template<typename T >
void dds::pub::DataWriter< T >::write (
    const T & instance_data,
    const dds::core::InstanceHandle & handle ) [inline]
```

Modifies the value of a data instance.

When this operation is used, RTI Connext will automatically supply the value of the `source_timestamp` that is made available to **dds::sub::DataReader** (p. 756) objects by means of the `source_timestamp` attribute inside the **dds::sub::SampleInfo** (p. 1992). (Refer to **dds::sub::SampleInfo** (p. 1992) and **DESTINATION_ORDER** (p. 316) QoS policy for details).

As a side effect, this operation asserts liveness on the **dds::pub::DataWriter** (p. 908) itself, the **dds::pub::Publisher** (p. 1719) and the **dds::domain::DomainParticipant** (p. 1079).

Note that the special value `dds::core::InstanceHandle::nil()` (p. 1358) can be used for the parameter `handle`. This indicates the identity of the instance should be automatically deduced from the `instance_data` (by means of the `key`).

If `handle` is any value other than `dds::core::InstanceHandle::nil()` (p. 1358), then it must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with `dds::core::InvalidArgumentError` (p. 1363).

RTI Connext will not detect the error when the `handle` is any value other than `dds::core::InstanceHandle::nil()` (p. 1358), corresponds to an instance that has been registered, but does not correspond to the instance deduced from the `instance_data` (by means of the `key`). RTI Connext will treat as if the `write()` (p.918) operation is for the instance as indicated by the `handle`.

This operation may block if the **RELIABILITY** (p.335) `kind` is set to `dds::core::policy::ReliabilityKind_def::←RELIABLE` (p.1881) and the modification would cause data to be lost or else cause one of the limits specified in the **RESOURCE_LIMITS** (p. 336) to be exceeded.

This operation will not block when using `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p.1881). If you are using **BEST_EFFORT** Reliability in combination with `rti::core::policy::PublishModeKind_def::ASYNCHRONOUS` (p. 1745), then instead of being blocked, samples that are queued to be sent by the asynchronous publishing thread will be overwritten when the number of DDS samples that are currently queued has reached the `depth` QoS value in the `dds::core::policy::History` (p. 1346).

If `dds::core::policy::Reliability::max_blocking_time` (p. 1877) elapses before the `dds::pub::DataWriter` (p. 908) can store the modification without exceeding the limits, the operation will fail and return `dds::core::TimeoutError` (p.2177) for **KEEP_ALL** configurations.

Here is how the write operation behaves when `dds::core::policy::HistoryKind::KEEP_LAST` and `dds::core::policy::←ReliabilityKind_def::RELIABLE` (p. 1881) are used:

- The send window size is determined by the `rti::core::RtpsReliableWriterProtocol::max_send_window_size` and `rti::core::RtpsReliableWriterProtocol::min_send_window_size` fields in the `rti::core::policy::DataWriterProtocol` (p. 979). If a send window is specified (`max_send_window_size` is not **UNLIMITED**) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the `dds::core::policy::Reliability::max_blocking_time` (p. 1877) expires.
- Then, the `dds::pub::DataWriter` (p. 908) will try to add the new sample to the writer history.
- If the instance associated with the sample is present in the writer history and there are `depth` (in the **HISTORY** (p. 324)) samples in the instance, the `DataWriter` (p. 908) will replace the oldest sample of that instance independently of that sample's acknowledged status, and the write operation will return `.` Otherwise, no sample will be replaced and the write operation will continue.
- If the instance associated with the sample is not present in the writer history and `dds::core::policy::Resource←Limits::max_instances` (p. 1924) is exceeded, the `DataWriter` (p. 908) will try to replace an existing instance (and its samples) according to the value of `rti::core::policy::DataWriterResourceLimits::instance_replacement` (p. 1008) (see `DataWriterResourceLimitsInstanceReplacementKind`).
 - If no instance can be replaced, the write operation returns `dds::core::OutOfResourcesError` (p. 1629).
- If `dds::core::policy::ResourceLimits::max_samples` (p. 1924) is exceeded, the `DataWriter` (p. 908) will try to drop a sample from a different instance as follows:
 - The `DataWriter` (p. 908) will try first to remove a fully ACKed (2) sample from a different instance 'I' as long as that sample is not the last remaining sample for the instance 'I'. To find this sample, the `DataWriter` (p. 908) starts iterating from the oldest sample in the writer history to the newest sample.

- If no such sample is found, the **DataWriter** (p. 908) will replace the oldest sample in the writer history.
- The sample is added to the writer history, and the write operation returns .

Here is how the write operation behaves when `dds::core::policy::HistoryKind::KEEP_ALL` and `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881) are used:

- The send window size is determined by the `rti::core::RtpsReliableWriterProtocol::max_send_window_size` and `rti::core::RtpsReliableWriterProtocol::min_send_window_size` fields in the **DATA_WRITER_PROTOCOL** (p. 314). If a send window is specified (`max_send_window_size` is not UNLIMITED) and the window is full, the write operation will block until one of the samples in the send window is protocol-acknowledged (ACKed) (1) or until the `dds::core::policy::Reliability::max_blocking_time` (p. 1877) expires.
 - If the `max_blocking_time` expires, the write operation returns `dds::core::TimeoutError` (p. 2177).
- When a sample is protocol-ACKed (1) before `max_blocking_time` expires, the **DataWriter** (p. 908) will try to add the sample to the writer history as follows:
 - If the instance associated with the sample is not present in the writer history and `max_instances` is exceeded, the **DataWriter** (p. 908) will try to replace an existing instance (and its samples) according to the value of `rti::core::policy::DataWriterResourceLimits::instance_replacement` (p. 1008) (see `DataWriterResourceLimitsInstanceReplacementKind`).
 - * If no instance can be replaced, the write operation returns `dds::core::OutOfResourcesError` (p. 1629).
 - If `dds::core::policy::ResourceLimits::max_samples` (p. 1924) is exceeded, the **DataWriter** (p. 908) will go through the samples in the order in which they were added, and it will replace the first sample that is fully ACKed (2).
 - * If no fully ACKed sample is found, the **DataWriter** (p. 908) will block (3) until a sample is fully ACKed and can be replaced or `dds::core::policy::Reliability::max_blocking_time` (p. 1877) expires. If the `max_blocking_time` expires, the write operation will return `dds::core::TimeoutError` (p. 2177).
 - If `dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925) is exceeded, the **DataWriter** (p. 908) will go through the samples of the instance in the order in which they were added, and it will replace the first sample that is fully ACKed.
 - * If no fully ACKed sample is found, the **DataWriter** (p. 908) will block (3) until a sample is fully ACKed and can be replaced or the `max_blocking_time` expires. If the `max_blocking_time` expires, the write operation will return `dds::core::TimeoutError` (p. 2177).
 - The sample is added to the writer history, and the write operation returns .

If there are no instance resources left, this operation may fail with `dds::core::OutOfResourcesError` (p. 1629). Calling `dds::pub::DataWriter::unregister_instance` (p. 930) may help freeing up some resources.

This operation will fail with `dds::core::PreconditionNotMetError` (p. 1669) if the timestamp is less than the timestamp used in the last writer operation (*register*, *unregister*, *dispose*, or *write*, with either the automatically supplied timestamp or the application-provided timestamp).

If an instance obtained from `dds::pub::DataWriter::get_loan` (p. 953) is modified with this operation, then all instances modified thereafter should be from `dds::pub::DataWriter::get_loan` (p. 953).

See `rti::core::policy::AcknowledgmentKind_def` (p. 585) for more information on the following notes:

(1) A sample in the writer history is considered "protocol ACKed" when the sample has been individually ACKed at the RTPS protocol level by each one of the DataReaders that matched the **DataWriter** (p. 908) at the moment the sample was added to the writer queue.

- Late joiners do not change the protocol ACK state of a sample. If a sample is marked as protocol ACKed because it has been acknowledged by all the matching DataReaders and a DataReader joins later on, the historical sample is still considered protocol ACKed even if it has not been received by the late joiner.
- If a sample 'S1' is protocol ACKed and a TopicQuery is received, triggering the publication of 'S1', the sample is still considered protocol ACKed. If a sample 'S1' is not ACKed and a TopicQuery is received triggering the publication of 'S1', the **DataWriter** (p.908) will require that both the matching DataReaders on the live RTPS channel and the DataReader on the TopicQuery channel individually protocol ACK the sample in order to consider the sample protocol ACKed.

(2) A sample in the writer history is considered "fully ACKed" when all of the following conditions are met:

- The sample is protocol-ACKed.
- The sample has been "application-level ACKed" by all the DataReaders matching the **DataWriter** (p.908) that have their **dds::core::policy::Reliability::acknowledgment_kind** (p.1878) set to **rti::core::policy::← AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p.586) or **rti::core::policy::AcknowledgmentKind← _def::APPLICATION_AUTO** (p.586). Once the sample is application-level ACKed, it cannot change its status to not ACKed after new DataReaders are matched. (Application-level ACK occurs when the application acknowledges receipt of a sample.)
- If required subscriptions are enabled (see **rti::core::policy::Availability** (p.654)), the sample must also be ACKed by all the required subscriptions configured on the **DataWriter** (p.908).

(3) It is possible within a single call to the write operation for a **DataWriter** (p.908) to block both when the send window is full and then again when **dds::core::policy::ResourceLimits::max_samples** (p.1924) or **dds::core::policy::← ::ResourceLimits::max_samples_per_instance** (p.1925) is exceeded. This can happen because blocking on the send window only considers protocol-ACKed samples, while blocking based on resource limits considers fully-ACKed samples. In any case, the total max blocking time of a single call to the write operation will not exceed **dds::core::← ::policy::Reliability::max_blocking_time** (p.1877).

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p.157) The data to write.
----------------------	--

Parameters

<i>handle</i>	<< <i>in</i> >> (p.157) Either the handle returned by a previous call to dds::pub::DataWriter::register_instance (p.928), or else the special value dds::core::InstanceHandle::nil() (p.1358). If \mathbb{T} has a key, <i>handle</i> must represent a registered instance of type \mathbb{T} . Otherwise, this method may fail with dds::core::InvalidArgumentError (p.1363).
---------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p.228), dds::core::TimeoutError (p.2177), dds::core::PreconditionNotMetError (p.1669), dds::core::OutOfResourcesError (p.1629), or dds::core::NotEnabledError (p.1601).
------------	--

MT Safety:

It is UNSAFE to modify `instance_data` before the operation has finished. The operation is otherwise SAFE.

`dds::sub::DataReader` (p. 756)

`dds::pub::DataWriter::write(const T&,const dds::core::Time&)` (p. 919)

`DESTINATION_ORDER` (p. 316)

8.66.4.4 `write()` [4/11]

```
template<typename T >
void dds::pub::DataWriter< T >::write (
    const T & instance_data,
    const dds::core::InstanceHandle & handle,
    const dds::core::Time & source_timestamp ) [inline]
```

Modifies the value of a data instance and specifies the timestamp.

Explicitly provides the timestamp that will be available to the `dds::sub::DataReader` (p. 756) objects by means of the `source_timestamp` attribute inside the `dds::sub::SampleInfo` (p. 1992). (Refer to `dds::sub::SampleInfo` (p. 1992) and `DESTINATION_ORDER` (p. 316) QoS policy for details)

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the `dds::pub::DataWriter::write()` (p. 918) operation.

This operation may block and time out (`dds::core::TimeoutError` (p. 2177)) under the same circumstances described for `dds::pub::DataWriter::write()` (p. 918).

If there are no instance resources left, this operation may fail with `dds::core::OutOfResourcesError` (p. 1629). Calling `dds::pub::DataWriter::unregister_instance` (p. 930) may help free up some resources.

This operation may fail with `dds::core::InvalidArgumentError` (p. 1363) under the same circumstances described for the write operation.

Parameters

<code>instance_data</code>	<< <i>in</i> >> (p. 157) The data to write.
<code>handle</code>	<< <i>in</i> >> (p. 157) Either the handle returned by a previous call to <code>dds::pub::DataWriter::register_instance</code> (p. 928), or else the special value <code>dds::core::InstanceHandle::nil()</code> (p. 1358). If <code>T</code> has a key, <code>handle</code> must represent a registered instance of type <code>T</code> . Otherwise, this method may fail with <code>dds::core::InvalidArgumentError</code> (p. 1363).
<code>source_timestamp</code>	<< <i>in</i> >> (p. 157) When using <code>dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP</code> the timestamp value must be greater than or equal to the timestamp value used in the last writer operation (<code>register</code> , <code>unregister</code> , <code>dispose</code> , or <code>write</code> , with either the automatically supplied timestamp or the application-provided timestamp) However, if it is less than the timestamp of the previous operation but the difference is less than the
Generated by Doxygen	<code>dds::core::policy::DestinationOrder::source_timestamp_tolerance</code> (p. 1026), the timestamp of the previous operation will be used as the source timestamp of this sample. Otherwise, if the difference is greater than <code>dds::core::policy::DestinationOrder::source_timestamp_tolerance</code> (p. 1026), the function

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::TimeoutError (p. 2177), dds::core::OutOfResourcesError (p. 1629), or dds::core::NotEnabledError (p. 1601).

8.66.4.5 write() [5/11]

```
template<typename T >
void dds::pub::DataWriter< T >::write (
    const dds::topic::TopicInstance< T > & topic_instance ) [inline]
```

Write a **dds::topic::TopicInstance** (p. 2209).

A TopicInstance encapsulates the sample and its associated instance handle.

Parameters

<i>topic_instance</i>	The instance to write.
-----------------------	------------------------

template<typename T >
void dds::pub::DataWriter< T >::write (
    const dds::topic::TopicInstance< T > & topic_instance,
    const dds::core::Time & timestamp ) [inline]
```

Write a topic instance with time stamp.

Parameters

<i>topic_instance</i>	the TopicInstance to write.
<i>timestamp</i>	the timestamp for this sample.

See also

void **write(const T&, const dds::core::InstanceHandle&, const dds::core::Time&)** (p. 923)

```

const FWIterator & begin,
const FWIterator & end,
const dds::core::Time & timestamp ) [inline]

```

Write a series of samples or TopicInstances with a given timestamp

Template Parameters

<i>FWIterator</i>	A forward iterator. Depending on its value type this function can write data samples or TopicInstance objects.
-------------------	--

Parameters

<i>begin</i>	The beginning of the range
<i>end</i>	The end of the range
<i>timestamp</i>	The timestamp to use for all samples in the range

See also

write(const T&, const dds::core::Time&) (p. 919)

8.66.4.9 write() [9/11]

```

template<typename T >
template<typename SamplesFWIterator , typename HandlesFWIterator >
void dds::pub::DataWriter< T >::write (
    const SamplesFWIterator & data_begin,
    const SamplesFWIterator & data_end,
    const HandlesFWIterator & handle_begin,
    const HandlesFWIterator & handle_end ) [inline]

```

Write a series of samples and their parallel instance handles.

Template Parameters

<i>SamplesFWIterator</i>	Sample forward iterator
<i>HandlesFWIterator</i>	InstanceHandle forward iterator

Parameters

<i>data_begin</i>	The beginning of the data sample range
<i>data_end</i>	The end of the data sample range

Parameters

<i>handle_begin</i>	The beginning of the InstanceHandle range
<i>handle_end</i>	The end of the InstanceHandle range

```

Writes a sample with an instance handle.

See also

write(const T&, const dds::core::InstanceHandle&) (p. 919)

8.66.4.14 register_instance() [1/3]

```
template<typename T >
const dds::core::InstanceHandle dds::pub::DataWriter< T >::register_instance (
    const T & instance_data ) [inline]
```

Informs RTI Connext that the application will be modifying a particular instance.

This operation is only useful for keyed data types. Using it for non-keyed types causes no effect and returns **dds::core::InstanceHandle::nil()** (p. 1358). The operation takes as a parameter an instance (of which only the key value is examined) and returns a `handle` that can be used in successive **write()** (p. 918) or **dispose_instance()** (p. 932) operations.

The operation gives RTI Connext an opportunity to pre-configure itself to improve performance.

The use of this operation by an application is optional even for keyed types. If an instance has not been pre-registered, the application can call the **write()** (p. 918) or **dispose_instance()** overloads that don't receive a **dds::core::InstanceHandle** (p. 1356) and RTI Connext will auto-register the instance.

For best performance, the operation should be invoked prior to calling any operation that modifies the instance, such as `dds::pub::DataWriter::write()` (p. 918), `dds::pub::DataWriter::write(const T&,const dds::core::Time&)` (p. 919), `dds::pub::DataWriter::dispose_instance()` (p. 932) and `dds::pub::DataWriter::dispose_instance(const dds::core::InstanceHandle&,const dds::core::Time&)` (p. 933) and the handle used in conjunction with the data for those calls.

When this operation is used, RTI Connexx will automatically supply the value of the `source_timestamp` that is used.

This operation may fail and return `dds::core::InstanceHandle::nil()` (p. 1358) if `dds::core::policy::ResourceLimits::max_instances` (p. 1924) limit has been exceeded.

The operation is **idempotent**. If it is called for an already registered instance, it just returns the already allocated handle. This may be used to lookup and retrieve the handle allocated to a given instance.

This operation can only be called after `dds::pub::DataWriter` (p. 908) has been enabled. Otherwise, `dds::core::InstanceHandle::nil()` (p. 1358) will be returned.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 157) The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function.
----------------------	---

Returns

For keyed data type, a handle that can be used in the calls that take a `dds::core::InstanceHandle` (p. 1356), such as `write`, `dispose`, `unregister_instance`, or return `dds::core::InstanceHandle::nil()` (p. 1358) on failure. If the `instance_data` is of a data type that has no keys, this function always returns `dds::core::InstanceHandle::nil()` (p. 1358).

See also

`dds::pub::DataWriter::unregister_instance` (p. 930), `dds::pub::DataWriter::key_value` (p. 934), **Relationship between registration, liveliness and ownership** (p. 1633)

8.66.4.15 register_instance() [2/3]

```
template<typename T >
const dds::core::InstanceHandle dds::pub::DataWriter< T >::register_instance (
    const T & instance_data,
    const dds::core::Time & source_timestamp ) [inline]
```

Informs RTI Connexx that the application will be modifying a particular instance and specifies the timestamp.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 316) QoS policy for details.

This operation may fail and return `dds::core::InstanceHandle::nil()` (p. 1358) if `dds::core::policy::ResourceLimits::max_instances` (p. 1924) limit has been exceeded.

This operation can only be called after `dds::pub::DataWriter` (p. 908) has been enabled. Otherwise, `dds::core::InstanceHandle::nil()` (p. 1358) will be returned.

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 157) The instance that should be registered. Of this instance, only the fields that represent the key are examined by the function.
<i>source_timestamp</i>	<< <i>in</i> >> (p. 157) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a <i>register</i> , <i>unregister</i> , <i>dispose</i> , or <i>write</i> , with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers.

Returns

For keyed data type, return a handle that can be used in the calls that take a **dds::core::InstanceHandle** (p. 1356), such as *write*, *dispose*, *unregister_instance*, or return **dds::core::InstanceHandle::nil()** (p. 1358) on failure. If the *instance_data* is of a data type that has no keys, this function always return **dds::core::InstanceHandle::nil()** (p. 1358).

See also

dds::pub::DataWriter::unregister_instance (p. 930), **dds::pub::DataWriter::key_value** (p. 934)

Notes about DataWriter destruction (p. 914)

8.66.4.16 unregister_instance() [1/3]

```
template<typename T >
DataWriter & dds::pub::DataWriter< T >::unregister_instance (
    const dds::core::InstanceHandle & handle ) [inline]
```

Unregister an instance.

This operation is useful only for keyed data types. Using it for non-keyed types causes no effect and reports no error.

This operation should only be called on an instance that is currently registered. This includes instances that have been auto-registered by calling operations such as *write* or *dispose* as described in **dds::pub::DataWriter::register_instance** (p. 928). Otherwise, this operation may fail with **dds::core::InvalidArgumentError** (p. 1363).

This only need be called just once per instance, regardless of how many times *register_instance* was called for that instance.

When this operation is used, RTI ConnexT will automatically supply the value of the *source_timestamp* that is used.

This operation informs RTI ConnexT that the **dds::pub::DataWriter** (p. 908) is no longer going to provide any information about the instance. This operation also indicates that RTI ConnexT can locally remove all information regarding that instance. The application should not attempt to use the *handle* previously allocated to that instance after calling this function.

The parameter *handle* must correspond to an instance that has been registered. If there is no correspondence, the operation will fail with **dds::core::InvalidArgumentError** (p. 1363).

If, after a `dds::pub::DataWriter::unregister_instance` (p. 930), the application wants to modify (`dds::pub::DataWriter::write`) (p. 918) or `dds::pub::DataWriter::dispose_instance` (p. 932)) an instance, it has to register it again, or else use the functions that don't receive a `dds::core::InstanceHandle` (p. 1356).

This operation does not indicate that the instance is deleted (that is the purpose of `dds::pub::DataWriter::dispose_instance` (p. 932)). The operation `dds::pub::DataWriter::unregister_instance` (p. 930) just indicates that the `dds::pub::DataWriter` (p. 908) no longer has anything to say about the instance. `dds::sub::DataReader` (p. 756) entities that are reading the instance may receive a sample with `dds::sub::status::InstanceState::not_alive_no_writers` (p. 1361) for the instance, unless there are other `dds::pub::DataWriter` (p. 908) objects writing that same instance.

`dds::core::policy::WriterDataLifecycle::autodispose_unregistered_instances` (p. 2360) controls whether instances are automatically disposed when they are unregistered.

This operation can affect the ownership of the data instance (see **OWNERSHIP** (p. 329)). If the `dds::pub::DataWriter` (p. 908) was the exclusive owner of the instance, then calling `unregister_instance` (p. 930) will relinquish that ownership.

If `dds::core::policy::Reliability::kind` (p. 1876) is set to `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881) and the unregistration would overflow the resource limits of this writer or of a reader, this operation may block for up to `dds::core::policy::Reliability::max_blocking_time` (p. 1877); if this writer is still unable to unregister after that period, this method will fail with `dds::core::TimeoutError` (p. 2177).

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 157) represents the <code>instance</code> to be unregistered. It must represent an instance that has been registered. Otherwise, this method may fail with <code>dds::core::InvalidArgumentError</code> (p. 1363).
---------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), <code>dds::core::TimeoutError</code> (p. 2177) or <code>dds::core::NotEnabledError</code> (p. 1601)
------------	---

See also

`dds::pub::DataWriter::register_instance` (p. 928)

`dds::pub::DataWriter::unregister_instance(const dds::core::InstanceHandle&, const dds::core::Time&)` (p. 931)

`dds::pub::DataWriter::key_value` (p. 934)

Relationship between registration, liveness and ownership (p. 1633)

8.66.4.17 `unregister_instance()` [2/3]

```
template<typename T >
DataWriter & dds::pub::DataWriter< T >::unregister_instance (
    const dds::core::InstanceHandle & handle,
    const dds::core::Time & source_timestamp ) [inline]
```

Unregister an instance with timestamp.

The provided `source_timestamp` potentially affects the relative order in which readers observe events from multiple writers. Refer to **DESTINATION_ORDER** (p. 316) QoS policy for details.

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the **dds::pub::DataWriter::unregister_instance** (p. 930) operation.

This operation may block and may time out (**dds::core::TimeoutError** (p.2177)) under the same circumstances described for the `unregister_instance` operation.

Parameters

<code>handle</code>	<< <i>in</i> >> (p. 157) represents the <code>instance</code> to be unregistered. It must represent an instance that has been registered. Otherwise, this method may fail with dds::core::InvalidArgumentError (p. 1363).
<code>source_timestamp</code>	<< <i>in</i> >> (p. 157) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a <code>register</code> , <code>unregister</code> , <code>dispose</code> , or <code>write</code> , with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::TimeoutError (p. 2177) or dds::core::NotEnabledError (p. 1601).
------------	--

See also

- dds::pub::DataWriter::register_instance** (p. 928)

8.66.4.18 `dispose_instance()` [1/3]

```
template<typename T >
DataWriter & dds::pub::DataWriter< T >::dispose_instance (
    const dds::core::InstanceHandle & handle ) [inline]
```

Requests the middleware to delete the instance identified by the instance handle.

This operation is useful only for keyed data types. Using it for non-keyed types has no effect and reports no error.

When an instance is disposed, the **dds::pub::DataWriter** (p.908) communicates this state change to **dds::sub::DataReader** (p. 756) objects by propagating a dispose sample. When the instance changes to a disposed state, you can see the state change on the DataReader by looking at **dds::sub::status::DataState::instance_state()** (p. 893) in

`dds::sub::SampleInfo::state()` (p. 1996). Disposed instances have the value `dds::sub::status::InstanceState::not_←_alive_disposed()` (p. 1361).

The resources allocated to dispose instances on the `DataWriter` (p. 908) are not removed by default. The removal of the resources allocated to a dispose instance on the `DataWriter` (p. 908) queue can be controlled by using the QoS `dds::core::policy::WriterDataLifecycle::autopurge_disposed_instances_delay` (p. 2362).

Likewise, on the `DataReader`, the removal of the resources associated with an instance in the dispose state can be controlled by using the QoS `dds::core::policy::ReaderDataLifecycle::autopurge_disposed_instances_delay` (p. 1866).

When this operation is used, RTI Connex will automatically supply the value of the `source_timestamp` that is made available to `dds::sub::DataReader` (p. 756) objects by means of the `source_timestamp` attribute inside the `dds::sub←::SampleInfo` (p. 1992).

The constraints on the values of the handle parameter and the corresponding error behavior are the same specified for the `dds::pub::DataWriter::unregister_instance` (p. 930) operation.

This operation may block and time out (`dds::core::TimeoutError` (p. 2177)) under the same circumstances described for `dds::pub::DataWriter::write()` (p. 918).

If there are no instance resources left, this operation may fail with `dds::core::OutOfResourcesError` (p. 1629). Calling `dds::pub::DataWriter::unregister_instance` (p. 930) may help free up some resources.

Parameters

<i>handle</i>	The handle returned by a previous call to <code>register_instance()</code> (p. 928) or <code>lookup_instance()</code> (p. 935). If <code>instance_handle</code> doesn't correspond to an instance previously written or registered with this writer, this function fails with <code>dds::core::InvalidArgumentError</code> (p. 1363).
---------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), <code>dds::core::TimeoutError</code> (p. 2177), <code>dds::core::OutOfResourcesError</code> (p. 1629) or <code>dds::core::NotEnabledError</code> (p. 1601).
------------	---

See also

`dds::pub::DataWriter::dispose_instance(const dds::core::InstanceHandle&,const dds::core::Time&)` (p. 933)

Relationship between registration, liveliness and ownership (p. 1633)

8.66.4.19 `dispose_instance()` [2/3]

```
template<typename T >
DataWriter & dds::pub::DataWriter< T >::dispose_instance (
    const dds::core::InstanceHandle & the_instance_handle,
    const dds::core::Time & source_timestamp ) [inline]
```

Dispose an instance with a timestamp.

The constraints on the values of the `handle` parameter and the corresponding error behavior are the same specified for the `dds::pub::DataWriter::dispose_instance()` (p. 932) operation.

This operation may block and time out (`dds::core::TimeoutError` (p. 2177)) under the same circumstances described for `dds::pub::DataWriter::write()` (p. 918).

If there are no instance resources left, this operation may fail with `dds::core::OutOfResourcesError` (p. 1629). Calling `dds::pub::DataWriter::unregister_instance` (p. 930) may help freeing up some resources.

Parameters

<i>the_instance_handle</i>	<< <i>in</i> >> (p. 157) Either the handle returned by a previous call to <code>dds::pub::DataWriter::register_instance</code> (p. 928), or else the special value <code>dds::core::InstanceHandle::nil()</code> (p. 1358). If <code>T</code> has a key, <code>handle</code> must represent a registered instance of type <code>T</code> . Otherwise, this method may fail with <code>dds::core::InvalidArgumentError</code> (p. 1363).
<i>source_timestamp</i>	<< <i>in</i> >> (p. 157) The timestamp value must be greater than or equal to the timestamp value used in the last writer operation (used in a <i>register</i> , <i>unregister</i> , <i>dispose</i> , or <i>write</i> , with either the automatically supplied timestamp or the application provided timestamp). This timestamp may potentially affect the order in which readers observe events from multiple writers. This timestamp will be available to the <code>dds::sub::DataReader</code> (p. 756) objects by means of the <code>source_timestamp</code> attribute inside the <code>dds::sub::SampleInfo</code> (p. 1992).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), <code>dds::core::TimeoutError</code> (p. 2177), <code>dds::core::OutOfResourcesError</code> (p. 1629) or <code>dds::core::NotEnabledError</code> (p. 1601).
------------	---

See also

`dds::pub::DataWriter::dispose_instance()` (p. 932)

8.66.4.20 key_value() [1/2]

```
template<typename T >
T & dds::pub::DataWriter< T >::key_value (
    T & key_holder,
    const dds::core::InstanceHandle & handle ) [inline]
```

Retrieve the instance key that corresponds to an instance handle.

Useful for keyed data types.

The operation will only fill the fields that form the `key` inside the `key_holder` instance. If the type has no keys, this method has no effect and exits with no error.

For keyed data types, this operation may fail with `dds::core::InvalidArgumentError` (p. 1363) if the `handle` does not correspond to an existing data-object known to the `dds::pub::DataWriter` (p. 908).

Parameters

<i>key_holder</i>	<< <i>inout</i> >> (p. 157) a user data type specific key holder, whose <i>key</i> fields are filled by this operation. If <i>T</i> has no key, this method has no effect.
-------------------	--

Parameters

<i>handle</i>	<< <i>in</i> >> (p. 157) the <i>instance</i> whose key is to be retrieved. If <i>T</i> has a key, <i>handle</i> must represent a registered instance of type <i>T</i> . Otherwise, this method will fail with <code>dds::core::InvalidArgumentError</code> (p. 1363). If <i>T</i> has a key and <i>handle</i> is <code>dds::core::InstanceHandle::nil()</code> (p. 1358), this method will fail with <code>dds::core::InvalidArgumentError</code> (p. 1363).
---------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or <code>dds::core::NotEnabledError</code> (p. 1601).
------------	--

Returns

A reference to *key_holder*

See also

`dds::sub::DataReader::key_value` (p. 780)

8.66.4.21 `key_value()` [2/2]

```
template<typename T >
dds::topic::TopicInstance< T > & dds::pub::DataWriter< T >::key_value (
    dds::topic::TopicInstance< T > & key_holder,
    const dds::core::InstanceHandle & handle ) [inline]
```

Retrieve the instance key that corresponds to an instance handle.

See also

`key_value(T&, const dds::core::InstanceHandle&)` (p. 934)

8.66.4.22 lookup_instance()

```
template<typename T >
dds::core::InstanceHandle dds::pub::DataWriter< T >::lookup_instance (
    const T & key_holder ) [inline]
```

Retrieve the instance handle that corresponds to an instance `key_holder`.

Useful for keyed data types.

This operation takes as a parameter an instance and returns a handle that can be used in subsequent operations that accept an instance handle as an argument. The instance parameter is only used for the purpose of examining the fields that define the key. This operation does not register the instance in question. If the instance has not been previously registered, or if for any other reason RTI Connex is unable to provide an instance handle, RTI Connex will return the special value `HANDLE_NIL`.

Parameters

<code>key_holder</code>	<< <i>in</i> >> (p. 157) a user data type specific key holder.
-------------------------	--

Returns

the instance handle associated with this instance. If `T` has no key, this method has no effect and returns `dds::core::InstanceHandle::nil()` (p. 1358)

8.66.4.23 qos() [1/2]

```
template<typename T >
const dds::pub::qos::DataWriterQos dds::pub::DataWriter< T >::qos ( ) const [inline]
```

Gets the `DataWriterQos`.

8.66.4.24 qos() [2/2]

```
template<typename T >
void dds::pub::DataWriter< T >::qos (
    const dds::pub::qos::DataWriterQos & the_qos ) [inline]
```

Sets the `DataWriterQos`.

This operation modifies the QoS of the `dds::pub::DataWriter` (p. 908).

The `dds::core::policy::UserData` (p. 2292), `dds::core::policy::Deadline` (p. 1020), `dds::core::policy::LatencyBudget` (p. 1375), `dds::core::policy::OwnershipStrength` (p. 1637), `dds::core::policy::TransportPriority` (p. 2255), `dds::core::policy::Lifespan` (p. 1379) and `dds::core::policy::WriterDataLifecycle` (p. 2359) can be changed. The other policies are immutable.

Parameters

<i>the_qos</i>	<< <i>in</i> >> (p. 157) The <code>dds::pub::qos::DataWriterQos</code> (p. 994) to be set to. Policies must be consistent. Immutable policies cannot be changed after <code>dds::pub::DataWriter</code> (p. 908) is enabled. The special value <code>DATAWRITER_QOS_DEFAULT</code> can be used to indicate that the QoS of the <code>dds::pub::DataWriter</code> (p. 908) should be changed to match the current default <code>dds::pub::qos::DataWriterQos</code> (p. 994) set in the <code>dds::pub::Publisher</code> (p. 1719).
----------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), <code>dds::core::ImmutablePolicyError</code> (p. 1353) or <code>dds::core::InconsistentPolicyError</code> (p. 1354)
------------	---

See also

`dds::pub::qos::DataWriterQos` (p. 994) for rules on consistency among QoS

`set_qos (abstract)` (p. 1267)

Operations Allowed in Listener Callbacks (p. 1383)

8.66.4.25 `operator<<()` [4/4]

```
template<typename T >
DataWriter & dds::pub::DataWriter< T >::operator<< (
    const dds::pub::qos::DataWriterQos & the_qos ) [inline]
```

Set the `DataWriterQos`.

Parameters

<i>the_qos</i>	the new qos for this <code>DataWriter</code> (p. 908).
----------------	--

See also

`qos()` (p. 936)

8.66.4.26 `operator>>()`

```
template<typename T >
const DataWriter & dds::pub::DataWriter< T >::operator>> (
    dds::pub::qos::DataWriterQos & the_qos ) const [inline]
```

Get the `DataWriterQos`.

Parameters

<i>the_qos</i>	the object to populate with the qos for this DataWriter (p. 908).
----------------	--

See also

qos() (p. 936)

8.66.4.27 topic()

```
template<typename T >
const dds::topic::Topic< T > & dds::pub::DataWriter< T >::topic ( ) const [inline]
```

Get the **Topic** associated with this **DataWriter** (p. 908).

8.66.4.28 publisher()

```
template<typename T >
const dds::pub::Publisher & dds::pub::DataWriter< T >::publisher ( ) const [inline]
```

Get the **Publisher** (p. 1719) that owns this **DataWriter** (p. 908).

8.66.4.29 wait_for_acknowledgments()

```
template<typename T >
void dds::pub::DataWriter< T >::wait_for_acknowledgments (
    const dds::core::Duration & max_wait ) [inline]
```

Blocks the calling thread until all data written by reliable **DataWriter** (p. 908) entity is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable **dds::pub::DataWriter** (p. 908) entity is acknowledged by (a) all reliable **dds::sub::DataReader** (p. 756) entities that are matched and alive and (b) by all required subscriptions, or until the duration specified by the *max_wait* parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged by all reliable matched data readers and by all required subscriptions; a timeout indicates that *max_wait* elapsed before all the data was acknowledged.

Note that if a thread is blocked in the call to *wait_for_acknowledgments* on a **DataWriter** (p. 908) and a different thread writes new samples on the same **DataWriter** (p. 908), the new samples must be acknowledged before unblocking the thread waiting on *wait_for_acknowledgments*.

If the **dds::pub::DataWriter** (p. 908) does not have **dds::core::policy::Reliability** (p. 1873) kind set to RELIABLE, this operation will succeed immediately.

Parameters

<i>max_wait</i>	<< <i>in</i> >> (p. 157) Specifies maximum time to wait for acknowledgements dds::core::Duration (p. 1194) .
-----------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::NotEnabledError (p. 1601), dds::core::TimeoutError (p. 2177)
------------	---

8.66.4.30 listener() [1/2]

```
template<typename T >
void dds::pub::DataWriter< T >::listener (
    DataWriterListener< T > * l,
    const dds::core::status::StatusMask & mask ) [inline]
```

Sets the **DataWriter** (p. 908) listener.

[DEPRECATED] The use of **set_listener()** (p. 939) is recommended. Unlike this function, **set_listener** receives a **shared_ptr** which simplifies the management of listener's lifecycle.

Parameters

<i>l</i>	The DataWriterListener (p. 972) to set
<i>mask</i>	The dds::core::status::StatusMask (p. 2082) associated with the listener

8.66.4.31 listener() [2/2]

```
template<typename T >
DataWriterListener< T > * dds::pub::DataWriter< T >::listener ( ) const [inline]
```

Returns the listener currently associated with this **DataWriter** (p. 908).

[DEPRECATED] Prefer **get_listener()** (p. 940) instead of this function.

If there's no listener it returns NULL.

8.66.4.32 set_listener() [1/2]

```
template<typename T >
void dds::pub::DataWriter< T >::set_listener (
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this writer.

The writer will hold a `shared_ptr` to the listener argument, ensuring that it is not deleted at least until this writer is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the writer. If it does, the application needs to manually reset the listener or manually close this writer to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
<i>event_mask</i>	A mask that indicates which status updates will be notified to the listener

8.66.4.33 set_listener() [2/2]

```
template<typename T >
void dds::pub::DataWriter< T >::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets the listener associated with this writer.

If `the_listener` is not `nullptr`, this overload is equivalent to:

```
writer.set_listener(the_listener, dds::core::status::StatusMask::all());
```

If `the_listener` is `nullptr`, it is equivalent to:

```
writer.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
---------------------	---

8.66.4.34 get_listener()

```
template<typename T >
std::shared_ptr< Listener > dds::pub::DataWriter< T >::get_listener ( ) const [inline]
```

Returns the listener currently associated with this writer.

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.66.4.35 liveliness_lost_status()

```
template<typename T >
const dds::core::status::LivelinessLostStatus dds::pub::DataWriter< T >::liveliness_lost_status
( ) [inline]
```

Get the LivelinessLostStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

8.66.4.36 offered_deadline_missed_status()

```
template<typename T >
const dds::core::status::OfferedDeadlineMissedStatus dds::pub::DataWriter< T >::offered_↔
deadline_missed_status ( ) [inline]
```

Get the OfferedDeadlineMissedStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

8.66.4.37 offered_incompatible_qos_status()

```
template<typename T >
const dds::core::status::OfferedIncompatibleQosStatus dds::pub::DataWriter< T >::offered_↔
incompatible_qos_status ( ) [inline]
```

Get the OfferedIncompatibleQosStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

8.66.4.38 publication_matched_status()

```
template<typename T >
const dds::core::status::PublicationMatchedStatus dds::pub::DataWriter< T >::publication_↔
matched_status ( ) [inline]
```

Get the PublicationMatchedStatus.

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

8.66.4.39 assert_liveliness()

```
template<typename T >
void dds::pub::DataWriter< T >::assert_liveliness ( ) [inline]
```

Manually asserts the liveliness of this **DataWriter** (p. 908).

This is used in combination with the **LIVELINESS** (p. 326) policy to indicate to RTI Connexxt that the **dds::pub::Data↔Writer** (p. 908) remains active.

You only need to use this operation if the **LIVELINESS** (p. 326) setting is either `dds::core::policy::LivelinessKind::↔MANUAL_BY_PARTICIPANT` or `dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC`. Otherwise, it has no effect.

Note: writing data via the `dds::pub::DataWriter::write()` (p. 918) or `dds::pub::DataWriter::write(const T&, const dds::core::Time&)` (p. 919) operation asserts liveliness on the **dds::pub::DataWriter** (p. 908) itself, and its **dds↔::domain::DomainParticipant** (p. 1079). Consequently the use of `assert_liveliness()` (p. 942) is only needed if the application is not writing data regularly.

Exceptions

One	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
-----	---

See also

dds::core::policy::Liveliness (p. 1389)

8.66.4.40 unregister_instance() [3/3]

```
template<typename T >
void unregister_instance (
    rti::pub::WriteParams & params )
```

<<**extension**>> (p. 156) Unregister an instance with parameters

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

See also

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 949)

dds::pub::DataWriter::dispose_instance(rti::pub::WriteParams&) (p. 943)

8.66.4.41 dispose_instance() [3/3]

```
template<typename T >
void dispose_instance (
    rti::pub::WriteParams & params )
```

<<**extension**>> (p. 156) Dispose an instance with parameters

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

See also

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 949)

8.66.4.42 is_sample_app_acknowledged()

```
template<typename T >
bool is_sample_app_acknowledged (
    const rti::core::SampleIdentity & sample_id )
```

<<**extension**>> (p. 156) Indicates if a sample is considered application-acknowledged

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This method can be used to see if a sample has been application acknowledged by all the matching DataReaders that were alive when the sample was written.

If a DataReader does not enable application acknowledgment (by setting **dds::core::policy::Reliability**↔**::acknowledgment_kind** (p. 1878) to a value other than **rti::core::policy::AcknowledgmentKind_def::PROTOCOL** (p. 585)), the sample is considered application acknowledged for that DataReader.

Parameters

<i>sample</i> ↔ <i>_id</i>	<< in >> (p. 157) Sample identity.
-------------------------------	---

Returns

true when the sample has been application acknowledged. Otherwise, false.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.66.4.43 wait_for_asynchronous_publishing()

```
template<typename T >
void wait_for_asynchronous_publishing (
    const dds::core::Duration & max_wait )
```

<<**extension**>> (p. 156) Blocks the calling thread until asynchronous sending is complete.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This operation blocks the calling thread (up to `max_wait`) until all data written by the asynchronous **dds::pub::DataWriter** (p. 908) is sent and acknowledged (if reliable) by all matched **dds::sub::DataReader** (p. 756) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; a time out indicates that `max_wait` elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **dds::sub::DataReader** (p. 756) is complete in addition to what **dds::pub::DataWriter::wait_for_acks** (p. 938) provides.

If the **dds::pub::DataWriter** (p. 908) does not have **rti::core::policy::PublishMode** (p. 1739) kind set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745) the operation will complete immediately with .

Parameters

<code>max_wait</code>	<< <i>in</i> >> (p. 157) Specifies maximum time to wait for acknowledgements dds::core::Duration (p. 1194) .
-----------------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::NotEnabledError (p. 1601), dds::core::TimeoutError (p. 2177)
------------	---

8.66.4.44 reliable_writer_cache_changed_status()

```
template<typename T >
rti::core::status::ReliableWriterCacheChangedStatus reliable_writer_cache_changed_status ( )
```

<<*extension*>> (p. 156) Get the reliable cache status for this writer.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.66.4.45 reliable_reader_activity_changed_status()

```
template<typename T >
rti::core::status::ReliableReaderActivityChangedStatus reliable_reader_activity_changed_status ( )
```

<<**extension**>> (p. 156) Get the reliable reader activity changed status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

8.66.4.46 datawriter_cache_status()

```
template<typename T >
rti::core::status::DataWriterCacheStatus datawriter_cache_status ( )
```

<<**extension**>> (p. 156) Get the cache status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Exceptions

One	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
-----	--

8.66.4.47 datawriter_protocol_status()

```
template<typename T >
rti::core::status::DataWriterProtocolStatus datawriter_protocol_status ( )
```

<<**extension**>> (p. 156) Get the protocol status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
------------	--

8.66.4.48 matched_subscription_datawriter_protocol_status() [1/2]

```
template<typename T >
rti::core::status::DataWriterProtocolStatus matched_subscription_datawriter_protocol_status (
    const dds::core::InstanceHandle & subscription_handle )
```

<<**extension**>> (p. 156) Get the datawriter protocol status for this writer, per matched subscription identified by the subscription_handle.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Parameters

<i>subscription_handle</i>	<< in >> (p. 157) Handle to a specific subscription associated with the dds::sub::DataReader (p. 756). Must correspond to a subscription currently associated with the dds::pub::DataWriter (p. 908).
----------------------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
------------	--

8.66.4.49 matched_subscription_datawriter_protocol_status() [2/2]

```
template<typename T >
rti::core::status::DataWriterProtocolStatus matched_subscription_datawriter_protocol_status (
    const rti::core::Locator & subscription_locator )
```

<<**extension**>> (p. 156) Get the datawriter protocol status for this writer, per matched subscription identified by the locator

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
------------	--

Parameters

<i>subscription_locator</i>	<< in >> (p. 157) Locator to a specific locator associated with the DataReader. Must correspond to a locator of one or more subscriptions currently associated with the DataWriter (p. 908).
-----------------------------	--

8.66.4.50 service_request_accepted_status()

```
template<typename T >
rti::core::status::ServiceRequestAcceptedStatus service_request_accepted_status ( )
```

<<**extension**>> (p. 156) Get the service request accepted status for this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Note: Status for a remote entity is only kept while the entity is alive. Once a remote entity is no longer alive, its status is deleted.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
------------	--

8.66.4.51 flush()

```
template<typename T >
void flush ( )
```

<<**extension**>> (p. 156) Flushes the batch in progress in the context of the calling thread.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

After being flushed, the batch is available to be sent on the network.

If the **dds::pub::DataWriter** (p. 908) does not have **rti::core::policy::PublishMode** (p. 1739) kind set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745), the batch will be sent on the network immediately (in the context of the calling thread).

If the **dds::pub::DataWriter** (p. 908) does have **rti::core::policy::PublishMode** (p. 1739) kind set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745), the batch will be sent in the context of the asynchronous publishing thread.

This operation may block in the same conditions as **dds::pub::DataWriter::write()** (p. 918).

If this operation does block, the RELIABILITY `max_blocking_time` configures the maximum time the write operation may block (waiting for space to become available). If `max_blocking_time` elapses before the DDS_DataWriter is able to store the modification without exceeding the limits, the operation will fail with `DDS_RETCODE_TIMEOUT`.

MT Safety:

flush() (p. 948) is only thread-safe with batching if **rti::core::policy::Batch::thread_safe_write** (p. 671) is TRUE.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::TimeoutError (p. 2177), dds::core::OutOfResourcesError (p. 1629) or dds::core::NotEnabledError (p. 1601).
------------	---

8.66.4.52 write() [11/11]

```
template<typename T >
void write (
    const T & instance_data,
    rti::pub::WriteParams & params )
```

<<**extension**>> (p. 156) Write with advanced parameters

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Allows provision of the sample identity, related sample identity, source timestamp, instance handle, and publication priority contained in `params`.

This operation may block and time out (**dds::core::TimeoutError** (p. 2177)) under the same circumstances described for **dds::pub::DataWriter::write()** (p. 918).

If there are no instance resources left, this operation may fail with **dds::core::OutOfResourcesError** (p. 1629). Calling **dds::pub::DataWriter::unregister_instance(rti::pub::WriteParams&)** (p. 943) may help free up some resources.

This operation may fail with **dds::core::InvalidArgumentError** (p. 1363) under the same circumstances described for the **dds::pub::DataWriter::write()** (p. 918).

Parameters

<i>instance_data</i>	<< <i>in</i> >> (p. 157) The data to write.
<i>params</i>	<< <i>inout</i> >> (p. 157) The write parameters. Note that this is an inout parameter if you activate rti::pub::WriteParams::replace_automatic_values (p. 2344); otherwise it won't be modified.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::TimeoutError (p. 2177), dds::core::OutOfResourcesError (p. 1629) or dds::core::NotEnabledError (p. 1601).
------------	---

dds::pub::DataWriter::write() (p. 918)

dds::sub::DataReader (p. 756)

8.66.4.53 write_noexcept() [1/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
    const T & sample ) [noexcept]
```

<<**extension**>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&)** (p. 918) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Example:

```
auto result = writer->write_noexcept(sample);
if (!result.is_ok()) {
    if (result.get_return_code() == DDS_RETCODE_TIMEOUT) {
        // Handle timeout
    }
    // ...
}
```

Returns

The Result of the operation.

8.66.4.54 write_noexcept() [2/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
    const T & sample,
    const dds::core::Time & timestamp ) [noexcept]
```

<<**extension**>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, const dds::core::Time&)** (p. 919) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.66.4.55 write_noexcept() [3/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
    const T & sample,
    const dds::core::InstanceHandle & instance ) [noexcept]
```

<<**extension**>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, const dds::core::InstanceHandle&)** (p. 919) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.66.4.56 write_noexcept() [4/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
    const T & sample,
    const dds::core::InstanceHandle & instance,
    const dds::core::Time & timestamp ) [noexcept]
```

<<**extension**>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, const dds::core::InstanceHandle&, const dds::core::Time&)** (p. 923) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.66.4.57 write_noexcept() [5/5]

```
template<typename T >
rti::core::Result< void > write_noexcept (
    const T & instance_data,
    rti::pub::WriteParams & params ) [noexcept]
```

<<**extension**>> (p. 156) Alternative to **write()** (p. 918) that doesn't throw exceptions.

This operation behaves exactly like **write(const T&, rti::pub::WriteParams&)** (p. 949) but is guaranteed to not throw exceptions.

As an extension function, it must be accessed with the `extensions()` method or with the `->` operator. Since `extensions()` can throw if the object is not a valid reference, the `->` operator is recommended.

Returns

The Result of the operation.

8.66.4.58 create_data()

```
template<typename T >
T * create_data ( )
```

<<**extension**>> (p. 156) Create data from this writer and initialize it

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Returns

Newly created data type

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

dds::pub::DataWriter::delete_data (p. 953)

8.66.4.59 delete_data()

```
template<typename T >
bool delete_data (
    T * sample )
```

<<**extension**>> (p. 156) Delete data created with **create_data()** (p. 952).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The behavior of this API is identical to FooTypeSupport::delete_data.

Parameters

<i>sample</i>	<< in >> (p. 157) Cannot be NULL.
---------------	--

Returns

true on success.

See also

dds::pub::DataWriter::create_data (p. 952)

8.66.4.60 get_loan()

```
template<typename T >
T * get_loan ( )
```

<<**extension**>> (p. 156) Get a loaned sample from this writer

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This operation is supported while using **Zero Copy transfer** (p. 49) over shared memory" or \ref RTIFlatDataModule "FlatData language binding". For FlatData types, this function should be used directly if the type is final; if the type is mutable, **rti::flat::build_data()** (p. 211) should be used to obtain a sample builder to work with the loaned sample.

The loaned sample is obtained from a DataWriter-managed sample pool and is uninitialized by default. An initialized sample can be obtained by setting **rti::core::policy::DataWriterResourceLimits::initialize_writer_loaned_sample** (p. 1013) to true. The **rti::core::policy::DataWriterResourceLimits::writer_loaned_sample_allocation** (p. 1012) settings can be used to configure the DataWriter-managed sample pool.

dds::pub::DataWriter::get_loan (p. 953) fails with **dds::core::OutOfResourcesError** (p. 1629) if **rti::core::AllocationSettings::max_count** (p. 592) samples have been loaned, and none of those samples has been written with **dds::pub::DataWriter::write()** (p. 918) or discarded via **dds::pub::DataWriter::discard_loan** (p. 955).

Samples returned from **dds::pub::DataWriter::get_loan** (p. 953) have an associated state. Due to the optimized nature of the write operation while using Zero Copy transfer over shared memory or FlatData language binding, this sample state is used to control when a sample is available for reuse after the write operation. The possible sample states are free, allocated, removed or serialized. A sample that has never been allocated is "free". **dds::pub::DataWriter::get_loan** (p. 953) takes a "free" or "removed" sample and makes it "allocated". When a sample is written, its state transitions from "allocated" to "serialized", and the **DataWriter** (p. 908) takes responsibility for returning the sample back to its sample pool. The sample remains in the "serialized" state until it is removed from the **DataWriter** (p. 908) queue. For a reliable **DataWriter** (p. 908), the sample is removed from the **DataWriter** (p. 908)'s queue when the sample is acknowledged by all DataReaders. For a best-effort **DataWriter** (p. 908), the sample is removed from the queue immediately after the write operation. After the sample is removed from the **DataWriter** (p. 908) queue, the sample is put back into the sample pool, and its state transitions from "serialized" to "removed". At this time, a new call to **dds::pub::DataWriter::get_loan** (p. 953) may return the same sample.

A loaned sample should not be reused to write a new value after the first write operation. Instead, a new sample from **dds::pub::DataWriter::get_loan** (p. 953) should be used to write the new value. A loaned sample that has not been written can be returned to the **DataWriter** (p. 908)'s sample pool by using **dds::pub::DataWriter::discard_loan** (p. 955). If the write operation fails, then the sample can be used again with a write or discard_loan operation. Disposing or unregistering an instance with loaned samples follows the same pattern. A loaned sample used successfully with a dispose or unregister operation cannot be used again. But if the dispose or unregister operation fails, the sample is available for reuse.

A **DataWriter** (p. 908) cannot write managed samples (created with get_loan) and unmanaged samples (created in any other way) at the same time. The first call to get_loan automatically prepares this **DataWriter** (p. 908) to work with managed samples. Calls to get_loan will fail with **dds::core::PreconditionNotMetError** (p. 1669) if an unmanaged sample was written with this **DataWriter** (p. 908) earlier. Similarly, **dds::pub::DataWriter::write()** (p. 918) will fail to write an unmanaged sample if get_loan was called.

Returns

a loaned sample

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::OutOfResourcesError (p. 1629) or dds::core::PreconditionNotMetError (p. 1669).
------------	---

8.66.5 Friends And Related Function Documentation

8.66.5.1 ignore() [1/2]

```
template<typename T >
void ignore (
    dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle ) [related]
```

Instructs RTI Connex to locally ignore a publication.

A publication is defined by the association of a topic name, user data, and partition set on the **dds::pub::Publisher** (p. 1719) (see **dds::topic::PublicationBuiltinTopicData** (p. 1703)). After this call, any data written by that publication's **dds::pub::DataWriter** (p. 908) will be ignored.

This operation can be used to ignore local *and* remote DataWriters.

The publication (**DataWriter** (p. 908)) to ignore is identified by the `handle` argument.

- To ignore a *remote* **DataWriter** (p. 908), the `handle` can be obtained from the **dds::sub::SampleInfo** (p. 1992) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 756) for the publication topic.
- To ignore a *local* **DataWriter** (p. 908), the `handle` can be obtained by calling **dds::core::Entity::instance_↔handle()** (p. 1270) for the local **DataWriter** (p. 908).

There is no way to reverse this operation.

Parameters

<i>participant</i>	The DomainParticipant where the publication will be ignored
<i>handle</i>	<< <i>in</i> >> (p. 157) Handle of the dds::pub::DataWriter (p. 908) to be ignored.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::OutOfResourcesError (p. 1629) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

`dds::topic::PublicationBuiltinTopicData` (p. 1703)

`dds::topic::publication_topic_name()` (p. 243)

`dds::sub::builtin_subscriber` (p. 459)

8.66.5.2 `ignore()` [2/2]

```
template<typename FwdIterator >
void ignore (
    dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end ) [related]
```

Instructs RTI Connex to locally ignore several publications.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is <code>dds::core::InstanceHandle</code> (p. 1356)
--------------------	---

See also

`ignore(dds::domain::DomainParticipant&, const dds::core::InstanceHandle&)` (p. 956);

References `dds::pub::ignore()`.

8.66.5.3 `matched_subscriptions()` [1/2]

```
template<typename T >
dds::core::InstanceHandleSeq matched_subscriptions (
    const dds::pub::DataWriter< T > & writer ) [related]
```

Retrieve the list of subscriptions currently associated with a `dds::pub::DataWriter` (p. 908).

A subscription is considered to be matching if all of the following criteria are true:

- The subscription is within the same domain as this publication.
- The subscription has a matching `dds::topic::Topic` (p. 2178).
- The subscription has compatible QoS.
- If the applications are using partitions, the subscription shares a common partition with this publication.

- The `dds::domain::DomainParticipant` (p. 1079) has not indicated that the subscription's `dds::domain::DomainParticipant` (p. 1079) should be "ignored" by means of the `dds::pub::ignore` (p. 435) API.
- If the publication is using the `rti::core::policy::MultiChannel` (p. 1483) and the subscription is using a `dds::topic::ContentFilteredTopic` (p. 735), there is an intersection between at least one of the associated filters.
- If the endpoints need to exchange key material to communicate (i.e., they are securing their communications), the writer has completed the key exchange with reader.

The handles returned list are the ones that RTI Connex uses to locally identify the corresponding matched `dds::sub::DataReader` (p. 756) entities. These handles match the ones that appear in the `dds::sub::SampleInfo::instance_handle` (p. 1997) field of the `dds::sub::SampleInfo` (p. 1992) when reading the `dds::topic::subscription_topic_name()` (p. 243) builtin topic.

This API may return the subscription handles of subscriptions that are inactive. `dds::pub::DataWriter::is_matched_subscription_active` (p. 961) can be used to check this.

The maximum number of matches possible is configured with `rti::core::policy::DomainParticipantResourceLimits` (p. 1143).

Exceptions

One	of the Standard Exceptions (p. 228), or <code>dds::core::NotEnabledError</code> (p. 1601)
-----	--

8.66.5.4 `matched_subscriptions()` [2/2]

```
template<typename T , typename FwdIterator >
FwdIterator matched_subscriptions (
    const dds::pub::DataWriter< T > & writer,
    FwdIterator begin,
    FwdIterator end ) [related]
```

Retrieve the list of subscriptions currently associated with a `dds::pub::DataWriter` (p. 908).

This operation is similar to `matched_subscriptions(const dds::pub::DataWriter<T>&)` (p. 957) but it copies the instance handles into an iterator range.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is <code>dds::core::InstanceHandle</code> (p. 1356)
--------------------	---

References `dds::pub::matched_subscriptions()`.

8.66.5.5 matched_subscription_data() [1/2]

```
template<typename T >
const dds::topic::SubscriptionBuiltinTopicData matched_subscription_data (
    const dds::pub::DataWriter< T > & writer,
    const dds::core::InstanceHandle & subscription_handle ) [related]
```

Retrieves information on a subscription that is currently associated with a **dds::pub::DataWriter** (p. 908).

The `subscription_handle` must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 908). Otherwise, the operation will fail and fail with **dds::core::InvalidArgumentError** (p. 1363). Use **dds::pub::matched_subscriptions()** (p. 436) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 908).

The above information is also available through **dds::sub::DataReaderListener::on_data_available()** (p. 835) (if a reader listener is installed on the `dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>`).

When the subscription data is updated, for example when the content filter property changes, there is a small window of time in between when the **DataWriter** (p. 908) is made aware of these changes and when they actually take effect. Taking effect in this example means that the **DataWriter** (p. 908) will perform writer-side filtering using the new filter property values (filter expression and/or parameters).

When the **DataWriter** (p. 908) is made aware of the changes they will first be seen in the **dds::sub::DataReaderListener::on_data_available()** (p. 835) of the `dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>`. When these changes are applied, they will be seen in the output of this API because this API blocks until the most recent changes known to the **DataWriter** (p. 908) have taken effect. This API will only block when called outside of a listener callback, in order to not block the internal threads from making progress.

If application behavior depends on being made aware of information about a subscription only after it has taken effect on the **DataWriter** (p. 908), the recommended pattern for usage of this API is to wait for subscription data to be received either through polling this API or by installing a listener on the `dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>`. When a new sample is received by the builtin **DataReader**, this API may be called in a separate thread and will return the expected matched subscription data once it has been applied to the **DataWriter** (p. 908).

Because this API blocks, it is possible for this API to time out while waiting for the changes to be applied. A timeout may happen if the **DataReader's** subscription data is changing rapidly, preventing the **DataWriter** (p. 908) from returning valid information before newer data has been received, or if an application is performing a task in a listener callback, thereby preventing the middleware's threads from executing events in a timely manner.

Note: This operation does not retrieve the **dds::topic::SubscriptionBuiltinTopicData::type** (p. 2140). This information is available through **dds::sub::DataReaderListener::on_data_available()** (p. 835) (if a reader listener is installed on the `dds::sub::DataReader<dds::topic::SubscriptionBuiltinTopicData>`).

Parameters

<i>writer</i>	The DataWriter (p. 908) to which the subscription is associated
<i>subscription_handle</i>	<<in>> (p. 157). Handle to a specific subscription associated with the dds::sub::DataReader (p. 756). Must correspond to a subscription currently associated with the dds::pub::DataWriter (p. 908).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::NotEnabledError (p. 1601), or dds::core::TimeoutError (p. 2177)
------------	--

8.66.5.6 `matched_subscription_participant_data()`

```
template<typename T >
dds::topic::ParticipantBuiltinTopicData matched_subscription_participant_data (
    const dds::pub::DataWriter< T > & writer,
    const dds::core::InstanceHandle & handle ) [related]
```

<<*extension*>> (p. 156) This operation retrieves the information on the discovered **dds::domain::Domain**↔**Participant** (p. 1079) associated with the subscription that is currently matching with the **dds::pub::DataWriter** (p. 908).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

The `subscription_handle` must correspond to a subscription currently associated with the **dds::pub::DataWriter** (p. 908). Otherwise, the operation will fail with **dds::core::InvalidArgumentError** (p. 1363). The operation may also fail with **dds::core::PreconditionNotMetError** (p. 1669) if the subscription corresponds to the same **dds::domain::DomainParticipant** (p. 1079) that the **DataWriter** (p. 908) belongs to. Use **dds::pub::matched_subscriptions()** (p. 436) to find the subscriptions that are currently matched with the **dds::pub::DataWriter** (p. 908).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::NotEnabledError (p. 1601)
------------	--

Template Parameters

<i>T</i>	The topic-type that the DataWriter (p. 908) subscribes to
----------	--

Parameters

<i>writer</i>	The writer to lookup the matched participant data of
<i>handle</i>	The InstanceHandle to a specific subscription. Must correspond to a subscription currently associated with the DataWriter (p. 908).

Returns

The **dds::topic::ParticipantBuiltinTopicData** (p. 1639) of the DomainParticipant of a matched subscription of a **dds::pub::DataWriter** (p. 908)

8.66.5.7 matched_subscriptions_locators()

```
template<typename T >
rti::core::LocatorSeq matched_subscriptions_locators (
    const dds::pub::DataWriter< T > & writer ) [related]
```

<<**extension**>> (p. 156) Retrieve the list of locators for subscriptions currently associated with this **DataWriter** (p. 908).

The locators returned are the ones that are used by the DDS implementation to communicate with the corresponding matched DataReaders.

Template Parameters

<i>T</i>	The topic-type that the DataWriter (p. 908) publishes.
----------	---

Parameters

<i>writer</i>	The DataWriter (p. 908).
---------------	---------------------------------

Returns

The list of locators

8.66.5.8 is_matched_subscription_active()

```
template<typename T >
bool is_matched_subscription_active (
    const dds::pub::DataWriter< T > & writer,
    const dds::core::InstanceHandle & handle ) [related]
```

<<**extension**>> (p. 156) Check if a matched subscription is active.

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>T</i>	The topic-type that the DataWriter (p. 908) publishes.
----------	---

Parameters

<i>writer</i>	The DataWriter (p. 908).
<i>handle</i>	The dds::core::InstanceHandle (p. 1356) of the matched subscription.

This API is used for querying the endpoint liveness of a matched subscription. A matched subscription will be marked as inactive when it becomes nonprogressing (e.g., not responding to a **DataWriter** (p. 908)'s heartbeats, or letting its internal queue fill up without taking the available data). Note that if the participant associated with the matched subscription loses liveness, the **dds::core::InstanceHandle** (p. 1356) will become invalid and this function will fail with **dds::core::InvalidArgumentError** (p. 1363).

Returns

A boolean indicating whether or not the matched subscription is active.

8.66.5.9 matched_subscription_data() [2/2]

```
template<typename T >
std::vector< dds::topic::SubscriptionBuiltinTopicData > matched_subscription_data (
    const dds::pub::DataWriter< T > & writer ) [related]
```

<<**extension**>> (p. 156) Obtain the SubscriptionBuiltinTopicData for all of the subscriptions matched with a **DataWriter** (p. 908).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

This API retrieves the matched publication data from all of the subscriptions currently matched a **DataWriter** (p. 908).

Template Parameters

<i>T</i>	The topic-type that the DataWriter (p. 908) publishes.
----------	---

Parameters

<i>writer</i>	The DataWriter (p. 908).
---------------	---------------------------------

Returns

A `std::vector` containing all of the matched subscription data.

8.66.5.10 `find()` [1/2]

```
template<typename Writer , typename FwdIterator >
uint32_t find (
    const dds::pub::Publisher & publisher,
    RTI_STRING_IN topic_name,
    FwdIterator begin,
    uint32_t max_size ) [related]
```

Retrieves the **dds::pub::DataWriter** (p. 908) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 908) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p. 908) is attached to the **dds::pub::Publisher** (p. 1719) with the same `topic_name`, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 908) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 908).

This function retrieves a previously-created **DataWriter** (p. 908) belonging to the **dds::pub::Publisher** (p. 1719) that is attached to a **dds::topic::Topic** (p. 2178) with a matching topic name. If no such **DataWriter** (p. 908) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p. 1719) allows access to the built-in **DataWriter** (p. 908) entities for the built-in topics

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
<i>FwdIterator</i>	The type of forward iterator passed to this function

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) the DataWriter (p. 908) belongs to
<i>topic_name</i>	Name of the dds::topic::Topic (p. 2178) associated with the DataWriter (p. 908) that is to be looked up.
<i>begin</i>	A forward iterator to the position in the destination container to insert the found DataWriter (p. 908) in
<i>max_size</i>	Only 1 DataWriter (p. 908) will be returned from this function

Returns

The number of **DataWriters** that were found (either 0 or 1)

8.66.5.11 find() [2/2]

```
template<typename Writer , typename BinIterator >
uint32_t find (
    const dds::pub::Publisher & publisher,
    RTI_STRING_IN topic_name,
    BinIterator begin ) [related]
```

Retrieves the **dds::pub::DataWriter** (p. 908) for a specific topic name.

This returned **dds::pub::DataWriter** (p. 908) is either enabled or disabled.

If more than one **dds::pub::DataWriter** (p.908) is attached to the **dds::pub::Publisher** (p.1719) with the same *topic_name*, then this operation may return any one of them.

MT Safety:

UNSAFE. It is not safe to lookup a **dds::pub::DataWriter** (p. 908) in one thread while another thread is simultaneously creating or destroying that **dds::pub::DataWriter** (p. 908).

This function retrieves a previously created **DataWriter** (p.908) belonging to the **dds::pub::Publisher** (p.1719) that is attached to a **dds::topic::Topic** (p.2178) with a matching topic name. If no such **DataWriter** (p.908) exists, the operation will return an empty container. The use of this operation on the built-in **Publisher** (p.1719) allows access to the built-in **DataWriter** (p. 908) entities for the built-in topics

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p.603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p.1364))
<i>BinIterator</i>	BinIterator The type of back-inserting iterator passed to this function

Parameters

<i>publisher</i>	The dds::pub::Publisher (p.1719) the DataWriter (p.908) belongs to
<i>topic_name</i>	Name of the dds::topic::Topic (p.2178) associated with the DataWriter (p.908) that is to be looked up.
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataWriter (p.908) into

Returns

The number of DataWriters that were found (either 0 or 1)

8.66.5.12 find_datawriters() [1/2]

```
template<typename AnyDataWriterBackInsertIterator >
uint32_t find_datawriters (
    dds::pub::Publisher publisher,
    AnyDataWriterBackInsertIterator begin ) [related]
```

Retrieve all the **dds::pub::DataWriter** (p. 908) created from this **dds::pub::Publisher** (p. 1719).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>AnyDataWriterBackInsertIterator</i>	An iterator whose <code>value_type</code> is dds::pub::AnyDataWriter (p. 603)
--	--

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) the DataWriters belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found DataWriters into

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 115)

8.66.5.13 find_datawriters() [2/2]

```
template<typename AnyDataWriterForwardIterator >
uint32_t find_datawriters (
    dds::pub::Publisher publisher,
    AnyDataWriterForwardIterator begin,
    uint32_t max_size ) [related]
```

Retrieve all the **dds::pub::DataWriter** (p. 908) created from this **dds::pub::Publisher** (p. 1719).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>AnyDataWriterForwardIterator</i>	An iterator whose <code>value_type</code> is <code>dds::pub::AnyDataWriter</code> (p. 603)
-------------------------------------	--

Parameters

<i>publisher</i>	The <code>dds::pub::Publisher</code> (p. 1719) the DataWriters belong to
<i>begin</i>	A forward iterator to the first position in the destination container to copy the found DataWriters into
<i>max_size</i>	The maximum number of DataWriters to return

Returns

The number of found DataWriters

See also

Looking up DataWriters (p. 115)

8.66.5.14 `find_datawriter_by_topic_name()`

```
template<typename Writer >
Writer find_datawriter_by_topic_name (
    dds::pub::Publisher publisher,
    const std::string & topic_name ) [related]
```

<<*extension*>> (p. 156) Retrieves a `dds::pub::DataWriter` (p. 908) with the given name within the `dds::pub::Publisher` (p. 1719)

Note

This is a standalone function in the namespace `rti::pub` (p. 523)

Every `dds::pub::DataWriter` (p. 908) in the system has an entity name which is configured and stored in the <<*extension*>> (p. 156) `EntityName` policy, `ENTITY_NAME` (p. 323).

This operation retrieves the `dds::pub::DataWriter` (p. 908) within the `dds::pub::Publisher` (p. 1719) whose name matches the one specified. If there are several `dds::pub::DataWriter` (p. 908) with the same name within the `dds::pub::Publisher` (p. 1719), the operation returns the first matching occurrence.

Template Parameters

<i>Writer</i>	The type of the writer. It can be <code>dds::pub::AnyDataWriter</code> (p. 603), or an instantiation of <code>dds::pub::DataWriter<T></code> (if T is not the correct type, this function throws <code>dds::core::InvalidDowncastError</code> (p. 1364))
---------------	--

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) that created the DataWriter (p. 908) to find
<i>topic_name</i>	Entity name of the DataWriter (p. 908) to find

Returns

The **AnyDataWriter** (p. 603) with the given name

See also

Looking up DataWriters (p. 115)

References **dds::core::null**.

8.66.5.15 find_datawriter_by_name() [1/2]

```
template<typename Writer >
Writer find_datawriter_by_name (
    dds::pub::Publisher publisher,
    const std::string & datawriter_name ) [related]
```

<<**extension**>> (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) with the given name within the **dds::pub::Publisher** (p. 1719)

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Every **dds::pub::DataWriter** (p. 908) in the system has an entity name which is configured and stored in the <<**extension**>> (p. 156) EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves the **dds::pub::DataWriter** (p. 908) within the **dds::pub::Publisher** (p. 1719) whose name matches the one specified. If there are several **dds::pub::DataWriter** (p. 908) with the same name within the **dds::pub::Publisher** (p. 1719), the operation returns the first matching occurrence.

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Parameters

<i>publisher</i>	The dds::pub::Publisher (p. 1719) that created the DataWriter (p. 908) to find
------------------	--

Parameters

<i>datawriter_name</i>	Entity name of the DataWriter (p. 908) to find
------------------------	---

Returns

The **WRITER** with the given name

See also

Looking up DataWriters (p. 115)

References **dds::core::null**.

8.66.5.16 find_datawriter_by_name() [2/2]

```
template<typename Writer >
Writer find_datawriter_by_name (
    dds::domain::DomainParticipant participant,
    const std::string & datawriter_name ) [related]
```

<<**extension**>> (p. 156) Retrieves a **dds::pub::DataWriter** (p. 908) within the **dds::domain::DomainParticipant** (p. 1079) with the given name

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Every **dds::pub::DataWriter** (p. 908) in the system has an entity name which is configured and stored in the **EntityName** policy, **ENTITY_NAME** (p. 323).

Every **dds::pub::Publisher** (p. 1719) in the system has an entity name which is also configured and stored in the **EntityName** policy.

This operation retrieves a **dds::pub::DataWriter** (p. 908) within a **dds::pub::Publisher** (p. 1719) given the specified name which encodes both to the **dds::pub::DataWriter** (p. 908) and the **dds::pub::Publisher** (p. 1719) name.

If there are several **dds::pub::DataWriter** (p. 908) with the same name within the corresponding **dds::pub::Publisher** (p. 1719) this function returns the first matching occurrence.

The specified name might be given as a fully-qualified entity name or as a plain name.

The fully qualified entity name is a concatenation of the **dds::pub::Publisher** (p. 1719) to which the **dds::pub::DataWriter** (p. 908) belongs and the entity name of of the **dds::pub::DataWriter** (p. 908) itself, separated by a double colon "::**:**". For example: MyPublisherName::**MyDataWriterName**

The plain name contains the **dds::pub::DataWriter** (p. 908) name only. In this situation it is implied that the **dds::pub::DataWriter** (p. 908) belongs to the implicit **dds::pub::Publisher** (p. 1719) so the use of a plain name is equivalent to specifying a fully qualified name with the **dds::pub::Publisher** (p. 1719) name part being "implicit". For example: the plain name "MyDataWriterName" is equivalent to specifying the fully qualified name "implicit::**MyDataWriterName**"

The **dds::pub::DataWriter** (p. 908) is only looked up within the **dds::pub::Publisher** (p. 1719) specified in the fully qualified name, or within the implicit **dds::pub::Publisher** (p. 1719) if the name was not fully qualified.

Template Parameters

<i>Writer</i>	The type of the writer. It can be dds::pub::AnyDataWriter (p. 603), or an instantiation of dds::pub::DataWriter<T> (if T is not the correct type, this function throws dds::core::InvalidDowncastError (p. 1364))
---------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) within which the dds::pub::DataWriter (p. 908) exists
<i>datawriter_name</i>	EntityName (p. 1275) of the DataWriter (p. 908) to find

Returns

The WRITER with the given name

The highest value of `rti::core::status::DataWriterCacheStatus::unregistered_instance_count` (p. 971) over the lifetime of the DataWriter.

8.67.1 Detailed Description

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::datawriter_cache()` (p. 2093)

Entity:

`dds::pub::DataWriter` (p. 908)

8.67.2 Member Function Documentation

8.67.2.1 `sample_count()`

```
int64_t rti::core::status::DataWriterCacheStatus::sample_count ( ) const [inline]
```

The number of samples in the DataWriter's queue. This statistic includes meta-samples that represent the unregistration or disposal of an instance.

8.67.2.2 `sample_count_peak()`

```
int64_t rti::core::status::DataWriterCacheStatus::sample_count_peak ( ) const [inline]
```

The highest value of `rti::core::status::DataWriterCacheStatus::sample_count` (p. 970) over the lifetime of the DataWriter.

8.67.2.3 alive_instance_count()

```
int64_t rti::core::status::DataWriterCacheStatus::alive_instance_count ( ) const [inline]
```

The number of instances currently in the DataWriter's queue that have an instance_state equal to **dds::sub::status::InstanceState::alive**() (p. 1361).

8.67.2.4 alive_instance_count_peak()

```
int64_t rti::core::status::DataWriterCacheStatus::alive_instance_count_peak ( ) const [inline]
```

The highest value of **rti::core::status::DataWriterCacheStatus::alive_instance_count** (p. 970) over the lifetime of the DataWriter.

8.67.2.5 disposed_instance_count()

```
int64_t rti::core::status::DataWriterCacheStatus::disposed_instance_count ( ) const [inline]
```

The number of instances currently in the DataWriter's queue that have an instance_state equal to **dds::sub::status::InstanceState::not_alive_disposed**() (p. 1361) (due to, for example, being disposed via the **dds::pub::DataWriter::dispose_instance**() (p. 932) operation).

8.67.2.6 disposed_instance_count_peak()

```
int64_t rti::core::status::DataWriterCacheStatus::disposed_instance_count_peak ( ) const [inline]
```

The highest value of **rti::core::status::DataWriterCacheStatus::disposed_instance_count** (p. 971) over the lifetime of the DataWriter.

8.67.2.7 unregistered_instance_count()

```
int64_t rti::core::status::DataWriterCacheStatus::unregistered_instance_count ( ) const [inline]
```

The number of instances currently in the DataWriter's queue that the DataWriter has unregistered from via the **dds::pub::DataWriter::unregister_instance** (p. 930) operation.

8.67.2.8 unregistered_instance_count_peak()

```
int64_t rti::core::status::DataWriterCacheStatus::unregistered_instance_count_peak ( ) const [inline]
```

The highest value of `rti::core::status::DataWriterCacheStatus::unregistered_instance_count` (p. 971) over the lifetime of the `DataWriter`.

8.68 dds::pub::DataWriterListener< T > Class Template Reference

The **Listener** (p. 1381) to notify status changes for a `dds::pub::DataWriter` (p. 908).

```
#include <dds/pub/DataWriterListener.hpp>
```

Inheritance diagram for `dds::pub::DataWriterListener< T >`:

Public Member Functions

- virtual void **on_offered_deadline_missed** (`dds::pub::DataWriter< T >` &writer, const `dds::core::status::OfferedDeadlineMissedStatus` &status)=0
Handles the `dds::core::status::OfferedDeadlineMissedStatus` (p. 1603) status.
- virtual void **on_offered_incompatible_qos** (`dds::pub::DataWriter< T >` &writer, const `dds::core::status::OfferedIncompatibleQosStatus` &status)=0
Handles the `dds::core::status::OfferedIncompatibleQosStatus` (p. 1604) status.
- virtual void **on_liveliness_lost** (`dds::pub::DataWriter< T >` &writer, const `dds::core::status::LivelinessLostStatus` &status)=0
Handles the `dds::core::status::LivelinessLostStatus` (p. 1398) status.
- virtual void **on_publication_matched** (`dds::pub::DataWriter< T >` &writer, const `dds::core::status::PublicationMatchedException` &status)=0
Handles the `dds::core::status::PublicationMatchedException` (p. 1717) status.
- virtual void **on_reliable_writer_cache_changed** (`dds::pub::DataWriter< T >` &writer, const `rti::core::status::ReliableWriterCacheChangedStatus` &status)=0
 <<extension>> (p. 156) *Handles the `dds::core::status::ReliableWriterCacheChangedStatus` status*
- virtual void **on_reliable_reader_activity_changed** (`dds::pub::DataWriter< T >` &writer, const `rti::core::status::ReliableReaderActivityChangedStatus` &status)=0
 <<extension>> (p. 156) *Handles the `dds::core::status::ReliableReaderActivityChangedStatus` status*
- virtual void **on_instance_replaced** (`dds::pub::DataWriter< T >` &writer, const `dds::core::InstanceHandle` &handle)=0
 <<extension>> (p. 156) *Notifies when an instance is replaced in `DataWriter` (p. 908) queue.*
- virtual void **on_application_acknowledgment** (`dds::pub::DataWriter< T >` &writer, const `rti::pub::AcknowledgmentInfo` &acknowledgment_info)=0

<<*extension*>> (p. 156) Called when a sample is application-acknowledged.

- virtual void **on_service_request_accepted** (dds::pub::DataWriter< T > &writer, const rti::core::status::ServiceRequestAcceptedStatus &status)=0

<<*extension*>> (p. 156) Called when a sample that has been received on a the built-in service channel is intended for the **DataWriter** (p. 908) that has installed this listener

- virtual void **on_sample_removed** (dds::pub::DataWriter< T > &writer, const rti::core::Cookie &cookie)=0

<<*extension*>> (p. 156) Called when a sample is removed from the **DataWriter** (p. 908) queue.

8.68.1 Detailed Description

```
template<typename T>
class dds::pub::DataWriterListener< T >
```

The **Listener** (p. 1381) to notify status changes for a **dds::pub::DataWriter** (p. 908).

Entity:

dds::pub::DataWriter (p. 908)

Status:

dds::core::status::StatusMask::liveliness_lost() (p. 2090), **dds::core::status::LivelinessLostStatus** (p. 1398);

dds::core::status::StatusMask::offered_deadline_missed() (p. 2086), **dds::core::status::OfferedDeadlineMissedStatus** (p. 1603);

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::OfferedIncompatibleQosStatus** (p. 1604);

dds::core::status::StatusMask::publication_matched() (p. 2091), **dds::core::status::PublicationMatchedStatus** (p. 1717);

dds::core::status::StatusMask::reliable_reader_activity_changed() (p. 2092), **rti::core::status::ReliableReaderActivityChangedStatus** (p. 1881);

dds::core::status::StatusMask::reliable_writer_cache_changed() (p. 2092), **rti::core::status::ReliableWriterCacheChangedStatus** (p. 1883);

Status Kinds (p. 229)

Operations Allowed in Listener Callbacks (p. 1383)

NoOpDataWriterListener (p. 1573)

8.68.2 Member Function Documentation

8.68.2.1 on_offered_deadline_missed()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_offered_deadline_missed (
    dds::pub::DataWriter< T > & writer,
    const dds::core::status::OfferedDeadlineMissedStatus & status ) [pure virtual]
```

Handles the **dds::core::status::OfferedDeadlineMissedStatus** (p. 1603) status.

This callback is called when the deadline that the **dds::pub::DataWriter** (p. 908) has committed through its **DEADLINE** (p. 316) qos policy was not respected for a specific instance. This callback is called for each deadline period elapsed during which the **dds::pub::DataWriter** (p. 908) failed to provide data for an instance.

Parameters

<i>writer</i>	<< out >> (p. 157) Locally created dds::pub::DataWriter (p. 908) that triggers the listener callback
<i>status</i>	<< out >> (p. 157) Current deadline missed status of locally created dds::pub::DataWriter (p. 908)

Implemented in **dds::pub::NoOpDataWriterListener**< T > (p. 1574).

8.68.2.2 on_offered_incompatible_qos()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_offered_incompatible_qos (
    dds::pub::DataWriter< T > & writer,
    const dds::core::status::OfferedIncompatibleQosStatus & status ) [pure virtual]
```

Handles the **dds::core::status::OfferedIncompatibleQosStatus** (p. 1604) status.

This callback is called when the **dds::pub::qos::DataWriterQos** (p. 994) of the **dds::pub::DataWriter** (p. 908) was incompatible with what was requested by a **dds::sub::DataReader** (p. 756). This callback is called when a **dds::pub::DataWriter** (p. 908) has discovered a **dds::sub::DataReader** (p. 756) for the same **dds::topic::Topic** (p. 2178) and common partition, but with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 908).

Parameters

<i>writer</i>	<< out >> (p. 157) Locally created dds::pub::DataWriter (p. 908) that triggers the listener callback
<i>status</i>	<< out >> (p. 157) Current incompatible qos status of locally created dds::pub::DataWriter (p. 908)

Implemented in **dds::pub::NoOpDataWriterListener**< T > (p. 1574).

8.68.2.3 on_liveliness_lost()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_liveliness_lost (
```

```

    dds::pub::DataWriter< T > & writer,
    const dds::core::status::LivelinessLostStatus & status ) [pure virtual]

```

Handles the **dds::core::status::LivelinessLostStatus** (p. 1398) status.

This callback is called when the liveliness that the **dds::pub::DataWriter** (p. 908) has committed through its **LIVELINESS** (p. 326) qos policy was not respected; this **dds::sub::DataReader** (p. 756) entities will consider the **dds::pub::DataWriter** (p. 908) as no longer "alive/active". This callback will not be called when an already not alive **dds::pub::DataWriter** (p. 908) simply remains not alive for another liveliness period.

Parameters

<i>writer</i>	<< out >> (p. 157) Locally created dds::pub::DataWriter (p. 908) that triggers the listener callback
<i>status</i>	<< out >> (p. 157) Current liveliness lost status of locally created dds::pub::DataWriter (p. 908)

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1574).

8.68.2.4 on_publication_matched()

```

template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_publication_matched (
    dds::pub::DataWriter< T > & writer,
    const dds::core::status::PublicationMatchedStatus & status ) [pure virtual]

```

Handles the **dds::core::status::PublicationMatchedStatus** (p. 1717) status.

This callback is called when the **dds::pub::DataWriter** (p. 908) has found a **dds::sub::DataReader** (p. 756) that matches the **dds::topic::Topic** (p. 2178), has a common partition and compatible QoS, or has ceased to be matched with a **dds::sub::DataReader** (p. 756) that was previously considered to be matched.

Parameters

<i>writer</i>	<< out >> (p. 157) Locally created dds::pub::DataWriter (p. 908) that triggers the listener callback
<i>status</i>	<< out >> (p. 157) Current publication match status of locally created dds::pub::DataWriter (p. 908)

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1574).

8.68.2.5 on_reliable_writer_cache_changed()

```

template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_reliable_writer_cache_changed (
    dds::pub::DataWriter< T > & writer,
    const rti::core::status::ReliableWriterCacheChangedStatus & status ) [pure virtual]

```

<<**extension**>> (p. 156) Handles the `dds::core::status::ReliableWriterCacheChangedStatus` status

This listener callback is triggered when:

- The cache is empty (contains no unacknowledged samples).
- The cache is full (the number of unacknowledged samples has reached the value specified in `dds::core::policy::ResourceLimits::max_samples` (p. 1924)).
- The number of unacknowledged samples has reached `rti::core::RtpsReliableWriterProtocol::high_watermark` or `rti::core::RtpsReliableWriterProtocol::low_watermark`.

Parameters

<i>writer</i>	<< out >> (p. 157) Locally created <code>dds::pub::DataWriter</code> (p. 908) that triggers the listener callback
<i>status</i>	<< out >> (p. 157) Current reliable writer cache changed status of locally created <code>dds::pub::DataWriter</code> (p. 908)

Implemented in `dds::pub::NoOpDataWriterListener< T >` (p. 1575).

8.68.2.6 on_reliable_reader_activity_changed()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_reliable_reader_activity_changed (
    dds::pub::DataWriter< T > & writer,
    const rti::core::status::ReliableReaderActivityChangedStatus & status ) [pure virtual]
```

<<**extension**>> (p. 156) Handles the `dds::core::status::ReliableReaderActivityChangedStatus` status

Parameters

<i>writer</i>	<< out >> (p. 157) Locally created <code>dds::pub::DataWriter</code> (p. 908) that triggers the listener callback
<i>status</i>	<< out >> (p. 157) Current reliable reader activity changed status of locally created <code>dds::pub::DataWriter</code> (p. 908)

Implemented in `dds::pub::NoOpDataWriterListener< T >` (p. 1575).

8.68.2.7 on_instance_replaced()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_instance_replaced (
    dds::pub::DataWriter< T > & writer,
    const dds::core::InstanceHandle & handle ) [pure virtual]
```

<<*extension*>> (p. 156) Notifies when an instance is replaced in **DataWriter** (p. 908) queue.

This callback is called when an instance is replaced by the **dds::pub::DataWriter** (p. 908) due to instance resource limits being reached. This callback returns to the user the handle of the replaced instance, which can be used to get the key of the replaced instance using the **dds::pub::DataWriter::key_value** (p. 934) API.

Because this callback can be called within the context of an in-progress write, dispose, or unregister call, most APIs on the **DataWriter** (p. 908) must not be used. The only **DataWriter** (p. 908) APIs that are safe to call within this callback are:

- **dds::pub::DataWriter::key_value** (p. 934)
- **dds::pub::DataWriter::create_data** (p. 952)
- **dds::pub::DataWriter::delete_data** (p. 953)
- **dds::pub::matched_subscriptions()** (p. 436)
- **dds::pub::DataWriter::is_matched_subscription_active** (p. 961)
- **dds::pub::DataWriter::matched_subscription_participant_data()** (p. 960)
- **dds::pub::DataWriter::topic()** (p. 938)
- **dds::pub::DataWriter::publisher()** (p. 938)
- **dds::pub::DataWriter::is_sample_app_acknowledged** (p. 943)

Parameters

<i>writer</i>	<< <i>out</i> >> (p. 157) Locally created dds::pub::DataWriter (p. 908) that triggers the listener callback
<i>handle</i>	<< <i>out</i> >> (p. 157) Handle of the replaced instance

Implemented in **dds::pub::NoOpDataWriterListener< T >** (p. 1575).

8.68.2.8 on_application_acknowledgment()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_application_acknowledgment (
    dds::pub::DataWriter< T > & writer,
    const rti::pub::AcknowledgmentInfo & acknowledgment_info ) [pure virtual]
```

<<*extension*>> (p. 156) Called when a sample is application-acknowledged.

Applicable only when **dds::core::policy::Reliability::acknowledgment_kind** (p. 1878) = **rti::core::policy::← AcknowledgmentKind_def::APPLICATION_AUTO** (p. 586) or **rti::core::policy::← AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 586)

Called when a sample is application-level acknowledged. Provides identities of the sample and the acknowledging **dds::sub::DataReader** (p. 756). Also provides user-specified response data sent from the **dds::sub::DataReader** (p. 756) by the acknowledgment message.

Parameters

<i>writer</i>	<<out>> (p. 157) Locally created DataWriter (p. 908) that triggers the listener callback
<i>acknowledgment_info</i>	<<out>> (p. 157) rti::pub::AcknowledgmentInfo (p. 583) of the acknowledged sample

Implemented in **dds::pub::NoOpDataWriterListener**< T > (p. 1575).

8.68.2.9 on_service_request_accepted()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_service_request_accepted (
    dds::pub::DataWriter< T > & writer,
    const rti::core::status::ServiceRequestAcceptedStatus & status ) [pure virtual]
```

<<extension>> (p. 156) Called when a sample that has been received on a the built-in service channel is intended for the **DataWriter** (p. 908) that has installed this listener

See also

Topic Queries (p. 66)

Implemented in **dds::pub::NoOpDataWriterListener**< T > (p. 1576).

8.68.2.10 on_sample_removed()

```
template<typename T >
virtual void dds::pub::DataWriterListener< T >::on_sample_removed (
    dds::pub::DataWriter< T > & writer,
    const rti::core::Cookie & cookie ) [pure virtual]
```

<<extension>> (p. 156) Called when a sample is removed from the **DataWriter** (p. 908) queue.

This callback is called only if the sample was written with a **rti::core::Cookie** (p. 746) with **dds::pub::DataWriter**↔**::write(const T&,rti::pub::WriteParams&)** (p. 949), or if this writer uses **Zero Copy** (p. 49) transfer over shared memory" or **FlatData Topic-Types** (p. 219) "FlatData language binding".

Parameters

<i>writer</i>	<<out>> (p. 157) Locally created dds::pub::DataWriter (p. 908) that triggers the listener callback
<i>cookie</i>	<<out>> (p. 157) <ul style="list-style-type: none"> If this sample was written with dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 949), this field contains a copy of the cookie set in rti::pub::WriteParams (p. 2342). If this writer uses Zero Copy transfer over shared memory (p. 49) or FlatData language binding (p. 219), this field contains the absolute address of the sample that is removed. The address of the sample can be obtained by using rti::core::Cookie::to_pointer (p. 748)

See also

`dds::pub::DataWriter::get_loan` (p. 953)

Implemented in `dds::pub::NoOpDataWriterListener< T >` (p. 1577).

8.69 rti::core::policy::DataWriterProtocol Class Reference

<<*extension*>> (p. 156) Configures aspects of an the RTPS protocol related to a `dds::pub::DataWriter` (p. 908)

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

Getter (see setter with the same name)
- **DataWriterProtocol & serialize_key_with_dispose** (bool the_serialize_key_with_dispose)
Controls whether or not the serialized key is propagated on the wire with dispose samples.
- `bool serialize_key_with_dispose` () const
Getter (see setter with the same name)
- **DataWriterProtocol & propagate_app_ack_with_no_response** (bool the_propagate_app_ack_with_no_response)
Controls whether or not a `dds::pub::DataWriter` (p. 908) receives `dds::pub::DataWriterListener::on_application_↔ acknowledgment` (p. 977) notifications with an empty or invalid response.
- `bool propagate_app_ack_with_no_response` () const
Getter (see setter with the same name)

- **DataWriterProtocol** & **rtps_reliable_writer** (const **RtpsReliableWriterProtocol** &the_rtps_reliable_writer)
*RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **dds::pub::DataWriter** (p. 908). This parameter only has effect if both the writer and the matching reader are configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881) **dds::core::policy::ReliabilityKind_def** (p. 1879).*
- const **RtpsReliableWriterProtocol** & **rtps_reliable_writer** () const
Gets the reliable settings by const-reference (see setter)
- **RtpsReliableWriterProtocol** & **rtps_reliable_writer** ()
Gets the reliable settings by reference (see setter)
- **DataWriterProtocol** & **initial_virtual_sequence_number** (const **rti::core::SequenceNumber** &the_initial_virtual_sequence_number)
Determines, the initial virtual sequence number for this DataWriter.

8.69.1 Detailed Description

<<**extension**>> (p. 156) Configures aspects of an the RTPS protocol related to a **dds::pub::DataWriter** (p. 908)

DDS has a standard protocol for packet (user and meta data) exchange between applications using DDS for communications. This QoS policy and **rti::core::policy::DataWriterProtocol** (p. 979) give you control over configurable portions of the protocol, including the configuration of the reliable data delivery mechanism of the protocol on a per DataWriter or DataReader basis.

These configuration parameters control timing, timeouts, and give you the ability to tradeoff between speed of data loss detection and repair versus network and CPU bandwidth used to maintain reliability.

It is important to tune the reliability protocol (on a per **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) basis) to meet the requirements of the end-user application so that data can be sent between DataWriters and DataReaders in an efficient and optimal manner in the presence of data loss.

You can also use this QoS policy to control how RTI Connnext responds to "slow" reliable DataReaders or ones that disconnect or are otherwise lost. See **dds::core::policy::Reliability** (p. 1873) for more information on the per-DataReader/DataWriter reliability configuration. **dds::core::policy::History** (p. 1346) and **dds::core::policy::ResourceLimits** (p. 1921) also play an important role in the DDS reliable protocol.

This QoS policy is an extension to the DDS standard.

Entity:

dds::pub::DataWriter (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.69.2 Constructor & Destructor Documentation

8.69.2.1 DataWriterProtocol()

```
rti::core::policy::DataWriterProtocol::DataWriterProtocol ( ) [inline]
```

Creates the default policy.

8.69.3 Member Function Documentation

8.69.3.1 virtual_guid() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::virtual_guid (
    const rti::core::Guid & the_virtual_guid )
```

The virtual GUID (Global Unique Identifier).

The virtual GUID is used to uniquely identify different incarnations of the same **dds::pub::DataWriter** (p. 908).

RTI Connex uses the virtual GUID to associate a persisted writer history to a specific **dds::pub::DataWriter** (p. 908).

The RTI Connex Persistence **Service** (p. 2057) uses the virtual GUID to send samples on behalf of the original **dds::pub::DataWriter** (p. 908).

[default] **rti::core::Guid::automatic()** (p. 1341)

8.69.3.2 virtual_guid() [2/2]

```
rti::core::Guid rti::core::policy::DataWriterProtocol::virtual_guid ( ) const
```

Getter (see setter with the same name)

8.69.3.3 rtps_object_id() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_object_id (
    uint32_t the_rtps_object_id )
```

The RTPS Object ID.

This value is used to determine the RTPS object ID of a data writer according to the DDS-RTPS Interoperability Wire Protocol.

Only the last 3 bytes are used; the most significant byte is ignored.

If the default value is specified, RTI Connex will automatically assign the object ID based on a counter value (per participant) starting at 0x00800000. That value is incremented for each new data writer.

A `rtps_object_id` value in the interval [0x00800000,0x00ffffff] may collide with the automatic values assigned by RTI Connex. In those cases, the recommendation is not to use automatic object ID assignment.

[default] **rti::core::policy::WireProtocol::RTPS_AUTO_ID** (p. 2341)

[range] [0,0x00ffffff]

8.69.3.4 rtps_object_id() [2/2]

```
uint32_t rti::core::policy::DataWriterProtocol::rtps_object_id ( ) const
```

Getter (see setter with the same name)

8.69.3.5 push_on_write() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::push_on_write (
    bool the_push_on_write )
```

Whether to push sample out when write is called.

If set to true (the default), the writer will send a sample every time write is called. Otherwise, the sample is put into the queue waiting for a NACK from remote reader(s) to be sent out.

[default] true

8.69.3.6 push_on_write() [2/2]

```
bool rti::core::policy::DataWriterProtocol::push_on_write ( ) const
```

Getter (see setter with the same name)

8.69.3.7 disable_positive_acks() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::disable_positive_acks (
    bool the_disable_positive_acks )
```

Controls whether or not the writer expects positive acknowledgements from matching readers.

If set to true, the writer does not expect readers to send send positive acknowledgments to the writer. Consequently, instead of keeping a sample queued until all readers have positively acknowledged it, the writer will keep a sample for at least `rti::core::RtpsReliableWriterProtocol::disable_positive_acks_min_sample_keep_duration`, after which the sample is logically considered as positively acknowledged.

If set to false (the default), the writer expects to receive positive acknowledgements from its acknowledging readers (`rti::core::policy::DataReaderProtocol::disable_positive_acks` (p. 839) = false) and it applies the keep-duration to its non-acknowledging readers (`rti::core::policy::DataReaderProtocol::disable_positive_acks` (p. 839) = true).

A writer with both acknowledging and non-acknowledging readers keeps a sample queued until acknowledgements have been received from all acknowledging readers and the keep-duration has elapsed for non-acknowledging readers.

[default] false

8.69.3.8 disable_positive_acks() [2/2]

```
bool rti::core::policy::DataWriterProtocol::disable_positive_acks ( ) const
```

Getter (see setter with the same name)

8.69.3.9 disable_inline_keyhash() [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::disable_inline_keyhash (
    bool the_disable_inline_keyhash )
```

Controls whether or not a keyhash is propagated on the wire with each sample.

This field only applies to keyed writers.

With each key, RTI Connexx associates an internal 16-byte representation, called a keyhash.

When this field is false, the keyhash is sent on the wire with every data instance.

When this field is true, the keyhash is not sent on the wire and the readers must compute the value using the received data.

If the *reader* is CPU bound, sending the keyhash on the wire may increase performance, because the reader does not have to get the keyhash from the data.

If the *writer* is CPU bound, sending the keyhash on the wire may decrease performance, because it requires more bandwidth (16 more bytes per sample).

Note: Setting `disable_inline_keyhash` to true is not compatible with using RTI Real-Time Connect or RTI Recorder.

[default] false

8.69.3.10 disable_inline_keyhash() [2/2]

```
bool rti::core::policy::DataWriterProtocol::disable_inline_keyhash ( ) const
```

Getter (see setter with the same name)

8.69.3.11 `serialize_key_with_dispose()` [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::serialize_key_with_dispose (
    bool the_serialize_key_with_dispose )
```

Controls whether or not the serialized key is propagated on the wire with dispose samples.

This field only applies to keyed writers.

We recommend setting this field to true if there are `DataReaders` where `rti::core::policy::DataReaderProtocol::propagate_dispose_of_unregistered_instances` (p. 840) is also true.

When setting `serialize_key_with_dispose` to `FALSE`, only a key hash is included in the dispose meta-sample sent by a `DataWriter` for a dispose action. If a dispose meta-sample only includes the key hash, then `DataReaders` must have previously received an actual data sample for the instance being disposed, in order for a `DataReader` to map a key hash/instance handle to actual key values.

If an actual data sample was never received for an instance and `serialize_key_with_dispose` is set to `FALSE`, then the `DataReader` application will not be able to determine the value of the key that was disposed, since `dds::sub::DataReader::key_value` (p. 780) will not be able to map an instance handle to actual key values.

By setting `serialize_key_with_dispose` to `TRUE`, the values of the key members of a data type will be sent in the dispose meta-sample for a dispose action by the `DataWriter`. This allows the `DataReader` to map an instance handle to the values of the key members even when receiving a dispose meta-sample without previously having received a data sample for the instance.

Important: When this field is true, batching will not be compatible with RTI Connex 4.3e, 4.4b, or 4.4c. The `dds::sub::DataReader` (p. 756) entities will receive incorrect data and/or encounter deserialization errors.

[default] false

8.69.3.12 `serialize_key_with_dispose()` [2/2]

```
bool rti::core::policy::DataWriterProtocol::serialize_key_with_dispose ( ) const
```

Getter (see setter with the same name)

8.69.3.13 `propagate_app_ack_with_no_response()` [1/2]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::propagate_app_ack_with_no_response (
    bool the_propagate_app_ack_with_no_response )
```

Controls whether or not a `dds::pub::DataWriter` (p. 908) receives `dds::pub::DataWriterListener::on_application_acknowledgment` (p. 977) notifications with an empty or invalid response.

When this field is set to false, the callback `dds::pub::DataWriterListener::on_application_acknowledgment` (p. 977) will not be invoked if the sample being acknowledged has an empty or invalid response.

[default] true

8.69.3.14 propagate_app_ack_with_no_response() [2/2]

```
bool rti::core::policy::DataWriterProtocol::propagate_app_ack_with_no_response ( ) const
```

Getter (see setter with the same name)

8.69.3.15 rtps_reliable_writer() [1/3]

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_reliable_writer (
    const RtpsReliableWriterProtocol & the_rtps_reliable_writer )
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a **dds::pub::DataWriter** (p.908). This parameter only has effect if both the writer and the matching reader are configured with **dds::core::policy::ReliabilityKind_def::RELIABLE** (p.1881) **dds::core::policy::ReliabilityKind_def** (p.1879).

For details, refer to the `rti::core::RtpsReliableWriterProtocol`

[default] [default] See `rti::core::RtpsReliableWriterProtocol`

8.69.3.16 rtps_reliable_writer() [2/3]

```
const RtpsReliableWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_reliable_writer (
) const
```

Gets the reliable settings by const-reference (see setter)

8.69.3.17 rtps_reliable_writer() [3/3]

```
RtpsReliableWriterProtocol & rti::core::policy::DataWriterProtocol::rtps_reliable_writer ( )
```

Gets the reliable settings by reference (see setter)

8.69.3.18 initial_virtual_sequence_number()

```
DataWriterProtocol & rti::core::policy::DataWriterProtocol::initial_virtual_sequence_number (
    const rti::core::SequenceNumber & the_initial_virtual_sequence_number )
```

Determines, the initial virtual sequence number for this DataWriter.

By default, the virtual sequence number of the first sample published by a DataWriter will be 1 for DataWriters that do not use durable writer history. For durable writers, the default virtual sequence number will be the last sequence number they published in a previous execution, plus one. So, when a non-durable DataWriter is restarted and must continue communicating with the same DataReaders, its samples start over with sequence number 1. Durable DataWriters start over where the last sequence number left off, plus one.

This QoS setting allows overwriting the default initial virtual sequence number.

Normally, this parameter is not expected to be modified; however, in some scenarios when continuing communication after restarting, applications may require the DataWriter's virtual sequence number to start at something other than the value described above. An example would be to enable non-durable DataWriters to start at the last sequence number published, plus one, similar to the durable DataWriter. This property enables you to make such a configuration, if desired.

The virtual sequence number can be overwritten as well on a per sample basis by updating **rti::pub::WriteParams**↔
::identity (p. 2344) in the **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 949).

[default] SequenceNumber_t::AUTO

The virtual sequence number of the last available sample currently queued in the local DataWriter.
- **rti::core::SequenceNumber first_unacknowledged_sample_virtual_sequence_number () const**
The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.
- **dds::core::InstanceHandle first_unacknowledged_sample_subscription_handle () const**
The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.
- **rti::core::SequenceNumber first_unelapsed_keep_duration_sample_sequence_number () const**
The sequence number of the first sample whose keep duration has not yet elapsed.
- **int64_t pushed_fragment_count () const**
The number of DATA_FRAG messages that have been pushed by this DataWriter.
- **int64_t pushed_fragment_bytes () const**
The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.
- **int64_t pulled_fragment_count () const**
The number of DATA_FRAG messages that have been pulled from this DataWriter.
- **int64_t pulled_fragment_bytes () const**
The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.
- **int64_t received_nack_fragment_count () const**
The number of NACK_FRAG messages that have been received by this DataWriter.
- **int64_t received_nack_fragment_bytes () const**
The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

8.70.1 Detailed Description

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::datawriter_protocol()` (p. 2093)

Entity:

`dds::pub::DataWriter` (p. 908)

8.70.2 Member Function Documentation

8.70.2.1 `pushed_sample_count()`

```
EventCount64 rti::core::status::DataWriterProtocolStatus::pushed_sample_count ( ) const [inline]
```

The number of user samples pushed on write from a local `DataWriter` to a matching remote `DataReader`.

Counts protocol (RTPS) messages pushed by a `DataWriter` when writing, unregistering, and disposing. The count is the number of sends done internally, and it may be greater than the number of user writes.

For large data, counts whole samples, not fragments. The fragment count is tracked in the `rti::core::status::DataWriterProtocolStatus::pushed_fragment_count` (p. 992) statistic.

8.70.2.2 `pushed_sample_bytes()`

```
EventCount64 rti::core::status::DataWriterProtocolStatus::pushed_sample_bytes ( ) const [inline]
```

The number of bytes of user samples pushed on write from a local `DataWriter` to a matching remote `DataReader`.

Counts bytes of protocol (RTPS) messages pushed by a `DataWriter` when writing, unregistering, and disposing. The count of bytes corresponds to the number of sends done internally, and it may be greater than the number of user writes.

When data fragmentation is used, this statistic is incremented as fragments are written.

8.70.2.3 `filtered_sample_count()`

```
EventCount64 rti::core::status::DataWriterProtocolStatus::filtered_sample_count ( ) const [inline]
```

[Not supported.] The number of user samples preemptively filtered by a local `DataWriter` due to Content-Filtered Topics.

8.70.2.4 filtered_sample_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::filtered_sample_bytes ( ) const [inline]
```

[Not supported.] The number of bytes of user samples preemptively filtered by a local DataWriter due to Content-Filtered Topics.

8.70.2.5 sent_heartbeat_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_heartbeat_count ( ) const [inline]
```

The number of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

8.70.2.6 sent_heartbeat_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_heartbeat_bytes ( ) const [inline]
```

The number of bytes of Heartbeats sent between a local DataWriter and matching remote DataReader.

Because periodic and piggyback heartbeats are sent to remote readers and their locators differently in different situations, when a reader has more than one locator, this count may be larger than expected, to reflect the sending of Heartbeats to the multiple locators.

8.70.2.7 pulled_sample_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::pulled_sample_count ( ) const [inline]
```

The number of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when `rti::core::policy::DataWriterProtocol::push_on_write` (p. 982) is false.

When data fragmentation is used, this statistic is incremented as fragments are written.

8.70.2.8 pulled_sample_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::pulled_sample_bytes ( ) const [inline]
```

The number of bytes of user samples pulled from local DataWriter by matching DataReaders.

Pulled samples are samples sent for repairs, for late joiners, and all samples sent by the local DataWriter when `rti::core::policy::DataWriterProtocol::push_on_write` (p. 982) is false.

When data fragmentation is used, this statistic is incremented as fragments are written.

8.70.2.9 received_ack_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::received_ack_count ( ) const [inline]
```

The number of ACKs from a remote DataReader received by a local DataWriter.

8.70.2.10 received_ack_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::received_ack_bytes ( ) const [inline]
```

The number of bytes of ACKs from a remote DataReader received by a local DataWriter.

8.70.2.11 received_nack_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::received_nack_count ( ) const [inline]
```

The number of NACKs from a remote DataReader received by a local DataWriter.

8.70.2.12 received_nack_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::received_nack_bytes ( ) const [inline]
```

The number of bytes of NACKs from a remote DataReader received by a local DataWriter.

8.70.2.13 sent_gap_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_gap_count ( ) const [inline]
```

The number of GAPS sent from local DataWriter to matching remote DataReaders.

8.70.2.14 sent_gap_bytes()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::sent_gap_bytes ( ) const [inline]
```

The number of bytes of GAPS sent from local DataWriter to matching remote DataReaders.

8.70.2.15 rejected_sample_count()

```
EventCount64 rti::core::status::DataWriterProtocolStatus::rejected_sample_count ( ) const [inline]
```

[Not supported.]

8.70.2.16 send_window_size()

```
int32_t rti::core::status::DataWriterProtocolStatus::send_window_size ( ) const [inline]
```

Current maximum number of outstanding samples allowed in the DataWriter's queue.

Spans the range from rti::core::RtpsReliableWriterProtocol::min_send_window_size to rti::core::RtpsReliableWriterProtocol::max_send_window_size.

8.70.2.17 first_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_available_sample_↔  
sequence_number ( ) const [inline]
```

The sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.70.2.18 last_available_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::last_available_sample_↔  
sequence_number ( ) const [inline]
```

The sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.70.2.19 first_unacknowledged_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_unacknowledged_↔  
sample_sequence_number ( ) const [inline]
```

The sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.70.2.20 first_available_sample_virtual_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_available_sample_↔
virtual_sequence_number ( ) const [inline]
```

The virtual sequence number of the first available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.70.2.21 last_available_sample_virtual_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::last_available_sample_↔
virtual_sequence_number ( ) const [inline]
```

The virtual sequence number of the last available sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.70.2.22 first_unacknowledged_sample_virtual_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_unacknowledged_↔
sample_virtual_sequence_number ( ) const [inline]
```

The virtual sequence number of the first unacknowledged sample currently queued in the local DataWriter.

Applies only for local DataWriter status.

8.70.2.23 first_unacknowledged_sample_subscription_handle()

```
dds::core::InstanceHandle rti::core::status::DataWriterProtocolStatus::first_unacknowledged_↔
sample_subscription_handle ( ) const [inline]
```

The handle of a remote DataReader that has not acknowledged the first unacknowledged sample of the local DataWriter.

Applies only for local DataWriter status.

8.70.2.24 first_unelapsed_keep_duration_sample_sequence_number()

```
rti::core::SequenceNumber rti::core::status::DataWriterProtocolStatus::first_unelapsed_keep_↔
duration_sample_sequence_number ( ) const [inline]
```

The sequence number of the first sample whose keep duration has not yet elapsed.

Applicable only when **rti::core::policy::DataWriterProtocol::disable_positive_acks** (p. 982) is set.

Sequence number of the first sample kept in the DataWriter's queue whose keep_duration (applied when **rti::core::↔
::policy::DataWriterProtocol::disable_positive_acks** (p. 982) is set) has not yet elapsed.

Applies only for local DataWriter status.

8.70.2.25 pushed_fragment_count()

```
int64_t rti::core::status::DataWriterProtocolStatus::pushed_fragment_count ( ) const [inline]
```

The number of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.70.2.26 pushed_fragment_bytes()

```
int64_t rti::core::status::DataWriterProtocolStatus::pushed_fragment_bytes ( ) const [inline]
```

The number of bytes of DATA_FRAG messages that have been pushed by this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.70.2.27 pulled_fragment_count()

```
int64_t rti::core::status::DataWriterProtocolStatus::pulled_fragment_count ( ) const [inline]
```

The number of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.70.2.28 pulled_fragment_bytes()

```
int64_t rti::core::status::DataWriterProtocolStatus::pulled_fragment_bytes ( ) const [inline]
```

The number of bytes of DATA_FRAG messages that have been pulled from this DataWriter.

This statistic is incremented as each DATA_FRAG message is sent, not when the entire sample has been sent. Applicable only when data is fragmented.

8.70.2.29 received_nack_fragment_count()

```
int64_t rti::core::status::DataWriterProtocolStatus::received_nack_fragment_count ( ) const [inline]
```

The number of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.70.2.30 received_nack_fragment_bytes()

```
int64_t rti::core::status::DataWriterProtocolStatus::received_nack_fragment_bytes ( ) const [inline]
```

The number of bytes of NACK_FRAG messages that have been received by this DataWriter.

NACK FRAG RTPS messages are sent when large data is used in conjunction with reliable communication. They have the same properties as NACK messages, but instead of applying to samples, they apply to fragments. Applicable only when data is fragmented.

8.71 dds::pub::qos::DataWriterQos Class Reference

<<**value-type**>> (p. 152) Container of the QoS policies that a **dds::pub::DataWriter** (p. 908) supports

```
#include <dds/pub/qos/DataWriterQos.hpp>
```

Public Member Functions

8.71.1 Detailed Description

<<value-type>> (p. 152) Container of the QoS policies that a `dds::pub::DataWriter` (p. 908) supports

8.71.2 DataWriterQos policies

A `DataWriterQos` (p. 994) contains the following policies:

- `dds::core::policy::Durability` (p. 1181),
- `dds::core::policy::DurabilityService` (p. 1190),
- `dds::core::policy::Deadline` (p. 1020),
- `dds::core::policy::LatencyBudget` (p. 1375),
- `dds::core::policy::Liveliness` (p. 1389),
- `dds::core::policy::Reliability` (p. 1873),
- `dds::core::policy::DestinationOrder` (p. 1022),
- `dds::core::policy::History` (p. 1346),
- `dds::core::policy::ResourceLimits` (p. 1921),
- `dds::core::policy::TransportPriority` (p. 2255),
- `dds::core::policy::Lifespan` (p. 1379),
- `dds::core::policy::UserData` (p. 2292),
- `dds::core::policy::Ownership` (p. 1630),
- `dds::core::policy::OwnershipStrength` (p. 1637),

- **dds::core::policy::WriterDataLifecycle** (p. 2359),
- **dds::core::policy::DataRepresentation** (p. 883),
- **dds::core::policy::DataTag** (p. 902),
- **rti::core::policy::DataWriterResourceLimits** (p. 1002),
- **rti::core::policy::DataWriterProtocol** (p. 979),
- **rti::core::policy::TransportSelection** (p. 2257),
- **rti::core::policy::TransportUnicast** (p. 2259),
- **rti::core::policy::TransportEncapsulation**,
- **rti::core::policy::PublishMode** (p. 1739),
- **rti::core::policy::Property** (p. 1695),
- **rti::core::policy::Service** (p. 2057),
- **rti::core::policy::Batch** (p. 665),
- **rti::core::policy::MultiChannel** (p. 1483),
- **rti::core::policy::Availability** (p. 654),
- **rti::core::policy::EntityName** (p. 1275),
- **rti::core::policy::TopicQueryDispatch** (p. 2226),
- **rti::core::policy::DataWriterTransferMode** (p. 1017),
- **rti::core::policy::TypeSupport** (p. 2275)

To get or set policies use the **policy()** (p. 998) getters and setters or operator `<<` (see **examples** (p. 392)).

You must set certain members in a consistent manner:

- **dds::core::policy::History** (p. 1346) `.depth <= dds::core::policy::ResourceLimits` (p. 1921) `.max_samples_per_instance`
- **dds::core::policy::ResourceLimits** (p. 1921) `.max_samples_per_instance <= dds::core::policy::ResourceLimits` (p. 1921) `.max_samples`
- **dds::core::policy::ResourceLimits** (p. 1921) `.initial_samples <= dds::core::policy::ResourceLimits` (p. 1921) `.max_samples`
- **dds::core::policy::ResourceLimits** (p. 1921) `.initial_instances <= dds::core::policy::ResourceLimits` (p. 1921) `.max_instances`
- length of **dds::core::policy::UserData** (p. 2292) `.value <= dds::domain::qos::DomainParticipantQos::resource_limits.writer_user_data_max_length`

If any of the above are not true, **dds::pub::DataWriter::qos(const dds::pub::qos::DataWriterQos&)** (p. 936) and **dds::pub::Publisher::default_datawriter_qos(const dds::pub::qos::DataWriterQos&)** (p. 1725) will fail with **dds::core::InconsistentPolicyError** (p. 1354) and the **dds::pub::DataWriter** (p. 908) constructors will fail with **dds::core::Error** (p. 1284)

Entity:

dds::pub::DataWriter (p. 908)

See also

QoS Policies (p. 302) allowed ranges within each Qos.

Qos Use Cases (p. 391)

8.71.3 Constructor & Destructor Documentation

8.71.3.1 DataWriterQos() [1/2]

```
dds::pub::qos::DataWriterQos::DataWriterQos ( )
```

Creates a **DataWriterQos** (p. 994) with the default value for each policy.

Note

If you configure Qos in XML, obtain the default value from the default QosProvider, since it can be overridden by configuration:

```
DataWriterQos writer_qos = dds::core::QosProvider::Default().datawriter_qos();
```

8.71.3.2 DataWriterQos() [2/2]

```
dds::pub::qos::DataWriterQos::DataWriterQos (
    const dds::topic::qos::TopicQos & topic_qos )
```

Creates a **DataWriterQos** (p. 994) with the policies of a given TopicQos.

The QoS policies that are exclusive to a **DataWriter** (p. 908) retain their default values. A **dds::topic::qos::TopicQos** (p. 2213) contains a subset of the policies of a **DataWriterQos** (p. 994). This constructor copies those common policies while initializing the policies that are only defined in **DataWriterQos** (p. 994) to their default values.

Parameters

<i>topic_qos</i>	The TopicQos being copied.
------------------	----------------------------

Example:

```
DataWriterQos writer_qos(topic_qos());
```

8.71.4 Member Function Documentation

8.71.4.1 operator=()

```
DataWriterQos & dds::pub::qos::DataWriterQos::operator= (
    const dds::topic::qos::TopicQos & topic_qos ) [inline]
```

Copies into this **DataWriterQos** (p. 994) those policies that are also in TopicQos.

A **dds::topic::qos::TopicQos** (p. 2213) contains a subset of the policies of a **DataWriterQos** (p. 994). This assignment operator copies those common policies into this instance while leaving the policies that are only defined in **DataWriterQos** (p. 994) unaltered.

Parameters

<i>topic_qos</i>	The TopicQos to copy the common policies from.
------------------	--

For example:

```
// Load a TopicQos from a Qos profile
TopicQos topic_qos = dds::core::QosProvider::Default().topic_qos("MyLibrary::MyProfile");
// Create a DataWriterQos with the default policies
DataWriterQos writer_qos = dds::core::QosProvider::Default().datawriter_qos();
// Overwrite the policies that are also defined in topic_qos
writer_qos = topic_qos;
```

8.71.4.2 policy() [1/3]

```
template<typename Policy >
const Policy & dds::pub::qos::DataWriterQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

<i>Policy</i>	One of the DataWriterQos policies (p. 995)
---------------	---

See also

Setting Qos Values (p. 392)

8.71.4.3 policy() [2/3]

```
template<typename Policy >
Policy & dds::pub::qos::DataWriterQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

<i>Policy</i>	One of the DataWriterQos policies (p. 995)
---------------	---

See also

Setting Qos Values (p. 392)

8.71.4.4 policy() [3/3]

```
template<typename Policy >
DataWriterQos & dds::pub::qos::DataWriterQos::policy (
    const Policy & p ) [inline]
```

Sets a policy.

See also

policy() (p. 998)

Setting Qos Values (p. 392)

8.71.4.5 operator<<()

```
template<typename Policy >
DataWriterQos & dds::pub::qos::DataWriterQos::operator<< (
    const Policy & p ) [inline]
```

Sets a policy.

See also

policy() (p. 998)

Setting Qos Values (p. 392)

8.71.4.6 operator>>()

```
template<typename Policy >
const DataWriterQos & dds::pub::qos::DataWriterQos::operator>> (
    Policy & p ) const [inline]
```

Copies the values of a policy.

Parameters

<i>p</i>	The destination where to copy the current value of the Policy

policy() (p. 998)

Setting Qos Values (p. 392)

8.71.5 Friends And Related Function Documentation

8.71.5.1 to_string() [1/3]

```
std::string to_string (
    const DataWriterQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 994)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DataWriterQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DataWriterQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DataWriterQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.71.5.2 to_string() [2/3]

```
std::string to_string (
    const DataWriterQos & qos,
    const DataWriterQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::DataWriterQos** (p. 994)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.71.5.3 to_string() [3/3]

```
std::string to_string (
    const DataWriterQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::DataWriterQos**

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.71.5.4 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::pub::qos::DataWriterQos & qos ) [related]
```

<<**extension**>> (p. 156) Prints a **dds::pub::qos::DataWriterQos** (p. 994) to an output stream.

8.72 rti::core::policy::DataWriterResourceLimits Class Reference

<<**extension**>> (p. 156) Configures the memory usage of a **dds::pub::DataWriter** (p. 908)

```
#include <rti/core/policy/CorePolicy.hpp>
```

Getter (see setter with the same name)
 - **DataWriterResourceLimits & max_active_topic_queries** (`int32_t the_max_active_topic_queries`)
*Represents the maximum number of active topic queries a **dds::pub::DataWriter** (p. 908) will manage.*
 - `int32_t max_active_topic_queries () const`
Getter (see setter with the same name)
 - `const AllocationSettings & writer_loaned_sample_allocation () const`
*Represents the allocation settings of loaned samples managed by a **dds::pub::DataWriter** (p. 908).*
 - **AllocationSettings & writer_loaned_sample_allocation ()**

Getter by non-const reference (see getter by const reference with the same name)

- **DataWriterResourceLimits** & **initialize_writer_loaned_sample** (bool the_initialize_writer_loaned_sample)
Whether or not to initialize loaned samples returned by a `dds::pub::DataWriter` (p. 908).
- bool **initialize_writer_loaned_sample** () const
Getter (see setter with the same name)

8.72.1 Detailed Description

<<**extension**>> (p. 156) Configures the memory usage of a **dds::pub::DataWriter** (p. 908)

DataWriters must allocate internal structures to handle the simultaneously blocking of threads trying to call **dds::pub::DataWriter::write()** (p. 918) on the same **dds::pub::DataWriter** (p. 908), for the storage used to batch small samples, and for content-based filters specified by DataReaders.

Most of these internal structures start at an initial size and, by default, will be grown as needed by dynamically allocating additional memory. You may set fixed, maximum sizes for these internal structures if you want to bound the amount of memory that can be used by a **dds::pub::DataWriter** (p. 908). By setting the initial size to the maximum size, you will prevent RTI Connext from dynamically allocating any memory after the creation of the **dds::pub::DataWriter** (p. 908).

This QoS policy is an extension to the DDS standard.

Entity:

dds::pub::DataWriter (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.72.2 Constructor & Destructor Documentation

8.72.2.1 DataWriterResourceLimits()

```
rti::core::policy::DataWriterResourceLimits::DataWriterResourceLimits ( ) [inline]
```

Creates a **DataWriterResourceLimits** (p. 1002) qos policy with default values.

8.72.3 Member Function Documentation

8.72.3.1 initial_concurrent_blocking_threads() [1/2]

```

DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::initial_concurrent_↵
blocking_threads (
    int32_t the_initial_concurrent_blocking_threads )

```

The initial number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 908).

This value only applies if **dds::core::policy::History** (p. 1346) has its kind set to **dds::core::policy::HistoryKind::KEEP_↵_ALL** and **dds::core::policy::Reliability::max_blocking_time** (p. 1877) is > 0.

[default] 1

[range] [1, 10000], <= max_concurrent_blocking_threads

8.72.3.2 initial_concurrent_blocking_threads() [2/2]

```

int32_t rti::core::policy::DataWriterResourceLimits::initial_concurrent_blocking_threads ( ) const

```

Getter (see setter with the same name)

8.72.3.3 max_concurrent_blocking_threads() [1/2]

```

DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_concurrent_blocking_↵
_threads (
    int32_t the_max_concurrent_blocking_threads )

```

The maximum number of threads that are allowed to concurrently block on write call on the same **dds::pub::DataWriter** (p. 908).

This value only applies if **dds::core::policy::History** (p. 1346) has its kind set to **dds::core::policy::HistoryKind::KEEP_↵_ALL** and **dds::core::policy::Reliability::max_blocking_time** (p. 1877) is > 0.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 10000] or **dds::core::LENGTH_UNLIMITED** (p. 238), >= initial_concurrent_blocking_threads

8.72.3.4 max_concurrent_blocking_threads() [2/2]

```

int32_t rti::core::policy::DataWriterResourceLimits::max_concurrent_blocking_threads ( ) const

```

Getter (see setter with the same name)

8.72.3.5 max_remote_reader_filters() [1/2]

```

DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_remote_reader_filters
(
    int32_t the_max_remote_reader_filters )

```

The maximum number of remote DataReaders for which the **dds::pub::DataWriter** (p. 908) will perform content-based filtering.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [0, (2³¹)-2] or **dds::core::LENGTH_UNLIMITED** (p. 238).

0: The **dds::pub::DataWriter** (p. 908) will not perform filtering for any **dds::sub::DataReader** (p. 756).

1 to (2³¹)-2: The DataWriter will filter for up to the specified number of DataReaders. In addition, the Datawriter will store the result of the filtering per sample per DataReader.

dds::core::LENGTH_UNLIMITED (p. 238): The DataWriter will filter for up to (2³¹)-2 DataReaders. However, in this case, the DataWriter will not store the filtering result per sample per DataReader. Thus, if a sample is resent (such as due to a loss of reliable communication), the sample will be filtered again.

8.72.3.6 max_remote_reader_filters() [2/2]

```

int32_t rti::core::policy::DataWriterResourceLimits::max_remote_reader_filters ( ) const

```

Getter (see setter with the same name)

8.72.3.7 initial_batches() [1/2]

```

DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::initial_batches (
    int32_t the_initial_batches )

```

Represents the initial number of batches a **dds::pub::DataWriter** (p. 908) will manage.

[default] 8

[range] [1,100 million]

See also

rti::core::policy::Batch (p. 665)

8.72.3.8 initial_batches() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::initial_batches ( ) const
```

Getter (see setter with the same name)

8.72.3.9 max_batches() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_batches (
    int32_t the_max_batches )
```

Represents the maximum number of batches a **dds::pub::DataWriter** (p. 908) will manage.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

When batching is enabled, the maximum number of samples that a **dds::pub::DataWriter** (p. 908) can store is limited by this value and **dds::core::policy::ResourceLimits::max_samples** (p. 1924).

[range] [1,100 million] or **dds::core::LENGTH_UNLIMITED** (p. 238) \geq `DDS_RtpsReliableWriterProtocol_t::heartbeats_per_max_samples` if batching is enabled

See also

rti::core::policy::Batch (p. 665)

8.72.3.10 max_batches() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::max_batches ( ) const
```

Getter (see setter with the same name)

8.72.3.11 cookie_max_length() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::cookie_max_length (
    int32_t max_length )
```

Represents the maximum length in bytes of a **rti::core::Cookie** (p. 746).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

Sets the maximum allowed byte-sequence length of a **rti::core::Cookie** (p. 746) used when writing with parameters

[range] [1,100 million] or **dds::core::LENGTH_UNLIMITED** (p. 238)

See also

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 949), **dds::pub::DataWriter::dispose_**
instance(rti::pub::WriteParams&) (p. 943), **dds::pub::DataWriter::register_instance(const T&, rti::pub::**
WriteParams&) (p. 955), **dds::pub::DataWriter::unregister_instance(rti::pub::WriteParams&)** (p. 943)

8.72.3.12 cookie_max_length() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::cookie_max_length ( ) const
```

Getter (see setter with the same name)

8.72.3.13 instance_replacement() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::instance_replacement (
    DataWriterResourceLimitsInstanceReplacementKind the_instance_replacement )
```

Sets the kinds of instances allowed to be replaced when instance resource limits are reached.

When a **dds::pub::DataWriter** (p. 908)'s number of active instances is greater than **dds::core::policy::ResourceLimits::max_instances** (p. 1924), it will try to make room by replacing an existing instance. This field specifies the kinds of instances allowed to be replaced.

If a replaceable instance is not available, either an out-of-resources exception will be returned, or the writer may block if the instance reclamation was done when writing.

[default] `DataWriterResourceLimitsInstanceReplacementKind::UNREGISTERED_INSTANCE_REPLACEMENT`

See also

`DataWriterResourceLimitsInstanceReplacementKind`

8.72.3.14 instance_replacement() [2/2]

```
DataWriterResourceLimitsInstanceReplacementKind rti::core::policy::DataWriterResourceLimits←
::instance_replacement ( ) const
```

Getter (see setter with the same name)

8.72.3.15 replace_empty_instances() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::replace_empty_instances (
    bool the_replace_empty_instances )
```

Whether or not to replace empty instances during instance replacement.

When a **dds::pub::DataWriter** (p. 908) has more active instances than allowed by **dds::core::policy::ResourceLimits::max_instances** (p. 1924), it tries to make room by replacing an existing instance. This field configures whether empty instances (i.e. instances with no samples) may be replaced. If set true, then a **dds::pub::DataWriter** (p. 908) will first try reclaiming empty instances, before trying to replace whatever is specified by **rti::core::policy::DataWriterResourceLimits::instance_replacement** (p. 1008).

[default] `false`

See also

`DataWriterResourceLimitsInstanceReplacementKind`

8.72.3.16 replace_empty_instances() [2/2]

```
bool rti::core::policy::DataWriterResourceLimits::replace_empty_instances ( ) const
```

Getter (see setter with the same name)

8.72.3.17 autoregister_instances() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::autoregister_instances (
    bool the_autoregister_instances )
```

Whether or not to automatically register new instances.

[default] false

When set to true, it is possible to write with a non-NIL handle of an instance that is not registered: the write operation will succeed and the instance will be registered. Otherwise, that write operation would fail.

See also

dds::pub::DataWriter::write() (p.918)

8.72.3.18 autoregister_instances() [2/2]

```
bool rti::core::policy::DataWriterResourceLimits::autoregister_instances ( ) const
```

Getter (see setter with the same name)

8.72.3.19 initial_virtual_writers() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::initial_virtual_writers (
    int32_t the_initial_virtual_writers )
```

The initial number of virtual writers supported by a **dds::pub::DataWriter** (p.908).

[default] 1

[range] [1, 1000000], or **dds::core::LENGTH_UNLIMITED** (p.238)

8.72.3.20 initial_virtual_writers() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::initial_virtual_writers ( ) const
```

Getter (see setter with the same name)

8.72.3.21 max_virtual_writers() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_virtual_writers (
    int32_t the_max_virtual_writers )
```

The maximum number of virtual writers supported by a **dds::pub::DataWriter** (p. 908).

Sets the maximum number of unique virtual writers supported by a **dds::pub::DataWriter** (p. 908), where virtual writers are added when samples are written with the virtual writer GUID.

This field is specially relevant in the configuration of Persistence **Service** (p. 2057) DataWriters since these DataWriters will publish samples on behalf of multiple virtual writers.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1000000], or **dds::core::LENGTH_UNLIMITED** (p. 238)

8.72.3.22 max_virtual_writers() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::max_virtual_writers ( ) const
```

Getter (see setter with the same name)

8.72.3.23 max_remote_readers() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_remote_readers (
    int32_t the_max_remote_readers )
```

The maximum number of remote readers supported by a **dds::pub::DataWriter** (p. 908).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1000000], or **dds::core::LENGTH_UNLIMITED** (p. 238)

8.72.3.24 max_remote_readers() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::max_remote_readers ( ) const
```

Getter (see setter with the same name)

8.72.3.25 max_app_ack_remote_readers() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_app_ack_remote_↔
readers (
    int32_t the_max_app_ack_remote_readers )
```

The maximum number of application-level acknowledging remote readers supported by a **dds::pub::DataWriter** (p. 908).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1000000], or **dds::core::LENGTH_UNLIMITED** (p. 238)

8.72.3.26 max_app_ack_remote_readers() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::max_app_ack_remote_readers ( ) const
```

Getter (see setter with the same name)

8.72.3.27 initial_active_topic_queries() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::initial_active_topic_↔
queries (
    int32_t the_initial_active_topic_queries )
```

Represents the initial number of active topic queries a **dds::pub::DataWriter** (p. 908) will manage.

[default] 1

[range] [1, 1000000]

See also

rti::core::policy::TopicQueryDispatch (p. 2226)

8.72.3.28 initial_active_topic_queries() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::initial_active_topic_queries ( ) const
```

Getter (see setter with the same name)

8.72.3.29 max_active_topic_queries() [1/2]

```
DataWriterResourceLimits & rti::core::policy::DataWriterResourceLimits::max_active_topic_queries  
(  
    int32_t the_max_active_topic_queries )
```

Represents the maximum number of active topic queries a **dds::pub::DataWriter** (p. 908) will manage.

When topic queries are enabled, the maximum number of topic queries that a **dds::pub::DataWriter** (p. 908) can publish data samples for at the same time is limited by this value.

When the DataWriter receives one topic query above this limit, it will wait to process it until it finishes publishing all the samples for at least one of the current topic queries.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 1000000] or **dds::core::LENGTH_UNLIMITED** (p. 238)

See also

rti::core::policy::TopicQueryDispatch (p. 2226)

8.72.3.30 max_active_topic_queries() [2/2]

```
int32_t rti::core::policy::DataWriterResourceLimits::max_active_topic_queries ( ) const
```

Getter (see setter with the same name)

8.72.3.31 `writer_loaned_sample_allocation()` [1/2]

```
const AllocationSettings & rti::core::policy::DataWriterResourceLimits::writer_loaned_sample_allocation ( ) const
```

Represents the allocation settings of loaned samples managed by a `dds::pub::DataWriter` (p. 908).

The number of samples loaned by a `dds::pub::DataWriter` (p. 908) via `dds::pub::DataWriter::get_loan` (p. 953) is limited by the `rti::core::AllocationSettings::max_count` (p. 592) of `rti::core::policy::DataWriterResourceLimits::writer_loaned_sample_allocation` (p. 1012). `dds::pub::DataWriter::get_loan` (p. 953) returns NULL if and only if `rti::core::AllocationSettings::max_count` (p. 592) samples have been loaned, and none of those samples has been written with `dds::pub::DataWriter::write()` (p. 918) or discarded via `dds::pub::DataWriter::discard_loan` (p. 955).

[default] `initial_count` = `rti::core::AllocationSettings::AUTO_COUNT` (p. 593) (`dds::core::policy::ResourceLimits::initial_samples` (p. 1925) + 1); `max_count` = `rti::core::AllocationSettings::AUTO_COUNT` (p. 593) (`dds::core::policy::ResourceLimits::max_samples` (p. 1924) + 1); `incremental_count` = `rti::core::AllocationSettings::AUTO_COUNT` (p. 593) (0 if `initial_count` = `max_count`; `initial_count` otherwise);

[range] See allowed ranges in struct `rti::core::AllocationSettings` (p. 591)

See also

`dds::pub::DataWriter::get_loan` (p. 953)

`dds::pub::DataWriter::discard_loan` (p. 955)

8.72.3.32 `writer_loaned_sample_allocation()` [2/2]

```
AllocationSettings & rti::core::policy::DataWriterResourceLimits::writer_loaned_sample_allocation ( )
```

ALIVE_THEN_DISPOSED ,
DISPOSED_THEN_ALIVE ,
ALIVE_OR_DISPOSED }

The underlying enum type.

8.73.1 Detailed Description

<<*extension*>> (p. 156) The enumeration for DataWriter Resource Limits

When **dds::core::policy::ResourceLimits::max_instances** (p. 1924) is reached, a **dds::pub::DataWriter** (p. 908) will try to make room for a new instance by attempting to reclaim an existing instance based on the instance replacement kind specified by **rti::core::policy::DataWriterResourceLimits::instance_replacement** (p. 1008).

Only instances whose states match the specified kinds are eligible to be replaced. In addition, an instance must have had all of its samples fully acknowledged for it to be considered replaceable.

For all kinds, a **dds::pub::DataWriter** (p. 908) will replace the oldest instance satisfying that kind. For example, when the kind is **DataWriterResourceLimitsInstanceReplacementKind::UNREGISTERED_INSTANCE_REPLACEMENT**, a **dds::pub::DataWriter** (p. 908) will remove the oldest, fully acknowledged, unregistered instance, if such an instance exists.

If no replaceable instance exists, the invoked function will either return with an appropriate out-of-resources return code, or in the case of a write, it may first block to wait for an instance to be acknowledged. Otherwise, the **dds::pub::DataWriter** (p. 908) will replace the old instance with the new instance, and invoke, if available, the **dds::pub::DataWriterListener::on_instance_replaced** (p. 976) to notify the user about an instance being replaced.

A **dds::pub::DataWriter** (p. 908) checks for replaceable instances in the following order, stopping once a replaceable instance is found:

- If `rti::core::policy::DataWriterResourceLimits::replace_empty_instances` (p. 1008) is true, a `dds::pub::DataWriter` (p. 908) first tries replacing instances that have no samples. These empty instances can be unregistered, disposed, or alive.
- Next, a `dds::pub::DataWriter` (p. 908) tries replacing unregistered instances. Since an unregistered instance indicates that the `dds::pub::DataWriter` (p. 908) is done modifying it, unregistered instances are replaced before instances of any other state (alive, disposed). This is the same as the `DataWriterResourceLimitsInstanceReplacementKind::UNREGISTERED_INSTANCE_REPLACEMENT` kind.
- Then, a `dds::pub::DataWriter` (p. 908) tries replacing what is specified by `rti::core::policy::DataWriterResourceLimits::instance_replacement` (p. 1008). With unregistered instances already checked, this leaves alive and disposed instances. When both alive and disposed instances may be replaced, the kind specifies whether the particular order matters (e.g., `DISPOSED_THEN_ALIVE`, `ALIVE_THEN_DISPOSED`) or not (`ALIVE_OR_DISPOSED`).

QoS:

`rti::core::policy::DataWriterResourceLimits` (p. 1002)

8.73.2 Member Enumeration Documentation

8.73.2.1 type

```
enum rti::core::policy::DataWriterResourceLimitsInstanceReplacementKind_def::type
```

The underlying `enum` type.

Enumerator

UNREGISTERED	Allows a <code>dds::pub::DataWriter</code> (p. 908) to reclaim unregistered acknowledged instances. By default, all instance replacement kinds first attempt to reclaim an unregistered, acknowledged instance. Used in <code>rti::core::policy::DataWriterResourceLimits::instance_replacement</code> (p. 1008) [default]
ALIVE	Allows a <code>dds::pub::DataWriter</code> (p. 908) to reclaim alive, acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a <code>dds::pub::DataWriter</code> (p. 908) to reclaim an alive, acknowledged instance, where an alive instance is a registered, non-disposed instance. The least recently registered or written alive instance will be reclaimed.
DISPOSED	Allows a <code>dds::pub::DataWriter</code> (p. 908) to reclaim disposed acknowledged instances. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a <code>dds::pub::DataWriter</code> (p. 908) to reclaim a disposed, acknowledged instance. The least recently disposed instance will be reclaimed.
ALIVE_THEN_DISPOSED	Allows a <code>dds::pub::DataWriter</code> (p. 908) first to reclaim an alive, acknowledged instance, and then, if necessary, a disposed, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a <code>dds::pub::DataWriter</code> (p. 908) to first try reclaiming an alive, acknowledged instance. If no instance is reclaimable, then it tries reclaiming a disposed, acknowledged instance. The least recently used (i.e., registered, written, or disposed) instance will be reclaimed.
Generated by Doxygen	

Enumerator

DISPOSED_THEN_ALIVE	Allows a dds::pub::DataWriter (p. 908) first to reclaim a disposed, acknowledged instance, and then, if necessary, an alive, acknowledged instance. When an unregistered, acknowledged instance is not available to reclaim, this kind allows a dds::pub::DataWriter (p. 908) to first try reclaiming a disposed, acknowledged instance. If no instance is reclaimable, then it tries reclaiming an alive, acknowledged instance. The least recently used (i.e., disposed, registered, or written) instance will be reclaimed.
ALIVE_OR_DISPOSED	Allows a dds::pub::DataWriter (p. 908) to reclaim a either an alive acknowledged instance or a disposed acknowledged instance. When an unregistered acknowledged instance is not available to reclaim, this kind allows a dds::pub::DataWriter (p. 908) to reclaim either an alive, acknowledged instance or a disposed, acknowledged instance. If both instance kinds are available to reclaim, the dds::pub::DataWriter (p. 908) will reclaim the least recently used (i.e. disposed, registered, or written) instance.

8.74 rti::core::DataWriterShmemRefTransferModeSettings Class Reference

<<*extension*>> (p. 156) Configures aspects of the shared memory reference transfer mode related to a DataWriter

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **DataWriterShmemRefTransferModeSettings** ()
Creates an instance with the default settings.
- **DataWriterShmemRefTransferModeSettings** & **enable_data_consistency_check** (bool the_enable_data_↔ consistency_check)
Controls if samples can be checked for consistency.
- bool **enable_data_consistency_check** () const
Getter (see setter with the same name)

8.74.1 Detailed Description

<<*extension*>> (p. 156) Configures aspects of the shared memory reference transfer mode related to a DataWriter

It is used to configure a **dds::pub::DataWriter** (p. 908) using **Zero Copy transfer over shared memory** (p. 49).

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

QoS:

rti::core::policy::DataWriterTransferMode (p. 1017)

8.74.2 Constructor & Destructor Documentation

8.74.2.1 DataWriterShmemRefTransferModeSettings()

```
rti::core::DataWriterShmemRefTransferModeSettings::DataWriterShmemRefTransferModeSettings ( )
[inline]
```

Creates an instance with the default settings.

8.74.3 Member Function Documentation

8.74.3.1 enable_data_consistency_check() [1/2]

```
DataWriterShmemRefTransferModeSettings & rti::core::DataWriterShmemRefTransferModeSettings↔
::enable_data_consistency_check (
    bool the_enable_data_consistency_check )
```

Controls if samples can be checked for consistency.

When this setting is true, the **dds::pub::DataWriter** (p. 908) sends an incrementing sequence number as an inline QoS with every sample. This sequence number allows a **dds::sub::DataReader** (p. 756) to use the **dds::sub::Data↔Reader::is_data_consistent** (p. 799) API to detect if the **dds::pub::DataWriter** (p. 908) overwrote the sample before the **dds::sub::DataReader** (p. 756) could complete processing the sample.

[default] true

8.74.3.2 enable_data_consistency_check() [2/2]

```
bool rti::core::DataWriterShmemRefTransferModeSettings::enable_data_consistency_check ( ) const
```

Getter (see setter with the same name)

Getter by reference (see setter)

8.76 dds::core::policy::Deadline Class Reference

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Deadline** ()
Creates the default deadline, with an infinite period.
- **Deadline** (const **dds::core::Duration** &d)
Creates a deadline policy with the specified period.
- **Deadline & period** (const **dds::core::Duration** &the_period)
Sets the duration of the deadline period.
- const **dds::core::Duration** **period** () const
Getter (see setter with the same name)

8.76.1 Detailed Description

Expresses the maximum duration (deadline) within which an instance is expected to be updated.

A **dds::sub::DataReader** (p.756) expects a new sample updating the value of each instance at least once every `period`. That is, `period` specifies the maximum expected elapsed time between arriving data samples.

A **dds::pub::DataWriter** (p.908) indicates that the application commits to write a new value (using the **dds::pub::DataWriter** (p.908)) for each instance managed by the **dds::pub::DataWriter** (p.908) at least once every `period`.

This QoS can be used during system integration to ensure that applications have been coded to meet design specifications.

It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions to prevent total system failure when data is not received in time. For topics on which data is not expected to be periodic, `period` should be set to an infinite value.

Entity:

dds::topic::Topic (p.2178), **dds::sub::DataReader** (p.756), **dds::pub::DataWriter** (p.908)

Status:

dds::core::status::StatusMask::offered_deadline_missed() (p.2086), **dds::core::status::StatusMask::requested_deadline_missed()** (p.2087), **dds::core::status::StatusMask::offered_incompatible_qos()** (p.2087), **dds::core::status::StatusMask::requested_incompatible_qos()** (p.2088)

Properties:

RxO (p.307) = YES

Changeable (p.307) = YES (p.307)

8.76.2 Usage

This policy is useful for cases where a **dds::topic::Topic** (p. 2178) is expected to have each instance updated periodically. On the publishing side this setting establishes a contract that the application must meet. On the subscribing side the setting establishes a minimum requirement for the remote publishers that are expected to supply the data values.

When RTI Connex 'matches' a **dds::pub::DataWriter** (p. 908) and a **dds::sub::DataReader** (p. 756) it checks whether the settings are compatible (i.e., *offered deadline* \leq *requested deadline*); if they are not, the two entities are informed (via the **Listener** (p. 1381) or **dds::core::cond::Condition** (p. 729) mechanism) of the incompatibility of the QoS settings and communication will not occur.

Assuming that the reader and writer ends have compatible settings, the fulfilment of this contract is monitored by RTI Connex and the application is informed of any violations by means of the proper **Listener** (p. 1381) or **dds::core::cond::Condition** (p. 729).

8.76.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered period* \leq *requested period* holds.

8.76.4 Consistency

The setting of the **DEADLINE** (p. 316) policy must be set consistently with that of the **TIME_BASED_FILTER** (p. 338).

For these two policies to be consistent the settings must be such that *deadline period* \geq *minimum_separation*.

An attempt to set these policies in an inconsistent manner will result in **dds::core::InconsistentPolicyError** (p. 1354) in **set_qos (abstract)** (p. 1267), or the **dds::core::Entity** (p. 1265) will not be created.

For a **dds::sub::DataReader** (p. 756), the **DEADLINE** (p. 316) policy and **dds::core::policy::TimeBasedFilter** (p. 2174) may interact such that even though the **dds::pub::DataWriter** (p. 908) is writing samples fast enough to fulfill its commitment to its own deadline, the **dds::sub::DataReader** (p. 756) may see violations of its deadline. This happens because RTI Connex will drop any samples received within the **dds::core::policy::TimeBasedFilter** \leftarrow **::minimum_separation** (p. 2177). To avoid triggering the **dds::sub::DataReader** (p. 756)'s deadline, even though the matched **dds::pub::DataWriter** (p. 908) is meeting its own deadline, set the two QoS parameters so that:

$$\text{reader_deadline} \geq \text{reader_minimum_separation} + \text{writer_deadline}$$

See **dds::core::policy::TimeBasedFilter** (p. 2174) for more information about the interactions between deadlines and time-based filters.

8.77.1 Detailed Description

Controls the logical order of updates to the same instance by a **dds::pub::Publisher** (p. 1719).

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::StatusMask**↔
::requested_incompatible_qos() (p. 2088)

Properties:

RxO (p. 307) = YES
Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

8.77.2 Usage

When multiple DataWriters send data for the same topic, the order in which data from different DataWriters are received by the applications of different DataReaders may be different. So different DataReaders may not receive the same "last" value when DataWriters stop sending data.

This QoS policy controls how each subscriber resolves the final value of a data instance that is written by multiple **dds::pub::DataWriter** (p. 908) entities (which may be associated with different **dds::pub::Publisher** (p. 1719) entities) running on different nodes.

This QoS can be used to create systems that have the property of "eventual consistency." Thus intermediate states across multiple applications may be inconsistent, but when DataWriters stop sending changes to the same topic, all applications will end up having the same state.

This QoS policy can be set for both DataWriters and DataReaders.

For the DataReader:

The default setting, `dds::core::policy::DestinationOrderKind::BY_RECEPTION_TIMESTAMP`, indicates that (assuming the **OWNERSHIP_STRENGTH** (p. 330) policy allows it) the latest received value for the instance should be the one whose value is kept. That is, data will be delivered by a **dds::sub::DataReader** (p. 756) in the order in which it was *received* (which may lead to inconsistent final values).

For `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`, if the scope is set to `dds::core::policy::DestinationOrderScopeKind::INSTANCE` (default), within each instance, the sample's source timestamp shall be used to determine the most recent information. This is the only setting that, in the case of concurrent same-strength DataWriters updating the same instance, ensures that all DataReaders end up with the same final value for the instance. If a DataReader receives a sample for an instance with a source timestamp that is older than the last source timestamp received for the instance, the sample is dropped. The `SAMPLE_REJECTED` status or the `SAMPLE_LOST` status will not be updated.

If scope is set to `dds::core::policy::DestinationOrderScopeKind::TOPIC`, the ordering is enforced per topic across all instances.

In addition, a DataReader will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than `source_timestamp_tolerance`. Otherwise, the DDS sample is dropped. The `SAMPLE_REJECTED` status or the `SAMPLE_LOST` status will not be updated.

For the DataWriter:

For the default setting, `dds::core::policy::DestinationOrderKind::BY_RECEPTION_TIMESTAMP`, the DataWriter will not enforce source timestamp ordering when writing samples using the **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 949) or **dds::pub::DataWriter::write(const T&,const dds::core::Time&)** (p. 919) API. The source timestamp of a new sample can be older than the source timestamp of the previous samples.

When using `dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`, If scope is set to `dds::core::policy::DestinationOrderScopeKind::INSTANCE` (default), when writing a sample, the sample's timestamp must not be older than the timestamp of the previously written DDS sample for the same instance. If, however, the timestamp is older than the timestamp of the previously written DDS sample—but the difference is less than the `source_timestamp_tolerance`—the DDS sample will use the previously written DDS sample's timestamp as its timestamp. Otherwise, if the difference is greater than the tolerance, the write will fail with retcode **dds::core::InvalidArgumentError** (p. 1363).

If scope is set to `dds::core::policy::DestinationOrderScopeKind::TOPIC`, a new sample timestamp must not be older than the timestamp of the previously written DDS sample, across all instances. (The ordering is enforced across all instances.)

8.77.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind* \geq *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of **dds::core::policy::DestinationOrder::kind** (p. 1025) are considered ordered such that `dds::core::policy::DestinationOrderKind::BY_RECEPTION_TIMESTAMP < dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP`

8.77.4 Constructor & Destructor Documentation

8.77.4.1 DestinationOrder() [1/2]

```
dds::core::policy::DestinationOrder::DestinationOrder ( ) [inline]
```

Creates the default policy.

8.77.4.2 DestinationOrder() [2/2]

```
dds::core::policy::DestinationOrder::DestinationOrder (
    dds::core::policy::DestinationOrderKind the_kind ) [inline], [explicit]
```

Creates a policy with the specified destination order kind.

8.77.5 Member Function Documentation

8.77.5.1 kind() [1/2]

```
DestinationOrder & dds::core::policy::DestinationOrder::kind (
    dds::core::policy::DestinationOrderKind the_kind ) [inline]
```

Sets the destination order kind.

[default] `dds::core::policy::DestinationOrderKind::BY_RECEPTION_TIMESTAMP`,

8.77.5.2 kind() [2/2]

```
dds::core::policy::DestinationOrderKind dds::core::policy::DestinationOrder::kind ( ) const [inline]
```

Getter (see the setter with the same name)

8.77.5.3 SourceTimestamp()

```
static DestinationOrder dds::core::policy::DestinationOrder::SourceTimestamp ( ) [inline], [static]
```

Creates a **DestinationOrder** (p. 1022) with DestinationOrderKind::BY_SOURCE_TIMESTAMP.

8.77.5.4 ReceptionTimestamp()

```
static DestinationOrder dds::core::policy::DestinationOrder::ReceptionTimestamp ( ) [inline], [static]
```

Creates a **DestinationOrder** (p. 1022) with DestinationOrderKind::BY_RECEPTION_TIMESTAMP.

References **dds::core::Duration::from_millisecs()**.

8.77.5.5 scope() [1/2]

```
dds::core::policy::DestinationOrder & scope (
    rti::core::policy::DestinationOrderScopeKind the_scope )
```

<<**extension**>> (p. 156) Sets the destination order scope

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Indicates if tolerance check and the current sample's timestamp is computed based on instance or topic basis.

[default] dds::core::policy::DestinationOrderScopeKind::INSTANCE

8.77.5.6 scope() [2/2]

```
rti::core::policy::DestinationOrderScopeKind scope ( ) const
```

<<**extension**>> (p. 156) Getter (see the setter with the same name)

8.77.5.7 source_timestamp_tolerance() [1/2]

```
dds::core::policy::DestinationOrder & source_timestamp_tolerance (
    const dds::core::Duration & ms )
```

<<*extension*>> (p. 156) Sets the allowed tolerance between source timestamps of consecutive samples.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

When a **dds::pub::DataWriter** (p. 908) sets **dds::core::policy::DestinationOrderKind** (p. 317) to **dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP**, when writing a sample, its timestamp must not be less than the timestamp of the previously written sample. However, if it is less than the timestamp of the previously written sample but the difference is less than this tolerance, the sample will use the previously written sample's timestamp as its timestamp. Otherwise, if the difference is greater than this tolerance, the write will fail.

When a **dds::sub::DataReader** (p. 756) sets **dds::core::policy::DestinationOrderKind** (p. 317) to **dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP**, the **dds::sub::DataReader** (p. 756) will accept a sample only if the source timestamp is no farther in the future from the reception timestamp than this tolerance. Otherwise, the sample is dropped.

[default] 100 milliseconds for **dds::pub::DataWriter** (p. 908), 30 seconds for **dds::sub::DataReader** (p. 756) and when default-constructed

8.77.5.8 source_timestamp_tolerance() [2/2]

```
dds::core::Duration source_timestamp_tolerance ( ) const
```

<<*extension*>> (p. 156) Getter (see the setter with the same name)

```

Public Types

- enum **type** {
 BY_RECEPTION_TIMESTAMP ,
 BY_SOURCE_TIMESTAMP }

The underlying enum type.

8.78.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `DestinationOrderKind`.

8.78.2 Member Enumeration Documentation

8.78.2.1 type

```
enum dds::core::policy::DestinationOrderKind_def::type
```

The underlying `enum` type.

Enumerator

BY_RECEPTION_TIMESTAMP	[default] Indicates that data is ordered based on the reception time at each <code>dds::sub::Subscriber</code> (p. 2116). Since each subscriber may receive the data at different times there is no guarantee that the changes will be seen in the same order. Consequently, it is possible for each subscriber to end up with a different final value for the data.
BY_SOURCE_TIMESTAMP	Indicates that data is ordered based on a time-stamp placed at the source (by RTI Connex or by the application). In any case this guarantees a consistent final value for the data in all subscribers. Note: If Batching is needed along with <code>dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP</code> and <code>dds::core::policy::DestinationOrderScopeKind::INSTANCE</code> , then the <code>rti::core::policy::Batch::source_timestamp_resolution</code> (p. 670) and <code>rti::core::policy::Batch::thread_safe_write</code> (p. 671) setting of <code>rti::core::policy::Batch</code> (p. 665) should be set to <code>dds::core::Duration::zero()</code> (p. 1197) and <code>true</code> respectively.

8.79 rti::core::policy::DestinationOrderScopeKind_def Struct Reference

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `DestinationOrderScopeKind`

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
 INSTANCE ,
 TOPIC }

The underlying enum type.

8.79.1 Detailed Description

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `DestinationOrderScopeKind`

8.79.2 Member Enumeration Documentation

8.79.2.1 type

```
enum rti::core::policy::DestinationOrderScopeKind_def::type
```

The underlying `enum` type.

Enumerator

INSTANCE	[default] Indicates that data is ordered on a per instance basis if used along with <code>dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP</code> . The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same instance. The tolerance check is also applied per instance.
TOPIC	Indicates that data is ordered on a per topic basis if used along with <code>dds::core::policy::DestinationOrderKind::BY_SOURCE_TIMESTAMP</code> . The source timestamp of the current sample is compared to the source timestamp of the previously received sample for the same topic. The tolerance check is also applied per topic.

8.80 rti::core::policy::Discovery Class Reference

<<*extension*>> (p. 156) Configures entity discovery

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Discovery** ()
Creates the default policy.
- **Discovery & enabled_transports** (const `dds::core::StringSeq` &the_enabled_transports)
Sets the transports (by their aliases) available for the discovery mechanism.
- **dds::core::StringSeq enabled_transports** () const
Getter (see setter with the same name)
- **Discovery & initial_peers** (const `dds::core::StringSeq` &the_initial_peers)
Sets the initial list of peers that the discovery mechanism will contact to announce this DomainParticipant.
- **dds::core::StringSeq initial_peers** () const

- Getter (see setter with the same name)*
- **Discovery & multicast_receive_addresses** (const **dds::core::StringSeq** &the_multicast_receive_addresses)

*Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain←Participant.*
 - **dds::core::StringSeq multicast_receive_addresses** () const

Getter (see setter with the same name)
 - **Discovery & metatraffic_transport_priority** (int32_t the_metatraffic_transport_priority)

*The transport priority to use for the **Discovery** (p. 1029) meta-traffic.*
 - int32_t **metatraffic_transport_priority** () const

Getter (see setter with the same name)
 - **Discovery & accept_unknown_peers** (bool the_accept_unknown_peers)

Whether to accept a new participant that is not in the initial peers list.
 - bool **accept_unknown_peers** () const

Getter (see setter with the same name)
 - **Discovery & enable_endpoint_discovery** (bool the_enable_endpoint_discovery)

Whether to automatically enable endpoint discovery for all the remote participants.
 - bool **enable_endpoint_discovery** () const

Getter (see setter with the same name)

8.80.1 Detailed Description

<<**extension**>> (p. 156) Configures entity discovery

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.80.2 Usage

This QoS policy identifies where on the network this application can *potentially* discover other applications with which to communicate.

The middleware will periodically send network packets to these locations, announcing itself to any remote applications that may be present, and will listen for announcements from those applications.

This QoS policy is an extension to the DDS standard.

NDDS_DISCOVERY_PEERS (p. 349)

rti::core::policy::DiscoveryConfig (p. 1035)

8.80.3 Constructor & Destructor Documentation

8.80.3.1 Discovery()

```
rti::core::policy::Discovery::Discovery ( )
```

Creates the default policy.

8.80.4 Member Function Documentation

8.80.4.1 enabled_transports() [1/2]

```
Discovery & rti::core::policy::Discovery::enabled_transports (
    const dds::core::StringSeq & the_enabled_transports )
```

Sets the transports (by their aliases) available for the discovery mechanism.

Only these transports can be used by the discovery mechanism to send meta-traffic via the builtin endpoints (built-in **dds::sub::DataReader** (p. 756) and **dds::pub::DataWriter** (p. 908)).

Also determines the unicast addresses on which the **Discovery** (p. 1029) mechanism will listen for meta-traffic. These along with the `domain_id` and `participant_id` determine the unicast locators on which the **Discovery** (p. 1029) mechanism can receive meta-data.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 339). These alias names are case sensitive and should be written in lowercase.

[default] Empty sequence. All the transports available to the DomainParticipant are available for use by the **Discovery** (p. 1029) mechanism.

[range] Sequence of non-null, non-empty strings.

8.80.4.2 enabled_transports() [2/2]

```
dds::core::StringSeq rti::core::policy::Discovery::enabled_transports ( ) const
```

Getter (see setter with the same name)

8.80.4.3 `initial_peers()` [1/2]

```
Discovery & rti::core::policy::Discovery::initial_peers (
    const dds::core::StringSeq & the_initial_peers )
```

Sets the initial list of peers that the discovery mechanism will contact to announce this DomainParticipant.

As part of the participant discovery phase, the **dds::domain::DomainParticipant** (p. 1079) will announce itself to the domain by sending participant DATA messages. The `initial_peers` specifies the initial list of peers that will be contacted. A remote **dds::domain::DomainParticipant** (p. 1079) is discovered by receiving participant announcements from a remote peer. When the new remote **dds::domain::DomainParticipant** (p. 1079) has been added to the participant's database, the endpoint discovery phase commences and information about the DataWriters and DataReaders is exchanged.

Each element of this list must be a peer descriptor in the proper format (see **Peer Descriptor Format** (p. 350)).

[default] builtin.udpv4://239.255.0.1, builtin.udpv4://127.0.0.1, builtin.shmem:// (See also **NDDS_DISCOVERY_PEERS** (p. 349))

[range] Sequence of arbitrary length.

See also

Peer Descriptor Format (p. 350)

dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string) (p. 1105)()

8.80.4.4 `initial_peers()` [2/2]

```
dds::core::StringSeq rti::core::policy::Discovery::initial_peers ( ) const
```

Getter (see setter with the same name)

8.80.4.5 `multicast_receive_addresses()` [1/2]

```
Discovery & rti::core::policy::Discovery::multicast_receive_addresses (
    const dds::core::StringSeq & the_multicast_receive_addresses )
```

Specifies the multicast group addresses on which discovery-related **meta-traffic** can be received by the Domain↔ Participant.

The multicast group addresses on which the **Discovery** (p. 1029) mechanism will listen for meta-traffic.

Each element of this list must be a valid multicast address (IPv4 or IPv6) in the proper format (see **Address Format** (p. 351)).

The `domain_id` determines the multicast port on which the **Discovery** (p. 1029) mechanism can receive meta-data.

If `NDDS_DISCOVERY_PEERS` does *not* contain a multicast address, then the string sequence `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032) is cleared and the RTI discovery process will not listen for discovery messages via multicast.

If `NDDS_DISCOVERY_PEERS` contains one or more multicast addresses, the addresses will be stored in `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032), starting at element 0. They will be stored in the order they appear `NDDS_DISCOVERY_PEERS`.

Note: Currently, RTI Connext will only listen for discovery traffic on the first multicast address (element 0) in `rti::core::policy::Discovery::multicast_receive_addresses` (p. 1032).

[default] `builtin.udpv4://239.255.0.1` (See also `NDDS_DISCOVERY_PEERS` (p. 349))

[range] Sequence of length [0,1], whose elements are multicast addresses. Currently only the first multicast address (if any) is used. The rest are ignored.

See also

Address Format (p. 351)

8.80.4.6 `multicast_receive_addresses()` [2/2]

```
dds::core::StringSeq rti::core::policy::Discovery::multicast_receive_addresses ( ) const
```

Getter (see setter with the same name)

8.80.4.7 `metatraffic_transport_priority()` [1/2]

```
Discovery & rti::core::policy::Discovery::metatraffic_transport_priority (
    int32_t the_metatraffic_transport_priority )
```

The transport priority to use for the **Discovery** (p. 1029) meta-traffic.

The discovery metatraffic will be sent by the built-in `dds::pub::DataWriter` (p. 908) using this transport priority.

[default] 0

[range] [0, MAX_UINT]

8.80.4.8 `metatraffic_transport_priority()` [2/2]

```
int32_t rti::core::policy::Discovery::metatraffic_transport_priority ( ) const
```

Getter (see setter with the same name)

8.80.4.9 `accept_unknown_peers()` [1/2]

```
Discovery & rti::core::policy::Discovery::accept_unknown_peers (
    bool the_accept_unknown_peers )
```

Whether to accept a new participant that is not in the initial peers list.

If false, the participant will only communicate with those in the initial peers list and those added via `dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)` (p. 1105).

If true, the participant will also communicate with all discovered remote participants.

Note: If `accept_unknown_peers` is false and shared memory is disabled, applications on the same node will *not* communicate if only 'localhost' is specified in the peers list. If shared memory is disabled or 'shmem://' is not specified in the peers list, to communicate with other applications on the same node through the loopback interface, you must put the actual node address or hostname in **NDDS_DISCOVERY_PEERS** (p. 349).

[default] true

8.80.4.10 `accept_unknown_peers()` [2/2]

```
bool rti::core::policy::Discovery::accept_unknown_peers ( ) const
```

Getter (see setter with the same name)

8.80.4.11 `enable_endpoint_discovery()` [1/2]

```
Discovery & rti::core::policy::Discovery::enable_endpoint_discovery (
    bool the_enable_endpoint_discovery )
```

Whether to automatically enable endpoint discovery for all the remote participants.

If true, endpoint discovery will automatically occur for every discovered remote participant.

If false, endpoint discovery will be initially disabled and manual activation is required for each discovered participant by calling `dds::domain::DomainParticipant::resume_endpoint_discovery` (p. 1109).

[default] true

8.80.4.12 `enable_endpoint_discovery()` [2/2]

```
bool rti::core::policy::Discovery::enable_endpoint_discovery ( ) const
```

Getter (see setter with the same name)

8.81 rti::core::policy::DiscoveryConfig Class Reference

<<*extension*>> (p. 156) Configures the discovery mechanism

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **DiscoveryConfig** ()
Creates the default policy.
- **DiscoveryConfig** & **participant_liveliness_lease_duration** (const **dds::core::Duration** &the_participant_↔
liveliness_lease_duration)
The liveliness lease duration for the participant.
- **dds::core::Duration** **participant_liveliness_lease_duration** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **participant_liveliness_assert_period** (const **dds::core::Duration** &the_participant_↔
liveliness_assert_period)
The period to assert liveliness for the participant.
- **dds::core::Duration** **participant_liveliness_assert_period** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **participant_announcement_period** (const **dds::core::Duration** &the_participant_↔
announcement_period)
*The period at which a participant announces itself to potential peers when using the Simple Participant **Discovery** (p. 1029) Protocol 2.0 (SPDP2).*
- **dds::core::Duration** **participant_announcement_period** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **remote_participant_purge_kind** (**RemoteParticipantPurgeKind** the_remote_↔
participant_purge_kind)
The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.
- **RemoteParticipantPurgeKind** **remote_participant_purge_kind** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **max_liveliness_loss_detection_period** (const **dds::core::Duration** &the_max_↔
liveliness_loss_detection_period)
The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.
- **dds::core::Duration** **max_liveliness_loss_detection_period** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **initial_participant_announcements** (int32_t the_initial_participant_announcements)
The number of initial announcements sent when a participant is first enabled.
- int32_t **initial_participant_announcements** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **new_remote_participant_announcements** (int32_t the_new_remote_participant_↔
announcements)
The number of participant announcements sent when a remote participant is newly discovered.
- int32_t **new_remote_participant_announcements** () const
Getter (see setter with the same name)

- **DiscoveryConfig** & **min_initial_participant_announcement_period** (const **dds::core::Duration** &the_min↔
_initial_participant_announcement_period)
The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
- **dds::core::Duration** **min_initial_participant_announcement_period** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **max_initial_participant_announcement_period** (const **dds::core::Duration** &the↔
max_initial_participant_announcement_period)
The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.
- **dds::core::Duration** **max_initial_participant_announcement_period** () const
Getter (see setter with the same name)
- **DiscoveryConfig** & **participant_reader_resource_limits** (const **BuiltinTopicReaderResourceLimits** &the↔
_participant_reader_resource_limits)
Resource limits.
- const **BuiltinTopicReaderResourceLimits** & **participant_reader_resource_limits** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits** & **participant_reader_resource_limits** ()
Getter (see setter with the same name)
- **DiscoveryConfig** & **publication_reader** (const **RtpsReliableReaderProtocol** &the_publication_reader)
RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.
- const **RtpsReliableReaderProtocol** & **publication_reader** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **publication_reader** ()
Getter (see setter with the same name)
- **DiscoveryConfig** & **publication_reader_resource_limits** (const **BuiltinTopicReaderResourceLimits** &the↔
_publication_reader_resource_limits)
Resource limits.
- const **BuiltinTopicReaderResourceLimits** & **publication_reader_resource_limits** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits** & **publication_reader_resource_limits** ()
Getter (see setter with the same name)
- **DiscoveryConfig** & **subscription_reader** (const **RtpsReliableReaderProtocol** &the_subscription_reader)
RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.
- const **RtpsReliableReaderProtocol** & **subscription_reader** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **subscription_reader** ()
Getter (see setter with the same name)
- **DiscoveryConfig** & **subscription_reader_resource_limits** (const **BuiltinTopicReaderResourceLimits**
&the_subscription_reader_resource_limits)
Resource limits.
- const **BuiltinTopicReaderResourceLimits** & **subscription_reader_resource_limits** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits** & **subscription_reader_resource_limits** ()
Getter (see setter with the same name)
- **DiscoveryConfig** & **publication_writer** (const **RtpsReliableWriterProtocol** &the_publication_writer)
RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.
- const **RtpsReliableWriterProtocol** & **publication_writer** () const

- Getter (see setter with the same name)*

 - **RtpsReliableWriterProtocol & publication_writer ()**

Getter (see setter with the same name)
- **DiscoveryConfig & publication_writer_data_lifecycle (const dds::core::policy::WriterDataLifecycle &the_publication_writer_data_lifecycle)**

Writer data lifecycle settings for a built-in publication writer.

 - const **dds::core::policy::WriterDataLifecycle & publication_writer_data_lifecycle () const**

Getter (see setter with the same name)
- **dds::core::policy::WriterDataLifecycle & publication_writer_data_lifecycle ()**

Getter (see setter with the same name)
- **DiscoveryConfig & subscription_writer (const RtpsReliableWriterProtocol &the_subscription_writer)**

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in subscription writer.

 - const **RtpsReliableWriterProtocol & subscription_writer () const**

Getter (see setter with the same name)
- **RtpsReliableWriterProtocol & subscription_writer ()**

Getter (see setter with the same name)
- **DiscoveryConfig & subscription_writer_data_lifecycle (const dds::core::policy::WriterDataLifecycle &the_subscription_writer_data_lifecycle)**

Writer data lifecycle settings for a built-in subscription writer.

 - const **dds::core::policy::WriterDataLifecycle & subscription_writer_data_lifecycle () const**

Getter (see setter with the same name)
- **dds::core::policy::WriterDataLifecycle & subscription_writer_data_lifecycle ()**

Getter (see setter with the same name)
- **DiscoveryConfig & builtin_discovery_plugins (const DiscoveryConfigBuiltinPluginKindMask &the_built_in_discovery_plugins)**

Mask of built-in discovery plugin kinds.

 - **DiscoveryConfigBuiltinPluginKindMask builtin_discovery_plugins () const**

Getter (see setter with the same name)
- **DiscoveryConfig & enabled_built_in_channels (const DiscoveryConfigBuiltinChannelKindMask &the_built_in_discovery_plugins)**

The mask specifying which built-in channels should be enabled.

 - **DiscoveryConfigBuiltinChannelKindMask enabled_built_in_channels () const**

Getter (see setter with the same name)
- **DiscoveryConfig & participant_message_reader_reliability_kind (dds::core::policy::ReliabilityKind the_participant_message_reader_reliability_kind)**

Reliability policy for a built-in participant message reader.

 - **dds::core::policy::ReliabilityKind participant_message_reader_reliability_kind () const**

Getter (see setter with the same name)
- **DiscoveryConfig & participant_message_reader (const RtpsReliableReaderProtocol &the_participant_message_reader)**

RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if rti::core::policy::DiscoveryConfig::participant_message_reader_reliability_kind (p. 1054) is set to dds::core::policy::ReliabilityKind_def::RELIABLE (p. 1881).

 - const **RtpsReliableReaderProtocol & participant_message_reader () const**

Getter (see setter with the same name)
- **RtpsReliableReaderProtocol & participant_message_reader ()**

Getter (see setter with the same name)
- **DiscoveryConfig & participant_message_writer (const RtpsReliableWriterProtocol &the_participant_message_writer)**

RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in participant message writer. This parameter only has effect if the matching participant message reader is configured with `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881) `dds::core::policy::ReliabilityKind_def` (p. 1879).

- `const RtpsReliableWriterProtocol & participant_message_writer () const`
Getter (see setter with the same name)
- `RtpsReliableWriterProtocol & participant_message_writer ()`
Getter (see setter with the same name)
- `DiscoveryConfig & publication_writer_publish_mode (const PublishMode &the_publication_writer_↔ publish_mode)`
Publish mode policy for the built-in publication writer.
- `const PublishMode & publication_writer_publish_mode () const`
Getter (see setter with the same name)
- `PublishMode & publication_writer_publish_mode ()`
Getter (see setter with the same name)
- `DiscoveryConfig & subscription_writer_publish_mode (const PublishMode &the_subscription_writer_↔ publish_mode)`
Publish mode policy for the built-in subscription writer.
- `const PublishMode & subscription_writer_publish_mode () const`
Getter (see setter with the same name)
- `PublishMode & subscription_writer_publish_mode ()`
Getter (see setter with the same name)
- `DiscoveryConfig & asynchronous_publisher (const AsynchronousPublisher &the_asynchronous_↔ publisher)`
Asynchronous publishing settings for the discovery `dds::pub::Publisher` (p. 1719) and all entities that are created by it.
- `const AsynchronousPublisher & asynchronous_publisher () const`
Getter (see setter with the same name)
- `AsynchronousPublisher & asynchronous_publisher ()`
Getter (see setter with the same name)
- `DiscoveryConfig & default_domain_announcement_period (const dds::core::Duration &the_default_↔ domain_announcement_period)`
The period to announce a participant to the default domain 0.
- `dds::core::Duration default_domain_announcement_period () const`
Getter (see setter with the same name)
- `DiscoveryConfig & ignore_default_domain_announcements (bool the_ignore_default_domain_↔ announcements)`
Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.
- `bool ignore_default_domain_announcements () const`
Getter (see setter with the same name)
- `DiscoveryConfig & service_request_writer (const RtpsReliableWriterProtocol &the_service_request_↔ writer)`
RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in `rti::topic::ServiceRequest` (p. 2065) writer.
- `const RtpsReliableWriterProtocol & service_request_writer () const`
Getter (see setter with the same name)
- `RtpsReliableWriterProtocol & service_request_writer ()`
Getter (see setter with the same name)
- `DiscoveryConfig & service_request_writer_data_lifecycle (const dds::core::policy::WriterDataLifecycle &lifecycle)`

Writer data lifecycle settings for a built-in rti::topic::ServiceRequest (p. 2065) writer.

- `const dds::core::policy::WriterDataLifecycle & service_request_writer_data_lifecycle () const`
Getter (see setter with the same name)
- `dds::core::policy::WriterDataLifecycle & service_request_writer_data_lifecycle ()`
Getter (see setter with the same name)
- `DiscoveryConfig & service_request_writer_publish_mode (const PublishMode &the_service_request_↔ writer_publish_mode)`
Publish mode policy for the built-in service request writer.
- `const PublishMode & service_request_writer_publish_mode () const`
Getter (see setter with the same name)
- `PublishMode & service_request_writer_publish_mode ()`
Getter (see setter with the same name)
- `DiscoveryConfig & service_request_reader (const RtpsReliableReaderProtocol &the_service_request_↔ reader)`
RTPS reliable reader protocol-related configuration settings for a built-in rti::topic::ServiceRequest (p. 2065) reader.
- `const RtpsReliableReaderProtocol & service_request_reader () const`
Getter (see setter with the same name)
- `RtpsReliableReaderProtocol & service_request_reader ()`
Getter (see setter with the same name)
- `DiscoveryConfig & locator_reachability_assert_period (const dds::core::Duration &the_locator_↔ reachability_assert_period)`
Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.
- `dds::core::Duration locator_reachability_assert_period () const`
Getter (see setter with the same name)
- `DiscoveryConfig & locator_reachability_lease_duration (const dds::core::Duration &the_locator_↔ reachability_lease_duration)`
The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.
- `dds::core::Duration locator_reachability_lease_duration () const`
Getter (see setter with the same name)
- `DiscoveryConfig & locator_reachability_change_detection_period (const dds::core::Duration &the_↔ locator_reachability_change_detection_period)`
Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.
- `dds::core::Duration locator_reachability_change_detection_period () const`
Getter (see setter with the same name)
- `DiscoveryConfig & secure_volatile_writer (const RtpsReliableWriterProtocol &the_secure_volatile_writer)`
RTPS protocol-related configuration settings for the RTPS reliable writer associated with the built-in secure volatile writer.
- `const RtpsReliableWriterProtocol & secure_volatile_writer () const`
Getter (see setter with the same name)
- `RtpsReliableWriterProtocol & secure_volatile_writer ()`
Getter (see setter with the same name)
- `DiscoveryConfig & secure_volatile_writer_publish_mode (const PublishMode &the_secure_volatile_↔ writer_publish_mode)`
Publish mode policy for the built-in secure volatile writer.
- `const PublishMode & secure_volatile_writer_publish_mode () const`
Getter (see setter with the same name)
- `PublishMode & secure_volatile_writer_publish_mode ()`
Getter (see setter with the same name)

- **DiscoveryConfig & secure_volatile_reader** (const **RtpsReliableReaderProtocol** &the_secure_volatile_↔
reader)
RTPS reliable reader protocol-related configuration settings for the built-in secure volatile reader.
- const **RtpsReliableReaderProtocol & secure_volatile_reader** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol & secure_volatile_reader** ()
Getter (see setter with the same name)
- **DiscoveryConfig & endpoint_type_object_lb_serialization_threshold** (int32_t the_endpoint_type_object_↔
_lb_serialization_threshold)
*Option to reduce the size required to propagate a TypeObject in Simple Endpoint **Discovery** (p. 1029).*
- int32_t **endpoint_type_object_lb_serialization_threshold** () const
Getter (see setter with the same name)
- **DiscoveryConfig & dns_tracker_polling_period** (const **dds::core::Duration** &the_dns_tracker_polling_↔
period)
Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.
- **dds::core::Duration dns_tracker_polling_period** () const
Getter (see setter with the same name)
- **DiscoveryConfig & participant_configuration_reader** (const **RtpsReliableReaderProtocol** &the_↔
participant_configuration_reader)
RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in participant configuration reader.
- const **RtpsReliableReaderProtocol & participant_configuration_reader** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol & participant_configuration_reader** ()
Getter (see setter with the same name)
- **DiscoveryConfig & participant_configuration_reader_resource_limits** (const **BuiltinTopicReader**↔
ResourceLimits &the_participant_configuration_reader_resource_limits)
Resource limits for the built-in topic participant configuration reader.
- const **BuiltinTopicReaderResourceLimits & participant_configuration_reader_resource_limits** () const
Getter (see setter with the same name)
- **BuiltinTopicReaderResourceLimits & participant_configuration_reader_resource_limits** ()
Getter (see setter with the same name)
- **DiscoveryConfig & participant_configuration_writer** (const **RtpsReliableWriterProtocol** &the_participant_↔
_configuration_writer)
RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.

Getter (see setter with the same name)
- **PublishMode** & **participant_configuration_writer_publish_mode** ()
Getter (see setter with the same name)

8.81.1 Detailed Description

<<*extension*>> (p. 156) Configures the discovery mechanism

<<*extension*>> (p. 156) This QoS policy controls the amount of delay in discovering entities in the system and the amount of discovery traffic in the network.

The amount of network traffic required by the discovery process can vary widely, based on how your application has chosen to configure the middleware's network addressing (e.g., unicast vs. multicast, multicast TTL, etc.), the size of the system, whether all applications are started at the same time or whether start times are staggered, and other factors. Your application can use this policy to make tradeoffs between discovery completion time and network bandwidth utilization. In addition, you can introduce random back-off periods into the discovery process to decrease the probability of network contention when many applications start simultaneously.

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.81.2 Constructor & Destructor Documentation

8.81.2.1 DiscoveryConfig()

```
rti::core::policy::DiscoveryConfig::DiscoveryConfig ( ) [inline]
```

Creates the default policy.

8.81.3 Member Function Documentation

8.81.3.1 participant_liveliness_lease_duration() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration (
    const dds::core::Duration & the_participant_liveliness_lease_duration )
```

The liveliness lease duration for the participant.

This is the same as the expiration time of the DomainParticipant as defined in the RTPS protocol.

If the participant has not refreshed its own liveliness to other participants at least once within this period, it may be considered as stale by other participants in the network.

Should be strictly greater than `rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period` (p. 1042).

[default] 100 seconds

[range] [1 nanosec,1 year], > participant_liveliness_assert_period

8.81.3.2 participant_liveliness_lease_duration() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration ( )
const
```

Getter (see setter with the same name)

8.81.3.3 participant_liveliness_assert_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period (
    const dds::core::Duration & the_participant_liveliness_assert_period )
```

The period to assert liveliness for the participant.

The period at which the participant will refresh its liveliness to all the peers.

Should be strictly less than `rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration` (p. 1041).

[default] 30 seconds

[range] [1 nanosec,1 year], < participant_liveliness_lease_duration

8.81.3.4 participant_liveliness_assert_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period ( )
const
```

Getter (see setter with the same name)

8.81.3.5 participant_announcement_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_announcement_period (
    const dds::core::Duration & the_participant_announcement_period )
```

The period at which a participant announces itself to potential peers when using the Simple Participant **Discovery** (p. 1029) Protocol 2.0 (SPDP2).

The `rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) list `dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)` (p. 1105) API are used to configure a set of potential peers that a DomainParticipant may discover. The `rti::core::policy::DiscoveryConfig::participant_announcement_period` (p. 1042) configures how frequently a DomainParticipant will announce itself to the subset of the configured potential peers that it has not matched with yet. Once a DomainParticipant matches with a DomainParticipant at one of configured potential peer locators, it will no longer announce itself to that locator at this period unless liveliness is lost.

This QoS policy is only supported when using the Simple Participant **Discovery** (p. 1029) Protocol 2.0 (SPDP2). Setting this value when using the Simple Participant **Discovery** (p. 1029) Protocol (SPDP) or other participant discovery protocols is not supported and will result in an error.

[default] `dds::core::Duration::automatic()` (p. 1198) (Takes the value of `rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period` (p. 1042))

[range] [1 nanosec, 1 year]

8.81.3.6 participant_announcement_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::participant_announcement_period ( ) const
```

Getter (see setter with the same name)

8.81.3.7 remote_participant_purge_kind() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::remote_participant_purge_kind (
    RemoteParticipantPurgeKind the_remote_participant_purge_kind )
```

The participant's behavior for maintaining knowledge of remote participants (and their contained entities) with which discovery communication has been lost.

Most users will not need to change this value from its default, `RemoteParticipantPurgeKind::LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE`. However, `RemoteParticipantPurgeKind::NO_REMOTE_PARTICIPANT_PURGE` may be a good choice if the following conditions apply:

1. **Discovery** (p. 1029) communication with a remote participant may be lost while data communication remains intact. Such will not typically be the case if discovery takes place over the Simple **Discovery** (p. 1029) Protocol, but may be the case if the RTI Enterprise **Discovery** (p. 1029) **Service** (p. 2057) is used.
2. Extensive and prolonged lack of discovery communication between participants is not expected to be common, either because participant loss itself is expected to be rare, or because participants may be lost sporadically but will typically return again.
3. Maintaining inter-participant liveliness is problematic, perhaps because a participant has no writers with the appropriate `dds::core::policy::LivelinessKind` (p. 327).

[default] `RemoteParticipantPurgeKind::LIVELINESS_BASED_REMOTE_PARTICIPANT_PURGE`

8.81.3.8 remote_participant_purge_kind() [2/2]

```
RemoteParticipantPurgeKind rti::core::policy::DiscoveryConfig::remote_participant_purge_kind ( )
const
```

Getter (see setter with the same name)

8.81.3.9 max_liveliness_loss_detection_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::max_liveliness_loss_detection_period (
    const dds::core::Duration & the_max_liveliness_loss_detection_period )
```

The maximum amount of time between when a remote entity stops maintaining its liveliness and when the matched local entity realizes that fact.

Notification of the loss of liveliness of a remote entity may come more quickly than this duration, depending on the liveliness contract between the local and remote entities and the capabilities of the discovery mechanism in use. For example, a **dds::sub::DataReader** (p. 756) will learn of the loss of liveliness of a matched **dds::pub::DataWriter** (p. 908) within the reader's offered liveliness lease duration.

Shortening this duration will increase the responsiveness of entities to communication failures. However, it will also increase the CPU usage of the application, as the liveliness of remote entities will be examined more frequently.

[default] 60 seconds

[range] [1 nanosec, 1 year]

8.81.3.10 max_liveliness_loss_detection_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::max_liveliness_loss_detection_period ( )
const
```

Getter (see setter with the same name)

8.81.3.11 initial_participant_announcements() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::initial_participant_announcements (
    int32_t the_initial_participant_announcements )
```

The number of initial announcements sent when a participant is first enabled.

[default] 5

[range] [1,1 million]

8.81.3.12 initial_participant_announcements() [2/2]

```
int32_t rti::core::policy::DiscoveryConfig::initial_participant_announcements ( ) const
```

Getter (see setter with the same name)

8.81.3.13 new_remote_participant_announcements() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::new_remote_participant_announcements (
    int32_t the_new_remote_participant_announcements )
```

The number of participant announcements sent when a remote participant is newly discovered.

These announcements are only sent to the newly discovered remote participant, they are not also broadcast to the `initial_peers` list.

[default] 2

[range] [0,1 million]

8.81.3.14 new_remote_participant_announcements() [2/2]

```
int32_t rti::core::policy::DiscoveryConfig::new_remote_participant_announcements ( ) const
```

Getter (see setter with the same name)

8.81.3.15 min_initial_participant_announcement_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::min_initial_participant_announcement_period
(
    const dds::core::Duration & the_min_initial_participant_announcement_period )
```

The minimum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between this and `rti::core::policy::DiscoveryConfig::max_initial_participant_announcement_period` (p. 1046) is introduced in between initial announcements when a new remote participant is discovered.

The setting of `rti::core::policy::DiscoveryConfig::min_initial_participant_announcement_period` (p. 1045) must be consistent with `rti::core::policy::DiscoveryConfig::max_initial_participant_announcement_period` (p. 1046). For these two values to be consistent, they must verify that:

```
rti::core::policy::DiscoveryConfig::min_initial_participant_announcement_period (p. 1045) <= rti::core::policy::DiscoveryConfig::max_initial_participant_announcement_period (p. 1046).
```

[default] 10 milliseconds

[range] [1 nanosec,1 year]

8.81.3.16 min_initial_participant_announcement_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::min_initial_participant_↔
period ( ) const
```

Getter (see setter with the same name)

8.81.3.17 max_initial_participant_announcement_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::max_initial_participant_↔
period (
    const dds::core::Duration & the_max_initial_participant_announcement_↔
period )
```

The maximum period between initial announcements when a participant is first enabled or when a remote participant is newly discovered.

A random delay between `rti::core::policy::DiscoveryConfig::min_initial_participant_announcement_period` (p. 1045) and this is introduced in between initial announcements when a new remote participant is discovered.

The setting of `rti::core::policy::DiscoveryConfig::max_initial_participant_announcement_period` (p. 1046) must be consistent with `rti::core::policy::DiscoveryConfig::min_initial_participant_announcement_period` (p. 1045). For these two values to be consistent, they must verify that:

```
rti::core::policy::DiscoveryConfig::min_initial_participant_↔
announcement_period (p. 1045) <= rti::core↔
::policy::DiscoveryConfig::max_initial_participant_↔
announcement_period (p. 1046).
```

[default] 1 second

[range] [1 nanosec,1 year]

8.81.3.18 max_initial_participant_announcement_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::max_initial_participant_↔
period ( ) const
```

Getter (see setter with the same name)

8.81.3.19 participant_reader_resource_limits() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_reader_resource_↔
limits (
    const BuiltinTopicReaderResourceLimits & the_participant_reader_resource_↔
limits )
```

Resource limits.

Resource limit of the built-in topic participant reader. For details, see `BuiltinTopicReaderResourceLimits_t`.

8.81.3.20 participant_reader_resource_limits() [2/3]

```
const BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::participant_reader↔
_resource_limits ( ) const
```

Getter (see setter with the same name)

8.81.3.21 participant_reader_resource_limits() [3/3]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::participant_reader↔
resource_limits ( )
```

Getter (see setter with the same name)

8.81.3.22 publication_reader() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::publication_reader (
    const RtpsReliableReaderProtocol & the_publication_reader )
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in publication reader.

For details, refer to the **rti::core::RtpsReliableReaderProtocol** (p. 1934)

[default]

```
min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;
```

8.81.3.23 publication_reader() [2/3]

```
const RtpsReliableReaderProtocol & rti::core::policy::DiscoveryConfig::publication_reader ( )
const
```

Getter (see setter with the same name)

8.81.3.24 publication_reader() [3/3]

```
RtpsReliableReaderProtocol & rti::core::policy::DiscoveryConfig::publication_reader ( )
```

Getter (see setter with the same name)

8.81.3.25 publication_reader_resource_limits() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::publication_reader_resource_limits (
    const BuiltinTopicReaderResourceLimits & the_publication_reader_resource_limits )
```

Resource limits.

Resource limit of the built-in topic publication reader. For details, see [BuiltinTopicReaderResourceLimits_t](#).

8.81.3.26 publication_reader_resource_limits() [2/3]

```
const BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::publication_reader↔
_resource_limits ( ) const
```

Getter (see setter with the same name)

8.81.3.27 publication_reader_resource_limits() [3/3]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::publication_reader↔
resource_limits ( )
```

Getter (see setter with the same name)

8.81.3.28 subscription_reader() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::subscription_reader (
    const RtpsReliableReaderProtocol & the_subscription_reader )
```

RTPS protocol-related configuration settings for the RTPS reliable reader associated with a built-in subscription reader.

For details, refer to the [rti::core::RtpsReliableReaderProtocol](#) (p. 1934)

[default]

```
min_heartbeat_response_delay 0.0 seconds;
max_heartbeat_response_delay 0.0 seconds;
heartbeat_suppression_duration 0.0625 seconds;
nack_period 5.0 seconds;
receive_window_size 256;
round_trip_time 0.0 seconds;
app_ack_period 5.0 seconds;
samples_per_app_ack 1;
```

8.81.3.29 subscription_reader() [2/3]

```
const RtpsReliableReaderProtocol & rti::core::policy::DiscoveryConfig::subscription_reader ( )  
const
```

Getter (see setter with the same name)

8.81.3.30 subscription_reader() [3/3]

```
RtpsReliableReaderProtocol & rti::core::policy::DiscoveryConfig::subscription_reader ( )
```

Getter (see setter with the same name)

8.81.3.31 subscription_reader_resource_limits() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::subscription_reader_resource_limits (   
    const BuiltinTopicReaderResourceLimits & the_subscription_reader_resource_limits )
```

Resource limits.

Resource limit of the built-in topic subscription reader. For details, see `BuiltinTopicReaderResourceLimits_t`.

8.81.3.32 subscription_reader_resource_limits() [2/3]

```
const BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::subscription_↔  
reader_resource_limits ( ) const
```

Getter (see setter with the same name)

8.81.3.33 subscription_reader_resource_limits() [3/3]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::subscription_reader_↔  
resource_limits ( )
```

Getter (see setter with the same name)

8.81.3.34 publication_writer() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::publication_writer (
    const RtpsReliableWriterProtocol & the_publication_writer )
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in publication writer.

For details, refer to the `rti::core::RtpsReliableWriterProtocol`

[default]

8.81.3.42 subscription_writer() [3/3]

```

RtpsReliableWriterProtocol & rti::core::policy::DiscoveryConfig::subscription_writer ( )

```

Getter (see setter with the same name)

8.81.3.43 subscription_writer_data_lifecycle() [1/3]

```

DiscoveryConfig & rti::core::policy::DiscoveryConfig::subscription_writer_data_lifecycle (
    const dds::core::policy::WriterDataLifecycle & the_subscription_writer_data_lifecycle
)

```

Writer data lifecycle settings for a built-in subscription writer.

For details, refer to the **dds::core::policy::WriterDataLifecycle** (p. 2359). **dds::core::policy::WriterDataLifecycle**↔
::autodispose_unregistered_instances (p. 2360) will always be forced to true.

8.81.3.44 subscription_writer_data_lifecycle() [2/3]

```
const dds::core::policy::WriterDataLifecycle & rti::core::policy::DiscoveryConfig::subscription_↔
_writer_data_lifecycle ( ) const
```

Getter (see setter with the same name)

8.81.3.45 subscription_writer_data_lifecycle() [3/3]

```
dds::core::policy::WriterDataLifecycle & rti::core::policy::DiscoveryConfig::subscription_↔
writer_data_lifecycle ( )
```

Getter (see setter with the same name)

8.81.3.46 builtin_discovery_plugins() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::builtin_discovery_plugins (
    const DiscoveryConfigBuiltinPluginKindMask & the_builtin_discovery_plugins )
```

Mask of built-in discovery plugin kinds.

There are several built-in discovery plugins. This mask enables the different plugins. Any plugin not enabled will not be created.

[default] `rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::SDP` (p. 1079)

See also

DiscoveryConfigBuiltinPluginKindMask (p. 1075)

8.81.3.47 builtin_discovery_plugins() [2/2]

```
DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfig::builtin_discovery_↔
plugins ( ) const
```

Getter (see setter with the same name)

8.81.3.48 enabled_builtin_channels() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::enabled_builtin_channels (
    const DiscoveryConfigBuiltinChannelKindMask & the_builtin_discovery_plugins )
```

The mask specifying which built-in channels should be enabled.

While there are a number of built-in channels that are used by Connex DDS, the only built-in channel which can currently be enabled or disabled is the **Service** (p.2057) Request Channel. This channel is used by the **Locator** (p.1416) Reachability and Topic Query features. If you are not using these features and wish to reduce network traffic and endpoint resource usage, you may disable the service request channel with this QoS.

[default] DiscoveryConfigBuiltinChannelKind::DISCOVERYCONFIG_SERVICE_REQUEST_CHANNEL

8.81.3.49 enabled_builtin_channels() [2/2]

```
DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfig::enabled_builtin_↔
channels ( ) const
```

Getter (see setter with the same name)

8.81.3.50 participant_message_reader_reliability_kind() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_message_reader_reliability_kind
(
    dds::core::policy::ReliabilityKind the_participant_message_reader_reliability_kind )
```

Reliability policy for a built-in participant message reader.

For details, refer to the **dds::core::policy::ReliabilityKind_def** (p.1879).

[default] dds::core::policy::ReliabilityKind_def::BEST_EFFORT (p.1881)

8.81.3.51 participant_message_reader_reliability_kind() [2/2]

```
dds::core::policy::ReliabilityKind rti::core::policy::DiscoveryConfig::participant_message_↔
reader_reliability_kind ( ) const
```

Getter (see setter with the same name)

8.81.3.52 participant_message_reader() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_message_reader (
    const RtpsReliableReaderProtocol & the_participant_message_reader )
```

RTPS reliable reader protocol-related configuration settings for a built-in participant message reader. This parameter only has effect if `rti::core::policy::DiscoveryConfig::participant_message_reader_reliability_kind` (p. 1054) is set to `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881).

For details, refer to the `rti::core::RtpsReliableReaderProtocol` (p. 1934)

[default]

```
min_heartbeat_response_delay 0.0 seconds;

const AsynchronousPublisher & rti::core::policy::DiscoveryConfig::asynchronous_publisher ( )  
const
```

Getter (see setter with the same name)

8.81.3.66 asynchronous_publisher() [3/3]

```
AsynchronousPublisher & rti::core::policy::DiscoveryConfig::asynchronous_publisher ( )
```

Getter (see setter with the same name)

8.81.3.67 default_domain_announcement_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::default_domain_announcement_period (
    const dds::core::Duration & the_default_domain_announcement_period )
```

The period to announce a participant to the default domain 0.

The period at which a participant will announce itself to the default domain 0 using the default UDPv4 multicast group address for discovery traffic on that domain.

For domain 0, the default discovery multicast address is 239.255.0.1:7400.

To disable announcement to the default domain, set this period to **dds::core::Duration::infinite()** (p. 1197).

When this period is set to a value other than **dds::core::Duration::infinite()** (p. 1197) and **rti::core::policy::DiscoveryConfig::ignore_default_domain_announcements** (p. 1059) is set to false, you can get information about participants running in different domains by creating a participant in domain 0 and implementing the `on_data_available` callback in the **dds::topic::ParticipantBuiltinTopicData** (p. 1639) built-in DataReader's listener.

You can learn the domain ID associated with a participant by looking at the field **dds::topic::ParticipantBuiltinTopicData::domain_id** (p. 1644).

[default] 30 seconds

[range] [1 nanosec,1 year] or **dds::core::Duration::infinite()** (p. 1197)

See also

dds::topic::ParticipantBuiltinTopicData::domain_id (p. 1644)

8.81.3.68 default_domain_announcement_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::default_domain_announcement_period ( )
const
```

Getter (see setter with the same name)

8.81.3.69 ignore_default_domain_announcements() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::ignore_default_domain_announcements (
    bool the_ignore_default_domain_announcements )
```

Used to ignore the announcements received by a participant on the default domain 0 corresponding to participants running on domains IDs other than 0.

This setting only applies to participants running on the default domain 0 and using the default port mapping.

When this setting is set to true, a participant running on the default domain 0 will ignore announcements from participants running on different domain IDs.

When this setting is set to false, a participant running on the default domain 0 will provide announcements from participants running on different domain IDs to the application via the **dds::topic::ParticipantBuiltinTopicData** (p. 1639) built-in DataReader.

[default] true

```

Getter (see setter with the same name)

8.81.3.83 locator_reachability_assert_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::locator_reachability_assert_period (
    const dds::core::Duration & the_locator_reachability_assert_period )
```

Period at which this DomainParticipant will assert the locators discovered from other DomainParticipants.

This setting configures the period at which this **dds::domain::DomainParticipant** (p. 1079) will ping all the locators that it has discovered from other DomainParticipants. This period should be strictly less than **rti::core::policy::DiscoveryConfig::locator_reachability_lease_duration** (p. 1064).

If **rti::core::policy::DiscoveryConfig::locator_reachability_lease_duration** (p. 1064) is **dds::core::Duration::infinite()** (p. 1197) this parameter is ignored. The DomainParticipant will not assert remote locators.

[default] 20 seconds

[range] [1 nanosec, 1 year]

rti::core::policy::DiscoveryConfig::locator_reachability_lease_duration (p. 1064)

8.81.3.84 locator_reachability_assert_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::locator_reachability_assert_period ( )
const
```

Getter (see setter with the same name)

8.81.3.85 locator_reachability_lease_duration() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::locator_reachability_lease_duration (
    const dds::core::Duration & the_locator_reachability_lease_duration )
```

The time period after which other DomainParticipants can consider one of their locators as "unreachable" if they do not receive a REACHABILITY PING from this DomainParticipant.

For the purpose of this explanation, we will use 'local' to refer to the DomainParticipant in which we configure `locator_reachability_lease_duration` and 'remote' to refer to the other DomainParticipants communicating with the local DomainParticipant.

This setting configures a timeout announced to the remote DomainParticipants. This timeout is used by the remote DomainParticipants as the maximum period by which a remote locator must be asserted by the local DomainParticipant (through a REACHABILITY PING message) before considering this locator as "unreachable" from the local DomainParticipant.

When a remote DomainParticipant detects that one of its locators is not reachable from the local DomainParticipant, it will notify the local DomainParticipant of this event. From that moment on, and until notified otherwise, the local DomainParticipant will not send RTPS messages to remote DomainParticipants using this locator.

If this value is set to `dds::core::Duration::infinite()` (p. 1197), the local DomainParticipant will send RTPS messages to a remote DomainParticipant on the locators announced by the remote DomainParticipant, regardless of whether or not the remote DomainParticipant can be reached using these locators.

[default] `dds::core::Duration::infinite()` (p. 1197)

[range] [1 nanosec,1 year] or `dds::core::Duration::infinite()` (p. 1197)

8.81.3.86 locator_reachability_lease_duration() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::locator_reachability_lease_duration ( )
const
```

Getter (see setter with the same name)

8.81.3.87 locator_reachability_change_detection_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::locator_reachability_change_detection_↔
period (
    const dds::core::Duration & the_locator_reachability_change_detection_period )
```

Period at which this DomainParticipant will check if its locators are reachable from other DomainParticipants.

This setting determines the maximum period at which this DomainParticipant will check to see if its locators are reachable from other DomainParticipants according to the other DomainParticipants' **rti::core::policy::DiscoveryConfig↔::locator_reachability_lease_duration** (p. 1064) value.

If **rti::core::policy::DiscoveryConfig::locator_reachability_lease_duration** (p. 1064) is **dds::core::Duration↔::infinite()** (p. 1197) this parameter is ignored. The DomainParticipant will not schedule an event to see if its locators are reachable from other DomainParticipants.

[default] 60 seconds

[range] [1 nanosec,1 year]

8.81.3.98 endpoint_type_object_lb_serialization_threshold() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::endpoint_type_object_lb_serialization_↔  
threshold (   
    int32_t the_endpoint_type_object_lb_serialization_threshold )
```

Option to reduce the size required to propagate a TypeObject in Simple Endpoint **Discovery** (p. 1029).

Minimum size (in bytes) of the serialized TypeObject that will trigger the serialization of a TypeObjectLb instead of the regular TypeObject.

For example, setting this property to 1000 will trigger the serialization of the TypeObjectLb for TypeObjects whose serialized size is greater than 1000 Bytes.

The sentinel value -1 disables TypeObject compression.

[default] 0. The default value 0 enables TypeObject compression by always sending TypeObjectLb.

[range] [-1, 2147483647]

8.81.3.99 endpoint_type_object_lb_serialization_threshold() [2/2]

```
int32_t rti::core::policy::DiscoveryConfig::endpoint_type_object_lb_serialization_threshold ( )  
const
```

Getter (see setter with the same name)

8.81.3.100 dns_tracker_polling_period() [1/2]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::dns_tracker_polling_period (   
    const dds::core::Duration & the_dns_tracker_polling_period )
```

Duration that specifies the period used by the DNS tracker to poll the DNS service and check for changes in the hostnames.

RTI ConnexT allows the use of hostnames instead of IP addresses when configuring initial peers for specific transports (e.g.: UDPv4 and UDPv6). The DNS tracker keeps the IP addresses of these hostnames updated. The DNS tracker builds a list of hostnames from the initial peers of a DomainParticipant, queries the DNS for those hostnames, and updates the resolved IP addresses when the IP addresses change. The frequency of these queries is defined by the DNS tracker polling period. When the period is set to **dds::core::Duration::infinite()** (p. 1197), the tracker is disabled.

RTI ConnexT keeps information regarding the hostnames of peers if they are part of the **rti::core::policy::Discovery↔::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1031). The information regarding peers added through the **dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)** (p. 1105) operation is kept only if the DNS tracker has been enabled before adding a peer.

[default] **dds::core::Duration::infinite()** (p. 1197)

[range] [1 second,1 year], **dds::core::Duration::infinite()** (p. 1197)

8.81.3.101 dns_tracker_polling_period() [2/2]

```
dds::core::Duration rti::core::policy::DiscoveryConfig::dns_tracker_polling_period ( ) const
```

Getter (see setter with the same name)

8.81.3.102 participant_configuration_reader() [1/3]

```

8.81.3.103 participant_configuration_reader() [2/3]

```
const RtpsReliableReaderProtocol & rti::core::policy::DiscoveryConfig::participant_configuration_reader ( ) const
```

Getter (see setter with the same name)

8.81.3.104 participant_configuration_reader() [3/3]

```
RtpsReliableReaderProtocol & rti::core::policy::DiscoveryConfig::participant_configuration_reader ( )
```

Getter (see setter with the same name)

8.81.3.105 participant_configuration_reader_resource_limits() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_configuration_reader_resource←
_limits (
    const BuiltinTopicReaderResourceLimits & the_participant_configuration_reader←
resource_limits )
```

Resource limits for the built-in topic participant configuration reader.

For details, see [BuiltinTopicReaderResourceLimits_t](#).

8.81.3.106 participant_configuration_reader_resource_limits() [2/3]

```
const BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::participant_configuration←
_reader_resource_limits ( ) const
```

Getter (see setter with the same name)

8.81.3.107 participant_configuration_reader_resource_limits() [3/3]

```
BuiltinTopicReaderResourceLimits & rti::core::policy::DiscoveryConfig::participant_configuration←
_reader_resource_limits ( )
```

Getter (see setter with the same name)

8.81.3.108 participant_configuration_writer() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_configuration_writer (
    const RtpsReliableWriterProtocol & the_participant_configuration_writer )
```

RTPS protocol-related configuration settings for the RTPS reliable writer associated with a built-in participant configuration writer.

For details, refer to the [rti::core::RtpsReliableWriterProtocol](#)

```

8.81.3.109 participant_configuration_writer() [2/3]

```

const RtpsReliableWriterProtocol & rti::core::policy::DiscoveryConfig::participant_configuration↔
_writer ( ) const

```

Getter (see setter with the same name)

8.81.3.110 participant_configuration_writer() [3/3]

```

RtpsReliableWriterProtocol & rti::core::policy::DiscoveryConfig::participant_configuration_writer
( )

```

Getter (see setter with the same name)

8.81.3.111 participant_configuration_writer_data_lifecycle() [1/3]

```

DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_configuration_writer_data↔
_lifecycle (
    const dds::core::policy::WriterDataLifecycle & the_participant_configuration↔
_writer_data_lifecycle )

```

Writer data lifecycle settings for a built-in participant configuration writer.

For details, refer to the **dds::core::policy::WriterDataLifecycle** (p. 2359). **dds::core::policy::WriterDataLifecycle↔::autodispose_unregistered_instances** (p. 2360) will always be forced to true.

8.81.3.112 participant_configuration_writer_data_lifecycle() [2/3]

```
const dds::core::policy::WriterDataLifecycle & rti::core::policy::DiscoveryConfig::participant_↔
configuration_writer_data_lifecycle ( ) const
```

Getter (see setter with the same name)

8.81.3.113 participant_configuration_writer_data_lifecycle() [3/3]

```
dds::core::policy::WriterDataLifecycle & rti::core::policy::DiscoveryConfig::participant_configuration↔
_writer_data_lifecycle ( )
```

Getter (see setter with the same name)

8.81.3.114 participant_configuration_writer_publish_mode() [1/3]

```
DiscoveryConfig & rti::core::policy::DiscoveryConfig::participant_configuration_writer_publish_↔
mode (
    const PublishMode & the_participant_configuration_writer_publish_mode )
```

Publish mode policy for the built-in participant configuration writer.

Determines whether the **Discovery** (p. 1029) built-in participant configuration **dds::pub::DataWriter** (p. 908) publishes data synchronously or asynchronously and how.

8.81.3.115 participant_configuration_writer_publish_mode() [2/3]

```
const PublishMode & rti::core::policy::DiscoveryConfig::participant_configuration_writer_publish_↔
_mode ( ) const
```

Getter (see setter with the same name)

8.81.3.116 participant_configuration_writer_publish_mode() [3/3]

```
PublishMode & rti::core::policy::DiscoveryConfig::participant_configuration_writer_publish_mode (
)
```

Getter (see setter with the same name)

8.82 rti::core::policy::DiscoveryConfigBuiltinChannelKindMask Class Reference

<<*extension*>> (p. 156) A mask that selects the built-in channels to be used

```
#include <PolicyKind.hpp>
```

Inherits std::bitset< 7 >.

Public Types

- typedef std::bitset< 7 > **MaskType**
The base type, std::bitset.

Public Member Functions

- **DiscoveryConfigBuiltinChannelKindMask** ()=default
Creates an empty mask.
- **DiscoveryConfigBuiltinChannelKindMask** (uint64_t mask)
Creates a mask from the bits in an integer.
- **DiscoveryConfigBuiltinChannelKindMask** (const **MaskType** &mask)
Creates a mask from a std::bitset.

Static Public Member Functions

- static **DiscoveryConfigBuiltinChannelKindMask** **all** ()
All the bits are set, indicating that all channels are enabled.
- static **DiscoveryConfigBuiltinChannelKindMask** **none** ()
No bits are set, indicating that all channels are disabled.
- static **DiscoveryConfigBuiltinChannelKindMask** **service_request** ()
Set the bits to enable the service request channel (which is the default setting).

8.82.1 Detailed Description

<<*extension*>> (p. 156) A mask that selects the built-in channels to be used

8.82.2 Member Typedef Documentation

8.82.2.1 MaskType

```
typedef std::bitset<7> rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::MaskType
```

The base type, std::bitset.

8.82.3 Constructor & Destructor Documentation

8.82.3.1 DiscoveryConfigBuiltinChannelKindMask() [1/3]

```
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::DiscoveryConfigBuiltinChannelKindMask (  
    ) [default]
```

Creates an empty mask.

Referenced by `all()`, `none()`, and `service_request()`.

8.82.3.2 DiscoveryConfigBuiltinChannelKindMask() [2/3]

```
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::DiscoveryConfigBuiltinChannelKindMask (  
    uint64_t mask ) [inline], [explicit]
```

Creates a mask from the bits in an integer.

8.82.3.3 DiscoveryConfigBuiltinChannelKindMask() [3/3]

```
rti::core::policy::DiscoveryConfigBuiltinChannelKindMask::DiscoveryConfigBuiltinChannelKindMask (  
    const MaskType & mask ) [inline], [explicit]
```

Creates a mask from a std::bitset.

8.82.4 Member Function Documentation

8.82.4.1 all()

```
static DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannel←
KindMask::all ( ) [inline], [static]
```

All the bits are set, indicating that all channels are enabled.

References **DiscoveryConfigBuiltinChannelKindMask()**.

8.82.4.2 none()

```
static DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannel←
KindMask::none ( ) [inline], [static]
```

No bits are set, indicating that all channels are disabled.

References **DiscoveryConfigBuiltinChannelKindMask()**.

8.82.4.3 service_request()

```
static DiscoveryConfigBuiltinChannelKindMask rti::core::policy::DiscoveryConfigBuiltinChannel←
KindMask::service_request ( ) [inline], [static]
```

Set the bits to enable the service request channel (which is the default setting).

References **DiscoveryConfigBuiltinChannelKindMask()**.

8.83 rti::core::policy::DiscoveryConfigBuiltinPluginKindMask Class Reference

<<*extension*>> (p. 156) A mask that selects the built-in discovery plugins to be used

```
#include <PolicyKind.hpp>
```

Inherits `std::bitset< 5 >`.

Public Types

- typedef `std::bitset< 5 >` **MaskType**

The base type, std::bitset.

Public Member Functions

- **DiscoveryConfigBuiltinPluginKindMask** ()
Creates an empty mask.
- **DiscoveryConfigBuiltinPluginKindMask** (uint64_t mask)
Creates a mask from the bits in an integer.
- **DiscoveryConfigBuiltinPluginKindMask** (const **MaskType** &mask)
Creates a mask from a std::bitset.

Static Public Member Functions

- static const **DiscoveryConfigBuiltinPluginKindMask** none ()
No bits are set.
- static const **DiscoveryConfigBuiltinPluginKindMask** SPDP ()
*Simple Participant **Discovery** (p. 1029) Protocol.*
- static const **DiscoveryConfigBuiltinPluginKindMask** SEDP ()
*Simple Endpoint **Discovery** (p. 1029) Protocol.*
- static const **DiscoveryConfigBuiltinPluginKindMask** SPDP2 ()
*Simple Participant **Discovery** (p. 1029) Protocol 2.0.*
- static const **DiscoveryConfigBuiltinPluginKindMask** DPSE ()
Dynamic Participant discovery, Static Endpoint discovery.
- static const **DiscoveryConfigBuiltinPluginKindMask** SDP ()
Simple discovery plugin (default).
- static const **DiscoveryConfigBuiltinPluginKindMask** SDP2 ()
Simple discovery plugin 2.0.

8.83.1 Detailed Description

<<**extension**>> (p. 156) A mask that selects the built-in discovery plugins to be used

8.83.2 Member Typedef Documentation

8.83.2.1 MaskType

```
typedef std::bitset<5> rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::MaskType
```

The base type, std::bitset.

8.83.3 Constructor & Destructor Documentation

8.83.3.1 DiscoveryConfigBuiltinPluginKindMask() [1/3]

```
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::DiscoveryConfigBuiltinPluginKindMask ( )  
[inline]
```

Creates an empty mask.

Referenced by **DPSE()**, **none()**, **SDP()**, **SDP2()**, **SEDP()**, **SPDP()**, and **SPDP2()**.

8.83.3.2 DiscoveryConfigBuiltinPluginKindMask() [2/3]

```
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::DiscoveryConfigBuiltinPluginKindMask (   
    uint64_t mask ) [inline], [explicit]
```

Creates a mask from the bits in an integer.

8.83.3.3 DiscoveryConfigBuiltinPluginKindMask() [3/3]

```
rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::DiscoveryConfigBuiltinPluginKindMask (   
    const MaskType & mask ) [inline]
```

Creates a mask from a std::bitset.

8.83.4 Member Function Documentation

8.83.4.1 none()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↔  
PluginKindMask::none ( ) [inline], [static]
```

No bits are set.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.83.4.2 SPDP()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↔  
PluginKindMask::SPDP ( ) [inline], [static]
```

Simple Participant **Discovery** (p. 1029) Protocol.

Enables the first phase of the Simple **Discovery** (p. 1029) Protocol (SDP), in which DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant declaration messages, also known as participant DATA submessages or participant announcements.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.83.4.3 SEDP()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↔  
PluginKindMask::SEDP ( ) [inline], [static]
```

Simple Endpoint **Discovery** (p. 1029) Protocol.

Enables the second phase of the Simple **Discovery** (p. 1029) Protocol (SDP), in which the information (GUID, QoS, etc.) about your application's DataReaders and DataWriters is exchanged by sending publication/subscription declarations in DATA messages, also known as publication DATAs and subscription DATAs.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.83.4.4 SPDP2()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↔  
PluginKindMask::SPDP2 ( ) [inline], [static]
```

Simple Participant **Discovery** (p. 1029) Protocol 2.0.

Enables the Simple Participant **Discovery** (p. 1029) Protocol 2.0, in which a DomainParticipant's details are communicated to all other DomainParticipants in the same DDS domain by sending participant bootstrap messages. These bootstrap messages contain only a subset of the information in the Simple Participant **Discovery** (p. 1029) Protocol (SPDP) participant announcements that is required to match two participants and bootstrap the system. The DomainParticipant's full configuration is then sent reliably with participant configuration announcements. Two DomainParticipants that use SPDP2 will maintain liveliness using liveliness participant messages.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.83.4.5 DPSE()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↔
PluginKindMask::DPSE ( ) [inline], [static]
```

Dynamic Participant discovery, Static Endpoint discovery.

Enables static endpoint discovery for a DomainParticipant. In this type of discovery, information from remote endpoints is extracted from a local DDS-XML file instead of being received over the network, reducing the number of exchanged packets and consequently reducing bandwidth consumption used for discovery. Using this value in **DiscoveryConfig↔BuiltinPluginKindMask** (p. 1075) requires the 'librtlibedisc' library (included in the RTI Connex Professional bundles) to be reachable (PATH, LD_LIBRARY_PATH or DYLD_LIBRARY_PATH).

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.83.4.6 SDP()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↔
PluginKindMask::SDP ( ) [inline], [static]
```

Simple discovery plugin (default).

It is equivalent to SPDP + SEDP.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.83.4.7 SDP2()

```
static const DiscoveryConfigBuiltinPluginKindMask rti::core::policy::DiscoveryConfigBuiltin↔
PluginKindMask::SDP2 ( ) [inline], [static]
```

Simple discovery plugin 2.0.

It is equivalent to SPDP2 + SEDP.

References **DiscoveryConfigBuiltinPluginKindMask()**.

8.84 dds::domain::DomainParticipant Class Reference

<<*reference-type*>> (p. 153) Container for all **dds::core::Entity** (p. 1265) objects.

