API to create some state that can facilitate filtering on the writer side.

This function is called to create some state required to perform filtering on the writer side using writer-side filtering APIs. This function will be called for every **DDS\_DataWriter** (p. 478); it will be called only the first time the **DDS\_DataWriter** (p. 478) matches a **DDS\_DataReader** (p. 608) using the specified filter. This function will not be called for any subsequent DataReaders that match the DataWriter and are using the same filter.

#### Parameters

<i>writer_filter_data</i>	<< <i>out</i> >> (p. 818) A user-specified opaque pointer to some state created on the <b>DDS_DataWriter</b> (p. 478) that will help perform writer-side filtering efficiently.
---------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

### 5.20.2.8 writer\_detach

**DDS\_ContentFilterWriterDetachFunction** DDS\_ContentFilter::writer\_detach

A writer-side filtering API to clean up a previously created state using **DDS\_ContentFilter::writer\_attach** (p. 1357).

This function is called to delete any state created using the **DDS\_ContentFilter::writer\_attach** (p. 1357) function. This function will be called when the **DDS\_DataWriter** (p. 478) is deleted.

#### Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 818) A pointer to the state created using <b>DDS_ContentFilter::writer_attach</b> (p. 1357).
---------------------------	------------------------------------------------------------------------------------------------------------------

### 5.20.2.9 writer\_return\_loan

**DDS\_ContentFilterWriterReturnLoanFunction** `DDS_ContentFilter::writer_return_loan`

A writer-side filtering API to return the loan on the list of DataReaders returned by **DDS\_ContentFilter::writer\_evaluate** (p. 1355).

This function is called to return the loan on **DDS\_CookieSeq** (p. 1361) returned by **DDS\_ContentFilter::writer\_↔return\_loan** (p. 1358). It is possible for multiple threads to be calling into this function at the same time.

#### Parameters

<i>writer_filter_data</i>	<< <i>in</i> >> (p. 818) A pointer to the state created using <b>DDS_ContentFilter::writer_attach</b> (p. 1357).
<i>cookies</i>	<< <i>in</i> >> (p. 818) <b>DDS_CookieSeq</b> (p. 1361) for which the <b>DDS_ContentFilter::writer_return_loan</b> (p. 1358) was invoked.

### 5.20.2.10 filter\_data

`void* DDS_ContentFilter::filter_data`

A place for filter implementors to keep a pointer to data that may be needed by their filter.

## 5.21 DDS\_ContentFilterProperty\_t Struct Reference

<<*extension*>> (p. 817) Type used to provide all the required information to enable content filtering.

## Data Fields

- char \* **content\_filter\_topic\_name**  
*Name of the Content-filtered Topic associated with the Reader.*
- char \* **related\_topic\_name**  
*Name of the Topic related to the Content-filtered Topic.*
- char \* **filter\_class\_name**  
*Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).*
- char \* **filter\_expression**  
*The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.*
- struct **DDS\_StringSeq expression\_parameters**  
*Defines the value for each parameter in the filter expression.*

### 5.21.1 Detailed Description

<<*extension*>> (p. 817) Type used to provide all the required information to enable content filtering.

### 5.21.2 Field Documentation

#### 5.21.2.1 content\_filter\_topic\_name

```
char* DDS_ContentFilterProperty_t::content_filter_topic_name
```

Name of the Content-filtered Topic associated with the Reader.

#### 5.21.2.2 related\_topic\_name

```
char* DDS_ContentFilterProperty_t::related_topic_name
```

Name of the Topic related to the Content-filtered Topic.

#### 5.21.2.3 filter\_class\_name

```
char* DDS_ContentFilterProperty_t::filter_class_name
```

Identifies the filter class this filter belongs to. RTPS can support multiple filter classes (SQL, regular expressions, custom filters, etc).

#### 5.21.2.4 filter\_expression

```
char* DDS_ContentFilterProperty_t::filter_expression
```

The actual filter expression. Must be a valid expression for the filter class specified using filterClassName.

#### 5.21.2.5 expression\_parameters

```
struct DDS_StringSeq DDS_ContentFilterProperty_t::expression_parameters
```

Defines the value for each parameter in the filter expression.

## 5.22 DDS\_Cookie\_t Struct Reference

<<*extension*>> (p. 817) Sequence of bytes.

### Data Fields

- struct **DDS\_OctetSeq** value  
*a sequence of octets*

#### 5.22.1 Detailed Description

<<*extension*>> (p. 817) Sequence of bytes.

#### 5.22.2 Field Documentation

##### 5.22.2.1 value

```
struct DDS_OctetSeq DDS_Cookie_t::value
```

a sequence of octets

**[default]** Empty (zero-sized)

## 5.23 DDS\_CookieSeq Struct Reference

Declares IDL sequence < DDS\_Cookie\_t (p. 1360) > .

### 5.23.1 Detailed Description

Declares IDL sequence < DDS\_Cookie\_t (p. 1360) > .

## 5.24 DDS\_DatabaseQosPolicy Struct Reference

Various threads and resource limits settings used by RTI Connex to control its internal database.

### Data Fields

- struct **DDS\_ThreadSettings\_t thread**  
*Database thread settings.*
- struct **DDS\_Duration\_t shutdown\_timeout**  
*The maximum wait time during a shutdown.*
- struct **DDS\_Duration\_t cleanup\_period**  
*The period at which the database thread wakes up to remove deleted records.*
- struct **DDS\_Duration\_t shutdown\_cleanup\_period**  
*The clean-up period used during database shut-down.*
- **DDS\_Long initial\_records**  
*The initial number of total records.*
- **DDS\_Long max\_skiplist\_level**  
*The maximum level of the skiplist.*
- **DDS\_Long max\_weak\_references**  
*The maximum number of weak references.*
- **DDS\_Long initial\_weak\_references**  
*The initial number of weak references.*

### 5.24.1 Detailed Description

Various threads and resource limits settings used by RTI Connex to control its internal database.

RTI uses an internal in-memory "database" to store information about entities created locally as well as remote entities found during the discovery process. This database uses a background thread to garbage-collect records related to deleted entities. When the **DDS\_DomainParticipant** (p. 72) that maintains this database is deleted, it shuts down this thread.

The Database QoS policy is used to configure how RTI Connex manages its database, including how often it cleans up, the priority of the database thread, and limits on resources that may be allocated by the database.

You may be interested in modifying the **DDS\_DatabaseQosPolicy::shutdown\_timeout** (p. 1362) and **DDS\_DatabaseQosPolicy::shutdown\_cleanup\_period** (p. 1363) parameters to decrease the time it takes to delete a **DDS\_DomainParticipant** (p. 72) when your application is shutting down.

The **DDS\_DomainParticipantResourceLimitsQosPolicy** (p. 1494) controls the memory allocation for elements stored in the database.

This QoS policy is an extension to the DDS standard.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) **NO** (p. 1048)

### 5.24.2 Field Documentation

#### 5.24.2.1 thread

```
struct DDS_ThreadSettings_t DDS_DatabaseQosPolicy::thread
```

Database thread settings.

There is only one database thread: the clean-up thread.

**[default]** Priority: LOW.

The actual value depends on your architecture:

For Windows: -3

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

**[default]** Stack Size: The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

**[default]** Mask: **DDS\_THREAD\_SETTINGS\_STUDIO** (p. 1040)

### 5.24.2.2 shutdown\_timeout

```
struct DDS_Duration_t DDS_DatabaseQosPolicy::shutdown_timeout
```

The maximum wait time during a shutdown.

The domain participant will exit after the timeout, even if the database has not been fully cleaned up.

**[default]** 15 seconds

**[range]** [0,DDS\_DURATION\_INFINITE (p. 1011)]

### 5.24.2.3 cleanup\_period

```
struct DDS_Duration_t DDS_DatabaseQosPolicy::cleanup_period
```

The period at which the database thread wakes up to remove deleted records.

**[default]** 61 seconds

**[range]** [0,1 year]

### 5.24.2.4 shutdown\_cleanup\_period

```
struct DDS_Duration_t DDS_DatabaseQosPolicy::shutdown_cleanup_period
```

The clean-up period used during database shut-down.

If you would like to shorten the time taken for a DomainParticipant to shutdown, you can decrease this value.

It is recommended to set this value to something other than 0 if running in an RTOS environment, to avoid CPU starvation.

**[default]** 10 milliseconds

**[range]** [0,1 year]

### 5.24.2.5 initial\_records

```
DDS_Long DDS_DatabaseQosPolicy::initial_records
```

The initial number of total records.

**[default]** 1024

**[range]** [1,10 million]

### 5.24.2.6 max\_skiplist\_level

**DDS\_Long** DDS\_DatabaseQosPolicy::max\_skiplist\_level

The maximum level of the skiplist.

The skiplist is used to keep records in the database. Usually, the search time is  $\log_2(N)$ , where  $N$  is the total number of records in one skiplist. However, once  $N$  exceeds  $2^n$ , where  $n$  is the maximum skiplist level, the search time will become more and more linear. Therefore, the maximum level should be set such that  $2^n$  is larger than the maximum( $N$  among all skiplists). Usually, the maximum  $N$  is the maximum number of remote and local writers or readers.

**[default]** 7

**[range]** [1,31]

### 5.24.2.7 max\_weak\_references

**DDS\_Long** DDS\_DatabaseQosPolicy::max\_weak\_references

The maximum number of weak references.

A weak reference is an internal data structure that refers to a record within RTI Connex't internal database. This field configures the maximum number of such references that RTI Connex't may create.

The actual number of weak references is permitted to grow from an initial value (indicated by **DDS\_DatabaseQosPolicy::initial\_weak\_references** (p. 1364)) to this maximum. To prevent RTI Connex't from allocating any weak references after the system has reached a steady state, set the initial and maximum values equal to one another. To indicate that the number of weak references should continue to grow as needed indefinitely, set this field to **DDS\_LENGTH\_UNLIMITED** (p. 1127). Be aware that although a single weak reference occupies very little memory, allocating a very large number of them can have a significant impact on your overall memory usage.

Tuning this value precisely is difficult without intimate knowledge of the structure of RTI Connex't database; doing so is an advanced feature not required by most applications. The default value has been chosen to be sufficient for reasonably large systems. If you believe you may need to modify this value, please consult with RTI support personnel for assistance.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 100 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  initial\_weak\_references

See also

**DDS\_DatabaseQosPolicy::initial\_weak\_references** (p. 1364)

### 5.24.2.8 initial\_weak\_references

`DDS_Long DDS_DatabaseQosPolicy::initial_weak_references`

The initial number of weak references.

See `DDS_DatabaseQosPolicy::max_weak_references` (p. 1364) for more information about what a weak reference is.

If the QoS set contains an `initial_weak_references` value that is too small to ever grow to `DDS_DatabaseQosPolicy::max_weak_references` (p. 1364) using RTI Connex't internal algorithm, this value will be adjusted upwards as necessary. Subsequent accesses of this value will reveal the actual initial value used.

Changing the value of this field is an advanced feature; it is recommended that you consult with RTI support personnel before doing so.

**[default]** 2049, which is the minimum initial value imposed by REDA when the maximum is unlimited. If a lower value is specified, it will simply be increased to 2049 automatically.

**[range]** [1, 100 million], <= max\_weak\_references

See also

`DDS_DatabaseQosPolicy::max_weak_references` (p. 1364)

## 5.25 DDS\_DataReaderCacheStatus Struct Reference

<<*extension*>> (p. 817) The status of the reader's cache.

### Data Fields

- **DDS\_LongLong sample\_count\_peak**  
*The highest number of samples in the reader's queue over the lifetime of the reader.*
- **DDS\_LongLong sample\_count**  
*The number of samples in the reader's queue.*
- **DDS\_LongLong old\_source\_timestamp\_dropped\_sample\_count**  
*The number of samples dropped as a result of receiving a sample older than the last one, using `DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS` (p. 1075).*
- **DDS\_LongLong tolerance\_source\_timestamp\_dropped\_sample\_count**  
*The number of samples dropped as a result of receiving a sample in the future, using `DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS` (p. 1075).*
- **DDS\_LongLong ownership\_dropped\_sample\_count**  
*The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.*
- **DDS\_LongLong content\_filter\_dropped\_sample\_count**  
*The number of user samples filtered by the DataReader due to Content-Filtered Topics.*
- **DDS\_LongLong time\_based\_filter\_dropped\_sample\_count**  
*The number of user samples filtered by the DataReader due to `DDS_TimeBasedFilterQosPolicy` (p. 1767).*

- **DDS\_LongLong expired\_dropped\_sample\_count**  
*The number of samples expired by the DataReader due to **DDS\_LifespanQosPolicy** (p. 1567) or the autopurge sample delays.*
- **DDS\_LongLong virtual\_duplicate\_dropped\_sample\_count**  
*The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.*
- **DDS\_LongLong replaced\_dropped\_sample\_count**  
*The number of samples replaced by the DataReader due to **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094) replacement.*
- **DDS\_LongLong writer\_removed\_batch\_sample\_dropped\_sample\_count**  
*The number of batch samples received by the DataReader that were marked as removed by the DataWriter.*
- **DDS\_LongLong total\_samples\_dropped\_by\_instance\_replacement**  
*The number of samples with sample state **DDS\_NOT\_READ\_SAMPLE\_STATE** (p. 702) that were dropped when removing an instance due to instance replacement. See **DDS\_DataReaderResourceLimitsQosPolicy::instance\_replacement** (p. 1409) for more details about when instances are replaced.*
- **DDS\_LongLong alive\_instance\_count**  
*The number of instances in the DataReader's queue with an instance state equal to **DDS\_ALIVE\_INSTANCE\_STATE** (p. 707).*
- **DDS\_LongLong alive\_instance\_count\_peak**  
*The highest value of **DDS\_DataReaderCacheStatus::alive\_instance\_count** (p. 1369) over the lifetime of the DataReader.*
- **DDS\_LongLong no\_writers\_instance\_count**  
*The number of instances in the DataReader's queue with an instance state equal to **DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707).*
- **DDS\_LongLong no\_writers\_instance\_count\_peak**  
*The highest value of **DDS\_DataReaderCacheStatus::no\_writers\_instance\_count** (p. 1370) over the lifetime of the DataReader.*
- **DDS\_LongLong disposed\_instance\_count**  
*The number of instances in the DataReader's queue with an instance state equal to **DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707).*
- **DDS\_LongLong disposed\_instance\_count\_peak**  
*The highest value of **DDS\_DataReaderCacheStatus::disposed\_instance\_count** (p. 1370) over the lifetime of the DataReader.*
- **DDS\_LongLong detached\_instance\_count**  
*The number of minimal instance states currently being maintained in the DataReader's queue.*
- **DDS\_LongLong detached\_instance\_count\_peak**  
*The highest value of **DDS\_DataReaderCacheStatus::detached\_instance\_count** (p. 1371) over the lifetime of the DataReader.*
- **DDS\_LongLong compressed\_sample\_count**  
*The number of received samples compressed by a DataWriter.*

### 5.25.1 Detailed Description

<<**extension**>> (p. 817) The status of the reader's cache.

Entity:

**DDS\_DataReader** (p. 608)

## 5.25.2 Field Documentation

### 5.25.2.1 sample\_count\_peak

**DDS\_LongLong** DDS\_DataReaderCacheStatus::sample\_count\_peak

The highest number of samples in the reader's queue over the lifetime of the reader.

### 5.25.2.2 sample\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::sample\_count

The number of samples in the reader's queue.

includes samples that may not yet be available to be read or taken by the user, due to samples being received out of order or **PRESENTATION** (p. 1105)

### 5.25.2.3 old\_source\_timestamp\_dropped\_sample\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::old\_source\_timestamp\_dropped\_sample\_count

The number of samples dropped as a result of receiving a sample older than the last one, using **DDS\_BY\_SOURCE\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p. 1075).

When the DataReader is using **DDS\_BY\_SOURCE\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p. 1075):

- If the DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped.
- If the DataReader receives a sample for an instance with a source timestamp that is equal to the last source timestamp received for the instance and the writer has a higher virtual GUID, the sample is dropped.

### 5.25.2.4 tolerance\_source\_timestamp\_dropped\_sample\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::tolerance\_source\_timestamp\_dropped\_sample\_count

The number of samples dropped as a result of receiving a sample in the future, using **DDS\_BY\_SOURCE\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p. 1075).

When the DataReader is using **DDS\_BY\_SOURCE\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p. 1075): the DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than the `source_timestamp_tolerance`. Otherwise, the sample is dropped.

### 5.25.2.5 ownership\_dropped\_sample\_count

`DDS_LongLong DDS_DataReaderCacheStatus::ownership_dropped_sample_count`

The number of samples dropped as a result of receiving a sample from a DataWriter with a lower strength, using Exclusive Ownership.

When using Exclusive Ownership, the DataReader receives data from multiple DataWriters. Each instance can only be owned by one DataWriter.

If other DataWriters write samples on this instance, the samples will be dropped.

### 5.25.2.6 content\_filter\_dropped\_sample\_count

`DDS_LongLong DDS_DataReaderCacheStatus::content_filter_dropped_sample_count`

The number of user samples filtered by the DataReader due to Content-Filtered Topics.

When using a content filter on the DataReader side, if the sample received by the DataReader does not pass the filter, it will be dropped.

### 5.25.2.7 time\_based\_filter\_dropped\_sample\_count

`DDS_LongLong DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count`

The number of user samples filtered by the DataReader due to **DDS\_TimeBasedFilterQosPolicy** (p. 1767).

When using **TIME\_BASED\_FILTER** (p. 1129) on the DataReader side, if the sample received by the DataReader does not pass the minimum\_separation filter, it will be dropped.

### 5.25.2.8 expired\_dropped\_sample\_count

`DDS_LongLong DDS_DataReaderCacheStatus::expired_dropped_sample_count`

The number of samples expired by the DataReader due to **DDS\_LifespanQosPolicy** (p. 1567) or the autopurge sample delays.

- **DDS\_LifespanQosPolicy** (p. 1567)  
When a sample expires due to **DDS\_LifespanQosPolicy** (p. 1567), the data is removed from the DataReader caches. This sample will be considered dropped if its **DDS\_SampleStateKind** (p. 702) was **DDS\_NOT\_READ**↔**\_SAMPLE\_STATE** (p. 702).
- **DDS\_ReaderDataLifecycleQosPolicy::autopurge\_nowriter\_samples\_delay** (p. 1675)  
When a sample expires due to **DDS\_ReaderDataLifecycleQosPolicy::autopurge\_nowriter\_samples\_delay** (p. 1675), this sample will be considered dropped if its **DDS\_SampleStateKind** (p. 702) was **DDS\_NOT\_READ**↔**\_SAMPLE\_STATE** (p. 702).
- **DDS\_ReaderDataLifecycleQosPolicy::autopurge\_disposed\_samples\_delay** (p. 1675)  
When a sample expires due to **DDS\_ReaderDataLifecycleQosPolicy::autopurge\_disposed\_samples\_delay** (p. 1675), this sample will be considered dropped if its **DDS\_SampleStateKind** (p. 702) was **DDS\_NOT\_READ**↔**\_SAMPLE\_STATE** (p. 702).

### 5.25.2.9 virtual\_duplicate\_dropped\_sample\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::virtual\_duplicate\_dropped\_sample\_count

The number of virtual duplicate samples dropped by the DataReader. A sample is a virtual duplicate if it has the same identity (Virtual Writer GUID and Virtual Sequence Number) as a previously received sample.

When two DataWriters with the same logical data source publish a sample with the same sequence\_number, one sample will be dropped and the other will be received by the DataReader.

This can happen when multiple writers are writing on behalf of the same original DataWriter: for example, in systems with redundant Routing Services or when a DataReader is receiving samples both directly from the original DataWriter and from an instance of Persistence Service.

### 5.25.2.10 replaced\_dropped\_sample\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::replaced\_dropped\_sample\_count

The number of samples replaced by the DataReader due to **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094) replacement.

When the number of samples for an instance in the queue reaches the **DDS\_HistoryQosPolicy::depth** (p. 1560) value, a new sample for the instance will replace the oldest sample for the instance in the queue.

The new sample will be accepted and the old sample will be dropped.

This counter will only be updated if the replaced sample's **DDS\_SampleStateKind** (p. 702) was **DDS\_NOT\_READ\_SAMPLE\_STATE** (p. 702).

### 5.25.2.11 writer\_removed\_batch\_sample\_dropped\_sample\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::writer\_removed\_batch\_sample\_dropped\_sample\_count

The number of batch samples received by the DataReader that were marked as removed by the DataWriter.

When the DataReader receives a batch, the batch can contain samples marked as removed by the DataWriter. Examples of removed samples in a batch could be because of sample replacement due to **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094) **DDS\_HistoryQosPolicy** (p. 1558) QoS on the DataWriter or because the duration in **DDS\_LifespanQosPolicy** (p. 1567) was reached. By default, any sample marked as removed from a batch is dropped (unless you set the `dds.data_reader.accept_writer_removed_batch_samples` property in the **DDS\_PropertyQosPolicy** (p. 1645) to true). Note: Historical data with removed batch samples written before the DataReader joined the DDS domain will also be included in the count.

### 5.25.2.12 total\_samples\_dropped\_by\_instance\_replacement

**DDS\_LongLong** DDS\_DataReaderCacheStatus::total\_samples\_dropped\_by\_instance\_replacement

The number of samples with sample state **DDS\_NOT\_READ\_SAMPLE\_STATE** (p. 702) that were dropped when removing an instance due to instance replacement. See **DDS\_DataReaderResourceLimitsQosPolicy::instance\_replacement** (p. 1409) for more details about when instances are replaced.

### 5.25.2.13 `alive_instance_count`

`DDS_LongLong DDS_DataReaderCacheStatus::alive_instance_count`

The number of instances in the DataReader's queue with an instance state equal to `DDS_ALIVE_INSTANCE_STATE` (p. 707).

### 5.25.2.14 `alive_instance_count_peak`

`DDS_LongLong DDS_DataReaderCacheStatus::alive_instance_count_peak`

The highest value of `DDS_DataReaderCacheStatus::alive_instance_count` (p. 1369) over the lifetime of the DataReader.

See also

`DDS_DataReaderCacheStatus::alive_instance_count` (p. 1369)

### 5.25.2.15 `no_writers_instance_count`

`DDS_LongLong DDS_DataReaderCacheStatus::no_writers_instance_count`

The number of instances in the DataReader's queue with an instance state equal to `DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE` (p. 707).

### 5.25.2.16 `no_writers_instance_count_peak`

`DDS_LongLong DDS_DataReaderCacheStatus::no_writers_instance_count_peak`

The highest value of `DDS_DataReaderCacheStatus::no_writers_instance_count` (p. 1370) over the lifetime of the DataReader.

See also

`DDS_DataReaderCacheStatus::no_writers_instance_count` (p. 1370)

### 5.25.2.17 disposed\_instance\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::disposed\_instance\_count

The number of instances in the DataReader's queue with an instance state equal to **DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707).

### 5.25.2.18 disposed\_instance\_count\_peak

**DDS\_LongLong** DDS\_DataReaderCacheStatus::disposed\_instance\_count\_peak

The highest value of **DDS\_DataReaderCacheStatus::disposed\_instance\_count** (p. 1370) over the lifetime of the DataReader.

See also

**DDS\_DataReaderCacheStatus::disposed\_instance\_count** (p. 1370)

### 5.25.2.19 detached\_instance\_count

**DDS\_LongLong** DDS\_DataReaderCacheStatus::detached\_instance\_count

The number of minimal instance states currently being maintained in the DataReader's queue.

If **DDS\_DataReaderResourceLimitsQosPolicy::keep\_minimum\_state\_for\_instances** (p. 1408) is true, the DataReader will keep up to a maximum of **DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances** (p. 1405) detached instances in its queue. For a more in-depth description of detached instances, refer to **DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances** (p. 1405).

### 5.25.2.20 detached\_instance\_count\_peak

**DDS\_LongLong** DDS\_DataReaderCacheStatus::detached\_instance\_count\_peak

The highest value of **DDS\_DataReaderCacheStatus::detached\_instance\_count** (p. 1371) over the lifetime of the DataReader.

See also

**DDS\_DataReaderCacheStatus::detached\_instance\_count** (p. 1371)

### 5.25.2.21 compressed\_sample\_count

`DDS_LongLong DDS_DataReaderCacheStatus::compressed_sample_count`

The number of received samples compressed by a DataWriter.

These include data, dispose, and unregister samples sent by a DataWriter.

## 5.26 DDS\_DataReaderListener Struct Reference

<<*interface*>> (p. 818) `DDS_Listener` (p. 1569) for reader status.

### Data Fields

- struct `DDS_Listener` as `listener`  
*The superclass instance of this `DDS_DataReaderListener` (p. 1372).*
- `DDS_DataReaderListener_RequestedDeadlineMissedCallback` `on_requested_deadline_missed`  
*Handles the `DDS_REQUESTED_DEADLINE_MISSED_STATUS` (p. 1032) communication status.*
- `DDS_DataReaderListener_RequestedIncompatibleQosCallback` `on_requested_incompatible_qos`  
*Handles the `DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS` (p. 1032) communication status.*
- `DDS_DataReaderListener_SampleRejectedCallback` `on_sample_rejected`  
*Handles the `DDS_SAMPLE_REJECTED_STATUS` (p. 1033) communication status.*
- `DDS_DataReaderListener_LivelinessChangedCallback` `on_liveliness_changed`  
*Handles the `DDS_LIVELINESS_CHANGED_STATUS` (p. 1034) communication status.*
- `DDS_DataReaderListener_DataAvailableCallback` `on_data_available`  
*Handle the `DDS_DATA_AVAILABLE_STATUS` (p. 1033) communication status.*
- `DDS_DataReaderListener_SubscriptionMatchedCallback` `on_subscription_matched`  
*Handles the `DDS_SUBSCRIPTION_MATCHED_STATUS` (p. 1035) communication status.*
- `DDS_DataReaderListener_SampleLostCallback` `on_sample_lost`  
*Handles the `DDS_SAMPLE_LOST_STATUS` (p. 1033) communication status.*

### 5.26.1 Detailed Description

<<*interface*>> (p. 818) `DDS_Listener` (p. 1569) for reader status.

Entity:

`DDS_DataReader` (p. 608)

Status:

**DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033);  
**DDS\_LIVELINESS\_CHANGED\_STATUS** (p. 1034), **DDS\_LivelinessChangedStatus** (p. 1572);  
**DDS\_REQUESTED\_DEADLINE\_MISSED\_STATUS** (p. 1032), **DDS\_RequestedDeadlineMissedStatus** (p. 1688);  
**DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_RequestedIncompatibleQosStatus** (p. 1689);  
**DDS\_SAMPLE\_LOST\_STATUS** (p. 1033), **DDS\_SampleLostStatus** (p. 1732);  
**DDS\_SAMPLE\_REJECTED\_STATUS** (p. 1033), **DDS\_SampleRejectedStatus** (p. 1733);  
**DDS\_SUBSCRIPTION\_MATCHED\_STATUS** (p. 1035), **DDS\_SubscriptionMatchedStatus** (p. 1758);

See also

**Status Kinds** (p. 1025)  
**Operations Allowed in Listener Callbacks** (p. 1571)

Examples

**HelloWorld\_subscriber.c.**

## 5.26.2 Field Documentation

### 5.26.2.1 as\_listener

```
struct DDS_Listener DDS_DataReaderListener::as_listener
```

The superclass instance of this **DDS\_DataReaderListener** (p. 1372).

### 5.26.2.2 on\_requested\_deadline\_missed

```
DDS_DataReaderListener_RequestedDeadlineMissedCallback DDS_DataReaderListener::on_requested_↔  
deadline_missed
```

Handles the **DDS\_REQUESTED\_DEADLINE\_MISSED\_STATUS** (p. 1032) communication status.

Examples

**HelloWorld\_subscriber.c.**

### 5.26.2.3 on\_requested\_incompatible\_qos

`DDS_DataReaderListener_RequestedIncompatibleQosCallback` `DDS_DataReaderListener::on_requested_incompatible_qos`

Handles the **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032) communication status.

#### Examples

`HelloWorld_subscriber.c`.

### 5.26.2.4 on\_sample\_rejected

`DDS_DataReaderListener_SampleRejectedCallback` `DDS_DataReaderListener::on_sample_rejected`

Handles the **DDS\_SAMPLE\_REJECTED\_STATUS** (p. 1033) communication status.

#### Examples

`HelloWorld_subscriber.c`.

### 5.26.2.5 on\_liveliness\_changed

`DDS_DataReaderListener_LivelinessChangedCallback` `DDS_DataReaderListener::on_liveliness_changed`

Handles the **DDS\_LIVELINESS\_CHANGED\_STATUS** (p. 1034) communication status.

#### Examples

`HelloWorld_subscriber.c`.

### 5.26.2.6 on\_data\_available

`DDS_DataReaderListener_DataAvailableCallback` `DDS_DataReaderListener::on_data_available`

Handle the **DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033) communication status.

#### Examples

`HelloWorld_subscriber.c`.

### 5.26.2.7 on\_subscription\_matched

`DDS_DataReaderListener_SubscriptionMatchedCallback` `DDS_DataReaderListener::on_subscription_↔  
matched`

Handles the `DDS_SUBSCRIPTION_MATCHED_STATUS` (p. 1035) communication status.

#### Examples

`HelloWorld_subscriber.c`.

### 5.26.2.8 on\_sample\_lost

`DDS_DataReaderListener_SampleLostCallback` `DDS_DataReaderListener::on_sample_lost`

Handles the `DDS_SAMPLE_LOST_STATUS` (p. 1033) communication status.

#### Examples

`HelloWorld_subscriber.c`.

## 5.27 DDS\_DataReaderProtocolQoSPolicy Struct Reference

Along with `DDS_WireProtocolQoSPolicy` (p. 1827) and `DDS_DataWriterProtocolQoSPolicy` (p. 1422), this QoS policy configures the DDS on-the-network protocol (RTPS).

### Data Fields

- struct `DDS_GUID_t` `virtual_guid`  
*The virtual GUID (Global Unique Identifier).*
- `DDS_UnsignedLong` `rtps_object_id`  
*The RTPS Object ID.*
- `DDS_Boolean` `expects_inline_qos`  
*Specifies whether this DataReader expects inline QoS with every sample.*
- `DDS_Boolean` `disable_positive_acks`  
*Whether the reader sends positive acknowledgements to writers.*
- `DDS_Boolean` `propagate_dispose_of_unregistered_instances`  
*Indicates whether or not an instance can move to the `DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 707) state without being in the `DDS_ALIVE_INSTANCE_STATE` (p. 707) state.*
- `DDS_Boolean` `propagate_unregister_of_disposed_instances`  
*Indicates whether or not an instance can move to the `DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE` (p. 707) state directly from the `DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 707).*
- struct `DDS_RtpsReliableReaderProtocol_t` `rtps_reliable_reader`  
*RTPS protocol-related configuration settings for the RTPS reliable reader associated with a `DDS_DataReader` (p. 608). This parameter only has effect if the reader is configured with `DDS_RELIABLE_RELIABILITY_QOS` (p. 1124) `DDS_↔  
ReliabilityQoSPolicyKind` (p. 1123).*

### 5.27.1 Detailed Description

Along with **DDS\_WireProtocolQosPolicy** (p. 1827) and **DDS\_DataWriterProtocolQosPolicy** (p. 1422), this QoS policy configures the DDS on-the-network protocol (RTPS).

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **DDS\_DataReaderProtocolQosPolicy** (p. 1375) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connexnt responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **DDS\_ReliabilityQosPolicy** (p. 1678) for more information on the per-DataReader/DataWriter reliability configuration. **DDS\_HistoryQosPolicy** (p. 1558) and **DDS\_ResourceLimitsQosPolicy** (p. 1690) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

#### Entity:

**DDS\_DataReader** (p. 608)

#### Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.27.2 Field Documentation

#### 5.27.2.1 virtual\_guid

```
struct DDS_GUID_t DDS_DataReaderProtocolQosPolicy::virtual_guid
```

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDS\_DataReader** (p. 608).

The association between a **DDS\_DataReader** (p. 608) and its persisted state is done using the virtual GUID.

**[default] DDS\_GUID\_AUTO** (p. 1016)

### 5.27.2.2 rtps\_object\_id

```
DDS_UnsignedLong DDS_DataReaderProtocolQosPolicy::rtps_object_id
```

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data reader according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connexx will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data reader.

A rtps\_object\_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connexx. In those cases, the recommendation is not to use automatic object ID assignment.

**[default]** DDS\_RTPS\_AUTO\_ID (p. ??)

**[range]** [0,0x00ffffff]

### 5.27.2.3 expects\_inline\_qos

```
DDS_Boolean DDS_DataReaderProtocolQosPolicy::expects_inline_qos
```

Specifies whether this DataReader expects inline QoS with every sample.

RTI Connexx DataWriters do not match with DataReaders that set this field to **DDS\_BOOLEAN\_TRUE** (p. 1004) (because RTI Connexx DataWriters do not support sending inline QoS), but here is how the field is meant to be used:

In RTI Connexx, a **DDS\_DataReader** (p. 608) nominally relies on Discovery to propagate QoS on a matched **DDS\_DataWriter** (p. 478).

Alternatively, a **DDS\_DataReader** (p. 608) may get information on a matched **DDS\_DataWriter** (p. 478) through QoS sent inline with a sample.

Asserting **DDS\_DataReaderProtocolQosPolicy::expects\_inline\_qos** (p. 1377) indicates to a matching **DDS\_DataWriter** (p. 478) that this **DDS\_DataReader** (p. 608) expects to receive inline QoS with every sample. The complete set of inline QoS that a **DDS\_DataWriter** (p. 478) may send inline is specified by the Real-Time Publish-Subscribe (RTPS) Wire Interoperability Protocol.

Because RTI Connexx **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) cache Discovery information, inline QoS are largely redundant and thus unnecessary. Only for other stateless implementations whose **DDS\_DataReader** (p. 608) does not cache Discovery information is inline QoS necessary.

Also note that inline QoS are additional wire-payload that consume additional bandwidth and serialization and deserialization time.

**[default]** DDS\_BOOLEAN\_FALSE (p. 1004)

#### 5.27.2.4 `disable_positive_acks`

`DDS_Boolean DDS_DataReaderProtocolQosPolicy::disable_positive_acks`

Whether the reader sends positive acknowledgements to writers.

If set to `DDS_BOOLEAN_TRUE` (p. 1004), the reader does not send positive acknowledgments (ACKs) in response to Heartbeat messages. The reader will send negative acknowledgements (NACKs) when a Heartbeat advertises samples that it has not received.

Otherwise, if set to `DDS_BOOLEAN_FALSE` (p. 1004) (the default), the reader will send ACKs to writers that expect ACKs (`DDS_DataWriterProtocolQosPolicy::disable_positive_acks` (p. 1424) = `DDS_BOOLEAN_FALSE` (p. 1004)) and it will not send ACKs to writers that disable ACKs (`DDS_DataWriterProtocolQosPolicy::disable_positive_acks` (p. 1424) = `DDS_BOOLEAN_TRUE` (p. 1004))

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

#### 5.27.2.5 `propagate_dispose_of_unregistered_instances`

`DDS_Boolean DDS_DataReaderProtocolQosPolicy::propagate_dispose_of_unregistered_instances`

Indicates whether or not an instance can move to the `DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 707) state without being in the `DDS_ALIVE_INSTANCE_STATE` (p. 707) state.

This field only applies to keyed readers.

When the field is set to `DDS_BOOLEAN_TRUE` (p. 1004), the DataReader will receive dispose notifications even if the instance is not alive.

To guarantee the key availability through the usage of the API `FooDataReader_get_key_value` (p.640), this option should be used in combination with setting `DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose` (p. 1425) on the DataWriter to `DDS_BOOLEAN_TRUE` (p. 1004).

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

#### 5.27.2.6 `propagate_unregister_of_disposed_instances`

`DDS_Boolean DDS_DataReaderProtocolQosPolicy::propagate_unregister_of_disposed_instances`

Indicates whether or not an instance can move to the `DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE` (p. 707) state directly from the `DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 707).

This field only applies to keyed readers.

When the field is set to `DDS_BOOLEAN_TRUE` (p. 1004), the DataReader will receive unregister notifications even if the instance is not alive.

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

### 5.27.2.7 rtps\_reliable\_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DataReaderProtocolQosPolicy::rtps_reliable_reader
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a **DDS\_DataReader** (p. 608). This parameter only has effect if the reader is configured with **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124) **DDS\_↔ReliabilityQosPolicyKind** (p. 1123).

For details, refer to the **DDS\_RtpsReliableReaderProtocol\_t** (p. 1695)

[default] See **DDS\_RtpsReliableReaderProtocol\_t** (p. 1695)

## 5.28 DDS\_DataReaderProtocolStatus Struct Reference

<<**extension**>> (p. 817) The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

### Data Fields

- **DDS\_LongLong received\_sample\_count**  
*The number of samples received by a DataReader.*
- **DDS\_LongLong received\_sample\_count\_change**  
*The change in **DDS\_DataReaderProtocolStatus::received\_sample\_count** (p. 1381) since the last time the status was read.*
- **DDS\_LongLong received\_sample\_bytes**  
*The number of bytes received by a DataReader.*
- **DDS\_LongLong received\_sample\_bytes\_change**  
*The change in **DDS\_DataReaderProtocolStatus::received\_sample\_bytes** (p. 1382) since the last time the status was read.*
- **DDS\_LongLong duplicate\_sample\_count**

### 5.28.1 Detailed Description

<<*extension*>> (p. 817) The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic.

Entity:

**DDS\_DataReader** (p. 608)

### 5.28.2 Field Documentation

#### 5.28.2.1 received\_sample\_count

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::received\_sample\_count

The number of samples received by a DataReader.

Depending on how the **DDS\_DataReaderProtocolStatus** (p. 1379) was obtained this may count samples coming from a specific DataWriter or from all the DataWriters that are matched with the DataReader.

If the **DDS\_DataReaderProtocolStatus** (p.1379) is obtained using the **DDS\_DataReader\_get\_datareader\_protocol\_status** (p.678) operation then it will count samples from any DataWriter. If the DataReaderProtocolStatus is obtained using the **DDS\_DataReader\_get\_matched\_publication\_datareader\_protocol\_status** (p.678) then it will count the samples for the DataWriter specified as a parameter to the function.

Duplicate samples arriving from the DataWriter(s) (e.g. via multiple network paths) are detected prior to increasing this counter. The duplicate samples are counted by **DDS\_DataReaderProtocolStatus::duplicate\_sample\_count** (p. 1383).

If the DataReader has specified a ContentFilter the received samples that do not pass the filter are part of this counter. The filtered samples are counted by **DDS\_DataReaderProtocolStatus::filtered\_sample\_count** (p. 1383).

Samples rejected because they do not fit on the DataReader Queue are also part of this counter.

Note the received\_sample\_count counts samples received from all DataWriters and it does not necessarily match the number of samples accepted into the DataReader Queue. This is because:

- Samples can also be inserted into the DataReader Queue by lifecycle events that are locally detected like an instance becoming not alive as a result of DataWriters leaving the network.
- Samples can be filtered out due to ContentFilter or TimeFilter
- Samples can be rejected because there is no space in DataReader Queue

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

#### 5.28.2.2 received\_sample\_count\_change

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::received\_sample\_count\_change

The change in **DDS\_DataReaderProtocolStatus::received\_sample\_count** (p. 1381) since the last time the status was read.

See also

**DDS\_DataReaderProtocolStatus::received\_sample\_count** (p. 1381)

Note that when data is fragmented, this statistic is updated when all of the fragments required to reassemble a sample are received, not when individual fragments are received.

#### 5.28.2.3 received\_sample\_bytes

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::received\_sample\_bytes

The number of bytes received by a DataReader.

See also

**DDS\_DataReaderProtocolStatus::received\_sample\_count** (p. 1381)

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

#### 5.28.2.4 received\_sample\_bytes\_change

`DDS_LongLong DDS_DataReaderProtocolStatus::received_sample_bytes_change`

The change in `DDS_DataReaderProtocolStatus::received_sample_bytes` (p. 1382) since the last time the status was read.

See also

`DDS_DataReaderProtocolStatus::received_sample_count_change` (p. 1382)

Note that when data is fragmented, this statistic is updated upon the receipt of each fragment, not when a sample is reassembled.

#### 5.28.2.5 duplicate\_sample\_count

`DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_count`

The number of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

#### 5.28.2.6 duplicate\_sample\_count\_change

`DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_count_change`

The change in `DDS_DataReaderProtocolStatus::duplicate_sample_count` (p. 1383) since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

#### 5.28.2.7 duplicate\_sample\_bytes

`DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_bytes`

The number of bytes of samples from a remote DataWriter received, not for the first time, by a local DataReader.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

#### 5.28.2.8 duplicate\_sample\_bytes\_change

`DDS_LongLong DDS_DataReaderProtocolStatus::duplicate_sample_bytes_change`

The change in `DDS_DataReaderProtocolStatus::duplicate_sample_bytes` (p. 1383) since the last time the status was read.

Such samples can be redundant, out-of-order, etc. and are not stored in the reader's queue.

### 5.28.2.9 filtered\_sample\_count

`DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_count`

[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 1368)  
`DDS_DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 1368)

### 5.28.2.10 filtered\_sample\_count\_change

`DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_count_change`

[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 1368)  
`DDS_DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 1368)

### 5.28.2.11 filtered\_sample\_bytes

`DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_bytes`

[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 1368)  
`DDS_DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 1368)

### 5.28.2.12 filtered\_sample\_bytes\_change

`DDS_LongLong DDS_DataReaderProtocolStatus::filtered_sample_bytes_change`

[DEPRECATED]. See: `DDS_DataReaderCacheStatus::time_based_filter_dropped_sample_count` (p. 1368)  
`DDS_DataReaderCacheStatus::content_filter_dropped_sample_count` (p. 1368)

### 5.28.2.13 received\_heartbeat\_count

`DDS_LongLong DDS_DataReaderProtocolStatus::received_heartbeat_count`

The number of Heartbeats from a remote DataWriter received by a local DataReader.

### 5.28.2.14 received\_heartbeat\_count\_change

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::received\_heartbeat\_count\_change

The change in **DDS\_DataReaderProtocolStatus::received\_heartbeat\_count** (p. 1384) since the last time the status was read.

### 5.28.2.15 received\_heartbeat\_bytes

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::received\_heartbeat\_bytes

The number of bytes of Heartbeats from a remote DataWriter received by a local DataReader.

### 5.28.2.16 received\_heartbeat\_bytes\_change

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::received\_heartbeat\_bytes\_change

The change in **DDS\_DataReaderProtocolStatus::received\_heartbeat\_bytes** (p. 1385) since the last time the status was read.

### 5.28.2.17 sent\_ack\_count

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_ack\_count

The number of ACKs sent from a local DataReader to a matching remote DataWriter.

### 5.28.2.18 sent\_ack\_count\_change

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_ack\_count\_change

The change in **DDS\_DataReaderProtocolStatus::sent\_ack\_count** (p. 1385) since the last time the status was read.

### 5.28.2.19 sent\_ack\_bytes

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_ack\_bytes

The number of bytes of ACKs sent from a local DataReader to a matching remote DataWriter.

### 5.28.2.20 sent\_ack\_bytes\_change

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_ack\_bytes\_change

The change in **DDS\_DataReaderProtocolStatus::sent\_ack\_bytes** (p. 1385) since the last time the status was read.

### 5.28.2.21 sent\_nack\_count

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_nack\_count

The number of NACKs sent from a local DataReader to a matching remote DataWriter.

### 5.28.2.22 sent\_nack\_count\_change

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_nack\_count\_change

The change in **DDS\_DataReaderProtocolStatus::sent\_nack\_count** (p. 1386) since the last time the status was read.

### 5.28.2.23 sent\_nack\_bytes

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_nack\_bytes

The number of bytes of NACKs sent from a local DataReader to a matching remote DataWriter.

### 5.28.2.24 sent\_nack\_bytes\_change

**DDS\_LongLong** DDS\_DataReaderProtocolStatus::sent\_nack\_bytes\_change

The change in **DDS\_DataReaderProtocolStatus::sent\_nack\_bytes** (p. 1386) since the last time the status was read.

### 5.28.2.25 received\_gap\_count

`DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_count`

The number of GAPS received from remote DataWriter to this DataReader.

### 5.28.2.26 received\_gap\_count\_change

`DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_count_change`

The change in `DDS_DataReaderProtocolStatus::received_gap_count` (p. 1386) since the last time the status was read.

### 5.28.2.27 received\_gap\_bytes

`DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_bytes`

The number of bytes of GAPS received from remote DataWriter to this DataReader.

### 5.28.2.28 received\_gap\_bytes\_change

`DDS_LongLong DDS_DataReaderProtocolStatus::received_gap_bytes_change`

The change in `DDS_DataReaderProtocolStatus::received_gap_bytes` (p. 1387) since the last time the status was read.

### 5.28.2.29 rejected\_sample\_count

`DDS_LongLong DDS_DataReaderProtocolStatus::rejected_sample_count`

The number of times a sample is rejected because it cannot be accepted by a reliable DataReader.

Samples rejected by a reliable DataReader will be NACKed, and they will have to be resent by the DataWriter if they are still available in the DataWriter queue.

This counter will always be 0 when using `DDS_BEST_EFFORT_RELIABILITY_QOS` (p. 1124).

### 5.28.2.30 rejected\_sample\_count\_change

```
DDS_LongLong DDS_DataReaderProtocolStatus::rejected_sample_count_change
```

The change in `DDS_DataReaderProtocolStatus::rejected_sample_count` (p. 1387) since the last time the status was read.

This counter will always be 0 when using `DDS_BEST_EFFORT_RELIABILITY_QOS` (p. 1124).

### 5.28.2.31 first\_available\_sample\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::first_available_sample_sequence_number
```

Sequence number of the first available sample in a matched DataWriters reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

### 5.28.2.32 last\_available\_sample\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::last_available_sample_sequence_number
```

Sequence number of the last available sample in a matched Datawriter's reliability queue.

Applicable only for reliable DataReaders, and when retrieving matched DataWriter statuses.

Updated upon receiving Heartbeat submessages from a matched reliable DataWriter.

### 5.28.2.33 last\_committed\_sample\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataReaderProtocolStatus::last_committed_sample_sequence_number
```

Sequence number of the newest sample received from the matched DataWriter committed to the DataReader's queue.

Applicable only when retrieving matched DataWriter statuses.

For best-effort DataReaders, this is the sequence number of the latest sample received.

For reliable DataReaders, this is the sequence number of the latest sample that is available to be read or taken from the DataReader's queue.

### 5.28.2.34 uncommitted\_sample\_count

```
DDS_Long DDS_DataReaderProtocolStatus::uncommitted_sample_count
```

Number of received samples that are not yet available to be read or taken, due to being received out of order.

Applicable only when retrieving matched DataWriter statuses.

### 5.28.2.35 out\_of\_range\_rejected\_sample\_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::out_of_range_rejected_sample_count
```

The number of samples dropped by the DataReader due to received window is full and the sample is out-of-order.

When using **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124); if the DataReader received samples out-of-order, they are stored internally until the missing samples are received. The number of out-of-order samples that the DataReader can keep is set by **DDS\_RtpsReliableReaderProtocol\_t::receive\_window\_size** (p. 1697). When the received window is full any out-of-order sample received will be dropped.

### 5.28.2.36 received\_fragment\_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::received_fragment_count
```

The number of DATA\_FRAG messages that have been received by this DataReader.

This statistic is incremented upon the receipt of each DATA\_FRAG message. Fragments from duplicate samples do not count towards this statistic. Applicable only when data is fragmented.

### 5.28.2.37 dropped\_fragment\_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::dropped_fragment_count
```

The number of DATA\_FRAG messages that have been dropped by a DataReader.

This statistic does not include malformed fragments. Applicable only when data is fragmented.

### 5.28.2.38 reassembled\_sample\_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::reassembled_sample_count
```

The number of fragmented samples that have been reassembled by a DataReader.

This statistic is incremented when all of the fragments which are required to reassemble an entire sample have been received. Applicable only when data is fragmented.

### 5.28.2.39 sent\_nack\_fragment\_count

```
DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_fragment_count
```

The number of NACK fragments that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

### 5.28.2.40 sent\_nack\_fragment\_bytes

`DDS_LongLong DDS_DataReaderProtocolStatus::sent_nack_fragment_bytes`

The number of NACK fragment bytes that have been sent from a DataReader to a DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

## 5.29 DDS\_DataReaderQos Struct Reference

QoS policies supported by a `DDS_DataReader` (p. 608) entity.

### 5.29.1 Detailed Description

QoS policies supported by a **DDS\_DataReader** (p. 608) entity.

You must set certain members in a consistent manner:

**DDS\_DataReaderQos::deadline** (p. 1392) .period >= **DDS\_DataReaderQos::time\_based\_filter** (p. 1393) .minimum\_separation

**DDS\_DataReaderQos::history** (p. 1393) .depth <= **DDS\_DataReaderQos::resource\_limits** (p. 1393) .max\_samples\_per\_instance

**DDS\_DataReaderQos::resource\_limits** (p. 1393) .max\_samples\_per\_instance <= **DDS\_DataReaderQos::resource\_limits** (p. 1393) .max\_samples **DDS\_DataReaderQos::resource\_limits** (p. 1393) .initial\_samples <= **DDS\_DataReaderQos::resource\_limits** (p. 1393) .max\_samples

**DDS\_DataReaderQos::resource\_limits** (p. 1393) .initial\_instances <= **DDS\_DataReaderQos::resource\_limits** (p. 1393) .max\_instances

**DDS\_DataReaderQos::reader\_resource\_limits** (p. 1394) .initial\_remote\_writers\_per\_instance <= **DDS\_DataReaderQos::reader\_resource\_limits** (p. 1394) .max\_remote\_writers\_per\_instance

**DDS\_DataReaderQos::reader\_resource\_limits** (p. 1394) .initial\_infos <= **DDS\_DataReaderQos::reader\_resource\_limits** (p. 1394) .max\_infos

**DDS\_DataReaderQos::reader\_resource\_limits** (p. 1394) `.max_remote_writers_per_instance` `<=` **DDS\_DataReaderQos::reader\_resource\_limits** (p. 1394) `.max_remote_writers`

**DDS\_DataReaderQos::reader\_resource\_limits** (p. 1394) `.max_samples_per_remote_writer` `<=` **DDS\_DataReaderQos::resource\_limits** (p. 1393) `.max_samples`

length of **DDS\_DataReaderQos::user\_data** (p. 1393) `.value` `<=` **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) `.reader_user_data_max_length`

If any of the above are not true, **DDS\_DataReader\_set\_qos** (p. 679) and **DDS\_DataReader\_set\_qos\_with\_profile** (p. 679) will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025) and **DDS\_Subscriber\_create\_datareader** (p. 574) will return NULL.

## 5.29.2 Field Documentation

### 5.29.2.1 durability

```
struct DDS_DurabilityQosPolicy DDS_DataReaderQos::durability
```

Durability policy, **DURABILITY** (p. 1086).

### 5.29.2.2 deadline

```
struct DDS_DeadlineQosPolicy DDS_DataReaderQos::deadline
```

Deadline policy, **DEADLINE** (p. 1073).

### 5.29.2.3 latency\_budget

```
struct DDS_LatencyBudgetQosPolicy DDS_DataReaderQos::latency_budget
```

Latency budget policy, **LATENCY\_BUDGET** (p. 1095).

### 5.29.2.4 liveliness

```
struct DDS_LivelinessQosPolicy DDS_DataReaderQos::liveliness
```

Liveliness policy, **LIVELINESS** (p. 1097).

### 5.29.2.5 reliability

```
struct DDS_ReliabilityQosPolicy DDS_DataReaderQos::reliability
```

Reliability policy, **RELIABILITY** (p. 1122).

### 5.29.2.6 destination\_order

```
struct DDS_DestinationOrderQosPolicy DDS_DataReaderQos::destination_order
```

Destination order policy, **DESTINATION\_ORDER** (p. 1074).

### 5.29.2.7 history

```
struct DDS_HistoryQosPolicy DDS_DataReaderQos::history
```

History policy, **HISTORY** (p. 1093).

### 5.29.2.8 resource\_limits

```
struct DDS_ResourceLimitsQosPolicy DDS_DataReaderQos::resource_limits
```

Resource limits policy, **RESOURCE\_LIMITS** (p. 1126).

### 5.29.2.9 user\_data

```
struct DDS_UserDataQosPolicy DDS_DataReaderQos::user_data
```

User data policy, **USER\_DATA** (p. 1143).

### 5.29.2.10 ownership

```
struct DDS_OwnershipQosPolicy DDS_DataReaderQos::ownership
```

Ownership policy, **OWNERSHIP** (p. 1102).

### 5.29.2.11 time\_based\_filter

```
struct DDS_TimeBasedFilterQosPolicy DDS_DataReaderQos::time_based_filter
```

Time-based filter policy, **TIME\_BASED\_FILTER** (p. 1129).

### 5.29.2.12 reader\_data\_lifecycle

```
struct DDS_ReaderDataLifecycleQosPolicy DDS_DataReaderQos::reader_data_lifecycle
```

Reader data lifecycle policy, **READER\_DATA\_LIFECYCLE** (p. 1121).

### 5.29.2.13 representation

```
struct DDS_DataRepresentationQosPolicy DDS_DataReaderQos::representation
```

Data representation policy, **DATA\_REPRESENTATION** (p. 1057).

### 5.29.2.14 type\_consistency

```
struct DDS_TypeConsistencyEnforcementQosPolicy DDS_DataReaderQos::type_consistency
```

Type consistency enforcement policy, **TYPE\_CONSISTENCY\_ENFORCEMENT** (p. 1140).

### 5.29.2.15 data\_tags

```
DDS_DataTagQosPolicy DDS_DataReaderQos::data_tags
```

DataTag policy, **DATA\_TAG** (p. 1064).

### 5.29.2.16 reader\_resource\_limits

```
struct DDS_DataReaderResourceLimitsQosPolicy DDS_DataReaderQos::reader_resource_limits
```

<<*extension*>> (p. 817) **DDS\_DataReader** (p. 608) resource limits policy, **DATA\_READER\_RESOURCE\_LIMITS** (p. 1055). This policy is an extension to the DDS standard.

### 5.29.2.17 protocol

```
struct DDS_DataReaderProtocolQosPolicy DDS_DataReaderQos::protocol
```

<<*extension*>> (p. 817) **DDS\_DataReader** (p. 608) protocol policy, **DATA\_READER\_PROTOCOL** (p. 1054)

### 5.29.2.18 transport\_selection

```
struct DDS_TransportSelectionQosPolicy DDS_DataReaderQos::transport_selection
```

<<*extension*>> (p. 817) Transport selection policy, **TRANSPORT\_SELECTION** (p. 1139).

Specifies the transports available for use by the **DDS\_DataReader** (p. 608).

### 5.29.2.19 unicast

```
struct DDS_TransportUnicastQosPolicy DDS_DataReaderQos::unicast
```

<<*extension*>> (p. 817) Unicast transport policy, **TRANSPORT\_UNICAST** (p. 1139).

Specifies the unicast transport interfaces and ports on which **messages** can be received.

The unicast interfaces are used to receive messages from **DDS\_DataWriter** (p. 478) entities in the domain.

### 5.29.2.20 multicast

```
struct DDS_TransportMulticastQosPolicy DDS_DataReaderQos::multicast
```

<<*extension*>> (p. 817) Multicast transport policy, **TRANSPORT\_MULTICAST** (p. 1136).

Specifies the multicast group addresses and ports on which **messages** can be received.

The multicast addresses are used to receive messages from **DDS\_DataWriter** (p. 478) entities in the domain.

### 5.29.2.21 property

```
struct DDS_PropertyQosPolicy DDS_DataReaderQos::property
```

<<*extension*>> (p. 817) Property policy, **PROPERTY** (p. 1107). See also [Property Reference Guide](#).

### 5.29.2.22 service

```
struct DDS_ServiceQosPolicy DDS_DataReaderQos::service
```

<<*extension*>> (p. 817) Service policy, **SERVICE** (p. 1127).

### 5.29.2.23 availability

```
struct DDS_AvailabilityQosPolicy DDS_DataReaderQos::availability
```

<<*extension*>> (p. 817) Availability policy, **AVAILABILITY** (p. 1052).

### 5.29.2.24 subscription\_name

```
struct DDS_EntityNameQosPolicy DDS_DataReaderQos::subscription_name
```

<<*extension*>> (p. 817) EntityName policy, **ENTITY\_NAME** (p. 1091).

### 5.29.2.25 transport\_priority

```
struct DDS_TransportPriorityQosPolicy DDS_DataReaderQos::transport_priority
```

Transport priority policy, **TRANSPORT\_PRIORITY** (p. 1138).

### 5.29.2.26 type\_support

```
struct DDS_TypeSupportQosPolicy DDS_DataReaderQos::type_support
```

<<*extension*>> (p. 817) type support data, **TYPESUPPORT** (p. 1142).

Optional value that is passed to a type plugin's `on_endpoint_attached` and `deserialization` functions.

## 5.30 DDS\_DataReaderResourceLimitsInstanceReplacementSettings Struct Reference

Instance replacement kind applied to each instance state.

## Data Fields

- **DDS\_DataReaderInstanceRemovalKind alive\_instance\_removal**  
*Removal kind applied to alive (**DDS\_ALIVE\_INSTANCE\_STATE** (p. 707)) instances.*
- **DDS\_DataReaderInstanceRemovalKind disposed\_instance\_removal**  
*Removal kind applied to disposed (**DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707)) instances.*
- **DDS\_DataReaderInstanceRemovalKind no\_writers\_instance\_removal**  
*Removal kind applied to fully-unregistered (**DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707)) instances.*

### 5.30.1 Detailed Description

Instance replacement kind applied to each instance state.

[default]

- **DDS\_DataReaderResourceLimitsInstanceReplacementSettings::alive\_instance\_removal** (p. 1397) = **DDS\_NO\_INSTANCE\_REMOVAL** (p. 1056)
- **DDS\_DataReaderResourceLimitsInstanceReplacementSettings::disposed\_instance\_removal** (p. 1397) = **DDS\_EMPTY\_INSTANCE\_REMOVAL** (p. 1056)
- **DDS\_DataReaderResourceLimitsInstanceReplacementSettings::no\_writers\_instance\_removal** (p. 1397) = **DDS\_EMPTY\_INSTANCE\_REMOVAL** (p. 1056)

### 5.30.2 Field Documentation

#### 5.30.2.1 alive\_instance\_removal

**DDS\_DataReaderInstanceRemovalKind** **DDS\_DataReaderResourceLimitsInstanceReplacementSettings::alive↔\_instance\_removal**

Removal kind applied to alive (**DDS\_ALIVE\_INSTANCE\_STATE** (p. 707)) instances.

[default] **DDS\_NO\_INSTANCE\_REMOVAL** (p. 1056)

#### 5.30.2.2 disposed\_instance\_removal

**DDS\_DataReaderInstanceRemovalKind** **DDS\_DataReaderResourceLimitsInstanceReplacementSettings::disposed↔\_instance\_removal**

Removal kind applied to disposed (**DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707)) instances.

[default] **DDS\_EMPTY\_INSTANCE\_REMOVAL** (p. 1056)

### 5.30.2.3 no\_writers\_instance\_removal

`DDS_DataReaderInstanceRemovalKind` `DDS_DataReaderResourceLimitsInstanceReplacementSettings::no_↔`  
`writers_instance_removal`

Removal kind applied to fully-unregistered (`DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE` (p. 707)) instances.

[default] `DDS_EMPTY_INSTANCE_REMOVAL` (p. 1056)

## 5.31 DDS\_DataReaderResourceLimitsQosPolicy Struct Reference

Various settings that configure how a `DDS_DataReader` (p. 608) allocates and uses physical memory for internal resources.

### Data Fields

- **DDS\_Long max\_remote\_writers**  
*The maximum number of remote writers from which a `DDS_DataReader` (p. 608) may read, including all instances.*
- **DDS\_Long max\_remote\_writers\_per\_instance**  
*The maximum number of remote writers from which a `DDS_DataReader` (p. 608) may read a single instance.*
- **DDS\_Long max\_samples\_per\_remote\_writer**  
*The maximum number of out-of-order samples from a given remote `DDS_DataWriter` (p. 478) that a `DDS_DataReader` (p. 608) may store when maintaining a reliable connection to the `DDS_DataWriter` (p. 478).*
- **DDS\_Long max\_infos**  
*The maximum number of info units that a `DDS_DataReader` (p. 608) can use to store `DDS_SampleInfo` (p. 1720).*
- **DDS\_Long initial\_remote\_writers**  
*The initial number of remote writers from which a `DDS_DataReader` (p. 608) may read, including all instances.*
- **DDS\_Long initial\_remote\_writers\_per\_instance**  
*The initial number of remote writers from which a `DDS_DataReader` (p. 608) may read a single instance.*
- **DDS\_Long initial\_infos**  
*The initial number of info units that a `DDS_DataReader` (p. 608) can have, which are used to store `DDS_SampleInfo` (p. 1720).*
- **DDS\_Long initial\_outstanding\_reads**  
*The initial number of outstanding calls to read/take (or one of their variants) on the same `DDS_DataReader` (p. 608) for which memory has not been returned by calling `FooDataReader_return_loan` (p. 639).*
- **DDS\_Long max\_outstanding\_reads**  
*The maximum number of outstanding read/take calls (or one of their variants) on the same `DDS_DataReader` (p. 608) for which memory has not been returned by calling `FooDataReader_return_loan` (p. 639).*
- **DDS\_Long max\_samples\_per\_read**  
*The maximum number of data samples that the application can receive from the middleware in a single call to `FooData↔`  
`Reader_read` (p. 618) or `FooDataReader_take` (p. 619). If more data exists in the middleware, the application will need to issue multiple read/take calls.*
- **DDS\_Boolean disable\_fragmentation\_support**  
*Determines whether the `DDS_DataReader` (p. 608) can receive fragmented samples.*
- **DDS\_Long max\_fragmented\_samples**  
*The maximum number of samples for which the `DDS_DataReader` (p. 608) may store fragments at a given point in time.*

- **DDS\_Long initial\_fragmented\_samples**  
*The initial number of samples for which a **DDS\_DataReader** (p. 608) may store fragments.*
- **DDS\_Long max\_fragmented\_samples\_per\_remote\_writer**  
*The maximum number of samples per remote writer for which a **DDS\_DataReader** (p. 608) may store fragments.*
- **DDS\_Long max\_fragments\_per\_sample**  
*Maximum number of fragments for a single sample.*
- **DDS\_Boolean dynamically\_allocate\_fragmented\_samples**  
*Determines whether the **DDS\_DataReader** (p. 608) pre-allocates storage for storing fragmented samples.*
- **DDS\_Long max\_total\_instances**  
*Maximum number of instances for which a **DataReader** will keep state.*
- **DDS\_Long max\_remote\_virtual\_writers**  
*The maximum number of remote virtual writers from which a **DDS\_DataReader** (p. 608) may read, including all instances.*
- **DDS\_Long initial\_remote\_virtual\_writers**  
*The initial number of remote virtual writers from which a **DDS\_DataReader** (p. 608) may read, including all instances.*
- **DDS\_Long max\_remote\_virtual\_writers\_per\_instance**  
*The maximum number of virtual remote writers that can be associated with an instance.*
- **DDS\_Long initial\_remote\_virtual\_writers\_per\_instance**  
*The initial number of virtual remote writers per instance.*
- **DDS\_Long max\_remote\_writers\_per\_sample**  
*The maximum number of remote writers allowed to write the same sample.*
- **DDS\_Long max\_query\_condition\_filters**  
*The maximum number of query condition filters a reader is allowed.*
- **DDS\_Long max\_app\_ack\_response\_length**  
*Maximum length of application-level acknowledgment response data.*
- **DDS\_Boolean keep\_minimum\_state\_for\_instances**  
*Whether or not keep a minimum instance state for up to **DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances** (p. 1405).*
- **DDS\_Long initial\_topic\_queries**  
*The initial number of **TopicQueries** allocated by a **DDS\_DataReader** (p. 608).*
- **DDS\_Long max\_topic\_queries**  
*The maximum number of active **TopicQueries** that a **DDS\_DataReader** (p. 608) can create.*
- struct **DDS\_AllocationSettings\_t shm\_ref\_transfer\_mode\_attached\_segment\_allocation**  
*Allocation resource for the shared memory segments attached by the **DDS\_DataReader** (p. 608).*
- struct **DDS\_DataReaderResourceLimitsInstanceReplacementSettings instance\_replacement**  
*Sets the kind of instances allowed to be replaced for each instance state (**DDS\_InstanceStateKind** (p. 706)) when a **DataReader** reaches **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693).*
- struct **DDS\_Duration\_t autopurge\_remote\_not\_alive\_writer\_delay**  
*Maximum duration for which the **DDS\_DataReader** (p. 608) will maintain information regarding a **DDS\_DataWriter** (p. 478) once the **DDS\_DataWriter** (p. 478) has become not alive.*

### 5.31.1 Detailed Description

Various settings that configure how a **DDS\_DataReader** (p. 608) allocates and uses physical memory for internal resources.

DataReaders must allocate internal structures to handle the maximum number of DataWriters that may connect to it, whether or not a **DDS\_DataReader** (p. 608) handles data fragmentation and how many data fragments that it may

handle (for data samples larger than the MTU of the underlying network transport), how many simultaneous outstanding loans of internal memory holding data samples can be provided to user code, as well as others.

Most of these internal structures start at an initial size and, by default, will grow as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDS\_DataReader** (p. 608). By setting the initial size to the maximum size, you will prevent RTI Connext from dynamically allocating any memory after the creation of the **DDS\_DataReader** (p. 608).

This QoS policy is an extension to the DDS standard.

Entity:

**DDS\_DataReader** (p. 608)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.31.2 Field Documentation

### 5.31.2.1 max\_remote\_writers

**DDS\_Long** `DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers`

The maximum number of remote writers from which a **DDS\_DataReader** (p. 608) may read, including all instances.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  initial\_remote\_writers,  $\geq$  max\_remote\_writers\_per\_instance

For unkeyed types, this value has to be equal to max\_remote\_writers\_per\_instance if max\_remote\_writers\_per\_instance is not equal to **DDS\_LENGTH\_UNLIMITED** (p. 1127).

Note: For efficiency, set max\_remote\_writers  $\geq$  **DDS\_DataReaderResourceLimitsQosPolicy::max\_remote\_writers\_per\_instance** (p. 1400).

### 5.31.2.2 max\_remote\_writers\_per\_instance

**DDS\_Long** `DDS_DataReaderResourceLimitsQosPolicy::max_remote_writers_per_instance`

The maximum number of remote writers from which a **DDS\_DataReader** (p. 608) may read a single instance.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1024] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\leq$  max\_remote\_writers or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  initial\_remote\_writers\_per\_instance

For unkeyed types, this value has to be equal to max\_remote\_writers if it is not **DDS\_LENGTH\_UNLIMITED** (p. 1127).

Note: For efficiency, set max\_remote\_writers\_per\_instance  $\leq$  **DDS\_DataReaderResourceLimitsQosPolicy::max\_remote\_writers** (p. 1400)

### 5.31.2.3 max\_samples\_per\_remote\_writer

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_samples\_per\_remote\_writer

The maximum number of out-of-order samples from a given remote **DDS\_DataWriter** (p. 478) that a **DDS\_DataReader** (p. 608) may store when maintaining a reliable connection to the **DDS\_DataWriter** (p. 478).

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 100 million] or **DDS\_LENGTH\_UNLIMITED** (p.1127),  $\leq$  **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693)

### 5.31.2.4 max\_infos

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_infos

The maximum number of info units that a **DDS\_DataReader** (p. 608) can use to store **DDS\_SampleInfo** (p. 1720).

When read/take is called on a DataReader, the DataReader passes a sequence of data samples and an associated sample info sequence. The sample info sequence contains additional information for each data sample.

max\_infos determines the resources allocated for storing sample info. This memory is loaned to the application when passing a sample info sequence.

Note that sample info is a snapshot, generated when read/take is called.

max\_infos should not be less than max\_samples.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  initial\_infos

### 5.31.2.5 initial\_remote\_writers

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_remote\_writers

The initial number of remote writers from which a **DDS\_DataReader** (p. 608) may read, including all instances.

**[default]** 2

**[range]** [1, 1 million],  $\leq$  max\_remote\_writers

For unkeyed types this value has to be equal to initial\_remote\_writers\_per\_instance.

Note: For efficiency, set initial\_remote\_writers  $\geq$  **DDS\_DataReaderResourceLimitsQosPolicy::initial\_remote\_writers\_per\_instance** (p. 1401).

### 5.31.2.6 initial\_remote\_writers\_per\_instance

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_remote\_writers\_per\_instance

The initial number of remote writers from which a **DDS\_DataReader** (p. 608) may read a single instance.

**[default]** 2

**[range]** [1,1024], <= max\_remote\_writers\_per\_instance

For unkeyed types this value has to be equal to initial\_remote\_writers.

Note: For efficiency, set initial\_remote\_writers\_per\_instance <= **DDS\_DataReaderResourceLimitsQosPolicy**↔  
::initial\_remote\_writers (p. 1401).

### 5.31.2.7 initial\_infos

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_infos

The initial number of info units that a **DDS\_DataReader** (p. 608) can have, which are used to store **DDS\_SampleInfo** (p. 1720).

**[default]** 32

**[range]** [1,1 million], <= max\_infos

### 5.31.2.8 initial\_outstanding\_reads

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_outstanding\_reads

The initial number of outstanding calls to read/take (or one of their variants) on the same **DDS\_DataReader** (p. 608) for which memory has not been returned by calling **FooDataReader\_return\_loan** (p. 639).

**[default]** 2

**[range]** [1, 65536], <= max\_outstanding\_reads

### 5.31.2.9 max\_outstanding\_reads

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_outstanding\_reads

The maximum number of outstanding read/take calls (or one of their variants) on the same **DDS\_DataReader** (p. 608) for which memory has not been returned by calling **FooDataReader\_return\_loan** (p. 639).

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 65536] or **DDS\_LENGTH\_UNLIMITED** (p. 1127), >= initial\_outstanding\_reads

### 5.31.2.10 max\_samples\_per\_read

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_samples\_per\_read

The maximum number of data samples that the application can receive from the middleware in a single call to **FooDataReader\_read** (p. 618) or **FooDataReader\_take** (p. 619). If more data exists in the middleware, the application will need to issue multiple read/take calls.

When reading data using listeners, the expected number of samples available for delivery in a single `take` call is typically small: usually just one, in the case of unbatched data, or the number of samples in a single batch, in the case of batched data. (See **DDS\_BatchQosPolicy** (p. 1334) for more information about this feature.) When polling for data or using a **DDS\_WaitSet** (p. 1170), however, multiple samples (or batches) could be retrieved at once, depending on the data rate.

A larger value for this parameter makes the API simpler to use at the expense of some additional memory consumption.

**[default]** 1024

**[range]** [1,65536]

### 5.31.2.11 disable\_fragmentation\_support

**DDS\_Boolean** DDS\_DataReaderResourceLimitsQosPolicy::disable\_fragmentation\_support

Determines whether the **DDS\_DataReader** (p. 608) can receive fragmented samples.

When fragmentation support is not needed, disabling fragmentation support will save some memory resources.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.31.2.12 max\_fragmented\_samples

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_fragmented\_samples

The maximum number of samples for which the **DDS\_DataReader** (p. 608) may store fragments at a given point in time.

At any given time, a **DDS\_DataReader** (p. 608) may store fragments for up to `max_fragmented_samples` samples while waiting for the remaining fragments. These samples need not have consecutive sequence numbers and may have been sent by different **DDS\_DataWriter** (p. 478) instances.

Once all fragments of a sample have been received, the sample is treated as a regular sample and becomes subject to standard QoS settings such as **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693).

The middleware will drop fragments if the `max_fragmented_samples` limit has been reached. For best-effort communication, the middleware will accept a fragment for a new sample, but drop the oldest fragmented sample from the same remote writer. For reliable communication, the middleware will drop fragments for any new samples until all fragments for at least one older sample from that writer have been received.

Only applies if **DDS\_DataReaderResourceLimitsQosPolicy::disable\_fragmentation\_support** (p. 1403) is **DDS\_BOOLEAN\_FALSE** (p. 1004).

**[default]** 1024

**[range]** [1, 1 million]

### 5.31.2.13 initial\_fragmented\_samples

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_fragmented\_samples

The initial number of samples for which a **DDS\_DataReader** (p. 608) may store fragments.

Only applies if **DDS\_DataReaderResourceLimitsQosPolicy::disable\_fragmentation\_support** (p. 1403) is **DDS\_↔  
BOOLEAN\_FALSE** (p. 1004).

**[default]** 4

**[range]** [1,1024], <= max\_fragmented\_samples

### 5.31.2.14 max\_fragmented\_samples\_per\_remote\_writer

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_fragmented\_samples\_per\_remote\_writer

The maximum number of samples per remote writer for which a **DDS\_DataReader** (p. 608) may store fragments.

Logical limit so a single remote writer cannot consume all available resources.

Only applies if **DDS\_DataReaderResourceLimitsQosPolicy::disable\_fragmentation\_support** (p. 1403) is **DDS\_↔  
BOOLEAN\_FALSE** (p. 1004).

**[default]** 256

**[range]** [1, 1 million], <= max\_fragmented\_samples

### 5.31.2.15 max\_fragments\_per\_sample

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_fragments\_per\_sample

Maximum number of fragments for a single sample.

Only applies if **DDS\_DataReaderResourceLimitsQosPolicy::disable\_fragmentation\_support** (p. 1403) is **DDS\_↔  
BOOLEAN\_FALSE** (p. 1004).

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.31.2.16 dynamically\_allocate\_fragmented\_samples

**DDS\_Boolean** DDS\_DataReaderResourceLimitsQosPolicy::dynamically\_allocate\_fragmented\_samples

Determines whether the **DDS\_DataReader** (p. 608) pre-allocates storage for storing fragmented samples.

By default, the middleware does not allocate memory upfront, but instead allocates memory from the heap upon receiving the first fragment of a new sample. The amount of memory allocated equals the amount of memory needed to store all fragments in the sample. Once all fragments of a sample have been received, the sample is deserialized and stored in the regular receive queue. At that time, the dynamically allocated memory is freed again.

This QoS setting is useful for large, but variable-sized data types where upfront memory allocation for multiple samples based on the maximum possible sample size may be expensive. The main disadvantage of not pre-allocating memory is that one can no longer guarantee the middleware will have sufficient resources at runtime.

If `dynamically_allocate_fragmented_samples` is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), the middleware will allocate memory upfront for storing fragments for up to **DDS\_DataReaderResourceLimitsQosPolicy::initial\_fragmented\_samples** (p. 1403) samples. This memory may grow up to **DDS\_DataReaderResourceLimitsQosPolicy::max\_fragmented\_samples** (p. 1403) if needed.

Only applies if **DDS\_DataReaderResourceLimitsQosPolicy::disable\_fragmentation\_support** (p. 1403) is **DDS\_BOOLEAN\_FALSE** (p. 1004).

[default] **DDS\_BOOLEAN\_TRUE** (p. 1004)

### 5.31.2.17 max\_total\_instances

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances

Maximum number of instances for which a DataReader will keep state.

The maximum number of instances actively managed by a DataReader is determined by **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693).

These instances have associated DataWriters or samples in the DataReader's queue and are visible to the user through operations such as **FooDataReader\_take** (p. 619), **FooDataReader\_read** (p. 618), and **FooDataReader\_get\_key\_value** (p. 640).

The features Durable Reader State, MultiChannel DataWriters and RTI Persistence Service require RTI Connex to keep some internal state even for instances without DataWriters or samples in the DataReader's queue. The additional state is used to filter duplicate samples that could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

The total maximum number of instances that will be managed by the middleware, including instances without associated DataWriters or samples, is determined by `max_total_instances`.

When a new instance is received, RTI Connex will check the resource limit **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693). If the limit is exceeded, RTI Connex will drop the sample with the reason **LOST\_BY\_INSTANCES\_LIMIT**. If the limit is not exceeded, RTI Connex will check `max_total_instances`. If `max_total_instances` is exceeded, RTI Connex will replace an existing instance without DataWriters and samples with the new one. The application could receive duplicate samples for the replaced instance if it becomes alive again.

The `max_total_instances` limit is not used if **DDS\_DataReaderResourceLimitsQosPolicy::keep\_minimum\_state\_for\_instances** (p. 1408) is false, and in that case should be left at the default value.

[default] **DDS\_AUTO\_MAX\_TOTAL\_INSTANCES** (p. 1057)

[range] [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127) or **DDS\_AUTO\_MAX\_TOTAL\_INSTANCES** (p. 1057),  $\geq$  **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693)

### 5.31.2.18 max\_remote\_virtual\_writers

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_remote\_virtual\_writers

The maximum number of remote virtual writers from which a **DDS\_DataReader** (p. 608) may read, including all instances.

When **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) is set to **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106), this value determines the maximum number of DataWriter groups that can be managed by the **DDS\_↔Subscriber** (p. 565) containing this **DDS\_DataReader** (p. 608).

Since the **DDS\_Subscriber** (p. 565) may contain more than one **DDS\_DataReader** (p. 608), only the setting of the first applies.

**[default]** DDS\_LENGTH\_UNLIMITED (p. 1127)

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  initial\_remote\_virtual\_writers,  $\geq$  max\_remote\_↔virtual\_writers\_per\_instance

### 5.31.2.19 initial\_remote\_virtual\_writers

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_remote\_virtual\_writers

The initial number of remote virtual writers from which a **DDS\_DataReader** (p. 608) may read, including all instances.

**[default]** 2

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\leq$  max\_remote\_virtual\_writers

### 5.31.2.20 max\_remote\_virtual\_writers\_per\_instance

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_remote\_virtual\_writers\_per\_instance

The maximum number of virtual remote writers that can be associated with an instance.

**[default]** DDS\_LENGTH\_UNLIMITED (p. 1127)

**[range]** [1, 1024] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  initial\_remote\_virtual\_writers\_per\_instance

For unkeyed types, this value is ignored.

The features of Durable Reader State and MultiChannel DataWriters, and RTI Persistence Service require RTI Connex to keep some internal state per virtual writer and instance that is used to filter duplicate samples. These duplicate samples could be coming from different DataWriter channels or from multiple executions of RTI Persistence Service.

Once an association between a remote virtual writer and an instance is established, it is permanent – it will not disappear even if the physical writer incarnating the virtual writer is destroyed.

If max\_remote\_virtual\_writers\_per\_instance is exceeded for an instance, RTI Connex will not associate this instance with new virtual writers. Duplicates samples from these virtual writers will not be filtered on the reader.

If you are not using Durable Reader State, MultiChannel DataWriters or RTI Persistence Service in your system, you can set this property to 1 to optimize resources.

### 5.31.2.21 initial\_remote\_virtual\_writers\_per\_instance

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_remote\_virtual\_writers\_per\_instance

The initial number of virtual remote writers per instance.

**[default]** 2

**[range]** [1, 1024], <= max\_remote\_virtual\_writers\_per\_instance

For unkeyed types, this value is ignored.

### 5.31.2.22 max\_remote\_writers\_per\_sample

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_remote\_writers\_per\_sample

The maximum number of remote writers allowed to write the same sample.

One scenario in which two DataWriters may write the same sample is Persistence Service. The DataReader may receive the same sample coming from the original DataWriter and from a Persistence Service DataWriter. **[default]** 3

**[range]** [1, 1024]

### 5.31.2.23 max\_query\_condition\_filters

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_query\_condition\_filters

The maximum number of query condition filters a reader is allowed.

**[default]** 4

**[range]** [0, 32]

This value determines the maximum number of unique query condition content filters that a reader may create.

Each query condition content filter is comprised of both its `query_expression` and `query_parameters`. Two query conditions that have the same `query_expression` will require unique query condition filters if their `query_parameters` differ. Query conditions that differ only in their state masks will share the same query condition filter.

### 5.31.2.24 max\_app\_ack\_response\_length

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::max\_app\_ack\_response\_length

Maximum length of application-level acknowledgment response data.

The maximum length of response data in an application-level acknowledgment.

When set to zero, no response data is sent with application-level acknowledgments.

**[default]** 1

**[range]** [0, 32768]

### 5.31.2.25 keep\_minimum\_state\_for\_instances

**DDS\_Boolean** DDS\_DataReaderResourceLimitsQosPolicy::keep\_minimum\_state\_for\_instances

Whether or not keep a minimum instance state for up to **DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances** (p. 1405).

The features Durable Reader State, multi-channel DataWriters, and Persistence Service require RTI Connex to keep some minimal internal state even for instances without DataWriters or DDS samples in the DataReader's queue, or that have been purged due to a dispose. The additional state is used to filter duplicate DDS samples that could be coming from different DataWriter channels or from multiple executions of Persistence Service. The total maximum number of instances that will be managed by the middleware, including instances without associated DataWriters or DDS samples or that have been purged due to a dispose, is determined by **DDS\_DataReaderResourceLimitsQosPolicy::max\_total\_instances** (p. 1405).

This additional state will only be kept for up to max\_total\_instances if this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), otherwise the additional state will not be kept for any instances.

The minimum state includes information such as the source timestamp of the last sample received by the instance and the last sequence number received from a virtual GUID.

**[default]** **DDS\_BOOLEAN\_TRUE** (p. 1004)

### 5.31.2.26 initial\_topic\_queries

**DDS\_Long** DDS\_DataReaderResourceLimitsQosPolicy::initial\_topic\_queries

The initial number of TopicQueries allocated by a **DDS\_DataReader** (p. 608).

**[default]** 1

See also

**DDS\_TopicQuery** (p. 698)

### 5.31.2.27 max\_topic\_queries

```
DDS_Long DDS_DataReaderResourceLimitsQosPolicy::max_topic_queries
```

The maximum number of active TopicQueries that a **DDS\_DataReader** (p. 608) can create.

Once this limit is reached, a **DDS\_DataReader** (p. 608) can create more TopicQueries only if it deletes some of the previously created ones.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

See also

**DDS\_TopicQuery** (p. 698)

### 5.31.2.28 shm\_ref\_transfer\_mode\_attached\_segment\_allocation

```
struct DDS_AllocationSettings_t DDS_DataReaderResourceLimitsQosPolicy::shm_ref_transfer_mode_↔
attached_segment_allocation
```

Allocation resource for the shared memory segments attached by the **DDS\_DataReader** (p. 608).

The max\_count does not limit the total number of shared memory segments used by the **DDS\_DataReader** (p. 608). When this limit is hit, the **DDS\_DataReader** (p. 608) will try to detach from a segment that doesn't contain any loaned samples and attach to a new segment. If samples are loaned from all attached segments, then the **DDS\_DataReader** (p. 608) will fail to attach to the new segment. This scenario will result in a sample loss.

**[default]** initial\_count = **DDS\_AUTO\_COUNT** (p. 1085) (**DDS\_DataReaderResourceLimitsQosPolicy::initial\_↔** remote\_writers (p. 1401)); max\_count = **DDS\_AUTO\_COUNT** (p. 1085) (**DDS\_DataReaderResourceLimitsQos\_↔** Policy::max\_remote\_writers (p. 1400)); incremental\_count = **DDS\_AUTO\_COUNT** (p. 1085) (0 if initial\_count = max\_count; -1 otherwise);

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.31.2.29 instance\_replacement

```
struct DDS_DataReaderResourceLimitsInstanceReplacementSettings DDS_DataReaderResourceLimitsQos↔
Policy::instance_replacement
```

Sets the kind of instances allowed to be replaced for each instance state (**DDS\_InstanceStateKind** (p. 706)) when a DataReader reaches **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693).

When **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693) is reached, a **DDS\_DataReader** (p. 608) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kinds specified by this field.

A `DataReader` can choose what kinds of instances can be replaced for each `DDS_InstanceStateKind` (p. 706) separately. This means, for example, that a `DataReader` can choose to not allow replacing alive (`DDS_ALIVE_INSTANCE_STATE` (p. 707)) instances but allow replacement of empty disposed (`DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 707)) instances.

Only instances whose states match the specified kinds are eligible to be replaced. In addition, there must be no outstanding loans on any of the samples belonging to the instance for it to be considered for replacement.

For all kinds, a `DDS_DataReader` (p. 608) will replace the least-recently-updated instance satisfying that kind. An instance is considered 'updated' when a valid sample or dispose sample is received and accepted for that instance. When using `DDS_EXCLUSIVE_OWNERSHIP_QOS` (p. 1103), only samples that are received from the owner of the instance will cause the instance to be considered updated. An instance is not considered updated when an unregister sample is received because the unregister message simply indicates that there is one less writer that has updates for the instance, not that the instance itself was updated.

If no replaceable instance exists, the sample for the new instance will be considered lost with lost reason `DDS_LOST_BY_INSTANCES_LIMIT` (p. 611) and the instance will not be asserted into the `DataReader` queue.

#### [default]

- `DDS_DataReaderResourceLimitsInstanceReplacementSettings::alive_instance_removal` (p. 1397) = `DDS_NO_INSTANCE_REMOVAL` (p. 1056)
- `DDS_DataReaderResourceLimitsInstanceReplacementSettings::disposed_instance_removal` (p. 1397) = `DDS_EMPTY_INSTANCE_REMOVAL` (p. 1056)
- `DDS_DataReaderResourceLimitsInstanceReplacementSettings::no_writers_instance_removal` (p. 1397) = `DDS_EMPTY_INSTANCE_REMOVAL` (p. 1056)

See also

`DDS_DataReaderResourceLimitsInstanceReplacementSettings` (p. 1396)

#### 5.31.2.30 `autopurge_remote_not_alive_writer_delay`

```
struct DDS_Duration_t DDS_DataReaderResourceLimitsQosPolicy::autopurge_remote_not_alive_writer_↵
delay
```

Maximum duration for which the `DDS_DataReader` (p. 608) will maintain information regarding a `DDS_DataWriter` (p. 478) once the `DDS_DataWriter` (p. 478) has become not alive.

After this time elapses, the `DDS_DataReader` (p. 608) will purge all internal information regarding the not alive `DDS_↵`  
`DataWriter` (p. 478).

See also

**DDS\_LivelinessQosPolicy** (p. 1575) for more information on when a **DDS\_DataWriter** (p. 478) is considered not alive.

When set to **DDS\_DURATION\_AUTO** (p. 1012), this parameter is set to 10 times the value of **DDS\_DiscoveryConfig::QosPolicy::participant\_liveliness\_lease\_duration** (p. 1462).

This QoS only applies when the **DDS\_DataReader** (p. 608) is using **DDS\_RECOVER\_INSTANCE\_STATE\_CONSISTENCY** (p. 1125) for the **DDS\_ReliabilityQosPolicy::instance\_state\_consistency\_kind** (p. 1682) QoS. When using **DDS\_RECOVER\_INSTANCE\_STATE\_CONSISTENCY** (p. 1125), a **DDS\_DataReader** (p. 608) keeps state about all **DDS\_DataWriter** (p. 478) entities and the instances they were writing in order to be able to transition those instances back to their correct state if liveliness with the **DDS\_DataWriter** (p. 478) is recovered. This can cause unbounded memory growth if that state is never purged and **DDS\_DataWriter** (p. 478) entities continuously come and go in a system. This QoS avoids that unbounded memory growth by setting a time at which that state will be purged.

This QoS should be set such that it is longer than the longest period of time for which a **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) are expected to be disconnected and then reconnected in your system.

An alternative to using this QoS to purge the state is to set the **DDS\_DataReaderResourceLimitsQosPolicy::max\_remote\_writers** (p. 1400) QoS to a finite value. If that QoS is set to a finite value and the number of alive + not alive **DDS\_DataWriter** (p. 478) entities reaches the limit when a new **DDS\_DataWriter** (p. 478) is discovered, the oldest not alive **DDS\_DataWriter** (p. 478) will be replaced.

[default] **DDS\_DURATION\_AUTO** (p. 1012)

[range] > 0 or **DDS\_DURATION\_AUTO** (p. 1012)

Declares IDL `sequence` < **DDS\_DataRepresentationId\_t** (p. 1058) >

See also

**DDS\_DataRepresentationId\_t** (p. 1058)

## 5.34 DDS\_DataRepresentationQosPolicy Struct Reference

This QoS policy contains a list of representation identifiers and compression settings used by **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) entities to negotiate which data representation and compression settings to use.

### Data Fields

- struct **DDS\_DataRepresentationIdSeq** `value`  
*Sequence of representation identifiers.*
- struct **DDS\_CompressionSettings\_t** `compression_settings`  
<<*extension*>> (p. 817) *Structure that contains the compression settings.*

### 5.34.1 Detailed Description

This QoS policy contains a list of representation identifiers and compression settings used by **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) entities to negotiate which data representation and compression settings to use.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_↔ STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES  
**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

See also

**DATA\_REPRESENTATION** (p. 1057)

This policy has request-offer semantics for both representation and compression. For representation, a **DDS\_DataWriter** (p. 478) may only offer a single representation. Attempting to put multiple representations in a **DDS\_DataWriter** (p. 478) will result in **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025). A **DDS\_DataWriter** (p. 478) will use its offered policy to communicate with its matched **DDS\_DataReader** (p. 608) entities. A **DDS\_DataReader** (p. 608) requests one or more representations. If a **DDS\_DataWriter** (p. 478) offers a representation that is contained within the sequence of the **DDS\_DataReader** (p. 608), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When representations are specified in the **DDS\_TopicQos** (p. 1778), **DDS\_Publisher\_copy\_from\_topic\_qos** (p. 455) copies the first element of the sequence, and **DDS\_Subscriber\_copy\_from\_topic\_qos** (p. 584) copies the whole sequence.

For Compression, only the **DDS\_CompressionSettings\_t::compression\_ids** (p. 1349) is propagated and a **DDS\_DataWriter** (p. 478) may only offer a single compression id. Attempting to put multiple **compression\_ids** in a **DDS\_DataWriter** (p. 478) will result in **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025).

A **DDS\_DataWriter** (p. 478) will use its offered compression algorithm to compress data that it sends to its matched **DDS\_DataReader** (p. 608) entities. A **DDS\_DataReader** (p. 608) requests zero or more compression algorithms. If a **DDS\_DataWriter** (p. 478) offers a representation that is contained within the algorithms requested by the **DDS\_DataReader** (p. 608), the offer satisfies the request and the policies are compatible. Otherwise, they are incompatible.

When compression IDs are specified in the **DDS\_TopicQos** (p. 1778), **DDS\_Publisher\_copy\_from\_topic\_qos** (p. 455) copies a single compression ID (see **DDS\_CompressionSettings\_t::compression\_ids** (p. 1349)), and **DDS\_Subscriber\_copy\_from\_topic\_qos** (p. 584) copies all of the **compression\_ids**.

## 5.34.2 Field Documentation

### 5.34.2.1 value

```
struct DDS_DataRepresentationIdSeq DDS_DataRepresentationQosPolicy::value
```

Sequence of representation identifiers.

**[default]** For **DDS\_Topic** (p. 172), **DDS\_DataWriter** (p. 478), and **DDS\_DataReader** (p. 608), a list with one element: **DDS\_AUTO\_DATA\_REPRESENTATION** (p. 1059).

Note

An empty sequence is equivalent to a list with one element: **DDS\_XCDR\_DATA\_REPRESENTATION** (p. 1058).

### 5.34.2.2 compression\_settings

```
struct DDS_CompressionSettings_t DDS_DataRepresentationQosPolicy::compression_settings
```

<<*extension*>> (p. 817) Structure that contains the compression settings.

compression\_ids:

**[default]** The value depends on the entity

**DDS\_DataWriter** (p. 478) and **DDS\_Topic** (p. 172) are set to **DDS\_COMPRESSION\_ID\_MASK\_NONE** (p. 1061)

**DDS\_DataReader** (p. 608) **DDS\_COMPRESSION\_ID\_MASK\_ALL** (p. 1061)

writer\_compression\_level:

**[default]** The value depends on the entity

**DDS\_DataWriter** (p. 478) and **DDS\_Topic** (p. 172) are set to **DDS\_COMPRESSION\_LEVEL\_DEFAULT** (p. 1062)

**DDS\_DataReader** (p. 608) NOT SUPPORTED

writer\_compression\_threshold:

**[default]** The value depends on the entity

**DDS\_DataWriter** (p. 478) and **DDS\_Topic** (p. 172) are set to **DDS\_COMPRESSION\_THRESHOLD\_DEFAULT** (p. 1062)

**DDS\_DataReader** (p. 608) NOT SUPPORTED

See also

**DDS\_CompressionSettings\_t** (p. 1348)

## 5.35 DDS\_DataTags Struct Reference

Definition of **DDS\_DataTagQosPolicy** (p. 1065).

### Data Fields

- struct **DDS\_TagSeq tags**

*Sequence of data tags.*

### 5.35.1 Detailed Description

Definition of **DDS\_DataTagQosPolicy** (p. 1065).

### 5.35.2 Field Documentation

### 5.35.2.1 tags

```
struct DDS_TagSeq DDS_DataTags::tags
```

Sequence of data tags.

[default] An empty list.

## 5.36 DDS\_DataWriterCacheStatus Struct Reference

<<**extension**>> (p. 817) The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue.

### Data Fields

- **DDS\_LongLong sample\_count\_peak**  
*The highest value of `DDS_DataWriterCacheStatus::sample_count` (p. 1416) over the lifetime of the DataWriter.*
- **DDS\_LongLong sample\_count**  
*The number of samples in the DataWriter's queue. This statistic includes meta-samples that represent the unregistration or disposal of an instance.*
- **DDS\_LongLong alive\_instance\_count**  
*The number of instances currently in the DataWriter's queue that have an `instance_state` equal to `DDS_ALIVE` ↔ `INSTANCE_STATE` (p. 707).*
- **DDS\_LongLong alive\_instance\_count\_peak**  
*The highest value of `DDS_DataWriterCacheStatus::alive_instance_count` (p. 1416) over the lifetime of the DataWriter.*
- **DDS\_LongLong disposed\_instance\_count**  
*The number of instances currently in the DataWriter's queue that have an `instance_state` equal to `DDS_NOT_ALIVE` ↔ `DISPOSED_INSTANCE_STATE` (p. 707) (due to, for example, being disposed via the `FooDataWriter_dispose` (p. 495) operation).*
- **DDS\_LongLong disposed\_instance\_count\_peak**  
*The highest value of `DDS_DataWriterCacheStatus::disposed_instance_count` (p. 1416) over the lifetime of the DataWriter.*
- **DDS\_LongLong unregistered\_instance\_count**  
*The number of instances currently in the DataWriter's queue that the DataWriter has unregistered from via the `FooDataWriter_unregister_instance` (p. 486) operation.*
- **DDS\_LongLong unregistered\_instance\_count\_peak**  
*The highest value of `DDS_DataWriterCacheStatus::unregistered_instance_count` (p. 1417) over the lifetime of the DataWriter.*

### 5.36.1 Detailed Description

<<**extension**>> (p. 817) The status of the DataWriter's cache. Provides information on cache related metrics such as the number of samples and instances in the DataWriter queue.

Entity:

**DDS\_DataWriter** (p. 478)

## 5.36.2 Field Documentation

### 5.36.2.1 sample\_count\_peak

**DDS\_LongLong** DDS\_DataWriterCacheStatus::sample\_count\_peak

The highest value of **DDS\_DataWriterCacheStatus::sample\_count** (p. 1416) over the lifetime of the DataWriter.

### 5.36.2.2 sample\_count

**DDS\_LongLong** DDS\_DataWriterCacheStatus::sample\_count

The number of samples in the DataWriter's queue. This statistic includes meta-samples that represent the unregistration or disposal of an instance.

### 5.36.2.3 alive\_instance\_count

**DDS\_LongLong** DDS\_DataWriterCacheStatus::alive\_instance\_count

The number of instances currently in the DataWriter's queue that have an instance\_state equal to **DDS\_ALIVE\_↔INSTANCE\_STATE** (p. 707).

### 5.36.2.4 alive\_instance\_count\_peak

**DDS\_LongLong** DDS\_DataWriterCacheStatus::alive\_instance\_count\_peak

The highest value of **DDS\_DataWriterCacheStatus::alive\_instance\_count** (p. 1416) over the lifetime of the Data↔Writer.

### 5.36.2.5 disposed\_instance\_count

**DDS\_LongLong** DDS\_DataWriterCacheStatus::disposed\_instance\_count

The number of instances currently in the DataWriter's queue that have an instance\_state equal to **DDS\_NOT\_ALIVE\_↔DISPOSED\_INSTANCE\_STATE** (p. 707) (due to, for example, being disposed via the **FooDataWriter\_dispose** (p. 495) operation).

### 5.36.2.6 disposed\_instance\_count\_peak

**DDS\_LongLong** DDS\_DataWriterCacheStatus::disposed\_instance\_count\_peak

The highest value of **DDS\_DataWriterCacheStatus::disposed\_instance\_count** (p. 1416) over the lifetime of the DataWriter.

### 5.36.2.7 unregistered\_instance\_count

**DDS\_LongLong** DDS\_DataWriterCacheStatus::unregistered\_instance\_count

The number of instances currently in the DataWriter's queue that the DataWriter has unregistered from via the **Foo**↔**DataWriter\_unregister\_instance** (p. 486) operation.

### 5.36.2.8 unregistered\_instance\_count\_peak

**DDS\_LongLong** DDS\_DataWriterCacheStatus::unregistered\_instance\_count\_peak

The highest value of **DDS\_DataWriterCacheStatus::unregistered\_instance\_count** (p. 1417) over the lifetime of the DataWriter.

## 5.37 DDS\_DataWriterListener Struct Reference

<<*interface*>> (p. 818) **DDS\_Listener** (p. 1569) for writer status.

### Data Fields

- struct **DDS\_Listener** as **listener**
  - The superclass instance of this **DDS\_DataWriterListener** (p. 1417).*
- **DDS\_DataWriterListener\_OfferedDeadlineMissedCallback** **on\_offered\_deadline\_missed**
  - Handles the **DDS\_OFFERED\_DEADLINE\_MISSED\_STATUS** (p. 1031) status.*
- **DDS\_DataWriterListener\_OfferedIncompatibleQosCallback** **on\_offered\_incompatible\_qos**
  - Handles the **DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032) status.*
- **DDS\_DataWriterListener\_LivelinessLostCallback** **on\_liveliness\_lost**
  - Handles the **DDS\_LIVELINESS\_LOST\_STATUS** (p. 1034) status.*
- **DDS\_DataWriterListener\_PublicationMatchedCallback** **on\_publication\_matched**
  - Handles the **DDS\_PUBLICATION\_MATCHED\_STATUS** (p. 1035) status.*
- **DDS\_DataWriterListener\_ReliableWriterCacheChangedCallback** **on\_reliable\_writer\_cache\_changed**
  - <<*extension*>> (p. 817) *A change has occurred in the writer's cache of unacknowledged samples.*
- **DDS\_DataWriterListener\_ReliableReaderActivityChangedCallback** **on\_reliable\_reader\_activity\_changed**

- <<*extension*>> (p. 817) *A matched reliable reader has become active or become inactive.*
- **DDS\_DataWriterListener\_SampleRemovedCallback on\_sample\_removed**  
<<*extension*>> (p. 817) *Called when a sample is removed from the DataWriter queue.*
- **DDS\_DataWriterListener\_InstanceReplacedCallback on\_instance\_replaced**  
<<*extension*>> (p. 817) *Notifies when an instance is replaced in DataWriter queue.*
- **DDS\_DataWriterListener\_OnApplicationAcknowledgmentCallback on\_application\_acknowledgment**  
<<*extension*>> (p. 817) *Called when a sample is application-acknowledged*
- **DDS\_DataWriterListener\_ServiceRequestAcceptedCallback on\_service\_request\_accepted**  
<<*extension*>> (p. 817) *Called when a **DDS\_ServiceRequest** (p. 1736) for the **DDS\_TopicQuery** (p. 698) service is dispatched to this **DDS\_DataWriter** (p. 478) for processing.*

### 5.37.1 Detailed Description

<<*interface*>> (p. 818) **DDS\_Listener** (p. 1569) for writer status.

Entity:

**DDS\_DataWriter** (p. 478)

Status:

**DDS\_LIVELINESS\_LOST\_STATUS** (p. 1034), **DDS\_LivelinessLostStatus** (p. 1574);  
**DDS\_OFFERED\_DEADLINE\_MISSED\_STATUS** (p. 1031), **DDS\_OfferedDeadlineMissedStatus** (p. 1607);  
**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_OfferedIncompatibleQosStatus** (p. 1609);  
**DDS\_PUBLICATION\_MATCHED\_STATUS** (p. 1035), **DDS\_PublicationMatchedStatus** (p. 1658);  
**DDS\_RELIABLE\_READER\_ACTIVITY\_CHANGED\_STATUS** (p. 1037), **DDS\_ReliableReaderActivity**↔  
**ChangedStatus** (p. 1682);  
**DDS\_RELIABLE\_WRITER\_CACHE\_CHANGED\_STATUS** (p. 1037), **DDS\_ReliableWriterCache**↔  
**Status** (p. 1684);

**Operations Allowed in Listener Callbacks** (p. 1571)

### 5.37.2 Field Documentation

#### 5.37.2.1 as\_listener

```
struct DDS_Listener DDS_DataWriterListener::as_listener
```

The superclass instance of this **DDS\_DataWriterListener** (p. 1417).

### 5.37.2.2 on\_offered\_deadline\_missed

```
DDS_DataWriterListener_OfferedDeadlineMissedCallback DDS_DataWriterListener::on_offered_deadline↔  
_missed
```

Handles the **DDS\_OFFERED\_DEADLINE\_MISSED\_STATUS** (p. 1031) status.

This callback is called when the deadline that the **DDS\_DataWriter** (p. 478) has committed through its **DEADLINE** (p. 1073) qos policy was not respected for a specific instance. This callback is called for each deadline period elapsed during which the **DDS\_DataWriter** (p. 478) failed to provide data for an instance.

### 5.37.2.3 on\_offered\_incompatible\_qos

```
DDS_DataWriterListener_OfferedIncompatibleQosCallback DDS_DataWriterListener::on_offered_incompatible↔  
_qos
```

Handles the **DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032) status.

This callback is called when the **DDS\_DataWriterQos** (p. 1438) of the **DDS\_DataWriter** (p. 478) was incompatible with what was requested by a **DDS\_DataReader** (p. 608). This callback is called when a **DDS\_DataWriter** (p. 478) has discovered a **DDS\_DataReader** (p. 608) for the same **DDS\_Topic** (p. 172) and common partition, but with a requested QoS that is incompatible with that offered by the **DDS\_DataWriter** (p. 478).

### 5.37.2.4 on\_liveliness\_lost

```
DDS_DataWriterListener_LivelinessLostCallback DDS_DataWriterListener::on_liveliness_lost
```

Handles the **DDS\_LIVELINESS\_LOST\_STATUS** (p. 1034) status.

This callback is called when the liveliness that the **DDS\_DataWriter** (p. 478) has committed through its **LIVELINESS** (p. 1097) qos policy was not respected; this **DDS\_DataReader** (p. 608) entities will consider the **DDS\_DataWriter** (p. 478) as no longer "alive/active". This callback will not be called when an already not alive **DDS\_DataWriter** (p. 478) simply remains not alive for another liveliness period.

### 5.37.2.5 on\_publication\_matched

```
DDS_DataWriterListener_PublicationMatchedCallback DDS_DataWriterListener::on_publication_matched
```

Handles the **DDS\_PUBLICATION\_MATCHED\_STATUS** (p. 1035) status.

This callback is called when the **DDS\_DataWriter** (p. 478) has found a **DDS\_DataReader** (p. 608) that matches the **DDS\_Topic** (p. 172), has a common partition and compatible QoS, or has ceased to be matched with a **DDS\_Data↔  
Reader** (p. 608) that was previously considered to be matched.

### 5.37.2.6 on\_reliable\_writer\_cache\_changed

`DDS_DataWriterListener_ReliableWriterCacheChangedCallback` `DDS_DataWriterListener::on_reliable_↔  
writer_cache_changed`

<<*extension*>> (p. 817) A change has occurred in the writer's cache of unacknowledged samples.

This listener callback is triggered when:

- The cache is empty (contains no unacknowledged samples).
- The cache is full (the number of unacknowledged samples has reached the value specified in `DDS_Resource↔  
LimitsQosPolicy::max_samples` (p. 1693)).
- The number of unacknowledged samples has reached `DDS_RtpsReliableWriterProtocol_t::high_watermark` (p. 1701) or `DDS_RtpsReliableWriterProtocol_t::low_watermark` (p. 1701).

### 5.37.2.7 on\_reliable\_reader\_activity\_changed

`DDS_DataWriterListener_ReliableReaderActivityChangedCallback` `DDS_DataWriterListener::on_reliable↔  
_reader_activity_changed`

<<*extension*>> (p. 817) A matched reliable reader has become active or become inactive.

### 5.37.2.8 on\_sample\_removed

`DDS_DataWriterListener_SampleRemovedCallback` `DDS_DataWriterListener::on_sample_removed`

<<*extension*>> (p. 817) Called when a sample is removed from the DataWriter queue.

This callback is called only if the sample was written with a `DDS_Cookie_t` (p. 1360) with `FooDataWriter_write_w↔  
_params` (p. 494), or if this writer uses **Zero Copy** (p. 205) transfer over shared memory" or **FlatData Topic-Types** (p. 205) "FlatData language binding".

See also

`FooDataWriter_get_loan` (p. 501)

### 5.37.2.9 on\_instance\_replaced

**DDS\_DataWriterListener\_InstanceReplacedCallback** DDS\_DataWriterListener::on\_instance\_replaced

<<*extension*>> (p. 817) Notifies when an instance is replaced in DataWriter queue.

This callback is called when an instance is replaced by the **DDS\_DataWriter** (p. 478) due to instance resource limits being reached. This callback returns to the user the handle of the replaced instance, which can be used to get the key of the replaced instance using the **FooDataWriter\_get\_key\_value** (p. 498) API.

Because this callback can be called within the context of an in-progress write, dispose, or unregister call, most APIs on the DataWriter must not be used. The only DataWriter APIs that are safe to call within this callback are:

- **FooDataWriter\_get\_key\_value** (p. 498)
- **FooDataWriter\_narrow** (p. 483)
- **FooDataWriter\_as\_datawriter** (p. 483)
- **FooDataWriter\_create\_data** (p. 499)
- **FooDataWriter\_create\_data\_w\_params** (p. 500)
- **FooDataWriter\_delete\_data** (p. 500)
- **FooDataWriter\_delete\_data\_w\_params** (p. 501)
- **DDS\_DataWriter\_as\_entity** (p. 530)
- **DDS\_DataWriter\_get\_matched\_subscriptions** (p. 532)
- **DDS\_DataWriter\_is\_matched\_subscription\_active** (p. 533)
- **DDS\_DataWriter\_get\_matched\_subscription\_participant\_data** (p. 535)
- **DDS\_DataWriter\_get\_topic** (p. 535)
- **DDS\_DataWriter\_get\_publisher** (p. 536)
- **DDS\_DataWriter\_is\_sample\_app\_acknowledged** (p. 537)

### 5.37.2.10 on\_application\_acknowledgment

**DDS\_DataWriterListener\_OnApplicationAcknowledgmentCallback** DDS\_DataWriterListener::on\_application\_↔  
\_acknowledgment

<<*extension*>> (p. 817) Called when a sample is application-acknowledged

Applicable only when **DDS\_ReliabilityQosPolicy::acknowledgment\_kind** (p. 1681) = **DDS\_APPLICATION\_AUTO\_↔**  
**\_ACKNOWLEDGMENT\_MODE** (p. 1124) or **DDS\_APPLICATION\_EXPLICIT\_ACKNOWLEDGMENT\_MODE** (p. 1125)

Called when a sample is application-level acknowledged. Provides identities of the sample and the acknowledging **DDS\_DataReader** (p. 608). Also provides user-specified response data sent from the **DDS\_DataReader** (p. 608) by the acknowledgment message.

### 5.37.2.11 on\_service\_request\_accepted

`DDS_DataWriterListener_ServiceRequestAcceptedCallback` `DDS_DataWriterListener::on_service_request_accepted`

<<*extension*>> (p. 817) Called when a `DDS_ServiceRequest` (p. 1736) for the `DDS_TopicQuery` (p. 698) service is dispatched to this `DDS_DataWriter` (p. 478) for processing.

See also

`Topic Queries` (p. 695)

## 5.38 DDS\_DataWriterProtocolQosPolicy Struct Reference

Protocol that applies only to `DDS_DataWriter` (p. 478) instances.

### Data Fields

- struct `DDS_GUID_t` `virtual_guid`  
*The virtual GUID (Global Unique Identifier).*
- `DDS_UnsignedLong` `rtps_object_id`  
*The RTPS Object ID.*
- `DDS_Boolean` `push_on_write`  
*Whether to push sample out when write is called.*
- `DDS_Boolean` `disable_positive_acks`  
*Controls whether or not the writer expects positive acknowledgements from matching readers.*
- `DDS_Boolean` `disable_inline_keyhash`  
*Controls whether or not a keyhash is propagated on the wire with each sample.*
- `DDS_Boolean` `serialize_key_with_dispose`  
*Controls whether or not the serialized key is propagated on the wire with dispose samples.*
- `DDS_Boolean` `propagate_app_ack_with_no_response`  
*Controls whether or not a `DDS_DataWriter` (p. 478) receives `DDS_DataWriterListener::on_application_acknowledgment` (p. 1421) notifications with an empty or invalid response.*
- struct `DDS_RtpsReliableWriterProtocol_t` `rtps_reliable_writer`  
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with a `DDS_DataWriter` (p. 478). This parameter only has effect if both the writer and the matching reader are configured with `DDS_RELIABLE_RELIABILITY_QOS` (p. 1124) `DDS_ReliabilityQosPolicyKind` (p. 1123).*
- struct `DDS_SequenceNumber_t` `initial_virtual_sequence_number`  
*Determines, the initial virtual sequence number for this DataWriter.*

### 5.38.1 Detailed Description

Protocol that applies only to **DDS\_DataWriter** (p. 478) instances.

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **DDS\_DataWriterProtocolQoSPolicy** (p. 1422) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connnext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **DDS\_ReliabilityQoSPolicy** (p. 1678) for more information on the per-Data↔Reader/DataWriter reliability configuration. **DDS\_HistoryQoSPolicy** (p. 1558) and **DDS\_ResourceLimitsQoSPolicy** (p. 1690) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.38.2 Field Documentation

#### 5.38.2.1 virtual\_guid

```
struct DDS_GUID_t DDS_DataWriterProtocolQoSPolicy::virtual_guid
```

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **DDS\_DataWriter** (p. 478).

RTI Connnext uses the virtual GUID to associate a persisted writer history to a specific **DDS\_DataWriter** (p. 478).

The RTI Connnext Persistence Service uses the virtual GUID to send samples on behalf of the original **DDS\_DataWriter** (p. 478).

**[default] DDS\_GUID\_AUTO** (p. 1016)

### 5.38.2.2 rtps\_object\_id

**DDS\_UnsignedLong** DDS\_DataWriterProtocolQosPolicy::rtps\_object\_id

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data writer according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connexx will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data writer.

A rtps\_object\_id value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connexx. In those cases, the recommendation is not to use automatic object ID assignment.

**[default]** DDS\_RTPS\_AUTO\_ID (p. ??)

**[range]** [0,0x00ffffff]

### 5.38.2.3 push\_on\_write

**DDS\_Boolean** DDS\_DataWriterProtocolQosPolicy::push\_on\_write

Whether to push sample out when write is called.

If set to **DDS\_BOOLEAN\_TRUE** (p. 1004) (the default), the writer will send a sample every time write is called. Otherwise, the sample is put into the queue waiting for a NACK from remote reader(s) to be sent out.

**[default]** DDS\_BOOLEAN\_TRUE (p. 1004)

### 5.38.2.4 disable\_positive\_acks

**DDS\_Boolean** DDS\_DataWriterProtocolQosPolicy::disable\_positive\_acks

Controls whether or not the writer expects positive acknowledgements from matching readers.

If set to **DDS\_BOOLEAN\_TRUE** (p. 1004), the writer does not expect readers to send positive acknowledgements to the writer. Consequently, instead of keeping a sample queued until all readers have positively acknowledged it, the writer will keep a sample for at least **DDS\_RtpsReliableWriterProtocol\_t::disable\_positive\_acks\_min\_sample\_keep\_duration** (p. 1708), after which the sample is logically considered as positively acknowledged.

If set to **DDS\_BOOLEAN\_FALSE** (p. 1004) (the default), the writer expects to receive positive acknowledgements from its acknowledging readers (**DDS\_DataReaderProtocolQosPolicy::disable\_positive\_acks** (p. 1377) = **DDS\_BOOLEAN\_FALSE** (p. 1004)) and it applies the keep-duration to its non-acknowledging readers (**DDS\_DataReaderProtocolQosPolicy::disable\_positive\_acks** (p. 1377) = **DDS\_BOOLEAN\_TRUE** (p. 1004)).

A writer with both acknowledging and non-acknowledging readers keeps a sample queued until acknowledgements have been received from all acknowledging readers and the keep-duration has elapsed for non-acknowledging readers.

**[default]** DDS\_BOOLEAN\_FALSE (p. 1004)

### 5.38.2.5 disable\_inline\_keyhash

```
DDS_Boolean DDS_DataWriterProtocolQosPolicy::disable_inline_keyhash
```

Controls whether or not a keyhash is propagated on the wire with each sample.

This field only applies to keyed writers.

With each key, RTI Connex associates an internal 16-byte representation, called a keyhash.

When this field is **DDS\_BOOLEAN\_FALSE** (p. 1004), the keyhash is sent on the wire with every data instance.

When this field is **DDS\_BOOLEAN\_TRUE** (p. 1004), the keyhash is not sent on the wire and the readers must compute the value using the received data.

If the *reader* is CPU bound, sending the keyhash on the wire may increase performance, because the reader does not have to get the keyhash from the data.

If the *writer* is CPU bound, sending the keyhash on the wire may decrease performance, because it requires more bandwidth (16 more bytes per sample).

Note: Setting `disable_inline_keyhash` to **DDS\_BOOLEAN\_TRUE** (p. 1004) is not compatible with using RTI Real-Time Connect or RTI Recorder.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.38.2.6 serialize\_key\_with\_dispose

```
DDS_Boolean DDS_DataWriterProtocolQosPolicy::serialize_key_with_dispose
```

Controls whether or not the serialized key is propagated on the wire with dispose samples.

This field only applies to keyed writers.

We recommend setting this field to **DDS\_BOOLEAN\_TRUE** (p. 1004) if there are DataReaders where **DDS\_DataReaderProtocolQosPolicy::propagate\_dispose\_of\_unregistered\_instances** (p. 1378) is also **DDS\_BOOLEAN\_TRUE** (p. 1004).

When setting `serialize_key_with_dispose` to **FALSE**, only a key hash is included in the dispose meta-sample sent by a DataWriter for a dispose action. If a dispose meta-sample only includes the key hash, then DataReaders must have previously received an actual data sample for the instance being disposed, in order for a DataReader to map a key hash/instance handle to actual key values.

If an actual data sample was never received for an instance and `serialize_key_with_dispose` is set to **FALSE**, then the DataReader application will not be able to determine the value of the key that was disposed, since **FooDataReader::get\_key\_value** (p. 640) will not be able to map an instance handle to actual key values.

By setting `serialize_key_with_dispose` to **TRUE**, the values of the key members of a data type will be sent in the dispose meta-sample for a dispose action by the DataWriter. This allows the DataReader to map an instance handle to the values of the key members even when receiving a dispose meta-sample without previously having received a data sample for the instance.

*Important:* When this field is **DDS\_BOOLEAN\_TRUE** (p. 1004), batching will not be compatible with RTI Connex 4.3e, 4.4b, or 4.4c. The **DDS\_DataReader** (p. 608) entities will receive incorrect data and/or encounter deserialization errors.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.38.2.7 propagate\_app\_ack\_with\_no\_response

```
DDS_Boolean DDS_DataWriterProtocolQosPolicy::propagate_app_ack_with_no_response
```

Controls whether or not a **DDS\_DataWriter** (p.478) receives **DDS\_DataWriterListener::on\_application\_↔\_acknowledgment** (p.1421) notifications with an empty or invalid response.

When this field is set to **DDS\_BOOLEAN\_FALSE** (p.1004), the callback **DDS\_DataWriterListener::on\_application\_↔\_acknowledgment** (p.1421) will not be invoked if the sample being acknowledged has an empty or invalid response.

**[default]** **DDS\_BOOLEAN\_TRUE** (p.1004)

### 5.38.2.8 rtps\_reliable\_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **DDS\_DataWriter** (p.478). This parameter only has effect if both the writer and the matching reader are configured with **DDS\_RELIABLE\_↔\_RELIABILITY\_QOS** (p.1124) **DDS\_ReliabilityQosPolicyKind** (p.1123).

For details, refer to the **DDS\_RtpsReliableWriterProtocol\_t** (p.1699)

**[default]** **[default]** See **DDS\_RtpsReliableWriterProtocol\_t** (p.1699)

### 5.38.2.9 initial\_virtual\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolQosPolicy::initial_virtual_sequence_number
```

Determines, the initial virtual sequence number for this DataWriter.