```
#include <dds/domain/DomainParticipant.hpp>
```

Inheritance diagram for dds::domain::DomainParticipant:

Public Types

- typedef **DomainParticipantListener** **Listener**
*The **Listener** (p. 1381) type that **DomainParticipants** use.*

Public Member Functions

- **DomainParticipant** (int32_t the_domain_id)
*Create a new **DomainParticipant** (p. 1079) with default Qos.*
- **DomainParticipant** (int32_t the_domain_id, const **dds::domain::qos::DomainParticipantQos** &the_qos, **dds::domain::DomainParticipantListener** *the_listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
*Create a new **DomainParticipant** (p. 1079).*
- **DomainParticipant** (int32_t the_domain_id, const **dds::domain::qos::DomainParticipantQos** &the_qos, std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
*Create a new **DomainParticipant** (p. 1079).*
- void **listener** (**Listener** *l, const **dds::core::status::StatusMask** &mask)
*Register a listener with the **DomainParticipant** (p. 1079).*
- **Listener** * **listener** () const
*Get the **DomainParticipant** (p. 1079) listener.*
- void **set_listener** (std::shared_ptr< **Listener** > the_listener, const **dds::core::status::StatusMask** &event_mask)
Sets the listener associated with this participant.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)
Sets the listener associated with this participant.
- std::shared_ptr< **Listener** > **get_listener** () const
Returns the listener currently associated with this participant.
- const **dds::domain::qos::DomainParticipantQos** **qos** () const
*Gets the current QoS policies of this **DomainParticipant** (p. 1079).*
- void **qos** (const **dds::domain::qos::DomainParticipantQos** &the_qos)
*Set the **DomainParticipantQos** setting for this **DomainParticipant** (p. 1079) instance.*
- **DomainParticipant** & **operator**<< (const **dds::domain::qos::DomainParticipantQos** &the_qos)
*Equivalent to **set_qos**(the_qos)*
- const **DomainParticipant** & **operator**>> (**dds::domain::qos::DomainParticipantQos** &the_qos) const
*Equivalent to **get_qos** ()*
- int32_t **domain_id** () const
Get the unique domain identifier.
- void **assert_liveliness** ()
*Manually assert the liveliness of the **DomainParticipant** (p. 1079).*
- void **property** (const std::string &property_name, const std::string &value, bool propagate)
*Set the value for a property that applies to a **DomainParticipant** (p. 1079).*
- bool **contains_entity** (const **dds::core::InstanceHandle** &a_handle)
*Check whether or not the given handle represents an Entity that was created from the **DomainParticipant** (p. 1079).*
- **dds::core::Time** **current_time** ()
Get the current time.
- **dds::pub::qos::PublisherQos** **default_publisher_qos** () const

- Get the current default **dds::pub::qos::PublisherQos** (p. 1733).
- **DomainParticipant & default_publisher_qos** (const **dds::pub::qos::PublisherQos** &the_qos)
Set the default **dds::pub::qos::PublisherQos** (p. 1733) for this **DomainParticipant** (p. 1079).
 - **dds::sub::qos::SubscriberQos default_subscriber_qos** () const
Get the current default **dds::sub::qos::SubscriberQos** (p. 2129).
 - **DomainParticipant & default_subscriber_qos** (const **dds::sub::qos::SubscriberQos** &the_qos)
Set the default **dds::sub::qos::SubscriberQos** (p. 2129) for this **DomainParticipant** (p. 1079).
 - **dds::topic::qos::TopicQos default_topic_qos** () const
Get the current default **dds::topic::qos::TopicQos** (p. 2213).
 - **DomainParticipant & default_topic_qos** (const **dds::topic::qos::TopicQos** &the_qos)
Set the default **dds::topic::qos::TopicQos** (p. 2213) for this **DomainParticipant** (p. 1079).
 - void **close_contained_entities** ()
<<extension>> (p. 156) Closes all the entities created from this **DomainParticipant** (p. 1079)
 - **dds::pub::qos::DataWriterQos default_datawriter_qos** () const
<<extension>> (p. 156) Get the current default **dds::pub::qos::DataWriterQos** (p. 994).
 - void **default_datawriter_qos** (const **dds::pub::qos::DataWriterQos** & qos)
<<extension>> (p. 156) Set the default **dds::pub::qos::DataWriterQos** (p. 994) for this **DomainParticipant** (p. 1079).
 - **dds::sub::qos::DataReaderQos default_datareader_qos** () const
<<extension>> (p. 156) Get the current default **dds::sub::qos::DataReaderQos** (p. 848).
 - void **default_datareader_qos** (const **dds::sub::qos::DataReaderQos** & qos)
<<extension>> (p. 156) Set the default **dds::sub::qos::DataReaderQos** (p. 848) for this **DomainParticipant** (p. 1079).
 - void **register_contentfilter** (const **rti::topic::CustomFilter**< **rti::topic::ContentFilterBase** > &custom_filter, const std::string &filter_name)
<<extension>> (p. 156) Register a content filter which can be used to create a **dds::topic::ContentFilteredTopic** (p. 735).
 - void **unregister_contentfilter** (const std::string &filter_name)
<<extension>> (p. 156) Unregister a content filter previously registered with **dds::domain::DomainParticipant**←
::register_contentfilter(const rti::topic::CustomFilter< rti::topic::ContentFilterBase> & custom_filter, const std←
::string& filter_name) (p. 1103).
 - void **unregister_type** (const std::string &name)
<<extension>> (p. 156) Unregister a type that has previously been registered to this **dds::domain::Domain**←
Participant (p. 1079).
 - bool **is_type_registered** (const std::string &name) const
<<extension>> (p. 156) Check if a type has previously been registered to this **dds::domain::DomainParticipant** (p. 1079).
 - void **add_peer** (const std::string &peer_descr_string)
<<extension>> (p. 156) Attempt to contact one or more additional peer participants.
 - void **remove_peer** (const std::string &peer_descr_string)
<<extension>> (p. 156) Remove one or more peer participants from the list of peers with which this **dds::domain::**←
DomainParticipant (p. 1079) will try to communicate.
 - **dds::core::Duration dns_tracker_polling_period** () const
Retrieves the frequency used by the DNS tracker thread to query the DNS service.
 - void **dns_tracker_polling_period** (const **dds::core::Duration** &polling_period)
Configures the frequency in which the DNS tracker queries the DNS service.
 - void **resume_endpoint_discovery** (const **dds::core::InstanceHandle** &remote_participant_handle)
<<extension>> (p. 156) Initiates endpoint discovery with the remote **dds::domain::DomainParticipant** (p. 1079) identified by its **InstanceHandle**.
 - void **delete_durable_subscription** (const **rti::core::EndpointGroup** &group)

- `<<extension>>` (p. 156) *Deletes an existing Durable Subscription on all Persistence Services.*
- void **register_durable_subscription** (const **rti::core::EndpointGroup** &group, const std::string &topic_name)
 - `<<extension>>` (p. 156) *Registers a Durable Subscription on the specified **dds::topic::Topic** (p. 2178) on all Persistence Services.*
- **rti::core::status::DomainParticipantProtocolStatus** participant_protocol_status ()
 - `<<extension>>` (p. 156) *Get the protocol status for this participant*

Static Public Member Functions

- static void **participant_factory_qos** (const **dds::domain::qos::DomainParticipantFactoryQos** &qos)
 - Set the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130).
- static **dds::domain::qos::DomainParticipantFactoryQos** participant_factory_qos ()
 - Get the current **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130).
- static void **finalize_participant_factory** ()
 - Finalize the **DomainParticipantFactory**.
- static **dds::domain::qos::DomainParticipantQos** default_participant_qos ()
 - Get the current **DomainParticipantQos** for this instance.
- static void **default_participant_qos** (const **dds::domain::qos::DomainParticipantQos** &qos)
 - Set the **DomainParticipantQos**.

Related Functions

- template<typename T >
 void **register_type** (const std::string ®istered_type_name= **dds::topic::topic_type_name**< T >::value())
 <<extension>> (p. 156) Registers a User-Generated Type with RTI Connex. This function is used along with XML Application Creation.

8.84.1 Detailed Description

<<reference-type>> (p. 153) Container for all **dds::core::Entity** (p. 1265) objects.

- It acts as a container for all other **dds::core::Entity** (p. 1265) objects.
- It acts as a *factory* for the **dds::pub::Publisher** (p. 1719), **dds::sub::Subscriber** (p. 2116), **dds::topic::Topic** (p. 2178) and MultiTopic **dds::core::Entity** (p. 1265) objects.
- It represents the participation of the application on a communication plane that isolates applications running on the same set of physical computers from each other. A domain establishes a virtual network linking all applications that share the same `domainId` and isolating them from applications running on different domains. In this way, several independent distributed applications can coexist in the same physical network without interfering, or even being aware of each other.
- It provides administration services in the domain, offering operations that allow the application to ignore locally any information about a given participant (**dds::domain::ignore** (p. 423)), publication (**dds::pub::ignore** (p. 435)), subscription (**dds::sub::ignore()** (p. 455)) or topic (**dds::topic::ignore()** (p. 481)).

The following operations may be called even if the `dds::domain::DomainParticipant` (p. 1079) is not enabled. Operations NOT in this list will fail with `dds::core::NotEnabledError` (p. 1601) \ if called on a disabled `DomainParticipant` (p. 1079).

- `dds::core::Entity::enable` (p. 1269),
- `dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&)` (p. 1090), `dds::domain::DomainParticipant::qos() const` (p. 1090),
- `dds::domain::DomainParticipant::set_listener` (p. 1088), `dds::domain::DomainParticipant::get_listener` (p. 1089),
- The constructors of `rti::pub::FlowController` (p. 1316), `dds::topic::Topic` (p. 2178), `dds::pub::Publisher` (p. 1719), `dds::sub::Subscriber` (p. 2116).
- `dds::domain::DomainParticipant::default_topic_qos` (p. 1098), `dds::domain::DomainParticipant::default_topic_qos()` (p. 1098), `dds::domain::DomainParticipant::default_publisher_qos` (p. 1095), `dds::domain::DomainParticipant::default_publisher_qos()` (p. 1095), `dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)` (p. 1097), `dds::domain::DomainParticipant::default_subscriber_qos` (p. 1096), `dds::domain::DomainParticipant::default_datareader_qos` (p. 1101), `dds::domain::DomainParticipant::default_datareader_qos()` (p. 1101), `dds::domain::DomainParticipant::default_datawriter_qos` (p. 1100), `dds::domain::DomainParticipant::default_datawriter_qos()` (p. 1100), ;
- Operations for looking up topics: `dds::topic::find()` (p. 482);
- Operations that access status: `dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)` (p. 2080), `dds::core::Entity::status_changes()` (p. 1270).

QoS:

`dds::domain::qos::DomainParticipantQos` (p. 1136)

Status:

`Status Kinds` (p. 229)

Listener:

`DomainParticipantListener` (p. 1134)

See also

Operations Allowed in Listener Callbacks (p. 1383)

Other operations related to a **DomainParticipant** (p. 1079) in other namespaces:

- Related to **dds::topic::Topic** (p.2178): **dds::topic::find()** (p.482), **dds::topic::discover_any_topic** (p.478), **dds::topic::discover_topic_data** (p.479), **dds::topic::ignore()** (p.481) and similar operations
- Related to **dds::sub::Subscriber** (p.2116): **rti::sub::find_subscribers()** (p.544), **dds::sub::builtin_↔subscriber()** (p.459), **rti::sub::implicit_subscriber()** (p.541)
- Related to **dds::sub::DataReader** (p.756): **dds::sub::ignore()** (p.455), **rti::sub::find_datareader_by_↔name()** (p.549)
- Related to **dds::pub::Publisher** (p.1719): **rti::pub::find_publishers()** (p.530), **rti::pub::implicit_↔publisher()** (p.525)
- Related to **dds::pub::DataWriter** (p.908): **dds::pub::ignore()** (p.435), **rti::pub::find_datawriter_by_↔name()** (p.535)
- Related to **rti::pub::FlowController** (p.1316): **rti::pub::find_flow_controller()** (p.537)

dds::core::QosProvider::create_participant_from_config (p.1771) to create a **DomainParticipant** (p.1079) from an XML definition

Participant Use Cases (p.107)

Entity Use Cases (p.126)

Examples

Foo.hpp, **Foo_publisher.cxx**, and **Foo_subscriber.cxx**.

8.84.2 Member Typedef Documentation

8.84.2.1 Listener

```
typedef DomainParticipantListener dds::domain::DomainParticipant::Listener
```

The **Listener** (p.1381) type that DomainParticipants use.

8.84.3 Constructor & Destructor Documentation

8.84.3.1 DomainParticipant() [1/3]

```
dds::domain::DomainParticipant::DomainParticipant (
    int32_t the_domain_id ) [inline], [explicit]
```

Create a new **DomainParticipant** (p.1079) with default Qos.

Same as **DomainParticipant(int32_t, const dds::domain::qos::DomainParticipantQos&, dds::domain::Domain↔ParticipantListener*, const dds::core::status::StatusMask&)** (p.1085) except that it uses the **default Domain↔ParticipantQos** (p.1267)

8.84.3.2 DomainParticipant() [2/3]

```

dds::domain::DomainParticipant::DomainParticipant (
    int32_t the_domain_id,
    const dds::domain::qos::DomainParticipantQos & the_qos,
    dds::domain::DomainParticipantListener * the_listener = NULL,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a new **DomainParticipant** (p. 1079).

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p. 1381)> instead of a regular `Listener*` pointer.

The **DomainParticipant** (p. 1079) signifies that the application intends to join the Domain identified by the `domain_id` argument.

Parameters

<i>the_domain_id</i>	the id of the domain joined by this DomainParticipant (p. 1079). [range] [≥ 0], and does not violate guidelines stated in rti::core::RtpsWellKnownPorts (p. 1965).
<i>the_qos</i>	The QoS settings for this DomainParticipant (p. 1079). See also <code>set_qos()</code> .
<i>the_listener</i>	The listener (NULL by default)
<i>mask</i>	Changes of communication status to be invoked on the listener.

Precondition

The specified QoS policies must be consistent or the operation will fail and no **dds::domain::DomainParticipant** (p. 1079) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **rti::core::policy::WireProtocol** (p. 2331)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

Safe.

Specifying QoS on entities (p. 306) for information on setting QoS before entity creation
dds::domain::qos::DomainParticipantQos (p. 1136) for rules on consistency among QoS
NDDS_DISCOVERY_PEERS (p. 349)
dds::core::QosProvider (p. 1752)
dds::domain::DomainParticipant::default_participant_qos() (p. 1094)
dds::domain::DomainParticipant::set_listener (p. 1088)

8.84.3.3 DomainParticipant() [3/3]

```

dds::domain::DomainParticipant::DomainParticipant (
    int32_t the_domain_id,
    const dds::domain::qos::DomainParticipantQos & the_qos,
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a new **DomainParticipant** (p. 1079).

The **DomainParticipant** (p. 1079) signifies that the application intends to join the Domain identified by the `domain_id` argument.

Parameters

<i>the_domain_id</i>	the id of the domain joined by this DomainParticipant (p. 1079). [range] [≥ 0], and does not violate guidelines stated in rti::core::RtpsWellKnownPorts (p. 1965).
<i>the_qos</i>	The QoS settings for this DomainParticipant (p. 1079). See also <code>set_qos()</code> .
<i>the_listener</i>	A <code>shared_ptr</code> to the listener. See set_listener() (p. 1088) for more information.
<i>mask</i>	Changes of communication status to be invoked on the listener.

Precondition

The specified QoS policies must be consistent or the operation will fail and no **dds::domain::DomainParticipant** (p. 1079) will be created.

If you want to create multiple participants on a given host in the same domain, make sure each one has a different participant index (set in the **rti::core::policy::WireProtocol** (p. 2331)). This in turn will ensure each participant uses a different port number (since the unicast port numbers are calculated from the participant index and the domain ID).

Note that if there is a single participant per host in a given domain, the participant index can be left at the default value (-1).

MT Safety:

Safe.

NDDS_DISCOVERY_PEERS (p. 349)
dds::core::QosProvider (p. 1752)
dds::domain::DomainParticipant::default_participant_qos() (p. 1094)
dds::domain::DomainParticipant::set_listener (p. 1088)

8.84.4 Member Function Documentation

8.84.4.1 listener() [1/2]

```
void dds::domain::DomainParticipant::listener (
    Listener * l,
    const dds::core::status::StatusMask & mask ) [inline]
```

Register a listener with the **DomainParticipant** (p. 1079).

[DEPRECATED] The use of **set_listener()** (p. 1088) is recommended. Unlike this function, **set_listener** receives a **shared_ptr** which simplifies the management of listener's lifecycle.

8.84.4.2 listener() [2/2]

```
Listener * dds::domain::DomainParticipant::listener ( ) const [inline]
```

Get the **DomainParticipant** (p. 1079) listener.

[DEPRECATED] Prefer **get_listener()** (p. 1089) instead of this function.

Returns

The existing listener attached to the **DomainParticipant** (p. 1079) or NULL if no listener has been set.

8.84.4.3 set_listener() [1/2]

```
void dds::domain::DomainParticipant::set_listener (
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this participant.

The **DomainParticipant** (p. 1079) will hold the **shared_ptr**, ensuring that the listener is not deleted at least until this **DomainParticipant** (p. 1079) is deleted or the listener is reset with **set_listener(nullptr)**.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the participant. If it does, the application needs to manually reset the listener or manually close this participant to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
<i>event_mask</i>	A mask that indicates which status updates will be notified to the listener

MT Safety:

Unsafe. This method is not synchronized with the listener callbacks, so it is possible to set a new listener on a participant when the old listener is in a callback.

Care should therefore be taken not to delete any listener that has been set on an enabled participant unless some application-specific means are available of ensuring that the old listener cannot still be in use.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

set_listener (abstract) (p. 1268)

8.84.4.4 set_listener() [2/2]

```
void dds::domain::DomainParticipant::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets the listener associated with this participant.

If *the_listener* is not `nullptr`, this overload is equivalent to:

```
participant.set_listener(the_listener,
dds::core::status::StatusMask::all());
```

If *the_listener* is `nullptr`, it is equivalent to:

```
participant.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
---------------------	---

8.84.4.5 get_listener()

```
std::shared_ptr< Listener > dds::domain::DomainParticipant::get_listener ( ) const [inline]
```

Returns the listener currently associated with this participant.

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.84.4.6 qos() [1/2]

```
const dds::domain::qos::DomainParticipantQos dds::domain::DomainParticipant::qos ( ) const [inline]
```

Gets the current QoS policies of this **DomainParticipant** (p. 1079).

Returns

The current QoS policies.

8.84.4.7 qos() [2/2]

```
void dds::domain::DomainParticipant::qos (
    const dds::domain::qos::DomainParticipantQos & the_qos ) [inline]
```

Set the DomainParticipantQos setting for this **DomainParticipant** (p. 1079) instance.

Parameters

<i>the_qos</i>	Set of policies to be applied to the DomainParticipant (p. 1079). Immutable policies cannot be changed after this entity has been enabled.
----------------	---

Exceptions

dds::core::ImmutablePolicyError (p. 1353)	if <i>the_qos</i> contains a different value for an immutable policy.
dds::core::InconsistentPolicyError (p. 1354)	if some policies are inconsistent.

See also

dds::domain::qos::DomainParticipantQos (p. 1136) for rules on consistency among QoS policies

set_qos (abstract) (p. 1267)

default_participant_qos() (p. 1094)

dds::core::QosProvider::participant_qos() (p. 1757)

8.84.4.8 operator<<()

```
DomainParticipant & dds::domain::DomainParticipant::operator<< (
    const dds::domain::qos::DomainParticipantQos & the_qos ) [inline]
```

Equivalent to set_qos(the_qos)

8.84.4.9 operator>>()

```
const DomainParticipant & dds::domain::DomainParticipant::operator>> (
    dds::domain::qos::DomainParticipantQos & the_qos ) const [inline]
```

Equivalent to get_qos()

Parameters

<i>the_qos</i>	the new qos for this DomainParticipant (p. 1079).
----------------	--

8.84.4.10 domain_id()

```
int32_t dds::domain::DomainParticipant::domain_id ( ) const [inline]
```

Get the unique domain identifier.

This operation retrieves the domain id used to create the **dds::domain::DomainParticipant** (p. 1079). The domain id identifies the DDS domain to which the **dds::domain::DomainParticipant** (p. 1079) belongs. Each DDS domain represents a separate data 'communication plane' isolated from other domains.

Returns

the domain id

8.84.4.11 assert_liveliness()

```
void dds::domain::DomainParticipant::assert_liveliness ( ) [inline]
```

Manually assert the liveliness of the **DomainParticipant** (p. 1079).

This is used in combination with the **dds::core::policy::Liveliness** (p. 1389) to indicate to RTI Connex that the entity remains active.

You need to use this operation if the **dds::domain::DomainParticipant** (p. 1079) contains **dds::pub::DataWriter** (p. 908) entities with the **dds::core::policy::Liveliness::kind** (p. 1393) set to **dds::core::policy::LivelinessKind::MANUAL_BY_PARTICIPANT** and it only affects the liveliness of those **dds::pub::DataWriter** (p. 908) entities. Otherwise, it has no effect.

Note: writing data via the **dds::pub::DataWriter::write()** (p. 918) or **dds::pub::DataWriter::write(const T&,const dds::core::Time&)** (p. 919) operation asserts liveliness on the **dds::pub::DataWriter** (p. 908) itself and its **dds::domain::DomainParticipant** (p. 1079). Consequently the use of **assert_liveliness()** (p. 1091) is only needed if the application is not writing data regularly.

8.84.4.12 property()

```
void dds::domain::DomainParticipant::property (
    const std::string & property_name,
    const std::string & value,
    bool propagate ) [inline]
```

Set the value for a property that applies to a **DomainParticipant** (p. 1079).

Warning

This method is not implemented in all APIs and it's intended only for testing purposes. You should use **dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&)** (p. 1090) instead.

Parameters

<i>property_name</i>	<< <i>in</i> >> (p. 157). Name of the property that you want to set.
<i>value</i>	<< <i>in</i> >> (p. 157). New value for the property.
<i>propagate</i>	<< <i>in</i> >> (p. 157). Indicates if the property will be propagated or not.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

dds::pub::DataWriter::set_property
 dds::sub::DataReader::set_property

dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&) (p. 1090)

8.84.4.13 contains_entity()

```
bool dds::domain::DomainParticipant::contains_entity (
    const dds::core::InstanceHandle & a_handle ) [inline]
```

Check whether or not the given handle represents an Entity that was created from the **DomainParticipant** (p. 1079).

This operation checks whether or not the given `a_handle` represents an **dds::core::Entity** (p. 1265) that was created from the **dds::domain::DomainParticipant** (p. 1079). The containment applies recursively. That is, it applies both to entities (`TopicDescription`, **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116)) created directly using the **dds::domain::DomainParticipant** (p. 1079) as well as entities created using a contained **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) as the factory, and so forth.

The `instance` handle for an **dds::core::Entity** (p. 1265) may be obtained from built-in topic data, from various statuses, or from the operation **dds::core::Entity::instance_handle()** (p. 1270).

Parameters

<code>a_handle</code>	<< <i>in</i> >> (p. 157) dds::core::InstanceHandle (p. 1356) of the dds::core::Entity (p. 1265) to be checked.
-----------------------	--

Returns

true if **dds::core::Entity** (p. 1265) is contained by the **dds::domain::DomainParticipant** (p. 1079), or false otherwise.

8.84.4.14 current_time()

```
dds::core::Time dds::domain::DomainParticipant::current_time ( ) [inline]
```

Get the current time.

The current value of the time that RTI Connext uses to time-stamp **dds::pub::DataWriter** (p. 908) and to set the reception-timestamp for the data updates that it receives.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

Returns

The current time

8.84.4.15 participant_factory_qos() [1/2]

```
static void dds::domain::DomainParticipant::participant_factory_qos (
    const dds::domain::qos::DomainParticipantFactoryQos & qos ) [inline], [static]
```

Set the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130).

Parameters

<i>qos</i>	The DomainParticipantFactoryQos to set.
------------	---

8.84.4.16 participant_factory_qos() [2/2]

```
static dds::domain::qos::DomainParticipantFactoryQos dds::domain::DomainParticipant::participant↔
_factory_qos ( ) [inline], [static]
```

Get the current **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130).

Returns

The current DomainParticipantFactoryQos

8.84.4.17 finalize_participant_factory()

```
static void dds::domain::DomainParticipant::finalize_participant_factory ( ) [inline], [static]
```

Finalize the DomainParticipantFactory.

The DomainParticipantFactory is a singleton that the C++ API uses implicitly to create participants. RTI Connex provides this operation for users who want to release memory used by the participant factory.

Warning

This method uses a static variable. To avoid undefined behavior in the order of destruction it shouldn't be called in the destructor of a type for which other global or static variables exist.

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.84.4.18 default_participant_qos() [1/2]

```
static dds::domain::qos::DomainParticipantQos dds::domain::DomainParticipant::default_participant_qos ( ) [inline], [static]
```

Get the current DomainParticipantQos for this instance.

Returns

The current DomainParticipantQos

See also

Default QoS (p. 1267)

8.84.4.19 default_participant_qos() [2/2]

```
static void dds::domain::DomainParticipant::default_participant_qos (
    const dds::domain::qos::DomainParticipantQos & qos ) [inline], [static]
```

Set the DomainParticipantQos.

The UserData and EntityFactory policies can be changed. The other policies are immutable.

Parameters

<i>qos</i>	The DomainParticipantQos to set.
------------	----------------------------------

See also

Default QoS (p. 1267)

8.84.4.20 default_publisher_qos() [1/2]

```
dds::pub::qos::PublisherQos dds::domain::DomainParticipant::default_publisher_qos ( ) const [inline]
```

Get the current default **dds::pub::qos::PublisherQos** (p. 1733).

The retrieved qos will match the set of values specified on the last successful call to **default_publisher_qos(const dds::pub::qos::PublisherQos& qos)** (p. 1096), or else, if the call was never made, the RTI Connex default values for the **dds::pub::qos::PublisherQos** (p. 1733).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no PublisherQos is specified when a **dds::pub::Publisher** (p. 1719) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the Publisher.

MT Safety:

UNSAFE. It is not safe to retrieve the default publisher QoS from a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_publisher_qos** (p. 1095)

Returns

The current default PublisherQos

8.84.4.21 default_publisher_qos() [2/2]

```
DomainParticipant & dds::domain::DomainParticipant::default_publisher_qos (
    const dds::pub::qos::PublisherQos & the_qos ) [inline]
```

Set the default **dds::pub::qos::PublisherQos** (p. 1733) for this **DomainParticipant** (p. 1079).

This set of default values will be used for a newly created **dds::pub::Publisher** (p. 1719) if no **dds::pub::qos::PublisherQos** (p. 1733) is specified when constructing the Publisher.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1354)

MT Safety:

UNSAFE. It is not safe to set the default publisher QoS for a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_publisher_qos** (p. 1095), **dds::domain::DomainParticipant::default_publisher_qos()** (p. 1095) or creating a Publisher with default QoS values.

Parameters

<i>the_qos</i>	The PublisherQos to set.
----------------	--------------------------

Returns

This **DomainParticipant** (p. 1079) instance

Exceptions

<i>One</i>	of the standard Exceptions (p. 227), or dds::core::InconsistentPolicyError (p. 1354)
------------	--

8.84.4.22 default_subscriber_qos() [1/2]

```
dds::sub::qos::SubscriberQos dds::domain::DomainParticipant::default_subscriber_qos ( ) const
[inline]
```

Get the current default **dds::sub::qos::SubscriberQos** (p. 2129).

The retrieved `qos` will match the set of values specified on the last successful call to **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1097), or **dds::domain::DomainParticipant::set_default_subscriber_qos_with_profile**, or else, if the call was never made, the default values listed in **dds::sub::qos::SubscriberQos** (p. 2129).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no `SubscriberQos` is specified when a **dds::sub::Subscriber** (p. 2116) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the `Subscriber`.

MT Safety:

UNSAFE. It is not safe to retrieve the default `Subscriber QoS` from a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1097).

See also

dds::sub::Subscriber::Subscriber (p. 2119)

Returns

The current default `SubscriberQos`

8.84.4.23 default_subscriber_qos() [2/2]

```
DomainParticipant & dds::domain::DomainParticipant::default_subscriber_qos (
    const dds::sub::qos::SubscriberQos & the_qos ) [inline]
```

Set the default **dds::sub::qos::SubscriberQos** (p. 2129) for this **DomainParticipant** (p. 1079).

This set of default values will be used for a newly created **dds::sub::Subscriber** (p. 2116) when the `qos` parameter is not specified

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1354)

MT Safety:

UNSAFE. It is not safe to set the default `Subscriber QoS` for a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1097), **dds::domain::DomainParticipant::default_subscriber_qos** (p. 1096) or calling **dds::sub::Subscriber::Subscriber** (p. 2119) with `SUBSCRIBER_QOS_DEFAULT` as the `qos` parameter.

Parameters

<i>the_qos</i>	The SubscriberQos to set.
----------------	---------------------------

Exceptions

<i>One</i>	of the standard Exceptions (p. 227), or dds::core::InconsistentPolicyError (p. 1354)
------------	--

8.84.4.24 default_topic_qos() [1/2]

```
dds::topic::qos::TopicQos dds::domain::DomainParticipant::default_topic_qos ( ) const [inline]
```

Get the current default **dds::topic::qos::TopicQos** (p. 2213).

The retrieve d qos will match the set of values specified on the last successful call to **default_topic_qos(const dds::topic::qos::TopicQos& qos)** (p. 1098), or else, if the call was never made, the RTI Connex default values for the **dds::topic::qos::TopicQos** (p. 2213).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no TopicQos is specified when a **dds::topic::Topic** (p. 2178) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the Topic.

MT Safety:

UNSAFE. It is not safe to retrieve the default Topic QoS from a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_topic_qos** (p. 1098)

Returns

The current default TopicQos

8.84.4.25 default_topic_qos() [2/2]

```
DomainParticipant & dds::domain::DomainParticipant::default_topic_qos (
    const dds::topic::qos::TopicQos & the_qos ) [inline]
```

Set the default **dds::topic::qos::TopicQos** (p. 2213) for this **DomainParticipant** (p. 1079).

This set of default values will be used for a newly created **dds::topic::Topic** (p. 2178) if no **dds::topic::qos::TopicQos** (p. 2213) is specified when constructing the Topic.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1354)

MT Safety:

UNSAFE. It is not safe to set the default topic QoS for a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_topic_qos** (p. 1098), **dds::domain::DomainParticipant::default_topic_qos()** (p. 1098) or creating a Topic with default QoS values.

Parameters

<i>the_qos</i>	The TopicQos to set.
----------------	----------------------

Returns

This **DomainParticipant** (p. 1079) instance

Exceptions

<i>One</i>	of the standard Exceptions (p. 227), or dds::core::InconsistentPolicyError (p. 1354)
------------	--

8.84.4.26 close_contained_entities()

```
void close_contained_entities ( )
```

<<*extension*>> (p. 156) Closes all the entities created from this **DomainParticipant** (p. 1079)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Calling this function explicitly is not necessary to close a **DomainParticipant** (p. 1079).

This operation closes all contained **dds::pub::Publisher** (p. 1719) (including an implicit Publisher, if one exists), **dds::sub::Subscriber** (p. 2116) (including implicit Subscriber), **dds::topic::Topic** (p. 2178), **dds::topic::ContentFilteredTopic** (p. 735), and MultiTopic objects.

Prior to closing each contained entity, this operation will recursively call the corresponding **close_contained_entities()** (p. 1099) operation on each contained entity (if applicable). This pattern is applied recursively. In this manner the operation **close_contained_entities()** (p. 1099) on the **dds::domain::DomainParticipant** (p. 1079) will end up recursively closing all the entities contained in the **dds::domain::DomainParticipant** (p. 1079), including the **dds::pub::DataWriter** (p. 908), **dds::sub::DataReader** (p. 756), as well as the **dds::sub::cond::QueryCondition** (p. 1784), **dds::sub::cond::ReadCondition** (p. 1858), and **rti::sub::TopicQuery** (p. 2220) objects belonging to the contained **dds::sub::DataReader** (p. 756).

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1669) if any of the contained entities is in a state where it cannot be closed .

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::PreconditionNotMetError (p. 1669).
------------	---

8.84.4.27 default_datawriter_qos() [1/2]

```
dds::pub::qos::DataWriterQos default_datawriter_qos ( ) const
```

<<*extension*>> (p. 156) Get the current default **dds::pub::qos::DataWriterQos** (p. 994).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The retrieved qos will match the set of values specified on the last successful call to **default_datawriter_qos(const dds::pub::qos::DataWriterQos& qos)** (p. 1100), or else, if the call was never made, the RTI Connex default values for the **dds::pub::qos::DataWriterQos** (p. 994).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no DataWriterQos is specified when a **dds::pub::DataWriter** (p. 908) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the DataWriter.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataWriterQoS from a DomainParticipant while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datawriter_qos** (p. 1100).

Returns

The current default DataWriterQos

8.84.4.28 default_datawriter_qos() [2/2]

```
void default_datawriter_qos (
    const ::dds::pub::qos::DataWriterQos & qos )
```

<<*extension*>> (p. 156) Set the default **dds::pub::qos::DataWriterQos** (p.994) for this **DomainParticipant** (p. 1079).

Note

This function is an extension, it must be called via the **extensions()** member function (p. 156)

This set of default values will be used for a newly created **dds::pub::DataWriter** (p. 908) if no **dds::pub::qos::DataWriterQos** (p. 994) is specified when constructing the DataWriter.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1354)

MT Safety:

UNSAFE. It is not safe to set the default DataWriter QoS for a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datawriter_qos** (p. 1100) or **dds::domain::DomainParticipant::default_datawriter_qos()** (p. 1100) or creating a DataWriter with default QoS values.

Parameters

<i>qos</i>	The DataWriterQos to set.
------------	---------------------------

Exceptions

<i>One</i>	of the standard Exceptions (p. 227), or dds::core::InconsistentPolicyError (p. 1354)
------------	--

8.84.4.29 default_datareader_qos() [1/2]

```
dds::sub::qos::DataReaderQos default_datareader_qos ( ) const
```

<<*extension*>> (p. 156) Get the current default **dds::sub::qos::DataReaderQos** (p. 848).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The retrieved qos will match the set of values specified on the last successful call to **default_datareader_qos(const ::dds::sub::qos::DataReaderQos& qos)** (p. 1102), or else, if the call was never made, the RTI Connexx default values for the **dds::sub::qos::DataReaderQos** (p. 848).

This method may potentially allocate memory depending on the sequences contained in some QoS policies.

If no DataReaderQos is specified when a **dds::sub::DataReader** (p. 756) is constructed, the default value of the QoS set in the factory, equivalent to the value obtained by calling this method, will be used to create the DataReader.

MT Safety:

UNSAFE. It is not safe to retrieve the default DataReader QoS from a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datareader_qos** (p. 1101).

Returns

The current default DataReaderQos

8.84.4.30 default_datareader_qos() [2/2]

```
void default_datareader_qos (
    const ::dds::sub::qos::DataReaderQos & qos )
```

<<**extension**>> (p. 156) Set the default **dds::sub::qos::DataReaderQos** (p. 848) for this **DomainParticipant** (p. 1079).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This set of default values will be used for a newly created **dds::sub::DataReader** (p. 756) if no **dds::sub::qos::DataReaderQos** (p. 848) is specified when constructing the DataReader.

Precondition

The specified QoS policies must be consistent, or else the operation will have no effect and fail with **dds::core::InconsistentPolicyError** (p. 1354)

MT Safety:

UNSAFE. It is not safe to set the default DataReader QoS for a **DomainParticipant** (p. 1079) while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_datareader_qos** (p. 1101) or **dds::domain::DomainParticipant::default_datareader_qos()** (p. 1101). or creating a DataReader with default QoS values.

Parameters

<i>qos</i>	The DataReaderQos to set.
------------	---------------------------

Exceptions

<i>One</i>	of the standard Exceptions (p. 227), or dds::core::InconsistentPolicyError (p. 1354)
------------	--

8.84.4.31 register_contentfilter()

```
void register_contentfilter (
    const rti::topic::CustomFilter< rti::topic::ContentFilterBase > & custom_filter,
    const std::string & filter_name )
```

<<**extension**>> (p. 156) Register a content filter which can be used to create a **dds::topic::ContentFilteredTopic** (p. 735).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

DDS specifies a SQL-like content filter for use by content filtered topics. If this filter does not meet your filtering requirements, you can register a custom filter.

To use a custom filter, it must be registered in the following places:

- In any application that uses the custom filter to create a **dds::topic::ContentFilteredTopic** (p. 735) and the corresponding **dds::sub::DataReader** (p. 756).
- In each application that writes the data to the applications mentioned above.

For example, suppose Application A on the subscription side creates a Topic named X and a ContentFilteredTopic named filteredX (and a corresponding DataReader), using a previously registered content filter, myFilter. With only that, you will have filtering at the subscription side. If you also want to perform filtering in any application that publishes Topic X, then you also need to register the same definition of the ContentFilter myFilter in that application.

Each *filter_name* can only be used to registered a content filter once with a **dds::domain::DomainParticipant** (p. 1079).

See also

dds::domain::DomainParticipant::unregister_contentfilter(const std::string & filter_name) (p. 1104)

Parameters

<i>custom_filter</i>	A custom filter
<i>filter_name</i>	Name of the filter. The name must be unique within the DomainParticipant (p. 1079) and must not exceed 255 characters.

Exceptions

<i>One</i>	of the standard Exceptions (p. 227)
------------	--

See also

Creating Custom Content Filters (p. 134)

8.84.4.32 unregister_contentfilter()

```
void unregister_contentfilter (
    const std::string & filter_name )
```

<<**extension**>> (p. 156) Unregister a content filter previously registered with **dds::domain::DomainParticipant**↔**::register_contentfilter(const rti::topic::CustomFilter<rti::topic::ContentFilterBase>& custom_filter, const std::string& filter_name)** (p. 1103).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

A *filter_name* can be unregistered only if it has been previously registered to the **dds::domain::Domain**↔**Participant** (p. 1079) with **dds::domain::DomainParticipant::register_contentfilter(const rti::topic::CustomFilter < rti::topic::ContentFilterBase > & custom_filter, const std::string & filter_name)** (p. 1103).

The unregistration of filter is not allowed if there are any existing **dds::topic::ContentFilteredTopic** (p. 735) objects that are using the filter. If the operation is called on a filter with existing **dds::topic::ContentFilteredTopic** (p. 735) objects attached to it, this operation will fail with **dds::core::PreconditionNotMetError** (p. 1669).

If there are still existing discovered **dds::sub::DataReader** (p. 756) s with the same *filter_name* and the filter's compile method of the filter have previously been called on the discovered **dds::sub::DataReader** (p. 756) s, finalize method of the filter will be called on those discovered **dds::sub::DataReader** (p. 756) s before the content filter is unregistered. This means filtering will now be performed on the application that is creating the **dds::sub::DataReader** (p. 756).

Parameters

<i>filter_name</i>	Name of the filter to unregister.
--------------------	-----------------------------------

Exceptions

<i>One</i>	of the standard Exceptions (p. 227), or dds::core::PreconditionNotMetError (p. 1669)
------------	--

8.84.4.33 unregister_type()

```
void unregister_type (
    const std::string & name )
```

<<**extension**>> (p. 156) Unregister a type that has previously been registered to this **dds::domain::DomainParticipant** (p. 1079).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Parameters

<i>name</i>	The name of the type to unregister
-------------	------------------------------------

8.84.4.34 is_type_registered()

```
bool is_type_registered (
    const std::string & name ) const
```

<<**extension**>> (p. 156) Check if a type has previously been registered to this **dds::domain::DomainParticipant** (p. 1079).

Parameters

<i>name</i>	The name of the type to check
-------------	-------------------------------

Returns

bool true if it is registered, false otherwise

8.84.4.35 add_peer()

```
void add_peer (
    const std::string & peer_descr_string )
```

<<**extension**>> (p. 156) Attempt to contact one or more additional peer participants.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Add the given peer description to the list of peers with which this **dds::domain::DomainParticipant** (p. 1079) will try to communicate.

This method may be called at any time after this **dds::domain::DomainParticipant** (p. 1079) has been created (before or after it has been enabled).

If this method is called after **dds::core::Entity::enable** (p. 1269), an attempt will be made to contact the new peer(s) immediately.

If this method is called *before* the **DomainParticipant** (p. 1079) is enabled, the peer description will simply be added to the list that was populated by **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1031); the first attempted contact will take place after this **dds::domain::DomainParticipant** (p. 1079) is enabled.

Adding a peer description with this method does not guarantee that any peer(s) discovered as a result will exactly correspond to those described:

- This **dds::domain::DomainParticipant** (p. 1079) will attempt to discover peer participants at the given locations but may not succeed if no such participants are available. In this case, this method will not wait for contact attempt(s) to be made and it will not report an error.
- If remote participants described by the given peer description *are* discovered, the distributed application is configured with asymmetric peer lists, and **rti::core::policy::Discovery::accept_unknown_peers** (p. 1033) is set to true. Thus, this **dds::domain::DomainParticipant** (p. 1079) may actually discover *more* peers than are described in the given peer description.

To be informed of the exact remote participants that are discovered, regardless of which peers this **dds::domain::DomainParticipant** (p. 1079) *attempts* to discover, use the built-in participant topic: **dds::topic::participant_topic_name()** (p. 241).

To remove specific peer locators, you may use **dds::domain::DomainParticipant::remove_peer(const std::string & peer_descr_string)** (p. 1107). If a peer is removed, the `add_peer` operation will add it back to the list of peers.

To stop communicating with a peer **dds::domain::DomainParticipant** (p. 1079) that has been discovered, use **dds::domain::ignore** (p. 423).

Adding a peer description with this method has no effect on the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1031) that may be subsequently retrieved with **dds::domain::DomainParticipant::qos() const** (p. 1090)() (because **rti::core::policy::Discovery** (p. 1029) is immutable).

Parameters

<i>peer_descr_string</i>	New peer descriptor to be added. The format is specified in Peer Descriptor Format (p. 350).
--------------------------	---

Exceptions

<i>One</i>	of the standard Exceptions (p. 227)
------------	--

8.84.4.36 remove_peer()

```
void remove_peer (
    const std::string & peer_descr_string )
```

<<**extension**>> (p. 156) Remove one or more peer participants from the list of peers with which this **dds::domain::DomainParticipant** (p. 1079) will try to communicate.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This method may be called any time after this **dds::domain::DomainParticipant** (p. 1079) has been enabled

Calling this method has the following effects:

- If a **dds::domain::DomainParticipant** (p. 1079) was already discovered, it will be locally removed along with all its entities.
- Any further requests coming from a **dds::domain::DomainParticipant** (p. 1079) located on any of the removed peers will be ignored.
- All the locators contained in the peer description will be removed from the peer list. The local **dds::domain::DomainParticipant** (p. 1079) will stop sending announcement to those locators.

If remote participants located on a peer that was previously removed are discovered, they will be ignored until the related peer is added back by using **dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string)** (p. 1105).

Removing a peer description with this method has no effect on the **rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)** (p. 1031) that may be subsequently retrieved with **dds::domain::DomainParticipant::qos() const** (p. 1090)() (because **rti::core::policy::Discovery** (p. 1029) is immutable).

Parameters

<i>peer_descr_string</i>	Peer descriptor to be removed. The format is specified in Peer Descriptor Format (p. 350).
--------------------------	---

Exceptions

One	of the standard Exceptions (p. 227)
-----	--

8.84.4.37 dns_tracker_polling_period() [1/2]

```
dds::core::Duration dns_tracker_polling_period ( ) const
```

Retrieves the frequency used by the DNS tracker thread to query the DNS service.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The DNS tracker queries the DNS for hostnames specified in the initial peers of a **DomainParticipant** (p. 1079). The frequency of these queries is defined by **rti::core::policy::DiscoveryConfig::dns_tracker_polling_period** (p. 1068). If the value returned is **dds::core::Duration::infinite()** (p. 1197), the DNS tracker is disabled.

Returns

The DNS polling period

Exceptions

One	of the standard Exceptions (p. 227)
-----	--

See also

rti::core::policy::DiscoveryConfig::dns_tracker_polling_period (p. 1068)

8.84.4.38 dns_tracker_polling_period() [2/2]

```
void dns_tracker_polling_period (
    const dds::core::Duration & polling_period )
```

Configures the frequency in which the DNS tracker queries the DNS service.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This API allows you to change the frequency of the polling period for the DNS tracker. The range of accepted values, in seconds, goes from 1 second to 1 year. **dds::core::Duration::infinite()** (p. 1197) is also accepted as a valid value. If the duration is set to **dds::core::Duration::infinite()** (p. 1197), the DNS tracker is disabled.

Modifying the DNS tracker polling period through this has no effect on the **rti::core::policy::DiscoveryConfig::dns_tracker_polling_period** (p. 1068) when it is retrieved with **dds::domain::DomainParticipant::qos() const** (p. 1090)().

Parameters

<i>polling_period</i>	Polling period to be configured.
-----------------------	----------------------------------

Exceptions

<i>One</i>	of the standard Exceptions (p. 227)
------------	--

See also

rti::core::policy::DiscoveryConfig::dns_tracker_polling_period (p. 1068)

dds::domain::DomainParticipant::add_peer(const std::string & peer_descr_string) (p. 1105)

8.84.4.39 resume_endpoint_discovery()

```
void resume_endpoint_discovery (
    const dds::core::InstanceHandle & remote_participant_handle )
```

<<**extension**>> (p. 156) Initiates endpoint discovery with the remote **dds::domain::DomainParticipant** (p. 1079) identified by its InstanceHandle.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

If the operation completes successfully, the **dds::domain::DomainParticipant** (p. 1079) will initiate endpoint discovery with the remote **dds::domain::DomainParticipant** (p. 1079) provided as a parameter.

When **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1034) is set to false, this operation allows the RTI Connex application to select for which remote DomainParticipants endpoint discovery is performed. By disabling endpoint discovery, the **DomainParticipant** (p. 1079) will not store any state about remote endpoints and will not send local endpoint information to remote DomainParticipants.

If **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1034) is set to true, endpoint discovery will automatically occur for every discovered **dds::domain::DomainParticipant** (p. 1079). In this case, invoking this operation will have no effect and will return successfully.

When **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1034) is set to false, you have two options after a remote **dds::domain::DomainParticipant** (p. 1079) is discovered:

- Call this operation to enable endpoint discovery. After invoking this operation, the **dds::domain::DomainParticipant** (p. 1079) will start to exchange endpoint information so that matching and communication can occur with the remote **dds::domain::DomainParticipant** (p. 1079).
- Call the **dds::domain::ignore** (p. 423) operation to permanently ignore endpoint discovery with the remote **dds::domain::DomainParticipant** (p. 1079).

Setting **rti::core::policy::Discovery::enable_endpoint_discovery** (p. 1034) to false enables application-level authentication use cases, in which a **dds::domain::DomainParticipant** (p. 1079) will initiate endpoint discovery with a remote **dds::domain::DomainParticipant** (p. 1079) after successful authentication at the application level.

The `remote_participant_handle` parameter is the one that appears in the **dds::sub::SampleInfo** (p. 1992) retrieved when reading the data samples available for the built-in ParticipantBuiltinTopicDataReader.

If the specified remote **dds::domain::DomainParticipant** (p. 1079) is not in the database of discovered DomainParticipants or has been previously ignored, this operation will fail with **dds::core::Error** (p. 1284).

This operation can be called multiple times on the same remote participant. If endpoint discovery has already been resumed, successive calls will have no effect and will return successfully.

Parameters

<code>remote_participant_handle</code>	<< <i>in</i> >> (p. 157) Handle of a discovered dds::domain::DomainParticipant (p. 1079) for which endpoint discovery is to be resumed.
--	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::NotEnabledError (p. 1601)
------------	--

See also

rti::core::policy::Discovery (p. 1029)

8.84.4.40 delete_durable_subscription()

```
void delete_durable_subscription (
    const rti::core::EndpointGroup & group )
```

<<*extension*>> (p. 156) Deletes an existing Durable Subscription on all Persistence Services.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The Persistence Service will delete the Durable Subscription and the quorum of the existing samples will be considered satisfied.

Parameters

<i>group</i>	<< <i>in</i> >> (p. 157) rti::core::EndpointGroup (p. 1259) specifying the Durable Subscription name. Quorum is not required for this operation.
--------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.84.4.41 register_durable_subscription()

```
void register_durable_subscription (
    const rti::core::EndpointGroup & group,
    const std::string & topic_name )
```

<<**extension**>> (p. 156) Registers a Durable Subscription on the specified **dds::topic::Topic** (p. 2178) on all Persistence Services.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

If you need to receive all samples published on a **dds::topic::Topic** (p. 2178), including the ones published while a **dds::sub::DataReader** (p. 756) is inactive or before it may be created, create a Durable Subscription using this method.

In this way, the Persistence Service will ensure that all the samples on that **dds::topic::Topic** (p. 2178) are retained until they are acknowledged by at least *N* DataReaders belonging to the Durable Subscription where *N* is the quorum count.

If the same Durable Subscription is created on a different **dds::topic::Topic** (p. 2178), the Persistence Service will implicitly delete the previous Durable Subscription and create a new one on the new **dds::topic::Topic** (p. 2178).

Parameters

<i>group</i>	<< <i>in</i> >> (p. 157) rti::core::EndpointGroup (p. 1259) The Durable Subscription name and quorum.
<i>topic_name</i>	<< <i>in</i> >> (p. 157) The topic name for which the Durable Subscription is created.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.84.4.42 participant_protocol_status()

```
rti::core::status::DomainParticipantProtocolStatus participant_protocol_status ( )
```

<<*extension*>> (p. 156) Get the protocol status for this participant

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This also resets the status so that it is no longer considered changed.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).
------------	--

8.84.5 Friends And Related Function Documentation

8.84.5.1 ignore() [1/2]

```
void ignore (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle ) [related]
```

Instructs RTI Connex to locally ignore a remote **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

From the time of this call onwards, RTI Connex will locally behave as if the remote participant did not exist. This means it will ignore any topic, publication, or subscription that originates on that **dds::domain::DomainParticipant** (p. 1079).

There is no way to reverse this operation.

This operation can be used in conjunction with the discovery of remote participants offered by means of the **dds::topic::ParticipantBuiltinTopicData** (p. 1639) to provide access control.

Application data can be associated with a **dds::domain::DomainParticipant** (p. 1079) by means of the **USER_DATA** (p. 344) policy. This application data is propagated as a field in the built-in topic and can be used by an application to implement its own access control policy.

The **dds::domain::DomainParticipant** (p. 1079) to ignore is identified by the `handle` argument. This `handle` is the one that appears in the **dds::sub::SampleInfo** (p. 1992) retrieved when reading the data-samples available for the built-in **dds::sub::DataReader** (p. 756) to the **dds::domain::DomainParticipant** (p. 1079) topic. The built-in **dds::sub::DataReader** (p. 756) is read with the same **dds::sub::DataReader::read** (p. 773) and **dds::sub::DataReader::take** (p. 774) operations used for any **dds::sub::DataReader** (p. 756).

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) for which the remote entity will be ignored.
<i>handle</i>	The dds::core::InstanceHandle (p. 1356) of the remote entity that will be ignored.

8.84.5.2 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end ) [related]
```

Instructs RTI Connex to locally ignore a group of remote **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

The series of entities whose instance handles are made available via the provided iterators will be ignored.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) for which the remote entity will be ignored
<i>begin</i>	The begin iterator for the series of InstanceHandles to ignore
<i>end</i>	The end iterator for the series of InstanceHandles to ignore

See also

ignore(const dds::domain::DomainParticipant& participant, const dds::core::InstanceHandle& handle)
(p. 1112)

References **dds::domain::ignore()**.

8.84.5.3 discovered_participants() [1/2]

```
dds::core::InstanceHandleSeq discovered_participants (
    const dds::domain::DomainParticipant & participant ) [related]
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

This operation retrieves the list of **dds::domain::DomainParticipant** (p. 1079) entities that have been discovered in the domain and that the application has not indicated should be "ignored" by means of the **dds::domain::ignore** (p. 423) operation. When using **rti::core::policy::DiscoveryConfigBuiltinPluginKindMask::SPDP2** (p. 1078), this list only includes **dds::domain::DomainParticipant** (p. 1079) entities that the application has received configuration information from.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) where to look up the discovered participants
--------------------	---

Returns

The list of `InstanceHandles` that can be passed to **dds::domain::discovered_participant_data** (p. 426).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
------------	---

8.84.5.4 discovered_participants() [2/2]

```
template<typename FwdIterator >
FwdIterator discovered_participants (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end ) [related]
```

Retrieves the list of other participants discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is dds::core::InstanceHandleSeq (p. 407)
--------------------	---

This overload copies the instance handles into an iterator range.

Parameters

<i>participant</i>	The participant whose discovered participants are looked up
<i>begin</i>	The begin iterator where to copy the instance handles
<i>end</i>	One past the last position where instance handles are copied

References **dds::domain::discovered_participants()**.

8.84.5.5 discovered_participant_data()

```
dds::topic::ParticipantBuiltinTopicData discovered_participant_data (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & participant_handle ) [related]
```

Retrieves the information about one participant discovered by this participant.

```
#include <dds/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

This operation retrieves information on a **dds::domain::DomainParticipant** (p. 1079) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 423) operation.

The *participant_handle* must correspond to such a **DomainParticipant** (p. 1079). Otherwise, the operation will fail with **dds::core::PreconditionNotMetError** (p. 1669).

Use the operation **dds::domain::discovered_participants** (p. 425) to find the **dds::domain::DomainParticipant** (p. 1079) entities that are currently discovered.

MT Safety:

Safe.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) where to look up the information
<i>participant_handle</i>	<< <i>in</i> >> (p. 157) dds::core::InstanceHandle (p. 1356) of dds::domain::DomainParticipant (p. 1079).

Returns

The participant information about `participant_handle`

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::topic::ParticipantBuiltinTopicData (p. 1639)

dds::domain::discovered_participants (p. 425)

8.84.5.6 find()

```
DomainParticipant find (
    int32_t domain_id ) [related]
```

Locates an existing **dds::domain::DomainParticipant** (p. 1079).

```
#include <dds/domain/find.hpp>
```

Note

This is a standalone function in the namespace **dds::domain** (p. 422)

If no such **DomainParticipant** (p. 1079) exists, the operation will return **dds::core::null** (p. 238).

If multiple **DomainParticipants** belonging to that domain id exist, then the operation will return one of them. It is not specified which one.

Parameters

<i>domain</i> ↔ <i>_id</i>	The domain id of the DomainParticipant (p. 1079) to find
-------------------------------	---

8.84.5.7 banish_ignored_participants()

```
void banish_ignored_participants (
    const dds::domain::DomainParticipant & participant ) [related]
```

<<*extension*>> (p. 156) Prevents ignored remote DomainParticipants from receiving traffic from the local **DomainParticipant** (p. 1079).

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 514)

This method complements **dds::domain::ignore** (p. 423): `ignore_participant` prevents the local **dds::domain::DomainParticipant** (p. 1079) from processing traffic from the remote **DomainParticipant** (p. 1079), while this method prevents already ignored remote DomainParticipants from processing traffic from the local **DomainParticipant** (p. 1079).

Note: this method is currently only supported when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669), dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::domain::ignore (p. 423)

8.84.5.8 discovered_participant_subject_name()

```
rti::core::optional_value< std::string > discovered_participant_subject_name (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & participant_handle ) [related]
```

<<*extension*>> (p. 156) Returns **rti::core::policy::EntityName::name** (p. 1276) for the specified **DomainParticipant** (p. 1079).

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 514)

This operation retrieves the **rti::core::policy::EntityName::name** (p. 1276) of a **dds::domain::DomainParticipant** (p. 1079) that has been discovered on the network. The participant must be in the same domain as the participant on which this operation is invoked and must not have been "ignored" by means of the **dds::domain::ignore** (p. 423) operation.

The `participant_handle` must correspond to such a **DomainParticipant** (p. 1079). If the `participant_handle` is **dds::core::InstanceHandle::nil()** (p. 1358) or is not a valid **dds::core::InstanceHandle** (p. 1356) for a **DomainParticipant** (p. 1079), then the operation will fail with **dds::core::InvalidArgumentError** (p. 1363). If the `participant_handle` corresponds to a **DomainParticipant** (p. 1079) that has not been discovered, then the operation will fail with **dds::core::PreconditionNotMetError** (p. 1669).

Use the operation **dds::domain::discovered_participants** (p. 425) to find the **dds::domain::DomainParticipant** (p. 1079) entities that are currently discovered.

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

MT Safety:

Safe.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) that has discovered the discovered participant.
<i>participant_handle</i>	<< <i>in</i> >> (p. 157) dds::core::InstanceHandle (p. 1356) of dds::domain::DomainParticipant (p. 1079).

Returns

The **rti::core::policy::EntityName::name** (p. 1276) for the `participant_handle`

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

rti::core::policy::EntityName::name (p. 1276)
dds::domain::discovered_participants (p. 425)

8.84.5.9 discovered_participants_from_subject_name()

```
dds::core::InstanceHandleSeq discovered_participants_from_subject_name (
    const dds::domain::DomainParticipant & participant,
    const rti::core::optional_value< std::string > & subject_name ) [related]
```

<<*extension*>> (p. 156) Returns a list of discovered **DomainParticipant** (p. 1079) entities that have the given **rti::core::policy::EntityName::name** (p. 1276).

```
#include <rti/domain/discovery.hpp>
```

Note

This is a standalone function in the namespace **rti::domain** (p. 514)

This operation retrieves the same list as **dds::domain::discovered_participants** (p. 425), except this list contains only the participants that have the given **rti::core::policy::EntityName::name** (p. 1276).

Note: this method has different functionality when enabling the RTI Security Plugins. Please refer to the **RTI Security Plugins User's Manual** for more information.

MT Safety:

Safe.

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) whose discovered participants this operation will look up.
<i>subject_name</i>	<< <i>in</i> >> (p. 157) The rti::core::policy::EntityName::name (p. 1276) by which to filter the list.

Returns

The list of `InstanceHandles` corresponding to participants with the given **rti::core::policy::EntityName::name** (p. 1276).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601)
------------	---

8.84.5.10 find_participant_by_name()

```
dds::domain::DomainParticipant find_participant_by_name (
    const std::string & participant_name ) [related]
```

<<*extension*>> (p. 156) Locates an existing **dds::domain::DomainParticipant** (p. 1079) by name.

Note

`#include <rti/domain/find.hpp>` This function is in the `rti::domain` (p. 514) namespace

If no such **DomainParticipant** (p. 1079) exists, the operation will return `dds::core::null` (p. 238).

8.84.5.11 find_participants() [1/2]

```
template<typename ParticipantFwdIterator >
uint32_t find_participants (
    ParticipantFwdIterator begin,
    uint32_t max_size ) [related]
```

<<**extension**>> (p. 156) Retrieves all the participants created by the application up to a maximum number.

Note

`#include <rti/domain/find.hpp>` This function is in the `rti::domain` (p. 514) namespace

If no such **DomainParticipant** (p. 1079) exists, the operation will return `dds::core::null` (p. 238).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

<i>ParticipantFwdIterator</i>	A forward iterator whose value type is <code>dds::domain::DomainParticipant</code> (p. 1079)
-------------------------------	--

Parameters

<i>begin</i>	The iterator where to begin adding DomainParticipants.
<i>max_size</i>	The maximum number of elements to add

Returns

The number of elements added

8.84.5.12 find_participants() [2/2]

```
template<typename ParticipantFwdIterator >
uint32_t find_participants (
    ParticipantFwdIterator begin ) [related]
```

<<*extension*>> (p. 156) Retrieves all the participants created by the application.

Note

`#include <rti/domain/find.hpp>` This function is in the `rti::domain` (p. 514) namespace

If no such **DomainParticipant** (p. 1079) exists, the operation will return `dds::core::null` (p. 238).

DomainParticipants are ordered in the output sequence from the most recently created to the oldest.

MT Safety:

Unsafe. Creating or deleting DomainParticipants at the same time as calling this operation is not safe.

Template Parameters

<i>ParticipantFwdIterator</i>	A forward iterator whose value type is <code>dds::domain::DomainParticipant</code> (p. 1079)
-------------------------------	--

Parameters

<i>begin</i>	The iterator where to begin adding DomainParticipants.
--------------	--

Returns

The number of elements added

8.84.5.13 find_type()

```
const dds::core::xtypes::DynamicType & find_type (
    const dds::domain::DomainParticipant & participant,
    const std::string & type_name ) [related]
```

<<*extension*>> (p. 156) Retrieves a type registered with this participant

`#include <rti/domain/find.hpp>`

Note

This is a standalone function in the namespace `rti::domain` (p. 514)

Every data type used in a **DomainParticipant** (p. 1079) has a registered type name, which in most cases is the same as the type's name (the name used to define the type), but it can be different.

Types are registered by the creation of a `dds::topic::Topic` (p. 2178), whose constructors optionally receive a registered type name different from the type's name.

Types can also be registered when parsing an XML configuration and calling `dds::core::QosProvider::create_↔ participant_from_config()` (p. 1771).

Parameters

<i>participant</i>	The DomainParticipant (p. 1079) where the type is registered
<i>type_name</i>	The name used to register the type in this participant

Returns

If *type_name* exists in this *participant*, this function returns the `DynamicType` describing the type. It can be cast down to **dds::core::xtypes::StructType** (p.2107) or **dds::core::xtypes::UnionType** (p.2285), depending on whether the type is a struct or a union.

Exceptions

dds::core::Error (p. 1284)	If the type doesn't exist or the operation fails for any other reason
-----------------------------------	---

Example:

```
dds::domain::DomainParticipant participant(0);
dds::topic::Topic<Foo> topic1(participant, "Foo Topic"); // registered as "Foo"
dds::topic::Topic<Foo> topic2(participant, "MyFoo Topic", "MyFoo"); // registered as "MyFoo"
const auto& type1 = rti::domain::find_type(participant, "Foo");
const auto& type2 = rti::domain::find_type(participant, "MyFoo");
std::cout << type1 << std::endl;
std::cout << type2 << std::endl;
assert(type1 == type2); // Same type registered with different names
// Cast to StructType to access more information about the type
const auto& type1_struct =
    static_cast<const dds::core::xtypes::StructType&>(type1);
std::cout << type1_struct.member(0).name() << std::endl;
```

8.84.5.14 register_type() [1/2]

```
void register_type (
    dds::domain::DomainParticipant & participant,
    const std::string & name,
    const dds::core::xtypes::DynamicType & type,
    const rti::core::xtypes::DynamicDataTypeSerializationProperty & serialization_↔
property = rti::core::xtypes::DynamicDataTypeSerializationProperty::DEFAULT ) [related]
```

<<**extension**>> (p. 156) Registers a `DynamicType` with specific serialization properties

Typically you don't need to call this function, since the topic constructor takes care of that automatically. You do need to call this function before creating the topic if you want to change the default data-serialization property.

Calling this function also allows to change the registered name of the type, which by default is `type.name()`.

Parameters

<i>participant</i>	The participant where to register this type
<i>name</i>	The name to use to register this type
<i>type</i>	The type definition
<i>serialization_property</i>	The data-serialization property

See also

`dds::core::xtypes::DynamicType` (p. 1249)

`dds::core::xtypes::DynamicData` (p. 1208)

Examples

`Foo.hpp`.

8.84.5.15 register_type() [2/2]

```
template<typename T >
void register_type (
    const std::string & registered_type_name = dds::topic::topic_type_name<T>::value()
) [related]
```

<<**extension**>> (p. 156) Registers a User-Generated Type with RTI Connex. This function is used along with XML Application Creation.

When using XML Application creation, you must use this function to register any user-generated types with RTI Connex before creating your system.

When you don't use XML Application creation, you don't typically need to call this function, since the topic constructor takes care of that automatically.

Template Parameters

<i>T</i>	The user-generated type that is being registered
----------	--

Parameters

<i>registered_type_name</i>	The name to use when registering the type. This is the name that will be used in your XML configuration file to refer to the type.
-----------------------------	--

8.85.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Input paramaters for creating a participant from xml configuration. It allows modification of some of the properties of the entities defined in the configuration.

See also

`dds::core::QosProvider::create_participant_from_config` (p. 1771)

8.85.2 Constructor & Destructor Documentation

8.85.2.1 DomainParticipantConfigParams()

```
rti::domain::DomainParticipantConfigParams::DomainParticipantConfigParams (
    int32_t the_domain_id = DOMAIN_ID_USE_XML_CONFIG,
    const std::string & the_participant_name = ENTITY_NAME_USE_XML_CONFIG,
    const std::string & the_participant_qos_library_name = QOS_ELEMENT_NAME_USE_XML_CONFIG,
    const std::string & the_participant_qos_profile_name = QOS_ELEMENT_NAME_USE_XML_CONFIG,
    const std::string & the_domain_entity_qos_library_name = QOS_ELEMENT_NAME_USE_XML_CONFIG,
    const std::string & the_domain_entity_qos_profile_name = QOS_ELEMENT_NAME_USE_XML_CONFIG ) [inline]
```

Create a **DomainParticipantConfigParams** (p. 1123) object with the specified values.

All parameters are optional. If omitted, the value for that parameter will be retrieved from the xml configuration.

Parameters

<i>the_domain_id</i>	Domain ID from which the DomainParticipant is created.
<i>the_participant_name</i>	The name assigned to the DomainParticipant
<i>the_participant_qos_library_name</i>	QoS library name containing the QoS profile from which the DDS_DomainParticipant is created.
<i>the_participant_qos_profile_name</i>	QoS profile name from which the DomainParticipant is created.
<i>the_domain_entity_qos_library_name</i>	QoS library name containing the QoS profile from which the all the entities defined under the participant configuration are created.
<i>the_domain_entity_qos_profile_name</i>	QoS profile name from which the all the entities defined under the participant configuration are created.

8.85.3 Member Function Documentation

8.85.3.1 domain_id() [1/2]

```
int32_t rti::domain::DomainParticipantConfigParams::domain_id ( ) const [inline]
```

Get the domain id.

See also

domain_id(int32_t) (p. 1126)

8.85.3.2 domain_id() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::domain_id (
    int32_t the_domain_id ) [inline]
```

Set the domain id from which the DomainParticipant is created.

Allows overriding the domain ID defined in the configuration for the participant to be created. If the special value DOMAIN_ID_USE_XML_CONFIG is specified then the ID in the configuration will be used.

8.85.3.3 participant_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::participant_name ( ) const [inline]
```

Get the participant name.

See also

participant_name(const std::string&) (p. 1126)

8.85.3.4 participant_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::participant_name (
    const std::string & the_participant_name ) [inline]
```

Set the name assigned to the DomainParticipant.

This is the name that will be set in the dds::domain::qos::DomainParticipantQos::participant_name. It allows overriding the participant name that is generated automatically.

When this member is lexicographically equal to the special value ENTITY_NAME_USE_XML_CONFIG then an automatically generated name will be assigned.

8.85.3.5 participant_qos_library_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::participant_qos_library_name ( ) const  
[inline]
```

Get the participant qos library name.

See also

participant_qos_library_name(const std::string&) (p. 1127)

8.85.3.6 participant_qos_library_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::participant_qos_↵  
library_name (   
    const std::string & the_participant_qos_library_name ) [inline]
```

Set the QoS library name containing the QoS profile from which the DDS_DomainParticipant is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **dds::domain::DomainParticipant** (p. 1079).

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **rti::domain::DomainParticipantConfigParams::participant_qos_profile_name** (p. 1127) will be ignored.

8.85.3.7 participant_qos_profile_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::participant_qos_profile_name ( ) const  
[inline]
```

Get the participant qos profile name.

See also

participant_qos_profile_name(const std::string&) (p. 1127)

8.85.3.8 participant_qos_profile_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::participant_qos_↔
profile_name (
    const std::string & the_participant_qos_profile_name ) [inline]
```

Set the QoS profile name from which the DomainParticipant is created.

Allows overriding the QoS defined in the configuration for the participant to be created. This value only affects to the **dds::domain::DomainParticipant** (p. 1079).

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **rti::domain::DomainParticipantConfigParams::participant_qos_library_name** (p. 1126) will be ignored.

8.85.3.9 domain_entity_qos_library_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::domain_entity_qos_library_name ( ) const
[inline]
```

Get the domain entity qos library name.

See also

domain_entity_qos_library_name(const std::string&) (p. 1128)

8.85.3.10 domain_entity_qos_library_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::domain_entity_qos_↔
library_name (
    const std::string & the_domain_entity_qos_library_name ) [inline]
```

Set the QoS library name containing the QoS profile from which the all the entities defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the DomainEntity.

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS library from the configuration will be applied. Also, the same action will apply for the QoS profile and the value in **rti::domain::DomainParticipantConfigParams::domain_entity_qos_profile_name** (p. 1128) will be ignored.

8.85.3.11 domain_entity_qos_profile_name() [1/2]

```
std::string rti::domain::DomainParticipantConfigParams::domain_entity_qos_profile_name ( ) const
[inline]
```

Get the domain entity qos profile name.

See also

DomainParticipantConfigParams (p. 1123)& **domain_entity_qos_profile_name(const std::string&)** (p. 1129)

8.85.3.12 domain_entity_qos_profile_name() [2/2]

```
DomainParticipantConfigParams & rti::domain::DomainParticipantConfigParams::domain_entity_qos_↔
profile_name (
    const std::string & the_domain_entity_qos_profile_name ) [inline]
```

Set the QoS profile name from which the all the entities defined under the participant configuration are created.

Allows overriding the QoS defined in the configuration for the domain entities to be created. This value only affects to the DomainEntity.

When this member is lexicographically equal to the special value QOS_ELEMENT_NAME_USE_XML_CONFIG then the QoS profile from the configuration will be applied. Also, the same action will apply for the QoS library and the value in **rti::domain::DomainParticipantConfigParams::domain_entity_qos_library_name** (p. 1128) will be ignored.

8.85.4 Member Data Documentation**8.85.4.1 ENTITY_NAME_USE_XML_CONFIG**

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::domain::DomainParticipantConfigParams::ENTITY_↔
NAME_USE_XML_CONFIG [static]
```

Special value to be used to indicate that a participant should be created with an autogenerated entity name.

8.85.4.2 QOS_ELEMENT_NAME_USE_XML_CONFIG

```
OMG_DDS_API_CLASS_VARIABLE const std::string rti::domain::DomainParticipantConfigParams::QOS_↔
ELEMENT_NAME_USE_XML_CONFIG [static]
```

Special value to be used to indicate that entities should be created from the QoS profile specified in the participant configuration.

8.85.4.3 DOMAIN_ID_USE_XML_CONFIG

```
OMG_DDS_API_CLASS_VARIABLE const int32_t rti::domain::DomainParticipantConfigParams::DOMAIN_ID_USE_XML_CONFIG [static]
```

Special value to be used to indicate that a participant should be created using the domain ID specified in the participant configuration.

8.86 dds::domain::qos::DomainParticipantFactoryQos Class Reference

Qos Use Cases (p. 391)

8.86.2 Member Function Documentation

8.86.2.1 policy() [1/2]

```
template<typename POLICY >
const POLICY & dds::domain::qos::DomainParticipantFactoryQos::policy ( ) const
```

Gets a QoS policy by const reference.

See also

policy() (p. 1131)

8.86.2.2 policy() [2/2]

```
template<typename POLICY >
POLICY & dds::domain::qos::DomainParticipantFactoryQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

<i>Policy</i>	<p>One of the DomainParticipantFactory QoS policies:</p> <ul style="list-style-type: none"> • dds::core::policy::EntityFactory (p. 1272), • rti::core::policy::SystemResourceLimits (p. 2149)
---------------	---

Note

In other language APIs the **DomainParticipantFactoryQos** (p. 1130) also contains the policies to configure the loading of Qos profiles in XML (ProfileQosPolicy) and the logging configuration. These are configured through **dds::core::QosProvider** (p. 1752) and **rti::config::Logger** (p. 1426) respectively.

See also

DDSQosModule_set_qos

8.86.3 Friends And Related Function Documentation**8.86.3.1 to_string() [1/3]**

```
std::string to_string (
    const DomainParticipantFactoryQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DomainParticipantFactoryQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantFactoryQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantFactoryQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.86.3.2 to_string() [2/3]

```
std::string to_string (
    const DomainParticipantFactoryQos & qos,
    const DomainParticipantFactoryQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.86.3.3 to_string() [3/3]

```
std::string to_string (
    const DomainParticipantFactoryQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantFactoryQos** (p. 1130)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is `rti::core::qos_print_all` (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.86.3.4 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::domain::qos::DomainParticipantFactoryQos & qos ) [related]
```

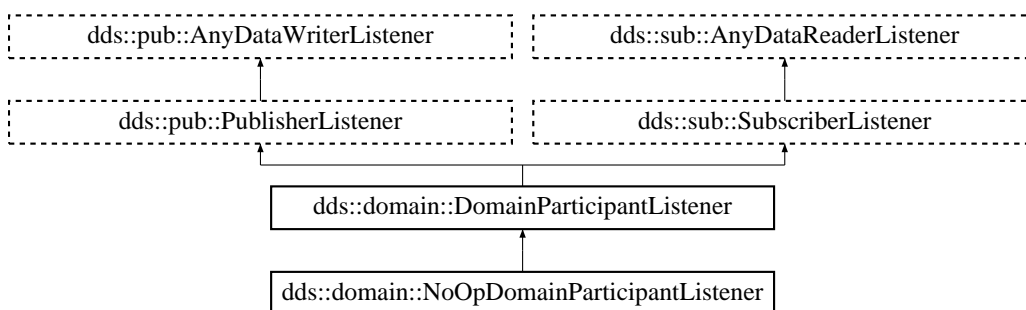

<<*extension*>> (p. 156) Prints a `dds::sub::qos::DomainParticipantFactoryQos` to an output stream.

8.87 dds::domain::DomainParticipantListener Class Reference

The listener class for a **DomainParticipant** (p. 1079).

```
#include "dds/domain/DomainParticipantListener.hpp"
```

Inheritance diagram for `dds::domain::DomainParticipantListener`:

Public Member Functions

- virtual void **on_invalid_local_identity_status_advance_notice** (**DomainParticipant** &participant, const **rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus** &status)=0

<<*extension*>> (p. 156) Notifies that the identity of the local **DomainParticipant** (p. 1079) is about to expire.

8.87.1 Detailed Description

The listener class for a **DomainParticipant** (p. 1079).

8.87.2 Member Function Documentation

8.87.2.1 on_invalid_local_identity_status_advance_notice()

```
virtual void dds::domain::DomainParticipantListener::on_invalid_local_identity_status_advance_↵
notice (
    DomainParticipant & participant,
    const rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus & status ) [pure
virtual]
```

<<*extension*>> (p. 156) Notifies that the identity of the local **DomainParticipant** (p. 1079) is about to expire.

Implemented in **dds::domain::NoOpDomainParticipantListener** (p. 1581).

8.88 rti::core::status::DomainParticipantProtocolStatus Class Reference

```
#include <Status.hpp>
```

Inherits **rti::core::NativeValueType**< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **int64_t corrupted_rtps_message_count** () const
The number of corrupted RTPS messages detected by the domain participant.
- **int64_t corrupted_rtps_message_count_change** () const
The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.
- **dds::core::Time last_corrupted_message_timestamp** () const
The timestamp when the last corrupted RTPS message was detected by the domain participant.

8.88.1 Detailed Description

Entity:

dds::domain::DomainParticipant (p. 1079) The corrupted messages are detected by validating the received CRC. The participant protocol status can be obtained by enabling **rti::core::policy::WireProtocol::compute_crc** (p. 2340) and **rti::core::policy::WireProtocol::check_crc** (p. 2340) at the publishing and subscribing application respectively.

8.88.2 Member Function Documentation

8.88.2.1 corrupted_rtps_message_count()

```
int64_t rti::core::status::DomainParticipantProtocolStatus::corrupted_rtps_message_count ( ) const [inline]
```

The number of corrupted RTPS messages detected by the domain participant.

Counts the corrupted RTPS messages received by the participant. It includes messages belonging to discovery and user traffic.

8.88.2.2 corrupted_rtps_message_count_change()

```
int64_t rti::core::status::DomainParticipantProtocolStatus::corrupted_rtps_message_count_change ( ) const [inline]
```

The incremental change in the number of corrupted RTPS messages detected by the domain participant since the last time the status was read.

8.88.2.3 last_corrupted_message_timestamp()

```
dds::core::Time rti::core::status::DomainParticipantProtocolStatus::last_corrupted_message_↔ timestamp ( ) const [inline]
```

The timestamp when the last corrupted RTPS message was detected by the domain participant.

8.89 dds::domain::qos::DomainParticipantQos Class Reference

<<*value-type*>> (p. 152) Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1079) supports

```
#include <dds/domain/qos/DomainParticipantQos.hpp>
```

Public Member Functions

<<**extension**>> (p. 156) *Prints a **dds::sub::qos::DomainParticipantQos** to an output stream.*

8.89.1 Detailed Description

<<**value-type**>> (p. 152) Container of the QoS policies that a **dds::domain::DomainParticipant** (p. 1079) supports

8.89.2 DomainParticipantQos Policies

A `DomainParticipantQos` (p. 1136) contains the following policies:

- `dds::core::policy::UserData` (p. 2292),
- `dds::core::policy::EntityFactory` (p. 1272),
- `rti::core::policy::WireProtocol` (p. 2331),
- `rti::core::policy::TransportBuiltin` (p. 2237),
- `rti::core::policy::TransportUnicast` (p. 2259),
- `rti::core::policy::Discovery` (p. 1029),
- `rti::core::policy::DomainParticipantResourceLimits` (p. 1143),
- `rti::core::policy::Event` (p. 1285),
- `rti::core::policy::ReceiverPool` (p. 1868),
- `rti::core::policy::Database` (p. 751),
- `rti::core::policy::DiscoveryConfig` (p. 1035),
- `rti::core::policy::Property` (p. 1695),
- `rti::core::policy::EntityName` (p. 1275),
- `rti::core::policy::TransportMulticastMapping` (p. 2250)
- `rti::core::policy::Service` (p. 2057)
- `rti::core::policy::Partition`

To get or set policies use the `policy()` (p. 1139) getters and setters or operator `<<` (see **examples** (p. 392)).

Certain members must be set in a consistent manner:

Length of `dds::domain::qos::DomainParticipantQos::user_data .value` \leq `dds::domain::qos::DomainParticipantQos::resource_limits .participant_user_data_max_length`

For `dds::domain::qos::DomainParticipantQos::discovery_config .publication_writer`
`high_watermark` \leq `dds::domain::qos::DomainParticipantQos::resource_limits .local_writer_allocation .max_count`
`heartbeats_per_max_samples` \leq `dds::domain::qos::DomainParticipantQos::resource_limits .local_writer_allocation .max_count`

For `dds::domain::qos::DomainParticipantQos::discovery_config .subscription_writer`
`high_watermark` \leq `dds::domain::qos::DomainParticipantQos::resource_limits .local_reader_allocation .max_count`
`heartbeats_per_max_samples` \leq `dds::domain::qos::DomainParticipantQos::resource_limits .local_reader_allocation .max_count`

If any of the above are not true, `dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&)` (p. 1090) and `dds::domain::DomainParticipant::set_qos_with_profile` and `dds::domain::DomainParticipant::default_participant_qos()` (p. 1094) will fail with `dds::core::InconsistentPolicyError` (p. 1354), and the `dds::domain::DomainParticipant` (p. 1079) constructors will fail with `dds::core::Error` (p. 1284)

Entity:

dds::domain::DomainParticipant (p. 1079)

8.89.5 Friends And Related Function Documentation

8.89.5.1 to_string() [1/3]

```
std::string to_string (
    const DomainParticipantQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1136)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several to_string overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
DomainParticipantQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for DomainParticipantQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
DomainParticipantQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.89.5.2 to_string() [2/3]

```
std::string to_string (
    const DomainParticipantQos & qos,
    const DomainParticipantQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1136)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.89.5.3 to_string() [3/3]

```
std::string to_string (
    const DomainParticipantQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::domain::qos::DomainParticipantQos** (p. 1136)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.89.5.4 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::domain::qos::DomainParticipantQos & qos ) [related]
```

<<**extension**>> (p. 156) Prints a dds::sub::qos::DomainParticipantQos to an output stream.

8.90 rti::core::policy::DomainParticipantResourceLimits Class Reference

<<**extension**>> (p. 156) Configures the memory usage of certain **dds::domain::DomainParticipant** (p. 1079) resources

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **DomainParticipantResourceLimits & local_writer_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to local DataWriters.
- **AllocationSettings local_writer_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & local_reader_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to local DataReaders.
- **AllocationSettings local_reader_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & local_publisher_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to local Publisher.
- **AllocationSettings local_publisher_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & local_subscriber_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to local Subscriber.
- **DomainParticipantResourceLimits & local_topic_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to local Topic.
- **AllocationSettings local_topic_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & remote_writer_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to remote DataWriters.
- **AllocationSettings remote_writer_allocation** () const
Getter (see setter with the same name)

- **DomainParticipantResourceLimits & remote_reader_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to remote DataReaders.
- **AllocationSettings remote_reader_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & remote_participant_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to remote DomainParticipants.
- **AllocationSettings remote_participant_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & matching_writer_reader_pair_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to matching local writer and remote/local reader pairs.
- **AllocationSettings matching_writer_reader_pair_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & matching_reader_writer_pair_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to matching local reader and remote/local writer pairs.
- **AllocationSettings matching_reader_writer_pair_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & ignored_entity_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to ignored entities.
- **AllocationSettings ignored_entity_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & content_filtered_topic_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to content filtered topic.
- **AllocationSettings content_filtered_topic_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & content_filter_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to content filter.
- **AllocationSettings content_filter_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & read_condition_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to read condition pool.
- **AllocationSettings read_condition_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & query_condition_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to query condition pool.
- **AllocationSettings query_condition_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & outstanding_asynchronous_sample_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to the maximum number of samples (from all `dds::pub::DataWriter` (p. 908)) waiting to be asynchronously written.
- **AllocationSettings outstanding_asynchronous_sample_allocation** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & flow_controller_allocation** (const **AllocationSettings** &settings)
Allocation settings applied to flow controllers.
- **AllocationSettings flow_controller_allocation** () const

- Getter (see setter with the same name)*
- **DomainParticipantResourceLimits & local_writer_hash_buckets** (int32_t hash_buckets)
Hash_Buckets settings applied to local DataWriters.
 - int32_t **local_writer_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & local_reader_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for local DataReaders.
 - int32_t **local_reader_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & local_publisher_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for local Publisher.
 - int32_t **local_publisher_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & local_subscriber_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for local Subscriber.
 - int32_t **local_subscriber_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & local_topic_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for local Topic.
 - int32_t **local_topic_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & remote_writer_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for remote DataWriters.
 - int32_t **remote_writer_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & remote_reader_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for remote DataReaders.
 - int32_t **remote_reader_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & remote_participant_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for remote DomainParticipants.
 - int32_t **remote_participant_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & matching_writer_reader_pair_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for matching local writer and remote/local reader pairs.
 - int32_t **matching_writer_reader_pair_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & matching_reader_writer_pair_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for matching local reader and remote/local writer pairs.
 - int32_t **matching_reader_writer_pair_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & ignored_entity_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for ignored entities.
 - int32_t **ignored_entity_hash_buckets** () const
Getter (see setter with the same name)
 - **DomainParticipantResourceLimits & content_filtered_topic_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for content filtered topics.

- `int32_t content_filtered_topic_hash_buckets () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & content_filter_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for content filters.
- `int32_t content_filter_hash_buckets () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & flow_controller_hash_buckets** (int32_t hash_buckets)
Number of hash buckets for flow controllers.
- `int32_t flow_controller_hash_buckets () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & max_gather_destinations** (int32_t max_destinations)
Maximum number of destinations per RTI Connex send.
- `int32_t max_gather_destinations () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & participant_user_data_max_length** (int32_t max_length)
Maximum length of user data in `dds::domain::qos::DomainParticipantQos` (p. 1136) and `dds::topic::ParticipantBuiltinTopicData` (p. 1639).
- `int32_t participant_user_data_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & topic_data_max_length** (int32_t max_length)
Maximum length of topic data in `dds::topic::qos::TopicQos` (p. 2213), `dds::topic::TopicBuiltinTopicData` (p. 2197), `dds::topic::PublicationBuiltinTopicData` (p. 1703) and `dds::topic::SubscriptionBuiltinTopicData` (p. 2133).
- `int32_t topic_data_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & publisher_group_data_max_length** (int32_t max_length)
Maximum length of group data in `dds::pub::qos::PublisherQos` (p. 1733) and `dds::topic::PublicationBuiltinTopicData` (p. 1703).
- `int32_t publisher_group_data_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & subscriber_group_data_max_length** (int32_t max_length)
Maximum length of group data in `dds::sub::qos::SubscriberQos` (p. 2129) and `dds::topic::SubscriptionBuiltinTopicData` (p. 2133).
- `int32_t subscriber_group_data_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & writer_user_data_max_length** (int32_t max_length)
Maximum length of user data in `dds::pub::qos::DataWriterQos` (p. 994) and `dds::topic::PublicationBuiltinTopicData` (p. 1703).
- `int32_t writer_user_data_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & reader_user_data_max_length** (int32_t max_length)
Maximum length of user data in `dds::sub::qos::DataReaderQos` (p. 848) and `dds::topic::SubscriptionBuiltinTopicData` (p. 2133).
- `int32_t reader_user_data_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & max_partitions** (int32_t partitions)
Maximum number of partition name strings allowable in a `dds::core::policy::Partition` (p. 1652).
- `int32_t max_partitions () const`
Getter (see setter with the same name)

- **DomainParticipantResourceLimits & max_partition_cumulative_characters** (int32_t max_characters)
Maximum number of combined characters allowable in all partition names in a `dds::core::policy::Partition` (p. 1652).
- **DomainParticipantResourceLimits & type_code_max_serialized_length** (int32_t max_length)
Maximum size of serialized string for type code.
- int32_t **type_code_max_serialized_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & type_object_max_serialized_length** (int32_t max_length)
The maximum length, in bytes, that the buffer to serialize a `TypeObject` can consume.
- int32_t **type_object_max_serialized_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & type_object_max_deserialized_length** (int32_t max_length)
The maximum number of bytes that a deserialized `TypeObject` can consume.
- int32_t **type_object_max_deserialized_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & deserialized_type_object_dynamic_allocation_threshold** (int32_t threshold)
A threshold, in bytes, for dynamic memory allocation for the deserialized `TypeObject`.
- int32_t **deserialized_type_object_dynamic_allocation_threshold** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & serialized_type_object_dynamic_allocation_threshold** (int32_t threshold)
A threshold, in bytes, for dynamic memory allocation for the serialized `TypeObject`.
- int32_t **serialized_type_object_dynamic_allocation_threshold** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & contentfilter_property_max_length** (int32_t max_length)
This field is the maximum length of all data related to a Content-filtered topic.
- int32_t **contentfilter_property_max_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & channel_seq_max_length** (int32_t max_length)
Maximum number of channels that can be specified in `rti::core::policy::MultiChannel` (p. 1483) for `MultiChannel` (p. 1483) `DataWriters`.
- int32_t **channel_seq_max_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & channel_filter_expression_max_length** (int32_t max_length)
Maximum length of a channel `rti::core::ChannelSettings::filter_expression` (p. 705) in a `MultiChannel` (p. 1483) `DataWriter`.
- int32_t **channel_filter_expression_max_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & participant_property_list_max_length** (int32_t max_length)
Maximum number of properties associated with the `dds::domain::DomainParticipant` (p. 1079).
- int32_t **participant_property_list_max_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & participant_property_string_max_length** (int32_t max_length)
Maximum string length of the properties associated with the `dds::domain::DomainParticipant` (p. 1079).
- int32_t **participant_property_string_max_length** () const
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & writer_property_list_max_length** (int32_t max_length)
Maximum number of properties associated with a `dds::pub::DataWriter` (p. 908).

- `int32_t writer_property_list_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & writer_property_string_max_length** (`int32_t max_length`)
Maximum string length of the properties associated with a `dds::pub::DataWriter` (p. 908).
- `int32_t writer_property_string_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & reader_property_list_max_length** (`int32_t max_length`)
Maximum number of properties associated with a `dds::sub::DataReader` (p. 756).
- `int32_t reader_property_list_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & reader_property_string_max_length** (`int32_t max_length`)
Maximum string length of the properties associated with a `dds::sub::DataReader` (p. 756).
- `int32_t reader_property_string_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & max_endpoint_groups** (`int32_t max_groups`)
Maximum number of `rti::core::EndpointGroup` (p. 1259) allowable in a `rti::core::policy::Availability` (p. 654).
- `int32_t max_endpoint_groups () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & max_endpoint_group_cumulative_characters** (`int32_t max_cumulative_characters`)
Maximum number of combined `role_name` characters allowed in all `rti::core::EndpointGroup` (p. 1259) in a `rti::core::policy::Availability` (p. 654).
- `int32_t max_endpoint_group_cumulative_characters () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & transport_info_list_max_length** (`int32_t max_length`)
Maximum number of installed transports to send and receive information about in `dds::topic::ParticipantBuiltinTopicData::transport_info` (p. 1644).
- `int32_t transport_info_list_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & ignored_entity_replacement_kind** (`IgnoredEntityReplacementKind max_length`)
Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in `rti::core::policy::DomainParticipantResourceLimits::ignored_entity_allocation` (p. 1154) are reached.
- **IgnoredEntityReplacementKind ignored_entity_replacement_kind** (`IgnoredEntityReplacementKind`) `const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & remote_topic_query_allocation** (`const AllocationSettings &settings`)
Allocation settings applied to remote `TopicQueries`.
- **AllocationSettings remote_topic_query_allocation** (`AllocationSettings`) `const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & remote_topic_query_hash_buckets** (`int32_t hash_buckets`)
Number of hash buckets for remote `TopicQueries`.
- `int32_t remote_topic_query_hash_buckets () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & writer_data_tag_list_max_length** (`int32_t max_length`)
Maximum number of data tags associated with a `dds::pub::DataWriter` (p. 908).
- `int32_t writer_data_tag_list_max_length () const`
Getter (see setter with the same name)
- **DomainParticipantResourceLimits & writer_data_tag_string_max_length** (`int32_t max_length`)

Maximum string length of the data tags associated with a `dds::pub::DataWriter` (p. 908).

- `int32_t writer_data_tag_string_max_length ()` const
Getter (see setter with the same name)
- `DomainParticipantResourceLimits & reader_data_tag_list_max_length (int32_t max_length)`
Maximum number of data tags associated with a `dds::sub::DataReader` (p. 756).
- `int32_t reader_data_tag_list_max_length ()` const
Getter (see setter with the same name)
- `DomainParticipantResourceLimits & reader_data_tag_string_max_length (int32_t max_length)`
Maximum string length of the data tags associated with a `dds::sub::DataReader` (p. 756).
- `int32_t reader_data_tag_string_max_length ()` const
Getter (see setter with the same name)
- `DomainParticipantResourceLimits & shmем_ref_transfer_mode_max_segments (uint32_t the_shmem_ref_transfer_mode_max_segments)`
Maximum number of segments created by all `DataWriters` belonging to a `dds::domain::DomainParticipant` (p. 1079).
- `uint32_t shmем_ref_transfer_mode_max_segments ()` const
Getter (see setter with the same name)

8.90.1 Detailed Description

<<*extension*>> (p. 156) Configures the memory usage of certain `dds::domain::DomainParticipant` (p. 1079) resources

This QoS policy sets maximum size limits on variable-length parameters used by the participant and its contained Entities. It also controls the initial and maximum sizes of data structures used by the participant to store information about locally-created and remotely-discovered entities (such as `DataWriters/DataReaders`), as well as parameters used by the internal database to size the hash tables it uses.

By default, a `dds::domain::DomainParticipant` (p. 1079) is allowed to dynamically allocate memory as needed as users create local Entities such as `dds::pub::DataWriter` (p. 908) and `dds::sub::DataReader` (p. 756) or as the participant discovers new applications to store their information. By setting fixed values for the maximum parameters in this QoS Policy, you can bound the memory that can be allocated by a `DomainParticipant`. In addition, by setting the initial values to the maximum values, you can reduce the amount of memory allocated by `DomainParticipants` after the initialization period. Notice that memory can still be allocated dynamically after the initialization period. For example, when a new local `dds::pub::DataWriter` (p. 908) or `dds::sub::DataReader` (p. 756) is created, the initial memory required for its queue is allocated dynamically.

The maximum sizes of different variable-length parameters such as the number of partitions that can be stored in the `dds::core::policy::Partition` (p. 1652), the maximum length of data store in the `dds::core::policy::UserData` (p. 2292) and `dds::core::policy::GroupData` (p. 1335), and many others can be changed from their defaults using this QoS policy. However, it is important that all `DomainParticipants` that need to communicate with each other use the *same set* of maximum values. Otherwise, when these parameters are propagated from one `dds::domain::DomainParticipant` (p. 1079) to another, a `dds::domain::DomainParticipant` (p. 1079) with a smaller maximum length may reject the parameter, resulting in an error.

An important parameter in this QoS policy that is often changed by users is `rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length` (p. 1169).

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.90.2 Member Function Documentation

8.90.2.1 local_writer_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔
writer_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to local DataWriters.

[default] initial_count = 16; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

References **rti::core::policy::auto_writer_depth()**.

8.90.2.2 local_writer_allocation() [2/2]

```
AllocationSettings rti::core::policy::DomainParticipantResourceLimits::local_writer_allocation (
) const
```

Getter (see setter with the same name)

8.90.2.3 local_reader_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔
reader_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to local DataReaders.

[default] initial_count = 16; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.4 local_reader_allocation() [2/2]

```
AllocationSettings rti::core::policy::DomainParticipantResourceLimits::local_reader_allocation (
) const
```

Getter (see setter with the same name)

8.90.2.5 local_publisher_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↵
publisher_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to local Publisher.

[default] initial_count = 4; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.6 local_publisher_allocation() [2/2]

```
AllocationSettings rti::core::policy::DomainParticipantResourceLimits::local_publisher_allocation
( ) const
```

Getter (see setter with the same name)

8.90.2.7 local_subscriber_allocation()

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↵
subscriber_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to local Subscriber.

[default] initial_count = 4; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.8 local_topic_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔
topic_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to local Topic.

[default] initial_count = 16; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.9 local_topic_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::local_topic_allocation ( )
const

```

Getter (see setter with the same name)

8.90.2.10 remote_writer_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔
writer_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to remote DataWriters.

Remote DataWriters include all DataWriters, both local and remote.

[default] initial_count = 64; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.11 remote_writer_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::remote_writer_allocation (
) const

```

Getter (see setter with the same name)

8.90.2.12 remote_reader_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔
reader_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to remote DataReaders.

Remote DataReaders include all DataReaders, both local and remote.

[default] initial_count = 64; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.13 remote_reader_allocation() [2/2]

```
AllocationSettings rti::core::policy::DomainParticipantResourceLimits::remote_reader_allocation (
) const
```

Getter (see setter with the same name)

8.90.2.14 remote_participant_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔
participant_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to remote DomainParticipants.

Remote DomainParticipants include all DomainParticipants, both local and remote.

[default] initial_count = 16; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.15 remote_participant_allocation() [2/2]

```
AllocationSettings rti::core::policy::DomainParticipantResourceLimits::remote_participant_↔
allocation ( ) const
```

Getter (see setter with the same name)

8.90.2.16 `matching_writer_reader_pair_allocation()` [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::matching_↔
writer_reader_pair_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to matching local writer and remote/local reader pairs.

[default] `initial_count = 32; max_count = dds::core::LENGTH_UNLIMITED` (p. 238); `incremental_count = -1`

[range] See allowed ranges in struct `rti::core::AllocationSettings` (p. 591)

8.90.2.17 `matching_writer_reader_pair_allocation()` [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::matching_writer_reader_↔
pair_allocation ( ) const

```

Getter (see setter with the same name)

8.90.2.18 `matching_reader_writer_pair_allocation()` [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::matching_↔
reader_writer_pair_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to matching local reader and remote/local writer pairs.

[default] `initial_count = 32; max_count = dds::core::LENGTH_UNLIMITED` (p. 238); `incremental_count = -1`

[range] See allowed ranges in struct `rti::core::AllocationSettings` (p. 591)

8.90.2.19 `matching_reader_writer_pair_allocation()` [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::matching_reader_writer_↔
pair_allocation ( ) const

```

Getter (see setter with the same name)

8.90.2.20 ignored_entity_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::ignored_↔
entity_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to ignored entities.

[default] initial_count = 8; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.21 ignored_entity_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::ignored_entity_allocation
( ) const

```

Getter (see setter with the same name)

8.90.2.22 content_filtered_topic_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::content_↔
filtered_topic_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to content filtered topic.

[default] initial_count = 4; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.23 content_filtered_topic_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::content_filtered_topic_↔
allocation ( ) const

```

Getter (see setter with the same name)

8.90.2.24 content_filter_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::content_↔
filter_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to content filter.

[default] initial_count = 4; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238); incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.25 content_filter_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::content_filter_allocation
( ) const

```

Getter (see setter with the same name)

8.90.2.26 read_condition_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::read_↔
condition_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to read condition pool.

[default] initial_count = 4; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238), incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.27 read_condition_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::read_condition_allocation
( ) const

```

Getter (see setter with the same name)

8.90.2.28 query_condition_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::query_↔
condition_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to query condition pool.

[default] initial_count = 4; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238), incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.29 query_condition_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::query_condition_allocation
( ) const

```

Getter (see setter with the same name)

8.90.2.30 outstanding_asynchronous_sample_allocation() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::outstanding_↔
_asynchronous_sample_allocation (
    const AllocationSettings & settings )

```

Allocation settings applied to the maximum number of samples (from all **dds::pub::DataWriter** (p. 908)) waiting to be asynchronously written.

[default] initial_count = 64; max_count = **dds::core::LENGTH_UNLIMITED** (p. 238), incremental_count = -1

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.31 outstanding_asynchronous_sample_allocation() [2/2]

```

AllocationSettings rti::core::policy::DomainParticipantResourceLimits::outstanding_asynchronous_↔
_sample_allocation ( ) const

```

Getter (see setter with the same name)

8.90.2.32 flow_controller_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::flow_↔
controller_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to flow controllers.

[default] initial_count = 4; max_count = `dds::core::LENGTH_UNLIMITED` (p. 238), incremental_count = -1

[range] See allowed ranges in struct `rti::core::AllocationSettings` (p. 591)

8.90.2.33 flow_controller_allocation() [2/2]

```
AllocationSettings rti::core::policy::DomainParticipantResourceLimits::flow_controller_allocation
( ) const
```

Getter (see setter with the same name)

8.90.2.34 local_writer_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔
writer_hash_buckets (
    int32_t hash_buckets )
```

Hash_Buckets settings applied to local DataWriters.

[default] 4

[range] [1, 10000]

8.90.2.35 local_writer_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::local_writer_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.36 local_reader_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔
reader_hash_buckets (
    int32_t hash_buckets )
```

Number of hash buckets for local DataReaders.

[default] 4

[range] [1, 10000]

8.90.2.37 local_reader_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::local_reader_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.38 local_publisher_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔  
publisher_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for local Publisher.

[default] 1

[range] [1, 10000]

8.90.2.39 local_publisher_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::local_publisher_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.40 local_subscriber_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔  
subscriber_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for local Subscriber.

[default] 1

[range] [1, 10000]

8.90.2.41 local_subscriber_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::local_subscriber_hash_buckets ( )  
const
```

Getter (see setter with the same name)

8.90.2.42 local_topic_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::local_↔  
topic_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for local Topic.

[default] 4

[range] [1, 10000]

8.90.2.43 local_topic_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::local_topic_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.44 remote_writer_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔  
writer_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for remote DataWriters.

Remote DataWriters include all DataWriters, both local and remote.

[default] 16

[range] [1, 10000]

8.90.2.45 remote_writer_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::remote_writer_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.46 remote_reader_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔  
reader_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for remote DataReaders.

Remote DataReaders include all DataReaders, both local and remote.

[default] 16

[range] [1, 10000]

8.90.2.47 remote_reader_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::remote_reader_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.48 remote_participant_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔  
participant_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for remote DomainParticipants.

Remote DomainParticipants include all DomainParticipants, both local and remote.

[default] 4

[range] [1, 10000]

8.90.2.49 remote_participant_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::remote_participant_hash_buckets ( )  
const
```

Getter (see setter with the same name)

8.90.2.50 matching_writer_reader_pair_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::matching_↔  
writer_reader_pair_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for matching local writer and remote/local reader pairs.

[default] 32

[range] [1, 10000]

8.90.2.51 matching_writer_reader_pair_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::matching_writer_reader_pair_hash_↔  
buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.52 matching_reader_writer_pair_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::matching_↔  
reader_writer_pair_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for matching local reader and remote/local writer pairs.

[default] 32

[range] [1, 10000]

8.90.2.53 matching_reader_writer_pair_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::matching_reader_writer_pair_hash_↔  
buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.54 ignored_entity_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::ignored_↔  
entity_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for ignored entities.

[default] 1

[range] [1, 10000]

8.90.2.55 ignored_entity_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::ignored_entity_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.56 content_filtered_topic_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::content_↔  
filtered_topic_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for content filtered topics.

[default] 1

[range] [1, 10000]

8.90.2.57 content_filtered_topic_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::content_filtered_topic_hash_buckets (   
 ) const
```

Getter (see setter with the same name)

8.90.2.58 content_filter_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::content_↔  
filter_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for content filters.

[default] 1

[range] [1, 10000]

8.90.2.59 content_filter_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::content_filter_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.60 flow_controller_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::flow_↔  
controller_hash_buckets (   
    int32_t hash_buckets )
```

Number of hash buckets for flow controllers.

[default] 1

[range] [1, 10000]

8.90.2.61 flow_controller_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::flow_controller_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.90.2.62 max_gather_destinations() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::max_↔  
gather_destinations (   
    int32_t max_destinations )
```

Maximum number of destinations per RTI Connex send.

When RTI Connex sends out a message, it has the capability to send to multiple destinations to be more efficient. The maximum number of destinations per RTI Connex send is specified by `max_gather_destinations`.

[default] 16

[range] [16, 1 million]

8.90.2.63 max_gather_destinations() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::max_gather_destinations ( ) const
```

Getter (see setter with the same name)

8.90.2.64 participant_user_data_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::participant_↔
_user_data_max_length (
    int32_t max_length )
```

Maximum length of user data in **dds::domain::qos::DomainParticipantQos** (p. 1136) and **dds::topic::Participant↔BuiltinTopicData** (p. 1639).

[default] 256

[range] [0,0x7fffffff]

8.90.2.65 participant_user_data_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::participant_user_data_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.66 topic_data_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::topic_↔
data_max_length (
    int32_t max_length )
```

Maximum length of topic data in **dds::topic::qos::TopicQos** (p. 2213), **dds::topic::TopicBuiltinTopicData** (p. 2197), **dds::topic::PublicationBuiltinTopicData** (p. 1703) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2133).

[default] 256

[range] [0,0x7fffffff]

8.90.2.67 topic_data_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::topic_data_max_length ( ) const
```

Getter (see setter with the same name)

8.90.2.68 publisher_group_data_max_length() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::publisher↔
_group_data_max_length (
    int32_t max_length )

```

Maximum length of group data in **dds::pub::qos::PublisherQos** (p. 1733) and **dds::topic::PublicationBuiltinTopic↔Data** (p. 1703).

[default] 256

[range] [0,0x7ffffff]

8.90.2.69 publisher_group_data_max_length() [2/2]

```

int32_t rti::core::policy::DomainParticipantResourceLimits::publisher_group_data_max_length ( )
const

```

Getter (see setter with the same name)

8.90.2.70 subscriber_group_data_max_length() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::subscriber↔
_group_data_max_length (
    int32_t max_length )

```

Maximum length of group data in **dds::sub::qos::SubscriberQos** (p. 2129) and **dds::topic::SubscriptionBuiltin↔TopicData** (p. 2133).

[default] 256

[range] [0,0x7ffffff]

8.90.2.71 subscriber_group_data_max_length() [2/2]

```

int32_t rti::core::policy::DomainParticipantResourceLimits::subscriber_group_data_max_length ( )
const

```

Getter (see setter with the same name)

8.90.2.72 `writer_user_data_max_length()` [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::writer_↔
user_data_max_length (
    int32_t max_length )

```

Maximum length of user data in `dds::pub::qos::DataWriterQos` (p. 994) and `dds::topic::PublicationBuiltinTopic↔Data` (p. 1703).

[default] 256

[range] [0,0x7ffffff]

8.90.2.73 `writer_user_data_max_length()` [2/2]

```

int32_t rti::core::policy::DomainParticipantResourceLimits::writer_user_data_max_length ( ) const

```

Getter (see setter with the same name)

8.90.2.74 `reader_user_data_max_length()` [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::reader_↔
user_data_max_length (
    int32_t max_length )

```

Maximum length of user data in `dds::sub::qos::DataReaderQos` (p. 848) and `dds::topic::SubscriptionBuiltin↔TopicData` (p. 2133).

[default] 256

[range] [0,0x7ffffff]

8.90.2.75 `reader_user_data_max_length()` [2/2]

```

int32_t rti::core::policy::DomainParticipantResourceLimits::reader_user_data_max_length ( ) const

```

Getter (see setter with the same name)

8.90.2.76 max_partitions() [1/2]

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::max_↔
partitions (
    int32_t partitions )

```

Maximum number of partition name strings allowable in a **dds::core::policy::Partition** (p. 1652).

This setting is made on a per DomainParticipant basis; it cannot be set individually on a per Publisher/Subscriber basis. However, the limit is enforced and applies per Publisher/Subscriber.

This value cannot exceed 64.

[default] 64

[range] [0,64]

8.90.2.77 max_partitions() [2/2]

```

int32_t rti::core::policy::DomainParticipantResourceLimits::max_partitions ( ) const

```

Getter (see setter with the same name)

8.90.2.78 max_partition_cumulative_characters()

```

DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::max_↔
partition_cumulative_characters (
    int32_t max_characters )

```

Maximum number of combined characters allowable in all partition names in a **dds::core::policy::Partition** (p. 1652).

The maximum number of combined characters should account for a terminating NULL ('\0') character for each partition name string.

This setting is made on a per DomainParticipant basis; it cannot be set individually on a per Publisher/Subscriber basis. However, the limit is enforced and applies per Publisher/Subscriber.

This value cannot exceed 256.

[default] 256

[range] [0,256]

8.90.2.79 type_code_max_serialized_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::type_code↔
_max_serialized_length (
    int32_t max_length )
```

Maximum size of serialized string for type code.

This parameter is an alternative to `rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length` (p. 1169) for limiting the size of the type code that a `dds::domain::DomainParticipant` (p. 1079) is able to store and propagate for user data types. Type codes can be used by external applications to understand user data types without having the data type predefined in compiled form. However, since type codes contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in large type codes. So it is common for users to set this parameter to a large value, if used (by default, it is set to 0). However, as with all parameters in this QoS policy defining maximum sizes for variable-length elements, all DomainParticipants in the same domain should use the same value for this parameter. Note: TypeObject is now the standard method of exchanging type information in RTI Connext. It is recommended to use `rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length` (p. 1169) to configure the maximum serialized type object string.

[default] 0

[range] [0,0xffff]

8.90.2.80 type_code_max_serialized_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::type_code_max_serialized_length ( )
const
```

Getter (see setter with the same name)

8.90.2.81 type_object_max_serialized_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::type↔
_object_max_serialized_length (
    int32_t max_length )
```

The maximum length, in bytes, that the buffer to serialize a TypeObject can consume.

This parameter limits the size of the TypeObject that a DomainParticipant is able to propagate. Since TypeObjects contain all of the information of a data structure, including the strings that define the names of the members of a structure, complex data structures can result in TypeObjects larger than the default maximum of 8192 bytes. This field allows you to specify a larger value. The desired size for a given `dds::core::xtypes::DynamicType` (p. 1249) can be obtained using `dds::core::xtypes::DynamicType::get_type_object_serialized_size`.

[default] 8192

[range] [0,0x7fffffff]

8.90.2.82 type_object_max_serialized_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length ( )
const
```

Getter (see setter with the same name)

8.90.2.83 type_object_max_deserialized_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::type_↔
object_max_deserialized_length (
    int32_t max_length )
```

The maximum number of bytes that a deserialized TypeObject can consume.

This parameter limits the size of the TypeObject that a DomainParticipant is able to store.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

[range] [0,0x7fffffff] or `dds::core::LENGTH_UNLIMITED` (p. 238)

8.90.2.84 type_object_max_deserialized_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::type_object_max_deserialized_length (
) const
```

Getter (see setter with the same name)

8.90.2.85 deserialized_type_object_dynamic_allocation_threshold() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::deserialized_↔
_type_object_dynamic_allocation_threshold (
    int32_t threshold )
```

A threshold, in bytes, for dynamic memory allocation for the deserialized TypeObject.

Above this threshold, the memory for a TypeObject is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

In case `rti::core::policy::DomainParticipantResourceLimits::type_object_max_deserialized_length` (p. 1170) is different than `dds::core::LENGTH_UNLIMITED` (p. 238) and is smaller than `rti::core::policy::DomainParticipantResourceLimits::deserialized_type_object_dynamic_allocation_threshold` (p. 1170): `rti::core::policy::DomainParticipantResourceLimits::deserialized_type_object_dynamic_allocation_threshold` (p. 1170) will be adjusted to `rti::core::policy::DomainParticipantResourceLimits::type_object_max_deserialized_length` (p. 1170).

[default] 4096

[range] [0,0x7fffffff] <= `rti::core::policy::DomainParticipantResourceLimits::type_object_max_deserialized_length` (p. 1170)

8.90.2.86 `deserialized_type_object_dynamic_allocation_threshold()` [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::deserialized_type_object_dynamic_↔
allocation_threshold ( ) const
```

Getter (see setter with the same name)

8.90.2.87 `serialized_type_object_dynamic_allocation_threshold()` [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::serialized_↔
_type_object_dynamic_allocation_threshold (
    int32_t threshold )
```

A threshold, in bytes, for dynamic memory allocation for the serialized TypeObject.

Above this threshold, the memory for a TypeObject is allocated dynamically. Below it, the memory is obtained from a pool of fixed-size buffers. The size of the buffers is equal to this threshold.

In case `rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length` (p.1169) is different than `dds::core::LENGTH_UNLIMITED` (p.238) and is smaller than `rti::core::policy::DomainParticipantResourceLimits::serialized_type_object_dynamic_allocation_threshold` (p.1171): `rti::core::policy::DomainParticipantResourceLimits::serialized_type_object_dynamic_allocation_threshold` (p.1171) will be adjusted to `rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length` (p.1169).

[default] 8192

[range] [0,0x7fffffff] <= `rti::core::policy::DomainParticipantResourceLimits::type_object_max_serialized_length` (p.1169)

8.90.2.88 `serialized_type_object_dynamic_allocation_threshold()` [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::serialized_type_object_dynamic_↔
allocation_threshold ( ) const
```

Getter (see setter with the same name)

8.90.2.89 `contentfilter_property_max_length()` [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::contentfilter_↔
_property_max_length (
    int32_t max_length )
```

This field is the maximum length of all data related to a Content-filtered topic.

This is the sum of the length of the ContentFilteredTopic name, the length of the related topic name, the length of the filter expression, the length of the filter parameters, and the length of the filter name. The maximum number of combined characters should account for a terminating NULL ('\0') character for each string.

[default] 256

[range] [0,0xffff]

8.90.2.90 contentfilter_property_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::contentfilter_property_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.91 channel_seq_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::channel_↔
seq_max_length (
    int32_t max_length )
```

Maximum number of channels that can be specified in **rti::core::policy::MultiChannel** (p. 1483) for **MultiChannel** (p. 1483) DataWriters.

[default] 32

[range] [0,0xffff]

8.90.2.92 channel_seq_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::channel_seq_max_length ( ) const
```

Getter (see setter with the same name)

8.90.2.93 channel_filter_expression_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::channel_↔
filter_expression_max_length (
    int32_t max_length )
```

Maximum length of a channel **rti::core::ChannelSettings::filter_expression** (p. 705) in a **MultiChannel** (p. 1483) DataWriter.

The length should account for a terminating NULL ('\0') character.

[default] 256

[range] [0,0xffff]

8.90.2.94 channel_filter_expression_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::channel_filter_expression_max_length (
) const
```

Getter (see setter with the same name)

8.90.2.95 participant_property_list_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::participant←
_property_list_max_length (
    int32_t max_length )
```

Maximum number of properties associated with the **dds::domain::DomainParticipant** (p. 1079).

[default] 32

[range] [0,0xffff]

8.90.2.96 participant_property_list_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::participant_property_list_max_length (
) const
```

Getter (see setter with the same name)

8.90.2.97 participant_property_string_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::participant←
_property_string_max_length (
    int32_t max_length )
```

Maximum string length of the properties associated with the **dds::domain::DomainParticipant** (p. 1079).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **dds::domain::DomainParticipant** (p. 1079) properties.

[default] 4096

[range] [0,0xffff]

8.90.2.98 participant_property_string_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::participant_property_string_max_length
( ) const
```

Getter (see setter with the same name)

8.90.2.99 writer_property_list_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::writer_↔
property_list_max_length (
    int32_t max_length )
```

Maximum number of properties associated with a **dds::pub::DataWriter** (p. 908).

[range] [0,0xffff]

[default] 32

8.90.2.100 writer_property_list_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::writer_property_list_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.101 writer_property_string_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::writer_↔
property_string_max_length (
    int32_t max_length )
```

Maximum string length of the properties associated with a **dds::pub::DataWriter** (p. 908).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **dds::pub::DataWriter** (p. 908) properties.

[default] 1024

[range] [0,0xffff]

8.90.2.102 writer_property_string_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::writer_property_string_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.103 reader_property_list_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::reader_↔
property_list_max_length (
    int32_t max_length )
```

Maximum number of properties associated with a **dds::sub::DataReader** (p. 756).

[default] 32

[range] [0,0xffff]

8.90.2.104 reader_property_list_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::reader_property_list_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.105 reader_property_string_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::reader_↔
property_string_max_length (
    int32_t max_length )
```

Maximum string length of the properties associated with a **dds::sub::DataReader** (p. 756).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with a **dds::sub::DataReader** (p. 756) properties.

[default] 1024

[range] [0,0xffff]

8.90.2.106 reader_property_string_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::reader_property_string_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.107 max_endpoint_groups() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::max_↔
endpoint_groups (
    int32_t max_groups )
```

Maximum number of **rti::core::EndpointGroup** (p. 1259) allowable in a **rti::core::policy::Availability** (p. 654).

[default] 32

[range] [0,65535]

8.90.2.108 max_endpoint_groups() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::max_endpoint_groups ( ) const
```

Getter (see setter with the same name)

8.90.2.109 max_endpoint_group_cumulative_characters() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::max_↔
endpoint_group_cumulative_characters (
    int32_t max_cumulative_characters )
```

Maximum number of combined role_name characters allowed in all **rti::core::EndpointGroup** (p. 1259) in a **rti::core::policy::Availability** (p. 654).

The maximum number of combined characters should account for a terminating NULL character for each role_name string.

[default] 1024

[range] [0,65535]

8.90.2.110 max_endpoint_group_cumulative_characters() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::max_endpoint_group_cumulative_characters
( ) const
```

Getter (see setter with the same name)

8.90.2.111 transport_info_list_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::transport↔
_info_list_max_length (
    int32_t max_length )
```

Maximum number of installed transports to send and receive information about in **dds::topic::ParticipantBuiltin↔**
TopicData::transport_info (p. 1644).

[default] 12

[range] [0,100]

8.90.2.112 transport_info_list_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::transport_info_list_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.113 ignored_entity_replacement_kind() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::ignored_↔
entity_replacement_kind (
    IgnoredEntityReplacementKind max_length )
```

Replacement policy for the ignored entities. It sets what entity can be replaced when resource limits set in **rti::core↔**
::policy::DomainParticipantResourceLimits::ignored_entity_allocation (p. 1154) are reached.

When a **dds::domain::DomainParticipant** (p. 1079)'s number of ignored entities is greater than **rti::core::policy↔**
::DomainParticipantResourceLimits::ignored_entity_allocation (p. 1154), the **dds::domain::DomainParticipant**
(p. 1079) will try to make room by replacing an existing ignored participant entry. This field specifies what entity is
allowed to be replaced.

If a replaceable participant entry is not available, an out-of-resources exception will be returned.

[default] **DomainParticipantResourceLimitsIgnoredEntityReplacementKind::NO_REPLACEMENT_IGNORED_↔**
ENTITY_REPLACEMENT

See also

DomainParticipantResourceLimitsIgnoredEntityReplacementKind

8.90.2.114 ignored_entity_replacement_kind() [2/2]

```
IgnoredEntityReplacementKind rti::core::policy::DomainParticipantResourceLimits::ignored_entity↔
_replacement_kind ( ) const
```

Getter (see setter with the same name)

8.90.2.115 remote_topic_query_allocation() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔
topic_query_allocation (
    const AllocationSettings & settings )
```

Allocation settings applied to remote TopicQueries.

Settings applied to the allocation of information about **rti::sub::TopicQuery** (p. 2220) objects created by other participants and discovered by this participant.

When the participant receives a new topic query that would make the current count go above `max_count`, it is not processed until the current count drops (i.e. another topic query is cancelled). The topic query stays in the Built-in ServiceRequest DataReader queue until it can be processed or it is cancelled.

[default] `initial_count = 1`; `max_count = dds::core::LENGTH_UNLIMITED` (p. 238); `incremental_count = -1`

[range] See allowed ranges in struct **rti::core::AllocationSettings** (p. 591)

8.90.2.116 remote_topic_query_allocation() [2/2]

```
AllocationSettings rti::core::policy::DomainParticipantResourceLimits::remote_topic_query_↔
allocation ( ) const
```

Getter (see setter with the same name)

8.90.2.117 remote_topic_query_hash_buckets() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::remote_↔
topic_query_hash_buckets (
    int32_t hash_buckets )
```

Number of hash buckets for remote TopicQueries.

[default] 1

[range] [1, 10000]

See also

rti::core::policy::DomainParticipantResourceLimits::remote_topic_query_allocation (p. 1178)

8.90.2.118 remote_topic_query_hash_buckets() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::remote_topic_query_hash_buckets ( )
const
```

Getter (see setter with the same name)

8.90.2.119 writer_data_tag_list_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::writer_↔
data_tag_list_max_length (
    int32_t max_length )
```

Maximum number of data tags associated with a **dds::pub::DataWriter** (p. 908).

[default] 0

[range] [0,0xffff]

8.90.2.120 writer_data_tag_list_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::writer_data_tag_list_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.121 writer_data_tag_string_max_length() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::writer_↔
data_tag_string_max_length (
    int32_t max_length )
```

Maximum string length of the data tags associated with a **dds::pub::DataWriter** (p. 908).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the **dds::pub::DataWriter** (p. 908) data tags.

[default] 0

[range] [0,0xffff]

8.90.2.122 `writer_data_tag_string_max_length()` [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::writer_data_tag_string_max_length ( )  
const
```

Getter (see setter with the same name)

8.90.2.123 `reader_data_tag_list_max_length()` [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::reader_↔  
data_tag_list_max_length (   
    int32_t max_length )
```

Maximum number of data tags associated with a `dds::sub::DataReader` (p. 756).

[default] 0

[range] [0,0xffff]

8.90.2.124 `reader_data_tag_list_max_length()` [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::reader_data_tag_list_max_length ( )  
const
```

Getter (see setter with the same name)

8.90.2.125 `reader_data_tag_string_max_length()` [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::reader_↔  
data_tag_string_max_length (   
    int32_t max_length )
```

Maximum string length of the data tags associated with a `dds::sub::DataReader` (p. 756).

The string length is defined as the cumulative length in bytes, including the null terminating characters, of all the pairs (name, value) associated with the `dds::sub::DataReader` (p. 756) data tags.

[default] 0

[range] [0,0xffff]

8.90.2.126 reader_data_tag_string_max_length() [2/2]

```
int32_t rti::core::policy::DomainParticipantResourceLimits::reader_data_tag_string_max_length ( )
const
```

Getter (see setter with the same name)

8.90.2.127 shmем_ref_transfer_mode_max_segments() [1/2]

```
DomainParticipantResourceLimits & rti::core::policy::DomainParticipantResourceLimits::shmем_ref↔
_transfer_mode_max_segments (
    uint32_t the_shmem_ref_transfer_mode_max_segments )
```

Maximum number of segments created by all DataWriters belonging to a **dds::domain::DomainParticipant** (p. 1079).

[default] 500

[range] [0,0xffffffff], but in practice, this value will be limited by the system-wide maximum number of shared memory segments. On a Linux machine, this value is provided by the kernel parameter shmmni.

8.90.2.128 shmем_ref_transfer_mode_max_segments() [2/2]

```
uint32_t rti::core::policy::DomainParticipantResourceLimits::shmем_ref_transfer_mode_max_segments
( ) const
```

Getter (see setter with the same name)

8.91 dds::core::policy::Durability Class Reference

Specifies whether a **dds::pub::DataWriter** (p. 908) will store and deliver previously published data samples to late-joining **dds::sub::DataReader** (p. 756) entities.

```
#include <dds/core/policy/CorePolicy.hpp>
```

8.91.1 Detailed Description

Specifies whether a **dds::pub::DataWriter** (p. 908) will store and deliver previously published data samples to late-joining **dds::sub::DataReader** (p. 756) entities.

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::StatusMask**↔
::requested_incompatible_qos() (p. 2088)

Properties:

RxO (p. 307) = YES
Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

See also

DURABILITY_SERVICE (p. 323)

8.91.2 Usage

It is possible for a **dds::pub::DataWriter** (p. 908) to start publishing data before all (or any) **dds::sub::DataReader** (p. 756) entities have joined the network.

Moreover, a **dds::sub::DataReader** (p. 756) that joins the network after some data has been written could potentially be interested in accessing the most current values of the data, as well as potentially some history.

This policy makes it possible for a late-joining **dds::sub::DataReader** (p. 756) to obtain previously published samples.

By helping to ensure that DataReaders get all data that was sent by DataWriters, regardless of when it was sent, using this QoS policy can increase system tolerance to failure conditions.

Note that although related, this does not strictly control what data RTI Connexx will maintain internally. That is, RTI Connexx may choose to maintain some data for its own purposes (e.g., flow control) and yet not make it available to late-joining readers if the **DURABILITY** (p. 320) policy is set to **dds::core::policy::DurabilityKind::VOLATILE**.

8.91.2.1 Transient and Persistent Durability

For the purpose of implementing the DURABILITY QoS kind TRANSIENT or PERSISTENT, RTI Connexx behaves *as if* for each Topic that has **dds::core::policy::Durability::kind** (p. 1185) of **dds::core::policy::DurabilityKind::TRANSIENT** or **dds::core::policy::DurabilityKind::PERSISTENT** there is a corresponding "built-in" **dds::sub::DataReader** (p. 756) and **dds::pub::DataWriter** (p. 908) configured with the same DURABILITY kind. In other words, it is *as if* somewhere in the system, independent of the original **dds::pub::DataWriter** (p. 908), there is a built-in durable **dds::sub::DataReader** (p. 756) subscribing to that Topic and a built-in durable DataWriter re-publishing it as needed for the new subscribers that join the system. This functionality is provided by the *RTI Persistence Service*.

The Persistence Service can configure itself based on the QoS of your application's **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) entities. For each transient or persistent **dds::topic::Topic** (p. 2178), the built-in fictitious Persistence Service **dds::sub::DataReader** (p. 756) and **dds::pub::DataWriter** (p. 908) have their QoS configured from the QoS of your application's **dds::pub::DataWriter** (p. 908) and **dds::sub::DataReader** (p. 756) entities that communicate on that **dds::topic::Topic** (p. 2178).

For a given **dds::topic::Topic** (p. 2178), the usual request/offered semantics apply to the matching between any **dds**↔
::pub::DataWriter (p. 908) in the domain that writes the **dds::topic::Topic** (p. 2178) and the built-in transient/persistent

dds::sub::DataReader (p. 756) for that **dds::topic::Topic** (p. 2178); similarly for the built-in transient/persistent **dds::pub::DataWriter** (p. 908) for a **dds::topic::Topic** (p. 2178) and any **dds::sub::DataReader** (p. 756) for the **dds::topic::Topic** (p. 2178). As a consequence, a **dds::pub::DataWriter** (p. 908) that has an incompatible QoS will not send its data to the *RTI Persistence Service*, and a **dds::sub::DataReader** (p. 756) that has an incompatible QoS will not get data from it.

Incompatibilities between local **dds::sub::DataReader** (p. 756) and **dds::pub::DataWriter** (p. 908) entities and the corresponding fictitious built-in transient/persistent entities cause the **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2088) and **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2087) to change and the corresponding **Listener** (p. 1381) invocations and/or signaling of **dds::core::cond::Condition** (p. 729) objects as they would with your application's own entities.

The value of **dds::core::policy::DurabilityService::service_cleanup_delay** (p. 1192) controls when *RTI Persistence Service* is able to remove all information regarding a data instances.

Information on a data instance is maintained until the following conditions are met:

1. The instance has been explicitly disposed (`instance_state = NOT_ALIVE_DISPOSED`),

and

1. All samples for the disposed instance have been acknowledged, including the dispose sample itself,

and

1. A time interval longer than **dds::core::policy::DurabilityService::service_cleanup_delay** (p. 1192) has elapsed since the moment RTI Connext detected that the previous two conditions were met. (Note: Only values of zero or **dds::core::Duration::infinite()** (p. 1197) are currently supported for the `service_cleanup_delay`)

The utility of **dds::core::policy::DurabilityService::service_cleanup_delay** (p. 1192) is apparent in the situation where an application disposes an instance and it crashes before it has a chance to complete additional tasks related to the disposition. Upon restart, the application may ask for initial data to regain its state and the delay introduced by the `service_cleanup_delay` will allow the restarted application to receive the information on the disposed instance and complete the interrupted tasks.

8.91.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered kind* \geq *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of DURABILITY kind are considered ordered such that `dds::core::policy::DurabilityKind::VOLATILE` < `dds::core::policy::DurabilityKind::TRANSIENT_LOCAL` < `dds::core::policy::DurabilityKind::TRANSIENT` < `dds::core::policy::DurabilityKind::PERSISTENT`.

8.91.4 Constructor & Destructor Documentation

8.91.4.1 Durability() [1/2]

```
dds::core::policy::Durability::Durability ( ) [inline]
```

Creates the default **Durability** (p. 1181).

8.91.4.2 Durability() [2/2]

```
dds::core::policy::Durability::Durability (
    dds::core::policy::DurabilityKind the_kind ) [inline], [explicit]
```

Creates an instance with a specific durability kind.

The kind of durability.

[default] dds::core::policy::DurabilityKind::VOLATILE

8.91.5 Member Function Documentation

8.91.5.1 kind() [1/2]

```
Durability & dds::core::policy::Durability::kind (
    dds::core::policy::DurabilityKind the_kind ) [inline]
```

Sets the **Durability** (p. 1181) kind.

The kind of durability.

[default] dds::core::policy::DurabilityKind::VOLATILE

8.91.5.2 kind() [2/2]

```
dds::core::policy::DurabilityKind dds::core::policy::Durability::kind ( ) const [inline]
```

Getter (see setter with the same name)

8.91.5.3 Volatile()

```
static Durability dds::core::policy::Durability::Volatile ( ) [inline], [static]
```

Creates a **Durability** (p. 1181) instance with volatile kind.

8.91.5.4 TransientLocal()

```
static Durability dds::core::policy::Durability::TransientLocal ( ) [inline], [static]
```

Creates a **Durability** (p. 1181) instance with transient-local kind.

8.91.5.5 Transient()

```
static Durability dds::core::policy::Durability::Transient ( ) [inline], [static]
```

Creates a **Durability** (p. 1181) instance with transient kind.

8.91.5.6 Persistent()

```
static Durability dds::core::policy::Durability::Persistent ( ) [inline], [static]
```

Creates a **Durability** (p. 1181) instance with persistent kind.

8.91.5.7 direct_communication() [1/2]

```
dds::core::policy::Durability & direct_communication (
    bool the_direct_communication )
```

<<**extension**>> (p. 156) Indicates whether or not a transient or persistent **dds::sub::DataReader** (p. 756) should receive samples directly from a transient or persistent **dds::pub::DataWriter** (p. 908)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

When `direct_communication` is set to true, a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 756) will receive samples from both the original **dds::pub::DataWriter** (p. 908) configured with TRANSIENT or PERSISTENT durability and the **dds::pub::DataWriter** (p. 908) created by the persistence service. This peer-to-peer communication pattern provides low latency between end-points.

If the same sample is received from the original **dds::pub::DataWriter** (p. 908) and the persistence service, the middleware will discard the duplicate.

When `direct_communication` is set to false, a TRANSIENT or PERSISTENT **dds::sub::DataReader** (p. 756) will only receive samples from the **dds::pub::DataWriter** (p. 908) created by the persistence service. This brokered communication pattern provides a way to guarantee eventual consistency.

[default] true

8.91.5.8 direct_communication() [2/2]

```
bool direct_communication ( ) const
```

<<**extension**>> (p. 156) Getter (see setter with the same name)

8.91.5.9 writer_depth() [1/2]

```
dds::core::policy::Durability & writer_depth (
    int32_t the_writer_depth )
```

<<**extension**>> (p. 156) Indicates the number of samples a durable DataWriter will send to a late joining DataReader.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The default value, **rti::core::policy::auto_writer_depth()** (p. 322), makes this parameter equal to the following:

- **dds::core::policy::History::depth** (p. 1349) if the history kind is **dds::core::policy::HistoryKind::KEEP_LAST**.
- **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 1925) in the **dds::core::policy::ResourceLimits** (p. 1921) if the history kind is **dds::core::policy::HistoryKind::KEEP_ALL**.

The `writer_depth` must be \leq **dds::core::policy::History::depth** (p. 1349).

`writer_depth` applies only to non-volatile DataWriters (those for which the kind is **TRANSIENT_LOCAL**, **TRANSIENT**, or **PERSISTENT**).

When **rti::core::policy::Batch::enable** (p. 667) is set to true, `writer_depth` acts as a minimum number of samples per instance that will be sent to late joiners, as opposed to the maximum. As long as a batch contains a single sample that falls within the `writer_depth` for the instance to which it belongs, then the entire batch will be sent. This means that batches sent to late-joining DataReaders may contain more samples per instance than is specified by the `writer_depth` QoS setting.

When a DataWriter responds to a TopicQuery, the samples that are evaluated against the TopicQuery filter are only those samples that fall within the `writer_depth`, not the **dds::core::policy::History::depth** (p. 1349).

Setting `writer_depth` on the DataReader side will be ignored.

[default] **rti::core::policy::auto_writer_depth()** (p. 322)

8.91.5.10 writer_depth() [2/2]

```
int32_t writer_depth ( ) const
```

<<**extension**>> (p. 156) Getter (see setter with the same name)

8.91.5.11 storage_settings() [1/3]

```
dds::core::policy::Durability & storage_settings (
    const rti::core::PersistentStorageSettings & the_storage_settings )
```

<<*extension*>> (p. 156) Used to configure durable writer history and durable reader state.

By default, durable writer history and durable reader state are disabled. This means that a DataWriter will not persist its historical cache and a DataReader will not persist its state.

To enable durable writer history and durable reader state set `rti::core::PersistentStorageSettings::enable` (p. 1658) to true.

8.91.5.12 storage_settings() [2/3]

```
const rti::core::PersistentStorageSettings & storage_settings ( ) const
```

Gets the persistent storage settings by const-reference (see setter)

8.91.5.13 storage_settings() [3/3]

```
rti::core::PersistentStorageSettings & storage_settings ( )
```

Gets the persistent storage settings by reference (see setter)

8.92 dds::core::policy::DurabilityKind_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) DurabilityKind.

```
#include <PolicyKind.hpp>
```

Public Types

- enum type {
 VOLATILE ,
 TRANSIENT_LOCAL ,
 TRANSIENT ,
 PERSISTENT }

The underlying enum type.

8.92.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) DurabilityKind.

8.92.2 Member Enumeration Documentation

8.92.2.1 type

enum `dds::core::policy::DurabilityKind_def::type`

The underlying enum type.

Enumerator

VOLATILE	<p>[default] RTI Connexx does not need to keep any samples of data instances on behalf of any dds::sub::DataReader (p. 756) that is unknown by the dds::pub::DataWriter (p. 908) at the time the instance is written. In other words, RTI Connexx will only attempt to provide the data to existing subscribers.</p> <p>This option does not require RTI Persistence Service.</p>
TRANSIENT_LOCAL	<p>RTI Connexx will attempt to keep some samples so that they can be delivered to any potential late-joining dds::sub::DataReader (p. 756). Which particular samples are kept depends on other QoS such as dds::core::policy::History (p. 1346) and dds::core::policy::ResourceLimits (p. 1921). RTI Connexx is only required to keep the data in memory of the dds::pub::DataWriter (p. 908) that wrote the data. Data is not required to survive the dds::pub::DataWriter (p. 908).</p> <p>For this setting to be effective, you must also set the dds::core::policy::Reliability::kind (p. 1876) to dds::core::policy::ReliabilityKind_def::RELIABLE (p. 1881). This option does not require RTI Persistence Service.</p>
TRANSIENT	<p>RTI Connexx will attempt to keep some samples so that they can be delivered to any potential late-joining dds::sub::DataReader (p. 756). Which particular samples are kept depends on other QoS such as dds::core::policy::History (p. 1346) and dds::core::policy::ResourceLimits (p. 1921). RTI Connexx is only required to keep the data in memory and not in permanent storage. Data is not tied to the lifecycle of the dds::pub::DataWriter (p. 908). Data will survive the dds::pub::DataWriter (p. 908).</p> <p>This option requires RTI Persistence Service.</p>
PERSISTENT	<p>Data is kept on permanent storage, so that they can outlive a system session. This option requires RTI Persistence Service.</p>

8.93 dds::core::policy::DurabilityService Class Reference

Configures the external RTI Persistence Service used by persistent and transient DataWriters.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **DurabilityService** ()
Creates the default policy.
- **DurabilityService** (const **dds::core::Duration** &the_service_cleanup_delay, **dds::core::policy::HistoryKind** the_history_kind, int32_t the_history_depth, int32_t the_max_samples, int32_t the_max_instances, int32_t the_max_samples_per_instance)
Creates an instance with all the parameters set.
- **DurabilityService** & **service_cleanup_delay** (const **dds::core::Duration** &d)
Controls when the service is able to remove all information regarding a data instances.
- **dds::core::Duration** **service_cleanup_delay** () const

Getter (see setter with the same name)

- **DurabilityService** & **history_kind** (**dds::core::policy::HistoryKind** the_kind)

The kind of history to apply in recouping durable data.
- **dds::core::policy::HistoryKind** **history_kind** () const

Getter (see setter with the same name)
- **DurabilityService** & **history_depth** (int32_t the_depth)

Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1187) when recouping durable data.
- int32_t **history_depth** () const

Getter (see setter with the same name)
- **DurabilityService** & **max_samples** (int32_t the_max_samples)

Part of resource limits QoS policy to apply when feeding a late joiner.
- int32_t **max_samples** () const

Getter (see setter with the same name)
- **DurabilityService** & **max_instances** (int32_t the_max_instances)

Part of resource limits QoS policy to apply when feeding a late joiner.
- **DurabilityService** & **max_samples_per_instance** (int32_t the_max_samples_per_instance)

Part of resource limits QoS policy to apply when feeding a late joiner.
- int32_t **max_samples_per_instance** () const

Getter (see setter with the same name)

8.93.1 Detailed Description

Configures the external RTI Persistence Service used by persistent and transient DataWriters.

Entity:

dds::topic::Topic (p. 2178), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

See also

DURABILITY (p. 320)

HISTORY (p. 324)

RESOURCE_LIMITS (p. 336)

8.93.2 Usage

When a DataWriter's **dds::core::policy::Durability::kind** (p. 1185) is **dds::core::policy::DurabilityKind::PERSISTENT** or **dds::core::policy::DurabilityKind::TRANSIENT**, an external service, the *RTI Persistence Service*, is used to store and possibly forward the data sent by the **dds::pub::DataWriter** (p. 908) to **dds::sub::DataReader** (p. 756) objects that are created *after* the data was initially sent.

This QoS policy is used to configure certain parameters of the Persistence Service when it operates on the behalf of the **dds::pub::DataWriter** (p. 908), such as how much data to store. For example, it configures the **DURABILITY** (p. 320), **HISTORY** (p. 324), and the **RESOURCE_LIMITS** (p. 336) used by the fictitious DataReader and DataWriter used by the Persistence Service. Note, however, that the Persistence Service itself may be configured to ignore these values and instead use values from its own configuration file.

8.93.3 Constructor & Destructor Documentation

8.93.3.1 DurabilityService() [1/2]

```
dds::core::policy::DurabilityService::DurabilityService ( ) [inline]
```

Creates the default policy.

8.93.3.2 DurabilityService() [2/2]

```
dds::core::policy::DurabilityService::DurabilityService (
    const dds::core::Duration & the_service_cleanup_delay,
    dds::core::policy::HistoryKind the_history_kind,
    int32_t the_history_depth,
    int32_t the_max_samples,
    int32_t the_max_instances,
    int32_t the_max_samples_per_instance ) [inline]
```

Creates an instance with all the parameters set.

8.93.4 Member Function Documentation

8.93.4.1 service_cleanup_delay() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::service_cleanup_delay (
    const dds::core::Duration & d ) [inline]
```

Controls when the service is able to remove all information regarding a data instances.

When the service cleanup delay is set to 0, disposed instances will be completely removed from the service. Only values of 0 and `dds::core::Duration::infinite()` (p. 1197) are currently supported.

[default] 0

8.93.4.2 service_cleanup_delay() [2/2]

```
dds::core::Duration dds::core::policy::DurabilityService::service_cleanup_delay ( ) const [inline]
```

Getter (see setter with the same name)

8.93.4.3 history_kind() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::history_kind (
    dds::core::policy::HistoryKind the_kind ) [inline]
```

The kind of history to apply in recouping durable data.

[default] dds::core::policy::HistoryKind::KEEP_LAST

8.93.4.4 history_kind() [2/2]

```
dds::core::policy::HistoryKind dds::core::policy::DurabilityService::history_kind ( ) const [inline]
```

Getter (see setter with the same name)

8.93.4.5 history_depth() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::history_depth (
    int32_t the_depth ) [inline]
```

Setting to use for the **dds::core::policy::Durability::writer_depth** (p. 1187) when recouping durable data.

If the **dds::core::policy::History::depth** (p. 1349) is set to a value lower than this value, **dds::core::policy::History::depth** (p. 1349) will be set equal to the value of this field.

[default] rti::core::policy::auto_writer_depth() (p. 322) (1)

8.93.4.6 history_depth() [2/2]

```
int32_t dds::core::policy::DurabilityService::history_depth ( ) const [inline]
```

Getter (see setter with the same name)

8.93.4.7 max_samples() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::max_samples (
    int32_t the_max_samples ) [inline]
```

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] dds::core::LENGTH_UNLIMITED (p. 238)

8.93.4.8 max_samples() [2/2]

```
int32_t dds::core::policy::DurabilityService::max_samples ( ) const [inline]
```

Getter (see setter with the same name)

8.93.4.9 max_instances()

```
DurabilityService & dds::core::policy::DurabilityService::max_instances (
    int32_t the_max_instances ) [inline]
```

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

8.93.4.10 max_samples_per_instance() [1/2]

```
DurabilityService & dds::core::policy::DurabilityService::max_samples_per_instance (
    int32_t the_max_samples_per_instance ) [inline]
```

Part of resource limits QoS policy to apply when feeding a late joiner.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

8.93.4.11 max_samples_per_instance() [2/2]

```
int32_t dds::core::policy::DurabilityService::max_samples_per_instance ( ) const [inline]
```

Getter (see setter with the same name)

8.94 dds::core::Duration Class Reference

<< *value-type* >> (p. 152) Represents a time interval

```
#include <Duration.hpp>
```

Public Member Functions

- **Duration** ()
*Create a **Duration** (p. 1194) elapsing zero seconds.*

8.94.1 Detailed Description

<<**value-type**>> (p. 152) Represents a time interval

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.94.2 Constructor & Destructor Documentation

8.94.2.1 Duration() [1/3]

```
dds::core::Duration::Duration ( )
```

Create a **Duration** (p. 1194) elapsing zero seconds.

8.94.2.2 Duration() [2/3]

```
dds::core::Duration::Duration (
    int32_t sec,
    uint32_t nanosec = 0 ) [explicit]
```

Create a duration elapsing a specific amount of time.

Parameters

<i>sec</i>	The number of seconds to represent
<i>nanosec</i>	The number of nanoseconds to represent

8.94.2.3 Duration() [3/3]

```
template<typename Rep , typename Period >
dds::core::Duration::Duration (
    const std::chrono::duration< Rep, Period > & duration ) [inline]
```

<<**C++11**>> (p. 155) <<**extension**>> (p. 156) Allow implicit creation from std::chrono::duration

For example:

```
dds::core::cond::WaitSet waitset;
// ...
waitset.wait(std::chrono::seconds(1) + std::chrono::milliseconds(250));
```

8.94.3 Member Function Documentation

8.94.3.1 zero()

```
static Duration dds::core::Duration::zero ( ) [static]
```

Returns a zero duration.

Returns

Duration() (p. 1196)

8.94.3.2 infinite()

```
static Duration dds::core::Duration::infinite ( ) [static]
```

Special value that represents an infinite **Duration** (p. 1194).

8.94.3.3 automatic()

```
static Duration dds::core::Duration::automatic ( ) [static]
```

Special value that indicates that RTI Connext will automatically assign a value.

8.94.3.4 from_microsecs()

```
static Duration dds::core::Duration::from_microsecs (
    uint64_t microseconds ) [static]
```

Create a **Duration** (p. 1194) elapsing a specific number of microseconds.

Parameters

<i>microseconds</i>	The number of microseconds to construct the object from
---------------------	---

Returns

A newly constructed **Duration** (p. 1194) object

8.94.3.5 from_millisecs()

```
static Duration dds::core::Duration::from_millisecs (
    uint64_t milliseconds ) [static]
```

Create a **Duration** (p. 1194) elapsing a specific number of milliseconds.

Parameters

<i>milliseconds</i>	The number of milliseconds to construct the object from
---------------------	---

Returns

A newly constructed **Duration** (p. 1194) object

Referenced by **dds::core::policy::DestinationOrder::ReceptionTimestamp()**.

8.94.3.6 from_secs()

```
static Duration dds::core::Duration::from_secs (  
    double seconds ) [static]
```

Create a **Duration** (p. 1194) elapsing a specific number of seconds.

Parameters

<i>seconds</i>	The number of seconds to construct the object from
----------------	--

Returns

A newly constructed **Duration** (p. 1194) object

8.94.3.7 sec() [1/2]

```
int32_t dds::core::Duration::sec ( ) const
```

Get the number of seconds represented by this **Duration** (p. 1194) object.

Returns

The number of seconds (excluding the nanoseconds)

8.94.3.8 sec() [2/2]

```
void dds::core::Duration::sec (  
    int32_t s )
```

Set the number of seconds represented by this **Duration** (p. 1194) object.

Parameters

<i>s</i>	The number of seconds to set
----------	------------------------------

8.94.3.9 nanosec() [1/2]

```
uint32_t dds::core::Duration::nanosec ( ) const
```

Get the number of nanoseconds represented by this **Duration** (p. 1194) object.

Returns

The number of nanoseconds (excluding the seconds)

8.94.3.10 nanosec() [2/2]

```
void dds::core::Duration::nanosec (
    uint32_t ns )
```

Set the number of nanoseconds represented by this **Duration** (p. 1194) object.

Parameters

<i>ns</i>	The number of nanoseconds to set
-----------	----------------------------------

8.94.3.11 compare()

```
int dds::core::Duration::compare (
    const Duration & that ) const
```

Compare two **Duration** (p. 1194) objects.

Parameters

<i>that</i>	The Duration (p. 1194) object to compare with this Duration (p. 1194).
-------------	--

Returns

int The result of the comparison can be: -1 if this **Duration** (p. 1194) is less than other; 0 if they are equal; 1 if this **Duration** (p. 1194) is greater than other

8.94.3.12 operator>()

```
bool dds::core::Duration::operator> (
    const Duration & that ) const
```

Check if this **Duration** (p. 1194) is greater than another.

Parameters

<i>that</i>	The Duration (p. 1194) to compare with this Duration (p. 1194).
-------------	---

Returns

bool false if this **Duration** (p. 1194) is less than or equal to the other object, true otherwise.

8.94.3.13 operator>=()

```
bool dds::core::Duration::operator>= (
    const Duration & that ) const
```

Check if this **Duration** (p. 1194) is greater than or equal another.

Parameters

<i>that</i>	The Duration (p. 1194) to compare with this Duration (p. 1194).
-------------	---

Returns

bool false if this **Duration** (p. 1194) is less than to the other object, true otherwise.

8.94.3.14 operator==(())

```
bool dds::core::Duration::operator==(
    const Duration & that ) const
```

Check if this **Duration** (p. 1194) is equal to another.

Parameters

<i>that</i>	The Duration (p. 1194) to compare with this Duration (p. 1194).
-------------	---

Returns

bool false if this **Duration** (p. 1194) is not equal to the other object, true otherwise.

8.94.3.15 operator"!=()

```
bool dds::core::Duration::operator!= (
    const Duration & other ) const
```

Check if this **Duration** (p. 1194) is not equal to another.

Parameters

<i>other</i>	The Duration (p. 1194) to compare with this Duration (p. 1194).
--------------	---

Returns

bool false if this **Duration** (p. 1194) is equal to the other object, true otherwise.

8.94.3.16 operator<=()

```
bool dds::core::Duration::operator<= (
    const Duration & that ) const
```

Check if this **Duration** (p. 1194) is less than or equal another.

Parameters

<i>that</i>	The Duration (p. 1194) to compare with this Duration (p. 1194).
-------------	---

Returns

bool false if this **Duration** (p. 1194) is greater than to the other object, true otherwise.

8.94.3.17 operator<()

```
bool dds::core::Duration::operator< (
    const Duration & that ) const
```

Check if this **Duration** (p. 1194) is less than another.

Parameters

<i>that</i>	The Duration (p. 1194) to compare with this Duration (p. 1194).
-------------	---

Returns

bool false if this **Duration** (p. 1194) is greater than or equal to the other object, true otherwise.

8.94.3.18 operator+=()

```
Duration & dds::core::Duration::operator+= (
    const Duration & a_ti )
```

Add a **Duration** (p. 1194) to this **Duration** (p. 1194).

Parameters

<i>a_↔</i> <i>_ti</i>	The Duration (p. 1194) to add
------------------------------------	--------------------------------------

Returns

Duration (p. 1194)& This **Duration** (p. 1194), with the added **Duration** (p. 1194)

8.94.3.19 operator-=()

```
Duration & dds::core::Duration::operator-=(
    const Duration & a_ti )
```

Subtract a **Duration** (p. 1194) from this **Duration** (p. 1194).

Parameters

<i>a_↔</i> <i>_ti</i>	The Duration (p. 1194) to subtract
------------------------------------	---

Returns

Duration (p. 1194)& This **Duration** (p. 1194), after the subtraction

8.94.3.20 operator+()

```
Duration dds::core::Duration::operator+ (
    const Duration & other ) const
```

Add two **Duration** (p. 1194) objects.

Parameters

<i>other</i>	The other Duration (p. 1194) to add to this one
--------------	--

Returns

The result of the addition

8.94.3.21 operator-()

```
Duration dds::core::Duration::operator- (
    const Duration & other ) const
```

Subtract a **Duration** (p. 1194).

Parameters

<i>other</i>	The Duration (p. 1194) to subtract from this one
--------------	---

Returns

The result of the subtraction

8.94.3.22 to_nanosecs()

```
uint64_t dds::core::Duration::to_nanosecs ( ) const
```

Returns this **Duration** (p. 1194) in nanoseconds.

Returns

the **Duration** (p. 1194) in nanoseconds

8.94.3.23 to_millisecs()

```
uint64_t dds::core::Duration::to_millisecs ( ) const
```

Returns this **Duration** (p. 1194) in milliseconds.

Returns

the **Duration** (p. 1194) in milliseconds

8.94.3.24 to_microsecs()

```
uint64_t dds::core::Duration::to_microsecs ( ) const
```

Returns this **Duration** (p. 1194) in microseconds.

Returns

the **Duration** (p. 1194) in microseconds

8.94.3.25 to_secs()

```
double dds::core::Duration::to_secs ( ) const
```

Returns this **Duration** (p. 1194) in seconds.

Returns

the **Duration** (p. 1194) in seconds

8.94.3.26 to_chrono()

```
std::chrono::nanoseconds dds::core::Duration::to_chrono ( ) const [inline]
```

<<**C++11**>> (p. 155) <<**extension**>> (p. 156) Converts to std::chrono::nanoseconds

Returns

The **Duration** (p. 1194) in nanoseconds.

8.94.4 Friends And Related Function Documentation

8.94.4.1 operator*() [1/2]

```
Duration operator* (
    uint32_t lhs,
    const Duration & rhs ) [related]
```

Multiply a **Duration** (p. 1194) object by an unsigned integer.

Parameters

<i>lhs</i>	The unsigned integer to multiply the Duration (p. 1194) object by
<i>rhs</i>	The Duration (p. 1194) object to multiply

Returns

Duration (p. 1194) The result of the multiplication

8.94.4.2 operator*() [2/2]

```
Duration operator* (
    const Duration & lhs,
    uint32_t rhs ) [related]
```

Multiply a **Duration** (p. 1194) object by an unsigned integer.

Parameters

<i>lhs</i>	The Duration (p. 1194) object to multiply
<i>rhs</i>	The unsigned integer to multiply the Duration (p. 1194) object by

Returns

Duration (p. 1194) The result of the multiplication

8.94.4.3 operator/()

```
Duration operator/ (
    const Duration & lhs,
    uint32_t rhs ) [related]
```

Divide a **Duration** (p. 1194) object by an unsigned integer.

Parameters

<i>lhs</i>	The dividend
<i>rhs</i>	The divisor

Returns

Duration (p. 1194) The result of dividing the two **Duration** (p. 1194) objects

8.94.4.4 swap()

```
void swap (
    Duration & lhs,
    Duration & rhs ) [related]
```

Swap the contents of two **Duration** (p. 1194) objects.

Parameters

<i>lhs</i>	One of the Duration (p. 1194) objects
<i>rhs</i>	One of the Duration (p. 1194) objects

Examples

Foo.hpp.

Referenced by `dds::core::basic_string< CharType, Allocator >::basic_string()`, and `dds::core::basic_string< CharType, Allocator >::operator=()`.

8.95 rti::topic::dynamic_type< TopicType > Struct Template Reference

Provides a DynamicType that represents an IDL-generated type.

```
#include <rti/topic/TopicTraits.hpp>
```

8.95.1 Detailed Description

```
template<typename TopicType>
struct rti::topic::dynamic_type< TopicType >
```

Provides a DynamicType that represents an IDL-generated type.

This type is specialized for **IDL-generated types** (p. 395) to provide a **get ()** (p. 608) function whose return type is a const reference to a concrete subclass of **dds::core::xtypes::DynamicType** (p. 1249), such as **dds::core::xtypes::StructType** (p. 2107), **dds::core::xtypes::UnionType** (p. 2285), **dds::core::xtypes::EnumType** (p. 1280).

For example, given the following IDL type **Foo** (p. 1332) :

```
struct Foo {
    long x;
};
```

You can obtain its DynamicType (in this case a StructType) as follows:

```
const dds::core::xtypes::StructType& foo_dynamic = rti::topic::dynamic_type<Foo>::get();
std::cout << foo_dynamic.name() << std::endl; // Output: Foo
```

Note that if the type is an IDL alias such as the following:

```
typedef Foo Bar;
```

Then `rti::topic::dynamic_type<Bar>` resolves to `rti::topic::dynamic_type<Foo>`, both returning the same StructType. If you want to explicitly access the AliasType use the special tag type `BarAliasTag_t`:

```
const dds::core::xtypes::AliasType& bar_dynamic = rti::topic::dynamic_type<BarAliasTag_t>::get();
std::cout << bar_dynamic.name() << std::endl; // Output: Bar
```

8.96.1 Detailed Description

<<value-type>> (p. 152) A data sample of any complex data type, which can be inspected and manipulated reflectively.

DynamicData (p. 1208) allows manipulating a data sample whose type is unknown at compilation time. A **DynamicData** (p. 1208) object is created by passing its **DynamicType** (p. 1249), which can be a **StructType** (p. 2107), a **UnionType** (p. 2285), **ArrayType** (p. 616), **SequenceType** (p. 2051) or **AliasType** (p. 589). **DynamicData** (p. 1208) is a valid topic-type, so you can instantiate a `Topic<DynamicData>` (using the constructor that receives a **DynamicType** (p. 1249)), and then a `DataReader<DynamicData>` or a `DataWriter<DynamicData>`.

Several overloaded versions of the function `value()` (p. 1215) allow reading or writing the value of a member **by name or index** (p. 1212). Another set of functions, `loan_value()` (p. 1222), can access a non-primitive member (for reading and writing) without making a copy. For primitive arrays and sequences **DynamicData** (p. 1208) also provides a way to get or set all the values at once, using `set_values()` (p. 1221) and `get_values()` (p. 1218).

A number of other functions allow querying information about the sample and its type.

Applications that use both statically typed data and **DynamicData** (p. 1208) can benefit from the conversion between them, using `rti::core::xtypes::convert()`.

For examples on how to use **DynamicData** (p. 1208), see **Using DynamicData** (p. 400).

8.96.2 Member Names and Indexes

As mentioned before, to access a member you need to specify its name or its index. Depending on the **DynamicType** (p. 1249) of the **DynamicData** (p. 1208) sample, the name may apply or not and the index can mean different things. This table summarizes that:

DynamicType (p. 1249) of the sample	Can access by name?	What does index mean?
StructType (p. 2107)	Yes	The position of the member in the type (starting at 1)
UnionType (p. 2285)	Yes	The value of the label that selects a member, see discriminator_value() (p. 1224)
ArrayType (p. 616)	No	The position of the element in the array (1 to ArrayType::total_element_count() (p. 619))
SequenceType (p. 2051)	No	The position of the element in the sequence (1 to member_count() (p. 1228)) or past member_count() (p. 1228) to increase the length of the sequence.
Any other type	N/A	N/A

For example, given the following IDL description of a type:

```
struct Foo {
    long x;
    long y;
};
```

If we have a **DynamicData** (p. 1208) sample representing data of that type, we can access the member `y` in two different ways:

```
sample.value("y", 33); // Set value to 33
sample.value(2, 33); // Same effect
```

Accessing a member by index can be more efficient, so when accessing a member repeatedly it may be beneficial to obtain its index first:

```
const uint32_t y_index = sample.member_index("y");
while (...) {
    int32_t y_value = sample.value<int32_t>(y_index);
    // ...
}
```

For an example on how to access a union member, see **discriminator_value()** (p. 1224), and for more examples, including how to access elements in a collection see **Using DynamicData** (p. 400).

8.96.2.1 Hierarchical Member Names

It is possible to refer to a nested member in a type without first having to use the **loan_value()** (p. 1222) API. You can do this by using a hierarchical name. A hierarchical member name is a concatenation of member names separated by the '.' character. The hierarchical name describes the complete path from a top-level type to the nested member. For example, in the following type:

```
struct MyNestedType {
    char theChar;
    octet theOctetArray[10];
    long long theMultidimensionalArray[4][6][12];
    sequence<long> myArrayOfSeq[8];
};
struct MyType {
    MyNestedType theNestedType;
```

```
};
```

any **DynamicData** (p. 1208) API that receives a member name will accept "theNestedType.theChar" to refer to the char member in MyNestedType:

```
char my_char = myDynamicData.value<char>("theNestedType.theChar");
```

In order to access the value of theChar without using a hierarchical name, you would have to first bind to theNestedType and then get the value:

```
auto member = myDynamicData.lookup_value("theNestedType");
char my_char = member.get().value<char>("theChar");
```

As you can see, using a hierarchical member name removes the need to call the **lookup_value()** (p. 1222) API, and allows for access to nested members at any depth directly from the top-level type.

The member name can also contain indexes to address members in arrays and sequences. For example, to set the third member in the array theOctetArray, you can pass in "theNestedType.theOctetArray[2]" as the member name. The index values when used as part of the member name are 0-based.

For multi-dimensional arrays, the indexes for each dimension should be listed comma-separated in between brackets. For example, to address a member of theMultidimensionalArray, the member name should be something like "theNestedType.theMultidimensionalArray[3,2,5]".

In complex types with arrays and sequences that contain other arrays and sequences, the hierarchical name may include multiple index values, one right after another. For example, in MyNestedType, myArrayOfSeq is an array of sequences. In order to set the third member of the sequence in the fourth member of the array, the member name would be "myNestedType.myArrayOfSeq[3][2]".

8.96.3 Exceptions accessing a member

The different **DynamicData** (p. 1208) functions that access members may throw the following exceptions:

- **dds::core::InvalidArgumentError** (p. 1363) when attempting to **get** the value a member that doesn't exist in the type, is optional and is not set, or is part of a union and not currently selected (see discriminator_value). Attempting to **set** an unset optional member or an unselected union member is legal and will set the optional member or change the active union member.
- **dds::core::IllegalOperationError** (p. 1352) when attempting to get or set a member of the wrong type—that is, when the **DynamicType** (p. 1249) of that member doesn't match the template type **T** of the function. For example assuming that my_string_member is a string, the two following statements are illegal:

```
data.value("my_string_member", 3);
int v = data.value<int>("my_string_member");
```

8.96.3.1 Performance Considerations

By default, a **DynamicData** (p. 1208) object stores its content in an implementation-specific representation that allows getting and setting its fields by name or ID.

When a sample is received, the CDR-formatted data is deserialized into this buffer.

When a sample is published, the data is serialized into CDR from the buffer and sent to the network.

However, there are scenarios where **DynamicData** (p. 1208) is used for purposes that don't involve manipulating the object's content directly. Two common examples are:

- Recording/Replaying: Storing samples in persistent storage for later analysis or replay.
- Bridging: Transferring samples from one domain to another by transmitting samples received with a `DynamicDataReader` to another domain using a `DynamicDataWriter`.

RTI provides dedicated services, namely RTI Recording Service and RTI Routing Service, to address these use cases. However, in certain situations, you might be unable to utilize these services.

For scenarios where inspecting or modifying the content of `DynamicData` (p. 1208) fields is unnecessary, `DynamicData` (p. 1208) offers a high-performance method to configure a `DataReader` to avoid deserializing incoming samples into the internal representation. Additionally, the `DynamicData` (p. 1208) API provides a method to link a CDR-formatted serialization buffer directly with a `DynamicData` (p. 1208) object, facilitating direct transmission without converting the data from the internal representation to CDR.

To skip the deserialization of a `DynamicData` (p. 1208) object on the `DataReader` side, you can set the field `DynamicDataReader.SerializationProperty_t::skip_deserialization` to true.

Once a sample is received, you can access the serialized buffer directly by using the `dds::core::xtypes::DynamicData::get_cdr_buffer` (p. 1227). This buffer can be stored in persistent storage in a Recording/Replaying use case.

To link a serialization buffer directly with a `DynamicData` (p. 1208) object, you can use the `dds::core::xtypes::DynamicData::set_cdr_buffer` (p. 1228) method. This method allows you to set the buffer that will be used to serialize the `DynamicData` (p. 1208) object when it is published.

[Using DynamicData](#) (p. 400)

8.96.4 Constructor & Destructor Documentation

8.96.4.1 `DynamicData()` [1/2]

```
dds::core::xtypes::DynamicData::DynamicData (
    const dds::core::xtypes::DynamicType & type )
```

Creates a `DynamicData` (p. 1208) instance for a type.

Uses default `DynamicDataProperty`.

Precondition

`!is_primitive(type)` – a `DynamicData` (p. 1208) object cannot encapsulate a primitive type.

Parameters

<i>type</i>	The type of this data sample
-------------	------------------------------

8.96.4.2 DynamicData() [2/2]

```
dds::core::xtypes::DynamicData::DynamicData (
    const dds::core::xtypes::DynamicType & type,
    const DynamicDataProperty & property )
```

Creates a **DynamicData** (p. 1208) instance for a type with specific memory-management.

Precondition

`!is_primitive(type)` – a **DynamicData** (p. 1208) object cannot encapsulate a primitive type.

Parameters

<i>type</i>	The type of this data sample
<i>property</i>	Memory-management configuration

8.96.5 Member Function Documentation

8.96.5.1 value() [1/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::value (
    const std::string & name,
    const T & v )
```

Sets the value of a member by member name.

Template Parameters

<i>T</i>	<p>The type of the member to set. The possible types are:</p> <ul style="list-style-type: none"> • The types accepted by PrimitiveType<<i>T</i>> (p. 1685) • <code>std::string</code> (or dds::core::string (p. 235)), • DynamicData (p. 1208), when the member type is a nested struct or union. In this case you can use loan_value() (p. 1222) as well. • If the type of the member is an enumeration, use <code>int32_t</code>.
----------	---

Note

If the member type is a collection type, use `loan_value` for collections of complex types or `set_values` for collections of primitive types.

For examples on how to set member values, see **Publishing data using DynamicData** (p. 400).

If the member is optional and unset, this function will set it. To unset it again, see **clear_optional_member()** (p. 1225).

It is not always possible to rely on inferring the type `T` based on the argument `v`. For example, if the member being set is a `short`, this statement will throw an exception, because `T` is deduced as `int`:

```
sample.value("my_short", 10);
```

There are two ways to specify that the member is a `short`:

```
sample.value<short>("my_short", 10);
sample.value("my_short", (short) 10);
```

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212). This function also allows to access nested members
<i>v</i>	The value to set for that member

Exceptions

<i>See</i>	Exceptions accessing a member (p. 1213)
------------	--

See also

member_exists(const std::string&) const (p. 1229)

Publishing data using DynamicData (p. 400)

8.96.5.2 value() [2/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::value (
    uint32_t index,
    const T & v )
```

Sets the value of a member by member index.

Parameters

<i>index</i>	The position of the member in the type, see Member Names and Indexes (p. 1212).
<i>v</i>	The value to set for that member

Exceptions

See	Exceptions accessing a member (p. 1213)
-----	---

See also

[value\(const std::string&, const T&\)](#) (p. 1215)

8.96.5.3 value() [3/4]

```
template<typename T >
T dds::core::xtypes::DynamicData::value (
    const std::string & name ) const
```

Gets the value of a member by member name.

Template Parameters

<i>T</i>	The type of the member. See value(const std::string&, const T&) (p. 1215)
----------	---

For examples on how to get member values, see [Subscribing to data using DynamicData](#) (p. 401).

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	--

Returns

The value of that member

Exceptions

See	Exceptions accessing a member (p. 1213)
-----	---

See also

[value\(const std::string&, const T&\)](#) (p. 1215)

[Subscribing to data using DynamicData](#) (p. 401)

8.96.5.4 value() [4/4]

```
template<typename T >
T dds::core::xtypes::DynamicData::value (
    uint32_t index ) const
```

Gets the value of a member by member index.

Template Parameters

<i>T</i>	The type of the member. See value(const std::string&, const T&) (p. 1215)
----------	---

For examples on how to get member values, see [Subscribing to data using DynamicData](#) (p. 401).

Parameters

<i>index</i>	The position of the member in the type, see Member Names and Indexes (p. 1212).
--------------	---

Returns

The value of that member

Exceptions

<i>See</i>	Exceptions accessing a member (p. 1213)
------------	---

See also

[value\(const std::string&, const T&\)](#) (p. 1215)

[Member Names and Indexes](#) (p. 1212)

8.96.5.5 get_values() [1/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::get_values (
    const std::string & name,
    std::vector< T > & out_array ) const
```

Obtains the values of an array or sequence member by member name.

This function reuses an existing vector

Template Parameters

<i>T</i>	<p>The element type of the array or sequence. These are the possible types:</p> <ul style="list-style-type: none"> • The primitive types <code>char</code>, <code>(u)int8_t</code>, <code>(u)int16_t</code>, <code>DDS_Long</code>, <code>DDS_UnsignedLong</code>, <code>DDS_LongLong</code>, <code>DDS_UnsignedLongLong</code>, <code>float</code>, <code>double</code>. The types <code>int</code> and <code>unsigned int</code> may be used instead of <code>DDS_Long</code> and <code>DDS_UnsignedLong</code> except in some platforms (VxWorks). • If the element type is an enumeration, use <code>int32_t</code>. • If the element type is <code>bool</code>, use <code>uint8_t</code>.
----------	---

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
<i>out_array</i>	A vector containing the values of that array or sequence. The vector will be resized accordingly.

8.96.5.6 `get_values()` [2/4]

```
template<typename T >
void dds::core::xtypes::DynamicData::get_values (
    uint32_t index,
    std::vector< T > & out_array ) const
```

Obtains the values of an array or sequence member by member index.

This function reuses an existing vector

Template Parameters

<i>T</i>	The element type of the array or sequence. (See <code>get_values(const std::string&, std::vector<T>&) const</code> (p. 1218))
----------	---

Parameters

<i>index</i>	The position of the array or sequence member in the type, see Member Names and Indexes (p. 1212).
<i>out_array</i>	A vector containing the values of that array or sequence. The vector will be resized accordingly.

See also

Member Names and Indexes (p. 1212)

`get_values(const std::string& name, std::vector<T>& out_array) const` (p. 1218)

8.96.5.7 `get_values()` [3/4]

```
template<typename T >
std::vector< T > dds::core::xtypes::DynamicData::get_values (
    uint32_t index ) const
```

Obtains the values of an array or sequence member by member index.

This function returns a new vector.

Template Parameters

<i>T</i>	The element type of the array or sequence. (See <code>get_values(const std::string&, std::vector<T>&) const</code> (p. 1218))
----------	---

Parameters

<i>index</i>	The position of the array or sequence member in the type
--------------	--

Returns

A vector containing the values of that array or sequence.

See also

Member Names and Indexes (p. 1212)

`get_values(const std::string& name, std::vector<T>& out_array) const` (p. 1218)

8.96.5.8 `get_values()` [4/4]

```
template<typename T >
std::vector< T > dds::core::xtypes::DynamicData::get_values (
    const std::string & name ) const
```

Obtains the values of an array or sequence member by member name.

This function returns a new vector.

Template Parameters

<i>T</i>	The element type of the array or sequence. (See <code>get_values(const std::string&, std::vector<T>&) const</code> (p. 1218))
----------	---

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	---

Returns

A vector containing the values of that array or sequence.

See also

get_values(const std::string& name, std::vector<T>& out_array) const (p. 1218)

8.96.5.9 set_values() [1/2]

```
template<typename T >
void dds::core::xtypes::DynamicData::set_values (
    uint32_t index,
    const std::vector< T > & v )
```

Sets the values of an array or sequence member by member index.

Template Parameters

<i>T</i>	The element type of the array or sequence. (See get_values(const std::string&, std::vector<T>&) const (p. 1218))
----------	---

Parameters

<i>index</i>	The position of the array or sequence member in the type
<i>v</i>	A vector containing the values to be set for that array or sequence.

See also

Member Names and Indexes (p. 1212)

get_values(const std::string& name, std::vector<T>& out_array) const (p. 1218)

8.96.5.10 set_values() [2/2]

```
template<typename T >
void dds::core::xtypes::DynamicData::set_values (
```

```
const std::string & name,
const std::vector< T > & v )
```

Sets the values of an array or sequence member by member name.

Template Parameters

<i>T</i>	The element type of the array or sequence. (See get_values(const std::string&, std::vector<T>&) const (p. 1218))
----------	--

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
<i>v</i>	A vector containing the values to be set for that array or sequence.

See also

[get_values\(const std::string& name, std::vector<T>& out_array\) const](#) (p. 1218)

8.96.5.11 loan_value() [1/4]

```
LoanedDynamicData dds::core::xtypes::DynamicData::loan_value (
    const std::string & name )
```

Gets a view of a complex member.

This function returns a new `LoanedDynamicData` instance that provides a view of a complex member (a struct or a union).

Only a single member of a given `DynamicData` (p. 1208) object may be loaned at a time. However, members of members may be recursively loaned to any depth. Furthermore, while the outer object has a bound member, it may only be modified through that bound member. That is, after loaning this member, the outer object disables all calls to `set_value()` (p. 1215) until the loan is returned.

This method, as opposed to `value<DynamicData>()` (p. 1215) doesn't make a copy; it provides a view of the member so changes to the loaned member change the outer object.

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	--

Returns

The object to access the complex member

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

rti::core::xtypes::LoanedDynamicData (p. 1399)

Using DynamicData (p. 400).

8.96.5.12 loan_value() [2/4]

```
LoanedDynamicData dds::core::xtypes::DynamicData::loan_value (
    uint32_t index )
```

Gets a view of a complex member.

This function returns a new `LoanedDynamicData` instance that provides a view of a complex member (a struct or a union).

Parameters

<i>index</i>	The position of the member in the type, see Member Names and Indexes (p. 1212).
--------------	--

Returns

The object to access the complex member

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

loan_value(const std::string&) (p. 1222)

rti::core::xtypes::LoanedDynamicData (p. 1399)

Member Names and Indexes (p. 1212)

8.96.5.13 loan_value() [3/4]

```
LoanedDynamicData & dds::core::xtypes::DynamicData::loan_value (
    LoanedDynamicData & data,
    const std::string & name )
```

Gets a view of a complex member.

This function reuses a `LoanedDynamicData` instance, returning its previous loan.

Parameters

<i>data</i>	The object to access the complex member
<i>name</i>	The member name, see Member Names and Indexes (p. 1212).

See also

loan_value(const std::string&) (p. 1222)

rti::core::xtypes::LoanedDynamicData (p. 1399)

8.96.5.14 loan_value() [4/4]

```
LoanedDynamicData & dds::core::xtypes::DynamicData::loan_value (
    LoanedDynamicData & data,
    uint32_t mid )
```

Gets a view of a complex member.

This function reuses a `LoanedDynamicData` instance, returning its previous loan.

Parameters

<i>data</i>	The object to access the complex member
<i>mid</i>	The position of the member in the type, see Member Names and Indexes (p. 1212).

See also

loan_value(const std::string&) (p. 1222)

rti::core::xtypes::LoanedDynamicData (p. 1399)

8.96.5.15 discriminator_value()

```
uint32_t dds::core::xtypes::DynamicData::discriminator_value ( ) const
```

Obtains the value of the union discriminator (**UnionType** (p. 2285) only)

Use the value that this function returns in any function expecting a member index to access the active member in this union.

For example, given the following IDL Union:

```
union Foo switch (short) {
case 1:
    long x;
case 2:
case 3:
    string y;
};
```

If we have a **DynamicData** (p. 1208) sample of that type whose active member is "y", we can access it as follows:

```
std::string y_value = sample.value<std::string>(sample.discriminator_value());
y_value = sample.value<std::string>("y"); // Same effect
y_value = sample.value<std::string>(3); // Same effect
```

If you set a different member, the discriminator value automatically changes:

```
sample.value("x", 10);
assert (sample.discriminator_value() == 1);
```

Precondition

type() (p. 1228).kind() == TypeKind::UNION_TYPE – Only applies to samples of a **UnionType** (p. 2285).

Returns

The value of this sample's discriminator.

8.96.5.16 clear_all_members()

```
void dds::core::xtypes::DynamicData::clear_all_members ( )
```

Clear the contents of all data members of this object, including key members.

MT Safety:

UNSAFE.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

This API is not supported when the **DynamicData** (p. 1208) object is in CDR format and will fail with **dds::core::PreconditionNotMetError** (p. 1669). See **dds::core::xtypes::DynamicData::is_cdr** (p. 1227) for more information.

See also

dds::core::xtypes::DynamicData::clear_optional_member (p. 1225)

8.96.5.17 clear_optional_member() [1/2]

```
void dds::core::xtypes::DynamicData::clear_optional_member (
    const std::string & name )
```

Clear the contents of a single optional data member of this object.

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	---

8.96.5.18 clear_optional_member() [2/2]

```
void dds::core::xtypes::DynamicData::clear_optional_member (
    uint32_t index )
```

Clear the contents of a single optional data member of this object.

Parameters

<i>index</i>	The position of the member in the type, see Member Names and Indexes (p. 1212).
--------------	--

8.96.5.19 clear_member() [1/2]

```
void dds::core::xtypes::DynamicData::clear_member (
    const std::string & name )
```

Clear the contents of a single data member of this object.

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	---

8.96.5.20 clear_member() [2/2]

```
void dds::core::xtypes::DynamicData::clear_member (
    uint32_t index )
```

Clear the contents of a single data member of this object.

Parameters

<i>index</i>	The position of the member in the type, see Member Names and Indexes (p. 1212).
--------------	--

8.96.5.21 is_cdr()

```
bool dds::core::xtypes::DynamicData::is_cdr ( ) const
```

Determines if this **DynamicData** (p. 1208) sample is represented as CDR.

This method returns true if the **DynamicData** (p. 1208) object is using CDR as its data representation, and false otherwise.

When the **DynamicData** (p. 1208) object is using CDR as its data representation, many of the **DynamicData** (p. 1208) APIs cannot be used. The **DynamicData** (p. 1208) object will use CDR as its data representation when `DynamicData::TypeSerializationProperty_t::skip_deserialization` has been set to true or `dds::core::xtypes::DynamicData::set_cdr_buffer` (p. 1228) has been used to associate a CDR buffer with the **DynamicData** (p. 1208) object. See each function's documentation for whether or not the function is supported for **DynamicData** (p. 1208) objects in CDR format.

See also

`dds::core::xtypes::DynamicData::get_cdr_buffer` (p. 1227)

`dds::core::xtypes::DynamicData::set_cdr_buffer` (p. 1228)

`DynamicData::TypeSerializationProperty_t::skip_deserialization`

8.96.5.22 get_cdr_buffer()

```
std::pair< const char *, uint32_t > dds::core::xtypes::DynamicData::get_cdr_buffer ( ) const
```

Gets the CDR buffer of this **DynamicData** (p. 1208) sample.

This method returns the CDR buffer associated with a **DynamicData** (p. 1208) object.

If the **DynamicData** (p. 1208) object is not using CDR as its data representation, this method will throw an exception.

To configure a **DynamicData** (p. 1208) `DataReader` to not deserialize the incoming samples and keep the data in CDR format, you must set the configuration option `DynamicData::TypeSerializationProperty_t::skip_deserialization` to true.

MT Safety:

UNSAFE.

Parameters

<i>length</i>	<< out >> (p. 157) CDR buffer length.
---------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

Returns

The buffer

8.96.5.23 set_cdr_buffer()

```
void dds::core::xtypes::DynamicData::set_cdr_buffer (
    const char * buffer,
    uint32_t length )
```

Sets the CDR buffer of this **DynamicData** (p. 1208) sample.

Parameters

<i>buffer</i>	The buffer to set
<i>length</i>	The size of the buffer

8.96.5.24 type()

```
const dds::core::xtypes::DynamicType & dds::core::xtypes::DynamicData::type ( ) const
```

Gets the data type of this **DynamicData** (p. 1208).

8.96.5.25 type_kind()

```
dds::core::xtypes::TypeKind dds::core::xtypes::DynamicData::type_kind ( ) const
```

Gets the data type kind of this **DynamicData** (p. 1208).

Returns

this->**type()** (p. 1228).kind().

8.96.5.26 member_count()

```
uint32_t dds::core::xtypes::DynamicData::member_count ( ) const
```

Get the number of members in this sample.

For objects of type **ArrayType** (p. 616) or **SequenceType** (p. 2051), this method returns the number of elements in the collection.

For objects of type kind **StructType** (p. 2107), it returns the number of fields in the sample, which will always be the same as the number of fields in the type.

8.96.5.27 member_exists() [1/2]

```
bool dds::core::xtypes::DynamicData::member_exists (
    const std::string & name ) const
```

Indicates whether a member exists in this sample.

If the member doesn't exist in the type, this function returns false. In all other cases, it provides the same result as **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1242), which is retrieved with **member_info()** (p. 1230)).

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	---

8.96.5.28 member_exists() [2/2]

```
bool dds::core::xtypes::DynamicData::member_exists (
    uint32_t index ) const
```

Indicates whether a member exists in this sample.

If the member doesn't exist in the type, this function returns false. In all other cases, it provides the same result as **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1242), which is retrieved with **member_info()** (p. 1230)).

Parameters

<i>index</i>	The member index, see Member Names and Indexes (p. 1212).
--------------	--

8.96.5.29 member_exists_in_type() [1/2]

```
bool dds::core::xtypes::DynamicData::member_exists_in_type (
    const std::string & name ) const
```

Indicates whether a member with a particular name exists in **type()** (p. 1228)

8.96.5.30 member_exists_in_type() [2/2]

```
bool dds::core::xtypes::DynamicData::member_exists_in_type (
    uint32_t index ) const
```

Indicates whether a member of a particular index exists in **type()** (p. 1228)

8.96.5.31 info()

```
DynamicDataInfo dds::core::xtypes::DynamicData::info ( ) const
```

Returns information about this sample.

8.96.5.32 member_info() [1/2]

```
rti::core::xtypes::DynamicDataMemberInfo dds::core::xtypes::DynamicData::member_info (
    const std::string & name ) const
```

Returns information about a member.

Precondition

this->**type_kind()** (p. 1228) must be **dds::core::xtypes::TypeKind_def::ARRAY_TYPE** (p. 2275), **dds::core::xtypes::TypeKind_def::SEQUENCE_TYPE** (p. 2275), **dds::core::xtypes::TypeKind_def::STRUCTURE_TYPE** (p. 2275), or **dds::core::xtypes::TypeKind_def::UNION_TYPE** (p. 2275)

When *name* identifies a field in a struct or union:

- If the specified member is not defined in the type, this function throws **dds::core::InvalidArgumentError** (p. 1363).
- If the specified member is defined in the type but doesn't exist in this data sample, this function returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1242) set to false.

- If the specified member is defined in the type and exists in this data sample, `rti::core::xtypes::DynamicDataMemberInfo::member_exists` (p. 1242) is true.

When `name` identifies a sequence element, such as `"my_sequence [i]"`:

- If `i` is greater than the sequence's maximum length, this function throws `dds::core::InvalidArgumentError` (p. 1363).
- If `i` is greater than the sequence's current length but smaller than its maximum length, this function returns an object with `rti::core::xtypes::DynamicDataMemberInfo::member_exists()` (p. 1242) set to false.
- If `i` is smaller than or equal to the current length, `rti::core::xtypes::DynamicDataMemberInfo::member_exists()` (p. 1242) is true.

When `name` identifies an array element, such as `"my_array [i]"`, this function either throws when the `i` is out of bounds or else returns an object with `rti::core::xtypes::DynamicDataMemberInfo::member_exists()` (p. 1242) set to true.

Parameters

<code>name</code>	The member name, see Member Names and Indexes (p. 1212).
-------------------	---

Returns

Information about the member.

Exceptions

<code>dds::core::InvalidArgumentError</code> (p. 1363)	if the member doesn't exist in the type, or Standard Exceptions (p. 228).
--	--

8.96.5.33 member_info() [2/2]

```
rti::core::xtypes::DynamicDataMemberInfo dds::core::xtypes::DynamicData::member_info (
    uint32_t index ) const
```

Returns information about a member.

Precondition

`this->type_kind()` (p. 1228) must be `dds::core::xtypes::TypeKind_def::ARRAY_TYPE` (p. 2275), `dds::core::xtypes::TypeKind_def::SEQUENCE_TYPE` (p. 2275), or `dds::core::xtypes::TypeKind_def::STRUCTURE_TYPE` (p. 2275), `dds::core::xtypes::TypeKind_def::UNION_TYPE` (p. 2275)

When this sample represents a struct and `index` is the position of the member in the type definition, or when the sample represents a union and `index` is the discriminator value:

- If the specified member is not defined in the type, this function throws **dds::core::InvalidArgumentError** (p. 1363).
- If the specified member is defined in the type but doesn't exist in this data sample, this function returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1242) set to false.
- If the specified member is defined in the type and exists in this data sample, **rti::core::xtypes::DynamicDataMemberInfo::member_exists** (p. 1242) is true.

When this sample represents a sequence and `index` is the 1-based element index:

- If `index` is greater than the sequence's maximum length, this function throws **dds::core::InvalidArgumentError** (p. 1363).
- If `index` is greater than the sequence's current length but smaller than its maximum length, this function returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1242) set to false.
- If `index` is smaller than or equal to the current length, **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1242) is true.

When this sample represents an array this function either throws **dds::core::InvalidArgumentError** (p. 1363) when the index is out of bounds or else returns an object with **rti::core::xtypes::DynamicDataMemberInfo::member_exists()** (p. 1242) set to true.

Parameters

<i>index</i>	The member index, see Member Names and Indexes (p. 1212).
--------------	--

Returns

DynamicDataMemberInfo Information about the member.

Exceptions

dds::core::InvalidArgumentError (p. 1363)	if the member doesn't exist in the type or the element with this index doesn't exist in this sequence. See also Standard Exceptions (p. 228).
--	--

8.96.5.34 member_index()

```
uint32_t dds::core::xtypes::DynamicData::member_index (
    const std::string & name ) const
```

Translates from member name to member index.

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	---

Returns

The member index for the member with that name

Exceptions

<i>See</i>	Exceptions accessing a member (p. 1213)
------------	--

8.96.5.35 is_member_key() [1/2]

```
bool dds::core::xtypes::DynamicData::is_member_key (
    const std::string & name ) const
```

Returns whether a member is a key.

Parameters

<i>name</i>	The member name, see Member Names and Indexes (p. 1212).
-------------	---

Exceptions

<i>See</i>	Exceptions accessing a member (p. 1213)
------------	--

8.96.5.36 is_member_key() [2/2]

```
bool dds::core::xtypes::DynamicData::is_member_key (
    uint32_t index ) const
```

Returns whether a member is a key.

Parameters

<i>index</i>	The member index, see Member Names and Indexes (p. 1212).
--------------	--

Exceptions

See	Exceptions accessing a member (p. 1213)
-----	--

8.96.5.37 member_type() [1/2]

```
dds::core::xtypes::DynamicType dds::core::xtypes::DynamicData::member_type (
    const std::string & name ) const
```

Returns the type of a member.

8.96.5.38 member_type() [2/2]

```
dds::core::xtypes::DynamicType dds::core::xtypes::DynamicData::member_type (
    uint32_t index ) const
```

Returns the type of a member.

8.96.5.39 from_string()

```
void dds::core::xtypes::DynamicData::from_string (
    RTI_STRING_IN str,
    rti::topic::PrintFormatKind format_kind = rti::topic::PrintFormatKind::JSON ) [inline]
```

Populates this **DynamicData** (p. 1208) object from a JSON string representation.

This method takes a JSON string representing a data sample of this type, and uses it to populate this **DynamicData** (p. 1208).

Parameters

<i>str</i>	<< <i>in</i> >> (p. 157). The JSON string representation
<i>format_kind</i>	<< <i>in</i> >> (p. 157). Must be set to PrintFormatKind::JSON_PRINT_FORMAT, the only currently supported format.

Exceptions

One	of the Standard Exceptions (p. 228), dds::core::OutOfResourcesError (p. 1629)
-----	---

Referenced by `rti::topic::from_string()`.

8.96.6 Friends And Related Function Documentation

8.96.6.1 to_cdr_buffer()

```
std::vector< char > & to_cdr_buffer (
    std::vector< char > & buffer,
    const DynamicData & sample,
    dds::core::policy::DataRepresentationId representation_id = dds::core::policy::↔
DataRepresentation::auto_id() ) [related]
```

<<**extension**>> (p. 156) Serializes a **DynamicData** (p. 1208) sample into CDR format

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

Parameters

<i>buffer</i>	The output buffer, which will be resized to the correct size
<i>sample</i>	The sample to serialize
<i>representation↔ _id</i>	The data representation used to serialize the data

Returns

A reference to `buffer`

Examples

Foo.hpp.

8.96.6.2 from_cdr_buffer()

```
DynamicData & from_cdr_buffer (
    DynamicData & sample,
    const std::vector< char > & buffer ) [related]
```

<<**extension**>> (p. 156) Creates a **DynamicData** (p. 1208) sample by deserializing a CDR buffer'

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

Parameters

<i>sample</i>	The sample to deserialize.
<i>buffer</i>	The buffer containing the CDR data

Returns

A reference to `sample`

Examples

Foo.hpp.

8.96.6.3 convert() [1/2]

```
template<typename TopicType >
TopicType convert (
    const DynamicData & sample ) [related]
```

<<**extension**>> (p. 156) Creates a typed sample from a **DynamicData** (p. 1208) sample.

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 505)

This function is useful when an application uses **DynamicData** (p. 1208) and regular typed Topics at the same time.

For example, given this IDL type:

```
struct Foo {
    long x;
};
```

We can convert from **Foo** (p. 1332) and **DynamicData** (p. 1208) :

```
using dds::core::xtypes::DynamicData;
// Receive a DynamicData sample
dds::sub::DataReader<DynamicData> reader = // ...;
dds::sub::LoanedSamples<DynamicData> samples = reader.take();
assert (samples.size() > 0);
// Create a Foo sample
const DynamicData& dynamic_data = samples[0].data();
assert (rti::core::xtypes::can_convert<Foo>(dynamic_data));
Foo typed_data = rti::core::xtypes::convert<Foo>(dynamic_data);
assert (typed_data.x() == dynamic_data.value<int32_t>("x"));
```

Precondition

`can_convert<TopicType>(sample)`, otherwise the behavior is undefined.

Template Parameters

<i>TopicType</i>	An IDL topic-type
------------------	-------------------

Parameters

<i>sample</i>	The DynamicData (p. 1208) sample to convert to type <i>TopicType</i>
---------------	---

Returns

An instance of *TopicType* containing the data in *sample*.

8.96.6.4 convert() [2/2]

```
template<typename TopicType >
DynamicData convert (
    const TopicType & sample ) [related]
```

<<**extension**>> (p. 156) Creates a **DynamicData** (p. 1208) sample from a typed sample

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 505)

Template Parameters

<i>TopicType</i>	An IDL topic-type
------------------	-------------------

Parameters

<i>sample</i>	The typed sample to convert to DynamicData (p. 1208)
---------------	---

Returns

A new **DynamicData** (p. 1208) object whose type is `rti::topic::dynamic_type<TopicType>` and contains the data from *sample*

8.96.6.5 can_convert()

```
template<typename TopicType >
bool can_convert (
    const DynamicData & sample ) [related]
```

<<**extension**>> (p. 156) Determines if the **DynamicType** (p. 1249) of this sample is equal to the **DynamicType** (p. 1249) of `TopicType`

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

Template Parameters

<i>TopicType</i>	An IDL topic-type
------------------	-------------------

Returns

True if the **DynamicType** (p. 1249) of `TopicType` is the same as this sample's and therefore it is possible to create an instance of `TopicType` from this **DynamicData** (p. 1208) object.

convert() (p. 1236)

8.96.6.6 `get_tuple()`

```
template<typename... Types>
std::tuple< Types... > get_tuple (
    const dds::core::xtypes::DynamicData & data ) [related]
```

<<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Retrieves all the values of a **DynamicData** (p. 1208) object into an `std::tuple` at once

Note

This is a standalone function in the namespace `rti::core::xtypes` (p. 505)

See also

Manipulating data reflectively using C++ tuples (p. 402)

8.96.6.7 set_tuple()

```
template<typename... Types>
void set_tuple (
    dds::core::xtypes::DynamicData & data,
    const std::tuple< Types... > & value ) [related]
```

<<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Assigns the values of a std::tuple to a **DynamicData** (p. 1208) object at once

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 505)

See also

Manipulating data reflectively using C++ tuples (p. 402)

8.97 rti::core::xtypes::DynamicDataInfo Class Reference

Contains information about a DynamicData sample.

```
#include <DynamicDataInfo.hpp>
```

Public Member Functions

- int32_t **member_count** () const
The number of members of this sample.
- int32_t **stored_size** () const
The number of bytes currently used to store the data of this sample.

8.97.1 Detailed Description

Contains information about a DynamicData sample.

See also

DynamicData::info()

8.97.2 Member Function Documentation

8.97.2.1 member_count()

```
int32_t rti::core::xtypes::DynamicDataInfo::member_count ( ) const
```

The number of members of this sample.

8.97.2.2 stored_size()

```
int32_t rti::core::xtypes::DynamicDataInfo::stored_size ( ) const
```

The number of bytes currently used to store the data of this sample.

8.98 rti::core::xtypes::DynamicDataMemberInfo Class Reference

Contains information about a DynamicData member.

```
#include <DynamicDataMemberInfo.hpp>
```

Public Member Functions

- `uint32_t member_index () const`
The member index.
- `const dds::core::string & member_name () const`
The member name.
- `dds::core::xtypes::TypeKind member_kind () const`
The type kind of this member.
- `uint32_t element_count () const`
The number of elements in this member.
- `dds::core::xtypes::TypeKind element_kind () const`
If this member is a collection, this function returns the type kind of its elements.
- `bool member_exists () const`
Indicates if this member is present in this sample.

8.98.1 Detailed Description

Contains information about a DynamicData member.

See also

`dds::core::xtypes::DynamicData::member_info()` (p. 1230)

8.98.2 Member Function Documentation

8.98.2.1 member_index()

```
uint32_t rti::core::xtypes::DynamicDataMemberInfo::member_index ( ) const
```

The member index.

See also

Member Names and Indexes (p. 1212).

8.98.2.2 member_name()

```
const dds::core::string & rti::core::xtypes::DynamicDataMemberInfo::member_name ( ) const
```

The member name.

See also

Member Names and Indexes (p. 1212).

8.98.2.3 member_kind()

```
dds::core::xtypes::TypeKind rti::core::xtypes::DynamicDataMemberInfo::member_kind ( ) const
```

The type kind of this member.

This a convenience function, equivalent to looking up the member's `DynamicType::kind()`.

See also

dds::core::xtypes::DynamicData::type() (p. 1228)

dds::core::xtypes::DynamicType::kind() (p. 1251)

8.98.2.4 element_count()

```
uint32_t rti::core::xtypes::DynamicDataMemberInfo::element_count ( ) const
```

The number of elements in this member.

Only applies to members of ArrayType and SequenceType. For any other type this is always zero.

8.98.2.5 element_kind()

```
dds::core::xtypes::TypeKind rti::core::xtypes::DynamicDataMemberInfo::element_kind ( ) const
```

If this member is a collection, this function returns the type kind of its elements.

This function provides the same information as `dds::core::xtypes::CollectionType::content_type()` (p. 722).

See also

`dds::core::xtypes::DynamicData::type()` (p. 1228)

`dds::core::xtypes::CollectionType::content_type()` (p. 722)

8.98.2.6 member_exists()

```
bool rti::core::xtypes::DynamicDataMemberInfo::member_exists ( ) const
```

Indicates if this member is present in this sample.

A member that is defined in a type may not exist in a sample of that type in the following situations

- The member is optional and is unset
- Being part of a union, the discriminator doesn't select this member
- When getting the information about a sequence element, with index *i*, and *i* is greater than the current sequence length but smaller than its maximum length.

Getter (see setter with the same name)
- `DynamicDataProperty & buffer_initial_size (int32_t value)`
Sets the initial size of the buffer.
- `int32_t buffer_max_size () const`
Getter (see setter with the same name)
- `DynamicDataProperty & buffer_max_size (int32_t value)`
Sets the maximum size of the buffer.

8.99.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Specifies the properties of a DynamicData object

8.99.2 Member Function Documentation

8.99.2.1 buffer_initial_size() [1/2]

```
int32_t rti::core::xtypes::DynamicDataProperty::buffer_initial_size ( ) const [inline]
```

Getter (see setter with the same name)

8.99.2.2 buffer_initial_size() [2/2]

```
DynamicDataProperty & rti::core::xtypes::DynamicDataProperty::buffer_initial_size (
    int32_t value ) [inline]
```

Sets the initial size of the buffer.

Parameters

<i>value</i>	The new initial size of the buffer
--------------	------------------------------------

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The initial buffer size will be set to the minimum amount of space required to hold the overhead required by the DynamicData internal representation (about 100 bytes) in addition to the minimum deserialized size of

a sample. The minimum deserialized size of a sample assumes that all strings are allocated to their default values, sequences are left to length 0, and all optional members are unset.

If set to any value other than 0: The underlying buffer will be allocated to the provided size plus the overhead required by the DynamicData internal representation (about 100 bytes). If the provided size plus the overhead is less than the size used when `buffer_initial_size` is left to 0, then the default value is used.

See also

`rti::core::xtypes::DynamicDataProperty::buffer_max_size` (p. 1244)

8.99.2.3 `buffer_max_size()` [1/2]

```
int32_t rti::core::xtypes::DynamicDataProperty::buffer_max_size ( ) const [inline]
```

Getter (see setter with the same name)

8.99.2.4 `buffer_max_size()` [2/2]

```
DynamicDataProperty & rti::core::xtypes::DynamicDataProperty::buffer_max_size (
    int32_t value ) [inline]
```

Sets the maximum size of the buffer.

Parameters

<i>value</i>	The new maximum size of the buffer
--------------	------------------------------------

This property is used to configure the DynamicData objects that are created stand-alone as well as the DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

A DynamicData object will grow to this size from the initial size as needed. The `buffer_max_size` includes all overhead that is required for the internal DynamicData representation and therefore represents a hard upper limit on the size of the underlying DynamicData buffer.

If set to -1 (default): The buffer will grow unbounded to the size required to fit all members.

If set to any value other than -1: The buffer will not grow beyond this size. If setting a member's values requires the buffer to grow beyond this maximum, the member will fail to be set. If the buffer is required to grow beyond this maximum during deserialization, the sample will fail to be deserialized. The `buffer_max_size` cannot be smaller than the `buffer_initial_size`.

8.100.2.1 DynamicDataTypeSerializationProperty() [1/2]

```
rti::core::xtypes::DynamicDataTypeSerializationProperty::DynamicDataTypeSerializationProperty ( )
[inline]
```

Default configuration.

8.100.2.2 DynamicDataTypeSerializationProperty() [2/2]

```
rti::core::xtypes::DynamicDataTypeSerializationProperty::DynamicDataTypeSerializationProperty (
    int32_t the_max_size_serialized,
    int32_t the_min_size_serialized,
    bool the_trim_to_size,
    bool the_skip_deserialization = false ) [inline]
```

Specifies all the serialization parameters.

8.100.3 Member Function Documentation

8.100.3.1 max_size_serialized() [1/2]

```
uint32_t rti::core::xtypes::DynamicDataTypeSerializationProperty::max_size_serialized ( ) const
[inline]
```

Getter (see setter with the same name)

8.100.3.2 max_size_serialized() [2/2]

```
DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↔
::max_size_serialized (
    uint32_t value ) [inline]
```

This value is used to set the sizes of certain internal middleware buffers.

The effective value of the maximum serialized size will be the value of this field or the size automatically inferred from the type's `dds::core::xtypes::DynamicType` (p. 1249), whichever is smaller.

8.100.3.3 min_size_serialized() [1/2]

```
uint32_t rti::core::xtypes::DynamicDataTypeSerializationProperty::min_size_serialized ( ) const
[inline]
```

Getter (see setter with the same name)

8.100.3.4 min_size_serialized() [2/2]

```
DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↔
::min_size_serialized (
    uint32_t value ) [inline]
```

This value is used to set the sizes of certain internal middleware buffers.

Default: 0xFFFFFFFF, a sentinel that indicates that this value must be equal to the value specified in max_size_↔ serialized.

8.100.3.5 trim_to_size() [1/2]

```
bool rti::core::xtypes::DynamicDataTypeSerializationProperty::trim_to_size ( ) const [inline]
```

Getter (see setter with the same name)

8.100.3.6 trim_to_size() [2/2]

```
DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↔
::trim_to_size (
    bool value ) [inline]
```

This property only applies to DynamicData samples that are obtained from the sample pool that is created by each DynamicData DataReader.

If set to 0 (default): The buffer will not be reallocated unless the deserialized size of the incoming sample is greater than the current buffer size.

If set to 1: The buffer of a DynamicData object obtained from the DDS sample pool will be freed and re-allocated for each sample to just fit the size of the deserialized data of the incoming sample. The newly allocated size will not be smaller than **rti::core::xtypes::DynamicDataProperty::buffer_initial_size** (p. 1243).

8.100.3.7 skip_deserialization() [1/2]

```
bool rti::core::xtypes::DynamicDataTypeSerializationProperty::skip_deserialization ( ) const [inline]
```

Getter (see setter with the same name)

8.100.3.8 skip_deserialization() [2/2]

```
DynamicDataTypeSerializationProperty & rti::core::xtypes::DynamicDataTypeSerializationProperty↔  
::skip_deserialization (   
    bool value ) [inline]
```

Setting this member to true boosts the performance for use cases in which the application does not require accessing the value of the different members of the received DynamicData object. Those use cases include recording, replaying, and bridging. You can access the CDR buffer of a DynamicData object by calling the method **dds::core::xtypes::↔DynamicData::get_cdr_buffer** (p. 1227). This configuration option is only available in C, Traditional C++, Modern C++, and Python language bindings.

When this option is set to true, many of the DynamicData APIs cannot be used to access or manipulate the received DynamicData object. See each functions's documentation for whether or not the function is supported for DynamicData objects in CDR format.

8.101.1 Detailed Description

<<*value-type*>> (p. 152) Represents a runtime type.

A **DynamicType** (p. 1249) is a mechanism for representing a type at runtime. DynamicTypes allow the reflective manipulation of data (**DynamicData** (p. 1208)) and the inspection of the type information about discovered readers and writers.

You can obtain a **DynamicType** (p. 1249) in a few different ways:

1. Creating one by instantiating a subclass of **dds::core::xtypes::DynamicType** (p. 1249) instance, such as **dds::core::xtypes::StructType** (p. 2107) and adding members to it. For example:

```
using namespace dds::core::xtypes;
StructType point_type("Point");
point_type.add_member(Member("x", PrimitiveType<double>()));
point_type.add_member(Member("y", PrimitiveType<double>()));
```
2. From an IDL-generated type, using the **rti::topic::dynamic_type** (p. 1208) trait type. <<*extension*>> (p. 156)
3. From an XML description, using **dds::core::QosProvider::type()** (p. 1769).
4. Constructing it using tuples. <<*C++11*>> (p. 155) <<*experimental*>> (p. 157) <<*extension*>> (p. 156)
5. From a discovered DataReader or DataWriter, using the **built-in topics** (p. 44).

For examples, see **DynamicType and DynamicData Use Cases** (p. 398)

This is an abstract base class of all the types. This class contains all of the internal state—derived classes don't add any new state. That means that it is safe to copy a **DynamicType** (p. 1249) without slicing.

To downcast a **DynamicType** (p. 1249) into a concrete class, you can check its **kind()** (p. 1251) and then apply a **static_cast** to the appropriate class.

For example, let's assume we have the following IDL type:

```
struct Bar {
    long x;
};
struct Foo {
    Bar bar;
    long y;
};
```

We obtain the type of **Foo** (p. 1332) and want to know the type of its member **bar**:

```
// Get the DynamicType of the IDL-generated type Foo
const StructType& foo_type = rti::topic::dynamic_type<Foo>::get();
// Get the type of its member bar
const DynamicType& bar_type = foo_type.member("bar").type();
// Check type kind and downcast
if (bar_type.kind() == TypeKind::STRUCTURE_TYPE) {
    const StructType& bar_struct = static_cast<const StructType&>(bar_type);
}
```

8.101.2 Member Function Documentation

8.101.2.1 kind()

```
dds::core::xtypes::TypeKind dds::core::xtypes::DynamicType::kind ( ) const
```

Gets the type kind.

8.101.2.2 name()

```
std::string dds::core::xtypes::DynamicType::name ( ) const
```

Gets the name.

8.101.3 Friends And Related Function Documentation

8.101.3.1 is_primitive_type()

```
bool is_primitive_type (
    const DynamicType & t ) [related]
```

Determines if a **DynamicType** (p. 1249) is a **PrimitiveType** (p. 1685).

8.101.3.2 is_constructed_type()

```
bool is_constructed_type (
    const DynamicType & t ) [related]
```

Determines if a **DynamicType** (p. 1249) is a constructed type.

This includes **EnumType** (p. 1280), **AliasType** (p. 589), collection types and aggregation types.

See also

is_collection_type (p. 1251)

is_aggregation_type (p. 1252)

8.101.3.3 is_collection_type()

```
bool is_collection_type (
    const DynamicType & t ) [related]
```

Determines if a **DynamicType** (p. 1249) is a **CollectionType** (p. 721).

This includes **ArrayType** (p. 616), **SequenceType** (p. 2051), **StringType** (p. 2106), and **WStringType** (p. 2363).

8.101.3.4 is_aggregation_type()

```
bool is_aggregation_type (
    const DynamicType & t ) [related]
```

Determines if a **DynamicType** (p. 1249) is an aggregation type.

This includes **StructType** (p. 2107) and **UnionType** (p. 2285).

8.101.3.5 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const DynamicType & type ) [related]
```

<<**extension**>> (p. 156) Converts the **DynamicType** (p. 1249) to a string.

This operator writes the **DynamicType** (p. 1249) type to the ostream out using default values for **DynamicTypePrintFormatProperty** (p. 1253) and returns a reference to out.

8.101.3.6 print_idl()

```
void print_idl (
    const DynamicType & type,
    unsigned int indent = 0 ) [related]
```

<<**extension**>> (p. 156) Prints the IDL representation of this **DynamicType** (p. 1249) to the standard output

8.101.3.7 to_string() [1/2]

```
std::ostream & to_string (
    std::ostream & out,
    const DynamicType & type,
    const rti::core::xtypes::DynamicTypePrintFormatProperty & format = DynamicTypePrintFormatProperty ()
) [related]
```

<<**extension**>> (p. 156) Writes the string representation of this **DynamicType** (p. 1249) to an output stream.

Parameters

<i>out</i>	The output stream to which the string representation of the DynamicType (p. 1249) should be printed.
<i>type</i>	The DynamicType (p. 1249) to be printed.
<i>format</i>	The DynamicTypePrintFormatProperty (p. 1253) used to define the format of the string.

Returns

A reference to out.

8.101.3.8 to_string() [2/2]

```
std::string to_string (
    const DynamicType & type,
    const rti::core::xtypes::DynamicTypePrintFormatProperty & format = DynamicTypePrintFormatProperty()
) [related]
```

<<**extension**>> (p. 156) Creates the string representation of this **DynamicType** (p. 1249) to a string.

Parameters

<i>type</i>	The DynamicType (p. 1249) to be printed.
<i>format</i>	The DynamicTypePrintFormatProperty (p. 1253) used to define the format of the string.

Returns

The string representation of the **DynamicType** (p. 1249).

8.102 rti::core::xtypes::DynamicTypePrintFormatProperty Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) A collection of attributes used to configure how DynamicTypes will be formatted when converted to strings.

```
#include <rti/core/xtypes/DynamicTypePrintFormat.hpp>
```

Public Member Functions

- **DynamicTypePrintFormatProperty** (unsigned int indent_in=0, bool print_ordinals_in=false, const **DynamicTypePrintKind** print_kind_in= **rti::core::xtypes::DynamicTypePrintKind::idl**, bool print_complete_type_in=false)
 - Initializes the properties.*
- unsigned int **indent** () const

- Get the value of indent.*

 - **DynamicTypePrintFormatProperty** & **indent** (unsigned int value)
 - Set the amount of additional indent to be included when converting a DynamicType to a string.*

`rti::core::xtypes::to_string`

8.102.2 Constructor & Destructor Documentation

8.102.2.1 DynamicTypePrintFormatProperty()

```
rti::core::xtypes::DynamicTypePrintFormatProperty::DynamicTypePrintFormatProperty (
    unsigned int indent_in = 0,
    bool print_ordinals_in = false,
    const DynamicTypePrintKind print_kind_in = rti::core::xtypes::DynamicTypePrint←
Kind::idl,
    bool print_complete_type_in = false ) [inline], [explicit]
```

Initializes the properties.

8.102.3 Member Function Documentation

8.102.3.1 indent() [1/2]

```
unsigned int rti::core::xtypes::DynamicTypePrintFormatProperty::indent ( ) const [inline]
```

Get the value of indent.

See also

indent(unsigned int value) (p. 1255)

8.102.3.2 indent() [2/2]

```
DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::indent (
    unsigned int value ) [inline]
```

Set the amount of additional indent to be included when converting a DynamicType to a string.

Configures how much additional indent is applied when converting a TypeCode to a string. This value acts as a total offset on the string, increasing the indent applied to all elements by the same amount. With an indent of 0, a string representation of a TypeCode may appear as:

```
struct myType {
    long x;
};
```

Using an indent of 1, the same TypeCode would be printed as:

```
    struct myType {
        long x;
    };
```

I.e., the entire structure is indented.

Parameters

<i>value</i>	The value to set for indent
--------------	-----------------------------

8.102.3.3 print_ordinals() [1/2]

```
bool rti::core::xtypes::DynamicTypePrintFormatProperty::print_ordinals ( ) const [inline]
```

Get the value of `print_ordinal`s.

See also

`print_ordinal`(**bool value**) (p. 1256)

8.102.3.4 `print_ordinal`s() [2/2]

```
DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::print_ordinal (
    bool value ) [inline]
```

Set whether or not to print ordinal values when printing EnumTypes.

When set to true, the ordinal value of each enumerator within an enum will be printed, otherwise only non-default ordinals are printed. Take for example the following enum:

```
enum myEnum {
    RED,
    GREEN = 3,
    BLUE,
};
```

When `print_ordinal`s is set to false it would be printed as:

```
enum myEnum {
    RED,
    GREEN = 3,
    BLUE,
};
```

But with `print_ordinal`s set to true it would be printed as:

```
enum myEnum {
    RED = 0,
    GREEN = 3,
    BLUE = 4,
};
```

Parameters

<i>value</i>	The value to set for print_ordinal
--------------	------------------------------------

8.102.3.5 print_kind() [1/2]

```
DynamicTypePrintKind rti::core::xtypes::DynamicTypePrintFormatProperty::print_kind ( ) const  
[inline]
```

Get the value of print_kind.

See also

print_kind(DynamicTypePrintKind value) (p. 1257)

8.102.3.6 print_kind() [2/2]

```
DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::print_kind (   
    DynamicTypePrintKind value ) [inline]
```

Sets the format to use when printing the TypeCode.

When print_kind is DDS_TYPE_CODE_PRINT_KIND_IDL, the type will be printed in IDL format. For example:

```
struct Foo {  
    float32 bar;  
};
```

When print_kind is DDS_TYPE_CODE_PRINT_KIND_XML, the type will be printed in XML format. For example:

```
<struct name="Foo">  
    <member name="bar" type="float32"/>  
</struct>
```

Parameters

<i>value</i>	The value to set for print_kind
--------------	---------------------------------

8.102.3.7 print_complete_type() [1/2]

```
bool rti::core::xtypes::DynamicTypePrintFormatProperty::print_complete_type ( ) const [inline]
```

Get the value of print_complete_type.

See also

print_complete_type(bool value) (p. 1258)

8.102.3.8 print_complete_type() [2/2]

```
DynamicTypePrintFormatProperty & rti::core::xtypes::DynamicTypePrintFormatProperty::print_↔  
complete_type (   
    bool value ) [inline]
```

Set whether or not to print the complete type.

When print_complete_type is true, the complete type will be printed. When print_complete_type is false, only the top level will be printed.

Take for example the following types:

```
struct Foo {  
    float32 member;  
};  
struct Bar {  
    Foo foo;  
};
```

When print_complete_type is false, this is printed as:

```
struct Bar {  
    Foo foo;  
};
```

When print_complete_type is true, this is printed as:

```
struct Foo {  
    float32 member;  
};  
struct Bar {  
    Foo foo;  
};
```

Parameters

<i>value</i>	The value to set for <code>print_complete_type</code>
--------------	---

8.103 rti::core::EndpointGroup Class Reference

<<**extension**>> (p. 156) Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **EndpointGroup** (const std::string &the_role_name, int32_t the_quorum_count)
Creates an instance with a role name and a quorum.
- std::string **role_name** () const
Getter (see setter with the same name)
- **EndpointGroup & role_name** (const std::string &the_role_name)
Defines the role name of the endpoint group.
- int32_t **quorum_count** () const
Getter (see setter with the same name)
- **EndpointGroup & quorum_count** (int32_t the_quorum_count)
Defines the minimum number of members that satisfies the endpoint group.

8.103.1 Detailed Description

<<**extension**>> (p. 156) Specifies a group of endpoints that can be collectively identified by a name and satisfied by a quorum.

8.103.2 Constructor & Destructor Documentation

8.103.2.1 EndpointGroup()

```
rti::core::EndpointGroup::EndpointGroup (
    const std::string & the_role_name,
    int32_t the_quorum_count ) [inline]
```

Creates an instance with a role name and a quorum.

8.103.3 Member Function Documentation

8.103.3.1 `role_name()` [1/2]

```
std::string rti::core::EndpointGroup::role_name ( ) const [inline]
```

Getter (see setter with the same name)

8.103.3.2 `role_name()` [2/2]

```
EndpointGroup & rti::core::EndpointGroup::role_name (
    const std::string & the_role_name ) [inline]
```

Defines the role name of the endpoint group.

If used in the **rti::core::policy::Availability** (p.654) on a **dds::pub::DataWriter** (p.908), it specifies the name that identifies a Durable Subscription.

The role name can be at most 255 characters in length.

8.103.3.3 `quorum_count()` [1/2]

```
int32_t rti::core::EndpointGroup::quorum_count ( ) const [inline]
```

Getter (see setter with the same name)

8.103.3.4 `quorum_count()` [2/2]

```
EndpointGroup & rti::core::EndpointGroup::quorum_count (
    int32_t the_quorum_count ) [inline]
```

Defines the minimum number of members that satisfies the endpoint group.

If used in the **rti::core::policy::Availability** (p.654) on a **dds::pub::DataWriter** (p.908), it specifies the number of DataReaders that must acknowledge a sample before the sample is considered to be acknowledged by the Durable Subscription.

8.104 rti::topic::trust::EndpointTrustAlgorithmInfo Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Trust Plugins algorithm information associated with the discovered endpoint.

```
#include <rti/topic/trust/EndpointTrustAlgorithmInfo.hpp>
```

Public Member Functions

- **EndpointTrustAlgorithmInfo** ()=default
Create an instance with the default Trust Algorithm Info associated with the discovered endpoint.
- **EndpointTrustInterceptorAlgorithmInfo** **interceptor** () const
Get the Trust Plugins algorithms for interception of data and metadata exchanged by the endpoint.

8.104.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Trust Plugins algorithm information associated with the discovered endpoint.

8.104.2 Constructor & Destructor Documentation

8.104.2.1 EndpointTrustAlgorithmInfo()

```
rti::topic::trust::EndpointTrustAlgorithmInfo::EndpointTrustAlgorithmInfo ( ) [default]
```

Create an instance with the default Trust Algorithm Info associated with the discovered endpoint.

The meaning of this field may vary depending on what Trust Plugins the endpoint is using.

8.104.3 Member Function Documentation

8.104.3.1 interceptor()

```
EndpointTrustInterceptorAlgorithmInfo rti::topic::trust::EndpointTrustAlgorithmInfo::interceptor  
( ) const [inline]
```

Get the Trust Plugins algorithms for interception of data and metadata exchanged by the endpoint.

8.105 rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Trust Plugins interception algorithm information associated with the discovered endpoint.

```
#include <rti/topic/trust/EndpointTrustInterceptorAlgorithmInfo.hpp>
```

Public Member Functions

- **EndpointTrustInterceptorAlgorithmInfo** ()=default
Create an instance with the default Trust Interceptor Algorithm Info associated with the discovered endpoint.
- uint32_t **required_mask** () const
Get the Trust Plugins algorithms used for interception of data and metadata exchanged by the endpoint.
- uint32_t **supported_mask** () const
Get the Trust Plugins algorithms supported for interception of data and metadata exchanged by the endpoint.

8.105.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Trust Plugins interception algorithm information associated with the discovered endpoint.

8.105.2 Constructor & Destructor Documentation

8.105.2.1 EndpointTrustInterceptorAlgorithmInfo()

```
rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo::EndpointTrustInterceptorAlgorithmInfo (
) [default]
```

Create an instance with the default Trust Interceptor Algorithm Info associated with the discovered endpoint.

The meaning of this field may vary depending on what Trust Plugins the endpoint is using.

8.105.3 Member Function Documentation

8.105.3.1 required_mask()

```
uint32_t rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo::required_mask ( ) const [inline]
```

Get the Trust Plugins algorithms used for interception of data and metadata exchanged by the endpoint.

8.105.3.2 supported_mask()

```
uint32_t rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo::supported_mask ( ) const [inline]
```

Get the Trust Plugins algorithms supported for interception of data and metadata exchanged by the endpoint.

8.106 rti::topic::trust::EndpointTrustProtectionInfo Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Trust Plugins Protection information associated with the discovered endpoint.

```
#include <rti/topic/trust/EndpointTrustProtectionInfo.hpp>
```

Public Member Functions

- **EndpointTrustProtectionInfo** ()=default
Create an instance with the default Trust Plugins Protection Info associated with the discovered endpoint.
- uint32_t **bitmask** () const
Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.
- uint32_t **plugin_bitmask** () const
Internal plugin information that is opaque to DDS.

8.106.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Trust Plugins Protection information associated with the discovered endpoint.

8.106.2 Constructor & Destructor Documentation

8.106.2.1 EndpointTrustProtectionInfo()

```
rti::topic::trust::EndpointTrustProtectionInfo::EndpointTrustProtectionInfo ( ) [default]
```

Create an instance with the default Trust Plugins Protection Info associated with the discovered endpoint.

The meaning of this field may vary depending on what Trust Plugins the endpoint is using.

8.106.3 Member Function Documentation

8.106.3.1 bitmask()

```
uint32_t rti::topic::trust::EndpointTrustProtectionInfo::bitmask ( ) const [inline]
```

Information about how RTPS wire serialization, discovery, and liveliness interact with the associated Trust Plugins Protection configuration.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

8.106.3.2 plugin_bitmask()

```
uint32_t rti::topic::trust::EndpointTrustProtectionInfo::plugin_bitmask ( ) const [inline]
```

Internal plugin information that is opaque to DDS.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

8.107 dds::core::Entity Class Reference

<<**reference-type**>> (p. 153) This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.

```
#include <dds/core/Entity.hpp>
```

Inheritance diagram for dds::core::Entity:

Public Member Functions

- void **enable** ()
Enables this entity (if it was created disabled)
- const **dds::core::status::StatusMask status_changes** ()
Retrieves the list of communication statuses that are triggered.
- const **dds::core::InstanceHandle instance_handle** () const
Get the instance handle that represents this entity.
- void **close** ()
Forces the destruction of this entity.
- void **retain** ()
Disables the automatic destruction of this entity.

Related Functions

(Note that these are not member functions.)

- `template<typename TO , typename FROM >`
TO **polymorphic_cast** (const FROM &from)
*Downcasts an **Entity** (p. 1265) to a subclass.*

8.107.1 Detailed Description

<<**reference-type**>> (p. 153) This is the abstract base class for all the DDS objects that support QoS policies, a listener and a status condition.

Note

Entity (p. 1265) and its subclasses provides all the functions of a <<**reference-type**>> (p. 153), including **close()** (p. 1270) and **retain()** (p. 1271).

See also

Entity Use Cases (p. 126)

All operations except for **set_qos()**, **get_qos()**, **set_listener()**, **get_listener()** and **enable()** (p. 1269), may return the value **dds::core::NotEnabledError** (p. 1601).

QoS:

QoS Policies (p. 302)

Status:

Status Kinds (p. 229)

Listener:

Listener (p. 1381)

8.107.2 Abstract operations

Each derived entity provides the following operations specific to its role in RTI Connext. Note that these are not member functions of **dds::core::Entity** (p. 1265), but members of each of the derived classes.

8.107.2.1 set_qos (abstract)

This operation sets the QoS policies of the **dds::core::Entity** (p. 1265). For example, see **dds::domain::DomainParticipant::qos(const dds::domain::qos::DomainParticipantQos&)** (p. 1090).

Precondition

Certain policies are immutable (see **QoS Policies** (p. 302)): they can only be set at **dds::core::Entity** (p. 1265) creation time or before the entity is enabled. If `set_qos()` is invoked after the **dds::core::Entity** (p. 1265) is enabled and it attempts to change the value of an immutable policy, the operation will fail and return **dds::core::ImmutablePolicyError** (p. 1353).

Certain values of QoS policies can be incompatible with the settings of the other policies. The `set_qos()` operation will also fail if it specifies a set of values that, once combined with the existing values, would result in an inconsistent set of policies. In this case, the operation will fail and return **dds::core::InconsistentPolicyError** (p. 1354).

If the application supplies a non-default value for a QoS policy that is not supported by the implementation of the service, the `set_qos` operation will fail and return **dds::core::UnsupportedError** (p. 2291).

Postcondition

The existing set of policies is only changed if the `set_qos()` operation succeeds.

Possible exceptions thrown in addition to **Standard Exceptions** (p. 228) : **dds::core::ImmutablePolicyError** (p. 1353), **dds::core::InconsistentPolicyError** (p. 1354).

8.107.2.1.1 Default QoS When you create an **Entity** (p. 1265) the QoS parameter is optional. When you don't specify it the *default QoS* applies. Applications can configure this default value.

If the application does nothing explicit to specify the *default QoS*, the default RTI Connex values will be used whenever an entity is created. Each of the QoS policies and their defaults can be found here: **QoS Policies** (p. 302).

```
// Create a participant with default QoS
dds::domain::DomainParticipant dp_default_qos(0);

// Create a participant with specific QoS
dds::domain::qos::DomainParticipantQos participant_qos;

// Set some values in participant_qos
...

dds::domain::DomainParticipant dp_custom_qos(0, participant_qos);
```

For each entity, there are `default*_qos` member functions that allow an application to set the default QoS values for all entities that are created from that entity. For example, **dds::domain::DomainParticipant::default_subscriber_qos** (p. 1096) sets the default **dds::sub::qos::SubscriberQos** (p. 2129) that will be used for each **dds::sub::Subscriber** (p. 2116) that is created from that **DomainParticipant**.

```
dds::domain::DomainParticipant participant(0);
// Set the default qos for any subscriber that is created from this participant
dds::sub::qos::SubscriberQos subscriber_qos;
// Set some values in subscriber_qos
subscriber_qos.policy<dds::core::policy::Partition>(...);
// or get it from a QosProvider:
subscriber_qos = dds::core::QosProvider::Default().subscriber_qos(...);
participant.default_subscriber_qos(subscriber_qos);
```

See also

dds::core::QosProvider (p. 1752)

8.107.2.2 `get_qos` (abstract)

This operation allows access to the existing set of QoS policies for the `dds::core::Entity` (p. 1265). For example, see `dds::domain::DomainParticipant::qos() const` (p. 1090)

8.107.2.3 `set_listener` (abstract)

This operation installs a `Listener` (p. 1381) on the `dds::core::Entity` (p. 1265). The listener will only be invoked on the changes of communication status indicated by the specified `mask`.

There are two components involved when setting up listeners: the listener itself and the mask. Both of these can be NULL.

Listeners for some Entities derive from the Connex DDS Listeners for related Entities. This means that the derived `Listener` (p. 1381) has all of the methods of its parent class. You can install Listeners at all levels of the object hierarchy. At the top is the `DomainParticipantListener`; only one can be installed in a `DomainParticipant`. Then every `Subscriber` and `Publisher` can have their own `Listener` (p. 1381). Finally, each `Topic`, `DataReader` and `DataWriter` can have their own listeners. All are optional.

Suppose, however, that an `Entity` (p. 1265) does not install a `Listener` (p. 1381), or installs a `Listener` (p. 1381) that does not have particular communication status selected in the bitmask. In this case, if/when that particular status changes for that `Entity` (p. 1265), the corresponding `Listener` (p. 1381) for that `Entity` (p. 1265)'s parent is called. Status changes are "propagated" from child `Entity` (p. 1265) to parent `Entity` (p. 1265) until a `Listener` (p. 1381) is found that is registered for that status. Connex DDS will give up and drop the status-change event only if no Listeners have been installed in the object hierarchy to be called back for the specific status.

The following table describes the effect of different combinations of Listeners and Status Bit Masks considering the hierarchical processing.

Table 8.509 Effect of Different Combinations of Listeners and Status Bit Masks

	No Bits Set in Mask	Some/All Bits Set in Mask
<code>Listener</code> (p. 1381) is Specified	Connex DDS finds the next most relevant listener for the changed status	For the statuses that are enabled in the mask, the most relevant listener will be called. The 'statusChangedFlag' for the relevant status is reset
<code>Listener</code> (p. 1381) is NULL	Connex DDS behaves as if the listener is not installed and finds the next most relevant listener for that status	Connex DDS behaves as if the listener is installed, but the callback is doing nothing. This is called a "nil" listener

Postcondition

Only one listener can be attached to each `dds::core::Entity` (p. 1265). If a listener was already set, the operation `set_listener()` will replace it with the new one. Consequently, if the value NULL is passed for the listener parameter to the `set_listener` operation, any existing listener will be removed.

8.107.2.4 `get_listener` (abstract)

This operation allows access to the existing `Listener` (p. 1381) attached to the `dds::core::Entity` (p. 1265).

If no listener is installed on the `dds::core::Entity` (p. 1265), this operation will return NULL.

8.107.3 Member Function Documentation

8.107.3.1 enable()

```
void dds::core::Entity::enable ( ) [inline]
```

Enables this entity (if it was created disabled)

This operation enables the **Entity** (p. 1265). **Entity** (p. 1265) objects can be created either enabled or disabled. This is controlled by the value of the **ENTITY_FACTORY** (p. 323) QoS policy on the corresponding factory for the **dds::core::Entity** (p. 1265).

By default, **ENTITY_FACTORY** (p. 323) is set so that it is not necessary to explicitly call **dds::core::Entity::enable** (p. 1269) on newly created entities.

The **dds::core::Entity::enable** (p. 1269) operation is idempotent. Calling enable on an already enabled **Entity** (p. 1265) returns OK and has no effect.

If a **dds::core::Entity** (p. 1265) has not yet been enabled, the following kinds of operations may be invoked on it:

- set or get the QoS policies (including default QoS policies) and listener
- **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2080)
- **Entity** (p. 1265) constructors
- **dds::core::Entity::status_changes()** (p. 1270) and other get status operations (although the status of a disabled entity never changes)
- find operations

Other operations may explicitly state that they may be called on disabled entities; those that do not will return the error **dds::core::NotEnabledError** (p. 1601).

It is legal to delete an **dds::core::Entity** (p. 1265) that has not been enabled .

Entities created from a factory **Entity** (p. 1265) that is disabled are created disabled, regardless of the setting of the **dds::core::policy::EntityFactory** (p. 1272).

Calling enable on an **Entity** (p. 1265) whose factory **Entity** (p. 1265) is not enabled will fail and return **dds::core::PreconditionNotMetError** (p. 1669).

If **dds::core::policy::EntityFactory::autoenable_created_entities** (p. 1274) is TRUE, the enable operation on a factory will automatically enable all entities created from that factory (for example, enabling a **dds::pub::Publisher** (p. 1719) will enable all its contained **dds::pub::DataWriter** (p. 908) objects)

Listeners associated with an entity are not called until the entity is enabled.

Conditions associated with a disabled entity are "inactive," that is, they have a `trigger_value == FALSE`.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), Standard Exceptions (p. 228) or dds::core::PreconditionNotMetError (p. 1669).
------------	---

8.107.3.2 status_changes()

```
const dds::core::status::StatusMask dds::core::Entity::status_changes ( ) [inline]
```

Retrieves the list of communication statuses that are triggered.

That is, the list of statuses whose value has changed since the last time the application read the status using the `get_*_status()` method.

When the entity is first created or if the entity is not enabled, all communication statuses are in the "untriggered" state so the list returned by the `get_status_changes` operation will be empty.

The list of statuses returned by the `get_status_changes` operation refers to the status that are triggered on the **Entity** (p. 1265) itself and does not include statuses that apply to contained entities.

Returns

list of communication statuses in the **dds::core::Entity** (p. 1265) that are triggered.

See also

Status Kinds (p. 229)

8.107.3.3 instance_handle()

```
const dds::core::InstanceHandle dds::core::Entity::instance_handle ( ) const [inline]
```

Get the instance handle that represents this entity.

This operation returns the **dds::core::InstanceHandle** (p. 1356) that represents the **dds::core::Entity** (p. 1265).

Returns

the instance handle associated with this entity.

8.107.3.4 close()

```
void dds::core::Entity::close ( ) [inline]
```

Forces the destruction of this entity.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

See also

Reference types (p. 153)

8.107.3.5 retain()

```
void dds::core::Entity::retain ( ) [inline]
```

Disables the automatic destruction of this entity.

See also

Reference types (p. 153)

8.107.4 Friends And Related Function Documentation

8.107.4.1 polymorphic_cast()

```
template<typename TO , typename FROM >  
TO polymorphic_cast (   
    const FROM & from ) [related]
```

Downcasts an **Entity** (p. 1265) to a subclass.

Note

- Header: `<dds/core/ref_traits.hpp>`
- Namespace: `dds::core` (p. 404)

Template Parameters

<i>TO</i>	The type to cast to
<i>FROM</i>	The type to cast from

Parameters

<i>from</i>	The object to cast to type <i>TO</i>
-------------	--------------------------------------

Returns

A reference to the same object *from*, but cast to the type *TO*. Both objects share ownership of the underlying entity.

For example:

```
using namespace dds::core;
using namespace dds::domain;
DomainParticipant participant(0);
Entity entity = participant; // Assignment to base
DomainParticipant participant2 = polymorphic_cast<DomainParticipant>(entity);
assert (participant == participant2); // Same reference
```

Reference types (p. 153)

8.108 dds::core::policy::EntityFactory Class Reference

Configures a **dds::core::Entity** (p. 1265) that acts as factory of other entities.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TEntityFactory** ()
Default policy.
- **TEntityFactory** (bool the_auto_enable)
Specifies whether the entity acting as a factory automatically enables the instances it creates.
- **TEntityFactory & autoenable_created_entities** (bool on)
Specifies whether the entity acting as a factory automatically enables the instances it creates.
- bool **autoenable_created_entities** () const
Getter (see setter with the same name)

Static Public Member Functions

- static **TEntityFactory AutoEnable** ()
Creates EntityFactory(true)
- static **TEntityFactory ManuallyEnable** ()
Creates EntityFactory(false)

8.108.1 Detailed Description

Configures a **dds::core::Entity** (p. 1265) that acts as factory of other entities.

Entity:

DomainParticipantFactory, **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), **dds::sub::Subscriber** (p. 2116)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = **YES** (p. 307)

8.108.2 Usage

This policy controls the behavior of the **dds::core::Entity** (p. 1265) as a factory for other entities. It controls whether or not child entities are created in the enabled state.

RTI Connex uses a factory design pattern for creating DDS Entities. That is, a parent entity must be used to create child entities. DomainParticipants create Topics, Publishers and Subscribers. Publishers create DataWriters. Subscribers create DataReaders.

By default, a child object is enabled upon creation (initialized and may be actively used). With this QoS policy, a child object can be created in a disabled state. A disabled entity is only partially initialized and cannot be used until the entity is enabled. Note: an entity can only be *enabled*; it cannot be *disabled* after it has been enabled.

This QoS policy is useful to synchronize the initialization of DDS Entities. For example, when a **dds::sub::DataReader** (p. 756) is created in an enabled state, its existence is immediately propagated for discovery and the **dds::sub::DataReader** (p. 756) object's listener called as soon as data is received. The initialization process for an application may extend beyond the creation of the **dds::sub::DataReader** (p. 756), and thus, it may not be desirable for the **dds::sub::DataReader** (p. 756) to start to receive or process any data until the initialization process is complete. So by creating readers in a disabled state, your application can make sure that no data is received until the rest of the application initialization is complete, and at that time, enable the them.

Note: if an entity is disabled, then all of the child entities it creates will be disabled, too, regardless of the setting of this QoS policy. However, enabling a disabled entity will enable all of its children if this QoS policy is set to automatically enable children entities.

This policy is mutable. A change in the policy affects only the entities created after the change, not any previously created entities.

8.108.3 Member Function Documentation

8.108.3.1 TEntityFactory() [1/2]

```
dds::core::policy::EntityFactory::TEntityFactory ( ) [inline]
```

Default policy.

8.108.3.2 TEntityFactory() [2/2]

```
dds::core::policy::EntityFactory::TEntityFactory (
    bool the_auto_enable ) [inline], [explicit]
```

Specifies whether the entity acting as a factory automatically enables the instances it creates.

8.108.3.3 autoenable_created_entities() [1/2]

```
TEntityFactory & dds::core::policy::EntityFactory::autoenable_created_entities (
    bool on ) [inline]
```

Specifies whether the entity acting as a factory automatically enables the instances it creates.

8.108.3.4 autoenable_created_entities() [2/2]

```
bool dds::core::policy::EntityFactory::autoenable_created_entities ( ) const [inline]
```

Getter (see setter with the same name)

8.108.3.5 AutoEnable()

```
static TEntityFactory dds::core::policy::EntityFactory::AutoEnable ( ) [inline], [static]
```

Creates EntityFactory(true)

8.108.3.6 ManuallyEnable()

```
static TEntityFactory dds::core::policy::EntityFactory::ManuallyEnable ( ) [inline], [static]
```

Creates EntityFactory(false)

8.109 rti::core::policy::EntityName Class Reference

<<*extension*>> (p. 156) Assigns a name to a DomainParticipant, Publisher, Subscriber, DataWriter or DataReader.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **EntityName** ()
Creates the default policy (no name)
- **EntityName** (const std::string &the_name)
Creates an instance that specifies an entity name.
- **EntityName & name** (const rti::core::optional_value< std::string > &the_name)
Sets the entity name.
- **EntityName & name** (const char *the_name)
Sets the entity name.
- **rti::core::optional_value< std::string > name** () const
Gets the entity name.
- **EntityName & role_name** (const rti::core::optional_value< std::string > &the_name)
Specifies an entity role name.
- **EntityName & role_name** (const char *the_name)
Sets the role name.
- **rti::core::optional_value< std::string > role_name** () const
Gets the entity role name.

8.109.1 Detailed Description

<<*extension*>> (p. 156) Assigns a name to a DomainParticipant, Publisher, Subscriber, DataWriter or DataReader.

Except for the Publisher and Subscriber, these names are visible during the discovery process and in RTI tools to help you visualize and debug your system.

Entity:

dds::domain::DomainParticipant (p. 1079), **dds::sub::Subscriber** (p. 2116), **dds::pub::Publisher** (p. 1719), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = NO;
Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

8.109.2 Usage

The name and role name can be at most 255 characters in length.

8.109.3 Constructor & Destructor Documentation

8.109.3.1 EntityName() [1/2]

```
rti::core::policy::EntityName::EntityName ( ) [inline]
```

Creates the default policy (no name)

8.109.3.2 EntityName() [2/2]

```
rti::core::policy::EntityName::EntityName (
    const std::string & the_name ) [inline], [explicit]
```

Creates an instance that specifies an entity name.

8.109.4 Member Function Documentation

8.109.4.1 name() [1/3]

```
EntityName & rti::core::policy::EntityName::name (
    const rti::core::optional_value< std::string > & the_name )
```

Sets the entity name.

Parameters

<i>the_name</i>	An optional string. An unset value indicates that this entity should have no name. A set value will set a name. The string can't exceed 255 characters.
-----------------	---

[default] Unset (no name)

8.109.4.2 name() [2/3]

```
EntityName & rti::core::policy::EntityName::name (
    const char * the_name )
```

Sets the entity name.

Parameters

<i>the_name</i>	Can't exceed 255 characters.
-----------------	------------------------------

8.109.4.3 name() [3/3]

```
rti::core::optional_value< std::string > rti::core::policy::EntityName::name ( ) const
```

Gets the entity name.

Returns

An optional string. An unset value indicates that the entity has not been assigned a name.

8.109.4.4 role_name() [1/3]

```
EntityName & rti::core::policy::EntityName::role_name (
    const rti::core::optional_value< std::string > & the_name )
```

Specifies an entity role name.

With Durable Subscriptions this name is used to specify to which Durable Subscription the DataReader belongs.

With Collaborative DataWriters this name is used to specify to which endpoint group the DataWriter belongs.

Parameters

<i>the_name</i>	An optional string. An unset value indicates that the Entity will have no role name (the default). The string can't exceed 255 characters.
-----------------	--

[default] Unset (no role name)

8.109.4.5 role_name() [2/3]

```
EntityName & rti::core::policy::EntityName::role_name (
    const char * the_name )
```

Sets the role name.

See also

role_name(const rti::core::optional_value<std::string>&) (p. 1277)

8.109.4.6 role_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::policy::EntityName::role_name ( ) const
```

Gets the entity role name.

Returns

An optional string. An unset value indicates that the entity has not been assigned a role name.

8.110 dds::core::xtypes::EnumMember Class Reference

<<*value-type*>> (p. 152) Represents a **EnumType** (p. 1280) member

```
#include "dds/core/xtypes/MemberType.hpp"
```

Public Member Functions

- **EnumMember** (const std::string & name, int32_t ordinal)
- const **dds::core::string & name** () const
Gets the name.
- **dds::core::string & name** ()
Gets the member name.
- **EnumMember & name** (const **dds::core::string** &value)
Sets the name.
- int32_t **ordinal** () const
Gets the ordinal.
- **EnumMember & ordinal** (int32_t the_ordinal)
Sets the ordinal.

8.110.1 Detailed Description

<<*value-type*>> (p. 152) Represents a **EnumType** (p. 1280) member

Encapsulates the name and value (ordinal) of an IDL enum type

8.110.2 Constructor & Destructor Documentation

8.110.2.1 EnumMember()

```
dds::core::xtypes::EnumMember::EnumMember (
    const std::string & name,
    int32_t ordinal )
```

Creates a **EnumMember** (p. 1278) with a name and value (ordinal)

8.110.3 Member Function Documentation

8.110.3.1 name() [1/3]

```
const dds::core::string & dds::core::xtypes::EnumMember::name ( ) const
```

Gets the name.

8.110.3.2 name() [2/3]

```
dds::core::string & dds::core::xtypes::EnumMember::name ( )
```

Gets the member name.

8.110.3.3 name() [3/3]

```
EnumMember & dds::core::xtypes::EnumMember::name (
    const dds::core::string & value )
```

Sets the name.

8.110.3.4 ordinal() [1/2]

```
int32_t dds::core::xtypes::EnumMember::ordinal ( ) const
```

Gets the ordinal.

8.110.3.5 ordinal() [2/2]

```
EnumMember & dds::core::xtypes::EnumMember::ordinal (
    int32_t the_ordinal )
```

Sets the ordinal.

8.111 dds::core::xtypes::EnumType Class Reference

<<*value-type*>> (p. 152) Represents and IDL enum type

```
#include <dds/core/xtypes/EnumType.hpp>
```

Public Member Functions

- **EnumType** (const std::string &name)
Creates an empty enum type.
- template<typename Container >
EnumType (const std::string &the_name, const Container &the_members)
Creates an enum with the members in a container.
- template<typename MemberIter >
EnumType (const std::string &the_name, MemberIter begin, MemberIter end)
Creates a enum with the members in an iterator range.
- **EnumType** (const std::string &the_name, std::initializer_list< **EnumMember** > the_members)
Creates an enum with the members in an initializer_list.
- MemberIndex **find_member_by_ordinal** (int32_t ordinal) const
Gets the index of the member with this ordinal value.
- **EnumType** & **add_member** (const **EnumMember** &member)
Adds a member at the end.
- template<typename Container >
EnumType & **add_members** (const Container &the_members)
Adds all the members of a container at the end.
- **EnumType** & **add_members** (std::initializer_list< **EnumMember** > the_members)
Adds all the members of an initializer_list at the end.
- template<typename MemberIter >
EnumType & **add_members** (MemberIter begin, MemberIter end)
Adds all the members in an iterator range at the end.
- **dds::core::xtypes::ExtensibilityKind** **extensibility_kind** () const
Gets the extensibility kind.

8.111.1 Detailed Description

<<*value-type*>> (p. 152) Represents and IDL enum type

```
AbstractConstructedType<EnumMember>
```

Examples

Foo.hpp.

8.111.2 Constructor & Destructor Documentation

8.111.2.1 EnumType() [1/4]

```
dds::core::xtypes::EnumType::EnumType (
    const std::string & name )
```

Creates an empty enum type.

Members can be added after creation.

Parameters

<i>name</i>	The name of the type
-------------	----------------------

8.111.2.2 EnumType() [2/4]

```
template<typename Container >
dds::core::xtypes::EnumType::EnumType (
    const std::string & the_name,
    const Container & the_members ) [inline]
```

Creates an enum with the members in a container.

Template Parameters

<i>Container</i>	A container that provides the member functions begin() (p. 1412) and end() (p. 1413) to iterate over EnumMember (p. 1278) elements.
------------------	--

Parameters

<i>the_name</i>	The name of the type
<i>the_members</i>	A container with the members for this enum type

8.111.2.3 EnumType() [3/4]

```
template<typename MemberIter >
dds::core::xtypes::EnumType::EnumType (
```

```
const std::string & the_name,
MemberIter begin,
MemberIter end ) [inline]
```

Creates a enum with the members in an iterator range.

Template Parameters

<i>MemberIter</i>	A forward iterator of EnumMember (p. 1278) elements
-------------------	--

Parameters

<i>the_name</i>	The name of the type
<i>begin</i>	The beginning of the range of EnumMembers
<i>end</i>	The end of the range of EnumMembers

8.111.2.4 EnumType() [4/4]

```
dds::core::xtypes::EnumType::EnumType (
    const std::string & the_name,
    std::initializer_list< EnumMember > the_members )
```

Creates an enum with the members in an initializer_list.

Parameters

<i>the_name</i>	The name of the type
<i>the_members</i>	An ininitializer_list of EnumMembers

8.111.3 Member Function Documentation

8.111.3.1 find_member_by_ordinal()

```
MemberIndex dds::core::xtypes::EnumType::find_member_by_ordinal (
    int32_t ordinal ) const
```

Gets the index of the member with this ordinal value.

Returns

The index (which can be passed to member(uint32_t) of the member with this ordinal value or INVALID_INDEX if that ordinal doesn't exist

8.111.3.2 add_member()

```
EnumType & dds::core::xtypes::EnumType::add_member (
    const EnumMember & member )
```

Adds a member at the end.

8.111.3.3 add_members() [1/3]

```
template<typename Container >
EnumType & dds::core::xtypes::EnumType::add_members (
    const Container & the_members ) [inline]
```

Adds all the members of a container at the end.

8.111.3.4 add_members() [2/3]

```
EnumType & dds::core::xtypes::EnumType::add_members (
    std::initializer_list< EnumMember > the_members )
```

Adds all the members of an initializer_list at the end.

8.111.3.5 add_members() [3/3]

```
template<typename MemberIter >
EnumType & dds::core::xtypes::EnumType::add_members (
    MemberIter begin,
    MemberIter end ) [inline]
```

Adds all the members in an iterator range at the end.

8.111.3.6 extensibility_kind()

```
dds::core::xtypes::ExtensibilityKind dds::core::xtypes::AbstractConstructedType< MemberType >↔
::extensibility_kind ( ) const
```

Gets the extensibility kind.

8.112 rti::test::EnvVarToken Class Reference

```
#include <utilities.hpp>
```

8.112.1 Detailed Description

This class is used to create or modify an environment variable. If the variable didn't exist previously, the environment variable will be set and it will last as long as the life of this instance. If the variable already existed, this class will change its value to the provided one during the lifetime of this instance. After destruction, it will return to its previous value.

8.113 dds::core::Error Class Reference

A generic, unspecified **Error** (p. 1284).

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::Error:

Public Member Functions

- **Error** ()
*Create an **Error** (p. 1284) exception with no message.*
- **Error** (const std::string &msg)
*Create an **Error** (p. 1284) exception with a message.*
- virtual const char * **what** () const throw ()
*Access the message contained in this **Error** (p. 1284) exception.*

8.113.1 Detailed Description

A generic, unspecified **Error** (p. 1284).

Inherits also from `std::exception`

8.113.2 Constructor & Destructor Documentation

8.113.2.1 Error() [1/2]

```
dds::core::Error::Error ( )
```

Create an **Error** (p. 1284) exception with no message.

8.113.2.2 Error() [2/2]

```
dds::core::Error::Error (
    const std::string & msg ) [explicit]
```

Create an **Error** (p. 1284) exception with a message.

Parameters

<i>msg</i>	The message to create the Error (p. 1284) with.
------------	--

8.113.3 Member Function Documentation

8.113.3.1 what()

```
virtual const char * dds::core::Error::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **Error** (p. 1284) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.114 rti::core::policy::Event Class Reference

<<**extension**>> (p. 156) Configures the thread in a DomainParticipant that handles timed events.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Event** ()
Creates the default policy.
- **Event** (const **rti::core::ThreadSettings** &the_thread, int32_t the_initial_count, int32_t the_max_count)
Creates an instance with all the parameters set.
- **Event & thread** (const **rti::core::ThreadSettings** &the_thread)
Event (p. 1285) *thread QoS.*
- const **rti::core::ThreadSettings** & **thread** () const
Getter (see setter with the same name)
- **rti::core::ThreadSettings** & **thread** ()
Getter (see setter with the same name)
- **Event & initial_count** (int32_t the_initial_count)
The initial number of events.
- int32_t **initial_count** () const
Getter (see setter with the same name)
- **Event & max_count** (int32_t the_max_count)
The maximum number of events.
- int32_t **max_count** () const
Getter (see setter with the same name)

8.114.1 Detailed Description

<<**extension**>> (p. 156) Configures the thread in a DomainParticipant that handles timed events.

In a **dds::domain::DomainParticipant** (p. 1079), a thread is dedicated to handle all timed events, including checking for timeouts and deadlines and executing internal and user-defined timeout or exception handling routines/callbacks.

This QoS policy allows you to configure thread properties such as priority level and stack size. You can also configure the maximum number of events that can be posted to the event thread. By default, a **dds::domain::DomainParticipant** (p. 1079) will dynamically allocate memory as needed for events posted to the event thread. However, by setting a maximum value or setting the initial and maximum value to be the same, you can either bound the amount of memory allocated for the event thread or prevent a **dds::domain::DomainParticipant** (p. 1079) from dynamically allocating memory for the event thread after initialization.

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.114.2 Constructor & Destructor Documentation

8.114.2.1 Event() [1/2]

```
rti::core::policy::Event::Event ( ) [inline]
```

Creates the default policy.

8.114.2.2 Event() [2/2]

```
rti::core::policy::Event::Event (
    const rti::core::ThreadSettings & the_thread,
    int32_t the_initial_count,
    int32_t the_max_count )
```

Creates an instance with all the parameters set.

8.114.3 Member Function Documentation

8.114.3.1 thread() [1/3]

```
Event & rti::core::policy::Event::thread (
    const rti::core::ThreadSettings & the_thread )
```

Event (p. 1285) thread QoS.

There is only one event thread.

Priority:

[default] The actual value depends on your architecture:

For Windows: -2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

Stack Size:

[default] The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

8.114.3.6 max_count() [1/2]

```
Event & rti::core::policy::Event::max_count (
    int32_t the_max_count )
```

The maximum number of events.

The maximum number of events. If the limit is reached, no new event can be added.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

[range] [1, 1 million] or `dds::core::LENGTH_UNLIMITED` (p. 238), >= initial_count

8.114.3.7 max_count() [2/2]

```
int32_t rti::core::policy::Event::max_count ( ) const
```

Getter (see setter with the same name)

8.115 rti::core::status::EventCount< IntegerType > Class Template Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Encapsulates an event count containing a total count and an incremental count since the last time a status was read.

```
#include <Status.hpp>
```

Inherits std::pair< IntegerType, IntegerType >.

Public Member Functions

- IntegerType **total** () const
The total count.
- IntegerType **change** () const
The incremental count.

Related Functions

(Note that these are not member functions.)

- template<typename IntegerType >
std::ostream & **operator**<< (std::ostream &out, const **EventCount**< IntegerType > &event_count)
<<**extension**>> (p. 156) Prints an **rti::core::status::EventCount** (p. 1289) to an output stream.

8.115.1 Detailed Description

```
template<typename IntegerType>
class rti::core::status::EventCount< IntegerType >
```

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Encapsulates an event count containing a total count and an incremental count since the last time a status was read.

Template Parameters

<i>IntegerType</i>	The integer type used to measure the event counts.
--------------------	--

8.115.2 Member Function Documentation

8.115.2.1 total()

```
template<typename IntegerType >
IntegerType rti::core::status::EventCount< IntegerType >::total ( ) const [inline]
```

The total count.

8.115.2.2 change()

```
template<typename IntegerType >
IntegerType rti::core::status::EventCount< IntegerType >::change ( ) const [inline]
```

The incremental count.

8.115.3 Friends And Related Function Documentation

8.115.3.1 operator<<()

```
template<typename IntegerType >
std::ostream & operator<< (
    std::ostream & out,
    const EventCount< IntegerType > & event_count ) [related]
```

<<*extension*>> (p. 156) Prints an `rti::core::status::EventCount` (p. 1289) to an output stream.

8.116 dds::core::Exception Class Reference

The abstract base class for all of the DDS exceptions which may be thrown by the API.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::Exception:

Public Member Functions

- virtual const char * **what** () const =0 throw ()
Get a description of the error.

8.116.1 Detailed Description

The abstract base class for all of the DDS exceptions which may be thrown by the API.

8.116.2 Member Function Documentation

8.116.2.1 what()

```
virtual const char * dds::core::Exception::what ( ) const throw ( ) [pure virtual]
```

Get a description of the error.

Implemented in [dds::core::Error](#) (p.1285), [dds::core::AlreadyClosedError](#) (p.594), [dds::core::Illegal←OperationError](#) (p.1352), [dds::core::NotAllowedBySecurityError](#) (p.1600), [dds::core::ImmutablePolicyError](#) (p.1353), [dds::core::InconsistentPolicyError](#) (p.1354), [dds::core::InvalidArgumentError](#) (p.1363), [dds::core←::NotEnabledError](#) (p.1601), [dds::core::OutOfResourcesError](#) (p.1630), [dds::core::PreconditionNotMetError](#) (p.1669), [dds::core::TimeoutError](#) (p.2178), [dds::core::UnsupportedError](#) (p.2292), [dds::core::Invalid←DowncastError](#) (p.1364), [dds::core::NullReferenceError](#) (p.1602), [rti::queuing::NoMatchingQueueException](#) (p.1568), and [dds::rpc::RemoteUnknownOperationError](#) (p.1888).

8.117 rti::topic::ExpressionProperty Class Reference

<<*extension*>> (p.156) <<*value-type*>> (p.152) Provides additional information about the filter expression passed to the `writer_compile` method of [rti::topic::WriterContentFilter](#) (p.2351)

```
#include <rti/topic/ContentFilter.hpp>
```

Public Member Functions

- **ExpressionProperty** ()
 - Create a default **ExpressionProperty** (p.1292) with `key_only_filter = false` and `writer_side_filter_optimization = false`.*
- **ExpressionProperty** (bool `the_key_only_filter`, bool `the_writer_side_filter_optimization`)
 - Create an **ExpressionProperty** (p.1292) with the provided `key_only_filter`, and `writer_side_filter_optimization`.*
- bool **key_only_filter** () const
 - Get the value of `key_only_filter`.*
- **ExpressionProperty** & **key_only_filter** (bool `the_key_only_filter`)
 - Set the value for `key_only_filter`, indicating if the filter expression is based only on key fields. In this case, RTI Connext itself can cache the filtering results.*
- bool **writer_side_filter_optimization** () const
 - Get the value of `writer_side_filter_optimization`.*
- **ExpressionProperty** & **writer_side_filter_optimization** (bool `the_writer_side_filter_optimization`)
 - Set the value for `writer_side_filter_optimization`, indicating if the filter implementation can cache the filtering result for the provided expression.*

8.117.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides additional information about the filter expression passed to the `writer_compile` method of `rti::topic::WriterContentFilter` (p. 2351)

It is used by the filter implementation to indicate to the middleware whether or not the `WriterContentFilter` (p. 2351) will cache the result of filter evaluation.

See also

`rti::topic::WriterContentFilter` (p. 2351)

8.117.2 Constructor & Destructor Documentation

8.117.2.1 ExpressionProperty() [1/2]

```
rti::topic::ExpressionProperty::ExpressionProperty ( ) [inline]
```

Create a default `ExpressionProperty` (p. 1292) with `key_only_filter = false` and `writer_side_filter_optimization = false`.

8.117.2.2 ExpressionProperty() [2/2]

```
rti::topic::ExpressionProperty::ExpressionProperty (
    bool the_key_only_filter,
    bool the_writer_side_filter_optimization ) [inline]
```

Create an `ExpressionProperty` (p. 1292) with the provided `key_only_filter`, and `writer_side_filter_optimization`.

Parameters

<i>the_key_only_filter</i>	The value for <code>key_only_filter</code>
<i>the_writer_side_filter_optimization</i>	The value for <code>writer_side_filter_optimization</code>

8.117.3 Member Function Documentation

8.117.3.1 key_only_filter() [1/2]

```
bool rti::topic::ExpressionProperty::key_only_filter ( ) const [inline]
```

Get the value of `key_only_filter`.

See also

key_only_filter(bool the_key_only_filter) (p. 1294)

8.117.3.2 key_only_filter() [2/2]

```
ExpressionProperty & rti::topic::ExpressionProperty::key_only_filter (
    bool the_key_only_filter ) [inline]
```

Set the value for `key_only_filter`, indicating if the filter expression is based only on key fields. In this case, RTI Connex itself can cache the filtering results.

When this field is set to true, it indicates to RTI Connex that the filter expression is based only on key fields.

Parameters

<code>the_key_only_filter</code>	The value to set for <code>key_only_filter</code>
----------------------------------	---

8.117.3.3 writer_side_filter_optimization() [1/2]

```
bool rti::topic::ExpressionProperty::writer_side_filter_optimization ( ) const [inline]
```

Get the value of `writer_side_filter_optimization`.

See also

writer_side_filter_optimization(bool the_writer_side_filter_optimization) (p. 1294)

8.117.3.4 writer_side_filter_optimization() [2/2]

```
ExpressionProperty & rti::topic::ExpressionProperty::writer_side_filter_optimization (
    bool the_writer_side_filter_optimization ) [inline]
```

Set the value for `writer_side_filter_optimization`, indicating if the filter implementation can cache the filtering result for the provided expression.

When this field is set to true, RTI Connex will do no caching or explicit filter evaluation for the associated `dds::sub::← DataReader` (p. 756). Instead, it will rely on the filter implementation to provide appropriate results.

Parameters

<code>the_writer_side_filter_optimization</code>	The value to set for <code>writer_side_filter_optimization</code>
--	---

8.118 rti::topic::extensibility< TopicType > Struct Template Reference

<<**extension**>> (p. 156) Indicates the extensibility kind of a topic-type

```
#include <rti/topic/TopicTraits.hpp>
```

8.118.1 Detailed Description

```
template<typename TopicType>
struct rti::topic::extensibility< TopicType >
```

<<**extension**>> (p. 156) Indicates the extensibility kind of a topic-type

This trait type is specialized for **IDL-generated types** (p.395) provide a member `kind` of type `dds::core::xtypes::ExtensibilityKind` (p.421).

For example, given the following IDL type, **Foo** (p.1332) :

```
struct Foo {
    long x;
}; //@Extensibility MUTABLE_EXTENSIBILITY
```

You can obtain its extensibility kind:

```
assert (rti::topic::extensibility<Foo>::kind
    == dds::core::xtypes::ExtensibilityKind::MUTABLE);
```

8.119 dds::core::xtypes::ExtensibilityKind_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `ExtensibilityKind`.

```
#include <Annotations.hpp>
```

Public Types

- enum `type` {
 FINAL ,
 EXTENSIBLE ,
 MUTABLE }

8.119.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `ExtensibilityKind`.

8.119.2 Member Enumeration Documentation

8.119.2.1 type

enum `dds::core::xtypes::ExtensibilityKind_def::type`

The underlying enum type

Enumerator

FINAL	<p>Specifies that a type has FINAL extensibility. A type may be final, indicating that the range of its possible values is strictly defined. In particular, it is not possible to add elements to members of collection or aggregated types while maintaining type assignability.</p> <p>The following types are always final:</p> <ul style="list-style-type: none"> • <code>dds::core::xtypes::TypeKind_def::ARRAY_TYPE</code> (p. 2275) • All primitive types
EXTENSIBLE	<p>Specifies that a type has EXTENSIBLE extensibility. A type may be appendable (formerly called extensible), indicating that two types, where one contains all of the elements/members of the other plus additional elements/members appended to the end, may remain assignable.</p>
MUTABLE	<p>Specifies that a type has MUTABLE extensibility. A type may be mutable, indicating that two types may differ from one another in the additional, removal, and/or transposition of elements/members while remaining assignable.</p> <p>The following types are always mutable:</p> <ul style="list-style-type: none"> • <code>dds::core::xtypes::TypeKind_def::SEQUENCE_TYPE</code> (p. 2275) • <code>dds::core::xtypes::TypeKind_def::STRING_TYPE</code> (p. 2275) • <code>dds::core::xtypes::TypeKind_def::WSTRING_TYPE</code> (p. 2275)

8.120 `dds::core::external< T >` Class Template Reference

A managed reference to an object.

```
#include <dds/core/External.hpp>
```

Public Types

- using `shared_ptr` = `std::shared_ptr< T >`
The smart pointer that `external<T>` uses.

Public Member Functions

- **external** () OMG_NOEXCEPT
Creates an empty shared object.
- **external** (T *p, bool locked=false)
Creates a new shared object with the managed object p.
- **external** (**shared_ptr** p)
Creates an `external` instance that shares the managed object and reference counting with an existing `shared_ptr`.
- **external** (const **external** &other)
Creates a shared object from an existing shared object.
- **~external** ()
Destroys the managed object if this is the last shared object pointing to it.
- **external** & **operator=** (const **external** &other)
Assigns another external, depending on the locked state.
- T & **operator*** () OMG_NOEXCEPT
Obtains a reference to the managed object.
- const T & **operator*** () const OMG_NOEXCEPT
Obtains a const reference to the managed object.
- T * **get** () OMG_NOEXCEPT
Obtains a pointer to the managed object.
- const T * **get** () const OMG_NOEXCEPT
Obtains a const pointer to the managed object.
- **shared_ptr** **get_shared_ptr** ()
Obtains a `shared_ptr` to the managed object.
- T * **operator->** () OMG_NOEXCEPT
Allows accessing members of the managed object.
- const T * **operator->** () const OMG_NOEXCEPT
Allows accessing members of the managed object.
- bool **operator==** (const **external**< T > &other) const OMG_NOEXCEPT
Returns whether two shared objects manage the same object or are both empty.
- bool **operator!=** (const **external**< T > &other) const
Returns whether two shared objects do not manage the same object.
- RTI_EXPLICIT_CONVERSION **operator bool** () const OMG_NOEXCEPT
Checks if there is a managed object (is not null) or not (is null)
- bool **is_locked** () const
Indicates whether the managed object is locked or not.

Friends

- void **swap** (**external**< T > &a, **external**< T > &b) OMG_NOEXCEPT
Swaps the managed objects and the locked state.

8.120.1 Detailed Description

```
template<typename T>
class dds::core::external< T >
```

A managed reference to an object.

Template Parameters

<i>T</i>	The type of the object this <code>external<T></code> manages
----------	--

Members of an **IDL** (p. 395) type marked with the `@Shared` or `@external` tag map to this C++ type. External members can share the same object when publishing different data samples. This can make more efficient the publication of large objects by saving extra copies.

This class behaves like a `std::shared_ptr`, except when the object is in "locked" state.

Objects of this class created with any of the constructors documented here behave like a `std::shared_ptr<T>`. Objects that the middleware returns in a `LoanedSample` (for example, from `dds::sub::DataReader::take` (p. 774)) are in a "locked" state and its contents can't be shared or modified. When assigning a sample with locked external members into another one where those members are not locked, the contents are copied, not shared. Modifying a locked object is not allowed. This special behavior prevents applications from corrupting loaned memory.

See also

Working with IDL types (p. 395)

8.120.2 Constructor & Destructor Documentation

8.120.2.1 `external()` [1/4]

```
template<typename T >
dds::core::external< T >::external ( ) [inline]
```

Creates an empty shared object.

8.120.2.2 `external()` [2/4]

```
template<typename T >
dds::core::external< T >::external (
    T * p,
    bool locked = false ) [inline]
```

Creates a new shared object with the managed object `p`.

Parameters

<i>p</i>	The pointer to manage
<i>locked</i>	Should always be false except in objects created internally by the middleware.

8.120.2.3 external() [3/4]

```
template<typename T >
dds::core::external< T >::external (
    shared_ptr p ) [inline]
```

Creates an `external` instance that shares the managed object and reference counting with an existing `shared_ptr`.

This constructor is implicit to allow the direct usage of `shared_ptr`.

For example:

```
shared_ptr<MyResource> resource(new MyResource);
// pass resource directly to a data-type with a my_resource external
// member whose setter expects an external<MyResource>.
sample1.my_resource(resource);
sample2.my_resource(resource);
// ...
writer.write(sample1);
writer.write(sample2);
```

8.120.2.4 external() [4/4]

```
template<typename T >
dds::core::external< T >::external (
    const external< T > & other ) [inline]
```

Creates a shared object from an existing shared object.

In general, the new shared object shares ownership with `other`. Only if `other.is_locked()`, then the new shared object is allocated and its contents copied from `other`.

Postcondition

if `!other.is_locked()` (p. 1302), then `*this == other`. If `other.is_locked`, then `*(this) == *other` but `*this != other`.

8.120.2.5 ~external()

```
template<typename T >
dds::core::external< T >::~external ( ) [inline]
```

Destroys the managed object if this is the last shared object pointing to it.

8.120.3 Member Function Documentation

8.120.3.1 operator=()

```
template<typename T >
external & dds::core::external< T >::operator= (
    const external< T > & other ) [inline]
```

Assigns another external, depending on the locked state.

Depending on whether `this` or `other` are locked the behavior varies:

- If `this->is_locked()` (p.1302) this operation throws `dds::core::PreconditionNotMetError` (p.1669)
- If `other.is_locked()` it performs a deep copy of `*other`
- In any other case, after the assignment, `*this` and `other` share the same reference to the underlying object, that is, a `shared_ptr` assignment.

Exceptions

<code>dds::core::PreconditionNotMetError</code> (p. 1669)	if <code>this->is_locked()</code> (p. 1302)
---	--

References `dds::core::external< T >::is_locked()`.

8.120.3.2 operator*() [1/2]

```
template<typename T >
T & dds::core::external< T >::operator* ( ) [inline]
```

Obtains a reference to the managed object.

8.120.3.3 operator*() [2/2]

```
template<typename T >
const T & dds::core::external< T >::operator* ( ) const [inline]
```

Obtains a const reference to the managed object.

8.120.3.4 get() [1/2]

```
template<typename T >
T * dds::core::external< T >::get ( ) [inline]
```

Obtains a pointer to the managed object.

Warning

The returned pointer may become invalid if this is destroyed

8.120.3.5 get() [2/2]

```
template<typename T >
const T * dds::core::external< T >::get ( ) const [inline]
```

Obtains a const pointer to the managed object.

Warning

The returned pointer may become invalid if this is destroyed

8.120.3.6 get_shared_ptr()

```
template<typename T >
shared_ptr dds::core::external< T >::get_shared_ptr ( ) [inline]
```

Obtains a `shared_ptr` to the managed object.

The returned `shared_ptr` shares the same reference count.

Exceptions

<code>dds::core::IllegalOperationError</code> (p. 1352)	if <code>is_locked()</code> (p. 1302).
---	--

8.120.3.7 operator->() [1/2]

```
template<typename T >
T * dds::core::external< T >::operator-> ( ) [inline]
```

Allows accessing members of the managed object.

8.120.3.8 operator->() [2/2]

```
template<typename T >
const T * dds::core::external< T >::operator-> ( ) const [inline]
```

Allows accessing members of the managed object.

8.120.3.9 operator==()

```
template<typename T >
bool dds::core::external< T >::operator==(
    const external< T > & other ) const [inline]
```

Returns whether two shared objects manage the same object or are both empty.

8.120.3.10 operator!=()

```
template<typename T >
bool dds::core::external< T >::operator!=(
    const external< T > & other ) const [inline]
```

Returns whether two shared objects do not manage the same object.

8.120.3.11 operator bool()

```
template<typename T >
RTI_EXPLICIT_CONVERSION dds::core::external< T >::operator bool ( ) const [inline]
```

Checks if there is a managed object (is not null) or not (is null)

8.120.3.12 is_locked()

```
template<typename T >
bool dds::core::external< T >::is_locked ( ) const [inline]
```

Indicates whether the managed object is locked or not.

Referenced by `dds::core::external< T >::operator=()`.

8.120.4 Friends And Related Function Documentation

8.120.4.1 swap

```
template<typename T >
void swap (
    external< T > & a,
    external< T > & b ) [friend]
```

Swaps the managed objects and the locked state.

8.121 dds::topic::Filter Class Reference

Defines the filter to create a **ContentFilteredTopic** (p. 735).

```
#include <dds/topic/Filter.hpp>
```

Public Member Functions

- **Filter** (const std::string &filter_expression)
 - Creates a filter with a expression with no parameters.*
- template<typename FwdIterator >
 Filter (const std::string &filter_expression, const FwdIterator ¶ms_begin, const FwdIterator ¶ms_end)
 - Creates a filter with an expression that contains parameters.*
- **Filter** (const std::string &query_expression, const std::vector< std::string > ¶ms)
 - Creates a filter with an expression that contains parameters.*
- const std::string & **expression** () const
 - Gets the filter expression.*
- const_iterator **begin** () const
 - Provides the begin iterator to the parameter list.*
- const_iterator **end** () const
 - The end iterator to the parameter list.*
- iterator **begin** ()

Provides the begin iterator to the parameter list.

- iterator **end** ()

The end iterator to the parameter list.

- template<typename FwdIterator >

Filter & parameters (const FwdIterator &the_begin, const FwdIterator the_end)

Modifies the parameters.

- **Filter & add_parameter** (const std::string ¶m)

Appends a parameter.

- size_t **parameters_length** () const

Gets the number of parameters.

- std::string **name** () const

<<*extension*>> (p. 156) *Gets the filter name*

- **dds::topic::Filter & name** (const std::string &the_name)

<<*extension*>> (p. 156) *Sets a filter name*

8.121.1 Detailed Description

Defines the filter to create a **ContentFilteredTopic** (p. 735).

Contains the filter expression and optionally the expression parameters. It also contains the filter name, which allows selecting the filter class to use—by default it's the built-in SQL filter.

8.121.2 Constructor & Destructor Documentation

8.121.2.1 Filter() [1/3]

```
dds::topic::Filter::Filter (
    const std::string & filter_expression ) [inline]
```

Creates a filter with a expression with no parameters.

See also

Queries and Filters Syntax (p. 82)

8.121.2.2 Filter() [2/3]

```
template<typename FwdIterator >
dds::topic::Filter::Filter (
    const std::string & filter_expression,
    const FwdIterator & params_begin,
    const FwdIterator & params_end ) [inline]
```

Creates a filter with an expression that contains parameters.

Template Parameters

<i>FwdIterator</i>	A forwar iterator whose value type is <code>std::string</code> (or convertible to)
--------------------	--

Parameters

<i>filter_expression</i>	The filter expression
<i>params_begin</i>	The beginning of the range of expression parameters
<i>params_end</i>	The end of the range (the number of parameter to create a ContentFilteredTopic (p. 735) can't exceed 100)

See also

Queries and Filters Syntax (p. 82)

8.121.2.3 Filter() [3/3]

```
dds::topic::Filter::Filter (
    const std::string & query_expression,
    const std::vector< std::string > & params ) [inline]
```

Creates a filter with an expression that contains parameters.

Parameters

<i>query_expression</i>	The query expression
<i>params</i>	The expression parameters (the number of parameter to create a ContentFilteredTopic (p. 735) can't exceed 100)

See also

Queries and Filters Syntax (p. 82)

8.121.3 Member Function Documentation

8.121.3.1 expression()

```
const std::string & dds::topic::Filter::expression ( ) const [inline]
```

Gets the filter expression.

8.121.3.2 begin() [1/2]

```
const_iterator dds::topic::Filter::begin ( ) const [inline]
```

Provides the begin iterator to the parameter list.

8.121.3.3 end() [1/2]

```
const_iterator dds::topic::Filter::end ( ) const [inline]
```

The end iterator to the parameter list.

8.121.3.4 begin() [2/2]

```
iterator dds::topic::Filter::begin ( ) [inline]
```

Provides the begin iterator to the parameter list.

8.121.3.5 end() [2/2]

```
iterator dds::topic::Filter::end ( ) [inline]
```

The end iterator to the parameter list.

8.121.3.6 parameters()

```
template<typename FwdIterator >  
Filter & dds::topic::Filter::parameters (   
    const FwdIterator & the_begin,  
    const FwdIterator the_end ) [inline]
```

Modifies the parameters.

8.121.3.7 add_parameter()

```
Filter & dds::topic::Filter::add_parameter (
    const std::string & param ) [inline]
```

Appends a parameter.

8.121.3.8 parameters_length()

```
size_t dds::topic::Filter::parameters_length ( ) const [inline]
```

Gets the number of parameters.

8.121.3.9 name() [1/2]

```
std::string name ( ) const
```

<<**extension**>> (p. 156) Gets the filter name

Returns

The name of the filter, or an empty string when using the default SQL filter.

8.121.3.10 name() [2/2]

```
dds::topic::Filter & name (
    const std::string & the_name )
```

<<**extension**>> (p. 156) Sets a filter name

You can use one of the built-in filters (**rti::topic::sql_filter_name** (p. 48) and **rti::topic::stringmatch_filter_name** (p. 48)), or a custom filter, which you need to register using **dds::domain::DomainParticipant::register_contentfilter()** (p. 1103).

[default] Empty string (equivalent to **rti::topic::sql_filter_name** (p. 48))

8.122 rti::topic::FilterSampleInfo Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Provides meta information associated with the sample.

```
#include <rti/topic/FilterSampleInfo.hpp>
```

Public Member Functions

- **rti::core::SampleIdentity related_sample_identity () const**
Get the identity of another sample related to this one.
- **int32_t priority () const**
Get a positive integer designating the relative priority of the sample, used to determine the transmission order of pending transmissions.

8.122.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides meta information associated with the sample.

This can be used by a content filter to perform filtering on meta data.

8.122.2 Member Function Documentation

8.122.2.1 related_sample_identity()

```
rti::core::SampleIdentity rti::topic::FilterSampleInfo::related_sample_identity ( ) const [inline]
```

Get the identity of another sample related to this one.

The value of this field identifies another sample that is logically related to the one that is written. For example, the **dds::pub::DataWriter** (p. 908) created by a Replier uses this field to associate the identity of the request sample with a reponse sample.

To specify that there is no related sample identity, use the value **rti::core::SampleIdentity::unknown()** (p. 1991).

A **dds::sub::DataReader** (p. 756) can inspect the related sample identity of a received sample by accessing the fields **dds::sub::SampleInfo::related_original_publication_virtual_guid** (p. 1999) and **dds::sub::SampleInfo::related_↔original_publication_virtual_sequence_number** (p. 1999).

8.122.2.2 priority()

```
int32_t rti::topic::FilterSampleInfo::priority ( ) const [inline]
```

Get a positive integer designating the relative priority of the sample, used to determine the transmission order of pending transmissions.

To use publication priorities, the **rti::core::policy::PublishMode** (p. 1739) must be set for asynchronous publishing and the **dds::pub::DataWriter** (p. 908) must use a **rti::pub::FlowController** (p. 1316) with a **FlowControllerScheduling↔Policy_def::HIGHEST_PRIORITY_FIRST**

For Multi-channel DataWriters, the publication priority of a sample may be used as a filter criteria for determining channel membership.

8.123 rti::flat::FinalAlignedArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of final elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::FinalAlignedArrayOffset< ElementOffset, N >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)
Gets the Offset to an element.

Additional Inherited Members

8.123.1 Detailed Description

```
template<typename ElementOffset, unsigned int N>
class rti::flat::FinalAlignedArrayOffset< ElementOffset, N >
```

Offset to an array of final elements.

Template Parameters

<i>ElementOffset</i>	A final struct Offset, such as MyFlatFinalOffset (p. 1493).
<i>N</i>	The array bound. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

The following code shows how to use a **FinalAlignedArrayOffset** (p. 1309) to initialize an array member with **MyFlat** ← **MutableBuilder** (p. 1497):

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto array_offset = builder.add_my_final_array();
for (MyFlatFinalOffset element_offset : array_offset) {
    element_offset.my_primitive(3);
    // ...
}
// Or access an element directly:
```

```
auto element_offset = array_offset.get_element(3);
element_offset.my_primitive(3);
```

A more efficient way to access a final array, provided it complies with the required preconditions, is through `rti::flat::plain_cast()` (p.217).

FinalArrayOffset (p. 1310) and **FinalAlignedArrayOffset** (p. 1309) provide the same interface, but have different implementation details. **FinalArrayOffset** (p. 1310) is used when the array member is part of a final type too, whereas **FinalAlignedArrayOffset** (p. 1309) corresponds to an array inside a mutable type.

A **FinalAlignedArrayOffset** (p. 1309) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see `rti::flat::plain_cast()` (p.217)).

MutableArrayOffset (p. 1489) encapsulates arrays of variable-size elements

8.123.2 Member Function Documentation

8.123.2.1 get_element()

```
template<typename ElementOffset , unsigned int N>
ElementOffset rti::flat::FinalAlignedArrayOffset< ElementOffset, N >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

The Offset to the element in the i-th position

See also

`rti::flat::plain_cast()` (p. 217) for a method to access **all** (p. 487) the elements at once

8.124 rti::flat::FinalArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of final elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::FinalArrayOffset< ElementOffset, N >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)
Gets the Offset to an element.

8.124.1 Detailed Description

```
template<typename ElementOffset, unsigned int N>
class rti::flat::FinalArrayOffset< ElementOffset, N >
```

Offset to an array of final elements.

Template Parameters

<i>ElementOffset</i>	A final struct Offset, such as MyFlatFinalOffset (p. 1493).
<i>N</i>	The array bound. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

FinalArrayOffset (p. 1310) and **FinalAlignedArrayOffset** (p. 1309) provide the same interface, but have different implementation details. **FinalArrayOffset** (p. 1310) is used when the array member is part of a final type too, whereas **FinalAlignedArrayOffset** (p. 1309) corresponds to an array inside a mutable type.

A **FinalArrayOffset** (p. 1310) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast()** (p. 217)).

8.124.2 Member Function Documentation

8.124.2.1 get_element()

```
template<typename ElementOffset , unsigned int N>
ElementOffset rti::flat::FinalArrayOffset< ElementOffset, N >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

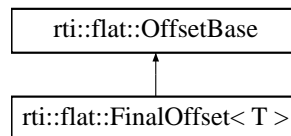

The Offset to the element in the *i*-th position

8.125 rti::flat::FinalOffset< T > Class Template Reference

The base class of all Offsets to a final struct type.

```
#include <Offset.hpp>
```

Inheritance diagram for rti::flat::FinalOffset< T >:

Additional Inherited Members

8.125.1 Detailed Description

```
template<typename T>
class rti::flat::FinalOffset< T >
```

The base class of all Offsets to a final struct type.

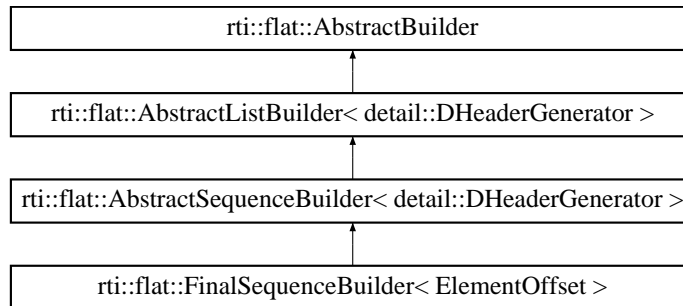

This class contains only implementation details; all the public accessors are defined in the generated type (**MyFlat**↔**FinalOffset** (p. 1493)).

8.126 rti::flat::FinalSequenceBuilder< ElementOffset > Class Template Reference

Builds a sequence member of fixed-size elements.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::FinalSequenceBuilder< ElementOffset >:

Public Member Functions

- ElementOffset **add_next** ()
Adds the next element.
- FinalSequenceBuilder & **add_n** (unsigned int count)
Adds a number of elements at once.
- Offset **finish** ()
Finishes building the sequence.

Additional Inherited Members

8.126.1 Detailed Description

```
template<typename ElementOffset>
class rti::flat::FinalSequenceBuilder< ElementOffset >
```

Builds a sequence member of fixed-size elements.

Template Parameters

<i>ElementOffset</i>	The Offset type for the elements of the sequence
----------------------	--

To add an element, call **add_next()** (p. 1314) and use the ElementOffset it returns to initialize the element's values. An empty sequence can be built by calling **finish()** (p. 1314) without any call to **add_next()** (p. 1314).

This class doesn't enforce the sequence bound set in IDL.

The following example uses a **FinalSequenceBuilder** (p. 1313) to initialize a sequence member of **MyFlatMutableBuilder** (p. 1497) with two elements:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto seq_builder = builder.build_my_final_seq();
MyFlatFinalOffset element = seq_builder.add_next();
element.my_primitive(1);
// ... continue initializing the first element
element = seq_builder.add_next();
element.my_primitive(2);
// ... continue initializing the second element

seq_builder.finish();
```

If the element type meets certain requirements, **rti::flat::plain_cast()** (p. 217) provides a more efficient way to initialize a sequence of final elements.

8.126.2 Member Function Documentation

8.126.2.1 add_next()

```
template<typename ElementOffset >
ElementOffset rti::flat::FinalSequenceBuilder< ElementOffset >::add_next ( ) [inline]
```

Adds the next element.

Returns

The Offset that can be used to set the element values

8.126.2.2 add_n()

```
template<typename ElementOffset >
FinalSequenceBuilder & rti::flat::FinalSequenceBuilder< ElementOffset >::add_n (
    unsigned int count ) [inline]
```

Adds a number of elements at once.

This is an alternative to **add_next()** (p. 1314).

To initialize the elements, call **finish()** (p. 1314) and use the Offset it returns to access the elements.

8.126.2.3 finish()

```
template<typename ElementOffset >
Offset rti::flat::FinalSequenceBuilder< ElementOffset >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

See also

discard() (p. 572)

8.127 rti::flat::flat_type_traits< T > Struct Template Reference

Given a **Sample** (p. 1981), an Offset or a Builder, it allows obtaining the other types.

8.127.1 Detailed Description

```
template<typename T>
struct rti::flat::flat_type_traits< T >
```

Given a **Sample** (p. 1981), an Offset or a Builder, it allows obtaining the other types.

Template Parameters

<i>T</i>	<p>One of the following:</p> <ul style="list-style-type: none"> • A Sample (p. 1981) type, such as MyFlatMutable (p. 213) • An Offset type, such as MyFlatMutableOffset (p. 1504) • A Builder type, such as MyFlatMutableBuilder (p. 1497)
----------	---

Given T, this type provides the following typedefs:

- `flat_type_traits<T>::offset`, T's related offset type (undefined if T itself is an Offset)
- `flat_type_traits<T>::builder`, T's related builder type (undefined if T itself is a Builder, or the topic-type is not mutable)
- `flat_type_traits<T>::flat_type`, T's related **Sample** (p. 1981) type (undefined if T itself is a **Sample** (p. 1981) type)

- `flat_type_traits<T>::plain_type`, T's equivalent definition as a plain (non-FlatData) type.

For example, for T = **MyFlatMutable** (p. 213), **flat_type_traits** (p. 1315) is defined as follows:

```
template <>
struct flat_type_traits<MyFlatMutable> {
    typedef MyFlatMutablePlainHelper plain_type;
    typedef MyFlatMutableOffset offset;
    typedef MyFlatMutableBuilder builder;
};
```

Or if T = **MyFlatMutableOffset** (p. 1504):

```
template <>
struct flat_type_traits<MyFlatMutableOffset> {
    typedef MyFlatMutable flat_type;
    typedef MyFlatMutablePlainHelper plain_type;
    typedef MyFlatMutableBuilder builder;
};
```

8.128 rti::pub::FlowController Class Reference

<<**extension**>> (p. 156) <<**reference-type**>> (p. 153) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **dds::pub::DataWriter** (p. 908) instances are allowed to write data.

```
#include <FlowController.hpp>
```

Inheritance diagram for `rti::pub::FlowController`:

Public Member Functions

- **FlowController** (**dds::domain::DomainParticipant** the_participant, const std::string &the_name, const **FlowControllerProperty** &the_property= **FlowControllerProperty**()) const
Creates a **FlowController** (p. 1316) with specific properties.
- std::string **name** () const
Gets the name of this **FlowController** (p. 1316).
- **dds::domain::DomainParticipant** **participant** () const
Gets the participant associated to this **FlowController** (p. 1316).
- **FlowControllerProperty** **property** () const
Gets the configuration of this **FlowController** (p. 1316).
- void **property** (const **FlowControllerProperty** &prop) const
Gets the configuration of this **FlowController** (p. 1316).

- void **trigger_flow** ()
*Provides an external way to trigger a **FlowController** (p. 1316).*
- void **retain** ()
Disables the automatic destruction of this object.
- void **close** ()
Manually destroys this object.
- bool **closed** () const
*Returns true if this **FlowController** (p. 1316) has been closed.*

Static Public Attributes

- static OMG_DDS_API_CLASS_VARIABLE const std::string **DEFAULT_NAME**
*Name that identifies the built-in default **FlowController** (p. 1316).*
- static OMG_DDS_API_CLASS_VARIABLE const std::string **FIXED_RATE_NAME**
*Name that identifies the built-in fixed-rate **FlowController** (p. 1316).*
- static OMG_DDS_API_CLASS_VARIABLE const std::string **ON_DEMAND_NAME**
*Name that identifies the built-in on-demand **FlowController** (p. 1316).*

Related Functions

(Note that these are not member functions.)

- **FlowController** **find_flow_controller** (**dds::domain::DomainParticipant** **participant**, const std::string & **name**)
*Retrieves an existing **FlowController** (p. 1316).*

8.128.1 Detailed Description

<<**extension**>> (p. 156) <<**reference-type**>> (p. 153) A flow controller is the object responsible for shaping the network traffic by determining when attached asynchronous **dds::pub::DataWriter** (p. 908) instances are allowed to write data.

Note

A **FlowController** (p. 1316) provides all the functions of a <<**reference-type**>> (p. 153), including **close()** (p. 1320) and **retain()** (p. 1320).

8.128.2 Constructor & Destructor Documentation

8.128.2.1 FlowController()

```
rti::pub::FlowController::FlowController (
    dds::domain::DomainParticipant the_participant,
    const std::string & the_name,
    const FlowControllerProperty & the_property = FlowControllerProperty() ) [inline]
```

Creates a **FlowController** (p. 1316) with specific properties.

Parameters

<i>the_participant</i>	The DomainParticipant where this FlowController (p. 1316) exists
<i>the_name</i>	Name to refer to this FlowController (p. 1316)
<i>the_property</i>	Determines how to shape the network traffic

The created **rti::pub::FlowController** (p. 1316) is associated with a **dds::pub::DataWriter** (p. 908) via **rti::core::policy::PublishMode::flow_controller_name** (p. 1743). A single **FlowController** (p. 1316) may service multiple DataWriters instances, even if they belong to a different **dds::pub::Publisher** (p. 1719). The `property` determines how the **FlowController** (p. 1316) shapes the network traffic.

Precondition

The specified `property` must be consistent, or the operation will fail and no **rti::pub::FlowController** (p. 1316) will be created.

See also

rti::pub::FlowControllerProperty (p. 1321) for rules on consistency among **property** (p. 1318)

8.128.3 Member Function Documentation

8.128.3.1 name()

```
std::string rti::pub::FlowController::name ( ) const [inline]
```

Gets the name of this **FlowController** (p. 1316).

8.128.3.2 participant()

```
dds::domain::DomainParticipant rti::pub::FlowController::participant ( ) const [inline]
```

Gets the participant associated to this **FlowController** (p. 1316).

8.128.3.3 property() [1/2]

```
FlowControllerProperty rti::pub::FlowController::property ( ) const [inline]
```

Gets the configuration of this **FlowController** (p. 1316).

8.128.3.4 property() [2/2]

```
void rti::pub::FlowController::property (
    const FlowControllerProperty & prop ) const [inline]
```

Gets the configuration of this **FlowController** (p. 1316).

This operation modifies the property of the **rti::pub::FlowController** (p. 1316).

Once a **rti::pub::FlowController** (p. 1316) has been instantiated, only the **rti::pub::FlowControllerProperty::token↔_bucket** (p. 1323) can be changed. The **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1323) is immutable.

A new **FlowControllerTokenBucketProperty::period** (p. 1331) only takes effect at the next scheduled token distribution time (as determined by its previous value).

Parameters

<i>prop</i>	<< <i>in</i> >> (p. 157) The new rti::pub::FlowControllerProperty (p. 1321). Property must be consistent. Immutable fields cannot be changed after rti::pub::FlowController (p. 1316) has been created.
-------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::ImmutablePolicyError (p. 1353), or dds::core::InconsistentPolicyError (p. 1354).
------------	---

See also

rti::pub::FlowControllerProperty (p. 1321) for rules on consistency among **property** (p. 1318) values.

8.128.3.5 trigger_flow()

```
void rti::pub::FlowController::trigger_flow ( ) [inline]
```

Provides an external way to trigger a **FlowController** (p. 1316).

Typically, a **rti::pub::FlowController** (p. 1316) uses an internal trigger to periodically replenish its tokens. The period by which this trigger is called is determined by the **FlowControllerTokenBucketProperty::period** (p. 1331) property setting.

This function provides an additional, external trigger to the **rti::pub::FlowController** (p. 1316). This trigger adds **Flow↔ControllerTokenBucketProperty::tokens_added_per_period** (p. 1329) tokens each time it is called (subject to the other property settings of the **rti::pub::FlowController** (p. 1316)).

An *on-demand* **rti::pub::FlowController** (p. 1316) can be created with a **dds::core::Duration::infinite()** (p. 1197) as **FlowControllerTokenBucketProperty::period** (p. 1331), in which case the only trigger source is external (i.e. the **FlowController** (p. 1316) is solely triggered by the user on demand).

rti::pub::FlowController::trigger_flow (p. 1319) can be called on both strict *on-demand* **FlowController** (p. 1316) and hybrid **FlowController** (p. 1316) (internally and externally triggered).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.128.3.6 retain()

```
void rti::pub::FlowController::retain ( ) [inline]
```

Disables the automatic destruction of this object.

Disables the automatic destruction of the underlying **FlowController** (p. 1316) when there are no more references to it. After that it can be looked up using **rti::pub::find_flow_controller** (p. 537)

To delete a retained object, manually call **close()** (p. 1320)

8.128.3.7 close()

```
void rti::pub::FlowController::close ( ) [inline]
```

Manually destroys this object.

Destroys the object referenced by this **FlowController** (p. 1316) reference.

After closing it, any calls to this object through this or other references throw **dds::core::AlreadyClosedError** (p. 594).

See also

retain() (p. 1320)

8.128.3.8 closed()

```
bool rti::pub::FlowController::closed ( ) const [inline]
```

Returns true if this **FlowController** (p. 1316) has been closed.

The **FlowController** (p.1316) may have been closed either by calling **close()** (p. 1320) or by closing the related DomainParticipant.

8.128.4 Friends And Related Function Documentation

8.128.4.1 find_flow_controller()

```
FlowController find_flow_controller (
    dds::domain::DomainParticipant participant,
    const std::string & name ) [related]
```

Retrieves an existing **FlowController** (p. 1316).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Parameters

<i>participant</i>	The DomainParticipant associated to the FlowController (p. 1316)
<i>name</i>	The name used to create the FlowController (p. 1316) or the name of one of the built-in FlowControllers (FlowController::DEFAULT_NAME (p. 57), FlowController::FIXED_RATE_NAME (p. 58), FlowController::ON_DEMAND_NAME (p. 59))

Returns

The flow controller with that name in that participant or an empty reference (equals to **dds::core::null** (p. 238)) if it doesn't exist

See also

FlowController::retain() (p. 1320)

8.129 rti::pub::FlowControllerProperty Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Configures a **FlowController** (p. 1316)

```

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **FlowControllerProperty** ()
*Creates a **FlowControllerProperty** (p. 1321) with earliest-deadline-first scheduling policy and default token-bucket configuration.*
- **FlowControllerProperty** (FlowControllerSchedulingPolicy::type **scheduling_policy**, const **FlowController**↔ **TokenBucketProperty** & **token_bucket**= **FlowControllerTokenBucketProperty**())
*Creates a **FlowControllerProperty** (p. 1321) with the specified scheduling policy and token-bucket configuration.*
- FlowControllerSchedulingPolicy::type **scheduling_policy** () const
Gets the scheduling policy.
- **FlowControllerProperty** & **scheduling_policy** (FlowControllerSchedulingPolicy::type value)
Sets the scheduling policy.
- **FlowControllerTokenBucketProperty** & **token_bucket** ()
Gets the token-bucket configuration by reference.
- const **FlowControllerTokenBucketProperty** & **token_bucket** () const
Gets the token-bucket configuration by const-reference.

Static Public Member Functions

- static **FlowControllerProperty RoundRobin** ()
Creates a **FlowControllerProperty** (p. 1321) with round-robin scheduling policy and default token-bucket configuration.
- static **FlowControllerProperty EarliestDeadlineFirst** ()
Creates a **FlowControllerProperty** (p. 1321) with earliest-deadline-first scheduling policy and default token-bucket configuration.
- static **FlowControllerProperty HighestPriorityFirst** ()
Creates a **FlowControllerProperty** (p. 1321) with highest-priority-first scheduling policy and default token-bucket configuration.

8.129.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Configures a **FlowController** (p. 1316)

The flow control characteristics shape the network traffic by determining how often and in what order associated asynchronous **dds::pub::DataWriter** (p. 908) instances are serviced and how much data they are allowed to send.

Note that these settings apply directly to the **rti::pub::FlowController** (p. 1316), and do not depend on the number of **dds::pub::DataWriter** (p. 908) instances the **rti::pub::FlowController** (p. 1316) is servicing. For instance, the specified flow rate does *not* double simply because two **dds::pub::DataWriter** (p. 908) instances are waiting to write.

Entity:

rti::pub::FlowController (p. 1316)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307) for **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1323), **YES** (p. 307) for **rti::pub::FlowControllerProperty::token_bucket** (p. 1323). However, the special value of **dds::core::Duration**↔**::infinite()** (p. 1197) as **FlowControllerTokenBucketProperty::period** (p. 1331) is strictly used to create an *on-demand* **rti::pub::FlowController** (p. 1316). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

8.129.2 Constructor & Destructor Documentation

8.129.2.1 FlowControllerProperty() [1/2]

```
rti::pub::FlowControllerProperty::FlowControllerProperty ( ) [inline]
```

Creates a **FlowControllerProperty** (p. 1321) with earliest-deadline-first scheduling policy and default token-bucket configuration.

8.129.2.2 FlowControllerProperty() [2/2]

```
rti::pub::FlowControllerProperty::FlowControllerProperty (
    FlowControllerSchedulingPolicy::type scheduling_policy,
    const FlowControllerTokenBucketProperty & token_bucket = FlowControllerToken↔
BucketProperty() )
```

Creates a **FlowControllerProperty** (p. 1321) with the specified scheduling policy and token-bucket configuration.

Parameters

<i>scheduling_policy</i>	The scheduling policy
<i>token_bucket</i>	The token-bucket configuration

8.129.3 Member Function Documentation

8.129.3.1 scheduling_policy() [1/2]

```
FlowControllerSchedulingPolicy::type rti::pub::FlowControllerProperty::scheduling_policy ( ) const
```

Gets the scheduling policy.

8.129.3.2 scheduling_policy() [2/2]

```
FlowControllerProperty & rti::pub::FlowControllerProperty::scheduling_policy (
    FlowControllerSchedulingPolicy::type value )
```

Sets the scheduling policy.

Returns

*this

8.129.3.3 token_bucket() [1/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerProperty::token_bucket ( )
```

Gets the token-bucket configuration by reference.

8.129.3.4 token_bucket() [2/2]

```
const FlowControllerTokenBucketProperty & rti::pub::FlowControllerProperty::token_bucket ( )  
const
```

Gets the token-bucket configuration by const-reference.

8.129.3.5 RoundRobin()

```
static FlowControllerProperty rti::pub::FlowControllerProperty::RoundRobin ( ) [inline], [static]
```

Creates a **FlowControllerProperty** (p. 1321) with round-robin scheduling policy and default token-bucket configuration.

See also

FlowControllerSchedulingPolicy_def::ROUND_ROBIN (p. 1326)

8.129.3.6 EarliestDeadlineFirst()

```
static FlowControllerProperty rti::pub::FlowControllerProperty::EarliestDeadlineFirst ( ) [inline],  
[static]
```

Creates a **FlowControllerProperty** (p. 1321) with earliest-deadline-first scheduling policy and default token-bucket configuration.

See also

FlowControllerSchedulingPolicy_def::EARLIEST_DEADLINE_FIRST (p. 1326)

8.129.3.7 HighestPriorityFirst()

```
static FlowControllerProperty rti::pub::FlowControllerProperty::HighestPriorityFirst ( ) [inline],  
[static]
```

Creates a **FlowControllerProperty** (p. 1321) with highest-priority-first scheduling policy and default token-bucket configuration.

See also

FlowControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST (p. 1327)

8.130 rti::pub::FlowControllerSchedulingPolicy_def Struct Reference

<<*extension*>> (p. 156) Kinds of flow controller shceduling policy

```
#include <FlowController.hpp>
```

Public Types

- enum **type** {
ROUND_ROBIN ,
EARLIEST_DEADLINE_FIRST ,
HIGHEST_PRIORITY_FIRST }

The underlying enum type.

8.130.1 Detailed Description

<<*extension*>> (p. 156) Kinds of flow controller shceduling policy

Samples written by an asynchronous **dds::pub::DataWriter** (p. 908) are not sent in the context of the **dds::pub::DataWriter::write()** (p. 918) call. Instead, the middleware puts the samples in a queue for future processing. The **rti::pub::FlowController** (p. 1316) associated with each asynchronous DataWriter instance determines when the samples are actually sent.

Each **rti::pub::FlowController** (p. 1316) maintains a separate FIFO queue for each unique destination (remote application). Samples written by asynchronous **dds::pub::DataWriter** (p. 908) instances associated with the flow controller, are placed in the queues that correspond to the intended destinations of the sample.

When tokens become available, a flow controller must decide which queue(s) to grant tokens first. This is determined by the flow controller's scheduling policy. Once a queue has been granted tokens, it is serviced by the asynchronous publishing thread. The queued up samples will be coalesced and sent to the corresponding destination. The number of samples sent depends on the data size and the number of tokens granted.

QoS:

rti::pub::FlowControllerProperty (p. 1321)

See also

rti::pub::FlowControllerSchedulingPolicy (p. 57) The safe enumeration for this **type** (p. 1325)

8.130.2 Member Enumeration Documentation

8.130.2.1 type

```
enum rti::pub::FlowControllerSchedulingPolicy_def::type
```

The underlying enum type.

Enumerator

ROUND_ROBIN	Indicates to flow control in a round-robin fashion. Whenever tokens become available, the flow controller distributes the tokens uniformly across all of its (non-empty) destination queues. No destinations are prioritized. Instead, all destinations are treated equally and are serviced in a round-robin fashion.
EARLIEST_DEADLINE_FIRST	<p>Indicates to flow control in an earliest-deadline-first fashion. A sample's deadline is determined by the time it was written plus the latency budget of the <code>DataWriter</code> at the time of the write call (as specified in the <code>dds::core::policy::LatencyBudget</code> (p. 1375)). The relative priority of a flow controller's destination queue is determined by the earliest deadline across all samples it contains.</p> <p>When tokens become available, the <code>rti::pub::FlowController</code> (p. 1316) distributes tokens to the destination queues in order of their deadline priority. In other words, the queue containing the sample with the earliest deadline is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal deadline value, the corresponding destination queues are serviced in a round-robin fashion.</p> <p>Hence, under the default <code>dds::core::policy::LatencyBudget::duration</code> (p. 1377) setting, an <code>EDF_FLOW_CONTROLLER_SCHED_POLICY</code> <code>rti::pub::FlowController</code> (p. 1316) preserves the order in which the user calls <code>dds::pub::DataWriter::write()</code> (p. 918) across the <code>DataWriters</code> associated with the flow controller.</p> <p>Since the <code>dds::core::policy::LatencyBudget</code> (p. 1375) is mutable, a sample written second may contain an earlier deadline than the sample written first if the <code>dds::core::policy::LatencyBudget::duration</code> (p. 1377) value is sufficiently decreased in between writing the two samples. In that case, if the first sample is not yet written (still in queue waiting for its turn), it inherits the priority corresponding to the (earlier) deadline from the second sample.</p> <p>In other words, the priority of a destination queue is always determined by the earliest deadline among all samples contained in the queue. This priority inheritance approach is required in order to both honor the updated <code>dds::core::policy::LatencyBudget::duration</code> (p. 1377) and adhere to the <code>dds::pub::DataWriter</code> (p. 908) in-order data delivery guarantee. [default] for <code>dds::pub::DataWriter</code> (p. 908)</p>

Enumerator

HIGHEST_PRIORITY_FIRST	<p>Indicates to flow control in a highest-priority-first fashion. Determines the next destination queue to service as determined by the publication priority of the dds::pub::DataWriter (p. 908), channel of multi-channel DataWriter, or individual sample.</p> <p>The relative priority of a flow controller's destination queue is determined by the highest publication priority of all samples it contains.</p> <p>When tokens become available, the rti::pub::FlowController (p. 1316) distributes tokens to the destination queues in order of their publication priority. In other words, the queue containing the sample with the highest publication priority is serviced first. The number of tokens granted equals the number of tokens required to send the first sample in the queue. Note that the priority of a queue may change as samples are sent (i.e. removed from the queue). If a sample must be sent to multiple destinations or two samples have an equal publication priority, the corresponding destination queues are serviced in a round-robin fashion.</p> <p>This priority inheritance approach is required in order to both honor the designated publication priority and adhere to the dds::pub::DataWriter (p. 908) in-order data delivery guarantee.</p>

8.131.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Configures a **FlowController** (p. 1316) based on a token-bucket mechanism

rti::pub::FlowController (p. 1316) uses the popular token bucket approach for open loop network flow control. The flow control characteristics are determined by the token bucket properties.

Asynchronously published samples are queued up and transmitted based on the token bucket flow control scheme. The token bucket contains tokens, each of which represents a number of bytes. Samples can be sent only when there are sufficient tokens in the bucket. As samples are sent, tokens are consumed. The number of tokens consumed is proportional to the size of the data being sent. Tokens are replenished on a periodic basis.

The rate at which tokens become available and other token bucket properties determine the network traffic flow.

Note that if the same sample must be sent to multiple destinations, separate tokens are required for each destination. Only when multiple samples are destined to the same destination will they be co-alesced and sent using the same token(s). In other words, each token can only contribute to a single network packet.

Entity:

rti::pub::FlowController (p. 1316)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **YES** (p. 307). However, the special value of **dds::core::Duration::infinite()** (p. 1197) as **FlowControllerTokenBucketProperty::period** (p. 1331) is strictly used to create an *on-demand* **rti::pub::FlowController** (p. 1316). The token period cannot toggle from an infinite to finite value (or vice versa). It can, however, change from one finite value to another.

8.131.2 Constructor & Destructor Documentation

8.131.2.1 FlowControllerTokenBucketProperty()

```
rti::pub::FlowControllerTokenBucketProperty::FlowControllerTokenBucketProperty (
    int32_t max_tokens = dds::core::LENGTH_UNLIMITED,
    int32_t tokens_added_per_period = dds::core::LENGTH_UNLIMITED,
    int32_t tokens_leaked_per_period = 0,
    const dds::core::Duration & period = dds::core::Duration(1, 0),
    int32_t bytes_per_token = dds::core::LENGTH_UNLIMITED )
```

Initializes the properties.

8.131.3 Member Function Documentation

8.131.3.1 max_tokens() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::max_tokens ( ) const
```

Gets the max_tokens.

See also

max_tokens(int32_t) (p. 1329)

8.131.3.2 max_tokens() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::max_tokens (
    int32_t value )
```

Sets the maximum number of tokens that can accumulate in the token bucket.

The number of tokens in the bucket will never exceed this value. Any excess tokens are discarded. This property value, combined with **FlowControllerTokenBucketProperty::bytes_per_token** (p. 1331), determines the maximum allowable data burst.

Use **dds::core::LENGTH_UNLIMITED** (p. 238) to allow accumulation of an unlimited amount of tokens (and therefore potentially an unlimited burst size).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, **dds::core::LENGTH_UNLIMITED** (p. 238)]

Returns

*this

8.131.3.3 tokens_added_per_period() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::tokens_added_per_period ( ) const
```

Gets the `tokens_added_per_period`.

See also

tokens_added_per_period(int32_t) (p. 1330)

8.131.3.4 tokens_added_per_period() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::tokens_added_per_↵
period (
    int32_t value )
```

Sets the number of tokens added to the token bucket per specified period.

rti::pub::FlowController (p. 1316) transmits data only when tokens are available. Tokens are periodically replenished. This field determines the number of tokens added to the token bucket with each periodic replenishment.

Available tokens are distributed to associated **dds::pub::DataWriter** (p. 908) instances based on the **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1323).

Use **dds::core::LENGTH_UNLIMITED** (p. 238) to add the maximum number of tokens allowed by **FlowControllerTokenBucketProperty::max_tokens** (p. 1329).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, **dds::core::LENGTH_UNLIMITED** (p. 238)]

Returns

*this

8.131.3.5 tokens_leaked_per_period() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::tokens_leaked_per_period ( ) const
```

Gets the `tokens_leaked_per_period`.

See also

tokens_leaked_per_period(int32_t) (p. 1330)

8.131.3.6 tokens_leaked_per_period() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::tokens_leaked_↔
per_period (
    int32_t value )
```

Sets the number of tokens removed from the token bucket per specified period.

rti::pub::FlowController (p. 1316) transmits data only when tokens are available. When tokens are replenished and there are sufficient tokens to send all samples in the queue, this property determines whether any or all of the leftover tokens remain in the bucket.

Use **dds::core::LENGTH_UNLIMITED** (p. 238) to remove all excess tokens from the token bucket once all samples have been sent. In other words, no token accumulation is allowed. When new samples are written after tokens were purged, the earliest point in time at which they can be sent is at the next periodic replenishment.

[default] 0

[range] [0, **dds::core::LENGTH_UNLIMITED** (p. 238)]

Returns

*this

8.131.3.7 period() [1/2]

```
dds::core::Duration rti::pub::FlowControllerTokenBucketProperty::period ( ) const
```

Gets the period.

See also

period(const dds::core::Duration&) (p. 1331)

8.131.3.8 period() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::period (
    const dds::core::Duration & value )
```

Sets the period for adding tokens to and removing tokens from the bucket.

rti::pub::FlowController (p. 1316) transmits data only when tokens are available. This field determines the period by which tokens are added or removed from the token bucket.

The special value **dds::core::Duration::infinite()** (p. 1197) can be used to create an *on-demand* **rti::pub::Flow↔Controller** (p. 1316), for which tokens are no longer replenished periodically. Instead, tokens must be added explicitly by calling **rti::pub::FlowController::trigger_flow** (p. 1319). This external trigger adds **FlowControllerTokenBucket↔Property::tokens_added_per_period** (p. 1329) tokens each time it is called (subject to the other property settings).

[default] 1 second

[range] [1 nanosec, 1 year] or **dds::core::Duration::infinite()** (p. 1197)

Returns

*this

8.131.3.9 bytes_per_token() [1/2]

```
int32_t rti::pub::FlowControllerTokenBucketProperty::bytes_per_token ( ) const
```

Gets the bytes_per_token.

See also

bytes_per_token(int32_t) (p. 1332)

8.131.3.10 bytes_per_token() [2/2]

```
FlowControllerTokenBucketProperty & rti::pub::FlowControllerTokenBucketProperty::bytes_per_token  
(  
    int32_t value )
```

Sets the maximum number of bytes allowed to send for each token available.

rti::pub::FlowController (p. 1316) transmits data only when tokens are available. This field determines the number of bytes that can actually be transmitted based on the number of tokens.

Tokens are always consumed in whole by each **dds::pub::DataWriter** (p. 908). That is, in cases where **FlowControllerTokenBucketProperty::bytes_per_token** (p. 1331) is greater than the sample size, multiple samples may be sent to the same destination using a single token (regardless of **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1323)).

Where fragmentation is required, the fragment size will be **FlowControllerTokenBucketProperty::bytes_per_token** (p. 1331) or the minimum largest message size across all transports installed with the **dds::pub::DataWriter** (p. 908), whichever is less.

Use **dds::core::LENGTH_UNLIMITED** (p. 238) to indicate that an unlimited number of bytes can be transmitted per token. In other words, a single token allows the recipient **dds::pub::DataWriter** (p. 908) to transmit all its queued samples to a single destination. A separate token is required to send to each additional destination.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1024,**dds::core::LENGTH_UNLIMITED** (p. 238)]

Returns

*this

8.132 Foo Class Reference

An example topic-type.

8.132.1 Detailed Description

An example topic-type.

This API documentation uses the type `Foo` (p. 1332) as a hypothetical **IDL-generated** (p. 395) **topic-type** (p. 244) for many code examples.

It is also used as a synonym of the template parameter of classes like `DataWriter<T>`.

Examples

`Foo.hpp`, and `Foo.idl`.

8.134.1 Detailed Description

Entity:

dds::pub::Publisher (p. 1719), **dds::sub::Subscriber** (p. 2116)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = YES (p. 307)

See also

dds::sub::builtin_subscriber (p. 459)

8.134.2 Usage

The additional information is attached to a `dds::pub::Publisher` (p. 1719) or `dds::sub::Subscriber` (p. 2116). This extra data is not used by RTI Connexx itself. When a remote application discovers the `dds::pub::Publisher` (p. 1719) or `dds::sub::Subscriber` (p. 2116), it can access that information and use it for its own purposes.

Use cases for this QoS policy, as well as the `dds::core::policy::TopicData` (p. 2204) and `dds::core::policy::UserData` (p. 2292), are often application-to-application identification, authentication, authorization, and encryption purposes. For example, applications can use Group or User Data to send security certificates to each other for RSA-type security.

In combination with `dds::sub::DataReaderListener` (p. 832), `dds::pub::DataWriterListener` (p. 972) and operations such as `dds::pub::ignore` (p. 435) and `dds::sub::ignore` (p. 455), this QoS policy can help an application to define and enforce its own security policies. For example, an application can implement matching policies similar to those of the `dds::core::policy::Partition` (p. 1652), except the decision can be made based on an application-defined policy.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connexx stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connexx with the maximum size of the data that will be stored in policies of this type. This size is configured with `rti::core::policy::DomainParticipantResourceLimits::publisher_group_data_max_length` (p. 1165) and `rti::core::policy::DomainParticipantResourceLimits::subscriber_group_data_max_length` (p. 1166).

```
dds::core::ByteSeq & dds::core::policy::GroupData::value (
    dds::core::ByteSeq & dst ) const [inline]
```

Sets the value for this **GroupData** (p. 1335).

8.134.4.4 begin()

```
const uint8_t * dds::core::policy::GroupData::begin ( ) const [inline]
```

Beginning of the range of bytes.

8.134.4.5 end()

```
const uint8_t * dds::core::policy::GroupData::end ( ) const [inline]
```

End of the range of bytes.

8.135 dds::core::cond::GuardCondition Class Reference

<<*reference-type*>> (p. 153) A condition whose trigger value is under the control of the application.

```
#include <dds/core/cond/GuardCondition.hpp>
```

Inheritance diagram for dds::core::cond::GuardCondition:

Public Member Functions

- template<typename Functor >
void **handler** (const Functor &func)
Registers a custom handler with this condition.
- void **reset_handler** ()
Resets the handler for this condition.
- void **trigger_value** (bool value)
Manually sets the trigger value.

8.135.1 Detailed Description

<<*reference-type*>> (p. 153) A condition whose trigger value is under the control of the application.

The `dds::core::cond::GuardCondition` (p. 1338) provides a way for an application to manually wake up a `dds::core::cond::WaitSet` (p. 2318). This is accomplished by attaching the `dds::core::cond::GuardCondition` (p. 1338) to the `dds::core::cond::WaitSet` (p. 2318) and then setting the `trigger_value` by means of the `dds::core::cond::GuardCondition::trigger_value()` (p. 1339) operation.

See also

`dds::core::cond::WaitSet` (p. 2318)

8.135.2 Member Function Documentation

8.135.2.1 handler()

```
template<typename Functor >
void dds::core::cond::GuardCondition::handler (
    const Functor & func ) [inline]
```

Registers a custom handler with this condition.

For information about condition handlers, see **this ReadCondition constructor** (p. 1859)

Parameters

<i>func</i>	The handler to be registered with this condition. This argument is copied.
-------------	--

MT Safety:

It is not safe to call **handler()** (p. 1338), **reset_handler()** (p. 1339) or **trigger_value()** (p. 1339) concurrently. It is not safe to call **handler()** (p. 1338) or **reset_handler()** (p. 1339) while this condition is attached to a waitset being dispatched.

8.135.2.2 reset_handler()

```
void dds::core::cond::GuardCondition::reset_handler ( ) [inline]
```

Resets the handler for this condition.

After the invocation of this method no handler will be registered with this condition.

MT Safety:

It is not safe to call **handler()** (p. 1338), **reset_handler()** (p. 1339) or **trigger_value()** (p. 1339) concurrently.

8.135.2.3 trigger_value()

```
void dds::core::cond::GuardCondition::trigger_value (
    bool value ) [inline]
```

Manually sets the trigger value.

Setting the trigger value to true causes the activation of the condition in a **WaitSet** (p. 2318).

See also

WaitSet::wait() (p. 2323)

WaitSet::dispatch() (p. 2325)

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Class for GUID (Global Unique Identifier) representation

8.136.2 Constructor & Destructor Documentation

8.136.2.1 Guid()

```
rti::core::Guid::Guid ( ) [inline]
```

Create a default **Guid** (p. 1340) representing the unknown guid.

8.136.3 Member Function Documentation

8.136.3.1 unknown()

```
static Guid rti::core::Guid::unknown ( ) [inline], [static]
```

Unknown GUID.

8.136.3.2 zero()

```
static Guid rti::core::Guid::zero ( ) [inline], [static]
```

Zero GUID.

8.136.3.3 automatic()

```
static Guid rti::core::Guid::automatic ( ) [inline], [static]
```

Construct a **Guid** (p. 1340) indicating that RTI Connex should choose an appropriate virtual GUID.

Indicates that RTI Connex should choose an appropriate virtual GUID.

If this special value is assigned to **rti::core::policy::DataWriterProtocol::virtual_guid** (p. 981) or **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 837), RTI Connex will assign the virtual GUID automatically based on the RTPS or physical GUID.

8.136.3.4 operator[]() [1/2]

```
uint8_t & rti::core::Guid::operator[] (
    uint32_t index )
```

Get a reference to value of the **Guid** (p. 1340) at position index.

8.136.3.5 operator[]() [2/2]

```
const uint8_t & rti::core::Guid::operator[] (
    uint32_t index ) const
```

Get const reference to the value of the **Guid** (p. 1340) at position index.

8.136.3.6 operator<()

```
bool rti::core::Guid::operator< (
    const Guid & other ) const
```

Compare two **Guids** for a less-than relationship.

8.136.3.7 operator<=()

```
bool rti::core::Guid::operator<= (
    const Guid & other ) const
```

Compare two **Guids** for a less-than-or-equal relationship.

8.136.3.8 operator>()

```
bool rti::core::Guid::operator> (
    const Guid & other ) const
```

Compare two **Guids** for a greater-than relationship.

8.136.3.9 operator>=()

```
bool rti::core::Guid::operator>= (
    const Guid & other ) const
```

Compare two **Guid**s for a greater-than-or-equal relationship.

8.136.4 Friends And Related Function Documentation

8.136.4.1 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const Guid & guid ) [related]
```

Prints a **Guid** (p. 1340) to an output stream.

8.136.5 Member Data Documentation

8.136.5.1 LENGTH

```
const size_t rti::core::Guid::LENGTH = 16 [static]
```

The number of elements of a **Guid** (p. 1340).

8.137 rti::util::heap_monitoring::HeapMonitoringParams Class Reference

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

```
#include <util.hpp>
```

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **HeapMonitoringParams** (**SnapshotOutputFormat** **snapshot_output_format**=rti::util::heap_monitoring::↔ SnapshotOutputFormat::STANDARD, **SnapshotContentFormat** **snapshot_content_format**=rti::util::heap_↔ monitoring::SnapshotContentFormat::DEFAULT)
- Create **HeapMonitoringParams** (p. 1343).
- **SnapshotOutputFormat** **snapshot_output_format** () const
- Get the format of the output of the snapshot.
- void **snapshot_output_format** (**SnapshotOutputFormat** **snapshot_output_format**)
- Set the format of the output of the snapshot.
- **SnapshotContentFormat** **snapshot_content_format** () const
- Get the bitmap to decide which information of the snapshot will be displayed.
- void **snapshot_content_format** (**SnapshotContentFormat** **snapshot_content_format**)
- Set the bitmap to decide which information of the snapshot will be displayed.

8.137.1 Detailed Description

Input parameters for enabling heap monitoring. They will be used for configuring the format of the snapshot.

<<**extension**>> (p. 156) Input parameters for enabling heap monitoring They will be used for configuring the format of the snapshot.

8.137.2 Constructor & Destructor Documentation

8.137.2.1 HeapMonitoringParams()

```
rti::util::heap_monitoring::HeapMonitoringParams::HeapMonitoringParams (
    SnapshotOutputFormat snapshot_output_format = rti::util::heap_monitoring::SnapshotOutputFormat↔
    ::STANDARD,
    SnapshotContentFormat snapshot_content_format = rti::util::heap_monitoring::SnapshotContentFormat↔
    ::DEFAULT )
```

Create **HeapMonitoringParams** (p. 1343).

Parameters

<i>snapshot_output_format</i>	The format of the output of the snapshot.
<i>snapshot_content_format</i>	The bitmap to decide which information of the snapshot will be displayed.

8.137.3 Member Function Documentation

8.137.3.1 snapshot_output_format() [1/2]

```
SnapshotOutputFormat rti::util::heap_monitoring::HeapMonitoringParams::snapshot_output_format ( )  
const
```

Get the format of the output of the snapshot.

Returns

The format of the output of the snapshot

8.137.3.2 snapshot_output_format() [2/2]

```
void rti::util::heap_monitoring::HeapMonitoringParams::snapshot_output_format (   
    SnapshotOutputFormat snapshot_output_format )
```

Set the format of the output of the snapshot.

Parameters

<i>snapshot_output_format</i>	The format of the output of the snapshot
-------------------------------	--

8.137.3.3 snapshot_content_format() [1/2]

```
SnapshotContentFormat rti::util::heap_monitoring::HeapMonitoringParams::snapshot_content_format (   
 ) const
```

Get the bitmap to decide which information of the snapshot will be displayed.

Returns

The bitmap to decide which information of the snapshot will be displayed.

8.137.3.4 snapshot_content_format() [2/2]

```
void rti::util::heap_monitoring::HeapMonitoringParams::snapshot_content_format (   
    SnapshotContentFormat snapshot_content_format )
```

Set the bitmap to decide which information of the snapshot will be displayed.

Parameters

<code>snapshot_content_format</code>	The bitmap to decide which information of the snapshot will be displayed.
--------------------------------------	---

8.138 dds::core::policy::History Class Reference

Specifies how much historical data a **dds::pub::DataWriter** (p. 908) and a **dds::sub::DataReader** (p. 756) can store.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **History** ()
Creates a policy that keeps the last sample only.
- **History** (**dds::core::policy::HistoryKind** the_kind, int32_t the_depth=1)
Creates a policy with a specific history kind and optionally a history depth.
- **History & kind** (**dds::core::policy::HistoryKind** the_kind)
Sets the history kind.
- **dds::core::policy::HistoryKind kind** () const
Gets the history kind.
- int32_t **depth** () const
Gets the history depth.
- **History & depth** (int32_t the_depth)
Sets the history depth.

Static Public Member Functions

- static **History KeepAll** ()
*Creates a **History** (p. 1346) with HistoryKind::KEEP_ALL.*
- static **History KeepLast** (uint32_t depth)
*Creates a **History** (p. 1346) with HistoryKind::KEEP_LAST and the specified depth.*

8.138.1 Detailed Description

Specifies how much historical data a **dds::pub::DataWriter** (p. 908) and a **dds::sub::DataReader** (p. 756) can store.

This QoS policy specifies how much data must to stored by RTI Connex for a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756). It controls whether RTI Connex should deliver only the most recent value, attempt to deliver all intermediate values, or do something in between.

On the publishing side, this QoS policy controls the samples that should be maintained by the **dds::pub::DataWriter** (p. 908) on behalf of existing **dds::sub::DataReader** (p. 756) entities. The behavior with regards to a **dds::sub::DataReader** (p. 756) entities discovered after a sample is written is controlled by the **DURABILITY** (p. 320) policy.

On the subscribing side, this QoS policy controls the samples that should be maintained until the application "takes" them from RTI Connex.

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

See also

dds::core::policy::Reliability (p. 1873)

dds::core::policy::History (p. 1346)

8.138.2 Usage

This policy controls the behavior of RTI Connex when the value of an instance changes before it is finally communicated to **dds::sub::DataReader** (p. 756) entities.

When a **dds::pub::DataWriter** (p. 908) sends data, or a **dds::sub::DataReader** (p. 756) receives data, the data sent or received is stored in a cache whose contents are controlled by this QoS policy. This QoS policy interacts with **dds::core::policy::Reliability** (p. 1873) by controlling whether RTI Connex guarantees that *all* of the sent data is received (**dds::core::policy::HistoryKind::KEEP_ALL**) or if only the last *N* data values sent are guaranteed to be received (**dds::core::policy::HistoryKind::KEEP_LAST**)—this is a reduced level of reliability.

The amount of data that is sent to new DataReaders who have configured their **dds::core::policy::Durability** (p. 1181) to receive previously published data is controlled by **dds::core::policy::Durability::writer_depth** (p. 1187), not by the **History** (p. 1346) QoS policy.

Note that the **History** (p. 1346) QoS policy does not control the *physical* sizes of the send and receive queues. The memory allocation for the queues is controlled by the **dds::core::policy::ResourceLimits** (p. 1921).

If *kind* is **dds::core::policy::HistoryKind::KEEP_LAST** (the default), then RTI Connex will only attempt to keep the latest values of the instance and discard the older ones. In this case, the value of *depth* regulates the maximum number of values (up to and including the most current one) RTI Connex will maintain and deliver until the samples are fully acknowledged. After *N* values have been sent or received, any new data will overwrite the oldest data in the queue. Thus the queue acts like a circular buffer of length *N*.

For keyed-data, there is different behavior on the publishing and subscribing sides associated with how invalid samples representing the disposal of or unregistration from an instance affect history.

On the publishing side, unregistering from or disposing of an instance creates an invalid sample that is accounted for in the history depth. This means that an invalid sample may replace a value that is currently being stored in the writer queue.

On the subscribing side, however, invalid samples do not count towards history depth and will not replace a value that is being stored in the reader queue.

On both the publishing and subscribing sides, there can only ever be one invalid sample per-instance and that one sample can be in different states depending on whether the instance has been disposed, unregistered, or both.

The default (and most common setting) for *depth* is 1, indicating that only the most recent value should be delivered.

If *kind* is **dds::core::policy::HistoryKind::KEEP_ALL**, then RTI Connex will attempt to maintain and deliver all the values of the instance to existing subscribers. The resources that RTI Connex can use to keep this history are limited by the settings of the **RESOURCE_LIMITS** (p. 336). If the limit is reached, then the behavior of RTI Connex will depend on the **RELIABILITY** (p. 335). If the **Reliability** (p. 1873) *kind* is **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 1881), then the old values will be discarded. If **Reliability** (p. 1873) *kind* is **RELIABLE**, then RTI Connex will block the **dds::pub::DataWriter** (p. 908) until it can deliver the necessary old values to all subscribers.

8.138.3 Consistency

This QoS policy's `depth` must be consistent with the **RESOURCE_LIMITS** (p.336) `max_samples_per_instance`. For these two QoS to be consistent, they must verify that `depth <= max_samples_per_instance`.

See also

dds::core::policy::ResourceLimits (p. 1921)

8.138.4 Constructor & Destructor Documentation

8.138.4.1 History() [1/2]

```
dds::core::policy::History::History ( ) [inline]
```

Creates a policy that keeps the last sample only.

8.138.4.2 History() [2/2]

```
dds::core::policy::History::History (
    dds::core::policy::HistoryKind the_kind,
    int32_t the_depth = 1 ) [inline]
```

Creates a policy with a specific history kind and optionally a history depth.

The history depth doesn't apply to `HistoryKind::KEEP_ALL`

8.138.5 Member Function Documentation

8.138.5.1 kind() [1/2]

```
History & dds::core::policy::History::kind (
    dds::core::policy::HistoryKind the_kind ) [inline]
```

Sets the history kind.

Specifies the kind of history to be kept.

For `DataWriters`, the samples are only kept either until they are fully acknowledged by all matching `DataReaders` or until they are replaced or removed. Samples can be replaced or removed for a number of reasons, including but not limited to **dds::core::policy::Lifespan** (p. 1379) expiration, replacement because the **dds::core::policy::History::depth** (p. 1349) has been exceeded, or one of the **dds::core::policy::ResourceLimits** (p. 1921) settings has been exceeded.

[default] `dds::core::policy::HistoryKind::KEEP_LAST`

8.138.5.2 kind() [2/2]

```
dds::core::policy::HistoryKind dds::core::policy::History::kind ( ) const [inline]
```

Gets the history kind.

8.138.5.3 depth() [1/2]

```
int32_t dds::core::policy::History::depth ( ) const [inline]
```

Gets the history depth.

8.138.5.4 depth() [2/2]

```
History & dds::core::policy::History::depth (
    int32_t the_depth ) [inline]
```

Sets the history depth.

Specifies the number of samples per instance to be kept, when the `kind` is `dds::core::policy::HistoryKind::KEEP_↔LAST<P>`

If a value other than 1 (the default) is specified, it should be consistent with the settings of the **RESOURCE_LIMITS** (p. 336) policy. That is:

`depth <= dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925)

When the `kind` is `dds::core::policy::HistoryKind::KEEP_ALL`, the depth has no effect. Its implied value is `infinity` (in practice limited by the settings of the **RESOURCE_LIMITS** (p. 336) policy).

When a `DataWriter` responds to a `TopicQuery`, the samples that are evaluated against the `TopicQuery` filter are only those samples that fall within the `dds::core::policy::Durability::writer_depth` (p. 1187), not this depth.

[default] 1

[range] [1,100 million], `<= dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925)

8.138.5.5 KeepAll()

```
static History dds::core::policy::History::KeepAll ( ) [inline], [static]
```

Creates a **History** (p. 1346) with `HistoryKind::KEEP_ALL`.

8.138.5.6 KeepLast()

```
static History dds::core::policy::History::KeepLast (
    uint32_t depth ) [inline], [static]
```

Creates a **History** (p. 1346) with HistoryKind::KEEP_LAST and the specified depth.

8.139 dds::core::policy::HistoryKind_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 1972) HistoryKind.

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
 KEEP_LAST ,
 KEEP_ALL }

The underlying enum type.

8.145.2 Constructor & Destructor Documentation

8.145.2.1 InstanceHandle()

```
dds::core::InstanceHandle::InstanceHandle (
    const dds::core::null_type & null_handle ) [inline]
```

Create a nil instance handle.

8.145.3 Member Function Documentation

8.145.3.1 operator==()

```
bool dds::core::InstanceHandle::operator==(
    const dds::core::null_type & ) const [inline]
```

Returns `is_nil()` (p. 1358)

8.145.3.2 nil()

```
static InstanceHandle dds::core::InstanceHandle::nil ( ) [inline], [static]
```

Returns the nil instance handle.

Special `dds::core::InstanceHandle` (p. 1356) value

See also

`dds::core::InstanceHandle::is_nil` (p. 1358)

8.145.3.3 is_nil()

```
bool dds::core::InstanceHandle::is_nil ( ) const [inline]
```

Check if this `InstanceHandle` (p. 1356) represents the nil `InstanceHandle` (p. 1356).

Returns

true if the `InstanceHandle` (p. 1356) is nil, false otherwise

8.145.4 Friends And Related Function Documentation

8.145.4.1 operator<<()

```
std::ostream & operator<< (
    std::ostream & os,
    const dds::core::InstanceHandle & h ) [related]
```

Prints an instance handle.

The format is 16 2-digit contiguous hexadecimal numbers, for example:

```
0000004d000000000000000000000000
```

Examples

Foo.hpp.

Indicates if the samples are from a live **dds::pub::DataWriter** (p. 908) or not.

```
#include <dds/sub/status/DataState.hpp>
```

Inherits `std::bitset< OMG_DDS_STATE_BIT_COUNT >`.

Public Types

- typedef `std::bitset< OMG_DDS_STATE_BIT_COUNT >` **MaskType**
An `std::bitset` of `InstanceStates`.

Public Member Functions

- **InstanceState** (const **MaskType** &other)
*Create an **InstanceState** (p. 1359) from `MaskType`.*

Static Public Member Functions

- static const **InstanceState** **alive** ()
*Creates an alive **InstanceState** (p. 1359) object.*
- static const **InstanceState** **not_alive_disposed** ()
*Creates a `not_alive_disposed` **InstanceState** (p. 1359) object.*
- static const **InstanceState** **not_alive_no_writers** ()
*Creates a `not_alive_no_writers` **InstanceState** (p. 1359) object.*
- static const **InstanceState** **not_alive_mask** ()
*Creates an **InstanceState** (p. 1359) object representing any not alive state.*
- static const **InstanceState** **any** ()
*Creates an **InstanceState** (p. 1359) object representing any instance state.*

Related Functions

(Note that these are not member functions.)

- `std::ostream & operator<<` (`std::ostream &os`, const **InstanceState** &s)
Prints an instance state as a readable string.

8.146.1 Detailed Description

Indicates if the samples are from a live `dds::pub::DataWriter` (p. 908) or not.

For each instance, the middleware internally maintains an instance state. The instance state can be:

- `dds::sub::status::InstanceState::alive()` (p. 1361) indicates that (a) samples have been received for the instance, (b) there are live `dds::pub::DataWriter` (p. 908) entities writing the instance, and (c) the instance has not been explicitly disposed (or else more samples have been received after it was disposed).
- `dds::sub::status::InstanceState::not_alive_disposed()` (p. 1361) indicates the instance was explicitly disposed by a `dds::pub::DataWriter` (p. 908) by means of the dispose operation.
- `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361) indicates the instance has been declared as not-alive by the `dds::sub::DataReader` (p. 756) because it detected that there are no live `dds::pub::DataWriter` (p. 908) entities writing that instance.

The precise behavior events that cause the instance state to change depends on the setting of the OWNERSHIP QoS:

- If **OWNERSHIP** (p. 329) is set to `dds::core::policy::OwnershipKind_def::EXCLUSIVE` (p. 1637), then the instance state becomes `dds::sub::status::InstanceState::not_alive_disposed()` (p. 1361) only if the `dds::pub::DataWriter` (p. 908) that "owns" the instance explicitly disposes it. The instance state becomes `dds::sub::status::InstanceState::alive()` (p. 1361) again only if the `dds::pub::DataWriter` (p. 908) that owns the instance writes it.
- If **OWNERSHIP** (p. 329) is set to `dds::core::policy::OwnershipKind_def::SHARED` (p. 1637), then the instance state becomes `dds::sub::status::InstanceState::not_alive_disposed()` (p. 1361) if any `dds::pub::DataWriter` (p. 908) explicitly disposes the instance. The instance state becomes `dds::sub::status::InstanceState::alive()` (p. 1361) as soon as any `dds::pub::DataWriter` (p. 908) writes the instance again.

The instance state available in the `dds::sub::SampleInfo` (p. 1992) is a snapshot of the instance state of the instance at the time the collection was obtained (i.e. at the time read or take was called). The instance state is therefore the same for all samples in the returned collection that refer to the same instance.

For example, you can check if an instance is disposed as follows:

```
for (auto sample : reader.take()) {
    if (sample.info().state().instance_state() ==
        dds::sub::status::InstanceState::not_alive_disposed()) {
        // ...
    }
}
```

8.146.2 Member Typedef Documentation

8.146.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATE_BIT_COUNT > dds::sub::status::InstanceState::MaskType
```

An std::bitset of InstanceStates.

8.146.3 Constructor & Destructor Documentation

8.146.3.1 InstanceState()

```
dds::sub::status::InstanceState::InstanceState (
    const MaskType & other ) [inline]
```

Create an **InstanceState** (p. 1359) from MaskType.

Parameters

<i>other</i>	The MaskType to create the InstanceState (p. 1359) with
--------------	--

8.146.4 Member Function Documentation

8.146.4.1 alive()

```
static const InstanceState dds::sub::status::InstanceState::alive ( ) [inline], [static]
```

Creates an alive **InstanceState** (p. 1359) object.

The instance is currently in existence.

Referenced by **dds::sub::status::DataState::any_data()**, **dds::sub::status::DataState::new_data()**, and **dds::sub::status::DataState::new_instance()**.

8.146.4.2 not_alive_disposed()

```
static const InstanceState dds::sub::status::InstanceState::not_alive_disposed ( ) [inline],
[static]
```

Creates a not_alive_disposed **InstanceState** (p. 1359) object.

Indicates that the instance has been disposed by a DataWriter.

8.146.4.3 not_alive_no_writers()

```
static const InstanceState dds::sub::status::InstanceState::not_alive_no_writers ( ) [inline],
[static]
```

Creates a not_alive_no_writers **InstanceState** (p. 1359) object.

Indicates that none of the DataWriters that are currently alive (according to the **dds::core::policy::Liveliness** (p. 1389) policy) are writing the instance.

8.146.4.4 not_alive_mask()

```
static const InstanceState dds::sub::status::InstanceState::not_alive_mask ( ) [inline], [static]
```

Creates an **InstanceState** (p. 1359) object representing any not alive state.

This is equivalent to **not_alive_disposed()** (p. 1361) | **not_alive_no_writers()** (p. 1361)

8.146.4.5 any()

```
static const InstanceState dds::sub::status::InstanceState::any ( ) [inline], [static]
```

Creates an **InstanceState** (p. 1359) object representing any instance state.

This is equivalent to **not_alive_mask()** (p. 1362) | **alive()** (p. 1361).

Referenced by **dds::sub::status::DataState::any()**.

8.146.5 Friends And Related Function Documentation

8.146.5.1 operator<<()

```
std::ostream & operator<< (
    std::ostream & os,
    const InstanceState & s ) [related]
```

Prints an instance state as a readable string.

8.147 dds::core::InvalidArgumentError Class Reference

Indicates that the application passed an illegal parameter value into an operation.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::InvalidArgumentError:

Public Member Functions

- virtual const char * **what** () const throw ()

*Access the message contained in this **InvalidArgumentError** (p. 1363) exception.*

8.147.1 Detailed Description

Indicates that the application passed an illegal parameter value into an operation.

Inherits also from `std::invalid_argument`

8.147.2 Member Function Documentation

8.147.2.1 what()

```
virtual const char * dds::core::InvalidArgumentError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **InvalidArgumentError** (p. 1363) exception.

Returns

The message.

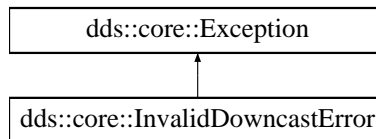

Implements **dds::core::Exception** (p. 1292).

8.148 dds::core::InvalidDowncastError Class Reference

Indicates that a downcast was incorrect.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::InvalidDowncastError:

Public Member Functions

- virtual const char * **what** () const throw ()
Access the message contained in this **InvalidDowncastError** (p. 1364) exception.

8.148.1 Detailed Description

Indicates that a downcast was incorrect.

Inherits also from `std::runtime_error`

See also

- [dds::core::polymorphic_cast](#) (p. 408)
- [dds::pub::AnyDataWriter::get\(\)](#) (p. 607)

8.148.2 Member Function Documentation

8.148.2.1 what()

```
virtual const char * dds::core::InvalidDowncastError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **InvalidDowncastError** (p. 1364) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.149 rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus Class Reference

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::invalid_local_identity_↔ advance_notice()` (p. 2095)

```
#include <Status.hpp>
```

Inherits `rti::core::NativeValueType< T, NATIVE_T, ADAPTER >`.

Public Member Functions

- `dds::core::Time expiration_time ()` const
The time when the local identity will expire.

8.149.1 Detailed Description

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::invalid_local_identity_↔ advance_notice()` (p. 2095)

Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the `RTI Security Plugins User's Manual` for more information.

8.149.2 Member Function Documentation

8.149.2.1 expiration_time()

```
dds::core::Time rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus::expiration_time ( )
const [inline]
```

The time when the local identity will expire.

8.150 dds::topic::is_topic_type< T > Struct Template Reference

Trait that indicates if a type is suitable to be the type of a `dds::topic::Topic` (p. 2178).

```
#include <TopicTraits.hpp>
```

Inherits `dds::core::false_type`.

8.150.1 Detailed Description

```
template<typename T>
struct dds::topic::is_topic_type< T >
```

Trait that indicates if a type is suitable to be the type of a **dds::topic::Topic** (p. 2178).

When a type T meets this requirement the `is_topic_type<T>` inherits from `dds::core::true_type` and defines a member constant `is_topic_type<T>::value` that is true. For all other types it inherits from `dds::core::false_type` and defines `value` to false.

Types **generated by rtdsngen** (p. 395) (except for those annotated with `@nested`), **dds::core::xtypes::DynamicData** (p. 1208) and the **Builtin types** (p. 49) all meet this requirement.

Attempting to instantiate a `dds::topic::Topic<Foo>` if `is_topic_type<Foo>::value` is false results in a compilation error.

8.151 rti::request::IsReplyRelatedPredicate< T > Class Template Reference

Functor to match replies by their related request.

```
#include <util.hpp>
```

Public Member Functions

- **IsReplyRelatedPredicate** (const **rti::core::SampleIdentity** &related_request_id)
Creates the predicate with the request id to match.
- bool **operator()** (**dds::sub::Sample**< T > sample)
Determines if a reply is related to the request id this object contains.
- bool **operator()** (**rti::sub::LoanedSample**< T > sample)
Determines if a reply is related to the request id this object contains.
- bool **operator()** (**dds::sub::SampleInfo** sample_info)
Determines if a reply info is related to the request id this object contains.

8.151.1 Detailed Description

```
template<typename T>
class rti::request::IsReplyRelatedPredicate< T >
```

Functor to match replies by their related request.

Useful for C++ standard algorithms like `std::find_if()`

See also

Correlating requests and replies (p. 147)

8.151.2 Constructor & Destructor Documentation

8.151.2.1 IsReplyRelatedPredicate()

```
template<typename T >
rti::request::IsReplyRelatedPredicate< T >::IsReplyRelatedPredicate (
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Creates the predicate with the request id to match.

8.151.3 Member Function Documentation

8.151.3.1 operator>() [1/3]

```
template<typename T >
bool rti::request::IsReplyRelatedPredicate< T >::operator() (
    dds::sub::Sample< T > sample ) [inline]
```

Determines if a reply is related to the request id this object contains.

References `dds::sub::Sample< T >::info()`, and `dds::sub::SampleInfo::related_original_publication_virtual_↔sample_identity()`.

8.151.3.2 operator>() [2/3]

```
template<typename T >
bool rti::request::IsReplyRelatedPredicate< T >::operator() (
    rti::sub::LoanedSample< T > sample ) [inline]
```

Determines if a reply is related to the request id this object contains.

References `rti::sub::LoanedSample< T >::info()`, and `dds::sub::SampleInfo::related_original_publication_virtual_↔virtual_sample_identity()`.

8.151.3.3 operator>() [3/3]

```
template<typename T >
bool rti::request::IsReplyRelatedPredicate< T >::operator() (
    dds::sub::SampleInfo sample_info ) [inline]
```

Determines if a reply info is related to the request id this object contains.

References `dds::sub::SampleInfo::related_original_publication_virtual_sample_identity()`.

8.152 rti::sub::IsValidData< T > Struct Template Reference

<<*extension*>> (p. 156) A functor that returns true when a sample has valid data.

```
#include <LoanedSamplesImpl.hpp>
```

Public Types

- typedef `LoanedSamples< T >::value_type` **sample_type**
LoanedSample (p. 1402) type.

Public Member Functions

- bool **operator()** (const **sample_type** &sample)
Returns true if this sample contains valid data.

8.152.1 Detailed Description

```
template<typename T>
struct rti::sub::IsValidData< T >
```

<<*extension*>> (p. 156) A functor that returns true when a sample has valid data.

This functor is useful in algorithms that iterate on `LoanedSamples`. For example:

```
LoanedSamples<Foo> samples = reader.take();
std::cout << "Valid sample count: "
    << std::count_if(samples.begin(), samples.end(), IsValidData<Foo>());
```

A similar utility is the iterator `valid_data()` (p. 553).

See also

- `dds::sub::LoanedSamples` (p. 1406)
- `valid_data()` (p. 553)

8.152.2 Member Typedef Documentation

8.152.2.1 sample_type

```
template<typename T >
typedef LoanedSamples<T>::value_type rti::sub::IsValidData< T >::sample_type
```

LoanedSample (p. 1402) type.

8.152.3 Member Function Documentation

8.152.3.1 operator()

```
template<typename T >
bool rti::sub::IsValidData< T >::operator() (
    const sample_type & sample ) [inline]
```

Returns true if this sample contains valid data.

That is, if `sample.info().valid()`.

8.153 dds::core::KeyedBytesTopicType Class Reference

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

```
#include <dds/core/BuiltinTopicTypes.hpp>
```

Public Member Functions

- **KeyedBytesTopicType** ()
Creates a sample with an empty array of bytes and an empty string.
- **KeyedBytesTopicType** (const std::string &the_key, const std::vector< uint8_t > &the_value)
Creates a sample with the given key and bytes.
- const **dds::core::string & key** () const
Gets the key.
- **dds::core::string & key** ()
Gets the key.
- void **key** (const **dds::core::string** &the_value)
Sets the key.
- **operator std::vector< uint8_t > ()** const
Conversion to std::vector by obtaining the bytes.
- std::vector< uint8_t > **value** () const
Gets the bytes.
- void **value** (const std::vector< uint8_t > &the_value)
Sets the bytes.
- uint8_t & **operator[]** (uint32_t index)
Accesses the bytes by index.
- uint8_t **operator[]** (uint32_t index) const
Accesses the bytes by index.
- int32_t **length** () const
Get the number of bytes.

8.153.1 Detailed Description

Built-in type consisting of a variable-length array of opaque bytes and a string that is the key.

8.153.2 Constructor & Destructor Documentation

8.153.2.1 KeyedBytesTopicType() [1/2]

```
dds::core::KeyedBytesTopicType::KeyedBytesTopicType ( ) [inline]
```

Creates a sample with an empty array of bytes and an empty string.

8.153.2 KeyedBytesTopicType() [2/2]

```
dds::core::KeyedBytesTopicType::KeyedBytesTopicType (
    const std::string & the_key,
    const std::vector< uint8_t > & the_value ) [inline]
```

Creates a sample with the given key and bytes.

8.153.3 Member Function Documentation

8.153.3.1 key() [1/3]

```
const dds::core::string & dds::core::KeyedBytesTopicType::key ( ) const [inline]
```

Gets the key.

8.153.3.2 key() [2/3]

```
dds::core::string & dds::core::KeyedBytesTopicType::key ( ) [inline]
```

Gets the key.

8.153.3.3 key() [3/3]

```
void dds::core::KeyedBytesTopicType::key (
    const dds::core::string & the_value ) [inline]
```

Sets the key.

References `dds::core::Value< D >::delegate()`.

8.153.3.4 operator std::vector< uint8_t >()

```
dds::core::KeyedBytesTopicType::operator std::vector< uint8_t > ( ) const [inline]
```

Conversion to `std::vector` by obtaining the bytes.

References `dds::core::Value< D >::delegate()`.

8.153.3.5 value() [1/2]

```
std::vector< uint8_t > dds::core::KeyedBytesTopicType::value ( ) const [inline]
```

Gets the bytes.

References [dds::core::Value< D >::delegate\(\)](#).

```
void dds::core::KeyedBytesTopicType::value (
    const std::vector< uint8_t > & the_value ) [inline]
```

Sets the bytes.

References [dds::core::Value< D >::delegate\(\)](#).

8.153.3.7 operator[]() [1/2]

```
uint8_t & dds::core::KeyedBytesTopicType::operator[] (
    uint32_t index ) [inline]
```

Accesses the bytes by index.

References [dds::core::Value< D >::delegate\(\)](#).

8.153.3.8 operator[]() [2/2]

```
uint8_t dds::core::KeyedBytesTopicType::operator[] (
    uint32_t index ) const [inline]
```

Accesses the bytes by index.

References [dds::core::Value< D >::delegate\(\)](#).

8.153.3.9 length()

```
int32_t dds::core::KeyedBytesTopicType::length ( ) const [inline]
```

Get the number of bytes.

References [dds::core::Value< D >::delegate\(\)](#).

8.154 dds::core::KeyedStringTopicType Class Reference

Built-in type consisting of a string payload and a second string that is the key.

```
#include <dds/core/BuiltinTopicTypes.hpp>
```

Public Member Functions

- **KeyedStringTopicType** ()
Creates a sample with two empty strings.
- **KeyedStringTopicType** (const **dds::core::string** &the_key, const **dds::core::string** &the_value)
Creates a sample with the two given strings.
- const **dds::core::string** & **key** () const
Gets the key.
- **dds::core::string** & **key** ()
Gets the key.
- void **key** (const **dds::core::string** &the_value)
Sets the key.
- const **dds::core::string** & **value** () const
Gets the value.
- **dds::core::string** & **value** ()
Gets the key.
- void **value** (const **dds::core::string** &the_value)
Gets the key.

8.154.1 Detailed Description

Built-in type consisting of a string payload and a second string that is the key.

See also

Built-in Types (p. 49)

8.154.3.5 value() [2/3]

```
dds::core::string & dds::core::KeyedStringTopicType::value ( ) [inline]
```

Gets the key.

References `dds::core::Value< D >::delegate()`.

8.154.3.6 value() [3/3]

```
void dds::core::KeyedStringTopicType::value (
    const dds::core::string & the_value ) [inline]
```

Gets the key.

References `dds::core::Value< D >::delegate()`.

8.155 dds::core::policy::LatencyBudget Class Reference

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **LatencyBudget** ()
Creates a latency budget with zero duration.
- **LatencyBudget** (const **dds::core::Duration** &the_duration)
Creates an instance with the specified duration.
- **LatencyBudget & duration** (const **dds::core::Duration** &the_duration)
Sets the duration of the maximum acceptable delay.
- const **dds::core::Duration duration** () const
Getter (see setter with the same name)

8.155.1 Detailed Description

Provides a hint as to the maximum acceptable delay from the time the data is written to the time it is received by the subscribing applications.

This policy is a *hint* to a DDS implementation; it can be used to change how it processes and sends data that has low latency requirements. The DDS specification does not mandate whether or how this policy is used.

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::StatusMask**↔
::requested_incompatible_qos() (p. 2088)

Properties:

RxO (p. 307) = YES
Changeable (p. 307) = YES (p. 307)

See also

rti::core::policy::PublishMode (p. 1739)
rti::pub::FlowController (p. 1316)

8.155.2 Usage

This policy provides a means for the application to indicate to the middleware the urgency of the data communication. By having a non-zero `duration`, RTI Connext can optimize its internal operation.

RTI Connext uses it in conjunction with **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745) **dds**↔
::pub::DataWriter (p. 908) instances associated with a `FlowControllerSchedulingPolicy_def::EARLIEST_DEADLINE`↔
`_FIRST` **rti::pub::FlowController** (p. 1316) only. Together with the time of write, **dds::core::policy::LatencyBudget**↔
::duration (p. 1377) determines the deadline of each individual sample. RTI Connext uses this information to prioritize the sending of asynchronously published data; see **rti::core::policy::AsynchronousPublisher** (p. 620).

8.155.3 Compatibility

The value offered is considered compatible with the value requested if and only if the inequality *offered duration* ≤ *requested duration* evaluates to 'TRUE'.

8.155.4 Constructor & Destructor Documentation

8.155.4.1 LatencyBudget() [1/2]

```
dds::core::policy::LatencyBudget::LatencyBudget ( ) [inline]
```

Creates a latency budget with zero duration.

8.155.4.2 LatencyBudget() [2/2]

```
dds::core::policy::LatencyBudget::LatencyBudget (
    const dds::core::Duration & the_duration ) [inline], [explicit]
```

Creates an instance with the specified duration.

8.155.5 Member Function Documentation

8.155.5.1 duration() [1/2]

```
LatencyBudget & dds::core::policy::LatencyBudget::duration (
    const dds::core::Duration & the_duration ) [inline]
```

Sets the duration of the maximum acceptable delay.

[default] 0 (meaning minimize the delay)

8.155.5.2 duration() [2/2]

```
const dds::core::Duration dds::core::policy::LatencyBudget::duration ( ) const [inline]
```

Getter (see setter with the same name)

8.156 rti::config::LibraryVersion Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) The version of a single library shipped as part of an RTI Connex distribution.

```
#include <rti/config/Version.hpp>
```

Public Member Functions

- `int32_t major_version () const`
Get the major version of a single RTI Connex library.
- `int32_t minor_version () const`
Get the minor version of a single RTI Connex library.
- `char release_version () const`
Get the release letter of a single RTI Connex library.
- `int32_t build_version () const`
Get the build number of a single RTI Connex library.

8.156.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) The version of a single library shipped as part of an RTI Connex distribution.

RTI Connex is comprised of a number of separate libraries. Although RTI Connex as a whole has a version, the individual libraries each have their own versions as well. It may be necessary to check these individual library versions when seeking technical support.

8.156.2 Member Function Documentation

8.156.2.1 major_version()

```
int32_t rti::config::LibraryVersion::major_version ( ) const
```

Get the major version of a single RTI Connex library.

8.156.2.2 minor_version()

```
int32_t rti::config::LibraryVersion::minor_version ( ) const
```

Get the minor version of a single RTI Connex library.

8.156.2.3 release_version()

```
char rti::config::LibraryVersion::release_version ( ) const
```

Get the release letter of a single RTI Connex library.

8.156.2.4 `build_version()`

```
int32_t rti::config::LibraryVersion::build_version ( ) const
```

Get the build number of a single RTI Connex library.

8.157 `dds::core::policy::Lifespan` Class Reference

Specifies how long the data written by a `dds::pub::DataWriter` (p. 908) is considered valid.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Lifespan** ()
Creates the default policy with an infinite lifespan.
- **Lifespan** (const `dds::core::Duration` &d)
Creates a policy with the specified lifespan duration.
- **Lifespan & duration** (const `dds::core::Duration` &d)
Sets the maximum duration for which the data is valid.
- const `dds::core::Duration` **duration** () const
Getter (see setter with the same name)

8.157.1 Detailed Description

Specifies how long the data written by a `dds::pub::DataWriter` (p. 908) is considered valid.

Each data sample written by the `dds::pub::DataWriter` (p. 908) has an associated expiration time beyond which the data should not be delivered to any application. Once the sample expires, the data will be removed from the `dds::sub::DataReader` (p. 756) caches as well as from the transient and persistent information caches.

The expiration time of each sample from the `dds::pub::DataWriter` (p. 908)'s cache is computed by adding the duration specified by this QoS policy to the time when the sample is added to the `dds::pub::DataWriter` (p. 908)'s cache. This timestamp is not necessarily equal to the sample's source timestamp that can be provided by the user using the `dds::pub::DataWriter::write(const T&,const dds::core::Time&)` (p. 919) or `dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)` (p. 949) API.

The expiration time of each sample from the `dds::sub::DataReader` (p. 756)'s cache is computed by adding the duration to the reception timestamp.

See also

`dds::pub::DataWriter::write()` (p. 918)

`dds::pub::DataWriter::write(const T&,const dds::core::Time&)` (p. 919)

Entity:

`dds::topic::Topic` (p. 2178), `dds::pub::DataWriter` (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **YES** (p. 307)

8.157.2 Usage

The **Lifespan** (p. 1379) QoS policy can be used to control how much data is stored by RTI Connex. Even if it is configured to store "all" of the data sent or received for a topic (see **dds::core::policy::History** (p. 1346)), the total amount of data it stores may be limited by this QoS policy.

You may also use this QoS policy to ensure that applications do not receive or act on data, commands or messages that are too old and have 'expired.'

To avoid inconsistencies, multiple writers of the same instance should have the same lifespan.

8.157.3 Constructor & Destructor Documentation

8.157.3.1 Lifespan() [1/2]

```
dds::core::policy::Lifespan::Lifespan ( ) [inline]
```

Creates the default policy with an infinite lifespan.

8.157.3.2 Lifespan() [2/2]

```
dds::core::policy::Lifespan::Lifespan (
    const dds::core::Duration & d ) [inline], [explicit]
```

Creates a policy with the specified lifespan duration.

8.157.4 Member Function Documentation

8.157.4.1 duration() [1/2]

```
Lifespan & dds::core::policy::Lifespan::duration (
    const dds::core::Duration & d ) [inline]
```

Sets the maximum duration for which the data is valid.

[default] **dds::core::Duration::infinite()** (p. 1197)

[range] [1 nanosec, 1 year] or **dds::core::Duration::infinite()** (p. 1197)

8.157.4.2 duration() [2/2]

```
const dds::core::Duration dds::core::policy::Lifespan::duration ( ) const [inline]
```

Getter (see setter with the same name)

8.158 Listener Class Reference

Entity listeners.

```
#include <dds/dds.hpp>
```

8.158.1 Detailed Description

Entity listeners.

Note

This type doesn't exist in the API, it just represents the concept that all subclasses of **dds::core::Entity** (p. 1265) have an associated listener type. The actual listener types are:

- **dds::domain::DomainParticipantListener** (p. 1134)
- **dds::topic::TopicListener** (p. 2212)
- **dds::sub::SubscriberListener** (p. 2128)
- **dds::pub::PublisherListener** (p. 1732)
- **dds::sub::DataReaderListener** (p. 832)
- **dds::pub::DataWriterListener** (p. 972)

Listeners provide a way for RTI Connex to asynchronously alert the application when there are relevant status changes.

Each dedicated listener presents a list of operations that correspond to the relevant communication status changes to which an application may respond.

The same **Listener** (p. 1381) instance may be shared among multiple entities if you so desire. Consequently, the provided parameter contains a reference to the concerned **dds::core::Entity** (p. 1265).

8.158.2 Access to Plain Communication Status

The general mapping between the plain communication statuses (see **Status Kinds** (p. 229)) and the listeners' operations is as follows:

- For each communication status, there is a corresponding operation whose name is `on_<communication_↔_status>()`, which takes a parameter of type `<communication_status>` as listed in **Status Kinds** (p. 229).
- `on_<communication_status>` is available on the relevant **dds::core::Entity** (p. 1265) as well as those that embed it, as expressed in the following figure:

listener processing. The most *specific* relevant enabled listener is called."

- When the application attaches a listener on an entity, it must set a mask. The mask indicates to RTI Connext which operations are enabled within the listener (cf. operation **dds::core::Entity** (p. 1265) `set_listener()`).
- When a plain communication status changes, RTI Connext triggers the most specific relevant listener operation that is enabled. In case the most specific relevant listener operation corresponds to an application-installed 'nil' listener the operation will be considered handled by a NO-OP operation that does not reset the communication status.

This behavior allows the application to set a default behavior (e.g., in the listener associated with the **dds::domain::↔DomainParticipant** (p. 1079)) and to set dedicated behaviors only where needed.

8.158.3 Access to Read Communication Status

The two statuses related to data arrival are treated slightly differently. Since they constitute the core purpose of the Data Distribution Service, there is no need to provide a default mechanism (as is done for the plain communication statuses above).

The rule is as follows. Each time the read communication status changes:

- First, RTI Connext tries to trigger the `dds::sub::SubscriberListener::on_data_on_readers` with a parameter of the related **dds::sub::Subscriber** (p. 2116);
- If this does not succeed (there is no listener or the operation is not enabled), RTI Connext tries to trigger `dds::sub::DataReaderListener::on_data_available` (p. 835) on all the related **dds::sub::DataReaderListener** (p. 832) objects, with a parameter of the related **dds::sub::DataReader** (p. 756).

The rationale is that either the application is interested in relations among data arrivals and it must use the first option (and then get the corresponding **dds::sub::DataReader** (p. 756) objects by calling `dds::sub::find` (p. 460) on the related **dds::sub::Subscriber** (p. 2116) and then get the data by calling `dds::sub::DataReader::read` (p. 773) or `dds::sub::DataReader::take` (p. 774) on the returned **dds::sub::DataReader** (p. 756) objects), or it wants to treat each **dds::sub::DataReader** (p. 756) independently and it may choose the second option (and then get the data by calling `dds::sub::DataReader::read` (p. 773) or `dds::sub::DataReader::take` (p. 774) on the related **dds::sub::DataReader** (p. 756)).

Note that if `dds::sub::SubscriberListener::on_data_on_readers` is called, RTI Connext will *not* try to call `dds::sub::↔DataReaderListener::on_data_available` (p. 835). However, an application can force a call to the **dds::sub::Data↔Reader** (p. 756) objects that have data by calling `dds::sub::Subscriber::notify_datareaders` (p. 2120).

8.158.4 How to set a listener

Listeners can be set in the Entity constructor, or the `set_listener()` function (for example, `dds::sub::DataReader<T>::set_listener()` (p. 783)).

These functions expect a `std::shared_ptr`. The Entity keeps a reference to the `std::shared_ptr` so the listener cannot be deleted until the Entity is destroyed or the listener is reset with `set_listener(nullptr)`.

Warning

It is not recommended to keep a reference to an Entity inside of its listener because it creates a cycle that prevents the destruction of both objects. If you need to keep a reference, make sure you call `entity.set_listener(nullptr)` or `entity.close()` (p. 801) explicitly.

8.158.5 Operations Allowed in Listener Callbacks

See `Restricted Operations in Listener Callbacks`, in the Core Libraries User's Manual.

8.158.6 Best Practices with Listeners

Note that all the issues described below are avoided by using `dds::core::cond::WaitSet` (p. 2318).

Avoid blocking or performing a lot of processing in Listener (p. 1381) callbacks

Listeners are invoked by internal threads that perform critical functions within the middleware and need to run in a timely manner. By default, Connex DDS creates a few threads to use to receive data and only a single thread to handle periodic events.

Because of this, user applications installing Listeners should never block in a **Listener** (p. 1381) callback. There are several negative consequences of blocking in a listener callback:

- The application may lose data for the DataReader the listener is installed on, because the receive thread is not removing it from the socket buffer and it gets overwritten.
- The application may receive strictly reliable data with a delay, because the receive thread is not removing it from the socket buffer and if it gets overwritten it must be re-sent.
- The application may lose or delay data for other DataReaders, because by default all DataReaders created with the same DomainParticipant share the same threads.
- The application may not be notified of periodic events on time

If the application needs to make a blocking call when data is available, or when another event occurs, the application should use `dds::core::cond::WaitSet` (p. 2318).

Avoid taking application mutexes/semaphores in `Listener` (p. 1381) callbacks

Taking application mutexes/semaphores within a `Listener` (p. 1381) callback may lead to unexpected deadlock scenarios.

When a `Listener` (p. 1381) callback is invoked the EA (Exclusive Area) of the Entity 'E' to which the callback applies is taken by the middleware.

If the application takes an application mutex 'M' within a critical section in which the application makes DDS calls affecting 'E', this may lead to following deadlock:

The middleware thread is within the entity EA trying to acquire the mutex 'M'. At the same time, the application thread has acquired 'M' and is blocked trying to acquire the entity EA.

Do not write data with a `DataWriter` within the `on_data_available` callback

Avoid writing data with a `DataWriter` within the `dds::sub::DataReaderListener::on_data_available()` (p. 835) callback. If the write operation blocks because e.g. the send window is full, this will lead to a deadlock.

Do not call `wait_for_acknowledgements` within the `on_data_available` callback

Do not call the `dds::pub::DataWriter::wait_for_acknowledgments` (p.938) within the `dds::sub::DataReaderListener::on_data_available()` (p. 835) callback. This will lead to deadlock.

8.159 `rti::core::ListenerBinder< Entity, Listener >` Class Template Reference

`<<reference-type>>` (p. 153) Automatically manages the association of an Entity and a `Listener` (p. 1381)

```
#include <rti/core/ListenerBinder.hpp>
```

Inheritance diagram for `rti::core::ListenerBinder< Entity, Listener >`:

Public Member Functions

- **Listener * get ()**
(Deprecated) Use `listener()` (p. 1387)
- **const Listener * get () const**
(Deprecated) Use `listener()` (p. 1387)
- **Listener * listener ()**
Retrieves the listener.
- **const Listener * listener () const**
Retrieves the listener.
- **Entity entity () const**
Retrieves the Entity associated with the listener.

Related Functions

(Note that these are not member functions.)

- `template<typename Entity , typename Listener >`
ListenerBinder< Entity, Listener > bind_listener (Entity entity, Listener *the_listener, dds::core::status::StatusMask mask)
Sets the listener and creates a `ListenerBinder` (p. 1384) that automatically resets it when all references go out of scope.
- `template<typename Entity , typename Listener >`
ListenerBinder< Entity, Listener > bind_listener (Entity entity, Listener *the_listener)
Sets the listener and creates a `ListenerBinder` (p. 1384) that automatically resets it when all references go out of scope.
- `template<typename Entity , typename Listener >`
ListenerBinder< Entity, Listener > bind_and_manage_listener (Entity entity, Listener *the_listener, dds::core::status::StatusMask mask)
Sets the listener and creates a `ListenerBinder` (p. 1384) that automatically resets and deletes it when all references go out of scope.
- `template<typename Entity , typename Listener >`
ListenerBinder< Entity, Listener > bind_and_manage_listener (Entity entity, Listener *the_listener)
Sets the listener and creates a `ListenerBinder` (p. 1384) that automatically resets and deletes it when all references go out of scope.

8.159.1 Detailed Description

```
template<typename Entity, typename Listener = typename Entity::Listener>
class rti::core::ListenerBinder< Entity, Listener >
```

<<*reference-type*>> (p. 153) Automatically manages the association of an Entity and a **Listener** (p. 1381)

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the `a std::shared_ptr` is used to set an Entity's listener.

Note

A **ListenerBinder** (p. 1384) provides all the functions of a <<*reference-type*>> (p. 153) except **close()** (p. 801) and **retain()**.

Ties the association listener/Entity to the existence of references to this type—that is, the constructor sets the listener; when the last reference is destroyed, the entity's listener is unset. Depending on how this type is created, the listener may also be deleted:

- **rti::core::bind_listener()** (p. 495) creates a **ListenerBinder** (p. 1384) that doesn't own the listener and won't delete it
- **rti::core::bind_and_manage_listener()** (p. 496) creates a **ListenerBinder** (p. 1384) that owns the listener and will delete it.

The goal is to simplify the destruction of an Entity by the application, which otherwise would have to reset the listener or close the Entity explicitly.

Example:

```
class MyListener : public DataReaderListener<Foo> { ... };
void f()
{
    MyListener listener;
    dds::sub::DataReader<Foo> my_reader(subscriber, topic);
    {
        auto scoped_listener = rti::core::bind_listener(
            my_reader,
            listener,
            dds::core::status::StatusMask::data_available());
        // my_reader has a listener
        // ...
    } // After this, my_reader doesn't have a listener
} // my_reader destroyed; if we hadn't used a ListenerBinder,
// my_reader would not have been destroyed
```

To create a **ListenerBinder** (p. 1384) use **rti::core::bind_listener()** (p. 495) or **rti::core::bind_and_manage_listener()** (p. 496). To retrieve the listener use **ListenerBinder::listener()** (p. 1387); to retrieve the entity, use **ListenerBinder::entity()** (p. 1387).

If the Entity changes its listener while references to this **ListenerBinder** (p. 1384) still exist, the **ListenerBinder** (p. 1384) will not reset the listener.

Template Parameters

<i>Entity</i>	A subclass of dds::core::Entity (p. 1265)
Listener (p. 1381)	The listener type, by default Entity::Listener

See also

Reference types (p. 153), for an explanation of how reference types work and the reasons why an Entity may be retained.

8.159.2 Member Function Documentation

8.159.2.1 get() [1/2]

```
template<typename Entity , typename Listener = typename Entity::Listener>  
Listener * rti::core::ListenerBinder< Entity, Listener >::get ( ) [inline]
```

(Deprecated) Use `listener()` (p. 1387)

8.159.2.2 get() [2/2]

```
template<typename Entity , typename Listener = typename Entity::Listener>  
const Listener * rti::core::ListenerBinder< Entity, Listener >::get ( ) const [inline]
```

(Deprecated) Use `listener()` (p. 1387)

8.159.2.3 listener() [1/2]

```
template<typename Entity , typename Listener = typename Entity::Listener>  
Listener * rti::core::ListenerBinder< Entity, Listener >::listener ( ) [inline]
```

Retrieves the listener.

Returns

The listener.

8.159.2.4 listener() [2/2]

```
template<typename Entity , typename Listener = typename Entity::Listener>  
const Listener * rti::core::ListenerBinder< Entity, Listener >::listener ( ) const [inline]
```

Retrieves the listener.

8.159.2.5 entity()

```
template<typename Entity , typename Listener = typename Entity::Listener>  
Entity rti::core::ListenerBinder< Entity, Listener >::entity ( ) const [inline]
```

Retrieves the Entity associated with the listener.

8.159.3 Friends And Related Function Documentation

8.159.3.1 bind_listener() [1/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_listener (
    Entity entity,
    Listener * the_listener,
    dds::core::status::StatusMask mask ) [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

The **ListenerBinder** (p. 1384) created from this function does not delete the listener, it simply sets the listener back to NULL in the Entity. The application is responsible for the life-cycle of the listener.

To also delete the listener when all references go out of scope, see **bind_and_manage_listener()** (p. 1388).

```
MyListener my_listener;
dds::sub::DataReader<Foo> reader(subscriber, topic);
// reader will have no listener after scoped_listener (and any other
// references created from scoped_listener) go out of scope--note that
// my_listener is a stack variable so scoped_listener should not delete it
auto scoped_listener = bind_listener(
    reader, &my_listener, dds::core::status::StatusMask::data_available());
```

8.159.3.2 bind_listener() [2/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_listener (
    Entity entity,
    Listener * the_listener ) [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

See also

bind_listener(Entity, Listener*, dds::core::status::StatusMask) (p. 1388)

8.159.3.3 bind_and_manage_listener() [1/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_and_manage_listener (
    Entity entity,
    Listener * the_listener,
    dds::core::status::StatusMask mask ) [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

Example:

```
dds::sub::DataReader<Foo> reader(subscriber, topic);
// The instance of MyListener we are creating and attaching to reader will be
// unset and deleted when scoped_listener (and any other references create
// from
// scoped_listener) go out of scope
auto scoped_listener = bind_and_manage_listener(
    reader, new MyListener(),
    dds::core::status::StatusMask::data_available());
```

See also

bind_listener() (p. 1388)

8.159.3.4 bind_and_manage_listener() [2/2]

```
template<typename Entity , typename Listener >
ListenerBinder< Entity, Listener > bind_and_manage_listener (
    Entity entity,
    Listener * the_listener ) [related]
```

Sets the listener and creates a **ListenerBinder** (p. 1384) that automatically resets and deletes it when all references go out of scope.

[DEPRECATED] The use of **ListenerBinder** (p. 1384) is no longer required as long as the a `std::shared_ptr` is used to set an Entity's listener.

This overload works for listeners that don't use a mask

*Creates a **Liveliness** (p. 1389) instance with **LivelinessKind::AUTOMATIC**.*
- static **Liveliness ManualByParticipant** (const **dds::core::Duration** &lease= **dds::core::Duration::infinite**())
*Creates a **Liveliness** (p. 1389) instance with **LivelinessKind::MANUAL_BY_PARTICIPANT** and the specified lease duration (infinite by default)*
- static **Liveliness ManualByTopic** (const **dds::core::Duration** &lease= **dds::core::Duration::infinite**())
*Creates a **Liveliness** (p. 1389) instance with **LivelinessKind::MANUAL_BY_TOPIC** and the specified lease duration (infinite by default)*

8.160.1 Detailed Description

Specifies and configures the mechanism that allows **dds::sub::DataReader** (p. 756)'s to detect when **dds::pub::DataWriter** (p. 908)'s become disconnected.

The liveliness status of a **dds::pub::DataWriter** (p. 908) is used to maintain instance ownership in combination with the setting of the **OWNERSHIP** (p. 329) policy. The application is also informed via **Listener** (p. 1381) when an **dds::pub::DataWriter** (p. 908) is no longer alive.

A **dds::pub::DataWriter** (p. 908) commits to signalling its liveliness at intervals not to exceed the **dds::core::policy::Liveliness::lease_duration** (p. 1393) configured on the **dds::pub::DataWriter** (p. 908). The rate at which the **dds::pub::DataWriter** (p. 908) will signal its liveliness is defined by **dds::core::policy::Liveliness::assertions_per_lease_duration** (p. 1394).

The **dds::sub::DataReader** (p. 756) **lease_duration** specifies the maximum period at which matching DataWriters must have their liveliness asserted.

In addition, in the subscribing application Connex DDS uses an internal thread that wakes up at the period set by the `DataReader`'s `lease_duration` to see if a `DataWriter` `lease_duration` has been violated.

Important: The `DataReader` `lease_duration` only configures how often a `DataReader` will check the liveliness of the matching `DataWriters`. The `DataWriter` `lease_duration` configures the period at which a `DataWriter` must assert its liveliness and is the value that the `DataReader` uses to determine if a matching `DataWriter` is alive or not.

Listeners are used to notify a `dds::sub::DataReader` (p. 756) of loss of liveliness and `dds::pub::DataWriter` (p. 908) of violations to the liveliness contract. The `on_liveliness_lost()` callback is only called *once*, after the first time the `lease_duration` is exceeded (when the `dds::pub::DataWriter` (p. 908) first loses liveliness).

This QoS policy can be used during system integration to ensure that applications have been coded to meet design specifications. It can also be used during runtime to detect when systems are performing outside of design specifications. Receiving applications can take appropriate actions in response to disconnected `DataWriters`.

Entity:

`dds::topic::Topic` (p. 2178), `dds::sub::DataReader` (p. 756), `dds::pub::DataWriter` (p. 908)

Status:

`dds::core::status::StatusMask::liveliness_lost()` (p. 2090), `dds::core::status::LivelinessLostStatus` (p. 1398);
`dds::core::status::StatusMask::liveliness_changed()` (p. 2090), `dds::core::status::LivelinessChangedStatus` (p. 1395);
`dds::core::status::StatusMask::requested_incompatible_qos()` (p. 2088), `dds::core::status::StatusMask::offered_incompatible_qos()` (p. 2087)

Properties:

`RxO` (p. 307) = YES
`Changeable` (p. 307) = UNTIL ENABLE (p. 307)

8.160.2 Usage

This policy controls the mechanism and parameters used by RTI Connex to ensure that particular `DataWriters` on the network are still alive. The liveliness can also affect the ownership of a particular instance, as determined by the **OWNERSHIP** (p. 329) policy.

This policy has several settings to support both data types that are updated periodically as well as those that are changed sporadically. It also allows customisation for different application requirements in terms of the kinds of failures that will be detected by the liveliness mechanism.

The `dds::core::policy::LivelinessKind::AUTOMATIC` liveliness setting is most appropriate for applications that only need to detect failures at the process-level, but not application-logic failures within a process. RTI Connex takes responsibility for renewing the leases at the required rates and thus, as long as the local process where a `dds::domain::DomainParticipant` (p. 1079) is running and the link connecting it to remote participants remains connected, the entities within the `dds::domain::DomainParticipant` (p. 1079) will be considered alive. This requires the lowest overhead.

The manual settings (`dds::core::policy::LivelinessKind::MANUAL_BY_PARTICIPANT`, `dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC`) require the application on the publishing side to periodically assert the liveliness before the lease expires to indicate the corresponding `dds::core::Entity` (p. 1265) is still alive. The action can be explicit by calling the `dds::pub::DataWriter::assert_liveliness` (p. 942) operation or implicit by writing some data.

The two possible manual settings control the granularity at which the application must assert liveliness.

- The setting `dds::core::policy::LivelinessKind::MANUAL_BY_PARTICIPANT` requires only that one `dds::core::Entity` (p. 1265) within a participant is asserted to be alive to deduce all other `dds::core::Entity` (p. 1265) objects within the same `dds::domain::DomainParticipant` (p. 1079) are also alive.
- The setting `dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC` requires that at least one instance within the `dds::pub::DataWriter` (p. 908) is asserted.

Changes in **LIVELINESS** (p. 326) must be detected by the Service with a time-granularity greater or equal to the `dds::core::policy::Liveliness::lease_duration` (p. 1393). This ensures that the value of the `dds::core::status::LivelinessChangedStatus` (p. 1395) is updated at least once during each `lease_duration` and the related Listeners and `dds::core::cond::WaitSet` (p. 2318) s are notified within a `lease_duration` from the time the **LIVELINESS** (p. 326) changed.

8.160.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality `offered kind >= requested kind` evaluates to 'TRUE'. For the purposes of this inequality, the values of `dds::core::policy::LivelinessKind` (p. 327) kind are considered ordered such that: `dds::core::policy::LivelinessKind::AUTOMATIC < dds::core::policy::LivelinessKind::MANUAL_BY_PARTICIPANT < dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC`.
- the inequality `offered lease_duration <= requested lease_duration` evaluates to true.

Relationship between registration, liveliness and ownership (p. 1633)

8.160.4 Constructor & Destructor Documentation

8.160.4.1 Liveliness() [1/2]

```
dds::core::policy::Liveliness::Liveliness ( ) [inline]
```

Creates an automatic liveliness policy with infinite lease duration.

8.160.4.2 Liveliness() [2/2]

```
dds::core::policy::Liveliness::Liveliness (
    dds::core::policy::LivelinessKind the_kind,
    const dds::core::Duration & the_lease_duration ) [inline]
```

Creates an instance with the specified liveliness kind and lease duration.

8.160.5 Member Function Documentation

8.160.5.1 kind() [1/2]

```
Liveliness & dds::core::policy::Liveliness::kind (
    dds::core::policy::LivelinessKind the_kind ) [inline]
```

Sets the liveliness kind.

[default] dds::core::policy::LivelinessKind::AUTOMATIC

8.160.5.2 kind() [2/2]

```
dds::core::policy::LivelinessKind dds::core::policy::Liveliness::kind ( ) const [inline]
```

Getter (see the setter with the same name)

8.160.5.3 lease_duration() [1/2]

```
Liveliness & dds::core::policy::Liveliness::lease_duration (
    const dds::core::Duration & the_lease_duration ) [inline]
```

Sets the duration within which a **dds::core::Entity** (p. 1265) must be asserted or else it is considered not alive.

The duration within which a **dds::pub::DataWriter** (p. 908) must be asserted, or else it is assumed to be not alive.

For a DataWriter, the `lease_duration` specifies a timeout by which liveliness must be asserted for the DataWriter, or the DataWriter will be considered inactive or not alive.

For a DataReader, the `lease_duration` specifies the maximum period at which the DataReader will check to see if the matching DataWriters are still alive according to the DataWriters `lease_duration` value.

Important: The DataWriter `lease_duration` is the value that the DataReader uses to determine if a matching DataWriter is alive or not.

[default] dds::core::Duration::infinite() (p. 1197)

[range] [0,1 year] or dds::core::Duration::infinite() (p. 1197)

8.160.5.4 lease_duration() [2/2]

```
dds::core::Duration dds::core::policy::Liveliness::lease_duration ( ) const [inline]
```

Getter (see the setter with the same name)

8.160.5.5 Automatic()

```
static Liveliness dds::core::policy::Liveliness::Automatic ( ) [inline], [static]
```

Creates a **Liveliness** (p. 1389) instance with LivelinessKind::AUTOMATIC.

8.160.5.6 ManualByParticipant()

```
static Liveliness dds::core::policy::Liveliness::ManualByParticipant (
    const dds::core::Duration & lease = dds::core::Duration::infinite() ) [inline],
[static]
```

Creates a **Liveliness** (p. 1389) instance with LivelinessKind::MANUAL_BY_PARTICIPANT and the specified lease duration (infinite by default)

8.160.5.7 ManualByTopic()

```
static Liveliness dds::core::policy::Liveliness::ManualByTopic (
    const dds::core::Duration & lease = dds::core::Duration::infinite() ) [inline],
[static]
```

Creates a **Liveliness** (p. 1389) instance with LivelinessKind::MANUAL_BY_TOPIC and the specified lease duration (infinite by default)

8.160.5.8 assertions_per_lease_duration() [1/2]

```
dds::core::policy::Liveliness & assertions_per_lease_duration (
    int32_t value )
```

<<**extension**>> (p. 156) The number of assertions to send during the lease duration

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This field only applies to a **dds::pub::DataWriter** (p. 908) and is not considered during QoS compatibility checks.

The default value is 3. A higher value will make the liveliness mechanism more robust against packet losses, but it will also increase the network traffic.

[default] 3

[range] [2, 100 million]

8.160.5.9 `assertions_per_lease_duration()` [2/2]

```
int32_t assertions_per_lease_duration ( ) const
```

<<**extension**>> (p. 156) Getter (see setter with the same name)

8.161 `dds::core::status::LivelinessChangedStatus` Class Reference

Information about the status `dds::core::status::StatusMask::liveliness_changed()` (p. 2090)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t alive_count () const`
The total count of currently alive `dds::pub::DataWriter` (p. 908) entities that write the `dds::topic::Topic` (p. 2178) that this `dds::sub::DataReader` (p. 756) reads.
- `int32_t not_alive_count () const`
The total count of currently not alive `dds::pub::DataWriter` (p. 908) entities that write the `dds::topic::Topic` (p. 2178) that this `dds::sub::DataReader` (p. 756) reads.
- `int32_t alive_count_change () const`
The change in the `alive_count` since the last time the listener was called or the status was read.
- `int32_t not_alive_count_change () const`
The change in the `not_alive_count` since the last time the listener was called or the status was read.
- `const dds::core::InstanceHandle last_publication_handle () const`
This `InstanceHandle` (p. 1356) can be used to look up which remote `dds::pub::DataWriter` (p. 908) was the last to cause this `DataReader`'s status to change, using `dds::sub::DataReader::matched_publication_data` (p. 810).

8.161.1 Detailed Description

Information about the status `dds::core::status::StatusMask::liveliness_changed()` (p. 2090)

The `dds::sub::DataReaderListener::on_liveliness_changed` (p. 834) callback may be invoked for the following reasons:

- The liveliness of any `dds::pub::DataWriter` (p. 908) matching this `DataReader` (as defined by the `dds::core::policy::LivelinessKind` (p. 327) setting) is lost.
- A `DataWriter`'s liveliness is recovered after being lost.
- A new matching `DataWriter` has been discovered.
- A matching `DataWriter` has been deleted.
- A QoS Policy has changed such that a `DataWriter` that matched this `DataReader` before no longer matches (such as a change to the `dds::core::policy::Partition` (p. 1652)). In this case, RTI Connext will no longer keep track of the `DataWriter`'s liveliness. Furthermore, consider two scenarios:

- DataWriter was alive when it and DataReader stopped matching: **dds::core::status::LivelinessChangedStatus::alive_count** (p. 1396) will decrease (since there's one less matching alive DataWriter) and **dds::core::status::LivelinessChangedStatus::not_alive_count** (p. 1396) will remain the same (since the DataWriter is still alive).
- DataWriter was not alive when it and DataReader stopped matching: **dds::core::status::LivelinessChangedStatus::alive_count** (p. 1396) will remain the same (since the matching DataWriter was not alive) and **dds::core::status::LivelinessChangedStatus::not_alive_count** (p. 1396) will decrease (since there's one less not-alive matching DataWriter).

Note: There are several ways that a DataWriter and DataReader can become incompatible after the DataWriter has lost liveliness. For example, when the **dds::core::policy::LivelinessKind** (p. 327) is set to `DDS_MANUAL_BY_PARTICIPANT_LIVELINESS_QOS`, it is possible that the DataWriter has not asserted its liveliness in a timely manner, and then a QoS change occurs on the DataWriter or DataReader that makes the entities incompatible.

- A QoS Policy (such as the **dds::core::policy::Partition** (p. 1652)) has changed such that a DataWriter that was unmatched with the DataReader now matches.

8.161.2 Member Function Documentation

8.161.2.1 `alive_count()`

```
int32_t dds::core::status::LivelinessChangedStatus::alive_count ( ) const [inline]
```

The total count of currently alive **dds::pub::DataWriter** (p. 908) entities that write the **dds::topic::Topic** (p. 2178) that this **dds::sub::DataReader** (p. 756) reads.

8.161.2.2 `not_alive_count()`

```
int32_t dds::core::status::LivelinessChangedStatus::not_alive_count ( ) const [inline]
```

The total count of currently not_alive **dds::pub::DataWriter** (p. 908) entities that write the **dds::topic::Topic** (p. 2178) that this **dds::sub::DataReader** (p. 756) reads.

8.161.2.3 `alive_count_change()`

```
int32_t dds::core::status::LivelinessChangedStatus::alive_count_change ( ) const [inline]
```

The change in the `alive_count` since the last time the listener was called or the status was read.

8.161.2.4 `not_alive_count_change()`

```
int32_t dds::core::status::LivelinessChangedStatus::not_alive_count_change ( ) const [inline]
```

The change in the `not_alive_count` since the last time the listener was called or the status was read.

Note that a positive `not_alive_count_change` means one of the following:

- The DomainParticipant containing the matched DataWriter has lost liveliness or has been deleted.
- The matched DataWriter has lost liveliness or has been deleted.

8.161.2.5 `last_publication_handle()`

```
const dds::core::InstanceHandle dds::core::status::LivelinessChangedStatus::last_publication_↔
handle ( ) const [inline]
```

This `InstanceHandle` (p. 1356) can be used to look up which remote `dds::pub::DataWriter` (p. 908) was the last to cause this DataReader's status to change, using `dds::sub::DataReader::matched_publication_data` (p. 810).

It's possible that the DataWriter has been purged from the discovery database. (See the "Discovery Overview" section of the `User's Manual`.) If so, the `dds::sub::DataReader::matched_publication_data` (p. 810) method will not be able to return information about the DataWriter. In this case, the only way to get information about the lost DataWriter is if you cached the information previously.

8.162 `dds::core::policy::LivelinessKind_def` Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `LivelinessKind`.

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
`AUTOMATIC` ,
`MANUAL_BY_PARTICIPANT` ,
`MANUAL_BY_TOPIC` }

The underlying enum type.

8.162.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `LivelinessKind`.

8.162.2 Member Enumeration Documentation

8.162.2.1 `type`

```
enum dds::core::policy::LivelinessKind_def::type
```

The underlying enum type.

Enumerator

AUTOMATIC	[default] The infrastructure will automatically signal liveliness for the dds::pub::DataWriter (p. 908) (s) at least as often as required by the dds::pub::DataWriter (p. 908) (S) <code>lease_duration</code> . A dds::pub::DataWriter (p. 908) with this setting does not need to take any specific action in order to be considered 'alive.' The dds::pub::DataWriter (p. 908) is only 'not alive' when the participant to which it belongs terminates (gracefully or not), or when there is a network problem that prevents the current participant from contacting that remote participant.
MANUAL_BY_PARTICIPANT	RTI Connexx will assume that as long as at least one dds::pub::DataWriter (p. 908) belonging to the dds::domain::DomainParticipant (p. 1079) (or the dds::domain::DomainParticipant (p. 1079) itself) has asserted its liveliness, then the other DataWriters belonging to that same dds::domain::DomainParticipant (p. 1079) are also alive. The user application takes responsibility to signal liveliness to RTI Connexx either by calling dds::domain::DomainParticipant::assert_liveliness (p. 1091), or by calling dds::pub::DataWriter::assert_liveliness (p. 942), or dds::pub::DataWriter::write() (p. 918) on any dds::pub::DataWriter (p. 908) belonging to the dds::domain::DomainParticipant (p. 1079).
MANUAL_BY_TOPIC	RTI Connexx will only assume liveliness of the dds::pub::DataWriter (p. 908) if the application has asserted liveliness of that dds::pub::DataWriter (p. 908) itself. The user application takes responsibility to signal liveliness to RTI Connexx using the dds::pub::DataWriter::assert_liveliness (p. 942) method, or by writing some data.

8.163 dds::core::status::LivelinessLostStatus Class Reference

Information about the status **dds::core::status::StatusMask::liveliness_lost()** (p. 2090)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t total_count () const`

*Total cumulative number of times that a previously-alive **dds::pub::DataWriter** (p. 908) became not alive due to a failure to to actively signal its liveliness within the offered liveliness period.*

- `int32_t total_count_change () const`

The incremental changes in `total_count` since the last time the listener was called or the status was read.

8.163.1 Detailed Description

Information about the status **dds::core::status::StatusMask::liveliness_lost()** (p. 2090)

Entity:

dds::pub::DataWriter (p. 908)

Listener:

dds::pub::DataWriterListener (p. 972)

The liveliness that the **dds::pub::DataWriter** (p.908) has committed through its **dds::core::policy::Liveliness** (p.1389) was not respected; thus **dds::sub::DataReader** (p.756) entities will consider the **dds::pub::DataWriter** (p.908) as no longer "alive/active".

8.163.2 Member Function Documentation

8.163.2.1 total_count()

```
int32_t dds::core::status::LivelinessLostStatus::total_count ( ) const [inline]
```

Total cumulative number of times that a previously-alive **dds::pub::DataWriter** (p. 908) became not alive due to a failure to actively signal its liveliness within the offered liveliness period.

This count does not change when an already not alive **dds::pub::DataWriter** (p.908) simply remains not alive for another liveliness period.

8.163.2.2 total_count_change()

```
int32_t dds::core::status::LivelinessLostStatus::total_count_change ( ) const [inline]
```

The incremental changes in total_count since the last time the listener was called or the status was read.

8.164 rti::core::xtypes::LoanedDynamicData Class Reference

<<*move-only-type*>> (p. 155) Gives temporary access to a member of another DynamicData object.

```
#include <DynamicDataImpl.hpp>
```

Public Member Functions

- `~LoanedDynamicData ()`
Returns the loan if it has not been returned with `return_loan()` (p. 1401)
- `void return_loan ()`
Explicitly returns the loan.
- `DynamicData & get ()`
Obtains the loaned DynamicData object representing a member of DynamicData object.
- `const DynamicData & get () const`
Obtains the loaned DynamicData object representing a member of DynamicData object.
- `operator DynamicData & ()`
Conversion to DynamicData for convenience.
- `operator const DynamicData & () const`
Conversion to DynamicData for convenience.
- `LoanedDynamicData (LoanedDynamicData &&other) OMG_NOEXCEPT`
<<C++11>> (p. 155) Move constructor.
- `LoanedDynamicData & operator= (LoanedDynamicData &&other) OMG_NOEXCEPT`
<<C++11>> (p. 155) Move-assignment operator.

8.164.1 Detailed Description

`<<move-only-type>>` (p. 155) Gives temporary access to a member of another DynamicData object.

This type can only be instantiated through `dds::core::xtypes::DynamicData::loan_value` (p. 1222). This type can't be copied. It can be moved `<<C++11>>` (p. 155).

An instance of this type contains a direct reference to a member of another DynamicData object, retrieved with `get()` (p. 1401). That object can be both inspected or modified and has to be eventually returned.

There are three ways to return the loan:

1. Letting the destructor do it
2. Calling `return_loan()` (p. 1401)
3. Reusing this object to obtain another loan (see `dds::core::xtypes::DynamicData::loan_value(LoanedDynamicData&,uint32_t)` (p. 1224))

See also

- `dds::core::xtypes::DynamicData::loan_value` (p. 1222)
- `Using DynamicData` (p. 400)

8.164.2 Constructor & Destructor Documentation

8.164.2.1 ~LoanedDynamicData()

```
rti::core::xtypes::LoanedDynamicData::~~LoanedDynamicData ( )
```

Returns the loan if it has not been returned with **return_loan()** (p. 1401)

8.164.2.2 LoanedDynamicData()

```
rti::core::xtypes::LoanedDynamicData::LoanedDynamicData (
    LoanedDynamicData && other ) [inline]
```

<<**C++11**>> (p. 155) Move constructor.

A **LoanedDynamicData** (p. 1399) can only be moved, not copied.

8.164.3 Member Function Documentation

8.164.3.1 return_loan()

```
void rti::core::xtypes::LoanedDynamicData::return_loan ( )
```

Explicitly returns the loan.

8.164.3.2 get() [1/2]

```
DynamicData & rti::core::xtypes::LoanedDynamicData::get ( ) [inline]
```

Obtains the loaned DynamicData object representing a member of DynamicData object.

The object can be modified and the changes will take effect in the DynamicData object that contains this one.

8.164.3.3 get() [2/2]

```
const DynamicData & rti::core::xtypes::LoanedDynamicData::get ( ) const [inline]
```

Obtains the loaned DynamicData object representing a member of DynamicData object.

8.164.3.4 operator DynamicData &()

```
rti::core::xtypes::LoanedDynamicData::operator DynamicData & ( ) [inline]
```

Conversion to DynamicData for convenience.

8.164.3.5 operator const DynamicData &()

```
rti::core::xtypes::LoanedDynamicData::operator const DynamicData & ( ) const [inline]
```

Conversion to DynamicData for convenience.

8.164.3.6 operator=()

```
LoanedDynamicData & rti::core::xtypes::LoanedDynamicData::operator= (
    LoanedDynamicData && other ) [inline]
```

<<**C++11**>> (p. 155) Move-assignment operator.

Since copying a **LoanedDynamicData** (p. 1399) is disabled, only the move-assignment operator is allowed.

This operation returns the loan that **this* currently holds.

For example:

```
LoanedDynamicData member = sample.loan_value(1);
member = sample.loan_value(2);
```

8.165 rti::sub::LoanedSample< T > Class Template Reference

The element type of a **dds::sub::LoanedSamples** (p. 1406) collection.

```
#include <LoanedSample.hpp>
```

Public Types

- typedef T **DataType**
The data type.
- typedef **dds::sub::SampleInfo** **InfoType**
dds::sub::SampleInfo (p. 1992)

Public Member Functions

- const **DataType** & **data** () const
Gets the data.
- const **InfoType** & **info** () const
Gets the sample info.
- **operator const DataType &** () const
Allows implicit conversion to the data type.
- bool **operator==** (const **LoanedSample** &other) const
Compares the data and info.

Related Functions

(Note that these are not member functions.)

- template<typename T >
dds::sub::Sample< T > **copy_to_sample** (const **rti::sub::LoanedSample**< T > &ls)
*Copies the contents of a **rti::sub::LoanedSample** (p. 1402) into a **dds::sub::Sample** (p. 1977).*
- template<typename T >
std::ostream & **operator<<** (std::ostream &out, const **LoanedSample**< T > &sample)
Calls the operator on the data or prints [invalid data].

8.165.1 Detailed Description

```
template<typename T>
class rti::sub::LoanedSample< T >
```

The element type of a **dds::sub::LoanedSamples** (p. 1406) collection.

This class encapsulates loaned, read-only data and SampleInfo from a DataReader.

LoanedSample (p. 1402) instances are always the element of a **dds::sub::LoanedSamples** (p. 1406) collection and have to be returned through that collection. A **LoanedSample** (p. 1402) instance is a lightweight handle to data owned by the DataReader from where you received a **LoanedSamples** collection.

This type is not exactly a reference type, value type or move-only type. Copying a **LoanedSample** (p. 1402) simply creates a new handle to the same loaned data.

The difference between **LoanedSample** (p. 1402) and **dds::sub::Sample** (p. 1977) is that the latter is a **value type** (p. 152) that the application owns. A **Sample** can be constructed by copying the data and meta-data referenced by a **LoanedSample** (p. 1402).

In most cases the only thing applications care about is that the elements of a **dds::sub::LoanedSamples** (p. 1406) collection have two methods, **data()** (p. 1404) and **info()** (p. 1404). For example:

```
dds::sub::LoanedSamples<Foo> samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        std::cout << sample.data() << std::endl;
    }
}
```

dds::sub::LoanedSamples (p. 1406)

8.165.2 Member Typedef Documentation

8.165.2.1 DataType

```
template<typename T >
typedef T rti::sub::LoanedSample< T >::DataType
```

The data type.

8.165.2.2 InfoType

```
template<typename T >
typedef dds::sub::SampleInfo rti::sub::LoanedSample< T >::InfoType
```

dds::sub::SampleInfo (p. 1992)

8.165.3 Member Function Documentation

8.165.3.1 data()

```
template<typename T >
const DataType & rti::sub::LoanedSample< T >::data ( ) const [inline]
```

Gets the data.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !info().valid().
---	---------------------

References **rti::sub::LoanedSample**< T >::info().

Referenced by **rti::sub::LoanedSample**< T >::operator const **DataType** &(), **rti::sub::LoanedSample**< T >↔
::operator<<(), and **rti::sub::LoanedSample**< T >::operator==().

8.165.3.2 info()

```
template<typename T >
const InfoType & rti::sub::LoanedSample< T >::info ( ) const [inline]
```

Gets the sample info.

Referenced by `rti::sub::LoanedSample< T >::data()`, `rti::request::IsReplyRelatedPredicate< T >::operator()`, `rti::sub::LoanedSample< T >::operator<<()`, and `rti::sub::LoanedSample< T >::operator==(())`.

8.165.3.3 operator const DataType &()

```
template<typename T >
rti::sub::LoanedSample< T >::operator const DataType & ( ) const [inline]
```

Allows implicit conversion to the data type.

One use of this conversion operator is to simplify the usage of generic algorithms that iterate on a `LoanedSamples` collection.

For example, the following example copies all the data of in a `LoanedSamples` collection into a vector of the data type.

The call to `std::copy` works as-is thanks to this conversion.

```
LoanedSamples<KeyedType> samples = reader.take();
std::vector<KeyedType> data_vector;
std::copy(samples.begin(), samples.end(), std::back_inserter(data_vector));
```

Note: the example above may throw `dds::core::PreconditionNotMetError` (p. 1669) if any of the samples has invalid data. See `valid_data()` (p. 553) to iterate only over samples with valid data.

Exceptions

<code>dds::core::PreconditionNotMetError</code> (p. 1669)	if <code>!info().valid()</code> .
---	-----------------------------------

References `rti::sub::LoanedSample< T >::data()`.

8.165.3.4 operator==(())

```
template<typename T >
bool rti::sub::LoanedSample< T >::operator==(
    const LoanedSample< T > & other ) const [inline]
```

Compares the data and info.

References `rti::sub::LoanedSample< T >::data()`, and `rti::sub::LoanedSample< T >::info()`.

8.165.4 Friends And Related Function Documentation

8.165.4.1 copy_to_sample()

```
template<typename T >
dds::sub::Sample< T > copy_to_sample (
    const rti::sub::LoanedSample< T > & ls ) [related]
```

Copies the contents of a `rti::sub::LoanedSample` (p. 1402) into a `dds::sub::Sample` (p. 1977).

Example:

```
dds::sub::LoanedSamples<Foo> samples = reader.take();
std::vector<Sample<Foo> > sample_vector;
std::transform(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(sample_vector),
    rti::sub::copy_to_sample<Foo>);
```

8.165.4.2 operator<<()

```
template<typename T >
std::ostream & operator<< (
    std::ostream & out,
    const LoanedSample< T > & sample ) [related]
```

Calls the operator on the data or prints [invalid data].

References `rti::sub::LoanedSample< T >::data()`, `rti::sub::LoanedSample< T >::info()`, and `dds::sub::SampleInfo::valid()`.

8.166 dds::sub::LoanedSamples< T > Class Template Reference

`<<move-only-type>>` (p. 155) Provides temporary access to a collection of samples (data and info) from a `DataReader` (p. 756).

```
#include <LoanedSamplesImpl.hpp>
```

Public Types

- typedef `SampleIterator< T >` `iterator`

The iterator type.

Public Member Functions

- **LoanedSamples** ()

8.166.1 Detailed Description

```
template<typename T>
class dds::sub::LoanedSamples< T >
```

<<*move-only-type*>> (p. 155) Provides temporary access to a collection of samples (data and info) from a **DataReader** (p. 756).

Template Parameters

<i>T</i>	The topic-type. It has to match the type of the DataReader (p. 756).
----------	---

This STL-like container encapsulates a collection of loaned, read-only data samples (**data** (p. 1404) and **info** (p. 1404)) from a **DataReader** (p. 756).

To obtain a **LoanedSamples** (p. 1406) you need to call one of the read/take operations from a **DataReader** (p. 756). The samples have to be eventually returned to the **DataReader** (p. 756). The destructor takes care of that, and the **return_loan()** (p. 1410) function lets you do it explicitly if needed.

As a move-only type copying a **LoanedSamples** (p. 1406) is not allowed. If you want to have more than one reference to a collection of loaned sample, see **SharedSamples** (p. 2069). If you need to return a **LoanedSamples** (p. 1406) from a function or assign it to another variable, use `dds::core::move()` (or `std::move()` <<*C++11*>> (p. 155)).

Iterators and overloaded subscript operators let you access the samples in this container, which are of the type **rti::sub::LoanedSample** (p. 1402).

This code demonstrates how to access the info and data of each sample in a **DataReader** (p. 756):

```
auto samples = reader.take();
for (auto sample : samples) {
    if (sample.info().valid()) {
        std::cout << sample.data() << std::endl;
    }
}
```

8.166.2 Member Typedef Documentation

8.166.2.1 iterator

```
template<typename T >
typedef SampleIterator<T> dds::sub::LoanedSamples< T >::iterator
```

The iterator type.

8.166.3 Constructor & Destructor Documentation

8.166.3.1 LoanedSamples() [1/2]

```
template<typename T >
dds::sub::LoanedSamples< T >::LoanedSamples ( ) [inline]
```

Creates an empty **LoanedSamples** (p. 1406) object.

8.166.3.2 ~LoanedSamples()

```
template<typename T >
dds::sub::LoanedSamples< T >::~~ LoanedSamples ( ) [inline], [noexcept]
```

Automatically returns the loan to the **DataReader** (p. 756).

See also

return_loan (p. 1410)

8.166.3.3 LoanedSamples() [2/2]

```
template<typename T >
dds::sub::LoanedSamples< T >::LoanedSamples (
    LoanedSamples< T > && other ) [inline]
```

<<**C++11**>> (p. 155) Moves the loan from an existing **LoanedSamples** (p. 1406) to a new one

References **dds::sub::LoanedSamples< T >::swap()**.

8.166.4 Member Function Documentation

8.166.4.1 operator[]()

```
template<typename T >
value_type dds::sub::LoanedSamples< T >::operator[] (
    size_t index ) [inline]
```

Provides access to the underlying **LoanedSample** object in array-like syntax.

Parameters

<i>index</i>	The index of the Sample (p. 1977). Allowed values are from 0 to length() (p. 1410)-1.
--------------	---

Returns

A **LoanedSample** object that refers to data and **SampleInfo** (p. 1992) at the specified *index*.

8.166.4.2 length()

```
template<typename T >
unsigned int dds::sub::LoanedSamples< T >::length ( ) const [inline]
```

Gets the number of samples in this collection.

8.166.4.3 return_loan()

```
template<typename T >
void dds::sub::LoanedSamples< T >::return_loan ( ) [inline]
```

Returns the samples to the **DataReader** (p. 756).

Note

Explicitly calling `return_loan` is optional, since the destructor does it implicitly.

This operation tells the **dds::sub::DataReader** (p. 756) that the application is done accessing the collection of samples.

It is not necessary for an application to return the loans immediately after the call to `read` or `take`. However, as these buffers correspond to internal resources, the application should not retain them indefinitely.

8.166.4.4 return_loan_noexcept()

```
template<typename T >
bool dds::sub::LoanedSamples< T >::return_loan_noexcept ( ) [inline], [noexcept]
```

Returns the samples to the **DataReader** (p. 756) (noexcept version)

This operation has the same behavior as **return_loan()** (p. 1410) but returns `false` in case of error and doesn't throw exceptions.

8.166.4.5 begin() [1/2]

```
template<typename T >
iterator dds::sub::LoanedSamples< T >::begin ( ) [inline]
```

Gets an iterator to the first sample.

Referenced by **dds::sub::LoanedSamples< T >::begin()**.

8.166.4.6 end() [1/2]

```
template<typename T >
iterator dds::sub::LoanedSamples< T >::end ( ) [inline]
```

Gets an iterator to one past the last sample.

Referenced by **dds::sub::LoanedSamples< T >::end()**.

8.166.4.7 begin() [2/2]

```
template<typename T >
const_iterator dds::sub::LoanedSamples< T >::begin ( ) const [inline]
```

Gets an iterator to the first sample.

8.166.4.8 end() [2/2]

```
template<typename T >
const_iterator dds::sub::LoanedSamples< T >::end ( ) const [inline]
```

Gets an iterator to one past the last sample.

8.166.4.9 swap()

```
template<typename T >
void dds::sub::LoanedSamples< T >::swap (
    LoanedSamples< T > & other ) throw ( ) [inline]
```

Swap two **LoanedSamples** (p. 1406) containers.

Referenced by **dds::sub::LoanedSamples< T >::LoanedSamples()**.

8.166.5 Friends And Related Function Documentation

8.166.5.1 move()

```
template<typename T >
LoanedSamples< T > move (
    LoanedSamples< T > & ls ) [related]
```

Creates a new **LoanedSamples** (p. 1406) instance by moving the contents of an existing one.

Note: in <<**C++11**>> (p. 155) you can directly use `std::move`.

The parameter object loses the ownership of the underlying samples and its state is reset as if it was default initialized. This function must be used to move any named **LoanedSamples** (p. 1406) instance (lvalue) in and out of a function by-value. Using this function is not necessary if the original **LoanedSamples** (p. 1406) is an rvalue. Moving is a very efficient operation and is guaranteed to not throw any exception.

Parameters

<i>ls</i>	The LoanedSamples (p. 1406) object that transfers its ownership of the contained samples into the returned object. After this call, <i>ls</i> is empty.
-----------	--

Returns

A new **LoanedSamples** (p. 1406) object, the new loan owner, with the same contents as *ls* had.

See also

LoanedSamples (p. 1406)

LoanedSamples::swap() (p. 1411)

8.166.5.7 valid_data() [1/2]

```
template<typename T >
ValidLoanedSamples< T > valid_data (
    LoanedSamples< T > && samples ) [related]
```

<<**C++11**>> (p. 155) <<**extension**>> (p. 156) Returns a collection that provides access only to samples with valid data

Template Parameters

<i>T</i>	The topic-type. It has to match the type of the DataReader (p. 756).
----------	---

This function transforms a **LoanedSamples** (p. 1406) collection into another collection whose iterators only access valid-data samples, skipping any sample such that !sample.info().valid().

This operation is O(1) and will not copy the data samples or allocated any additional memory.

The typical way to use this function is to directly call it on the return value of a **read()** (p. 449)/**take()** operation and use it in a for-loop. For example:

```
auto valid_samples = rti::sub::valid_data(reader.read());
for (auto sample : valid_samples) {
    // no need to check sample.info().valid()
    std::cout << sample.data() << std::endl;
}
```

Parameters

<i>samples</i>	<p>The collection of LoanedSamples (p. 1406) to transform into a ValidLoanedSamples. It must be an rvalue, so valid actual parameters are the result of one of the read/take operations:</p> <pre>auto vs = rti::sub::valid_data(reader.take());</pre> <p>Or an std::move'd existing collection:</p> <pre>auto ls = reader.take(); auto vs = rti::sub::valid_data(std::move(ls)); // 'ls' is now invalid and can't be further used</pre>
----------------	---

Returns

A forward-iterable collection that provides access only to samples with valid data. Note that this collection doesn't provide random access.

Postcondition

`samples` is invalid cannot be used after this call

See also

rti::sub::valid_data(const SampleIterator<T>&) (p. 554), which applies to an **iterator** (p. 1408) rather to the whole collection

Reading data samples (p. 119)

8.166.5.8 valid_data() [2/2]

```
template<typename T >
ValidSampleIterator< T > valid_data (
    const SampleIterator< T > & sample_iterator ) [related]
```

<<**extension**>> (p. 156) Returns an iterator that skips invalid samples

Given a regular sample iterator, this functions creates another iterator `it` that behaves exactly the same except that `it++` moves to the next valid sample (or to the end of the collection). That is, if `it` doesn't point to the end of the collection, `it->info.valid()` is always true.

This is useful when your application doesn't need to deal with samples containing meta-information only.

For example, the following code copies all the data in a **LoanedSamples** (p. 1406) collection skipping any invalid samples (otherwise, attempting to copy the data from an invalid sample would throw an exception, see `rti::sub::LoanedSample::operator const DataType& ()`).

```
dds::sub::LoanedSamples<KeyedType> samples = reader.take();
std::vector<KeyedType> data_vector;
std::copy(
    rti::sub::valid_data(samples.begin()),
    rti::sub::valid_data(samples.end()),
    std::back_inserter(data_vector));
```

Note that `valid_data(samples.begin())` won't point to the first element if that element is not a valid sample.

A similar utility is the functor **rti::sub::IsValidData** (p. 1368).

8.167.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Type used to represent the addressing information needed to send a message to an RTPS Endpoint using one of the supported transports.

8.167.2 Constructor & Destructor Documentation

8.167.2.1 Locator()

```
rti::core::Locator::Locator (
    const rti::core::LocatorKind::type the_kind,
    uint32_t the_port,
    const dds::core::ByteSeq & the_address ) [inline]
```

Construct a **Locator** (p. 1416) with the provided kind, port and address.

8.167.3 Member Function Documentation

8.167.3.1 kind() [1/2]

```
rti::core::LocatorKind::type rti::core::Locator::kind ( ) const [inline]
```

Get the kind associated with this **Locator** (p. 1416).

The kind of locator.

If the `Locator_t` kind is `Locator_t::KIND_UDPv4`, the address contains an IPv4 address. In this case, the leading 12 octets of the `Locator_t::address` must be zero. The last 4 octets of `Locator_t::address` are used to store the IPv4 address.

If the `Locator_t` kind is `Locator_t::KIND_UDPv6`, the address contains an IPv6 address. IPv6 addresses typically use a shorthand hexadecimal notation that maps one-to-one to the 16 octets in the `Locator_t::address` field.

See also

rti::core::LocatorKind_def (p. 1424)

8.167.3.2 kind() [2/2]

```
Locator & rti::core::Locator::kind (
    const rti::core::LocatorKind::type the_kind ) [inline]
```

Set the kind associated with this **Locator** (p. 1416).

See also

rti::core::LocatorKind_def (p. 1424)

8.167.3.3 port() [1/2]

```
uint32_t rti::core::Locator::port ( ) const [inline]
```

Get the port number associated with this **Locator** (p. 1416).

8.167.3.4 port() [2/2]

```
Locator & rti::core::Locator::port (
    uint32_t the_port ) [inline]
```

Set the port number associated with this **Locator** (p. 1416).

8.167.3.5 address() [1/2]

```
dds::core::ByteSeq rti::core::Locator::address ( ) const [inline]
```

Get the IP address associated with this **Locator** (p. 1416).

8.167.3.6 address() [2/2]

```
Locator & rti::core::Locator::address (
    const dds::core::ByteSeq & the_address ) [inline]
```

Set the address associated with this **Locator** (p. 1416) object.

8.167.3.7 Invalid()

```
static Locator rti::core::Locator::Invalid ( ) [inline], [static]
```

Construct an invalid locator.

Since this class doesn't provide a default constructor if you don't know the values of a **Locator** (p. 1416) at the moment of construction use this function explicitly to obtain an invalid object to be filled out.

8.167.4 Friends And Related Function Documentation

8.167.4.1 LocatorSeq

```
typedef std::vector< Locator> LocatorSeq [related]
```

A sequence of `rti::core::Locator` (p. 1416).

8.168 rti::core::policy::LocatorFilter Class Reference

<<*extension*>> (p. 156) Configures how the `dds::topic::PublicationBuiltinTopicData` (p. 1703) reports the configuration of a `MultiChannel` (p. 1483) DataWriter.

```
rti::core::LocatorFilterElement::LocatorFilterElement (
    const std::string & the_filter_expression,
    const rti::core::LocatorSeq & the_locators ) [inline]
```

Creates an instance with the provided filter_expression and locators.

Parameters

<i>the_filter_expression</i>	A logical expression used to determine the data that will be published in the channel.
<i>the_locators</i>	Sequence containing from one to four rti::core::Locator (p. 1416)

8.169.3 Member Function Documentation

8.169.3.1 locators() [1/2]

```
rti::core::LocatorSeq rti::core::LocatorFilterElement::locators ( ) const [inline]
```

Get the locators associated with this filter.

The locators are a sequence containing from one to four **rti::core::Locator** (p. 1416), used to specify the multicast address locators of an individual channel within a MultiChannel DataWriter.

8.169.3.2 locators() [2/2]

```
LocatorFilterElement & rti::core::LocatorFilterElement::locators (
    const LocatorSeq & the_locators ) [inline]
```

Set the locators associated with this LocatorFilterImpl.

8.169.3.3 filter_expression() [1/2]

```
std::string rti::core::LocatorFilterElement::filter_expression ( ) const [inline]
```

Get the filter expression.

8.169.3.4 filter_expression() [2/2]

```
LocatorFilterElement & rti::core::LocatorFilterElement::filter_expression (
    const std::string & the_expression ) [inline]
```

Set the filter expression.

The filter expression is a logical expression used to determine the data that will be published in the channel.

If the expression evaluates to TRUE, a sample will be published on the channel.

An empty string always evaluates the expression to TRUE.

The syntax of the expression will depend on the value of **rti::core::policy::LocatorFilter::filter_name** (p. 1421)

The underlying `enum` type.

8.171.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `LogCategory`.

8.171.2 Member Enumeration Documentation

8.171.2.1 `type`

```
enum rti::config::LogCategory_def::type
```

The underlying `enum` type.

Enumerator

<code>platform</code>	Log messages pertaining to the underlying platform (hardware and OS) on which RTI Connex is running are in this category.
-----------------------	---

Enumerator

communication	Log messages pertaining to data serialization and deserialization and network traffic are in this category.
database	Log messages pertaining to the internal database in which RTI Connex objects are stored are in this category.
entities	Log messages pertaining to local and remote entities, and to a subset of the discovery process, are in this category. (To see all discovery-related messages, use the DISCOVERY category.)
api	Log messages pertaining to the API layer of RTI Connex (such as method argument validation) are in this category.
discovery	Log messages pertaining to discovery are in this category.
security	Log messages pertaining to security are in this category. These messages include any messages logged by RTI Connex components even if they are not related to the Security Plugins.
user	Log messages that are generated by the user using the following log APIs: rti::config::Logger::emergency (p. 1432), rti::config::Logger::alert (p. 1432), rti::config::Logger::critical (p. 1432), rti::config::Logger::error (p. 1432), rti::config::Logger::warning (p. 1433), rti::config::Logger::notice (p. 1433), rti::config::Logger::informational (p. 1433), rti::config::Logger::debug (p. 1433).
all_categories	Log messages pertaining to all categories in RTI Connex.

8.172 rti::config::Logger Class Reference

The singleton type used to configure RTI Connex logging.

```
#include <rti/config/Logger.hpp>
```

Public Member Functions

- **Verbosity verbosity** ()
Get the verbosity at which RTI Connex is currently logging diagnostic information.
- **Verbosity verbosity_by_category** (**LogCategory** category)
Get the verbosity at which RTI Connex is currently logging diagnostic information in the given category.
- void **verbosity** (**Verbosity** verbosity)
Set the verbosity at which RTI Connex will log diagnostic information.
- void **verbosity_by_category** (**LogCategory** category, **Verbosity** verbosity)
Set the verbosity at which RTI Connex will log diagnostic information in the given category.
- FILE * **output_file** ()
Get the file to which the logged output is redirected.
- void **output_file** (FILE *out)
Set the file to which the logged output is redirected.
- void **output_file** (const char *file_name)
Set the name of the file to which the logged output is redirected.
- void **output_file_set** (const char *file_prefix, const char *file_suffix, int max_bytes, int max_files= **dds::core**←
::LENGTH_UNLIMITED)

Configure a set of files to redirect the logged output.

- void **output_handler** (std::function< void(const **LogMessage** &)> handler)

Redirects RTI Connex logging to a function.
- void **reset_output_handler** ()

Resets a previously set output handler.
- **PrintFormat print_format** ()

*Get the current message format for the log level **rti::config::LogLevel_def::EXCEPTION** (p. 1436).*
- void **print_format** (**PrintFormat** print_format)

*Set the message format that RTI Connex will use to log diagnostic information for all the log levels, except for **rti::config::LogLevel_def::FATAL_ERROR** (p. 1436). When the **Activity Context** (p. 247) is printed, the user can select the information that will be part of the **Activity Context** (p. 247) by using the API **rti::config::activity_context::set_attribute_mask()** (p. 248).*
- **PrintFormat print_format_by_log_level** (**LogLevel** log_level)

Get the current message format, by log level, that RTI Connex is using to log diagnostic information.
- void **print_format_by_log_level** (**PrintFormat** print_format, **LogLevel** log_level)

*Set the message format, by log level, that RTI Connex will use to log diagnostic information. When the **Activity Context** (p. 247) is printed, the user can select the information that will be part of the **Activity Context** (p. 247) by using the API **rti::config::activity_context::set_attribute_mask()** (p. 248).*
- void **emergency** (const char *msg)

*Logs message with **rti::config::SyslogLevel::emergency** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **alert** (const char *msg)

*Logs message with **rti::config::SyslogLevel::alert** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **critical** (const char *msg)

*Logs message with **rti::config::SyslogLevel::critical** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **error** (const char *msg)

*Logs message with **rti::config::SyslogLevel::error** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **warning** (const char *msg)

*Logs message with **rti::config::SyslogLevel::warning** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **notice** (const char *msg)

*Logs message with **rti::config::SyslogLevel::notice** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **informational** (const char *msg)

*Logs message with **rti::config::SyslogLevel::informational** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **debug** (const char *msg)

*Logs message with **rti::config::SyslogLevel::debug** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **emergency** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::emergency** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **alert** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::alert** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **critical** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::critical** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **error** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::error** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **warning** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::warning** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **notice** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::notice** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **informational** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::informational** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*
- void **debug** (std::string_view msg)

*Logs message with **rti::config::SyslogLevel::debug** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).*

Static Public Member Functions

- static `Logger & instance ()`
Get the singleton instance of this type.

8.172.1 Detailed Description

The singleton type used to configure RTI Connex logging.

8.172.2 Member Function Documentation

8.172.2.1 instance()

```
static Logger & rti::config::Logger::instance ( ) [inline], [static]
```

Get the singleton instance of this type.

Examples

`Foo_publisher.cxx`, and `Foo_subscriber.cxx`.

Referenced by `rti::config::ScopedLoggerVerbosity::ScopedLoggerVerbosity()`, and `rti::config::ScopedLoggerVerbosity::~ScopedLoggerVerbosity()`.

8.172.2.2 verbosity() [1/2]

```
Verbosity rti::config::Logger::verbosity ( )
```

Get the verbosity at which RTI Connex is currently logging diagnostic information.

The default verbosity if `rti::config::Logger::verbosity` (p.1428) is never called is `rti::config::Verbosity_def::exception` (p.2315).

If `rti::config::Logger::verbosity_by_category` (p.1428) has been used to set different verbositys for different categories of messages, this method will return the maximum verbosity of all categories.

Examples

`Foo_publisher.cxx`, and `Foo_subscriber.cxx`.

Referenced by `rti::config::ScopedLoggerVerbosity::ScopedLoggerVerbosity()`, and `rti::config::ScopedLoggerVerbosity::~ScopedLoggerVerbosity()`.

8.172.2.3 verbosity_by_category() [1/2]

```
Verbosity rti::config::Logger::verbosity_by_category (
    LogCategory category )
```

Get the verbosity at which RTI Connex is currently logging diagnostic information in the given category.

The default verbosity if **rti::config::Logger::verbosity** (p. 1428) and **rti::config::Logger::verbosity_by_category** (p. 1428) are never called is **rti::config::Verbosity_def::exception** (p. 2315).

8.172.2.4 verbosity() [2/2]

```
void rti::config::Logger::verbosity (
    Verbosity verbosity )
```

Set the verbosity at which RTI Connex will log diagnostic information.

Note: Logging at high verbosity levels will be detrimental to your application's performance. Your default setting should typically remain at **rti::config::Verbosity_def::warning** (p. 2315) or below. (The default verbosity if you never set it is **rti::config::Verbosity_def::exception** (p. 2315).)

8.172.2.5 verbosity_by_category() [2/2]

```
void rti::config::Logger::verbosity_by_category (
    LogCategory category,
    Verbosity verbosity )
```

Set the verbosity at which RTI Connex will log diagnostic information in the given category.

8.172.2.6 output_file() [1/3]

```
FILE * rti::config::Logger::output_file ( )
```

Get the file to which the logged output is redirected.

If no output file has been registered through **rti::config::Logger::output_file** (p. 1429), this method will return NULL. In this case, logged output will on most platforms go to standard out as if through printf.

8.172.2.7 output_file() [2/3]

```
void rti::config::Logger::output_file (
    FILE * out )
```

Set the file to which the logged output is redirected.

The file passed may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

For better performance when log messages are generated frequently, the log messages are not flushed into a file immediately after they are generated. In other words, while writing a log message, RTI Connex only calls the function `fwrite()` (see <https://pubs.opengroup.org/onlinepubs/009695399/functions/fwrite.html>); it does not call the function `fflush()` (see <https://pubs.opengroup.org/onlinepubs/009695399/functions/fflush.html>). If your application requires a different flushing behavior, you may use `rti::config::Logger::output_handler` (p. 1430) to configure a custom logging device.

8.172.2.8 output_file() [3/3]

```
void rti::config::Logger::output_file (
    const char * file_name )
```

Set the name of the file to which the logged output is redirected.

The name may be NULL, in which case further logged output will be redirected to the platform-specific default output location (standard out on most platforms).

See `rti::config::Logger::output_file` (p. 1429) for the flushing behavior.

8.172.2.9 output_file_set()

```
void rti::config::Logger::output_file_set (
    const char * file_prefix,
    const char * file_suffix,
    int max_bytes,
    int max_files = dds::core::LENGTH_UNLIMITED )
```

Configure a set of files to redirect the logged output.

The logged output will be redirected to a set of files whose names are configured with a prefix and a suffix. The maximum number of bytes configures how many bytes to write into a file before opening the next file. After reaching the maximum number of files, the first one is overwritten.

For example, if the prefix is '**Foo**' (p. 1332), the suffix is '.txt', the max number of bytes is 1GB, and the max number of files is 3, the logger will create (at most) these files: Foo1.txt, Foo2.txt, and Foo3.txt. It will write to Foo1.txt, and after writing 1GB, it will move on to Foo2.txt, then to Foo3.txt, then to Foo1.txt again, and so on.

To stop logging to these files and redirect the output to the platform-specific location, pass NULL, NULL, 0, 0.

See `rti::config::Logger::output_file` (p. 1429) for the flushing behavior.

8.172.2.10 output_handler()

```
void rti::config::Logger::output_handler (
    std::function< void(const LogMessage &)> handler ) [inline]
```

Redirects RTI Connex logging to a function.

When a handler is set, log messages stop being directed to the standard output and are passed to the handler.

To direct logging back to the standard output, use `reset_output_handler()` (p. 1431).

Parameters

<i>handler</i>	A function or function object capable of receiving a <code>const LogMessage</code> (p. 1436) & argument, the log message.
----------------	--

The following example sets a handler that saves all log messages in a vector:

```
std::vector<std::string> saved_logs;
Logger::instance().output_handler([&saved_logs](const LogMessage& message) {
    saved_logs.push_back(message.text); // message is copied as a std::string
});
```

The `char *` in the **LogMessage** (p. 1436) is only valid within the callback.

8.172.2.11 reset_output_handler()

```
void rti::config::Logger::reset_output_handler ( ) [inline]
```

Resets a previously set output handler.

Directs RTI Connex logging back to the standard output.

8.172.2.12 print_format() [1/2]

```
PrintFormat rti::config::Logger::print_format ( )
```

Get the current message format for the log level `rti::config::LogLevel_def::EXCEPTION` (p. 1436).

Use `rti::config::Logger::get_print_format_by_log_level` to retrieve the format for other log levels.

If `rti::config::Logger::print_format` (p. 1431) is never called, the default format is `PrintFormat_def::DEFAULT` (p. 1687).

8.172.2.13 print_format() [2/2]

```
void rti::config::Logger::print_format (
    PrintFormat print_format )
```

Set the message format that RTI Connex will use to log diagnostic information for all the log levels, except for `rti::config::LogLevel_def::FATAL_ERROR` (p. 1436). When the **Activity Context** (p. 247) is printed, the user can select the information that will be part of the **Activity Context** (p. 247) by using the API `rti::config::activity_context::set_attribute_mask()` (p. 248).

8.172.2.14 `print_format_by_log_level()` [1/2]

```
PrintFormat rti::config::Logger::print_format_by_log_level (
    LogLevel log_level )
```

Get the current message format, by log level, that RTI Connexxt is using to log diagnostic information.

If `rti::config::Logger::print_format` (p.1431) is never called, the default format is `PrintFormat_def::DEFAULT` (p.1687).

8.172.2.15 `print_format_by_log_level()` [2/2]

```
void rti::config::Logger::print_format_by_log_level (
    PrintFormat print_format,
    LogLevel log_level )
```

Set the message format, by log level, that RTI Connexxt will use to log diagnostic information. When the **Activity Context** (p.247) is printed, the user can select the information that will be part of the **Activity Context** (p.247) by using the API `rti::config::activity_context::set_attribute_mask()` (p.248).

8.172.2.16 `emergency()` [1/2]

```
void rti::config::Logger::emergency (
    const char * msg )
```

Logs message with `rti::config::SyslogLevel::emergency` (p.254) and `rti::config::LogCategory_def::user` (p.1426).

8.172.2.17 `alert()` [1/2]

```
void rti::config::Logger::alert (
    const char * msg )
```

Logs message with `rti::config::SyslogLevel::alert` (p.254) and `rti::config::LogCategory_def::user` (p.1426).

8.172.2.18 `critical()` [1/2]

```
void rti::config::Logger::critical (
    const char * msg )
```

Logs message with `rti::config::SyslogLevel::critical` (p.254) and `rti::config::LogCategory_def::user` (p.1426).

8.172.2.19 error() [1/2]

```
void rti::config::Logger::error (
    const char * msg )
```

Logs message with **rti::config::SyslogLevel::error** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.20 warning() [1/2]

```
void rti::config::Logger::warning (
    const char * msg )
```

Logs message with **rti::config::SyslogLevel::warning** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.21 notice() [1/2]

```
void rti::config::Logger::notice (
    const char * msg )
```

Logs message with **rti::config::SyslogLevel::notice** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.22 informational() [1/2]

```
void rti::config::Logger::informational (
    const char * msg )
```

Logs message with **rti::config::SyslogLevel::informational** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.23 debug() [1/2]

```
void rti::config::Logger::debug (
    const char * msg )
```

Logs message with **rti::config::SyslogLevel::debug** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.24 emergency() [2/2]

```
void rti::config::Logger::emergency (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::emergency** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.25 alert() [2/2]

```
void rti::config::Logger::alert (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::alert** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.26 critical() [2/2]

```
void rti::config::Logger::critical (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::critical** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.27 error() [2/2]

```
void rti::config::Logger::error (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::error** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.28 warning() [2/2]

```
void rti::config::Logger::warning (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::warning** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.29 notice() [2/2]

```
void rti::config::Logger::notice (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::notice** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.30 informational() [2/2]

```
void rti::config::Logger::informational (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::informational** (p.254) and **rti::config::LogCategory_def::user** (p. 1426).

8.172.2.31 debug() [2/2]

```
void rti::config::Logger::debug (
    std::string_view msg )
```

Logs message with **rti::config::SyslogLevel::debug** (p. 254) and **rti::config::LogCategory_def::user** (p. 1426).

8.173 rti::config::LogLevel_def Struct Reference

The definition of the **dds::core::safe_enum** (p. 1972) LogLevel;.

```
#include <rti/config/Logger.hpp>
```

Public Types

- enum **type** {
 FATAL_ERROR ,
 EXCEPTION ,
 WARNING ,
 STATUS_LOCAL ,
 STATUS_REMOTE ,
 STATUS_ALL }

The underlying enum type.

8.173.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `LogLevel`;

8.173.2 Member Enumeration Documentation

8.173.2.1 type

```
enum rti::config::LogLevel_def::type
```

The underlying `enum` type.

Enumerator

FATAL_ERROR	The message describes a fatal error. A fatal error indicates an unrecoverable situation in the functioning of RTI Connex. Error messages with this log level usually indicate a violation of an internal invariant or a segfault, and may include the function call stack where the fatal error happened.
EXCEPTION	The message describes an error. An error indicates a non-fatal problem in the functioning of RTI Connex. Errors are usually recoverable and will not stop application execution, although they may prevent some features from working properly. The most common cause of non-fatal errors is incorrect configuration and incorrect arguments.
WARNING	The message describes a warning. A warning indicates that RTI Connex is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
STATUS_LOCAL	The message contains information about the lifecycles of local RTI Connex objects will be logged.
STATUS_REMOTE	The message contains information about the lifecycles of remote RTI Connex objects will be logged.
STATUS_ALL	The message contains debug information that might be relevant to your application.

8.174 rti::config::LogMessage Struct Reference

A log message, including the text and additional information.

```
#include <rti/config/Logger.hpp>
```

Public Attributes

- `LogLevel level`

The log level of this message.

- `const char * text`

The text of this message.

- `bool is_security_message`

Indicates if the message is a security-related message.

- `unsigned int message_id`

A numeric code that identifies a specific log message.

- `dds::core::Duration timestamp`

The time when the log message was printed.

- `LogFacility facility`

The Facility associated with the log message.

8.174.1 Detailed Description

A log message, including the text and additional information.

This struct passed to the handler set in `Logger::output_handler()` (p. 1430).

8.174.2 Member Data Documentation

8.174.2.1 level

```
LogLevel rti::config::LogMessage::level
```

The log level of this message.

8.174.2.2 text

```
const char* rti::config::LogMessage::text
```

The text of this message.

8.174.2.3 `is_security_message`

```
bool rti::config::LogMessage::is_security_message
```

Indicates if the message is a security-related message.

A "security-related message" is a log message that meets any of the following:

- A security event logged with the RTI Security Plugins Logging Plugin.
- Any regular message coming from the RTI Security Plugins.
- RTI TLS Support log messages related to OpenSSL (e.g., SSL handshake failures or certificate validation failures).

8.174.2.4 `message_id`

```
unsigned int rti::config::LogMessage::message_id
```

A numeric code that identifies a specific log message.

8.174.2.5 `timestamp`

```
dds::core::Duration rti::config::LogMessage::timestamp
```

The time when the log message was printed.

8.174.2.6 `facility`

```
LogFacility rti::config::LogMessage::facility
```

The Facility associated with the log message.

LogFacility (p. 255)

8.175 rti::core::LongDouble Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Encapsulates an IDL long double

```
#include <LongDouble.hpp>
```

Inherits rti::core::NativeValueType< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **LongDouble** ()
Creates a long double with value 0.
- char **operator[]** (size_t i) const
Access a byte (0 to 15)
- char & **operator[]** (size_t i)
Access a byte (0 to 15)

8.175.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Encapsulates an IDL long double

Since the representation of a C++ long double is not portable, this class encapsulates an **IDL** (p. 395) 16-byte long double.

8.175.2 Constructor & Destructor Documentation

8.175.2.1 LongDouble()

```
rti::core::LongDouble::LongDouble ( ) [inline]
```

Creates a long double with value 0.

8.175.3 Member Function Documentation

8.175.3.1 operator[]() [1/2]

```
char rti::core::LongDouble::operator[] (
    size_t i ) const [inline]
```

Access a byte (0 to 15)

8.175.3.2 operator[]() [2/2]

```
char & rti::core::LongDouble::operator[] (
    size_t i ) [inline]
```

Access a byte (0 to 15)

8.176 dds::sub::DataReader< T >::ManipulatorSelector Class Reference

A **Selector** (p. 2027) class enabling the streaming API.

```
#include <TDataReader.hpp>
```

Public Member Functions

- **ManipulatorSelector & operator>>** (**dds::sub::LoanedSamples**< T > &samples)
*Streaming operator taking a **LoanedSamples** (p. 1406) object.*
- **ManipulatorSelector & operator>>** (bool(*manipulator)(**ReadModeDummyType**))
Streaming operator taking in a stream manipulator that will determine whether the samples will be read or taken.
- template<typename Functor >
ManipulatorSelector & operator>> (Functor f)
Streaming operator taking in a Functor.

8.176.1 Detailed Description

```
template<typename T>
class dds::sub::DataReader< T >::ManipulatorSelector
```

A **Selector** (p. 2027) class enabling the streaming API.

Similar to the **Selector** (p. 2027) class, the **ManipulatorSelector** (p. 1440) class is used by the **DataReader** (p. 756) to compose read and take operations using the streaming operator >>.

A **ManipulatorSelector** (p. 1440) has an associated **DataReader** (p. 756) and configures the behavior of the read or take operation performed by that **DataReader** (p. 756).

The **ManipulatorSelector** (p. 1440) works by using a number of functions which configure the stream:

- `read(dds::sub::ReadModeDummyType)` (p. 801)
- `take(dds::sub::ReadModeDummyType)` (p. 801)
- `dds::sub::max_samples(uint32_t n)` (p. 450)
- `dds::sub::content(const dds::sub::Query& query)` (p. 451)
- `dds::sub::condition(const dds::sub::cond::ReadCondition& condition)` (p. 451)
- `dds::sub::state(const dds::sub::status::DataState& s)` (p. 452)
- `dds::sub::instance(const dds::core::InstanceHandle& h)` (p. 453)
- `dds::sub::next_instance(const dds::core::InstanceHandle& h)` (p. 453)

The above functions all return functors. You do not and should not use these functors directly:

- `dds::sub::functors::MaxSamplesManipulatorFunctor`
- `dds::sub::functors::ContentFilterManipulatorFunctor`
- `dds::sub::functors::ConditionManipulatorFunctor`
- `dds::sub::functors::StateFilterManipulatorFunctor`
- `dds::sub::functors::InstanceManipulatorFunctor`
- `dds::sub::functors::NextInstanceManipulatorFunctor`

For example, to perform a read of at most 5 unread samples:

```

LoanedSamples<Foo> samples;
reader > read
    > max_samples(5)
    > state(dds::sub::status::DataState::new_data())
    > samples;

```

See also

[Accessing Received Data](#) (p. 119)

8.176.2 Member Function Documentation

8.176.2.1 `operator>>()` [1/3]

```

template<typename T >
ManipulatorSelector & dds::sub::DataReader< T >::ManipulatorSelector::operator>> (
    dds::sub::LoanedSamples< T > & samples ) [inline]

```

Streaming operator taking a **LoanedSamples** (p. 1406) object.

This operator allows you to direct the outcome of a string of stream operators into a **LoanedSamples** (p. 1406) object.

Parameters

<i>samples</i>	The LoanedSamples (p. 1406) container to fill with the read/taken samples.
----------------	---

8.176.2.2 operator>>() [2/3]

```
template<typename T >
ManipulatorSelector & dds::sub::DataReader< T >::ManipulatorSelector::operator>> (
    bool(*) ( ReadModeDummyType) manipulator ) [inline]
```

Streaming operator taking in a stream manipulator that will determine whether the samples will be read or taken.

The provided manipulator for this operator will be either **dds::sub::read** (p. 449) or **dds::sub::take** (p. 450).

Parameters

<i>manipulator</i>	Either dds::sub::read (p. 449) or dds::sub::take (p. 450)
--------------------	---

See also

dds::sub::read(dds::sub::ReadModeDummyType) (p. 449)

dds::sub::take(dds::sub::ReadModeDummyType) (p. 450)

8.176.2.3 operator>>() [3/3]

```
template<typename T >
template<typename Functor >
ManipulatorSelector & dds::sub::DataReader< T >::ManipulatorSelector::operator>> (
    Functor f ) [inline]
```

Streaming operator taking in a Functor.

There are a number of functions which return the Functors that this operator expects:

- **dds::sub::max_samples(uint32_t n)** (p. 450)
- **dds::sub::content(const dds::sub::Query& query)** (p. 451)
- **dds::sub::condition(const dds::sub::cond::ReadCondition& condition)** (p. 451)
- **dds::sub::state(const dds::sub::status::DataState& s)** (p. 452)
- **dds::sub::instance(const dds::core::InstanceHandle& h)** (p. 453)
- **dds::sub::next_instance(const dds::core::InstanceHandle& h)** (p. 453)

Parameters

<i>f</i>	A Functor that is returned from one of the above functions
----------	--

Returns

ManipulatorSelector (p. 1440)&

8.177 rti::sub::ManipulatorSelector< T > Class Template Reference

```
#include <SelectorImpl.hpp>
```

Inherits rti::sub::DefaultSelector< T >.

8.177.1 Detailed Description

```
template<typename T>
class rti::sub::ManipulatorSelector< T >
```

Selector class enabling the streaming API.

8.178 dds::core::xtypes::Member Class Reference

<<**value-type**>> (p. 152) Represents a **StructType** (p. 2107) member

```
#include "dds/core/xtypes/MemberType.hpp"
```

Public Member Functions

- **Member** (const std::string & **name**, const DynamicTypeImpl & **type**)
Creates a member consisting of a name and a type.
- **Member** (const std::string &the_name, DynamicTypeImpl &&the_type)
<<**C++11**>> (p. 155) *Creates a member consisting of a name and a type.*
- const **dds::core::string** & **name** () const
Gets the member name.
- **dds::core::string** & **name** ()
Gets the member name.
- const **DynamicType** & **type** ()
Gets the member type.
- bool **has_id** () const
Indicates if the member has an ID annotation.
- int32_t **get_id** () const

Returns the ID annotation of this member.

- bool **is_pointer** () const
 <<**extension**>> (p. 156) Indicates if this member is a pointer
- bool **is_key** () const
 Checks if a member is a key.
- bool **is_optional** () const
 Checks if a member is optional.
- bool **is_bitset** () const
 Checks if a member is a bitset.
- bool **has_bitbound** () const
 Unsupported, always returns false.
- int32_t **get_bitbound** () const
 Unsupported, always returns 32.
- **Member** & **name** (const **dds::core::string** &value)
 Sets the member name.
- **Member** & **key** (bool value)
 Sets the key annotation of a member.
- **Member** & **optional** (bool value)
 Sets the optional annotation of a member.
- **Member** & **id** (int32_t value)
 Sets the ID annotation of a member.
- **Member** & **pointer** (bool value)
 <<**extension**>> (p. 156) Makes a member a pointer

Static Public Attributes

- static const int32_t **INVALID_ID**
 The special ID of a member without the ID annotation.

8.178.1 Detailed Description

<<**value-type**>> (p. 152) Represents a **StructType** (p.2107) member

Encapsulates the name and type of a **StructType** (p.2107) member along with several IDL annotations (key, optional, bitset, bitbound, id).

8.178.2 Constructor & Destructor Documentation

8.178.2.1 Member() [1/2]

```
dds::core::xtypes::Member::Member (
    const std::string & name,
    const DynamicTypeImpl & type )
```

Creates a member consisting of a name and a type.

8.178.2.2 Member() [2/2]

```
dds::core::xtypes::Member::Member (
    const std::string & the_name,
    DynamicTypeImpl && the_type ) [inline]
```

<<**C++11**>> (p. 155) Creates a member consisting of a name and a type.

The type is moved.

8.178.3 Member Function Documentation

8.178.3.1 name() [1/3]

```
const dds::core::string & dds::core::xtypes::Member::name ( ) const
```

Gets the member name.

8.178.3.2 name() [2/3]

```
dds::core::string & dds::core::xtypes::Member::name ( )
```

Gets the member name.

8.178.3.3 type()

```
const DynamicType & dds::core::xtypes::Member::type ( )
```

Gets the member type.

8.178.3.4 has_id()

```
bool dds::core::xtypes::Member::has_id ( ) const
```

Indicates if the member has an ID annotation.

True if this member has been annotated explicitly with an ID. False if the has a default-assigned ID.

8.178.3.5 get_id()

```
int32_t dds::core::xtypes::Member::get_id ( ) const
```

Returns the ID annotation of this member.

If **has_id()** (p. 1445) is true, this returns the value of the ID annotation. Otherwise it returns `INVALID_ID`.

8.178.3.6 is_pointer()

```
bool dds::core::xtypes::Member::is_pointer ( ) const
```

<<**extension**>> (p. 156) Indicates if this member is a pointer

8.178.3.7 is_key()

```
bool dds::core::xtypes::Member::is_key ( ) const
```

Checks if a member is a key.

This corresponds to the `@Key` IDL member annotation

8.178.3.8 is_optional()

```
bool dds::core::xtypes::Member::is_optional ( ) const
```

Checks if a member is optional.

This corresponds to the `@Optional` IDL member annotation

8.178.3.9 is_bitset()

```
bool dds::core::xtypes::Member::is_bitset ( ) const
```

Checks if a member is a bitset.

8.178.3.10 has_bitbound()

```
bool dds::core::xtypes::Member::has_bitbound ( ) const
```

Unsupported, always returns false.

8.178.3.11 get_bitbound()

```
int32_t dds::core::xtypes::Member::get_bitbound ( ) const
```

Unsupported, always returns 32.

8.178.3.12 name() [3/3]

```
Member & dds::core::xtypes::Member::name (
    const dds::core::string & value )
```

Sets the member name.

8.178.3.13 key()

```
Member & dds::core::xtypes::Member::key (
    bool value )
```

Sets the key annotation of a member.

Postcondition

If **optional()** (p. 1447) was true and key is set to true, **optional()** (p. 1447) becomes false, because a member can't be both a key and optional.

[default] false

8.178.3.14 optional()

```
Member & dds::core::xtypes::Member::optional (
    bool value )
```

Sets the optional annotation of a member.

Postcondition

If **key()** (p. 1447) was true and optional is set to true, **key()** (p. 1447) becomes false, because a member can't be both a key and optional.

[default] false

8.178.3.15 id()

```
Member & dds::core::xtypes::Member::id (
    int32_t value )
```

Sets the ID annotation of a member.

[default] Automatically assigned as the ID of the previous member plus one previous member

8.178.3.16 pointer()

```
Member & dds::core::xtypes::Member::pointer (
    bool value )
```

<<*extension*>> (p. 156) Makes a member a pointer

[default] false

8.178.4 Member Data Documentation

8.178.4.1 INVALID_ID

```
const int32_t dds::core::xtypes::Member::INVALID_ID [static]
```

The special ID of a member without the ID annotation.

8.179 rti::core::policy::Monitoring Class Reference

<<*extension*>> (p. 156) Configures the use of the RTI **Monitoring** (p. 1448) Library 2.0 to collect and distribute RTI Connexx telemetry data.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Monitoring** ()
Creates the default policy (monitoring is disabled).
- **Monitoring & enable** (bool the_enable)
*Enables the collection and distribution of telemetry data for an RTI Connex application using RTI **Monitoring** (p. 1448) Library 2.0.*
- bool **enable** () const
Getter (see setter with the same name).
- **Monitoring & application_name** (const rti::core::optional_value< std::string > &the_application_name)
Sets the name of the resource that represents this RTI Connex application.
- **Monitoring & application_name** (const char *the_application_name)
Sets the name of the resource that represents this RTI Connex application.
- rti::core::optional_value< std::string > **application_name** () const
Getter (see setter with the same name).
- **Monitoring & distribution_settings** (const MonitoringDistributionSettings &the_distribution_settings)
Configures the distribution of telemetry data.
- const **MonitoringDistributionSettings & distribution_settings** () const
Gets the distribution settings by const-reference (see setter).
- **MonitoringDistributionSettings & distribution_settings** ()
Gets the distribution settings by reference (see setter).
- **Monitoring & telemetry_data** (const MonitoringTelemetryData &the_telemetry_data)
Configures the telemetry data that will be distributed.
- const **MonitoringTelemetryData & telemetry_data** () const
Gets the telemetry data by const-reference (see setter).
- **MonitoringTelemetryData & telemetry_data** ()
Gets the telemetry data by reference (see setter).

Static Public Member Functions

- static **Monitoring Enabled** ()
*Returns an instance that enables **Monitoring** (p. 1448) with default settings.*
- static **Monitoring Disabled** ()
*Returns an instance that disables **Monitoring** (p. 1448).*

8.179.1 Detailed Description

<<**extension**>> (p. 156) Configures the use of the RTI **Monitoring** (p. 1448) Library 2.0 to collect and distribute RTI Connex telemetry data.

8.179.2 Constructor & Destructor Documentation

8.179.2.1 Monitoring()

```
rti::core::policy::Monitoring::Monitoring ( ) [inline]
```

Creates the default policy (monitoring is disabled).

8.179.3 Member Function Documentation

8.179.3.1 Enabled()

```
static Monitoring rti::core::policy::Monitoring::Enabled ( ) [inline], [static]
```

Returns an instance that enables **Monitoring** (p. 1448) with default settings.

8.179.3.2 Disabled()

```
static Monitoring rti::core::policy::Monitoring::Disabled ( ) [inline], [static]
```

Returns an instance that disables **Monitoring** (p. 1448).

8.179.3.3 enable() [1/2]

```
Monitoring & rti::core::policy::Monitoring::enable (
    bool the_enable )
```

Enables the collection and distribution of telemetry data for an RTI Connex application using RTI **Monitoring** (p. 1448) Library 2.0.

Note: Enabling and disabling RTI **Monitoring** (p. 1448) Library 2.0 while DDS Entities are being created or deleted is not a safe operation. The entities created while RTI **Monitoring** (p. 1448) Library 2.0 is being enabled may not be monitored. In that case, children entities from that entity (invisible to the library) will not be monitored either.

[default] false

8.179.3.4 enable() [2/2]

```
bool rti::core::policy::Monitoring::enable ( ) const
```

Getter (see setter with the same name).

8.179.3.5 application_name() [1/3]

```
Monitoring & rti::core::policy::Monitoring::application_name (
    const rti::core::optional_value< std::string > & the_application_name )
```

Sets the name of the resource that represents this RTI Connex application.

Parameters

<i>the_application_name</i>	An optional string. An unset value indicates that the application name will be automatically assigned. A set value will set an application name.
-----------------------------	--

[default] Unset

When this member is set to a value, the resource identifier representing this application will be:

```
/applications/<application_name>
```

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The `application_name` should be unique across the RTI Connex system; however, RTI **Monitoring** (p. 1448) Library 2.0 does not currently enforce uniqueness.

When this member is not set, RTI **Monitoring** (p. 1448) Library 2.0 will automatically assign a resource identifier with this format:

```
/applications/<host_name:process_id:uuid>
```

8.179.3.6 application_name() [2/3]

```
Monitoring & rti::core::policy::Monitoring::application_name (
    const char * the_application_name )
```

Sets the name of the resource that represents this RTI Connex application.

Parameters

<i>the_application_name</i>	The application name. Cannot be NULL.
-----------------------------	---------------------------------------

When this member is set to a value, the resource identifier representing this application will be:

```
/applications/<application_name>
```

This is the resource identifier that will be used to send commands to this application from the RTI Observability Dashboards.

The `application_name` should be unique across the RTI Connex system; however, RTI **Monitoring** (p. 1448) Library 2.0 does not currently enforce uniqueness.

When this member is not set, RTI **Monitoring** (p. 1448) Library 2.0 will automatically assign a resource identifier with this format:

```
/applications/<host_name:process_id:uuid>
```

8.179.3.7 application_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::policy::Monitoring::application_name ( )  
const
```

Getter (see setter with the same name).

8.179.3.8 distribution_settings() [1/3]

```
Monitoring & rti::core::policy::Monitoring::distribution_settings (   
    const MonitoringDistributionSettings & the_distribution_settings )
```

Configures the distribution of telemetry data.

8.179.3.9 distribution_settings() [2/3]

```
const MonitoringDistributionSettings & rti::core::policy::Monitoring::distribution_settings ( )  
const
```

Gets the distribution settings by const-reference (see setter).

8.179.3.10 distribution_settings() [3/3]

```
MonitoringDistributionSettings & rti::core::policy::Monitoring::distribution_settings ( )
```

Gets the distribution settings by reference (see setter).

8.179.3.11 telemetry_data() [1/3]

```
Monitoring & rti::core::policy::Monitoring::telemetry_data (   
    const MonitoringTelemetryData & the_telemetry_data )
```

Configures the telemetry data that will be distributed.

8.179.3.12 telemetry_data() [2/3]

```
const MonitoringTelemetryData & rti::core::policy::Monitoring::telemetry_data ( ) const
```

Gets the telemetry data by const-reference (see setter).

8.179.3.13 telemetry_data() [3/3]

```
MonitoringTelemetryData & rti::core::policy::Monitoring::telemetry_data ( )
```

Gets the telemetry data by reference (see setter).

8.180 rti::core::MonitoringDedicatedParticipantSettings Class Reference

<<*extension*>> (p. 156) Configures the usage of a dedicated `dds::domain::DomainParticipant` (p. 1079) to distribute the RTI Connex application telemetry data.

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **MonitoringDedicatedParticipantSettings ()**
Creates an instance with the default settings.
- **MonitoringDedicatedParticipantSettings & enable** (bool the_enable)
Enables the use of a dedicated `dds::domain::DomainParticipant` (p. 1079) to distribute the RTI Connex application telemetry data.
- bool **enable ()** const
Getter (see setter with the same name).
- **MonitoringDedicatedParticipantSettings & domain_id** (int32_t the_domain_id)
The domain ID used in the creation of RTI Monitoring Library 2.0 `dds::domain::DomainParticipant` (p. 1079).
- int32_t **domain_id ()** const
Getter (see setter with the same name).
- **MonitoringDedicatedParticipantSettings & participant_qos_profile_name** (const rti::core::optional_↔ value< std::string > &the_participant_qos_profile_name)
Sets the fully qualified name of the profile used to configure the `dds::domain::DomainParticipant` (p. 1079) that will be used to distribute telemetry data.
- **MonitoringDedicatedParticipantSettings & participant_qos_profile_name** (const char *the_participant_↔ qos_profile_name)
Sets the fully qualified name of the profile used to configure the `dds::domain::DomainParticipant` (p. 1079) that will be used to distribute telemetry data.
- **rti::core::optional_value< std::string > participant_qos_profile_name ()** const
Getter (see setter with the same name).
- **MonitoringDedicatedParticipantSettings & collector_initial_peers** (const dds::core::StringSeq &the_↔ collector_initial_peers)
Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the `rti::core::MonitoringDistributionSettings::dedicated_participant` (p. 1459).
- **dds::core::StringSeq collector_initial_peers ()** const
Getter (see setter with the same name)

8.180.1 Detailed Description

<<*extension*>> (p. 156) Configures the usage of a dedicated **dds::domain::DomainParticipant** (p. 1079) to distribute the RTI Connex application telemetry data.

8.180.2 Constructor & Destructor Documentation

8.180.2.1 MonitoringDedicatedParticipantSettings()

```
rti::core::MonitoringDedicatedParticipantSettings::MonitoringDedicatedParticipantSettings ( )
[inline]
```

Creates an instance with the default settings.

8.180.3 Member Function Documentation

8.180.3.1 enable() [1/2]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings←
::enable (
    bool the_enable )
```

Enables the use of a dedicated **dds::domain::DomainParticipant** (p. 1079) to distribute the RTI Connex application telemetry data.

Setting this value to false is not currently supported.

[default] true

8.180.3.2 enable() [2/2]

```
bool rti::core::MonitoringDedicatedParticipantSettings::enable ( ) const
```

Getter (see setter with the same name).

8.180.3.3 domain_id() [1/2]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↔
::domain_id (
    int32_t the_domain_id )
```

The domain ID used in the creation of RTI Monitoring Library 2.0 **dds::domain::DomainParticipant** (p. 1079).

[default] 2

8.180.3.4 domain_id() [2/2]

```
int32_t rti::core::MonitoringDedicatedParticipantSettings::domain_id ( ) const
```

Getter (see setter with the same name).

8.180.3.5 participant_qos_profile_name() [1/3]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↔
::participant_qos_profile_name (
    const rti::core::optional_value< std::string > & the_participant_qos_profile_name )
```

Sets the fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1079) that will be used to distribute telemetry data.

Parameters

<i>the_participant_qos_profile_name</i>	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses rti::core::builtin_profiles::qos_lib::generic_monitoring2() (p. 274).
---	--

[default] Unset

If not set (the default value) then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 274).

8.180.3.6 participant_qos_profile_name() [2/3]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings↔
::participant_qos_profile_name (
    const char * the_participant_qos_profile_name )
```

Sets the fully qualified name of the profile used to configure the **dds::domain::DomainParticipant** (p. 1079) that will be used to distribute telemetry data.

Parameters

<i>the_participant_qos_profile_name</i>	The profile name. Cannot be NULL.
---	-----------------------------------

If not set (the default value) then RTI Monitoring Library 2.0 uses `rti::core::builtin_profiles::qos_lib::generic_monitoring2()` (p. 274).

8.180.3.7 participant_qos_profile_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::MonitoringDedicatedParticipantSettings←
::participant_qos_profile_name ( ) const
```

Getter (see setter with the same name).

8.180.3.8 collector_initial_peers() [1/2]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDedicatedParticipantSettings←
::collector_initial_peers (
    const dds::core::StringSeq & the_collector_initial_peers )
```

Determines the initial list of peers that the discovery process will contact to send announcements about the presence of the `rti::core::MonitoringDistributionSettings::dedicated_participant` (p. 1459).

Parameters

<i>the_collector_initial_peers</i>	The initial peers.
------------------------------------	--------------------

These initial peers should correspond with the RTI Observability Collector Service with which RTI Monitoring Library 2.0 has to communicate. The `collector_initial_peers` works the same as `initial_peers` for other `DomainParticipants`, except that it allows you to easily specify the initial peer(s) for the RTI Monitoring Library 2.0 `dds::domain::DomainParticipant` (p. 1079), which usually has different initial peer(s) than those used by your application.

If no `collector_initial_peers` are specified, or if it is explicitly set to an empty list, the `rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) list of `rti::core::MonitoringDedicatedParticipantSettings::participant_qos_profile_name` (p. 1455) will be used as the initial peers of `rti::core::MonitoringDistributionSettings::dedicated_participant` (p. 1459).

[default] An empty sequence.

See also

`rti::core::policy::Discovery::initial_peers(const dds::core::StringSeq & the_initial_peers)` (p. 1031) for further information about initial peers.

8.180.3.9 collector_initial_peers() [2/2]

```
dds::core::StringSeq rti::core::MonitoringDedicatedParticipantSettings::collector_initial_peers (
) const
```

Getter (see setter with the same name)

8.181 rti::core::MonitoringDistributionSettings Class Reference

<<*extension*>> (p. 156) Configures the distribution of telemetry data.

8.181.2 Constructor & Destructor Documentation

8.181.2.1 MonitoringDistributionSettings()

```
rti::core::MonitoringDistributionSettings::MonitoringDistributionSettings ( ) [inline]
```

Creates an instance with the default settings.

8.181.3 Member Function Documentation

8.181.3.1 publisher_qos_profile_name() [1/3]

```
MonitoringDistributionSettings & rti::core::MonitoringDistributionSettings::publisher_qos_←  
profile_name (   
    const rti::core::optional_value< std::string > & the_publisher_qos_profile_name )
```

Sets the fully qualified name of the profile used to configure the Publishers that distribute telemetry data.

Parameters

<i>the_publisher_qos_profile_name</i>	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses rti::core::builtin_profiles::qos_lib::generic_monitoring2() (p. 274).
---------------------------------------	--

[default] Unset

There is one Publisher for each telemetry data **dds::topic::Topic** (p. 2178): MONITORING_PERIODIC_TOPIC_NAME, MONITORING_EVENT_TOPIC_NAME, and MONITORING_LOGGING_TOPIC_NAME.

If not set (the default value) then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 274).

8.181.3.2 publisher_qos_profile_name() [2/3]

```
MonitoringDistributionSettings & rti::core::MonitoringDistributionSettings::publisher_qos_profile_name (
    const char * the_publisher_qos_profile_name )
```

Sets the fully qualified name of the profile used to configure the Publishers that distribute telemetry data.

Parameters

<i>the_publisher_qos_profile_name</i>	The profile name. Cannot be NULL.
---------------------------------------	-----------------------------------

There is one Publisher for each telemetry data **dds::topic::Topic** (p. 2178): MONITORING_PERIODIC_TOPIC_NAME, MONITORING_EVENT_TOPIC_NAME, and MONITORING_LOGGING_TOPIC_NAME.

If not set (the default value) then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 274).

8.181.3.3 publisher_qos_profile_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::MonitoringDistributionSettings::publisher_qos_profile_name ( ) const
```

Getter (see setter with the same name).