By default, the virtual sequence number of the first sample published by a DataWriter will be 1 for DataWriters that do not use durable writer history. For durable writers, the default virtual sequence number will be the last sequence number they published in a previous execution, plus one. So, when a non-durable DataWriter is restarted and must continue communicating with the same DataReaders, its samples start over with sequence number 1. Durable DataWriters start over where the last sequence number left off, plus one.

This QoS setting allows overwriting the default initial virtual sequence number.

Normally, this parameter is not expected to be modified; however, in some scenarios when continuing communication after restarting, applications may require the DataWriter's virtual sequence number to start at something other than the value described above. An example would be to enable non-durable DataWriters to start at the last sequence number published, plus one, similar to the durable DataWriter. This property enables you to make such a configuration, if desired.

The virtual sequence number can be overwritten as well on a per sample basis by updating **DDS\_WriteParams\_t\_↔::identity** (p.1834) in the **FooDataWriter\_write\_w\_params** (p.494).

**[default]** **DDS\_AUTO\_SEQUENCE\_NUMBER** (p.1021)

## 5.39 DDS\_DataWriterProtocolStatus Struct Reference

<<**extension**>> (p. 817) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

### Data Fields

- **DDS\_LongLong pushed\_sample\_count**  
*The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.*
- **DDS\_LongLong pushed\_sample\_count\_change**  
*The change in `DDS_DataWriterProtocolStatus::pushed_sample_count` (p. 1429) since the last time the status was read.*
- **DDS\_LongLong pushed\_sample\_bytes**  
*The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.*
- **DDS\_LongLong pushed\_sample\_bytes\_change**  
*The change in `DDS_DataWriterProtocolStatus::pushed_sample_bytes` (p. 1429) since the last time the status was read.*
- **DDS\_LongLong filtered\_sample\_count**  
*[Not supported.] The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.*
- **DDS\_LongLong filtered\_sample\_count\_change**  
*[Not supported.] The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.*
- **DDS\_LongLong filtered\_sample\_bytes**  
*[Not supported.] The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.*
- **DDS\_LongLong filtered\_sample\_bytes\_change**  
*[Not supported.] The incremental change in the number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.*
- **DDS\_LongLong sent\_heartbeat\_count**  
*The number of Heartbeats sent between a local DataWriter and matching remote DataReader.*
- **DDS\_LongLong sent\_heartbeat\_count\_change**  
*The change in `DDS_DataWriterProtocolStatus::sent_heartbeat_count` (p. 1431) since the last time the status was read.*
- **DDS\_LongLong sent\_heartbeat\_bytes**  
*The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.*
- **DDS\_LongLong sent\_heartbeat\_bytes\_change**  
*The change in `DDS_DataWriterProtocolStatus::sent_heartbeat_bytes` (p. 1431) since the last time the status was read.*
- **DDS\_LongLong pulled\_sample\_count**  
*The number of user samples pulled from local DataWriter by matching DataReaders.*
- **DDS\_LongLong pulled\_sample\_count\_change**  
*The change in `DDS_DataWriterProtocolStatus::pulled_sample_count` (p. 1431) since the last time the status was read.*
- **DDS\_LongLong pulled\_sample\_bytes**  
*The number of bytes of user samples pulled from local DataWriter by matching DataReaders.*
- **DDS\_LongLong pulled\_sample\_bytes\_change**  
*The change in `DDS_DataWriterProtocolStatus::pulled_sample_bytes` (p. 1432) since the last time the status was read.*
- **DDS\_LongLong received\_ack\_count**  
*The number of ACKs from a remote DataReader received by a local DataWriter.*

- **DDS\_LongLong received\_ack\_count\_change**  
*The change in `DDS_DataWriterProtocolStatus::received_ack_count` (p. 1432) since the last time the status was read.*
- **DDS\_LongLong received\_ack\_bytes**  
*The number of bytes of ACKs from a remote `DataReader` received by a local `DataWriter`.*
- **DDS\_LongLong received\_ack\_bytes\_change**  
*The change in `DDS_DataWriterProtocolStatus::received_ack_bytes` (p. 1433) since the last time the status was read.*
- **DDS\_LongLong received\_nack\_count**  
*The number of NACKs from a remote `DataReader` received by a local `DataWriter`.*
- **DDS\_LongLong received\_nack\_count\_change**  
*The change in `DDS_DataWriterProtocolStatus::received_nack_count` (p. 1433) since the last time the status was read.*
- **DDS\_LongLong received\_nack\_bytes**  
*The number of bytes of NACKs from a remote `DataReader` received by a local `DataWriter`.*
- **DDS\_LongLong received\_nack\_bytes\_change**  
*The change in `DDS_DataWriterProtocolStatus::received_nack_bytes` (p. 1434) since the last time the status was read.*
- **DDS\_LongLong sent\_gap\_count**  
*The number of GAPS sent from local `DataWriter` to matching remote `DataReaders`.*
- **DDS\_LongLong sent\_gap\_count\_change**  
*The change in `DDS_DataWriterProtocolStatus::sent_gap_count` (p. 1434) since the last time the status was read.*
- **DDS\_LongLong sent\_gap\_bytes**  
*The number of bytes of GAPS sent from local `DataWriter` to matching remote `DataReaders`.*
- **DDS\_LongLong sent\_gap\_bytes\_change**  
*The change in `DDS_DataWriterProtocolStatus::sent_gap_bytes` (p. 1434) since the last time the status was read.*
- **DDS\_LongLong rejected\_sample\_count**  
*[Not supported.]*
- **DDS\_LongLong rejected\_sample\_count\_change**  
*[Not supported.]*
- **DDS\_Long send\_window\_size**  
*Current maximum number of outstanding samples allowed in the `DataWriter`'s queue.*
- struct **DDS\_SequenceNumber\_t first\_available\_sample\_sequence\_number**  
*The sequence number of the first available sample currently queued in the local `DataWriter`.*
- struct **DDS\_SequenceNumber\_t last\_available\_sample\_sequence\_number**  
*The sequence number of the last available sample currently queued in the local `DataWriter`.*
- struct **DDS\_SequenceNumber\_t first\_unacknowledged\_sample\_sequence\_number**  
*The sequence number of the first unacknowledged sample currently queued in the local `DataWriter`.*
- struct **DDS\_SequenceNumber\_t first\_available\_sample\_virtual\_sequence\_number**  
*The virtual sequence number of the first available sample currently queued in the local `DataWriter`.*
- struct **DDS\_SequenceNumber\_t last\_available\_sample\_virtual\_sequence\_number**  
*The virtual sequence number of the last available sample currently queued in the local `DataWriter`.*
- struct **DDS\_SequenceNumber\_t first\_unacknowledged\_sample\_virtual\_sequence\_number**  
*The virtual sequence number of the first unacknowledged sample currently queued in the local `DataWriter`.*
- **DDS\_InstanceHandle\_t first\_unacknowledged\_sample\_subscription\_handle**  
*The handle of a remote `DataReader` that has not acknowledged the first unacknowledged sample of the local `DataWriter`.*
- struct **DDS\_SequenceNumber\_t first\_unelapsed\_keep\_duration\_sample\_sequence\_number**  
*The sequence number of the first sample whose keep duration has not yet elapsed.*
- **DDS\_LongLong pushed\_fragment\_count**  
*The number of `DATA_FRAG` messages that have been pushed by this `DataWriter`.*
- **DDS\_LongLong pushed\_fragment\_bytes**

*The number of bytes of DATA\_FRAG messages that have been pushed by this DataWriter.*

- **DDS\_LongLong pulled\_fragment\_count**

*The number of DATA\_FRAG messages that have been pulled from this DataWriter.*

- **DDS\_LongLong pulled\_fragment\_bytes**

*The number of bytes of DATA\_FRAG messages that have been pulled from this DataWriter.*

- **DDS\_LongLong received\_nack\_fragment\_count**

*The number of NACK\_FRAG messages that have been received by this DataWriter.*

- **DDS\_LongLong received\_nack\_fragment\_bytes**

*The number of bytes of NACK\_FRAG messages that have been received by this DataWriter.*

### 5.39.1 Detailed Description

<<*extension*>> (p. 817) The status of a writer's internal protocol related metrics, like the number of samples pushed, pulled, filtered; and status of wire protocol traffic.

Entity:

**DDS\_DataWriter** (p. 478)

### 5.39.2 Field Documentation

#### 5.39.2.1 pushed\_sample\_count

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::pushed\_sample\_count

The number of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count is the number of sends done internally, and it may be greater than the number of user writes.

For large data, counts whole samples, not fragments. The fragment count is tracked in the **DDS\_DataWriterProtocol↔ Status::pushed\_fragment\_count** (p. 1437) statistic.

#### 5.39.2.2 pushed\_sample\_count\_change

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::pushed\_sample\_count\_change

The change in **DDS\_DataWriterProtocolStatus::pushed\_sample\_count** (p. 1429) since the last time the status was read.

Counts protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing.

For large data, counts whole samples, not fragments.

### 5.39.2.3 pushed\_sample\_bytes

`DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes`

The number of bytes of user samples pushed on write from a local DataWriter to a matching remote DataReader.

Counts bytes of protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing. The count of bytes corresponds to the number of sends done internally, and it may be greater than the number of user writes.

When data fragmentation is used, this statistic is incremented as fragments are written.

### 5.39.2.4 pushed\_sample\_bytes\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::pushed_sample_bytes_change`

The change in `DDS_DataWriterProtocolStatus::pushed_sample_bytes` (p. 1429) since the last time the status was read.

Counts bytes of protocol (RTPS) messages pushed by a DataWriter when writing, unregistering, and disposing.

When data fragmentation is used, this statistic is incremented as fragments are written.

### 5.39.2.5 filtered\_sample\_count

`DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_count`

**[Not supported.]** The number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

### 5.39.2.6 filtered\_sample\_count\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_count_change`

**[Not supported.]** The incremental change in the number of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

### 5.39.2.7 filtered\_sample\_bytes

`DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_bytes`

**[Not supported.]** The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

### 5.39.2.8 filtered\_sample\_bytes\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::filtered_sample_bytes_change`

**[Not supported.]** The incremental change in the number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics since the last time the status was read.

### 5.39.2.9 sent\_heartbeat\_count

`DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count`

The number of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

### 5.39.2.10 sent\_heartbeat\_count\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_count_change`

The change in `DDS_DataWriterProtocolStatus::sent_heartbeat_count` (p. 1431) since the last time the status was read.

### 5.39.2.11 sent\_heartbeat\_bytes

`DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes`

The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

### 5.39.2.12 sent\_heartbeat\_bytes\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::sent_heartbeat_bytes_change`

The change in `DDS_DataWriterProtocolStatus::sent_heartbeat_bytes` (p. 1431) since the last time the status was read.

### 5.39.2.13 pulled\_sample\_count

`DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_count`

The number of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when `DDS_↔_DataWriterProtocolQosPolicy::push_on_write` (p. 1424) is `DDS_BOOLEAN_FALSE` (p. 1004).

When data fragmentation is used, this statistic is incremented as fragments are written.

### 5.39.2.14 pulled\_sample\_count\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_count_change`

The change in `DDS_DataWriterProtocolStatus::pulled_sample_count` (p. 1431) since the last time the status was read.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when `DDS_↔_DataWriterProtocolQosPolicy::push_on_write` (p. 1424) is `DDS_BOOLEAN_FALSE` (p. 1004).

For large data, counts whole samples, not fragments.

### 5.39.2.15 pulled\_sample\_bytes

`DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_bytes`

The number of bytes of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when `DDS_↔_DataWriterProtocolQosPolicy::push_on_write` (p. 1424) is `DDS_BOOLEAN_FALSE` (p. 1004).

When data fragmentation is used, this statistic is incremented as fragments are written.

### 5.39.2.16 pulled\_sample\_bytes\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::pulled_sample_bytes_change`

The change in `DDS_DataWriterProtocolStatus::pulled_sample_bytes` (p. 1432) since the last time the status was read.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when `DDS_↔_DataWriterProtocolQosPolicy::push_on_write` (p. 1424) is `DDS_BOOLEAN_FALSE` (p. 1004).

For large data, counts bytes of whole samples, not fragments.

### 5.39.2.17 received\_ack\_count

`DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_count`

The number of ACKs from a remote DataReader received by a local DataWriter.

### 5.39.2.18 received\_ack\_count\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_count_change`

The change in `DDS_DataWriterProtocolStatus::received_ack_count` (p. 1432) since the last time the status was read.

### 5.39.2.19 received\_ack\_bytes

`DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_bytes`

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

### 5.39.2.20 received\_ack\_bytes\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::received_ack_bytes_change`

The change in `DDS_DataWriterProtocolStatus::received_ack_bytes` (p. 1433) since the last time the status was read.

### 5.39.2.21 received\_nack\_count

`DDS_LongLong DDS_DataWriterProtocolStatus::received_nack_count`

The number of NACKs from a remote DataReader received by a local DataWriter.

### 5.39.2.22 received\_nack\_count\_change

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::received\_nack\_count\_change

The change in **DDS\_DataWriterProtocolStatus::received\_nack\_count** (p. 1433) since the last time the status was read.

### 5.39.2.23 received\_nack\_bytes

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::received\_nack\_bytes

The number of bytes of NACKs from a remote DataReader received by a local DataWriter.

### 5.39.2.24 received\_nack\_bytes\_change

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::received\_nack\_bytes\_change

The change in **DDS\_DataWriterProtocolStatus::received\_nack\_bytes** (p. 1434) since the last time the status was read.

### 5.39.2.25 sent\_gap\_count

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::sent\_gap\_count

The number of GAPS sent from local DataWriter to matching remote DataReaders.

### 5.39.2.26 sent\_gap\_count\_change

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::sent\_gap\_count\_change

The change in **DDS\_DataWriterProtocolStatus::sent\_gap\_count** (p. 1434) since the last time the status was read.

### 5.39.2.27 sent\_gap\_bytes

`DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_bytes`

The number of bytes of GAPS sent from local DataWriter to matching remote DataReaders.

### 5.39.2.28 sent\_gap\_bytes\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::sent_gap_bytes_change`

The change in `DDS_DataWriterProtocolStatus::sent_gap_bytes` (p. 1434) since the last time the status was read.

### 5.39.2.29 rejected\_sample\_count

`DDS_LongLong DDS_DataWriterProtocolStatus::rejected_sample_count`

[Not supported.]

### 5.39.2.30 rejected\_sample\_count\_change

`DDS_LongLong DDS_DataWriterProtocolStatus::rejected_sample_count_change`

[Not supported.]

### 5.39.2.31 send\_window\_size

`DDS_Long DDS_DataWriterProtocolStatus::send_window_size`

Current maximum number of outstanding samples allowed in the DataWriter's queue.

Spans the range from `DDS_RtpsReliableWriterProtocol_t::min_send_window_size` (p. 1710) to `DDS_RtpsReliableWriterProtocol_t::max_send_window_size` (p. 1711).

### 5.39.2.32 first\_available\_sample\_sequence\_number

`struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_available_sample_sequence_number`

The sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

### 5.39.2.33 last\_available\_sample\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::last_available_sample_sequence_number
```

The sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

### 5.39.2.34 first\_unacknowledged\_sample\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_sequence_↔  
number
```

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

### 5.39.2.35 first\_available\_sample\_virtual\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_available_sample_virtual_sequence_↔  
_number
```

The virtual sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

### 5.39.2.36 last\_available\_sample\_virtual\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::last_available_sample_virtual_sequence_↔  
_number
```

The virtual sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

### 5.39.2.37 first\_unacknowledged\_sample\_virtual\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_virtual_↔  
sequence_number
```

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

### 5.39.2.38 first\_unacknowledged\_sample\_subscription\_handle

```
DDS_InstanceHandle_t DDS_DataWriterProtocolStatus::first_unacknowledged_sample_subscription_↔  
handle
```

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

Applies only for local DataWriter status.

### 5.39.2.39 first\_unelapsd\_keep\_duration\_sample\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_DataWriterProtocolStatus::first_unelapsd_keep_duration_sample_↔  
sequence_number
```

The sequence number of the first sample whose keep duration has not yet elapsed.

Applicable only when **DDS\_DataWriterProtocolQosPolicy::disable\_positive\_acks** (p. 1424) is set.

Sequence number of the first sample kept in the DataWriter's queue whose keep\_duration (applied when **DDS\_Data↔  
WriterProtocolQosPolicy::disable\_positive\_acks** (p. 1424) is set) has not yet elapsed.

Applies only for local DataWriter status.

### 5.39.2.40 pushed\_fragment\_count

```
DDS_LongLong DDS_DataWriterProtocolStatus::pushed_fragment_count
```

The number of DATA\_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA\_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

### 5.39.2.41 pushed\_fragment\_bytes

```
DDS_LongLong DDS_DataWriterProtocolStatus::pushed_fragment_bytes
```

The number of bytes of DATA\_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA\_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

### 5.39.2.42 pulled\_fragment\_count

```
DDS_LongLong DDS_DataWriterProtocolStatus::pulled_fragment_count
```

The number of DATA\_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA\_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

### 5.39.2.43 pulled\_fragment\_bytes

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::pulled\_fragment\_bytes

The number of bytes of DATA\_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA\_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

### 5.39.2.44 received\_nack\_fragment\_count

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::received\_nack\_fragment\_count

The number of NACK\_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

### 5.39.2.45 received\_nack\_fragment\_bytes

**DDS\_LongLong** DDS\_DataWriterProtocolStatus::received\_nack\_fragment\_bytes

The number of bytes of NACK\_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

## 5.40 DDS\_DataWriterQos Struct Reference

QoS policies supported by a **DDS\_DataWriter** (p. 478) entity.

### 5.40.1 Detailed Description

QoS policies supported by a **DDS\_DataWriter** (p. 478) entity.

You must set certain members in a consistent manner:

- **DDS\_DataWriterQos::history** (p. 1442) .depth <= **DDS\_DataWriterQos::resource\_limits** (p. 1442) .max\_↔ samples\_per\_instance
- **DDS\_DataWriterQos::resource\_limits** (p. 1442) .max\_samples\_per\_instance <= **DDS\_DataWriterQos**↔ ::**resource\_limits** (p. 1442) .max\_samples
- **DDS\_DataWriterQos::resource\_limits** (p. 1442) .initial\_samples <= **DDS\_DataWriterQos::resource\_limits** (p. 1442) .max\_samples
- **DDS\_DataWriterQos::resource\_limits** (p. 1442) .initial\_instances <= **DDS\_DataWriterQos::resource\_limits** (p. 1442) .max\_instances
- length of **DDS\_DataWriterQos::user\_data** (p. 1442) .value <= **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) .writer\_user\_data\_max\_length

If any of the above are not true, **DDS\_DataWriter\_set\_qos** (p. 543) and **DDS\_DataWriter\_set\_qos\_with\_profile** (p. 544) and **DDS\_Publisher\_set\_default\_datawriter\_qos** (p. 443) and **DDS\_Publisher\_set\_default\_datawriter**↔ **qos\_with\_profile** (p. 443) will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025) and **DDS\_Publisher**↔ **create\_datawriter** (p. 446) and **DDS\_Publisher\_create\_datawriter\_with\_profile** (p. 448) and will return NULL.

Entity:

**DDS\_DataWriter** (p. 478)

See also

**QoS Policies** (p. 1041) allowed ranges within each QoS.

## 5.40.2 Field Documentation

### 5.40.2.1 durability

```
struct DDS_DurabilityQosPolicy DDS_DataWriterQos::durability
```

Durability policy, **DURABILITY** (p. 1086).

### 5.40.2.2 durability\_service

```
struct DDS_DurabilityServiceQosPolicy DDS_DataWriterQos::durability_service
```

DurabilityService policy, **DURABILITY\_SERVICE** (p. 1090).

### 5.40.2.3 deadline

```
struct DDS_DeadlineQosPolicy DDS_DataWriterQos::deadline
```

Deadline policy, **DEADLINE** (p. 1073).

### 5.40.2.4 latency\_budget

```
struct DDS_LatencyBudgetQosPolicy DDS_DataWriterQos::latency_budget
```

Latency budget policy, **LATENCY\_BUDGET** (p. 1095).

### 5.40.2.5 liveliness

```
struct DDS_LivelinessQosPolicy DDS_DataWriterQos::liveliness
```

Liveliness policy, **LIVELINESS** (p. 1097).

#### 5.40.2.6 reliability

```
struct DDS_ReliabilityQosPolicy DDS_DataWriterQos::reliability
```

Reliability policy, **RELIABILITY** (p. 1122).

#### 5.40.2.7 destination\_order

```
struct DDS_DestinationOrderQosPolicy DDS_DataWriterQos::destination_order
```

Destination order policy, **DESTINATION\_ORDER** (p. 1074).

#### 5.40.2.8 history

```
struct DDS_HistoryQosPolicy DDS_DataWriterQos::history
```

History policy, **HISTORY** (p. 1093).

#### 5.40.2.9 resource\_limits

```
struct DDS_ResourceLimitsQosPolicy DDS_DataWriterQos::resource_limits
```

Resource limits policy, **RESOURCE\_LIMITS** (p. 1126).

#### 5.40.2.10 transport\_priority

```
struct DDS_TransportPriorityQosPolicy DDS_DataWriterQos::transport_priority
```

Transport priority policy, **TRANSPORT\_PRIORITY** (p. 1138).

#### 5.40.2.11 lifespan

```
struct DDS_LifespanQosPolicy DDS_DataWriterQos::lifespan
```

Lifespan policy, **LIFESPAN** (p. 1096).

#### 5.40.2.12 user\_data

```
struct DDS_UserDataQosPolicy DDS_DataWriterQos::user_data
```

User data policy, **USER\_DATA** (p. 1143).

#### 5.40.2.13 ownership

```
struct DDS_OwnershipQosPolicy DDS_DataWriterQos::ownership
```

Ownership policy, **OWNERSHIP** (p. 1102).

#### 5.40.2.14 ownership\_strength

```
struct DDS_OwnershipStrengthQosPolicy DDS_DataWriterQos::ownership_strength
```

Ownership strength policy, **OWNERSHIP\_STRENGTH** (p. 1103).

#### 5.40.2.15 writer\_data\_lifecycle

```
struct DDS_WriterDataLifecycleQosPolicy DDS_DataWriterQos::writer_data_lifecycle
```

Writer data lifecycle policy, **WRITER\_DATA\_LIFECYCLE** (p. 1144).

#### 5.40.2.16 representation

```
struct DDS_DataRepresentationQosPolicy DDS_DataWriterQos::representation
```

Data representation policy, **DATA\_REPRESENTATION** (p. 1057).

#### 5.40.2.17 data\_tags

```
DDS_DataTagQosPolicy DDS_DataWriterQos::data_tags
```

DataTag policy, **DATA\_TAG** (p. 1064).

#### 5.40.2.18 writer\_resource\_limits

```
struct DDS_DataWriterResourceLimitsQosPolicy DDS_DataWriterQos::writer_resource_limits
```

<<*extension*>> (p. 817) Writer resource limits policy, **DATA\_WRITER\_RESOURCE\_LIMITS** (p. 1070).

#### 5.40.2.19 protocol

```
struct DDS_DataWriterProtocolQosPolicy DDS_DataWriterQos::protocol
```

<<*extension*>> (p. 817) **DDS\_DataWriter** (p. 478) protocol policy, **DATA\_WRITER\_PROTOCOL** (p. 1069)

#### 5.40.2.20 transport\_selection

```
struct DDS_TransportSelectionQosPolicy DDS_DataWriterQos::transport_selection
```

<<*extension*>> (p. 817) Transport plugin selection policy, **TRANSPORT\_SELECTION** (p. 1139).

Specifies the transports available for use by the **DDS\_DataWriter** (p. 478).

#### 5.40.2.21 unicast

```
struct DDS_TransportUnicastQosPolicy DDS_DataWriterQos::unicast
```

<<*extension*>> (p. 817) Unicast transport policy, **TRANSPORT\_UNICAST** (p. 1139).

Specifies the unicast transport interfaces and ports on which **messages** can be received.

The unicast interfaces are used to receive messages from **DDS\_DataReader** (p. 608) entities in the domain.

#### 5.40.2.22 publish\_mode

```
struct DDS_PublishModeQosPolicy DDS_DataWriterQos::publish_mode
```

<<*extension*>> (p. 817) Publish mode policy, **PUBLISH\_MODE** (p. 1118).

Determines whether the **DDS\_DataWriter** (p. 478) publishes data synchronously or asynchronously and how.

#### 5.40.2.23 property

```
struct DDS_PropertyQosPolicy DDS_DataWriterQos::property
```

<<*extension*>> (p. 817) Property policy, **PROPERTY** (p. 1107). See also [Property Reference Guide](#).

#### 5.40.2.24 service

```
struct DDS_ServiceQosPolicy DDS_DataWriterQos::service
```

<<*extension*>> (p. 817) Service policy, **SERVICE** (p. 1127).

#### 5.40.2.25 batch

```
struct DDS_BatchQosPolicy DDS_DataWriterQos::batch
```

<<*extension*>> (p. 817) Batch policy, **BATCH** (p. 1052).

#### 5.40.2.26 multi\_channel

```
struct DDS_MultiChannelQosPolicy DDS_DataWriterQos::multi_channel
```

<<*extension*>> (p. 817) Multi channel policy, **MULTICHANNEL** (p. 1101).

#### 5.40.2.27 availability

```
struct DDS_AvailabilityQosPolicy DDS_DataWriterQos::availability
```

<<*extension*>> (p. 817) Availability policy, **AVAILABILITY** (p. 1052).

#### 5.40.2.28 publication\_name

```
struct DDS_EntityNameQosPolicy DDS_DataWriterQos::publication_name
```

<<*extension*>> (p. 817) EntityName policy, **ENTITY\_NAME** (p. 1091).

### 5.40.2.29 topic\_query\_dispatch

```
struct DDS_TopicQueryDispatchQosPolicy DDS_DataWriterQos::topic_query_dispatch
```

<<*extension*>> (p. 817) Topic Query dispatch policy, **TOPIC\_QUERY\_DISPATCH** (p. 1131).

### 5.40.2.30 transfer\_mode

```
struct DDS_DataWriterTransferModeQosPolicy DDS_DataWriterQos::transfer_mode
```

<<*extension*>> (p. 817) TransferMode policy, **DATA\_WRITER\_TRANSFER\_MODE** (p. 1073).

### 5.40.2.31 type\_support

```
struct DDS_TypeSupportQosPolicy DDS_DataWriterQos::type_support
```

<<*extension*>> (p. 817) Type support data, **TYPESUPPORT** (p. 1142).

Optional value that is passed to a type plugin's `on_endpoint_attached` and serialization functions.

## 5.41 DDS\_DataWriterResourceLimitsQosPolicy Struct Reference

Various settings that configure how a **DDS\_DataWriter** (p. 478) allocates and uses physical memory for internal resources.

### Data Fields

- **DDS\_Long initial\_concurrent\_blocking\_threads**  
*The initial number of threads that are allowed to concurrently block on write call on the same **DDS\_DataWriter** (p. 478).*
- **DDS\_Long max\_concurrent\_blocking\_threads**  
*The maximum number of threads that are allowed to concurrently block on write call on the same **DDS\_DataWriter** (p. 478).*
- **DDS\_Long max\_remote\_reader\_filters**  
*The maximum number of remote DataReaders for which the **DDS\_DataWriter** (p. 478) will perform content-based filtering.*
- **DDS\_Long initial\_batches**  
*Represents the initial number of batches a **DDS\_DataWriter** (p. 478) will manage.*
- **DDS\_Long max\_batches**  
*Represents the maximum number of batches a **DDS\_DataWriter** (p. 478) will manage.*
- **DDS\_DataWriterResourceLimitsInstanceReplacementKind instance\_replacement**  
*Sets the kinds of instances allowed to be replaced when instance resource limits are reached.*
- **DDS\_Boolean replace\_empty\_instances**

*Whether or not to replace empty instances during instance replacement.*

*The initial number of virtual writers supported by a **DDS\_DataWriter** (p. 478).*

- **DDS\_Long max\_virtual\_writers**

*The maximum number of virtual writers supported by a **DDS\_DataWriter** (p. 478).*

- **DDS\_Long max\_remote\_readers**

*The maximum number of remote readers supported by a **DDS\_DataWriter** (p. 478).*

- **DDS\_Long max\_app\_ack\_remote\_readers**

*The maximum number of application-level acknowledging remote readers supported by a **DDS\_DataWriter** (p. 478).*

- **DDS\_Long initial\_active\_topic\_queries**

*Represents the initial number of active topic queries a **DDS\_DataWriter** (p. 478) will manage.*

- **DDS\_Long max\_active\_topic\_queries**

*Represents the maximum number of active topic queries a **DDS\_DataWriter** (p. 478) will manage.*

- struct **DDS\_AllocationSettings\_t writer\_loaned\_sample\_allocation**

*Represents the allocation settings of loaned samples managed by a **DDS\_DataWriter** (p. 478).*

- **DDS\_Boolean initialize\_writer\_loaned\_sample**

*Whether or not to initialize loaned samples returned by a **DDS\_DataWriter** (p. 478).*

### 5.41.1 Detailed Description

Various settings that configure how a **DDS\_DataWriter** (p. 478) allocates and uses physical memory for internal resources.

DataWriters must allocate internal structures to handle the simultaneously blocking of threads trying to call **FooDataWriter\_write** (p. 489) on the same **DDS\_DataWriter** (p. 478), for the storage used to batch small samples, and for content-based filters specified by DataReaders.

Most of these internal structures start at an initial size and, by default, will be grown as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **DDS\_DataWriter** (p. 478). By setting the initial size to the maximum size, you will prevent RTI Connexant from dynamically allocating any memory after the creation of the **DDS\_DataWriter** (p. 478).

This QoS policy is an extension to the DDS standard.

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.41.2 Field Documentation

### 5.41.2.1 initial\_concurrent\_blocking\_threads

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::initial\_concurrent\_blocking\_threads

The initial number of threads that are allowed to concurrently block on write call on the same **DDS\_DataWriter** (p. 478).

This value only applies if **DDS\_HistoryQosPolicy** (p. 1558) has its kind set to **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094) and **DDS\_ReliabilityQosPolicy::max\_blocking\_time** (p. 1681) is  $> 0$ .

**[default]** 1

**[range]** [1, 10000],  $\leq$  max\_concurrent\_blocking\_threads

### 5.41.2.2 max\_concurrent\_blocking\_threads

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::max\_concurrent\_blocking\_threads

The maximum number of threads that are allowed to concurrently block on write call on the same **DDS\_DataWriter** (p. 478).

This value only applies if **DDS\_HistoryQosPolicy** (p. 1558) has its kind set to **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094) and **DDS\_ReliabilityQosPolicy::max\_blocking\_time** (p. 1681) is  $> 0$ .

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 10000] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  initial\_concurrent\_blocking\_threads

### 5.41.2.3 max\_remote\_reader\_filters

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::max\_remote\_reader\_filters

The maximum number of remote DataReaders for which the **DDS\_DataWriter** (p. 478) will perform content-based filtering.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [0,  $(2^{31})-2$ ] or **DDS\_LENGTH\_UNLIMITED** (p. 1127).

0: The **DDS\_DataWriter** (p. 478) will not perform filtering for any **DDS\_DataReader** (p. 608).

1 to  $(2^{31})-2$ : The DataWriter will filter for up to the specified number of DataReaders. In addition, the Datawriter will store the result of the filtering per sample per DataReader.

**DDS\_LENGTH\_UNLIMITED** (p. 1127): The DataWriter will filter for up to  $(2^{31})-2$  DataReaders. However, in this case, the DataWriter will not store the filtering result per sample per DataReader. Thus, if a sample is resent (such as due to a loss of reliable communication), the sample will be filtered again.

#### 5.41.2.4 initial\_batches

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::initial\_batches

Represents the initial number of batches a **DDS\_DataWriter** (p. 478) will manage.

**[default]** 8

**[range]** [1,100 million]

See also

**DDS\_BatchQosPolicy** (p. 1334)

#### 5.41.2.5 max\_batches

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::max\_batches

Represents the maximum number of batches a **DDS\_DataWriter** (p. 478) will manage.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

When batching is enabled, the maximum number of samples that a **DDS\_DataWriter** (p. 478) can store is limited by this value and **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693).

**[range]** [1,100 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)  $\geq$  **DDS\_RtpsReliableWriterProtocol\_t**↔  
**::heartbeats\_per\_max\_samples** (p. 1705) if batching is enabled

See also

**DDS\_BatchQosPolicy** (p. 1334)

#### 5.41.2.6 instance\_replacement

**DDS\_DataWriterResourceLimitsInstanceReplacementKind** DDS\_DataWriterResourceLimitsQosPolicy::instance↔  
\_replacement

Sets the kinds of instances allowed to be replaced when instance resource limits are reached.

When a **DDS\_DataWriter** (p. 478)'s number of active instances is greater than **DDS\_ResourceLimitsQosPolicy**↔  
**::max\_instances** (p. 1693), it will try to make room by replacing an existing instance. This field specifies the kinds of instances allowed to be replaced.

If a replaceable instance is not available, either an out-of-resources exception will be returned, or the writer may block if the instance reclamation was done when writing.

**[default]** **DDS\_UNREGISTERED\_INSTANCE\_REPLACEMENT** (p. 1071)

See also

**DDS\_DataWriterResourceLimitsInstanceReplacementKind** (p. 1070)

### 5.41.2.7 `replace_empty_instances`

`DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::replace_empty_instances`

Whether or not to replace empty instances during instance replacement.

When a `DDS_DataWriter` (p. 478) has more active instances than allowed by `DDS_ResourceLimitsQosPolicy::max_instances` (p. 1693), it tries to make room by replacing an existing instance. This field configures whether empty instances (i.e. instances with no samples) may be replaced. If set `DDS_BOOLEAN_TRUE` (p. 1004), then a `DDS_DataWriter` (p. 478) will first try reclaiming empty instances, before trying to replace whatever is specified by `DDS_DataWriterResourceLimitsQosPolicy::instance_replacement` (p. 1449).

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

See also

`DDS_DataWriterResourceLimitsInstanceReplacementKind` (p. 1070)

### 5.41.2.8 `autoregister_instances`

`DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::autoregister_instances`

Whether or not to automatically register new instances.

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

When set to true, it is possible to write with a non-NIL handle of an instance that is not registered: the write operation will succeed and the instance will be registered. Otherwise, that write operation would fail.

See also

`FooDataWriter_write` (p. 489)

### 5.41.2.9 `initial_virtual_writers`

`DDS_Long DDS_DataWriterResourceLimitsQosPolicy::initial_virtual_writers`

The initial number of virtual writers supported by a `DDS_DataWriter` (p. 478).

[default] 1

[range] [1, 1000000], or `DDS_LENGTH_UNLIMITED` (p. 1127)

### 5.41.2.10 max\_virtual\_writers

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::max\_virtual\_writers

The maximum number of virtual writers supported by a **DDS\_DataWriter** (p. 478).

Sets the maximum number of unique virtual writers supported by a **DDS\_DataWriter** (p. 478), where virtual writers are added when samples are written with the virtual writer GUID.

This field is specially relevant in the configuration of Persistence Service DataWriters since these DataWriters will publish samples on behalf of multiple virtual writers.

**[default]** DDS\_LENGTH\_UNLIMITED (p. 1127)

**[range]** [1, 1000000], or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.41.2.11 max\_remote\_readers

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::max\_remote\_readers

The maximum number of remote readers supported by a **DDS\_DataWriter** (p. 478).

**[default]** DDS\_LENGTH\_UNLIMITED (p. 1127)

**[range]** [1, 1000000], or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.41.2.12 max\_app\_ack\_remote\_readers

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::max\_app\_ack\_remote\_readers

The maximum number of application-level acknowledging remote readers supported by a **DDS\_DataWriter** (p. 478).

**[default]** DDS\_LENGTH\_UNLIMITED (p. 1127)

**[range]** [1, 1000000], or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.41.2.13 initial\_active\_topic\_queries

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::initial\_active\_topic\_queries

Represents the initial number of active topic queries a **DDS\_DataWriter** (p. 478) will manage.

**[default]** 1

**[range]** [1, 1000000]

See also

**DDS\_TopicQueryDispatchQosPolicy** (p. 1783)

#### 5.41.2.14 max\_active\_topic\_queries

**DDS\_Long** DDS\_DataWriterResourceLimitsQosPolicy::max\_active\_topic\_queries

Represents the maximum number of active topic queries a **DDS\_DataWriter** (p. 478) will manage.

When topic queries are enabled, the maximum number of topic queries that a **DDS\_DataWriter** (p. 478) can publish data samples for at the same time is limited by this value.

When the DataWriter receives one topic query above this limit, it will wait to process it until it finishes publishing all the samples for at least one of the current topic queries.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1000000] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

See also

**DDS\_TopicQueryDispatchQosPolicy** (p. 1783)

#### 5.41.2.15 writer\_loaned\_sample\_allocation

struct **DDS\_AllocationSettings\_t** DDS\_DataWriterResourceLimitsQosPolicy::writer\_loaned\_sample\_allocation

Represents the allocation settings of loaned samples managed by a **DDS\_DataWriter** (p. 478).

The number of samples loaned by a **DDS\_DataWriter** (p. 478) via **FooDataWriter\_get\_loan** (p. 501) is limited by the **DDS\_AllocationSettings\_t::max\_count** (p. 1322) of **DDS\_DataWriterResourceLimitsQosPolicy::writer\_loaned\_sample\_allocation** (p. 1452). **FooDataWriter\_get\_loan** (p. 501) returns NULL if and only if **DDS\_AllocationSettings\_t::max\_count** (p. 1322) samples have been loaned, and none of those samples has been written with **FooDataWriter\_write** (p. 489) or discarded via **FooDataWriter\_discard\_loan** (p. 503).

**[default]** initial\_count = **DDS\_AUTO\_COUNT** (p. 1085) (**DDS\_ResourceLimitsQosPolicy::initial\_samples** (p. 1693) + 1); max\_count = **DDS\_AUTO\_COUNT** (p. 1085) (**DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693) + 1); incremental\_count = **DDS\_AUTO\_COUNT** (p. 1085) (0 if initial\_count = max\_count; initial\_count otherwise);

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

See also

**FooDataWriter\_get\_loan** (p. 501)

**FooDataWriter\_discard\_loan** (p. 503)

### 5.41.2.16 initialize\_writer\_loaned\_sample

`DDS_Boolean DDS_DataWriterResourceLimitsQosPolicy::initialize_writer_loaned_sample`

Whether or not to initialize loaned samples returned by a `DDS_DataWriter` (p. 478).

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

See also

`FooDataWriter_get_loan` (p. 501)

## 5.42 DDS\_DataWriterShmemRefTransferModeSettings Struct Reference

Settings related to transferring data using shared memory references.

### Data Fields

- `DDS_Boolean enable_data_consistency_check`  
*Controls if samples can be checked for consistency.*

### 5.42.1 Detailed Description

Settings related to transferring data using shared memory references.

It is used to configure a `DDS_DataWriter` (p. 478) using **Zero Copy transfer over shared memory** (p. 205).

Properties:

`RxO` (p. 1048) = N/A

`Changeable` (p. 1048) = **NO** (p. 1048)

QoS:

`DDS_DataWriterTransferModeQosPolicy` (p. 1454)

### 5.42.2 Field Documentation

### 5.42.2.1 enable\_data\_consistency\_check

**DDS\_Boolean** DDS\_DataWriterShmemRefTransferModeSettings::enable\_data\_consistency\_check

Controls if samples can be checked for consistency.

When this setting is true, the **DDS\_DataWriter** (p.478) sends an incrementing sequence number as an inline QoS with every sample. This sequence number allows a **DDS\_DataReader** (p.608) to use the **FooDataReader\_is\_data\_consistent** (p.642) API to detect if the **DDS\_DataWriter** (p.478) overwrote the sample before the **DDS\_DataReader** (p.608) could complete processing the sample.

[default] **DDS\_BOOLEAN\_TRUE** (p.1004)

## 5.43 DDS\_DataWriterTransferModeQosPolicy Struct Reference

<<*extension*>> (p.817) Qos related to transferring data

### Data Fields

- struct **DDS\_DataWriterShmemRefTransferModeSettings** **shmem\_ref\_settings**  
*Settings related to transferring data using shared memory references.*

### 5.43.1 Detailed Description

<<*extension*>> (p.817) Qos related to transferring data

It contains qualitative settings related to the actions a **DDS\_DataWriter** (p.478) performs while transferring its data.

Entity:

**DDS\_DataWriter** (p.478)

Properties:

**RxO** (p.1048) = N/A

**Changeable** (p.1048) = **NO** (p.1048)

### 5.43.2 Field Documentation

### 5.43.2.1 shmem\_ref\_settings

```
struct DDS_DataWriterShmemRefTransferModeSettings DDS_DataWriterTransferModeQosPolicy::shmem_ref_settings
```

Settings related to transferring data using shared memory references.

For details, refer to the [DDS\\_DataWriterShmemRefTransferModeSettings](#) (p. 1453)

## 5.44 DDS\_DeadlineQosPolicy Struct Reference

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

### Data Fields

- struct **DDS\_Duration\_t period**  
*Duration of the deadline period.*

### 5.44.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

A **DDS\_DataReader** (p. 608) expects a new sample updating the value of each instance at least once every `period`. That is, `period` specifies the maximum expected elapsed time between arriving data samples.

A **DDS\_DataWriter** (p. 478) indicates that the application commits to write a new value (using the **DDS\_DataWriter** (p. 478)) for each instance managed by the **DDS\_DataWriter** (p. 478) at least once every `period`.

This QoS can be used during system integration to ensure that applications have been coded to meet design specifications.

It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions to prevent total system failure when data is not received in time. For topics on which data is not expected to be periodic, `period` should be set to an infinite value.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_OFFERED\_DEADLINE\_MISSED\_STATUS** (p. 1031), **DDS\_REQUESTED\_DEADLINE\_MISSED\_STATUS** (p. 1032), **DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES  
**Changeable** (p. 1048) = **YES** (p. 1048)

### 5.44.2 Usage

This policy is useful for cases where a **DDS\_Topic** (p. 172) is expected to have each instance updated periodically. On the publishing side this setting establishes a contract that the application must meet. On the subscribing side the setting establishes a minimum requirement for the remote publishers that are expected to supply the data values.

When RTI Connext 'matches' a **DDS\_DataWriter** (p. 478) and a **DDS\_DataReader** (p. 608) it checks whether the settings are compatible (i.e., *offered deadline*  $\leq$  *requested deadline*); if they are not, the two entities are informed (via the **DDS\_Listener** (p. 1569) or **DDS\_Condition** (p. 1169) mechanism) of the incompatibility of the QoS settings and communication will not occur.

Assuming that the reader and writer ends have compatible settings, the fulfilment of this contract is monitored by RTI Connext and the application is informed of any violations by means of the proper **DDS\_Listener** (p. 1569) or **DDS\_Condition** (p. 1169).

### 5.44.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered period*  $\leq$  *requested period* holds.

### 5.44.4 Consistency

The setting of the **DEADLINE** (p. 1073) policy must be set consistently with that of the **TIME\_BASED\_FILTER** (p. 1129).

For these two policies to be consistent the settings must be such that *deadline period*  $\geq$  *minimum\_separation*.

An attempt to set these policies in an inconsistent manner will result in **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025) in **set\_qos (abstract)** (p. 1161), or the **DDS\_Entity** (p. 1160) will not be created.

For a **DDS\_DataReader** (p. 608), the **DEADLINE** (p. 1073) policy and **DDS\_TimeBasedFilterQosPolicy** (p. 1767) may interact such that even though the **DDS\_DataWriter** (p. 478) is writing samples fast enough to fulfill its commitment to its own deadline, the **DDS\_DataReader** (p. 608) may see violations of its deadline. This happens because RTI Connext will drop any samples received within the **DDS\_TimeBasedFilterQosPolicy::minimum\_separation** (p. 1770). To avoid triggering the **DDS\_DataReader** (p. 608)'s deadline, even though the matched **DDS\_DataWriter** (p. 478) is meeting its own deadline, set the two QoS parameters so that:

*reader deadline*  $\geq$  *reader minimum\_separation* + *writer deadline*

See **DDS\_TimeBasedFilterQosPolicy** (p. 1767) for more information about the interactions between deadlines and time-based filters.

See also

**DDS\_TimeBasedFilterQosPolicy** (p. 1767)

### 5.44.5 Field Documentation

### 5.44.5.1 period

```
struct DDS_Duration_t DDS_DeadlineQosPolicy::period
```

Duration of the deadline period.

[default] **DDS\_DURATION\_INFINITE** (p. 1011)

[range] [1 nanosec, 1 year] or **DDS\_DURATION\_INFINITE** (p. 1011),  $\geq$  **DDS\_TimeBasedFilterQosPolicy**↔  
::**minimum\_separation** (p. 1770)

## 5.45 DDS\_DestinationOrderQosPolicy Struct Reference

Controls how the middleware will deal with data sent by multiple **DDS\_DataWriter** (p. 478) entities for the same instance of data (i.e., same **DDS\_Topic** (p. 172) and key).

### Data Fields

- **DDS\_DestinationOrderQosPolicyKind kind**  
*Specifies the desired kind of destination order.*
- **DDS\_DestinationOrderQosPolicyScopeKind scope**  
*Specifies the desired scope of the source destination order.*
- struct **DDS\_Duration\_t source\_timestamp\_tolerance**  
<<*extension*>> (p. 817) *Allowed tolerance between source timestamps of consecutive samples.*

### 5.45.1 Detailed Description

Controls how the middleware will deal with data sent by multiple **DDS\_DataWriter** (p. 478) entities for the same instance of data (i.e., same **DDS\_Topic** (p. 172) and key).

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS**↔  
**STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES  
**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

## 5.45.2 Usage

When multiple DataWriters send data for the same topic, the order in which data from different DataWriters are received by the applications of different DataReaders may be different. So different DataReaders may not receive the same "last" value when DataWriters stop sending data.

This QoS policy controls how each subscriber resolves the final value of a data instance that is written by multiple **DDS\_DataWriter** (p.478) entities (which may be associated with different **DDS\_Publisher** (p.436) entities) running on different nodes.

This QoS can be used to create systems that have the property of "eventual consistency." Thus intermediate states across multiple applications may be inconsistent, but when DataWriters stop sending changes to the same topic, all applications will end up having the same state.

This QoS policy can be set for both DataWriters and DataReaders.

For the DataReader:

The default setting, **DDS\_BY\_RECEPTION\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p.1075), indicates that (assuming the **OWNERSHIP\_STRENGTH** (p.1103) policy allows it) the latest received value for the instance should be the one whose value is kept. That is, data will be delivered by a **DDS\_DataReader** (p.608) in the order in which it was *received* (which may lead to inconsistent final values).

For **DDS\_BY\_SOURCE\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p.1075), if the scope is set to **DDS\_↔INSTANCE\_SCOPE\_DESTINATIONORDER\_QOS** (p.1076) (default), within each instance, the sample's source timestamp shall be used to determine the most recent information. This is the only setting that, in the case of concurrent same-strength DataWriters updating the same instance, ensures that all DataReaders end up with the same final value for the instance. If a DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped. The **SAMPLE\_REJECTED** status or the **SAMPLE\_LOST** status will not be updated.

If scope is set to **DDS\_TOPIC\_SCOPE\_DESTINATIONORDER\_QOS** (p.1076), the ordering is enforced per topic across all instances.

In addition, a DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than `source_timestamp_tolerance`. Otherwise, the DDS sample is dropped. The **SAMPLE\_REJECTED** status or the **SAMPLE\_LOST** status will not be updated.

For the DataWriter:

For the default setting, **DDS\_BY\_RECEPTION\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p.1075), the DataWriter will not enforce source timestamp ordering when writing samples using the **FooDataWriter\_write\_w\_params** (p.494) or **FooDataWriter\_write\_w\_timestamp** (p.493) API. The source timestamp of a new sample can be older than the source timestamp of the previous samples.

When using **DDS\_BY\_SOURCE\_TIMESTAMP\_DESTINATIONORDER\_QOS** (p.1075), If scope is set to **DDS\_↔INSTANCE\_SCOPE\_DESTINATIONORDER\_QOS** (p.1076) (default), when writing a sample, the sample's timestamp must not be older than the timestamp of the previously written DDS sample for the same instance. If, however, the timestamp is older than the timestamp of the previously written DDS sample—but the difference is less than the `source_↔timestamp_tolerance`—the DDS sample will use the previously written DDS sample's timestamp as its timestamp. Otherwise, if the difference is greater than the tolerance, the write will fail with retcode **DDS\_RETCODE\_BAD\_PARAMETER** (p.1025).

If scope is set to **DDS\_TOPIC\_SCOPE\_DESTINATIONORDER\_QOS** (p.1076), a new sample timestamp must not be older than the timestamp of the previously written DDS sample, across all instances. (The ordering is enforced across all instances.)

### 5.45.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind*  $\geq$  *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of `DDS_DestinationOrderQosPolicy::kind` (p. 1459) are considered ordered such that `DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS` (p. 1075)  $<$  `DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS` (p. 1075)

### 5.45.4 Field Documentation

#### 5.45.4.1 kind

```
DDS_DestinationOrderQosPolicyKind DDS_DestinationOrderQosPolicy::kind
```

Specifies the desired kind of destination order.

[default] `DDS_BY_RECEPTION_TIMESTAMP_DESTINATIONORDER_QOS` (p. 1075),

#### 5.45.4.2 scope

```
DDS_DestinationOrderQosPolicyScopeKind DDS_DestinationOrderQosPolicy::scope
```

Specifies the desired scope of the source destination order.

Indicates if tolerance check and the current sample's timestamp is computed based on instance or topic basis.

[default] `DDS_INSTANCE_SCOPE_DESTINATIONORDER_QOS` (p. 1076)

#### 5.45.4.3 source\_timestamp\_tolerance

```
struct DDS_Duration_t DDS_DestinationOrderQosPolicy::source_timestamp_tolerance
```

<< *extension* >> (p. 817) Allowed tolerance between source timestamps of consecutive samples.

When a `DDS_DataWriter` (p. 478) sets `DDS_DestinationOrderQosPolicyKind` (p. 1075) to `DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS` (p. 1075), when writing a sample, its timestamp must not be less than the timestamp of the previously written sample. However, if it is less than the timestamp of the previously written sample but the difference is less than this tolerance, the sample will use the previously written sample's timestamp as its timestamp. Otherwise, if the difference is greater than this tolerance, the write will fail.

When a `DDS_DataReader` (p. 608) sets `DDS_DestinationOrderQosPolicyKind` (p. 1075) to `DDS_BY_SOURCE_TIMESTAMP_DESTINATIONORDER_QOS` (p. 1075), the `DDS_DataReader` (p. 608) will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than this tolerance. Otherwise, the sample is dropped.

[default] 100 milliseconds for `DDS_DataWriter` (p. 478), 30 seconds for `DDS_DataReader` (p. 608)

## 5.46 DDS\_DiscoveryConfigQosPolicy Struct Reference

Settings for discovery configuration.

### Data Fields

- struct **DDS\_Duration\_t participant\_liveliness\_lease\_duration**  
*The liveliness lease duration for the participant.*
- struct **DDS\_Duration\_t participant\_liveliness\_assert\_period**  
*The period to assert liveliness for the participant.*
- struct **DDS\_Duration\_t participant\_announcement\_period**  
*The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).*
- **DDS\_RemoteParticipantPurgeKind remote\_participant\_purge\_kind**  
*The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.*
- struct **DDS\_Duration\_t max\_liveliness\_loss\_detection\_period**  
*The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.*
- **DDS\_Long initial\_participant\_announcements**  
*The number of initial announcements sent when a participant is first enabled.*
- **DDS\_Long new\_remote\_participant\_announcements**  
*The number of participant announcements sent when a remote participant is newly discovered.*
- struct **DDS\_Duration\_t min\_initial\_participant\_announcement\_period**  
*The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.*
- struct **DDS\_Duration\_t max\_initial\_participant\_announcement\_period**  
*The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.*
- struct **DDS\_BuiltinTopicReaderResourceLimits\_t participant\_reader\_resource\_limits**  
*Resource limits.*
- struct **DDS\_RtpsReliableReaderProtocol\_t publication\_reader**  
*RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.*
- struct **DDS\_BuiltinTopicReaderResourceLimits\_t publication\_reader\_resource\_limits**  
*Resource limits.*
- struct **DDS\_RtpsReliableReaderProtocol\_t subscription\_reader**  
*RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.*
- struct **DDS\_BuiltinTopicReaderResourceLimits\_t subscription\_reader\_resource\_limits**  
*Resource limits.*
- struct **DDS\_RtpsReliableWriterProtocol\_t publication\_writer**  
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.*
- struct **DDS\_WriterDataLifecycleQosPolicy publication\_writer\_data\_lifecycle**  
*Writer data lifecycle settings for a built-in publication writer.*
- struct **DDS\_RtpsReliableWriterProtocol\_t subscription\_writer**  
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.*
- struct **DDS\_WriterDataLifecycleQosPolicy subscription\_writer\_data\_lifecycle**  
*Writer data lifecycle settings for a built-in subscription writer.*

- **DDS\_DiscoveryConfigBuiltinPluginKindMask builtin\_discovery\_plugins**  
*Mask of built-in discovery plugin kinds.*
- **DDS\_DiscoveryConfigBuiltinChannelKindMask enabled\_builtin\_channels**  
*The mask specifying which built-in channels should be enabled.*
- **DDS\_ReliabilityQosPolicyKind participant\_message\_reader\_reliability\_kind**  
*Reliability policy for a built-in participant message reader.*
- struct **DDS\_RtpsReliableReaderProtocol\_t participant\_message\_reader**  
*RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if `DDS_DiscoveryConfigQosPolicy::participant_message_reader_reliability_kind` (p. 1469) is set to `DDS_RELIABLE_RELIABILITY_QOS` (p. 1124).*
- struct **DDS\_RtpsReliableWriterProtocol\_t participant\_message\_writer**  
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with `DDS_RELIABLE_RELIABILITY_QOS` (p. 1124) `DDS_ReliabilityQosPolicyKind` (p. 1123).*
- struct **DDS\_PublishModeQosPolicy publication\_writer\_publish\_mode**  
*Publish mode policy for the built-in publication writer.*
- struct **DDS\_PublishModeQosPolicy subscription\_writer\_publish\_mode**  
*Publish mode policy for the built-in subscription writer.*
- struct **DDS\_AsynchronousPublisherQosPolicy asynchronous\_publisher**  
*Asynchronous publishing settings for the discovery `DDS_Publisher` (p. 436) and all entities that are created by it.*
- struct **DDS\_Duration\_t default\_domain\_announcement\_period**  
*The period to announce a participant to the default domain 0.*
- **DDS\_Boolean ignore\_default\_domain\_announcements**  
*Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.*
- struct **DDS\_RtpsReliableWriterProtocol\_t service\_request\_writer**  
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in `DDS_ServiceRequest` (p. 1736) writer.*
- struct **DDS\_WriterDataLifecycleQosPolicy service\_request\_writer\_data\_lifecycle**  
*Writer data lifecycle settings for a built-in `DDS_ServiceRequest` (p. 1736) writer.*
- struct **DDS\_PublishModeQosPolicy service\_request\_writer\_publish\_mode**  
*Publish mode policy for the built-in service request writer.*
- struct **DDS\_RtpsReliableReaderProtocol\_t service\_request\_reader**  
*RTPS reliable reader protocol-related configuration settings for a built-in `DDS_ServiceRequest` (p. 1736) reader.*
- struct **DDS\_Duration\_t locator\_reachability\_assert\_period**  
*Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.*
- struct **DDS\_Duration\_t locator\_reachability\_lease\_duration**  
*The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.*
- struct **DDS\_Duration\_t locator\_reachability\_change\_detection\_period**  
*Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.*
- struct **DDS\_RtpsReliableWriterProtocol\_t secure\_volatile\_writer**  
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.*
- struct **DDS\_PublishModeQosPolicy secure\_volatile\_writer\_publish\_mode**  
*Publish mode policy for the built-in secure volatile writer.*
- struct **DDS\_RtpsReliableReaderProtocol\_t secure\_volatile\_reader**  
*RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.*
- **DDS\_Long endpoint\_type\_object\_lb\_serialization\_threshold**

*Option to reduce the size required to propagate a TypeObject in Simple Endpoint Discovery.*

- struct **DDS\_Duration\_t dns\_tracker\_polling\_period**  
*Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.*
- struct **DDS\_PublishModeQosPolicy participant\_configuration\_writer\_publish\_mode**  
*Publish mode policy for the built-in participant configuration writer.*
- struct **DDS\_RtpsReliableWriterProtocol\_t participant\_configuration\_writer**  
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.*
- struct **DDS\_WriterDataLifecycleQosPolicy participant\_configuration\_writer\_data\_lifecycle**  
*Writer data lifecycle settings for a built-in participant configuration writer.*
- struct **DDS\_RtpsReliableReaderProtocol\_t participant\_configuration\_reader**  
*RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.*
- struct **DDS\_BuiltinTopicReaderResourceLimits\_t participant\_configuration\_reader\_resource\_limits**  
*Resource limits for the built-in topic participant configuration reader.*

### 5.46.1 Detailed Description

Settings for discovery configuration.

<<*extension*>> (p. 817) This QoS policy controls the amount of delay in discovering entities in the system and the amount of discovery traffic in the network.

The amount of network traffic required by the discovery process can vary widely, based on how your application has chosen to configure the middleware's network addressing (e.g., unicast vs. multicast, multicast TTL, etc.), the size of the system, whether all applications are started at the same time or whether start times are staggered, and other factors. Your application can use this policy to make tradeoffs between discovery completion time and network bandwidth utilization. In addition, you can introduce random back-off periods into the discovery process to decrease the probability of network contention when many applications start simultaneously.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.46.2 Field Documentation

### 5.46.2.1 participant\_liveliness\_lease\_duration

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::participant_liveliness_lease_duration
```

The liveliness lease duration for the participant.

This is the same as the expiration time of the DomainParticipant as defined in the RTPS protocol.

If the participant has not refreshed its own liveliness to other participants at least once within this period, it may be considered as stale by other participants in the network.

Should be strictly greater than **DDS\_DiscoveryConfigQosPolicy::participant\_liveliness\_assert\_period** (p. 1463).

**[default]** 100 seconds

**[range]** [1 nanosec,1 year], > participant\_liveliness\_assert\_period

### 5.46.2.2 participant\_liveliness\_assert\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::participant_liveliness_assert_period
```

The period to assert liveliness for the participant.

The period at which the participant will refresh its liveliness to all the peers.

Should be strictly less than **DDS\_DiscoveryConfigQosPolicy::participant\_liveliness\_lease\_duration** (p. 1462).

**[default]** 30 seconds

**[range]** [1 nanosec,1 year], < participant\_liveliness\_lease\_duration

### 5.46.2.3 participant\_announcement\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::participant_announcement_period
```

The period at which a participant announces itself to potential peers when using the Simple Participant Discovery Protocol 2.0 (SPDP2).

The **DDS\_DiscoveryQosPolicy::initial\_peers** (p. 1480) list **DDS\_DomainParticipant\_add\_peer** (p. 146) API are used to configure a set of potential peers that a DomainParticipant may discover. The **DDS\_DiscoveryConfigQosPolicy::participant\_announcement\_period** (p. 1463) configures how frequently a DomainParticipant will announce itself to the subset of the configured potential peers that it has not matched with yet. Once a DomainParticipant matches with a DomainParticipant at one of configured potential peer locators, it will no longer announce itself to that locator at this period unless liveliness is lost.

This QoS policy is only supported when using the Simple Participant Discovery Protocol 2.0 (SPDP2). Setting this value when using the Simple Participant Discovery Protocol (SPDP) or other participant discovery protocols is not supported and will result in an error.

**[default]** **DDS\_DURATION\_AUTO** (p.1012) (Takes the value of **DDS\_DiscoveryConfigQosPolicy::participant\_liveliness\_assert\_period** (p. 1463))

**[range]** [1 nanosec,1 year]

#### 5.46.2.4 remote\_participant\_purge\_kind

```
DDS_RemoteParticipantPurgeKind DDS_DiscoveryConfigQosPolicy::remote_participant_purge_kind
```

The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.

Most users will not need to change this value from its default, **DDS\_LIVELINESS\_BASED\_REMOTE\_PARTICIPANT\_PURGE** (p. 1083). However, **DDS\_NO\_REMOTE\_PARTICIPANT\_PURGE** (p. 1084) may be a good choice if the following conditions apply:

1. Discovery communication with a remote participant may be lost while data communication remains intact. Such will not typically be the case if discovery takes place over the Simple Discovery Protocol, but may be the case if the RTI Enterprise Discovery Service is used.
2. Extensive and prolonged lack of discovery communication between participants is not expected to be common, either because participant loss itself is expected to be rare, or because participants may be lost sporadically but will typically return again.
3. Maintaining inter-participant liveliness is problematic, perhaps because a participant has no writers with the appropriate **DDS\_LivelinessQosPolicyKind** (p. 1097).

**[default]** **DDS\_LIVELINESS\_BASED\_REMOTE\_PARTICIPANT\_PURGE** (p. 1083)

#### 5.46.2.5 max\_liveliness\_loss\_detection\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::max_liveliness_loss_detection_period
```

The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.

Notification of the loss of liveliness of a remote entity may come more quickly than this duration, depending on the liveliness contract between the local and remote entities and the capabilities of the discovery mechanism in use. For example, a **DDS\_DataReader** (p. 608) will learn of the loss of liveliness of a matched **DDS\_DataWriter** (p. 478) within the reader's offered liveliness lease duration.

Shortening this duration will increase the responsiveness of entities to communication failures. However, it will also increase the CPU usage of the application, as the liveliness of remote entities will be examined more frequently.

**[default]** 60 seconds

**[range]** [1 nanosec, 1 year]

#### 5.46.2.6 initial\_participant\_announcements

```
DDS_Long DDS_DiscoveryConfigQosPolicy::initial_participant_announcements
```

The number of initial announcements sent when a participant is first enabled.

**[default]** 5

**[range]** [1, 1 million]

### 5.46.2.7 new\_remote\_participant\_announcements

```
DDS_Long DDS_DiscoveryConfigQosPolicy::new_remote_participant_announcements
```

The number of participant announcements sent when a remote participant is newly discovered.

These announcements are only sent to the newly discovered remote participant, they are not also broadcast to the initial\_peers list.

**[default]** 2

**[range]** [0,1 million]

### 5.46.2.8 min\_initial\_participant\_announcement\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::min_initial_participant_announcement_period
```

The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between this and **DDS\_DiscoveryConfigQosPolicy::max\_initial\_participant\_announcement\_period** (p. 1465) is introduced in between initial announcements when a new remote participant is discovered.

The setting of **DDS\_DiscoveryConfigQosPolicy::min\_initial\_participant\_announcement\_period** (p. 1465) must be consistent with **DDS\_DiscoveryConfigQosPolicy::max\_initial\_participant\_announcement\_period** (p. 1465). For these two values to be consistent, they must verify that:

**DDS\_DiscoveryConfigQosPolicy::min\_initial\_participant\_announcement\_period** (p. 1465)  $\leq$  **DDS\_DiscoveryConfigQosPolicy::max\_initial\_participant\_announcement\_period** (p. 1465).

**[default]** 10 milliseconds

**[range]** [1 nanosec,1 year]

### 5.46.2.9 max\_initial\_participant\_announcement\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::max_initial_participant_announcement_period
```

The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between **DDS\_DiscoveryConfigQosPolicy::min\_initial\_participant\_announcement\_period** (p. 1465) and this is introduced in between initial announcements when a new remote participant is discovered.

The setting of **DDS\_DiscoveryConfigQosPolicy::max\_initial\_participant\_announcement\_period** (p. 1465) must be consistent with **DDS\_DiscoveryConfigQosPolicy::min\_initial\_participant\_announcement\_period** (p. 1465). For these two values to be consistent, they must verify that:

**DDS\_DiscoveryConfigQosPolicy::min\_initial\_participant\_announcement\_period** (p. 1465)  $\leq$  **DDS\_DiscoveryConfigQosPolicy::max\_initial\_participant\_announcement\_period** (p. 1465).

**[default]** 1 second

**[range]** [1 nanosec,1 year]

#### 5.46.2.10 participant\_reader\_resource\_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::participant_reader_↔  
resource_limits
```

Resource limits.

Resource limit of the built-in topic participant reader. For details, see [DDS\\_BuiltinTopicReaderResourceLimits\\_t](#) (p. 1339).

#### 5.46.2.11 publication\_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::publication_reader
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.

For details, refer to the [DDS\\_RtpsReliableReaderProtocol\\_t](#) (p. 1695)

##### [default]

```
min_heartbeat_response_delay 0.0 seconds;  
max_heartbeat_response_delay 0.0 seconds;  
heartbeat_suppression_duration 0.0625 seconds;  
nack_period 5.0 seconds;  
receive_window_size 256;  
round_trip_time 0.0 seconds;  
app_ack_period 5.0 seconds;  
samples_per_app_ack 1;
```

#### 5.46.2.12 publication\_reader\_resource\_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::publication_reader_↔  
resource_limits
```

Resource limits.

Resource limit of the built-in topic publication reader. For details, see [DDS\\_BuiltinTopicReaderResourceLimits\\_t](#) (p. 1339).

#### 5.46.2.13 subscription\_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::subscription_reader
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.

For details, refer to the [DDS\\_RtpsReliableReaderProtocol\\_t](#) (p. 1695)

##### [default]

```
min_heartbeat_response_delay 0.0 seconds;  
max_heartbeat_response_delay 0.0 seconds;  
heartbeat_suppression_duration 0.0625 seconds;  
nack_period 5.0 seconds;  
receive_window_size 256;  
round_trip_time 0.0 seconds;  
app_ack_period 5.0 seconds;  
samples_per_app_ack 1;
```

### 5.46.2.14 subscription\_reader\_resource\_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::subscription_reader↔
_resource_limits
```

Resource limits.

Resource limit of the built-in topic subscription reader. For details, see **DDS\_BuiltinTopicReaderResourceLimits\_t** (p. 1339).

### 5.46.2.15 publication\_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::publication_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.

For details, refer to the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699)

#### [default]

```
low_watermark 0;
high_watermark 1;
heartbeat_period 3.0 seconds;
fast_heartbeat_period 3.0 seconds;
late_joiner_heartbeat_period 3.0 seconds;

disable_repair_piggyback_heartbeat DDS_BOOLEAN_FALSE (p. 1004);
```

### 5.46.2.16 publication\_writer\_data\_lifecycle

```
struct DDS_WriterDataLifecycleQosPolicy DDS_DiscoveryConfigQosPolicy::publication_writer_data_↔
lifecycle
```

Writer data lifecycle settings for a built-in publication writer.

For details, refer to the **DDS\_WriterDataLifecycleQosPolicy** (p. 1838). **DDS\_WriterDataLifecycleQosPolicy↔::autodispose\_unregistered\_instances** (p. 1840) will always be forced to **DDS\_BOOLEAN\_TRUE** (p. 1004).

### 5.46.2.17 subscription\_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::subscription_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.

For details, refer to the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699)

#### [default]

```
low_watermark 0;
high_watermark 1;
heartbeat_period 3.0 seconds;
fast_heartbeat_period 3.0 seconds;
late_joiner_heartbeat_period 3.0 seconds;
virtual_heartbeat_period DDS_DURATION_INFINITE (p. 1011);

disable_positive_acks_increase_sample_keep_duration_factor 150;
min_send_window_size DDS_LENGTH_UNLIMITED (p. 1127);
max_send_window_size DDS_LENGTH_UNLIMITED (p. 1127);
send_window_update_period 3s;
send_window_increase_factor 105;
send_window_decrease_factor 50;
enable_multicast_periodic_heartbeat DDS_BOOLEAN_FALSE (p. 1004);
multicast_resend_threshold 2 readers;
disable_repair_piggyback_heartbeat DDS_BOOLEAN_FALSE (p. 1004);
```

### 5.46.2.18 subscription\_writer\_data\_lifecycle

```
struct DDS_WriterDataLifecycleQosPolicy DDS_DiscoveryConfigQosPolicy::subscription_writer_data_↔  
lifecycle
```

Writer data lifecycle settings for a built-in subscription writer.

For details, refer to the **DDS\_WriterDataLifecycleQosPolicy** (p. 1838). **DDS\_WriterDataLifecycleQosPolicy**↔  
::**autodispose\_unregistered\_instances** (p. 1840) will always be forced to **DDS\_BOOLEAN\_TRUE** (p. 1004).

### 5.46.2.19 builtin\_discovery\_plugins

```
DDS_DiscoveryConfigBuiltinPluginKindMask DDS_DiscoveryConfigQosPolicy::builtin_discovery_plugins
```

Mask of built-in discovery plugin kinds.

There are several built-in discovery plugins. This mask enables the different plugins. Any plugin not enabled will not be created.

**[default]** **DDS\_DISCOVERYCONFIG\_BUILTIN\_SDP** (p. 1081)

See also

**DDS\_DiscoveryConfigBuiltinPluginKind** (p. 1081)

### 5.46.2.20 enabled\_builtin\_channels

```
DDS_DiscoveryConfigBuiltinChannelKindMask DDS_DiscoveryConfigQosPolicy::enabled_builtin_channels
```

The mask specifying which built-in channels should be enabled.

While there are a number of built-in channels that are used by Connex DDS, the only built-in channel which can currently be enabled or disabled is the Service Request Channel. This channel is used by the Locator Reachability and Topic Query features. If you are not using these features and wish to reduce network traffic and endpoint resource usage, you may disable the service request channel with this QoS.

**[default]** **DDS\_DISCOVERYCONFIG\_SERVICE\_REQUEST\_CHANNEL** (p. 1082)

### 5.46.2.21 participant\_message\_reader\_reliability\_kind

```
DDS_ReliabilityQosPolicyKind DDS_DiscoveryConfigQosPolicy::participant_message_reader_reliability_↔  
_kind
```

Reliability policy for a built-in participant message reader.

For details, refer to the **DDS\_ReliabilityQosPolicyKind** (p. 1123).

**[default]** **DDS\_BEST\_EFFORT\_RELIABILITY\_QOS** (p. 1124)

### 5.46.2.22 participant\_message\_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::participant_message_reader
```

RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if **DDS\_DiscoveryConfigQosPolicy::participant\_message\_reader\_reliability\_kind** (p. 1469) is set to **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124).

For details, refer to the **DDS\_RtpsReliableReaderProtocol\_t** (p. 1695)

#### [default]

```
min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;
```

### 5.46.2.23 participant\_message\_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::participant_message_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with **DDS\_RELIABLE\_↔\_RELIABILITY\_QOS** (p. 1124) **DDS\_ReliabilityQosPolicyKind** (p. 1123).

For details, refer to the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699)

#### [default]

```
low_watermark 0;
high_watermark 1;
heartbeat_period 1.0 seconds;
fast_heartbeat_period 1.0 seconds;
late_joiner_heartbeat_period 1.0 seconds;
virtual_heartbeat_period DDS_DURATION_INFINITE (p. 1011);
samples_per_virtual_heartbeat DDS_LENGTH_UNLIMITED (p. 1127);

disable_positive_acks_increase_sample_keep_duration_factor 150;
min_send_window_size DDS_LENGTH_UNLIMITED (p. 1127);
```

max\_send\_window\_size **DDS\_LENGTH\_UNLIMITED** (p. 1127);  
 send\_window\_update\_period 1s;  
 send\_window\_increase\_factor 105;  
 send\_window\_decrease\_factor 50;  
 enable\_multicast\_periodic\_heartbeat **DDS\_BOOLEAN\_FALSE** (p. 1004);  
 multicast\_resend\_threshold 2 readers;  
 disable\_repair\_piggyback\_heartbeat **DDS\_BOOLEAN\_FALSE** (p. 1004);

#### 5.46.2.24 publication\_writer\_publish\_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::publication_writer_publish_mode
```

Publish mode policy for the built-in publication writer.

Determines whether the Discovery built-in publication **DDS\_DataWriter** (p. 478) publishes data synchronously or asynchronously and how.

#### 5.46.2.25 subscription\_writer\_publish\_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::subscription_writer_publish_mode
```

Publish mode policy for the built-in subscription writer.

Determines whether the Discovery built-in subscription **DDS\_DataWriter** (p. 478) publishes data synchronously or asynchronously and how.

#### 5.46.2.26 asynchronous\_publisher

```
struct DDS_AsynchronousPublisherQosPolicy DDS_DiscoveryConfigQosPolicy::asynchronous_publisher
```

Asynchronous publishing settings for the discovery **DDS\_Publisher** (p. 436) and all entities that are created by it.

#### 5.46.2.27 default\_domain\_announcement\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::default_domain_announcement_period
```

The period to announce a participant to the default domain 0.

The period at which a participant will announce itself to the default domain 0 using the default UDPv4 multicast group address for discovery traffic on that domain.

For domain 0, the default discovery multicast address is 239.255.0.1:7400.

To disable announcement to the default domain, set this period to **DDS\_DURATION\_INFINITE** (p. 1011).

When this period is set to a value other than **DDS\_DURATION\_INFINITE** (p. 1011) and **DDS\_DiscoveryConfigQosPolicy::ignore\_default\_domain\_announcements** (p. 1472) is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), you can get information about participants running in different domains by creating a participant in domain 0 and implementing the `on_data_available` callback in the **DDS\_ParticipantBuiltinTopicData** (p. 1616) built-in `DataReader`'s listener.

You can learn the domain ID associated with a participant by looking at the field **DDS\_ParticipantBuiltinTopicData::domain\_id** (p. 1619).

**[default]** 30 seconds

**[range]** [1 nanosec,1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

See also

**DDS\_ParticipantBuiltinTopicData::domain\_id** (p. 1619)

**DDS\_DiscoveryConfigQosPolicy::ignore\_default\_domain\_announcements** (p. 1472)

#### 5.46.2.28 ignore\_default\_domain\_announcements

```
DDS_Boolean DDS_DiscoveryConfigQosPolicy::ignore_default_domain_announcements
```

Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.

This setting only applies to participants running on the default domain 0 and using the default port mapping.

When this setting is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), a participant running on the default domain 0 will ignore announcements from participants running on different domain IDs.

When this setting is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), a participant running on the default domain 0 will provide announcements from participants running on different domain IDs to the application via the **DDS\_ParticipantBuiltinTopicData** (p. 1616) built-in DataReader.

**[default]** **DDS\_BOOLEAN\_TRUE** (p. 1004)

See also

**DDS\_ParticipantBuiltinTopicData::domain\_id** (p. 1619)

**DDS\_DiscoveryConfigQosPolicy::default\_domain\_announcement\_period** (p. 1471)

#### 5.46.2.29 service\_request\_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::service_request_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in **DDS\_ServiceRequest** (p. 1736) writer.

For details, refer to the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699)

**[default]**

low\_watermark 0;

high\_watermark 1;

heartbeat\_period 3.0 seconds;

fast\_heartbeat\_period 3.0 seconds;

late\_joiner\_heartbeat\_period 3.0 seconds;

virtual\_heartbeat\_period **DDS\_DURATION\_INFINITE** (p. 1011);

samples\_per\_virtual\_heartbeat **DDS\_LENGTH\_UNLIMITED** (p. 1127);

max\_heartbeat\_retries 10;

inactivate\_nonprogressing\_readers **DDS\_BOOLEAN\_FALSE** (p. 1004);  
 heartbeats\_per\_max\_samples 8;  
 min\_nack\_response\_delay 0.0 seconds;  
 max\_nack\_response\_delay 0.0 seconds;  
 nack\_suppression\_duration 0.0 seconds;  
 max\_bytes\_per\_nack\_response 131072 bytes;  
 disable\_positive\_acks\_min\_sample\_keep\_duration 1.0 milliseconds;  
 disable\_positive\_acks\_max\_sample\_keep\_duration 1.0 seconds;  
 disable\_positive\_acks\_enable\_adaptive\_sample\_keep\_duration **DDS\_BOOLEAN\_TRUE** (p. 1004);  
 disable\_positive\_acks\_decrease\_sample\_keep\_duration\_factor 95;  
 disable\_positive\_acks\_increase\_sample\_keep\_duration\_factor 150;  
 min\_send\_window\_size **DDS\_LENGTH\_UNLIMITED** (p. 1127);  
 max\_send\_window\_size **DDS\_LENGTH\_UNLIMITED** (p. 1127);  
 send\_window\_update\_period 3s;  
 send\_window\_increase\_factor 105;  
 send\_window\_decrease\_factor 50;  
 enable\_multicast\_periodic\_heartbeat **DDS\_BOOLEAN\_FALSE** (p. 1004);  
 multicast\_resend\_threshold 2 readers;  
 disable\_repair\_piggyback\_heartbeat **DDS\_BOOLEAN\_FALSE** (p. 1004);

#### 5.46.2.30 service\_request\_writer\_data\_lifecycle

```
struct DDS_WriterDataLifecycleQosPolicy DDS_DiscoveryConfigQosPolicy::service_request_writer_↔
data_lifecycle
```

Writer data lifecycle settings for a built-in **DDS\_ServiceRequest** (p. 1736) writer.

For details, refer to the **DDS\_WriterDataLifecycleQosPolicy** (p. 1838).

#### 5.46.2.31 service\_request\_writer\_publish\_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::service_request_writer_publish_mode
```

Publish mode policy for the built-in service request writer.

Determines whether the Discovery built-in service request **DDS\_DataWriter** (p. 478) publishes data synchronously or asynchronously and how.

#### 5.46.2.32 service\_request\_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::service_request_reader
```

RTPS reliable reader protocol-related configuration settings for a built-in **DDS\_ServiceRequest** (p. 1736) reader.

For details, refer to the **DDS\_RtpsReliableReaderProtocol\_t** (p. 1695)

##### [default]

min\_heartbeat\_response\_delay 0.0 seconds;  
 max\_heartbeat\_response\_delay 0.0 seconds;  
 heartbeat\_suppression\_duration 0.0625 seconds;  
 nack\_period 5.0 seconds;  
 receive\_window\_size 256;  
 round\_trip\_time 0.0 seconds;  
 app\_ack\_period 5.0 seconds;  
 samples\_per\_app\_ack 1;

### 5.46.2.33 locator\_reachability\_assert\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_assert_period
```

Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.

This setting configures the period at which this **DDS\_DomainParticipant** (p.72) will ping all the locators that it has discovered from other DomainParticipants. This period should be strictly less than **DDS\_DiscoveryConfigQosPolicy**↔  
↔**::locator\_reachability\_lease\_duration** (p. 1474).

If **DDS\_DiscoveryConfigQosPolicy::locator\_reachability\_lease\_duration** (p.1474) is **DDS\_DURATION\_INFINITE** (p. 1011) this parameter is ignored. The DomainParticipant will not assert remote locators.

**[default]** 20 seconds

**[range]** [1 nanosec,1 year]

See also

**DDS\_DiscoveryConfigQosPolicy::locator\_reachability\_lease\_duration** (p. 1474)

### 5.46.2.34 locator\_reachability\_lease\_duration

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_lease_duration
```

The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.

For the purpose of this explanation, we will use 'local' to refer to the DomainParticipant in which we configure `locator_reachability_lease_duration` and 'remote' to refer to the other DomainParticipants communicating with the local DomainParticipant.

This setting configures a timeout announced to the remote DomainParticipants. This timeout is used by the remote DomainParticipants as the maximum period by which a remote locator must be asserted by the local DomainParticipant (through a REACHABILITY PING message) before considering this locator as "unreachable" from the local Domain↔  
↔Participant.

When a remote DomainParticipant detects that one of its locators is not reachable from the local DomainParticipant, it will notify the local DomainParticipant of this event. From that moment on, and until notified otherwise, the local DomainParticipant will not send RTPS messages to remote DomainParticipants using this locator.

If this value is set to **DDS\_DURATION\_INFINITE** (p. 1011), the local DomainParticipant will send RTPS messages to a remote DomainParticipant on the locators announced by the remote DomainParticipant, regardless of whether or not the remote DomainParticipant can be reached using these locators.

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011)

**[range]** [1 nanosec,1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

### 5.46.2.35 locator\_reachability\_change\_detection\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::locator_reachability_change_detection_period
```

Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.

This setting determines the maximum period at which this DomainParticipant will check to see if its locators are reachable from other DomainParticipants according to the other DomainParticipants' **DDS\_DiscoveryConfigQosPolicy**::**locator\_reachability\_lease\_duration** (p. 1474) value.

If **DDS\_DiscoveryConfigQosPolicy::locator\_reachability\_lease\_duration** (p. 1474) is **DDS\_DURATION\_INFINITE** (p. 1011) this parameter is ignored. The DomainParticipant will not schedule an event to see if its locators are reachable from other DomainParticipants.

**[default]** 60 seconds

**[range]** [1 nanosec,1 year]

See also

**DDS\_DiscoveryConfigQosPolicy::locator\_reachability\_lease\_duration** (p. 1474)

### 5.46.2.36 secure\_volatile\_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::secure_volatile_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.

For details, refer to the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699)

**[default]**

```
low_watermark 0;
high_watermark 1;
heartbeat_period 1.0 second;
fast_heartbeat_period 250.0 milliseconds;
late_joiner_heartbeat_period 1.0 second;
virtual_heartbeat_period DDS_DURATION_INFINITE (p. 1011);
samples_per_virtual_heartbeat DDS_LENGTH_UNLIMITED (p. 1127);
max_heartbeat_retries DDS_LENGTH_UNLIMITED (p. 1127);
inactivate_nonprogressing_readers DDS_BOOLEAN_FALSE (p. 1004);
heartbeats_per_max_samples 1;
min_nack_response_delay 0.0 seconds;
max_nack_response_delay 0.0 seconds;
nack_suppression_duration 0.0 seconds;
max_bytes_per_nack_response 9216 bytes;
disable_positive_acks_min_sample_keep_duration 1.0 millisecond;
disable_positive_acks_max_sample_keep_duration 1.0 second;
disable_positive_acks_enable_adaptive_sample_keep_duration DDS_BOOLEAN_TRUE (p. 1004);
```

```

disable_positive_acks_decrease_sample_keep_duration_factor 95;
disable_positive_acks_increase_sample_keep_duration_factor 150;
min_send_window_size DDS_LENGTH_UNLIMITED (p. 1127);
max_send_window_size DDS_LENGTH_UNLIMITED (p. 1127);
send_window_update_period 1.0 second;
send_window_increase_factor 105;
send_window_decrease_factor 50;
enable_multicast_periodic_heartbeat DDS_BOOLEAN_FALSE (p. 1004);
multicast_resend_threshold 2 readers;
disable_repair_piggyback_heartbeat DDS_BOOLEAN_FALSE (p. 1004);

```

#### 5.46.2.37 secure\_volatile\_writer\_publish\_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::secure_volatile_writer_publish_mode
```

Publish mode policy for the built-in secure volatile writer.

Determines whether the built-in secure volatile **DDS\_DataWriter** (p.478) publishes data synchronously or asynchronously and how.

#### 5.46.2.38 secure\_volatile\_reader

```
struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::secure_volatile_reader
```

RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.

For details, refer to the **DDS\_RtpsReliableReaderProtocol\_t** (p. 1695)

##### [default]

```

min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;

```

#### 5.46.2.39 endpoint\_type\_object\_lb\_serialization\_threshold

```
DDS_Long DDS_DiscoveryConfigQosPolicy::endpoint_type_object_lb_serialization_threshold
```

Option to reduce the size required to propagate a TypeObject in Simple Endpoint Discovery.

Minimum size (in bytes) of the serialized TypeObject that will trigger the serialization of a TypeObjectLb instead of the regular TypeObject.

For example, setting this property to 1000 will trigger the serialization of the TypeObjectLb for TypeObjects whose serialized size is greater than 1000 Bytes.

The sentinel value -1 disables TypeObject compression.

**[default]** 0. The default value 0 enables TypeObject compression by always sending TypeObjectLb.

**[range]** [-1, 2147483647]

### 5.46.2.40 dns\_tracker\_polling\_period

```
struct DDS_Duration_t DDS_DiscoveryConfigQosPolicy::dns_tracker_polling_period
```

Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.

RTI Connexx allows the use of hostnames instead of IP addresses when configuring initial peers for specific transports (e.g.: UDPv4 and UDPv6). The DNS tracker keeps the IP addresses of these hostnames updated. The DNS tracker builds a list of hostnames from the initial peers of a DomainParticipant, queries the DNS for those hostnames, and updates the resolved IP addresses when the IP addresses change. The frequency of these queries is defined by the DNS tracker polling period. When the period is set to **DDS\_DURATION\_INFINITE** (p. 1011), the tracker is disabled.

RTI Connexx keeps information regarding the hostnames of peers if they are part of the **DDS\_DiscoveryQosPolicy**↔::**initial\_peers** (p. 1480). The information regarding peers added through the **DDS\_DomainParticipant\_add\_peer** (p. 146) operation is kept only if the DNS tracker has been enabled before adding a peer.

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011)

**[range]** [1 second,1 year], **DDS\_DURATION\_INFINITE** (p. 1011)

### 5.46.2.41 participant\_configuration\_writer\_publish\_mode

```
struct DDS_PublishModeQosPolicy DDS_DiscoveryConfigQosPolicy::participant_configuration_writer_↔  
publish_mode
```

Publish mode policy for the built-in participant configuration writer.

Determines whether the Discovery built-in participant configuration **DDS\_DataWriter** (p. 478) publishes data synchronously or asynchronously and how.

### 5.46.2.42 participant\_configuration\_writer

```
struct DDS_RtpsReliableWriterProtocol_t DDS_DiscoveryConfigQosPolicy::participant_configuration_↔  
_writer
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.

For details, refer to the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699)

**[default]**

```
low_watermark 0;  
high_watermark 1;  
heartbeat_period 3.0 seconds;  
fast_heartbeat_period 3.0 seconds;  
late_joiner_heartbeat_period 3.0 seconds;  
virtual_heartbeat_period DDS_DURATION_INFINITE (p. 1011);  
samples_per_virtual_heartbeat DDS_LENGTH_UNLIMITED (p. 1127);  
max_heartbeat_retries 10;
```

```

inactivate_nonprogressing_readers DDS_BOOLEAN_FALSE (p. 1004);
heartbeats_per_max_samples 8;
min_nack_response_delay 0.0 seconds;
max_nack_response_delay 0.0 seconds;
nack_suppression_duration 0.0 seconds;
max_bytes_per_nack_response 131072 bytes;
disable_positive_acks_min_sample_keep_duration 1.0 milliseconds;
disable_positive_acks_max_sample_keep_duration 1.0 seconds;
disable_positive_acks_enable_adaptive_sample_keep_duration DDS_BOOLEAN_TRUE (p. 1004);
disable_positive_acks_decrease_sample_keep_duration_factor 95;
disable_positive_acks_increase_sample_keep_duration_factor 150;
min_send_window_size DDS_LENGTH_UNLIMITED (p. 1127);
max_send_window_size DDS_LENGTH_UNLIMITED (p. 1127);
send_window_update_period 3s;
send_window_increase_factor 105;
send_window_decrease_factor 50;
enable_multicast_periodic_heartbeat DDS_BOOLEAN_FALSE (p. 1004);
multicast_resend_threshold 2 readers;
disable_repair_piggyback_heartbeat DDS_BOOLEAN_FALSE (p. 1004);

```

#### 5.46.2.43 participant\_configuration\_writer\_data\_lifecycle

```

struct DDS_WriterDataLifecycleQosPolicy DDS_DiscoveryConfigQosPolicy::participant_configuration↔
_writer_data_lifecycle

```

Writer data lifecycle settings for a built-in participant configuration writer.

For details, refer to the **DDS\_WriterDataLifecycleQosPolicy** (p. 1838). **DDS\_WriterDataLifecycleQosPolicy↔::autodispose\_unregistered\_instances** (p. 1840) will always be forced to **DDS\_BOOLEAN\_TRUE** (p. 1004).

#### 5.46.2.44 participant\_configuration\_reader

```

struct DDS_RtpsReliableReaderProtocol_t DDS_DiscoveryConfigQosPolicy::participant_configuration↔
_reader

```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.

For details, refer to the **DDS\_RtpsReliableReaderProtocol\_t** (p. 1695)

##### [default]

```

min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;

```

### 5.46.2.45 participant\_configuration\_reader\_resource\_limits

```
struct DDS_BuiltinTopicReaderResourceLimits_t DDS_DiscoveryConfigQosPolicy::participant_configuration←
_reader_resource_limits
```

Resource limits for the built-in topic participant configuration reader.

For details, see `DDS_BuiltinTopicReaderResourceLimits_t` (p. 1339).

## 5.47 DDS\_DiscoveryQosPolicy Struct Reference

<<*extension*>> (p. 817) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

### Data Fields

- struct **DDS\_StringSeq enabled\_transports**  
*The transports available for use by the Discovery mechanism.*
- struct **DDS\_StringSeq initial\_peers**  
*Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.*
- struct **DDS\_StringSeq multicast\_receive\_addresses**  
*Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain←Participant.*
- **DDS\_Long metatraffic\_transport\_priority**  
*The transport priority to use for the Discovery meta-traffic.*
- **DDS\_Boolean accept\_unknown\_peers**  
*Whether to accept a new participant that is not in the initial peers list.*
- **DDS\_Boolean enable\_endpoint\_discovery**  
*Whether to automatically enable endpoint discovery for all the remote participants.*

### 5.47.1 Detailed Description

<<*extension*>> (p. 817) Configures the mechanism used by the middleware to automatically discover and connect with new remote applications.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.47.2 Usage

This QoS policy identifies where on the network this application can *potentially* discover other applications with which to communicate.

The middleware will periodically send network packets to these locations, announcing itself to any remote applications that may be present, and will listen for announcements from those applications.

This QoS policy is an extension to the DDS standard.

See also

**NDDS\_DISCOVERY\_PEERS** (p. 1152)

**DDS\_DiscoveryConfigQosPolicy** (p. 1460)

## 5.47.3 Field Documentation

### 5.47.3.1 enabled\_transports

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::enabled_transports
```

The transports available for use by the Discovery mechanism.

Only these transports can be used by the discovery mechanism to send meta-traffic via the builtin endpoints (built-in **DDS\_DataReader** (p. 608) and **DDS\_DataWriter** (p. 478)).

Also determines the unicast addresses on which the Discovery mechanism will listen for meta-traffic. These along with the `domain_id` and `participant_id` determine the unicast locators on which the Discovery mechanism can receive meta-data.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1312). In particular, be careful to avoid a situation in which RTI Connex allocates a string on your behalf and you then reuse that string in such a way that RTI Connex believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT\_BUILTIN** (p. 1132). These alias names are case sensitive and should be written in lowercase.

**[default]** Empty sequence. All the transports available to the DomainParticipant are available for use by the Discovery mechanism.

**[range]** Sequence of non-null, non-empty strings.

### 5.47.3.2 initial\_peers

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::initial_peers
```

Determines the initial list of peers that will be contacted by the Discovery mechanism to send announcements about the presence of this participant.

As part of the participant discovery phase, the **DDS\_DomainParticipant** (p. 72) will announce itself to the domain by sending participant DATA messages. The `initial_peers` specifies the initial list of peers that will be contacted. A remote **DDS\_DomainParticipant** (p. 72) is discovered by receiving participant announcements from a remote peer. When the new remote **DDS\_DomainParticipant** (p. 72) has been added to the participant's database, the endpoint discovery phase commences and information about the DataWriters and DataReaders is exchanged.

Each element of this list must be a peer descriptor in the proper format (see **Peer Descriptor Format** (p. 1153)).

**[default]** builtin.udpv4://239.255.0.1, builtin.udpv4://127.0.0.1, builtin.shmem:// (See also **NDDS\_DISCOVERY\_PEERS** (p. 1152))

**[range]** Sequence of arbitrary length.

See also

**Peer Descriptor Format** (p. 1153)

**DDS\_DomainParticipant\_add\_peer()** (p. 146)

### 5.47.3.3 multicast\_receive\_addresses

```
struct DDS_StringSeq DDS_DiscoveryQosPolicy::multicast_receive_addresses
```

Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain↔ Participant.

The multicast group addresses on which the Discovery mechanism will listen for meta-traffic.

Each element of this list must be a valid multicast address (IPv4 or IPv6) in the proper format (see **Address Format** (p. 1154)).

The `domain_id` determines the multicast port on which the Discovery mechanism can receive meta-data.

If **NDDS\_DISCOVERY\_PEERS** does *not* contain a multicast address, then the string sequence **DDS\_DiscoveryQos↔ Policy::multicast\_receive\_addresses** (p. 1481) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If **NDDS\_DISCOVERY\_PEERS** contains one or more multicast addresses, the addresses will be stored in **DDS\_↔ DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481), starting at element 0. They will be stored in the order they appear **NDDS\_DISCOVERY\_PEERS**.

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in **DDS\_↔ DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481).

**[default]** builtin.udpv4://239.255.0.1 (See also **NDDS\_DISCOVERY\_PEERS** (p. 1152))

**[range]** Sequence of length [0,1], whose elements are multicast addresses. Currently only the first multicast address (if any) is used. The rest are ignored.

See also

**Address Format** (p. 1154)

#### 5.47.3.4 metatraffic\_transport\_priority

```
DDS_Long DDS_DiscoveryQosPolicy::metatraffic_transport_priority
```

The transport priority to use for the Discovery meta-traffic.

The discovery metatraffic will be sent by the built-in **DDS\_DataWriter** (p. 478) using this transport priority.

**[default]** 0

**[range]** [0, MAX\_UINT]

#### 5.47.3.5 accept\_unknown\_peers

```
DDS_Boolean DDS_DiscoveryQosPolicy::accept_unknown_peers
```

Whether to accept a new participant that is not in the initial peers list.

If **DDS\_BOOLEAN\_FALSE** (p. 1004), the participant will only communicate with those in the initial peers list and those added via **DDS\_DomainParticipant\_add\_peer()** (p. 146).

If **DDS\_BOOLEAN\_TRUE** (p. 1004), the participant will also communicate with all discovered remote participants.

Note: If `accept_unknown_peers` is **DDS\_BOOLEAN\_FALSE** (p. 1004) and shared memory is disabled, applications on the same node will *not* communicate if only 'localhost' is specified in the peers list. If shared memory is disabled or 'shmem://' is not specified in the peers list, to communicate with other applications on the same node through the loopback interface, you must put the actual node address or hostname in **NDDS\_DISCOVERY\_PEERS** (p. 1152).

**[default]** **DDS\_BOOLEAN\_TRUE** (p. 1004)

#### 5.47.3.6 enable\_endpoint\_discovery

```
DDS_Boolean DDS_DiscoveryQosPolicy::enable_endpoint_discovery
```

Whether to automatically enable endpoint discovery for all the remote participants.

If **DDS\_BOOLEAN\_TRUE** (p. 1004), endpoint discovery will automatically occur for every discovered remote participant.

If **DDS\_BOOLEAN\_FALSE** (p. 1004), endpoint discovery will be initially disabled and manual activation is required for each discovered participant by calling **DDS\_DomainParticipant\_resume\_endpoint\_discovery** (p. 138).

**[default]** **DDS\_BOOLEAN\_TRUE** (p. 1004)

## 5.48 DDS\_DomainParticipantConfigParams\_t Struct Reference

<<**extension**>> (p. 817) Input parameters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

## Data Fields

- int **domain\_id**  
*Domain ID from which the **DDS\_DomainParticipant** (p. 72) is created.*
- char \* **participant\_name**  
*Name assigned to the **DDS\_DomainParticipant** (p. 72).*
- char \* **participant\_qos\_library\_name**  
*QoS library name containing the QoS profile from which the **DDS\_DomainParticipant** (p. 72) is created.*
- char \* **participant\_qos\_profile\_name**  
*QoS profile name from which the **DDS\_DomainParticipant** (p. 72) is created.*
- char \* **domain\_entity\_qos\_library\_name**  
*QoS library name containing the QoS profile from which the all the **DDS\_DomainEntity** (p. 1162) defined under the participant configuration are created.*
- char \* **domain\_entity\_qos\_profile\_name**  
*QoS profile name from which the all the **DDS\_DomainEntity** (p. 1162) defined under the participant configuration are created.*

### 5.48.1 Detailed Description

<<**extension**>> (p. 817) Input paramaters for creating a participant from configuration. It allows to modify or override some of the properties of the entities defined in the configuration.

### 5.48.2 Field Documentation

#### 5.48.2.1 domain\_id

```
int DDS_DomainParticipantConfigParams_t::domain_id
```

Domain ID from which the **DDS\_DomainParticipant** (p. 72) is created.

Allows overriding the domain ID defined in the configuration for the participant to be created. If the special value **DDS\_↔\_DOMAIN\_ID\_USE\_XML\_CONFIG** (p. 1228) is specified then the ID in the configuration will be used.

#### 5.48.2.2 participant\_name

```
char* DDS_DomainParticipantConfigParams_t::participant_name
```

Name assigned to the **DDS\_DomainParticipant** (p. 72).

This is the name the name that will be set in the **DDS\_DomainParticipantQos::participant\_name** (p. 1493). It allows overriding the participant name that is generated automatically.

When this member is lexicographically equal to the special value **DDS\_ENTITY\_NAME\_USE\_XML\_CONFIG** (p. 1228) then an automatically generated name will be assigned.

### 5.48.2.3 participant\_qos\_library\_name

```
char* DDS_DomainParticipantConfigParams_t::participant_qos_library_name
```

QoS library name containing the QoS profile from which the **DDS\_DomainParticipant** (p. 72) is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **DDS\_DomainParticipant** (p. 72).

When this member is lexicographically equal to the special value **DDS\_QOS\_ELEMENT\_NAME\_USE\_XML\_CONFIG** (p. 1228) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **DDS\_DomainParticipantConfigParams\_t::participant\_qos\_profile\_name** (p. 1484) will be ignored.

### 5.48.2.4 participant\_qos\_profile\_name

```
char* DDS_DomainParticipantConfigParams_t::participant_qos_profile_name
```

QoS profile name from which the **DDS\_DomainParticipant** (p. 72) is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **DDS\_DomainParticipant** (p. 72).

When this member is lexicographically equal to the special value **DDS\_QOS\_ELEMENT\_NAME\_USE\_XML\_CONFIG** (p. 1228) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **DDS\_DomainParticipantConfigParams\_t::participant\_qos\_library\_name** (p. 1483) will be ignored.

### 5.48.2.5 domain\_entity\_qos\_library\_name

```
char* DDS_DomainParticipantConfigParams_t::domain_entity_qos_library_name
```

QoS library name containing the QoS profile from which the all the **DDS\_DomainEntity** (p. 1162) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **DDS\_DomainEntity** (p. 1162).

When this member is lexicographically equal to the special value **DDS\_QOS\_ELEMENT\_NAME\_USE\_XML\_CONFIG** (p. 1228) then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **DDS\_DomainParticipantConfigParams\_t::domain\_entity\_qos\_profile\_name** (p. 1484) will be ignored.

### 5.48.2.6 domain\_entity\_qos\_profile\_name

```
char* DDS_DomainParticipantConfigParams_t::domain_entity_qos_profile_name
```

QoS profile name from which the all the **DDS\_DomainEntity** (p. 1162) defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the **DDS\_DomainEntity** (p. 1162).

When this member is lexicographically equal to the special value **DDS\_QOS\_ELEMENT\_NAME\_USE\_XML\_CONFIG** (p. 1228) then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **DDS\_DomainParticipantConfigParams\_t::domain\_entity\_qos\_library\_name** (p. 1484) will be ignored.

## 5.49 DDS\_DomainParticipantFactoryQos Struct Reference

QoS policies supported by a **DDS\_DomainParticipantFactory** (p. 28).

### Data Fields

- struct **DDS\_EntityFactoryQosPolicy** `entity_factory`  
*Entity factory policy, ENTITY\_FACTORY* (p. 1090).
- struct **DDS\_SystemResourceLimitsQosPolicy** `resource_limits`  
<<extension>> (p. 817) *System resource limits, SYSTEM\_RESOURCE\_LIMITS* (p. 1129).
- struct **DDS\_ProfileQosPolicy** `profile`  
<<extension>> (p. 817) *Qos profile policy, PROFILE* (p. 1106).
- struct **DDS\_LoggingQosPolicy** `logging`  
<<extension>> (p. 817) *Logging qos policy, LOGGING* (p. 1099).
- struct **DDS\_MonitoringQosPolicy** `monitoring`  
<<extension>> (p. 817) *Monitoring qos policy, MONITORING* (p. 1100).

### 5.49.1 Detailed Description

QoS policies supported by a **DDS\_DomainParticipantFactory** (p. 28).

Entity:

**DDS\_DomainParticipantFactory** (p. 28)

See also

**QoS Policies** (p. 1041) and allowed ranges within each Qos.

## 5.49.2 Field Documentation

### 5.49.2.1 entity\_factory

```
struct DDS_EntityFactoryQosPolicy DDS_DomainParticipantFactoryQos::entity_factory
```

Entity factory policy, **ENTITY\_FACTORY** (p. 1090).

### 5.49.2.2 resource\_limits

```
struct DDS_SystemResourceLimitsQosPolicy DDS_DomainParticipantFactoryQos::resource_limits
```

<<*extension*>> (p. 817) System resource limits, **SYSTEM\_RESOURCE\_LIMITS** (p. 1129).

Note: This QoS policy cannot be configured from XML configuration files.

### 5.49.2.3 profile

```
struct DDS_ProfileQosPolicy DDS_DomainParticipantFactoryQos::profile
```

<<*extension*>> (p. 817) Qos profile policy, **PROFILE** (p. 1106).

Note: This QoS policy cannot be configured from XML configuration files.

### 5.49.2.4 logging

```
struct DDS_LoggingQosPolicy DDS_DomainParticipantFactoryQos::logging
```

<<*extension*>> (p. 817) Logging qos policy, **LOGGING** (p. 1099).

### 5.49.2.5 monitoring

```
struct DDS_MonitoringQosPolicy DDS_DomainParticipantFactoryQos::monitoring
```

<<*extension*>> (p. 817) Monitoring qos policy, **MONITORING** (p. 1100).

This QoS policy is used to collect and emit telemetry data of a Connex application using RTI Monitoring Library 2.0.

## 5.50 DDS\_DomainParticipantListener Struct Reference

<<*interface*>> (p. 818) Listener for participant status.

### Data Fields

- struct **DDS\_Listener as\_listener**  
A superclass instance of this *DDS\_DomainParticipantListener* (p. 1487).
- struct **DDS\_TopicListener as\_topiclistener**  
A superclass instance of this *DDS\_DomainParticipantListener* (p. 1487).
- struct **DDS\_PublisherListener as\_publisherlistener**  
A superclass instance of this *DDS\_DomainParticipantListener* (p. 1487).
- struct **DDS\_SubscriberListener as\_subscriberlistener**  
A superclass instance of this *DDS\_DomainParticipantListener* (p. 1487).
- **DDS\_DomainParticipantListener\_InvalidLocalIdentityAdvanceNoticeStatusCallback on\_invalid\_local\_↔  
identity\_status\_advance\_notice**  
Notifies the user that the identity of the local *DDS\_DomainParticipant* (p. 72) is about to expire.

### 5.50.1 Detailed Description

<<*interface*>> (p. 818) Listener for participant status.

Entity:

**DDS\_DomainParticipant** (p. 72)

Status:

**Status Kinds** (p. 1025)

This is the interface that can be implemented by an application-provided class and then registered with the **DDS\_↔  
DomainParticipant** (p. 72) such that the application can be notified by RTI Connex of relevant status changes.

The **DDS\_DomainParticipantListener** (p. 1487) interface extends all other Listener interfaces and has no additional operation beyond the ones defined by the more general listeners.

The purpose of the **DDS\_DomainParticipantListener** (p. 1487) is to be the listener of last resort that is notified of all status changes not captured by more specific listeners attached to the **DDS\_DomainEntity** (p. 1162) objects. When a relevant status change occurs, RTI Connex will first attempt to notify the listener attached to the concerned **DDS\_↔  
\_DomainEntity** (p. 1162) if one is installed. Otherwise, RTI Connex will notify the Listener attached to the **DDS\_↔  
DomainParticipant** (p. 72).

*Important:* Because a **DDS\_DomainParticipantListener** (p. 1487) may receive callbacks pertaining to many different entities, it is possible for the same listener to receive multiple callbacks simultaneously in different threads. (Such is not the case for listeners of other types.) It is therefore critical that users of this listener provide their own protection for any thread-unsafe activities undertaken in a **DDS\_DomainParticipantListener** (p. 1487) callback.

*Note:* Due to a thread-safety issue, the destruction of a DomainParticipantListener from an enabled DomainParticipant should be avoided – even if the DomainParticipantListener has been removed from the DomainParticipant. (This limitation does not affect the Java API.)

See also

**DDS\_Listener** (p. 1569)

**DDS\_DomainParticipant\_set\_listener** (p. 151)

## 5.50.2 Field Documentation

### 5.50.2.1 `as_listener`

```
struct DDS_Listener DDS_DomainParticipantListener::as_listener
```

A superclass instance of this **DDS\_DomainParticipantListener** (p. 1487).

### 5.50.2.2 `as_topiclistener`

```
struct DDS_TopicListener DDS_DomainParticipantListener::as_topiclistener
```

A superclass instance of this **DDS\_DomainParticipantListener** (p. 1487).

### 5.50.2.3 `as_publisherlistener`

```
struct DDS_PublisherListener DDS_DomainParticipantListener::as_publisherlistener
```

A superclass instance of this **DDS\_DomainParticipantListener** (p. 1487).

### 5.50.2.4 `as_subscriberlistener`

```
struct DDS_SubscriberListener DDS_DomainParticipantListener::as_subscriberlistener
```

A superclass instance of this **DDS\_DomainParticipantListener** (p. 1487).

### 5.50.2.5 `on_invalid_local_identity_status_advance_notice`

```
DDS_DomainParticipantListener_InvalidLocalIdentityAdvanceNoticeStatusCallback DDS_DomainParticipant↔  
Listener::on_invalid_local_identity_status_advance_notice
```

Notifies the user that the identity of the local **DDS\_DomainParticipant** (p. 72) is about to expire.

## 5.51 DDS\_DomainParticipantProtocolStatus Struct Reference

<<*extension*>> (p. 817) The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

### Data Fields

- **DDS\_LongLong corrupted\_rtps\_message\_count**  
*The number of corrupted RTPS messages detected by the domain participant.*
- **DDS\_LongLong corrupted\_rtps\_message\_count\_change**  
*The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.*
- struct **DDS\_Time\_t last\_corrupted\_message\_timestamp**  
*The timestamp when the last corrupted RTPS message was detected by the domain participant.*

### 5.51.1 Detailed Description

<<*extension*>> (p. 817) The status of a participant's protocol related metrics, like the number of corrupted messages, change in corrupted messages and timestamp of the last corrupted message.

Entity:

**DDS\_DomainParticipant** (p. 72) The corrupted messages are detected by validating the received CRC. The participant protocol status can be obtained by enabling **DDS\_WireProtocolQosPolicy::compute\_crc** (p. 1833) and **DDS\_WireProtocolQosPolicy::check\_crc** (p. 1833) at the publishing and subscribing application respectively.

### 5.51.2 Field Documentation

#### 5.51.2.1 corrupted\_rtps\_message\_count

**DDS\_LongLong** DDS\_DomainParticipantProtocolStatus::corrupted\_rtps\_message\_count

The number of corrupted RTPS messages detected by the domain participant.

Counts the corrupted RTPS messages received by the participant. It includes messages belonging to discovery and user traffic.

#### 5.51.2.2 corrupted\_rtps\_message\_count\_change

**DDS\_LongLong** DDS\_DomainParticipantProtocolStatus::corrupted\_rtps\_message\_count\_change

The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.

### 5.51.2.3 last\_corrupted\_message\_timestamp

```
struct DDS_Time_t DDS_DomainParticipantProtocolStatus::last_corrupted_message_timestamp
```

The timestamp when the last corrupted RTPS message was detected by the domain participant.

## 5.52 DDS\_DomainParticipantQos Struct Reference

QoS policies supported by a `DDS_DomainParticipant` (p. 72) entity.

### Data Fields

- struct **DDS\_UserDataQosPolicy** `user_data`  
*User data policy, **USER\_DATA** (p. 1143).*
- struct **DDS\_EntityFactoryQosPolicy** `entity_factory`  
*Entity factory policy, **ENTITY\_FACTORY** (p. 1090).*

*<<extension>> (p. 817) Default Unicast Transport policy, **TRANSPORT\_UNICAST** (p. 1139).*
- struct **DDS\_DiscoveryQosPolicy** `discovery`  
*<<extension>> (p. 817) Discovery policy, **DISCOVERY** (p. 1076).*
- struct **DDS\_DomainParticipantResourceLimitsQosPolicy** `resource_limits`  
*<<extension>> (p. 817) Domain participant resource limits policy, **DOMAIN\_PARTICIPANT\_RESOURCE\_LIMITS** (p. 1084).*
- struct **DDS\_EventQosPolicy** `event`  
*<<extension>> (p. 817) Event policy, **EVENT** (p. 1092).*
- struct **DDS\_ReceiverPoolQosPolicy** `receiver_pool`  
*<<extension>> (p. 817) Receiver pool policy, **RECEIVER\_POOL** (p. 1121).*
- struct **DDS\_DatabaseQosPolicy** `database`  
*<<extension>> (p. 817) Database policy, **DATABASE** (p. 1053).*
- struct **DDS\_DiscoveryConfigQosPolicy** `discovery_config`  
*<<extension>> (p. 817) Discovery config policy, **DISCOVERY\_CONFIG** (p. 1077).*
- struct **DDS\_PropertyQosPolicy** `property`  
*<<extension>> (p. 817) Property policy, **PROPERTY** (p. 1107). See also *Property Reference Guide*.*
- struct **DDS\_EntityNameQosPolicy** `participant_name`  
*<<extension>> (p. 817) The participant name. **ENTITY\_NAME** (p. 1091)*
- struct **DDS\_TransportMulticastMappingQosPolicy** `multicast_mapping`  
*<<extension>> (p. 817) The multicast mapping policy. **TRANSPORT\_MULTICAST\_MAPPING** (p. 1137)*
- struct **DDS\_ServiceQosPolicy** `service`  
*<<extension>> (p. 817) The service qos policy. **SERVICE** (p. 1127)*
- struct **DDS\_PartitionQosPolicy** `partition`  
*<<extension>> (p. 817) The partition qos policy. **PARTITION** (p. 1104)*
- struct **DDS\_TypeSupportQosPolicy** `type_support`  
*<<extension>> (p. 817) Type support data, **TYPESUPPORT** (p. 1142).*

### 5.52.1 Detailed Description

QoS policies supported by a **DDS\_DomainParticipant** (p. 72) entity.

Certain members must be set in a consistent manner:

Length of **DDS\_DomainParticipantQos::user\_data** (p. 1491) .value <= **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) .participant\_user\_data\_max\_length

For **DDS\_DomainParticipantQos::discovery\_config** (p. 1493) .publication\_writer  
high\_watermark <= **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) .local\_writer\_allocation .max\_count  
heartbeats\_per\_max\_samples <= **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) .local\_writer\_allocation.max\_count

For **DDS\_DomainParticipantQos::discovery\_config** (p. 1493) .subscription\_writer  
high\_watermark <= **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) .local\_reader\_allocation.max\_count  
heartbeats\_per\_max\_samples <= **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) .local\_reader\_allocation.max\_count

If any of the above are not true, **DDS\_DomainParticipant\_set\_qos** (p. 148) and **DDS\_DomainParticipant\_set\_qos\_with\_profile** (p. 149) and **DDS\_DomainParticipantFactory\_set\_default\_participant\_qos** (p. 35) will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025), and **DDS\_DomainParticipantFactory\_create\_participant** (p. 37) will fail.

Entity:

**DDS\_DomainParticipant** (p. 72)

See also

**QoS Policies** (p. 1041) and allowed ranges within each Qos.

**NDDS\_DISCOVERY\_PEERS** (p. 1152)

### 5.52.2 Field Documentation

#### 5.52.2.1 user\_data

```
struct DDS_UserDataQosPolicy DDS_DomainParticipantQos::user_data
```

User data policy, **USER\_DATA** (p. 1143).

### 5.52.2.2 entity\_factory

```
struct DDS_EntityFactoryQosPolicy DDS_DomainParticipantQos::entity_factory
```

Entity factory policy, **ENTITY\_FACTORY** (p. 1090).

### 5.52.2.3 wire\_protocol

```
struct DDS_WireProtocolQosPolicy DDS_DomainParticipantQos::wire_protocol
```

<<*extension*>> (p. 817) Wire Protocol policy, **WIRE\_PROTOCOL** (p. 1145).

The wire protocol (RTPS) attributes associated with the participant.

### 5.52.2.4 transport\_builtin

```
struct DDS_TransportBuiltinQosPolicy DDS_DomainParticipantQos::transport_builtin
```

<<*extension*>> (p. 817) Transport Builtin policy, **TRANSPORT\_BUILTIN** (p. 1132).

### 5.52.2.5 default\_unicast

```
struct DDS_TransportUnicastQosPolicy DDS_DomainParticipantQos::default_unicast
```

<<*extension*>> (p. 817) Default Unicast Transport policy, **TRANSPORT\_UNICAST** (p. 1139).

### 5.52.2.6 discovery

```
struct DDS_DiscoveryQosPolicy DDS_DomainParticipantQos::discovery
```

<<*extension*>> (p. 817) Discovery policy, **DISCOVERY** (p. 1076).

### 5.52.2.7 resource\_limits

```
struct DDS_DomainParticipantResourceLimitsQosPolicy DDS_DomainParticipantQos::resource_limits
```

<<*extension*>> (p. 817) Domain participant resource limits policy, **DOMAIN\_PARTICIPANT\_RESOURCE\_LIMITS** (p. 1084).

### 5.52.2.8 event

```
struct DDS_EventQosPolicy DDS_DomainParticipantQos::event
```

<<*extension*>> (p. 817) Event policy, **EVENT** (p. 1092).

### 5.52.2.9 receiver\_pool

```
struct DDS_ReceiverPoolQosPolicy DDS_DomainParticipantQos::receiver_pool
```

<<*extension*>> (p. 817) Receiver pool policy, **RECEIVER\_POOL** (p. 1121).

### 5.52.2.10 database

```
struct DDS_DatabaseQosPolicy DDS_DomainParticipantQos::database
```

<<*extension*>> (p. 817) Database policy, **DATABASE** (p. 1053).

### 5.52.2.11 discovery\_config

```
struct DDS_DiscoveryConfigQosPolicy DDS_DomainParticipantQos::discovery_config
```

<<*extension*>> (p. 817) Discovery config policy, **DISCOVERY\_CONFIG** (p. 1077).

### 5.52.2.12 property

```
struct DDS_PropertyQosPolicy DDS_DomainParticipantQos::property
```

<<*extension*>> (p. 817) Property policy, **PROPERTY** (p. 1107). See also [Property Reference Guide](#).

### 5.52.2.13 participant\_name

```
struct DDS_EntityNameQosPolicy DDS_DomainParticipantQos::participant_name
```

<<*extension*>> (p. 817) The participant name. **ENTITY\_NAME** (p. 1091)

#### 5.52.2.14 multicast\_mapping

```
struct DDS_TransportMulticastMappingQosPolicy DDS_DomainParticipantQos::multicast_mapping
```

<<*extension*>> (p. 817) The multicast mapping policy. **TRANSPORT\_MULTICAST\_MAPPING** (p. 1137)

#### 5.52.2.15 service

```
struct DDS_ServiceQosPolicy DDS_DomainParticipantQos::service
```

<<*extension*>> (p. 817) The service qos policy. **SERVICE** (p. 1127)

#### 5.52.2.16 partition

```
struct DDS_PartitionQosPolicy DDS_DomainParticipantQos::partition
```

<<*extension*>> (p. 817) The partition qos policy. **PARTITION** (p. 1104)

#### 5.52.2.17 type\_support

```
struct DDS_TypeSupportQosPolicy DDS_DomainParticipantQos::type_support
```

<<*extension*>> (p. 817) Type support data, **TYPESUPPORT** (p. 1142).

Optional value that is passed to a type plugin's `on_participant_attached` function.

### 5.53 DDS\_DomainParticipantResourceLimitsQosPolicy Struct Reference

Various settings that configure how a **DDS\_DomainParticipant** (p. 72) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

## Data Fields

- struct **DDS\_AllocationSettings\_t local\_writer\_allocation**  
*Allocation settings applied to local DataWriters.*

*Maximum length of user data in `DDS_DataWriterQos` (p. 1438) and `DDS_PublicationBuiltinTopicData` (p. 1648).*
- **DDS\_Long reader\_user\_data\_max\_length**  
*Maximum length of user data in `DDS_DataReaderQos` (p. 1390) and `DDS_SubscriptionBuiltinTopicData` (p. 1748).*
- **DDS\_Long max\_partitions**  
*Maximum number of partition name strings allowable in a `DDS_PartitionQosPolicy` (p. 1627).*
- **DDS\_Long max\_partition\_cumulative\_characters**  
*Maximum number of combined characters allowable in all partition names in a `DDS_PartitionQosPolicy` (p. 1627).*
- **DDS\_Long type\_code\_max\_serialized\_length**  
*Maximum size of serialized string for type code.*
- **DDS\_Long type\_object\_max\_serialized\_length**  
*The maximum length, in bytes, that the buffer to serialize a `TypeObject` can consume.*
- **DDS\_Long serialized\_type\_object\_dynamic\_allocation\_threshold**  
*A threshold, in bytes, for dynamic memory allocation for the serialized `TypeObject`.*
- **DDS\_Long type\_object\_max\_deserialized\_length**  
*The maximum number of bytes that a deserialized `TypeObject` can consume.*
- **DDS\_Long deserialized\_type\_object\_dynamic\_allocation\_threshold**

A threshold, in bytes, for dynamic memory allocation for the deserialized `TypeObject`.

- **DDS\_Long contentfilter\_property\_max\_length**  
This field is the maximum length of all data related to a Content-filtered topic.
- **DDS\_Long channel\_seq\_max\_length**  
Maximum number of channels that can be specified in `DDS_MultiChannelQosPolicy` (p. 1603) for MultiChannel Data↔ Writers.
- **DDS\_Long channel\_filter\_expression\_max\_length**  
Maximum length of a channel `DDS_ChannelSettings_t::filter_expression` (p. 1345) in a MultiChannel DataWriter.
- **DDS\_Long participant\_property\_list\_max\_length**  
Maximum number of properties associated with the `DDS_DomainParticipant` (p. 72).
- **DDS\_Long participant\_property\_string\_max\_length**  
Maximum string length of the properties associated with the `DDS_DomainParticipant` (p. 72).
- **DDS\_Long writer\_property\_list\_max\_length**  
Maximum number of properties associated with a `DDS_DataWriter` (p. 478).
- **DDS\_Long writer\_property\_string\_max\_length**  
Maximum string length of the properties associated with a `DDS_DataWriter` (p. 478).
- **DDS\_Long reader\_property\_list\_max\_length**  
Maximum number of properties associated with a `DDS_DataReader` (p. 608).
- **DDS\_Long reader\_property\_string\_max\_length**  
Maximum string length of the properties associated with a `DDS_DataReader` (p. 608).
- **DDS\_Long max\_endpoint\_groups**  
Maximum number of `DDS_EndpointGroup_t` (p. 1539) allowable in a `DDS_AvailabilityQosPolicy` (p. 1330).
- **DDS\_Long max\_endpoint\_group\_cumulative\_characters**  
Maximum number of combined `role_name` characters allowed in all `DDS_EndpointGroup_t` (p. 1539) in a `DDS_↔ AvailabilityQosPolicy` (p. 1330).
- **DDS\_Long transport\_info\_list\_max\_length**  
Maximum number of installed transports to send and receive information about in `DDS_ParticipantBuiltinTopicData↔ ::transport_info` (p. 1619).
- **DDS\_DomainParticipantResourceLimitsIgnoredEntityReplacementKind ignored\_entity\_replacement\_↔ kind**  
Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in `DDS_Domain↔ ParticipantResourceLimitsQosPolicy::ignored_entity_allocation` (p. 1501) are reached.
- struct **DDS\_AllocationSettings\_t remote\_topic\_query\_allocation**  
Allocation settings applied to remote `TopicQueries`.
- **DDS\_Long remote\_topic\_query\_hash\_buckets**  
Number of hash buckets for remote `TopicQueries`.
- **DDS\_Long writer\_data\_tag\_list\_max\_length**  
Maximum number of data tags associated with a `DDS_DataWriter` (p. 478).
- **DDS\_Long writer\_data\_tag\_string\_max\_length**  
Maximum string length of the data tags associated with a `DDS_DataWriter` (p. 478).
- **DDS\_Long reader\_data\_tag\_list\_max\_length**  
Maximum number of data tags associated with a `DDS_DataReader` (p. 608).
- **DDS\_Long reader\_data\_tag\_string\_max\_length**  
Maximum string length of the data tags associated with a `DDS_DataReader` (p. 608).
- **DDS\_UnsignedLong shmем\_ref\_transfer\_mode\_max\_segments**  
Maximum number of segments created by all `DataWriters` belonging to a `DDS_DomainParticipant` (p. 72).

### 5.53.1 Detailed Description

Various settings that configure how a **DDS\_DomainParticipant** (p. 72) allocates and uses physical memory for internal resources, including the maximum sizes of various properties.

This QoS policy sets maximum size limits on variable-length parameters used by the participant and its contained Entities. It also controls the initial and maximum sizes of data structures used by the participant to store information about locally-created and remotely-discovered entities (such as DataWriters/DataReaders), as well as parameters used by the internal database to size the hash tables it uses.

By default, a **DDS\_DomainParticipant** (p. 72) is allowed to dynamically allocate memory as needed as users create local Entities such as **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) or as the participant discovers new applications to store their information. By setting fixed values for the maximum parameters in this QoS policy, you can bound the memory that can be allocated by a DomainParticipant. In addition, by setting the initial values to the maximum values, you can reduce the amount of memory allocated by DomainParticipants after the initialization period. Notice that memory can still be allocated dynamically after the initialization period. For example, when a new local **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) is created, the initial memory required for its queue is allocated dynamically.

The maximum sizes of different variable-length parameters such as the number of partitions that can be stored in the **DDS\_PartitionQoSPolicy** (p. 1627), the maximum length of data store in the **DDS\_UserDataQoSPolicy** (p. 1820) and **DDS\_GroupDataQoSPolicy** (p. 1556), and many others can be changed from their defaults using this QoS policy. However, it is important that all DomainParticipants that need to communicate with each other use the *same set* of maximum values. Otherwise, when these parameters are propagated from one **DDS\_DomainParticipant** (p. 72) to another, a **DDS\_DomainParticipant** (p. 72) with a smaller maximum length may reject the parameter, resulting in an error.

An important parameter in this QoS policy that is often changed by users is **DDS\_DomainParticipantResourceLimitsQoSPolicy::type\_object\_max\_serialized\_length** (p. 1508).

This QoS policy is an extension to the DDS standard.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.53.2 Field Documentation

#### 5.53.2.1 local\_writer\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQoSPolicy::local_writer_↔
allocation
```

Allocation settings applied to local DataWriters.

**[default]** initial\_count = 16; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.2 local\_reader\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_reader_↔  
allocation
```

Allocation settings applied to local DataReaders.

**[default]** initial\_count = 16; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.3 local\_publisher\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_publisher_↔  
allocation
```

Allocation settings applied to local Publisher.

**[default]** initial\_count = 4; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.4 local\_subscriber\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_subscriber_↔  
allocation
```

Allocation settings applied to local Subscriber.

**[default]** initial\_count = 4; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.5 local\_topic\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::local_topic_↔  
allocation
```

Allocation settings applied to local Topic.

**[default]** initial\_count = 16; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.6 remote\_writer\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_writer_↔  
allocation
```

Allocation settings applied to remote DataWriters.

Remote DataWriters include all DataWriters, both local and remote.

**[default]** initial\_count = 64; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.7 remote\_reader\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_reader_↔  
allocation
```

Allocation settings applied to remote DataReaders.

Remote DataReaders include all DataReaders, both local and remote.

**[default]** initial\_count = 64; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.8 remote\_participant\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_participant_↔  
_allocation
```

Allocation settings applied to remote DomainParticipants.

Remote DomainParticipants include all DomainParticipants, both local and remote.

**[default]** initial\_count = 16; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.9 matching\_writer\_reader\_pair\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::matching_writer_↔  
reader_pair_allocation
```

Allocation settings applied to matching local writer and remote/local reader pairs.

**[default]** initial\_count = 32; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.10 matching\_reader\_writer\_pair\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::matching_reader_↔  
writer_pair_allocation
```

Allocation settings applied to matching local reader and remote/local writer pairs.

**[default]** initial\_count = 32; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.11 ignored\_entity\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_↔  
allocation
```

Allocation settings applied to ignored entities.

**[default]** initial\_count = 8; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.12 content\_filtered\_topic\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::content_filtered_↔  
topic_allocation
```

Allocation settings applied to content filtered topic.

**[default]** initial\_count = 4; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.13 content\_filter\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::content_filter_↔  
allocation
```

Allocation settings applied to content filter.

**[default]** initial\_count = 4; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127); incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

#### 5.53.2.14 read\_condition\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::read_condition_↔  
allocation
```

Allocation settings applied to read condition pool.

**[default]** initial\_count = 4; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127), incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

#### 5.53.2.15 query\_condition\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::query_condition_↔  
allocation
```

Allocation settings applied to query condition pool.

**[default]** initial\_count = 4; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127), incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

#### 5.53.2.16 outstanding\_asynchronous\_sample\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::outstanding_↔  
asynchronous_sample_allocation
```

Allocation settings applied to the maximum number of samples (from all **DDS\_DataWriter** (p. 478)) waiting to be asynchronously written.

**[default]** initial\_count = 64; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127), incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

#### 5.53.2.17 flow\_controller\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::flow_controller_↔  
allocation
```

Allocation settings applied to flow controllers.

**[default]** initial\_count = 4; max\_count = **DDS\_LENGTH\_UNLIMITED** (p. 1127), incremental\_count = -1

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.18 local\_writer\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_writer_hash_buckets`

Hash\_Buckets settings applied to local DataWriters.

**[default]** 4

**[range]** [1, 10000]

### 5.53.2.19 local\_reader\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_reader_hash_buckets`

Number of hash buckets for local DataReaders.

**[default]** 4

**[range]** [1, 10000]

### 5.53.2.20 local\_publisher\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_publisher_hash_buckets`

Number of hash buckets for local Publisher.

**[default]** 1

**[range]** [1, 10000]

### 5.53.2.21 local\_subscriber\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_subscriber_hash_buckets`

Number of hash buckets for local Subscriber.

**[default]** 1

**[range]** [1, 10000]

### 5.53.2.22 local\_topic\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::local_topic_hash_buckets`

Number of hash buckets for local Topic.

**[default]** 4

**[range]** [1, 10000]

### 5.53.2.23 remote\_writer\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_writer_hash_buckets`

Number of hash buckets for remote DataWriters.

Remote DataWriters include all DataWriters, both local and remote.

**[default]** 16

**[range]** [1, 10000]

### 5.53.2.24 remote\_reader\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_reader_hash_buckets`

Number of hash buckets for remote DataReaders.

Remote DataReaders include all DataReaders, both local and remote.

**[default]** 16

**[range]** [1, 10000]

### 5.53.2.25 remote\_participant\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_participant_hash_buckets`

Number of hash buckets for remote DomainParticipants.

Remote DomainParticipants include all DomainParticipants, both local and remote.

**[default]** 4

**[range]** [1, 10000]

### 5.53.2.26 matching\_writer\_reader\_pair\_hash\_buckets

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::matching_writer_reader_pair_hash_buckets`

Number of hash buckets for matching local writer and remote/local reader pairs.

**[default]** 32

**[range]** [1, 10000]

### 5.53.2.27 matching\_reader\_writer\_pair\_hash\_buckets

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::matching\_reader\_writer\_pair\_hash\_buckets

Number of hash buckets for matching local reader and remote/local writer pairs.

**[default]** 32

**[range]** [1, 10000]

### 5.53.2.28 ignored\_entity\_hash\_buckets

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::ignored\_entity\_hash\_buckets

Number of hash buckets for ignored entities.

**[default]** 1

**[range]** [1, 10000]

### 5.53.2.29 content\_filtered\_topic\_hash\_buckets

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::content\_filtered\_topic\_hash\_buckets

Number of hash buckets for content filtered topics.

**[default]** 1

**[range]** [1, 10000]

### 5.53.2.30 content\_filter\_hash\_buckets

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::content\_filter\_hash\_buckets

Number of hash buckets for content filters.

**[default]** 1

**[range]** [1, 10000]

### 5.53.2.31 flow\_controller\_hash\_buckets

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::flow\_controller\_hash\_buckets

Number of hash buckets for flow controllers.

**[default]** 1

**[range]** [1, 10000]

### 5.53.2.32 max\_gather\_destinations

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::max_gather_destinations`

Maximum number of destinations per RTI Connex send.

When RTI Connex sends out a message, it has the capability to send to multiple destinations to be more efficient. The maximum number of destinations per RTI Connex send is specified by `max_gather_destinations`.

**[default]** 16

**[range]** [16, 1 million]

### 5.53.2.33 participant\_user\_data\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::participant_user_data_max_length`

Maximum length of user data in `DDS_DomainParticipantQos` (p.1490) and `DDS_ParticipantBuiltinTopicData` (p.1616).

**[default]** 256

**[range]** [0,0x7ffffff]

### 5.53.2.34 topic\_data\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::topic_data_max_length`

Maximum length of topic data in `DDS_TopicQos` (p.1778), `DDS_TopicBuiltinTopicData` (p.1770), `DDS_↔PublicationBuiltinTopicData` (p.1648) and `DDS_SubscriptionBuiltinTopicData` (p.1748).

**[default]** 256

**[range]** [0,0x7ffffff]

### 5.53.2.35 publisher\_group\_data\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::publisher_group_data_max_length`

Maximum length of group data in `DDS_PublisherQos` (p.1661) and `DDS_PublicationBuiltinTopicData` (p.1648).

**[default]** 256

**[range]** [0,0x7ffffff]

### 5.53.2.36 subscriber\_group\_data\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_data_max_length`

Maximum length of group data in **DDS\_SubscriberQos** (p. 1746) and **DDS\_SubscriptionBuiltinTopicData** (p. 1748).

**[default]** 256

**[range]** [0,0x7ffffff]

### 5.53.2.37 writer\_user\_data\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_user_data_max_length`

Maximum length of user data in **DDS\_DataWriterQos** (p. 1438) and **DDS\_PublicationBuiltinTopicData** (p. 1648).

**[default]** 256

**[range]** [0,0x7ffffff]

### 5.53.2.38 reader\_user\_data\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_user_data_max_length`

Maximum length of user data in **DDS\_DataReaderQos** (p. 1390) and **DDS\_SubscriptionBuiltinTopicData** (p. 1748).

**[default]** 256

**[range]** [0,0x7ffffff]

### 5.53.2.39 max\_partitions

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions`

Maximum number of partition name strings allowable in a **DDS\_PartitionQosPolicy** (p. 1627).

This setting is made on a per DomainParticipant basis; it cannot be set individually on a per Publisher/Subscriber basis. However, the limit is enforced and applies per Publisher/Subscriber.

This value cannot exceed 64.

**[default]** 64

**[range]** [0,64]

#### 5.53.2.40 max\_partition\_cumulative\_characters

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::max\_partition\_cumulative\_characters

Maximum number of combined characters allowable in all partition names in a **DDS\_PartitionQosPolicy** (p. 1627).

The maximum number of combined characters should account for a terminating NULL ("0") character for each partition name string.

This setting is made on a per DomainParticipant basis; it cannot be set individually on a per Publisher/Subscriber basis. However, the limit is enforced and applies per Publisher/Subscriber.

This value cannot exceed 256.

**[default]** 256

**[range]** [0,256]

#### 5.53.2.41 type\_code\_max\_serialized\_length

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::type\_code\_max\_serialized\_length

Maximum size of serialized string for type code.

This parameter is an alternative to **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_serialized\_length** (p. 1508) for limiting the size of the type code that a **DDS\_DomainParticipant** (p. 72) is able to store and propagate for user data types. Type codes can be used by external applications to understand user data types without having the data type predefined in compiled form. However, since type codes contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in large type codes. So it is common for users to set this parameter to a large value, if used (by default, it is set to 0). However, as with all parameters in this QoS policy defining maximum sizes for variable-length elements, all DomainParticipants in the same domain should use the same value for this parameter. Note: TypeObject is now the standard method of exchanging type information in RTI Connext. It is recommended to use **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_serialized\_length** (p. 1508) to configure the maximum serialized type object string.

**[default]** 0

**[range]** [0,0xffff]

#### 5.53.2.42 type\_object\_max\_serialized\_length

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_serialized\_length

The maximum length, in bytes, that the buffer to serialize a TypeObject can consume.

This parameter limits the size of the TypeObject that a DomainParticipant is able to propagate. Since TypeObjects contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in TypeObjects larger than the default maximum of 8192 bytes. This field allows you to specify a larger value. The desired size for a given **DDS\_TypeCode** (p. 1806) can be obtained using **DDS\_TypeCode\_get\_type\_object\_serialized\_size** (p. 273).

**[default]** 8192

**[range]** [0,0x7ffffff]

### 5.53.2.43 serialized\_type\_object\_dynamic\_allocation\_threshold

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::serialized\_type\_object\_dynamic\_allocation\_threshold

A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject.

Above this threshold, the memory for a TypeObject is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

In case **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_serialized\_length** (p. 1508) is different than **DDS\_LENGTH\_UNLIMITED** (p. 1127) and is smaller than **DDS\_DomainParticipantResourceLimitsQosPolicy::serialized\_type\_object\_dynamic\_allocation\_threshold** (p. 1508): **DDS\_DomainParticipantResourceLimitsQosPolicy::serialized\_type\_object\_dynamic\_allocation\_threshold** (p. 1508) will be adjusted to **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_serialized\_length** (p. 1508).

**[default]** 8192

**[range]** [0,0x7fffffff] <= **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_serialized\_length** (p. 1508)

### 5.53.2.44 type\_object\_max\_deserialized\_length

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_deserialized\_length

The maximum number of bytes that a deserialized TypeObject can consume.

This parameter limits the size of the TypeObject that a DomainParticipant is able to store.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [0,0x7fffffff] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.53.2.45 deserialized\_type\_object\_dynamic\_allocation\_threshold

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::deserialized\_type\_object\_dynamic\_allocation\_threshold

A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject.

Above this threshold, the memory for a TypeObject is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

In case **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_deserialized\_length** (p. 1509) is different than **DDS\_LENGTH\_UNLIMITED** (p. 1127) and is smaller than **DDS\_DomainParticipantResourceLimitsQosPolicy::deserialized\_type\_object\_dynamic\_allocation\_threshold** (p. 1509): **DDS\_DomainParticipantResourceLimitsQosPolicy::deserialized\_type\_object\_dynamic\_allocation\_threshold** (p. 1509) will be adjusted to **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_deserialized\_length** (p. 1509).

**[default]** 4096

**[range]** [0,0x7fffffff] <= **DDS\_DomainParticipantResourceLimitsQosPolicy::type\_object\_max\_deserialized\_length** (p. 1509)

#### 5.53.2.46 contentfilter\_property\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::contentfilter_property_max_length`

This field is the maximum length of all data related to a Content-filtered topic.

This is the sum of the length of the ContentFilteredTopic name, the length of the related topic name, the length of the filter expression, the length of the filter parameters, and the length of the filter name. The maximum number of combined characters should account for a terminating NULL ('\0') character for each string.

**[default]** 256

**[range]** [0,0xffff]

#### 5.53.2.47 channel\_seq\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::channel_seq_max_length`

Maximum number of channels that can be specified in **DDS\_MultiChannelQosPolicy** (p. 1603) for MultiChannel Data↔ Writers.

**[default]** 32

**[range]** [0,0xffff]

#### 5.53.2.48 channel\_filter\_expression\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::channel_filter_expression_max_length`

Maximum length of a channel **DDS\_ChannelSettings\_t::filter\_expression** (p. 1345) in a MultiChannel DataWriter.

The length should account for a terminating NULL ('\0') character.

**[default]** 256

**[range]** [0,0xffff]

#### 5.53.2.49 participant\_property\_list\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::participant_property_list_max_length`

Maximum number of properties associated with the **DDS\_DomainParticipant** (p. 72).

**[default]** 32

**[range]** [0,0xffff]

### 5.53.2.50 participant\_property\_string\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::participant_property_string_max_length`

Maximum string length of the properties associated with the **DDS\_DomainParticipant** (p. 72).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDS\_DomainParticipant** (p. 72) properties.

**[default]** 4096

**[range]** [0,0xffff]

### 5.53.2.51 writer\_property\_list\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_property_list_max_length`

Maximum number of properties associated with a **DDS\_DataWriter** (p. 478).

**[range]** [0,0xffff]

**[default]** 32

### 5.53.2.52 writer\_property\_string\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_property_string_max_length`

Maximum string length of the properties associated with a **DDS\_DataWriter** (p. 478).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDS\_DataWriter** (p. 478) properties.

**[default]** 1024

**[range]** [0,0xffff]

### 5.53.2.53 reader\_property\_list\_max\_length

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_property_list_max_length`

Maximum number of properties associated with a **DDS\_DataReader** (p. 608).

**[default]** 32

**[range]** [0,0xffff]

#### 5.53.2.54 reader\_property\_string\_max\_length

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::reader\_property\_string\_max\_length

Maximum string length of the properties associated with a **DDS\_DataReader** (p. 608).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with a **DDS\_DataReader** (p. 608) properties.

**[default]** 1024

**[range]** [0,0xffff]

#### 5.53.2.55 max\_endpoint\_groups

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::max\_endpoint\_groups

Maximum number of **DDS\_EndpointGroup\_t** (p. 1539) allowable in a **DDS\_AvailabilityQosPolicy** (p. 1330).

**[default]** 32

**[range]** [0,65535]

#### 5.53.2.56 max\_endpoint\_group\_cumulative\_characters

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::max\_endpoint\_group\_cumulative\_characters

Maximum number of combined role\_name characters allowed in all **DDS\_EndpointGroup\_t** (p. 1539) in a **DDS\_↔ AvailabilityQosPolicy** (p. 1330).

The maximum number of combined characters should account for a terminating NULL character for each role\_name string.

**[default]** 1024

**[range]** [0,65535]

#### 5.53.2.57 transport\_info\_list\_max\_length

**DDS\_Long** DDS\_DomainParticipantResourceLimitsQosPolicy::transport\_info\_list\_max\_length

Maximum number of installed transports to send and receive information about in **DDS\_ParticipantBuiltinTopicData↔ ::transport\_info** (p. 1619).

**[default]** 12

**[range]** [0,100]

### 5.53.2.58 ignored\_entity\_replacement\_kind

```
DDS_DomainParticipantResourceLimitsIgnoredEntityReplacementKind DDS_DomainParticipantResourceLimitsQosPolicy::ignored_entity_replacement_kind
```

Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **DDS\_DomainParticipantResourceLimitsQosPolicy::ignored\_entity\_allocation** (p. 1501) are reached.

When a **DDS\_DomainParticipant** (p. 72)'s number of ignored entities is greater than **DDS\_DomainParticipantResourceLimitsQosPolicy::ignored\_entity\_allocation** (p. 1501), the **DDS\_DomainParticipant** (p. 72) will try to make room by replacing an existing ignored participant entry. This field specifies what entity is allowed to be replaced.

If a replaceable participant entry is not available, an out-of-resources exception will be returned.

**[default]** **DDS\_NO\_REPLACEMENT\_IGNORED\_ENTITY\_REPLACEMENT** (p. 1085)

See also

**DDS\_DomainParticipantResourceLimitsIgnoredEntityReplacementKind** (p. 1085)

### 5.53.2.59 remote\_topic\_query\_allocation

```
struct DDS_AllocationSettings_t DDS_DomainParticipantResourceLimitsQosPolicy::remote_topic_query_allocation
```

Allocation settings applied to remote TopicQueries.

Settings applied to the allocation of information about **DDS\_TopicQuery** (p. 698) objects created by other participants and discovered by this participant.

When the participant receives a new topic query that would make the current count go above `max_count`, it is not processed until the current count drops (i.e. another topic query is cancelled). The topic query stays in the Built-in ServiceRequest DataReader queue until it can be processed or it is cancelled.

**[default]** `initial_count = 1`; `max_count = DDS_LENGTH_UNLIMITED` (p. 1127); `incremental_count = -1`

**[range]** See allowed ranges in struct **DDS\_AllocationSettings\_t** (p. 1321)

### 5.53.2.60 remote\_topic\_query\_hash\_buckets

```
DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::remote_topic_query_hash_buckets
```

Number of hash buckets for remote TopicQueries.

**[default]** 1

**[range]** [1, 10000]

See also

**DDS\_DomainParticipantResourceLimitsQosPolicy::remote\_topic\_query\_allocation** (p. 1513)

### 5.53.2.61 `writer_data_tag_list_max_length`

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_data_tag_list_max_length`

Maximum number of data tags associated with a **DDS\_DataWriter** (p. 478).

**[default]** 0

**[range]** [0,0xffff]

### 5.53.2.62 `writer_data_tag_string_max_length`

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::writer_data_tag_string_max_length`

Maximum string length of the data tags associated with a **DDS\_DataWriter** (p. 478).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDS\_DataWriter** (p. 478) data tags.

**[default]** 0

**[range]** [0,0xffff]

### 5.53.2.63 `reader_data_tag_list_max_length`

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_data_tag_list_max_length`

Maximum number of data tags associated with a **DDS\_DataReader** (p. 608).

**[default]** 0

**[range]** [0,0xffff]

### 5.53.2.64 `reader_data_tag_string_max_length`

`DDS_Long DDS_DomainParticipantResourceLimitsQosPolicy::reader_data_tag_string_max_length`

Maximum string length of the data tags associated with a **DDS\_DataReader** (p. 608).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **DDS\_DataReader** (p. 608) data tags.

**[default]** 0

**[range]** [0,0xffff]

### 5.53.2.65 shmем\_ref\_transfer\_mode\_max\_segments

**DDS\_UnsignedLong** DDS\_DomainParticipantResourceLimitsQosPolicy::shmем\_ref\_transfer\_mode\_max\_segments

Maximum number of segments created by all DataWriters belonging to a **DDS\_DomainParticipant** (p. 72).

**[default]** 500

**[range]** [0,0xffffffff], but in practice, this value will be limited by the system-wide maximum number of shared memory segments. On a Linux machine, this value is provided by the kernel parameter shmmni.

## 5.54 DDS\_DomainParticipantSeq Struct Reference

## 5.56 DDS\_DurabilityQosPolicy Struct Reference

This QoS policy specifies whether or not RTI Connex will store and deliver previously published data samples to new **DDS\_DataReader** (p. 608) entities that join the network later.

### Data Fields

- **DDS\_DurabilityQosPolicyKind kind**  
*The kind of durability.*
- **DDS\_Boolean direct\_communication**  
<<extension>> (p. 817) Indicates whether or not a **TRANSIENT** or **PERSISTENT DDS\_DataReader** (p. 608) should receive samples directly from a **TRANSIENT** or **PERSISTENT DDS\_DataWriter** (p. 478)
- **DDS\_Long writer\_depth**  
<<extension>> (p. 817) Indicates the number of samples per instance that a durable **DDS\_DataWriter** (p. 478) will send to a late-joining **DDS\_DataReader** (p. 608).
- struct **DDS\_PersistentStorageSettings storage\_settings**  
*Configures durable writer history and durable reader state.*

### 5.56.1 Detailed Description

This QoS policy specifies whether or not RTI Connex will store and deliver previously published data samples to new **DDS\_DataReader** (p. 608) entities that join the network later.

#### Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

#### Status:

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_↔ STATUS** (p. 1032)

#### Properties:

**RxO** (p. 1048) = YES  
**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

#### See also

**DURABILITY\_SERVICE** (p. 1090)

## 5.56.2 Usage

It is possible for a **DDS\_DataWriter** (p. 478) to start publishing data before all (or any) **DDS\_DataReader** (p. 608) entities have joined the network.

Moreover, a **DDS\_DataReader** (p. 608) that joins the network after some data has been written could potentially be interested in accessing the most current values of the data, as well as potentially some history.

This policy makes it possible for a late-joining **DDS\_DataReader** (p. 608) to obtain previously published samples.

By helping to ensure that DataReaders get all data that was sent by DataWriters, regardless of when it was sent, using this QoS policy can increase system tolerance to failure conditions.

Note that although related, this does not strictly control what data RTI Connex will maintain internally. That is, RTI Connex may choose to maintain some data for its own purposes (e.g., flow control) and yet not make it available to late-joining readers if the **DURABILITY** (p. 1086) policy is set to **DDS\_VOLATILE\_DURABILITY\_QOS** (p. 1088).

### 5.56.2.1 Transient and Persistent Durability

For the purpose of implementing the **DURABILITY** QoS kind **TRANSIENT** or **PERSISTENT**, RTI Connex behaves *as if* for each Topic that has **DDS\_DurabilityQoSPolicy::kind** (p. 1518) of **DDS\_TRANSIENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) there is a corresponding "built-in" **DDS\_DataReader** (p. 608) and **DDS\_DataWriter** (p. 478) configured with the same **DURABILITY** kind. In other words, it is *as if* somewhere in the system, independent of the original **DDS\_DataWriter** (p. 478), there is a built-in durable **DDS\_DataReader** (p. 608) subscribing to that Topic and a built-in durable DataWriter re-publishing it as needed for the new subscribers that join the system. This functionality is provided by the *RTI Persistence Service*.

The Persistence Service can configure itself based on the QoS of your application's **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) entities. For each transient or persistent **DDS\_Topic** (p. 172), the built-in fictitious Persistence Service **DDS\_DataReader** (p. 608) and **DDS\_DataWriter** (p. 478) have their QoS configured from the QoS of your application's **DDS\_DataWriter** (p. 478) and **DDS\_DataReader** (p. 608) entities that communicate on that **DDS\_Topic** (p. 172).

For a given **DDS\_Topic** (p. 172), the usual request/offered semantics apply to the matching between any **DDS\_DataWriter** (p. 478) in the domain that writes the **DDS\_Topic** (p. 172) and the built-in transient/persistent **DDS\_DataReader** (p. 608) for that **DDS\_Topic** (p. 172); similarly for the built-in transient/persistent **DDS\_DataWriter** (p. 478) for a **DDS\_Topic** (p. 172) and any **DDS\_DataReader** (p. 608) for the **DDS\_Topic** (p. 172). As a consequence, a **DDS\_DataWriter** (p. 478) that has an incompatible QoS will not send its data to the *RTI Persistence Service*, and a **DDS\_DataReader** (p. 608) that has an incompatible QoS will not get data from it.

Incompatibilities between local **DDS\_DataReader** (p. 608) and **DDS\_DataWriter** (p. 478) entities and the corresponding fictitious built-in transient/persistent entities cause the **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032) and **DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032) to change and the corresponding Listener invocations and/or signaling of **DDS\_Condition** (p. 1169) objects as they would with your application's own entities.

The value of **DDS\_DurabilityServiceQoSPolicy::service\_cleanup\_delay** (p. 1521) controls when *RTI Persistence Service* is able to remove all information regarding a data instances.

Information on a data instance is maintained until the following conditions are met:

1. The instance has been explicitly disposed (`instance_state = NOT_ALIVE_DISPOSED`),

and

1. All samples for the disposed instance have been acknowledged, including the dispose sample itself,

and

1. A time interval longer than **DDS\_DurabilityServiceQosPolicy::service\_cleanup\_delay** (p. 1521) has elapsed since the moment RTI Connext detected that the previous two conditions were met. (Note: Only values of zero or **DDS\_DURATION\_INFINITE** (p. 1011) are currently supported for the `service_cleanup_delay`)

The utility of **DDS\_DurabilityServiceQosPolicy::service\_cleanup\_delay** (p. 1521) is apparent in the situation where an application disposes an instance and it crashes before it has a chance to complete additional tasks related to the disposition. Upon restart, the application may ask for initial data to regain its state and the delay introduced by the `service_cleanup_delay` will allow the restarted application to receive the information on the disposed instance and complete the interrupted tasks.

### 5.56.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind*  $\geq$  *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of DURABILITY kind are considered ordered such that **DDS\_VOLATILE\_DURABILITY\_QOS** (p. 1088)  $<$  **DDS\_TRANSIENT\_LOCAL\_DURABILITY\_QOS** (p. 1089)  $<$  **DDS\_TRANSIENT\_DURABILITY\_QOS** (p. 1089)  $<$  **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089).

### 5.56.4 Field Documentation

#### 5.56.4.1 kind

**DDS\_DurabilityQosPolicyKind** `DDS_DurabilityQosPolicy::kind`

The kind of durability.

[default] **DDS\_VOLATILE\_DURABILITY\_QOS** (p. 1088)

#### 5.56.4.2 direct\_communication

**DDS\_Boolean** `DDS_DurabilityQosPolicy::direct_communication`

$\langle\langle$  *extension*  $\rangle\rangle$  (p. 817) Indicates whether or not a TRANSIENT or PERSISTENT **DDS\_DataReader** (p. 608) should receive samples directly from a TRANSIENT or PERSISTENT **DDS\_DataWriter** (p. 478)

When `direct_communication` is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), a TRANSIENT or PERSISTENT **DDS\_DataReader** (p. 608) will receive samples from both the original **DDS\_DataWriter** (p. 478) configured with TRANSIENT or PERSISTENT durability and the **DDS\_DataWriter** (p. 478) created by the persistence service. This peer-to-peer communication pattern provides low latency between end-points.

If the same sample is received from the original **DDS\_DataWriter** (p. 478) and the persistence service, the middleware will discard the duplicate.

When `direct_communication` is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), a TRANSIENT or PERSISTENT **DDS\_DataReader** (p. 608) will only receive samples from the **DDS\_DataWriter** (p. 478) created by the persistence service. This brokered communication pattern provides a way to guarantee eventual consistency.

[default] **DDS\_BOOLEAN\_TRUE** (p. 1004)

### 5.56.4.3 writer\_depth

```
DDS_Long DDS_DurabilityQosPolicy::writer_depth
```

<<**extension**>> (p. 817) Indicates the number of samples per instance that a durable **DDS\_DataWriter** (p. 478) will send to a late-joining **DDS\_DataReader** (p. 608).

The default value, **DDS\_AUTO\_WRITER\_DEPTH** (p. 1089), makes this parameter equal to the following:

- **DDS\_HistoryQosPolicy::depth** (p. 1560) if the history kind is **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094).
- **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693) in the **DDS\_ResourceLimitsQosPolicy** (p. 1690) if the history kind is **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094).

The `writer_depth` must be  $\leq$  **DDS\_HistoryQosPolicy::depth** (p. 1560).

`writer_depth` applies only to non-volatile DataWriters (those for which the kind is **TRANSIENT\_LOCAL**, **TRANSIENT**, or **PERSISTENT**).

When **DDS\_BatchQosPolicy::enable** (p. 1335) is set to true, `writer_depth` acts as a minimum number of samples per instance that will be sent to late joiners, as opposed to the maximum. As long as a batch contains a single sample that falls within the `writer_depth` for the instance to which it belongs, then the entire batch will be sent. This means that batches sent to late-joining DataReaders may contain more samples per instance than is specified by the `writer_depth` QoS setting.

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the `writer_depth`, not the **DDS\_HistoryQosPolicy::depth** (p. 1560).

Setting `writer_depth` on the DataReader side will be ignored.

[default] **DDS\_AUTO\_WRITER\_DEPTH** (p. 1089)

### 5.56.4.4 storage\_settings

```
struct DDS_PersistentStorageSettings DDS_DurabilityQosPolicy::storage_settings
```

Configures durable writer history and durable reader state.

By default, durable writer history and durable reader state are disabled. This means that a DataWriter will not persist its historical cache and a DataReader will not persist its state.

To enable durable writer history and durable reader state set **DDS\_PersistentStorageSettings::enable** (p. 1631) to **DDS\_BOOLEAN\_TRUE** (p. 1004).

## 5.57 DDS\_DurabilityServiceQosPolicy Struct Reference

Various settings to configure the external *RTI Persistence Service* used by RTI Connext for DataWriters with a **DDS\_DurabilityQosPolicy** (p. 1516) setting of **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_DURABILITY\_QOS** (p. 1089).

## Data Fields

- struct **DDS\_Duration\_t service\_cleanup\_delay**  
Controls when the service is able to remove all information regarding a data instances.
- **DDS\_HistoryQosPolicyKind history\_kind**  
The kind of history to apply in recouping durable data.
- **DDS\_Long history\_depth**  
Setting to use for the **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518) when recouping durable data.
- **DDS\_Long max\_samples**  
Part of resource limits QoS policy to apply when feeding a late joiner.
- **DDS\_Long max\_instances**  
Part of resource limits QoS policy to apply when feeding a late joiner.
- **DDS\_Long max\_samples\_per\_instance**  
Part of resource limits QoS policy to apply when feeding a late joiner.

### 5.57.1 Detailed Description

Various settings to configure the external *RTI Persistence Service* used by RTI Connex for DataWriters with a **DDS\_↔ DurabilityQosPolicy** (p. 1516) setting of **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_↔ DURABILITY\_QOS** (p. 1089).

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = NO  
**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

See also

**DURABILITY** (p. 1086)  
**HISTORY** (p. 1093)  
**RESOURCE\_LIMITS** (p. 1126)

### 5.57.2 Usage

When a DataWriter's **DDS\_DurabilityQosPolicy::kind** (p. 1518) is **DDS\_PERSISTENT\_DURABILITY\_QOS** (p. 1089) or **DDS\_TRANSIENT\_DURABILITY\_QOS** (p. 1089), an external service, the *RTI Persistence Service*, is used to store and possibly forward the data sent by the **DDS\_DataWriter** (p. 478) to **DDS\_DataReader** (p. 608) objects that are created *after* the data was initially sent.

This QoS policy is used to configure certain parameters of the Persistence Service when it operates on the behalf of the **DDS\_DataWriter** (p. 478), such as how much data to store. For example, it configures the **DURABILITY** (p. 1086), **HISTORY** (p. 1093), and the **RESOURCE\_LIMITS** (p. 1126) used by the fictitious DataReader and DataWriter used by the Persistence Service. Note, however, that the Persistence Service itself may be configured to ignore these values and instead use values from its own configuration file.

### 5.57.3 Field Documentation

#### 5.57.3.1 service\_cleanup\_delay

```
struct DDS_Duration_t DDS_DurabilityServiceQosPolicy::service_cleanup_delay
```

Controls when the service is able to remove all information regarding a data instances.

When the service cleanup delay is set to 0, disposed instances will be completely removed from the service. Only values of 0 and **DDS\_DURATION\_INFINITE** (p. 1011) are currently supported.

**[default]** 0

#### 5.57.3.2 history\_kind

```
DDS_HistoryQosPolicyKind DDS_DurabilityServiceQosPolicy::history_kind
```

The kind of history to apply in recouping durable data.

**[default]** **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094)

#### 5.57.3.3 history\_depth

```
DDS_Long DDS_DurabilityServiceQosPolicy::history_depth
```

Setting to use for the **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518) when recouping durable data.

If the **DDS\_HistoryQosPolicy::depth** (p. 1560) is set to a value lower than this value, **DDS\_HistoryQosPolicy::depth** (p. 1560) will be set equal to the value of this field.

**[default]** **DDS\_AUTO\_WRITER\_DEPTH** (p. 1089) (1)

#### 5.57.3.4 max\_samples

```
DDS_Long DDS_DurabilityServiceQosPolicy::max_samples
```

Part of resource limits QoS policy to apply when feeding a late joiner.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.57.3.5 max\_instances

`DDS_Long DDS_DurabilityServiceQosPolicy::max_instances`

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] `DDS_LENGTH_UNLIMITED` (p. 1127)

### 5.57.3.6 max\_samples\_per\_instance

`DDS_Long DDS_DurabilityServiceQosPolicy::max_samples_per_instance`

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] `DDS_LENGTH_UNLIMITED` (p. 1127)

## 5.58 DDS\_Duration\_t Struct Reference

Type for *duration* representation.

### Data Fields

- `DDS_Long sec`  
*seconds*
- `DDS_UnsignedLong nanosec`  
*nanoseconds*

### 5.58.1 Detailed Description

Type for *duration* representation.

Represents a time interval.

#### Examples

`HelloWorld_publisher.c`, and `HelloWorld_subscriber.c`.

### 5.58.2 Field Documentation

### 5.58.2.1 sec

```
DDS_Long DDS_Duration_t::sec
```

seconds

Examples

**HelloWorld\_subscriber.c.**

### 5.58.2.2 nanosec

```
DDS_UnsignedLong DDS_Duration_t::nanosec
```

nanoseconds

**[range]** [0,1000000000)

## 5.59 DDS\_DynamicData Struct Reference

A sample of any complex data type, which can be inspected and manipulated reflectively.

### 5.59.1 Detailed Description

A sample of any complex data type, which can be inspected and manipulated reflectively.

Objects of type **DDS\_DynamicData** (p. 1523) represent corresponding objects of the type identified by their **DDS\_↔\_TypeCode** (p. 1806). Because the definition of these types may not have existed at compile time on the system on which the application is running, you will interact with the data using an API of reflective getters and setters.

For example, if you had access to your data types at compile time, you could do this:

```
theValue = theObject.theField;
```

Instead, you will do something like this:

```
theValue = get(theObject, "theField");
```

**DDS\_DynamicData** (p. 1523) objects can represent any complex data type, including those of type kinds **DDS\_TK\_↔\_ARRAY** (p. 239), **DDS\_TK\_SEQUENCE** (p. 239), **DDS\_TK\_STRUCT** (p. 239), **DDS\_TK\_UNION** (p. 239), and **DDS\_↔\_TK\_VALUE** (p. 239). They cannot represent objects of basic types (e.g., integers and strings). Since those type definitions always exist on every system, you can examine their objects directly.

## 5.59.2 Member Names and IDs

The members of a data type can be identified in one of two ways: by their name or by their numeric ID. The former is often more transparent to human users; the latter is typically faster.

You define the name and ID of a type member when you add that member to that type. If you define your type in IDL or XML, the name will be the field name that appears in the type definition; the ID will be the one-based index of the field in declaration order. For example, in the following IDL structure, the ID of `theLong` is 2.

```
struct MyNestedType {
    char theChar;

    octet theOctetArray[10];

    long long theMultidimensionalArray[4][6][12];

    sequence<long> myArrayOfSeq[8];
};

struct MyType {
    short theShort;

    long theLong;

    MyNestedType theNestedType;
};
```

For unions (**DDS\_TK\_UNION** (p. 239)), the ID of a member is the discriminator value corresponding to that member. To access the current discriminator of a union, you must use the **DDS\_DynamicData\_get\_member\_info\_by\_index** (p. 341) operation on the `DynamicData` object using an index value of 0. This operation fills in a **DDS\_DynamicData\_MemberInfo** (p. 1532), then you can access the populated **DDS\_DynamicDataMemberInfo::member\_id** (p. 1532) field to get the current discriminator. Once you know the value of the discriminator, you can use it in the proper `get/set_xxx()` operations to access and set the member's value. Here is an example of accessing the discriminator:

```
DynamicDataMemberInfo memberInfo;

myDynamicData.get_member_info_by_index(memberInfo, 0);

DynamicDataMemberId discriminatorValue = memberInfo.member_id;

DDS_Long myMemberValue = myDynamicData.get_long(NULL, discriminatorValue);
```

### 5.59.2.1 Hierarchical Member Names

It is possible to refer to a nested member in a type without first having to use the **DDS\_DynamicData\_bind\_complex\_member** (p. 334) API. You can do this by using a hierarchical name. A hierarchical member name is a concatenation of member names separated by the '.' character. The hierarchical name describes the complete path from a top-level type to the nested member. For example, in the above type, any `DynamicData` API that receives a member name will accept `"theNestedType.theChar"` to refer to the char member in `MyNestedType`:

```
char myChar = myDynamicData.get_char("theNestedType.theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

In order to access the value of `theChar` without using a hierarchical name, you would have to first bind to `theNestedType` and then get the value:

```
myDynamicData.bind_complex_member(myBoundData, "theNestedType", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);

DDS_Char myChar = myBoundData.get_char("theChar", DDS_DYNAMIC_DATA_MEMBER_ID_UNSPECIFIED);
```

As you can see, using a hierarchical member name removes the need to call the **DDS\_DynamicData\_bind\_complex\_member** (p. 334) and **DDS\_DynamicData\_unbind\_complex\_member** (p. 336) APIs, and allows for access to nested members at any depth directly from the top-level type.

The member name can also contain indexes to address members in arrays and sequences. For example, to set the third member in the array `theOctetArray`, you can pass in "theNestedType.theOctetArray[2]" as the member name to the **DDS\_DynamicData\_set\_octet** (p. 392) API. The index values when used as part of the member name are 0-based.

For multi-dimensional arrays, the indexes for each dimension should be listed comma-separated in between brackets. For example, to address a member of `theMultidimensionalArray`, the member name should be something like "theNestedType.theMultidimensionalArray[3,2,5]".

In complex types with arrays and sequences that contain other arrays and sequences, the hierarchical name may include multiple index values, one right after another. For example, in `MyNestedType`, `myArrayOfSeq` is an array of sequences. In order to set the third member of the sequence in the fourth member of the array, the member name would be "myNestedType.myArrayOfSeq[3][2]".

### 5.59.3 Arrays and Sequences

The "members" of array and sequence types, unlike those of structure and union types, don't have names or explicit member IDs. However, they may nevertheless be accessed by "ID": the ID is one more than the index. (The first element has ID 1, the second 2, etc.)

Multi-dimensional arrays are effectively flattened by this pattern. For example, for an array `theArray[4][5]`, accessing ID 7 is equivalent to index 6, or the second element of the second group of 5.

To determine the length of a collection-typed member of a structure or union, you have two choices:

1. Get the length along with the data: call the appropriate array accessor (see **Getters and Setters** (p. 1526)) and check the resulting length.
2. Get the length without getting the data itself: call **DDS\_DynamicData\_get\_member\_info** (p. 339) and check the resulting **DDS\_DynamicDataMemberInfo::element\_count** (p. 1534).

### 5.59.4 Available Functionality

The Dynamic Data API is large when measured by the number of methods it contains. But each method falls into one of a very small number of categories. You will find it easier to navigate this documentation if you understand these categories.

#### 5.59.4.1 Lifecycle and Utility Methods

Managing the lifecycle of **DDS\_DynamicData** (p. 1523) objects is simple. You have two choices:

1. Usually, you will go through a **DDS\_DynamicDataTypeSupport** (p. 321) factory object, which will ensure that the type and property information for the new **DDS\_DynamicData** (p. 1523) object corresponds to a registered type in your system.
2. In certain advanced cases, such as when you're navigating a nested structure, you will want to have a **DDS\_↔DynamicData** (p. 1523) object that is not bound up front to any particular type, or you will want to initialize the object in a custom way. In that case, you can call the constructor directly.

Table 5.10 Lifecycle

DDS_DynamicDataSupport (p. 321)	DDS_DynamicData (p. 1523)
DDS_DynamicDataSupport_create_data (p. 428)	DDS_DynamicData_new (p. 322)
DDS_DynamicDataSupport_initialize_data (p. 429)	DDS_DynamicData_initialize (p. 322)
DDS_DynamicDataSupport_finalize_data (p. 429)	DDS_DynamicData_finalize (p. 323)
DDS_DynamicDataSupport_delete_data (p. 428)	DDS_DynamicData_delete (p. 324)

You can also copy **DDS\_DynamicData** (p. 1523) objects:

- **DDS\_DynamicData\_copy** (p. 324)

You can test them for equality:

- **DDS\_DynamicData\_equal** (p. 324)

And you can print their contents:

- **DDS\_DynamicData\_print** (p. 329)
- **DDS\_DynamicDataSupport\_print\_data** (p. 428)

#### 5.59.4.2 Getters and Setters

Most methods get or set the value of some field. These methods are named according to the type of the field they access.

The names of types vary across languages. The programming API for each language reflects that programming language. However, if your chosen language does not use the same names as the language that you used to define your types (e.g., IDL), or if you need to interoperate among programming languages, you will need to understand these differences. They are explained the following table. (Note: for modern C++, see the RTI Connex Modern C++ API reference.)

Table 5.11 Type Names Across Languages

Type	IDL	C, Traditional C++	Java	Ada
16-bit integer	short	DDS_Short	short	Standard.DDS.↔ Short
32-bit integer	long	DDS_Long	int	Standard.DDS.Long
64-bit integer	long long	DDS_LongLong	long	Standard.DDS.↔ Long_Long
Unsigned 16-bit integer	unsigned short	DDS_Unsigned↔ Short	short	Standard.DDS.↔ Unsigned_Short
Unsigned 32-bit integer	unsigned long	DDS_Unsigned↔ Long	int	Standard.DDS.Long

Type	IDL	C, Traditional C++	Java	Ada
Unsigned 64-bit integer	unsigned long long	DDS_Unsigned↔ LongLong	long	Standard.DDS.↔ Unsigned_Long_↔ Long
float	float	DDS_Float	float	Standard.DDS.Float
double	double	DDS_Double	double	Standard.DDS.↔ Double
long double	long double	DDS_LongDouble	N/A (see CORE-14091 known issue)	Standard.DDS.↔ Long_Double
character	char	DDS_Char	char	Standard.DDS.Char
wide character	wchar	DDS_Wchar	char	Standard.DDS.↔ Wchar
octet	octet	DDS_Octet	byte	Standard.DDS.Octet
boolean	boolean	DDS_Boolean	boolean	Standard.DDS.↔ Boolean
string	string	DDS_Char*	String	Standard.DDS.↔ String
wstring	wstring	DDS_Wchar*	String	Standard.DDS.↔ Wide_String

When working with a **DDS\_DynamicData** (p. 1523) object representing an array or sequence, calling one of the "get" methods below for an index that is out of bounds will result in **DDS\_RETCODE\_NO\_DATA** (p. 1025). Calling "set" for an index that is past the end of a sequence will cause that sequence to automatically lengthen (filling with default contents).

When working with a **DDS\_DynamicData** (p. 1523) object whose type contains optional members, calling one of the "get" methods below on an unset optional member or any member that is part of an unset complex optional member will result in **DDS\_RETCODE\_NO\_DATA** (p. 1025).

**Table 5.12 Basic Types**

Get	Set
<b>DDS_DynamicData_get_long</b> (p. 343)	<b>DDS_DynamicData_set_long</b> (p. 386)
<b>DDS_DynamicData_get_ulong</b> (p. 345)	<b>DDS_DynamicData_set_ulong</b> (p. 388)
<b>DDS_DynamicData_get_short</b> (p. 344)	<b>DDS_DynamicData_set_short</b> (p. 387)
<b>DDS_DynamicData_get_ushort</b> (p. 346)	<b>DDS_DynamicData_set_ushort</b> (p. 389)
<b>DDS_DynamicData_get_longlong</b> (p. 350)	<b>DDS_DynamicData_set_longlong</b> (p. 393)
<b>DDS_DynamicData_get_ulonglong</b> (p. 351)	<b>DDS_DynamicData_set_ulonglong</b> (p. 394)

Table 5.15 Sequences of Basic Types

Get	Set
DDS_DynamicData_get_long_seq (p. 373)	DDS_DynamicData_set_long_seq (p. 414)
DDS_DynamicData_get_ulong_seq (p. 375)	DDS_DynamicData_set_ulong_seq (p. 415)
DDS_DynamicData_get_short_seq (p. 374)	DDS_DynamicData_set_short_seq (p. 414)
DDS_DynamicData_get_ushort_seq (p. 376)	DDS_DynamicData_set_ushort_seq (p. 416)
DDS_DynamicData_get_longlong_seq (p. 381)	DDS_DynamicData_set_longlong_seq (p. 420)
DDS_DynamicData_get_ulonglong_seq (p. 382)	DDS_DynamicData_set_ulonglong_seq (p. 421)
DDS_DynamicData_get_float_seq (p. 377)	DDS_DynamicData_set_float_seq (p. 417)
DDS_DynamicData_get_double_seq (p. 378)	DDS_DynamicData_set_double_seq (p. 417)
DDS_DynamicData_get_longdouble_seq (p. 383)	DDS_DynamicData_set_longdouble_seq (p. 422)
DDS_DynamicData_get_boolean_seq (p. 379)	DDS_DynamicData_set_boolean_seq (p. 418)
DDS_DynamicData_get_octet_seq (p. 380)	DDS_DynamicData_set_octet_seq (p. 420)
DDS_DynamicData_get_char_seq (p. 379)	DDS_DynamicData_set_char_seq (p. 419)
DDS_DynamicData_get_wchar_seq (p. 384)	DDS_DynamicData_set_wchar_seq (p. 423)

In addition to getting or setting a field, you can "clear" its value; that is, set it to a default zero value.

- **DDS\_DynamicData\_clear\_all\_members** (p. 325)
- **DDS\_DynamicData\_clear\_optional\_member** (p. 325)

#### 5.59.4.3 Query and Iteration

Not all components of your application will have static knowledge of all of the fields of your type. Sometimes, you will want to query meta-data about the fields that appear in a given data sample.

- **DDS\_DynamicData\_get\_type** (p. 337)
- **DDS\_DynamicData\_get\_type\_kind** (p. 337)
- **DDS\_DynamicData\_get\_member\_type** (p. 341)
- **DDS\_DynamicData\_get\_member\_info** (p. 339)
- **DDS\_DynamicData\_get\_member\_count** (p. 337)
- **DDS\_DynamicData\_get\_member\_info\_by\_index** (p. 341)
- **DDS\_DynamicData\_member\_exists** (p. 338)
- **DDS\_DynamicData\_member\_exists\_in\_type** (p. 339)
- **DDS\_DynamicData\_is\_member\_key** (p. 342)

#### 5.59.4.4 Type/Object Association

Sometimes, you may want to change the association between a data object and its type. This is not something you can do with a typical object, but with **DDS\_DynamicData** (p. 1523) objects, it is a powerful capability. It allows you to, for example, examine nested structures without copying them by using a "bound" **DDS\_DynamicData** (p. 1523) object as a view into an enclosing **DDS\_DynamicData** (p. 1523) object.

- **DDS\_DynamicData\_bind\_type** (p. 333)
- **DDS\_DynamicData\_unbind\_type** (p. 334)
- **DDS\_DynamicData\_bind\_complex\_member** (p. 334)
- **DDS\_DynamicData\_unbind\_complex\_member** (p. 336)

#### 5.59.4.5 Performance Considerations

By default, a `DynamicData` object stores its content in an implementation-specific representation that allows getting and setting its fields by name or ID.

When a sample is received, the CDR-formatted data is deserialized into this buffer.

When a sample is published, the data is serialized into CDR from the buffer and sent to the network.

However, there are scenarios where `DynamicData` is used for purposes that don't involve manipulating the object's content directly. Two common examples are:

- Recording/Replaying: Storing samples in persistent storage for later analysis or replay.
- Bridging: Transferring samples from one domain to another by transmitting samples received with a `DynamicDataReader` to another domain using a `DynamicDataWriter`.

RTI provides dedicated services, namely RTI Recording Service and RTI Routing Service, to address these use cases. However, in certain situations, you might be unable to utilize these services.

For scenarios where inspecting or modifying the content of `DynamicData` fields is unnecessary, `DynamicData` offers a high-performance method to configure a `DataReader` to avoid deserializing incoming samples into the internal representation. Additionally, the `DynamicData` API provides a method to link a CDR-formatted serialization buffer directly with a `DynamicData` object, facilitating direct transmission without converting the data from the internal representation to CDR.

To skip the deserialization of a `DynamicData` object on the `DataReader` side, you can set the field `DDS_DynamicDataTypeSerializationProperty_t::skip_deserialization` (p. 1538) to `DDS_BOOLEAN_TRUE` (p. 1004).

Once a sample is received, you can access the serialized buffer directly by using the `DDS_DynamicData_get_cdr_buffer` (p. 327). This buffer can be stored in persistent storage in a Recording/Replaying use case.

To link a serialization buffer directly with a `DynamicData` object, you can use the `DDS_DynamicData_set_cdr_buffer` (p. 327) method. This method allows you to set the buffer that will be used to serialize the `DynamicData` object when it is published.

#### MT Safety:

**UNSAFE.** In general, using a single `DDS_DynamicData` (p. 1523) object concurrently from multiple threads is *unsafe*.

#### Examples

**HelloWorldPlugin.c.**

## 5.60 DDS\_DynamicDataInfo Struct Reference

A descriptor for a `DDS_DynamicData` (p. 1523) object.

## Data Fields

- **DDS\_Long member\_count**

*The number of data members in this **DDS\_DynamicData** (p. 1523) sample.*

- **DDS\_Long stored\_size**

*The number of bytes currently used to store the data of this **DDS\_DynamicData** (p. 1523) sample.*

### 5.60.1 Detailed Description

A descriptor for a **DDS\_DynamicData** (p. 1523) object.

See also

**DDS\_DynamicData\_get\_info** (p. 333)

### 5.60.2 Field Documentation

#### 5.60.2.1 member\_count

**DDS\_Long** DDS\_DynamicDataInfo::member\_count

The number of data members in this **DDS\_DynamicData** (p. 1523) sample.

#### 5.60.2.2 stored\_size

**DDS\_Long** DDS\_DynamicDataInfo::stored\_size

The number of bytes currently used to store the data of this **DDS\_DynamicData** (p. 1523) sample.

## 5.61 DDS\_DynamicDataJsonParserProperties\_t Struct Reference

A collection of attributes used to configure **DDS\_DynamicData** (p. 1523) objects.

### 5.61.1 Detailed Description

A collection of attributes used to configure **DDS\_DynamicData** (p. 1523) objects.

To ensure that new objects are initialized to known values, assign them with the static initializer **DDS\_DynamicDataProperty\_t\_INITIALIZER** (p. 319).

See also

**DDS\_DynamicDataProperty\_t\_INITIALIZER** (p. 319)

## 5.62 DDS\_DynamicDataMemberInfo Struct Reference

A descriptor for a single member (i.e. field) of dynamically defined data type.

### Data Fields

- **DDS\_DynamicDataMemberId member\_id**  
*An integer that uniquely identifies the data member within this **DDS\_DynamicData** (p. 1523) sample's type.*
- **const char \* member\_name**  
*The string name of the data member.*
- **DDS\_Boolean member\_exists**  
*Indicates whether the member exists in this sample.*
- **DDS\_TCKind member\_kind**  
*The kind of type of this data member (e.g., integer, structure, etc.).*
- **DDS\_UnsignedLong element\_count**  
*The number of elements within this data member.*
- **DDS\_TCKind element\_kind**  
*The kind of type of the elements within this data member.*

### 5.62.1 Detailed Description

A descriptor for a single member (i.e. field) of dynamically defined data type.

See also

**DDS\_DynamicData\_get\_member\_info** (p. 339)

### 5.62.2 Field Documentation

### 5.62.2.1 member\_id

```
DDS_DynamicDataMemberId DDS_DynamicDataMemberInfo::member_id
```

An integer that uniquely identifies the data member within this **DDS\_DynamicData** (p. 1523) sample's type.

The member ID is assigned automatically by the middleware based on the member's declaration order within the type. It is a 1-based index of the member's position in the type.

See also

**DDS\_TCKind** (p. 239)

### 5.62.2.2 member\_name

```
const char* DDS_DynamicDataMemberInfo::member_name
```

The string name of the data member.

This name will be unique among members of the same type. However, a single named member may have multiple type representations.

### 5.62.2.3 member\_exists

```
DDS_Boolean DDS_DynamicDataMemberInfo::member_exists
```

Indicates whether the member exists in this sample.

A member that is defined in a type may not exist in a sample of that type in the following situations

- The member is optional and is unset
- Being part of a union, the discriminator doesn't select this member
- When getting the information about a sequence element, with index  $i$ , and  $i$  is greater than the current sequence length but smaller than its maximum length.

See also

**DDS\_DynamicData\_member\_exists\_in\_type** (p. 339)

#### 5.62.2.4 member\_kind

`DDS_TCKind DDS_DynamicDataMemberInfo::member_kind`

The kind of type of this data member (e.g., integer, structure, etc.).

This is a convenience field; it is equivalent to looking up the member in the **DDS\_TypeCode** (p. 1806) and getting the **DDS\_TCKind** (p. 239) from there.

#### 5.62.2.5 element\_count

`DDS_UnsignedLong DDS_DynamicDataMemberInfo::element_count`

The number of elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report zero (0) here.

#### 5.62.2.6 element\_kind

`DDS_TCKind DDS_DynamicDataMemberInfo::element_kind`

The kind of type of the elements within this data member.

This information is only valid for members of array or sequence types. Members of other types will always report **DDS\_TK\_NULL** (p. 239) here.

## 5.63 DDS\_DynamicDataProperty\_t Struct Reference

A collection of attributes used to configure **DDS\_DynamicData** (p. 1523) objects.

### Data Fields

- **DDS\_Long buffer\_initial\_size**  
*The initial amount of memory used by the underlying **DDS\_DynamicData** (p. 1523) buffer, in bytes.*
- **DDS\_Long buffer\_max\_size**  
*The maximum amount of memory that the underlying **DDS\_DynamicData** (p. 1523) buffer may use, in bytes.*

### 5.63.1 Detailed Description

A collection of attributes used to configure **DDS\_DynamicData** (p. 1523) objects.

To ensure that new objects are initialized to known values, assign them with the static initializer **DDS\_DynamicDataProperty\_t\_INITIALIZER** (p. 319).

See also

**DDS\_DynamicDataProperty\_t\_INITIALIZER** (p. 319)

## 5.63.2 Field Documentation

### 5.63.2.1 buffer\_initial\_size

**DDS\_Long** DDS\_DynamicDataProperty\_t::buffer\_initial\_size

The initial amount of memory used by the underlying **DDS\_DynamicData** (p. 1523) buffer, in bytes.

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The initial buffer size will be set to the minimum amount of space required to hold the overhead required by the DynamicData internal representation (about 100 bytes) in addition to the minimum deserialized size of a sample. The minimum deserialized size of a sample assumes that all strings are allocated to their default values, sequences are left to length 0, and all optional members are unset.

If set to any value other than 0: The underlying buffer will be allocated to the provided size plus the overhead required by the DynamicData internal representation (about 100 bytes). If the provided size plus the overhead is less than the size used when buffer\_initial\_size is left to 0, then the default value is used.

See also

**DDS\_DynamicDataProperty\_t::buffer\_max\_size** (p. 1535)

### 5.63.2.2 buffer\_max\_size

**DDS\_Long** DDS\_DynamicDataProperty\_t::buffer\_max\_size

The maximum amount of memory that the underlying **DDS\_DynamicData** (p. 1523) buffer may use, in bytes.

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

A DynamicData object will grow to this size from the initial size as needed. The buffer\_max\_size includes all overhead that is required for the internal DynamicData representation and therefore represents a hard upper limit on the size of the underlying DynamicData buffer.

If set to -1 (default): The buffer will grow unbounded to the size required to fit all members.

If set to any value other than -1: The buffer will not grow beyond this size. If setting a member's values requires the buffer to grow beyond this maximum, the member will fail to be set. If the buffer is required to grow beyond this maximum during deserialization, the sample will fail to be deserialized. The buffer\_max\_size cannot be smaller than the buffer\_initial\_size.

See also

**DDS\_DynamicDataProperty\_t::buffer\_initial\_size** (p. 1535)

## 5.64 DDS\_DynamicDataSeq Struct Reference

An ordered collection of **DDS\_DynamicData** (p. 1523) elements.

### 5.64.1 Detailed Description

An ordered collection of **DDS\_DynamicData** (p. 1523) elements.

Instantiates **FooSeq** (p. 1845) < **DDS\_DynamicData** (p. 1523) > .

See also

**FooSeq** (p. 1845)

**DDS\_DynamicData** (p. 1523)

## 5.65 DDS\_DynamicDataTypeProperty\_t Struct Reference

A collection of attributes used to configure **DDS\_DynamicDataTypeSupport** (p. 321) objects.

### Data Fields

- struct **DDS\_DynamicDataProperty\_t data**

*These properties will be provided to every new **DDS\_DynamicData** (p. 1523) sample created from the **DDS\_DynamicDataTypeSupport** (p. 321).*

- struct **DDS\_DynamicDataTypeSerializationProperty\_t serialization**

*Properties that govern how the data of this type will be serialized on the network.*

### 5.65.1 Detailed Description

A collection of attributes used to configure **DDS\_DynamicDataTypeSupport** (p. 321) objects.

The properties of a **DDS\_DynamicDataTypeSupport** (p. 321) object contain the properties that will be used to instantiate any samples created by that object.

### 5.65.2 Field Documentation

### 5.65.2.1 data

```
struct DDS_DynamicDataProperty_t DDS_DynamicDataTypeProperty_t::data
```

These properties will be provided to every new **DDS\_DynamicData** (p. 1523) sample created from the **DDS\_DynamicDataSupport** (p. 321).

These properties are also used to create the samples that are kept in the DataReader's queue.

### 5.65.2.2 serialization

```
struct DDS_DynamicDataTypeSerializationProperty_t DDS_DynamicDataTypeProperty_t::serialization
```

Properties that govern how the data of this type will be serialized on the network.

## 5.66 DDS\_DynamicDataTypeSerializationProperty\_t Struct Reference

Properties that govern how data of a certain type will be serialized on the network.

### Data Fields

- **DDS\_Boolean use\_42e\_compatible\_alignment**  
*[No longer supported] Use RTI Connex 4.2e-compatible alignment for large primitive types.*
- **DDS\_UnsignedLong max\_size\_serialized**

*Enable skipping the deserialization of data on the DataReader side.*

### 5.66.1 Detailed Description

Properties that govern how data of a certain type will be serialized on the network.

### 5.66.2 Field Documentation

### 5.66.2.1 use\_42e\_compatible\_alignment

`DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::use_42e_compatible_alignment`

**[No longer supported]** Use RTI Connex 4.2e-compatible alignment for large primitive types.

In RTI Connex 4.2e, the default alignment for large primitive types – **DDS\_LongLong** (p. 1006), **DDS\_UnsignedLong**↔**Long** (p. 1006), **DDS\_Double** (p. 1006), and **DDS\_LongDouble** (p. 1007) – was not RTPS-compliant. This compatibility mode allows applications targeting post-4.2e versions of RTI Connex to interoperate with 4.2e-based applications, regardless of the data types they use.

If this flag is not set, all data will be serialized in an RTPS-compliant manner, which for the types listed above, will not be interoperable with RTI Connex 4.2e.

### 5.66.2.2 max\_size\_serialized

`DDS_UnsignedLong DDS_DynamicDataTypeSerializationProperty_t::max_size_serialized`

**[No longer supported]** If you were previously using this property, use **DDS\_DynamicDataProperty\_t::buffer\_max**↔**\_size** (p. 1535) instead. The maximum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

The effective value of the maximum serialized size will be the value of this field or the size automatically inferred from the type's **DDS\_TypeCode** (p. 1806), whichever is smaller.

### 5.66.2.3 min\_size\_serialized

`DDS_UnsignedLong DDS_DynamicDataTypeSerializationProperty_t::min_size_serialized`

**[No longer supported]** If you were previously using this property, use **DDS\_DynamicDataProperty\_t::buffer\_initial**↔**\_size** (p. 1535) instead. The minimum number of bytes that objects of a given type could consume when serialized on the network.

This value is used to set the sizes of certain internal middleware buffers.

Default: 0xFFFFFFFF, a sentinel that indicates that this value must be equal to the value specified in **max\_size**↔**serialized**.

### 5.66.2.4 trim\_to\_size

`DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::trim_to_size`

Controls the growth of the buffer in a DynamicData object.

This property only applies to DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The buffer will not be reallocated unless the deserialized size of the incoming sample is greater than the current buffer size.

If set to 1: The buffer of a DynamicData object obtained from the DDS sample pool will be freed and re-allocated for each sample to just fit the size of the deserialized data of the incoming sample. The newly allocated size will not be smaller than **DDS\_DynamicDataProperty\_t::buffer\_initial\_size** (p. 1535).

### 5.66.2.5 skip\_deserialization

`DDS_Boolean DDS_DynamicDataTypeSerializationProperty_t::skip_deserialization`

Enable skipping the deserialization of data on the DataReader side.

Setting this member to `DDS_BOOLEAN_TRUE` (p. 1004) boosts the performance for use cases in which the application does not require accessing the value of the different members of the received DynamicData object. Those use cases include recording, replaying, and bridging. You can access the CDR buffer of a DynamicData object by calling the function `DDS_DynamicData_get_cdr_buffer` (p. 327). This configuration option is only available in C, Traditional C++, Modern C++, and Python language bindings.

When this option is set to `DDS_BOOLEAN_TRUE` (p. 1004), many of the DynamicData APIs cannot be used to access or manipulate the received DynamicData object. See each functions's documentation for whether or not the function is supported for DynamicData objects in CDR format.

See also

`DDS_DynamicData_is_cdr` (p. 328)

`DDS_DynamicData_get_cdr_buffer` (p. 327)

`DDS_DynamicData_set_cdr_buffer` (p. 327)

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

## 5.67 DDS\_EndpointGroup\_t Struct Reference

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

### Data Fields

- `char * role_name`  
*Defines the role name of the endpoint group.*
- `int quorum_count`  
*Defines the minimum number of members that satisfies the endpoint group.*

### 5.67.1 Detailed Description

Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

### 5.67.2 Field Documentation

### 5.67.2.1 `role_name`

```
char* DDS_EndpointGroup_t::role_name
```

Defines the role name of the endpoint group.

If used in the **DDS\_AvailabilityQosPolicy** (p. 1330) on a **DDS\_DataWriter** (p. 478), it specifies the name that identifies a Durable Subscription.

The role name can be at most 255 characters in length.

### 5.67.2.2 `quorum_count`

```
int DDS_EndpointGroup_t::quorum_count
```

Defines the minimum number of members that satisfies the endpoint group.

If used in the **DDS\_AvailabilityQosPolicy** (p. 1330) on a **DDS\_DataWriter** (p. 478), it specifies the number of Data↔Readers that must acknowledge a sample before the sample is considered to be acknowledged by the Durable Subscription.

## 5.68 **DDS\_EndpointGroupSeq** Struct Reference

A sequence of **DDS\_EndpointGroup\_t** (p. 1539).

### 5.68.1 Detailed Description

A sequence of **DDS\_EndpointGroup\_t** (p. 1539).

In the context of Collaborative DataWriters, it can be used by a **DDS\_DataReader** (p. 608) to define a group of remote DataWriters that the **DDS\_DataReader** (p. 608) will wait to discover before skipping missing samples.

In the context of Durable Subscriptions, it can be used to create a set of Durable Subscriptions identified by a name and a quorum count.

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

## 5.72 DDS\_EntityFactoryQosPolicy Struct Reference

A QoS policy for all **DDS\_Entity** (p. 1160) types that can act as factories for one or more other **DDS\_Entity** (p. 1160) types.

### Data Fields

- **DDS\_Boolean autoenable\_created\_entities**

*Specifies whether the entity acting as a factory automatically enables the instances it creates.*

### 5.72.1 Detailed Description

A QoS policy for all **DDS\_Entity** (p. 1160) types that can act as factories for one or more other **DDS\_Entity** (p. 1160) types.

Entity:

**DDS\_DomainParticipantFactory** (p. 28), **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), **DDS\_↔Subscriber** (p. 565)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **YES** (p. 1048)

## 5.72.2 Usage

This policy controls the behavior of the **DDS\_Entity** (p. 1160) as a factory for other entities. It controls whether or not child entities are created in the enabled state.

RTI Connex uses a factory design pattern for creating DDS Entities. That is, a parent entity must be used to create child entities. DomainParticipants create Topics, Publishers and Subscribers. Publishers create DataWriters. Subscribers create DataReaders.

By default, a child object is enabled upon creation (initialized and may be actively used). With this QoS policy, a child object can be created in a disabled state. A disabled entity is only partially initialized and cannot be used until the entity is enabled. Note: an entity can only be *enabled*; it cannot be *disabled* after it has been enabled.

This QoS policy is useful to synchronize the initialization of DDS Entities. For example, when a **DDS\_DataReader** (p. 608) is created in an enabled state, its existence is immediately propagated for discovery and the **DDS\_DataReader** (p. 608) object's listener called as soon as data is received. The initialization process for an application may extend beyond the creation of the **DDS\_DataReader** (p. 608), and thus, it may not be desirable for the **DDS\_DataReader** (p. 608) to start to receive or process any data until the initialization process is complete. So by creating readers in a disabled state, your application can make sure that no data is received until the rest of the application initialization is complete, and at that time, enable the them.

Note: if an entity is disabled, then all of the child entities it creates will be disabled, too, regardless of the setting of this QoS policy. However, enabling a disabled entity will enable all of its children if this QoS policy is set to automatically enable children entities.

This policy is mutable. A change in the policy affects only the entities created after the change, not any previously created entities.

## 5.72.3 Field Documentation

### 5.72.3.1 autoenable\_created\_entities

```
DDS_Boolean DDS_EntityFactoryQosPolicy::autoenable_created_entities
```

Specifies whether the entity acting as a factory automatically enables the instances it creates.

The setting of `autoenable_created_entities` to **DDS\_BOOLEAN\_TRUE** (p. 1004) indicates that the factory `create_<entity>` operation(s) will automatically invoke the **DDS\_Entity\_enable** (p. 1163) operation each time a new **DDS\_Entity** (p. 1160) is created. Therefore, the **DDS\_Entity** (p. 1160) returned by `create_<entity>` will already be enabled. A setting of **DDS\_BOOLEAN\_FALSE** (p. 1004) indicates that the **DDS\_Entity** (p. 1160) will not be automatically enabled. Your application will need to call **DDS\_Entity\_enable** (p. 1163) itself.

The default setting of `autoenable_created_entities = DDS_BOOLEAN_TRUE` (p. 1004) means that, by default, it is not necessary to explicitly call **DDS\_Entity\_enable** (p. 1163) on newly created entities.

[default] **DDS\_BOOLEAN\_TRUE** (p. 1004)

## 5.73 DDS\_EntityNameQosPolicy Struct Reference

Assigns a name and a role name to a **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565), **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). Except for **DDS\_Publisher** (p. 436) and **DDS\_Subscriber** (p. 565), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

### Data Fields

- char \* **name**  
*The name of the entity.*
- char \* **role\_name**  
*The entity role name.*

### 5.73.1 Detailed Description

Assigns a name and a role name to a **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565), **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). Except for **DDS\_Publisher** (p. 436) and **DDS\_Subscriber** (p. 565), these names will be visible during the discovery process and in RTI tools to help you visualize and debug your system.

Entity:

**DDS\_DomainParticipant** (p. 72), **DDS\_Subscriber** (p. 565), **DDS\_Publisher** (p. 436), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = NO;  
**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

### 5.73.2 Usage

The name and role name can be at most 255 characters in length.

The strings must be null-terminated strings allocated with **DDS\_String\_alloc** (p. 1313) or **DDS\_String\_dup** (p. 1313).

If you provide a non-null pointer when getting the QoS, then it should point to valid memory that can be written to, to avoid ungraceful failures.

### 5.73.3 Field Documentation

### 5.73.3.1 name

```
char* DDS_EntityNameQosPolicy::name
```

The name of the entity.

**[default]** null

**[range]** Null terminated string with length not exceeding 255. It can be null.

### 5.73.3.2 role\_name

```
char* DDS_EntityNameQosPolicy::role_name
```

The entity role name.

With Durable Subscriptions this name is used to specify to which Durable Subscription the **DDS\_DataReader** (p. 608) belongs.

With Collaborative DataWriters this name is used to specify to which endpoint group the **DDS\_DataWriter** (p. 478) belongs.

**[range]** Null terminated string with length not exceeding 255. It can be null.

**[default]** null

## 5.74 DDS\_EnumMember Struct Reference

A description of a member of an enumeration.

### Data Fields

- char \* **name**  
*The name of the enumeration member.*
- **DDS\_Long ordinal**  
*The value associated the the enumeration member.*

### 5.74.1 Detailed Description

A description of a member of an enumeration.

See also

**DDS\_EnumMemberSeq** (p. 1547)

**DDS\_TypeCodeFactory\_create\_enum\_tc** (p. 292)

## 5.74.2 Field Documentation

### 5.74.2.1 name

```
char* DDS_EnumMember::name
```

The name of the enumeration member.

Cannot be NULL.

### 5.74.2.2 ordinal

```
DDS_Long DDS_EnumMember::ordinal
```

The value associated the the enumeration member.

## 5.75 DDS\_EnumMemberSeq Struct Reference

Defines a sequence of enumerator members.

### 5.75.1 Detailed Description

Defines a sequence of enumerator members.

See also

**DDS\_EnumMember** (p. 1546)

**FooSeq** (p. 1845)

**DDS\_TypeCodeFactory\_create\_enum\_tc** (p. 292)

## 5.76 DDS\_EventQosPolicy Struct Reference

Settings for event.

### Data Fields

- struct **DDS\_ThreadSettings\_t** **thread**  
*Event thread QoS.*
- **DDS\_Long** **initial\_count**  
*The initial number of events.*
- **DDS\_Long** **max\_count**  
*The maximum number of events.*

### 5.76.1 Detailed Description

Settings for event.

In a **DDS\_DomainParticipant** (p. 72), a thread is dedicated to handle all timed events, including checking for timeouts and deadlines and executing internal and user-defined timeout or exception handling routines/callbacks.

This QoS policy allows you to configure thread properties such as priority level and stack size. You can also configure the maximum number of events that can be posted to the event thread. By default, a **DDS\_DomainParticipant** (p. 72) will dynamically allocate memory as needed for events posted to the event thread. However, by setting a maximum value or setting the initial and maximum value to be the same, you can either bound the amount of memory allocated for the event thread or prevent a **DDS\_DomainParticipant** (p. 72) from dynamically allocating memory for the event thread after initialization.

This QoS policy is an extension to the DDS standard.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.76.2 Field Documentation

#### 5.76.2.1 thread

```
struct DDS_ThreadSettings_t DDS_EventQosPolicy::thread
```

Event thread QoS.

There is only one event thread.

Priority:

**[default]** The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

Stack Size:

**[default]** The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

Mask:

**[default]** mask = **DDS\_THREAD\_SETTINGS\_FLOATING\_POINT** (p.1040) | **DDS\_THREAD\_SETTINGS\_STUDIO** (p. 1040)

### 5.76.2.2 initial\_count

`DDS_Long DDS_EventQosPolicy::initial_count`

The initial number of events.

**[default]** 256

**[range]** [1, 1 million],  $\leq$  max\_count

### 5.76.2.3 max\_count

`DDS_Long DDS_EventQosPolicy::max_count`

The maximum number of events.

The maximum number of events. If the limit is reached, no new event can be added.

**[default]** `DDS_LENGTH_UNLIMITED` (p. 1127)

**[range]** [1, 1 million] or `DDS_LENGTH_UNLIMITED` (p. 1127),  $\geq$  initial\_count

## 5.77 DDS\_ExpressionProperty Struct Reference

Provides additional information about the filter expression passed to `DDS_ContentFilter::writer_compile` (p. 1354).

### Data Fields

- **DDS\_Boolean key\_only\_filter**  
*Indicates if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.*
- **DDS\_Boolean writer\_side\_filter\_optimization**  
*Indicates if the filter implementation can cache the filtering result for the provided expression.*

### 5.77.1 Detailed Description

Provides additional information about the filter expression passed to `DDS_ContentFilter::writer_compile` (p. 1354).

It is used by the filter implementation to indicate to the middleware whether or not the `DDS_ContentFilter` (p. 1352) will cache the result of filter evaluation.

### 5.77.2 Field Documentation

### 5.77.2.1 key\_only\_filter

```
DDS_Boolean DDS_ExpressionProperty::key_only_filter
```

Indicates if the filter expression is based only on key fields. In this case, RTI Connex itself can cache the filtering results.

When this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), it indicates to RTI Connex that the filter expression is based only on key fields.

### 5.77.2.2 writer\_side\_filter\_optimization

```
DDS_Boolean DDS_ExpressionProperty::writer_side_filter_optimization
```

Indicates if the filter implementation can cache the filtering result for the provided expression.

When this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), RTI Connex will do no caching or explicit filter evaluation for the associated **DDS\_DataReader** (p. 608). Instead, it will rely on the filter implementation to provide appropriate results.

## 5.78 DDS\_FilterSampleInfo Struct Reference

Provides meta information associated with the sample.

### Data Fields

- struct **DDS\_SampleIdentity\_t related\_sample\_identity**  
*The identity of another sample related to this one.*
- struct **DDS\_GUID\_t related\_source\_guid**  
*Identifies the application logical data source that is related to the sample being written.*
- struct **DDS\_GUID\_t related\_reader\_guid**  
*Identifies a DataReader that is logically related to the sample.*

### 5.78.1 Detailed Description

Provides meta information associated with the sample.

This can be used by a content filter to perform filtering on meta data.

### 5.78.2 Field Documentation

### 5.78.2.1 related\_sample\_identity

```
struct DDS_SampleIdentity_t DDS_FilterSampleInfo::related_sample_identity
```

The identity of another sample related to this one.

The value of this field identifies another sample that is logically related to the one that is written. For example, the **DDS\_↔\_DataWriter** (p. 478) created by a Replier uses this field to associate the identity of the request sample with a reponse sample.

To specify that there is no related sample identity, use the value **DDS\_UNKNOWN\_SAMPLE\_IDENTITY** (p. 1188).

A **DDS\_DataReader** (p. 608) can inspect the related sample identity of a received sample by accessing the fields **DDS\_SampleInfo::related\_original\_publication\_virtual\_guid** (p. 1729) and **DDS\_SampleInfo::related\_original\_↔\_publication\_virtual\_sequence\_number** (p. 1730).

### 5.78.2.2 related\_source\_guid

```
struct DDS_GUID_t DDS_FilterSampleInfo::related_source_guid
```

Identifies the application logical data source that is related to the sample being written.

The `related_source_guid` can be set by using the field **DDS\_WriteParams\_t::related\_source\_guid** (p. 1837) when writing a sample using the function **FooDataWriter\_write\_w\_params** (p. 494).

### 5.78.2.3 related\_reader\_guid

```
struct DDS_GUID_t DDS_FilterSampleInfo::related_reader_guid
```

Identifies a DataReader that is logically related to the sample.

The `related_reader_guid` can be set by using the field **DDS\_WriteParams\_t::related\_reader\_guid** (p. 1838) when writing a sample using the function **FooDataWriter\_write\_w\_params** (p. 494).

## 5.79 DDS\_FloatSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Float** (p. 1006) >

### 5.79.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_Float** (p. 1006) >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_Float** (p. 1006)

**FooSeq** (p. 1845)

## 5.80 DDS\_FlowControllerProperty\_t Struct Reference

Determines the flow control characteristics of the **DDS\_FlowController** (p. 551).

### Data Fields

- **DDS\_FlowControllerSchedulingPolicy scheduling\_policy**  
*Scheduling policy.*
- struct **DDS\_FlowControllerTokenBucketProperty\_t token\_bucket**  
*Settings for the token bucket.*

### 5.80.1 Detailed Description

Determines the flow control characteristics of the **DDS\_FlowController** (p. 551).

The flow control characteristics shape the network traffic by determining how often and in what order associated asynchronous **DDS\_DataWriter** (p. 478) instances are serviced and how much data they are allowed to send.

Note that these settings apply directly to the **DDS\_FlowController** (p. 551), and do not depend on the number of **DDS\_↔\_DataWriter** (p. 478) instances the **DDS\_FlowController** (p. 551) is servicing. For instance, the specified flow rate does *not* double simply because two **DDS\_DataWriter** (p. 478) instances are waiting to write.

Entity:

**DDS\_FlowController** (p. 551)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048) for **DDS\_FlowControllerProperty\_t::scheduling\_policy** (p. 1552), **YES** (p. 1048) for **DDS\_FlowControllerProperty\_t::token\_bucket** (p. 1553). However, the special value of **DDS\_↔\_DURATION\_INFINITE** (p. 1011) as **DDS\_FlowControllerTokenBucketProperty\_t::period** (p. 1555) is strictly used to create an *on-demand* **DDS\_FlowController** (p. 551). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

### 5.80.2 Field Documentation

### 5.80.2.1 scheduling\_policy

```
DDS_FlowControllerSchedulingPolicy DDS_FlowControllerProperty_t::scheduling_policy
```

Scheduling policy.

Determines the scheduling policy for servicing the **DDS\_DataWriter** (p. 478) instances associated with the **DDS\_FlowController** (p. 551).

[default] **DDS\_EDF\_FLOW\_CONTROLLER\_SCHED\_POLICY** (p. 553)

### 5.80.2.2 token\_bucket

```
struct DDS_FlowControllerTokenBucketProperty_t DDS_FlowControllerProperty_t::token_bucket
```

Settings for the token bucket.

## 5.81 DDS\_FlowControllerTokenBucketProperty\_t Struct Reference

**DDS\_FlowController** (p. 551) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

### Data Fields

- **DDS\_Long max\_tokens**  
*Maximum number of tokens than can accumulate in the token bucket.*
- **DDS\_Long tokens\_added\_per\_period**  
*The number of tokens added to the token bucket per specified period.*
- **DDS\_Long tokens\_leaked\_per\_period**  
*The number of tokens removed from the token bucket per specified period.*
- struct **DDS\_Duration\_t period**  
*Period for adding tokens to and removing tokens from the bucket.*
- **DDS\_Long bytes\_per\_token**  
*Maximum number of bytes allowed to send for each token available.*

### 5.81.1 Detailed Description

**DDS\_FlowController** (p.551) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Asynchronously published samples are queued up and transmitted based on the token bucket flow control scheme. The token bucket contains tokens, each of which represents a number of bytes. Samples can be sent only when there are sufficient tokens in the bucket. As samples are sent, tokens are consumed. The number of tokens consumed is proportional to the size of the data being sent. Tokens are replenished on a periodic basis.

The rate at which tokens become available and other token bucket properties determine the network traffic flow.

Note that if the same sample must be sent to multiple destinations, separate tokens are required for each destination. Only when multiple samples are destined to the same destination will they be co-alesced and sent using the same token(s). In other words, each token can only contribute to a single network packet.

Entity:

**DDS\_FlowController** (p. 551)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p.1048) = **YES** (p.1048). However, the special value of **DDS\_DURATION\_INFINITE** (p.1011) as **DDS\_FlowControllerTokenBucketProperty\_t::period** (p. 1555) is strictly used to create an *on-demand* **DDS\_FlowController** (p.551). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

### 5.81.2 Field Documentation

#### 5.81.2.1 max\_tokens

**DDS\_Long** DDS\_FlowControllerTokenBucketProperty\_t::max\_tokens

Maximum number of tokens than can accumulate in the token bucket.