8.181.3.4 dedicated_participant() [1/3]

```
MonitoringDistributionSettings & rti::core::MonitoringDistributionSettings::dedicated_participant (
    const MonitoringDedicatedParticipantSettings & the_dedicated_participant )
```

Configures the use of a dedicated **dds::domain::DomainParticipant** (p. 1079) to distribute the RTI Connex application telemetry data.

8.181.3.5 dedicated_participant() [2/3]

```
const MonitoringDedicatedParticipantSettings & rti::core::MonitoringDistributionSettings::dedicated_↔  
_participant ( ) const
```

Gets the distribution settings by const-reference (see setter).

8.181.3.6 dedicated_participant() [3/3]

```
MonitoringDedicatedParticipantSettings & rti::core::MonitoringDistributionSettings::dedicated_↔  
participant ( )
```

Gets the distribution settings by reference (see setter).

8.182.1 Detailed Description

<<*extension*>> (p. 156) Configures the distribution of event metrics.

Event metrics are provided to RTI Monitoring Library 2.0 when they change.

For example, if the liveliness of a `dds::pub::DataWriter` (p. 908) is lost, a matching `dds::sub::DataReader` (p. 756) will push the new value of `dds::core::status::LivelinessChangedStatus` (p. 1395) to RTI Monitoring Library 2.0 so that the liveliness status change can be distributed.

There are three kinds of event metrics:

- **Configuration metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to QoS policies.
- **Status metrics:** Provided to RTI Monitoring Library 2.0 by pushing changes to the event statuses such as `dds::core::status::LivelinessChangedStatus` (p. 1395).
- **Resource metrics:** Provided to RTI Monitoring Library 2.0 when a resource (such as `dds::pub::DataWriter` (p. 908)) is created or deleted.

The event metrics that will be distributed for an observable resource can be configured with `rti::core::MonitoringTelemetryData::metrics` (p. 1482).

8.182.2 Constructor & Destructor Documentation

8.182.2.1 MonitoringEventDistributionSettings()

```
rti::core::MonitoringEventDistributionSettings::MonitoringEventDistributionSettings ( ) [inline]
```

Creates an instance with the default settings.

8.182.3 Member Function Documentation

8.182.3.1 concurrency_level() [1/2]

```
MonitoringEventDistributionSettings & rti::core::MonitoringEventDistributionSettings::concurrency_level(
    uint32_t the_concurrency_level )
```

Defines how concurrent the push of event metrics to RTI Monitoring Library 2.0 is.

With a `concurrency_level` of one, all the event metrics pushed to RTI Monitoring Library 2.0 will be stored in a single queue protected by a single mutex.

With a `concurrency_level` of 'n', RTI Monitoring Library 2.0 will create 'n' queues for event metrics, each queue protected by its own mutex. Each resource (e.g, a `dds::sub::DataReader` (p.756)) will be associated with one of the queues when the resource is registered with RTI Monitoring Library 2.0. Therefore, all the event metrics for a single resource always go to the same queue.

The event metrics for two resources associated with different event queues can be pushed in parallel. This is why a higher `concurrency_level` provides more concurrency.

The event metrics added to the event queues are processed by a single thread configured using `rti::core::MonitoringEventDistributionSettings::thread` (p. 1465).

[default] 5

[range] [1, 100]

8.182.3.2 concurrency_level() [2/2]

```
uint32_t rti::core::MonitoringEventDistributionSettings::concurrency_level ( ) const
```

Getter (see setter with the same name).

8.182.3.3 datawriter_qos_profile_name() [1/3]

```
MonitoringEventDistributionSettings & rti::core::MonitoringEventDistributionSettings::datawriter_qos_profile_name(
    const rti::core::optional_value< std::string > & the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the `dds::pub::DataWriter` (p.908) that distributes event metrics.

Parameters

<code>the_datawriter_qos_profile_name</code>	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses <code>rti::core::builtin_profiles::qos_lib::generic_monitoring2()</code> (p.274).
--	---

[default] Unset

The **dds::pub::DataWriter** (p. 908) Topic is MONITORING_EVENT_TOPIC_NAME.

If null (the default value), then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↔
monitoring2()** (p. 274).

[default] null

8.182.3.4 datawriter_qos_profile_name() [2/3]

```
MonitoringEventDistributionSettings & rti::core::MonitoringEventDistributionSettings::datawriter↔
_qos_profile_name (
    const char * the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 908) that distributes event metrics.

Parameters

<i>the_datawriter_qos_profile_name</i>	The profile name. Cannot be NULL.
--	-----------------------------------

The **dds::pub::DataWriter** (p. 908) Topic is MONITORING_EVENT_TOPIC_NAME.

If null (the default value), then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↔
monitoring2()** (p. 274).

[default] null

8.182.3.5 datawriter_qos_profile_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::MonitoringEventDistributionSettings::datawriter↔
_qos_profile_name ( ) const
```

Getter (see setter with the same name).

8.182.3.6 thread() [1/3]

```
MonitoringEventDistributionSettings & rti::core::MonitoringEventDistributionSettings::thread (
    const rti::core::ThreadSettings & the_thread )
```

The settings of the event metric thread.

The event metric thread periodically publishes the event metrics pushed into RTI Monitoring Library 2.0 event metric queues after they change their values.

The thread runs at the period configured using **rti::core::MonitoringEventDistributionSettings::publication_period** (p. 1466).

[default] DDS_THREAD_SETTINGS_DEFAULT

8.182.3.7 thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::MonitoringEventDistributionSettings::thread ( )
const
```

Getter (see setter with the same name).

8.182.3.8 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::MonitoringEventDistributionSettings::thread ( )
```

Getter (see setter with the same name).

8.182.3.9 publication_period() [1/2]

```
MonitoringEventDistributionSettings & rti::core::MonitoringEventDistributionSettings::publication←
_period (
    const dds::core::Duration & the_publication_period )
```

Period at which the event metric thread publishes the event metrics that have changed since the last time they were published.

With a period of 0 seconds, changes to event metrics will be published immediately after they are pushed into RTI Monitoring Library 2.0.

[default] 1 second

8.182.3.10 publication_period() [2/2]

```
dds::core::Duration rti::core::MonitoringEventDistributionSettings::publication_period ( ) const
```

Getter (see setter with the same name)

8.183 rti::core::MonitoringLoggingDistributionSettings Class Reference

<<*extension*>> (p. 156) Configures the distribution of log messages.

```
#include <rti/core/PolicySettings.hpp>
```

Getter (see setter with the same name).

8.183.1 Detailed Description

<<**extension**>> (p. 156) Configures the distribution of log messages.

Log messages are pushed into RTI Monitoring Library 2.0 and published by the logging thread.

The logging thread only publishes a log message with a Syslog level smaller than or equal to the forwarding level of the **rti::config::LogFacility** (p. 255) associated with the log message.

The default value of the forwarding level for all facilities is **rti::config::SyslogVerbosity::warning** (p. 254). This value can be changed with the **rti::core::MonitoringTelemetryData::logs** (p. 1483) QoS Policy or by sending a command to RTI Monitoring Library 2.0.

In this release, commands can only be sent from the RTI Observability Dashboards.

RTI Monitoring Library 2.0 can be configured to keep a history of log messages for later distribution when a log snapshot is requested by a RTI Observability Collector Service.

The log messages maintained in the history are the last 'n' messages published by the logging thread (where 'n' is the value of **rti::core::MonitoringLoggingDistributionSettings::max_historical_logs** (p. 1468)).

8.183.2 Constructor & Destructor Documentation

8.183.2.1 MonitoringLoggingDistributionSettings()

```
rti::core::MonitoringLoggingDistributionSettings::MonitoringLoggingDistributionSettings ( ) [inline]
```

Creates an instance with the default settings.

8.183.3 Member Function Documentation

8.183.3.1 concurrency_level() [1/2]

```
MonitoringLoggingDistributionSettings & rti::core::MonitoringLoggingDistributionSettings::concurrency↔  
_level (   
         uint32_t the_concurrency_level )
```

Defines how concurrent the push of log messages to RTI Monitoring Library 2.0 is.

With a `concurrency_level` of one, all the log messages pushed to RTI Monitoring Library 2.0 will be stored into a single queue protected by a single mutex.

With a `concurrency_level` of 'n', RTI Monitoring Library 2.0 will create 'n' queues for log messages, each queue protected by its own mutex.

The log messages generated by a single thread will always be pushed to the same queue. The log messages for two threads associated with different log queues can be pushed in parallel. This is why a higher `concurrency_level` provides more concurrency.

The log messages added to the log queues are processed and published by a single thread configured using `rti::core↔::MonitoringLoggingDistributionSettings::thread` (p. 1470).

[default] 5

[range] [1, 100]

8.183.3.2 concurrency_level() [2/2]

```
uint32_t rti::core::MonitoringLoggingDistributionSettings::concurrency_level ( ) const
```

Getter (see setter with the same name).

8.183.3.3 max_historical_logs() [1/2]

```
MonitoringLoggingDistributionSettings & rti::core::MonitoringLoggingDistributionSettings::max_historical_logs (
    uint32_t the_max_historical_logs )
```

The number of log messages that RTI Monitoring Library 2.0 will keep as history.

RTI Monitoring Library 2.0 will keep as history the last `max_historical_logs` published messages.

A value of 0 means that RTI Monitoring Library 2.0 should not keep any history.

[default] 128

8.183.3.4 max_historical_logs() [2/2]

```
uint32_t rti::core::MonitoringLoggingDistributionSettings::max_historical_logs ( ) const
```

Getter (see setter with the same name).

8.183.3.5 datawriter_qos_profile_name() [1/3]

```
MonitoringLoggingDistributionSettings & rti::core::MonitoringLoggingDistributionSettings::datawriter_qos_profile_name (
    const rti::core::optional_value< std::string > & the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 908) that distributes log messages.

Parameters

<i>the_datawriter_qos_profile_name</i>	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses rti::core::builtin_profiles::qos_lib::generic_monitoring2() (p. 274).
--	--

[default] Unset

The **dds::pub::DataWriter** (p. 908) Topic is `MONITORING_LOGGING_TOPIC_NAME`.

If null (the default value), then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_monitoring2()** (p. 274).

[default] null

8.183.3.6 datawriter_qos_profile_name() [2/3]

```
MonitoringLoggingDistributionSettings & rti::core::MonitoringLoggingDistributionSettings::datawriter_↔
_qos_profile_name (
    const char * the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the **dds::pub::DataWriter** (p. 908) that distributes log messages.

Parameters

<i>the_datawriter_qos_profile_name</i>	The profile name. Cannot be NULL.
--	-----------------------------------

The **dds::pub::DataWriter** (p. 908) Topic is MONITORING_LOGGING_TOPIC_NAME.

If null (the default value), then RTI Monitoring Library 2.0 uses **rti::core::builtin_profiles::qos_lib::generic_↔ monitoring2()** (p. 274).

[default] null

8.183.3.7 datawriter_qos_profile_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::MonitoringLoggingDistributionSettings↔
::datawriter_qos_profile_name ( ) const
```

Getter (see setter with the same name).

8.183.3.8 thread() [1/3]

```
MonitoringLoggingDistributionSettings & rti::core::MonitoringLoggingDistributionSettings::thread
(
    const rti::core::ThreadSettings & the_thread )
```

The settings of the logging thread.

The logging thread periodically publishes the log messages pushed into RTI Monitoring Library 2.0 log message queues after they are generated.

The thread runs at the period configured using **rti::core::MonitoringLoggingDistributionSettings::publication_↔ period** (p. 1471).

[default] DDS_THREAD_SETTINGS_DEFAULT

8.183.3.9 thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::MonitoringLoggingDistributionSettings::thread ( )
const
```

Getter (see setter with the same name).

8.183.3.10 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::MonitoringLoggingDistributionSettings::thread ( )
```

Getter (see setter with the same name).

8.183.3.11 publication_period() [1/2]

```
MonitoringLoggingDistributionSettings & rti::core::MonitoringLoggingDistributionSettings::publication↔
_period (
    const dds::core::Duration & the_publication_period )
```

Period at which the logging thread publishes log messages.

With a period of 0 seconds, log messages will be published immediately after they are pushed into RTI Monitoring Library 2.0.

[default] 1 second

8.183.3.12 publication_period() [2/2]

```
dds::core::Duration rti::core::MonitoringLoggingDistributionSettings::publication_period ( )
const
```

Getter (see setter with the same name)

8.184 rti::core::MonitoringLoggingForwardingSettings Class Reference

<<*extension*>> (p. 156) Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 255).

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **MonitoringLoggingForwardingSettings & middleware_forwarding_level** (const **rti::config::SyslogVerbosity** &middleware_forwarding_level)
*Sets the forwarding log level for **rti::config::LogFacility::middleware** (p. 255). Log messages with **rti::config::LogFacility::middleware** (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity middleware_forwarding_level** () const
Gets the middleware forwarding level by const-reference (see setter).
- **MonitoringLoggingForwardingSettings & security_event_forwarding_level** (const **rti::config::SyslogVerbosity** &security_event_forwarding_level)
*Sets the forwarding log level for **rti::config::LogFacility::security_event** (p. 255). Log messages with **rti::config::LogFacility::security_event** (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity security_event_forwarding_level** () const
Gets the security event forwarding level by const-reference (see setter).
- **MonitoringLoggingForwardingSettings & service_forwarding_level** (const **rti::config::SyslogVerbosity** &service_forwarding_level)
*Sets the forwarding log level for **rti::config::LogFacility::service** (p. 255). Log messages with **rti::config::LogFacility::service** (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity service_forwarding_level** () const
Gets the service forwarding level by const-reference (see setter).
- **MonitoringLoggingForwardingSettings & user_forwarding_level** (const **rti::config::SyslogVerbosity** &user_forwarding_level)
*Sets the forwarding log level for **rti::config::LogFacility::user** (p. 255). Log messages with **rti::config::LogFacility::user** (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.*
- **rti::config::SyslogVerbosity user_forwarding_level** () const
Gets the user forwarding level by const-reference (see setter).

8.184.1 Detailed Description

<<**extension**>> (p. 156) Configures the forwarding levels of log messages for the different **rti::config::LogFacility** (p. 255).

8.184.2 Member Function Documentation

8.184.2.1 middleware_forwarding_level() [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::middleware←
_forwarding_level (
    const rti::config::SyslogVerbosity & middleware_forwarding_level )
```

Sets the forwarding log level for **rti::config::LogFacility::middleware** (p. 255). Log messages with **rti::config::LogFacility::middleware** (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

<i>middleware_forwarding_level</i>	rti::config::SyslogVerbosity (p. 254) level.
------------------------------------	---

[default] rti::config::SyslogVerbosity::warning (p. 254)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **rti::config::Verbosity_def::warning** (p. 2315), may affect performance due to the large amount of messages produced.

8.184.2.2 middleware_forwarding_level() [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::middleware_forwarding_←
_level ( ) const
```

Gets the middleware forwarding level by const-reference (see setter).

8.184.2.3 security_event_forwarding_level() [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::security_←
event_forwarding_level (
    const rti::config::SyslogVerbosity & security_event_forwarding_level )
```

Sets the forwarding log level for **rti::config::LogFacility::security_event** (p. 255). Log messages with **rti::config::LogFacility::security_event** (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

<i>security_event_forwarding_level</i>	rti::config::SyslogVerbosity (p. 254) level.
--	---

[default] rti::config::SyslogVerbosity::warning (p. 254)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than **rti::config::Verbosity_def::warning** (p. 2315), may affect performance due to the large amount of messages produced.

8.184.2.4 security_event_forwarding_level() [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::security_event_←
forwarding_level ( ) const
```

Gets the security event forwarding level by const-reference (see setter).

8.184.2.5 `service_forwarding_level()` [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::service_↔
forwarding_level (
    const rti::config::SyslogVerbosity & service_forwarding_level )
```

Sets the forwarding log level for `rti::config::LogFacility::service` (p. 255). Log messages with `rti::config::LogFacility::service` (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

<code>service_forwarding_level</code>	<code>rti::config::SyslogVerbosity</code> (p. 254) level.
---------------------------------------	---

[default] `rti::config::SyslogVerbosity::warning` (p. 254)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than `rti::config::Verbosity_def::warning` (p. 2315), may affect performance due to the large amount of messages produced.

8.184.2.6 `service_forwarding_level()` [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::service_forwarding_↔
_level ( ) const
```

Gets the service forwarding level by const-reference (see setter).

8.184.2.7 `user_forwarding_level()` [1/2]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringLoggingForwardingSettings::user_↔
forwarding_level (
    const rti::config::SyslogVerbosity & user_forwarding_level )
```

Sets the forwarding log level for `rti::config::LogFacility::user` (p. 255). Log messages with `rti::config::LogFacility::user` (p. 255) and a log level more verbose than this value will not be distributed by RTI Monitoring Library 2.0.

Parameters

<code>user_forwarding_level</code>	<code>rti::config::SyslogVerbosity</code> (p. 254) level.
------------------------------------	---

[default] `rti::config::SyslogVerbosity::warning` (p. 254)

Keep in mind that setting this property beyond WARNING if your application's verbosity is greater than `rti::config::Verbosity_def::warning` (p. 2315), may affect performance due to the large amount of messages produced.

8.184.2.8 user_forwarding_level() [2/2]

```
rti::config::SyslogVerbosity rti::core::MonitoringLoggingForwardingSettings::user_forwarding_↔
level ( ) const
```

Gets the user forwarding level by const-reference (see setter).

8.185 rti::core::MonitoringMetricSelection Class Reference

<<**extension**>> (p. 156) Configures event and periodic metrics collection and distribution for a specific set of observable resources.

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **MonitoringMetricSelection** ()=default
Creates an instance with the default settings.
- **MonitoringMetricSelection & resource_selection** (const std::string &the_resource_selection)
*An expression pattern that selects a subset of resources by matching the pattern to the resource names. **rti::core::MonitoringMetricSelection::enabled_metrics_selection** (p. 1476) and **rti::core::MonitoringMetricSelection::disabled_metrics_selection** (p. 1477) are applied to this subset of resources.*
- std::string **resource_selection** () const
Getter (see setter with the same name).
- **MonitoringMetricSelection & enabled_metrics_selection** (const dds::core::StringSeq &the_enabled_↔ metrics_selection)
*Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **rti::core::MonitoringMetricSelection::resource_selection** (p. 1476).*
- **dds::core::StringSeq enabled_metrics_selection** () const
Getter (see setter with the same name)
- **MonitoringMetricSelection & disabled_metrics_selection** (const dds::core::StringSeq &the_disabled_↔ metrics_selection)
*Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should not be collected and distributed for the observable resources selected by **rti::core::MonitoringMetricSelection::resource_selection** (p. 1476).*
- **dds::core::StringSeq disabled_metrics_selection** () const
Getter (see setter with the same name)

8.185.1 Detailed Description

<<**extension**>> (p. 156) Configures event and periodic metrics collection and distribution for a specific set of observable resources.

8.185.2 Constructor & Destructor Documentation

8.185.2.1 MonitoringMetricSelection()

```
rti::core::MonitoringMetricSelection::MonitoringMetricSelection ( ) [default]
```

Creates an instance with the default settings.

8.185.3 Member Function Documentation

8.185.3.1 resource_selection() [1/2]

```
MonitoringMetricSelection & rti::core::MonitoringMetricSelection::resource_selection (
    const std::string & the_resource_selection )
```

An expression pattern that selects a subset of resources by matching the pattern to the resource names. **rti::core**↔
::MonitoringMetricSelection::enabled_metrics_selection (p.1476) and **rti::core**↔
::MonitoringMetricSelection↔
::disabled_metrics_selection (p.1477) are applied to this subset of resources.

Parameters

<i>the_resource_selection</i>	A string.
-------------------------------	-----------

Examples of resource expression patterns:

- /applications/myApp/domain_participants/myParticipant
- /applications/*/domain_participants/*/subscribers/*
- /applications/myApp/domain_participants/GUID(1234.5678.4321.8765)
- //myEntity

The first expression refers to a DomainParticipant named "myParticipant" that belongs to an application named "myApp". The second expression applies to all the Subscribers in the system (resource name wildcards follow the POSIX fnmatch syntax). The third expression refers to a DomainParticipant with a specific resource GUID in the "myApp" application. The last expression uses the XPath "/" operator. It matches observable resources named "myEntity" no matter where they are located in the resource hierarchy.

See the Telemetry Data / Resources chapter of the RTI Connex Observability Framework documentation for further information on the observable resource names and expression patterns.

8.185.3.2 resource_selection() [2/2]

```
std::string rti::core::MonitoringMetricSelection::resource_selection ( ) const
```

Getter (see setter with the same name).

8.185.3.3 enabled_metrics_selection() [1/2]

```
MonitoringMetricSelection & rti::core::MonitoringMetricSelection::enabled_metrics_selection (
    const dds::core::StringSeq & the_enabled_metrics_selection )
```

Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should be collected and distributed for the observable resources selected by **rti::core::MonitoringMetricSelection::resource_selection** (p. 1476).

This sequence is evaluated first, followed by **rti::core::MonitoringMetricSelection::disabled_metrics_selection** (p. 1477). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- dds_data_writer_qos_durability_writer_depth
- dds_data_reader_qos_reliability_*
- dds_application_*

The first pattern refers to a specific DataWriter metric (**dds::core::policy::Durability::writer_depth** (p. 1187)). The second pattern refers to all the DataReader **dds::core::policy::Reliability** (p. 1873) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connex Observability Framework documentation for further information on the metric names and metric patterns.

8.185.3.4 enabled_metrics_selection() [2/2]

```
dds::core::StringSeq rti::core::MonitoringMetricSelection::enabled_metrics_selection ( ) const
```

Getter (see setter with the same name)

8.185.3.5 disabled_metrics_selection() [1/2]

```
MonitoringMetricSelection & rti::core::MonitoringMetricSelection::disabled_metrics_selection (
    const dds::core::StringSeq & the_disabled_metrics_selection )
```

Sets A sequence of POSIX fnmatch patterns that match the names of the metrics that should not be collected and distributed for the observable resources selected by **rti::core::MonitoringMetricSelection::resource_selection** (p. 1476).

This sequence is evaluated after **rti::core::MonitoringMetricSelection::enabled_metrics_selection** (p. 1476). Therefore, if the same metric is enabled and disabled at the same time, the disablement will be the final result.

The patterns in the sequence are evaluated in order.

Examples of valid patterns:

- `dds_data_writer_qos_durability_writer_depth`
- `dds_data_reader_qos_reliability_*`
- `dds_application_*`

The first pattern refers to a specific DataWriter metric (`dds::core::policy::Durability::writer_depth` (p. 1187)). The second pattern refers to all the DataReader `dds::core::policy::Reliability` (p. 1873) metrics. The last pattern selects all the available application metrics.

See the Telemetry Data / Metrics chapter of the RTI Connex Observability Framework documentation for further information on the metric names and metric patterns.

8.185.3.6 `disabled_metrics_selection()` [2/2]

```
dds::core::StringSeq rti::core::MonitoringMetricSelection::disabled_metrics_selection ( ) const
```

Getter (see setter with the same name)

8.186 `rti::core::MonitoringPeriodicDistributionSettings` Class Reference

<<*extension*>> (p. 156) Configures the distribution of periodic metrics.

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **`MonitoringPeriodicDistributionSettings ()`**
Creates an instance with the default settings.
- **`MonitoringPeriodicDistributionSettings & datawriter_qos_profile_name (const rti::core::optional_value< std::string > &the_datawriter_qos_profile_name)`**
Sets The fully qualified name of the profile used to configure the `dds::pub::DataWriter` (p. 908) that distributes periodic metrics.
- **`MonitoringPeriodicDistributionSettings & datawriter_qos_profile_name (const char *the_datawriter_qos_profile_name)`**
Sets The fully qualified name of the profile used to configure the `dds::pub::DataWriter` (p. 908) that distributes periodic metrics.
- **`rti::core::optional_value< std::string > datawriter_qos_profile_name () const`**
Getter (see setter with the same name).
- **`MonitoringPeriodicDistributionSettings & thread (const rti::core::ThreadSettings &the_thread)`**
The settings of the periodic metric thread.
- **`const rti::core::ThreadSettings & thread () const`**
Getter (see setter with the same name).
- **`rti::core::ThreadSettings & thread ()`**
Getter (see setter with the same name).
- **`MonitoringPeriodicDistributionSettings & polling_period (const dds::core::Duration &the_polling_period)`**
Period at which the periodic metric thread polls and publishes the periodic metrics.
- **`dds::core::Duration polling_period () const`**
Getter (see setter with the same name)

8.186.1 Detailed Description

<<*extension*>> (p. 156) Configures the distribution of periodic metrics.

Periodic metrics change often, and they are polled and published periodically by a thread created by RTI Monitoring Library 2.0.

RTI Monitoring Library 2.0 obtains periodic metrics by polling the current value of periodic statuses such as `rti::core::status::DataWriterProtocolStatus` (p. 986).

The periodic metrics that will be distributed for an observable resource can be configured with `rti::core::MonitoringTelemetryData::metrics` (p. 1482).

8.186.2 Constructor & Destructor Documentation

8.186.2.1 MonitoringPeriodicDistributionSettings()

```
rti::core::MonitoringPeriodicDistributionSettings::MonitoringPeriodicDistributionSettings ( )
[inline]
```

Creates an instance with the default settings.

8.186.3 Member Function Documentation

8.186.3.1 datawriter_qos_profile_name() [1/3]

```
MonitoringPeriodicDistributionSettings & rti::core::MonitoringPeriodicDistributionSettings↔
::datawriter_qos_profile_name (
    const rti::core::optional_value< std::string > & the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the `dds::pub::DataWriter` (p. 908) that distributes periodic metrics.

Parameters

<i>the_datawriter_qos_profile_name</i>	An optional string. An unset value indicates that the RTI Monitoring Library 2.0 uses <code>rti::core::builtin_profiles::qos_lib::generic_monitoring2()</code> (p. 274).
--	--

[default] Unset

The `dds::pub::DataWriter` (p. 908) Topic is `MONITORING_PERIODIC_TOPIC_NAME`.

If null (the default value), then RTI Monitoring Library 2.0 uses `rti::core::builtin_profiles::qos_lib::generic_monitoring2()` (p. 274).

[default] null

8.186.3.2 `datawriter_qos_profile_name()` [2/3]

```
MonitoringPeriodicDistributionSettings & rti::core::MonitoringPeriodicDistributionSettings↔
::datawriter_qos_profile_name (
    const char * the_datawriter_qos_profile_name )
```

Sets The fully qualified name of the profile used to configure the `dds::pub::DataWriter` (p. 908) that distributes periodic metrics.

Parameters

<code><i>the_datawriter_qos_profile_name</i></code>	The profile name. Cannot be NULL.
---	-----------------------------------

The `dds::pub::DataWriter` (p. 908) Topic is `MONITORING_PERIODIC_TOPIC_NAME`.

If null (the default value), then RTI Monitoring Library 2.0 uses `rti::core::builtin_profiles::qos_lib::generic_monitoring2()` (p. 274).

[default] null

8.186.3.3 `datawriter_qos_profile_name()` [3/3]

```
rti::core::optional_value< std::string > rti::core::MonitoringPeriodicDistributionSettings↔
::datawriter_qos_profile_name ( ) const
```

Getter (see setter with the same name).

8.186.3.4 `thread()` [1/3]

```
MonitoringPeriodicDistributionSettings & rti::core::MonitoringPeriodicDistributionSettings↔
::thread (
    const rti::core::ThreadSettings & the_thread )
```

The settings of the periodic metric thread.

The periodic metric thread periodically polls and publishes periodic event metrics.

The thread runs at the period configured using `rti::core::MonitoringPeriodicDistributionSettings::polling_period` (p. 1481).

[default] `DDS_THREAD_SETTINGS_DEFAULT`

8.186.3.5 thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::MonitoringPeriodicDistributionSettings::thread ( )
const
```

Getter (see setter with the same name).

8.186.3.6 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::MonitoringPeriodicDistributionSettings::thread ( )
```

Getter (see setter with the same name).

8.186.3.7 polling_period() [1/2]

```
MonitoringPeriodicDistributionSettings & rti::core::MonitoringPeriodicDistributionSettings↔
::polling_period (
    const dds::core::Duration & the_polling_period )
```

Period at which the periodic metric thread polls and publishes the periodic metrics.

[default] 5 seconds

[range] > 0 seconds

8.186.3.8 polling_period() [2/2]

```
dds::core::Duration rti::core::MonitoringPeriodicDistributionSettings::polling_period ( ) const
```

Getter (see setter with the same name)

8.187 rti::core::MonitoringTelemetryData Class Reference

<<*extension*>> (p. 156) Configures the telemetry data that will be distributed.

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **MonitoringTelemetryData & metrics** (const **MonitoringMetricSelectionSeq** &the_metrics)
Sets the sequence of **rti::core::MonitoringMetricSelection** (p. 1475) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.
- **MonitoringMetricSelectionSeq metrics** () const
Gets the metrics (see setter).
- **MonitoringTelemetryData & logs** (const **MonitoringLoggingForwardingSettings** &the_logs)
Sets the **rti::core::MonitoringLoggingForwardingSettings** (p. 1471) containing the **rti::config::SyslogVerbosity** (p. 254) levels that will be forwarded for the different **rti::config::LogFacility** (p. 255).
- const **MonitoringLoggingForwardingSettings & logs** () const
Gets the metrics by const-reference (see setter).
- **MonitoringLoggingForwardingSettings & logs** ()
Gets the metrics by reference (see setter).

8.187.1 Detailed Description

<<**extension**>> (p. 156) Configures the telemetry data that will be distributed.

8.187.2 Member Function Documentation

8.187.2.1 metrics() [1/2]

```
MonitoringTelemetryData & rti::core::MonitoringTelemetryData::metrics (
    const MonitoringMetricSelectionSeq & the_metrics )
```

Sets the sequence of **rti::core::MonitoringMetricSelection** (p. 1475) containing the event and periodic metrics that will be collected and distributed for a given set of observable resources.

Parameters

<i>the_metrics</i>	sequence of rti::core::MonitoringMetricSelection (p. 1475).
--------------------	--

The different **rti::core::MonitoringMetricSelection** (p. 1475) in the sequence are evaluated in order.

[default] An empty sequence, meaning that no metrics will be collected and distributed for any observable resource.

See also

rti::core::MonitoringEventDistributionSettings (p. 1462) and **rti::core::MonitoringPeriodicDistributionSettings** (p. 1478) for further information on how RTI Monitoring Library 2.0 distributes **metrics** (p. 1482).

8.187.2.2 metrics() [2/2]

```
MonitoringMetricSelectionSeq rti::core::MonitoringTelemetryData::metrics ( ) const
```

Gets the metrics (see setter).

8.187.2.3 logs() [1/3]

```
MonitoringTelemetryData & rti::core::MonitoringTelemetryData::logs (
    const MonitoringLoggingForwardingSettings & the_logs )
```

Sets the **rti::core::MonitoringLoggingForwardingSettings** (p. 1471) containing the **rti::config::SyslogVerbosity** (p. 254) levels that will be forwarded for the different **rti::config::LogFacility** (p. 255).

Parameters

<i>the_logs</i>	rti::core::MonitoringLoggingForwardingSettings (p. 1471) object.
-----------------	---

See also

rti::core::MonitoringLoggingDistributionSettings (p. 1466) for further information on how RTI Monitoring Library 2.0 distributes log messages.

8.187.2.4 logs() [2/3]

```
const MonitoringLoggingForwardingSettings & rti::core::MonitoringTelemetryData::logs ( ) const
```

Gets the metrics by const-reference (see setter).

8.187.2.5 logs() [3/3]

```
MonitoringLoggingForwardingSettings & rti::core::MonitoringTelemetryData::logs ( )
```

Gets the metrics by reference (see setter).

8.188 rti::core::policy::MultiChannel Class Reference

<<**extension**>> (p. 156) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **MultiChannel** ()
Creates the default policy.
- **MultiChannel** (const **rti::core::ChannelSettingsSeq** &the_channels, const std::string &the_filter_name= **rti::topic::stringmatch_filter_name**())
Creates an instance with the specified channels and filter name.
- **MultiChannel** & **channels** (const **rti::core::ChannelSettingsSeq** &the_channels)
*A sequence of **rti::core::ChannelSettings** (p. 703) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.*
- **rti::core::ChannelSettingsSeq** **channels** () const
Getter (see the setter with the same name)
- **MultiChannel** & **filter_name** (const std::string &the_filter_name)
*Name of the filter class used to describe the filter expressions of a **MultiChannel** (p. 1483) DataWriter.*
- std::string **filter_name** () const
Getter (see the setter with the same name)

8.188.1 Detailed Description

<<**extension**>> (p. 156) Configures the ability of a DataWriter to send data on different multicast groups (addresses) based on the value of the data.

This QoS policy is used to partition the data published by a **dds::pub::DataWriter** (p. 908) across multiple channels. A *channel* is defined by a filter expression and a sequence of multicast locators.

Entity:

dds::pub::DataWriter (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.188.2 Usage

By using this QoS, a **dds::pub::DataWriter** (p. 908) can be configured to send data to different multicast groups based on the content of the data. Using syntax similar to those used in Content-Based Filters, you can associate different multicast addresses with filter expressions that operate on the values of the fields within the data. When your application's code calls **dds::pub::DataWriter::write()** (p. 918), data is sent to any multicast address for which the data passes the filter.

Multi-channel DataWriters can be used to trade off network bandwidth with the unnecessary processing of unwanted data for situations where there are multiple DataReaders that are interested in different subsets of data that come from the same data stream (Topic). For example, in Financial applications, the data stream may be quotes for different stocks at an exchange. Applications usually only want to receive data (quotes) for only a subset of the stocks being traded.

In tracking applications, a data stream may carry information on hundreds or thousands of objects being tracked, but again, applications may only be interested in a subset.

The problem is that the most efficient way to deliver data to multiple applications is to use multicast, so that a data value is only sent once on the network for any number of subscribers to the data. However, using multicast, an application will receive *all* of the data sent and not just the data in which it is interested, thus extra CPU time is wasted to throw away unwanted data. With this QoS, you can analyze the data-usage patterns of your applications and optimize network vs. CPU usage by partitioning the data into multiple multicast streams. While network bandwidth is still being conserved by sending data only once using multicast, most applications will only need to listen to a subset of the multicast addresses and receive a reduced amount of unwanted data.

Your system can gain more of the benefits of using multiple multicast groups if your network uses Layer 2 Ethernet switches. Layer 2 switches can be configured to only route multicast packets to those ports that have added membership to specific multicast groups. Using those switches will ensure that only the multicast packets used by applications on a node are routed to the node; all others are filtered-out by the switch.

8.188.3 Constructor & Destructor Documentation

8.188.3.1 MultiChannel() [1/2]

```
rti::core::policy::MultiChannel::MultiChannel ( ) [inline]
```

Creates the default policy.

8.188.3.2 MultiChannel() [2/2]

```
rti::core::policy::MultiChannel::MultiChannel (
    const rti::core::ChannelSettingsSeq & the_channels,
    const std::string & the_filter_name = rti::topic::stringmatch_filter_name() ) [inline]
```

Creates an instance with the specified channels and filter name.

8.188.4 Member Function Documentation

8.188.4.1 channels() [1/2]

```
MultiChannel & rti::core::policy::MultiChannel::channels (
    const rti::core::ChannelSettingsSeq & the_channels )
```

A sequence of **rti::core::ChannelSettings** (p. 703) used to configure the channels' properties. If the length of the sequence is zero, the QoS policy will be ignored.

A sequence length of zero indicates the **rti::core::policy::MultiChannel** (p. 1483) is not in use.

The sequence length cannot be greater than **rti::core::policy::DomainParticipantResourceLimits::channel_seq_↔max_length** (p. 1172).

[default] Empty sequence.

8.188.4.2 channels() [2/2]

```
rti::core::ChannelSettingsSeq rti::core::policy::MultiChannel::channels ( ) const
```

Getter (see the setter with the same name)

8.188.4.3 filter_name() [1/2]

```
MultiChannel & rti::core::policy::MultiChannel::filter_name (
    const std::string & the_filter_name )
```

Name of the filter class used to describe the filter expressions of a **MultiChannel** (p. 1483) DataWriter.

The following builtin filters are supported:

- **rti::topic::sql_filter_name** (p. 48)
- **rti::topic::stringmatch_filter_name** (p. 48)

[default] **rti::topic::stringmatch_filter_name** (p. 48)

8.188.4.4 filter_name() [2/2]

```
std::string rti::core::policy::MultiChannel::filter_name ( ) const
```

Getter (see the setter with the same name)

8.189 rti::flat::MutableArrayBuilder< ElementBuilder, N > Class Template Reference

Builds an array member of variable-size elements.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::MutableArrayBuilder< ElementBuilder, N >:

Public Types

- typedef **MutableArrayOffset**< typename ElementBuilder::Offset, N > **Offset**
The related Offset type.

Public Member Functions

- ElementBuilder **build_next** ()
Begins building the next element.
- **Offset finish** ()
Finishes building the array.

Additional Inherited Members

8.189.1 Detailed Description

```
template<typename ElementBuilder, unsigned int N>
class rti::flat::MutableArrayBuilder< ElementBuilder, N >
```

Builds an array member of variable-size elements.

Template Parameters

<i>ElementBuilder</i>	The Builder type for the elements of the array
<i>N</i>	The array bound; the exact number of elements this array builder must build. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

Each element of this array needs to be built using the `ElementBuilder` returned by `build_next()` (p. 1488). `N` elements exactly must be built. Unlike a sequence Builder, it is not possible to finish an array with less than `N` elements.

This example shows how to use a `MutableArrayBuilder` (p. 1487) to build an array member of `MyFlatMutableBuilder` (p. 1497):

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto array_builder = builder.build_my_mutable_array();
for (int i = 0; i < 10; i++) {
    FlatMutableBarBuilder element_builder = array_builder.build_next();
    // ... build element
    element_builder.finish();
}
array_builder.finish();
```

Note that Builder types are not necessary for arrays of fixed-size elements, since they are added at once (see `MyFlatMutableBuilder::add_my_final_array()` (p. 1502)).

8.189.2 Member Typedef Documentation

8.189.2.1 Offset

```
template<typename ElementBuilder , unsigned int N>
typedef MutableArrayOffset<typename ElementBuilder::Offset, N> rti::flat::MutableArrayBuilder<
ElementBuilder, N >::Offset
```

The related Offset type.

8.189.3 Member Function Documentation

8.189.3.1 build_next()

```
template<typename ElementBuilder , unsigned int N>
ElementBuilder rti::flat::MutableArrayBuilder< ElementBuilder, N >::build_next ( ) [inline]
```

Begins building the next element.

Before calling `build_next()` (p. 1488) to create a new element, the element Builder returned by a previous call to `build_next` must have been finished.

References `rti::flat::AbstractListBuilder< detail::DHeaderGenerator >::element_count()`.

8.189.3.2 finish()

```
template<typename ElementBuilder , unsigned int N>
Offset rti::flat::MutableArrayBuilder< ElementBuilder, N >::finish ( ) [inline]
```

Finishes building the array.

Precondition

build_next() (p. 1488) must have been successfully called N times exactly.

Returns

The Offset to the member that has been built.

See also

discard() (p. 572)

References **rti::flat::AbstractListBuilder< detail::DHeaderGenerator >::element_count()**.

8.190 rti::flat::MutableArrayOffset< ElementOffset, N > Class Template Reference

Offset to an array of variable-size elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::MutableArrayOffset< ElementOffset, N >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)
Gets the Offset to an element.

Additional Inherited Members

8.190.1 Detailed Description

```
template<typename ElementOffset, unsigned int N>
class rti::flat::MutableArrayOffset< ElementOffset, N >
```

Offset to an array of variable-size elements.

Template Parameters

<i>ElementOffset</i>	An Offset for a type of variable size, such as a mutable struct (MyFlatMutableOffset (p. 1504)), union, or StringOffset (p. 2101).
<i>N</i>	The array bound. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

Represents an Offset to an array member and allows getting an Offset to each of its elements.

See also

FinalArrayOffset (p. 1310) encapsulates arrays of fixed-size elements

8.190.2 Member Function Documentation

8.190.2.1 `get_element()`

```
template<typename ElementOffset , unsigned int N>
ElementOffset rti::flat::MutableArrayOffset< ElementOffset, N >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

The Offset to the element in the *i*-th position

8.191 `rti::flat::MutableOffset` Class Reference

The base class of all Offsets to a final struct type.

```
#include <Offset.hpp>
```

Inheritance diagram for `rti::flat::MutableOffset`:

Additional Inherited Members

8.191.1 Detailed Description

The base class of all Offsets to a final struct type.

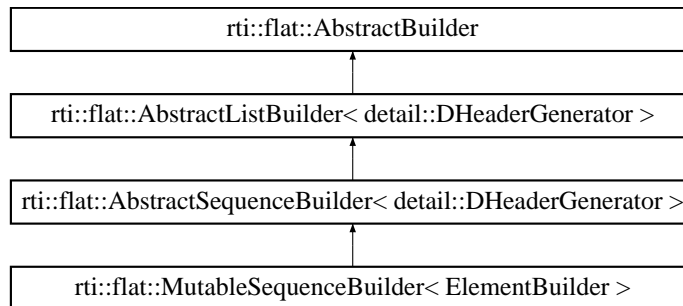

This class contains only implementation details; all the public accessors are defined in the generated type (**MyFlat**↔**MutableOffset** (p. 1504)).

8.192 rti::flat::MutableSequenceBuilder< ElementBuilder > Class Template Reference

Builds a sequence member of variable-size elements.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::MutableSequenceBuilder< ElementBuilder >:

Public Types

- typedef **SequenceOffset**< typename ElementBuilder::Offset > **Offset**
The related Offset type.

Public Member Functions

- ElementBuilder **build_next** ()
Begins building the next element.
- **Offset** **finish** ()
Finishes building the sequence.

Additional Inherited Members

8.192.1 Detailed Description

```
template<typename ElementBuilder>
class rti::flat::MutableSequenceBuilder< ElementBuilder >
```

Builds a sequence member of variable-size elements.

Template Parameters

<i>ElementBuilder</i>	The Builder type for the elements of the sequence
-----------------------	---

To build the elements use the `ElementBuilder` returned by `build_next()` (p. 1492). An empty sequence can be built by calling `finish()` (p. 1492) without any call to `build_next()` (p. 1492).

This class doesn't enforce the sequence bound set in IDL.

The following example uses a `MutableSequenceBuilder` (p. 1491) to initialize a sequence member of `MyFlatMutableBuilder` (p. 1497) with two elements:

```
MyFlatMutableBuilder builder = rti::flat::build_data(writer);
auto seq_builder = builder.build_my_mutable_seq();
auto element_builder = seq_builder.build_next();
// ... build the first element
element_builder.finish();
element_builder = seq_builder.build_next();
// ... build the second element
element_builder.finish();

seq_builder.finish();
```

8.192.2 Member Typedef Documentation

8.192.2.1 Offset

```
template<typename ElementBuilder >
typedef SequenceOffset<typename ElementBuilder::Offset> rti::flat::MutableSequenceBuilder<
ElementBuilder >::Offset
```

The related `Offset` type.

8.192.3 Member Function Documentation

8.192.3.1 build_next()

```
template<typename ElementBuilder >
ElementBuilder rti::flat::MutableSequenceBuilder< ElementBuilder >::build_next ( ) [inline]
```

Begins building the next element.

Before calling `build_next()` (p. 1492) to create a new element, the application must have called `finish()` (p. 1492) on the previous element Builder.

8.192.3.2 finish()

```
template<typename ElementBuilder >
Offset rti::flat::MutableSequenceBuilder< ElementBuilder >::finish ( ) [inline]
```

Finishes building the sequence.

Returns

An Offset to the member that has been built.

See also

discard() (p.572)

8.193 MyFlatFinalOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData final IDL struct.

```
#include <Offset.hpp>
```

Inheritance diagram for MyFlatFinalOffset:

Public Types

- typedef MyFlatFinalConstOffset **ConstOffset**

The equivalent read-only Offset type.

Public Member Functions

- **MyFlatFinalOffset** ()
Creates a null Offset.
- `int32_t my_primitive` () const
Retrieves the value for a primitive member.
- `FlatFinalBar::ConstOffset my_complex` () const
Retrieves a const Offset to a complex member.
- `const rti::flat::PrimitiveArrayOffset< int32_t, 10 > my_primitive_array` () const
Retrieves a const Offset to a primitive array.
- `rti::flat::FinalArrayOffset< FlatFinalBar::ConstOffset, 10 > my_complex_array` () const
Retrieves a const Offset to a complex array.
- `bool my_primitive` (int32_t value)
Sets the value for a primitive member.
- `FlatFinalBar::Offset my_complex` ()
Retrieves a non-const Offset to a complex member.
- `rti::flat::PrimitiveArrayOffset< int32_t, 10 > my_primitive_array` ()
Retrieves a non-const Offset to a primitive array.
- `rti::flat::FinalArrayOffset< FlatFinalBar::Offset, 10 > my_complex_array` ()
Retrieves a non-const Offset to a complex array.

8.193.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData final IDL struct.

This example type represents the Offset type that **rtiddsngen** would generate for **MyFlatFinal** (p. 213).

It provides accessors for each of its members. Accessors can return other Offsets or primitive values.

An Offset to a final type may meet the requirements to be cast to its equivalent plain C++ type (see **rti::flat::plain_cast()** (p. 217)).

8.193.2 Member Typedef Documentation

8.193.2.1 ConstOffset

```
typedef MyFlatFinalConstOffset MyFlatFinalOffset::ConstOffset
```

The equivalent read-only Offset type.

Each Offset for a user type has an equivalent const Offset that doesn't provide the methods to modify the Sample. For example, when reading data from a **dds::sub::DataReader** (p. 756), a const Sample's `Sample::root()` function returns a const Offset.

8.193.3 Constructor & Destructor Documentation

8.193.3.1 MyFlatFinalOffset()

```
MyFlatFinalOffset::MyFlatFinalOffset ( ) [inline]
```

Creates a null Offset.

Postcondition

`is_null()` (p. 1607)

8.193.4 Member Function Documentation

8.193.4.1 my_primitive() [1/2]

```
int32_t MyFlatFinalOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

8.193.4.2 my_complex() [1/2]

```
FlatFinalBar::ConstOffset MyFlatFinalOffset::my_complex ( ) const
```

Retrieves a const Offset to a complex member.

FlatFinalBar is another arbitrary user-defined final FlatData type.

8.193.4.3 my_primitive_array() [1/2]

```
const rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatFinalOffset::my_primitive_array ( )  
const
```

Retrieves a const Offset to a primitive array.

8.193.4.4 my_complex_array() [1/2]

```
rti::flat::FinalArrayOffset< FlatFinalBar::ConstOffset, 10 > MyFlatFinalOffset::my_complex_array
( ) const
```

Retrieves a const Offset to a complex array.

8.193.4.5 my_primitive() [2/2]

```
bool MyFlatFinalOffset::my_primitive (
    int32_t value )
```

Sets the value for a primitive member.

8.193.4.6 my_complex() [2/2]

```
FlatFinalBar::Offset MyFlatFinalOffset::my_complex ( )
```

Retrieves a non-const Offset to a complex member.

FlatFinalBar is another arbitrary user-defined final FlatData type.

8.193.4.7 my_primitive_array() [2/2]

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatFinalOffset::my_primitive_array ( )
```

Retrieves a non-const Offset to a primitive array.

8.193.4.8 my_complex_array() [2/2]

```
rti::flat::FinalArrayOffset< FlatFinalBar::Offset, 10 > MyFlatFinalOffset::my_complex_array ( )
```

Retrieves a non-const Offset to a complex array.

8.194 MyFlatMutableBuilder Class Reference

Represents the Builder for an arbitrary user-defined mutable type.

```
#include <Builder.hpp>
```

Inheritance diagram for MyFlatMutableBuilder:

Public Types

- typedef **MyFlatMutableOffset** **Offset**
The related offset type.

Public Member Functions

- **MyFlatMutableBuilder** ()
Creates an invalid Builder.
- **MyFlatMutableBuilder** (unsigned char *buffer, int32_t size, bool initialize_members=false)
Construct a Builder with an arbitrary buffer.
- **Offset finish** ()
Finishes building a member.
- **MyFlatMutable * finish_sample** ()
Finishes building a sample.
- bool **add_my_primitive** (int32_t value)
Adds a primitive member.
- bool **add_my_optional_primitive** (int32_t value)
Adds a primitive member.
- **rti::flat::PrimitiveArrayOffset**< int32_t, 10 > **add_my_primitive_array** ()
Adds a primitive array member.
- **rti::flat::PrimitiveSequenceBuilder**< int32_t > **build_my_primitive_seq** ()
Begins building a primitive-sequence member.
- **MyFlatFinalOffset add_my_final** ()
Adds a final complex member.
- **rti::flat::FinalAlignedArrayOffset**< **MyFlatFinalOffset**, 10 > **add_my_final_array** ()
Adds an array member of final complex elements.
- **rti::flat::FinalSequenceBuilder**< **MyFlatFinalOffset** > **build_my_final_seq** ()
Begins building a sequence member of final complex elements.
- FlatMutableBarBuilder **build_my_mutable** ()

Begins building a mutable complex member.

- **rti::flat::MutableArrayBuilder**< FlatMutableBarBuilder, 10 > **build_my_mutable_array** ()

Begins building an array member of mutable complex elements.

- **rti::flat::MutableSequenceBuilder**< FlatMutableBarBuilder > **build_my_mutable_seq** ()

Begins building a sequence member of mutable complex elements.

- **rti::flat::StringBuilder** **build_my_string** ()

Begins building a string member.

- **rti::flat::MutableSequenceBuilder**< **rti::flat::StringBuilder** > **build_my_string_seq** ()

Begins building a sequence member of string elements.

Additional Inherited Members

8.194.1 Detailed Description

Represents the Builder for an arbitrary user-defined mutable type.

This example type represents the **Builder** (p. 209) type that **rtiddsgen** would generate for **MyFlatMutable** (p. 213) and allows creating a sample or a member of that type.

The most common way to create a Builder is **rti::flat::build_data()** (p. 211), which obtains a managed sample from a **dds::pub::DataWriter** (p. 908) as described in **Publishing FlatData** (p. 220). It is also possible to create a Builder with an arbitrary buffer using the constructor that receives the buffer and its size.

When a Builder is created, the type is empty—it doesn't contain any members. The Builder provides functions to create each member. There are two kind of functions: `add` functions and `build` functions.

8.194.1.1 Adding fixed-size members

Fixed-size members are "added", and the corresponding function is called **add_<member_name>**. "Add" functions directly place the member in the buffer, and return an **Offset** (p. 214) that allows setting its values.

By default, after calling **add_<member_name>** the member values are uninitialized. This behavior can be changed by creating the writer with **rti::core::policy::DataWriterResourceLimits::initialize_writer_loaned_sample** (p. 1013); this is however not recommended in general because of the performance impact for large types.

```
MyFlatMutableBuilder builder = ...;
MyFinalFooOffset member_offset = builder.add_my_final();
member_offset.my_primitive(10);
// ... add/build more members
```

8.194.1.2 Building variable-size members

Variable-size members are "built", and the function is called **build_<member_name>**. "Build" functions return another **Builder** (p. 209) to build the member.

```
MyFlatMutableBuilder builder = ...;
auto member_builder = builder.build_my_mutable();
// ... use member_builder
member_builder.finish();
// ... add/build more members
```

While a member is being built, the parent Builder is a **bound** state, which prevents any changes to it until the member has been finished by calling `member_builder.finish()`. In particular, the member Builder must be finished before adding or building any other member, or before finishing `builder`.

8.194.1.3 Choosing which members are included

The `add/build` function for each member can be called one or zero times. That is, all members are optional, even those without the `@optional` IDL annotation. However `@key` member must be added or `dds::pub::DataWriter` `write()` (p. 918) will fail.

FlatData samples received by `dds::sub::DataReader` (p. 756) will not contain the members that were not added/built—the corresponding member getters return a null Offset. A `dds::sub::DataReader` (p. 756) for an equivalent non-FlatData (plain) definition of this type will assign default values to any non-optional members that were not present in the sample when written.

It is not permitted to add a member more than once, but builders don't enforce this. Trying to build/add a member more than once may cause the Builder to overflow (see **Builder Error Management** (p. 210)). If it doesn't, it may be possible to write and read the data samples, but the duplicate members will be ignored.

See also

FlatData Builders (p. 209)

8.194.2 Member Typedef Documentation

8.194.2.1 Offset

```
typedef MyFlatMutableOffset MyFlatMutableBuilder::Offset
```

The related offset type.

8.194.3 Constructor & Destructor Documentation

8.194.3.1 MyFlatMutableBuilder() [1/2]

```
MyFlatMutableBuilder::MyFlatMutableBuilder ( ) [inline]
```

Creates an invalid Builder.

Postcondition

```
!is_valid()
```

Note

Top-level builders are created with `rti::flat::build_data()` (p. 211), and member builders are created with the corresponding `build_<member>` function.

8.194.3.2 MyFlatMutableBuilder() [2/2]

```
MyFlatMutableBuilder::MyFlatMutableBuilder (
    unsigned char * buffer,
    int32_t size,
    bool initialize_members = false ) [inline]
```

Construct a Builder with an arbitrary buffer.

Note

The recommended way to create a Builder is `rti::flat::build_data()` (p. 211) as described in **Publishing FlatData** (p. 220). This constructor provides an alternative option to use an arbitrary data buffer.

Parameters

<i>buffer</i>	The buffer that will be used to build the data sample
<i>size</i>	The size of the buffer
<i>initialize_members</i>	Whether fixed-size elements added to this Builder will be initialized to their default values or will be left uninitialized (more efficient).

If the sample being built overflows the buffer size, the add/build operations will fail. See **Builder Error Management** (p. 210).

8.194.4 Member Function Documentation

8.194.4.1 finish()

```
Offset MyFlatMutableBuilder::finish ( )
```

Finishes building a member.

Returns

The Offset to the member (normally it can be ignored)

Precondition

is_nested() (p. 572). That is, this object must be a member Builder, not a sample Builder.

8.194.4.2 finish_sample()

```
MyFlatMutable * MyFlatMutableBuilder::finish_sample ( )
```

Finishes building a sample.

Precondition

!is_nested() (p. 572). That is, this object must be a sample Builder, not a member Builder.

Postcondition

!is_valid() (p. 572). That is, this Builder can no longer be used.

Returns

The sample, ready to be written.

This function completes and returns the sample built with this Builder.

See also

rti::flat::build_data() (p. 211), the function to create a **dds::pub::DataWriter** (p. 908)-managed sample Builder.

8.194.4.3 add_my_primitive()

```
bool MyFlatMutableBuilder::add_my_primitive (
    int32_t value )
```

Adds a primitive member.

8.194.4.4 add_my_optional_primitive()

```
bool MyFlatMutableBuilder::add_my_optional_primitive (
    int32_t value )
```

Adds a primitive member.

8.194.4.5 add_my_primitive_array()

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableBuilder::add_my_primitive_array ( )
```

Adds a primitive array member.

Returns

The Offset to the array, which can be used to set its values.

8.194.4.6 build_my_primitive_seq()

```
rti::flat::PrimitiveSequenceBuilder< int32_t > MyFlatMutableBuilder::build_my_primitive_seq ( )
```

Begins building a primitive-sequence member.

8.194.4.7 add_my_final()

```
MyFlatFinalOffset MyFlatMutableBuilder::add_my_final ( )
```

Adds a final complex member.

Returns

The Offset to the member, which can be used to set its values.

8.194.4.8 add_my_final_array()

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinalOffset, 10 > MyFlatMutableBuilder::add_my_↵  
final_array ( )
```

Adds an array member of final complex elements.

Returns

The Offset to the array, which can be used to set its values.

8.194.4.9 build_my_final_seq()

```
rti::flat::FinalSequenceBuilder< MyFlatFinalOffset > MyFlatMutableBuilder::build_my_final_seq ( )
```

Begins building a sequence member of final complex elements.

8.194.4.10 build_my_mutable()

```
FlatMutableBarBuilder MyFlatMutableBuilder::build_my_mutable ( )
```

Begins building a mutable complex member.

FlatMutableBar represents another arbitrary mutable FlatData type.

8.194.4.11 build_my_mutable_array()

```
rti::flat::MutableArrayBuilder< FlatMutableBarBuilder, 10 > MyFlatMutableBuilder::build_my_mutable_array ( )
```

Begins building an array member of mutable complex elements.

8.194.4.12 build_my_mutable_seq()

```
rti::flat::MutableSequenceBuilder< FlatMutableBarBuilder > MyFlatMutableBuilder::build_my_mutable_seq ( )
```

Begins building a sequence member of mutable complex elements.

8.194.4.13 build_my_string()

```
rti::flat::StringBuilder MyFlatMutableBuilder::build_my_string ( )
```

Begins building a string member.

8.194.4.14 build_my_string_seq()

```
rti::flat::MutableSequenceBuilder< rti::flat::StringBuilder > MyFlatMutableBuilder::build_my_↔
string_seq ( )
```

Begins building a sequence member of string elements.

8.195 MyFlatMutableOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.

```
#include <Offset.hpp>
```

- Retrieves a non-const Offset to a sequence of strings.*

8.195.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData mutable IDL struct.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatMutable** (p. 213).

It provides accessors for each of its members. Accessors can return other Offsets or primitive values.

8.195.2 Member Typedef Documentation

8.195.2.1 ConstOffset

```
typedef MyFlatMutableConstOffset MyFlatMutableOffset::ConstOffset
```

The equivalent read-only Offset type.

Each Offset for a user type has an equivalent const Offset that doesn't allow modifying the underlying Sample. For example, when reading data from a **dds::sub::DataReader** (p. 756), a const Sample's `Sample::root()` function returns a const Offset.

8.195.3 Constructor & Destructor Documentation

8.195.3.1 MyFlatMutableOffset()

```
MyFlatMutableOffset::MyFlatMutableOffset ( ) [inline]
```

Creates a null Offset.

Postcondition

is_null() (p. 1607)

8.195.4 Member Function Documentation

8.195.4.1 my_primitive() [1/2]

```
int32_t MyFlatMutableOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

Returns

The value of the member or its default value if this member doesn't exist in this Sample.

8.195.4.2 my_optional_primitive()

```
rti::flat::PrimitiveConstOffset< int32_t > MyFlatMutableOffset::my_optional_primitive ( ) const
```

Retrieves a const Offset to an optional primitive.

Unlike the non-optional `my_primitive()` (p.1506), which accesses the integer directly, for an optional primitive it is possible to check whether it exists or not. If it doesn't exist, the Offset this function returns will be null (`is_null()` (p.1607)).

8.195.4.3 my_primitive_array() [1/2]

```
const rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableOffset::my_primitive_array ( )  
const
```

Retrieves a const Offset to a primitive array.

8.195.4.4 my_primitive_seq() [1/2]

```
const rti::flat::PrimitiveSequenceOffset< int32_t > MyFlatMutableOffset::my_primitive_seq ( )  
const
```

Retrieves a const Offset to a primitive sequence.

8.195.4.5 my_final() [1/2]

```
MyFlatFinal::ConstOffset MyFlatMutableOffset::my_final ( ) const
```

Retrieves a const Offset to a complex member.

8.195.4.6 my_final_array() [1/2]

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinal::ConstOffset, 10 > MyFlatMutableOffset::my_↔  
final_array ( ) const
```

Retrieves a const Offset to a complex array.

8.195.4.7 my_final_seq() [1/2]

```
rti::flat::SequenceOffset< MyFlatFinal::ConstOffset > MyFlatMutableOffset::my_final_seq ( )  
const
```

Retrieves a const Offset to a complex sequence.

8.195.4.8 my_mutable() [1/2]

```
FlatMutableBar::ConstOffset MyFlatMutableOffset::my_mutable ( ) const
```

Retrieves a const Offset to a complex member.

FlatMutableBar is another arbitrary user-defined mutable FlatData type.

8.195.4.9 my_mutable_array() [1/2]

```
rti::flat::MutableArrayOffset< FlatMutableBar::ConstOffset, 10 > MyFlatMutableOffset::my_↔  
mutable_array ( ) const
```

Retrieves a const Offset to a complex array.

8.195.4.10 my_mutable_seq() [1/2]

```
rti::flat::SequenceOffset< FlatMutableBar::ConstOffset > MyFlatMutableOffset::my_mutable_seq ( )  
const
```

Retrieves a const Offset to a complex sequence.

8.195.4.11 my_string() [1/2]

```
const rti::flat::StringOffset MyFlatMutableOffset::my_string ( ) const
```

Retrieves a const Offset to a string.

8.195.4.12 my_string_seq() [1/2]

```
rti::flat::SequenceOffset< const rti::flat::StringOffset > MyFlatMutableOffset::my_string_seq (
) const
```

Retrieves a const Offset to a sequence of strings.

8.195.4.13 my_primitive() [2/2]

```
bool MyFlatMutableOffset::my_primitive (
    int32_t value )
```

Sets the value of a primitive member.

8.195.4.14 my_primitive_array() [2/2]

```
rti::flat::PrimitiveArrayOffset< int32_t, 10 > MyFlatMutableOffset::my_primitive_array ( )
```

Retrieves a non-const Offset to a primitive array.

8.195.4.15 my_primitive_seq() [2/2]

```
rti::flat::PrimitiveSequenceOffset< int32_t > MyFlatMutableOffset::my_primitive_seq ( )
```

Retrieves a non-const Offset to a primitive sequence.

8.195.4.16 my_final() [2/2]

```
MyFlatFinal::Offset MyFlatMutableOffset::my_final ( )
```

Retrieves a non-const Offset to a complex member.

8.195.4.17 my_final_array() [2/2]

```
rti::flat::FinalAlignedArrayOffset< MyFlatFinal::Offset, 10 > MyFlatMutableOffset::my_final_↔  
array ( )
```

Retrieves a non-const Offset to a complex array.

8.195.4.18 my_final_seq() [2/2]

```
rti::flat::SequenceOffset< MyFlatFinal::Offset > MyFlatMutableOffset::my_final_seq ( )
```

Retrieves a non-const Offset to a complex sequence.

8.195.4.19 my_mutable() [2/2]

```
FlatMutableBar::Offset MyFlatMutableOffset::my_mutable ( )
```

Retrieves a non-const Offset to a complex member.

FlatMutableBar is another arbitrary user-defined mutable FlatData type.

8.195.4.20 my_mutable_array() [2/2]

```
rti::flat::MutableArrayOffset< FlatMutableBar::Offset, 10 > MyFlatMutableOffset::my_mutable_↔  
array ( )
```

Retrieves a non-const Offset to a complex array.

8.195.4.21 my_mutable_seq() [2/2]

```
rti::flat::SequenceOffset< FlatMutableBar::Offset > MyFlatMutableOffset::my_mutable_seq ( )
```

Retrieves a non-const Offset to a complex sequence.

8.195.4.22 my_string() [2/2]

```
rti::flat::StringOffset MyFlatMutableOffset::my_string ( )
```

Retrieves a non-const Offset to a string.

8.195.4.23 my_string_seq() [2/2]

```
rti::flat::SequenceOffset< rti::flat::StringOffset > MyFlatMutableOffset::my_string_seq ( )
```

Retrieves a non-const Offset to a sequence of strings.

8.196 MyFlatUnionBuilder Class Reference

Represents the Builder for an arbitrary user-defined mutable IDL union.

```
#include <Builder.hpp>
```

Inheritance diagram for MyFlatUnionBuilder:

**Public Types**

- typedef **MyFlatUnionOffset** **Offset**
The related offset type.

Public Member Functions

- **MyFlatUnionBuilder** ()
Creates an invalid Builder.
- **Offset** **finish** ()
Finishes building a member.
- **MyFlatUnion** * **finish_sample** ()
Finishes building a sample.
- bool **add_my_primitive** (int32_t value)
Adds a primitive member.
- **MyFlatMutableBuilder** **build_my_mutable** (int32_t discriminator=1)
Builds a mutable-struct member.
- **MyFlatFinal::Offset** **add_my_final** ()
Adds a final-struct member.

Additional Inherited Members

8.196.1 Detailed Description

Represents the Builder for an arbitrary user-defined mutable IDL union.

This example type represents the **Builder** (p.209) type that **rtiddsgen** would generate for **MyFlatUnion** (p.213) and allows creating a sample or a member of that type.

Union builders are similar to struct builders (see **MyFlatMutableBuilder** (p.1497)), except that they only allow adding/building **one member**.

"Add" and "build" functions automatically set the discriminator value that in the IDL definition selects that member. If more than one discriminator value selects a member, the add/build function allows picking one.

8.196.2 Member Typedef Documentation

8.196.2.1 Offset

```
typedef MyFlatUnionOffset MyFlatUnionBuilder::Offset
```

The related offset type.

8.196.3 Constructor & Destructor Documentation

8.196.3.1 MyFlatUnionBuilder()

```
MyFlatUnionBuilder::MyFlatUnionBuilder ( ) [inline]
```

Creates an invalid Builder.

Postcondition

```
!is_valid()
```

Note

Top-level builders are created with **rtd::flat::build_data()** (p.211), and member builders are created with the corresponding **build_<member>** function.

8.196.4 Member Function Documentation

8.196.4.1 finish()

```
Offset MyFlatUnionBuilder::finish ( )
```

Finishes building a member.

See also

MyMutableBuilder::finish()

8.196.4.2 finish_sample()

```
MyFlatUnion * MyFlatUnionBuilder::finish_sample ( )
```

Finishes building a sample.

See also

MyMutableBuilder::finish_sample()

8.196.4.3 add_my_primitive()

```
bool MyFlatUnionBuilder::add_my_primitive (
    int32_t value )
```

Adds a primitive member.

This function automatically selects the discriminator 0, which corresponds to the member 'my_primitive' (see [MyFlatUnion](#) (p. 213))

8.196.4.4 build_my_mutable()

```
MyFlatMutableBuilder MyFlatUnionBuilder::build_my_mutable (
    int32_t discriminator = 1 )
```

Builds a mutable-struct member.

Parameters

<i>discriminator</i>	Allows selecting one of the possible discriminator values for this member: 1 or 2. This argument is optional: if not specified it selects the first 'case' label in the IDL definition (1).
----------------------	---

Returns

The Builder to build this member

8.196.4.5 add_my_final()

```
MyFlatFinal::Offset MyFlatUnionBuilder::add_my_final ( )
```

Adds a final-struct member.

Returns

The Offset to the member, which can be used to set its values.

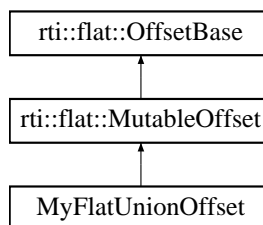

This function automatically selects the discriminator value 3, which corresponds to the member 'my_final' (see **MyFlatUnion** (p.213)).

8.197 MyFlatUnionOffset Class Reference

Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.

```
#include <Offset.hpp>
```

Inheritance diagram for MyFlatUnionOffset:

Public Types

- typedef MyFlatUnionConstOffset **ConstOffset**
The equivalent read-only Offset type.

Public Member Functions

- **MyFlatUnionOffset** ()
Creates a null Offset.
- `int32_t _d` () const
Retrieves the union discriminator.
- `int32_t my_primitive` () const
Retrieves the value for a primitive member.
- **MyFlatMutable::ConstOffset my_mutable** () const
Retrieves a const Offset to a complex member.
- **MyFlatFinal::ConstOffset my_final** () const
Retrieves a const Offset to a complex member.
- `bool my_primitive` (int32_t value)
Sets the value for a primitive member.
- **MyFlatMutable::Offset my_mutable** ()
Retrieves a non-const Offset to a complex member.
- **MyFlatFinal::Offset my_final** ()
Retrieves a non-const Offset to a complex member.

8.197.1 Detailed Description

Represents the Offset to an arbitrary user-defined FlatData mutable IDL union.

This example type represents the Offset type that **rtiddsgen** would generate for **MyFlatUnion** (p. 213).

It provides accessors for each of its members, plus the discriminator **_d()** (p. 1516). Accessors can return other Offsets or primitive values.

Given a union, only one member, the one identified by **_d()** (p. 1516), can exist at a time. The discriminator cannot be modified.

8.197.2 Member Typedef Documentation

8.197.2.1 ConstOffset

```
typedef MyFlatUnionConstOffset MyFlatUnionOffset::ConstOffset
```

The equivalent read-only Offset type.

8.197.3 Constructor & Destructor Documentation

8.197.3.1 MyFlatUnionOffset()

```
MyFlatUnionOffset::MyFlatUnionOffset ( ) [inline]
```

Creates a null Offset.

Postcondition

is_null() (p. 1607)

8.197.4 Member Function Documentation

8.197.4.1 _d()

```
int32_t MyFlatUnionOffset::_d ( ) const
```

Retrieves the union discriminator.

Returns

The union discriminator, which identifies which field this union contains.

In this example:

- 0 selects **my_primitive()** (p. 1516)
- 1 and 2 select **my_mutable()** (p. 1517)
- 3 selects `my_final`

Any other discriminator value indicates that no member or an unknown member follows.

Note that the discriminator cannot be modified, since that would potentially change the size of this Sample by selecting a different member. The discriminator is selected during the building of a Sample (see `MyUnionBuilder`).

8.197.4.2 my_primitive() [1/2]

```
int32_t MyFlatUnionOffset::my_primitive ( ) const
```

Retrieves the value for a primitive member.

Returns

The value of `my_primitive` if this member is selected by **_d()** (p. 1516) or its default value otherwise.

8.197.4.3 my_mutable() [1/2]

```
MyFlatMutable::ConstOffset MyFlatUnionOffset::my_mutable ( ) const
```

Retrieves a const Offset to a complex member.

Returns

The Offset to the 'my_mutable' member if selected by `_d()` (p. 1516), or a **null Offset** (p. 216) otherwise

8.197.4.4 my_final() [1/2]

```
MyFlatFinal::ConstOffset MyFlatUnionOffset::my_final ( ) const
```

Retrieves a const Offset to a complex member.

Returns

The Offset to the 'my_final' member if selected by `_d()` (p. 1516), or a **null Offset** (p. 216) otherwise

8.197.4.5 my_primitive() [2/2]

```
bool MyFlatUnionOffset::my_primitive (
    int32_t value )
```

Sets the value for a primitive member.

Precondition

`_d()` (p. 1516) must select 'my_primitive', otherwise this function returns false.

Returns

true if my_primitive was set or false if the operation failed.

8.197.4.6 `my_mutable()` [2/2]

```
MyFlatMutable::Offset MyFlatUnionOffset::my_mutable ( )
```

Retrieves a non-const Offset to a complex member.

Returns

The Offset to the 'my_mutable' member if selected by `_d()` (p. 1516), or a **null Offset** (p. 216) otherwise

8.197.4.7 `my_final()` [2/2]

```
MyFlatFinal::Offset MyFlatUnionOffset::my_final ( )
```

Retrieves a non-const Offset to a complex member.

Returns

The Offset to the 'my_final' member if selected by `_d()` (p. 1516), or a **null Offset** (p. 216) otherwise

8.198 `NDDS_Transport_Address_t` Struct Reference

Addresses are stored individually as network-ordered bytes.

Public Attributes

- unsigned char **network_ordered_value** [NDDS_TRANSPORT_ADDRESS_LENGTH]

8.198.1 Detailed Description

Addresses are stored individually as network-ordered bytes.

RTI Connex addresses are numerically stored in a transport independent manner. RTI Connex uses a IPv6-compatible format, which means that the data structure to hold an **NDDS_Transport_Address_t** (p. 1518) is the same size as a data structure needed to hold an IPv6 address.

In addition, the functions provided to translate a string representation of an RTI Connex address to a value assumes that the string presentation follows the IPv6 address presentation as specified in RFC 2373.

An **NDDS_Transport_Address_t** (p. 1518) always stores the address in network-byte order (which is Big Endian).

For example, IPv4 multicast address of 225.0.0.0 is represented by

```
{{0,0,0,0, 0,0,0,0, 0,0,0,0, 0xE1,0,0,0}}
```

 regardless of endianness,

where 0xE1 is the 13th byte of the structure (`network_ordered_value[12]`).

8.198.2 Member Data Documentation

8.198.2.1 network_ordered_value

```
unsigned char NDDS_Transport_Address_t::network_ordered_value[NDDS_TRANSPORT_ADDRESS_LENGTH]
```

network-byte ordered (i.e., bit 0 is the most significant bit and bit 128 is the least significant bit).

8.199 NDDS_Transport_Interface_t Struct Reference

Storage for the description of a network interface used by a Transport Plugin.

Public Attributes

- **NDDS_Transport_ClassId_t transport_classid**
The transport classid of the interface.
- **NDDS_Transport_Address_t address**
An unicast address that uniquely identifies this interface in the network specified by the transport class.
- **NDDS_Transport_Interface_Status_t status**
The state of the interface.
- **RTI_UINT16 rank**
Rank of the interface. Used when allow_interfaces_list Qos is set. A rank value will be assing to each of the interfaces that match the allow_interfaces_list filter allowing an endpoint to prioritace some interfaces upon others.

8.199.1 Detailed Description

Storage for the description of a network interface used by a Transport Plugin.

8.199.2 Member Data Documentation

8.199.2.1 transport_classid

```
NDDS_Transport_ClassId_t NDDS_Transport_Interface_t::transport_classid
```

The transport classid of the interface.

8.199.2.2 address

`NDDS_Transport_Address_t` `NDDS_Transport_Interface_t::address`

An unicast address that uniquely identifies this interface in the network specified by the transport class.

8.199.2.3 status

`NDDS_Transport_Interface_Status_t` `NDDS_Transport_Interface_t::status`

The state of the interface.

8.199.2.4 rank

`RTI_UINT16` `NDDS_Transport_Interface_t::rank`

Rank of the interface. Used when `allow_interfaces_list` Qos is set. A rank value will be assigned to each of the interfaces that match the `allow_interfaces_list` filter allowing an endpoint to prioritize some interfaces upon others.

8.200 NDDS_Transport_Property_t Struct Reference

Base configuration structure that must be inherited by derived Transport Plugin classes.

Public Attributes

- **NDDS_Transport_ClassId_t classid**
The Transport-Plugin Class ID.
- **RTI_INT32 address_bit_count**
Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.
- **RTI_INT32 properties_bitmap**
A bitmap that defines various properties of the transport to the RTI Connex core.
- **RTI_INT32 gather_send_buffer_count_max**
Specifies the maximum number of buffers that RTI Connex can pass to the `send()` method of a transport plugin.
- **RTI_INT32 message_size_max**
The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.
- **char ** allow_interfaces_list**
A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length > 0`), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.
- **RTI_INT32 allow_interfaces_list_length**

- Number of elements in the `allow_interfaces_list`.*

 - char ** **deny_interfaces_list**

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length > 0`), deny the use of these interfaces.
 - RTI_INT32 **deny_interfaces_list_length**

Number of elements in the `deny_interfaces_list`.
 - char ** **allow_multicast_interfaces_list**

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length > 0`), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.
 - RTI_INT32 **allow_multicast_interfaces_list_length**

Number of elements in the `allow_multicast_interfaces_list`.
 - char ** **deny_multicast_interfaces_list**

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length > 0`), deny the use of those interfaces for multicast.
 - RTI_INT32 **deny_multicast_interfaces_list_length**

Number of elements in `deny_multicast_interfaces_list`.
 - struct **NDDS_Transport_UUID** **transport_uuid**

Univocally identifies a transport plugin.
 - char * **thread_name_prefix**

Prefix used to name the transport threads.
 - RTI_INT32 **max_interface_count**

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

8.200.1 Detailed Description

Base configuration structure that must be inherited by derived Transport Plugin classes.

This structure contains properties that must be set before registration of any transport plugin with RTI Connex. The RTI Connex core will configure itself to use the plugin based on the properties set within this structure.

A transport plugin may extend from this structure to add transport-specific properties.

WARNING: The transport properties of an instance of a Transport Plugin should be considered immutable after the plugin has been created. That means the values contained in the property structure stored as a part of the transport plugin itself should not be changed. If those values are modified, the results are undefined.

8.200.2 Member Data Documentation

8.200.2.1 classid

`NDDS_Transport_ClassId_t` `NDDS_Transport_Property_t::classid`

The Transport-Plugin Class ID.

The transport plugin sets the value for this field.

Class IDs below **NDDS_TRANSPORT_CLASSID_RESERVED_RANGE** (p. 171) are reserved for RTI (Real-Time Innovations) usage.

User-defined transports should set an ID above this range.

The ID should be globally unique for each Transport-Plugin class. Transport-Plugin implementors should ensure that the class IDs do not conflict with each other amongst different Transport-Plugin classes.

Invariant

The `classid` is invariant for the lifecycle of a transport plugin.

8.200.2.2 address_bit_count

`RTI_INT32` `NDDS_Transport_Property_t::address_bit_count`

Number of bits in a 16-byte address that are used by the transport. Should be between -128 and 128.

The transport plugin sets the value for this field.

A transport plugin should define the range of addresses that are meaningful to the plugin. It does this by setting the number of bits of an IPv6 address that will be used to designate an address in the network to which the transport plugin is connected. The sign of this field determines whether the count of bits starts on the most significant bit (negative sign) or on the least significant bit (positive sign).

For example, for an address range of 0-255, the `address_bit_count` should be set to 8. For the range of addresses used by IPv4 (4 bytes), it should be set to 32.

See also

Transport Class Attributes (p. 75)

8.200.2.3 properties_bitmap

```
RTI_INT32 NDDS_Transport_Property_t::properties_bitmap
```

A bitmap that defines various properties of the transport to the RTI Connex core.

Currently, the only property supported is whether or not the transport plugin will always loan a buffer when RTI Connex tries to receive a message using the plugin. This is in support of a zero-copy interface.

See also

NDDS_TRANSPORT_PROPERTY_BIT_BUFFER_ALWAYS_LOANED (p. 172)

8.200.2.4 gather_send_buffer_count_max

```
RTI_INT32 NDDS_Transport_Property_t::gather_send_buffer_count_max
```

Specifies the maximum number of buffers that RTI Connex can pass to the `send()` method of a transport plugin.

The transport plugin `send()` API supports a gather-send concept, where the `send()` call can take several discontinuous buffers, assemble and send them in a single message. This enables RTI Connex to send a message from parts obtained from different sources without first having to copy the parts into a single contiguous buffer.

However, most transports that support a gather-send concept have an upper limit on the number of buffers that can be gathered and sent. Setting this value will prevent RTI Connex from trying to gather too many buffers into a send call for the transport plugin.

RTI Connex requires all transport-plugin implementations to support a gather-send of at least a minimum number of buffers. This minimum number is defined to be **NDDS_TRANSPORT_PROPERTY_GATHER_SEND_BUFFER_COUNT_MIN** (p. 172).

If the underlying transport does not support a gather-send concept directly, then the transport plugin itself must copy the separate buffers passed into the `send()` call into a single buffer for sending or otherwise send each buffer individually. However this is done by the transport plugin, the `receive_rEA()` call of the destination application should assemble, if needed, all of the pieces of the message into a single buffer before the message is passed to the RTI Connex layer.

8.200.2.5 message_size_max

```
RTI_INT32 NDDS_Transport_Property_t::message_size_max
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin.

If the maximum size of a message that can be sent by a transport plugin is user configurable, the transport plugin should provide a default value for this property. In any case, this value must be set before the transport plugin is registered, so that RTI Connex can properly use the plugin.

For information about the default value for different transports, see the `Core Libraries User's Manual`.

8.200.2.6 allow_interfaces_list

```
char** NDDS_Transport_Property_t::allow_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_interfaces_list_length > 0`), allow the use of only these interfaces. If the list is empty, allow the use of all interfaces.

The "white" list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that DomainParticipant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.*, 192.168.*, 192.*, ether0

The left-to-right order of this list matters if you are using the `max_interface_count` to limit the allowable interfaces further. See `max_interface_count`.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the `dds::domain::DomainParticipant` (p. 1079) is deleted.

[default] empty list that represents all available interfaces.

See also

NDDS_Transport_Property_t::max_interface_count (p. 1527)

8.200.2.7 allow_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_interfaces_list_length
```

Number of elements in the `allow_interfaces_list`.

By default, `allow_interfaces_list_length = 0`, i.e. an empty list.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.200.2.8 deny_interfaces_list

```
char** NDDS_Transport_Property_t::deny_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_interfaces_list_length > 0`), deny the use of these interfaces.

This "black" list is applied *after* the `allow_interfaces_list` and filters out the interfaces that should not be used.

The resulting list restricts *reception* to a particular set of interfaces for unicast UDP.

For UDPv4 and UDPv6 transports, the resulting list also controls the interfaces over which the DomainParticipant will send multicast traffic to the remote DomainParticipants (if multicast is supported on the platform).

Note: This property does not affect the interfaces that the transport uses to send unicast data from that DomainParticipant. That decision is made by the OS based on the destination address.

It is up to the transport plugin to interpret the list of strings passed in.

For example, the following are acceptable strings in IPv4 format: 192.168.1.1, 192.168.1.*, 192.168.*, 192.*, ether0

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the `dds::domain::DomainParticipant` (p. 1079) is deleted.

[default] empty list that represents no denied interfaces.

8.200.2.9 deny_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_interfaces_list_length
```

Number of elements in the `deny_interfaces_list`.

By default, `deny_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.200.2.10 allow_multicast_interfaces_list

```
char** NDDS_Transport_Property_t::allow_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `allow_multicast_interfaces_list_length > 0`), allow the use of multicast only on these interfaces; otherwise allow the use of all the allowed interfaces.

This "white" list sub-selects from the allowed interfaces obtained *after* applying the `allow_interfaces_list` "white" list *and* the `deny_interfaces_list` "black" list.

After `allow_multicast_interfaces_list`, the `deny_multicast_interfaces_list` is applied. Multicast output will be sent and may be received over the interfaces in the resulting list.

If this list is empty, all the allowed interfaces will be potentially used for multicast. It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the `dds::domain::DomainParticipant` (p. 1079) is deleted.

[default] empty list that represents all available interfaces.

8.200.2.11 allow_multicast_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::allow_multicast_interfaces_list_length
```

Number of elements in the `allow_multicast_interfaces_list`.

By default, `allow_multicast_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.200.2.12 deny_multicast_interfaces_list

```
char** NDDS_Transport_Property_t::deny_multicast_interfaces_list
```

A list of strings, each identifying a range of interface addresses or an interface name. If the list is non-empty (i.e., `deny_multicast_interfaces_list_length > 0`), deny the use of those interfaces for multicast.

This "black" list is applied after `allow_multicast_interfaces_list` and filters out interfaces that should not be used for multicast.

Multicast output will be sent and may be received over the interfaces in the resulting list.

It is up to the transport plugin to interpret the list of strings passed in.

This property is not interpreted by the RTI Connext core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

The caller (user) must manage the memory of the list. The memory may be freed after the `dds::domain::DomainParticipant` (p. 1079) is deleted.

[default] empty list that represents no denied interfaces.

8.200.2.13 deny_multicast_interfaces_list_length

```
RTI_INT32 NDDS_Transport_Property_t::deny_multicast_interfaces_list_length
```

Number of elements in `deny_multicast_interfaces_list`.

By default, `deny_multicast_interfaces_list_length = 0` (i.e., an empty list).

This property is not interpreted by the RTI Connex core; it is provided merely as a convenient and standardized way to specify the interfaces for the benefit of the transport plugin developer and user.

[default] 0

8.200.2.14 transport_uuid

```
struct NDDS_Transport_UUID NDDS_Transport_Property_t::transport_uuid
```

Univocally identifies a transport plugin.

It represents the prefix of the participant GUID.

8.200.2.15 thread_name_prefix

```
char* NDDS_Transport_Property_t::thread_name_prefix
```

Prefix used to name the transport threads.

This field is optional.

The maximum size of this string is 8 characters.

If "thread_name_prefix" is not set by the user, RTI Connex creates the following prefix: 'r' + 'Tr' + participant identifier + '\0'.

Where 'r' indicates this is a thread from RTI, 'Tr' indicates the thread is related to a transport, and participant identifier contains 5 characters as follows:

If `participant_name` is set: The participant identifier will be the first 3 characters and the last 2 characters of the `participant_name`.

If `participant_name` is not set, then the identifier is computed as `domain_id` (3 characters) followed by `participant_id` (2 characters).

If `participant_name` is not set and the `participant_id` is set to -1 (default value), then the participant identifier is computed as the last 5 digits of the `rtps_instance_id` in the participant GUID.

8.200.2.16 max_interface_count

RTI_INT32 NDDS_Transport_Property_t::max_interface_count

Maximum number of addresses from the `allow_interfaces_list` that will be announced.

By default, `max_interface_count` = `LENGTH_UNLIMITED`: all the interfaces are announced.

This feature is useful if you want to control the network interfaces on which your DomainParticipants receive data. For example, if you have one wired and one wireless interface both up and running, and `max_interface_count` is set to 1, the DomainParticipant will receive data over the interface you list first in the `allow_interfaces_list` -for example, the wired one.

RTI Connex selects the preferred interface(s) by iterating over the list of allowed interfaces until the first `max_↔ interfaces_count` of active interfaces encountered are announced. The order of iteration is left to right as specified in the `allow_interfaces_list` setting.

This setting applies only if the `allow_interfaces_list` is not empty.

The `max_interface_count` setting does not consider end-to-end connectivity to select interfaces. The decision is based purely on whether interfaces are up or down in a node. Therefore, this feature is not intended to be used in the following scenarios:

- A DomainParticipant is not reachable by other DomainParticipants in all the interfaces in the `allow_↔ interfaces_list`. This could occur if the DomainParticipant is in different subnets, and some of these subnets cannot be reached by other DomainParticipants.
- End-to-end connectivity issues lead to situations in which the interfaces selected after applying `max_↔ interface_count` cannot be reached by other DomainParticipants.

For UDPv4 and UDPv6 transports, this feature also affects multicast traffic by limiting the interfaces over which a DomainParticipant sends multicast traffic. The `(allow/deny)_multicast_interfaces_list` applies to the interfaces selected by using the `max_interfaces_count` property.

Note: If a pattern string in the `allow_interfaces_list` matches multiple interface addresses, and `max_↔ interface_count` is set to a finite value, the order for the matching allowed interfaces is decided based on the order in which the operating system provides these interfaces.

[default] `LENGTH_UNLIMITED`

8.201 NDDS_Transport_Shmem_Property_t Struct Reference

Subclass of `NDDS_Transport_Property_t` (p. 1520) allowing specification of parameters that are specific to the shared-memory transport.

Public Attributes

- struct **NDDS_Transport_Property_t** **parent**
Generic properties of all transport plugins.
- RTI_INT32 **received_message_count_max**
Number of messages that can be buffered in the receive queue.
- RTI_INT32 **receive_buffer_size**
The total number of bytes that can be buffered in the receive queue.
- RTIBool **enable_udp_debugging**
Enables UDP debugging when using shared memory.
- **NDDS_Transport_Address_t** **udp_debugging_address**
IP address to which shared memory traffic will be published if `ShmemTransport_Property_t::enable_udp_debugging` is set to '1'.
- **NDDS_Transport_Port_t** **udp_debugging_port**
Port to which shared memory traffic will be published if `ShmemTransport_Property_t::enable_udp_debugging` is set to '1'.

8.201.1 Detailed Description

Subclass of **NDDS_Transport_Property_t** (p. 1520) allowing specification of parameters that are specific to the shared-memory transport.

8.201.2 Member Data Documentation

8.201.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_Shmem_Property_t::parent
```

Generic properties of all transport plugins.

8.201.2.2 received_message_count_max

```
RTI_INT32 NDDS_Transport_Shmem_Property_t::received_message_count_max
```

Number of messages that can be buffered in the receive queue.

This does not guarantee that the Transport-Plugin will actually be able to buffer `received_message_count_max` messages of the maximum size set in **NDDS_Transport_Property_t::message_size_max** (p. 1523). The total number of bytes that can be buffered for a transport plug-in is actually controlled by `receive_buffer_size`.

See also

NDDS_Transport_Property_t (p. 1520), **NDDS_TRANSPORT_SHMEM_RECEIVED_MESSAGE_COUNT_MAX_DEFAULT** (p. 185)

8.201.2.3 receive_buffer_size

RTI_INT32 NDDS_Transport_Shmem_Property_t::receive_buffer_size

The total number of bytes that can be buffered in the receive queue.

This number controls how much memory is allocated by the plugin for the receive queue. The actual number of bytes allocated is:

```
size = receive_buffer_size + message_size_max +
      received_message_count_max * fixedOverhead
```

where `fixedOverhead` is some small number of bytes used by the queue data structure. The following rules are noted:

- `receive_buffer_size < message_size_max * received_message_count_max`, then the transport plugin will not be able to store `received_message_count_max` messages of size `message_size_max`.
- `receive_buffer_size > message_size_max * received_message_count_max`, then there will be memory allocated that cannot be used by the plugin and thus wasted.

To optimize memory usage, the user is allowed to specify a size for the receive queue to be less than that required to hold the maximum number of messages which are all of the maximum size.

In most situations, the average message size may be far less than the maximum message size. So for example, if the maximum message size is 64 K bytes, and the user configures the plugin to buffer at least 10 messages, then 640 K bytes of memory would be needed if all messages were 64 K bytes. Should this be desired, then `receive_buffer_size` should be set to 640 K bytes.

However, if the average message size is only 10 K bytes, then the user could set the `receive_buffer_size` to 100 K bytes. This allows the user to optimize the memory usage of the plugin for the average case and yet allow the plugin to handle the extreme case.

NOTE, the queue will always be able to hold 1 message of `message_size_max` bytes, no matter what the value of `receive_buffer_size` is.

NDDS_TRANSPORT_SHMEM_RECEIVE_BUFFER_SIZE_DEFAULT (p. 185)

8.201.2.4 enable_udp_debugging

RTIBool NDDS_Transport_Shmem_Property_t::enable_udp_debugging

Enables UDP debugging when using shared memory.

If set to '1', all shared memory traffic will be published to `ShmemTransport_Property_t::udp_debugging_address` ↔ `:: ShmemTransport_Property_t::udp_debugging_port`.

[default] 0

8.201.2.5 udp_debugging_address

`NDDS_Transport_Address_t` `NDDS_Transport_Shmem_Property_t::udp_debugging_address`

IP address to which shared memory traffic will be published if `ShmemTransport_Property_t::enable_udp_debugging` is set to '1'.

[default] 239.255.1.2

8.201.2.6 udp_debugging_port

`NDDS_Transport_Port_t` `NDDS_Transport_Shmem_Property_t::udp_debugging_port`

Port to which shared memory traffic will be published if `ShmemTransport_Property_t::enable_udp_debugging` is set to '1'.

[default] 7399

8.202 NDDS_Transport_UDP_WAN_CommPortsMappingInfo Struct Reference

Type for storing UDP WAN communication ports.

Public Attributes

- `NDDS_Transport_Port_t` `rtps_port`
RTPS port.
- `NDDS_Transport_UDP_Port` `host_port`
Host port.
- `NDDS_Transport_UDP_Port` `public_port`
Public port.

Public port.

8.203 NDDS_Transport_UDPv4_Property_t Struct Reference

Configurable IPv4/UDP Transport-Plugin properties.

Public Attributes

- struct **NDDS_Transport_Property_t parent**
Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**
Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**
Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**
Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**
Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**
Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**
Prevents the transport plugin from putting multicast packets onto the loopback interface.
- RTI_INT32 **ignore_loopback_interface**
Prevents the transport plugin from using the IP loopback interface.

- RTI_INT32 **ignore_nonup_interfaces**
[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.
- RTI_INT32 **ignore_nonrunning_interfaces**
Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**
[DEPRECATED] Prevents the transport plugin from doing a zero copy.
- RTI_INT32 **send_blocking**
Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**
Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**
Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**
Set low value of output range to IPv4 TOS.
- RTI_INT32 **transport_priority_mapping_high**
Set high value of output range to IPv4 TOS.
- RTI_INT32 **send_ping**
Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**
Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- RTI_UINT32 **interface_poll_period**
Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**
Controls whether or not to reuse multicast receive resources.
- RTI_INT32 **protocol_overhead_max**
Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**
Disables detection of network interface changes.
- RTI_UINT32 **join_multicast_group_timeout**
[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.
- char * **public_address**
Public IP address associated with the transport instantiation.
- RTI_INT32 **port_offset**
*Port offset to allow multiple instances of UDPv4 transports in the same **dds::domain::DomainParticipant** (p. 1079).*

8.203.1 Detailed Description

Configurable IPv4/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

Transport_Support::set_builtin_transport_property()

8.203.2 Member Data Documentation

8.203.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv4_Property_t::parent
```

Generic properties of all transport plugins.

8.203.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt ()` will be called to set the `SENDBUF` to the value of this parameter.

This value must be greater than or equal to `NDDS_Transport_Property_t::message_size_max` (p. 1523). The maximum value is operating system-dependent.

By default, it will be set to `UDPv4Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT`.

If you configure this parameter to be `UDPv4Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT`, then `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. The transport will use the OS default.

8.203.2.3 recv_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt ()` will be called to set the `RCVBUF` to the value of this parameter.

This value must be greater than or equal to `NDDS_Transport_Property_t::message_size_max` (p. 1523). The maximum value is operating system-dependent.

By default, it will be set to `UDPv4Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT`.

If you configure this parameter to be `UDPv4Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT`, then `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. The transport will use the OS default.

8.203.2.4 unicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

8.203.2.5 multicast_enabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use all the network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

8.203.2.6 multicast_ttl

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This value is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

8.203.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connex will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

[NOTE: Windows CE systems do not support multicast loopback. This field is ignored for Windows CE targets.]

8.203.2.8 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connexx decide between the above two choices.

The current "automatic" (-1) RTI Connexx policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connexx policy based on availability of the shared memory transport.

8.203.2.9 ignore_nonup_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonup_interfaces
```

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_Property_t::disable_interface_tracking** (p. 1540) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

8.203.2.10 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↔_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

8.203.2.11 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connexxt will use the zero-copy API if offered by the OS.

8.203.2.12 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS**: Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPV4_BLOCKING_NEVER**: Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPV4_BLOCKING_ALWAYS

8.203.2.13 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when `use_checksum` is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API `dds::domain::DomainParticipant::participant_protocol↔_status` (p. 1111).

[default] 1 (enabled)

8.203.2.14 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with `NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low` (p. 1538) and `NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high` (p. 1538) to define the mapping from the DDS transport priority (see `TRANSPORT_PRIORITY` (p. 341)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value `0x0000ff00` causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (`0x0000 - 0xff00` in this case) to the range specified by `low` and `high`.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

8.203.2.15 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with `NDDS_Transport_UDPv4_Property_t::transport_priority_mask` (p. 1538) and `NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high` (p. 1538) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

8.203.2.16 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p.1538) and **NDDS_Transport_UDPv4_Property_t::transport_priority_mapping_low** (p.1538) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

8.203.2.17 send_ping

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::send_ping
```

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

8.203.2.18 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

8.203.2.19 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

8.203.2.20 reuse_multicast_receive_resource

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

Setting this to 0 (FALSE) prevents multicast crosstalk by uniquely configuring a port and creating a receive thread for each multicast group address.

[default] 1.

8.203.2.21 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1523) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective `message_size_max`, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 1523)

8.203.2.22 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connex application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connex 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

8.203.2.23 join_multicast_group_timeout

```
RTI_UINT32 NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

On Windows, a network interface may be detected before it is allowed to join a multicast group address. This property adjusts how much time (milliseconds) to wait for the ADD_MEMBERSHIP multicast operation to succeed before withdrawing.

[default] 5000

8.203.2.24 public_address

```
char* NDDS_Transport_UDPv4_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **dds::domain::DomainParticipant** (p. 1079) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **rti::core::RtpsWellKnownPorts** (p. 1965)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **dds::domain::DomainParticipant** (p. 1079) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] null (the transport uses the IP addresses obtained from the NICs)

8.203.2.25 port_offset

RTI_INT32 NDDS_Transport_UDPv4_Property_t::port_offset

Port offset to allow multiple instances of UDPv4 transports in the same **dds::domain::DomainParticipant** (p. 1079).

By default, it is not possible to have multiple instances of the UDPv4 transport in the same **dds::domain::DomainParticipant** (p. 1079). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv4 transport in the same **dds::domain::DomainParticipant** (p. 1079).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

[default] 0

8.204 NDDS_Transport_UDPv4_WAN_Property_t Struct Reference

Configurable IPv4/UDP WAN Transport-Plugin properties.

Public Attributes

- struct **NDDS_Transport_Property_t parent**
Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**
Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**
Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **ignore_loopback_interface**
Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonup_interfaces**
[DEPRECATED] *Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.*
- RTI_INT32 **ignore_nonrunning_interfaces**
Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**
[DEPRECATED] *Prevents the transport plugin from doing a zero copy.*
- RTI_INT32 **send_blocking**
Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **use_checksum**
Configures whether to send UDP checksum.
- RTI_UINT32 **transport_priority_mask**
Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**
Set low value of output range to IPv4 TOS.

- RTI_INT32 **transport_priority_mapping_high**
Set high value of output range to IPv4 TOS.
- RTI_INT32 **send_ping**
Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**
Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.
- RTI_UINT32 **interface_poll_period**
Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **protocol_overhead_max**
Maximum size in bytes of protocol overhead, including headers.
- RTI_INT32 **disable_interface_tracking**
Disables detection of network interface changes.
- char * **public_address**
Public IP address associated with the transport instantiation.
- struct **NDDS_Transport_UDP_WAN_CommPortsMappingInfo** * **comm_ports_list**
Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.
- RTI_INT32 **comm_ports_list_length**
Number of elements in the `NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list` (p. 1549).
- RTI_INT32 **port_offset**
Port offset to allow coexistence with built-in UDPv4 transport.
- RTI_UINT32 **binding_ping_period**
Specifies the period in milliseconds at which BINDING PINGS messages are sent to keep NAT mappings open.

8.204.1 Detailed Description

Configurable IPv4/UDP WAN Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

`Transport_Support::set_builtin_transport_property()`

8.204.2 Member Data Documentation

8.204.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv4_WAN_Property_t::parent
```

Generic properties of all transport plugins.

8.204.2.2 send_socket_buffer_size

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_socket_buffer_size

Size in bytes of the send buffer of a socket used for sending.

See also

NDDS_Transport_UDPv4_Property_t::send_socket_buffer_size (p. 1534)

8.204.2.3 recv_socket_buffer_size

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::recv_socket_buffer_size

Size in bytes of the receive buffer of a socket used for receiving.

See also

NDDS_Transport_UDPv4_Property_t::recv_socket_buffer_size (p. 1534)

8.204.2.4 ignore_loopback_interface

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_loopback_interface

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. The IP loopback interface is not used, even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient plugin (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connexx decide between the above two choices.

The current "automatic" (-1) RTI Connexx policy is as follows:

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UPV4 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv4 for local traffic also).

[default] -1 Automatic RTI Connexx policy based on availability of the shared memory transport.

8.204.2.5 ignore_nonup_interfaces

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonup_interfaces

[DEPRECATED] Prevents the transport plugin from using a network interface that is not reported as UP by the operating system.

DEPRECATED: this property has no effect. Non-UP interfaces are ignored until they change their status to UP, unless **NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking** (p. 1548) is set to 1, in which case interfaces are ignored even if they change their status at a later point.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows you to configure the transport to start using even the interfaces that were not reported as UP.

Two values are allowed:

- **0**: Allow the use of interfaces that were not reported as UP.
- **1**: Do not use interfaces that were not reported as UP.

[default] 1

8.204.2.6 ignore_nonrunning_interfaces

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::ignore_nonrunning_interfaces

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↔_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure the interface is UP.
- **1**: Check the flag when enumerating interfaces, and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

8.204.2.7 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing a zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may err or malfunction. In case you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off zero copy use.

By default this is set to 0, so RTI Connexx will use the zero-copy API if offered by the OS.

8.204.2.8 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS:** Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPv4_BLOCKING_NEVER:** Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPv4_BLOCKING_ALWAYS

8.204.2.9 use_checksum

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::use_checksum
```

Configures whether to send UDP checksum.

This property specifies whether the UDP checksum will be computed. On Windows and Linux, the UDP protocol will not set the checksum when `use_checksum` is set to 0. This is useful when RTPS protocol statistics related to corrupted messages need to be collected through the API `dds::domain::DomainParticipant::participant_protocol↔_status` (p. 1111).

[default] 1 (enabled)

8.204.2.10 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 1547) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 1547) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p. 341)) to the IPv4 TOS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv4 TOS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv4 TOS for send sockets.

[default] 0.

8.204.2.11 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 1546) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high** (p. 1547) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the low value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0.

8.204.2.12 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv4 TOS.

This is used in conjunction with **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mask** (p. 1546) and **NDDS_Transport_UDPv4_WAN_Property_t::transport_priority_mapping_low** (p. 1547) to define the mapping from the DDS transport priority to the IPv4 TOS field. Defines the high value of the output range for scaling.

Note that IPv4 TOS is generally an 8-bit value.

[default] 0xff.

8.204.2.13 send_ping

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::send_ping

Configures whether to send PING messages.

This property specifies whether to send a PING message before commencing the discovery process. On certain operating systems or with certain switches the initial UDP packet, while configuring the ARP table, can unfortunately be dropped. To avoid dropping the initial RTPS discovery sample, a PING message is sent to preconfigure the ARP table in those environments.

[default] 1 (enabled)

8.204.2.14 force_interface_poll_detection

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::force_interface_poll_detection

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv4 interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. By setting this property on those OSes, the use of a polling mechanism to detect changes can be forced.

[default] 0 (disabled).

8.204.2.15 interface_poll_period

RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::interface_poll_period

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

When possible, the detection of an IP address change is done asynchronously using the APIs offered by the underlying OS. If there is no mechanism to do that, the detection will use a polling strategy where the polling period can be configured by setting this property.

[default] 500 milliseconds.

8.204.2.16 protocol_overhead_max

RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::protocol_overhead_max

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1523) plus this overhead is larger than the UDPv4 maximum message size (65535 bytes), the middleware will automatically reduce the effective message_size_max, to 65535 minus this overhead.

[default] 28.

See also

NDDS_Transport_Property_t::message_size_max (p. 1523)

8.204.2.17 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

By default, network interface changes are propagated in the form of locators to other applications. This is done to support IP mobility scenarios.

For example, you could start a RTI Connex application with Wi-Fi and move to a wired connection. In order to continue communicating with other applications, this interface change has to be propagated.

In RTI Connex 5.2 (the initial release) and earlier versions of the product, IP mobility scenarios were not supported. 5.2 applications will report errors if they detect locator changes in a DataWriter or DataReader.

You can disable the notification and propagation of interface changes by setting this property to 1.

This way, an interface change in a newer application will not trigger errors in an application running 5.2 or earlier. Of course, this will prevent the new application from being able to detect network interface changes.

[default] 0

8.204.2.18 public_address

```
char* NDDS_Transport_UDPv4_WAN_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary for the Real-Time WAN Transport associated with an external **dds**↔**::domain::DomainParticipant** (p. 1079) (publicly reachable) in order to support the two communication scenarios shown in the Figure below.

For an external **dds::domain::DomainParticipant** (p. 1079) behind a NAT-enabled router, this address is the public IP address of the router.

When this property is set, the DomainParticipant will announce PUBLIC+UUID locators to other DomainParticipants. These locators are reachable locators because they contain this public IP address.

For additional information on Real-Time WAN Transport locators, see the `Core Libraries User's Manual`.

with a Participant that has a Public Address"

[default] null (the transport will announce UUID locators)

8.204.2.19 comm_ports_list

```
struct NDDS_Transport_UDP_WAN_CommPortsMappingInfo* NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list
```

Configures the public and private UDP ports that a transport instance uses to receive/send RTPS data.

Array containing the mapping between "RTPS ports", "UDP receive host ports", and "UDP receive public ports".

When the transport is configured using properties, the port mapping array is provided using a JSON string.

For example:

```
{
  "default": {"host": 8192, "public": 9678},
  "mappings": [
    {"rtps": 1234, "host": 9999, "public": 5678},
    {"rtps": 1235, "host": 9990, "public": 5679},
  ]
}
```

It is also possible to configure the mapping with XML:

```
<transport_builtin>
  <udpv4_wan>
    <comm_ports>
      <default>
        <host>8192</host>
        <public>9678</public>
      </default>
      <mappings>
        <element>
          <rtps>1234</rtps>
          <host>9999</host>
          <public>5678</public>
        </element>
        <element>
          <rtps>1235</rtps>
          <host>9990</host>
          <public>5679</public>
        </element>
      </mappings>
    </comm_ports>
  </udpv4_wan>
</transport_builtin>
```

For additional information on how to set the value of this property, see the [Core Libraries User's Manual](#).

[default] NULL (The UDP ports used for communications will be derived from the RTPS ports associated with the locators for the DomainParticipant and its Endpoints (DataWriters and DataReaders)).

8.204.2.20 comm_ports_list_length

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list_length
```

Number of elements in the `NDDS_Transport_UDPv4_WAN_Property_t::comm_ports_list` (p.1549).

[default] 0

8.204.2.21 port_offset

```
RTI_INT32 NDDS_Transport_UDPv4_WAN_Property_t::port_offset
```

Port offset to allow coexistence with built-in UDPv4 transport.

This property allows using the built-in UDPv4 transport and the Real-Time WAN Transport at the same time.

```
<transport_builtin>
```

```
    <mask>UDPv4_WAN|UDPv4</mask>
```

```
</transport_builtin>
```

When the UDP ports used by Real-Time WAN Transport are not explicitly set, they are calculated as follows: RTPS port + port_offset.

[default] 125

8.204.2.22 binding_ping_period

```
RTI_UINT32 NDDS_Transport_UDPv4_WAN_Property_t::binding_ping_period
```

Specifies the period in milliseconds at which BINDING_PINGS messages are sent to keep NAT mappings open.

Configures the period in milliseconds at which BINDING_PING messages are sent by a local transport instance to a remote transport instance. For example, 1000 means to send BINDING_PING messages every second.

BINDING_PING messages are used on the sending side to open NAT bindings from a local transport instance to a remote transport instance and they are sent periodically to keep the bindings open.

On the receiving side, BINDING_PINGS are used to calculate the public IP transport address of an UUID locator. This address will be used to send data to the locator.

For additional information on the role of BINDING_PING, see the `Core Libraries User's Manual`.

From a configuration point of view, and to avoid communication disruptions, the period at which a transport instance sends BINDING_PING messages should be smaller than the NAT binding session timeout. This timeout depends on the NAT router configuration.

[default] 1000 (1 sec)

8.205 NDDS_Transport_UDPv6_Property_t Struct Reference

Configurable IPv6/UDP Transport-Plugin properties.

Public Attributes

- struct **NDDS_Transport_Property_t parent**
Generic properties of all transport plugins.
- RTI_INT32 **send_socket_buffer_size**
Size in bytes of the send buffer of a socket used for sending.
- RTI_INT32 **recv_socket_buffer_size**
Size in bytes of the receive buffer of a socket used for receiving.
- RTI_INT32 **unicast_enabled**
Allows the transport plugin to use unicast for sending and receiving.
- RTI_INT32 **multicast_enabled**
Allows the transport plugin to use multicast for sending and receiving.
- RTI_INT32 **multicast_ttl**
Value for the time-to-live parameter for all multicast sends using this plugin.
- RTI_INT32 **multicast_loopback_disabled**
Prevents the transport plugin from putting multicast packets onto the loopback interface.
- RTI_INT32 **ignore_loopback_interface**
Prevents the transport plugin from using the IP loopback interface.
- RTI_INT32 **ignore_nonrunning_interfaces**
Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.
- RTI_INT32 **no_zero_copy**
[DEPRECATED] *Prevents the transport plugin from doing zero copy.*
- RTI_INT32 **send_blocking**
Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.
- RTI_INT32 **enable_v4mapped**
Specify whether UDPv6 transport will process IPv4 addresses.
- RTI_UINT32 **transport_priority_mask**
Set mask for use of transport priority field.
- RTI_INT32 **transport_priority_mapping_low**
Set low value of output range to IPv6 TCLASS.
- RTI_INT32 **transport_priority_mapping_high**
Set high value of output range to IPv6 TCLASS.
- RTI_INT32 **send_ping**
Configures whether to send PING messages.
- RTI_INT32 **force_interface_poll_detection**
Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.
- RTI_UINT32 **interface_poll_period**
Specifies the period in milliseconds to query for changes in the state of all the interfaces.
- RTI_INT32 **reuse_multicast_receive_resource**
Controls whether or not to reuse multicast receive resources.
- RTI_INT32 **protocol_overhead_max**

Maximum size in bytes of protocol overhead, including headers.

- RTI_INT32 **disable_interface_tracking**

Disables detection of network interface changes.

- RTI_UINT32 **join_multicast_group_timeout**

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

- char * **public_address**

Public IP address associated with the transport instantiation.

- RTI_INT32 **port_offset**

Port offset to allow multiple instances of UDPv6 transports in the same `dds::domain::DomainParticipant` (p. 1079).

8.205.1 Detailed Description

Configurable IPv6/UDP Transport-Plugin properties.

You can modify the properties in this structure to configure the plugin. However, you must set the properties before the plugin is instantiated.

See also

`Transport_Support::set_builtin_transport_property()`

8.205.2 Member Data Documentation

8.205.2.1 parent

```
struct NDDS_Transport_Property_t NDDS_Transport_UDPv6_Property_t::parent
```

Generic properties of all transport plugins.

8.205.2.2 send_socket_buffer_size

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_socket_buffer_size
```

Size in bytes of the send buffer of a socket used for sending.

On most operating systems, `setsockopt()` will be called to set the `SENDBUF` to the value of this parameter.

This value must be greater than or equal to `NDDS_Transport_Property_t::message_size_max` (p. 1523). The maximum value is operating system-dependent.

By default, it will be set to `UDPv6Transport_SEND_SOCKET_BUFFER_SIZE_DEFAULT`.

If you configure this parameter to be `UDPv6Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT`, then `setsockopt()` (or equivalent) will not be called to size the send buffer of the socket. The transport will use the OS default.

8.205.2.3 `recv_socket_buffer_size`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::recv_socket_buffer_size
```

Size in bytes of the receive buffer of a socket used for receiving.

On most operating systems, `setsockopt()` will be called to set the `RCVBUF` to the value of this parameter.

This value must be greater than or equal to `NDDS_Transport_Property_t::message_size_max` (p. 1523). The maximum value is operating system-dependent.

By default, it will be set to `UDPv6Transport_RECV_SOCKET_BUFFER_SIZE_DEFAULT`.

If you configure this parameter to be `UDPv6Transport_SOCKET_BUFFER_SIZE_OS_DEFAULT`, then `setsockopt()` (or equivalent) will not be called to size the receive buffer of the socket. The transport will use the OS default.

8.205.2.4 `unicast_enabled`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::unicast_enabled
```

Allows the transport plugin to use unicast for sending and receiving.

This value turns unicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1). Also by default, the plugin will use all the allowed network interfaces that it finds up and running when the plugin is instantiated.

8.205.2.5 `multicast_enabled`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_enabled
```

Allows the transport plugin to use multicast for sending and receiving.

This value turns multicast UDP on (if set to 1) or off (if set to 0) for this plugin. By default, it will be turned on (1) for those platforms that support multicast. Also by default, the plugin will use the all network interfaces allowed for multicast that it finds up and running when the plugin is instantiated.

8.205.2.6 `multicast_ttl`

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_ttl
```

Value for the time-to-live parameter for all multicast sends using this plugin.

This is used to set the TTL of multicast packets sent by this transport plugin.

[default] 1

8.205.2.7 multicast_loopback_disabled

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::multicast_loopback_disabled
```

Prevents the transport plugin from putting multicast packets onto the loopback interface.

If multicast loopback is disabled (this value is set to 1), then when sending multicast packets, RTI Connexx will *not* put a copy of the packets on the loopback interface. This prevents applications on the same node (including itself) from receiving those packets.

This value is set to 0 by default, meaning multicast loopback is *enabled*.

Disabling multicast loopback (setting this value to 1) may result in minor performance gains when using multicast.

8.205.2.8 ignore_loopback_interface

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_loopback_interface
```

Prevents the transport plugin from using the IP loopback interface.

Currently three values are allowed:

- **0**: Forces local traffic to be sent over loopback, even if a more efficient transport (such as shared memory) is installed (in which case traffic will be sent over both transports).
- **1**: Disables local traffic via this plugin. Do not use the IP loopback interface even if no NICs are discovered. This is useful when you want applications running on the same node to use a more efficient transport (such as shared memory) instead of the IP loopback.
- **-1**: Automatic. Lets RTI Connexx decide between the above two choices.

The current "automatic" (-1) RTI Connexx policy is as follows.

- If a shared memory transport plugin is available for local traffic and there is a locator on the initial peers list that can use shared memory, the effective value is 1 (i.e., disable UDPv6 local traffic).
- Otherwise, the effective value is 0 (i.e., use UDPv6 for local traffic also).

[default] -1 Automatic RTI Connexx policy based on availability of the shared memory transport.

8.205.2.9 ignore_nonrunning_interfaces

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::ignore_nonrunning_interfaces
```

Prevents the transport plugin from using a network interface that is not reported as RUNNING by the operating system.

The transport checks the flags reported by the operating system for each network interface upon initialization. An interface that is not reported as UP will not be used. This property allows the same check to be extended to the IFF_↔_RUNNING flag implemented by some operating systems. The RUNNING flag is defined to mean that "all resources are allocated," and may be off if there is no link detected, e.g., the network cable is unplugged.

Two values are allowed:

- **0**: Do not check the RUNNING flag when enumerating interfaces, just make sure interface is UP.
- **1**: Check flag when enumerating interfaces and ignore those that are not reported as RUNNING. This can be used on some operating systems to cause the transport to ignore interfaces that are enabled but not connected to the network.

[default] 1 (i.e., check RUNNING flag)

8.205.2.10 no_zero_copy

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::no_zero_copy
```

[DEPRECATED] Prevents the transport plugin from doing zero copy.

DEPRECATED: This property has no effect. By default, this plugin will use the zero copy on OSes that offer it. While this is good for performance, it may sometimes tax the OS resources in a manner that cannot be overcome by the application.

The best example is if the hardware/device driver lends the buffer to the application itself. If the application does not return the loaned buffers soon enough, the node may error or malfunction. If you cannot reconfigure the H/W, device driver, or the OS to allow the zero copy feature to work for your application, you may have no choice but to turn off the use of zero copy.

By default this is set to 0, so RTI Connexxt will use the zero copy API if offered by the OS.

8.205.2.11 send_blocking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_blocking
```

Control blocking behavior of send sockets. CHANGING THIS FROM THE DEFAULT CAN CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

Currently two values are defined:

- **NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS**: Sockets are blocking (default socket options for the operating system).
- **NDDS_TRANSPORT_UDPv6_BLOCKING_NEVER**: Sockets are modified to make them non-blocking. THIS MAY CAUSE SIGNIFICANT PERFORMANCE PROBLEMS.

[default] NDDS_TRANSPORT_UDPv6_BLOCKING_ALWAYS.

8.205.2.12 enable_v4mapped

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::enable_v4mapped
```

Specify whether UDPv6 transport will process IPv4 addresses.

Set this to 1 to turn on processing of IPv4 addresses. Note that this may make it incompatible with use of the UDPv4 transport within the same domain participant.

[default] 0.

8.205.2.13 transport_priority_mask

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mask
```

Set mask for use of transport priority field.

If transport priority mapping is supported on the platform, this mask is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low** (p.1557) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high** (p.1557) to define the mapping from the DDS transport priority (see **TRANSPORT_PRIORITY** (p.341)) to the IPv6 TCLASS field. Defines a contiguous region of bits in the 32-bit transport priority value that is used to generate values for the IPv6 TCLASS field on an outgoing socket.

For example, the value 0x0000ff00 causes bits 9-16 (8 bits) to be used in the mapping. The value will be scaled from the mask range (0x0000 - 0xff00 in this case) to the range specified by low and high.

If the mask is set to zero, then the transport will not set IPv6 TCLASS for send sockets.

[default] 0.

8.205.2.14 transport_priority_mapping_low

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low
```

Set low value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p.1557) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high** (p.1557) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the low value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0.

8.205.2.15 transport_priority_mapping_high

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_high
```

Set high value of output range to IPv6 TCLASS.

This is used in conjunction with **NDDS_Transport_UDPv6_Property_t::transport_priority_mask** (p.1557) and **NDDS_Transport_UDPv6_Property_t::transport_priority_mapping_low** (p.1557) to define the mapping from the DDS transport priority to the IPv6 TCLASS field. Defines the high value of the output range for scaling.

Note that IPv6 TCLASS is generally an 8-bit value.

[default] 0xff.

8.205.2.16 send_ping

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::send_ping
```

Configures whether to send PING messages.

See also

NDDS_Transport_UDPv4_Property_t::send_ping (p.1539)

8.205.2.17 force_interface_poll_detection

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::force_interface_poll_detection
```

Forces the interface tracker to use a polling mechanism to detect changes on the UDPv6 interfaces.

See also

NDDS_Transport_UDPv4_Property_t::force_interface_poll_detection (p.1539)

8.205.2.18 interface_poll_period

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::interface_poll_period
```

Specifies the period in milliseconds to query for changes in the state of all the interfaces.

See also

NDDS_Transport_UDPv4_Property_t::interface_poll_period (p.1539)

8.205.2.19 reuse_multicast_receive_resource

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::reuse_multicast_receive_resource
```

Controls whether or not to reuse multicast receive resources.

See also

NDDS_Transport_UDPv4_Property_t::reuse_multicast_receive_resource (p. 1539)

8.205.2.20 protocol_overhead_max

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::protocol_overhead_max
```

Maximum size in bytes of protocol overhead, including headers.

This value is the maximum size, in bytes, of protocol-related overhead. Normally, the overhead accounts for UDP and IP headers. The default value is set to accommodate the most common UDP/IP header size.

Note that when **NDDS_Transport_Property_t::message_size_max** (p. 1523) plus this overhead is larger than the UDPv6 maximum message size (65535 bytes), the middleware will automatically reduce the effective `message_size_max`, to 65535 minus this overhead.

[default] 48.

See also

NDDS_Transport_Property_t::message_size_max (p. 1523)

8.205.2.21 disable_interface_tracking

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::disable_interface_tracking
```

Disables detection of network interface changes.

See also

NDDS_Transport_UDPv4_Property_t::disable_interface_tracking (p. 1540)

8.205.2.22 `join_multicast_group_timeout`

```
RTI_UINT32 NDDS_Transport_UDPv6_Property_t::join_multicast_group_timeout
```

[Windows only] Defines how much time (milliseconds) to wait to join a multicast group address when a new interface is detected.

See also

`NDDS_Transport_UDPv4_Property_t::join_multicast_group_timeout` (p. 1540)

8.205.2.23 `public_address`

```
char* NDDS_Transport_UDPv6_Property_t::public_address
```

Public IP address associated with the transport instantiation.

Setting the public IP address is only necessary to support communication over WAN that involves Network Address Translation (NAT).

Typically, the address is the public address of the IP NAT router that provides access to the WAN.

By default, the **`dds::domain::DomainParticipant`** (p. 1079) creating the transport will announce the IP addresses obtained from the NICs to other DomainParticipants in the system.

When this property is set, the DomainParticipant will announce the IP address corresponding to the property value instead of the LAN IP addresses associated with the NICs.

Note 1: Setting this property is necessary, but is not a sufficient condition for sending and receiving data over the WAN. You must also configure the IP NAT router to allow UDP traffic and to map the public IP address specified by this property to the DomainParticipant's private LAN IP address. This is typically done with one of the following mechanisms:

- Port Forwarding: You must map the private ports used to receive discovery and user data traffic to the corresponding public ports (see **`rti::core::RtpsWellKnownPorts`** (p. 1965)). Public and private ports must be the same since the transport does not allow you to change the mapping.
- 1:1 NAT: You must add a 1:1 NAT entry that maps the public IP address specified in this property to the private LAN IP address of the DomainParticipant.

Note 2: By setting this property, the **`dds::domain::DomainParticipant`** (p. 1079) only announces its public IP address to other DomainParticipants. Therefore, communication with DomainParticipants within the LAN that are running on different nodes will not work unless the NAT router is configured to enable NAT reflection (hairpin NAT).

There is another way to achieve simultaneous communication with DomainParticipants running in the LAN and WAN, that does not require hairpin NAT. This way uses a gateway application such as RTI Routing Service to provide access to the WAN.

[default] null (the transport uses the IP addresses obtained from the NICs)

8.205.2.24 port_offset

```
RTI_INT32 NDDS_Transport_UDPv6_Property_t::port_offset
```

Port offset to allow multiple instances of UDPv6 transports in the same **dds::domain::DomainParticipant** (p. 1079).

By default, it is not possible to have multiple instances of the UDPv6 transport in the same **dds::domain::DomainParticipant** (p. 1079). This is because all instances will try to bind to the same UDP port(s) for receiving data.

With this property, you can specify an offset that will be added to the RTPS port(s) to determine the UDP port(s) to bind to. This way, you can have multiple instances of the UDPv6 transport in the same **dds::domain::DomainParticipant** (p. 1079).

An RTPS port will be mapped to an UDP port as follows: UDP port = RTPS port + port_offset.

[default] 0

8.206 NDDS_Transport_UUID Struct Reference

Univocally identifies a transport plugin instance.

8.206.1 Detailed Description

Univocally identifies a transport plugin instance.

8.207 rti::util::network_capture::NetworkCaptureParams Class Reference

<<*extension*>> (p. 156) Input parameters for starting Network Capture.

```
#include <network_capture.hpp>
```

Inherits `rti::core::NativeValueType< T, NATIVE_T, ADAPTER >`.

Public Member Functions

- **dds::core::StringSeq transports** () const
Get the list of transports to capture.
- **NetworkCaptureParams & transports** (const **dds::core::StringSeq** &transports_in)
Set the list of transports to capture.
- **ContentKindMask dropped_content** () const
Get the type of contents to exclude from the capture file.
- **NetworkCaptureParams & dropped_content** (**ContentKindMask** dropped_content_in)
Set the type of contents to exclude from the capture file.
- **TrafficKindMask traffic** () const
Get the traffic direction to capture.
- **NetworkCaptureParams & traffic** (**TrafficKindMask** traffic_in)
Set the traffic direction to capture.
- bool **parse_encrypted_content** () const
Get whether Network Capture will parse encrypted contents.
- **NetworkCaptureParams & parse_encrypted_content** (bool parse_encrypted_content_in)
Set whether Network Capture will parse encrypted contents.
- const **rti::core::ThreadSettings & checkpoint_thread_settings** () const
Get the properties of the checkpoint thread.
- **NetworkCaptureParams & checkpoint_thread_settings** (const **rti::core::ThreadSettings** &checkpoint_thread_settings_in)
Set the properties of the checkpoint thread.
- int32_t **frame_queue_size** () const
Get the size of the frame queue (Bytes).
- **NetworkCaptureParams & frame_queue_size** (int32_t frame_queue_size_in)
Set the size of the frame queue.

8.207.1 Detailed Description

<<*extension*>> (p. 156) Input parameters for starting Network Capture.

8.207.2 Member Function Documentation

8.207.2.1 transports() [1/2]

```
dds::core::StringSeq rti::util::network_capture::NetworkCaptureParams::transports ( ) const
```

Get the list of transports to capture.

Returns

List of transports to capture.

8.207.2.2 transports() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::transports (
    const dds::core::StringSeq & transports_in )
```

Set the list of transports to capture.

Network Capture will only save RTPS frames if the associated transport protocol is part of this sequence.

[default] Empty sequence initializer. This means that by default all transports will be captured.

Parameters

<i>transports_↵ _in</i>	The sequence of transports that we want to capture traffic from.
-----------------------------	--

Returns

The Network Capture's parameter instance.

8.207.2.3 dropped_content() [1/2]

```
ContentKindMask rti::util::network_capture::NetworkCaptureParams::dropped_content ( ) const
```

Get the type of contents to exclude from the capture file.

Returns

Contents to exclude from the capture file.

8.207.2.4 dropped_content() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::dropped_content (
    ContentKindMask dropped_content_in )
```

Set the type of contents to exclude from the capture file.

It accepts values from **network_capture::ContentKindMask** (p. 743) .

We can choose to exclude user data or encrypted content from the capture file.

[default] No content is excluded - **network_capture::ContentKindMask::default_mask()** (p. 745).

Parameters

<i>dropped_content</i> <i>_in</i>	The mask of contents to exclude from the capture.
--------------------------------------	---

Returns

The Network Capture's parameter instance.

8.207.2.5 traffic() [1/2]

```
TrafficKindMask rti::util::network_capture::NetworkCaptureParams::traffic ( ) const
```

Get the traffic direction to capture.

Returns

Traffic direction to capture.

8.207.2.6 traffic() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::traffic (
    TrafficKindMask traffic_in )
```

Set the traffic direction to capture.

It accepts values from **network_capture::TrafficKindMask** (p. 2233) .

[default] Capture both inbound and outbound traffic - **network_capture::TrafficKindMask::default_mask()** (p. 2235).

Parameters

<i>traffic</i> <i>_in</i>	The mask with the traffic directions that we want to capture.
------------------------------	---

Returns

The Network Capture's parameter instance.

8.207.2.7 parse_encrypted_content() [1/2]

```
bool rti::util::network_capture::NetworkCaptureParams::parse_encrypted_content ( ) const
```

Get whether Network Capture will parse encrypted contents.

Returns

Whether Network Capture will parse encrypted contents.

8.207.2.8 parse_encrypted_content() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::parse_encrypted_content
(
    bool parse_encrypted_content_in )
```

Set whether Network Capture will parse encrypted contents.

Network Capture supports decryption of RTPS messages and submessages. It does not support decryption of the user data payload (<data_protection_kind> tag in the GovernanceDocument).

[default] false

Parameters

<i>parse_encrypted_content</i> _↔ <i>_in</i>	Boolean indicating whether to parse or not encrypted content.
---	---

Returns

The Network Capture's parameter instance.

8.207.2.9 checkpoint_thread_settings() [1/2]

```
const rti::core::ThreadSettings & rti::util::network_capture::NetworkCaptureParams::checkpoint_↔
thread_settings ( ) const
```

Get the properties of the checkpoint thread.

Returns

Properties of the checkpoint thread.

8.207.2.10 `checkpoint_thread_settings()` [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::checkpoint_thread_↵
settings (
    const rti::core::ThreadSettings & checkpoint_thread_settings_in )
```

Set the properties of the checkpoint thread.

The checkpoint thread is a per-participant thread responsible for reading frames from a queue and saving them to disk (as soon as they are produced).

The members that can be configured are:

- **rti::core::ThreadSettings::mask** (p.2155). Default value of `(rti::core::ThreadSettingsKindMask::THREAD_↵
SETTINGS_PRIORITY_ENFORCE | rti::core::ThreadSettingsKindMask::stdio())` (p.2161)).
- **rti::core::ThreadSettings::priority** (p.2156). Platform-dependent - Consult `Platform Notes` for additional details.
- **rti::core::ThreadSettings::stack_size** (p.2156). Platform-dependent - Consult `Platform Notes` for additional details.

Parameters

<code>checkpoint_thread_↵ _in</code>	Properties of the checkpoint thread that we want to set.
--	--

Returns

The Network Capture's parameter instance.

8.207.2.11 `frame_queue_size()` [1/2]

```
int32_t rti::util::network_capture::NetworkCaptureParams::frame_queue_size ( ) const
```

Get the size of the frame queue (Bytes).

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

[default] 2097152 (2MB).

Returns

Size of the frame queue (Bytes).

8.207.2.12 frame_queue_size() [2/2]

```
NetworkCaptureParams & rti::util::network_capture::NetworkCaptureParams::frame_queue_size (
    int32_t frame_queue_size_in )
```

Set the size of the frame queue.

Network Capture enqueues frames before saving them to disk, which takes place in a separate thread.

Network Capture does not block if the queue becomes full. Attempting to enqueue a frame with a full frame queue will fail (frame won't be captured) with a log message.

The size of the queue is dependent on the network traffic (amount of frames that we want to capture) and system resources (how fast we can capture frames).

[default] 2097152 (2MB).

Parameters

<code>frame_queue_size↔ _in</code>	Size of the frame queue in Bytes.
--	-----------------------------------

Returns

The Network Capture's parameter instance.

8.208 rti::topic::no_compile_data_t Struct Reference

The type to specify as the CompileData template parameter to your **ContentFilter** (p. 732) if your compile function does not return any data.

```
#include <rti/topic/ContentFilter.hpp>
```

8.208.1 Detailed Description

The type to specify as the CompileData template parameter to your **ContentFilter** (p. 732) if your compile function does not return any data.

8.209 rti::queuing::NoMatchingQueueException Class Reference

The entity lost matching with all the Queuing Service.

```
#include <QueueSupport.hpp>
```

Inheritance diagram for rti::queuing::NoMatchingQueueException:

Public Member Functions

- `const char * what () const throw ()`

Access the message contained in this **NoMatchingQueueException** (p. 1567) exception.

8.209.1 Detailed Description

The entity lost matching with all the Queuing Service.

Only operations related with sending samples or waiting for acknowledgements can throw this exception.

8.209.2 Member Function Documentation

8.209.2.1 what()

```
const char * rti::queuing::NoMatchingQueueException::what () const throw () [inline], [virtual]
```

Access the message contained in this **NoMatchingQueueException** (p. 1567) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.210 rti::core::cond::NoOpAsyncWaitSetListener Class Reference

A convenience implementation of **AsyncWaitSetListener** (p. 643) where all methods are overridden to do nothing.

```
#include <AsyncWaitSetListener.hpp>
```

Inheritance diagram for `rti::core::cond::NoOpAsyncWaitSetListener`:

Public Member Functions

- virtual void **on_thread_spawned** (ThreadId)
No-op.
- virtual void **on_thread_deleted** (ThreadId)
No-op.
- virtual void **on_wait_timeout** (ThreadId)
No-op.

8.210.1 Detailed Description

A convenience implementation of **AsyncWaitSetListener** (p. 643) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.210.2 Member Function Documentation

8.210.2.1 on_thread_spawned()

```
virtual void rti::core::cond::NoOpAsyncWaitSetListener::on_thread_spawned (  
    ThreadId ) [inline], [virtual]
```

No-op.

Implements **rti::core::cond::AsyncWaitSetListener** (p. 643).

8.210.2.2 on_thread_deleted()

```
virtual void rti::core::cond::NoOpAsyncWaitSetListener::on_thread_deleted (  
    ThreadId ) [inline], [virtual]
```

No-op.

Implements **rti::core::cond::AsyncWaitSetListener** (p. 644).

8.210.2.3 on_wait_timeout()

```
virtual void rti::core::cond::NoOpAsyncWaitSetListener::on_wait_timeout (
    ThreadId ) [inline], [virtual]
```

No-op.

Implements `rti::core::cond::AsyncWaitSetListener` (p. 644).

8.211 dds::sub::NoOpDataReaderListener< T > Class Template Reference

A convenience implementation of `DataReaderListener` (p. 832) where all methods are overridden to do nothing.

```
#include "dds/sub/DataReaderListener.hpp"
```

Inheritance diagram for `dds::sub::NoOpDataReaderListener< T >`:

Public Member Functions

- virtual void `on_requested_deadline_missed` (`DataReader< T > &`, const `dds::core::status::RequestedDeadlineMissedStatus &`)
No-op.
- virtual void `on_requested_incompatible_qos` (`DataReader< T > &`, const `dds::core::status::RequestedIncompatibleQosStatus &`)
No-op.
- virtual void `on_sample_rejected` (`DataReader< T > &`, const `dds::core::status::SampleRejectedStatus &`)
No-op.
- virtual void `on_liveliness_changed` (`DataReader< T > &`, const `dds::core::status::LivelinessChangedStatus &`)
No-op.
- virtual void `on_data_available` (`DataReader< T > &`)
No-op.
- virtual void `on_subscription_matched` (`DataReader< T > &`, const `dds::core::status::SubscriptionMatchedException &`)
No-op.
- virtual void `on_sample_lost` (`DataReader< T > &`, const `dds::core::status::SampleLostStatus &`)
No-op.

8.211.1 Detailed Description

```
template<typename T>
class dds::sub::NoOpDataReaderListener< T >
```

A convenience implementation of **DataReaderListener** (p. 832) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.211.2 Member Function Documentation

8.211.2.1 on_requested_deadline_missed()

```
template<typename T >
virtual void dds::sub::NoOpDataReaderListener< T >::on_requested_deadline_missed (
    DataReader< T > & ,
    const dds::core::status::RequestedDeadlineMissedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 834).

8.211.2.2 on_requested_incompatible_qos()

```
template<typename T >
virtual void dds::sub::NoOpDataReaderListener< T >::on_requested_incompatible_qos (
    DataReader< T > & ,
    const dds::core::status::RequestedIncompatibleQosStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 834).

8.211.2.3 on_sample_rejected()

```
template<typename T >
virtual void dds::sub::NoOpDataReaderListener< T >::on_sample_rejected (
    DataReader< T > & ,
    const dds::core::status::SampleRejectedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener< T >** (p. 834).

8.211.2.4 on_liveliness_changed()

```
template<typename T >
virtual void dds::sub::NoOpDataReaderListener< T >::on_liveliness_changed (
    DataReader< T > & ,
    const dds::core::status::LivelinessChangedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener**< T > (p. 834).

8.211.2.5 on_data_available()

```
template<typename T >
virtual void dds::sub::NoOpDataReaderListener< T >::on_data_available (
    DataReader< T > & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener**< T > (p. 835).

8.211.2.6 on_subscription_matched()

```
template<typename T >
virtual void dds::sub::NoOpDataReaderListener< T >::on_subscription_matched (
    DataReader< T > & ,
    const dds::core::status::SubscriptionMatchedException & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener**< T > (p. 835).

8.211.2.7 on_sample_lost()

```
template<typename T >
virtual void dds::sub::NoOpDataReaderListener< T >::on_sample_lost (
    DataReader< T > & ,
    const dds::core::status::SampleLostStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::DataReaderListener**< T > (p. 835).

8.212 dds::pub::NoOpDataWriterListener< T > Class Template Reference

A convenience implementation of **DataWriterListener** (p. 972) where all methods are overridden to do nothing.

```
#include "dds/pub/DataWriterListener.hpp"
```

8.212.1 Detailed Description

```
template<typename T>
class dds::pub::NoOpDataWriterListener< T >
```

A convenience implementation of **DataWriterListener** (p. 972) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.212.2 Member Function Documentation

8.212.2.1 on_offered_deadline_missed()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_offered_deadline_missed (
    dds::pub::DataWriter< T > & ,
    const dds::core::status::OfferedDeadlineMissedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::DataWriterListener< T >** (p. 973).

8.212.2.2 on_offered_incompatible_qos()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_offered_incompatible_qos (
    dds::pub::DataWriter< T > & ,
    const dds::core::status::OfferedIncompatibleQosStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::DataWriterListener< T >** (p. 974).

8.212.2.3 on_liveliness_lost()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_liveliness_lost (
    dds::pub::DataWriter< T > & ,
    const dds::core::status::LivelinessLostStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::DataWriterListener< T >** (p. 974).

8.212.2.4 on_publication_matched()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_publication_matched (
    dds::pub::DataWriter< T > & ,
    const dds::core::status::PublicationMatchedStatus & ) [inline], [virtual]
```

No-op.

Implements `dds::pub::DataWriterListener< T >` (p.975).

8.212.2.5 on_reliable_writer_cache_changed()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_reliable_writer_cache_changed (
    dds::pub::DataWriter< T > & ,
    const rti::core::status::ReliableWriterCacheChangedStatus & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements `dds::pub::DataWriterListener< T >` (p.975).

8.212.2.6 on_reliable_reader_activity_changed()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_reliable_reader_activity_changed (
    dds::pub::DataWriter< T > & ,
    const rti::core::status::ReliableReaderActivityChangedStatus & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements `dds::pub::DataWriterListener< T >` (p.976).

8.212.2.7 on_instance_replaced()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_instance_replaced (
    dds::pub::DataWriter< T > & ,
    const dds::core::InstanceHandle & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements `dds::pub::DataWriterListener< T >` (p.976).

8.212.2.8 on_application_acknowledgment()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_application_acknowledgment (
    dds::pub::DataWriter< T > & ,
    const rti::pub::AcknowledgmentInfo & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements **dds::pub::DataWriterListener< T >** (p.977).

8.212.2.9 on_service_request_accepted()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_service_request_accepted (
    dds::pub::DataWriter< T > & ,
    const rti::core::status::ServiceRequestAcceptedStatus & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements **dds::pub::DataWriterListener< T >** (p.978).

8.212.2.10 on_destination_unreachable()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_destination_unreachable (
    dds::pub::DataWriter< T > & ,
    const dds::core::InstanceHandle & ,
    const rti::core::Locator & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements **dds::pub::DataWriterListener< T >** (p.972).

8.212.2.11 on_data_request()

```
template<typename T >
virtual void * dds::pub::NoOpDataWriterListener< T >::on_data_request (
    dds::pub::DataWriter< T > & ,
    const rti::core::Cookie & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements **dds::pub::DataWriterListener< T >** (p.972).

8.212.2.12 on_data_return()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_data_return (
    dds::pub::DataWriter< T > & ,
    void * ,
    const rti::core::Cookie & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements `dds::pub::DataWriterListener< T >` (p. 972).

8.212.2.13 on_sample_removed()

```
template<typename T >
virtual void dds::pub::NoOpDataWriterListener< T >::on_sample_removed (
    dds::pub::DataWriter< T > & ,
    const rti::core::Cookie & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Implements `dds::pub::DataWriterListener< T >` (p. 978).

8.213 dds::domain::NoOpDomainParticipantListener Class Reference

A convenience implementation of `DomainParticipantListener` (p. 1134) where all methods are overridden to do nothing.

```
#include "dds/domain/DomainParticipantListener.hpp"
```

Inheritance diagram for `dds::domain::NoOpDomainParticipantListener`:

8.213.1 Detailed Description

A convenience implementation of **DomainParticipantListener** (p. 1134) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.213.2 Member Function Documentation

8.213.2.1 on_offered_deadline_missed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_offered_deadline_missed (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::OfferedDeadlineMissedStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1585).

8.213.2.2 on_offered_incompatible_qos()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_offered_incompatible_qos (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::OfferedIncompatibleQosStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1586).

8.213.2.3 on_liveliness_lost()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_liveliness_lost (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::LivelinessLostStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1586).

8.213.2.4 on_publication_matched()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_publication_matched (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::PublicationMatchedStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1586).

8.213.2.5 on_reliable_writer_cache_changed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_reliable_writer_cache_changed (
    dds::pub::AnyDataWriter & ,
    const rti::core::status::ReliableWriterCacheChangedStatus & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1586).

8.213.2.6 on_reliable_reader_activity_changed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_reliable_reader_activity_changed (
    dds::pub::AnyDataWriter & ,
    const rti::core::status::ReliableReaderActivityChangedStatus & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1587).

8.213.2.7 on_sample_removed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_sample_removed (
    dds::pub::AnyDataWriter & ,
    const rti::core::Cookie & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1587).

8.213.2.8 on_instance_replaced()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_instance_replaced (
    dds::pub::AnyDataWriter & ,
    const dds::core::InstanceHandle & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1587).

8.213.2.9 on_application_acknowledgment()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_application_acknowledgment (
    dds::pub::AnyDataWriter & ,
    const rti::pub::AcknowledgmentInfo & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1587).

8.213.2.10 on_service_request_accepted()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_service_request_accepted (
    dds::pub::AnyDataWriter & ,
    const rti::core::status::ServiceRequestAcceptedStatus & ) [inline], [virtual]
```

<<*extension*>> (p. 156) No-op

Reimplemented from **dds::pub::NoOpPublisherListener** (p. 1588).

8.213.2.11 on_invalid_local_identity_status_advance_notice()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_invalid_local_identity_status_advance←
_notice (
    DomainParticipant & ,
    const rti::core::status::InvalidLocalIdentityAdvanceNoticeStatus & ) [inline],
[virtual]
```

<<*extension*>> (p. 156) No-op

Implements **dds::domain::DomainParticipantListener** (p. 1135).

8.213.2.12 on_data_on_readers()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_data_on_readers (
    dds::sub::Subscriber & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1597).

8.213.2.13 on_requested_deadline_missed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_requested_deadline_missed (
    dds::sub::AnyDataReader & ,
    const dds::core::status::RequestedDeadlineMissedStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1597).

8.213.2.14 on_requested_incompatible_qos()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_requested_incompatible_qos (
    dds::sub::AnyDataReader & ,
    const dds::core::status::RequestedIncompatibleQosStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1597).

8.213.2.15 on_sample_rejected()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_sample_rejected (
    dds::sub::AnyDataReader & ,
    const dds::core::status::SampleRejectedStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1597).

8.213.2.16 on_liveliness_changed()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_liveliness_changed (
    dds::sub::AnyDataReader & ,
    const dds::core::status::LivelinessChangedStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1598).

8.213.2.17 on_data_available()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_data_available (
    dds::sub::AnyDataReader & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1598).

8.213.2.18 on_subscription_matched()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_subscription_matched (
    dds::sub::AnyDataReader & ,
    const dds::core::status::SubscriptionMatchedStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from **dds::sub::NoOpSubscriberListener** (p. 1598).

8.213.2.19 on_sample_lost()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_sample_lost (
    dds::sub::AnyDataReader & ,
    const dds::core::status::SampleLostStatus & ) [inline], [virtual]
```

No-op.

Reimplemented from `dds::sub::NoOpSubscriberListener` (p. 1598).

8.213.2.20 on_inconsistent_topic()

```
virtual void dds::domain::NoOpDomainParticipantListener::on_inconsistent_topic (
    dds::topic::AnyTopic & ,
    const dds::core::status::InconsistentTopicStatus & ) [inline], [virtual]
```

No-op.

8.214 dds::pub::NoOpPublisherListener Class Reference

A convenience implementation of `PublisherListener` (p. 1732) where all methods are overridden to do nothing.

```
#include <dds/pub/PublisherListener.hpp>
```

8.214.1 Detailed Description

A convenience implementation of **PublisherListener** (p. 1732) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.214.2 Member Function Documentation

8.214.2.1 on_offered_deadline_missed()

```
virtual void dds::pub::NoOpPublisherListener::on_offered_deadline_missed (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::OfferedDeadlineMissedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.609).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1579).

8.214.2.2 on_offered_incompatible_qos()

```
virtual void dds::pub::NoOpPublisherListener::on_offered_incompatible_qos (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::OfferedIncompatibleQosStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.610).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1579).

8.214.2.3 on_liveliness_lost()

```
virtual void dds::pub::NoOpPublisherListener::on_liveliness_lost (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::LivelinessLostStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.610).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1579).

8.214.2.4 on_publication_matched()

```
virtual void dds::pub::NoOpPublisherListener::on_publication_matched (
    dds::pub::AnyDataWriter & ,
    const ::dds::core::status::PublicationMatchedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.610).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1580).

8.214.2.5 on_reliable_writer_cache_changed()

```
virtual void dds::pub::NoOpPublisherListener::on_reliable_writer_cache_changed (
    dds::pub::AnyDataWriter & ,
    const rti::core::status::ReliableWriterCacheChangedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.610).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1580).

8.214.2.6 on_reliable_reader_activity_changed()

```
virtual void dds::pub::NoOpPublisherListener::on_reliable_reader_activity_changed (
    dds::pub::AnyDataWriter & ,
    const rti::core::status::ReliableReaderActivityChangedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.611).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1580).

8.214.2.7 on_sample_removed()

```
virtual void dds::pub::NoOpPublisherListener::on_sample_removed (
    dds::pub::AnyDataWriter & ,
    const rti::core::Cookie & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.611).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1580).

8.214.2.8 on_instance_replaced()

```
virtual void dds::pub::NoOpPublisherListener::on_instance_replaced (
    dds::pub::AnyDataWriter & ,
    const dds::core::InstanceHandle & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.611).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1581).

8.214.2.9 on_application_acknowledgment()

```
virtual void dds::pub::NoOpPublisherListener::on_application_acknowledgment (
    dds::pub::AnyDataWriter & ,
    const rti::pub::AcknowledgmentInfo & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.611).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1581).

8.214.2.10 on_service_request_accepted()

```
virtual void dds::pub::NoOpPublisherListener::on_service_request_accepted (
    dds::pub::AnyDataWriter & ,
    const rti::core::status::ServiceRequestAcceptedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::pub::AnyDataWriterListener** (p.612).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p.1581).

8.215 rti::queuing::NoOpQueueConsumerListener< T > Class Template Reference

A listener with an empty implementation of all methods.

```
#include <QueueConsumerListener.hpp>
```

Inheritance diagram for `rti::queuing::NoOpQueueConsumerListener< T >`:

Public Member Functions

- virtual void **on_sample_available** (`QueueConsumer< T > &`)
User callback.
- virtual void **on_shared_reader_queue_matched** (`QueueConsumer< T > &`, const `dds::core::status::↔ SubscriptionMatchedStatus &`)
User callback.

8.215.1 Detailed Description

```
template<typename T>
class rti::queuing::NoOpQueueConsumerListener< T >
```

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.215.2 Member Function Documentation

8.215.2.1 on_sample_available()

```
template<typename T >
virtual void rti::queuing::NoOpQueueConsumerListener< T >::on_sample_available (
    QueueConsumer< T > & ) [inline], [virtual]
```

User callback.

This callback is invoked whenever the **QueueConsumer** (p. 1787) has received at least one sample. Any operation to get samples i.e. `QueueConsumer::take_sample`) can be called within this context.

See also

dds::sub::DataReaderListener::on_data_available (p. 835)

Implements **rti::queuing::QueueConsumerListener< T >** (p. 1801).

8.215.2.2 on_shared_reader_queue_matched()

```
template<typename T >
virtual void rti::queuing::NoOpQueueConsumerListener< T >::on_shared_reader_queue_matched (
    QueueConsumer< T > & ,
    const dds::core::status::SubscriptionMatchedException & ) [inline], [virtual]
```

User callback.

This callback is invoked whenever a new `SharedReaderQueue` hosted by `Queuing Service` has matched the **QueueConsumer** (p. 1787), or if an existing matching `SharedReaderQueue` is disposed.

See also

dds::core::status::SubscriptionMatchedException (p. 2144)

dds::sub::DataReaderListener::on_subscription_matched (p. 835)

Implements **rti::queuing::QueueConsumerListener< T >** (p. 1802).

8.216 rti::queuing::NoOpQueueProducerListener< T > Class Template Reference

A listener with an empty implementation of all methods.

```
#include <QueueProducerListener.hpp>
```

Inheritance diagram for rti::queuing::NoOpQueueProducerListener< T >:

Public Member Functions

- virtual void **on_sample_acknowledged** (**QueueProducer**< T > &, const **rti::pub::AcknowledgmentInfo** &)
User callback.
- virtual void **on_shared_reader_queue_matched** (**QueueProducer**< T > &, const **dds::core::status::↔PublicationMatchedStatus** &)
User callback.

8.216.1 Detailed Description

```
template<typename T>
class rti::queuing::NoOpQueueProducerListener< T >
```

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.216.2 Member Function Documentation

8.216.2.1 on_sample_acknowledged()

```
template<typename T >
virtual void rti::queuing::NoOpQueueProducerListener< T >::on_sample_acknowledged (
    QueueProducer< T > & ,
    const rti::pub::AcknowledgmentInfo & ) [inline], [virtual]
```

User callback.

This callback is invoked whenever Queuing Service acknowledges a sample sent by the **QueueProducer** (p. 1805).

See also

[AcknowledgmentInfo](#)

Implements [rti::queuing::QueueProducerListener< T >](#) (p. 1816).

8.216.2.2 on_shared_reader_queue_matched()

```
template<typename T >
virtual void rti::queuing::NoOpQueueProducerListener< T >::on_shared_reader_queue_matched (
    QueueProducer< T > & ,
    const dds::core::status::PublicationMatchedStatus & ) [inline], [virtual]
```

User callback.

This callback is invoked whenever a new SharedReaderQueue hosted by Queuing Service has matched the **QueueProducer** (p. 1805), or if an existing matching SharedReaderQueue is disposed.

See also

dds::core::status::PublicationMatchedStatus (p. 1717)

dds::pub::DataWriterListener::on_publication_matched (p. 975)

Implements **rti::queuing::QueueProducerListener< T >** (p. 1816).

8.217 rti::queuing::NoOpQueueReplierListener< TReq, TRep > Class Template Reference

A listener with an empty implementation of all methods.

```
#include <rti/queuing/QueueReplierListener.hpp>
```

Inheritance diagram for **rti::queuing::NoOpQueueReplierListener< TReq, TRep >**:

Public Member Functions

- virtual void **on_reply_acknowledged** (**QueueReplier**< TReq, TRep > &, const **rti::pub::AcknowledgmentInfo** &)
User callback.
- virtual void **on_request_available** (**QueueReplier**< TReq, TRep > &)
User callback.
- virtual void **on_request_shared_reader_queue_matched** (**QueueReplier**< TReq, TRep > &, const **dds::core::status::SubscriptionMatchedStatus** &)
User callback.
- virtual void **on_reply_shared_reader_queue_matched** (**QueueReplier**< TReq, TRep > &, const **dds::core::status::PublicationMatchedStatus** &)
User callback.

8.217.1 Detailed Description

```
template<typename TReq, typename TRep>
class rti::queuing::NoOpQueueReplierListener< TReq, TRep >
```

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.217.2 Member Function Documentation

8.217.2.1 on_reply_acknowledged()

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueReplierListener< TReq, TRep >::on_reply_acknowledged (
    QueueReplier< TReq, TRep > & producer,
    const rti::pub::AcknowledgmentInfo & info ) [inline], [virtual]
```

User callback.

See also

[QueueProducerListener::on_sample_acknowledged](#) (p. 1816)

Implements [rti::queuing::QueueReplierListener< TReq, TRep >](#) (p. 1833).

8.217.2.2 on_request_available()

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueReplierListener< TReq, TRep >::on_request_available (
    QueueReplier< TReq, TRep > & requester ) [inline], [virtual]
```

User callback.

See also

[QueueConsumerListener::on_sample_available](#) (p. 1801)

Implements [rti::queuing::QueueReplierListener< TReq, TRep >](#) (p. 1833).

8.217.2.3 on_request_shared_reader_queue_matched()

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueReplierListener< TReq, TRep >::on_request_shared_reader_↔
queue_matched (
    QueueReplier< TReq, TRep > & requester,
    const dds::core::status::SubscriptionMatchedStatus & status ) [inline], [virtual]
```

User callback.

See also

[QueueConsumerListener::on_shared_reader_queue_matched](#) (p. 1802)

Implements [rti::queuing::QueueReplierListener< TReq, TRep >](#) (p. 1833).

8.217.2.4 on_reply_shared_reader_queue_matched()

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueReplierListener< TReq, TRep >::on_reply_shared_reader_↔
queue_matched (
    QueueReplier< TReq, TRep > & requester,
    const dds::core::status::PublicationMatchedStatus & status ) [inline], [virtual]
```

User callback.

See also

[QueueProducerListener::on_shared_reader_queue_matched](#) (p. 1816)

Implements [rti::queuing::QueueReplierListener< TReq, TRep >](#) (p. 1834).

8.218 rti::queuing::NoOpQueueRequesterListener< TReq, TRep > Class Template Reference

A listener with an empty implementation of all methods.

```
#include <rti/queuing/QueueRequesterListener.hpp>
```

Inheritance diagram for [rti::queuing::NoOpQueueRequesterListener< TReq, TRep >](#):

Public Member Functions

- virtual void `on_request_acknowledged` (`QueueRequester`< TReq, TRep > &, const `rti::pub::AcknowledgeInfo` &)
User callback.
- virtual void `on_reply_available` (`QueueRequester`< TReq, TRep > &)
User callback.
- virtual void `on_request_shared_reader_queue_matched` (`QueueRequester`< TReq, TRep > &, const `dds::core::status::PublicationMatchedStatus` &)
User callback.
- virtual void `on_reply_shared_reader_queue_matched` (`QueueRequester`< TReq, TRep > &, const `dds::core::status::SubscriptionMatchedStatus` &)
User callback.

8.218.1 Detailed Description

```
template<typename TReq, typename TRep>
class rti::queuing::NoOpQueueRequesterListener< TReq, TRep >
```

A listener with an empty implementation of all methods.

You can derive your listener from this class so you don't have to implement the methods you don't need.

8.218.2 Member Function Documentation

8.218.2.1 `on_request_acknowledged()`

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_request_acknowledged (
    QueueRequester< TReq, TRep > & ,
    const rti::pub::AcknowledgeInfo & ) [inline], [virtual]
```

User callback.

See also

`QueueProducerListener::on_sample_acknowledged` (p. 1816)

Implements `rti::queuing::QueueRequesterListener`< TReq, TRep > (p. 1852).

8.218.2.2 on_reply_available()

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_reply_available (
    QueueRequester< TReq, TRep > & ) [inline], [virtual]
```

User callback.

See also

[QueueConsumerListener::on_sample_available](#) (p. 1801)

Implements [rti::queuing::QueueRequesterListener< TReq, TRep >](#) (p. 1852).

8.218.2.3 on_request_shared_reader_queue_matched()

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_request_shared_reader_↔
queue_matched (
    QueueRequester< TReq, TRep > & ,
    const dds::core::status::PublicationMatchedStatus & ) [inline], [virtual]
```

User callback.

See also

[QueueProducerListener::on_shared_reader_queue_matched](#) (p. 1816)

Implements [rti::queuing::QueueRequesterListener< TReq, TRep >](#) (p. 1852).

8.218.2.4 on_reply_shared_reader_queue_matched()

```
template<typename TReq , typename TRep >
virtual void rti::queuing::NoOpQueueRequesterListener< TReq, TRep >::on_reply_shared_reader_↔
queue_matched (
    QueueRequester< TReq, TRep > & ,
    const dds::core::status::SubscriptionMatchedStatus & ) [inline], [virtual]
```

User callback.

See also

[QueueConsumerListener::on_shared_reader_queue_matched](#) (p. 1802)

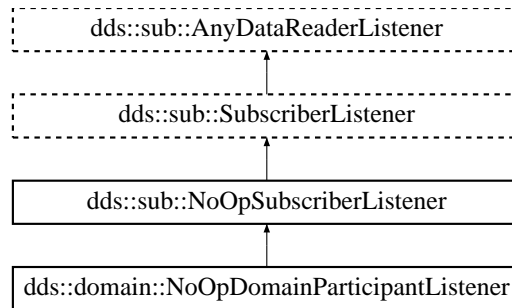

Implements [rti::queuing::QueueRequesterListener< TReq, TRep >](#) (p. 1853).

8.219 dds::sub::NoOpSubscriberListener Class Reference

A convenience implementation of **SubscriberListener** (p. 2128) where all methods are overridden to do nothing.

```
#include <dds/sub/SubscriberListener.hpp>
```

Inheritance diagram for dds::sub::NoOpSubscriberListener:

Public Member Functions

- virtual void **on_data_on_readers** (**Subscriber** &)
No-op.
- virtual void **on_requested_deadline_missed** (**AnyDataReader** &, const **dds::core::status::Requested↔DeadlineMissedStatus** &)
No-op.
- virtual void **on_requested_incompatible_qos** (**AnyDataReader** &, const **dds::core::status::Requested↔IncompatibleQosStatus** &)
No-op.
- virtual void **on_sample_rejected** (**AnyDataReader** &, const **dds::core::status::SampleRejectedStatus** &)
No-op.
- virtual void **on_liveliness_changed** (**AnyDataReader** &, const **dds::core::status::LivelinessChangedStatus** &)
No-op.
- virtual void **on_data_available** (**AnyDataReader** &)
No-op.
- virtual void **on_subscription_matched** (**AnyDataReader** &, const **dds::core::status::Subscription↔MatchedStatus** &)
No-op.
- virtual void **on_sample_lost** (**AnyDataReader** &, const **dds::core::status::SampleLostStatus** &)
No-op.

8.219.1 Detailed Description

A convenience implementation of **SubscriberListener** (p. 2128) where all methods are overridden to do nothing.

Most of the time, you can derive your listener from this class so you don't have to implement the methods you don't need.

8.219.2 Member Function Documentation

8.219.2.1 on_data_on_readers()

```
virtual void dds::sub::NoOpSubscriberListener::on_data_on_readers (
    Subscriber & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::SubscriberListener** (p. 2128).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1582).

8.219.2.2 on_requested_deadline_missed()

```
virtual void dds::sub::NoOpSubscriberListener::on_requested_deadline_missed (
    AnyDataReader & ,
    const dds::core::status::RequestedDeadlineMissedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 601).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1582).

8.219.2.3 on_requested_incompatible_qos()

```
virtual void dds::sub::NoOpSubscriberListener::on_requested_incompatible_qos (
    AnyDataReader & ,
    const dds::core::status::RequestedIncompatibleQosStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 601).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1582).

8.219.2.4 on_sample_rejected()

```
virtual void dds::sub::NoOpSubscriberListener::on_sample_rejected (
    AnyDataReader & ,
    const dds::core::status::SampleRejectedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 601).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1582).

8.219.2.5 on_liveliness_changed()

```
virtual void dds::sub::NoOpSubscriberListener::on_liveliness_changed (
    AnyDataReader & ,
    const dds::core::status::LivelinessChangedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 602).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1583).

8.219.2.6 on_data_available()

```
virtual void dds::sub::NoOpSubscriberListener::on_data_available (
    AnyDataReader & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 602).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1583).

8.219.2.7 on_subscription_matched()

```
virtual void dds::sub::NoOpSubscriberListener::on_subscription_matched (
    AnyDataReader & ,
    const dds::core::status::SubscriptionMatchedStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 602).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1583).

8.219.2.8 on_sample_lost()

```
virtual void dds::sub::NoOpSubscriberListener::on_sample_lost (
    AnyDataReader & ,
    const dds::core::status::SampleLostStatus & ) [inline], [virtual]
```

No-op.

Implements **dds::sub::AnyDataReaderListener** (p. 602).

Reimplemented in **dds::domain::NoOpDomainParticipantListener** (p. 1583).

8.220 dds::topic::NoOpTopicListener< T > Class Template Reference

A convenience implementation of **TopicListener** (p. 2212) where all methods are overridden to do nothing.

```
#include <dds/topic/TopicListener.hpp>
```

Inheritance diagram for dds::topic::NoOpTopicListener< T >:

Public Member Functions

- virtual void **on_inconsistent_topic** (**Topic**< T > &, const **dds::core::status::InconsistentTopicStatus** &)
No-op.

8.220.1 Detailed Description

```
template<typename T>
class dds::topic::NoOpTopicListener< T >
```

A convenience implementation of **TopicListener** (p. 2212) where all methods are overridden to do nothing.

8.220.2 Member Function Documentation

8.220.2.1 on_inconsistent_topic()

```
template<typename T >
virtual void dds::topic::NoOpTopicListener< T >::on_inconsistent_topic (
    Topic< T > & ,
    const dds::core::status::InconsistentTopicStatus & ) [inline], [virtual]
```

No-op.

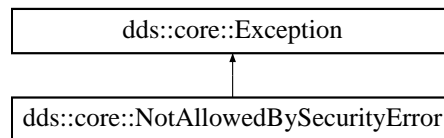

Implements `dds::topic::TopicListener< T >` (p.2213).

8.221 dds::core::NotAllowedBySecurityError Class Reference

Indicates that an operation on the DDS API fails because the security plugins do not allow it.

```
#include <Exception.hpp>
```

Inheritance diagram for `dds::core::NotAllowedBySecurityError`:

Public Member Functions

- virtual const char * **what** () const throw ()

*Access the message contained in this **NotAllowedBySecurityError** (p. 1600) exception.*

8.221.1 Detailed Description

Indicates that an operation on the DDS API fails because the security plugins do not allow it.

Inherits also from `std::logic_error`

An operation on the DDS API that fails because the security plugins do not allow it.

8.221.2 Member Function Documentation

8.221.2.1 what()

```
virtual const char * dds::core::NotAllowedBySecurityError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **NotAllowedBySecurityError** (p. 1600) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.222 dds::core::NotEnabledError Class Reference

A **NotEnabledError** (p. 1601) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1265) that is not yet enabled.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::NotEnabledError:

Public Member Functions

- virtual const char * **what** () const throw ()

*Access the message contained in this **NotEnabledError** (p. 1601) exception.*

8.222.1 Detailed Description

A **NotEnabledError** (p. 1601) is thrown when an operation is invoked on a **dds::core::Entity** (p. 1265) that is not yet enabled.

Inherits also from `std::logic_error`

8.222.2 Member Function Documentation

8.222.2.1 what()

```
virtual const char * dds::core::NotEnabledError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **NotEnabledError** (p. 1601) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.223 dds::core::NullReferenceError Class Reference

Indicates an attempt to access a null object.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::NullReferenceError:

Public Member Functions

- virtual const char * **what** () const throw ()
Get a description of the error.

8.223.1 Detailed Description

Indicates an attempt to access a null object.

8.223.2 Member Function Documentation

8.223.2.1 `what()`

```
virtual const char * dds::core::NullReferenceError::what ( ) const throw ( ) [virtual]
```

Get a description of the error.

Implements `dds::core::Exception` (p. 1292).

8.224 `dds::core::status::OfferedDeadlineMissedStatus` Class Reference

Information about the status `dds::core::status::StatusMask::offered_deadline_missed()` (p. 2086)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t total_count () const`
Total cumulative count of the number of times the `dds::pub::DataWriter` (p. 908) failed to write within its offered deadline.
- `int32_t total_count_change () const`
The incremental changes in `total_count` since the last time the listener was called or the status was read.
- `const dds::core::InstanceHandle last_instance_handle () const`
Handle to the last instance in the `dds::pub::DataWriter` (p. 908) for which an offered deadline was missed.

8.224.1 Detailed Description

Information about the status `dds::core::status::StatusMask::offered_deadline_missed()` (p. 2086)

Entity:

`dds::pub::DataWriter` (p. 908)

Listener:

`dds::pub::DataWriterListener` (p. 972)

The deadline that the `dds::pub::DataWriter` (p. 908) has committed through its `dds::core::policy::Deadline` (p. 1020) was not respected for a specific instance.

8.224.2 Member Function Documentation

8.224.2.1 total_count()

```
int32_t dds::core::status::OfferedDeadlineMissedStatus::total_count ( ) const [inline]
```

Total cumulative count of the number of times the **dds::pub::DataWriter** (p. 908) failed to write within its offered deadline.

Missed deadlines accumulate; that is, each deadline period the `total_count` will be incremented by one.

8.224.2.2 total_count_change()

```
int32_t dds::core::status::OfferedDeadlineMissedStatus::total_count_change ( ) const [inline]
```

The incremental changes in `total_count` since the last time the listener was called or the status was read.

8.224.2.3 last_instance_handle()

```
const dds::core::InstanceHandle dds::core::status::OfferedDeadlineMissedStatus::last_instance_↔  
handle ( ) const [inline]
```

Handle to the last instance in the **dds::pub::DataWriter** (p. 908) for which an offered deadline was missed.

8.225 dds::core::status::OfferedIncompatibleQoSStatus Class Reference

Information about the status **dds::core::status::StatusMask::offered_incompatible_qos()** (p. 2087)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t total_count () const`

*Total cumulative number of times the concerned **dds::pub::DataWriter** (p. 908) discovered a **dds::sub::DataReader** (p. 756) for the same **dds::topic::Topic** (p. 2178), common partition with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 908).*

- `int32_t total_count_change () const`

The incremental changes in `total_count` since the last time the listener was called or the status was read.

- `dds::core::policy::QoSPolicyId last_policy_id () const`

*The **dds::core::policy::QoSPolicyId** (p. 308) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*

- `const dds::core::policy::QoSPolicyCountSeq policies () const`

*A list containing for each policy the total number of times that the concerned **dds::pub::DataWriter** (p. 908) discovered a **dds::sub::DataReader** (p. 756) for the same **dds::topic::Topic** (p. 2178) and common partition with a requested QoS that is incompatible with that offered by the **dds::pub::DataWriter** (p. 908).*

8.225.1 Detailed Description

Information about the status `dds::core::status::StatusMask::offered_incompatible_qos()` (p. 2087)

Entity:

`dds::pub::DataWriter` (p. 908)

Listener:

`dds::pub::DataWriterListener` (p. 972)

The qos policy value was incompatible with what was requested.

8.225.2 Member Function Documentation

8.225.2.1 total_count()

```
int32_t dds::core::status::OfferedIncompatibleQosStatus::total_count ( ) const [inline]
```

Total cumulative number of times the concerned `dds::pub::DataWriter` (p. 908) discovered a `dds::sub::DataReader` (p. 756) for the same `dds::topic::Topic` (p. 2178), common partition with a requested QoS that is incompatible with that offered by the `dds::pub::DataWriter` (p. 908).

8.225.2.2 total_count_change()

```
int32_t dds::core::status::OfferedIncompatibleQosStatus::total_count_change ( ) const [inline]
```

The incremental changes in `total_count` since the last time the listener was called or the status was read.

8.225.2.3 last_policy_id()

```
dds::core::policy::QosPolicyId dds::core::status::OfferedIncompatibleQosStatus::last_policy_id ( ) const [inline]
```

The `dds::core::policy::QosPolicyId` (p. 308) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

8.225.2.4 policies()

```
const dds::core::policy::QosPolicyCountSeq dds::core::status::OfferedIncompatibleQosStatus←
::policies ( ) const [inline]
```

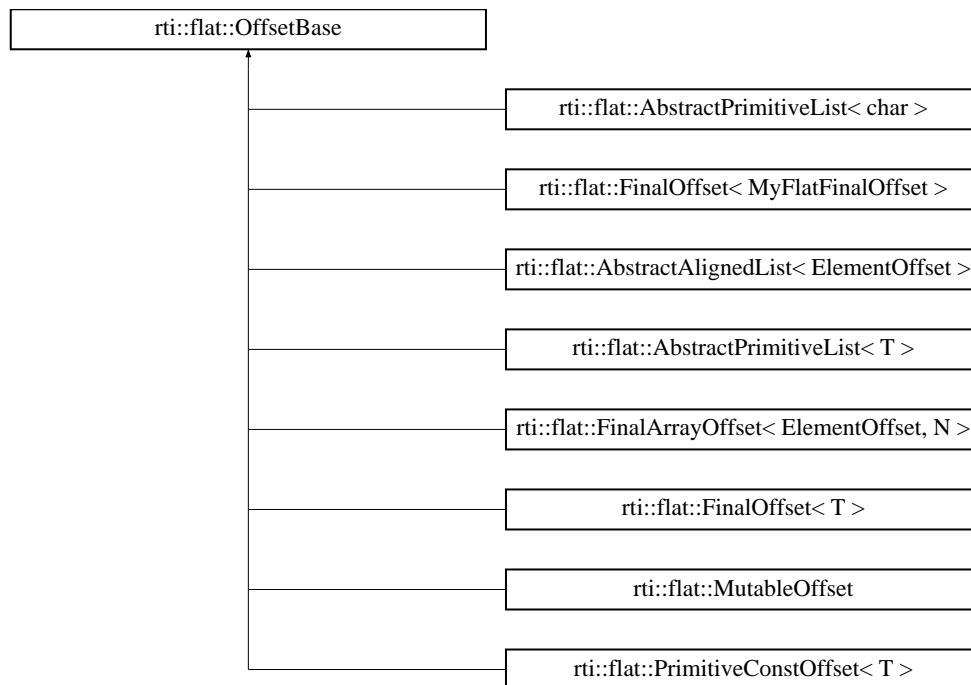

A list containing for each policy the total number of times that the concerned `dds::pub::DataWriter` (p. 908) discovered a `dds::sub::DataReader` (p. 756) for the same `dds::topic::Topic` (p. 2178) and common partition with a requested QoS that is incompatible with that offered by the `dds::pub::DataWriter` (p. 908).

8.226 rti::flat::OffsetBase Class Reference

Base class of all Offset types.

```
#include <Offset.hpp>
```

Inheritance diagram for `rti::flat::OffsetBase`:

Public Member Functions

- bool `is_null ()` const
Indicates whether this Offset doesn't point to a valid element.
- bool `is_cpp_compatible ()` const
Indicates whether `rti::flat::plain_cast()` (p. 217) is possible.
- const unsigned char * `get_buffer ()` const
Gets this member's position in the buffer.
- offset_t `get_buffer_size ()` const
Gets the size, in bytes, of this member in the buffer.

Friends

- bool **operator<** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.
- bool **operator>** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.
- bool **operator<=** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.
- bool **operator>=** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Compares two Offsets.
- bool **operator==** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Determines if two offsets point to the same position.
- bool **operator!=** (const **OffsetBase** &s1, const **OffsetBase** &s2)
Determines if two offsets point to different positions.

8.226.1 Detailed Description

Base class of all Offset types.

FlatData Offsets (p. 214)

8.226.2 Member Function Documentation

8.226.2.1 is_null()

```
bool rti::flat::OffsetBase::is_null ( ) const [inline]
```

Indicates whether this Offset doesn't point to a valid element.

Comparing this object with `nullptr` is equivalent to calling **is_null()** (p. 1607). For example:

```
MyFlatMutableOffset my_mutable = ...;
auto my_final_member = my_mutable.my_final();
if (my_final_member.is_null()) { ...member doesn't exist... }
// alternative syntax:
if (my_final_member == nullptr) {...}
```

See also

Offset Error Management (p. 216)

Referenced by **get_buffer()**.

8.226.2.2 is_cpp_compatible()

```
bool rti::flat::OffsetBase::is_cpp_compatible ( ) const [inline]
```

Indicates whether **rti::flat::plain_cast()** (p. 217) is possible.

Returns

True only if the data pointed to by this Offset can be **rti::flat::plain_cast()** (p. 217)

See also

rti::flat::plain_cast() (p. 217) for the requirements that a **type** (p. 1769) needs to meet

8.226.2.3 get_buffer()

```
const unsigned char * rti::flat::OffsetBase::get_buffer ( ) const [inline]
```

Gets this member's position in the buffer.

Note

This function should be used for debugging purposes only. To access the data in this Offset use the Offset accessor methods or, if this type allows it, **rti::flat::plain_cast()** (p. 217).

Returns the position within the **Sample** (p. 1981)'s buffer that this Offset points to.

See also

get_buffer_size() (p. 1608)

References **is_null()**.

Referenced by **rti::flat::StringOffset::get_string()**.

8.226.2.4 get_buffer_size()

```
offset_t rti::flat::OffsetBase::get_buffer_size ( ) const [inline]
```

Gets the size, in bytes, of this member in the buffer.

Returns the number of bytes that this member comprises after the position returned by **get_buffer()**.

Referenced by **rti::flat::AbstractAlignedList< ElementOffset >::begin()**, and **rti::flat::AbstractAlignedList< ElementOffset >::end()**.

8.226.3 Friends And Related Function Documentation

8.226.3.1 operator<

```
bool operator< (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position smaller than s2's.

8.226.3.2 operator>

```
bool operator> (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position greater than s2's.

8.226.3.3 operator<=

```
bool operator<= (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position equal to or smaller than s2's.

8.226.3.4 operator>=

```
bool operator>= (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Compares two Offsets.

Returns

True if s1 points to a position equal to or greater than s2's.

8.226.3.5 operator==

```
bool operator== (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Determines if two offsets point to the same position.

Returns

True if s1 points to the same position as s2.

8.226.3.6 operator!=

```
bool operator!= (
    const OffsetBase & s1,
    const OffsetBase & s2 ) [friend]
```

Determines if two offsets point to different positions.

Returns

True if s1 points to a different position than s2.

8.227 dds::core::optional< T > Class Template Reference

<<**value-type**>> (p. 152) Represents an object that may not contain a valid value

```
#include <dds/core/Optional.hpp>
```

Public Member Functions

- **optional** () **OMG_NOEXCEPT**
Create an unset optional object.
- **optional** (const T & **value**)
Create an optional object with a copy of a value.
- **optional** (T && **value**)
<<C++11>> (p. 155) Create an optional object moving a value
- **optional** (bool condition, const T & **value**)
Create an optional member conditionally set or unset.
- **optional** (bool condition, T && **value**)
<<C++11>> (p. 155) Creates an optional member conditionally set or unset by moving a value.
- **~optional** ()
Destroys the underlying object if it exists.
- void **set** (const T & **value**)
Assigns a copy of an object.
- void **set** (T && **value**)
<<C++11>> (p. 155) Assigns an object by moving it
- bool **is_set** () const **OMG_NOEXCEPT**
Checks if this optional instance contains a valid object.
- bool **has_value** () const **OMG_NOEXCEPT**
Checks if this optional instance contains a valid object.
- **operator bool** () const **OMG_NOEXCEPT**
*<<C++11>> (p. 155) Returns **has_value()** (p. 1615)*
- void **reset** ()
Destroys the underlying object and leaves this optional with an invalid (unset) value.
- const T & **value** () const
Retrieves the underlying object if it exists.
- T & **value** ()
Retrieves the underlying object if it exists.
- const T & **get** () const
Retrieves the underlying object if it exists.
- T & **get** ()
Retrieves the underlying object if it exists.
- const T * **get_ptr** () const
Returns &get() (p. 1617) if the object is initialized or NULL otherwise.
- T * **get_ptr** ()
Returns &get() (p. 1617) if the object is initialized or NULL otherwise.
- const T & **operator*** () const
- T & **operator*** ()
- const T * **operator->** () const
- T * **operator->** ()
- **optional**< T > & **operator=** (const **optional**< T > &other)
Assignment operator.
- **optional**< T > & **operator=** (**optional**< T > &&other) **OMG_NOEXCEPT**
<<C++11>> (p. 155) Move-assignment operator
- **optional**< T > & **operator=** (const T & **value**)
Assign a (valid) value.
- **optional**< T > & **operator=** (T && **value**)
Assign a (valid) value by moving an object.

Friends

- void **swap** (**optional**< T > &left, **optional**< T > &right) **OMG_NOEXCEPT**
Swaps the underlying objects.

Related Functions

(Note that these are not member functions.)

- template<typename T >
 bool **operator==** (const **optional**< T > &a, const **optional**< T > &b)
Compares two optional values.
- template<typename T >
 bool **operator!=** (const **optional**< T > &a, const **optional**< T > &b)
Compares two optional values.
- template<typename T >
 bool **operator==** (const **optional**< T > &optional_value, const T & **value**)
Compares an optional member and a value of the underlying type.

 bool **operator!=** (const T & **value**, const **optional**< T > &optional_value)
Compares an optional member and a value of the underlying type.
- template<typename T >
 std::ostream & **operator<<** (std::ostream &out, const **optional**< T > & **optional**)
*Applies operator<< to *optional or to the string "NULL" if !optional.has_value() (p. 1615).*

8.227.1 Detailed Description

```
template<typename T>
class dds::core::optional< T >
```

<< **value-type** >> (p. 152) Represents an object that may not contain a valid value

Template Parameters

<i>T</i>	The type of the actual object this <code>optional<T></code> wraps
----------	---

Members of an **IDL** (p. 395) type marked with the `@optional` tag map to this C++ type.

When an optional value has a valid value `has_value()` (p.1615) returns true and `operator*` returns a reference

to the actual object of type `T`. Otherwise `has_value()` (p. 1615) returns `false` and `operator*` throws `dds::core::PreconditionNotMetError` (p. 1669). To assign a value you can use the assignment operator.

An optional object has full **value-type semantics** (p. 152); copying an optional value copies the underlying object if it exists.

This type's API is similar to that of `std::optional`.

See also

Working with IDL types (p. 395)

Examples

Foo.hpp.

8.227.2 Constructor & Destructor Documentation

8.227.2.1 `optional()` [1/5]

```
template<typename T >
dds::core::optional< T >::optional ( ) [inline]
```

Create an unset optional object.

Postcondition

`!has_value()`

8.227.2.2 `optional()` [2/5]

```
template<typename T >
dds::core::optional< T >::optional (
    const T & value ) [inline]
```

Create an optional object with a copy of a value.

Postcondition

`has_value ()` (p. 1615) `&& *(*this) == value`

8.227.2.3 optional() [3/5]

```
template<typename T >
dds::core::optional< T >::optional (
    T && value ) [inline]
```

<<**C++11**>> (p. 155) Create an optional object moving a value

Postcondition

has_value() (p. 1615)

8.227.2.4 optional() [4/5]

```
template<typename T >
dds::core::optional< T >::optional (
    bool condition,
    const T & value ) [inline]
```

Create an optional member conditionally set or unset.

Parameters

<i>condition</i>	If true creates an optional member with <i>value</i> otherwise it creates an unset optional member
<i>value</i>	The value to set if condition is true

Postcondition

has_value() (p. 1615) == condition

8.227.2.5 optional() [5/5]

```
template<typename T >
dds::core::optional< T >::optional (
    bool condition,
    T && value ) [inline]
```

<<**C++11**>> (p. 155) Creates an optional member conditionally set or unset by moving a value.

Moves the value rather than copying it.

See also

optional(bool, const T&) (p. 1614)

8.227.2.6 ~optional()

```
template<typename T >
dds::core::optional< T >::~~ optional ( ) [inline]
```

Destroys the underlying object if it exists.

8.227.3 Member Function Documentation

8.227.3.1 set() [1/2]

```
template<typename T >
void dds::core::optional< T >::set (
    const T & value ) [inline]
```

Assigns a copy of an object.

[DEPRECATED] Use `operator=` instead.

8.227.3.2 set() [2/2]

```
template<typename T >
void dds::core::optional< T >::set (
    T && value ) [inline]
```

<<**C++11**>> (p. 155) Assigns an object by moving it

[DEPRECATED] Use `operator=` instead.

8.227.3.3 is_set()

```
template<typename T >
bool dds::core::optional< T >::is_set ( ) const [inline]
```

Checks if this optional instance contains a valid object.

[DEPRECATED] Use `has_value()` (p. 1615)

8.227.3.4 has_value()

```
template<typename T >
bool dds::core::optional< T >::has_value ( ) const [inline]
```

Checks if this optional instance contains a valid object.

If `my_optional.has_value()` is true, then `*my_optional` returns a valid object

Referenced by `dds::core::optional< T >::operator<<()`, and `dds::core::optional< T >::operator==()`.

8.227.3.5 operator bool()

```
template<typename T >
dds::core::optional< T >::operator bool ( ) const [inline], [explicit]
```

<<**C++11**>> (p. 155) Returns `has_value()` (p. 1615)

8.227.3.6 reset()

```
template<typename T >
void dds::core::optional< T >::reset ( ) [inline]
```

Destroys the underlying object and leaves this optional with an invalid (unset) value.

Postcondition

`!has_value()`

8.227.3.7 value() [1/2]

```
template<typename T >
const T & dds::core::optional< T >::value ( ) const [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value().
---	------------------

8.227.3.8 value() [2/2]

```
template<typename T >
T & dds::core::optional< T >::value ( ) [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value().
---	------------------

8.227.3.9 get() [1/2]

```
template<typename T >
const T & dds::core::optional< T >::get ( ) const [inline]
```

Retrieves the underlying object if it exists.

[DEPRECATED] Use `value()` (p. 1617) or `operator*`

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value().
---	------------------

Referenced by `dds::core::optional< T >::operator<<()`, and `dds::core::optional< T >::operator==(())`.

8.227.3.10 get() [2/2]

```
template<typename T >
T & dds::core::optional< T >::get ( ) [inline]
```

Retrieves the underlying object if it exists.

[DEPRECATED] Use `value()` (p. 1617) or `operator*`

Exceptions

<code>dds::core::PreconditionNotMetError</code> (p. 1669)	if !has_value().
---	------------------

8.227.3.11 `get_ptr()` [1/2]

```
template<typename T >
const T * dds::core::optional< T >::get_ptr ( ) const [inline]
```

Returns `&get()` (p. 1617) if the object is initialized or NULL otherwise.

[DEPRECATED]

8.227.3.12 `get_ptr()` [2/2]

```
template<typename T >
T * dds::core::optional< T >::get_ptr ( ) [inline]
```

Returns `&get()` (p. 1617) if the object is initialized or NULL otherwise.

[DEPRECATED]

8.227.3.13 `operator*()` [1/2]

```
template<typename T >
const T & dds::core::optional< T >::operator* ( ) const [inline]
```

Get the value, without checking if it exists

Precondition

`has_value()` (p. 1615), otherwise this operation has undefined behavior. See `value()` (p. 1617).

8.227.3.14 `operator*()` [2/2]

```
template<typename T >
T & dds::core::optional< T >::operator* ( ) [inline]
```

Get the value, without checking if it exists

Precondition

`has_value()` (p. 1615), otherwise this operation has undefined behavior. See `value()` (p. 1617).

8.227.3.15 `operator->()` [1/2]

```
template<typename T >
const T * dds::core::optional< T >::operator-> ( ) const [inline]
```

Get the value.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value()
---	-----------------

8.227.3.16 operator->() [2/2]

```
template<typename T >
T * dds::core::optional< T >::operator-> ( ) [inline]
```

Get the value.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value()
---	-----------------

8.227.3.17 operator=() [1/4]

```
template<typename T >
optional< T > & dds::core::optional< T >::operator= (
    const optional< T > & other ) [inline]
```

Assignment operator.

Copies *other if it exists.

8.227.3.18 operator=() [2/4]

```
template<typename T >
optional< T > & dds::core::optional< T >::operator= (
    optional< T > && other ) [inline]
```

<<**C++11**>> (p. 155) Move-assignment operator

Moves *other if it exists.

8.227.3.19 operator=() [3/4]

```
template<typename T >
optional< T > & dds::core::optional< T >::operator= (
    const T & value ) [inline]
```

Assign a (valid) value.

Parameters

<i>value</i>	The value to assign to this optional member
--------------	---

Postcondition

```
*(*this) == value
```

8.227.3.20 operator=() [4/4]

```
template<typename T >  
optional< T > & dds::core::optional< T >::operator= (  
    T && value ) [inline]
```

Assign a (valid) value by moving an object.

Parameters

<i>value</i>	The value to move into this optional member
--------------	---

Postcondition

```
has_value() (p. 1615)
```

8.227.4 Friends And Related Function Documentation**8.227.4.1 swap**

```
template<typename T >  
void swap (  
    optional< T > & left,  
    optional< T > & right ) [friend]
```

Swaps the underlying objects.

This operation is always O(1).

8.227.4.2 operator==() [1/3]

```
template<typename T >
bool operator==(
    const optional< T > & a,
    const optional< T > & b ) [related]
```

Compares two optional values.

Returns

true if both are unset or both are set and *a == *b.

Examples

Foo.hpp.

References **dds::core::optional< T >::get()**, and **dds::core::optional< T >::has_value()**.

8.227.4.3 operator!=() [1/3]

```
template<typename T >
bool operator!=(
    const optional< T > & a,
    const optional< T > & b ) [related]
```

Compares two optional values.

Returns

false if both are unset or both are set and *a == *b.

Examples

Foo.hpp.

8.227.4.4 operator==() [2/3]

```
template<typename T >
bool operator==(
    const optional< T > & optional_value,
    const T & value ) [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return true if optional_value is set and *optional_value == value

References **dds::core::optional< T >::get()**, and **dds::core::optional< T >::has_value()**.

8.227.4.5 operator==() [3/3]

```
template<typename T >
bool operator== (
    const T & value,
    const optional< T > & optional_value ) [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return true if optional_value is set and *optional_value == value

8.227.4.6 operator!=() [2/3]

```
template<typename T >
bool operator!= (
    const optional< T > & optional_value,
    const T & value ) [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return false if optional_value is set and *optional_value == value

8.227.4.7 operator!=() [3/3]

```
template<typename T >
bool operator!= (
    const T & value,
    const optional< T > & optional_value ) [related]
```

Compares an optional member and a value of the underlying type.

Returns

Return false if optional_value is set and *optional_value == value

8.227.4.8 operator<<()

```
template<typename T >
std::ostream & operator<< (
    std::ostream & out,
    const optional< T > & optional ) [related]
```

Applies operator<< to *optional or to the string "NULL" if !optional.has_value() (p.1615).

References dds::core::optional< T >::get(), and dds::core::optional< T >::has_value().

8.228 rti::core::optional_value< T > Class Template Reference

<<extension>> (p. 156) Represents a value that can be initialized or not

```
#include <OptionalValue.hpp>
```

Public Member Functions

- optional_value ()
Creates an uninitialized value.
- optional_value (const T & value)
Creates an instance with a value.
- optional_value (bool condition, const T & value)
Conditionally creates an instance that can be uninitialized or initialized with a value.
- optional_value (const optional_value< T > &other)
Copy constructor.

Swaps the underlying objects.

8.228.1 Detailed Description

```
template<typename T>
class rti::core::optional_value< T >
```

<<*extension*>> (p. 156) Represents a value that can be initialized or not

This class is similar to **dds::core::optional** (p. 1610) and `std::optional`.

They have different implementations. **dds::core::optional** (p. 1610) is only used in IDL-generated types, while **rti::core::optional_value** (p. 1623) is used in parts of the API.

8.228.2 Constructor & Destructor Documentation

8.228.2.1 optional_value() [1/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value ( ) [inline]
```

Creates an uninitialized value.

8.228.2.2 optional_value() [2/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value (
    const T & value ) [inline]
```

Creates an instance with a value.

8.228.2.3 optional_value() [3/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value (
    bool condition,
    const T & value ) [inline]
```

Conditionally creates an instance that can be uninitialized or initialized with a value.

Parameters

<i>condition</i>	If it is true it assigns <i>value</i> , otherwise this optional_value (p. 1623) is uninitialized
<i>value</i>	The value to use if <i>condition</i> is true.

References **rti::core::optional_value< T >::value()**.

8.228.2.4 optional_value() [4/4]

```
template<typename T >
rti::core::optional_value< T >::optional_value (
    const optional_value< T > & other ) [inline]
```

Copy constructor.

This **optional_value** (p. 1623) will be initialized only if *other* is initialized.

References **rti::core::optional_value< T >::get()**, and **rti::core::optional_value< T >::has_value()**.

8.228.3 Member Function Documentation

8.228.3.1 is_set()

```
template<typename T >
bool rti::core::optional_value< T >::is_set ( ) const [inline]
```

Returns true only if the value is initialized.

[DEPRECATED] Use **has_value ()** (p. 1625)

8.228.3.2 has_value()

```
template<typename T >
bool rti::core::optional_value< T >::has_value ( ) const [inline]
```

Returns true only if the value is initialized.

Referenced by **rti::core::optional_value< T >::optional_value()**, and **rti::core::optional_value< T >::value()**.

8.228.3.3 operator bool()

```
template<typename T >
rti::core::optional_value< T >::operator bool ( ) const [inline], [explicit]
```

<<**C++11**>> (p. 155) Returns **has_value()** (p. 1625)

8.228.3.4 reset()

```
template<typename T >
void rti::core::optional_value< T >::reset ( ) [inline]
```

After calling this function, this **optional_value** (p. 1623) is not set.

8.228.3.5 value() [1/2]

```
template<typename T >
const T & rti::core::optional_value< T >::value ( ) const [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value().
---	------------------

References **rti::core::optional_value< T >::has_value()**.

Referenced by **rti::core::optional_value< T >::get()**, **rti::core::optional_value< T >::operator->()**, and **rti::core::optional_value< T >::optional_value()**.

8.228.3.6 value() [2/2]

```
template<typename T >
T & rti::core::optional_value< T >::value ( ) [inline]
```

Retrieves the underlying object if it exists.

This operation, unlike `operator*` throws an exception if the underlying object doesn't exist.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value().
---	------------------

References [rti::core::optional_value< T >::has_value\(\)](#).**8.228.3.7 get()** [1/2]

```
template<typename T >
const T & rti::core::optional_value< T >::get ( ) const [inline]
```

Retrieves the underlying object if it exists.

[DEPRECATED] Use [value\(\)](#) (p. 1626) or [operator*](#)

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	if !has_value().
---	------------------

8.230.1 Detailed Description

Specifies whether it is allowed for multiple **dds::pub::DataWriter** (p. 908)'s to write the same instance of the data and if so, how these modifications should be arbitrated.

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::StatusMask**↔
::requested_incompatible_qos() (p. 2088)

Properties:

RxO (p. 307) = YES

Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

See also

OWNERSHIP_STRENGTH (p. 330)

8.230.2 Usage

Along with the **OWNERSHIP_STRENGTH** (p. 330), this QoS policy specifies if **dds::sub::DataReader** (p. 756) entities can receive updates to the same instance (identified by its key) from multiple **dds::pub::DataWriter** (p. 908) entities at the same time.

There are two kinds of ownership, selected by the setting of the `kind`: SHARED and EXCLUSIVE.

8.230.2.1 SHARED ownership

dds::core::policy::OwnershipKind_def::SHARED (p. 1637) indicates that RTI Connext does not enforce unique ownership for each instance. In this case, multiple writers can update the same data type instance. The subscriber to the **dds::topic::Topic** (p. 2178) will be able to access modifications from all **dds::pub::DataWriter** (p. 908) objects, subject to the settings of other QoS that may filter particular samples (e.g. the **TIME_BASED_FILTER** (p. 338) or **HISTORY** (p. 324) policy). In any case, there is no "filtering" of modifications made based on the identity of the **dds::pub::Data**↔
Writer (p. 908) that causes the modification.

8.230.2.2 EXCLUSIVE ownership

dds::core::policy::OwnershipKind_def::EXCLUSIVE (p. 1637) indicates that each instance of a data type can only be modified by one **dds::pub::DataWriter** (p. 908). In other words, at any point in time, a single **dds::pub::DataWriter** (p. 908) owns each instance and is the only one whose modifications will be visible to the **dds::sub::DataReader** (p. 756) objects. The owner is determined by selecting the **dds::pub::DataWriter** (p. 908) with the highest value of the **dds::core::policy::OwnershipStrength::value** (p. 1639) that is currently alive, as defined by the **LIVELINESS** (p. 326) policy, and has not violated its **DEADLINE** (p. 316) contract with regards to the data instance.

Ownership (p. 1630) can therefore change as a result of:

- a **dds::pub::DataWriter** (p. 908) in the system with a higher value of the strength that modifies the instance,
- a change in the strength value of the **dds::pub::DataWriter** (p. 908) that owns the instance, and
- a change in the liveliness of the **dds::pub::DataWriter** (p. 908) that owns the instance.
- a deadline with regards to the instance that is missed by the **dds::pub::DataWriter** (p. 908) that owns the instance.

The behavior of the system is as if the determination was made independently by each **dds::sub::DataReader** (p. 756). Each **dds::sub::DataReader** (p. 756) may detect the change of ownership at a different time. It is not a requirement that at a particular point in time all the **dds::sub::DataReader** (p. 756) objects for that **dds::topic::Topic** (p. 2178) have a consistent picture of who owns each instance.

It is also not a requirement that the **dds::pub::DataWriter** (p. 908) objects are aware of whether they own a particular instance. There is no error or notification given to a **dds::pub::DataWriter** (p. 908) that modifies an instance it does not currently own.

The requirements are chosen to (a) preserve the decoupling of publishers and subscriber, and (b) allow the policy to be implemented efficiently.

It is possible that multiple **dds::pub::DataWriter** (p. 908) objects with the same strength modify the same instance. If this occurs RTI Connex will pick one of the **dds::pub::DataWriter** (p. 908) objects as the owner. It is not specified how the owner is selected. However, the algorithm used to select the owner guarantees that all **dds::sub::DataReader** (p. 756) objects will make the same choice of the particular **dds::pub::DataWriter** (p. 908) that is the owner. It also guarantees that the owner remains the same until there is a change in strength, liveliness, the owner misses a deadline on the instance, or a new **dds::pub::DataWriter** (p. 908) with higher same strength, or a new **dds::pub::DataWriter** (p. 908) with same strength that should be deemed the owner according to the policy of the Service, modifies the instance.

Exclusive ownership is on an instance-by-instance basis. That is, a subscriber can receive values written by a lower strength **dds::pub::DataWriter** (p. 908) as long as they affect instances whose values have not been set by the higher-strength **dds::pub::DataWriter** (p. 908).

8.230.3 Compatibility

The value of the **dds::core::policy::OwnershipKind_def** (p. 1636) offered must exactly match the one requested or else they are considered incompatible.

8.230.4 Relationship between registration, liveness and ownership

The need for registering/unregistering instances stems from two use cases:

- **Ownership** (p. 1630) resolution on redundant systems
- Detection of loss in topological connectivity

These two use cases also illustrate the semantic differences between the **dds::pub::DataWriter::unregister_instance** (p. 930) and **dds::pub::DataWriter::dispose_instance()** (p. 932).

8.230.4.1 Ownership Resolution on Redundant Systems

It is expected that users may use DDS to set up redundant systems where multiple **dds::pub::DataWriter** (p. 908) entities are "capable" of writing the same instance. In this situation, the **dds::pub::DataWriter** (p. 908) entities are configured such that:

- Either both are writing the instance "constantly"
- Or else they use some mechanism to classify each other as "primary" and "secondary", such that the primary is the only one writing, and the secondary monitors the primary and only writes when it detects that the primary "writer" is no longer writing.

Both cases above use the **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1637) and arbitrate themselves by means of the **dds::core::policy::OwnershipStrength** (p. 1637). Regardless of the scheme, the desired behavior from the **dds::sub::DataReader** (p. 756) point of view is that **dds::sub::DataReader** (p. 756) normally receives data from the primary unless the "primary" writer stops writing, in which case the **dds::sub::DataReader** (p. 756) starts to receive data from the secondary **dds::pub::DataWriter** (p. 908).

This approach requires some mechanism to detect that a **dds::pub::DataWriter** (p. 908) (the primary) is no longer "writing" the data as it should. There are several reasons why this may happen and all must be detected (but not necessarily distinguished):

crash The writing process is no longer running (e.g. the whole application has crashed)

connectivity loss Connectivity to the writing application has been lost (e.g. network disconnection)

application fault The application logic that was writing the data is faulty and has stopped calling **dds::pub::DataWriter::write()** (p. 918).

Arbitrating from a **dds::pub::DataWriter** (p. 908) to one of a higher strength is simple and the decision can be taken autonomously by the **dds::sub::DataReader** (p. 756). Switching ownership from a higher strength **dds::pub::DataWriter** (p. 908) to one of a lower strength **dds::pub::DataWriter** (p. 908) requires that the **dds::sub::DataReader** (p. 756) can make a determination that the stronger **dds::pub::DataWriter** (p. 908) is "no longer writing the instance".

8.230.4.1.1 Case where the data is periodically updated This determination is reasonably simple when the data is being written periodically at some rate. The `dds::pub::DataWriter` (p. 908) simply states its offered `dds::core::policy::Deadline` (p. 1020) (maximum interval between updates) and the `dds::sub::DataReader` (p. 756) automatically monitors that the `dds::pub::DataWriter` (p. 908) indeed updates the instance at least once per `dds::core::policy::Deadline::period` (p. 1022). If the deadline is missed, the `dds::sub::DataReader` (p. 756) considers the `dds::pub::DataWriter` (p. 908) "not alive" and automatically gives ownership to the next highest-strength `dds::pub::DataWriter` (p. 908) that *is* alive.

8.230.4.1.2 Case where data is not periodically updated The case where the `dds::pub::DataWriter` (p. 908) is not writing data periodically is also a very important use-case. Since the instance is not being updated at any fixed period, the "deadline" mechanism cannot be used to determine ownership. The liveliness solves this situation. **Ownership** (p. 1630) is maintained while the `dds::pub::DataWriter` (p. 908) is "alive" and for the `dds::pub::DataWriter` (p. 908) to be alive it must fulfill its `dds::core::policy::Liveliness` (p. 1389) contract. The different means to renew liveliness (automatic, manual) combined by the implied renewal each time data is written handle the three conditions above [crash], [connectivity loss], and [application fault]. Note that to handle [application fault], `LIVELINESS` must be `dds::core::policy::LivelinessKind::MANUAL_BY_TOPIC`. The `dds::pub::DataWriter` (p. 908) can retain ownership by periodically writing data or else calling `assert_liveliness` if it has no data to write. Alternatively if only protection against [crash] or [connectivity loss] is desired, it is sufficient that some task on the `dds::pub::DataWriter` (p. 908) process periodically writes data or calls `dds::domain::DomainParticipant::assert_liveliness` (p. 1091). However, this scenario requires that the `dds::sub::DataReader` (p. 756) knows what instances are being "written" by the `dds::pub::DataWriter` (p. 908). That is the only way that the `dds::sub::DataReader` (p. 756) deduces the ownership of specific instances from the fact that the `dds::pub::DataWriter` (p. 908) is still "alive". Hence the need for the `dds::pub::DataWriter` (p. 908) to "register" and "unregister" instances. Note that while "registration" can be done lazily the first time the `dds::pub::DataWriter` (p. 908) writes the instance, "unregistration," in general, cannot. Similar reasoning will lead to the fact that unregistration will also require a message to be sent to the `dds::sub::DataReader` (p. 756).

8.230.4.2 Detection of Loss in Topological Connectivity

There are applications that are designed in such a way that their correct operation requires some minimal topological connectivity, that is, the writer needs to have a minimum number of readers or alternatively the reader must have a minimum number of writers.

A common scenario is that the application does not start doing its logic until it knows that some specific writers have the minimum configured readers (e.g. the alarm monitor is up).

A *more* common scenario is that the application logic will wait until some writers appear that can provide some needed source of information (e.g. the raw sensor data that must be processed).

Furthermore, once the application is running it is a requirement that this minimal connectivity (from the source of the data) is monitored and the application informed if it is ever lost. For the case where data is being written periodically, the `dds::core::policy::Deadline` (p. 1020) and the `on_deadline_missed` listener provides the notification. The case where data is not periodically updated requires the use of the `dds::core::policy::Liveliness` (p. 1389) in combination with `register_instance/unregister_instance` to detect whether the "connectivity" has been lost, and the notification is provided by means of `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361).

In terms of the required mechanisms, the scenario is very similar to the case of maintaining ownership. In both cases, the reader needs to know whether a writer is still "managing the current value of an instance" even though it is not continually writing it and this knowledge requires the writer to keep its liveliness plus some means to know which instances the writer is currently "managing" (i.e. the registered instances).

8.230.4.3 Semantic Difference between unregister_instance and dispose

dds::pub::DataWriter::dispose_instance() (p. 932) is semantically different from **dds::pub::DataWriter::unregister_instance** (p. 930). **dds::pub::DataWriter::dispose_instance()** (p. 932) indicates that the data instance no longer exists (e.g. a track that has disappeared, a simulation entity that has been destroyed, a record entry that has been deleted, etc.) whereas **dds::pub::DataWriter::unregister_instance** (p. 930) indicates that the writer is no longer taking responsibility for updating the value of the instance.

Deleting a **dds::pub::DataWriter** (p. 908) is equivalent to unregistering all the instances it was writing, but is *not* the same as "disposing" all the instances.

For a **dds::topic::Topic** (p. 2178) with **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1637), if the current owner of an instance *disposes* it, the readers accessing the instance will see the instance_state as being "DISPOSED" and not see the values being written by the weaker writer (even after the stronger one has disposed the instance). This is because the **dds::pub::DataWriter** (p. 908) that owns the instance is saying that the instance no longer exists (e.g. the master of the database is saying that a record has been deleted) and thus the readers should see it as such.

For a **dds::topic::Topic** (p. 2178) with **dds::core::policy::OwnershipKind_def::EXCLUSIVE** (p. 1637), if the current owner of an instance *unregisters* it, then it will relinquish ownership of the instance and thus the readers may see the value updated by another writer (which will then become the owner). This is because the owner said that it no longer will be providing values for the instance and thus another writer can take ownership and provide those values.

8.230.5 Constructor & Destructor Documentation

8.230.5.1 Ownership() [1/2]

```
dds::core::policy::Ownership::Ownership ( ) [inline]
```

Creates an ownership policy set to shared.

8.230.5.2 Ownership() [2/2]

```
dds::core::policy::Ownership::Ownership (
    dds::core::policy::OwnershipKind the_kind ) [inline], [explicit]
```

Creates an instance with the specified ownership kind.

8.230.6 Member Function Documentation

8.230.6.1 kind() [1/2]

```
Ownership & dds::core::policy::Ownership::kind (
    dds::core::policy::OwnershipKind the_kind ) [inline]
```

Sets the ownership kind.

[default] `dds::core::policy::OwnershipKind_def::SHARED` (p. 1637)

8.230.6.2 kind() [2/2]

```
dds::core::policy::OwnershipKind dds::core::policy::Ownership::kind ( ) const [inline]
```

Getter (see setter with the same name)

8.230.6.3 Exclusive()

```
static Ownership dds::core::policy::Ownership::Exclusive ( ) [inline], [static]
```

Creates a **Ownership** (p. 1630) instance with exclusive kind.

8.230.6.4 Shared()

```
static Ownership dds::core::policy::Ownership::Shared ( ) [inline], [static]
```

Creates a **Ownership** (p. 1630) instance with shared kind.

8.231 dds::core::policy::OwnershipKind_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `OwnershipKind`.

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
 SHARED ,
 EXCLUSIVE }

The underlying enum type.

8.231.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `OwnershipKind`.

8.231.2 Member Enumeration Documentation

8.231.2.1 type

```
enum dds::core::policy::OwnershipKind_def::type
```

The underlying `enum` type.

Enumerator

SHARED	[default] Indicates shared ownership for each instance. Multiple writers are allowed to update the same instance and all the updates are made available to the readers. In other words there is no concept of an owner for the instances. This is the default behavior if the OWNERSHIP (p. 329) policy is not specified or supported.
EXCLUSIVE	Indicates each instance can only be owned by one <code>dds::pub::DataWriter</code> (p. 908), but the owner of an instance can change dynamically. The selection of the owner is controlled by the setting of the OWNERSHIP_STRENGTH (p. 330) policy. The owner is always set to be the highest-strength <code>dds::pub::DataWriter</code> (p. 908) object among the ones currently active (as determined by the LIVELINESS (p. 326)).

8.232 dds::core::policy::OwnershipStrength Class Reference

Specifies the value of the strength used to arbitrate among multiple `dds::pub::DataWriter` (p. 908) objects that attempt to modify the same instance of a data type (identified by its `dds::topic::Topic` (p. 2178) and key).

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **OwnershipStrength** ()
Creates an instance with the default strength (0)
- **OwnershipStrength** (int32_t strength)
Creates an instance with the specified strength value.
- **OwnershipStrength & value** (int32_t strength)
Sets the ownership strength to arbitrate among multiple writers.
- int32_t **value** () const
Getter (see setter with the same name)

8.232.1 Detailed Description

Specifies the value of the strength used to arbitrate among multiple `dds::pub::DataWriter` (p. 908) objects that attempt to modify the same instance of a data type (identified by its `dds::topic::Topic` (p. 2178) and key).

This policy only applies if the **OWNERSHIP** (p. 329) policy is of kind `dds::core::policy::OwnershipKind_def::EXCLUSIVE` (p. 1637).

Entity:

`dds::pub::DataWriter` (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **YES** (p. 307)

The value of the **OWNERSHIP_STRENGTH** (p. 330) is used to determine the ownership of a data instance (identified by the key). The arbitration is performed by the `dds::sub::DataReader` (p. 756).

8.233.1 Detailed Description

Entry created when a **dds::domain::DomainParticipant** (p. 1079) is discovered.

8.233.2 Member Function Documentation

8.233.2.1 TParticipantBuiltinTopicData()

```
dds::topic::ParticipantBuiltinTopicData::TParticipantBuiltinTopicData ( ) [inline]
```

Create a default **ParticipantBuiltinTopicData** (p. 1639).

8.233.2.2 key()

```
const dds::topic::BuiltinTopicKey & dds::topic::ParticipantBuiltinTopicData::key ( ) const [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

8.233.2.3 user_data()

```
const dds::core::policy::UserData & dds::topic::ParticipantBuiltinTopicData::user_data ( ) const [inline]
```

Get the **dds::core::policy::UserData** (p.2292) policy of the corresponding **dds::domain::DomainParticipant** (p.1079).

Returns

The UserData policy

8.233.2.4 property()

```
const rti::core::policy::Property & property ( ) const
```

<<**extension**>> (p. 156) Get the name-value pair properties to be stored with **dds::domain::DomainParticipant**

Returns

The name-value pair properties that were propagated from the corresponding **dds::domain::DomainParticipant** (p.1079)

8.233.2.5 rtps_protocol_version()

```
const rti::core::ProtocolVersion & rtps_protocol_version ( ) const
```

<<**extension**>> (p. 156) Get the version number of the RTPS wire protocol used.

Returns

The protocol version.

8.233.2.6 rtps_vendor_id()

```
const rti::core::VendorId & rtps_vendor_id ( ) const
```

<<*extension*>> (p. 156) Get the ID of the vendor implementing the RTPS wire protocol.

Returns

The vendor id.

8.233.2.7 dds_builtin_endpoints()

```
uint32_t dds_builtin_endpoints ( ) const
```

<<*extension*>> (p. 156) Bitmap of builtin endpoints supported by the participant

Each bit indicates a builtin endpoint that may be available on the participant for use in discovery.

8.233.2.8 default_unicast_locators()

```
const dds::core::vector< rti::core::Locator > & default_unicast_locators ( ) const
```

<<*extension*>> (p. 156) Get the unicast locators used when individual entities do not specify unicast locators.

Returns

A sequence of the default unicast locators used

8.233.2.9 partition()

```
const dds::core::policy::Partition & partition ( ) const
```

<<*extension*>> (p. 156) Get the Partition QoS Policy

Returns

The Partition QoS policy

8.233.2.10 trust_protection_info()

```
const rti::topic::trust::ParticipantTrustProtectionInfo & trust_protection_info ( ) const
```

<<*extension*>> (p. 156) Trust plugins information associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two DomainParticipants will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

8.233.2.11 trust_algorithm_info()

```
const rti::topic::trust::ParticipantTrustAlgorithmInfo & trust_algorithm_info ( ) const
```

<<*extension*>> (p. 156) Trust plugins algorithms associated with the discovered DomainParticipant.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged DomainParticipant data and metadata. trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two DomainParticipants will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the DomainParticipant is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

8.233.2.12 product_version()

```
const rti::core::ProductVersion & product_version ( ) const
```

<<*extension*>> (p. 156) Get the current version for RTI Connex.

Returns

The RTI Connex version being used

8.233.2.13 participant_name()

```
const rti::core::policy::EntityName & participant_name ( ) const
```

<<*extension*>> (p. 156) Get the participant name and role name.

Returns

The **rti::core::policy::EntityName** (p. 1275) QoS policy for the corresponding **dds::domain::DomainParticipant** (p. 1079).

8.233.2.14 domain_id()

```
int32_t domain_id ( ) const
```

<<*extension*>> (p. 156) Get the domain ID associated with the discovered **dds::domain::DomainParticipant** (p. 1079).

Returns

The domain id

Examples

Foo_publisher.cxx, and **Foo_subscriber.cxx**.

8.233.2.15 transport_info()

```
const rti::core::TransportInfoSeq & transport_info ( ) const
```

<<*extension*>> (p. 156) Get the sequence of **rti::core::TransportInfo** (p. 2245) containing information about each of the installed transports of the discovered **dds::domain::DomainParticipant** (p. 1079).

This parameter contains a sequence of **rti::core::TransportInfo** (p. 2245) containing the `class_id` and `message_↔size_max` for all installed transports of the discovered participant. The maximum number of **rti::core::TransportInfo** (p. 2245) that will be stored in this sequence is controlled by the DomainParticipant's resource limit **rti::core::policy::↔DomainParticipantResourceLimits::transport_info_list_max_length** (p. 1177).

Returns

The sequence of transport infos

8.233.2.16 partial_configuration()

```
DDS_Boolean partial_configuration ( ) const
```

<<**extension**>> (p. 156) Get the value of partial_configuration in the **ParticipantBuiltinTopicData** (p. 1639). This will be TRUE if the **ParticipantBuiltinTopicData** (p. 1639) only contains bootstrapping information.

Returns

The value of partial_configuration

8.233.2.17 reachability_lease_duration()

```
const dds::core::Duration & reachability_lease_duration ( ) const
```

<<**extension**>> (p. 156) Get the reachability lease duration.

8.233.2.18 vendor_builtin_endpoints()

```
uint32_t vendor_builtin_endpoints ( ) const
```

<<**extension**>> (p. 156) Bitmap of vendor-specific builtin endpoints supported by the participant

8.234 rti::topic::trust::ParticipantTrustAlgorithmInfo Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Trust Plugins algorithm information associated with the discovered DomainParticipant.

```
#include <rti/topic/trust/ParticipantTrustAlgorithmInfo.hpp>
```

Public Member Functions

- **ParticipantTrustAlgorithmInfo** ()=default
Create an instance with the default Trust Algorithm Info associated with the discovered DomainParticipant.
- **ParticipantTrustSignatureAlgorithmInfo** **signature** () const
Get the Trust Plugins algorithms for validation of data and metadata exchanged by the DomainParticipant.
- **ParticipantTrustKeyEstablishmentAlgorithmInfo** **key_establishment** () const
Get the Trust Plugins algorithms for transformation of data and metadata exchanged by the DomainParticipant.
- **ParticipantTrustInterceptorAlgorithmInfo** **interceptor** () const
Get the Trust Plugins algorithms for interception of data and metadata exchanged by the DomainParticipant.

8.234.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Trust Plugins algorithm information associated with the discovered DomainParticipant.

8.234.2 Constructor & Destructor Documentation

8.234.2.1 ParticipantTrustAlgorithmInfo()

```
rti::topic::trust::ParticipantTrustAlgorithmInfo::ParticipantTrustAlgorithmInfo ( ) [default]
```

Create an instance with the default Trust Algorithm Info associated with the discovered DomainParticipant.

The meaning of this field may vary depending on what Trust Plugins the DomainParticipant is using.

8.234.3 Member Function Documentation

8.234.3.1 signature()

```
ParticipantTrustSignatureAlgorithmInfo rti::topic::trust::ParticipantTrustAlgorithmInfo::signature  
( ) const [inline]
```

Get the Trust Plugins algorithms for validation of data and metadata exchanged by the DomainParticipant.

8.234.3.2 key_establishment()

```
ParticipantTrustKeyEstablishmentAlgorithmInfo rti::topic::trust::ParticipantTrustAlgorithmInfo↔  
::key_establishment ( ) const [inline]
```

Get the Trust Plugins algorithms for transformation of data and metadata exchanged by the DomainParticipant.

8.234.3.3 interceptor()

```
ParticipantTrustInterceptorAlgorithmInfo rti::topic::trust::ParticipantTrustAlgorithmInfo::interceptor  
( ) const [inline]
```

Get the Trust Plugins algorithms for interception of data and metadata exchanged by the DomainParticipant.

8.235 rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Trust Plugins interception algorithm information associated with the discovered DomainParticipant.

```
#include <rti/topic/trust/ParticipantTrustInterceptorAlgorithmInfo.hpp>
```

Public Member Functions

- **ParticipantTrustInterceptorAlgorithmInfo** ()=default
Create an instance with the default Trust Interceptor Algorithm Info associated with the discovered DomainParticipant.
- uint32_t **supported_mask** () const
Get the Trust Plugins algorithms supported for interception of data and metadata exchanged by the DomainParticipant.
- uint32_t **builtin_endpoints_required_mask** () const
Get the Trust Plugins algorithms used for interception of metadata exchanged by the builtin endpoints.
- uint32_t **builtin_kx_endpoints_required_mask** () const
Get the Trust Plugins algorithms used for interception of metadata exchanged by the key exchange builtin endpoints.
- uint32_t **user_endpoints_default_required_mask** () const
Get the Trust Plugins algorithms used by default for interception of data exchanged by the user endpoints. This is the algorithm that remote DomainParticipants should assume when **rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo** (p. 1262) is not serialized.

8.235.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Trust Plugins interception algorithm information associated with the discovered DomainParticipant.

8.235.2 Constructor & Destructor Documentation

8.235.2.1 ParticipantTrustInterceptorAlgorithmInfo()

```
rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo::ParticipantTrustInterceptorAlgorithmInfo ( ) [default]
```

Create an instance with the default Trust Interceptor Algorithm Info associated with the discovered DomainParticipant.

The meaning of this field may vary depending on what Trust Plugins the DomainParticipant is using.

8.235.3 Member Function Documentation

8.235.3.1 supported_mask()

```
uint32_t rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo::supported_mask ( ) const
[inline]
```

Get the Trust Plugins algorithms supported for interception of data and metadata exchanged by the DomainParticipant.

8.235.3.2 builtin_endpoints_required_mask()

```
uint32_t rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo::builtin_endpoints_required_↵
_mask ( ) const [inline]
```

Get the Trust Plugins algorithms used for interception of metadata exchanged by the builtin endpoints.

8.235.3.3 builtin_kx_endpoints_required_mask()

```
uint32_t rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo::builtin_kx_endpoints_↵
required_mask ( ) const [inline]
```

Get the Trust Plugins algorithms used for interception of metadata exchanged by the key exchange builtin endpoints.

8.235.3.4 user_endpoints_default_required_mask()

```
uint32_t rti::topic::trust::ParticipantTrustInterceptorAlgorithmInfo::user_endpoints_default_↵
required_mask ( ) const [inline]
```

Get the Trust Plugins algorithms used by default for interception of data exchanged by the user endpoints. This is the algorithm that remote DomainParticipants should assume when `rti::topic::trust::EndpointTrustInterceptorAlgorithmInfo` (p. 1262) is not serialized.

8.236 rti::topic::trust::ParticipantTrustKeyEstablishmentAlgorithmInfo Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Trust Plugins key establishment algorithm information associated with the discovered DomainParticipant.

8.238.2.1 ParticipantTrustSignatureAlgorithmInfo()

```
rti::topic::trust::ParticipantTrustSignatureAlgorithmInfo::ParticipantTrustSignatureAlgorithmInfo
( ) [default]
```

Create an instance with the default Trust Signature Algorithm Info associated with the discovered DomainParticipant.

The meaning of this field may vary depending on what Trust Plugins the DomainParticipant is using.

8.238.3 Member Function Documentation

8.238.3.1 trust_chain()

```
TrustAlgorithmRequirements rti::topic::trust::ParticipantTrustSignatureAlgorithmInfo::trust_chain
( ) const [inline]
```

Get the Trust Plugins signature algorithm requirements of the DomainParticipant in the context of creating a chain of trust.

8.238.3.2 message_auth()

```
TrustAlgorithmRequirements rti::topic::trust::ParticipantTrustSignatureAlgorithmInfo::message_↔
auth ( ) const [inline]
```

Get the Trust Plugins signature algorithm requirements of the DomainParticipant in the context of checking that messages are authentic.

8.239 dds::core::policy::Partition Class Reference

Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) entities.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TPartition** ()
Creates a policy with the default partition.
- **TPartition** (const std::string &partition)
Creates a policy with a single partition with the specified name.
- **TPartition** (const **dds::core::StringSeq** &partitions)
Creates a policy with the partitions specified in a vector.
- **TPartition & name** (const **dds::core::StringSeq** &partitions)
Sets the partition names specified in a vector.
- const **dds::core::StringSeq** **name** () const
Getter (see setter with the same name)

8.239.1 Detailed Description

Set of strings that introduces logical partitions in **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) entities.

This QoS policy is used to set string identifiers that are used for partitioning entities that would otherwise be connected to and exchange data with each other:

- A **dds::pub::DataWriter** (p. 908) within a **dds::pub::Publisher** (p. 1719) only communicates with a **dds::sub::DataReader** (p. 756) in a **dds::sub::Subscriber** (p. 2116) if (in addition to matching the **dds::topic::Topic** (p. 2178) and having compatible QoS) the **dds::pub::Publisher** (p. 1719) and **dds::sub::Subscriber** (p. 2116) have a common partition name string.
- **dds::domain::DomainParticipant** (p. 1079) entities (with the same domain ID and domain tag) are visible to each other only if they have at least one partition name string in common.

Entity:

dds::pub::Publisher (p. 1719), **dds::sub::Subscriber** (p. 2116), **dds::domain::DomainParticipant** (p. 1079)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = YES (p. 307)

8.239.2 Usage

The **Partition** (p. 1652) QoS policy provides another way to control which entities will match-and thus communicate with-which other entities. It can be used to prevent entities that would have otherwise matched from talking to each other. Much in the same way that only applications within the same DDS domain will communicate with each other, only entities that belong to the same partition can talk to each other.

The **Partition** (p. 1652) QoS policy allows you to add one or more strings, "partitions", to an entity:

- A DataWriter and DataReader for the same topic are only considered matched if their Publishers and Subscribers have partitions in common (intersecting partitions).
- DomainParticipants (with the same domain ID and domain tag) are visible to each other only if they have at least one partition in common.

Since the set of partitions for an entity can be dynamically changed, the **Partition** (p. 1652) QoS policy is useful for creating temporary separation groups among entities that would otherwise be connected to and exchange data with each other.

DomainParticipant partitions and Publisher/Subscriber partitions are independent of each other. You can use both features independently or in combination to provide the right level of isolation.

Failure to match partitions is not considered an incompatible QoS and does not trigger any listeners or conditions. A change in this policy *can* potentially modify the "match" of existing DataReader and DataWriter entities. It may establish new "matches" that did not exist before, or break existing matches.

Partition (p. 1652) strings are usually directly matched via string comparisons. However, partition strings can also contain wildcard symbols so that partitions can be matched via pattern matching. As long as the partitions or wildcard patterns of an entity intersect with the partitions or wildcard patterns of otherwise matching entities, the entities match; otherwise they do not.

These partition name patterns are regular expressions as defined by the POSIX fnmatch API (1003.2-1992 section B.↔ 6). A **dds::domain::DomainParticipant** (p. 1079), **dds::pub::Publisher** (p. 1719), or **dds::sub::Subscriber** (p. 2116) entity may include regular expressions in partition names, but no two names that both contain wildcards will ever be considered to match. This means that although regular expressions may be used on the entities, RTI Connexx will not try to match two regular expressions.

Each entity must belong to at least one logical partition. A regular expression is not considered to be a logical partition. If an entity has not specified a logical partition, it is assumed to be in the default partition. The default partition is defined to be an empty string (""). Put another way:

- An empty sequence of strings in this QoS policy is considered equivalent to a sequence containing only a single string, the empty string.
- A string sequence that contains only regular expressions and no literal strings, it is treated as if it had an additional element, the empty string.

Partitions are different from creating **dds::core::Entity** (p. 1265) objects in different domains in several ways.

- First, entities belonging to different domains are completely isolated from each other; there is no traffic, meta-traffic or any other way for an application or RTI Connexx itself to see entities in a domain it does not belong to.

- Second, a **dds::core::Entity** (p. 1265) can only belong to one domain whereas a **dds::core::Entity** (p. 1265) can be in multiple partitions.
- Finally, as far as RTI Connext is concerned, each unique data instance is identified by the tuple (**DomainID**, **domain tag**, **dds::topic::Topic** (p. 2178), **key**). Therefore two **dds::core::Entity** (p. 1265) objects in different domains cannot refer to the same data instance. On the other hand, the same data instance can be made available (published) or requested (subscribed) on one or more partitions.