The number of tokens in the bucket will never exceed this value. Any excess tokens are discarded. This property value, combined with **DDS\_FlowControllerTokenBucketProperty\_t::bytes\_per\_token** (p. 1555), determines the maximum allowable data burst.

Use **DDS\_LENGTH\_UNLIMITED** (p. 1127) to allow accumulation of an unlimited amount of tokens (and therefore potentially an unlimited burst size).

[default] **DDS\_LENGTH\_UNLIMITED** (p. 1127)

[range] [1, **DDS\_LENGTH\_UNLIMITED** (p. 1127)]

### 5.81.2.2 tokens\_added\_per\_period

```
DDS_Long DDS_FlowControllerTokenBucketProperty_t::tokens_added_per_period
```

The number of tokens added to the token bucket per specified period.

**DDS\_FlowController** (p. 551) transmits data only when tokens are available. Tokens are periodically replenished. This field determines the number of tokens added to the token bucket with each periodic replenishment.

Available tokens are distributed to associated **DDS\_DataWriter** (p. 478) instances based on the **DDS\_FlowController**↔**Property\_t::scheduling\_policy** (p. 1552).

Use **DDS\_LENGTH\_UNLIMITED** (p. 1127) to add the maximum number of tokens allowed by **DDS\_FlowController**↔**TokenBucketProperty\_t::max\_tokens** (p. 1554).

[default] **DDS\_LENGTH\_UNLIMITED** (p. 1127)

[range] [1, **DDS\_LENGTH\_UNLIMITED** (p. 1127)]

### 5.81.2.3 tokens\_leaked\_per\_period

```
DDS_Long DDS_FlowControllerTokenBucketProperty_t::tokens_leaked_per_period
```

The number of tokens removed from the token bucket per specified period.

**DDS\_FlowController** (p. 551) transmits data only when tokens are available. When tokens are replenished and there are sufficient tokens to send all samples in the queue, this property determines whether any or all of the leftover tokens remain in the bucket.

Use **DDS\_LENGTH\_UNLIMITED** (p. 1127) to remove all excess tokens from the token bucket once all samples have been sent. In other words, no token accumulation is allowed. When new samples are written after tokens were purged, the earliest point in time at which they can be sent is at the next periodic replenishment.

[default] 0

[range] [0, **DDS\_LENGTH\_UNLIMITED** (p. 1127)]

### 5.81.2.4 period

```
struct DDS_Duration_t DDS_FlowControllerTokenBucketProperty_t::period
```

Period for adding tokens to and removing tokens from the bucket.

**DDS\_FlowController** (p. 551) transmits data only when tokens are available. This field determines the period by which tokens are added or removed from the token bucket.

The special value **DDS\_DURATION\_INFINITE** (p. 1011) can be used to create an *on-demand* **DDS\_FlowController** (p. 551), for which tokens are no longer replenished periodically. Instead, tokens must be added explicitly by calling **DDS\_FlowController\_trigger\_flow** (p. 556). This external trigger adds **DDS\_FlowControllerTokenBucketProperty**↔**\_t::tokens\_added\_per\_period** (p. 1554) tokens each time it is called (subject to the other property settings).

[default] 1 second

[range] [1 nanosec, 1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

### 5.81.2.5 bytes\_per\_token

**DDS\_Long** DDS\_FlowControllerTokenBucketProperty\_t::bytes\_per\_token

Maximum number of bytes allowed to send for each token available.

**DDS\_FlowController** (p. 551) transmits data only when tokens are available. This field determines the number of bytes that can actually be transmitted based on the number of tokens.

Tokens are always consumed in whole by each **DDS\_DataWriter** (p. 478). That is, in cases where **DDS\_FlowControllerTokenBucketProperty\_t::bytes\_per\_token** (p. 1555) is greater than the sample size, multiple samples may be sent to the same destination using a single token (regardless of **DDS\_FlowControllerProperty\_t::scheduling\_policy** (p. 1552)).

Where fragmentation is required, the fragment size will be **DDS\_FlowControllerTokenBucketProperty\_t::bytes\_per\_token** (p. 1555) or the minimum largest message size across all transports installed with the **DDS\_DataWriter** (p. 478), whichever is less.

Use **DDS\_LENGTH\_UNLIMITED** (p. 1127) to indicate that an unlimited number of bytes can be transmitted per token. In other words, a single token allows the recipient **DDS\_DataWriter** (p. 478) to transmit all its queued samples to a single destination. A separate token is required to send to each additional destination.

[default] **DDS\_LENGTH\_UNLIMITED** (p. 1127)

[range] [1024, **DDS\_LENGTH\_UNLIMITED** (p. 1127)]

## 5.82 DDS\_GroupDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

### Data Fields

- struct **DDS\_OctetSeq** value  
*a sequence of octets*

### 5.82.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

Entity:

**DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = YES (p. 1048)

See also

**DDS\_DomainParticipant\_get\_builtin\_subscriber** (p. 126)

### 5.82.2 Usage

The additional information is attached to a **DDS\_Publisher** (p. 436) or **DDS\_Subscriber** (p. 565). This extra data is not used by RTI Connexx itself. When a remote application discovers the **DDS\_Publisher** (p. 436) or **DDS\_Subscriber** (p. 565), it can access that information and use it for its own purposes.

Use cases for this QoS policy, as well as the **DDS\_TopicDataQosPolicy** (p. 1775) and **DDS\_UserDataQosPolicy** (p. 1820), are often application-to-application identification, authentication, authorization, and encryption purposes. For example, applications can use Group or User Data to send security certificates to each other for RSA-type security.

In combination with **DDS\_DataReaderListener** (p. 1372), **DDS\_DataWriterListener** (p. 1417) and operations such as **DDS\_DomainParticipant\_ignore\_publication** (p. 129) and **DDS\_DomainParticipant\_ignore\_subscription** (p. 130), this QoS policy can help an application to define and enforce its own security policies. For example, an application can implement matching policies similar to those of the **DDS\_PartitionQosPolicy** (p. 1627), except the decision can be made based on an application-defined policy.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

*Important:* RTI Connexx stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connexx with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS\_DomainParticipantResourceLimitsQosPolicy::publisher\_group\_data\_max\_length** (p. 1506) and **DDS\_DomainParticipantResourceLimitsQosPolicy::subscriber\_group\_data\_max\_length** (p. 1506).

### 5.82.3 Field Documentation

#### 5.82.3.1 value

```
struct DDS_OctetSeq DDS_GroupDataQosPolicy::value
```

a sequence of octets

**[default]** Empty (zero-sized)

**[range]** Octet sequence of length [0,max\_length]

## 5.83 DDS\_GUID\_t Struct Reference

Type for *GUID* (Global Unique Identifier) representation.

### Data Fields

- **DDS\_Octet value** [DDS\_GUID\_LENGTH]  
A 16 byte array containing the GUID value.

### 5.83.1 Detailed Description

Type for *GUID* (Global Unique Identifier) representation.

Represents a 128 bit GUID.

Alternative representation of **DDS\_RTSPS\_GUID\_t** (p. 1695). Memory and wire representation for this type is the same as the one for **DDS\_RTSPS\_GUID\_t** (p. 1695).

### 5.83.2 Field Documentation

#### 5.83.2.1 value

**DDS\_Octet** DDS\_GUID\_t::value [DDS\_GUID\_LENGTH]

A 16 byte array containing the GUID value.

## 5.84 DDS\_HistoryQosPolicy Struct Reference

Specifies the behavior of RTI Connex in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

### Data Fields

- **DDS\_HistoryQosPolicyKind kind**  
*Specifies the kind of history to be kept.*
- **DDS\_Long depth**  
*Specifies the number of samples per instance to be kept, when the kind is **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094).*

### 5.84.1 Detailed Description

Specifies the behavior of RTI Connex in the case where the value of a sample changes (one or more times) before it can be successfully communicated to one or more existing subscribers.

This QoS policy specifies how much data must to stored by RTI Connex for a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). It controls whether RTI Connex should deliver only the most recent value, attempt to deliver all intermediate values, or do something in between.

On the publishing side, this QoS policy controls the samples that should be maintained by the **DDS\_DataWriter** (p. 478) on behalf of existing **DDS\_DataReader** (p. 608) entities. The behavior with regards to a **DDS\_DataReader** (p. 608) entities discovered after a sample is written is controlled by the **DURABILITY** (p. 1086) policy.

On the subscribing side, this QoS policy controls the samples that should be maintained until the application "takes" them from RTI Connex.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

See also

**DDS\_ReliabilityQosPolicy** (p. 1678)

**DDS\_HistoryQosPolicy** (p. 1558)

### 5.84.2 Usage

This policy controls the behavior of RTI Connex when the value of an instance changes before it is finally communicated to **DDS\_DataReader** (p. 608) entities.

When a **DDS\_DataWriter** (p. 478) sends data, or a **DDS\_DataReader** (p. 608) receives data, the data sent or received is stored in a cache whose contents are controlled by this QoS policy. This QoS policy interacts with **DDS\_ReliabilityQosPolicy** (p. 1678) by controlling whether RTI Connex guarantees that *all* of the sent data is received (**DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094)) or if only the last N data values sent are guaranteed to be received (**DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094))—this is a reduced level of reliability.

The amount of data that is sent to new DataReaders who have configured their **DDS\_DurabilityQosPolicy** (p. 1516) to receive previously published data is controlled by **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518), not by the History QoS policy.

Note that the History QoS policy does not control the *physical* sizes of the send and receive queues. The memory allocation for the queues is controlled by the **DDS\_ResourceLimitsQosPolicy** (p. 1690).

If `kind` is **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094) (the default), then RTI Connexx will only attempt to keep the latest values of the instance and discard the older ones. In this case, the value of `depth` regulates the maximum number of values (up to and including the most current one) RTI Connexx will maintain and deliver until the samples are fully acknowledged. After `N` values have been sent or received, any new data will overwrite the oldest data in the queue. Thus the queue acts like a circular buffer of length `N`.

For keyed-data, there is different behavior on the publishing and subscribing sides associated with how invalid samples representing the disposal of or unregistration from an instance affect history.

On the publishing side, unregistering from or disposing of an instance creates an invalid sample that is accounted for in the history depth. This means that an invalid sample may replace a value that is currently being stored in the writer queue.

On the subscribing side, however, invalid samples do not count towards history depth and will not replace a value that is being stored in the reader queue.

On both the publishing and subscribing sides, there can only ever be one invalid sample per-instance and that one sample can be in different states depending on whether the instance has been disposed, unregistered, or both.

The default (and most common setting) for `depth` is 1, indicating that only the most recent value should be delivered.

If `kind` is **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094), then RTI Connexx will attempt to maintain and deliver all the values of the instance to existing subscribers. The resources that RTI Connexx can use to keep this history are limited by the settings of the **RESOURCE\_LIMITS** (p. 1126). If the limit is reached, then the behavior of RTI Connexx will depend on the **RELIABILITY** (p. 1122). If the Reliability `kind` is **DDS\_BEST\_EFFORT\_RELIABILITY\_QOS** (p. 1124), then the old values will be discarded. If Reliability `kind` is **RELIABLE**, then RTI Connexx will block the **DDS\_DataWriter** (p. 478) until it can deliver the necessary old values to all subscribers.

### 5.84.3 Consistency

This QoS policy's `depth` must be consistent with the **RESOURCE\_LIMITS** (p. 1126) `max_samples_per_instance`. For these two QoS to be consistent, they must verify that `depth <= max_samples_per_instance`.

See also

**DDS\_ResourceLimitsQosPolicy** (p. 1690)

### 5.84.4 Field Documentation

#### 5.84.4.1 `kind`

**DDS\_HistoryQosPolicyKind** `DDS_HistoryQosPolicy::kind`

Specifies the kind of history to be kept.

For DataWriters, the samples are only kept either until they are fully acknowledged by all matching DataReaders or until they are replaced or removed. Samples can be replaced or removed for a number of reasons, including but not limited to **DDS\_LifespanQosPolicy** (p. 1567) expiration, replacement because the **DDS\_HistoryQosPolicy::depth** (p. 1560) has been exceeded, or one of the **DDS\_ResourceLimitsQosPolicy** (p. 1690) settings has been exceeded.

[default] **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094)

### 5.84.4.2 depth

**DDS\_Long** DDS\_HistoryQosPolicy::depth

Specifies the number of samples per instance to be kept, when the `kind` is **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094).

If a value other than 1 (the default) is specified, it should be consistent with the settings of the **RESOURCE\_LIMITS** (p. 1126) policy. That is:

depth <= **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693)

When the `kind` is **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094), the depth has no effect. Its implied value is `infinity` (in practice limited by the settings of the **RESOURCE\_LIMITS** (p. 1126) policy).

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518), not this depth.

**[default]** 1

**[range]** [1,100 million], <= **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693)

## 5.85 DDS\_InconsistentTopicStatus Struct Reference

**DDS\_INCONSISTENT\_TOPIC\_STATUS** (p. 1031)

### Data Fields

- **DDS\_Long total\_count**

*Total cumulative count of the pairs (**DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)) whose topic names match the **DDS\_Topic** (p. 172) to which this status is attached and whose types are inconsistent according to the rules defined in **DDS\_TypeConsistencyEnforcementQosPolicy** (p. 1811).*

- **DDS\_Long total\_count\_change**

*The incremental number of inconsistent pairs (**DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)) for the **DDS\_Topic** (p. 172) to which this status is attached, that have been discovered since the last time this status was read.*

### 5.85.1 Detailed Description

**DDS\_INCONSISTENT\_TOPIC\_STATUS** (p. 1031)

Entity:

**DDS\_Topic** (p. 172)

Listener:

**DDS\_TopicListener** (p. 1777)

Every time a **DDS\_DataReader** (p. 608) and **DDS\_DataWriter** (p. 478) with the same **DDS\_Topic** (p. 172) do not match because the type-consistency enforcement policy fails, the inconsistent topic status is updated for the **DDS\_Topic** (p. 172).

See also

**DDS\_TypeConsistencyEnforcementQosPolicy** (p. 1811)

## 5.85.2 Field Documentation

### 5.85.2.1 total\_count

`DDS_Long DDS_InconsistentTopicStatus::total_count`

Total cumulative count of the pairs (**DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)) whose topic names match the **DDS\_Topic** (p. 172) to which this status is attached and whose types are inconsistent according to the rules defined in **DDS\_TypeConsistencyEnforcementQosPolicy** (p. 1811).

### 5.85.2.2 total\_count\_change

`DDS_Long DDS_InconsistentTopicStatus::total_count_change`

The incremental number of inconsistent pairs (**DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)) for the **DDS\_Topic** (p. 172) to which this status is attached, that have been discovered since the last time this status was read.

## 5.86 DDS\_InstanceHandleSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_InstanceHandle\_t** (p. 210) > .

### 5.86.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_InstanceHandle\_t** (p. 210) > .

## 5.88 DDS\_InvalidLocalIdentityAdvanceNoticeStatus Struct Reference

`DDS_INVALID_LOCAL_IDENTITY_ADVANCE_NOTICE_STATUS` (p. 1035)

### Data Fields

- struct `DDS_Time_t expiration_time`  
*The time when the local identity will expire.*

### 5.88.1 Detailed Description

`DDS_INVALID_LOCAL_IDENTITY_ADVANCE_NOTICE_STATUS` (p. 1035)

Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

### 5.88.2 Field Documentation

#### 5.88.2.1 `expiration_time`

```
struct DDS_Time_t DDS_InvalidLocalIdentityAdvanceNoticeStatus::expiration_time
```

The time when the local identity will expire.

## 5.89 DDS\_KeyedOctets Struct Reference

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

### Data Fields

- char \* **key**  
*Instance key associated with the specified value.*
- int **length**  
*Number of octets to serialize.*
- unsigned char \* **value**  
*DDS\_Octets (p. 1606) array value.*

### 5.89.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

## 5.90 DDS\_KeyedOctetsSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_KeyedOctets** (p. 1564) >.

## 5.95 DDS\_LatencyBudgetQosPolicy Struct Reference

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

### Data Fields

- struct **DDS\_Duration\_t** **duration**  
*Duration of the maximum acceptable delay.*

### 5.95.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

This policy is a *hint* to a DDS implementation; it can be used to change how it processes and sends data that has low latency requirements. The DDS specification does not mandate whether or how this policy is used.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_↔  
STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES  
**Changeable** (p. 1048) = **YES** (p. 1048)

See also

**DDS\_PublishModeQosPolicy** (p. 1664)  
**DDS\_FlowController** (p. 551)

### 5.95.2 Usage

This policy provides a means for the application to indicate to the middleware the urgency of the data communication. By having a non-zero `duration`, RTI Connext can optimize its internal operation.

RTI Connext uses it in conjunction with **DDS\_ASYNCHRONOUS\_PUBLISH\_MODE\_QOS** (p. 1120) **DDS\_Data↔  
Writer** (p. 478) instances associated with a **DDS\_EDF\_FLOW\_CONTROLLER\_SCHED\_POLICY** (p. 553) **DDS\_Flow↔  
Controller** (p. 551) only. Together with the time of write, **DDS\_LatencyBudgetQosPolicy::duration** (p. 1567) determines the deadline of each individual sample. RTI Connext uses this information to prioritize the sending of asynchronously published data; see **DDS\_AsynchronousPublisherQosPolicy** (p. 1323).

### 5.95.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered duration*  $\leq$  *requested duration* evaluates to 'TRUE'.

### 5.95.4 Field Documentation

#### 5.95.4.1 duration

```
struct DDS_Duration_t DDS_LatencyBudgetQosPolicy::duration
```

Duration of the maximum acceptable delay.

**[default]** 0 (meaning minimize the delay)

## 5.96 DDS\_LifespanQosPolicy Struct Reference

Specifies how long the data written by the **DDS\_DataWriter** (p. 478) is considered valid.

### Data Fields

- struct **DDS\_Duration\_t** **duration**  
*Maximum duration for the data's validity.*

### 5.96.1 Detailed Description

Specifies how long the data written by the **DDS\_DataWriter** (p. 478) is considered valid.

Each data sample written by the **DDS\_DataWriter** (p. 478) has an associated expiration time beyond which the data should not be delivered to any application. Once the sample expires, the data will be removed from the **DDS\_DataReader** (p. 608) caches as well as from the transient and persistent information caches.

The expiration time of each sample from the **DDS\_DataWriter** (p. 478)'s cache is computed by adding the duration specified by this QoS policy to the time when the sample is added to the **DDS\_DataWriter** (p. 478)'s cache. This timestamp is not necessarily equal to the sample's source timestamp that can be provided by the user using the **FooDataWriter\_write\_w\_timestamp** (p. 493) or **FooDataWriter\_write\_w\_params** (p. 494) API.

The expiration time of each sample from the **DDS\_DataReader** (p. 608)'s cache is computed by adding the duration to the reception timestamp.

See also

**FooDataWriter\_write** (p. 489)

**FooDataWriter\_write\_w\_timestamp** (p. 493)

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **YES** (p. 1048)

## 5.96.2 Usage

The Lifespan QoS policy can be used to control how much data is stored by RTI Connext. Even if it is configured to store "all" of the data sent or received for a topic (see **DDS\_HistoryQoSPolicy** (p. 1558)), the total amount of data it stores may be limited by this QoS policy.

You may also use this QoS policy to ensure that applications do not receive or act on data, commands or messages that are too old and have 'expired.'

To avoid inconsistencies, multiple writers of the same instance should have the same lifespan.

See also

**DDS\_SampleInfo::source\_timestamp** (p. 1725)

**DDS\_SampleInfo::reception\_timestamp** (p. 1728)

## 5.96.3 Field Documentation

### 5.96.3.1 duration

```
struct DDS_Duration_t DDS_LifespanQoSPolicy::duration
```

Maximum duration for the data's validity.

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011)

**[range]** [1 nanosec, 1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

## 5.97 DDS\_Listener Struct Reference

<<*interface*>> (p. 818) Abstract base class for all Listener interfaces.

### Data Fields

- void \* **listener\_data**

*A place for listener implementors to keep a pointer to data that may be needed by their listener.*

### 5.97.1 Detailed Description

Status:

**Status Kinds** (p. 1025)

All the supported kinds of concrete **DDS\_Listener** (p. 1569) interfaces (one per concrete **DDS\_Entity** (p. 1160) type) derive from this root and add functions whose prototype depends on the concrete Listener.

Listeners provide a way for RTI Connex to asynchronously alert the application when there are relevant status changes.

Almost every application will have to implement listener interfaces.

Each dedicated listener presents a list of operations that correspond to the relevant communication status changes to which an application may respond.

The same **DDS\_Listener** (p. 1569) instance may be shared among multiple entities if you so desire. Consequently, the provided parameter contains a reference to the concerned **DDS\_Entity** (p. 1160).

### 5.97.2 Access to Plain Communication Status

The general mapping between the plain communication statuses (see **Status Kinds** (p. 1025)) and the listeners' operations is as follows:

- For each communication status, there is a corresponding operation whose name is `on_<communication_status>()`, which takes a parameter of type `<communication_status>` as listed in **Status Kinds** (p. 1025).
- `on_<communication_status>` is available on the relevant **DDS\_Entity** (p. 1160) as well as those that embed it, as expressed in the following figure:

listener processing. The most *specific* relevant enabled listener is called."

- When the application attaches a listener on an entity, it must set a mask. The mask indicates to RTI Connex which operations are enabled within the listener (cf. operation **DDS\_Entity** (p. 1160) `set_listener()` ).
- When a plain communication status changes, RTI Connex triggers the most specific relevant listener operation that is enabled. In case the most specific relevant listener operation corresponds to an application-installed 'nil' listener the operation will be considered handled by a NO-OP operation that does not reset the communication status.

This behavior allows the application to set a default behavior (e.g., in the listener associated with the **DDS\_DomainParticipant** (p. 72)) and to set dedicated behaviors only where needed.

### 5.97.3 Access to Read Communication Status

The two statuses related to data arrival are treated slightly differently. Since they constitute the core purpose of the Data Distribution Service, there is no need to provide a default mechanism (as is done for the plain communication statuses above).

The rule is as follows. Each time the read communication status changes:

- First, RTI Connex tries to trigger the **DDS\_SubscriberListener::on\_data\_on\_readers** (p. 1745) with a parameter of the related **DDS\_Subscriber** (p. 565);
- If this does not succeed (there is no listener or the operation is not enabled), RTI Connex tries to trigger **DDS\_DataReaderListener::on\_data\_available** (p. 1374) on all the related **DDS\_DataReaderListener** (p. 1372) objects, with a parameter of the related **DDS\_DataReader** (p. 608).

The rationale is that either the application is interested in relations among data arrivals and it must use the first option (and then get the corresponding **DDS\_DataReader** (p. 608) objects by calling **DDS\_Subscriber\_get\_datareaders** (p. 581) on the related **DDS\_Subscriber** (p. 565) and then get the data by calling **FooDataReader\_read** (p. 618) or **FooDataReader\_take** (p. 619) on the returned **DDS\_DataReader** (p. 608) objects), or it wants to treat each **DDS\_DataReader** (p. 608) independently and it may choose the second option (and then get the data by calling **FooDataReader\_read** (p. 618) or **FooDataReader\_take** (p. 619) on the related **DDS\_DataReader** (p. 608)).

Note that if **DDS\_SubscriberListener::on\_data\_on\_readers** (p. 1745) is called, RTI Connex will *not* try to call **DDS\_DataReaderListener::on\_data\_available** (p. 1374). However, an application can force a call to the **DDS\_DataReader** (p. 608) objects that have data by calling **DDS\_Subscriber\_notify\_datareaders** (p. 583).

### 5.97.4 Operations Allowed in Listener Callbacks

See `Restricted Operations in Listener Callbacks`, in the Core Libraries User's Manual.

### 5.97.5 Best Practices with Listeners

Note that all the issues described below are avoided by using `DDS_WaitSet` (p. 1170).

#### Avoid blocking or performing a lot of processing in Listener callbacks

Listeners are invoked by internal threads that perform critical functions within the middleware and need to run in a timely manner. By default, Connex DDS creates a few threads to use to receive data and only a single thread to handle periodic events.

Because of this, user applications installing Listeners should never block in a Listener callback. There are several negative consequences of blocking in a listener callback:

- The application may lose data for the `DataReader` the listener is installed on, because the receive thread is not removing it from the socket buffer and it gets overwritten.
- The application may receive strictly reliable data with a delay, because the receive thread is not removing it from the socket buffer and if it gets overwritten it must be re-sent.
- The application may lose or delay data for other `DataReaders`, because by default all `DataReaders` created with the same `DomainParticipant` share the same threads.
- The application may not be notified of periodic events on time

If the application needs to make a blocking call when data is available, or when another event occurs, the application should use `DDS_WaitSet` (p. 1170).

#### Avoid taking application mutexes/semaphores in Listener callbacks

Taking application mutexes/semaphores within a Listener callback may lead to unexpected deadlock scenarios.

When a Listener callback is invoked the EA (Exclusive Area) of the Entity 'E' to which the callback applies is taken by the middleware.

If the application takes an application mutex 'M' within a critical section in which the application makes DDS calls affecting 'E', this may lead to following deadlock:

The middleware thread is within the entity EA trying to acquire the mutex 'M'. At the same time, the application thread has acquired 'M' and is blocked trying to acquire the entity EA.

#### Do not write data with a `DataWriter` within the `on_data_available` callback

Avoid writing data with a `DataWriter` within the `DDS_DataReaderListener::on_data_available()` (p. 1374) callback. If the write operation blocks because e.g. the send window is full, this will lead to a deadlock.

#### Do not call `wait_for_acknowledgements` within the `on_data_available` callback

Do not call the `DDS_DataWriter_wait_for_acknowledgments` (p. 536) within the `DDS_DataReaderListener::on_data_available()` (p. 1374) callback. This will lead to deadlock.

## 5.97.6 Field Documentation

### 5.97.6.1 listener\_data

```
void* DDS_Listener::listener_data
```

A place for listener implementors to keep a pointer to data that may be needed by their listener.

## 5.98 DDS\_LivelinessChangedStatus Struct Reference

**DDS\_LIVELINESS\_CHANGED\_STATUS** (p. 1034)

### Data Fields

- **DDS\_Long alive\_count**  
*The total count of currently alive **DDS\_DataWriter** (p. 478) entities that write the **DDS\_Topic** (p. 172) that this **DDS\_↔\_DataReader** (p. 608) reads.*
- **DDS\_Long not\_alive\_count**  
*The total count of currently not\_alive **DDS\_DataWriter** (p. 478) entities that write the **DDS\_Topic** (p. 172) that this **DDS\_↔\_DataReader** (p. 608) reads.*
- **DDS\_Long alive\_count\_change**  
*The change in the alive\_count since the last time the listener was called or the status was read.*
- **DDS\_Long not\_alive\_count\_change**  
*The change in the not\_alive\_count since the last time the listener was called or the status was read.*
- **DDS\_InstanceHandle\_t last\_publication\_handle**  
*This InstanceHandle can be used to look up which remote **DDS\_DataWriter** (p. 478) was the last to cause this Data↔Reader's status to change, using **DDS\_DataReader\_get\_matched\_publication\_data** (p. 671).*

### 5.98.1 Detailed Description

**DDS\_LIVELINESS\_CHANGED\_STATUS** (p. 1034)

The **DDS\_DataReaderListener::on\_liveliness\_changed** (p. 1374) callback may be invoked for the following reasons:

- The liveliness of any **DDS\_DataWriter** (p. 478) matching this DataReader (as defined by the **DDS\_Liveliness↔QosPolicyKind** (p. 1097) setting) is lost.
- A DataWriter's liveliness is recovered after being lost.
- A new matching DataWriter has been discovered.
- A matching DataWriter has been deleted.

- A QoS Policy has changed such that a DataWriter that matched this DataReader before no longer matches (such as a change to the **DDS\_PartitionQosPolicy** (p. 1627)). In this case, RTI Connext will no longer keep track of the DataWriter's liveliness. Furthermore, consider two scenarios:
  - DataWriter was alive when it and DataReader stopped matching: **DDS\_LivelinessChangedStatus::alive\_count** (p. 1573) will decrease (since there's one less matching alive DataWriter) and **DDS\_LivelinessChangedStatus::not\_alive\_count** (p. 1573) will remain the same (since the DataWriter is still alive).
  - DataWriter was not alive when it and DataReader stopped matching: **DDS\_LivelinessChangedStatus::alive\_count** (p. 1573) will remain the same (since the matching DataWriter was not alive) and **DDS\_LivelinessChangedStatus::not\_alive\_count** (p. 1573) will decrease (since there's one less not-alive matching DataWriter).

Note: There are several ways that a DataWriter and DataReader can become incompatible after the DataWriter has lost liveliness. For example, when the **DDS\_LivelinessQosPolicyKind** (p. 1097) is set to **DDS\_MANUAL\_BY\_PARTICIPANT\_LIVELINESS\_QOS**, it is possible that the DataWriter has not asserted its liveliness in a timely manner, and then a QoS change occurs on the DataWriter or DataReader that makes the entities incompatible.
- A QoS Policy (such as the **DDS\_PartitionQosPolicy** (p. 1627)) has changed such that a DataWriter that was unmatched with the DataReader now matches.

### Examples

**HelloWorld\_subscriber.c.**

## 5.98.2 Field Documentation

### 5.98.2.1 alive\_count

```
DDS_Long DDS_LivelinessChangedStatus::alive_count
```

The total count of currently alive **DDS\_DataWriter** (p. 478) entities that write the **DDS\_Topic** (p. 172) that this **DDS\_DataReader** (p. 608) reads.

### 5.98.2.2 not\_alive\_count

```
DDS_Long DDS_LivelinessChangedStatus::not_alive_count
```

The total count of currently not\_alive **DDS\_DataWriter** (p. 478) entities that write the **DDS\_Topic** (p. 172) that this **DDS\_DataReader** (p. 608) reads.

### 5.98.2.3 `alive_count_change`

`DDS_Long DDS_LivelinessChangedStatus::alive_count_change`

The change in the `alive_count` since the last time the listener was called or the status was read.

### 5.98.2.4 `not_alive_count_change`

`DDS_Long DDS_LivelinessChangedStatus::not_alive_count_change`

The change in the `not_alive_count` since the last time the listener was called or the status was read.

Note that a positive `not_alive_count_change` means one of the following:

- The DomainParticipant containing the matched DataWriter has lost liveliness or has been deleted.
- The matched DataWriter has lost liveliness or has been deleted.

### 5.98.2.5 `last_publication_handle`

`DDS_InstanceHandle_t DDS_LivelinessChangedStatus::last_publication_handle`

This InstanceHandle can be used to look up which remote `DDS_DataWriter` (p. 478) was the last to cause this DataReader's status to change, using `DDS_DataReader_get_matched_publication_data` (p. 671).

It's possible that the DataWriter has been purged from the discovery database. (See the "Discovery Overview" section of the `User's Manual`.) If so, the `DDS_DataReader_get_matched_publication_data` (p. 671) method will not be able to return information about the DataWriter. In this case, the only way to get information about the lost DataWriter is if you cached the information previously.

## 5.99 `DDS_LivelinessLostStatus` Struct Reference

`DDS_LIVELINESS_LOST_STATUS` (p. 1034)

### Data Fields

- `DDS_Long total_count`

*Total cumulative number of times that a previously-alive `DDS_DataWriter` (p. 478) became not alive due to a failure to actively signal its liveliness within the offered liveliness period.*

- `DDS_Long total_count_change`

*The incremental changes in `total_count` since the last time the listener was called or the status was read.*

## 5.99.1 Detailed Description

**DDS\_LIVELINESS\_LOST\_STATUS** (p. 1034)

Entity:

**DDS\_DataWriter** (p. 478)

Listener:

**DDS\_DataWriterListener** (p. 1417)

The liveliness that the **DDS\_DataWriter** (p. 478) has committed through its **DDS\_LivelinessQosPolicy** (p. 1575) was not respected; thus **DDS\_DataReader** (p. 608) entities will consider the **DDS\_DataWriter** (p. 478) as no longer "alive/active".

## 5.99.2 Field Documentation

### 5.99.2.1 total\_count

```
DDS_Long DDS_LivelinessLostStatus::total_count
```

Total cumulative number of times that a previously-alive **DDS\_DataWriter** (p. 478) became not alive due to a failure to actively signal its liveliness within the offered liveliness period.

This count does not change when an already not alive **DDS\_DataWriter** (p. 478) simply remains not alive for another liveliness period.

### 5.99.2.2 total\_count\_change

```
DDS_Long DDS_LivelinessLostStatus::total_count_change
```

The incremental changes in total\_count since the last time the listener was called or the status was read.

## 5.100 DDS\_LivelinessQosPolicy Struct Reference

Specifies and configures the mechanism that allows **DDS\_DataReader** (p. 608) entities to detect when **DDS\_DataWriter** (p. 478) entities become disconnected or "dead."

## Data Fields

- **DDS\_LivelinessQosPolicyKind kind**  
*The kind of liveliness desired.*
- struct **DDS\_Duration\_t lease\_duration**  
*The duration within which a **DDS\_DataWriter** (p. 478) must be asserted, or else it is assumed to be not alive.*
- **DDS\_Long assertions\_per\_lease\_duration**  
*The number of assertions a **DDS\_DataWriter** (p. 478) will send during a its **DDS\_LivelinessQosPolicy::lease\_duration** (p. 1578).*

### 5.100.1 Detailed Description

Specifies and configures the mechanism that allows **DDS\_DataReader** (p. 608) entities to detect when **DDS\_DataWriter** (p. 478) entities become disconnected or "dead."

The liveliness status of a **DDS\_DataWriter** (p. 478) is used to maintain instance ownership in combination with the setting of the **OWNERSHIP** (p. 1102) policy. The application is also informed via **DDS\_Listener** (p. 1569) when an **DDS\_DataWriter** (p. 478) is no longer alive.

A **DDS\_DataWriter** (p. 478) commits to signalling its liveliness at intervals not to exceed the **DDS\_LivelinessQosPolicy::lease\_duration** (p. 1578) configured on the **DDS\_DataWriter** (p. 478). The rate at which the **DDS\_DataWriter** (p. 478) will signal its liveliness is defined by **DDS\_LivelinessQosPolicy::assertions\_per\_lease\_duration** (p. 1578).

The **DDS\_DataReader** (p. 608) `lease_duration` specifies the maximum period at which matching DataWriters must have their liveliness asserted.

In addition, in the subscribing application Connex DDS uses an internal thread that wakes up at the period set by the DataReader's `lease_duration` to see if a DataWriter `lease_duration` has been violated.

**Important:** The DataReader `lease_duration` only configures how often a DataReader will check the liveliness of the matching DataWriters. The DataWriter `lease_duration` configures the period at which a DataWriter must assert its liveliness and is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

Listeners are used to notify a **DDS\_DataReader** (p. 608) of loss of liveliness and **DDS\_DataWriter** (p. 478) of violations to the liveliness contract. The `on_liveliness_lost()` callback is only called *once*, after the first time the `lease_duration` is exceeded (when the **DDS\_DataWriter** (p. 478) first loses liveliness).

This QoS policy can be used during system integration to ensure that applications have been coded to meet design specifications. It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions in response to disconnected DataWriters.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_LIVELINESS\_LOST\_STATUS** (p. 1034), **DDS\_LivelinessLostStatus** (p. 1574);  
**DDS\_LIVELINESS\_CHANGED\_STATUS** (p. 1034), **DDS\_LivelinessChangedStatus** (p. 1572);  
**DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES  
**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

## 5.100.2 Usage

This policy controls the mechanism and parameters used by RTI Connex to ensure that particular DataWriters on the network are still alive. The liveliness can also affect the ownership of a particular instance, as determined by the **OWNERSHIP** (p. 1102) policy.

This policy has several settings to support both data types that are updated periodically as well as those that are changed sporadically. It also allows customisation for different application requirements in terms of the kinds of failures that will be detected by the liveliness mechanism.

The **DDS\_AUTOMATIC\_LIVELINESS\_QOS** (p. 1098) liveliness setting is most appropriate for applications that only need to detect failures at the process-level, but not application-logic failures within a process. RTI Connex takes responsibility for renewing the leases at the required rates and thus, as long as the local process where a **DDS\_↔DomainParticipant** (p. 72) is running and the link connecting it to remote participants remains connected, the entities within the **DDS\_DomainParticipant** (p. 72) will be considered alive. This requires the lowest overhead.

The manual settings (**DDS\_MANUAL\_BY\_PARTICIPANT\_LIVELINESS\_QOS** (p. 1098), **DDS\_MANUAL\_BY\_↔TOPIC\_LIVELINESS\_QOS** (p. 1098)) require the application on the publishing side to periodically assert the liveliness before the lease expires to indicate the corresponding **DDS\_Entity** (p. 1160) is still alive. The action can be explicit by calling the **DDS\_DataWriter\_assert\_liveliness** (p. 531) operation or implicit by writing some data.

The two possible manual settings control the granularity at which the application must assert liveliness.

- The setting **DDS\_MANUAL\_BY\_PARTICIPANT\_LIVELINESS\_QOS** (p. 1098) requires only that one **DDS\_Entity** (p. 1160) within a participant is asserted to be alive to deduce all other **DDS\_Entity** (p. 1160) objects within the same **DDS\_DomainParticipant** (p. 72) are also alive.
- The setting **DDS\_MANUAL\_BY\_TOPIC\_LIVELINESS\_QOS** (p. 1098) requires that at least one instance within the **DDS\_DataWriter** (p. 478) is asserted.

Changes in **LIVELINESS** (p. 1097) must be detected by the Service with a time-granularity greater or equal to the **DDS\_↔\_LivelinessQosPolicy::lease\_duration** (p. 1578). This ensures that the value of the **DDS\_LivelinessChangedStatus** (p. 1572) is updated at least once during each *lease\_duration* and the related Listeners and **DDS\_WaitSet** (p. 1170) s are notified within a *lease\_duration* from the time the **LIVELINESS** (p. 1097) changed.

## 5.100.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered kind*  $\geq$  *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS\_LivelinessQosPolicyKind** (p. 1097) kind are considered ordered such that: **DDS\_AUTOMATIC\_↔LIVELINESS\_QOS** (p. 1098) < **DDS\_MANUAL\_BY\_PARTICIPANT\_LIVELINESS\_QOS** (p. 1098) < **DDS\_↔MANUAL\_BY\_TOPIC\_LIVELINESS\_QOS** (p. 1098).
- the inequality *offered lease\_duration*  $\leq$  *requested lease\_duration* evaluates to **DDS\_BOOLEAN\_↔\_TRUE** (p. 1004).

See also

**Relationship between registration, liveliness and ownership** (p. 1613)

## 5.100.4 Field Documentation

### 5.100.4.1 kind

```
DDS_LivelinessQosPolicyKind DDS_LivelinessQosPolicy::kind
```

The kind of liveliness desired.

**[default]** `DDS_AUTOMATIC_LIVELINESS_QOS` (p. 1098)

### 5.100.4.2 lease\_duration

```
struct DDS_Duration_t DDS_LivelinessQosPolicy::lease_duration
```

The duration within which a **DDS\_DataWriter** (p. 478) must be asserted, or else it is assumed to be not alive.

For a DataWriter, the `lease_duration` specifies a timeout by which liveliness must be asserted for the DataWriter, or the DataWriter will be considered inactive or not alive.

For a DataReader, the `lease_duration` specifies the maximum period at which the DataReader will check to see if the matching DataWriters are still alive according to the DataWriters `lease_duration` value.

**Important:** The DataWriter `lease_duration` is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

**[default]** `DDS_DURATION_INFINITE` (p. 1011)

**[range]** [0,1 year] or `DDS_DURATION_INFINITE` (p. 1011)

### 5.100.4.3 assertions\_per\_lease\_duration

```
DDS_Long DDS_LivelinessQosPolicy::assertions_per_lease_duration
```

The number of assertions a **DDS\_DataWriter** (p.478) will send during a its **DDS\_LivelinessQosPolicy::lease\_↔duration** (p. 1578).

This field only applies to a **DDS\_DataWriter** (p. 478) and is not considered during QoS compatibility checks.

The default value is 3. A higher value will make the liveliness mechanism more robust against packet losses, but it will also increase the network traffic.

**[default]** 3

**[range]** [2, 100 million]

## 5.101 DDS\_Locator\_t Struct Reference

<<*extension*>> (p. 817) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

### Data Fields

- **DDS\_Long kind**  
*The kind of locator.*
- **DDS\_UnsignedLong port**  
*the port number*
- **DDS\_Octet address [ DDS\_LOCATOR\_ADDRESS\_LENGTH\_MAX]**  
*A DDS\_LOCATOR\_ADDRESS\_LENGTH\_MAX (p. 908) octet field to hold the IP address.*

### 5.101.1 Detailed Description

<<*extension*>> (p. 817) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

### 5.101.2 Field Documentation

#### 5.101.2.1 kind

```
DDS_Long DDS_Locator_t::kind
```

The kind of locator.

If the Locator\_t kind is **DDS\_LOCATOR\_KIND\_UDPv4** (p. 914), the address contains an IPv4 address. In this case, the leading 12 octets of the **DDS\_Locator\_t::address** (p. 1579) must be zero. The last 4 octets of **DDS\_Locator\_t::address** (p. 1579) are used to store the IPv4 address.

If the Locator\_t kind is **DDS\_LOCATOR\_KIND\_UDPv6** (p. 914), the address contains an IPv6 address. IPv6 addresses typically use a shorthand hexadecimal notation that maps one-to-one to the 16 octets in the **DDS\_Locator\_t::address** (p. 1579) field.

#### 5.101.2.2 port

```
DDS_UnsignedLong DDS_Locator_t::port
```

the port number

### 5.101.2.3 address

```
DDS_Octet DDS_Locator_t::address[ DDS_LOCATOR_ADDRESS_LENGTH_MAX]
```

A `DDS_LOCATOR_ADDRESS_LENGTH_MAX` (p. 908) octet field to hold the IP address.

## 5.102 DDS\_LocatorFilter\_t Struct Reference

Specifies the configuration of an individual channel within a MultiChannel DataWriter.

### Data Fields

- struct `DDS_LocatorSeq` `locators`

*Sequence containing from one to 16 `DDS_Locator_t` (p. 1579), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.*

- char \* `filter_expression`

*A logical expression used to determine the data that will be published in the channel.*

### 5.102.1 Detailed Description

Specifies the configuration of an individual channel within a MultiChannel DataWriter.

QoS:

`DDS_LocatorFilterQosPolicy` (p. 1581)

### 5.102.2 Field Documentation

#### 5.102.2.1 locators

```
struct DDS_LocatorSeq DDS_LocatorFilter_t::locators
```

Sequence containing from one to 16 `DDS_Locator_t` (p. 1579), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

**[default]** Empty sequence.

### 5.102.2.2 filter\_expression

```
char* DDS_LocatorFilter_t::filter_expression
```

A logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

A NULL value is not allowed.

The syntax of the expression will depend on the value of **DDS\_LocatorFilterQosPolicy::filter\_name** (p. 1582)

*Important:* This value must be an allocated string with **DDS\_String\_alloc** (p. 1313) or **DDS\_String\_dup** (p. 1313). It should not be assigned to a string constant.

See also

**Queries and Filters Syntax** (p. 730)

[default] NULL (invalid value)

## 5.103 DDS\_LocatorFilterQosPolicy Struct Reference

The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS\_PublicationBuiltinTopicData** (p. 1648).

### Data Fields

- struct **DDS\_LocatorFilterSeq locator\_filters**

*A sequence of **DDS\_LocatorFilter\_t** (p. 1580). Each **DDS\_LocatorFilter\_t** (p. 1580) reports the configuration of a single channel of a MultiChannel DataWriter.*

- char \* **filter\_name**

*Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.*

### 5.103.1 Detailed Description

The QoS policy used to report the configuration of a MultiChannel DataWriter as part of **DDS\_PublicationBuiltinTopicData** (p. 1648).

Entity:

**DDS\_PublicationBuiltinTopicData** (p. 1648)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.103.2 Field Documentation

### 5.103.2.1 locator\_filters

```
struct DDS_LocatorFilterSeq DDS_LocatorFilterQosPolicy::locator_filters
```

A sequence of **DDS\_LocatorFilter\_t** (p. 1580). Each **DDS\_LocatorFilter\_t** (p. 1580) reports the configuration of a single channel of a MultiChannel DataWriter.

A sequence length of zero indicates the **DDS\_MultiChannelQosPolicy** (p. 1603) is not in use.

**[default]** Empty sequence.

### 5.103.2.2 filter\_name

```
char* DDS_LocatorFilterQosPolicy::filter_name
```

Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported: **DDS\_SQLFILTER\_NAME** (p. 160) and **DDS\_STRINGMATCHFILTER\_NAME** (p. 161).

#### Warning

This value must be assigned to either one of the predefined values (**DDS\_SQLFILTER\_NAME** (p. 160) or **DDS\_STRINGMATCHFILTER\_NAME** (p. 161)), or to an allocated string with **DDS\_String\_alloc** (p. 1313) or **DDS\_String\_dup** (p. 1313). It should not be assigned to a string constant.

**[default]** **DDS\_STRINGMATCHFILTER\_NAME** (p. 161)

## 5.104 DDS\_LocatorFilterSeq Struct Reference

Declares IDL `sequence< DDS_LocatorFilter_t (p. 1580) >`.

### 5.104.1 Detailed Description

Declares IDL `sequence< DDS_LocatorFilter_t (p. 1580) >`.

A sequence of **DDS\_LocatorFilter\_t** (p. 1580) used to report the channels' properties. If the length of the sequence is zero, the **DDS\_MultiChannelQosPolicy** (p. 1603) is not in use.

#### Instantiates:

`<<generic>>` (p. 818) **FooSeq** (p. 1845)

## 5.106 DDS\_LoggingQosPolicy Struct Reference

Configures the RTI Connex logging facility.

### Data Fields

- **NDDS\_Config\_LogVerbosity verbosity**  
*The verbositys at which RTI Connex diagnostic information is logged.*
- **NDDS\_Config\_LogCategory category**  
*Categories of logged messages.*
- **NDDS\_Config\_LogPrintFormat print\_format**  
*The format used to output RTI Connex diagnostic information.*
- char \* **output\_file**  
*Specifies the file to which log messages will be redirected to.*
- char \* **output\_file\_suffix**  
*Sets the file suffix when logging to a set of files.*
- **DDS\_Long max\_bytes\_per\_file**  
*Specifies the maximum number of bytes a single file can contain.*
- **DDS\_Long max\_files**  
*Specifies the maximum number of files to create before overwriting the previous ones.*

### 5.106.1 Detailed Description

Configures the RTI Connex logging facility.

All the properties associated with RTI Connex logging can be configured using this QoS policy. This allows you to configure logging using XML QoS Profiles. See the "Troubleshooting" chapter in the [User's Manual](#) for details.

Entity:

[DDS\\_DomainParticipantFactory](#) (p. 28)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **Changeable** (p. 1048)

## 5.106.2 Field Documentation

### 5.106.2.1 verbosity

`NDDS_Config_LogVerbosity` `DDS_LoggingQosPolicy::verbosity`

The verbosity levels at which RTI Connexx diagnostic information is logged.

**[default]** `NDDS_CONFIG_LOG_VERBOSITY_ERROR` (p. 1240)

### 5.106.2.2 category

`NDDS_Config_LogCategory` `DDS_LoggingQosPolicy::category`

Categories of logged messages.

**[default]** Logging will be enabled for all the categories.

### 5.106.2.3 print\_format

`NDDS_Config_LogPrintFormat` `DDS_LoggingQosPolicy::print_format`

The format used to output RTI Connexx diagnostic information.

**[default]** `NDDS_CONFIG_LOG_PRINT_FORMAT_DEFAULT` (p. 1243).

### 5.106.2.4 output\_file

`char* DDS_LoggingQosPolicy::output_file`

Specifies the file to which log messages will be redirected to.

If the value of `output_file` is set to `NULL`, log messages will be sent to standard output.

If `DDS_LoggingQosPolicy::max_bytes_per_file` (p. 1585) is not `DDS_LENGTH_UNLIMITED` (p. 1127), this is used as the file name prefix for a set of numbered files.

*Important:* This value must be an allocated string with `DDS_String_alloc` (p. 1313) or `DDS_String_dup` (p. 1313). It should not be assigned to a string constant.

**[default]** `NULL`

See also

`NDDS_Config_Logger_set_output_file_name` (p. 1247)

`NDDS_Config_Logger_set_output_file_set` (p. 1247)

### 5.106.2.5 output\_file\_suffix

```
char* DDS_LoggingQosPolicy::output_file_suffix
```

Sets the file suffix when logging to a set of files.

#### Note

This field only applies when `idref_LoggingQosPolicy_max_bytes_per_file` is different than **DDS\_LENGTH\_UNLIMITED** (p. 1127).

It specifies the suffix to use for the set of files used to redirect the logging output. The prefix is **DDS\_LoggingQosPolicy::output\_file** (p. 1584).

*Important:* This value must be an allocated string with **DDS\_String\_alloc** (p. 1313) or **DDS\_String\_dup** (p. 1313). It should not be assigned to a string constant.

**[default]** NULL

**[default]** No suffix

#### See also

**NDDS\_Config\_Logger\_set\_output\_file\_set** (p. 1247)

### 5.106.2.6 max\_bytes\_per\_file

```
DDS_Long DDS_LoggingQosPolicy::max_bytes_per_file
```

Specifies the maximum number of bytes a single file can contain.

When this field is different than **DDS\_LENGTH\_UNLIMITED** (p. 1127), it enables logging to separate files as they reach this size.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127) (a single file is used)

#### See also

**NDDS\_Config\_Logger\_set\_output\_file\_set** (p. 1247)

### 5.106.2.7 max\_files

`DDS_Long DDS_LoggingQosPolicy::max_files`

Specifies the maximum number of files to create before overwriting the previous ones.

#### Note

This field only applies when `idref_LoggingQosPolicy_max_bytes_per_file` is different than `DDS_LENGTH_UNLIMITED` (p. 1127).

When this field is different than `DDS_LENGTH_UNLIMITED` (p. 1127), and the number of files reaches this number, future logging messages overwrite the previously created files.

[default] `DDS_LENGTH_UNLIMITED` (p. 1127) (files aren't overwritten)

#### See also

`NDDS_Config_Logger_set_output_file_set` (p. 1247)

## 5.107 DDS\_LongDoubleSeq Struct Reference

## 5.110 DDS\_MonitoringDedicatedParticipantSettings Struct Reference

Configures the use of a dedicated **DDS\_DomainParticipant** (p. 72) to distribute the RTI Connex application telemetry data.

### Data Fields

- **DDS\_Boolean enable**  
*Enables the use of a dedicated **DDS\_DomainParticipant** (p. 72) to distribute the RTI Connex application telemetry data.*
- int **domain\_id**  
*The domain ID used in the creation of RTI Monitoring Library 2.0 **DDS\_DomainParticipant** (p. 72).*
- char \* **participant\_qos\_profile\_name**  
*The fully qualified name of the profile used to configure the **DDS\_DomainParticipant** (p. 72) that will be used to distribute telemetry data.*
- struct **DDS\_StringSeq collector\_initial\_peers**  
*Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **DDS\_MonitoringDistributionSettings::dedicated\_participant** (p. 1590).*

### 5.110.1 Detailed Description

Configures the use of a dedicated **DDS\_DomainParticipant** (p. 72) to distribute the RTI Connex application telemetry data.

### 5.110.2 Field Documentation

#### 5.110.2.1 enable

```
DDS_Boolean DDS_MonitoringDedicatedParticipantSettings::enable
```

Enables the use of a dedicated **DDS\_DomainParticipant** (p. 72) to distribute the RTI Connex application telemetry data.

Setting this value to **DDS\_BOOLEAN\_FALSE** (p. 1004) is not currently supported.

**[default]** **DDS\_BOOLEAN\_TRUE** (p. 1004)

#### 5.110.2.2 domain\_id

```
int DDS_MonitoringDedicatedParticipantSettings::domain_id
```

The domain ID used in the creation of RTI Monitoring Library 2.0 **DDS\_DomainParticipant** (p. 72).

**[default]** 2

#### 5.110.2.3 participant\_qos\_profile\_name

```
char* DDS_MonitoringDedicatedParticipantSettings::participant_qos_profile_name
```

The fully qualified name of the profile used to configure the **DDS\_DomainParticipant** (p. 72) that will be used to distribute telemetry data.

If NULL (the default value) then RTI Monitoring Library 2.0 uses **DDS\_PROFILE\_GENERIC\_MONITORING2** (p. 1207).

**[default]** NULL

### 5.110.2.4 collector\_initial\_peers

```
struct DDS_StringSeq DDS_MonitoringDedicatedParticipantSettings::collector_initial_peers
```

Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the **DDS\_MonitoringDistributionSettings::dedicated\_participant** (p. 1590).

These initial peers should correspond with the RTI Observability Collector Service with which RTI Monitoring Library 2.0 has to communicate. The `collector_initial_peers` works the same as `initial_peers` for other `DomainParticipants`, except that it allows you to easily specify the initial peer(s) for the RTI Monitoring Library 2.0 **DDS\_DomainParticipant** (p. 72), which usually has different initial peer(s) than those used by your application.

If no `collector_initial_peers` are specified, or if it is explicitly set to an empty list, the **DDS\_DiscoveryQosPolicy::initial\_peers** (p. 1480) list of **DDS\_MonitoringDedicatedParticipantSettings::participant\_qos\_profile\_name** (p. 1588) will be used as the initial peers of **DDS\_MonitoringDistributionSettings::dedicated\_participant** (p. 1590).

**[default]** An empty sequence.

See also

**DDS\_DiscoveryQosPolicy::initial\_peers** (p. 1480) for further information about initial peers.

## 5.111 DDS\_MonitoringDistributionSettings Struct Reference

Configures the distribution of telemetry data.

### Data Fields

- struct **DDS\_MonitoringDedicatedParticipantSettings** **dedicated\_participant**  
*Configures the use of a dedicated **DDS\_DomainParticipant** (p. 72) to distribute the RTI Connex application telemetry data.*
- char \* **publisher\_qos\_profile\_name**  
*The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.*
- struct **DDS\_MonitoringEventDistributionSettings** **event\_settings**  
*Configures the distribution of event metrics.*
- struct **DDS\_MonitoringPeriodicDistributionSettings** **periodic\_settings**  
*Configures the distribution of periodic metrics.*
- struct **DDS\_MonitoringLoggingDistributionSettings** **logging\_settings**  
*Configures the distribution of logging messages.*

### 5.111.1 Detailed Description

Configures the distribution of telemetry data.

## 5.111.2 Field Documentation

### 5.111.2.1 dedicated\_participant

```
struct DDS_MonitoringDedicatedParticipantSettings DDS_MonitoringDistributionSettings::dedicated↔  
_participant
```

Configures the use of a dedicated **DDS\_DomainParticipant** (p. 72) to distribute the RTI Connex application telemetry data.

### 5.111.2.2 publisher\_qos\_profile\_name

```
char* DDS_MonitoringDistributionSettings::publisher_qos_profile_name
```

The fully qualified name of the profile used to configure the Publishers that distribute telemetry data.

There is one Publisher for each telemetry data **DDS\_Topic** (p. 172): **RTI\_MONITORING\_PERIODIC\_TOPIC\_NAME** (p. 1233), **RTI\_MONITORING\_EVENT\_TOPIC\_NAME** (p. 1233), and **RTI\_MONITORING\_LOGGING\_TOPIC\_NAME** (p. 1233).

If NULL (the default value) then RTI Monitoring Library 2.0 uses **DDS\_PROFILE\_GENERIC\_MONITORING2** (p. 1207).

**[default]** NULL

### 5.111.2.3 event\_settings

```
struct DDS_MonitoringEventDistributionSettings DDS_MonitoringDistributionSettings::event_settings
```

Configures the distribution of event metrics.

### 5.111.2.4 periodic\_settings

```
struct DDS_MonitoringPeriodicDistributionSettings DDS_MonitoringDistributionSettings::periodic↔  
settings
```

Configures the distribution of periodic metrics.

### 5.111.2.5 logging\_settings

```
struct DDS_MonitoringLoggingDistributionSettings DDS_MonitoringDistributionSettings::logging_↔
settings
```

Configures the distribution of logging messages.

## 5.112 DDS\_MonitoringEventDistributionSettings Struct Reference

Configures the distribution of event metrics.

### Data Fields

- **DDS\_UnsignedLong concurrency\_level**  
*Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.*
- char \* **datawriter\_qos\_profile\_name**  
*The fully qualified name of the profile used to configure the **DDS\_DataWriter** (p. 478) that distributes event metrics.*
- struct **DDS\_ThreadSettings\_t thread**  
*The settings of the event metric thread.*
- struct **DDS\_Duration\_t publication\_period**  
*Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.*

### 5.112.1 Detailed Description

Configures the distribution of event metrics.

Event metrics are provided to RTI Monitoring Library 2.0 when they change.

For example, if the liveliness of a **DDS\_DataWriter** (p. 478) is lost, a matching **DDS\_DataReader** (p. 608) will push the new value of **DDS\_LivelinessChangedStatus** (p. 1572) to RTI Monitoring Library 2.0 so that the liveliness status change can be distributed.

There are three kinds of event metrics:

- **Configuration metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to QoS policies.
- **Status metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to the event statuses such as **DDS\_↔\_LivelinessChangedStatus** (p. 1572).
- **Resource metrics:** Provided to RTI Monitoring Library 2.0 when a resource (such as **DDS\_DataWriter** (p. 478)) is created or deleted.

The event metrics that will be distributed for an observable resource can be configured with **DDS\_Monitoring\_↔TelemetryData::metrics** (p. 1603).

## 5.112.2 Field Documentation

### 5.112.2.1 concurrency\_level

```
DDS_UnsignedLong DDS_MonitoringEventDistributionSettings::concurrency_level
```

Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.

With a `concurrency_level` of one, all the event metrics pushed to RTI Monitoring Library 2.0 will be stored in a single queue protected by a single mutex.

With a `concurrency_level` of 'n', RTI Monitoring Library 2.0 will create 'n' queues for event metrics, each queue protected by its own mutex. Each resource (e.g, a **DDS\_DataReader** (p. 608)) will be associated with one of the queues when the resource is registered with RTI Monitoring Library 2.0. Therefore, all the event metrics for a single resource always go to the same queue.

The event metrics for two resources associated with different event queues can be pushed in parallel. This is why a higher `concurrency_level` provides more concurrency.

The event metrics added to the event queues are processed by a single thread configured using **DDS\_MonitoringEventDistributionSettings::thread** (p. 1592).

**[default]** 5

**[range]** [1, 100]

### 5.112.2.2 datawriter\_qos\_profile\_name

```
char* DDS_MonitoringEventDistributionSettings::datawriter_qos_profile_name
```

The fully qualified name of the profile used to configure the **DDS\_DataWriter** (p. 478) that distributes event metrics.

The **DDS\_DataWriter** (p. 478) Topic is **RTI\_MONITORING\_EVENT\_TOPIC\_NAME** (p. 1233).

If NULL (the default value), then RTI Monitoring Library 2.0 uses **DDS\_PROFILE\_GENERIC\_MONITORING2** (p. 1207).

**[default]** NULL

### 5.112.2.3 thread

```
struct DDS_ThreadSettings_t DDS_MonitoringEventDistributionSettings::thread
```

The settings of the event metric thread.

The event metric thread periodically publishes the event metrics pushed into RTI Monitoring Library 2.0 event metric queues after they change their values.

The thread runs at the period configured using **DDS\_MonitoringEventDistributionSettings::publication\_period** (p. 1592).

**[default]** DDS\_THREAD\_SETTINGS\_DEFAULT

#### 5.112.2.4 publication\_period

```
struct DDS_Duration_t DDS_MonitoringEventDistributionSettings::publication_period
```

Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.

With a period of 0 seconds, changes to event metrics will be published immediately after they are pushed into RTI Monitoring Library 2.0.

**[default]** 1 second

## 5.113 DDS\_MonitoringLoggingDistributionSettings Struct Reference

Configures the distribution of log messages.

### Data Fields

- **DDS\_UnsignedLong concurrency\_level**  
*Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.*
- **DDS\_UnsignedLong max\_historical\_logs**  
*The number of log messages that RTI Monitoring Library 2.0 will keep as history.*
- char \* **datawriter\_qos\_profile\_name**  
*The fully qualified name of the profile used to configure the **DDS\_DataWriter** (p. 478) that distributes log messages.*
- struct **DDS\_ThreadSettings\_t thread**  
*The settings of the logging thread.*
- struct **DDS\_Duration\_t publication\_period**  
*Period at which the logging thread publishes log messages.*

### 5.113.1 Detailed Description

Configures the distribution of log messages.

Log messages are pushed into RTI Monitoring Library 2.0 and published by the logging thread.

The logging thread only publishes a log message with a Syslog level smaller than or equal to the forwarding level of the **NDDS\_Config\_LogFacility** (p. 1243) associated with the log message.

The default value of the forwarding level for all facilities is **NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_WARNING** (p. 1245). This value can be changed with the **DDS\_MonitoringTelemetryData::logs** (p. 1603) QoS Policy or by sending a command to RTI Monitoring Library 2.0.

In this release, commands can only be sent from the RTI Observability Dashboards.

RTI Monitoring Library 2.0 can be configured to keep a history of log messages for later distribution when a log snapshot is requested by a RTI Observability Collector Service.

The log messages maintained in the history are the last 'n' messages published by the logging thread (where 'n' is the value of **DDS\_MonitoringLoggingDistributionSettings::max\_historical\_logs** (p. 1594)).

## 5.113.2 Field Documentation

### 5.113.2.1 concurrency\_level

```
DDS_UnsignedLong DDS_MonitoringLoggingDistributionSettings::concurrency_level
```

Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.

With a `concurrency_level` of one, all the log messages pushed to RTI Monitoring Library 2.0 will be stored into a single queue protected by a single mutex.

With a `concurrency_level` of 'n', RTI Monitoring Library 2.0 will create 'n' queues for log messages, each queue protected by its own mutex.

The log messages generated by a single thread will always be pushed to the same queue. The log messages for two threads associated with different log queues can be pushed in parallel. This is why a higher `concurrency_level` provides more concurrency.

The log messages added to the log queues are processed and published by a single thread configured using `DDS_MonitoringLoggingDistributionSettings::thread` (p. 1594).

**[default]** 5

**[range]** [1, 100]

### 5.113.2.2 max\_historical\_logs

```
DDS_UnsignedLong DDS_MonitoringLoggingDistributionSettings::max_historical_logs
```

The number of log messages that RTI Monitoring Library 2.0 will keep as history.

RTI Monitoring Library 2.0 will keep as history the last `max_historical_logs` published messages.

A value of 0 means that RTI Monitoring Library 2.0 should not keep any history.

**[default]** 128

### 5.113.2.3 datawriter\_qos\_profile\_name

```
char* DDS_MonitoringLoggingDistributionSettings::datawriter_qos_profile_name
```

The fully qualified name of the profile used to configure the `DDS_DataWriter` (p. 478) that distributes log messages.

The `DDS_DataWriter` (p. 478) Topic is `RTI_MONITORING_LOGGING_TOPIC_NAME` (p. 1233).

If NULL (the default value), then RTI Monitoring Library 2.0 uses `DDS_PROFILE_GENERIC_MONITORING2` (p. 1207).

**[default]** NULL

### 5.113.2.4 thread

```
struct DDS_ThreadSettings_t DDS_MonitoringLoggingDistributionSettings::thread
```

The settings of the logging thread.

The logging thread periodically publishes the log messages pushed into RTI Monitoring Library 2.0 log message queues after they are generated.

The thread runs at the period configured using **DDS\_MonitoringLoggingDistributionSettings::publication\_period** (p. 1595).

**[default]** DDS\_THREAD\_SETTINGS\_DEFAULT

### 5.113.2.5 publication\_period

```
struct DDS_Duration_t DDS_MonitoringLoggingDistributionSettings::publication_period
```

Period at which the logging thread publishes log messages.

With a period of 0 seconds, log messages will be published immediately after they are pushed into RTI Monitoring Library 2.0.

**[default]** 1 second

## 5.114 DDS\_MonitoringLoggingForwardingSettings Struct Reference

Configures the forwarding levels of log messages for the different **NDDS\_Config\_LogFacility** (p. 1243).

### Data Fields

- **NDDS\_Config\_SyslogVerbosity middleware\_forwarding\_level**  
*Log messages with **NDDS\_CONFIG\_LOG\_FACILITY\_MIDDLEWARE** (p. 1244) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **NDDS\_Config\_SyslogVerbosity security\_event\_forwarding\_level**  
*Log messages with **NDDS\_CONFIG\_LOG\_FACILITY\_SECURITY\_EVENT** (p. 1244) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **NDDS\_Config\_SyslogVerbosity service\_forwarding\_level**  
*Log messages with **NDDS\_CONFIG\_LOG\_FACILITY\_SERVICE** (p. 1244) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **NDDS\_Config\_SyslogVerbosity user\_forwarding\_level**  
*Log messages with **NDDS\_CONFIG\_LOG\_FACILITY\_USER** (p. 1243) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*

### 5.114.1 Detailed Description

Configures the forwarding levels of log messages for the different **NDDS\_Config\_LogFacility** (p. 1243).

### 5.114.2 Field Documentation

#### 5.114.2.1 middleware\_forwarding\_level

**NDDS\_Config\_SyslogVerbosity** `DDS_MonitoringLoggingForwardingSettings::middleware_forwarding_level`

Log messages with **NDDS\_CONFIG\_LOG\_FACILITY\_MIDDLEWARE** (p. 1244) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[default] **NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_WARNING** (p. 1245)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **NDDS\_CONFIG\_LOG\_VERBOSITY\_WARNING** (p. 1240), may affect performance due to the large amount of messages produced.

#### 5.114.2.2 security\_event\_forwarding\_level

**NDDS\_Config\_SyslogVerbosity** `DDS_MonitoringLoggingForwardingSettings::security_event_forwarding_level`

Log messages with **NDDS\_CONFIG\_LOG\_FACILITY\_SECURITY\_EVENT** (p. 1244) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[default] **NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_WARNING** (p. 1245)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **NDDS\_CONFIG\_LOG\_VERBOSITY\_WARNING** (p. 1240), may affect performance due to the large amount of messages produced.

#### 5.114.2.3 service\_forwarding\_level

**NDDS\_Config\_SyslogVerbosity** `DDS_MonitoringLoggingForwardingSettings::service_forwarding_level`

Log messages with **NDDS\_CONFIG\_LOG\_FACILITY\_SERVICE** (p. 1244) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[default] **NDDS\_CONFIG\_SYSLOG\_VERBOSITY\_WARNING** (p. 1245)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **NDDS\_CONFIG\_LOG\_VERBOSITY\_WARNING** (p. 1240), may affect performance due to the large amount of messages produced.

#### 5.114.2.4 user\_forwarding\_level

`NDDS_Config_SyslogVerbosity DDS_MonitoringLoggingForwardingSettings::user_forwarding_level`

Log messages with `NDDS_CONFIG_LOG_FACILITY_USER` (p. 1243) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

[default] `NDDS_CONFIG_SYSLOG_VERBOSITY_WARNING` (p. 1245)

Keep in mind that setting this property beyond `WARNING` if your application's verbosity is greater than `NDDS_CONFIG_LOG_VERBOSITY_WARNING` (p. 1240), may affect performance due to the large amount of messages produced.

## 5.115 DDS\_MonitoringMetricSelection Struct Reference

This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.

### Data Fields

- char \* **resource\_selection**

*An expression pattern that selects a subset of resources by matching the pattern to the resource names. `DDS_MonitoringMetricSelection::enabled_metrics_selection` (p. 1598) and `DDS_MonitoringMetricSelection::disabled_metrics_selection` (p. 1598) are applied to this subset of resources.*

- struct **DDS\_StringSeq enabled\_metrics\_selection**

*A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by `DDS_MonitoringMetricSelection::resource_selection` (p. 1597).*

- struct **DDS\_StringSeq disabled\_metrics\_selection**

*A sequence of POSIX fnmatch patterns that match the names of the metrics that should not be collected and distributed for the observable resources selected by `DDS_MonitoringMetricSelection::resource_selection` (p. 1597).*

### 5.115.1 Detailed Description

This data structure is used to configure event and periodic metrics collection and distribution for a specific set of observable resources.

### 5.115.2 Field Documentation

### 5.115.2.1 resource\_selection

```
char* DDS_MonitoringMetricSelection::resource_selection
```

An expression pattern that selects a subset of resources by matching the pattern to the resource names. **DDS\_MonitoringMetricSelection::enabled\_metrics\_selection** (p. 1598) and **DDS\_MonitoringMetricSelection::disabled\_metrics\_selection** (p. 1598) are applied to this subset of resources.

Examples of resource expression patterns:

- /applications/myApp/domain\_participants/myParticipant
- /applications/\*/domain\_participants/\*/subscribers/\*
- /applications/myApp/domain\_participants/GUID(1234.5678.4321.8765)
- //myEntity

The first expression refers to a DomainParticipant named "myParticipant" that belongs to an application named "myApp". The second expression applies to all the Subscribers in the system (resource name wildcards follow the POSIX fnmatch syntax). The third expression refers to a DomainParticipant with a specific resource GUID in the "myApp" application. The last expression uses the XPath "/" operator. It matches observable resources named "myEntity" no matter where they are located in the resource hierarchy.

See the Telemetry Data / Resources chapter of the RTI Connex Observability Framework documentation for further information on the observable resource names and expression patterns.

### 5.115.2.2 enabled\_metrics\_selection

```
struct DDS_StringSeq DDS_MonitoringMetricSelection::enabled_metrics_selection
```

A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **DDS\_MonitoringMetricSelection::resource\_selection** (p. 1597).

This sequence is evaluated first, followed by **DDS\_MonitoringMetricSelection::disabled\_metrics\_selection** (p. 1598). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds\_data\_writer\_qos\_durability\_writer\_depth
- dds\_data\_reader\_qos\_reliability\_\*
- dds\_application\_\*

The first pattern refers to a specific DataWriter metric (**DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518)). The second pattern refers to all the DataReader **DDS\_ReliabilityQosPolicy** (p. 1678) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connex Observability Framework documentation for further information on the metric names and metric patterns.

### 5.115.2.3 disabled\_metrics\_selection

```
struct DDS_StringSeq DDS_MonitoringMetricSelection::disabled_metrics_selection
```

A sequence of POSIX fnmatch patterns that match the names of the metrics that should not be collected and distributed for the observable resources selected by **DDS\_MonitoringMetricSelection::resource\_selection** (p. 1597).

This sequence is evaluated after **DDS\_MonitoringMetricSelection::enabled\_metrics\_selection** (p. 1598). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds\_data\_writer\_qos\_durability\_writer\_depth
- dds\_data\_reader\_qos\_reliability\_\*
- dds\_application\_\*

The first pattern refers to a specific DataWriter metric (**DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518)). The second pattern refers to all the DataReader **DDS\_ReliabilityQosPolicy** (p. 1678) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connex Observability Framework documentation for further information on the metric names and metric patterns.

## 5.116 DDS\_MonitoringMetricSelectionSeq Struct Reference

Declares IDL *sequence* < **DDS\_MonitoringMetricSelection** (p. 1597) >

### 5.116.1 Detailed Description

Declares IDL *sequence* < **DDS\_MonitoringMetricSelection** (p. 1597) >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_MonitoringMetricSelection** (p. 1597)

## 5.117 DDS\_MonitoringPeriodicDistributionSettings Struct Reference

Configures the distribution of periodic metrics.

## Data Fields

- char \* **datawriter\_qos\_profile\_name**  
*The fully qualified name of the profile used to configure the **DDS\_DataWriter** (p. 478) that distributes periodic metrics.*
- struct **DDS\_ThreadSettings\_t** **thread**  
*The settings of the periodic metric thread.*
- struct **DDS\_Duration\_t** **polling\_period**  
*Period at which the periodic metric thread polls and publishes the periodic metrics.*

### 5.117.1 Detailed Description

Configures the distribution of periodic metrics.

Periodic metrics change often, and they are polled and published periodically by a thread created by RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 obtains periodic metrics by polling the current value of periodic statuses such as **DDS\_↔DataWriterProtocolStatus** (p. 1427).

The periodic metrics that will be distributed for an observable resource can be configured with **DDS\_Monitoring↔TelemetryData::metrics** (p. 1603).

### 5.117.2 Field Documentation

#### 5.117.2.1 datawriter\_qos\_profile\_name

```
char* DDS_MonitoringPeriodicDistributionSettings::datawriter_qos_profile_name
```

The fully qualified name of the profile used to configure the **DDS\_DataWriter** (p. 478) that distributes periodic metrics.

The **DDS\_DataWriter** (p. 478) Topic is **RTI\_MONITORING\_PERIODIC\_TOPIC\_NAME** (p. 1233).

If NULL (the default value), then RTI Monitoring Library 2.0 uses **DDS\_PROFILE\_GENERIC\_MONITORING2** (p. 1207).

**[default]** NULL

#### 5.117.2.2 thread

```
struct DDS_ThreadSettings_t DDS_MonitoringPeriodicDistributionSettings::thread
```

The settings of the periodic metric thread.

The periodic metric thread periodically polls and publishes periodic event metrics.

The thread runs at the period configured using **DDS\_MonitoringPeriodicDistributionSettings::polling\_period** (p. 1600).

**[default]** DDS\_THREAD\_SETTINGS\_DEFAULT

### 5.117.2.3 polling\_period

```
struct DDS_Duration_t DDS_MonitoringPeriodicDistributionSettings::polling_period
```

Period at which the periodic metric thread polls and publishes the periodic metrics.

**[default]** 5 seconds

**[range]** > 0 seconds

## 5.118 DDS\_MonitoringQosPolicy Struct Reference

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI ConnexT telemetry data.

### Data Fields

- **DDS\_Boolean enable**  
*Enables the collection and distribution of telemetry data for an RTI ConnexT application using RTI Monitoring Library 2.0.*
- char \* **application\_name**  
*The name of the resource that represents this RTI ConnexT application.*
- struct **DDS\_MonitoringDistributionSettings distribution\_settings**  
*Configures the distribution of telemetry data.*
- struct **DDS\_MonitoringTelemetryData telemetry\_data**  
*Configures the telemetry data that will be distributed.*

### 5.118.1 Detailed Description

Configures the use of RTI Monitoring Library 2.0 to collect and distribute RTI ConnexT telemetry data.

### 5.118.2 Field Documentation

#### 5.118.2.1 enable

```
DDS_Boolean DDS_MonitoringQosPolicy::enable
```

Enables the collection and distribution of telemetry data for an RTI ConnexT application using RTI Monitoring Library 2.0.

**Note:** Enabling and disabling RTI Monitoring Library 2.0 while DDS Entities are being created or deleted is not a safe operation. The entities created while RTI Monitoring Library 2.0 is being enabled may not be monitored. In that case, children entities from that entity (invisible to the library) will not be monitored either.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.118.2.2 application\_name

```
char* DDS_MonitoringQosPolicy::application_name
```

The name of the resource that represents this RTI Connex application.

When this member is set to a value other than NULL , the resource identifier representing this application will be:

```
/applications/<application_name>
```

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The application\_name should be unique across the RTI Connex system; however, RTI Monitoring Library 2.0 does not currently enforce uniqueness.

When this member is set to NULL , RTI Monitoring Library 2.0 will automatically assign a resource identifier with this format:

```
/applications/<host_name:process_id:uuid>
```

**[default]** NULL

### 5.118.2.3 distribution\_settings

```
struct DDS_MonitoringDistributionSettings DDS_MonitoringQosPolicy::distribution_settings
```

Configures the distribution of telemetry data.

### 5.118.2.4 telemetry\_data

```
struct DDS_MonitoringTelemetryData DDS_MonitoringQosPolicy::telemetry_data
```

Configures the telemetry data that will be distributed.

## 5.119 DDS\_MonitoringTelemetryData Struct Reference

Configures the telemetry data that will be distributed.

### Data Fields

- struct **DDS\_MonitoringMetricSelectionSeq** **metrics**  
*Sequence of **DDS\_MonitoringMetricSelection** (p. 1597) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.*
- struct **DDS\_MonitoringLoggingForwardingSettings** **logs**  
*DDS\_MonitoringLoggingForwardingSettings (p. 1595) containing the **NDDS\_Config\_SyslogVerbosity** (p. 1244) levels that will be forwarded for the different **NDDS\_Config\_LogFacility** (p. 1243).*

### 5.119.1 Detailed Description

Configures the telemetry data that will be distributed.

### 5.119.2 Field Documentation

#### 5.119.2.1 metrics

```
struct DDS_MonitoringMetricSelectionSeq DDS_MonitoringTelemetryData::metrics
```

Sequence of **DDS\_MonitoringMetricSelection** (p. 1597) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.

The different **DDS\_MonitoringMetricSelection** (p. 1597) in the sequence are evaluated in order.

**[default]** An empty sequence, meaning that no metrics will be collected and distributed for any observable resource.

See also

**DDS\_MonitoringEventDistributionSettings** (p. 1591) and **DDS\_MonitoringPeriodicDistributionSettings** (p. 1599) for further information on how RTI Monitoring Library 2.0 distributes **metrics** (p. 1603).

#### 5.119.2.2 logs

```
struct DDS_MonitoringLoggingForwardingSettings DDS_MonitoringTelemetryData::logs
```

**DDS\_MonitoringLoggingForwardingSettings** (p. 1595) containing the **NDDS\_Config\_SyslogVerbosity** (p. 1244) levels that will be forwarded for the different **NDDS\_Config\_LogFacility** (p. 1243).

See also

**DDS\_MonitoringLoggingDistributionSettings** (p. 1593) for further information on how RTI Monitoring Library 2.0 distributes log messages.

## 5.120 DDS\_MultiChannelQosPolicy Struct Reference

Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

## Data Fields

- struct **DDS\_ChannelSettingsSeq channels**  
*A sequence of **DDS\_ChannelSettings\_t** (p. 1344) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.*
- char \* **filter\_name**  
*Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.*

### 5.120.1 Detailed Description

Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

This QoS policy is used to partition the data published by a **DDS\_DataWriter** (p. 478) across multiple channels. A *channel* is defined by a filter expression and a sequence of multicast locators.

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.120.2 Usage

By using this QoS, a **DDS\_DataWriter** (p. 478) can be configured to send data to different multicast groups based on the content of the data. Using syntax similar to those used in Content-Based Filters, you can associate different multicast addresses with filter expressions that operate on the values of the fields within the data. When your application's code calls **FooDataWriter\_write** (p. 489), data is sent to any multicast address for which the data passes the filter.

Multi-channel DataWriters can be used to trade off network bandwidth with the unnecessary processing of unwanted data for situations where there are multiple DataReaders that are interested in different subsets of data that come from the same data stream (Topic). For example, in Financial applications, the data stream may be quotes for different stocks at an exchange. Applications usually only want to receive data (quotes) for only a subset of the stocks being traded. In tracking applications, a data stream may carry information on hundreds or thousands of objects being tracked, but again, applications may only be interested in a subset.

The problem is that the most efficient way to deliver data to multiple applications is to use multicast, so that a data value is only sent once on the network for any number of subscribers to the data. However, using multicast, an application will receive *all* of the data sent and not just the data in which it is interested, thus extra CPU time is wasted to throw away unwanted data. With this QoS, you can analyze the data-usage patterns of your applications and optimize network vs. CPU usage by partitioning the data into multiple multicast streams. While network bandwidth is still being conserved by sending data only once using multicast, most applications will only need to listen to a subset of the multicast addresses and receive a reduced amount of unwanted data.

Your system can gain more of the benefits of using multiple multicast groups if your network uses Layer 2 Ethernet switches. Layer 2 switches can be configured to only route multicast packets to those ports that have added membership to specific multicast groups. Using those switches will ensure that only the multicast packets used by applications on a node are routed to the node; all others are filtered-out by the switch.

### 5.120.3 Field Documentation

#### 5.120.3.1 channels

```
struct DDS_ChannelSettingsSeq DDS_MultiChannelQosPolicy::channels
```

A sequence of **DDS\_ChannelSettings\_t** (p. 1344) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

A sequence length of zero indicates the **DDS\_MultiChannelQosPolicy** (p. 1603) is not in use.

The sequence length cannot be greater than **DDS\_DomainParticipantResourceLimitsQosPolicy::channel\_seq\_↔ max\_length** (p. 1510).

**[default]** Empty sequence.

#### 5.120.3.2 filter\_name

```
char* DDS_MultiChannelQosPolicy::filter_name
```

Name of the filter class used to describe the filter expressions of a MultiChannel DataWriter.

The following builtin filters are supported:

- **DDS\_SQLFILTER\_NAME** (p. 160)
- **DDS\_STRINGMATCHFILTER\_NAME** (p. 161)

#### Warning

The value for this field can be one of the constants above or a string allocated with **DDS\_String\_dup()** (p. 1313) to specify your own filter. You should not assign a string literal. When you assign a new value with **DDS\_String\_↔ \_dup()** (p. 1313), first check if the current value is one of the constants above. If it is, simply replace it; if it's not, you have to release the current string and assign the new one. Here is an example of such an approach:

```
struct DDS_DataWriterQos writer_qos;
char *filter_name = NULL;
DDS_DataWriterQos_initialize(&writer_qos);
...
DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);
...
filter_name = writer_qos.multi_channel.filter_name;
if (filter_name == DDS_SQLFILTER_NAME
    || filter_name == DDS_STRINGMATCH_FILTER_NAME) {
    // Since the value was never on the heap, this won't leak memory
```

```
    filter_name = NULL;
} else {
    // This means the value is present on the heap
    DDS_String_free(filter_name);
}
// New value using DDS_String_dup() or one of the predefined constants
filter_name = DDS_String_dup("My custom filter name");
...
DDS_DataWriterQos_finalize(&writer_qos);
```

The strings allocated with **DDS\_String\_dup()** (p. 1313) are released when `writer_qos` is finalized.

More information about string handling can be found under **String Conventions** (p. 1312).

**[default] DDS\_STRINGMATCHFILTER\_NAME** (p. 161)

## 5.121 DDS\_Octets Struct Reference

Built-in type consisting of a variable-length array of opaque bytes.

### Data Fields

- int **length**  
*Number of octets to serialize.*
- unsigned char \* **value**  
*DDS\_Octets (p. 1606) array value.*

### 5.121.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes.

## 5.122 DDS\_OctetSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Octet** (p. 1005) >

### 5.122.1 Detailed Description

### 5.124.1 Detailed Description

<<*interface*>> (p. 818) **DDS\_Octets** (p. 1606) type support.

## 5.125 DDS\_OfferedDeadlineMissedStatus Struct Reference

**DDS\_OFFERED\_DEADLINE\_MISSED\_STATUS** (p. 1031)

## Data Fields

- **DDS\_Long total\_count**  
*Total cumulative count of the number of times the **DDS\_DataWriter** (p. 478) failed to write within its offered deadline.*
- **DDS\_Long total\_count\_change**  
*The incremental changes in total\_count since the last time the listener was called or the status was read.*
- **DDS\_InstanceHandle\_t last\_instance\_handle**  
*Handle to the last instance in the **DDS\_DataWriter** (p. 478) for which an offered deadline was missed.*

### 5.125.1 Detailed Description

**DDS\_OFFERED\_DEADLINE\_MISSED\_STATUS** (p. 1031)

Entity:

**DDS\_DataWriter** (p. 478)

Listener:

**DDS\_DataWriterListener** (p. 1417)

The deadline that the **DDS\_DataWriter** (p. 478) has committed through its **DDS\_DeadlineQosPolicy** (p. 1455) was not respected for a specific instance.

### 5.125.2 Field Documentation

#### 5.125.2.1 total\_count

**DDS\_Long** `DDS_OfferedDeadlineMissedStatus::total_count`

Total cumulative count of the number of times the **DDS\_DataWriter** (p. 478) failed to write within its offered deadline.

Missed deadlines accumulate; that is, each deadline period the `total_count` will be incremented by one.

#### 5.125.2.2 total\_count\_change

**DDS\_Long** `DDS_OfferedDeadlineMissedStatus::total_count_change`

The incremental changes in `total_count` since the last time the listener was called or the status was read.

### 5.125.2.3 last\_instance\_handle

`DDS_InstanceHandle_t DDS_OfferedDeadlineMissedStatus::last_instance_handle`

Handle to the last instance in the **DDS\_DataWriter** (p. 478) for which an offered deadline was missed.

## 5.126 DDS\_OfferedIncompatibleQosStatus Struct Reference

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032)

### Data Fields

- **DDS\_Long total\_count**

*Total cumulative number of times the concerned **DDS\_DataWriter** (p. 478) discovered a **DDS\_DataReader** (p. 608) for the same **DDS\_Topic** (p. 172), common partition with a requested QoS that is incompatible with that offered by the **DDS\_DataWriter** (p. 478).*

- **DDS\_Long total\_count\_change**

*The incremental changes in total\_count since the last time the listener was called or the status was read.*

- **DDS\_QosPolicyId\_t last\_policy\_id**

*The **DDS\_QosPolicyId\_t** (p. 1048) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*

- struct **DDS\_QosPolicyCountSeq policies**

*A list containing for each policy the total number of times that the concerned **DDS\_DataWriter** (p. 478) discovered a **DDS\_DataReader** (p. 608) for the same **DDS\_Topic** (p. 172) and common partition with a requested QoS that is incompatible with that offered by the **DDS\_DataWriter** (p. 478).*

### 5.126.1 Detailed Description

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032)

Entity:

**DDS\_DataWriter** (p. 478)

Listener:

**DDS\_DataWriterListener** (p. 1417)

The qos policy value was incompatible with what was requested.

### 5.126.2 Field Documentation

### 5.126.2.1 total\_count

```
DDS_Long DDS_OfferedIncompatibleQoSStatus::total_count
```

Total cumulative number of times the concerned **DDS\_DataWriter** (p. 478) discovered a **DDS\_DataReader** (p. 608) for the same **DDS\_Topic** (p. 172), common partition with a requested QoS that is incompatible with that offered by the **DDS\_DataWriter** (p. 478).

### 5.126.2.2 total\_count\_change

```
DDS_Long DDS_OfferedIncompatibleQoSStatus::total_count_change
```

The incremental changes in total\_count since the last time the listener was called or the status was read.

### 5.126.2.3 last\_policy\_id

```
DDS_QosPolicyId_t DDS_OfferedIncompatibleQoSStatus::last_policy_id
```

The **DDS\_QosPolicyId\_t** (p. 1048) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

### 5.126.2.4 policies

```
struct DDS_QosPolicyCountSeq DDS_OfferedIncompatibleQoSStatus::policies
```

A list containing for each policy the total number of times that the concerned **DDS\_DataWriter** (p. 478) discovered a **DDS\_DataReader** (p. 608) for the same **DDS\_Topic** (p. 172) and common partition with a requested QoS that is incompatible with that offered by the **DDS\_DataWriter** (p. 478).

## 5.127 DDS\_OwnershipQoSPolicy Struct Reference

Specifies whether it is allowed for multiple **DDS\_DataWriter** (p. 478) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

### Data Fields

- **DDS\_OwnershipQoSPolicyKind kind**

*The kind of ownership.*

### 5.127.1 Detailed Description

Specifies whether it is allowed for multiple **DDS\_DataWriter** (p. 478) (s) to write the same instance of the data and if so, how these modifications should be arbitrated.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_↔STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES

**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

See also

**OWNERSHIP\_STRENGTH** (p. 1103)

### 5.127.2 Usage

Along with the **OWNERSHIP\_STRENGTH** (p. 1103), this QoS policy specifies if **DDS\_DataReader** (p. 608) entities can receive updates to the same instance (identified by its key) from multiple **DDS\_DataWriter** (p. 478) entities at the same time.

There are two kinds of ownership, selected by the setting of the `kind`: SHARED and EXCLUSIVE.

#### 5.127.2.1 SHARED ownership

**DDS\_SHARED\_OWNERSHIP\_QOS** (p. 1103) indicates that RTI Connexx does not enforce unique ownership for each instance. In this case, multiple writers can update the same data type instance. The subscriber to the **DDS\_Topic** (p. 172) will be able to access modifications from all **DDS\_DataWriter** (p. 478) objects, subject to the settings of other QoS that may filter particular samples (e.g. the **TIME\_BASED\_FILTER** (p. 1129) or **HISTORY** (p. 1093) policy). In any case, there is no "filtering" of modifications made based on the identity of the **DDS\_DataWriter** (p. 478) that causes the modification.

### 5.127.2.2 EXCLUSIVE ownership

**DDS\_EXCLUSIVE\_OWNERSHIP\_QOS** (p. 1103) indicates that each instance of a data type can only be modified by one **DDS\_DataWriter** (p. 478). In other words, at any point in time, a single **DDS\_DataWriter** (p. 478) owns each instance and is the only one whose modifications will be visible to the **DDS\_DataReader** (p. 608) objects. The owner is determined by selecting the **DDS\_DataWriter** (p. 478) with the highest value of the **DDS\_OwnershipStrengthQosPolicy::value** (p. 1616) that is currently alive, as defined by the **LIVELINESS** (p. 1097) policy, and has not violated its **DEADLINE** (p. 1073) contract with regards to the data instance.

Ownership can therefore change as a result of:

- a **DDS\_DataWriter** (p. 478) in the system with a higher value of the strength that modifies the instance,
- a change in the strength value of the **DDS\_DataWriter** (p. 478) that owns the instance, and
- a change in the liveliness of the **DDS\_DataWriter** (p. 478) that owns the instance.
- a deadline with regards to the instance that is missed by the **DDS\_DataWriter** (p. 478) that owns the instance.

The behavior of the system is as if the determination was made independently by each **DDS\_DataReader** (p. 608). Each **DDS\_DataReader** (p. 608) may detect the change of ownership at a different time. It is not a requirement that at a particular point in time all the **DDS\_DataReader** (p. 608) objects for that **DDS\_Topic** (p. 172) have a consistent picture of who owns each instance.

It is also not a requirement that the **DDS\_DataWriter** (p. 478) objects are aware of whether they own a particular instance. There is no error or notification given to a **DDS\_DataWriter** (p. 478) that modifies an instance it does not currently own.

The requirements are chosen to (a) preserve the decoupling of publishers and subscriber, and (b) allow the policy to be implemented efficiently.

It is possible that multiple **DDS\_DataWriter** (p. 478) objects with the same strength modify the same instance. If this occurs RTI Connext will pick one of the **DDS\_DataWriter** (p. 478) objects as the owner. It is not specified how the owner is selected. However, the algorithm used to select the owner guarantees that all **DDS\_DataReader** (p. 608) objects will make the same choice of the particular **DDS\_DataWriter** (p. 478) that is the owner. It also guarantees that the owner remains the same until there is a change in strength, liveliness, the owner misses a deadline on the instance, or a new **DDS\_DataWriter** (p. 478) with higher same strength, or a new **DDS\_DataWriter** (p. 478) with same strength that should be deemed the owner according to the policy of the Service, modifies the instance.

Exclusive ownership is on an instance-by-instance basis. That is, a subscriber can receive values written by a lower strength **DDS\_DataWriter** (p. 478) as long as they affect instances whose values have not been set by the higher-strength **DDS\_DataWriter** (p. 478).

### 5.127.3 Compatibility

The value of the **DDS\_OwnershipQosPolicyKind** (p. 1102) offered must exactly match the one requested or else they are considered incompatible.

### 5.127.4 Relationship between registration, liveliness and ownership

The need for registering/unregistering instances stems from two use cases:

- Ownership resolution on redundant systems
- Detection of loss in topological connectivity

These two use cases also illustrate the semantic differences between the **FooDataWriter\_unregister\_instance** (p. 486) and **FooDataWriter\_dispose** (p. 495).

#### 5.127.4.1 Ownership Resolution on Redundant Systems

It is expected that users may use DDS to set up redundant systems where multiple **DDS\_DataWriter** (p. 478) entities are "capable" of writing the same instance. In this situation, the **DDS\_DataWriter** (p. 478) entities are configured such that:

- Either both are writing the instance "constantly"
- Or else they use some mechanism to classify each other as "primary" and "secondary", such that the primary is the only one writing, and the secondary monitors the primary and only writes when it detects that the primary "writer" is no longer writing.

Both cases above use the **DDS\_EXCLUSIVE\_OWNERSHIP\_QOS** (p. 1103) and arbitrate themselves by means of the **DDS\_OwnershipStrengthQosPolicy** (p. 1615). Regardless of the scheme, the desired behavior from the **DDS\_DataReader** (p. 608) point of view is that **DDS\_DataReader** (p. 608) normally receives data from the primary unless the "primary" writer stops writing, in which case the **DDS\_DataReader** (p. 608) starts to receive data from the secondary **DDS\_DataWriter** (p. 478).

This approach requires some mechanism to detect that a **DDS\_DataWriter** (p. 478) (the primary) is no longer "writing" the data as it should. There are several reasons why this may happen and all must be detected (but not necessarily distinguished):

crash The writing process is no longer running (e.g. the whole application has crashed)

connectivity loss Connectivity to the writing application has been lost (e.g. network disconnection)

application fault The application logic that was writing the data is faulty and has stopped calling **FooDataWriter\_write** (p. 489).

Arbitrating from a **DDS\_DataWriter** (p. 478) to one of a higher strength is simple and the decision can be taken autonomously by the **DDS\_DataReader** (p. 608). Switching ownership from a higher strength **DDS\_DataWriter** (p. 478) to one of a lower strength **DDS\_DataWriter** (p. 478) requires that the **DDS\_DataReader** (p. 608) can make a determination that the stronger **DDS\_DataWriter** (p. 478) is "no longer writing the instance".

**5.127.4.1.1 Case where the data is periodically updated** This determination is reasonably simple when the data is being written periodically at some rate. The **DDS\_DataWriter** (p.478) simply states its offered **DDS\_DeadlineQosPolicy** (p.1455) (maximum interval between updates) and the **DDS\_DataReader** (p.608) automatically monitors that the **DDS\_DataWriter** (p.478) indeed updates the instance at least once per **DDS\_DeadlineQosPolicy::period** (p.1456). If the deadline is missed, the **DDS\_DataReader** (p.608) considers the **DDS\_DataWriter** (p.478) "not alive" and automatically gives ownership to the next highest-strength **DDS\_DataWriter** (p.478) that *is* alive.

**5.127.4.1.2 Case where data is not periodically updated** The case where the **DDS\_DataWriter** (p.478) is not writing data periodically is also a very important use-case. Since the instance is not being updated at any fixed period, the "deadline" mechanism cannot be used to determine ownership. The liveliness solves this situation. Ownership is maintained while the **DDS\_DataWriter** (p.478) is "alive" and for the **DDS\_DataWriter** (p.478) to be alive it must fulfill its **DDS\_LivelinessQosPolicy** (p.1575) contract. The different means to renew liveliness (automatic, manual) combined by the implied renewal each time data is written handle the three conditions above [crash], [connectivity loss], and [application fault]. Note that to handle [application fault], **LIVELINESS** must be **DDS\_MANUAL\_BY\_TOPIC\_LIVELINESS\_QOS** (p.1098). The **DDS\_DataWriter** (p.478) can retain ownership by periodically writing data or else calling `assert_liveliness` if it has no data to write. Alternatively if only protection against [crash] or [connectivity loss] is desired, it is sufficient that some task on the **DDS\_DataWriter** (p.478) process periodically writes data or calls **DDS\_DomainParticipant\_assert\_liveliness** (p.133). However, this scenario requires that the **DDS\_DataReader** (p.608) knows what instances are being "written" by the **DDS\_DataWriter** (p.478). That is the only way that the **DDS\_DataReader** (p.608) deduces the ownership of specific instances from the fact that the **DDS\_DataWriter** (p.478) is still "alive". Hence the need for the **DDS\_DataWriter** (p.478) to "register" and "unregister" instances. Note that while "registration" can be done lazily the first time the **DDS\_DataWriter** (p.478) writes the instance, "unregistration," in general, cannot. Similar reasoning will lead to the fact that unregistration will also require a message to be sent to the **DDS\_DataReader** (p.608).

#### 5.127.4.2 Detection of Loss in Topological Connectivity

There are applications that are designed in such a way that their correct operation requires some minimal topological connectivity, that is, the writer needs to have a minimum number of readers or alternatively the reader must have a minimum number of writers.

A common scenario is that the application does not start doing its logic until it knows that some specific writers have the minimum configured readers (e.g the alarm monitor is up).

A *more* common scenario is that the application logic will wait until some writers appear that can provide some needed source of information (e.g. the raw sensor data that must be processed).

Furthermore, once the application is running it is a requirement that this minimal connectivity (from the source of the data) is monitored and the application informed if it is ever lost. For the case where data is being written periodically, the **DDS\_DeadlineQosPolicy** (p.1455) and the `on_deadline_missed` listener provides the notification. The case where data is not periodically updated requires the use of the **DDS\_LivelinessQosPolicy** (p.1575) in combination with `register_instance/unregister_instance` to detect whether the "connectivity" has been lost, and the notification is provided by means of **DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p.707).

In terms of the required mechanisms, the scenario is very similar to the case of maintaining ownership. In both cases, the reader needs to know whether a writer is still "managing the current value of an instance" even though it is not continually writing it and this knowledge requires the writer to keep its liveliness plus some means to know which instances the writer is currently "managing" (i.e. the registered instances).

### 5.127.4.3 Semantic Difference between unregister\_instance and dispose

**FooDataWriter\_dispose** (p. 495) is semantically different from **FooDataWriter\_unregister\_instance** (p. 486). **FooDataWriter\_dispose** (p. 495) indicates that the data instance no longer exists (e.g. a track that has disappeared, a simulation entity that has been destroyed, a record entry that has been deleted, etc.) whereas **FooDataWriter\_unregister\_instance** (p. 486) indicates that the writer is no longer taking responsibility for updating the value of the instance.

Deleting a **DDS\_DataWriter** (p. 478) is equivalent to unregistering all the instances it was writing, but is *not* the same as "disposing" all the instances.

For a **DDS\_Topic** (p. 172) with **DDS\_EXCLUSIVE\_OWNERSHIP\_QOS** (p. 1103), if the current owner of an instance *disposes* it, the readers accessing the instance will see the instance\_state as being "DISPOSED" and not see the values being written by the weaker writer (even after the stronger one has disposed the instance). This is because the **DDS\_DataWriter** (p. 478) that owns the instance is saying that the instance no longer exists (e.g. the master of the database is saying that a record has been deleted) and thus the readers should see it as such.

For a **DDS\_Topic** (p. 172) with **DDS\_EXCLUSIVE\_OWNERSHIP\_QOS** (p. 1103), if the current owner of an instance *unregisters* it, then it will relinquish ownership of the instance and thus the readers may see the value updated by another writer (which will then become the owner). This is because the owner said that it no longer will be providing values for the instance and thus another writer can take ownership and provide those values.

## 5.127.5 Field Documentation

### 5.127.5.1 kind

```
DDS_OwnershipQosPolicyKind DDS_OwnershipQosPolicy::kind
```

The kind of ownership.

[default] **DDS\_SHARED\_OWNERSHIP\_QOS** (p. 1103)

## 5.128 DDS\_OwnershipStrengthQosPolicy Struct Reference

Specifies the value of the strength used to arbitrate among multiple **DDS\_DataWriter** (p. 478) objects that attempt to modify the same instance of a data type (identified by **DDS\_Topic** (p. 172) + key).

### Data Fields

- **DDS\_Long value**

*The strength value used to arbitrate among multiple writers.*

### 5.128.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple **DDS\_DataWriter** (p. 478) objects that attempt to modify the same instance of a data type (identified by **DDS\_Topic** (p. 172) + key).

This policy only applies if the **OWNERSHIP** (p. 1102) policy is of kind **DDS\_EXCLUSIVE\_OWNERSHIP\_QOS** (p. 1103).

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **YES** (p. 1048)

The value of the **OWNERSHIP\_STRENGTH** (p. 1103) is used to determine the ownership of a data instance (identified by the key). The arbitration is performed by the **DDS\_DataReader** (p. 608).

See also

**EXCLUSIVE ownership** (p. 1612)

### 5.128.2 Field Documentation

#### 5.128.2.1 value

**DDS\_Long** `DDS_OwnershipStrengthQosPolicy::value`

The strength value used to arbitrate among multiple writers.

**[default]** 0

**[range]** [0, 1 million]

## 5.129 DDS\_ParticipantBuiltinTopicData Struct Reference

Entry created when a DomainParticipant object is discovered.

## Data Fields

- **DDS\_BuiltinTopicKey\_t key**  
*DCPS key to distinguish entries.*
- struct **DDS\_UserDataQosPolicy user\_data**  
*Policy of the corresponding DomainParticipant.*

### 5.129.1 Detailed Description

Entry created when a DomainParticipant object is discovered.

Data associated with the built-in topic **DDS\_PARTICIPANT\_TOPIC\_NAME** (p. 896). It contains QoS policies and additional information that apply to the remote **DDS\_DomainParticipant** (p. 72).

See also

**DDS\_PARTICIPANT\_TOPIC\_NAME** (p. 896)

**DDS\_ParticipantBuiltinTopicDataDataReader** (p. 896)

## 5.129.2 Field Documentation

### 5.129.2.1 key

```
DDS_BuiltinTopicKey_t DDS_ParticipantBuiltinTopicData::key
```

DCPS key to distinguish entries.

### 5.129.2.2 user\_data

```
struct DDS_UserDataQosPolicy DDS_ParticipantBuiltinTopicData::user_data
```

Policy of the corresponding DomainParticipant.

### 5.129.2.3 property

```
struct DDS_PropertyQosPolicy DDS_ParticipantBuiltinTopicData::property
```

<<*extension*>> (p. 817) Name value pair properties to be stored with DomainParticipant

### 5.129.2.4 rtps\_protocol\_version

```
DDS_ProtocolVersion_t DDS_ParticipantBuiltinTopicData::rtps_protocol_version
```

<<*extension*>> (p. 817) Version number of the RTPS wire protocol used.

### 5.129.2.5 rtps\_vendor\_id

```
struct DDS_VendorId_t DDS_ParticipantBuiltinTopicData::rtps_vendor_id
```

<<*extension*>> (p. 817) ID of vendor implementing the RTPS wire protocol.

### 5.129.2.6 dds\_builtin\_endpoints

```
DDS_UnsignedLong DDS_ParticipantBuiltinTopicData::dds_builtin_endpoints
```

<<*extension*>> (p. 817) Bitmap of builtin endpoints supported by the participant.

Each bit indicates a builtin endpoint that may be available on the participant for use in discovery.

### 5.129.2.7 default\_unicast\_locators

```
struct DDS_LocatorSeq DDS_ParticipantBuiltinTopicData::default_unicast_locators
```

<<*extension*>> (p. 817) Unicast locators used when individual entities do not specify unicast locators.

### 5.129.2.8 product\_version

```
struct DDS_ProductVersion_t DDS_ParticipantBuiltinTopicData::product_version
```

<<*extension*>> (p. 817) This is a vendor specific parameter. It gives the current version for rti-dds.

### 5.129.2.9 participant\_name

```
struct DDS_EntityNameQosPolicy DDS_ParticipantBuiltinTopicData::participant_name
```

<<*extension*>> (p. 817) The participant name and role name.

This parameter contains the name and the role name of the discovered participant.

### 5.129.2.10 domain\_id

```
DDS_DomainId_t DDS_ParticipantBuiltinTopicData::domain_id
```

<<*extension*>> (p. 817) Domain ID associated with the discovered participant.

### 5.129.2.11 transport\_info

```
struct DDS_TransportInfoSeq DDS_ParticipantBuiltinTopicData::transport_info
```

<<*extension*>> (p. 817) A sequence of **DDS\_TransportInfo\_t** (p. 1787) containing information about each of the installed transports of the discovered participant.

This parameter contains a sequence of **DDS\_TransportInfo\_t** (p. 1787) containing the `class_id` and `message_size_max` for all installed transports of the discovered participant. The maximum number of **DDS\_TransportInfo\_t** (p. 1787) that will be stored in this sequence is controlled by the Domain Participant's resource limit **DDS\_DomainParticipantResourceLimitsQosPolicy::transport\_info\_list\_max\_length** (p. 1512).

### 5.129.2.12 reachability\_lease\_duration

```
struct DDS_Duration_t DDS_ParticipantBuiltinTopicData::reachability_lease_duration
```

<<*extension*>> (p. 817) Locator reachability lease duration.

This parameter contains the value of the participant properties: **dds.domain\_participant.locator\_reachability\_lease\_duration.sec** and **dds.domain\_participant.locator\_reachability\_lease\_duration.nanosec** used to configure the locator reachability lease duration.

### 5.129.2.13 partition

```
struct DDS_PartitionQosPolicy DDS_ParticipantBuiltinTopicData::partition
```

<<*extension*>> (p. 817) PartitionQosPolicy of the participant.

### 5.129.2.14 trust\_protection\_info

```
DDS_ParticipantTrustProtectionInfo DDS_ParticipantBuiltinTopicData::trust_protection_info
```

<<*extension*>> (p. 817) Trust Plugins protection information associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata.

`trust_protection_info` contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two DomainParticipants will not match if their `trust_protection_info` is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

### 5.129.2.15 trust\_algorithm\_info

`DDS_ParticipantTrustAlgorithmInfo DDS_ParticipantBuiltinTopicData::trust_algorithm_info`

<<*extension*>> (p. 817) Trust Plugins algorithms associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata. `trust_algorithm_info` contains information about what algorithms the loaded Trust Plugins are running. Two DomainParticipants will not match if their `trust_algorithm_info` are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

### 5.129.2.16 partial\_configuration

`DDS_Boolean DDS_ParticipantBuiltinTopicData::partial_configuration`

<<*extension*>> (p. 817) Indicates whether a `DDS_ParticipantBuiltinTopicData` (p. 1616) only contains bootstrapping information.

If this is `DDS_BOOLEAN_TRUE` (p. 1004), the `DDS_ParticipantBuiltinTopicData` (p. 1616) only contains bootstrapping information. If it is `DDS_BOOLEAN_FALSE` (p. 1004), it contains both bootstrapping and configuration information. The following fields are valid when this is set to `DDS_BOOLEAN_TRUE` (p. 1004):

- `DDS_ParticipantBuiltinTopicData::key` (p. 1618)
- `DDS_ParticipantBuiltinTopicData::property` (p. 1618) (only `dds.domain_participant.domain_tag` is valid if set)
- `DDS_ParticipantBuiltinTopicData::rtps_protocol_version` (p. 1618)
- `DDS_ParticipantBuiltinTopicData::rtps_vendor_id` (p. 1618)
- `DDS_ParticipantBuiltinTopicData::product_version` (p. 1619)
- `DDS_ParticipantBuiltinTopicData::domain_id` (p. 1619)
- `DDS_ParticipantBuiltinTopicData::transport_info` (p. 1619)
- `DDS_ParticipantBuiltinTopicData::partition` (p. 1620)
- `DDS_ParticipantBuiltinTopicData::trust_protection_info` (p. 1620)
- `DDS_ParticipantBuiltinTopicData::trust_algorithm_info` (p. 1620)

All other fields are invalid.

This field will only be set to `DDS_BOOLEAN_TRUE` (p. 1004) if a participant using `DDS_DISCOVERYCONFIG_BUILTIN_SPDP2` (p. 1082) receives a bootstrap message and `DDS_DiscoveryConfigQosPolicy::ignore_default_domain_announcements` (p. 1472) is set to `DDS_BOOLEAN_FALSE` (p. 1004) (non-default).

If a participant is using `DDS_DISCOVERYCONFIG_BUILTIN_SPDP` (p. 1081), this field will always be set to `DDS_BOOLEAN_FALSE` (p. 1004).

## 5.130 DDS\_ParticipantBuiltinTopicDataSeq Struct Reference

Instantiates `FooSeq` (p. 1845) < `DDS_ParticipantBuiltinTopicData` (p. 1616) > .

### 5.130.1 Detailed Description

Instantiates `FooSeq` (p. 1845) < `DDS_ParticipantBuiltinTopicData` (p. 1616) > .

Instantiates:

<<*generic*>> (p. 818) `FooSeq` (p. 1845)

## 5.132 DDS\_ParticipantTrustAlgorithmInfo Struct Reference

Trust Plugins algorithm information associated with the discovered `DomainParticipant`.

### Data Fields

- **DDS\_ParticipantTrustSignatureAlgorithmInfo signature**  
*Information regarding algorithms for validation of data and metadata exchanged by the `DomainParticipant`.*
- **DDS\_ParticipantTrustKeyEstablishmentAlgorithmInfo key\_establishment**  
*Information regarding algorithms for transformation of data and metadata exchanged between two `DomainParticipants`.*
- **DDS\_ParticipantTrustInterceptorAlgorithmInfo interceptor**  
*Information regarding algorithms for interception of data and metadata exchanged by the `DomainParticipant`.*

### 5.132.1 Detailed Description

Trust Plugins algorithm information associated with the discovered DomainParticipant.

### 5.132.2 Field Documentation

#### 5.132.2.1 signature

`DDS_ParticipantTrustSignatureAlgorithmInfo` `DDS_ParticipantTrustAlgorithmInfo::signature`

Information regarding algorithms for validation of data and metadata exchanged by the DomainParticipant.

#### 5.132.2.2 key\_establishment

`DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo` `DDS_ParticipantTrustAlgorithmInfo::key_establishment`

Information regarding algorithms for transformation of data and metadata exchanged between two DomainParticipants.

#### 5.132.2.3 interceptor

`DDS_ParticipantTrustInterceptorAlgorithmInfo` `DDS_ParticipantTrustAlgorithmInfo::interceptor`

Information regarding algorithms for interception of data and metadata exchanged by the DomainParticipant.

## 5.133 DDS\_ParticipantTrustInterceptorAlgorithmInfo Struct Reference

Trust Plugins interception algorithm information associated with the discovered DomainParticipant.

### Data Fields

- **DDS\_TrustAlgorithmSet supported\_mask**  
*Trust Plugins algorithms supported for interception of data and metadata exchanged by the DomainParticipant.*
- **DDS\_TrustAlgorithmSet builtin\_endpoints\_required\_mask**  
*Trust Plugins algorithms used for interception of metadata exchanged by the discovery, service request, and liveliness builtin endpoints.*
- **DDS\_TrustAlgorithmSet builtin\_kx\_endpoints\_required\_mask**  
*Trust Plugins algorithms used for interception of metadata exchanged by the key exchange builtin endpoints.*
- **DDS\_TrustAlgorithmSet user\_endpoints\_default\_required\_mask**  
*Default trust plugin algorithms used for interception of data exchanged by the user endpoints. This is the algorithm that remote DomainParticipants should assume when `DDS_EndpointTrustInterceptorAlgorithmInfo` (p. 1541) is not serialized.*

### 5.133.1 Detailed Description

Trust Plugins interception algorithm information associated with the discovered DomainParticipant.

### 5.133.2 Field Documentation

#### 5.133.2.1 supported\_mask

**DDS\_TrustAlgorithmSet** DDS\_ParticipantTrustInterceptorAlgorithmInfo::supported\_mask

Trust Plugins algorithms supported for interception of data and metadata exchanged by the DomainParticipant.

#### 5.133.2.2 builtin\_endpoints\_required\_mask

**DDS\_TrustAlgorithmSet** DDS\_ParticipantTrustInterceptorAlgorithmInfo::builtin\_endpoints\_required\_↔  
mask

Trust Plugins algorithms used for interception of metadata exchanged by the discovery, service request, and liveliness builtin endpoints.

#### 5.133.2.3 builtin\_kx\_endpoints\_required\_mask

**DDS\_TrustAlgorithmSet** DDS\_ParticipantTrustInterceptorAlgorithmInfo::builtin\_kx\_endpoints\_required\_↔  
\_mask

Trust Plugins algorithms used for interception of metadata exchanged by the key exchange builtin endpoints.

#### 5.133.2.4 user\_endpoints\_default\_required\_mask

**DDS\_TrustAlgorithmSet** DDS\_ParticipantTrustInterceptorAlgorithmInfo::user\_endpoints\_default\_↔  
required\_mask

Default trust plugin algorithms used for interception of data exchanged by the user endpoints. This is the algorithm that remote DomainParticipants should assume when **DDS\_EndpointTrustInterceptorAlgorithmInfo** (p. 1541) is not serialized.

## 5.134 DDS\_ParticipantTrustKeyEstablishmentAlgorithmInfo Struct Reference

Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.

### Data Fields

- **DDS\_TrustAlgorithmRequirements shared\_secret**

*Trust Plugins key establishment algorithm requirements of the DomainParticipant in the context of deriving a shared secret.*

### 5.134.1 Detailed Description

Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.

### 5.134.2 Field Documentation

#### 5.134.2.1 shared\_secret

`DDS_TrustAlgorithmRequirements DDS_ParticipantTrustKeyEstablishmentAlgorithmInfo::shared_secret`

Trust Plugins key establishment algorithm requirements of the DomainParticipant in the context of deriving a shared secret.

Trust Plugins Protection information associated with the discovered DomainParticipant.

### Data Fields

- **DDS\_ParticipantTrustAttributesMask bitmask**

*Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.*

- **DDS\_PluginParticipantTrustAttributesMask plugin\_bitmask**

*Internal plugin information that is opaque to DDS.*

### 5.135.1 Detailed Description

Trust Plugins Protection information associated with the discovered DomainParticipant.

## 5.135.2 Field Documentation

### 5.135.2.1 bitmask

`DDS_ParticipantTrustAttributesMask` `DDS_ParticipantTrustProtectionInfo::bitmask`

Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

### 5.135.2.2 plugin\_bitmask

`DDS_PluginParticipantTrustAttributesMask` `DDS_ParticipantTrustProtectionInfo::plugin_bitmask`

Internal plugin information that is opaque to DDS.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

## 5.136 DDS\_ParticipantTrustSignatureAlgorithmInfo Struct Reference

Trust Plugins signature algorithm information associated with the discovered DomainParticipant.

### Data Fields

- **DDS\_TrustAlgorithmRequirements trust\_chain**  
*Trust Plugins signature algorithm requirements of the DomainParticipant in the context of creating a chain of trust.*
- **DDS\_TrustAlgorithmRequirements message\_auth**  
*Trust Plugins signature algorithm requirements of the DomainParticipant in the context of checking that messages are authentic.*

### 5.136.1 Detailed Description

Trust Plugins signature algorithm information associated with the discovered DomainParticipant.

## 5.136.2 Field Documentation

### 5.136.2.1 trust\_chain

**DDS\_TrustAlgorithmRequirements** DDS\_ParticipantTrustSignatureAlgorithmInfo::trust\_chain

Trust Plugins signature algorithm requirements of the DomainParticipant in the context of creating a chain of trust.

### 5.136.2.2 message\_auth

**DDS\_TrustAlgorithmRequirements** DDS\_ParticipantTrustSignatureAlgorithmInfo::message\_auth

Trust Plugins signature algorithm requirements of the DomainParticipant in the context of checking that messages are authentic.

## 5.137 DDS\_PartitionQosPolicy Struct Reference

Set of strings that introduces logical partitions in **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), or **DDS\_Subscriber** (p. 565) entities.

### Data Fields

- struct **DDS\_StringSeq** name  
*A list of partition names.*

### 5.137.1 Detailed Description

Set of strings that introduces logical partitions in **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), or **DDS\_Subscriber** (p. 565) entities.

This QoS policy is used to set string identifiers that are used for partitioning entities that would otherwise be connected to and exchange data with each other:

- A **DDS\_DataWriter** (p. 478) within a **DDS\_Publisher** (p. 436) only communicates with a **DDS\_DataReader** (p. 608) in a **DDS\_Subscriber** (p. 565) if (in addition to matching the **DDS\_Topic** (p. 172) and having compatible QoS) the **DDS\_Publisher** (p. 436) and **DDS\_Subscriber** (p. 565) have a common partition name string.
- **DDS\_DomainParticipant** (p. 72) entities (with the same domain ID and domain tag) are visible to each other only if they have at least one partition name string in common.

Entity:

**DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565), **DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = YES (p. 1048)

### 5.137.2 Usage

The Partition QoS policy provides another way to control which entities will match-and thus communicate with-which other entities. It can be used to prevent entities that would have otherwise matched from talking to each other. Much in the same way that only applications within the same DDS domain will communicate with each other, only entities that belong to the same partition can talk to each other.

The Partition QoS policy allows you to add one or more strings, "partitions", to an entity:

- A DataWriter and DataReader for the same topic are only considered matched if their Publishers and Subscribers have partitions in common (intersecting partitions).
- DomainParticipants (with the same domain ID and domain tag) are visible to each other only if they have at least one partition in common.

Since the set of partitions for an entity can be dynamically changed, the Partition QoS policy is useful for creating temporary separation groups among entities that would otherwise be connected to and exchange data with each other.

DomainParticipant partitions and Publisher/Subscriber partitions are independent of each other. You can use both features independently or in combination to provide the right level of isolation.

Failure to match partitions is not considered an incompatible QoS and does not trigger any listeners or conditions. A change in this policy *can* potentially modify the "match" of existing DataReader and DataWriter entities. It may establish new "matches" that did not exist before, or break existing matches.

Partition strings are usually directly matched via string comparisons. However, partition strings can also contain wildcard symbols so that partitions can be matched via pattern matching. As long as the partitions or wildcard patterns of an entity intersect with the partitions or wildcard patterns of otherwise matching entities, the entities match; otherwise they do not.

These partition name patterns are regular expressions as defined by the POSIX fnmatch API (1003.2-1992 section B.6). A **DDS\_DomainParticipant** (p. 72), **DDS\_Publisher** (p. 436), or **DDS\_Subscriber** (p. 565) entity may include regular expressions in partition names, but no two names that both contain wildcards will ever be considered to match. This means that although regular expressions may be used on the entities, RTI Connex will not try to match two regular expressions.

Each entity must belong to at least one logical partition. A regular expression is not considered to be a logical partition. If an entity has not specified a logical partition, it is assumed to be in the default partition. The default partition is defined to be an empty string (""). Put another way:

- An empty sequence of strings in this QoS policy is considered equivalent to a sequence containing only a single string, the empty string.
- A string sequence that contains only regular expressions and no literal strings, it is treated as if it had an additional element, the empty string.

Partitions are different from creating **DDS\_Entity** (p. 1160) objects in different domains in several ways.

- First, entities belonging to different domains are completely isolated from each other; there is no traffic, meta-traffic or any other way for an application or RTI Connex itself to see entities in a domain it does not belong to.
- Second, a **DDS\_Entity** (p. 1160) can only belong to one domain whereas a **DDS\_Entity** (p. 1160) can be in multiple partitions.
- Finally, as far as RTI Connex is concerned, each unique data instance is identified by the tuple (**DomainID**, **domain tag**, **DDS\_Topic** (p. 172), **key**). Therefore two **DDS\_Entity** (p. 1160) objects in different domains cannot refer to the same data instance. On the other hand, the same data instance can be made available (published) or requested (subscribed) on one or more partitions.

For more information, see the "PARTITION QoS Policy" section of the `Core Libraries User's Manual`.

### 5.137.3 Field Documentation

#### 5.137.3.1 name

```
struct DDS_StringSeq DDS_PartitionQosPolicy::name
```

A list of partition names.

Several restrictions apply to the partition names in this sequence. A violation of one of the following rules will result in a **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025) when setting a **DDS\_Publisher** (p. 436)'s or **DDS\_Subscriber** (p. 565)'s QoS.

- A partition name string cannot be NULL, nor can it contain the reserved comma character (',').
- The maximum number of partition name strings allowable in a **DDS\_PartitionQosPolicy** (p. 1627) is specified on a domain basis in **DDS\_DomainParticipantResourceLimitsQosPolicy::max\_partitions** (p. 1507). The length of this sequence may not be greater than that value.
- The maximum cumulative length of all partition name strings in a **DDS\_PartitionQosPolicy** (p. 1627) is specified on a domain basis in **DDS\_DomainParticipantResourceLimitsQosPolicy::max\_partition\_cumulative\_characters** (p. 1507).

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1312). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

**[default]** Empty sequence (zero-length sequence). Since no logical partition is specified, RTI Connexx will assume the entity to be in default partition (empty string partition "").

**[range]** List of partition name with above restrictions

## 5.138 DDS\_PersistentStorageSettings Struct Reference

Configures durable writer history and durable reader state.

## Data Fields

- **DDS\_Boolean enable**  
*Enables durable writer history in a **DDS\_DataWriter** (p. 478) and durable reader state in a **DDS\_DataReader** (p. 608).*
- char \* **file\_name**  
*The file name where the durable writer history or durable reader state will be stored.*
- char \* **trace\_file\_name**  
*The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.*
- **DDS\_PersistentJournalKind journal\_kind**  
*Sets the journal mode of the persistent storage.*
- **DDS\_PersistentSynchronizationKind synchronization\_kind**  
*Sets the level of synchronization with the physical disk.*
- **DDS\_Boolean vacuum**  
*Sets the auto-vacuum status of the storage.*
- **DDS\_Boolean restore**  
*Indicates if the persisted writer history or reader state must be restored.*
- struct **DDS\_AllocationSettings\_t writer\_instance\_cache\_allocation**

*Configures the resource limits associated with the sample durable writer history cache.*
- **DDS\_Boolean writer\_memory\_state**  
*Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.*
- **DDS\_UnsignedLong reader\_checkpoint\_frequency**  
*Controls how often the reader state is stored into the database.*

### 5.138.1 Detailed Description

Configures durable writer history and durable reader state.

In a **DDS\_DataWriter** (p. 478), this structure configures durable writer history. This feature allows a DataWriter to persist its historical cache, so that it can survive shutdowns, crashes, and restarts. When an application restarts, each DataWriter that has been configured to have durable writer history automatically loads all of the data in this cache from disk and can carry on sending data as if it had never stopped executing.

In a **DDS\_DataReader** (p. 608), this structure configures durable reader state. This feature allows a DataReader to persist its state and remember which data it has already received. When an application restarts, each DataReader that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the DataReader before the restart will be suppressed so that it is not even sent over the network.

RTI Connex uses SQLite to store the durable writer history and durable reader state.

QoS:

**DDS\_DurabilityQosPolicy** (p. 1516)

## 5.138.2 Field Documentation

### 5.138.2.1 enable

```
DDS_Boolean DDS_PersistentStorageSettings::enable
```

Enables durable writer history in a **DDS\_DataWriter** (p. 478) and durable reader state in a **DDS\_DataReader** (p. 608).

When this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), the persistent storage configuration using this structure will take precedence over the configuration using the deprecated **dds.data\_writer.history.odbc\_plugin.builtin.\*** and **dds.data\_reader.state.\*** properties.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.138.2.2 file\_name

```
char* DDS_PersistentStorageSettings::file_name
```

The file name where the durable writer history or durable reader state will be stored.

Setting this field to a value other than NULL is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **DDS\_PersistentStorageSettings::restore** (p. 1632) is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **DDS\_DataReaderProtocolQosPolicy::virtual\_guid** (p. 1376) and **DDS\_DataWriterProtocolQosPolicy::virtual\_guid** (p. 1423) will be set by RTI Connext based on the file content. If you change these fields, the value will be ignored.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

**[default]** NULL

### 5.138.2.3 trace\_file\_name

```
char* DDS_PersistentStorageSettings::trace_file_name
```

The file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Setting this field to a value other than NULL will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

**[default]** NULL

#### 5.138.2.4 journal\_kind

`DDS_PersistentJournalKind DDS_PersistentStorageSettings::journal_kind`

Sets the journal mode of the persistent storage.

[default] `DDS_WAL_PERSISTENT_JOURNAL` (p. 1087)

#### 5.138.2.5 synchronization\_kind

`DDS_PersistentSynchronizationKind DDS_PersistentStorageSettings::synchronization_kind`

Sets the level of synchronization with the physical disk.

[default] `DDS_NORMAL_PERSISTENT_SYNCHRONIZATION` (p. 1088)

#### 5.138.2.6 vacuum

`DDS_Boolean DDS_PersistentStorageSettings::vacuum`

Sets the auto-vacuum status of the storage.

When auto-vacuum is `DDS_BOOLEAN_TRUE` (p. 1004), the storage files will be compacted automatically with every transaction.

When auto-vacuum is `DDS_BOOLEAN_FALSE` (p. 1004), after data is deleted from the storage files, the files remain the same size.

[default] `DDS_BOOLEAN_TRUE` (p. 1004)

#### 5.138.2.7 restore

`DDS_Boolean DDS_PersistentStorageSettings::restore`

Indicates if the persisted writer history or reader state must be restored.

For a `DDS_DataWriter` (p. 478), this field indicates whether or not the persisted writer history must be restored once the `DataWriter` is restarted.

For a `DDS_DataReader` (p. 608), this field indicates whether or not the persisted reader state must be restored once the `DataReader` is restarted.

[default] `DDS_BOOLEAN_TRUE` (p. 1004)

### 5.138.2.8 writer\_instance\_cache\_allocation

```
struct DDS_AllocationSettings_t DDS_PersistentStorageSettings::writer_instance_cache_allocation
```

Configures the resource limits associated with the instance durable writer history cache.

This field only applies to **DDS\_DataWriter** (p. 478) entities.

To minimize the number of accesses to the persisted storage, RTI Connexx uses an instance cache.

Do not confuse this limit with the initial and maximum number of instances that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693) and **DDS\_ResourceLimitsQosPolicy::initial\_instances** (p. 1694).

If **DDS\_PersistentStorageSettings::writer\_memory\_state** (p. 1633) is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then the value of **DDS\_AllocationSettings\_t::max\_count** (p. 1322) is set to **DDS\_LENGTH\_UNLIMITED** (p. 1127), overwriting any value set by the user.

**DDS\_AllocationSettings\_t::incremental\_count** (p. 1322) is ignored.

[range] **DDS\_AllocationSettings\_t::max\_count** (p. 1322) in interval [1, INT\_MAX], **DDS\_LENGTH\_AUTO** (p. 1122), or **DDS\_LENGTH\_UNLIMITED** (p. 1127). **DDS\_AllocationSettings\_t::initial\_count** (p. 1322) in interval [1, INT\_MAX], or **DDS\_LENGTH\_AUTO** (p. 1122).

**DDS\_LENGTH\_AUTO** (p. 1122) means that the value will be set to the equivalent value of **DDS\_ResourceLimitsQosPolicy** (p. 1690).

[default] **DDS\_AllocationSettings\_t::max\_count** (p. 1322) = **DDS\_LENGTH\_AUTO** (p. 1122) (= **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693)) and **DDS\_AllocationSettings\_t::initial\_count** (p. 1322) = **DDS\_LENGTH\_AUTO** (p. 1122) (= **DDS\_ResourceLimitsQosPolicy::initial\_instances** (p. 1694)).

### 5.138.2.9 writer\_sample\_cache\_allocation

```
struct DDS_AllocationSettings_t DDS_PersistentStorageSettings::writer_sample_cache_allocation
```

Configures the resource limits associated with the sample durable writer history cache.

This field only applies to **DDS\_DataWriter** (p. 478) entities.

To minimize the number of accesses to the persisted storage, RTI Connexx uses a sample cache.

Do not confuse this limit with the initial and maximum number of samples that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693) and **DDS\_ResourceLimitsQosPolicy::initial\_samples** (p. 1693).

**DDS\_AllocationSettings\_t::incremental\_count** (p. 1322) is ignored.

[range] **DDS\_AllocationSettings\_t::max\_count** (p. 1322) in interval [1, INT\_MAX], **DDS\_LENGTH\_AUTO** (p. 1122), or **DDS\_LENGTH\_UNLIMITED** (p. 1127). **DDS\_AllocationSettings\_t::initial\_count** (p. 1322) in interval [1, INT\_MAX], or **DDS\_LENGTH\_AUTO** (p. 1122).

**DDS\_LENGTH\_AUTO** (p. 1122) means that the value will be set to the equivalent value of **DDS\_ResourceLimitsQosPolicy** (p. 1690).

[default] **DDS\_AllocationSettings\_t::max\_count** (p. 1322) = 32 and **DDS\_AllocationSettings\_t::initial\_count** (p. 1322) = 32.

### 5.138.2.10 `writer_memory_state`

`DDS_Boolean DDS_PersistentStorageSettings::writer_memory_state`

Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.

This field only applies to `DDS_DataWriter` (p. 478) entities.

If this field is set to `DDS_BOOLEAN_TRUE` (p. 1004), then `DDS_AllocationSettings_t::max_count` (p. 1322) in `DDS_PersistentStorageSettings::writer_instance_cache_allocation` (p. 1632) is set to `DDS_LENGTH_UNLIMITED` (p. 1127), overwriting any value set by the user.

In addition, the durable writer history will keep a fixed state overhead per sample in memory. This mode provides the best durable writer history performance. However, the restore operation will be slower, and the maximum number of samples that the durable writer history can manage is limited by the available physical memory.

If this field is set to `DDS_BOOLEAN_FALSE` (p. 1004), all the state will be kept in the underlying database. In this mode, the maximum number of samples in the durable writer history is not limited by the physical memory available.

This field is always set to `DDS_BOOLEAN_FALSE` (p. 1004) when the `DataWriter` is configured with `DDS_↔ ReliabilityQosPolicy::acknowledgment_kind` (p. 1681) set to `DDS_APPLICATION_AUTO_ACKNOWLEDGMENT_↔ _MODE` (p. 1124) or `DDS_APPLICATION_EXPLICIT_ACKNOWLEDGMENT_MODE` (p. 1125), or `DDS_Availability_↔ QosPolicy::enable_required_subscriptions` (p. 1333) is set to `DDS_BOOLEAN_TRUE` (p. 1004).

[default] `DDS_BOOLEAN_TRUE` (p. 1004)

### 5.138.2.11 `reader_checkpoint_frequency`

`DDS_UnsignedLong DDS_PersistentStorageSettings::reader_checkpoint_frequency`

Controls how often the reader state is stored into the database.

This field only applies to `DDS_DataReader` (p. 608) entities.

A value of N means store the state once every N received and processed samples.

The circumstances under which a data sample is considered "processed by the application" depends on the `DataReader` configuration.

For additional information on when a sample is considered "processed by the application" see `Durable Reader State`, in the `Core Libraries User's Manual`.

A high value will provide better performance. However, if the `DataReader` is restarted it may receive some duplicate samples.

[range] [1, 1000000] [default] 1

## 5.139 `DDS_PresentationQosPolicy` Struct Reference

Specifies how the samples representing changes to data instances are presented to a subscribing application.

## Data Fields

- **DDS\_PresentationQosPolicyAccessScopeKind access\_scope**  
*Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.*
- **DDS\_Boolean coherent\_access**  
*Specifies support for coherent access. Controls whether coherent access is supported within the scope access\_scope.*
- **DDS\_Boolean ordered\_access**  
*Specifies support for ordered access to the samples received at the subscription end. Controls whether ordered access is supported within the scope access\_scope.*
- **DDS\_Boolean drop\_incomplete\_coherent\_set**  
*<<extension>> (p. 817) Indicates whether or not a **DDS\_DataReader** (p. 608) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the **SAMPLE\_LOST** Status.*

### 5.139.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

This QoS policy controls the extent to which changes to data instances can be made dependent on each other and also the kind of dependencies that can be propagated and maintained by RTI Connext. Specifically, this policy affects the application's ability to:

- specify and receive coherent changes to instances
- specify the relative order in which changes are presented

Entity:

**DDS\_Publisher** (p. 436), **DDS\_Subscriber** (p. 565)

Status:

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_↔ STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES

**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

## 5.139.2 Usage

A **DDS\_DataReader** (p. 608) will usually receive data in the order that it was sent by a **DDS\_DataWriter** (p. 478), and the data is presented to the **DDS\_DataReader** (p. 608) as soon as the application receives the next expected value. However, sometimes you may want a set of data for the same DataWriter or different DataWriters to be presented to the DataReader(s) only after *all* of the elements of the set have been received, but not before. Or you may want the data to be presented in a different order than that in which it was sent. Specifically for keyed data, you may want the middleware to present the data in keyed – or *instance* – order, such that samples pertaining to the same instance are presented together.

The Presentation QoS policy is a request-offered QoS policy that allows you to specify different *scopes* of presentation. It also controls whether or not a set of changes within the scope is delivered at the same time or can be delivered as soon as each element is received.

- `coherent_access` controls whether RTI Connex will preserve the groupings of changes made by a publishing application by means of the operations **DDS\_Publisher\_begin\_coherent\_changes** (p. 452) and **DDS\_Publisher\_end\_coherent\_changes** (p. 453).
- `ordered_access` controls whether RTI Connex will preserve the order of changes.
- `access_scope` controls the granularity of the other settings. See below:

If `coherent_access` is set, then the `access_scope` set on the **DDS\_Subscriber** (p. 565) controls the maximum extent of coherent changes. The behavior is as follows:

- If `access_scope` is set to **DDS\_INSTANCE\_PRESENTATION\_QOS** (p. 1106) (the default), the behavior is the same as **DDS\_TOPIC\_PRESENTATION\_QOS** (p. 1106).
- If `access_scope` is set to **DDS\_TOPIC\_PRESENTATION\_QOS** (p. 1106), then coherent changes (indicated by their enclosure within calls to **DDS\_Publisher\_begin\_coherent\_changes** (p. 452) and **DDS\_Publisher\_end\_coherent\_changes** (p. 453)) will be made available as a unit to each remote **DDS\_DataReader** (p. 608) independently. That is, changes made to instances within each individual **DDS\_DataWriter** (p. 478) will be presented as a unit. They will not be grouped with changes made to instances belonging to a different **DDS\_DataWriter** (p. 478).
- If `access_scope` is set to **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106), then coherent changes made to instances through a set of **DDS\_DataWriter** (p. 478) entities attached to a common **DDS\_Publisher** (p. 436) will be made available as a unit to the **DDS\_DataReader** (p. 608) entities within a **DDS\_Subscriber** (p. 565).

If `ordered_access` is set, then the `access_scope` set on the **DDS\_Subscriber** (p. 565) controls the maximum extent to which order will be preserved by RTI Connex.

- If `access_scope` is set to **DDS\_INSTANCE\_PRESENTATION\_QOS** (p. 1106) (the lowest level), then the relative order of DDS samples sent by a **DDS\_DataWriter** (p. 478) is only preserved on a per-instance basis. If two DDS samples refer to the same instance (identified by Topic and a particular value for the key), then the order in which they are stored in the **DDS\_DataReader** (p. 608) queue is consistent with the order in which the changes occurred. However, if the two DDS samples belong to different instances, the order in which they are presented may or may not match the order in which the changes occurred. This is the case even if it is the same application thread making the changes using the same **DDS\_DataWriter** (p. 478).

- If `access_scope` is set to **DDS\_TOPIC\_PRESENTATION\_QOS** (p. 1106), changes (creations, deletions, modifications) made by a single **DDS\_DataWriter** (p. 478) to one or more instances are presented to a **DDS\_DataReader** (p. 608) in the same order in which they occur. Changes made to instances through different **DDS\_DataWriter** (p. 478) entities are not required to be presented in the order in which they occur. This is the case even if the changes are made by a single application thread using **DDS\_DataWriter** (p. 478) objects attached to the same **DDS\_Publisher** (p. 436).
- Finally, if `access_scope` is set to **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106), changes made to instances via **DDS\_DataWriter** (p. 478) entities attached to the same **DDS\_Publisher** (p. 436) object are presented to the **DDS\_DataReader** (p. 608) entities within a **DDS\_Subscriber** (p. 565) in the same order in which they occur. For this to happen, the application must take the samples using the Subscriber's **DDS\_Subscriber\_begin\_access** (p. 580) and **DDS\_Subscriber\_end\_access** (p. 581) operations (see the "Ordered Access" section in the "PRESENTATION QoS Policy" section of the [manual/RTI\\_ConnextDDS\\_CoreLibraries\\_UsersManual.pdf](http://manual.rti.com/manual/RTI_ConnextDDS_CoreLibraries_UsersManual.pdf) target="\_blank">Core Libraries User's Manual).

If `access_scope` is set to **DDS\_HIGHEST\_OFFERED\_PRESENTATION\_QOS** (p. 1106) on the **DDS\_Subscriber** (p. 565), then the **DDS\_Subscriber** (p. 565) will use the `access_scope` offered by the remote **DDS\_Publisher** (p. 436).

Note that this QoS policy controls the scope at which related changes are made available to the subscriber. This means the subscriber **can** access the changes in a coherent manner and in the proper order; however, it does not necessarily imply that the **DDS\_Subscriber** (p. 565) **will** indeed access the changes in the correct order. For that to occur, the application at the subscriber end must use the proper logic in reading the **DDS\_DataReader** (p. 608) objects.

For **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106) the subscribing application must use the APIs **DDS\_Subscriber\_begin\_access** (p. 580), **DDS\_Subscriber\_end\_access** (p. 581) and **DDS\_Subscriber\_get\_datareaders** (p. 581) to access the changes in the proper order. If you do not use these operations, the data may not be ordered across DataWriters that belong to the same **DDS\_Publisher** (p. 436).

The field **DDS\_SampleInfo::coherent\_set\_info** (p. 1731) is set when a sample is part of a coherent set. This field provides information to identify the coherent set that a sample is part of. In addition, **DDS\_CoherentSetInfo\_t::incomplete\_coherent\_set** (p. 1348) indicates if a sample is part of an incomplete coherent set (one for which not all samples have been received). Coherent sets for which some of the samples are filtered out by content or time on the **DDS\_DataWriter** (p. 478) are considered incomplete.

By default, the samples that are received from an incomplete coherent set are dropped by the DataReader(s) and they are not provided to the application. Such samples are reported as lost in the `SAMPLE_LOST` Status. By setting **DDS\_PresentationQosPolicy::drop\_incomplete\_coherent\_set** (p. 1638) to **DDS\_BOOLEAN\_FALSE** (p. 1004), you can change this behavior and, in this case, samples from incomplete coherent sets will be provided to the application. These samples have **DDS\_CoherentSetInfo\_t::incomplete\_coherent\_set** (p. 1348) set to **DDS\_BOOLEAN\_TRUE** (p. 1004).

### 5.139.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered access\_scope*  $\geq$  *requested access\_scope* evaluates to 'TRUE' or requested `access_scope` is **DDS\_HIGHEST\_OFFERED\_PRESENTATION\_QOS** (p. 1106). For the purposes of this inequality, the values of `access_scope` are considered ordered such that **DDS\_INSTANCE\_PRESENTATION\_QOS** (p. 1106) < **DDS\_TOPIC\_PRESENTATION\_QOS** (p. 1106) < **DDS\_GROUP\_PRESENTATION\_QOS** (p. 1106).

- requested `coherent_access` is **DDS\_BOOLEAN\_FALSE** (p.1004), or else both offered and requested `coherent_access` are **DDS\_BOOLEAN\_TRUE** (p. 1004).
- requested `ordered_access` is **DDS\_BOOLEAN\_FALSE** (p.1004), or else both offered and requested `ordered_access` are **DDS\_BOOLEAN\_TRUE** (p. 1004).

## 5.139.4 Field Documentation

### 5.139.4.1 access\_scope

**DDS\_PresentationQosPolicyAccessScopeKind** `DDS_PresentationQosPolicy::access_scope`

Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

[default] **DDS\_INSTANCE\_PRESENTATION\_QOS** (p. 1106)

### 5.139.4.2 coherent\_access

**DDS\_Boolean** `DDS_PresentationQosPolicy::coherent_access`

Specifies support for *coherent* access. Controls whether coherent access is supported within the scope `access_↔scope`.

That is, the ability to group a set of changes as a unit on the publishing end such that they are received as a unit at the subscribing end.

Note: To use this feature, the DataWriter must be configured for RELIABLE communication (see **DDS\_RELIABLE\_↔RELIABILITY\_QOS** (p. 1124)).

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.139.4.3 ordered\_access

**DDS\_Boolean** `DDS_PresentationQosPolicy::ordered_access`

Specifies support for *ordered* access to the samples received at the subscription end. Controls whether ordered access is supported within the scope `access_scope`.

That is, the ability of the subscriber to see changes in the same order as they occurred on the publishing end.

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### 5.139.4.4 drop\_incomplete\_coherent\_set

`DDS_Boolean DDS_PresentationQosPolicy::drop_incomplete_coherent_set`

<<*extension*>> (p. 817) Indicates whether or not a **DDS\_DataReader** (p.608) should drop samples from an incomplete coherent set (one for which not all the samples were received). Such samples are reported as lost in the SAMPLE\_LOST Status.

Note that a coherent set will be considered incomplete if some of its samples are filtered by content or time on the DataWriter side.

By default, the samples that are received from an incomplete coherent set are dropped (and reported as lost) by the DataReader(s) and they are not provided to the application. By setting this parameter to **DDS\_BOOLEAN\_FALSE** (p. 1004), you can change this behavior.

Samples from an incomplete coherent set have **DDS\_CoherentSetInfo\_t::incomplete\_coherent\_set** (p. 1348) set to **DDS\_BOOLEAN\_TRUE** (p. 1004) in **DDS\_SampleInfo::coherent\_set\_info** (p. 1731).

[default] **DDS\_BOOLEAN\_TRUE** (p. 1004)

## 5.140 DDS\_PrintFormatProperty Struct Reference

A collection of attributes used to configure how data samples will be formatted when converted to a string.

### Data Fields

- **DDS\_PrintFormatKind kind**  
*The kind of format to be used when converting a data sample to a string.*
- **DDS\_Boolean pretty\_print**  
*Choose whether to print a data sample in a more readable format or to eliminate all white space.*
- **DDS\_Boolean enum\_as\_int**  
*Choose whether to print enum values as integers or as strings.*
- **DDS\_Boolean include\_root\_elements**  
*Choose whether or not to include the root elements of the print format in the output string.*

### 5.140.1 Detailed Description

A collection of attributes used to configure how data samples will be formatted when converted to a string.

To ensure that new objects are initialized to known values, assign them with the static initializer **DDS\_PrintFormatProperty\_INITIALIZER** (p. 169).

**DDS\_PrintFormatProperty\_INITIALIZER** (p. 169)

Examples

**HelloWorldPlugin.c.**

## 5.140.2 Field Documentation

### 5.140.2.1 kind

```
DDS_PrintFormatKind DDS_PrintFormatProperty::kind
```

The kind of format to be used when converting a data sample to a string.

Data samples can be represented in a default, XML, or JSON format.

See also

**DDS\_PrintFormatKind** (p. 182)

**[default] DDS\_DEFAULT\_PRINT\_FORMAT** (p. 182)

### 5.140.2.2 pretty\_print

```
DDS_Boolean DDS_PrintFormatProperty::pretty_print
```

Choose whether to print a data sample in a more readable format or to eliminate all white space.

A value of **DDS\_BOOLEAN\_TRUE** (p. 1004) will add indentation and newlines to the string representation of the data sample making it more readable. For example:

```
<FooType>
  <myLong>5</myLong>
</FooType>
```

A value of **DDS\_BOOLEAN\_FALSE** (p. 1004) will cause all white space in the string representation of the data sample to be eliminated. For example:

```
<FooType><myLong>5</myLong></FooType>
```

**[default] DDS\_BOOLEAN\_TRUE** (p. 1004)

### 5.140.2.3 enum\_as\_int

```
DDS_Boolean DDS_PrintFormatProperty::enum_as_int
```

Choose whether to print enum values as integers or as strings.

A value of **DDS\_BOOLEAN\_TRUE** (p. 1004) will cause enumeration literals to be printed using their integer value. For example:

```
<FooType>
  <myEnum>5</myEnum>
</FooType>
```

A value of **DDS\_BOOLEAN\_FALSE** (p. 1004) will cause enumeration literals to be printed as strings using their member names. For example:

```
<FooType>
  <myEnum>RED</myEnum>
</FooType>
```

**[default] DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.140.2.4 include\_root\_elements

```
DDS_Boolean DDS_PrintfFormatProperty::include_root_elements
```

Choose whether or not to include the root elements of the print format in the output string.

This field only applies if the `DDS_PrintfFormatProperty::kind` (p. 1640) is `DDS_XML_PRINT_FORMAT` (p. 182) or `DDS_JSON_PRINT_FORMAT` (p. 182)

If the value is `DDS_BOOLEAN_TRUE` (p. 1004) and the kind is `DDS_XML_PRINT_FORMAT` (p. 182) then a top-level tag with the type's name in it will be included in the output. For example:

```
<FooType>
  <myLong>5</myLong>
</FooType>
```

If the value is `DDS_BOOLEAN_TRUE` (p. 1004) and the kind is `DDS_JSON_PRINT_FORMAT` (p. 182) then top-level opening and closing braces will be included in the output. For example:

```
{
  "myLong": 5
}
```

If the value is `DDS_BOOLEAN_FALSE` (p. 1004) the elements described above will not be included in the output. For example:

```
<myLong>5</myLong>
"myLong": 5
```

[default] `DDS_BOOLEAN_TRUE` (p. 1004)

## 5.141 DDS\_ProductVersion\_t Struct Reference

<<*extension*>> (p. 817) Type used to represent the current version of RTI Connex.

### Data Fields

## 5.141.2 Field Documentation

### 5.141.2.1 major

`DDS_Char DDS_ProductVersion_t::major`

Major product version.

### 5.141.2.2 minor

`DDS_Char DDS_ProductVersion_t::minor`

Minor product version.

### 5.141.2.3 release

`DDS_Char DDS_ProductVersion_t::release`

Release letter for product version.

### 5.141.2.4 revision

`DDS_Char DDS_ProductVersion_t::revision`

Revision number of product.

## 5.142 DDS\_ProfileQoSPolicy Struct Reference

Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

## Data Fields

- struct **DDS\_StringSeq string\_profile**  
*Sequence of strings containing a XML document to load.*
- struct **DDS\_StringSeq url\_profile**  
*Sequence of **URL groups** (p. 777) containing a set of XML documents to load.*
- **DDS\_Boolean ignore\_user\_profile**  
*Ignores the file `USER_QOS_PROFILES.xml` in the current working directory.*
- **DDS\_Boolean ignore\_environment\_profile**  
*Ignores the value of the `NDDS_QOS_PROFILES environment variable` (p. 778).*
- **DDS\_Boolean ignore\_resource\_profile**  
*Ignores the file `NDDS_QOS_PROFILES.xml`.*

### 5.142.1 Detailed Description

Configures the way that XML documents containing QoS profiles are loaded by RTI Connex.

All QoS values for Entities can be configured in QoS profiles defined in XML documents. XML documents can be passed to RTI Connex in string form or, more likely, through files found on a file system.

There are also default locations where DomainParticipants will look for files to load QoS profiles. These include the current working directory from where an application is started, a file in the distribution directory for RTI Connex, and the locations specified by an environment variable.

You may disable any or all of these default locations using the Profile QoS policy.

Entity:

**DDS\_DomainParticipantFactory** (p. 28)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **Changeable** (p. 1048)

### 5.142.2 Field Documentation

#### 5.142.2.1 string\_profile

```
struct DDS_StringSeq DDS_ProfileQoSPolicy::string_profile
```

Sequence of strings containing a XML document to load.

The concatenation of the strings in this sequence must be a valid XML document according to the XML QoS profile schema.

**[default]** Empty sequence (zero-length).

### 5.142.2.2 url\_profile

```
struct DDS_StringSeq DDS_ProfileQosPolicy::url_profile
```

Sequence of **URL groups** (p. 777) containing a set of XML documents to load.

Only one of the elements of each group will be loaded by RTI Connext, starting from the left.

**[default]** Empty sequence (zero-length).

### 5.142.2.3 ignore\_user\_profile

```
DDS_Boolean DDS_ProfileQosPolicy::ignore_user_profile
```

Ignores the file USER\_QOS\_PROFILES.xml in the current working directory.

When this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), the QoS profiles contained in the file USER\_QOS\_↔  
PROFILES.xml in the current working directory will be ignored.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.142.2.4 ignore\_environment\_profile

```
DDS_Boolean DDS_ProfileQosPolicy::ignore_environment_profile
```

Ignores the value of the **NDDS\_QOS\_PROFILES environment variable** (p. 778).

When this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), the value of the environment variable NDDS\_QOS\_↔  
PROFILES will be ignored.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.142.2.5 ignore\_resource\_profile

```
DDS_Boolean DDS_ProfileQosPolicy::ignore_resource_profile
```

Ignores the file NDDS\_QOS\_PROFILES.xml.

When this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), the QoS profiles contained in the file NDDS\_QOS\_↔  
PROFILES.xml in \$NDDSHOME/resource/xml will be ignored.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

## 5.143 DDS\_Property\_t Struct Reference

Properties are name/value pairs objects.

## Data Fields

- char \* **name**  
*Property name.*
- char \* **value**  
*Property value.*
- **DDS\_Boolean propagate**  
*Indicates if the property must be propagated on discovery.*

### 5.143.1 Detailed Description

Properties are name/value pairs objects.

### 5.143.2 Field Documentation

#### 5.143.2.1 name

```
char* DDS_Property_t::name
```

Property name.

It must be a NULL-terminated string allocated with **DDS\_String\_alloc** (p. 1313) or **DDS\_String\_dup** (p. 1313).

#### 5.143.2.2 value

```
char* DDS_Property_t::value
```

Property value.

It must be a NULL-terminated string allocated with **DDS\_String\_alloc** (p. 1313) or **DDS\_String\_dup** (p. 1313).

#### 5.143.2.3 propagate

```
DDS_Boolean DDS_Property_t::propagate
```

Indicates if the property must be propagated on discovery.

## 5.144 DDS\_PropertyQosPolicy Struct Reference

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

## Data Fields

- struct **DDS\_PropertySeq** value  
*Sequence of properties.*

### 5.144.1 Detailed Description

Stores name/value(string) pairs that can be used to configure certain parameters of RTI Connex that are not exposed through formal QoS policies. Can also be used to store and propagate application-specific name/value pairs that can be retrieved by user code during discovery.

Entity:

**DDS\_DomainParticipant** (p. 72) **DDS\_DataReader** (p. 608) **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A;  
**Changeable** (p. 1048) = **YES** (p. 1048)

See also

**DDS\_DomainParticipant\_get\_builtin\_subscriber** (p. 126)

### 5.144.2 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478), or **DDS\_DomainParticipant** (p. 72). This is similar to the **DDS\_UserDataQoSPolicy** (p. 1820), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the [Property Reference Guide](#).

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 771)
- Durable Reader State, see **Configuring Durable Reader State** (p. 773)
- Builtin Transport Plugins, see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 848), **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 864), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 842)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 719)
- **Clock Selection** (p. 21)

In addition, you may add your own name/value pairs to the Property QoS policy of an Entity. Via this QoS policy, you can direct RTI Connex to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **DDS\_UserDataQoSPolicy** (p. 1820) or **DDS\_Group↔DataQoSPolicy** (p. 1556)).

### 5.144.2.1 Reasons for Using the PropertyQoSPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI ConnexT capabilities configurable via the Property QoS policy can also be configured in code via APIs. However, the Property QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the Property QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 1107) page.

### 5.144.3 Field Documentation

#### 5.144.3.1 value

```
struct DDS_PropertySeq DDS_PropertyQoSPolicy::value
```

Sequence of properties.

**[default]** An empty list.

## 5.145 DDS\_PropertySeq Struct Reference

Declares IDL `sequence < DDS_Property_t (p. 1644) >`

### 5.145.1 Detailed Description

Declares IDL `sequence < DDS_Property_t (p. 1644) >`

See also

## 5.146 DDS\_ProtocolVersion\_t Struct Reference

<<*extension*>> (p. 817) Type used to represent the version of the RTPS protocol.

### Data Fields

- **DDS\_Octet major**  
*Major protocol version number.*
- **DDS\_Octet minor**  
*Minor protocol version number.*

### 5.146.1 Detailed Description

<<*extension*>> (p. 817) Type used to represent the version of the RTPS protocol.

### 5.146.2 Field Documentation

#### 5.146.2.1 major

```
DDS_Octet DDS_ProtocolVersion_t::major
```

Major protocol version number.

#### 5.146.2.2 minor

```
DDS_Octet DDS_ProtocolVersion_t::minor
```

Minor protocol version number.

## 5.147 DDS\_PublicationBuiltinTopicData Struct Reference

Entry created when a **DDS\_DataWriter** (p. 478) is discovered in association with its Publisher.

## Data Fields

- **DDS\_BuiltinTopicKey\_t key**  
*DCPS key to distinguish entries.*
- **DDS\_BuiltinTopicKey\_t participant\_key**  
*DCPS key of the participant to which the DataWriter belongs.*
- char \* **topic\_name**  
*Name of the related **DDS\_Topic** (p. 172).*
- char \* **type\_name**  
*Name of the type attached to the **DDS\_Topic** (p. 172).*
- struct **DDS\_DurabilityQosPolicy durability**  
*durability policy of the corresponding DataWriter*
- struct **DDS\_DurabilityServiceQosPolicy durability\_service**  
*durability\_service policy of the corresponding DataWriter*
- struct **DDS\_DeadlineQosPolicy deadline**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_LatencyBudgetQosPolicy latency\_budget**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_LivelinessQosPolicy liveliness**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_ReliabilityQosPolicy reliability**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_LifespanQosPolicy lifespan**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_UserDataQosPolicy user\_data**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_OwnershipQosPolicy ownership**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_OwnershipStrengthQosPolicy ownership\_strength**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_DestinationOrderQosPolicy destination\_order**  
*Policy of the corresponding DataWriter.*
- struct **DDS\_PresentationQosPolicy presentation**  
*Policy of the Publisher to which the DataWriter belongs.*
- struct **DDS\_PartitionQosPolicy partition**  
*Policy of the Publisher to which the DataWriter belongs.*
- struct **DDS\_TopicDataQosPolicy topic\_data**  
*Policy of the related Topic.*
- struct **DDS\_GroupDataQosPolicy group\_data**  
*Policy of the Publisher to which the DataWriter belongs.*
- struct **DDS\_DataRepresentationQosPolicy representation**  
*Data representation policy of the corresponding DataWriter.*
- **DDS\_DataTagQosPolicy data\_tags**  
*Tags of the corresponding DataWriter.*
- struct **DDS\_TypeCode \* type\_code**  
*<<extension>> (p. 817) Type code information of the corresponding Topic*
- **DDS\_BuiltinTopicKey\_t publisher\_key**

- <<*extension*>> (p. 817) DCPS key of the publisher to which the *DataWriter* belongs
- struct **DDS\_PropertyQosPolicy property**
  - <<*extension*>> (p. 817) Properties of the corresponding *DataWriter*.
- struct **DDS\_LocatorSeq unicast\_locators**
  - <<*extension*>> (p. 817) Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.
- struct **DDS\_GUID\_t virtual\_guid**
  - <<*extension*>> (p. 817) Virtual GUID associated to the *DataWriter*.
- struct **DDS\_ServiceQosPolicy service**
  - <<*extension*>> (p. 817) Policy of the corresponding *DataWriter*.
- **DDS\_ProtocolVersion\_t rtps\_protocol\_version**
  - <<*extension*>> (p. 817) Version number of the RTPS wire protocol used.
- struct **DDS\_VendorId\_t rtps\_vendor\_id**
  - <<*extension*>> (p. 817) ID of vendor implementing the RTPS wire protocol.
- struct **DDS\_ProductVersion\_t product\_version**
  - <<*extension*>> (p. 817) This is a vendor specific parameter. It gives the current version for rti-dds.
- struct **DDS\_LocatorFilterQosPolicy locator\_filter**
  - <<*extension*>> (p. 817) Policy of the corresponding *DataWriter*
- **DDS\_Boolean disable\_positive\_acks**
  - <<*extension*>> (p. 817) This is a vendor specific parameter. Determines whether matching *DataReaders* send positive acknowledgements for reliability.
- struct **DDS\_EntityNameQosPolicy publication\_name**
  - <<*extension*>> (p. 817) The publication name and role name.
- struct **DDS\_EndpointTrustProtectionInfo trust\_protection\_info**
  - <<*extension*>> (p. 817) Trust Plugins protection information associated with the discovered *DataWriter*.
- struct **DDS\_EndpointTrustAlgorithmInfo trust\_algorithm\_info**
  - <<*extension*>> (p. 817) Trust Plugins algorithms associated with the discovered *DataWriter*.

### 5.147.1 Detailed Description

Entry created when a **DDS\_DataWriter** (p. 478) is discovered in association with its Publisher.

Data associated with the built-in topic **DDS\_PUBLICATION\_TOPIC\_NAME** (p. 900). It contains QoS policies and additional information that apply to the remote **DDS\_DataWriter** (p. 478) the related **DDS\_Publisher** (p. 436).

See also

**DDS\_PUBLICATION\_TOPIC\_NAME** (p. 900)

**DDS\_PublicationBuiltinTopicDataDataReader** (p. 900)

### 5.147.2 Field Documentation

### 5.147.2.1 key

```
DDS_BuiltinTopicKey_t DDS_PublicationBuiltinTopicData::key
```

DCPS key to distinguish entries.

### 5.147.2.2 participant\_key

```
DDS_BuiltinTopicKey_t DDS_PublicationBuiltinTopicData::participant_key
```

DCPS key of the participant to which the DataWriter belongs.

### 5.147.2.3 topic\_name

```
char* DDS_PublicationBuiltinTopicData::topic_name
```

Name of the related **DDS\_Topic** (p. 172).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1312).

See also

**String Conventions** (p. 1312)

### 5.147.2.4 type\_name

```
char* DDS_PublicationBuiltinTopicData::type_name
```

Name of the type attached to the **DDS\_Topic** (p. 172).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1312).

See also

**String Conventions** (p. 1312)

#### 5.147.2.5 durability

```
struct DDS_DurabilityQosPolicy DDS_PublicationBuiltinTopicData::durability
```

durability policy of the corresponding DataWriter

#### 5.147.2.6 durability\_service

```
struct DDS_DurabilityServiceQosPolicy DDS_PublicationBuiltinTopicData::durability_service
```

durability\_service policy of the corresponding DataWriter

#### 5.147.2.7 deadline

```
struct DDS_DeadlineQosPolicy DDS_PublicationBuiltinTopicData::deadline
```

Policy of the corresponding DataWriter.

#### 5.147.2.8 latency\_budget

```
struct DDS_LatencyBudgetQosPolicy DDS_PublicationBuiltinTopicData::latency_budget
```

Policy of the corresponding DataWriter.

#### 5.147.2.9 liveliness

```
struct DDS_LivelinessQosPolicy DDS_PublicationBuiltinTopicData::liveliness
```

Policy of the corresponding DataWriter.

#### 5.147.2.10 reliability

```
struct DDS_ReliabilityQosPolicy DDS_PublicationBuiltinTopicData::reliability
```

Policy of the corresponding DataWriter.

### 5.147.2.11 lifespan

```
struct DDS_LifespanQosPolicy DDS_PublicationBuiltinTopicData::lifespan
```

Policy of the corresponding DataWriter.

### 5.147.2.12 user\_data

```
struct DDS_UserDataQosPolicy DDS_PublicationBuiltinTopicData::user_data
```

Policy of the corresponding DataWriter.

### 5.147.2.13 ownership

```
struct DDS_OwnershipQosPolicy DDS_PublicationBuiltinTopicData::ownership
```

Policy of the corresponding DataWriter.

### 5.147.2.14 ownership\_strength

```
struct DDS_OwnershipStrengthQosPolicy DDS_PublicationBuiltinTopicData::ownership_strength
```

Policy of the corresponding DataWriter.

### 5.147.2.15 destination\_order

```
struct DDS_DestinationOrderQosPolicy DDS_PublicationBuiltinTopicData::destination_order
```

Policy of the corresponding DataWriter.

#### Warning

Only the field **DDS\_DestinationOrderQosPolicy::kind** (p. 1459) is propagated during discovery. The other fields always contain their default values.

#### 5.147.2.16 presentation

```
struct DDS_PresentationQosPolicy DDS_PublicationBuiltinTopicData::presentation
```

Policy of the Publisher to which the DataWriter belongs.

#### 5.147.2.17 partition

```
struct DDS_PartitionQosPolicy DDS_PublicationBuiltinTopicData::partition
```

Policy of the Publisher to which the DataWriter belongs.

#### 5.147.2.18 topic\_data

```
struct DDS_TopicDataQosPolicy DDS_PublicationBuiltinTopicData::topic_data
```

Policy of the related Topic.

#### 5.147.2.19 group\_data

```
struct DDS_GroupDataQosPolicy DDS_PublicationBuiltinTopicData::group_data
```

Policy of the Publisher to which the DataWriter belongs.

#### 5.147.2.20 representation

```
struct DDS_DataRepresentationQosPolicy DDS_PublicationBuiltinTopicData::representation
```

Data representation policy of the corresponding DataWriter.

#### 5.147.2.21 data\_tags

```
DDS_DataTagQosPolicy DDS_PublicationBuiltinTopicData::data_tags
```

Tags of the corresponding DataWriter.

### 5.147.2.22 type\_code

```
struct DDS_TypeCode* DDS_PublicationBuiltinTopicData::type_code
```

<<*extension*>> (p. 817) Type code information of the corresponding Topic

### 5.147.2.23 publisher\_key

```
DDS_BuiltinTopicKey_t DDS_PublicationBuiltinTopicData::publisher_key
```

<<*extension*>> (p. 817) DCPS key of the publisher to which the DataWriter belongs

### 5.147.2.24 property

```
struct DDS_PropertyQosPolicy DDS_PublicationBuiltinTopicData::property
```

<<*extension*>> (p. 817) Properties of the corresponding DataWriter.

### 5.147.2.25 unicast\_locators

```
struct DDS_LocatorSeq DDS_PublicationBuiltinTopicData::unicast_locators
```

<<*extension*>> (p. 817) Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

### 5.147.2.26 virtual\_guid

```
struct DDS_GUID_t DDS_PublicationBuiltinTopicData::virtual_guid
```

<<*extension*>> (p. 817) Virtual GUID associated to the DataWriter.

See also

**DDS\_GUID\_t** (p. 1557)

#### 5.147.2.27 service

```
struct DDS_ServiceQosPolicy DDS_PublicationBuiltinTopicData::service
```

<<*extension*>> (p. 817) Policy of the corresponding DataWriter.

#### 5.147.2.28 rtps\_protocol\_version

```
DDS_ProtocolVersion_t DDS_PublicationBuiltinTopicData::rtps_protocol_version
```

<<*extension*>> (p. 817) Version number of the RTPS wire protocol used.

#### 5.147.2.29 rtps\_vendor\_id

```
struct DDS_VendorId_t DDS_PublicationBuiltinTopicData::rtps_vendor_id
```

<<*extension*>> (p. 817) ID of vendor implementing the RTPS wire protocol.

#### 5.147.2.30 product\_version

```
struct DDS_ProductVersion_t DDS_PublicationBuiltinTopicData::product_version
```

<<*extension*>> (p. 817) This is a vendor specific parameter. It gives the current version for rti-dds.

#### 5.147.2.31 locator\_filter

```
struct DDS_LocatorFilterQosPolicy DDS_PublicationBuiltinTopicData::locator_filter
```

<<*extension*>> (p. 817) Policy of the corresponding DataWriter

Related to **DDS\_MultiChannelQosPolicy** (p. 1603).

#### 5.147.2.32 disable\_positive\_acks

```
DDS_Boolean DDS_PublicationBuiltinTopicData::disable_positive_acks
```

<<*extension*>> (p. 817) This is a vendor specific parameter. Determines whether matching DataReaders send positive acknowledgements for reliability.

### 5.147.2.33 publication\_name

```
struct DDS_EntityNameQosPolicy DDS_PublicationBuiltinTopicData::publication_name
```

<<*extension*>> (p. 817) The publication name and role name.

This member contains the name and the role name of the discovered publication.

### 5.147.2.34 trust\_protection\_info

```
struct DDS_EndpointTrustProtectionInfo DDS_PublicationBuiltinTopicData::trust_protection_info
```

<<*extension*>> (p. 817) Trust Plugins protection information associated with the discovered DataWriter.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust\_protection\_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust\_protection\_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

### 5.147.2.35 trust\_algorithm\_info

```
struct DDS_EndpointTrustAlgorithmInfo DDS_PublicationBuiltinTopicData::trust_algorithm_info
```

<<*extension*>> (p. 817) Trust Plugins algorithms associated with the discovered DataWriter.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust\_algorithm\_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust\_algorithm\_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

## 5.148 DDS\_PublicationBuiltinTopicDataSeq Struct Reference

## 5.150 DDS\_PublicationMatchedStatus Struct Reference

`DDS_PUBLICATION_MATCHED_STATUS` (p. 1035)

### Data Fields

- **DDS\_Long total\_count**  
*The total cumulative number of times that this `DDS_DataWriter` (p. 478) discovered a "match" with a `DDS_DataReader` (p. 608).*
- **DDS\_Long total\_count\_change**  
*The changes in `total_count` since the last time the listener was called or the status was read.*
- **DDS\_Long current\_count**  
*The current number of `DataReaders` with which this `DDS_DataWriter` (p. 478) is matched.*
- **DDS\_Long current\_count\_peak**  
*<<extension>> (p. 817) Greatest number of `DataReaders` that matched this `DDS_DataWriter` (p. 478) simultaneously.*
- **DDS\_Long current\_count\_change**  
*The change in `current_count` since the last time the listener was called or the status was read.*
- **DDS\_InstanceHandle\_t last\_subscription\_handle**  
*This `InstanceHandle` can be used to look up which remote `DDS_DataReader` (p. 608) was the last to cause this `DataWriter`'s status to change, using `DDS_DataWriter_get_matched_subscription_data` (p. 533).*

## 5.150.1 Detailed Description

### DDS\_PUBLICATION\_MATCHED\_STATUS (p. 1035)

A "match" happens when the **DDS\_DataWriter** (p. 478) finds a **DDS\_DataReader** (p. 608) with the same **DDS\_Topic** (p. 172), same or compatible data type, and requested QoS that is compatible with that offered by the **DDS\_DataWriter** (p. 478). (For information on compatible data types, see the [Extensible Types Guide](#).)

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDS\_DataWriter** (p. 478) will become "unmatched" from a remote **DDS\_DataReader** (p. 608) when that **DDS\_DataReader** (p. 608) goes away for any of the following reasons:

- The matched **DDS\_DataReader** (p. 608)'s **DDS\_DomainParticipant** (p. 72) has lost liveliness.
- This DataWriter or the matched DataReader has changed QoS such that the entities are now incompatible.
- The matched DataReader has been deleted.

This status may reflect changes from multiple match or unmatched events, and the **DDS\_PublicationMatchedStatus**↔**::current\_count\_change** (p. 1660) can be used to determine the number of changes since the listener was called back or the status was checked.

## 5.150.2 Field Documentation

### 5.150.2.1 total\_count

```
DDS_Long DDS_PublicationMatchedStatus::total_count
```

The total cumulative number of times that this **DDS\_DataWriter** (p. 478) discovered a "match" with a **DDS\_DataReader** (p. 608).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **DDS\_PublicationMatchedStatus** (p. 1658).

### 5.150.2.2 total\_count\_change

```
DDS_Long DDS_PublicationMatchedStatus::total_count_change
```

The changes in total\_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times this DataWriter ever matched with a DataReader).

### 5.150.2.3 `current_count`

`DDS_Long DDS_PublicationMatchedStatus::current_count`

The current number of DataReaders with which this **DDS\_DataWriter** (p. 478) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **DDS\_PublicationMatchedStatus** (p. 1658).

### 5.150.2.4 `current_count_peak`

`DDS_Long DDS_PublicationMatchedStatus::current_count_peak`

<<*extension*>> (p. 817) Greatest number of DataReaders that matched this **DDS\_DataWriter** (p. 478) simultaneously.

That is, there was no moment in time when more than this many DataReaders matched this DataWriter. (As a result, `total_count` can be higher than `current_count_peak`.)

### 5.150.2.5 `current_count_change`

`DDS_Long DDS_PublicationMatchedStatus::current_count_change`

The change in `current_count` since the last time the listener was called or the status was read.

Note that a negative `current_count_change` means that one or more DataReaders have become unmatched for one or more of the reasons described in **DDS\_PublicationMatchedStatus** (p. 1658).

### 5.150.2.6 `last_subscription_handle`

`DDS_InstanceHandle_t DDS_PublicationMatchedStatus::last_subscription_handle`

This InstanceHandle can be used to look up which remote **DDS\_DataReader** (p. 608) was the last to cause this DataWriter's status to change, using **DDS\_DataWriter\_get\_matched\_subscription\_data** (p. 533).

If the DataReader no longer matches this DataWriter due to any of the reasons in **DDS\_PublicationMatchedStatus** (p. 1658) except incompatible QoS, then the DataReader has been purged from this DataWriter's DomainParticipant discovery database. (See the "Discovery Overview" section of the *User's Manual*.) In that case, the **DDS\_DataWriter\_get\_matched\_subscription\_data** (p. 533) method will not be able to return information about the DataReader. The only way to get information about the lost DataReader is if you cached the information previously.

## 5.151 DDS\_PublisherListener Struct Reference

<<*interface*>> (p. 818) **DDS\_Listener** (p. 1569) for **DDS\_Publisher** (p. 436) status.

## Data Fields

- struct **DDS\_DataWriterListener** *as\_datawriterlistener*

*The superclass instance of this **DDS\_PublisherListener** (p. 1660).*

### 5.151.1 Detailed Description

<<*interface*>> (p. 818) **DDS\_Listener** (p. 1569) for **DDS\_Publisher** (p. 436) status.

Entity:

**DDS\_Publisher** (p. 436)

Status:

**DDS\_LIVELINESS\_LOST\_STATUS** (p. 1034), **DDS\_LivelinessLostStatus** (p. 1574);  
**DDS\_OFFERED\_DEADLINE\_MISSED\_STATUS** (p. 1031), **DDS\_OfferedDeadlineMissedStatus** (p. 1607);  
**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_OfferedIncompatibleQosStatus** (p. 1609);

### 5.151.2 Field Documentation

#### 5.151.2.1 *as\_datawriterlistener*

```
struct DDS_DataWriterListener DDS_PublisherListener::as_datawriterlistener
```

The superclass instance of this **DDS\_PublisherListener** (p. 1660).

## 5.152 DDS\_PublisherQos Struct Reference

QoS policies supported by a **DDS\_Publisher** (p. 436) entity.

## Data Fields

- struct **DDS\_PresentationQosPolicy** **presentation**  
Presentation policy, **PRESENTATION** (p. 1105).
- struct **DDS\_PartitionQosPolicy** **partition**  
Partition policy, **PARTITION** (p. 1104).
- struct **DDS\_GroupDataQosPolicy** **group\_data**  
Group data policy, **GROUP\_DATA** (p. 1094).
- struct **DDS\_EntityFactoryQosPolicy** **entity\_factory**  
Entity factory policy, **ENTITY\_FACTORY** (p. 1090).
- struct **DDS\_AsynchronousPublisherQosPolicy** **asynchronous\_publisher**  
<<extension>> (p. 817) Asynchronous publishing settings for the **DDS\_Publisher** (p. 436) and all entities that are created by it.
- struct **DDS\_EntityNameQosPolicy** **publisher\_name**  
<<extension>> (p. 817) EntityName policy, **ENTITY\_NAME** (p. 1091).

### 5.152.1 Detailed Description

QoS policies supported by a **DDS\_Publisher** (p. 436) entity.

You must set certain members in a consistent manner:

length of **DDS\_GroupDataQosPolicy::value** (p. 1557) <= **DDS\_DomainParticipantResourceLimitsQosPolicy::publisher\_group\_data\_max\_length** (p. 1506)

length of **DDS\_PartitionQosPolicy::name** (p. 1629) <= **DDS\_DomainParticipantResourceLimitsQosPolicy::max\_partitions** (p. 1507)

combined number of characters (including terminating 0) in **DDS\_PartitionQosPolicy::name** (p. 1629) <= **DDS\_DomainParticipantResourceLimitsQosPolicy::max\_partition\_cumulative\_characters** (p. 1507)

If any of the above are not true, **DDS\_Publisher\_set\_qos** (p. 455) and **DDS\_Publisher\_set\_qos\_with\_profile** (p. 456) will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025) and **DDS\_DomainParticipant\_create\_publisher** (p. 100) will return NULL.

### 5.152.2 Field Documentation

#### 5.152.2.1 presentation

### 5.152.2.6 publisher\_name

```
struct DDS_EntityNameQosPolicy DDS_PublisherQos::publisher_name
```

<<*extension*>> (p. 817) EntityName policy, **ENTITY\_NAME** (p. 1091).

## 5.153 DDS\_PublisherSeq Struct Reference

Declares IDL sequence < **DDS\_Publisher** (p. 436) > .

### 5.153.1 Detailed Description

Declares IDL sequence `< DDS_Publisher (p. 436) >` .

See also

**FooSeq** (p. 1845)

## 5.154 DDS\_PublishModeQosPolicy Struct Reference

Specifies how RTI Connexx sends application data on the network. This QoS policy can be used to tell RTI Connexx to use its *own* thread to send data, instead of the user thread.

### Data Fields

- **DDS\_PublishModeQosPolicyKind kind**  
*Publishing mode.*
- `char * flow_controller_name`  
*Name of the associated flow controller.*
- **DDS\_Long priority**  
*Publication priority.*

### 5.154.1 Detailed Description

Specifies how RTI Connexx sends application data on the network. This QoS policy can be used to tell RTI Connexx to use its *own* thread to send data, instead of the user thread.

The publishing mode of a **DDS\_DataWriter** (p. 478) determines whether data is written synchronously in the context of the user thread when calling **FooDataWriter\_write** (p. 489) or asynchronously in the context of a separate thread internal to the middleware.

Each **DDS\_Publisher** (p. 436) spawns a single asynchronous publishing thread (**DDS\_AsynchronousPublisherQosPolicy::thread** (p. 1324)) to serve all its asynchronous **DDS\_DataWriter** (p. 478) instances.

See also

**DDS\_AsynchronousPublisherQosPolicy** (p. 1323)

**DDS\_HistoryQosPolicy** (p. 1558)

**DDS\_FlowController** (p. 551)

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.154.2 Usage

The fastest way for RTI Connext to send data is for the user thread to execute the middleware code that actually sends the data itself. However, there are times when user applications may need or want an internal middleware thread to send the data instead. For instance, to send large data reliably, you must use an asynchronous thread.

When data is written asynchronously, a **DDS\_FlowController** (p. 551), identified by `flow_controller_name`, can be used to shape the network traffic. Shaping a data flow usually means limiting the maximum data rates at which the middleware will send data for a **DDS\_DataWriter** (p. 478). The flow controller will buffer any excess data and only send it when the send rate drops below the maximum rate. The flow controller's properties determine when the asynchronous publishing thread is allowed to send data and how much.

Asynchronous publishing may increase latency, but offers the following advantages:

- The **FooDataWriter\_write** (p. 489) call does not make any network calls and is therefore faster and more deterministic. This becomes important when the user thread is executing time-critical code.
- When data is written in bursts or when sending large data types as multiple fragments, a flow controller can throttle the send rate of the asynchronous publishing thread to avoid flooding the network.
- Asynchronously written samples for the same destination will be coalesced into a single network packet which reduces bandwidth consumption.

The maximum number of samples that will be coalesced depends on **NDDS\_Transport\_Property\_t::gather\_send\_buffer\_count\_max** (p. 1857) (each sample requires at least 2-4 gather-send buffers). Performance can be improved by increasing **NDDS\_Transport\_Property\_t::gather\_send\_buffer\_count\_max** (p. 1857). Note that the maximum value is operating system dependent.

The middleware must queue samples until they can be sent by the asynchronous publishing thread (as determined by the corresponding **DDS\_FlowController** (p. 551)). The number of samples that will be queued is determined by the **DDS\_HistoryQosPolicy** (p. 1558). When using **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094), only the most recent **DDS\_HistoryQosPolicy::depth** (p. 1560) samples are kept in the queue. Once unsent samples are removed from the queue, they are no longer available to the asynchronous publishing thread and will therefore never be sent.

## 5.154.3 Field Documentation

### 5.154.3.1 kind

```
DDS_PublishModeQosPolicyKind DDS_PublishModeQosPolicy::kind
```

Publishing mode.

**[default]** **DDS\_SYNCHRONOUS\_PUBLISH\_MODE\_QOS** (p. 1120)

### 5.154.3.2 flow\_controller\_name

char\* DDS\_PublishModeQosPolicy::flow\_controller\_name

Name of the associated flow controller.

The following builtin values are supported:

- **DDS\_DEFAULT\_FLOW\_CONTROLLER\_NAME** (p. 557)
- **DDS\_FIXED\_RATE\_FLOW\_CONTROLLER\_NAME** (p. 557)
- **DDS\_ON\_DEMAND\_FLOW\_CONTROLLER\_NAME** (p. 558)

NULL value or zero-length string refers to **DDS\_DEFAULT\_FLOW\_CONTROLLER\_NAME** (p. 557).

#### Warning

The value for this field can be one of the constants above or a string allocated with **DDS\_String\_dup()** (p. 1313) to specify your own custom flow controller name. You should not assign a string literal. When you assign a new value with **DDS\_String\_dup()** (p. 1313), first check if the current value is one of the constants above. If it is, simply replace it; if it's not, you have to release the current string and assign the new one. Here is an example of such an approach:

```
struct DDS_DataWriterQos writer_qos;

char *flow_controller_name = NULL;

DDS_DataWriterQos_initialize(&writer_qos);

...

DDS_Publisher_get_default_datawriter_qos(publisher, &writer_qos);

...

flow_controller_name = writer_qos.publish_mode.flow_controller_name;

if (flow_controller_name == DDS_DEFAULT_FLOW_CONTROLLER_NAME
    || flow_controller_name == DDS_FIXED_RATE_FLOW_CONTROLLER_NAME
    || flow_controller_name == DDS_ON_DEMAND_FLOW_CONTROLLER_NAME) {

    // Since the value was never on the heap, this won't leak memory
    flow_controller_name = NULL;

} else {

    // This means the value is present on the heap
    DDS_String_free(flow_controller_name);

}

// New value using DDS_String_dup() or one of the predefined constants
flow_controller_name = DDS_String_dup("My custom flow controller name");

...

DDS_DataWriterQos_finalize(&writer_qos);
```

The strings allocated with **DDS\_String\_dup()** (p. 1313) are released when `writer_qos` is finalized.

More information about string handling can be found under **String Conventions** (p. 1312).

#### See also

**DDS\_DomainParticipant\_create\_flowcontroller** (p. 121)

**[default] DDS\_DEFAULT\_FLOW\_CONTROLLER\_NAME** (p. 557)

### 5.154.3.3 priority

**DDS\_Long** DDS\_PublishModeQosPolicy::priority

Publication priority.

A positive integer value designating the relative priority of the **DDS\_DataWriter** (p. 478), used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**DDS\_ASYNCHRONOUS\_PUBLISH\_MODE**↔**\_QOS** (p. 1120)) with **DDS\_FlowControllerProperty\_t::scheduling\_policy** (p. 1552) set to **DDS\_HPF\_FLOW**↔**CONTROLLER\_SCHED\_POLICY** (p. 554).

Larger numbers have higher priority.

For multi-channel DataWriters, if the publication priority of any channel is set to any value other than **DDS**↔**PUBLICATION\_PRIORITY\_UNDEFINED** (p. 1119), then the channel's priority will take precedence over that of the DataWriter.

For multi-channel DataWriters, if the publication priority of any channel is **DDS\_PUBLICATION\_PRIORITY**↔**UNDEFINED** (p. 1119), then the channel will inherit the publication priority of the DataWriter.

If the publication priority of the DataWriter, and of any channel of a multi-channel DataWriter, are **DDS\_PUBLICATION**↔**\_PRIORITY\_UNDEFINED** (p. 1119), then the priority of the DataWriter or DataWriter channel will be assigned the lowest priority value.

If the publication priority of the DataWriter is **DDS\_PUBLICATION\_PRIORITY\_AUTOMATIC** (p. 1119), then the Data↔Writer will be assigned the priority of the largest publication priority of all samples in the DataWriter.

The publication priority of each sample can be set in the **DDS\_WriteParams\_t** (p. 1833) of the **FooDataWriter\_write**↔**\_w\_params** (p. 494) function.

For dispose and unregister samples, use the **DDS\_WriteParams\_t** (p. 1833) of **FooDataWriter\_dispose\_w\_params** (p. 497) and **FooDataWriter\_unregister\_instance\_w\_params** (p. 489).

[default] **DDS\_PUBLICATION\_PRIORITY\_UNDEFINED** (p. 1119)

[range] [-1, MAX\_INT]

## 5.155 DDS\_QosPolicyCount Struct Reference

Type to hold a counter for a **DDS\_QosPolicyId\_t** (p. 1048).

### Data Fields

- **DDS\_QosPolicyId\_t** policy\_id  
*The QosPolicy ID.*
- **DDS\_Long** count  
*a counter*

### 5.155.1 Detailed Description

Type to hold a counter for a `DDS_QosPolicyId_t` (p. 1048).

### 5.155.2 Field Documentation

#### 5.155.2.1 `policy_id`

`DDS_QosPolicyId_t DDS_QosPolicyCount::policy_id`

The `QosPolicy` ID.

#### 5.155.2.2 `count`

`DDS_Long DDS_QosPolicyCount::count`

a counter

## 5.156 DDS\_QosPolicyCountSeq Struct Reference

## 5.157 DDS\_QosPrintFormat Struct Reference

A collection of attributes used to configure how a QoS appears when printed.

## Data Fields

- **DDS\_Boolean is\_standalone**  
*Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).*
- **DDS\_Boolean print\_private**  
*Configures how private QoS policies should be printed.*
- **DDS\_UnsignedLong indent**  
*Configures how much additional indent should be added to the string representation of a QoS.*

### 5.157.1 Detailed Description

A collection of attributes used to configure how a QoS appears when printed.

To ensure that new objects of this type are initialized to a known value, assign them with the static initializer **DDS\_↔QoSPrintFormat\_INITIALIZER** (p. 1048).

### 5.157.2 Field Documentation

#### 5.157.2.1 is\_standalone

```
DDS_Boolean DDS_QoSPrintFormat::is_standalone
```

Controls whether or not to print valid XML for this QoS policy (through the inclusion of a preamble).

The default value for this property (false) results in QoS being printed starting from the <ENTITY\_qos> tag (where the <ENTITY\_qos> tag is, e.g., <domain\_participant\_qos>, or, <datareader\_qos>). This result cannot be directly parsed as valid XML (as it lacks <dds>, <qos\_library>, and <qos\_profile> tags). If is\_standalone is set to true, these additional tags are printed, resulting in valid, parseable XML.

For example, with is\_standalone set to false, a Qos may appear as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

Setting is\_standalone to true would result in the same Qos being printed as:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <qos_library name="QoSLibrary">
    <qos_profile name="QoSProfile">
      <datareader_qos>
        <durability>
          <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
        </durability>
      </datareader_qos>
    </qos_profile>
  </qos_library>
</dds>
```

**[default]** false

### 5.157.2.2 print\_private

**DDS\_Boolean** DDS\_QoSPrintFormat::print\_private

Configures how private QoS policies should be printed.

There are some QoS policies which are not intended for external use. By default, these QoS policies are only printed if they are different to the default value for that policy. When true, private policies are treated like any other policy, and printed if they are different to the supplied base QoS. These private policies cannot be parsed from XML, and are always printed as XML comments.

**[default]** false

### 5.157.2.3 indent

**DDS\_UnsignedLong** DDS\_QoSPrintFormat::indent

Configures how much additional indent should be added to the string representation of a QoS.

Configures how much additional indent is applied when converting a QoS to a string. This value acts as a total offset on the string, increasing the indent which is applied to all elements by the same amount. With indent set to 0, a string representation of a QoS may appear as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

Setting the indent property to 1, the same QoS would be printed as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

I.e., the entire structure is indented.

[default] 0

## 5.158 DDS\_QueryConditionParams Struct Reference

### 5.160.1 Detailed Description

Controls how a `DataReader` manages the lifecycle of the data that it has received.

When a `DataReader` receives data, it is stored in a receive queue for the `DataReader`. The user application may either take the data from the queue or leave it there.

This QoS policy controls whether or not RTI Connext will automatically remove data from the receive queue (so that user applications cannot access it afterwards) when it detects that there are no more `DataWriters` alive for that data. It specifies how long a `DDS_DataReader` (p. 608) must retain information regarding instances that have the `instance_state` `DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE` (p. 707).

Note: This policy is not concerned with keeping reliable reader state or discovery information.

The `DDS_DataReader` (p. 608) internally maintains the samples that have not been "taken" by the application, subject to the constraints imposed by other QoS policies such as `DDS_HistoryQosPolicy` (p. 1558) and `DDS_ResourceLimitsQosPolicy` (p. 1690).

The `DDS_DataReader` (p. 608) also maintains information regarding the identity, `view_state` and `instance_state` of data instances even after all samples have been taken. This is needed to properly compute the states when future samples arrive.

Under normal circumstances the `DDS_DataReader` (p. 608) can only reclaim all resources for instances for which there are no writers and for which all samples have been 'taken'. The last sample the `DDS_DataReader` (p. 608) will have taken for that instance will have an `instance_state` of either `DDS_NOT_ALIVE_NO_WRITERS_INSTANCE_STATE` (p. 707) or `DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 707) depending on whether or not the last writer that had ownership of the instance disposed it.

In the absence of `READER_DATA_LIFECYCLE` (p. 1121), this behavior could cause problems if the application forgets to take those samples. "Untaken" samples will prevent the `DDS_DataReader` (p. 608) from reclaiming the resources and they would remain in the `DDS_DataReader` (p. 608) indefinitely.

A `DataReader` can also reclaim all resources for instances that have an `instance_state` of `DDS_NOT_ALIVE_DISPOSED_INSTANCE_STATE` (p. 707) and for which all DDS samples have been 'taken'. `DataReaders` will only reclaim resources in this situation when the `autopurge_disposed_instances_delay` has been set to zero.

For keyed Topics, the consideration of removing data samples from the receive queue is done on a per instance (key) basis. Thus when RTI Connext detects that there are no longer `DataWriters` alive for a certain key value of a Topic (an instance of the Topic), it can be configured to remove all data samples for that instance (key).

Entity:

`DDS_DataReader` (p. 608)

Properties:

`RxO` (p. 1048) = N/A

`Changeable` (p. 1048) = YES (p. 1048)

## 5.160.2 Field Documentation

### 5.160.2.1 autopurge\_nowriter\_samples\_delay

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_samples_delay
```

Minimum duration for which the **DDS\_DataReader** (p. 608) will maintain information regarding an instance once its `instance_state` becomes **DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707).

At some point after this time elapses, the **DDS\_DataReader** (p. 608) will purge all internal information regarding the instance, any "untaken" samples will also be dropped.

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011)

**[range]** [1 nanosec, 1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

### 5.160.2.2 autopurge\_disposed\_samples\_delay

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_samples_delay
```

Minimum duration for which the **DDS\_DataReader** (p. 608) will maintain samples for an instance once its `instance_state` becomes **DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707).

After this time elapses, the **DDS\_DataReader** (p. 608) will purge all samples for the instance even if they have not been read by the application. This purge is done lazily when space is needed for other samples or instances.

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011)

**[range]** [1 nanosec, 1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

### 5.160.2.3 autopurge\_disposed\_instances\_delay

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_disposed_instances_delay
```

**<<extension>>** (p. 817) Minimum duration for which the **DDS\_DataReader** (p. 608) will maintain information about a received instance once its `instance_state` becomes **DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707) and there are no samples for the instance in the DataReader queue.

After this time elapses, when the last sample for the disposed instance is taken, the **DDS\_DataReader** (p. 608) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set `keep_minimum_state_for_instances` to **FALSE** in **DDS\_DataReaderResourceLimitsQosPolicy** (p. 1398).

The only currently supported values are **DDS\_DURATION\_ZERO** (p. 1012) and **DDS\_DURATION\_INFINITE** (p. 1011). A value of **DDS\_DURATION\_ZERO** (p. 1012) will purge an instance's state immediately after the instance state transitions to **DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707), as long as all samples, including the dispose sample, associated with that instance have been 'taken'.

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011)

#### 5.160.2.4 autopurge\_nowriter\_instances\_delay

```
struct DDS_Duration_t DDS_ReaderDataLifecycleQosPolicy::autopurge_nowriter_instances_delay
```

<<*extension*>> (p. 817) Minimum duration for which the **DDS\_DataReader** (p. 608) will maintain information about a received instance once its `instance_state` becomes **DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707) and there are no samples for the instance in the DataReader queue.

An instance will transition to the **DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707) `instance_state` when all known writers for the instance have either lost liveliness or have unregistered themselves from the instance. After this time elapses, when the last sample for the instance without writers is taken, the **DDS\_DataReader** (p. 608) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set `keep_minimum_state_for_instances` to `FALSE` in **DDS\_DataReaderResourceLimitsQosPolicy** (p. 1398).

The only currently supported values are **DDS\_DURATION\_ZERO** (p. 1012) and **DDS\_DURATION\_INFINITE** (p. 1011). A value of **DDS\_DURATION\_ZERO** (p. 1012) will purge an instance's state immediately after the instance state transitions to **DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707), as long as all samples, including the `no_↔writers` sample, associated with that instance have been 'taken'.

[default] **DDS\_DURATION\_ZERO** (p. 1012)

## 5.161 DDS\_ReceiverPoolQosPolicy Struct Reference

Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

### Data Fields

- struct **DDS\_ThreadSettings\_t** `thread`  
*Receiver pool thread(s).*
- **DDS\_Long** `buffer_size`  
*The receive buffer size in bytes.*
- **DDS\_Long** `buffer_alignment`  
*The receive buffer alignment.*

### 5.161.1 Detailed Description

Configures threads used by RTI Connex to receive and process data from transports (for example, UDP sockets).

This QoS policy is an extension to the DDS standard.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

See also

**Controlling CPU Core Affinity for RTI Threads** (p. 1040)

## 5.161.2 Usage

This QoS policy sets the thread properties such as priority level and stack size for the threads used by the middleware to receive and process data from transports.

RTI uses a separate receive thread per port per transport plug-in. To force RTI Connexx to use a separate thread to process the data for a **DDS\_DataReader** (p. 608), set a unique port for the **DDS\_TransportUnicastQosPolicy** (p. 1800) or **DDS\_TransportMulticastQosPolicy** (p. 1793) for the **DDS\_DataReader** (p. 608).

This QoS policy also sets the size of the buffer used to store packets received from a transport. This buffer size will limit the largest single packet of data that a **DDS\_DomainParticipant** (p. 72) will accept from a transport. Users will often set this size to the largest packet that any of the transports used by their application will deliver. For many applications, the value 65,536 (64 K) is a good choice; this value is the largest packet that can be sent/received via UDP.

## 5.161.3 Field Documentation

### 5.161.3.1 thread

```
struct DDS_ThreadSettings_t DDS_ReceiverPoolQosPolicy::thread
```

Receiver pool thread(s).

There is at least one receive thread, possibly more.

**[default]** priority above normal.

The actual value depends on your architecture:

For Windows: 2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

**[default]** The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

**[default]** mask **DDS\_THREAD\_SETTINGS\_FLOATING\_POINT** (p. 1040) | **DDS\_THREAD\_SETTINGS\_STUDIO** (p. 1040)

### 5.161.3.2 `buffer_size`

```
DDS_Long DDS_ReceiverPoolQosPolicy::buffer_size
```

The receive buffer size in bytes.

The receive buffer is used by the receive thread to store the raw data that arrives over the transports in non-zero-copy transports.

Zero-copy transports do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in buffers allocated by the transports themselves. Only the shared memory built-in transport (SHMEM) supports zero-copy.

`buffer_size` must always be at least as large as the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1857) across *all* of the transports being used that are not doing zero-copy.

By default (`DDS_LENGTH_AUTO` (p. 1122)): the size is equal to the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1857) across *all* of the non-zero-copy transports.

You may want the value to be greater than the default if you try to limit the largest data packet that can be sent through the transport(s) in one application, but you still want to receive data from other applications that have not made the same change.

For example, to avoid IP fragmentation, you may want to set `NDDS_Transport_Property_t::message_size_max` (p. 1857) for IP-based transports to a small value, such as 1400 bytes. However, you may not be able to apply this change to all the applications at the same time. To receive data from these other applications the `buffer_size` should be equal to the original `NDDS_Transport_Property_t::message_size_max` (p. 1857).

**[default]** `DDS_LENGTH_AUTO` (p. 1122)

**[range]** [1, 1 GB] or `DDS_LENGTH_AUTO` (p. 1122)

### 5.161.3.3 `buffer_alignment`

```
DDS_Long DDS_ReceiverPoolQosPolicy::buffer_alignment
```

The receive buffer alignment.

Most users will not need to change this alignment.

**[default]** 16

**[range]** [1,1024] Value must be a power of 2.

## 5.162 `DDS_ReliabilityQosPolicy` Struct Reference

Indicates the level of reliability offered/requested by RTI Connex.

## Data Fields

- **DDS\_ReliabilityQosPolicyKind kind**  
*Kind of reliability.*
- struct **DDS\_Duration\_t max\_blocking\_time**  
*The maximum time a DataWriter can block on a write() call.*
- **DDS\_ReliabilityQosPolicyAcknowledgmentModeKind acknowledgment\_kind**  
<<extension>> (p. 817) *Kind of reliable acknowledgment*
- **DDS\_InstanceStateConsistencyKind instance\_state\_consistency\_kind**  
<<extension>> (p. 817) *Whether instance state consistency is enabled*

### 5.162.1 Detailed Description

Indicates the level of reliability offered/requested by RTI Connex.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_OFFERED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_↔ STATUS** (p. 1032)

Properties:

**RxO** (p. 1048) = YES  
**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048) (the instance\_state\_consistency\_kind is **Changeable** (p. 1048) = **NO** (p. 1048))

### 5.162.2 Usage

This policy indicates the level of reliability requested by a **DDS\_DataReader** (p. 608) or offered by a **DDS\_DataWriter** (p. 478).

The reliability of a connection between a DataWriter and DataReader is entirely user configurable. It can be done on a per DataWriter/DataReader connection. A connection may be configured to be "best effort" which means that RTI Connex will not use any resources to monitor or guarantee that the data sent by a DataWriter is received by a DataReader.

For some use cases, such as the periodic update of sensor values to a GUI displaying the value to a person, **DDS\_↔ BEST\_EFFORT\_RELIABILITY\_QOS** (p. 1124) delivery is often good enough. It is certainly the fastest, most efficient, and least resource-intensive (CPU and network bandwidth) method of getting the newest/latest value for a topic from DataWriters to DataReaders. But there is no guarantee that the data sent will be received. It may be lost due to a variety of factors, including data loss by the physical transport such as wireless RF or even Ethernet.

However, there are data streams (topics) in which you want an absolute guarantee that all data sent by a `DataWriter` is received reliably by `DataReaders`. This means that RTI Connext must check whether or not data was received, and repair any data that was rejected by resending a copy of the data as many times as it takes for the `DataReader` to receive the data. RTI Connext uses a reliability protocol configured and tuned by these QoS policies: `DDS_HistoryQosPolicy` (p. 1558), `DDS_DataWriterProtocolQosPolicy` (p. 1422), `DDS_DataReaderProtocolQosPolicy` (p. 1375), and `DDS_ResourceLimitsQosPolicy` (p. 1690).

The Reliability QoS policy is simply a switch to turn on the reliability protocol for a `DataWriter/DataReader` connection. The level of reliability provided by RTI Connext is determined by the configuration of the aforementioned QoS policies.

You can configure RTI Connext to deliver *all* data in the order they were sent (also known as absolute or strict reliability). Or, as a tradeoff for less memory, CPU, and network usage, you can choose a reduced level of reliability where only the last *N* values are guaranteed to be delivered reliably to `DataReaders` (where *N* is user-configurable). In the reduced level of reliability, there are no guarantees that the data sent before the last *N* are received. Only the last *N* data packets are monitored and repaired if necessary.

These levels are ordered, `DDS_BEST_EFFORT_RELIABILITY_QOS` (p. 1124) < `DDS_RELIABLE_RELIABILITY_QOS` (p. 1124). A `DDS_DataWriter` (p. 478) offering one level is implicitly offering all levels below.

Note: To send *large* data reliably, you will also need to set `DDS_ASYNCHRONOUS_PUBLISH_MODE_QOS` (p. 1120). *Large* in this context means that the data cannot be sent as a single packet by the transport (for example, data larger than 63K when using UDP/IP).

The setting of this policy has a dependency on the setting of the `RESOURCE_LIMITS` (p. 1126) policy. In case the reliability kind is set to `DDS_RELIABLE_RELIABILITY_QOS` (p. 1124) the write operation on the `DDS_DataWriter` (p. 478) may block if the modification would cause data to be lost or else cause one of the limits in specified in the `RESOURCE_LIMITS` (p. 1126) to be exceeded. Under these circumstances, the `RELIABILITY` (p. 1122) `max_blocking_time` configures the maximum duration the write operation may block.

If the `DDS_ReliabilityQosPolicy::kind` (p. 1681) is set to `DDS_RELIABLE_RELIABILITY_QOS` (p. 1124), data samples originating from a single `DDS_DataWriter` (p. 478) cannot be made available to the `DDS_DataReader` (p. 608) if there are previous data samples that have not been received yet due to a communication error. In other words, RTI Connext will repair the error and resend data samples as needed in order to reconstruct a correct snapshot of the `DDS_DataWriter` (p. 478) history before it is accessible by the `DDS_DataReader` (p. 608).

If the `DDS_ReliabilityQosPolicy::kind` (p. 1681) is set to `DDS_BEST_EFFORT_RELIABILITY_QOS` (p. 1124), the service will not re-transmit missing data samples. However, for data samples originating from any one `DataWriter` the service will ensure they are stored in the `DDS_DataReader` (p. 608) history in the same order they originated in the `DDS_DataWriter` (p. 478). In other words, the `DDS_DataReader` (p. 608) may miss some data samples, but it will never see the value of a data object change from a newer value to an older value.

See also

`DDS_HistoryQosPolicy` (p. 1558)

`DDS_ResourceLimitsQosPolicy` (p. 1690)

### 5.162.3 Compatibility

The value offered is considered compatible with the value requested if and only if:

- the inequality *offered kind*  $\geq$  *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS\_ReliabilityQosPolicy::kind** (p. 1681) are considered ordered such that **DDS\_BEST\_EFFORT**  $\leftarrow$  **\_RELIABILITY\_QOS** (p. 1124)  $<$  **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124).
- The offered `acknowledgment_kind` = **DDS\_PROTOCOL\_ACKNOWLEDGMENT\_MODE** (p.1124) and requested `acknowledgment_kind` = **DDS\_PROTOCOL\_ACKNOWLEDGMENT\_MODE** (p.1124) OR offered `acknowledgment_kind`  $\neq$  **DDS\_PROTOCOL\_ACKNOWLEDGMENT\_MODE** (p. 1124).
- the inequality *offered instance\_state\_consistency\_kind*  $\geq$  *requested instance\_state*  $\leftarrow$  *\_consistency\_kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **DDS**  $\leftarrow$  **ReliabilityQosPolicy::instance\_state\_consistency\_kind** (p.1682) are considered ordered such that **DDS**  $\leftarrow$  **\_NO\_RECOVER\_INSTANCE\_STATE\_CONSISTENCY** (p.1125)  $<$  **DDS\_RECOVER\_INSTANCE\_STATE**  $\leftarrow$  **CONSISTENCY** (p. 1125).

## 5.162.4 Field Documentation

### 5.162.4.1 kind

**DDS\_ReliabilityQosPolicyKind** DDS\_ReliabilityQosPolicy::kind

Kind of reliability.

**[default]** **DDS\_BEST\_EFFORT\_RELIABILITY\_QOS** (p. 1124) for **DDS\_DataReader** (p. 608) and **DDS\_Topic** (p. 172), **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124) for **DDS\_DataWriter** (p. 478)

### 5.162.4.2 max\_blocking\_time

**struct DDS\_Duration\_t** DDS\_ReliabilityQosPolicy::max\_blocking\_time

The maximum time a DataWriter can block on a write() call.

See `Writing Data`, in the Core Libraries User's Manual, for more information about when the write() call can block and what happens when it times out.

Has no meaning for DataReaders.

**[default]** 100 milliseconds

**[range]** [0,1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

See also

**DDS\_ResourceLimitsQosPolicy** (p. 1690)

### 5.162.4.3 acknowledgment\_kind

`DDS_ReliabilityQosPolicyAcknowledgmentModeKind` `DDS_ReliabilityQosPolicy::acknowledgment_kind`

<<*extension*>> (p. 817) Kind of reliable acknowledgment

This setting applies only to the case where `DDS_ReliabilityQosPolicy::kind` (p. 1681) = `DDS_RELIABLE_↔RELIABILITY_QOS` (p. 1124).

Sets the kind acknowledgments supported by a `DDS_DataWriter` (p. 478) and sent by `DDS_DataReader` (p. 608).

[default] `DDS_PROTOCOL_ACKNOWLEDGMENT_MODE` (p. 1124)

### 5.162.4.4 instance\_state\_consistency\_kind

`DDS_InstanceStateConsistencyKind` `DDS_ReliabilityQosPolicy::instance_state_consistency_kind`

<<*extension*>> (p. 817) Whether instance state consistency is enabled

A DataReader that determines that the DataWriter is no longer alive will transition instances to `NOT_ALIVE_NO_↔WRITERS` if there are no other DataWriters updating that instance. If the DataReader rediscovers the DataWriter, the DataReader does not automatically transition instances back to the state they were in prior to the disconnection until it gets updates (i.e., samples) for them.

If `InstanceStateConsistencyKind` is set to `RECOVER_INSTANCE_STATE_CONSISTENCY`, then when the DataReader rediscovers a DataWriter, the DataReader will query the DataWriter for the state of its instances, and restore the instances to their correct state.

[default] `DDS_NO_RECOVER_INSTANCE_STATE_CONSISTENCY` (p. 1125) for `DDS_DataReader` (p. 608), `DDS_↔_RECOVER_INSTANCE_STATE_CONSISTENCY` (p. 1125) for `DDS_DataWriter` (p. 478)

## 5.163 DDS\_ReliableReaderActivityChangedStatus Struct Reference

<<*extension*>> (p. 817) Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer.

### Data Fields

- **DDS\_Long active\_count**  
*The current number of reliable readers currently matched with this reliable writer.*
- **DDS\_Long inactive\_count**  
*The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.*
- **DDS\_Long active\_count\_change**  
*The most recent change in the number of active remote reliable readers.*
- **DDS\_Long inactive\_count\_change**  
*The most recent change in the number of inactive remote reliable readers.*
- **DDS\_InstanceHandle\_t last\_instance\_handle**  
*The instance handle of the last reliable remote reader to be determined inactive.*

## 5.163.1 Detailed Description

<<*extension*>> (p. 817) Describes the activity (i.e. are acknowledgements forthcoming) of reliable readers matched to a reliable writer.

Entity:

**DDS\_DataWriter** (p. 478)

Listener:

**DDS\_DataWriterListener** (p. 1417)

This status is the reciprocal status to the **DDS\_LivelinessChangedStatus** (p. 1572) on the reader. It is different than the **DDS\_LivelinessLostStatus** (p. 1574) on the writer in that the latter informs the writer about its own liveliness; this status informs the writer about the "liveliness" (activity) of its matched readers.

All counts in this status will remain at zero for best effort writers.

## 5.163.2 Field Documentation

### 5.163.2.1 active\_count

**DDS\_Long** DDS\_ReliableReaderActivityChangedStatus::active\_count

The current number of reliable readers currently matched with this reliable writer.

### 5.163.2.2 inactive\_count

**DDS\_Long** DDS\_ReliableReaderActivityChangedStatus::inactive\_count

The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.

A reader is considered to be inactive after is has been sent heartbeats **DDS\_RtpsReliableWriterProtocol\_t::max\_heartbeat\_retries** (p. 1704) times, each heartbeat having been separated from the previous by the current heartbeat period.

### 5.163.2.3 active\_count\_change

`DDS_Long DDS_ReliableReaderActivityChangedStatus::active_count_change`

The most recent change in the number of active remote reliable readers.

### 5.163.2.4 inactive\_count\_change

`DDS_Long DDS_ReliableReaderActivityChangedStatus::inactive_count_change`

The most recent change in the number of inactive remote reliable readers.

### 5.163.2.5 last\_instance\_handle

`DDS_InstanceHandle_t DDS_ReliableReaderActivityChangedStatus::last_instance_handle`

The instance handle of the last reliable remote reader to be determined inactive.

## 5.164 DDS\_ReliableWriterCacheChangedStatus Struct Reference

<<*extension*>> (p. 817) A summary of the state of a data writer's cache of unacknowledged samples written.

### Data Fields

- struct **DDS\_ReliableWriterCacheEventCount empty\_reliable\_writer\_cache**  
*The number of times the reliable writer's cache of unacknowledged samples has become empty.*
- struct **DDS\_ReliableWriterCacheEventCount full\_reliable\_writer\_cache**  
*The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.*
- struct **DDS\_ReliableWriterCacheEventCount low\_watermark\_reliable\_writer\_cache**  
*The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.*
- struct **DDS\_ReliableWriterCacheEventCount high\_watermark\_reliable\_writer\_cache**  
*The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.*
- **DDS\_Long unacknowledged\_sample\_count**  
*The current number of unacknowledged samples in the writer's cache.*
- **DDS\_Long unacknowledged\_sample\_count\_peak**  
*The highest value that unacknowledged\_sample\_count has reached until now.*
- **DDS\_LongLong replaced\_unacknowledged\_sample\_count**  
*The number of unacknowledged samples that have been replaced in the writer's cache.*

### 5.164.1 Detailed Description

<<**extension**>> (p. 817) A summary of the state of a data writer's cache of unacknowledged samples written.

Entity:

**DDS\_DataWriter** (p. 478)

Listener:

**DDS\_DataWriterListener** (p. 1417)

A written sample is unacknowledged (and therefore accounted for in this status) if the writer is reliable and one or more readers matched with the writer has not yet sent an acknowledgement to the writer declaring that it has received the sample.

If the low watermark is zero and the unacknowledged sample count decreases to zero, both the low watermark and cache empty events are considered to have taken place. A single callback will be dispatched (assuming the user has requested one) that contains both status changes. The same logic applies when the high watermark is set equal to the maximum number of samples and the cache becomes full.

### 5.164.2 Field Documentation

#### 5.164.2.1 empty\_reliable\_writer\_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::empty_reliable_↔
writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has become empty.