For more information, see the "PARTITION QoS Policy" section of the `Core Libraries User's Manual`.

8.239.3 Member Function Documentation

8.239.3.1 TPartition() [1/3]

```
dds::core::policy::Partition::TPartition ( ) [inline]
```

Creates a policy with the default partition.

8.239.3.2 TPartition() [2/3]

```
dds::core::policy::Partition::TPartition (
    const std::string & partition ) [inline], [explicit]
```

Creates a policy with a single partition with the specified name.

8.239.3.3 TPartition() [3/3]

```
dds::core::policy::Partition::TPartition (
    const dds::core::StringSeq & partitions ) [inline], [explicit]
```

Creates a policy with the partitions specified in a vector.

8.239.3.4 name() [1/2]

```
TPartition & dds::core::policy::Partition::name (
    const dds::core::StringSeq & partitions ) [inline]
```

Sets the partition names specified in a vector.

Several restrictions apply to the partition names in this sequence. A violation of one of the following rules will result in a **dds::core::InconsistentPolicyError** (p. 1354) when setting a **dds::pub::Publisher** (p. 1719)'s or **dds::sub::Subscriber** (p. 2116)'s QoS.

- A partition name string cannot contain the reserved comma character (',').
- The maximum number of partition name strings allowable in a **dds::core::policy::Partition** (p. 1652) is specified on a domain basis in **rti::core::policy::DomainParticipantResourceLimits::max_partitions** (p. 1167). The length of this sequence may not be greater than that value.
- The maximum cumulative length of all partition name strings in a **dds::core::policy::Partition** (p. 1652) is specified on a domain basis in **rti::core::policy::DomainParticipantResourceLimits::max_partition_cumulative_characters** (p. 1168).

[default] Empty sequence (zero-length sequence). Since no logical partition is specified, RTI Connext will assume the entity to be in default partition (empty string partition "").

[range] List of partition name with above restrictions

8.239.3.5 name() [2/2]

```
const dds::core::StringSeq dds::core::policy::Partition::name ( ) const [inline]
```

Getter (see setter with the same name)

8.240 rti::core::PersistentStorageSettings Class Reference

<<**extension**>> (p. 156) Configures the persistent storage settings for durable writer history and durable reader state.

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **PersistentStorageSettings** ()
Creates an instance with the default settings.
- **PersistentStorageSettings** & **enable** (bool the_enable)
*Enables durable writer history in a **dds::pub::DataWriter** (p. 908) and durable reader state in a **dds::sub::DataReader** (p. 756).*
- bool **enable** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **file_name** (const rti::core::optional_value< std::string > &the_file_name)
Sets the file name where the durable writer history or durable reader state will be stored.
- **PersistentStorageSettings** & **file_name** (const char *the_file_name)
Sets the file name where the durable writer history or durable reader state will be stored.
- rti::core::optional_value< std::string > **file_name** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **trace_file_name** (const rti::core::optional_value< std::string > &the_trace_file_name)
Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
- **PersistentStorageSettings** & **trace_file_name** (const char *the_trace_file_name)
Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.
- rti::core::optional_value< std::string > **trace_file_name** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **journal_kind** (rti::core::policy::PersistentJournalKind the_journal_kind)
Sets the journal mode of the persistent storage.
- rti::core::policy::PersistentJournalKind **journal_kind** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **synchronization_kind** (rti::core::policy::PersistentSynchronizationKind the_synchronization_kind)
Sets the level of synchronization with the physical disk.
- rti::core::policy::PersistentSynchronizationKind **synchronization_kind** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **vacuum** (bool the_vacuum)
Sets the auto-vacuum status of the storage.
- bool **vacuum** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **restore** (bool the_restore)
Indicates if the persisted writer history or reader state must be restored.
- bool **restore** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **writer_instance_cache_allocation** (const AllocationSettings &the_writer_instance_cache_allocation)
Configures the resource limits associated with the instance durable writer history cache.
- **AllocationSettings** **writer_instance_cache_allocation** () const
Gets the writer instance cache allocation (see setter)
- **PersistentStorageSettings** & **writer_sample_cache_allocation** (const AllocationSettings &the_writer_sample_cache_allocation)

Configures the resource limits associated with the sample durable writer history cache.

- **AllocationSettings** **writer_sample_cache_allocation** () const
Gets the writer instance cache allocation (see setter)
- **PersistentStorageSettings** & **writer_memory_state** (bool the_writer_memory_state)
Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.
- bool **writer_memory_state** () const
Getter (see setter with the same name).
- **PersistentStorageSettings** & **reader_checkpoint_frequency** (uint32_t the_reader_checkpoint_frequency)
Controls how often the reader state is stored into the database.
- uint32_t **reader_checkpoint_frequency** () const
Getter (see setter with the same name).

8.240.1 Detailed Description

<<**extension**>> (p. 156) Configures the persistent storage settings for durable writer history and durable reader state.

In a **dds::pub::DataWriter** (p. 908), this structure configures durable writer history. This feature allows a DataWriter to persist its historical cache, so that it can survive shutdowns, crashes, and restarts. When an application restarts, each DataWriter that has been configured to have durable writer history automatically loads all of the data in this cache from disk and can carry on sending data as if it had never stopped executing.

In a **dds::sub::DataReader** (p. 756), this structure configures durable reader state. This feature allows a DataReader to persist its state and remember which data it has already received. When an application restarts, each DataReader that has been configured to have durable reader state automatically loads its state from disk and can carry on receiving data as if it had never stopped executing. Data that had already been received by the DataReader before the restart will be suppressed so that it is not even sent over the network.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

QoS:

dds::core::policy::Durability (p. 1181)

8.240.2 Constructor & Destructor Documentation

8.240.2.1 PersistentStorageSettings()

```
rti::core::PersistentStorageSettings::PersistentStorageSettings ( ) [inline]
```

Creates an instance with the default settings.

8.240.3 Member Function Documentation

8.240.3.1 enable() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::enable (
    bool the_enable )
```

Enables durable writer history in a **dds::pub::DataWriter** (p. 908) and durable reader state in a **dds::sub::DataReader** (p. 756).

When this field is set to true, the persistent storage configuration using this structure will take precedence over the configuration using the deprecated **dds.data_writer.history.odbc_plugin.builtin.*** and **dds.data_reader.state.*** properties.

[default] false

8.240.3.2 enable() [2/2]

```
bool rti::core::PersistentStorageSettings::enable ( ) const
```

Getter (see setter with the same name).

8.240.3.3 file_name() [1/3]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::file_name (
    const rti::core::optional_value< std::string > & the_file_name )
```

Sets the file name where the durable writer history or durable reader state will be stored.

Parameters

<i>the_file_name</i>	An optional string. A value is required when enable is set to true.
----------------------	---

Setting this field to a value other than NULL is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **rti::core::PersistentStorageSettings::restore** (p. 1663) is set to true, the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 837) and **rti::core::policy::DataWriterProtocol::virtual_guid** (p. 981) will be set by RTI Connex based on the file content. If you change these fields, the value will be ignored.

RTI Connex uses SQLite to store the durable writer history and durable reader state.

[default] NULL

8.240.3.4 file_name() [2/3]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::file_name (
    const char * the_file_name )
```

Sets the file name where the durable writer history or durable reader state will be stored.

Parameters

<i>the_file_name</i>	The file name. A value different other than NULL is required when enable is set to true.
----------------------	--

Setting this field to a value other than NULL is mandatory when enabling durable writer history or durable reader state.

If the file does not exist, it will be created.

If the file exists and **rti::core::PersistentStorageSettings::restore** (p. 1663) is set to true, the durable writer history or durable reader state will be restored from the file. Otherwise, the file will be overwritten.

Important: When the file exists, the fields **rti::core::policy::DataReaderProtocol::virtual_guid** (p. 837) and **rti::core::policy::DataWriterProtocol::virtual_guid** (p. 981) will be set by RTI Connext based on the file content. If you change these fields, the value will be ignored.

RTI Connext uses SQLite to store the durable writer history and durable reader state.

[default] NULL

8.240.3.5 file_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::PersistentStorageSettings::file_name ( )
const
```

Getter (see setter with the same name).

8.240.3.6 trace_file_name() [1/3]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::trace_file_name (
    const rti::core::optional_value< std::string > & the_trace_file_name )
```

Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Parameters

<i>the_trace_file_name</i>	An optional string. When not set, no trace file will be generated.
----------------------------	--

Setting this field to a value other than NULL will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

[default] NULL

8.240.3.7 trace_file_name() [2/3]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::trace_file_name (
    const char * the_trace_file_name )
```

Sets the file name where to store the SQL statements executed when loading and storing the durable writer history or durable reader state.

Parameters

<i>the_trace_file_name</i>	The trace file name. When NULL, no trace file will be generated.
----------------------------	--

Setting this field to a value other than NULL will enable tracing of the SQL statements executed when loading and storing the durable writer history or durable reader state.

Important: Enabling tracing will have a negative impact on performance. Use this feature only for debugging purposes.

[default] NULL

8.240.3.8 trace_file_name() [3/3]

```
rti::core::optional_value< std::string > rti::core::PersistentStorageSettings::trace_file_name (
) const
```

Getter (see setter with the same name).

8.240.3.9 journal_kind() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::journal_kind (
    rti::core::policy::PersistentJournalKind the_journal_kind )
```

Sets the journal mode of the persistent storage.

Parameters

<i>the_journal_kind</i>	The journal kind.
-------------------------	-------------------

[default] dds::core::policy::PersistentJournalKind::wal_journal

8.240.3.10 journal_kind() [2/2]

```
rti::core::policy::PersistentJournalKind rti::core::PersistentStorageSettings::journal_kind ( )
const
```

Getter (see setter with the same name).

8.240.3.11 synchronization_kind() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::synchronization_kind (
    rti::core::policy::PersistentSynchronizationKind the_synchronization_kind )
```

Sets the level of synchronization with the physical disk.

Parameters

<i>the_synchronization_kind</i>	The synchronization kind.
---------------------------------	---------------------------

[default] dds::core::policy::PersistentSynchronizationKind::normal

8.240.3.12 synchronization_kind() [2/2]

```
rti::core::policy::PersistentSynchronizationKind rti::core::PersistentStorageSettings::synchronization←
_kind ( ) const
```

Getter (see setter with the same name).

8.240.3.13 vacuum() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::vacuum (
    bool the_vacuum )
```

Sets the auto-vacuum status of the storage.

When auto-vacuum is true, the storage files will be compacted automatically with every transaction.

When auto-vacuum is false, after data is deleted from the storage files, the files remain the same size.

[default] true

8.240.3.14 vacuum() [2/2]

```
bool rti::core::PersistentStorageSettings::vacuum ( ) const
```

Getter (see setter with the same name).

8.240.3.15 restore() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::restore (
    bool the_restore )
```

Indicates if the persisted writer history or reader state must be restored.

For a **dds::pub::DataWriter** (p. 908), this field indicates whether or not the persisted writer history must be restored once the DataWriter is restarted.

For a **dds::sub::DataReader** (p. 756), this field indicates whether or not the persisted reader state must be restored once the DataReader is restarted.

[default] true

8.240.3.16 restore() [2/2]

```
bool rti::core::PersistentStorageSettings::restore ( ) const
```

Getter (see setter with the same name).

8.240.3.17 writer_instance_cache_allocation() [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::writer_instance_cache_allocation
(
    const AllocationSettings & the_writer_instance_cache_allocation )
```

Configures the resource limits associated with the instance durable writer history cache.

This field only applies to **dds::pub::DataWriter** (p. 908) entities.

To minimize the number of accesses to the persisted storage, RTI Connex uses an instance cache.

Do not confuse this limit with the initial and maximum number of instances that can be maintained by a DataWriter in persistent storage. These resource limits are configured using **dds::core::policy::ResourceLimits::max_instances** (p. 1924) and **dds::core::policy::ResourceLimits::initial_instances** (p. 1926).

If **rti::core::PersistentStorageSettings::writer_memory_state** (p. 1664) is set to true, then the value of **rti::core::AllocationSettings::max_count** (p. 592) is set to **dds::core::LENGTH_UNLIMITED** (p. 238), overwriting any value set by the user.

rti::core::AllocationSettings::incremental_count (p. 593) is ignored.

[range] **rti::core::AllocationSettings::max_count** (p. 592) in interval [1, INT_MAX], **rti::core::LENGTH_AUTO**, or **dds::core::LENGTH_UNLIMITED** (p. 238). **rti::core::AllocationSettings::initial_count** (p. 592) in interval [1, INT_MAX], or **rti::core::LENGTH_AUTO**.

rti::core::LENGTH_AUTO means that the value will be set to the equivalent value of **dds::core::policy::ResourceLimits** (p. 1921).

[default] **rti::core::AllocationSettings::max_count** (p. 592) = **rti::core::LENGTH_AUTO** (= **dds::core::policy::ResourceLimits::max_instances** (p. 1924)) and **rti::core::AllocationSettings::initial_count** (p. 592) = **rti::core::LENGTH_AUTO** (= **dds::core::policy::ResourceLimits::initial_instances** (p. 1926)).

8.240.3.18 `writer_instance_cache_allocation()` [2/2]

```
AllocationSettings rti::core::PersistentStorageSettings::writer_instance_cache_allocation ( )
const
```

Gets the writer instance cache allocation (see setter)

8.240.3.19 `writer_sample_cache_allocation()` [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::writer_sample_cache_allocation
(
    const AllocationSettings & the_writer_sample_cache_allocation )
```

Configures the resource limits associated with the sample durable writer history cache.

This field only applies to **dds::pub::DataWriter** (p. 908) entities.

To minimize the number of accesses to the persisted storage, RTI Connext uses a sample cache.

Do not confuse this limit with the initial and maximum number of samples that can be maintained by a `DataWriter` in persistent storage. These resource limits are configured using **dds::core::policy::ResourceLimits::max_samples** (p. 1924) and **dds::core::policy::ResourceLimits::initial_samples** (p. 1925).

rti::core::AllocationSettings::incremental_count (p. 593) is ignored.

[range] **rti::core::AllocationSettings::max_count** (p. 592) in interval [1, INT_MAX], **rti::core::LENGTH_AUTO**, or **dds::core::LENGTH_UNLIMITED** (p. 238). **rti::core::AllocationSettings::initial_count** (p. 592) in interval [1, INT_MAX], or **rti::core::LENGTH_AUTO**.

rti::core::LENGTH_AUTO means that the value will be set to the equivalent value of **dds::core::policy::ResourceLimits** (p. 1921).

[default] **rti::core::AllocationSettings::max_count** (p. 592) = 32 and **rti::core::AllocationSettings::initial_count** (p. 592) = 32.

8.240.3.20 `writer_sample_cache_allocation()` [2/2]

```
AllocationSettings rti::core::PersistentStorageSettings::writer_sample_cache_allocation ( ) const
```

Gets the writer instance cache allocation (see setter)

8.240.3.21 `writer_memory_state()` [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::writer_memory_state (
    bool the_writer_memory_state )
```

Determines how much state will be kept in memory by the durable writer history in order to avoid accessing the persistent storage in disk.

This field only applies to **dds::pub::DataWriter** (p. 908) entities.

If this field is set to true, then **rti::core::AllocationSettings::max_count** (p. 592) in **rti::core::PersistentStorageSettings::writer_instance_cache_allocation** (p. 1663) is set to **dds::core::LENGTH_UNLIMITED** (p. 238), overwriting any value set by the user.

In addition, the durable writer history will keep a fixed state overhead per sample in memory. This mode provides the best durable writer history performance. However, the restore operation will be slower, and the maximum number of samples that the durable writer history can manage is limited by the available physical memory.

If this field is set to false, all the state will be kept in the underlying database. In this mode, the maximum number of samples in the durable writer history is not limited by the physical memory available.

This field is always set to false when the DataWriter is configured with **dds::core::policy::Reliability::acknowledgment_kind** (p. 1878) set to **rti::core::policy::AcknowledgmentKind_def::APPLICATION_AUTO** (p. 586) or **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 586), or **rti::core::policy::Availability::enable_required_subscriptions** (p. 657) is set to true.

[default] true

8.240.3.22 `writer_memory_state()` [2/2]

```
bool rti::core::PersistentStorageSettings::writer_memory_state ( ) const
```

Getter (see setter with the same name).

8.240.3.23 `reader_checkpoint_frequency()` [1/2]

```
PersistentStorageSettings & rti::core::PersistentStorageSettings::reader_checkpoint_frequency (
    uint32_t the_reader_checkpoint_frequency )
```

Controls how often the reader state is stored into the database.

This field only applies to **dds::sub::DataReader** (p. 756) entities.

A value of N means store the state once every N received and processed samples.

The circumstances under which a data sample is considered "processed by the application" depends on the DataReader configuration.

For additional information on when a sample is considered "processed by the application" see `Durable Reader State`, in the Core Libraries User's Manual.

A high value will provide better performance. However, if the DataReader is restarted it may receive some duplicate samples.

[range] [1, 1000000] **[default]** 1

8.240.3.24 reader_checkpoint_frequency() [2/2]

```
uint32_t rti::core::PersistentStorageSettings::reader_checkpoint_frequency ( ) const
```

Getter (see setter with the same name).

8.241 rti::core::pointer< T > Class Template Reference

```
#include <Pointer.hpp>
```

Public Member Functions

- **pointer** () OMG_NOEXCEPT
- **pointer** (T *ptr) OMG_NOEXCEPT
- void **set** (T *ptr) OMG_NOEXCEPT
- T * **get** () const OMG_NOEXCEPT
- **pointer**< T > & **operator=** (T *other) OMG_NOEXCEPT
- bool **operator==** (const **pointer**< T > &other) const
- bool **operator!=** (const **pointer**< T > &other) const

8.241.1 Detailed Description

```
template<typename T>
class rti::core::pointer< T >
```

Helper class for generated types that contain IDL pointers (an RTI extension)

It wraps a loaned pointer and provides overloads of certain operators to access the contents rather than the pointer. It never deep-copies or deletes the underlying pointer.

8.241.2 Constructor & Destructor Documentation

8.241.2.1 pointer() [1/2]

```
template<typename T >
rti::core::pointer< T >::pointer ( ) [inline]
```

Initialize to NULL

8.241.2.2 pointer() [2/2]

```
template<typename T >
rti::core::pointer< T >::pointer (
    T * ptr ) [inline]
```

Shallow-copy the pointer and allow automatic conversion from T *

8.241.3 Member Function Documentation

8.241.3.1 set()

```
template<typename T >
void rti::core::pointer< T >::set (
    T * ptr ) [inline]
```

Set the underlying pointer. This function does not copy or delete, it just replaces this pointer.

8.241.3.2 get()

```
template<typename T >
T * rti::core::pointer< T >::get ( ) const [inline]
```

Returns the underlying pointer

Referenced by `rti::core::pointer< T >::operator==()`.

8.241.3.3 operator=()

```
template<typename T >
pointer< T > & rti::core::pointer< T >::operator= (
    T * other ) [inline]
```

Assign another pointer replacing the current one

8.241.3.4 operator==()

```
template<typename T >
bool rti::core::pointer< T >::operator== (
    const pointer< T > & other ) const [inline]
```

Deep equality comparison

References `rti::core::pointer< T >::get()`.

8.241.3.5 operator"!=()

```
template<typename T >
bool rti::core::pointer< T >::operator!= (
    const pointer< T > & other ) const [inline]
```

Deep inequality comparison

8.242 dds::core::policy::policy_id< Policy > Class Template Reference

Obtains the QoSPolicyId of a QoS Policy.

```
#include <PolicyTraits.hpp>
```

8.242.1 Detailed Description

```
template<typename Policy>
class dds::core::policy::policy_id< Policy >
```

Obtains the QoSPolicyId of a QoS Policy.

Template Parameters

A	QoS policy from the namespaces dds::core::policy (p. 415) or rti::core::policy
---	--

Specializations for each QoS policy provide the following constant:

```
static const dds::core::policy::QoSPolicyId value;
```

For example, the policy ID for the **dds::core::policy::Deadline** (p.1020) policy is `dds::core::policy::policy_id<dds::core::policy::Deadline>::value`.

8.243 dds::core::policy::policy_name< Policy > Class Template Reference

Obtains the policy name.

```
#include <PolicyTraits.hpp>
```

8.243.1 Detailed Description

```
template<typename Policy>
class dds::core::policy::policy_name< Policy >
```

Obtains the policy name.

Template Parameters

A	QoS policy from the namespaces dds::core::policy (p. 415) or rti::core::policy
---	--

Specializations for each QoS policy provide the following method:

```
static const std::string& name();
```

For example:

```
using namespace dds::core::policy;
std::cout << policy_name<Reliability>::name() << std::endl; // Prints "Reliability"
```

8.244 dds::core::PreconditionNotMetError Class Reference

A **PreconditionNotMetError** (p. 1669) is thrown when a pre-condition for the operation was not met.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::core::PreconditionNotMetError:

Public Member Functions

- virtual const char * **what** () const throw ()

*Access the message contained in this **PreconditionNotMetError** (p. 1669) exception.*

8.244.1 Detailed Description

A **PreconditionNotMetError** (p. 1669) is thrown when a pre-condition for the operation was not met.

Inherits also from `std::logic_error`

The system is not in the expected state when the function is called, or the parameter itself is not in the expected state when the function is called.

8.244.2 Member Function Documentation

8.244.2.1 what()

```
virtual const char * dds::core::PreconditionNotMetError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **PreconditionNotMetError** (p. 1669) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.245 dds::core::policy::Presentation Class Reference

Specifies how the samples representing changes to data instances are presented to a subscribing application.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Presentation** ()
 - Create an instance with the default value.*
- **Presentation** (**dds::core::policy::PresentationAccessScopeKind** the_access_scope, bool the_coherent_↵ access, bool the_ordered_access)
 - Creates an instance with the specified access scope and coherent and ordered access.*
- **Presentation & access_scope** (**dds::core::policy::PresentationAccessScopeKind** the_access_scope)
 - Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.*
- **dds::core::policy::PresentationAccessScopeKind** access_scope () const
 - Getter (see setter with the same name)*
- **Presentation & coherent_access** (bool enable)
 - Controls whether coherent access is supported within the access_scope.*
- bool **coherent_access** () const
 - Getter (see setter with the same name)*
- **Presentation & ordered_access** (bool enable)
 - Controls whether ordered access is supported within the access_scope.*
- bool **ordered_access** () const
 - Getter (see setter with the same name)*
- **dds::core::policy::Presentation & drop_incomplete_coherent_set** (bool enable)
 - <<extension>> (p. 156) Indicates whether or not a DataReader should drop samples from an incomplete coherent set for which not all the relevant samples where received.*
- bool **drop_incomplete_coherent_set** () const
 - <<extension>> (p. 156) Getter (see setter with the same name)*

Static Public Member Functions

- static **Presentation GroupAccessScope** (bool coherent, bool ordered)
*Creates a **Presentation** (p. 1670) instance with group access scope.*
- static **Presentation InstanceAccessScope** (bool coherent, bool ordered)
*Creates a **Presentation** (p. 1670) instance with instance access scope.*
- static **Presentation TopicAccessScope** (bool coherent, bool ordered)
*Creates a **Presentation** (p. 1670) instance with topic access scope.*

8.245.1 Detailed Description

Specifies how the samples representing changes to data instances are presented to a subscribing application.

This QoS policy controls the extent to which changes to data instances can be made dependent on each other and also the kind of dependencies that can be propagated and maintained by RTI Connext. Specifically, this policy affects the application's ability to:

- specify and receive coherent changes to instances
- specify the relative order in which changes are presented

Entity:

dds::pub::Publisher (p. 1719), **dds::sub::Subscriber** (p. 2116)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::StatusMask**↔
::requested_incompatible_qos() (p. 2088)

Properties:

RxO (p. 307) = YES

Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

8.245.2 Usage

A `dds::sub::DataReader` (p. 756) will usually receive data in the order that it was sent by a `dds::pub::DataWriter` (p. 908), and the data is presented to the `dds::sub::DataReader` (p. 756) as soon as the application receives the next expected value. However, sometimes you may want a set of data for the same DataWriter or different DataWriters to be presented to the DataReader(s) only after *all* of the elements of the set have been received, but not before. Or you may want the data to be presented in a different order than that in which it was sent. Specifically for keyed data, you may want the middleware to present the data in *keyed* – or *instance* – order, such that samples pertaining to the same instance are presented together.

The **Presentation** (p. 1670) QoS policy is a request-offered QoS policy that allows you to specify different *scopes* of presentation. It also controls whether or not a set of changes within the scope is delivered at the same time or can be delivered as soon as each element is received.

- `coherent_access` controls whether RTI Connexx will preserve the groupings of changes made by a publishing application by means of the operations `dds::pub::CoherentSet::CoherentSet` (p. 715) and `dds::pub::CoherentSet::end()` (p. 716).
- `ordered_access` controls whether RTI Connexx will preserve the order of changes.
- `access_scope` controls the granularity of the other settings. See below:

If `coherent_access` is set, then the `access_scope` set on the `dds::sub::Subscriber` (p. 2116) controls the maximum extent of coherent changes. The behavior is as follows:

- If `access_scope` is set to `dds::core::policy::PresentationAccessScopeKind_def::INSTANCE` (p. 1677) (the default), the behavior is the same as `dds::core::policy::PresentationAccessScopeKind_def::TOPIC` (p. 1677).
- If `access_scope` is set to `dds::core::policy::PresentationAccessScopeKind_def::TOPIC` (p. 1677), then coherent changes (indicated by their enclosure within calls to `dds::pub::CoherentSet::CoherentSet` (p. 715) and `dds::pub::CoherentSet::end()` (p. 716)) will be made available as a unit to each remote `dds::sub::DataReader` (p. 756) independently. That is, changes made to instances within each individual `dds::pub::DataWriter` (p. 908) will be presented as a unit. They will not be grouped with changes made to instances belonging to a different `dds::pub::DataWriter` (p. 908).
- If `access_scope` is set to `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677), then coherent changes made to instances through a set of `dds::pub::DataWriter` (p. 908) entities attached to a common `dds::pub::Publisher` (p. 1719) will be made available as a unit to the `dds::sub::DataReader` (p. 756) entities within a `dds::sub::Subscriber` (p. 2116).

If `ordered_access` is set, then the `access_scope` set on the `dds::sub::Subscriber` (p. 2116) controls the maximum extent to which order will be preserved by RTI Connexx.

- If `access_scope` is set to `dds::core::policy::PresentationAccessScopeKind_def::INSTANCE` (p. 1677) (the lowest level), then the relative order of DDS samples sent by a `dds::pub::DataWriter` (p. 908) is only preserved on a per-instance basis. If two DDS samples refer to the same instance (identified by Topic and a particular value for the key), then the order in which they are stored in the `dds::sub::DataReader` (p. 756) queue is consistent with the order in which the changes occurred. However, if the two DDS samples belong to different instances, the order in which they are presented may or may not match the order in which the changes occurred. This is the case even if it is the same application thread making the changes using the same `dds::pub::DataWriter` (p. 908).
- If `access_scope` is set to `dds::core::policy::PresentationAccessScopeKind_def::TOPIC` (p. 1677), changes (creations, deletions, modifications) made by a single `dds::pub::DataWriter` (p. 908) to one or more instances are presented to a `dds::sub::DataReader` (p. 756) in the same order in which they occur. Changes made to instances through different `dds::pub::DataWriter` (p. 908) entities are not required to be presented in the order in which they occur. This is the case even if the changes are made by a single application thread using `dds::pub::DataWriter` (p. 908) objects attached to the same `dds::pub::Publisher` (p. 1719).
- Finally, if `access_scope` is set to `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677), changes made to instances via `dds::pub::DataWriter` (p. 908) entities attached to the same `dds::pub::Publisher` (p. 1719) object are presented to the `dds::sub::DataReader` (p. 756) entities within a `dds::sub::Subscriber` (p. 2116) in the same order in which they occur. For this to happen, the application must take the samples using the Subscriber's `dds::sub::CoherentAccess::CoherentAccess()` (p. 712) and `dds::sub::CoherentAccess::end()` (p. 714) operations (see the "Ordered Access" section in the "PRESENTATION QoS Policy" section of the [Core Libraries User's Manual](http://www.rti.com/manuals/connext_dds_professional/users_manual/RTI_ConnextDDS_CoreLibraries_UsersManual.pdf)).

If `access_scope` is set to `dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED` (p. 1677) on the `dds::sub::Subscriber` (p. 2116), then the `dds::sub::Subscriber` (p. 2116) will use the `access_scope` offered by the remote `dds::pub::Publisher` (p. 1719).

Note that this QoS policy controls the scope at which related changes are made available to the subscriber. This means the subscriber **can** access the changes in a coherent manner and in the proper order; however, it does not necessarily imply that the `dds::sub::Subscriber` (p. 2116) **will** indeed access the changes in the correct order. For that to occur, the application at the subscriber end must use the proper logic in reading the `dds::sub::DataReader` (p. 756) objects.

For `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677) the subscribing application must use the APIs `dds::sub::CoherentAccess::CoherentAccess()` (p. 712), `dds::sub::CoherentAccess::end()` (p. 714) and `dds::sub::find` (p. 460) to access the changes in the proper order. If you do not use these operations, the data may not be ordered across `DataWriters` that belong to the same `dds::pub::Publisher` (p. 1719).

The field `dds::sub::SampleInfo::coherent_set_info` (p. 2002) is set when a sample is part of a coherent set. This field provides information to identify the coherent set that a sample is part of. In addition, `rti::core::CoherentSetInfo::incomplete_coherent_set` (p. 720) indicates if a sample is part of an incomplete coherent set (one for which not all samples have been received). Coherent sets for which some of the samples are filtered out by content or time on the `dds::pub::DataWriter` (p. 908) are considered incomplete.

By default, the samples that are received from an incomplete coherent set are dropped by the `DataReader(s)` and they are not provided to the application. Such samples are reported as lost in the `SAMPLE_LOST` Status. By setting `dds::core::policy::Presentation::drop_incomplete_coherent_set` (p. 1676) to false, you can change this behavior and, in this case, samples from incomplete coherent sets will be provided to the application. These samples have `rti::core::CoherentSetInfo::incomplete_coherent_set` (p. 720) set to true.

8.245.3 Compatibility

The value offered is considered compatible with the value requested if and only if the following conditions are met:

- the inequality *offered access_scope* \geq *requested access_scope* evaluates to 'TRUE' or requested *access_scope* is `dds::core::policy::PresentationAccessScopeKind_def::HIGHEST_OFFERED` (p. 1677). For the purposes of this inequality, the values of *access_scope* are considered ordered such that `dds::core::policy::PresentationAccessScopeKind_def::INSTANCE` (p. 1677) $<$ `dds::core::policy::PresentationAccessScopeKind_def::TOPIC` (p. 1677) $<$ `dds::core::policy::PresentationAccessScopeKind_def::GROUP` (p. 1677).
- requested *coherent_access* is false, or else both offered and requested *coherent_access* are true.
- requested *ordered_access* is false, or else both offered and requested *ordered_access* are true.

8.245.4 Constructor & Destructor Documentation

8.245.4.1 Presentation() [1/2]

```
dds::core::policy::Presentation::Presentation ( ) [inline]
```

Create an instance with the default value.

8.245.4.2 Presentation() [2/2]

```
dds::core::policy::Presentation::Presentation (
    dds::core::policy::PresentationAccessScopeKind the_access_scope,
    bool the_coherent_access,
    bool the_ordered_access ) [inline]
```

Creates an instance with the specified access scope and coherent and ordered access.

See the corresponding setters.

8.245.5 Member Function Documentation

8.245.5.1 access_scope() [1/2]

```
Presentation & dds::core::policy::Presentation::access_scope (
    dds::core::policy::PresentationAccessScopeKind the_access_scope ) [inline]
```

Determines the largest scope spanning the entities for which the order and coherency of changes can be preserved.

[default] dds::core::policy::PresentationAccessScopeKind_def::INSTANCE (p. 1677)

8.245.5.2 access_scope() [2/2]

```
dds::core::policy::PresentationAccessScopeKind dds::core::policy::Presentation::access_scope ( )
const [inline]
```

Getter (see setter with the same name)

8.245.5.3 coherent_access() [1/2]

```
Presentation & dds::core::policy::Presentation::coherent_access (
    bool enable ) [inline]
```

Controls whether coherent access is supported within the `access_scope`.

That is, the ability to group a set of changes as a unit on the publishing end such that they are received as a unit at the subscribing end.

Note: To use this feature, the DataWriter must be configured for RELIABLE communication (see **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881)).

[default] false

8.245.5.4 coherent_access() [2/2]

```
bool dds::core::policy::Presentation::coherent_access ( ) const [inline]
```

Getter (see setter with the same name)

8.245.5.5 ordered_access() [1/2]

```
Presentation & dds::core::policy::Presentation::ordered_access (
    bool enable ) [inline]
```

Controls whether ordered access is supported within the `access_scope`.

That is, the ability of the subscriber to see changes in the same order as they occurred on the publishing end.

[default] false

8.245.5.6 ordered_access() [2/2]

```
bool dds::core::policy::Presentation::ordered_access ( ) const [inline]
```

Getter (see setter with the same name)

8.245.5.7 GroupAccessScope()

```
static Presentation dds::core::policy::Presentation::GroupAccessScope (
    bool coherent,
    bool ordered ) [inline], [static]
```

Creates a **Presentation** (p. 1670) instance with group access scope.

8.245.5.8 InstanceAccessScope()

```
static Presentation dds::core::policy::Presentation::InstanceAccessScope (
    bool coherent,
    bool ordered ) [inline], [static]
```

Creates a **Presentation** (p. 1670) instance with instance access scope.

8.245.5.9 TopicAccessScope()

```
static Presentation dds::core::policy::Presentation::TopicAccessScope (
    bool coherent,
    bool ordered ) [inline], [static]
```

Creates a **Presentation** (p. 1670) instance with topic access scope.

8.245.5.10 drop_incomplete_coherent_set() [1/2]

```
dds::core::policy::Presentation & drop_incomplete_coherent_set (
    bool enable )
```

<<*extension*>> (p. 156) Indicates whether or not a DataReader should drop samples from an incomplete coherent set for which not all the relevant samples were received.

Note that a coherent set will be considered incomplete if some of its samples are filtered by content or time on the DataWriter side.

By default, the samples that are received from an incomplete coherent set are dropped (and reported as lost) by the DataReader(s) and they are not provided to the application. By setting this parameter to false, you can change this behavior.

Samples from an incomplete coherent set have **rti::core::CoherentSetInfo::incomplete_coherent_set** (p. 720) set to true in **dds::sub::SampleInfo::coherent_set_info** (p. 2002).

[default] true

8.245.5.11 drop_incomplete_coherent_set() [2/2]

```
bool drop_incomplete_coherent_set ( ) const
```

<<*extension*>> (p. 156) Getter (see setter with the same name)

8.246 dds::core::policy::PresentationAccessScopeKind_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `PresentationAccessScopeKind`.

```
#include <PolicyKind.hpp>
```

Public Types

- enum type {
INSTANCE ,
TOPIC ,
GROUP ,
HIGHEST_OFFERED }

The underlying enum type.

8.246.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `PresentationAccessScopeKind`.

8.246.2 Member Enumeration Documentation

8.246.2.1 type

```
enum dds::core::policy::PresentationAccessScopeKind_def::type
```

The underlying enum type.

Enumerator

INSTANCE	[default] Scope spans only a single instance. Indicates that changes to one instance need not be coherent nor ordered with respect to changes to any other instance. In other words, order and coherent changes apply to each instance separately.
TOPIC	Scope spans all instances within the same <code>dds::pub::DataWriter</code> (p. 908), but not across instances in different <code>dds::pub::DataWriter</code> (p. 908) entities.
GROUP	Scope spans all instances belonging to <code>dds::pub::DataWriter</code> (p. 908) entities within the same <code>dds::pub::Publisher</code> (p. 1719).
HIGHEST_OFFERED	This value only applies to a <code>dds::sub::Subscriber</code> (p. 2116). The <code>dds::sub::Subscriber</code> (p. 2116) will use the access scope specified by each remote <code>dds::pub::Publisher</code>

8.247 rti::flat::PrimitiveArrayOffset< T, N > Class Template Reference

Offset to an array of primitive elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::PrimitiveArrayOffset< T, N >:

Public Member Functions

- unsigned int **element_count** () const
Returns the number of elements, N.

8.247.1 Detailed Description

```
template<typename T, unsigned int N>
class rti::flat::PrimitiveArrayOffset< T, N >
```

Offset to an array of primitive elements.

Template Parameters

<i>T</i>	The primitive type
<i>N</i>	The array bound. For multidimensional arrays, <i>N</i> is the product of each dimension bound.

A **PrimitiveArrayOffset** (p. 1678) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast**() (p. 217)).

8.247.2 Member Function Documentation

8.247.2.1 element_count()

```
template<typename T , unsigned int N>
unsigned int rti::flat::PrimitiveArrayOffset< T, N >::element_count ( ) const [inline]
```

Returns the number of elements, N.

8.248 rti::flat::PrimitiveConstOffset< T > Struct Template Reference

A const Offset to an optional primitive member.

```
#include <Offset.hpp>
```

Inheritance diagram for rti::flat::PrimitiveConstOffset< T >:

Public Member Functions

- T **get** () const
Gets the value of this primitive member.

8.248.1 Detailed Description

```
template<typename T>
struct rti::flat::PrimitiveConstOffset< T >
```

A const Offset to an optional primitive member.

Read-only version of **PrimitiveOffset** (p. 1680).

If `!is_null()`, the value can be retrieved with **get()** (p. 1679).

8.248.2 Member Function Documentation

8.248.2.1 get()

```
template<typename T >
T rti::flat::PrimitiveConstOffset< T >::get ( ) const [inline]
```

Gets the value of this primitive member.

Precondition

```
!is_null()
```

8.249 rti::flat::PrimitiveOffset< T > Struct Template Reference

An Offset to an optional primitive member.

```
#include <Offset.hpp>
```

Inheritance diagram for rti::flat::PrimitiveOffset< T >:

Public Member Functions

- bool **set** (T value)
Sets a value for this primitive member.

8.249.1 Detailed Description

```
template<typename T>
struct rti::flat::PrimitiveOffset< T >
```

An Offset to an optional primitive member.

Template Parameters

<i>T</i>	The primitive type
----------	--------------------

Non-optional primitive members are accessed directly using its container type's methods; however, since an optional member may not exist, this Offset is returned instead. The only purpose of the type **PrimitiveOffset** (p. 1680) is to provide a way to check for the member's existence.

If `lis_null()`, the value can be retrieved with **get()** (p. 1679) or set with **set()** (p. 1680).

See also

MyFlatMutableOffset::my_optional_primitive (p. 1506) vs. **MyFlatMutableOffset::my_primitive** (p. 1506)

8.249.2 Member Function Documentation

8.249.2.1 set()

```
template<typename T >
bool rti::flat::PrimitiveOffset< T >::set (
    T value ) [inline]
```

Sets a value for this primitive member.

Precondition

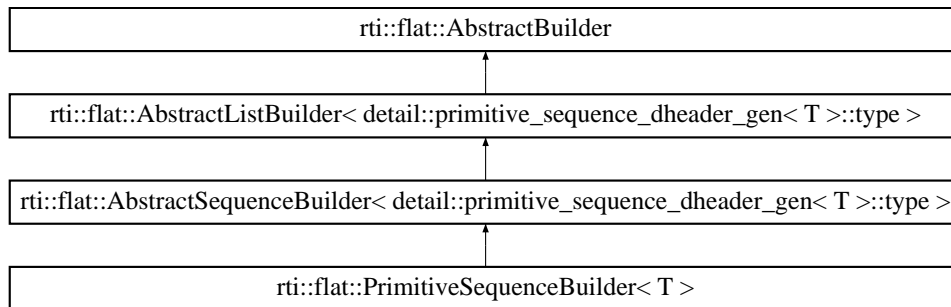

```
!is_null()
```

8.250 rti::flat::PrimitiveSequenceBuilder< T > Class Template Reference

Builds a sequence of primitive members.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::PrimitiveSequenceBuilder< T >:

Public Member Functions

- **PrimitiveSequenceBuilder** & **add_next** (T value)
Adds the next element.
- **PrimitiveSequenceBuilder** & **add_n** (const T *array, unsigned int count)
Adds all the elements in an array.
- **PrimitiveSequenceBuilder** & **add_n** (unsigned int count, T value)
Adds a number of elements with the same value.
- **PrimitiveSequenceBuilder** & **add_n** (unsigned int count)
Adds a number of uninitialized elements.
- **Offset finish** ()
Finishes building the sequence.

Additional Inherited Members

8.250.1 Detailed Description

```
template<typename T>
class rti::flat::PrimitiveSequenceBuilder< T >
```

Builds a sequence of primitive members.

The elements can be added one by one with `add_next()` or all at once with `add_n()` (p. 1682).

8.250.2 Member Function Documentation

8.250.2.1 `add_next()`

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_next (
    T value ) [inline]
```

Adds the next element.

Parameters

<i>value</i>	The primitive element to add
--------------	------------------------------

8.250.2.2 `add_n()` [1/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
    const T * array,
    unsigned int count ) [inline]
```

Adds all the elements in an array.

Parameters

<i>array</i>	The array containing the values to add
<i>count</i>	The size of the array

8.250.2.3 add_n() [2/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
    unsigned int count,
    T value ) [inline]
```

Adds a number of elements with the same value.

This overload initializes all the elements to a value.

Note

This operation is $O(\text{count})$. The other overloads, **add_n(unsigned int)** (p. 1683) and **add_n(const T*, unsigned int)** (p. 1682), are more efficient

Parameters

<i>count</i>	The number of elements to add
<i>value</i>	The value to set for each element

8.250.2.4 add_n() [3/3]

```
template<typename T >
PrimitiveSequenceBuilder & rti::flat::PrimitiveSequenceBuilder< T >::add_n (
    unsigned int count ) [inline]
```

Adds a number of uninitialized elements.

This operation is $O(1)$, since it leaves the elements uninitialized. They can be initialized using the Offset returned by **finish()** (p. 1683) and **rti::flat::plain_cast()** (p. 217). For example:

```
MyFlatMutableBuilder builder = ...;
auto seq_builder = builder.build_my_primitive_seq();
seq_builder.add_n(1000);
auto seq_offset = seq_builder.finish();
int32_t *elements = rti::flat::plain_cast(seq_offset);
for (int i = 0; i < 1000; i++) {
    elements[i] = ...;
}
```

Parameters

<i>count</i>	The number of elements to add
--------------	-------------------------------

8.250.2.5 finish()

```
template<typename T >
```

Offset `rti::flat::PrimitiveSequenceBuilder< T >::finish ()` [inline]

Finishes building the sequence.

Returns

An Offset to the member that has been built.

See also

discard() (p. 572)

8.251 `rti::flat::PrimitiveSequenceOffset< T >` Class Template Reference

Offset to a sequence of primitive elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for `rti::flat::PrimitiveSequenceOffset< T >`:

Public Member Functions

- unsigned int **element_count** () const
Returns the number of elements.

8.251.1 Detailed Description

```
template<typename T>
class rti::flat::PrimitiveSequenceOffset< T >
```

Offset to a sequence of primitive elements.

Template Parameters

<i>T</i>	The primitive type
----------	--------------------

8.251.2 Member Function Documentation

8.251.2.1 element_count()

```
template<typename T >
unsigned int rti::flat::PrimitiveSequenceOffset< T >::element_count ( ) const [inline]
```

Returns the number of elements.

Referenced by `rti::flat::StringOffset::element_count()`.

8.252 dds::core::xtypes::PrimitiveType Class Reference

<<*value-type*>> (p. 152) Represents and IDL primitive type

```
#include <dds/core/xtypes/PrimitiveTypes.hpp>
```

Inheritance diagram for `dds::core::xtypes::PrimitiveType`:

Related Functions

(Note that these are not member functions.)

- `template<typename T > const PrimitiveType< T > & primitive_type ()`
Obtains a singleton of PrimitiveType<T>

Additional Inherited Members

8.252.1 Detailed Description

<<*value-type*>> (p. 152) Represents and IDL primitive type

Template Parameters

T	The C++ primitive type for which to obtain a DynamicType (p. 1249). These are the possible types:	
	C++ type (T)	IDL type
	char	char
	bool	boolean
	uint8_t	octet
	(u)int16_t	(unsigned) short
	(u)int32_t	(unsigned) long
	(u)int64_t	(unsigned) long long
	float	float
	double	double
	rti::core::LongDouble (p. 1439)	long double
	wchar_t	wchar

Instead of instantiating this class it is recommended to obtain a singleton for each primitive type T using `primitive_type`.

Note: this class doesn't have any members other than those inherited from **DynamicType** (p. 1249).

See also

`primitive_type()` (p. 1686)

8.252.2 Friends And Related Function Documentation

8.252.2.1 `primitive_type()`

```
template<typename T >
const PrimitiveType< T > & primitive_type ( ) [related]
```

Obtains a singleton of `PrimitiveType<T>`

8.253 `rti::config::PrintFormat_def` Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `PrintFormat`.

```
#include <rti/config/Logger.hpp>
```

Public Types

- enum `type` { }

The underlying enum type.

8.253.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `PrintFormat`.

8.253.2 Member Enumeration Documentation

8.253.2.1 type

```
enum rti::config::PrintFormat_def::type
```

The underlying `enum` type.

Enumerator

DEFAULT	(default) Print message, method name, log level, Activity Context (p. 247) (what was happening when the event occurred), and logging category.
TIMESTAMPED	Print message, method name, log level, Activity Context (p. 247), logging category, and timestamp.
VERBOSE	Print message with all available context information (includes thread identifier, message location).
VERBOSE_TIMESTAMPED	Print message with all available context information, and timestamp.
DEBUG	Print a set of fields (including message number and backtrace information) that may be useful for internal debugging.
MINIMAL	Print only message number and message location.
MAXIMAL	Print all available fields.

8.254 rti::topic::PrintFormatKind_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `PrintFormatKind`.

```
#include <PrintFormat.hpp>
```

Public Types

- enum `type` {
DEFAULT = DDS_DEFAULT_PRINT_FORMAT ,
XML = DDS_XML_PRINT_FORMAT ,
JSON = DDS_JSON_PRINT_FORMAT }

The underlying `enum` type.

8.254.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `PrintFormatKind`.

8.254.2 Member Enumeration Documentation

8.254.2.1 type

```
enum rti::topic::PrintFormatKind_def::type
```

The underlying `enum` type.

Enumerator

DEFAULT	Use a default format specific to RTI Connex to represent the data when converting a data sample to a string.
XML	Use an XML format to represent the data when converting a data sample to a string.
JSON	Use an JSON format to represent the data when converting a data sample to a string.

8.255 rti::topic::PrintFormatProperty Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A collection of attributes used to configure how data samples will be formatted when converted to a string.

```
#include <rti/topic/PrintFormat.hpp>
```

Public Member Functions

- **PrintFormatProperty** (**PrintFormatKind** the_kind=PrintFormatKind::DEFAULT, bool is_pretty_print=true, bool is_enum_as_int=false, bool is_include_root_elements=true)
Initializes the properties.
- **PrintFormatKind kind** () const
Get the value of kind.
- **PrintFormatProperty & kind** (**PrintFormatKind** value)
Set the value for kind, indicating the kind of format to be used when converting a data sample to a string.
- bool **pretty_print** () const
Get the value of pretty_print.
- **PrintFormatProperty & pretty_print** (bool value)
Set the value for pretty_print, indicating if the string representation of the data sample should be a more readable format or should be void of all white space.

- bool **enum_as_int** () const
Get the value of enum_as_int.
- **PrintFormatProperty & enum_as_int** (bool value)
Set the value for enum_as_int, indicating whether to format enum values as integers or as strings when converting data samples to strings.
- bool **include_root_elements** () const
Get the value of include_root_elements.
- **PrintFormatProperty & include_root_elements** (bool value)
Set the value for include_root_elements, indicating whether to include the root elements of the print format in the output string when converting data samples to strings.

Static Public Member Functions

- static **PrintFormatProperty Default** ()
Creates a property with PrintFormatKind::DEFAULT.
- static **PrintFormatProperty Xml** ()
Creates a property with PrintFormatKind::XML.
- static **PrintFormatProperty Json** ()
Creates a property with PrintFormatKind::JSON.

8.255.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) A collection of attributes used to configure how data samples will be formatted when converted to a string.

See also

[rti::topic::to_string](#) (p. 245)

8.255.2 Constructor & Destructor Documentation

8.255.2.1 PrintFormatProperty()

```
rti::topic::PrintFormatProperty::PrintFormatProperty (
    PrintFormatKind the_kind = PrintFormatKind::DEFAULT,
    bool is_pretty_print = true,
    bool is_enum_as_int = false,
    bool is_include_root_elements = true ) [inline]
```

Initializes the properties.

8.255.3 Member Function Documentation

8.255.3.1 kind() [1/2]

```
PrintFormatKind rti::topic::PrintFormatProperty::kind ( ) const [inline]
```

Get the value of kind.

See also

kind(PrintFormatKind value) (p. 1690)

8.255.3.2 kind() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::kind (   
    PrintFormatKind value ) [inline]
```

Set the value for kind, indicating the kind of format to be used when converting a data sample to a string.

Data samples can be represented in a default, XML, or JSON format.

See also

PrintFormatKind (p. 245)

[default] PrintFormatKind::DEFAULT_PRINT_FORMAT

Parameters

<i>value</i>	The value to set for kind
--------------	---------------------------

8.255.3.3 pretty_print() [1/2]

```
bool rti::topic::PrintFormatProperty::pretty_print ( ) const [inline]
```

Get the value of pretty_print.

See also

pretty_print(bool value) (p. 1690)

8.255.3.4 pretty_print() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::pretty_print (
    bool value ) [inline]
```

Set the value for pretty_print, indicating if the string representation of the data sample should be a more readable format or should be void of all white space.

A value of true will add indentation and newlines to the string representation of the data sample making it more readable.

For example:

```
<FooType>
  <myLong>5</myLong>
</FooType>
```

A value of false will cause all white space in the string representation of the data sample to be eliminated. For example:

```
<FooType><myLong>5</myLong></FooType>
```

[default] true

Parameters

<i>value</i>	The value to set for pretty_print
--------------	-----------------------------------

8.255.3.5 enum_as_int() [1/2]

```
bool rti::topic::PrintFormatProperty::enum_as_int ( ) const [inline]
```

Get the value of enum_as_int.

See also

enum_as_int(bool value) (p. 1691)

8.255.3.6 enum_as_int() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::enum_as_int (
    bool value ) [inline]
```

Set the value for enum_as_int, indicating whether to format enum values as integers or as strings when converting data samples to strings.

A value of true will cause enumeration literals to be printed using their integer value. For example:

```
<FooType>
  <myEnum>5</myEnum>
</FooType>
```

A value of false will cause enumeration literals to be printed as strings using their member names. For example:

```
<FooType>
  <myEnum>RED</myEnum>
</FooType>
```

[default] false

Parameters

<i>value</i>	The value to set for <code>enum_as_int</code>
--------------	---

8.255.3.7 include_root_elements() [1/2]

```
bool rti::topic::PrintFormatProperty::include_root_elements ( ) const [inline]
```

Get the value of `include_root_elements`.

See also

include_root_elements(bool value) (p. 1692)

8.255.3.8 include_root_elements() [2/2]

```
PrintFormatProperty & rti::topic::PrintFormatProperty::include_root_elements (
    bool value ) [inline]
```

Set the value for `include_root_elements`, indicating whether to include the root elements of the print format in the output string when converting data samples to strings.

This field only applies if the **PrintFormatProperty::kind** (p. 1690) is `PrintFormatKind::XML_PRINT_FORMAT` or `PrintFormatKind::JSON_PRINT_FORMAT`

If the value is true and the kind is `PrintFormatKind::XML_PRINT_FORMAT` then a top-level tag with the type's name in it will be included in the output. For example:

```
<FooType>
  <myLong>5</myLong>
</FooType>
```

If the value is true and the kind is `PrintFormatKind::JSON_PRINT_FORMAT` then top-level opening and closing braces will be included in the output. For example:

```
{
  "myLong":5
}
```

If the value is false the elements described above will not be included in the output. For example:

```
<myLong>5</myLong>
"myLong":5
```

[default] true

Parameters

<i>value</i>	The value to set for <code>include_root_elements</code>
--------------	---

8.255.3.9 Default()

```
static PrintFormatProperty rti::topic::PrintFormatProperty::Default ( ) [inline], [static]
```

Creates a property with PrintFormatKind::DEFAULT.

8.255.3.10 Xml()

```
static PrintFormatProperty rti::topic::PrintFormatProperty::Xml ( ) [inline], [static]
```

Creates a property with PrintFormatKind::XML.

8.255.3.11 Json()

```
static PrintFormatProperty rti::topic::PrintFormatProperty::Json ( ) [inline], [static]
```

Creates a property with PrintFormatKind::JSON.

8.256 rti::core::ProductVersion Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Represents the current version of RTI Connex

```
#include <rti/core/ProductVersion.hpp>
```

Public Member Functions

- **ProductVersion** ()
*Creates the **unknown()** (p. 1695) product version.*
- std::string **to_string** () const
Get the product version as a string.
- uint8_t **major_version** () const
Get the major product version.
- uint8_t **minor_version** () const
Get the minor product version.
- uint8_t **release_version** () const
Get the release letter for product version.
- uint8_t **revision_version** () const
Get the revision number of product.

Static Public Member Functions

- static **ProductVersion** **current** ()
Returns the current version of RTI Connex.
- static **ProductVersion** **unknown** ()
Returns the value to indicate that the version is unknown.

8.256.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Represents the current version of RTI Connex

8.256.2 Constructor & Destructor Documentation

8.256.2.1 ProductVersion()

```
rti::core::ProductVersion::ProductVersion ( ) [inline]
```

Creates the **unknown**() (p. 1695) product version.

8.256.3 Member Function Documentation

8.256.3.1 to_string()

```
std::string rti::core::ProductVersion::to_string ( ) const [inline]
```

Get the product version as a string.

8.256.3.2 major_version()

```
uint8_t rti::core::ProductVersion::major_version ( ) const [inline]
```

Get the major product version.

8.256.3.3 minor_version()

```
uint8_t rti::core::ProductVersion::minor_version ( ) const [inline]
```

Get the minor product version.

8.256.3.4 release_version()

```
uint8_t rti::core::ProductVersion::release_version ( ) const [inline]
```

Get the release letter for product version.

8.256.3.5 revision_version()

```
uint8_t rti::core::ProductVersion::revision_version ( ) const [inline]
```

Get the revision number of product.

8.256.3.6 current()

```
static ProductVersion rti::core::ProductVersion::current ( ) [inline], [static]
```

Returns the current version of RTI Connex.

8.256.3.7 unknown()

```
static ProductVersion rti::core::ProductVersion::unknown ( ) [inline], [static]
```

Returns the value to indicate that the version is unknown.

8.257 rti::core::policy::Property Class Reference

<<**extension**>> (p. 156) Stores key/value string pairs that can configure certain parameters of RTI Connex not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a **dds::core::Entity** (p. 1265).

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Types

- typedef std::pair< std::string, std::string > **Entry**
*The type of the elements that **Property** (p. 1695) contains.*

Public Member Functions

- **Property** ()
*Creates an empty **Property** (p. 1695) container.*
- template<typename EntryIter >
Property (EntryIter begin, EntryIter end, bool is_propagate=false)
*Creates a **Property** (p. 1695) container with the entries specified by an iterator range.*
- **Property** (std::initializer_list< **Entry** > entries)
 <<**C++11**>> (p. 155) *Creates a **Property** (p. 1695) container with entries from an initializer_list*
- bool **exists** (const std::string &key) const
Returns true if a property exists.
- std::string **get** (const std::string &key) const
Returns the value of a property identified by a key if it exists.
- **rti::core::optional_value**< std::string > **try_get** (const std::string &key) const
*Returns the value of a property identified by a key or an empty **optional_value** (p. 1623) if it doesn't exist.*
- **Property & set** (const **Entry** &property, bool **propagate**=false)
Adds or assigns a property from a pair of strings.
- template<typename EntryIter >
Property & set (EntryIter begin, EntryIter end, bool is_propagate=false)
Adds a range of properties.
- bool **remove** (const std::string &key)
Removes the property identified by a key.
- size_t **size** () const
Returns the number of properties.
- std::map< std::string, std::string > **get_all** () const
Retrieves a copy of all the entries in a std::map.
- void **set** (std::initializer_list< **Entry** > entries, bool is_propagate=false)
 <<**C++11**>> (p. 155) *Adds properties from an initializer_list*
- bool **propagate** (const std::string &key) const
Returns whether the 'propagate' attribute for a property is set or not.

8.257.1 Detailed Description

<<**extension**>> (p. 156) Stores key/value string pairs that can configure certain parameters of RTI Connex not exposed through QoS policies. It can also store and propagate through the discovery mechanism application-specific information associated to a **dds::core::Entity** (p. 1265).

Entity:

dds::domain::DomainParticipant (p. 1079) **dds::sub::DataReader** (p. 756) **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = N/A;
Changeable (p. 307) = **YES** (p. 307)

See also

dds::sub::builtin_subscriber (p. 459)

8.257.2 Usage

The PROPERTY QoS policy can be used to associate a set of properties in the form of (name, value) pairs with a **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908), or **dds::domain::DomainParticipant** (p. 1079). This is similar to the **dds::core::policy::UserData** (p. 2292), except this policy uses (name, value) pairs, and you can select whether or not a particular pair should be propagated (included in the builtin topic).

You can find a complete list of predefined properties in the [Property Reference Guide](#).

This QoS policy may be used to configure:

- Durable Writer History, see **Configuring Durable Writer History** (p. 99)
- Durable Reader State, see **Configuring Durable Reader State** (p. 101)
- Builtin Transport Plugins, see **UDPv4 Transport Property Names in Property QoS Policy of Domain Participant** (p. 188), **UDPv6 Transport Property Names in Property QoS Policy of Domain Participant** (p. 201), and **Shared Memory Transport Property Names in Property QoS Policy of Domain Participant** (p. 183)
- Extension Transport Plugins, see **Loading Transport Plugins through Property QoS Policy of Domain Participant** (p. 79)
- **Clock Selection** (p. 41)

In addition, you may add your own name/value pairs to the **Property** (p. 1695) QoS policy of an Entity. Via this QoS policy, you can direct RTI Connext to propagate these name/value pairs with the discovery information for the Entity. Applications that discover the Entity can then access the user-specific name/value pairs in the discovery information of the remote Entity. This allows you to add meta-information about an Entity for application-specific use, for example, authentication/authorization certificates (which can also be done using the **dds::core::policy::UserData** (p. 2292) or **dds::core::policy::GroupData** (p. 1335)).

8.257.2.1 Reasons for Using the PropertyQoSPolicy

- Supports dynamic loading of extension transports
- Supports multiple instances of the builtin transports
- Allows full pluggable transport configuration for non-C/C++ language bindings (Java, .NET, etc.)
- Avoids the process of creating entities disabled, changing their QoS settings, then enabling them
- Allows selection of clock

Some of the RTI Connexr capabilities configurable via the **Property** (p. 1695) QoS policy can also be configured in code via APIs. However, the **Property** (p. 1695) QoS policy allows you to configure those parameters via XML files. In addition, some of the configuration APIs will only work if the Entity was created in a disabled state and then enabled after the configuration change was applied. By configuring those parameters using the **Property** (p. 1695) QoS policy during entity creation, you avoid the additional work of first creating a disabled entity and then enabling it afterwards.

There are helper functions to facilitate working with properties, see the **PROPERTY** (p. 332) page.

8.257.3 Member Typedef Documentation

8.257.3.1 Entry

```
typedef std::pair<std::string, std::string> rti::core::policy::Property::Entry
```

The type of the elements that **Property** (p. 1695) contains.

Key/value string pairs.

8.257.4 Constructor & Destructor Documentation

8.257.4.1 Property() [1/3]

```
rti::core::policy::Property::Property ( ) [inline]
```

Creates an empty **Property** (p. 1695) container.

8.257.4.2 Property() [2/3]

```
template<typename EntryIter >
rti::core::policy::Property::Property (
    EntryIter begin,
    EntryIter end,
    bool is_propagate = false ) [inline]
```

Creates a **Property** (p. 1695) container with the entries specified by an iterator range.

See also

set(EntryIter, EntryIter, bool) (p. 1700)

8.257.4.3 Property() [3/3]

```
rti::core::policy::Property::Property (
    std::initializer_list< Entry > entries ) [inline]
```

<<**C++11**>> (p. 155) Creates a **Property** (p. 1695) container with entries from an `initializer_list`

For example:

```
Property my_properties {"key 1", "value 1"}, {"key 2", "value 2"};
```

If a key is duplicated, only one entry will be inserted, with the value that comes last.

8.257.5 Member Function Documentation

8.257.5.1 exists()

```
bool rti::core::policy::Property::exists (
    const std::string & key ) const [inline]
```

Returns true if a property exists.

8.257.5.2 get()

```
std::string rti::core::policy::Property::get (
    const std::string & key ) const
```

Returns the value of a property identified by a key if it exists.

If the property doesn't exist it throws **dds::core::PreconditionNotMetError** (p. 1669).

8.257.5.3 try_get()

```
rti::core::optional_value< std::string > rti::core::policy::Property::try_get (
    const std::string & key ) const
```

Returns the value of a property identified by a key or an empty **optional_value** (p. 1623) if it doesn't exist.

8.257.5.4 set() [1/3]

```
Property & rti::core::policy::Property::set (
    const Entry & property,
    bool propagate = false )
```

Adds or assigns a property from a pair of strings.

If the key doesn't exist it adds the new entry, otherwise it overrides its value with the new one.

Parameters

<i>property</i>	<code>property.first</code> is the key and <code>property.second</code> is the value
<i>propagate</i>	Indicates if the property must be propagated on discovery

8.257.5.5 set() [2/3]

```
template<typename EntryIter >
Property & rti::core::policy::Property::set (
    EntryIter begin,
    EntryIter end,
    bool is_propagate = false ) [inline]
```

Adds a range of properties.

If a key is duplicated, only one entry will remain, with the value that comes last.

Template Parameters

<i>EntryIter</i>	A forward iterator whose value type is Property::Entry (p. 1698), such as the iterators of a <code>std::map<std::string, std::string></code> .
------------------	---

Parameters

<i>begin</i>	Beginning of a range of Entry
--------------	-------------------------------

Parameters

<i>end</i>	End of that range
<i>is_propagate</i>	Indicates if the property must be propagated on discovery

8.257.5.6 remove()

```
bool rti::core::policy::Property::remove (
    const std::string & key )
```

Removes the property identified by a key.

Returns

true if the property was removed or false if it didn't exist.

8.257.5.7 size()

```
size_t rti::core::policy::Property::size ( ) const
```

Returns the number of properties.

8.257.5.8 get_all()

```
std::map< std::string, std::string > rti::core::policy::Property::get_all ( ) const
```

Retrieves a copy of all the entries in a std::map.

8.257.5.9 set() [3/3]

```
void rti::core::policy::Property::set (
    std::initializer_list< Entry > entries,
    bool is_propagate = false ) [inline]
```

<<**C++11**>> (p. 155) Adds properties from an initializer_list

8.257.5.10 propagate()

```
bool rti::core::policy::Property::propagate (
    const std::string & key ) const
```

Returns whether the 'propagate' attribute for a property is set or not.

8.258 rti::core::ProtocolVersion Class Reference

<<*extension*>> (p. 156) Represents the current version of RTI Connex

```
#include <rti/core/ProtocolVersion.hpp>
```

Public Member Functions

- **ProtocolVersion** ()
Creates an invalid protocol version.
- **ProtocolVersion** (uint8_t major, uint8_t minor)
Creates a version with the given major and minor values.
- uint8_t **major_version** () const
The major version number.
- uint8_t **minor_version** () const
The minor version number.

Static Public Member Functions

- static **ProtocolVersion current** ()
The most recent protocol version. Currently 2.1.

8.258.1 Detailed Description

<<*extension*>> (p. 156) Represents the current version of RTI Connex

8.258.2 Constructor & Destructor Documentation

8.258.2.1 ProtocolVersion() [1/2]

```
rti::core::ProtocolVersion::ProtocolVersion ( ) [inline]
```

Creates an invalid protocol version.

8.258.2 ProtocolVersion() [2/2]

```
rti::core::ProtocolVersion::ProtocolVersion (
    uint8_t major,
    uint8_t minor ) [inline]
```

Creates a version with the given major and minor values.

8.258.3 Member Function Documentation

8.258.3.1 major_version()

```
uint8_t rti::core::ProtocolVersion::major_version ( ) const [inline]
```

The major version number.

8.258.3.2 minor_version()

```
uint8_t rti::core::ProtocolVersion::minor_version ( ) const [inline]
```

The minor version number.

8.258.3.3 current()

```
static ProtocolVersion rti::core::ProtocolVersion::current ( ) [inline], [static]
```

The most recent protocol version. Currently 2.1.

8.259 dds::topic::PublicationBuiltinTopicData Class Reference

Entry created when a **dds::pub::DataWriter** (p. 908) is discovered in association with its **dds::pub::Publisher** (p. 1719).

```
#include <dds/topic/BuiltinTopic.hpp>
```

Public Member Functions

- **TPublicationBuiltinTopicData** ()
*Create a default **PublicationBuiltinTopicData** (p. 1703).*

8.259.1 Detailed Description

Entry created when a **dds::pub::DataWriter** (p. 908) is discovered in association with its **dds::pub::Publisher** (p. 1719).

Data associated with the built-in topic **dds::topic::publication_topic_name()** (p. 243). It contains QoS policies and additional information that apply to the remote **dds::pub::DataWriter** (p. 908) the related **dds::pub::Publisher** (p. 1719).

8.259.2 Member Function Documentation

8.259.2.1 TPublicationBuiltinTopicData()

```
dds::topic::PublicationBuiltinTopicData::TPublicationBuiltinTopicData ( ) [inline]
```

Create a default **PublicationBuiltinTopicData** (p. 1703).

8.259.2.2 key()

```
const dds::topic::BuiltinTopicKey & dds::topic::PublicationBuiltinTopicData::key ( ) const [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

8.259.2.3 participant_key()

```
const dds::topic::BuiltinTopicKey & dds::topic::PublicationBuiltinTopicData::participant_key ( )  
const [inline]
```

Get the DCPS key of the **dds::domain::DomainParticipant** (p. 1079) to which the **dds::pub::DataWriter** (p. 908) belongs.

Returns

The DomainParticipant's key

8.259.2.4 topic_name()

```
const dds::core::string & dds::topic::PublicationBuiltinTopicData::topic_name ( ) const [inline]
```

Get the name of the related **dds::topic::Topic** (p. 2178).

Returns

The topic name

8.259.2.5 type_name()

```
const dds::core::string & dds::topic::PublicationBuiltinTopicData::type_name ( ) const [inline]
```

Get the name of the type attached to the **dds::topic::Topic** (p. 2178).

Returns

The type name

8.259.2.6 durability()

```
const dds::core::policy::Durability & dds::topic::PublicationBuiltinTopicData::durability ( )  
const [inline]
```

Get the **dds::core::policy::Durability** (p. 1181) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Durability policy

8.259.2.7 durability_service()

```
const dds::core::policy::DurabilityService & dds::topic::PublicationBuiltinTopicData::durability↔  
_service ( ) const [inline]
```

Get the **dds::core::policy::DurabilityService** (p. 1190) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The DurabilityService policy

8.259.2.8 deadline()

```
const dds::core::policy::Deadline & dds::topic::PublicationBuiltinTopicData::deadline ( ) const  
[inline]
```

Get the **dds::core::policy::Deadline** (p. 1020) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Deadline policy

8.259.2.9 latency_budget()

```
const dds::core::policy::LatencyBudget & dds::topic::PublicationBuiltinTopicData::latency_budget  
( ) const [inline]
```

Get the **dds::core::policy::LatencyBudget** (p. 1375) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The LatencyBudget policy

8.259.2.10 liveliness()

```
const dds::core::policy::Liveliness & dds::topic::PublicationBuiltinTopicData::liveliness ( )  
const [inline]
```

Get the **dds::core::policy::Liveliness** (p. 1389) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Liveliness policy

8.259.2.11 reliability()

```
const dds::core::policy::Reliability & dds::topic::PublicationBuiltinTopicData::reliability ( )  
const [inline]
```

Get the **dds::core::policy::Reliability** (p. 1873) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Reliability policy

8.259.2.12 lifespan()

```
const dds::core::policy::Lifespan & dds::topic::PublicationBuiltinTopicData::lifespan ( ) const  
[inline]
```

Get the **dds::core::policy::Lifespan** (p. 1379) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Lifespan policy

8.259.2.13 user_data()

```
const dds::core::policy::UserData & dds::topic::PublicationBuiltinTopicData::user_data ( ) const [inline]
```

Get the **dds::core::policy::UserData** (p. 2292) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The UserData policy

8.259.2.14 ownership()

```
const dds::core::policy::Ownership & dds::topic::PublicationBuiltinTopicData::ownership ( ) const [inline]
```

Get the **dds::core::policy::Ownership** (p. 1630) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Ownership policy

8.259.2.15 ownership_strength()

```
const dds::core::policy::OwnershipStrength & dds::topic::PublicationBuiltinTopicData::ownership↔_strength ( ) const [inline]
```

Get the **dds::core::policy::OwnershipStrength** (p. 1637) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The OwnershipStrength policy

8.259.2.16 destination_order()

```
const dds::core::policy::DestinationOrder & dds::topic::PublicationBuiltinTopicData::destination↔_order ( ) const [inline]
```

Get the **dds::core::policy::DestinationOrder** (p. 1022) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The DestinationOrder policy

8.259.2.17 presentation()

```
const dds::core::policy::Presentation & dds::topic::PublicationBuiltinTopicData::presentation ( )  
const [inline]
```

Get the **dds::core::policy::Presentation** (p. 1670) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Presentation policy

8.259.2.18 partition()

```
const dds::core::policy::Partition & dds::topic::PublicationBuiltinTopicData::partition ( ) const  
[inline]
```

Get the **dds::core::policy::Partition** (p. 1652) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The Partition policy

References **dds::core::Value< D >::delegate()**.

8.259.2.19 topic_data()

```
const dds::core::policy::TopicData & dds::topic::PublicationBuiltinTopicData::topic_data ( )  
const [inline]
```

Get the **dds::core::policy::TopicData** (p. 2204) policy of the related **dds::topic::Topic** (p. 2178).

Returns

The TopicData policy

References **dds::core::Value< D >::delegate()**.

8.259.2.20 group_data()

```
const dds::core::policy::GroupData & dds::topic::PublicationBuiltinTopicData::group_data ( )  
const [inline]
```

Get the **dds::core::policy::GroupData** (p. 1335) policy of the **dds::pub::Publisher** (p. 1719) to which the **dds::pub::DataWriter** (p. 908) belongs.

Returns

The GroupData policy

References **dds::core::Value< D >::delegate()**.

8.259.2.21 representation() [1/2]

```
const dds::core::policy::DataRepresentation & dds::topic::PublicationBuiltinTopicData::representation  
( ) const [inline]
```

Get the **dds::core::policy::DataRepresentation** (p. 883) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The DataRepresentation policy

References **dds::core::Value< D >::delegate()**.

8.259.2.22 data_tag()

```
const dds::core::policy::DataTag & dds::topic::PublicationBuiltinTopicData::data_tag ( ) const  
[inline]
```

Get the **dds::core::policy::DataTag** (p. 902) policy of the corresponding **dds::pub::DataWriter** (p. 908).

Returns

The DataTag policy

References **dds::core::Value< D >::delegate()**.

8.259.2.23 representation() [2/2]

```
const dds::core::policy::DataRepresentation & representation ( ) const
```

Get the publication data representation.

Returns

The `dds::core::policy::DataRepresentation` (p. 883) policy of the corresponding DataWriter

Examples

Foo.hpp.

8.259.2.24 type()

```
dds::core::optional< dds::core::xtypes::DynamicType > type ( ) const
```

<<*extension*>> (p. 156) Get the type

Note

This is not a lightweight getter—obtaining the type may require some processing so it is recommended that you keep the value if you need to use it multiple times rather than look it up every time. See also `get_type_no_copy()` (p. 1712).

Returns

The type or an unset optional value if the type is not available

Examples

Foo.hpp.

8.259.2.25 get_type_no_copy()

```
const dds::core::optional< dds::core::xtypes::DynamicType > & get_type_no_copy ( ) const
```

<<*extension*>> (p. 156) Get the type by reference if possible

Exceptions

<code>dds::core::PreconditionNotMet</code>	If the type is available but is not in a format that is directly accessible. In that case it needs some extra processing and has to be accessed using <code>type()</code> (p. 1712). You can also ensure that it is in the right format by setting <code>rti::core::policy::↔DomainParticipantResourceLimits::type_code_max_serialized_length()</code> (p. 1168) to 0.
--	--

Returns

The type or an unset optional value if the type is not available

See also

`type()` (p. 1712)

8.259.2.26 `publisher_key()`

```
const dds::topic::BuiltinTopicKey & publisher_key ( ) const
```

<<*extension*>> (p. 156) Get the DCPS key of the `dds::pub::Publisher` (p. 1719) to which the `dds::pub::DataWriter` (p. 908) belongs

Returns

The key

8.259.2.27 `property()`

```
const rti::core::policy::Property & property ( ) const
```

<<*extension*>> (p. 156) Get the propagated name-value properties of the corresponding `dds::pub::DataWriter` (p. 908).

Returns

The properties

8.259.2.28 unicast_locators()

```
const dds::core::vector< rti::core::Locator > & unicast_locators ( ) const
```

<<*extension*>> (p. 156) Get the custom unicast locators that the endpoint can specify.

The default locators will be used if this is not specified.

Returns

The custom unicast locators specified by the corresponding DataWriter

8.259.2.29 virtual_guid()

```
const rti::core::Guid & virtual_guid ( ) const
```

<<*extension*>> (p. 156) Get the virtual **rti::core::Guid** (p. 1340) associated to the **dds::pub::DataWriter** (p. 908).

Returns

The virtual guid

8.259.2.30 rtps_protocol_version()

```
const rti::core::ProtocolVersion & rtps_protocol_version ( ) const
```

<<*extension*>> (p. 156) Get the version number of the RTPS wire protocol used.

Returns

The RTPS wire protocol version

8.259.2.31 rtps_vendor_id()

```
const rti::core::VendorId & rtps_vendor_id ( ) const
```

<<*extension*>> (p. 156) Get the ID of the vendor implementing the RTPS wire protocol.

Returns

The vendor ID

8.259.2.32 product_version()

```
const rti::core::ProductVersion & product_version ( ) const
```

<<*extension*>> (p. 156) Get the current version for RTI Connex.

Returns

The

8.259.2.33 locator_filter()

```
const rti::core::policy::LocatorFilter & locator_filter ( ) const
```

<<*extension*>> (p. 156) Get the locator filters of the corresponding **dds::pub::DataWriter** (p. 908)

Returns

The `rti::core::LocatorFilterQosPolicy`

See also

rti::core::policy::MultiChannel (p. 1483)

8.259.2.34 disable_positive_acks()

```
bool disable_positive_acks ( ) const
```

<<*extension*>> (p. 156) See whether or not a matching **dds::sub::DataReader** (p. 756) will send positive acknowledgments for reliability.

Returns

true if positive acks are disabled, false otherwise

8.259.2.35 publication_name()

```
const rti::core::policy::EntityName & publication_name ( ) const
```

<<*extension*>> (p. 156) Get the publication name and role name.

Returns

The `rti::core::policy::EntityName` (p. 1275) policy of the corresponding `DataWriter`

8.259.2.36 trust_protection_info()

```
const rti::topic::trust::EndpointTrustProtectionInfo & trust_protection_info ( ) const
```

<<*extension*>> (p. 156) Get the Trust Plugins information associated with the discovered `DataWriter`.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

`trust_protection_info` contains information about how RTPS wire serialization, discovery, and liveness interact with the loaded Trust Plugins. Two endpoints will not match if their `trust_protection_info` is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.259.2.37 trust_algorithm_info()

```
const rti::topic::trust::EndpointTrustAlgorithmInfo & trust_algorithm_info ( ) const
```

<<*extension*>> (p. 156) Get the Trust plugins algorithms associated with the discovered `DataWriter`.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

`trust_algorithm_info` contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their `trust_algorithm_info` are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the `RTI Security Plugins User's Manual`.

8.259.2.38 service()

```
const rti::core::policy::Service & service ( ) const
```

<<*extension*>> (p. 156) Get the Service policy

8.260 `dds::core::status::PublicationMatchedStatus` Class Reference

Information about the status `dds::core::status::StatusMask::publication_matched()` (p. 2091)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t total_count () const`
The total cumulative number of times that this `dds::pub::DataWriter` (p. 908) discovered a "match" with a `dds::sub::DataReader` (p. 756).
- `int32_t total_count_change () const`
The changes in `total_count` since the last time the listener was called or the status was read.
- `int32_t current_count () const`
The current number of `DataReaders` with which this `dds::pub::DataWriter` (p. 908) is matched.
- `int32_t current_count_change () const`
The change in `current_count` since the last time the listener was called or the status was read.
- `const dds::core::InstanceHandle last_subscription_handle () const`
This `InstanceHandle` (p. 1356) can be used to look up which remote `dds::sub::DataReader` (p. 756) was the last to cause this `DataWriter`'s status to change, using `dds::pub::matched_subscription_data()` (p. 438).
- `int32_t current_count_peak () const`
<<extension>> (p. 156) Greatest number of `DataReaders` that matched this `dds::pub::DataWriter` (p. 908) simultaneously.

8.260.1 Detailed Description

Information about the status `dds::core::status::StatusMask::publication_matched()` (p. 2091)

A "match" happens when the `dds::pub::DataWriter` (p. 908) finds a `dds::sub::DataReader` (p. 756) with the same `dds::topic::Topic` (p. 2178), same or compatible data type, and requested QoS that is compatible with that offered by the `dds::pub::DataWriter` (p. 908). (For information on compatible data types, see the `Extensible Types Guide`.)

This status is also changed (and the listener, if any, called) when a match is ended. A local `dds::pub::DataWriter` (p. 908) will become "unmatched" from a remote `dds::sub::DataReader` (p. 756) when that `dds::sub::DataReader` (p. 756) goes away for any of the following reasons:

- The matched `dds::sub::DataReader` (p. 756)'s `dds::domain::DomainParticipant` (p. 1079) has lost liveliness.
- This `DataWriter` or the matched `DataReader` has changed QoS such that the entities are now incompatible.
- The matched `DataReader` has been deleted.

This status may reflect changes from multiple match or unmatched events, and the `dds::core::status::PublicationMatchedStatus::current_count_change` (p. 1718) can be used to determine the number of changes since the listener was called back or the status was checked.

8.260.2 Member Function Documentation

8.260.2.1 total_count()

```
int32_t dds::core::status::PublicationMatchedStatus::total_count ( ) const [inline]
```

The total cumulative number of times that this **dds::pub::DataWriter** (p. 908) discovered a "match" with a **dds::sub::DataReader** (p. 756).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **dds::core::status::PublicationMatchedStatus** (p. 1717).

8.260.2.2 total_count_change()

```
int32_t dds::core::status::PublicationMatchedStatus::total_count_change ( ) const [inline]
```

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times this DataWriter ever matched with a DataReader).

8.260.2.3 current_count()

```
int32_t dds::core::status::PublicationMatchedStatus::current_count ( ) const [inline]
```

The current number of DataReaders with which this **dds::pub::DataWriter** (p. 908) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **dds::core::status::PublicationMatchedStatus** (p. 1717).

8.260.2.4 current_count_change()

```
int32_t dds::core::status::PublicationMatchedStatus::current_count_change ( ) const [inline]
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataReaders have become unmatched for one or more of the reasons described in **dds::core::status::PublicationMatchedStatus** (p. 1717).

8.260.2.5 last_subscription_handle()

```
const dds::core::InstanceHandle dds::core::status::PublicationMatchedStatus::last_subscription_↵
handle ( ) const [inline]
```

This **InstanceHandle** (p. 1356) can be used to look up which remote **dds::sub::DataReader** (p. 756) was the last to cause this DataWriter's status to change, using **dds::pub::matched_subscription_data()** (p. 438).

If the DataReader no longer matches this DataWriter due to any of the reasons in **dds::core::status::Publication↵ MatchedStatus** (p. 1717) except incompatible QoS, then the DataReader has been purged from this DataWriter's DomainParticipant discovery database. (See the "Discovery Overview" section of the *User's Manual*.) In that case, the **dds::pub::matched_subscription_data()** (p. 438) method will not be able to return information about the DataReader. The only way to get information about the lost DataReader is if you cached the information previously.

8.260.2.6 current_count_peak()

```
int32_t current_count_peak ( ) const
```

<<**extension**>> (p. 156) Greatest number of DataReaders that matched this **dds::pub::DataWriter** (p. 908) simultaneously.

That is, there was no moment in time when more than this many DataReaders matched this DataWriter. (As a result, `total_count` can be higher than `current_count_peak`.)

8.261 dds::pub::Publisher Class Reference

<<**reference-type**>> (p. 153) A publisher is the object responsible for the actual dissemination of publications.

```
#include <dds/pub/Publisher.hpp>
```

`uint32_t find_publishers` (const `dds::domain::DomainParticipant participant`, `PublisherBackInsertIterator begin`)
Retrieve all the dds::pub::Publisher (p. 1719) created from this `dds::domain::DomainParticipant` (p. 1079).
- `dds::pub::Publisher find_publisher` (const `dds::domain::DomainParticipant participant`, const `std::string &publisher_name`)
<<extension>> (p. 156) Looks up a `dds::pub::Publisher` (p. 1719) by its entity name within the `dds::domain::DomainParticipant` (p. 1079).
- `dds::pub::Publisher implicit_publisher` (const `dds::domain::DomainParticipant &dp`)
<<extension>> (p. 156) Get the implicit `dds::pub::Publisher` (p. 1719) for a given `dds::domain::DomainParticipant` (p. 1079).

8.261.1 Detailed Description

<<reference-type>> (p. 153) A publisher is the object responsible for the actual dissemination of publications.

QoS:

`dds::pub::qos::PublisherQos` (p. 1733)

Listener:

`PublisherListener` (p. 1732)

A publisher acts on the behalf of one or several `dds::pub::DataWriter` (p. 908) objects that belong to it. When it is informed of a change to the data associated with one of its `dds::pub::DataWriter` (p. 908) objects, it decides when it is appropriate to actually send the data-update message. In making this decision, it considers any extra information that goes with the data (timestamp, writer, etc.) as well as the QoS of the `dds::pub::Publisher` (p. 1719) and the `dds::pub::DataWriter` (p. 908).

The following operations may be called even if the `dds::pub::Publisher` (p. 1719) is not enabled. Other operations will fail with the value `dds::core::NotEnabledError` (p. 1601) if called on a disabled `dds::pub::Publisher` (p. 1719):

- `dds::core::Entity::enable` (p. 1269),
- `dds::pub::Publisher::qos(const dds::pub::qos::PublisherQos&)` (p. 1724), `dds::pub::Publisher::qos() const` (p. 1723)
- `dds::pub::Publisher::set_listener` (p. 1726), `dds::pub::Publisher::get_listener` (p. 1727),
- `dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)` (p. 2080), `dds::core::Entity::status_changes()` (p. 1270)
- `dds::pub::DataWriter` (p. 908) constructors, `dds::pub::DataWriter::close()` (p. 1270),
- `dds::pub::Publisher::default_datawriter_qos(const dds::pub::qos::DataWriterQos&)` (p. 1725), `dds::pub::Publisher::default_datawriter_qos()` (p. 1725), `dds::pub::Publisher::wait_for_acknowledgments` (p. 1727),

Examples

Foo_publisher.cxx.

8.261.2 Constructor & Destructor Documentation

8.261.2.1 Publisher() [1/3]

```
dds::pub::Publisher::Publisher (
    const dds::domain::DomainParticipant & the_participant ) [inline], [explicit]
```

Create a **Publisher** (p. 1719).

It uses default **qos::PublisherQos** (p. 1733) and no listener.

Parameters

<i>the_participant</i>	The DomainParticipant where this Publisher (p. 1719) will be created
------------------------	---

8.261.2.2 Publisher() [2/3]

```
dds::pub::Publisher::Publisher (
    const dds::domain::DomainParticipant & the_participant,
    const dds::pub::qos::PublisherQos & the_qos,
    dds::pub::PublisherListener * the_listener = NULL,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a **Publisher** (p. 1719) with the desired QoS policies and attaches to it the specified **PublisherListener** (p. 1732).

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener (p. 1381)>` instead of a regular `Listener*` pointer.

Precondition

The specified QoS policies must be consistent, or the operation will fail

Parameters

<i>the_participant</i>	The DomainParticipant where this Publisher (p. 1719) will be created
<i>the_qos</i>	The PublisherQos
<i>the_listener</i>	The PublisherListener (p. 1732)
<i>mask</i>	Indicates which status updates the listener will receive

Exceptions

dds::core::Error (p. 1284)	If there is any error creating the Publisher (p. 1719)
-----------------------------------	---

8.261.2.3 Publisher() [3/3]

```

dds::pub::Publisher::Publisher (
    const ::dds::domain::DomainParticipant & the_participant,
    const dds::pub::qos::PublisherQos & the_qos,
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a **Publisher** (p. 1719) with the desired QoS policies and attaches to it the specified **PublisherListener** (p. 1732).

Precondition

The specified QoS policies must be consistent, or the operation will fail

Parameters

<i>the_participant</i>	The DomainParticipant where this Publisher (p. 1719) will be created
<i>the_qos</i>	The PublisherQos
<i>the_listener</i>	A shared_ptr to the listener. See set_listener() (p. 1726) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

Exceptions

dds::core::Error (p. 1284)	If there is any error creating the Publisher (p. 1719)
-----------------------------------	---

8.261.3 Member Function Documentation

8.261.3.1 qos() [1/2]

```
const dds::pub::qos::PublisherQos dds::pub::Publisher::qos ( ) const [inline]
```

Gets the PublisherQos.

8.261.3.2 qos() [2/2]

```
void dds::pub::Publisher::qos (
    const dds::pub::qos::PublisherQos & the_qos ) [inline]
```

Set the PublisherQos.

This operation modifies the QoS of the **dds::pub::Publisher** (p. 1719).

The **dds::core::policy::GroupData** (p. 1335), **dds::core::policy::Partition** (p. 1652) and **dds::core::policy::EntityFactory** (p. 1272) can be changed. The other policies are immutable.

Parameters

<i>the_qos</i>	<< <i>in</i> >> (p. 157) dds::pub::qos::PublisherQos (p. 1733) to be set to. Policies must be consistent. Immutable policies cannot be changed after dds::pub::Publisher (p. 1719) is enabled. The special value PUBLISHER_QOS_DEFAULT can be used to indicate that the QoS of the dds::pub::Publisher (p. 1719) should be changed to match the current default dds::pub::qos::PublisherQos (p. 1733) set in the dds::domain::DomainParticipant (p. 1079).
----------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::ImmutablePolicyError (p. 1353), or dds::core::InconsistentPolicyError (p. 1354).
------------	---

See also

dds::pub::qos::PublisherQos (p. 1733) for rules on consistency among QoS

set_qos (abstract) (p. 1267)

Operations Allowed in Listener Callbacks (p. 1383)

8.261.3.3 operator<<()

```
Publisher & dds::pub::Publisher::operator<< (
    const dds::pub::qos::PublisherQos & the_qos ) [inline]
```

Sets the PublisherQos.

8.261.3.4 operator>>()

```
Publisher & dds::pub::Publisher::operator>> (
    dds::pub::qos::PublisherQos & the_qos ) [inline]
```

Gets the PublisherQos.

8.261.3.5 default_datawriter_qos() [1/2]

```
Publisher & dds::pub::Publisher::default_datawriter_qos (
    const dds::pub::qos::DataWriterQos & dw_qos ) [inline]
```

Sets the default DataWriterQos.

8.261.3.6 default_datawriter_qos() [2/2]

```
dds::pub::qos::DataWriterQos dds::pub::Publisher::default_datawriter_qos ( ) const [inline]
```

Gets the default DataWriterQos.

The retrieved DataWriterQos will match the set of values specified on the last call to **default_datawriter_qos(const dds::pub::qos::DataWriterQos&)** (p. 1725). If the application never called that function, the default value comes from the **dds::domain::DomainParticipant** (p. 1079).

8.261.3.7 listener() [1/2]

```
void dds::pub::Publisher::listener (
    Listener * plistener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the **Publisher** (p. 1719) listener.

[DEPRECATED] The use of **set_listener()** (p. 1726) is recommended. Unlike this function, **set_listener** receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

See also

set_listener (abstract) (p. 1268)

Parameters

<i>plistener</i>	the topic listener
<i>event_mask</i>	Changes of communication status to be invoked on the listener

8.261.3.8 listener() [2/2]

```
Listener * dds::pub::Publisher::listener ( ) const [inline]
```

Returns the listener currently associated with this **Publisher** (p. 1719).

[DEPRECATED] Use `get_listener` instead of this function.

If there's no listener it returns NULL.

8.261.3.9 set_listener() [1/2]

```
void dds::pub::Publisher::set_listener (
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this publisher.

The **Publisher** (p. 1719) will hold a `shared_ptr` to the listener argument, ensuring that it is not deleted at least until this **Publisher** (p. 1719) is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the **Publisher** (p. 1719). If it does, the application needs to manually reset the listener or manually close this **Publisher** (p. 1719) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
<i>event_mask</i>	A mask that indicates which status updates will be notified to the listener

8.261.3.10 set_listener() [2/2]

```
void dds::pub::Publisher::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets the listener associated with this publisher.

If `the_listener` is not `nullptr`, this overload is equivalent to:

```
publisher.set_listener(the_listener,
dds::core::status::StatusMask::all());
```

If `the_listener` is `nullptr`, it is equivalent to:

```
publisher.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
---------------------	---

8.261.3.11 get_listener()

```
std::shared_ptr< Listener > dds::pub::Publisher::get_listener ( ) const [inline]
```

Returns the listener currently associated with this **Publisher** (p. 1719).

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.261.3.12 wait_for_acknowledgments()

```
void dds::pub::Publisher::wait_for_acknowledgments (
    const dds::core::Duration & max_wait ) [inline]
```

Blocks the calling thread until all data written by this **Publisher** (p. 1719)'s reliable DataWriters is acknowledged, or until timeout expires.

This operation blocks the calling thread until either all data written by the reliable DataWriters entities is acknowledged by (a) all reliable **dds::sub::DataReader** (p. 756) entities that are matched and alive and (b) by all required subscriptions, or until the duration specified by the `max_wait` parameter elapses, whichever happens first. A successful completion indicates that all the samples written have been acknowledged; a timeout indicates that `max_wait` elapsed before all the data was acknowledged.

Note that if a thread is blocked in the call to this operation on a **dds::pub::Publisher** (p. 1719) and a different thread writes new samples on any of the reliable DataWriters that belong to this **Publisher** (p. 1719), the new samples must be acknowledged before unblocking the thread that is waiting on this operation.

If none of the **dds::pub::DataWriter** (p. 908) instances have **dds::core::policy::Reliability** (p. 1873) kind set to RELIABLE, the operation will complete successfully.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::NotEnabledError (p. 1601), dds::core::TimeoutError (p. 2177)
------------	---

8.261.3.13 participant()

```
const dds::domain::DomainParticipant & dds::pub::Publisher::participant ( ) const [inline]
```

Gets the DomainParticipant to which this **Publisher** (p. 1719) belongs.

8.261.3.14 wait_for_asynchronous_publishing()

```
void wait_for_asynchronous_publishing (
    const dds::core::Duration & max_wait )
```

<<**extension**>> (p. 156) Blocks the calling thread until asynchronous sending is complete.

This operation blocks the calling thread (up to `max_wait`) until all data written by the asynchronous **dds::pub::DataWriter** (p. 908) entities is sent and acknowledged (if reliable) by all matched **dds::sub::DataReader** (p. 756) entities. A successful completion indicates that all the samples written have been sent and acknowledged where applicable; if it times out, this indicates that `max_wait` elapsed before all the data was sent and/or acknowledged.

In other words, this guarantees that sending to best effort **dds::sub::DataReader** (p. 756) is complete in addition to what **dds::pub::Publisher::wait_for_acknowledgments** (p. 1727) provides.

If none of the **dds::pub::DataWriter** (p. 908) instances have **rti::core::policy::PublishMode::kind** (p. 1742) set to **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745), the operation will complete immediately .

Parameters

<i>max_wait</i>	<< in >> (p. 157) Specifies maximum time to wait for acknowledgements dds::core::Duration (p. 1194).
-----------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::NotEnabledError (p. 1601), dds::core::TimeoutError (p. 2177)
------------	---

8.261.3.15 close_contained_entities()

```
void close_contained_entities ( )
```

<<**extension**>> (p. 156) Closes all the entities created from this **Publisher** (p. 1719)

Note

This function is an extension, it must be called via the **extensions()** member function (p. 156)

Calling this function explicitly is not necessary to close a **Publisher** (p. 1719).

Deletes all contained **dds::pub::DataWriter** (p. 908) objects. Once **dds::pub::Publisher::close_contained_entities** (p. 1728) completes successfully, the application may delete the **dds::pub::Publisher** (p. 1719), knowing that it has no contained **dds::pub::DataWriter** (p. 908) objects.

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1669) if any of the contained entities is in a state where it cannot be deleted.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the Standard Exceptions (p. 228) or dds::core::PreconditionNotMetError (p. 1669).
-----	--

8.261.4 Friends And Related Function Documentation

8.261.4.1 find_publishers() [1/2]

```
template<typename PublisherForwardIterator >
uint32_t find_publishers (
    const dds::domain::DomainParticipant participant,
    PublisherForwardIterator begin,
    uint32_t max_size ) [related]
```

<<**extension**>> (p. 156) Retrieve all of the **dds::pub::Publisher** (p. 1719) created from this **dds::domain::DomainParticipant** (p. 1079)

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Template Parameters

<i>PublisherForwardIterator</i>	A forward iterator whose value type is dds::pub::Publisher (p. 1719)
---------------------------------	---

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Publishers belong to
<i>begin</i>	A forward iterator to the position in the destination container to insert the found Publishers into
<i>max_size</i>	The maximum number of Publishers to add

Returns

The number of found Publishers

See also

Looking up DataWriters (p. 115)

8.261.4.2 find_publishers() [2/2]

```
template<typename PublisherBackInsertIterator >
uint32_t find_publishers (
    const dds::domain::DomainParticipant participant,
    PublisherBackInsertIterator begin ) [related]
```

Retrieve all the **dds::pub::Publisher** (p. 1719) created from this **dds::domain::DomainParticipant** (p. 1079).

Template Parameters

<i>PublisherBackInsertIterator</i>	A back-inserting iterator whose value type is dds::pub::Publisher (p. 1719)
------------------------------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Publishers belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found Publishers in

Returns

The number of found Publishers

See also

[Looking up DataWriters](#) (p. 115)

8.261.4.3 find_publisher()

```
dds::pub::Publisher find_publisher (
    const dds::domain::DomainParticipant participant,
    const std::string & publisher_name ) [related]
```

<<*extension*>> (p. 156) Looks up a **dds::pub::Publisher** (p. 1719) by its entity name within the **dds::domain::DomainParticipant** (p. 1079).

Note

This is a standalone function in the namespace **rti::pub** (p. 523)

Every **dds::pub::Publisher** (p. 1719) in the system has an entity name which is configured and stored in the EntityName policy, **ENTITY_NAME** (p. 323).

This operation retrieves a **dds::pub::Publisher** (p. 1719) within the **dds::domain::DomainParticipant** (p. 1079) given the entity's name. If there are several **dds::pub::Publisher** (p. 1719) with the same name within the **dds::domain::DomainParticipant** (p. 1079), this function returns the first matching occurrence.

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) to look for the dds::pub::Publisher (p. 1719) in.
<i>publisher_name</i>	Entity name of the Publisher (p. 1719)

Returns

The first **Publisher** (p. 1719) found with the specified name or **dds::core::null** (p. 238) if it is not found.

See also

[Looking up DataWriters](#) (p. 115)

8.261.4.4 implicit_publisher()

```
dds::pub::Publisher implicit_publisher (
    const dds::domain::DomainParticipant & dp ) [related]
```

<<*extension*>> (p. 156) Get the implicit **dds::pub::Publisher** (p. 1719) for a given **dds::domain::DomainParticipant** (p. 1079).

Note

This is a standalone function in the namespace `rti::pub` (p. 523)

If an implicit **Publisher** (p. 1719) does not already exist, this creates one.

The implicit **Publisher** (p. 1719) is created with default `dds::pub::qos::PublisherQos` (p. 1733) and no listener. When a DomainParticipant is deleted, if there are no attached `dds::pub::DataWriter` (p. 908) that belong to the implicit **Publisher** (p. 1719), the implicit **Publisher** (p. 1719) will be implicitly deleted.

MT Safety:

UNSAFE. It is not safe to create an implicit **Publisher** (p. 1719) while another thread may be simultaneously calling `dds::domain::DomainParticipant::default_publisher_qos` (p. 1095).

Parameters

<i>dp</i>	The DomainParticipant that the implicit publisher belongs to
-----------	--

Returns

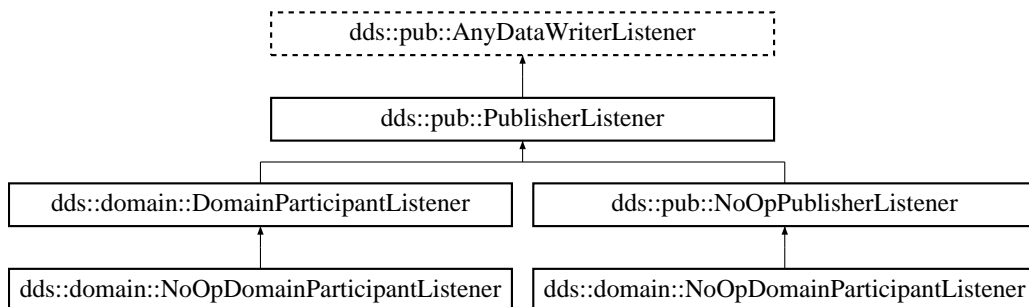

The implicit publisher

8.262 dds::pub::PublisherListener Class Reference

The listener to notify status changes for a `dds::pub::Publisher` (p. 1719).

```
#include <dds/pub/PublisherListener.hpp>
```

Inheritance diagram for `dds::pub::PublisherListener`:

**Additional Inherited Members**

8.262.1 Detailed Description

The listener to notify status changes for a `dds::pub::Publisher` (p. 1719).

A **PublisherListener** (p. 1732) contains exactly the same methods as a **AnyDataWriterListener** (p. 608), since it can receive status changes from any of its contained DataWriters.

Entity:

dds::pub::Publisher (p. 1719)

Status:

dds::core::status::StatusMask::liveliness_lost() (p. 2090), **dds::core::status::LivelinessLostStatus** (p. 1398);
dds::core::status::StatusMask::offered_deadline_missed() (p. 2086), **dds::core::status::OfferedDeadlineMissedStatus** (p. 1603);
dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::OfferedIncompatibleQosStatus** (p. 1604);
dds::core::status::StatusMask::publication_matched() (p. 2091), **dds::core::status::PublicationMatchedStatus** (p. 1717);
dds::core::status::StatusMask::reliable_reader_activity_changed() (p. 2092), **rti::core::status::ReliableReaderActivityChangedStatus** (p. 1881);
dds::core::status::StatusMask::reliable_writer_cache_changed() (p. 2092), **rti::core::status::ReliableWriterCacheChangedStatus** (p. 1883)

- std::string **to_string** (const **PublisherQos** &qos, const **rti::core::qos_print_all_t** &qos_print_all, const **rti::core::QosPrintFormat** &format= **rti::core::QosPrintFormat**())
*<<extension>> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)*
- std::ostream & **operator<<** (std::ostream &out, const **rti::pub::qos::PublisherQos** &qos)
*<<extension>> (p. 156) Prints a **dds::pub::qos::PublisherQos** (p. 1733) to an output stream.*

8.263.1 Detailed Description

<<*value-type*>> (p. 152) Container of the QoS policies that a **dds::pub::Publisher** (p. 1719) supports

8.263.2 PublisherQos Policies

A **PublisherQos** (p. 1733) contains the following policies:

- **dds::core::policy::Presentation** (p. 1670),
- **dds::core::policy::Partition** (p. 1652),
- **dds::core::policy::GroupData** (p. 1335),
- **dds::core::policy::EntityFactory** (p. 1272),
- **rti::core::policy::AsynchronousPublisher** (p. 620),
- **rti::core::policy::EntityName** (p. 1275)

To get or set policies use the **policy()** (p. 1735) getters and setters or operator << (see **examples** (p. 392)).

You must set certain members in a consistent manner:

length of **dds::core::policy::GroupData::value** (p. 1337) <= **rti::core::policy::DomainParticipantResourceLimits::publisher_group_data_max_length** (p. 1165)

length of **dds::core::policy::Partition::name** (p. 1655) <= **rti::core::policy::DomainParticipantResourceLimits::max_partitions** (p. 1167)

combined number of characters (including terminating 0) in **dds::core::policy::Partition::name** (p. 1655) <= **rti::core::policy::DomainParticipantResourceLimits::max_partition_cumulative_characters** (p. 1168)

If any of the above are not true, **dds::pub::Publisher::qos(const dds::pub::qos::PublisherQos&)** (p. 1724) and **dds::pub::Publisher::set_qos_with_profile** will fail with **dds::core::InconsistentPolicyError** (p. 1354) and the **dds::pub::Publisher** (p. 1719) constructors will fail with **dds::core::Error** (p. 1284)

Qos Use Cases (p. 391)

8.263.3 Member Function Documentation

8.263.3.1 policy() [1/3]

```
template<typename POLICY >
const POLICY & dds::pub::qos::PublisherQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

<i>Policy</i>	One of the PublisherQos Policies (p. 1734)
---------------	---

See also

Setting Qos Values (p. 392)

8.263.3.2 policy() [2/3]

```
template<typename POLICY >
POLICY & dds::pub::qos::PublisherQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

<i>Policy</i>	One of the PublisherQos Policies (p. 1734)
---------------	---

See also

Setting Qos Values (p. 392)

8.263.3.3 policy() [3/3]

```
template<typename Policy >
PublisherQos & dds::pub::qos::PublisherQos::policy (
    const Policy & p ) [inline]
```

Sets a policy.

policy() (p. 1735)

Setting Qos Values (p. 392)

8.263.3.5 operator>>()

```
template<typename Policy >
const PublisherQos & dds::pub::qos::PublisherQos::operator>> (
    Policy & p ) const [inline]
```

Copies the values of a policy.

Parameters

<i>p</i>	The destination where to copy the current value of the Policy
----------	---

See also

policy() (p. 1735)

Setting Qos Values (p. 392)

8.263.4 Friends And Related Function Documentation

8.263.4.1 swap()

```
void swap (
    PublisherQosImpl & left,
    PublisherQosImpl & right ) [related]
```

Swap the contents of two **PublisherQos** (p. 1733) objects.

Parameters

<i>left</i>	A PublisherQos (p. 1733)
<i>right</i>	The other PublisherQos (p. 1733)

8.263.4.2 to_string() [1/3]

```
std::string to_string (
    const PublisherQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
PublisherQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for PublisherQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
PublisherQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.263.4.3 to_string() [2/3]

```
std::string to_string (
    const PublisherQos & qos,
    const PublisherQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.263.4.4 to_string() [3/3]

```
std::string to_string (
    const PublisherQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::pub::qos::PublisherQos** (p. 1733)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is `rti::core::qos_print_all` (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.263.4.5 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::pub::qos::PublisherQos & qos ) [related]
```

<<*extension*>> (p. 156) Prints a `dds::pub::qos::PublisherQos` (p. 1733) to an output stream.

8.264 rti::core::policy::PublishMode Class Reference

<<*extension*>> (p. 156) Specifies whether a `dds::pub::DataWriter` (p. 908) sends data synchronously or asynchronously.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **PublishMode** ()
*Creates a **PublishMode** (p. 1739) qos policy of synchronous kind.*
- **PublishMode & kind** (const `rti::core::policy::PublishModeKind` the_kind)
Sets the publish mode (synchronous or asynchronous) for a DataWriter.
- **rti::core::policy::PublishModeKind kind** () const
Gets the publish mode.
- `std::string flow_controller_name` () const
Gets the flow controller name.
- **PublishMode & flow_controller_name** (const `std::string &name`)
Sets the flow controller name associated with a DataWriter.
- `int32_t priority` () const
Sets the priority of all samples written by a DataWriter.
- **PublishMode & priority** (`int32_t` value)
Gets the priority.

*Creates a **PublishMode** (p. 1739) qos policy of asynchronous kind with specific flow controller and priority.*

8.264.1 Detailed Description

<<**extension**>> (p. 156) Specifies whether a **dds::pub::DataWriter** (p. 908) sends data synchronously or asynchronously.

The publishing mode of a **dds::pub::DataWriter** (p. 908) determines whether data is written synchronously in the context of the user thread when calling **dds::pub::DataWriter::write()** (p. 918) or asynchronously in the context of a separate thread internal to the middleware.

Each **dds::pub::Publisher** (p. 1719) spawns a single asynchronous publishing thread (**rti::core::policy::↔AsynchronousPublisher::thread** (p. 623)) to serve all its asynchronous **dds::pub::DataWriter** (p. 908) instances.

See also

- rti::core::policy::AsynchronousPublisher** (p. 620)
- dds::core::policy::History** (p. 1346)
- rti::pub::FlowController** (p. 1316)

Entity:

- dds::pub::DataWriter** (p. 908)

Properties:

- RxO** (p. 307) = N/A
- Changeable** (p. 307) = **NO** (p. 307)

8.264.2 Usage

The fastest way for RTI Connexx to send data is for the user thread to execute the middleware code that actually sends the data itself. However, there are times when user applications may need or want an internal middleware thread to send the data instead. For instance, to send large data reliably, you must use an asynchronous thread.

When data is written asynchronously, a **rti::pub::FlowController** (p. 1316), identified by `flow_controller_name`, can be used to shape the network traffic. Shaping a data flow usually means limiting the maximum data rates at which the middleware will send data for a **dds::pub::DataWriter** (p. 908). The flow controller will buffer any excess data and only send it when the send rate drops below the maximum rate. The flow controller's properties determine when the asynchronous publishing thread is allowed to send data and how much.

Asynchronous publishing may increase latency, but offers the following advantages:

- The **dds::pub::DataWriter::write()** (p. 918) call does not make any network calls and is therefore faster and more deterministic. This becomes important when the user thread is executing time-critical code.
- When data is written in bursts or when sending large data types as multiple fragments, a flow controller can throttle the send rate of the asynchronous publishing thread to avoid flooding the network.
- Asynchronously written samples for the same destination will be coalesced into a single network packet which reduces bandwidth consumption.

The maximum number of samples that will be coalesced depends on **NDDS_Transport_Property_t::gather_send↔buffer_count_max** (p. 1523) (each sample requires at least 2-4 gather-send buffers). Performance can be improved by increasing **NDDS_Transport_Property_t::gather_send_buffer_count_max** (p. 1523). Note that the maximum value is operating system dependent.

The middleware must queue samples until they can be sent by the asynchronous publishing thread (as determined by the corresponding **rti::pub::FlowController** (p. 1316)). The number of samples that will be queued is determined by the **dds::core::policy::History** (p. 1346). When using **dds::core::policy::HistoryKind::KEEP_LAST**, only the most recent **dds::core::policy::History::depth** (p. 1349) samples are kept in the queue. Once unsent samples are removed from the queue, they are no longer available to the asynchronous publishing thread and will therefore never be sent.

8.264.3 Constructor & Destructor Documentation

8.264.3.1 PublishMode()

```
rti::core::policy::PublishMode::PublishMode ( )
```

Creates a **PublishMode** (p. 1739) qos policy of synchronous kind.

8.264.4 Member Function Documentation

8.264.4.1 Synchronous()

```
static PublishMode rti::core::policy::PublishMode::Synchronous ( ) [static]
```

Creates a **PublishMode** (p. 1739) qos policy of synchronous kind.

8.264.4.2 Asynchronous() [1/3]

```
static PublishMode rti::core::policy::PublishMode::Asynchronous ( ) [static]
```

Creates a **PublishMode** (p. 1739) qos policy of asynchronous kind with default flow controller and undefined priority.

8.264.4.3 Asynchronous() [2/3]

```
static PublishMode rti::core::policy::PublishMode::Asynchronous (
    const std::string & flow_controller_name ) [static]
```

Creates a **PublishMode** (p. 1739) qos policy of asynchronous kind with a specific flow controller and undefined priority.

8.264.4.4 Asynchronous() [3/3]

```
static PublishMode rti::core::policy::PublishMode::Asynchronous (
    const std::string & flow_controller_name,
    int32_t priority ) [static]
```

Creates a **PublishMode** (p. 1739) qos policy of asynchronous kind with specific flow controller and priority.

8.264.4.5 kind() [1/2]

```
PublishMode & rti::core::policy::PublishMode::kind (
    const rti::core::policy::PublishModeKind the_kind )
```

Sets the publish mode (synchronous or asynchronous) for a DataWriter.

[default] rti::core::policy::PublishModeKind_def::SYNCHRONOUS (p. 1745)

8.264.4.6 kind() [2/2]

```
rti::core::policy::PublishModeKind rti::core::policy::PublishMode::kind ( ) const
```

Gets the publish mode.

8.264.4.7 flow_controller_name() [1/2]

```
std::string rti::core::policy::PublishMode::flow_controller_name ( ) const
```

Gets the flow controller name.

8.264.4.8 flow_controller_name() [2/2]

```
PublishMode & rti::core::policy::PublishMode::flow_controller_name (
    const std::string & name )
```

Sets the flow controller name associated with a DataWriter.

The following builtin values are supported:

- `rti::pub::FlowController::DEFAULT_NAME` (p. 57)
- `rti::pub::FlowController::FIXED_RATE_NAME` (p. 58)
- `rti::pub::FlowController::ON_DEMAND_NAME` (p. 59)

See also

`rti::pub::FlowController::FlowController(dds::domain::DomainParticipant, const FlowControllerProperty&)` (p. 1317) `std::string&, const`

[default] `rti::pub::FlowController::DEFAULT_NAME` (p. 57)

8.264.4.9 priority() [1/2]

```
int32_t rti::core::policy::PublishMode::priority ( ) const
```

Sets the priority of all samples written by a DataWriter.

A positive integer value designating the relative priority of the **dds::pub::DataWriter** (p. 908), used to determine the transmission order of pending writes.

Use of publication priorities requires the asynchronous publisher (**rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745)) with **rti::pub::FlowControllerProperty::scheduling_policy** (p. 1323) set to **FlowControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST**.

Larger numbers have higher priority.

For multi-channel DataWriters, if the publication priority of any channel is set to any value other than **PUBLICATION_PRIORITY_UNDEFINED**, then the channel's priority will take precedence over that of the DataWriter.

For multi-channel DataWriters, if the publication priority of any channel is **PUBLICATION_PRIORITY_UNDEFINED**, then the channel will inherit the publication priority of the DataWriter.

If the publication priority of the DataWriter, and of any channel of a multi-channel DataWriter, are **PUBLICATION_PRIORITY_UNDEFINED**, then the priority of the DataWriter or DataWriter channel will be assigned the lowest priority value.

If the publication priority of the DataWriter is **PUBLICATION_PRIORITY_AUTOMATIC**, then the DataWriter will be assigned the priority of the largest publication priority of all samples in the DataWriter.

The publication priority of each sample can be set in the **rti::pub::WriteParams** (p. 2342) of the **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 949) function.

For dispose and unregister samples, use the **rti::pub::WriteParams** (p. 2342) of **dds::pub::DataWriter::dispose_instance(rti::pub::WriteParams&)** (p. 943) and **dds::pub::DataWriter::unregister_instance(rti::pub::WriteParams&)** (p. 943).

[default] PUBLICATION_PRIORITY_UNDEFINED

[range] [-1, MAX_INT]

8.264.4.10 priority() [2/2]

```
PublishMode & rti::core::policy::PublishMode::priority (
    int32_t value )
```

Gets the priority.

8.265 rti::core::policy::PublishModeKind_def Struct Reference

<<**extension**>> (p. 156) The enumeration for **PublishMode** (p. 1739) kinds

```
#include <PolicyKind.hpp>
```

Public Types

- enum **type** {
SYNCHRONOUS ,
ASYNCHRONOUS }

The underlying *enum* type.

<<*extension*>> (p. 156) The enumeration for **PublishMode** (p. 1739) kinds

8.265.2 Member Enumeration Documentation

8.265.2.1 type

```
enum rti::core::policy::PublishModeKind_def::type
```

The underlying *enum* type.

Enumerator

SYNCHRONOUS	<p>Indicates to send data synchronously. If rti::core::policy::DataWriterProtocol::push_on_write (p. 982) is true, data is sent immediately in the context of dds::pub::DataWriter::write() (p. 918). As data is sent immediately in the context of the user thread, no flow control is applied.</p> <p>See also</p> <p>rti::core::policy::DataWriterProtocol::push_on_write (p. 982)</p> <p>[default] for dds::pub::DataWriter (p. 908)</p>
ASYNCHRONOUS	<p>Indicates to send data asynchronously. Configures the dds::pub::DataWriter (p. 908) to delegate the task of data transmission to a separate publishing thread. The dds::pub::DataWriter::write() (p. 918) call does not send the data, but instead schedules the data to be sent later by its associated dds::pub::Publisher (p. 1719). Each dds::pub::Publisher (p. 1719) uses its dedicated publishing thread (rti::core::policy::AsynchronousPublisher (p. 620)) to send data for all its asynchronous DataWriters. For each asynchronous DataWriter, the associated rti::pub::FlowController (p. 1316) determines when the publishing thread is allowed to send the data. dds::pub::DataWriter::wait_for_asynchronous_publishing (p. 944) and dds::pub::Publisher::wait_for_asynchronous_publishing (p. 1728) enable you to determine when the data has actually been sent.</p> <p>See also</p> <p>rti::pub::FlowController (p. 1316)</p> <p>dds::core::policy::History (p. 1346)</p> <p>dds::pub::DataWriter::wait_for_asynchronous_publishing (p. 944)</p>
Generated by Doxygen	<p>dds::pub::Publisher::wait_for_asynchronous_publishing (p. 1728)</p> <p>NDDS_Transport_Property_t::gather_send_buffer_count_max (p. 1523)</p>

8.266 rti::core::qos_print_all_t Struct Reference

A tag type that selects the to_string overload that prints all the values of a Qos object.

```
#include <types.hpp>
```

8.266.1 Detailed Description

A tag type that selects the to_string overload that prints all the values of a Qos object.

The only value of this type is `rti::core::qos_print_all` (p. 238), and is used only as a sentinel to select one of the to_string overloads.

For example:

```
auto s = to_string(my_reader_qos, ..., rti::core::qos_print_all);
```

See `rti::sub::qos::to_string(...)`.

See also

`rti::sub::qos::to_string`

8.267 dds::core::policy::QosPolicyCount Class Reference

<<**value-type**>> (p. 152) Holds a counter for a QosPolicyId

```
#include <dds/core/policy/QosPolicyCount.hpp>
```

Public Member Functions

- **QosPolicyCount** (**QosPolicyId** the_policy_id, **int32_t** the_count)
Creates an instance with the policy ID and its counter.
- **QosPolicyId** **policy_id** () const
Gets the policy ID.
- **int32_t** **count** () const
Gets the counter.

8.267.1 Detailed Description

<<**value-type**>> (p. 152) Holds a counter for a QosPolicyId

8.267.2 Constructor & Destructor Documentation

8.267.2.1 QosPolicyCount()

```
dds::core::policy::QosPolicyCount::QosPolicyCount (
    QosPolicyId the_policy_id,
    int32_t the_count ) [inline]
```

Creates an instance with the policy ID and its counter.

8.267.3 Member Function Documentation

8.267.3.1 policy_id()

```
QosPolicyId dds::core::policy::QosPolicyCount::policy_id ( ) const [inline]
```

Gets the policy ID.

8.267.3.2 count()

```
int32_t dds::core::policy::QosPolicyCount::count ( ) const [inline]
```

Gets the counter.

8.268 rti::core::QosPrintFormat Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A collection of attributes used to configure how QoS will be formatted when converted to strings.

```
#include <rti/core/QosPrintFormat.hpp>
```

Public Member Functions

- **QosPrintFormat** ()
Initializes the properties with the default values.
- **QosPrintFormat** (unsigned int indent_in, bool print_private_in, bool is_standalone_in)
Initializes the properties.
- unsigned int **indent** () const
Get the value of indent.
- **QosPrintFormat & indent** (unsigned int value)
Set the amount of additional indent to be included when converting a QoS to a string.
- bool **print_private** () const
Get the value of print_private.
- **QosPrintFormat & print_private** (bool value)
Set whether or not to print private QoS fields.
- bool **is_standalone** () const
Get the value of is_standalone.
- **QosPrintFormat & is_standalone** (bool value)
Set whether or not to print the XML preamble.

8.268.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) A collection of attributes used to configure how QoS will be formatted when converted to strings.

8.268.2 Constructor & Destructor Documentation

8.268.2.1 QosPrintFormat() [1/2]

```
rti::core::QosPrintFormat::QosPrintFormat ( ) [inline]
```

Initializes the properties with the default values.

8.268.2.2 QosPrintFormat() [2/2]

```
rti::core::QosPrintFormat::QosPrintFormat (
    unsigned int indent_in,
    bool print_private_in,
    bool is_standalone_in ) [inline]
```

Initializes the properties.

8.268.3 Member Function Documentation

8.268.3.1 indent() [1/2]

```
unsigned int rti::core::QosPrintFormat::indent ( ) const [inline]
```

Get the value of indent.

See also

indent(unsigned int value) (p. 1749)

8.268.3.2 indent() [2/2]

```
QosPrintFormat & rti::core::QosPrintFormat::indent (
    unsigned int value ) [inline]
```

Set the amount of additional indent to be included when converting a QoS to a string.

Configures how much additional indent is applied when converting a QoS to a string. This value acts as a total offset on the string, increasing the indent which is applied to all elements by the same amount. With indent set to 0, a string representation of a QoS may appear as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

Setting the indent property to 1, the same QoS would be printed as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

I.e., the entire structure is indented.

[default] 0

Parameters

<i>value</i>	The value to set for indent
--------------	-----------------------------

8.268.3.3 print_private() [1/2]

```
bool rti::core::QosPrintFormat::print_private ( ) const [inline]
```

Get the value of print_private.

See also

print_private(bool value) (p. 1750)

8.268.3.4 print_private() [2/2]

```
QosPrintFormat & rti::core::QosPrintFormat::print_private (
    bool value ) [inline]
```

Set whether or not to print private QoS fields.

There are some QoS policies which are not intended for external use. By default, these QoS policies are only printed if they are different to the default value for that policy. When true, private policies are treated like any other policy, and printed if they are different to the supplied base QoS. These private policies cannot be parsed from XML, and are always printed as XML comments.

[default] false

Parameters

<i>value</i>	The value to set for print_private.
--------------	-------------------------------------

8.268.3.5 is_standalone() [1/2]

```
bool rti::core::QosPrintFormat::is_standalone ( ) const [inline]
```

Get the value of is_standalone.

See also

print_private(bool value) (p. 1750)

8.268.3.6 is_standalone() [2/2]

```
QosPrintFormat & rti::core::QosPrintFormat::is_standalone (
    bool value ) [inline]
```

Set whether or not to print the XML preamble.

The default value for this property (false) results in QoS being printed starting from the <ENTITY_qos> tag (where the <ENTITY_qos> tag is, e.g., <domain_participant_qos>, or, <datareader_qos>. This result cannot be directly parsed as valid XML (as it lacks <dds>, <qos_library>, and <qos_profile> tags). If is_standalone is set to true, these additional tags are printed, resulting in valid, parseable XML.

For example, with is_standalone set to false, a Qos may appear as:

```
<datareader_qos>
  <durability>
    <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
  </durability>
</datareader_qos>
```

Setting is_standalone to true would result in the same Qos being printed as:

```
<?xml version="1.0"?>
<dds xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
  <qos_library name="QosLibrary">
    <qos_profile name="QosProfile">
      <datareader_qos>
        <durability>
          <kind>TRANSIENT_LOCAL_DURABILITY_QOS</kind>
        </durability>
      </datareader_qos>
    </qos_profile>
  </qos_library>
</dds>
```

[default] false

Parameters

<i>value</i>	The value to set for <code>is_standalone</code> .
--------------	---

8.269 dds::core::QosProvider Class Reference

<<[reference-type](#)>> (p. 153) The **QosProvider** (p. 1752) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connext

8.269.1 Detailed Description

<<reference-type>> (p. 153) The **QosProvider** (p. 1752) class provides a way for a user to control and access the XML QoS profiles that are loaded by RTI Connex

A **QosProvider** (p. 1752) is created with a URI that identifies a resource from where to load the definition of:

- QoS profiles
- Type definitions
- Full XML-defined DDS systems

The URI can be:

- An XML file
- A string representation of an XML document `str:// "..."`
- A group of several files and strings (see `URL Groups` in the User's Manual)

The following example loads a file named "MyProfiles.xml" in the current directory. Then it retrieves the `DataReaderQos` from a `<qos_profile>` named "MyProfile" under a `<qos_library>` named "MyLibrary" to create a `DataReader`:

```
dds::core::QosProvider my_qos_provider("MyProfiles.xml");
dds::sub::DataReader<Foo> my_reader(
    my_subscriber,
    my_topic,
    my_qos_provider.datareader_qos("MyLibrary::MyProfile"));
```

To load type definitions, see `QosProvider::type()` (p. 1769).

To create a `DomainParticipant` and its contained entities, see `QosProvider::create_participant_from_config()` (p. 1771).

8.269.2 Selecting a QoS profile

The profile name argument is optional:

```
auto reader_qos = my_qos_provider.datareader_qos();
```

When omitted, the `QosProvider` (p. 1752) looks for a profile as follows (in order of precedence):

- The profile set with `default_profile()` (p. 1766)
- The profile set in the constructor (an optional argument)
- The `<qos_profile>` identified as the default profile with the attribute `is_default_qos=true`
- If none of the above methods have been used, a QoS object with the documented default values is returned

A `QosProvider` (p.1752) can be used in combination with functions such as `dds::pub::Publisher::default_datawriter_qos()` (p. 1725) or `dds::sub::Subscriber::default_datareader_qos()` (p. 2123) to set the profile that entities are created with by default:

```
subscriber.default_datareader_qos(
    my_qos_provider.datareader_qos("MyLibrary::MyProfile"));
// reader created with the QoS in the profile "MyLibrary::MyProfile"
dds::sub::DataReader<Foo> reader(subscriber, topic);
```

More information about QoS Profiles can be found in the `QoS Profiles` section, in the User's Manual.

8.269.3 The Default QosProvider

A special `QosProvider` (p. 1752), `QosProvider::Default()` (p. 1761) is always available to obtain the QoS profiles from the default locations, such as the file `USER_QOS_PROFILES.xml` in the current directory. For example, the following code obtains the default `DataReaderQos`:

```
dds::sub::qos::DataReaderQos default_reader_qos =
    dds::core::QosProvider::Default().datareader_qos();
```

This section in the User's Manual explains which profiles are automatically loaded by the default `QosProvider` (p. 1752).

The profiles that `QosProvider::Default()` (p. 1761) loads can be configured with `rti::core::default_qos_provider_params()` (p. 498).

`QosProvider::Default()` (p. 1761) also determines the default values for `<participant_factory_qos>`, which can be used to configure logging.

8.269.4 Built-in QoS Profiles

Any **QosProvider** (p. 1752), including the default **QosProvider** (p. 1752), has access to the **Builtin QoS Profiles** (p. 258). For example, to obtain the `DataWriterQoS` from the "strict reliable" built-in profile:

```
auto strict_reliable_writer_qos =
    dds::core::QosProvider::Default().datawriter_qos(
        rti::core::builtin_profiles::qos_lib::generic_strict_reliable());
```

8.269.5 Specifying a Topic Filter

XML QoS definitions can specify a `topic_filter` attribute. Several functions (such as `datareader_qos_w_topic_name()` (p. 1764)) receive a `topic_name` argument. When these functions look for the QoS, they will try to match the `topic_name` against the `topic_filters`, if they are used. See the [Topic Filters](#) section in the User's Manual.

See also

For more examples, see [Qos Provider Use Cases](#) (p. 393)

8.269.6 Constructor & Destructor Documentation

8.269.6.1 QosProvider() [1/2]

```
dds::core::QosProvider::QosProvider (
    const std::string & uri,
    const std::string & profile ) [inline]
```

Create a **QosProvider** (p. 1752) fetching QoS configuration from the specified URI.

For instance, the following code:

```
dds::core::QosProvider xml_file_provider(
    "file:///somewhere/on/disk/qos-config.xml", "MyLibrary::MyProfile");
```

will create a **QosProvider** (p. 1752) which loads all of the QoS profiles from `qos-config.xml` and uses "MyLibrary::MyProfile" as the default profile when the profile argument to the **QosProvider** (p. 1752) getters is omitted, as described in [Selecting a QoS profile](#) (p. 1755).

Parameters

<i>uri</i>	The URI describing the location of the QoS profiles to load.
<i>profile</i>	The QoS profile to set as the default, overriding any <code>is_default_qos</code> tag in the loaded XML file.

8.269.6.2 QosProvider() [2/2]

```
dds::core::QosProvider::QosProvider (
    const std::string & uri ) [inline], [explicit]
```

Create a **QosProvider** (p. 1752) fetching QoS configuration from the specified URI.

For instance, the following code:

```
QosProvider xml_file_provider("file:///somewhere/on/disk/qos-config.xml");
```

will create a **QosProvider** (p. 1752) which loads all of the QoS profiles from qos-config.xml. When the profile argument to the **QosProvider** (p. 1752) getters is omitted, the default profile is determined as described in **Selecting a QoS profile** (p. 1755).

Parameters

<i>uri</i>	The URI describing the location of the QoS profiles to load. If no <code>is_default_qos</code> tag is found in the QoS profiles, then no profile will be set as default. Instead, the QosProvider (p. 1752) will be associated with the DDS default QoS values until a default profile is set using the <code>default_library</code> and <code>default_profile</code> methods.
------------	---

8.269.7 Member Function Documentation

8.269.7.1 participant_qos() [1/2]

```
const dds::domain::qos::DomainParticipantQos dds::core::QosProvider::participant_qos ( ) [inline]
```

Get the **dds::domain::qos::DomainParticipantQos** (p. 1136) in the default profile.

See **Selecting a QoS profile** (p. 1755) for information on how the default profile is chosen.

Returns

The **DomainParticipantQos**

8.269.7.2 participant_qos() [2/2]

```
const dds::domain::qos::DomainParticipantQos dds::core::QosProvider::participant_qos (
    const std::string & profile ) [inline]
```

Get the **DomainParticipantQos** from a QoS profile.

Parameters

<i>profile</i>	The profile from which to get the DomainParticipantQos, for example "MyLibrary::MyProfile"
----------------	--

Returns

The DomainParticipantQos that is located in the specified profile

8.269.7.3 topic_qos() [1/2]

```
const dds::topic::qos::TopicQos dds::core::QosProvider::topic_qos ( ) [inline]
```

Get the **dds::topic::qos::TopicQos** (p. 2213) in the default profile.

See **Selecting a QoS profile** (p. 1755) for information on how the default profile is chosen.

Returns

The TopicQos

8.269.7.4 topic_qos() [2/2]

```
const dds::topic::qos::TopicQos dds::core::QosProvider::topic_qos (
    const std::string & profile ) [inline]
```

Get the **dds::topic::qos::TopicQos** (p. 2213) from a QoS profile.

Parameters

<i>profile</i>	The profile from which to get the TopicQos, for example "MyLibrary::MyProfile"
----------------	--

Returns

The TopicQos that is located in the specified profile

8.269.7.5 subscriber_qos() [1/2]

```
const dds::sub::qos::SubscriberQos dds::core::QosProvider::subscriber_qos ( ) [inline]
```

Get the `dds::sub::qos::SubscriberQos` (p. 2129) in the default profile.

See **Selecting a QoS profile** (p. 1755) for information on how the default profile is chosen.

Returns

The `SubscriberQos`

8.269.7.6 subscriber_qos() [2/2]

```
const dds::sub::qos::SubscriberQos dds::core::QosProvider::subscriber_qos (
    const std::string & profile ) [inline]
```

Get the `dds::sub::qos::SubscriberQos` (p. 2129) from a QoS profile.

Parameters

<i>profile</i>	The profile from which to get the <code>SubscriberQos</code> , for example <code>"MyLibrary:MyProfile"</code>
----------------	---

Returns

The `SubscriberQos` that is located in the specified profile

8.269.7.7 datareader_qos() [1/2]

```
const dds::sub::qos::DataReaderQos dds::core::QosProvider::datareader_qos ( ) [inline]
```

Get the `dds::sub::qos::DataReaderQos` (p. 848) in the default profile.

See **Selecting a QoS profile** (p. 1755) for information on how the default profile is chosen.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See `datareader_qos_↔w_topic_name()` (p. 1764).

Returns

The `DataReaderQos`

8.269.7.8 datareader_qos() [2/2]

```
const dds::sub::qos::DataReaderQos dds::core::QosProvider::datareader_qos (
    const std::string & profile ) [inline]
```

Get the **dds::sub::qos::DataReaderQos** (p. 848) from a QoS profile.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See **datareader_qos_w_topic_name()** (p. 1764).

Parameters

<i>profile</i>	The profile from which to get the DataReaderQos, for example "MyLibrary::MyProfile"
----------------	---

Returns

The DataReaderQos that is located in the specified profile

8.269.7.9 publisher_qos() [1/2]

```
const dds::pub::qos::PublisherQos dds::core::QosProvider::publisher_qos ( ) [inline]
```

Get the **dds::pub::qos::PublisherQos** (p. 1733) in the default profile.

See **Selecting a QoS profile** (p. 1755) for information on how the default profile is chosen.

Returns

The PublisherQos

8.269.7.10 publisher_qos() [2/2]

```
dds::pub::qos::PublisherQos dds::core::QosProvider::publisher_qos (
    const std::string & profile ) [inline]
```

Get the **dds::pub::qos::PublisherQos** (p. 1733) from a QoS profile.

Parameters

<i>profile</i>	The profile from which to get the PublisherQos, for example "MyLibrary::MyProfile"
----------------	--

Returns

The PublisherQos that is located in the specified profile

8.269.7.11 datawriter_qos() [1/2]

```
const dds::pub::qos::DataWriterQos dds::core::QosProvider::datawriter_qos ( ) [inline]
```

Get the **dds::pub::qos::DataWriterQos** (p. 994) from the default profile.

See **Selecting a QoS profile** (p. 1755) for information on how the default profile is chosen.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See **datawriter_qos_w↔_topic_name()** (p. 1765).

Returns

The DataWriterQos

8.269.7.12 datawriter_qos() [2/2]

```
const dds::pub::qos::DataWriterQos dds::core::QosProvider::datawriter_qos (
    const std::string & profile ) [inline]
```

Get the **dds::pub::qos::DataWriterQos** (p. 994) from a QoS profile.

Note

This function doesn't take into account the `topic_filter` used in the profile, if any. See **datawriter_qos_w↔_topic_name()** (p. 1765).

Parameters

<i>profile</i>	The profile from which to get the DataWriterQos, for example "MyLibrary::MyProfile"
----------------	---

Returns

The DataWriterQos that is located in the specified profile

8.269.7.13 Default()

```
static QosProvider dds::core::QosProvider::Default ( ) [inline], [static]
```

Get the default **QosProvider** (p. 1752).

The default **QosProvider** (p. 1752) automatically loads XML QoS, types and application profiles from several predetermined locations, such as the file USER_QOS_PROFILES.xml in the current working directory.

Returns

The Default **QosProvider** (p. 1752)

See also

The Default QosProvider (p. 1755)

Default QoS (p. 1267)

Default QosProvider Use Cases (p. 394)

8.269.7.14 reset_default()

```
static void dds::core::QosProvider::reset_default ( ) [inline], [static]
```

Reset the default settings of the default **QosProvider** (p. 1752).

If you change the default library or profile associated with the default **QosProvider** (p. 1752), calling `reset_default` will set the library and profile back to the default values.

8.269.7.15 default_provider_params() [1/2]

```
static rti::core::QosProviderParams default_provider_params ( ) [static]
```

<<*extension*>> (p. 156) (deprecated) Get the **rti::core::QosProviderParams** (p. 1773) for the default **QosProvider** (p. 1752)

[DEPRECATED] Use **rti::core::default_qos_provider_params()** (p. 498)

Returns

rti::core::QosProviderParams (p. 1773)

8.269.7.16 default_provider_params() [2/2]

```
static void default_provider_params (
    const rti::core::QosProviderParams & params ) [static]
```

<<*extension*>> (p. 156) (deprecated) Set the **rti::core::QosProviderParams** (p. 1773) for the default **QosProvider** (p. 1752)

[DEPRECATED] Use **rti::core::default_qos_provider_params()** (p. 498)

Parameters

<i>params</i>	The QosProviderParams to set
---------------	------------------------------

8.269.7.17 topic_qos_w_topic_name() [1/2]

```
const dds::topic::qos::TopicQos topic_qos_w_topic_name (
    const std::string & profile,
    const std::string & topic_name ) const
```

<<**extension**>> (p. 156) Get the **dds::topic::qos::TopicQos** (p. 2213) for a topic name in a given profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The TopicQos will be found based on the given profile name and topic name.

Parameters

<i>profile</i>	The profile where the QosProvider (p. 1752) should look for the TopicQos
<i>topic_name</i>	The topic name used to select a qos within the profile, if the <i>topic_filter</i> attribute is used

Returns

dds::topic::qos::TopicQos (p. 2213) The TopicQos that is located in the specified profile

8.269.7.18 topic_qos_w_topic_name() [2/2]

```
const dds::topic::qos::TopicQos topic_qos_w_topic_name (
    const std::string & topic_name ) const
```

<<**extension**>> (p. 156) Get the **dds::topic::qos::TopicQos** (p. 2213) for a topic name in the default profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The TopicQos will be found based on the given topic name and must be located in the default profile (see **Selecting a QoS profile** (p. 1755) for information on how the default profile is determined).

Parameters

<i>topic_name</i>	The topic name used to select a qos within the profile, if the <code>topic_filter</code> attribute is used
-------------------	--

Returns

dds::topic::qos::TopicQos (p. 2213) The TopicQos that is located in the specified profile

8.269.7.19 datareader_qos_w_topic_name() [1/2]

```
const dds::sub::qos::DataReaderQos datareader_qos_w_topic_name (
    const std::string & profile,
    const std::string & topic_name ) const
```

<<**extension**>> (p. 156) Get the **dds::sub::qos::DataReaderQos** (p. 848) for a topic name in a given profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The DataReaderQos will be found based on the given profile name and topic name.

Parameters

<i>profile</i>	The profile where the QosProvider (p. 1752) should look for the DataReaderQos
<i>topic_name</i>	The topic name used to select a qos within the profile, if the <code>topic_filter</code> attribute is used

Returns

dds::sub::qos::DataReaderQos (p. 848) The DataReaderQos that is located in the specified profile

8.269.7.20 datareader_qos_w_topic_name() [2/2]

```
const dds::sub::qos::DataReaderQos datareader_qos_w_topic_name (
    const std::string & topic_name ) const
```

<<**extension**>> (p. 156) Get the **dds::sub::qos::DataReaderQos** (p. 848) for a topic name in the default profile.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The DataReaderQos will be found based on the given topic name and must be located in the default profile (see **Selecting a QoS profile** (p. 1755) for information on how the default profile can be determined).

Parameters

<i>topic_name</i>	The topic name used to select a qos within the profile, if the <code>topic_filter</code> attribute is used
-------------------	--

Returns

dds::sub::qos::DataReaderQos (p. 848) The DataReaderQos that is located in the specified profile

8.269.7.21 datawriter_qos_w_topic_name() [1/2]

```
const dds::pub::qos::DataWriterQos datawriter_qos_w_topic_name (
    const std::string & profile,
    const std::string & topic_name ) const
```

<<**extension**>> (p. 156) Get the **dds::pub::qos::DataWriterQos** (p. 994) for a topic name.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The DataWriterQos will be found based on the given profile name and topic name.

Parameters

<i>profile</i>	The profile where the QosProvider (p. 1752) should look for the DataWriterQos
<i>topic_name</i>	The topic name used to select a qos within the profile, if the <code>topic_filter</code> attribute is used

Returns

dds::pub::qos::DataWriterQos (p. 994) The DataWriterQos that is located in the specified profile

8.269.7.22 datawriter_qos_w_topic_name() [2/2]

```
const dds::pub::qos::DataWriterQos datawriter_qos_w_topic_name (
    const std::string & topic_name ) const
```

<<**extension**>> (p. 156) Get the **dds::pub::qos::DataWriterQos** (p. 994) for a topic name.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The DataWriterQos will be found based on the given topic name and must be located in the current default profile associated with the **QosProvider** (p. 1752).

Parameters

<i>topic_name</i>	The topic name used to select a qos within the profile, if the <code>topic_filter</code> attribute is used
-------------------	--

Returns

dds::pub::qos::DataWriterQos (p. 994) The DataWriterQos that is located in the specified profile

8.269.7.23 default_library() [1/2]

```
void default_library (
    const std::string & library_name )
```

<<**extension**>> (p. 156) Set the default library for this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

After a default library is set, the functions that expect a `profile` argument don't need the library name prefix. For example:

```
auto reader_qos = qos_provider.datareader_qos("MyLibrary::MyProfile");
// This has the same effect:
qos_provider.extensions().default_library("MyLibrary");
reader_qos = qos_provider.datareader_qos("MyProfile");
```

Parameters

<i>library_name</i>	The library to set as the default, or <code>rti::core::USE_DDS_DEFAULT_QOS_PROFILE</code> to unset the default library and use the system default.
---------------------	--

8.269.7.24 default_profile() [1/2]

```
void default_profile (
    const std::string & profile_name )
```

<<**extension**>> (p. 156) Set the default profile for this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

When a default profile is set, the getters that don't receive a profile argument retrieve the QoS object from this profile (see **Selecting a QoS profile** (p. 1755)).

The profile must be located in the current default library unless the library is also specified in the name.

Parameters

<i>profile_name</i>	The profile to set as the default in the form "MyLibrary::MyProfile", or if the default_library() (p. 1766) is also set, "MyProfile". The special value <code>rti::core::USE_DDS_DEFAULT_QOS_PROFILE</code> unsets a previously set default profile.
---------------------	---

8.269.7.25 default_library() [2/2]

```
rti::core::optional_value< std::string > default_library ( ) const
```

<<**extension**>> (p. 156) Get the default library associated with this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

There may not be a default library set. The default library is the library that is checked in when setting the default profile if no library name is explicitly given. The default library is configurable.

Returns

rti::core::optional_value<std::string> The default library.

8.269.7.26 default_profile() [2/2]

```
rti::core::optional_value< std::string > default_profile ( ) const
```

<<**extension**>> (p. 156) Get the default profile associated with this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

There may not be a default profile set.

Returns

rti::core::optional_value<std::string> The default profile.

8.269.7.27 default_profile_library()

```
rti::core::optional_value< std::string > default_profile_library ( ) const
```

<<**extension**>> (p. 156) Get the default profile library associated with this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

There may not be a default profile library set. The default profile library is the library in which the default profile resides and is not necessarily the same library as the one returned from **default_library()** (p. 1766). The default profile library is not configurable.

Returns

rti::core::optional_value<std::string> The default profile library.

8.269.7.28 qos_profile_libraries()

```
dds::core::StringSeq qos_profile_libraries ( ) const
```

<<**extension**>> (p. 156) Get a list of the QoS profile libraries loaded by this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Returns

dds::core::StringSeq (p. 236) A list of the currently loaded QoS profile libraries.

8.269.7.29 qos_profiles()

```
dds::core::StringSeq qos_profiles (
    const std::string & library_name ) const
```

<<**extension**>> (p. 156) Get a list of the QoS profiles located in the default library of this **QosProvider** (p. 1752).

Returns

dds::core::StringSeq (p. 236) A list of profiles.

8.269.7.30 profiles_loaded()

```
bool profiles_loaded ( ) const
```

<<**extension**>> (p. 156) Check if the profiles are loaded by this **QosProvider** (p. 1752)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Returns

bool false if the profiles are not loaded, true otherwise.

8.269.7.31 type()

```
const dds::core::xtypes::DynamicType & type (
    const std::string & type_name ) const
```

<<**extension**>> (p. 156) Load a type

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Parameters

<i>type_name</i>	The name of the type
------------------	----------------------

This function loads a type from its XML definition under the tags <dds><types>.

See also

Example (p. 399).

8.269.7.32 provider_params() [1/2]

```
rti::core::QosProviderParams provider_params ( ) const
```

<<**extension**>> (p. 156) Get the **QosProvider** (p. 1752) params for this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Returns

rti::core::QosProviderParams (p. 1773) The QosProviderParams for this **QosProvider** (p. 1752).

8.269.7.33 provider_params() [2/2]

```
void provider_params (
    const rti::core::QosProviderParams & provider_params )
```

<<**extension**>> (p. 156) Set the **rti::core::QosProviderParams** (p. 1773) for this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Parameters

<i>provider_params</i>	The QosProviderParams to set.
------------------------	-------------------------------

8.269.7.34 load_profiles()

```
void load_profiles ( )
```

<<**extension**>> (p. 156) Load the XML QoS profiles.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The XML QoS profiles are loaded implicitly after the first **dds::domain::DomainParticipant** (p. 1079) is created or explicitly, after a call to this function. This method has the same effect as **reload_profiles()** (p. 1770).

8.269.7.35 reload_profiles()

```
void reload_profiles ( )
```

<<**extension**>> (p. 156) Reload the XML QoS profiles.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The XML QoS profiles are loaded implicitly after the first DomainParticipant is created or explicitly, after a call to this function. This method has the same effect as **load_profiles()** (p. 1770).

8.269.7.36 unload_profiles()

```
void unload_profiles ( )
```

<<*extension*>> (p. 156) Unload the XML QoS profiles.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The resources associated with the XML QoS profiles are freed. Any reference to the profiles after calling this function will fail with an **Exception** (p. 1291).

8.269.7.37 create_participant_from_config()

```
dds::domain::DomainParticipant create_participant_from_config (
    const std::string & config_name,
    const rti::domain::DomainParticipantConfigParams & params = rti::domain::Domain←
ParticipantConfigParams() )
```

<<*extension*>> (p. 156) Creates a **dds::domain::DomainParticipant** (p. 1079) given its configuration name from a description provided in an XML configuration file that has been loaded by this **QosProvider** (p. 1752).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This operation creates a **dds::domain::DomainParticipant** (p. 1079) registering all the necessary data types and creating all the contained entities (**dds::topic::Topic** (p. 2178), **dds::pub::Publisher** (p. 1719), **dds::sub::Subscriber** (p. 2116), **dds::pub::DataWriter** (p. 908), **dds::sub::DataReader** (p. 756)) from a description given in an XML configuration file.

The configuration name is the fully qualified name of the XML participant object, consisting of the name of the participant library plus the name of participant configuration.

For example the name "MyParticipantLibrary::PublicationParticipant" can be used to create the domain participant from the description in an XML file with contents shown in the snippet below:

```
<participant_library name="MyParticipantLibrary">
    <domain_participant name="PublicationParticipant" domain_ref="MyDomainLibrary::HelloWorldDomain">
        <publisher name="MyPublisher">
            <data_writer name="HelloWorldWriter" topic_ref="HelloWorldTopic"/>
        </publisher>
    </domain_participant>
</participant_library>
```

The entities belonging to the newly created **dds::domain::DomainParticipant** (p. 1079) can be retrieved with the help of lookup operations such as: **rti::sub::find_datareader_by_name** (p. 549).

MT Safety:

Safe.

See also

rti::domain::find_participant_by_name (p. 518)

dds::topic::find() (p. 482)

rti::pub::find_publisher (p. 531)

rti::sub::find_subscriber (p. 545)

rti::sub::find_datareader_by_name (p. 549)

rti::pub::find_datawriter_by_name (p. 535)

rti::pub::find_datawriter_by_name (p. 535)

rti::sub::find_datareader_by_name (p. 549)

Parameters

<i>config_name</i>	Name of the participant configuration in the XML file.
<i>params</i>	input parameters that allow changing some properties of the configuration referred to by <i>config_name</i> . Specifically, <i>params</i> allows overriding the domain ID, participant name, and entities QoS specified in the XML configuration.

8.269.8 Friends And Related Function Documentation

8.269.8.1 USE_DDS_DEFAULT_QOS_PROFILE

```
const char* USE_DDS_DEFAULT_QOS_PROFILE [related]
```

Special value to select the default QoS profile.

8.269.8.2 create_qos_provider_ex()

```
dds::core::detail::QosProvider create_qos_provider_ex (
    const rti::core::QosProviderParams & params ) [related]
```

<<**extension**>> (p. 156) Creates a **QosProvider** (p. 1752) with parameters

Note

This is a standalone function in the namespace **rti::core** (p. 489)

A **dds::core::QosProvider** (p. 1752) is usually created with one of its constructors, but this extension function allows configuring certain parameters. By default a **QosProvider** (p. 1752) loads the profiles from certain standard locations; this function allows, for example, disabling that behavior.

8.269.8.3 default_qos_provider_params() [1/2]

QosProviderParams default_qos_provider_params () [related]

<<**extension**>> (p. 156) Get the **rti::core::QosProviderParams** (p. 1773) for the default **QosProvider** (p. 1752)

Note

This is a standalone function in the namespace **rti::core** (p. 489)

Returns

rti::core::QosProviderParams (p. 1773)

8.269.8.4 default_qos_provider_params() [2/2]

```
void default_qos_provider_params (
    const rti::core::QosProviderParams & params ) [related]
```

<<**extension**>> (p. 156) Set the **rti::core::QosProviderParams** (p. 1773) for the default **QosProvider** (p. 1752)

Note

This is a standalone function in the namespace **rti::core** (p. 489)

Use this function to configure the profiles that **dds::core::QosProvider::Default()** (p. 1761) loads.

```
rti::core::QosProviderParams params;
params.url_profile({"my_profiles.xml"});
rti::core::default_qos_provider_params(params);
auto participant_qos =
    dds::core::QosProvider::Default().participant_qos("my_library:my_profile");
```

Parameters

<i>params</i>	The QosProviderParams to set
---------------	------------------------------

8.270 rti::core::QosProviderParams Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Configure options that control the way that XML documents containing QoS profiles are loaded by a **dds::core::QosProvider** (p. 1752).

```
#include <rti/core/QosProviderParams.hpp>
```

8.270.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Configure options that control the way that XML documents containing QoS profiles are loaded by a **dds::core::QosProvider** (p. 1752).

All QoS values for Entities can be configured in QoS profiles defined in XML documents. XML documents can be passed to RTI Connex in string form or, more likely, through files found on a file system.

There are also default locations where DomainParticipants will look for files to load QoS profiles. These include the current working directory from where an application is started, a file in the distribution directory for RTI Connex, and the locations specified by an environment variable.

You may disable any or all of these default locations using the Profile QoS policy.

Note: This class is equivalent to **DDS_ProfileQosPolicy** the other RTI Connex language APIs.

8.270.2 Constructor & Destructor Documentation

8.270.2.1 QosProviderParams()

```
rti::core::QosProviderParams::QosProviderParams ( ) [inline]
```

Create a **QosProviderParams** (p. 1773) with default settings.

8.270.3 Member Function Documentation

8.270.3.1 string_profile() [1/2]

```
const dds::core::StringSeq rti::core::QosProviderParams::string_profile ( ) const
```

Get the current list of string profiles stored by this **QosProviderParams** (p. 1773).

Returns

dds::core::StringSeq (p. 236) The list of string profiles.

8.270.3.2 string_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::string_profile (
    const dds::core::StringSeq & the_string_profile )
```

Set the current list of string profiles stored by this **QosProviderParams** (p. 1773).

Parameters

<i>the_string_profile</i>	A sequence of strings containing an XML document to load. The concatenation of the strings in this sequence must be a valid XML document according to the XML QoS profile schema.
---------------------------	---

[default] An empty list

8.270.3.3 url_profile() [1/2]

```
const dds::core::StringSeq rti::core::QosProviderParams::url_profile ( ) const
```

Get the current list of **URL groups** (p. 105) stored by this **QosProviderParams** (p. 1773).

Returns

dds::core::StringSeq (p. 236) The list of string profiles.

8.270.3.4 url_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::url_profile (
    const dds::core::StringSeq & the_url_profile )
```

Set the current list of **URL groups** (p. 105) stored by this **QosProviderParams** (p. 1773).

Parameters

<i>the_url_profile</i>	Sequence of URL groups (p. 105) containing a set of XML documents to load. Only one of the elements of each group will be loaded by RTI Connex, starting from the left.
------------------------	--

[default] An empty list

8.270.3.5 ignore_user_profile() [1/2]

```
bool rti::core::QosProviderParams::ignore_user_profile ( ) const
```

Get the value that is currently set for ignore_user_profile.

Returns

bool Whether or not the **dds::core::QosProvider** (p. 1752) set with these **QosProviderParams** (p. 1773) will ignore the USER_QOS_PROFILES.xml.

8.270.3.6 ignore_user_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::ignore_user_profile (
    bool the_ignore_user_profile )
```

Choose whether or not to ignore USER_QOS_PROFILES.xml.

When this field is set to true, the QoS profiles contained in the file USER_QOS_PROFILES.xml in the current working directory will not be loaded.

Parameters

<i>the_ignore_user_profile</i>	Whether or not to ignore the USER_QOS_PROFILES.xml in the current working directory.
--------------------------------	--

Returns

QosProviderParams (p. 1773)& This **QosProviderParams** (p. 1773)

[default] false

8.270.3.7 ignore_environment_profile() [1/2]

```
bool rti::core::QosProviderParams::ignore_environment_profile ( ) const
```

Get the value that is currently set for ignore_environment_profile.

Returns

bool Whether or not the **dds::core::QosProvider** (p.1752) set with these **QosProviderParams** (p.1773) will ignore the **NDDS_QOS_PROFILES** (p.106).

8.270.3.8 ignore_environment_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::ignore_environment_profile (
    bool the_ignore_environment_profile )
```

Choose whether or not to ignore the **NDDS_QOS_PROFILES** (p.106).

When this field is set to true, the QoS profiles pointed to by the **NDDS_QOS_PROFILES** (p.106) will not be loaded.

Parameters

<i>the_ignore_environment_profile</i>	Whether or not to ignore NDDS_QOS_PROFILES (p.106).
---------------------------------------	--

Returns

QosProviderParams (p.1773)& This **QosProviderParams** (p.1773)

[default] false

8.270.3.9 ignore_resource_profile() [1/2]

```
bool rti::core::QosProviderParams::ignore_resource_profile ( ) const
```

Get the value that is currently set for ignore_resource_profile.

Returns

bool Whether or not the **dds::core::QosProvider** (p.1752) set with these **QosProviderParams** (p.1773) will ignore NDDS_QOS_PROFILES.xml.

8.270.3.10 ignore_resource_profile() [2/2]

```
QosProviderParams & rti::core::QosProviderParams::ignore_resource_profile (
    bool the_ignore_resource_profile )
```

Choose whether or not to ignore NDDS_QOS_PROFILES.xml.

When this field is set to true, the QoS profiles contained in the file NDDS_QOS_PROFILES.xml in \$← NDDSHOME/resource/qos_profiles_../xml will not be loaded.

Parameters

<i>the_ignore_resource_profile</i>	Whether or not to ignore the NDDS_QOS_PROFILES.xml.
------------------------------------	---

Returns

QosProviderParams (p. 1773)& This **QosProviderParams** (p. 1773)

[default] false

8.271 dds::sub::Query Class Reference

<<**value-type**>> (p. 152) Encapsulates a query for a **dds::sub::cond::QueryCondition** (p. 1784).

```
#include <dds/sub/Query.hpp>
```

- const **AnyDataReader** & **data_reader** () const

*Gets the related **DataReader** (p. 756).*

8.271.1 Detailed Description

<<*value-type*>> (p. 152) Encapsulates a query for a **dds::sub::cond::QueryCondition** (p. 1784).

A query contains the **DataReader** (p. 756) to query data from, an expression and optionally a list of parameters.

Queries and Filters Syntax (p. 82) defines the syntax of the expression and the parameters.

See also

Filtering with Query Conditions (p. 133)

8.271.2 Constructor & Destructor Documentation

8.271.2.1 Query() [1/3]

```
template<typename T >
dds::sub::Query::Query (
    const dds::sub::DataReader< T > & reader,
    const std::string & query_expression ) [inline]
```

Creates a query.

Template Parameters

<i>T</i>	The topic-type of the DataReader (p. 756)
----------	--

Parameters

<i>reader</i>	DataReader (p. 756) to query data from
<i>query_expression</i>	Expression describing the query

8.271.2.2 Query() [2/3]

```
template<typename T , typename FWIterator >
dds::sub::Query::Query (
    const dds::sub::DataReader< T > & reader,
    const std::string & query_expression,
    const FWIterator & params_begin,
    const FWIterator & params_end ) [inline]
```

Creates a query with the expression parameters in an iterator range.

Template Parameters

<i>T</i>	The topic-type of the DataReader (p. 756)
<i>FWIterator</i>	A forward iterator whose value type is std::string (or convertible to std::string)

Parameters

<i>reader</i>	DataReader (p. 756) to query data from
<i>query_expression</i>	Expression describing the query
<i>params_begin</i>	The beginning of a range of parameters for the query expression
<i>params_end</i>	The end of the range

8.271.2.3 Query() [3/3]

```
template<typename T >
dds::sub::Query::Query (
    const dds::sub::DataReader< T > & reader,
    const std::string & query_expression,
    const std::vector< std::string > & params ) [inline]
```

Creates a query with the expression parameters in a vector.

Template Parameters

<i>T</i>	The topic-type of the DataReader (p. 756)
----------	--

Parameters

<i>reader</i>	DataReader (p. 756) to query data from
<i>query_expression</i>	Expression describing the query
<i>params</i>	The parameters for the query expression

8.271.3 Member Function Documentation

8.271.3.1 expression()

```
const std::string & dds::sub::Query::expression ( ) const [inline]
```

Gets the expression.

8.271.3.2 begin() [1/2]

```
const_iterator dds::sub::Query::begin ( ) const [inline]
```

Provides the begin iterator to the parameter list.

Returns

A random-access iterator whose value type is `std::string`

8.271.3.3 end() [1/2]

```
const_iterator dds::sub::Query::end ( ) const [inline]
```

Provides the end iterator to the parameter list.

Returns

A random-access iterator whose value type is `std::string`

8.271.3.4 begin() [2/2]

```
iterator dds::sub::Query::begin ( ) [inline]
```

Provides the begin iterator to the parameter list.

Returns

A random-access iterator whose value type is `std::string`

8.271.3.5 end() [2/2]

```
iterator dds::sub::Query::end ( ) [inline]
```

Provides the end iterator to the parameter list.

Returns

A random-access iterator whose value type is `std::string`

8.271.3.6 parameters() [1/2]

```
template<typename FWIterator >
void dds::sub::Query::parameters (
    const FWIterator & the_begin,
    const FWIterator the_end ) [inline]
```

Sets the parameters for the expression.

Template Parameters

<i>FWIterator</i>	A forward iterator whose value type is <code>std::string</code> (or convertible to <code>std::string</code>)
-------------------	---

Parameters

<i>the_begin</i>	The beginning of a range of parameters for the query expression
<i>the_end</i>	The end of the range

8.271.3.7 add_parameter()

```
void dds::sub::Query::add_parameter (
    const std::string & param ) [inline]
```

Appends a parameter.

8.271.3.8 parameters_length()

```
size_t dds::sub::Query::parameters_length ( ) const [inline]
```

Gets the number of parameters.

8.271.3.9 parameters() [2/2]

```
const std::vector< std::string > & dds::sub::Query::parameters ( ) const
```

<<*extension*>> (p. 156) Gets the parameters

8.271.3.10 name() [1/2]

```
std::string dds::sub::Query::name ( ) const
```

<<*extension*>> (p. 156) Gets the filter name

Returns

The name of the filter, or an empty string when using the default SQL filter.

8.271.3.11 name() [2/2]

```
dds::sub::Query & dds::sub::Query::name (
    const std::string & the_name )
```

<<*extension*>> (p. 156) Sets a filter name

You can use one of the built-in filters (**rti::topic::sql_filter_name** (p. 48) and **rti::topic::stringmatch_filter_name** (p. 48)), or a custom filter, which you need to register using **dds::domain::DomainParticipant::register_contentfilter()** (p. 1103).

[default] Empty string (equivalent to **rti::topic::sql_filter_name** (p. 48))

8.271.3.12 data_reader()

```
const AnyDataReader & dds::sub::Query::data_reader ( ) const [inline]
```

Gets the related **DataReader** (p. 756).

8.272 dds::sub::cond::QueryCondition Class Reference

<<*reference-type*>> (p. 153) Specialized **ReadCondition** (p. 1858) that allows applications to also specify a filter on the data available in a **dds::sub::DataReader** (p. 756)

```
#include <dds/sub/cond/QueryCondition.hpp>
```

Inheritance diagram for dds::sub::cond::QueryCondition:

Public Types

- typedef DELEGATE::iterator **iterator**
Parameter iterator. A random-access iterator of std::string.
- typedef DELEGATE::const_iterator **const_iterator**
Parameter iterator. A random-access iterator of std::string.

Public Member Functions

- **QueryCondition** (const **dds::sub::Query** &query, const **dds::sub::status::DataState** &status)
Creates a **QueryCondition** (p. 1784).
- template<typename Functor >
QueryCondition (const **dds::sub::Query** &query, const **dds::sub::status::DataState** &status, const Functor &functor)
Creates a **QueryCondition** (p. 1784) with a handler.

Modifies the query parameters.
- uint32_t **parameters_length** () const
Gets the number of parameters.
- void **parameters** (const **dds::core::StringSeq** ¶meters)
<<*extension*>> (p. 156) Set the parameters

Additional Inherited Members

8.272.1 Detailed Description

<<*reference-type*>> (p. 153) Specialized **ReadCondition** (p. 1858) that allows applications to also specify a filter on the data available in a **dds::sub::DataReader** (p. 756)

Each query condition filter is composed of a **dds::sub::cond::ReadCondition** (p. 1858) state filter and a content filter expressed as a `query_expression` and `query_parameters`.

The query (`query_expression`) is similar to an SQL WHERE clause and can be parameterised by arguments that are dynamically changeable by the `set_query_parameters()` operation.

Two query conditions that have the same `query_expression` will require unique query condition content filters if their `query_paramters` differ. **Query** (p. 1778) conditions that differ only in their state masks will share the same query condition content filter.

Queries and Filters Syntax (p. 82) describes the syntax of `query_expression` and `query_parameters`.

See also

Filtering with Query Conditions (p. 133)

8.272.2 Member Typedef Documentation

8.272.2.1 iterator

```
typedef DELEGATE::iterator dds::sub::cond::QueryCondition::iterator
```

Parameter iterator. A random-access iterator of `std::string`.

8.272.2.2 const_iterator

```
typedef DELEGATE::const_iterator dds::sub::cond::QueryCondition::const_iterator
```

Parameter iterator. A random-access iterator of `std::string`.

8.272.3 Constructor & Destructor Documentation

8.272.3.1 QueryCondition() [1/2]

```
dds::sub::cond::QueryCondition::QueryCondition (  
    const dds::sub::Query & query,  
    const dds::sub::status::DataState & status ) [inline]
```

Creates a **QueryCondition** (p. 1784).

Parameters

<i>query</i>	The query
<i>status</i>	The sample, view and instance states of interest.

See also

ReadCondition (p. 1858)

`rti::sub::cond::create_query_condition_ex`

8.272.3.2 QueryCondition() [2/2]

```
template<typename Functor >

8.273.1 Detailed Description

```
template<typename T>
class rti::queuing::QueueConsumer< T >
```

Allows you to receive samples from a SharedReaderQueue.

A **QueueConsumer** (p. 1787) is an entity that allows you to receive samples from a SharedReaderQueue hosted by Queuing Service. A **QueueConsumer** (p. 1787) has one underlying **dds::sub::DataReader** (p. 756) to communicate with a SharedReaderQueue.

Valid types for the topic of the DataReader (T) are those generated by rttidsgen, the **DDS built-in types** (p. 49), and **dds::core::xtypes::DynamicData** (p. 1208).

To receive samples from a SharedReaderQueue, a **QueueConsumer** (p. 1787) must set its topic name (see QueueConsumerParams::queue_topic_name) equal to the SharedReaderQueue topic name (set with the XML tag <topic_name> under <shared_reader_queue>).

In addition, the **QueueConsumer** (p. 1787) must set its SharedSubscriber name (QueueConsumerParams::shared_subscriber_name) equal to the name of the SharedSubscriber hosting the SharedReaderQueue.

The **QueueConsumer** (p. 1787) and the SharedReaderQueue must also be in the same DDS domain (that is, they must have the same domain ID).

A **QueueConsumer** (p. 1787) has an associated **dds::domain::DomainParticipant** (p. 1079), which can be shared with other QueueConsumers or RTI Connex routines. All the other DDS entities required for queuing interaction, including the **dds::sub::DataReader** (p. 756) to receive samples, are automatically created when the **QueueConsumer** (p. 1787) is constructed.

Quality of Service (QoS) for the underlying DataReader is configurable (see QueueConsumerParams::qos_profile (p. 1804) and QueueConsumerParams::datareader_qos).

If no QoS is specified in the **QueueConsumerParams** (p. 1802), the default DataReaderQos will be used.

A **QueueConsumer** (p. 1787) must always be reliable in order to match and communicate with the SharedReaderQueue. In addition, it shall use application acknowledgement to notify Queuing Service that a sample has been consumed successfully. Hence, whichever DataReaderQos is selected, the following QoS settings are always overridden:

- **dds::core::policy::Reliability::kind** (p. 1876) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881).
- **dds::core::policy::Reliability::acknowledgment_kind** (p. 1878) is set to **rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT** (p. 586).
- **rti::core::policy::DataReaderResourceLimits::max_app_ack_response_length** (p. 873) is set to 1.

The underlying `DataReader` is created with an internal `dds::sub::DataReaderListener` (p. 832), which is required to provide the behavior of a `QueueConsumer` (p. 1787), including notification of events via `QueueConsumerListener` (p. 1800). For this reason, when accessing the underlying `DataReader`, the listener should not be set, removed or modified; otherwise the behavior of the `QueueConsumer` (p. 1787) will be incorrect and unpredictable.

Optionally, a `QueueConsumer` (p. 1787) can be configured to create an availability channel (`QueueConsumerParams`↔`::enable_availability`). This channel is used to report the `QueueConsumer` (p. 1787)'s availability to the `SharedReader`↔`Queue` from which the `QueueConsumer` (p. 1787) receives samples. Queuing Service uses the reported availability to distribute samples to the `QueueConsumer` (p. 1787).

If the availability channel is enabled for the `QueueConsumer` (p. 1787), a `dds::pub::DataWriter` (p. 908) is created to send availability samples to the `SharedReaderQueue`.

You can configure the `DataWriterQos` used by the availability `DataWriter` by using `QueueConsumerParams`↔`::qos_profile` (p. 1804).

Whichever `DataWriterQos` is selected, the following QoS settings are always overridden:

- `dds::core::policy::Reliability::kind` (p. 1876) is set to `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881).
- `dds::core::policy::Durability::kind` (p. 1185) is set to `dds::core::policy::DurabilityKind::TRANSIENT_LOCAL`.
- `dds::core::policy::History::kind` (p. 1348) is set to `dds::core::policy::HistoryKind::KEEP_LAST`.

Template Parameters

<code>T</code>	The data type for the <code>SharedReaderQueue</code> topic
----------------	--

See also

`QueueConsumer` (p. 1787)

`QueueConsumerListener` (p. 1800)

8.273.2 Constructor & Destructor Documentation

8.273.2.1 `QueueConsumer()` [1/2]

```
template<typename T >
rti::queuing::QueueConsumer< T >::QueueConsumer (
    const QueueConsumerParams & params,
    bool is_enabled = true,
    Listener * consumer_listener = NULL,
    const rti::core::Guid & consumer_guid = rti::core::Guid::unknown() ) [inline],
[explicit]
```

Creates a queue consumer.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p. 1381)> instead of a regular `Listener*` pointer.

8.273.2.2 QueueConsumer() [2/2]

```
template<typename T >
rti::queuing::QueueConsumer< T >::QueueConsumer (
    const QueueConsumerParams & params,
    bool is_enabled,
    std::shared_ptr< Listener > consumer_listener,
    const rti::core::Guid & consumer_guid = rti::core::Guid::unknown() ) [inline],
[explicit]
```

Creates a **QueueConsumer** (p. 1787) with parameters.

Parameters

<i>params</i>	All the parameters that configure this QueueConsumer (p. 1787)
<i>is_enabled</i>	Specifies if the QueueConsumer (p. 1787) is created ready to receive notifications in its listener and receive data. If you choose to bind the QueueConsumer (p. 1787) to a QueueConsumerListener (p. 1800) using an rti::core::ListenerBinder (p. 1384) you should create the QueueConsumer (p. 1787) disabled to avoid missing listener notifications. You can later enable the disabled QueueConsumer (p. 1787) using QueueConsumer::enable (p. 1794).
<i>consumer_listener</i>	A shared_ptr to a QueueConsumerListener (p. 1800) object to receive event notifications.
<i>consumer_guid</i>	A GUID identifier for the consumer. When <i>consumer_guid</i> is set to rti::core::Guid::unknown() (p. 1341) the Guid identifier is generated automatically. You can retrieve the generated QueueConsumer (p. 1787) Guid using the QueueConsumer::guid (p. 1795) method. To restart a QueueConsumer (p. 1787) just create a new one with its same GUID.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

QueueConsumerParams (p. 1802)

8.273.3 Member Function Documentation

8.273.3.1 listener() [1/2]

```
template<typename T >
void rti::queuing::QueueConsumer< T >::listener (
    Listener * the_listener,
    const dds::core::status::StatusMask & event_mask = dds::core::status::StatusMask↔
::none() ) [inline]
```

Sets the listener associated with this consumer.

[DEPRECATED] The use of `set_listener()` (p. 1793) is recommended. Unlike this function, `set_listener` receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Parameters

<i>the_listener</i>	The QueueConsumerListener (p. 1800) to set
<i>event_mask</i>	The dds::core::status::StatusMask (p. 2082) associated with the listener

8.273.3.2 listener() [2/2]

```
template<typename T >
Listener * rti::queuing::QueueConsumer< T >::listener ( ) const [inline]
```

Returns the listener currently associated with this Consumer.

[DEPRECATED] Prefer **get_listener()** (p. 1793) instead of this function.

If there is no listener it returns NULL.

8.273.3.3 get_listener()

```
template<typename T >
std::shared_ptr< Listener > rti::queuing::QueueConsumer< T >::get_listener ( ) const [inline]
```

Gets the listener.

8.273.3.4 set_listener()

```
template<typename T >
void rti::queuing::QueueConsumer< T >::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive updates or <code>nullptr</code> to reset the current listener and stop receiving updates.
---------------------	---

8.273.3.5 enable()

```
template<typename T >
void rti::queuing::QueueConsumer< T >::enable ( ) [inline]
```

Enables the **QueueConsumer** (p. 1787) to receive data and listener notifications.

If you create the **QueueConsumer** (p. 1787) disabled you can enable it using this method. To avoid missing listener notification when you use an **rti::core::ListenerBinder** (p. 1384) to bind the **QueueConsumer** (p. 1787) to a **QueueConsumerListener** (p. 1800) use **QueueConsumer::enable** (p. 1794) to enable the **QueueConsumer** (p. 1787) after it is bound to the listener.

8.273.3.6 acknowledge_sample()

```
template<typename T >
void rti::queuing::QueueConsumer< T >::acknowledge_sample (
    const dds::sub::SampleInfo & sample_info,
    bool is_positive_acknowledgment = true ) [inline]
```

Explicitly acknowledges a single sample.

This operation calls **dds::sub::DataReader::acknowledge_sample** (p. 792) on the underlying DataReader.

The parameter `is_positive_acknowledgment` indicates whether or not the acknowledged sample was successfully processed by the application. If the sample was not processed successfully, Queuing Service will try to redeliver it to a different **QueueConsumer** (p. 1787) according to the delivery policy of the SharedReaderQueue.

Parameters

<i>sample_info</i>	Identifies the sample being acknowledged. The <code>sampleInfo</code> can be extracted from <code>Sample::info</code> .
<i>is_positive_acknowledgment</i>	Indicates whether or not the sample was successfully processed.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.273.3.7 acknowledge_all()

```
template<typename T >
void rti::queuing::QueueConsumer< T >::acknowledge_all (
    bool is_positive_acknowledgment = true ) [inline]
```

Acknowledge all previously accessed samples.

This is equivalent to calling `QueueConsumer::acknowledge_sample(const dds::sub::SampleInfo&, bool)` (p. 1794) for every single previously accessed sample.

Parameters

<i>is_positive_acknowledgment</i>	Indicates whether or not the acknowledged samples were successfully processed by the application. If the samples were not processed successfully, Queuing Service will try to redeliver them to a different <code>QueueConsumer</code> (p. 1787) according to the delivery policy of the SharedReaderQueue.
-----------------------------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

`QueueConsumer::acknowledge_sample(const dds::sub::SampleInfo&, bool)` (p. 1794)

8.273.3.8 reader()

```
template<typename T >
dds::sub::DataReader< T > rti::queuing::QueueConsumer< T >::reader ( ) const [inline]
```

Retrieves the underlying `dds::sub::DataReader` (p. 756).

Accessing the DataReader may be useful for a number of advanced use cases, such as getting DataReader protocol or cache statuses.

MT Safety:

SAFE

See also

`dds::sub::DataReader` (p. 756)

`dds::sub::DataReader` (p. 756)

`dds::sub::DataReader::datareader_protocol_status` (p. 790)

8.273.3.9 `guid()`

```
template<typename T >
rti::core::Guid rti::queuing::QueueConsumer< T >::guid ( ) const [inline]
```

Returns the GUID of this **QueueConsumer** (p. 1787).

The GUID of the **QueueConsumer** (p. 1787) is determined based on the value of `QueueConsumerParams::entity_name` and `QueueConsumerParams::queue_topic_name`. Note that the **QueueConsumer** (p. 1787) GUID may be equal or different than the GUID of the underlying `DataReader` virtual GUID.

The GUID identifies a **QueueConsumer** (p. 1787) and the samples it consumes. The underlying `DataReader`'s content filter on the `related_reader_guid` is set to the **QueueConsumer** (p. 1787)'s GUID.

`QueueConsumerParams::entity_name`
QueueProducer::guid (p. 1814)

8.273.3.10 `receive_samples()` [1/2]

```
template<typename T >
dds::sub::LoanedSamples< T > rti::queuing::QueueConsumer< T >::receive_samples (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple samples and provides a loaned container to access them.

Equivalent to using `QueueConsumer::receive_samples(int, int, const dds::core::Duration&)` (p. 1796) with `min_count=1` and `max_count=dds::core::LENGTH_UNLIMITED` (p. 238).

See also

`dds::sub::LoanedSamples` (p. 1406)
QueueConsumer::receive_samples(int, int, const dds::core::Duration&) (p. 1796)

8.273.3.11 `receive_samples()` [2/2]

```
template<typename T >
dds::sub::LoanedSamples< T > rti::queuing::QueueConsumer< T >::receive_samples (
    int min_count,
    int max_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple samples and provides a loaned container to access them.

Equivalent to using `QueueConsumer::wait_for_samples(int, const dds::core::Duration&)` (p. 1798) and `QueueConsumer::take_samples(int)` (p. 1797).

See also

`dds::sub::LoanedSamples` (p. 1406)
QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 1798)
QueueConsumer::take_samples(int) (p. 1797)

8.273.3.12 take_samples() [1/2]

```
template<typename T >
dds::sub::LoanedSamples< T > rti::queuing::QueueConsumer< T >::take_samples ( ) [inline]
```

Provides a loaned container to access the existing samples.

This operation is equivalent to using **QueueConsumer::take_samples(int)** (p.1797) with `max_count=dds::core::LENGTH_UNLIMITED` (p.238).

See also

dds::sub::LoanedSamples (p. 1406)

QueueConsumer::take_samples(int) (p. 1797)

8.273.3.13 take_samples() [2/2]

```
template<typename T >
dds::sub::LoanedSamples< T > rti::queuing::QueueConsumer< T >::take_samples (
    int max_count ) [inline]
```

Provides a loaned container to access the existing samples.

Takes all the existing samples up to `max_count` and provides a loaned container to access them.

This operation does not make a copy of the data.

The loan is returned with **dds::sub::LoanedSamples::return_loan** (p. 1410).

This operation may be used after a call to **QueueConsumer::wait_for_samples(int, const dds::core::Duration&)** (p. 1798).

Parameters

<i>max_count</i>	The maximum number of samples that are taken at a time. The special value dds::core::LENGTH_UNLIMITED (p. 238) may be used. This value will read up to the limit specified by rti::core::policy::DataReaderResourceLimits::max_samples_per_read (p. 865).
------------------	---

Returns

A container with up to `max_count` elements. May be empty if there were no replies to get.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

MT Safety:

SAFE

QueueConsumer::take_samples() (p. 1796)

8.273.3.14 read_samples() [1/2]

```
template<typename T >
dds::sub::LoanedSamples< T > rti::queuing::QueueConsumer< T >::read_samples ( ) [inline]
```

Provides a loaned container to access the existing samples.

This operation is equivalent to **QueueConsumer::take_samples()** (p. 1796), except the samples remain in the **QueueConsumer** (p. 1787) and can be read or taken again.

8.273.3.15 read_samples() [2/2]

```
template<typename T >
dds::sub::LoanedSamples< T > rti::queuing::QueueConsumer< T >::read_samples (
    int max_count ) [inline]
```

Provides a loaned container to access the existing samples.

This operation is equivalent to **QueueConsumer::take_samples(int)** (p. 1797), except the samples remain in the **QueueConsumer** (p. 1787) and can be read or taken again.

8.273.3.16 wait_for_samples() [1/2]

```
template<typename T >
bool rti::queuing::QueueConsumer< T >::wait_for_samples (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for samples.

This operation is equivalent to **QueueConsumer::wait_for_samples(int, const dds::core::Duration&)** (p. 1798) with `min_count=1`.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 1798)

8.273.3.17 wait_for_samples() [2/2]

```
template<typename T >
bool rti::queuing::QueueConsumer< T >::wait_for_samples (
    int min_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for samples.

This operation waits for `min_count` samples to be available. It will wait up to `max_wait` .

If this operation is called several times but the available samples are not taken (with **QueueConsumer::take_↔samples(int)** (p. 1797)), this operation may return immediately and will not wait for new samples. New samples may replace existing ones if they are not taken, depending on the **dds::core::policy::History** (p. 1346) used to configure this **QueueConsumer** (p. 1787).

Parameters

<i>min_count</i>	Minimum number of samples that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum waiting time after which this operation unblocks regardless of how many samples are available.

Returns

true if at least `min_count` samples were available before `max_wait` elapsed, or false otherwise.

MT Safety:

Concurrent calls to this operation on the same object are not allowed.

QueueConsumer::take_samples(int) (p. 1797)

8.273.3.18 send_availability()

```
template<typename T >
void rti::queuing::QueueConsumer< T >::send_availability (
    ConsumerAvailabilityParams parameters ) [inline]
```

Sends the **QueueConsumer** (p. 1787) availability to Queuing Service.

This method will use the availability DataWriter to send a sample to Queue Service indicating the availability status of the **QueueConsumer** (p. 1787) application.

The method throws **dds::core::PreconditionNotMetError** (p. 1669) if availability is not enabled for this **Queue↔Consumer** (p. 1787) using `QueueConsumerParams::enable_availability`.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) ;

Public Member Functions

- virtual void **on_sample_available** (**QueueConsumer**< T > &consumer)=0
User callback.
- virtual void **on_shared_reader_queue_matched** (**QueueConsumer**< T > &consumer, const **dds::core**↔
::status::SubscriptionMatchedStatus &status)=0
User callback.

8.274.1 Detailed Description

```
template<typename T>
class rti::queuing::QueueConsumerListener< T >
```

Called when certain events occur in a **QueueConsumer** (p. 1787).

A **QueueConsumer** (p. 1787) listener is a way to implement a callback that will be invoked when certain events happen. It is an optional parameter in **QueueConsumerParams** (p. 1802).

You can use this listener to receive notification when:

- Samples are available
- There are SharedReaderQueue matching events

virtual void rti::queuing::QueueConsumerListener< T >::on_shared_reader_queue_matched (
    QueueConsumer< T > & consumer,
    const dds::core::status::SubscriptionMatchedStatus & status ) [pure virtual]
```

User callback.

This callback is invoked whenever a new SharedReaderQueue hosted by Queuing Service has matched the **QueueConsumer** (p. 1787), or if an existing matching SharedReaderQueue is disposed.

See also

dds::core::status::SubscriptionMatchedStatus (p. 2144)

dds::sub::DataReaderListener::on_subscription_matched (p. 835)

Implemented in **rti::queuing::NoOpQueueConsumerListener< T >** (p. 1589), **rti::queuing::NoOpQueueConsumerListener< TRep >** (p. 1589), and **rti::queuing::NoOpQueueConsumerListener< TReq >** (p. 1589).

8.275 rti::queuing::QueueConsumerParams Class Reference

Contains the parameters for creating a **QueueConsumer** (p. 1787).

```
#include <rti/queuing/QueueParams.hpp>
```

Inheritance diagram for `rti::queuing::QueueConsumerParams`:

Public Member Functions

- **QueueConsumerParams** (`dds::domain::DomainParticipant` participant)
*Creates a **QueueConsumerParams** (p. 1802) object with the participant set.*
- **QueueConsumerParams** & `enable_availability` (bool enable)
*Indicates whether the availability channel is enabled for a **QueueConsumer** (p. 1787).*

8.275.1 Detailed Description

Contains the parameters for creating a **QueueConsumer** (p. 1787).

8.275.2 Constructor & Destructor Documentation

8.275.2.1 QueueConsumerParams()

```
rti::queuing::QueueConsumerParams::QueueConsumerParams (
    dds::domain::DomainParticipant participant ) [inline], [explicit]
```

Creates a **QueueConsumerParams** (p. 1802) object with the participant set.

The rest of the parameters that can be set in a **QueueConsumerParams** (p. 1802) object are optional.

Parameters

<i>participant</i>	The <code>dds::domain::DomainParticipant</code> (p. 1079) a QueueConsumer (p. 1787) uses to join a domain.
--------------------	---

8.275.3 Member Function Documentation

8.275.3.1 enable_availability()

```
QueueConsumerParams & rti::queuing::QueueConsumerParams::enable_availability (
    bool enable ) [inline]
```

Indicates whether the availability channel is enabled for a **QueueConsumer** (p. 1787).

When this parameter is set to true, the **QueueConsumer** (p. 1787) creates a `DataWriter` to report its availability to the `SharedReaderQueue` from which the **QueueConsumer** (p. 1787) receives samples.

The **QueueConsumer** (p. 1787) can send availability samples to the `SharedReaderQueue` using the method **QueueConsumer::send_availability(ConsumerAvailabilityParams)** (p. 1799)

See also

`QueueConsumer::send_availability(ConsumerAvailabilityParams)` (p. 1799)

References `rti::util::network_capture::enable()`.

8.276 `rti::queuing::QueueEntityParams< ActualEntity >` Class Template Reference

A parent class for all queue parameter classes.

```
#include <rti/queuing/QueueParams.hpp>
```

Inherits `rti::request::detail::EntityParamsWithSetters< ActualEntity >`.

Public Member Functions

- `ActualEntity & qos_profile` (const std::string &qos_library_name, const std::string &qos_profile_name)
Specifies an XML QoS profile that will be used to configure the quality of service of the DDS entities created. This includes the DataReader and DataWriter used to send and receive samples from a SharedReaderQueue. Alternatively, you can set the DataReader and DataWriter QoS using `datareader_qos()` and `datawriter_qos()` methods. If you set the DataReader QoS or the DataWriter QoS the provided values will be used instead of the QoS specified in the XML qos profile. .
- `ActualEntity & shared_subscriber_name` (const std::string &name)
Sets the SharedSubscriber name associated with the SharedReaderQueues.
- `ActualEntity & entity_name` (const std::string &name)
Sets the name of the QueueEntity.

8.276.1 Detailed Description

```
template<typename ActualEntity>
class rti::queuing::QueueEntityParams< ActualEntity >
```

A parent class for all queue parameter classes.

8.276.2 Member Function Documentation

8.276.2.1 `qos_profile()`

```
template<typename ActualEntity >
ActualEntity & rti::queuing::QueueEntityParams< ActualEntity >::qos_profile (
    const std::string & qos_library_name,
    const std::string & qos_profile_name ) [inline]
```

Specifies an XML QoS profile that will be used to configure the quality of service of the DDS entities created. This includes the DataReader and DataWriter used to send and receive samples from a SharedReaderQueue. Alternatively, you can set the DataReader and DataWriter QoS using `datareader_qos()` and `datawriter_qos()` methods. If you set the DataReader QoS or the DataWriter QoS the provided values will be used instead of the QoS specified in the XML qos profile. .

Parameters

<i>qos_library_name</i>	The name of the QoS library
<i>qos_profile_name</i>	The name of the QoS profile inside the QoS library

8.276.2.2 shared_subscriber_name()

```
template<typename ActualEntity >
ActualEntity & rti::queuing::QueueEntityParams< ActualEntity >::shared_subscriber_name (
    const std::string & name ) [inline]
```

Sets the SharedSubscriber name associated with the SharedReaderQueues.

8.276.2.3 entity_name()

```
template<typename ActualEntity >
ActualEntity & rti::queuing::QueueEntityParams< ActualEntity >::entity_name (
    const std::string & name ) [inline]
```

Sets the name of the QueueEntity.

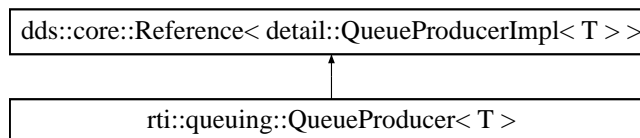

The name of the QueueEntity is used along with the topic name to generate the QueueEntity's GUID. The entity name is used along with the topic name to generate a Guid. By default, entity name is null which means that the entity Guid is randomly generated.

8.277 rti::queuing::QueueProducer< T > Class Template Reference

Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service.

```
#include <rti/queuing/QueueProducer.hpp>
```

Inheritance diagram for rti::queuing::QueueProducer< T >:

Public Member Functions

- **QueueProducer** (const **QueueProducerParams** ¶ms, bool is_enabled=true, **Listener** *producer_listener=NULL, const **rti::core::Guid** &producer_guid= **rti::core::Guid::unknown**())

Sends a sample with the specified parameters and gets back metadata information related to the sample sent.
- bool **wait_for_acknowledgments** (const **dds::core::Duration** &max_wait)
*Blocks the calling thread until all samples written by this **QueueProducer** (p. 1805) since the last call to this method are acknowledged by Queuing Service.*
- bool **wait_for_acknowledgments** (const **rti::core::SampleIdentity** &identity, const **dds::core::Duration** &max_wait)
Blocks the calling thread until the sample identified by identity is acknowledged by Queuing Service.
- **dds::pub::DataWriter**< T > **writer** () const
*Retrieves the underlying **dds::pub::DataWriter** (p. 908).*
- **rti::core::Guid** **guid** () const
*Returns the GUID of this **QueueProducer** (p. 1805).*
- bool **has_matching_reader_queue** ()
*Checks whether this **QueueProducer** (p. 1805) has matched with at least one SharedReaderQueue.*

8.277.1 Detailed Description

```
template<typename T>
class rti::queuing::QueueProducer< T >
```

Allows you to send samples to a specific SharedReaderQueue hosted by Queuing Service.

A **QueueProducer** (p. 1805) is an entity that allows you to send samples to a SharedReaderQueue hosted by Queuing Service. A **QueueProducer** (p. 1805) has one underlying **dds::pub::DataWriter** (p. 908) to communicate with a SharedReaderQueue.

Valid types for the topic of the DataWriter (T) are those generated by rtidsgen, the **DDS built-in types** (p. 49), and **dds::core::xtypes::DynamicData** (p. 1208).

To send samples to a SharedReaderQueue, a **QueueProducer** (p. 1805) must set its topic name (see `QueueProducer←Params::queue_topic_name`) equal to the SharedReaderQueue topic name.

The **QueueProducer** (p. 1805) and the SharedReaderQueue must also be in the same DDS domain (that is, they must have the same domain ID).

A **QueueProducer** (p. 1805) has an associated **dds::domain::DomainParticipant** (p. 1079), which can be shared with other QueueProducers or RTI Connex routines. All the other RTI Connex entities required for queuing interaction, including a **dds::pub::DataWriter** (p. 908) for writing samples, are automatically created when the **QueueProducer** (p. 1805) is constructed.

Quality of Service (QoS) for the underlying DataWriter is configurable (see **QueueProducerParams::qos_profile** (p. 1804) and `QueueProducerParams::datawriter_qos`).

If no QoS is specified in the **QueueProducerParams** (p. 1817), the default DataWriterQos will be used.

A **QueueProducer** (p. 1805) must always be reliable in order to match and communicate with the SharedReaderQueue. Hence, whichever DataWriterQos is selected, the following QoS setting is always overridden:

- **dds::core::policy::Reliability::kind** (p. 1876) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881).

The underlying DataWriter is created with an internal **dds::pub::DataWriterListener** (p. 972), which is required to provide the behavior of a **QueueProducer** (p. 1805), including the notification of events via **QueueProducerListener** (p. 1815). For this reason, when accessing the underlying DataWriter, the listener should not be set, removed or modified; otherwise the behavior of the **QueueProducer** (p. 1805) will be incorrect and unpredictable.

Template Parameters

<i>T</i>	The data type for the SharedReaderQueue topic
----------	---

See also

QueueProducer (p. 1805)

QueueProducerListener (p. 1815)

8.277.2 Constructor & Destructor Documentation

8.277.2.1 QueueProducer() [1/2]

```
template<typename T >
rti::queuing::QueueProducer< T >::QueueProducer (
```

```

const QueueProducerParams & params,
bool is_enabled = true,
Listener * producer_listener = NULL,
const rti::core::Guid & producer_guid = rti::core::Guid::unknown() ) [inline],
[explicit]

```

Creates a queue producer.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p. 1381)> instead of a regular `Listener*` pointer.

8.277.2.2 QueueProducer() [2/2]

```

template<typename T >
rti::queuing::QueueProducer< T >::QueueProducer (
    const QueueProducerParams & params,
    bool is_enabled,
    std::shared_ptr< Listener > producer_listener,
    const rti::core::Guid & producer_guid = rti::core::Guid::unknown() ) [inline],
[explicit]

```

Creates a **QueueProducer** (p. 1805) with parameters.

Parameters

<i>params</i>	All the parameters that configure this QueueProducer (p. 1805). See QueueProducerParams (p. 1817) for the list of required parameters.
<i>is_enabled</i>	Specifies if the QueueProducer (p. 1805) is created ready to receive notifications in its listener and send data. If you choose to bind the QueueProducer (p. 1805) to a QueueProducerListener (p. 1815) using an rti::core::ListenerBinder (p. 1384) you should create the QueueProducer (p. 1805) disabled to avoid missing listener notifications. You can later enable the disabled QueueProducer (p. 1805) using QueueProducer::enable (p. 1810).
<i>producer_listener</i>	A <code>shared_ptr</code> to a QueueProducerListener (p. 1815) object to receive event notifications.
<i>producer_guid</i>	A GUID identifier for the producer. When <i>producer_guid</i> is set to rti::core::Guid::unknown() (p. 1341) the Guid identifier is generated automatically. You can retrieve the generated QueueProducer (p. 1805) Guid using the QueueProducer::guid (p. 1814) method. To restart a QueueProducer (p. 1805) just create a new one with its same GUID.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

QueueProducerParams (p. 1817)

8.277.3 Member Function Documentation

8.277.3.1 listener() [1/2]

```
template<typename T >
void rti::queuing::QueueProducer< T >::listener (
    Listener * the_listener,
    const dds::core::status::StatusMask & event_mask = dds::core::status::StatusMask<
::none() ) [inline]
```

Sets the listener associated with this producer.

[DEPRECATED] The use of `set_listener()` (p. 1809) is recommended. Unlike this function, `set_listener` receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Parameters

<i>the_listener</i>	The <code>QueueProducerListener</code> (p. 1815) to set
<i>event_mask</i>	The <code>dds::core::status::StatusMask</code> (p. 2082) associated with the listener

8.277.3.2 listener() [2/2]

```
template<typename T >
Listener * rti::queuing::QueueProducer< T >::listener ( ) const [inline]
```

Returns the listener currently associated with this Producer.

[DEPRECATED] Prefer `get_listener()` (p. 1809) instead of this function.

If there is no listener it returns NULL.

8.277.3.3 get_listener()

```
template<typename T >
std::shared_ptr< Listener > rti::queuing::QueueProducer< T >::get_listener ( ) const [inline]
```

Gets the listener.

8.277.3.4 set_listener()

```
template<typename T >
void rti::queuing::QueueProducer< T >::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive updates or <code>nullptr</code> to reset the current listener and stop receiving updates.
---------------------	---

8.277.3.5 enable()

```
template<typename T >
void rti::queuing::QueueProducer< T >::enable ( ) [inline]
```

Enables the **QueueProducer** (p. 1805) to send data and receive listener notifications.

If you create the **QueueProducer** (p. 1805) disabled you can enable it using this method. To avoid missing listener notification when you use an **rti::core::ListenerBinder** (p. 1384) to bind the **QueueProducer** (p. 1805) to a **QueueProducerListener** (p. 1815) use **QueueProducer::enable** (p. 1810) to enable the **QueueProducer** (p. 1805) after it is bound to the listener.

8.277.3.6 send_sample() [1/2]

```
template<typename T >
void rti::queuing::QueueProducer< T >::send_sample (
    const T & sample ) [inline]
```

Sends a sample.

This operation is equivalent to calling **QueueProducer::send_sample(const T&, rti::pub::WriteParams&)** (p. 1810) using a default **rti::pub::WriteParams** (p. 2342).

Parameters

<i>sample</i>	The sample to be sent
---------------	-----------------------

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or NoMatchingQueueException (p. 1567)
------------	---

MT Safety:

SAFE

See also

QueueProducer::send_sample(const T&, rti::pub::WriteParams&) (p. 1810)

8.277.3.7 send_sample() [2/2]

```
template<typename T >
void rti::queuing::QueueProducer< T >::send_sample (
    const T & sample,
    rti::pub::WriteParams & write_params ) [inline]
```

Sends a sample with the specified parameters and gets back metadata information related to the sample sent.

After calling this operation, write_params contains valid metadata information associated with the sample sent.

The metadata field rti::pub::WriteParams::source_guid (p. 2349) of the write_params in the sample is always set to this QueueProducer (p. 1805)'s GUID.

Parameters

<i>sample</i>	<< <i>in</i> >> (p. 157) the sample to send.
<i>write_params</i>	<< <i>inout</i> >> (p. 157) Parameters to send the sample. When this call ends successfully, write_params contains valid metadata information associated with the sample sent.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or NoMatchingQueueException (p. 1567) if by the time this operation is called there is not a single matching SharedReaderQueue.
------------	---

MT Safety:

SAFE

See also

QueueProducer::send_sample(const T&) (p. 1810)

8.277.3.8 wait_for_acknowledgments() [1/2]

```
template<typename T >
bool rti::queuing::QueueProducer< T >::wait_for_acknowledgments (
    const dds::core::Duration & max_wait ) [inline]
```

Blocks the calling thread until all samples written by this QueueProducer (p. 1805) since the last call to this method are acknowledged by Queuing Service.

This operation will keep the calling thread blocked as long as there are samples pending on acknowledgement, unless a timeout occurs.

After unblocking, the return value is true if all samples have been acknowledged positively or false if at least one of them was acknowledged negatively.

If there is a timeout, this operation throws **dds::core::TimeoutError** (p. 2177).

This operation requires setting `QueueProducerParams::enable_wait_for_ack` to true. Otherwise, it will throw **dds::core::PreconditionNotMetError** (p. 1669).

When a `SharedReaderQueue` is not replicated, a sample is acknowledged positively once the running `Queuing Service` instance has enqueued the sample.

When a `SharedReaderQueue` is replicated, a sample is acknowledged positively once it has been enqueued by the `Queuing Service` instance acting as a master. This means that the sample has been received and enqueued by a configurable quorum of instances (using `<replication_settings>/<queue_instances>`).

This operation waits until all the previously written samples since the last call to this method are acknowledged. If you want to wait for a specific sample, use the method **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 1812).

This operation cannot be called by two threads concurrently. If this occurs, the second thread will throw **dds::core::PreconditionNotMetError** (p. 1669).

This operation cannot be called concurrently with **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 1812) either.

Parameters

<i>max_wait</i>	<code><<in>></code> (p. 157) Maximum waiting time.
-----------------	--

Returns

true if all the samples are acknowledged positively or false if there was at least one sample acknowledged negatively.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) ; NoMatchingQueueException (p. 1567) if during this call, the QueueProducer (p. 1805) lost the matching status with <code>Queuing Service</code> . dds::core::TimeoutError (p. 2177) if a timeout occurs before receiving all the acknowledgments.
------------	--

8.277.3.9 wait_for_acknowledgments() [2/2]

```
template<typename T >
bool rti::queuing::QueueProducer< T >::wait_for_acknowledgments (
    const rti::core::SampleIdentity & identity,
    const dds::core::Duration & max_wait ) [inline]
```

Blocks the calling thread until the sample identified by identity is acknowledged by Queuing Service.

This operation blocks the calling thread until the sample identified by identity is acknowledged by Queuing Service or there is a timeout.

After unblocking, the return value is true if the sample has been acknowledged positively or false if the sample has been acknowledged negatively.

If there is a timeout, this operation throws **dds::core::TimeoutError** (p. 2177).

This operation requires setting QueueProducerParams::enable_wait_for_ack to true. Otherwise, it will throw **dds::core::PreconditionNotMetError** (p. 1669).

When a SharedReaderQueue is not replicated, a sample is acknowledged positively once the running Queuing Service instance has enqueued the sample.

When a SharedReaderQueue is replicated, a sample is acknowledged positively once it has been enqueued by the Queuing Service instance acting as a master. This means that the sample has been received and enqueued by a configurable quorum of instances (using <replication_settings>/<queue_instances>).

This operation cannot be called by two threads concurrently on the same identity. If this occurs, the second thread will throw **dds::core::PreconditionNotMetError** (p. 1669).

This operation cannot be called concurrently with **QueueProducer::wait_for_acknowledgments(const dds::core::Duration&)** (p. 1811) either.

Parameters

<i>max_wait</i>	<< <i>in</i> >> (p. 157) Maximum waiting time.
<i>identity</i>	<< <i>in</i> >> (p. 157). Sample identity.

Returns

true if the sample is acknowledged positively or false if the sample is acknowledged negatively.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) ; NoMatchingQueueException (p. 1567) if during this call, the QueueProducer (p. 1805) lost the matching status with Queuing Service. dds::core::TimeoutError (p. 2177) if a timeout occurs before receiving all the acknowledgments.
------------	--

8.277.3.10 writer()

```
template<typename T >
dds::pub::DataWriter< T > rti::queuing::QueueProducer< T >::writer ( ) const [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 908).

Accessing the DataWriter may be useful for a number of advanced use cases, such as getting the DataWriter protocol or cache statuses.

MT Safety:

SAFE

See also

dds::pub::DataWriter (p. 908)

dds::pub::DataWriter (p. 908)

dds::pub::DataWriter::datawriter_protocol_status() (p. 946)

8.277.3.11 `guid()`

```
template<typename T >
rti::core::Guid rti::queuing::QueueProducer< T >::guid ( ) const [inline]
```

Returns the GUID of this **QueueProducer** (p. 1805).

The GUID of the **QueueProducer** (p. 1805) is determined based on the value of `QueueEntityParams::entity_name` and `QueueProducerParams::queue_topic_name`. Note that the **QueueProducer** (p. 1805) GUID may be equal to or different than the GUID of the underlying DataWriter virtual GUID.

The GUID identifies a **QueueProducer** (p. 1805) and the samples it writes. This is the value set in the source GUID of the samples sent by the **QueueProducer** (p. 1805).

See also

QueueProducer::send_sample(const T&) (p. 1810)

`QueueEntityParams::entity_name`

8.277.3.12 `has_matching_reader_queue()`

```
template<typename T >
bool rti::queuing::QueueProducer< T >::has_matching_reader_queue ( ) [inline]
```

Checks whether this **QueueProducer** (p. 1805) has matched with at least one `SharedReaderQueue`.

Exceptions

One	of the Standard Exceptions (p. 228) ;
-----	--

Returns

True if this **QueueProducer** (p. 1805) matches with at least one SharedReaderQueue.

MT Safety:

SAFE

8.278 rti::queuing::QueueProducerListener< T > Class Template Reference

Called when certain events occur in a **QueueProducer** (p. 1805).

```
#include <rti/queuing/QueueProducerListener.hpp>
```

Inheritance diagram for rti::queuing::QueueProducerListener< T >:

Public Member Functions

- virtual void **on_sample_acknowledged** (**QueueProducer**< T > &producer, const **rti::pub::← AcknowledgmentInfo** &info)=0
User callback.
- virtual void **on_shared_reader_queue_matched** (**QueueProducer**< T > &producer, const **dds::core::← ::status::PublicationMatchedStatus** &status)=0
User callback.

8.278.1 Detailed Description

```
template<typename T>
class rti::queuing::QueueProducerListener< T >
```

Called when certain events occur in a **QueueProducer** (p. 1805).

A **QueueProducer** (p. 1805) listener is a way to implement a callback that will be invoked when certain events happen. It is an optional parameter in **QueueProducerParams** (p. 1817).

You can use this listener to receive notification when:

- A sample previously sent by a **QueueProducer** (p. 1805) has been acknowledged by Queuing Service.
- There are SharedReaderQueue matching events.

See also

QueueProducer::QueueProducer() (p. 1807)

8.278.2 Member Function Documentation

8.278.2.1 on_sample_acknowledged()

```
template<typename T >
virtual void rti::queuing::QueueProducerListener< T >::on_sample_acknowledged (
    QueueProducer< T > & producer,
    const rti::pub::AcknowledgmentInfo & info ) [pure virtual]
```

User callback.

This callback is invoked whenever Queuing Service acknowledges a sample sent by the **QueueProducer** (p. 1805).

See also

AcknowledgmentInfo

Implemented in **rti::queuing::NoOpQueueProducerListener< T >** (p. 1590), **rti::queuing::NoOpQueueProducerListener< TRep >** (p. 1590), and **rti::queuing::NoOpQueueProducerListener< TReq >** (p. 1590).

8.278.2.2 on_shared_reader_queue_matched()

```
template<typename T >
virtual void rti::queuing::QueueProducerListener< T >::on_shared_reader_queue_matched (
    QueueProducer< T > & producer,
    const dds::core::status::PublicationMatchedStatus & status ) [pure virtual]
```

User callback.

This callback is invoked whenever a new SharedReaderQueue hosted by Queuing Service has matched the **QueueProducer** (p. 1805), or if an existing matching SharedReaderQueue is disposed.

See also

dds::core::status::PublicationMatchedStatus (p. 1717)

Implemented in **rti::queuing::NoOpQueueProducerListener< T >** (p. 1590), **rti::queuing::NoOpQueueProducerListener< TRep >** (p. 1590), and **rti::queuing::NoOpQueueProducerListener< TReq >** (p. 1590).

8.279 rti::queuing::QueueProducerParams Class Reference

Contains the parameters for creating a **QueueProducer** (p. 1805).

```
#include <rti/queuing/QueueParams.hpp>
```

Inheritance diagram for rti::queuing::QueueProducerParams:

Public Member Functions

- **QueueProducerParams** (**dds::domain::DomainParticipant** participant)
Creates a **QueueProducerParams** (p. 1817) object with the participant set.
- bool **enable_sample_replication** () const
Causes the **QueueProducer** (p. 1805) to write all the samples with the **dds::sub::SampleInfo::flag** (p. 2000) including the bit **rti::core::SampleFlag::replicate** (p. 1987).
- **QueueProducerParams** & **enable_wait_for_ack** (bool enable)
Enables the Queuing Service's 'Acknowledgment Management' feature for the **QueueProducer** (p. 1805).

8.279.1 Detailed Description

Contains the parameters for creating a **QueueProducer** (p. 1805).

8.279.2 Constructor & Destructor Documentation

8.279.2.1 QueueProducerParams()

```
rti::queuing::QueueProducerParams::QueueProducerParams (
    dds::domain::DomainParticipant participant ) [inline], [explicit]
```

Creates a **QueueProducerParams** (p. 1817) object with the participant set.

The rest of the parameters that can be set in a **QueueProducerParams** (p. 1817) object are optional.

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) a QueueProducer (p. 1805) uses to join a domain.
--------------------	---

8.279.3 Member Function Documentation

8.279.3.1 enable_sample_replication()

```
bool rti::queuing::QueueProducerParams::enable_sample_replication ( ) const [inline]
```

Causes the **QueueProducer** (p. 1805) to write all the samples with the **dds::sub::SampleInfo::flag** (p. 2000) including the bit **rti::core::SampleFlag::replicate** (p. 1987).

When this value is set to true, all the samples are written with the associated metadata containing the bit **rti::core::SampleFlag::replicate** (p. 1987). This behavior cannot be changed once this option is enabled (no matter which operation is used to send samples).

8.279.3.2 enable_wait_for_ack()

```
QueueProducerParams & rti::queuing::QueueProducerParams::enable_wait_for_ack (
    bool enable ) [inline]
```

Enables the Queuing Service's 'Acknowledgment Management' feature for the **QueueProducer** (p. 1805).

When this value is set to true, you can call the APIs **QueueProducer::wait_for_acknowledgments(const dds::core::Duration&)** (p. 1811) and **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 1812) to wait for acknowledgments from Queuing Service. These acknowledgments indicate whether or not samples have been successfully enqueued.

Notice that if you enable this feature, at some point you must call **QueueProducer::wait_for_acknowledgments(const dds::core::Duration&)** (p. 1811) or **QueueProducer::wait_for_acknowledgments(const rti::core::SampleIdentity&, const dds::core::Duration&)** (p. 1812). Otherwise, the **QueueProducer** (p. 1805)'s memory will grow unbounded, since it will keep some state per sample.

You must also set the XML tag `<app_ack_sample_to_producer>` under `<queue_qos>/<reliability>` to true.

[default] true

References **rti::util::network_capture::enable()**.

8.280 rti::queuing::QueueReplier< TReq, TRep > Class Template Reference

Allows receiving requests and sending replies.

*Retrieves the underlying **dds::sub::DataReader** (p. 756) used to receive requests.*
- **rti::core::Guid** **guid** ()
*Returns the GUID of this **QueueReplier** (p. 1819).*

8.280.1 Detailed Description

```
template<typename TReq, typename TRep>
class rti::queuing::QueueReplier< TReq, TRep >
```

Allows receiving requests and sending replies.

A **QueueReplier** (p. 1819) is a component suited for the queuing request-reply use case. A **QueueReplier** (p. 1819) plays the role of a request **QueueConsumer** (p. 1787) and reply **QueueProducer** (p. 1805).

A **QueueReplier** (p. 1819) is an entity that allows you to receive requests from a request SharedReaderQueue and send replies to a reply SharedReaderQueue, which are hosted by Queuing Service.

To communicate with the SharedReaderQueues, the **QueueReplier** (p. 1819) creates two topics. The first topic corresponds to the request SharedReaderQueue topic and the second topic to the reply SharedReaderQueue topic.

Valid types for these topics (TReq and TRep) are: those generated by rttidsgen, the **DDS built-in types** (p. 49), and **dds::core::xtypes::DynamicData** (p. 1208).

See also

QueueConsumer (p. 1787)

QueueProducer (p. 1805)

Template Parameters

<i>TReq</i>	The data type for the request SharedReaderQueue topic
<i>TRep</i>	The data type for the reply SharedReaderQueue topic

8.280.2 Constructor & Destructor Documentation

8.280.2.1 QueueReplier() [1/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueReplier< TReq, TRep >::QueueReplier (
    const QueueReplierParams & params,
    bool is_enabled = true,
    Listener * replier_listener = NULL,
    const rti::core::Guid & replier_guid = rti::core::Guid::unknown() ) [inline],
[explicit]
```

Creates a queue replier.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<**Listener** (p. 1381)> instead of a regular **Listener*** pointer.

8.280.2.2 QueueReplier() [2/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueReplier< TReq, TRep >::QueueReplier (
    const QueueReplierParams & params,
    bool is_enabled,
    std::shared_ptr< Listener > replier_listener,
    const rti::core::Guid & replier_guid = rti::core::Guid::unknown() ) [inline],
[explicit]
```

Creates a Replier with parameters.

Parameters

<i>params</i>	All the parameters that configure this QueueReplier (p. 1819) See QueueReplierParams (p. 1834) for the list of required parameters.
<i>is_enabled</i>	Specifies if the QueueReplier (p. 1819) is created ready to receive notifications in its listener and send or receive data. If you choose to bind the QueueReplier (p. 1819) to a QueueReplierListener (p. 1832) using an rti::core::ListenerBinder (p. 1384) you should create the QueueReplier (p. 1819) disabled to avoid missing listener notifications. You can later enable the disabled QueueReplier (p. 1819) using QueueReplier::enable (p. 1823).
<i>replier_listener</i>	A <code>shared_ptr</code> to a QueueReplierListener (p. 1832) object to receive event notifications.
<i>replier_guid</i>	A GUID identifier for the replier. When <code>replier_guid</code> is set to rti::core::Guid::unknown() (p. 1341) the Guid identifier is generated automatically. You can retrieve the generated QueueReplier (p. 1819) Guid using the QueueReplier::guid() (p. 1831) method. To restart a QueueReplier (p. 1819) just create a new one with its same GUID.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

QueueReplierParams (p. 1834)

8.280.3 Member Function Documentation

8.280.3.1 listener() [1/2]

```
template<typename TReq , typename TRep >
void rti::queuing::QueueReplier< TReq, TRep >::listener (
    Listener * the_listener,
    const dds::core::status::StatusMask & event_mask = dds::core::status::StatusMask<
::none() ) [inline]
```

Sets the listener associated with this queue requester.

[DEPRECATED] The use of **set_listener()** (p. 1823) is recommended. Unlike this function, `set_listener` receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Parameters

<i>the_listener</i>	The QueueReplierListener (p. 1832) to set
<i>event_mask</i>	The dds::core::status::StatusMask (p. 2082) associated with the listener

8.280.3.2 listener() [2/2]

```
template<typename TReq , typename TRep >
Listener * rti::queuing::QueueReplier< TReq, TRep >::listener ( ) const [inline]
```

Returns the listener currently associated with this requester.

[DEPRECATED] Prefer `get_listener()` (p.1823) instead of this function.

If there is no listener it returns NULL.

8.280.3.3 get_listener()

```
template<typename TReq , typename TRep >
std::shared_ptr< Listener > rti::queuing::QueueReplier< TReq, TRep >::get_listener ( ) const
[inline]
```

Gets the listener.

8.280.3.4 set_listener()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueReplier< TReq, TRep >::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive updates or <code>nullptr</code> to reset the current listener and stop receiving updates.
---------------------	---

8.280.3.5 enable()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueReplier< TReq, TRep >::enable ( ) [inline]
```

Enables the **QueueReplier** (p. 1819) to send data, receive data and receive listener notifications.

If you create the **QueueReplier** (p. 1819) disabled you can enable it using this method. To avoid missing listener notification when you use an **rti::core::ListenerBinder** (p. 1384) to bind the **QueueReplier** (p. 1819) to a **QueueReplierListener** (p. 1832) use **QueueReplier::enable** (p. 1823) to enable the **QueueReplier** (p. 1819) after it is bound to the listener.

8.280.3.6 send_reply() [1/2]

```
template<typename TReq , typename TRep >
void rti::queuing::QueueReplier< TReq, TRep >::send_reply (
    const TRep & reply,
    const dds::sub::SampleInfo & related_request_info ) [inline]
```

Sends a reply for a previous request.

The related request identity can be retrieved from an existing request sample (Sample).

Parameters

<i>reply</i>	The reply to be sent
<i>related_request_info</i>	The identity of a previously received request

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

QueueProducer::send_sample(const T&) (p. 1810)

8.280.3.7 send_reply() [2/2]

```
template<typename TReq , typename TRep >
void rti::queuing::QueueReplier< TReq, TRep >::send_reply (
    const TRep & reply,
    rti::pub::WriteParams & write_params ) [inline]
```

Sends a reply with the specified parameters and gets back metadata information related to the reply sent.

After calling this operation, `write_params` contains metadata information associated with the reply sent.

Contrary to the **QueueRequester** (p. 1836), where retrieving the sample identity for correlation is common, on the **QueueReplier** (p. 1819) side using a `write_params` is only necessary when the default write parameters need to be overridden, and **QueueReplier::send_reply(const TRep&, const dds::sub::SampleInfo&)** (p. 1824) may be used if that is not necessary.

Parameters

<i>reply</i>	<< <i>in</i> >> (p. 157) the reply sample to send.
<i>write_params</i>	<< <i>inout</i> >> (p. 157) Parameters used to send the reply. When this call ends successfully, <i>write_params</i> contains valid metadata information associated with the reply sent.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or NoMatchingQueueException (p. 1567) if by the time this operation is called there is not a single matching SharedReaderQueue.

8.280.3.21 get_write_params_for_related_request()

```
template<typename TReq , typename TRep >
rti::pub::WriteParams rti::queuing::QueueReplier< TReq, TRep >::get_write_params_for_related_↔
request (
    rti::pub::WriteParams & write_params,
    const dds::sub::SampleInfo & related_request_info ) [inline]
```

Gets the write parameters ready to send a reply for a given related request.

You can use this method to modify the parameters before you send a reply using **QueueReplier::send_reply(const TRep&, rti::pub::WriteParams&)** (p. 1824).

Parameters

<i>write_params</i>	<< out >> (p. 157) the write params to send the reply.
<i>related_request_info</i>	<< in >> (p. 157) The sample info of the related request.

MT Safety:

QueueReplier::send_reply(const TReq&, rti::pub::WriteParams&) (p. 1824)**8.280.3.22 take_requests()** [1/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq > rti::queuing::QueueReplier< TReq, TRep >::take_requests ( )
[inline]
```

Provides a loaned container to access the existing requests.

See also

QueueConsumer::take_samples() (p. 1796)**8.280.3.23 take_requests()** [2/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq > rti::queuing::QueueReplier< TReq, TRep >::take_requests (
    int max_count ) [inline]
```

Provides a loaned container to access the existing requests.

See also

QueueConsumer::take_samples(int) (p. 1797)

8.280.3.24 read_requests() [1/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq > rti::queuing::QueueReplier< TReq, TRep >::read_requests ( )
[inline]
```

Provides a loaned container from which you can access the existing requests.

This operation is equivalent to **QueueReplier::take_requests()** (p. 1830), except the sample remains in the **QueueReplier** (p. 1819) and can be read or taken again.

8.280.3.25 read_requests() [2/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TReq > rti::queuing::QueueReplier< TReq, TRep >::read_requests (
    int max_count ) [inline]
```

Provides a loaned container from which you can access the existing requests.

This operation is equivalent to **QueueReplier::take_requests(int)** (p. 1830), except the sample remains in the **QueueReplier** (p. 1819) and can be read or taken again.

8.280.3.26 writer()

```
template<typename TReq , typename TRep >
dds::pub::DataWriter< TRep > rti::queuing::QueueReplier< TReq, TRep >::writer ( ) const [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 908) used to send replies.

See also

QueueProducer::writer() (p. 1813)

8.280.3.27 reader()

```
template<typename TReq , typename TRep >
dds::sub::DataReader< TReq > rti::queuing::QueueReplier< TReq, TRep >::reader ( ) const [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 756) used to receive requests.

See also

QueueConsumer::reader (p. 1795)

8.280.3.28 guid()

```
template<typename TReq , typename TRep >
rti::core::Guid rti::queuing::QueueReplier< TReq, TRep >::guid ( ) [inline]
```

Returns the GUID of this **QueueReplier** (p. 1819).

The **QueueReplier** (p. 1819)'s GUID is the same GUID of both underlying **QueueProducer** (p. 1805) and **QueueConsumer** (p. 1787).

8.281.1 Detailed Description

```
template<typename TReq, typename TRep>
class rti::queuing::QueueReplierListener< TReq, TRep >
```

Called when certain events occur in a **QueueReplier** (p. 1819).

A **QueueReplier** (p. 1819) listener is a way to implement a callback that will be invoked when certain events happen. It is an optional parameter in **QueueReplierParams** (p. 1834).

Implemented in [rti::queuing::NoOpQueueReplierListener< TReq, TRep >](#) (p. 1593).

8.282 rti::queuing::QueueReplierParams Class Reference

Contains the parameters for creating a [QueueReplier](#) (p. 1819).

```
#include <rti/queuing/QueueParams.hpp>
```

Inheritance diagram for [rti::queuing::QueueReplierParams](#):

Public Member Functions

- **QueueReplierParams** (**dds::domain::DomainParticipant** participant)
*Creates a **QueueReplierParams** (p. 1834) object with the participant set.*
- **QueueReplierParams** & **enable_availability** (bool enable)
*Indicates whether the availability channel is enabled with the request **SharedReaderQueue**.*
- **QueueReplierParams** & **enable_sample_replication** (bool enable)
*Causes the **QueueReplier** (p. 1819) to write all the replies with the **dds::sub::SampleInfo::flag** (p. 2000) including the bit **rti::core::SampleFlag::replicate** (p. 1987).*
- **QueueReplierParams** & **enable_wait_for_ack** (bool enable)
*Enables **Queuing Service's 'Acknowledgment Management'** feature for replies.*

8.282.1 Detailed Description

Contains the parameters for creating a **QueueReplier** (p. 1819).

8.282.2 Constructor & Destructor Documentation

8.282.2.1 QueueReplierParams()

```
rti::queuing::QueueReplierParams::QueueReplierParams (
    dds::domain::DomainParticipant participant ) [inline], [explicit]
```

Creates a **QueueReplierParams** (p. 1834) object with the participant set.

The rest of the parameters that can be set in a **QueueReplierParams** (p. 1834) object are optional.

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) a QueueReplier (p. 1819) uses to join a domain.
--------------------	--

8.282.3 Member Function Documentation

8.282.3.1 enable_availability()

```
QueueReplierParams & rti::queuing::QueueReplierParams::enable_availability (
    bool enable ) [inline]
```

Indicates whether the availability channel is enabled with the request **SharedReaderQueue**.

See also

`QueueConsumerParams::enable_availability`.

References `rti::util::network_capture::enable()`.

8.282.3.2 `enable_sample_replication()`

```
QueueReplierParams & rti::queuing::QueueReplierParams::enable_sample_replication (
    bool enable ) [inline]
```

Causes the `QueueReplier` (p. 1819) to write all the replies with the `dds::sub::SampleInfo::flag` (p. 2000) including the bit `rti::core::SampleFlag::replicate` (p. 1987).

See also

`QueueProducerParams::enable_sample_replication` (p. 1818)

References `rti::util::network_capture::enable()`.

8.282.3.3 `enable_wait_for_ack()`

```
QueueReplierParams & rti::queuing::QueueReplierParams::enable_wait_for_ack (
    bool enable ) [inline]
```

Enables Queuing Service's 'Acknowledgment Management' feature for replies.

See also

`QueueProducerParams::enable_wait_for_ack`

References `rti::util::network_capture::enable()`.

8.283 `rti::queuing::QueueRequester< TReq, TRep >` Class Template Reference

Allows sending requests and receiving replies.

```
#include <rti/queuing/QueueRequester.hpp>
```

Inheritance diagram for `rti::queuing::QueueRequester< TReq, TRep >`:

Public Member Functions

- **QueueRequester** (const **QueueRequesterParams** ¶ms, bool is_enabled=true, **Listener** *requester_↵ listener=NULL, const **rti::core::Guid** &requester_guid= **rti::core::Guid::unknown**())
Creates a queue requester.
- **QueueRequester** (const **QueueRequesterParams** ¶ms, bool is_enabled, std::shared_ptr< **Listener** > requester_listener, const **rti::core::Guid** &requester_guid= **rti::core::Guid::unknown**())
*Creates a **QueueRequester** (p. 1836) with parameters.*
- void **listener** (**Listener** *the_listener, const **dds::core::status::StatusMask** &event_mask= **dds::core::↵ ::status::StatusMask::none**())
Sets the listener associated with this queue requester.
- **Listener** * **listener** () const
Returns the listener currently associated with this requester.
- std::shared_ptr< **Listener** > **get_listener** () const
Gets the listener.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)
Sets a listener to be notified of status updates.
- void **enable** ()
*Enables the **QueueRequester** (p. 1836) to send data, receive data and receive listener notifications.*
- **dds::sub::LoanedSamples**< TRep > **receive_replies** (const **dds::core::Duration** &max_wait)
Waits for multiple replies and provides a loaned container to access them.
- **dds::sub::LoanedSamples**< TRep > **receive_replies** (int min_count, int max_count, const **dds::core::↵ Duration** &max_wait)
Waits for multiple replies and provides a loaned container to access them.
- **dds::sub::LoanedSamples**< TRep > **take_replies** ()
Provides a loaned container from which you can access the existing replies.
- **dds::sub::LoanedSamples**< TRep > **take_replies** (int max_count)
Provides a loaned container from which you can access the existing replies.
- **dds::sub::LoanedSamples**< TRep > **read_replies** ()
Provides a loaned container from which you can access the existing replies.
- **dds::sub::LoanedSamples**< TRep > **read_replies** (int max_count)
Provides a loaned container from which you can access the existing replies for a specific request.
- **dds::sub::LoanedSamples**< TRep > **take_replies** (int max_count, const **rti::core::SampleIdentity** &related_request_id)
Provides a loaned container to access the existing replies for a specific request.
- **dds::sub::LoanedSamples**< TRep > **take_replies** (const **rti::core::SampleIdentity** &related_request_id)
Provides a loaned container from which you can access the existing replies for a specific request.
- **dds::sub::LoanedSamples**< TRep > **read_replies** (const **rti::core::SampleIdentity** &related_request_id)
Provides a loaned container from which you can access the existing replies for a specific request.
- void **send_request** (const TReq &request)
Sends a request.
- void **send_request** (const TReq &request, **rti::pub::WriteParams** &write_params)
Sends a request with the specified parameters and gets back metadata information related to the request sent.
- void **acknowledge_reply** (const **dds::sub::SampleInfo** &sample_info, bool is_positive_acknowledgment=true)
Explicitly acknowledges a single reply.
- void **acknowledge_all** (bool is_positive_acknowledgment=true)
Acknowledges all previously accessed replies.
- bool **wait_for_acknowledgments** (const **dds::core::Duration** &max_wait)

Blocks the calling thread until all requests written by this **QueueRequester** (p. 1836) are acknowledged Queuing Service, or until a timeout occurs.