#### 5.164.2.2 full\_reliable\_writer\_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::full_reliable_↔
writer_cache
```

The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.

Applies to writer's cache when the send window is enabled (when both **DDS\_RtpsReliableWriterProtocol\_t::min\_↔\_send\_window\_size** (p. 1710) and **DDS\_RtpsReliableWriterProtocol\_t::max\_send\_window\_size** (p. 1711) are not **DDS\_LENGTH\_UNLIMITED** (p. 1127)).

Otherwise, applies when the number of unacknowledged samples has reached the send window limit.

### 5.164.2.3 low\_watermark\_reliable\_writer\_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::low_watermark_↔
reliable_writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

A low watermark event will only be considered to have taken place when the number of unacknowledged samples in the writer's cache *decreases* to this value. A sample count that increases to this value will not result in a callback or in a change to the total count of low watermark events.

When the writer's send window is enabled, the low watermark is scaled down, if necessary, to fit within the current send window.

Set the low watermark value using the **DDS\_RtpsReliableWriterProtocol\_t::low\_watermark** (p. 1701) field of the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699) structure.

### 5.164.2.4 high\_watermark\_reliable\_writer\_cache

```
struct DDS_ReliableWriterCacheEventCount DDS_ReliableWriterCacheChangedStatus::high_watermark_↔
reliable_writer_cache
```

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

A high watermark event will only be considered to have taken place when the number of unacknowledged sampled *increases* to this value. A sample count that was above this value and then decreases back to it will not trigger an event.

When the writer's send window is enabled, the high watermark is scaled down, if necessary, to fit within the current send window.

Set the high watermark value using the **DDS\_RtpsReliableWriterProtocol\_t::high\_watermark** (p. 1701) field of the **DDS\_RtpsReliableWriterProtocol\_t** (p. 1699) structure.

### 5.164.2.5 unacknowledged\_sample\_count

```
DDS_Long DDS_ReliableWriterCacheChangedStatus::unacknowledged_sample_count
```

The current number of unacknowledged samples in the writer's cache.

A sample is considered unacknowledged if the writer has failed to receive an acknowledgement from one or more reliable readers matched to it.

### 5.164.2.6 unacknowledged\_sample\_count\_peak

```
DDS_Long DDS_ReliableWriterCacheChangedStatus::unacknowledged_sample_count_peak
```

The highest value that `unacknowledged_sample_count` has reached until now.

### 5.164.2.7 replaced\_unacknowledged\_sample\_count

`DDS_LongLong DDS_ReliableWriterCacheChangedStatus::replaced_unacknowledged_sample_count`

The number of unacknowledged samples that have been replaced in the writer's cache.

Total number of unacknowledged samples that have been replaced by a DataWriter after applying `DDS_KEEP_LAST`↔  
`_HISTORY_QOS` (p. 1094) policy.

## 5.165 DDS\_ReliableWriterCacheEventCount Struct Reference

<<*extension*>> (p. 817) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

### Data Fields

- **DDS\_Long total\_count**  
*The total number of times the event has occurred.*
- **DDS\_Long total\_count\_change**  
*The incremental number of times the event has occurred since the listener was last invoked or the status read.*

### 5.165.1 Detailed Description

<<*extension*>> (p. 817) The number of times the number of unacknowledged samples in the cache of a reliable writer hit a certain well-defined threshold.

The threshold interpretation depends on the usage of this data type in `DDS_ReliableWriterCacheChangedStatus` (p. 1684).

`DDS_ReliableWriterCacheChangedStatus` (p. 1684)

### 5.165.2 Field Documentation

#### 5.165.2.1 total\_count

`DDS_Long DDS_ReliableWriterCacheEventCount::total_count`

The total number of times the event has occurred.

### 5.165.2.2 total\_count\_change

**DDS\_Long** DDS\_ReliableWriterCacheEventCount::total\_count\_change

The incremental number of times the event has occurred since the listener was last invoked or the status read.

## 5.166 DDS\_RequestedDeadlineMissedStatus Struct Reference

**DDS\_REQUESTED\_DEADLINE\_MISSED\_STATUS** (p. 1032)

### Data Fields

- **DDS\_Long total\_count**  
*Total cumulative count of the deadlines detected for any instance read by the **DDS\_DataReader** (p. 608).*
- **DDS\_Long total\_count\_change**  
*The incremental number of deadlines detected since the last time the listener was called or the status was read.*
- **DDS\_InstanceHandle\_t last\_instance\_handle**  
*Handle to the last instance in the **DDS\_DataReader** (p. 608) for which a deadline was detected.*

### 5.166.1 Detailed Description

**DDS\_REQUESTED\_DEADLINE\_MISSED\_STATUS** (p. 1032)

#### Examples

HelloWorld\_subscriber.c.

### 5.166.2 Field Documentation

#### 5.166.2.1 total\_count

**DDS\_Long** DDS\_RequestedDeadlineMissedStatus::total\_count

Total cumulative count of the deadlines detected for any instance read by the **DDS\_DataReader** (p. 608).

### 5.166.2.2 total\_count\_change

`DDS_Long DDS_RequestedDeadlineMissedStatus::total_count_change`

The incremental number of deadlines detected since the last time the listener was called or the status was read.

### 5.166.2.3 last\_instance\_handle

`DDS_InstanceHandle_t DDS_RequestedDeadlineMissedStatus::last_instance_handle`

Handle to the last instance in the `DDS_DataReader` (p. 608) for which a deadline was detected.

## 5.167 DDS\_RequestedIncompatibleQosStatus Struct Reference

`DDS_REQUESTED_INCOMPATIBLE_QOS_STATUS` (p. 1032)

### Data Fields

- `DDS_Long total_count`

*Total cumulative count of how many times the concerned `DDS_DataReader` (p. 608) discovered a `DDS_DataWriter` (p. 478) for the same `DDS_Topic` (p. 172) with an offered QoS that is incompatible with that requested by the `DDS_DataReader` (p. 608).*

- `DDS_Long total_count_change`

*The change in `total_count` since the last time the listener was called or the status was read.*

- `DDS_QosPolicyId_t last_policy_id`

*The `DDS_QosPolicyId_t` (p. 1048) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*

- struct `DDS_QosPolicyCountSeq policies`

*A list containing, for each policy, the total number of times that the concerned `DDS_DataReader` (p. 608) discovered a `DDS_DataWriter` (p. 478) for the same `DDS_Topic` (p. 172) with an offered QoS that is incompatible with that requested by the `DDS_DataReader` (p. 608).*

## 5.167.2 Field Documentation

### 5.167.2.1 total\_count

```
DDS_Long DDS_RequestedIncompatibleQosStatus::total_count
```

Total cumulative count of how many times the concerned **DDS\_DataReader** (p. 608) discovered a **DDS\_DataWriter** (p. 478) for the same **DDS\_Topic** (p. 172) with an offered QoS that is incompatible with that requested by the **DDS\_↔DataReader** (p. 608).

### 5.167.2.2 total\_count\_change

```
DDS_Long DDS_RequestedIncompatibleQosStatus::total_count_change
```

The change in `total_count` since the last time the listener was called or the status was read.

### 5.167.2.3 last\_policy\_id

```
DDS_QosPolicyId_t DDS_RequestedIncompatibleQosStatus::last_policy_id
```

The **DDS\_QosPolicyId\_t** (p. 1048) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

### 5.167.2.4 policies

```
struct DDS_QosPolicyCountSeq DDS_RequestedIncompatibleQosStatus::policies
```

A list containing, for each policy, the total number of times that the concerned **DDS\_DataReader** (p. 608) discovered a **DDS\_DataWriter** (p. 478) for the same **DDS\_Topic** (p. 172) with an offered QoS that is incompatible with that requested by the **DDS\_DataReader** (p. 608).

## 5.168 DDS\_ResourceLimitsQosPolicy Struct Reference

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

## Data Fields

- **DDS\_Long max\_samples**  
*Represents the maximum samples the middleware can store for any one **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)).*
- **DDS\_Long max\_instances**  
*Represents the maximum number of instances a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) can manage.*
- **DDS\_Long max\_samples\_per\_instance**  
*Represents the maximum number of samples of any one instance a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) can manage.*
- **DDS\_Long initial\_samples**  
*<<extension>> (p. 817) Represents the initial samples the middleware will store for any one **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)).*
- **DDS\_Long initial\_instances**  
*<<extension>> (p. 817) Represents the initial number of instances a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) will manage.*
- **DDS\_Long instance\_hash\_buckets**  
*<<extension>> (p. 817) Number of hash buckets for instances.*

### 5.168.1 Detailed Description

Controls the amount of physical memory allocated for DDS entities, if dynamic allocations are allowed, and how they occur. Also controls memory usage among different instance values for keyed topics.

Entity:

**DDS\_Topic** (p. 172), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Status:

**DDS\_SAMPLE\_REJECTED\_STATUS** (p. 1033), **DDS\_SampleRejectedStatus** (p. 1733)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

## 5.168.2 Usage

This policy controls the resources that RTI Connexx can use to meet the requirements imposed by the application and other QoS settings.

For the reliability protocol (and **DDS\_DurabilityQosPolicy** (p. 1516)), this QoS policy determines the actual maximum queue size when the **DDS\_HistoryQosPolicy** (p. 1558) is set to **DDS\_KEEP\_ALL\_HISTORY\_QOS** (p. 1094).

In general, this QoS policy is used to limit the amount of system memory that RTI Connexx can allocate. For embedded real-time systems and safety-critical systems, pre-determination of maximum memory usage is often required. In addition, dynamic memory allocation could introduce non-deterministic latencies in time-critical paths.

This QoS policy can be set such that an entity does not dynamically allocate any more memory after its initialization phase.

If **DDS\_DataWriter** (p. 478) objects are communicating samples faster than they are ultimately taken by the **DDS\_DataReader** (p. 608) objects, the middleware will eventually hit against some of the QoS-imposed resource limits. Note that this may occur when just a single **DDS\_DataReader** (p. 608) cannot keep up with its corresponding **DDS\_DataWriter** (p. 478). The behavior in this case depends on the setting for the **RELIABILITY** (p. 1122). If reliability is **DDS\_BEST\_EFFORT\_RELIABILITY\_QOS** (p. 1124), then RTI Connexx is allowed to drop samples. If the reliability is **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124), RTI Connexx will block the **DDS\_DataWriter** (p. 478) or discard the sample at the **DDS\_DataReader** (p. 608) in order not to lose existing samples.

The constant **DDS\_LENGTH\_UNLIMITED** (p. 1127) may be used to indicate the absence of a particular limit. For example setting **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693) to **DDS\_LENGTH\_UNLIMITED** (p. 1127) will cause RTI Connexx not to enforce this particular limit.

If these resource limits are not set sufficiently, under certain circumstances the **DDS\_DataWriter** (p. 478) may block on a write() call even though the **DDS\_HistoryQosPolicy** (p. 1558) is **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094). To guarantee the writer does not block for **DDS\_KEEP\_LAST\_HISTORY\_QOS** (p. 1094), make sure the resource limits are set such that:

```
max_samples >= max_instances * max_samples_per_instance
```

See also

**DDS\_ReliabilityQosPolicy** (p. 1678)

**DDS\_HistoryQosPolicy** (p. 1558)

## 5.168.3 Consistency

The setting of **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693) must be consistent with **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693). For these two values to be consistent, it must be true that **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693)  $\geq$  **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693). As described above, this limit will not be enforced if **DDS\_ResourceLimitsQosPolicy::max\_samples\_per\_instance** (p. 1693) is set to **DDS\_LENGTH\_UNLIMITED** (p. 1127).

The setting of **RESOURCE\_LIMITS** (p. 1126) `max_samples_per_instance` must be consistent with the **HISTORY** (p. 1093) `depth`. For these two QoS to be consistent, it must be true that  $depth \leq max\_samples\_per\_instance$ .

See also

**DDS\_HistoryQosPolicy** (p. 1558)

## 5.168.4 Field Documentation

### 5.168.4.1 max\_samples

`DDS_Long DDS_ResourceLimitsQosPolicy::max_samples`

Represents the maximum samples the middleware can store for any one **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)).

Specifies the maximum number of data samples a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) can manage across all the instances associated with it.

For unkeyed types, this value has to be equal to `max_samples_per_instance` if `max_samples_per_instance` is not equal to **DDS\_LENGTH\_UNLIMITED** (p. 1127).

When batching is enabled, the maximum number of data samples a **DDS\_DataWriter** (p. 478) can manage will also be limited by **DDS\_DataWriterResourceLimitsQosPolicy::max\_batches** (p. 1449).

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 100 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  `initial_samples`,  $\geq$  `max_samples_per_instance`,  $\geq$  **DDS\_DataReaderResourceLimitsQosPolicy::max\_samples\_per\_remote\_writer** (p. 1400) or  $\geq$  **DDS\_RtpsReliableWriterProtocol\_t::heartbeats\_per\_max\_samples** (p. 1705)

For **DDS\_DataWriterQos** (p. 1438) `max_samples`  $\geq$  **DDS\_RtpsReliableWriterProtocol\_t::heartbeats\_per\_max\_samples** (p. 1705) in **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426) if batching is disabled.

### 5.168.4.2 max\_instances

`DDS_Long DDS_ResourceLimitsQosPolicy::max_instances`

Represents the maximum number of instances a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) can manage.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  `initial_instances`

### 5.168.4.3 max\_samples\_per\_instance

`DDS_Long DDS_ResourceLimitsQosPolicy::max_samples_per_instance`

Represents the maximum number of samples of any one instance a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) can manage.

While an unkeyed type is logically considered as a single instance, for unkeyed types this value has to be equal to `max_samples` or **DDS\_LENGTH\_UNLIMITED** (p. 1127).

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 100 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\leq$  `max_samples` or **DDS\_LENGTH\_UNLIMITED** (p. 1127),  $\geq$  **DDS\_HistoryQosPolicy::depth** (p. 1560)

#### 5.168.4.4 initial\_samples

`DDS_Long DDS_ResourceLimitsQosPolicy::initial_samples`

<<*extension*>> (p. 817) Represents the initial samples the middleware will store for any one **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)).

Specifies the initial number of data samples a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) will manage across all the instances associated with it.

**[default]** 32

**[range]** [1,100 million], <= max\_samples

#### 5.168.4.5 initial\_instances

`DDS_Long DDS_ResourceLimitsQosPolicy::initial_instances`

<<*extension*>> (p. 817) Represents the initial number of instances a **DDS\_DataWriter** (p. 478) (or **DDS\_DataReader** (p. 608)) will manage.

**[default]** 32

**[range]** [1,1 million], <= max\_instances

#### 5.168.4.6 instance\_hash\_buckets

`DDS_Long DDS_ResourceLimitsQosPolicy::instance_hash_buckets`

<<*extension*>> (p. 817) Number of hash buckets for instances.

The instance hash table facilitates instance lookup. A higher number of buckets decreases instance lookup time but increases the memory usage.

**[default]** 1 **[range]** [1,1 million]

## 5.169 DDS\_RTPS\_EntityId\_t Struct Reference

From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.

### 5.169.1 Detailed Description

From the DDS-RTPS specification: type used to hold the suffix part of the globally-unique RTPS-entity identifiers.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

## 5.170 DDS\_RTPS\_GUID\_t Struct Reference

From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.

### 5.170.1 Detailed Description

From the DDS-RTPS specification: type used to hold a globally-unique RTPS-entity identifier.

From DDS-RTPS Specification, clauses 8.4.2.1 and 9.3.1.

## 5.171 DDS\_RtpsReliableReaderProtocol\_t Struct Reference

Qos related to reliable reader protocol defined in RTPS.

### Data Fields

- struct **DDS\_Duration\_t min\_heartbeat\_response\_delay**  
*The minimum delay to respond to a heartbeat.*
- struct **DDS\_Duration\_t max\_heartbeat\_response\_delay**  
*The maximum delay to respond to a heartbeat.*
- struct **DDS\_Duration\_t heartbeat\_suppression\_duration**  
*The duration a reader ignores consecutively received heartbeats.*
- struct **DDS\_Duration\_t nack\_period**  
*The period at which to send NACKs.*
- **DDS\_Long receive\_window\_size**  
*The number of received out-of-order samples a reader can keep at a time.*
- struct **DDS\_Duration\_t round\_trip\_time**  
*The duration from sending a NACK to receiving a repair of a sample.*
- struct **DDS\_Duration\_t app\_ack\_period**  
*The period at which application-level acknowledgment messages are sent.*
- struct **DDS\_Duration\_t min\_app\_ack\_response\_keep\_duration**  
*Minimum duration for which application-level acknowledgment response data is kept.*
- **DDS\_Long samples\_per\_app\_ack**  
*The minimum number of samples acknowledged by one application-level acknowledgment message.*

### 5.171.1 Detailed Description

Qos related to reliable reader protocol defined in RTPS.

It is used to config reliable reader according to RTPS protocol.

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

QoS:

**DDS\_DataReaderProtocolQosPolicy** (p. 1375) **DDS\_DiscoveryConfigQosPolicy** (p. 1460)

## 5.171.2 Field Documentation

### 5.171.2.1 min\_heartbeat\_response\_delay

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::min_heartbeat_response_delay
```

The minimum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of the minimum delay.

**[default]** 0 seconds

**[range]** [0, 1 year], <= max\_heartbeat\_response\_delay

### 5.171.2.2 max\_heartbeat\_response\_delay

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::max_heartbeat_response_delay
```

The maximum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of maximum delay.

**[default]** The default value depends on the container policy:

- For **DDS\_DataReaderProtocolQosPolicy::rtps\_reliable\_reader** (p. 1378): 0.5 seconds
- For **DDS\_DiscoveryConfigQosPolicy::publication\_reader** (p. 1466): 0 seconds
- For **DDS\_DiscoveryConfigQosPolicy::subscription\_reader** (p. 1466): 0 seconds
- For **DDS\_DiscoveryConfigQosPolicy::participant\_message\_reader** (p. 1469): 0 seconds

**[range]** [0, 1 year], >= min\_heartbeat\_response\_delay

### 5.171.2.3 heartbeat\_suppression\_duration

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::heartbeat_suppression_duration
```

The duration a reader ignores consecutively received heartbeats.

When a reliable reader receives consecutive heartbeats within a short duration that will trigger redundant NACKs, the reader may ignore the latter heartbeat(s). This sets the duration during which additionally received heartbeats are suppressed.

**[default]** 0.0625 seconds

**[range]** [0, 1 year],

### 5.171.2.4 nack\_period

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::nack_period
```

The period at which to send NACKs.

A reliable reader will send periodic NACKs at this rate when it first matches with a reliable writer. The reader will stop sending NACKs when it has received all available historical data from the writer.

**[default]** 5 seconds

**[range]** [1 nanosec, 1 year]

### 5.171.2.5 receive\_window\_size

```
DDS_Long DDS_RtpsReliableReaderProtocol_t::receive_window_size
```

The number of received out-of-order samples a reader can keep at a time.

A reliable reader stores the out-of-order samples it receives until it can present them to the application in-order. The receive window is the maximum number of out-of-order samples that a reliable reader keeps at a given time. When the receive window is full, subsequently received out-of-order samples are dropped.

**[default]** 256

**[range]** [ $\geq 1$ ]

### 5.171.2.6 round\_trip\_time

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::round_trip_time
```

The duration from sending a NACK to receiving a repair of a sample.

This round-trip time is an estimate of the time starting from when the reader sends a NACK for a specific sample to when it receives that sample. For each sample, the reader will not send a subsequent NACK for it until the round-trip time has passed, thus preventing inefficient redundant requests.

**[default]** 0 seconds

**[range]** [0 nanosec, 1 year]

### 5.171.2.7 app\_ack\_period

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::app_ack_period
```

The period at which application-level acknowledgment messages are sent.

A **DDS\_DataReader** (p. 608) sends application-level acknowledgment messages to a **DDS\_DataWriter** (p. 478) at this periodic rate, and will continue sending until it receives a message from the **DDS\_DataWriter** (p. 478) that it has received and processed the acknowledgment and an AppAckConfirmation has been received by the **DDS\_DataReader** (p. 608). Note: application-level acknowledgment messages can also be sent non-periodically, as determined by **DDS\_RtpsReliableReaderProtocol\_t::samples\_per\_app\_ack** (p. 1698).

**[default]** 5 seconds

**[range]** [1 nanosec, 1 year]

### 5.171.2.8 min\_app\_ack\_response\_keep\_duration

```
struct DDS_Duration_t DDS_RtpsReliableReaderProtocol_t::min_app_ack_response_keep_duration
```

Minimum duration for which application-level acknowledgment response data is kept.

The user-specified response data of an explicit application-level acknowledgment (called by **DDS\_DataReader\_acknowledge\_sample** (p. 669) or **DDS\_DataReader\_acknowledge\_all** (p. 669)) is cached by the **DDS\_DataReader** (p. 608) for the purpose of reliably resending the data with the acknowledgment message. After this duration has passed from the time of the first acknowledgment, the response data is dropped from the cache and will not be resent with future acknowledgments for the corresponding sample(s).

**[default]** 0 sec

**[range]** [0 sec, 1 year]

### 5.171.2.9 samples\_per\_app\_ack

**DDS\_Long** DDS\_RtpsReliableReaderProtocol\_t::samples\_per\_app\_ack

The minimum number of samples acknowledged by one application-level acknowledgment message.

This setting applies only when **DDS\_ReliabilityQosPolicy::acknowledgment\_kind** (p. 1681) = **DDS\_APPLICATION\_←\_EXPLICIT\_ACKNOWLEDGMENT\_MODE** (p. 1125) or **DDS\_APPLICATION\_AUTO\_ACKNOWLEDGMENT\_MODE** (p. 1124)

A **DDS\_DataReader** (p. 608) will immediately send an application-level acknowledgment message when it has at least this many samples that have been acknowledged. It will not send an acknowledgment message until it has at least this many samples pending acknowledgment.

For example, calling **DDS\_DataReader\_acknowledge\_sample** (p. 669) this many times consecutively will trigger the sending of an acknowledgment message. Calling **DDS\_DataReader\_acknowledge\_all** (p. 669) may trigger the sending of an acknowledgment message, if at least this many samples are being acknowledged at once.

This is independent of the **DDS\_RtpsReliableReaderProtocol\_t::app\_ack\_period** (p. 1698), where a **DDS\_Data\_←Reader** (p. 608) will send acknowledgement messages at the periodic rate regardless.

When this is set to **DDS\_LENGTH\_UNLIMITED** (p. 1127), then acknowledgement messages are sent only periodically, at the rate set by **DDS\_RtpsReliableReaderProtocol\_t::app\_ack\_period** (p. 1698).

[default] 1

[range] [1, 1000000], or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

## 5.172 DDS\_RtpsReliableWriterProtocol\_t Struct Reference

QoS related to the reliable writer protocol defined in RTPS.

### Data Fields

- **DDS\_Long low\_watermark**

*When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **DDS\_RELIABLE\_WRITER\_CACHE\_CHANGED\_STATUS** (p. 1037) is considered to have changed.*

- **DDS\_Long high\_watermark**

*When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **DDS\_RELIABLE\_WRITER\_CACHE\_CHANGED\_STATUS** (p. 1037) is considered to have changed.*

- struct **DDS\_Duration\_t heartbeat\_period**

*The period at which to send heartbeats.*

- struct **DDS\_Duration\_t fast\_heartbeat\_period**

*An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.*

- struct **DDS\_Duration\_t late\_joiner\_heartbeat\_period**

*An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.*

- struct **DDS\_Duration\_t virtual\_heartbeat\_period**

The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

- **DDS\_Long samples\_per\_virtual\_heartbeat**  
The number of samples that a reliable writer has to publish before sending a virtual heartbeat.
- **DDS\_Long max\_heartbeat\_retries**  
The maximum number of periodic heartbeat retries before marking a remote reader as inactive.
- **DDS\_Boolean inactivate\_nonprogressing\_readers**  
Whether to treat remote readers as inactive when their NACKs do not progress.
- **DDS\_Long heartbeats\_per\_max\_samples**  
The number of piggyback heartbeats sent per max send window.
- struct **DDS\_Duration\_t min\_nack\_response\_delay**  
The minimum delay to respond to a NACK.
- struct **DDS\_Duration\_t max\_nack\_response\_delay**  
The maximum delay to respond to a nack.
- struct **DDS\_Duration\_t nack\_suppression\_duration**  
The duration for ignoring consecutive NACKs that may trigger redundant repairs.
- **DDS\_Long max\_bytes\_per\_nack\_response**  
The maximum total message size when resending rejected samples.
- struct **DDS\_Duration\_t disable\_positive\_acks\_min\_sample\_keep\_duration**  
The minimum duration a sample is queued for ACK-disabled readers.
- struct **DDS\_Duration\_t disable\_positive\_acks\_max\_sample\_keep\_duration**  
The maximum duration a sample is queued for ACK-disabled readers.
- **DDS\_Boolean disable\_positive\_acks\_enable\_adaptive\_sample\_keep\_duration**  
Enables dynamic adjustment of sample keep duration in response to congestion.
- **DDS\_Long disable\_positive\_acks\_decrease\_sample\_keep\_duration\_factor**  
Controls rate of contraction of dynamic sample keep duration.
- **DDS\_Long disable\_positive\_acks\_increase\_sample\_keep\_duration\_factor**  
Controls rate of growth of dynamic sample keep duration.
- **DDS\_Long min\_send\_window\_size**  
Minimum size of send window of unacknowledged samples.
- **DDS\_Long max\_send\_window\_size**  
Maximum size of send window of unacknowledged samples.
- struct **DDS\_Duration\_t send\_window\_update\_period**  
Period in which send window may be dynamically changed.
- **DDS\_Long send\_window\_increase\_factor**  
Increases send window size by this percentage when reacting dynamically to network conditions.
- **DDS\_Long send\_window\_decrease\_factor**  
Decreases send window size by this percentage when reacting dynamically to network conditions.
- **DDS\_Boolean enable\_multicast\_periodic\_heartbeat**  
Whether periodic heartbeat messages are sent over multicast.
- **DDS\_Long multicast\_resend\_threshold**  
The minimum number of requesting readers needed to trigger a multicast resend.
- **DDS\_Boolean disable\_repair\_piggyback\_heartbeat**  
Prevents piggyback heartbeats from being sent with repair samples.

### 5.172.1 Detailed Description

QoS related to the reliable writer protocol defined in RTPS.

It is used to configure a reliable writer according to RTPS protocol.

The reliability protocol settings are applied to batches instead of individual data samples when batching is enabled.

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

QoS:

**DDS\_DataWriterProtocolQosPolicy** (p. 1422) **DDS\_DiscoveryConfigQosPolicy** (p. 1460)

### 5.172.2 Field Documentation

#### 5.172.2.1 low\_watermark

**DDS\_Long** DDS\_RtpsReliableWriterProtocol\_t::low\_watermark

When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **DDS\_RELIABLE\_WRITER\_CACHE\_CHANGED\_STATUS** (p. 1037) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be greater than or equal to zero and strictly less than high\_watermark.

The high and low watermarks are used for switching between the regular and fast heartbeat rates (**DDS\_RtpsReliableWriterProtocol\_t::heartbeat\_period** (p. 1702) and **DDS\_RtpsReliableWriterProtocol\_t::fast\_heartbeat\_period** (p. 1702), respectively). When the number of unacknowledged samples in the queue of a reliable **DDS\_DataWriter** (p. 478) meets or exceeds high\_watermark, the **DDS\_RELIABLE\_WRITER\_CACHE\_CHANGED\_STATUS** (p. 1037) is changed, and the DataWriter will start heartbeating at **DDS\_RtpsReliableWriterProtocol\_t::fast\_heartbeat\_period** (p. 1702). When the number of samples meets or falls below low\_watermark, **DDS\_RELIABLE\_WRITER\_CACHE\_CHANGED\_STATUS** (p. 1037) is changed, and the heartbeat rate will return to the "normal" rate (**DDS\_RtpsReliableWriterProtocol\_t::heartbeat\_period** (p. 1702)).

**[default]** 0

**[range]** [0, 100 million], < high\_watermark

### 5.172.2.2 high\_watermark

`DDS_Long DDS_RtpsReliableWriterProtocol_t::high_watermark`

When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the `DDS_RELIABLE_WRITER_CACHE_CHANGED_STATUS` (p. 1037) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be strictly greater than `low_watermark` and less than or equal to a maximum that depends on the container QoS policy:

In `DDS_DomainParticipantQos::discovery_config` (p. 1493):

For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 1467)

`high_watermark <= DDS_AllocationSettings_t::max_count` (p. 1322) in `DDS_DomainParticipantResourceLimits↔QosPolicy::local_writer_allocation` (p. 1498)

For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 1468)

`high_watermark <= DDS_AllocationSettings_t::max_count` (p. 1322) in `DDS_DomainParticipantResourceLimits↔QosPolicy::local_reader_allocation` (p. 1498)

In `DDS_DataWriterQos::protocol` (p. 1444):

For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 1426),

`high_watermark <= DDS_ResourceLimitsQosPolicy::max_samples` (p. 1693) if batching is disabled. Otherwise, `high_watermark <= DDS_DataWriterResourceLimitsQosPolicy::max_batches` (p. 1449) `high_watermark <= DDS_↔RtpsReliableWriterProtocol_t::max_send_window_size` (p. 1711)

**[default]** 1

**[range]** [1, 100 million] or `DDS_LENGTH_UNLIMITED` (p. 1127), `> low_watermark <= maximum` which depends on the container policy

### 5.172.2.3 heartbeat\_period

`struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::heartbeat_period`

The period at which to send heartbeats.

A reliable writer will send periodic heartbeats at this rate.

**[default]** The default value depends on the container policy:

- For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 1426): 3.0 seconds
- For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 1467): 3.0 seconds
- For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 1468): 3.0 seconds
- For `DDS_DiscoveryConfigQosPolicy::participant_message_writer` (p. 1470): 1.0 seconds

**[range]** [1 nanosec, 1 year], `>= DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period` (p. 1702), `>= DDS_↔RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period` (p. 1703)

#### 5.172.2.4 fast\_heartbeat\_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::fast_heartbeat_period
```

An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

This heartbeat period will be used when the number of unacknowledged samples in the cache of a reliable writer meets or exceeds the writer's high watermark and has not subsequently dropped to the low watermark. The normal period will be used at all other times.

This period must not be slower (i.e. must be of the same or shorter duration) than the normal heartbeat period.

**[default]** The default value depends on the container policy:

- For **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426): 3.0 seconds
- For **DDS\_DiscoveryConfigQosPolicy::publication\_writer** (p. 1467): 3.0 seconds
- For **DDS\_DiscoveryConfigQosPolicy::subscription\_writer** (p. 1468): 3.0 seconds
- For **DDS\_DiscoveryConfigQosPolicy::participant\_message\_writer** (p. 1470): 1.0 seconds

**[range]** [1 nanosec,1 year], <= **DDS\_RtpsReliableWriterProtocol\_t::heartbeat\_period** (p. 1702)

#### 5.172.2.5 late\_joiner\_heartbeat\_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::late_joiner_heartbeat_period
```

An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

This heartbeat period will be used when a reliable reader joins after a reliable writer with non-volatile durability has begun publishing samples. Once the reliable reader has received all cached samples, it will be serviced at the same rate as other reliable readers.

This period must not be slower (i.e., must be of the same or shorter duration) than the normal heartbeat period.

A reliable writer will use whichever heartbeat period is faster, the current heartbeat period being used for other reliable readers or the **DDS\_RtpsReliableWriterProtocol\_t::late\_joiner\_heartbeat\_period** (p. 1703), to service the late joining reader. This means that if the **DDS\_RtpsReliableWriterProtocol\_t::fast\_heartbeat\_period** (p. 1702) is currently being used and is faster than the `late_joiner_heartbeat_period`, then the `fast_heartbeat_period` will continue to be used for the late joiner as well.

**[default]** The default value depends on the container policy:

- For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 1426): 3.0 seconds
- For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 1467): 3.0 seconds
- For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 1468): 3.0 seconds
- For `DDS_DiscoveryConfigQosPolicy::participant_message_writer` (p. 1470): 1.0 seconds

**[range]** [1 nanosec,1 year], <= `DDS_RtpsReliableWriterProtocol_t::heartbeat_period` (p. 1702)

### 5.172.2.6 virtual\_heartbeat\_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::virtual_heartbeat_period
```

The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

A reliable writer will send periodic virtual heartbeats at this rate.

**[default]** The default value depends on the container policy:

- For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 1426): `DDS_DURATION_AUTO` (p. 1012). If `DDS_PresentationQosPolicy::access_scope` (p. 1638) is set to `DDS_GROUP_PRESENTATION_QOS` (p. 1106) on the DataWriter, this value is set to `DDS_RtpsReliableWriterProtocol_t::heartbeat_period` (p. 1702). Otherwise, the value is set to `DDS_DURATION_INFINITE` (p. 1011).
- For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 1467): `DDS_DURATION_INFINITE` (p. 1011)
- For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 1468): `DDS_DURATION_INFINITE` (p. 1011)
- For `DDS_DiscoveryConfigQosPolicy::participant_message_writer` (p. 1470): `DDS_DURATION_INFINITE` (p. 1011)

**[range]** > 1 nanosec, `DDS_DURATION_INFINITE` (p. 1011), or `DDS_DURATION_AUTO` (p. 1012)

### 5.172.2.7 samples\_per\_virtual\_heartbeat

```
DDS_Long DDS_RtpsReliableWriterProtocol_t::samples_per_virtual_heartbeat
```

The number of samples that a reliable writer has to publish before sending a virtual heartbeat.

**[default]** `DDS_LENGTH_UNLIMITED` (p. 1127)

**[range]** [1,1000000], `DDS_LENGTH_UNLIMITED` (p. 1127)

### 5.172.2.8 max\_heartbeat\_retries

```
DDS_Long DDS_RtpsReliableWriterProtocol_t::max_heartbeat_retries
```

The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.

When a remote reader has not acked all the samples the reliable writer has in its queue, and max\_heartbeat\_retries number of periodic heartbeats has been sent without receiving any ack/nack back, the remote reader will be marked as inactive (not alive) and be ignored until it resumes sending ack/nack.

Note that piggyback heartbeats do NOT count towards this value.

**[default]** 10

**[range]** [1, 1 million] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

### 5.172.2.9 inactivate\_nonprogressing\_readers

```
DDS_Boolean DDS_RtpsReliableWriterProtocol_t::inactivate_nonprogressing_readers
```

Whether to treat remote readers as inactive when their NACKs do not progress.

Nominally, a remote reader is marked inactive when a successive number of periodic heartbeats equal or greater than **DDS\_RtpsReliableWriterProtocol\_t::max\_heartbeat\_retries** (p. 1704) have been sent without receiving any ack/nacks back.

By setting this **DDS\_BOOLEAN\_TRUE** (p. 1004), it changes the conditions of inactivating a remote reader: a reader will be considered inactive when it either does not send any ack/nacks or keeps sending non-progressing nacks for **DDS\_RtpsReliableWriterProtocol\_t::max\_heartbeat\_retries** (p. 1704) number of heartbeat periods, where a non-progressing nack is one whose oldest sample requested has not advanced from the oldest sample requested of the previous nack.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.172.2.10 heartbeats\_per\_max\_samples

```
DDS_Long DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples
```

The number of piggyback heartbeats sent per max send window.

When a DataWriter is configured with a fixed send window size (**DDS\_RtpsReliableWriterProtocol\_t::min\_send\_window\_size** (p. 1710) is equal to effective max\_send\_window\_size), a piggyback heartbeat is sent every [(effective max send window size/heartbeats\_per\_max\_samples)] number of samples written.

Otherwise, the number of piggyback heartbeats sent is scaled according to the current size of the send window. For example, consider a **DDS\_RtpsReliableWriterProtocol\_t::heartbeats\_per\_max\_samples** (p. 1705) of 50. If the current send window size is 100, a piggyback heartbeat will be sent every 2 samples. If the send window size grows to 150, a piggyback heartbeat will be sent every 3 samples, and so on. Additionally, when the send window size grows, a piggyback heartbeat is sent with the next sample. (If it weren't, the sending of that heartbeat could be delayed, since the heartbeat rate scales with the increasing window size.)

The effective max send window is calculated as follows:

Without batching:

`min (DDS_ResourceLimitsQosPolicy::max_samples (p. 1693), DDS_RtpsReliableWriterProtocol_t::max_send_window_size (p. 1711))`

With batching:

`min (DDS_DataWriterResourceLimitsQosPolicy::max_batches (p. 1449), DDS_RtpsReliableWriterProtocol_t::max_send_window_size (p. 1711))`

If `heartbeats_per_max_samples` is set to zero, no piggyback heartbeats will be sent.

If current send window size is `DDS_LENGTH_UNLIMITED` (p. 1127), 100 million is assumed as the effective max send window.

**[default]** The default value depends on the container policy:

- For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 1426): 8
- For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 1467): 8
- For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 1468): 8
- For `DDS_DiscoveryConfigQosPolicy::participant_message_writer` (p. 1470): 1

**[range]** [0, 100 million]

- For `DDS_DiscoveryConfigQosPolicy::publication_writer` (p. 1467):  
`heartbeats_per_max_samples` ≤ `DDS_AllocationSettings_t::max_count` (p. 1322) in `DDS_DomainParticipantResourceLimitsQosPolicy::local_writer_allocation` (p. 1498)
- For `DDS_DiscoveryConfigQosPolicy::subscription_writer` (p. 1468):  
`heartbeats_per_max_samples` ≤ `DDS_AllocationSettings_t::max_count` (p. 1322) in `DDS_DomainParticipantResourceLimitsQosPolicy::local_reader_allocation` (p. 1498)
- For `DDS_DataWriterProtocolQosPolicy::rtps_reliable_writer` (p. 1426):

`heartbeats_per_max_samples` ≤ `DDS_ResourceLimitsQosPolicy::max_samples` (p. 1693) if batching is disabled. Otherwise:

`heartbeats_per_max_samples` ≤ `DDS_DataWriterResourceLimitsQosPolicy::max_batches` (p. 1449)

`heartbeats_per_max_samples` ≤ `DDS_RtpsReliableWriterProtocol_t::max_send_window_size` (p. 1711)

### 5.172.2.11 min\_nack\_response\_delay

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::min_nack_response_delay
```

The minimum delay to respond to a NACK.

When a reliable writer receives a NACK from a remote reader, the writer can choose to delay a while before it sends repair samples or a heartbeat. This sets the value of the minimum delay.

**[default]** 0 seconds

**[range]** [0,1 day], <= max\_nack\_response\_delay

### 5.172.2.12 max\_nack\_response\_delay

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::max_nack_response_delay
```

The maximum delay to respond to a nack.

This set the value of maximum delay between receiving a NACK and sending repair samples or a heartbeat.

**[default]** The default value depends on the container policy:

- For **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426): 0.2 seconds
- For **DDS\_DiscoveryConfigQosPolicy::publication\_writer** (p. 1467): 0 seconds
- For **DDS\_DiscoveryConfigQosPolicy::subscription\_writer** (p. 1468): 0 seconds
- For **DDS\_DiscoveryConfigQosPolicy::participant\_message\_writer** (p. 1470): 0 seconds

**[range]** [0,1 day], >= min\_nack\_response\_delay

### 5.172.2.13 nack\_suppression\_duration

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::nack_suppression_duration
```

The duration for ignoring consecutive NACKs that may trigger redundant repairs.

A reliable writer may receive consecutive NACKs within a short duration from a remote reader that will trigger the sending of redundant repair messages.

This specifies the duration during which consecutive NACKs are ignored to prevent redundant repairs from being sent.

**[default]** 0 seconds

**[range]** [0,1 day],

#### 5.172.2.14 max\_bytes\_per\_nack\_response

```
DDS_Long DDS_RtpsReliableWriterProtocol_t::max_bytes_per_nack_response
```

The maximum total message size when resending rejected samples.

As part of the reliable communication protocol, data writers send heartbeat (HB) messages to their data readers. Each HB message contains the sequence number of the most recent sample sent by the data writer.

In response, a data reader sends an acknowledgement (ACK) message, indicating what sequence numbers it did not receive, if any. If the data reader is missing some samples, the data writer will send them again.

max\_bytes\_per\_nack\_response determines the maximum size of the message sent by the data writer in response to an ACK. This message may contain multiple samples. The data writer will always send at least one message, even if the size of that message exceeds the max\_bytes\_per\_nack\_response value.

If max\_bytes\_per\_nack\_response is larger than the maximum message size supported by the underlying transport, RTI Connext will send multiple messages. If the total size of all samples that need to be resent is larger than max\_bytes\_per\_nack\_response, the remaining samples will be resent the next time an ACK arrives.

**[default]** The default value depends on the container policy:

- For **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426): 131072 bytes
- For **DDS\_DiscoveryConfigQosPolicy::publication\_writer** (p. 1467): 131072 bytes
- For **DDS\_DiscoveryConfigQosPolicy::subscription\_writer** (p. 1468): 131072 bytes
- For **DDS\_DiscoveryConfigQosPolicy::participant\_message\_writer** (p. 1470): 9216 bytes

**[range]** [0, 1 GB]

#### 5.172.2.15 disable\_positive\_acks\_min\_sample\_keep\_duration

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_min_sample_keep_↵
duration
```

The minimum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (**DDS\_DataWriterProtocolQosPolicy::disable\_positive\_acks** (p. 1424) = **DDS\_BOOLEAN\_TRUE** (p. 1004)) or a data reader (**DDS\_DataReaderProtocolQosPolicy::disable\_↵positive\_acks** (p. 1377) = **DDS\_BOOLEAN\_TRUE** (p. 1004)), a sample is available from the data writer's queue for at least this duration, after which the sample may be considered to be acknowledged.

**[default]** 1 millisecond

**[range]** [0,1 year], <= **DDS\_RtpsReliableWriterProtocol\_t::disable\_positive\_acks\_max\_sample\_keep\_duration** (p. 1708)

### 5.172.2.16 disable\_positive\_acks\_max\_sample\_keep\_duration

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_max_sample_keep_↵
duration
```

The maximum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (**DDS\_DataWriterProtocolQosPolicy::disable\_positive\_acks** (p. 1424) = **DDS\_BOOLEAN\_TRUE** (p. 1004)) or a data reader (**DDS\_DataReaderProtocolQosPolicy::disable\_↵**  
**positive\_acks** (p. 1377) = **DDS\_BOOLEAN\_TRUE** (p. 1004)), a sample is available from the data writer's queue for at most this duration, after which the sample is considered to be acknowledged.

**[default]** 1 second

**[range]** [0,1 year], >= **DDS\_RtpsReliableWriterProtocol\_t::disable\_positive\_acks\_min\_sample\_keep\_duration** (p. 1708)

### 5.172.2.17 disable\_positive\_acks\_enable\_adaptive\_sample\_keep\_duration

```
DDS_Boolean DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_↵
duration
```

Enables dynamic adjustment of sample keep duration in response to congestion.

For dynamic networks where a static minimum sample keep duration may not provide sufficient performance or reliability, setting **DDS\_RtpsReliableWriterProtocol\_t::disable\_positive\_acks\_enable\_adaptive\_sample\_keep\_duration** (p. 1709) = **DDS\_BOOLEAN\_TRUE** (p. 1004), enables the sample keep duration to be dynamically adjusted to adapt to network conditions. The keep duration changes according to the detected level of congestion, which is determined to be proportional to the rate of NACKs received. An adaptive algorithm automatically controls the keep duration to optimize throughput and reliability.

To relieve high congestion, the keep duration is increased to effectively decrease the send rate; this lengthening of the keep duration is controlled by **DDS\_RtpsReliableWriterProtocol\_t::disable\_positive\_acks\_increase\_sample\_↵**  
**\_keep\_duration\_factor** (p. 1710). Alternatively, when congestion is low, the keep duration is decreased to effectively increase send rate; this shortening of the keep duration is controlled by **DDS\_RtpsReliableWriterProtocol\_t::disable\_↵**  
**\_positive\_acks\_decrease\_sample\_keep\_duration\_factor** (p. 1709).

The lower and upper bounds of the dynamic sample keep duration are set by **DDS\_RtpsReliableWriterProtocol\_↵**  
**\_t::disable\_positive\_acks\_min\_sample\_keep\_duration** (p. 1708) and **DDS\_RtpsReliableWriterProtocol\_t\_↵**  
**::disable\_positive\_acks\_max\_sample\_keep\_duration** (p. 1708), respectively.

When **DDS\_RtpsReliableWriterProtocol\_t::disable\_positive\_acks\_enable\_adaptive\_sample\_keep\_duration** (p. 1709) = **DDS\_BOOLEAN\_FALSE** (p. 1004), the sample keep duration is set to **DDS\_RtpsReliableWriterProtocol\_↵**  
**\_t::disable\_positive\_acks\_min\_sample\_keep\_duration** (p. 1708) .

**[default]** **DDS\_BOOLEAN\_TRUE** (p. 1004)

### 5.172.2.18 `disable_positive_acks_decrease_sample_keep_duration_factor`

**DDS\_Long** `DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_decrease_sample_keep_duration_factor`

Controls rate of contraction of dynamic sample keep duration.

Used when `DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration` (p. 1709) = `DDS_BOOLEAN_TRUE` (p. 1004).

When the adaptive algorithm determines that the keep duration should be decreased, this factor (a percentage) is multiplied with the current keep duration to get the new shorter keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 95% would result in a new keep duration of 19 milliseconds.

**[default]** 95

**[range]**  $\leq 100$

### 5.172.2.19 `disable_positive_acks_increase_sample_keep_duration_factor`

**DDS\_Long** `DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_increase_sample_keep_duration_factor`

Controls rate of growth of dynamic sample keep duration.

Used when `DDS_RtpsReliableWriterProtocol_t::disable_positive_acks_enable_adaptive_sample_keep_duration` (p. 1709) = `DDS_BOOLEAN_TRUE` (p. 1004).

When the adaptive algorithm determines that the keep duration should be increased, this factor (a percentage) is multiplied with the current keep duration to get the new longer keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 150% would result in a new keep duration of 30 milliseconds.

**[default]** 150

**[range]**  $\geq 100$

### 5.172.2.20 `min_send_window_size`

**DDS\_Long** `DDS_RtpsReliableWriterProtocol_t::min_send_window_size`

Minimum size of send window of unacknowledged samples.

A `DDS_DataWriter` (p. 478) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (this field) and a maximum size (`max_send_window_size`). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When a variable sized send window is used (i.e., when `min_send_window_size` and `max_send_window_size` are not set to the same value) the send window is initialized to `min_send_window_size`.

**[default]** `DDS_LENGTH_UNLIMITED` (p. 1127)

**[range]**  $> 0$ ,  $\leq \text{max\_send\_window\_size}$ , or `DDS_LENGTH_UNLIMITED` (p. 1127)

See also

**DDS\_RtpsReliableWriterProtocol\_t::max\_send\_window\_size** (p. 1711)

**DDS\_RtpsReliableWriterProtocol\_t::low\_watermark** (p. 1701)

**DDS\_RtpsReliableWriterProtocol\_t::high\_watermark** (p. 1701)

**DDS\_ReliableWriterCacheChangedStatus::full\_reliable\_writer\_cache** (p. 1685)

### 5.172.2.21 max\_send\_window\_size

**DDS\_Long** DDS\_RtpsReliableWriterProtocol\_t::max\_send\_window\_size

Maximum size of send window of unacknowledged samples.

A **DDS\_DataWriter** (p. 478) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (`min_send_window_size`) and a maximum size (this field). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When a variable sized send window is used (i.e., when `min_send_window_size` and `max_send_window_size` are not set to the same value) the send window is initialized to `min_send_window_size`.

When both `min_send_window_size` and `max_send_window_size` are **DDS\_LENGTH\_UNLIMITED** (p. 1127), then either **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693) (for non-batching) or **DDS\_DataWriterResourceLimitsQosPolicy::max\_batches** (p. 1449) (for batching) serves as the effective `max_send_window_size`. When **DDS\_ResourceLimitsQosPolicy::max\_samples** (p. 1693) (for non-batching) or **DDS\_DataWriterResourceLimitsQosPolicy::max\_batches** (p. 1449) (for batching) is less than `max_send_window_size`, then it serves as the effective `max_send_window_size`. If it is also less than `min_send_window_size`, then effectively both min and max send window sizes are equal to `max_samples` or `max_batches`.

In addition, the low and high watermarks are scaled down linearly to stay within the current send window size, and the full reliable queue status is set when the send window is full.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]**  $> 0$ ,  $\geq \text{min\_send\_window\_size}$ , or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

See also

**DDS\_RtpsReliableWriterProtocol\_t::min\_send\_window\_size** (p. 1710)

**DDS\_RtpsReliableWriterProtocol\_t::low\_watermark** (p. 1701)

**DDS\_RtpsReliableWriterProtocol\_t::high\_watermark** (p. 1701)

**DDS\_ReliableWriterCacheChangedStatus::full\_reliable\_writer\_cache** (p. 1685)

### 5.172.2.22 send\_window\_update\_period

```
struct DDS_Duration_t DDS_RtpsReliableWriterProtocol_t::send_window_update_period
```

Period in which send window may be dynamically changed.

The **DDS\_DataWriter** (p. 478)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

The change in send window size happens at this update period, whereupon the send window is either increased or decreased in size according to the increase or decrease factors, respectively.

**[default]** The default value depends on the container policy:

- For **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426): 3 seconds
- For **DDS\_DiscoveryConfigQosPolicy::publication\_writer** (p. 1467): 3 seconds
- For **DDS\_DiscoveryConfigQosPolicy::subscription\_writer** (p. 1468): 3 seconds
- For **DDS\_DiscoveryConfigQosPolicy::participant\_message\_writer** (p. 1470): 1 second

**[range]** > [0,1 year]

See also

**DDS\_RtpsReliableWriterProtocol\_t::send\_window\_increase\_factor** (p. 1712), **DDS\_RtpsReliableWriterProtocol\_t::send\_window\_decrease\_factor** (p. 1712)

### 5.172.2.23 send\_window\_increase\_factor

```
DDS_Long DDS_RtpsReliableWriterProtocol_t::send_window_increase_factor
```

Increases send window size by this percentage when reacting dynamically to network conditions.

The **DDS\_DataWriter** (p. 478)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

After an update period during which no negative acknowledgements were received, the send window will be increased by this factor. The factor is treated as a percentage, where a factor of 150 would increase the send window by 150%. The increased send window size will not exceed the `max_send_window_size`.

**[default]** 105

**[range]** > 100

See also

**DDS\_RtpsReliableWriterProtocol\_t::send\_window\_update\_period** (p. 1711), **DDS\_RtpsReliableWriterProtocol\_t::send\_window\_decrease\_factor** (p. 1712)

### 5.172.2.24 send\_window\_decrease\_factor

**DDS\_Long** DDS\_RtpsReliableWriterProtocol\_t::send\_window\_decrease\_factor

Decreases send window size by this percentage when reacting dynamically to network conditions.

The **DDS\_DataWriter** (p. 478)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When increased network congestion causes a negative acknowledgement to be received by a writer, the send window will be decreased by this factor to throttle the effective send rate. The factor is treated as a percentage, where a factor of 80 would decrease the send window to 80% of its previous size. The decreased send window size will not be less than the `min_send_window_size`.

**[default]** The default value depends on the container policy:

- For **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426): 70
- For **DDS\_DiscoveryConfigQosPolicy::publication\_writer** (p. 1467): 50
- For **DDS\_DiscoveryConfigQosPolicy::subscription\_writer** (p. 1468): 50
- For **DDS\_DiscoveryConfigQosPolicy::participant\_message\_writer** (p. 1470): 50

**[range]** [0, 100]

See also

**DDS\_RtpsReliableWriterProtocol\_t::send\_window\_update\_period** (p. 1711), **DDS\_RtpsReliableWriterProtocol\_t::send\_window\_increase\_factor** (p. 1712)

### 5.172.2.25 enable\_multicast\_periodic\_heartbeat

**DDS\_Boolean** DDS\_RtpsReliableWriterProtocol\_t::enable\_multicast\_periodic\_heartbeat

Whether periodic heartbeat messages are sent over multicast.

When enabled, if a reader has a multicast destination, then the writer will send its periodic HEARTBEAT messages to that destination. Otherwise, if not enabled or the reader does not have a multicast destination, the writer will send its periodic HEARTBEATs over unicast.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.172.2.26 multicast\_resend\_threshold

**DDS\_Long** DDS\_RtpsReliableWriterProtocol\_t::multicast\_resend\_threshold

The minimum number of requesting readers needed to trigger a multicast resend.

Given readers with multicast destinations, when a reader NACKs for samples to be resent, the writer can either resend them over unicast or multicast. In order for the writer to resend over multicast, this threshold is the minimum number of readers of the same multicast group that the writer must receive NACKs from within a single response-delay. This allows the writer to coalesce near-simultaneous unicast resends into a multicast resend. Note that a threshold of 1 means that all resends will be sent over multicast, if available.

**[default]** 2

**[range]** [ $\geq$  1]

### 5.172.2.27 disable\_repair\_piggyback\_heartbeat

**DDS\_Boolean** DDS\_RtpsReliableWriterProtocol\_t::disable\_repair\_piggyback\_heartbeat

Prevents piggyback heartbeats from being sent with repair samples.

When samples are repaired, the **DDS\_DataWriter** (p. 478) resends **DDS\_RtpsReliableWriterProtocol\_t::max\_bytes\_per\_nack\_response** (p. 1707) bytes and a piggyback heartbeat with each message. You can configure the **DDS\_DataWriter** (p. 478) to not send the piggyback heartbeat and instead rely on the **DDS\_RtpsReliableWriterProtocol\_t::late\_joiner\_heartbeat\_period** (p. 1703) to control the throughput used to repair samples. This field is mutable only for **DDS\_DataWriterProtocolQosPolicy::rtps\_reliable\_writer** (p. 1426). **[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

*Additional offset for **usertraffic** unicast port.*

### 5.173.1 Detailed Description

RTPS well-known port mapping configuration.

RTI Connex uses the RTPS wire protocol. The discovery protocols defined by RTPS rely on well-known ports to initiate discovery. These well-known ports define the multicast and unicast ports on which a Participant will listen for discovery **metatraffic** from other Participants. The discovery metatraffic contains all the information required to establish the presence of remote DDS entities in the network.

The well-known ports are defined by RTPS in terms of port mapping expressions with several tunable parameters, which allow you to customize what network ports are used by RTI Connex. These parameters are exposed in **DDS\_RtpsWellKnownPorts\_t** (p. 1714). In order for all Participants in a system to correctly discover each other, it is important that they all use the same port mapping expressions.

The actual port mapping expressions, as defined by the RTPS specification, can be found below. In addition to the parameters listed in **DDS\_RtpsWellKnownPorts\_t** (p. 1714), the port numbers depend on:

- `domain_id`, as specified in **DDS\_DomainParticipantFactory\_create\_participant** (p. 37)
- `participant_id`, as specified using **DDS\_WireProtocolQosPolicy::participant\_id** (p. 1830)

The `domain_id` parameter ensures no port conflicts exist between Participants belonging to different domains. This also means that discovery metatraffic in one domain is not visible to Participants in a different domain. The `participant_id` parameter ensures that unique unicast port numbers are assigned to Participants belonging to the same domain on a given host.

The `metatraffic_unicast_port` is used to exchange discovery metatraffic using unicast.

```
metatraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + b
```

The `metatraffic_multicast_port` is used to exchange discovery metatraffic using multicast. The corresponding multicast group addresses are specified via **DDS\_DiscoveryQosPolicy::multicast\_receive\_addresses** (p. 1481) on a **DDS\_DomainParticipant** (p. 72) entity.

```
metatraffic_multicast_port = port_base + (domain_id_gain * domain_id) + builtin_multicast_port_offset
```

RTPS also defines the *default* multicast and unicast ports on which DataReaders and DataWriters receive **usertraffic**. These default ports can be overridden using the **DDS\_DataReaderQos::multicast** (p. 1395), **DDS\_DataReaderQos::unicast** (p. 1395), or by the **DDS\_DataWriterQos::unicast** (p. 1444) QoS policies.

The `usertraffic_unicast_port` is used to exchange user data using unicast.

```
usertraffic_unicast_port = port_base + (domain_id_gain * domain_id) + (participant_id_gain * participant_id) + u
```

The `usertraffic_multicast_port` is used to exchange user data using multicast. The corresponding multicast group addresses can be configured using **DDS\_TransportMulticastQosPolicy** (p. 1793).

```
usertraffic_multicast_port = port_base + (domain_id_gain * domain_id) + user_multicast_port_offset
```

By default, the port mapping parameters are configured to compliant with OMG's DDS Interoperability Wire Protocol (see also **DDS\_INTEROPERABLE\_RTPTS\_WELL\_KNOWN\_PORTS** (p. 1149)).

The OMG's DDS Interoperability Wire Protocol compliant port mapping parameters are *not* backwards compatible with previous versions of the RTI Connex middleware.

When modifying the port mapping parameters, care must be taken to avoid port aliasing. This would result in undefined discovery behavior. The chosen parameter values will also determine the maximum possible number of domains in the system and the maximum number of participants per domain. Additionally, any resulting mapped port number must be within the range imposed by the underlying transport. For example, for UDPv4, this range typically equals [1024 - 65535].

Note: On Windows, you should avoid using ports 49152 through 65535 for inbound traffic. RTI Connex's ephemeral ports (see "Ports Used for Communication" in the *User's Manual*) may be within that range (see [https://msdn.microsoft.com/en-us/library/windows/desktop/ms737550\(v=vs.85\).aspx](https://msdn.microsoft.com/en-us/library/windows/desktop/ms737550(v=vs.85).aspx)). With the default `RtpsWellKnownPorts` settings, port 49152 corresponds to domain ID 167, so using domain IDs 168 through 232 on Windows introduces the risk of a port collision and failure to create the Domain Participant when using multicast discovery. You may see this error:

RTIOsapiSocket\_bindWithIP:OS bind() failure, error 0X271D: An attempt was made to access a socket in a way forbidden by its access permissions.

QoS:

**DDS\_WireProtocolQosPolicy** (p. 1827)

## 5.173.2 Field Documentation

### 5.173.2.1 port\_base

**DDS\_Long** `DDS_RtpsWellKnownPorts_t::port_base`

The base port offset.

All mapped well-known ports are offset by this value.

**[default]** 7400

**[range]** [ $\geq 1$ ], but resulting ports must be within the range imposed by the underlying transport.

### 5.173.2.2 domain\_id\_gain

`DDS_Long DDS_RtpsWellKnownPorts_t::domain_id_gain`

Tunable domain gain parameter.

Multiplier of the `domain_id`. Together with `participant_id_gain`, it determines the highest `domain_id` and `participant_id` allowed on this network.

In general, there are two ways to setup `domain_id_gain` and `participant_id_gain` parameters.

If `domain_id_gain > participant_id_gain`, it results in a port mapping layout where all **DDS\_DomainParticipant** (p. 72) instances within a single domain occupy a consecutive range of `domain_id_gain` ports. Precisely, all ports occupied by the domain fall within:

$$(\text{port\_base} + (\text{domain\_id\_gain} * \text{domain\_id}))$$

and:

$$(\text{port\_base} + (\text{domain\_id\_gain} * (\text{domain\_id} + 1)) - 1)$$

Under such a case, the highest `domain_id` is limited only by the underlying transport's maximum port. The highest `participant_id`, however, must satisfy:

$$\text{max\_participant\_id} < (\text{domain\_id\_gain} / \text{participant\_id\_gain})$$

On the contrary, if `domain_id_gain <= participant_id_gain`, it results in a port mapping layout where a given domain's **DDS\_DomainParticipant** (p. 72) instances occupy ports spanned across the entire valid port range allowed by the underlying transport. For instance, it results in the following potential mapping:

Mapped Port	Domain Id	Participant ID
higher port number	Domain Id = 1	Participant ID = 2
	Domain Id = 0	Participant ID = 2
	Domain Id = 1	Participant ID = 1
	Domain Id = 0	Participant ID = 1
	Domain Id = 1	Participant ID = 0
lower port number	Domain Id = 0	Participant ID = 0

Under this case, the highest `participant_id` is limited only by the underlying transport's maximum port. The highest `domain_id`, however, must satisfy:

$$\text{max\_domain\_id} < (\text{participant\_id\_gain} / \text{domain\_id\_gain})$$

Additionally, `domain_id_gain` also determines the range of the port-specific offsets.

$$\text{domain\_id\_gain} > \text{abs}(\text{builtin\_multicast\_port\_offset} - \text{user\_multicast\_port\_offset})$$

$$\text{domain\_id\_gain} > \text{abs}(\text{builtin\_unicast\_port\_offset} - \text{user\_unicast\_port\_offset})$$

Violating this may result in port aliasing and undefined discovery behavior.

**[default]** 250

**[range]** [ $> 0$ ], but resulting ports must be within the range imposed by the underlying transport.

### 5.173.2.3 participant\_id\_gain

```
DDS_Long DDS_RtpsWellKnownPorts_t::participant_id_gain
```

Tunable participant gain parameter.

Multiplier of the `participant_id`. See `DDS_RtpsWellKnownPorts_t::domain_id_gain` (p. 1716) for its implications on the highest `domain_id` and `participant_id` allowed on this network.

Additionally, `participant_id_gain` also determines the range of `builtin_unicast_port_offset` and `user_unicast_port_offset`.

```
participant_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

**[default]** 2

**[range]** [ $> 0$ ], but resulting ports must be within the range imposed by the underlying transport.

### 5.173.2.4 builtin\_multicast\_port\_offset

```
DDS_Long DDS_RtpsWellKnownPorts_t::builtin_multicast_port_offset
```

Additional offset for **metatraffic** multicast port.

It must be unique from other port-specific offsets.

**[default]** 0

**[range]** [ $\geq 0$ ], but resulting ports must be within the range imposed by the underlying transport.

### 5.173.2.5 builtin\_unicast\_port\_offset

```
DDS_Long DDS_RtpsWellKnownPorts_t::builtin_unicast_port_offset
```

Additional offset for **metatraffic** unicast port.

It must be unique from other port-specific offsets.

**[default]** 10

**[range]** [ $\geq 0$ ], but resulting ports must be within the range imposed by the underlying transport.

### 5.173.2.6 user\_multicast\_port\_offset

`DDS_Long DDS_RtpsWellKnownPorts_t::user_multicast_port_offset`

Additional offset for **usertraffic** multicast port.

It must be unique from other port-specific offsets.

**[default]** 1

**[range]** [ $\geq 0$ ], but resulting ports must be within the range imposed by the underlying transport.

### 5.173.2.7 user\_unicast\_port\_offset

`DDS_Long DDS_RtpsWellKnownPorts_t::user_unicast_port_offset`

Additional offset for **usertraffic** unicast port.

It must be unique from other port-specific offsets.

**[default]** 11

**[range]** [ $\geq 0$ ], but resulting ports must be within the range imposed by the underlying transport.

## 5.174 DDS\_SampleHandler Struct Reference

**<<experimental>>** (p. 817) **<<extension>>** (p. 817) **<<interface>>** (p. 818) Handler called by a sample dispatcher, such as **DDS\_SampleProcessor** (p. 1290).

### Data Fields

- void \* **handler\_data**  
*A place for handler implementors to keep a pointer to data that may be needed by their handler.*
- DDS\_SampleHandler\_OnNewSampleCallback **on\_new\_sample**  
*Handles the dispatch of a sample read from the associated **DDS\_DataReader** (p. 608).*

### 5.174.1 Detailed Description

**<<experimental>>** (p. 817) **<<extension>>** (p. 817) **<<interface>>** (p. 818) Handler called by a sample dispatcher, such as **DDS\_SampleProcessor** (p. 1290).

### 5.174.2 Field Documentation

### 5.174.2.1 handler\_data

```
void* DDS_SampleHandler::handler_data
```

A place for handler implementors to keep a pointer to data that may be needed by their handler.

### 5.174.2.2 on\_new\_sample

```
DDS_SampleHandler_OnNewSampleCallback DDS_SampleHandler::on_new_sample
```

Handles the dispatch of a sample read from the associated **DDS\_DataReader** (p. 608).

This operation is called from the dispatcher after reading a new sample from an associated **DDS\_DataReader** (p. 608). Note that the type of the data portion of the Sample must correspond with the type of the associated **DDS\_DataReader** (p. 608).

## 5.175 DDS\_SampleIdentity\_t Struct Reference

Type definition for a Sample Identity.

### Data Fields

- struct **DDS\_GUID\_t** **writer\_guid**  
*16-byte identifier identifying the virtual GUID.*
- struct **DDS\_SequenceNumber\_t** **sequence\_number**  
*monotonically increasing 64-bit integer that identifies the sample in the data source.*

### 5.175.1 Detailed Description

Type definition for a Sample Identity.

A SampleIdentity defines a pair (Virtual Writer GUID, Sequence Number) that uniquely identifies a sample within a DDS domain and a Topic.

## 5.176 DDS\_SampleInfo Struct Reference

Information that accompanies each sample that is `read` or `taken`.

## Data Fields

- **DDS\_SampleStateKind sample\_state**  
*The sample state of the sample.*
- **DDS\_ViewStateKind view\_state**  
*The view state of the instance.*
- **DDS\_InstanceStateKind instance\_state**  
*The instance state of the instance.*
- struct **DDS\_Time\_t source\_timestamp**  
*The timestamp when the sample was written by a DataWriter.*
- **DDS\_InstanceHandle\_t instance\_handle**  
*Identifies locally the corresponding instance.*
- **DDS\_InstanceHandle\_t publication\_handle**  
*Identifies locally the DataWriter that modified the instance.*
- **DDS\_Long disposed\_generation\_count**  
*The disposed generation count of the instance at the time of sample reception.*
- **DDS\_Long no\_writers\_generation\_count**  
*The no writers generation count of the instance at the time of sample reception.*
- **DDS\_Long sample\_rank**  
*The sample rank of the sample.*
- **DDS\_Long generation\_rank**  
*The generation rank of the sample.*
- **DDS\_Long absolute\_generation\_rank**  
*The absolute generation rank of the sample.*
- **DDS\_Boolean valid\_data**  
*Indicates whether the `DataSample` contains data or else it is only used to communicate a change in the `instance↔_state` of the instance.*
- struct **DDS\_Time\_t reception\_timestamp**  
*<<extension>> (p. 817) The timestamp when the sample was committed by a DataReader.*
- struct **DDS\_SequenceNumber\_t publication\_sequence\_number**  
*<<extension>> (p. 817) The publication sequence number.*
- struct **DDS\_SequenceNumber\_t reception\_sequence\_number**  
*<<extension>> (p. 817) The reception sequence number when sample was committed by a DataReader*
- struct **DDS\_GUID\_t original\_publication\_virtual\_guid**  
*<<extension>> (p. 817) The original publication virtual GUID.*
- struct **DDS\_SequenceNumber\_t original\_publication\_virtual\_sequence\_number**  
*<<extension>> (p. 817) The original publication virtual sequence number.*
- struct **DDS\_GUID\_t related\_original\_publication\_virtual\_guid**  
*<<extension>> (p. 817) The original publication virtual GUID of a related sample.*
- struct **DDS\_SequenceNumber\_t related\_original\_publication\_virtual\_sequence\_number**  
*<<extension>> (p. 817) The original publication virtual sequence number of a related sample.*
- **DDS\_SampleFlag flag**  
*<<extension>> (p. 817) Flags associated with the sample.*
- struct **DDS\_GUID\_t source\_guid**  
*<<extension>> (p. 817) The application logical data source associated with the sample.*
- struct **DDS\_GUID\_t related\_source\_guid**  
*<<extension>> (p. 817) The application logical data source that is related to the sample.*

- struct **DDS\_GUID\_t related\_subscription\_guid**  
 <<extension>> (p. 817) *The related\_reader\_guid associated with the sample.*
- struct **DDS\_GUID\_t topic\_query\_guid**  
 <<extension>> (p. 817) *The GUID of the **DDS\_TopicQuery** (p. 698) that is related to the sample.*
- struct **DDS\_CoherentSetInfo\_t \* coherent\_set\_info**  
 <<extension>> (p. 817) *The information about the coherent set that this sample is a part of.*

### 5.176.1 Detailed Description

Information that accompanies each sample that is `read` or `taken`.

### 5.176.2 Interpretation of the SampleInfo

The **DDS\_SampleInfo** (p. 1720) contains information pertaining to the associated `Data` instance sample including:

- the `sample_state` of the `Data` value (i.e., if it has already been read or not)
- the `view_state` of the related instance (i.e., if the instance is new or not)
- the `instance_state` of the related instance (i.e., if the instance is alive or not)
- **DDS\_SampleInfo::valid\_data** (p. 1728) flag. This flag indicates whether there is data associated with the sample. Some samples do not contain data indicating only a change on the `instance_state` of the corresponding instance.
- The values of `disposed_generation_count` and `no_writers_generation_count` for the related instance at the time the sample was received. These counters indicate the number of times the instance had become ALIVE (with `instance_state= DDS_ALIVE_INSTANCE_STATE` (p. 707)) at the time the sample was received.
- The `sample_rank` and `generation_rank` of the sample within the returned sequence. These ranks provide a preview of the samples that follow within the sequence returned by the `read` or `take` operations.
- The `absolute_generation_rank` of the sample within the **DDS\_DataReader** (p. 608). This rank provides a preview of what is available within the **DDS\_DataReader** (p. 608).
- The `source_timestamp` of the sample. This is the timestamp provided by the **DDS\_DataWriter** (p. 478) at the time the sample was produced.

### 5.176.3 Interpretation of the SampleInfo disposed\_generation\_count and no\_writers\_generation\_count

For each instance, RTI Connexx internally maintains two counts, the **DDS\_SampleInfo::disposed\_generation\_count** (p. 1726) and **DDS\_SampleInfo::no\_writers\_generation\_count** (p. 1726), relative to each DataReader:

- The **DDS\_SampleInfo::disposed\_generation\_count** (p. 1726) and **DDS\_SampleInfo::no\_writers\_generation\_count** (p. 1726) are initialized to zero when the **DDS\_DataReader** (p. 608) first detects the presence of a never-seen-before instance.
- The **DDS\_SampleInfo::disposed\_generation\_count** (p. 1726) is incremented each time the instance\_state of the corresponding instance changes from **DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707) to **DDS\_ALIVE\_INSTANCE\_STATE** (p. 707).
- The **DDS\_SampleInfo::no\_writers\_generation\_count** (p. 1726) is incremented each time the instance\_state of the corresponding instance changes from **DDS\_NOT\_ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707) to **DDS\_ALIVE\_INSTANCE\_STATE** (p. 707).
- These 'generation counts' are reset to zero when the instance resource is reclaimed.

The **DDS\_SampleInfo::disposed\_generation\_count** (p. 1726) and **DDS\_SampleInfo::no\_writers\_generation\_count** (p. 1726) available in the **DDS\_SampleInfo** (p. 1720) capture a snapshot of the corresponding counters at the time the sample was received.

### 5.176.4 Interpretation of the SampleInfo sample\_rank, generation\_rank and absolute\_generation\_rank

The **DDS\_SampleInfo::sample\_rank** (p. 1727) and **DDS\_SampleInfo::generation\_rank** (p. 1727) available in the **DDS\_SampleInfo** (p. 1720) are computed based solely on the actual samples in the ordered collection returned by read or take.

- The **DDS\_SampleInfo::sample\_rank** (p. 1727) indicates the number of samples of the same instance that follow the current one in the collection.
- The **DDS\_SampleInfo::generation\_rank** (p. 1727) available in the **DDS\_SampleInfo** (p. 1720) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that appears in the returned Collection (MRSIC). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the reception of MRSIC.
- These 'generation ranks' are reset to zero when the instance resource is reclaimed.

The **DDS\_SampleInfo::generation\_rank** (p. 1727) is computed using the formula:

```

generation_rank = (MRSIC.disposed_generation_count
                   + MRSIC.no_writers_generation_count)
                 - (S.disposed_generation_count
                   + S.no_writers_generation_count)

```

The **DDS\_SampleInfo::absolute\_generation\_rank** (p. 1727) available in the **DDS\_SampleInfo** (p. 1720) indicates the difference in "generations" between the sample (S) and the Most Recent Sample of the same instance that the middleware has received (MRS). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the time when the read or take was called.

```

absolute_generation_rank = (MRS.disposed_generation_count
                            + MRS.no_writers_generation_count)
                          - (S.disposed_generation_count
                            + S.no_writers_generation_count)

```

### 5.176.5 Interpretation of the SampleInfo counters and ranks

These counters and ranks allow the application to distinguish samples belonging to different "generations" of the instance. Note that it is possible for an instance to transition from not-alive to alive (and back) several times before the application accesses the data by means of read or take. In this case, the returned collection may contain samples that cross generations (i.e. some samples were received before the instance became not-alive, other after the instance re-appeared again). Using the information in the **DDS\_SampleInfo** (p. 1720), the application can anticipate what other information regarding the same instance appears in the returned collection, as well as in the infrastructure and thus make appropriate decisions.

For example, an application desiring to only consider the most current sample for each instance would only look at samples with `sample_rank == 0`. Similarly, an application desiring to only consider samples that correspond to the latest generation in the collection will only look at samples with `generation_rank == 0`. An application desiring only samples pertaining to the latest generation available will ignore samples for which `absolute_generation_rank != 0`. Other application-defined criteria may also be used.

**DDS\_SampleStateKind** (p. 702), **DDS\_InstanceStateKind** (p. 706), **DDS\_ViewStateKind** (p. 704), **DDS\_SampleInfo::valid\_data** (p. 1728)

"Statechart of the \p instance\_state and \p view\_state of a single instance"

### 5.176.6 Field Documentation

### 5.176.6.1 sample\_state

`DDS_SampleStateKind DDS_SampleInfo::sample_state`

The sample state of the sample.

Indicates whether or not the corresponding data sample has already been read.

See also

**DDS\_SampleStateKind** (p. 702)

### 5.176.6.2 view\_state

`DDS_ViewStateKind DDS_SampleInfo::view_state`

The view state of the instance.

Indicates whether the **DDS\_DataReader** (p. 608) has already seen samples for the most-current generation of the related instance.

See also

**DDS\_ViewStateKind** (p. 704)

### 5.176.6.3 instance\_state

`DDS_InstanceStateKind DDS_SampleInfo::instance_state`

The instance state of the instance.

Indicates whether the instance is currently in existence or, if it has been disposed, the reason why it was disposed.

See also

**DDS\_InstanceStateKind** (p. 706)

#### 5.176.6.4 source\_timestamp

```
struct DDS_Time_t DDS_SampleInfo::source_timestamp
```

The timestamp when the sample was written by a DataWriter.

#### 5.176.6.5 instance\_handle

```
DDS_InstanceHandle_t DDS_SampleInfo::instance_handle
```

Identifies locally the corresponding instance.

The handle is equal to **DDS\_HANDLE\_NIL** (p. 224) for unkeyed topics.

#### 5.176.6.6 publication\_handle

```
DDS_InstanceHandle_t DDS_SampleInfo::publication_handle
```

Identifies locally the DataWriter that modified the instance.

The `publication_handle` is the same **DDS\_InstanceHandle\_t** (p. 210) that is returned by the operation **DDS\_DataReader\_get\_matched\_publications** (p. 670) and can also be used as a parameter to the operation **DDS\_DataReader\_get\_matched\_publication\_data** (p. 671).

#### 5.176.6.7 disposed\_generation\_count

```
DDS_Long DDS_SampleInfo::disposed_generation_count
```

The disposed generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **DDS\_NOT\_ALIVE\_DISPOSED\_INSTANCE\_STATE** (p. 707) to **DDS\_ALIVE\_INSTANCE\_STATE** (p. 707). The counter is reset when the instance resource is reclaimed (removed from the DataReader cache).

See also

**Interpretation of the SampleInfo disposed\_generation\_count and no\_writers\_generation\_count** (p. 1723)

**Interpretation of the SampleInfo counters and ranks** (p. 1724)

### 5.176.6.8 no\_writers\_generation\_count

**DDS\_Long** DDS\_SampleInfo::no\_writers\_generation\_count

The no writers generation count of the instance at the time of sample reception.

Indicates how many times the `instance_state` of the corresponding instance changed from **DDS\_NOT\_ALIVE**↔**\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707) to **DDS\_ALIVE\_INSTANCE\_STATE** (p. 707). The counter is reset when the instance resource is reclaimed (removed from the DataReader cache).

See also

**Interpretation of the SampleInfo disposed\_generation\_count and no\_writers\_generation\_count** (p. 1723)  
**Interpretation of the SampleInfo counters and ranks** (p. 1724)

### 5.176.6.9 sample\_rank

**DDS\_Long** DDS\_SampleInfo::sample\_rank

The sample rank of the sample.

Indicates the number of samples related to the same instance that follow in the collection returned by `read` or `take`.

See also

**Interpretation of the SampleInfo sample\_rank, generation\_rank and absolute\_generation\_rank** (p. 1723)  
**Interpretation of the SampleInfo counters and ranks** (p. 1724)

### 5.176.6.10 generation\_rank

**DDS\_Long** DDS\_SampleInfo::generation\_rank

The generation rank of the sample.

Indicates the generation difference (number of times the instance was **NOT\_ALIVE** and become alive again) between the time the sample was received and the time the most recent sample in the collection related to the same instance was received.

See also

**Interpretation of the SampleInfo sample\_rank, generation\_rank and absolute\_generation\_rank** (p. 1723)  
**Interpretation of the SampleInfo counters and ranks** (p. 1724)

### 5.176.6.11 absolute\_generation\_rank

```
DDS_Long DDS_SampleInfo::absolute_generation_rank
```

The absolute generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample (which may not be in the returned collection) related to the same instance was received.

See also

**Interpretation of the SampleInfo sample\_rank, generation\_rank and absolute\_generation\_rank** (p. 1723)  
**Interpretation of the SampleInfo counters and ranks** (p. 1724)

### 5.176.6.12 valid\_data

```
DDS_Boolean DDS_SampleInfo::valid_data
```

Indicates whether the `DataSample` contains data or else it is only used to communicate a change in the `instance↔_state` of the instance.

Normally each `DataSample` contains both a **DDS\_SampleInfo** (p. 1720) and some Data. However there are situations where a `DataSample` contains only the **DDS\_SampleInfo** (p. 1720) and does not have any associated data. This occurs when the RTI Connexx notifies the application of a change of state for an instance that was caused by some internal mechanism (such as a timeout) for which there is no associated data. An example of this situation is when the RTI Connexx detects that an instance has no writers and changes the corresponding `instance_state` to **DDS\_NOT\_↔ALIVE\_NO\_WRITERS\_INSTANCE\_STATE** (p. 707).

The application can distinguish whether a particular `DataSample` has data by examining the value of the **DDS\_↔SampleInfo::valid\_data** (p. 1728). If this flag is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then the `Data↔Sample` contains valid Data. If the flag is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), the `DataSample` contains no Data.

To ensure correctness and portability, the `valid_data` flag must be examined by the application prior to accessing the Data associated with the `DataSample` and if the flag is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), the application should not access the Data associated with the `DataSample`, that is, the application should access only the **DDS\_↔SampleInfo** (p. 1720).

### 5.176.6.13 reception\_timestamp

```
struct DDS_Time_t DDS_SampleInfo::reception_timestamp
```

<<*extension*>> (p. 817) The timestamp when the sample was committed by a `DataReader`.

#### 5.176.6.14 publication\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::publication_sequence_number
```

<<*extension*>> (p. 817) The publication sequence number.

#### 5.176.6.15 reception\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::reception_sequence_number
```

<<*extension*>> (p. 817) The reception sequence number when sample was committed by a DataReader

#### 5.176.6.16 original\_publication\_virtual\_guid

```
struct DDS_GUID_t DDS_SampleInfo::original_publication_virtual_guid
```

<<*extension*>> (p. 817) The original publication virtual GUID.

If the **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) of the **DDS\_Publisher** (p. 436) is **DDS\_GROUP\_PPRESENTATION\_QOS** (p. 1106), this field contains the **DDS\_Publisher** (p. 436) virtual GUID that uniquely identifies the DataWriter group.

See also

**DDS\_SampleInfo\_get\_sample\_identity** (p. 694)

#### 5.176.6.17 original\_publication\_virtual\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::original_publication_virtual_sequence_number
```

<<*extension*>> (p. 817) The original publication virtual sequence number.

If the **DDS\_PresentationQosPolicy::access\_scope** (p. 1638) of the **DDS\_Publisher** (p. 436) is **DDS\_GROUP\_PPRESENTATION\_QOS** (p. 1106), this field contains the **DDS\_Publisher** (p. 436) virtual sequence number that uniquely identifies a sample within the DataWriter group.

See also

**DDS\_SampleInfo\_get\_sample\_identity** (p. 694)

#### 5.176.6.18 related\_original\_publication\_virtual\_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_original_publication_virtual_guid
```

<<**extension**>> (p. 817) The original publication virtual GUID of a related sample.

See also

**DDS\_SampleInfo\_get\_related\_sample\_identity** (p. 694)

#### 5.176.6.19 related\_original\_publication\_virtual\_sequence\_number

```
struct DDS_SequenceNumber_t DDS_SampleInfo::related_original_publication_virtual_sequence_number
```

<<**extension**>> (p. 817) The original publication virtual sequence number of a related sample.

See also

**DDS\_SampleInfo\_get\_related\_sample\_identity** (p. 694)

#### 5.176.6.20 flag

```
DDS_SampleFlag DDS_SampleInfo::flag
```

<<**extension**>> (p. 817) Flags associated with the sample.

The flags can be set by using the field **DDS\_WriteParams\_t::flag** (p. 1836) when writing a sample using the function **FooDataWriter\_write\_w\_params** (p. 494).

#### 5.176.6.21 source\_guid

```
struct DDS_GUID_t DDS_SampleInfo::source_guid
```

<<**extension**>> (p. 817) The application logical data source associated with the sample.

The `source_guid` can be set by using the field **DDS\_WriteParams\_t::source\_guid** (p. 1837) when writing a sample using the function **FooDataWriter\_write\_w\_params** (p. 494).

### 5.176.6.22 related\_source\_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_source_guid
```

<<**extension**>> (p. 817) The application logical data source that is related to the sample.

The related\_source\_guid can be set by using the field **DDS\_WriteParams\_t::related\_source\_guid** (p. 1837) when writing a sample using the function **FooDataWriter\_write\_w\_params** (p. 494).

### 5.176.6.23 related\_subscription\_guid

```
struct DDS_GUID_t DDS_SampleInfo::related_subscription_guid
```

<<**extension**>> (p. 817) The related\_reader\_guid associated with the sample.

The related\_reader\_guid can be set by using the field **DDS\_WriteParams\_t::related\_reader\_guid** (p. 1838) when writing a sample using the function **FooDataWriter\_write\_w\_params** (p. 494).

### 5.176.6.24 topic\_query\_guid

```
struct DDS_GUID_t DDS_SampleInfo::topic_query_guid
```

<<**extension**>> (p. 817) The GUID of the **DDS\_TopicQuery** (p. 698) that is related to the sample.

This GUID indicates whether a sample is part of the response to a **DDS\_TopicQuery** (p. 698) or a regular ("live") sample:

- If the sample was written for the TopicQuery stream, this field contains the GUID of the target TopicQuery.
- If the sample was written for the live stream, this field will be set to **DDS\_GUID\_UNKNOWN** (p. 1016).

### 5.176.6.25 coherent\_set\_info

```
struct DDS_CoherentSetInfo_t* DDS_SampleInfo::coherent_set_info
```

<<**extension**>> (p. 817) The information about the coherent set that this sample is a part of.

This field is set for all samples that are part of a coherent set. Coherent sets are initiated using the operation **DDS\_Publisher\_begin\_coherent\_changes** (p. 452) and finalized using the operation **DDS\_Publisher\_end\_coherent\_changes** (p. 453).

See also

**DDS\_Publisher\_begin\_coherent\_changes** (p. 452) for additional information on coherent sets.

## 5.177 DDS\_SampleInfoSeq Struct Reference

Declares IDL sequence < DDS\_SampleInfo (p. 1720) > .

### 5.177.1 Detailed Description

Declares IDL sequence < DDS\_SampleInfo (p. 1720) > .

See also

**FooSeq** (p. 1845)

Examples

**HelloWorld\_subscriber.c.**

## 5.178 DDS\_SampleLostStatus Struct Reference

**DDS\_SAMPLE\_LOST\_STATUS** (p. 1033)

### Data Fields

- **DDS\_Long total\_count**  
*Total cumulative count of all samples lost across all instances of data published under the **DDS\_Topic** (p. 172).*
- **DDS\_Long total\_count\_change**  
*The incremental number of samples lost since the last time the listener was called or the status was read.*
- **DDS\_SampleLostStatusKind last\_reason**  
*<<extension>> (p. 817) Reason why the last sample was lost.*

### 5.178.1 Detailed Description

**DDS\_SAMPLE\_LOST\_STATUS** (p. 1033)

Examples

**HelloWorld\_subscriber.c.**

### 5.178.2 Field Documentation

### 5.178.2.1 total\_count

**DDS\_Long** DDS\_SampleLostStatus::total\_count

Total cumulative count of all samples lost across all instances of data published under the **DDS\_Topic** (p. 172).

### 5.178.2.2 total\_count\_change

**DDS\_Long** DDS\_SampleLostStatus::total\_count\_change

The incremental number of samples lost since the last time the listener was called or the status was read.

### 5.178.2.3 last\_reason

**DDS\_SampleLostStatusKind** DDS\_SampleLostStatus::last\_reason

<<*extension*>> (p. 817) Reason why the last sample was lost.

See also

**DDS\_SampleLostStatusKind** (p. 611)

## 5.179 DDS\_SampleRejectedStatus Struct Reference

**DDS\_SAMPLE\_REJECTED\_STATUS** (p. 1033)

### Data Fields

- **DDS\_Long total\_count**  
*Total cumulative count of samples rejected by the **DDS\_DataReader** (p. 608).*
- **DDS\_Long total\_count\_change**  
*The incremental number of samples rejected since the last time the listener was called or the status was read.*
- **DDS\_SampleRejectedStatusKind last\_reason**  
*Reason for rejecting the last sample rejected.*
- **DDS\_InstanceHandle\_t last\_instance\_handle**  
*Handle to the instance being updated by the last sample that was rejected.*

## 5.179.1 Detailed Description

**DDS\_SAMPLE\_REJECTED\_STATUS** (p. 1033)

Examples

```
HelloWorld_subscriber.c.
```

## 5.179.2 Field Documentation

### 5.179.2.1 total\_count

```
DDS_Long DDS_SampleRejectedStatus::total_count
```

Total cumulative count of samples rejected by the **DDS\_DataReader** (p. 608).

### 5.179.2.2 total\_count\_change

```
DDS_Long DDS_SampleRejectedStatus::total_count_change
```

The incremental number of samples rejected since the last time the listener was called or the status was read.

### 5.179.2.3 last\_reason

```
DDS_SampleRejectedStatusKind DDS_SampleRejectedStatus::last_reason
```

Reason for rejecting the last sample rejected.

See also

**DDS\_SampleRejectedStatusKind** (p. 615)

### 5.179.2.4 last\_instance\_handle

`DDS_InstanceHandle_t DDS_SampleRejectedStatus::last_instance_handle`

Handle to the instance being updated by the last sample that was rejected.

If the sample was rejected because of `DDS_REJECTED_BY_DECODE_FAILURE` (p.617) and the `DDS_DataWriter` (p.478) set `DDS_DataWriterProtocolQosPolicy::disable_inline_keyhash` (p.1424) to `DDS_BOOLEAN_TRUE` (p.1004), then the `last_instance_handle` may not be correct if the sample was encrypted.

## 5.180 DDS\_SequenceNumber\_t Struct Reference

Type for *sequence* number representation.

### Data Fields

- **DDS\_Long high**  
*The most significant part of the sequence number.*
- **DDS\_UnsignedLong low**  
*The least significant part of the sequence number.*

### 5.180.1 Detailed Description

Type for *sequence* number representation.

Represents a 64-bit sequence number.

### 5.180.2 Field Documentation

#### 5.180.2.1 high

`DDS_Long DDS_SequenceNumber_t::high`

The most significant part of the sequence number.

#### 5.180.2.2 low

`DDS_UnsignedLong DDS_SequenceNumber_t::low`

The least significant part of the sequence number.

## 5.181 DDS\_ServiceQosPolicy Struct Reference

Service associated with a DDS entity.

### Data Fields

- **DDS\_ServiceQosPolicyKind** kind

*The kind of service.*

### 5.181.1 Detailed Description

Service associated with a DDS entity.

This QoS policy is intended to be used by RTI infrastructure services.

User applications should not modify its value.

Entity:

**DDS\_DomainParticipant** (p. 72), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

### 5.181.2 Field Documentation

#### 5.181.2.1 kind

```
DDS_ServiceQosPolicyKind DDS_ServiceQosPolicy::kind
```

The kind of service.

[default] **DDS\_NO\_SERVICE\_QOS** (p. 1128)

## 5.182 DDS\_ServiceRequest Struct Reference

A request coming from one of the built-in services.

## Data Fields

- **DDS\_Long service\_id**  
*The id of the service that the request was sent on.*
- struct **DDS\_GUID\_t instance\_id**  
*Each ServiceRequest is keyed on the instance\_id.*
- struct **DDS\_OctetSeq request\_body**  
*Service-specific information.*

### 5.182.1 Detailed Description

A request coming from one of the built-in services.

Data associated with the built-in topic **DDS\_SERVICE\_REQUEST\_TOPIC\_NAME** (p. 906). It contains service-specific information.

See also

**DDS\_SERVICE\_REQUEST\_TOPIC\_NAME** (p. 906)

**DDS\_ParticipantBuiltinTopicDataDataReader** (p. 896)

### 5.182.2 Field Documentation

#### 5.182.2.1 service\_id

```
DDS_Long DDS_ServiceRequest::service_id
```

The id of the service that the request was sent on.

There can be multiple services that use the built-in ServiceRequest topic. The service\_id identifies which service a specific request was sent from.

See also

**DDS\_UNKNOWN\_SERVICE\_REQUEST\_ID** (p. 905)

**DDS\_TOPIC\_QUERY\_SERVICE\_REQUEST\_ID** (p. 905)

#### 5.182.2.2 instance\_id

```
struct DDS_GUID_t DDS_ServiceRequest::instance_id
```

Each ServiceRequest is keyed on the instance\_id.

The instance\_id provides a way for users to differentiate between different requests coming from the same service.

### 5.182.2.3 request\_body

```
struct DDS_OctetSeq DDS_ServiceRequest::request_body
```

Service-specific information.

Each service uses the `request_body` field to send information specific to that service in the form of an opaque sequence of bytes. Each service provides a helper function that will deserialize the information from the request body.

See also

`DDS_TopicQueryHelper_topic_query_data_from_service_request` (p. 699)

## 5.183 DDS\_ServiceRequestAcceptedStatus Struct Reference

`DDS_SERVICE_REQUEST_ACCEPTED_STATUS` (p. 1036)

### Data Fields

- **DDS\_Long total\_count**  
*The total cumulative number of ServiceRequests that have been accepted by a `DDS_DataWriter` (p. 478).*
- **DDS\_Long total\_count\_change**  
*The incremental changes in `total_count` since the last time the listener was called or the status was read.*
- **DDS\_Long current\_count**  
*The current number of ServiceRequests that have been accepted by this `DDS_DataWriter` (p. 478).*
- **DDS\_Long current\_count\_change**  
*The change in `current_count` since the last time the listener was called or the status was read.*
- **DDS\_InstanceHandle\_t last\_request\_handle**  
*A handle to the last `DDS_ServiceRequest` (p. 1736) that caused the `DDS_DataWriter` (p. 478)'s status to change.*
- **DDS\_Long service\_id**  
*ID of the service to which the accepted Request belongs.*

### 5.183.1 Detailed Description

`DDS_SERVICE_REQUEST_ACCEPTED_STATUS` (p. 1036)

Currently, the only service that causes the `ServiceRequestAcceptedStatus` to be triggered is the `DDS_TopicQuery` (p. 698) service. A `DDS_ServiceRequest` (p. 1736) is accepted when a `DDS_DataWriter` (p. 478) matches with a `DDS_DataReader` (p. 608) that has created a `DDS_TopicQuery` (p. 698).

This status is also changed (and the listener, if any, called) when a `ServiceRequest` has been cancelled, or deleted. This will happen when a `DDS_DataReader` (p. 608) deletes a `TopicQuery` using `DDS_DataReader_delete_topic_query` (p. 684).

## 5.183.2 Field Documentation

### 5.183.2.1 total\_count

`DDS_Long DDS_ServiceRequestAcceptedStatus::total_count`

The total cumulative number of ServiceRequests that have been accepted by a **DDS\_DataWriter** (p. 478).

This number increases whenever a new request is accepted. It does not change when a request is cancelled.

### 5.183.2.2 total\_count\_change

`DDS_Long DDS_ServiceRequestAcceptedStatus::total_count_change`

The incremental changes in total\_count since the last time the listener was called or the status was read.

### 5.183.2.3 current\_count

`DDS_Long DDS_ServiceRequestAcceptedStatus::current_count`

The current number of ServiceRequests that have been accepted by this **DDS\_DataWriter** (p. 478).

This number increases when a new request is accepted and decreases when an existing request is cancelled.

### 5.183.2.4 current\_count\_change

`DDS_Long DDS_ServiceRequestAcceptedStatus::current_count_change`

The change in current\_count since the last time the listener was called or the status was read.

### 5.183.2.5 last\_request\_handle

`DDS_InstanceHandle_t DDS_ServiceRequestAcceptedStatus::last_request_handle`

A handle to the last **DDS\_ServiceRequest** (p. 1736) that caused the **DDS\_DataWriter** (p. 478)'s status to change.

### 5.183.2.6 service\_id

`DDS_Long DDS_ServiceRequestAcceptedStatus::service_id`

ID of the service to which the accepted Request belongs.

See also

`DDS_TOPIC_QUERY_SERVICE_REQUEST_ID` (p. 905)

## 5.184 DDS\_ServiceRequestSeq Struct Reference

Instantiates `FooSeq` (p. 1845) < `DDS_ServiceRequest` (p. 1736) > .

### 5.184.1 Detailed Description

Instantiates `FooSeq` (p. 1845) < `DDS_ServiceRequest` (p. 1736) > .

Instantiates:

<<*generic*>> (p. 818) `FooSeq` (p. 1845)

See also

`DDS_ServiceRequest` (p. 1736)

## 5.185 DDS\_ServiceRequestTypeSupport Struct Reference

Instantiates `TypeSupport` < `DDS_ServiceRequest` (p. 1736) > .

### 5.185.1 Detailed Description

Instantiates `TypeSupport` < `DDS_ServiceRequest` (p. 1736) > .

Instantiates:

<<*generic*>> (p. 818) `FooTypeSupport` (p. 1846)

See also

`DDS_ServiceRequest` (p. 1736)

## 5.186 DDS\_ShortSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Short** (p. 1005) >

### 5.186.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_Short** (p. 1005) >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_Short** (p. 1005)

**FooSeq** (p. 1845)

## 5.187 DDS\_StringSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < char\* > with value type semantics.

### 5.187.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < char\* > with value type semantics.

StringSeq is a sequence that contains strings.

Even though the element type is a `char*`, i.e. a pointer, the sequence semantically behaves as a sequence of `char*` *value* types. When a **DDS\_StringSeq** (p. 1741) is copied or deleted, the contained strings are also respectively copied or deleted.

*Important:* Users of this type must understand its memory management contract.

- Ownership of this sequence's buffer implies ownership of the pointers stored in that buffer; a loan of the buffer implies lack of ownership of the pointers. In other words, for a type **FooSeq** (p. 1845) where **Foo** (p. 1841) is a pointer, ownership of **Foo** (p. 1841) implies ownership of \***Foo** (p. 1841). In other words, deleting a string sequence that owns its memory implies the deletion of all strings in that sequence. See **FooSeq\_loan\_contiguous** (p. 1306) for more information about sequence memory ownership.
- The second important rule is that non-NULL strings are *assumed to be of sufficient size* to store the necessary characters. This is a dangerous rule, but it cannot be avoided because a string doesn't store the amount of memory it has. The only other alternative is to always free and re-allocate memory. Not only would this latter policy be very expensive, but it would essentially render any loaned **DDS\_StringSeq** (p. 1741) immutable, since to modify any string in it would require freeing and re-allocating that string, which would violate the first principle discussed above.

It is also worth noting that the element type of a string sequence is `char*`, not `const char*`. It is therefore incorrect and dangerous, for example, to insert a string literal into a string sequence without first copying it into mutable memory.

In order to guarantee correct behavior, it is recommended that the contained elements always be manipulated using the string support API's described in **String Support** (p. 1311).

## 5.188 DDS\_StringTypeSupport Struct Reference

<<*interface*>> (p. 818) String type support.

### 5.188.1 Detailed Description

<<*interface*>> (p. 818) String type support.

## 5.189 DDS\_StructMember Struct Reference

A description of a member of a struct.

### Data Fields

- char \* **name**  
*The name of the struct member.*
- const **DDS\_TypeCode** \* **type**  
*The type of the struct member.*
- **DDS\_Boolean is\_pointer**  
*Indicates whether the struct member is a pointer or not.*
- **DDS\_Short bits**  
*Number of bits of a bitfield member.*
- **DDS\_Boolean is\_key**  
*Indicates if the struct member is a key member or not.*
- **DDS\_Long id**  
*The member ID.*
- **DDS\_Boolean is\_optional**  
*Indicates if the struct member is optional or required.*

## 5.189.1 Detailed Description

A description of a member of a struct.

See also

[DDS\\_StructMemberSeq](#) (p. 1744)

[DDS\\_TypeCodeFactory\\_create\\_struct\\_tc](#) (p. 287)

## 5.189.2 Field Documentation

### 5.189.2.1 name

```
char* DDS_StructMember::name
```

The name of the struct member.

Cannot be NULL.

### 5.189.2.2 type

```
const DDS_TypeCode* DDS_StructMember::type
```

The type of the struct member.

Cannot be NULL.

### 5.189.2.3 is\_pointer

```
DDS_Boolean DDS_StructMember::is_pointer
```

Indicates whether the struct member is a pointer or not.

### 5.189.2.4 bits

```
DDS_Short DDS_StructMember::bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain [DDS\\_TYPECODE\\_NOT\\_BITFIELD](#) (p. 234).

### 5.189.2.5 is\_key

`DDS_Boolean DDS_StructMember::is_key`

Indicates if the struct member is a key member or not.

### 5.189.2.6 id

`DDS_Long DDS_StructMember::id`

The member ID.

Use `DDS_TYPECODE_MEMBER_ID_INVALID` (p. 233) to have the member ID automatically assigned.

### 5.189.2.7 is\_optional

`DDS_Boolean DDS_StructMember::is_optional`

Indicates if the struct member is optional or required.

## 5.190 DDS\_StructMemberSeq Struct Reference

Defines a sequence of struct members.

### 5.190.1 Detailed Description

Defines a sequence of struct members.

See also

`DDS_StructMember` (p. 1742)

`FooSeq` (p. 1845)

## 5.191 DDS\_SubscriberListener Struct Reference

<<*interface*>> (p. 818) `DDS_Listener` (p. 1569) for status about a subscriber.

## Data Fields

- struct **DDS\_DataReaderListener as\_datareaderlistener**  
*The superclass instance of this **DDS\_SubscriberListener** (p. 1744).*
- **DDS\_SubscriberListener\_DataOnReadersCallback on\_data\_on\_readers**  
*Handles the **DDS\_DATA\_ON\_READERS\_STATUS** (p. 1033) communication status.*

### 5.191.1 Detailed Description

<<*interface*>> (p. 818) **DDS\_Listener** (p. 1569) for status about a subscriber.

Entity:

**DDS\_Subscriber** (p. 565)

Status:

**DDS\_DATA\_AVAILABLE\_STATUS** (p. 1033);  
**DDS\_DATA\_ON\_READERS\_STATUS** (p. 1033);  
**DDS\_LIVELINESS\_CHANGED\_STATUS** (p. 1034), **DDS\_LivelinessChangedStatus** (p. 1572);  
**DDS\_REQUESTED\_DEADLINE\_MISSED\_STATUS** (p. 1032), **DDS\_RequestedDeadlineMissedStatus**  
(p. 1688);  
**DDS\_REQUESTED\_INCOMPATIBLE\_QOS\_STATUS** (p. 1032), **DDS\_RequestedIncompatibleQosStatus**  
(p. 1689);  
**DDS\_SAMPLE\_LOST\_STATUS** (p. 1033), **DDS\_SampleLostStatus** (p. 1732);  
**DDS\_SAMPLE\_REJECTED\_STATUS** (p. 1033), **DDS\_SampleRejectedStatus** (p. 1733);  
**DDS\_SUBSCRIPTION\_MATCHED\_STATUS** (p. 1035), **DDS\_SubscriptionMatchedStatus** (p. 1758);

See also

**DDS\_Listener** (p. 1569)  
**Status Kinds** (p. 1025)  
**Operations Allowed in Listener Callbacks** (p. 1571)

### 5.191.2 Field Documentation

#### 5.191.2.1 as\_datareaderlistener

```
struct DDS_DataReaderListener DDS_SubscriberListener::as_datareaderlistener
```

The superclass instance of this **DDS\_SubscriberListener** (p. 1744).

### 5.191.2.2 on\_data\_on\_readers

`DDS_SubscriberListener_DataOnReadersCallback` `DDS_SubscriberListener::on_data_on_readers`

Handles the `DDS_DATA_ON_READERS_STATUS` (p. 1033) communication status.

## 5.192 DDS\_SubscriberQos Struct Reference

QoS policies supported by a `DDS_Subscriber` (p. 565) entity.

### Data Fields

- struct `DDS_PresentationQosPolicy` `presentation`  
*Presentation policy, `PRESENTATION` (p. 1105).*
- struct `DDS_PartitionQosPolicy` `partition`  
*Partition policy, `PARTITION` (p. 1104).*
- struct `DDS_GroupDataQosPolicy` `group_data`  
*Group data policy, `GROUP_DATA` (p. 1094).*
- struct `DDS_EntityFactoryQosPolicy` `entity_factory`  
*Entity factory policy, `ENTITY_FACTORY` (p. 1090).*
- struct `DDS_EntityNameQosPolicy` `subscriber_name`  
*<<extension>> (p. 817) EntityName policy, `ENTITY_NAME` (p. 1091).*

### 5.192.1 Detailed Description

QoS policies supported by a `DDS_Subscriber` (p. 565) entity.

You must set certain members in a consistent manner:

length of `DDS_GroupDataQosPolicy::value` (p. 1557)  $\leq$  `DDS_DomainParticipantResourceLimitsQosPolicy::subscriber_group_data_max_length` (p. 1506)

length of `DDS_PartitionQosPolicy::name` (p. 1629)  $\leq$  `DDS_DomainParticipantResourceLimitsQosPolicy::max_partitions` (p. 1507)

combined number of characters (including terminating 0) in `DDS_PartitionQosPolicy::name` (p. 1629)  $\leq$  `DDS_DomainParticipantResourceLimitsQosPolicy::max_partition_cumulative_characters` (p. 1507)

If any of the above are not true, `DDS_Subscriber_set_qos` (p. 585) and `DDS_Subscriber_set_qos_with_profile` (p. 585) will fail with `DDS_RETCODE_INCONSISTENT_POLICY` (p. 1025)

### 5.192.2 Field Documentation

### 5.192.2.1 presentation

```
struct DDS_PresentationQosPolicy DDS_SubscriberQos::presentation
```

Presentation policy, **PRESENTATION** (p. 1105).

### 5.192.2.2 partition

```
struct DDS_PartitionQosPolicy DDS_SubscriberQos::partition
```

Partition policy, **PARTITION** (p. 1104).

### 5.192.2.3 group\_data

```
struct DDS_GroupDataQosPolicy DDS_SubscriberQos::group_data
```

Group data policy, **GROUP\_DATA** (p. 1094).

### 5.192.2.4 entity\_factory

```
struct DDS_EntityFactoryQosPolicy DDS_SubscriberQos::entity_factory
```

Entity factory policy, **ENTITY\_FACTORY** (p. 1090).

### 5.192.2.5 subscriber\_name

```
struct DDS_EntityNameQosPolicy DDS_SubscriberQos::subscriber_name
```

<<*extension*>> (p. 817) EntityName policy, **ENTITY\_NAME** (p. 1091).

## 5.193 DDS\_SubscriberSeq Struct Reference

Declares IDL sequence < **DDS\_Subscriber** (p. 565) > .

### 5.193.1 Detailed Description

Declares IDL `sequence < DDS_Subscriber (p. 565) >` .

See also

`FooSeq` (p. 1845)

## 5.194 DDS\_SubscriptionBuiltinTopicData Struct Reference

Entry created when a `DDS_DataReader` (p. 608) is discovered in association with its Subscriber.

### Data Fields

- **DDS\_BuiltinTopicKey\_t key**  
*DCPS key to distinguish entries.*
- **DDS\_BuiltinTopicKey\_t participant\_key**  
*DCPS key of the participant to which the DataReader belongs.*
- char \* **topic\_name**  
*Name of the related `DDS_Topic` (p. 172).*
- char \* **type\_name**  
*Name of the type attached to the `DDS_Topic` (p. 172).*
- struct **DDS\_DurabilityQosPolicy durability**  
*Policy of the corresponding DataReader.*
- struct **DDS\_DeadlineQosPolicy deadline**  
*Policy of the corresponding DataReader.*
- struct **DDS\_LatencyBudgetQosPolicy latency\_budget**  
*Policy of the corresponding DataReader.*
- struct **DDS\_LivelinessQosPolicy liveliness**  
*Policy of the corresponding DataReader.*
- struct **DDS\_ReliabilityQosPolicy reliability**  
*Policy of the corresponding DataReader.*
- struct **DDS\_OwnershipQosPolicy ownership**  
*Policy of the corresponding DataReader.*
- struct **DDS\_DestinationOrderQosPolicy destination\_order**  
*Policy of the corresponding DataReader.*
- struct **DDS\_UserDataQosPolicy user\_data**  
*Policy of the corresponding DataReader.*
- struct **DDS\_TimeBasedFilterQosPolicy time\_based\_filter**  
*Policy of the corresponding DataReader.*
- struct **DDS\_PresentationQosPolicy presentation**  
*Policy of the Subscriber to which the DataReader belongs.*
- struct **DDS\_PartitionQosPolicy partition**  
*Policy of the Subscriber to which the DataReader belongs.*
- struct **DDS\_TopicDataQosPolicy topic\_data**

*Policy of the related Topic.*

- struct **DDS\_GroupDataQosPolicy group\_data**  
*Policy of the Subscriber to which the DataReader belongs.*
- struct **DDS\_TypeConsistencyEnforcementQosPolicy type\_consistency**  
*Policy of the corresponding DataReader.*
- struct **DDS\_DataRepresentationQosPolicy representation**  
*Data representation policy of the corresponding DataReader.*
- **DDS\_DataTagQosPolicy data\_tags**  
*Tags of the corresponding DataReader.*
- struct **DDS\_TypeCode \* type\_code**  
<<extension>> (p. 817) *Type code information of the corresponding Topic*
- **DDS\_BuiltinTopicKey\_t subscriber\_key**  
<<extension>> (p. 817) *DCPS key of the subscriber to which the DataReader belongs.*
- struct **DDS\_PropertyQosPolicy property**  
<<extension>> (p. 817) *Properties of the corresponding DataReader.*
- struct **DDS\_LocatorSeq unicast\_locators**  
<<extension>> (p. 817) *Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.*
- struct **DDS\_LocatorSeq multicast\_locators**  
<<extension>> (p. 817) *Custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.*
- struct **DDS\_ContentFilterProperty\_t content\_filter\_property**  
<<extension>> (p. 817) *This field provides all the required information to enable content filtering on the Writer side.*
- struct **DDS\_GUID\_t virtual\_guid**  
<<extension>> (p. 817) *Virtual GUID associated to the DataReader.*
- struct **DDS\_ServiceQosPolicy service**  
<<extension>> (p. 817) *Policy of the corresponding DataReader.*
- **DDS\_ProtocolVersion\_t rtps\_protocol\_version**  
<<extension>> (p. 817) *Version number of the RTPS wire protocol used.*
- struct **DDS\_VendorId\_t rtps\_vendor\_id**  
<<extension>> (p. 817) *ID of vendor implementing the RTPS wire protocol.*
- struct **DDS\_ProductVersion\_t product\_version**  
<<extension>> (p. 817) *This is a vendor specific parameter. It gives the current version of RTI Connext*
- **DDS\_Boolean disable\_positive\_acks**  
<<extension>> (p. 817) *This is a vendor specific parameter. Determines whether the corresponding DataReader sends positive acknowledgments for reliability.*
- struct **DDS\_EntityNameQosPolicy subscription\_name**  
<<extension>> (p. 817) *The subscription name and role name.*
- struct **DDS\_EndpointTrustProtectionInfo trust\_protection\_info**  
<<extension>> (p. 817) *Trust plugins protection information associated with the discovered DataReader.*
- struct **DDS\_EndpointTrustAlgorithmInfo trust\_algorithm\_info**  
<<extension>> (p. 817) *Trust Plugins algorithms associated with the discovered DataReader.*

### 5.194.1 Detailed Description

Entry created when a **DDS\_DataReader** (p. 608) is discovered in association with its Subscriber.

Data associated with the built-in topic **DDS\_SUBSCRIPTION\_TOPIC\_NAME** (p. 902). It contains QoS policies and additional information that apply to the remote **DDS\_DataReader** (p. 608) the related **DDS\_Subscriber** (p. 565).

See also

**DDS\_SUBSCRIPTION\_TOPIC\_NAME** (p. 902)

**DDS\_SubscriptionBuiltinTopicDataDataReader** (p. 902)

### 5.194.2 Field Documentation

#### 5.194.2.1 key

```
DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::key
```

DCPS key to distinguish entries.

#### 5.194.2.2 participant\_key

```
DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::participant_key
```

DCPS key of the participant to which the DataReader belongs.

#### 5.194.2.3 topic\_name

```
char* DDS_SubscriptionBuiltinTopicData::topic_name
```

Name of the related **DDS\_Topic** (p. 172).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1312).

See also

**String Conventions** (p. 1312)

#### 5.194.2.4 type\_name

```
char* DDS_SubscriptionBuiltinTopicData::type_name
```

Name of the type attached to the **DDS\_Topic** (p. 172).

The length of this string is limited to 255 characters.

The memory for this field is managed as described in **String Conventions** (p. 1312).

See also

**String Conventions** (p. 1312)

#### 5.194.2.5 durability

```
struct DDS_DurabilityQosPolicy DDS_SubscriptionBuiltinTopicData::durability
```

Policy of the corresponding DataReader.

#### 5.194.2.6 deadline

```
struct DDS_DeadlineQosPolicy DDS_SubscriptionBuiltinTopicData::deadline
```

Policy of the corresponding DataReader.

#### 5.194.2.7 latency\_budget

```
struct DDS_LatencyBudgetQosPolicy DDS_SubscriptionBuiltinTopicData::latency_budget
```

Policy of the corresponding DataReader.

#### 5.194.2.8 liveliness

```
struct DDS_LivelinessQosPolicy DDS_SubscriptionBuiltinTopicData::liveliness
```

Policy of the corresponding DataReader.

### 5.194.2.9 reliability

```
struct DDS_ReliabilityQosPolicy DDS_SubscriptionBuiltinTopicData::reliability
```

Policy of the corresponding DataReader.

### 5.194.2.10 ownership

```
struct DDS_OwnershipQosPolicy DDS_SubscriptionBuiltinTopicData::ownership
```

Policy of the corresponding DataReader.

### 5.194.2.11 destination\_order

```
struct DDS_DestinationOrderQosPolicy DDS_SubscriptionBuiltinTopicData::destination_order
```

Policy of the corresponding DataReader.

#### Warning

Only the field **DDS\_DestinationOrderQosPolicy::kind** (p. 1459) is propagated during discovery. The other fields always contain their default values.

### 5.194.2.12 user\_data

```
struct DDS_UserDataQosPolicy DDS_SubscriptionBuiltinTopicData::user_data
```

Policy of the corresponding DataReader.

### 5.194.2.13 time\_based\_filter

```
struct DDS_TimeBasedFilterQosPolicy DDS_SubscriptionBuiltinTopicData::time_based_filter
```

Policy of the corresponding DataReader.

#### 5.194.2.14 presentation

```
struct DDS_PresentationQosPolicy DDS_SubscriptionBuiltinTopicData::presentation
```

Policy of the Subscriber to which the DataReader belongs.

#### 5.194.2.15 partition

```
struct DDS_PartitionQosPolicy DDS_SubscriptionBuiltinTopicData::partition
```

Policy of the Subscriber to which the DataReader belongs.

#### 5.194.2.16 topic\_data

```
struct DDS_TopicDataQosPolicy DDS_SubscriptionBuiltinTopicData::topic_data
```

Policy of the related Topic.

#### 5.194.2.17 group\_data

```
struct DDS_GroupDataQosPolicy DDS_SubscriptionBuiltinTopicData::group_data
```

Policy of the Subscriber to which the DataReader belongs.

#### 5.194.2.18 type\_consistency

```
struct DDS_TypeConsistencyEnforcementQosPolicy DDS_SubscriptionBuiltinTopicData::type_consistency
```

Policy of the corresponding DataReader.

#### 5.194.2.19 representation

```
struct DDS_DataRepresentationQosPolicy DDS_SubscriptionBuiltinTopicData::representation
```

Data representation policy of the corresponding DataReader.

#### 5.194.2.20 data\_tags

```
DDS_DataTagQosPolicy DDS_SubscriptionBuiltinTopicData::data_tags
```

Tags of the corresponding DataReader.

#### 5.194.2.21 type\_code

```
struct DDS_TypeCode* DDS_SubscriptionBuiltinTopicData::type_code
```

<<*extension*>> (p. 817) Type code information of the corresponding Topic

#### 5.194.2.22 subscriber\_key

```
DDS_BuiltinTopicKey_t DDS_SubscriptionBuiltinTopicData::subscriber_key
```

<<*extension*>> (p. 817) DCPS key of the subscriber to which the DataReader belongs.

#### 5.194.2.23 property

```
struct DDS_PropertyQosPolicy DDS_SubscriptionBuiltinTopicData::property
```

<<*extension*>> (p. 817) Properties of the corresponding DataReader.

#### 5.194.2.24 unicast\_locators

```
struct DDS_LocatorSeq DDS_SubscriptionBuiltinTopicData::unicast_locators
```

<<*extension*>> (p. 817) Custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

#### 5.194.2.25 multicast\_locators

```
struct DDS_LocatorSeq DDS_SubscriptionBuiltinTopicData::multicast_locators
```

<<*extension*>> (p. 817) Custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.

#### 5.194.2.26 content\_filter\_property

```
struct DDS_ContentFilterProperty_t DDS_SubscriptionBuiltinTopicData::content_filter_property
```

<<*extension*>> (p. 817) This field provides all the required information to enable content filtering on the Writer side.

#### 5.194.2.27 virtual\_guid

```
struct DDS_GUID_t DDS_SubscriptionBuiltinTopicData::virtual_guid
```

<<*extension*>> (p. 817) Virtual GUID associated to the DataReader.

See also

**DDS\_GUID\_t** (p. 1557)

#### 5.194.2.28 service

```
struct DDS_ServiceQosPolicy DDS_SubscriptionBuiltinTopicData::service
```

<<*extension*>> (p. 817) Policy of the corresponding DataReader.

#### 5.194.2.29 rtps\_protocol\_version

```
DDS_ProtocolVersion_t DDS_SubscriptionBuiltinTopicData::rtps_protocol_version
```

<<*extension*>> (p. 817) Version number of the RTPS wire protocol used.

### 5.194.2.30 rtps\_vendor\_id

```
struct DDS_VendorId_t DDS_SubscriptionBuiltinTopicData::rtps_vendor_id
```

<<*extension*>> (p. 817) ID of vendor implementing the RTPS wire protocol.

### 5.194.2.31 product\_version

```
struct DDS_ProductVersion_t DDS_SubscriptionBuiltinTopicData::product_version
```

<<*extension*>> (p. 817) This is a vendor specific parameter. It gives the current version of RTI Connext

### 5.194.2.32 disable\_positive\_acks

```
DDS_Boolean DDS_SubscriptionBuiltinTopicData::disable_positive_acks
```

<<*extension*>> (p. 817) This is a vendor specific parameter. Determines whether the corresponding DataReader sends positive acknowledgments for reliability.

### 5.194.2.33 subscription\_name

```
struct DDS_EntityNameQosPolicy DDS_SubscriptionBuiltinTopicData::subscription_name
```

<<*extension*>> (p. 817) The subscription name and role name.

This member contains the name and the role name of the discovered subscription.

### 5.194.2.34 trust\_protection\_info

```
struct DDS_EndpointTrustProtectionInfo DDS_SubscriptionBuiltinTopicData::trust_protection_info
```

<<*extension*>> (p. 817) Trust plugins protection information associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust\_protection\_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust\_protection\_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

### 5.194.2.35 trust\_algorithm\_info

```
struct DDS_EndpointTrustAlgorithmInfo DDS_SubscriptionBuiltinTopicData::trust_algorithm_info
```

<<**extension**>> (p. 817) Trust Plugins algorithms associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust\_algorithm\_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust\_algorithm\_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

## 5.195 DDS\_SubscriptionBuiltinTopicDataSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_SubscriptionBuiltinTopicData** (p. 1748) > .

### 5.195.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_SubscriptionBuiltinTopicData** (p. 1748) > .

Instantiates:

<<**generic**>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_SubscriptionBuiltinTopicData** (p. 1748)

## 5.196 DDS\_SubscriptionBuiltinTopicDataTypeSupport Struct Reference

Instantiates **TypeSupport** < **DDS\_SubscriptionBuiltinTopicData** (p. 1748) > .

### 5.196.1 Detailed Description

Instantiates **TypeSupport** < **DDS\_SubscriptionBuiltinTopicData** (p. 1748) > .

Instantiates:

<<**generic**>> (p. 818) **FooTypeSupport** (p. 1846)

See also

**DDS\_SubscriptionBuiltinTopicData** (p. 1748)

## 5.197 DDS\_SubscriptionMatchedStatus Struct Reference

**DDS\_SUBSCRIPTION\_MATCHED\_STATUS** (p. 1035)

### Data Fields

- **DDS\_Long total\_count**

*The total cumulative number of times that this **DDS\_DataReader** (p. 608) discovered a "match" with a **DDS\_DataWriter** (p. 478).*

- **DDS\_Long total\_count\_change**

*The changes in total\_count since the last time the listener was called or the status was read.*

- **DDS\_Long current\_count**

*The current number of DataWriters with which the **DDS\_DataReader** (p. 608) is matched.*

- **DDS\_Long current\_count\_peak**

*<<extension>> (p. 817) Greatest number of DataWriters that matched this DataReader simultaneously.*

- **DDS\_Long current\_count\_change**

*The change in current\_count since the last time the listener was called or the status was read.*

- **DDS\_InstanceHandle\_t last\_publication\_handle**

*This InstanceHandle can be used to look up which remote **DDS\_DataWriter** (p. 478) was the last to cause this DataReader's status to change, using **DDS\_DataReader\_get\_matched\_publication\_data** (p. 671).*

### 5.197.1 Detailed Description

**DDS\_SUBSCRIPTION\_MATCHED\_STATUS** (p. 1035)

A "match" happens when the **DDS\_DataReader** (p. 608) finds a **DDS\_DataWriter** (p. 478) with the same **DDS\_Topic** (p. 172), same or compatible data type, and an offered QoS that is compatible with that requested by the **DDS\_DataReader** (p. 608). (For information on compatible data types, see the [Extensible Types Guide](#).)

This status is also changed (and the listener, if any, called) when a match is ended. A local **DDS\_DataReader** (p. 608) will become "unmatched" from a remote **DDS\_DataWriter** (p. 478) when that **DDS\_DataWriter** (p. 478) goes away for any of the following reasons:

- The **DDS\_DomainParticipant** (p. 72) containing the matched **DDS\_DataWriter** (p. 478) has lost liveliness.
- This DataReader or the matched DataWriter has changed QoS such that the entities are now incompatible.
- The matched DataWriter has been deleted.

This status may reflect changes from multiple match or unmatched events, and the **DDS\_SubscriptionMatchedStatus::current\_count\_change** (p. 1759) can be used to determine the number of changes since the listener was called back or the status was checked.

Note: A DataWriter's loss of liveliness (which is determined by **DDS\_LivelinessQosPolicyKind** (p. 1097)) does not trigger an unmatched event. So a DataWriter may still match even though its liveliness is lost.

#### Examples

**HelloWorld\_subscriber.c.**

## 5.197.2 Field Documentation

### 5.197.2.1 total\_count

`DDS_Long DDS_SubscriptionMatchedStatus::total_count`

The total cumulative number of times that this **DDS\_DataReader** (p. 608) discovered a "match" with a **DDS\_DataWriter** (p. 478).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **DDS\_SubscriptionMatchedStatus** (p. 1758).

### 5.197.2.2 total\_count\_change

`DDS_Long DDS_SubscriptionMatchedStatus::total_count_change`

The changes in total\_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times the DataReader ever matched with a DataWriter).

### 5.197.2.3 current\_count

`DDS_Long DDS_SubscriptionMatchedStatus::current_count`

The current number of DataWriters with which the **DDS\_DataReader** (p. 608) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **DDS\_SubscriptionMatchedStatus** (p. 1758).

### 5.197.2.4 current\_count\_peak

`DDS_Long DDS_SubscriptionMatchedStatus::current_count_peak`

<<*extension*>> (p. 817) Greatest number of DataWriters that matched this DataReader simultaneously.

That is, there was no moment in time when more than this many DataWriters matched this DataReader. (As a result, total\_count can be higher than current\_count\_peak.)

### 5.197.2.5 current\_count\_change

**DDS\_Long** DDS\_SubscriptionMatchedStatus::current\_count\_change

The change in current\_count since the last time the listener was called or the status was read.

Note that a negative current\_count\_change means that one or more DataWriters have become unmatched for one or more of the reasons described in **DDS\_SubscriptionMatchedStatus** (p. 1758).

### 5.197.2.6 last\_publication\_handle

**DDS\_InstanceHandle\_t** DDS\_SubscriptionMatchedStatus::last\_publication\_handle

This InstanceHandle can be used to look up which remote **DDS\_DataWriter** (p. 478) was the last to cause this DataReader's status to change, using **DDS\_DataReader\_get\_matched\_publication\_data** (p. 671).

If the DataWriter no longer matches this DataReader due to any of the reasons in **DDS\_SubscriptionMatchedStatus** (p. 1758) except incompatible QoS, then the DataWriter has been purged from this DataReader's DomainParticipant discovery database. (See the "Discovery Overview" section of the *User's Manual*.) In that case, the **DDS\_DataReader\_get\_matched\_publication\_data** (p. 671) method will not be able to return information about the DataWriter. The only way to get information about the lost DataWriter is if you cached the information previously.

## 5.198 DDS\_SystemResourceLimitsQosPolicy Struct Reference

<<*extension*>> (p. 817) Configures **DDS\_DomainParticipant** (p. 72)-independent resources used by RTI Connex. Mainly used to change the maximum number of **DDS\_DomainParticipant** (p. 72) entities that can be created within a single process (address space).

### Data Fields

- **DDS\_Long max\_objects\_per\_thread**  
*The maximum number of objects that can be stored per thread for a DDS\_DomainParticipantFactory (p. 28).*
- **DDS\_Long initial\_objects\_per\_thread**  
*The number of objects per thread for a DDS\_DomainParticipantFactory (p. 28) for which infrastructure will initially be allocated.*

### 5.198.1 Detailed Description

<<*extension*>> (p. 817) Configures **DDS\_DomainParticipant** (p. 72)-independent resources used by RTI Connex. Mainly used to change the maximum number of **DDS\_DomainParticipant** (p. 72) entities that can be created within a single process (address space).

Entity:

**DDS\_DomainParticipantFactory** (p. 28)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.198.2 Usage

Within a single process (or address space for some supported real-time operating systems), applications may create and use multiple **DDS\_DomainParticipant** (p.72) entities. This QoS policy sets a parameter that places an effective upper bound on the maximum number of **DDS\_DomainParticipant** (p.72) entities that can be created in a single process/address space. These values cannot be changed after a DomainParticipant has been created and they cannot be set in a QoS XML file.

## 5.198.3 Field Documentation

### 5.198.3.1 max\_objects\_per\_thread

```
DDS_Long DDS_SystemResourceLimitsQoSPolicy::max_objects_per_thread
```

The maximum number of objects that can be stored per thread for a **DDS\_DomainParticipantFactory** (p.28).

This value is the upper bound on the number of objects that can be stored per thread. When a **DDS\_DomainParticipantFactory** (p.28) is created, infrastructure will be created to manage the number of objects specified by `initial_objects_per_thread`. As more objects are required by the application, the infrastructure will be automatically grown to accommodate up to `max_objects_per_thread` objects. Leave this property set to the default value to allow the infrastructure to grow as needed. If you wish to strictly control memory allocation, set `max_objects_per_thread` to a smaller value, but note that this runs the risk of a runtime error and reduced application functionality if your limit is reached.

**[default]** 261120

**[range]** [1, 261120]

### 5.198.3.2 initial\_objects\_per\_thread

```
DDS_Long DDS_SystemResourceLimitsQoSPolicy::initial_objects_per_thread
```

The number of objects per thread for a **DDS\_DomainParticipantFactory** (p.28) for which infrastructure will initially be allocated.

The infrastructure for managing thread-specific objects will initially be sized according to this value. The infrastructure will grow automatically, up to a maximum of `max_objects_per_thread`, as required by the application at runtime. If you are certain that more than the default value of `initial_objects_per_thread` will be required for your application and you wish to reduce the number of memory allocations performed while your application reaches steady state, you may set this value to a larger number. To improve the efficiency of memory allocation, RTI Connexant may initially size the infrastructure to a larger value than the value of `initial_objects_per_thread`. The infrastructure will never be sized less than `initial_objects_per_thread` or greater than `max_objects_per_thread`. When the infrastructure for managing thread-specific objects is created or increased, a log message stating "Allowed number of thread specific objects is now " will be produced at the local log level.

**[default]** 1024

**[range]** [1, 261120]; must be less than or equal to `max_objects_per_thread`

## 5.199 DDS\_Tag Struct Reference

Tags are name/value pair objects.

### Data Fields

- char \* **name**  
*Tag name.*
- char \* **value**  
*Tag value.*

### 5.199.1 Detailed Description

Tags are name/value pair objects.

### 5.199.2 Field Documentation

#### 5.199.2.1 name

```
char* DDS_Tag::name
```

Tag name.

It must be a NULL-terminated string.

#### 5.199.2.2 value

```
char* DDS_Tag::value
```

Tag value.

It must be a NULL-terminated string.

DDS\_Tag (p. 1762)

## 5.201 DDS\_ThreadFactory Struct Reference

<<*extension*>> (p. 817) <<*interface*>> (p. 818) Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDS\_ThreadFactory\_OnSpawned**↔**Function** (p. 1230) that specifies the operation to run in the new thread.

### Data Fields

- void \* **factory\_data**  
*A place for interface implementors to keep a pointer to data that may be needed by their factory.*
- **DDS\_ThreadFactory\_CreateThreadCallback** **create\_thread**  
*Handles the creation of new threads.*
- **DDS\_ThreadFactory\_DeleteThreadCallback** **delete\_thread**  
*Handles the deletion of threads previously created by this factory.*

### 5.201.1 Detailed Description

<<*extension*>> (p. 817) <<*interface*>> (p. 818) Interface for providing the threads needed by the middleware. It consists of operations to create and delete threads. The interface depends on the **DDS\_ThreadFactory\_OnSpawned**↔**Function** (p. 1230) that specifies the operation to run in the new thread.

### 5.201.2 Field Documentation

#### 5.201.2.1 factory\_data

```
void* DDS_ThreadFactory::factory_data
```

A place for interface implementors to keep a pointer to data that may be needed by their factory.

### 5.201.2.2 create\_thread

```
DDS_ThreadFactory_CreateThreadCallback DDS_ThreadFactory::create_thread
```

Handles the creation of new threads.

This callback is called by the middleware whenever it needs to create a new thread. The operation creates a new thread of control that will call the function specified by **DDS\_ThreadFactory\_OnSpawnedFunction** (p. 1230). On success, this operation must guarantee that after return the new thread of control been spawned and its execution has started or will start some time after.

The **DDS\_ThreadFactory\_OnSpawnedFunction** (p. 1230), function must be called in the new thread and return its value on finalization. The function should be called as follows:

```
void * thread_out = on_spawned(thread_params);
```

```
...
```

```
return thread_out;
```

Some thread frameworks do this directly by just receiving the function and its parameters as arguments on thread creation. For instance, POSIX follows this model when creating a thread and the start\_routine function has the same signature as **DDS\_ThreadFactory\_OnSpawnedFunction** (p. 1230), so the parameter can be passed directly:

```
int result = pthread_create(&pthread_handle, &attr, on_spawned, thread_params);
```

```
...
```

```
return &pthread_handle;
```

### 5.201.2.3 delete\_thread

```
DDS_ThreadFactory_DeleteThreadCallback DDS_ThreadFactory::delete_thread
```

Handles the deletion of threads previously created by this factory.

This callback is called by the middleware whenever it needs to delete a thread. This operation deletes a thread previously created via a call to **DDS\_ThreadFactory::create\_thread** (p. 1763) on the same factory object. On success, the thread must be deleted but it does not have to guarantee that the execution has finished. Likewise, resources associated with the underlying operating system may be still in use. Depending on the thread framework, resources allocated on thread creation are released upon thread finalization. POSIX follows this model so no actions are required on the thread handle returned by `pthread_create()`.

## 5.202 DDS\_ThreadSettings\_t Struct Reference

The properties of a thread of execution.

## Data Fields

- **DDS\_ThreadSettingsKindMask** `mask`  
*Describes the type of thread.*
- **DDS\_Long** `priority`  
*Thread priority.*
- **DDS\_Long** `stack_size`  
*The thread stack-size.*
- struct **DDS\_LongSeq** `cpu_list`  
*The list of processors on which the thread(s) may run.*
- **DDS\_ThreadSettingsCpuRotationKind** `cpu_rotation`  
*Determines how processor affinity is applied to multiple threads.*

### 5.202.1 Detailed Description

The properties of a thread of execution.

QoS:

**DDS\_EventQosPolicy** (p. 1547) **DDS\_DatabaseQosPolicy** (p. 1361) **DDS\_ReceiverPoolQosPolicy** (p. 1676)  
**DDS\_AsynchronousPublisherQosPolicy** (p. 1323)

### 5.202.2 Field Documentation

#### 5.202.2.1 mask

**DDS\_ThreadSettingsKindMask** `DDS_ThreadSettings_t::mask`

Describes the type of thread.

The meaning of each bit of the mask are defined by **DDS\_ThreadSettingsKind** (p. 1040).

**[default]** 0, use default options of the OS

#### 5.202.2.2 priority

**DDS\_Long** `DDS_ThreadSettings_t::priority`

Thread priority.

**[range]** Platform-dependent - Consult `Platform Notes` for additional details.

### 5.202.2.3 `stack_size`

```
DDS_Long DDS_ThreadSettings_t::stack_size
```

The thread stack-size.

**[range]** Platform-dependent. Consult `Platform Notes` for additional details.

### 5.202.2.4 `cpu_list`

```
struct DDS_LongSeq DDS_ThreadSettings_t::cpu_list
```

The list of processors on which the thread(s) may run.

A sequence of integers that represent the set of processors on which the thread(s) controlled by this QoS may run. An empty sequence (the default) means the middleware will make no CPU affinity adjustments.

Note: This feature is currently only supported on a subset of architectures (see the `Platform Notes`). The API may change as more architectures are added in future releases.

This value is only relevant to the **DDS\_ReceiverPoolQoSPolicy** (p. 1676). It is ignored within other QoS policies that include **DDS\_ThreadSettings\_t** (p. 1764).

See also

**Controlling CPU Core Affinity for RTI Threads** (p. 1040)

**[default]** Empty sequence

### 5.202.2.5 `cpu_rotation`

```
DDS_ThreadSettingsCpuRotationKind DDS_ThreadSettings_t::cpu_rotation
```

Determines how processor affinity is applied to multiple threads.

This value is only relevant to the **DDS\_ReceiverPoolQoSPolicy** (p. 1676). It is ignored within other QoS policies that include **DDS\_ThreadSettings\_t** (p. 1764).

See also

**Controlling CPU Core Affinity for RTI Threads** (p. 1040)

Note: This feature is currently only supported on a subset of architectures (see the `Platform Notes`). The API may change as more architectures are added in future releases. ;

## 5.203 DDS\_Time\_t Struct Reference

Type for *time* representation.

### Data Fields

- **DDS\_LongLong** *sec*  
*seconds*
- **DDS\_UnsignedLong** *nanosec*  
*nanoseconds*

### 5.203.1 Detailed Description

Type for *time* representation.

A **DDS\_Time\_t** (p. 1767) represents a moment in time.

### 5.203.2 Field Documentation

#### 5.203.2.1 **sec**

**DDS\_LongLong** DDS\_Time\_t::sec

seconds

#### 5.203.2.2 **nanosec**

**DDS\_UnsignedLong** DDS\_Time\_t::nanosec

nanoseconds

[range] [0,1000000000)

## 5.204 DDS\_TimeBasedFilterQosPolicy Struct Reference

Filter that allows a **DDS\_DataReader** (p. 608) to specify that it is interested only in (potentially) a subset of the values of the data.

## Data Fields

- struct **DDS\_Duration\_t minimum\_separation**  
*The minimum separation duration between subsequent samples.*

### 5.204.1 Detailed Description

Filter that allows a **DDS\_DataReader** (p. 608) to specify that it is interested only in (potentially) a subset of the values of the data.

The filter states that the **DDS\_DataReader** (p. 608) does not want to receive more than one value each `minimum_separation`, regardless of how fast the changes occur.

Entity:

**DDS\_DataReader** (p. 608)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **YES** (p. 1048)

### 5.204.2 Usage

You can use this QoS policy to reduce the amount of data received by a **DDS\_DataReader** (p. 608). **DDS\_DataWriter** (p. 478) entities may send data faster than needed by a **DDS\_DataReader** (p. 608). For example, a **DDS\_DataReader** (p. 608) of sensor data that is displayed to a human operator in a GUI application does not need to receive data updates faster than a user can reasonably perceive changes in data values. This is often measured in tenths (0.1) of a second up to several seconds. However, a **DDS\_DataWriter** (p. 478) of sensor information may have other **DDS\_DataReader** (p. 608) entities that are processing the sensor information to control parts of the system and thus need new data updates in measures of hundredths (0.01) or thousandths (0.001) of a second.

With this QoS policy, different **DDS\_DataReader** (p. 608) entities can set their own time-based filters, so that data published faster than the period set by a each **DDS\_DataReader** (p. 608) will not be delivered to that **DDS\_DataReader** (p. 608).

The **TIME\_BASED\_FILTER** (p. 1129) also applies to each instance separately; that is, the constraint is that the **DDS\_DataReader** (p. 608) does not want to see more than one sample of each instance per `minimum_separation` period.

This QoS policy allows you to optimize resource usage (CPU and possibly network bandwidth) by only delivering the required amount of data to each **DDS\_DataReader** (p. 608), accommodating the fact that, for rapidly-changing data, different subscribers may have different requirements and constraints as to how frequently they need or can handle being notified of the most current values. As such, it can also be used to protect applications that are running on a heterogeneous network where some nodes are capable of generating data much faster than others can consume it.

For best effort data delivery, if the data type is unkeyed and the **DDS\_DataWriter** (p. 478) has an infinite **DDS\_LivelinessQosPolicy::lease\_duration** (p. 1578), RTI Connex will only send as many packets to a **DDS\_DataReader** (p. 608) as required by the **TIME\_BASED\_FILTER**, no matter how fast **FooDataWriter\_write** (p. 489) is called.

For multicast data delivery to multiple DataReaders, the one with the lowest `minimum_separation` determines the DataWriter's send rate. For example, if a **DDS\_DataWriter** (p. 478) sends over multicast to two DataReaders, one with `minimum_separation` of 2 seconds and one with `minimum_separation` of 1 second, the DataWriter will send every 1 second.

In configurations where RTI Connexx must send all the data published by the **DDS\_DataWriter** (p. 478) (for example, when the **DDS\_DataWriter** (p. 478) is reliable, when the data type is keyed, or when the **DDS\_DataWriter** (p. 478) has a finite **DDS\_LivelinessQosPolicy::lease\_duration** (p. 1578)), only the data that passes the `TIME_BASED_FILTER` will be stored in the receive queue of the **DDS\_DataReader** (p. 608). Extra data will be accepted but dropped. Note that filtering is only applied on alive samples (that is, samples that have not been disposed/unregistered).

### 5.204.3 Consistency

It is inconsistent for a **DDS\_DataReader** (p. 608) to have a `minimum_separation` longer than its **DEADLINE** (p. 1073) `period`.

However, it is important to be aware of certain edge cases that can occur when your publication rate, minimum separation, and deadline period align and that can cause missed deadlines that you may not expect. For example, suppose that you nominally publish samples every second but that this rate can vary somewhat over time. You declare a minimum separation of 1 second to filter out rapid updates and set a deadline of two seconds so that you will be aware if the rate falls too low. Even if your update rate never wavers, you can still miss deadlines! Here's why:

Suppose you publish the first sample at time  $t=0$  seconds. You then publish your next sample at  $t=1$  seconds. Depending on how your operating system schedules the time-based filter execution relative to the publication, this second sample may be filtered. You then publish your third sample at  $t=2$  seconds, and depending on how your OS schedules this publication in relation to the deadline check, you could miss the deadline.

This scenario demonstrates a couple of rules of thumb:

- Beware of setting your `minimum_separation` to a value very close to your publication rate: you may filter more data than you intend to.
- Beware of setting your `minimum_separation` to a value that is too close to your deadline period relative to your publication rate. You may miss deadlines.

See **DDS\_DeadlineQosPolicy** (p. 1455) for more information about the interactions between deadlines and time-based filters.

The setting of a **TIME\_BASED\_FILTER** (p. 1129) – that is, the selection of a `minimum_separation` with a value greater than zero – is consistent with all settings of the **HISTORY** (p. 1093) and **RELIABILITY** (p. 1122) QoS. The **TIME↔\_BASED\_FILTER** (p. 1129) specifies the samples that are of interest to the **DDS\_DataReader** (p. 608). The **HISTORY** (p. 1093) and **RELIABILITY** (p. 1122) QoS affect the behavior of the middleware with respect to the samples that have been determined to be of interest to the **DDS\_DataReader** (p. 608); that is, they apply *after* the **TIME\_BASED\_FILTER** (p. 1129) has been applied.

In the case where the reliability QoS kind is **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124), in steady-state – defined as the situation where the **DDS\_DataWriter** (p. 478) does not write new samples for a period "long" compared to the `minimum_separation` – the system should guarantee delivery of the last sample to the **DDS\_DataReader** (p. 608).

### 5.205.1 Detailed Description

Entry created when a Topic object discovered.

Data associated with the built-in topic **DDS\_TOPIC\_TOPIC\_NAME** (p. 898). It contains QoS policies and additional information that apply to the remote **DDS\_Topic** (p. 172).

Note: The **DDS\_TopicBuiltinTopicData** (p. 1770) built-in topic is meant to convey information about discovered Topics. This Topic's samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**DDS\_PublicationBuiltinTopicData** (p. 1648) and **DDS\_Subscription↔BuiltinTopicData** (p. 1748)). Therefore TopicBuiltinTopicData DataReaders will not receive any data.

## 5.208 DDS\_TopicDataQosPolicy Struct Reference

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

### Data Fields

- struct `DDS_OctetSeq` value  
*a sequence of octets*

### 5.208.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

Entity:

**DDS\_Topic** (p. 172)

Properties:

**RxO** (p. 1048) = NO

**Changeable** (p. 1048) = **YES** (p. 1048)

See also

**DDS\_DomainParticipant\_get\_builtin\_subscriber** (p. 126)

### 5.208.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDS\_Topic** (p. 172) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This extra data is not used by RTI Connex.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with **DDS\_DataReaderListener** (p. 1372), **DDS\_DataWriterListener** (p. 1417), or operations such as **DDS\_DomainParticipant\_ignore\_topic** (p. 129), this QoS policy can assist an application in defining and enforcing its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

*Important:* RTI Connex stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connex with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS\_DomainParticipantResourceLimitsQosPolicy::topic\_data\_max\_length** (p. 1506).

### 5.208.3 Field Documentation

#### 5.208.3.1 value

```
struct DDS_OctetSeq DDS_TopicDataQosPolicy::value
```

a sequence of octets

**[default]** empty (zero-length)

**[range]** Octet sequence of length [0,max\_length]

## 5.209 DDS\_TopicListener Struct Reference

<<*interface*>> (p. 818) **DDS\_Listener** (p. 1569) for **DDS\_Topic** (p. 172) entities.

### Data Fields

- struct **DDS\_Listener as\_listener**  
*The superclass instance of this **DDS\_TopicListener** (p. 1777).*
- **DDS\_TopicListener\_InconsistentTopicCallback on\_inconsistent\_topic**  
*Handle the **DDS\_INCONSISTENT\_TOPIC\_STATUS** (p. 1031) status.*

### 5.209.1 Detailed Description

<<*interface*>> (p. 818) **DDS\_Listener** (p. 1569) for **DDS\_Topic** (p. 172) entities.

Entity:

**DDS\_Topic** (p. 172)

Status:

**DDS\_INCONSISTENT\_TOPIC\_STATUS** (p. 1031), **DDS\_InconsistentTopicStatus** (p. 1561)

This is the interface that can be implemented by an application-provided class and then registered with the **DDS\_Topic** (p. 172) such that the application can be notified by RTI Connexet of relevant status changes.

See also

- Status Kinds** (p. 1025)
- DDS\_Listener** (p. 1569)
- DDS\_Topic\_set\_listener** (p. 195)
- Operations Allowed in Listener Callbacks** (p. 1571)

### 5.209.2 Field Documentation

#### 5.209.2.1 as\_listener

```
struct DDS_Listener DDS_TopicListener::as_listener
```

The superclass instance of this **DDS\_TopicListener** (p. 1777).

### 5.209.2.2 on\_inconsistent\_topic

`DDS_TopicListener_InconsistentTopicCallback` `DDS_TopicListener::on_inconsistent_topic`

Handle the `DDS_INCONSISTENT_TOPIC_STATUS` (p. 1031) status.

This callback is called when a remote `DDS_Topic` (p. 172) is discovered but is inconsistent with the locally created `DDS_Topic` (p. 172) of the same topic name.

## 5.210 DDS\_TopicQos Struct Reference

QoS policies supported by a `DDS_Topic` (p. 172) entity.

### Data Fields

- struct `DDS_TopicDataQosPolicy` `topic_data`  
*Topic data policy, `TOPIC_DATA` (p. 1130).*
- struct `DDS_DurabilityQosPolicy` `durability`  
*Durability policy, `DURABILITY` (p. 1086).*
- struct `DDS_DurabilityServiceQosPolicy` `durability_service`  
*DurabilityService policy, `DURABILITY_SERVICE` (p. 1090).*
- struct `DDS_DeadlineQosPolicy` `deadline`  
*Deadline policy, `DEADLINE` (p. 1073).*
- struct `DDS_LatencyBudgetQosPolicy` `latency_budget`  
*Latency budget policy, `LATENCY_BUDGET` (p. 1095).*
- struct `DDS_LivelinessQosPolicy` `liveliness`  
*Liveliness policy, `LIVELINESS` (p. 1097).*
- struct `DDS_ReliabilityQosPolicy` `reliability`  
*Reliability policy, `RELIABILITY` (p. 1122).*
- struct `DDS_DestinationOrderQosPolicy` `destination_order`  
*Destination order policy, `DESTINATION_ORDER` (p. 1074).*
- struct `DDS_HistoryQosPolicy` `history`  
*History policy, `HISTORY` (p. 1093).*
- struct `DDS_ResourceLimitsQosPolicy` `resource_limits`  
*Resource limits policy, `RESOURCE_LIMITS` (p. 1126).*
- struct `DDS_TransportPriorityQosPolicy` `transport_priority`  
*Transport priority policy, `TRANSPORT_PRIORITY` (p. 1138).*
- struct `DDS_LifespanQosPolicy` `lifespan`  
*Lifespan policy, `LIFESPAN` (p. 1096).*
- struct `DDS_OwnershipQosPolicy` `ownership`  
*Ownership policy, `OWNERSHIP` (p. 1102).*
- struct `DDS_DataRepresentationQosPolicy` `representation`  
*Data representation policy, `DATA_REPRESENTATION` (p. 1057).*

## 5.210.1 Detailed Description

QoS policies supported by a **DDS\_Topic** (p. 172) entity.

You must set certain members in a consistent manner:

length of **DDS\_TopicQos::topic\_data** (p. 1779) .value <= **DDS\_DomainParticipantQos::resource\_limits** (p. 1492) .topic\_data\_max\_length

If any of the above are not true, **DDS\_Topic\_set\_qos** (p. 193), **DDS\_Topic\_set\_qos\_with\_profile** (p. 194) and **DDS\_↔DomainParticipant\_set\_default\_topic\_qos** (p. 82) will fail with **DDS\_RETCODE\_INCONSISTENT\_POLICY** (p. 1025) and **DDS\_DomainParticipant\_create\_topic** (p. 112) will return NULL.

Entity:

**DDS\_Topic** (p. 172)

See also

**QoS Policies** (p. 1041) allowed ranges within each Qos.

## 5.210.2 Field Documentation

### 5.210.2.1 topic\_data

```
struct DDS_TopicDataQosPolicy DDS_TopicQos::topic_data
```

Topic data policy, **TOPIC\_DATA** (p. 1130).

### 5.210.2.2 durability

```
struct DDS_DurabilityQosPolicy DDS_TopicQos::durability
```

Durability policy, **DURABILITY** (p. 1086).

### 5.210.2.3 durability\_service

```
struct DDS_DurabilityServiceQosPolicy DDS_TopicQos::durability_service
```

DurabilityService policy, **DURABILITY\_SERVICE** (p. 1090).

#### 5.210.2.4 deadline

```
struct DDS_DeadlineQosPolicy DDS_TopicQos::deadline
```

Deadline policy, **DEADLINE** (p. 1073).

#### 5.210.2.5 latency\_budget

```
struct DDS_LatencyBudgetQosPolicy DDS_TopicQos::latency_budget
```

Latency budget policy, **LATENCY\_BUDGET** (p. 1095).

#### 5.210.2.6 liveliness

```
struct DDS_LivelinessQosPolicy DDS_TopicQos::liveliness
```

Liveliness policy, **LIVELINESS** (p. 1097).

#### 5.210.2.7 reliability

```
struct DDS_ReliabilityQosPolicy DDS_TopicQos::reliability
```

Reliability policy, **RELIABILITY** (p. 1122).

#### 5.210.2.8 destination\_order

```
struct DDS_DestinationOrderQosPolicy DDS_TopicQos::destination_order
```

Destination order policy, **DESTINATION\_ORDER** (p. 1074).

#### 5.210.2.9 history

```
struct DDS_HistoryQosPolicy DDS_TopicQos::history
```

History policy, **HISTORY** (p. 1093).

### 5.210.2.10 resource\_limits

```
struct DDS_ResourceLimitsQosPolicy DDS_TopicQos::resource_limits
```

Resource limits policy, **RESOURCE\_LIMITS** (p. 1126).

### 5.210.2.11 transport\_priority

```
struct DDS_TransportPriorityQosPolicy DDS_TopicQos::transport_priority
```

Transport priority policy, **TRANSPORT\_PRIORITY** (p. 1138).

### 5.210.2.12 lifespan

```
struct DDS_LifespanQosPolicy DDS_TopicQos::lifespan
```

Lifespan policy, **LIFESPAN** (p. 1096).

### 5.210.2.13 ownership

```
struct DDS_OwnershipQosPolicy DDS_TopicQos::ownership
```

Ownership policy, **OWNERSHIP** (p. 1102).

### 5.210.2.14 representation

```
struct DDS_DataRepresentationQosPolicy DDS_TopicQos::representation
```

Data representation policy, **DATA\_REPRESENTATION** (p. 1057).

## 5.211 DDS\_TopicQueryData Struct Reference

<<**extension**>> (p. 817) Provides information about a **DDS\_TopicQuery** (p. 698)

## Data Fields

- struct **DDS\_TopicQuerySelection** `topic_query_selection`  
*The data selection.*
- char \* **topic\_name**  
*The topic name of the **DDS\_DataReader** (p. 608).*
- struct **DDS\_GUID\_t** `original_related_reader_guid`  
*Identifies the **DDS\_DataReader** (p. 608) that created the **DDS\_TopicQuery** (p. 698).*

### 5.211.1 Detailed Description

<<*extension*>> (p. 817) Provides information about a **DDS\_TopicQuery** (p. 698)

Contains the information about a TopicQuery that can be retrieved using **DDS\_TopicQueryHelper\_topic\_query\_↔data\_from\_service\_request** (p. 699).

See also

**DDS\_TopicQueryHelper\_topic\_query\_data\_from\_service\_request** (p. 699)

### 5.211.2 Field Documentation

#### 5.211.2.1 `topic_query_selection`

```
struct DDS_TopicQuerySelection DDS_TopicQueryData::topic_query_selection
```

The data selection.

#### 5.211.2.2 `topic_name`

```
char* DDS_TopicQueryData::topic_name
```

The topic name of the **DDS\_DataReader** (p. 608).

#### 5.211.2.3 `original_related_reader_guid`

```
struct DDS_GUID_t DDS_TopicQueryData::original_related_reader_guid
```

Identifies the **DDS\_DataReader** (p. 608) that created the **DDS\_TopicQuery** (p. 698).

## 5.212 DDS\_TopicQueryDispatchQosPolicy Struct Reference

Configures the ability of a **DDS\_DataWriter** (p. 478) to publish samples in response to a **DDS\_TopicQuery** (p. 698).

### Data Fields

- **DDS\_Boolean enable**  
*Allows this writer to dispatch TopicQueries.*
- struct **DDS\_Duration\_t publication\_period**  
*Sets the periodic interval at which samples are published.*
- **DDS\_Long samples\_per\_period**  
*Sets the maximum number of samples to publish in each publication\_period.*

### 5.212.1 Detailed Description

Configures the ability of a **DDS\_DataWriter** (p. 478) to publish samples in response to a **DDS\_TopicQuery** (p. 698).

Enables the ability of a **DDS\_DataWriter** (p. 478) to publish historical samples upon reception of a **DDS\_TopicQuery** (p. 698) and how often they are published.

Since a TopicQuery selects previously written samples, the DataWriter must have a **DDS\_DurabilityQosPolicy::kind** (p. 1518) different from **DDS\_VOLATILE\_DURABILITY\_QOS** (p. 1088). Also, **DDS\_ReliabilityQosPolicy::kind** (p. 1681) must be set to **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124).

Only samples that fall within the **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518) for an instance are evaluated against the TopicQuery filter. While the DataWriter is waiting for acknowledgements from one or more DataReaders, there may temporarily be more than **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518) samples per instance in the DataWriter's queue if the **DDS\_HistoryQosPolicy::depth** (p. 1560) is set to a higher value than **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518). Those additional samples past **DDS\_DurabilityQosPolicy::writer\_depth** (p. 1518) are not eligible to be sent in response to the TopicQuery.

A TopicQuery may select multiple samples at once. The writer will publish them periodically, independently from newly written samples. **DDS\_TopicQueryDispatchQosPolicy::publication\_period** (p. 1784) configures the frequency of that period and **DDS\_TopicQueryDispatchQosPolicy::samples\_per\_period** (p. 1784) configures the maximum number of samples to publish each period.

If the DataWriter blocks during the publication of one of these samples, it will stop and try again the next period. (See **FooDataWriter\_write** (p. 489) for the conditions that may cause the write operation to block.)

All the DataWriters that belong to a single **DDS\_Publisher** (p. 436) and enable TopicQueries share the same event thread, but each DataWriter schedules separate events. To configure that thread, see **DDS\_AsynchronousPublisherQosPolicy::topic\_query\_publication\_thread** (p. 1326).

If the DataWriter is dispatching more than one TopicQuery at the same time, the configuration of this periodic event applies to all of them. For example, if a DataWriter receives two TopicQueries around the same time, the period is 1 second, the number of samples per period is 10, the first TopicQuery selects 5 samples, and the second one selects 8, the DataWriter will immediately attempt to publish all 5 for the first TopicQuery and 5 for the second one. After one second, it will publish the remaining 3 samples.

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

See also

**DDS\_Publisher** (p. 436)

## 5.212.2 Field Documentation

### 5.212.2.1 enable

```
DDS_Boolean DDS_TopicQueryDispatchQosPolicy::enable
```

Allows this writer to dispatch TopicQueries.

When set to true, this writer can receive and dispatch TopicQueries.

**[default]** **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.212.2.2 publication\_period

```
struct DDS_Duration_t DDS_TopicQueryDispatchQosPolicy::publication_period
```

Sets the periodic interval at which samples are published.

**[default]** 1 second

**[range]** [0,1 year]

### 5.212.2.3 samples\_per\_period

```
DDS_Long DDS_TopicQueryDispatchQosPolicy::samples_per_period
```

Sets the maximum number of samples to publish in each publication\_period.

**[default]** **DDS\_LENGTH\_UNLIMITED** (p. 1127)

**[range]** [1, 100000000] or **DDS\_LENGTH\_UNLIMITED** (p. 1127)

## 5.213 DDS\_TopicQuerySelection Struct Reference

<<*extension*>> (p. 817) Specifies the data query that defines a **DDS\_TopicQuery** (p. 698)

### Data Fields

- char \* **filter\_class\_name**  
*The name of the filter to use.*
- char \* **filter\_expression**  
*The filter expression.*
- struct **DDS\_StringSeq filter\_parameters**  
*The query parameters.*
- **DDS\_TopicQuerySelectionKind kind**  
*Indicates whether the sample selection is limited to cached samples or not.*

### 5.213.1 Detailed Description

<<*extension*>> (p. 817) Specifies the data query that defines a **DDS\_TopicQuery** (p. 698)

The query format is similar to the expression and parameters of a **DDS\_QueryCondition** (p. 691) or a **DDS\_ContentFilteredTopic** (p. 173), as described in **DDS\_DomainParticipant\_create\_contentfilteredtopic\_with\_filter** (p. 116).

There are two special queries:

- **DDS\_TOPIC\_QUERY\_SELECTION\_SELECT\_ALL** (p. 701)
- **DDS\_TOPIC\_QUERY\_SELECTION\_USE\_READER\_CONTENT\_FILTER** (p. 701)

See also

**Queries and Filters Syntax** (p. 730)

### 5.213.2 Field Documentation

#### 5.213.2.1 filter\_class\_name

```
char* DDS_TopicQuerySelection::filter_class_name
```

The name of the filter to use.

Name of content filter to use. Must be one of the built-in filter names or previously registered with **DDS\_DomainParticipant\_register\_contentfilter** (p. 117) on the same **DDS\_DomainParticipant** (p. 72).

Built-in filter names are **DDS\_SQLFILTER\_NAME** (p. 160) and **DDS\_STRINGMATCHFILTER\_NAME** (p. 161).

[default] See **DDS\_TOPIC\_QUERY\_SELECTION\_USE\_READER\_CONTENT\_FILTER** (p. 701)

### 5.213.2.2 filter\_expression

```
char* DDS_TopicQuerySelection::filter_expression
```

The filter expression.

The expression to filter samples in the DataWriters. It follows the format described in **Queries and Filters Syntax** (p. 730).

**[default]** See **DDS\_TOPIC\_QUERY\_SELECTION\_USE\_READER\_CONTENT\_FILTER** (p. 701)

See also

**Queries and Filters Syntax** (p. 730)

### 5.213.2.3 filter\_parameters

```
struct DDS_StringSeq DDS_TopicQuerySelection::filter_parameters
```

The query parameters.

**[default]** See **DDS\_TOPIC\_QUERY\_SELECTION\_USE\_READER\_CONTENT\_FILTER** (p. 701)

See also

**DDS\_DomainParticipant\_create\_contentfilteredtopic\_with\_filter** (p. 116).

### 5.213.2.4 kind

```
DDS_TopicQuerySelectionKind DDS_TopicQuerySelection::kind
```

Indicates whether the sample selection is limited to cached samples or not.

**[default]** **DDS\_TOPIC\_QUERY\_SELECTION\_KIND\_HISTORY\_SNAPSHOT** (p. 699)

## 5.214 DDS\_TransportBuiltinQosPolicy Struct Reference

Specifies which built-in transports are used.

## Data Fields

- **DDS\_TransportBuiltinKindMask** *mask*

*Specifies the built-in transports that are registered automatically when the **DDS\_DomainParticipant** (p. 72) is enabled.*

### 5.214.1 Detailed Description

Specifies which built-in transports are used.

Three different transport plug-ins are built into the core RTI Connex libraries (for most supported target platforms): UDPv4, shared memory, and UDPv6.

This QoS policy allows you to control which of these built-in transport plug-ins are used by a **DDS\_DomainParticipant** (p. 72). By default, only the UDPv4 and shared memory plug-ins are enabled (although on some embedded platforms, the shared memory plug-in is not available). In some cases, users will disable the shared memory transport when they do not want applications to use shared memory to communicate when running on the same node.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.214.2 Field Documentation

#### 5.214.2.1 mask

```
DDS_TransportBuiltinKindMask DDS_TransportBuiltinQosPolicy::mask
```

Specifies the built-in transports that are registered automatically when the **DDS\_DomainParticipant** (p. 72) is enabled.

RTI Connex provides several built-in transports. Only those that are specified with this mask are registered automatically when the **DDS\_DomainParticipant** (p. 72) is enabled.

[default] **DDS\_TRANSPORTBUILTIN\_MASK\_DEFAULT** (p. 1133)

## 5.215 DDS\_TransportInfo\_t Struct Reference

Contains the `class_id` and `message_size_max` of an installed transport.

## Data Fields

- **NDDS\_Transport\_ClassId\_t class\_id**  
*The class\_id identifies the transport associated with the message\_size\_max.*
- **DDS\_Long message\_size\_max**  
*The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin identified by the class\_id.*

### 5.215.1 Detailed Description

Contains the class\_id and message\_size\_max of an installed transport.

### 5.215.2 Field Documentation

#### 5.215.2.1 class\_id

```
NDDS_Transport_ClassId_t DDS_TransportInfo_t::class_id
```

The class\_id identifies the transport associated with the message\_size\_max.

#### 5.215.2.2 message\_size\_max

```
DDS_Long DDS_TransportInfo_t::message_size_max
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin identified by the class\_id.

## 5.216 DDS\_TransportInfoSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_TransportInfo\_t** (p. 1787) > .

### 5.216.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_TransportInfo\_t** (p. 1787) > .

Instantiates:

```
<<generic>> (p. 818) FooSeq (p. 1845)
```

See also

```
DDS_TransportInfo_t (p. 1787)
```

## 5.217 DDS\_TransportMulticastMapping\_t Struct Reference

Type representing a list of multicast mapping elements.

### Data Fields

- char \* **addresses**  
*A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive multicast traffic for the entity with a topic that matches the **DDS\_TransportMulticastMapping\_t::topic\_expression** (p. 1789).*
- char \* **topic\_expression**  
*A regular expression that will be used to map topic names to corresponding multicast receive addresses.*
- struct **DDS\_TransportMulticastMappingFunction\_t mapping\_function**  
*Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.*

### 5.217.1 Detailed Description

Type representing a list of multicast mapping elements.

A multicast mapping element specifies a string containing a list of IP addresses, a topic expression and a mapping function.

QoS:

**DDS\_TransportMulticastMappingQosPolicy** (p. 1791)

### 5.217.2 Field Documentation

#### 5.217.2.1 addresses

```
char* DDS_TransportMulticastMapping_t::addresses
```

A string containing a comma-separated list of IP addresses or IP address ranges to be used to receive *multicast* traffic for the entity with a topic that matches the **DDS\_TransportMulticastMapping\_t::topic\_expression** (p. 1789).

The string must contain IPv4 or IPv6 addresses separated by commas. For example: "239.255.100.1,239.255.100.↵  
2,239.255.100.3"

You may specify ranges of addresses by enclosing the start address and the end address in square brackets. For example: "[239.255.100.1,239.255.100.3]"

You may combine the two approaches. For example:

```
"239.255.200.1,[239.255.100.1,239.255.100.3], 239.255.200.3"
```

IPv4 addresses must be specified in Dot-decimal notation.

IPv6 addresses must be specified using 8 groups of 16-bit hexadecimal values separated by colons. For example: FF00:0000:0000:0000:0202:B3FF:FE1E:8329

Leading zeroes can be skipped. For example: "FF00:0:0:0:202:B3FF:FE1E:8329"

You may replace a consecutive number of zeroes with a double colon, but only once within an address. For example: "FF00::202:B3FF:FE1E:8329"

**[default]** NULL

### 5.217.2.2 topic\_expression

```
char* DDS_TransportMulticastMapping_t::topic_expression
```

A regular expression that will be used to map topic names to corresponding multicast receive addresses.

A topic name must match the expression before a corresponding address is assigned.

**[default]** NULL

### 5.217.2.3 mapping\_function

```
struct DDS_TransportMulticastMappingFunction_t DDS_TransportMulticastMapping_t::mapping_function
```

Specifies a function that will define the mapping between a topic name and a specific multicast address from a list of addresses.

This function is optional. If not specified, the middleware will use a hash function to perform the mapping.

## 5.218 DDS\_TransportMulticastMappingFunction\_t Struct Reference

Type representing an external mapping function.

### Data Fields

- char \* **dll**  
*Specifies a dynamic library that contains a mapping function.*
- char \* **function\_name**  
*Specifies the name of a mapping function.*

### 5.218.1 Detailed Description

Type representing an external mapping function.

A mapping function is defined by a dynamic library name and a function name.

QoS:

**DDS\_TransportMulticastMappingQosPolicy** (p. 1791)

### 5.218.2 Field Documentation

### 5.218.2.1 dll

```
char* DDS_TransportMulticastMappingFunction_t::dll
```

Specifies a dynamic library that contains a mapping function.

A relative or absolute path can be specified.

If the name is specified as "foo", the library name on Linux systems will be libfoo.so; on Windows systems it will be foo.dll.

**[default]** NULL

### 5.218.2.2 function\_name

```
char* DDS_TransportMulticastMappingFunction_t::function_name
```

Specifies the name of a mapping function.

This function must be implemented in the library specified in **DDS\_TransportMulticastMappingFunction\_t::dll** (p. 1790).

The function must implement the following interface:

```
int function(const char* topic_name, int numberOfAddresses);
```

The function must return an integer that indicates the *index* of the address to use for the given `topic_name`. For example, if the first address in the list should be used, it must return 0; if the second address in the list should be used, it must return 1, etc.

## 5.219 DDS\_TransportMulticastMappingQosPolicy Struct Reference

Specifies a list of `topic_expressions` and multicast addresses that can be used by an Entity with a specific topic name to receive data.

### Data Fields

- struct **DDS\_TransportMulticastMappingSeq** **value**  
*A sequence of multicast communication mappings.*

### 5.219.1 Detailed Description

Specifies a list of topic\_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

This QoS policy provides an alternate way to assign multicast receive addresses to DataReaders. It allows you to perform multicast configuration at the **DDS\_DomainParticipant** (p. 72) level.

To use multicast communication *without* this QoS policy, you must explicitly assign a multicast receive address on each **DDS\_DataReader** (p. 608). This can quickly become difficult to configure as more DataReaders of different topics and multicast addresses are added.

With this QoS policy, you can configure a set of multicast addresses on the **DDS\_DomainParticipant** (p. 72); those addresses will then be automatically assigned to the DomainParticipant's DataReaders. A single configuration on the **DDS\_DomainParticipant** (p. 72) can thus replace per-DataReader configuration.

On the DomainParticipant, the set of assignable addresses can be configured for specific topics. Addresses are configured on topics because efficient usage of multicast will have all DataWriters and DataReaders of a single topic using the same multicast address.

You can specify a mapping between a topic's name and a multicast address. For example, topic 'A' can be assigned to address 239.255.1.1 and topic 'B' can be assigned to address 239.255.1.2.

You can use filter expressions to configure a subset of topics to use a specific list of addresses. For example, suppose topics "X", "Y" and "Z" need to be sent to any address within the range [239.255.1.1, 239.255.1.255]. You can specify an expression on the topic name (e.g. "[X-Z]") corresponding to that range of addresses. Then the DomainParticipant will select an address for a topic whose name matches the expression.

The middleware will use a hash function to perform the mapping from topic to address. Alternatively, you can specify a pluggable mapping function.

IMPORTANT: All the strings defined in each element of the sequence must be assigned using `RTI_String_dup("foo");`. For example:

```
mcastMappingElement->addresses = DDS_String_dup("[239.255.1.1,239.255.1.255]");
```

**NOTE:** To use this QoS policy, you must:

- Set **DDS\_TransportMulticastQosPolicy::kind** (p. 1794) to **DDS\_AUTOMATIC\_TRANSPORT\_MULTICAST\_QOS** (p. 1137).
- Set the first element in **DDS\_DataReader** (p. 608)'s **DDS\_TransportMulticastQosPolicy::value** (p. 1794) with an empty address.

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.219.2 Field Documentation

### 5.219.2.1 value

```
struct DDS_TransportMulticastMappingSeq DDS_TransportMulticastMappingQosPolicy::value
```

A sequence of multicast communication mappings.

[default] Empty sequence.

## 5.220 DDS\_TransportMulticastMappingSeq Struct Reference

Declares IDL `sequence< DDS_TransportMulticastMapping_t (p. 1789) >`

### 5.220.1 Detailed Description

Declares IDL `sequence< DDS_TransportMulticastMapping_t (p. 1789) >`

Instantiates:

`<<generic>>` (p. 818) `FooSeq` (p. 1845)

See also

`DDS_TransportMulticastMapping_t` (p. 1789)

## 5.221 DDS\_TransportMulticastQosPolicy Struct Reference

Specifies the multicast address on which a `DDS_DataReader` (p. 608) wants to receive its data. It can also specify a port number as well as a subset of the available (at the `DDS_DomainParticipant` (p. 72) level) transports with which to receive the multicast data.

### Data Fields

- struct `DDS_TransportMulticastSettingsSeq` `value`  
*A sequence of multicast communications settings.*
- `DDS_TransportMulticastQosPolicyKind` `kind`  
*A value that specifies a way to determine how to obtain the multicast address.*

### 5.221.1 Detailed Description

Specifies the multicast address on which a **DDS\_DataReader** (p. 608) wants to receive its data. It can also specify a port number as well as a subset of the available (at the **DDS\_DomainParticipant** (p. 72) level) transports with which to receive the multicast data.

By default, a **DDS\_DataWriter** (p. 478) will send individually addressed packets for each **DDS\_DataReader** (p. 608) that subscribes to the topic of the DataWriter – this is known as unicast delivery. Thus, as many copies of the data will be sent over the network as there are DataReaders for the data. The network bandwidth used by a DataWriter will thus increase linearly with the number of DataReaders.

Multicast addressing (on UDP/IP transports) allows multiple DataReaders to receive the *same* network packet. By using multicast, a **DDS\_DataWriter** (p. 478) can send a single network packet that is received by all subscribing applications. Thus the network bandwidth usage will be constant, independent of the number of DataReaders.

Coordinating the multicast address specified by DataReaders can help optimize network bandwidth usage in systems where there are multiple DataReaders for the same **DDS\_Topic** (p. 172).

Entity:

**DDS\_DataReader** (p. 608)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.221.2 Field Documentation

#### 5.221.2.1 value

```
struct DDS_TransportMulticastSettingsSeq DDS_TransportMulticastQosPolicy::value
```

A sequence of multicast communications settings.

An empty sequence means that multicast is not used by the entity.

The RTPS wire protocol currently limits the maximum number of multicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain\_participant.max\_announced\_locator\_list\_size' property in the **DDS\_PropertyQosPolicy** (p. 1645) associated with the **DDS\_DomainParticipantQos** (p. 1490).

**[default]** Empty sequence.

### 5.221.2.2 kind

`DDS_TransportMulticastQosPolicyKind` `DDS_TransportMulticastQosPolicy::kind`

A value that specifies a way to determine how to obtain the multicast address.

This field can be set to one of the following two values: `DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS` (p. 1137) or `DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_QOS` (p. 1137).

- If it is set to `DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS` (p. 1137), the behavior will depend on the `DDS_TransportMulticastQosPolicy::value` (p. 1794):
  - If `DDS_TransportMulticastQosPolicy::value` (p. 1794) does not have any elements, then multicast will not be used.
  - If `DDS_TransportMulticastQosPolicy::value` (p. 1794) first element has an empty address, then the address will be obtained from `DDS_TransportMulticastMappingQosPolicy` (p. 1791).
  - If none of the elements in `DDS_TransportMulticastQosPolicy::value` (p. 1794) is empty, and at least one element has a valid address, then that address will be used.
- If it is set to `DDS_UNICAST_ONLY_TRANSPORT_MULTICAST_QOS` (p. 1137), then multicast will not be used.

[default] `DDS_AUTOMATIC_TRANSPORT_MULTICAST_QOS` (p. 1137)

## 5.222 DDS\_TransportMulticastSettings\_t Struct Reference

Type representing a list of multicast locators.

### Data Fields

- struct `DDS_StringSeq transports`  
*A sequence of transport aliases that specifies the transports on which to receive multicast traffic for the entity.*
- char \* `receive_address`  
*The multicast group address on which the entity can receive data.*
- `DDS_Long receive_port`  
*The multicast port on which the entity can receive data.*

### 5.222.1 Detailed Description

Type representing a list of multicast locators.

A multicast locator specifies a transport class, a multicast address, and a multicast port number on which messages can be received by an entity.

QoS:

`DDS_TransportMulticastQosPolicy` (p. 1793)

## 5.222.2 Field Documentation

### 5.222.2.1 transports

```
struct DDS_StringSeq DDS_TransportMulticastSettings_t::transports
```

A sequence of transport aliases that specifies the transports on which to receive *multicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias in this sequence are used to subscribe to the multicast group addresses. Thus, this list of aliases sub-selects from the transport s available to the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1312). In particular, be careful to avoid a situation in which RTI Connexxt allocates a string on your behalf and you then reuse that string in such a way that RTI Connexxt believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT\_BUILTIN** (p. 1132).

**[default]** Empty sequence; i.e. all the transports available to the entity.

**[range]** Any sequence of non-null, non-empty strings.

### 5.222.2.2 receive\_address

```
char* DDS_TransportMulticastSettings_t::receive_address
```

The multicast group address on which the entity can receive data.

Must must be an address in the proper format (see **Address Format** (p. 1154)).

**[default]** NONE/INVALID. Required to specify a multicast group address to join.

**[range]** A valid IPv4 or IPv6 multicast address.

See also

**Address Format** (p. 1154)

### 5.222.2.3 receive\_port

`DDS_Long DDS_TransportMulticastSettings_t::receive_port`

The multicast port on which the entity can receive data.

**[default]** 0, which implies that the actual port number is determined by a formula as a function of the `domain_id` (see `DDS_WireProtocolQosPolicy::participant_id` (p. 1830)).

**[range]** [0,0xffffffff]

## 5.223 DDS\_TransportMulticastSettingsSeq Struct Reference

Declares IDL `sequence< DDS_TransportMulticastSettings_t` (p. 1795) >

### 5.223.1 Detailed Description

Declares IDL `sequence< DDS_TransportMulticastSettings_t` (p. 1795) >

Instantiates:

<<*generic*>> (p. 818) `FooSeq` (p. 1845)

See also

`DDS_TransportMulticastSettings_t` (p. 1795)

## 5.224 DDS\_TransportPriorityQosPolicy Struct Reference

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

### Data Fields

- **DDS\_Long value**

*This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.*

### 5.224.1 Detailed Description

This QoS policy allows the application to take advantage of transports that are capable of sending messages with different priorities.

The Transport Priority QoS policy is optional and only supported on certain OSs and transports. It allows you to specify on a per-DataWriter or DataReader basis that the data sent by that endpoint is of a different priority.

The DDS specification does not indicate how a DDS implementation should treat data of different priorities. It is often difficult or impossible for DDS implementations to treat data of higher priority differently than data of lower priority, especially when data is being sent (delivered to a physical transport) directly by the thread that called **FooDataWriter**↔**\_write** (p. 489). Also, many physical network transports themselves do not have a end-user controllable level of data packet priority.

Entity:

**DDS\_DataWriter** (p. 478), **DDS\_DataReader** (p. 608), **DDS\_Topic** (p. 172)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.224.2 Usage

In RTI Connext, for the IP-based transports (UDPv4, UDPv6, Real-Time WAN, and TCP), the value set in the Transport Priority QoS policy can be used to set the differentiated services field (DS field) bits of the IPv4 and IPv6 headers for datagrams sent by a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608). It is platform-dependent on how and whether setting the DS field has an effect. Some platforms may require external permissions in order to set the DS field.

The transport priority value is not provided as is to the transports, but transformed according to the following fields: **transport\_priority\_mask** (for example, see **NDDS\_Transport\_UDPv4\_Property\_t::transport\_priority\_mask** (p. 1872)), **transport\_priority\_mapping\_low** (for example, see **NDDS\_Transport\_UDPv4\_Property\_t::transport\_↔priority\_mapping\_low** (p. 1873)), and **transport\_priority\_mapping\_high** (for example, see **NDDS\_Transport\_UDPv4\_↔Property\_t::transport\_priority\_mapping\_high** (p. 1873)). If you want the priority value to be exactly equal to the DS value, then the only change you need to make is to set **transport\_priority\_mask** to `0xff` (and keep the **transport\_↔priority\_mapping\_low** and **transport\_priority\_mapping\_high** defaults).

It is incorrect to assume that using the Transport Priority QoS policy will have any effect at all on the end-to-end delivery of data from a **DDS\_DataWriter** (p. 478) and a **DDS\_DataReader** (p. 608). All network elements, including switches and routers, must have the capability and be enabled to actually use the DS field to treat higher priority packets differently. Thus the ability to use the Transport Priority QoS policy must be designed and configured at a *system* level; just turning it on in an application may have no effect at all at a transport level.

For additional details on how to set the DS field in IP-based transports, see the "TRANSPORT\_PRIORITY QoSPolicy" section of the `User's Manual`.

### 5.224.3 Field Documentation

#### 5.224.3.1 value

`DDS_Long DDS_TransportPriorityQosPolicy::value`

This policy is a hint to the infrastructure as to how to set the priority of the underlying transport used to send the data.

You may choose any value within the range of a 32-bit signed integer; higher values indicate higher priority. However, any further interpretation of this policy is specific to a particular transport and a particular DDS implementation. For example, a particular transport is permitted to treat a range of priority values as equivalent to one another.

[default] 0

## 5.225 DDS\_TransportSelectionQosPolicy Struct Reference

Specifies the physical transports a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) may use to send or receive data.

### Data Fields

- struct **DDS\_StringSeq enabled\_transports**

*A sequence of transport aliases that specifies the transport instances available for use by the entity.*

### 5.225.1 Detailed Description

Specifies the physical transports a **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) may use to send or receive data.

An application may be simultaneously connected to many different physical transports, e.g., Ethernet, Infiniband, shared memory, VME backplane, and wireless. By default, RTI Connexx will use up to 16 transports to deliver data from a DataWriter to a DataReader.

This QoS policy can be used to both limit and control which of the application's available transports may be used by a **DDS\_DataWriter** (p. 478) to send data or by a **DDS\_DataReader** (p. 608) to receive data.

Entity:

**DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.225.2 Field Documentation

### 5.225.2.1 enabled\_transports

```
struct DDS_StringSeq DDS_TransportSelectionQosPolicy::enabled_transports
```

A sequence of transport aliases that specifies the transport instances available for use by the entity.

Of the transport instances installed with the **DDS\_DomainParticipant** (p. 72), only those with aliases matching an alias in this sequence are available to the entity.

Thus, this list of aliases sub-selects from the transports available to the **DDS\_DomainParticipant** (p. 72).

An empty sequence is a special value that specifies all the transports installed with the **DDS\_DomainParticipant** (p. 72).

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1312). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT\_BUILTIN** (p. 1132). These alias names are case sensitive and should be written in lowercase.

**[default]** Empty sequence; i.e. all the transports installed with and available to the **DDS\_DomainParticipant** (p. 72).

**[range]** A sequence of non-null, non-empty strings.

See also

**DDS\_DomainParticipantQos::transport\_builtin** (p. 1492).

## 5.226 DDS\_TransportUnicastQosPolicy Struct Reference

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

### Data Fields

- struct **DDS\_TransportUnicastSettingsSeq** value  
*A sequence of unicast communication settings.*

### 5.226.1 Detailed Description

Specifies a subset of transports and a port number that can be used by an Entity to receive data.

Entity:

**DDS\_DomainParticipant** (p. 72), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

### 5.226.2 Usage

RTI Connext may send data to a variety of Entities, not just DataReaders. For example, reliable DataWriters may receive ACK/NACK packets from reliable DataReaders.

During discovery, each **DDS\_Entity** (p. 1160) announces to remote applications a list of (up to 16) unicast addresses to which the remote application should send data (either user data packets or reliable protocol meta-data such as ACK/↔NACKs and heartbeats). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain\_participant.max\_announced\_locator\_list\_size' property in the **DDS\_PropertyQosPolicy** (p. 1645) associated with the **DDS\_DomainParticipantQos** (p. 1490).

By default, the list of addresses is populated automatically with values obtained from the enabled transport plug-ins allowed to be used by the Entity (see **DDS\_TransportBuiltinQosPolicy** (p. 1786) and **DDS\_TransportSelection↔QosPolicy** (p. 1799)). Also, the associated ports are automatically determined (see **DDS\_RtpsWellKnownPorts\_t** (p. 1714)).

Use this QoS policy to manually set the receive address list for an Entity. You may optionally set a port to use a non-default receive port as well. Only the first 16 addresses will be used.

RTI Connext will create a receive thread for every unique port number that it encounters (on a per transport basis).

- For a **DDS\_DomainParticipant** (p. 72), this QoS policy sets the default list of addresses used by other applications to send user data for local DataReaders.
- For a **DDS\_DataReader** (p. 608), if set, then other applications will use the specified list of addresses to send user data (and reliable protocol packets for reliable DataReaders). Otherwise, if not set, the other applications will use the addresses set by the **DDS\_DomainParticipant** (p. 72).
- For a reliable **DDS\_DataWriter** (p. 478), if set, then other applications will use the specified list of addresses to send reliable protocol packets (ACKS/NACKS) on the behalf of reliable DataReaders. Otherwise, if not set, the other applications will use the addresses set by the **DDS\_DomainParticipant** (p. 72).

### 5.226.3 Field Documentation

#### 5.226.3.1 value

```
struct DDS_TransportUnicastSettingsSeq DDS_TransportUnicastQosPolicy::value
```

A sequence of unicast communication settings.

An empty sequence means that applicable defaults specified by elsewhere (e.g. **DDS\_DomainParticipantQos**↔  
::**default\_unicast** (p. 1492)) should be used.

The RTPS wire protocol currently limits the maximum number of unicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain\_participant.max\_announced\_locator\_list\_size' property in the **DDS\_PropertyQosPolicy** (p. 1645) associated with the **DDS\_DomainParticipantQos** (p. 1490).

**[default]** Empty sequence.

See also

**DDS\_DomainParticipantQos::default\_unicast** (p. 1492)

## 5.227 DDS\_TransportUnicastSettings\_t Struct Reference

Type representing a list of unicast locators.

### Data Fields

- struct **DDS\_StringSeq transports**  
*A sequence of transport aliases that specifies the unicast interfaces on which to receive unicast traffic for the entity.*
- **DDS\_Long receive\_port**  
*The unicast port on which the entity can receive data.*

#### 5.227.1 Detailed Description

Type representing a list of unicast locators.

A unicast locator specifies a transport class, a unicast address, and a unicast port number on which messages can be received by an entity.

QoS:

**DDS\_TransportUnicastQosPolicy** (p. 1800)

## 5.227.2 Field Documentation

### 5.227.2.1 transports

```
struct DDS_StringSeq DDS_TransportUnicastSettings_t::transports
```

A sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias on this sequence are used to determine the unicast interfaces used by the entity.

Thus, this list of aliases sub-selects from the transports available to the entity.

Each unicast interface on a transport results in a unicast locator for the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

The memory for the strings in this sequence is managed according to the conventions described in **String Conventions** (p. 1312). In particular, be careful to avoid a situation in which RTI Connexx allocates a string on your behalf and you then reuse that string in such a way that RTI Connexx believes it to have more memory allocated to it than it actually does.

Alias names for the builtin transports are defined in **TRANSPORT\_BUILTIN** (p. 1132).

**[default]** Empty sequence; i.e. all the transports available to the entity.

**[range]** Any sequence of non-null, non-empty strings.

### 5.227.2.2 receive\_port

```
DDS_Long DDS_TransportUnicastSettings_t::receive_port
```

The unicast port on which the entity can receive data.

Must be an *unused* unicast port on the system.

**[default]** 0, which implies that the actual port number is determined by a formula as a function of the `domain_id`, and the `DDS_WireProtocolQosPolicy::participant_id` (p. 1830).

**[range]** [0,0xffffffff]

See also

`DDS_WireProtocolQosPolicy::participant_id` (p. 1830).

## 5.228 DDS\_TransportUnicastSettingsSeq Struct Reference

Declares IDL `sequence< DDS_TransportUnicastSettings_t` (p. 1802) >

### 5.228.1 Detailed Description

Declares IDL `sequence< DDS_TransportUnicastSettings_t (p. 1802) >`

Instantiates:

`<<generic>> (p. 818) FooSeq (p. 1845)`

`DDS_TransportUnicastSettings_t (p. 1802)`

## 5.229 DDS\_TrustAlgorithmRequirements Struct Reference

Type to describe Trust Plugins algorithm requirements for an entity.

### Data Fields

- **DDS\_TrustAlgorithmSet supported\_mask**  
*Trust Plugins algorithms that an entity supports.*
- **DDS\_TrustAlgorithmSet required\_mask**  
*Trust Plugins algorithms that an entity uses.*

### 5.229.1 Detailed Description

Type to describe Trust Plugins algorithm requirements for an entity.

### 5.229.2 Field Documentation

#### 5.229.2.1 supported\_mask

`DDS_TrustAlgorithmSet DDS_TrustAlgorithmRequirements::supported_mask`

Trust Plugins algorithms that an entity supports.

### 5.229.2.2 required\_mask

`DDS_TrustAlgorithmSet DDS_TrustAlgorithmRequirements::required_mask`

Trust Plugins algorithms that an entity uses.

## 5.230 DDS\_TypeAllocationParams\_t Struct Reference

Configures whether or not to allocate pointer and optional members.

### Data Fields

- **DDS\_Boolean allocate\_pointers**  
*Whether to allocate pointer members or not.*
- **DDS\_Boolean allocate\_optional\_members**  
*Whether to allocate optional members or not.*

### 5.230.1 Detailed Description

Configures whether or not to allocate pointer and optional members.

By default pointers are allocated and optional members are not.

This structure is also defined in `xcdr.1.0/srcC/typeObject/TypeObjectInfrastructure.h`. If changes are made, please ensure they are made in both locations.

#### Examples

`HelloWorld.c`, and `HelloWorldPlugin.c`.

### 5.230.2 Field Documentation

#### 5.230.2.1 allocate\_pointers

`DDS_Boolean DDS_TypeAllocationParams_t::allocate_pointers`

Whether to allocate pointer members or not.

#### Examples

`HelloWorld.c`, and `HelloWorldPlugin.c`.

### 5.230.2.2 `allocate_optional_members`

`DDS_Boolean DDS_TypeAllocationParams_t::allocate_optional_members`

Whether to allocate optional members or not.

## 5.231 DDS\_TypeCode Struct Reference

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with `rtiddsgen` (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

### 5.231.1 Detailed Description

The definition of a particular data type, which you can use to inspect the name, members, and other properties of types generated with `rtiddsgen` (see the `Code Generator User's Manual`) or to modify types you define yourself at runtime.

You create `DDS_TypeCode` (p. 1806) objects using the `DDS_TypeCodeFactory` (p. 1806) singleton. Then you can use the functions on *this* class to inspect and modify the data type definition.

This class is based on a similar class from CORBA.

#### MT Safety:

SAFE for read-only access, UNSAFE for modification. Modifying a single `DDS_TypeCode` (p. 1806) object concurrently from multiple threads is *unsafe*. Modifying a `DDS_TypeCode` (p. 1806) from a single thread while concurrently reading the state of that `DDS_TypeCode` (p. 1806) from another thread is also *unsafe*. However, reading the state of a `DDS_TypeCode` (p. 1806) concurrently from multiple threads, without any modification, is *safe*.

#### Examples

`HelloWorld.c`, and `HelloWorldPlugin.c`.

## 5.232 DDS\_TypeCodeFactory Struct Reference

A singleton factory for creating, copying, and deleting data type definitions dynamically.

### 5.232.1 Detailed Description

A singleton factory for creating, copying, and deleting data type definitions dynamically.

You can access the singleton with the **DDS\_TypeCodeFactory\_get\_instance** (p. 285) function.

If you want to publish and subscribe to data of types that are not known to you at system design time, this class will be your starting point. After creating a data type definition with this class, you will modify that definition using the **DDS\_TypeCode** (p. 1806) class and then register it with the **Dynamic Data** (p. 308) API.

The functions of this class fall into several categories:

#### Getting definitions for primitive types:

Type definitions for primitive types (e.g. integers, floating point values, etc.) are pre-defined; your application only needs to *get* them, not *create* them.

- **DDS\_TypeCodeFactory\_get\_primitive\_tc** (p. 287)

#### Creating definitions for strings, arrays, and sequences:

Type definitions for strings, arrays, and sequences (i.e. variables-size lists) must be created as you need them, because the type definition includes the maximum length of those containers.

- **DDS\_TypeCodeFactory\_create\_string\_tc** (p. 294)
- **DDS\_TypeCodeFactory\_create\_wstring\_tc** (p. 294)
- **DDS\_TypeCodeFactory\_create\_array\_tc** (p. 296)
- **DDS\_TypeCodeFactory\_create\_sequence\_tc** (p. 295)

#### Creating definitions for structured types:

Structured types include structures, value types, and unions.

- **DDS\_TypeCodeFactory\_create\_struct\_tc** (p. 287)
- **DDS\_TypeCodeFactory\_create\_value\_tc** (p. 289)
- **DDS\_TypeCodeFactory\_create\_union\_tc** (p. 290)

#### Creating definitions for other types:

The type system also supports enumerations and aliases (i.e. `typedefs` in C and C++).

- **DDS\_TypeCodeFactory\_create\_enum\_tc** (p. 292)
- **DDS\_TypeCodeFactory\_create\_alias\_tc** (p. 293)

#### Deleting type definitions:

When you're finished using a type definition, you should delete it. (*Note* that you only need to delete a **DDS\_TypeCode** (p. 1806) that you *created*; if you got the object from **DDS\_TypeCodeFactory\_get\_primitive\_tc** (p. 287), you must *not* delete it.)

- **DDS\_TypeCodeFactory\_delete\_tc** (p. 286)

#### Copying type definitions:

You can also create deep copies of type definitions:

- **DDS\_TypeCodeFactory\_clone\_tc** (p. 285)

## 5.233 DDS\_TypeCodePrintFormatProperty Struct Reference

A collection of attributes used to configure how a TypeCode appears when converted to a string.

### Data Fields

- **DDS\_Long indent**  
*Configures how much indent should be added to the string representation of a **DDS\_TypeCode** (p. 1806).*
- **DDS\_Boolean print\_ordinals**  
*Configures whether or not to print the ordinal value of each enumerator within a **DDS\_TypeCode** (p. 1806).*
- **DDS\_TypeCodePrintFormatKind print\_kind**  
*Configures whether the type should be printed in XML or IDL format.*
- **DDS\_Boolean print\_complete\_type**  
*Configures whether or not to print the complete type.*

### 5.233.1 Detailed Description

A collection of attributes used to configure how a TypeCode appears when converted to a string.

To ensure that new objects are initialized to a known value, assign them with the static initializer **DDS\_TypeCode\_↔PrintFormat\_INITIALIZER** (p. 237).

### 5.233.2 Field Documentation

#### 5.233.2.1 indent

```
DDS_Long DDS_TypeCodePrintFormatProperty::indent
```

Configures how much indent should be added to the string representation of a **DDS\_TypeCode** (p. 1806).

Configures how much additional indent is applied when converting a TypeCode to a string. This value acts as a total offset on the string, increasing the indent applied to all elements by the same amount. With an indent of 0, a string representation of a TypeCode may appear as:

```
struct myType {  
    long x;  
};
```

Using an indent of 1, the same TypeCode would be printed as:

```
    struct myType {  
        long x;  
    };
```

I.e., the entire structure is indented.

### 5.233.2.2 print\_ordinals

**DDS\_Boolean** DDS\_TypeCodePrintFormatProperty::print\_ordinals

Configures whether or not to print the ordinal value of each enumerator within a **DDS\_TypeCode** (p. 1806).

When set to true, the ordinal value of each enumerator within an enum will be printed, otherwise only non-default ordinals are printed. Take for example the following enum:

```
enum myEnum {  
    RED,  
    GREEN = 3,  
    BLUE,  
};
```

When print\_ordinals is set to false it would be printed as:

```
enum myEnum {  
    RED,  
    GREEN = 3,  
    BLUE,  
};
```

But with print\_ordinals set to true it would be printed as:

```
enum myEnum {  
    RED = 0,  
    GREEN = 3,  
    BLUE = 4,  
};
```

### 5.233.2.3 print\_kind

**DDS\_TypeCodePrintFormatKind** DDS\_TypeCodePrintFormatProperty::print\_kind

Configures whether the type should be printed in XML or IDL format.

When print\_kind is DDS\_TYPE\_CODE\_PRINT\_KIND\_IDL, the type will be printed in IDL format. For example:

```
struct Foo {  
    float32 bar;  
};
```

When `print_kind` is `DDS_TYPE_CODE_PRINT_KIND_XML`, the type will be printed in XML format. For example:

```
<struct name="Foo">  
    <member name="bar" type="float32"/>  
</struct>
```

#### 5.233.2.4 `print_complete_type`

**DDS\_Boolean** `DDS_TypeCodePrintFormatProperty::print_complete_type`

Configures whether or not to print the complete type.

When `print_complete_type` is true, the complete type will be printed. When `print_complete_type` is false, only the top level will be printed.

Take for example the following types:

```
struct Foo {  
    float32 member;  
};  
  
struct Bar {  
    Foo foo;  
};
```

When `print_complete_type` is false, this is printed as:

```
struct Bar {  
    Foo foo;  
};
```

When `print_complete_type` is true, this is printed as:

```
struct Foo {  
    float32 member;  
};  
  
struct Bar {  
    Foo foo;  
};
```

## 5.234 DDS\_TypeConsistencyEnforcementQosPolicy Struct Reference

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

### Data Fields

- **DDS\_Boolean ignore\_enum\_literal\_names**  
*Controls whether enumeration constant names are taken into consideration for type assignability.*

### 5.234.1 Detailed Description

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

This policy defines a type consistency kind, which allows applications to select from among a set of predetermined behaviors. The following consistency kinds are specified: **DDS\_DISALLOW\_TYPE\_COERCION** (p. 1141), **DDS\_↔ALLOW\_TYPE\_COERCION** (p. 1141) and **DDS\_AUTO\_TYPE\_COERCION** (p. 1142).

The type-consistency-enforcement rules consist of two steps:

**Step 1.** If both the DataWriter and DataReader specify a TypeObject, it is considered first. If the DataReader allows type coercion, then its type must be assignable from the DataWriter's type, taking into account the values of prevent\_type\_↔widening, ignore\_sequence\_bounds, ignore\_string\_bounds, ignore\_member\_names, and ignore\_enum\_literal\_names. If the DataReader does not allow type coercion, then its type must be equivalent to the type of the DataWriter.

**Step 2.** If either the DataWriter or the DataReader does not provide a TypeObject definition, then the registered type names are examined. The DataReader's and DataWriter's registered type names must match exactly, as was true in RTI Connext releases prior to 5.0.0.

If either Step 1 or Step 2 fails, the Topics associated with the DataReader and DataWriter are considered to be inconsistent and the **DDS\_InconsistentTopicStatus** (p. 1561) is updated.

The default enforcement kind is **DDS\_AUTO\_TYPE\_COERCION** (p. 1142). This default kind translates to **DDS\_↔ALLOW\_TYPE\_COERCION** (p. 1141) except in the following cases:

- When a **Zero Copy** (p. 205) DataReader is used, the kind is translated to **DDS\_DISALLOW\_TYPE\_COERCION** (p. 1141).
- When the middleware is introspecting the built-in topic data declaration of a remote DataReader in order to determine whether it can match with a local DataWriter, if it observes that no TypeConsistencyEnforcement↔QosPolicy value is provided (as would be the case when communicating with a Service implementation not in conformance with this specification), it assumes a kind of **DDS\_DISALLOW\_TYPE\_COERCION** (p. 1141).

For additional information on type consistency enforcement refer to the `Extensible Types Guide` and the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

#### Entity:

**DDS\_DataReader** (p. 608)

#### Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **UNTIL ENABLE** (p. 1048)

## 5.234.2 Field Documentation

### 5.234.2.1 kind

**DDS\_TypeConsistencyKind** `DDS_TypeConsistencyEnforcementQosPolicy::kind`

Type consistency kind.

**[default] DDS\_AUTO\_TYPE\_COERCION** (p. 1142)

### 5.234.2.2 ignore\_sequence\_bounds

**DDS\_Boolean** `DDS_TypeConsistencyEnforcementQosPolicy::ignore_sequence_bounds`

Controls whether sequence bounds are taken into consideration for type assignability.

If the option is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then sequence bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 sequence type with maximum length L2 would be assignable to a T1 sequence type with maximum length L1, even if L2 is greater than L1. If the option is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), then sequence bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that  $L1 \geq L2$ .

**[default] DDS\_BOOLEAN\_TRUE** (p. 1004)

### 5.234.2.3 ignore\_string\_bounds

`DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_string_bounds`

Controls whether string bounds are taken into consideration for type assignability.

If the option is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then string bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 string type with maximum length L2 would be assignable to a T1 string type with maximum length L1, even if L2 is greater than L1. If the option is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), then string bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that  $L1 \geq L2$ .

[default] **DDS\_BOOLEAN\_TRUE** (p. 1004)

### 5.234.2.4 ignore\_member\_names

`DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::ignore_member_names`

Controls whether member names are taken into consideration for type assignability.

If the option is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then member names are not considered as part of the type assignability. If the option is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), then member names are taken into consideration for type assignability, and in order for members with the same ID to be assignable, the members must also have the same name.

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.234.2.5 prevent\_type\_widening

`DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::prevent_type_widening`

Controls whether type widening is allowed.

If the option is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), then type widening is permitted. If the option is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then a wider type may not be assignable from a narrower type.

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.234.2.6 force\_type\_validation

`DDS_Boolean DDS_TypeConsistencyEnforcementQosPolicy::force_type_validation`

Controls whether type information must be available in order to complete matching between a **DDS\_DataWriter** (p. 478) and a **DDS\_DataReader** (p. 608).

If the option is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then type information must be available in order to complete matching between a **DDS\_DataWriter** (p. 478) and a **DDS\_DataReader** (p. 608). If the option is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), then matching can occur without complete type information as long as the type names match exactly. Note that if the types have the same name but are not assignable, DataReaders may fail to deserialize incoming data samples.

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

### 5.234.2.7 ignore\_enum\_literal\_names

**DDS\_Boolean** DDS\_TypeConsistencyEnforcementQosPolicy::ignore\_enum\_literal\_names

Controls whether enumeration constant names are taken into consideration for type assignability.

If the option is set to **DDS\_BOOLEAN\_TRUE** (p. 1004), then enumeration constants may change their names, but not their values, and still maintain assignability. If the option is set to **DDS\_BOOLEAN\_FALSE** (p. 1004), then in order for enumerations to be assignable, any constant that has the same value in both enumerations must also have the same name.

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

## 5.235 DDS\_TypeDeallocationParams\_t Struct Reference

Configures whether to release or not pointer and optional members.

### Data Fields

- **DDS\_Boolean delete\_pointers**  
*Whether to delete pointer members or not.*
- **DDS\_Boolean delete\_optional\_members**  
*Whether to delete optional members or not.*

### 5.235.1 Detailed Description

Configures whether to release or not pointer and optional members.

By default both pointers optional members are released when they are not null.

This structure is also defined in `xcdr.1.0/srcC/typeObject/TypeObjectInfrastructure.h`. If changes are made, please ensure they are made in both locations.

#### Examples

**HelloWorld.c**, and **HelloWorldPlugin.c**.

### 5.235.2 Field Documentation

### 5.235.2.1 delete\_pointers

`DDS_Boolean DDS_TypeDeallocationParams_t::delete_pointers`

Whether to delete pointer members or not.

#### Examples

`HelloWorld.c`, and `HelloWorldPlugin.c`.

### 5.235.2.2 delete\_optional\_members

`DDS_Boolean DDS_TypeDeallocationParams_t::delete_optional_members`

Whether to delete optional members or not.

#### Examples

`HelloWorld.c`, and `HelloWorldPlugin.c`.

## 5.236 DDS\_TypeSupportQosPolicy Struct Reference

Allows you to attach application-specific values to a `DDS_DataWriter` (p. 478) or `DDS_DataReader` (p. 608), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

### Data Fields

- `void * plugin_data`  
*Value to pass into the type plugin's de-/serialization function.*
- `DDS_CdrPaddingKind cdr_padding_kind`  
*Determines whether or not the padding bytes will be set to zero during CDR serialization.*

### 5.236.1 Detailed Description

Allows you to attach application-specific values to a `DDS_DataWriter` (p. 478) or `DDS_DataReader` (p. 608), which are passed to the serialization or deserialization routine of the associated data type and choose whether to set padding bytes to zero during serialization.

The purpose of this QoS is to allow a user application to pass data to a type plugin's support functions and choose whether or not to set the padding bytes to zero when serializing a sample using CDR encapsulation.

#### Entity:

`DDS_DomainParticipant` (p. 72), `DDS_DataReader` (p. 608), `DDS_DataWriter` (p. 478)

#### Properties:

`RxO` (p. 1048) = NO

`Changeable` (p. 1048) = `UNTIL ENABLE` (p. 1048)

## 5.236.2 Usage

The `DDS_TypeSupportQoSPolicy::plugin_data` (p. 1816) allows you to associate a pointer to an object with a `DDS_↔_DataWriter` (p. 478) or `DDS_DataReader` (p. 608). This object pointer is passed to the serialization routine of the data type associated with the `DDS_DataWriter` (p. 478) or the deserialization routine of the data type associated with the `DDS_DataReader` (p. 608).

You can modify the rtdsdgen-generated code so that the de/serialization routines act differently depending on the information passed in via the object pointer. (The generated serialization and deserialization code does not use the pointer.)

This functionality can be used to change how data sent by a `DDS_DataWriter` (p. 478) or received by a `DDS_Data↔Reader` (p. 608) is serialized or deserialized on a per DataWriter and DataReader basis.

It can also be used to dynamically change how serialization (or for a less common case, deserialization) occurs. For example, a data type could represent a table, including the names of the rows and columns. However, since the row/column names of an instance of the table (a Topic) don't change, they only need to be sent once. The information passed in through the TypeSupport QoS policy could be used to signal the serialization routine to send the row/column names the first time a `DDS_DataWriter` (p. 478) calls `FooDataWriter_write` (p. 489), and then never again.

The `DDS_TypeSupportQoSPolicy::cdr_padding_kind` (p. 1816) allows you to choose whether or not the padding bytes are set to zero during CDR serialization.

## 5.236.3 Field Documentation

### 5.236.3.1 plugin\_data

```
void* DDS_TypeSupportQoSPolicy::plugin_data
```

Value to pass into the type plugin's de-/serialization function.

**[default]** NULL

### 5.236.3.2 cdr\_padding\_kind

```
DDS_CdrPaddingKind DDS_TypeSupportQoSPolicy::cdr_padding_kind
```

Determines whether or not the padding bytes will be set to zero during CDR serialization.

In a DomainParticipant, this value configures how the padding bytes are set when serializing data for the Built-In Topic DataWriters and DataReaders. A value of `DDS_AUTO_CDR_PADDING` (p. 1143) defaults to `DDS_NOT_SET_CDR↔_PADDING` (p. 1143).

For DataWriters and DataReaders, this value configures how padding bytes are set when serializing data for that entity. A value of `DDS_AUTO_CDR_PADDING` (p. 1143) means that the entity will inherit whatever value is set on the Domain↔Participant.

**[default]** `DDS_AUTO_CDR_PADDING` (p. 1143)

## 5.237 DDS\_UInt8Seq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_UInt8** (p. 1005) >

### 5.237.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_UInt8** (p. 1005) >

Instantiates:

## 5.238 DDS\_UnionMember Struct Reference

A description of a member of a union.

### Data Fields

- char \* **name**  
*The name of the union member.*
- **DDS\_Boolean is\_pointer**  
*Indicates whether the union member is a pointer or not.*
- struct **DDS\_LongSeq labels**  
*The labels of the union member.*
- const **DDS\_TypeCode \* type**  
*The type of the union member.*

### 5.238.1 Detailed Description

A description of a member of a union.

See also

**DDS\_UnionMemberSeq** (p. 1818)

**DDS\_TypeCodeFactory\_create\_union\_tc** (p. 290)

## 5.238.2 Field Documentation

### 5.238.2.1 name

```
char* DDS_UnionMember::name
```

The name of the union member.

Cannot be NULL.

### 5.238.2.2 is\_pointer

```
DDS_Boolean DDS_UnionMember::is_pointer
```

Indicates whether the union member is a pointer or not.

### 5.238.2.3 labels

```
struct DDS_LongSeq DDS_UnionMember::labels
```

The labels of the union member.

Each union member should contain at least one label. If the union discriminator type is not **DDS\_Long** (p. 1006) the label value should be evaluated to an integer value. For instance, 'a' would be evaluated to 97.

### 5.238.2.4 type

```
const DDS_TypeCode* DDS_UnionMember::type
```

The type of the union member.

Cannot be NULL.

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

### Data Fields

- struct **DDS\_OctetSeq** value  
*a sequence of octets*

### 5.243.1 Detailed Description

Attaches a buffer of opaque data that is distributed by means of **Built-in Topics** (p. 162) during discovery.

Entity:

**DDS\_DomainParticipant** (p. 72), **DDS\_DataReader** (p. 608), **DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = NO;

**Changeable** (p. 1048) = YES (p. 1048)

See also

**DDS\_DomainParticipant\_get\_builtin\_subscriber** (p. 126)

### 5.243.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **DDS\_Entity** (p. 1160) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This information is not used by RTI Connex.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with operations such as **DDS\_DomainParticipant\_ignore\_participant** (p. 128), **DDS\_DomainParticipant\_ignore\_publication** (p. 129), **DDS\_DomainParticipant\_ignore\_subscription** (p. 130), and **DDS\_DomainParticipant\_ignore\_topic** (p. 129), this QoS policy can assist an application to define and enforce its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

*Important:* RTI Connex stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connex with the maximum size of the data that will be stored in policies of this type. This size is configured with **DDS\_DomainParticipantResourceLimitsQosPolicy::participant\_user\_data\_max\_length** (p. 1506), **DDS\_DomainParticipantResourceLimitsQosPolicy::writer\_user\_data\_max\_length** (p. 1507), and **DDS\_DomainParticipantResourceLimitsQosPolicy::reader\_user\_data\_max\_length** (p. 1507).

### 5.243.3 Field Documentation

#### 5.243.3.1 value

```
struct DDS_OctetSeq DDS_UserDataQosPolicy::value
```

a sequence of octets

**[default]** empty (zero-length)

**[range]** Octet sequence of length [0,max\_length]

## 5.244 DDS\_ValueMember Struct Reference

A description of a member of a value type.

## Data Fields

- `char * name`  
*The name of the value member.*
- `const DDS_TypeCode * type`  
*The type of the value member.*
- `DDS_Boolean is_pointer`  
*Indicates whether the value member is a pointer or not.*
- `DDS_Short bits`  
*Number of bits of a bitfield member.*
- `DDS_Boolean is_key`  
*Indicates if the value member is a key member or not.*
- `DDS_Visibility access`  
*The type of access (public, private) for the value member.*
- `DDS_Long id`  
*The member ID.*
- `DDS_Boolean is_optional`  
*Indicates if the value member is optional or required.*

### 5.244.1 Detailed Description

A description of a member of a value type.

See also

`DDS_ValueMemberSeq` (p. 1824)

`DDS_TypeCodeFactory_create_value_tc` (p. 289)

### 5.244.2 Field Documentation

#### 5.244.2.1 name

```
char* DDS_ValueMember::name
```

The name of the value member.

Cannot be NULL.

#### 5.244.2.2 type

```
const DDS_TypeCode* DDS_ValueMember::type
```

The type of the value member.

Cannot be NULL.

### 5.244.2.3 is\_pointer

```
DDS_Boolean DDS_ValueMember::is_pointer
```

Indicates whether the value member is a pointer or not.

### 5.244.2.4 bits

```
DDS_Short DDS_ValueMember::bits
```

Number of bits of a bitfield member.

If the struct member is a bitfield, this field contains the number of bits of the bitfield. Otherwise, bits should contain **DDS\_TYPECODE\_NOT\_BITFIELD** (p. 234).

### 5.244.2.5 is\_key

```
DDS_Boolean DDS_ValueMember::is_key
```

Indicates if the value member is a key member or not.

### 5.244.2.6 access

```
DDS_Visibility DDS_ValueMember::access
```

The type of access (public, private) for the value member.

It can take the values: **DDS\_PRIVATE\_MEMBER** (p. 235) or **DDS\_PUBLIC\_MEMBER** (p. 235).

### 5.244.2.7 id

```
DDS_Long DDS_ValueMember::id
```

The member ID.

Use **DDS\_TYPECODE\_MEMBER\_ID\_INVALID** (p. 233) to have the member ID automatically assigned.

### 5.244.2.8 is\_optional

```
DDS_Boolean DDS_ValueMember::is_optional
```

Indicates if the value member is optional or required.

## 5.245 DDS\_ValueMemberSeq Struct Reference

Defines a sequence of value members.

### 5.245.1 Detailed Description

Defines a sequence of value members.

#### 5.246.2.1 vendorId

**DDS\_Octet** DDS\_VendorId\_t::vendorId[ **DDS\_VENDOR\_ID\_LENGTH\_MAX**]

The vendor Id.

## 5.247 DDS\_WaitSetProperty\_t Struct Reference

<<*extension*>> (p. 817) Specifies the **DDS\_WaitSet** (p. 1170) behavior for multiple trigger events.

### Data Fields

- **DDS\_Long max\_event\_count**  
*Maximum number of trigger events to cause a **DDS\_WaitSet** (p. 1170) to awaken.*
- struct **DDS\_Duration\_t max\_event\_delay**  
*Maximum delay from occurrence of first trigger event to cause a **DDS\_WaitSet** (p. 1170) to awaken.*

### 5.247.1 Detailed Description

<<*extension*>> (p. 817) Specifies the **DDS\_WaitSet** (p. 1170) behavior for multiple trigger events.

In simple use, a **DDS\_WaitSet** (p. 1170) returns when a single trigger event occurs on one of its attached **DDS\_↔Condition** (p. 1169) (s), or when the `timeout` maximum wait duration specified in the **DDS\_WaitSet\_wait** (p. 1180) call expires.

The **DDS\_WaitSetProperty\_t** (p. 1825) allows configuration of the waiting behavior of a **DDS\_WaitSet** (p. 1170). If no conditions are true at the time of the call to wait, then the `max_event_count` parameter may be used to configure the WaitSet to wait for `max_event_count` trigger events to occur before returning, or to wait for up to `max_event_↔delay` time from the occurrence of the first trigger event before returning.

The `timeout` maximum wait duration specified in the **DDS\_WaitSet\_wait** (p. 1180) call continues to apply.

Entity:

**DDS\_WaitSet** (p. 1170)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **YES** (p. 1048)

### 5.247.2 Field Documentation

### 5.247.2.1 max\_event\_count

```
DDS_Long DDS_WaitSetProperty_t::max_event_count
```

Maximum number of trigger events to cause a **DDS\_WaitSet** (p. 1170) to awaken.

The **DDS\_WaitSet** (p. 1170) will wait until up to `max_event_count` trigger events have occurred before returning. The **DDS\_WaitSet** (p. 1170) may return earlier if either the `timeout` duration has expired, or `max_event_delay` has elapsed since the occurrence of the first trigger event. `max_event_count` may be used to "collect" multiple trigger events for processing at the same time.

**[default]** 1

**[range]**  $\geq 1$

;

### 5.247.2.2 max\_event\_delay

```
struct DDS_Duration_t DDS_WaitSetProperty_t::max_event_delay
```

Maximum delay from occurrence of first trigger event to cause a **DDS\_WaitSet** (p. 1170) to awaken.

The **DDS\_WaitSet** (p. 1170) will return no later than `max_event_delay` after the first trigger event. `max_event_delay` may be used to establish a maximum latency for events reported by the **DDS\_WaitSet** (p. 1170).

Note that **DDS\_RETCODE\_TIMEOUT** (p. 1025) is *not* returned if `max_event_delay` is exceeded. **DDS\_RETCODE\_TIMEOUT** (p. 1025) is returned only if the `timeout` duration expires before any trigger events occur.

**[default]** **DDS\_DURATION\_INFINITE** (p. 1011) ;

## 5.248 DDS\_WcharSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Wchar** (p. 1005) >

### 5.248.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_Wchar** (p. 1005) >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_Wchar** (p. 1005)

**FooSeq** (p. 1845)

## 5.249 DDS\_WireProtocolQosPolicy Struct Reference

Specifies the wire-protocol-related attributes for the **DDS\_DomainParticipant** (p. 72).

### Data Fields

- **DDS\_Long participant\_id**  
*A value used to distinguish among different participants belonging to the same domain on the same host.*
- **DDS\_UnsignedLong rtps\_host\_id**  
*The RTPS Host ID of the domain participant.*
- **DDS\_UnsignedLong rtps\_app\_id**  
*The RTPS App ID of the domain participant.*
- **DDS\_UnsignedLong rtps\_instance\_id**  
*The RTPS Instance ID of the **DDS\_DomainParticipant** (p. 72).*
- struct **DDS\_RtpsWellKnownPorts\_t rtps\_well\_known\_ports**  
*Configures the RTPS well-known port mappings.*
- **DDS\_RtpsReservedPortKindMask rtps\_reserved\_port\_mask**  
*Specifies which well-known ports to reserve when enabling the participant.*
- **DDS\_WireProtocolQosPolicyAutoKind rtps\_auto\_id\_kind**  
*Kind of auto mechanism used to calculate the GUID prefix.*
- **DDS\_Boolean compute\_crc**  
*Adds RTPS CRC submessage to every message when this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004).*
- **DDS\_Boolean check\_crc**  
*Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to **DDS\_BOOLEAN\_TRUE** (p. 1004).*

### 5.249.1 Detailed Description

Specifies the wire-protocol-related attributes for the **DDS\_DomainParticipant** (p. 72).

Entity:

**DDS\_DomainParticipant** (p. 72)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **NO** (p. 1048)

## 5.249.2 Usage

This QoS policy configures some participant-wide properties of the DDS Real-Time Publish Subscribe (RTPS) on-the-wire protocol. (**DDS\_DataWriterProtocolQosPolicy** (p. 1422) and **DDS\_DataReaderProtocolQosPolicy** (p. 1375) configure RTPS and reliability properties on a per **DDS\_DataWriter** (p. 478) or **DDS\_DataReader** (p. 608) basis.)

**NOTE:** The default QoS policies returned by RTI Connext contain the correctly initialized wire protocol attributes. The defaults are not normally expected to be modified, but are available to the advanced user customizing the implementation behavior.

The default values should not be modified without an understanding of the underlying Real-Time Publish Subscribe (RTPS) wire protocol.

In order for the discovery process to work correctly, each **DDS\_DomainParticipant** (p. 72) must have a unique identifier. This QoS policy specifies how that identifier should be generated.

RTPS defines a 96-bit prefix to this identifier; each **DDS\_DomainParticipant** (p. 72) must have a unique value for this prefix relative to all other participants in its domain.

If an application dies unexpectedly and is restarted, the IDs used by the new instance of DomainParticipants should be different than the ones used by the previous instances. A change in these values allows other DomainParticipants to know that they are communicating with a new instance of an application, and not the previous instance.

For legacy reasons, RTI Connext divides the 96-bit prefix into three integers:

- The first integer is called host ID. The original purpose of this integer was to contain the identity of the machine on which the DomainParticipant is executing.
- The second integer is called an application ID. The original purpose of this integer was to contain a value that identifies the process or task in which the DomainParticipant is contained.
- The third integer is called instance ID. The original purpose was to contain a value that uniquely identifies a DomainParticipant within a task or process.

The **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) field can be used to configure the algorithm that RTI Connext uses to populate the 96-bit prefix. Then you can optionally overwrite specific parts of the 96-bit prefix by explicitly configuring the **DDS\_WireProtocolQosPolicy::rtps\_host\_id** (p. 1831) (first integer), **DDS\_WireProtocolQosPolicy::rtps\_app\_id** (p. 1831) (second integer), and **DDS\_WireProtocolQosPolicy::rtps\_instance\_id** (p. 1831) (third integer).

The **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) field supports three different prefix generation algorithms:

1. In the default and most common scenario, **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is set to **DDS\_RTPS\_AUTO\_ID\_FROM\_UUID** (p. 1148). As the name suggests, this mechanism uses a unique, randomly generated UUID to fill the **rtps\_host\_id**, **rtps\_app\_id**, or **rtps\_instance\_id** fields. The first two bytes of the **rtps\_host\_id** are replaced with the RTI vendor ID (0x0101).
2. (Legacy) When **rtps\_auto\_id\_kind** is set to **DDS\_RTPS\_AUTO\_ID\_FROM\_IP** (p. 1148), the 96-bit prefix is generated as follows:

- **rtps\_host\_id**: The 32-bit value of the IPv4 of the first up and running interface of the host machine is assigned. If the host does not have an IPv4 address, the host-id will be automatically set to 0x7F000001.
- **rtps\_app\_id**: The process (or task) ID is assigned.
- **rtps\_instance\_id**: A counter is assigned that is incremented per new participant within a process.

DDS\_RTPS\_AUTO\_ID\_FROM\_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

3. (Legacy) When `rtps_auto_id_kind` is set to **DDS\_RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148), the 96-bit prefix is generated as follows:

- **rtps\_host\_id**: The first 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
- **rtps\_app\_id**: The last 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
- **rtps\_instance\_id**: This field is split into two different parts. The process (or task) ID is assigned to the first 24 bits. A counter is assigned to the last 8 bits. This counter is incremented per new participant.

DDS\_RTPS\_AUTO\_ID\_FROM\_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

Some examples are provided to clarify the behavior of this QoS Policy in case you want to change the default behavior with **DDS\_RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148).

First, get the participant QoS from the `DomainParticipantFactory`:

```
DDS_DomainParticipantFactory_get_default_participant_qos(
    DDS_DomainParticipantFactory_get_instance(),
    &participant_qos);
```

Second, change the **DDS\_WireProtocolQosPolicy** (p. 1827) using one of the options shown below.

Third, create the **DDS\_DomainParticipant** (p. 72) as usual, using the modified QoS structure instead of the default one.

Option 1: Use **DDS\_RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148) to explicitly set just the application/task identifier portion of the **rtps\_instance\_id** field.

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id     = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id     = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id = (/* App ID */ (12 << 8) |
    /* Instance ID */ (DDS_RTPS_AUTO_ID));
```

Option 2: Handle only the per participant counter and let RTI Connext handle the application/task identifier:

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id     = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id     = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id = (/* App ID */ (DDS_RTPS_AUTO_ID) |
    /* Instance ID */ (12));
```

Option 3: Handle the entire **rtps\_instance\_id** field yourself:

```
participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;
```

```

participant_qos.wire_protocol.rtps_host_id      = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id      = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id = ( /* App ID */ (12 << 8) |
                                                /* Instance ID */ (9) )

```

**NOTE:** If you are using **DDS\_RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148) as **rtps\_auto\_id\_kind** and you decide to manually handle the **rtps\_instance\_id** field, you must ensure that both parts are non-zero (otherwise RTI Connex will take responsibility for them). RTI recommends that you always specify the two parts separately in order to avoid errors.

Option 4: Let RTI Connex handle the entire **rtps\_instance\_id** field:

```

participant_qos.wire_protocol.rtps_auto_id_kind = DDS_RTPS_AUTO_ID_FROM_MAC;
participant_qos.wire_protocol.rtps_host_id      = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_app_id      = DDS_RTPS_AUTO_ID;
participant_qos.wire_protocol.rtps_instance_id = DDS_RTPS_AUTO_ID;

```

**NOTE:** If you are using **DDS\_RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148) as **rtps\_auto\_id\_kind** and you decide to manually handle the **rtps\_instance\_id** field, you must ensure that both parts are non-zero (otherwise RTI Connex will take responsibility for them). RTI recommends that you always specify the two parts separately in order to clearly show the difference.

## 5.249.3 Field Documentation

### 5.249.3.1 participant\_id

**DDS\_Long** `DDS_WireProtocolQosPolicy::participant_id`

A value used to distinguish among different participants belonging to the same domain on the same host.

Determines the unicast port on which meta-traffic is received. Also defines the *default* unicast port for receiving user-traffic for DataReaders and DataWriters (can be overridden by the **DDS\_DataReaderQos::unicast** (p. 1395) or **DDS\_↔\_DataWriterQos::unicast** (p. 1444)).

For more information on port mapping, please refer to **DDS\_RtpsWellKnownPorts\_t** (p. 1714).

Each **DDS\_DomainParticipant** (p. 72) in the same domain and running on the same host, must have a unique `participant_id`. The participants may be in the same address space or in distinct address spaces.

A negative number (-1) means that RTI Connex will *automatically* resolve the participant ID as follows.

- RTI Connex will pick the *smallest* participant ID based on the unicast ports available on the transports enabled for discovery.
- RTI Connex will attempt to resolve an automatic port index either when a DomainParticipant is enabled, or when a DataReader or DataWriter is created. Therefore, all the transports enabled for discovery must have been registered by this time. Otherwise, the discovery transports registered after resolving the automatic port index may produce port conflicts when the DomainParticipant is enabled.

**[default]** -1 [automatic], i.e. RTI Connex will automatically pick the `participant_id`, as described above.

**[range]** [ $\geq 0$ ], or -1, and does not violate guidelines stated in **DDS\_RtpsWellKnownPorts\_t** (p. 1714).

See also

**DDS\_Entity\_enable()** (p. 1163)

**NDDS\_Transport\_Support\_register\_transport()** (p. 722)

### 5.249.3.2 rtps\_host\_id

```
DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_host_id
```

The RTPS Host ID of the domain participant.

A specific host ID that is unique in the domain.

**[default] DDS RTPS\_AUTO\_ID** (p. ??). The default value is interpreted as follows:

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_IP** (p. 1148), the value will be interpreted as the IPv4 address of the *first* up and running interface of the host machine.

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148), the value will be interpreted as the first 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_UUID** (p. 1148), the value will be the first 32 bits of the GUID prefix assigned by the UUID algorithm.

**[range]** [0,0xffffffff]

### 5.249.3.3 rtps\_app\_id

```
DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_app_id
```

The RTPS App ID of the domain participant.

A participant specific ID that, together with the `rtps_instance_id`, is unique within the scope of the `rtps_host_id`.

If a participant dies and is restarted, it is recommended that it be given an app ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

**[default] DDS RTPS\_AUTO\_ID** (p. ??). The default value is interpreted as follows:

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_IP** (p. 1148) the value will be the process (or task) ID.

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148) the value will be the last 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_UUID** (p. 1148), the value will be the middle 32 bits of the GUID prefix assigned by the UUID algorithm.

**[range]** [0,0xffffffff]

### 5.249.3.4 rtps\_instance\_id