- bool **wait_for_acknowledgments** (const **rti::core::SampleIdentity** &identity, const **dds::core::Duration** &max_wait)

Blocks the calling thread until the request identified by identity is acknowledged by Queuing Service, or until a timeout occurs.
- **rti::queuing::QueueConsumer**< TRep > **consumer** () const

Retrieves the underlying **QueueConsumer** (p. 1787).
- **rti::queuing::QueueProducer**< TReq > **producer** () const

Retrieves the underlying **QueueProducer** (p. 1805).
- bool **wait_for_replies** (const **dds::core::Duration** &max_wait)

Waits for replies to any request.
- bool **wait_for_replies** (int min_count, const **dds::core::Duration** &max_wait)

Waits for replies to any request.
- bool **wait_for_replies** (int min_count, const **dds::core::Duration** &max_wait, const **rti::core::SampleIdentity** &related_request_id)

Waits for replies to a specific request.
- void **send_availability** (**ConsumerAvailabilityParams** parameters)

Sends the availability status of the **QueueConsumer** (p. 1787) receiving samples from the reply SharedReaderQueue to Queuing Service.
- bool **has_matching_request_reader_queue** ()

Checks whether this **QueueRequester** (p. 1836) has matched with at least one request SharedReaderQueue.
- bool **has_matching_reply_reader_queue** ()

Checks whether this **QueueRequester** (p. 1836) has matched with at least one reply SharedReaderQueue.
- **dds::pub::DataWriter**< TReq > **writer** () const

Retrieves the underlying **dds::pub::DataWriter** (p. 908) used to send requests.
- **dds::sub::DataReader**< TRep > **reader** () const

Retrieves the underlying **dds::sub::DataReader** (p. 756) used to receive replies.
- **rti::core::Guid** **guid** ()

Returns the GUID of this **QueueRequester** (p. 1836).

8.283.1 Detailed Description

```
template<typename TReq, typename TRep>
class rti::queuing::QueueRequester< TReq, TRep >
```

Allows sending requests and receiving replies.

A **QueueRequester** (p. 1836) is a component suited for the queuing request-reply use case. A **QueueRequester** (p. 1836) plays the role of a request **QueueProducer** (p. 1805) and reply **QueueConsumer** (p. 1787).

A **QueueRequester** (p. 1836) is the entity that allows sending requests to a request SharedReaderQueue and receiving replies from a reply SharedReaderQueue.

To communicate with the SharedReaderQueues the **QueueRequester** (p. 1836) creates two topics. The first topic corresponds to the request SharedReaderQueue topic and the second topic to the reply SharedReaderQueue topic.

Valid types for these topics (TReq and TRep) are: those generated by rttidsgen, the **DDS built-in types** (p. 49), and **dds::core::xtypes::DynamicData** (p. 1208).

See also

QueueProducer (p. 1805)

QueueConsumer (p. 1787)

Template Parameters

<i>TReq</i>	The data type for the request SharedReaderQueue topic
<i>TRep</i>	The data type for the reply SharedReaderQueue topic

8.283.2 Constructor & Destructor Documentation

8.283.2.1 QueueRequester() [1/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueRequester< TReq, TRep >::QueueRequester (
    const QueueRequesterParams & params,
    bool is_enabled = true,
    Listener * requester_listener = NULL,
    const rti::core::Guid & requester_guid = rti::core::Guid::unknown() ) [inline],
[explicit]
```

Creates a queue requester.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener>` (p. 1381) instead of a regular `Listener*` pointer.

8.283.2.2 QueueRequester() [2/2]

```
template<typename TReq , typename TRep >
rti::queuing::QueueRequester< TReq, TRep >::QueueRequester (
    const QueueRequesterParams & params,
    bool is_enabled,
    std::shared_ptr< Listener > requester_listener,
    const rti::core::Guid & requester_guid = rti::core::Guid::unknown() ) [inline],
[explicit]
```

Creates a `QueueRequester` (p. 1836) with parameters.

Parameters

<i>params</i>	All the parameters that configure this <code>QueueRequester</code> (p. 1836). See <code>QueueRequesterParams</code> (p. 1853) for the list of mandatory parameters.
<i>is_enabled</i>	Specifies if the <code>QueueRequester</code> (p. 1836) is created ready to receive notifications in its listener and send or receive data. If you choose to bind the <code>QueueRequester</code> (p. 1836) to a <code>QueueRequesterListener</code> (p. 1851) using an <code>rti::core::ListenerBinder</code> (p. 1384) you should create the <code>QueueRequester</code> (p. 1836) disabled to avoid missing listener notifications. You can later enable the disabled <code>QueueRequester</code> (p. 1836) using <code>QueueRequester::enable</code> (p. 1841).
<i>requester_listener</i>	A <code>shared_ptr</code> to a <code>QueueRequesterListener</code> (p. 1851) object to receive event notifications.
<i>requester_guid</i> <small>Generated by Doxygen</small>	A GUID identifier for the requester. When <code>requester_guid</code> is set to <code>rti::core::Guid::unknown()</code> (p. 1341) the Guid identifier is generated automatically. You can retrieve the generated <code>QueueRequester</code> (p. 1836) Guid using the <code>QueueRequester::guid()</code> (p. 1850) method. To restart a <code>QueueRequester</code> (p. 1836) just create a new one with its same GUID.

Exceptions

One	of the Standard Exceptions (p.228)
-----	---

See also

QueueRequesterParams (p. 1853)**8.283.3 Member Function Documentation****8.283.3.1 listener()** [1/2]

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::listener (
    Listener * the_listener,
    const dds::core::status::StatusMask & event_mask = dds::core::status::StatusMask←
    ::none() ) [inline]
```

Sets the listener associated with this queue requester.

[DEPRECATED] The use of **set_listener()** (p. 1841) is recommended. Unlike this function, **set_listener** receives a **shared_ptr** which simplifies the management of listener's lifecycle.

Parameters

<i>the_listener</i>	The QueueRequesterListener (p. 1851) to set
<i>event_mask</i>	The dds::core::status::StatusMask (p.2082) associated with the listener

8.283.3.2 listener() [2/2]

```
template<typename TReq , typename TRep >
Listener * rti::queuing::QueueRequester< TReq, TRep >::listener ( ) const [inline]
```

Returns the listener currently associated with this requester.

[DEPRECATED] Prefer **get_listener()** (p. 1840) instead of this function.

If there is no listener it returns NULL.

8.283.3.3 get_listener()

```
template<typename TReq , typename TRep >
std::shared_ptr< Listener > rti::queuing::QueueRequester< TReq, TRep >::get_listener ( ) const
[inline]
```

Gets the listener.

8.283.3.4 set_listener()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified of status updates.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to this object. If it does, the application needs to manually reset the listener or manually close this object to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive updates or <code>nullptr</code> to reset the current listener and stop receiving updates.
---------------------	---

8.283.3.5 enable()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::enable ( ) [inline]
```

Enables the **QueueRequester** (p. 1836) to send data, receive data and receive listener notifications.

If you create the **QueueRequester** (p. 1836) disabled you can enable it using this method. To avoid missing listener notification when you use an **rti::core::ListenerBinder** (p. 1384) to bind the **QueueRequester** (p. 1836) to a **QueueRequesterListener** (p. 1851) use **QueueRequester::enable** (p. 1841) to enable the **QueueRequester** (p. 1836) after it is bound to the listener.

8.283.3.6 receive_replies() [1/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::receive_replies (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple replies and provides a loaned container to access them.

See also

QueueConsumer::receive_samples(const dds::core::Duration&) (p. 1796)

QueueRequester::wait_for_replies(int, const dds::core::Duration&) (p. 1848)

QueueRequester::take_replies(int) (p. 1842)

8.283.3.7 receive_replies() [2/2]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::receive_replies (
    int min_count,
    int max_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple replies and provides a loaned container to access them.

See also

QueueConsumer::receive_samples(int, int, const dds::core::Duration&) (p. 1796)

QueueRequester::wait_for_replies(int, const dds::core::Duration&) (p. 1848)

QueueRequester::take_replies(int) (p. 1842)

8.283.3.8 take_replies() [1/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::take_replies ( )
[inline]
```

Provides a loaned container from which you can access the existing replies.

See also

QueueConsumer::take_samples() (p. 1796)

8.283.3.9 take_replies() [2/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::take_replies (
    int max_count ) [inline]
```

Provides a loaned container from which you can access the existing replies.

See also

QueueConsumer::take_samples(int) (p. 1797)

8.283.3.10 read_replies() [1/3]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::read_replies ( )
[inline]
```

Provides a loaned container from which you can access the existing replies.

This operation is equivalent to **QueueRequester::take_replies()** (p. 1842), except the sample remains in the **QueueRequester** (p. 1836) and can be read or taken again.

8.283.3.11 read_replies() [2/3]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::read_replies (
    int max_count ) [inline]
```

Provides a loaned container from which you can access the existing replies for a specific request.

This operation is equivalent to **QueueRequester::take_replies(int, const rti::core::SampleIdentity&)** (p. 1843), except the sample remains in the **QueueRequester** (p. 1836) and can be read or taken again.

8.283.3.12 take_replies() [3/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::take_replies (
    int max_count,
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Provides a loaned container to access the existing replies for a specific request.

This operation is analogous to **QueueRequester::take_replies(int)** (p. 1842), except the replies this operation provides correspond to a specific request.

Parameters

<i>max_count</i>	The maximum number of samples that are taken at a time. The special value dds::core::LENGTH_UNLIMITED (p. 238) may be used.
<i>related_request_id</i>	The identity of a request previously sent by this QueueRequester (p. 1836)

MT Safety:

SAFE

See also

QueueRequester::take_replies(int) (p. 1842)**dds::sub::LoanedSamples** (p. 1406)**8.283.3.13 take_replies()** [4/4]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::take_replies (
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Provides a loaned container from which you can access the existing replies for a specific request.

This operation is equivalent to using **QueueRequester::take_replies(int, const rti::core::SampleIdentity&)** (p. 1843) with `max_count=dds::core::LENGTH_UNLIMITED` (p. 238)

MT Safety:

SAFE

See also

dds::sub::LoanedSamples (p. 1406)**QueueRequester::take_replies(int, const rti::core::SampleIdentity&)** (p. 1843)**8.283.3.14 read_replies()** [3/3]

```
template<typename TReq , typename TRep >
dds::sub::LoanedSamples< TRep > rti::queuing::QueueRequester< TReq, TRep >::read_replies (
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Provides a loaned container from which you can access the existing replies for a specific request.

This operation is equivalent to **QueueRequester::take_replies(int, const rti::core::SampleIdentity&)** (p. 1843), except the sample remains in the **QueueRequester** (p. 1836) and can be read or taken again.

8.283.3.15 send_request() [1/2]

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::send_request (
    const TReq & request ) [inline]
```

Sends a request.

. If a future reply needs to be correlated to exactly this request, use QueueRequester::send_request_w_writesample.

Parameters

<i>request</i>	The request to be sent
----------------	------------------------

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

MT Safety:

SAFE

See also

QueueProducer::send_sample(const T&, rti::pub::WriteParams&) (p. 1810)

8.283.3.16 send_request() [2/2]

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::send_request (
    const TReq & request,
    rti::pub::WriteParams & write_params ) [inline]
```

Sends a request with the specified parameters and gets back metadata information related to the request sent.

After calling this operation, write_params contains valid metadata information associated with the request sent.

The metadata field **rti::pub::WriteParams::source_guid** (p. 2349) of the write_params in the request is always set to this **QueueProducer** (p. 1805)'s GUID.

Parameters

<i>request</i>	<< <i>in</i> >> (p. 157) the request sample to send.
<i>write_params</i>	<< <i>inout</i> >> (p. 157) Parameters used to send the request. When this call ends successfully, write_params contains valid metadata information associated with the request sent.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or NoMatchingQueueException (p. 1567) if by the time this operation is called there is not a single matching SharedReaderQueue.

8.283.3.19 wait_for_acknowledgments() [1/2]

```
template<typename TReq , typename TRep >
bool rti::queuing::QueueRequester< TReq, TRep >::wait_for_acknowledgments (
    const dds::core::Duration & max_wait ) [inline]
```

Blocks the calling thread until all requests written by this **QueueRequester** (p. 1836) are acknowledged Queuing Service, or until a timeout occurs.

See also

QueueProducer::wait_for_acknowledgments(const dds::core::Duration&) (p. 1811)

QueueRequester::send_request(const TReq&) (p. 1844)

8.283.3.21 consumer()

```
template<typename TReq , typename TRep >
rti::queuing::QueueConsumer< TRep > rti::queuing::QueueRequester< TReq, TRep >::consumer ( )
const [inline]
```

Retrieves the underlying **QueueConsumer** (p. 1787).

8.283.3.22 producer()

```
template<typename TReq , typename TRep >
rti::queuing::QueueProducer< TReq > rti::queuing::QueueRequester< TReq, TRep >::producer ( )
const [inline]
```

Retrieves the underlying **QueueProducer** (p. 1805).

8.283.3.23 wait_for_replies() [1/3]

```
template<typename TReq , typename TRep >
bool rti::queuing::QueueRequester< TReq, TRep >::wait_for_replies (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for replies to any request.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 1798)

8.283.3.24 wait_for_replies() [2/3]

```
template<typename TReq , typename TRep >
bool rti::queuing::QueueRequester< TReq, TRep >::wait_for_replies (
    int min_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for replies to any request.

See also

QueueConsumer::wait_for_samples(int, const dds::core::Duration&) (p. 1798)

8.283.3.25 wait_for_replies() [3/3]

```
template<typename TReq , typename TRep >
bool rti::queuing::QueueRequester< TReq, TRep >::wait_for_replies (
    int min_count,
    const dds::core::Duration & max_wait,
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Waits for replies to a specific request.

This operation is analogous to **QueueRequester::wait_for_replies(int, const dds::core::Duration&)** (p. 1848), except this operation waits for replies for a specific request.

Parameters

<i>min_count</i>	Minimum number of replies for the related request that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum wait time after which this operation unblocks, regardless of how many replies are available.
<i>related_request_id</i>	The identity of a request previously sent by this QueueRequester (p. 1836)

Returns

true if at least *min_count* replies for the related request were available before *max_wait* elapsed, or false otherwise.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

MT Safety:

SAFE

QueueRequester::wait_for_replies(int, const dds::core::Duration&) (p. 1848)

8.283.3.26 send_availability()

```
template<typename TReq , typename TRep >
void rti::queuing::QueueRequester< TReq, TRep >::send_availability (
    ConsumerAvailabilityParams parameters ) [inline]
```

Sends the availability status of the **QueueConsumer** (p. 1787) receiving samples from the reply SharedReaderQueue to Queuing Service.

See also

QueueConsumer::send_availability(ConsumerAvailabilityParams) (p. 1799)

QueueRequesterParams::enable_availability

8.283.3.27 has_matching_request_reader_queue()

```
template<typename TReq , typename TRep >
bool rti::queuing::QueueRequester< TReq, TRep >::has_matching_request_reader_queue ( ) [inline]
```

Checks whether this **QueueRequester** (p. 1836) has matched with at least one request **SharedReaderQueue**.

See also

QueueProducer::has_matching_reader_queue() (p. 1814)

8.283.3.28 has_matching_reply_reader_queue()

```
template<typename TReq , typename TRep >
bool rti::queuing::QueueRequester< TReq, TRep >::has_matching_reply_reader_queue ( ) [inline]
```

Checks whether this **QueueRequester** (p. 1836) has matched with at least one reply **SharedReaderQueue**.

See also

QueueConsumer::has_matching_reader_queue() (p. 1800)

8.283.3.29 writer()

```
template<typename TReq , typename TRep >
dds::pub::DataWriter< TReq > rti::queuing::QueueRequester< TReq, TRep >::writer ( ) const [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 908) used to send requests.

See also

QueueProducer::writer() (p. 1813)

8.283.3.30 reader()

```
template<typename TReq , typename TRep >
dds::sub::DataReader< TRep > rti::queuing::QueueRequester< TReq, TRep >::reader ( ) const [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 756) used to receive replies.

See also

QueueConsumer::reader (p. 1795)

8.283.3.31 guid()

```
template<typename TReq , typename TRep >
rti::core::Guid rti::queuing::QueueRequester< TReq, TRep >::guid ( ) [inline]
```

Returns the GUID of this **QueueRequester** (p. 1836).

The **QueueRequester** (p. 1836)'s GUID is the same GUID of both the underlying **QueueProducer** (p. 1805) and **QueueConsumer** (p. 1787).

The GUID of the **QueueRequester** (p. 1836) is also used by Queuing Service to correlate the replies the **QueueRequester** (p. 1836) produces. Replies are only delivered to the **QueueRequester** (p. 1836) that generated the related request.

8.285 rti::queuing::QueueRequesterParams Class Reference

Contains the parameters for creating a [QueueRequester](#) (p. 1836).

```
#include <rti/queuing/QueueParams.hpp>
```

Inheritance diagram for rti::queuing::QueueRequesterParams:

Public Member Functions

- **QueueRequesterParams** (`dds::domain::DomainParticipant` participant)
*Creates a **QueueRequesterParams** (p. 1853) object with the participant set.*
- **QueueRequesterParams** & **enable_availability** (bool enable)
*Indicates whether the availability channel is enabled with the reply **SharedReaderQueue**.*
- **QueueRequesterParams** & **enable_sample_replication** (bool enable)
*Causes the **QueueRequester** (p. 1836) to write all the requests with the **dds::sub::SampleInfo::flag** (p. 2000) including the bit **rti::core::SampleFlag::replicate** (p. 1987).*
- **QueueRequesterParams** & **enable_wait_for_ack** (bool enable)
*Enables **Queueing Service's 'Acknowledgment Management'** feature for requests.*

8.285.1 Detailed Description

Contains the parameters for creating a **QueueRequester** (p. 1836).

8.285.2 Constructor & Destructor Documentation

8.285.2.1 QueueRequesterParams()

```
rti::queuing::QueueRequesterParams::QueueRequesterParams (
    dds::domain::DomainParticipant participant ) [inline], [explicit]
```

Creates a **QueueRequesterParams** (p. 1853) object with the participant set.

The rest of the parameters that can be set in a **QueueRequesterParams** (p. 1853) object are optional.

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) a QueueRequester (p. 1836) uses to join a domain.
--------------------	--

8.285.3 Member Function Documentation

8.285.3.1 enable_availability()

```
QueueRequesterParams & rti::queuing::QueueRequesterParams::enable_availability (
    bool enable ) [inline]
```

Indicates whether the availability channel is enabled with the reply **SharedReaderQueue**.

See also

QueueConsumerParams::enable_availability.

References [rti::util::network_capture::enable\(\)](#).

8.285.3.2 enable_sample_replication()

```
QueueRequesterParams & rti::queuing::QueueRequesterParams::enable_sample_replication (
    bool enable ) [inline]
```

Causes the **QueueRequester** (p. 1836) to write all the requests with the **dds::sub::SampleInfo::flag** (p. 2000) including the bit **rti::core::SampleFlag::replicate** (p. 1987).

See also

QueueProducerParams::enable_sample_replication (p. 1818)

QueueProducerParams::enable_wait_for_ack

References [rti::util::network_capture::enable\(\)](#).

8.286 dds::sub::Rank Class Reference

<<**value-type**>> (p. 152) Contains the sample and generation ranks of a data-sample

```
#include <TRank.hpp>
```

Public Member Functions

- **Rank** ()
Create a default **Rank** (p. 1855) object.
- **Rank** (int32_t sample_rank, int32_t generation_rank, int32_t absolute_generation_rank)
Create a **Rank** (p. 1855) object with the provided *sample_rank*, *generation_rank*, and *absolute_generation_rank*.
- int32_t **sample** () const
Get the sample rank of the sample.
- int32_t **generation** () const
Get the generation rank of the sample.
- int32_t **absolute_generation** () const
Get the absolute generation rank of the sample.

8.286.1 Detailed Description

<<**value-type**>> (p. 152) Contains the sample and generation ranks of a data-sample

See also

dds::sub::SampleInfo::rank() (p. 1996)

8.286.2 Constructor & Destructor Documentation

8.286.2.1 Rank() [1/2]

```
dds::sub::Rank::Rank ( ) [inline]
```

Create a default **Rank** (p. 1855) object.

8.286.2.2 Rank() [2/2]

```
dds::sub::Rank::Rank (
    int32_t sample_rank,
    int32_t generation_rank,
    int32_t absolute_generation_rank ) [inline]
```

Create a **Rank** (p. 1855) object with the provided *sample_rank*, *generation_rank*, and *absolute_generation_rank*.

8.286.3 Member Function Documentation

8.286.3.1 sample()

```
int32_t dds::sub::Rank::sample ( ) const [inline]
```

Get the sample rank of the sample.

The sample rank of the sample.

Indicates the number of samples related to the same instance that follow in the collection returned by `read` or `take`.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1994)

Interpretation of the SampleInfo counters and ranks (p. 1995)

8.286.3.2 generation()

```
int32_t dds::sub::Rank::generation ( ) const [inline]
```

Get the generation rank of the sample.

The generation rank of the sample.

Indicates the generation difference (number of times the instance was NOT_ALIVE and become alive again) between the time the sample was received and the time the most recent sample in the collection related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1994)

Interpretation of the SampleInfo counters and ranks (p. 1995)

8.286.3.3 absolute_generation()

```
int32_t dds::sub::Rank::absolute_generation ( ) const [inline]
```

Get the absolute generation rank of the sample.

The absolute generation rank of the sample.

Indicates the generation difference (number of times the instance was disposed and become alive again) between the time the sample was received, and the time the most recent sample (which may not be in the returned collection) related to the same instance was received.

See also

Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank (p. 1994)

Interpretation of the SampleInfo counters and ranks (p. 1995)

8.287 dds::sub::cond::ReadCondition Class Reference

<<*reference-type*>> (p. 153) Condition specifically dedicated to read operations and attached to one **dds::sub::DataReader** (p. 756).

```
#include <dds/sub/cond/ReadCondition.hpp>
```

Inheritance diagram for dds::sub::cond::ReadCondition:

Public Member Functions

- template<typename T >
ReadCondition (const **dds::sub::DataReader**< T > &reader, const **dds::sub::status::DataState** &status)
*Creates a **ReadCondition** (p. 1858).*
- template<typename T , typename Functor >
ReadCondition (const **dds::sub::DataReader**< T > &reader, const **dds::sub::status::DataState** &status, const Functor &handler)
*Creates a **ReadCondition** (p. 1858) with a handler.*
- const **dds::sub::status::DataState** **state_filter** () const
*Returns the **DataState** of this condition.*
- const **AnyDataReader** & **data_reader** () const
*Returns the **DataReader** (p. 756) associated to this condition.*
- void **close** ()
*Closes the **ReadCondition** (p. 1858).*
- bool **closed** () const
*Indicates whether this **ReadCondition** (p. 1858) has been closed with **close()** (p. 1861).*

Related Functions

(Note that these are not member functions.)

- dds::sub::cond::detail::ReadCondition **create_read_condition_ex** (const **dds::sub::AnyDataReader** &reader, const **::rti::sub::status::DataStateEx** &status)
*<<extension>> (p. 156) Creates a **ReadCondition** (p. 1858) with the extended **DataStateEx**.*
- template<typename Functor >
dds::sub::cond::detail::ReadCondition **create_read_condition_ex** (const **dds::sub::AnyDataReader** &reader, const **::rti::sub::status::DataStateEx** &status, const Functor &handler)
*<<extension>> (p. 156) Creates a **ReadCondition** (p. 1858) with the extended **DataStateEx** and a handler.*

8.287.1 Detailed Description

<<*reference-type*>> (p. 153) Condition specifically dedicated to read operations and attached to one **dds::sub::DataReader** (p. 756).

dds::sub::cond::ReadCondition (p. 1858) objects allow an application to specify the data samples it is interested in (by specifying the desired `sample_states`, `view_states` as well as `instance_states` in **dds::sub::DataReader::read** (p. 773) and **dds::sub::DataReader::take** (p. 774) variants.

This allows RTI Connex to enable the condition only when suitable information is available. They are to be used in conjunction with a WaitSet as normal conditions.

More than one **dds::sub::cond::ReadCondition** (p.1858) may be attached to the same **dds::sub::DataReader** (p. 756).

Examples

`Foo_subscriber.cxx.`

8.287.2 Constructor & Destructor Documentation

8.287.2.1 ReadCondition() [1/2]

```
template<typename T >
dds::sub::cond::ReadCondition::ReadCondition (
    const dds::sub::DataReader< T > & reader,
    const dds::sub::status::DataState & status ) [inline]
```

Creates a **ReadCondition** (p. 1858).

Template Parameters

<i>T</i>	The topic-type of the DataReader (p. 756).
----------	---

Parameters

<i>reader</i>	The reader associated to the condition. One reader can have multiple ReadConditions but one ReadCondition (p. 1858) belongs to exactly one DataReader (p. 756).
<i>status</i>	The sample, view and instance states of interest.

See also

`rti::sub::cond::create_read_condition_ex`

8.287.2.2 ReadCondition() [2/2]

```
template<typename T , typename Functor >
dds::sub::cond::ReadCondition::ReadCondition (
    const dds::sub::DataReader< T > & reader,
    const dds::sub::status::DataState & status,
    const Functor & handler ) [inline]
```

Creates a **ReadCondition** (p. 1858) with a handler.

Template Parameters

<i>T</i>	The topic-type of the DataReader (p. 756).
<i>Functor</i>	Any type whose instances can be called with a no-argument function call (i.e. <code>f()</code> , if <code>f</code> is an instance of Functor), or with a Condition argument (<code>f(condition)</code>) Examples are functions, types that override <code>operator()</code> , and lambdas.

Parameters

<i>reader</i>	The reader associated to the condition. One reader can have multiple ReadConditions but one ReadCondition (p. 1858) belongs to exactly one DataReader (p. 756).
<i>status</i>	The sample, view and instance states of interest.
<i>handler</i>	The handler that dds::core::cond::WaitSet::dispatch() (p. 2325) will call when the condition is triggered. This argument is copied.

The following examples creates two **ReadConditions** with handlers. The first one receives a lambda function with no arguments. The second one receives a function with the condition as an argument.

```
// Example 1: lambda function with no arguments
dds::sub::cond::ReadCondition my_read_condition(
    reader,
    dds::sub::status::DataState::any(),
    []()
    {
        std::cout << "condition has been triggered\n";
    }
);
// Example 2: function with a condition argument
void function_handler(dds::core::cond::Condition c)
{
    // function receiving the condition
    std::cout << "condition has been triggered\n";
}
dds::sub::cond::ReadCondition my_read_condition2(
    reader,
    dds::sub::status::DataState::any(),
    function_handler
);
```

See also

dds::core::cond::WaitSet::dispatch() (p. 2325)

WaitSet wait and dispatch examples (p. 131)

8.287.3 Member Function Documentation

8.287.3.1 state_filter()

```
const dds::sub::status::DataState dds::sub::cond::ReadCondition::state_filter ( ) const [inline]
```

Returns the **DataState** of this condition.

8.287.3.2 data_reader()

```
const AnyDataReader & dds::sub::cond::ReadCondition::data_reader ( ) const [inline]
```

Returns the **DataReader** (p. 756) associated to this condition.

To obtain the actual typed **DataReader** (p. 756), see **AnyDataReader::get()** (p. 598)

8.287.3.3 close()

```
void dds::sub::cond::ReadCondition::close ( ) [inline]
```

Closes the **ReadCondition** (p. 1858).

This is an explicit deletion, which otherwise would occur when all references to this **ReadCondition** (p. 1858) go out of scope.

Precondition

The **ReadCondition** (p. 1858) must not be attached to any Waitsets.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	If the ReadCondition (p. 1858) is attached to a Waitset when it is closed.
---	---

8.287.3.4 closed()

```
bool dds::sub::cond::ReadCondition::closed ( ) const [inline]
```

Indicates whether this **ReadCondition** (p. 1858) has been closed with **close()** (p. 1861).

8.287.4 Friends And Related Function Documentation

8.287.4.1 create_read_condition_ex() [1/2]

```
dds::sub::cond::detail::ReadCondition create_read_condition_ex (
    const dds::sub::AnyDataReader & reader,
    const ::rti::sub::status::DataStateEx & status ) [related]
```

<<*extension*>> (p. 156) Creates a **ReadCondition** (p. 1858) with the extended DataStateEx.

Note

This is a standalone function in the namespace `rti::sub::cond`

The usual way to create a **dds::sub::cond::ReadCondition** (p. 1858) is the constructor that receives a **dds::sub::status::DataState** (p. 888). This extension function allows using **rti::sub::status::DataStateEx** (p. 896), which includes additional state masks.

References **dds::sub::condition()**.

8.287.4.2 create_read_condition_ex() [2/2]

```
template<typename Functor >
dds::sub::cond::detail::ReadCondition create_read_condition_ex (
    const dds::sub::AnyDataReader & reader,
    const ::rti::sub::status::DataStateEx & status,
    const Functor & handler ) [related]
```

<<*extension*>> (p. 156) Creates a **ReadCondition** (p. 1858) with the extended DataStateEx and a handler.

Note

This is a standalone function in the namespace `rti::sub::cond`

The usual way to create a **dds::sub::cond::ReadCondition** (p. 1858) is the constructor that receives a **dds::sub::status::DataState** (p. 888). This extension function allows using **rti::sub::status::DataStateEx** (p. 896), which includes additional state masks.

References **dds::sub::condition()**.

8.288 dds::core::policy::ReaderDataLifecycle Class Reference

Controls how a DataReader manages the lifecycle of the data that it has received.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **ReaderDataLifecycle** ()
Creates the default policy.
- **ReaderDataLifecycle** (const **dds::core::Duration** &the_nowriter_delay, const **dds::core::Duration** &the_disposed_samples_delay)
Creates an instance with the specified nowriter and disposed-samples purge delays.
- **ReaderDataLifecycle & autopurge_nowriter_samples_delay** (const **dds::core::Duration** &duration)
Minimum duration for which the DataReader will maintain information regarding an instance once its `instance_state` becomes `InstanceStateKind::NOT_ALIVE_NO_WRITERS`.
- **dds::core::Duration autopurge_nowriter_samples_delay** () const
Getter (see setter with the same name)
- **ReaderDataLifecycle & autopurge_disposed_samples_delay** (const **dds::core::Duration** &duration)
Minimum duration for which the DataReader will maintain information regarding an instance once its `instance_state` becomes `InstanceStateKind::NOT_ALIVE_DISPOSED`.
- **dds::core::Duration autopurge_disposed_samples_delay** () const
Getter (see setter with the same name)

Static Public Member Functions

- static **ReaderDataLifecycle NoAutoPurge** ()
Returns a policy where all purge delays are disabled (the default)
- static **ReaderDataLifecycle AutoPurgeDisposedSamples** (const **dds::core::Duration** &duration)
Returns a policy where only the disposed-samples purge delay is enabled with a specified duration.
- static **ReaderDataLifecycle AutoPurgeNoWriterSamples** (const **dds::core::Duration** &d)
Returns a policy where only the no-writer purge delay is enabled with a specified duration.

8.288.1 Detailed Description

Controls how a DataReader manages the lifecycle of the data that it has received.

When a DataReader receives data, it is stored in a receive queue for the DataReader. The user application may either take the data from the queue or leave it there.

This QoS policy controls whether or not RTI Connext will automatically remove data from the receive queue (so that user applications cannot access it afterwards) when it detects that there are no more DataWriters alive for that data. It specifies how long a `dds::sub::DataReader` (p. 756) must retain information regarding instances that have the `instance_state` `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361).

Note: This policy is not concerned with keeping reliable reader state or discovery information.

The `dds::sub::DataReader` (p. 756) internally maintains the samples that have not been "taken" by the application, subject to the constraints imposed by other QoS policies such as `dds::core::policy::History` (p. 1346) and `dds::core::policy::ResourceLimits` (p. 1921).

The `dds::sub::DataReader` (p. 756) also maintains information regarding the identity, `view_state` and `instance_state` of data instances even after all samples have been taken. This is needed to properly compute the states when future samples arrive.

Under normal circumstances the `dds::sub::DataReader` (p. 756) can only reclaim all resources for instances for which there are no writers and for which all samples have been 'taken'. The last sample the `dds::sub::DataReader` (p. 756) will have taken for that instance will have an `instance_state` of either `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361) or `dds::sub::status::InstanceState::not_alive_disposed()` (p. 1361) depending on whether or not the last writer that had ownership of the instance disposed it.

In the absence of `READER_DATA_LIFECYCLE` (p. 334), this behavior could cause problems if the application forgets to take those samples. "Untaken" samples will prevent the `dds::sub::DataReader` (p. 756) from reclaiming the resources and they would remain in the `dds::sub::DataReader` (p. 756) indefinitely.

A `DataReader` can also reclaim all resources for instances that have an instance state of `dds::sub::status::InstanceState::not_alive_disposed()` (p. 1361) and for which all DDS samples have been 'taken'. `DataReaders` will only reclaim resources in this situation when the `autopurge_disposed_instances_delay` has been set to zero.

For keyed Topics, the consideration of removing data samples from the receive queue is done on a per instance (key) basis. Thus when RTI Connext detects that there are no longer `DataWriters` alive for a certain key value of a Topic (an instance of the Topic), it can be configured to remove all data samples for that instance (key).

Entity:

`dds::sub::DataReader` (p. 756)

Properties:

`RxO` (p. 307) = N/A

`Changeable` (p. 307) = YES (p. 307)

8.288.2 Constructor & Destructor Documentation

8.288.2.1 ReaderDataLifecycle() [1/2]

```
dds::core::policy::ReaderDataLifecycle::ReaderDataLifecycle ( ) [inline]
```

Creates the default policy.

8.288.2.2 ReaderDataLifecycle() [2/2]

```
dds::core::policy::ReaderDataLifecycle::ReaderDataLifecycle (
    const dds::core::Duration & the_nowriter_delay,
    const dds::core::Duration & the_disposed_samples_delay ) [inline]
```

Creates an instance with the specified nowriter and disposed-samples purge delays.

8.288.3 Member Function Documentation

8.288.3.1 autopurge_nowriter_samples_delay() [1/2]

```
ReaderDataLifecycle & dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay (
    const dds::core::Duration & duration ) [inline]
```

Minimum duration for which the DataReader will maintain information regarding an instance once its `instance_↔state` becomes `InstanceStateKind::NOT_ALIVE_NO_WRITERS`.

At some point after this time elapses, the `dds::sub::DataReader` (p. 756) will purge all internal information regarding the instance, any "untaken" samples will also be dropped.

[default] `dds::core::Duration::infinite()` (p. 1197)

[range] [1 nanosec, 1 year] or `dds::core::Duration::infinite()` (p. 1197)

8.288.3.2 autopurge_nowriter_samples_delay() [2/2]

```
dds::core::Duration dds::core::policy::ReaderDataLifecycle::autopurge_nowriter_samples_delay ( )
const [inline]
```

Getter (see setter with the same name)

8.288.3.3 autopurge_disposed_samples_delay() [1/2]

```
ReaderDataLifecycle & dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_delay (
    const dds::core::Duration & duration ) [inline]
```

Minimum duration for which the DataReader will maintain information regarding an instance once its `instance_↵` state becomes `InstanceStateKind::NOT_ALIVE_DISPOSED`.

After this time elapses, the **dds::sub::DataReader** (p. 756) will purge all samples for the instance even if they have not been read by the application. This purge is done lazily when space is needed for other samples or instances.

[default] **dds::core::Duration::infinite()** (p. 1197)

[range] [1 nanosec, 1 year] or **dds::core::Duration::infinite()** (p. 1197)

8.288.3.4 autopurge_disposed_samples_delay() [2/2]

```
dds::core::Duration dds::core::policy::ReaderDataLifecycle::autopurge_disposed_samples_delay ( )
const [inline]
```

Getter (see setter with the same name)

8.288.3.5 NoAutoPurge()

```
static ReaderDataLifecycle dds::core::policy::ReaderDataLifecycle::NoAutoPurge ( ) [inline],
[static]
```

Returns a policy where all purge delays are disabled (the default)

[DEPRECATED] Use the default constructor instead

8.288.3.6 AutoPurgeDisposedSamples()

```
static ReaderDataLifecycle dds::core::policy::ReaderDataLifecycle::AutoPurgeDisposedSamples (
    const dds::core::Duration & duration ) [inline], [static]
```

Returns a policy where only the disposed-samples purge delay is enabled with a specified duration.

8.288.3.7 AutoPurgeNoWriterSamples()

```
static ReaderDataLifecycle dds::core::policy::ReaderDataLifecycle::AutoPurgeNoWriterSamples (
    const dds::core::Duration & d ) [inline], [static]
```

Returns a policy where only the no-writer purge delay is enabled with a specified duration.

8.288.3.8 autopurge_disposed_instances_delay() [1/2]

```
dds::core::policy::ReaderDataLifecycle & autopurge_disposed_instances_delay (
    const dds::core::Duration & duration )
```

<<**extension**>> (p. 156) Minimum duration for which the DataReader will maintain an instance once its `instance_↵_state` becomes `InstanceStateKind::NOT_ALIVE_DISPOSED`.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

After this time elapses, when the last sample for the disposed instance is taken, the **dds::sub::DataReader** (p. 756) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set `keep_minimum_state_for_instances` to `FALSE` in **rti::core::policy::DataReaderResourceLimits** (p. 856).

The only currently supported values are **dds::core::Duration::zero()** (p. 1197) and **dds::core::Duration::infinite()** (p. 1197). A value of **dds::core::Duration::zero()** (p. 1197) will purge an instance's state immediately after the instance state transitions to **dds::sub::status::InstanceState::not_alive_disposed()** (p. 1361), as long as all samples, including the dispose sample, associated with that instance have been 'taken'.

[default] dds::core::Duration::infinite() (p. 1197)

8.288.3.9 autopurge_disposed_instances_delay() [2/2]

```
dds::core::Duration autopurge_disposed_instances_delay ( ) const
```

<<**extension**>> (p. 156) Getter (see setter with the same name)

8.288.3.10 autopurge_nowriter_instances_delay() [1/2]

```
dds::core::policy::ReaderDataLifecycle & autopurge_nowriter_instances_delay (
    const dds::core::Duration & duration )
```

<<**extension**>> (p. 156) Minimum duration for which the DataReader will maintain an instance once its `instance_↵_state` becomes `InstanceStateKind::NOT_ALIVE_NO_WRITERS`.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

An instance will transition to the **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1361) `instance_↵_state` when all known writers for the instance have either lost liveliness or have unregistered themselves from the instance. After this time elapses, when the last sample for the instance without writers is taken, the **dds::sub::Data↵Reader** (p. 756) will keep only the minimum state about the instance.

If you do not want to keep this minimum state after the delay period, also set `keep_minimum_state_for_instances` to `FALSE` in **rti::core::policy::DataReaderResourceLimits** (p. 856).

The only currently supported values are **dds::core::Duration::zero()** (p. 1197) and **dds::core::Duration::infinite()** (p. 1197). A value of **dds::core::Duration::zero()** (p. 1197) will purge an instance's state immediately after the instance state transitions to **dds::sub::status::InstanceState::not_alive_no_writers()** (p. 1361), as long as all samples, including the `no_writers` sample, associated with that instance have been 'taken'.

[default] dds::core::Duration::zero() (p. 1197)

8.288.3.11 autopurge_nowriter_instances_delay() [2/2]

```
dds::core::Duration autopurge_nowriter_instances_delay ( ) const
```

8.290.1 Detailed Description

<<**extension**>> (p. 156) Configures threads that RTI Connex uses to receive and process data from the transport modules (such as UDP)

This QoS policy is an extension to the DDS standard.

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

See also

Controlling CPU Core Affinity for RTI Threads (p. 2158)

8.290.2 Usage

This QoS policy sets the thread properties such as priority level and stack size for the threads used by the middleware to receive and process data from transports.

RTI uses a separate receive thread per port per transport plug-in. To force RTI Connex to use a separate thread to process the data for a **dds::sub::DataReader** (p. 756), set a unique port for the **rti::core::policy::TransportUnicast** (p. 2259) or **rti::core::policy::TransportMulticast** (p. 2247) for the **dds::sub::DataReader** (p. 756).

This QoS policy also sets the size of the buffer used to store packets received from a transport. This buffer size will limit the largest single packet of data that a **dds::domain::DomainParticipant** (p. 1079) will accept from a transport. Users will often set this size to the largest packet that any of the transports used by their application will deliver. For many applications, the value 65,536 (64 K) is a good choice; this value is the largest packet that can be sent/received via UDP.

8.290.3 Constructor & Destructor Documentation

8.290.3.1 ReceiverPool() [1/2]

```
rti::core::policy::ReceiverPool::ReceiverPool ( ) [inline]
```

Creates the default policy.

```
rti::core::policy::ReceiverPool::ReceiverPool (
    const rti::core::ThreadSettings & the_thread,
    int32_t the_buffer_size,
    int32_t the_buffer_alignment )
```

Creates an instance with the thread settings, buffer size and buffer alignment configuration.

See individual setters.

8.290.4 Member Function Documentation

8.290.4.1 thread() [1/3]

```
ReceiverPool & rti::core::policy::ReceiverPool::thread (
    const rti::core::ThreadSettings & the_thread )
```

Configures the receiver pool thread(s)

There is at least one receive thread, possibly more.

[default] priority above normal.

The actual value depends on your architecture:

For Windows: 2

For Linux: OS default priority

For a complete list of platform specific values, please refer to [Platform Notes](#).

[default] The actual value depends on your architecture:

For Windows: OS default stack size

For Linux: OS default stack size

For a complete list of platform specific values, please refer to [Platform Notes](#).

[default] mask **rti::core::ThreadSettingsKindMask::floating_point()** (p.2161) | **rti::core::ThreadSettingsKindMask::stdio()** (p.2161)

8.290.4.2 thread() [2/3]

```
const rti::core::ThreadSettings & rti::core::policy::ReceiverPool::thread ( ) const
```

Getter (see setter with the same name)

8.290.4.3 thread() [3/3]

```
rti::core::ThreadSettings & rti::core::policy::ReceiverPool::thread ( )
```

Getter (see setter with the same name)

8.290.4.4 buffer_size() [1/2]

```
ReceiverPool & rti::core::policy::ReceiverPool::buffer_size (
    int32_t the_buffer_size )
```

Sets the length of the buffer used to store the incoming raw data.

The receive buffer is used by the receive thread to store the raw data that arrives over the transports in non-zero-copy transports.

Zero-copy transports do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in buffers allocated by the transports themselves. Only the shared memory built-in transport (SHMEM) supports zero-copy.

`buffer_size` must always be at least as large as the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1523) across *all* of the transports being used that are not doing zero-copy.

By default (`rti::core::LENGTH_AUTO`): the size is equal to the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1523) across *all* of the non-zero-copy transports.

You may want the value to be greater than the default if you try to limit the largest data packet that can be sent through the transport(s) in one application, but you still want to receive data from other applications that have not made the same change.

For example, to avoid IP fragmentation, you may want to set `NDDS_Transport_Property_t::message_size_max` (p. 1523) for IP-based transports to a small value, such as 1400 bytes. However, you may not be able to apply this change to all the applications at the same time. To receive data from these other applications the `buffer_size` should be equal to the original `NDDS_Transport_Property_t::message_size_max` (p. 1523).

[default] `rti::core::LENGTH_AUTO`

[range] [1, 1 GB] or `rti::core::LENGTH_AUTO`

8.290.4.5 buffer_size() [2/2]

```
int32_t rti::core::policy::ReceiverPool::buffer_size ( ) const
```

Getter (see setter with the same name)

8.290.4.6 `buffer_alignment()` [1/2]

```
ReceiverPool & rti::core::policy::ReceiverPool::buffer_alignment (
    int32_t the_buffer_alignment )
```

Sets the receive buffer alignment.

The receive buffer is used by the receive thread to store the raw data that arrives over the transports in non-zero-copy transports.

Zero-copy transports do not copy their data into the buffer provided by the receive thread. Instead, they provide the receive thread data in buffers allocated by the transports themselves. Only the shared memory built-in transport (SHMEM) supports zero-copy.

`buffer_size` must always be at least as large as the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1523) across *all* of the transports being used that are not doing zero-copy.

By default (`rti::core::LENGTH_AUTO`): the size is equal to the maximum `NDDS_Transport_Property_t::message_size_max` (p. 1523) across *all* of the non-zero-copy transports.

You may want the value to be greater than the default if you try to limit the largest data packet that can be sent through the transport(s) in one application, but you still want to receive data from other applications that have not made the same change.

For example, to avoid IP fragmentation, you may want to set `NDDS_Transport_Property_t::message_size_max` (p. 1523) for IP-based transports to a small value, such as 1400 bytes. However, you may not be able to apply this change to all the applications at the same time. To receive data from these other applications the `buffer_size` should be equal to the original `NDDS_Transport_Property_t::message_size_max` (p. 1523).

[default] `rti::core::LENGTH_AUTO`

[range] [1, 1 GB] or `rti::core::LENGTH_AUTO`

8.290.4.7 `buffer_alignment()` [2/2]

```
int32_t rti::core::policy::ReceiverPool::buffer_alignment ( ) const
```

Getter (see setter with the same name)

8.292.1 Detailed Description

Indicates the level of reliability in sample delivered that a **dds::pub::DataWriter** (p. 908) offers or a **dds::sub::Data←Reader** (p. 756) requests.

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Status:

dds::core::status::StatusMask::offered_incompatible_qos() (p. 2087), **dds::core::status::StatusMask←::requested_incompatible_qos()** (p. 2088)

Properties:

RxO (p. 307) = YES
Changeable (p. 307) = **UNTIL ENABLE** (p. 307) (the `instance_state_consistency_kind` is **Changeable** (p. 307) = **NO** (p. 307))

8.292.2 Usage

This policy indicates the level of reliability requested by a **dds::sub::DataReader** (p. 756) or offered by a **dds::pub::←DataWriter** (p. 908).

The reliability of a connection between a DataWriter and DataReader is entirely user configurable. It can be done on a per DataWriter/DataReader connection. A connection may be configured to be "best effort" which means that RTI Connex will not use any resources to monitor or guarantee that the data sent by a DataWriter is received by a DataReader.

For some use cases, such as the periodic update of sensor values to a GUI displaying the value to a person, **dds←::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 1881) delivery is often good enough. It is certainly the fastest, most efficient, and least resource-intensive (CPU and network bandwidth) method of getting the newest/latest value for a topic from DataWriters to DataReaders. But there is no guarantee that the data sent will be received. It may be lost due to a variety of factors, including data loss by the physical transport such as wireless RF or even Ethernet.

However, there are data streams (topics) in which you want an absolute guarantee that all data sent by a DataWriter is received reliably by DataReaders. This means that RTI Connex must check whether or not data was received, and repair any data that was rejected by resending a copy of the data as many times as it takes for the DataReader to receive

the data. RTI Connex uses a reliability protocol configured and tuned by these QoS policies: **dds::core::policy::History** (p. 1346), **rti::core::policy::DataWriterProtocol** (p. 979), **rti::core::policy::DataReaderProtocol** (p. 836), and **dds::core::policy::ResourceLimits** (p. 1921).

The **Reliability** (p. 1873) QoS policy is simply a switch to turn on the reliability protocol for a DataWriter/DataReader connection. The level of reliability provided by RTI Connex is determined by the configuration of the aforementioned QoS policies.

You can configure RTI Connex to deliver *all* data in the order they were sent (also known as absolute or strict reliability). Or, as a tradeoff for less memory, CPU, and network usage, you can choose a reduced level of reliability where only the last *N* values are guaranteed to be delivered reliably to DataReaders (where *N* is user-configurable). In the reduced level of reliability, there are no guarantees that the data sent before the last *N* are received. Only the last *N* data packets are monitored and repaired if necessary.

These levels are ordered, **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 1881) < **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881). A **dds::pub::DataWriter** (p. 908) offering one level is implicitly offering all levels below.

Note: To send *large* data reliably, you will also need to set **rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745). *Large* in this context means that the data cannot be sent as a single packet by the transport (for example, data larger than 63K when using UDP/IP).

The setting of this policy has a dependency on the setting of the **RESOURCE_LIMITS** (p. 336) policy. In case the reliability kind is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881) the write operation on the **dds::pub::DataWriter** (p. 908) may block if the modification would cause data to be lost or else cause one of the limits in specified in the **RESOURCE_LIMITS** (p. 336) to be exceeded. Under these circumstances, the **RELIABILITY** (p. 335) `max_blocking_time` configures the maximum duration the write operation may block.

If the **dds::core::policy::Reliability::kind** (p. 1876) is set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881), data samples originating from a single **dds::pub::DataWriter** (p. 908) cannot be made available to the **dds::sub::DataReader** (p. 756) if there are previous data samples that have not been received yet due to a communication error. In other words, RTI Connex will repair the error and resend data samples as needed in order to reconstruct a correct snapshot of the **dds::pub::DataWriter** (p. 908) history before it is accessible by the **dds::sub::DataReader** (p. 756).

If the **dds::core::policy::Reliability::kind** (p. 1876) is set to **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 1881), the service will not re-transmit missing data samples. However, for data samples originating from any one DataWriter the service will ensure they are stored in the **dds::sub::DataReader** (p. 756) history in the same order they originated in the **dds::pub::DataWriter** (p. 908). In other words, the **dds::sub::DataReader** (p. 756) may miss some data samples, but it will never see the value of a data object change from a newer value to an older value.

dds::core::policy::History (p. 1346)

dds::core::policy::ResourceLimits (p. 1921)

8.292.3 Compatibility

The value offered is considered compatible with the value requested if and only if:

- the inequality *offered kind* \geq *requested kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of `dds::core::policy::Reliability::kind` (p.1876) are considered ordered such that `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p.1881) $<$ `dds::core::policy::ReliabilityKind_def::RELIABLE` (p.1881).
- The offered `acknowledgment_kind = rti::core::policy::AcknowledgmentKind_def::PROTOCOL` (p.585) and requested `acknowledgment_kind = rti::core::policy::AcknowledgmentKind_def::PROTOCOL` (p.585) OR offered `acknowledgment_kind != rti::core::policy::AcknowledgmentKind_def::PROTOCOL` (p.585).
- the inequality *offered instance_state_consistency_kind* \geq *requested instance_state_consistency_kind* evaluates to 'TRUE'. For the purposes of this inequality, the values of `dds::core::policy::Reliability::instance_state_consistency_kind` (p.1878) are considered ordered such that `rti::core::policy::InstanceStateConsistencyKind::none` (p.336) $<$ `rti::core::policy::InstanceStateConsistencyKind::recover_state` (p.336).

8.292.4 Constructor & Destructor Documentation

8.292.4.1 Reliability() [1/2]

```
dds::core::policy::Reliability::Reliability ( ) [inline]
```

Creates a best-effort policy.

8.292.4.2 Reliability() [2/2]

```
dds::core::policy::Reliability::Reliability (
    dds::core::policy::ReliabilityKind the_kind,
    const dds::core::Duration & the_max_blocking_time = dds::core::Duration::from_
millisecs(100) ) [inline]
```

Creates an instance with the specified reliability kind an optionally a specific maximum blocking time.

The max blocking time only applies to reliable DataWriters.

8.292.5 Member Function Documentation

8.292.5.1 kind() [1/2]

```
Reliability & dds::core::policy::Reliability::kind (
    dds::core::policy::ReliabilityKind the_kind ) [inline]
```

Sets the reliability kind.

[default] `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p.1881) for `dds::sub::DataReader` (p.756) and `dds::topic::Topic` (p.2178), `dds::core::policy::ReliabilityKind_def::RELIABLE` (p.1881) for `dds::pub::DataWriter` (p.908)

8.292.5.2 kind() [2/2]

```
dds::core::policy::ReliabilityKind dds::core::policy::Reliability::kind ( ) const [inline]
```

Getter (see setter with the same name)

8.292.5.3 max_blocking_time() [1/2]

```
Reliability & dds::core::policy::Reliability::max_blocking_time (
    const dds::core::Duration & d ) [inline]
```

Sets the maximum time a DataWriter may block on a call to **write()** (p.949).

See [Writing Data](#), in the Core Libraries User's Manual, for more information about when the **write()** (p.949) call can block and what happens when it times out.

Has no meaning for DataReaders.

[default] 100 milliseconds

[range] [0,1 year] or `dds::core::Duration::infinite()` (p.1197)

See also

`dds::core::policy::ResourceLimits` (p.1921)

8.292.5.4 max_blocking_time() [2/2]

```
dds::core::Duration dds::core::policy::Reliability::max_blocking_time ( ) const [inline]
```

Getter (see setter with the same name)

8.292.5.5 Reliable()

```
static Reliability dds::core::policy::Reliability::Reliable (
    const dds::core::Duration & max_blocking_time = dds::core::Duration::from_millisecs(100)
) [inline], [static]
```

Creates a policy with ReliabilityKind::RELIABLE and optionally a max blocking time.

8.292.5.6 BestEffort()

```
static Reliability dds::core::policy::Reliability::BestEffort ( ) [inline], [static]
```

Creates a policy with ReliabilityKind::BEST Effort.

8.292.5.7 acknowledgment_kind() [1/2]

```
dds::core::policy::Reliability & acknowledgment_kind (
    rti::core::policy::AcknowledgmentKind ack_kind )
```

<<*extension*>> (p. 156) Sets the kind of reliable acknowledgment

Note

This function is an extension, it must be called via the **extensions()** member function (p. 156)

This setting applies only to the case where **dds::core::policy::Reliability::kind** (p. 1876) = **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881).

Sets the kind acknowledgments supported by a **dds::pub::DataWriter** (p. 908) and sent by **dds::sub::DataReader** (p. 756).

[default] **rti::core::policy::AcknowledgmentKind_def::PROTOCOL** (p. 585)

8.292.5.8 acknowledgment_kind() [2/2]

```
rti::core::policy::AcknowledgmentKind acknowledgment_kind ( ) const
```

<<*extension*>> (p. 156) Getter (see setter with the same name)

8.292.5.9 instance_state_consistency_kind() [1/2]

```
dds::core::policy::Reliability & instance_state_consistency_kind (
    rti::core::policy::InstanceStateConsistencyKind isr_kind )
```

<<**extension**>> (p. 156) Whether instance state consistency is enabled

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

A DataReader that determines that the DataWriter is no longer alive will transition instances to NOT_ALIVE_NO_↵ WRITERS if there are no other DataWriters updating that instance. If the DataReader rediscovers the DataWriter, the DataReader does not automatically transition instances back to the state they were in prior to the disconnection until it gets updates (i.e., samples) for them.

If InstanceStateConsistencyKind is set to RECOVER_INSTANCE_STATE_CONSISTENCY, then when the DataReader rediscovers a DataWriter, the DataReader will query the DataWriter for the state of its instances, and restore the instances to their correct state.

[default] rti::core::policy::InstanceStateConsistencyKind::none (p. 336) for dds::sub::DataReader (p. 756), rti↵ ::core::policy::InstanceStateConsistencyKind::recover_state (p. 336) for dds::pub::DataWriter (p. 908)

8.292.5.10 instance_state_consistency_kind() [2/2]

```
rti::core::policy::InstanceStateConsistencyKind instance_state_consistency_kind ( ) const
```

<<**extension**>> (p. 156) Getter (see setter with the same name)

8.293 dds::core::policy::ReliabilityKind_def Struct Reference

The definition of the dds::core::safe_enum (p. 1972) ReliabilityKind.

```
#include <PolicyKind.hpp>
```

Public Types

- enum type {
 BEST_EFFORT ,
 RELIABLE }

The underlying enum type.

8.293.1 Detailed Description

The definition of the dds::core::safe_enum (p. 1972) ReliabilityKind.

8.293.2 Member Enumeration Documentation

8.293.2.1 type

enum `dds::core::policy::ReliabilityKind_def::type`

The underlying `enum` type.

Enumerator

BEST_EFFORT	Indicates that it is acceptable to not retry propagation of any samples. Presumably new values for the samples are generated often enough that it is not necessary to re-send or acknowledge any samples. [default] for dds::sub::DataReader (p. 756) and dds::topic::Topic (p. 2178)
RELIABLE	Specifies that RTI Connexx will attempt to deliver all samples in its history. Missed samples may be retried. In steady-state (no modifications communicated via the dds::pub::DataWriter (p. 908)), RTI Connexx guarantees that all samples in the dds::pub::DataWriter (p. 908) history will eventually be delivered to all the dds::sub::DataReader (p. 756) objects (subject to timeouts that indicate loss of communication with a particular dds::sub::Subscriber (p. 2116)). Outside steady state, the HISTORY (p. 324) and RESOURCE_LIMITS (p. 336) policies will determine how samples become part of the history and whether samples can be discarded from it. [default] for dds::pub::DataWriter (p. 908)

8.294 rti::core::status::ReliableReaderActivityChangedStatus Class Reference

<<*extension*>> (p. 156) Information about the status **dds::core::status::StatusMask::reliable_reader_activity_↔changed()** (p. 2092)

```
#include <Status.hpp>
```

Inherits **rti::core::NativeValueType**< T, NATIVE_T, ADAPTER >.

Public Member Functions

- **EventCount32 active_count** () const
The current number of reliable readers currently matched with this reliable writer.
- **EventCount32 inactive_count** () const
The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.
- **dds::core::InstanceHandle last_instance_handle** () const
The instance handle of the last reliable remote reader to be determined inactive.

8.294.1 Detailed Description

<<*extension*>> (p. 156) Information about the status **dds::core::status::StatusMask::reliable_reader_activity_↔changed()** (p. 2092)

Entity:

dds::pub::DataWriter (p. 908)

Listener:

dds::pub::DataWriterListener (p. 972)

This status is the reciprocal status to the **dds::core::status::LivelinessChangedStatus** (p. 1395) on the reader. It is different than the **dds::core::status::LivelinessLostStatus** (p. 1398) on the writer in that the latter informs the writer about its own liveliness; this status informs the writer about the "liveliness" (activity) of its matched readers.

All counts in this status will remain at zero for best effort writers.

8.294.2 Member Function Documentation

8.294.2.1 active_count()

```
EventCount32 rti::core::status::ReliableReaderActivityChangedStatus::active_count ( ) const [inline]
```

The current number of reliable readers currently matched with this reliable writer.

8.294.2.2 inactive_count()

```
EventCount32 rti::core::status::ReliableReaderActivityChangedStatus::inactive_count ( ) const [inline]
```

The number of reliable readers that have been dropped by this reliable writer because they failed to send acknowledgements in a timely fashion.

A reader is considered to be inactive after is has been sent heartbeats `rti::core::RtpsReliableWriterProtocol::max_↔heartbeat_retries` times, each heartbeat having been separated from the previous by the current heartbeat period.

8.294.2.3 last_instance_handle()

```
dds::core::InstanceHandle rti::core::status::ReliableReaderActivityChangedStatus::last_instance↔_handle ( ) const [inline]
```

The instance handle of the last reliable remote reader to be determined inactive.

8.295 rti::core::status::ReliableWriterCacheChangedStatus Class Reference

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::reliable_writer_cache_↔changed()` (p. 2092)

```
#include <Status.hpp>
```

Inherits `rti::core::NativeValueType< T, NATIVE_T, ADAPTER >`.

Public Member Functions

- **EventCount32 empty_reliable_writer_cache ()** const
The number of times the reliable writer's cache of unacknowledged samples has become empty.
- **EventCount32 full_reliable_writer_cache ()** const
The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.
- **EventCount32 low_watermark_reliable_writer_cache ()** const
The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.
- **EventCount32 high_watermark_reliable_writer_cache ()** const
The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.
- **int32_t unacknowledged_sample_count ()** const
The current number of unacknowledged samples in the writer's cache.
- **int32_t unacknowledged_sample_count_peak ()** const
The highest value that unacknowledged_sample_count has reached until now.
- **int64_t replaced_unacknowledged_sample_count ()** const
The number of unacknowledged samples that have been replaced in the writer's cache.

8.295.1 Detailed Description

<<*extension*>> (p. 156) Information about the status `dds::core::status::StatusMask::reliable_writer_cache_↔changed()` (p. 2092)

Entity:

dds::pub::DataWriter (p. 908)

Listener:

dds::pub::DataWriterListener (p. 972)

A written sample is unacknowledged (and therefore accounted for in this status) if the writer is reliable and one or more readers matched with the writer has not yet sent an acknowledgement to the writer declaring that it has received the sample.

If the low watermark is zero and the unacknowledged sample count decreases to zero, both the low watermark and cache empty events are considered to have taken place. A single callback will be dispatched (assuming the user has requested one) that contains both status changes. The same logic applies when the high watermark is set equal to the maximum number of samples and the cache becomes full.

8.295.2 Member Function Documentation

8.295.2.1 empty_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::empty_reliable_writer_cache ( )
const [inline]
```

The number of times the reliable writer's cache of unacknowledged samples has become empty.

8.295.2.2 full_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::full_reliable_writer_cache ( )
const [inline]
```

The number of times the reliable writer's cache, or send window, of unacknowledged samples has become full.

Applies to writer's cache when the send window is enabled (when both `rti::core::RtpsReliableWriterProtocol::min_send_window_size` and `rti::core::RtpsReliableWriterProtocol::max_send_window_size` are not **dds::core::LENGTH_UNLIMITED** (p. 238)).

Otherwise, applies when the number of unacknowledged samples has reached the send window limit.

8.295.2.3 low_watermark_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::low_watermark_reliable_writer_↔
_cache ( ) const [inline]
```

The number of times the reliable writer's cache of unacknowledged samples has fallen to the low watermark.

A low watermark event will only be considered to have taken place when the number of unacknowledged samples in the writer's cache *decreases* to this value. A sample count that increases to this value will not result in a callback or in a change to the total count of low watermark events.

When the writer's send window is enabled, the low watermark is scaled down, if necessary, to fit within the current send window.

Set the low watermark value using the `rti::core::RtpsReliableWriterProtocol::low_watermark` field of the `rti::core::RtpsReliableWriterProtocol` structure.

8.295.2.4 high_watermark_reliable_writer_cache()

```
EventCount32 rti::core::status::ReliableWriterCacheChangedStatus::high_watermark_reliable_↔  
writer_cache ( ) const [inline]
```

The number of times the reliable writer's cache of unacknowledged samples has risen to the high watermark.

A high watermark event will only be considered to have taken place when the number of unacknowledged sampled *increases* to this value. A sample count that was above this value and then decreases back to it will not trigger an event.

When the writer's send window is enabled, the high watermark is scaled down, if necessary, to fit within the current send window.

Set the high watermark value using the rti::core::RtpsReliableWriterProtocol::high_watermark field of the rti::core::↔RtpsReliableWriterProtocol structure.

8.295.2.5 unacknowledged_sample_count()

```
int32_t rti::core::status::ReliableWriterCacheChangedStatus::unacknowledged_sample_count ( ) const  
[inline]
```

The current number of unacknowledged samples in the writer's cache.

A sample is considered unacknowledged if the writer has failed to receive an acknowledgement from one or more reliable readers matched to it.

8.295.2.6 unacknowledged_sample_count_peak()

```
int32_t rti::core::status::ReliableWriterCacheChangedStatus::unacknowledged_sample_count_peak ( )  
const [inline]
```

The highest value that unacknowledged_sample_count has reached until now.

8.295.2.7 replaced_unacknowledged_sample_count()

```
int64_t rti::core::status::ReliableWriterCacheChangedStatus::replaced_unacknowledged_sample_count  
( ) const [inline]
```

The number of unacknowledged samples that have been replaced in the writer's cache.

Total number of unacknowledged samples that have been replaced by a DataWriter after applying dds::core::policy::↔HistoryKind::KEEP_LAST policy.

8.296 rti::core::policy::RemoteParticipantPurgeKind_def Struct Reference

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `RemoteParticipantPurgeKind`

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
 LIVELINESS_BASED ,
 NO_PURGE }

The underlying enum type.

8.296.1 Detailed Description

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `RemoteParticipantPurgeKind`

Available behaviors for halting communication with remote participants (and their contained entities) with which discovery communication has been lost.

When discovery communication with a remote participant has been lost, the local participant must make a decision about whether to continue attempting to communicate with that participant and its contained entities. This "kind" is used to select the desired behavior.

This "kind" does not pertain to the situation in which a remote participant has been gracefully deleted and notification of that deletion have been successfully received by its peers. In that case, the local participant will immediately stop attempting to communicate with those entities and will remove the associated remote entity records from its internal database.

See also

`rti::core::policy::DiscoveryConfig::remote_participant_purge_kind` (p. 1043)

8.296.2 Member Enumeration Documentation

8.296.2.1 type

```
enum rti::core::policy::RemoteParticipantPurgeKind_def::type
```

The underlying enum type.

Enumerator

LIVELINESS_BASED	<p>[default] Maintain knowledge of the remote participant for as long as it maintains its liveliness contract. A participant will continue attempting communication with its peers, even if discovery communication with them is lost, as long as the remote participants maintain their liveliness. If both discovery communication and participant liveliness are lost, however, the local participant will remove all records of the remote participant and its contained endpoints, and no further data communication with them will occur until and unless they are rediscovered.</p> <p>The liveliness contract a participant promises to its peers – its "liveliness lease duration" – is specified in its rti::core::policy::DiscoveryConfig::participant_liveliness_lease_duration (p. 1041) QoS field. It maintains that contract by writing data to those other participants with a writer that has a dds::core::policy::LivelinessKind (p. 327) of dds::core::policy::LivelinessKind::AUTOMATIC or dds::core::policy::LivelinessKind::MANUAL_BY_PARTICIPANT and by asserting itself (at the rti::core::policy::DiscoveryConfig::participant_liveliness_assert_period (p. 1042)) over the Simple Discovery (p. 1029) Protocol.</p>
NO_PURGE	<p>Never "forget" a remote participant with which discovery communication has been lost. If a participant with this behavior loses discovery communication with a remote participant, it will nevertheless remember that remote participant and its endpoints and continue attempting to communicate with them indefinitely.</p> <p>This value has consequences for a participant's resource usage. If discovery communication with a remote participant is lost, but the same participant is later rediscovered, any relevant records that remain in the database will be reused. However, if it is not rediscovered, the records will continue to take up space in the database for as long as the local participant remains in existence.</p>

8.297 dds::rpc::RemoteUnknownOperationError Class Reference

Thrown when a Client calls an operation that doesn't exist in the Service.

```
#include <Exception.hpp>
```

Inheritance diagram for dds::rpc::RemoteUnknownOperationError:

Public Member Functions

- virtual const char * **what** () const noexcept

Access the message contained in this **RemoteUnknownOperationError** (p. 1887) exception.

8.297.1 Detailed Description

Thrown when a Client calls an operation that doesn't exist in the Service.

Inherits also from `std::logic_error`

8.297.2 Member Function Documentation

8.297.2.1 what()

```
virtual const char * dds::rpc::RemoteUnknownOperationError::what ( ) const [inline], [virtual],
[noexcept]
```

Access the message contained in this **RemoteUnknownOperationError** (p. 1887) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.298 rti::request::Replier< RequestType, ReplyType > Class Template Reference

<<*reference-type*>> (p. 153) Allows receiving requests and sending replies

```
#include <rti/request/Replier.hpp>
```

Inheritance diagram for `rti::request::Replier< RequestType, ReplyType >`:

Public Member Functions

- **Replier** (**dds::domain::DomainParticipant** participant, const std::string &service_name)
*Creates a **Replier** (p. 1888) with the minimum set of parameters.*
- **Replier** (const **ReplierParams** ¶ms)
*Creates a **Replier** (p. 1888) with parameters.*
- **Replier** (const **ReplierParams** ¶ms, **Listener** *the_listener)
Creates a replier with additional parameters and a listener.
- **Replier** (const **ReplierParams** ¶ms, std::shared_ptr< **Listener** > the_listener)
Creates a replier with additional parameters and a listener.
- void **send_reply** (const ReplyType &reply, const **rti::core::SampleIdentity** &related_request_id)
Sends a reply for a previous request.
- void **send_reply** (const ReplyType &reply, const **dds::sub::SampleInfo** &related_request_info)
Sends a reply.
- void **send_reply** (const ReplyType &reply, **rti::pub::WriteParams** ¶ms)
Sends a reply with advanced parameters.
- bool **wait_for_requests** (const **dds::core::Duration** &max_wait)
Waits for requests.
- bool **wait_for_requests** (int min_count, const **dds::core::Duration** &max_wait)
Waits for requests.
- **dds::sub::LoanedSamples**< RequestType > **receive_requests** (const **dds::core::Duration** &max_wait)
Waits for multiple requests and provides a loaned container to access them.
- **dds::sub::LoanedSamples**< RequestType > **receive_requests** (int min_count, const **dds::core::Duration** &max_wait)
Waits for multiple requests and provides a loaned container to access them.
- **dds::sub::LoanedSamples**< RequestType > **take_requests** ()
Takes all the requests.
- **dds::sub::LoanedSamples**< RequestType > **read_requests** ()
Reads all the requests.
- **Listener** * **listener** () const
Gets the replier listener.
- void **listener** (**Listener** *the_listener, const **dds::core::status::StatusMask** &= **dds::core::status::StatusMask::none**())
Sets a listener to be notified when requests are available.
- std::shared_ptr< **Listener** > **get_listener** () const
Gets the replier listener.
- void **set_listener** (std::shared_ptr< **Listener** > the_listener)
Sets a listener to be notified when requests are available.
- **dds::sub::DataReader**< RequestType > **request_datareader** () const
*Retrieves the underlying **dds::sub::DataReader** (p. 756).*
- **dds::pub::DataWriter**< ReplyType > **reply_datawriter** () const
*Retrieves the underlying **dds::pub::DataWriter** (p. 908).*

Related Functions

(Note that these are not member functions.)

size_t **matched_requester_count** (**Replier**< RequestType, ReplyType > replier)
*Obtains the number of Requesters that match with a **Replier** (p. 1888).*

8.298.1 Detailed Description

```
template<typename RequestType, typename ReplyType>
class rti::request::Replier< RequestType, ReplyType >
```

<<*reference-type*>> (p. 153) Allows receiving requests and sending replies

Note

A **Replier** (p. 1888) provides all the functions of a <<*reference-type*>> (p. 153) except **close()** (p. 801) and **retain()**.

A **Replier** (p. 1888) is an entity with two associated **topics** (p. 46): a request topic and a reply topic. It can receive requests by subscribing to the request topic and can send replies to those requests by publishing the reply topic.

Valid types for these topics are: those generated by `rtiddsgen`, the **DDS built-in types** (p. 49), and `dds::core::xtypes<::DynamicData` (p. 1208). See **Creating a Replier** (p. 148).

A **Replier** (p. 1888) has four main types of operations:

- Waiting for requests to be received from the middleware
- Getting those requests
- Receiving requests (a convenience operation that is a combination of waiting and getting in a single operation)
- Sending a reply for a previously received request (i.e., publishing a reply sample on the reply topic with special meta-data so that the original **Requester** (p. 1907) can identify it)

For multi-reply scenarios in which a `rti::request::Replier` (p. 1888) generates more than one reply for a request, the `rti::request::Replier` (p. 1888) should mark all the intermediate replies (all but the last) using the `rti::core::SampleFlag::intermediate_reply_sequence` (p. 1987) flag in `rti::pub::WriteParams::flag` (p. 2348).

Much like a **Requester** (p. 1907), a **Replier** (p. 1888) has an associated `dds::domain::DomainParticipant` (p. 1079), which can be shared with other Repliers or RTI Connex routines. All the other entities required for the request-reply interaction, including a `dds::pub::DataWriter` (p. 908) for writing replies and a `dds::sub::DataReader` (p. 756) for reading requests, are automatically created when the **Replier** (p. 1888) is constructed.

Quality of Service for the underlying `DataWriter` and `DataReader` can be configured (see `RequesterParams::qos_<` profile). By default, they are created with `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 149)

There are several ways to use a **Replier** (p. 1888):

- A thread **receives** (p. 1895) requests and then dispatches them. If the computation of a reply is a simple operation, consider using a **SimpleReplier** (p. 2075) instead of a **Replier** (p. 1888).
- Polling without waiting, using `rti::request::Replier::take_requests` (p. 1896) directly.
- Using a **ReplierListener** (p. 1899) to get notified and **get** (p. 1896) the requests within the callback.

Template Parameters

<i>RequestType</i>	The data type for the request topic
<i>ReplyType</i>	The data type for the reply topic

rti::request::Requester (p. 1907)

Request-Reply Examples (p. 145)

Basic Replier example (p. 149)

8.298.2 Constructor & Destructor Documentation

8.298.2.1 Replier() [1/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
    dds::domain::DomainParticipant participant,
    const std::string & service_name ) [inline]
```

Creates a **Replier** (p. 1888) with the minimum set of parameters.

Parameters

<i>participant</i>	The DomainParticipant that this Replier (p. 1888) uses to join a domain.
<i>service_name</i>	The service name. See ReplierParams::service_name (p. 1901)

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.298.2.2 Replier() [2/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
    const ReplierParams & params ) [inline], [explicit]
```

Creates a **Replier** (p. 1888) with parameters.

Parameters

<i>params</i>	All the parameters that configure this Replier (p. 1888)
---------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

ReplierParams (p. 1900)

Creating a Replier (p. 148)

8.298.2.3 Replier() [3/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
    const ReplierParams & params,
    Listener * the_listener ) [inline]
```

Creates a replier with additional parameters and a listener.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p. 1381)> instead of a regular `Listener*` pointer.

Parameters

<i>params</i>	All the parameters that configure this Replier (p. 1888)
<i>the_listener</i>	A ReplierListener (p. 1899) that notifies when new requests are available. Cannot be NULL.

Note

The listener must be reset with `this->listener(NULL)` before this object can be destroyed. Alternatively, create the **Replier** (p. 1888) and then use `rti::core::bind_listener()` (p. 495) to have it automatically reset.

8.298.2.4 Replier() [4/4]

```
template<typename RequestType , typename ReplyType >
rti::request::Replier< RequestType, ReplyType >::Replier (
    const ReplierParams & params,
    std::shared_ptr< Listener > the_listener ) [inline]
```

Creates a replier with additional parameters and a listener.

Parameters

<i>params</i>	All the parameters that configure this Replier (p. 1888)
<i>the_listener</i>	A ReplierListener (p. 1899) that notifies when new requests are available. Cannot be nullptr, but the parameter can be omitted.

8.298.3 Member Function Documentation

8.298.3.1 send_reply() [1/3]

```
template<typename RequestType , typename ReplyType >
void rti::request::Replier< RequestType, ReplyType >::send_reply (
    const ReplyType & reply,
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Sends a reply for a previous request.

The related request identity can be retrieved from an existing request sample (Sample).

Parameters

<i>reply</i>	The reply to be sent.
<i>related_request_id</i>	The identity of a previously received request

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

Sample::identity

rti::request::Replier::receive_requests (p. 1895)

rti::request::Replier::take_requests (p. 1896)

Basic Replier example (p. 149)

8.298.3.2 send_reply() [2/3]

```
template<typename RequestType , typename ReplyType >
void rti::request::Replier< RequestType, ReplyType >::send_reply (
```

```
const ReplyType & reply,
const dds::sub::SampleInfo & related_request_info ) [inline]
```

Sends a reply.

This operation obtains the `related_request_id` from a request `SampleInfo`, that is, it's equivalent to `send_reply(reply, related_request_info->original_publication_virtual_sample_identity())` (p. 1999)

References `dds::sub::SampleInfo::original_publication_virtual_sample_identity()`.

8.298.3.3 `send_reply()` [3/3]

```
template<typename RequestType , typename ReplyType >
void rti::request::Replier< RequestType, ReplyType >::send_reply (
    const ReplyType & reply,
    rti::pub::WriteParams & params ) [inline]
```

Sends a reply with advanced parameters.

Parameters

<i>reply</i>	The reply to be sent
<i>params</i>	(in-out) The parameters to write the reply (see).

Precondition

`params.related_sample_identity()` must be set with the related request `SampleIdentity`.

Other parameters to customize are discussed in `dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)` (p. 949). In particular, `rti::pub::WriteParams::flag` (p. 2348) can be set to `rti::core::SampleFlag::intermediate_reply_sequence` (p. 1987) to inform the **Requester** (p. 1907) application that this reply will be followed by additional replies to the same request. The **Requester** (p. 1907) can access the flag in `dds::sub::SampleInfo::flag()` (p. 2000) when it receives the reply.

8.298.3.4 `wait_for_requests()` [1/2]

```
template<typename RequestType , typename ReplyType >
bool rti::request::Replier< RequestType, ReplyType >::wait_for_requests (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for requests.

Equivalent to `rti::request::Replier::wait_for_requests` (p. 1894) with `min_count=1`

See also

`rti::request::Replier::wait_for_requests` (p. 1894)

8.298.3.5 wait_for_requests() [2/2]

```
template<typename RequestType , typename ReplyType >
bool rti::request::Replier< RequestType, ReplyType >::wait_for_requests (
    int min_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for requests.

This operation waits for min_count requests to be available. It will wait up to max_wait .

This operation is similar to **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 1914).

Parameters

<i>min_count</i>	Minimum number of requests that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum waiting time after which this operation unblocks regardless of how many requests are available.

Returns

true if at least min_count requests were available before max_wait elapsed, or false otherwise.

See also

rti::request::Replier::take_requests (p. 1896)

rti::request::Requester::wait_for_replies(int, const dds::core::Duration&) (p. 1914)

8.298.3.6 receive_requests() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType > rti::request::Replier< RequestType, ReplyType >::receive←
_requests (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple requests and provides a loaned container to access them.

Equivalent to using **rti::request::Replier::receive_requests** (p. 1895) with min_count=1 and max_count=dds←
::core::LENGTH_UNLIMITED (p. 238)

See also

dds::sub::LoanedSamples (p. 1406)

rti::request::Replier::receive_requests (p. 1895)

8.298.3.7 receive_requests() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType > rti::request::Replier< RequestType, ReplyType >::receive←
_requests (
    int min_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple requests and provides a loaned container to access them.

Equivalent to using `rti::request::Replier::wait_for_requests` (p.1894) and `rti::request::Replier::take_requests` (p.1896)

See also

- `dds::sub::LoanedSamples` (p.1406)
- `rti::request::Replier::wait_for_requests` (p.1894)
- `rti::request::Replier::take_requests` (p.1896)

8.298.3.8 take_requests()

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType > rti::request::Replier< RequestType, ReplyType >::take←
requests ( ) [inline]
```

Takes all the requests.

See also

- `rti::request::Requester::take_replies` (p.1912)

8.298.3.9 read_requests()

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< RequestType > rti::request::Replier< RequestType, ReplyType >::read←
requests ( ) [inline]
```

Reads all the requests.

This operation is equivalent to `rti::request::Replier::take_requests` (p.1896) except the requests remain in the **Replier** (p.1888) and can be read or taken again.

8.298.3.10 listener() [1/2]

```
template<typename RequestType , typename ReplyType >
Listener * rti::request::Replier< RequestType, ReplyType >::listener ( ) const [inline]
```

Gets the replier listener.

[DEPRECATED] Prefer `get_listener()` (p.1897) instead of this function.

8.298.3.11 listener() [2/2]

```
template<typename RequestType , typename ReplyType >
void rti::request::Replier< RequestType, ReplyType >::listener (
    Listener * the_listener,
    const dds::core::status::StatusMask & = dds::core::status::StatusMask::none() )
[inline]
```

Sets a listener to be notified when requests are available.

[DEPRECATED] The use of `set_listener()` (p.1897) is recommended. Unlike this function, `set_listener` receives a `shared_ptr` which simplifies the management of listener's lifecycle.

The listener will be called when new requests are available.

Note

`rti::core::bind_listener()` (p.495) is recommended instead of this listener setter. `bind_listener()` (p.1388) and `bind_and_manage_listener()` (p.1388) automatically remove the listener, which allows the `Replier` (p.1888) to be automatically destroyed.

(The second parameter is ignored)

8.298.3.12 get_listener()

```
template<typename RequestType , typename ReplyType >
std::shared_ptr< Listener > rti::request::Replier< RequestType, ReplyType >::get_listener ( )
const [inline]
```

Gets the replier listener.

The listener will be called when new requests are available

8.298.3.13 set_listener()

```
template<typename RequestType , typename ReplyType >
void rti::request::Replier< RequestType, ReplyType >::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets a listener to be notified when requests are available.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the replier. If it does, the application needs to manually reset the listener (`set_listener(nullptr)`) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive updates or <code>nullptr</code> to reset the current listener and stop receiving updates.
---------------------	---

8.298.3.14 request_datareader()

```
template<typename RequestType , typename ReplyType >
dds::sub::DataReader< RequestType > rti::request::Replier< RequestType, ReplyType >::request_↔
datareader ( ) const [inline]
```

Retrieves the underlying **dds::sub::DataReader** (p. 756).

See also

`rti::request::Requester::get_reply_datareader`

Referenced by `rti::request::Replier< RequestType, ReplyType >::matched_requester_count()`.

8.298.3.15 reply_datawriter()

```
template<typename RequestType , typename ReplyType >
dds::pub::DataWriter< ReplyType > rti::request::Replier< RequestType, ReplyType >::reply_↔
datawriter ( ) const [inline]
```

Retrieves the underlying **dds::pub::DataWriter** (p. 908).

See also

`rti::request::Requester::get_request_datawriter`

Referenced by `rti::request::Replier< RequestType, ReplyType >::matched_requester_count()`.

8.298.4 Friends And Related Function Documentation

8.298.4.1 matched_requester_count()

```
template<typename RequestType , typename ReplyType >
size_t matched_requester_count (
    Replier< RequestType, ReplyType > replier ) [related]
```

Obtains the number of Requesters that match with a **Replier** (p. 1888).

Note

This is a standalone function in the namespace rti::request

For a **Requester** (p. 1907) to be included in the total count, the **Requester** (p. 1907)'s DataReader or DataWriter role name (in **rti::core::policy::EntityName** (p. 1275)) must not have been modified.

References **rti::request::Replier< RequestType, ReplyType >::reply_datawriter()**, and **rti::request::Replier< RequestType, ReplyType >::request_datareader()**.

8.299 rti::request::ReplierListener< RequestType, ReplyType > Class Template Reference

Called when a **Replier** (p. 1888) has new available requests.

```
#include <rti/request/ReplierListener.hpp>
```

Public Member Functions

- virtual void **on_request_available** (**Replier**< RequestType, ReplyType > &replier)=0

User callback.

8.299.1 Detailed Description

```
template<typename RequestType, typename ReplyType>
class rti::request::ReplierListener< RequestType, ReplyType >
```

Called when a **Replier** (p. 1888) has new available requests.

A replier listener is a way to implement a callback that will be invoked when requests are available.

This listener simply notifies when requests are available. The callback implementation can then use **rti::request::Replier::take_requests** (p. 1896) to retrieve them.

A simpler callback mechanism, where one request sample is a parameter and the reply is the callback return value, is implemented by the **SimpleReplier** (p. 2075).

See also

rti::request::Replier::Replier(const ReplierParams&) (p. 1891)

8.299.2 Member Function Documentation

8.299.2.1 on_request_available()

```
template<typename RequestType , typename ReplyType >
virtual void rti::request::ReplierListener< RequestType, ReplyType >::on_request_available (
    Replier< RequestType, ReplyType > & replier ) [pure virtual]
```

User callback.

8.300.1 Detailed Description

Contains the parameters for creating a **rti::request::Replier** (p. 1888).

See also

RequesterParams (p. 1917)

8.300.2 Constructor & Destructor Documentation

8.300.2.1 ReplierParams()

```
rti::request::ReplierParams::ReplierParams (
    dds::domain::DomainParticipant participant ) [inline], [explicit]
```

Creates a **ReplierParams** (p. 1900) with the parameters that a **Replier** (p. 1888) always needs.

In addition to the participant , a **Replier** (p. 1888) needs either:

- A service name (**ReplierParams::service_name** (p. 1901)), or
- Custom topic names (**ReplierParams::reply_topic_name** (p. 1902) and **ReplierParams::request_topic_name** (p. 1902)).

When **dds::core::xtypes::DynamicData** (p. 1208) is used, **ReplierParams::request_type** (p. 1903) and/or **ReplierParams::reply_type** (p. 1903) are required as well.

The other parameters are optional.

Parameters

<i>participant</i>	The DomainParticipant that this replier uses to join a domain.
--------------------	--

8.300.3 Member Function Documentation

8.300.3.1 service_name()

```
ReplierParams & rti::request::ReplierParams::service_name (
    const std::string & name )
```

The service name the **Replier** (p. 1888) offers and Requesters use to match.

See also

RequesterParams::service_name (p. 1919)

8.300.3.2 request_topic_name()

```
ReplierParams & rti::request::ReplierParams::request_topic_name (
    const std::string & name )
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **ReplierParams**↔
::**service_name** (p. 1901). If that topic already exists, it will be reused. This is useful to have the **Replier** (p. 1888) use
a **dds::topic::ContentFilteredTopic** (p. 735) to receive only certain requests.

8.300.3.3 reply_topic_name()

```
ReplierParams & rti::request::ReplierParams::reply_topic_name (
    const std::string & name )
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on c the **Replier**↔
Params::service_name (p. 1901). If that topic already exists, it will be reused.

8.300.3.4 datawriter_qos()

```
ReplierParams & rti::request::ReplierParams::datawriter_qos (
    const dds::core::optional< dds::pub::qos::DataWriterQos > & qos )
```

Sets the quality of service of the reply DataWriter.

See also

dds::core::QosProvider (p. 1752) to access Qos profiles.

8.300.3.5 datareader_qos()

```
ReplierParams & rti::request::ReplierParams::datareader_qos (
    const dds::core::optional< dds::sub::qos::DataReaderQos > & qos )
```

Sets the quality of service of the request DataReader.

See also

dds::core::QosProvider (p. 1752) to access Qos profiles.

8.300.3.6 publisher()

```
ReplierParams & rti::request::ReplierParams::publisher (
    dds::pub::Publisher publisher )
```

Sets a specific Publisher.

See also

RequesterParams::publisher (p. 1920)

8.300.3.7 subscriber()

```
ReplierParams & rti::request::ReplierParams::subscriber (
    dds::sub::Subscriber subscriber )
```

Sets a specific Subscriber.

See also

RequesterParams::subscriber (p. 1920)

8.300.3.8 request_type()

```
ReplierParams & rti::request::ReplierParams::request_type (
    const dds::core::optional< dds::core::xtypes::DynamicType > & type )
```

The request type, when DynamicData is used.

This is required when the **Replier** (p. 1888) RequestType is **dds::core::xtypes::DynamicData** (p. 1208). Otherwise this is ignored.

8.300.3.9 reply_type()

```
ReplierParams & rti::request::ReplierParams::reply_type (
    const dds::core::optional< dds::core::xtypes::DynamicType > & type )
```

The reply type, when DynamicData is used.

This is required when the **Replier** (p. 1888) ReplyType is **dds::core::xtypes::DynamicData** (p. 1208). Otherwise this is ignored.

8.301 dds::core::status::RequestedDeadlineMissedStatus Class Reference

Information about the status `dds::core::status::StatusMask::requested_deadline_missed()` (p. 2087)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t total_count () const`
Total cumulative count of the deadlines detected for any instance read by the `dds::sub::DataReader` (p. 756).
- `int32_t total_count_change () const`
The incremental number of deadlines detected since the last time the listener was called or the status was read.
- `const dds::core::InstanceHandle last_instance_handle () const`
Handle to the last instance in the `dds::sub::DataReader` (p. 756) for which a deadline was detected.

8.301.1 Detailed Description

Information about the status `dds::core::status::StatusMask::requested_deadline_missed()` (p. 2087)

8.301.2 Member Function Documentation

8.301.2.1 total_count()

```
int32_t dds::core::status::RequestedDeadlineMissedStatus::total_count ( ) const [inline]
```

Total cumulative count of the deadlines detected for any instance read by the `dds::sub::DataReader` (p. 756).

8.301.2.2 total_count_change()

```
int32_t dds::core::status::RequestedDeadlineMissedStatus::total_count_change ( ) const [inline]
```

The incremental number of deadlines detected since the last time the listener was called or the status was read.

8.301.2.3 last_instance_handle()

```
const dds::core::InstanceHandle dds::core::status::RequestedDeadlineMissedStatus::last_instance↔
_handle ( ) const [inline]
```

Handle to the last instance in the **dds::sub::DataReader** (p. 756) for which a deadline was detected.

8.302 dds::core::status::RequestedIncompatibleQosStatus Class Reference

Information about the status **dds::core::status::StatusMask::requested_incompatible_qos()** (p. 2088)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t total_count () const`
*Total cumulative count of how many times the concerned **dds::sub::DataReader** (p. 756) discovered a **dds::pub::Data↔Writer** (p. 908) for the same **dds::topic::Topic** (p. 2178) with an offered QoS that is incompatible with that requested by the **dds::sub::DataReader** (p. 756).*
- `int32_t total_count_change () const`
The change in `total_count` since the last time the listener was called or the status was read.
- `dds::core::policy::QosPolicyId last_policy_id () const`
*The **dds::core::policy::QosPolicyId** (p. 308) of one of the policies that was found to be incompatible the last time an incompatibility was detected.*
- `const dds::core::policy::QosPolicyCountSeq policies () const`
*A list containing, for each policy, the total number of times that the concerned **dds::sub::DataReader** (p. 756) discovered a **dds::pub::DataWriter** (p. 908) for the same **dds::topic::Topic** (p. 2178) with an offered QoS that is incompatible with that requested by the **dds::sub::DataReader** (p. 756).*

8.302.2 Member Function Documentation

8.302.2.1 total_count()

```
int32_t dds::core::status::RequestedIncompatibleQosStatus::total_count ( ) const [inline]
```

Total cumulative count of how many times the concerned **dds::sub::DataReader** (p. 756) discovered a **dds::pub::DataWriter** (p. 908) for the same **dds::topic::Topic** (p. 2178) with an offered QoS that is incompatible with that requested by the **dds::sub::DataReader** (p. 756).

8.302.2.2 total_count_change()

```
int32_t dds::core::status::RequestedIncompatibleQosStatus::total_count_change ( ) const [inline]
```

The change in `total_count` since the last time the listener was called or the status was read.

8.302.2.3 last_policy_id()

```
dds::core::policy::QosPolicyId dds::core::status::RequestedIncompatibleQosStatus::last_policy_id ( ) const [inline]
```

The **dds::core::policy::QosPolicyId** (p. 308) of one of the policies that was found to be incompatible the last time an incompatibility was detected.

8.302.2.4 policies()

```
const dds::core::policy::QosPolicyCountSeq dds::core::status::RequestedIncompatibleQosStatus::policies ( ) const [inline]
```

A list containing, for each policy, the total number of times that the concerned **dds::sub::DataReader** (p. 756) discovered a **dds::pub::DataWriter** (p. 908) for the same **dds::topic::Topic** (p. 2178) with an offered QoS that is incompatible with that requested by the **dds::sub::DataReader** (p. 756).

8.303 rti::request::Requester< RequestType, ReplyType > Class Template Reference

<<*reference-type*>> (p. 153) Allows sending requests and receiving replies

```

Waits for multiple replies and provides a loaned container to access them.
- **dds::sub::LoanedSamples< ReplyType > take_replies** ()
Takes all the replies.
- **dds::sub::LoanedSamples< ReplyType > take_replies** (const **rti::core::SampleIdentity** &related_request←_id)
Takes the replies for a specific requests.
- **dds::sub::LoanedSamples< ReplyType > read_replies** ()
Reads all the replies.
- **dds::sub::LoanedSamples< ReplyType > read_replies** (const **rti::core::SampleIdentity** &related_request←_id)
Reads the replies for a specific request.
- bool **wait_for_replies** (const **dds::core::Duration** &max_wait)
Waits for replies to any request.
- bool **wait_for_replies** (int min_count, const **dds::core::Duration** &max_wait)
Waits for replies to any request.
- bool **wait_for_replies** (int min_count, const **dds::core::Duration** &max_wait, const **rti::core::SampleIdentity** &related_request_id)
Waits for replies to a specific request.
- **dds::pub::DataWriter< RequestType > request_datawriter** () const
*Retrieves the underlying **dds::pub::DataWriter** (p. 908).*
- **dds::sub::DataReader< ReplyType > reply_datareader** () const
*Retrieves the underlying **dds::sub::DataReader** (p. 756).*

8.303.1 Detailed Description

```
template<typename RequestType, typename ReplyType>
class rti::request::Requester< RequestType, ReplyType >
```

<<*reference-type*>> (p. 153) Allows sending requests and receiving replies

Note

A **Requester** (p. 1907) provides all the functions of a <<*reference-type*>> (p. 153) except **close()** (p. 801) and **retain()**.

A requester is an entity with two associated **topics** (p. 46): a request topic and a reply topic. It can send requests by publishing samples of the request topic and receive replies to those requests by subscribing to the reply topic.

Valid types for these topics are: those generated by `rtiddsgen`, the **DDS built-in types** (p. 49), and `dds::core::xtypes`↔`::DynamicData` (p. 1208).

A **Replier** (p. 1888) and a **Requester** (p. 1907) communicate when they use the same topics for requests and replies (see `RequesterParams::service_name` (p. 1919)) on the same domain ID.

A **Requester** (p. 1907) can send requests and receive one or multiple replies. It does that using the following operations:

- Sending requests (i.e. publishing request samples on the request topic)
- Waiting for replies to be received by the middleware (for any request or for a specific request)
- Getting those replies from the middleware. There are two ways to do this: **take** (the data samples are removed from the middleware), **read** (the data samples remain in the middleware and can be read or taken again).
- A convenience operation, **receive** (which is a combination of wait and take).

In all cases, the middleware guarantees that a requester only receives reply samples that are associated with those requests that it sends.

For multi-reply scenarios, in which a **Requester** (p. 1907) receives multiple replies from a **Replier** (p. 1888) for a given request, the **Requester** (p. 1907) can check if a reply is the last reply of a sequence of replies. To do so, see if the bit `rti::core::SampleFlag::intermediate_reply_sequence` (p. 1987) is set in `dds::sub::SampleInfo::flag` (p. 2000) after receiving each reply. This indicates it is NOT the last reply.

A requester has an associated `dds::domain::DomainParticipant` (p. 1079), which can be shared with other requesters or RTI Connex routines. All the other RTI Connex entities required for the request-reply interaction, including a `dds`↔`::pub::DataWriter` (p. 908) for writing requests and a `dds::sub::DataReader` (p. 756) for reading replies, are automatically created when the requester is constructed.

Quality of Service for the underlying `DataWriter` and `DataReader` can be configured (see `RequesterParams::qos`↔`profile`). By default, they are created with `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881). The exact default configuration is described here: **Configuring Request-Reply QoS profiles** (p. 149)

Template Parameters

<i>RequestType</i>	The data type for the request topic
<i>ReplyType</i>	The data type for the reply topic

rti::request::Replier (p. 1888)

Request-Reply Examples (p. 145)

Basic Requester example (p. 147)

8.303.2 Constructor & Destructor Documentation

8.303.2.1 Requester() [1/2]

```
template<typename RequestType , typename ReplyType >
rti::request::Requester< RequestType, ReplyType >::Requester (
    const RequesterParams & params ) [inline], [explicit]
```

Creates a **Requester** (p. 1907) with parameters.

Parameters

<i>params</i>	All the parameters that configure this requester. See RequesterParams (p. 1917) for the list of mandatory parameters.
---------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

RequesterParams (p. 1917)

Requester Creation (p. 146)

8.303.2.2 Requester() [2/2]

```
template<typename RequestType , typename ReplyType >
rti::request::Requester< RequestType, ReplyType >::Requester (
```

```

    dds::domain::DomainParticipant participant,
    const std::string & service_name ) [inline]

```

Creates a **Requester** (p. 1907) with the minimum set of parameters.

Parameters

<i>participant</i>	The DomainParticipant this requester uses to join a DDS domain
<i>service_name</i>	The service name. See RequesterParams::service_name (p. 1919)

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

8.303.3 Member Function Documentation

8.303.3.1 send_request() [1/2]

```

template<typename RequestType , typename ReplyType >
rti::core::SampleIdentity rti::request::Requester< RequestType, ReplyType >::send_request (
    const RequestType & request ) [inline]

```

Sends a request.

Parameters

<i>request</i>	The request to be sent
----------------	------------------------

Returns

The identity of the request, which can be used to correlate it with a future reply (see **rti::request::Requester**↔
::wait_for_replies(int, const dds::core::Duration&, const rti::core::SampleIdentity&) (p. 1915))

8.303.3.2 send_request() [2/2]

```

template<typename RequestType , typename ReplyType >
void rti::request::Requester< RequestType, ReplyType >::send_request (
    const RequestType & request,
    rti::pub::WriteParams & params ) [inline]

```

Sends a request with advanced parameters.

Parameters

<i>request</i>	The request to be sent
<i>params</i>	(in-out) The parameters to write the request (see <code>dds::pub::DataWriter::write(const T&, rti::pub::WriteParams&)</code> (p. 949))

This function allows setting the request identity in `params.identity()`, among other advanced parameters. If the identity is not set, RTI Connexx automatically assigns it, and to obtain it `params.replace_automatic_values()` needs to be set to true. Then, after this function ends, `params.identity()` will contain the request identity. If no additional parameters need to be set, use the simpler `send_request(const RequestType&)` (p. 1910), which directly returns the automatically assigned identity.

8.303.3.3 receive_replies() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::receive←
_replies (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple replies and provides a loaned container to access them.

This operation is equivalent to using `rti::request::Requester::receive_replies` (p. 1911) with `min_count=1` and `max_count=dds::core::LENGTH_UNLIMITED` (p. 238)

MT Safety:

See `rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)` (p. 1914)

See also

`dds::sub::LoanedSamples` (p. 1406)

`rti::request::Requester::receive_replies` (p. 1911)

8.303.3.4 receive_replies() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::receive←
_replies (
    int min_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for multiple replies and provides a loaned container to access them.

This operation is equivalent to using `rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)` (p. 1914) and `rti::request::Requester::take_replies` (p. 1912).

MT Safety:

See `rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)` (p. 1914)

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

See also

dds::sub::LoanedSamples (p. 1406)

rti::request::Requester::wait_for_replies(int, const dds::core::Duration&) (p. 1914)

rti::request::Requester::take_replies (p. 1912)

8.303.3.5 take_replies() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::take_↔
replies ( ) [inline]
```

Takes all the replies.

Takes all the existing replies up to `max_count` and provides a loaned container to access them.

This operation does not make a copy of the data. It is similar to **dds::sub::DataReader::take** (p. 774).

The loan is returned with **dds::sub::LoanedSamples::return_loan** (p. 1410) or in the destructor

This operation may be used after a call to **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 1914)

Returns

A container with up to `max_count` elements. May be empty if there were no replies to get.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

MT Safety:

SAFE

See also

dds::sub::LoanedSamples (p. 1406)

dds::sub::LoanedSamples::return_loan (p. 1410)

rti::request::Requester::wait_for_replies(int, const dds::core::Duration&) (p. 1914)

dds::sub::DataReader::take (p. 774) (for a more detailed description on how QoS and other **parameters** (p. 1787) affect the underlying DataReader)

8.303.3.6 take_replies() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::take_↔
replies (
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Takes the replies for a specific requests.

This operation is operation is analogous to **take_replies()** (p. 1912) but it only returns those replies associated with a specific request.

Parameters

<i>related_request_↔ _id</i>	Identifies a request previously sent by this Requester (p. 1907)'s send_request() (p. 1910).
----------------------------------	--

8.303.3.7 read_replies() [1/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::read_↔
replies ( ) [inline]
```

Reads all the replies.

This operation is equivalent to **rti::request::Requester::take_replies** (p. 1912) except the replies remain in the **Requester** (p. 1907) and can be read or taken again.

8.303.3.8 read_replies() [2/2]

```
template<typename RequestType , typename ReplyType >
dds::sub::LoanedSamples< ReplyType > rti::request::Requester< RequestType, ReplyType >::read_↔
replies (
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Reads the replies for a specific request.

This operation is equivalent to **take_replies(const rti::core::SampleIdentity&)** (p. 1913), except the replies remain in the **Requester** (p. 1907) and can be read or taken again.

8.303.3.9 wait_for_replies() [1/3]

```
template<typename RequestType , typename ReplyType >
bool rti::request::Requester< RequestType, ReplyType >::wait_for_replies (
    const dds::core::Duration & max_wait ) [inline]
```

Waits for replies to any request.

This operation is equivalent to using `rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)` (p. 1914) with `min_count=1`.

See also

`rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)` (p. 1914)

8.303.3.10 wait_for_replies() [2/3]

```
template<typename RequestType , typename ReplyType >
bool rti::request::Requester< RequestType, ReplyType >::wait_for_replies (
    int min_count,
    const dds::core::Duration & max_wait ) [inline]
```

Waits for replies to any request.

This operation waits for `min_count` requests to be available for up to `max_wait` .

If this operation is called several times but the available replies are not taken (with `rti::request::Requester::take_↔replies` (p. 1912)), this operation may return immediately and will not wait for new replies. New replies may replace existing ones if they are not taken, depending on the `dds::core::policy::History` (p. 1346) used to configure this **Requester** (p. 1907).

Parameters

<i>min_count</i>	Minimum number of replies that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum waiting time after which this operation unblocks, regardless of how many replies are available.

Returns

true if at least `minCount` replies were available before `maxWait` elapsed, or false otherwise.

MT Safety:

Concurrent calls to this operation on the same object are not allowed. However, waiting for replies for specific requests in parallel is supported (see `rti::request::Requester::wait_for_replies(int, const dds::core::Duration&, const rti::core::SampleIdentity&)` (p. 1915)).

See also

rti::request::Requester::take_replies (p. 1912)

8.303.3.11 wait_for_replies() [3/3]

```
template<typename RequestType , typename ReplyType >
bool rti::request::Requester< RequestType, ReplyType >::wait_for_replies (
    int min_count,
    const dds::core::Duration & max_wait,
    const rti::core::SampleIdentity & related_request_id ) [inline]
```

Waits for replies to a specific request.

This operation is analogous to **rti::request::Requester::wait_for_replies(int, const dds::core::Duration&)** (p. 1914) except this operation waits for replies for a specific request.

Parameters

<i>min_count</i>	Minimum number of replies for the related request that need to be available for this operation to unblock.
<i>max_wait</i>	Maximum wait time after which this operation unblocks, regardless of how many replies are available.
<i>related_request_id</i>	The identity of a request previously sent by this Requester (p. 1907)

Returns

true if at least *min_count* replies for the related request were available before *max_wait* elapsed, or false otherwise.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

MT Safety:

SAFE

8.304.1 Detailed Description

Contains the parameters for creating a **rti::request::Requester** (p. 1907).

See also

Creating a Requester with optional parameters (p. 146)

8.304.2 Constructor & Destructor Documentation

8.304.2.1 RequesterParams()

```
rti::request::RequesterParams::RequesterParams (
    dds::domain::DomainParticipant participant ) [inline], [explicit]
```

Creates a **RequesterParams** (p. 1917) with the parameters a **Requester** (p. 1907) always needs.

In addition to the participant , a **Requester** (p. 1907) needs either:

- A service name (**RequesterParams::service_name** (p. 1919)),
- Or custom topic names (**RequesterParams::request_topic_name** (p. 1919) and **RequesterParams::reply_↔
topic_name** (p. 1919))

When **dds::core::xtypes::DynamicData** (p. 1208) is used, **RequesterParams::request_type** (p. 1920) and/or **RequesterParams::reply_type** (p. 1921) are required as well.

The rest of the parameters that can be set in a **RequesterParams** (p. 1917) object are optional.

Parameters

<i>participant</i>	The <code>dds::domain::DomainParticipant</code> (p. 1079) this requester uses to join a domain.
--------------------	---

See also

[Creating a Requester with optional parameters](#) (p. 146)

8.304.3 Member Function Documentation

8.304.3.1 `service_name()`

```
RequesterParams & rti::request::RequesterParams::service_name (
    const std::string & name )
```

The service name that Repliers and **Requester** (p. 1907) use to match and communicate.

A **Requester** (p. 1907) and a **Replier** (p. 1888) need to be configured with the same topic names in order to match.

The service name is used to generate a request topic and a reply topic that the **Requester** (p. 1907) and **Replier** (p. 1888) will use to communicate. For example, the service name "MyService" will be used to create topics named "MyServiceRequest" and "MyServiceReply".

In some cases, the name of these topics is known beforehand or needs to be customized for another reason. The service name can be overridden by setting specific request and reply topic names using **RequesterParams::request_↵_topic_name** (p. 1919) and **RequesterParams::reply_↵_topic_name** (p. 1919).

8.304.3.2 `request_topic_name()`

```
RequesterParams & rti::request::RequesterParams::request_topic_name (
    const std::string & name )
```

Sets a specific request topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **Requester↵_Params::service_name** (p. 1919). If that topic already exists, it will be reused.

8.304.3.3 `reply_topic_name()`

```
RequesterParams & rti::request::RequesterParams::reply_topic_name (
    const std::string & name )
```

Sets a specific reply topic name.

The specified topic name will be used, instead of allowing a topic name to be generated based on the **Requester↵_Params::service_name** (p. 1919). If that topic already exists, it will be reused.

8.304.3.4 datawriter_qos()

```
RequesterParams & rti::request::RequesterParams::datawriter_qos (
    const dds::core::optional< dds::pub::qos::DataWriterQos > & qos )
```

Sets the quality of service of the request DataWriter.

See also

dds::core::QosProvider (p. 1752) to access Qos profiles.

8.304.3.5 datareader_qos()

```
RequesterParams & rti::request::RequesterParams::datareader_qos (
    const dds::core::optional< dds::sub::qos::DataReaderQos > & qos )
```

Sets the quality of service of the request DataReader.

See also

dds::core::QosProvider (p. 1752) to access Qos profiles.

8.304.3.6 publisher()

```
RequesterParams & rti::request::RequesterParams::publisher (
    dds::pub::Publisher publisher )
```

Sets a specific Publisher.

By default, a **Requester** (p. 1907) uses the DomainParticipant's implicit Publisher. Sometimes a different Publisher may be needed, for example, to use non-default PublisherQos.

8.304.3.7 subscriber()

```
RequesterParams & rti::request::RequesterParams::subscriber (
    dds::sub::Subscriber subscriber )
```

Sets a specific Subscriber.

By default, a **Requester** (p. 1907) uses the DomainParticipant's implicit Subscriber. Sometimes a different Subscriber may be needed, for example, to use non-default SubscriberQos.

8.304.3.8 request_type()

```
RequesterParams & rti::request::RequesterParams::request_type (
    const dds::core::optional< dds::core::xtypes::DynamicType > & type )
```

The request type, when DynamicData is used.

This is required when the **Requester** (p. 1907) RequestType is **dds::core::xtypes::DynamicData** (p. 1208). Otherwise this is ignored.

8.304.3.9 reply_type()

```
RequesterParams & rti::request::RequesterParams::reply_type (
    const dds::core::optional< dds::core::xtypes::DynamicType > & type )
```

The reply type, when DynamicData is used.

This is required when the **Requester** (p. 1907) ReplyType is **dds::core::xtypes::DynamicData** (p. 1208). Otherwise this is ignored.

8.305 dds::core::policy::ResourceLimits Class Reference

Controls the memory usage of **dds::pub::DataWriter** (p. 908) or a **dds::sub::DataReader** (p. 756).

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **ResourceLimits** ()
Creates the default policy.
- **ResourceLimits** (int32_t the_max_samples, int32_t the_max_instances, int32_t the_max_samples_per_instance)
*Creates a **ResourceLimits** (p. 1921) object with the specified max_samples, max_instances, and max_samples_per_instance and default values for the rest of the parameters.*
- **ResourceLimits & max_samples** (int32_t the_max_samples)
Sets the maximum number of data samples that a DataWriter or a DataReader can manage across all instances.
- int32_t **max_samples** () const
Getter (see setter with the same name)
- **ResourceLimits & max_instances** (int32_t the_max_instances)
Sets the maximum number of instances that a DataWriter or a DataReader can manage.
- int32_t **max_instances** () const
Getter (see setter with the same name)
- **ResourceLimits & max_samples_per_instance** (int32_t the_max_samples_per_instance)
Sets the maximum number of data samples per instance that a DataWriter or a DataReader can manage.
- int32_t **max_samples_per_instance** () const
Getter (see setter with the same name)

- **dds::core::policy::ResourceLimits & initial_samples** (int32_t the_initial_samples)

8.305.1 Detailed Description

Controls the memory usage of **dds::pub::DataWriter** (p. 908) or a **dds::sub::DataReader** (p. 756).

Entity:

dds::topic::Topic (p. 2178), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Status:

dds::core::status::StatusMask::sample_rejected() (p. 2089), **dds::core::status::SampleRejectedStatus** (p. 2022)

Properties:

RxO (p. 307) = NO
Changeable (p. 307) = UNTIL ENABLE (p. 307)

8.305.2 Usage

This policy controls the resources that RTI Connexx can use to meet the requirements imposed by the application and other QoS settings.

For the reliability protocol (and **dds::core::policy::Durability** (p. 1181)), this QoS policy determines the actual maximum queue size when the **dds::core::policy::History** (p. 1346) is set to **dds::core::policy::HistoryKind::KEEP_ALL**.

In general, this QoS policy is used to limit the amount of system memory that RTI Connexx can allocate. For embedded real-time systems and safety-critical systems, pre-determination of maximum memory usage is often required. In addition, dynamic memory allocation could introduce non-deterministic latencies in time-critical paths.

This QoS policy can be set such that an entity does not dynamically allocate any more memory after its initialization phase.

If `dds::pub::DataWriter` (p. 908) objects are communicating samples faster than they are ultimately taken by the `dds::sub::DataReader` (p. 756) objects, the middleware will eventually hit against some of the QoS-imposed resource limits. Note that this may occur when just a single `dds::sub::DataReader` (p. 756) cannot keep up with its corresponding `dds::pub::DataWriter` (p. 908). The behavior in this case depends on the setting for the **RELIABILITY** (p. 335). If reliability is `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p. 1881), then RTI Connext is allowed to drop samples. If the reliability is `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881), RTI Connext will block the `dds::pub::DataWriter` (p. 908) or discard the sample at the `dds::sub::DataReader` (p. 756) in order not to lose existing samples.

The constant `dds::core::LENGTH_UNLIMITED` (p. 238) may be used to indicate the absence of a particular limit. For example setting `dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925) to `dds::core::LENGTH_UNLIMITED` (p. 238) will cause RTI Connext not to enforce this particular limit.

If these resource limits are not set sufficiently, under certain circumstances the `dds::pub::DataWriter` (p. 908) may block on a `write()` (p. 949) call even though the `dds::core::policy::History` (p. 1346) is `dds::core::policy::HistoryKind::KEEP_LAST`. To guarantee the writer does not block for `dds::core::policy::HistoryKind::KEEP_LAST`, make sure the resource limits are set such that:

```
max_samples >= max_instances * max_samples_per_instance
```

See also

`dds::core::policy::Reliability` (p. 1873)

`dds::core::policy::History` (p. 1346)

8.305.3 Consistency

The setting of `dds::core::policy::ResourceLimits::max_samples` (p. 1924) must be consistent with `dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925). For these two values to be consistent, it must be true that `dds::core::policy::ResourceLimits::max_samples` (p. 1924) \geq `dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925). As described above, this limit will not be enforced if `dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925) is set to `dds::core::LENGTH_UNLIMITED` (p. 238).

The setting of **RESOURCE_LIMITS** (p. 336) `max_samples_per_instance` must be consistent with the **HISTORY** (p. 324) `depth`. For these two QoS to be consistent, it must be true that `depth` \leq `max_samples_per_instance`.

`dds::core::policy::History` (p. 1346)

8.305.4 Constructor & Destructor Documentation

8.305.4.1 ResourceLimits() [1/2]

```
dds::core::policy::ResourceLimits::ResourceLimits ( ) [inline]
```

Creates the default policy.

8.305.4.2 ResourceLimits() [2/2]

```
dds::core::policy::ResourceLimits::ResourceLimits (
    int32_t the_max_samples,
    int32_t the_max_instances,
    int32_t the_max_samples_per_instance ) [inline]
```

Creates a **ResourceLimits** (p. 1921) object with the specified max_samples, max_instances, and max_samples_per_instance and default values for the rest of the parameters.

8.305.5 Member Function Documentation

8.305.5.1 max_samples() [1/2]

```
ResourceLimits & dds::core::policy::ResourceLimits::max_samples (
    int32_t the_max_samples ) [inline]
```

Sets the maximum number of data samples that a DataWriter or a DataReader can manage across all instances.

Specifies the maximum number of data samples a **dds::pub::DataWriter** (p. 908) (or **dds::sub::DataReader** (p. 756)) can manage across all the instances associated with it.

For unkeyed types, this value has to be equal to max_samples_per_instance if max_samples_per_instance is not equal to **dds::core::LENGTH_UNLIMITED** (p. 238).

When batching is enabled, the maximum number of data samples a **dds::pub::DataWriter** (p. 908) can manage will also be limited by **rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1007).

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), >= initial_samples, >= max_samples_per_instance, >= **rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 862) or >= **rti::core::RtpsReliableWriterProtocol::heartbeats_per_max_samples**

For **dds::pub::qos::DataWriterQos** (p. 994) max_samples >= **rti::core::RtpsReliableWriterProtocol::heartbeats_per_max_samples** in **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p. 985) if batching is disabled.

8.305.5.2 max_samples() [2/2]

```
int32_t dds::core::policy::ResourceLimits::max_samples ( ) const [inline]
```

Getter (see setter with the same name)

8.305.5.3 max_instances() [1/2]

```
ResourceLimits & dds::core::policy::ResourceLimits::max_instances (
    int32_t the_max_instances ) [inline]
```

Sets the maximum number of instances that a DataWriter or a DataReader can manage.

[default] dds::core::LENGTH_UNLIMITED (p. 238)

[range] [1, 1 million] or dds::core::LENGTH_UNLIMITED (p. 238), >= initial_instances

8.305.5.4 max_instances() [2/2]

```
int32_t dds::core::policy::ResourceLimits::max_instances ( ) const [inline]
```

Getter (see setter with the same name)

8.305.5.5 max_samples_per_instance() [1/2]

```
ResourceLimits & dds::core::policy::ResourceLimits::max_samples_per_instance (
    int32_t the_max_samples_per_instance ) [inline]
```

Sets the maximum number of data samples per instance that a DataWriter or a DataReader can manage.

While an unkeyed type is logically considered as a single instance, for unkeyed types this value has to be equal to max_samples or dds::core::LENGTH_UNLIMITED (p. 238).

[default] dds::core::LENGTH_UNLIMITED (p. 238)

[range] [1, 100 million] or dds::core::LENGTH_UNLIMITED (p. 238), <= max_samples or dds::core::LENGTH_UNLIMITED (p. 238), >= dds::core::policy::History::depth (p. 1349)

8.305.5.6 max_samples_per_instance() [2/2]

```
int32_t dds::core::policy::ResourceLimits::max_samples_per_instance ( ) const [inline]
```

Getter (see setter with the same name)

8.305.5.7 `initial_samples()` [1/2]

```
dds::core::policy::ResourceLimits & initial_samples (
    int32_t the_initial_samples )
```

<<**extension**>> (p. 156) Sets the number of samples that a DataReader or a DataWriter will preallocate.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Specifies the initial number of data samples a **dds::pub::DataWriter** (p. 908) (or **dds::sub::DataReader** (p. 756)) will manage across all the instances associated with it.

[default] 32

[range] [1,100 million], <= max_samples

8.305.5.8 `initial_samples()` [2/2]

```
int32_t initial_samples ( ) const
```

Getter (see setter with the same name)

8.305.5.9 `initial_instances()` [1/2]

```
dds::core::policy::ResourceLimits & initial_instances (
    int32_t the_initial_instances )
```

<<**extension**>> (p. 156) Sets the number of instances that a DataReader or a DataWriter will preallocate.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

[default] 32

[range] [1,1 million], <= max_instances

8.305.5.10 `initial_instances()` [2/2]

```
int32_t initial_instances ( ) const
```

Getter (see setter with the same name)

8.305.5.11 instance_hash_buckets() [1/2]

```
dds::core::policy::ResourceLimits & instance_hash_buckets (
    int32_t the_instance_hash_buckets )
```

<<**extension**>> (p. 156) Sets the number of hash buckets for looking up instances

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The instance hash table facilitates instance lookup. A higher number of buckets decreases instance lookup time but increases the memory usage.

[default] 1 **[range]** [1,1 million]

8.305.5.12 instance_hash_buckets() [2/2]

```
int32_t instance_hash_buckets ( ) const
```

Getter (see setter with the same name)

8.306 rti::core::Result< T > Class Template Reference

A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.

```
#include <Result.hpp>
```

Public Member Functions

- **Result** ()=default
*Creates a **Result** (p. 1927) object with a return code of DDS_RETCODE_ERROR and no value.*
- **Result** (const T &value)
*Creates a **Result** (p. 1927) object with a return code of DDS_RETCODE_OK and a value that is copied.*
- **Result** (T &&value)
*Creates a **Result** (p. 1927) object with a return code of DDS_RETCODE_OK and a value that is moved.*
- **Result** (DDS_ReturnCode_t retcode)
*Creates a **Result** (p. 1927) object with a return code and no value.*
- const T & **get** () const &noexcept
Gets the value without checking if the operation was successful.
- T & **get** () &noexcept
Gets the value without checking if the operation was successful.
- DDS_ReturnCode_t **get_return_code** () const noexcept
Gets the return code.
- bool **is_ok** () const noexcept
Returns true if the operation was successful.
- const T & **get_if_ok** () const &
Gets the value if the operation was successful, otherwise throws an exception.
- T & **get_if_ok** () &
Gets the value if the operation was successful, otherwise throws an exception.
- T && **get_if_ok** () &&
Gets the value if the operation was successful, otherwise throws an exception.
- void **throw_if_error** () const
Throws an exception if the operation was not successful.

8.306.1 Detailed Description

```
template<typename T>
class rti::core::Result< T >
```

A result from an operation that doesn't throw exceptions containing a return code and (if successful) a value.

For some critical operations in the API a exception-throwing and a noexcept version of the same function are provided. The noexcept versions return a Result<T> object to indicate if the operation was successful or not and, if it was, provide the return value of type T.

Note that **Result** (p. 1927) <void> is specialized to not provide a value, only a return code.

8.306.2 Constructor & Destructor Documentation

8.306.2.1 Result() [1/4]

```
template<typename T >
rti::core::Result< T >::Result ( ) [default]
```

Creates a **Result** (p. 1927) object with a return code of DDS_RETCODE_ERROR and no value.

8.306.2.2 Result() [2/4]

```
template<typename T >
rti::core::Result< T >::Result (
    const T & value ) [inline], [explicit]
```

Creates a **Result** (p. 1927) object with a return code of DDS_RETCODE_OK and a value that is copied.

8.306.2.3 Result() [3/4]

```
template<typename T >
rti::core::Result< T >::Result (
    T && value ) [inline], [explicit]
```

Creates a **Result** (p. 1927) object with a return code of DDS_RETCODE_OK and a value that is moved.

8.306.2.4 Result() [4/4]

```
template<typename T >
rti::core::Result< T >::Result (
    DDS_ReturnCode_t retcode ) [inline], [explicit]
```

Creates a **Result** (p. 1927) object with a return code and no value.

8.306.3 Member Function Documentation

8.306.3.1 get() [1/2]

```
template<typename T >
const T & rti::core::Result< T >::get ( ) const & [inline], [noexcept]
```

Gets the value without checking if the operation was successful.

If the operation was not successful, the behavior is undefined; use **is_ok()** (p. 1929) first or use **get_if_ok()** (p. 1930) instead.

8.306.3.2 get() [2/2]

```
template<typename T >
T & rti::core::Result< T >::get ( ) & [inline], [noexcept]
```

Gets the value without checking if the operation was successful.

If the operation was not successful, the behavior is undefined; use **is_ok()** (p. 1929) first or use **get_if_ok()** (p. 1930) instead.

8.306.3.3 get_return_code()

```
template<typename T >
DDS_ReturnCode_t rti::core::Result< T >::get_return_code ( ) const [inline], [noexcept]
```

Gets the return code.

8.306.3.4 is_ok()

```
template<typename T >
bool rti::core::Result< T >::is_ok ( ) const [inline], [noexcept]
```

Returns true if the operation was successful.

This is equivalent to `get_return_code () (p.1929) == DDS_RETCODE_OK`

8.306.3.5 get_if_ok() [1/3]

```
template<typename T >
const T & rti::core::Result< T >::get_if_ok ( ) const & [inline]
```

Gets the value if the operation was successful, otherwise throws an exception.

References `rti::core::Result< T >::throw_if_error()`.

8.306.3.6 get_if_ok() [2/3]

```
template<typename T >
T & rti::core::Result< T >::get_if_ok ( ) & [inline]
```

Gets the value if the operation was successful, otherwise throws an exception.

References `rti::core::Result< T >::throw_if_error()`.

8.306.3.7 get_if_ok() [3/3]

```
template<typename T >
T && rti::core::Result< T >::get_if_ok ( ) && [inline]
```

Gets the value if the operation was successful, otherwise throws an exception.

References `rti::core::Result< T >::throw_if_error()`.

8.306.3.8 `throw_if_error()`

```
template<typename T >
void rti::core::Result< T >::throw_if_error ( ) const [inline]
```

Throws an exception if the operation was not successful.

If the operation was successful, this function does nothing.

Referenced by `rti::core::Result< T >::get_if_ok()`.

8.307 `rpc_example::RobotControl` Class Reference

The synchronous interface generated from the `RobotControl` (p. 95) IDL service.

```
#include <ServiceEndpoint.hpp>
```

Inheritance diagram for `rpc_example::RobotControl`:

Public Member Functions

- virtual Coordinates `walk_to` (const Coordinates &destination, float speed)=0
An IDL interface method defined in `RobotControl` (p. 1931).
- virtual float `get_speed` ()=0
An IDL interface method defined in `RobotControl` (p. 1931).
- virtual `~RobotControl` ()
An empty virtual destructor.

8.307.1 Detailed Description

The synchronous interface generated from the `RobotControl` (p. 95) IDL service.

`RobotControlClient` (p. 1934) implements this interface to make synchronous remote function calls.

Server-side applications must implement this interface to handle remote calls. To execute an implementation of this interface, create a `RobotControlService` (p. 208).

8.307.2 Constructor & Destructor Documentation

8.307.2.1 ~RobotControl()

```
virtual rpc_example::RobotControl::~~RobotControl ( ) [inline], [virtual]
```

An empty virtual destructor.

8.307.3 Member Function Documentation

8.307.3.1 walk_to()

```
virtual Coordinates rpc_example::RobotControl::walk_to (
    const Coordinates & destination,
    float speed ) [pure virtual]
```

An IDL interface method defined in **RobotControl** (p. 1931).

Parameters

<i>destination</i>	An input argument
<i>speed</i>	An input argument

Returns

A return value

8.307.3.2 get_speed()

```
virtual float rpc_example::RobotControl::get_speed ( ) [pure virtual]
```

An IDL interface method defined in **RobotControl** (p. 1931).

Returns

The return value of this method

8.308 rpc_example::RobotControlAsync Class Reference

The asynchronous interface derived from the **RobotControl** (p. 1931) service.

```
#include <ServiceEndpoint.hpp>
```

Inheritance diagram for rpc_example::RobotControlAsync:

Public Member Functions

- virtual std::future< Coordinates > **walk_to_async** (const Coordinates &destination, float speed)=0
*An IDL interface method defined in **RobotControl** (p. 1931).*
- virtual std::future< float > **get_speed_async** ()=0
*An IDL interface method defined in **RobotControl** (p. 1931).*
- virtual **~RobotControlAsync** ()
An empty virtual destructor.

8.308.1 Detailed Description

The asynchronous interface derived from the **RobotControl** (p. 1931) service.

RobotControlClient (p. 1934) implements this interface to make asynchronous remote function calls.

This interface is not implemented on the server side.

8.308.2 Constructor & Destructor Documentation

8.308.2.1 ~RobotControlAsync()

```
virtual rpc_example::RobotControlAsync::~~RobotControlAsync ( ) [inline], [virtual]
```

An empty virtual destructor.

8.308.3 Member Function Documentation

8.308.3.1 walk_to_async()

```
virtual std::future< Coordinates > rpc_example::RobotControlAsync::walk_to_async (
    const Coordinates & destination,
    float speed ) [pure virtual]
```

An IDL interface method defined in **RobotControl** (p. 1931).

Parameters

<i>destination</i>	An input argument
<i>speed</i>	An input argument

Returns

The future return value

8.308.3.2 `get_speed_async()`

```
virtual std::future< float > rpc_example::RobotControlAsync::get_speed_async ( ) [pure virtual]
```

An IDL interface method defined in **RobotControl** (p. 1931).

8.309 `rpc_example::RobotControlClient` Class Reference

<<*reference-type*>> (p. 153) Allows client applications to make remote function calls

```
#include <ClientEndpoint.hpp>
```

Inheritance diagram for `rpc_example::RobotControlClient`:

Additional Inherited Members

8.309.1 Detailed Description

<<*reference-type*>> (p. 153) Allows client applications to make remote function calls

This class implements the **RobotControl** (p. 1931) and **RobotControlAsync** (p. 1933) interfaces to make remote function calls. It also inherits from `RobotControlClientEndpoint`, which manages the DDS entities required to make those function calls.

8.310 `rti::core::RtpsReliableReaderProtocol` Class Reference

<<*extension*>> (p. 156) Configures aspects of the RTPS protocol related to a reliable DataReader

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **RtpsReliableReaderProtocol** ()
Creates an instance with the default settings.
- **RtpsReliableReaderProtocol** & **min_heartbeat_response_delay** (const **dds::core::Duration** &the_min_↔
heartbeat_response_delay)
The minimum delay to respond to a heartbeat.
- **dds::core::Duration** **min_heartbeat_response_delay** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **max_heartbeat_response_delay** (const **dds::core::Duration** &the_max_↔
heartbeat_response_delay)
The maximum delay to respond to a heartbeat.
- **dds::core::Duration** **max_heartbeat_response_delay** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **heartbeat_suppression_duration** (const **dds::core::Duration** &the_↔
heartbeat_suppression_duration)
The duration a reader ignores consecutively received heartbeats.
- **dds::core::Duration** **heartbeat_suppression_duration** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **nack_period** (const **dds::core::Duration** &the_nack_period)
The period at which to send NACKs.
- **dds::core::Duration** **nack_period** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **receive_window_size** (int32_t the_receive_window_size)
The number of received out-of-order samples a reader can keep at a time.
- int32_t **receive_window_size** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **round_trip_time** (const **dds::core::Duration** &the_round_trip_time)
The duration from sending a NACK to receiving a repair of a sample.
- **dds::core::Duration** **round_trip_time** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **app_ack_period** (const **dds::core::Duration** &the_app_ack_period)
The period at which application-level acknowledgment messages are sent.
- **dds::core::Duration** **app_ack_period** () const
Getter (see setter with the same name)
- **RtpsReliableReaderProtocol** & **samples_per_app_ack** (int32_t the_samples_per_app_ack)
The minimum number of samples acknowledged by one application-level acknowledgment message.
- int32_t **samples_per_app_ack** () const
Getter (see setter with the same name)

8.310.1 Detailed Description

<<**extension**>> (p. 156) Configures aspects of the RTPS protocol related to a reliable DataReader

It is used to config reliable reader according to RTPS protocol.

Properties:

RxO (p. 307) = N/A**Changeable** (p. 307) = **NO** (p. 307)

QoS:

rti::core::policy::DataReaderProtocol (p. 836) **rti::core::policy::DiscoveryConfig** (p. 1035)

8.310.2 Constructor & Destructor Documentation

8.310.2.1 RtpsReliableReaderProtocol()

```
rti::core::RtpsReliableReaderProtocol::RtpsReliableReaderProtocol ( ) [inline]
```

Creates an instance with the default settings.

8.310.3 Member Function Documentation

8.310.3.1 min_heartbeat_response_delay() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::min_heartbeat_response_delay  
(  
    const dds::core::Duration & the_min_heartbeat_response_delay )
```

The minimum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0, 1 year], <= max_heartbeat_response_delay

8.310.3.2 min_heartbeat_response_delay() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::min_heartbeat_response_delay ( ) const
```

Getter (see setter with the same name)

8.310.3.3 max_heartbeat_response_delay() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::max_heartbeat_response_delay
(
    const dds::core::Duration & the_max_heartbeat_response_delay )
```

The maximum delay to respond to a heartbeat.

When a reliable reader receives a heartbeat from a remote writer and finds out that it needs to send back an ACK/NACK message, the reader can choose to delay a while. This sets the value of maximum delay.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataReaderProtocol::rtps_reliable_reader` (p. 841): 0.5 seconds
- For `rti::core::policy::DiscoveryConfig::publication_reader` (p. 1047): 0 seconds
- For `rti::core::policy::DiscoveryConfig::subscription_reader` (p. 1048): 0 seconds
- For `rti::core::policy::DiscoveryConfig::participant_message_reader` (p. 1054): 0 seconds

[range] [0, 1 year], \geq min_heartbeat_response_delay

8.310.3.4 max_heartbeat_response_delay() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::max_heartbeat_response_delay ( ) const
```

Getter (see setter with the same name)

8.310.3.5 heartbeat_suppression_duration() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::heartbeat_suppression_↔
duration (
    const dds::core::Duration & the_heartbeat_suppression_duration )
```

The duration a reader ignores consecutively received heartbeats.

When a reliable reader receives consecutive heartbeats within a short duration that will trigger redundant NACKs, the reader may ignore the latter heartbeat(s). This sets the duration during which additionally received heartbeats are suppressed.

[default] 0.0625 seconds

[range] [0, 1 year],

8.310.3.6 heartbeat_suppression_duration() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::heartbeat_suppression_duration ( )
const
```

Getter (see setter with the same name)

8.310.3.7 nack_period() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::nack_period (
    const dds::core::Duration & the_nack_period )
```

The period at which to send NACKs.

A reliable reader will send periodic NACKs at this rate when it first matches with a reliable writer. The reader will stop sending NACKs when it has received all available historical data from the writer.

[default] 5 seconds

[range] [1 nanosec, 1 year]

8.310.3.8 nack_period() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::nack_period ( ) const
```

Getter (see setter with the same name)

8.310.3.9 receive_window_size() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::receive_window_size (
    int32_t the_receive_window_size )
```

The number of received out-of-order samples a reader can keep at a time.

A reliable reader stores the out-of-order samples it receives until it can present them to the application in-order. The receive window is the maximum number of out-of-order samples that a reliable reader keeps at a given time. When the receive window is full, subsequently received out-of-order samples are dropped.

[default] 256

[range] [≥ 1]

8.310.3.10 receive_window_size() [2/2]

```
int32_t rti::core::RtpsReliableReaderProtocol::receive_window_size ( ) const
```

Getter (see setter with the same name)

8.310.3.11 round_trip_time() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::round_trip_time (
    const dds::core::Duration & the_round_trip_time )
```

The duration from sending a NACK to receiving a repair of a sample.

This round-trip time is an estimate of the time starting from when the reader sends a NACK for a specific sample to when it receives that sample. For each sample, the reader will not send a subsequent NACK for it until the round-trip time has passed, thus preventing inefficient redundant requests.

[default] 0 seconds

[range] [0 nanosec, 1 year]

8.310.3.12 round_trip_time() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::round_trip_time ( ) const
```

Getter (see setter with the same name)

8.310.3.13 app_ack_period() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::app_ack_period (
    const dds::core::Duration & the_app_ack_period )
```

The period at which application-level acknowledgment messages are sent.

A **dds::sub::DataReader** (p.756) sends application-level acknowledgment messages to a **dds::pub::DataWriter** (p.908) at this periodic rate, and will continue sending until it receives a message from the **dds::pub::DataWriter** (p.908) that it has received and processed the acknowledgment and an AppAckConfirmation has been received by the **dds::sub::DataReader** (p.756). Note: application-level acknowledgment messages can also be sent non-periodically, as determined by **rti::core::RtpsReliableReaderProtocol::samples_per_app_ack** (p.1940).

[default] 5 seconds

[range] [1 nanosec, 1 year]

8.310.3.14 app_ack_period() [2/2]

```
dds::core::Duration rti::core::RtpsReliableReaderProtocol::app_ack_period ( ) const
```

Getter (see setter with the same name)

8.310.3.15 samples_per_app_ack() [1/2]

```
RtpsReliableReaderProtocol & rti::core::RtpsReliableReaderProtocol::samples_per_app_ack (
    int32_t the_samples_per_app_ack )
```

The minimum number of samples acknowledged by one application-level acknowledgment message.

This setting applies only when `dds::core::policy::Reliability::acknowledgment_kind` (p. 1878) = `rti::core::policy::AcknowledgmentKind_def::APPLICATION_EXPLICIT` (p. 586) or `rti::core::policy::AcknowledgmentKind_def::APPLICATION_AUTO` (p. 586)

A `dds::sub::DataReader` (p. 756) will immediately send an application-level acknowledgment message when it has at least this many samples that have been acknowledged. It will not send an acknowledgment message until it has at least this many samples pending acknowledgment.

For example, calling `dds::sub::DataReader::acknowledge_sample` (p. 792) this many times consecutively will trigger the sending of an acknowledgment message. Calling `dds::sub::DataReader::acknowledge_all` (p. 790) may trigger the sending of an acknowledgment message, if at least this many samples are being acknowledged at once.

This is independent of the `rti::core::RtpsReliableReaderProtocol::app_ack_period` (p. 1939), where a `dds::sub::DataReader` (p. 756) will send acknowledgement messages at the periodic rate regardless.

When this is set to `dds::core::LENGTH_UNLIMITED` (p. 238), then acknowledgement messages are sent only periodically, at the rate set by `rti::core::RtpsReliableReaderProtocol::app_ack_period` (p. 1939).

[default] 1

[range] [1, 1000000], or `dds::core::LENGTH_UNLIMITED` (p. 238)

8.310.3.16 samples_per_app_ack() [2/2]

```
int32_t rti::core::RtpsReliableReaderProtocol::samples_per_app_ack ( ) const
```

Getter (see setter with the same name)

Decreases send window size by this percentage when reacting dynamically to network conditions.
 - `int32_t send_window_decrease_factor () const`
Getter (see setter with the same name)
 - **RtpsReliableWriterProtocol & enable_multicast_periodic_heartbeat** (`bool the_enable_multicast_periodic_heartbeat`)
Whether periodic heartbeat messages are sent over multicast.
 - `bool enable_multicast_periodic_heartbeat () const`
Getter (see setter with the same name)
 - **RtpsReliableWriterProtocol & multicast_resend_threshold** (`int32_t the_multicast_resend_threshold`)
The minimum number of requesting readers needed to trigger a multicast resend.
 - `int32_t multicast_resend_threshold () const`
Getter (see setter with the same name)
 - **RtpsReliableWriterProtocol & disable_repair_piggyback_heartbeat** (`bool the_disable_repair_piggyback_heartbeat`)
Prevents piggyback heartbeats from being sent with repair samples.
 - `bool disable_repair_piggyback_heartbeat () const`
Getter (see setter with the same name)

8.311.1 Detailed Description

<<**extension**>> (p. 156) Configures aspects of an RTPS reliable writer

It is used to configure a reliable writer according to RTPS protocol.

The reliability protocol settings are applied to batches instead of individual data samples when batching is enabled.

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

QoS:

rti::core::policy::DataWriterProtocol (p. 979) **rti::core::policy::DiscoveryConfig** (p. 1035)

8.311.2 Constructor & Destructor Documentation

8.311.2.1 RtpsReliableWriterProtocol()

```
rti::core::policy::RtpsReliableWriterProtocol::RtpsReliableWriterProtocol ( ) [inline]
```

Creates an instance with the default settings.

8.311.3 Member Function Documentation

8.311.3.1 low_watermark() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::low_watermark (
    int32_t the_low_watermark )
```

When the number of unacknowledged samples in the current send window of a reliable writer meets or falls below this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2092) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be greater than or equal to zero and strictly less than high_watermark.

The high and low watermarks are used for switching between the regular and fast heartbeat rates (rti::core::↵ RtpsReliableWriterProtocol::heartbeat_period and rti::core::RtpsReliableWriterProtocol::fast_heartbeat_period, respectively). When the number of unacknowledged samples in the queue of a reliable **dds::pub::DataWriter** (p. 908) meets or exceeds high_watermark, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2092) is changed, and the DataWriter will start heartbeating at rti::core::RtpsReliableWriterProtocol::fast_heartbeat_period. When the number of samples meets or falls below low_watermark, **dds::core::status::StatusMask::reliable_writer_↵ _cache_changed()** (p. 2092) is changed, and the heartbeat rate will return to the "normal" rate (rti::core::RtpsReliable↵ WriterProtocol::heartbeat_period).

[default] 0

[range] [0, 100 million], < high_watermark

8.311.3.2 low_watermark() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::low_watermark ( ) const
```

Getter (see setter with the same name)

8.311.3.3 high_watermark() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::high_watermark (
    int32_t the_high_watermark )
```

When the number of unacknowledged samples in the current send window of a reliable writer meets or exceeds this threshold, the **dds::core::status::StatusMask::reliable_writer_cache_changed()** (p. 2092) is considered to have changed.

This value is measured in units of samples, except with batching configurations where it is measured in units of batches.

The value must be strictly greater than `low_watermark` and less than or equal to a maximum that depends on the container QoS policy:

In `dds::domain::qos::DomainParticipantQos::discovery_config`:

For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049)

`high_watermark <= rti::core::AllocationSettings::max_count` (p. 592) in `rti::core::policy::DomainParticipant`↔
ResourceLimits::local_writer_allocation (p. 1150)

For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051)

`high_watermark <= rti::core::AllocationSettings::max_count` (p. 592) in `rti::core::policy::DomainParticipant`↔
ResourceLimits::local_reader_allocation (p. 1150)

In `rti::core::policy::DataWriterProtocol` (p. 979):

For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985),

`high_watermark <= dds::core::policy::ResourceLimits::max_samples` (p. 1924) if batching is disabled. Otherwise,
`high_watermark <= rti::core::policy::DataWriterResourceLimits::max_batches` (p. 1007) `high_watermark <= rti`↔
`::core::RtpsReliableWriterProtocol::max_send_window_size`

[default] 1

[range] [1, 100 million] or **dds::core::LENGTH_UNLIMITED** (p. 238), > `low_watermark` <= *maximum* which depends on the container policy

8.311.3.4 high_watermark() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::high_watermark ( ) const
```

Getter (see setter with the same name)

8.311.3.5 heartbeat_period() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::heartbeat_period (
    const dds::core::Duration & the_heartbeat_period )
```

The period at which to send heartbeats.

A reliable writer will send periodic heartbeats at this rate.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): 1.0 seconds

[range] [1 nanosec,1 year], \geq `rti::core::RtpsReliableWriterProtocol::fast_heartbeat_period`, \geq `rti::core::RtpsReliableWriterProtocol::late_joiner_heartbeat_period`

8.311.3.6 heartbeat_period() [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::heartbeat_period ( ) const
```

Getter (see setter with the same name)

8.311.3.7 fast_heartbeat_period() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::fast_heartbeat_period (
    const dds::core::Duration & the_fast_heartbeat_period )
```

An alternative heartbeat period used when a reliable writer needs to flush its unacknowledged samples more quickly.

This heartbeat period will be used when the number of unacknowledged samples in the cache of a reliable writer meets or exceeds the writer's high watermark and has not subsequently dropped to the low watermark. The normal period will be used at all other times.

This period must not be slower (i.e. must be of the same or shorter duration) than the normal heartbeat period.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): 1.0 seconds

[range] [1 nanosec,1 year], \leq `rti::core::RtpsReliableWriterProtocol::heartbeat_period`

8.311.3.8 fast_heartbeat_period() [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::fast_heartbeat_period ( )
const
```

Getter (see setter with the same name)

8.311.3.9 late_joiner_heartbeat_period() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::late_joiner_heartbeat←
_period (
    const dds::core::Duration & the_late_joiner_heartbeat_period )
```

An alternative heartbeat period used when a reliable reader joins late and needs to be caught up on cached samples of a reliable writer more quickly than the normal heartbeat rate.

This heartbeat period will be used when a reliable reader joins after a reliable writer with non-volatile durability has begun publishing samples. Once the reliable reader has received all cached samples, it will be serviced at the same rate as other reliable readers.

This period must not be slower (i.e., must be of the same or shorter duration) than the normal heartbeat period.

A reliable writer will use whichever heartbeat period is faster, the current heartbeat period being used for other reliable readers or the `rti::core::RtpsReliableWriterProtocol::late_joiner_heartbeat_period`, to service the late joining reader. This means that if the `rti::core::RtpsReliableWriterProtocol::fast_heartbeat_period` is currently being used and is faster than the `late_joiner_heartbeat_period`, then the `fast_heartbeat_period` will continue to be used for the late joiner as well.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): 3.0 seconds
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): 1.0 seconds

[range] [1 nanosec,1 year], \leq `rti::core::RtpsReliableWriterProtocol::heartbeat_period`

8.311.3.10 late_joiner_heartbeat_period() [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::late_joiner_heartbeat_period (
) const
```

Getter (see setter with the same name)

8.311.3.11 virtual_heartbeat_period()

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::virtual_heartbeat_↵
period (
    const dds::core::Duration & the_virtual_heartbeat_period )
```

The period at which to send virtual heartbeats. Virtual heartbeats inform the reliable reader about the range of samples currently present, for each virtual GUID, in the reliable writer's queue.

A reliable writer will send periodic virtual heartbeats at this rate.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): `dds::core::Duration::automatic()` (p. 1198). If `dds::core::policy::Presentation::access_scope` (p. 1674) is set to `dds::core::policy::↵ PresentationAccessScopeKind_def::GROUP` (p. 1677) on the DataWriter, this value is set to `rti::core::↵ RtpsReliableWriterProtocol::heartbeat_period`. Otherwise, the value is set to `dds::core::Duration::infinite()` (p. 1197).
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): `dds::core::Duration::infinite()` (p. 1197)
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): `dds::core::Duration::infinite()` (p. 1197)
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): `dds::core::Duration↵ ::infinite()` (p. 1197)

[range] > 1 nanosec, `dds::core::Duration::infinite()` (p. 1197), or `dds::core::Duration::automatic()` (p. 1198)

8.311.3.12 samples_per_virtual_heartbeat() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::samples_per_virtual↵
_heartbeat (
    int32_t the_samples_per_virtual_heartbeat )
```

The number of samples that a reliable writer has to publish before sending a virtual heartbeat.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

[range] [1,1000000], `dds::core::LENGTH_UNLIMITED` (p. 238)

8.311.3.13 samples_per_virtual_heartbeat() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::samples_per_virtual_heartbeat ( ) const
```

Getter (see setter with the same name)

8.311.3.14 max_heartbeat_retries() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::max_heartbeat_retries
(
    int32_t the_max_heartbeat_retries )
```

The maximum number of *periodic* heartbeat retries before marking a remote reader as inactive.

When a remote reader has not acked all the samples the reliable writer has in its queue, and max_heartbeat_retries number of periodic heartbeats has been sent without receiving any ack/nack back, the remote reader will be marked as inactive (not alive) and be ignored until it resumes sending ack/nack.

Note that piggyback heartbeats do NOT count towards this value.

[default] 10

[range] [1, 1 million] or **dds::core::LENGTH_UNLIMITED** (p. 238)

8.311.3.15 max_heartbeat_retries() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::max_heartbeat_retries ( ) const
```

Getter (see setter with the same name)

8.311.3.16 inactivate_nonprogressing_readers() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::inactivate_nonprogressing↔
_readers (
    bool the_inactivate_nonprogressing_readers )
```

Whether to treat remote readers as inactive when their NACKs do not progress.

Nominally, a remote reader is marked inactive when a successive number of periodic heartbeats equal or greater than rti::core::RtpsReliableWriterProtocol::max_heartbeat_retries have been sent without receiving any ack/nacks back.

By setting this true, it changes the conditions of inactivating a remote reader: a reader will be considered inactive when it either does not send any ack/nacks or keeps sending non-progressing nacks for rti::core::RtpsReliableWriterProtocol↔::max_heartbeat_retries number of heartbeat periods, where a non-progressing nack is one whose oldest sample requested has not advanced from the oldest sample requested of the previous nack.

[default] false

8.311.3.17 `inactivate_nonprogressing_readers()` [2/2]

```
bool rti::core::policy::RtpsReliableWriterProtocol::inactivate_nonprogressing_readers ( ) const
```

Getter (see setter with the same name)

8.311.3.18 `heartbeats_per_max_samples()` [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::heartbeats_per_max_↵
samples (
    int32_t the_heartbeats_per_max_samples )
```

The number of piggyback heartbeats sent per max send window.

When a DataWriter is configured with a fixed send window size (`rti::core::RtpsReliableWriterProtocol::min_send_↵`
`window_size` is equal to effective `max_send_window_size`), a piggyback heartbeat is sent every [(effective max send
window size/`heartbeats_per_max_samples`)] number of samples written.

Otherwise, the number of piggyback heartbeats sent is scaled according to the current size of the send window. For
example, consider a `rti::core::RtpsReliableWriterProtocol::heartbeats_per_max_samples` of 50. If the current send win-
dow size is 100, a piggyback heartbeat will be sent every 2 samples. If the send window size grows to 150, a piggyback
heartbeat will be sent every 3 samples, and so on. Additionally, when the send window size grows, a piggyback heart-
beat is sent with the next sample. (If it weren't, the sending of that heartbeat could be delayed, since the heartbeat rate
scales with the increasing window size.)

The effective max send window is calculated as follows:

Without batching:

```
min (dds::core::policy::ResourceLimits::max_samples (p. 1924), rti::core::RtpsReliableWriterProtocol::max_send_↵
_window_size)
```

With batching:

```
min (rti::core::policy::DataWriterResourceLimits::max_batches (p. 1007), rti::core::RtpsReliableWriterProtocol↵
::max_send_window_size)
```

If `heartbeats_per_max_samples` is set to zero, no piggyback heartbeats will be sent.

If current send window size is `dds::core::LENGTH_UNLIMITED` (p. 238), 100 million is assumed as the effective max
send window.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): 8
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): 8

- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): 8
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): 1

[range] [0, 100 million]

- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049):
`heartbeats_per_max_samples` ≤ `rti::core::AllocationSettings::max_count` (p. 592) in `rti::core::policy::↔DomainParticipantResourceLimits::local_writer_allocation` (p. 1150)
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051):
`heartbeats_per_max_samples` ≤ `rti::core::AllocationSettings::max_count` (p. 592) in `rti::core::policy::↔DomainParticipantResourceLimits::local_reader_allocation` (p. 1150)
- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985):

`heartbeats_per_max_samples` ≤ `dds::core::policy::ResourceLimits::max_samples` (p. 1924) if batching is disabled. Otherwise:

`heartbeats_per_max_samples` ≤ `rti::core::policy::DataWriterResourceLimits::max_batches` (p. 1007)

`heartbeats_per_max_samples` ≤ `rti::core::RtpsReliableWriterProtocol::max_send_window_size`

8.311.3.19 `heartbeats_per_max_samples()` [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::heartbeats_per_max_samples ( ) const
```

Getter (see setter with the same name)

8.311.3.20 `min_nack_response_delay()` [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::min_nack_response_↔
delay (
    const dds::core::Duration & the_min_nack_response_delay )
```

The minimum delay to respond to a NACK.

When a reliable writer receives a NACK from a remote reader, the writer can choose to delay a while before it sends repair samples or a heartbeat. This sets the value of the minimum delay.

[default] 0 seconds

[range] [0,1 day], ≤ `max_nack_response_delay`

8.311.3.21 min_nack_response_delay() [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::min_nack_response_delay ( )
const
```

Getter (see setter with the same name)

8.311.3.22 max_nack_response_delay() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::max_nack_response_↔
delay (
    const dds::core::Duration & the_max_nack_response_delay )
```

The maximum delay to respond to a nack.

This set the value of maximum delay between receiving a NACK and sending repair samples or a heartbeat.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): 0.2 seconds
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): 0 seconds
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): 0 seconds
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): 0 seconds

[range] [0,1 day], \geq min_nack_response_delay

8.311.3.23 max_nack_response_delay() [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::max_nack_response_delay ( )
const
```

Getter (see setter with the same name)

8.311.3.24 `nack_suppression_duration()` [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::nack_suppression_↔
duration (
    const dds::core::Duration & the_nack_suppression_duration )
```

The duration for ignoring consecutive NACKs that may trigger redundant repairs.

A reliable writer may receive consecutive NACKs within a short duration from a remote reader that will trigger the sending of redundant repair messages.

This specifies the duration during which consecutive NACKs are ignored to prevent redundant repairs from being sent.

[default] 0 seconds

[range] [0,1 day],

8.311.3.25 `nack_suppression_duration()` [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::nack_suppression_duration ( )
const
```

Getter (see setter with the same name)

8.311.3.26 `max_bytes_per_nack_response()` [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::max_bytes_per_nack_↔
response (
    int32_t the_max_bytes_per_nack_response )
```

The maximum total message size when resending rejected samples.

As part of the reliable communication protocol, data writers send heartbeat (HB) messages to their data readers. Each HB message contains the sequence number of the most recent sample sent by the data writer.

In response, a data reader sends an acknowledgement (ACK) message, indicating what sequence numbers it did not receive, if any. If the data reader is missing some samples, the data writer will send them again.

`max_bytes_per_nack_response` determines the maximum size of the message sent by the data writer in response to an ACK. This message may contain multiple samples. The data writer will always send at least one message, even if the size of that message exceeds the `max_bytes_per_nack_response` value.

If `max_bytes_per_nack_response` is larger than the maximum message size supported by the underlying transport, RTI Connex will send multiple messages. If the total size of all samples that need to be resent is larger than `max_bytes_↔per_nack_response`, the remaining samples will be resent the next time an ACK arrives.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): 131072 bytes
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): 131072 bytes
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): 131072 bytes
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): 9216 bytes

[range] [0, 1 GB]

8.311.3.27 `max_bytes_per_nack_response()` [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::max_bytes_per_nack_response ( ) const
```

Getter (see setter with the same name)

8.311.3.28 `disable_positive_acks_min_sample_keep_duration()` [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::disable_positive_↵
acks_min_sample_keep_duration (
    const dds::core::Duration & duration )
```

The minimum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (`rti::core::policy::DataWriterProtocol::disable_positive_acks` (p. 982) = true) or a data reader (`rti::core::policy::DataReaderProtocol::disable_positive_acks` (p. 839) = true), a sample is available from the data writer's queue for at least this duration, after which the sample may be considered to be acknowledged.

[default] 1 millisecond

[range] [0,1 year], <= `rti::core::RtpsReliableWriterProtocol::disable_positive_acks_max_sample_keep_duration`

8.311.3.29 `disable_positive_acks_min_sample_keep_duration()` [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_min_↵
sample_keep_duration ( ) const
```

Getter (see setter with the same name)

8.311.3.30 disable_positive_acks_max_sample_keep_duration() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::disable_positive_←
acks_max_sample_keep_duration (
    const dds::core::Duration & duration )
```

The maximum duration a sample is queued for ACK-disabled readers.

When positive ACKs are disabled for a data writer (**rti::core::policy::DataWriterProtocol::disable_positive_acks** (p. 982) = true) or a data reader (**rti::core::policy::DataReaderProtocol::disable_positive_acks** (p. 839) = true), a sample is available from the data writer's queue for at most this duration, after which the sample is considered to be acknowledged.

[default] 1 second

[range] [0,1 year], >= rti::core::RtpsReliableWriterProtocol::disable_positive_acks_min_sample_keep_duration

8.311.3.31 disable_positive_acks_max_sample_keep_duration() [2/2]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_max_←
sample_keep_duration ( ) const
```

Getter (see setter with the same name)

8.311.3.32 disable_positive_acks_enable_adaptive_sample_keep_duration() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::disable_positive_←
acks_enable_adaptive_sample_keep_duration (
    bool disable )
```

Enables dynamic adjustment of sample keep duration in response to congestion.

For dynamic networks where a static minimum sample keep duration may not provide sufficient performance or reliability, setting **rti::core::RtpsReliableWriterProtocol::disable_positive_acks_enable_adaptive_sample_keep_duration** = true, enables the sample keep duration to be dynamically adjusted to adapt to network conditions. The keep duration changes according to the detected level of congestion, which is determined to be proportional to the rate of NACKs received. An adaptive algorithm automatically controls the keep duration to optimize throughput and reliability.

To relieve high congestion, the keep duration is increased to effectively decrease the send rate; this lengthening of the keep duration is controlled by **rti::core::RtpsReliableWriterProtocol::disable_positive_acks_increase_sample_keep_←duration_factor**. Alternatively, when congestion is low, the keep duration is decreased to effectively increase send rate; this shortening of the keep duration is controlled by **rti::core::RtpsReliableWriterProtocol::disable_positive_acks_←_decrease_sample_keep_duration_factor**.

The lower and upper bounds of the dynamic sample keep duration are set by **rti::core::RtpsReliableWriterProtocol::←disable_positive_acks_min_sample_keep_duration** and **rti::core::RtpsReliableWriterProtocol::disable_positive_acks_←_max_sample_keep_duration**, respectively.

When **rti::core::RtpsReliableWriterProtocol::disable_positive_acks_enable_adaptive_sample_keep_duration** = false, the sample keep duration is set to **rti::core::RtpsReliableWriterProtocol::disable_positive_acks_min_sample_keep_duration**.

[default] true

8.311.3.33 disable_positive_acks_enable_adaptive_sample_keep_duration() [2/2]

```
bool rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_enable_adaptive_sample_keep_duration ( ) const
```

Getter (see setter with the same name)

8.311.3.34 disable_positive_acks_decrease_sample_keep_duration_factor() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_decrease_sample_keep_duration_factor (
    int32_t factor )
```

Controls rate of contraction of dynamic sample keep duration.

Used when `rti::core::RtpsReliableWriterProtocol::disable_positive_acks_enable_adaptive_sample_keep_duration = true`.

When the adaptive algorithm determines that the keep duration should be decreased, this factor (a percentage) is multiplied with the current keep duration to get the new shorter keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 95% would result in a new keep duration of 19 milliseconds.

[default] 95

[range] <= 100

8.311.3.35 disable_positive_acks_decrease_sample_keep_duration_factor() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_decrease_sample_keep_duration_factor ( ) const
```

Getter (see setter with the same name)

8.311.3.36 disable_positive_acks_increase_sample_keep_duration_factor() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_increase_sample_keep_duration_factor (
    int32_t factor )
```

Controls rate of growth of dynamic sample keep duration.

Used when `rti::core::RtpsReliableWriterProtocol::disable_positive_acks_enable_adaptive_sample_keep_duration = true`.

When the adaptive algorithm determines that the keep duration should be increased, this factor (a percentage) is multiplied with the current keep duration to get the new longer keep duration. For example, if the current keep duration is 20 milliseconds, using the default factor of 150% would result in a new keep duration of 30 milliseconds.

[default] 150

[range] >= 100

8.311.3.37 disable_positive_acks_increase_sample_keep_duration_factor() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::disable_positive_acks_increase_sample_↔  
keep_duration_factor ( ) const
```

Getter (see setter with the same name)

8.311.3.38 min_send_window_size() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::min_send_window_size  
(  
    int32_t the_min_send_window_size )
```

Minimum size of send window of unacknowledged samples.

A **dds::pub::DataWriter** (p. 908) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (this field) and a maximum size (`max_send_window_size`). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When a variable sized send window is used (i.e., when `min_send_window_size` and `max_send_window_size` are not set to the same value) the send window is initialized to `min_send_window_size`.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] > 0, <= `max_send_window_size`, or **dds::core::LENGTH_UNLIMITED** (p. 238)

`rti::core::RtpsReliableWriterProtocol::high_watermark`

rti::core::status::ReliableWriterCacheChangedStatus::full_reliable_writer_cache (p. 1884)

8.311.3.39 min_send_window_size() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::min_send_window_size ( ) const
```

Getter (see setter with the same name)

8.311.3.40 max_send_window_size() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::max_send_window_size
(
    int32_t the_max_send_window_size )
```

Maximum size of send window of unacknowledged samples.

A **dds::pub::DataWriter** (p. 908) has a limit on the number of unacknowledged samples in-flight at a time. This send window can be configured to have a minimum size (`min_send_window_size`) and a maximum size (this field). The send window can dynamically change, between the min and max sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When a variable sized send window is used (i.e., when `min_send_window_size` and `max_send_window_size` are not set to the same value) the send window is initialized to `min_send_window_size`.

When both `min_send_window_size` and `max_send_window_size` are **dds::core::LENGTH_UNLIMITED** (p. 238), then either **dds::core::policy::ResourceLimits::max_samples** (p. 1924) (for non-batching) or **rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1007) (for batching) serves as the effective `max_send_window_size`. When **dds::core::policy::ResourceLimits::max_samples** (p. 1924) (for non-batching) or **rti::core::policy::DataWriterResourceLimits::max_batches** (p. 1007) (for batching) is less than `max_send_window_size`, then it serves as the effective `max_send_window_size`. If it is also less than `min_send_window_size`, then effectively both min and max send window sizes are equal to `max_samples` or `max_batches`.

In addition, the low and high watermarks are scaled down linearly to stay within the current send window size, and the full reliable queue status is set when the send window is full.

[default] **dds::core::LENGTH_UNLIMITED** (p. 238)

[range] > 0 , $\geq \text{min_send_window_size}$, or **dds::core::LENGTH_UNLIMITED** (p. 238)

rti::core::status::ReliableWriterCacheChangedStatus::full_reliable_writer_cache (p. 1884)

8.311.3.41 max_send_window_size() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::max_send_window_size ( ) const
```

Getter (see setter with the same name)

8.311.3.42 send_window_update_period() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::send_window_update_↔
period (
    const dds::core::Duration & the_send_window_update_period )
```

Period in which send window may be dynamically changed.

The **dds::pub::DataWriter** (p.908)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

The change in send window size happens at this update period, whereupon the send window is either increased or decreased in size according to the increase or decrease factors, respectively.

[default] The default value depends on the container policy:

- For **rti::core::policy::DataWriterProtocol::rtps_reliable_writer** (p.985): 3 seconds
- For **rti::core::policy::DiscoveryConfig::publication_writer** (p.1049): 3 seconds
- For **rti::core::policy::DiscoveryConfig::subscription_writer** (p.1051): 3 seconds
- For **rti::core::policy::DiscoveryConfig::participant_message_writer** (p.1055): 1 second

[range] > [0,1 year]

```
dds::core::Duration rti::core::policy::RtpsReliableWriterProtocol::send_window_update_period ( )
const
```

Getter (see setter with the same name)

8.311.3.44 send_window_increase_factor() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::send_window_increas↵
_factor (
    int32_t the_send_window_increase_factor )
```

Increases send window size by this percentage when reacting dynamically to network conditions.

The **dds::pub::DataWriter** (p. 908)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

After an update period during which no negative acknowledgements were received, the send window will be increased by this factor. The factor is treated as a percentage, where a factor of 150 would increase the send window by 150%. The increased send window size will not exceed the `max_send_window_size`.

[default] 105

[range] > 100

See also

```
rti::core::RtpsReliableWriterProtocol::send_window_update_period, rti::core::RtpsReliableWriterProtocol::send↵
_window_decrease_factor
```

8.311.3.45 send_window_increase_factor() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::send_window_increase_factor ( ) const
```

Getter (see setter with the same name)

8.311.3.46 send_window_decrease_factor() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::send_window_decreas↵
_factor (
    int32_t the_send_window_decrease_factor )
```

Decreases send window size by this percentage when reacting dynamically to network conditions.

The **dds::pub::DataWriter** (p. 908)'s send window will dynamically change, between the min and max send window sizes, to throttle the effective send rate in response to changing network congestion, as measured by negative acknowledgements received.

When increased network congestion causes a negative acknowledgement to be received by a writer, the send window will be decreased by this factor to throttle the effective send rate. The factor is treated as a percentage, where a factor of 80 would decrease the send window to 80% of its previous size. The decreased send window size will not be less than the `min_send_window_size`.

[default] The default value depends on the container policy:

- For `rti::core::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985): 70
- For `rti::core::policy::DiscoveryConfig::publication_writer` (p. 1049): 50
- For `rti::core::policy::DiscoveryConfig::subscription_writer` (p. 1051): 50
- For `rti::core::policy::DiscoveryConfig::participant_message_writer` (p. 1055): 50

[range] [0, 100]

`rti::core::RtpsReliableWriterProtocol::send_window_update_period`, `rti::core::RtpsReliableWriterProtocol::send_↔
_window_increase_factor`

8.311.3.47 `send_window_decrease_factor()` [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::send_window_decrease_factor ( ) const
```

Getter (see setter with the same name)

8.311.3.48 `enable_multicast_periodic_heartbeat()` [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::enable_multicast_↔  
periodic_heartbeat (   
    bool the_enable_multicast_periodic_heartbeat )
```

Whether periodic heartbeat messages are sent over multicast.

When enabled, if a reader has a multicast destination, then the writer will send its periodic HEARTBEAT messages to that destination. Otherwise, if not enabled or the reader does not have a multicast destination, the writer will send its periodic HEARTBEATS over unicast.

[default] false

8.311.3.49 `enable_multicast_periodic_heartbeat()` [2/2]

```
bool rti::core::policy::RtpsReliableWriterProtocol::enable_multicast_periodic_heartbeat ( ) const
```

Getter (see setter with the same name)

8.311.3.50 multicast_resend_threshold() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::multicast_resend_↵
threshold (
    int32_t the_multicast_resend_threshold )
```

The minimum number of requesting readers needed to trigger a multicast resend.

Given readers with multicast destinations, when a reader NACKs for samples to be resent, the writer can either resend them over unicast or multicast. In order for the writer to resend over multicast, this threshold is the minimum number of readers of the same multicast group that the writer must receive NACKs from within a single response-delay. This allows the writer to coalesce near-simultaneous unicast resends into a multicast resend. Note that a threshold of 1 means that all resends will be sent over multicast, if available.

[default] 2

[range] [\geq 1]

8.311.3.51 multicast_resend_threshold() [2/2]

```
int32_t rti::core::policy::RtpsReliableWriterProtocol::multicast_resend_threshold ( ) const
```

Getter (see setter with the same name)

8.311.3.52 disable_repair_piggyback_heartbeat() [1/2]

```
RtpsReliableWriterProtocol & rti::core::policy::RtpsReliableWriterProtocol::disable_repair_↵
piggyback_heartbeat (
    bool the_disable_repair_piggyback_heartbeat )
```

Prevents piggyback heartbeats from being sent with repair samples.

When samples are repaired, the **dds::pub::DataWriter** (p. 908) resends `rti::core::RtpsReliableWriterProtocol::max_↵ bytes_per_nack_response` bytes and a piggyback heartbeat with each message. You can configure the **dds::pub::↵ DataWriter** (p. 908) to not send the piggyback heartbeat and instead rely on the `rti::core::RtpsReliableWriterProtocol↵ ::late_joiner_heartbeat_period` to control the throughput used to repair samples. This field is mutable only for `rti::core↵ ::policy::DataWriterProtocol::rtps_reliable_writer` (p. 985). **[default]** false

8.311.3.53 disable_repair_piggyback_heartbeat() [2/2]

```
bool rti::core::policy::RtpsReliableWriterProtocol::disable_repair_piggyback_heartbeat ( ) const
```

8.313.1 Detailed Description

<<*extension*>> (p. 156) Configures the mapping of the RTPS well-known ports

RTI Connex uses the RTPS wire protocol. The discovery protocols defined by RTPS rely on well-known ports to initiate discovery. These well-known ports define the multicast and unicast ports on which a Participant will listen for discovery **metatraffic** from other Participants. The discovery metatraffic contains all the information required to establish the presence of remote DDS entities in the network.

The well-known ports are defined by RTPS in terms of port mapping expressions with several tunable parameters, which allow you to customize what network ports are used by RTI Connex. These parameters are exposed in **rti::core::RtpsWellKnownPorts** (p. 1965). In order for all Participants in a system to correctly discover each other, it is important that they all use the same port mapping expressions.

The actual port mapping expressions, as defined by the RTPS specification, can be found below. In addition to the parameters listed in **rti::core::RtpsWellKnownPorts** (p. 1965), the port numbers depend on:

- `domain_id`, as specified in **dds::domain::DomainParticipant()** (p. 1079)
- `participant_id`, as specified using **rti::core::policy::WireProtocol::participant_id** (p. 2336)

The `domain_id` parameter ensures no port conflicts exist between Participants belonging to different domains. This also means that discovery metatraffic in one domain is not visible to Participants in a different domain. The `participant_id` parameter ensures that unique unicast port numbers are assigned to Participants belonging to the same domain on a given host.

The `metatraffic_unicast_port` is used to exchange discovery metatraffic using unicast.

$$\text{metatraffic_unicast_port} = \text{port_base} + (\text{domain_id_gain} * \text{domain_id}) + (\text{participant_id_gain} * \text{participant_id}) + b$$

The `metatraffic_multicast_port` is used to exchange discovery metatraffic using multicast. The corresponding multicast group addresses are specified via **rti::core::policy::Discovery::multicast_receive_addresses** (p. 1032) on a **dds::domain::DomainParticipant** (p. 1079) entity.

$$\text{metatraffic_multicast_port} = \text{port_base} + (\text{domain_id_gain} * \text{domain_id}) + \text{builtin_multicast_port_offset}$$

RTPS also defines the *default* multicast and unicast ports on which DataReaders and DataWriters receive **usertraffic**. These default ports can be overridden using the **rti::core::policy::TransportMulticast** (p. 2247), **rti::core::policy::TransportUnicast** (p. 2259), or by the **rti::core::policy::TransportUnicast** (p. 2259) QoS policies.

The `usertraffic_unicast_port` is used to exchange user data using unicast.

$$\text{usertraffic_unicast_port} = \text{port_base} + (\text{domain_id_gain} * \text{domain_id}) + (\text{participant_id_gain} * \text{participant_id}) + u$$

The `usertraffic_multicast_port` is used to exchange user data using multicast. The corresponding multicast group addresses can be configured using **rti::core::policy::TransportMulticast** (p. 2247).

$$\text{usertraffic_multicast_port} = \text{port_base} + (\text{domain_id_gain} * \text{domain_id}) + \text{user_multicast_port_offset}$$

By default, the port mapping parameters are configured to compliant with OMG's DDS Interoperability Wire Protocol (see also `rti::core::RtpsWellKnownPorts::Interoperable()` (p. 348)).

The OMG's DDS Interoperability Wire Protocol compliant port mapping parameters are *not* backwards compatible with previous versions of the RTI Connex middleware.

When modifying the port mapping parameters, care must be taken to avoid port aliasing. This would result in undefined discovery behavior. The chosen parameter values will also determine the maximum possible number of domains in the system and the maximum number of participants per domain. Additionally, any resulting mapped port number must be within the range imposed by the underlying transport. For example, for UDPv4, this range typically equals [1024 - 65535].

Note: On Windows, you should avoid using ports 49152 through 65535 for inbound traffic. RTI Connex's ephemeral ports (see "Ports Used for Communication" in the *User's Manual*) may be within that range (see [https://msdn.microsoft.com/en-us/library/windows/desktop/ms737550\(v=vs.85\).aspx](https://msdn.microsoft.com/en-us/library/windows/desktop/ms737550(v=vs.85).aspx)). With the default `RtpsWellKnownPorts` (p. 1965) settings, port 49152 corresponds to domain ID 167, so using domain IDs 168 through 232 on Windows introduces the risk of a port collision and failure to create the Domain Participant when using multicast discovery. You may see this error:

RTIOsapiSocket_bindWithIP:OS bind() failure, error 0X271D: An attempt was made to access a socket in a way forbidden by its access permissions.

QoS:

`rti::core::policy::WireProtocol` (p. 2331)

8.313.2 Constructor & Destructor Documentation

8.313.2.1 `RtpsWellKnownPorts()` [1/2]

```
rti::core::RtpsWellKnownPorts::RtpsWellKnownPorts ( ) [inline]
```

Creates an instance that contains the default RTPS well-known ports.

8.313.2.2 `RtpsWellKnownPorts()` [2/2]

```
rti::core::RtpsWellKnownPorts::RtpsWellKnownPorts (
    int32_t the_port_base,
    int32_t the_domain_id_gain,
    int32_t the_participant_id_gain,
    int32_t the_builtin_multicast_port_offset,
    int32_t the_builtin_unicast_port_offset,
    int32_t the_user_multicast_port_offset,
    int32_t the_user_unicast_port_offset ) [inline]
```

Creates an instance with the specified ports.

See individual setters.

8.313.3 Member Function Documentation

8.313.3.1 port_base() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::port_base ( ) const [inline]
```

Getter (see setter with the same name)

8.313.3.2 port_base() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::port_base (
    int32_t the_port_base ) [inline]
```

The base port offset.

All mapped well-known ports are offset by this value.

[default] 7400

[range] [≥ 1], but resulting ports must be within the range imposed by the underlying transport.

8.313.3.3 domain_id_gain() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::domain_id_gain ( ) const [inline]
```

Getter (see setter with the same name)

8.313.3.4 domain_id_gain() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::domain_id_gain (
    int32_t the_domain_id_gain ) [inline]
```

Tunable domain gain parameter.

Multiplier of the `domain_id`. Together with `participant_id_gain`, it determines the highest `domain_id` and `participant_id` allowed on this network.

In general, there are two ways to setup `domain_id_gain` and `participant_id_gain` parameters.

If `domain_id_gain > participant_id_gain`, it results in a port mapping layout where all `dds::domain::DomainParticipant` (p. 1079) instances within a single domain occupy a consecutive range of `domain_id_gain` ports. Precisely, all ports occupied by the domain fall within:

$$(\text{port_base} + (\text{domain_id_gain} * \text{domain_id}))$$

and:

$$(\text{port_base} + (\text{domain_id_gain} * (\text{domain_id} + 1)) - 1)$$

Under such a case, the highest `domain_id` is limited only by the underlying transport's maximum port. The highest `participant_id`, however, must satisfy:

$$\text{max_participant_id} < (\text{domain_id_gain} / \text{participant_id_gain})$$

On the contrary, if `domain_id_gain <= participant_id_gain`, it results in a port mapping layout where a given domain's `dds::domain::DomainParticipant` (p. 1079) instances occupy ports spanned across the entire valid port range allowed by the underlying transport. For instance, it results in the following potential mapping:

Mapped Port	Domain Id	Participant ID
higher port number	Domain Id = 1	Participant ID = 2
	Domain Id = 0	Participant ID = 2
	Domain Id = 1	Participant ID = 1
	Domain Id = 0	Participant ID = 1
	Domain Id = 1	Participant ID = 0
lower port number	Domain Id = 0	Participant ID = 0

Under this case, the highest `participant_id` is limited only by the underlying transport's maximum port. The highest `domain_id`, however, must satisfy:

```
max_domain_id < (participant_id_gain / domain_id_gain)
```

Additionally, `domain_id_gain` also determines the range of the port-specific offsets.

```
domain_id_gain > abs(builtin_multicast_port_offset - user_multicast_port_offset)
```

```
domain_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

Violating this may result in port aliasing and undefined discovery behavior.

[default] 250

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

8.313.3.5 `participant_id_gain()` [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::participant_id_gain ( ) const [inline]
```

Getter (see setter with the same name)

8.313.3.6 `participant_id_gain()` [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::participant_id_gain (
    int32_t the_participant_id_gain ) [inline]
```

Tunable participant gain parameter.

Multiplier of the `participant_id`. See `rti::core::RtpsWellKnownPorts::domain_id_gain` (p. 1969) for its implications on the highest `domain_id` and `participant_id` allowed on this network.

Additionally, `participant_id_gain` also determines the range of `builtin_unicast_port_offset` and `user_unicast_port_offset`.

```
participant_id_gain > abs(builtin_unicast_port_offset - user_unicast_port_offset)
```

[default] 2

[range] [> 0], but resulting ports must be within the range imposed by the underlying transport.

8.313.3.7 builtin_multicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::builtin_multicast_port_offset ( ) const [inline]
```

Getter (see setter with the same name)

8.313.3.8 builtin_multicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::builtin_multicast_port_offset (
    int32_t the_builtin_multicast_port_offset ) [inline]
```

Additional offset for **metatraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 0

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

8.313.3.9 builtin_unicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::builtin_unicast_port_offset ( ) const [inline]
```

Getter (see setter with the same name)

8.313.3.10 builtin_unicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::builtin_unicast_port_offset (
    int32_t the_builtin_unicast_port_offset ) [inline]
```

Additional offset for **metatraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 10

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

8.313.3.11 user_multicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::user_multicast_port_offset ( ) const [inline]
```

Getter (see setter with the same name)

8.313.3.12 user_multicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::user_multicast_port_offset (
    int32_t the_user_multicast_port_offset ) [inline]
```

Additional offset for **usertraffic** multicast port.

It must be unique from other port-specific offsets.

[default] 1

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

8.313.3.13 user_unicast_port_offset() [1/2]

```
int32_t rti::core::RtpsWellKnownPorts::user_unicast_port_offset ( ) const [inline]
```

Getter (see setter with the same name)

8.313.3.14 user_unicast_port_offset() [2/2]

```
RtpsWellKnownPorts & rti::core::RtpsWellKnownPorts::user_unicast_port_offset (
    int32_t the_user_unicast_port_offset ) [inline]
```

Additional offset for **usertraffic** unicast port.

It must be unique from other port-specific offsets.

[default] 11

[range] [≥ 0], but resulting ports must be within the range imposed by the underlying transport.

8.314 dds::core::safe_enum< def, inner > Class Template Reference

<<**value-type**>> (p. 152) Provides a safe, scoped enumeration based on def::type

```
#include <SafeEnumeration.hpp>
```

Inherits def.

Public Types

- typedef inner **inner_enum**

Public Member Functions

- **safe_enum** ()
Initializes the enumeration to zero.
- **safe_enum** (**inner_enum** v)
Copy constructor.
- **inner_enum underlying** () const
Retrieves the actual `enum` value.
- bool **operator==** (const **safe_enum** &s) const
Applies operator to underlying enumeration value.
- bool **operator!=** (const **safe_enum** &s) const
Applies operator to underlying enumeration value.
- bool **operator<** (const **safe_enum** &s) const
Applies operator to underlying enumeration value.
- bool **operator<=** (const **safe_enum** &s) const
Applies operator to underlying enumeration value.
- bool **operator>** (const **safe_enum** &s) const
Applies operator to underlying enumeration value.
- bool **operator>=** (const **safe_enum** &s) const
Applies operator to underlying enumeration value.

Friends

- void **swap** (**safe_enum** &left, **safe_enum** &right) **OMG_NOEXCEPT**
Swaps the enumeration values.

Related Functions

(Note that these are not member functions.)

- `template<typename def, typename inner >`
`std::ostream & operator<< (std::ostream &out, const safe_enum< def, inner > &the_enum)`
Applies `operator<<` to the underlying enum.

8.314.1 Detailed Description

```
template<typename def, typename inner = typename def::type>
class dds::core::safe_enum< def, inner >
```

<< **value-type** >> (p. 152) Provides a safe, scoped enumeration based on `def::type`

The purpose of this class is to provide a C++11-style enum class, where the enumeration constants are scoped.

Template Parameters

<i>def</i>	A struct containing the actual enumeration, <code>def::type</code>
------------	--

See for example `dds::core::policy::ReliabilityKind` (p.335). The actual enumeration is in `dds::core::policy::ReliabilityKind_def` (p. 1879), but the application only needs to use the former:

```
using dds::core::policy::ReliabilityKind;
ReliabilityKind kind = ReliabilityKind::RELIABLE;
```

A `safe_enum` (p. 1972) can be converted to and from an integer.

To convert to an integer, use the member function `underlying()` (p. 1975):

```
ReliabilityKind reliability = ReliabilityKind::RELIABLE;
int reliability_as_int = reliability.underlying();
```

To convert from an integer, `static_cast` it to the member type `inner_enum`:

```
int reliability_as_int = 2;
ReliabilityKind reliability = static_cast<ReliabilityKind::inner_enum>(reliability_as_int);
```

8.314.2 Member Typedef Documentation

8.314.2.1 inner_enum

```
template<typename def , typename inner = typename def::type>
typedef inner dds::core::safe_enum< def, inner >::inner_enum
```

The underlying enum type

To convert from an integer, `static_cast` it to the member type `inner_enum`:

```
int reliability_as_int = 2;
ReliabilityKind reliability = static_cast<ReliabilityKind::inner_enum>(reliability_as_int);
```

8.314.3 Constructor & Destructor Documentation

8.314.3.1 safe_enum() [1/2]

```
template<typename def , typename inner = typename def::type>
dds::core::safe_enum< def, inner >::safe_enum ( ) [inline]
```

Initializes the enumeration to zero.

Note

Zero may not be a valid enumerator. It's best to assign a valid enumerator whenever possible:

```
Reliability reliability = Reliability::RELIABLE;
```

8.314.3.2 safe_enum() [2/2]

```
template<typename def , typename inner = typename def::type>
dds::core::safe_enum< def, inner >::safe_enum (
    inner_enum v ) [inline]
```

Copy constructor.

8.314.4 Member Function Documentation

8.314.4.1 underlying()

```
template<typename def , typename inner = typename def::type>
inner_enum dds::core::safe_enum< def, inner >::underlying ( ) const [inline]
```

Retrieves the actual enum value.

Referenced by `dds::core::safe_enum< def, inner >::operator<<()`.

8.314.4.2 operator==()

```
template<typename def , typename inner = typename def::type>
bool dds::core::safe_enum< def, inner >::operator== (
    const safe_enum< def, inner > & s ) const [inline]
```

Applies operator to underlying enumeration value.

8.314.4.3 operator!=()

```
template<typename def , typename inner = typename def::type>
bool dds::core::safe_enum< def, inner >::operator!= (
    const safe_enum< def, inner > & s ) const [inline]
```

Applies operator to underlying enumeration value.

8.314.4.4 operator<>()

```
template<typename def , typename inner = typename def::type>
bool dds::core::safe_enum< def, inner >::operator< (
    const safe_enum< def, inner > & s ) const [inline]
```

Applies operator to underlying enumeration value.

8.314.4.5 operator<=>()

```
template<typename def , typename inner = typename def::type>
bool dds::core::safe_enum< def, inner >::operator<= (
    const safe_enum< def, inner > & s ) const [inline]
```

Applies operator to underlying enumeration value.

8.314.4.6 operator>()

```
template<typename def , typename inner = typename def::type>
bool dds::core::safe_enum< def, inner >::operator> (
    const safe_enum< def, inner > & s ) const [inline]
```

Applies operator to underlying enumeration value.

8.314.4.7 operator>=()

```
template<typename def , typename inner = typename def::type>
bool dds::core::safe_enum< def, inner >::operator>= (
    const safe_enum< def, inner > & s ) const [inline]
```

Applies operator to underlying enumeration value.

8.314.5 Friends And Related Function Documentation

8.314.5.1 swap

```
template<typename def , typename inner = typename def::type>
void swap (
    safe_enum< def, inner > & left,
    safe_enum< def, inner > & right ) [friend]
```

Swaps the enumeration values.

8.314.5.2 operator<<()

```
template<typename def , typename inner >
std::ostream & operator<< (
    std::ostream & out,
    const safe_enum< def, inner > & the_enum ) [related]
```

Applies operator<< to the underlying enum.

References `dds::core::safe_enum< def, inner >::underlying()`.

8.315 dds::sub::Sample< T > Class Template Reference

<<*value-type*>> (p. 152) This class encapsulate the data and meta-data associated with DDS samples.

```
#include "dds/sub/Sample.hpp"
```

Public Member Functions

8.315.1 Detailed Description

```
template<typename T>
class dds::sub::Sample< T >
```

<<**value-type**>> (p. 152) This class encapsulate the data and meta-data associated with DDS samples.

Template Parameters

<i>The</i>	type of the data that Sample (p. 1977) represents
------------	--

8.315.2 Constructor & Destructor Documentation

8.315.2.1 Sample() [1/4]

```
template<typename T >
dds::sub::Sample< T >::Sample ( ) [default]
```

Create a sample.

Postcondition

The value of **data()** (p. 1979) is default-constructed, and **info()** (p. 1980).valid() is false.

8.315.2.2 Sample() [2/4]

```
template<typename T >
dds::sub::Sample< T >::Sample (
    const T & the_data,
    const SampleInfo & the_info ) [inline]
```

Create a **Sample** (p. 1977) with the provided data and **SampleInfo** (p. 1992).

Parameters

<i>the_data</i>	The data to create the Sample (p. 1977) with
<i>the_info</i>	The SampleInfo (p. 1992) to create the Sample (p. 1977) with

8.315.2.3 Sample() [3/4]

```
template<typename T >
dds::sub::Sample< T >::Sample (
    const rti::sub::LoanedSample< T > & loaned_sample ) [inline], [explicit]
```

<<**extension**>> (p. 156) Construct a **Sample** (p. 1977) from a **LoanedSample**

If `loaned_sample.info().valid()` is false, this sample's data value is default-constructed.

8.315.2.4 Sample() [4/4]

```
template<typename T >
dds::sub::Sample< T >::Sample (
    const Sample< T > & other ) [default]
```

Copy constructor.

8.315.3 Member Function Documentation

8.315.3.1 operator=() [1/2]

```
template<typename T >
Sample & dds::sub::Sample< T >::operator= (
    const Sample< T > & other ) [default]
```

Copy assignment operator.

8.315.3.2 data() [1/2]

```
template<typename T >
const DataType & dds::sub::Sample< T >::data ( ) const [inline]
```

Get the data of type T associated with this **Sample** (p. 1977).

This function returns the current value of the data even if **info()** (p. 1980).`valid()` is false.

8.315.3.3 data() [2/2]

```
template<typename T >
void dds::sub::Sample< T >::data (
    const DataType & the_data ) [inline]
```

Set the data of type T associated with this **Sample** (p. 1977).

8.315.3.4 info() [1/2]

```
template<typename T >
const SampleInfo & dds::sub::Sample< T >::info ( ) const [inline]
```

Get the **SampleInfo** (p. 1992) associated with this **Sample** (p. 1977).

Referenced by **rti::request::IsReplyRelatedPredicate< T >::operator()**.

8.315.3.5 info() [2/2]

```
template<typename T >
void dds::sub::Sample< T >::info (
    const SampleInfo & the_info ) [inline]
```

Set the **SampleInfo** (p. 1992) associated with this **Sample** (p. 1977).

8.315.3.6 operator=() [2/2]

```
template<typename T >
Sample & dds::sub::Sample< T >::operator= (
    const rti::sub::LoanedSample< T > & loaned_sample ) [inline]
```

<<**extension**>> (p. 156) Assignment operator from an **rti::sub::LoanedSample** (p. 1402)

This operator allows obtaining a copy of both the data and the info from a **LoanedSample**.

Postcondition

If `loaned_sample.info().valid()` is false, this sample's **data()** (p. 1979) value is not modified, but **info()** (p. 1980).`valid()` is false.

8.316 rti::flat::Sample< OffsetType > Class Template Reference

The generic definition of FlatData topic-types.

```
#include <FlatSample.hpp>
```

Inherits rti::flat::SampleBase.

Public Types

- typedef OffsetType **Offset**
The related Offset type.
- typedef OffsetType::ConstOffset **ConstOffset**
The related read-only Offset type.

Public Member Functions

- **Offset** root ()
Provides the Offset to the top-level type.
- **ConstOffset** root () const
Provides the Offset to the top-level type.
- **Sample**< OffsetType > * **clone** () const
*Clones a **Sample** (p. 1981), creating an unmanaged **Sample** (p. 1981).*

Static Public Member Functions

- static **Sample**< OffsetType > * **create_data** ()
*Creates an unmanaged FlatData **Sample** (p. 1981).*
- static void **delete_data** (rti::flat::Sample< OffsetType > *sample)
*Releases an unmanaged **Sample** (p. 1981).*

8.316.1 Detailed Description

```
template<typename OffsetType>
class rti::flat::Sample< OffsetType >
```

The generic definition of FlatData topic-types.

Template Parameters

<i>OffsetType</i>	The Offset to the beginning of the data Sample (p. 1981) (the root), for example MyFlatFinalOffset (p. 1493), or MyFlatMutableOffset (p. 1504).
-------------------	--

For a FlatData IDL type, **rtiddsgen** generates an instantiation of this class, such as `MyFlatFinal` or `MyFlatMutable`. That's the **topic-type** used to declare a `dds::topic::Topic` (p. 2178) and write or read FlatData samples.

A FlatData **Sample** (p. 1981) owns an inline buffer that contains the serialized data. To access the **Sample** (p. 1981) data members we use **Offsets** (p. 214), iterators that point to the position of a member in the **Sample** (p. 1981) buffer. The **root()** (p. 1983) is the Offset to the top-level element (for example `MyFlatMutableOffset` (p. 1504)). From there `MyFlatMutableOffset` (p. 1504)'s member functions provide access to its members.

The method to create a **Sample** (p. 1981) varies depending on whether the type is final or mutable.

Samples of **final** FlatData types always have the same size, and can be obtained directly with `dds::pub::DataWriter< >::get_loan()` (p. 953).

Samples of **mutable** FlatData types need to be "built" using the Builder returned by `rti::flat::build_data()` (p. 211) (`MyFlatMutableBuilder` (p. 1497) in this example). A Builder allows adding each member individually in any order, and sizing sequences as needed.

See **Publishing FlatData** (p. 220) for code snippets.

Samples created with `dds::pub::DataWriter::get_loan()` (p. 953) or `rti::flat::build_data()` (p. 211) are DataWriter-managed and do not need to be explicitly deleted. See `dds::pub::DataWriter::get_loan()` (p. 953) for an explanation of the lifecycle of DataWriter-managed samples.

Samples received with a `dds::sub::DataReader` (p. 756) can be examined by obtaining the **root()** (p. 1983), but cannot be modified. See **Subscribing to FlatData** (p. 221).

FlatData samples are not value types. They don't provide copy constructors or assignment operators, because of their definition as an inline buffer that contains the serialized **Sample** (p. 1981) at all times. A **Sample** (p. 1981) can be cloned with the static function `clone()` (p. 1984). A cloned **Sample** (p. 1981) is unmanaged and has to be deleted with the static function `delete_data()` (p. 1984).

8.316.2 Member Typedef Documentation

8.316.2.1 Offset

```
template<typename OffsetType >
typedef OffsetType rti::flat::Sample< OffsetType >::Offset
```

The related Offset type.

This is the template parameter, OffsetType

8.316.2.2 ConstOffset

```
template<typename OffsetType >
typedef OffsetType::ConstOffset rti::flat::Sample< OffsetType >::ConstOffset
```

The related read-only Offset type.

For example, `MyFlatMutableOffset::ConstOffset` (p. 1505).

8.316.3 Member Function Documentation

8.316.3.1 root() [1/2]

```
template<typename OffsetType >
Offset rti::flat::Sample< OffsetType >::root ( ) [inline]
```

Provides the Offset to the top-level type.

Returns

An Offset that allows reading and modifying the members of this **Sample** (p. 1981), for example **MyFlatFinalOffset** (p. 1493) or **MyFlatMutableOffset** (p. 1504).

This overload allows modifying the **Sample** (p. 1981).

Example:

```
MyFlatFinal *my_sample = ...; // for example, created with DataWriter::get_loan()
MyFlatFinalOffset my_sample_root = my_sample->root();
my_sample_root.my_primitive(33);
auto my_member_offset = my_sample_root.my_complex();
// ... modify my_member_offset
```

8.316.3.2 root() [2/2]

```
template<typename OffsetType >
ConstOffset rti::flat::Sample< OffsetType >::root ( ) const [inline]
```

Provides the Offset to the top-level type.

Returns

An Offset that allows reading the members of this **Sample** (p. 1981). For example, **MyFlatFinalOffset::ConstOffset** (p. 1494) or **MyFlatMutableOffset::ConstOffset** (p. 1505).

This overload doesn't allow modifying the **Sample** (p. 1981).

Example:

```
const MyFlatMutable *my_sample = ...; // for example, read from a DataReader
MyFlatMutableOffset::ConstOffset my_sample_root = my_sample->root();
std::cout << my_sample_root.my_primitive() << std::endl;
auto my_member_offset = my_sample_root.my_mutable_seq();
// ... read my_member_offset
```

8.316.3.3 create_data()

```
template<typename OffsetType >
Sample< OffsetType > * rti::flat::Sample< OffsetType >::create_data [static]
```

Creates an unmanaged FlatData **Sample** (p. 1981).

Note

In general on the publication side it is recommended to create DataWriter-managed samples using **dds::pub::DataWriter::get_loan** (p. 953) (for final types) and **rti::flat::build_data**(p. 211) (for mutable types).

If the topic-type is final, the returned **Sample** (p. 1981) can be initialized by obtaining the **root**() (p. 1983).

If the topic-type is mutable, the resulting **Sample** (p. 1981) has no members, and **root**() (p. 1983) returns a **null** (p. 1607) Offset. The result of **create_data**(p. 1983) must be used to create a Builder. This is a rare use case, and **rti::flat::build_data**(p. 211) should be used in most situations.

In all cases, the returned **Sample** (p. 1981) must be explicitly deleted with **delete_data**(p. 1984).

8.316.3.4 clone()

```
template<typename OffsetType >
Sample< OffsetType > * rti::flat::Sample< OffsetType >::clone ( ) const [inline]
```

Clones a **Sample** (p. 1981), creating an unmanaged **Sample** (p. 1981).

Warning

When this **Sample** (p. 1981) has been created with **dds::pub::DataWriter::get_loan** (p. 953) or **rti::flat::build_data**(p. 211), the clone this function creates cannot be used in **dds::pub::DataWriter::write**(p. 918), because the DataWriter is managing the lifecycle of its samples.

Creates a new **Sample** (p. 1981) and copies the underlying serialized buffer.

delete_data(p. 1984) must be called to release the **Sample** (p. 1981).

8.316.3.5 delete_data()

```
template<typename OffsetType >
static void rti::flat::Sample< OffsetType >::delete_data (
    rti::flat::Sample< OffsetType > * sample ) [inline], [static]
```

Releases an unmanaged **Sample** (p. 1981).

Unmanaged samples are those created with **create_data**(p. 1983) or **clone**(p. 1984).

Precondition

`sample` cannot have been created with **dds::pub::DataWriter::get_loan** (p. 953) or **rti::flat::build_data**(p. 211).

Postcondition

`sample` becomes invalid and shouldn't be used

8.317 rti::core::SampleFlag Class Reference

<<*extension*>> (p. 156) A set of flags that can be associated with a sample.

```
#include "rti/core/SampleFlag.hpp"
```

Inherits `std::bitset< 32 >`.

Public Types

- typedef `std::bitset< 32 >` **MaskType**
A typedef of `std::bitset<32>` for convenience.

Public Member Functions

- **SampleFlag** ()
*Construct an empty **SampleFlag** (p. 1985) with no bits set.*
- **SampleFlag** (uint64_t mask)
*Construct a **SampleFlag** (p. 1985) from an integer.*
- **SampleFlag** (const **MaskType** &mask)
*Construct a **SampleFlag** (p. 1985) from a **MaskType** object.*

Static Public Member Functions

- static const **SampleFlag** **redelivered** ()
Indicates that a sample has been redelivered by RTI Queuing Service.
- static const **SampleFlag** **intermediate_reply_sequence** ()
Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connex Repliers sending multiple responses for a request.
- static const **SampleFlag** **replicate** ()
Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.
- static const **SampleFlag** **last_shared_reader_queue** ()
Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.
- static const **SampleFlag** **intermediate_topic_query_sample** ()
Indicates that a sample for a TopicQuery will be followed by more samples.
- static const **SampleFlag** **writer_removed_batch_sample** ()
This flag will be set if a sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed.
- static const **SampleFlag** **discovery_service_sample** ()
This flag will be set if the sample was sent by Cloud Discovery Service.

8.317.1 Detailed Description

<<*extension*>> (p. 156) A set of flags that can be associated with a sample.

A set of flags that can be associated with a sample.

- Least-significant bits [0-7] are reserved by RTI
- Least-significant bits [8-15] are application specific
- Least-significant bits [16-31] are invalid and cannot be used

8.317.2 Member Typedef Documentation

8.317.2.1 MaskType

```
typedef std::bitset<32> rti::core::SampleFlag::MaskType
```

A typedef of `std::bitset<32>` for convenience.

8.317.3 Constructor & Destructor Documentation

8.317.3.1 SampleFlag() [1/3]

```
rti::core::SampleFlag::SampleFlag ( ) [inline]
```

Construct an empty **SampleFlag** (p. 1985) with no bits set.

8.317.3.2 SampleFlag() [2/3]

```
rti::core::SampleFlag::SampleFlag (
    uint64_t mask ) [inline], [explicit]
```

Construct a **SampleFlag** (p. 1985) from an integer.

Parameters

<i>mask</i>	Value whose bits are copied to the bitset positions
-------------	---

8.317.3.3 SampleFlag() [3/3]

```
rti::core::SampleFlag::SampleFlag (  
    const MaskType & mask ) [inline]
```

Construct a **SampleFlag** (p. 1985) from a **MaskType** object.

Parameters

<i>mask</i>	A std::bitset<32> to construct this SampleFlag (p. 1985) from
-------------	--

8.317.4 Member Function Documentation

8.317.4.1 redelivered()

```
static const SampleFlag rti::core::SampleFlag::redelivered ( ) [inline], [static]
```

Indicates that a sample has been redelivered by RTI Queuing Service.

8.317.4.2 intermediate_reply_sequence()

```
static const SampleFlag rti::core::SampleFlag::intermediate_reply_sequence ( ) [inline], [static]
```

Indicates that a response sample is not the last response sample for a given request. This bit is usually set by Connex Repliers sending multiple responses for a request.

8.317.4.3 replicate()

```
static const SampleFlag rti::core::SampleFlag::replicate ( ) [inline], [static]
```

Indicates if a sample must be broadcast by one RTI Queuing Service replica to other replicas.

8.317.4.4 last_shared_reader_queue()

```
static const SampleFlag rti::core::SampleFlag::last_shared_reader_queue ( ) [inline], [static]
```

Indicates that a sample is the last sample in a SharedReaderQueue for a QueueConsumer DataReader.

8.317.4.5 intermediate_topic_query_sample()

```
static const SampleFlag rti::core::SampleFlag::intermediate_topic_query_sample ( ) [inline], [static]
```

Indicates that a sample for a TopicQuery will be followed by more samples.

This flag only applies to samples that have been published as a response to a **rti::sub::TopicQuery** (p. 2220).

When this bit is not set and **dds::sub::SampleInfo::topic_query_guid** (p. 2001) is different from **rti::core::Guid**↔**::unknown()** (p. 1341), this sample is the last sample for that TopicQuery coming from the DataWriter identified by **dds::sub::SampleInfo::original_publication_virtual_guid** (p. 1998).

8.317.4.6 writer_removed_batch_sample()

```
static const SampleFlag rti::core::SampleFlag::writer_removed_batch_sample ( ) [inline], [static]
```

This flag will be set if a sample was accepted into the DataReader queue even though it was marked by the DataWriter as removed.

A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the KEEP_LAST↔HISTORY_QOS QoS or because the duration in LifespanQosPolicy was reached.

If the DataReader sets the property "dds.data_reader.accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.

A sample can be marked as removed by the DataWriter in a batch when it is replaced due to the dds::core::policy::↔HistoryKind::KEEP_LAST **dds::core::policy::History** (p. 1346) QoS or because the duration in **dds::core::policy::↔Lifespan** (p. 1379) was reached.

If the DataReader sets the property "dds.data_reader.accept_writer_removed_batch_samples" to true, the removed sample will be accepted into the DataReader queue and this flag will be set.

8.317.4.7 discovery_service_sample()

```
static const SampleFlag rti::core::SampleFlag::discovery_service_sample ( ) [inline], [static]
```

This flag will be set if the sample was sent by Cloud Discovery Service.

The samples sent by Cloud Discovery Service are participant announcement samples on the ParticipantBuiltinTopic.

8.318 rti::core::SampleIdentity Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A **SampleIdentity** (p. 1989) defines a pair (Virtual Writer **Guid** (p. 1340), **SequenceNumber** (p. 2042)) that uniquely identifies a sample within a DDS domain and a Topic.

```
#include "rti/core/SampleIdentity.hpp"
```

Public Member Functions

- **SampleIdentity** ()
*Create a default **SampleIdentity** (p. 1989) object.*
- **SampleIdentity** (const **Guid** &the_writer_guid, const **SequenceNumber** &the_sequence_number)
*Create a **SampleIdentity** (p. 1989) with the provided **Guid** (p. 1340) and **SequenceNumber** (p. 2042).*
- const **Guid** & writer_guid () const
*Get the 16-byte identifier identifying the virtual **Guid** (p. 1340).*
- **Guid** & writer_guid ()
*Get the 16-byte identifier identifying the virtual **Guid** (p. 1340).*
- const **SequenceNumber** & sequence_number () const
*Get the monotonically increasing 64-bit **SequenceNumber** (p. 2042) that identifies the sample in the data source.*
- **SequenceNumber** & sequence_number ()
*Get the monotonically increasing 64-bit **SequenceNumber** (p. 2042) that identifies the sample in the data source.*

Static Public Member Functions

- static **SampleIdentity** automatic ()
Special value to indicate that RTI Connnext will automatically assign the identity of a sample.
- static **SampleIdentity** unknown ()
An invalid or unknown sample identity.

Related Functions

(Note that these are not member functions.)

- std::ostream & **operator**<< (std::ostream &out, const **SampleIdentity** &sid)
*Prints a **SampleIdentity** (p. 1989) to an output stream.*

8.318.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A **SampleIdentity** (p. 1989) defines a pair (Virtual Writer **Guid** (p. 1340), **SequenceNumber** (p. 2042)) that uniquely identifies a sample within a DDS domain and a Topic.

8.318.2 Constructor & Destructor Documentation

8.318.2.1 SampleIdentity() [1/2]

```
rti::core::SampleIdentity::SampleIdentity ( ) [inline]
```

Create a default **SampleIdentity** (p. 1989) object.

8.318.2.2 SampleIdentity() [2/2]

```
rti::core::SampleIdentity::SampleIdentity (
    const Guid & the_writer_guid,
    const SequenceNumber & the_sequence_number ) [inline]
```

Create a **SampleIdentity** (p. 1989) with the provided **Guid** (p. 1340) and **SequenceNumber** (p. 2042).

Parameters

<i>the_writer_guid</i>	The Guid (p. 1340) to create the SampleIdentity (p. 1989) with
<i>the_sequence_number</i>	The SequenceNumber (p. 2042) to create the SampleIdentity (p. 1989) with

8.318.3 Member Function Documentation

8.318.3.1 writer_guid() [1/2]

```
const Guid & rti::core::SampleIdentity::writer_guid ( ) const [inline]
```

Get the 16-byte identifier identifying the virtual **Guid** (p. 1340).

8.318.3.2 writer_guid() [2/2]

```
Guid & rti::core::SampleIdentity::writer_guid ( ) [inline]
```

Get the 16-byte identifier identifying the virtual **Guid** (p. 1340).

8.318.3.3 sequence_number() [1/2]

```
const SequenceNumber & rti::core::SampleIdentity::sequence_number ( ) const [inline]
```

Get the monotonically increasing 64-bit **SequenceNumber** (p. 2042) that identifies the sample in the data source.

8.318.3.4 sequence_number() [2/2]

```
SequenceNumber & rti::core::SampleIdentity::sequence_number ( ) [inline]
```

Get the monotonically increasing 64-bit **SequenceNumber** (p. 2042) that identifies the sample in the data source.

8.318.3.5 automatic()

```
static SampleIdentity rti::core::SampleIdentity::automatic ( ) [inline], [static]
```

Special value to indicate that RTI Connex will automatically assign the identity of a sample.

8.318.3.6 unknown()

```
static SampleIdentity rti::core::SampleIdentity::unknown ( ) [inline], [static]
```

An invalid or unknown sample identity.

8.318.4 Friends And Related Function Documentation

8.318.4.1 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const SampleIdentity & sid ) [related]
```

Prints a **SampleIdentity** (p. 1989) to an output stream.

8.319 dds::sub::SampleInfo Class Reference

<< **value-type** >> (p. 152) Information that accompanies each sample received by a **DataReader** (p. 756)

```
#include "dds/sub/SampleInfo.hpp"
```

Public Member Functions

- **dds::core::Time source_timestamp () const**
Get the timestamp when the sample was written by a DataWriter.
- **dds::sub::status::DataState state () const**
*Get the **dds::sub::status::DataState** (p. 888) of the sample.*
- **dds::sub::GenerationCount generation_count () const**

 - `<<extension>>` (p. 156) *When set, this field provides the information about the coherent set associated with the sample.*

8.319.1 Detailed Description

`<<value-type>>` (p. 152) Information that accompanies each sample received by a `DataReader` (p. 756)

Information that accompanies each sample that is `read` or `taken`.

8.319.2 Interpretation of the SampleInfo

The `dds::sub::SampleInfo` (p. 1992) contains information pertaining to the associated `Data` instance sample including:

- the `dds::sub::status::DataState` (p. 888) of the `Data` value. The `DataState` provides information about:
- the `sample_state` of the `Data` value (i.e., if it has already been read or not)
- the `view_state` of the related instance (i.e., if the instance is new or not)
- the `instance_state` of the related instance (i.e., if the instance is alive or not)
- `dds::sub::SampleInfo::valid` (p. 1996) flag. This flag indicates whether there is data associated with the sample. Some samples do not contain data indicating only a change on the `instance_state` of the corresponding instance.
- the `dds::sub::GenerationCount` (p. 1333) of the `Data` value. The `GenerationCount` (p. 1333) provides information about:
- The values of `disposed_generation_count` and `no_writers_generation_count` for the related instance at the time the sample was received. These counters indicate the number of times the instance had become `ALIVE` (with `instance_state= dds::sub::status::InstanceState::alive()` (p. 1361)) at the time the sample was received.
- the `dds::sub::Rank` (p. 1855) of the `Data` value. The `Rank` (p. 1855) provides information about:
- The `sample_rank` and `generation_rank` of the sample within the returned sequence. These ranks provide a preview of the samples that follow within the sequence returned by the `read` or `take` operations.
- The `absolute_generation_rank` of the sample within the `dds::sub::DataReader` (p. 756). This rank provides a preview of what is available within the `dds::sub::DataReader` (p. 756).
- The `source_timestamp` of the sample. This is the timestamp provided by the `dds::pub::DataWriter` (p. 908) at the time the sample was produced.

8.319.3 Interpretation of the SampleInfo disposed_generation_count and no_writers_generation_count

For each instance, RTI Connexxt internally maintains two counts, the `dds::sub::GenerationCount::disposed()` (p. 1334) and `dds::sub::GenerationCount::no_writers()` (p. 1334), relative to each `DataReader` (p. 756):

- The `dds::sub::GenerationCount::disposed()` (p. 1334) and `dds::sub::GenerationCount::no_writers()` (p. 1334) are initialized to zero when the `dds::sub::DataReader` (p. 756) first detects the presence of a never-seen-before instance.
- The `dds::sub::GenerationCount::disposed()` (p. 1334) is incremented each time the `instance_state` of the corresponding instance changes from `dds::sub::status::InstanceState::not_alive_disposed()` (p. 1361) to `dds::sub::status::InstanceState::alive()` (p. 1361).
- The `dds::sub::GenerationCount::no_writers()` (p. 1334) is incremented each time the `instance_state` of the corresponding instance changes from `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361) to `dds::sub::status::InstanceState::alive()` (p. 1361).
- These 'generation counts' are reset to zero when the instance resource is reclaimed.

The `dds::sub::GenerationCount::disposed()` (p. 1334) and `dds::sub::GenerationCount::no_writers()` (p. 1334) available in the `dds::sub::SampleInfo` (p. 1992) capture a snapshot of the corresponding counters at the time the sample was received.

8.319.4 Interpretation of the SampleInfo sample_rank, generation_rank and absolute_generation_rank

The `dds::sub::Rank::sample()` (p. 1857) and `dds::sub::Rank::generation()` (p. 1857) available in the `dds::sub::SampleInfo` (p. 1992) are computed based solely on the actual samples in the ordered collection returned by `read` or `take`.

- The `dds::sub::Rank::sample()` (p. 1857) indicates the number of samples of the same instance that follow the current one in the collection.
- The `dds::sub::Rank::generation()` (p. 1857) available in the `dds::sub::SampleInfo` (p. 1992) indicates the difference in "generations" between the sample (S) and the Most Recent `Sample` (p. 1977) of the same instance that appears in the returned Collection (MRSIC). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the reception of MRSIC.
- These 'generation ranks' are reset to zero when the instance resource is reclaimed.

The `dds::sub::Rank::generation()` (p. 1857) is computed using the formula:

```

generation_rank = (MRSIC.disposed_generation_count
                   + MRSIC.no_writers_generation_count)
                 - (S.disposed_generation_count
                   + S.no_writers_generation_count)

```

The **dds::sub::Rank::absolute_generation()** (p. 1857) available in the **dds::sub::SampleInfo** (p. 1992) indicates the difference in "generations" between the sample (S) and the Most Recent **Sample** (p. 1977) of the same instance that the middleware has received (MRS). That is, it counts the number of times the instance transitioned from not-alive to alive in the time from the reception of the S to the time when the read or take was called.

```

absolute_generation_rank = (MRS.disposed_generation_count
                           + MRS.no_writers_generation_count)
                          - (S.disposed_generation_count
                              + S.no_writers_generation_count)

```

8.319.5 Interpretation of the SampleInfo counters and ranks

These counters and ranks allow the application to distinguish samples belonging to different "generations" of the instance. Note that it is possible for an instance to transition from not-alive to alive (and back) several times before the application accesses the data by means of read or take. In this case, the returned collection may contain samples that cross generations (i.e. some samples were received before the instance became not-alive, other after the instance re-appeared again). Using the information in the **dds::sub::SampleInfo** (p. 1992), the application can anticipate what other information regarding the same instance appears in the returned collection, as well as in the infrastructure and thus make appropriate decisions.

For example, an application desiring to only consider the most current sample for each instance would only look at samples with `sample_rank == 0`. Similarly, an application desiring to only consider samples that correspond to the latest generation in the collection will only look at samples with `generation_rank == 0`. An application desiring only samples pertaining to the latest generation available will ignore samples for which `absolute_generation_rank != 0`. Other application-defined criteria may also be used.

"Statechart of the `\p instance_state` and `\p view_state` of a single instance"

8.319.6 Member Function Documentation

8.319.6.1 source_timestamp()

```
dds::core::Time dds::sub::SampleInfo::source_timestamp ( ) const [inline]
```

Get the timestamp when the sample was written by a DataWriter.

8.319.6.2 state()

```
dds::sub::status::DataState dds::sub::SampleInfo::state ( ) const [inline]
```

Get the **dds::sub::status::DataState** (p. 888) of the sample.

The DataState encapsulates the sample's **dds::sub::status::InstanceState** (p. 1359), **dds::sub::status::ViewState** (p. 2315), and **dds::sub::status::SampleState** (p. 2023)

8.319.6.3 generation_count()

```
dds::sub::GenerationCount dds::sub::SampleInfo::generation_count ( ) const [inline]
```

Get the **dds::sub::GenerationCount** (p. 1333) of the sample.

8.319.6.4 rank()

```
dds::sub::Rank dds::sub::SampleInfo::rank ( ) const [inline]
```

Get the **dds::sub::Rank** (p. 1855) of the sample.

8.319.6.5 valid()

```
bool dds::sub::SampleInfo::valid ( ) const [inline]
```

Indicates whether the `DataSample` contains data or else it is only used to communicate a change in the `dds::sub::status::InstanceState` (p. 1359) of the instance.

Normally each `DataSample` contains both a `dds::sub::SampleInfo` (p. 1992) and some `Data`. However there are situations where a `DataSample` contains only the `dds::sub::SampleInfo` (p. 1992) and does not have any associated data. This occurs when the RTI Connexx notifies the application of a change of state for an instance that was caused by some internal mechanism (such as a timeout) for which there is no associated data. An example of this situation is when the RTI Connexx detects that an instance has no writers and changes the corresponding `instance_state` to `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361).

The application can distinguish whether a particular `DataSample` has data by examining the value of the `dds::sub::SampleInfo::valid` (p. 1996). If this flag is set to true, then the `DataSample` contains valid `Data`. If the flag is set to false, the `DataSample` contains no `Data`.

Applications should check the `valid()` (p. 1996) flag before accessing the data. An attempt to access `rti::sub::LoanedSample::data()` (p. 1404) or `dds::sub::Sample::data()` (p. 1979) when `valid()` (p. 1996) is false will throw `dds::core::PreconditionNotMetError` (p. 1669).

8.319.6.6 instance_handle()

```
dds::core::InstanceHandle dds::sub::SampleInfo::instance_handle ( ) const [inline]
```

Identifies locally the corresponding instance.

The handle is equal to `dds::core::InstanceHandle::nil()` (p. 1358) for unkeyed topics.

8.319.6.7 publication_handle()

```
dds::core::InstanceHandle dds::sub::SampleInfo::publication_handle ( ) const [inline]
```

Identifies locally the `DataWriter` that modified the instance.

The `publication_handle` is the same `dds::core::InstanceHandle` (p. 1356) that is returned by the operation `dds::sub::matched_publications` (p. 456) and can also be used as a parameter to the operation `dds::sub::DataReader::matched_publication_data` (p. 810).

8.319.6.8 reception_timestamp()

```
dds::core::Time reception_timestamp ( ) const
```

<<*extension*>> (p. 156) The timestamp when the sample was committed by a `dds::sub::DataReader` (p. 756).

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

rti::core::SampleFlag flag ( ) const
```

<<*extension*>> (p. 156) Flags associated with the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The flags can be set by using the field **rti::pub::WriteParams::flag** (p. 2348) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 949).

8.319.6.18 source_guid()

```
rti::core::Guid source_guid ( ) const
```

<<**extension**>> (p. 156) The application logical data source associated with the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The source_guid can be set by using the field **rti::pub::WriteParams::source_guid** (p. 2349) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 949).

8.319.6.19 related_source_guid()

```
rti::core::Guid related_source_guid ( ) const
```

<<**extension**>> (p. 156) The application logical data source that is related to the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The source_guid can be set by using the field **rti::pub::WriteParams::source_guid** (p. 2349) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 949).

8.319.6.20 related_subscription_guid()

```
rti::core::Guid related_subscription_guid ( ) const
```

<<**extension**>> (p. 156) The related_reader_guid associated with the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

The related_reader_guid can be set by using the field **rti::pub::WriteParams::related_reader_guid** (p. 2350) when writing a sample using the method **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p. 949).

8.319.6.21 topic_query_guid()

```
rti::core::Guid topic_query_guid ( ) const
```

<<*extension*>> (p. 156) The GUID of the **rti::sub::TopicQuery** (p. 2220) that is related to the sample.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

This GUID indicates whether a sample is part of the response to a **rti::sub::TopicQuery** (p. 2220) or a regular ("live") sample:

- If the sample was written for the TopicQuery stream, this field contains the GUID of the target TopicQuery.
- If the sample was written for the live stream, this field will be set to **rti::core::Guid::unknown()** (p. 1341).

8.319.6.22 encapsulation_id()

```
rti::core::EncapsulationId encapsulation_id ( ) const
```

<<*extension*>> (p. 156) The encapsulation kind.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

8.319.6.23 coherent_set_info()

```
rti::core::optional_value< rti::core::CoherentSetInfo > coherent_set_info ( ) const
```

<<*extension*>> (p. 156) When set, this field provides the information about the coherent set associated with the sample.

This field is set for all samples that are part of a coherent set. Coherent sets are initiated using the operation **dds::pub::CoherentSet::CoherentSet** (p. 715) and finalized using the operation **dds::pub::CoherentSet::end()** (p. 716).

See also

dds::pub::CoherentSet::CoherentSet (p. 715) for additional information on coherent sets.

8.320 rti::sub::SampleIterator< T > Class Template Reference

A random-access iterator of **LoanedSample** (p. 1402).

```
#include <SampleIterator.hpp>
```

8.320.1 Detailed Description

```
template<typename T>  
class rti::sub::SampleIterator< T >
```

A random-access iterator of **LoanedSample** (p. 1402).

Inherits `std::bitset< OMG_DDS_STATE_BIT_COUNT >`.

Public Member Functions

- **SampleLostState** ()
*Creates **not_lost()** (p. 2005)*
- **SampleLostState** (const MaskType &src)
Create from a bitset.

Static Public Member Functions

- static const **SampleLostState not_lost** ()
The sample was not lost.
- static const **SampleLostState lost_by_writer** ()
A `dds::pub::DataWriter` (p. 908) removed the sample before being received by the `dds::sub::DataReader` (p. 756).
- static const **SampleLostState lost_by_instances_limit** ()
A resource limit on the number of instances (`dds::core::policy::ResourceLimits::max_instances` (p. 1924)) was reached.
- static const **SampleLostState lost_by_remote_writers_per_instance_limit** ()
A resource limit on the number of remote writers for a single instance from which a `dds::sub::DataReader` (p. 756) may read (`rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance` (p. 861)) was reached.
- static const **SampleLostState lost_by_incomplete_coherent_set** ()
A sample is lost because it is part of an incomplete coherent set. An incomplete coherent set is a coherent set for which some of the samples are missing.
- static const **SampleLostState lost_by_large_coherent_set** ()
A sample is lost because it is part of a large coherent set. A large coherent set is a coherent set that cannot fit all at once into the `dds::sub::DataReader` (p. 756) queue because resource limits are exceeded.
- static const **SampleLostState lost_by_samples_per_remote_writer_limit** ()
When using `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p. 1881): a resource limit on the number of samples from a given remote writer that a `dds::sub::DataReader` (p. 756) may store (`rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer` (p. 862)) was reached. When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881), reaching `rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer` (p. 862) will trigger a rejection, not a loss, with reason `dds::core::status::SampleRejectedState::rejected_by_samples_per_remote_writer_limit` (p. 2020).
- static const **SampleLostState lost_by_virtual_writers_limit** ()
A resource limit on the number of virtual writers from which a `dds::sub::DataReader` (p. 756) may read (`rti::core::policy::DataReaderResourceLimits::max_remote_virtual_writers` (p. 869)) was reached.
- static const **SampleLostState lost_by_remote_writers_per_sample_limit** ()
A resource limit on the number of remote writers per sample (`rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_sample` (p. 872)) was reached.
- static const **SampleLostState lost_by_availability_waiting_time** ()
`rti::core::policy::Availability::max_data_availability_waiting_time` (p. 658) expired.
- static const **SampleLostState lost_by_remote_writers_per_virtual_queue_limit** ()
A resource limit on the number of samples published by a remote writer on behalf of a virtual writer that a `dds::sub::DataReader` (p. 756) may store was reached. (This field is currently not used.)
- static const **SampleLostState lost_by_out_of_memory** ()
A sample was lost because there was not enough memory to store the sample.
- static const **SampleLostState lost_by_unknown_instance** ()
A received sample was lost because it doesn't contain enough information for the reader to know what instance it is associated with.
- static const **SampleLostState lost_by_deserialization_failure** ()
A received sample was lost because it could not be deserialized.
- static const **SampleLostState lost_by_decode_failure** ()
When using `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p. 1881): A received sample was lost because it could not be decoded. When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881), the sample will be rejected, not lost, with reason `dds::core::status::SampleRejectedState::rejected_by_decode_failure` (p. 2021).
- static const **SampleLostState lost_by_samples_per_instance_limit** ()

When using `dds::core::policy::ReliabilityKind_def::BEST Effort` (p. 1881): A resource limit on the number of samples per instance (`dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925)) was reached. When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881), reaching `dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925) will trigger a rejection, not a loss, with reason `dds::core::status::SampleRejectedState::rejected_by_samples_per_instance_limit` (p. 2020).

- static const `SampleLostState lost_by_samples_limit` ()

When using `dds::core::policy::ReliabilityKind_def::BEST Effort` (p. 1881): A resource limit on the number of samples (`dds::core::policy::ResourceLimits::max_samples` (p. 1924)) was reached. When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881), reaching `dds::core::policy::ResourceLimits::max_samples` (p. 1924) will trigger a rejection, not a loss, with reason `dds::core::status::SampleRejectedState::rejected_by_samples_limit` (p. 2019).

instance_limit ( ) [inline], [static]
```

A resource limit on the number of remote writers for a single instance from which a **dds::sub::DataReader** (p. 756) may read (**rti::core::policy::DataReaderResourceLimits::max_remote_writers_per_instance** (p. 861)) was reached.

See also

rti::core::policy::DataReaderResourceLimits (p. 856)

8.321.3.5 lost_by_incomplete_coherent_set()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_incomplete_coherent_set
( ) [inline], [static]
```

A sample is lost because it is part of an incomplete coherent set. An incomplete coherent set is a coherent set for which some of the samples are missing.

For example, consider a **dds::pub::DataWriter** (p. 908) using **dds::core::policy::HistoryKind::KEEP_LAST** with a depth of 1. The DataWriter publishes two samples of the same instance as part of a coherent set 'CS1'; the first sample of 'CS1' is replaced by a new sample before it can be successfully delivered to the **dds::sub::DataReader** (p. 756). In this case, the coherent set containing the two samples is considered incomplete. The new sample, by default, will not be provided to the application, and will be reported as **LOST_BY_INCOMPLETE_COHERENT_SET**. (You can change this default behavior by setting **dds::core::policy::Presentation::drop_incomplete_coherent_set** (p. 1676) to **FALSE**. If you do, the new sample will be provided to the application, but it will be marked as part of an incomplete coherent set in the **dds::sub::SampleInfo** (p. 1992) structure.)

8.321.3.6 lost_by_large_coherent_set()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_large_coherent_set ( )
[inline], [static]
```

A sample is lost because it is part of a large coherent set. A large coherent set is a coherent set that cannot fit all at once into the **dds::sub::DataReader** (p. 756) queue because resource limits are exceeded.

For example, if **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 1925) on the DataReader is 10 and the coherent set has 15 samples for a given instance, the coherent set is a large coherent set that will be considered incomplete.

The resource limits that can lead to large coherent sets are: **dds::core::policy::ResourceLimits::max_samples** (p. 1924), **dds::core::policy::ResourceLimits::max_samples_per_instance** (p. 1925), **dds::core::policy::ResourceLimits::max_instances** (p. 1924), and **rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 862).

8.321.3.7 lost_by_samples_per_remote_writer_limit()

```
static const SampleLostState rti::core::status::SampleLostState::lost_by_samples_per_remote_
writer_limit ( ) [inline], [static]
```

When using **dds::core::policy::ReliabilityKind_def::BEST_EFFORT** (p. 1881): a resource limit on the number of samples from a given remote writer that a **dds::sub::DataReader** (p. 756) may store (**rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 862)) was reached. When using **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881), reaching **rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer** (p. 862) will trigger a rejection, not a loss, with reason **dds::core::status::SampleRejectedState::rejected_by_samples_per_remote_writer_limit()** (p. 2020).

8.323.1 Detailed Description

<<**extension**>> (p. 156) <<**reference-type**>> (p. 153) Utility to read and process the data samples that one or more DataReaders receive using a sample handler.

The following example shows how to create an full application that subscribes to a topic and prints each sample it receives:

```
int subscriber_main(int domain_id, int sample_count)
{
    dds::domain::DomainParticipant participant(domain_id);
    dds::topic::Topic<Foo> topic(participant, "Example Foo");
    dds::sub::DataReader<Foo> reader(dds::sub::Subscriber(participant), topic);
    int count = 0;
    rti::sub::SampleProcessor sample_processor;
    sample_processor.attach_reader(reader, [](const rti::sub::LoanedSample<Foo>& sample) {
        if (sample.info().valid()) {
            std::cout << "Received " << sample.data() << std::endl;
        }
    });
}
```

```

    }
    });
    while(1) {
        // wait forever
    }
    return 1;
}

```

Note that the expected sample handler is a functor with signature `std::function<void(const rti::sub::LoanedSample<T>&>>`, where `T` is the type associated with the `dds::sub::DataReader` (p. 756).

A `rti::sub::SampleProcessor` (p. 2012) relies on an underlying `rti::core::cond::AsyncWaitSet` (p. 627) to read and dispatch the data from the DataReaders. It internally creates a `dds::sub::cond::ReadCondition` (p. 1858) for each attached DataReader, and associates a custom handler that contains state to read samples and notify the corresponding handler.

The `SampleProcessor` (p. 2012) uses this `ReadCondition` to wait for data and then calls `dds::sub::DataReader::select()` (p. 780) to take all the available data.

Notifications to any handler may be concurrent if the thread pool size set in `rti::core::cond::AsyncWaitSetProperty::thread_pool_size` (p. 648) is greater than 1. The same or different handlers may be called in parallel. The `SampleProcessor` (p. 2012) cycles through all attached DataReaders dispatching a sample at a time with the next available thread. This mechanism guarantees concurrent dispatching of the samples across all DataReaders.

The `rti::sub::SampleProcessor` (p. 2012) internally creates and uses a `dds::sub::cond::ReadCondition` (p. 1858) for each attached `dds::sub::DataReader` (p. 756) to read the data. It's recommended to perform all the reading of the `dds::sub::DataReader` (p. 756)'s samples through the `rti::sub::SampleProcessor` (p. 2012) and avoid reading with through other mechanisms in different part of your applications. Similarly, your application must be careful to not modify the `dds::sub::cond::ReadCondition` (p. 1858) associated with an attached `dds::sub::DataReader` (p. 756).

In general, avoid or beware of using the following operations in combination with a `rti::sub::SampleProcessor` (p. 2012):

- read or take operation (and any of its overloads) of a `dds::sub::DataReader` (p. 756) from any part of your application, including a `dds::sub::DataReaderListener` (p. 832) or a handler.
- Perform actions based on the `dds::core::cond::StatusCondition` (p. 2079) with the `dds::core::status::StatusMask::data_available()` (p. 2090) enabled (for example through a `rti::core::cond::AsyncWaitSet` (p. 627)).

On the other hand, you can externally provide the underlying `rti::sub::SampleProcessor` (p. 2012)'s `rti::core::cond::AsyncWaitSet` (p. 627) if you want to access additional capabilities of the `rti::core::cond::AsyncWaitSet` (p. 627) and use it to attach other `dds::core::cond::Condition` (p. 729) to handle other aspects of your application.

8.323.2 SampleProcessor Thread Safety

Similar to the `rti::core::cond::AsyncWaitSet` (p. 627), the `rti::sub::SampleProcessor` (p. 2012) provides a thread-safe interface. All the operations of this class can be called concurrently from multiple threads.

Because the `rti::sub::SampleProcessor` (p. 2012) relies on an `rti::core::cond::AsyncWaitSet` (p. 627) to dispatch the samples the same threading concepts apply. This means that operations on a `rti::sub::SampleProcessor` (p. 2012) may require synchronizing with the thread pool for safety. `rti::sub::SampleProcessor` (p. 2012) also relies on the asynchronous completion pattern to effectively interact with the underlying thread pool.

For instance to detach a `dds::sub::DataReader` (p. 756), the `rti::sub::SampleProcessor` (p. 2012) generates an internal request to its thread pool to process it. As soon as the detachment completes, the thread pool provides the notification through an associated completion token on which the `rti::sub::SampleProcessor` (p. 2012) waits and blocks until it completes.

Due to the concurrent processing nature of operations on a `rti::sub::SampleProcessor` (p. 2012) as well as the sample handling, it's important to keep in mind the following aspects:

- The handler operation can be called concurrently for each sample. Therefore, handler implementations may need to apply thread synchronization strategies to protect shared resources.
- Calling a `rti::sub::SampleProcessor` (p. 2012) operation that requires internal synchronization (e.g., `rti::sub::SampleProcessor::attach_reader` (p. 2016)) from a handler notification will result in a error.

Note that the interface of the `rti::sub::SampleProcessor` (p. 2012) is similar to that of the `rti::core::cond::AsyncWaitSet` (p. 627) but reduced and simplified. As noted above, if more advanced use and control of the thread pool is required, you can always create the `rti::core::cond::AsyncWaitSet` (p. 627) externally when calling `dds::sub::SampleProcessor::SampleProcessor(rti::core::cond::AsyncWaitSet)`.

MT Safety:

Safe.

8.323.3 Constructor & Destructor Documentation

8.323.3.1 SampleProcessor() [1/3]

```
rti::sub::SampleProcessor::SampleProcessor (
    const rti::core::cond::AsyncWaitSetProperty & aws_property ) [inline]
```

Single-argument constructor that allows creating a `rti::sub::SampleProcessor` (p. 2012) with the configuration of the underlying `rti::core::cond::AsyncWaitSet` (p. 627).

You can provide `rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty()` (p. 646) as `property` to create the underlying `rti::core::cond::AsyncWaitSet` (p. 627) with default behavior.

This constructor creates `rti::core::cond::AsyncWaitSet` (p. 627) with no listener installed and will call `rti::core::cond::AsyncWaitSet::start` (p. 632) right after its creation.

Parameters

<i>aws_property</i>	<< <i>in</i> >> (p. 157) configuraition of the underlying rti::core::cond::AsyncWaitSet (p. 627).
---------------------	--

See also

dds::sub::SampleProcessor::SampleProcessor(rti::core::cond::AsyncWaitSet)

8.323.3.2 SampleProcessor() [2/3]

```
rti::sub::SampleProcessor::SampleProcessor ( ) [inline]
```

Creates a **rti::sub::SampleProcessor** (p. 2012) with the default **rti::core::cond::AsyncWaitSetProperty** (p. 644).

See also

rti::core::cond::AsyncWaitSetProperty::AsyncWaitSetProperty() (p. 646)

8.323.3.3 SampleProcessor() [3/3]

```
rti::sub::SampleProcessor::SampleProcessor (
    rti::core::cond::AsyncWaitSet aws ) [inline]
```

Constructor that allows specifying an externally created **rti::core::cond::AsyncWaitSet** (p. 627).

Creates a new **rti::sub::SampleProcessor** (p. 2012) with the specified **rti::core::cond::AsyncWaitSet** (p. 627).

This constructor flavor decouples the lifecycle of the **rti::sub::SampleProcessor** (p. 2012) from the **rti::core::cond::AsyncWaitSet** (p. 627). It allows the application to have more control on the **rti::core::cond::AsyncWaitSet** (p. 627), such as to install an **rti::core::cond::AsyncWaitSetListener** (p. 643), a custom ThreadFactory, and controlling when it starts or stops.

Note that this constructor will not call **rti::core::cond::AsyncWaitSet::start** (p. 632), so it's the caller responsibility to start and stop it. You can provide the external **rti::core::cond::AsyncWaitSet::start** (p. 632) in either started or stopped state.

Parameters

<i>aws</i>	<< <i>in</i> >> (p. 157) the externally created rti::core::cond::AsyncWaitSet (p. 627).
------------	--

See also

`dds::sub::SampleProcessor::SampleProcessor(const rti::core::cond::AsyncWaitSetProperty&)`

8.323.4 Member Function Documentation

8.323.4.1 `attach_reader()`

```
template<typename T , typename FUNCTOR >
SampleProcessor & rti::sub::SampleProcessor::attach_reader (
    dds::sub::DataReader< T > reader,
    const FUNCTOR & handler ) [inline]
```

Attaches the specified **dds::sub::DataReader** (p. 756) with an associated sample handler to this **rti::sub::SampleProcessor** (p. 2012).

Note that the expected sample handler is a functor with signature `std::function<void(const rti::sub::LoanedSample<T>&>>`, where `T` is the type associated with the **dds::sub::DataReader** (p. 756).

This operation will block until the attach request completes. Upon successful return, it is guaranteed that the specified **dds::sub::DataReader** (p. 756) is attached and notifications to the handler may occur.

If this operation is called multiple times for an already attached **dds::sub::DataReader** (p. 756), it will result in no-op and return successfully, ignoring the specified handler. So if the handler is different, it will not be updated.

Parameters

<i>reader</i>	<< <i>in</i> >> (p. 157) dds::sub::DataReader (p. 756) to be attached.
<i>handler</i>	<< <i>in</i> >> (p. 157) handler to be notified on dispatching of the <i>reader</i> samples.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

`rti::sub::SampleProcessor::detach_reader` (p. 2016)

References `attach_reader()`.

Referenced by `attach_reader()`.

8.323.4.2 `detach_reader()`

```
template<typename T >
SampleProcessor & rti::sub::SampleProcessor::detach_reader (
    dds::sub::DataReader< T > reader ) [inline]
```

Detaches the specified **dds::sub::DataReader** (p. 756) from this **rti::sub::SampleProcessor** (p. 2012).

Once the **dds::sub::DataReader** (p. 756) is detached, it is guaranteed that the **rti::sub::SampleProcessor** (p. 2012) will no longer process it so it is safe for your application to release any resources associated with the detached **dds::sub::DataReader** (p. 756).

This operation blocks until the detach request completes. Upon successful return, it is guaranteed that the specified **dds::sub::DataReader** (p. 756) is detached.

dds::sub::DataReader (p. 756) may be detached at any time independently of the state of the **rti::sub::SampleProcessor** (p. 2012).

Parameters

<i>reader</i>	<< <i>in</i> >> (p. 157) dds::sub::DataReader (p. 756) to be detached.
---------------	---

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228)
------------	--

```

Returns the list of attached **dds::sub::DataReader** (p. 756) (s).

8.324 `dds::core::status::SampleRejectedState` Class Reference

Reasons why a sample was rejected.

```
#include <State.hpp>
```

Inherits `std::bitset< OMG_DDS_STATE_BIT_COUNT >`.

Public Member Functions

- **SampleRejectedState** ()
Creates not_lost()
- **SampleRejectedState** (const MaskType &src)
Create from a bitset.

Static Public Member Functions

- static const **SampleRejectedState** not_rejected ()
The sample was not rejected.
- static const **SampleRejectedState** rejected_by_samples_limit ()
When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881): A resource limit on the number of samples (`dds::core::policy::ResourceLimits::max_samples` (p. 1924)) was reached. When using `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p. 1881), reaching `dds::core::policy::ResourceLimits::max_samples` (p. 1924) will trigger a loss, not a rejection, with reason `rti::core::status::SampleLostState::lost_by_samples_limit()` (p. 2010).
- static const **SampleRejectedState** rejected_by_instances_limit ()
Connext DDS does not reject samples based on instance limits (`dds::core::policy::ResourceLimits::max_instances` (p. 1924)), so this value will never be used.
- static const **SampleRejectedState** rejected_by_samples_per_instance_limit ()
When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881): A resource limit on the number of samples per instance (`dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925)) was reached. When using `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p. 1881), reaching `dds::core::policy::ResourceLimits::max_samples_per_instance` (p. 1925) will trigger a loss, not a rejection, with reason `rti::core::status::SampleLostState::lost_by_samples_per_instance_limit()` (p. 2010).
- static const **SampleRejectedState** rejected_by_samples_per_remote_writer_limit ()
When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881): a resource limit on the number of samples from a given remote writer that a `dds::sub::DataReader` (p. 756) may store (`rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer` (p. 862)) was reached. When using `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p. 1881), reaching `rti::core::policy::DataReaderResourceLimits::max_samples_per_remote_writer` (p. 862) will trigger a loss, not a rejection, with reason `rti::core::status::SampleLostState::lost_by_samples_per_remote_writer_limit()` (p. 2007).
- static const **SampleRejectedState** rejected_by_remote_writers_per_virtual_queue_limit ()
A resource limit on the number of samples published by a remote writer on behalf of a virtual writer that a `dds::sub::DataReader` (p. 756) may store was reached. (This field is currently not used.)
- static const **SampleRejectedState** rejected_by_decode_failure ()
When using `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881): A received sample was rejected because it could not be decoded. When using `dds::core::policy::ReliabilityKind_def::BEST_EFFORT` (p. 1881), the sample will be lost, not rejected, with reason `rti::core::status::SampleLostState::lost_by_decode_failure()` (p. 2009).

8.324.1 Detailed Description

Reasons why a sample was rejected.

Prints a sample state as a readable string.

8.326.1 Detailed Description

Indicates whether or not a sample has ever been read.

For example, you can check if a sample has been read before as follows:

```
for (auto sample : reader.read()) {
    if (sample.info().state().sample_state() ==
        dds::sub::status::SampleState::read()) {
        // ...
    }
}
```

8.326.2 Member Typedef Documentation

8.326.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATE_BIT_COUNT > dds::sub::status::SampleState::MaskType
```

An std::bitset of SampleStates.

8.326.3 Constructor & Destructor Documentation

8.326.3.1 SampleState()

```
dds::sub::status::SampleState::SampleState (
    const MaskType & other ) [inline]
```

Create an **SampleState** (p. 2023) from MaskType.

Parameters

<i>other</i>	The MaskType to create the SampleState (p. 2023) with
--------------	--

8.326.4 Member Function Documentation

8.326.4.1 read()

```
static const SampleState dds::sub::status::SampleState::read ( ) [inline], [static]
```

Creates a read **SampleState** (p. 2023).

Indicates that the application has already accessed that sample by means of a read or take operation.

8.326.4.2 not_read()

```
static const SampleState dds::sub::status::SampleState::not_read ( ) [inline], [static]
```

Creates a not_read **SampleState** (p. 2023) object.

Indicates that the application has not accessed that sample before.

Referenced by **dds::sub::status::DataState::new_data()**.

8.326.4.3 any()

```
static const SampleState dds::sub::status::SampleState::any ( ) [inline], [static]
```

Creates a **SampleState** (p. 2023) object representing any sample state.

This is equivalent to **read ()** (p. 2025) | **not_read ()** (p. 2025)

Referenced by **dds::sub::status::DataState::any()**, **dds::sub::status::DataState::any_data()**, and **dds::sub::status::DataState::new_instance()**.

 - Take samples, inserting them into a provided container.*

8.328.1 Detailed Description

```
template<typename T>
class dds::sub::DataReader< T >::Selector
```

The **Selector** (p. 2027) class is used by the **DataReader** (p. 756) to compose read and take operations.

A **Selector** (p. 2027) has an associated **DataReader** (p. 756) and configures the behavior of the read or take operation performed by that **DataReader** (p. 756).

A **Selector** (p. 2027) call is typically composed of the following steps:

1. Start with a call to `reader.select()` to return a **Selector** (p. 2027);
2. Follow with one or more **Selector** (p. 2027) setters configure what data to read;
3. Finally call `read()` (p. 2032) or `take()` (p. 2033) to perform the operation.

The following example reads a maximum of 5 previously unread samples:

```
loanedSamples<Foo> samples = reader.select()
    .max_samples(5)
    .state(dds::sub::status::DataState::new_data());
    .read()
```

The selector also allows iterating over the samples one instance at a time, using the `next_instance()` (p. 2029) setter.

Accessing Received Data (p. 119)

8.328.2 Constructor & Destructor Documentation

8.328.2.1 Selector()

```
template<typename T >
dds::sub::DataReader< T >::Selector::Selector (
    DataReader & dr ) [inline]
```

Create a **Selector** (p. 2027) for this **DataReader** (p. 756).

Selectors are created with the default filter state of the **DataReader** (p. 756)

Parameters

<i>dr</i>	The DataReader (p. 756) that this Selector (p. 2027) is attached to
-----------	---

See also

`dds::sub::DataReader::default_filter_state()` (p. 770)

8.328.3 Member Function Documentation

8.328.3.1 instance()

```
template<typename T >
Selector & dds::sub::DataReader< T >::Selector::instance (
    const dds::core::InstanceHandle & h ) [inline]
```

Select a specific instance to read/take.

This operation causes the subsequent read or take operation to access only samples belonging the single specified instance whose handle is *h*.

Upon successful completion, the data collection will contain samples all belonging to the same instance. The corresponding **SampleInfo** (p. 1992) verifies **SampleInfo.instance_handle()** (p. 1997) == *h*.

The subsequent read/take operation will be semantically equivalent to a read or take without specifying the instance, except in building the collection, the **DataReader** (p. 756) will check that the sample belongs to the specified instance and otherwise it will not place the sample in the returned collection.

The subsequent read/take may operation may fail with **dds::core::InvalidArgumentError** (p. 1363) if the InstanceHandle does not correspond to an existing data-object known to the **DataReader** (p. 756).

Parameters

<i>h</i>	The handle of the instance to select
----------	--------------------------------------

8.328.3.2 next_instance()

```
template<typename T >
Selector & dds::sub::DataReader< T >::Selector::next_instance (
    const dds::core::InstanceHandle & previous_handle ) [inline]
```

Select the instance after a specific instance.

This operation causes the subsequent read or take operation to access only samples belonging a single instance whose handle is considered 'next' after the provided InstanceHandle *h*.

The accessed samples will all belong to the 'next' instance with InstanceHandle 'greater' than the specified previous handle that has available samples.

This operation implies the existence of a total order 'greater-than' relationship between the instance handles. The specifics of this relationship are not all important and are implementation specific. The important thing is that, according to the middleware, all instances are ordered relative to each other. This ordering is between the instance handles; It should not depend on the state of the instance (e.g. whether it has data or not) and must be defined even for instance handles that do not correspond to instances currently managed by the `dds::sub::DataReader` (p. 756). For the purposes of the ordering, it should be 'as if' each instance handle was represented as unique integer.

The behavior of `dds::sub::DataReader::Selector::next_instance` (p.2029) is 'as if' the `dds::sub::DataReader` (p. 756) invoked `dds::sub::instance(const dds::core::InstanceHandle& h)` (p. 453), passing the smallest `instance_handle` among all the ones that: (a) are greater than `previous_handle`, and (b) have available samples (i.e. samples that meet the constraints imposed by the specified states).

The special value `dds::core::InstanceHandle::nil()` (p. 1358) is guaranteed to be 'less than' any valid `instance_handle`. So the use of the parameter value `previous_handle == dds::core::InstanceHandle::nil()` (p. 1358) will return the samples for the instance which has the smallest `instance_handle` among all the instances that contain available samples.

Note

The operation `dds::sub::DataReader::Selector::next_instance` (p.2029) is intended to be used in an application-driven iteration, where the application starts by passing `previous_handle == dds::core::InstanceHandle::nil()` (p.1358), examines the samples returned, and then uses the `instance_handle` returned in the `dds::sub::SampleInfo` (p. 1992) as the value of the `previous_handle` argument to the next call to `dds::sub::DataReader::Selector::next_instance` (p.2029). The iteration continues until the read/take operation doesn't return any more samples. This application-driven iteration is required to ensure that all samples on the reader queue are read.

Note that it is possible to call the `dds::sub::DataReader::Selector::next_instance` (p.2029) operation with a `previous_handle` that does not correspond to an instance currently managed by the `dds::sub::DataReader` (p. 756). This is because as stated earlier the 'greater-than' relationship is defined even for handles not managed by the `dds::sub::DataReader` (p. 756). One practical situation where this may occur is when an application is iterating through all the instances, takes all the samples of a `dds::sub::status::InstanceState::not_alive_no_writers()` (p. 1361) instance, returns the loan (at which point the instance information may be removed, and thus the handle becomes invalid), and tries to read the next instance.

Parameters

<code>previous_handle</code>	The 'next smallest' instance with a value greater than this value that has available samples will be returned.
------------------------------	--

See also

Selecting what samples to read (p. 120) for an example

8.328.3.3 state()

```
template<typename T >
Selector & dds::sub::DataReader< T >::Selector::state (
    const dds::sub::status::DataState & s ) [inline]
```

Select a specific DataState.

By setting the DataState, you can specify the state of the samples that should be read or taken. The DataState of a sample encapsulates the SampleState, ViewState, and InstanceState of a sample. For example:

```
using namespace dds::sub::status;
LoanedSamples<Foo> samples = reader.select()
    .state(DataState(SampleState::not_read(), ViewState::new_view(), InstanceState::alive()))
    .read();
```

If you're only interested in the SampleState, the ViewState, or the InstanceState, you can pass it directly. For example, to read alive instances with any SampleState or ViewState:

```
LoanedSamples<Foo> samples = reader.select()
    .state(InstanceState::alive())
    .read();
```

If this method comes before a call to **condition()** (p. 2031), then it will be overridden and will not have any effect on the read or take operation.

Parameters

s	The selected DataState
---	------------------------

8.328.3.4 content()

```
template<typename T >
Selector & dds::sub::DataReader< T >::Selector::content (
    const dds::sub::Query & query ) [inline]
```

Select samples based on a **Query** (p. 1778).

The effect of using this manipulator is that the subsequent read/take will filter the samples based on the **Query** (p. 1778)'s expression. If the **DataReader** (p. 756) has no samples that meet the constraints, the read/take will not return any data.

If this method is called before a call to condition then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **condition()** (p. 2031), then the previously set ReadCondition will be cleared.

Parameters

query	The Query (p. 1778) to read/take with
-------	--

8.328.3.5 condition()

```
template<typename T >
Selector & dds::sub::DataReader< T >::Selector::condition (
    const dds::sub::cond::ReadCondition & the_condition ) [inline]
```

Select samples based on a ReadCondition.

When passing a QueryCondition, the effect of calling this method is that the subsequent read/take will filter the samples based on the QueryCondition's expression and state. If the **DataReader** (p. 756) has no samples that meet the constraints, the read/take will not return any data.

Passing an actual ReadCondition will only filter based on the state.

If this method is called before a call to content then it will be overridden and will not have any effect on the read or take operation. Similarly, if this operation follows a call to **content()** (p. 2031) and/or state, then the previously set **Query** (p. 1778) and DataState will be cleared.

This method is effectively a combination of calling content and state, but a QueryCondition is more efficient when reading with the same query multiple times.

For example:

```
samples = reader.select()
    .read()
    .content(dds::sub::Query(system.reader, "foo = 7"))
    .state(dds::sub::status::DataState::new_data())
```

is equivalent to:

```
samples = reader.select()
    .read()
    .condition(QueryCondition(Query(system.reader, "foo = 7"), DataState::new_data()))
```

Parameters

<i>the_condition</i>	The ReadCondition (or QueryCondition) to read/take with
----------------------	---

8.328.3.6 max_samples()

```
template<typename T >
Selector & dds::sub::DataReader< T >::Selector::max_samples (
    int32_t n ) [inline]
```

Choose to only read/take up to a maximum number of samples.

Parameters

<i>n</i>	The maximum number of samples to read/take
----------	--

8.328.3.7 read() [1/3]

```
template<typename T >
dds::sub::LoanedSamples< T > dds::sub::DataReader< T >::Selector::read ( ) [inline]
```

Read samples based on the state associated with this **Selector** (p. 2027).

Returns

dds::sub::LoanedSamples<T>

8.328.3.8 take() [1/3]

```
template<typename T >
dds::sub::LoanedSamples< T > dds::sub::DataReader< T >::Selector::take ( ) [inline]
```

Take samples based on the state associated with this **Selector** (p. 2027).

Returns

dds::sub::LoanedSamples<T>

8.328.3.9 reader()

```
template<typename T >
DataReader dds::sub::DataReader< T >::Selector::reader ( ) const [inline]
```

Returns the **DataReader** (p. 756) associated with the **Selector** (p. 2027).

Returns

dds::sub::DataReader (p. 756)

8.328.3.10 read() [2/3]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t dds::sub::DataReader< T >::Selector::read (
    SamplesFWIterator sfit,
    int32_t the_max_samples ) [inline]
```

Read up to max_samples samples, inserting the samples into a provided container.

Template Parameters

<i>SamplesFWIterator</i>	A forward iterator whose value type is dds::sub::Sample<T>
--------------------------	--

Parameters

<i>sfit</i>	A forward iterator pointing to the position in a container in which to put the read samples
<i>the_max_samples</i>	The maximum number of samples to read

Returns

uint32_t The number of read samples

8.328.3.11 take() [2/3]

```
template<typename T >
template<typename SamplesFWIterator >
uint32_t dds::sub::DataReader< T >::Selector::take (
    SamplesFWIterator sfit,
    int32_t the_max_samples ) [inline]
```

Take up to max_samples samples, inserting the samples into a provided container.

Template Parameters

<i>SamplesFWIterator</i>	A forward iterator whose value type is dds::sub::Sample<T>
--------------------------	--

Parameters

<i>sfit</i>	A forward iterator pointing to the position in a container in which to put the taken samples
<i>the_max_samples</i>	The maximum number of samples to take

Returns

uint32_t The number of taken samples

8.328.3.12 read() [3/3]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t dds::sub::DataReader< T >::Selector::read (
    SamplesBIIterator sbit ) [inline]
```

Read samples, inserting them into a provided container.

Template Parameters

<i>SamplesBIIterator</i>	A back-inserting iterator whose value type is <code>dds::sub::Sample<T></code>
--------------------------	--

Parameters

<i>sbit</i>	A back-inserting iterator placed at the position in the destination container where the read samples should be placed
-------------	---

Returns

`uint32_t` The number of samples that were read

8.328.3.13 take() [3/3]

```
template<typename T >
template<typename SamplesBIIterator >
uint32_t dds::sub::DataReader< T >::Selector::take (
    SamplesBIIterator sbit ) [inline]
```

Take samples, inserting them into a provided container.

Template Parameters

<i>SamplesBIIterator</i>	A back-inserting iterator whose value type is <code>dds::sub::Sample<T></code>
--------------------------	--

Parameters

<i>sbit</i>	A back-inserting iterator placed at the position in the destination container where the taken samples should be placed
-------------	--

Returns

`uint32_t` The number of samples that were taken

8.329 rti::flat::Sequenceliterator< E, OffsetKind > Class Template Reference

Iterator for collections of Offsets.

```
#include <SequenceIterator.hpp>
```

Public Types

- typedef std::forward_iterator_tag **iterator_category**
The iterator category.
- typedef E **value_type**
The element type.
- typedef **value_type** reference
The reference type is the same as the value type, an Offset.
- typedef **value_type** pointer
The pointer type is the same as the value type, an Offset.
- typedef std::ptrdiff_t **difference_type**
The difference type.

Public Member Functions

- **Sequenceliterator** ()
Constructs an invalid iterator.
- bool **is_null** () const
Returns whether the iterator is invalid.
- **value_type** **operator*** () const
Returns the Offset of the current element.
- **value_type** **operator->** () const
Returns the Offset of the current element.
- bool **advance** ()
Advances to the next element, reporting any errors by returning false.
- **Sequenceliterator** & **operator++** ()
Advances to the next element.
- **Sequenceliterator** **operator++** (int)
Advances to the next element.

Friends

- bool **operator<** (const **Sequenceliterator** &s1, const **Sequenceliterator** &s2)
Compares two iterators.
- bool **operator>** (const **Sequenceliterator** &s1, const **Sequenceliterator** &s2)
Compares two iterators.
- bool **operator<=** (const **Sequenceliterator** &s1, const **Sequenceliterator** &s2)
Compares two iterators.
- bool **operator>=** (const **Sequenceliterator** &s1, const **Sequenceliterator** &s2)
Compares two iterators.
- bool **operator==** (const **Sequenceliterator** &s1, const **Sequenceliterator** &s2)
Compares two iterators.
- bool **operator!=** (const **Sequenceliterator** &s1, const **Sequenceliterator** &s2)
Compares two iterators.

8.329.1 Detailed Description

```
template<typename E, typename OffsetKind>  
class rti::flat::Sequenceliterator< E, OffsetKind >
```

Iterator for collections of Offsets.

Template Parameters

<i>E</i>	The Offset type of the elements
<i>OffsetKind</i>	(implementation detail)

Note

This type should not be declared directly. For example, for a **SequenceOffset** (p. 2050), use **SequenceOffset**↔
↔**iterator** (p. 570) (or simply `auto`).

A **SequenceIterator** (p. 2035) moves through the Offset to elements of a sequence or array **Offset** (p. 214), and provides the functionality of a standard `forward_iterator`.

Note that a dereferenced **SequenceIterator** (p. 2035) returns **by value** the Offset to the current element; it doesn't return it by reference.

8.329.2 Member Typedef Documentation

8.329.2.1 iterator_category

```
template<typename E , typename OffsetKind >
typedef std::forward_iterator_tag rti::flat::SequenceIterator< E, OffsetKind >::iterator_↔
category
```

The iterator category.

8.329.2.2 value_type

```
template<typename E , typename OffsetKind >
typedef E rti::flat::SequenceIterator< E, OffsetKind >::value_type
```

The element type.

8.329.2.3 reference

```
template<typename E , typename OffsetKind >
typedef value_type rti::flat::SequenceIterator< E, OffsetKind >::reference
```

The reference type is the same as the value type, an Offset.

8.329.2.4 pointer

```
template<typename E , typename OffsetKind >
typedef value_type rti::flat::SequenceIterator< E, OffsetKind >::pointer
```

The pointer type is the same as the value type, an Offset.

8.329.2.5 difference_type

```
template<typename E , typename OffsetKind >
typedef std::ptrdiff_t rti::flat::SequenceIterator< E, OffsetKind >::difference_type
```

The difference type.

8.329.3 Constructor & Destructor Documentation

8.329.3.1 SequenceIterator()

```
template<typename E , typename OffsetKind >
rti::flat::SequenceIterator< E, OffsetKind >::SequenceIterator ( ) [inline]
```

Constructs an invalid iterator.

8.329.4 Member Function Documentation

8.329.4.1 is_null()

```
template<typename E , typename OffsetKind >
bool rti::flat::SequenceIterator< E, OffsetKind >::is_null ( ) const [inline]
```

Returns whether the iterator is invalid.

8.329.4.2 operator*()

```
template<typename E , typename OffsetKind >
value_type rti::flat::SequenceIterator< E, OffsetKind >::operator* ( ) const [inline]
```

Returns the Offset of the current element.

Returns

The Offset to the current element. Note that this function returns by value, not by reference. This Offset may be **null** (p. 1607) if the iterator has surpassed the length of the collection. See **Offset Error Management** (p.216).

8.329.4.3 operator->()

```
template<typename E , typename OffsetKind >
value_type rti::flat::SequenceIterator< E, OffsetKind >::operator-> ( ) const [inline]
```

Returns the Offset of the current element.

8.329.4.4 advance()

```
template<typename E , typename OffsetKind >
bool rti::flat::SequenceIterator< E, OffsetKind >::advance ( ) [inline]
```

Advances to the next element, reporting any errors by returning false.

Unlike operator++, which throws an exception in case of error, **advance()** (p. 2040) returns false

Returns

True if the function succeeds, or false if there was an error

8.329.4.5 operator++() [1/2]

```
template<typename E , typename OffsetKind >
SequenceIterator & rti::flat::SequenceIterator< E, OffsetKind >::operator++ ( ) [inline]
```

Advances to the next element.

8.329.4.6 operator++() [2/2]

```
template<typename E , typename OffsetKind >
SequenceIterator rti::flat::SequenceIterator< E, OffsetKind >::operator++ (
    int ) [inline]
```

Advances to the next element.

8.329.5 Friends And Related Function Documentation

8.329.5.1 operator<

```
template<typename E , typename OffsetKind >
bool operator< (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

8.329.5.2 operator>

```
template<typename E , typename OffsetKind >
bool operator> (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

8.329.5.3 operator<=

```
template<typename E , typename OffsetKind >
bool operator<= (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

8.329.5.4 operator>=

```
template<typename E , typename OffsetKind >
bool operator>= (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

8.329.5.5 operator==

```
template<typename E , typename OffsetKind >
bool operator== (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

8.329.5.6 operator!=

```
template<typename E , typename OffsetKind >
bool operator!= (
    const SequenceIterator< E, OffsetKind > & s1,
    const SequenceIterator< E, OffsetKind > & s2 ) [friend]
```

Compares two iterators.

8.330 rti::core::SequenceNumber Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A class representing the DDS 64-bit Sequence Number

```
#include <rti/core/SequenceNumber.hpp>
```

Public Member Functions

- **SequenceNumber** ()
Create a default **SequenceNumber** (p. 2042), equal to **unknown()** (p. 2045)
- **SequenceNumber** (int32_t high_value, uint32_t low_value)
Create a **SequenceNumber** (p. 2042) with the provided high and low values.
- **SequenceNumber** (int64_t the_value)
Creates a **SequenceNumber** (p. 2042) from an int64_t.
- int32_t **high** () const
Get the value of the most significant part of the sequence number.
- **SequenceNumber** & **high** (int32_t the_value)
Set the value of the most significant part of the sequence number.
- uint32_t **low** () const
Get the value of the most significant part of the sequence number.
- **SequenceNumber** & **low** (uint32_t the_value)
Set the value of the least significant part of the sequence number.
- long long **value** () const
Get the value of the sequence number.
- void **value** (long long value)
Set the value of the sequence number.
- **SequenceNumber operator+** (const **SequenceNumber** &other) const
Add two SequenceNumbers.
- **SequenceNumber operator-** (const **SequenceNumber** &other) const
Subtract one **SequenceNumber** (p. 2042) from another.
- **SequenceNumber** & **operator+=** (const **SequenceNumber** &other)
Compound assignment operator, assigning the result of the addition to the current **SequenceNumber** (p. 2042) object.
- **SequenceNumber** & **operator-=** (const **SequenceNumber** &other)
Compound assignment operator, assigning the result of the subtraction to the current **SequenceNumber** (p. 2042) object.
- **SequenceNumber operator++** ()
Pre-increment the value of the **SequenceNumber** (p. 2042) by 1.
- **SequenceNumber operator++** (int)
Post-increment the value of the **SequenceNumber** (p. 2042) by 1.
- **SequenceNumber operator--** ()
Pre-decrement the value of the **SequenceNumber** (p. 2042) by 1.
- **SequenceNumber operator--** (int)
Post-decrement the value of the **SequenceNumber** (p. 2042) by 1.
- bool **operator<** (const **SequenceNumber** &other) const
Compare two SequenceNumbers for a less-than relationship.
- bool **operator<=** (const **SequenceNumber** &other) const
Compare two SequenceNumbers for a less-than-or-equal relationship.
- bool **operator>** (const **SequenceNumber** &other) const
Compare two SequenceNumbers for a greater-than relationship.
- bool **operator>=** (const **SequenceNumber** &other) const
Compare two SequenceNumbers for a greater-than-or-equal relationship.

Static Public Member Functions

- static **SequenceNumber zero** ()
Create a **SequenceNumber** (p. 2042) representing 0.
- static **SequenceNumber unknown** ()
Create a **SequenceNumber** (p. 2042) representing the unknown **SequenceNumber** (p. 2042) value.
- static **SequenceNumber maximum** ()
Create a **SequenceNumber** (p. 2042) representing the highest, most positive value for the sequence number.
- static **SequenceNumber automatic** ()
Create a **SequenceNumber** (p. 2042) that will cause the value to be internally determined by RTI Connext.

Related Functions

(Note that these are not member functions.)

- `std::ostream & operator<< (std::ostream &out, const SequenceNumber &sn)`
Prints a **SequenceNumber** (p. 2042) to an output stream.

8.330.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A class representing the DDS 64-bit Sequence Number

8.330.2 Constructor & Destructor Documentation

8.330.2.1 SequenceNumber() [1/3]

```
rti::core::SequenceNumber::SequenceNumber ( ) [inline]
```

Create a default **SequenceNumber** (p. 2042), equal to **unknown()** (p. 2045)

8.330.2.2 SequenceNumber() [2/3]

```
rti::core::SequenceNumber::SequenceNumber (
    int32_t high_value,
    uint32_t low_value ) [inline]
```

Create a **SequenceNumber** (p. 2042) with the provided high and low values.

Parameters

<i>high_value</i>	The value for the most significant part of the sequence number.
<i>low_value</i>	The value for the least significant part of the sequence number.

8.330.2.3 SequenceNumber() [3/3]

```
rti::core::SequenceNumber::SequenceNumber (
    int64_t the_value ) [inline]
```

Creates a **SequenceNumber** (p. 2042) from an `int64_t`.

8.330.3 Member Function Documentation

8.330.3.1 zero()

```
static SequenceNumber rti::core::SequenceNumber::zero ( ) [inline], [static]
```

Create a **SequenceNumber** (p. 2042) representing 0.

8.330.3.2 unknown()

```
static SequenceNumber rti::core::SequenceNumber::unknown ( ) [inline], [static]
```

Create a **SequenceNumber** (p. 2042) representing the unknown **SequenceNumber** (p. 2042) value.

8.330.3.3 maximum()

```
static SequenceNumber rti::core::SequenceNumber::maximum ( ) [inline], [static]
```

Create a **SequenceNumber** (p. 2042) representing the highest, most positive value for the sequence number.

8.330.3.4 automatic()

```
static SequenceNumber rti::core::SequenceNumber::automatic ( ) [inline], [static]
```

Create a **SequenceNumber** (p. 2042) that will cause the value to be internally determined by RTI Connex.

See also

```
rti::core::WriteParams::replace_automatic_values()
```

8.330.3.5 high() [1/2]

```
int32_t rti::core::SequenceNumber::high ( ) const [inline]
```

Get the value of the most significant part of the sequence number.

8.330.3.6 high() [2/2]

```
SequenceNumber & rti::core::SequenceNumber::high (
    int32_t the_value ) [inline]
```

Set the value of the most significant part of the sequence number.

8.330.3.7 low() [1/2]

```
uint32_t rti::core::SequenceNumber::low ( ) const [inline]
```

Get the value of the most significant part of the sequence number.

8.330.3.8 low() [2/2]

```
SequenceNumber & rti::core::SequenceNumber::low (
    uint32_t the_value ) [inline]
```

Set the value of the least significant part of the sequence number.

8.330.3.9 value() [1/2]

```
long long rti::core::SequenceNumber::value ( ) const
```

Get the value of the sequence number.

8.330.3.10 value() [2/2]

```
void rti::core::SequenceNumber::value (
    long long value )
```

Set the value of the sequence number.

8.330.3.11 operator+()

```
SequenceNumber rti::core::SequenceNumber::operator+ (
    const SequenceNumber & other ) const
```

Add two SequenceNumbers.

8.330.3.12 operator-()

```
SequenceNumber rti::core::SequenceNumber::operator- (
    const SequenceNumber & other ) const
```

Subtract one **SequenceNumber** (p. 2042) from another.

8.330.3.13 operator+=()

```
SequenceNumber & rti::core::SequenceNumber::operator+= (
    const SequenceNumber & other )
```

Compound assignment operator, assigning the result of the addition to the current **SequenceNumber** (p. 2042) object.

8.330.3.14 operator-=()

```
SequenceNumber & rti::core::SequenceNumber::operator-= (
    const SequenceNumber & other )
```

Compound assignment operator, assigning the result of the subtraction to the current **SequenceNumber** (p.2042) object.

8.330.3.15 operator++() [1/2]

```
SequenceNumber rti::core::SequenceNumber::operator++ ( )
```

Pre-increment the value of the **SequenceNumber** (p.2042) by 1.

8.330.3.16 operator++() [2/2]

```
SequenceNumber rti::core::SequenceNumber::operator++ (
    int )
```

Post-increment the value of the **SequenceNumber** (p.2042) by 1.

8.330.3.17 operator--() [1/2]

```
SequenceNumber rti::core::SequenceNumber::operator-- ( )
```

Pre-decrement the value of the **SequenceNumber** (p.2042) by 1.

8.330.3.18 operator--() [2/2]

```
SequenceNumber rti::core::SequenceNumber::operator-- (
    int )
```

Post-decrement the value of the **SequenceNumber** (p.2042) by 1.

8.330.3.19 operator<()

```
bool rti::core::SequenceNumber::operator< (
    const SequenceNumber & other ) const
```

Compare two SequenceNumbers for a less-than relationship.

8.330.3.20 operator<=()

```
bool rti::core::SequenceNumber::operator<= (
    const SequenceNumber & other ) const
```

Compare two SequenceNumbers for a less-than-or-equal relationship.

8.330.3.21 operator>()

```
bool rti::core::SequenceNumber::operator> (
    const SequenceNumber & other ) const
```

Compare two SequenceNumbers for a greater-than relationship.

8.330.3.22 operator>=()

```
bool rti::core::SequenceNumber::operator>= (
    const SequenceNumber & other ) const
```

Compare two SequenceNumbers for a greater-than-or-equal relationship.

8.330.4 Friends And Related Function Documentation

8.330.4.1 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const SequenceNumber & sn ) [related]
```

Prints a **SequenceNumber** (p. 2042) to an output stream.

8.331 rti::flat::SequenceOffset< ElementOffset > Class Template Reference

Offset to a sequence of non-primitive elements.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::SequenceOffset< ElementOffset >:

Public Member Functions

- ElementOffset **get_element** (unsigned int i)
Gets the Offset to an element.
- unsigned int **element_count** () const
The number of elements.

Additional Inherited Members

8.331.1 Detailed Description

```
template<typename ElementOffset>
class rti::flat::SequenceOffset< ElementOffset >
```

Offset to a sequence of non-primitive elements.

Template Parameters

<i>ElementOffset</i>	The Offset type, for example MyFlatMutableOffset (p. 1504), MyFlatFinalOffset (p. 1493), or StringOffset (p. 2101).
----------------------	--

Represents an Offset to a sequence member and allows getting an Offset to each of its elements.

A **SequenceOffset** (p. 2050) may meet the requirements to be cast to an array of the equivalent plain C++ element type (see **rti::flat::plain_cast** (p. 217)), if the `ElementOffset` is a final type.

8.331.2 Member Function Documentation

8.331.2.1 get_element()

```
template<typename ElementOffset >
ElementOffset rti::flat::SequenceOffset< ElementOffset >::get_element (
    unsigned int i ) [inline]
```

Gets the Offset to an element.

Parameters

<i>i</i>	The zero-based index to the element
----------	-------------------------------------

Returns

The Offset to the element in the i-th position

8.331.2.2 element_count()

```
template<typename ElementOffset >
unsigned int rti::flat::SequenceOffset< ElementOffset >::element_count ( ) const [inline]
```

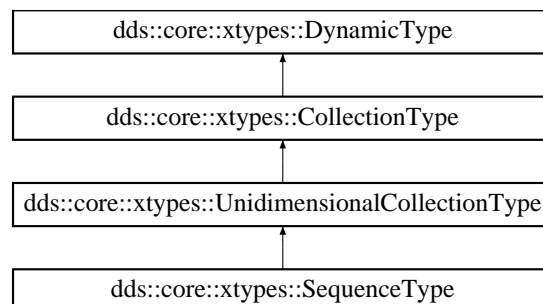

The number of elements.

8.332 dds::core::xtypes::SequenceType Class Reference

<<*value-type*>> (p. 152) Represents an IDL sequence type.

```
#include <dds/core/xtypes/CollectionTypes.hpp>
```

Inheritance diagram for dds::core::xtypes::SequenceType:

Public Member Functions

- **SequenceType** (const **dds::core::xtypes::DynamicType** &type)
Creates an unbounded collection with an element type.
- **SequenceType** (const **dds::core::xtypes::DynamicType** &type, uint32_t bounds)
Creates a bounded collection with an element type.
- **SequenceType** (**dds::core::xtypes::DynamicType** &&type)
<<C++11>> (p. 155) *Creates an unbounded collection with an element type*
- **SequenceType** (**dds::core::xtypes::DynamicType** &&type, uint32_t the_bounds)
<<C++11>> (p. 155) *Creates a bounded collection with an element type*

Additional Inherited Members

8.332.1 Detailed Description

<<*value-type*>> (p. 152) Represents an IDL *sequence* type.

8.332.2 Constructor & Destructor Documentation

8.332.2.1 SequenceType() [1/4]

```
dds::core::xtypes::SequenceType::SequenceType (
    const dds::core::xtypes::DynamicType & type ) [explicit]
```

Creates an unbounded collection with an element type.

Parameters

<i>type</i>	The element type
-------------	------------------

8.332.2.2 SequenceType() [2/4]

```
dds::core::xtypes::SequenceType::SequenceType (
    const dds::core::xtypes::DynamicType & type,
    uint32_t bounds )
```

Creates a bounded collection with an element type.

Parameters

<i>type</i>	The element type
<i>bounds</i>	The maximum length

8.332.2.3 SequenceType() [3/4]

```
dds::core::xtypes::SequenceType::SequenceType (
    dds::core::xtypes::DynamicType && type ) [inline], [explicit]
```

<<**C++11**>> (p. 155) Creates an unbounded collection with an element type

Parameters

<i>type</i>	The element type
-------------	------------------

8.332.2.4 SequenceType() [4/4]

```
dds::core::xtypes::SequenceType::SequenceType (
    dds::core::xtypes::DynamicType && type,
    uint32_t the_bounds ) [inline]
```

<<**C++11**>> (p. 155) Creates a bounded collection with an element type

Parameters

<i>type</i>	The element type
<i>the_bounds</i>	The maximum length

8.333 dds::rpc::Server Class Reference

<<**reference-type**>> (p. 153) Provides the execution environment for one or more **ServiceEndpoint** (p.2061).

```
#include <dds/rpc/Server.hpp>
```

Public Member Functions

- **Server** ()

- Creates a new server with default **ServerParams** (p. 2055).*

 - **Server** (const **ServerParams** ¶ms)
 - Creates a new server with the specified **ServerParams** (p. 2055).*
 - void **run** ()
 - Holds the execution of the current thread.*
 - void **run** (const **dds::core::Duration** &max_wait)
 - Holds the execution of the current thread for the specified amount of time.*
 - void **close** ()
 - Forces the destruction of this entity.*

8.333.1 Detailed Description

<<*reference-type*>> (p. 153) Provides the execution environment for one or more **ServiceEndpoint** (p. 2061).

8.333.2 Constructor & Destructor Documentation

8.333.2.1 Server() [1/2]

```
dds::rpc::Server::Server ( ) [inline]
```

Creates a new server with default **ServerParams** (p. 2055).

8.333.2.2 Server() [2/2]

```
dds::rpc::Server::Server (
    const ServerParams & params ) [inline], [explicit]
```

Creates a new server with the specified **ServerParams** (p. 2055).

8.333.3 Member Function Documentation

8.333.3.1 run() [1/2]

```
void dds::rpc::Server::run ( ) [inline]
```

Holds the execution of the current thread.

Calling this function is optional. A **Server** (p. 2053) manages a thread pool that runs as soon as a **ServiceEndpoint** (p. 2061) is attached.

8.333.3.2 run() [2/2]

```
void dds::rpc::Server::run (
    const dds::core::Duration & max_wait ) [inline]
```

Holds the execution of the current thread for the specified amount of time.

Calling this function is optional. A **Server** (p.2053) manages a thread pool that runs as soon as a **ServiceEndpoint** (p.2061) is attached.

Parameters

<i>max_wait</i>	The time to sleep
-----------------	-------------------

8.333.3.3 close()

```
void dds::rpc::Server::close ( ) [inline]
```

Forces the destruction of this entity.

If **run()** (p.2054) is currently blocked on another thread, **close()** (p.2055) unblocks it.

Any operation after **close()** (p.2055) throws **dds::core::AlreadyClosedError** (p.594)

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Reference types (p.153)

8.334 dds::rpc::ServerParams Class Reference

<<**value-type**>> (p.152) The parameters used to configure a **Server** (p.2053)

```
#include <dds/rpc/ServerParams.hpp>
```

Public Member Functions

- void **thread_pool_size** (int32_t size)
*Configures the number of threads of a **Server** (p. 2053) thread pool.*
- int32_t **thread_pool_size** () const
Returns the thread pool size.
- rti::core::cond::AsyncWaitSetProperty & **async_waitset_property** ()
Allows fine-tuning the internal AsyncWaitSet used to process function calls.
- const rti::core::cond::AsyncWaitSetProperty & **async_waitset_property** () const
Returns the AsyncWaitSetProperty by const reference.

8.334.1 Detailed Description

<<*value-type*>> (p. 152) The parameters used to configure a **Server** (p. 2053)

8.334.2 Member Function Documentation

8.334.2.1 thread_pool_size() [1/2]

```
void thread_pool_size (
    int32_t size )
```

Configures the number of threads of a **Server** (p. 2053) thread pool.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

By default a server uses only one thread, processing all function calls sequentially. Increasing the pool size provides more parallelism.

8.334.2.2 thread_pool_size() [2/2]

```
int32_t thread_pool_size ( ) const
```

Returns the thread pool size.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

8.334.2.3 `async_waitset_property()` [1/2]

```
rti::core::cond::AsyncWaitSetProperty & async_waitset_property ( )
```

Allows fine-tuning the internal AsyncWaitSet used to process function calls.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

8.334.2.4 `async_waitset_property()` [2/2]

```
const rti::core::cond::AsyncWaitSetProperty & async_waitset_property ( ) const
```

Returns the AsyncWaitSetProperty by const reference.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

8.335 `rti::core::policy::Service` Class Reference

<<*extension*>> (p. 156) Indicates if an Entity is associated with a service and if so, which one.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **Service** ()
Creates the default policy (no service)
- **Service** (`rti::core::policy::ServiceKind` the_kind)
Creates an instance with the specified service kind.
- **Service & kind** (const `rti::core::policy::ServiceKind` the_kind)
Sets the service kind.
- **rti::core::policy::ServiceKind** kind () const
Gets the service kind.

Static Public Member Functions

- static **Service NoService** ()
*Returns a **Service** (p. 2057) with ServiceKind::NO_SERVICE.*
- static **Service PersistenceService** ()
*Returns a **Service** (p. 2057) with ServiceKind::PERSISTENCE.*
- static **Service QueuingService** ()
*Returns a **Service** (p. 2057) with ServiceKind::QUEUING.*
- static **Service RoutingService** ()
*Returns a **Service** (p. 2057) with ServiceKind::ROUTING.*
- static **Service RecordingService** ()
*Returns a **Service** (p. 2057) with ServiceKind::RECORDING.*
- static **Service ReplayService** ()
*Returns a **Service** (p. 2057) with ServiceKind::REPLAY.*
- static **Service DatabaseIntegrationService** ()
*Returns a **Service** (p. 2057) with ServiceKind::DATABASE_INTEGRATION.*
- static **Service WebIntegrationService** ()
*Returns a **Service** (p. 2057) with ServiceKind::WEB_INTEGRATION.*
- static **Service ObservabilityCollectorService** ()
*Returns a **Service** (p. 2057) with ServiceKind::OBSERVABILITY_COLLECTOR.*

8.335.1 Detailed Description

<<*extension*>> (p. 156) Indicates if an Entity is associated with a service and if so, which one.

This QoS policy is intended to be used by RTI infrastructure services.

User applications should not modify its value.

Entity:

dds::domain::DomainParticipant (p. 1079), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = UNTIL ENABLE (p. 307)

8.335.2 Constructor & Destructor Documentation

8.335.2.1 Service() [1/2]

```
rti::core::policy::Service::Service ( ) [inline]
```

Creates the default policy (no service)

8.335.2.2 Service() [2/2]

```
rti::core::policy::Service::Service (
    rti::core::policy::ServiceKind the_kind ) [inline]
```

Creates an instance with the specified service kind.

8.335.3 Member Function Documentation

8.335.3.1 NoService()

```
static Service rti::core::policy::Service::NoService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::NO_SERVICE.

8.335.3.2 PersistenceService()

```
static Service rti::core::policy::Service::PersistenceService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::PERSISTENCE.

8.335.3.3 QueuingService()

```
static Service rti::core::policy::Service::QueuingService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::QUEUEING.

8.335.3.4 RoutingService()

```
static Service rti::core::policy::Service::RoutingService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::ROUTING.

8.335.3.5 RecordingService()

```
static Service rti::core::policy::Service::RecordingService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::RECORDING.

8.335.3.6 ReplayService()

```
static Service rti::core::policy::Service::ReplayService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::REPLAY.

8.335.3.7 DatabaseIntegrationService()

```
static Service rti::core::policy::Service::DatabaseIntegrationService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::DATABASE_INTEGRATION.

8.335.3.8 WebIntegrationService()

```
static Service rti::core::policy::Service::WebIntegrationService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::WEB_INTEGRATION.

8.335.3.9 ObservabilityCollectorService()

```
static Service rti::core::policy::Service::ObservabilityCollectorService ( ) [inline], [static]
```

Returns a **Service** (p. 2057) with ServiceKind::OBSERVABILITY_COLLECTOR.

8.335.3.10 kind() [1/2]

```
Service & rti::core::policy::Service::kind (
    const rti::core::policy::ServiceKind the_kind )
```

Sets the service kind.

8.335.3.11 kind() [2/2]

```
rti::core::policy::ServiceKind rti::core::policy::Service::kind ( ) const
```

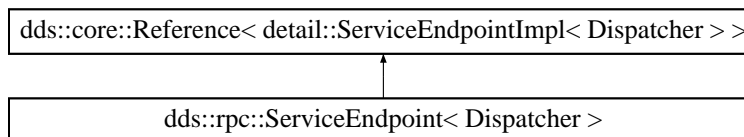

Gets the service kind.

8.336 dds::rpc::ServiceEndpoint< Dispatcher > Class Template Reference

Manages the DDS entities required to receive function calls and send the return values.

```
#include <ServiceEndpoint.hpp>
```

Inheritance diagram for dds::rpc::ServiceEndpoint< Dispatcher >:

Public Types

- using **InterfaceType** = typename Dispatcher::InterfaceType
The interface type, such as `rpc_example::RobotControl` (p. 1931).
- using **RequestType** = typename Dispatcher::RequestType
The internal type used to receive requests (function calls)
- using **ReplyType** = typename Dispatcher::ReplyType
The internal type used to send replies (the return values of the function calls)

Public Member Functions

- **ServiceEndpoint** (std::shared_ptr< **InterfaceType** > service_impl, **dds::rpc::Server** server, const **Service**↔
Params ¶ms)
Construct a new Service Endpoint object.
- void **close** ()
Destroys the underlying resources.
- **dds::sub::DataReader**< **RequestType** > **request_datareader** ()
Accesses the underlying DataReader that receives the requests (function calls)
- **dds::pub::DataWriter**< **ReplyType** > **reply_datawriter** ()
Accesses the underlying DataWriter that sends the replies (return values from the function calls)

8.336.1 Detailed Description

```
template<typename Dispatcher>
class dds::rpc::ServiceEndpoint< Dispatcher >
```

Manages the DDS entities required to receive function calls and send the return values.

Template Parameters

<i>Dispatcher</i>	Internal type generated by <code>rtiddsgen</code>
-------------------	---

Applications shouldn't use this class directly. `rtiddsgen` will generate the proper instantiation of this class, such as `rpc_example::RobotControlService`

A **ServiceEndpoint** (p. 2061) requires a an implementation of an IDL service interface, such as **rpc_example::RobotControl** (p. 1931).

A **ServiceEndpoint** (p. 2061) is attached to a **Server** (p. 2053) in order to start receiving and processing remote function calls.

8.336.2 Member Typedef Documentation

8.336.2.1 InterfaceType

```
template<typename Dispatcher >
using dds::rpc::ServiceEndpoint< Dispatcher >::InterfaceType = typename Dispatcher::InterfaceType
```

The interface type, such as **rpc_example::RobotControl** (p. 1931).

8.336.2.2 RequestType

```
template<typename Dispatcher >
using dds::rpc::ServiceEndpoint< Dispatcher >::RequestType = typename Dispatcher::RequestType
```

The internal type used to receive requests (function calls)

8.336.2.3 ReplyType

```
template<typename Dispatcher >
using dds::rpc::ServiceEndpoint< Dispatcher >::ReplyType = typename Dispatcher::ReplyType
```

The internal type used to send replies (the return values of the function calls)

8.336.3 Constructor & Destructor Documentation

8.336.3.1 ServiceEndpoint()

```
template<typename Dispatcher >
dds::rpc::ServiceEndpoint< Dispatcher >::ServiceEndpoint (
    std::shared_ptr< InterfaceType > service_impl,
    dds::rpc::Server server,
    const ServiceParams & params ) [inline]
```

Construct a new Service Endpoint object.

Parameters

<i>service_impl</i>	The implementation of the DDS service, such as <code>rpc_example::RobotControl</code> (p. 1931).
<i>server</i>	The server where to run this service endpoint.
<i>params</i>	The parameters used to configure this service endpoint

8.336.4 Member Function Documentation

8.336.4.1 close()

```
template<typename Dispatcher >
void dds::rpc::ServiceEndpoint< Dispatcher >::close ( ) [inline]
```

Destroys the underlying resources.

Any operation after `close()` (p. 2063) throws `dds::core::AlreadyClosedError` (p. 594)

8.336.4.2 request_datareader()

```
template<typename Dispatcher >
dds::sub::DataReader< RequestType > dds::rpc::ServiceEndpoint< Dispatcher >::request_datareader
( ) [inline]
```

Accesses the underlying DataReader that receives the requests (function calls)

Returns

The DataReader

8.336.4.3 reply_datawriter()

```
template<typename Dispatcher >
dds::pub::DataWriter< ReplyType > dds::rpc::ServiceEndpoint< Dispatcher >::reply_datawriter (
) [inline]
```

Accesses the underlying DataWriter that sends the replies (return values from the function calls)

Returns

The DataWriter

8.337 rti::core::policy::ServiceKind_def Struct Reference

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) ServiceKind

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
 - `NO_SERVICE`,
 - `PERSISTENCE`,
 - `QUEUING`,
 - `ROUTING`,
 - `RECORDING`,
 - `REPLAY`,
 - `DATABASE_INTEGRATION`,
 - `WEB_INTEGRATION`,
 - `OBSERVABILITY_COLLECTOR` }

The underlying enum type.

8.337.1 Detailed Description

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `ServiceKind`

8.337.2 Member Enumeration Documentation

8.337.2.1 type

```
enum rti::core::policy::ServiceKind_def::type
```

The underlying `enum` type.

Enumerator

NO_SERVICE	There is no service associated to the Entity.
PERSISTENCE	The Entity is associated to RTI Persistence Service (p. 2057).
QUEUING	The Entity is associated to RTI Queuing Service (p. 2057).
ROUTING	The Entity is associated to RTI Routing Service (p. 2057).
RECORDING	The Entity is associated to RTI Recording Service (p. 2057).
REPLAY	The Entity is associated to RTI Replay Service (p. 2057).
DATABASE_INTEGRATION	The Entity is associated to RTI Database (p. 751) Integration Service (p. 2057).
WEB_INTEGRATION	The Entity is associated to RTI Web Integration Service (p. 2057).
OBSERVABILITY_COLLECTOR	The Entity is associated to RTI Observability Collector Service (p. 2057).

8.338 rti::topic::ServiceRequest Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A request coming from one of the built-in services

```
#include <dds/topic/BuiltinTopic.hpp>
```

Public Member Functions

- `rti::core::ServiceRequestId service_id () const`
Get the service id of the request.
- `const rti::core::Guid & instance_id () const`
Get the instance id of the request.
- `const dds::core::vector< uint8_t > & request_body () const`
Get the request body of the request.

8.338.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) A request coming from one of the built-in services

Data associated with the built-in topic `rti::topic::service_request_topic_name()` (p. 358). It contains service-specific information.

See also

`rti::topic::service_request_topic_name()` (p. 358)

8.338.2 Member Function Documentation

8.338.2.1 `service_id()`

```
rti::core::ServiceRequestId rti::topic::ServiceRequest::service_id ( ) const [inline]
```

Get the service id of the request.

Returns

The service id of the request

8.338.2.2 `instance_id()`

```
const rti::core::Guid & rti::topic::ServiceRequest::instance_id ( ) const [inline]
```

Get the instance id of the request.

Returns

The instance id of the request

8.338.2.3 `request_body()`

```
const dds::core::vector< uint8_t > & rti::topic::ServiceRequest::request_body ( ) const [inline]
```

Get the request body of the request.

Returns

The request body of the request

8.339 rti::core::status::ServiceRequestAcceptedStatus Class Reference

<<*extension*>> (p.156) Information about the status `dds::core::status::StatusMask::service_request_↔`
`accepted()` (p.2095)

```
#include <Status.hpp>
```

Inherits `rti::core::NativeValueType< T, NATIVE_T, ADAPTER >`.

Public Member Functions

- **EventCount32 total_count ()** const
The total cumulative number of ServiceRequests that have been accepted by a `dds::pub::DataWriter` (p.908).
- **EventCount32 current_count ()** const
The current number of ServiceRequests that have been accepted by this `dds::pub::DataWriter` (p.908).
- **dds::core::InstanceHandle last_request_handle ()** const
A handle to the last `rti::topic::ServiceRequest` (p.2065) that caused the `dds::pub::DataWriter` (p.908)'s status to change.
- **rti::core::ServiceRequestId service_id ()** const
ID of the service to which the accepted Request belongs.

8.339.1 Detailed Description

<<*extension*>> (p.156) Information about the status `dds::core::status::StatusMask::service_request_↔`
`accepted()` (p.2095)

Currently, the only service that causes the `ServiceRequestAcceptedStatus` (p.2067) to be triggered is the `rti::sub↔`
`::TopicQuery` (p.2220) service. A `rti::topic::ServiceRequest` (p.2065) is accepted when a `dds::pub::DataWriter`
(p.908) matches with a `dds::sub::DataReader` (p.756) that has created a `rti::sub::TopicQuery` (p.2220).

This status is also changed (and the listener, if any, called) when a ServiceRequest has been cancelled, or deleted. This will happen when a `dds::sub::DataReader` (p.756) deletes a TopicQuery using `rti::sub::TopicQuery::close()` (p.2222).

8.339.2 Member Function Documentation

8.339.2.1 total_count()

```
EventCount32 rti::core::status::ServiceRequestAcceptedStatus::total_count ( ) const [inline]
```

The total cumulative number of ServiceRequests that have been accepted by a `dds::pub::DataWriter` (p.908).

This number increases whenever a new request is accepted. It does not change when a request is cancelled.

8.339.2.2 `current_count()`

```
EventCount32 rti::core::status::ServiceRequestAcceptedStatus::current_count ( ) const [inline]
```

The current number of ServiceRequests that have been accepted by this **dds::pub::DataWriter** (p. 908).

This number increases when a new request is accepted and decreases when an existing request is cancelled.

8.339.2.3 `last_request_handle()`

```
dds::core::InstanceHandle rti::core::status::ServiceRequestAcceptedStatus::last_request_handle (
) const [inline]
```

A handle to the last **rti::topic::ServiceRequest** (p. 2065) that caused the **dds::pub::DataWriter** (p. 908)'s status to change.

8.339.2.4 `service_id()`

```
rti::core::ServiceRequestId rti::core::status::ServiceRequestAcceptedStatus::service_id ( ) const
[inline]
```

ID of the service to which the accepted Request belongs.

See also

rti::core::ServiceRequestId_def::TOPIC_QUERY (p. 2069)

8.340 `rti::core::ServiceRequestId_def` Struct Reference

The definition of the `rti::core::safe_enum` `ServiceRequestId`.

```
#include <rti/core/ServiceRequestId.hpp>
```

Public Types

- **enum type** {
 - UNKNOWN** = PRES_SERVICE_REQUEST_ID_UNKNOWN ,
 - TOPIC_QUERY** = PRES_SERVICE_REQUEST_ID_TOPIC_QUERY ,
 - LOCATOR_REACHABILITY** = PRES_SERVICE_REQUEST_ID_LOCATOR_REACHABILITY ,
 - INSTANCE_STATE** = PRES_SERVICE_REQUEST_ID_INSTANCE_STATE ,
 - MONITORING_LIBRARY_COMMAND** ,
 - MONITORING_LIBRARY_REPLY** }

The underlying enum type.

8.340.1 Detailed Description

The definition of the rti::core::safe_enum ServiceRequestId.

Use ServiceRequestId.

8.340.2 Member Enumeration Documentation

8.340.2.1 type

```
enum rti::core::ServiceRequestId_def::type
```

The underlying enum type.

Enumerator

UNKNOWN	An unknown service.
TOPIC_QUERY	The topic query service.
LOCATOR_REACHABILITY	The locator reachability service.
INSTANCE_STATE	The instance state service.
MONITORING_LIBRARY_COMMAND	The Monitoring Library 2.0 command service.
MONITORING_LIBRARY_REPLY	The Monitoring Library 2.0 reply service.

8.341 dds::sub::SharedSamples< T, DELEGATE > Class Template Reference

<<*reference-type*>> (p. 153) A sharable and container-safe version of **LoanedSamples** (p. 1406).

```
#include <dds/sub/SharedSamples.hpp>
```

Public Member Functions

*<<extension>> (p. 156) <<C++11>> (p. 155) Unpacks a **LoanedSamples** (p. 1406) collection into individual *shared_ptr*'s in a vector*

8.341.1 Detailed Description

```
template<typename T, template< typename Q > class DELEGATE = detail::SharedSamples>
class dds::sub::SharedSamples< T, DELEGATE >
```

<<reference-type>> (p. 153) A sharable and container-safe version of **LoanedSamples** (p. 1406).

A **SharedSamples** (p. 2069) instance is constructed from a **LoanedSamples** (p. 1406) instance, removing the ownership of the loan from the **LoanedSamples** (p. 1406).

The destruction of the **LoanedSamples** (p. 1406) object or the explicit invocation of its method `return_loan` will have no effect on loaned data.

Constructing a **SharedSamples** (p. 2069) from another **SharedSamples** (p. 2069), creates a new reference to the same loan. Loaned data will be returned automatically to the **DataReader** (p. 756) once the reference count reaches zero.

See also

LoanedSamples (p. 1406)

8.341.2 Constructor & Destructor Documentation

8.341.2.1 SharedSamples()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
dds::sub::SharedSamples< T, DELEGATE >::SharedSamples (
    dds::sub::LoanedSamples< T > & ls ) [inline]
```

Constructs and instance of **SharedSamples** (p. 2069) removing the ownership of the loan from the **LoanedSamples** (p. 1406).

The constructor is implicit to simplify statements like the following:

```
SharedSamples<Foo> samples = reader.take(); // reader.take() returns LoanedSamples
```

Parameters

<i>/s</i>	the loaned samples.
-----------	---------------------

8.341.3 Member Function Documentation

8.341.3.1 begin()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
const_iterator dds::sub::SharedSamples< T, DELEGATE >::begin ( ) const [inline]
```

Same as **LoanedSamples::begin()** (p. 1410)

See also

LoanedSamples::begin() (p. 1410)

8.341.3.2 end()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
const_iterator dds::sub::SharedSamples< T, DELEGATE >::end ( ) const [inline]
```

Same as **LoanedSamples::end()** (p. 1411)

See also

LoanedSamples::end() (p. 1411)

8.341.3.3 operator[]()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
DELEGATE< T >::value_type dds::sub::SharedSamples< T, DELEGATE >::operator[] (
    size_t index ) const [inline]
```

Same as **LoanedSamples::operator[](size_t)** (p. 1409)

See also

LoanedSamples::operator[](size_t) (p. 1409)

8.341.3.4 length()

```
template<typename T , template< typename Q > class DELEGATE = detail::SharedSamples>
uint32_t dds::sub::SharedSamples< T, DELEGATE >::length ( ) const [inline]
```

Returns the number of samples.

See also

LoanedSamples::length() (p. 1410)

Referenced by **dds::sub::SharedSamples< T, DELEGATE >::unpack()**.

8.341.4 Friends And Related Function Documentation

8.341.4.1 unpack() [1/3]

```
template<typename T >
void unpack (
    const dds::sub::SharedSamples< T > & samples,
    std::vector< std::shared_ptr< const T > > & sample_vector ) [related]
```

<<**extension**>> (p. 156) <<**C++11**>> (p. 155) Unpacks a **SharedSamples** (p.2069) collection into individual `shared_ptr`'s in a vector

Note

```
#include <rti/sub/unpack.hpp>
```

This is a standalone function in the namespace **rti::sub** (p. 538)

This function creates a reference (not a copy) to each sample with valid data in a **SharedSamples** (p. 2069) container and pushes it back into a vector.

Each individual sample in the vector retains a reference to the original **SharedSamples** (p. 2069) that controls when the loan is returned. These references can be further shared. When all the references go out of scope, the loan is returned.

This can be also useful to insert samples from different calls to **read()** (p. 449)/**take()** into the same vector. It is however recommended to not hold these samples indefinitely, since they use internal resources.

Example:

```
dds::sub::SharedSamples<Foo> shared_samples = reader.take();
std::vector<std::shared_ptr<const Foo> sample_vector;
rti::sub::unpack(shared_samples, sample_vector);
std::cout << *sample_vector[0] << std::endl;
// ...
// Read more samples, unpack them at the end of the same vector
shared_samples = reader.take();
rti::sub::unpack(shared_samples, sample_vector);
// References to the samples can be shared freely
std::shared_ptr<const Foo> sample = sample_vector[3];
// ...
// The loans will be returned automatically
```

Note

To finalize a **DataReader** (p. 756), all the `shared_ptr` obtained via **unpack()** (p. 2072) need to have been released. Otherwise **DataReader::close()** (p. 801) will fail with **dds::core::PreconditionNotMetError** (p. 1669).

Template Parameters

<i>T</i>	The topic-type
----------	----------------

Parameters

<i>samples</i>	The collection of samples obtained from the DataReader (p. 756)
<i>sample_vector</i>	The destination where the samples are pushed back.

8.341.4.2 `unpack()` [2/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > unpack (
    const dds::sub::SharedSamples< T > & samples ) [related]
```

<<**extension**>> (p. 156) <<**C++11**>> (p. 155) Unpacks a **SharedSamples** (p.2069) collection into individual `shared_ptr`'s in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

This overload returns a new vector instead of adding into an existing one.

See also

unpack(const dds::sub::SharedSamples<T>&, std::vector<std::shared_ptr<const T> >&) (p. 2072)

References **dds::sub::SharedSamples< T, DELEGATE >::length()**, and **rti::sub::unpack()**.

8.341.4.3 `unpack()` [3/3]

```
template<typename T >
std::vector< std::shared_ptr< const T > > unpack (
    dds::sub::LoanedSamples< T > && samples ) [related]
```

<<**extension**>> (p. 156) <<**C++11**>> (p. 155) Unpacks a **LoanedSamples** (p.1406) collection into individual `shared_ptr`'s in a vector

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

This overload is a shortcut for `unpack(SharedSamples<T>(loaned_samples))` to simplify code like the following:

```
auto sample_vector = unpack(reader.take());
```

unpack(const dds::sub::SharedSamples<T>&, std::vector<std::shared_ptr<const T> >&) (p. 2072)

References **rti::sub::unpack()**.

8.342 rti::sub::SharedSamples< T > Class Template Reference

Provides access to a collection of middleware-loaned samples.

```
#include <SharedSamplesImpl.hpp>
```

Public Types

- typedef **SampleIterator**< T > **iterator**

The iterator type.

8.342.1 Detailed Description

```
template<typename T>
class rti::sub::SharedSamples< T >
```

Provides access to a collection of middleware-loaned samples.

The samples in this container are loaned from the middleware and must be returned at some point.

To return the loan, use **dds::sub::LoanedSamples::return_loan** (p. 1410)

The contents of this container should not be modified and references to the samples it contains are only valid before the loan is returned.

Template Parameters

<i>T</i>	The data type of the contained Samples
----------	--

8.342.2 Member Typedef Documentation

8.342.2.1 iterator

```
template<typename T >
typedef SampleIterator<T> rti::sub::SharedSamples< T >::iterator
```

The iterator type.

8.343 rti::request::SimpleReplier< RequestType, ReplyType > Class Template Reference

<<*reference-type*>> (p. 153) A callback-based replier

```
#include <rti/request/SimpleReplier.hpp>
```

Inheritance diagram for rti::request::SimpleReplier< RequestType, ReplyType >:

Public Member Functions

- template<typename Functor >
SimpleReplier (**dds::domain::DomainParticipant** participant, const std::string &service_name, Functor request_handler)
*Creates a **SimpleReplier** (p. 2075).*
- template<typename Functor >
SimpleReplier (const **ReplierParams** ¶ms, Functor request_handler)
*Creates a **SimpleReplier** (p. 2075) with additional parameters.*

8.343.1 Detailed Description

```
template<typename RequestType, typename ReplyType>
class rti::request::SimpleReplier< RequestType, ReplyType >
```

<<*reference-type*>> (p. 153) A callback-based replier

Note

A **SimpleReplier** (p. 2075) provides all the functions of a <<*reference-type*>> (p. 153) except **close()** (p. 801) and **retain()**.

A **SimpleReplier** (p. 2075) is based on a callback functor . Requests are passed to the callback, which returns a reply. The reply is directed only to the **Requester** (p. 1907) that sent the request.

SimpleRepliers are useful for simple use cases where a single reply for a request can be generated quickly, for example, looking up a table.

When more than one reply for a request can be generated or the processing is complex or needs to happen asynchronously, use a **rti::request::Replier** (p. 1888) instead.

See also

rti::request::Replier (p. 1888)

SimpleReplier example (p. 149)

In the following example, the **SimpleReplier** (p. 2075) responds to requests consisting of the built-in type **dds::core::StringTopicType** (p. 2102) with another string that prepends "Hello" to the request.

```
SimpleReplier<StringTopicType, StringTopicType> simple_replier(
    participant,
    "Test",
    [](const StringTopicType& request) {
        // If a Requester sends "World", this SimpleReplier will
        // reply with "Hello World"
        return StringTopicType("Hello " + request.data());
    }
);
```

8.343.2 Constructor & Destructor Documentation

8.343.2.1 SimpleReplier() [1/2]

```
template<typename RequestType , typename ReplyType >
template<typename Functor >
rti::request::SimpleReplier< RequestType, ReplyType >::SimpleReplier (
    dds::domain::DomainParticipant participant,
    const std::string & service_name,
    Functor request_handler ) [inline]
```

Creates a **SimpleReplier** (p. 2075).

Template Parameters

<i>Functor</i>	A function or function object that can receive a single parameter <code>const RequestType&</code> and returns a <code>ReplyType</code> instance by value.
----------------	---

Parameters

<i>participant</i>	The DomainParticipant that the Replier (p. 1888) uses to join a domain.
<i>service_name</i>	The service name. See ReplierParams::service_name (p. 1901)
<i>request_handler</i>	A functor that receives a request and returns a reply

8.343.2.2 SimpleReplier() [2/2]

```
template<typename RequestType , typename ReplyType >
template<typename Functor >
```

```
rti::request::SimpleReplier< RequestType, ReplyType >::SimpleReplier (
    const ReplierParams & params,
    Functor request_handler ) [inline]
```

Creates a **SimpleReplier** (p. 2075) with additional parameters.

Template Parameters

<i>Functor</i>	A function or function object that can receive a single parameter const RequestType& and returns a ReplyType instance by value.
----------------	---

Parameters

<i>params</i>	The parameters used to configure the replier
<i>request_handler</i>	A functor that receives a request and returns a reply

8.344 rti::util::heap_monitoring::SnapshotContentFormat_def Struct Reference

Bitmap used to decide which information of the snapshot will be displayed.

```
#include <rti/util/util.hpp>
```

Public Types

- enum **type** {
TOPIC ,
FUNCTION ,
ACTIVITY ,
DEFAULT ,
MINIMAL }

The underlying enum type.

8.344.1 Detailed Description

Bitmap used to decide which information of the snapshot will be displayed.

The definition of the **rti::util::heap_monitoring** (p. 566) SnapshotContentFormat;

8.344.2 Member Enumeration Documentation

8.344.2.1 type

```
enum rti::util::heap_monitoring::SnapshotContentFormat_def::type
```

The underlying enum type.

Enumerator

TOPIC	Add the topic to the snapshot of heap monitoring.
FUNCTION	Add the function name to the snapshot of heap monitoring.
ACTIVITY	Add the activity context to the snapshot of heap monitoring. The user can select the information that will be part of the activity context by using the API <code>rti::config::activity_context::set_attribute_mask()</code> (p. 248)
DEFAULT	Add all the optional attributes to the snapshot of heap monitoring.
MINIMAL	Not add any optional attribute to the snapshot of heap monitoring.

8.345 rti::util::heap_monitoring::SnapshotOutputFormat_def Struct Reference

Specify the format of the output of the snapshot. RTI Connex.

```
#include <rti/util/util.hpp>
```

Public Types

- enum `type` {
STANDARD ,
COMPRESSED }

The underlying enum type.

8.345.1 Detailed Description

Specify the format of the output of the snapshot. RTI Connex.

The definition of the `rti::util::heap_monitoring` (p. 566) `SnapshotOutputFormat`;

8.345.2 Member Enumeration Documentation

8.345.2.1 type

```
enum rti::util::heap_monitoring::SnapshotOutputFormat_def::type
```

The underlying enum type.

Enumerator

STANDARD	The output of the snapshot will be in plain text.
COMPRESSED	The output of the snapshot will be compressed using Zlib technology. The file can be uncompressed using zlib-flate.

8.346 dds::core::cond::StatusCondition Class Reference

<<*reference-type*>> (p. 153) A condition associated with each `dds::core::Entity` (p. 1265)

```
#include <dds/core/cond/StatusCondition.hpp>
```

Inheritance diagram for `dds::core::cond::StatusCondition`:

Public Member Functions

- **StatusCondition** (const `dds::core::Entity` &the_entity)
Obtains a reference to the *StatusCondition* (p. 2079) in an entity.
- void **enabled_statuses** (const `dds::core::status::StatusMask` &status)
Defines the list of communication statuses that determine the trigger value.
- const `dds::core::status::StatusMask` **enabled_statuses** () const
Gets the list of enabled statuses.
- `dds::core::Entity` **entity** () const
Get the *dds::core::Entity* (p. 1265) associated with this *StatusCondition* (p. 2079).
- template<typename Functor >
void **handler** (const Functor &func)
<<*extension*>> (p. 156) Registers a custom handler with this condition.
- void **reset_handler** ()
<<*extension*>> (p. 156) Resets the handler for this condition.

8.346.1 Detailed Description

<<*reference-type*>> (p. 153) A condition associated with each `dds::core::Entity` (p. 1265)

The `trigger_value` of the `dds::core::cond::StatusCondition` (p. 2079) depends on the communication status of that entity (e.g., arrival of data, loss of information, etc.), 'filtered' by the set of `enabled_statuses` on the `dds::core::cond::StatusCondition` (p. 2079).

See also

Status Kinds (p. 229)

dds::core::cond::WaitSet (p. 2318), **dds::core::cond::Condition** (p. 729)

Listener (p. 1381)

Note

There is exactly one **StatusCondition** (p. 2079) per **Entity** (p. 1265) and one **Entity** (p. 1265) per **StatusCondition** (p. 2079).

Warning

Destroying an **Entity** (p. 1265) invalidates all references to its **StatusCondition** (p. 2079). To avoid that, always keep a reference to the **Entity** (p. 1265) while you also have one to its **StatusCondition** (p. 2079) or **retain** (p. 1271) the **Entity** (p. 1265).

8.346.2 Constructor & Destructor Documentation

8.346.2.1 StatusCondition()

```
dds::core::cond::StatusCondition::StatusCondition (
    const dds::core::Entity & the_entity ) [inline]
```

Obtains a reference to the **StatusCondition** (p. 2079) in an entity.

Parameters

<i>the_entity</i>	The Entity (p. 1265) whose status condition we're getting a reference to. There is exactly one StatusCondition (p. 2079) per Entity (p. 1265) and one Entity (p. 1265) per StatusCondition (p. 2079).
-------------------	--

Note

This constructor doesn't create a new **Condition** (p. 729). It obtains a reference to the **StatusCondition** (p. 2079) that each **Entity** (p. 1265) owns. You can use this constructor as many times as needed to obtain a reference to the same **StatusCondition** (p. 2079).

8.346.3 Member Function Documentation

8.346.3.1 enabled_statuses() [1/2]

```
void dds::core::cond::StatusCondition::enabled_statuses (
    const dds::core::status::StatusMask & status ) [inline]
```

Defines the list of communication statuses that determine the trigger value.

This operation may change the `trigger_value` of the **dds::core::cond::StatusCondition** (p. 2079).

dds::core::cond::WaitSet (p. 2318) objects' behavior depends on the changes of the `trigger_value` of their attached conditions. Therefore, any **dds::core::cond::WaitSet** (p. 2318) to which the **dds::core::cond::StatusCondition** (p. 2079) is attached is potentially affected by this operation.

If this function is not invoked, the default list of enabled statuses includes all the statuses.

Exceptions

One	of the Standard Exceptions (p. 228)
-----	--

8.346.3.2 enabled_statuses() [2/2]

```
const dds::core::status::StatusMask dds::core::cond::StatusCondition::enabled_statuses ( ) const
[inline]
```

Gets the list of enabled statuses.

See also

enabled_statuses(const dds::core::status::StatusMask&) (p. 2080)

8.346.3.3 entity()

```
dds::core::Entity dds::core::cond::StatusCondition::entity ( ) const [inline]
```

Get the **dds::core::Entity** (p. 1265) associated with this **StatusCondition** (p. 2079).

There is exactly one **Entity** (p. 1265) associated with each **StatusCondition** (p. 2079).

8.346.3.4 handler()

```
template<typename Functor >
void handler (
    const Functor & func )
```

<<**extension**>> (p. 156) Registers a custom handler with this condition.

For information about condition handlers, see **this ReadCondition constructor** (p. 1859)

Note

Changing this handler will affect any other references to this **Entity** (p. 1265)'s **StatusCondition** (p. 2079).

MT Safety:

It is not safe to call **handler()** (p. 2081) or **reset_handler()** (p. 2082) concurrently or while this condition is attached to a waitset being dispatched.

8.346.3.5 reset_handler()

```
void reset_handler ( )
```

<<**extension**>> (p. 156) Resets the handler for this condition.

After the invocation of this method no handler will be registered with this condition.

Note

Changing this handler will affect any other references to this **Entity** (p. 1265)'s **StatusCondition** (p. 2079).

MT Safety:

It is not safe to call **handler()** (p. 2081) or **reset_handler()** (p. 2082) while this condition is attached to a waitset being dispatched.

8.347 dds::core::status::StatusMask Class Reference

A `std::bitset` (list) of statuses.

```
#include <State.hpp>
```

Inherits `std::bitset< OMG_DDS_STATUS_COUNT >`.

Public Types

- typedef std::bitset< OMG_DDS_STATUS_COUNT > **MaskType**
The base class, a std::bitset.

Public Member Functions

- **StatusMask** ()
Creates **StatusMask::none()** (p. 2086)
- **StatusMask** (uint64_t mask)
Creates a **StatusMask** (p. 2082) from the bits in a uint64_t value.
- **StatusMask** (const **MaskType** &mask)
Creates a **StatusMask** (p. 2082) from a bitset.

Static Public Member Functions

- static const **StatusMask all** ()
All the bits are set.
- static const **StatusMask none** ()
No bits are set.
- static const **StatusMask inconsistent_topic** ()
Another topic exists with the same name but different characteristics.
- static const **StatusMask offered_deadline_missed** ()
The deadline that the **dds::pub::DataWriter** (p. 908) has committed through its **dds::core::policy::Deadline** (p. 1020) was not respected for a specific instance.
- static const **StatusMask requested_deadline_missed** ()
The deadline that the **dds::sub::DataReader** (p. 756) was expecting through its **dds::core::policy::Deadline** (p. 1020) was not respected for a specific instance.
- static const **StatusMask offered_incompatible_qos** ()
A QosPolicy value was incompatible with what was requested.
- static const **StatusMask requested_incompatible_qos** ()
A QosPolicy value was incompatible with what is offered.
- static const **StatusMask sample_lost** ()
A sample has been lost (i.e. was never received).
- static const **StatusMask sample_rejected** ()
A (received) sample has been rejected.
- static const **StatusMask data_on_readers** ()
New data is available.
- static const **StatusMask data_available** ()
One or more new data samples have been received.
- static const **StatusMask liveliness_lost** ()
The liveliness that the **dds::pub::DataWriter** (p. 908) has committed to through its **dds::core::policy::Liveliness** (p. 1389) policy was not respected, thus **dds::sub::DataReader** (p. 756) entities will consider the writer as no longer alive.
- static const **StatusMask liveliness_changed** ()
The liveliness of one or more **dds::pub::DataWriter** (p. 908) that were writing instances read through the **dds::sub::DataReader** (p. 756) has changed. Some **dds::pub::DataWriter** (p. 908) have become alive or not_alive.

- static const **StatusMask publication_matched ()**
The `dds::pub::DataWriter` (p. 908) has found `dds::sub::DataReader` (p. 756) that matches the `dds::topic::Topic` (p. 2178) and has compatible QoS.
- static const **StatusMask subscription_matched ()**
The `dds::sub::DataReader` (p. 756) has found `dds::pub::DataWriter` (p. 908) that matches the `dds::topic::Topic` (p. 2178) and has compatible QoS.
- static const **StatusMask reliable_writer_cache_changed ()**
<<extension>> (p. 156) The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point.
- static const **StatusMask reliable_reader_activity_changed ()**
<<extension>> (p. 156) One or more reliable readers has become active or inactive.
- static const **StatusMask datawriter_cache ()**
<<extension>> (p. 156) The status of the writer's cache.
- static const **StatusMask datawriter_protocol ()**
<<extension>> (p. 156) The status of a writer's internal protocol related metrics
- static const **StatusMask datareader_cache ()**
<<extension>> (p. 156) The status of the reader's cache.
- static const **StatusMask datareader_protocol ()**
<<extension>> (p. 156) The status of a reader's internal protocol related metrics
- static const **StatusMask datawriter_application_acknowledgment ()**
<<extension>> (p. 156) A `dds::pub::DataWriter` (p. 908) has received an application-level acknowledgment for a sample
- static const **StatusMask datawriter_instance_replaced ()**
<<extension>> (p. 156) A `dds::pub::DataWriter` (p. 908) instance has been replaced
- static const **StatusMask service_request_accepted ()**
<<extension>> (p. 156) A service request has been received for a `dds::pub::DataWriter` (p. 908)
- static const **StatusMask invalid_local_identity_advance_notice ()**
<<extension>> (p. 156) The local `dds::domain::DomainParticipant` (p. 1079) credential will be invalid soon.
- static const **StatusMask sample_removed ()**
<<extension>> (p. 156) A sample has been removed from a `dds::pub::DataWriter` (p. 908)

Related Functions

(Note that these are not member functions.)

- `template<typename STATUS >`
StatusMask get_status ()
*Obtains the **StatusMask** (p. 2082) mask associated to a status class.*

8.347.1 Detailed Description

A `std::bitset` (list) of statuses.

The bit-mask is an efficient and compact representation of a fixed-length list of `dds::core::status::StatusMask` (p. 2082) values.

Bits in the mask correspond to different statuses. You can choose which changes in status will trigger a callback by setting the corresponding status bits in this bit-mask and installing callbacks for each of those statuses.

The bits that are true indicate that the listener will be called back for changes in the corresponding status.

See also

[Changing the listener and enabling/disabling statuses associated with it](#) (p. 127)

8.347.2 Member Typedef Documentation

8.347.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATUS_COUNT > dds::core::status::StatusMask::MaskType
```

The base class, a `std::bitset`.

8.347.3 Constructor & Destructor Documentation

8.347.3.1 StatusMask() [1/3]

```
dds::core::status::StatusMask::StatusMask ( ) [inline]
```

Creates `StatusMask::none()` (p. 2086)

Listener:

dds::pub::DataWriterListener (p. 972)

References **StatusMask()**.

8.347.4.15 subscription_matched()

```
static const StatusMask dds::core::status::StatusMask::subscription_matched ( ) [inline], [static]
```

The **dds::sub::DataReader** (p.756) has found **dds::pub::DataWriter** (p.908) that matches the **dds::topic::Topic** (p.2178) and has compatible QoS.

Entity:

dds::sub::DataReader (p.756)

Status:

dds::core::status::SubscriptionMatchedStatus (p.2144)

Listener:

dds::sub::DataReaderListener (p.832)

References **StatusMask()**.

8.347.4.16 reliable_writer_cache_changed()

```
static const StatusMask dds::core::status::StatusMask::reliable_writer_cache_changed ( ) [inline], [static]
```

<<**extension**>> (p.156) The number of unacknowledged samples in a reliable writer's cache has changed such that it has reached a pre-defined trigger point.

This status is considered changed at the following times: the cache is empty (i.e., contains no unacknowledged samples), the cache is full (i.e., the sample count has reached the value specified in **dds::core::policy::ResourceLimits::max_samples** (p.1924)), or the number of samples has reached a high (see **rti::core::RtpsReliableWriterProtocol::high_watermark**) or low (see **rti::core::RtpsReliableWriterProtocol::low_watermark**) watermark.

Entity:

dds::pub::DataWriter (p.908)

Status:

rti::core::status::ReliableWriterCacheChangedStatus (p.1883)

Listener:

dds::pub::DataWriterListener (p.972)

References **StatusMask()**.

8.347.4.17 reliable_reader_activity_changed()

```
static const StatusMask dds::core::status::StatusMask::reliable_reader_activity_changed ( ) [inline],  
[static]
```

<<*extension*>> (p. 156) One or more reliable readers has become active or inactive.

A reliable reader is considered active by a reliable writer with which it is matched if that reader acknowledges the samples it has been sent in a timely fashion. For the definition of "timely" in this case, see `rti::core::RtpsReliableWriterProtocol` and `rti::core::status::ReliableReaderActivityChangedStatus` (p. 1881).

`rti::core::status::ReliableReaderActivityChangedStatus` (p. 1881)

References `StatusMask()`.

8.347.4.18 datawriter_cache()

```
static const StatusMask dds::core::status::StatusMask::datawriter_cache ( ) [inline], [static]
```

<<*extension*>> (p. 156) The status of the writer's cache.

Changes to this status do not trigger a `dds::core::cond::StatusCondition` (p. 2079).

References `StatusMask()`.

8.347.4.19 datawriter_protocol()

```
static const StatusMask dds::core::status::StatusMask::datawriter_protocol ( ) [inline], [static]
```

<<*extension*>> (p. 156) The status of a writer's internal protocol related metrics

The status of a writer's internal protocol-related metrics, such as the number of samples pushed, pulled, and filtered and the status of wire protocol traffic. Changes to this status information do not trigger a `dds::core::cond::StatusCondition` (p. 2079).

References `StatusMask()`.

8.347.4.20 `datareader_cache()`

```
static const StatusMask dds::core::status::StatusMask::datareader_cache ( ) [inline], [static]
```

<<**extension**>> (p. 156) The status of the reader's cache.

Changes to this status do not trigger a **dds::core::cond::StatusCondition** (p. 2079).

References **StatusMask()**.

8.347.4.21 `datareader_protocol()`

```
static const StatusMask dds::core::status::StatusMask::datareader_protocol ( ) [inline], [static]
```

<<**extension**>> (p. 156) The status of a reader's internal protocol related metrics

The status of a reader's internal protocol related metrics, like the number of samples received, filtered, rejected; and status of wire protocol traffic. Changes to this status do not trigger a **dds::core::cond::StatusCondition** (p. 2079).

References **StatusMask()**.

8.347.4.22 `datawriter_application_acknowledgment()`

```
static const StatusMask dds::core::status::StatusMask::datawriter_application_acknowledgment ( ) [inline], [static]
```

<<**extension**>> (p. 156) A **dds::pub::DataWriter** (p. 908) has received an application-level acknowledgment for a sample

Enables a **dds::pub::DataWriter** (p. 908) callback that is called when an application-level acknowledgment from a **dds::sub::DataReader** (p. 756) is received. The callback is called for each sample that is application-level acknowledged. Changes to this status do not trigger a **dds::core::cond::StatusCondition** (p. 2079).

Entity:

dds::pub::DataWriter (p. 908)

Listener:

dds::pub::DataWriterListener (p. 972)

References **StatusMask()**.

8.347.4.23 datawriter_instance_replaced()

```
static const StatusMask dds::core::status::StatusMask::datawriter_instance_replaced ( ) [inline],  
[static]
```

<<*extension*>> (p. 156) A **dds::pub::DataWriter** (p. 908) instance has been replaced

<<*extension*>> (p. 156) A **dds::pub::DataWriter** (p. 908) instance has been replaced

Enables a **dds::pub::DataWriter** (p. 908) callback that is called when an instance in the writer queue is replaced.

Entity:

dds::pub::DataWriter (p. 908)

Listener:

dds::pub::DataWriterListener (p. 972)

References **StatusMask**().

8.347.4.24 service_request_accepted()

```
static const StatusMask dds::core::status::StatusMask::service_request_accepted ( ) [inline],  
[static]
```

<<*extension*>> (p. 156) A service request has been received for a **dds::pub::DataWriter** (p. 908)

Enables a **dds::pub::DataWriter** (p. 908) callback that is called when a **rti::topic::ServiceRequest** (p. 2065) has been accepted and dispatched to the DataWriter.

Entity:

dds::pub::DataWriter (p. 908)

Listener:

dds::pub::DataWriterListener (p. 972)

References **StatusMask**().

8.347.4.25 `invalid_local_identity_advance_notice()`

```
static const StatusMask dds::core::status::StatusMask::invalid_local_identity_advance_notice ( )
[inline], [static]
```

<<*extension*>> (p. 156) The local **dds::domain::DomainParticipant** (p. 1079) credential will be invalid soon.

Enables a **dds::domain::DomainParticipant** (p. 1079) callback that is called when the local **dds::domain::DomainParticipant** (p. 1079) has or is about to have an invalid identity credential. Currently, this status is only triggered when enabling the RTI Security Plugins. Please refer to the [RTI Security Plugins User's Manual](#) for more information.

Entity:

dds::domain::DomainParticipant (p. 1079)

Listener:

`DomainParticipantListener`

References **StatusMask()**.

8.347.4.26 `sample_removed()`

```
static const StatusMask dds::core::status::StatusMask::sample_removed ( ) [inline], [static]
```

<<*extension*>> (p. 156) A sample has been removed from a **dds::pub::DataWriter** (p. 908)

Enables a **dds::pub::DataWriter** (p. 908) callback that is called when a sample is removed from its queue.

Entity:

dds::pub::DataWriter (p. 908)

Listener:

dds::pub::DataWriterListener (p. 972)

References **StatusMask()**.

8.347.5 Friends And Related Function Documentation

8.347.5.1 get_status()

```
template<typename STATUS >
StatusMask get_status ( ) [related]
```

Obtains the **StatusMask** (p. 2082) mask associated to a status class.

For example:

```
using namespace dds::core::status;
StatusMask mask = get_status<PublicationMatchedStatus>();
assert(mask == StatusMask::publication_matched());
```

8.348 rti::util::StreamFlagSaver Class Reference

```
#include <StreamFlagSaver.hpp>
```

8.348.1 Detailed Description

RAII utility to save and restore the flags of a std::ostream

```
Use: void example(std::ostream& out) { rti::util::StreamFlagSaver (p. 2097) flag_saver (out); out << std::hex << 33;
// ... } // out flags restored
```

8.349 rti::sub::status::StreamKind Class Reference

<<**extension**>> (p. 156) Indicates which stream to read from: live stream, topic-query stream or both

```
#include <rti/sub/status/DataStateEx.hpp>
```

Inherits std::bitset< OMG_DDS_STATE_BIT_COUNT >.

Public Types

- typedef std::bitset< OMG_DDS_STATE_BIT_COUNT > **MaskType**
An std::bitset of StreamKinds.

Public Member Functions

- **StreamKind** (const **MaskType** &other)
Create an **StreamKind** (p. 2097) from MaskType.

Static Public Member Functions

- static **StreamKind** **live** ()
Returns the **StreamKind** (p. 2097) that selects the live stream.
- static **StreamKind** **topic_query** ()
Returns the **StreamKind** (p. 2097) that selects the topic-query stream.
- static **StreamKind** **any** ()
Returns the **StreamKind** (p. 2097) that selects either stream.

8.349.1 Detailed Description

<<**extension**>> (p. 156) Indicates which stream to read from: live stream, topic-query stream or both

See also

Topic Queries (p. 66)

8.349.2 Member Typedef Documentation

8.349.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATE_BIT_COUNT > rti::sub::status::StreamKind::MaskType
```

An std::bitset of StreamKinds.

8.349.3 Constructor & Destructor Documentation

8.349.3.1 StreamKind()

```
rti::sub::status::StreamKind::StreamKind (
    const MaskType & other ) [inline]
```

Create an **StreamKind** (p. 2097) from MaskType.

Parameters

<i>other</i>	The MaskType to create the StreamKind (p. 2097) with
--------------	---

8.349.4 Member Function Documentation

8.349.4.1 live()

```
static StreamKind rti::sub::status::StreamKind::live ( ) [inline], [static]
```

Returns the **StreamKind** (p. 2097) that selects the live stream.

8.349.4.2 topic_query()

```
static StreamKind rti::sub::status::StreamKind::topic_query ( ) [inline], [static]
```

Returns the **StreamKind** (p. 2097) that selects the topic-query stream.

8.349.4.3 any()

```
static StreamKind rti::sub::status::StreamKind::any ( ) [inline], [static]
```

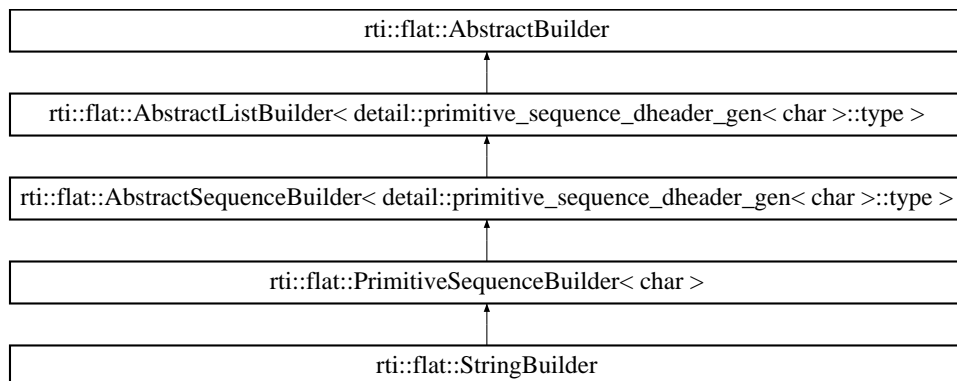

Returns the **StreamKind** (p. 2097) that selects either stream.

8.350 rti::flat::StringBuilder Class Reference

Builds a string.

```
#include <SequenceBuilders.hpp>
```

Inheritance diagram for rti::flat::StringBuilder:

Public Member Functions

- **StringBuilder** & **set_string** (const char *value)
Sets the string value.
- **Offset** **finish** ()
Finishes building the string.

Additional Inherited Members

8.350.1 Detailed Description

Builds a string.

A **StringBuilder** (p. 2099) only provides one method, **set_string()** (p. 2100), so it can be typically used as follows:

```
MyFlatMutableBuilder my_builder = ...;
my_builder.build_my_string().set_string("Hello!");
```

Note that by relying on the builder destructor, there is no need to call **finish()** (p. 2100) on the object returned by `build_my_string()`.

8.350.2 Member Function Documentation

8.350.2.1 set_string()

```
StringBuilder & rti::flat::StringBuilder::set_string (
    const char * value ) [inline]
```

Sets the string value.

References `rti::flat::PrimitiveSequenceBuilder< char >::add_n()`.

8.350.2.2 finish()

```
Offset rti::flat::StringBuilder::finish ( ) [inline]
```

Finishes building the string.

Returns

An Offset to the member that has been built.

See also

discard() (p. 572)

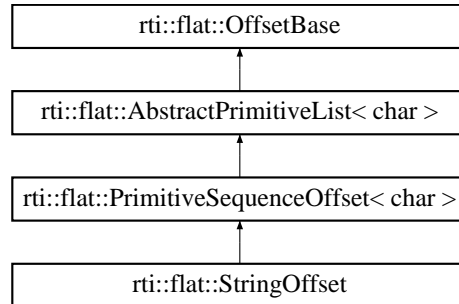

References `rti::flat::PrimitiveSequenceBuilder< char >::add_next()`.

8.351 rti::flat::StringOffset Class Reference

Offset to a string.

```
#include <SequenceOffsets.hpp>
```

Inheritance diagram for rti::flat::StringOffset:

Public Member Functions

- char * **get_string** ()
Gets the string.
- const char * **get_string** () const
Gets the string (const)
- unsigned int **element_count** () const
Returns the number of characters.

8.351.1 Detailed Description

Offset to a string.

8.351.2 Member Function Documentation

8.351.2.1 get_string() [1/2]

```
char * rti::flat::StringOffset::get_string ( ) [inline]
```

Gets the string.

The string returned can be modified as long as its size doesn't change.

References [rti::flat::OffsetBase::get_buffer\(\)](#).

8.351.2.2 `get_string()` [2/2]

```
const char * rti::flat::StringOffset::get_string ( ) const [inline]
```

Gets the string (const)

References `rti::flat::OffsetBase::get_buffer()`.

8.351.2.3 `element_count()`

```
unsigned int rti::flat::StringOffset::element_count ( ) const [inline]
```

Returns the number of characters.

This number doesn't include the null terminating character.

References `rti::flat::PrimitiveSequenceOffset< T >::element_count()`.

8.352 `dds::core::StringTopicType` Class Reference

Built-in type consisting of a single character string.

```
#include <dds/core/BuiltinTopicTypes.hpp>
```

Public Member Functions

- **`StringTopicType ()`**
Creates a sample containing an empty string.
- **`StringTopicType (const dds::core::string &the_data)`**
Creates a sample from a `dds::core::string` (p. 235).
- **`StringTopicType (const std::string &the_data)`**
Creates a sample from a `std::string`.
- **`StringTopicType (const char *the_data)`**
Creates an instance from a `char`.*
- **`operator std::string () const`**
Automatic conversion to `std::string`.
- **`operator dds::core::string & ()`**
Automatic conversion to `dds::core::string` (p. 235).
- **`operator const dds::core::string & () const`**
Automatic conversion to `dds::core::string` (p. 235).
- **`const dds::core::string & data () const`**
Gets the string.
- **`dds::core::string & data ()`**
Gets the string.
- **`void data (const dds::core::string &value)`**
Sets the string.

8.352.1 Detailed Description

Built-in type consisting of a single character string.

See also

Built-in Types (p. 49)

8.352.2 Constructor & Destructor Documentation

8.352.2.1 StringTopicType() [1/4]

```
dds::core::StringTopicType::StringTopicType ( ) [inline]
```

Creates a sample containing an empty string.

8.352.2.2 StringTopicType() [2/4]

```
dds::core::StringTopicType::StringTopicType (
    const dds::core::string & the_data ) [inline]
```

Creates a sample from a **dds::core::string** (p. 235).

Note that this constructor is implicit so you can use a **dds::core::string** (p. 235) wherever a **StringTopicType** (p. 2102) instance is expected

8.352.2.3 StringTopicType() [3/4]

```
dds::core::StringTopicType::StringTopicType (
    const std::string & the_data ) [inline]
```

Creates a sample from a `std::string`.

Note that this constructor is implicit so you can use an `std::string` wherever a **StringTopicType** (p. 2102) instance is expected, for example:

```
dds::pub::DataWriter<StringTopicType> writer(...);
std::string str = "Hello World!";
writer.write(str);
```

Parameters

<i>the_data</i>	The string to be copied to create this instance
-----------------	---

8.352.2.4 StringTopicType() [4/4]

```
dds::core::StringTopicType::StringTopicType (
    const char * the_data ) [inline]
```

Creates an instance from a char*.

Note that this constructor is implicit so you can use an char* wherever a **StringTopicType** (p. 2102) instance is expected, for example:

```
dds::pub::DataWriter<StringTopicType> writer(...);
writer.write("Hello, World!");
```

Parameters

<i>the_data</i>	The string to be copied to create this instance
-----------------	---

8.352.3 Member Function Documentation

8.352.3.1 operator std::string()

```
dds::core::StringTopicType::operator std::string ( ) const [inline]
```

Automatic conversion to std::string.

Returns

A copy of the string

8.352.3.2 operator dds::core::string &()

```
dds::core::StringTopicType::operator dds::core::string & ( ) [inline]
```

Automatic conversion to **dds::core::string** (p. 235).

Returns

A reference to the string

8.352.3.3 operator const dds::core::string &()

```
dds::core::StringTopicType::operator const dds::core::string & ( ) const [inline]
```

Automatic conversion to **dds::core::string** (p. 235).

Returns

A const-reference to the string

8.352.3.4 data() [1/3]

```
const dds::core::string & dds::core::StringTopicType::data ( ) const [inline]
```

Gets the string.

Returns

A const-reference to the string

8.352.3.5 data() [2/3]

```
dds::core::string & dds::core::StringTopicType::data ( ) [inline]
```

Gets the string.

Returns

A reference to the string

8.352.3.6 data() [3/3]

```
void dds::core::StringTopicType::data (
    const dds::core::string & value ) [inline]
```

Sets the string.

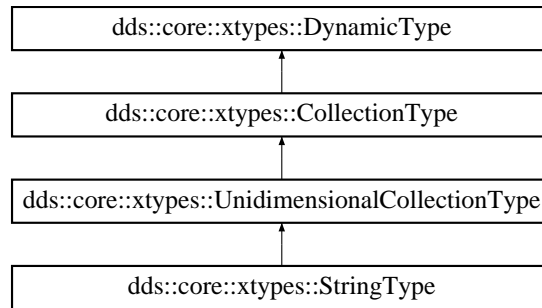

References **dds::core::Value< D >::delegate()**.

8.353 dds::core::xtypes::StringType Class Reference

<< *value-type* >> (p. 152) Represents an IDL `string` type.

```
#include <dds/core/xtypes/CollectionTypes.hpp>
```

Inheritance diagram for `dds::core::xtypes::StringType`:

Public Member Functions

- **StringType** (`uint32_t bounds`)
Creates a bounded string.

Additional Inherited Members

8.353.1 Detailed Description

<< *value-type* >> (p. 152) Represents an IDL `string` type.

8.353.2 Constructor & Destructor Documentation

8.353.2.1 StringType()

```
dds::core::xtypes::StringType::StringType (
    uint32_t bounds ) [explicit]
```

Creates a bounded string.

Parameters

<i>bounds</i>	The maximum length
---------------	--------------------

8.354 dds::core::xtypes::StructType Class Reference

<< *value-type* >> (p. 152) Represents and IDL struct type

```
#include <dds/core/xtypes/StructType.hpp>
```

Inheritance diagram for dds::core::xtypes::StructType:

Public Member Functions

- **StructType** (const std::string & name)
Creates an empty struct type.
- **StructType** (const std::string & name, const **StructType** & parent)
Creates an empty struct type with a base type.
- template<typename Container >
StructType (const std::string &the_name, const Container &the_members)
Creates a struct with the members in a container.
- template<typename Container >
StructType (const std::string &the_name, const **StructType** &the_parent, const Container &the_members)
Creates a struct with a base type and the members in a container.
- template<typename MemberIter >
StructType (const std::string &the_name, MemberIter begin, MemberIter end)
Creates a struct with the members in an iterator range.
- template<typename MemberIter >
StructType (const std::string &the_name, const **StructType** &the_parent, MemberIter begin, MemberIter end)
Creates a struct with a base type and the members in an iterator range.
- **StructType** (const std::string &the_name, **StructType** &&the_parent)
<< **C++11** >> (p. 155) *Creates an empty struct type with a base type.*
- template<typename MemberIter >
StructType (const std::string &the_name, **StructType** &&the_parent, MemberIter begin, MemberIter end)
<< **C++11** >> (p. 155) *Creates an empty struct type with a base type and the members in an iterator range.*
- template<typename Container >
StructType (const std::string &the_name, **StructType** &&the_parent, const Container &the_members)
<< **C++11** >> (p. 155) *Creates an empty struct type with a base type and the members in a container.*
- **StructType** (const std::string &the_name, std::initializer_list< MemberImpl > the_members)
<< **C++11** >> (p. 155) *Creates a struct with the members in an initializer_list*
- **StructType** (const std::string &the_name, const **StructType** &the_parent, std::initializer_list< MemberImpl > the_members)
<< **C++11** >> (p. 155) *Creates a struct with the members in an initializer_list and a base type*

- **StructType** (const std::string &the_name, **StructType** &&the_parent, std::initializer_list< MemberImpl > the_members)
 - <<C++11>> (p. 155) Creates a struct with the members in an initializer_list and a base type
- **StructType & extensibility_kind** (dds::core::xtypes::ExtensibilityKind kind)
 - Sets the type extensibility kind.
- bool **has_parent** () const
 - Indicates if this type has a base type.
- const **StructType & parent** () const
 - Retrieves the base type.
- **MemberIndex find_member_by_id** (uint32_t id) const
 - Gets the index of the member with a specific member ID.
- **StructType & add_member** (const MemberImpl & member)
 - Adds a member at the end.
- template<typename Container >
 StructType & add_members (const Container &the_members)
 - Adds all the members of a container at the end.
- **StructType & add_members** (std::initializer_list< MemberImpl > the_members)
 - <<C++11>> (p. 155) Adds all the members of an initializer_list at the end
- template<typename MemberIter >
 StructType & add_members (MemberIter begin, MemberIter end)
 - Adds all the members in an iterator range at the end.
- **StructType & add_member** (MemberImpl &&the_member)
 - <<C++11>> (p. 155) Adds a member, moving it, at the end

Related Functions

(Note that these are not member functions.)

- template<typename... Types>
 dds::core::xtypes::StructType create_type_from_tuple (const std::string & name)
 - <<C++11>> (p. 155) <<experimental>> (p. 157) <<extension>> (p. 156) Creates a **StructType** (p. 2107) from a list of types or a std::tuple

Additional Inherited Members

8.354.1 Detailed Description

<<value-type>> (p. 152) Represents and IDL struct type

Examples

Foo.hpp.

8.354.2 Constructor & Destructor Documentation

8.354.2.1 StructType() [1/12]

```
dds::core::xtypes::StructType::StructType (
    const std::string & name )
```

Creates an empty struct type.

The struct doesn't have a base type. Members can be added after creation.

Parameters

<i>name</i>	The name of the type
-------------	----------------------

8.354.2.2 StructType() [2/12]

```
dds::core::xtypes::StructType::StructType (
    const std::string & name,
    const StructType & parent )
```

Creates an empty struct type with a base type.

Members can be added after creation.

Parameters

<i>name</i>	The name of the type
<i>parent</i>	The base type

8.354.2.3 StructType() [3/12]

```
template<typename Container >
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    const Container & the_members ) [inline]
```

Creates a struct with the members in a container.

The struct doesn't have a base type.

Template Parameters

<i>Container</i>	A container that provides the member functions begin() (p. 1412) and end() (p. 1413) to iterate over Member (p. 1443) elements.
------------------	--

Parameters

<i>the_name</i>	The name of the type
<i>the_members</i>	A container with the members for this struct type

8.354.2.4 StructType() [4/12]

```
template<typename Container >
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    const StructType & the_parent,
    const Container & the_members ) [inline]
```

Creates a struct with a base type and the members in a container.

Template Parameters

<i>Container</i>	A container that provides the member functions begin() (p. 1412) and end() (p. 1413) to iterate over Member (p. 1443) elements.
------------------	--

Parameters

<i>the_name</i>	The name of the type
<i>the_parent</i>	The base type
<i>the_members</i>	A container with the members for this struct type

8.354.2.5 StructType() [5/12]

```
template<typename MemberIter >
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    MemberIter begin,
    MemberIter end ) [inline]
```

Creates a struct with the members in an iterator range.

The struct doesn't have a base type.

Template Parameters

<i>MemberIter</i>	A forward iterator of Member (p. 1443) elements
-------------------	--

Parameters

<i>the_name</i>	The name of the type
<i>begin</i>	The beginning of the range of Members
<i>end</i>	The end of the range of Members

8.354.2.6 StructType() [6/12]

```
template<typename MemberIter >
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    const StructType & the_parent,
    MemberIter begin,
    MemberIter end ) [inline]
```

Creates a struct with a base type and the members in an iterator range.

Template Parameters

<i>MemberIter</i>	A forward iterator of Member (p. 1443) elements
-------------------	--

Parameters

<i>the_parent</i>	The base type
<i>the_name</i>	The name of the type
<i>begin</i>	The beginning of the range of Members
<i>end</i>	The end of the range of Members

8.354.2.7 StructType() [7/12]

```
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    StructType && the_parent ) [inline]
```

<<**C++11**>> (p. 155) Creates an empty struct type with a base type.

The base type is moved. This is useful to save a copy in situations like the following example:

```
StructType my_type("my_type", StructType("parent_type", parent_members));
```

8.354.2.8 StructType() [8/12]

```
template<typename MemberIter >
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    StructType && the_parent,
    MemberIter begin,
    MemberIter end ) [inline]
```

<<**C++11**>> (p. 155) Creates an empty struct type with a base type and the members in an iterator range.

The base type is moved.

8.354.2.9 StructType() [9/12]

```
template<typename Container >
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    StructType && the_parent,
    const Container & the_members ) [inline]
```

<<**C++11**>> (p. 155) Creates an empty struct type with a base type and the members in a container.

The base type is moved.

8.354.2.10 StructType() [10/12]

```
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    std::initializer_list< MemberImpl > the_members ) [inline]
```

<<**C++11**>> (p. 155) Creates a struct with the members in an initializer_list

Parameters

<i>the_name</i>	The name of the type
<i>the_members</i>	An ininitializer_list of Members

8.354.2.11 StructType() [11/12]

```
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    const StructType & the_parent,
    std::initializer_list< MemberImpl > the_members ) [inline]
```

<<**C++11**>> (p. 155) Creates a struct with the members in an initializer_list and a base type

Parameters

<i>the_name</i>	The name of the type
<i>the_parent</i>	The base type
<i>the_members</i>	An initializer_list of Members

8.354.2.12 StructType() [12/12]

```
dds::core::xtypes::StructType::StructType (
    const std::string & the_name,
    StructType && the_parent,
    std::initializer_list< MemberImpl > the_members ) [inline]
```

<<**C++11**>> (p. 155) Creates a struct with the members in an initializer_list and a base type

Parameters

<i>the_name</i>	The name of the type
<i>the_parent</i>	The base type (moved)
<i>the_members</i>	An initializer_list of Members

8.354.3 Member Function Documentation**8.354.3.1 extensibility_kind()**

```
StructType & dds::core::xtypes::StructType::extensibility_kind (
    dds::core::xtypes::ExtensibilityKind kind )
```

Sets the type extensibility kind.

8.354.3.2 has_parent()

```
bool dds::core::xtypes::StructType::has_parent ( ) const
```

Indicates if this type has a base type.

8.354.3.3 parent()

```
const StructType & dds::core::xtypes::StructType::parent ( ) const
```

Retrieves the base type.

If this type doesn't have a base type it throws **PreconditionNotMetError** (p. 1669).

See also

has_parent() (p. 2113)

8.354.3.4 find_member_by_id()

```
MemberIndex dds::core::xtypes::StructType::find_member_by_id (
    uint32_t id ) const
```

Gets the index of the member with a specific member ID.

Returns

The index (which can be passed to `member(uint32_t)` of the member selected by label or `INVALID_INDEX` if the ID doesn't exist in this type

8.354.3.5 add_member() [1/2]

```
StructType & dds::core::xtypes::StructType::add_member (
    const MemberImpl & member )
```

Adds a member at the end.

8.354.3.6 add_members() [1/3]

```
template<typename Container >
StructType & dds::core::xtypes::StructType::add_members (
    const Container & the_members ) [inline]
```

Adds all the members of a container at the end.

8.354.3.7 add_members() [2/3]

```
StructType & dds::core::xtypes::StructType::add_members (
    std::initializer_list< MemberImpl > the_members ) [inline]
```

<<**C++11**>> (p. 155) Adds all the members of an initializer_list at the end

8.354.3.8 add_members() [3/3]

```
template<typename MemberIter >
StructType & dds::core::xtypes::StructType::add_members (
    MemberIter begin,
    MemberIter end ) [inline]
```

Adds all the members in an iterator range at the end.

8.354.3.9 add_member() [2/2]

```
StructType & dds::core::xtypes::StructType::add_member (
    MemberImpl && the_member ) [inline]
```

<<**C++11**>> (p. 155) Adds a member, moving it, at the end

8.354.4 Friends And Related Function Documentation**8.354.4.1 create_type_from_tuple()**

```
template<typename... Types>
dds::core::xtypes::StructType create_type_from_tuple (
    const std::string & name ) [related]
```

<<**C++11**>> (p. 155) <<**experimental**>> (p. 157) <<**extension**>> (p. 156) Creates a **StructType** (p. 2107) from a list of types or a std::tuple

Note

This is a standalone function in the namespace **rti::core::xtypes** (p. 505)

Template Parameters

<i>Types</i>	A list of types or a <code>std::tuple</code> . The types must be primitive (see <code>dds::core::xtypes::PrimitiveType</code> (p. 1685)) or <code>std::string</code> .
--------------	--

The **StructType** (p. 2107) members are all default-created (i.e. non-key, non-optional, with default IDs..) and their names are m0, m1, m2, etc.

*<<extension>> (p. 156) Retrieves the implicit **dds::sub::Subscriber** (p. 2116) for the given **dds::domain::DomainParticipant** (p. 1079).*

8.355.1 Detailed Description

<<*reference-type*>> (p. 153) A subscriber is the object responsible for actually receiving data from a subscription.

QoS:

dds::sub::qos::SubscriberQos (p. 2129)

Status:

dds::core::status::StatusMask::data_on_readers() (p. 2089)

Listener:

dds::sub::SubscriberListener (p. 2128)

A subscriber acts on the behalf of one or several **dds::sub::DataReader** (p. 756) objects that are related to it. When it receives data (from the other parts of the system), it builds the list of concerned **dds::sub::DataReader** (p. 756) objects and then indicates to the application that data is available through its listener or by enabling related conditions.

The application can access the list of concerned **dds::sub::DataReader** (p. 756) objects through the operation **dds::sub::find** (p. 460) and then access the data available through operations on the **dds::sub::DataReader** (p. 756).

The following operations may be called even if the **dds::sub::Subscriber** (p. 2116) is not enabled. Other operations will the value **dds::core::NotEnabledError** (p. 1601) if called on a disabled **dds::sub::Subscriber** (p. 2116):

- **dds::core::Entity::enable** (p. 1269),
- **dds::sub::Subscriber::qos(const dds::sub::qos::SubscriberQos&)** (p. 2122), **dds::sub::Subscriber::qos() const** (p. 2122)
- **dds::sub::Subscriber::set_listener** (p. 2121), **dds::sub::Subscriber::get_listener** (p. 2122),
- **dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)** (p. 2080), **dds::core::Entity::status_changes()** (p. 1270)
- **dds::sub::DataReader::DataReader()**, **dds::sub::DataReader::close()** (p. 801),
- **dds::sub::Subscriber::default_datareader_qos(const dds::sub::qos::DataReaderQos&)** (p. 2123), **dds::sub::Subscriber::default_datareader_qos** (p. 2123),

All operations except for **dds::sub::Subscriber::qos(const dds::sub::qos::SubscriberQos&)** (p. 2122), **dds::sub::Subscriber::qos() const** (p. 2122), **dds::sub::Subscriber::set_listener** (p. 2121), **dds::sub::Subscriber::get_listener** (p. 2122), **dds::core::Entity::enable** (p. 1269) and **dds::sub::DataReader::DataReader()** may fail with **dds::core::NotEnabledError** (p. 1601).

Entity Use Cases (p. 126)

Examples

Foo_subscriber.cxx.

8.355.2 Constructor & Destructor Documentation

8.355.2.1 Subscriber() [1/3]

```
dds::sub::Subscriber::Subscriber (
    const ::dds::domain::DomainParticipant & the_participant ) [inline], [explicit]
```

Create a **Subscriber** (p. 2116) attached to the given DomainParticipant.

The subscriber QoS will be set to participant.default_subscriber_qos()

Parameters

<i>the_participant</i>	the DomainParticipant that will own this subscriber.
------------------------	--

8.355.2.2 Subscriber() [2/3]

```
dds::sub::Subscriber::Subscriber (
    const ::dds::domain::DomainParticipant & dp,
    const dds::sub::qos::SubscriberQos & the_qos,
    dds::sub::SubscriberListener * the_listener = NULL,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a **Subscriber** (p. 2116) attached to the given DomainParticipant.

[DEPRECATED] When using a listener, prefer the constructor that receives a shared_ptr<Listener (p. 1381)> instead of a regular Listener* pointer.

Parameters

<i>dp</i>	The DomainParticipant that will own this subscriber.
<i>the_qos</i>	The qos::SubscriberQos (p. 2129)
<i>the_listener</i>	The subscriber listener.
<i>mask</i>	Indicates which status updates the listener will receive

8.355.2.3 Subscriber() [3/3]

```
dds::sub::Subscriber::Subscriber (
    const ::dds::domain::DomainParticipant & dp,
```

```

const dds::sub::qos::SubscriberQos & the_qos,
std::shared_ptr< Listener > the_listener,
const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a **Subscriber** (p. 2116) attached to the given DomainParticipant.

Parameters

<i>dp</i>	The DomainParticipant that will own this subscriber.
<i>the_qos</i>	The qos::SubscriberQos (p. 2129)
<i>the_listener</i>	A shared_ptr to the listener. See set_listener() (p. 2121) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

8.355.3 Member Function Documentation

8.355.3.1 notify_datareaders()

```
void dds::sub::Subscriber::notify_datareaders ( ) [inline]
```

This operation invokes the operation `on_data_available` on the **DataReaderListener** (p. 832) objects attached to contained **DataReader** (p. 756) entities with a `DATA_AVAILABLE` status that is considered changed as described in **Changes in read communication status** (p. 232).

This operation is typically invoked from the `dds::sub::SubscriberListener::on_data_on_readers` operation in the **dds::sub::SubscriberListener** (p. 2128). That way the **dds::sub::SubscriberListener** (p. 2128) can delegate to the **dds::sub::DataReaderListener** (p. 832) objects the handling of the data.

The operation will notify the data readers that have a `sample_state` of **dds::sub::status::SampleState::not_read()** (p. 2025), `view_state` of `any()` and `instance_state` of `any()`.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::NotEnabledError (p. 1601).
------------	---

8.355.3.2 listener() [1/2]

```

void dds::sub::Subscriber::listener (
    Listener * the_listener,
    const dds::core::status::StatusMask & event_mask ) [inline]

```

Attach a listener to this **Subscriber** (p. 2116).

[DEPRECATED] The use of `set_listener()` (p. 2121) is recommended. Unlike this function, `set_listener` receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Parameters

<i>the_listener</i>	The listener
<i>event_mask</i>	The event mask for the listener.

8.355.3.3 listener() [2/2]

```
Listener * dds::sub::Subscriber::listener ( ) const [inline]
```

Get the **Subscriber** (p. 2116) listener.

[DEPRECATED] Use `get_listener` instead of this function.

8.355.3.4 set_listener() [1/2]

```
void dds::sub::Subscriber::set_listener (
    std::shared_ptr< Listener > the_listener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this subscriber.

The **Subscriber** (p. 2116) will hold a `shared_ptr` to the listener argument, ensuring that it is not deleted at least until this **Subscriber** (p. 2116) is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the **Subscriber** (p. 2116). If it does, the application needs to manually reset the listener or manually close this **Subscriber** (p. 2116) to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
<i>event_mask</i>	A mask that indicates which status updates will be notified to the listener

8.355.3.5 set_listener() [2/2]

```
void dds::sub::Subscriber::set_listener (
    std::shared_ptr< Listener > the_listener ) [inline]
```

Sets the listener associated with this subscriber.

If *the_listener* is not `nullptr`, this overload is equivalent to:

```
subscriber.set_listener(the_listener, dds::core::status::StatusMask::all());
```

If *the_listener* is `nullptr`, it is equivalent to:

```
subscriber.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

<i>the_listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
---------------------	---

8.355.3.6 get_listener()

```
std::shared_ptr< Listener > dds::sub::Subscriber::get_listener ( ) const [inline]
```

Returns the listener currently associated with this **Subscriber** (p. 2116).

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.355.3.7 qos() [1/2]

```
const dds::sub::qos::SubscriberQos dds::sub::Subscriber::qos ( ) const [inline]
```

Get the **Subscriber** (p. 2116) QoS.

8.355.3.8 qos() [2/2]

```
void dds::sub::Subscriber::qos (
    const dds::sub::qos::SubscriberQos & the_qos ) [inline]
```

Set the **Subscriber** (p. 2116) QoS.

Parameters

<i>the_qos</i>	the new QoS.
----------------	--------------

8.355.3.9 default_datareader_qos() [1/2]

```
dds::sub::qos::DataReaderQos dds::sub::Subscriber::default_datareader_qos ( ) const [inline]
```

Get the default **DataReader** (p. 756) QoS.

Returns

dds::sub::qos::DataReaderQos (p. 848)

8.355.3.10 default_datareader_qos() [2/2]

```
Subscriber & dds::sub::Subscriber::default_datareader_qos (
    const dds::sub::qos::DataReaderQos & the_qos ) [inline]
```

Set the default DataReaderQoS.

Parameters

<i>the_qos</i>	The default DataReaderQoS.
----------------	----------------------------

8.355.3.11 participant()

```
const dds::domain::DomainParticipant & dds::sub::Subscriber::participant ( ) const [inline]
```

Return the DomainParticipant that owns this **Subscriber** (p. 2116).

Returns

const **dds::domain::DomainParticipant** (p. 1079) & The DomainParticipant that owns this subscriber

8.355.3.12 close_contained_entities()

```
void close_contained_entities ( )
```

<<**extension**>> (p. 156) Closes all the entities created from this **Subscriber** (p. 2116)

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Calling this function explicitly is not necessary to close a **Subscriber** (p. 2116).

Deletes all contained **dds::sub::DataReader** (p. 756) objects. This pattern is applied recursively. In this manner, the operation **dds::sub::Subscriber::close_contained_entities** (p. 2123) on the **dds::sub::Subscriber** (p. 2116) will end up deleting all the entities recursively contained in the **dds::sub::Subscriber** (p. 2116), including the **dds::sub::cond::QueryCondition** (p. 1784), **dds::sub::cond::ReadCondition** (p. 1858), and **rti::sub::TopicQuery** (p. 2220) objects belonging to the contained **dds::sub::DataReader** (p. 756).

The operation will fail with **dds::core::PreconditionNotMetError** (p. 1669) if any of the contained entities is in a state where it cannot be deleted. This will occur, for example, if a contained **dds::sub::DataReader** (p. 756) cannot be deleted because the application has called a **dds::sub::DataReader::read** (p. 773) or **dds::sub::DataReader::take** (p. 774) operation and the loan has not been returned.

MT Safety:

UNSAFE. It is not safe to delete an entity while another thread may be simultaneously calling an API that uses the entity.

Exceptions

One	of the Standard Exceptions (p. 228), or dds::core::PreconditionNotMetError (p. 1669)
-----	--

8.355.4 Friends And Related Function Documentation

8.355.4.1 builtin_subscriber()

```
dds::sub::Subscriber builtin_subscriber (
    const dds::domain::DomainParticipant & dp ) [related]
```

Access the built-in **Subscriber** (p. 2116).

Each **dds::domain::DomainParticipant** (p. 1079) contains several built-in **dds::topic::Topic** (p. 2178) objects as well as corresponding **dds::sub::DataReader** (p. 756) objects to access them. All of these **dds::sub::DataReader** (p. 756) objects belong to a single built-in **dds::sub::Subscriber** (p. 2116).

The built-in Topics are used to communicate information about other **dds::domain::DomainParticipant** (p. 1079), **dds::topic::Topic** (p. 2178), **dds::sub::DataReader** (p. 756), and **dds::pub::DataWriter** (p. 908) objects.

The built-in subscriber is created when this operation is called for the first time. The built-in subscriber is deleted automatically when the **dds::domain::DomainParticipant** (p. 1079) is deleted.

Returns

The built-in **dds::sub::Subscriber** (p. 2116) singleton.

See also

dds::topic::SubscriptionBuiltinTopicData (p. 2133)

dds::topic::PublicationBuiltinTopicData (p. 1703)

dds::topic::ParticipantBuiltinTopicData (p. 1639)

dds::topic::TopicBuiltinTopicData (p. 2197)

Parameters

<i>dp</i>	The DomainParticipant that the built-in subscriber belongs to.
-----------	--

8.355.4.2 find_subscribers() [1/2]

```
template<typename SubscriberForwardIterator >
uint32_t find_subscribers (
    const dds::domain::DomainParticipant participant,
    SubscriberForwardIterator begin,
    uint32_t max_size ) [related]
```

<<**extension**>> (p. 156) Retrieve all of the **dds::sub::Subscriber** (p.2116) created from this **dds::domain::DomainParticipant** (p. 1079)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>SubscriberForwardIterator</i>	Type of the forward iterator passed into this function, whose value_type must be dds::sub::Subscriber (p. 2116).
----------------------------------	---

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Publishers belong to
<i>begin</i>	A forward iterator to the position in the destination container where to begin copying the found Subscribers into
<i>max_size</i>	The maximum size of Subscribers to add

Returns

The number of found Subscribers

References [rti::sub::begin\(\)](#).

8.355.4.3 find_subscribers() [2/2]

```
template<typename SubscriberBackInsertIterator >
uint32_t find_subscribers (
    const dds::domain::DomainParticipant participant,
    SubscriberBackInsertIterator begin ) [related]
```

<<**extension**>> (p. 156) Retrieve all of the **dds::sub::Subscriber** (p.2116) created from this **dds::domain::DomainParticipant** (p. 1079)

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderBackInsertIterator</i>	Type of the back-inserting iterator passed into this function, whose value_type must be dds::sub::Subscriber (p. 2116).
--	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Subscribers belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found Subscribers into

Returns

The number of found Subscribers

References [rti::sub::begin\(\)](#).

8.355.4.4 find_subscriber()

```
dds::sub::Subscriber find_subscriber (
    const dds::domain::DomainParticipant participant,
    const std::string & subscriber_name ) [related]
```

<<**extension**>> (p. 156) Finds a **Subscriber** (p.2116) by name

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

Template Parameters

<i>AnyDataReaderBackInsertIterator</i>	Type of the back-inserting iterator passed into this function, whose <code>value_type</code> must be dds::sub::AnyDataReader (p. 595).
--	---

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Subscribers belong to
<i>subscriber_name</i>	The name of the Subscriber (p. 2116)

Returns

A valid reference if the a subscriber with that name exists or a reference equals to **dds::core::null** (p. 238) otherwise.

8.355.4.5 implicit_subscriber()

```
dds::sub::Subscriber implicit_subscriber (
    const dds::domain::DomainParticipant & dp ) [related]
```

<<*extension*>> (p. 156) Retrieves the implicit **dds::sub::Subscriber** (p.2116) for the given **dds::domain::DomainParticipant** (p. 1079).

Note

This is a standalone function in the namespace **rti::sub** (p. 538)

If an implicit **Subscriber** (p. 2116) does not already exist, this creates one.

The implicit **Subscriber** (p.2116) is created with default **dds::sub::qos::SubscriberQos** (p.2129) and no listener. When a DomainParticipant is deleted, if there are no attached **dds::sub::DataReader** (p. 756) that belong to the implicit **Subscriber** (p. 2116), the implicit **Subscriber** (p. 2116) will be implicitly deleted.

MT Safety:

UNSAFE. it is not safe to create the implicit subscriber while another thread may be simultaneously calling **dds::domain::DomainParticipant::default_subscriber_qos(const dds::sub::qos::SubscriberQos & qos)** (p. 1097).

Parameters

<i>dp</i>	The DomainParticipant that the implicit subscriber belongs to.
-----------	--

Returns

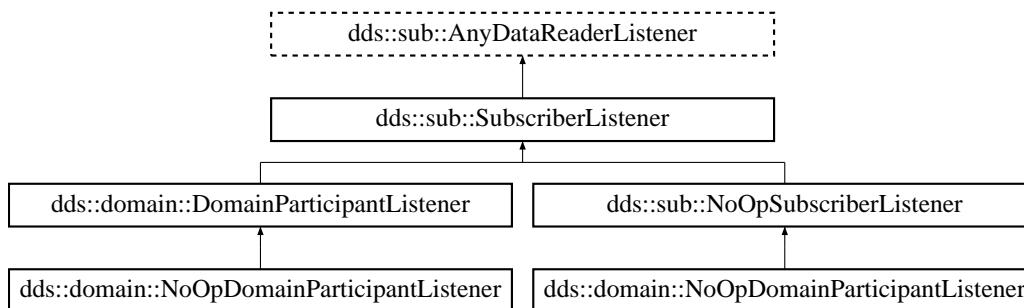

The implicit **Subscriber** (p. 2116)

8.356 dds::sub::SubscriberListener Class Reference

The listener to notify status changes for a **dds::sub::Subscriber** (p. 2116).

```
#include <dds/sub/SubscriberListener.hpp>
```

Inheritance diagram for dds::sub::SubscriberListener:

Additional Inherited Members

8.356.1 Detailed Description

The listener to notify status changes for a **dds::sub::Subscriber** (p. 2116).

A **SubscriberListener** (p. 2128) contains exactly the same methods as a **AnyDataReaderListener** (p. 600), since it can receive status changes from any of its contained DataReaders.

Entity:

dds::sub::Subscriber (p. 2116)

Status:

dds::core::status::StatusMask::data_available() (p. 2090);
dds::core::status::StatusMask::data_on_readers() (p. 2089);
dds::core::status::StatusMask::liveliness_changed() (p. 2090), **dds::core::status::LivelinessChanged←
 Status** (p. 1395);
dds::core::status::StatusMask::requested_deadline_missed() (p. 2087), **dds::core::status::Requested←
 DeadlineMissedStatus** (p. 1904);
dds::core::status::StatusMask::requested_incompatible_qos() (p. 2088), **dds::core::status::Requested←
 IncompatibleQosStatus** (p. 1905);
dds::core::status::StatusMask::sample_lost() (p. 2088), **dds::core::status::SampleLostStatus** (p. 2010);
dds::core::status::StatusMask::sample_rejected() (p. 2089), **dds::core::status::SampleRejectedStatus**
 (p. 2022);
dds::core::status::StatusMask::subscription_matched() (p. 2091), **dds::core::status::Subscription←
 MatchedStatus** (p. 2144);

- `std::ostream & operator<<` (std::ostream &out, const **rti::sub::qos::SubscriberQos** &qos)
<<extension>> (p. 156) Prints a **dds::sub::qos::SubscriberQos** (p. 2129) to an output stream.

8.357.1 Detailed Description

<<value-type>> (p. 152) Container of the QoS policies that a **dds::sub::Subscriber** (p. 2116) supports

You must set certain members in a consistent manner:

length of **dds::core::policy::GroupData::value** (p. 1337) \leq **rti::core::policy::DomainParticipantResourceLimits::subscriber_group_data_max_length** (p. 1166)

length of **dds::core::policy::Partition::name** (p. 1655) \leq **rti::core::policy::DomainParticipantResourceLimits::max_partitions** (p. 1167)

combined number of characters (including terminating 0) in **dds::core::policy::Partition::name** (p. 1655) \leq **rti::core::policy::DomainParticipantResourceLimits::max_partition_cumulative_characters** (p. 1168)

If any of the above are not true, **dds::sub::Subscriber::qos(const dds::sub::qos::SubscriberQos&)** (p. 2122) will fail with **dds::core::InconsistentPolicyError** (p. 1354)

8.357.3 Friends And Related Function Documentation

8.357.3.1 to_string() [1/3]

```
std::string to_string (
    const SubscriberQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat( ) ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
SubscriberQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for SubscriberQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
SubscriberQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.357.3.2 `to_string()` [2/3]

```
std::string to_string (
    const SubscriberQos & qos,
    const SubscriberQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a rti::core::qos_print_all_t (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.357.3.3 to_string() [3/3]

```
std::string to_string (
    const SubscriberQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::sub::qos::SubscriberQos** (p. 2129)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.357.3.4 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::sub::qos::SubscriberQos & qos ) [related]
```

<<**extension**>> (p. 156) Prints a **dds::sub::qos::SubscriberQos** (p. 2129) to an output stream.

8.358 dds::topic::SubscriptionBuiltinTopicData Class Reference

Entry created when a **dds::sub::DataReader** (p. 756) is discovered in association with its **dds::sub::Subscriber** (p. 2116).

```
#include <dds/topic/BuiltinTopic.hpp>
```

 <<extension>> (p. 156) Get the Service policy of the corresponding DataReader.

8.358.1 Detailed Description

Entry created when a **dds::sub::DataReader** (p. 756) is discovered in association with its **dds::sub::Subscriber** (p. 2116).

Data associated with the built-in topic **dds::topic::subscription_topic_name()** (p. 243). It contains QoS policies and additional information that apply to the remote **dds::sub::DataReader** (p. 756) the related **dds::sub::Subscriber** (p. 2116).

8.358.2 Member Function Documentation

8.358.2.1 TSubscriptionBuiltinTopicData()

```
dds::topic::SubscriptionBuiltinTopicData::TSubscriptionBuiltinTopicData ( ) [inline]
```

Create a default **SubscriptionBuiltinTopicData** (p. 2133).

8.358.2.2 key()

```
const dds::topic::BuiltinTopicKey & dds::topic::SubscriptionBuiltinTopicData::key ( ) const [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

8.358.2.3 participant_key()

```
const dds::topic::BuiltinTopicKey & dds::topic::SubscriptionBuiltinTopicData::participant_key ( )  
const [inline]
```

Get the DCPS key of the **dds::domain::DomainParticipant** (p. 1079) to which the **dds::sub::DataReader** (p. 756) belongs.

Returns

The DomainParticipant's key

8.358.2.4 topic_name()

```
const dds::core::string & dds::topic::SubscriptionBuiltinTopicData::topic_name ( ) const [inline]
```

Get the name of the related **dds::topic::Topic** (p. 2178).

Returns

The topic name

8.358.2.5 type_name()

```
const dds::core::string & dds::topic::SubscriptionBuiltinTopicData::type_name ( ) const [inline]
```

Get the name of the type attached to the **dds::topic::Topic** (p. 2178).

Returns

The type name

8.358.2.6 durability()

```
const dds::core::policy::Durability & dds::topic::SubscriptionBuiltinTopicData::durability ( )  
const [inline]
```

Get the **dds::core::policy::Durability** (p. 1181) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The Durability policy

8.358.2.7 deadline()

```
const dds::core::policy::Deadline & dds::topic::SubscriptionBuiltinTopicData::deadline ( ) const  
[inline]
```

Get the **dds::core::policy::Deadline** (p. 1020) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The Deadline policy

8.358.2.8 latency_budget()

```
const dds::core::policy::LatencyBudget & dds::topic::SubscriptionBuiltinTopicData::latency_budget  
( ) const [inline]
```

Get the **dds::core::policy::LatencyBudget** (p. 1375) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The LatencyBudget policy

8.358.2.9 liveliness()

```
const dds::core::policy::Liveliness & dds::topic::SubscriptionBuiltinTopicData::liveliness ( )  
const [inline]
```

Get the **dds::core::policy::Liveliness** (p. 1389) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The Liveliness policy

8.358.2.10 reliability()

```
const dds::core::policy::Reliability & dds::topic::SubscriptionBuiltinTopicData::reliability ( )  
const [inline]
```

Get the **dds::core::policy::Reliability** (p. 1873) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The Reliability policy

8.358.2.11 ownership()

```
const dds::core::policy::Ownership & dds::topic::SubscriptionBuiltinTopicData::ownership ( )  
const [inline]
```

Get the **dds::core::policy::Ownership** (p. 1630) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The Ownership policy

8.358.2.12 destination_order()

```
const dds::core::policy::DestinationOrder & dds::topic::SubscriptionBuiltinTopicData::destination←  
_order ( ) const [inline]
```

Get the **dds::core::policy::DestinationOrder** (p. 1022) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The DestinationOrder policy

8.358.2.13 user_data()

```
const dds::core::policy::UserData & dds::topic::SubscriptionBuiltinTopicData::user_data ( ) const [inline]
```

Get the **dds::core::policy::UserData** (p. 2292) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The UserData policy

8.358.2.14 time_based_filter()

```
const dds::core::policy::TimeBasedFilter & dds::topic::SubscriptionBuiltinTopicData::time_based←_filter ( ) const [inline]
```

Get the **dds::core::policy::TimeBasedFilter** (p. 2174) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The TimeBasedFilter policy

8.358.2.15 presentation()

```
const dds::core::policy::Presentation & dds::topic::SubscriptionBuiltinTopicData::presentation ( ) const [inline]
```

Get the **dds::core::policy::Presentation** (p. 1670) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The Presentation policy

8.358.2.16 partition()

```
const dds::core::policy::Partition & dds::topic::SubscriptionBuiltinTopicData::partition ( ) const [inline]
```

Get the **dds::core::policy::Partition** (p. 1652) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The Partition policy

8.358.2.17 topic_data()

```
const dds::core::policy::TopicData & dds::topic::SubscriptionBuiltinTopicData::topic_data ( )  
const [inline]
```

Get the **dds::core::policy::TopicData** (p. 2204) policy of the related **dds::topic::Topic** (p. 2178).

Returns

The TopicData policy

8.358.2.18 group_data()

```
const dds::core::policy::GroupData & dds::topic::SubscriptionBuiltinTopicData::group_data ( )  
const [inline]
```

Get the **dds::core::policy::GroupData** (p. 1335) policy of the **dds::sub::Subscriber** (p. 2116) to which the **dds::sub::DataReader** (p. 756) belongs.

Returns

The GroupData policy

8.358.2.19 representation()

```
const dds::core::policy::DataRepresentation & dds::topic::SubscriptionBuiltinTopicData::representation  
( ) const [inline]
```

Get the **dds::core::policy::DataRepresentation** (p. 883) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The DataRepresentation policy

8.358.2.20 data_tag()

```
const dds::core::policy::DataTag & dds::topic::SubscriptionBuiltinTopicData::data_tag ( ) const  
[inline]
```

Get the **dds::core::policy::DataTag** (p. 902) policy of the corresponding **dds::sub::DataReader** (p. 756).

Returns

The DataTag policy

8.358.2.21 type()

```
dds::core::optional< dds::core::xtypes::DynamicType > type ( ) const
```

<<*extension*>> (p. 156) Get the type

Note

This is not a lightweight getter—obtaining the type may require some processing so it is recommended that you keep the value if you need to use it multiple times rather than look it up every time. See also **get_type_no_copy()** (p. 2141).

Returns

The type or an unset optional value if the type is not available

8.358.2.22 get_type_no_copy()

```
const dds::core::optional< dds::core::xtypes::DynamicType > & get_type_no_copy ( ) const
```

<<*extension*>> (p. 156) Get the type by reference if possible

Exceptions

<i>dds::core::PreconditionNotMet</i>	If the type is available but is not in a format that is directly accessible. In that case it needs some extra processing and has to be accessed using type() (p. 2140). You can also ensure that it is in the right format by setting rti::core::policy::↔DomainParticipantResourceLimits::type_code_max_serialized_length() (p. 1168) to 0.
--------------------------------------	--

Returns

The type or an unset optional value if the type is not available

See also

type() (p. 2140)

8.358.2.23 subscriber_key()

```
const dds::topic::BuiltinTopicKey & subscriber_key ( ) const
```

<<*extension*>> (p. 156) Get the DCPS key of the subscriber to which the DataReader belongs.

8.358.2.24 property()

```
const rti::core::policy::Property & property ( ) const
```

<<*extension*>> (p. 156) Get the Property policy of the corresponding DataReader

Returns

8.358.2.25 unicast_locators()

```
const dds::core::vector< rti::core::Locator > & unicast_locators ( ) const
```

<<*extension*>> (p. 156) Get the custom unicast locators that the endpoint can specify. The default locators will be used if this is not specified.

8.358.2.26 multicast_locators()

```
const dds::core::vector< rti::core::Locator > & multicast_locators ( ) const
```

<<*extension*>> (p. 156) Get the custom multicast locators that the endpoint can specify. The default locators will be used if this is not specified.

8.358.2.27 content_filter_property()

```
const rti::core::ContentFilterProperty & content_filter_property ( ) const
```

<<*extension*>> (p. 156) This provides all the required information to enable content filtering on the Writer side.

8.358.2.28 virtual_guid()

```
const rti::core::Guid & virtual_guid ( ) const
```

<<*extension*>> (p. 156) Gets the virtual GUID associated to the DataReader.

8.358.2.29 rtps_protocol_version()

```
const rti::core::ProtocolVersion & rtps_protocol_version ( ) const
```

<<*extension*>> (p. 156) Get the version of the RTPS wire protocol used.

8.358.2.30 rtps_vendor_id()

```
const rti::core::VendorId & rtps_vendor_id ( ) const
```

<<*extension*>> (p. 156) Get the ID of vendor implementing the RTPS wire protocol

8.358.2.31 product_version()

```
const rti::core::ProductVersion & product_version ( ) const
```

<<*extension*>> (p. 156) Gets the version of RTI Connext

Returns

8.358.2.32 disable_positive_acks()

```
bool disable_positive_acks ( ) const
```

<<*extension*>> (p. 156) Get whether or not the corresponding **dds::sub::DataReader** (p. 756) sends positive acknowledgments for reliability.

Returns

false if positive acknowledgments are disabled, true otherwise

8.358.2.33 subscription_name()

```
const rti::core::policy::EntityName & subscription_name ( ) const
```

<<*extension*>> (p. 156) Get the subscription name and role name.

8.358.2.34 trust_protection_info()

```
const rti::topic::trust::EndpointTrustProtectionInfo & trust_protection_info ( ) const
```

<<*extension*>> (p. 156) Get the Trust Plugins information associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_protection_info contains information about how RTPS wire serialization, discovery, and liveliness interact with the loaded Trust Plugins. Two endpoints will not match if their trust_protection_info is incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

8.358.2.35 trust_algorithm_info()

```
const rti::topic::trust::EndpointTrustAlgorithmInfo & trust_algorithm_info ( ) const
```

<<*extension*>> (p. 156) Get the Trust plugins algorithms associated with the discovered DataReader.

Trust Plugins is a generic abstraction that represents any plugin intended to do transformation, interception, and validation of exchanged data and metadata.

trust_algorithm_info contains information about what algorithms the loaded Trust Plugins are running. Two endpoints will not match if their trust_algorithm_info are incompatible.

The meaning of the contents of this field may vary depending on what Trust Plugins the endpoint is using. For information about how this field interacts with the RTI Security Plugins, please refer to the [RTI Security Plugins User's Manual](#).

8.358.2.36 service()

```
const rti::core::policy::Service & service ( ) const
```

<<*extension*>> (p. 156) Get the Service policy of the corresponding DataReader.

8.359 dds::core::status::SubscriptionMatchedStatus Class Reference

Information about the status `dds::core::status::StatusMask::subscription_matched()` (p. 2091)

```
#include <TStatus.hpp>
```

Public Member Functions

- `int32_t total_count () const`
The total cumulative number of times that this `dds::sub::DataReader` (p. 756) discovered a "match" with a `dds::pub::DataWriter` (p. 908).
- `int32_t total_count_change () const`
The changes in `total_count` since the last time the listener was called or the status was read.
- `int32_t current_count () const`
The current number of `DataWriters` with which the `dds::sub::DataReader` (p. 756) is matched.
- `int32_t current_count_change () const`
The change in `current_count` since the last time the listener was called or the status was read.
- `const dds::core::InstanceHandle last_publication_handle () const`
This `InstanceHandle` (p. 1356) can be used to look up which remote `dds::pub::DataWriter` (p. 908) was the last to cause this `DataReader`'s status to change, using `dds::sub::DataReader::matched_publication_data` (p. 810).
- `int32_t current_count_peak () const`
<<extension>> (p. 156) Greatest number of `DataReaders` that matched this `dds::pub::DataWriter` (p. 908) simultaneously.

8.359.1 Detailed Description

Information about the status `dds::core::status::StatusMask::subscription_matched()` (p. 2091)

A "match" happens when the `dds::sub::DataReader` (p. 756) finds a `dds::pub::DataWriter` (p. 908) with the same `dds::topic::Topic` (p. 2178), same or compatible data type, and an offered QoS that is compatible with that requested by the `dds::sub::DataReader` (p. 756). (For information on compatible data types, see the [Extensible Types Guide](#).)

This status is also changed (and the listener, if any, called) when a match is ended. A local `dds::sub::DataReader` (p. 756) will become "unmatched" from a remote `dds::pub::DataWriter` (p. 908) when that `dds::pub::DataWriter` (p. 908) goes away for any of the following reasons:

- The `dds::domain::DomainParticipant` (p. 1079) containing the matched `dds::pub::DataWriter` (p. 908) has lost liveliness.
- This `DataReader` or the matched `DataWriter` has changed QoS such that the entities are now incompatible.
- The matched `DataWriter` has been deleted.

This status may reflect changes from multiple match or unmatched events, and the `dds::core::status::SubscriptionMatchedStatus::current_count_change` (p. 2146) can be used to determine the number of changes since the listener was called back or the status was checked.

Note: A `DataWriter`'s loss of liveliness (which is determined by `dds::core::policy::LivelinessKind` (p. 327)) does not trigger an unmatched event. So a `DataWriter` may still match even though its liveliness is lost.

8.359.2 Member Function Documentation

8.359.2.1 total_count()

```
int32_t dds::core::status::SubscriptionMatchedStatus::total_count ( ) const [inline]
```

The total cumulative number of times that this **dds::sub::DataReader** (p. 756) discovered a "match" with a **dds::pub::DataWriter** (p. 908).

This number increases whenever a new match is discovered. It does not decrease when an existing match goes away for any of the reasons described in **dds::core::status::SubscriptionMatchedStatus** (p. 2144).

8.359.2.2 total_count_change()

```
int32_t dds::core::status::SubscriptionMatchedStatus::total_count_change ( ) const [inline]
```

The changes in total_count since the last time the listener was called or the status was read.

Note that this number will never be negative (because it's the total number of times the DataReader ever matched with a DataWriter).

8.359.2.3 current_count()

```
int32_t dds::core::status::SubscriptionMatchedStatus::current_count ( ) const [inline]
```

The current number of DataWriters with which the **dds::sub::DataReader** (p. 756) is matched.

This number increases when a new match is discovered and decreases when an existing match goes away for any of the reasons described in **dds::core::status::SubscriptionMatchedStatus** (p. 2144).

8.359.2.4 current_count_change()

```
int32_t dds::core::status::SubscriptionMatchedStatus::current_count_change ( ) const [inline]
```

The change in current_count since the last time the listener was called or the status was read.

Note that a negative current_count_change means that one or more DataWriters have become unmatched for one or more of the reasons described in **dds::core::status::SubscriptionMatchedStatus** (p. 2144).

8.359.2.5 last_publication_handle()

```
const dds::core::InstanceHandle dds::core::status::SubscriptionMatchedStatus::last_publication_↔  
handle ( ) const [inline]
```

This **InstanceHandle** (p. 1356) can be used to look up which remote **dds::pub::DataWriter** (p. 908) was the last to cause this DataReader's status to change, using **dds::sub::DataReader::matched_publication_data** (p. 810).

If the DataWriter no longer matches this DataReader due to any of the reasons in **dds::core::status::SubscriptionMatchedStatus** (p. 2144) except incompatible QoS, then the DataWriter has been purged from this DataReader's DomainParticipant discovery database. (See the "Discovery Overview" section of the *User's Manual*.) In that case, the **dds::sub::DataReader::matched_publication_data** (p. 810) method will not be able to return information about the DataWriter. The only way to get information about the lost DataWriter is if you cached the information previously.

8.359.2.6 current_count_peak()

```
int32_t current_count_peak ( ) const
```

<<*extension*>> (p. 156) Greatest number of DataReaders that matched this **dds::pub::DataWriter** (p. 908) simultaneously.

That is, there was no moment in time when more than this many DataReaders matched this DataWriter. (As a result, total_count can be higher than current_count_peak.)

8.360 dds::pub::SuspendedPublication Class Reference

<<*value-type*>> (p. 152) Indicates that the application is about to make multiple modifications using several **dds::pub::DataWriter** (p. 908)'s belonging to the same **dds::pub::Publisher** (p. 1719)

```
#include <dds/pub/SuspendedPublication.hpp>
```

Public Member Functions

- **SuspendedPublication** (const **dds::pub::Publisher** &pub)
Suspends the publications of the publisher.
- void **resume** ()
Indicates that the application has completed these changes.
- **~SuspendedPublication** ()
*Calls **resume()** (p. 2148)*

8.360.1 Detailed Description

<<*value-type*>> (p. 152) Indicates that the application is about to make multiple modifications using several **dds::pub::DataWriter** (p. 908)'s belonging to the same **dds::pub::Publisher** (p. 1719)

It is a **hint** to RTI Connexx so it can optimize its performance by e.g., holding the dissemination of the modifications and then batching them.

The use of this operation must be matched by a corresponding call to **dds::pub::SuspendedPublication::resume()** (p. 2148) indicating that the set of modifications has completed.

If the **dds::pub::Publisher** (p. 1719) is deleted before **dds::pub::SuspendedPublication::resume()** (p. 2148) is called, any suspended updates yet to be published will be discarded.

RTI Connexx is not required and does not currently make use of this hint in any way. However, similar results can be achieved by using *asynchronous publishing*. Combined with **rtdi::pub::FlowController** (p. 1316), **rtdi::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p. 1745) **dds::pub::DataWriter** (p. 908) instances allow the user even finer control of traffic shaping and sample coalescing.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228) or dds::core::NotEnabledError (p. 1601).

Getter (see setter with the same name)

8.361.1 Detailed Description

<<*extension*>> (p. 156) Configures resources that RTI Connex uses

Entity:

DomainParticipantFactory

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.361.2 Usage

Within a single process (or address space for some supported real-time operating systems), applications may create and use multiple **dds::domain::DomainParticipant** (p. 1079) entities. This QoS policy sets a parameter that places an effective upper bound on the maximum number of **dds::domain::DomainParticipant** (p. 1079) entities that can be created in a single process/address space. These values cannot be changed after a DomainParticipant has been created and they cannot be set in a QoS XML file.

8.361.3 Constructor & Destructor Documentation

8.361.3.1 SystemResourceLimits() [1/3]

```
rti::core::policy::SystemResourceLimits::SystemResourceLimits ( ) [inline]
```

Creates a **SystemResourceLimits** (p. 2149) qos policy with default values.

8.361.3.2 SystemResourceLimits() [2/3]

```
rti::core::policy::SystemResourceLimits::SystemResourceLimits (
    int32_t the_max_objects_per_thread ) [inline], [explicit]
```

Creates a **SystemResourceLimits** (p. 2149) qos policy with the provided max_objects_per_thread and set initial_↔objects_per_thread accordingly.

8.361.3.3 SystemResourceLimits() [3/3]

```
rti::core::policy::SystemResourceLimits::SystemResourceLimits (
    int32_t the_max_objects_per_thread,
    int32_t the_initial_objects_per_thread ) [inline]
```

Creates a **SystemResourceLimits** (p. 2149) qos policy with the provided max_objects_per_thread and initial_↔objects_per_thread.

8.361.4 Member Function Documentation

8.361.4.1 max_objects_per_thread() [1/2]

```
SystemResourceLimits & rti::core::policy::SystemResourceLimits::max_objects_per_thread (
    int32_t the_max_objects_per_thread )
```

Sets the maximum number of objects that can be stored per thread.

This value is the upper bound on the number of objects that can be stored per thread. When a DomainParticipantFactory is created, infrastructure will be created to manage the number of objects specified by initial_objects_per_thread. As more objects are required by the application, the infrastructure will be automatically grown to accommodate up to max_objects_per_thread objects. Leave this property set to the default value to allow the infrastructure to grow as needed. If you wish to strictly control memory allocation, set max_objects_per_thread to a smaller value, but note that this runs the risk of a runtime error and reduced application functionality if your limit is reached.

[default] 261120

[range] [1, 261120]

8.361.4.2 initial_objects_per_thread() [1/2]

```
SystemResourceLimits & rti::core::policy::SystemResourceLimits::initial_objects_per_thread (
    int32_t the_initial_objects_per_thread )
```

Sets the initial number of objects that can be stored per thread.

The infrastructure for managing thread-specific objects will initially be sized according to this value. The infrastructure will grow automatically, up to a maximum of max_objects_per_thread, as required by the application at runtime. If you are certain that more than the default value of initial_objects_per_thread will be required for your application and you wish to reduce the number of memory allocations performed while your application reaches steady state, you may set this value to a larger number. To improve the efficiency of memory allocation, RTI Connext may initially size the infrastructure to a larger value than the value of initial_objects_per_thread. The infrastructure will never be sized less than initial_objects_per_thread or greater than max_objects_per_thread. When the infrastructure for managing thread-specific objects is created or increased, a log message stating "Allowed number of thread specific objects is now " will be produced at the local log level.

[default] 1024

[range] [1, 261120]; must be less than or equal to max_objects_per_thread

8.361.4.3 max_objects_per_thread() [2/2]

```
int32_t rti::core::policy::SystemResourceLimits::max_objects_per_thread ( ) const
```

Getter (see setter with the same name)

8.361.4.4 initial_objects_per_thread() [2/2]

```
int32_t rti::core::policy::SystemResourceLimits::initial_objects_per_thread ( ) const
```

<<*extension*>> (p. 156) The properties of a thread of execution.

```
#include <rti/core/ThreadSettings.hpp>
```

Public Member Functions

- **ThreadSettings** ()
Creates the default thread settings.
- **ThreadSettings** (**ThreadSettingsKindMask** the_mask, int32_t the_priority, int32_t the_stack_size, **dds::core::vector**< int32_t > the_cpu_list, ThreadSettingsCpuRotationKind::type the_cpu_rotation)
Creates an instance with all the specified parameters.
- **ThreadSettingsKindMask** mask () const
Getter (see setter with the same name)
- **ThreadSettings** & mask (**ThreadSettingsKindMask** the_mask)
Describes the type of thread.
- int32_t priority () const
Getter (see setter with the same name)
- **ThreadSettings** & priority (int32_t the_priority)
Thread priority.
- int32_t stack_size () const
Getter (see setter with the same name)
- **ThreadSettings** & stack_size (int32_t the_stack_size)
The thread stack-size.
- **dds::core::vector**< int32_t > cpu_list () const
Getter (see setter with the same name)
- **ThreadSettings** & cpu_list (const **dds::core::vector**< int32_t > &the_cpu_list)
The list of processors on which the thread(s) may run.
- **ThreadSettingsCpuRotationKind** cpu_rotation () const
Getter (see setter with the same name)
- **ThreadSettings** & cpu_rotation (**ThreadSettingsCpuRotationKind** the_cpu_rotation)
Determines how processor affinity is applied to multiple threads.

8.363.1 Detailed Description

<<*extension*>> (p. 156) The properties of a thread of execution.

Consult `Platform Notes` for additional platform specific details.

QoS:

rti::core::policy::Event (p. 1285) **rti::core::policy::Database** (p. 751) **rti::core::policy::ReceiverPool** (p. 1868)
rti::core::policy::AsynchronousPublisher (p. 620)

8.363.2 Constructor & Destructor Documentation

8.363.2.1 ThreadSettings() [1/2]

```
rti::core::ThreadSettings::ThreadSettings ( ) [inline]
```

Creates the default thread settings.

8.363.2.2 ThreadSettings() [2/2]

```
rti::core::ThreadSettings::ThreadSettings (
    ThreadSettingsKindMask the_mask,
    int32_t the_priority,
    int32_t the_stack_size,
    dds::core::vector< int32_t > the_cpu_list,
    ThreadSettingsCpuRotationKind::type the_cpu_rotation )
```

Creates an instance with all the specified parameters.

8.363.3 Member Function Documentation

8.363.3.1 mask() [1/2]

```
ThreadSettingsKindMask rti::core::ThreadSettings::mask ( ) const
```

Getter (see setter with the same name)

8.363.3.2 mask() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::mask (
    ThreadSettingsKindMask the_mask )
```

Describes the type of thread.

The meaning of each bit of the mask are defined by **rti::core::ThreadSettingsKindMask** (p. 2159).

[default] 0, use default options of the OS

8.363.3.3 priority() [1/2]

```
int32_t rti::core::ThreadSettings::priority ( ) const
```

Getter (see setter with the same name)

8.363.3.4 priority() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::priority (
    int32_t the_priority )
```

Thread priority.

[range] Platform-dependent - Consult `Platform Notes` for additional details.

8.363.3.5 stack_size() [1/2]

```
int32_t rti::core::ThreadSettings::stack_size ( ) const
```

Getter (see setter with the same name)

8.363.3.6 stack_size() [2/2]

```
ThreadSettings & rti::core::ThreadSettings::stack_size (
    int32_t the_stack_size )
```

The thread stack-size.

[range] Platform-dependent. Consult `Platform Notes` for additional details.

8.363.3.7 `cpu_list()` [1/2]

```
dds::core::vector< int32_t > rti::core::ThreadSettings::cpu_list ( ) const
```

Getter (see setter with the same name)

8.363.3.8 `cpu_list()` [2/2]

```
ThreadSettings & rti::core::ThreadSettings::cpu_list (
    const dds::core::vector< int32_t > & the_cpu_list )
```

The list of processors on which the thread(s) may run.

A sequence of integers that represent the set of processors on which the thread(s) controlled by this QoS may run. An empty sequence (the default) means the middleware will make no CPU affinity adjustments.

Note: This feature is currently only supported on a subset of architectures (see the [Platform Notes](#)). The API may change as more architectures are added in future releases.

This value is only relevant to the `rti::core::policy::ReceiverPool` (p. 1868). It is ignored within other QoS policies that include `rti::core::ThreadSettings` (p. 2154).

See also

Controlling CPU Core Affinity for RTI Threads (p. 2158)

[default] Empty sequence

8.363.3.9 `cpu_rotation()` [1/2]

```
ThreadSettingsCpuRotationKind rti::core::ThreadSettings::cpu_rotation ( ) const
```

Getter (see setter with the same name)

8.363.3.10 `cpu_rotation()` [2/2]

```
ThreadSettings & rti::core::ThreadSettings::cpu_rotation (
    ThreadSettingsCpuRotationKind the_cpu_rotation )
```

Determines how processor affinity is applied to multiple threads.

This value is only relevant to the `rti::core::policy::ReceiverPool` (p. 1868). It is ignored within other QoS policies that include `rti::core::ThreadSettings` (p. 2154).

See also

Controlling CPU Core Affinity for RTI Threads (p. 2158)

Note: This feature is currently only supported on a subset of architectures (see the [Platform Notes](#)). The API may change as more architectures are added in future releases.

8.364 rti::core::ThreadSettingsCpuRotationKind_def Struct Reference

Determines how `rti::core::ThreadSettings::cpu_list` (p. 2156) affects processor affinity for thread-related QoS policies that apply to multiple threads.

```
#include <ThreadSettings.hpp>
```

Public Types

- enum `type` {
`NO_ROTATION` ,
`ROUND_ROBIN` }

The underlying enum type.

8.364.1 Detailed Description

Determines how `rti::core::ThreadSettings::cpu_list` (p. 2156) affects processor affinity for thread-related QoS policies that apply to multiple threads.

8.364.2 Controlling CPU Core Affinity for RTI Threads

Most thread-related QoS settings apply to a single thread (such as for the `rti::core::policy::Event` (p. 1285), `rti::core::policy::Database` (p. 751), and `rti::core::policy::AsynchronousPublisher` (p. 620)). However, the thread settings in the `rti::core::policy::ReceiverPool` (p. 1868) control every receive thread created. In this case, there are several schemes to map M threads to N processors; the rotation kind controls which scheme is used.

Controlling CPU Core Affinity is only relevant to the `rti::core::policy::ReceiverPool` (p. 1868). It is ignored within other QoS policies that include `rti::core::ThreadSettings` (p. 2154).

If `rti::core::ThreadSettings::cpu_list` (p. 2156) is empty, the rotation is irrelevant since no affinity adjustment will occur. Suppose instead that `rti::core::ThreadSettings::cpu_list` (p. 2156) = {0, 1} and that the middleware creates three receive threads: {A, B, C}. If `rti::core::ThreadSettings::cpu_rotation` (p. 2157) is `rti::core::ThreadSettingsCpuRotationKind_def::NO_ROTATION` (p. 2159), threads A, B and C will have the same processor affinities (0-1), and the OS will control thread scheduling within this bound. It is common to denote CPU affinities as a bitmask, where set bits represent allowed processors to run on. This mask is printed in hex, so a CPU core affinity of 0-1 can be represented by the mask 0x3.

If `rti::core::ThreadSettings::cpu_rotation` (p. 2157) is `rti::core::ThreadSettingsCpuRotationKind_def::ROUND_ROBIN` (p. 2159), each thread will be assigned in round-robin fashion to one of the processors in `rti::core::ThreadSettings::cpu_list` (p. 2156); perhaps thread A to 0, B to 1, and C to 0. Note that the order in which internal middleware threads spawn is unspecified.

Not all of these options may be relevant for all operating systems. Refer to the Platform Notes for further information.

8.364.3 Member Enumeration Documentation

8.364.3.1 type

```
enum rti::core::ThreadSettingsCpuRotationKind_def::type
```

The underlying enum type.

Enumerator

NO_ROTATION	Any thread controlled by this QoS can run on any listed processor, as determined by OS scheduling.
ROUND_ROBIN	Threads controlled by this QoS will be assigned one processor from the list in round-robin order.

8.365 rti::core::ThreadSettingsKindMask Class Reference

<<*extension*>> (p. 156) A collection of flags used to configure threads of execution

```
#include <rti/core/ThreadSettings.hpp>
```

Inherits std::bitset< 4 >.

Public Types

- typedef std::bitset< 4 > **MaskType**

The base type, a std::bitset.

Public Member Functions

- ThreadSettingsKindMask** ()
The default thread settings mask.
- ThreadSettingsKindMask** (uint64_t mask)
Create from the bits in an integer.
- ThreadSettingsKindMask** (const **MaskType** &mask)
Create from a std::bitset.

Static Public Member Functions

- static const **ThreadSettingsKindMask** **floating_point** ()
Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.
- static const **ThreadSettingsKindMask** **stdio** ()
Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.
- static const **ThreadSettingsKindMask** **realtime_priority** ()
The thread will be scheduled on a FIFO basis.
- static const **ThreadSettingsKindMask** **priority_enforce** ()
Strictly enforce this thread's priority.
- static const **ThreadSettingsKindMask** **cancel_asynchronous** ()
Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

8.365.1 Detailed Description

<<*extension*>> (p. 156) A collection of flags used to configure threads of execution

Not all of these options may be relevant for all operating systems. Consult `Platform Notes` for additional details.

8.365.2 Member Typedef Documentation

8.365.2.1 MaskType

```
typedef std::bitset<4> rti::core::ThreadSettingsKindMask::MaskType
```

The base type, a `std::bitset`.

8.365.3 Constructor & Destructor Documentation

8.365.3.1 ThreadSettingsKindMask() [1/3]

```
rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask ( ) [inline]
```

The default thread settings mask.

8.365.3.2 ThreadSettingsKindMask() [2/3]

```
rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask (
    uint64_t mask ) [inline], [explicit]
```

Create from the bits in an integer.

8.365.3.3 ThreadSettingsKindMask() [3/3]

```
rti::core::ThreadSettingsKindMask::ThreadSettingsKindMask (
    const MaskType & mask ) [inline]
```

Create from a `std::bitset`.

8.365.4 Member Function Documentation

8.365.4.1 floating_point()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::floating_point ( ) [inline],  
[static]
```

Code executed within the thread may perform floating point operations. Currently applicable only for VxWorks platforms, where user callbacks use floating-point operations.

8.365.4.2 stdio()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::stdio ( ) [inline], [static]
```

Code executed within the thread may access standard I/O. Currently applicable only for VxWorks platforms, where user callbacks do standard I/O operations.

8.365.4.3 realtime_priority()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::realtime_priority ( )  
[inline], [static]
```

The thread will be scheduled on a FIFO basis.

8.365.4.4 priority_enforce()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::priority_enforce ( ) [inline],  
[static]
```

Strictly enforce this thread's priority.

8.365.4.5 cancel_asynchronous()

```
static const ThreadSettingsKindMask rti::core::ThreadSettingsKindMask::cancel_asynchronous ( )  
[inline], [static]
```

Allows the thread to be cancelled without first reaching a cancellable state or cancellation point.

8.366 dds::core::Time Class Reference

<<*extension*>> (p. 156) Represents a point in time

```
#include <Time.hpp>
```

Public Member Functions

- **Time** ()

Create a default **Time** (p. 2162) object. The constructed **Time** (p. 2162) object will represent 0 seconds and 0 nanoseconds.
- **Time** (int64_t **sec**, uint32_t **nanosec**=0)

Create a **Time** (p. 2162) object. The constructed **Time** (p. 2162) object will represent the given amount of time.
- int64_t **sec** () const

Get the number of seconds that are represented by this **Time** (p. 2162) object.
- void **sec** (int64_t s)

Set the number of seconds that are represented by this **Time** (p. 2162) object.
- uint32_t **nanosec** () const

Get the number of nanoseconds that are represented by this **Time** (p. 2162) object.
- void **nanosec** (uint32_t ns)

Set the number of nanoseconds that are represented by this **Time** (p. 2162) object.
- int **compare** (const **Time** &other) const

Compare two **Time** (p. 2162) objects.
- bool **operator**> (const **Time** &other) const

Check if this **Time** (p. 2162) is greater than another.
- bool **operator**>= (const **Time** &other) const

Check if this **Time** (p. 2162) is greater than or equal another.
- bool **operator**== (const **Time** &other) const

Check if this **Time** (p. 2162) of **Time** (p. 2162) is equal to another.
- bool **operator**!= (const **Time** &other) const

Check if this **Time** (p. 2162) is not equal to another.
- bool **operator**<= (const **Time** &other) const

Check if this **Time** (p. 2162) is less than or equal another.
- bool **operator**< (const **Time** &other) const

Check if this **Time** (p. 2162) is less than another.
- **Time** & **operator**+ = (const **Duration** &duration)

Add a **Duration** (p. 1194) to this **Time** (p. 2162) object.
- **Time** & **operator**- = (const **Duration** &duration)

Subtract a **Duration** (p. 1194) from this **Time** (p. 2162) object.
- uint64_t **to_millisecs** () const

Convert this **Time** (p. 2162) to milliseconds.
- uint64_t **to_microsecs** () const

Convert this **Time** (p. 2162) to microseconds.
- uint64_t **to_nanosecs** () const

Convert this **Time** (p. 2162) to nanoseconds.
- double **to_secs** () const

Convert this **Time** (p. 2162) to seconds.

Static Public Member Functions

- static **Time** **invalid** ()
Get a **Time** (p. 2162) object representing an invalid amount of time.
- static **Time** **zero** ()
Get a **Time** (p. 2162) object representing zero time.
- static **Time** **maximum** ()
Get a **Time** (p. 2162) object representing the maximum amount of time.
- static **Time** **from_microsecs** (uint64_t microseconds)
Create a **Time** (p. 2162) object from microseconds.
- static **Time** **from_millisecs** (uint64_t milliseconds)
Create a **Time** (p. 2162) object from milliseconds.
- static **Time** **from_secs** (double seconds)
Create a **Time** (p. 2162) object from seconds.

Related Functions

(Note that these are not member functions.)

- **Time** **operator+** (const **Time** &time, const **Duration** &duration)
Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.
- **Time** **operator+** (const **Duration** &duration, const **Time** &time)
Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.
- **Time** **operator-** (const **Time** &time, const **Duration** &duration)
Subtract a **Duration** (p. 1194) from a **Time** (p. 2162).
- **Duration** **operator-** (const **Time** &time1, const **Time** &time2)
Calculate the duration between two times.

8.366.1 Detailed Description

<<*extension*>> (p. 156) Represents a point in time

8.366.2 Constructor & Destructor Documentation

8.366.2.1 Time() [1/2]

```
dds::core::Time::Time ( )
```

Create a default **Time** (p. 2162) object. The constructed **Time** (p. 2162) object will represent 0 seconds and 0 nanoseconds.

8.366.2.2 Time() [2/2]

```
dds::core::Time::Time (
    int64_t sec,
    uint32_t nanosec = 0 ) [explicit]
```

Create a **Time** (p. 2162) object. The constructed **Time** (p. 2162) object will represent the given amount of time.

8.366.3 Member Function Documentation

8.366.3.1 invalid()

```
static Time dds::core::Time::invalid ( ) [static]
```

Get a **Time** (p. 2162) object representing an invalid amount of time.

Returns

const **Time** (p. 2162) A **Time** (p. 2162) object representing an invalid amount of time.

8.366.3.2 zero()

```
static Time dds::core::Time::zero ( ) [static]
```

Get a **Time** (p. 2162) object representing zero time.

Returns

const **Time** (p. 2162) A **Time** (p. 2162) object representing zero time.

8.366.3.3 maximum()

```
static Time dds::core::Time::maximum ( ) [static]
```

Get a **Time** (p. 2162) object representing the maximum amount of time.

Returns

const **Time** (p. 2162) A **Time** (p. 2162) object representing the maximum amount of time.

8.366.3.4 from_microsecs()

```
static Time dds::core::Time::from_microsecs (
    uint64_t microseconds ) [static]
```

Create a **Time** (p. 2162) object from microseconds.

Parameters

<i>microseconds</i>	How many microseconds this Time (p. 2162) represent
---------------------	--

Returns

Time (p. 2162) A new instance of **Time** (p. 2162) representing the given microseconds

8.366.3.5 from_millisecs()

```
static Time dds::core::Time::from_millisecs (  
    uint64_t milliseconds ) [static]
```

Create a **Time** (p. 2162) object from milliseconds.

Parameters

<i>milliseconds</i>	How many milliseconds this Time (p. 2162) should represent
---------------------	---

Returns

Time (p. 2162) A new instance of **Time** (p. 2162) representing the given milliseconds

8.366.3.6 from_secs()

```
static Time dds::core::Time::from_secs (  
    double seconds ) [static]
```

Create a **Time** (p. 2162) object from seconds.

Parameters

<i>seconds</i>	How many seconds this Time (p. 2162) should represent
----------------	--

Returns

Time (p. 2162) A new instance of **Time** (p. 2162) representing the given seconds

8.366.3.7 sec() [1/2]

```
int64_t dds::core::Time::sec ( ) const
```

Get the number of seconds that are represented by this **Time** (p. 2162) object.

Returns

int64_t The number of seconds

8.366.3.8 sec() [2/2]

```
void dds::core::Time::sec (
    int64_t s )
```

Set the number of seconds that are represented by this **Time** (p. 2162) object.

Parameters

s	The number of seconds to set.
---	-------------------------------

8.366.3.9 nanosec() [1/2]

```
uint32_t dds::core::Time::nanosec ( ) const
```

Get the number of nanoseconds that are represented by this **Time** (p. 2162) object.

Returns

uint32_t The number of nanoseconds

8.366.3.10 nanosec() [2/2]

```
void dds::core::Time::nanosec (
    uint32_t ns )
```

Set the number of nanoseconds that are represented by this **Time** (p. 2162) object.

Parameters

<i>ns</i>	The number of nanoseconds to set.
-----------	-----------------------------------

8.366.3.11 compare()

```
int dds::core::Time::compare (
    const Time & other ) const
```

Compare two **Time** (p. 2162) objects.

Parameters

<i>other</i>	The Time (p. 2162) object to compare with this Time (p. 2162).
--------------	--

Returns

int The result of the comparison can be: -1 if this **Time** (p. 2162) is less than other; 0 if they are equal; 1 if this **Time** (p. 2162) is greater than other

8.366.3.12 operator>()

```
bool dds::core::Time::operator> (
    const Time & other ) const
```

Check if this **Time** (p. 2162) is greater than another.

Parameters

<i>other</i>	The Time (p. 2162) object to compare with this Time (p. 2162).
--------------	--

Returns

bool false if this **Time** (p. 2162) is less than or equal to the other object, true otherwise.

8.366.3.13 operator>=()

```
bool dds::core::Time::operator>= (
    const Time & other ) const
```

Check if this **Time** (p. 2162) is greater than or equal another.

Parameters

<i>other</i>	The Time (p. 2162) object to compare with this Time (p. 2162).
--------------	--

Returns

bool false if this **Time** (p. 2162) is less than to the other object, true otherwise.

8.366.3.14 operator==()

```
bool dds::core::Time::operator==(
    const Time & other ) const
```

Check if this **Time** (p. 2162) of **Time** (p. 2162) is equal to another.

Parameters

<i>other</i>	The Time (p. 2162) object to compare with this Time (p. 2162).
--------------	--

Returns

bool false if this **Time** (p. 2162) is not equal to the other object, true otherwise.

8.366.3.15 operator!=()

```
bool dds::core::Time::operator!=(
    const Time & other ) const
```

Check if this **Time** (p. 2162) is not equal to another.

Parameters

<i>other</i>	The Time (p. 2162) object to compare with this Time (p. 2162).
--------------	--

Returns

bool false if this **Time** (p. 2162) is equal to the other object, true otherwise.

8.366.3.16 operator<=()

```
bool dds::core::Time::operator<= (
    const Time & other ) const
```

Check if this **Time** (p. 2162) is less than or equal another.

Parameters

<i>other</i>	The Time (p. 2162) object to compare with this Time (p. 2162).
--------------	--

Returns

bool false if this **Time** (p. 2162) is greater than to the other object, true otherwise.

8.366.3.17 operator<()

```
bool dds::core::Time::operator< (
    const Time & other ) const
```

Check if this **Time** (p. 2162) is less than another.

Parameters

<i>other</i>	The Time (p. 2162) object to compare with this Time (p. 2162).
--------------	--

Returns

bool false if this **Time** (p. 2162) is greater than or equal to the other object, true otherwise.

8.366.3.18 operator+=()

```
Time & dds::core::Time::operator+= (
    const Duration & duration )
```

Add a **Duration** (p. 1194) to this **Time** (p. 2162) object.

Parameters

<i>duration</i>	The Duration (p. 1194) to add
-----------------	--------------------------------------

Returns

Time (p.2162)& This **Time** (p.2162), with the added **Duration** (p.1194)

8.366.3.19 operator-=()

```
Time & dds::core::Time::operator-= (
    const Duration & duration )
```

Subtract a **Duration** (p.1194) from this **Time** (p.2162) object.

Parameters

<i>duration</i>	The Duration (p.1194) to subtract
-----------------	--

Returns

Time (p.2162)& This **Time** (p.2162), with the subtracted **Duration** (p.1194)

8.366.3.20 to_millisecs()

```
uint64_t dds::core::Time::to_millisecs ( ) const
```

Convert this **Time** (p.2162) to milliseconds.

Returns

uint64_t The number of milliseconds represented by this **Time** (p.2162) object.

Exceptions

<i>std::overflow_error</i>	if the time in milliseconds exceeds the value that can be stored in an uint64_t
----------------------------	---

8.366.3.21 to_microsecs()

```
uint64_t dds::core::Time::to_microsecs ( ) const
```

Convert this **Time** (p.2162) to microseconds.

Returns

uint64_t The number of microseconds represented by this **Time** (p. 2162) object.

Exceptions

<code>std::overflow_error</code>	if the time in microseconds exceeds the value that can be stored in an uint64_t
----------------------------------	---

8.366.3.22 to_nanosecs()

```
uint64_t dds::core::Time::to_nanosecs ( ) const
```

Convert this **Time** (p. 2162) to nanoseconds.

Returns

uint64_t The number of nanoseconds represented by this **Time** (p. 2162) object.

Exceptions

<code>std::overflow_error</code>	if the time in nanoseconds exceeds the value that can be stored in an uint64_t
----------------------------------	--

8.366.3.23 to_secs()

```
double dds::core::Time::to_secs ( ) const
```

Convert this **Time** (p. 2162) to seconds.

Returns

double The number of seconds represented by this **Time** (p. 2162) object.

8.366.4 Friends And Related Function Documentation**8.366.4.1 operator+() [1/2]**

```
Time operator+ (
    const Time & time,
    const Duration & duration ) [related]
```

Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.

Parameters

<i>time</i>	The Time (p. 2162) object to add
<i>duration</i>	The Duration (p. 1194) object to add

Returns

Time (p. 2162) The result of the addition represented as a **Time** (p. 2162) object

8.366.4.2 operator+() [2/2]

```
Time operator+ (
    const Duration & duration,
    const Time & time ) [related]
```

Add a **Time** (p. 2162) and a **Duration** (p. 1194) together.

Parameters

<i>duration</i>	The Duration (p. 1194) object to add
<i>time</i>	The Time (p. 2162) object to add

Returns

Time (p. 2162) The result of the addition represented as a **Time** (p. 2162) object

8.366.4.3 operator-() [1/2]

```
Time operator- (
    const Time & time,
    const Duration & duration ) [related]
```

Subtract a **Duration** (p. 1194) from a **Time** (p. 2162).

Parameters

<i>time</i>	The Time (p. 2162) object to subtract from
<i>duration</i>	The Duration (p. 1194) object to subtract

Returns

Time (p. 2162) The result of the subtraction represented as a **Time** (p. 2162) object

8.366.4.4 operator-() [2/2]

```
Duration operator- (
    const Time & time1,
    const Time & time2 ) [related]
```

Calculate the duration between two times.

Parameters

<i>time1</i>	The first ("before") time
<i>time2</i>	The second ("after") time

Exceptions

<code>std::overflow_error</code>	if duration exceeds the infinite limit
----------------------------------	--

Returns

The duration elapsed between time1 and time2. If time1 > time2 the duration is zero. If time1 is **Time::maximum()** (p. 2164), the duration is **Duration::infinite()** (p. 1197);

8.367 dds::core::policy::TimeBasedFilter Class Reference

Allows a **dds::sub::DataReader** (p. 756) to indicate that it is not interested in all the sample updates that occur within a time period.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TimeBasedFilter** ()
Creates the default time-based filter.
- **TimeBasedFilter** (const **dds::core::Duration** &the_min_separation)
Creates a policy with the specified minimum separation.
- **TimeBasedFilter** & **minimum_separation** (const **dds::core::Duration** &min_separation)
Sets the minimum separation between subsequent samples.
- const **dds::core::Duration** **minimum_separation** () const
Getter (see setter with the same name)

8.367.1 Detailed Description

Allows a **dds::sub::DataReader** (p. 756) to indicate that it is not interested in all the sample updates that occur within a time period.

The filter states that the **dds::sub::DataReader** (p. 756) does not want to receive more than one value each `minimum_separation`, regardless of how fast the changes occur.

Entity:

dds::sub::DataReader (p. 756)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **YES** (p. 307)

8.367.2 Usage

You can use this QoS policy to reduce the amount of data received by a **dds::sub::DataReader** (p. 756). **dds::pub::DataWriter** (p. 908) entities may send data faster than needed by a **dds::sub::DataReader** (p. 756). For example, a **dds::sub::DataReader** (p. 756) of sensor data that is displayed to a human operator in a GUI application does not need to receive data updates faster than a user can reasonably perceive changes in data values. This is often measured in tenths (0.1) of a second up to several seconds. However, a **dds::pub::DataWriter** (p. 908) of sensor information may have other **dds::sub::DataReader** (p. 756) entities that are processing the sensor information to control parts of the system and thus need new data updates in measures of hundredths (0.01) or thousandths (0.001) of a second.

With this QoS policy, different **dds::sub::DataReader** (p. 756) entities can set their own time-based filters, so that data published faster than the period set by a each **dds::sub::DataReader** (p. 756) will not be delivered to that **dds::sub::DataReader** (p. 756).

The **TIME_BASED_FILTER** (p. 338) also applies to each instance separately; that is, the constraint is that the **dds::sub::DataReader** (p. 756) does not want to see more than one sample of each instance per `minimum_separation` period.

This QoS policy allows you to optimize resource usage (CPU and possibly network bandwidth) by only delivering the required amount of data to each **dds::sub::DataReader** (p. 756), accommodating the fact that, for rapidly-changing data, different subscribers may have different requirements and constraints as to how frequently they need or can handle being notified of the most current values. As such, it can also be used to protect applications that are running on a heterogeneous network where some nodes are capable of generating data much faster than others can consume it.

For best effort data delivery, if the data type is unkeyed and the **dds::pub::DataWriter** (p. 908) has an infinite **dds::core::policy::Liveliness::lease_duration** (p. 1393), RTI Connext will only send as many packets to a **dds::sub::DataReader** (p. 756) as required by the **TIME_BASED_FILTER**, no matter how fast **dds::pub::DataWriter::write()** (p. 918) is called.

For multicast data delivery to multiple DataReaders, the one with the lowest `minimum_separation` determines the DataWriter's send rate. For example, if a **dds::pub::DataWriter** (p. 908) sends over multicast to two DataReaders, one with `minimum_separation` of 2 seconds and one with `minimum_separation` of 1 second, the DataWriter will send every 1 second.

In configurations where RTI Connext must send all the data published by the **dds::pub::DataWriter** (p. 908) (for example, when the **dds::pub::DataWriter** (p. 908) is reliable, when the data type is keyed, or when the **dds::pub::DataWriter** (p. 908) has a finite **dds::core::policy::Liveliness::lease_duration** (p. 1393)), only the data that passes the **TIME_BASED_FILTER** will be stored in the receive queue of the **dds::sub::DataReader** (p. 756). Extra data will be accepted but dropped. Note that filtering is only applied on alive samples (that is, samples that have not been disposed/unregistered).

8.367.3 Consistency

It is inconsistent for a `dds::sub::DataReader` (p. 756) to have a `minimum_separation` longer than its **DEADLINE** (p. 316) `period`.

However, it is important to be aware of certain edge cases that can occur when your publication rate, minimum separation, and deadline period align and that can cause missed deadlines that you may not expect. For example, suppose that you nominally publish samples every second but that this rate can vary somewhat over time. You declare a minimum separation of 1 second to filter out rapid updates and set a deadline of two seconds so that you will be aware if the rate falls too low. Even if your update rate never wavers, you can still miss deadlines! Here's why:

Suppose you publish the first sample at time $t=0$ seconds. You then publish your next sample at $t=1$ seconds. Depending on how your operating system schedules the time-based filter execution relative to the publication, this second sample may be filtered. You then publish your third sample at $t=2$ seconds, and depending on how your OS schedules this publication in relation to the deadline check, you could miss the deadline.

This scenario demonstrates a couple of rules of thumb:

- Beware of setting your `minimum_separation` to a value very close to your publication rate: you may filter more data than you intend to.
- Beware of setting your `minimum_separation` to a value that is too close to your deadline period relative to your publication rate. You may miss deadlines.

See `dds::core::policy::Deadline` (p. 1020) for more information about the interactions between deadlines and time-based filters.

The setting of a **TIME_BASED_FILTER** (p. 338) – that is, the selection of a `minimum_separation` with a value greater than zero – is consistent with all settings of the **HISTORY** (p. 324) and **RELIABILITY** (p. 335) QoS. The **TIME_BASED_FILTER** (p. 338) specifies the samples that are of interest to the `dds::sub::DataReader` (p. 756). The **HISTORY** (p. 324) and **RELIABILITY** (p. 335) QoS affect the behavior of the middleware with respect to the samples that have been determined to be of interest to the `dds::sub::DataReader` (p. 756); that is, they apply *after* the **TIME_BASED_FILTER** (p. 338) has been applied.

In the case where the reliability QoS kind is `dds::core::policy::ReliabilityKind_def::RELIABLE` (p. 1881), in steady-state – defined as the situation where the `dds::pub::DataWriter` (p. 908) does not write new samples for a period "long" compared to the `minimum_separation` – the system should guarantee delivery of the last sample to the `dds::sub::DataReader` (p. 756).

8.368 dds::core::TimeoutError Class Reference

Indicates that an operation has timed out.

```
#include <Exception.hpp>
```

Inheritance diagram for `dds::core::TimeoutError`:

Public Member Functions

- virtual const char * **what** () const throw ()

Access the message contained in this **TimeoutError** (p. 2177) exception.

8.368.1 Detailed Description

Indicates that an operation has timed out.

Inherits also from `std::runtime_error`

8.368.2 Member Function Documentation

8.368.2.1 what()

```
virtual const char * dds::core::TimeoutError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **TimeoutError** (p. 2177) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.369 dds::topic::Topic< T > Class Template Reference

<<**reference-type**>> (p. 153) **Topic** (p. 2178) is the most basic description of the data to be published and subscribed.

```
#include <dds/topic/Topic.hpp>
```

Inheritance diagram for `dds::topic::Topic< T >`:

Public Member Functions

- **Topic** (const **dds::domain::DomainParticipant** & participant, RTI_STRING_IN topic_name)
Creates a new topic.
- **Topic** (const **dds::domain::DomainParticipant** &dp, RTI_STRING_IN topic_name, RTI_STRING_IN **type_name**)
Creates a new topic.
- **Topic** (const **dds::domain::DomainParticipant** &dp, RTI_STRING_IN topic_name, const **dds::topic::qos** & qos, **dds::topic::TopicListener**< T > * listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
*Creates a new **Topic** (p. 2178).*
- **Topic** (const **dds::domain::DomainParticipant** & participant, RTI_STRING_IN topic_name, RTI_STRING_IN **type_name**, const **dds::topic::qos::TopicQos** & qos, **dds::topic::TopicListener**< T > * listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
Create a new topic.
- **Topic** (const **dds::domain::DomainParticipant** & participant, RTI_STRING_IN topic_name, const **dds::core::xtypes::DynamicType** &type)
Create a new topic with a dynamic type description.
- **Topic** (const **dds::domain::DomainParticipant** & participant, RTI_STRING_IN topic_name, const **dds::core::xtypes::DynamicType** &type, const **dds::topic::qos::TopicQos** & qos, **dds::topic::TopicListener**< T > * listener=NULL, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
Create a new topic with a dynamic type description.
- **Topic** (const **dds::domain::DomainParticipant** &dp, RTI_STRING_IN topic_name, const **dds::topic::qos** & qos, std::shared_ptr< **Listener** > listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
*Creates a new **Topic** (p. 2178).*
- **Topic** (const **dds::domain::DomainParticipant** & participant, RTI_STRING_IN topic_name, RTI_STRING_IN **type_name**, const **dds::topic::qos::TopicQos** & qos, std::shared_ptr< **Listener** > listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
Create a new topic.
- **Topic** (const **dds::domain::DomainParticipant** & participant, RTI_STRING_IN topic_name, const **dds::core::xtypes::DynamicType** &type, const **dds::topic::qos::TopicQos** & qos, std::shared_ptr< **Listener** > listener, const **dds::core::status::StatusMask** &mask= **dds::core::status::StatusMask::all**())
Create a new topic with a dynamic type description.
- void **listener** (**Listener** *listener, const **dds::core::status::StatusMask** &event_mask)
Sets the listener.
- **Listener** * **listener** () const
Gets the listener.
- void **set_listener** (std::shared_ptr< **Listener** > listener, const **dds::core::status::StatusMask** &event_mask)
Sets the listener associated with this topic.
- void **set_listener** (std::shared_ptr< **Listener** > listener)
Sets the listener associated with this topic.
- std::shared_ptr< **Listener** > **get_listener** () const
Returns the listener currently associated with this topic.
- const **dds::topic::qos::TopicQos** **qos** () const
*Gets the current TopicQos for this **Topic** (p. 2178).*
- void **qos** (const **dds::topic::qos::TopicQos** &qos)
*Sets the TopicQos setting for this **Topic** (p. 2178).*
- **dds::core::status::InconsistentTopicStatus** **inconsistent_topic_status** () const
*Retrieve the current InconsistentTopicStatus of this **Topic** (p. 2178).*

8.369.1 Detailed Description

```
template<typename T>
class dds::topic::Topic< T >
```

<<reference-type>> (p. 153) **Topic** (p. 2178) is the most basic description of the data to be published and subscribed.

Template Parameters

<i>T</i>	The type associated to this topic. It must be a type such that <code>dds::topic::is_topic_type<T>::value</code> is true (see <code>dds::topic::is_topic_type</code> (p. 1365)). Valid types are IDL-generated types (p. 395), the built-in types (p. 49) and <code>dds::core::xtypes::DynamicData</code> (p. 1208).
----------	---

QoS:

`dds::topic::qos::TopicQos` (p. 2213)

Status:

`dds::core::status::StatusMask::inconsistent_topic()` (p. 2086), `dds::core::status::InconsistentTopicStatus` (p. 1355)

Listener:

`TopicListener` (p. 2212)

A `dds::topic::Topic` (p. 2178) is identified by its name, which must be unique in the whole domain. In addition (by virtue of extending `TopicDescription` (p. 2207)) it fully specifies the type of the data that can be communicated when publishing or subscribing to the `dds::topic::Topic` (p. 2178).

`dds::topic::Topic` (p. 2178) is the only `TopicDescription` (p. 2207) that can be used for publications and therefore associated with a `dds::pub::DataWriter` (p. 908).

The following operations may be called even if the `dds::topic::Topic` (p. 2178) is not enabled. Other operations will fail with the value `dds::core::NotEnabledError` (p. 1601) if called on a disabled `dds::topic::Topic` (p. 2178):

- `dds::core::Entity::enable` (p. 1269)
- `dds::topic::Topic::qos(const dds::topic::qos::TopicQos&)` (p. 2188), `dds::topic::Topic::qos() const` (p. 2188)
- `dds::topic::Topic::set_listener` (p. 2187), `dds::topic::Topic::get_listener` (p. 2188)
- `dds::core::cond::StatusCondition::StatusCondition(const dds::core::Entity&)` (p. 2080), `dds::core::Entity::status_changes()` (p. 1270)
- `dds::topic::Topic::inconsistent_topic_status` (p. 2189)

Examples

`Foo_publisher.cxx`, and `Foo_subscriber.cxx`.

8.369.2 Constructor & Destructor Documentation

8.369.2.1 Topic() [1/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & participant,
    RTI_STRING_IN topic_name ) [inline]
```

Creates a new topic.

This constructor automatically deduces the type name, uses **the default TopicQos** (p. 1267) and doesn't set a listener.

Parameters

<i>participant</i>	The domain participant on which the topic will be defined.
<i>topic_name</i>	The topic name.

8.369.2.2 Topic() [2/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & dp,
    RTI_STRING_IN topic_name,
    RTI_STRING_IN type_name ) [inline]
```

Creates a new topic.

This constructor uses **the default TopicQos** (p. 1267) and doesn't set a listener.

Parameters

<i>dp</i>	The domain participant on which the topic will be defined.
<i>topic_name</i>	The topic name.
<i>type_name</i>	The name to register the type with

8.369.2.3 Topic() [3/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
```

```

const dds::domain::DomainParticipant & dp,
RTI_STRING_IN topic_name,
const dds::topic::qos::TopicQos & qos,
    dds::topic::TopicListener< T > * listener = NULL,
const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Creates a new **Topic** (p.2178).

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p.1381)> instead of a regular `Listener*` pointer.

This constructor deduces the type name automatically

8.369.2.4 Topic() [4/9]

```

template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & participant,
    RTI_STRING_IN topic_name,
    RTI_STRING_IN type_name,
    const dds::topic::qos::TopicQos & qos,
    dds::topic::TopicListener< T > * listener = NULL,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]

```

Create a new topic.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p.1381)> instead of a regular `Listener*` pointer.

Parameters

<i>participant</i>	The domain participant on which the topic will be defined.
<i>topic_name</i>	The Topic (p.2178) name. Must not exceed 255 characters.
<i>type_name</i>	The name given to the type T
<i>qos</i>	The Qos settings for this Topic (p.2178)
<i>listener</i>	the topic listener (default: NULL)
<i>mask</i>	the event mask associated to the DataReader listener.

See also

Specifying QoS on entities (p.306) for information on setting QoS before entity creation
dds::topic::qos::TopicQos (p.2213) for rules on consistency among QoS
dds::core::QosProvider (p.1752)
dds::domain::DomainParticipant::default_topic_qos() (p.1098)
listener() (p.2186)

8.369.2.5 Topic() [5/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & participant,
    RTI_STRING_IN topic_name,
    const dds::core::xtypes::DynamicType & type ) [inline]
```

Create a new topic with a dynamic type description.

This constructor uses a dynamic type description, **the default TopicQos** (p. 1267) and doesn't set a listener.

8.369.2.6 Topic() [6/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & participant,
    RTI_STRING_IN topic_name,
    const dds::core::xtypes::DynamicType & type,
    const dds::topic::qos::TopicQos & qos,
    dds::topic::TopicListener< T > * listener = NULL,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a new topic with a dynamic type description.

[DEPRECATED] When using a listener, prefer the constructor that receives a `shared_ptr<Listener` (p. 1381) > instead of a regular `Listener*` pointer.

Notice that in this case the data type `T` has to be `DynamicData`. Thus the **Topic** (p.2178) type will be `Topic<↔ DynamicData>`.

Parameters

<i>participant</i>	the domain participant on which the topic will be defined.
<i>topic_name</i>	the topic's name.
<i>type</i>	The <code>DynamicType</code> that describes the type for the <code>DynamicData</code> samples of this topic.
<i>qos</i>	The Qos settings for this Topic (p. 2178)
<i>listener</i>	the topic listener (default: NULL)
<i>mask</i>	the event mask associated to the <code>DataReader</code> listener.

8.369.2.7 Topic() [7/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & dp,
    RTI_STRING_IN topic_name,
    const dds::topic::qos::TopicQos & qos,
    std::shared_ptr< Listener > listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Creates a new **Topic** (p. 2178).

This constructor deduces the type name automatically.

8.369.2.8 Topic() [8/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & participant,
    RTI_STRING_IN topic_name,
    RTI_STRING_IN type_name,
    const dds::topic::qos::TopicQos & qos,
    std::shared_ptr< Listener > listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a new topic.

Parameters

<i>participant</i>	The domain participant on which the topic will be defined.
<i>topic_name</i>	The Topic (p. 2178) name. Must not exceed 255 characters.
<i>type_name</i>	The name given to the type T
<i>qos</i>	The Qos settings for this Topic (p. 2178)
<i>listener</i>	A shared_ptr to the listener. See set_listener() (p. 2187) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

See also

Specifying QoS on entities (p. 306) for information on setting QoS before entity creation

dds::domain::DomainParticipant::default_topic_qos() (p. 1098)

listener() (p. 2186)

8.369.2.9 Topic() [9/9]

```
template<typename T >
dds::topic::Topic< T >::Topic (
    const dds::domain::DomainParticipant & participant,
    RTI_STRING_IN topic_name,
    const dds::core::xtypes::DynamicType & type,
    const dds::topic::qos::TopicQos & qos,
    std::shared_ptr< Listener > listener,
    const dds::core::status::StatusMask & mask = dds::core::status::StatusMask::all() )
[inline]
```

Create a new topic with a dynamic type description.

Notice that in this case the data type T has to be DynamicData. Thus the **Topic** (p.2178) type will be `Topic<DynamicData>`.

Parameters

<i>participant</i>	the domain participant on which the topic will be defined.
<i>topic_name</i>	the topic's name.
<i>type</i>	The DynamicType that describes the type for the DynamicData samples of this topic.
<i>qos</i>	The Qos settings for this Topic (p. 2178)
<i>listener</i>	A shared_ptr to the listener. See set_listener() (p.2187) for more information.
<i>mask</i>	Indicates which status updates the listener will receive

dds::core::xtypes::DynamicData (p. 1208)

rti::domain::register_type() (p. 520)

8.369.3 Member Function Documentation

8.369.3.1 listener() [1/2]

```
template<typename T >
void dds::topic::Topic< T >::listener (
    Listener * listener,
    const ::dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener.

[DEPRECATED] The use of **set_listener()** (p. 2187) is recommended. Unlike this function, **set_listener** receives a `shared_ptr` which simplifies the management of listener's lifecycle.

Parameters

<i>listener</i>	the topic listener
<i>event_mask</i>	Changes of communication status to be invoked on the listener

8.369.3.2 listener() [2/2]

```
template<typename T >
Listener * dds::topic::Topic< T >::listener ( ) const [inline]
```

Gets the listener.

[DEPRECATED] Prefer `get_listener()` (p. 2188) instead of this function.

Returns the listener or NULL if there's no listener attached.

8.369.3.3 set_listener() [1/2]

```
template<typename T >
void dds::topic::Topic< T >::set_listener (
    std::shared_ptr< Listener > listener,
    const dds::core::status::StatusMask & event_mask ) [inline]
```

Sets the listener associated with this topic.

The topic will hold a `shared_ptr` to the listener argument, ensuring that it is not deleted at least until this topic is deleted or the listener is reset with `set_listener(nullptr)`.

Warning

It's recommended that the listener implementation doesn't hold a permanent reference to the topic. If it does, the application needs to manually reset the listener or manually close this topic to ensure that there is no cycle that prevents the destruction of these two objects.

Parameters

<i>listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
<i>event_mask</i>	A mask that indicates which status updates will be notified to the listener

8.369.3.4 set_listener() [2/2]

```
template<typename T >
void dds::topic::Topic< T >::set_listener (
    std::shared_ptr< Listener > listener ) [inline]
```

Sets the listener associated with this topic.

If `listener` is not `nullptr`, this overload is equivalent to:

```
topic.set_listener(listener, dds::core::status::StatusMask::all());
```

If `listener` is `nullptr`, it is equivalent to:

```
topic.set_listener(nullptr, dds::core::status::StatusMask::none());
```

Parameters

<i>listener</i>	A shared pointer to the listener to receive status updates or <code>nullptr</code> to reset the current listener and stop receiving status updates.
-----------------	---

8.369.3.5 get_listener()

```
template<typename T >
std::shared_ptr< Listener > dds::topic::Topic< T >::get_listener ( ) const [inline]
```

Returns the listener currently associated with this topic.

Returns

The shared pointer to the current listener or `nullptr` if there is currently no listener associated to this entity.

8.369.3.6 qos() [1/2]

```
template<typename T >
const dds::topic::qos::TopicQos dds::topic::Topic< T >::qos ( ) const [inline]
```

Gets the current TopicQos for this **Topic** (p. 2178).

8.369.3.7 qos() [2/2]

```
template<typename T >
void dds::topic::Topic< T >::qos (
    const dds::topic::qos::TopicQos & qos ) [inline]
```

Sets the TopicQos setting for this **Topic** (p. 2178).

Parameters

<i>qos</i>	Set of policies to be applied to the Topic (p. 2178). Immutable policies cannot be changed after this entity has been enabled.
------------	---

Exceptions

dds::core::ImmutablePolicyError (p. 1353)	if <i>qos</i> contains a different value for an immutable policy.
dds::core::InconsistentPolicyError (p. 1354)	if some policies are inconsistent.

See also

dds::topic::qos::TopicQos (p. 2213) for rules on consistency among QoS policies

8.369.3.8 inconsistent_topic_status()

```
template<typename T >
dds::core::status::InconsistentTopicStatus dds::topic::Topic< T >::inconsistent_topic_status ( )
const [inline]
```

Retrieve the current InconsistentTopicStatus of this **Topic** (p. 2178).

8.369.4 Friends And Related Function Documentation

8.369.4.1 discover_any_topic() [1/2]

```
template<typename FwdIterator >
int32_t discover_any_topic (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    int32_t max_size ) [related]
```

Retrieves the topics discovered in a DomainParticipant.

Template Parameters

<i>FwdIterator</i>	A forward iterator whose value type is dds::core::InstanceHandle (p. 1356)
--------------------	---

Parameters

<i>participant</i>	The DomainParticipant where to look up the discovered topics
<i>begin</i>	The beginning of the range where to insert the InstanceHandles that correspond to the discovered topics
<i>max_size</i>	The maximum number of topics to insert or dds::core::LENGTH_UNLIMITED (p. 238)

8.369.4.2 discover_any_topic() [2/2]

```
template<typename BinIterator >
int32_t discover_any_topic (
    const dds::domain::DomainParticipant & participant,
    BinIterator begin ) [related]
```

Retrieves the topics discovered in a DomainParticipant.

This is equivalent to `discover_any_topic(participant, begin, dds::core::LENGTH_UNLIMITED)`

References **dds::topic::discover_any_topic()**, and **dds::core::LENGTH_UNLIMITED**.

8.369.4.3 discover_topic_data() [1/4]

```
template<typename T >
dds::topic::TopicBuiltinTopicData discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & topic_handle ) [related]
```

Gets the information about a discovered topic.

Returns **dds::topic::TopicBuiltinTopicData** (p. 2197) for the specified **dds::topic::Topic** (p. 2178).

This operation retrieves information on a **dds::topic::Topic** (p. 2178) that has been discovered by the local Participant and must not have been "ignored" by means of the **dds::topic::ignore()** (p. 481) operation.

The *topic_handle* must correspond to such a topic. Otherwise, the operation will fail with **dds::core::PreconditionNotMetError** (p. 1669).

This call is not supported for remote topics. If a remote *topic_handle* is used, the operation will fail with **dds::core::UnsupportedError** (p. 2291).

Use the operation **dds::topic::discover_any_topic()** (p. 478) to find the topics that are currently discovered.

Parameters

<i>participant</i>	The DomainParticipant where to look up the topic information
<i>topic_handle</i>	<< <i>in</i> >> (p. 157) dds::core::InstanceHandle (p. 1356) of dds::topic::Topic (p. 2178).

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::PreconditionNotMetError (p. 1669) or dds::core::NotEnabledError (p. 1601)
------------	--

See also

dds::topic::TopicBuiltinTopicData (p. 2197)

dds::topic::discover_any_topic() (p. 478)

8.369.4.4 discover_topic_data() [2/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    const dds::core::InstanceHandleSeq & handles ) [related]
```

Gets the information about several topics.

8.369.4.5 discover_topic_data() [3/4]

```
template<typename FwdIterator >
int32_t discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    int32_t max_size ) [related]
```

Gets the information about all topics.

Template Parameters

<i>A</i>	forward iterator whose value type is dds::topic::TopicBuiltinTopicData (p. 2197)
----------	---

Parameters

<i>participant</i>	The DomainParticipant where to look up all the topics
<i>begin</i>	The beginning of a range where to copy the topic data
<i>max_size</i>	The maximum number of items to copy or dds::core::LENGTH_UNLIMITED (p. 238)

8.369.4.6 discover_topic_data() [4/4]

```
template<typename BinIterator >
int32_t discover_topic_data (
    const dds::domain::DomainParticipant & participant,
    BinIterator begin ) [related]
```

Gets the information about all topics.

References **dds::topic::discover_topic_data()**, and **dds::core::LENGTH_UNLIMITED**.

8.369.4.7 ignore() [1/2]

```
template<typename T >
void ignore (
    dds::domain::DomainParticipant & participant,
    const dds::core::InstanceHandle & handle ) [related]
```

Instructs a DomainParticipant to ignore a topic.

Instructs RTI Connex to locally ignore a **dds::topic::Topic** (p. 2178).

This means it will locally ignore any publication, or subscription to the **dds::topic::Topic** (p. 2178).

There is no way to reverse this operation.

This operation can be used to save local resources when the application knows that it will never publish or subscribe to data under certain topics.

The **dds::topic::Topic** (p. 2178) to ignore is identified by the `handle` argument. This is the handle of a **dds::topic::Topic** (p. 2178) that appears in the **dds::sub::SampleInfo** (p. 1992) retrieved when reading data samples from the built-in **dds::sub::DataReader** (p. 756) for the **dds::topic::Topic** (p. 2178).

Parameters

<i>participant</i>	The DomainParticipant where to ignore the topic
<i>handle</i>	<< <i>in</i> >> (p. 157) Handle of the dds::topic::Topic (p. 2178) to be ignored.

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), dds::core::OutOfResourcesError (p. 1629) or dds::core::NotEnabledError (p. 1601)
------------	--

8.369.4.8 ignore() [2/2]

```
template<typename FwdIterator >
void ignore (
    dds::domain::DomainParticipant & participant,
    FwdIterator begin,
    FwdIterator end ) [related]
```

Ignores a range of topics.

See also

ignore(dds::domain::DomainParticipant&,const dds::core::InstanceHandle&) (p. 2192)

References **dds::topic::ignore()**.

8.369.4.9 find()

```
template<typename TOPIC >
TOPIC find (
    const dds::domain::DomainParticipant & participant,
    const std::string & topic_name ) [related]
```

Looks up a **Topic** (p. 2178) from a DomainParticipant.

Template Parameters

<i>TOPIC</i>	<p>The topic to find; it can be one of the following:</p> <ul style="list-style-type: none"> • A typed TopicDescription (p. 2207), such as <code>dds::topic::TopicDescription<Foo></code>, • A typed Topic (p. 2178), such as <code>dds::topic::Topic<Foo></code> • A typed ContentFilteredTopic (p. 735), such as <code>dds::topic::ContentFilteredTopic<Foo></code> • dds::topic::AnyTopic (p. 612)
--------------	---

Parameters

<i>participant</i>	The DomainParticipant that contains the Topic (p. 2178)
<i>topic_name</i>	The topic name

Returns

A reference to an existing **Topic** (p. 2178) in this participant or an empty reference (i.e. equals to **dds::core::null** (p. 238)) if it doesn't exist.

Exceptions

dds::core::InvalidDowncastError (p. 1364)	If the concrete type of the topic description identified by <code>topic_name</code> is not <code>TOPIC</code> . For example, if the <code>topic_name</code> identifies a topic of type <code>Bar</code> , but the template parameter was <code>dds::topic::Topic<Foo></code> .
--	--

The participant doesn't need to be enabled. The returned topic may be enabled or disabled.

8.369.4.10 find_topics() [1/2]

```
template<typename AnyTopicBackInsertIterator >
uint32_t find_topics (
    dds::domain::DomainParticipant participant,
    AnyTopicBackInsertIterator begin ) [related]
```

<<**extension**>> (p. 156) Retrieve all the **dds::topic::Topic** (p. 2178) created from this **dds::domain::DomainParticipant** (p. 1079)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 558)

Template Parameters

<i>AnyTopicBackInsertIterator</i>	Type of the back-inserting iterator, whose <code>value_type</code> is dds::topic::AnyTopic (p. 612).
-----------------------------------	---

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Topics belong to
<i>begin</i>	A back-inserting iterator to the position in the destination container to insert the found Topics into

Returns

The number of found Topics

8.369.4.11 find_topics() [2/2]

```
template<typename AnyTopicForwardIterator >
uint32_t find_topics (
    dds::domain::DomainParticipant participant,
    AnyTopicForwardIterator begin,
    uint32_t max_size ) [related]
```

<<**extension**>> (p. 156) Retrieve all the **dds::topic::Topic** (p.2178) created from this **dds::domain::DomainParticipant** (p. 1079)

```
#include <dds/topic/find.hpp>
```

Note

This is a standalone function in the namespace **rti::topic** (p. 558)

Template Parameters

<i>AnyTopicBackInsertIterator</i>	Type of the back-inserting iterator, whose value_type is dds::topic::AnyTopic (p. 612).
-----------------------------------	--

Parameters

<i>participant</i>	The dds::domain::DomainParticipant (p. 1079) the Topics belong to
<i>begin</i>	A forward iterator to the position in the destination container to insert the found Topics in
<i>max_size</i>	The maximum number of Topics to return

Returns

The number of found Topics

8.370 rti::topic::topic_type_disabled_copy< TopicType > Struct Template Reference

<<**extension**>> (p. 156) Indicates whether a TopicType is uncopiable

```
#include <rti/topic/TopicTraits.hpp>
```

Inherits dds::core::false_type.

8.370.1 Detailed Description

```
template<typename TopicType>
struct rti::topic::topic_type_disabled_copy< TopicType >
```

<<**extension**>> (p. 156) Indicates whether a TopicType is uncopyable

In general this is `false_type` (TopicType is a value types and therefore copyable), There is one situation when this is `true_type`:

- IDL types annotated with `@language_binding(FLAT_DATA)`

This trait enables (when it's `false_type`) or disables (when it's `true_type`) the DataReader read/take operations that copy instead of loaning the data (for example, `dds::sub::DataReader::take(SamplesFWIterator, int32_t)` (p. 778))

8.371 rti::topic::topic_type_has_external_members< TopicType > Struct Template Reference

<<**extension**>> (p. 156) Indicates if a topic type contains directly or indirectly IDL external members.

```
#include <rti/topic/TopicTraits.hpp>
```

Inherits `dds::core::false_type`.

8.371.1 Detailed Description

```
template<typename TopicType>
struct rti::topic::topic_type_has_external_members< TopicType >
```

<<**extension**>> (p. 156) Indicates if a topic type contains directly or indirectly IDL external members.

This template is specialized in the generated code for topic types that do contain `&external` members.

8.372 dds::topic::topic_type_name< T > Struct Template Reference

Provides the name of a topic-type.

```
#include <TopicTraits.hpp>
```

8.372.1 Detailed Description

```
template<typename T>
struct dds::topic::topic_type_name< T >
```

Provides the name of a topic-type.

For example:

```
std::cout << dds::topic::topic_type_name<Foo>::value() << std::endl;
std::cout << dds::topic::topic_type_name<dds::core::StringTopicType>::value() << std::endl;
// output:
// Foo
// DDS::String
```

Note that `topic_type_name<dds::core::xtypes::DynamicData>::value()` is undefined, because `DynamicData` is used to dynamically represent any type so its actual topic-type is unknown at compilation time.

8.373 `dds::topic::topic_type_support< T >` Struct Template Reference

Provides convenience operations for a topic-type.

```
#include <TopicTraits.hpp>
```

8.373.1 Detailed Description

```
template<typename T>
struct dds::topic::topic_type_support< T >
```

Provides convenience operations for a topic-type.

8.374 `dds::topic::TopicBuiltinTopicData` Class Reference

Entry created when a `dds::topic::Topic` (p. 2178) object is discovered.

```
#include <dds/topic/BuiltinTopic.hpp>
```

8.374.1 Detailed Description

Entry created when a **dds::topic::Topic** (p. 2178) object is discovered.

Data associated with the built-in topic **dds::topic::topic_topic_name()** (p. 242). It contains QoS policies and additional information that apply to the remote **dds::topic::Topic** (p. 2178).

Note: The **dds::topic::TopicBuiltinTopicData** (p. 2197) built-in topic is meant to convey information about discovered Topics. This **Topic** (p. 2178)'s samples are not propagated in a separate packet on the wire. Instead, the data is sent as part of the information carried by other built-in topics (**dds::topic::PublicationBuiltinTopicData** (p. 1703) and **dds::topic::SubscriptionBuiltinTopicData** (p. 2133)). Therefore **TopicBuiltinTopicData** (p. 2197) DataReaders will not receive any data.

8.374.2 Member Function Documentation

8.374.2.1 key()

```
const dds::topic::BuiltinTopicKey & dds::topic::TopicBuiltinTopicData::key ( ) const [inline]
```

Get the DCPS key to distinguish entries.

Returns

The key

References [dds::core::Value< D >::delegate\(\)](#).

8.374.2.2 name()

```
const dds::core::string & dds::topic::TopicBuiltinTopicData::name ( ) const [inline]
```

Get the name of the [dds::topic::Topic](#) (p. 2178).

Returns

The topic's name

References [dds::core::Value< D >::delegate\(\)](#).

8.374.2.3 type_name()

```
const dds::core::string & dds::topic::TopicBuiltinTopicData::type_name ( ) const [inline]
```

Get the name of the type attached to the [dds::topic::Topic](#) (p. 2178).

Returns

The type's name

References [dds::core::Value< D >::delegate\(\)](#).

8.374.2.4 durability()

```
const dds::core::policy::Durability & dds::topic::TopicBuiltinTopicData::durability ( ) const  
[inline]
```

Get the **dds::core::policy::Durability** (p. 1181) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The Durability policy

8.374.2.5 durability_service()

```
const dds::core::policy::DurabilityService & dds::topic::TopicBuiltinTopicData::durability_↔  
service ( ) const [inline]
```

Get the **dds::core::policy::DurabilityService** (p. 1190) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The DurabilityService policy

References **dds::core::Value< D >::delegate()**.

8.374.2.6 deadline()

```
const dds::core::policy::Deadline & dds::topic::TopicBuiltinTopicData::deadline ( ) const [inline]
```

Get the **dds::core::policy::Deadline** (p. 1020) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The Deadline policy

8.374.2.7 latency_budget()

```
const dds::core::policy::LatencyBudget & dds::topic::TopicBuiltinTopicData::latency_budget ( )  
const [inline]
```

Get the **dds::core::policy::LatencyBudget** (p. 1375) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The LatencyBudget policy

References **dds::core::Value< D >::delegate()**.

8.374.2.8 liveliness()

```
const dds::core::policy::Liveliness & dds::topic::TopicBuiltinTopicData::liveliness ( ) const  
[inline]
```

Get the **dds::core::policy::Liveliness** (p. 1389) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The Liveliness policy

References **dds::core::Value< D >::delegate()**.

8.374.2.9 reliability()

```
const dds::core::policy::Reliability & dds::topic::TopicBuiltinTopicData::reliability ( ) const  
[inline]
```

Get the **dds::core::policy::Reliability** (p. 1873) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The Reliability policy

References **dds::core::Value< D >::delegate()**.

8.374.2.10 transport_priority()

```
const dds::core::policy::TransportPriority & dds::topic::TopicBuiltinTopicData::transport_↔  
priority ( ) const [inline]
```

Get the **dds::core::policy::TransportPriority** (p. 2255) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The TransportPriority policy

References **dds::core::Value< D >::delegate()**.

8.374.2.11 lifespan()

```
const dds::core::policy::Lifespan & dds::topic::TopicBuiltinTopicData::lifespan ( ) const [inline]
```

Get the **dds::core::policy::Lifespan** (p. 1379) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The Lifespan policy

References **dds::core::Value< D >::delegate()**.

8.374.2.12 destination_order()

```
const dds::core::policy::DestinationOrder & dds::topic::TopicBuiltinTopicData::destination_order  
( ) const [inline]
```

Get the **dds::core::policy::DestinationOrder** (p. 1022) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The DestinationOrder policy

References **dds::core::Value< D >::delegate()**.

8.374.2.13 history()

```
const dds::core::policy::History & dds::topic::TopicBuiltinTopicData::history ( ) const [inline]
```

Get the **dds::core::policy::History** (p. 1346) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The History policy

References **dds::core::Value< D >::delegate()**.

8.374.2.14 resource_limits()

```
const dds::core::policy::ResourceLimits & dds::topic::TopicBuiltinTopicData::resource_limits ( )  
const [inline]
```

Get the **dds::core::policy::ResourceLimits** (p. 1921) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The ResourceLimits policy

References **dds::core::Value< D >::delegate()**.

8.374.2.15 ownership()

```
const dds::core::policy::Ownership & dds::topic::TopicBuiltinTopicData::ownership ( ) const [inline]
```

Get the **dds::core::policy::Ownership** (p. 1630) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The Ownership policy

References **dds::core::Value< D >::delegate()**.

8.374.2.16 topic_data()

```
const dds::core::policy::TopicData & dds::topic::TopicBuiltinTopicData::topic_data ( ) const
[inline]
```

Get the **dds::core::policy::TopicData** (p. 2204) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The TopicData policy

References **dds::core::Value< D >::delegate()**.

8.374.2.17 representation()

```
const dds::core::policy::DataRepresentation & dds::topic::TopicBuiltinTopicData::representation (
) const [inline]
```

Get the **dds::core::policy::DataRepresentation** (p. 883) policy of the corresponding **dds::topic::Topic** (p. 2178).

Returns

The DataRepresentation policy

References **dds::core::Value< D >::delegate()**.

8.375 dds::core::policy::TopicData Class Reference

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TopicData** ()
Creates an empty sequence of bytes.
- **TopicData** (const **dds::core::ByteSeq** &seq)
Creates an instance from a vector of bytes.
- **TopicData** (const uint8_t *value_begin, const uint8_t *value_end)
Creates an instance from a range of bytes.
- template<typename OCTET_ITER >
TopicData & **value** (OCTET_ITER the_begin, OCTET_ITER the_end)
Set the value for the topic data.
- const **dds::core::ByteSeq** **value** () const
Get the topic data.
- **dds::core::ByteSeq** & **value** (**dds::core::ByteSeq** &dst) const
Get the topic data.
- const uint8_t * **begin** () const
Beginning of the range of bytes.
- const uint8_t * **end** () const
End of the range of bytes.

8.375.1 Detailed Description

Entity:

dds::topic::Topic (p. 2178)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = **YES** (p. 307)

See also

dds::sub::builtin_subscriber (p. 459)

8.375.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created **dds::topic::Topic** (p. 2178) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This extra data is not used by RTI Connex.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with **dds::sub::DataReaderListener** (p. 832), **dds::pub::DataWriterListener** (p. 972), or operations such as **dds::topic::ignore()** (p. 481), this QoS policy can assist an application in defining and enforcing its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connex stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connex with the maximum size of the data that will be stored in policies of this type. This size is configured with **rti::core::policy::DomainParticipantResourceLimits::topic_data_max_length** (p. 1165).

8.375.3 Constructor & Destructor Documentation

8.375.3.1 TopicData() [1/3]

```
dds::core::policy::TopicData::TopicData ( ) [inline]
```

Creates an empty sequence of bytes.

8.375.3.2 TopicData() [2/3]

```
dds::core::policy::TopicData::TopicData (
    const dds::core::ByteSeq & seq ) [inline], [explicit]
```

Creates an instance from a vector of bytes.

8.375.3.3 TopicData() [3/3]

```
dds::core::policy::TopicData::TopicData (
    const uint8_t * value_begin,
    const uint8_t * value_end ) [inline]
```

Creates an instance from a range of bytes.

8.375.4 Member Function Documentation**8.375.4.1 value() [1/3]**

```
template<typename OCTET_ITER >
TopicData & dds::core::policy::TopicData::value (
    OCTET_ITER the_begin,
    OCTET_ITER the_end ) [inline]
```

Set the value for the topic data.

8.375.4.2 value() [2/3]

```
const dds::core::ByteSeq dds::core::policy::TopicData::value ( ) const [inline]
```

Get the topic data.

8.375.4.3 value() [3/3]

```
dds::core::ByteSeq & dds::core::policy::TopicData::value (
    dds::core::ByteSeq & dst ) const [inline]
```

Get the topic data.

8.375.4.4 begin()

```
const uint8_t * dds::core::policy::TopicData::begin ( ) const [inline]
```

Beginning of the range of bytes.

8.375.4.5 end()

```
const uint8_t * dds::core::policy::TopicData::end ( ) const [inline]
```

End of the range of bytes.

8.376 dds::topic::TopicDescription< T > Class Template Reference

Abstract base class of **Topic** (p. 2178) and **ContentFilteredTopic** (p. 735).