```
DDS_UnsignedLong DDS_WireProtocolQosPolicy::rtps_instance_id
```

The RTPS Instance ID of the **DDS\_DomainParticipant** (p. 72).

This is an instance-specific ID of a participant that, together with the `rtps_app_id`, is unique within the scope of the `rtps_host_id`.

If a participant dies and is restarted, it is recommended that it be given an instance ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

**[default]** **DDS RTPS\_AUTO\_ID** (p. ??). The default value is interpreted as follows:

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_IP** (p. 1148), a counter is assigned that is incremented per new participant. For VxWorks-653, the first 8 bits are assigned to the partition id for the application.

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148), the first 24 bits are assigned to the application/task identifier and the last 8 bits are assigned to a counter that is incremented per new participant.

If **DDS\_WireProtocolQosPolicy::rtps\_auto\_id\_kind** (p. 1832) is equal to **DDS RTPS\_AUTO\_ID\_FROM\_UUID** (p. 1148), the value will be the last 32 bits of the GUID prefix assigned by the UUID algorithm.

**[range]** [0,0xffffffff] **NOTE:** If you use **DDS RTPS\_AUTO\_ID\_FROM\_MAC** (p. 1148) as **rtps\_auto\_id\_kind** and you decide to manually handle the **rtps\_instance\_id** field, you must ensure that both the two parts are non-zero, otherwise the middleware will take responsibility for them. We recommend that you always specify the two parts separately in order to avoid errors. ( [examples](#) )

### 5.249.3.5 rtps\_well\_known\_ports

```
struct DDS_RtpsWellKnownPorts_t DDS_WireProtocolQosPolicy::rtps_well_known_ports
```

Configures the RTPS well-known port mappings.

Determines the well-known multicast and unicast port mappings for discovery (meta) traffic and user traffic.

**[default]** **DDS\_INTEROPERABLE RTPS\_WELL\_KNOWN\_PORTS** (p. 1149)

### 5.249.3.6 rtps\_reserved\_port\_mask

```
DDS_RtpsReservedPortKindMask DDS_WireProtocolQosPolicy::rtps_reserved_port_mask
```

Specifies which well-known ports to reserve when enabling the participant.

Specifies which of the well-known multicast and unicast ports will be reserved when the DomainParticipant is enabled. Failure to allocate a port that is computed based on the **DDS\_RtpsWellKnownPorts\_t** (p. 1714) will be detected at this time, and the enable operation will fail.

**[default]** **DDS RTPS\_RESERVED\_PORT\_MASK\_DEFAULT** (p. 1146)

### 5.249.3.7 rtps\_auto\_id\_kind

`DDS_WireProtocolQosPolicyAutoKind DDS_WireProtocolQosPolicy::rtps_auto_id_kind`

Kind of auto mechanism used to calculate the GUID prefix.

[default] `DDS_RTSPS_AUTO_ID_FROM_UUID` (p. 1148)

### 5.249.3.8 compute\_crc

`DDS_Boolean DDS_WireProtocolQosPolicy::compute_crc`

Adds RTPS CRC submessage to every message when this field is set to `DDS_BOOLEAN_TRUE` (p. 1004).

The computed CRC covers the entire RTPS message excluding the RTPS header.

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

### 5.249.3.9 check\_crc

`DDS_Boolean DDS_WireProtocolQosPolicy::check_crc`

Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to `DDS_BOOLEAN_TRUE` (p. 1004).

`DDS_WireProtocolQosPolicy::compute_crc` (p. 1833) must be enabled at the publishing application for validating the message at the subscribing application.

[default] `DDS_BOOLEAN_FALSE` (p. 1004)

## 5.250 DDS\_WriteParams\_t Struct Reference

<<*extension*>> (p. 817) Input parameters for writing with `FooDataWriter_write_w_params` (p. 494), `FooDataWriter_dispose_w_params` (p. 497), `FooDataWriter_register_instance_w_params` (p. 486), `FooDataWriter_unregister_instance_w_params` (p. 489)

## Data Fields

- **DDS\_Boolean replace\_auto**  
*Allows retrieving the actual value of those fields that were automatic.*
- struct **DDS\_SampleIdentity\_t identity**  
*Identity of the sample.*
- struct **DDS\_SampleIdentity\_t related\_sample\_identity**  
*The identity of another sample related to this one.*
- struct **DDS\_Time\_t source\_timestamp**  
*Source timestamp upon write.*
- struct **DDS\_Cookie\_t cookie**  
*Octet sequence identifying written data sample.*
- **DDS\_InstanceHandle\_t handle**  
*Instance handle.*
- **DDS\_Long priority**  
*Publication priority.*
- **DDS\_SampleFlag flag**  
*Flags associated with the sample.*
- struct **DDS\_GUID\_t source\_guid**  
*Identifies the application logical data source associated with the sample being written.*
- struct **DDS\_GUID\_t related\_source\_guid**  
*Identifies the application logical data source that is related to the sample being written.*
- struct **DDS\_GUID\_t related\_reader\_guid**  
*Identifies a DataReader that is logically related to the sample that is being written.*

### 5.250.1 Detailed Description

<<*extension*>> (p. 817) Input parameters for writing with **FooDataWriter\_write\_w\_params** (p. 494), **FooDataWriter\_dispose\_w\_params** (p. 497), **FooDataWriter\_register\_instance\_w\_params** (p. 486), **FooDataWriter\_unregister\_instance\_w\_params** (p. 489)

### 5.250.2 Field Documentation

#### 5.250.2.1 replace\_auto

```
DDS_Boolean DDS_WriteParams_t::replace_auto
```

Allows retrieving the actual value of those fields that were automatic.

When this field is set, the fields that were configured with an automatic value (for example, **DDS\_AUTO\_SAMPLE\_IDENTITY** (p. 1188)) receive their actual value after **FooDataWriter\_write\_w\_params** (p. 494) is called.

To reset those fields to their automatic value after calling **FooDataWriter\_write\_w\_params** (p. 494), use **DDS\_WriteParams\_reset** (p. 1187)

### 5.250.2.2 identity

```
struct DDS_SampleIdentity_t DDS_WriteParams_t::identity
```

Identity of the sample.

Identifies the sample being written. The identity consists of a pair (Virtual Writer GUID, Virtual Sequence Number).

Use the default value to let RTI Connexx determine the sample identity as follows:

- The Virtual Writer GUID is the virtual GUID associated with the writer writing the sample. This virtual GUID is configured using **DDS\_DataWriterProtocolQosPolicy::virtual\_guid** (p. 1423).
- The sequence number is increased by one with respect to the previous value.

The virtual sequence numbers for a virtual writer must be strictly monotonically increasing. If the user tries to write a sample with a sequence number smaller or equal to the last sequence number, the write operation will fail.

A DataReader can access the identity of a received sample by using the fields **DDS\_SampleInfo::original\_publication\_virtual\_guid** (p. 1729) and **DDS\_SampleInfo::original\_publication\_virtual\_sequence\_number** (p. 1729) in the **DDS\_SampleInfo** (p. 1720).

[default] **DDS\_AUTO\_SAMPLE\_IDENTITY** (p. 1188).

### 5.250.2.3 related\_sample\_identity

```
struct DDS_SampleIdentity_t DDS_WriteParams_t::related_sample_identity
```

The identity of another sample related to this one.

Identifies another sample that is logically related to the one that is written.

When this field is set, the related sample identity is propagated and subscribing applications can retrieve it from the **DDS\_SampleInfo** (p. 1720) (see **DDS\_SampleInfo\_get\_related\_sample\_identity** (p. 694)).

The default value is **DDS\_UNKNOWN\_SAMPLE\_IDENTITY** (p. 1188), and is not propagated.

A DataReader can access the related identity of a received sample by using the fields **DDS\_SampleInfo::related\_original\_publication\_virtual\_guid** (p. 1729) and **DDS\_SampleInfo::related\_original\_publication\_virtual\_sequence\_number** (p. 1730) in the **DDS\_SampleInfo** (p. 1720).

[default] **DDS\_UNKNOWN\_SAMPLE\_IDENTITY** (p. 1188)

### 5.250.2.4 source\_timestamp

```
struct DDS_Time_t DDS_WriteParams_t::source_timestamp
```

Source timestamp upon write.

Specifies the source timestamp that will be available to the **DDS\_DataReader** (p. 608) objects by means of the **source\_timestamp** attribute within the **DDS\_SampleInfo** (p. 1720).

[default] **DDS\_TIME\_INVALID** (p. 1011).

### 5.250.2.5 cookie

```
struct DDS_Cookie_t DDS_WriteParams_t::cookie
```

Octet sequence identifying written data sample.

Used in the callback **DDS\_DataWriterListener::on\_sample\_removed** (p. 1420) to associate a removed sample with a written sample.

**[default]** Empty sequence (zero-length).

### 5.250.2.6 handle

```
DDS_InstanceHandle_t DDS_WriteParams_t::handle
```

Instance handle.

Either the handle returned by a previous call to **FooDataWriter\_register\_instance** (p. 484), or else the special value **DDS\_HANDLE\_NIL** (p. 224).

**[default]** **DDS\_HANDLE\_NIL** (p. 224)

### 5.250.2.7 priority

```
DDS_Long DDS_WriteParams_t::priority
```

Publication priority.

A positive integer value designating the relative priority of the sample, used to determine the transmission order of pending writes.

Use of publication priorities requires an asynchronous publisher (**DDS\_ASYNCHRONOUS\_PUBLISH\_MODE\_↔QOS** (p. 1120)) with **DDS\_FlowControllerProperty\_t::scheduling\_policy** (p. 1552) set to **DDS\_HPF\_FLOW\_↔CONTROLLER\_SCHED\_POLICY** (p. 554).

Larger numbers have higher priority.

For multi-channel DataWriters, the publication priority of a sample may be used as a filter criteria for determining channel membership.

If the publication priority of the parent DataWriter, or for multi-channel DataWriters, if the publication priority of the parent channel, is set to **DDS\_PUBLICATION\_PRIORITY\_AUTOMATIC** (p. 1119), then the DataWriter or channel will be assigned the priority of the largest publication priority of all samples in the DataWriter or channel.

If the publication priority of the parent DataWriter, and for multi-channel DataWriters, if the publication priority of the parent channel, are set to **DDS\_PUBLICATION\_PRIORITY\_UNDEFINED** (p. 1119), then the DataWriter or channel will be assigned the lowest priority, regardless of the value of the publication priorities of samples written to the DataWriter or channel.

The publication priority of each sample can be set in the **DDS\_WriteParams\_t** (p. 1833) of **FooDataWriter\_write\_w\_↔\_params** (p. 494).

For dispose and unregister samples, use the **DDS\_WriteParams\_t** (p. 1833) of **FooDataWriter\_dispose\_w\_params** (p. 497) and **FooDataWriter\_unregister\_instance\_w\_params** (p. 489).

**[default]** 0 (lowest priority)

See also

**DDS\_ChannelSettings\_t::priority** (p. 1345)

### 5.250.2.8 flag

```
DDS_SampleFlag DDS_WriteParams_t::flag
```

Flags associated with the sample.

The flags are represented as a 32-bit integer, of which only the 16 least-significant bits are used.

RTI reserves least-significant bits [0-7] for middleware-specific usage.

The application can use least-significant bits [8-15].

The first bit (**DDS\_REDELIVERED\_SAMPLE** (p. 1185)) is reserved for marking samples as redelivered when using RTI Queuing Service.

The second bit (**DDS\_INTERMEDIATE\_REPLY\_SEQUENCE\_SAMPLE** (p. 1185)) is used to indicate that a response sample is not the last response sample for a given request. This bit is usually set by a Replier sending multiple responses for a request.

An application can inspect the flags associated with a received sample by checking the field **DDS\_SampleInfo::flag** (p. 1730).

**[default]** 0 (no flags are set)

### 5.250.2.9 source\_guid

```
struct DDS_GUID_t DDS_WriteParams_t::source_guid
```

Identifies the application logical data source associated with the sample being written.

When this field is set, the `source_guid` is propagated and subscribing applications can retrieve it from the **DDS\_SampleInfo** (p. 1720) (see **DDS\_SampleInfo::source\_guid** (p. 1730)).

The default value is **DDS\_GUID\_AUTO** (p. 1016), and is not propagated.

The main use case for `source_guid` and `related_source_guid` is a request/reply scenario in which a reply has to be sent only to the Requester that issue the related request.

In this case, the Requester's DataWriter will send a request setting the `source_guid` to a unique value. This value must be the same value even after Requester restart.

The Replier's DataReader will get the request's `source_guid` from the `SampleInfo` and it will send it as the `related_source_guid` of the reply using the Replier's DataWriter.

The Requester's DataReader will install a CFT on the `related_source_guid` using a filter expression. For example:

```
@related_source_guid.value = &hex(00000000000000000000000000000001)
```

This way the reply will be send only to the right Requester.

The `source_guid` and `related_source_guid` fields are used by RTI Queuing Service in a request/reply scenario.

**[default]** **DDS\_GUID\_AUTO** (p. 1016) (the `source_guid` is automatically set to the **DDS\_DataWriter** (p. 478) virtual GUID).

See also

**DDS\_WriteParams\_t::related\_source\_guid** (p. 1837)

### 5.250.2.10 related\_source\_guid

```
struct DDS_GUID_t DDS_WriteParams_t::related_source_guid
```

Identifies the application logical data source that is related to the sample being written.

When this field is set, the `related_source_guid` is propagated and subscribing applications can retrieve it from the `DDS_SampleInfo` (p. 1720) (see `DDS_SampleInfo::related_source_guid` (p. 1730)).

The default value is `DDS_GUID_UNKNOWN` (p. 1016), and is not propagated.

[default] `DDS_GUID_UNKNOWN` (p. 1016)

See also

`DDS_WriteParams_t::source_guid` (p. 1837)

### 5.250.2.11 related\_reader\_guid

```
struct DDS_GUID_t DDS_WriteParams_t::related_reader_guid
```

Identifies a DataReader that is logically related to the sample that is being written.

When this field is set, the `related_reader_guid` is propagated and subscribing applications can retrieve it from the `DDS_SampleInfo` (p. 1720) (see `DDS_SampleInfo::related_subscription_guid` (p. 1731)).

The default value is `DDS_GUID_UNKNOWN` (p. 1016), and is not propagated.

The main use case for this field is point-to-point sample distribution using CFT. DataReaders install a CFT on the `related_reader_guid` using a unique GUID. For example, the filter for DataReader 'n' can be:

```
@related_reader_guid.value = &hex(00000000000000000000000000000001)
```

Then, a DataWriter that wants to send the sample to DataReader 'n' will use the `FooDataWriter_write_w_params` (p. 494) function and set `related_reader_guid` to the value used by DataReader 'n' in its filter expression.

This field is currently used by RTI Queuing Service to distribute a sample to only one of the Consumer's DataReaders attached to a SharedReaderQueue.

[default] `DDS_GUID_UNKNOWN` (p. 1016)

## 5.251 DDS\_WriterDataLifecycleQosPolicy Struct Reference

Controls how a `DDS_DataWriter` (p. 478) handles the lifecycle of the instances (keys) that it is registered to manage.

## Data Fields

- **DDS\_Boolean autodispose\_unregistered\_instances**  
*Boolean flag that controls the behavior when the **DDS\_DataWriter** (p. 478) unregisters an instance by means of the unregister operations.*
- struct **DDS\_Duration\_t autopurge\_unregistered\_instances\_delay**  
<<**extension**>> (p. 817) *Maximum duration for which the **DDS\_DataWriter** (p. 478) will maintain information regarding an instance once it has unregistered the instance.*
- struct **DDS\_Duration\_t autopurge\_disposed\_instances\_delay**  
<<**extension**>> (p. 817) *Maximum duration for which the **DDS\_DataWriter** (p. 478) will maintain information regarding an instance once it has disposed the instance.*

### 5.251.1 Detailed Description

Controls how a **DDS\_DataWriter** (p. 478) handles the lifecycle of the instances (keys) that it is registered to manage.

Entity:

**DDS\_DataWriter** (p. 478)

Properties:

**RxO** (p. 1048) = N/A

**Changeable** (p. 1048) = **YES** (p. 1048)

### 5.251.2 Usage

This policy determines how the **DDS\_DataWriter** (p. 478) acts with regards to the lifecycle of the data instances it manages (data instances that have been either explicitly registered with the **DDS\_DataWriter** (p. 478) or implicitly registered by directly writing the data).

You may use **FooDataWriter\_unregister\_instance** (p. 486) to indicate that the **DDS\_DataWriter** (p. 478) no longer wants to send data for a **DDS\_Topic** (p. 172).

The behavior controlled by this QoS policy applies on a per instance (key) basis for keyed Topics, so that when a **DDS\_↔\_DataWriter** (p. 478) unregisters an instance, RTI Connex can automatically also dispose that instance. This is the default behavior.

In many cases where the ownership of a Topic is shared (see **DDS\_OwnershipQosPolicy** (p. 1610)), DataWriters may want to relinquish their ownership of a particular instance of the Topic to allow other DataWriters to send updates for the value of that instance regardless of Ownership Strength. In that case, you may only want a DataWriter to unregister an instance without disposing the instance. *Disposing* an instance is a statement that an instance no longer exists. User applications may be coded to trigger on the disposal of instances, thus the ability to unregister without disposing may be useful to properly maintain the semantic of disposal.

### 5.251.3 Field Documentation

#### 5.251.3.1 autodispose\_unregistered\_instances

```
DDS_Boolean DDS_WriterDataLifecycleQosPolicy::autodispose_unregistered_instances
```

Boolean flag that controls the behavior when the **DDS\_DataWriter** (p. 478) unregisters an instance by means of the unregister operations.

- **DDS\_BOOLEAN\_TRUE** (p. 1004)  
The **DDS\_DataWriter** (p. 478) will dispose of the instance each time it is unregistered. The behavior is identical to explicitly calling one of the `dispose` operations on the instance prior to calling the `unregister` operation.
- **DDS\_BOOLEAN\_FALSE** (p. 1004) (default)  
The **DDS\_DataWriter** (p. 478) will not dispose of the instance. The application can still call one of the `dispose` operations prior to unregistering the instance and dispose of the instance that way.

[default] **DDS\_BOOLEAN\_FALSE** (p. 1004)

#### 5.251.3.2 autopurge\_unregistered\_instances\_delay

```
struct DDS_Duration_t DDS_WriterDataLifecycleQosPolicy::autopurge_unregistered_instances_delay
```

<<*extension*>> (p. 817) Maximum duration for which the **DDS\_DataWriter** (p. 478) will maintain information regarding an instance once it has unregistered the instance.

Determines how long the **DDS\_DataWriter** (p. 478) will maintain information regarding an instance that has been unregistered. By default, the **DDS\_DataWriter** (p. 478) resources associated with an instance (e.g., the space needed to remember the Instance Key or KeyHash) are released lazily. This means the resources are only reclaimed when the space is needed for another instance because **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693) is exceeded. This behavior can be changed by setting `autopurge_unregistered_instances_delay` to a value other than **DDS\_DURATION\_INFINITY** (p. 1011).

After this time elapses, the **DDS\_DataWriter** (p. 478) will purge all internal information regarding the instance, including historical samples, even if **DDS\_ResourceLimitsQosPolicy::max\_instances** (p. 1693) has not been reached.

The purging of unregistered instances can be done based on the source timestamp of the unregister sample or the time where the unregister sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): `dds.data_writer.history.source_timestamp_based_autopurge_instances_delay`.

For durable writer history, `autopurge_unregistered_instances_delay` supports only the **DDS\_DURATION\_INFINITY** (p. 1011) value.

[default] **DDS\_DURATION\_INFINITY** (p. 1011) (disabled) for all **DDS\_DataWriter** (p. 478) except for the built-in discovery DataWriters

**DDS\_DURATION\_ZERO** (p.1012) for built-in discovery DataWriters (see **DDS\_DiscoveryConfigQosPolicy::publication\_writer\_data\_lifecycle** (p. 1467), **DDS\_DiscoveryConfigQosPolicy::subscription\_writer\_data\_lifecycle** (p. 1468) and **DDS\_DiscoveryConfigQosPolicy::participant\_configuration\_writer\_data\_lifecycle** (p. 1478)).

[range] [0, 1 year] or **DDS\_DURATION\_INFINITY** (p. 1011)

### 5.251.3.3 autopurge\_disposed\_instances\_delay

```
struct DDS_Duration_t DDS_WriterDataLifecycleQosPolicy::autopurge_disposed_instances_delay
```

<<*extension*>> (p. 817) Maximum duration for which the **DDS\_DataWriter** (p. 478) will maintain information regarding an instance once it has disposed the instance.

Determines how long the **DDS\_DataWriter** (p. 478) will maintain information regarding an instance that has been disposed of. By default, disposing of an instance does not make it eligible to be purged. By setting `autopurge_disposed_instances_delay` to a value other than **DDS\_DURATION\_INFINITE** (p. 1011), the DataWriter will delete the resources associated with an instance (including historical samples) once the time has elapsed and all matching DataReaders have acknowledged all the samples for this instance including the dispose sample.

The purging of disposed instances can be done based on the source timestamp of the dispose sample or the time when the dispose sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): `dds.data_writer.history.source_timestamp_based_autopurge_instances_delay`.

This QoS value is supported with durable DataWriter queues only for **DDS\_DURATION\_ZERO** (p. 1012) and **DDS\_DURATION\_INFINITE** (p. 1011) values (finite values are not supported).

[default] **DDS\_DURATION\_INFINITE** (p. 1011) (disabled)

[range] [0, 1 year] or **DDS\_DURATION\_INFINITE** (p. 1011)

## 5.252 DDS\_WstringSeq Struct Reference

Instantiates **FooSeq** (p. 1845) < **DDS\_Wchar** (p. 1005)\* >

### 5.252.1 Detailed Description

Instantiates **FooSeq** (p. 1845) < **DDS\_Wchar** (p. 1005)\* >

Instantiates:

<<*generic*>> (p. 818) **FooSeq** (p. 1845)

See also

**DDS\_StringSeq** (p. 1741)

**FooSeq** (p. 1845)

## 5.253 Foo Struct Reference

A representative user-defined data type.

### 5.253.1 Detailed Description

A representative user-defined data type.

**Foo** (p. 1841) represents a user-defined data-type that is intended to be distributed using DDS.

The type **Foo** (p. 1841) is usually defined using IDL syntax and placed in a ".idl" file that is then processed using `rtiddsgen`. The `rtiddsgen` utility generates the helper classes **FooSeq** (p. 1845) as well as the necessary code for DDS to manipulate the type (serialize it so that it can be sent over the network) as well as the implied **FooDataReader** (p. 1845) and **FooDataWriter** (p. 1845) types that allow the application to send and receive data of this type.

See also

**FooSeq** (p. 1845), **FooDataWriter** (p. 1845), **FooDataReader** (p. 1845), **FooTypeSupport** (p. 1846), the `Code Generator User's Manual`

## 5.254 FooBarReplier Struct Reference

Allows receiving requests and sending replies.

### 5.254.1 Detailed Description

Allows receiving requests and sending replies.

A Replier is an entity with two associated **topics** (p. 164): a request topic and a reply topic. It can receive requests by subscribing to the request topic and can send replies to those requests by publishing the reply topic.

Valid types for these topics (`TReq` and `TRep`) are: those generated by `rtiddsgen`, the **DDS built-in types** (p. 301), and **DDS\_DynamicData** (p. 1523). **Note:** At this moment, in the C version of this API, only `rtiddsgen`-generated types are supported.

To create a Replier for two types, a request type `TReq=Foo` (p. 1841) and a reply type `TRep=Bar`, your application needs to instantiate the data structure **FooBarReplier** (p. 1842) and the specific operations that can publish and subscribe to those types. In this documentation we refer to the type-dependent operations as `FooBarReplier_` (for example, **FooBarReplier\_take\_requests** (p. 763)). Some operations are type-independent and their names always begin with `RTI_Connext_Replier_` (for example, **RTI\_Connext\_Replier\_wait\_for\_requests** (p. 760)). See **Creating a Replier** (p. 811).

A Replier has four main types of operations:

- Waiting for requests to be received from the middleware
- Getting those requests
- Receiving requests (a convenience operation that is a combination of waiting and getting in a single operation)
- Sending a reply for a previously received request (i.e., publishing a reply sample on the reply topic with special meta-data so that the original Requester can identify it)

For multi-reply scenarios in which a **FooBarReplier** (p. 1842) generates more than one reply for a request, the **FooBarReplier** (p. 1842) should mark all the intermediate replies (all but the last) using the **DDS\_INTERMEDIATE\_REPLY\_SEQUENCE\_SAMPLE** (p. 1185) flag in **DDS\_WriteParams\_t::flag** (p. 1836).

Much like a Requester, a Replier has an associated **DDS\_DomainParticipant** (p. 72), which can be shared with other Repliers or RTI Connex routines. All the other entities required for the request-reply interaction, including a **DDS\_DataWriter** (p. 478) for writing replies and a **DDS\_DataReader** (p. 608) for reading requests, are automatically created when the Replier is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **RTI\_Connext\_Requester\_Params::qos\_profile\_name** (p.1907)). By default, they are created with **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 814)

There are several ways to use a Replier:

- A thread **receives** (p. 762) requests and then dispatches them. If the computation of a reply is a simple operation, consider using a **FooBarSimpleReplier** (p. 1844) instead of a Replier.
- Polling without waiting, using **FooBarReplier\_take\_requests** (p. 763) directly.
- Using a **RTI\_Connext\_ReplierListener** (p. 1900) to get notified and **get** (p. 763) the requests within the callback.

**Replier example** (p. 812)

## 5.255 FooBarRequester Struct Reference

Allows sending requests and receiving replies.

### 5.255.1 Detailed Description

Allows sending requests and receiving replies.

A requester is an entity with two associated **topics** (p. 164): a request topic and a reply topic. It can send requests by publishing samples of the request topic and receive replies to those requests by subscribing to the reply topic.

Valid types for these topics (**TReq** and **TRep**) are: those generated by **rtiddsgen**, the **DDS built-in types** (p. 301), and **DDS\_DynamicData** (p. 1523). **Note:** At this moment, in the C version of this API, only **rtiddsgen**-generated types are supported.

To create a Requester for two types, a request type **TReq=Foo** (p. 1841) and a reply type **TRep=Bar**, your application needs to instantiate the data structure **FooBarRequester** (p. 1843) and the specific operations that can publish and subscribe to those types. In this documentation we refer to the type-dependent operations as **FooBarRequester\_** (for example, **FooBarRequester\_take\_replies** (p. 748)). Some operations are type-independent and their name always begins with **RTI\_Connext\_Requester\_** (for example, **RTI\_Connext\_Requester\_wait\_for\_replies** (p. 742)).

See **Creating a Requester** (p. 808) to see how to instantiate a **FooBarRequester** (p. 1843).

A Replier and a Requester communicate when they use the same topics for requests and replies (see **RTI\_Connext\_Requester\_Params::service\_name** (p. 1906)) on the same **domain** (p. 72).

A Requester can send requests and receive one or multiple replies. It does that using the following operations:

- Sending requests (i.e. publishing request samples on the request topic)
- Waiting for replies to be received by the middleware (for any request or for a specific request)
- Getting those replies from the middleware. There are two ways to do this: take (the data samples are removed from the middleware), read (the data samples remain in the middleware and can be read or taken again).
- A convenience operation, receive (which is a combination of wait and take).

In all cases, the middleware guarantees that a requester only receives reply samples that are associated with those requests that it sends.

For multi-reply scenarios, in which a Requester receives multiple replies from a Replier for a given request, the Requester can check if a reply is the last reply of a sequence of replies. To do so, see if the bit **DDS\_INTERMEDIATE\_REPLY**↔**\_SEQUENCE\_SAMPLE** (p. 1185) is set in **DDS\_SampleInfo::flag** (p. 1730) after receiving each reply. This indicates it is NOT the last reply.

A requester has an associated **DDS\_DomainParticipant** (p. 72), which can be shared with other requesters or RTI Connex routines. All the other RTI Connex entities required for the request-reply interaction, including a **DDS\_Data**↔**Writer** (p. 478) for writing requests and a **DDS\_DataReader** (p. 608) for reading replies, are automatically created when the requester is constructed.

Quality of Service for the underlying DataWriter and DataReader can be configured (see **RTI\_Connext\_Requester**↔**Params::qos\_profile\_name** (p. 1907)). By default, they are created with **DDS\_RELIABLE\_RELIABILITY\_QOS** (p. 1124). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 814)

## 5.256 FooBarSimpleReplier Struct Reference

A callback-based replier.

### 5.256.1 Detailed Description

A callback-based replier.

A SimpleReplier is based on a **RTI\_Connext\_SimpleReplierListener** (p. 1908) that users provide . Requests are passed to the callback, which returns a reply. The reply is directed only to the Requester that sent the request.

SimpleRepliers are useful for simple use cases where a single reply for a request can be generated quickly, for example, looking up a table.

When more than one reply for a request can be generated or the processing is complex or needs to happen asynchronously, use a **FooBarReplier** (p. 1842) instead.

See also

**FooBarReplier** (p. 1842)

## 5.259 FooSeq Struct Reference

<<*interface*>> (p. 818) <<*generic*>> (p. 818) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **Foo** (p. 1841).

### 5.259.1 Detailed Description

<<*interface*>> (p. 818) <<*generic*>> (p. 818) A type-safe, ordered collection of elements. The type of these elements is referred to in this documentation as **Foo** (p. 1841).

For users who define data types in OMG IDL, this type corresponds to the IDL express `sequence<Foo>` (p. 1841).

For any user-data type **Foo** (p. 1841) that an application defines for the purpose of data-distribution with RTI Connext, a **FooSeq** (p. 1845) is generated. We refer to an IDL `sequence<Foo>` (p. 1841) as **FooSeq** (p. 1845).

The state of a sequence is described by the properties 'maximum', 'length' and 'owned'.

- The 'maximum' represents the size of the underlying buffer; this is the maximum number of elements it can possibly hold. It is returned by the **FooSeq\_get\_maximum** (p. 1299) operation.
- The 'length' represents the actual number of elements it currently holds. It is returned by the **FooSeq\_get\_length** (p. 1300) operation.
- The 'owned' flag represents whether the sequence owns the underlying buffer. It is returned by the **FooSeq\_↔has\_ownership** (p. 1309) operation. If the sequence does not own the underlying buffer, the underlying buffer is loaned from somewhere else. This flag influences the lifecycle of the sequence and what operations are allowed on it. The general guidelines are provided below and more details are described in detail as pre-conditions and post-conditions of each of the sequence's operations:
  - If `owned == DDS_BOOLEAN_TRUE` (p. 1004), the sequence has ownership on the buffer. It is then responsible for destroying the buffer when the sequence is destroyed.
  - If the `owned == DDS_BOOLEAN_FALSE` (p. 1004), the sequence does not have ownership on the buffer. This implies that the sequence is loaning the buffer. The sequence cannot be destroyed until the loan is returned.
  - A sequence with a zero maximum always has `owned == DDS_BOOLEAN_TRUE` (p. 1004)

## 5.261 NDDS\_Config\_LibraryVersion\_t Struct Reference

The version of a single library shipped as part of an RTI Connex distribution.

### Data Fields

- **DDS\_Long major**  
*The major version of a single RTI Connex library.*
- **DDS\_Long minor**  
*The minor version of a single RTI Connex library.*
- char **release**  
*The release letter of a single RTI Connex library.*
- **DDS\_Long build**  
*The build number of a single RTI Connex library.*

### 5.261.1 Detailed Description

The version of a single library shipped as part of an RTI Connex distribution.

RTI Connex is comprised of a number of separate libraries. Although RTI Connex as a whole has a version, the individual libraries each have their own versions as well. It may be necessary to check these individual library versions when seeking technical support.

### 5.261.2 Field Documentation

### 5.261.2.1 major

```
DDS_Long NDDS_Config_LibraryVersion_t::major
```

The major version of a single RTI Connex library.

### 5.261.2.2 minor

```
DDS_Long NDDS_Config_LibraryVersion_t::minor
```

The minor version of a single RTI Connex library.

### 5.261.2.3 release

```
char NDDS_Config_LibraryVersion_t::release
```

The release letter of a single RTI Connex library.

### 5.261.2.4 build

```
DDS_Long NDDS_Config_LibraryVersion_t::build
```

The build number of a single RTI Connex library.

## 5.262 NDDS\_Config\_Logger Struct Reference

<<*interface*>> (p. 818) The singleton type used to configure RTI Connex logging.

### 5.262.1 Detailed Description

<<*interface*>> (p. 818) The singleton type used to configure RTI Connex logging.

## 5.263 NDDS\_Config\_LoggerDevice Struct Reference

<<*interface*>> (p. 818) Logging device interface. Use for user-defined logging devices.

## Data Fields

- **NDDS\_Config\_LoggerDeviceWriteFnc** **write**  
*Write a log message to a specified logging device.*
- **NDDS\_Config\_LoggerDeviceCloseFnc** **close**  
*Close the logging device.*

### 5.263.1 Detailed Description

<<*interface*>> (p. 818) Logging device interface. Use for user-defined logging devices.

Interface for handling log messages.

By default, the logger sends the log messages generated by RTI Connex to the standard output.

You can use the function **NDDS\_Config\_Logger\_set\_output\_file** (p. 1246) to redirect the log messages to a file.

To further customize the management of generated log messages, the logger offers the function **NDDS\_Config\_Logger\_set\_output\_device** (p. 1251) that allows you to install a user-defined logging device.

The logging device installed by the user must implement this interface.

**Note:** It is not safe to make any calls to the RTI Connex core library, including calls to **DDS\_DomainParticipant\_get\_current\_time** (p. 135), from any of the logging device operations.

### 5.263.2 Field Documentation

#### 5.263.2.1 write

**NDDS\_Config\_LoggerDeviceWriteFnc** `NDDS_Config_LoggerDevice::write`

Write a log message to a specified logging device.

**Note:** It is not safe to make any calls to the RTI Connex core library, including calls to **DDS\_DomainParticipant\_get\_current\_time** (p. 135), from any of the logging device operations.

#### 5.263.2.2 close

**NDDS\_Config\_LoggerDeviceCloseFnc** `NDDS_Config_LoggerDevice::close`

Close the logging device.

**Note:** It is not safe to make any calls to the RTI Connex core library, including calls to **DDS\_DomainParticipant\_get\_current\_time** (p. 135), from any of the logging device operations.

## 5.264 NDDS\_Config\_LogMessage Struct Reference

Log message.

### 5.264.1 Detailed Description

Log message.

### 5.264.2 Field Documentation

#### 5.264.2.1 text

```
const char* NDDS_Config_LogMessage::text
```

Message text.

#### 5.264.2.2 level

```
NDDS_Config_LogLevel NDDS_Config_LogMessage::level
```

Message level.

### 5.264.2.3 is\_security\_message

```
DDS_Boolean NDDS_Config_LogMessage::is_security_message
```

Indicates if the message is a security-related message.

A "security-related message" is a log message that meets any of the following:

- A security event logged with the RTI Security Plugins Logging Plugin.
- Any regular message coming from the RTI Security Plugins.
- RTI TLS Support log messages related to OpenSSL (e.g., SSL handshake failures or certificate validation failures).

### 5.264.2.4 message\_id

```
DDS_UnsignedLong NDDS_Config_LogMessage::message_id
```

A numeric code that identifies a specific log message.

Two log messages that have the same `message_id` will have a similar structure. E.g. "ERROR: Failed to get DataWriterQos" and "ERROR: Failed to get TopicName". In this case, the `message_id` is associated to the get failure.

### 5.264.2.5 timestamp

```
struct DDS_Duration_t NDDS_Config_LogMessage::timestamp
```

The time when the log message was printed.

### 5.264.2.6 facility

```
NDDS_Config_LogFacility NDDS_Config_LogMessage::facility
```

The Facility associated with the log message. See [NDDS\\_Config\\_LogFacility](#) (p. 1243).

## 5.265 NDDS\_Config\_Version\_t Struct Reference

<<*interface*>> (p. 818) The version of an RTI Connex distribution.

### 5.265.1 Detailed Description

<<*interface*>> (p. 818) The version of an RTI Connex distribution.

The complete version is made up of the versions of the individual libraries that make up the product distribution.

## 5.266 NDDS\_Transport\_Address\_t Struct Reference

Addresses are stored individually as network-ordered bytes.

### Data Fields

- unsigned char **network\_ordered\_value** [NDDS\_TRANSPORT\_ADDRESS\_LENGTH]

### 5.266.1 Detailed Description

Addresses are stored individually as network-ordered bytes.

RTI Connex addresses are numerically stored in a transport independent manner. RTI Connex uses a IPv6-compatible format, which means that the data structure to hold an **NDDS\_Transport\_Address\_t** (p. 1852) is the same size as a data structure needed to hold an IPv6 address.

In addition, the functions provided to translate a string representation of an RTI Connex address to a value assumes that the string presentation follows the IPv6 address presentation as specified in RFC 2373.

An **NDDS\_Transport\_Address\_t** (p. 1852) always stores the address in network-byte order (which is Big Endian).

For example, IPv4 multicast address of 225.0.0.0 is represented by

```
{{0,0,0,0, 0,0,0,0, 0,0,0,0, 0xE1,0,0,0}}
```

 regardless of endianness,

where 0xE1 is the 13th byte of the structure (`network_ordered_value[12]`).

### 5.266.2 Field Documentation

#### 5.266.2.1 network\_ordered\_value

```
unsigned char NDDS_Transport_Address_t::network_ordered_value[NDDS_TRANSPORT_ADDRESS_LENGTH]
```

network-byte ordered (i.e., bit 0 is the most significant bit and bit 128 is the least significant bit).

## 5.267 NDDS\_Transport\_Interface\_t Struct Reference

Storage for the description of a network interface used by a Transport Plugin.

### Data Fields

- **NDDS\_Transport\_ClassId\_t transport\_classid**  
*The transport classid of the interface.*
- **NDDS\_Transport\_Address\_t address**  
*An unicast address that uniquely identifies this interface in the network specified by the transport class.*
- **NDDS\_Transport\_Interface\_Status\_t status**  
*The state of the interface.*
- **RTI\_UINT16 rank**  
*Rank of the interface. Used when allow\_interfaces\_list Qos is set. A rank value will be assing to each of the interfaces that match the allow\_interfaces\_list filter allowing an endpoint to prioritace some interfaces upon others.*

### 5.267.1 Detailed Description

Storage for the description of a network interface used by a Transport Plugin.

### 5.267.2 Field Documentation

#### 5.267.2.1 transport\_classid

```
NDDS_Transport_ClassId_t NDDS_Transport_Interface_t::transport_classid
```

The transport classid of the interface.

#### 5.267.2.2 address

```
NDDS_Transport_Address_t NDDS_Transport_Interface_t::address
```

An unicast address that uniquely identifies this interface in the network specified by the transport class.

### 5.267.2.3 status

`NDDS_Transport_Interface_Status_t` `NDDS_Transport_Interface_t::status`

The state of the interface.

### 5.267.2.4 rank

`RTI_UINT16` `NDDS_Transport_Interface_t::rank`

Rank of the interface. Used when `allow_interfaces_list` Qos is set. A rank value will be assigned to each of the interfaces that match the `allow_interfaces_list` filter allowing an endpoint to prioritize some interfaces upon others.

## 5.268 NDDS\_Transport\_Property\_t Struct Reference

Base configuration structure that must be inherited by derived Transport Plugin classes.

### Data Fields

- **NDDS\_Transport\_ClassId\_t classid**  
*The Transport-Plugin Class ID.*
- `RTI_INT32` **address\_bit\_count**  
*Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.*
- `RTI_INT32` **properties\_bitmap**  
*A bitmap that defines various properties of the transport to the RTI Connex core.*
- `RTI_INT32` **gather\_send\_buffer\_count\_max**  
*Specifies the maximum number of buffers that RTI Connex can pass to the `send()` function of a transport plugin.*
- `RTI_INT32` **message\_size\_max**  
*The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.*
- `char **` **allow\_interfaces\_list**  
*A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length > 0`), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.*
- `RTI_INT32` **allow\_interfaces\_list\_length**  
*Number of elements in the `allow_interfaces_list`.*
- `char **` **deny\_interfaces\_list**  
*A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length > 0`), deny the use of these interfaces.*
- `RTI_INT32` **deny\_interfaces\_list\_length**  
*Number of elements in the `deny_interfaces_list`.*
- `char **` **allow\_multicast\_interfaces\_list**

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length > 0`), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

- RTI\_INT32 **allow\_multicast\_interfaces\_list\_length**

Number of elements in the `allow_multicast_interfaces_list`.

- char \*\* **deny\_multicast\_interfaces\_list**

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length > 0`), deny the use of those interfaces for multicast.

- RTI\_INT32 **deny\_multicast\_interfaces\_list\_length**

Number of elements in `deny_multicast_interfaces_list`.

- struct **NDDS\_Transport\_UUID** **transport\_uuid**

Univocally identifies a transport plugin.

- char \* **thread\_name\_prefix**

Prefix used to name the transport threads.

- RTI\_INT32 **max\_interface\_count**

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

### 5.268.1 Detailed Description

Base configuration structure that must be inherited by derived Transport Plugin classes.

This structure contains properties that must be set before registration of any transport plugin with RTI Connex. The RTI Connex core will configure itself to use the plugin based on the properties set within this structure.

A transport plugin may extend from this structure to add transport-specific properties.

In the C-language, this can be done by creating a custom plugin property structure whose first member is a **NDDS\_Transport\_Property\_t** (p. 1854) structure.

For example,

```
struct MyTransport_Plugin_Property_t {
    NDDS_Transport_Property_t base_properties;
    int myIntProperty;
    < etc >;
};
```

**WARNING:** The transport properties of an instance of a Transport Plugin should be considered immutable after the plugin has been created. That means the values contained in the property structure stored as a part of the transport plugin itself should not be changed. If those values are modified, the results are undefined.

### 5.268.2 Field Documentation

### 5.268.2.1 classid

`NDDS_Transport_ClassId_t` `NDDS_Transport_Property_t::classid`

The Transport-Plugin Class ID.

The transport plugin sets the value for this field.

Class IDs below **NDDS\_TRANSPORT\_CLASSID\_RESERVED\_RANGE** (p. 830) are reserved for RTI (Real-Time Innovations) usage.

User-defined transports should set an ID above this range.

The ID should be globally unique for each Transport-Plugin class. Transport-Plugin implementors should ensure that the class IDs do not conflict with each other amongst different Transport-Plugin classes.

#### Invariant

The `classid` is invariant for the lifecycle of a transport plugin.

### 5.268.2.2 address\_bit\_count

`RTI_INT32` `NDDS_Transport_Property_t::address_bit_count`

Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.

The transport plugin sets the value for this field.

A transport plugin should define the range of addresses that are meaningful to the plugin. It does this by setting the number of bits of an IPv6 address that will be used to designate an address in the network to which the transport plugin is connected. The sign of this field determines whether the count of bits starts on the most significant bit (negative sign) or on the least significant bit (positive sign).

For example, for an address range of 0-255, the `address_bit_count` should be set to 8. For the range of addresses used by IPv4 (4 bytes), it should be set to 32.

#### See also

**Transport Class Attributes** (p. 714)

### 5.268.2.3 properties\_bitmap

```
RTI_INT32 NDDS_Transport_Property_t::properties_bitmap
```

A bitmap that defines various properties of the transport to the RTI Connex core.

Currently, the only property supported is whether or not the transport plugin will always loan a buffer when RTI Connex tries to receive a message using the plugin. This is in support of a zero-copy interface.

See also

**NDDS\_TRANSPORT\_PROPERTY\_BIT\_BUFFER\_ALWAYS\_LOANED** (p. 830)

### 5.268.2.4 gather\_send\_buffer\_count\_max

```
RTI_INT32 NDDS_Transport_Property_t::gather_send_buffer_count_max
```

Specifies the maximum number of buffers that RTI Connex can pass to the `send()` function of a transport plugin.

The transport plugin `send()` API supports a gather-send concept, where the `send()` call can take several discontinuous buffers, assemble and send them in a single message. This enables RTI Connex to send a message from parts obtained from different sources without first having to copy the parts into a single contiguous buffer.

However, most transports that support a gather-send concept have an upper limit on the number of buffers that can be gathered and sent. Setting this value will prevent RTI Connex from trying to gather too many buffers into a send call for the transport plugin.

RTI Connex requires all transport-plugin implementations to support a gather-send of at least a minimum number of buffers. This minimum number is defined to be **NDDS\_TRANSPORT\_PROPERTY\_GATHER\_SEND\_BUFFER\_COUNT\_MIN** (p. 831).

If the underlying transport does not support a gather-send concept directly, then the transport plugin itself must copy the separate buffers passed into the `send()` call into a single buffer for sending or otherwise send each buffer individually. However this is done by the transport plugin, the `receive_rEA()` call of the destination application should assemble, if needed, all of the pieces of the message into a single buffer before the message is passed to the RTI Connex layer.

### 5.268.2.5 message\_size\_max

```
RTI_INT32 NDDS_Transport_Property_t::message_size_max
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.

If the maximum size of a message that can be sent by a transport plugin is user configurable, the transport plugin should provide a default value for this property. In any case, this value must be set before the transport plugin is registered, so that RTI Connex can properly use the plugin.

For information about the default value for different transports, see the `Core Libraries User's Manual`.

### 5.268.2.6 allow\_interfaces\_list

```
char** NDDS_Transport_Property_t::allow_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length > 0`), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

The "white" list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

*Note:* This property does not affect the interfaces that the transport uses to send unicast data from that DomainParticipant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.\*, 192.168.\*, 192.\*, ether0

The left-to-right order of this list matters if you are using the `max_interface_count` to limit the allowable interfaces further. See `max_interface_count`.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS\_DomainParticipant** (p. 72) is deleted.

**[default]** empty list that represents all available interfaces.

See also

**NDDS\_Transport\_Property\_t::max\_interface\_count** (p. 1861)

### 5.268.2.7 allow\_interfaces\_list\_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_interfaces_list_length
```

Number of elements in the `allow_interfaces_list`.

By default, `allow_interfaces_list_length = 0`, i.e. an empty list.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

**[default]** 0

### 5.268.2.8 deny\_interfaces\_list

```
char** NDDS_Transport_Property_t::deny_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length > 0`), deny the use of these interfaces.

This "black" list is applied *after* the `allow_interfaces_list` and filters out the interfaces that should not be used.

The resulting list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

*Note:* This property does not affect the interfaces that the transport uses to send unicast data from that DomainParticipant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.\*, 192.168.\*, 192.\*, ether0

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS\_DomainParticipant** (p. 72) is deleted.

**[default]** empty list that represents no denied interfaces.

### 5.268.2.9 deny\_interfaces\_list\_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_interfaces_list_length
```

Number of elements in the `deny_interfaces_list`.

By default, `deny_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

**[default]** 0

### 5.268.2.10 allow\_multicast\_interfaces\_list

```
char** NDDS_Transport_Property_t::allow_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length > 0`), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

This "white" list sub-selects from the allowed interfaces obtained *after* applying the `allow_interfaces_list` "white" list *and* the `deny_interfaces_list` "black" list.

After `allow_multicast_interfaces_list`, the `deny_multicast_interfaces_list` is applied. Multicast output will be sent and may be received over the interfaces in the resulting list.

If this list is empty, all the allowed interfaces will be potentially used for multicast. It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS\_DomainParticipant** (p. 72) is deleted.

**[default]** empty list that represents all available interfaces.

### 5.268.2.11 allow\_multicast\_interfaces\_list\_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_multicast_interfaces_list_length
```

Number of elements in the `allow_multicast_interfaces_list`.

By default, `allow_multicast_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

**[default]** 0

### 5.268.2.12 deny\_multicast\_interfaces\_list

```
char** NDDS_Transport_Property_t::deny_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length > 0`), deny the use of those interfaces for multicast.

This "black" list is applied after `allow_multicast_interfaces_list` and filters out interfaces that should not be used for multicast.

Multicast output will be sent and may be received over the interfaces in the resulting list.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the **DDS\_DomainParticipant** (p. 72) is deleted.

**[default]** empty list that represents no denied interfaces.

### 5.268.2.13 deny\_multicast\_interfaces\_list\_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_multicast_interfaces_list_length
```

Number of elements in `deny_multicast_interfaces_list`.

By default, `deny_multicast_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connex core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

**[default]** 0

### 5.268.2.14 transport\_uuid

```
struct NDDS_Transport_UUID NDDS_Transport_Property_t::transport_uuid
```

Univocally identifies a transport plugin.

It represents the prefix of the participant GUID.

### 5.268.2.15 thread\_name\_prefix

```
char* NDDS_Transport_Property_t::thread_name_prefix
```

Prefix used to name the transport threads.

This field is optional.

The maximum size of this string is 8 characters.

If "thread\_name\_prefix" is not set by the user, RTI Connex creates the following prefix: 'r' + 'Tr' + participant identifier + '\0'.

Where 'r' indicates this is a thread from RTI, 'Tr' indicates the thread is related to a transport, and participant identifier contains 5 characters as follows:

If `participant_name` is set: The participant identifier will be the first 3 characters and the last 2 characters of the `participant_name`.

If `participant_name` is not set, then the identifier is computed as `domain_id` (3 characters) followed by `participant_id` (2 characters).

If `participant_name` is not set and the `participant_id` is set to -1 (default value), then the participant identifier is computed as the last 5 digits of the `rtps_instance_id` in the participant GUID.

### 5.268.2.16 max\_interface\_count

RTI\_INT32 NDDS\_Transport\_Property\_t::max\_interface\_count

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

By default, `max_interface_count` = `LENGTH_UNLIMITED`: all the interfaces are announced.

This feature is useful if you want to control the network interfaces on which your DomainParticipants receive data. For example, if you have one wired and one wireless interface both up and running, and `max_interface_count` is set to 1, the DomainParticipant will receive data over the interface you list first in the `allow_interfaces_list` -for example, the wired one.

RTI Connex selects the preferred interface(s) by iterating over the list of allowed interfaces until the first `max_↔ interfaces_count` of active interfaces encountered are announced. The order of iteration is left to right as specified in the `allow_interfaces_list` setting.

This setting applies only if the `allow_interfaces_list` is not empty.

The `max_interface_count` setting does not consider end-to-end connectivity to select interfaces. The decision is based purely on whether interfaces are up or down in a node. Therefore, this feature is not intended to be used in the following scenarios:

- A DomainParticipant is not reachable by other DomainParticipants in all the interfaces in the `allow_↔ interfaces_list`. This could occur if the DomainParticipant is in different subnets, and some of these subnets cannot be reached by other DomainParticipants.
- End-to-end connectivity issues lead to situations in which the interfaces selected after applying `max_↔ interface_count` cannot be reached by other DomainParticipants.

For UDPv4 and UDPv6 transports, this feature also affects multicast traffic by limiting the interfaces over which a DomainParticipant sends multicast traffic. The `(allow/deny)_multicast_interfaces_list` applies to the interfaces selected by using the `max_interfaces_count` property.

Note: If a pattern string in the `allow_interfaces_list` matches multiple interface addresses, and `max_↔ interface_count` is set to a finite value, the order for the matching allowed interfaces is decided based on the order in which the operating system provides these interfaces.

**[default]** `LENGTH_UNLIMITED`

**`NDDS_Transport_Property_t::allow_interfaces_list`** (p. 1857)

## 5.269 NDDS\_Transport\_Shmem\_Property\_t Struct Reference

Subclass of **`NDDS_Transport_Property_t`** (p. 1854) allowing specification of parameters that are specific to the shared-memory transport.

## Data Fields

- struct **NDDS\_Transport\_Property\_t** **parent**  
*Generic properties of all transport plugins.*
- RTI\_INT32 **received\_message\_count\_max**  
*Number of messages that can be buffered in the receive queue.*
- RTI\_INT32 **receive\_buffer\_size**  
*The total number of bytes that can be buffered in the receive queue.*
- RTIBool **enable\_udp\_debugging**  
*Enables UDP debugging when using shared memory.*
- **NDDS\_Transport\_Address\_t** **udp\_debugging\_address**  
*IP address to which shared memory traffic will be published if `NDDS_Transport_Shmem_Property_t::enable_udp_debugging` (p. 1864) is set to '1'.*
- **NDDS\_Transport\_Port\_t** **udp\_debugging\_port**  
*Port to which shared memory traffic will be published if `NDDS_Transport_Shmem_Property_t::enable_udp_debugging` (p. 1864) is set to '1'.*

### 5.269.1 Detailed Description

Subclass of **NDDS\_Transport\_Property\_t** (p. 1854) allowing specification of parameters that are specific to the shared-memory transport.

See also

**NDDS\_Transport\_Support\_set\_builtin\_transport\_property()** (p. 727)

### 5.269.2 Field Documentation

#### 5.269.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_Shmem_Property_t::parent
```

Generic properties of all transport plugins.

#### 5.269.2.2 received\_message\_count\_max

```
RTI_INT32 NDDS_Transport_Shmem_Property_t::received_message_count_max
```

Number of messages that can be buffered in the receive queue.

This does not guarantee that the Transport-Plugin will actually be able to buffer `received_message_count_max` messages of the maximum size set in **NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857). The total number of bytes that can be buffered for a transport plug-in is actually controlled by `receive_buffer_size`.

See also

**NDDS\_Transport\_Property\_t** (p. 1854), **NDDS\_TRANSPORT\_SHMEM\_RECEIVED\_MESSAGE\_COUNT\_MAX\_DEFAULT** (p. 844)

### 5.269.2.3 receive\_buffer\_size

```
RTI_INT32 NDDS_Transport_Shmem_Property_t::receive_buffer_size
```

The total number of bytes that can be buffered in the receive queue.

This number controls how much memory is allocated by the plugin for the receive queue. The actual number of bytes allocated is:

```
size = receive_buffer_size + message_size_max +
      received_message_count_max * fixedOverhead
```

where `fixedOverhead` is some small number of bytes used by the queue data structure. The following rules are noted:

- `receive_buffer_size < message_size_max * received_message_count_max`, then the transport plugin will not be able to store `received_message_count_max` messages of size `message_size_max`.
- `receive_buffer_size > message_size_max * received_message_count_max`, then there will be memory allocated that cannot be used by the plugin and thus wasted.

To optimize memory usage, the user is allowed to specify a size for the receive queue to be less than that required to hold the maximum number of messages which are all of the maximum size.

In most situations, the average message size may be far less than the maximum message size. So for example, if the maximum message size is 64 K bytes, and the user configures the plugin to buffer at least 10 messages, then 640 K bytes of memory would be needed if all messages were 64 K bytes. Should this be desired, then `receive_buffer_size` should be set to 640 K bytes.

However, if the average message size is only 10 K bytes, then the user could set the `receive_buffer_size` to 100 K bytes. This allows the user to optimize the memory usage of the plugin for the average case and yet allow the plugin to handle the extreme case.

**NOTE**, the queue will always be able to hold 1 message of `message_size_max` bytes, no matter what the value of `receive_buffer_size` is.

See also

**NDDS\_TRANSPORT\_SHMEM\_RECEIVE\_BUFFER\_SIZE\_DEFAULT** (p. 844)

### 5.269.2.4 enable\_udp\_debugging

```
RTIBool NDDS_Transport_Shmem_Property_t::enable_udp_debugging
```

Enables UDP debugging when using shared memory.

If set to '1', all shared memory traffic will be published to **NDDS\_Transport\_Shmem\_Property\_t::udp\_debugging\_address** (p. 1864) :: **NDDS\_Transport\_Shmem\_Property\_t::udp\_debugging\_port** (p. 1865).

[default] 0

### 5.269.2.5 udp\_debugging\_address

**NDDS\_Transport\_Address\_t** NDDS\_Transport\_Shmem\_Property\_t::udp\_debugging\_address

IP address to which shared memory traffic will be published if **NDDS\_Transport\_Shmem\_Property\_t::enable\_udp\_↔\_debugging** (p. 1864) is set to '1'.

[default] 239.255.1.2

### 5.269.2.6 udp\_debugging\_port

**NDDS\_Transport\_Port\_t** NDDS\_Transport\_Shmem\_Property\_t::udp\_debugging\_port

Port to which shared memory traffic will be published if **NDDS\_Transport\_Shmem\_Property\_t::enable\_udp\_↔\_debugging** (p. 1864) is set to '1'.

[default] 7399

*Configures whether to send UDP checksum.*
- RTI\_UINT32 **transport\_priority\_mask**  
*Set mask for use of transport priority field.*
- RTI\_INT32 **transport\_priority\_mapping\_low**  
*Set low value of output range to IPv4 TOS.*
- RTI\_INT32 **transport\_priority\_mapping\_high**  
*Set high value of output range to IPv4 TOS.*
- RTI\_INT32 **send\_ping**  
*Configures whether to send PING messages.*
- RTI\_INT32 **force\_interface\_poll\_detection**  
*Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.*
- RTI\_UINT32 **interface\_poll\_period**  
*Specifies the period in milliseconds to query for changes in the state of all the interfaces.*
- RTI\_INT32 **reuse\_multicast\_receive\_resource**  
*Controls whether or not to reuse multicast receive resources.*
- RTI\_INT32 **protocol\_overhead\_max**  
*Maximum size in bytes of protocol overhead, including headers.*
- RTI\_INT32 **disable\_interface\_tracking**  
*Disables detection of network interface changes.*

- RTI\_UINT32 **join\_multicast\_group\_timeout**  
*[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.*
- char \* **public\_address**  
*Public IP address associated with the transport instantiation.*
- RTI\_INT32 **port\_offset**  
*Port offset to allow multiple instances of UDPv4 transports in the same **DDS\_DomainParticipant** (p. 72).*

### 5.272.1 Detailed Description

Configurable IPv4/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

**NDDS\_Transport\_Support\_set\_builtin\_transport\_property()** (p. 727)

**NDDS\_Transport\_UDPv4\_new** (p. 854)

### 5.272.2 Field Documentation

#### 5.272.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv4_Property_t::parent
```

Generic properties of all transport plugins.

#### 5.272.2.2 send\_socket\_buffer\_size

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the `SENDBUF` to the value of this parameter.

This value must be greater than or equal to **NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857). The maximum value is operating system-dependent.

By default, it will be set to **NDDS\_TRANSPORT\_UDPv4\_SEND\_SOCKET\_BUFFER\_SIZE\_DEFAULT** (p. 851).

If you configure this parameter to be **NDDS\_TRANSPORT\_UDPv4\_SOCKET\_BUFFER\_SIZE\_OS\_DEFAULT** (p. 851), then `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. The transport will use the OS default.

### 5.272.2.3 `recv_socket_buffer_size`

RTTI\_INT32 NDDS\_Transport\_UDPv4\_Property\_t::recv\_socket\_buffer\_size

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the `RECVBUF` to the value of this parameter.

This value must be greater than or equal to `NDDS_Transport_Property_t::message_size_max` (p. 1857). The maximum value is operating system-dependent.

By default, it will be set to `NDDS_TRANSPORT_UDPV4_RECV_SOCKET_BUFFER_SIZE_DEFAULT` (p. 852).

If you configure this parameter to be `NDDS_TRANSPORT_UDPV4_SOCKET_BUFFER_SIZE_OS_DEFAULT` (p. 851), then `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. The transport will use the OS default.

### 5.272.2.4 `unicast_enabled`

RTTI\_INT32 NDDS\_Transport\_UDPv4\_Property\_t::unicast\_enabled

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

### 5.272.2.5 `multicast_enabled`

RTTI\_INT32 NDDS\_Transport\_UDPv4\_Property\_t::multicast\_enabled

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use all the network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

### 5.272.2.6 `multicast_ttl`

RTTI\_INT32 NDDS\_Transport\_UDPv4\_Property\_t::multicast\_ttl

Value for the time-to-live parameter for all multicast sends using this plugin.

This value is used to set the TTL of multicast packets sent by this transport plugin.

**[default]** 1

See also

**NDDS\_TRANSPORT\_UDPV4\_MULTICAST\_TTL\_DEFAULT** (p. 852)

### 5.272.2.7 multicast\_loopback\_disabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connex will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

[NOTE: Windows CE systems do not support multicast loopback. This field is ignored for Windows CE targets.]

### 5.272.2.8 ignore\_loopback\_interface

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connex decide between the above two choices.

The current "automatic" (-1) RTI Connex policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

**[default]** -1 Automatic RTI Connex policy based on availability of the shared memory transport.

### 5.272.2.9 ignore\_nonup\_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces
```

**[DEPRECATED]** Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS\_Transport\_UDPv4\_Property\_t::disable\_interface\_tracking** (p. 1875) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

**[default]** 1

### 5.272.2.10 ignore\_nonrunning\_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF\_↔\_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

**[default]** 1 (i.e., check RUNNING flag)

### 5.272.2.11 no\_zero\_copy

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::no_zero_copy
```

**[DEPRECATED]** Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connexx will use the zero-copy API if offered by the OS.

### 5.272.2.12 send\_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS\_TRANSPORT\_UDPv4\_BLOCKING\_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS\_TRANSPORT\_UDPv4\_BLOCKING\_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

**[default]** NDDS\_TRANSPORT\_UDPv4\_BLOCKING\_ALWAYS

### 5.272.2.13 use\_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use\_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **DDS\_DomainParticipant\_get\_participant\_protocol\_status** (p. 125).

**[default]** 1 (enabled)

#### 5.272.2.14 transport\_priority\_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS\_Transport\_UDPv4\_Property\_t::transport\_priority\_mapping\_low** (p. 1873) and **NDDS\_Transport\_UDPv4\_Property\_t::transport\_priority\_mapping\_high** (p. 1873) to define the mapping from the DDS transport priority (see **TRANSPORT\_PRIORITY** (p. 1138)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

**[default]** 0.

#### 5.272.2.15 transport\_priority\_mapping\_low

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS\_Transport\_UDPv4\_Property\_t::transport\_priority\_mask** (p. 1872) and **NDDS\_Transport\_UDPv4\_Property\_t::transport\_priority\_mapping\_high** (p. 1873) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

**[default]** 0.

#### 5.272.2.16 transport\_priority\_mapping\_high

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS\_Transport\_UDPv4\_Property\_t::transport\_priority\_mask** (p. 1872) and **NDDS\_Transport\_UDPv4\_Property\_t::transport\_priority\_mapping\_low** (p. 1873) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

**[default]** 0xff.

### 5.272.2.17 send\_ping

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

**[default]** 1 (enabled)

### 5.272.2.18 force\_interface\_poll\_detection

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

**[default]** 0 (disabled).

### 5.272.2.19 interface\_poll\_period

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

**[default]** 500 milliseconds.

### 5.272.2.20 reuse\_multicast\_receive\_resource

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

Setting this to 0 (FALSE) prevents multicast crosstalk by uniquely configuring a port and creating a receive thread for each multicast group address.

**[default]** 1.

### 5.272.2.21 protocol\_overhead\_max

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective `message_size_max`, to 65535 minus this overhead.

**[default]** 28.

See also

**NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857)

### 5.272.2.22 disable\_interface\_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connex application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connex 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

**[default]** 0

### 5.272.2.23 join\_multicast\_group\_timeout

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

On Windows, a network interface may be detected before it is allowed to join a multicast group address. This property adjusts how much time (milliseconds) to wait for the ADD\_MEMBERSHIP multicast operation to succeed before withdrawing.

**[default]** 5000

### 5.272.2.24 public\_address

```
char* NDDS_Transport_UDPv4_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **DDS\_DomainParticipant** (p. 72) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

**Note 1:** Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **DDS\_RtpsWellKnownPorts\_t** (p. 1714)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

**Note 2:** By setting this property, the **DDS\_DomainParticipant** (p. 72) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

**[default]** NULL (the transport uses the IP addresses obtained from the NICs)

### 5.272.2.25 port\_offset

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::port_offset
```

Port offset to allow multiple instances of UDPv4 transports in the same **DDS\_DomainParticipant** (p. 72).

By default, it is not possible to have multiple instances of the UDPv4 transport in the same **DDS\_DomainParticipant** (p. 72). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv4 transport in the same **DDS\_DomainParticipant** (p. 72).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port\_offset.

**[default]** 0

## 5.273 NDDS\_Transport\_UDPv4\_WAN\_Property\_t Struct Reference

Configurable IPv4/UDP WAN Transport-Plugin properties.

### Data Fields

*Port offset to allow coexistence with built-in UDPv4 transport.*
- RTI\_UINT32 **binding\_ping\_period**  
*Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.*

### 5.273.1 Detailed Description

Configurable IPv4/UDP WAN Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

**NDDS\_Transport\_Support\_set\_builtin\_transport\_property()** (p. 727)

**NDDS\_Transport\_UDPv4\_WAN\_new** (p. 860)

### 5.273.2 Field Documentation

#### 5.273.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv4_WAN_Property_t::parent
```

Generic properties of all transport plugins.

#### 5.273.2.2 send\_socket\_buffer\_size

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::send\_socket\_buffer\_size** (p. 1868)

### 5.273.2.3 recv\_socket\_buffer\_size

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::recv\_socket\_buffer\_size

Size in bytes of the receive buffer of a socket used for receiving.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::recv\_socket\_buffer\_size** (p. 1868)

### 5.273.2.4 ignore\_loopback\_interface

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::ignore\_loopback\_interface

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connexx decide between the above two choices.

The current "automatic" (-1) RTI Connexx policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

**[default]** -1 Automatic RTI Connexx policy based on availability of the shared memory transport.

### 5.273.2.5 ignore\_nonup\_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonup_interfaces
```

**[DEPRECATED]** Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS\_Transport\_UDPv4\_WAN\_Property\_t::disable\_interface\_tracking** (p.1883) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

**[default]** 1

### 5.273.2.6 ignore\_nonrunning\_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF\_↔\_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

**[default]** 1 (i.e., check RUNNING flag)

### 5.273.2.7 no\_zero\_copy

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::no\_zero\_copy

**[DEPRECATED]** Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connexx will use the zero-copy API if offered by the OS.

### 5.273.2.8 send\_blocking

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::send\_blocking

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS\_TRANSPORT\_UDPv4\_BLOCKING\_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS\_TRANSPORT\_UDPv4\_BLOCKING\_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

**[default]** NDDS\_TRANSPORT\_UDPv4\_BLOCKING\_ALWAYS

### 5.273.2.9 use\_checksum

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::use\_checksum

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when use\_checksum is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API **DDS\_DomainParticipant\_get\_participant\_protocol\_status** (p. 125).

**[default]** 1 (enabled)

### 5.273.2.10 transport\_priority\_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS\_Transport\_UDPv4\_WAN\_Property\_t::transport\_priority\_mapping\_low** (p. 1882) and **NDDS\_Transport\_UDPv4\_WAN\_Property\_t::transport\_priority\_mapping\_high** (p. 1882) to define the mapping from the DDS transport priority (see **TRANSPORT\_PRIORITY** (p. 1138)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

**[default]** 0.

### 5.273.2.11 transport\_priority\_mapping\_low

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS\_Transport\_UDPv4\_WAN\_Property\_t::transport\_priority\_mask** (p. 1881) and **NDDS\_Transport\_UDPv4\_WAN\_Property\_t::transport\_priority\_mapping\_high** (p. 1882) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

**[default]** 0.

### 5.273.2.12 transport\_priority\_mapping\_high

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS\_Transport\_UDPv4\_WAN\_Property\_t::transport\_priority\_mask** (p. 1881) and **NDDS\_Transport\_UDPv4\_WAN\_Property\_t::transport\_priority\_mapping\_low** (p. 1882) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

**[default]** 0xff.

### 5.273.2.13 send\_ping

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::send\_ping

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

**[default]** 1 (enabled)

### 5.273.2.14 force\_interface\_poll\_detection

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::force\_interface\_poll\_detection

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

**[default]** 0 (disabled).

### 5.273.2.15 interface\_poll\_period

RTI\_UINT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::interface\_poll\_period

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

**[default]** 500 milliseconds.

### 5.273.2.16 protocol\_overhead\_max

RTI\_INT32 NDDS\_Transport\_UDPv4\_WAN\_Property\_t::protocol\_overhead\_max

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message\_size\_max, to 65535 minus this overhead.

**[default]** 28.

See also

**NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857)

### 5.273.2.17 `disable_interface_tracking`

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connex application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connex 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a `DataWriter` or `DataReader`.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

**[default]** 0

### 5.273.2.18 `public_address`

```
char* NDDS_Transport_UDPv4_WAN_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary for the Real-Time WAN Transport associated with an external **DDS↔\_DomainParticipant** (p. 72) (publicly reachable) in order to support the two communication scenarios shown in the Figure below.

For an external **DDS\_DomainParticipant** (p. 72) behind a NAT-enabled router, this address is the public IP address of the router.

When this property is set, the `DomainParticipant` will announce `PUBLIC+UUID` locators to other `DomainParticipants`. These locators are reachable locators because they contain this public IP address.

For additional information on Real-Time WAN Transport locators, see the `Core Libraries User's Manual`.

with a Participant that has a Public Address"

**[default]** NULL (the transport will announce UUID locators)

### 5.273.2.19 comm\_ports\_list

```
struct NDDS_Transport_UDP_WAN_CommPortsMappingInfo* NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list
```

Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

Array containing the mapping between "RTPS ports", "UDP receive host ports", and "UDP receive public ports".

When the transport is configured using properties, the port mapping array is provided using a JSON string.

For example:

```
{
  "default": {"host": 8192, "public": 9678},
  "mappings": [
    {"rtps": 1234, "host": 9999, "public": 5678},
    {"rtps": 1235, "host": 9990, "public": 5679},
  ]
}
```

It is also possible to configure the mapping with XML:

```
<transport_builtin>
  <udpv4_wan>
    <comm_ports>
      <default>
        <host>8192</host>
        <public>9678</public>
      </default>
      <mappings>
        <element>
          <rtps>1234</rtps>
          <host>9999</host>
          <public>5678</public>
        </element>
        <element>
          <rtps>1235</rtps>
          <host>9990</host>
          <public>5679</public>
        </element>
      </mappings>
    </comm_ports>
  </udpv4_wan>
</transport_builtin>
```

For additional information on how to set the value of this property, see the [Core Libraries User's Manual](#).

**[default]** NULL (The UDP ports used for communications will be derived from the RTPS ports associated with the locators for the DomainParticipant and its Endpoints (DataWriters and DataReaders)).

### 5.273.2.20 comm\_ports\_list\_length

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list_length
```

Number of elements in the `NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list` (p.1884).

**[default]** 0

### 5.273.2.21 port\_offset

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::port_offset
```

Port offset to allow coexistence with built-in UDPv4 transport.

This property allows using the built-in UDPv4 transport and the Real-Time WAN Transport at the same time.

```
<transport_builtin>
```

```
<mask>UDPv4_WAN|UDPv4</mask>
```

```
</transport_builtin>
```

When the UDP ports used by Real-Time WAN Transport are not explicitly set, they are calculated as follows: RTPS port + port\_offset.

**[default]** 125

### 5.273.2.22 binding\_ping\_period

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::binding_ping_period
```

Specifies the period in milliseconds at which BINDING\_PINGS messages are sent to keep NAT mappings open.

Configures the period in milliseconds at which BINDING\_PING messages are sent by a local transport instance to a remote transport instance. For example, 1000 means to send BINDING\_PING messages every second.

BINDING\_PING messages are used on the sending side to open NAT bindings from a local transport instance to a remote transport instance and they are sent periodically to keep the bindings open.

On the receiving side, BINDING\_PINGS are used to calculate the public IP transport address of an UUID locator. This address will be used to send data to the locator.

For additional information on the role of BINDING\_PING, see the `Core Libraries User's Manual`.

From a configuration point of view, and to avoid communication disruptions, the period at which a transport instance sends BINDING\_PING messages should be smaller than the NAT binding session timeout. This timeout depends on the NAT router configuration.

**[default]** 1000 (1 sec)

## 5.274 NDDS\_Transport\_UDPv6\_Property\_t Struct Reference

Configurable IPv6/UDP Transport-Plugin properties.

### Data Fields

- struct **NDDS\_Transport\_Property\_t parent**  
*Generic properties of all transport plugins.*
- RTI\_INT32 **send\_socket\_buffer\_size**  
*Size in bytes of the send buffer of a socket used for sending.*
- RTI\_INT32 **recv\_socket\_buffer\_size**  
*Size in bytes of the receive buffer of a socket used for receiving.*
- RTI\_INT32 **unicast\_enabled**  
*Allows the transport plugin to use unicast for sending and receiving.*
- RTI\_INT32 **multicast\_enabled**  
*Allows the transport plugin to use multicast for sending and receiving.*
- RTI\_INT32 **multicast\_ttl**  
*Value for the time-to-live parameter for all multicast sends using this plugin.*
- RTI\_INT32 **multicast\_loopback\_disabled**  
*Prevents the transport plugin from putting multicast packets onto the loopback interface.*
- RTI\_INT32 **ignore\_loopback\_interface**  
*Prevents the transport plugin from using the IP loopback interface.*
- RTI\_INT32 **ignore\_nonrunning\_interfaces**  
*Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.*
- RTI\_INT32 **no\_zero\_copy**  
*[DEPRECATED] Prevents the transport plugin from doing zero copy.*

- RTI\_INT32 **transport\_priority\_mapping\_low**  
*Set low value of output range to IPv6 TCLASS.*
- RTI\_INT32 **transport\_priority\_mapping\_high**  
*Set high value of output range to IPv6 TCLASS.*
- RTI\_INT32 **send\_ping**  
*Configures whether to send PING messages.*
- RTI\_INT32 **force\_interface\_poll\_detection**  
*Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.*
- RTI\_UINT32 **interface\_poll\_period**  
*Specifies the period in milliseconds to query for changes in the state of all the interfaces.*
- RTI\_INT32 **reuse\_multicast\_receive\_resource**  
*Controls whether or not to reuse multicast receive resources.*
- RTI\_INT32 **protocol\_overhead\_max**

*Maximum size in bytes of protocol overhead, including headers.*

- RTI\_INT32 **disable\_interface\_tracking**

*Disables detection of network interface changes.*

- RTI\_UINT32 **join\_multicast\_group\_timeout**

*[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.*

- char \* **public\_address**

*Public IP address associated with the transport instantiation.*

- RTI\_INT32 **port\_offset**

*Port offset to allow multiple instances of UDPv6 transports in the same **DDS\_DomainParticipant** (p. 72).*

### 5.274.1 Detailed Description

Configurable IPv6/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

**NDDS\_Transport\_Support\_set\_builtin\_transport\_property()** (p. 727)

**NDDS\_Transport\_UDPv6\_new** (p. 869)

### 5.274.2 Field Documentation

#### 5.274.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv6_Property_t::parent
```

Generic properties of all transport plugins.

#### 5.274.2.2 send\_socket\_buffer\_size

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the `SENDBUF` to the value of this parameter.

This value must be greater than or equal to **NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857). The maximum value is operating system-dependent.

By default, it will be set to **NDDS\_TRANSPORT\_UDPv6\_SEND\_SOCKET\_BUFFER\_SIZE\_DEFAULT** (p. 867).

If you configure this parameter to be **NDDS\_TRANSPORT\_UDPv6\_SOCKET\_BUFFER\_SIZE\_OS\_DEFAULT** (p. 867), then `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. The transport will use the OS default.

### 5.274.2.3 `recv_socket_buffer_size`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the `RECVBUF` to the value of this parameter.

This value must be greater than or equal to `NDDS_Transport_Property_t::message_size_max` (p. 1857). The maximum value is operating system-dependent.

By default, it will be set to `NDDS_TRANSPORT_UDPV6_RECV_SOCKET_BUFFER_SIZE_DEFAULT` (p. 867).

If you configure this parameter to be `NDDS_TRANSPORT_UDPV6_SOCKET_BUFFER_SIZE_OS_DEFAULT` (p. 867), then `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. The transport will use the OS default.

### 5.274.2.4 `unicast_enabled`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

### 5.274.2.5 `multicast_enabled`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

### 5.274.2.6 `multicast_ttl`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This is used to set the TTL of multicast packets sent by this transport plugin.

**[default]** 1

See also

**NDDS\_TRANSPORT\_UDPV6\_MULTICAST\_TTL\_DEFAULT** (p. 868)

### 5.274.2.7 multicast\_loopback\_disabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connex will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

### 5.274.2.8 ignore\_loopback\_interface

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. Do not use the IP loopback interface even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient transport (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connex decide between the above two choices.

The current "automatic" (-1) RTI Connex policy is as follows.

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UDPv6 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv6 for local traffic also).

**[default]** -1 Automatic RTI Connex policy based on availability of the shared memory transport.

### 5.274.2.9 ignore\_nonrunning\_interfaces

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF\_↔\_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure interface is UP.
- **1**: Check flag when enumerating interfaces and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

**[default]** 1 (i.e., check RUNNING flag)

### 5.274.2.10 no\_zero\_copy

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::no_zero_copy
```

**[DEPRECATED]** Prevents the transport plugin from doing zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. If you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off the use of zero copy.

By default this is set to 0, so RTI Connexx will use the zero copy API if offered by the OS.

### 5.274.2.11 send\_blocking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS\_TRANSPORT\_UDPv6\_BLOCKING\_ALWAYS**: Sockets are blocking (default socket options for the operating system).
- **NDDS\_TRANSPORT\_UDPv6\_BLOCKING\_NEVER**: Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

**[default]** NDDS\_TRANSPORT\_UDPv6\_BLOCKING\_ALWAYS.

### 5.274.2.12 enable\_v4mapped

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::enable_v4mapped
```

Specify whether UDPv6 transport will process IPv4 addresses.

Set this to 1 to turn on processing of IPv4 addresses. Note that this may make it incompatible with use of the UDPv4 transport within the same domain participant.

**[default]** 0.

### 5.274.2.13 transport\_priority\_mask

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

If transport priority mapping is supported on the platform, this mask is used in conjunction with **NDDS\_Transport\_UDPv6\_Property\_t::transport\_priority\_mapping\_low** (p.1892) and **NDDS\_Transport\_UDPv6\_Property\_t::transport\_priority\_mapping\_high** (p.1892) to define the mapping from the DDS transport priority (see **TRANSPORT\_PRIORITY** (p. 1138)) to the IPv6 TCLASS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv6 TCLASS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv6 TCLASS for send sockets.

**[default]** 0.

### 5.274.2.14 transport\_priority\_mapping\_low

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS\_Transport\_UDPv6\_Property\_t::transport\_priority\_mask** (p.1892) and **NDDS\_Transport\_UDPv6\_Property\_t::transport\_priority\_mapping\_high** (p.1892) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the low value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

**[default]** 0.

### 5.274.2.15 transport\_priority\_mapping\_high

RTI\_INT32 NDDS\_Transport\_UDPv6\_Property\_t::transport\_priority\_mapping\_high

Set high value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS\_Transport\_UDPv6\_Property\_t::transport\_priority\_mask** (p.1892) and **NDDS\_Transport\_UDPv6\_Property\_t::transport\_priority\_mapping\_low** (p.1892) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the high value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

**[default]** 0xff.

### 5.274.2.16 send\_ping

RTI\_INT32 NDDS\_Transport\_UDPv6\_Property\_t::send\_ping

Configures whether to send PING messages.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::send\_ping** (p.1873)

### 5.274.2.17 force\_interface\_poll\_detection

RTI\_INT32 NDDS\_Transport\_UDPv6\_Property\_t::force\_interface\_poll\_detection

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::force\_interface\_poll\_detection** (p.1874)

### 5.274.2.18 interface\_poll\_period

RTI\_UINT32 NDDS\_Transport\_UDPv6\_Property\_t::interface\_poll\_period

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::interface\_poll\_period** (p.1874)

### 5.274.2.19 reuse\_multicast\_receive\_resource

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::reuse\_multicast\_receive\_resource** (p. 1874)

### 5.274.2.20 protocol\_overhead\_max

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857) plus this overhead is larger than the UDPv6 maximum message size (65535 bytes), the middleware will automatically reduce the effective `message_size_max`, to 65535 minus this overhead.

**[default]** 48.

See also

**NDDS\_Transport\_Property\_t::message\_size\_max** (p. 1857)

### 5.274.2.21 disable\_interface\_tracking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::disable\_interface\_tracking** (p. 1875)

### 5.274.2.22 join\_multicast\_group\_timeout

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

See also

**NDDS\_Transport\_UDPv4\_Property\_t::join\_multicast\_group\_timeout** (p. 1875)

### 5.274.2.23 public\_address

```
char* NDDS_Transport_UDPv6_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **DDS\_DomainParticipant** (p. 72) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

**Note 1:** Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **DDS\_RtpsWellKnownPorts\_t** (p. 1714)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

**Note 2:** By setting this property, the **DDS\_DomainParticipant** (p. 72) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

**[default]** NULL (the transport uses the IP addresses obtained from the NICs)

### 5.274.2.24 port\_offset

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::port_offset
```

Port offset to allow multiple instances of UDPv6 transports in the same **DDS\_DomainParticipant** (p. 72).

By default, it is not possible to have multiple instances of the UDPv6 transport in the same **DDS\_DomainParticipant** (p. 72). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv6 transport in the same **DDS\_DomainParticipant** (p. 72).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port\_offset.

[default] 0

## 5.275 NDDS\_Transport\_UUID Struct Reference

Univocally identifies a transport plugin instance.

### 5.275.1 Detailed Description

Univocally identifies a transport plugin instance.

## 5.276 NDDS\_Utility\_HeapMonitoringParams\_t Struct Reference

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

### Data Fields

- **NDDS\_Utility\_HeapMonitoringSnapshotOutputFormat snapshot\_output\_format**  
*Specify the format of the output of the snapshot.*
- **NDDS\_Utility\_HeapMonitoringSnapshotContentFormat snapshot\_content\_format**  
*It is a bitmap to decide which information of the snapshot will be displayed.*

### 5.276.1 Detailed Description

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

### 5.276.2 Field Documentation

### 5.276.2.1 snapshot\_output\_format

**NDDS\_UTILITY\_HeapMonitoringSnapshotOutputFormat** NDDS\_UTILITY\_HeapMonitoringParams\_t::snapshot\_↔  
output\_format

Specify the format of the output of the snapshot.

The enum can take two options:

- **NDDS\_UTILITY\_HEAP\_MONITORING\_SNAPSHOT\_OUTPUT\_FORMAT\_STANDARD** (p. 1265):  
The output of the snapshot will be in plain text.
- **NDDS\_UTILITY\_HEAP\_MONITORING\_SNAPSHOT\_OUTPUT\_FORMAT\_COMPRESSED** (p. 1265):  
The output of the snapshot will be compressed using Zlib technology.  
The file can be uncompressed using zlib-flate.

[default] **NDDS\_UTILITY\_HEAP\_MONITORING\_SNAPSHOT\_OUTPUT\_FORMAT\_STANDARD** (p. 1265).

### 5.276.2.2 snapshot\_content\_format

**NDDS\_UTILITY\_HeapMonitoringSnapshotContentFormat** NDDS\_UTILITY\_HeapMonitoringParams\_t::snapshot\_↔  
content\_format

It is a bitmap to decide which information of the snapshot will be displayed.

`` suggestion Bitmap that specifies the field to display in the snapshot.

You can combine these values by logically ORing them together. For example: (**NDDS\_UTILITY\_HEAP\_↔  
\_MONITORING\_SNAPSHOT\_CONTENT\_BIT\_TOPIC** (p. 1265) | **NDDS\_UTILITY\_HEAP\_MONITORING\_↔  
SNAPSHOT\_CONTENT\_BIT\_FUNCTION** (p. 1265))

[default] **NDDS\_UTILITY\_HEAP\_MONITORING\_SNAPSHOT\_CONTENT\_DEFAULT** (p. 1265)

## 5.277 NDDS\_UTILITY\_NetworkCaptureParams\_t Struct Reference

Input parameters for starting network capture.

### Data Fields

- struct **DDS\_StringSeq transports**  
*List of transports to capture.*
- **NDDS\_UTILITY\_NetworkCaptureContentKindMask dropped\_content**  
*Exclude contents from the capture file.*
- **NDDS\_UTILITY\_NetworkCaptureTrafficKindMask traffic**  
*Traffic direction to capture.*
- **DDS\_Boolean parse\_encrypted\_content**  
*If secure traffic should be decrypted or not.*
- struct **DDS\_ThreadSettings\_t checkpoint\_thread\_settings**  
*The properties of the checkpoint thread.*
- **DDS\_Long frame\_queue\_size**  
*Size of the frame queue (Bytes).*

### 5.277.1 Detailed Description

Input parameters for starting network capture.

### 5.277.2 Field Documentation

#### 5.277.2.1 transports

```
struct DDS_StringSeq NDDS_Utility_NetworkCaptureParams_t::transports
```

List of transports to capture.

Network Capture will only save RTPS frames if the associated transport protocol is part of this sequence.

**[default]** Empty sequence initializer. This means that by default all transports will be captured.

#### 5.277.2.2 dropped\_content

```
NDDS_Utility_NetworkCaptureContentKindMask NDDS_Utility_NetworkCaptureParams_t::dropped_content
```

Exclude contents from the capture file.

It accepts values from **NDDS\_Utility\_NetworkCaptureContentKind** (p. 1274) and **NDDS\_Utility\_NetworkCaptureContentKindMask** (p. 1274) .

We can choose to exclude user data or encrypted content from the capture file.

**[default]** No content is excluded - **NDDS\_UTILITY\_NETWORK\_CAPTURE\_CONTENT\_MASK\_DEFAULT** (p. 1272).

#### 5.277.2.3 traffic

```
NDDS_Utility_NetworkCaptureTrafficKindMask NDDS_Utility_NetworkCaptureParams_t::traffic
```

Traffic direction to capture.

It accepts values from **NDDS\_Utility\_NetworkCaptureTrafficKind** (p. 1275) and **NDDS\_Utility\_NetworkCaptureTrafficKindMask** (p. 1274) .

**[default]** Capture both inbound and outbound traffic - **NDDS\_UTILITY\_NETWORK\_CAPTURE\_TRAFFIC\_MASK\_DEFAULT** (p. 1273).

### 5.277.2.4 parse\_encrypted\_content

```
DDS_Boolean NDDS_UTILITY_NetworkCaptureParams_t::parse_encrypted_content
```

If secure traffic should be decrypted or not.

Network Capture supports decryption of RTPS messages and submessages. It does not support decryption of the user data payload (<data\_protection\_kind> tag in the GovernanceDocument).

**[default]** DDS\_BOOLEAN\_FALSE (p. 1004)

### 5.277.2.5 checkpoint\_thread\_settings

```
struct DDS_ThreadSettings_t NDDS_UTILITY_NetworkCaptureParams_t::checkpoint_thread_settings
```

The properties of the checkpoint thread.

The checkpoint thread is a per-participant thread responsible for reading frames from a queue and saving them to disk (as soon as they are produced).

The members that can be configured are:

- **DDS\_ThreadSettings\_t::mask** (p. 1765). Default value of (**DDS\_THREAD\_SETTINGS\_PRIORITY\_ENFORCE** (p. 1040) | **DDS\_THREAD\_SETTINGS\_STDIO** (p. 1040)).
- **DDS\_ThreadSettings\_t::priority** (p. 1765). Platform-dependent - Consult *Platform Notes* for additional details.
- **DDS\_ThreadSettings\_t::stack\_size** (p. 1765). Platform-dependent - Consult *Platform Notes* for additional details.

### 5.277.2.6 frame\_queue\_size

```
DDS_Long NDDS_UTILITY_NetworkCaptureParams_t::frame_queue_size
```

Size of the frame queue (Bytes).

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

**[default]** 2097152 (2MB).

## 5.278 RTI\_Connext\_Replier Struct Reference

The type-independent version of a Replier.

### 5.278.1 Detailed Description

The type-independent version of a Replier.

Any `FooBarReplier*` can be safely cast to `RTI_Connext_Replier*`.

See also

**FooBarReplier** (p. 1842)

**FooBarSimpleReplier** (p. 1844)

## 5.279 RTI\_Connext\_ReplierListener Struct Reference

Called when a **FooBarReplier** (p. 1842) has new available requests.

### Data Fields

- **RTI\_Connext\_ReplierListener\_OnRequestAvailableCallback** `on_request_available`

*User callback.*

- `void *` **user\_data**

*User data attached to a listener.*

### 5.279.1 Detailed Description

Called when a **FooBarReplier** (p. 1842) has new available requests.

A replier listener is a way to implement a callback that will be invoked when requests are available. It is an optional **RTI\_Connext\_ReplierParams** (p. 1901).

This listener simply notifies when requests are available. The callback implementation can then use **FooBarReplier\_↔take\_requests** (p. 763) to retrieve them.

A simpler callback mechanism, where one request sample is a parameter and the reply is the callback return value, is implemented by the **FooBarSimpleReplier** (p. 1844).

See also

**FooBarReplier\_create\_w\_params** (p. 761)

## 5.279.2 Field Documentation

### 5.279.2.1 user\_data

```
void* RTI_Connext_ReplierListener::user_data
```

User data attached to a listener.

## 5.280 RTI\_Connext\_ReplierParams Struct Reference

Contains the parameters for creating a **FooBarReplier** (p. 1842).

### Data Fields

- **DDS\_DomainParticipant \* participant**  
*The participant this replier uses to join a domain.*
- char \* **service\_name**  
*The service name the Replier offers and Requesters use to match.*
- char \* **request\_topic\_name**  
*Sets a specific request topic name.*
- char \* **reply\_topic\_name**  
*Sets a specific reply topic name.*
- char \* **qos\_library\_name**  
*Sets the library that contains the `RTI_Connext_ReplierParams::qos_profile_name` (p. 1903).*
- char \* **qos\_profile\_name**  
*Sets a QoS profile for the entities in this replier.*
- const struct **DDS\_DataWriterQos \* datawriter\_qos**  
*Sets the quality of service of the reply DataWriter.*
- const struct **DDS\_DataReaderQos \* datareader\_qos**  
*Sets the quality of service of the request DataReader.*
- **DDS\_Publisher \* publisher**  
*Sets a specific Publisher.*
- **DDS\_Subscriber \* subscriber**  
*Sets a specific Subscriber.*
- struct **RTI\_Connext\_ReplierListener \* listener**  
*Sets a listener that is called when requests are available.*

### 5.280.1 Detailed Description

Contains the parameters for creating a **FooBarReplier** (p. 1842).

See also

**RTI\_Connext\_RequesterParams** (p. 1905)

## 5.280.2 Field Documentation

### 5.280.2.1 participant

```
DDS_DomainParticipant* RTI_Connext_ReplierParams::participant
```

The participant this replier uses to join a domain.

### 5.280.2.2 service\_name

```
char* RTI_Connext_ReplierParams::service_name
```

The service name the Replier offers and Requesters use to match.

See also

**RTI\_Connext\_RequesterParams::service\_name** (p. 1906)

### 5.280.2.3 request\_topic\_name

```
char* RTI_Connext_ReplierParams::request_topic_name
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RTI\_Connext\_↔\_ReplierParams::service\_name** (p. 1902). If that topic already exists, it will be reused. This is useful to have the Replier use a **DDS\_ContentFilteredTopic** (p. 173) to receive only certain requests.

### 5.280.2.4 reply\_topic\_name

```
char* RTI_Connext_ReplierParams::reply_topic_name
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on c the **RTI\_Connext\_↔\_ReplierParams::service\_name** (p. 1902). If that topic already exists, it will be reused.

### 5.280.2.5 qos\_library\_name

```
char* RTI_Connext_ReplierParams::qos_library_name
```

Sets the library that contains the **RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903).

See also

**RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903)

### 5.280.2.6 qos\_profile\_name

```
char* RTI_Connext_ReplierParams::qos_profile_name
```

Sets a QoS profile for the entities in this replier.

Specifies the XML QoS profile that will be used to configure the quality of service for the Replier's underlying reply DataWriter and request DataReader.

Parameters

<i>qos_library_name</i>	The name of the QoS library
<i>qos_profile_name</i>	The name of the QoS profile inside the QoS library

See also

**RTI\_Connext\_RequesterParams::qos\_profile\_name** (p. 1907)

**Configuring Request-Reply QoS profiles** (p. 814)

**Configuring QoS Profiles with XML** (p. 776)

### 5.280.2.7 datawriter\_qos

```
const struct DDS_DataWriterQos* RTI_Connext_ReplierParams::datawriter_qos
```

Sets the quality of service of the reply DataWriter.

See also

**RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903)

### 5.280.2.8 datareader\_qos

```
const struct DDS_DataReaderQos* RTI_Connext_ReplierParams::datareader_qos
```

Sets the quality of service of the request DataReader.

See also

**RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903)

### 5.280.2.9 publisher

```
DDS_Publisher* RTI_Connext_ReplierParams::publisher
```

Sets a specific Publisher.

See also

**RTI\_Connext\_RequesterParams::publisher** (p. 1908)

### 5.280.2.10 subscriber

```
DDS_Subscriber* RTI_Connext_ReplierParams::subscriber
```

Sets a specific Subscriber.

See also

**RTI\_Connext\_RequesterParams::subscriber** (p. 1908)

### 5.280.2.11 listener

```
struct RTI_Connext_ReplierListener* RTI_Connext_ReplierParams::listener
```

Sets a listener that is called when requests are available.

See also

**RTI\_Connext\_ReplierListener** (p. 1900)

## 5.281 RTI\_Connext\_Requester Struct Reference

The type-independent version of a Requester.

### 5.281.1 Detailed Description

The type-independent version of a Requester.

Any `FooBarRequester*` can be safely cast to `RTI_Connext_Requester*`.

See also

**FooBarRequester** (p. 1843)

## 5.282 RTI\_Connext\_RequesterParams Struct Reference

Contains the parameters for creating a **FooBarRequester** (p. 1843).

### Data Fields

- **DDS\_DomainParticipant \* participant**  
*The participant this requester uses to join a DDS domain.*
- char \* **service\_name**  
*The service name that Repliers and Requester use to match and communicate.*
- char \* **request\_topic\_name**  
*Sets a specific request topic name.*
- char \* **reply\_topic\_name**  
*Sets a specific reply topic name.*
- char \* **qos\_library\_name**  
*Sets the library that contains the `RTI_Connext_RequesterParams::qos_profile_name` (p. 1907).*
- char \* **qos\_profile\_name**  
*Sets a QoS profile for the entities in this requester.*
- const struct **DDS\_DataWriterQos \* datawriter\_qos**  
*Sets the quality of service of the request DataWriter.*
- const struct **DDS\_DataReaderQos \* datareader\_qos**  
*Sets the quality of service of the request DataReader.*
- **DDS\_Publisher \* publisher**  
*Sets a specific Publisher.*
- **DDS\_Subscriber \* subscriber**  
*Sets a specific Subscriber.*

### 5.282.1 Detailed Description

Contains the parameters for creating a **FooBarRequester** (p. 1843).

The following parameters are required to create a Requester:

- A **DDS\_DomainParticipant** (p. 72) (**RTI\_Connext\_RequesterParams::participant** (p. 1906)), and
- Either a service name (**RTI\_Connext\_RequesterParams::service\_name** (p. 1906))
- Or custom topic names (**RTI\_Connext\_RequesterParams::request\_topic\_name** (p. 1906) and **RTI\_Connext\_RequesterParams::reply\_topic\_name** (p. 1907))

The rest of the parameters that can be set in a RequesterParams object are optional.

See also

**Creating a Requester with optional parameters** (p. 808)

### 5.282.2 Field Documentation

#### 5.282.2.1 participant

```
DDS_DomainParticipant* RTI_Connext_RequesterParams::participant
```

The participant this requester uses to join a DDS domain.

#### 5.282.2.2 service\_name

```
char* RTI_Connext_RequesterParams::service_name
```

The service name that Repliers and Requester use to match and communicate.

A Requester and a Replier need to be configured with the same topic names in order to match.

The service name is used to generate a request topic and a reply topic that the Requester and Replier will use to communicate. For example, the service name "MyService" will be used to create topics named "MyServiceRequest" and "MyServiceReply".

In some cases, the name of these topics is known beforehand or needs to be customized for another reason. The service name can be overridden by setting specific request and reply topic names using **RTI\_Connext\_RequesterParams::request\_topic\_name** (p. 1906) and **RTI\_Connext\_RequesterParams::reply\_topic\_name** (p. 1907).

### 5.282.2.3 request\_topic\_name

```
char* RTI_Connext_RequesterParams::request_topic_name
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RTI\_Connext\_RequesterParams::service\_name** (p. 1906). If that topic already exists, it will be reused.

### 5.282.2.4 reply\_topic\_name

```
char* RTI_Connext_RequesterParams::reply_topic_name
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **RTI\_Connext\_RequesterParams::service\_name** (p. 1906). If that topic already exists, it will be reused.

### 5.282.2.5 qos\_library\_name

```
char* RTI_Connext_RequesterParams::qos_library_name
```

Sets the library that contains the **RTI\_Connext\_RequesterParams::qos\_profile\_name** (p. 1907).

See also

**RTI\_Connext\_RequesterParams::qos\_profile\_name** (p. 1907)

### 5.282.2.6 qos\_profile\_name

```
char* RTI_Connext_RequesterParams::qos_profile_name
```

Sets a QoS profile for the entities in this requester.

Specifies an XML QoS profile that will be used to configure the quality of service of a Requester's underlying request DataWriter and reply DataReader.

Within that profile, the DataWriter QoS in <datawriter\_qos> will be used to configure the request DataWriter and the DataReader.

Alternatively, you can set the QoS using the DataWriterQos and DataReaderQos objects (**RTI\_Connext\_RequesterParams::datawriter\_qos** (p. 1907), **RTI\_Connext\_RequesterParams::datareader\_qos** (p. 1908)).

The library where this profile is located has to be set with **RTI\_Connext\_RequesterParams::qos\_library\_name** (p. 1907)

See also

**RTI\_Connext\_RequesterParams::qos\_library\_name** (p. 1907)

**Configuring Request-Reply QoS profiles** (p. 814)

**Configuring QoS Profiles with XML** (p. 776)

### 5.282.2.7 `datawriter_qos`

```
const struct DDS_DataWriterQos* RTI_Connext_RequesterParams::datawriter_qos
```

Sets the quality of service of the request DataWriter.

See also

[RTI\\_Connext\\_RequesterParams::qos\\_profile\\_name](#) (p. 1907)

### 5.282.2.8 `datareader_qos`

```
const struct DDS_DataReaderQos* RTI_Connext_RequesterParams::datareader_qos
```

Sets the quality of service of the request DataReader.

See also

[RTI\\_Connext\\_RequesterParams::qos\\_profile\\_name](#) (p. 1907)

### 5.282.2.9 `publisher`

```
DDS_Publisher* RTI_Connext_RequesterParams::publisher
```

Sets a specific Publisher.

By default, a Requester uses the DomainParticipant's implicit Publisher. Sometimes a different Publisher may be needed, for example, to use non-default PublisherQos.

### 5.282.2.10 `subscriber`

```
DDS_Subscriber* RTI_Connext_RequesterParams::subscriber
```

Sets a specific Subscriber.

By default, a Requester uses the DomainParticipant's implicit Subscriber. Sometimes a different Subscriber may be needed, for example, to use non-default SubscriberQos.

## 5.283 `RTI_Connext_SimpleReplierListener` Struct Reference

The listener called by a SimpleReplier.

## Data Fields

- **RTI\_Connext\_SimpleReplierListener\_OnRequestAvailableCallback** `on_request_available`  
*User callback that receives a request and provides a reply.*
- **RTI\_Connext\_SimpleReplierListener\_OnReturnLoanCallback** `return_loan`  
*Returns a previously generated reply to the user.*
- `void * user_data`  
*User data attached to a listener.*

### 5.283.1 Detailed Description

The listener called by a SimpleReplier.

See also

**FooBarSimpleReplier** (p. 1844)

**SimpleReplier example** (p. 813)

### 5.283.2 Field Documentation

#### 5.283.2.1 `user_data`

```
void* RTI_Connext_SimpleReplierListener::user_data
```

User data attached to a listener.

## 5.284 RTI\_Connext\_SimpleReplierParams Struct Reference

Contains the parameters for creating a **FooBarSimpleReplier** (p. 1844).

## Data Fields

- **DDS\_DomainParticipant \* participant**  
*The participant this replier uses to join a DDS domain.*
- **char \* service\_name**  
*The service name the Replier offers and Requesters use to match.*
- **char \* request\_topic\_name**  
*Sets a specific request topic name.*
- **char \* reply\_topic\_name**  
*Sets a specific reply topic name.*
- **char \* qos\_library\_name**  
*Sets the library that contains the `RTI_Connext_SimpleReplierParams::qos_profile_name` (p. 1911).*
- **char \* qos\_profile\_name**  
*Sets a QoS profile for the entities in this replier.*
- **const struct DDS\_DataWriterQos \* datawriter\_qos**  
*Sets the quality of service of the reply DataWriter.*
- **const struct DDS\_DataReaderQos \* datareader\_qos**  
*Sets the quality of service of the request DataReader.*
- **DDS\_Publisher \* publisher**  
*Sets a specific Publisher.*
- **DDS\_Subscriber \* subscriber**  
*Sets a specific Subscriber.*
- **struct RTI\_Connext\_SimpleReplierListener \* simple\_listener**  
*Sets a listener that is called when requests are available.*

### 5.284.1 Detailed Description

Contains the parameters for creating a **FooBarSimpleReplier** (p. 1844).

The parameters for a SimpleReplier are identical to those of the Replier, except for the SimpleReplierListener, which is required and has a different user callback.

See also

**RTI\_Connext\_ReplierParams** (p. 1901)

### 5.284.2 Field Documentation

#### 5.284.2.1 participant

```
DDS_DomainParticipant* RTI_Connext_SimpleReplierParams::participant
```

The participant this replier uses to join a DDS domain.

### 5.284.2.2 service\_name

```
char* RTI_Connext_SimpleReplierParams::service_name
```

The service name the Replier offers and Requesters use to match.

See also

**RTI\_Connext\_RequesterParams::service\_name** (p. 1906)

### 5.284.2.3 request\_topic\_name

```
char* RTI_Connext_SimpleReplierParams::request_topic_name
```

Sets a specific request topic name.

This is an alternative to **RTI\_Connext\_SimpleReplierParams::service\_name** (p. 1910)

### 5.284.2.4 reply\_topic\_name

```
char* RTI_Connext_SimpleReplierParams::reply_topic_name
```

Sets a specific reply topic name.

This is an alternative to **RTI\_Connext\_SimpleReplierParams::service\_name** (p. 1910)

### 5.284.2.5 qos\_library\_name

```
char* RTI_Connext_SimpleReplierParams::qos_library_name
```

Sets the library that contains the **RTI\_Connext\_SimpleReplierParams::qos\_profile\_name** (p. 1911).

See also

**RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903)

### 5.284.2.6 qos\_profile\_name

```
char* RTI_Connext_SimpleReplierParams::qos_profile_name
```

Sets a QoS profile for the entities in this replier.

See also

**RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903)

### 5.284.2.7 datawriter\_qos

```
const struct DDS_DataWriterQos* RTI_Connext_SimpleReplierParams::datawriter_qos
```

Sets the quality of service of the reply DataWriter.

See also

**RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903)

### 5.284.2.8 datareader\_qos

```
const struct DDS_DataReaderQos* RTI_Connext_SimpleReplierParams::datareader_qos
```

Sets the quality of service of the request DataReader.

See also

**RTI\_Connext\_ReplierParams::qos\_profile\_name** (p. 1903)

### 5.284.2.9 publisher

```
DDS_Publisher* RTI_Connext_SimpleReplierParams::publisher
```

Sets a specific Publisher.

See also

**RTI\_Connext\_RequesterParams::publisher** (p. 1908)

### 5.284.2.10 subscriber

```
DDS_Subscriber* RTI_Connext_SimpleReplierParams::subscriber
```

Sets a specific Subscriber.

See also

[RTI\\_Connext\\_RequesterParams::subscriber](#) (p. 1908)

### 5.284.2.11 simple\_listener

```
struct RTI_Connext_SimpleReplierListener* RTI_Connext_SimpleReplierParams::simple_listener
```

Sets a listener that is called when requests are available.

See also

[RTI\\_Connext\\_ReplierListener](#) (p. 1900)

## 5.285 TransportAllocationSettings\_t Struct Reference

Allocation settings used by various internal buffers.

### 5.285.1 Detailed Description

Allocation settings used by various internal buffers.

An allocation setting structure defines the rules of memory management used by internal buffers.

An internal buffer can provide blocks of memory of fixed size. They are used in several places of any transport, and this structure defines its starting size, limits, and how to increase its capacity.

It contains three values:

- `initial_count`: the number of individual elements that are allocated when the buffer is created.
- `max_count`: the maximum number of elements the buffer can hold. The buffer will grow up to this amount. After this limit is reached, new allocation requests will fail. For unlimited size, use the value `NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED`
- `incremental_count`: The amount of elements that are allocated at every increment. You can use the value `NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC` to have the buffer double its size at every reallocation request.

## Chapter 6

# Example Documentation

### 6.1 HelloWorld.idl

#### 6.1.1 IDL Type Description

The data type to be disseminated by RTI Connext is described in language-independent IDL. The IDL file is input to `rtiddsgen` (see the `Code Generator User's Manual` for more information), which produces the following files.

The programming language specific type representation of the type **Foo** (p. 1841) = `HelloWorld`, for use in the application code.

- `HelloWorld.h`
- `HelloWorld.c`

**User Data Type Support** (p. 206) types as required by the DDS specification for use in the application code.

- `HelloWorldSupport.h`
- `HelloWorldSupport.c`

Methods required by the RTI Connext implementation. These contains the auto-generated methods for serializing and deserializing the type.

- `HelloWorldPlugin.h`
- `HelloWorldPlugin.c`

#### 6.1.1.1 HelloWorld.idl

```
struct HelloWorld {  
    string<128> msg;  
};
```

## 6.2 HelloWorld.c

### 6.2.1 Programming Language Type Description

The following programming language specific type representation is generated by rtiddsgen (see the Code Generator User's Manual for more information) for use in application code, where:

- **Foo** (p. 1841) = HelloWorld
- **FooSeq** (p. 1845) = HelloWorldSeq

#### 6.2.1.1 HelloWorld.h

 */
/* HelloWorld_publisher.c

```

A publication of data of type HelloWorld

This file is derived from code automatically generated by the `rtiddsgen` command:

```
rtiddsgen -language C -example <arch> HelloWorld.idl
```

Example publication of type HelloWorld automatically generated by 'rtiddsgen'. To test it, follow these steps:

- (1) Compile this file and the example subscription.
- (2) Start the subscription on the same domain used for RTI Connex
- (3) Start the publication on the same domain used for RTI Connex
- (4) [Optional] Specify the list of discovery initial peers and multicast receive addresses via an environment variable or a file (in the current working directory) called `NDDS_DISCOVERY_PEERS`.

You can run any number of publisher and subscriber programs, and can add and remove them dynamically from the domain.

```

*/