```
#include <dds/topic/TopicDescription.hpp>
```

Inheritance diagram for dds::topic::TopicDescription< T >:

Public Member Functions

- `const std::string & name () const`
Gets the topic name.
- `const std::string & type_name () const`
Gets the type name.
- `const dds::domain::DomainParticipant & participant () const`
Gets the related `dds::domain::DomainParticipant` (p. 1079).

Additional Inherited Members

8.376.1 Detailed Description

```
template<typename T>
class dds::topic::TopicDescription< T >
```

Abstract base class of **Topic** (p. 2178) and **ContentFilteredTopic** (p. 735).

TopicDescription (p. 2207) represents the fact that both publications and subscriptions are tied to a single data-type. Its attribute `type_name` defines a unique resulting type for the publication or the subscription and therefore creates an implicit association with a `TypeSupport`.

TopicDescription (p. 2207) has also a `name` that allows it to be retrieved locally.

See also

`TypeSupport`, `FooTypeSupport`

Template Parameters

<i>T</i>	The topic-type
----------	----------------

8.376.2 Member Function Documentation

8.376.2.1 name()

```
template<typename T >
const std::string & dds::topic::TopicDescription< T >::name ( ) const [inline]
```

Gets the topic name.

8.376.2.2 type_name()

```
template<typename T >
const std::string & dds::topic::TopicDescription< T >::type_name ( ) const [inline]
```

Gets the type name.

The type name defines a locally unique type for the publication or the subscription.

The association between the topic and the type name is automatic through the template parameter `T`, via the trait `dds::topic::topic_type_name<T>::name()`, that is given

When `T` is `rti::core::xtypes::DynamicData`, the type name is obtained by default from the `rti::core::xtypes::DynamicType`.

8.376.2.3 participant()

```
template<typename T >
const dds::domain::DomainParticipant & dds::topic::TopicDescription< T >::participant ( ) const
[inline]
```

Gets the related `dds::domain::DomainParticipant` (p. 1079).

8.377 dds::topic::TopicInstance< T > Class Template Reference

Encapsulates a sample and its associated instance handle.

```
#include <TopicInstance.hpp>
```

Public Member Functions

- **TopicInstance** ()
*Create a null **TopicInstance** (p. 2209).*
- **TopicInstance** (const `::dds::core::InstanceHandle` &the_handle)
*Create a **TopicInstance** (p. 2209) with an InstanceHandle.*
- **TopicInstance** (const `::dds::core::InstanceHandle` &the_handle, const T &the_sample)
*Create a **TopicInstance** (p. 2209) with a data sample and an InstanceHandle.*
- **operator dds::core::InstanceHandle** () const
Obtains the InstanceHandle.
- **dds::core::InstanceHandle handle** () const
Obtains the InstanceHandle.
- void **handle** (const `::dds::core::InstanceHandle` &the_handle)
Sets the InstanceHandle.
- const T & **sample** () const
Gets the sample by const reference.
- T & **sample** ()
Gets the sample by reference.
- void **sample** (const T &the_sample)
Assigns the data sample.

8.377.1 Detailed Description

```
template<typename T>
class dds::topic::TopicInstance< T >
```

Encapsulates a sample and its associated instance handle.

Template Parameters

<i>The</i>	type of the sample that the TopicInstance (p. 2209) is encapsulating.
------------	--

See also

dds::pub::DataWriter::write(const dds::topic::TopicInstance<T>&) (p. 924)

8.377.2 Constructor & Destructor Documentation

8.377.2.1 TopicInstance() [1/3]

```
template<typename T >
dds::topic::TopicInstance< T >::TopicInstance ( ) [inline]
```

Create a null **TopicInstance** (p. 2209).

The sample is default constructed and the instance handle is equal to **dds::core::null** (p. 238).

8.377.2.2 TopicInstance() [2/3]

```
template<typename T >
dds::topic::TopicInstance< T >::TopicInstance (
    const ::dds::core::InstanceHandle & the_handle ) [inline]
```

Create a **TopicInstance** (p. 2209) with an InstanceHandle.

The sample is default constructed and the instance handle is copied from handle.

8.377.2.3 TopicInstance() [3/3]

```
template<typename T >
dds::topic::TopicInstance< T >::TopicInstance (
    const ::dds::core::InstanceHandle & the_handle,
    const T & the_sample ) [inline]
```

Create a **TopicInstance** (p. 2209) with a data sample and an InstanceHandle.

8.377.3 Member Function Documentation

8.377.3.1 operator dds::core::InstanceHandle()

```
template<typename T >
dds::topic::TopicInstance< T >::operator dds::core::InstanceHandle ( ) const [inline]
```

Obtains the InstanceHandle.

References **dds::topic::TopicInstance< T >::handle()**.

8.377.3.2 handle() [1/2]

```
template<typename T >
dds::core::InstanceHandle dds::topic::TopicInstance< T >::handle ( ) const [inline]
```

Obtains the InstanceHandle.

Referenced by **dds::topic::TopicInstance< T >::operator dds::core::InstanceHandle()**.

8.377.3.3 handle() [2/2]

```
template<typename T >
void dds::topic::TopicInstance< T >::handle (
    const dds::core::InstanceHandle & the_handle ) [inline]
```

Sets the InstanceHandle.

8.377.3.4 sample() [1/3]

```
template<typename T >
const T & dds::topic::TopicInstance< T >::sample ( ) const [inline]
```

Gets the sample by const reference.

8.377.3.5 sample() [2/3]

```
template<typename T >
T & dds::topic::TopicInstance< T >::sample ( ) [inline]
```

Gets the sample by reference.

8.377.3.6 sample() [3/3]

```
template<typename T >
void dds::topic::TopicInstance< T >::sample (
    const T & the_sample ) [inline]
```

Assigns the data sample.

Parameters

<code>the_sample</code>	The data sample to copy into this TopicInstance (p. 2209)
-------------------------	--

8.378 dds::topic::TopicListener< T > Class Template Reference

The listener to notify status changes for a **dds::topic::Topic** (p. 2178).

```
#include <dds/topic/TopicListener.hpp>
```

Inheritance diagram for `dds::topic::TopicListener< T >`:

Public Member Functions

- virtual void **on_inconsistent_topic** (**Topic**< T > &topic, const **dds::core::status::InconsistentTopicStatus** &status)=0

*Handles the **dds::core::status::InconsistentTopicStatus** (p. 1355) status.*

8.378.1 Detailed Description

```
template<typename T>
class dds::topic::TopicListener< T >
```

The listener to notify status changes for a **dds::topic::Topic** (p. 2178).

Entity:

dds::topic::Topic (p. 2178)

Status:

dds::core::status::StatusMask::inconsistent_topic() (p. 2086), **dds::core::status::InconsistentTopicStatus** (p. 1355)

This is the interface that can be implemented by an application-provided class and then registered with the **dds::topic::Topic** (p. 2178) such that the application can be notified by RTI Connex of relevant status changes.

See also

Status Kinds (p. 229)

Listener (p. 1381)

dds::topic::Topic::set_listener (p. 2187)

Operations Allowed in Listener Callbacks (p. 1383)

NoOpTopicListener (p. 1599)

8.378.2 Member Function Documentation

8.378.2.1 on_inconsistent_topic()

```
template<typename T >
virtual void dds::topic::TopicListener< T >::on_inconsistent_topic (
    Topic< T > & topic,
    const dds::core::status::InconsistentTopicStatus & status ) [pure virtual]
```

Handles the `dds::core::status::InconsistentTopicStatus` (p. 1355) status.

This callback is called when a remote `dds::topic::Topic` (p. 2178) is discovered but is inconsistent with the locally created `dds::topic::Topic` (p. 2178) of the same topic name.

Parameters

<i>topic</i>	<< out >> (p. 157) Locally created <code>dds::topic::Topic</code> (p. 2178) that triggers the listener callback
<i>status</i>	<< out >> (p. 157) Current inconsistent status of locally created <code>dds::topic::Topic</code> (p. 2178)

Implemented in `dds::topic::NoOpTopicListener< T >` (p. 1599).

8.379 dds::topic::qos::TopicQos Class Reference

<<**value-type**>> (p. 152) Container of the QoS policies that a `dds::topic::Topic` (p. 2178) supports

```
#include <dds/topic/qos/TopicQos.hpp>
```

Public Member Functions

- **TopicQos** ()
*Creates a **TopicQos** (p. 2213) with the default value for each policy.*
- template<typename POLICY >
const POLICY & **policy** () const
Gets a QoS policy by const reference.
- template<typename POLICY >
POLICY & **policy** ()
Gets a QoS policy by reference.
- template<typename Policy >
TopicQos & **policy** (const Policy &p)
Sets a policy.
- template<typename Policy >
TopicQos & **operator**<< (const Policy &p)
Sets a policy.
- template<typename Policy >
const **TopicQos** & **operator**>> (Policy &p) const
Copies the values of a policy.

Related Functions

(Note that these are not member functions.)

- `std::string to_string` (const `TopicQos` &qos, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
<<extension>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)
- `std::string to_string` (const `TopicQos` &qos, const `TopicQos` &base, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
<<extension>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)
- `std::string to_string` (const `TopicQos` &qos, const `rti::core::qos_print_all_t` &qos_print_all, const `rti::core::QosPrintFormat` &format= `rti::core::QosPrintFormat()`)
<<extension>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)
- `std::ostream & operator<<` (std::ostream &out, const `rti::topic::qos::TopicQos` &qos)
<<extension>> (p. 156) Prints a `dds::topic::qos::TopicQos` (p. 2213) to an output stream.

8.379.1 Detailed Description

<<value-type>> (p. 152) Container of the QoS policies that a `dds::topic::Topic` (p. 2178) supports

8.379.2 TopicQos Policies

A `TopicQos` (p. 2213) contains the following policies:

- `dds::core::policy::TopicData` (p. 2204),
- `dds::core::policy::Durability` (p. 1181),
- `dds::core::policy::DurabilityService` (p. 1190),
- `dds::core::policy::Deadline` (p. 1020),
- `dds::core::policy::LatencyBudget` (p. 1375),
- `dds::core::policy::Liveliness` (p. 1389),
- `dds::core::policy::Reliability` (p. 1873),
- `dds::core::policy::DestinationOrder` (p. 1022),
- `dds::core::policy::History` (p. 1346),
- `dds::core::policy::ResourceLimits` (p. 1921),
- `dds::core::policy::TransportPriority` (p. 2255),
- `dds::core::policy::Lifespan` (p. 1379),
- `dds::core::policy::Ownership` (p. 1630),
- `dds::core::policy::DataRepresentation` (p. 883)

To get or set policies use the **policy()** (p. 2216) getters and setters or operator `<<` (see **examples** (p. 392)).

You must set certain members in a consistent manner:

```
length of dds::topic::qos::TopicQos::topic_data .value <= dds::domain::qos::DomainParticipantQos::resource_limits
.topic_data_max_length
```

If any of the above are not true, **dds::topic::Topic::qos(const dds::topic::qos::TopicQos&)** (p. 2188), **dds::topic::Topic::qos()** (p. 2188) and **dds::domain::DomainParticipant::default_topic_qos** (p. 1098) will fail with **dds::core::InconsistentPolicyError** (p. 1354) and the **dds::topic::Topic** (p. 2178) constructors will fail with **dds::core::Error** (p. 1284)

Entity:

dds::topic::Topic (p. 2178)

See also

QoS Policies (p. 302) allowed ranges within each Qos.

Qos Use Cases (p. 391)

8.379.3 Constructor & Destructor Documentation

8.379.3.1 TopicQos()

```
dds::topic::qos::TopicQos::TopicQos ( ) [inline]
```

Creates a **TopicQos** (p. 2213) with the default value for each policy.

8.379.4 Member Function Documentation

8.379.4.1 policy() [1/3]

```
template<typename POLICY >
const POLICY & dds::topic::qos::TopicQos::policy ( ) const
```

Gets a QoS policy by const reference.

Template Parameters

<i>Policy</i>	One of the TopicQos Policies (p. 2214)
---------------	---

See also

Setting Qos Values (p. 392)

8.379.4.2 policy() [2/3]

```
template<typename POLICY >
POLICY & dds::topic::qos::TopicQos::policy ( )
```

Gets a QoS policy by reference.

Template Parameters

<i>Policy</i>	One of the TopicQos Policies (p. 2214)
---------------	---

See also

Setting Qos Values (p. 392)

8.379.4.3 policy() [3/3]

```
template<typename Policy >
TopicQos & dds::topic::qos::TopicQos::policy (
    const Policy & p ) [inline]
```

Sets a policy.

See also

policy() (p. 2216)

Setting Qos Values (p. 392)

8.379.4.4 operator<<()

```
template<typename Policy >
TopicQos & dds::topic::qos::TopicQos::operator<< (
    const Policy & p ) [inline]
```

Sets a policy.

policy() (p. 2216)

Setting Qos Values (p. 392)

8.379.4.5 operator>>()

```
template<typename Policy >
const TopicQos & dds::topic::qos::TopicQos::operator>> (
    Policy & p ) const [inline]
```

Copies the values of a policy.

Parameters

<i>p</i>	The destination where to copy the current value of the Policy
----------	---

See also

policy() (p. 2216)

Setting Qos Values (p. 392)

References **rti::topic::to_string()**.

8.379.5 Friends And Related Function Documentation

8.379.5.1 to_string() [1/3]

```
std::string to_string (
    const TopicQos & qos,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2213)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>format</i>	The optional print format used to format the output string.

The several `to_string` overloads allow formatting the output and printing only the differences with respect to another Qos object.

```
TopicQos qos;
// When no QosPrintFormat is supplied, the default is used. Similarly, since
// no base profile has been specified we will only print the differences
// with respect to the documented default for TopicQos
std::string str = to_string(qos);
// In this overload we are specifying the print format used to format the output
// string.
QosPrintFormat format; // ...;
str = to_string(qos, format);
// Here, the differences between qos and base will be included in the output
// string. If the two qos objects are the same, the resulting string will
// be empty.
TopicQos base; // ...;
str = to_string(qos, base);
// We could also specify the format at this point
str = to_string(qos, base, format);
// Instead of supplying a base profile, the sentinel value qos_print_all can
// be supplied. This will result in the entire Qos object being printed (as
// opposed to only the differences with respect to a base qos).
str = to_string(qos, qos_print_all);
```

This overload uses the default print format and only prints the differences between qos and the documented default.

Returns

The string representation of the qos

8.379.5.2 `to_string()` [2/3]

```
std::string to_string (
    const TopicQos & qos,
    const TopicQos & base,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the `dds::topic::qos::TopicQos` (p. 2213)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>base</i>	The base qos. Only the differences between base and qos are included in the output string. If you want to print everything within the QoS, use the overload that accepts a <code>rti::core::qos_print_all_t</code> (p. 1746).
<i>format</i>	The optional print format used to format the output string.

This overload prints the differences between qos and base. If no print format is specified, the default will be used.

Returns

The string representation of the qos

8.379.5.3 to_string() [3/3]

```
std::string to_string (
    const TopicQos & qos,
    const rti::core::qos_print_all_t & qos_print_all,
    const rti::core::QosPrintFormat & format = rti::core::QosPrintFormat() ) [related]
```

<<**extension**>> (p. 156) Obtains a string representation of the **dds::topic::qos::TopicQos** (p. 2213)

Parameters

<i>qos</i>	The qos object to convert to a string
<i>qos_print_all</i>	The sentinel value indicating that the entire QoS should be converted to a string. The other overloads of this API only print the differences with respect to a base profile, or to the documented default.
<i>format</i>	The optional print format used to format the output string.

This overload prints all of the policies within qos. If no print format is specified, the default will be used.

The only valid value for the qos_print_all argument is **rti::core::qos_print_all** (p. 238)

For example:

```
to_string(qos, rti::core::qos_print_all);
```

Returns

The string representation of the qos

8.379.5.4 operator<<()

```
std::ostream & operator<< (
    std::ostream & out,
    const rti::topic::qos::TopicQos & qos ) [related]
```

<<**extension**>> (p. 156) Prints a **dds::topic::qos::TopicQos** (p. 2213) to an output stream.

8.380 rti::sub::TopicQuery Class Reference

<<*extension*>> (p. 156) <<*reference-type*>> (p. 153) Allows a **dds::sub::DataReader** (p. 756) to query the sample cache of its matching **dds::pub::DataWriters**.

```
#include <rti/sub/TopicQuery.hpp>
```

Inheritance diagram for **rti::sub::TopicQuery**:

Public Member Functions

- **TopicQuery** (**dds::sub::AnyDataReader** reader, const **TopicQuerySelection** &selection)
Creates a **TopicQuery** (p. 2220) for a given **DataReader**.
- void **close** ()
Deletes and cancels this **TopicQuery** (p. 2220).
- const **rti::core::Guid** **guid** () const
Gets the **TopicQuery** (p. 2220) **GUID**.
- bool **closed** () const
Indicates whether this **TopicQuery** (p. 2220) has been closed with **close()** (p. 2222).
- **dds::sub::AnyDataReader** **datareader** () const
Gets the **DataReader** associated to this **TopicQuery** (p. 2220).

Static Public Member Functions

- static **TopicQuery** **UseReaderContentFilter** (**dds::sub::AnyDataReader** reader)
Creates a **TopicQuery** (p. 2220) with the same filter as this reader's **ContentFilteredTopic**.
- static **TopicQuery** **SelectAll** (**dds::sub::AnyDataReader** reader)
Creates a **TopicQuery** (p. 2220) that requests all the samples in the **DataWriters'** cache.

Related Functions

(Note that these are not member functions.)

- **TopicQuery** **find_topic_query** (**dds::sub::AnyDataReader** datareader, const **rti::core::Guid** & **guid**)
Looks up a **TopicQuery** (p. 2220) by its **GUID**.

8.380.1 Detailed Description

<<*extension*>> (p. 156) <<*reference-type*>> (p. 153) Allows a **dds::sub::DataReader** (p. 756) to query the sample cache of its matching **dds::pub::DataWriters**.

Note

A **TopicQuery** (p. 2220) provides all the functions of a <<*reference-type*>> (p. 153), including **close()** (p. 2222) and **retain()**.

You can create a **TopicQuery** (p. 2220) for a **DataReader** with the constructor that receives a **TopicQuerySelection** (p. 2229) or with the following static member functions:

- **TopicQuery::UseReaderContentFilter** (p. 2222)
- **TopicQuery::SelectAll** (p. 2223)

As a <<*reference-type*>> (p. 153), a **TopicQuery** (p. 2220) will be deleted when all references to it go out of scope or after calling **close()** (p. 2222). The middleware will notify the deletion of a **TopicQuery** (p. 2220) to the **DataWriters**. See **close()** (p. 2222) for more details.

8.380.2 Constructor & Destructor Documentation

8.380.2.1 TopicQuery()

```
rti::sub::TopicQuery::TopicQuery (
    dds::sub::AnyDataReader reader,
    const TopicQuerySelection & selection ) [inline]
```

Creates a **TopicQuery** (p. 2220) for a given **DataReader**.

The resulting **TopicQuery** (p. 2220) will propagate to the matching **DataWriters** right after creating if the reader is enabled. Otherwise it will propagate after enabling the reader.

Any late-joining **DataWriter** matching with the **DataReader** will also receive the query.

Parameters

<i>reader</i>	The DataReader that will query and receive the requested samples
<i>selection</i>	Selects which samples the matching DataWriters will provide.

There are two special kinds of **TopicQueries**, created with the static member functions **UseReaderContentFilter()** (p. 2222) and **SelectAll()** (p. 2223).

8.380.3 Member Function Documentation

8.380.3.1 close()

```
void rti::sub::TopicQuery::close ( ) [inline]
```

Deletes and cancels this **TopicQuery** (p. 2220).

This is a explicit deletion, which otherwise would occur when all references to this **TopicQuery** (p. 2220) go out of scope.

After deleting a **TopicQuery** (p. 2220) new DataWriters won't discover it and existing DataWriters currently publishing cached samples may stop before delivering all of them.

8.380.3.2 guid()

```
const rti::core::Guid rti::sub::TopicQuery::guid ( ) const [inline]
```

Gets the **TopicQuery** (p. 2220) GUID.

See also

rti::sub::find_topic_query() (p. 556)

8.380.3.3 closed()

```
bool rti::sub::TopicQuery::closed ( ) const [inline]
```

Indicates whether this **TopicQuery** (p. 2220) has been closed with **close()** (p. 2222).

8.380.3.4 datareader()

```
dds::sub::AnyDataReader rti::sub::TopicQuery::datareader ( ) const [inline]
```

Gets the DataReader associated to this **TopicQuery** (p. 2220).

8.380.3.5 UseReaderContentFilter()

```
static TopicQuery rti::sub::TopicQuery::UseReaderContentFilter (
    dds::sub::AnyDataReader reader ) [static]
```

Creates a **TopicQuery** (p. 2220) with the same filter as this reader's ContentFilteredTopic.

If the reader doesn't use a **dds::topic::ContentFilteredTopic** (p. 735), this **TopicQuery** (p. 2220) behaves as **TopicQuery::SelectAll()** (p. 2223).

8.380.3.6 SelectAll()

```
static TopicQuery rti::sub::TopicQuery::SelectAll (
    dds::sub::AnyDataReader reader ) [static]
```

Creates a **TopicQuery** (p. 2220) that requests all the samples in the DataWriters' cache.

8.380.4 Friends And Related Function Documentation

8.380.4.1 find_topic_query()

```
TopicQuery find_topic_query (
    dds::sub::AnyDataReader datareader,
    const rti::core::Guid & guid ) [related]
```

Looks up a **TopicQuery** (p. 2220) by its GUID.

Parameters

<i>datareader</i>	The DataReader used to create the TopicQuery (p. 2220)
<i>guid</i>	The TopicQuery (p. 2220)'s GUID

Returns

The **TopicQuery** (p. 2220) if it exists or a **dds::core::null** (p. 238) reference otherwise.

See also

rti::sub::TopicQuery::guid() (p. 2222)

8.381 rti::sub::TopicQueryData Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides information about a **TopicQuery** (p. 2220)

```
#include <rti/sub/TopicQuery.hpp>
```

Inherits `rti::core::NativeValueType< T, NATIVE_T, ADAPTER >`.

Public Member Functions

*Creates a **TopicQueryData** (p. 2224) from a *ServiceRequest*.*

8.381.1 Detailed Description

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Provides information about a **TopicQuery** (p. 2220)

Contains the information about a **TopicQuery** (p. 2220) that can be retrieved using `rti::sub::create_topic_query_data_from_service_request()` (p. 555).

See also

`rti::sub::create_topic_query_data_from_service_request()` (p. 555)

8.381.2 Member Function Documentation

8.381.2.1 selection()

```
TopicQuerySelection rti::sub::TopicQueryData::selection ( ) const
```

The data selection.

8.381.2.2 topic_name()

```
const dds::core::string & rti::sub::TopicQueryData::topic_name ( ) const
```

The topic name of the **dds::sub::DataReader** (p. 756).

8.381.2.3 original_related_reader_guid()

```
const rti::core::Guid & rti::sub::TopicQueryData::original_related_reader_guid ( ) const
```

Identifies the **dds::sub::DataReader** (p. 756) that created the **rti::sub::TopicQuery** (p. 2220).

8.381.3 Friends And Related Function Documentation

8.381.3.1 create_topic_query_data_from_service_request()

```
TopicQueryData create_topic_query_data_from_service_request (
    const rti::topic::ServiceRequest & service_request ) [related]
```

Creates a **TopicQueryData** (p. 2224) from a **ServiceRequest**.

This operation will extract the content from the request body of the **rti::topic::ServiceRequest** (p. 2065) to create a **rti::sub::TopicQueryData** (p. 2224) object.

The specified **rti::topic::ServiceRequest** (p. 2065) must be a valid sample associated with the service id **rti::core::↔ServiceRequestId_def::TOPIC_QUERY** (p. 2069). Otherwise this operation will return false.

This operation can be called within the context of a **dds::pub::DataWriterListener::on_service_request_accepted** (p. 978) to retrieve the **rti::sub::TopicQueryData** (p. 2224) of a **rti::topic::ServiceRequest** (p. 2065) that has been received with service id **rti::core::ServiceRequestId_def::TOPIC_QUERY** (p. 2069)

Parameters

<code>service_request</code>	The <code>rti::topic::ServiceRequest</code> (p. 2065) that contains the <code>rti::sub::TopicQueryData</code> (p. 2224) as part of its request body.
------------------------------	--

Returns

A `rti::sub::TopicQueryData` (p. 2224) object where the content from the service request is extracted.

8.382 `rti::core::policy::TopicQueryDispatch` Class Reference

<<*extension*>> (p. 156) Configures the ability of a `dds::pub::DataWriter` (p. 908) to publish samples in response to a `rti::sub::TopicQuery` (p. 2220)

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- `TopicQueryDispatch` ()
Creates the default policy.
- `TopicQueryDispatch` (bool the_enable, const `dds::core::Duration` &the_publication_period, int32_t the_samples_per_period)
Creates a policy with the provided values for enable, publication_period and samples_per_period.
- `TopicQueryDispatch` & `enable` (bool the_enable)
Allows this writer to dispatch TopicQueries.
- bool `enable` () const
Getter (see setter with the same name)
- `TopicQueryDispatch` & `publication_period` (const `dds::core::Duration` &the_publication_period)
Sets the periodic interval at which samples are published.
- `dds::core::Duration` `publication_period` () const
Getter (see setter with the same name)
- `TopicQueryDispatch` & `samples_per_period` (int32_t the_samples_per_period)
Sets the maximum number of samples to publish in each publication_period.
- int32_t `samples_per_period` () const
Getter (see setter with the same name)

8.382.1 Detailed Description

<<*extension*>> (p. 156) Configures the ability of a **dds::pub::DataWriter** (p. 908) to publish samples in response to a **rti::sub::TopicQuery** (p. 2220)

Enables the ability of a **dds::pub::DataWriter** (p. 908) to publish historical samples upon reception of a **rti::sub::TopicQuery** (p. 2220) and how often they are published.

Since a TopicQuery selects previously written samples, the DataWriter must have a **dds::core::policy::Durability::kind** (p. 1185) different from **dds::core::policy::DurabilityKind::VOLATILE**. Also, **dds::core::policy::Reliability::kind** (p. 1876) must be set to **dds::core::policy::ReliabilityKind_def::RELIABLE** (p. 1881).

Only samples that fall within the **dds::core::policy::Durability::writer_depth** (p. 1187) for an instance are evaluated against the TopicQuery filter. While the DataWriter is waiting for acknowledgements from one or more DataReaders, there may temporarily be more than **dds::core::policy::Durability::writer_depth** (p. 1187) samples per instance in the DataWriter's queue if the **dds::core::policy::History::depth** (p. 1349) is set to a higher value than **dds::core::policy::Durability::writer_depth** (p. 1187). Those additional samples past **dds::core::policy::Durability::writer_depth** (p. 1187) are not eligible to be sent in response to the TopicQuery.

A TopicQuery may select multiple samples at once. The writer will publish them periodically, independently from newly written samples. **rti::core::policy::TopicQueryDispatch::publication_period** (p. 2228) configures the frequency of that period and **rti::core::policy::TopicQueryDispatch::samples_per_period** (p. 2229) configures the maximum number of samples to publish each period.

If the DataWriter blocks during the publication of one of these samples, it will stop and try again the next period. (See **dds::pub::DataWriter::write()** (p. 918) for the conditions that may cause the write operation to block.)

All the DataWriters that belong to a single **dds::pub::Publisher** (p. 1719) and enable TopicQueries share the same event thread, but each DataWriter schedules separate events. To configure that thread, see **rti::core::policy::AsynchronousPublisher::topic_query_publication_thread** (p. 626).

If the DataWriter is dispatching more than one TopicQuery at the same time, the configuration of this periodic event applies to all of them. For example, if a DataWriter receives two TopicQueries around the same time, the period is 1 second, the number of samples per period is 10, the first TopicQuery selects 5 samples, and the second one selects 8, the DataWriter will immediately attempt to publish all 5 for the first TopicQuery and 5 for the second one. After one second, it will publish the remaining 3 samples.

Entity:

dds::pub::DataWriter (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.382.2 Constructor & Destructor Documentation

8.382.2.1 TopicQueryDispatch() [1/2]

```
rti::core::policy::TopicQueryDispatch::TopicQueryDispatch ( ) [inline]
```

Creates the default policy.

8.382.2.2 TopicQueryDispatch() [2/2]

```
rti::core::policy::TopicQueryDispatch::TopicQueryDispatch (
    bool the_enable,
    const dds::core::Duration & the_publication_period,
    int32_t the_samples_per_period ) [inline]
```

Creates a policy with the provided values for enable, publication_period and samples_per_period.

8.382.3 Member Function Documentation

8.382.3.1 enable() [1/2]

```
TopicQueryDispatch & rti::core::policy::TopicQueryDispatch::enable (
    bool the_enable )
```

Allows this writer to dispatch TopicQueries.

When set to true, this writer can receive and dispatch TopicQueries.

[default] false

8.382.3.2 enable() [2/2]

```
bool rti::core::policy::TopicQueryDispatch::enable ( ) const
```

Getter (see setter with the same name)

8.382.3.3 publication_period() [1/2]

```
TopicQueryDispatch & rti::core::policy::TopicQueryDispatch::publication_period (
    const dds::core::Duration & the_publication_period )
```

Sets the periodic interval at which samples are published.

[default] 1 second

[range] [0,1 year]

8.382.3.4 publication_period() [2/2]

```
dds::core::Duration rti::core::policy::TopicQueryDispatch::publication_period ( ) const
```

Getter (see setter with the same name)

8.382.3.5 samples_per_period() [1/2]

```
TopicQueryDispatch & rti::core::policy::TopicQueryDispatch::samples_per_period (
    int32_t the_samples_per_period )
```

Sets the maximum number of samples to publish in each `publication_period`.

[default] `dds::core::LENGTH_UNLIMITED` (p. 238)

[range] [1, 100000000] or `dds::core::LENGTH_UNLIMITED` (p. 238)

8.382.3.6 samples_per_period() [2/2]

```
int32_t rti::core::policy::TopicQueryDispatch::samples_per_period ( ) const
```

Getter (see setter with the same name)

8.383 rti::sub::TopicQuerySelection Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Specifies the data query that defines a **TopicQuery** (p. 2220).

```
#include <rti/sub/TopicQuery.hpp>
```

Public Types

- typedef **TopicQuerySelectionKind** Kind
Alias for TopicQuerySelectionKind.

Public Member Functions

- **TopicQuerySelection** (const **dds::topic::Filter** &the_filter)
*Creates a **TopicQuerySelection** (p. 2229).*
- **TopicQuerySelection** (const **dds::topic::Filter** &the_filter, **Kind** the_kind)
*Creates a **TopicQuerySelection** (p. 2229) with a selection kind.*
- **dds::topic::Filter** & filter ()
Gets the filter.
- const **dds::topic::Filter** & filter () const
Gets the filter.
- **Kind** kind () const
Gets the selection kind.
- **TopicQuerySelection** & kind (**Kind** the_kind)
Indicates whether the sample selection is limited to cached samples or not.

8.383.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Specifies the data query that defines a **TopicQuery** (p. 2220).

A **TopicQuerySelection** (p. 2229) is defined by a **dds::topic::Filter** (p. 1303) that selects a subset of samples in the `dds::pub::DataWriters`

8.383.2 Member Typedef Documentation

8.383.2.1 Kind

```
typedef TopicQuerySelectionKind rti::sub::TopicQuerySelection::Kind
```

Alias for TopicQuerySelectionKind.

8.383.3 Constructor & Destructor Documentation

8.383.3.1 TopicQuerySelection() [1/2]

```
rti::sub::TopicQuerySelection::TopicQuerySelection (
    const dds::topic::Filter & the_filter ) [inline], [explicit]
```

Creates a **TopicQuerySelection** (p. 2229).

Parameters

<i>the_filter</i>	Defines the data query
-------------------	------------------------

Note

The filter expression can start with the special condition "@instance_state = ALIVE AND" followed by the rest of the expression. This restricts the selection to samples of alive instances.

```
rti::sub::TopicQuerySelection::TopicQuerySelection (
    const dds::topic::Filter & the_filter,
    Kind the_kind ) [inline]
```

Creates a **TopicQuerySelection** (p. 2229) with a selection kind.

Parameters

<i>the_filter</i>	Defines the data query
<i>the_kind</i>	Indicates the kind of selection

8.383.4 Member Function Documentation

8.383.4.1 filter() [1/2]

```
dds::topic::Filter & rti::sub::TopicQuerySelection::filter ( ) [inline]
```

Gets the filter.

8.383.4.2 filter() [2/2]

```
const dds::topic::Filter & rti::sub::TopicQuerySelection::filter ( ) const [inline]
```

Gets the filter.

8.383.4.3 kind() [1/2]

```
Kind rti::sub::TopicQuerySelection::kind ( ) const [inline]
```

Gets the selection kind.

8.383.4.4 kind() [2/2]

```
TopicQuerySelection & rti::sub::TopicQuerySelection::kind (
    Kind the_kind ) [inline]
```

Indicates whether the sample selection is limited to cached samples or not.

[default] rti::sub::TopicQuerySelectionKind::HISTORY_SNAPSHOT

8.384 rti::sub::TopicQuerySelectionKind_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `rti::sub::TopicQuerySelectionKind` (p. 69).

```
#include <TopicQuery.hpp>
```

Public Types

- enum `type` {
`HISTORY_SNAPSHOT` ,
`CONTINUOUS` }

The underlying enum type.

8.384.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `rti::sub::TopicQuerySelectionKind` (p. 69).

8.384.2 Member Enumeration Documentation

8.384.2.1 type

```
enum rti::sub::TopicQuerySelectionKind_def::type
```

The underlying enum type.

Enumerator

HISTORY_SNAPSHOT	Indicates that the <code>rti::sub::TopicQuery</code> (p. 2220) may only select samples that were in the DataWriter cache upon reception. [default]
CONTINUOUS	Indicates that the <code>rti::sub::TopicQuery</code> (p. 2220) may continue selecting samples published after its reception. The subscribing application must explicitly delete the <code>TopicQuery</code> (p. 2220) (see <code>rti::sub::TopicQuery::close()</code> (p. 2222)) to signal the DataWriters to stop publishing samples for it.

8.385 rti::util::network_capture::TrafficKindMask Class Reference

<<*extension*>> (p. 156) Mask indicating the traffic direction to capture.

```
#include <network_capture.hpp>
```

Inherits `std::bitset< 32 >`.

Public Types

- typedef `std::bitset< 32 >` **MaskType**
A typedef of `std::bitset<32>` for convenience.

Public Member Functions

- **TrafficKindMask** ()
*Default constructor for **TrafficKindMask** (p. 2233).*
- **TrafficKindMask** (uint64_t mask)
*Construct a **TrafficKindMask** (p. 2233) from an integer.*
- **TrafficKindMask** (const **MaskType** &mask)
*Construct a **TrafficKindMask** (p. 2233) from a **MaskType** object.*

Static Public Member Functions

- static const **TrafficKindMask** **out** ()
Do not capture outbound traffic.
- static const **TrafficKindMask** **in** ()
Do not capture inbound traffic.
- static const **TrafficKindMask** **default_mask** ()
Default mask for `network_capture::TrafficKindMask` (p. 2233).
- static const **TrafficKindMask** **none** ()
Do not capture any traffic.
- static const **TrafficKindMask** **all** ()
Capture all traffic (both inbound and outbound).

8.385.1 Detailed Description

<<*extension*>> (p. 156) Mask indicating the traffic direction to capture.

The masks are based on a combination (or only one) of the `network_capture::TrafficKindMask` (p. 2233) bitmaps.

See also

`network_capture::TrafficKindMask` (p. 2233)

8.385.2 Member Typedef Documentation

8.385.2.1 MaskType

```
typedef std::bitset<32> rti::util::network_capture::TrafficKindMask::MaskType
```

A typedef of `std::bitset<32>` for convenience.

8.385.3 Constructor & Destructor Documentation

8.385.3.1 TrafficKindMask() [1/3]

```
rti::util::network_capture::TrafficKindMask::TrafficKindMask ( ) [inline]
```

Default constructor for `TrafficKindMask` (p. 2233).

8.385.3.2 TrafficKindMask() [2/3]

```
rti::util::network_capture::TrafficKindMask::TrafficKindMask (
    uint64_t mask ) [inline], [explicit]
```

Construct a `TrafficKindMask` (p. 2233) from an integer.

Parameters

<i>mask</i>	Value whose bits are copied to the bitset positions
-------------	---

8.385.3.3 TrafficKindMask() [3/3]

```
rti::util::network_capture::TrafficKindMask::TrafficKindMask (  
    const MaskType & mask ) [inline]
```

Construct a **TrafficKindMask** (p. 2233) from a **MaskType** object.

Parameters

<i>mask</i>	A std::bitset<32> to construct this TrafficKindMask (p. 2233) from.
-------------	--

8.385.4 Member Function Documentation

8.385.4.1 out()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::out ( ) [inline],  
[static]
```

Do not capture outbound traffic.

8.385.4.2 in()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::in ( ) [inline], [static]
```

Do not capture inbound traffic.

8.385.4.3 default_mask()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::default_mask ( ) [inline],  
[static]
```

Default mask for **network_capture::TrafficKindMask** (p. 2233).

It is equivalent to **network_capture::TrafficKindMask::all()** (p. 2236).

[default] Capture all traffic: inbound and outbound.

8.385.4.4 none()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::none ( ) [inline],
[static]
```

Do not capture any traffic.

8.385.4.5 all()

```
static const TrafficKindMask rti::util::network_capture::TrafficKindMask::all ( ) [inline],
[static]
```

Capture all traffic (both inbound and outbound).

The value is equal to setting both the input and output bits of the mask: (**network_capture::TrafficKindMask::out()** (p. 2235) | **network_capture::TrafficKindMask::in()** (p. 2235)).

8.386 TransportAllocationSettings_t Struct Reference

Allocation settings used by various internal buffers.

8.386.1 Detailed Description

Allocation settings used by various internal buffers.

An allocation setting structure defines the rules of memory management used by internal buffers.

An internal buffer can provide blocks of memory of fixed size. They are used in several places of any transport, and this structure defines its starting size, limits, and how to increase its capacity.

It contains three values:

- `initial_count`: the number of individual elements that are allocated when the buffer is created.
- `max_count`: the maximum number of elements the buffer can hold. The buffer will grow up to this amount. After this limit is reached, new allocation requests will fail. For unlimited size, use the value `NDDS_TRANSPORT_ALLOCATION_SETTINGS_MAX_COUNT_UNLIMITED`
- `incremental_count`: The amount of elements that are allocated at every increment. You can use the value `NDDS_TRANSPORT_ALLOCATION_SETTINGS_INCREMENTAL_COUNT_AUTOMATIC` to have the buffer double its size at every reallocation request.

8.387 rti::core::policy::TransportBuiltin Class Reference

<<*extension*>> (p. 156) Specifies which built-in transports to use

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TransportBuiltin** ()
Creates the default policy.
- **TransportBuiltin** (const **rti::core::policy::TransportBuiltinMask** &the_mask)
Creates an instance with the transport selection that the mask specifies.
- **TransportBuiltin** & **mask** (**rti::core::policy::TransportBuiltinMask** the_mask)
Set the selected transports through a mask.
- **rti::core::policy::TransportBuiltinMask** **mask** () const
Get the mask that indicates which transports are selected.

Static Public Member Functions

- static **TransportBuiltin** **All** ()
*Creates a policy that selects **TransportBuiltinMask::all()** (p. 2242)*
- static **TransportBuiltin** **None** ()
*Creates a policy that selects **TransportBuiltinMask::none()** (p. 2242)*
- static **TransportBuiltin** **Shmem** ()
*Creates a policy that selects **TransportBuiltinMask::shmem()** (p. 2243)*
- static **TransportBuiltin** **UDPv4** ()
*Creates a policy that selects **TransportBuiltinMask::udpv4()** (p. 2243)*

*Creates a policy that selects **TransportBuiltinMask::udpv6()** (p. 2243)*
- static **TransportBuiltin** **UDPv4_WAN** ()
*Creates a policy that selects **TransportBuiltinMask::udpv4_wan()** (p. 2243)*

Static Public Attributes

- static const std::string **SHMEM_ALIAS**
Alias name for the shared-memory built-in transport: "builtin.shmem".
- static const std::string **UDPv4_ALIAS**
Alias name for the UDPv4 built-in transport: "builtin.udpv4".
- static const std::string **UDPv4_WAN_ALIAS**
Alias name for the UDPv4 asymmetric built-in transport: "builtin.udpv4_wan".
- static const std::string **UDPv6_ALIAS**
Alias name for the UDPv6 built-in transport: "builtin.udpv6".

8.387.1 Detailed Description

<<*extension*>> (p. 156) Specifies which built-in transports to use

Three different transport plug-ins are built into the core RTI Connex libraries (for most supported target platforms): UDPv4, shared memory, and UDPv6.

This QoS policy allows you to control which of these built-in transport plug-ins are used by a `dds::domain::DomainParticipant` (p. 1079). By default, only the UDPv4 and shared memory plug-ins are enabled (although on some embedded platforms, the shared memory plug-in is not available). In some cases, users will disable the shared memory transport when they do not want applications to use shared memory to communicate when running on the same node.

Entity:

`dds::domain::DomainParticipant` (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.387.2 Constructor & Destructor Documentation

8.387.2.1 TransportBuiltin() [1/2]

```
rti::core::policy::TransportBuiltin::TransportBuiltin ( ) [inline]
```

Creates the default policy.

8.387.2.2 TransportBuiltin() [2/2]

```
rti::core::policy::TransportBuiltin::TransportBuiltin (
    const rti::core::policy::TransportBuiltinMask & the_mask ) [inline]
```

Creates an instance with the transport selection that the mask specifies.

8.387.3 Member Function Documentation

8.387.3.1 All()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::All ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::all()** (p. 2242)

8.387.3.2 None()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::None ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::none()** (p. 2242)

8.387.3.3 Shmem()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::Shmem ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::shmem()** (p. 2243)

8.387.3.4 UDPv4()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::UDPv4 ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::udpv4()** (p. 2243)

8.387.3.5 UDPv6()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::UDPv6 ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::udpv6()** (p. 2243)

8.387.3.6 UDPv4_WAN()

```
static TransportBuiltin rti::core::policy::TransportBuiltin::UDPv4_WAN ( ) [inline], [static]
```

Creates a policy that selects **TransportBuiltinMask::udpv4_wan()** (p. 2243)

8.387.3.7 mask() [1/2]

```
TransportBuiltin & rti::core::policy::TransportBuiltin::mask (
    rti::core::policy::TransportBuiltinMask the_mask )
```

Set the selected transports through a mask.

8.387.3.8 mask() [2/2]

```
rti::core::policy::TransportBuiltinMask rti::core::policy::TransportBuiltin::mask ( ) const
```

Get the mask that indicates which transports are selected.

<<*extension*>> (p. 156) Mask that specifies which built-in transports are used

```
#include <PolicyKind.hpp>
```

Inherits std::bitset< 8 >.

Public Types

- typedef std::bitset< 8 > **MaskType**
The base type, std::bitset.

Public Member Functions

- **TransportBuiltinMask** (uint64_t mask)
Creates a mask from the bits in an integer.
- **TransportBuiltinMask** (const **MaskType** &mask)
Creates a mask from a std::bitset.

Static Public Member Functions

- static const **TransportBuiltinMask** **all** ()
All bits are set.
- static const **TransportBuiltinMask** **none** ()
No bits are set.
- static const **TransportBuiltinMask** **shmem** ()
Selects the built-in shared-memory transport.
- static const **TransportBuiltinMask** **udpv4** ()
Selects the built-in UDPv4 transport.
- static const **TransportBuiltinMask** **udpv4_wan** ()
Selects the built-in UDPv4 asymmetric transport.
- static const **TransportBuiltinMask** **udpv6** ()
Selects the built-in UDPv6 transport.

8.388.1 Detailed Description

<<*extension*>> (p. 156) Mask that specifies which built-in transports are used

8.388.2 Member Typedef Documentation

8.388.2.1 MaskType

```
typedef std::bitset<8> rti::core::policy::TransportBuiltinMask::MaskType
```

The base type, std::bitset.

8.388.3 Constructor & Destructor Documentation

8.388.3.1 TransportBuiltinMask() [1/2]

```
rti::core::policy::TransportBuiltinMask::TransportBuiltinMask (  
    uint64_t mask ) [inline], [explicit]
```

Creates a mask from the bits in an integer.

8.388.3.2 TransportBuiltinMask() [2/2]

```
rti::core::policy::TransportBuiltinMask::TransportBuiltinMask (  
    const MaskType & mask ) [inline]
```

Creates a mask from a std::bitset.

8.388.4 Member Function Documentation

8.388.4.1 all()

```
static const TransportBuiltinMask rti::core::policy::TransportBuiltinMask::all ( ) [inline],  
[static]
```

All bits are set.

8.388.4.2 none()

```
static const TransportBuiltinMask rti::core::policy::TransportBuiltinMask::none ( ) [inline],  
[static]
```

No bits are set.

8.388.4.3 shmем()

```
static const TransportBuiltinMask rti::core::policy::TransportBuiltinMask::shmем ( ) [inline],  
[static]
```

Selects the built-in shared-memory transport.

Referenced by `rti::core::policy::TransportBuiltin::mask()`.

8.388.4.4 udpv4()

```
static const TransportBuiltinMask rti::core::policy::TransportBuiltinMask::udpv4 ( ) [inline],  
[static]
```

Selects the built-in UDPv4 transport.

8.388.4.5 udpv4_wan()

```
static const TransportBuiltinMask rti::core::policy::TransportBuiltinMask::udpv4_wan ( ) [inline],  
[static]
```

Selects the built-in UDPv4 asymmetric transport.

8.388.4.6 udpv6()

```
static const TransportBuiltinMask rti::core::policy::TransportBuiltinMask::udpv6 ( ) [inline],  
[static]
```

Selects the built-in UDPv6 transport.

Referenced by `rti::core::policy::TransportUnicast::TransportUnicast()`.

8.389 rti::core::TransportClassId_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `TransportClassId`.

```
#include <TransportInfo.hpp>
```

Public Types

- enum `type` {
 - `INVALID` = `NDDS_TRANSPORT_CLASSID_INVALID`,
 - `ANY` = `NDDS_TRANSPORT_CLASSID_ANY`,
 - `UDPv4` = `NDDS_TRANSPORT_CLASSID_UDPv4`,
 - `UDPv4_WAN` = `NDDS_TRANSPORT_CLASSID_UDPv4_WAN`,
 - `SHMEM` = `NDDS_TRANSPORT_CLASSID_SHMEM`,
 - `SHMEM_510` = `NDDS_TRANSPORT_CLASSID_SHMEM_510`,
 - `INTRA` = `NDDS_TRANSPORT_CLASSID_INTRA`,
 - `UDPv6` = `NDDS_TRANSPORT_CLASSID_UDPv6`,
 - `UDPv6_510` = `NDDS_TRANSPORT_CLASSID_UDPv6_510`,
 - `TCPV4_LAN` = `NDDS_TRANSPORT_CLASSID_TCPV4_LAN`,
 - `TCPV4_WAN` = `NDDS_TRANSPORT_CLASSID_TCPV4_WAN`,
 - `TLSV4_LAN` = `NDDS_TRANSPORT_CLASSID_TLSV4_LAN`,
 - `TLSV4_WAN` = `NDDS_TRANSPORT_CLASSID_TLSV4_WAN`,
 - `RESERVED_RANGE` = `NDDS_TRANSPORT_CLASSID_RESERVED_RANGE` }

The underlying `enum` type.

8.389.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `TransportClassId`.

8.389.2 Member Enumeration Documentation

8.389.2.1 `type`

```
enum rti::core::TransportClassId_def::type
```

The underlying `enum` type.

Enumerator

<code>INVALID</code>	Invalid.
<code>UDPv4</code>	UDPv4.
<code>UDPv4_WAN</code>	UDPv4 WAN.
<code>SHMEM</code>	Shared memory.
<code>SHMEM_510</code>	Shared memory in RTI Connex 5.1.0 and earlier.

Enumerator

UDPv6	UDPv6.
UDPv6_510	UDPv6 in RTI Connex 5.1.0 and earlier.
TCPV4_LAN	TCPv4 LAN mode.
TCPV4_WAN	TCPv4 WAN mode.
TLSV4_LAN	TCPv4 LAN mode with TLS.
TLSV4_WAN	TCPv4 WAN mode with TLS.
RESERVED_RANGE	Reserved for additional user-defined transport plugins.

8.390 rti::core::TransportInfo Class Reference

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Contains the class id and message max size of an installed transport

```
#include <rti/core/TransportInfo.hpp>
```

Public Member Functions

- **TransportInfo** ()
Creates an instance with default values.
- **TransportInfo** (const rti::core::TransportClassId::type &the_class_id, int32_t the_message_size_max)
Creates an instance with the specified class id and max size.
- **rti::core::TransportClassId class_id** () const
Getter (see setter with the same name)
- **TransportInfo & class_id** (const rti::core::TransportClassId::type &the_class_id)
The class_id identifies the transport associated with the message_size_max.
- int32_t **message_size_max** () const
Getter (see setter with the same name)
- **TransportInfo & message_size_max** (int32_t the_message_size_max)
The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin identified by the class_id.

8.390.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Contains the class id and message max size of an installed transport

8.390.2 Constructor & Destructor Documentation

8.390.2.1 TransportInfo() [1/2]

```
rti::core::TransportInfo::TransportInfo ( ) [inline]
```

Creates an instance with default values.

8.390.2.2 TransportInfo() [2/2]

```
rti::core::TransportInfo::TransportInfo (
    const rti::core::TransportClassId::type & the_class_id,
    int32_t the_message_size_max ) [inline]
```

Creates an instance with the specified class id and max size.

8.390.3 Member Function Documentation

8.390.3.1 class_id() [1/2]

```
rti::core::TransportClassId rti::core::TransportInfo::class_id ( ) const [inline]
```

Getter (see setter with the same name)

8.390.3.2 class_id() [2/2]

```
TransportInfo & rti::core::TransportInfo::class_id (
    const rti::core::TransportClassId::type & the_class_id ) [inline]
```

The class_id identifies the transport associated with the message_size_max.

8.390.3.3 message_size_max() [1/2]

```
int32_t rti::core::TransportInfo::message_size_max ( ) const [inline]
```

Getter (see setter with the same name)

8.390.3.4 message_size_max() [2/2]

```
TransportInfo & rti::core::TransportInfo::message_size_max (
    int32_t the_message_size_max ) [inline]
```

The maximum size of an RTPS message in bytes that can be sent or received by the transport plugin identified by the class_id.

8.391 rti::core::policy::TransportMulticast Class Reference

<<*extension*>> (p. 156) Specifies the multicast address on which a **dds::sub::DataReader** (p. 756) wants to receive its data and other settings.

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TransportMulticast** ()
Creates the default policy.
- **TransportMulticast** (const **TransportMulticastSettingsSeq** &the_value, **TransportMulticastKind** the_kind)
Creates an instance with the specified multicast settings.
- **TransportMulticast** & **settings** (const **TransportMulticastSettingsSeq** &the_settings)
A sequence of multicast communications settings.
- **TransportMulticastSettingsSeq** **settings** () const
Getter (see setter with the same name)
- **TransportMulticast** & **kind** (**TransportMulticastKind** the_kind)
A value that specifies a way to determine how to obtain the multicast address.
- **TransportMulticastKind** **kind** () const
Getter (see setter with the same name)

8.391.1 Detailed Description

<<*extension*>> (p. 156) Specifies the multicast address on which a **dds::sub::DataReader** (p. 756) wants to receive its data and other settings.

By default, a **dds::pub::DataWriter** (p. 908) will send individually addressed packets for each **dds::sub::DataReader** (p. 756) that subscribes to the topic of the DataWriter – this is known as unicast delivery. Thus, as many copies of the data will be sent over the network as there are DataReaders for the data. The network bandwidth used by a DataWriter will thus increase linearly with the number of DataReaders.

Multicast addressing (on UDP/IP transports) allows multiple DataReaders to receive the *same* network packet. By using multicast, a **dds::pub::DataWriter** (p. 908) can send a single network packet that is received by all subscribing applications. Thus the network bandwidth usage will be constant, independent of the number of DataReaders.

Coordinating the multicast address specified by DataReaders can help optimize network bandwidth usage in systems where there are multiple DataReaders for the same **dds::topic::Topic** (p. 2178).

Entity:

dds::sub::DataReader (p. 756)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.391.2 Constructor & Destructor Documentation

8.391.2.1 TransportMulticast() [1/2]

```
rti::core::policy::TransportMulticast::TransportMulticast ( ) [inline]
```

Creates the default policy.

8.391.2.2 TransportMulticast() [2/2]

```
rti::core::policy::TransportMulticast::TransportMulticast (
    const TransportMulticastSettingsSeq & the_value,
    TransportMulticastKind the_kind )
```

Creates an instance with the speicified multicast settings.

See individual setters.

8.391.3 Member Function Documentation

8.391.3.1 settings() [1/2]

```
TransportMulticast & rti::core::policy::TransportMulticast::settings (
    const TransportMulticastSettingsSeq & the_settings )
```

A sequence of multicast communications settings.

An empty sequence means that multicast is not used by the entity.

The RTPS wire protocol currently limits the maximum number of multicast locators to

1. Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **rti::core::policy::Property** (p. 1695) associated with the **dds::domain::qos::DomainParticipantQos** (p. 1136).

[default] Empty sequence.

8.391.3.2 settings() [2/2]

```
TransportMulticastSettingsSeq rti::core::policy::TransportMulticast::settings ( ) const
```

Getter (see setter with the same name)

8.391.3.3 kind() [1/2]

```
TransportMulticast & rti::core::policy::TransportMulticast::kind (
    TransportMulticastKind the_kind )
```

A value that specifies a way to determine how to obtain the multicast address.

This field can be set to one of the following two values: `rti::core::policy::TransportMulticastKind::AUTOMATIC_↔TRANSPORT` or `rti::core::policy::TransportMulticastKind::UNICAST_ONLY_TRANSPORT`.

- If it is set to `rti::core::policy::TransportMulticastKind::AUTOMATIC_TRANSPORT`, the behavior will depend on the `rti::core::policy::TransportMulticast::value`:
 - If `rti::core::policy::TransportMulticast::value` does not have any elements, then multicast will not be used.
 - If `rti::core::policy::TransportMulticast::value` first element has an empty address, then the address will be obtained from **rti::core::policy::TransportMulticastMapping** (p. 2250).
 - If none of the elements in `rti::core::policy::TransportMulticast::value` is empty, and at least one element has a valid address, then that address will be used.
- If it is set to `rti::core::policy::TransportMulticastKind::UNICAST_ONLY_TRANSPORT`, then multicast will not be used.

[default] `rti::core::policy::TransportMulticastKind::AUTOMATIC_TRANSPORT`

8.391.3.4 kind() [2/2]

```
TransportMulticastKind rti::core::policy::TransportMulticast::kind ( ) const
```

Getter (see setter with the same name)

8.392 rti::core::policy::TransportMulticastKind_def Struct Reference

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `TransportMulticastKind`

```
#include <PolicyKind.hpp>
```

Public Types

- enum type {
AUTOMATIC,
UNICAST }

The underlying enum type.

8.392.1 Detailed Description

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `TransportMulticastKind`

8.392.2 Member Enumeration Documentation

8.392.2.1 type

```
enum rti::core::policy::TransportMulticastKind_def::type
```

The underlying enum type.

Enumerator

AUTOMATIC	Selects the multicast address automatically. NOTE: This setting is required when using the <code>rti::core::policy::TransportMulticastMapping</code> (p. 2250).
UNICAST	Selects a unicast-only mode.

8.393 rti::core::policy::TransportMulticastMapping Class Reference

Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

```
#include <CorePolicy.hpp>
```

Public Member Functions

- MulticastMappingSeq `mappings` () const
Getter (see setter with the same name)

8.393.1 Detailed Description

Specifies a list of topic_expressions and multicast addresses that can be used by an Entity with a specific topic name to receive data.

This QoS policy provides an alternate way to assign multicast receive addresses to DataReaders. It allows you to perform multicast configuration at the **dds::domain::DomainParticipant** (p. 1079) level.

To use multicast communication *without* this QoS policy, you must explicitly assign a multicast receive address on each **dds::sub::DataReader** (p. 756). This can quickly become difficult to configure as more DataReaders of different topics and multicast addresses are added.

With this QoS policy, you can configure a set of multicast addresses on the **dds::domain::DomainParticipant** (p. 1079); those addresses will then be automatically assigned to the DomainParticipant's DataReaders. A single configuration on the **dds::domain::DomainParticipant** (p. 1079) can thus replace per-DataReader configuration.

On the DomainParticipant, the set of assignable addresses can be configured for specific topics. Addresses are configured on topics because efficient usage of multicast will have all DataWriters and DataReaders of a single topic using the same multicast address.

You can specify a mapping between a topic's name and a multicast address. For example, topic 'A' can be assigned to address 239.255.1.1 and topic 'B' can be assigned to address 239.255.1.2.

You can use filter expressions to configure a subset of topics to use a specific list of addresses. For example, suppose topics "X", "Y" and "Z" need to be sent to any address within the range [239.255.1.1, 239.255.1.255]. You can specify an expression on the topic name (e.g. "[X-Z]") corresponding to that range of addresses. Then the DomainParticipant will select an address for a topic whose name matches the expression.

The middleware will use a hash function to perform the mapping from topic to address. Alternatively, you can specify a pluggable mapping function.

IMPORTANT: All the strings defined in each element of the sequence must be assigned using `RTI_String_dup("foo");`. For example:

```
mcastMappingElement->addresses = DDS_String_dup("[239.255.1.1,239.255.1.255]");
```

NOTE: To use this QoS policy, you must:

- Set **rti::core::policy::TransportMulticast::kind** (p. 2249) to `rti::core::policy::TransportMulticastKind::AUTOMATIC_TRANSPORT`.
- Set the first element in **dds::sub::DataReader** (p. 756)'s `rti::core::policy::TransportMulticast::value` with an empty address.

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.393.2 Member Function Documentation

8.393.2.1 mappings()

```
MulticastMappingSeq rti::core::policy::TransportMulticastMapping::mappings ( ) const
```

Getter (see setter with the same name)

8.394 rti::core::TransportMulticastSettings Class Reference

<<*extension*>> (p. 156) Represents a list of multicast locators

```
#include <rti/core/PolicySettings.hpp>
```

Public Member Functions

- **TransportMulticastSettings** (const **dds::core::StringSeq** &the_transports, const std::string &the_receive_↔ address, int32_t the_receive_port)

Creates an instance with the specified transport aliases, receive address and receive port.
- **TransportMulticastSettings & transports** (const **dds::core::StringSeq** &the_transports)

A sequence of transport aliases that specifies the transports on which to receive multicast traffic for the entity.
- **dds::core::StringSeq transports** () const

Getter (see the setter with the same name)
- **TransportMulticastSettings & receive_address** (const std::string &the_receive_address)

The multicast group address on which the entity can receive data.
- std::string **receive_address** () const

Getter (see the setter with the same name)
- **TransportMulticastSettings & receive_port** (int32_t the_receive_port)

The multicast port on which the entity can receive data.
- int32_t **receive_port** () const

Getter (see the setter with the same name)

8.394.1 Detailed Description

<<*extension*>> (p. 156) Represents a list of multicast locators

A multicast locator specifies a transport class, a multicast address, and a multicast port number on which messages can be received by an entity.

QoS:

rti::core::policy::TransportMulticast (p. 2247)

8.394.2 Constructor & Destructor Documentation

8.394.2.1 TransportMulticastSettings()

```
rti::core::TransportMulticastSettings::TransportMulticastSettings (
    const dds::core::StringSeq & the_transports,
    const std::string & the_receive_address,
    int32_t the_receive_port ) [inline]
```

Creates an instance with the specified transport aliases, receive address and receive port.

See individual setters.

8.394.3 Member Function Documentation

8.394.3.1 transports() [1/2]

```
TransportMulticastSettings & rti::core::TransportMulticastSettings::transports (
    const dds::core::StringSeq & the_transports ) [inline]
```

A sequence of transport aliases that specifies the transports on which to receive *multicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias in this sequence are used to subscribe to the multicast group addresses. Thus, this list of aliases sub-selects from the transport s available to the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 339).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

8.394.3.2 transports() [2/2]

```
dds::core::StringSeq rti::core::TransportMulticastSettings::transports ( ) const [inline]
```

Getter (see the setter with the same name)

8.394.3.3 receive_address() [1/2]

```
TransportMulticastSettings & rti::core::TransportMulticastSettings::receive_address (
    const std::string & the_receive_address )
```

The multicast group address on which the entity can receive data.

Must be an address in the proper format (see **Address Format** (p. 351)).

[default] NONE/INVALID. Required to specify a multicast group address to join.

[range] A valid IPv4 or IPv6 multicast address.

See also

Address Format (p. 351)

8.394.3.4 receive_address() [2/2]

```
std::string rti::core::TransportMulticastSettings::receive_address ( ) const [inline]
```

Getter (see the setter with the same name)

8.394.3.5 receive_port() [1/2]

```
TransportMulticastSettings & rti::core::TransportMulticastSettings::receive_port (
    int32_t the_receive_port ) [inline]
```

The multicast port on which the entity can receive data.

[default] 0, which implies that the actual port number is determined by a formula as a function of the `domain_id` (see **rti::core::policy::WireProtocol::participant_id** (p. 2336)).

[range] [0,0xffffffff]

8.394.3.6 receive_port() [2/2]

```
int32_t rti::core::TransportMulticastSettings::receive_port ( ) const [inline]
```

Getter (see the setter with the same name)

8.395 dds::core::policy::TransportPriority Class Reference

Allows applications to take advantage of transports capable of sending messages with different priorities.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **TransportPriority** ()
Creates a policy with priority 0.
- **TransportPriority** (int32_t priority)
Creates a policy with the specified priority.
- **TransportPriority & value** (int32_t priority)
Sets the priority.
- int32_t **value** () const
Getter (see setter with the same name)

8.395.1 Detailed Description

Allows applications to take advantage of transports capable of sending messages with different priorities.

The Transport Priority QoS policy is optional and only supported on certain OSs and transports. It allows you to specify on a per-DataWriter or DataReader basis that the data sent by that endpoint is of a different priority.

The DDS specification does not indicate how a DDS implementation should treat data of different priorities. It is often difficult or impossible for DDS implementations to treat data of higher priority differently than data of lower priority, especially when data is being sent (delivered to a physical transport) directly by the thread that called **dds::pub::DataWriter::write()** (p. 918). Also, many physical network transports themselves do not have a end-user controllable level of data packet priority.

Entity:

dds::pub::DataWriter (p. 908), **dds::sub::DataReader** (p. 756), **dds::topic::Topic** (p. 2178)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.395.2 Usage

In RTI Connex, for the IP-based transports (UDPv4, UDPv6, Real-Time WAN, and TCP), the value set in the Transport Priority QoS policy can be used to set the differentiated services field (DS field) bits of the IPv4 and IPv6 headers for datagrams sent by a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756). It is platform-dependent on how and whether setting the DS field has an effect. Some platforms may require external permissions in order to set the DS field.

The transport priority value is not provided as is to the transports, but transformed according to the following fields: `transport_priority_mask` (for example, see **NDDS_Transport_UDPv4_Property_t::transport_priority_mask** (p. 1538)), `transport_priority_mapping_low` (for example, see **NDDS_Transport_UDPv4_Property_t::transport_↵_priority_mapping_low** (p. 1538)), and `transport_priority_mapping_high` (for example, see **NDDS_Transport_UDPv4_↵_Property_t::transport_priority_mapping_high** (p. 1538)). If you want the priority value to be exactly equal to the DS value, then the only change you need to make is to set `transport_priority_mask` to `0xff` (and keep the `transport_↵_priority_mapping_low` and `transport_priority_mapping_high` defaults).

It is incorrect to assume that using the Transport Priority QoS policy will have any effect at all on the end-to-end delivery of data from a **dds::pub::DataWriter** (p. 908) and a **dds::sub::DataReader** (p. 756). All network elements, including switches and routers, must have the capability and be enabled to actually use the DS field to treat higher priority packets differently. Thus the ability to use the Transport Priority QoS policy must be designed and configured at a *system* level; just turning it on in an application may have no effect at all at a transport level.

For additional details on how to set the DS field in IP-based transports, see the "TRANSPORT_PRIORITY QoSPolicy" section of the `User's Manual`.

8.395.3 Constructor & Destructor Documentation

8.395.3.1 TransportPriority() [1/2]

```
dds::core::policy::TransportPriority::TransportPriority ( ) [inline]
```

Creates a policy with priority 0.

8.395.3.2 TransportPriority() [2/2]

```
dds::core::policy::TransportPriority::TransportPriority (
    int32_t priority ) [inline], [explicit]
```

Creates a policy with the specified priority.

8.395.4 Member Function Documentation

8.395.4.1 value() [1/2]

```
TransportPriority & dds::core::policy::TransportPriority::value (
    int32_t priority ) [inline]
```

Sets the priority.

You may choose any value within the range of a 32-bit signed integer; higher values indicate higher priority. However, any further interpretation of this policy is specific to a particular transport and a particular DDS implementation. For example, a particular transport is permitted to treat a range of priority values as equivalent to one another.

[default] 0

8.395.4.2 value() [2/2]

```
int32_t dds::core::policy::TransportPriority::value ( ) const [inline]
```

Getter (see setter with the same name)

8.396 rti::core::policy::TransportSelection Class Reference

<<*extension*>> (p. 156) Specifies the transports that a **dds::pub::DataWriter** (p. 908) or a **dds::sub::DataReader** (p. 756) may use to send or receive data

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

Creates the default policy.
- **TransportSelection** (const **dds::core::StringSeq** &the_enabled_transports)
Creates an instance with the specified transport aliases.
- **TransportSelection** & **enabled_transports** (const **dds::core::StringSeq** &the_enabled_transports)
A sequence of transport aliases that specifies the transport instances available for use by the entity.
- **dds::core::StringSeq** **enabled_transports** () const
Getter (see setter with the same name)

8.396.1 Detailed Description

<<*extension*>> (p. 156) Specifies the transports that a **dds::pub::DataWriter** (p. 908) or a **dds::sub::DataReader** (p. 756) may use to send or receive data

An application may be simultaneously connected to many different physical transports, e.g., Ethernet, Infiniband, shared memory, VME backplane, and wireless. By default, RTI Connex will use up to 16 transports to deliver data from a DataWriter to a DataReader.

This QoS policy can be used to both limit and control which of the application's available transports may be used by a **dds::pub::DataWriter** (p. 908) to send data or by a **dds::sub::DataReader** (p. 756) to receive data.

Entity:

dds::sub::DataReader (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.396.2 Constructor & Destructor Documentation

8.396.2.1 TransportSelection() [1/2]

```
rti::core::policy::TransportSelection::TransportSelection ( ) [inline]
```

Creates the default policy.

8.396.2.2 TransportSelection() [2/2]

```
rti::core::policy::TransportSelection::TransportSelection (
    const dds::core::StringSeq & the_enabled_transports ) [inline], [explicit]
```

Creates an instance with the specified transport aliases.

8.396.3 Member Function Documentation

8.396.3.1 enabled_transports() [1/2]

```
TransportSelection & rti::core::policy::TransportSelection::enabled_transports (
    const dds::core::StringSeq & the_enabled_transports )
```

A sequence of transport aliases that specifies the transport instances available for use by the entity.

Of the transport instances installed with the **dds::domain::DomainParticipant** (p. 1079), only those with aliases matching an alias in this sequence are available to the entity.

Thus, this list of aliases sub-selects from the transports available to the **dds::domain::DomainParticipant** (p. 1079).

An empty sequence is a special value that specifies all the transports installed with the **dds::domain::DomainParticipant** (p. 1079).

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 339). These alias names are case sensitive and should be written in lowercase.

[default] Empty sequence; i.e. all the transports installed with and available to the **dds::domain::DomainParticipant** (p. 1079).

[range] A sequence of non-empty strings.

- **rti::core::TransportUnicastSettingsSeq** settings () const
Gets the unicast settings.

8.397.1 Detailed Description

<<**extension**>> (p. 156) Specifies a subset of transports and a port number that can be used by a **dds::core::Entity** (p. 1265) to receive data.

Entity:

dds::domain::DomainParticipant (p. 1079), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.397.2 Usage

RTI Connext may send data to a variety of Entities, not just DataReaders. For example, reliable DataWriters may receive ACK/NACK packets from reliable DataReaders.

During discovery, each **dds::core::Entity** (p. 1265) announces to remote applications a list of (up to 16) unicast addresses to which the remote application should send data (either user data packets or reliable protocol meta-data such as ACK/NACKs and heartbeats). Note that this is a hard limit that cannot be increased. However, this limit can be decreased by configuring the 'dds.domain_participant.max_announced_locator_list_size' property in the **rti::core::policy::Property** (p. 1695) associated with the **dds::domain::qos::DomainParticipantQos** (p. 1136).

By default, the list of addresses is populated automatically with values obtained from the enabled transport plug-ins allowed to be used by the Entity (see **rti::core::policy::TransportBuiltin** (p. 2237) and **rti::core::policy::TransportSelection** (p. 2257)). Also, the associated ports are automatically determined (see **rti::core::RtpsWellKnownPorts** (p. 1965)).

Use this QoS policy to manually set the receive address list for an Entity. You may optionally set a port to use a non-default receive port as well. Only the first 16 addresses will be used.

RTI Connext will create a receive thread for every unique port number that it encounters (on a per transport basis).

- For a **dds::domain::DomainParticipant** (p. 1079), this QoS policy sets the default list of addresses used by other applications to send user data for local DataReaders.
- For a **dds::sub::DataReader** (p. 756), if set, then other applications will use the specified list of addresses to send user data (and reliable protocol packets for reliable DataReaders). Otherwise, if not set, the other applications will use the addresses set by the **dds::domain::DomainParticipant** (p. 1079).
- For a reliable **dds::pub::DataWriter** (p. 908), if set, then other applications will use the specified list of addresses to send reliable protocol packets (ACKS/NACKS) on the behalf of reliable DataReaders. Otherwise, if not set, the other applications will use the addresses set by the **dds::domain::DomainParticipant** (p. 1079).

8.397.3 Constructor & Destructor Documentation

8.397.3.1 TransportUnicast() [1/2]

```
rti::core::policy::TransportUnicast::TransportUnicast ( ) [inline]
```

Creates the default policy.

References [rti::core::policy::TransportBuiltinMask::udpv6\(\)](#).

8.398.1 Detailed Description

<<*extension*>> (p. 156) Represents a list of unicast locators

A unicast locator specifies a transport class, a unicast address, and a unicast port number on which messages can be received by an entity.

QoS:

rti::core::policy::TransportUnicast (p. 2259)

8.398.2 Constructor & Destructor Documentation

8.398.2.1 TransportUnicastSettings() [1/2]

```
rti::core::TransportUnicastSettings::TransportUnicastSettings ( ) [inline]
```

Creates the default policy.

8.398.2.2 TransportUnicastSettings() [2/2]

```
rti::core::TransportUnicastSettings::TransportUnicastSettings (
    const dds::core::StringSeq & transports,
    int32_t receive_port = 0 ) [explicit]
```

Creates an instance with the specified transports and receive_port.

8.398.3 Member Function Documentation

8.398.3.1 transports() [1/2]

```
TransportUnicastSettings & rti::core::TransportUnicastSettings::transports (
    const dds::core::StringSeq & value )
```

Sets a sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.

A sequence of transport aliases that specifies the unicast interfaces on which to receive *unicast* traffic for the entity.

Of the transport instances available to the entity, only those with aliases matching an alias on this sequence are used to determine the unicast interfaces used by the entity.

Thus, this list of aliases sub-selects from the transports available to the entity.

Each unicast interface on a transport results in a unicast locator for the entity.

An empty sequence is a special value that specifies all the transports available to the entity.

Alias names for the builtin transports are defined in **TRANSPORT_BUILTIN** (p. 339).

[default] Empty sequence; i.e. all the transports available to the entity.

[range] Any sequence of non-null, non-empty strings.

8.398.3.2 transports() [2/2]

```
dds::core::StringSeq rti::core::TransportUnicastSettings::transports ( ) const
```

Getter (see setter with the same name)

8.398.3.3 receive_port() [1/2]

```
TransportUnicastSettings & rti::core::TransportUnicastSettings::receive_port (
    int32_t value )
```

The unicast port on which the entity can receive data.

The unicast port on which the entity can receive data.

Must be an *unused* unicast port on the system.

[default] 0, which implies that the actual port number is determined by a formula as a function of the `domain_id`, and the `rti::core::policy::WireProtocol::participant_id` (p. 2336).

[range] [0,0xffffffff]

8.400.1 Detailed Description

Defines the rules for determining whether the type used to publish a given topic is consistent with that used to subscribe to it.

This policy defines a type consistency kind, which allows applications to select from among a set of predetermined behaviors. The following consistency kinds are specified: `TypeConsistencyKind::DISALLOW_TYPE_COERCION`, `TypeConsistencyKind::ALLOW_TYPE_COERCION` and `TypeConsistencyKind::AUTO_TYPE_COERCION`.

The type-consistency-enforcement rules consist of two steps:

Step 1. If both the `DataWriter` and `DataReader` specify a `TypeObject`, it is considered first. If the `DataReader` allows type coercion, then its type must be assignable from the `DataWriter`'s type, taking into account the values of `prevent_type_widening`, `ignore_sequence_bounds`, `ignore_string_bounds`, `ignore_member_names`, and `ignore_enum_literal_names`. If the `DataReader` does not allow type coercion, then its type must be equivalent to the type of the `DataWriter`.

Step 2. If either the `DataWriter` or the `DataReader` does not provide a `TypeObject` definition, then the registered type names are examined. The `DataReader`'s and `DataWriter`'s registered type names must match exactly, as was true in RTI Connex releases prior to 5.0.0.

If either Step 1 or Step 2 fails, the Topics associated with the `DataReader` and `DataWriter` are considered to be inconsistent and the `dds::core::status::InconsistentTopicStatus` (p. 1355) is updated.

The default enforcement kind is `TypeConsistencyKind::AUTO_TYPE_COERCION`. This default kind translates to `TypeConsistencyKind::ALLOW_TYPE_COERCION` except in the following cases:

- When a **Zero Copy** (p. 49) `DataReader` is used, the kind is translated to `TypeConsistencyKind::DISALLOW_TYPE_COERCION`.
- When the middleware is introspecting the built-in topic data declaration of a remote `DataReader` in order to determine whether it can match with a local `DataWriter`, if it observes that no `TypeConsistencyEnforcementQosPolicy` value is provided (as would be the case when communicating with a `Service` implementation not in conformance with this specification), it assumes a kind of `TypeConsistencyKind::DISALLOW_TYPE_COERCION`.

For additional information on type consistency enforcement refer to the `Extensible Types Guide` and the `OMG Extensible and Dynamic Topic Types for DDS Specification`.

Entity:

`dds::sub::DataReader` (p. 756)

Properties:

`RxO` (p. 307) = N/A

`Changeable` (p. 307) = **UNTIL ENABLE** (p. 307)

8.400.2 Constructor & Destructor Documentation

8.400.2.1 TypeConsistencyEnforcement() [1/2]

```
dds::core::policy::TypeConsistencyEnforcement::TypeConsistencyEnforcement ( ) [inline]
```

Creates the default policy.

8.400.2.2 TypeConsistencyEnforcement() [2/2]

```
dds::core::policy::TypeConsistencyEnforcement::TypeConsistencyEnforcement (
    dds::core::policy::TypeConsistencyEnforcementKind the_kind ) [inline], [explicit]
```

Creates an instance with a specific enforcement kind.

8.400.3 Member Function Documentation

8.400.3.1 kind() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::kind (
    dds::core::policy::TypeConsistencyEnforcementKind value ) [inline]
```

Sets the enforcement kind.

[default] TypeConsistencyKind::AUTO_TYPE_COERCION

8.400.3.2 kind() [2/2]

```
dds::core::policy::TypeConsistencyEnforcementKind dds::core::policy::TypeConsistencyEnforcement↔
::kind ( ) const [inline]
```

Gets the enforcement kind.

8.400.3.3 ignore_sequence_bounds() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_sequence_↔
bounds (
    bool ignore ) [inline]
```

Controls whether sequence bounds are ignored.

If the option is set to true, then sequence bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 sequence type with maximum length L2 would be assignable to a T1 sequence type with maximum length L1, even if L2 is greater than L1. If the option is set to false, then sequence bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that $L1 \geq L2$.

[default] true

8.400.3.4 ignore_sequence_bounds() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_sequence_bounds ( ) const [inline]
```

Getter (see setter with the same name)

8.400.3.5 ignore_string_bounds() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_string_bounds  
(  
    bool ignore ) [inline]
```

Controls whether string bounds are ignored.

If the option is set to true, then string bounds (maximum lengths) are not considered as part of the type assignability. This means that a T2 string type with maximum length L2 would be assignable to a T1 string type with maximum length L1, even if L2 is greater than L1. If the option is set to false, then string bounds are taken into consideration for type assignability, and in order for T1 to be assignable from T2, it is required that $L1 \geq L2$.

[default] true

8.400.3.6 ignore_string_bounds() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_string_bounds ( ) const [inline]
```

Getter (see setter with the same name)

8.400.3.7 ignore_member_names() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_member_names (   
    bool ignore ) [inline]
```

Controls whether member names are ignored.

If the option is set to true, then member names are not considered as part of the type assignability. If the option is set to false, then member names are taken into consideration for type assignability, and in order for members with the same ID to be assignable, the members must also have the same name.

[default] false

8.400.3.8 ignore_member_names() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_member_names ( ) const [inline]
```

Getter (see setter with the same name)

8.400.3.9 prevent_type_widening() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::prevent_type_widening
(
    bool prevent ) [inline]
```

Controls whether type widening is prevented.

If the option is set to false, then type widening is permitted. If the option is set to true, then a wider type may not be assignable from a narrower type.

[default] false

8.400.3.10 prevent_type_widening() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::prevent_type_widening ( ) const [inline]
```

Getter (see setter with the same name)

8.400.3.11 force_type_validation() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::force_type_validation
(
    bool force ) [inline]
```

Controls whether type validation is forced.

If the option is set to true, then type information must be available in order to complete matching between a **dds::pub::DataWriter** (p. 908) and a **dds::sub::DataReader** (p. 756). If the option is set to false, then matching can occur without complete type information as long as the type names match exactly. Note that if the types have the same name but are not assignable, DataReaders may fail to deserialize incoming data samples.

[default] false

8.400.3.12 force_type_validation() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::force_type_validation ( ) const [inline]
```

Getter (see setter with the same name)

8.400.3.13 ignore_enum_literal_names() [1/2]

```
TypeConsistencyEnforcement & dds::core::policy::TypeConsistencyEnforcement::ignore_enum_literal↔  
_names (   
    bool ignore ) [inline]
```

Controls whether enumeration literal names are ignored.

If the option is set to true, then enumeration constants may change their names, but not their values, and still maintain assignability. If the option is set to false, then in order for enumerations to be assignable, any constant that has the same value in both enumerations must also have the same name.

[default] false

8.400.3.14 ignore_enum_literal_names() [2/2]

```
bool dds::core::policy::TypeConsistencyEnforcement::ignore_enum_literal_names ( ) const [inline]
```

Getter (see setter with the same name)

8.400.3.15 AllowTypeCoercion()

```
static TypeConsistencyEnforcement dds::core::policy::TypeConsistencyEnforcement::AllowType↔  
Coercion ( ) [inline], [static]
```

Creates an instance with `TypeConsistencyEnforcementKind::ALLOW_TYPE_COERCION`.

8.400.3.16 DisallowTypeCoercion()

```
static TypeConsistencyEnforcement dds::core::policy::TypeConsistencyEnforcement::DisallowType↔  
Coercion ( ) [inline], [static]
```

Creates an instance with `TypeConsistencyEnforcementKind::DISALLOW_TYPE_COERCION`.

8.400.3.17 AutoTypeCoercion()

```
static TypeConsistencyEnforcement dds::core::policy::TypeConsistencyEnforcement::AutoTypeCoercion
( ) [inline], [static]
```

Creates an instance with TypeConsistencyEnforcementKind::AUTO_TYPE_COERCION.

Creates the default policy.
- **TypeSupport** & **plugin_data** (void *the_plugin_data)
Value to pass into the type plugin's de-/serialization function.
- void * **plugin_data** ()
Getter (see setter with the same name)
- **TypeSupport** & **cdr_padding_kind** (**CdrPaddingKind** the_cdr_padding_kind)
Determines whether or not the padding bytes will be set to zero during CDR serialization.
- **CdrPaddingKind** **cdr_padding_kind** () const
Getter (see setter with the same name)

8.403.1 Detailed Description

<<*extension*>> (p. 156) Allows attaching application-specific information to a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756) that is passed to the serilization and deserialization routines.

The purpose of this QoS is to allow a user application to pass data to a type plugin's support functions and choose whether or not to set the padding bytes to zero when serializing a sample using CDR encapsulation.

Entity:

dds::domain::DomainParticipant (p. 1079), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = NO

Changeable (p. 307) = **UNTIL ENABLE** (p. 307)

8.403.2 Usage

The **rti::core::policy::TypeSupport::plugin_data** (p. 2277) allows you to associate a pointer to an object with a **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756). This object pointer is passed to the serialization routine of the data type associated with the **dds::pub::DataWriter** (p. 908) or the deserialization routine of the data type associated with the **dds::sub::DataReader** (p. 756).

You can modify the rtdsngen-generated code so that the de/serialization routines act differently depending on the information passed in via the object pointer. (The generated serialization and deserialization code does not use the pointer.)

This functionality can be used to change how data sent by a **dds::pub::DataWriter** (p. 908) or received by a **dds::sub::DataReader** (p. 756) is serialized or deserialized on a per DataWriter and DataReader basis.

It can also be used to dynamically change how serialization (or for a less common case, deserialization) occurs. For example, a data type could represent a table, including the names of the rows and columns. However, since the row/column names of an instance of the table (a Topic) don't change, they only need to be sent once. The information passed in through the **TypeSupport** (p. 2275) QoS policy could be used to signal the serialization routine to send the row/column names the first time a **dds::pub::DataWriter** (p. 908) calls **dds::pub::DataWriter::write()** (p. 918), and then never again.

The **rti::core::policy::TypeSupport::cdr_padding_kind** (p. 2277) allows you to choose whether or not the padding bytes are set to zero during CDR serialization.

8.403.3 Constructor & Destructor Documentation

8.403.3.1 TypeSupport()

```
rti::core::policy::TypeSupport::TypeSupport ( ) [inline]
```

Creates the default policy.

8.403.4 Member Function Documentation

8.403.4.1 plugin_data() [1/2]

```
TypeSupport & rti::core::policy::TypeSupport::plugin_data (
    void * the_plugin_data )
```

Value to pass into the type plugin's de-/serialization function.

[default] NULL

8.403.4.2 plugin_data() [2/2]

```
void * rti::core::policy::TypeSupport::plugin_data ( )
```

Getter (see setter with the same name)

8.403.4.3 cdr_padding_kind() [1/2]

```
TypeSupport & rti::core::policy::TypeSupport::cdr_padding_kind (
    CdrPaddingKind the_cdr_padding_kind )
```

Determines whether or not the padding bytes will be set to zero during CDR serialization.

In a DomainParticipant, this value configures how the padding bytes are set when serializing data for the Built-In Topic DataWriters and DataReaders. A value of CdrPaddingKind::AUTO_CDR_PADDING defaults to CdrPaddingKind::NOT_SET_CDR_PADDING.

For DataWriters and DataReaders, this value configures how padding bytes are set when serializing data for that entity. A value of CdrPaddingKind::AUTO_CDR_PADDING means that the entity will inherit whatever value is set on the DomainParticipant.

[default] CdrPaddingKind::AUTO_CDR_PADDING

8.403.4.4 cdr_padding_kind() [2/2]

```
CdrPaddingKind rti::core::policy::TypeSupport::cdr_padding_kind ( ) const
```

Getter (see setter with the same name)

8.404 dds::core::xtypes::UnidimensionalCollectionType Class Reference

<<*value-type*>> (p. 152) The base class of collection types with only one dimension.

```
#include <dds/core/xtypes/CollectionTypes.hpp>
```

Inheritance diagram for dds::core::xtypes::UnidimensionalCollectionType:

Public Member Functions

- uint32_t **bounds** () const
Gets the maximum length of this collection.

Additional Inherited Members

8.404.1 Detailed Description

<<*value-type*>> (p. 152) The base class of collection types with only one dimension.

8.404.2 Member Function Documentation

8.404.2.1 bounds()

```
uint32_t dds::core::xtypes::UnidimensionalCollectionType::bounds ( ) const
```

Gets the maximum length of this collection.

8.405 rti::flat::UnionBuilder< Discriminator > Class Template Reference

Base class of builders for user-defined mutable unions.

```
#include <AggregationBuilders.hpp>
```

Inheritance diagram for rti::flat::UnionBuilder< Discriminator >:

Additional Inherited Members

8.405.1 Detailed Description

```
template<typename Discriminator>
class rti::flat::UnionBuilder< Discriminator >
```

Base class of builders for user-defined mutable unions.

Union builders can only add or build a single member.

This class contains implementation details and doesn't add any public function to **AbstractBuilder** (p. 571).

8.406 dds::core::xtypes::UnionMember Class Reference

<< **value-type** >> (p. 152) Represents a **UnionType** (p. 2285) member

```
#include "dds/core/xtypes/MemberType.hpp"
```

Public Types

- typedef DDS_Long **DiscriminatorType**
The type to represent a union discriminator.
- typedef std::vector< **DiscriminatorType** > **LabelSeq**
A sequence of values for the discriminator that select a member.

Public Member Functions

- **UnionMember** (const std::string & **name**, const DynamicTypeImpl & **type**, const **LabelSeq** & **labels**)
Creates a union member with a name, type and selected by one or more labels.
- **UnionMember** (const std::string & **name**, const DynamicTypeImpl & **type**, **DiscriminatorType** **label**)
Creates a union member with a name, type and selected by a single label.
- **UnionMember** (const std::string &the_name, DynamicTypeImpl &&the_type, const **LabelSeq** &the_labels)
<<C++11>> (p. 155) Creates a union member with a name, type and selected by one or more labels.
- **UnionMember** (const std::string &the_name, DynamicTypeImpl &&the_type, **DiscriminatorType** the_label)
<<C++11>> (p. 155) Creates a union member with a name, type and selected by a single label.
- const **dds::core::string** & **name** () const
Gets the member name.
- **dds::core::string** & **name** ()
Gets the member name.
- const **DynamicType** & **type** ()
Gets the member type.
- bool **has_id** () const
Indicates if the member has an ID annotation.
- int32_t **get_id** () const
Returns the ID annotation of this member.
- bool **is_pointer** () const
<<extension>> (p. 156) Indicates if this member is a pointer
- uint32_t **label_count** () const
Gets the number of labels that select this member.
- **LabelSeq** **labels** () const
Gets a copy of all the labels that select this member.
- **UnionMember** & **labels** (const **LabelSeq** &values)
Sets the labels that select this member.
- **UnionMember** & **label** (**DiscriminatorType** value)
Sets a single label that selects this member.
- **UnionMember** & **name** (const **dds::core::string** &value)
Sets the name.
- **UnionMember** & **id** (int32_t value)
Sets the ID annotation of a member.
- **UnionMember** & **pointer** (bool value)
<<extension>> (p. 156) Makes a member a pointer

Static Public Attributes

- static OMG_DDS_API_CLASS_VARIABLE **DiscriminatorType** **DEFAULT_LABEL**
Special value for the `default`: union label.
- static const int32_t **INVALID_ID**
The special ID of a member without the ID annotation.

8.406.1 Detailed Description

<<*value-type*>> (p. 152) Represents a **UnionType** (p. 2285) member

Encapsulates the name, type and labels of a **UnionType** (p. 2285) member along with several IDL annotations such as `id`.

8.406.2 Member Typedef Documentation

8.406.2.1 DiscriminatorType

```
typedef DDS_Long dds::core::xtypes::UnionMember::DiscriminatorType
```

The type to represent a union discriminator.

8.406.2.2 LabelSeq

```
typedef std::vector< DiscriminatorType> dds::core::xtypes::UnionMember::LabelSeq
```

A sequence of values for the discriminator that select a member.

8.406.3 Constructor & Destructor Documentation

8.406.3.1 UnionMember() [1/4]

```
dds::core::xtypes::UnionMember::UnionMember (  
    const std::string & name,  
    const DynamicTypeImpl & type,  
    const LabelSeq & labels )
```

Creates a union member with a name, type and selected by one or more labels.

8.406.3.2 UnionMember() [2/4]

```
dds::core::xtypes::UnionMember::UnionMember (
    const std::string & name,
    const DynamicTypeImpl & type,
    DiscriminatorType label )
```

Creates a union member with a name, type and selected by a single label.

8.406.3.3 UnionMember() [3/4]

```
dds::core::xtypes::UnionMember::UnionMember (
    const std::string & the_name,
    DynamicTypeImpl && the_type,
    const LabelSeq & the_labels ) [inline]
```

<<C++11>> (p. 155) Creates a union member with a name, type and selected by one or more labels.

It moves the type.

8.406.3.4 UnionMember() [4/4]

```
dds::core::xtypes::UnionMember::UnionMember (
    const std::string & the_name,
    DynamicTypeImpl && the_type,
    DiscriminatorType the_label ) [inline]
```

<<C++11>> (p. 155) Creates a union member with a name, type and selected by a single label.

It moves the type.

8.406.4 Member Function Documentation

8.406.4.1 name() [1/3]

```
const dds::core::string & dds::core::xtypes::UnionMember::name ( ) const
```

Gets the member name.

8.406.4.2 name() [2/3]

```
dds::core::string & dds::core::xtypes::UnionMember::name ( )
```

Gets the member name.

8.406.4.3 type()

```
const DynamicType & dds::core::xtypes::UnionMember::type ( )
```

Gets the member type.

8.406.4.4 has_id()

```
bool dds::core::xtypes::UnionMember::has_id ( ) const
```

Indicates if the member has an ID annotation.

Returns

True if this member has been annotated explicitly with an ID; false if the has a default-assigned ID.

8.406.4.5 get_id()

```
int32_t dds::core::xtypes::UnionMember::get_id ( ) const
```

Returns the ID annotation of this member.

Returns

If **has_id()** (p. 2283) is true, this returns the value of the ID annotation. Otherwise it returns INVALID_ID.

8.406.4.6 is_pointer()

```
bool dds::core::xtypes::UnionMember::is_pointer ( ) const
```

<<**extension**>> (p. 156) Indicates if this member is a pointer

8.406.4.7 label_count()

```
uint32_t dds::core::xtypes::UnionMember::label_count ( ) const
```

Gets the number of labels that select this member.

8.406.4.8 labels() [1/2]

```
LabelSeq dds::core::xtypes::UnionMember::labels ( ) const
```

Gets a copy of all the labels that select this member.

8.406.4.9 labels() [2/2]

```
UnionMember & dds::core::xtypes::UnionMember::labels (
    const LabelSeq & values )
```

Sets the labels that select this member.

8.406.4.10 label()

```
UnionMember & dds::core::xtypes::UnionMember::label (
    DiscriminatorType value )
```

Sets a single label that selects this member.

If more than one label selects this case, use **labels(const LabelSeq&)** (p. 2284)

8.406.4.11 name() [3/3]

```
UnionMember & dds::core::xtypes::UnionMember::name (
    const dds::core::string & value )
```

Sets the name.

8.406.4.12 id()

```
UnionMember & dds::core::xtypes::UnionMember::id (
    int32_t value )
```

Sets the ID annotation of a member.

[default] Automatically assigned as the ID of the previous member plus one previous member

8.406.4.13 pointer()

```
UnionMember & dds::core::xtypes::UnionMember::pointer (
    bool value )
```

<<*extension*>> (p. 156) Makes a member a pointer

[default] false

8.406.5 Member Data Documentation

8.406.5.1 DEFAULT_LABEL

```
OMG_DDS_API_CLASS_VARIABLE DiscriminatorType dds::core::xtypes::UnionMember::DEFAULT_LABEL [static]
```

Special value for the default : union label.

8.406.5.2 INVALID_ID

```
const int32_t dds::core::xtypes::UnionMember::INVALID_ID [static]
```

The special ID of a member without the ID annotation.

8.407 dds::core::xtypes::UnionType Class Reference

<<*value-type*>> (p. 152) Represents and IDL union type

```
#include <dds/core/xtypes/UnionType.hpp>
```

Inheritance diagram for dds::core::xtypes::UnionType:

Public Types

- typedef UnionMember::DiscriminatorType **DiscriminatorType**

The type used to set and get discriminator (label) values.

Public Member Functions

- **UnionType** (const std::string &the_name, const DynamicTypeImpl &discriminator_type)
Creates an empty union.
- template<typename Container >
UnionType (const std::string &the_name, const DynamicTypeImpl &discriminator_type, const Container &the_←members)
Creates a union with the members in a container.
- template<typename MemberIter >
UnionType (const std::string &the_name, const DynamicTypeImpl &discriminator_type, MemberIter begin, MemberIter end)
Creates a union with the members in an iterator range.
- **UnionType** (const std::string &the_name, const DynamicTypeImpl &discriminator_type, std::initializer_list<**UnionMember** > the_members)
Creates a union with the members in an initializer_list.
- const DynamicTypeImpl & **discriminator** () const
Gets the type of the discriminator.
- **MemberIndex find_member_by_label** (**DiscriminatorType** label) const
Gets the index of the member selected by a label.
- **MemberIndex find_member_by_id** (uint32_t id) const
Gets the index of the member with a specific member ID.
- **UnionType & add_member** (const **UnionMember** & member)
Add a member to the end of this union.
- template<typename Container >
UnionType & add_members (const Container &the_members)
Adds all the members of a container at the end.
- **UnionType & add_members** (std::initializer_list< **UnionMember** > the_members)
Adds all the members of an initializer_list at the end.
- template<typename MemberIter >
UnionType & add_members (MemberIter begin, MemberIter end)
Adds all the members in an iterator range at the end.
- **UnionType & add_member** (**UnionMember** &&the_member)
Adds a member, moving it, at the end.

Additional Inherited Members

8.407.1 Detailed Description

<< **value-type** >> (p. 152) Represents and IDL union type

Examples

Foo.hpp.

8.407.2 Member Typedef Documentation

8.407.2.1 DiscriminatorType

```
typedef UnionMember::DiscriminatorType dds::core::xtypes::UnionType::DiscriminatorType
```

The type used to set and get discriminator (label) values.

Note that this is different from **discriminator()** (p. 2289), which represents the discriminator type as defined in IDL.

8.407.3 Constructor & Destructor Documentation

8.407.3.1 UnionType() [1/4]

```
dds::core::xtypes::UnionType::UnionType (
    const std::string & the_name,
    const DynamicTypeImpl & discriminator_type ) [inline]
```

Creates an empty union.

Members can be added after creation.

Parameters

<i>the_name</i>	The name of the type
<i>discriminator_type</i>	The type of the discriminator

8.407.3.2 UnionType() [2/4]

```
template<typename Container >
dds::core::xtypes::UnionType::UnionType (
    const std::string & the_name,
    const DynamicTypeImpl & discriminator_type,
    const Container & the_members ) [inline]
```

Creates a union with the members in a container.

Template Parameters

<i>Container</i>	A container that provides the member functions begin() (p. 1412) and end() (p. 1413) to iterate over UnionMember (p. 2279) elements.
------------------	---

Parameters

<i>the_name</i>	The name of the type
<i>discriminator_type</i>	The type of the discriminator, which can be a primitive type, an EnumType (p. 1280) or an AliasType (p. 589) to any of these.
<i>the_members</i>	A container with the members for this union type

8.407.3.3 UnionType() [3/4]

```
template<typename MemberIter >
dds::core::xtypes::UnionType::UnionType (
    const std::string & the_name,
    const DynamicTypeImpl & discriminator_type,
    MemberIter begin,
    MemberIter end ) [inline]
```

Creates a union with the members in an iterator range.

Template Parameters

<i>MemberIter</i>	A forward iterator of UnionMember (p. 2279) elements
-------------------	---

Parameters

<i>the_name</i>	The name of the type
<i>discriminator_type</i>	The type of the discriminator
<i>begin</i>	The beginning of the range of UnionMembers
<i>end</i>	The end of the range of UnionMembers

8.407.3.4 UnionType() [4/4]

```
dds::core::xtypes::UnionType::UnionType (
    const std::string & the_name,
    const DynamicTypeImpl & discriminator_type,
    std::initializer_list< UnionMember > the_members ) [inline]
```

Creates a union with the members in an initializer_list.

Parameters

<i>the_name</i>	The name of the type
<i>discriminator_type</i>	The type of the discriminator
<i>the_members</i>	An initializer_list of UnionMembers

8.407.4 Member Function Documentation

8.407.4.1 discriminator()

```
const DynamicTypeImpl & dds::core::xtypes::UnionType::discriminator ( ) const
```

Gets the type of the discriminator.

8.407.4.2 find_member_by_label()

```
MemberIndex dds::core::xtypes::UnionType::find_member_by_label (   
    DiscriminatorType label ) const
```

Gets the index of the member selected by a label.

The result of this function can be passed to member(uint32_t).

Returns

The index of the member selected by label or INVALID_INDEX if that label doesn't select any member

8.407.4.3 find_member_by_id()

```
MemberIndex dds::core::xtypes::UnionType::find_member_by_id (   
    uint32_t id ) const
```

Gets the index of the member with a specific member ID.

The result of this function can be passed to member(uint32_t).

Returns

The index of the member that has this id or INVALID_INDEX if no member uses that id.

8.407.4.4 add_member() [1/2]

```
UnionType & dds::core::xtypes::UnionType::add_member (
    const UnionMember & member )
```

Add a member to the end of this union.

8.407.4.5 add_members() [1/3]

```
template<typename Container >
UnionType & dds::core::xtypes::UnionType::add_members (
    const Container & the_members ) [inline]
```

Adds all the members of a container at the end.

8.407.4.6 add_members() [2/3]

```
UnionType & dds::core::xtypes::UnionType::add_members (
    std::initializer_list< UnionMember > the_members ) [inline]
```

Adds all the members of an initializer_list at the end.

8.407.4.7 add_members() [3/3]

```
template<typename MemberIter >
UnionType & dds::core::xtypes::UnionType::add_members (
    MemberIter begin,
    MemberIter end ) [inline]
```

Adds all the members in an iterator range at the end.

8.407.4.8 add_member() [2/2]

```
UnionType & dds::core::xtypes::UnionType::add_member (
    UnionMember && the_member ) [inline]
```

Adds a member, moving it, at the end.

8.408 rti::core::UnregisterThreadOnExit Class Reference

<<*extension*>> (p. 156) Utility that calls `rti::core::unregister_thread` (p. 237) when leaving scope

```
#include <rti/core/thread.hpp>
```

Public Member Functions

- `~UnregisterThreadOnExit ()`
Calls `rti::core::unregister_thread` (p. 237).

8.408.1 Detailed Description

<<*extension*>> (p. 156) Utility that calls `rti::core::unregister_thread` (p. 237) when leaving scope

Declare an instance of this type in a thread function before any DDS API is called. After the function exits, this variable will be destroyed and the thread unregistered after everything else.

For example:

```
void my_thread()
{
    // Whenever my_thread leaves, rti::core::unregister_thread will be called.
    UnregisterThreadOnExit unregister_thread_on_exit;
    // Use DDS API
}
```

8.408.2 Constructor & Destructor Documentation

8.408.2.1 ~UnregisterThreadOnExit()

```
rti::core::UnregisterThreadOnExit::~UnregisterThreadOnExit ( ) [inline]
```

Calls `rti::core::unregister_thread` (p. 237).

References `rti::core::unregister_thread()`.

8.409 dds::core::UnsupportedError Class Reference

Indicates that the application used an unsupported operation.

```
#include <Exception.hpp>
```

Inheritance diagram for `dds::core::UnsupportedError`:

Public Member Functions

- virtual const char * **what** () const throw ()

Access the message contained in this **UnsupportedError** (p. 2291) exception.

8.409.1 Detailed Description

Indicates that the application used an unsupported operation.

Inherits also from `std::logic_error`

Only unsupported operations can throw this exception.

8.409.2 Member Function Documentation

8.409.2.1 what()

```
virtual const char * dds::core::UnsupportedError::what ( ) const throw ( ) [virtual]
```

Access the message contained in this **UnsupportedError** (p. 2291) exception.

Returns

The message.

Implements **dds::core::Exception** (p. 1292).

8.410 dds::core::policy::UserData Class Reference

Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 44) during discovery.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **UserData** ()
Creates an instance with an empty sequence of bytes.
- **UserData** (const **dds::core::ByteSeq** &seq)
Creates an instance with a sequence of bytes.
- **UserData** (const uint8_t *value_begin, const uint8_t *value_end)
Creates an instance with a sequence of bytes.
- template<typename OctetIter >
UserData & **value** (OctetIter the_begin, OctetIter the_end)
Sets the byte sequence.
- const **dds::core::ByteSeq** **value** () const
Gets the user data.
- **dds::core::ByteSeq** & **value** (**dds::core::ByteSeq** &dest) const
Gets the user data.
- const uint8_t * **begin** () const
*Gets the beginning of the range of bytes in this **UserData** (p. 2292).*
- const uint8_t * **end** () const
*Gets the end of the range of bytes in this **UserData** (p. 2292).*

8.410.1 Detailed Description

Attaches a buffer of opaque data that is distributed by **Built-in Topics** (p. 44) during discovery.

Entity:

dds::domain::DomainParticipant (p. 1079), **dds::sub::DataReader** (p. 756), **dds::pub::DataWriter** (p. 908)

Properties:

RxO (p. 307) = NO;

Changeable (p. 307) = YES (p. 307)

See also

dds::sub::builtin_subscriber (p. 459)

8.410.2 Usage

The purpose of this QoS is to allow the application to attach additional information to the created `dds::core::Entity` (p. 1265) objects, so that when a remote application discovers their existence, it can access that information and use it for its own purposes. This information is not used by RTI Connex.

One possible use of this QoS is to attach security credentials or some other information that can be used by the remote application to authenticate the source.

In combination with operations such as `dds::domain::ignore` (p. 423), `dds::pub::ignore` (p. 435), `dds::sub::ignore` (p. 455), and `dds::topic::ignore()` (p. 481), this QoS policy can assist an application to define and enforce its own security policies.

The use of this QoS is not limited to security; it offers a simple, yet flexible extensibility mechanism.

Important: RTI Connex stores the data placed in this policy in pre-allocated pools. It is therefore necessary to configure RTI Connex with the maximum size of the data that will be stored in policies of this type. This size is configured with `rti::core::policy::DomainParticipantResourceLimits::participant_user_data_max_length` (p. 1164), `rti::core::policy::DomainParticipantResourceLimits::writer_user_data_max_length` (p. 1166), and `rti::core::policy::DomainParticipantResourceLimits::reader_user_data_max_length` (p. 1167).

8.410.3 Constructor & Destructor Documentation

8.410.3.1 UserData() [1/3]

```
dds::core::policy::UserData::UserData ( ) [inline]
```

Creates an instance with an empty sequence of bytes.

8.410.3.2 UserData() [2/3]

```
dds::core::policy::UserData::UserData (
    const dds::core::ByteSeq & seq ) [inline], [explicit]
```

Creates an instance with a sequence of bytes.

Parameters

<code>seq</code>	A vector containing the bytes to create this <code>UserData</code> (p. 2292)
------------------	--

8.410.3.3 UserData() [3/3]

```
dds::core::policy::UserData::UserData (
    const uint8_t * value_begin,
    const uint8_t * value_end ) [inline]
```

Creates an instance with a sequence of bytes.

Parameters

<i>value_begin</i>	Beginning of a range of bytes
<i>value_end</i>	End of the reange

8.410.4 Member Function Documentation

8.410.4.1 value() [1/3]

```
template<typename OctetIter >
UserData & dds::core::policy::UserData::value (
    OctetIter the_begin,
    OctetIter the_end ) [inline]
```

Sets the byte sequence.

Template Parameters

<i>OctetIter</i>	An input iterator of bytes (convertible to uint8_t).
------------------	--

Parameters

<i>the_begin</i>	Beginning of the range
<i>the_end</i>	End of the range

8.410.4.2 value() [2/3]

```
const dds::core::ByteSeq dds::core::policy::UserData::value ( ) const [inline]
```

Gets the user data.

Returns

the sequence of bytes representing the user data

8.410.4.3 value() [3/3]

```
dds::core::ByteSeq & dds::core::policy::UserData::value (
    dds::core::ByteSeq & dest ) const [inline]
```

Gets the user data.

Parameters

<i>dest</i>	The vector where the bytes will be copied
-------------	---

Returns

A reference to *dest*

8.410.4.4 begin()

```
const uint8_t * dds::core::policy::UserData::begin ( ) const [inline]
```

Gets the beginning of the range of bytes in this **UserData** (p. 2292).

8.410.4.5 end()

```
const uint8_t * dds::core::policy::UserData::end ( ) const [inline]
```

Gets the end of the range of bytes in this **UserData** (p. 2292).

8.411 rti::sub::ValidLoanedSamples< T > Class Template Reference

<<**extension**>> (p. 156) <<**C++11**>> (p. 155) <<**move-only-type**>> (p. 155) Provides access to only those samples that contain valid data

```
#include <LoanedSamplesImpl.hpp>
```

Public Types

- typedef **ValidSampleIterator**< T > **iterator**
*The iterator type that **ValidLoanedSamples** (p. 2296) provides.*
- typedef **ValidSampleIterator**< T > **const_iterator**
*The const-iterator type that **ValidLoanedSamples** (p. 2296) provides.*
- typedef **ValidSampleIterator**< T >::value_type **value_type**
*This collection's value type, **LoanedSample**<T>*

Public Member Functions

- **ValidLoanedSamples** (**LoanedSamples**< T > &&loaned_samples)
*Constructor from an rvalue **LoanedSamples**.*
- **ValidLoanedSamples** (**ValidLoanedSamples**< T > &&other)
Move constructor.
- **iterator begin** ()
Returns a forward iterator to the first valid-data sample.
- **const_iterator begin** () const
Returns a forward const iterator to the first valid-data sample.
- **iterator end** ()
Returns a forward iterator that indicates the end of the collection.
- **const_iterator end** () const
Returns a forward const iterator that indicates the end of the collection.

Related Functions

(Note that these are not member functions.)

ValidLoanedSamples< T >::**iterator begin** (**ValidLoanedSamples**< T > &ls)
- template<typename T >
ValidLoanedSamples< T >::**const_iterator begin** (const **ValidLoanedSamples**< T > &ls)
- template<typename T >
ValidLoanedSamples< T >::**iterator end** (**ValidLoanedSamples**< T > &ls)
- template<typename T >
ValidLoanedSamples< T >::**const_iterator end** (const **ValidLoanedSamples**< T > &ls)
- template<typename T >
void **swap** (**ValidLoanedSamples**< T > &ls1, **ValidLoanedSamples**< T > &ls2) throw()

8.411.1 Detailed Description

```
template<typename T>
class rti::sub::ValidLoanedSamples< T >
```

<<**extension**>> (p. 156) <<**C++11**>> (p. 155) <<**move-only-type**>> (p. 155) Provides access to only those samples that contain valid data

Template Parameters

<i>T</i>	The topic-type. It has to match the type of the DataReader.
----------	---

An instance of **ValidLoanedSamples** (p. 2296) is a wrapper that takes an existing `LoanedSamples` and provides forward iterators that only access samples with valid data.

The typical way to use this collection is through the function `rti::sub::valid_data` (p. 553), which transforms a `dds↔::sub::LoanedSamples` (p. 1406) into a **ValidLoanedSamples** (p. 2296).

For more information and a code example, see `rti::sub::valid_data(LoanedSamples<T>&&)` (p. 553)

Reading data samples (p. 119)

8.411.2 Member Typedef Documentation

8.411.2.1 iterator

```
template<typename T >
typedef ValidSampleIterator<T> rti::sub::ValidLoanedSamples< T >::iterator
```

The iterator type that **ValidLoanedSamples** (p. 2296) provides.

8.411.2.2 const_iterator

```
template<typename T >
typedef ValidSampleIterator<T> rti::sub::ValidLoanedSamples< T >::const_iterator
```

The const-iterator type that **ValidLoanedSamples** (p. 2296) provides.

8.411.2.3 value_type

```
template<typename T >
typedef ValidSampleIterator<T>::value_type rti::sub::ValidLoanedSamples< T >::value_type
```

This collection's value type, `LoanedSample<T>`

8.411.3 Constructor & Destructor Documentation

8.411.3.1 ValidLoanedSamples() [1/2]

```
template<typename T >
rti::sub::ValidLoanedSamples< T >::ValidLoanedSamples (
    LoanedSamples< T > && loaned_samples ) [inline]
```

Constructor from an rvalue LoanedSamples.

The only way to create a **ValidLoanedSamples** (p.2296) is through moving an existing LoanedSamples.

Postcondition

`loaned_samples` is invalid should not be used; this **ValidLoanedSamples** (p.2296) now owns it.

Note

This constructor should not be used directly, the function **rti::sub::valid_data(LoanedSamples<T>&&)** (p.553) is more convenient since it can deduce the template type.

8.411.3.2 ValidLoanedSamples() [2/2]

```
template<typename T >
rti::sub::ValidLoanedSamples< T >::ValidLoanedSamples (
    ValidLoanedSamples< T > && other ) [inline]
```

Move constructor.

A **ValidLoanedSamples** (p.2296), just like LoanedSamples can be moved but not copied.

8.411.4 Member Function Documentation

8.411.4.1 begin() [1/2]

```
template<typename T >
iterator rti::sub::ValidLoanedSamples< T >::begin ( ) [inline]
```

Returns a forward iterator to the first valid-data sample.

Referenced by **rti::sub::ValidLoanedSamples< T >::begin()**.

8.411.4.2 begin() [2/2]

```
template<typename T >
const_iterator rti::sub::ValidLoanedSamples< T >::begin ( ) const [inline]
```

Returns a forward const iterator to the first valid-data sample.

8.411.4.3 end() [1/2]

```
template<typename T >
iterator rti::sub::ValidLoanedSamples< T >::end ( ) [inline]
```

Returns a forward iterator that indicates the end of the collection.

Referenced by `rti::sub::ValidLoanedSamples< T >::end()`.

8.411.4.4 end() [2/2]

```
template<typename T >
const_iterator rti::sub::ValidLoanedSamples< T >::end ( ) const [inline]
```

Returns a forward const iterator that indicates the end of the collection.

8.411.5 Friends And Related Function Documentation

8.411.5.1 begin() [1/2]

```

8.412 rti::sub::ValidSampleIterator< T > Class Template Reference

A forward iterator adapter that skips invalid samples.

```
#include <SampleIterator.hpp>
```

8.412.1 Detailed Description

```
template<typename T>
class rti::sub::ValidSampleIterator< T >
```

A forward iterator adapter that skips invalid samples.

Instead of instantiating this class directly, use [valid_data\(\)](#) (p. 553).

See also

[rti::sub::valid_data\(const SampleIterator<T> &\)](#) (p. 554)

[rti::sub::valid_data\(LoanedSamples<T>&&\)](#) (p. 553)

8.413 dds::core::Value< D > Class Template Reference

```
#include <Value.hpp>
```

Public Member Functions

- const D * **operator->** () const OMG_NOEXCEPT
- D * **operator->** () OMG_NOEXCEPT
- const D & **delegate** () const OMG_NOEXCEPT
- D & **delegate** () OMG_NOEXCEPT
- const D & **extensions** () const OMG_NOEXCEPT
- D & **extensions** () OMG_NOEXCEPT
- **operator D&** () OMG_NOEXCEPT
- **operator const D &** () const OMG_NOEXCEPT

8.413.1 Detailed Description

```
template<typename D>
class dds::core::Value< D >
```

This class provides the basic behavior for **Value** (p. 2302) types.

8.413.2 Member Function Documentation

8.413.2.1 operator->() [1/2]

```
template<typename D >
const D * dds::core::Value< D >::operator-> ( ) const [inline]
```

Return the delegate.

8.413.2.2 operator->() [2/2]

```
template<typename D >
D * dds::core::Value< D >::operator-> ( ) [inline]
```

Return the delegate.

8.413.2.3 delegate() [1/2]

```
template<typename D >
const D & dds::core::Value< D >::delegate ( ) const [inline]
```

Return the delegate.

Referenced by `dds::core::StringTopicType::data()`, `dds::topic::PublicationBuiltinTopicData::data_tag()`, `dds::topic::TopicBuiltinTopicData::destination_order()`, `dds::topic::TopicBuiltinTopicData::durability_service()`, `dds::topic::PublicationBuiltinTopicData::group_data()`, `dds::topic::TopicBuiltinTopicData::history()`, `dds::core::KeyedStringTopicType::key()`, `dds::topic::TopicBuiltinTopicData::key()`, `dds::core::KeyedBytesTopicType::key()`, `dds::topic::TopicBuiltinTopicData::latency_budget()`, `dds::core::BytesTopicType::length()`, `dds::core::KeyedBytesTopicType::length()`, `dds::topic::TopicBuiltinTopicData::lifespan()`, `dds::topic::TopicBuiltinTopicData::liveliness()`, `dds::topic::TopicBuiltinTopicData::name()`, `dds::core::KeyedBytesTopicType::operator std::vector< uint8_t >()`, `dds::core::BytesTopicType::operator[]()`, `dds::core::KeyedBytesTopicType::operator[]()`, `dds::topic::TopicBuiltinTopicData::ownership()`, `dds::topic::PublicationBuiltinTopicData::partition()`, `dds::topic::TopicBuiltinTopicData::reliability()`, `dds::topic::TopicBuiltinTopicData::representation()`, `dds::topic::PublicationBuiltinTopicData::representation()`, `dds::topic::TopicBuiltinTopicData::resource_limits()`, `dds::pub::SuspendedPublication::resume()`, `dds::topic::TopicBuiltinTopicData::topic_data()`, `dds::topic::PublicationBuiltinTopicData::topic_data()`, `dds::topic::TopicBuiltinTopicData::transport_priority()`, `dds::topic::TopicBuiltinTopicData::type_name()`, `dds::core::KeyedStringTopicType::value()`, and `dds::core::KeyedBytesTopicType::value()`.

8.413.2.4 delegate() [2/2]

```
template<typename D >
D & dds::core::Value< D >::delegate ( ) [inline]
```

Return the delegate.

8.413.2.5 extensions() [1/2]

```
template<typename D >
const D & dds::core::Value< D >::extensions ( ) const [inline]
```

Provides access to the extensions (just like **delegate()** (p. 2303))

8.413.2.6 extensions() [2/2]

```
template<typename D >
D & dds::core::Value< D >::extensions ( ) [inline]
```

Provides access to the extensions (just like **delegate()**)

8.413.2.7 operator D&()

```
template<typename D >
dds::core::Value< D >::operator D& ( ) [inline]
```

Return the delegate.

8.413.2.8 operator const D &()

```
template<typename D >
dds::core::Value< D >::operator const D & ( ) const [inline]
```

Return the delegate.

8.414 dds::core::vector< T > Class Template Reference

<<**value-type**>> (p. 152) A vector convertible to `std::vector` and with similar functionality

```
#include <dds/core/vector.hpp>
```

Public Member Functions

- **vector** ()
Creates an empty vector.
- **vector** (size_type initial_size)
Creates a vector with a number of default-constructed elements.
- **vector** (size_type initial_size, const T &value)
Creates a vector with a number of copies of a value.
- **vector** (const **vector** &other)
Creates a copy.
- **vector** (const std::vector< T > &other)
Implicit construction from std::vector.
- **vector** (**vector** &&other) **OMG_NOEXCEPT**
Creates a vector by moving an existing one.
- **operator std::vector< T > ()** const
Provides a conversion to std::vector.
- size_type **size** () const
Get the current size.
- size_type **capacity** () const
Get the current capacity.
- void **resize** (size_type new_size)
Set the size to new_size.
- void **resize** (size_type new_size, const T &value)
Set the size to new_size, copying value if new elements are added.
- void **clear** ()
Resize to zero.
- void **reserve** (size_type new_capacity)
Reserve a new capacity without creating any elements or changing the size.
- reference **at** (size_type i)
Get an element by reference and check bounds.
- const_reference **at** (size_type i) const
Get an element by const-reference and check bounds.
- reference **operator[]** (size_type i)
Get an element by reference.
- const_reference **operator[]** (size_type i) const
Get an element by const-reference.
- **vector** & **operator=** (const **vector** &other)
Assign another vector to this one.
- **vector** & **operator=** (**vector** &&other) **OMG_NOEXCEPT**
Move-assign another vector to this one.
- bool **operator==** (const **vector** &other) const
Returns if the elements of two vectors are equal.
- bool **operator!=** (const **vector** &other) const
Returns if two vectors are different.
- iterator **begin** ()
Iterator to the first element.
- const_iterator **begin** () const

Const iterator to first element.

- iterator **end** ()

Iterator to last element plus one.

- const_iterator **end** () const

Const iterator to last element plus one.

Friends

- void **swap** (**vector** &left, **vector** &right) OMG_NOEXCEPT

Efficiently swaps the contents of two vectors.

Related Functions

(Note that these are not member functions.)

- template<typename T, size_t N>
std::ostream & **operator**<< (std::ostream &out, const bounded_sequence< T, N > &v)
Print a vector applying << to all of its elements.
- template<typename T >
std::ostream & **operator**<< (std::ostream &out, const **vector**< T > &v)
Print a vector applying << to all of its elements.

8.414.1 Detailed Description

```
template<typename T>
class dds::core::vector< T >
```

<<**value-type**>> (p. 152) A vector convertible to std::vector and with similar functionality

In many cases, for performance reasons and other implementation requirements, the RTI Connex API uses **dds::core::vector** (p. 2304) instead of std::vector. The most significant case is the C++ types that rtdsgen generates from IDL (p. 395).

A **dds::core::vector** (p. 2304) provides a subset of the functionality of a `std::vector`, including iterators, resizing and indexed access. It also provides automatic conversion to and from std::vector, making code like the following possible:

```
// IDL-generated type
class Foo {
public:
    // ...
    const dds::core::vector<int32_t>& my_ints() const;
};
// Application
Foo sample = ...;
dds::vector<int32_t> my_std_vector = sample.my_ints(); // conversion to std::vector
// ...
sample.my_ints() = my_std_vector; // conversion from std::vector
```

8.414.2 Constructor & Destructor Documentation

8.414.2.1 vector() [1/6]

```
template<typename T >  
dds::core::vector< T >::vector ( ) [inline]
```

Creates an empty vector.

8.414.2.2 vector() [2/6]

```
template<typename T >  
dds::core::vector< T >::vector (   
    size_type initial_size ) [inline], [explicit]
```

Creates a vector with a number of default-constructed elements.

8.414.2.3 vector() [3/6]

```
template<typename T >  
dds::core::vector< T >::vector (   
    size_type initial_size,  
    const T & value ) [inline]
```

Creates a vector with a number of copies of a value.

8.414.2.4 vector() [4/6]

```
template<typename T >  
dds::core::vector< T >::vector (   
    const vector< T > & other ) [inline]
```

Creates a copy.

8.414.2.5 vector() [5/6]

```
template<typename T >
dds::core::vector< T >::vector (
    const std::vector< T > & other ) [inline]
```

Implicit construction from std::vector.

Note: this operation makes a copy of all the elements in other

8.414.2.6 vector() [6/6]

```
template<typename T >
dds::core::vector< T >::vector (
    vector< T > && other ) [inline]
```

Creates a vector by moving an existing one.

8.414.3 Member Function Documentation

8.414.3.1 operator std::vector< T >()

```
template<typename T >
dds::core::vector< T >::operator std::vector< T > ( ) const [inline]
```

Provides a conversion to std::vector.

Note: this operation makes a copy of all the elements in this vector

8.414.3.2 size()

```
template<typename T >
size_type dds::core::vector< T >::size ( ) const [inline]
```

Get the current size.

8.414.3.3 capacity()

```
template<typename T >
size_type dds::core::vector< T >::capacity ( ) const [inline]
```

Get the current capacity.

8.414.3.4 `resize()` [1/2]

```
template<typename T >
void dds::core::vector< T >::resize (
    size_type new_size ) [inline]
```

Set the size to `new_size`.

8.414.3.5 `resize()` [2/2]

```
template<typename T >
void dds::core::vector< T >::resize (
    size_type new_size,
    const T & value ) [inline]
```

Set the size to `new_size`, copying value if new elements are added.

8.414.3.6 `clear()`

```
template<typename T >
void dds::core::vector< T >::clear ( ) [inline]
```

Resize to zero.

8.414.3.7 `reserve()`

```
template<typename T >
void dds::core::vector< T >::reserve (
    size_type new_capacity ) [inline]
```

Reserve a new capacity without creating any elements or changing the size.

8.414.3.8 `at()` [1/2]

```
template<typename T >
reference dds::core::vector< T >::at (
    size_type i ) [inline]
```

Get an element by reference and check bounds.

Exceptions

<code>std::out_of_range</code>	if <code>i</code> is out of bounds
--------------------------------	------------------------------------

8.414.3.9 `at()` [2/2]

```
template<typename T >
const_reference dds::core::vector< T >::at (
    size_type i ) const [inline]
```

Get an element by const-reference and check bounds.

Exceptions

<code>std::out_of_range</code>	if <code>i</code> is out of bounds
--------------------------------	------------------------------------

8.414.3.10 `operator[]()` [1/2]

```
template<typename T >
reference dds::core::vector< T >::operator[] (
    size_type i ) [inline]
```

Get an element by reference.

8.414.3.11 `operator[]()` [2/2]

```
template<typename T >
const_reference dds::core::vector< T >::operator[] (
    size_type i ) const [inline]
```

Get an element by const-reference.

8.414.3.12 `operator=()` [1/2]

```
template<typename T >
vector & dds::core::vector< T >::operator= (
    const vector< T > & other ) [inline]
```

Assign another vector to this one.

8.414.3.13 operator=() [2/2]

```
template<typename T >
vector & dds::core::vector< T >::operator= (
    vector< T > && other ) [inline]
```

Move-assign another vector to this one.

8.414.3.14 operator==()

```
template<typename T >
bool dds::core::vector< T >::operator== (
    const vector< T > & other ) const [inline]
```

Returns if the elements of two vectors are equal.

8.414.3.15 operator!=()

```
template<typename T >
bool dds::core::vector< T >::operator!= (
    const vector< T > & other ) const [inline]
```

Returns if two vectors are different.

8.414.3.16 begin() [1/2]

```
template<typename T >
iterator dds::core::vector< T >::begin ( ) [inline]
```

Iterator to the first element.

8.414.3.17 begin() [2/2]

```
template<typename T >
const_iterator dds::core::vector< T >::begin ( ) const [inline]
```

Const iterator to first element.

8.414.3.18 end() [1/2]

```
template<typename T >
iterator dds::core::vector< T >::end ( ) [inline]
```

Iterator to last element plus one.

8.414.3.19 end() [2/2]

```
template<typename T >
const_iterator dds::core::vector< T >::end ( ) const [inline]
```

Const iterator to last element plus one.

8.414.4 Friends And Related Function Documentation

8.414.4.1 swap

```
template<typename T >
void swap (
    vector< T > & left,
    vector< T > & right ) [friend]
```

Efficiently swaps the contents of two vectors.

8.414.4.2 operator<<() [1/2]

```
template<typename T , size_t N>
std::ostream & operator<< (
    std::ostream & out,
    const bounded_sequence< T, N > & v ) [related]
```

Print a vector applying << to all of its elements.

8.414.4.3 operator<<() [2/2]

```
template<typename T >
std::ostream & operator<< (
    std::ostream & out,
    const vector< T > & v ) [related]
```

Print a vector applying << to all of its elements.

8.415 rti::core::VendorId Class Reference

<<*extension*>> (p. 156) Represents the vendor of the service implementing the RTPS protocol.

```
#include <rti/core/VendorId.hpp>
```

Public Member Functions

- **VendorId** ()
*Creates the **unknown()** (p. 2314) vendor id.*
- std::vector< uint8_t > **value** () const
Provides access to the bytes that represent the vendor id.

Static Public Member Functions

- static **VendorId unknown** ()
The ID that indicates that the vendor is unknown.

8.415.1 Detailed Description

<<*extension*>> (p. 156) Represents the vendor of the service implementing the RTPS protocol.

8.415.2 Constructor & Destructor Documentation

8.415.2.1 VendorId()

```
rti::core::VendorId::VendorId ( ) [inline]
```

Creates the **unknown()** (p. 2314) vendor id.

8.415.3 Member Function Documentation

8.415.3.1 value()

```
std::vector< uint8_t > rti::core::VendorId::value ( ) const [inline]
```

Provides access to the bytes that represent the vendor id.

8.415.3.2 unknown()

```
static VendorId rti::core::VendorId::unknown ( ) [inline], [static]
```

The ID that indicates that the vendor is unknown.

8.416 rti::config::Verbosity_def Struct Reference

The definition of the `dds::core::safe_enum` (p. 1972) `Verbosity`.

```
#include <rti/config/Logger.hpp>
```

Public Types

- enum `type` {
 - `silent`,
 - `exception`,
 - `warning`,
 - `status_local`,
 - `status_remote`,
 - `status_all`,
 - `SILENT` = `silent`,
 - `EXCEPTION` = `exception`,
 - `WARNING` = `warning`,
 - `STATUS_LOCAL` = `status_local`,
 - `STATUS_REMOTE` = `status_remote`,
 - `STATUS_ALL` = `status_all`,
 - `ERRORY` = `EXCEPTION` }

The underlying `enum` type.

8.416.1 Detailed Description

The definition of the `dds::core::safe_enum` (p. 1972) `Verbosity`.

8.416.2 Member Enumeration Documentation

8.416.2.1 type

```
enum rti::config::Verbosity_def::type
```

The underlying enum type.

Enumerator

silent	No further output will be logged.
exception	Only error and fatal error messages will be logged. An error indicates something wrong in the functioning of RTI Connex. The most common cause of errors is incorrect configuration.
warning	Both error and warning messages will be logged. A warning indicates that RTI Connex is taking an action that may or may not be what you intended. Some configuration information is also logged at this verbosity to aid in debugging.
status_local	Errors, warnings, and verbose information about the lifecycles of local RTI Connex objects will be logged.
status_remote	Errors, warnings, and verbose information about the lifecycles of remote RTI Connex objects will be logged.
status_all	Errors, warnings, verbose information about the lifecycles of local and remote RTI Connex objects, and periodic information about RTI Connex threads will be logged.

8.417 dds::sub::status::ViewState Class Reference

Indicates whether or not an instance is new.

```
#include <dds/sub/status/DataState.hpp>
```

Inherits std::bitset< OMG_DDS_STATE_BIT_COUNT >.

Public Types

- typedef std::bitset< OMG_DDS_STATE_BIT_COUNT > **MaskType**
An std::bitset of ViewStates.

Public Member Functions

- **ViewState** (const **MaskType** &other)
*Create an **ViewState** (p. 2315) from MaskType.*

Static Public Member Functions

- static const **ViewState** **new_view** ()
Creates a new_view ViewState (p. 2315) object.
- static const **ViewState** **not_new_view** ()
Creates a not_new_view ViewState (p. 2315) object.
- static const **ViewState** **any** ()
Creates a ViewState (p. 2315) object representing any view state.

Related Functions

(Note that these are not member functions.)

- `std::ostream & operator<< (std::ostream &os, const ViewState &s)`
Prints a view state as a readable string.

8.417.1 Detailed Description

Indicates whether or not an instance is new.

For each instance (identified by the key), the middleware internally maintains a view state relative to each **dds::sub::DataReader** (p. 756). The view state can be either:

- **dds::sub::status::ViewState::new_view()** (p. 2317) indicates that either this is the first time that the **dds::sub::DataReader** (p. 756) has ever accessed samples of that instance, or else that the **dds::sub::DataReader** (p. 756) has accessed previous samples of the instance, but the instance has since been reborn (i.e. become not-alive and then alive again). These two cases are distinguished by examining the **dds::sub::GenerationCount::disposed()** (p. 1334) and the **dds::sub::GenerationCount::no_writers()** (p. 1334).
- **dds::sub::status::ViewState::not_new_view()** (p. 2317) indicates that the **dds::sub::DataReader** (p. 756) has already accessed samples of the same instance and that the instance has not been reborn since.

The `view_state` available in the **dds::sub::SampleInfo** (p. 1992) is a snapshot of the view state of the instance relative to the **dds::sub::DataReader** (p. 756) used to access the samples at the time the collection was obtained (i.e. at the time `read` or `take` was called). The `view_state` is therefore the same for all samples in the returned collection that refer to the same instance.

Once an instance has been detected as not having any "live" writers and all the samples associated with the instance are "taken" from the **dds::sub::DataReader** (p. 756), the middleware can reclaim all local resources regarding the instance. Future samples will be treated as "never seen."

8.417.2 Member Typedef Documentation

8.417.2.1 MaskType

```
typedef std::bitset<OMG_DDS_STATE_BIT_COUNT > dds::sub::status::ViewState::MaskType
```

An std::bitset of ViewStates.

8.417.3 Constructor & Destructor Documentation

8.417.3.1 ViewState()

```
dds::sub::status::ViewState::ViewState (
    const MaskType & other ) [inline]
```

Create an **ViewState** (p. 2315) from MaskType.

Parameters

<i>other</i>	The MaskType to create the ViewState (p. 2315) with
--------------	--

8.417.4 Member Function Documentation

8.417.4.1 new_view()

```
static const ViewState dds::sub::status::ViewState::new_view ( ) [inline], [static]
```

Creates a new_view **ViewState** (p. 2315) object.

A new_view **ViewState** (p. 2315) indicates that the latest generation of the instance has not previously been accessed.

Referenced by **dds::sub::status::DataState::new_instance()**.

8.417.4.2 not_new_view()

```
static const ViewState dds::sub::status::ViewState::not_new_view ( ) [inline], [static]
```

Creates a not_new_view **ViewState** (p. 2315) object.

Indicates that the latest generation of an instance has previously been accessed.

8.417.4.3 any()

```
static const ViewState dds::sub::status::ViewState::any ( ) [inline], [static]
```

Creates a **ViewState** (p. 2315) object representing any view state.

This is equivalent to **new_view()** (p. 2317) | **not_new_view()** (p. 2317)

Referenced by **dds::sub::status::DataState::any()**, **dds::sub::status::DataState::any_data()**, and **dds::sub::status::DataState::new_data()**.

8.417.5 Friends And Related Function Documentation

8.417.5.1 operator<<()

```
std::ostream & operator<< (
    std::ostream & os,
    const ViewState & s ) [related]
```

Prints a view state as a readable string.

8.418 dds::core::cond::WaitSet Class Reference

<<**reference-type**>> (p. 153) Allows an application to wait until one or more of the attached **Condition** (p. 729) objects have a `trigger_value` of true or else until the timeout expires.

```
#include <dds/core/cond/WaitSet.hpp>
```

Public Types

- typedef std::vector< **dds::core::cond::Condition** > **ConditionSeq**
A vector of Conditions.

Public Member Functions

- **WaitSet** ()
*Creates a **WaitSet** (p. 2318) with no conditions attached.*
- **WaitSetImpl** (const **rti::core::cond::WaitSetProperty** & **property**)
<<*extension*>> (p. 156) *Creates a **WaitSet** (p. 2318) with a **WaitSetProperty***
- const **ConditionSeq** **wait** (const **dds::core::Duration** & **timeout**)
Allows an application thread to wait for the occurrence of certain conditions.
- const **ConditionSeq** **wait** ()
Allows an application thread to wait for the occurrence of certain conditions.
- **ConditionSeq** & **wait** (**ConditionSeq** & **triggered**, const **dds::core::Duration** & **timeout**)
Allows an application thread to wait for the occurrence of certain conditions.
- **ConditionSeq** & **wait** (**ConditionSeq** & **triggered**)
Allows an application thread to wait for the occurrence of certain conditions.
- void **dispatch** (const **dds::core::Duration** & **timeout**)
Waits for at least one of the attached conditions to trigger and then dispatches the events.
- void **dispatch** ()
Waits for at least one of the attached conditions to trigger and then dispatches the events.
- **WaitSet** & **operator+=** (**dds::core::cond::Condition** **cond**)
*Same as **attach_condition()** (p. 2326)*
- **WaitSet** & **operator-=** (**dds::core::cond::Condition** **cond**)
*Same as **detach_condition()** (p. 2326).*
- **WaitSet** & **attach_condition** (**dds::core::cond::Condition** **cond**)
*Attaches a **Condition** (p. 729) to the **WaitSet** (p. 2318).*
- bool **detach_condition** (**dds::core::cond::Condition** **cond**)
*Detaches a **Condition** (p. 729) from the **WaitSet** (p. 2318).*
- **ConditionSeq** **conditions** () const
Retrieves the list of attached conditions.
- **ConditionSeq** & **conditions** (**ConditionSeq** & **conds**) const
Retrieves the list of attached conditions.
- void **detach_all** ()
<<*extension*>> (p. 156) *Detaches all the conditions.*
- **rti::core::cond::WaitSetProperty** **property** () const
<<*extension*>> (p. 156) *Gets the **WaitSetProperty***
- void **property** (const **rti::core::cond::WaitSetProperty** & **property**)
<<*extension*>> (p. 156) *Sets the property to configure the **WaitSet** (p. 2318) to return after one or more trigger events have occurred.*

8.418.1 Detailed Description

<<*reference-type*>> (p. 153) Allows an application to wait until one or more of the attached **Condition** (p. 729) objects have a **trigger_value** of true or else until the timeout expires.

Note

A **WaitSet** (p. 2318) provides all the functions of a <<*reference-type*>> (p. 153) except **close()** (p. 801) and **retain()**.

8.418.2 Usage

dds::core::cond::Condition (p. 729) (s) (in conjunction with wait-sets) provide an alternative mechanism to allow the middleware to communicate communication status changes (including arrival of data) to the application.

"dds::core::cond::WaitSet and dds::core::cond::Condition (s)"

This mechanism is wait-based. Its general use pattern is as follows:

- The application indicates which relevant information it wants to get by creating **dds::core::cond::Condition** (p. 729) objects (**dds::core::cond::StatusCondition** (p. 2079), **dds::sub::cond::ReadCondition** (p. 1858) or **dds::sub::cond::QueryCondition** (p. 1784)) and attaching them to a **dds::core::cond::WaitSet** (p. 2318).
- It then waits on that **dds::core::cond::WaitSet** (p. 2318) until the `trigger_value` of one or several **dds::core::cond::Condition** (p. 729) objects become true.
- It then uses the result of the wait (i.e., `active_conditions`, the list of **dds::core::cond::Condition** (p. 729) objects with `trigger_value == true`) to actually get the information:
 - by calling **dds::core::Entity::status_changes()** (p. 1270) and then `get_<communication_status>()` on the relevant **dds::core::Entity** (p. 1265), if the condition is a **dds::core::cond::StatusCondition** (p. 2079) and the status changes, refer to plain communication status;
 - by calling **dds::core::Entity::status_changes()** (p. 1270) and then **dds::sub::find** (p. 460) on the relevant **dds::sub::Subscriber** (p. 2116) (and then **dds::sub::DataReader::read()** (p. 773) or **dds::sub::DataReader::take** (p. 774) on the returned **dds::sub::DataReader** (p. 756) objects), if the condition is a **dds::core::cond::StatusCondition** (p. 2079) and the status changes refers to **dds::core::status::StatusMask::data_on_readers()** (p. 2089);
 - by calling **dds::core::Entity::status_changes()** (p. 1270) and then **dds::sub::DataReader::read()** (p. 773) or **dds::sub::DataReader::take** (p. 774) on the relevant **dds::sub::DataReader** (p. 756), if the condition is a **dds::core::cond::StatusCondition** (p. 2079) and the status changes refers to **dds::core::status::StatusMask::data_available()** (p. 2090);
 - by calling directly **dds::sub::DataReader::read_w_condition** or **dds::sub::DataReader::take_w_condition** on a **dds::sub::DataReader** (p. 756) with the **dds::core::cond::Condition** (p. 729) as a parameter if it is a **dds::sub::cond::ReadCondition** (p. 1858) or a **dds::sub::cond::QueryCondition** (p. 1784).

Usually the first step is done in an initialization phase, while the others are put in the application main loop.

As there is no extra information passed from the middleware to the application when a wait returns (only the list of triggered **dds::core::cond::Condition** (p. 729) objects), **dds::core::cond::Condition** (p. 729) objects are meant to embed all that is needed to react properly when enabled. In particular, **dds::core::Entity** (p. 1265)-related conditions are related to exactly one **dds::core::Entity** (p. 1265) and cannot be shared.

The blocking behavior of the **dds::core::cond::WaitSet** (p. 2318) is illustrated below.

blocking behavior"

The result of a **dds::core::cond::WaitSet::wait** (p. 2323) operation depends on the state of the **dds::core::cond::WaitSet** (p. 2318), which in turn depends on whether at least one attached **dds::core::cond::Condition** (p. 729) has a `trigger_value` of true. If the wait operation is called on **dds::core::cond::WaitSet** (p. 2318) with state BLOCKED, it will block the calling thread. If wait is called on a **dds::core::cond::WaitSet** (p. 2318) with state UNBLOCKED, it will return immediately. In addition, when the **dds::core::cond::WaitSet** (p. 2318) transitions from BLOCKED to UNBLOCKED it wakes up any threads that had called wait on it.

A key aspect of the **Condition** (p. 729) and **WaitSet** (p. 2318) mechanism is the setting of the `trigger_value` of each **dds::core::cond::Condition** (p. 729).

The **dds::core::cond::WaitSet** (p. 2318) cannot be used after calling `DomainParticipantFactory::finalize_instance`.

8.418.3 Trigger State of a dds::core::cond::StatusCondition

The `trigger_value` of a **dds::core::cond::StatusCondition** (p. 2079) is the boolean OR of the ChangedStatusFlag of all the communication statuses (see **Status Kinds** (p. 229)) to which it is sensitive. That is, `trigger_value == false` only if all the values of the ChangedStatusFlags are false.

The sensitivity of the **dds::core::cond::StatusCondition** (p. 2079) to a particular communication status is controlled by the list of `enabled_statuses` set on the condition by means of the **dds::core::cond::StatusCondition::enabled_statuses(const dds::core::status::StatusMask&)** (p. 2080) operation.

Once the `trigger_value` of a **StatusCondition** (p. 2079) becomes true, it remains true until the status that changed is reset. To reset a status, call the related `get_*_status()` operation. Or, in the case of the data available status, call **read()** (p. 801), **take()** (p. 801), or one of their variants. Therefore, if you are using a **dds::core::cond::StatusCondition** (p. 2079) on a **dds::core::cond::WaitSet** (p. 2318) to be notified of events, your thread will wake up when one of the statuses associated with the **StatusCondition** (p. 2079) becomes true. If you do not reset the status, the **StatusCondition** (p. 2079) `trigger_value` remains true and your **WaitSet** (p. 2318) will not block again; it will immediately wake up when you call **dds::core::cond::WaitSet::wait** (p. 2323).

8.418.4 Trigger State of a dds::sub::cond::ReadCondition

Similar to the **dds::core::cond::StatusCondition** (p. 2079), a **dds::sub::cond::ReadCondition** (p. 1858) also has a `trigger_value` that determines whether the attached **dds::core::cond::WaitSet** (p. 2318) is BLOCKED or UNBLOCKED. However, unlike the **dds::core::cond::StatusCondition** (p. 2079), the `trigger_value` of the **dds::sub::cond::ReadCondition** (p. 1858) is tied to the presence of *at least a sample* managed by RTI Connex with **dds::sub::status::SampleState** (p. 2023) and **dds::sub::status::ViewState** (p. 2315) matching those of the **dds::sub::cond::ReadCondition** (p. 1858). Furthermore, for the **dds::sub::cond::QueryCondition** (p. 1784) to have a `trigger_value == true`, the data associated with the sample must be such that the `query_expression` evaluates to true.

The fact that the `trigger_value` of a **dds::sub::cond::ReadCondition** (p. 1858) depends on the presence of samples on the associated **dds::sub::DataReader** (p. 756) implies that a single take operation can potentially change the `trigger_value` of several **dds::sub::cond::ReadCondition** (p. 1858) or **dds::sub::cond::QueryCondition** (p. 1784) conditions. For example, if all samples are taken, any **dds::sub::cond::ReadCondition** (p. 1858) and **dds::sub::cond::QueryCondition** (p. 1784) conditions associated with the **dds::sub::DataReader** (p. 756) that had their `trigger_value==TRUE` before will see the `trigger_value` change to FALSE. Note that this does not guarantee that **dds::core::cond::WaitSet** (p. 2318) objects that were separately attached to those conditions will not be woken up. Once we have `trigger_value==TRUE` on a condition, it may wake up the attached **dds::core::cond::WaitSet** (p. 2318), the condition transitioning to `trigger_value==FALSE` does not necessarily 'unwake up' the **WaitSet** (p. 2318) as 'unwakening' may not be possible in general.

The consequence is that an application blocked on a **dds::core::cond::WaitSet** (p. 2318) may return from the wait with a list of conditions, some of which are not no longer 'active'. This is unavoidable if multiple threads are concurrently waiting on separate **dds::core::cond::WaitSet** (p. 2318) objects and taking data associated with the same **dds::sub::DataReader** (p. 756) entity.

To elaborate further, consider the following example: A **dds::sub::cond::ReadCondition** (p. 1858) that has a `sample_state_mask = {dds::sub::status::SampleState::not_read() (p. 2025)}` will have `trigger_value` of true whenever a new sample arrives and will transition to false as soon as all the newly-arrived samples are either read (so their sample state changes to READ) or taken (so they are no longer managed by RTI Connex). However if the same **dds::sub::cond::ReadCondition** (p. 1858) had a `sample_state_mask = { dds::sub::status::SampleState::read() (p. 2025), dds::sub::status::SampleState::not_read() (p. 2025) }`, then the `trigger_value` would only become false once all the newly-arrived samples are taken (it is not sufficient to read them as that would only change the sample state to READ), which overlaps the mask on the **dds::sub::cond::ReadCondition** (p. 1858).

8.418.5 Trigger State of a `dds::core::cond::GuardCondition`

The `trigger_value` of a `dds::core::cond::GuardCondition` (p. 1338) is completely controlled by the application via the operation `dds::core::cond::GuardCondition::trigger_value()` (p. 1339).

Waitset Use Cases (p. 131)

Examples

`Foo_subscriber.cxx`.

8.418.6 Member Typedef Documentation

8.418.6.1 `ConditionSeq`

```
typedef std::vector< dds::core::cond::Condition> dds::core::cond::WaitSet::ConditionSeq
```

A vector of Conditions.

8.418.7 Constructor & Destructor Documentation

8.418.7.1 `WaitSet()`

```
dds::core::cond::WaitSet::WaitSet ( ) [inline]
```

Creates a **WaitSet** (p. 2318) with no conditions attached.

8.418.8 Member Function Documentation

8.418.8.1 WaitSetImpl()

```
dds::core::cond::WaitSet::WaitSetImpl (
    const rti::core::cond::WaitSetProperty & property )
```

<<**extension**>> (p. 156) Creates a **WaitSet** (p. 2318) with a WaitSetProperty

8.418.8.2 wait() [1/4]

```
const ConditionSeq dds::core::cond::WaitSet::wait (
    const dds::core::Duration & timeout ) [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

If none of the conditions attached to the **dds::core::cond::WaitSet** (p. 2318) have a trigger_value of true, the wait operation will block, suspending the calling thread.

The result of the wait operation is the list of all the attached conditions that have a trigger_value of true (i.e., the conditions that unblocked the wait).

The wait operation takes a timeout argument that specifies the maximum duration for the wait. If this duration is exceeded and none of the attached **dds::core::cond::Condition** (p. 729) objects are true, wait will return an empty condition sequence.

Note: The resolution of the timeout period is constrained by the resolution of the system clock.

It is not allowable for more than one application thread to be waiting on the same **WaitSet** (p. 2318). If the wait operation is invoked on a **WaitSet** (p. 2318) that already has a thread blocking on it, the operation will return immediately with the value **dds::core::PreconditionNotMetError** (p. 1669).

Parameters

<i>timeout</i>	The maximum time to wait
----------------	--------------------------

Returns

A vector containing the active conditions or an empty vector if the operation times out.

Exceptions

dds::core::PreconditionNotMetError (p. 1669)	or one of the other Standard Exceptions (p. 228). Note however that this operation <i>does not</i> throw dds::core::TimeoutError (p. 2177).
---	---

8.418.8.3 wait() [2/4]

```
const ConditionSeq dds::core::cond::WaitSet::wait ( ) [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

This function is equivalent to `wait(dds::core::Duration::infinite())`.

See also

wait(const dds::core::Duration&) (p. 2323)

8.418.8.4 wait() [3/4]

```
ConditionSeq & dds::core::cond::WaitSet::wait (
    ConditionSeq & triggered,
    const dds::core::Duration & timeout ) [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

This function is equivalent to **wait(const dds::core::Duration&)** (p. 2323) but reuses an existing vector instead of returning a new one.

Parameters

<i>triggered</i>	A vector where the active conditions will be added. Any element already present in the vector will be removed. If the operation times out, this vector will be empty.
<i>timeout</i>	The wait timeout

Returns

A reference to `triggered` for convenience.

See also

wait(const dds::core::Duration&) (p. 2323)

8.418.8.5 wait() [4/4]

```
ConditionSeq & dds::core::cond::WaitSet::wait (
    ConditionSeq & triggered ) [inline]
```

Allows an application thread to wait for the occurrence of certain conditions.

This application is equivalent to `wait(triggered, dds::core::Duration::infinite());`

See also

wait(ConditionSeq&, const dds::core::Duration&) (p. 2324)

8.418.8.6 dispatch() [1/2]

```
void dds::core::cond::WaitSet::dispatch (
    const dds::core::Duration & timeout ) [inline]
```

Waits for at least one of the attached conditions to trigger and then dispatches the events.

This is an alternative, simpler pattern to the use of **wait()** (p. 2323). Instead of receiving the list of active conditions, the application associates a handler (functor) to each conditions before attaching it to the **WaitSet** (p. 2318). Whenever this function wakes up it will call—in the current thread context—the handler of each triggered condition before returning.

Note that each condition can only have one handler, so if you want to attach it to multiple WaitSets you may need to use **wait()** (p. 2323) instead of **dispatch()** (p. 2325).

Parameters

<i>timeout</i>	The maximum time to wait. If that time elapses dispatch() (p. 2325) will return without having called any of the condition handlers.
----------------	---

MT Safety:

It is not thread-safe to reset or replace a condition's handler while **dispatch()** (p. 2325) is running. It should be detached first. Detaching a condition from a **WaitSet** (p. 2318) while **dispatch()** (p. 2325) is running is safe even if the condition is active, but whether the condition handler will be executed or not is undefined.

See also

WaitSet wait and dispatch examples (p. 131)

Examples

Foo_subscriber.cxx.

8.418.8.7 dispatch() [2/2]

```
void dds::core::cond::WaitSet::dispatch ( ) [inline]
```

Waits for at least one of the attached conditions to trigger and then dispatches the events.

This function is equivalent to `dispatch(dds::core::Duration::infinite());`

See also

dispatch(const dds::core::Duration&) (p. 2325)

8.418.8.8 operator+=()

```
WaitSet & dds::core::cond::WaitSet::operator+= (
    dds::core::cond::Condition cond ) [inline]
```

Same as `attach_condition()` (p. 2326)

8.418.8.9 operator-=()

```
WaitSet & dds::core::cond::WaitSet::operator-= (
    dds::core::cond::Condition cond ) [inline]
```

Same as `detach_condition()` (p. 2326).

8.418.8.10 attach_condition()

```
WaitSet & dds::core::cond::WaitSet::attach_condition (
    dds::core::cond::Condition cond ) [inline]
```

Attaches a **Condition** (p. 729) to the **WaitSet** (p. 2318).

It is possible to attach a **dds::core::cond::Condition** (p. 729) on a **dds::core::cond::WaitSet** (p. 2318) that is currently being waited upon (via the wait operation). In this case, if the **dds::core::cond::Condition** (p. 729) has a `trigger_value` of true, then attaching the condition will unblock the **dds::core::cond::WaitSet** (p. 2318).

Parameters

<i>cond</i>	<< <i>in</i> >> (p. 157) Condition (p. 729) to be attached.
-------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or dds::core::OutOfResourcesError (p. 1629).
------------	---

8.418.8.11 detach_condition()

```
bool dds::core::cond::WaitSet::detach_condition (
    dds::core::cond::Condition cond ) [inline]
```

Detaches a **Condition** (p. 729) from the **WaitSet** (p. 2318).

It is possible to detach a `dds::core::cond::Condition` (p. 729) on a `dds::core::cond::WaitSet` (p. 2318) that is currently being waited upon (via the wait operation). If the `dds::core::cond::Condition` (p. 729) was not attached to the `dds::core::cond::WaitSet` (p. 2318), the operation will return `dds::core::InvalidArgumentError` (p. 1363).

Parameters

<i>cond</i>	<< <i>in</i> >> (p. 157) Condition (p. 729) to be detached.
-------------	--

Exceptions

<i>One</i>	of the Standard Exceptions (p. 228), or <code>dds::core::PreconditionNotMetError</code> (p. 1669).
------------	---

8.418.8.12 conditions() [1/2]

```
ConditionSeq dds::core::cond::WaitSet::conditions ( ) const [inline]
```

Retrieves the list of attached conditions.

Returns

the list of attached conditions.

8.418.8.13 conditions() [2/2]

```
ConditionSeq & dds::core::cond::WaitSet::conditions (
    ConditionSeq & conds ) const [inline]
```

Retrieves the list of attached conditions.

Parameters

<i>conds</i>	A vector where the conditions will be added
--------------	---

Returns

A reference to `conds`.

8.418.8.14 detach_all()

```
void detach_all ( )
```

<<**extension**>> (p. 156) Detaches all the conditions.

8.419.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Specifies the **dds::core::cond::WaitSet** (p. 2318) behavior for multiple trigger events

In simple use, a **dds::core::cond::WaitSet** (p. 2318) returns when a single trigger event occurs on one of its attached **dds::core::cond::Condition** (p. 729) (s), or when the `timeout` maximum wait duration specified in the **dds::core::cond::WaitSet::wait** (p. 2323) call expires.

The **rti::core::cond::WaitSetProperty** (p. 2328) allows configuration of the waiting behavior of a **dds::core::cond::WaitSet** (p. 2318). If no conditions are true at the time of the call to `wait`, then the `max_event_count` parameter may be used to configure the **WaitSet** to wait for `max_event_count` trigger events to occur before returning, or to wait for up to `max_event_delay` time from the occurrence of the first trigger event before returning.

The `timeout` maximum wait duration specified in the **dds::core::cond::WaitSet::wait** (p. 2323) call continues to apply.

Entity:

dds::core::cond::WaitSet (p. 2318)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **YES** (p. 307)

8.419.2 Constructor & Destructor Documentation

8.419.2.1 WaitSetProperty() [1/2]

```
rti::core::cond::WaitSetProperty::WaitSetProperty ( )
```

Creates the default **WaitSetProperty** (p. 2328).

8.419.2.2 WaitSetProperty() [2/2]

```
rti::core::cond::WaitSetProperty::WaitSetProperty (
    int32_t the_max_event_count,
    const dds::core::Duration & the_max_event_delay )
```

Creates a **WaitSetProperty** (p. 2328) with the given parameters.

8.419.3 Member Function Documentation

8.419.3.1 max_event_count() [1/2]

```
int32_t rti::core::cond::WaitSetProperty::max_event_count ( ) const
```

Gets the `max_event_count`.

See also

max_event_count(int32_t) (p. 2330)

8.419.3.2 max_event_count() [2/2]

```
WaitSetProperty & rti::core::cond::WaitSetProperty::max_event_count (
    int32_t value )
```

Sets the maximum number of trigger events to cause a **WaitSet** to wake up.

The **dds::core::cond::WaitSet** (p. 2318) will wait until up to `max_event_count` trigger events have occurred before returning. The **dds::core::cond::WaitSet** (p. 2318) may return earlier if either the `timeout` duration has expired, or `max_event_delay` has elapsed since the occurrence of the first trigger event. `max_event_count` may be used to "collect" multiple trigger events for processing at the same time.

[default] 1

[range] >= 1

8.419.3.3 `max_event_delay()` [1/2]

```
dds::core::Duration rti::core::cond::WaitSetProperty::max_event_delay ( ) const
```

Gets the `max_event_delay`.

See also

`max_event_delay(const dds::core::Duration&)` (p. 2331)

8.419.3.4 `max_event_delay()` [2/2]

```
WaitSetProperty & rti::core::cond::WaitSetProperty::max_event_delay (
    const dds::core::Duration & value )
```

Sets the maximum delay from occurrence of first trigger event to cause a `WaitSet` to wake up.

The `dds::core::cond::WaitSet` (p. 2318) will return no later than `max_event_delay` after the first trigger event. `max_event_delay` may be used to establish a maximum latency for events reported by the `dds::core::cond::WaitSet` (p. 2318).

Note that `dds::core::TimeoutError` (p. 2177) is *not* returned if `max_event_delay` is exceeded. `dds::core::TimeoutError` (p. 2177) is returned only if the `timeout` duration expires before any trigger events occur.

[default] `dds::core::Duration::infinite()` (p. 1197)

8.420 `dds::core::WeakReference< T >` Class Template Reference

```
#include <WeakReference.hpp>
```

8.420.1 Detailed Description

```
template<typename T>
class dds::core::WeakReference< T >
```

Unsupported - `WeakReference` (p. 2331) is not currently supported.

8.421 `rti::core::policy::WireProtocol` Class Reference

<< *extension* >> (p. 156) Configures the write protocol of a `dds::domain::DomainParticipant` (p. 1079)

```
#include <rti/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **WireProtocol** ()
Creates the default policy.
- **WireProtocol** & **participant_id** (int32_t the_participant_id)
A value used to distinguish among different participants belonging to the same domain on the same host.
- int32_t **participant_id** () const
Getter (see the setter with the same name)
- **WireProtocol** & **rtps_host_id** (uint32_t the_rtps_host_id)
The RTPS Host ID of the domain participant.
- uint32_t **rtps_host_id** () const
Getter (see the setter with the same name)
- **WireProtocol** & **rtps_app_id** (uint32_t the_rtps_app_id)
The RTPS App ID of the domain participant.
- uint32_t **rtps_app_id** () const
Getter (see the setter with the same name)
- **WireProtocol** & **rtps_instance_id** (uint32_t the_rtps_instance_id)
The RTPS Instance ID of the `dds::domain::DomainParticipant` (p. 1079).
- uint32_t **rtps_instance_id** () const
Getter (see the setter with the same name)
- **WireProtocol** & **rtps_well_known_ports** (const **rti::core::RtpsWellKnownPorts** &the_rtps_well_known_ports)
Configures the RTPS well-known port mappings.
- **rti::core::RtpsWellKnownPorts** **rtps_well_known_ports** () const
Getter (see the setter with the same name)
- **WireProtocol** & **rtps_reserved_port_mask** (const **RtpsReservedPortKindMask** &the_rtps_reserved_port_mask)
Specifies which well-known ports to reserve when enabling the participant.
- **RtpsReservedPortKindMask** **rtps_reserved_port_mask** () const
Getter (see the setter with the same name)
- **WireProtocol** & **rtps_auto_id_kind** (**rti::core::policy::WireProtocolAutoKind** the_kind)
Kind of auto mechanism used to calculate the GUID prefix.
- **rti::core::policy::WireProtocolAutoKind** **rtps_auto_id_kind** () const
Getter (see the setter with the same name)
- **WireProtocol** & **compute_crc** (bool crc_needed)
Adds RTPS CRC submessage to every message when this field is set to true.
- bool **compute_crc** () const
Getter (see the setter with the same name)
- **WireProtocol** & **check_crc** (bool crc_checked)
Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to true.
- bool **check_crc** () const
Getter (see the setter with the same name)

Static Public Attributes

- static **OMG_DDS_API_CLASS_VARIABLE** const uint32_t **RTPS_AUTO_ID**
Indicates that RTI Connext should choose an appropriate host, app, instance or object ID automatically.

8.421.1 Detailed Description

<<*extension*>> (p. 156) Configures the write protocol of a **dds::domain::DomainParticipant** (p. 1079)

Entity:

dds::domain::DomainParticipant (p. 1079)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **NO** (p. 307)

8.421.2 Usage

This QoS policy configures some participant-wide properties of the DDS Real-Time Publish Subscribe (RTPS) on-the-wire protocol. (**rti::core::policy::DataWriterProtocol** (p. 979) and **rti::core::policy::DataReaderProtocol** (p. 836) configure RTPS and reliability properties on a per **dds::pub::DataWriter** (p. 908) or **dds::sub::DataReader** (p. 756) basis.)

NOTE: The default QoS policies returned by RTI Connext contain the correctly initialized wire protocol attributes. The defaults are not normally expected to be modified, but are available to the advanced user customizing the implementation behavior.

The default values should not be modified without an understanding of the underlying Real-Time Publish Subscribe (RTPS) wire protocol.

In order for the discovery process to work correctly, each **dds::domain::DomainParticipant** (p. 1079) must have a unique identifier. This QoS policy specifies how that identifier should be generated.

RTPS defines a 96-bit prefix to this identifier; each **dds::domain::DomainParticipant** (p. 1079) must have a unique value for this prefix relative to all other participants in its domain.

If an application dies unexpectedly and is restarted, the IDs used by the new instance of DomainParticipants should be different than the ones used by the previous instances. A change in these values allows other DomainParticipants to know that they are communicating with a new instance of an application, and not the previous instance.

For legacy reasons, RTI Connext divides the 96-bit prefix into three integers:

- The first integer is called host ID. The original purpose of this integer was to contain the identity of the machine on which the DomainParticipant is executing.
- The second integer is called an application ID. The original purpose of this integer was to contain a value that identifies the process or task in which the DomainParticipant is contained.
- The third integer is called instance ID. The original purpose was to contain a value that uniquely identifies a DomainParticipant within a task or process.

The `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p.2339) field can be used to configure the algorithm that RTI Connext uses to populate the 96-bit prefix. Then you can optionally overwrite specific parts of the 96-bit prefix by explicitly configuring the `rti::core::policy::WireProtocol::rtps_host_id` (p.2336) (first integer), `rti::core::policy::WireProtocol::rtps_app_id` (p.2337) (second integer), and `rti::core::policy::WireProtocol::rtps_instance_id` (p.2338) (third integer).

The `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p.2339) field supports three different prefix generation algorithms:

1. In the default and most common scenario, `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p.2339) is set to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_UUID` (p.2342). As the name suggests, this mechanism uses a unique, randomly generated UUID to fill the `rtps_host_id`, `rtps_app_id`, or `rtps_instance_id` fields. The first two bytes of the `rtps_host_id` are replaced with the RTI vendor ID (0x0101).
2. (Legacy) When `rtps_auto_id_kind` is set to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_IP` (p.2342), the 96-bit prefix is generated as follows:
 - **rtps_host_id:** The 32-bit value of the IPv4 of the first up and running interface of the host machine is assigned. If the host does not have an IPv4 address, the host-id will be automatically set to 0x7F000001.
 - **rtps_app_id:** The process (or task) ID is assigned.
 - **rtps_instance_id:** A counter is assigned that is incremented per new participant within a process.

DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

3. (Legacy) When `rtps_auto_id_kind` is set to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC` (p.2342), the 96-bit prefix is generated as follows:
 - **rtps_host_id:** The first 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
 - **rtps_app_id:** The last 32 bits of the MAC address of the first up and running interface of the host machine are assigned.
 - **rtps_instance_id:** This field is split into two different parts. The process (or task) ID is assigned to the first 24 bits. A counter is assigned to the last 8 bits. This counter is incremented per new participant.

DDS_RTPS_AUTO_ID_FROM_IP is not a good algorithm to guarantee prefix uniqueness, because the process ID can be recycled by the OSs.

Some examples are provided to clarify the behavior of this QoS Policy in case you want to change the default behavior with `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC` (p.2342).

First, get the participant QoS from the DomainParticipantFactory:

Second, change the `rti::core::policy::WireProtocol` (p.2331) using one of the options shown below.

Third, create the `dds::domain::DomainParticipant` (p.1079) as usual, using the modified QoS structure instead of the default one.

Option 1: Use `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC` (p.2342) to explicitly set just the application/task identifier portion of the `rtps_instance_id` field.

```
using namespace rti::core::policy;
```

```

participant_qos « WireProtocol()
    .rtps_auto_id_kind(WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC)
    .rtps_instance_id(
        /* App ID */ (12 << 8) | /* Instance ID */ WireProtocol::RTPS_AUTO_ID);

```

Option 2: Handle only the per participant counter and let RTI Connexthandle the application/task identifier:

```

using namespace rti::core::policy;

participant_qos « WireProtocol()
    .rtps_auto_id_kind(WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC)
    .rtps_instance_id(
        /* App ID */ WireProtocol::RTPS_AUTO_ID | /* Instance ID */ 12);

```

Option 3: Handle the entire **rtps_instance_id** field yourself:

```

using namespace rti::core::policy;

participant_qos « WireProtocol()
    .rtps_auto_id_kind(WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC)
    .rtps_instance_id(
        /* App ID */ (12 << 8) | /* Instance ID */ 9);

```

NOTE: If you are using **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC** (p. 2342) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connexthandle will take responsibility for them). RTI recommends that you always specify the two parts separately in order to avoid errors.

Option 4: Let RTI Connexthandle the entire **rtps_instance_id** field:

```

using namespace rti::core::policy;

participant_qos « WireProtocol().rtps_auto_id_kind(
    WireProtocolAutoKind::RTPS_AUTO_ID_FROM_MAC);

```

NOTE: If you are using **rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC** (p. 2342) as **rtps_auto_id_kind** and you decide to manually handle the **rtps_instance_id** field, you must ensure that both parts are non-zero (otherwise RTI Connexthandle will take responsibility for them). RTI recommends that you always specify the two parts separately in order to clearly show the difference.

8.421.3 Constructor & Destructor Documentation

8.421.3.1 WireProtocol()

```

rti::core::policy::WireProtocol::WireProtocol ( ) [inline]

```

Creates the default policy.

8.421.4 Member Function Documentation

8.421.4.1 participant_id() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::participant_id (
    int32_t the_participant_id )
```

A value used to distinguish among different participants belonging to the same domain on the same host.

Determines the unicast port on which meta-traffic is received. Also defines the *default* unicast port for receiving user-traffic for DataReaders and DataWriters (can be overridden by the **rti::core::policy::TransportUnicast** (p. 2259) or **rti::core::policy::TransportUnicast** (p. 2259)).

For more information on port mapping, please refer to **rti::core::RtpsWellKnownPorts** (p. 1965).

Each **dds::domain::DomainParticipant** (p. 1079) in the same domain and running on the same host, must have a unique `participant_id`. The participants may be in the same address space or in distinct address spaces.

A negative number (-1) means that RTI Connext will *automatically* resolve the participant ID as follows.

- RTI Connext will pick the *smallest* participant ID based on the unicast ports available on the transports enabled for discovery.
- RTI Connext will attempt to resolve an automatic port index either when a DomainParticipant is enabled, or when a DataReader or DataWriter is created. Therefore, all the transports enabled for discovery must have been registered by this time. Otherwise, the discovery transports registered after resolving the automatic port index may produce port conflicts when the DomainParticipant is enabled.

[default] -1 [automatic], i.e. RTI Connext will automatically pick the `participant_id`, as described above.

[range] [≥ 0], or -1, and does not violate guidelines stated in **rti::core::RtpsWellKnownPorts** (p. 1965).

See also

dds::core::Entity::enable() (p. 1269)

8.421.4.2 participant_id() [2/2]

```
int32_t rti::core::policy::WireProtocol::participant_id ( ) const
```

Getter (see the setter with the same name)

8.421.4.3 rtps_host_id() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::rtps_host_id (
    uint32_t the_rtps_host_id )
```

The RTPS Host ID of the domain participant.

A specific host ID that is unique in the domain.

[default] `rti::core::policy::WireProtocol::RTPS_AUTO_ID` (p. 2341). The default value is interpreted as follows:

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_IP` (p. 2342), the value will be interpreted as the IPv4 address of the *first* up and running interface of the host machine.

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC` (p. 2342), the value will be interpreted as the first 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_UUID` (p. 2342), the value will be the first 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

8.421.4.4 rtps_host_id() [2/2]

```
uint32_t rti::core::policy::WireProtocol::rtps_host_id ( ) const
```

Getter (see the setter with the same name)

8.421.4.5 rtps_app_id() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::rtps_app_id (
    uint32_t the_rtps_app_id )
```

The RTPS App ID of the domain participant.

A participant specific ID that, together with the `rtps_instance_id`, is unique within the scope of the `rtps_host_id`.

If a participant dies and is restarted, it is recommended that it be given an app ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] `rti::core::policy::WireProtocol::RTPS_AUTO_ID` (p. 2341). The default value is interpreted as follows:

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_IP` (p. 2342) the value will be the process (or task) ID.

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC` (p. 2342) the value will be the last 32 bits of the MAC address assigned to the *first* up and running interface of the host machine.

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_UUID` (p. 2342), the value will be the middle 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff]

8.421.4.6 rtps_app_id() [2/2]

```
uint32_t rti::core::policy::WireProtocol::rtps_app_id ( ) const
```

Getter (see the setter with the same name)

8.421.4.7 rtps_instance_id() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::rtps_instance_id (
    uint32_t the_rtps_instance_id )
```

The RTPS Instance ID of the **dds::domain::DomainParticipant** (p. 1079).

This is an instance-specific ID of a participant that, together with the `rtps_app_id`, is unique within the scope of the `rtps_host_id`.

If a participant dies and is restarted, it is recommended that it be given an instance ID that is distinct from the previous one so that other participants in the domain can distinguish between them.

[default] `rti::core::policy::WireProtocol::RTPS_AUTO_ID` (p. 2341). The default value is interpreted as follows:

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_IP` (p. 2342), a counter is assigned that is incremented per new participant. For VxWorks-653, the first 8 bits are assigned to the partition id for the application.

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC` (p. 2342), the first 24 bits are assigned to the application/task identifier and the last 8 bits are assigned to a counter that is incremented per new participant.

If `rti::core::policy::WireProtocol::rtps_auto_id_kind` (p. 2339) is equal to `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_UUID` (p. 2342), the value will be the last 32 bits of the GUID prefix assigned by the UUID algorithm.

[range] [0,0xffffffff] **NOTE:** If you use `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_MAC` (p. 2342) as `rtps_auto_id_kind` and you decide to manually handle the `rtps_instance_id` field, you must ensure that both the two parts are non-zero, otherwise the middleware will take responsibility for them. We recommend that you always specify the two parts separately in order to avoid errors. ([examples](#))

8.421.4.8 rtps_instance_id() [2/2]

```
uint32_t rti::core::policy::WireProtocol::rtps_instance_id ( ) const
```

Getter (see the setter with the same name)

8.421.4.9 rtps_well_known_ports() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::rtps_well_known_ports (
    const RtpsWellKnownPorts & the_rtps_well_known_ports )
```

Configures the RTPS well-known port mappings.

Determines the well-known multicast and unicast port mappings for discovery (meta) traffic and user traffic.

[default] `rti::core::RtpsWellKnownPorts::Interoperable()` (p. 348)

8.421.4.10 rtps_well_known_ports() [2/2]

```
RtpsWellKnownPorts rti::core::policy::WireProtocol::rtps_well_known_ports ( ) const
```

Getter (see the setter with the same name)

8.421.4.11 rtps_reserved_port_mask() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::rtps_reserved_port_mask (
    const RtpsReservedPortKindMask & the_rtps_reserved_port_mask )
```

Specifies which well-known ports to reserve when enabling the participant.

Specifies which of the well-known multicast and unicast ports will be reserved when the DomainParticipant is enabled. Failure to allocate a port that is computed based on the `rti::core::RtpsWellKnownPorts` (p. 1965) will be detected at this time, and the enable operation will fail.

[default] `RTPS_RESERVED_PORT_MASK_DEFAULT`

8.421.4.12 rtps_reserved_port_mask() [2/2]

```
RtpsReservedPortKindMask rti::core::policy::WireProtocol::rtps_reserved_port_mask ( ) const
```

Getter (see the setter with the same name)

```
WireProtocol & rti::core::policy::WireProtocol::rtps_auto_id_kind (
    RtpsAutoIdKind the_kind )
```

Kind of auto mechanism used to calculate the GUID prefix.

[default] `rti::core::policy::WireProtocolAutoKind_def::RTPS_AUTO_ID_FROM_UUID` (p. 2342)

8.421.4.14 rtps_auto_id_kind() [2/2]

```
rti::core::policy::WireProtocolAutoKind rti::core::policy::WireProtocol::rtps_auto_id_kind ( )  
const
```

Getter (see the setter with the same name)

8.421.4.15 compute_crc() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::compute_crc (   
    bool crc_needed )
```

Adds RTPS CRC submessage to every message when this field is set to true.

The computed CRC covers the entire RTPS message excluding the RTPS header.

[default] false

8.421.4.16 compute_crc() [2/2]

```
bool rti::core::policy::WireProtocol::compute_crc ( ) const
```

Getter (see the setter with the same name)

8.421.4.17 check_crc() [1/2]

```
WireProtocol & rti::core::policy::WireProtocol::check_crc (   
    bool crc_checked )
```

Checks if the received RTPS message is valid by comparing the computed CRC with the received RTPS CRC submessage when this field is set to true.

rti::core::policy::WireProtocol::compute_crc (p.2340) must be enabled at the publishing application for validating the message at the subscribing application.

[default] false

8.421.4.18 check_crc() [2/2]

```
bool rti::core::policy::WireProtocol::check_crc ( ) const
```

Getter (see the setter with the same name)

8.421.5 Member Data Documentation

8.421.5.1 RTPS_AUTO_ID

```
OMG_DDS_API_CLASS_VARIABLE const uint32_t rti::core::policy::WireProtocol::RTPS_AUTO_ID [static]
```

Indicates that RTI Connexx should choose an appropriate host, app, instance or object ID automatically.

If this special value is assigned to `rti::core::policy::WireProtocol::rtps_host_id` (p. 2336), `rti::core::policy::WireProtocol::rtps_app_id` (p. 2337), `rti::core::policy::WireProtocol::rtps_instance_id` (p. 2338), `rti::core::policy::DataWriterProtocol::rtps_object_id` (p. 981) or `rti::core::policy::DataReaderProtocol::rtps_object_id` (p. 838) RTI Connexx will assign the ID automatically.

The actual ID value is chosen when the QoS is set: the QoS returned from `dds::domain::DomainParticipant::qos()` (p. 1090), `dds::pub::DataWriter::qos()` (p. 936) or `dds::sub::DataReader::qos()` (p. 784) will never have this value.

QoS:

```
rti::core::policy::WireProtocol::rtps_host_id (p. 2336) rti::core::policy::WireProtocol::rtps_app_id (p. 2337)
rti::core::policy::WireProtocol::rtps_instance_id (p. 2338)
```

8.422 rti::core::policy::WireProtocolAutoKind_def Struct Reference

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `WireProtocolAutoKind`

```
#include <PolicyKind.hpp>
```

Public Types

- enum `type` {
 - `RTPS_AUTO_ID_FROM_IP`,
 - `RTPS_AUTO_ID_FROM_MAC`,
 - `RTPS_AUTO_ID_FROM_UUID` }

The underlying enum type.

8.422.1 Detailed Description

<<*extension*>> (p. 156) The definition of the `dds::core::safe_enum` (p. 1972) `WireProtocolAutoKind`

8.422.2 Member Enumeration Documentation

8.422.2.1 type

```
enum rti::core::policy::WireProtocolAutoKind_def::type
```

The underlying enum type.

Enumerator

RTPS_AUTO_ID_FROM_IP	Builds the GUID prefix using the IPv4 address and process ID. Uses the IPv4 address of the first up-and-running interface of the host machine and the process ID to build the GUID prefix.
RTPS_AUTO_ID_FROM_MAC	Builds the GUID prefix using the MAC address and process ID. Uses the first 32 bits of the MAC address assigned to the first up-and-running interface and the process ID to build the GUID prefix. Note to Android Users: DDS_RTPS_AUTO_ID_FROM_MAC is not supported in recent versions of Android (6.0 and later).
RTPS_AUTO_ID_FROM_UUID	Builds the GUID prefix by selecting the UUID-based algorithm (default). This method of generating the GUID prefix does not require having a network interface and is friendly to IP mobility scenarios in which an RTI Connex application may start in a node that does not have a physical network interface enabled.

8.423 rti::pub::WriteParams Class Reference

<<*extension*>> (p. 156) <<*value-type*>> (p. 152) Advanced parameters for writing with a DataWriter

```
#include "rti/pub/WriteParams.hpp"
```

Public Member Functions

- **WriteParams ()**
*Creates a **WriteParams** (p. 2342) object with default values.*
- void **reset ()**
Resets all the fields to their default values.
- bool **replace_automatic_values ()** const
Indicates if the replacement of automatic values has been activated or not.
- **WriteParams & replace_automatic_values (bool value)**
Allows retrieving the actual value of those fields that were automatic.
- **rti::core::SampleIdentity identity ()** const
Gets the sample identity.
- **WriteParams & identity (const rti::core::SampleIdentity &value)**
Sets a explicit sample identity for writing.
- **rti::core::SampleIdentity related_sample_identity ()** const
Gets the related sample identity.
- **WriteParams & related_sample_identity (const rti::core::SampleIdentity &value)**
Sets a related sample identity for a sample.
- **dds::core::Time source_timestamp ()** const
Gets the timestamp.
- **WriteParams & source_timestamp (const dds::core::Time &value)**
Sets the source timestamp for writing.
- **rti::core::Cookie cookie ()** const

- Gets the cookie.*
- **WriteParams & cookie** (const **rti::core::Cookie** &value)
Sets a cookie for writing.
- **dds::core::InstanceHandle handle** () const
Gets the instance handle.
- **WriteParams & handle** (const **dds::core::InstanceHandle** &value)
Sets the instance handle for writing.
- **int32_t priority** () const
Gets the priority.
- **WriteParams & priority** (int32_t value)
Sets the priority for writing.
- **rti::core::SampleFlag flag** () const
Gets the sample flag.
- **WriteParams & flag** (const **rti::core::SampleFlag** &value)
Sets the sample flags for writing.
- **rti::core::Guid source_guid** () const
Gets the source GUID.
- **WriteParams & source_guid** (const **rti::core::Guid** &value)
Sets the source GUID for writing.
- **rti::core::Guid related_source_guid** () const
Gets the related source guid.
- **WriteParams & related_source_guid** (const **rti::core::Guid** &value)
Sets the related source guid for writing.
- **rti::core::Guid related_reader_guid** () const
Gets the related reader GUID.
- **WriteParams & related_reader_guid** (const **rti::core::Guid** &value)
Sets the related reader guid for writing.

8.423.1 Detailed Description

<<**extension**>> (p. 156) <<**value-type**>> (p. 152) Advanced parameters for writing with a DataWriter

See also

dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&) (p. 949)

8.423.2 Constructor & Destructor Documentation

8.423.2.1 WriteParams()

```
rti::pub::WriteParams::WriteParams ( ) [inline]
```

Creates a **WriteParams** (p. 2342) object with default values.

The default instance is such that it makes **dds::pub::DataWriter**(const T&, **WriteParams**&) (p. 908) behave identically to **dds::pub::DataWriter**(const T&) (p. 908).

8.423.3 Member Function Documentation

8.423.3.1 reset()

```
void rti::pub::WriteParams::reset ( )
```

Resets all the fields to their default values.

See also

[replace_automatic_values\(\)](#) (p. 2344)

8.423.3.2 replace_automatic_values() [1/2]

```
bool rti::pub::WriteParams::replace_automatic_values ( ) const
```

Indicates if the replacement of automatic values has been activated or not.

8.423.3.3 replace_automatic_values() [2/2]

```
WriteParams & rti::pub::WriteParams::replace_automatic_values (
    bool value )
```

Allows retrieving the actual value of those fields that were automatic.

When this field is set, the fields that were configured with an automatic value (for example, [rti::core::SampleIdentity::automatic\(\)](#) (p. 1991)) receive their actual value after [dds::pub::DataWriter::write\(const T&,rti::pub::WriteParams&\)](#) (p. 949) is called.

To reset those fields to their automatic value after calling [dds::pub::DataWriter::write\(const T&,rti::pub::WriteParams&\)](#) (p. 949), use [rti::pub::WriteParams::reset](#) (p. 2344)

Parameters

<i>value</i>	Whether to replace automatic values or not
--------------	--

[default] false

8.423.3.4 identity() [1/2]

```
rti::core::SampleIdentity rti::pub::WriteParams::identity ( ) const
```

Gets the sample identity.

8.423.3.5 identity() [2/2]

```
WriteParams & rti::pub::WriteParams::identity (
    const rti::core::SampleIdentity & value )
```

Sets a explicit sample identity for writing.

Identifies the sample being written. The identity consists of a pair (Virtual Writer GUID, Virtual Sequence Number).

Use the default value to let RTI Connext determine the sample identity as follows:

- The Virtual Writer GUID is the virtual GUID associated with the writer writing the sample. This virtual GUID is configured using `rti::core::policy::DataWriterProtocol::virtual_guid` (p.981).
- The sequence number is increased by one with respect to the previous value.

The virtual sequence numbers for a virtual writer must be strictly monotonically increasing. If the user tries to write a sample with a sequence number smaller or equal to the last sequence number, the write operation will fail.

A DataReader can access the identity of a received sample by using the fields `dds::sub::SampleInfo::original_publication_virtual_guid` (p.1998) and `dds::sub::SampleInfo::original_publication_virtual_sequence_number` (p.1998) in the `dds::sub::SampleInfo` (p.1992).

[default] `rti::core::SampleIdentity::automatic()` (p.1991).

8.423.3.6 related_sample_identity() [1/2]

```
rti::core::SampleIdentity rti::pub::WriteParams::related_sample_identity ( ) const
```

Gets the related sample identity.

8.423.3.7 related_sample_identity() [2/2]

```
WriteParams & rti::pub::WriteParams::related_sample_identity (
    const rti::core::SampleIdentity & value )
```

Sets a related sample identity for a sample.

Identifies another sample that is logically related to the one that is written.

When this field is set, the related sample identity is propagated and subscribing applications can retrieve it from the `dds::sub::SampleInfo` (p. 1992) (see `dds::sub::SampleInfo::related_original_publication_virtual_sample_identity` (p. 2000)).

The default value is `rti::core::SampleIdentity::unknown()` (p. 1991), and is not propagated.

A DataReader can access the related identity of a received sample by using the fields `dds::sub::SampleInfo::related_original_publication_virtual_guid` (p. 1999) and `dds::sub::SampleInfo::related_original_publication_virtual_sequence_number` (p. 1999) in the `dds::sub::SampleInfo` (p. 1992).

[default] `rti::core::SampleIdentity::unknown()` (p. 1991)

8.423.3.8 source_timestamp() [1/2]

```
dds::core::Time rti::pub::WriteParams::source_timestamp ( ) const
```

Gets the timestamp.

8.423.3.9 source_timestamp() [2/2]

```
WriteParams & rti::pub::WriteParams::source_timestamp (
    const dds::core::Time & value )
```

Sets the source timestamp for writing.

Specifies the source timestamp that will be available to the `dds::sub::DataReader` (p. 756) objects by means of the `source_timestamp` attribute within the `dds::sub::SampleInfo` (p. 1992).

[default] `dds::core::Time::invalid()` (p. 2164).

8.423.3.10 cookie() [1/2]

```
rti::core::Cookie rti::pub::WriteParams::cookie ( ) const
```

Gets the cookie.

8.423.3.11 cookie() [2/2]

```
WriteParams & rti::pub::WriteParams::cookie (
    const rti::core::Cookie & value )
```

Sets a cookie for writing.

Used in the callback **dds::pub::DataWriterListener::on_sample_removed** (p.978) to associate a removed sample with a written sample.

[default] Empty sequence (zero-length).

8.423.3.12 handle() [1/2]

```
dds::core::InstanceHandle rti::pub::WriteParams::handle ( ) const
```

Gets the instance handle.

Either the handle returned by a previous call to **dds::pub::DataWriter::register_instance** (p.928), or else the special value **dds::core::InstanceHandle::nil()** (p.1358).

[default] **dds::core::InstanceHandle::nil()** (p.1358)

8.423.3.13 handle() [2/2]

```
WriteParams & rti::pub::WriteParams::handle (
    const dds::core::InstanceHandle & value )
```

Sets the instance handle for writing.

ă Instance handle

Either the handle returned by a previous call to **dds::pub::DataWriter::register_instance** (p.928), or else the special value **dds::core::InstanceHandle::nil()** (p.1358).

[default] **dds::core::InstanceHandle::nil()** (p.1358)

8.423.3.14 priority() [1/2]

```
int32_t rti::pub::WriteParams::priority ( ) const
```

Gets the priority.

8.423.3.15 priority() [2/2]

```
WriteParams & rti::pub::WriteParams::priority (
    int32_t value )
```

Sets the priority for writing.

A positive integer value designating the relative priority of the sample, used to determine the transmission order of pending writes.

Use of publication priorities requires an asynchronous publisher (**rti::core::policy::PublishModeKind_def::ASYNCHRONOUS** (p.1745)) with **rti::pub::FlowControllerProperty::scheduling_policy** (p.1323) set to **FlowControllerSchedulingPolicy_def::HIGHEST_PRIORITY_FIRST** (p.1327).

Larger numbers have higher priority.

For multi-channel DataWriters, the publication priority of a sample may be used as a filter criteria for determining channel membership.

If the publication priority of the parent DataWriter, or for multi-channel DataWriters, if the publication priority of the parent channel, is set to PUBLICATION_PRIORITY_AUTOMATIC, then the DataWriter or channel will be assigned the priority of the largest publication priority of all samples in the DataWriter or channel.

If the publication priority of the parent DataWriter, and for multi-channel DataWriters, if the publication priority of the parent channel, are set to PUBLICATION_PRIORITY_UNDEFINED, then the DataWriter or channel will be assigned the lowest priority, regardless of the value of the publication priorities of samples written to the DataWriter or channel.

The publication priority of each sample can be set in the **rti::pub::WriteParams** (p.2342) of **dds::pub::DataWriter::write(const T&,rti::pub::WriteParams&)** (p.949).

For dispose and unregister samples, use the **rti::pub::WriteParams** (p.2342) of **dds::pub::DataWriter::dispose_instance(rti::pub::WriteParams&)** (p.943) and **dds::pub::DataWriter::unregister_instance(rti::pub::WriteParams&)** (p.943).

[default] 0 (lowest priority)

See also

rti::core::ChannelSettings::priority (p.706)

8.423.3.16 flag() [1/2]

```
rti::core::SampleFlag rti::pub::WriteParams::flag ( ) const
```

Gets the sample flag.

8.423.3.17 flag() [2/2]

```
WriteParams & rti::pub::WriteParams::flag (
    const rti::core::SampleFlag & value )
```

Sets the sample flags for writing.

The flags are represented as a 32-bit integer, of which only the 16 least-significant bits are used.

RTI reserves least-significant bits [0-7] for middleware-specific usage.

The application can use least-significant bits [8-15].

The first bit (**rti::core::SampleFlag::redelivered** (p. 1987)) is reserved for marking samples as redelivered when using RTI Queuing Service.

The second bit (**rti::core::SampleFlag::intermediate_reply_sequence** (p. 1987)) is used to indicate that a response sample is not the last response sample for a given request. This bit is usually set by a Replier sending multiple responses for a request.

An application can inspect the flags associated with a received sample by checking the field **dds::sub::SampleInfo::flag** (p. 2000).

[default] 0 (no flags are set)

8.423.3.18 source_guid() [1/2]

```
rti::core::Guid rti::pub::WriteParams::source_guid ( ) const
```

Gets the source GUID.

8.423.3.19 source_guid() [2/2]

```
WriteParams & rti::pub::WriteParams::source_guid (
    const rti::core::Guid & value )
```

Sets the source GUID for writing.

When this field is set, the `source_guid` is propagated and subscribing applications can retrieve it from the **dds::sub::SampleInfo** (p. 1992) (see **dds::sub::SampleInfo::source_guid** (p. 2000)).

The default value is **rti::core::Guid::automatic()** (p. 1341), and is not propagated.

The main use case for `source_guid` and `related_source_guid` is a request/reply scenario in which a reply has to be sent only to the Requester that issue the related request.

In this case, the Requester's DataWriter will send a request setting the `source_guid` to a unique value. This value must be the same value even after Requester restart.

The Replier's DataReader will get the request's `source_guid` from the `SampleInfo` and it will send it as the `related_source_guid` of the reply using the Replier's DataWriter.

The Requester's DataReader will install a CFT on the `related_source_guid` using a filter expression. For example:
`@related_source_guid.value = &hex(00000000000000000000000000000001)`

This way the reply will be send only to the right Requester.

The `source_guid` and `related_source_guid` fields are used by RTI Queuing Service in a request/reply scenario.

[default] **rti::core::Guid::automatic()** (p. 1341) (the `source_guid` is automatically set to the **dds::pub::DataWriter** (p. 908) virtual GUID).

See also

[rti::pub::WriteParams::related_source_guid](#) (p. 2350)

8.423.3.20 related_source_guid() [1/2]

```
rti::core::Guid rti::pub::WriteParams::related_source_guid ( ) const
```

Gets the related source guid.

8.423.3.21 related_source_guid() [2/2]

```
WriteParams & rti::pub::WriteParams::related_source_guid (
    const rti::core::Guid & value )
```

Sets the related source guid for writing.

When this field is set, the `related_source_guid` is propagated and subscribing applications can retrieve it from the `dds::sub::SampleInfo` (p. 1992) (see `dds::sub::SampleInfo::related_source_guid` (p. 2001)).

The default value is `rti::core::Guid::unknown()` (p. 1341), and is not propagated.

[default] `rti::core::Guid::unknown()` (p. 1341)

See also

[rti::pub::WriteParams::source_guid](#) (p. 2349)

8.423.3.22 related_reader_guid() [1/2]

```
rti::core::Guid rti::pub::WriteParams::related_reader_guid ( ) const
```

Gets the related reader GUID.

8.423.3.23 related_reader_guid() [2/2]

```
WriteParams & rti::pub::WriteParams::related_reader_guid (
    const rti::core::Guid & value )
```

Sets the related reader guid for writing.

When this field is set, the related_reader_guid is propagated and subscribing applications can retrieve it from the `dds::sub::SampleInfo` (p. 1992) (see `dds::sub::SampleInfo::related_subscription_guid` (p. 2001)).

The default value is `rti::core::Guid::unknown()` (p. 1341), and is not propagated.

The main use case for this field is point-to-point sample distribution using CFT. DataReaders install a CFT on the related_reader_guid using a unique GUID. For example, the filter for DataReader 'n' can be:

```
@related_reader_guid.value = &hex(00000000000000000000000000000001)
```

Then, a DataWriter that wants to send the sample to DataReader 'n' will use the `dds::pub::DataWriter::write(const T&, rti::pub::WriteParams&)` (p. 949) method and set related_reader_guid to the value used by DataReader 'n' in its filter expression.

This field is currently used by RTI Queuing Service to distribute a sample to only one of the Consumer's DataReaders attached to a SharedReaderQueue.

[default] `rti::core::Guid::unknown()` (p. 1341)

8.424 rti::topic::WriterContentFilter< T, CompileData, WriterFilterData > Class Template Reference

Additional Inherited Members

8.424.1 Detailed Description

```
template<typename T, typename CompileData = no_compile_data_t, typename WriterFilterData = no_compile_data_t>
class rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >
```

<<**extension**>> (p. 156) A class to inherit from when implementing a writer-side custom content filter

This interface can be implemented by an application-provided class and then registered with the DomainParticipant such that samples can be filtered for **dds::topic::ContentFilteredTopic** (p. 735) with the filter name that the filter is registered with. This class inherits from **rti::topic::ContentFilter** (p. 732), therefore you must implement the compile, evaluate, and finalize functions from that class in addition to the functions in this class.

Note: the API for using a custom content filter is subject to change in a future release.

For an example of how to create a custom content filter see **Creating Custom Content Filters** (p. 134)

Template Parameters

<i>T</i>	The type of the samples that this ContentFilter (p. 732) will filter
<i>CompileData</i>	the type of the data that the compile function will return. If your compile function will not return data, you can leave this template parameter to the default no_compile_data_t (p. 1567) type and return rti::topic::no_compile_data in your compile function
<i>WriterFilterData</i>	the type of the data that the writer_attach function will return. If your writer_attach function will not return data, you can leave this template parameter to the default no_compile_data_t (p. 1567) type and return rti::topic::no_compile_data in your compile function

See also

rti::topic::CustomFilter (p. 749)

rti::topic::ContentFilter (p. 732)

dds::domain::DomainParticipant::register_contentfilter() (p. 1103)

8.424.2 Member Function Documentation

8.424.2.1 writer_compile()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_compile_data_t>
virtual void rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_compile
(
    WriterFilterData & writer_filter_data,
    ExpressionProperty & prop,
    const std::string & expression,
    const dds::core::StringSeq & parameters,
    const dds::core::optional< dds::core::xtypes::DynamicType > & type_code,
    const std::string & type_class_name,
    const rti::core::Cookie & cookie ) [pure virtual]
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 756).

This method is called when the **dds::pub::DataWriter** (p. 908) discovers a **dds::sub::DataReader** (p. 756) with a **dds::topic::ContentFilteredTopic** (p. 735) or when a **dds::pub::DataWriter** (p. 908) is notified of a change in a DataReader's filter parameter for the locally registered content filter instance.

It is possible for multiple threads to be calling into this function at the same time.

Parameters

<i>writer_filter_data</i>	The state created using <code>writer_attach</code>
<i>prop</i>	An ExpressionProperty (p. 1292) that allows you to indicate to RTI Connex if a filter expression can be optimized.
<i>expression</i>	An <code>std::string</code> with the filter expression. If you want to manipulate this string, you must first make a copy of it.
<i>parameters</i>	A string sequence with the expression parameters the <code>ContentFilteredTopic</code> was created with. The string sequence is equal (but not identical) to the string sequence passed to dds::topic::ContentFilteredTopic() (p. 735). Note that the sequence passed to the compile function is owned by RTI Connex and must not be referenced outside the compile function.
<i>type_code</i>	The <code>DynamicType</code> for the related Topic of the <code>ContentFilteredTopic</code> . A type code is a description of a type in terms of which types it contains (such as long, string, etc.) and the corresponding member field names in the data type structure. The type code can be used to write custom content filters that can be used with any type.
<i>type_class_name</i>	Fully qualified class name of the related Topic.
<i>cookie</i>	rti::core::Cookie (p. 746) to uniquely identify the <code>DataReader</code> for which <code>writer_compile</code> was called

8.424.2.2 writer_evaluate()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↵
compile_data_t>
virtual rti::core::CookieSeq & rti::topic::WriterContentFilter< T, CompileData, WriterFilterData
>::writer_evaluate (
    WriterFilterData & writer_filter_data,
    const T & sample,
    const FilterSampleInfo & meta_data ) [pure virtual]
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 756).

This method is called every time a **dds::pub::DataWriter** (p. 908) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **dds::pub::DataWriter** (p. 908) is performing writer-side filtering and return the list of **rti::core::Cookie** (p. 746) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

Parameters

<i>writer_filter_data</i>	The state created using the writer_compile method
<i>sample</i>	A deserialized sample to be filtered.
<i>meta_data</i>	Meta data associated with the sample.

Returns

A **rti::core::CookieSeq** which identifies the set of DataReaders whose filters pass the sample.

8.424.2.3 writer_finalize()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↵
compile_data_t>
virtual void rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_↵
finalize (
    WriterFilterData & writer_filter_data,
    const rti::core::Cookie & cookie ) [pure virtual]
```

A writer-side filtering API to clean up a previously compiled instance of the content filter.

This method is called to notify the filter implementation that the **dds::pub::DataWriter** (p. 908) is no longer matching with a **dds::sub::DataReader** (p. 756) for which it was previously performing writer-side filtering. This will allow the filter to purge any state it was maintaining for the **dds::sub::DataReader** (p. 756).

It is possible for multiple threads to be calling into this function at the same time.

Parameters

<i>writer_filter_data</i>	The state created using <code>writer_attach</code>
<i>cookie</i>	<code>rti::core::Cookie</code> (p. 746) to uniquely identify the <code>DataReader</code> for which this method was invoked

8.424.2.4 `writer_attach()`

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↵
compile_data_t>
virtual WriterFilterData & rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >↵
::writer_attach ( ) [pure virtual]
```

A writer-side filtering API to create some state that can facilitate filtering on the writer side.

This method is called to create some state required to perform filtering on the writer side using writer-side filtering APIs. This method will be called for every `dds::pub::DataWriter` (p. 908); it will be called only the first time the `dds::pub::↵DataWriter` (p. 908) matches a `dds::sub::DataReader` (p. 756) using the specified filter. This function will not be called for any subsequent `DataReaders` that match the `DataWriter` and are using the same filter.

Returns

An object of user-specified type to some state created on the `DataWriter` that will help perform writer-side filtering efficiently. Can be `no_compile_data`

8.424.2.5 `writer_detach()`

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↵
compile_data_t>
virtual void rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_detach
(
    WriterFilterData & writer_filter_data ) [pure virtual]
```

A writer-side filtering API to clean up a previously created state using `writer_attach`.

This method is called to delete any state created using the `WriterContentFilter::writer_attach` (p. 2355) function. This method will be called when the `dds::pub::DataWriter` (p. 908) is deleted.

Parameters

<i>writer_filter_data</i>	The state created using <code>writer_attach</code>
---------------------------	--

8.424.2.6 writer_return_loan()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↵
compile_data_t>
virtual void rti::topic::WriterContentFilter< T, CompileData, WriterFilterData >::writer_↵
return_loan (
    WriterFilterData & writer_filter_data,
    rti::core::CookieSeq & cookies ) [pure virtual]
```

A writer-side filtering API to return the loan on the list of DataReaders returned by writer_evaluate.

This method is called to return the loan on CookieSeq returned by **WriterContentFilter::writer_return_loan** (p. 2355). It is possible for multiple threads to be calling into this function at the same time.

Parameters

<i>writer_filter_data</i>	The state created using writer_attach
<i>cookies</i>	rti::core::CookieSeq for which writer_return_loan was invoked

8.425 rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData > Class Template Reference

<<**extension**>> (p. 156) A class to inherit from when implementing a writer-side custom content filter.

```
#include <rti/topic/ContentFilter.hpp>
```

Inheritance diagram for rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >:

Public Member Functions

- virtual void **writer_evaluate_helper** (WriterFilterData &writer_filter_data, const T &sample, const **Filter**↵**SampleInfo** &meta_data)=0

*A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 756).*

Protected Member Functions

- void **add_cookie** (rti::core::Cookie &cookie)

A helper function which will add a *rti::core::Cookie* (p. 746) to the *CookieSeq* that is then returned by the *writer_evaluate* function.

Additional Inherited Members

8.425.1 Detailed Description

```
template<typename T, typename CompileData = no_compile_data_t, typename WriterFilterData = no_compile_data_t>
class rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >
```

<<**extension**>> (p. 156) A class to inherit from when implementing a writer-side custom content filter.

This class manages for you the *rti::core::CookieSeq* which maintains a list of Cookies associated with the *DataReaders* whose filters pass the sample.

This class has a private *CookieSeq* member that you can add cookies too using the helper method, **add_cookie()** (p. 2358), and the sequence is automatically cleared for you in the *return_loan* method, meaning that you do not need to implement that method yourself.

For an example of how to create a custom content filter see **Creating Custom Content Filters** (p. 134)

Template Parameters

<i>T</i>	The type of the samples that this ContentFilter (p. 732) will filter
<i>CompileData</i>	the type of the data that the compile function will return. If your compile function will not return data, you can leave this template parameter to the default no_compile_data_t (p. 1567) type and return <i>rti::topic::no_compile_data</i> in your compile function
<i>WriterFilterData</i>	the type of the data that the <i>writer_attach</i> function will return. If your <i>writer_attach</i> function will not return data, you can leave this template parameter to the default no_compile_data_t (p. 1567) type and return <i>rti::topic::no_compile_data</i> in your compile function

8.425.2 Member Function Documentation

8.425.2.1 writer_evaluate_helper()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↵
compile_data_t>
virtual void rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >::writer_↵
_evaluate_helper (
    WriterFilterData & writer_filter_data,
    const T & sample,
    const FilterSampleInfo & meta_data ) [pure virtual]
```

A writer-side filtering API to compile an instance of the content filter according to the filter expression and parameters specified by a matching **dds::sub::DataReader** (p. 756).

This method is called every time a **dds::pub::DataWriter** (p. 908) writes a new sample. Its purpose is to evaluate the sample for all the readers for which the **dds::pub::DataWriter** (p. 908) is performing writer-side filtering and return the list of **rti::core::Cookie** (p. 746) structures associated with the DataReaders whose filters pass the sample.

It is possible for multiple threads to be calling into this function at the same time

When using the **WriterContentFilterHelper** (p. 2356) helper class, you implement this method instead of `writer_↵ evaluate`. The `writer_evaluate` function calls this method and then returns the `CookieSeq` for you.

Parameters

<i>writer_filter_data</i>	The state created using the <code>writer_compile</code> method
<i>sample</i>	A deserialized sample to be filtered.
<i>meta_data</i>	Meta data associated with the sample.

8.425.2.2 add_cookie()

```
template<typename T , typename CompileData = no_compile_data_t, typename WriterFilterData = no_↵
compile_data_t>
void rti::topic::WriterContentFilterHelper< T, CompileData, WriterFilterData >::add_cookie (
    rti::core::Cookie & cookie ) [inline], [protected]
```

A helper function which will add a **rti::core::Cookie** (p. 746) to the `CookieSeq` that is then returned by the `writer_↵ evaluate` function.

Call this method from `writer_evaluate_helper` whenever you need to add a `Cookie` for a `DataReader` whose filter has passed a particular sample.

Parameters

<i>cookie</i>	The cookie to add to the <code>CookieSeq</code>
---------------	---

8.426 dds::core::policy::WriterDataLifecycle Class Reference

Controls how a `dds::pub::DataWriter` (p. 908) handles the lifecycle of the instances (keys) that it writes.

```
#include <dds/core/policy/CorePolicy.hpp>
```

Public Member Functions

- **WriterDataLifecycle** ()
Creates the default policy.
- **WriterDataLifecycle** (bool autodispose)
Creates an instance with a value for auto-dispose unregistered instances and default values for the rest of parameters.
- **WriterDataLifecycle & autodispose_unregistered_instances** (bool b)
Indicates whether the DataWriter should automatically dispose an instance when it unregisters it.
- bool **autodispose_unregistered_instances** () const
Getter (see setter with the same name)
- **dds::core::policy::WriterDataLifecycle & autopurge_unregistered_instances_delay** (const **dds::core::Duration** &duration)
<<extension>> (p. 156) Maximum duration for which the DataWriter will maintain information regarding an instance once it has unregistered the instance.
- **dds::core::Duration autopurge_unregistered_instances_delay** () const
<<extension>> (p. 156) Getter (see setter with the same name)
- **dds::core::policy::WriterDataLifecycle & autopurge_disposed_instances_delay** (const **dds::core::Duration** &duration)
<<extension>> (p. 156) Maximum duration for which the DataWriter will maintain information regarding an instance once it has disposed the instance.
- **dds::core::Duration autopurge_disposed_instances_delay** () const
<<extension>> (p. 156) Getter (see setter with the same name)

Static Public Member Functions

- static **WriterDataLifecycle AutoDisposeUnregisteredInstances** ()
Creates WriterDataLifecycle(true)
- static **WriterDataLifecycle ManuallyDisposeUnregisteredInstances** ()
Creates WriterDataLifecycle(false)

8.426.1 Detailed Description

Controls how a `dds::pub::DataWriter` (p. 908) handles the lifecycle of the instances (keys) that it writes.

Entity:

dds::pub::DataWriter (p. 908)

Properties:

RxO (p. 307) = N/A

Changeable (p. 307) = **YES** (p. 307)

8.426.2 Usage

This policy determines how the `dds::pub::DataWriter` (p. 908) acts with regards to the lifecycle of the data instances it manages (data instances that have been either explicitly registered with the `dds::pub::DataWriter` (p. 908) or implicitly registered by directly writing the data).

You may use `dds::pub::DataWriter::unregister_instance` (p. 930) to indicate that the `dds::pub::DataWriter` (p. 908) no longer wants to send data for a `dds::topic::Topic` (p. 2178).

The behavior controlled by this QoS policy applies on a per instance (key) basis for keyed Topics, so that when a `dds::pub::DataWriter` (p. 908) unregisters an instance, RTI Connex can automatically also dispose that instance. This is the default behavior.

In many cases where the ownership of a Topic is shared (see `dds::core::policy::Ownership` (p. 1630)), DataWriters may want to relinquish their ownership of a particular instance of the Topic to allow other DataWriters to send updates for the value of that instance regardless of `Ownership` (p. 1630) Strength. In that case, you may only want a DataWriter to unregister an instance without disposing the instance. *Disposing* an instance is a statement that an instance no longer exists. User applications may be coded to trigger on the disposal of instances, thus the ability to unregister without disposing may be useful to properly maintain the semantic of disposal.

8.426.3 Constructor & Destructor Documentation

8.426.3.1 WriterDataLifecycle() [1/2]

```
dds::core::policy::WriterDataLifecycle::WriterDataLifecycle ( ) [inline]
```

Creates the default policy.

8.426.3.2 WriterDataLifecycle() [2/2]

```
dds::core::policy::WriterDataLifecycle::WriterDataLifecycle (
    bool autodispose ) [inline], [explicit]
```

Creates an instance with a value for auto-dispose unregistered instances and default values for the rest of parameters.

8.426.4 Member Function Documentation

8.426.4.1 autodispose_unregistered_instances() [1/2]

```

WriterDataLifecycle & dds::core::policy::WriterDataLifecycle::autodispose_unregistered_instances
(
    bool b ) [inline]

```

Indicates whether the DataWriter should automatically dispose an instance when it unregisters it.

- true
The **dds::pub::DataWriter** (p. 908) will dispose of the instance each time it is unregistered. The behavior is identical to explicitly calling one of the `dispose` operations on the instance prior to calling the `unregister` operation.
- false (default)
The **dds::pub::DataWriter** (p. 908) will not dispose of the instance. The application can still call one of the `dispose` operations prior to unregistering the instance and dispose of the instance that way.

[default] false

8.426.4.2 autodispose_unregistered_instances() [2/2]

```

bool dds::core::policy::WriterDataLifecycle::autodispose_unregistered_instances ( ) const [inline]

```

Getter (see setter with the same name)

8.426.4.3 AutoDisposeUnregisteredInstances()

```

static WriterDataLifecycle dds::core::policy::WriterDataLifecycle::AutoDisposeUnregistered↔
Instances ( ) [inline], [static]

```

Creates `WriterDataLifecycle(true)`

8.426.4.4 ManuallyDisposeUnregisteredInstances()

```

static WriterDataLifecycle dds::core::policy::WriterDataLifecycle::ManuallyDisposeUnregistered↔
Instances ( ) [inline], [static]

```

Creates `WriterDataLifecycle(false)`

8.426.4.5 autopurge_unregistered_instances_delay() [1/2]

```
dds::core::policy::WriterDataLifecycle & autopurge_unregistered_instances_delay (
    const dds::core::Duration & duration )
```

<<**extension**>> (p. 156) Maximum duration for which the DataWriter will maintain information regarding an instance once it has unregistered the instance.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Determines how long the **dds::pub::DataWriter** (p. 908) will maintain information regarding an instance that has been unregistered. By default, the **dds::pub::DataWriter** (p. 908) resources associated with an instance (e.g., the space needed to remember the Instance Key or KeyHash) are released lazily. This means the resources are only reclaimed when the space is needed for another instance because **dds::core::policy::ResourceLimits::max_instances** (p. 1924) is exceeded. This behavior can be changed by setting `autopurge_unregistered_instances_delay` to a value other than **dds::core::Duration::infinite()** (p. 1197).

After this time elapses, the **dds::pub::DataWriter** (p. 908) will purge all internal information regarding the instance, including historical samples, even if **dds::core::policy::ResourceLimits::max_instances** (p. 1924) has not been reached.

The purging of unregistered instances can be done based on the source timestamp of the unregister sample or the time where the unregister sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): `dds.data_writer.history.source_timestamp_based_autopurge_instances_delay`.

For durable writer history, `autopurge_unregistered_instances_delay` supports only the **dds::core::Duration::infinite()** (p. 1197) value.

[default] **dds::core::Duration::infinite()** (p. 1197) (disabled) for all **dds::pub::DataWriter** (p. 908) except for the built-in discovery DataWriters

dds::core::Duration::zero() (p. 1197) for built-in discovery DataWriters (see `rti::core::policy::DiscoveryConfig::publication_writer_data_lifecycle` (p. 1050), `rti::core::policy::DiscoveryConfig::subscription_writer_data_lifecycle` (p. 1052) and `rti::core::policy::DiscoveryConfig::participant_configuration_writer_data_lifecycle` (p. 1071)).

[range] [0, 1 year] or **dds::core::Duration::infinite()** (p. 1197)

8.426.4.6 autopurge_unregistered_instances_delay() [2/2]

```
dds::core::Duration autopurge_unregistered_instances_delay ( ) const
```

<<**extension**>> (p. 156) Getter (see setter with the same name)

8.426.4.7 autopurge_disposed_instances_delay() [1/2]

```
dds::core::policy::WriterDataLifecycle & autopurge_disposed_instances_delay (
    const dds::core::Duration & duration )
```

<<**extension**>> (p. 156) Maximum duration for which the DataWriter will maintain information regarding an instance once it has disposed the instance.

Note

This function is an extension, it must be called via the **extensions() member function** (p. 156)

Determines how long the **dds::pub::DataWriter** (p. 908) will maintain information regarding an instance that has been disposed of. By default, disposing of an instance does not make it eligible to be purged. By setting `autopurge_←disposed_instances_delay` to a value other than **dds::core::Duration::infinite()** (p. 1197), the DataWriter will delete the resources associated with an instance (including historical samples) once the time has elapsed and all matching DataReaders have acknowledged all the samples for this instance including the dispose sample.

The purging of disposed instances can be done based on the source timestamp of the dispose sample or the time when the dispose sample was added to the DataWriter queue by setting the following property to 1 or 0 respectively (default: 0): **dds.data_writer.history.source_timestamp_based_autopurge_instances_delay**.

This QoS value is supported with durable DataWriter queues only for **dds::core::Duration::zero()** (p. 1197) and **dds←::core::Duration::infinite()** (p. 1197) values (finite values are not supported).

[default] **dds::core::Duration::infinite()** (p. 1197) (disabled)

[range] [0, 1 year] or **dds::core::Duration::infinite()** (p. 1197)

8.426.4.8 autopurge_disposed_instances_delay() [2/2]

```
dds::core::Duration autopurge_disposed_instances_delay ( ) const
```

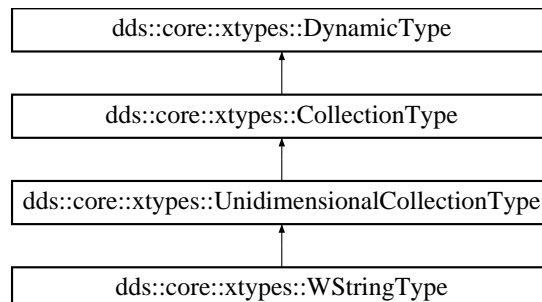

<<**extension**>> (p. 156) Getter (see setter with the same name)

8.427 dds::core::xtypes::WStringType Class Reference

<<**value-type**>> (p. 152) Represents an IDL `wstring` type.

```
#include <dds/core/xtypes/CollectionTypes.hpp>
```

Inheritance diagram for `dds::core::xtypes::WStringType`:

Public Member Functions

- **WStringType** (uint32_t **bounds**)
Creates a bounded wide string.

Additional Inherited Members

8.427.1 Detailed Description

<<**value-type**>> (p. 152) Represents an IDL `wstring` type.

8.427.2 Constructor & Destructor Documentation

8.427.2.1 WStringType()

```
dds::core::xtypes::WStringType::WStringType (
    uint32_t bounds ) [explicit]
```

Creates a bounded wide string.

Parameters

<i>bounds</i>	The maximum length
---------------	--------------------

8.428 rti::config::compliance::XTypesMask Class Reference

This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

```
#include <rti/config/Compliance.hpp>
```

Inherits `std::bitset< 32 >`.

Public Types

- typedef `std::bitset< 32 >` **MaskType**
A typedef of `std::bitset<32>` for convenience.

Public Member Functions

- **XTypesMask** ()
Default XTypes compliance mask.
- **XTypesMask** (uint64_t mask)
Construct a XTypesMask (p. 2364) from an integer.
- **XTypesMask** (const **MaskType** &mask)
Construct a XTypesMask (p. 2364) from a MaskType object.

Static Public Member Functions

- static const **XTypesMask** **dheader_in_non_primitive_collections** ()
When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER.
- static const **XTypesMask** **enum_as_primitive_in_collections** ()
When this bit is set, enums are considered primitive types in collection types.
- static const **XTypesMask** **parameter_length_with_padding** ()
When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary.
- static const **XTypesMask** **encapsulation_options_with_padding** ()
When this bit is set, RTI Connex will set the padding bits in the options field of the encapsulation header of a serialized payload.
- static const **XTypesMask** **vendor** ()
XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.
- static const **XTypesMask** **default_mask** ()
Default XTypes compliance mask.

8.428.1 Detailed Description

This mask configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

XTypes compliance mask.

The **rti::config::compliance::XTypesMask** (p. 2364) configures different aspects of the Extended CDR encoding (XCDR and XCDR2).

Applications that don't use the exact same XTypes compliance mask may not be interoperable.

By default, data serialization is not fully compliant with Extended CDR encoding due to bugs when implementing the standard. These bugs do not result in breaking functional correctness. They only affect interoperability with other vendors.

You can change the default compliance mask for an application using any of the following mechanisms:

- Setting the environment variable **NDDS_XTYPES_COMPLIANCE_MASK**
- Calling the function **rti::config::compliance::set_xtypes_mask()** (p. 249)

The environment variable will be automatically loaded when a DomainParticipantFactory is created. If you need to load it before that, use the function **rti::config::compliance::load_compliance_masks()** (p. 250).

The format of the environment variable is an unsigned integer, which can be in HEX notation. For example: 0x00000001.

The default value is **rti::config::compliance::XTypesMask::default_mask()** (p. 2369).

To be fully compliant with the XTypes specification, set the mask to **rti::config::compliance::XTypesMask::vendor()** (p. 2368).

[default] rti::config::compliance::XTypesMask::default_mask() (p. 2369)

8.428.2 Member Typedef Documentation

8.428.2.1 MaskType

```
typedef std::bitset<32> rti::config::compliance::XTypesMask::MaskType
```

A typedef of `std::bitset<32>` for convenience.

8.428.3 Constructor & Destructor Documentation

8.428.3.1 XTypesMask() [1/3]

```
rti::config::compliance::XTypesMask::XTypesMask ( ) [inline]
```

Default XTypes compliance mask.

The mask sets the following bits:

- `rti::config::compliance::XTypesMask::parameter_length_with_padding()` (p. 2367)
- `rti::config::compliance::XTypesMask::encapsulation_options_with_padding()` (p. 2368)

The HEX value for the mask is: 0x0000000C.

8.428.3.2 XTypesMask() [2/3]

```
rti::config::compliance::XTypesMask::XTypesMask (
    uint64_t mask ) [inline], [explicit]
```

Construct a **XTypesMask** (p. 2364) from an integer.

Parameters

<i>mask</i>	Value whose bits are copied to the bitset positions
-------------	---

8.428.3.3 XTypesMask() [3/3]

```
rti::config::compliance::XTypesMask::XTypesMask (
    const MaskType & mask ) [inline]
```

Construct a **XTypesMask** (p. 2364) from a MaskType object.

Parameters

<i>mask</i>	A std::bitset<32> to construct this XTypesMask (p. 2364) from
-------------	--

8.428.4 Member Function Documentation

8.428.4.1 dheader_in_non_primitive_collections()

```
static const XTypesMask rti::config::compliance::XTypesMask::dheader_in_non_primitive_collections
( ) [inline], [static]
```

When this bit is set, the serialization of sequences and arrays with non-primitive members includes a DHEADER.

Value: 0x00000001

To be compatible with the XTypes specification, this bit must be set.

This bit only applies to XCDR2 encoding.

Limitation: For FlatData, the compliant encoding is applied to arrays and sequences of mutable types, but not final types . The serialization of final types containing arrays of non-primitive types in the FlatData language binding is not compliant with Extended CDR encoding version 2 in any case.

8.428.4.2 enum_as_primitive_in_collections()

```
static const XTypesMask rti::config::compliance::XTypesMask::enum_as_primitive_in_collections ( )
[inline], [static]
```

When this bit is set, enums are considered primitive types in collection types.

Value: 0x00000002

A DHEADER will not be added to collections of enums if **rti::config::compliance::XTypesMask::dheader_in_non_↵ primitive_collections()** (p. 2367) is set.

To be compatible with the XTypes specification, this bit must be unset.

This bit only applies to XCDR2 encoding.

8.428.4.3 parameter_length_with_padding()

```
static const XTypesMask rti::config::compliance::XTypesMask::parameter_length_with_padding ( )  
[inline], [static]
```

When this bit is set, the length of a member header in a mutable type or an optional member will include padding bytes to a 4-byte boundary.

Value: 0x00000004

To be compatible with the XTypes specification, this bit must be unset.

This bit only applies to XCDR encoding.

8.428.4.4 encapsulation_options_with_padding()

```
static const XTypesMask rti::config::compliance::XTypesMask::encapsulation_options_with_padding ( )  
[inline], [static]
```

When this bit is set, RTI Connex will set the padding bits in the options field of the encapsulation header of a serialized payload.

Value: 0x00000008

When this bit is set RTI Connex will set the least significant two bits in the second byte of the options field to a value that encodes the number of padding bytes needed after the end of the serialized payload in order to reach the next 4-byte aligned offset. Specifically, the least significant two bits shall be set to binary 00 if no padding bits would be needed and binary 01, 10, or 11 if, respectively, there would be one, two, or three bytes of padding needed. These bits in the options field will be interpreted by a `DataReader` to determine where the serialized data exactly ended.

To be compatible with the XTypes specification, this bit must be set.

To be compatible with the following Micro versions this bit must be unset because those versions of Micro did not support padding bits and will discard any data with encapsulations options not set to 0.

- RTI Connex Micro 3.x.y.z
- RTI Connex Micro 2.4.15.1
- RTI Connex Micro 2.4.14.0 and 2.4.14.1
- RTI Connex Micro 2.4.13.1 through 2.4.13.5
- RTI Connex Micro 2.4.12.z

This bit applies to both, XCDR and XCDR2 encodings.

8.428.4.5 vendor()

```
static const XTypesMask rti::config::compliance::XTypesMask::vendor ( ) [inline], [static]
```

XTypes vendor compliance mask. This value is fully aligned with the XTypes specification.

The mask sets the following bits:

- **rti::config::compliance::XTypesMask::dheader_in_non_primitive_collections()** (p. 2367)
- **rti::config::compliance::XTypesMask::encapsulation_options_with_padding()** (p. 2368)

The HEX value for the mask is: 0x00000009.

8.428.4.6 default_mask()

```
static const XTypesMask rti::config::compliance::XTypesMask::default_mask ( ) [inline], [static]
```

Default XTypes compliance mask.

The mask sets the following bits:

- **rti::config::compliance::XTypesMask::parameter_length_with_padding()** (p. 2367)
- **rti::config::compliance::XTypesMask::encapsulation_options_with_padding()** (p. 2368)

The HEX value for the mask is: 0x0000000C.

Chapter 9

Example Documentation

9.1 Foo.idl

The definition of the type in IDL that rtdsgen uses to generate Foo_publisher.cxx, Foo_subscriber.cxx and the type-support code. There is also the definition of MyType and MyOtherType, used in some **Programming How-To's** (p. 164).

See also

Working with IDL types (p. 395)

```
struct Foo {
    long x; //@key
    long y;
};
struct MyType {
    long my_long;
    string<512> my_string;
    Foo my_foo;
    sequence<long, 10> my_sequence;
    Foo my_array[5];
    Foo my_optional; //@Optional
};
enum Color {
    RED,
    GREEN,
    BLUE
};
enum MyUnionDiscriminator {
    USE_LONG,
    USE_STRING,
    USE_FOO
};
union MyUnion switch (MyUnionDiscriminator) {
case USE_LONG:
    long my_long;
case USE_STRING:
    string my_string;
case USE_FOO:
    Foo my_foo;
};
struct MyOtherType {
    long m1;
    double m2;
    string m3;
};
```

9.2 Foo.hpp

The definition of the C++ types create from Foo.idl
